Rotary Blowing-machines.—The blowing-machines above described may be classed as reciprocating machines, being driven by the to-and-fro motion of a piston or of a bellows-frame. Another class is that of rotary machines in which the apparatus is driven directly by a rotating shaft. Of this type there are three sub-classes, viz., disk-blowers, fans, and positive blowers. Disk-blowers are used for moving large quantities of air at the lowest pressures, as for exhausting air from heated rooms or for ventilation. A form of such blower is shown in Fig. 6. It is built in various sizes, from 12 to 96 inches in diameter. A 12-inch fan, driven at 1,000 to 2,000 revolutions per minute, will absorb $\frac{1}{16}$ of horse-power, and will exhaust from 1,500 to 3,000 cubic feet of air per minute, while a 96-inch fan, driven from 200 to 300 revolutions per minute, will require from 4 to 10 horse-power, and will exhaust from 60,000 to 90,000 cubic feet per minute. The operation of a disk-blower in air is similar to that of a screw propeller in water.

A fan is somewhat similar to a rotary disk-blower, but the wings or vanes are parallel with the shaft, and are inclosed in a sheet-metal box or case, which has an opening at the axis to receive the air and another at the periphery of the case to discharge it. For a further description, see FANS.

Root's rotary positive blower is shown in section in Fig. 7. It consists of an oblong metal case closed at the ends, con-

taining two parallel shafts geared together at each end outside of the case, and each carrying what is known as "revolvers." The action of these revolvers, in taking air from the lower half of the case and pushing it outward and upward through the exit, is clearly shown in the cut.

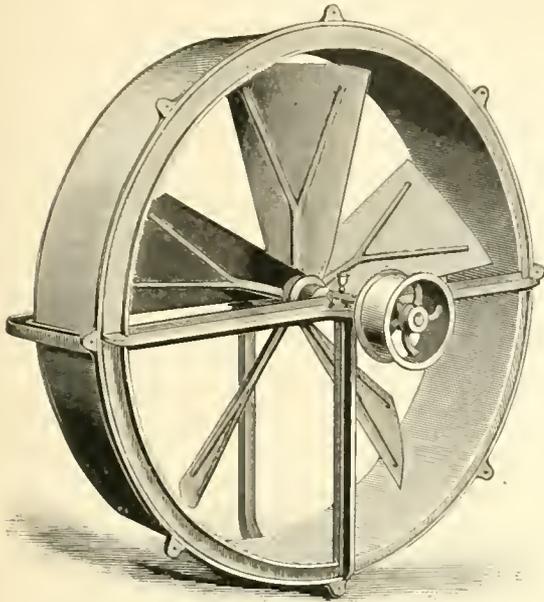

FIG. 6.—Exhaust disk-wheel.

The Baker positive blower is composed of three drums, each of which is a single casting, turned and balanced. The upper drum to which the pulley or engine is attached does all the work of blowing or exhausting. The two lower drums are merely valves for the purpose of preventing the air from escaping or returning.

Both fans and positive blowers are used for blowing cupolas for melting iron. Positive blowers are capable of giving much higher pressures than fans, while the fans, being run at higher rotative speeds, are cheaper in first cost for a given quantity of blast.

Steam-jet Blowers.—Steam escaping at high pressure through a small nozzle creates induced currents in the surrounding atmosphere, on the principle of the injector, and a steam-pipe of small diameter inserted in an air-pipe of considerably larger diameter, which is open at both ends, makes a simple form of blower. Such an apparatus is occasionally used to increase the draft in steam-boilers by blowing

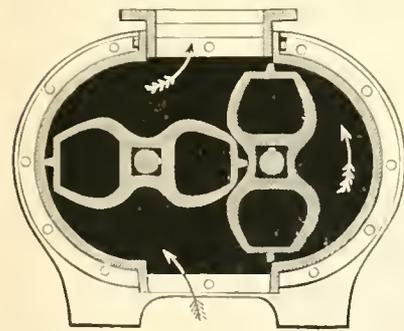

FIG. 7.—Root's positive blower.

ing a forced blast under the grate-bars. A steam-pipe inserted into a chimney, and discharging steam in a vertical direction, constitutes the steam-jet blower commonly used in locomotives and steam fire-engines for producing a powerful draft. For this purpose the steam-nozzle requires to be given a proper shape and dimensions, depending upon the size and shape of the chimney pipe and the quantity of the chimney gases. For blowing air into furnaces certain shapes of nozzles and of air-pipes have been found advantageous. A furnace-blower of the steam-jet type, known as the Korting, is shown in Fig. 8.

Water-blast Blowers.—A jet or falling stream of water may also be used to create a blast of air by means of induced currents. The *Trompe*, described in early works on metallurgy of iron, is an apparatus based on this principle. In it a stream of water falls through a vertical wooden tube

into a large air-tight chamber below. Numerous small holes are cut in the tube, through which air is drawn by the descending stream, which air is set free in the chamber, whence it is led by a pipe to the furnace. The efficiency of this apparatus is much lower than that of a blowing-machine driven by a water-wheel.

A more efficient form of water-blower, applicable in situations where the quantity and fall of water bear proper relations to the quantity and pressure of air to be supplied, consists of two air-tight tanks placed at the level of the tail-race, which are alternately filled through tubes from the head-race. While being filled the air displaced in them is forced into the blast main, and while being emptied a valve admits air from the external atmosphere.

The *D'Aubisson Oscillating Cylinder* is a peculiar form of blowing-machine of limited application. It comprises a barrel with a diaphragm, central through the entire length and of nearly the whole diameter, and two valves alternately aspirating and expiring. In its normal position the diaphragm is vertical; the barrel is filled half full of water, and is then set in slow oscillation by means of a crank and pitman. During each oscillation the water passes from one half of the barrel to the other, drawing air into the emptying half and expelling it from the other.

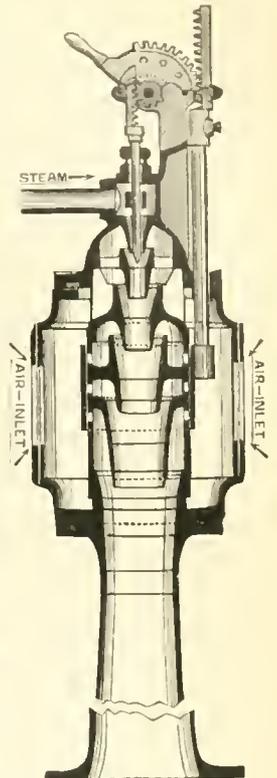

FIG. 8.—Steam-jet blower.

WILLIAM KENT.

Blowpipe (in Fr. *chalumeau*; Germ. *Löthrohr*): a tube bent at right angles and terminating in a fine nozzle, for directing a current of air from the mouth across the flame of a lamp, candle, or gas-jet. It produces a conical-pointed flame, intensely hot, which can be readily directed upon small objects by the operator. It is constantly used by the jeweler in soldering, but in the hands of the chemist and mineralogist it is the basis of a distinct and comprehensive system of analysis, both qualitative and quantitative. By using a gentle current of air, and not permitting the nozzle to enter the flame, the entire flame is brought into a horizontal position, but its chemical character is not changed; it is still composed of combustible gases rich in carbon; and as these, when directed upon many metallic oxides, reduce or liberate the metals, this flame is called the *reducing* flame. If, on the other hand, a more powerful current of air is blown into the interior of the flame, a sharp-pointed jet of a blue tint is the result. Many metals, placed just beyond the point of this flame, are rapidly oxidized; hence it is called the *oxidizing* flame. The chemist is thus enabled by the aid of the blowpipe to expose small quantities of minerals or other substances either to a reducing or an oxidizing influence. By holding the substance in platinum-pointed forceps its fusibility can be determined, or it may communicate to the flame some characteristic color. By placing it upon charcoal many important facts can be learned with regard to it; i. e. it may produce white or colored deposits upon the coal, or evolve a characteristic odor, etc. By subjecting it at the same time to the action of carbonate of soda it may yield metallic globules or powder, with or without a coating. By the aid of a loop of platinum wire the body under examination may be exposed to the action of borax or salt of phosphorus, when glassy beads of characteristic colors may result. Thus with the aid of the blowpipe the analyst subjects the substance to a series of tests, by which its exact character is revealed. By the use of the balance, clay crucibles, cupels of bone-ash, and a great variety of reagents, the percentages of certain metals can be determined, such as copper, cobalt, nickel,

gold, and especially silver. The art of keeping up an uninterrupted current of air through the blowpipe is easily acquired. See Eldeshorst's *Manual of Blowpipe Analysis*, and Plattner's *Manual of Qualitative and Quantitative Analysis with the Blowpipe*; also OXYHYDROGEN BLOWPIPE.

Blowpipe-and-Arrow, called also **Gravata'na-and-Poc'na**: a weapon used by some of the Indians of South America, both in war and for killing game. It is a straight tube, in which a poisoned arrow is placed and forcibly expelled by the breath. The tube, etc., is from 2 to 12 feet long, the bore not large enough to admit the little finger. It is made of reed or of the stem of a palm. The arrows are from 1 or 2 to 18 inches long, made of the spines of a palm, sharp, notched so as to break off in the wound, and their points covered with curare or other poison. A little down is twisted round each arrow, to fit the tube. In the hand of a practiced Indian it is a very deadly weapon. As his weapon makes no noise, the hunter often does wonderful execution.

Blubber: the cellular membrane in which the oil or fat of the whale is inclosed; the layer of fat which lies just beneath the skin of the whale. A single whale often contains 30 tons of blubber, from which about 20 tons of oil are extracted. The blubber serves to protect the whale from cold and to diminish its specific gravity. It is an important article of food to the Esquimaux.

Blücher, blü'cher, GEBHARD LEBERECHE, von: Prince of Wahlstadt; Prussian general; b. at Rostock, Dec. 16, 1742. He entered the service of Prussia in 1760; became a captain in 1771, and a colonel in 1790. In 1794 he distinguished himself as a cavalry officer in the war against the French, and was raised to the rank of major-general. He led the vanguard at the battle of Auerstadt (1806), from which he retreated to Lübeck. He was defeated and taken prisoner near Lübeck in Nov., 1806. When the war between the allies and Napoleon was renewed in Mar., 1813, Blücher was appointed commander-in-chief of the Prussian army, which he led at Lützen and Bautzen. He defeated Macdonald at the Katsbach in August, and took many prisoners. On Oct. 16 he gained a victory over Marshal Marmont at Möckern, and then formed a junction with the allied armies, which, with his co-operation, defeated Napoleon at the battle of Leipzig, Oct. 17-19, 1813. He was raised to the rank of field-marshal in 1813, and led the Prussian army, about 60,000 strong, which invaded France early in 1814. Between Feb. 10 and 15 he was defeated by Napoleon at Champaubert, Montmirail, Vauchamps, etc., and lost about 15,000 men, but he defeated the same enemy at Laon, Mar. 9, entered Paris at the end of that month, and here received from his king the title of Prince of Wahlstadt. On the renewal of the war in 1815 he took command of the Prussian army, and was defeated at Ligny, June 16, but reached Waterloo in time to decide the victory, June 18, 1815. D. in Kriebowitz, Silesia, Sept. 12, 1819. He was noted for his energy and rapid movements, and was surnamed Marshal Vorwärts (Forward). In 1826 a large bronze statue by Rauch was erected to him in Berlin, and another in Breslau in 1827. See Foerster, *Blücher und seine Umgebung* (1821); Pischon, *Blüchers Leben, Thaten, und Ende* (1842); Varnhagen von Ense, *Blüchers Lebensbeschreibung* (1827); *Life and Campaigns of Blücher* (London, 1815); Scherr, *Blücher, seine Zeit und sein Leben* (2 vols., 1862); Bieske, *G. L. Blücher von Wahlstadt* (1862); and Chesney, *Waterloo Lectures* (1874).

Blue: one of the three primary colors, and one of the seven prismatic colors, of which the complementary is orange. The blue coloring-matter of flowers has been called anthokyan or cyanine; little is known of its chemical constitution. The blue pigments are (1) ultramarine, obtained originally from lapis-lazuli, now manufactured artificially; (2) Prussian or Berlin blue, the sesquiferro-cyanide of iron; (3) smalt, glass colored blue by oxide of cobalt; modifications of this pigment are called azure blue, cerulean blue, indigo blue, deep blue, king's blue, etc.; (4) Thénard's or cobalt blue, a compound of alumina and oxide of cobalt; (5) verditer or Bremen blue, mountain blue, etc., a basic carbonate of copper; (6) blue ochre or iron blue, native Prussian blue, is a phosphate of protoxide of iron found in many places.

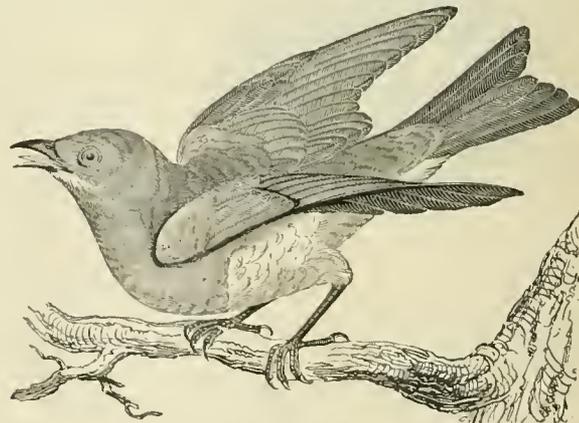

The blue dyes are (1) indigo. This is applied as Saxon blue, or indigo extract, a solution of indigo in fuming sulphuric acid. Chemic, or chemic blue, is the tery acid solu-

tion; indigo carmine is the extract neutralized by an alkali, as the indigo vat, indigo reduced to a colorless solution by protoxide of iron or grape-sugar, which becomes blue again in the air. (2) Prussian blue, already mentioned as a pigment. (3) Logwood blue, produced by logwood extract on goods mordanted with alum and cream of tartar. (4) Azuline, or phenol blue, prepared from phenol or carbolic acid. (5) Aniline blues, (a) bleu de Lyons, triphenylrosaniline; (b) Nicholson's, or alkali blue, etc. (6) Toluidine blue. (7) Diphenylamine blue. (8) Quinoline blue, etc. C. F. C.

Blue-Beard (Fr. *Barbe-bleu*; Germ. *Blaubart*): the epithet applied to the central figure of a famous popular tale, first given literary form by Charles Perrault in his *Contes de ma mère Poye* (1697). The story runs that a certain rich nobleman, named Raoul, distinguished by a blue (i. e. blue-black) beard, married a young and innocent wife. Soon after, going away for a time, he left with her the key to a chamber, which he forbade her to enter. Curiosity made her disobey, and she found in the room evidences of the murder of his six previous wives. Raoul returns, discovers what she has done, and is about to slay her also, when her two brothers arrive upon the scene, kill the husband, and save her life. Since Perrault this tale has had universal currency, both as a nursery tale and as a literary theme. Its origin has been sought in very different places. Perrault seems to have obtained his material from local Low Breton sources. Hence attempts to find the original theme among Celtic traditions. K. Hofmann thinks he has found it in the tale of Aristor and the sister of Percival in the prose Grail. Others point to the story of Cômor, a Breton king of the sixth century, and St. Triphine. The most elaborate theory, however, identifies Blue-Beard with Gilles de Laval, Marshal de Rais Retz (*q. v.*), who, after winning great renown as a soldier and comrade-in-arms of Jeanne d'Arc, fell into the depths of depravity, and enticed into his power a great number of young boys and girls, whom he debauched and then murdered. See the Abbé Bossard's work, *Gilles de Rais dit Barbe-Bleue* (Paris, 1886). A. R. MARSH.

Bluebell: the name in Great Britain of two widely different wild flowers: (1) the *Hyacinthus non-scriptus*, a hyacinth with beautiful blue flowers, and a root which was formerly gathered for the starch it contains; (2) the *Campanula rotundifolia*, the harebell, very common throughout Europe, and having a wide range in Asia and North America. This and other blue-flowered species of *Campanula* are sometimes called "bluebell" in the U. S., where the name is also in some places incorrectly given to the blue-fringed gentian.

Bluebird (*Sialia sialis*): a bird of the family *Turdidæ*; a general favorite in the U. S., which it visits as a summer bird of passage, and is welcomed as a harbinger of spring. It prefers the vicinity of human habitations, and often

The bluebird.

builds in orchards and gardens. The upper part of it is a rich sky-blue color; the breast and throat are a reddish chestnut. Its song is a mellow, sweet-toned, and agreeable warble. This bird lays about five pale-blue eggs. The male and female both defend their nest and young with remarkable courage when attacked by serpents or other animals. They generally build their nest in the hollow limb of a tree or in a box about the house or garden kindly provided by the farmer, whom they repay partly by the

cheerfulness of their song, partly by the multitude of injurious insects which they daily destroy. In the summer their food consists of insects and spiders; in the winter, of berries. In the month of October their song changes, and the pleasant warble shrinks into one single plaintive note. Even after the trees are stripped of their leaves they still linger for a short time over their native fields. Two other species occur in the U. S., *S. arctica* in the northwest and *S. mexicana* in the southwest.

Bluebooks: the term applied in Great Britain and the U. S. to certain official government publications, the name alluding to the fact of such books in Great Britain usually have blue paper covers. In Great Britain the bluebooks are reports and other papers printed and issued under the authority of Parliament, or the Privy Council, or other chief department of government, primarily for the information of Parliament. As applied to the official publications of the U. S., the term is generally restricted in meaning to (a) the publications containing the rules and regulations for the general government of the U. S. navy, and (b) to the published official list of the names and salaries of all the government employees. The term is therefore popularly used also as the name for any list of names of an exclusive character, either financially or socially. The official publications containing the reports of the heads of departments, etc., in France have yellow and blue covers, in Italy green, and in other countries various other colors, but they are all popularly designated as bluebooks.

Bluebreast: See BLUETHROAT.

Blue Earth City: village; capital of Faribault co., Minn. (for location of county, see map of Minnesota, ref. 11-E); on C. M., St. P. and O. R. R., and on Blue Earth river, 120 miles S. S. W. of St. Paul; has a fine school, seven churches, and an opera-house. There are manufacturing, milling, and extensive farming industries. Pop. (1880) 1,066; (1890) 1,569; (1895) 2,432. EDITORS OF "POST."

Blue-eye (*Entomiza cyanotis*): sometimes called *Blue-checked honey-eater*; a beautiful bird abundant in New South Wales. It is a species of honey-sucker, and feeds on insects and honey, which it obtains chiefly from the blossoms of the *Eucalyptus*. It is gregarious, and remarkable for its graceful movements.

Bluefield: village; Mercer co., West Va. (for location of county, see map of West Virginia, ref. 11-F); on Norfolk and West. R. R.; 100 miles W. of Roanoke; has 3 graded schools, 6 churches, machine-shops, electric lights, and water-works. A street-railway company has now (1893) been organized. Bluefield is a center of trade for the soft-coal region of the Virginias. Pop. (1890) 1,775; (1893) estimated, 5,000. EDITOR OF "JOURNAL."

Bluefields, or Blewfields: a river of Nicaragua, in the Mosquito Territory; flows eastward, and enters the Caribbean Sea at the town of Bluefields, which has a good harbor, and is in lat. 12° N., lon. 83° W. (see map of Central America, ref. 6-J).

Bluefish (*Pomatomus saltatrix*): a fish of the family *Pomatomidae*; allied to the mackerels. It derives its specific name from a habit of leaping out of the water. It frequents the coasts of the U. S. in spring and summer, is very swift and voracious, and preys on the weakfish and other fishes. It weighs from 5 to 10 lb., and is a fine fish for the table.

Blue Gowns: an order of paupers formerly existing in Scotland. They received annually from the king a largess of alms on condition that they prayed for his welfare; hence also called the king's *bedesmen*, or beadsmen. Every year after his accession to the throne the king elected a member of the order. The alms consisted chiefly of a blue gown or cloak (hence the name), and a purse containing as many Scotch shillings, equivalent to pennies sterling, as the years of the king's life, besides a pewter badge bearing the words "pass and repass," which gave them protection against the laws interdicting mendicancy, and gained them among strangers alms or a night's lodging. They continued to be appointed up to 1833, but the order did not become finally extinct until 1863.

Blue Grass, called also **Green Meadow Grass** and **June Grass:** a species of grass (*Poa pratensis*) which is a native of both Europe and America; distinguished from other species of its genus by its flat panicles, smooth culms and sheaths, and short, blunt ligules. Though common in many

regions, this grass attains its chief value in that part of Central Kentucky which is called the "blue-grass region," where it is considered to afford the most important crop that can be raised by farmers. It is chiefly cultivated for pasturage and lawns, though on certain soils it makes excellent hay. To this grass Kentucky owes her great reputation as a stock-raising State.

Blue-gum: See EUCALYPTUS.

Blue Laws: laws of puritanical strictness in religious or sumptuary matters; in particular, certain fanatical and meddlesome laws said to have once existed in the colony of New Haven, now a part of the State of Connecticut. They are the fabrication of Samuel Peters, an Episcopal clergyman, and are found in *A General History of Connecticut, from its first Settlement by George Fenwick, Esq.*, which was written by Peters, and published in London in 1781. (See PETERS, SAMUEL.) The book was not generally well received at the time, and a review of it said: "We . . . observe in it so many marks of party spleen and idle credulity that we do not hesitate to pronounce it altogether unworthy of public attention." It has, however, been quoted as authentic by numerous writers, not without prominence, even so late as 1870. Blue was a symbol of constancy in Chaucer's time, and in his *Court of Love* he speaks of "folke that knele in blew . . . in signe they ever were and ever will be true." Later the phrase true blue came to be applied to rigid adherence to one's convictions, and then to bigotry and fanaticism. The laws of the New Haven colony had been called "blue laws" in New York early in the eighteenth century, and undoubtedly in allusion to the strictness of its religious and moral laws, and to the fact that only church-members could vote or hold offices. By the laws of the first constitution and code of Connecticut the penalty of death was inflicted for witchcraft, blasphemy, idolatry, adultery, rape, kidnaping, and cursing and smiting one's parents; and it was a penalty punishable by fine to play at shuffle-board, to be an idler, to lie, to indulge in profane swearing, to take tobacco in public places, to tarry in a tavern longer than half an hour, or later than 9 o'clock p. m. According to the alleged laws of Peters, "No one shall run upon the Sabbath day, or walk in the garden or elsewhere, except reverently to and from meeting." "No woman shall kiss her child on the Sabbath or fasting days." "No minister shall keep a school." "No one shall read Common-Prayer, keep Christmas or Saints' days, make mince pies, dance, play cards, or play on any instrument of music, except the drum, trumpet, and jew's-harp." "Every male shall have his hair cut round, according to a cup," etc. This will serve to illustrate the character of the real and the fictitious blue laws. See J. Hammond Trumbull's *True Blue Laws of Connecticut and New Haven, and the False Blue Laws invented by Samuel Peters* (8vo, Hartford, 1876). F. STURGES ALLEN.

Blue Light: See BENGAL LIGHT.

Blue Monday: so named from an ancient custom in some parts of Europe of decorating churches with blue on the Monday before Lent, this particular Monday, and afterward all Mondays, being considered holidays for men whose business obliged them to work on Sundays. This practice led to riotous excesses still traditionally remembered, and it was generally suppressed by legal enactments.

Blue Mountain, Pennsylvania: See KITTATINNY.

Blue Mountains: a range in the eastern part of New South Wales, and N. of the Australian Alps. It is nearly parallel with the sea-coast, from which it is about 100 miles distant. The highest peaks of this range rise over 4,000 feet above the level of the sea. The range long formed a barrier between the settlements on the coast and the interior. In 1815 a road was opened through these mountains to the rich pastures of Bathurst Plains; and now a railroad connects Sydney and Bathurst, crossing the Blue Mountains at an elevation of over 3,000 feet.

Blue Nile: See BAHR-EL-AZREK.

Blue Pill (called also *Blue Mass*, or *Massa Hydrargyri*): a drug made by rubbing up metallic mercury with liquorice and other excipients. Each grain of the mass contains one-third grain of mercury, and the dose of the mass is from one to twenty grains. It is used in medicine for the purpose of stimulating the liver to greater secretion, and so increases the flow of bile. In Great Britain, the mass is mixed with both liquorice and confection of roses. In the U. S., the use of a saccharine fluid, such as honey, is recommended in place of the confection of roses.

Blue Ridge: the range of the Appalachians which is nearest to the Atlantic Ocean. It extends in a N. E. and S. W. direction through Pennsylvania, Maryland, Virginia, North Carolina, and Georgia. The part of this ridge in Pennsylvania is called the South Mountain. In Virginia it forms the S. E. boundary of the Great Valley, and is remarkable for beautiful scenery. The Peaks of Otter, which are the highest points of this ridge in Virginia, rise about 3,993 feet above the level of the sea. From North Carolina southward the name of Blue Ridge is invariably applied to the watershed which divides the waters flowing into the Atlantic from those of the Gulf of Mexico.

Blue River, Africa: See BAHR-EL-AZREK.

Blue River, Col.: See BUNKARA RIVER.

Blue River: of Indiana; rises in Henry County, in the east part of the State, and flows southwestward. After it has united with several streams it receives the name of Driftwood or East Fork of White River.

Bluestocking (in Fr. *bas bleu*): a term applied to literary ladies, and generally with the imputation of pedantry. It originated in England in Dr. Johnson's time, when there existed bluestocking clubs, at which literary ladies met to converse with distinguished literati. According to Boswell, they were so called because Mr. Stillingfleet, one of the prominent members, always wore blue hose.

Blue Sulphur Springs: a post-village of Greenbrier co., West Va.; 22 miles W. of the famous White Sulphur Springs. The springs afford a copious supply of valuable saline chalybeate waters, useful in the treatment of many diseases.

Blue-throat, sometimes called **Bluebreast**, or **Blue-throated Rob'in** (*Phœnicura suecica*): a beautiful bird of the family *Sylviæ*; is common on the continent of Europe as a summer bird of passage, and is supposed to pass the winter in Africa. It resembles a redbreast in form, but is rather larger, and has a brilliant sky-blue plumage on its throat, below which is a black bar. It sings sweetly, and imitates the notes of many other birds. This is one of the birds which the Italians call BECCAFICO (*q. v.*).

Blue Vitriol: the sulphate of copper. See COPPER.

Bluwing-duck, or **Bluwing-teal**: a species of duck (*Anas discors*): an abundant game-bird of America. Vast numbers spend the winter in the marshes near the mouths of the Mississippi, to which they congregate both from the North and the East; the summer migrations of the species extend as far N. as the 57th parallel, and it is plentiful on the Saskatchewan in the breeding-season. It breeds also in the marshes of the South, and is common in Jamaica, where it is a permanent resident. No duck is in higher esteem for the table. In the summer plumage of the male the upper part of the head is black; the other parts of the head are of a deep purplish blue, except a patch of pure white before each eye; the plumage on the upper part is brown mixed and glossed with green, except that the wings exhibit various shades of blue, the lesser wing-coverts being of a rich ultramarine, with an almost metallic luster; the lower parts are reddish orange spotted with black; the tail-feathers are short and pointed. It is a bird of extremely rapid and well-sustained flight.

Bluff: a high bank or cliff presenting a steep or abrupt front toward a river, lake, or sea. The term is often applied to the high banks of the Mississippi and other Western rivers. Between the bluff and the river sometimes occurs a flat tract of considerable width called a bottom. On the Mississippi below Lake Pepin the bluffs of magnesian limestone rise about 350 feet above the river.

Bluffton: city and railroad junction; capital of Wells co., Ind. (for location of county, see map of Indiana, ref. 4-G); on L. E. and W. and T., St. L. and K. C. R. Rs., and on Wabash river; 25 miles S. of Fort Wayne. Bluffton has 3 schools, 7 churches, city water-works, natural gas, electric lights, and macadamized streets. It has planing-mills, corn-planter manufactory (steam), barrel manufactories, foundries and machine-shops, stave and heading factories, flouring-mills, furniture-frame factory, furniture-factory, boot and shoe factory, washing-machine factory, and a large grain, lumber, and stock trade. Pop. (1880) 2,354; (1890) 3,589; (1892) estimated, 3,800. EDITOR OF "BUGLE."

Bluffton: village; Allen co., O. (for location of county, see map of Ohio, ref. 3-D); situated at junction of Lake Erie and West., and Pitts., Akron and West. R. Rs. Bluff-

ton has flouring and saw mills and lime-kilns, and horse-breeding and poultry-raising farms. There are outcropping magnesium-limestone formations, and extensive and valuable quarries have been developed. The surrounding farming region is populated by one of the largest exclusively German settlements in the U. S. Pop. (1890) 1,290; (1893) estimated 1,500. EDITOR OF "NEWS."

Bluhme, bloo'me, FRIEDRICH: German juriseonsult; b. in Hamburg, June 29, 1797; d. at Bonn, Nov. 5, 1874. He studied law at Halle, Göttingen, and Jena, and made in 1821 an extensive tour in Italy, the results of which are found in his essay, *Die Ordnung der Fragmente in den Pandekten-titeln*, in the *Zeitschrift für geschichtliche Rechtswissenschaft*, vol. iv., in his edition of Gaius, his *Iter Italicum* (Berlin, 1824-37, 4 vols.), etc. He successively filled the chairs of jurisprudence at Halle, Göttingen, and Bonn, and published *Das Kirchenrecht der Juden und Christen* (Halle, 1826; 2d ed. 1851); *Grundriss der Pandektenrechts* (Halle, 1829; 2d ed. 1843), and *Encyclopädie und System der in Deutschland geltende Rechte* (Bonn, 1847-58, 3 vols.), his chief work.

Blum, bloom, ROBERT: democrat and popular orator; b. of poor parents at Cologne, Nov. 10, 1807. He founded the Schiller-Verein (Schiller Society) at Leipzig in 1840, and the German Catholic Church at Leipzig in 1845. In 1848 he was the master-spirit of the Saxon liberals or democrats, and a member of the Frankfort parliament, in which he was the leader of the Left or moderate opposition. Having been sent by this party to Vienna, he joined the insurgents of that city, which was soon captured by the Austrian army. Blum was arrested and shot at Vienna, Nov. 9, 1848. See EDUARD DULLER, *R. Blums Leben und Tod*, 1848; E. Franke, *Leben des R. Blum*, 1848.

Blum, ROBERT FREDERICK: figure-painter; b. in Cincinnati, O., July, 1857; studied in New York, Italy, Holland, and Spain. Member of the Society of American Artists (1882) and of the American Water-color Society; associate National Academy, New York; third-class medal, Paris Exposition, 1889. He first exhibited in New York in 1879, is well known as a water-color and pastel painter, and is a talented American illustrator. Aside from various single figures and compositions painted in oil, the most notable feature of which is harmonious and delicate color, he has painted a number of pictures of Venice and of life in Italy and Spain. His picture of *Venetian Bead Stringers* was awarded a prize of \$2,500 at an exhibition held under the auspices of the American Art Association at New York in 1889. He is one of the most brilliant technicians among American water-color painters. Studio in New York.

WILLIAM A. COFFIN.

Blumenbach, bloo'men-bää'kh, JOHANN FRIEDRICH, M. D.: naturalist; b. at Gotha, May 11, 1752. He graduated as M. D. at Göttingen in 1775, and wrote for that occasion a remarkable thesis *On the Varieties of the Human Race*. In 1778 he became Professor of Medicine and Anatomy in the University of Göttingen, where he lectured for fifty years. He published a *Manual of Natural History* (1780), often reprinted. He may be said to have first placed natural history on the scientific basis of comparative anatomy. Among his works is a *Manual of Comparative Anatomy* (1805), which was translated into many languages. He advocated the doctrine of the unity of the human species, which he divided into five races—the Caucasian, Mongolian, Malay, American, and Ethiopian. D. Jan. 22, 1840. See C. F. II, Marx, *Zum Andenken an J. F. Blumenbach* (1840).

Blumenthal, bloo'men-taäl, JACOB, von: composer; b. at Hamburg, Germany, Oct. 4, 1829; studied music there and at Paris and Vienna; became an excellent pianist. In 1848 he took up his residence in London, where he has since remained and is known as Jacques Blumenthal. His compositions are entirely of a light class, and include brilliant and effective parlor piano pieces and many songs which have become extremely popular. D. E. HERVEY.

Blumenthal, LEONARD, von: b. in Schwedt, July 30, 1810; educated at the military academies of Culm and Berlin; entered the Prussian army as second lieutenant at seventeen; became first lieutenant in 1846; captain in the general staff in 1849, and in the same year captain in the general staff of the Schleswig-Holstein army; was made colonel in 1860; was distinguished in the war against Denmark; became major-general in 1864, serving with distinction in the war with Austria, and was appointed chief of

the general staff of the crown prince at the beginning of the war with France. He was appointed field-marshal in 1888. D. at Cassel, May 15, 1892.

Blumhardt, bloom härt, CHRISTIAN GOTTLIEB: b. in Stuttgart, Apr. 29, 1779; d. in Basel, Dec. 19, 1838. He studied theology at Tübingen; was appointed secretary of the German Missionary Society in Basel in 1803; pastor of Bürg 1809, and director of the missionary school in Basel in 1816. Since 1816 he edited the *Missionsmagazin*. From 1828 also the *Heidenbote*, and published *Versuch einer allgemeinen Missionsgeschichte der Kirche Christi* (Basel, 1828-37, 5 vols.).

Blunt, GEORGE WILLIAM: hydrographer; b. in Newburyport, Mass., Mar. 11, 1802; educated in New York city. He was the author of various charts, *Atlantic Memoir*; *Sheet Anchor*; *Harbor Laws of New York*; *Plan to Avoid the Center of Violent Gales*; and compiler of the *American Coast Pilot*. He was a commissioner of emigration (1852-54), a pilot-commissioner in 1845, and became a harbor-commissioner in 1867. D. in New York, Apr. 19, 1878.

Blunt, JAMES G., M. D.: general; b. in Trenton, Me., July 20, 1826; took degree of M. D. in 1849, and practiced in Ohio till 1856, when he removed to Kansas; was appointed in 1861 brigadier-general and commander of the department of Kansas; major-general in 1862. In 1863 he commanded the army of the frontier. D. in Washington, D. C., in 1881.

Blunt, JOHN HENRY, M. A., D. D., F. S. A.: a clergyman of the Church of England; b. in Chelsea, England, Aug. 25, 1823; educated at University College, Durham; filled various curacies in the dioceses of Durham, Oxford, Exeter, and Ely; appointed Rector of Beverton, Gloucestershire, in 1873. He was a very prolific writer, especially of books of an encyclopædic character. Most widely known perhaps are *A Dictionary of Doctrinal and Historical Theology* (1870) and *A Dictionary of Sects, Heresies, Ecclesiastical Parties, and Schools of Religious Thought* (1874). Among his other works are *Directorium Pastorale* (1864), a volume on the principles and practice of pastoral work in the Church of England; *Household Theology* (1865), a handbook of religious information; *The Annotated Bible* (1878), in three large 8vo vols.; *The Annotated Book of Common Prayer* (1866), an historical, ritual, and theological commentary on the devotional system of the Church of England; *The Reformation of the Church of England, its History, Principles, and Results* (2 vols.), the sixth edition of which appeared in 1885. D. in London, Apr. 11, 1884.

Bluntschli, blöont shlē, JOHANN KASPAR: b. in Zurich, Mar. 7, 1808; d. at Carlsruhe, Oct. 21, 1881. He studied jurisprudence in his native city, and in Berlin under Savigny, and was appointed Professor of Law at Zurich in 1833 and at Heidelberg in 1859. He took a very active part in the politics of both Switzerland and Baden, but always as a conservative. His writings are partly historical; *The History of Zurich* (1838, 2 vols.); *The History of Uri, Schwyz, and Unterwald* (1847), etc., partly juridical; *Geschichte des allgemeinen Rechts* (1864); *Das moderne Kriegerrecht* (1866); *Das moderne Völkerrecht* (1868); *Die Lehre vom Staat* (1875), etc. He presided over the congress of jurists in Dresden in 1861, and enjoyed a great reputation in the juridical world.

Blythe, SAMUEL: a British naval officer; b. in 1784; commanded the brig Boxer in an engagement off Portland, Me., with the U. S. brig Enterprise, Sept. 4, 1814, during which he was killed by a cannon-ball. His remains were interred in Portland with the honors of war by the side of Lieut. Burrows, who commanded the Enterprise, and was also killed.

Bo'a: a genus of large non-venomous serpents; devoid of poison-fangs, they kill their prey by constriction. They are all natives of the warm parts of America, the similar large serpents of Asia and Africa forming the genus *Python*, though formerly the name was applied without any distinction to both genera. The family *Boide* (containing the *Pythons*, etc., of the Old World, as well as the true *Boas*, anacondas, etc., of the New) is almost exclusively tropical, and nearly all the species are of great size and strength. It is related by Livy that a serpent 120 feet in length devoured several soldiers and caused alarm to a Roman army in Africa; the skin is said to have been long preserved at Rome. Their teeth are long and directed backward, to prevent the escape of the prey, which is first seized by the mouth, and then the serpent, with a rapidity of motion which the eye of

the observer fails to follow, coils itself around it; the muscles of the body afterward compress it, so that in a few minutes life is extinct. Deglutition then takes place, accompanied with a flow of saliva, not only for lubrication, but to hasten the process of digestion. The food is always swallowed entire, and the process seems to require no small effort. The neck is distended to an enormous degree as the prey passes through. After a repast these serpents spend a considerable time in a state of torpidity—several weeks elapsing before they require a new supply—and in this state they are easily killed.

The lungs consist of two lobes, one much larger than the other, and at the extremity of the larger is a capacious air-bag, supposed to serve for the aëration of the blood during deglutition. There are two claws, one on each side of the anus, which are the representatives of the hinder limbs of the superior vertebrate animals, and which, on dissection, are found to be connected not only with strong muscles, but with bones entirely concealed within the serpent. The head, which has great prehensile power, is thick and somewhat elongated; the eyes small; the tail blunt; the scales numerous and rather small; the colors in many species bright and elegantly disposed. The true boas have the plates under the tail single, while in the pythons they are double. They are of four species. The *Boa constrictor* is far from being one of the largest, seldom obtaining a length of more than 12 feet. It is common in parts of South America, where its skin is used for making boots and saddles. Uric acid is prepared in Europe from the excrement of the boa. The name *boa constrictor* is, however, popularly extended to any very large non-venomous serpent. The only members of the boa family in the U. S. are two or three small species found in Arizona and neighboring regions.

Revised by DAVID S. JORDAN.

Boabdil, bō-ab-deel' (properly *Abu-Abdallah*): last Moorish King of Granada; wrested the throne from his father 1481; defeated by the Castilians and made to pay tribute 1483; weakened by contest with his father and uncle; finally surrendered Granada to Ferdinand of Aragon 1491; soon after crossed to Africa, where he died in battle.

Boadice'a, written also **Voadica**: a warlike British queen; King of Prasutagus, King of the Iceni, who died about 60 A. D. Soon after this date she and her subjects, exasperated by the rapacity and outrages of the Roman soldiers, took arms against them. The Britons took the Roman colonies of Camalodunum and Londinium (London), and killed about 70,000 Romans. She was defeated in 62 A. D. by Suetonius Paulinus, and then killed herself. See Tacitus, *Annals*.

Boar: the male of the *Sus scrofa*, or swine. When applied to the wild stock of swine found in various countries, the term is used without particular reference to the sex of the animals. The native country of this species is in the Old World, where the wild stock abounds in parts of Europe, in Asia, and in Africa. The wild boars found in the Southern States (especially in Florida) are descended from the domestic swine; but have reverted quite to the wild type in respect to the form of the body, ears, and tusks, the bristly crest on the back, the black or red color, and the striped young. Most writers make all the domestic breeds of swine descendants of the wild stock. Others think the small native pig of the Pacific islands is of a separate species; but it is asserted by some that no swine were known on these islands till after they were visited by European ships, which certainly left swine and other domestic animals in many parts of Polynesia. A few writers regard the East Indian bear as of a distinct species. Swine with solid hoofs have been long known, the variety being produced through the coalescence of the last joint of the foot with the hoofs of the middle toe. No true swine are native to America or Australia. Boar-hunting has long been regarded as one of the most exciting sports of the chase. It is practiced in Europe, India, and Syria—in some places with toils or nets, in others with dogs, which bring the boar to bay, when he is dispatched with a spear or long knife. In India he is hunted on horseback and killed with a boar-spear. It is held un-sportsmanlike to shoot the boar. When at bay the wild boar is a very dangerous animal.

Board: a piece of timber sawed thin; if more than 1½ inches thick, it is called a plank. The word *board* has many other meanings, e. g., a table; entertainment or food; the deck of a ship or vessel; a table at which a council or court is held; a body of public men constituting a quorum in

session. Board is a general term applied to persons in a collective capacity who have the management of some public office or department, bank, etc.; thus the directors of a bank or railroad are called the board of directors; the British lords of the treasury, the board of treasury. In nautical language, board is the space or portion of sea over which a ship passes on one tack when beating.

To go aboard or on board is to enter a vessel, to embark in it. The mast is said to go by the board when it carries away and falls into the water.

To board, in naval warfare, signifies to enter a ship by force in order to capture it. The assailants sometimes throw on the enemy's deck combustibles, etc., in order to confuse the crew, and then board the ship, armed with boarding-pikes, pistols, and cutlasses. Some of the most desperate naval conflicts have been determined by boarding, as in the case of the *Bon Homme Richard* and *Serapis*.

Board'man, GEORGE DANA; Baptist missionary; b. in Livermore, Me., Feb. 8, 1801; graduated at Waterville College (now Colby University) in 1822, and at Andover Theological Seminary in 1825. He sailed for Burma July 16, 1825, and distinguished himself by his zeal and devotion to the work among the Karens, being practically the founder of the Karen mission. D. near Tavoy, Feb. 11, 1831. His widow, Sarah Hall, married Adoniram Judson, June 10, 1834.

Boardman, GEORGE DANA, D. D., LL. D.; Baptist minister and author; son of the preceding; b. at Tavoy, in Burma, Aug. 18, 1823; graduated at Brown University (1852), and at Newton Theological Institution (1853). He has been the pastor of the First Baptist church in Philadelphia since 1864. Dr. Boardman has held positions as president of the American Baptist Missionary Union, president of the Christian Institution and Peace Society of America, secretary of the Society for Providing Christian Literature for the Blind, chaplain of the University of Pennsylvania, overseer of Columbian University, and trustee or manager of numerous other corporations, institutions, and societies. He has published *Lectures on the Creation Week* (1878); *Studies in the Model Prayer* (1879); *Epiphanies of the Risen Lord* (1879); *Studies in the Mountain Instruction* (1880); *The Divine Man* (first volume of expected *Life of our Lord*, 1887); *University Lectures on the Ten Commandments* (1889); besides numerous sermons and articles in reviews.

Boardman, RICHARD; one of Wesley's first missionaries to America; b. in England in 1738; joined Wesley's conference in 1763; volunteered for America in 1769; preached in New York and generally through the Middle States till 1774, when he returned to England, and continued his itinerant ministry till his death at Cork, Ireland, Oct. 4, 1782. He is esteemed as one of the founders of Methodism in the U. S.

Board of Admiralty; the commissioners for executing the office of Lord High Admiral of the United Kingdom of Great Britain and Ireland. James II. declared himself Lord High Admiral, and took the management of the navy in his own hands. But by Act 2, William and Mary, 1690, his Majesty was moved "to constitute a commission of admiralty of persons of known experience in maritime affairs, that for the future all orders for the management of the fleet do pass through the admiralty that shall be so constituted."

The board as now constituted consists of six members and three secretaries, as follows: First lord, a civilian, member of the cabinet, and responsible to the crown and to Parliament for the management of the navy. His assistants are: First naval (or sea) lord, who has general supervision of maritime defenses, mobilization of fleet, and the direction of its military movements, etc. Second naval lord, *personnel*, mobilization of naval reserves, etc. Third naval lord and controller, general supervision of *matériel*. Junior naval lord, transport service, victualing, etc. Civil lord, Works Department, buildings, etc. See ADMIRALTY.

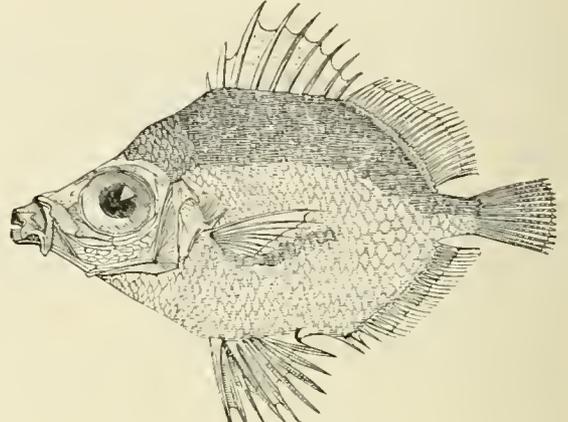

S. B. LUCE.

Board of Ordnance: See ORDNANCE DEPARTMENT.

Board of Trade; in the U. S. a voluntary association of business men of a city to promote the commercial interests of the place; also called chamber of commerce. In 1868 a national board of trade was organized, consisting of delegates from the local boards, holding annual meetings for the discussion of questions of general interest. Local boards of trade or chambers of commerce have even more importance and more legal recognition in Europe than in the U. S. See CHAMBERS OF COMMERCE.

In Great Britain the Board of Trade is a branch of the Government dealing with commerce and statistics. It is controlled by a president, who is an important member of the cabinet, and two general secretaries. One of its departments deals with general trade questions; another with railway appliances, accidents, and, since 1888, with railway rates; a third, and most important, with harbors, shipping, officers' certificates, and marine accidents; a fourth with financial and commercial statistics. A. T. HADLEY.

Boarfish: a fish of the genus *Capros* and dory family, or *Zel'de*; differing from fishes of the genus *Zeus* in the

The boarfish.

still more protractile mouth (the resemblance of which to the snout of a hog is supposed to have given origin to the name), in the want of spines at the base of the dorsal and anal fins, and of long filaments to the dorsal spines. The body has the usual oval, much-compressed form of the family. The common boarfish (*Capros aper*) is a well-known inhabitant of the Mediterranean, rarely caught on the coasts of England. The flesh is little esteemed.

Boas, bō'ās, FRANZ, Ph. D.; ethnologist; b. in Minden, Westphalia, Germany, July 9, 1858; pursued his education from 1877 to 1882 at the universities of Heidelberg, Bonn, and Kiel, and in the latter year prepared at Berlin for an Arctic voyage. In June, 1883, he sailed to Cumberland Sound, Baffin Land; traveled in that region until Sept., 1884, and returned by way of St. John's, Newfoundland, to New York. Assistant in the Royal Ethnographical Museum at Berlin, and privat-docent of geography at the University of Berlin 1885-86, making, however, a journey to British Columbia in the winter of 1885-86 for the purpose of studying the Indians of that region; assistant editor of *Science* 1886-88; and teacher of anthropology at Clark University, Worcester, Mass., 1889-92. During these years he made repeated journeys among the Indian tribes. His principal publications are *Baffin Land* (Gotha, 1885); *The Central Eskimo*, in Sixth Annual Report of the U. S. Bureau of Ethnology (Washington, 1888); *Indians of British Columbia*, Reports to the British Association for the Advancement of Science (London, 1888-92); *Volkssagen aus British Columbia*, Verh. der Ges. für Anthropologie, Ethnologie und Urgeschichte in Berlin (Berlin, 1891).

Boat: any kind of water craft, but, in a particular sense, a small open vessel propelled by oars, sails, steam, or electricity. The name is variously compounded, as steamboat, canal-boat, etc. The boats used on board ship are the launch (both sailing and steam), longboat, barge, pinnace, cutter, yawl, jollyboat, dinghy, gig, lifeboat, whaleboat. There are also quarter-boats, waist-boats, and stern-boats, according to the place where the boat is habitually carried. A *carvel*-built boat has the planking running fore and aft, with flush joints; *clinker*-built, the planking running fore and aft, and lap-jointed. The *diagonal* built has the planking running diagonally, the direction of the inside planking crossing that of the outside, and flush-jointed. The seats for the crew of a boat are called the thwarts; a *single-banked* boat has one rower or oarsman to a thwart; a *double-banked* boat has two. The strips running fore and aft on which the thwarts rest is the *rising*. The *stern-sheets* is the space abaft the after thwart; the *fore-sheets*, the space forward of foremost thwart. The spaces in the wash-streak for the oars are the

rowlocks. The frames, knees, hooks, stern, and stern-posts of wooden boats are generally of oak; the planking of cedar. Oars are made of ash. The blade of the oar is the flat part that goes in the water; the *loom* is the rounded part, at the inner extremity of which is the *handle*. The rigs for boats are the *sloop-rig*, *sliding-gunter*, sprit, and lug. In the U. S. navy the barge is for the exclusive use of the commander-in-chief; the gig for the commanding officer of the ship. All other boats are for general service of the ship, such as conveying passengers to and fro, bringing off stores, etc. For military operations all the boats of a ship are put in requisition for landing the naval brigade formed of the ship's company; also, as many as may be necessary, for "cutting out" expeditions; and, organized as a fleet, for the practice of naval tactics. In these and similar operations the sailing launch carries a Howitzer, and the entire flotilla is often taken in tow by the steam-launch. It is now the practice to allow an admiral a steam-barge; when that is not the case his barge is a large double-banked 32-foot boat, with twelve or fourteen oars. The gig is a light, narrow, single-banked boat, about 30 feet long, built for speed. In addition to the foregoing is the *barge*, a large flat-bottom boat for carrying freight; the racing *shell*, built of veneering or paper; the gondola, dory, wherry, skiff, the *Sam-pan* of China, etc.

For an exhaustive treatise on boats, their uses, and management, see *Luce's Seamanship* (New York, 1891). S. B. L.

Boatbill: the *Cancroma cochlearia*, a bird of the order *Grallatores* and of the heron family. It differs from the heron chiefly in the form of its bill, which is very broad, and somewhat similar in shape to a boat. The mandibles have been compared to the bowls of two spoons placed one upon the other. It is found in the tropical parts of South America, and feeds on fish.

Boat-fly, or Water-boatman: an aquatic insect of the genus *Nolonecta* and order *Hemiptera* and sub-order *Heteroptera*. It derives its name from the form of the body, which resembles a boat, and is well adapted to movement in the water. The boat-flies have the remarkable peculiarity of always swimming on their backs. The *Nolonecta glauca*, called water-boatmen, is common in Great Britain, and is about half an inch long. It can fly well, but seldom uses its wings.

Boating: See ROWING and SCULLING.

Boat-racing: See ROWING and SCULLING.

Boatswain, commonly pronounced by sailors *bō su* [*swain* here means lad, servant, and is a Scand. loan-word, *lecl. sveinn*]: an officer on a ship of war who has charge of the sails, rigging, cables, anchors, and cordage. He must frequently examine the masts, yards, sails, and ropes, and report their condition. It is also his duty to summon the crew to their work, and to assist in the necessary business of the ship and in relieving the watch. In the performance of his duties he is assisted by a boatswain's mate.

Boatswain: a name applied to the tropic-birds (*Phaethon*) and to the jagers (*Stercorarius*), in both cases in allusion to the elongated tail-feathers, resembling marline-spikes, "the emblem of the boatswain." See TROPIC-BIRD and JAEGER.

Bobadilla, *bō-bāā-deel-yā*, FRANCISCO, de: a governor of Hispaniola and knight of Calatrava; sent in 1500 by Ferdinand and Isabella with plenary powers to investigate the affairs of that colony. He immediately put Columbus, who was then governor, in irons, and sent him to Spain. Columbus was, however, well received at court and by the nation, and was sent back on his fourth voyage, arriving there on the day when Bobadilla started to return to Spain, for he had been recalled. Bobadilla's government had been very disorderly and unfortunate, and hardly had he left the port when his ship was lost in a hurricane, and he was drowned, June 29, 1502.

Bobbin: a cylindrical piece of wood, or a wooden roller, flanged at each end, used to hold yarn, which is wound on it, preparatory to warping, in the weaving of cloth. In throstle-spinning bobbins are an essential part of the machinery, as they receive the thread from the rollers. The number of bobbins used in the various branches of business is enormous. In the thread manufacture alone in Great Britain it is stated that 2,000,000 gross are used annually. Thread-bobbins are turned by a self-acting lathe, which turns out 100 gross in ten hours, a saving of sixteenfold as compared with hand-turning; the attendant has to feed the machine by dropping blocks into a hopper, from which they pass into the lathe, where they are finished.

Bobbinet' (i. e. *bobbin-net*): a sort of lace or net-fabric woven by machinery, and usually made of cotton. It is a fine and elegant textile fabric of a peculiar texture, which consists in the interlacing of a set of long threads, representing the warp in common weaving with a set of cross ones, in such a manner as to form a mesh texture. Bobbinet is made at Nottingham, England, and in France.

Bobcaygeon, *bob-kay'jūn*: a post-village of Verulam township, Victoria co., Ontario, Canada; on an island in Sturgeon and Pigeon Lakes, 18 miles from Lindsay (see map of Ontario, ref. 3-E). The town is divided by a canal which, with its locks, cost \$150,000. It has a large trade in lumber, and has daily lines of steamboats, except in winter. Pop. 1,000.

Bobolink, *bob ō-lingk'*, **Reedbird**, or **Ricebird** (*Dolichonyx oryzivorus*): a beautiful American migratory bird of the order *Passeres* and family *Icteridae*. It passes the winter in the West Indies or in Southern lowlands. It comes northward early in spring, and arrives in May in the latitude of New York State, in which latitude it breeds. It builds its nest in meadows among the grass, and renders service to farmers by the destruction of insects and worms. In May

The bobolink.

and June the male is very musical, singing in the air with great volubility and hilarity, and rising and falling as if by a series of jerks. "He chants out," says Wilson, "such a jingling medley of short variable notes, uttered with such seeming confusion and rapidity, that it appears as if half a dozen birds of different kinds were singing all together." The summer plumage of the male is mostly black, variegated with white on the scapularies and tail-coverts, and yellow, which it exchanges in July or August for a plumage like that of the female. This is marked with several shades of brown or dull yellow. Its length is $7\frac{1}{2}$ inches. About the end of June the birds cease to sing, become gregarious, and move in large flocks to the Middle States. They are called reedbirds in Pennsylvania, where many of them are shot for the table in autumn. In the latter part of autumn immense flocks of them attack the rice-crops of South Carolina, where they receive the name of ricebird. Many of them are kept in cages for their song, but they do not sing in autumn or winter.

Bobruisk, *bō-broo-ček'*: a town of Russia; on the Berezina; in the government of Minsk, and 110 miles S. E. of

Minsk; was formerly fortified (see map of Russia, ref. 8-C). It is connected by steamboat with the towns on the river. Pop. (1887) 58,356.

Bob-white (*Colinus virginianus*): a very common small game-bird of the U. S., belonging to the family *Tetraonidae*, and hence allied to the European partridge. The species is usually known as quail in the Northern States and as partridge in the South. The name bob-white is given for its peculiar call. See QUAIL.

Boca del Rio: See BAGDAD.

Bocage. bō-kaa zhāy, MANOEL MARIA BARBOSA, dn: Portuguese poet; b. in Setúbal, Sept. 15, 1765; gave his early youth to military service; in 1790 settled in Lisbon and associated himself with the poets of the so-called Nova Arcadia, with the name Elmano Sadino. In 1791 his *Rimas* won applause, and from this time on he produced continually, much of his work being purely occasional, but all having the traces of that poetic talent which made him the true forerunner of Almeida-Garrett and Castilho. In opinion he was an adherent of the Revolution, and in 1797 he was imprisoned for so-called atheistical and seditious utterances. The best edition of Bocage's works is that edited by Th. Braga (7 vols., Porto, 1876). See Th. Braga, *Vida de Bocage e sua epoca litteraria* (1876, seq.). D. Dec. 21, 1805. A. R. MARSH.

Boea Tigris, bok'a-tee'gris (in Chinese, *Hu-mén* or *Hu-mün*, i. e. mouth of the tiger): the entrance of the Canton river into the Outer Waters, or Liutin Bay, called also the *Bogue*. On A-nung-hoy Point, on S. Wang-tong and Tiger islands, are the remains of a number of forts and batteries called "Bogue forts," which guard the entrance to the river, and were stormed by the British in 1841 and 1857.

Boccaccio, bok-kaat'chō, GIOVANNI, or **Boccaccio da Certaldo:** celebrated Italian poet, novelist, and scholar; b. in Paris, 1313; the illegitimate son of an Italian merchant and a French mother. His father wished to make a merchant of him, and about 1330 he went as such to Naples. He wasted six years thus, as he used to say; then was permitted to study canon law, on which he wasted other six years. His call was to poetry and to learning. In Naples he felt the full force of two impulses which were to make him famous—the one, that of admiration for the ancients and longing to know their works; the other, that of imaginative creation. His importance to the world is in these two directions; he was, with Petrarch, a founder of humanistic studies and of modern classical learning; as poet and novelist he was one of the great creative influences of early modern literature. Before he left Naples he had carried far his studies in classical mythology, and he had besides written several works of importance in the Italian tongue. The immediate occasion for the latter was his passion for Maria, natural daughter of King Robert of Naples (the *Fiammetta* of his works). In her honor he wrote *Il Filocolo* (wrongly called *Filicopo*), a prose romance upon the story of Floire and Blanchefleur; also *Il Teseide*, used by Chaucer for his *Knight's Tale*, and probably the first important poem in *ottave rime*; *Il Filostrato*, the tale of Troilus and Griseida; *Il Ninfale Fiesolano*. In 1341 he left Naples for a time and went to Florence. There, under the melancholy of absence from his mistress, he wrote the *Ameto*, or in full *Il Ninfale d'Ameto*, in prose alternating with lyrics; *L'Amorosa Visione*, a dream in which the poet, led by his lady, sees the lovers and heroes of the past; the *Fiammetta*, a romance in prose. In 1344 he returned to Naples, and began writing those tales in prose which were afterward put into the mouths of Florentine ladies and gentlemen, and called the *Decamerone*. Most of these were probably written between 1344 and 1350. In 1349 or 1350 Boccaccio was called back to Florence by the death of his father, and was received with great distinction by the Florentines. In Florence probably, in 1354 or 1355, he wrote his *Corbaccio*, or *Labyrinthus d'amore*. The rest of his life, however, was devoted for the most part to classical studies. He eagerly admired Petrarch, and wished to imitate him. He longed to study Greek, and did actually take lessons of a Greek, Leonzio Pilato, who at his request translated Homer into bad Latin, so that Boccaccio probably first of moderns read that poet. He himself toiled laboriously at works of encyclopaedic scholarship: *De Genealogia Deorum Libri XVI.*; *De Montium, Silvarum, Lacuum, et Marium nominibus Liber*; *De Casibus Virorum et Feminarum Illustratum libri IX.*; and *De Claris Mulieribus*. These works are now unreach-

able, but the impulse given by them to European scholarship was very great, and they were much drawn upon (especially the *De Casibus*) by later writers for their imaginative material. In 1373 the Florentines appointed Boccaccio to the new chair established by them for the exposition of Dante. He had already written a *Life of Dante*, and now he prepared a commentary upon a little more than sixteen cantos of the *Inferno*. In 1374, however, he went to Certaldo, the home of his father's family, to live, and there he died Dec. 21, 1375. The literature about Boccaccio is very extensive. The following works, however, will suffice, the more so since they contain further bibliographical information: M. Landau, *G. Boccaccio, sein Leben u. seine Werke* (1877); G. Koerting, *Boccaccio's Leben und Werke* (Leipzig, 1880); A. Hortis, *Studi sulle Opere Latine del Boccaccio* (Trieste, 1879); M. Landau, *Die Quellen d. Decamerone* (2d ed. Stuttgart, 1884); A. Bartoli, *I Precursori del Boccaccio e alcune delle sue Fonti* (Florence, 1876); G. Voigt, *Die Wiederbelebung des classischen Alterthums* (2d ed. 1880); A. Gaspari, *Geschichte der Italienischen Literatur* (vol. ii. 1888).

A. R. MARSH.

Bochart, bō'shaar', SAMUEL: Protestant Orientalist and theologian; b. at Ronen, France, May 30, 1599; studied Arabic, Chaldee, and Syriac under Erpenius at Leyden, and excelled in philology. He became in 1625 pastor of the Protestant church at Caen, where he remained forty-two years, and gained a high reputation as a preacher and writer. His most important works are a *Sacred Geography*, in Latin (Caen, 1646), and *Hierozoicon*, or an account of the animals mentioned in the Bible (London, 1663). D. at Caen, May 16, 1667. His *Geographia Sacra* displays great learning and sagacity. His complete works appeared Leyden, 1675, 2 vols.; 3d ed. 1712, 3 vols. See Étienne Morin, *De Vita et Scriptis S. Bocharti*, prefixed to edition of his works (1692); Edward H. Smith, *S. Bochart: Recherches sur la Vie de cet Auteur illustre* (1833).

Bochnia, bokh'nē-a: a town of Austria; in Galicia; 23 miles by rail E. S. E. of Craeov (see map of Austria-Hungary, ref. 3-1). It has several churches. Here are mines of salt which yield about 15,000 tons annually. Pop. 9,000.

Bocholt, bokh'ōlt, or **Bocholt:** a town of Prussia; in Westphalia, on the Aa; 42 miles W. S. W. of Münster (see map of German Empire, ref. 4-D). It has a castle, and manufactures of silk fabrics, hosiery, and cotton stuffs. Pop. (1890) 13,034.

Bochum, bokh'oom: a Prussian town in Westphalia; 31 miles by rail N. E. of Düsseldorf (see map of German Empire, ref. 4-C); has manufactures of woollens, paper-hangings, hardware, iron, and tobacco, and important mines of coal. Pop. (1880) 33,440; (1890) 47,618.

Bockenheim, bok'en'hīm: a town in Prussia; province of Hesse-Nassau; 3 miles N. W. of Frankfort-on-the-Main (see map of German Empire, ref. 5-D). It has manufactures of ironware, jewelry, and pianos, and a large cattle-market. Pop. (1890) 18,675.

Böckh, bök, or **Boeckh.** PHILIPP AUGUST: philologist and classical antiquary; b. at Carlsruhe, Nov. 24, 1785; educated at Halle; became in 1809 professor in the University of Heidelberg, and obtained in 1810 the chair of Eloquence and Ancient (or Greek) Literature in the University of Berlin, where he taught for forty years or more. His lectures comprised archaeology and the history of ancient literature, philosophy, politics, etc. Among his greatest works, which have formed an era in archaeology and philology, are *The Political Economy of the Athenians* (2 vols., 1817), which Sir George Cornewall Lewis translated into English; *Investigations Concerning the Weights, Coins, and Measures of Antiquity* (Berlin, 1830); and *Records of the Maritime Affairs of Attica* (1840). He commenced in 1824 the great work called *Corpus Inscriptionum Graecarum* (4th vol., 1867), which he destined to comprise all existing Greek inscriptions, whether printed or not. D. Aug. 3, 1867. Cf. Bursian, *Gesch. d. class. Philol. in Deutschland*, pp. 687-705.

Bodenstedt, bō-den-stet, FRIEDRICH MARTIN, von: German poet and translator; b. in Peine, Hanover, Aug. 22, 1819; through residence in Moscow as tutor (1840, seq.) became an enthusiastic lover of Slavic literature. In 1844 he went to Tiflis, where he remained two years, devoting himself to the study of the peoples of the Caucasus and of Oriental languages. In 1848 his work *Die Völker des Kaukasus* showed the outcome of this study. In 1845 his translations

of poetic tales in the Little Russian dialect, *Die poetische Ukraine*, made some stir in Germany. In 1849 appeared his *Tausend und ein Tag im Orient*; in 1851 his most famous book, *Die Lieder des Mirza Schaffy*, which in 1887 had reached its 126th edition, and was widely translated in other countries. At first these poems were taken to be translations, but eventually it appeared that Mirza Schaffy had been the poet's friend and teacher in Tiflis, to whom the poems were simply dedicated out of grateful remembrance. From the year 1851 Bodenstedt has published incessantly both original works and translations from the Oriental tongues. His *Gesammelte Schriften* appeared 1865-69 in twelve volumes. Since 1869 have been published *Einkkehr und Umschau* (1873); *Verschollenes und Neues* (1877); *Aus Morgenland und Abendland* (1882); *Neues Leben* (1866); *Sakuntala* (1888). In 1881 he traveled in the U. S., and in 1882 described what he had seen in his *Vom Atlantischen zum Stillen Ocean*. In 1855 he published a translation of the poems of Puschkin; in 1877 one of the poems of Hafiz; in 1881 one of Omar Khayyam. He also busied himself much with the Elizabethan period of English literature: *Shakspeare's Zeitgenossen u. ihre Werke*, in his *Charakteristiken u. Uebersetzungen* (3 vols., 1858-60); *Shakspeare's Sonnette* (4th ed. 1873); *Shakspeare's Frauencharaktere* (1874). More recently his *Erinnerungen aus meinem Leben* (2d ed. 1888) have excited great interest. D. in Wiesbaden, Apr. 19, 1892. A. R. MARSH.

Bode, bō'de, JOHANN EILERT: astronomer; b. at Hamburg, Jan. 19, 1747; d. in Berlin, Nov. 23, 1826. At the age of twenty-five he became astronomer of the Berlin Academy, a position which he held for more than fifty years. He shortly afterward commenced the celebrated ephemeris afterward known as the *Berliner Astronomisches Jahrbuch*, the publication of which he conducted for more than fifty years. He was the author of several astronomical works of a more or less popular character, but his name is best known from his announcement of the law which, before the discovery of Neptune, was supposed to govern the distances of the planets from the sun. (See BODE'S LAW.) It is found, however, that this law should really be ascribed to Titius, another German astronomer, who published it in 1766.

SIMON NEWCOMB.

Bode's Law: an empirical formula which marks quite closely the relative distances of the planets, Neptune excepted, from the sun. See ASTEROIDS.

The law may be thus exhibited: Under the names of the several planets in the order of their distance set the number 4. Then below this row of fours write in order the numbers 0, 3, 6, 12, 24, 48, and so on, the 0 falling under Mercury, the 3 under Venus, and so on. Adding the several columns thus obtained, we have the following result:

Mercury.	Venus.	Earth.	Mars.	Asteroids.	Jupiter.	Saturn.	Uranus.	Neptune.
4	4	4	4	4	4	4	4	4
0	3	6	12	24	48	96	192	384
4	7	10	16	28	52	100	196	388

The numbers thus obtained correspond closely with the relative distances of the planets, except only in the case of Neptune. The real distances, calling the earth's distance 10, are as follows:

Mercury.	Venus.	Earth.	Mars.	Asteroids.	Jupiter.	Saturn.	Uranus.	Neptune.
3.9	7.2	10	15	27.5	52	95	192	300

It will be seen that the distance of Neptune falls far short of that which Bode's law would assign to a trans-Uranian planet. It does not therefore express any general law of nature, and fails entirely in the cases of the satellites.

Bodie: Mono co., Cal. (for location of county, see map of California, ref. 7-F). Here are the noted "Bodie" and "Standard" gold mines. Pop. (1880) 2,712; (1890) 595.

Bodin, bō'dān, JEAN: French political writer; b. in Angers in 1530. He published in 1576 a treatise on government entitled *De la République*, and in 1586 a Latin version of the same. He advocated a limited monarchy as the best form of government. In the latter part of his life he was an adherent of Henry IV. D. in Laon in 1596. His *Heptaplomeres de abditis rerum sublimium arcibus* is considered one of the most interesting books of that age.

Bodleian Library: the principal library of Oxford University; was founded by Sir Thomas Bodley (see below), who in 1597-98 offered to restore to its former use the old room which once had held a collection of books. He expended some £10,000 of his own money in the purchase of books on the Continent, and secured the co-operation of his numerous friends; and so as the idea of making the library worthy of the university found favor, the collection was already quite large when the building was thrown open to the public by James I., Nov. 8, 1603, who gave the library Bodley's name. Since 1610 it has been entitled to receive a copy of every book published in the United Kingdom. Private donors have added to its stores. It contains now 550,000 printed volumes and over 30,000 manuscripts. The building contains also art treasures—e. g. the Pomfret and Arundel marbles, the Hope collection of portraits (200,000 engravings), and is connected with the "Camera Bodleiana" or "Radcliffe," a circular structure where the more modern books are kept. The first catalogue was published in 1605. Bodley left a large amount of money for the endowment of the library. See W. D. Maeray, *Annals of the Bodleian Library* (Oxford and New York, 1868; 2d ed. 1890).

Bodley, Sir THOMAS: an English diplomatist; b. in Exeter, Mar. 2, 1544; graduated at Oxford in 1566. He was sent by Queen Elizabeth on diplomatic missions to France, Denmark, and Holland. He expended much money in collecting rare and valuable books, and endowed the great BODLEIAN LIBRARY (q. v.). D. in Oxford, Jan. 28, 1612.

Bodmer, bōt'mer, JOHANN JAKOB: Swiss critic and poet; b. near Zurich, July 19, 1688. He founded in 1721, after the model of the *Spectator*, a literary journal called *Discourse der Maler*, which promoted a reform in German literature, and waged a literary war against Gottsched. A great admirer of English poetry and especially of Milton, he revolutionized literary criticism in Germany by aesthetic doctrines derived from his English models. His writings had great influence upon the rising generation of German poets like Klopstock and Wieland. He was also among the first who appreciated the poetry of the German *Minnesong*. Even Goethe paid homage to the old patriarch on one of his early visits to Switzerland. Among his numerous works (which lack originality) is the *Noachide* (1752). He was Professor of History at Zurich for fifty years. He translated *Paradise Lost* into German. D. in Zurich, Jan. 2, 1783. See Mörikofer, *Die Schweiz. Lit. des 18. Jahrh.* (Leipzig, 1861); Servaes, *Die Poetik Gottscheds* (Strassburg, 1887); Brautmaier, *Geschichte der poet. Theorie*, etc. (Frankfurt, 1889). Revised by JULIUS GOEBEL.

Bodmin: a town of England; capital of Cornwall; 26 miles W. N. W. of Plymouth (see map of England, ref. 14-C). It consists chiefly of one long street in a valley between two hills; it was once an important place. It now contains a court-house, a jail, an ancient priory, and a grammar school founded by Queen Elizabeth, and is one of the stannary towns of Cornwall. Pop. (1891) 5,151.

Bodrum: See BUDRŪN.

Bødteher, bōt'cher, LUDVIG ABOLF: Danish lyric poet; b. in Copenhagen, Apr. 22, 1793; d. there Oct. 1, 1874. Bødteher wrote little, but his poetry, much of which is erotic, is remarkable for beauty of form and exquisite finish. See Gosse's *Northern Studies* (1879).

Body, GEORGE, D. D.: canon missionary of Durham; b. at Cheriton, Fitzpaine, Devonshire, Jan. 7, 1840; graduated at St. John's College, Cambridge, 1862; ordained 1863. Author of *The Life of Justification* (1870; 6th ed. 1884); *Life of Temptation* (1870; 7th ed. 1891); *Mission Tracts*; *The School of Calvary* (1890; 2d ed. 1891).

Body Color: in painting, color which is so mixed for application as to be thick and to form a coating upon the surface to be painted. The term is especially used in water color to distinguish color made opaque by the mixture with it of white, from transparent or translucent color, which merely stains the surface. See WATER-COLOR PAINTING.

Body's Island: the long, low, sandy strip of land between Rannoke and Abenmarle Sounds and the Atlantic Ocean N. of Oregon inlet. Body's island lighthouse, 2 miles N. of Oregon inlet (lat. 35° 48' 47" N., lon. 75° 33' 20" W.), is a brick tower with a granite foundation and an iron top, 150 feet high, showing a first-order dioptric white fixed light, 156 feet above the sea. The island is here 2 miles wide, and is in Dare co., N. C.

Boece, bois, or **Boyce**, or **Boethius**, HECTOR: historian; b. at Dundee about 1465. He studied and graduated at the University of Paris, where he became in 1492 Professor of Philosophy. In 1498 he went to Aberdeen, where he became later principal of King's College. He was a friend of Erasmus. His chief work is a *History of Scotland* (in Latin, Paris, 1526; Eng. trans. reprinted Edinburgh, 1821), which is highly esteemed. D. in Aberdeen, 1536.

Boehmeria [from G. R. Böhmer, a German savant]: a genus of plants of the family *Urticaceæ*; formerly included in the genus *Urtica* (nettle). The fibers of several species of this genus are used to make ropes, twine, nets, and cloth. The beautiful fabric called China grass-cloth is made of the fibers of *Boehmeria nivea*, a perennial herbaceous plant, with broad ovate leaves, without stings, cultivated by the Chinese, who call it *choo-ma*. It can be propagated by seeds, and thrives best in shade and moisture. It grows naturally in China, Sumatra, and Burma, and other parts of the East Indies. The Malays call it *ramie*. The cultivation of ramie has been tried in some of the Southern U. S., with decided success. Nepal produces an important species, *Boehmeria frutescens*, which grows from 6 to 8 feet high, the fiber of which is said to be equal to flax. The natives call it pooce, yenki, or kienki. This fiber also makes excellent paper, and will probably become an important commercial product. There is one native species in the U. S. See RAMIE.

Boeo, Cape: See CAPE BOEO.

Bœotia (in Gr. *Bœotia*): a country or state of ancient Greece; bounded N. by Locris, N. E. and E. by the Eubœan Channel, S. by Attica and Megaris, S. W. by the Corinthian Gulf, and W. by Phœcis. Area, estimated at 1,100 sq. miles. It may be described as a hollow basin, inclosed, on the N. by Mt. Parnassus and the Opuntian Mountains, on the E. by a continuation of the Opuntian range, on the S. by Mt. Cithæron and Mt. Parnes, and on the W. by Mt. Helicon. The surface is diversified by other mountains and several valleys and plains. It contained a large lake named Copais (now Topolias) which had no outlet except subterranean channels in the limestone mountains. These channels, now called *Katabothra*, were not sufficient to carry off the water of the lake, which sometimes inundated the surrounding plain. To obviate this evil the ancient Bœotians constructed two tunnels through the rock. One of these tunnels was nearly 4 miles long, with twenty vertical shafts let down into it. These two great works are perhaps the most remarkable monuments of what is called the heroic age. The largest rivers of Bœotia were the Asopus and the Cephissus, the latter of which rises in Phœcis and enters Lake Copais. The Asopus flowed eastward through the southern part, and entered the Euripus. Instead of the pure and transparent air of Attica, the air of Bœotia is rendered damp and heavy by vapors rising from lakes and marshes. The winters were very severe, and the snow sometimes lay on the mountains for many days. The soil, which is mostly a rich mould, was very fertile and produced in ancient times, as well as in the present, abundant crops of grain. The plain of the Copais is especially remarkable for its fertility. Bœotia was famous for meadow and pasture land, on which were raised the excellent horses of the Bœotian cavalry. The grape and other fruits flourished in this region. Among the other productions was the anætic or flute reed, which grew in the marshes of Lake Copais, and had an important influence on the development of Greek music.

The most remarkable tribes that inhabited Bœotia in the heroic age were the Minya, who lived at Orchomenus, and the Cadmeans, or Cadmeones, who lived at Thebes. At the commencement of the historical period the Minyans and other tribes had nearly disappeared, and the country was occupied by the Bœotians, who are supposed to have come from Thessaly. The principal cities formed a confederacy under the presidency of Thebes. Orchomenus was the second city in importance. Among the other towns were Coroneia, Haliartus, Thespie, Tanagra, Plataea, and Anthedon. The Bœotians were regarded as a dull, unintellectual people, and less refined and polished than most of the Hellenic tribes. Their natural dullness was ascribed to the dampness and ungenial quality of their climate. According to Cornelius Nepos, they paid more attention to the development of their physical powers than the cultivation of their minds. Yet this state produced a few great men—Epaminondas, Hesiod, Pindar, and Plutarch. See Forchhammer, *Hellenika* (1837); Leake, *Travels in North-*

ern Greece (1835); Klutz, *De Fœdere Bœotico* (1821); Mure, *Travels in Greece*. See also ATTICA.

Boerhaave, boor'haa'-ve, HERMAN: Ph. D., M. D., F. R. S.; a Dutch physician; b. at Voorhout, near Leyden, Dec. 31, 1668. He studied the ancient languages and history at Leyden, where he took the degree of doctor of philosophy in 1689. He began the study of medicine in 1690, and graduated as M. D. at Barderwick in 1693, after which he practiced at Leyden. In 1701 he was appointed Lecturer on the Theory of Medicine in the University of Leyden, and adopted the method of Hippocrates. He afterward deviated from that method, and substituted mechanical and chemical hypotheses to explain diseases. He published in 1708 an excellent systematic work called *Medical Institutes* (*Institutiones Medicæ in Usus annuæ Exercitationis Domesticæ*). He became in 1709 Professor of Medicine and Botany at Leyden, where he acquired great popularity as a teacher. Among his important works are *Aphorisms on the Diagnosis and Cure of Diseases* (*Aphorismi de Cognoscendis et Curandis Morbis*, 1709), which is a model for style and other merits, and *Elements of Chemistry* (1724), which some persons consider his capital work. His reputation extended to every part of Christendom, and patients came to consult him from every country of Europe. He received, it is said, a letter from a Chinese mandarin, addressed "To Boerhaave, physician in Europe." D. Sept. 23, 1738.

Boers, boorz [recent loan-word from Dutch, but closely connected with *boor* and Germ. *Bauer*, peasant]: the farmers in South Africa of Dutch descent. After the annexation of Cape Colony by Great Britain, troubles arose between the Government and the Boers, and in 1836 many of them left the colony and founded the Orange Free State and also the Transvaal Republic. In 1858 they gave themselves a constitution, and after a time the commonwealth was recognized. But in 1877 the Cape Government, fearing an outbreak which might lead to a general rising of the natives, took possession of and annexed the territory. In Dec., 1880, the Boers took up arms, but a treaty of peace ensued in 1881 under which British suzerainty was recognized as to foreign affairs. In 1884 this treaty was modified, and the suzerainty was practically given up by the British Government. The Boers are sturdy, independent, and mostly farmers; they use an antiquated Dutch and are little given to refinements.

Bœthius, or **Boetius**, ANICIUS MANLIUS TORQUATUS SEVERINUS: Roman philosopher and statesman; b. in Rome, after 475 A. D. He was liberally educated; became a good Greek scholar; was chosen consul in 510, and gained the confidence of Theodoric, King of the Goths, who reigned at Rome, and appointed Boethius *magister officiorum* in his court. His political influence was exerted for the benefit of the country, but his probity and virtues provoked the enmity of powerful courtiers whose corrupt or oppressive conduct he had opposed. He was accused of treasonable designs, was confined in prison, and finally executed by the sword by order of Theodoric in 525 A. D. Whether he was a Christian or not is a matter of uncertainty. He was considered such in the Middle Ages, and the Bollandists gave him the position of a saint, and his works are included in Migne's edition of the Latin ecclesiastical writers (vols. lxxiii., lxxiv.). Several theological tracts are attributed to him, and were included in the Leyden edition (1671) of his *Consolation of Philosophy*. But there is a predominance of argument in favor of the opinion that he was not, in any proper sense, a Christian, and that the tract on the Trinity was from another hand, probably from a monk of the same name, although Peiper maintains that it was a work of the early years of Boethius. Boethius holds a place in the history of scholastic philosophy from the fact that a passage from his commentary on the *Isagoge* of Porphyry gave rise to the long-continued discussions between the Realists and the Nominalists. While he was in prison he wrote, partly in verse, *De Consolatione Philosophiæ* (*On the Consolation of Philosophy*), which is his greatest work, and was very popular in the Middle Ages. It was translated into Anglo-Saxon by Alfred the Great and into English by Chaucer. It contains no allusions to Christianity—a fact which can hardly be reconciled with the hypothesis of his being a Christian, considering the circumstances under which it was written. See Barberini, *Esposizione della Vita de Boetio* (1783); Dom Gervaise, *Histoire de Boèce* (1715); Heyne, *Censura Ingenii Boethii* (1806); *Life of Boethius*, prefixed to Kidpath's translation of the *De Consolatione Philosophiæ*

(1785), English translation in Bohn's Library; Rudolphus Peiper's edition of the *Consolatio* (Leipzig, 1871). The mathematical and musical treatises of Boethius have been edited by J. Friedlein (Leipzig, 1867).

Revised by W. T. HARRIS.

Boethius, HECTOR: See BOECK.

Beuf, Bayou, bi oo-bef; a river or creek of Arkansas and Louisiana; fed by water which it receives from the Mississippi river during inundations. It extends from Chicot co., Ark., southwestward into Louisiana, and unites with the Washita river at the south extremity of Franklin parish. Steamboats can ascend it 100 miles or more during high water.

Bofarull y Broca, bō-faa roo-lee-brō'kūā, ANTONIO; Spanish and Catalan historian and philologist; b. Dec. 4, 1821; director of the archives of Barcelona. He has been an ardent participator in the new Catalan literary movement, and has published many poems in the revived tongue under the pseudonym of *El Coblejador de Moncada*. He is best known, however, for his *Historia crítica civil y eclesiástica de Cataluña* (9 vols., 1876-78), and his *Historia crítica de la Guerra de la Independencia en Cataluña* (1886-87). Worth mentioning also is his *Estudios, sistema gramatical y etimología de la lengua catalana* (1864). A. R. MARSH.

Bog [Gael. *bog*, soft; in compos. *bog*]; a swamp or tract of wet land, covered in many cases with PEAT (*q. v.*). Bogs, called mosses in Scotland and swamps in America, often contain the well-preserved trunks of trees, especially of the oak in Ireland, and of the cypress in America. In many cases these tracts are higher than the surrounding country, and may thus be easily drained, when they often become very fertile land. See DRAINAGE.

Bog: River of Russia. See BUC.

Bogar'dus, EVERARD: second minister of New York (then New Amsterdam): b. in Holland; came to America in 1633, and obtained by marriage in 1638 with Annetje Jansen (or, as she is commonly called, Anneke Jans) a farm (the "Dominie's Bouwerie") of 62 acres, now owned by the Trinity church corporation, an estate in much litigation, but with the title confirmed to Trinity church. Having much trouble with the magistrates and people, he resigned in 1647, in answer to charges against him before the classis of Amsterdam, and sailed for Holland, but was wrecked on the English coast, and with Gov. Kieft and many others was drowned, Sept. 27, 1647.

Bogatzky, bō-gat'skee, KARL HEINRICH, von: a German devotional writer and pietist; b. at Jankowe, Silesia, Sept. 7, 1690; studied at Jena and Halle; lived in literary retirement, on Franke's invitation, in the famous orphanage in the latter city from 1746 until his death, June 15, 1774. He wrote *The Golden Treasury* (orig. Breslau, 1718; 58th ed. Halle, 1885; Eng. trans. n. e. 1888). See his *Life*, by J. Kelly (London, 1889).

Bogar'dus, JAMES: b. at Catskill, N. Y., Mar. 14, 1800. In 1814 he was apprenticed to a watchmaker. He made important improvements in cotton-spinning in 1828; invented a gas-meter (1832); a machine for engraving (1836); a pyrometer, and many other mechanical improvements. In 1847 he built in New York the first iron building in the U. S. D. in New York city, Apr. 13, 1874.

Bogart, JOHN: civil engineer; b. in Albany, N. Y., Feb. 8, 1836; educated at Albany Academy and at Rutgers College, N. J. During the civil war he was attached to the engineer corps. Later he had charge of the Brooklyn park system, designed the Albany park, the State grounds at Nashville, Tenn., and the improvements in New Orleans park. From 1870 to 1877 he was chief engineer of the department of parks of New York. From 1877 to 1890 he was secretary and librarian of the American Society of Civil Engineers. In 1888 he was elected State engineer of the State of New York, and held the office for four years. He is now consulting engineer of the Cataract Construction Company, engaged in developing the water-power of the Niagara river.

Bog-butter: a substance which is found in peaty earth in some of the bogs of Ireland. In composition and qualities it exhibits the general properties of a fat, and melts at 124° F. It is probably fossil butter.

Bogenhausen, bō'gen-how-zen: a village of Bavaria; on the Isar, 2 miles N. E. of Munich. Pop. 1,000. Here is the royal observatory of Munich, which was erected in 1817,

and is one of the best in Europe; lat. 48° 8' 54" N., lon. 11° 36' 22" E.

Boggs, CHARLES STUART: U. S. admiral; b. in New Brunswick, N. J., Jan. 28, 1811; entered the navy as a midshipman Nov. 1, 1826, became a passed midshipman in 1832, a lieutenant in 1837, a commander in 1855, a captain in 1862, a commodore in 1866, a rear-admiral in 1870, and retired from active service in 1873. He commanded the Varuna at the passage of Forts St. Philip and Jackson and capture of New Orleans. D. at New Brunswick, N. J., Apr. 22, 1888.

Bogh, bōch, ERIC: Danish man of letters; b. Jan. 17, 1822. He is a popular poet and play-writer, but is most remarkable for his short stories and humorous sketches. Besides several volumes of plays, *Dramatiske Arbejder* (7 vols., 1858-71); *Udvalgte Dramatiske Arbejder* (1885 ff.); and of poems, he has published, among other works, *Syv Forelesninger* (Seven Lectures, 1858); *Jonas Tevemooses Ergrelser* (J. T.'s Troubles, 1864-75); *Udvalgte Fortællinger* (Selected Tales, 1876); *Billeder paa Vers og Prosa* (Pictures in Verse and Prose, 1891); and a series of feuilletons (1860, etc.) called *Dit og Dat* (Odds and Ends). G. L. KITTRIDGE.

Boghead Coal: a highly bituminous variety of the cannel coal of Scotland; from Boghead, in Linlithgowshire. The varieties of cannel pass into shale by insensible gradations, so that it is impossible to draw a line which shall properly limit the use of the term coal. The boghead is one of these substances, more valuable for gas-making, and for the oils and paraffine obtained from it by distillation, than for fuel. Dr. Fife found a picked specimen to yield on analysis 70 per cent. of volatile matter and 30 per cent. of ash.

Bog Iron Ore: a mineral of variable composition, in which the peroxide of iron often amounts to 60 per cent., the water to 20, phosphoric acid from 2 to 11 per cent., while silica, clay, and other substances make up the rest. Bog iron ore occurs in alluvial soils, in bogs, lakes, etc. It is of a yellowish or blackish-brown color. Some varieties are earthy and friable; some are in masses of an earthy character, and some compact, with conchoidal fracture. It is abundant in the northern countries of Europe generally; also in various parts of the U. S.

Revised by C. KIRCHHOFF.

Boglipoor: same as BILGALPUR.

Bogomiles [so named from their leader, the Bulgarian priest *Bogomil*, middle of tenth century]; a dualistic-manichaeanistic sect of Thrace, Macedonia, and Bulgaria, originating in the early part of the tenth century. It spread over Servia, Bosnia, Dalmatia, and Croatia. In the latter countries it was called Patarenes, but by itself the Bosnia Church, and had many adherents among the aristocracy. It survived persecution, but when the Turks overran the country (1463) its members almost to a man became Mohammedans. Its principal doctrines were the origin of evil in the declension from God, the good principal; doctetic views of the person of Christ in that they affirmed that Christ saved men by his teaching; the rejection of the sacraments; and the use of images in worship, and all the Old Testament except the Psalms, and to the New Testament they added certain apocrypha.

Bog'os: a Negro tribe; inhabiting the highlands N. of Tigré, Abyssinia; have become known by the explorations of Werner, Munzinger, and Th. Heuglin. The flora and the fauna of the country of the Bogos are exceedingly rich. Mighty sycamores and tamarind trees, and lions, elephants, buffaloes, and antelopes, as well as the rhinoceros and many varieties of beasts of prey, are found here. The total population is estimated by Munzinger at 10,000 persons, of whom only one-third are true Bogos, who speak the Belen language. The rest are tribes subject to them, who speak the Tigré. The Bogos are well formed, and profess Christianity, but have very little religious knowledge. For several years they have paid a small annual tribute to Abyssinia. The Bogos have suffered much from the invasions of the inhabitants of Barha.

Bogoslof, bō-gō-slof: a small volcanic island of the Aleutian Archipelago; lat. 53° 58' N., lon. 168° W. Previous to 1795 its site was occupied by a group of reefs and low rocks. In that year began a period of eruption resulting in a craggy peak about 450 feet high. In 1883 a broader peak of the same height, Grewinek, was thrown up from the sea at a distance of a mile, and the two were connected by a spit.

G. K. G.

Bogotá, *bō-gō-laa'* (formerly SANTA FÉ DE BOGOTÁ); a city of South America; capital of the republic of Colombia; pleasantly situated on the San Francisco river, which here joins the Rio de Bogotá, and at the foot of two mountains (see map of South America, ref. 2-B). It is on an extensive plateau, which is about 8,700 feet above the level of the sea, and enjoys a mild and genial climate like a perpetual autumn. Lat. 4° 35' 48" N., lon. 74° 13' 45" W. The adjacent table-land is very fertile, and is inclosed on several sides by high peaks of the Andes. Bogotá is well built, but, as it is subject to earthquakes, the houses are generally only two stories high. No vehicles are used in the streets, which are all narrow. It is the seat of an archbishop, and contains a cathedral and numerous churches, a palace of the president, a university, a national academy, a public library, and a theater. It has several public squares adorned with fountains, and some very good institutions for higher education. Mines of coal, salt, and precious stones occur in the vicinity. A few miles below the city is the great Cataract of Tequendamá, where the Bogotá river has a perpendicular fall of 475 feet. Bogotá was founded in 1537. It has several times suffered considerably from earthquakes. Pop. (1886) 120,000.

Bogra, *bōg-raa'*: a district of Bengal, British India; between lat. 24° 20' and 25° 20' N., and meridians 88° 56' and 89° 49' E.; on the right bank of the Brahmaputra river. Area, 1,498 sq. miles. Pop. 750,000, 80 per cent. of whom are Mohammedans and 19 per cent. Hindus. It is a level plain intersected with streams and dotted with jungles. It is nearly all cultivated; the eastern portion is low, subject to inundations, and yielding heavy crops of rice. The western portion is higher, and is also devoted to rice, but of a finer quality. Fishing is also an important industry. The climate is oppressive, except in winter. The annual rainfall is about 80 inches.

Bogue, DAVID, D. D.: a Scottish preacher; called the founder of the London Missionary Society; b. in Hallydown, in Berwickshire, Feb. 18, 1750; educated at Edinburgh; after teaching he became pastor in Gosport to an Independent church; was the first editor of the *Evangelical Magazine*, and wrote an *Essay on the Divine Authority of the New Testament* (London, 1801). He was author, in conjunction with James Bennett, of a *History of Dissenters from 1689 to 1808* (1808-12, 4 vols.; 2d ed. 1833). He and others founded the London Missionary Society in 1795. Yale College gave him a D. D. in 1815. D. in Brighton, Oct. 25, 1825.

Bohe'mia (in Lat. *Bohemia*; Germ. *Böhmen* and *Böhmeim*): a former kingdom of Europe, now a part of Austria-Hungary. It is bounded N. by Saxony and Prussian Silesia, E. by Moravia and Prussia, S. by Lower Austria, and W. by Bavaria. It is between lat. 48° 33' and 51° 3' N., and between lon. 12° and 16° 46' E. Its area is 20,960 sq. miles. It is inclosed on all sides by four chains of mountains, which constitute its natural boundaries—namely, the Erzgebirge (Ore Mountains), which separate it from Saxony on the N. and N. W.; the Riesengebirge (Giant Mountains), which extend along the N. E. frontier; the Moravian Mountains, which separate it from Moravia on the S. E.; and the Böhmerwald (Bohemian Forest), which extends along the S. W. border. The Schneekoppe, which is the highest peak of the Riesengebirge, rises 5,275 feet above the level of the sea. The surface of Bohemia is mostly undulating, and belongs to the basin of the Elbe, which rises in the northeast part. The other principal rivers are the Moldau, which rises in the Böhmerwald, flows northward, and enters the Elbe; and the Eger, which flows through the northwest part into the Elbe. The Moldau and Elbe are navigable for steamboats. The climate is healthy, and mild in the valleys or lowlands. The mean annual temperature at Prague is 49° F. The soil is generally fertile. The staple productions are rye, oats, barley, flax, and wheat. The grapevine is also extensively cultivated. Nearly one-third of the country is covered with forests. Large numbers of cattle and sheep are raised in some parts of the country. Bohemia is rich in minerals, which are found chiefly in the mountains. Among its mineral resources are copper, tin, iron, lead, cobalt, silver, nickel, zinc, arsenic, sulphur, coal, cinnabar, alum, and precious stones. Here are also quarries of marble, granite, and sandstone. Famous mineral springs occur at Marienbad, Carlsbad, and Töplitz. The manufactures of Bohemia are very important and varied, the principal products being linens, cotton goods, woolens, glass, and paper. The manufacture of damask,

cambric, lawn, and other linen goods employs about 400,000 flax-spinners and 50,000 weavers. Over 500,000 spindles are employed in the production of cotton yarn. Beet-sugar is extensively manufactured. The number of paper-mills is over 120. Bohemia has long been celebrated for its glass-works, which employ about 30,000 persons. A considerable quantity of iron is manufactured here. Railways extend from Prague in several directions, connecting it with Dresden, the cities of Bavaria, and those of Moravia. The chief towns are Prague, Pilsen, and Budweis. Bohemia has one university (Prague), twenty-three gymnasia, as well as numerous Realschulen, and other institutions of learning. A large majority of the inhabitants belong to the Roman Catholic Church, that being the established religion, but other churches are tolerated. The number of Protestants in Bohemia in 1880 was 120,120. Pop. (1890) 5,843,094, of whom about three-fifths are Czechs, and two-fifths Germans.

Bohemia derives its name from the *Boii*, a Celtic people who settled here before the Christian era, and were expelled by the Marcomanni in the time of the Roman Emperor Augustus. It was conquered by the Cechi (or Czechs), a Slavie race, who first established themselves in Bohemia in the second half of the sixth century, and in 630 A. D. made themselves independent. For several centuries the family of the Przemyslides ruled with varying success until in 1310 the kings of the House of Luxemburg ascended the throne, and ruled until 1437. John Huss effected a religious reformation in this country (1400-14), and was burned by the Catholics. The consequence was the sixteen years' war of the Hussites. In 1526 Bohemia was annexed to the dominions of Ferdinand I. of Austria. The majority of the Bohemians in the sixteenth century were Protestants, who, for the assertion of their religious liberty, revolted against the Emperor of Austria, and in 1619 elected as their king Frederick, the elector palatine. He was defeated near Prague in 1620 by the Austrians, who then commenced a cruel persecution of the Protestants, and almost exterminated them. The population was reduced in twenty years (1617-37) from 3,000,000 to 780,000. In recent times the country has been agitated by a strong political antagonism between the Czechs and the Germans, the former demanding the re-establishment of a kingdom embracing Bohemia and Moravia, and enjoying the same autonomy in point of administration which has been conceded to Hungary. See AUSTRIA-HUNGARY.

Revised by C. K. ADAMS.

Bohemian Brethren, or **Moravian Brethren**: the name of a sect of Christians. The followers of Huss (*q. v.*) were divided into Calixtines and Taborites; the former approached the doctrines of the Roman Church, but the latter rejected all the distinctive ones, but at first united with the Calixtines in opposing the invasion by the Roman Church. But later the Calixtines, through the Compactata of Basel (1433), made peace with the Church; and so the Taborites were defeated. Ruined as a political power, they still lived as a sect. Under the name of "The Brethren and Sisters of the Law of Christ" they put themselves under the leadership of Gregory, the nephew of Rokyzana, the great Calixtine chief, and lived in apostolic simplicity at Lititz, in Bohemia. Later they changed their name to "The Unity of the Brethren" (*Unitas Fratrum*). Briefly, they held to these views: The three orders of the ministry; diocesan synods for local affairs; association of all the bishops in a general council for general affairs; permission of marriage to the clergy; rejection of purgatory, Mariolatry, and saint-worship; acceptance of only two sacraments and of infant baptism; church discipline of the most rigorous character. They found many sympathizers and converts, but were persecuted by the Roman Church and their former brethren, the Calixtines. When the Protestant movement began they numbered in Bohemia and Moravia about 200,000. They corresponded with the Reformers, learned much from them, but did not coalesce. In 1519 persecution drove them in large numbers to Poland, where they flourished. In 1620 the fate of the Brethren was sealed at the battle of the White Mountain, and they well-nigh vanished. Many were killed, many became members of the Roman Church, and many joined either the Lutheran or the Reformed bodies. In 1656 the Polish branch was similarly destroyed and absorbed; but in 1722 the remnants of the sect, which had come secretly and very obscurely existed all these years, came together on the domain of Count Zinzendorf at Berthelsdorf, near Zittau, about 60 miles S. E. of Dresden, on the border between Saxony and Bohemia, and then arose the renewed Moravian Brethren (*q. v.*). See C. A.

Pescheck, *Reform and Anti-reform in Bohemia* (London, 1845, 2 vols.); A. Gindely, *Geschichte der Böhmischen Brüder* (Prag, 1857); E. De Schweinitz, *History of the Unitas Fratrum* (Bethlehem, Pa., 1885). SAMUEL MACAULEY JACKSON.

Bohemian Forest, or **Böhmerwald**, bö-mer-wald: a chain of mountains in Germany, which forms the boundary between Bohemia and Bavaria, and separates the basin of the Danube from that of the Elbe. It extends in a S. E. and N. W. direction, and is about 130 miles long. The rocks of which it is formed are granite and gneiss. The highest summits of this chain are the Aber, 4,848 feet, and the Rachelberg, 4,743 feet, above the level of the sea. A large portion of these mountains is covered with dense forests. A railway extending from Bavaria to Prague crosses this range through the valley of the Cham.

Bohemian Language: See SLAVIC LANGUAGES.

Bohemian Literature: See CZECH LITERATURE.

Bohemond (Lat. *Bohemundus*) I.: a famous leader of the first crusade; b. about 1056; son of Robert Guiscard, Duke of Apulia and Calabria. He joined the crusade with a large army in 1095, and took part in the capture of Antioch in 1098. He remained at Antioch while the other crusaders marched to Jerusalem, and he reigned there as Prince of Antioch. He waged war with varying success against the Greek Emperor Alexis, and married a daughter of Philip I. of France. D. in Italy in 1111.

Bohemond II: a son of the preceding; was a minor at his father's death. He became Prince of Antioch in 1126, and fought against the Saracens as an ally of Baldwin, King of Jerusalem. He was killed in battle in 1130.

Böhl, bö, EDUARD, Ph. D., D. D.: Professor of Reformed Dogmatics and Symbolics, and of Pedagogics, Philosophy of Religion, and Apologetics, in the Protestant faculty of Theology at Vienna, Austria; b. at Hamburg, Nov. 18, 1836; educated at the universities of Berlin, Halle, and Erlangen, taking his present position in 1864. He is the author of a large number of exegetical, critical, and theological works in Latin and German, and has contributed in English to American reviews and periodicals. His position is extremely conservative, especially in the line of deprecating all revision of existing creeds. W. J. BEECHER.

Bohlen, bö-len, PETER, van: German Orientalist; b. in Oldenburg, Mar. 9, 1796. He became Professor of Oriental Languages at Königsberg in 1826; published, besides other works, an able treatise on Indian antiquities entitled *Das alte Indien* (2 vols., 1830). D. Feb. 6, 1840. See his *Autobiography* (1841).

Bohlen Lectures, THE: a series of lectures established by John Bohlen, a layman of the Protestant Episcopal Church in the U. S. (d. Apr. 26, 1874), who bequeathed to trustees \$100,000 to be distributed to religious charities in accordance with the testator's wishes. On June 2, 1875, the trustees paid over to "the rector, churchwardens, and vestrymen of the Church of the Holy Trinity, Philadelphia," a sum of money for certain designated purposes, out of which fund \$10,000 was set apart for the endowment of *The John Bohlen Lectureship*, for the delivery and publication of at least 100 copies of two or more lectures on subjects within the terms of the will of the founder of the Bampton Lectures, "or on any other subject distinctively connected with or relating to the Christian religion." These lectures have been delivered as follows: Rev. Alexander H. Vinton, D. D., *Introductory Series*; Bishop Fred. D. Huntington, *The Fitness of Christianity to Man*; Rev. Phillips Brooks, *The Influence of Jesus*; Rev. John S. Howson, Dean of Chester, England, *The Evidential Value of the Acts of the Apostles*; Bishop Thomas C. Dudley, of Kentucky, *The Church's Need*; Bishop Samuel S. Harris, of Michigan, *The Relation of Christianity to Civil Society*; Rev. Alexander V. G. Allen, Cambridge, Mass., *The Continuity of Christian Thought*; Rev. Joseph F. Garrison, *The American Prayer-book*; Bishop William Stevens Perry, of Iowa, *Constitutional History of the American Church*; Rev. W. R. Huntington, *The Peace of the Church*. W. S. PERRY.

Böhler, bö-ler, PETER: a theologian and Moravian bishop; b. in Frankfort-on-the-Main, Dec. 31, 1712. He is recognized in Methodist history as having given a decisive impulse to Wesley's opinions and career. He removed to America in 1738, and in 1740 founded the town of Nazareth, Pa. D. in London, Apr. 27, 1775.

Böhm, böm, THEOBALD: musician; b. in Munich, Apr. 9, 1791; d. there, Nov. 25, 1881; noted for an improvement in the construction of the flute. The Böhm flute is more accurate and even in tone, and more easily fingered, than those formerly in use. He also introduced improvements in other instruments, and composed musical pieces.

Böhm, böme, or **Böhms**, böm, or **Behmen**, bay men, JAKOB: German mystic; b. near Görlitz, in Upper Lusatia, in 1575. He learned the trade of a shoemaker, worked at his trade at Görlitz, and became a member of the Lutheran Church. He had a very fertile imagination and a remarkable faculty of intuition, and professed to be divinely inspired and illuminated. His first work was entitled *Livora, or the Morning Redness* (about 1612). This was condemned by the ecclesiastical authorities of Görlitz. He published several other works, which were admired by some eminent men, but they appear visionary and unintelligible to the generality of persons. D. at Görlitz, Nov. 24, 1624. His works (10 vols., 1682) were translated into English (2 vols. 4to, 1861) by William Law, who was an admirer of Böhm. He was a religious genius of great depth, and can be understood only by people of strong religious feeling and some religious experience; to them he is as sublime as he is obscure to others. See La Motte-Fouqué, *Notice sur J. Boehm* (1831); Fechner, *Jakob Böhm, sein Leben und seine Schriften* (Görlitz, 1857); Geiss, *Jakob Böhm, der Deutsche Philosoph* (Leipzig, 1860); also Rhys Evans's translation of Martensen's *Jacob Boehme*. Revised by W. T. HARRIS.

Böhmerwald: See BOHEMIAN FOREST.

Böh-misch-Lei'pa: town of Bohemia; on the Polzen; 56 miles N. of Prague (see map of Austria-Hungary, ref. 3-D). It has a gymnasium, and manufactures of woolen and cotton cloths, glass, and hardware. Pop. (1890) 10,406.

Bohn, HENRY GEORGE: bookseller, of German extraction; b. in London, Jan. 4, 1796; promoted the popularization of good literature by publishing translations from ancient and modern languages; made several useful compilations, and wrote a *Handbook of Pottery*. D. at Twickenham, London, Aug. 24, 1884.

Bohras: See ISMAELIAH.

Böhtlingk, bö-tingk, OTTO: Russian Orientalist of German extraction; b. at St. Petersburg, May 30, 1815. After studying at Bonn he returned to St. Petersburg in 1842, and was made a member of the Imperial Academy in 1845. At the age of twenty-five he published an edition of one of the most difficult books of all literature, the Sanskrit grammar of PANINI (*g. v.*). There followed the *Çakuntala* of KALIDASA (*g. v.*) text and translation (1842); *Sanskrit Chrestomathy* (1845); Vopadeva's *Grammar* (1847); Hemachandra's *Dictionary* (1847); a volume *On the Language of the Yajurts* (1851); a collection of over 7,600 Sanskrit proverbs (*Indische Sprüche*, 3 vols., 2d ed. 1870-73), with critically edited text and German translation. In 1852 he began with RUDOLF ROTM (*g. v.*) the publication of the Sanskrit-German dictionary of the Imperial Academy, a great seven-volume folio, which they brought to a successful completion after twenty-three years in 1875. This dictionary gives the historical development of the meanings of the words, and illustrates them by citations excerpted often from works existing at the time in manuscript only. It is the greatest single contribution to Indology that has ever been made, and also the most fundamental. In 1879 Böhtlingk began to publish alone a *Sanskrit Wörterbuch in kürzerer Fassung*, which is an abridgment of the first, but is also a supplement thereto. This he completed in seven folio volumes in Jan., 1889. In 1886-87 he published a new edition of Panini, with translation, etc.; in 1889 the *Chandogyia Upanishad* and the *Brihad Aranyaka Upanishad*; and in 1890 Dandin's *Poetics*, all three works in text and translation. Besides the above he has published some other books and many minor treatises. He is remarkable for having left none of his great undertakings unfinished. He is a text-critic of the first rank. Every one of his works marks a distinct advance of science. C. R. LAXMAN.

Bo'hun U'pas [Malay, poison-tree]: the *Antiaris toxicaria*, a tree of the Malay and Philippine archipelagoes, of the family *Artocarpaceæ*. Many grossly exaggerated reports of its fatal qualities have been published. Its poison appears to be of an acrid, not a narcotic, character. The stories of the upas valley in Java, where nothing can grow but the upas-tree, probably arose from the now well-ascertained fact that certain close mountain-ravines in that

island so abound in poisonous volcanic gases that no plant, not even the upas, can live there. Besides the above, another bobun upas, the *Strychnos tiente*, is found in that region. It abounds in strychnine, and is even more deadly than the other.

Boiardo, bō-yar'dō, MATTEO MARIA: Count of Scandiano; Italian poet; b. at Scandiano about 1434. He was patronized by Borso and Ereole d'Este, and became governor of Modena in 1481. His chief work is the romantic chivalrous poem *Orlando Innamorato*, which he left unfinished, and which was published in 1495. After his death, Niccolò degli Agostini, a poor poet, continued it, publishing three additional books (1506-14-24). Boiardo treated his material in a somewhat burlesque and satirical style; but in 1541 FRANCESCO BERNI (*q. v.*) published his *Rifacimento* of the poem, in which, by means of exquisite polish and point, the satiric effect is greatly heightened. The *Rifacimento* was so popular that it nearly supplanted the original, the subject of which was also continued by Ariosto (*q. v.*) in his *Orlando Furioso*. Curiously enough a second *Rifacimento*, by Lodovico Domenichi (1545), later superseded that of Berni.

BIBLIOGRAPHY.—A. Pabizzi, *Boiardo, Orlando Innamorato*; Ariosto, *Orlando Furioso*, with an essay on the *Romantic Narrative Poetry of the Italians, Monarchs, and Notes* (9 vols., London, Pickering, 1830); J. Boghen, *Matteo Maria Boiardo e l'Orlando Innamorato* (Ferrara, 1879). D. in Reggio, Dec. 20, 1494. Revised by A. R. MARSH.

Boies, HORACE: politician; b. on a farm near Aurora, Erie co., N. Y., Dec. 7, 1827; educated in the common school and academy of the county; studied law; member of New York Assembly 1858; removed to Waterloo, Ia., 1867; having been a Republican in politics, he left that party in 1883 on account of objections to its attitude on the tariff and prohibition, and became a leader of the Democratic party in that State. Elected Governor of Iowa 1889; re-elected 1891. Candidate of the Iowa delegation for the presidency in the National Democratic Convention at Chicago 1892.

C. H. THURBER.

Boi'i: an ancient Celtic people; emigrated across the Po and occupied Umbria, where they waged war for several centuries against the Romans. They were defeated by the Romans in 283 B. C., and became allies of Hannibal when he invaded Italy in 218 B. C. Many years later the Romans expelled them from Umbria and drove them beyond the Alps. A portion of the Boii migrated to the country on the north side of the Danube and founded the kingdom of Boiohemum (Bohemia), from which they were expelled by the Marcomanni in the time of Augustus. From them also Bavaria takes its name.

Boil (in Lat. *furunculus*): a hard, painful, inflammatory swelling on the surface of the body, which begins as a point of a dusky red color, and is hot, aching, and throbbing. These symptoms increase in severity for several days, when the swelling is of a conical form, with a broad, firm base, and has on the apex a whitish point, which contains a little matter; this opens, and after a few days more there is discharged a slough of cellular tissue, and the cavity left heals, leaving a depressed scar. Boils often attack young and plethoric persons, and their appearance is not incompatible with robust health, although they may be so numerous as to greatly reduce the strength. Men in training for athletic exercises, or others who have suddenly changed their habits, are subject to them. Sometimes boils continue to succeed each other for a length of time. The treatment of boils is simple. The intestinal canal should be cleared by laxative medicines and the digestive powers improved by tonics and antacids. The tincture of perchloride of iron is often a useful remedy. The skin should be kept healthy by frequent washing, while the inflamed point should be poulticed. Wet lint is a sufficient application after the core has been thrown off. Free incision of the boil greatly hastens its course.

Boieldieu, bō'el'dyō', or **Boieldieu**, bō'yēl'dyō', ADRIEN FRANÇOIS: a French composer; b. at Rouen, Dec. 15, 1775. He went to Russia in 1803, and was there appointed chapel-master to the Emperor Alexander; but he returned to Paris in 1811. Among his works are the operas *La Dame Blanche*, *Jean de Paris*, and *My Aunt Aurora*, D. Oct. 8, 1834. See Réfuveille, *Boieldieu, sa Vie et ses Œuvres* (1851).

Boileau, or, more fully, **Boileau-Despréaux**, NICOLAS: poet and satirist; b. near Paris, Nov. 1, 1636. He was liberally educated, and followed no profession but that of an

author. He began his literary career in 1660 or 1661 by composing a satire for recitation to his friends, among whom were Racine, Molière, and La Fontaine. This satire (subsequently cut in two, *Adieux d'un poète à Paris* and *Les Embarras de Paris*) was so successful that the young author composed others, five in number, between 1661 and 1665. In 1666, moved by a surreptitious publication of them in Holland, he issued them himself in a volume. Among his best works are the *Lutrin* (Reading-desk, 1674) and the *Art of Poetry* (*L'Art Poétique*, 1674), which is an exquisite performance, and is considered by some French critics as equal to Horace's *Art of Poetry*. Hardly less successful were the *Réflexions sur Longin* (1693), the outcome of the famous quarrels as to the relative merits of the ancients and the moderns, in which Perrault was Boileau's chief antagonist. The *Épîtres*, written at long intervals between 1669 and 1701, show as the poet maturer, calmer, but also colder than in the *Satires*. His extensive *Correspondance* with his friends is full of interesting material for the literary history of his time. Boileau was admitted into the French Academy in 1684. He had an immense influence on French literature, being for many years the literary legislator of France. He made war on the survivors of the tedious and pedantic school of Ronsard, upon the one hand, on the followers of Malherbe, now declining into Marinism and other puerilities, on the other. He laid down the following as the basis of all sound poetic doctrine:

Aimez donc la raison; que toujours vos écrits
Empruntent d'elle seule et leur lustre et leur prix.
Rien n'est beau que le vrai, le vrai seul est aimable.

This doctrine, however, confirmed the French in a tendency already visible in them—the tendency to prose in preference to poetry. D. in Paris, Mar. 13, 1711. See D'Alembert, *Éloge de Boileau*; Desmaizeaux, *Vie de Boileau* (1712); Daunou, *Éloge de Boileau* (1787); L. S. Auger, *Éloge de Boileau-Despréaux* (1805); E. Deschanel, *Boileau et Charles Perrault* (1888). A. Ch. Gidel, *Œuvres complètes de Boileau* (with *Life*), 4 vols., Paris, 1870-73.

Revised by A. R. MARSH.

Boiler: See STEAM-BOILER.

Boiling-point: the temperature at which the elastic force of the vapor of any liquid is equal to the pressure of the atmosphere. When a vessel containing water is heated, the temperature rises and vapor silently passes off from the surface; but at 212° F. or 100° C. (the barometric column standing at 30 inches at the sea-level) steam begins to be formed in bubbles at the bottom, and rising through the liquid throws it into commotion. If the steam is allowed freely to escape, the temperature of the water rises no higher. The water is then said to *boil*, and the temperature at which it remains is its *boiling-point*. Every liquid has a boiling-point of its own.

TABLE OF BOILING-POINTS AT 76 CENTIMETERS PRESSURE.

Sulphur	+448.5	"

The boiling-point of liquids depends upon the pressure to which they are subjected. When the barometer stands at 30 inches, showing an atmospheric pressure of 15 lb. on the sq. inch, the boiling-point of water is 212° F. (100° C.). When part of the pressure is removed it boils before coming to 212°, and when the pressure is increased the boiling-point rises. Thus in elevated positions, where there is less air above the liquid to press on it, the boiling-point is lower than at the level of the sea. An elevation of 510 feet makes a diminution of 1° F.; at higher levels the difference of

elevation corresponding to a degree of temperature in the boiling-point increases, and a method is thus furnished of measuring the heights of mountains. At the city of Mexico, 7,471 feet above the sea, water boils at 198.1 F. (92.2 C.); at Quito, 9,541 feet, at 194 F. (90 C.); in the Himalayas, at the height of 18,000 feet, at 180 F. (82.2 C.). Boiling water is thus not always equally hot, and in elevated places many substances can not be cooked by boiling. Under the receiver of an air-pump water boils at lower and lower temperatures as the pressure diminishes, until at last, if proper precautions are taken to dispose of the vapor as rapidly as it appears, the liquid may be converted into ice by the cold due to its own evaporation. It will freeze while still in a state of violent ebullition.

This effect of diminished pressure is largely turned to account in sugar-boiling, in preparing extracts, in distilling vegetable oils, and in other processes where the substances are apt to be injured by high temperature. By increasing the pressure, on the other hand, water may be heated to any degree without boiling. Papin's digester is formed on this principle. Under a pressure of two atmospheres the boiling-point rises to 120° C. (248 F.), at three atmospheres to 180° C. (356 F.). See the articles HEAT, STEAM, and LIQUIDS; also Balfour Stewart's *Elementary Treatise on Heat*; Tait, *On Heat*; and Maxwell's *Theory of Heat*.

Revised by E. L. NICHOLS.

Bois d'Arc, popularly pronounced *bō dock*; Fr. pron. *bwaā daark* (Fr., bow-wood); the Osage orange-tree (*Mucuna aurantiaca* or *Toxylon pomiferum*, family *Artocarpacea*). It is often used for a hedge-plant. As a tree its timber is tough, elastic, and extremely useful. It is a near relative of the fastic-tree, and its wood yields a yellow dye. It was used by the Indians for making bows and arrows. For its use in hedge-fences, see OSAGE ORANGE.

Bois de Boulogne, *bwaā de-boō-lōn'*: a grove or public park in the environs of Paris; on the right bank of the Seine, about 3 miles W. of the city. It is nearly 3 miles long and 1 mile wide. It was the finest promenade in the vicinity of Paris, but many of the trees were cut down and burned when that city was besieged by the Germans in 1870. It is during the afternoon the rendezvous of the elegant society of Paris, and in the height of the season presents a sight of unequalled splendor.

Bois-Duval, *bwaā dū-vaāl*, JEAN ALPHONSE; b. at Ticheville, department of Orne, France, June 17, 1801; studied medicine and natural history at Rouen and Paris, and did excellent service as a physician during the first invasion of cholera in 1835. He wrote several valuable works on botany and entomology; *Flora française* (1828, 3 vols.), in which the plants are arranged according to natural families; *Histoire des lépidoptères et des chenilles de l'Amérique septentrionale* (1829-47); *Les chenilles d'Europe* (1832, et seq., 2 vols.); *Histoire de lépidoptères de la Californie* (1852), written in conjunction with M. A. Guenée; *Essai sur l'entomologie horticole* (1856); *Histoire naturelle des insectes* (1874). D. in Ticheville, Dec. 30, 1879.

Boise, JAMES ROBINSON, Ph.D., LL.D.; b. in Blandford, Hampden co., Mass., Jan. 27, 1815; graduated at Brown University in 1840; tutor of Latin and Greek in that college from 1840 to 1843, and Professor of Greek till 1850. From 1852 till 1868 he was Professor of Greek in the University of Michigan. Thereafter he filled the same position in the University of Chicago. D. in Chicago, Feb. 9, 1895. Prof. Boise published several classical text-books, among which are editions, with English notes, of Xenophon's *Anabasis* and the first six books of Homer's *Iliad*.

Boise, OTIS B.; musician; b. in Cleveland, O., in 1844; and very early showed great inclination toward music. Sent abroad by his father, he entered the Conservatory at Leipzig, remaining there three years, studying under Wenzel, Richter, and Hauptmann, and then went to Berlin, where he studied the piano under Kullak. After his return to the U. S. he busied his leisure hours in composing, and he completed *In Memoriam*, a motet on the *Thirteenth Psalm*, a large work for organ and orchestra, played in Trinity church, New York; a *Concertstück*, for piano and orchestra, performed by Hamerik's orchestra in Baltimore; a piano concerto in G minor; a festival overture, and a trio for violin, piano, and violoncello, etc. He has given up the musical profession and gone into business. D. E. HERVEY.

Boisé City: capital of Idaho and of Ada co. (for location of county, see map of Idaho, ref. 9-A); in the southern

portion of the State; on Union Pac. R. R. and on Boisé river, 50 miles above its confluence with the Snake, in the Great Snake river valley; lat. 43° 34' N., lon. about 116° W. It is surrounded by a fine agricultural and grazing country, and derives large support from the rich placer and quartz mines in the mountain districts within 50 miles N., S., and E. The principal business houses are fire-proof brick. The city has a U. S. assay-office, a penitentiary, high school, and various mechanical industries. Two large ditches, bringing the water from Boisé river, give an abundance of water-power, and side ditches for irrigating purposes carry the water to every lot in the city. Pop. (1880) 1,899; (1890) 2,311; (1891) estimated with suburbs, 5,300.

EDITOR OF "STATES-MAN."

Boisé River: See BIG WOOD RIVER.

Boisgobey, *bwaā go-bay'*, FORTUNÉ, du; French novelist; b. in Normandy, 1824; army paymaster in Algeria; began to write in 1868. Author of *L'Homme sans Nom* (1872); *L'As de Cœur* (1875); *Le Crime de l'Opéra* (1880); *Le Secret de Berthe* (1884).

Bois-le-duc, *bwaā le-dük* (in Dutch 'S Hertogenbosch, i. e. duke's wood); town of Holland; capital of North Brabant; at the junction of the rivers Aa and Dommel; 30 miles S. S. E. of Utrecht (see map of Holland and Belgium, ref. 7-F). It is a clean and well-built town, intersected by several canals and defended by a citadel and two forts. It has a fine cathedral, a college, an academy of art, an arsenal, and a grammar school in which the celebrated Erasmus studied. Here are manufactures of cutlery, ribbons, woolen goods, linen thread, etc. It was founded in 1184 by the Duke of Brabant in a wood while hunting; hence its name. Pop. (1891) 27,302.

Boisserée, *bwaā se-ray'*, SELPIZ; architect and antiquary of French extraction; b. at Cologne, Aug. 2, 1783. He devoted himself to the collection of specimens of early German art, in which he was aided by his brother Melchior (1786-1851). They collected about 200 pictures, which were purchased by the King of Bavaria, and are called the "Boisseréan Collection." He published *Monuments of Architecture on the Lower Rhine from the Seventh to the Thirteenth Century* (1830-33), and *Views, Plans, and Details of the Cathedral of Cologne, etc.* (1823). D. in Bonn, May 2, 1841.

Boissier, *bwaā si-ay'*, MARIE LOUIS GASTON; French scholar; b. in Nîmes, Aug. 15, 1823; Professor of Latin Oratory in Collège de France 1861; elected a member of the French Academy June 8, 1876. Author of *Une étude sur Terentius Varro; Cicéron et ses Amis; La Religion Romaine d'Auguste aux Antonins*; and many papers in the *Revue des Deux Mondes* and the *Revue de l'Instruction Publique*.

Boissonade, *bwaā sō-nāād'*, JEAN FRANÇOIS; classical scholar; b. in Paris, Aug. 12, 1774. He became Professor of Greek in the University of Paris in 1812; admitted into the Academy of Inscriptions in 1813; became Professor of Greek in the Collège de France in 1828, which position he held until a few days before his death. He edited several Greek prose authors, and published *Sylloge Poetarum Græcorum* (24 vols., 1823-26). He acquired a high reputation as a Hellenist, and gave a powerful impulse to the study of classical literature. D. Sept. 8, 1857.

Boissy d'Anglas, *bwaā see' daān' glān'*, FRANÇOIS ANTOINE, Count de; a French statesman; b. in Saint-Jean Chambre, Ardèche, Dec. 8, 1756. He became a moderate member of the States-General in 1789; of the Convention in 1792. He was a member of the Committee of Public Safety in 1794; chosen president of the Tribunal in 1802; created a senator and count by Napoleon in 1805, and a peer of France by Louis XVIII. He wrote several political essays and a *Life of Malesherbes* (1819). D. in Paris, Oct. 20, 1826.

Boito, *bō-ee'tō*, ARRIGO; poet and composer; b. in Padua, Italy, Feb. 24, 1842; early acquired a taste for poetry, music, and art; studied at the Milan Conservatory, and during this time composed several numbers of his opera *Mefistofele*, of which he wrote his own libretto. During the years which followed up to 1867 he busied himself with literature, and wrote poems and novels. In the Garibaldian insurrection Boito took part, and after it was over went to Paris to become a French journalist. In the meantime, however, he continued to work leisurely on his *Mefistofele*. The manager of La Scala, Milan, hearing of this, induced him to complete it, and announced it for production in the season of 1867-68, and the first performance took place

on Mar. 5, 1868. Although the performance lasted nearly six hours, the work was a success, though it aroused such a furious opposition that it was withdrawn. He revised and largely rewrote it, and the new version was produced on Oct. 4, 1875. He wrote the librettos of *Ero e Leandro* and *Nerone*, and composed the music, but not being satisfied with them gave the former to Bottesini, who composed and produced it, and locked the latter up in his desk. He has also composed and written another opera, *Orestide*, which likewise he retains unproduced. He has written numerous librettos for other composers, including *Amleto* (Faccio), *Gioconda* (Ponchielli), *Alessandro Farnese* (Palumbo), *Tram* (Dominiceto), *Otello* and *Falstaff* (Verdi), besides translating several of Wagner's opera-texts into Italian. His poems, found in *Il Libro dei Versi*, are very highly praised. Since 1867 he has lived in Milan, and is one of Verdi's most cherished friends. He is a great admirer of Bach, Beethoven and Wagner. He married Erminia Borghi-Mamo, who sang in the 1875 production of *Mefistofele*.

D. E. HERVEY.

Boivin, bwa'vā'vā', MARIE ANNE VICTOIRE GILLAIN, M. D.: French midwife; b. Apr. 9, 1773; educated in a nunnery, and afterward studied the elements of medicine. She married in 1797, but was soon left a widow with one child. To gain a living she worked in the Maternité Hospital, in Paris, of which she became superintendent in 1801. The King of Prussia gave her the civil order of merit, and the University of Marburg the degree of M. D. She wrote valuable professional works. D. May 16, 1841.

Bojador, Cape: See CAPE BOJADOR.

Bo'ker, GEORGE HENRY: poet; b. in Philadelphia, Oct. 6, 1823; graduated at Princeton, N. J., in 1842. He published *The Lesson of Life and other Poems* (1847); *Cataynos*, a tragedy (1848), which was performed with great success in England; *Plays and Poems* (1856); *Poems of the War* (1864); *Königsmark* (1869); *Book of the Dead* (1882); and *Sonnets* (1886). He was minister to Turkey 1871-75, and to Russia 1875-79. D. in Philadelphia, Jan. 2, 1890.

Bokha'ra (Lat. *Bucharia*: anc. *Sogdiana* and *Transoxiana*): also called *Uzbekistan*; a Russian vassal state of Central Asia; N. of the upper Oxus river; between Russian Turkestan and Afghanistan, between the meridians 62° and 72° E. and parallels 37° and 41° N. Area, estimated at 92,254 sq. miles. The high mountain-range of Hindu Kush extends along the southern border of Bokhara, the east part of which is occupied by offsets from the Bolor Tagh, but the greater part of the country is level. This level tract resembles the dry steppes and sandy wastes of the basin of the Caspian. The largest rivers of Bokhara are the Amu (Oxus), the Jihun, and the Samarcand river, or Kohik. Along the banks of these rivers there is arable and fertile land, which is about one-tenth of the whole country. The climate is moderate. Gold is found in the sands of the Oxus, but Bokhara is deficient in metals and timber. Among the products of the soil are cotton, rice, wheat, barley, silk, tobacco, and abundant fruits. The inhabitants raise great numbers of camels, sheep, goats, and horses. They manufacture silk stuffs, firearms, cutlery, shagreen, gold and silver ornaments, sabers, etc. This country derives commercial advantage and importance from its position between Russia and the south of Asia. The population is composed of a mixture of races, who mostly profess the Mohammedan religion. Bokhara partly corresponds to the ancient *Bactria*. It was conquered by Jengis Khan in 1219. The Uzbeks became masters of it in 1505. In 1864 the Russians moved up the Syr-Darya, captured several important cities, together with the northern half of Bokhara, and formed the government of Turkestan. Between 1866-68 the Russians conquered the cities of Samarcand and Katty Kurgan, with the territory belonging to them. Since then Bokhara has become more and more dependent upon Russia. In 1870 Russia conquered Badakshan and gave it to Bokhara, and in 1873, owing to the victory of the Russians over Khiva, the Amu was made the boundary between Khiva and Bokhara. The Transcaspian railway to Samarcand now runs through Bokhara. Trade is rapidly passing into Russian hands. The Amir Sayid Abdul Ahad, b. in 1860 and educated in Russia, succeeded his father in 1885. He gave 100,000 roubles for the relief of the distress by famine in S. E. Russia in 1892. The capital is the city of Bokhara. The other chief towns are Karshi (pop. 25,000), Hissar (10,000). Total pop. estimated at 2,500,000.

REFERENCES.—Burnes, *Travels in Bokhara* (1839); Van-

béry, *History of Bokhara* (1873); Curzon, *Russia in Central Asia* (1889).

Revised by M. W. HARRINGTON.

Bokhara (i. e. treasury of sciences): a city of Central Asia; capital of Bokhara; situated on a plain near the river Sogd or Zerafshan; 138 miles W. S. W. of Samarcand (see map of Asia, ref. 4-D). The streets are very narrow and ill paved, the houses are small, have flat roofs, and are built of sun-dried bricks. Bokhara is probably the most important commercial town of Central Asia, and has numerous extensive bazaars, in which nearly all kinds of goods can be procured. Among the articles exported from it are silks, cotton, wool, coarse chintzes, lapis-lazuli, and dried fruits. This city is said to have 360 mosques, some of which are beautiful structures. It has long been famous as a seat of Mohammedan learning, and is said to contain over 100 colleges, with about 10,000 students. Among the principal edifices is the palace of the khan, which is inclosed by a wall about 65 feet high. Bokhara was ruined by Jengis Khan in 1220, and was rebuilt at the end of his reign. It was pillaged again by his successors in 1273 and 1276. The railway station for the Transcaspian road is at New Bokhara, about 10 miles from the old city. Pop. 70,000 to 100,000.

Bokhara Languages: See IRANIAN LANGUAGES.

Bo'lan (bō'-laan') **Pass**: a pass in the mountains of Baluchistan; is 50 miles long, and is on the route from Sind to Kandahar and Kelat. The highest part of the pass is 5,793 feet above the level of the sea. The average ascent is 90 feet in a mile. The Bolan river rises here. In 1839 a small British army with heavy artillery marched through this pass from Sind to Afghanistan.

Bo'las [Span., plur. of *bola*, ball]: a Spanish-American name for a missile used by the Indians of the South American plains, and borrowed from them by the gauchos. It consists of a pair of balls (formerly made of clay by the Indians, but now often of iron) fastened together by a thong of hide. The bolas are hurled with great precision at the ox, horse, guanaco, or ostrich, and, entangling the legs of the animal, detain it till it can be captured or killed. Sixty feet or more is a moderate range for the bolas, which are thrown from the saddle.

Bolbec': a town of France; department of Seine-Inférieure; on a small river of its own name; 20 miles by rail E. N. E. of Havre; on the railway which connects Paris with the latter place (see map of France, ref. 2-D). It is well built, and is adorned with fountains. Here are manufactures of cotton, linen, and woolen fabrics, and chemicals, and three annual fairs doing considerable business. Pop. (1891) 12,028.

Boldini, bōl-dee'nē, GIOVANNI: contemporary painter of genre and of portraits, who, though born at Ferrara, Italy, has long resided in Paris, and is identified with the French school. He is an artist of the rarest talent, and one of the most wonderful technicians in modern art. His pictures are generally of small size and of minute finish, but possess a breadth of handling that gives them extraordinary value in the eyes of artists and connoisseurs. His portraits are treated much more synthetically than his small pictures, and some of them, notably those painted in pastel, are remarkable for their elegance of aspect and beauty of style. His pictures are well known in the U. S., and two exquisite examples of his work, *Ladies of the First Empire* and *The Parisians*, are in the collection of Mrs. W. H. Vanderbilt, New York. He was awarded a medal of honor at the Paris Exposition, 1889. Studio in Paris. WILLIAM A. COFFIN.

Bole [from Lat. *bolus*, from Gr. βῶλος, clod]: a hydrous silicate of aluminium, classified by Dana as one of the varieties of halloysite (so called in honor of the Belgian geologist J. B. J. d'Omalius d'Halloy, 1783-1875). Dana's classification was made with some reserve, however, for he states that more investigation is needed before it can be definitely determined that bole is not a mere mixture. It is a soft, colored, unctuous, compact, claylike substance, occurring in amorphous masses, has a conchoidal fracture and a greasy luster, is highly absorbent, and carries more or less oxide of iron and about 24 per cent. of water. The iron gives it a brownish, yellowish, or reddish color. It is found in Armenia, Italy, Java, France, Scotland, Ireland, and Germany. Savage tribes in South America eat bole when starving. It was at one time used in medicine, and the Armenian bole has been employed in veterinary practice. Under the names of English red and Berlin red it is used in Germany as a pigment. French bole and

Lemnian bole are of a pale red color; Bohemian bole is reddish yellow; Silesian bole, pale yellow; and Blois bole is yellow.

Bolero, *bō-lay' rō*: a Spanish national dance; generally in the time of a minuet, and with a peculiar rhythm. It is accompanied with the music of the guitar and castanet, and with songs. The dancer seeks to represent by pantomime the successive symptoms and emotions of amorous affection, with its various moods of jealousy, despair, triumph, etc. Adopted by the ballet-masters, it made its tour all over the world.

Bole'tus [Lat., from Gr. *βωλίτης*]: a genus of fungi of the order *Hymenomyces* and family *Polyporaceæ*. It comprises several species, which resemble the mushroom (*Agaricus*) in form, but instead of having gills the under side of the cap (*pileus*) is occupied by a layer (*hymenium*) quite distinct from the body of the pileus in substance, and pierced by pores, so as to be composed of numerous small tubes united together. *Boletus edulis* is used as food in France and Germany, where it grows on the ground in woods and mossy places. In moist, warm summers it is very abundant, and sometimes very large (a foot in diameter). The part which is eaten is the flesh of the cap, which is firm, white, and delicate. Several other species are edible.

Boleyn, *bōl'en*, or **Bul'ten**, ANNE: Queen of England; b. in 1507; daughter of Sir Thomas Bullen, afterward Earl of Wiltshire. Her mother was a daughter of the Duke of Norfolk. She was educated at the French court, and became about 1525 one of the maids of honor to the English queen, Catherine. Henry VIII., attracted by her beauty, applied to the pope to obtain a divorce from Catherine, and married Anne privately early in 1533. She became the mother of the Princess Elizabeth in September of that year. She showed favor to the cause of the Reformation. Having been supplanted in the favor of the king, she was accused of criminal intercourse with several men, was condemned by a jury of peers, and beheaded in the Tower of London May 19, 1536. Some writers think that her crime was not proven. See Froude, *History of England*, vol. ii.; Miss Benger, *Memoirs of Anne Boleyn*; Miss Strickland, *Queens of England*.

Bolgrad, *bōl-graad'*: a town of Russia; on Lake Yal-pukh; 30 miles N. of Ismail, and near the frontier between Russia and Roumania (see map of Russia, ref. 10-B). In 1856 it was ceded by Russia to Turkey, but in 1878 it was ceded to Russia. It is a station on the railway from Galatz to Koshinef, and has excellent professional schools. Pop. 9,000.

Boli, *bō-lō'*: a town in Asiatic Turkey; in Kastamuni; 85 miles N. W. of Angora (see map of Turkey, ref. 4-F); inhabited by Turks and Armenians. The manufactures are gold ornaments and leather. Pop. about 10,000.

Bolingbroke, *bol'ing-brōök*, HENRY ST. JOHN, Viscount; author and statesman; b. at Battersea, England, Oct. 1, 1678. He was educated at Eton and Oxford, and was extremely dissipated in his youth. Having entered Parliament in 1701, he soon became a prominent orator of the Tory party, and was appointed Secretary of War in 1704. He lost this office when the Whigs obtained power in 1708, but he continued to be a favorite counselor of Queen Anne, who dismissed the Whigs in 1710, and placed Harley at the head of a ministry in which St. John was Secretary for Foreign Affairs. He received in 1712 the title of Viscount Bolingbroke, and in 1713 concluded the treaty of Utrecht, which ended a long war between England and France. He quarreled with Harley (Earl of Oxford), and supplanted him as prime minister in July, 1714. His ambitious hopes were blasted by the death of Queen Anne (Aug., 1714), which also frustrated his designs and schemes to restore the Stuart dynasty. He was attainted in 1715, but he had escaped to France, and entered the service of the Pretender as his prime minister. In 1721 he was permitted to return to England, but not to enter Parliament. He wrote for the *Craftsman* many articles against Walpole, and published, besides other works, a *Dissertation on Parties* (1739) and *Remarks on the History of England* (1743). D. at Battersea, Dec. 12, 1751. He was brilliant and versatile, but not profound. His collected works, which have little merit except style, were published by David Mallet in five volumes (London, 1754). See Goldsmith, *Life of Lord Bolingbroke*; G. W. Cooke, *Memoirs of Lord Bolingbroke* (London, 1835); J. C. Collins, *Bolingbroke, an Historical Study* (1886).

Bolinfineanu, DIMITRIE: poet and journalist; b. at Bolintina, Wallachia, in 1826; educated at Bucharest; studied in Paris; edited in 1848 a revolutionary paper, and was banished by Prince Stirbey; settled once more in Paris, but returned home under Prince Cuza; edited another journal, and received a high governmental position after the *coup d'état*, May 2, 1864. A French translation by himself of some of his poems was published under the title *Brisés d'Orient* (Paris, 1866). D. in Bucharest, Sept. 1, 1872. An edition of a part of his works (*Poesii*) appeared in 1877 in two volumes at Bucharest, with a preface by G. Sion.

Revised by E. S. SNELDON.

Bolivar: city; capital of Polk co., Mo. (for location of county, see map of Missouri, ref. 6-F); 110 miles S. W. of Jefferson City. It has a fine high-school building, a woolen-mill, cotton-gin, flouring-mill, and other manufactories. Pop. (1880) 516; (1890) 1,485.

Bolivar, *bol-i-vaar'*: capital of Hardeman co., Tenn. (for location of county, see map of Tennessee, ref. 7-B); 1 mile S. of Hatchie river; 28 miles S. of Jackson, and 68 miles E. of Memphis; in an excellent cotton region, with fine water-power and plenty of timber. It has a foundry, steam saw and grist mill, four academies, and the West Tennessee Hospital of the Insane. Pop. (1880) 1,043; (1890) 1,100.

EDITORS OF "BULLETIN."

Bolivar, *bō-lee'var*: a colony of Venezuela; near to and E. of Caracas; in the state of Guzman Blanco. In 1881 it obtained independent political rights. Area, 8 sq. miles. Pop. (1890) 855.

Bolivar: a state of Venezuela, the northern boundary of which is formed by the rivers Orinoco and Apure from the Caroni river (lon. about 63° W.) to lon. 70° W. The eastern boundary is the river Caroni; on the S. are Brazilian Guiana and Alto Orinoco; on the W. the latter, with Colombia and Armisticio. The name has been applied to several different territories in Venezuela, but the present outlines were established in 1884. Area, 88,701 sq. miles. Pop. (1890) 60,097. M. W. H.

Bolivar, or **Ciudad** (*thē-oo-daad'*) **Bolivar** (formerly *Angostura*): a town of Venezuela; largest in the state of Bolivar; on the right bank of the Orinoco; 240 miles from its mouth (see map of South America, ref. 1-D). It is situated near a pass or narrows of the river, hence the last name. It can be reached by vessels of 300 tons, and considerable trade is carried on here, chiefly in cocoa, sugar, cotton, jerked meat, hides, and a medicinal bark called angostura. Pop. 11,686. M. W. H.

Bolivar: a central-plateau province of Ecuador; perhaps the smallest of the sixteen provinces of the republic. Pop. 43,000.

Bolivar: one of nine departments of the South American republic of Colombia; bounded N. by the Caribbean Sea, E. by Magdalena and Santander, S. by Antioquia, and on the W. by Cauca. Area, 21,315 sq. miles. Besides the Magdalena, which flows along its entire west boundary, the only river of importance is the Cauca. The principal towns are Cartagena, the capital, and Mompos. Pop. 280,000.

Bolivar (Sp. pron. *bō-lee'var*), SIMON, or **Bolivar y Ponte**, *bō-lee-var-ē-pōn'tāy*: surnamed THE LIBERATOR; a South American patriot; b. at Caracas, July 25, 1783; inherited an ample fortune. He studied law at Madrid, and afterward joined the patriots who revolted against Spain in 1810. He served as an officer under Miranda in several battles. Having obtained the command of a separate army, he defeated the Spaniards and entered Caracas in triumph in Aug., 1813, soon after which he was appointed dictator. He was defeated and driven out of Venezuela in 1814, but again rallied to the standard of liberty near the end of 1816, and gained several victories over the Spanish general Morillo in 1817. In Feb., 1819, a congress was opened at Angostura, and Bolivar was chosen president. In Dec., 1819, Venezuela and New Granada were united to form the republic of Colombia, of which Bolivar was elected the first president. He gained a victory at Carabobo in June, 1821, and in 1822 led an army into Peru, which he liberated from the Spaniards. He became dictator of Peru in 1823, and made a tour through that country, in which he was received with triumphal demonstrations. In honor of him the southern part of Peru was named Bolivia, and erected in 1825 into a separate state, of which he became president for life. He was also re-elected president of Colombia in 1826. In 1829 Venezuela seceded from the republic of Co-

lombia, which was much disturbed by faction. D. in San Pedro, near Santa Martha, Dec. 17, 1830. See Ducoudray-Holstein, *Mémoires de S. Bolivar* (1829).

Bolivar Point is at the north side of the entrance to Galveston Bay, Tex.; in Chambers co.; lat. 29° 22' 02" N., lon. 94° 45' 34" W. It has an iron lighthouse 110 feet high, with a white fixed light 117 feet above the sea.

Bolivia (Sp. pron. bō-lee'vée-a): a central country of South America, between Brazil and Argentina on the N., E., and S., and Chili and Peru on the W.; extending from about lat. 8° to 23° 15' S., and from lon. 57° 20' to about 73° W. Area about 567,240 sq. miles. The Atacama region of the Pacific coast was ceded to Chili after the war of 1879. Pop. 2,019,549, besides wild Indians.

Topography.—Primarily, Bolivia is divided into the high or Andean region, occupying the southwestern half, and the lowlands of the east and north, which lie in the great depressions of the Paraguay and Madeira. The Andean portion, taken as a whole, is the highest region of its size in America, averaging 13,000 feet or more. It may be described as a table-land capped by mountain-chains, of which the principal are the Andes and the Eastern Cordillera, each with an average elevation of about 15,000 feet, and with peaks rising above 20,000 feet. The Andes skirt the western frontier; the Eastern Cordillera (called *Cordillera Real* toward the north) is roughly parallel to the Andes, and about 125 miles farther inland. The space between these ranges is occupied by two great elevated basins, separated by a cross range of mountains about lat. 19° 50' S. The northern basin is that of Lake Titicaca and the Desaguadero river, and extends a little way into Peru. (See *TITICACA*.) The southern basin, partly in Argentina, is a little-known region of arid lands, salt marshes, and isolated mountains, called the *Desertos de Lipés*. The average height of these basins is not less than 12,000 feet. The highest mountains of Bolivia are in the *Cordillera Real* (Eastern Cordillera). The Nevado de Sorata, or Illampu, in that range, is an imposing mass, formerly supposed to be the highest in America, but recent estimates make it under 22,000 feet. The twin peak of Illimani, near it, is almost as high. Eastward from the Eastern Cordillera a great number of branches or spurs spread over the highlands, inclosing valleys which are the finest parts of Bolivia. As the mountains subside eastward a kind of terrace is reached which drops abruptly to the lowlands. This terrace and the outlying Llanos de los Chiquitos in Eastern Bolivia resemble the Brazilian table-land, and probably were once a part of it. The eastern lowlands include a portion of the Gran Chaco (see *GRAN CHACO*), passing northward into plains which are partly covered with forest; some isolated low mountains are found here, and the region is hardly separated from the great Madeira depression of the north (see *PARAGUAY RIVER* and *MADEIRA*), a vast expanse of damp tropical forests and plains which are very imperfectly explored. The forests extend for some distance up the eastern mountain-slopes and valleys; but except on this border the highlands of Bolivia are without forest growth.

Climate.—The lowlands are hot, with heavy rains, especially from October to April; there is a marked dry season only in the Paraguayan basin. Above these there is every gradation to the snow-limit, which in Bolivia is at about 15,000 feet. Five zones of climate are commonly distinguished: *Yunga*, the plains and valleys to 5,000 feet; *Valle*, or *Medio Yunga*, 5,000 to 9,000 feet; *Cabezera de Valle*, high valleys from 9,000 to 11,000 feet; *Puna* and *Puna brava* above, the latter cold and sterile. Some parts of the great elevated basins southward are almost rainless.

Lakes and Rivers.—Titicaca, on the borders of Peru, is the largest lake in South America, and the highest large body of water in the world; it discharges southward by the deep and rapid Desaguadero river, 150 miles long; this flows into the Aullagas lake or swamp, where it is lost. (See *TITICACA*.) The great rivers are in the lowlands, the Pilcomayo flowing S. E. to the Paraguay, and the Mamore, Beni, and Madre de Dios northward to the Madeira; the headwaters of the Purús are in the northern forests of Bolivia, but the river has been explored only from the Amazon. The branches of the Madeira offer the most promising outlet for the future commerce of Bolivia.

Geology.—Very imperfectly known. Portions of the Eastern Cordillera and the Titicaca basin contain paleozoic rocks, and there are tertiary beds bordering the Gran Chaco. The Andes range is largely volcanic and several of the peaks

are active. Earthquakes are frequent in the mountain regions, but there have been few severe ones.

Minerals.—In minerals Bolivia is probably the richest country in South America, and heretofore they have formed the chief product. Silver is the most important metal, still constituting two-thirds of the value of exports. The former output of the Potosí and Porcos mines would seem fabulous were it not well attested (see *POTOSÍ*), but there is little doubt that it may be equaled or exceeded with proper management. There are rich mines of gold and copper; tin, lead, and mercury are extracted from some of the silver ores, and beds of coal and iron are known.

Plants.—The richest rubber region of the world is probably about the river plains of Northern Bolivia. The eichona trees of the mountain-slope forests are said to be nearly exhausted; but the other forest riches of Bolivia are untouched. Coea grows wild on the highlands, but is also cultivated and exported; wheat is exported, principally from Cochabamba, and coffee-raising is growing in importance in the *medio yunga* region. The soil of Bolivia is everywhere rich except in the *puna-brava* zone, and almost any temperate or tropical plant can be grown in some part. Among crops raised for home consumption are mandioca, plantains, tropical fruits, and maize in the lower lands, and potatoes, quinoa, and barley in the *puna* zone.

Animals.—The lowlands have the usual forest and prairie animals of the neotropical region (see *AMERICA, SOUTH*), including tapirs, jaguars, pumas, ant-eaters, armadillos, sloths, American monkeys, ostriches, and a great variety of birds, insects, etc. Among the animals peculiar to the highlands are bears, condors, and the wild llamas called *guanacs* and vicuñas. Tame llamas are raised as beasts of burden, and alpacas for their fleece. Sheep and cattle raising is growing in importance.

Inhabitants.—Nearly all the civilized population is in the highlands, and three-fourths are pure Aymará Indians, speaking their own language and retaining some of their customs; they are nominally Catholics and form the best portion of the laboring class, besides being excellent soldiers. Spanish is spoken in the towns. The largest city is La Paz (40,000 inhabitants). Other towns are Sucre or Chuquisaca, the capital (20,000), Cochabamba (20,000), Potosí (12,000), Santa Cruz (10,288), Oruro (10,000). The principal settlements of the lowland are mission villages of Indians, formed by the Jesuits, and now (1894) in a state of decadence. Large portions of these plains are unexplored, and peopled only by small tribes of wild Indians. The total number of these Indians probably does not exceed 150,000.

Government, etc.—The executive power is invested in a president, who is now elected for four years; Congress consists of a Senate and House of Representatives, chosen, like the president, by universal suffrage. There is a small standing army, and the national guard includes all able-bodied men. Primary education is free and obligatory, but there are few good schools; four universities are well patronized. The recognized religion is Roman Catholic, but other sects are tolerated. The public debt is about \$5,000,000, and is said to be diminishing.

Railways, etc.—The great want of Bolivia has been good means of external communication, by which her magnificent resources can be made available. Attempts to use the natural highways of the northern rivers have failed through bad management or lack of capital, and trade is mainly through Chili and Peru to the Pacific. A railway from the Chilean port of Antofagasta is now (1893) completed to Oruro, 500 miles of the line being in Bolivia; it will be continued to La Paz, thus opening up the great elevated basins. Another railway runs from La Paz to Lake Titicaca, and many more are projected. Great improvements have been made in the common roads. The telegraph system is very incomplete, generally following the railways.

History.—Probably the oldest civilized empire in America existed in the Titicaca basin, but we know of it only by vague tradition and by the ruins at Tiahuanacu and other places. (See *INCAS ANTIQUITIES*.) It appears to have been broken up about the eighth century; the Collas or so-called Aymarás remained in the Bolivian highlands and retained some civilization. They were subdued in the fourteenth century by the Incas of Cuzco. (See *INCAS*.) After the Inca empire had been overturned by Francisco Pizarro, he sent his brother Hernando to annex this southern region (1538), and in 1559 it was formed into the *audiencia* of Charcas, or Upper Peru. It was governed by judges who

resided at Chuquisaca (the modern Sucre), and at first were subject to the Viceroy of Peru; but in 1776 Charcas was made a province of the new viceroyalty of Buenos Ayres. The rich silver mines gave this region a special importance with Spain; but here as elsewhere the colonists, and especially the Indians, had much cause for discontent. A revolt in 1809 was speedily crushed, and patriot invading armies from Buenos Ayres (1811-1815) and from Peru (1821) were repulsed by the Spaniards. Thus Charcas was the last region in South America to be freed from Spanish troops. This was effected after the great victory of Ayacucho in Peru; early in 1825 Bolivar sent Sucre into Charcas, and the remaining Spaniards were speedily subdued; Bolivar himself followed a little later, formed or approved a constitution, and the same year the old province of Charcas was declared an independent country, taking the name of Bolivia in honor of its founder. Sucre, the first president, was obliged to resign in Sept., 1828. His successor, Marshal Andres Santa Cruz, interfered in the affairs of Peru (1835), and in 1836 a federal republic was formed, consisting of three states, North Peru, South Peru, and Bolivia, each governed by a president and Congress, with Santa Cruz as supreme protector. Malcontents from Peru, aided by an invading army from Chili, overthrew Santa Cruz in 1839, and the confederation was dissolved. In 1841 Gamana, president of Peru, made war on Bolivia, but was defeated and killed at the battle of Yngavi (Nov. 20, 1841), and peace was made next year. After 1845 most of the presidents were military adventurers who held their places by force of revolutions; but there were exceptions, as Dr. Linares, elected in 1858, and Col. Adolfo Ballivian, whose election in 1873 promised to put a stop to the disorders, but who died shortly after. Chili declared war on Bolivia in 1879 to uphold her seizure of the nitrate regions of Atacama; Bolivia and her ally, Peru, were beaten in the war, and Atacama was given up, leaving Bolivia without a sea-coast. During this war the president of Bolivia, Gen. Hilarión Daza, was deposed by his own troops on account of cowardice, and was succeeded by Campero. Since the war Bolivia has been quiet, and the period of military revolutions seems to be past; but lack of external communications has retarded the natural development of the country.

(Paris, 1851); Mathews, *Up the Amazon and Madeira Rivers* (London, 1879); Wappaus, *Mittel und Sud Amerika* (1871); the works of Aramago, Cortes, and Von Tschudi; Markham, *The War between Peru and Chili* (London, 1883). There is a good map in Markham's *History of Peru* (Chicago, 1892), and reports by Minister Anderson on the Bolivian gold and silver mines may be found in *U. S. Consular Reports*, Feb. and Mar., 1892.

HERBERT H. SMITH.

Bolivian Literature: See SPANISH-AMERICAN LITERATURE.

Bolkhoff, bol-khoff: a town of Russia; government of Orel; on the Nugra; 30 miles N. of Orel (see map of Russia, ref. 8-D). It is built mostly of wood, and has about twenty churches; also manufactures of gloves, hoisery, hats, and leather. Hemp, hides, oils, and tallow are exported. Pop. (1883) 26,395.

Bollandists: certain Jesuits who compiled, and are compiling, a voluminous work called *Acta Sanctorum*, or *Lives of the Saints* (53 vols., 1643-1794). They derived their name from John Bollandus. (See BOLLANDUS.) After his death the work was continued by a number of men, among whom were Daniel Papebroek, Conrad Janning, P. van den Bosche, Suyskens, and Hubens. In 1837 a new Bollandist association was formed by the Jesuits in Belgium, who have continued the work of publication. The sixty-first volume, published in 1887, comes down to the saints of Nov. 3. The earlier volumes were reprinted in Paris 1863-83. See L. P. Guéhard, *Mémoire historique sur les Bollandistes* (Ghent, 1835).

Bollandus, or **Bol'land**, JOHN: a Flemish Jesuit; b. in Julemont, near Liège, Belgium, Aug. 13, 1596. In conjunction with Godfrey Henschen, he published in 1643-58 five vol-

umes of the *Acta Sanctorum*. D. in Antwerp, Sept. 12, 1665. See BOLLANDISTS.

Bol'ler, ALFRED PANCOAST, A. M., C. E.: civil engineer; b. in Philadelphia, Pa., Feb. 23, 1840; graduated at University of Pennsylvania in 1858, and from Reisselaer Polytechnic Institute, Troy, N. Y., in 1861. He has been engaged in many railroad and bridge constructions as chief and consulting engineer, among which are the Hudson River R. R.; West Side and Yonkers R. R.; Manhattan Elevated R. R.; the Arthur Kill bridge, Staten Island; the Thames River bridge at New London, Conn.; and the department of public works, New York city. He is the author of *Iron Highway Bridges* (1876) and *Report on Thames River Bridge* (1890). See BRIDGES.

Bologna, bō-lōn'ya: a province of Emilia, Italy; was previous to 1860 a legation, that is, was ruled by a cardinal. It is bounded N. by Ferrara, E. by Ravenna, S. by Florence, and W. by Módena; area, 1,392 sq. miles. The southern part is mountainous; the soil is mostly very fertile. Among the staple products are silk, wine, grain, olive oil, hemp, flax, and rice. Pop. (1890) 482,219. Capital, Bologna.

Bologna (anc. *Felsina* and *Bononia*): a famous city of Italy; capital of province of same name; situated in a fertile plain near the northern foot of the Apennines; 23 miles by rail S. E. of Modena and 83 miles by rail N. of Florence; lat. 44° 30' N., lon. 11° 21' E. (see map of Italy, ref. 4-1). Several railways extend from this point to Ferrara, Ancona, Modena, and Florence; that which connects it with Florence crosses the Apennines by numerous tunnels. Bologna is a handsome city with well-paved streets, lined with rich and varied colonnades, which afford shelter from the rain and sun, and it is adorned with many beautiful churches and fine palaces of the nobility, richly furnished with paintings of the old masters. Among the remarkable edifices are the Palazzo del Podestà; the Palazzo Maggiore del Pubbico; the leaning tower of Asinelli, built about 1110, and 256 feet high; the cathedral, rich in works of art; the Church of San Stefano, one of the oldest in Italy, and containing Greek frescoes of the twelfth century; the Church of San Petronio, a noble specimen of the Italian Gothic style, adorned with many masterpieces of painters and sculptors; and the Church of San Domenico, in which may be seen sculptures by Michael Angelo and paintings by Guido, L. Caracci, and Colonna. The number of churches in Bologna is about seventy-four.

Bologna is one of the great centers of learning in Italy. Its university, said to have been founded as early as 425, is the oldest in the peninsula. This school attained great celebrity, and was attended by thousands of students from all parts of Europe. The number of its students about the year 1260 is said to have amounted to 10,000. Several women have occupied chairs as professors in this institution. The library of the university has about 160,000 volumes and 1,000 valuable MSS. Bologna has an academy of fine arts and several theaters. Here are important manufactures of silk goods, velvet, erape, chemicals, paper, musical instruments, and sausages. This city was the native place of many eminent painters, including Albano, the three Caracci, and Guido; also of Pope Benedict XIV., Galvani, and Malpighi. A town called *Felsina*, founded here by the Etruscans, was perhaps as ancient as the city of Rome. The Romans, who obtained possession of it in 189 B. C., changed its name to *Bononia*. It was taken by Charlemagne in 800 A. D., and was the capital of the most powerful Italian republic from 1118 to 1274. It was annexed to the Papal States in 1514, and to the new kingdom of Italy in 1859. Pop. 120,000 (147,000 in the commune in 1891).

Bologna, GIOVANNI: sculptor; b. in Douai, 1524. His real name was Jean Boulogne, afterward Italianized. The equestrian statue of *Cosimo I.*; the well-known group the *Rape of the Sabinas*, in the Loggia dei Lanzi; and the *Flying Mercury*, so called, in the Uffizi Museum, all in Florence, are among his more important works. D. in Florence in 1608.

Bologna Stone: a radiated, globular variety of barite or heavy spar, sulphate of baryta, found in a bed of clay in Mt. Paterno, near Bologna, Italy. In 1602 a shoemaker, V. Casciarolus, noticed that it possessed the property of becoming phosphorescent when heated with charcoal. It is also known as Bolognian or Bononian phosphorus.

Bolom'eter [from Gr. βολή, stroke, ray + μέτρον, measure]: an instrument for the measurement of radiant energy by means of the change in electrical resistance of a

metallic strip or wire. It is one of the most delicate instruments used in actinometry. The strip, which should be of very small mass, is exposed to the rays to be measured. It forms one arm of a Wheatstone's bridge, the balance of which is determined by a galvanometer of great sensitiveness. The metal employed is usually iron or platinum. By means of this instrument in the hands of its inventor, Prof. S. P. Langley, heat-measurements previously considered to be entirely below the range of direct experiment have been made. The most striking instances are the determination of the heat of the moon's direct and reflected rays and the exploration of the spectrum of the light of the Cuban fire-fly. Prof. Knut Angstrom, of Upsala, with a similar instrument has determined the radiant efficiency of such feeble sources of illumination as the electric glow in vacuum tubes, while Prof. B. W. Snow has explored the bright line spectra in various metals, and of the voltaic arc. See **WHEATSTONE'S BRIDGE**, **ELECTRIC DISCHARGE**, **GALVANOMETER**, and **HEAT**; also the *Proceedings American Academy of Arts and Sciences*, vol. xvi. (1881); *Professional Papers of the Signal Service*, No. 15 (Washington, 1883); *Transactions of Academy of Sciences of Upsala* (Sweden, 1892), or *Physical Review* (vol. i., 1893). E. L. NICHOLS.

Bolsena, bol-say'nā (anc. *Volsinii* or *Volsinium*): a town of Italy; on the north shore of Lake Bolsena; about 20 miles N. N. W. of Viterbo (see map of Italy, ref. 5-D). It is now a small and mean village, but in ancient times it was an important Etruscan city and the capital of the Volsci. It was taken and destroyed in 280 B. C. by the Romans, who built here another city. This was the native place of Senjanus. Pop. 3,000. The lake was celebrated in the Middle Ages for its eels. Pope Leo X. was accustomed to visit the island in this lake, on which ruins of beautiful castles, built by the Farnese, are still visible.

Bolt: a dart or pointed shaft, a thunderbolt; also a strong cylindrical pin of iron or other metal. Iron bolts are often used to fasten doors and protect dwelling-houses and warehouses against robbers. Metallic bolts, with a head at one end and a screw-thread and nut at the other, are extensively used in building ships and houses, in order to bind together timber or masonry. Bolts in ship-building are usually either iron or copper, and are of various forms and sizes, some being many feet long.

Bol'ton-le-Moors': an important manufacturing town of Lancashire, England; on the Croal; 11 miles by rail N. W. of Manchester (see map of England, ref. 7-G). Several railways extend from this place to Liverpool, Manchester, and Blackburn. Bolton returns two members to Parliament. It is one of the principal seats of the cotton manufacture, and is the birthplace of the inventors Arkwright and Crompton. The chief products of its manufactories are muslins, fine calicoes, counterpanes, dimities, cotton shawls, and fustians. Here are also paper-mills, foundries, and machine-shops. Numerous coal mines are worked in the parish of Bolton. The manufacture of cotton and wool was introduced into this place by the Flemings about 1337. Pop. (1881) 105,422; (1891) 115,002.

Bolus [Lat. *bolus*, from Gr. *βῶλος*, elod]: a dose of medicine given in a mass larger than a pill, yet small enough to be swallowed. The bolus is now seldom used.

Bolzano, bōl-zaa'nō, BERNHARD: b. in Prague, Oct. 5, 1781; d. there Dec. 18, 1848; studied theology and philosophy; took holy orders, and was in 1805 appointed professor in the university of his native city. Somewhat influenced by Hermes, he tried, like him, to represent the dogmas of the Roman Catholic Church as a complete and consistent system perfectly in harmony with human reason. He made a great impression on the students; but the curia suspected him, and, though protected by his archbishop, he was in 1820 deposed, and even suspended from his priestly functions. His principal work is *Wissenschaftslehre* (Salzbach, 1837), besides a number of minor essays on mathematical subjects.

Bo'ma: capital of the CONGO FREE STATE (*q. v.*); on the right bank of the Congo river; has considerable trade (see map of Africa, ref. 6-D).

Bomarsund, bō-mar-soond: a fortress of Russia; on the southeast side of the island of Åland, which forms one of the principal links in that chain of fortifications which guard St. Petersburg from the sea side, and may be called an outwork of Cronstadt; lat. 60° 12' 40" N., lon. 20° 15' E. This important fortress was taken by the allied English and

French fleets in Aug., 1854, and was afterward blown up by the allies.

Bomb, bom or būm, or **Bomb'shell** [viâ Fr. and Span. from Lat. *bombus*, Gr. *βόμβος*, a humming, buzzing]: a kind of shell; a hollow ball of cast iron which, filled with powder or other explosive substance, is discharged from a mortar or heavy ordnance, and explodes when it strikes the ground or before it falls. The powder in it is usually exploded by a fuse or hollow tube filled with a slow-burning compound, which is ignited by the discharge of the mortar. The largest bomb in ordinary use is 13 inches in diameter, weighs about 195 lb., and is charged with 7 or 8 lb. of powder. Bombs are thrown at angles varying from twenty to forty-five degrees. See **MORTAR**.

Bom'ba: a surname or nickname given to Ferdinand II., King of the Two Sicilies, in consequence of his cruel bombardment of Messina, Sept. 2-7, 1848.

Bom'bard: a name applied during the Middle Ages to a war-engine resembling the ballista. After the invention of gunpowder the name was applied to all kinds of firearms; but at the beginning of the fifteenth century it was restricted to short pieces of large caliber, firing stone projectiles.

Bombard'ment: the firing from mortars of *bombs* (that is, shells or incendiary projectiles) into a fortress or place to compel, or aid in compelling, its surrender. "Bombardments," says Bardin (*Dict. de l'Armée*), "are an impolitic and barbarous means, since it attacks non-combatants, and is rather a warfare against the inhabitants than against the armed defenders, exasperating the people and *nationalizing* the strife." Among recorded bombardments may be mentioned that of Genoa in 1684; of Tripoli in 1685, 1728, and 1747; Barcelona, 1691. Brussels was bombarded in 1694 by Louis XIV. ("3,000 bombs and three times as many red-hot shot" were thrown in); Prague was bombarded in 1759; Breda, Lille, Lyons, Maestricht, Mayence, in 1793; and Menin, Valenciennes, Le Quesnoy, Ostende, Nieuwpoort, and Lécule in 1794. Some resisted—as Lille and Mayence—others succumbed. That of Lille is most noted, this small place being subjected for 140 hours (six days and nights) to the fire of 12 mortars and 24 cannons. During the siege in 1832 of Antwerp 31,689 shells were thrown into the citadel without material effect in accelerating the surrender. Glogau, Breslau, and Schweidnitz were bombarded by the French in 1806 and 1807. During the long two years' blockade, 1809-10, of Cadiz, by the French under Marshal Victor it was found impossible to reach the city from the lines with shells from ordinary mortars; long bronze howitzers of 10 inches caliber were cast at Seville (one of which is now to be seen as a trophy (see Fig. 1) in St. James's Park near the Horse Guards, London), and called *à la Villanroys*, from the French colonel of artillery who had proposed them. These, elevated 45 degrees, threw their projectiles 5,000 meters (3 miles) into the heart of the city; but to attain this range it was found necessary to load the shells (already weighing 95 lb.) with lead, to the exclusion of most of the bursting-charge. In bursting they produced no effect, and it is stated that the inhabitants were "scarcely aware of the bombardment."

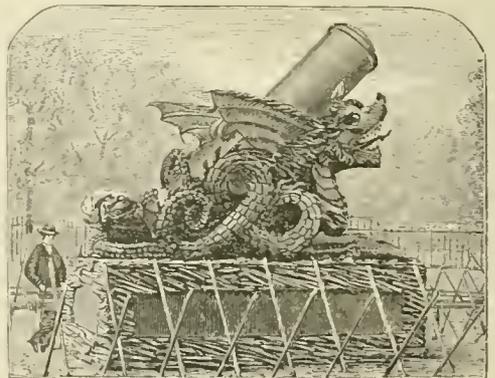

FIG. 1.

At the siege of Antwerp a mortar of 60 cm. (24 inches) caliber, weighing 7,000 kilogram, and throwing a shell of 500 kilogram (1,100 lb.), designed by Col. Paixhans, was used. It threw fifteen shells in the last two days of the siege. It

was thought that if one fell on a magazine it would destroy it; but the shells actually thrown caused no serious damage. (*Spectateur Mil.*, 1833.) It was fired with 8 kilog. of powder, but its full charge was 13 kilog. Fired subsequently with this charge it burst.

At the siege of Vera Cruz by Gen. Scott in Mar., 1847, three mortar batteries, each containing four (10-inch) mortars, and a battery of eight large (8-inch) howitzers were established bearing upon the quarter called "La Merced." On the 23d Gen. Scott summoned the place and a conference was had; it proving fruitless, the twelve mortars opened on that day and the howitzer battery the day following. The fire continued throughout the 25th, 26th, and 27th. The La Merced quarter soon became ruinous—200 persons are said to have been injured. The fears of an assault caused Gen. Morales to surrender on the 27th. A shot from the Fort St. Juan entered one of the mortar batteries on the 22d, killing by its "wind" (for though knocking off his cap, the skin was not broken) Capt. John R. Vinton, Third Artillery.* During the bombardment our fleet kept up a cannonade on the fort, which, though intact, surrendered a few hours after the city.

De Blois (*Capitaine d'Artillerie*) published in 1818 a *Traité des Bombardements* to maintain that this means has not, as asserted, fallen into disuse; that bombardments reduce places with much less loss of time, munitions, and blood than regular sieges; and, finally, to defend the system "against the unjust reprobation cast upon it in characterizing its employment as an act of barbarity."

The cases cited by him, nearly all of which have been referred to in this article, scarcely sustain his thesis; still very recent examples go to prove that it is an agent which will continue, under certain circumstances, to be resorted to. Grivel (*La Marine dans l'Attaque des Fortifications et le Bombardement des Villes*, Paris, 1856) maintains that in the use of curved fires, combined with direct ones, naval armaments will in future find the most effective method of attacking fortified places. By the term *curved fires* he includes fire by which projectiles from rifled guns (or even smoothbores) can, by elevating the piece, be sent, at long ranges, into the interior of a place. The increase of caliber of modern artillery, and more especially the introduction of the rifled principle, has made such fires as effective as that from mortars, and the term "bombardment" is now extended to such.

At Odessa this species of bombardment was first effectively employed in 1854. The results attained there suggested to the allies the advantages to be derived from this application of floating artillery, and the subsequent bombardment of Sweaborg was provided for, in 1855, by adding to the fleet twenty-one mortar vessels which were towed to within about 2 miles (3,400 meters) of the center of the Russian arsenal, while the gunboats of the squadron, keeping in constant motion, approached to distances of 2,000 or 3,000 meters. The fire was maintained forty-five hours, during which 4,150 projectiles (2,828 of which were mortar shells) were thrown into the place, killing and wounding 2,000 men and destroying magazines, supplies, and shipping.

At an early period of the civil war in the U. S. the project of capturing New Orleans was mooted. The reduction of Forts Jackson and St. Philip seemed a necessary preliminary. For this object a fleet of twenty mortar vessels, each bearing one of the new model 13-inch mortars, weighing 11,500 lb., was prepared, and, under command of Commander (afterward Admiral) David D. Porter, added to Admiral Farragut's fleet. These vessels were moored to the right bank of the river at distances of 3,000 to 4,000 yards from the forts, their positions being screened from view by the woods. The bombardment began on Apr. 18, 1862, continued six days and six nights, during which time 7,500 bombs were fired, of which 1,080 exploded in the air and 1,113 were afterward counted as having fallen upon the fort and solid ground of glacis and levees, and 3,339 were computed to have fallen in the wet ditches and overflowed lands surrounding the fort (for the levees being broken by the shells the site was overflowed). At the end of this bombardment Admiral Farragut forced the passage with his fleet, and, destroying the Confederate flotilla of ironclads and gunboats, the forts surrendered.

Fort Jackson has a portion of its guns in casemates of the curtains; the arches were of brick of very moderate

thickness, roofed with concrete, affording at the crown a thickness of 3 feet of masonry. These were covered by the earthen parapet and terreplein. In the flanks of the bastions were flanking casemates, the brick arches of which were not only destitute of earth covering but of the usual concrete covering. All the guns of Fort St. Philip were "en barbette." An engineer officer (Gen. Weitzel) examined the work immediately after its capture, and states:

"Fort St. Philip stands with one or two slight exceptions to-day without a scratch. Fort Jackson was subjected to a torrent of 13-inch and 11-inch shells during 144 hours. To an inexperienced eye it seems as if this work were badly cut up. It is as strong to-day as when the first shell was fired at it. The garrison did not bomb-proof the citadel" (i. e. had not placed earth over the heavy timber blindage spanning the walls for that purpose) "consequently the roof and furring caught fire. This fire, with subsequent shells, ruined the walls so much that I am tearing it down and removing the *débris* to the outside of the work. Three shot furnaces and three cisterns were destroyed. At several points the breast neight walls were knocked down. One angle of the magazine on the north side of the postern was knocked off. Several shells went through the flank casemate arches (which were not covered with earth), and a few through the other casemate arches (where two or more struck in the same place). At several points in the casemates the 13-inch shell would penetrate through the earth over the arches, be stopped by the latter, then explode and loosen a patch of brickwork in the soffit of the arch about 3 feet in diameter and three-quarters of a brick deep, at its greatest depth. . . . To resist an assault, and even regular approaches, it is as strong to-day as it ever was." Gen. Abbott subsequently examined Fort Jackson, and reports that in one case a curtain casemate arch was broken through where there was 3 feet of masonry and 6½ feet of earth (the earth being a very pervious river formation). It does not appear that otherwise the forts were much injured or that the efficiency of their fire upon the fleet was seriously impaired. Doubtless, however, the loss of *morale* in the garrison which induced the surrender was due not merely to the successful passage and the destruction of the floating defenses, but to the physical exhaustion arising from the six days' bombardment and subsequent furious artillery contest with our fleet; and the bombardment is not therefore to be reckoned as without influence in the final result. This conclusion has an important bearing; for the writer, in calling for the use of mortars, in a memoir prepared for the Navy Department, did not maintain that the passage could not be forced, but contended that "to pass these works with a fleet and appear before New Orleans is merely a raid—no capture. New Orleans and the river can not be held until communications are perfectly established."

Mortar vessels as well as improvised ironclads were at an early date provided for our fleet in the upper Mississippi. After the fall of Forts Henry and Donelson and the evacuation of Columbus, the agency of bombardment (in conjunction with the fire of the cannon of the fleet) was first brought to bear upon the fortified position of Island No. 10 in the Mississippi, a short distance below New Madrid (Missouri). The bombardment was kept up from Mar. 16 to Apr. 8 (1862), the mortar vessels at one time numbering sixteen. The works and troops being disseminated over an extensive area (the island being over a mile long and 1½ miles

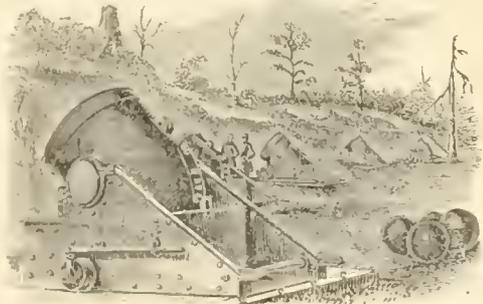

FIG. 2.

wide), neither the cannonade nor the bombs appear to have had much influence in causing the surrender. A similar remark is applicable to Fort Pillow, situated on the Mississippi, about 100 miles above Memphis.

* The facts are undoubtedly as stated. Whether death resulted from the "wind," from heart disease, or from other organic trouble, may be an open question. J. M.

40 feet high above the enrockment from which it rose. The embrasures of the second tier had never been finished, and before the siege began had been walled up with brick. The fort never received its full armament. The nearest land is the north end of Morris island, nearly due S, about 1,400 yards distant from the fort, and from this point the island—a narrow strip of sand—stretches across the coast in a southerly direction for a little more than 34 miles. When siege operations began the Confederates had possession of the whole of Morris island, and had erected a strong and heavily armed earthwork—Fort Wagner—1,300 yards from the north end of it, and 2,700 yards from Fort Sumter, with the object of holding at least the northern half of the island, in order to prevent the establishment of batteries thereon, within effective breaching distance of Fort Sumter. They also had defenses on the south end of the island to prevent its capture. The plan of attack agreed upon comprised:

1. The capture of the south end of Morris island by assault.
2. The siege and capture of Fort Wagner.
3. The demolition of Fort Sumter by batteries established on the north end of Morris island; and
4. The entrance of the monitors into the inner harbor, and their passage up to the city of Charleston.

This programme was carried out with the following results.

On July 10, 1863, the south end of Morris island and the several batteries erected for its defense were captured by a brigade of infantry, which approached in small boats and landed under fire.

Two open assaults of Fort Wagner—on July 11 and 18 respectively—demonstrated the impracticability of carrying the position by that method of attack.

The plan of operations was then changed so as to give the demolition of Fort Sumter precedence, in point of time, over the capture of Fort Wagner, in order not to delay unnecessarily the entrance of the fleet and the capture of Charleston, for although Fort Wagner, in the hands of the besieged, was intended to prevent the erection of effective batteries against Fort Sumter, it did not protect the channel of approach by Fort Sumter to the inner harbor, or any of the channel obstructions erroneously supposed to exist there.

First Bombardment of Fort Sumter.—The demolition of Fort Sumter over the heads of the garrison of Fort Wagner was then the next step in the modified plan.

The armament placed in position for this purpose, and their several distances from Fort Sumter, are shown in the following table:

1.	2 8-inch Parrott rifles.	3,516 yards distant.
2.	3 6 1/4-inch " "	3,117 " "
3.	2 6 1/4-inch " "	3,128 " "
4.	2 8-inch " "	3,398 " "
5.	12 80-pdr. Whitworth rifles	4,172 " "
6.	1 8-inch " "	4,372 " "
7.	2 6 1/4-inch " "	4,278 " "
8.	1 10-inch " "	4,290 " "

Firing from these batteries commenced on Aug. 17, 1863. Its first stage ended Aug. 23. The firing from the most advanced of these batteries, which were less than 900 yards distant from Fort Wagner, was seriously interfered with and at times partially suspended, by the galling fire from that work to which the cannoniers were almost constantly exposed. The combined fire of mortars and light pieces, aided by the gunboats and ironclads, failed to subdue it, and it was necessary occasionally to turn the breaching batteries upon it. The result of this seven days' bombardment is thus given in the official report of the chief of artillery of the siege.

The fire from the breaching batteries upon Sumter was incessant, and kept up continuously from daylight till dark, until the evening of the 23d. For five days all the guns were directed upon the gorge wall, and had resulted in bringing it down to such an extent that on the evening of the 21st a practicable breach had been accomplished. On the morning of the 22d the fire from Batteries Nos. 1, 2, and 3 was directed upon the southeasterly face or right flank of the work, with the view of dismounting the guns on the barbette of this face, which commanded the entrance to the harbor, as well as to destroy the guns on the northeasterly face, which thus fire would take in reverse. The fire upon the gorge had, by the morning of the 23d, suc-

ceeded in destroying every gun upon the parapet of it, and, as far as could be observed, had disabled or dismounted all the guns upon the parapet of the two faces looking toward the city, which it had taken in reverse. The parapet and ramparts of the gorge were, for nearly the entire length of the face, completely demolished, and in places everything was swept off down to the arches, the *débris* forming an accessible ramp to the top of the ruins.

There being nothing further to gain by a longer fire upon this face, all the guns were directed this day upon the southeasterly flank, and continued an incessant fire throughout the day. The demolition of the fort at the close of this day's firing was complete, so far as its offensive powers were considered. Every gun upon the parapet was either dismounted or seriously damaged; the terreplein for the entire circuit of the place must have been shattered and plowed up by our projectiles, hundreds of which had been seen to strike upon it. The parapet could be seen in many places, both on the sea and channel fronts, completely torn away down to the terreplein. The place, in fine, was a ruin, and effectually disabled for any immediate defense of the harbor of Charleston.

Having accomplished the end proposed, orders were accordingly issued on the evening of the 23d for the firing to cease, having been continuously sustained for seven days. There had been thrown 5,000 projectiles, of which about one-half had struck the fort. The weight of metal thrown during the seven days ending Aug. 23 was 289,986 lb., omitting that expended by the four rifles in the naval battery (No. 4), say 20,000 lb. The enemy remained in possession of the work, having constructed a system of subterranean galleries within the ruined casemates of the fort.

Second Bombardment of Fort Sumter.—Fort Wagner was captured on the morning of Sept. 7, thus giving the besiegers possession of the whole of Morris island. Heavy guns bearing upon Fort Sumter were at once established in Fort Wagner and on the north end of the island. Up to this time the gorge wall only had been breached. The southeast face, the only one seen from Morris island except the gorge, remained standing, although badly shattered in many places. Reports having been made by reconnoitering parties that the garrison were attempting to remount guns on this face, it was determined to cut down that face with the rifled guns established in Fort Wagner and on the north end of this island, so that the fire of the besiegers passing over the *débris* of the gorge and northeast face would take the casemates of the opposite or channel fronts in reverse, and prevent the mounting of guns there.

Fire was opened on the southeast face on Oct. 26. The armament used for this purpose comprised one 10-inch, two 8-inch, and nine 6 1/2-inch rifles, one 10-inch columbiad, and four 10-inch sea-coast mortars. The distances of these several guns from Fort Sumter varied from 2,500 to 1,300 yards.

In a few days the southeast face was more completely a ruin than the gorge wall. The *débris* formed a continuous and practicable ramp, reaching from the water to the summit of the breach. The two faces of the work seen from Morris island were both in ruins, many of the casemate arches of the channel fronts had fallen in from the reverse fire, and the entire armament of the work had been destroyed or removed to prevent destruction.

FIG. 5.—Fort Sumter, Nov. 1, 1863, after the second bombardment.

The Franco-Prussian war of 1870 furnished numerous examples of a resort to bombardment as an auxiliary to siege or blockade, of which the most conspicuous are the sieges of Strassburg and Paris. The former city, fully invested on Aug. 8, was attacked by regular siege approaches and sur-

rendered (Sept. 27) only after, its walls breached, it became exposed (according to Gen. Ulrich) to the "doubtful chances of sustaining an assault." But a bombardment from Krupp guns, howitzers, and mortars commenced Aug. 18, and threw shells into the streets of the city, to the serious injury of the venerable and magnificent cathedral.

Paris was invested soon after the surrender at Sedan; and it was doubtless believed that its surrender would follow. No attempt at regular siege was ever made, and it was not until late in December (probably owing to the difficulty of collecting siege artillery, the Strassburg and numerous minor sieges employing all available) that from the heights of Chatillon a cannonade was opened upon the southern forts. Early in the following January shells commenced to be thrown from the same point into the southern quarters of

1871) that from a military point of view the bombardment by itself was wholly inefficacious.

Nevertheless, though a city so extensive as Paris may endure a protracted bombardment, the destruction of life and property is something serious, and it must especially be so in *small* fortified towns: hence the increased range and accuracy of hollow projectiles have rendered the old system of closely surrounding a town with a continuous rampart or *enceinte* both useless and dangerous unless supplemented by a system of detached forts sufficiently in advance to keep an enemy's artillery beyond that distance, from which he might destroy the place by his shells. The fortifications of Paris are now supplemented by a second and much farther removed cordon of detached forts.

Small forts, by *themselves*, may, however, very safely defy

bombardment, if reasonably provided with casemates or bomb-proofs. Fort Jackson, subjected to vertical fire only, was materially intact after a six-days bombardment, though doubtless the surrender was in *some* degree due to it. Fort Pulaski surrendered because its walls were thrown down and its magazines exposed, by the agency of *direct* fire. Fort Sumter was reduced to a ruin by breaching fire directed against its exposed vertical walls, but it never surrendered; while the little sand work, Fort Wagner, defied both direct and curved fire for two months, and was finally evacuated. An attempt to destroy by shells the bomb-proof or timber blindage covered with sand which sheltered its garrison—the exposed end of which could be seen over the parapet—signally failed, the sand

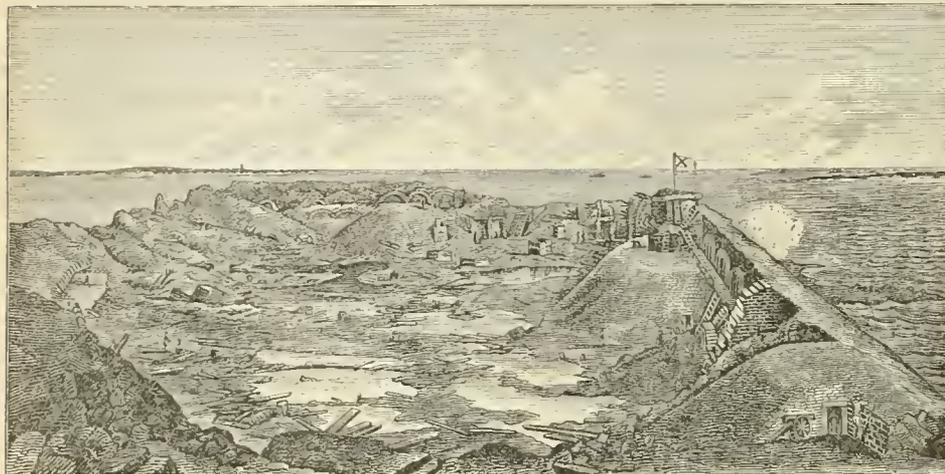

FIG. 6.—Fort Sumter, Dec. 9, 1863. Interior view from the southwest angle—from a drawing made by the Confederates. The original bears the autograph approval of the Confederate general commanding the Department of South Carolina, Georgia, and Florida, and may therefore be assumed to be correct. Morris island and the U. S. fleet are seen on the right, and Sullivan's island and Fort Moultrie on the left. The right of view shows the gorge face and the top of the adjoining face looking down the harbor. Both were breached by the Morris island batteries, although oblique to the line of fire. The *débris* formed an easy ascent from the water to the crest. The left and foreground show the other faces, in ruins from the reverse fire from Morris island. The interior slopes were subsequently made much steeper by the besieged than shown in the view, and were revetted with gabions. Bomb-proof quarters were also constructed under the ruins for the garrison. These quarters consisted of a continuous gallery all around in the ruins, protected on top and on the side next Morris island by thick embankments of earth. Throughout the autumn of 1863 the ruins contained no mounted guns. It was simply an infantry outpost. It repulsed a naval assault from small boats Sept. 8, 1863, and was held until Feb., 1865. On Apr. 14, 1865, the fourth anniversary of its capture by the Confederates, the U. S. flag was again raised over the ruins with imposing ceremonies.

Paris, and this was continued till the 27th. On Jan. 21 a violent cannonade and bombardment was opened upon the detached forts of St.-Denis and also upon the town, 120 shells falling there in one hour (23d), and many hitting the ancient cathedral. The population took refuge in Paris. At the time (1840-48) the defenses of Paris were constructed the extreme range of projectiles did not exceed $2\frac{1}{2}$ miles; and it was in relation to the artillery service of the day that the forts were located. Hence they did not perfectly protect Paris from bombardment, which, however, had no important effect. The distance from the Prussian batteries on the heights of Chatillon to the nearest fort (Vanvres) was about a mile—to the nearest part of the *enceinte*, $2\frac{1}{2}$ miles; to the populous regions of the southern quarters, 3 miles; to the Palace of Luxembourg, Panthéon, Hôtel des Invalides, and the "monumental" portions of Southern Paris, $3\frac{1}{2}$ miles. Hence the modern rifle (Krupp's guns of the Prussians) extended its range (with high elevation) to all these regions.

It is computed that in thirteen days, from Jan. 5 to 18, about 500 shells a day fell in Paris, hitting and wounding 308 persons, a fourth of them mortally, i. e. an average of 25 persons each day and 25 shells for each person hit. The number of private edifices hit averaged 50 a day, double the number of persons hit. The surface over which the bombardment extended was about 2,000 hectares (5,000 acres), or one-fourth the total area of Paris, chiefly on the left or south bank of the Seine. The population of this portion may be estimated at about 500,000. The Panthéon, the Museum, the Hôtel des Invalides (with its church and tomb of Napoleon) are among the monumental structures of this portion of the city. All were more or less injured.

It is asserted (L. Simonin, *Revue des Deux Mondes*, Feb.,

running in quite as fast as it could be blown away by shells.

Hence though the fortification of capitals, great naval or military dépôts, must, if attempted at all, be undertaken on an immense scale, yet the applicability of modern rifled guns (in place of *mortars*) to the purposes of bombardment, and the increased range of their curved fire, has not destroyed the utility of small forts as elements of the outer cordon of great fortified places; or, used isolatedly, for the special purposes of guarding great military routes, railroads, or water approaches.* See the article FORTIFICATION.

Revised by JAMES MERCUR.

Bombax [Late Lat., corruption of Lat. *bombyx*, silk-worm, silk, cotton]: a genus of large soft-wooded trees of the family *Sterculiaceæ*; nearly related to the baobab-tree. They are natives of tropical climates, especially America. They yield great quantities of cotton, but the fiber is short, does not spin well, and is not durable. Nevertheless, in India cloth is made of it to a small extent. It would probably make good paper.

* The development of rifled mortars and howitzers, with an effective range for the larger calibers of nearly 8 miles and extreme accuracy of fire, with a capacity to throw torpedo-shells containing large charges of high explosives, has materially increased the strength of trench and thickness of cover required by bomb-proofs to withstand their effects.

This increased protection for men and materials is attainable at a reasonable expense by the use of concrete and sand. For the heavier guns it presents a more difficult problem, the only practicable solution seeming to be the use of iron and steel, at great cost.

The same problem is, however, presented to the attack, since the heavy artillery of the defense has advanced *pari passu* with that of the attack, and is correspondingly efficient against the siege-works, etc. The rapid fire and machine guns of the defense can be protected against the bombardment in the bomb-proofs, and will retain their full efficiency against a subsequent assault. J. M.

Bombay': a presidency of British India; bounded W. by the Indian Ocean and Baluchistan. Area, including Sind, 125,391 sq. miles. A large part of the surface is mountainous. The long range of the Western Ghats extends parallel to the seacoast in a direction nearly N. and S. Between this range and the sea is a narrow tract called the North and South Konkans, the climate of which is very hot and moist. The annual rainfall in the Konkans is more than 100 inches, in consequence of the vapors of the southwest monsoon being intercepted by the Ghats. This province is intersected by the Nerbudda and Tapi rivers, which flow westward into the Gulf of Cambay, and is also drained by the sources of the Godavari and the Krishna, which run in the opposite direction. The Indus crosses the western part. The soil of the valleys and plains is fertile. Cotton and rice are the staple productions of this region, which contains the richest cotton-fields of India. Sugar and indigo are also raised here. Among the indigenous plants are the cocoa-palm and the teak-tree. Bombay has important manufactures of silk stuffs and of woollen and cotton cloths. In 1880 it had over 1,800 miles of railway in operation. The administration of this country is vested in a governor and three councilors, subject to the superintendence, direction, and control of the Governor-General of India in council. It is divided into the northern division with 10 districts, the southern divisions with 9 districts, and Sind with 4 districts, and contains within its limits many feudatory states, the most of them very small. To this province belongs the naval force for all the presidencies. The annual revenue for the fiscal year 1890 amounted to 13,086,288 rupees, or \$4,700,000; expenditures, 8,888,721 rupees, or \$3,200,000. Pop. (1891) 18,826,820. Capital, Bombay.

Bombay [Eng. form of native name *Mumbai* or *Bambai*]: a city and seaport of British India; capital of presidency of same name. It is situated on the south end of the island of Bombay and on the Indian Ocean; lat. 18° 56' N., lon. 72° 54' E. (see map of S. India, ref. 3-C). It has an excellent harbor, affording good anchorage for ships of the largest size, and is favorably situated for commerce, being in a direct line between Calcutta and Aden. It is the west terminus of railway systems connecting it with Delhi and Peshawar, Calcutta, and Madras. The mean temperature is 82° F. At the southern end of the island, which is 8 miles long and 3 miles wide, is the fortified European town, and a mile north of that is the Black Town, in which the Hindus and Mohammedans reside. The density of the population of this part of the city is more than three times that of the most populous districts of London—namely, 759 persons on an acre (according to the census of 1882), while the extreme ever reached in London is 222. Between these two towns is the esplanade and the barracks. Among the most remarkable buildings are the town-hall, mint, cathedral, the custom-house, the library of the Asiatic Society, the Elphinstone Institution, the missionary houses, the Grant Medical College, the great Hindu temple of *Momba Devi*, and the Jansetjee Hospital. The Bombay water-works, among the largest in the world, were formally opened by the Viceroy of India in 1892. These are capable of supplying 31,000,000 gal. of water daily, and cost 15,000,000 rupees. The dam which forms the reservoir is 2 miles long, and there are 61 miles of tunneling, ducts, and pipes. The chief articles of export are raw cotton, shawls, opium, coffee, pepper, ivory, and gums. Bombay imports raw silk, sugar, and silk stuffs from China, and cotton yarn, cotton cloth, hardware, glass, copper, etc., from England. The sum of foreign imports for the fiscal year 1891 was 653,716,000 rupees, or about \$235,000,000. Bombay, excepting Calcutta and Canton, is the greatest commercial emporium of Asia, and is the chief Indian port connected with the establishment of steam-navigation between India and the British islands. There is now a regular communication by steamers between Bombay and Europe through the Red Sea and the Mediterranean. Steamers also ply between this port and Point de Galle in Ceylon. Among the races that compose the population of Bombay the Parsis, descended from the Persian fire-worshippers, are distinguished for their respectability, wealth, and commercial enterprise. They are extensively engaged in ship-building, which is one of the most important interests of the city. The most flourishing and important industry in Bombay is the manufacture of yarn and cotton cloth, for which it has numerous large steam spinning and weaving mills. Area, 22 sq. miles. Pop. (1881) 753,000; (1891) 821,764.

Bombay Hook Island: Delaware; a part of Duck creek hundred, Kent County, separated from the mainland by Duck creek. Its north end (lat. 39° 21' 46" N., lon. 75° 39' 19" W.) has a brick lighthouse 36 feet high, with a fixed white light 46 feet above the water.

Bombberger, JOHN HENRY AUGUSTUS, D. D., LL. D.; writer on theological and biblical subjects; b. in Lancaster, Pa., Jan. 13, 1817; graduated from Marshall College and from the Theological Seminary at Mercersburg, Pa. He served in the pastorate in several churches from 1838 to 1881. He was president of Ursinus College, Colledgeville, Pa., from 1870 till his death there Aug. 19, 1890. He was editor of a condensation of the Herzog *Encyclopaedia*, of which the first volume appeared in 1858 and the second in 1860. He edited the *Reformed Church Monthly* 1868-75. Other works are a translation of the *Handbook of Church History*, by Kurtz (2 vols., 1860-62); *Infant Salvation and Baptism* (1860); *Revised Liturgy* (1867); *Reformed not Ritualistic* (1867). W. J. BRECHER.

Bomb-lance: an explosive missile used in the whale-fishery; consists of a cylindrical shell of iron armed with a sharp and heavy point of a triangular form. It is charged with powder, introduced through an opening at the rear end of the shell, and the opening is afterward stopped by melted lead. The lance is discharged from the barrel of a musket, and is exploded by a fuse after it has penetrated the body of the whale.

Bomford, GEORGE; soldier; b. in New York in 1780; graduated at West Point in 1805; chief of ordnance, U. S. A., May 30, 1832, with the rank of colonel. He was engaged as an engineer upon the construction of fortifications till 1812, when he was placed on ordnance duty. To the skill and inventive talent of this officer the country was largely indebted preceding and during the war of 1812-15 with Great Britain, he being almost the only one well informed as to the manufacture of ordnance and ordnance stores; he also introduced the bomb-cannon under the name of "columbiads." Brevetted lieutenant-colonel Dec. 22, 1814, for meritorious services in the ordnance department. After 1842 he was on inspection duty, and made many ingenious and valuable experiments on the best forms for heavy artillery. D. in Boston, Mass., Mar. 25, 1848.

Bona [in Fr. *Bône*; anc. *Hippo Regius*; called by the Arabs *Beled-el-Arab*]; a fortified seaport-town of Algeria; province of Constantine; on a bay of the Mediterranean; 74 miles N. E. of Constantine; lat. 36° 54' N., lon. 7° 48' E. (see map of Africa, ref. 1-D). It is finely situated at the foot of a hill near the mouth of the river Scibons or Scibus; and is defended by Port Cigogne, which is on the top of the hill. Bona was occupied by the French in 1832, since which it has been much improved. It has new markets, bazaars, and reading-rooms; also manufactures of tapestry, saddles, and native clothing. Wool, hides, grain, and coral are exported from it by steamboats. Near Bona are the ruins of the great city of *Hippo Regius*, once the see of St. Augustine. It was destroyed by the Arabs in 646 A. D. Pop. (1881) 19,687; (1891) 30,806.

Bona, GIOVANNI; a cardinal of the Roman Church; b. at Mondovi, Piedmont, Oct. 10, 1609; made cardinal in 1669; d. at Rome, Oct. 25, 1674. His principal works are *De Divina Psalmodia* (1663) and *Res Liturgica* (1671). He was equally distinguished for piety and learning.

Bona De'a (i. e. good goddess); a Roman divinity; the sister or wife of Faunus; was worshiped only by the Roman women, who concealed her name from the men. According to some authorities, she was identified with Ops. Her annual festival was celebrated on May 1, in the house of the consul, with mysterious rites, from which all males were strictly excluded. Her symbol was a serpent.

Bona Fide [Lat.; a legal term derived from the civil law, and meaning in good faith, without fraud or deceit, innocently]: A *bona fide* purchaser is one who purchases for a valuable consideration, without notice of opposing interests of third parties. This subject is of great importance in equity jurisprudence. It is a general rule that a court of equity will grant no relief against a purchaser in good faith. If, on the other hand, the purchaser has notice, actual or constructive, of the equitable rights of others, he will stand in no better position than the person from whom he acquired his title. Thus if a mortgage of land were canceled through mistake by a mortgagee, a purchaser in good faith from the mortgagor would hold free from the mort-

gauge. On the other hand, if he had notice of the facts, a court would set up the mortgage against him as well as against the mortgagor. (See NOTICE.) The same question is presented in the case of bills of exchange, promissory notes, and other commercial paper. If the acceptor or maker has a defense to it as to the payee, it will in general be shut off as to a purchaser in good faith before maturity. But if the purchaser had notice of the defense before the purchase, he would stand in the same position as the payee. A contract not entered into in good faith is voidable at the option of the innocent party. The question of good faith is often of importance in actions for slander or libel, where it is frequently the case that certain acts if done *bona fide*, or in good faith, are not actionable, but are if done with malicious intent.

Revised by F. STURGES ALLEN.

Bonaire, *bōnār*, or **Buen-Ayre**, *bwen'āyā* (i. e. good air): one of the Dutch West Indian islands; N. of Venezuela and E. of Curaçoa; lat. 12° 20' N., lon. 68° 27' W. (see map of West Indies, ref. 9-1). It is 20 miles long by 6 broad. Area, 129 sq. miles. Pop. 4,700; about 400 white. The climate is dry and the soil poor. Salt and charcoal are manufactured. Aloes, divi-divi, guaiacum, Brazil-wood, and live stock (donkeys and cattle) are exported.

M. W. H.

Bonald, *bō'naal'*. LOUIS GABRIEL AMBROISE, Vicomte de: an eminent French publicist and ultra-royalist; b. near Milhau, Oct. 2, 1754. He emigrated in 1791, and published a *Theory of Political and Religious Power* (3 vols., 1796), having returned to France about 1806. He was elected to the Chamber of Deputies in 1815, and acquired much influence under the Bonapartes and the Bourbons. He advocated absolutism and the infallibility of the pope. In 1823 he became a peer of France. Among his works is *La Législation Primitive*. D. in his castle near Milhau, Nov. 23, 1840. See Henri de Bonald, *Notice sur le Vicomte de Bonald* (1841).

Bonan'za [Span., fair weather, prosperity; Ital. *bonaccia*; Fr. *bonace*]: in the mining districts of California and Northern Mexico, an abundance of metal or an ore-body. The mines of Northern Mexico are principally what are called "pocket-mines," with thin veins of poor metal connecting the pockets. When a pocket of rich ore is struck the mine is said to be in *bonanza*. When the veins run out without leading to pockets, the mine is said to be in *borra* (i. e. useless words), from the verb *borrar*, to rub out or to blot out.

Bonaparte, CARLO: a Corsican lawyer; b. in Ajaccio, Mar. 29, 1746; the father of Napoleon I. He married in 1767 Maria Letitia (Letizia) Ramolino, and had five sons and three daughters. He became counselor and assessor of Ajaccio in 1773. D. in Montpellier, Feb. 24, 1785.

Bonaparte, CAROLINE MARIE ANNONCIADÉ: Queen of Naples: a daughter of the preceding; b. at Ajaccio, Mar. 26, 1782. She was married in 1800 to Joachim Murat, who became King of Naples in 1808. She was the mother of two sons and two daughters. After the death of her husband she took the title of Countess of Lipona. D. in Florence, May 18, 1839.

Bonaparte, CHARLES LUCIEN JULES LAURENT: Prince of Canino; a son of Lucien Bonaparte; b. in Paris, May 24, 1803. He was distinguished as an ornithologist, and took little part in political affairs. His wife was a daughter of Joseph Bonaparte. He resided in Philadelphia (1822-28) and Italy, and published *American Ornithology, or a History of the Birds of the United States*. D. in Paris, July 30, 1857.

Bonaparte, JÉRÔME: King of Westphalia; a brother of Napoleon I.; b. at Ajaccio, Nov. 15, 1784. He entered the French army in 1800, and during a visit to the U. S. married, in 1803, Miss Patterson, of Baltimore, without the consent of Napoleon. This marriage was annulled by order of Napoleon in 1805. (Madame Jérôme Bonaparte, née Elizabeth Patterson, b. in Baltimore, Md., Feb. 6, 1785; d. there Apr. 4, 1879.) Jérôme served as general of brigade against the Prussians in 1806, and was crowned King of Westphalia in 1807. In the same year he married a daughter of the King of Württemberg. He lost his throne in Oct., 1813, and led a division at Waterloo in June, 1815. After many years in exile he became a marshal of France in 1850. D. in Villegentis, near Paris, June 24, 1860.

Bonaparte, JÉRÔME NAPOLEON: a son of the preceding by his first wife; b. in Camberwell, England, July 7, 1805; graduated at Harvard in 1826. He greatly resembled Na-

poleon I. in appearance. He left two sons, Jérôme and Charles Joseph. D. in Baltimore, Md., June 17, 1870.

Bonaparte, JÉRÔME NAPOLEON: soldier; grandson of Jérôme Bonaparte, King of Westphalia; grand-nephew of Napoleon I.; b. in Baltimore, Md., 1830; graduated at West Point in 1852; and till his resignation of his lieutenantancy in the Mounted Riflemen, Aug. 16, 1854, served on frontier duty. He entered the French imperial army Sept. 5, 1854, as second lieutenant of the Seventh Dragoons, became chef d'escadron Third Cuirassiers Aug. 15, 1855, and was transferred Mar. 16, 1857, to the Dragons de l'Impératrice. He served in the Crimean war against Russia (1854-55); engineer at Balaklava, Inkerman, Tcherniaia, and the siege of Sebastopol; for all of which active and distinguished services he was decorated by the Sultan of Turkey with the Medjidie Order, made knight of the Legion of Honor of France, and received the Crimean medal from the Queen of England. He was in the Algerian campaign in 1856-57; engaged in several actions with the Kabyles; in Italian campaign against Austria 1859; engaged at Montebello, Solferino, and various outpost affairs, receiving for his gallantry the French "médaille d'Italie" and the decoration of "Military Valor" from the King of Sardinia; in garrison at various posts 1859-67, and in the guard of the Empress of France 1867-72. On the fall of the empire he with difficulty escaped from the hands of the Commune in Paris. He was exiled in 1886. D. Sept. 3, 1893.

Bonaparte, JOSEPH: King of Spain; the eldest brother of Napoleon I.; was born in Corte, Corsica, Jan. 7, 1768. He studied law, married Julie Marie Clary, and was elected to the French Council of Five Hundred in 1797. He negotiated the treaty of Lunéville with Austria in 1801, and that of Amiens with England in Mar., 1802. On these and other occasions he showed considerable talents for diplomacy. Urged by the imperious will of Napoleon, he accepted the throne of Naples in 1806, though he does not appear to have been ambitious of such a position. He was transferred in May, 1808, to the throne of Spain, against the will of the majority of the Spanish people, who obstinately resisted the domination of the French. During his nominal reign many battles were fought between the French and the allied English and Spanish armies, who expelled him from Spain in June, 1813. In 1815 he emigrated to the U. S., and lived at Bordentown, N. J., under the name of the Count de Surville. D. in Florence, Italy, July 28, 1844. See A. du Casse, *Mémoires et Correspondance du Roi Joseph* (10 vols., 1854); Thiers, *History of the Consulate and the Empire*.

Bonaparte, LOUIS: a brother of Napoleon I.; b. at Ajaccio, Sept. 2, 1778. He entered the army in youth, and served at Arcola and Rivoli (1797). In compliance with Napoleon's will, he married Hortense de Beauharnais in 1802, and became King of Holland in June, 1808. He and his wife separated about 1807, in consequence of their incompatibility. As nominal King of Holland he was not able to pursue the policy which he preferred, but was compelled by Napoleon to sacrifice the interests of the Dutch to the designs of the emperor, who was offended because Louis was not sufficiently subservient. Louis abdicated the throne in 1810, after which he resided in Italy. He was the putative father of Napoleon III. D. at Florence, June 29, 1846. See Thiers, *History of the Consulate and the Empire*; also his *Mémoires sur la Cour de Louis Napoléon et sur la Hollande* (Paris, 1828).

Bonaparte, LOUIS NAPOLEON: See NAPOLEON III.

Bonaparte, LOUIS LUCIEN: a son of Lucien and a nephew of Napoleon I.; b. in Mongrove, Worcestershire, England, Jan. 4, 1813. He was elected to the French National Assembly in 1849, became a senator in 1852, and grand officer of the Legion of Honor in 1855. He is distinguished for his labors in philology and chemistry. D. in Fano, Italy, Nov. 3, 1891.

Bonaparte, LUCIEN: Prince of Canino; a brother of Napoleon I.; b. at Ajaccio, May 21, 1775. He was an active and energetic republican in the French Revolution. In 1795 he married Christine Boyer, a woman of obscure birth. He was chosen in 1798 a member of the Council of Five Hundred, in which he opposed the Directory. On the 18th Brumaire (Nov., 1799) he displayed great resolution, and efficiently promoted the success of Napoleon. Lucien became Minister of the Interior in Dec., 1799, ambassador to Spain in 1800, and a tribune in 1802. Having lost his first wife, he married in 1803 a widow named Joubertson with-

out the consent of Napoleon, who was angry at the match. Lucien went into exile, and refused the throne of Italy, which Napoleon offered him on condition that he should divorce his wife. He was in France during the Hundred Days, 1815, and actively supported Napoleon in that crisis. He passed the latter part of his life in Italy, and died at Viterbo, June 29, 1840, leaving five sons and six daughters. With the exception of his brother Napoleon, he was undoubtedly the most eminent and talented member of his family. See Lucien Bonaparte's *Autobiographic Memoirs* (1836).

Bonaparte, Lucien Louis Joseph Napoleon: second son of Charles Lucien; b. at Rome, Nov. 15, 1828. He entered the priesthood, and on Mar. 13, 1868, was made a cardinal priest. D. in Rome, Italy, Nov. 19, 1895.

Bonaparte, Marie Ann Élise: Princess de Piombino; a sister of Napoleon I.; b. in Corsica, Jan. 3, 1777. She was married in 1797 to Felix Bacciochi, a Corsican officer, and received in 1805 the title of Princess of Luca and Piombino. She was for about six years (1809-14) Grand Duchess of Tuscany, which she ruled with ability. D. Aug. 7, 1820.

Bonaparte, Maria Letizia Ramolino: mother of Napoleon I.; b. in Ajaccio, Corsica, Aug. 24, 1750. She was considered a beauty, and had an uncommon intellect. According to her son Napoleon, "she had a great character, with much energy, elevation, and pride." She was married to Carlo Bonaparte in 1767. In 1804 she received the title of Madame Mère on the establishment of the empire. D. Feb. 2, 1836.

Bonaparte, Napoleon: See NAPOLEON I.

Bonaparte, Napoléon Joseph Charles Paul: prince; a son of Jérôme, King of Westphalia; b. at Trieste, Sept. 9, 1822. His mother was a daughter of the King of Württemberg. As a professed democrat he was elected to the French Constituent Assembly in 1848. In 1852 he received the title of prince, and was recognized as the heir of his cousin, Napoleon III., in case the latter should die without issue. He married Clotilde, a daughter of King Victor Emmanuel. His features resembled those of his uncle, Napoleon I. He was called Plon-Plon. He was banished from France in 1873 and again in 1886. D. in Rome, Mar. 17, 1891.

Bonaparte, Pauline: Princess Borghese; b. at Ajaccio, Oct. 20, 1780; was the most beautiful of Napoleon's sisters. In 1801 she became the wife of Gen. Leclerc, who died in 1802. She was married in 1803 to Prince Camille Borghese, an Italian, from whom she soon separated. A statue of Pauline, executed by Canova, is said to resemble the Venus of Praxiteles. D. in Florence, June 9, 1825.

Bon'ar, Horatius, D. D.: hymnologist and religious writer; b. in Edinburgh, Scotland, Dec. 19, 1808. He graduated at Edinburgh University; was minister at Kelso from 1838 to 1866, and afterward of the Grange Free church, Edinburgh. He was a prolific author of tracts, sermons, and other religious literature, but is most generally known as a hymnologist. Among his publications in this kind are *Hymns of Faith and Hope* (3 vols., 1857-71); *Hymns of the Nativity* (1878); and *Selected Hymns* (1879). D. in Edinburgh, July 31, 1889. See his *Memorial* (New York, 1889).

HENRY A. BEERS.

Bona'sa: a genus of gallinaceous birds of the family *Tetraonidae*, and one of the genera included in the popular term "grouse." It comprises the hazel-grouse, a European bird, the *Bonasa bonasa*. This bird, which is about as large as the common partridge, is prettily mottled with gray and reddish brown. It prefers the deep solitude of the forests. Its flesh is highly esteemed. Another species of this genus is the American ruffed grouse (*Bonasa umbellus*), which is about 18 inches long, and is called the pheasant in Pennsylvania and the partridge in New York and New England. The male has on each side a large shoulder tuft or ruff. In the breeding season it struts with erected ruff and tail like a turkey-cock. The loud thumping or "drumming" sound heard in the localities frequented by this bird is produced by the bird beating on its sides with its wings. It is heard most often in the morning and evening. This bird makes its nest on the ground in the forests. Its flesh is excellent as food.

Bonaventura, Saint Giovanni Fidanza: scholastic theologian; called THE SERAPHIC DOCTOR; b. in Bagnorea, States of the Church, 1221. He became a Franciscan monk, studied and afterward taught theology in Paris, became

general of the order of Franciscans in 1256 and a cardinal in 1273. He had great influence in the Church, and was venerated for his ascetic piety and the miracles ascribed to him. Bonaventura was one of the most eminent of the Schoolmen. "His great mind," says Neander, "grasped the whole compass of learning as it existed in his time." Among his numerous works are *Breviloquium*; *Biblia Pauperum* (Poor Man's Bible); and *Itinerarium Mentis in Deum* (Progress of the Mind toward God; Eng. tr. in vol. xxi. *Jour. Spec. Philos.*). D. in Lyons, July 15, 1274; was canonized in 1482, and was made a doctor of the Church in 1587. His complete works have been often reprinted; best ed. Florence, 1844, *sqq.*, 15 vols.; Eng. trans. of his *Life of St. Francis of Assisi* (London, 1868); and *Life of Christ* (1881). See his life by A. M. da Vicensa; Germ. trans. from the Italian, Paderborn (1874); also SCHOLASTICISM. Revised by W. T. HARRIS.

Bonavis'ta: a port of entry and capital of Bonavista district, Newfoundland, and one of the oldest towns on the island. It has rather a poor harbor, a jail, and a fine Anglican church. Its people are mostly fishermen, but agriculture is also carried on. Pop. 3,500. The lighthouse on Cape Bonavista (lat. 48° 41' 56" N., lon. 53° 5' 20" W.) is a catoptric revolving white and red light, 150 feet above the sea.

Bouchamp, bōn'shān'. CHARLES MELCHIOR ARTUS, Marquis de; b. at Jouvenceil, France, May 10, 1760; was one of the most distinguished royalist generals in the Vendean war in France, in which he was mortally wounded at Chollet, Oct. 17, 1793. His soldiers were about to massacre 5,000 republican prisoners to avenge him, but at his dying request they were spared.

Bouchut, bōn'shū', ERNEST: French specialist in children's diseases; b. May 16, 1818; M. D. 1842; member of the Medical Faculty of Paris 1842; number of his published works exceeds 100, among them being *Traité des maladies des nouveau-nés, des enfants à la mamelle et de la seconde enfance* (7th ed. Paris, 1879); *Hygiène de la première enfance*; *Nouveaux éléments de pathologie générale* (4th ed. 1882); *Traité de diagnostic et de sémiologie* (1883). D. in 1892.

Bond [same word as *band*, and from the root of the verb *bind*]; in law, an instrument in writing, sealed and delivered, whereby a person binds himself to pay a sum of money. It is also called a deed. It is either simple or with a condition. A bond is said to be simple when the engagement to pay is absolute. An instrument in the form of an ordinary promissory note becomes a simple bond if executed under seal. The most common form of bond is one executed under a condition. The instrument in this case consists of two parts—the engagement to pay, and the condition upon which the engagement to pay will become inoperative and void. The condition may be either for the payment of money or the performance of an act, such as the faithful execution of the duties of a public office or of agency or other authority. When for the payment of money, it is usually called a "money bond." In this case it is common to make the engagement to pay, called the penalty, double the amount expressed in the condition of the bond. The penalty will not, however, necessarily limit the amount of the recovery. In other words, in certain cases more may be recovered than the amount named in penalty of the bond; as, for example, the real debt and the interest accruing from delay in payment. At an early day, if the money named in the condition was not paid punctually, the whole penalty could be recovered. Courts of equity, however, regarded this result as in the nature of a forfeiture, and confined the recovery to the debt and the interest. When the bond is given for the performance of an act, the recovery is limited to the damages sustained by non-performance. The person who enters into the bond is called the *obligor*; the person to whom the engagement is made is termed the *obligee*. When it is executed by two or more persons, they may be either "joint" obligors or "joint and several"; that is, they may either bind themselves collectively, or both collectively and separately. An execution of the instrument by two persons simply would be joint. Express words should be used to create a "joint and several" obligation. This is an important distinction where some of the obligors are sureties, as is usual in bonds executed by incumbents of a public office. In the case of a *joint* bond, if one of the sureties should die, his estate would be discharged both in law and equity. This would not be the case had it been both *joint* and *several*, since the individual obligation would remain, though that which is joint would be at an end. A bond is otherwise termed a specialty. It is of a

higher grade than an ordinary contract, which is termed a simple contract. Accordingly, if A should owe money to B for goods sold or services rendered, and should give his bond for the amount, the original claim would be merged in the bond, and if the debt were not paid an action could be brought only on the bond. This would not be the case if A had given B his promissory note, or other engagement not under seal, for the amount of the claim. If the note were not paid at maturity, the original cause of action would remain. A bond, as a general rule, is not negotiable, but assignable. A purchaser would take it subject to the equities between the original parties. (See ASSIGNMENT.) The obligor of the bond commonly professes not only to bind himself, but his heirs, executors, administrators, etc. However, if these words were omitted, his obligation would be transferred to these successors in interest to the extent of the assets received from the obligor, it being a general rule in the U. S. that a debtor's property, both real and personal, is liable for his debts in the hands of heirs and other successors in interest.

T. W. DWIGHT.

Bond, EDWARD AUGUSTUS, C. B., LL. D., F. S. A.: English scholar; b. at Hanwell, Middlesex, England, Dec. 31, 1815; entered the British Museum as assistant in the department of manuscripts in 1838; librarian of the Edgerton MSS. in 1852; assistant keeper of the MSS. in 1854; keeper of the department in 1866; principal librarian of the British Museum in 1878; resigned in 1888; in 1870 founded the Palaeographical Society, of which he is president. Edited many scholarly works for the library and the Government.

Bond, GEORGE PHILLIPS: astronomer; b. at Dorchester, Mass., May 20, 1825; graduated at Harvard in 1845. He aided his father, W. C. Bond, in the observatory at Cambridge, and in 1859 succeeded him in the directorship of the observatory. He wrote several works, among which is an article *On the Construction of the Rings of Saturn*, and a work on Donati's comet. D. in Cambridge, Mass., Feb. 17, 1865.

Bond, THOMAS EMERSON, D. D., M. D.: physician and Methodist writer; b. at Baltimore, Md., in Feb., 1782. He became a professor in the Medical College of Maryland, and afterward a local Methodist preacher. He edited the *Christian Advocate and Journal* for twelve years, and wrote important pamphlets in defense of his Church. D. in New York city, Mar. 14, 1856.

Bond, WILLIAM CRANCH: astronomer; b. at Portland, Me., Sept. 9, 1789, and became a watchmaker. He was the first director of the observatory of Harvard University. He distinguished himself by his observations on Saturn, and discovered a satellite of that planet. D. in Cambridge, Jan. 29, 1859.

Bondage: originally, the villeinage or basest form of tenure of the Old English feudal law. The term is now used for a species of tenure existing in Scotland and the north of England, by which the tenant of a cottage on a farm is bound to work at certain seasons for the farmer under whom he holds the cottage. Such a tenant is called a bondager.

Bonded Warehouse: See WAREHOUSING SYSTEM.

Bön'der: the yeomanry of Sweden and Norway. The bönder often claim an aristocratic origin. They have many virtues as a class, and constitute a large majority of the population.

Bondu', or Bondou: a small district or kingdom of Western Africa; in Senegal; about lat. 14 to 15° N., and lon. 11° to 13° W. It is bounded on the E. by the river Falemé, which separates it from Bambuk. The surface is mostly level; the soil is fertile, well watered, and extensively covered with forests. The staple productions are cotton, indigo, maize, tobacco, and millet. Among the forest trees are the baobab and acacia. Iron is abundant here, and wild animals are numerous. The Fuldis are the most numerous of the tribes which inhabit Bondu. It is now under French protection. Capital, Bulibani, a mean town on the Falemé. Pop. estimated at 1,500,000.

Bône, a town of Algeria: See BONA.

Bone [O. Eng. *bān*; Germ. *Bein*; Swed. *ben*]; the substance of which the hard internal skeleton or framework of most vertebrate animals is formed. In the embryo the bones, with few exceptions, are preceded by masses of cartilage, or gristle, which in the course of development are replaced by true osseous tissue forming the skeleton; in some of the low fishes no such substitution takes place, the cartilage persisting as the adult skeleton. In addition to

contributing the supporting framework, in many animals bone occurs in other localities; thus bony plates are found in the integument of armadillos, turtles, lizards, and certain fishes, in the heart of ruminants, in the diaphragm of camels, in the eye of many animals, in the tongue of certain birds and fishes, and in other organs. In animals below the vertebrates there is no true bone, osseous tissue here being substituted by amorphous incrustations and hardened excretions, composed principally of calcium carbonate.

Bone consists of two parts: (1) an *organic portion*, composed of a "matrix" of closely interwoven connective-tissue fibers, united by a homogeneous "ground-substance," containing cellular elements, the "bone-cells," within interfibrillar spaces, and yielding gelatin on boiling; and (2) *earthy matter*, which impregnates the ground-substance and produces the characteristic hardness of the tissue. If a bone be soaked in dilute hydrochloric acid for a sufficiently long time, the organic matter, called "ossein," or "bone-cartilage," alone remains, retaining the form of the original bone, and being flexible, tough, and translucent. If, on the other hand, a bone be burned in a hot fire with a strong blast of air, the animal matter is all burned away, leaving the earthy or inorganic matter a white, brittle mass, with just the form of the original bone. It consists of calcium phosphate (which constitutes more than half the weight of the whole bone), together with calcium carbonate and fluoride, magnesium phosphate and sodium chloride, with traces of other elements. The proportions vary in different parts of the skeleton, in the same bone at different ages, in various diseases, and in the corresponding bones of different species. Living bone is of a reddish-white tint externally, and is of a much deeper red within. Its physical properties include a specific gravity of 1.87-1.97, toughness and some elasticity, with a strength equal to twice that of oak; a cubic inch of bone will support 5,000 lb. Bones are usually covered at their ends or in some other part by cartilage; but the surface, with the exception of portions forming joints, is covered by a tough, fibrous membrane, the "periosteum"; hollow bones have a similar membrane within, the "endosteum." These membranes are of the utmost importance in the growth, nourishment, and repair of bones. The endosteum also nourishes the marrow, a substance filling the cavities of bones, and occurring in the adult in two forms—red and yellow marrow. (See HISTOLOGY.) In the young bones all marrow is red, but in after life the red marrow is confined to the vertebrae, ribs, certain small and flat bones, and the ends of the larger long bones. These forms of marrow differ principally in the lessened vascularity and increased quantity of fatty tissue contained in the yellow variety. The red marrow is of especial consequence as an important source of new red blood-cells throughout life.

From the periosteum, arteries and nerves enter the bone, traversing the longitudinal "Haversian canals," which are from $\frac{1}{100}$ to $\frac{1}{200}$ of an inch in diameter, and lined with a delicate membrane resembling periosteum. Each canal is surrounded by concentric layers of bone, constituting an "Haversian system," between the concentric lamella of which lie connective-tissue cells, the "bone-cells," each occupying a cavity called a "lacuna." The lacunae send out lateral branching, freely communicating canals, the "canaliculi," $\frac{1}{14000}$ to $\frac{1}{20000}$ of an inch in diameter. Osseous tissue is arranged to form compact and cancellous bone, but the two differ only in relative density and the relative size of the contained cavities. For full account of structure of bone, see HISTOLOGY.

Osseous tissue is liable to several diseases, such as caries, necrosis, rachitis (rickets), osteomalacia, periostitis, osteomyelitis, cancer, exostosis, etc., each described under its own name. For descriptions of the several bones and of their relations to each other, see OSTEOLOGY and the names of particular bones, such as CLAVICLE, HUMERUS, etc.

Revised by GEORGE A. PIERSON.

Bone-ash: the residue of burnt bones; it amounts to about 66 per cent. of the weight of the original bones. It consists of the earthy salts of the bone. Bone-ash is largely exported from South America. It is used as manure, for the manufacture of superphosphates, phosphorus, and cupels, and is an important constituent of English china. Also called BONE-EARTH.

Bone-black, or Animal Charcoal: the residue left on calcining bones in close vessels. The bones are placed either in retorts, like those used in making coal-gas, or in iron pots. On the application of heat destructive distillation

takes place. Combustible gases escape, accompanied by vapors which condense to ammoniacal water and offensive oils. Bone or Dippel's oil is thus produced. The residue in the vessels amounts to about 50 per cent. in weight of the original bones. It is passed between rollers, and separated by sieves into different sizes. Bone-black usually contains, after exposure to the air, from 1 to 6 or 7 per cent. of moisture. The average composition of dry bone-black, in 100, is carbon, containing nitrogen, 10; phosphate of lime, including a little phosphate of magnesia, 88; carbonate of lime, 8; sulphate of lime, 0.2; alkaline salts, 0.8; oxide of iron, 0.1; and silica, 0.3.

Animal charcoal possesses to a high degree the property of absorbing gases, and also of absorbing various substances from solutions. Its action is not limited to any one class of substances. It absorbs vegetable bases, bitter principles, astringent bodies, coloring-matters, iodine, metallic oxides, salts, etc. Its chief application in the arts is for the purification of sugar. The raw sugar is dissolved in water, more or less completely freed from suspended impurities by the aid of blood, and filtered through bags of cotton cloth, and then passed through high cylinders of iron containing the bone-black. It is thus almost completely decolorized, and at the same time freed from lime and other salts, and from certain organic substances which interfere with crystallization. On subsequently concentrating the solution in the vacuum-pan it readily yields perfectly white loaf sugar. (See SUGAR.) By washing with warm water, and subjecting to a red heat in suitable retorts, the black is *revivified*, when it may be used again. Sometimes it is also purified by fermentation and treatment with small quantities of dilute acids or alkalis. By repeated reheatings, however, the black becomes greatly condensed, owing to the semi-fusion of the phosphate of lime, and its decolorizing and purifying power is reduced to such a degree that it must be replaced by fresh black. This exhausted black, as well as the fine dust which is not suited for sugar-refining, finds a ready market for the manufacture of superphosphates to be used as fertilizers, for the manufacture of phosphorus, etc. In France, pulverized bone-black in fine powder is often boiled with the raw sugar before it goes to the bag filters.

When bone-black is to be used for decolorizing acid solutions, the phosphate of lime is first removed from it by dilute hydrochloric acid. Bone-black is sometimes employed to remove lime from highly calcareous waters. Many other forms of charcoal possess these properties, but none of them have been found so well adapted for the use of sugar-refiners as bone-black. Under the name of ivory-black animal charcoal is used as a pigment, especially for the preparation of shoe-lacking.

Bone-dust: a name applied to various bone fertilizers characterized by very fine division of the particles. The term is used for the finely ground product of dry and clean bones, or for the product of fresh or soft bone, meat, and other animal material, which are by-products in other industries or the refuse of slaughter-houses. If the bone has been heated before grinding, much of the nitrogen may be lost. In common with all bone fertilizers, the particular value of bone-dust lies in its phosphorus, although the nitrogen contents may run from 2 to 6 per cent.

Bonefish: a name applied to the ladyfish, *Albula vulpes*.

Bone-gelatin: See GELATIN.

Boner, JOHN HENRY: poet; b. in Salem, N. C., Jan. 31, 1845; educated privately. In 1867 edited *Salem Observer* and *Asherville Pioneer*. In the following year he was appointed assistant secretary to the North Carolina Constitutional Convention, and was made chief clerk of the House of Representatives for 1869-70; was for sixteen years in the civil service at Washington. In 1887 removed to New York, where he served on the editorial staff of the *Century Dictionary*. Subsequently became literary editor of the *New York World*, which position he resigned to join the editorial staff of the *Standard Dictionary*. In 1883 he published a volume of poems, entitled *Whispering Pines*. He is a contributor to the magazines and is a member of the Authors' Club.

Boneset: the *Eupatorium perfoliatum* (fam. *Compositae*), an herbaceous plant, a native of the U. S., growing in low or moist places. It is a bitter weed, having hairy leaves, which are united at the base around the stem, and are serrate, very veiny, and wrinkled. An infusion of the leaves is used as a tonic, diaphoretic, etc.

Bon'gar: the native name for *Bungarus fasciatus*, a poisonous snake of the East Indies, related to the famous cobra, but having the neck less dilatible. It is of a light color, banded with black, and attains a length of 4 or 5 feet. P. A. L.

Bonghi, bon gee, RUGGIERO: Italian scholar and statesman; b. at Naples, Mar. 21, 1826; Professor of Philosophy, Academy of Milan, 1859; entered Italian Parliament 1860; Professor of Greek Literature at Turin 1864; of Latin at Florence 1865; and later of Ancient History at University of Rome; Minister of Public Instruction in Minghetti cabinet 1874-76; founded *La Cultura* (1881). Editor and translator of classics, and author of *Frati, Papi e Re* (1873); *Leon XIII. e l'Italia* (1878); *Francesco d'Assisi* (1884); *Vita di Gesù* (1890). D. near Naples, Oct. 22, 1895.

Bon'ham: town; capital of Fannin co., Tex. (for location of county, see map of Texas, ref. 2-1); on railroad; has numerous churches, Carlton College, Bonham Masonic Female Institute, and several handsome public school-buildings, etc.; also very fine flouring-mills, railroad machine-shops, manufactures of carriages, wagons, tobacco, brooms, mattresses, etc. In the cotton season 1890-91, 26,200 bales of cotton, and large quantities of flour, oats, corn, cotton-seed, etc., were shipped. Pop. (1880) 1,880; (1890) 3,361.

EDITOR OF "NEWS."

Bonham, MILLEDGE L.: statesman and soldier; b. in South Carolina, May 6, 1815; graduated at South Carolina College in 1834; became a lawyer; and served in the Mexican war. He was solicitor for the southern circuit 1848-50, and a member of Congress from 1856 to 1860; was appointed major-general of South Carolina troops, and afterward brigadier-general in the Confederate army. Having been elected to the Confederate Senate he withdrew from the army, and became Governor of South Carolina 1862-64, after which he resumed his position in the army, and held it at the time of Lee's surrender. D. Aug. 27, 1890.

Bonheur, bo-nür, FRANÇOIS AUGUSTE: painter of animals and landscape; b. at Bordeaux, Nov. 4, 1824. D. in Bellevue, Feb. 22, 1884. Though less famous than his sister, Rosa Bonheur, he achieved a high reputation in the artistic world, and his work is marked by most serious and meritorious qualities. He was a pupil of his father, Raymond Bonheur, and received a first-class medal at the Paris Salon 1861; Legion of Honor 1867. One of his very best works, a fine landscape with cattle, *Environ of Fontainebleau*, is in the Metropolitan Museum, New York. WILLIAM A. COFFIN.

Bonheur, MARIE ROSA: eminent painter of animals, whose pictures are widely known in Europe and America; b. at Bordeaux, Mar. 22, 1822. She was a pupil of her father, Raymond Bonheur, and began her studies by copying pictures in the Louvre. She first attracted public notice by the exhibition of two pictures at Bordeaux in 1841, and has since then produced a large number of works which have placed her in the front rank of artists in the field to which she devoted herself. She received a first-class medal at the Paris Salon in 1848; was exempted by a special decree in 1853 from having her works passed upon by the Salon jury; received a first-class medal at the Paris Exposition 1855, and the Legion of Honor in 1865. *The Horse Fair*, painted in 1853, is perhaps the best, and is the most celebrated of her pictures. It was sold in the A. T. Stewart collection in New York in 1887, and presented by the purchaser, Cornelius Vanderbilt, to the Metropolitan Museum, New York, where it now is. A replica of this picture, of smaller size, is in the National Gallery, London, and a fine work, *Plowing in the Nivernais*, is in the Luxembourg Gallery, Paris. Her painting is exceedingly robust and vigorous in style; and, as may be seen in *The Horse Fair*, which was painted when the artist was in her best period, she possesses a fine talent for composition.

WILLIAM A. COFFIN.

Bon'i: a state in the southwest peninsula of the island of Celebes; on the west side of the Gulf of Boni. It is about 80 miles long, and produces rice, sago, and cassia. The natives manufacture cotton cloth and articles of gold and iron. Area, 450 sq. miles. Pop. estimated at 200,000. Capital, Boni.

Boni, Gulf of, called also **Bughis** (boo-gŭs) Bay; separates the two southern peninsulas of Celebes. It is nearly 200 miles long, and from 40 to 80 miles wide. It is dangerous to navigation from its numerous reefs.

Bon'iface (Lat. *Bonifacius*): several popes have borne this name: (1) St. BONIFACE I.; elected in 418 A. D. St.

Augustine dedicated several works to him. D. in 422. (2) **BONIFACE II.**, a Goth; b. at Rome; succeeded Pope Felix IV. in 530. D. in 532 A. D. (3) **BONIFACE III.** was chosen pope in 607, and died the same year. He was the first to whom the title of "universal bishop" was given by the Greek emperor (Phocas). (4) **BONIFACE IV.**, pope; b. at Valeria in Italy; succeeded Boniface III. in 608. He converted the pagan Pantheon of Rome into a church. D. in 615. (5) **BONIFACE V.**, a native of Naples; became pope in 619. He died in 625, and was succeeded by Honorius I. (6) **BONIFACE VI.**, a native of Rome; succeeded Formosus in 896, and died fifteen days after his election. He was an abandoned character. (7) **BONIFACE VII.**, considered by some authors an anti-pope; was elected in 974 as a rival of Benedict VI. He was driven out of Rome in 975, and was starved to death in prison in 985. (8) **BONIFACE VIII.**, Cardinal (BENEDETTO GAETANI); was born at Anagni about 1228. He became pope in 1294. He issued a bull forbidding all the clergy to pay any tax on ecclesiastical property, by which he was involved in a contest with Philip the Fair of France. He excommunicated Philip, who accused the pope of heresy and simony, and besieged him in his own palace. Boniface was skilled in both civil and canon law, and published the sixth book of *Papal Decretals*. He died Oct. 11, 1303. (See Dante, *Inferno*, canto xxvii.; W. Drumann, *Geschichte des Papstes Bonifacius VIII.*, 2 vols., 1852; Luigi Tosti, *Storia di Bonifazio VIII.*, 1847.) (9) **BONIFACE IX.** (PIETRO TOMACELLI) succeeded Urban VI. in 1389. He was a despotic ruler, and was accused of selling benefices and indulgences. He died Oct. 1, 1404, and was succeeded by Innocent VII.

Boniface, Saint WINFRID: called THE APOSTLE OF GERMANY; b. in Kirton, near Exeter, England, 680. He began in 716 to preach in Germany; converted a great number of people and founded schools and monasteries. He was made bishop by Pope Gregory II. in 723, and in 732 Gregory III. made him archbishop and primate of all Germany. In 718, in 723, and again in 738, he visited Rome. He became Archbishop of Mainz 745. June 5, 755, he was assassinated by a pagan mob at Dokkum in West Friesland, and his remains were finally taken to the famous abbey of Fulda, founded by him. See his works, edited by J. A. Giles, London, 1844, 2 vols., and in Migne, *Pat. Lat.* LXXXIX.; the original life is in Latin, by his pupil, Willibald, Germ. trans. Berlin, 1856; modern lives by G. W. Coxé, 1853; A. Werner, Leipzig, 1875; G. Pfahler, Regensburg, 1880; O. Fischer, Leipzig, 1881; A. Ebrard, Gütersloh, 1882.

Bonifacio, JOSÉ: See ANDRADA E SILVA.

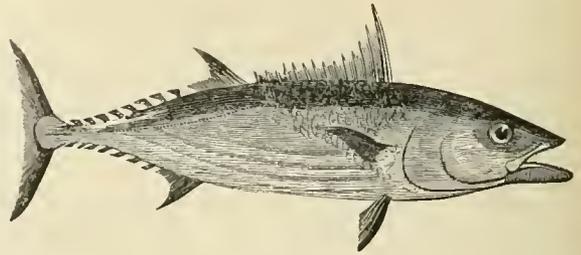

Bonifacio, bō-nē-faa'chō, Strait of (anc. *Fretum Gallicum*): the channel which separates Corsica and Sardinia. The narrowest part is only 7 miles wide. On the top of a white calcareous rock on the north stands the town of Bonifacio, which has a good harbor.

Bō'nin (or Uninhabited) Islands [from Chinese *Wuh nin*, without men]: islands in the Pacific Ocean; about 500 miles S. of Japan. They extend from lat. 26° 30' to 27° 44' N., and are about lon. 142° E. (see map of World, ref. 5-C). They are divisible into three groups, the most northern of which are called Parry islands, and the most southern Baily islands. Area, 38 sq. miles. Peel island, which is one of the middle group, is occupied by a small number of European and Polynesian colonists, the only inhabitants of the group. Japan now owns the group, and calls it Bonin-shima, i. e. Bonin islands.

Bon'ington, RICHARD PARKES: painter; b. at Arnold, near Nottingham, England, Oct. 25, 1801; d. in London, Sept. 23, 1828. Pupil of Baron Gros, though he began his studies by copying pictures in the Louvre, having been taken to Paris by his father, who was a portrait-painter, about 1816. Bonington painted landscapes chiefly, but also essayed figure subjects and marine views. He was in sympathy with the new movement in landscape painting originated by Constable, and his work was highly appreciated by French artists and critics. His influence on the new school forming in Paris, headed by the "men of 1830," was considerable. His work is notable for great truth of observation and refined quality of color. His *Column of St. Mark's, Venice*, is in the National Gallery, London, and *Francis I. and Duchess d'Elampes* and *The Park of Versailles* are in the Louvre. WILLIAM A. COFFIN.

Bonito, bō-nē'tō: one of several fishes of the family *Scombridae*, allied to the mackerel. One of these, *Gymnosarda pelamys*, is a native of warm seas. It is a beautiful

fish, about 24 feet long, and resembles a mackerel in form. The color of its back and sides is a brilliant steel-blue.

The bonito.

Four dark lines extend along each side of the belly, from the throat to the tail. Its flesh, though rather dry, is eaten and relished by many. The term bonito is still more frequently applied to a related species (*Sarda sarda*) found on both shores of the North Atlantic, and distinguished from the preceding species by its strong teeth. On the Pacific coast is another bonito (*Sarda chilensis*).

Revised by D. S. JORDAN.

Bō'nitz, HERMANN: Platonic and Aristotelian scholar, and a high authority in educational matters; b. in Langensalza, July 29, 1814. Professor in the University of Vienna 1849-67; reorganizer of the Austrian school system; professor in Berlin till his death in that city, July 25, 1888. Wrote *Platonische Studien; Index Aristotelicus; Latin Commentary on Aristotle's Metaphysics* (Bonn, 1849), with a German translation published after his death by E. Wellmann; *Ueber den Ursprung der homerischen Gedichte* (1881, 5th ed.); and numerous critical contributions. See Th. Gomperz, *Biogr. Jahrb.*, vii. (1888), pp. 53-100.

ALFRED GUEMAN.

Bonn (anc. *Bonna*): a city of Rhenish Prussia; beautifully situated on the left bank of the Rhine; 19 miles by rail S. S. E. of Cologne (see map of German Empire, ref. 5-C). It is on the railway which connects Cologne with Coblenz. It has an ancient cathedral, which is a fine specimen of the Romanesque style. Here are manufactures of cotton goods, earthenware, and soap. Bonn is the seat of a celebrated university founded in 1818, which has a library of 250,000 volumes and is attended by over 1,200 students. Connected with it are an observatory, a botanic garden, and a museum of natural history. The buildings of this institution are excellent and very extensive. Niebuhr, A. W. Schlegel, Hermes, Simrock, and other eminent men have been professors in this university. Here are several large and elegant hotels for the accommodation of tourists, who are attracted by the picturesque scenery of the vicinity. Bonn is a very ancient town. *Bonna*, which was an important Roman station, is said to have been rebuilt by the Emperor Julian in the fourth century. It was conquered by the French in 1802, and annexed to Prussia in 1814. It is the native place of Beethoven, and a statue was erected to him in the Münsterplatz in 1845. Niebuhr is buried in the cemetery outside of the Sternthor, where there is a monument to him, erected by Frederick William IV. Pop. (1890) 39,805.

Bonnat, bon'naa', LÉON JOSEPH FLORENTIN: one of the most eminent painters of the contemporary French school; b. at Bayonne, June 20, 1833; pupil of Federico de Madrazo and Léon Cogniet. He is highly esteemed by his fellow-artists, and since the death of Meissonier is the recognized head of the art world of Paris. President of the Society of French Artists. He is most famous as a painter of portraits, but has also painted a number of historical and religious compositions, and numerous genre-pictures of Italian peasants. As a young man he spent several years in Spain and Italy, first gaining recognition at the Paris Salon in 1861, when he received a second-class medal. The list of his honors is a long one, including the medal of honor at the Salon of 1869. In the Legion of Honor he was made chevalier in 1867, officer in 1874, and commander in 1882. Member of the Institute and one of the three professors of painting at the Government École des Beaux-Arts. He has painted the portraits of many distinguished persons, including those of Thiers, Victor Hugo, Presidents Grévy and Carnot, Cardinal Lavignerie, Rénan, and Alexandre Dumas. He has also painted numerous Americans, and his portrait work is well known in the U. S. Some of his principal works are *St. Vincent de Paul taking the place of a Galley Slave* (1866);

Christ on the Cross (1874), in the Palais de Justice, Paris; *Jacob Wrestling with the Angel* (1876); *Job* (1880); *The Youth of Samson* (1891); and *Martyrdom of St. Denis* (1885), in the Panthéon, Paris. His *Job* and the portrait of his master, Léon Cogniet, are in the Luxembourg Gallery. At the Metropolitan Museum, New York, is a portrait by him of John Taylor Johnston, a founder and at the time of his death (Mar. 24, 1893) honorary president of that institution. *Italian Girl* is in the collection of Mrs. August Belmont, and *Arab Plucking a Thorn from his Foot* in that of Mrs. W. H. Vanderbilt, both in New York. Bonnat's portraits are characterized by great truthfulness to the sitter and fine drawing and modeling. He is not remarkable as a colorist.

WILLIAM A. COFFIN.

Bon'ner, EDMUND: an English prelate notorious as a persecutor; b. in Hanley about 1500. He was educated at Oxford; gained the favor of Henry VIII., who about 1532 sent him on a mission to the pope, and appointed him Bishop of Hereford in 1538 and Bishop of London in 1539. Having showed himself hostile to the Protestant cause, he was deprived of his bishopric in 1549 and imprisoned in the Marshalsea prison in London until the accession of Queen Mary in 1553, when he was restored to his office. He was the principal instigator of the bloody persecutions which disgraced the reign of Mary. Refusing to take the oath of supremacy on the accession of Elizabeth in 1558, he was imprisoned in the Marshalsea, London, where he died Sept. 5, 1569.

Bonnet: in fortification of the old school a small defense-work constructed at salient angles of the glacis or larger works. It has only two faces, with a parapet 3 feet high and 10 or 12 broad. A larger kind, with three salient angles, is called a priest's bonnet.

Bonnet, bon'nā, CHARLES, LL. D., F. R. S.: Swiss naturalist and philosopher; b. at Geneva, Mar. 13, 1720. He made discoveries in the reproductive and other functions of insects, etc., which he announced in his *Treatise on Insectology* (2 vols., 1745). He published in 1754 a valuable work *On the Use of the Leaves of Plants*. His sight having become impaired by the use of the microscope, he turned his attention to philosophy. Among his other works (all in French) are *Considerations on Organized Bodies* (1762) and *Philosophical Palingenesis* (3 vols., 1769), in which he argued that the Christian revelation is true. D. at Genéve, on Lake Geneva, May 20, 1793. The genus *Bonnetia* was named in his honor. See H. B. de Saussure, *Éloge historique de C. Bonnet* (1787); J. Trembley, *Mémoire de la Vie de C. Bonnet* (1794); A. Lemoine, *C. Bonnet de Genève, Philosophie et Naturaliste* (1850).

Bonne Terre: village; St. François co., Mo. (for location of county, see map of Missouri, ref. 5-1); on Miss. Riv. and Bonne Terre R. R.; 32 miles S. by W. of St. Louis. Its principal industries are lead-mining and smelting. Pop. (1890) 3,719.

Bonnet-head: a shark (*Sphyrna tiburo*), allied to the hammer-head, but with the head rather kidney-shaped than hammer-shaped. It reaches a length of 6 feet, and is found in tropical seas.

Bonneval, bon'vāäl, CLAUDE ALEXANDRE, Count de; a French adventurer; b. in Limousin, July 14, 1675. He deserted from the French army and entered the service of Austria, in which he distinguished himself by several daring exploits, and obtained the rank of general. Having quarreled with the governor of the Low Countries, he was condemned to death by a court martial about 1724, but the penalty was commuted to exile. He entered the Turkish army, took the name of Ahmed, and became a pasha of three tails. D. in Constantinople, Mar. 27, 1745. See D. Fassmann, *Leben des Grafen von Bonneval* (1740); *Memoirs of the Bagshaw Count Bonneval* (London, 1750).

Bonneville, Lake: an extinct Pleistocene lake that twice occupied the now desert interior basin of Utah. Its shore-lines, contouring around the inclosing mountainsides, have been noticed by many explorers. Its history has been deciphered by Gilbert (Monograph I, U. S. Geol. Survey). The area and depth of the lake at its various levels are indicated by the shore-lines above mentioned. When at its greatest expansion its surface measured almost 20,000 sq. miles, and its depth was nearly 1,000 feet. The sediments corresponding to the shore-lines are found to lie on gravels, thus indicating that before the lake existed its basin was a dry interior depression as now. Moreover, the literal and bottom deposits are separated by a series of

gravel beds, indicating an arid period between two periods of high water. When at its highest level in the second period, forming what is called the Bonneville shore-line, the waters of the lake overflowed northward across Red Rock pass to a branch of the Shoshone river, and thus reached the Pacific. The pass was cut down about 370 feet, and at this level the waters lingered long enough to cut a second series of shore-lines, called the Provo shore. Then loss by evaporation overcame rainfall supply; overflow ceased, and the lake dwindled away, revealing its bottom as a desert plain. The variation in the area of the ancient lake indicates climatic changes from drier to moister conditions; and these alternations are apparently coincident with the alternations of glacial climates of Northeastern North America. Since the waters of the lake have dried away the shore-lines have been slightly warped out of level, as if owing to the relief of the weight of the water on the land. See GREAT SALT LAKE and LABONTAN. W. M. DAVIS.

Bon'ney, CHARLES CARROLL: president of the World's Congress Auxiliary of the World's Columbian Exposition; b. in 1831 in Hamilton, N. Y.; removed to Peoria, Ill., 1850; admitted to the bar 1852; removed to Chicago 1860; president of the Illinois State Bar Association 1882; has been president of the International Law and Order League, which he helped to found, since 1885; has been active in works of practical reform; author of the scheme for a series of world's congresses in connection with the World's Columbian Exposition of 1893 "to promote future progress by the fraternal co-operation of the enlightened minds of all countries." C. H. THURBER.

Bonney, THOMAS GEORGE, LL. D.: author, scientist, and divine; b. in Rugeley, July 27, 1833; educated at St. John's College, Cambridge, where he took his B. A. degree in 1856; fellow St. John's College, Cambridge, 1859; elected Professor of Geology at University College, London, 1877; president Geological Society 1884-86. He has translated Pierotti's *Jerusalem Explored* (2 vols., 1864); *Pierotti's Customs and Traditions of Palestine*. Author *The Holy Places of Jerusalem* (1864); *Outline Sketches in the High Alps of Dauphiné* (1865); *Testimony of the Primitive Fathers to the Truth of the Gospel History* (1867); *Four Sermons* preached before the University of Cambridge (1868); *The Alpine Regions of Switzerland and the Neighboring Countries* (1868); *The Coast of Norway* (1870); *Vignettes, Alpine and Eastern* (1873); *The Bernese Oberland* (1874); *Lake and Mountain Scenery of the Swiss Alps* (1874); *Elementary Geology* (1874); *Welsh Scenery* (1875-76); *Sketch of the Geology of Cambridgeshire* (1875); *English Lake Scenery* (1876); *Elementary Physical Geography* (1877); *Sermons on some Questions of the Day* (1878); *The Influence of Science on Theology*, Hulsean Lectures (1885); contributor to the *Transactions of the Royal Society*, the *Journal of the Geological Society*, and other scientific publications. W. S. PERRY.

Bonniyard, bon'nē'vaar, FRANÇOIS, de; writer and politician of Geneva; b. in France, 1496; educated at Turin; succeeded to the priory of St. Victor, near Geneva, 1510; sided with Geneva against the Duke of Savoy, by whose agents he was arrested and imprisoned in the castle of Chillon 1530; was liberated 1536, when his countrymen captured Chillon; wrote the chronicles of Geneva (1546-52); left several works in MSS. His books, given to the city, formed the nucleus of the public library of Geneva. His imprisonment is the foundation of Byron's poem, *The Prisoner of Chillon*. D. in Geneva, about 1571.

C. H. THURBER.

Bon'ycastle, CHARLES: b. at Woolwich, England, in 1792; son of John, noticed below. He was one of the professors brought over by Mr. Jefferson for the University of Virginia in 1825. He at first occupied the chair of Natural Philosophy, and afterward that of Mathematics. He published a treatise on *Algebra*, one on *Inductive Geometry*, and various scientific papers. D. at Charlottesville, Va., Oct., 1840.

Bonnycastle, JOUX: mathematician; b. in Whitehrech, Buckinghamshire, probably about 1750. He was Professor of Mathematics at the Royal Military Academy at Woolwich from 1782 to 1785, and published, besides other works, *Elements of Geometry* (1789) and *Elements of Algebra* (2 vols., 1813), which were highly esteemed. D. May 15, 1821.

Bonnycastle, SIR RICHARD HENRY: son of the foregoing; b. in 1791; served in Flanders and afterward in Cana-

da against the U. S. (1812-15); became in 1848 lieutenant-colonel of British engineers. Most of his life was passed in British North America. He was knighted for services in defense of Kingston, Canada, in 1837, and published *Canada as it Was, Is, and May Be*, and other works on Canada, and also one on *Spanish America* (1818). D. in 1848.

Bonpland, bōn'plān', AIMÉ: French botanist; b. at La Rochelle, Aug. 22, 1773. He studied medicine and botany at Paris, and formed a friendship with Humboldt. In 1799 he accompanied Humboldt in a scientific expedition to South America, where they traveled about five years. After their return to France he published a splendid work entitled *Equinoctial Plants collected in Mexico* (2 vols., Paris, 1808-16, with 140 plates). He had collected 6,000 species of plants, of which 3,500 were entirely new. He became Professor of Natural History at Buenos Ayres in 1816, and departed in 1821 on an excursion to the Andes, but as he was passing through Paraguay he was arrested by order of Dr. Francia, who detained him as a prisoner nearly ten years. After his release in 1831 he resided for many years in Uruguay. D. in Santa Anna, May 11, 1858. Humboldt, Bonpland, and Kunth published a work called *Nova Genera et Species Plantarum* (7 vols., 1815-25, with 700 plates).

Bonus [orig. a jocularly inaccurate use of the Lat. adjec. good, as if meaning "a good thing"]; a sum or consideration given or paid beyond what is statedly or properly due. Specifically: (a) an extra dividend or allowance paid to the shareholders of a stock company, holders of insurance policies, etc., out of accumulated profits; (b) a premium for a loan distinct from the interest, and hence a premium paid for a charter or other privilege granted to a corporation or individual.

Bony Fishes: See FISH.

Bonvin, bōn vān', FRANÇOIS SAINT-: French genre-painter, whose pictures are highly appreciated by artists and amateurs of art; b. at Vaugirard, near Paris, Sept. 22, 1817. He was self-taught, and began his art studies by copying the works of the Dutch masters in the Louvre. He exhibited frequently at the Paris Salon, and received a second-class medal in 1851 and the Legion of Honor in 1870; but his works did not gain for him a popular reputation. His pictures are now much sought for by collectors, and are justly valued for their sobriety but richness and depth of color, and their quiet, unobtrusive technique. His work has much in common with that of the great Dutch painters of the seventeenth century, but is distinguished by marked personal qualities. D. at Saint-Germain-en-Laye, Dec. 18, 1887.

WILLIAM A. COFFIN.

Bony-pike: a ganoid fish of the genus *Lepidosteus* (originally spelled *Lepisosteus*); found in America; especially remarkable as being examples of a type of fishes now almost extinct, but which in the old red sandstone period were extremely numerous. To the same genus belong the gar-pike and the alligator-gar of the U. S. The latter is sometimes 6 feet in length, and derives its name from its wide flattened head, which suggests that of an alligator. See LEPISTHEIDÆ.

DAVID S. JORDAN.

Bouze, bonz: a name sometimes applied by foreigners to the Buddhist monks of China and Japan. The word may be a corruption of the Japanese *bozu*, a Buddhist monk, or of the Chinese *fan siang* (pronounced in Japan *hon* (or *bon*) *zo*), "an ordinary member of the assembly," i. e. of the monastic order founded by the Buddha. See BUDDHISM and GAUTAMA.

Booby: one of several species of aquatic birds of the same genus as the gannet (*Sula*) and family *Sulidae*. They are found on the coasts of tropical and sub-tropical countries. They seldom swim, but are birds of powerful wing, and feed on fish, which are caught near the surface of the water by a sudden plunge. They are remarkable for stupidity and slow movement on the land, and will remain motionless when approached. The boobies are persecuted by the frigate-bird, which sometimes compels them to give up the fishes they have caught, and even to disgorge those they have devoured. The name is more commonly applied to the darker species of the genus, the white ones being known as gannets. The commonest species in the U. S. is *Sula leucogastra*, which is very abundant along the South Atlantic and Gulf coasts.

D. S. JORDAN.

Boodha: See BUDDHA.

Boofarik, boo-fān-reek', or **Boufarik**: a town of Algeria. See BUFARIK.

Book: a treatise written or printed on any material and put together in any convenient form. The materials and form have varied greatly among different nations and at different periods. The ordinary writing material of the ancients was papyrus. Parchment, thin leaves of lead and copper, ivory tablets, linen, etc., were also used. Leaves joined end to end and rolled up on a small roller made a "volume" (Lat. *volumen*, from *volvere*, to roll). Books in a square form came in later. Such a book was called a codex. Books were copied by hand down to the invention of printing, were frequently illuminated—i. e. adorned with sketches and miniatures in colors—and were rare and expensive. From the seventh to the eleventh centuries books were so scarce that often not one could be found in an entire city, and even rich monasteries possessed only a single mass-book. The introduction of paper into Europe about the thirteenth century, and the invention of printing in the fifteenth century, made possible the great accomplishments of modern bookmaking. Books printed before 1500 are known as incunabula (Lat. *incunabulum*, cradle). Scarcity of parchment led in the Middle Ages to the practice of washing or scraping off one writing to make room for another. A manuscript so treated was called a PALIMPSEST (*g. v.*). The terms folio (fol.), quarto (4to), octavo (8vo), duodecimo (12mo), etc., applied to books, indicate in a general way the size, folio being the largest. Books are printed on large sheets of paper; when these sheets are folded once, making each two leaves and four pages, the book is a folio; when folded twice, so as to make each four leaves and eight pages, the book is a quarto; folded so as to make eight leaves and sixteen pages, octavo, etc. See BIBLIOGRAPHY, BOOKBINDING, COPYRIGHT, and PALEOGRAPHY.

Bookbinding: the art of fastening together and inclosing the leaves of a book for preservation and use; practiced for many centuries. Long before the invention of printing the written leaves of missals and other books were united together, and inclosed in covers of wood, parchment, and other materials. Much labor and expense was bestowed on a single volume, and the covers were frequently decorated with jewels and ornaments of gold and silver. Some of these volumes are still preserved in the monasteries and museums of the Old World, and are objects of interest and study.

Since the invention of printing, and especially from the beginning of this century, the rapid advancement of the mechanical arts, the extension of education, and the general diffusion of knowledge have made books as much a necessity of life as food and clothing, and their preservation is therefore an object of importance.

The modern operations of bookbinding may be grouped in two main divisions—"forwarding" and "finishing," the first comprehending what is necessary for the preservation of books, the latter pertaining to their embellishment. In each of these departments there are various subdivisions, which may be noted. The sheets are generally received from the printer in bundles containing a thousand, more or less, of one kind.

The first operation is to fold the sheet, by means of a thin piece of ivory or bone, about 9 inches long, called a "folder." The object of this is to bring the pages together in regular order, and on the care with which the folding is done much of the appearance of the book depends. The next process is "gathering" and "collating." Gathering consists in putting together one each of the various sheets of which the book is made, and collating is the examination of the numbers 1, 2, 3, etc., which are placed at the foot of the outside page of the folded sections, and which are called "signatures."

The next thing required is to make the book solid. This is done by placing it either in a hydraulic press or under some other form of pressure, such as the nature and size of the book may require. After being pressed the book is prepared for sewing by having indentations made in the back of the sheets by passing them over rapidly revolving circular saws. They are now sewed on a frame called a "sewing-bench," each sheet being sewed around twine bands, which are afterward fastened to the boards. Much of its durability depends on the sewing being well done, and all large work is improved by having the sections at the beginning and end of the book cross or "whip stitched."

The greater part of the labor has so far been done by women, who by practice acquire great dexterity in the performance of the various processes involved. Machinery is

used with considerable success in folding, and a machine has been introduced for sewing, but all the work in the early stages is still in great measure done by hand-labor. In the more advanced stages of binding machinery is used extensively, and our description will be in accordance with the methods pursued where large quantities are constantly being bound, and where machinery is used to facilitate production. The book, after being removed from the sewing-bench, and having about an inch of the twine left on either side to fasten to the pasteboard cover, has the end leaves applied. These are of colored, white, or marble paper, as the nature of the work may require. The book is now "cut" by being fastened tightly in a cutting-machine, and a vibrating knife is brought down on the edge, which is cut off smoothly at the point desired. The edges are either left white, are colored by being sprinkled with color thrown on finely with a brush, or are marbled, which is done by dipping the edge on colors which float on the surface of gum-water. The "comb edge" so much used is made by a comb being drawn through the colors on the surface of the gum-water before the book is dipped. If the book is to have gilt edges, it is placed in a press and a coating of red color applied. The edges are then sized with white of egg, and gold-leaf laid over the size. When the sizing is thoroughly dried the gold is burnished with agate or bloodstone.

A coating of glue is now applied to the back, and when partially dry a round is formed in the front and back by a slight hammering on the back. The book is then fastened firmly between iron clamps in a backing-machine, and a roller is then pressed heavily across the back, which turns part of the back over either side of the clamps, making a groove to hold the board of which the inside of the cover is made. The piece of silk braid or colored cloth which projects over the leaves of the back inside the cover, and is called the "head-band," is now fastened with glue, and the whole back has a lining of cloth or strong rope paper firmly applied to it with glue and paste. The open or spring back is now made by applying two thicknesses of paper, open in the center, but fastened at the edges—one thickness of the paper being attached to the back of the book, and the other thickness to the leather or other material of which the outside cover may be made. The book is now ready for the cover, the outside of which may be of muslin, sheepskin, calf, Turkey morocco, or such other materials as may be desired. The cover, or "case," is made by boards being cut larger than the leaves of the book, over which the outside material is fastened by glue or paste, a space being left between the two boards large enough to fit the back of the book in, the boards being required to fit nicely into the grooves made in backing. Much of the material used for boards of common books is straw, but all good work should have a hard, smooth board made of rope. The edge of the board is frequently ground off on a rapidly revolving emery wheel, which makes a beveled edge, now much used.

After the cover is dry the embellishment is done by stamping in gold, blank, and colors. If in gold, the leather or cloth is sized with albumin, and gold-leaf laid on with oil. The ornamental die or lettering being fastened in an "embossing-press" and heated, it is brought with sufficient pressure on the cover to make the gold-leaf adhere. The surplus gold being brushed off, leaves the impression of the die. The dies are cut in brass or steel, and very elaborate and beautiful designs, which formerly would have taken many weeks to execute by hand-labor, are now produced almost instantly by the embossing-press.

The cover having received all intended ornament, the back of the book is glued and fitted into it, the end-papers are pasted to the inside of the cover, and the book is placed in a press to remain till dry. When removed from the press it is ready for the publisher and the public.

"Half binding," much used for library and reference books, is that style of binding where the back and corners are covered with leather, and the sides with cloth or paper.

The old process of "forwarding" by hand, in which each book is backed by a hammer and cut singly by press and plow, and the book finished by the slow method of former years, is still followed to some extent in small binderies, but requires no minute description, as the system is almost obsolete for books in quantities.

Machinery is now much used in bookbinding, and large editions are produced in a style of great elegance and dura-

bility, and at prices so moderate as to be within reach of all classes of the community.

JAMES SOMERVILLE.

Bookkeeping: the art of recording, in a regular and systematic manner, the transactions of merchants or other persons engaged in pursuits connected with money. There are two modes of keeping books of account—the one by what is termed *single*, and the other by *double entry*. Both are in general use. The system of single entry is the simpler mode of bookkeeping, and consists of only a day-book and a ledger. In the day-book the dealer enters his sales and purchases, and in his ledger he carries the former to the debit of his customers, and the latter to the credit of the merchants who supply him with goods. By making at any time a list of the sums due to him by his customers, and of those due by him to others, the dealer may, after adding to the debts due to him the value of his stock on hand, arrive at an approximation to the real state of his debts and assets. This, however, is but an imperfect method of bookkeeping, and in the case of wholesale mercantile business, where extensive and multifarious transactions have to be recorded, recourse is had to the system of *double entry*. This system possesses all the advantages of single entry, besides being so complete and comprehensive in its principles, and so certain in its results, as to admit of universal application.

No authentic accounts exist of the origin of bookkeeping. The double-entry system appears to have been first practiced in Italy in the latter part of the fifteenth century.

The objects of bookkeeping are to exhibit transactions in the most minute detail and in the most condensed form; advancing from the earliest stage to the latest by such clear and lucid steps as to admit of every fact being traced in its progress, so as to be secured at every step against error.

The three principal books required under the system of double entry are a cash-book, journal, and ledger. In the first of these every transaction is recorded where money is one of the elements. The journal forms a most important part of the system. It exhibits a narrative of every transaction of which an actual transfer of money does not form one of the elements, arranging the facts in as simple a form as correctness and intelligibility will admit of; and the results of those entries in the journal are afterward introduced into the ledger, which thereby becomes a key to the history of every transaction. In like manner cash transactions are often introduced into the journal, and are at stated periods classed and arranged in a condensed form and transferred to the ledger. The journal is advantageously ruled with four columns—two for entries debtor, and two for entries creditor; and all the transactions being connected either with personal and property accounts or with nominal accounts, such as charges, profit and loss, and so forth, they are classed accordingly in the columns on the debtor or creditor side of the journal respectively; and as the debit entries are at all times equal to the credit entries, the aggregate of the two columns on the debtor side must tally with the aggregate of the two on the creditor side of the journal. Experience and practice are occasionally suggesting minor improvements upon the forms of the cash-book, journal, and ledger to suit particular cases; and indeed an intelligent bookkeeper may accomplish much by a judicious classification of the facts in auxiliary books; but the fundamental principles of the double-entry system of bookkeeping remain perfect and unchanged, and may be regarded as the best hitherto discovered.

Book of the Dead: See RITUAL OF THE DEAD.

Boole, GEORGE: b. in Lincoln, England, Nov. 2, 1815; Professor of Mathematics, Queen's College, Cork, Ireland, and published, besides treatises on mathematics, *An Investigation into the Laws of Thought, on which are Founded the Mathematical Theories of Logic and Probabilities* (London, 1854). D. in Cork, Dec. 8, 1864.

Boogarin: See BULGARIN.

Boom, bôm: a town of Belgium; province of Antwerp; on the river Rupel, at its junction with the Brussels Canal, 9 miles S. of Antwerp (see map of Holland and Belgium, ref. 9 E). It has a gymnasium and extensive brick and tile works, tanneries, ropewalks, and manufactures of sail-cloth. Pop. (1890) 14,080.

Boondce: feudatory state and town of Rajputana, India. See BUNDI.

Boone: on railroad; a city; capital of Boone co., Ia. (for location of county, see map of Iowa, ref. 5-G). Immense

quantities of coal are shipped from here, and the adjacent timber lands are among the best in the State. The river affords a good water-power. The town of Boonsboro was annexed to Boone city before the census of 1890. Pop. (1880) 3,330; (1890) 6,520; (1895) 8,845.

Boone, DANIEL: a pioneer and hunter; b. in Berks co., Pa., Feb. 11, 1735. He emigrated to North Carolina, where he married. In 1769, with five companions, he penetrated into the forests of Kentucky, which were then uninhabited by white men. He was captured by Indians, but escaped, and continued to hunt in that region for more than a year. Having returned home early in 1771, he moved with his own and five other families to Kentucky in the autumn of 1773. To defend his colony against the savages, he built, in 1775, a fort at Boonesborough, on the Kentucky river. The Indians attacked this fort several times in 1777, but were repulsed. Boone was surprised and captured by them in Feb., 1778. They took him to Detroit, and treated him with lenity, but he soon escaped, and returned to his fort, which he defended with success against 450 Indians in Aug., 1778. He removed in 1795 to a place which is nearly 45 miles W. of St. Louis, Mo., and found there a new field for his favorite pursuits. He had received large land grants in Kentucky and Missouri which involved him in litigation, and most of his property was wrested from him. D. on his Missouri farm, Sept. 26, 1820, but his remains were removed in 1845 by the State of Kentucky and interred near Frankfort. See Sparks, *American Biography*, vol. xiii., second series; W. H. Bogart, *Life of Daniel Boone* (1857).

Boone, WILLIAM JONES, D. D.: first missionary bishop of the Protestant Episcopal Church to China; b. at Walterborough, S. C., July 1, 1811; graduated at College of South Carolina 1829; studied law and was admitted to the bar in 1833, but relinquished the practice of this profession to take holy orders. Having devoted himself to foreign missions, he took a course in medicine, receiving the degree of M. D. from the South Carolina Medical College. He was ordained Sept. 18, 1836, sailing for China July 8, 1837; consecrated bishop to China Oct. 26, 1844. D. at Shanghai, China, July 17, 1864. His published writings were mainly connected with the translation of the Bible into Chinese.—His son, **WILLIAM JONES BOONE, D. D.**; b. in Shanghai, China, May 17, 1846; graduated at Princeton 1865, and ordained in 1868; became himself missionary bishop in China, after many years of service there, succeeding Bishop Schereschewsky, who had resigned on account of failing health. He was consecrated Bishop of Shanghai, having jurisdiction in China, Oct. 28, 1884. D. at his post Oct. 5, 1891.

W. S. PERRY.

Boonesborough, Iowa: See **BOONSBORO**.

Booneville: See **BOONVILLE**.

Boon Island: 10 miles E. of the harbor of York, Me.; is in lat. 43° 07' 16" N., lon. 70° 28' 16" W. It has a granite lighthouse 123 feet high, showing a fixed white dioptric light of the second order, 133 feet above the sea.

Boonsboro, or Boonsborough, Ia.: See **BOONE**.

Boon'ton: Morris co., N. J. (for location of county, see map of New Jersey, ref. 2-D); on railroad and the Rockaway river; about 30 miles from New York city. It has iron-works among the largest in the U. S.; the rolling-mills, nut-mills, plate-mills, nail-mills, and blast furnaces covering at least 50 acres of land. Pop. of township (1880) 2,682; (1890) 3,307; (1895) 3,276.

Boon'ville: town; capital of Warrick co., Ind. (for location of county, see map of Indiana, ref. 11-B); on L. E. and St. L. R. R.; 9 miles from Ohio river and 17 miles from Evansville. It has 8 churches (2 for colored people), 3 schools (1 for colored people); agriculture is the chief occupation, but coal is abundant and mined everywhere. Timber is abundant in the surrounding country. The town was founded about 1818. Pop. (1880) 1,182; (1890) 1,881; (1893) estimated with suburbs, 3,000. EDITOR OF "STANDARD."

Boonville, or Booneville: a city and river port; capital of Cooper co., Mo. (for location, see map of Missouri, ref. 4-G); on J. C. B. and L. branch of Mo. Pac. R. R., and M. K. and T. R. R., and on the right (S.) bank of the Missouri river; 227 miles by water and 187 miles by railroad W. by N. of St. Louis. It stands on a bluff about 100 feet above the river, is very healthy, and has an advantageous position for trade. The railroad bridge which here crosses the river is one of the most costly that spans the Missouri. Boonville has excellent schools, public and private; its manufactures

are few, the inhabitants being generally well to do. The town was founded in 1818. During the civil war a Confederate camp was established at this place. On June 16, 1861, Gen. Lyon reached Rockport, opposite Boonville, and on the following day attacked the forces in camp at Boonville under Col. Marmaduke. The Confederate force, amounting to only about 2,500 poorly armed raw troops, was routed, abandoning two guns and a large quantity of clothing, camp equipage, etc. Pop. (1880) 3,854; (1890) 4,141.

EDITOR OF "STAR."

Boonville: village; Oneida co., N. Y. (for location of county, see map of New York, ref. 4-II); 35 miles N. of Utica, on the Rome, Watertown and Ogdensburg R. R., and on Black River Canal. Here are 6 churches, an academy, Erwin Library and Institute, chair-factory, foundry, and 3 grist-mills. This neighborhood is a popular place of summer resort. Pop. (1880) 1,677; (1890) 1,615.

EDITOR OF "HERALD."

Boorhanpoor: city of the Central Provinces, India. See **BURHANPUR**.

Booro: a large island in the East Indies. See **BURU**.

Boorogird: a city of Persia. See **BURUGIRD**.

Boossa: African town on the Central Niger. See **BUSSANG**.

Bootau: native state in the Himalayan Mountains. See **BIUTAN**.

Boö'tes [Gr. Βοώτης, i. e. plowman]: a name of **PHILOMELUS**; son of Ceres and a brother of **Plutus**. He is said to have invented the plow, and used it in cultivation of the soil. To reward him for this service he was translated into a constellation, under the name of **Boötes**.

Boötes: a northern constellation; represented on celestial globes as a man holding in one hand a club, and in the other a leash by which he leads two hunting-dogs. This constellation comprises **Arcturus**, a star of the first magnitude. **Boötes** is bounded N. by **Draco**, E. by **Corona Borealis** and **Serpens**, S. by **Virgo**, and W. by **Canes Venatici** and **Coma Berenices**.

Booth, ABRAHAM: b. at Blackwell, Derbyshire, England, May 20, 1734; from 1769 till his death pastor of the Baptist church in Goodman's Fields, London. He was author of *The Reign of Grace* (London, 1768) and *Pædobaptism Examined* 1784; 2d ed. 2 vols., 1787). The latter work was republished in 4 vols. 8vo in 1829, and is regarded by the Baptists as an able argument in defense of their opinions. D. Jan. 27, 1806.

Booth, BARTON: actor and dramatist; b. in 1681. He first appeared in 1698 at Dublin, Ireland, in Thomas Southern's *Oroonoko*. In 1701 he first acted in London as **Maximus** in Lord Rochester's *Valentinian*. Thenceforward his career was prosperous and distinguished. He left the stage in 1728. D. in Hampstead, May 10, 1733. He was deemed excellent in such various parts as **Hotspur**, **Antony**, **Othello**, and **Henry VIII**. He wrote a masque entitled *The Death of Dido* (1716). He was twice married, but left no children. He was an Englishman of good family, a good classical scholar, a quaint poet, and a notably handsome person. His grave is at Cowley, near Uxbridge, England.

Booth, EDWIN: actor; son of J. B. Booth; b. in Baltimore, Nov. 15, 1833; first appeared on the stage Sept. 10, 1849, at the Boston Museum, as **Tressel** in *Richard III*. After several years of "strolling" in California and Australia, he returned to New York and other Northern cities, and speedily acquired a high professional rank. He opened Booth's theater, New York, Feb. 3, 1869, and made a highly successful professional tour in Europe in 1882-83. His name, as an actor, is identified with **Hamlet**, **Richard III**, **Iago**, **Bertuccio**, and **Lucius Brutus**. His acting was remarkable for intellectual power, refinement, and gleams of passionate fire. He retired from the stage in 1891 on the death of **Lawrence Barrett**, with whom he had been acting. See his *Life*, by **Winter** (1886). D. June 7, 1893.

Booth, HENRY MATTHIAS, D. D.: Presbyterian minister and writer on practical religious subjects; b. in New York city, Oct. 3, 1843; graduated at Williams College (1864) and at the Union Theological Seminary (1867). From 1867 to 1891 he was pastor in Englewood, N. J. He published *The Heavenly Vision and other Sermons* (New York, 1885); *The Sunrise, Noonday, and Sunset of the Day of Grace* (1888).

W. J. BECHER.

Booth, JOHN WILKES: assassin of **Abraham Lincoln**; b. in Harford co., Md., in 1838; brother of **Edwin Booth**, the actor.

He became an actor, and in the civil war sided with the Confederates. To avenge the "lost cause," he formed a conspiracy with Suratt, Powell, and others. On Apr. 11, 1865, he entered Ford's theater, Washington, and shot President Lincoln, who was sitting in a private box. Exclaiming, "*Sic semper tyrannis!*" he leaped down to the stage and broke his leg, but he mounted a horse that was standing ready and escaped to Virginia. He concealed himself in a barn near Bowling Green, where he was discovered by his pursuers, and, refusing to surrender, he was shot, April 26, 1865.

Booth, JUNIUS BRUTUS; actor; b. near London, England, May 1, 1796; first appeared on the stage, Dec. 13, 1813, at Deptford, England, as Campillo, in Tobin's *Honeymoon*, and within four years became famous in London as Richard III. and Sir Giles Overreach. These and Pescara were his great parts. He first acted in the U. S., July 13, 1821, at Richmond, Va., as Richard III. His career on the U. S. stage was one long triumph—marred, however, by intemperance and incipient insanity. He died on a Mississippi river steamboat, Nov. 3, 1852, and was buried at Baltimore, Md. His wife was a Miss Holmes, of Reading, England. His children were Junius Brutus, Rosalie Anne, Edwin Thomas, Annie Sydney, Joseph Addison, Henry Byron, Mary, Frederick, Elizabeth, and John Wilkes. See *The Elder and the Younger Booth* (1882) in the American Actor Series.

Booth, MARY LOUISE; writer and journalist; b. at Yaphank, N. Y., Apr. 19, 1831; published a *History of the City of New York* (1859-67; 2d ed. New York, 1880), and over thirty volumes of French translations, among which are the works of De Gasparin, Cochin, and Laboulaye on the American civil war, and Henri Martin's abridged *History of France* (1880). From its beginning in 1867 until her death in New York, Mar. 5, 1889, she was editor of *Harper's Bazar*.

Booth, NEWTON; b. in Salem, Washington co., Ind., Dec. 25, 1825; graduated at Asbury University in 1846; studied law in Terre Haute, and was admitted to the bar in 1850; went to California soon afterward, and engaged in business in Sacramento; returned in 1857 to Terre Haute, and practiced law till 1860, when he went back to California. In 1863 he was elected to the California State Senate; in 1871 was elected Governor of California, but resigned in Mar., 1874, when elected U. S. Senator. He served from Mar. 9, 1875, till Mar. 3, 1881. D. in Sacramento, July 14, 1892.

Booth, ROBERT RUSSELL, D. D.; Presbyterian minister; b. in New York city, May 16, 1830; graduated at Williams College (1849), and at Auburn Theological Seminary (1852). Previous to his present pastorate in Rutgers Riverside Presbyterian church in New York city, he was pastor successively in Troy, N. Y., Stamford, Conn., and of the Mercer Street and University Place churches, New York city. He has published many pamphlets and discourses, and is a trustee of Williams College, a director of Princeton Theological Seminary, a member of the Presbyterian Board of Foreign Missions, etc. W. J. BEECHER.

Booth, WILLIAM; general of the Salvation Army; b. in Nottingham, England, Apr. 10, 1829; educated at a private school in that town; became a minister of the Methodist New Connection in 1850; resigned from the Conference in 1861 to enter upon evangelistic work. In July, 1865, he started "The Christian Mission" in the East End of London. This mission grew rapidly, and was organized on military lines. In 1878 Mr. Booth gave to it the name of "The Salvation Army," of which he became general and absolute commander. His entire family have shared with him in this work. He has published several hymn-books: *Salvation Soldiers; Training of Children; Letters to Soldiers; In Darkest England*, the latter containing a scheme, subsequently put in operation at great expense, for the enlightenment and industrial support of the lowest classes. In 1880 Gen. Booth established the *War Cry* as the weekly gazette of the army. This is now (1897) published in some twenty-eight different languages, with a total circulation of about 600,000. See SALVATION ARMY. C. H. THURBER.

Boothbay Harbor; town; Lincoln co., Me. (for location of county, see map of Maine, ref. 10-11); on Atlantic Ocean; 14 miles from Knox and Lincoln R. R., and 16 miles from Bath, from which it is reached by steamer. The town has two churches, a high school, bone-phosphate, canning, and cold-storage industries, two marine railways, steam lumber-mill, and a boat-manufacture. The fine bathing, sailing, and fishing to be had here, and the romantic scenery in the neighborhood, have made this place a popular summer-

resort. This town was separated from Boothbay Feb. 16, 1889. Pop. of Boothbay township (1880) 3,575, including Boothbay Harbor; (1890) 1,718, of Boothbay Harbor (1890) 1,699. EDITOR OF "REGISTER."

Boo'thia Fe'lix; a peninsula or island of North America; in the Arctic Ocean; extends from lat. 69 to 75 N. It is bounded on the E. by Boothia Gulf. It was discovered by Sir John Ross, and named in honor of Sir Felix Booth. It contains the north magnetic pole.

Boots; articles of dress worn on the feet, and reaching up the legs sometimes above the knees. They were developed from the sandal by slow stages, and appeared in England during the reign of Edward II. as part of a knight's costume. The Greek *colluratus* or buskin was sometimes a boot reaching to near the knee, and made with thick soles to increase the stature of actors. The Roman patricians wore leather shoes, the color of which indicated rank. A senator's shoes were red. In the time of Charles I. a wide-topped boot of Spanish leather came into use, and this in turn was superseded by an elaborately adorned French boot. In the cavalry service this article of apparel became a matter of regulation by the government, and was known as the jack-boot, a high-topped heavy boot worn with spurs. In the eighteenth century a yellow-topped boot was fashionable in Great Britain, and copied thence in France. The Hessian boot followed; was worn over the trousers, and was decorated with a tassel. This gave way to modifications known as the Blücher and the Wellington boots. These forms are giving place to the modern SIOG (*q. v.* for the processes of manufacture).

In Scotland the name *boot* was applied to an instrument of torture in use until late in the seventeenth century. It consisted of a wooden or iron case, was placed on the lower part of the leg, and then tightened by driving in wedges with repeated blows of a mallet, and at times with such force as to crush the bones and muscles. It was employed by the privy council in putting a man to the question, and especially used upon the Covenanters. A milder form of the boot consisted of a wet leather or parchment envelope bound closely on the leg, and then shrunk by drying.

The *boot* of a carriage is a covered receptacle, placed either beside the driver or behind the body of the coach, in which baggage is carried; also a leather apron attached to the dash-board, and used as a protection against stormy weather.

Booty [deriv. of *boot*, profit < O. Eng. *bōt*; Germ. *Busse*]; in international law, personal property captured on land by a public enemy in time of war. It differs from prize, which is captured at sea. (See PRIZE.) In the case of prize the ownership of the property does not pass to the captor until condemnation by a prize court. Booty belongs to the captor after an undisturbed possession of twenty-four hours, and the right of *post liminium* is at an end. (See POSTLIMINIUM.) In strictness of law, booty belongs to the sovereign, and not to the individual soldier who captures it. It is quite common for the sovereign power to bestow a portion or the whole of it upon its subjects. This matter, however, is not governed by international rules, but by the municipal law of the captor.

Bopp, FRANZ; German philologist; b. at Mentz, Sept. 14, 1791. He studied languages in Paris and Göttingen, and became in 1821 Professor of Philology at Berlin. He published a *Glossarium Sanscritum* and a *Critical Grammar of the Sanskrit Tongue*. He was an efficient promoter of the study of Sanskrit, and is regarded as the founder of the science of comparative philology. His most important work is a *Comparative Grammar of the Sanskrit, Zend, Greek, Latin, Lithuanian, Old Slavonian, Gothic, and German Languages* (1833; 2d edition, 3 vols., Berlin, 1857-61), which has been translated into English and published at Oxford (3 vols., 1845-50). D. in Berlin, Oct. 23, 1867. See Preface to the French translation of Bopp's *Comparative Grammar*, by Bréal (Paris, 1866-72, 4 vols.), and Lefmann's *Franz Bopp, sein Leben und seine Wissenschaft* (Berlin, 1891).

Bo'ra, or Boh'ren, KATHURINA, von; a German nun, who became the wife of Martin Luther; b. in Bitterfeld, Saxony, Jan. 29, 1499. She was converted to the Lutheran doctrines, and escaped from her convent in 1523. She was married to Luther, June 13, 1525, and bore him three sons and three daughters. After Luther's death (Feb. 18, 1546) she continued to live at Wittenberg, but in 1552 the plague drove her to Torgau, where she died Dec. 20, 1552. See her *Life*

by C. W. F. Walch (Halle, 1751-54, 2 vols.); F. G. Hofmann (Leipzig, 1845); A. Stein (Halle, 1878; 3d ed. 1886).

Boraçic (or **Bo'ric**) **Acid** occurs native in certain lagoons of Tuscany, and in a crater in the island of Vulcano (Volcano), N. of Sicily. It is of great commercial importance for the manufacture of borax. The acid has the composition $B(OH)_3$. When heated it loses the elements of water and forms the oxide B_2O_3 , which is frequently called boracic acid.

Bo'rage: a short-lived annual or biennial herb (*Borago officinalis*), a foot or two high, native of Europe, long cultivated in gardens, and now escaped to waste ground and rubbish heaps. Its pretty blue flowers are quite ornamental, and yield nectar to bees, and are thus of value to bee-keepers. It was formerly used in medicine as a demulcent, refrigerant, and diaphoretic, but it is now regarded as of secondary value only, and has fallen into disuse. C. E. B.

Borage Family (*Boraginaceæ*): mostly rough, hairy herbaceous dicotyledons, with gamopetalous corollas and superior four-lobed ovaries. There are about 600 species, which are widely distributed in temperate climates.

CHARLES E. BESSEY.

Bo'rax [from Arab. *bōraq*, *būraq*, borax] (also called *sodium tetraborate*): a compound ($Na_2B_4O_7 + 10H_2O$) of boracic acid and soda; found native as a saline incrustation on the shores of lakes in Persia, Thibet, and India. The impure borax collected on these shores is called *lineal* or *erude* borax, which is also found in Peru, Chili, California, Nevada, and other regions. Borax is also prepared from boracic acid by solution in boiling water, and the addition of a boiling solution of sodium carbonate (Na_2CO_3). It is also prepared from borate of lime, a salt largely procured from Chili, Peru, etc. Borax is a white salt of a sweetish taste, soluble in twice its weight of boiling water. It is useful as a flux in promoting the fusion of metallic mixtures and producing fusible silicates in assaying and in welding iron. As an agent in experimenting with the blowpipe it is valuable for the readiness with which it forms colored glasses with various metallic oxides. It is also used in medicine, and as a detergent in the laundry. More than 4,000,000 lb. are annually produced from native boracic acid in Italy, hot springs affording the heat necessary in the manufacture. The annual production on the Pacific coast has varied widely, declining from 5,180,810 lb. in 1876 to 1,584,966 lb. in 1879, but rising again to 11,000,000 lb. in 1887. In 1888 the product was 7,589,000 lb., valued at \$455,340. See BORACIC ACID.

Revised by IRA REMSEN.

Borax Lake: a small lake in Lake co., Cal., the water of which is a strong solution of borax. Crystals of borax are also found in large numbers in the muddy sediment at the bottom. Many hundreds of tons of these have been collected and sent to San Francisco.

Borda, bōr'dā', JEAN CHARLES, de: French mathematician and astronomer; b. at Dax, department of Landes, May 4, 1733. He served as an engineer in the army, and became a captain in the navy. As a naval officer he fought for the U. S. in 1778-82. He wrote several scientific works, contributed much to the progress of nautical science, and invented or improved the reflecting circle. Aided by Delambre and Méchain, he measured an arc of the meridian from Dunkirk to the Balearic isles. D. in Paris, Feb. 20, 1799.

Borde, or **Boorde**, bōrd, ANDREW: English physician and writer; b. at Boord's Hill, near Cuckfield, in Sussex, about 1490. Educated at Oxford, he became a Carthusian monk in London; became suffragan bishop of Chichester, 1521; but, finding the order too severe, he obtained a dispensation from his vow in 1528 and studied medicine on the Continent and at Glasgow; traveled much, and was for a time patronized by Henry VIII.; d. in 1549, after spending a little time in the Fleet prison. Author of a *Dycetary*; the *Fyrst Booke of the Introduction of Knowledge* (edited by Dr. Furnivall, 1870); and various books of travel, including an *Itinerary of England*.

Bordeaux, bōr'dō': a city and seaport of France; capital of the department of Gironde; finely situated on a plain on the left bank of the river Garonne; 58 miles from its mouth and 364 miles by rail S. S. W. of Paris; lat. 44° 50' N., lon. 0° 54' W. (see map of France, ref. 7-D). It has a spacious harbor, and is accessible by vessels of 600 tons at all stages of the tide. The river, which is here about 650 yards wide, is crossed by a noble bridge of seventeen arches. Bordeaux

is an archbishop's see. It is connected by several railways with Paris, Toulouse, Marseilles, and other towns. It is probably the most commercial city of France, except Marseilles. The harbor is large enough to admit 1,200 vessels of the largest size. Its commerce extends to all parts of the world. The newer portions of the city have wide streets and pleasant promenades lined with trees. Among its remarkable edifices are the Gothic cathedral, consecrated in 1096; the church of St. Croix, which belongs to the tenth century; the town-hall; the Hôtel de la Marine; the bridge, which cost about \$1,300,000; and the Great theater, which is one of the finest in Europe, and was built by Louis XVI. Bordeaux contains a mint, a college, a university or *Académie Universitaire*, a normal school, a school of navigation, and a public library of 190,000 volumes. Here are extensive manufactures of wine, brandy, chemicals, printed calicoes, woolen goods, carpets, hats, paper, etc. The chief articles of export are wine, brandy, vinegar, dried fruits, turpentine, and glass bottles. Wine of superior quality, called Médoc, claret, or Bordeaux wine, is produced in this vicinity. The principal merchants of Bordeaux are engaged in the wine-trade. The Canal du Midi affords a communication with the Mediterranean. Pop. (1886) 240,582; (1891) 252,415. Bordeaux, called in ancient times *Burdigala*, was founded before the Christian era, and was the capital of the Bituriges Vivisci. It became the capital of Aquitania Secunda in the reign of Hadrian. In 1152 it was transferred to the crown of the English kings by the marriage of Henry of Anjou (afterward Henry II. of England) with Eleanor of Guienne. It received important liberties and privileges from the English. The famous Black Prince held his court here. It has belonged to France since 1451. Among the remains of the ancient city is a palace of Gallienus. During the revolution of 1789 this city was the headquarters of the Girondists, and suffered terribly at the hands of the Terrorists. In consequence of the damage to its commerce by the continental system of Napoleon, Bordeaux was one of the first cities to declare for the Bourbons. On Dec. 10, 1870, the seat of government was transferred to Bordeaux, while Paris was besieged by the German armies and several members of the provisional government were shut up in the metropolis. The provinces were then subject to the authority of Gambetta and his colleagues, who, after they had been driven from Tours by the approach of the enemy, removed to Bordeaux. The National Assembly, elected in Feb., 1871, met first in this city, but removed to Versailles in March of that year.

Revised by M. W. HARRINGTON.

Bordeaux Wines: a general name for several sorts of French wine produced in the department of Gironde. The red wines of Bordeaux are commonly called claret in the U. S., to which they are largely exported. The average quantity produced annually in the Gironde is about 31,500,000 gal., the ravages of the phylloxera having diminished the vintage. Among the best of these wines are the Médoc, which is red, and the Graves, which is white. No French wines except champagne are so largely exported.

Bordentown: borough; Burlington co., N. J. (for location of county, see map of New Jersey, ref. 5-D); on Amboy Division of Pa. R. R., and on Delaware river; 30 miles N. E. of Philadelphia and 6 miles S. E. of Trenton. Two passenger steamboats run daily to Philadelphia. Bordentown is the terminus of the Delaware and Raritan Canal, and is about 60 feet above the river. It has three female colleges, a military institute, a park, water and gas works, an opera-house, a very large steam-forging, and several foundries and manufactories. Bordentown was the home of Francis Hopkinson, signer of the Declaration of Independence, and is the seat of a mansion built by Joseph Bonaparte, ex-King of Spain. Pop. (1880) 4,258; (1890) 4,232; (1895) 4,185.

PUBLISHER OF "REGISTER."

Bordes, bōrd, ERNEST: contemporary painter of history and figure subjects; b. at Pau; pupil of Bonnat and of Cormon; second-class medal, Salon, 1886; second-class medal, Paris Exposition, 1889. Obtained a solid reputation as a painter of serious merit by the exhibition of a picture, *The Death of Bishop Proextatus*, at the Salon of 1886, now in the museum at Reims. Studio in Paris. W. A. C.

Bore, called also **Ea'gre** [etymology unknown]: In estuaries into which large rivers flow, the struggle between the ascending tidal wave and the opposing current of the stream produces the imposing phenomenon of a huge wave, which, like a moving wall of water, advances with great rapidity

and a deep roaring noise up the river, often for hundreds of miles, to the limit of tide-water. This is called the *bore*. In the Hugli river, one of the main mouths of the Ganges, the bore rushes up the river with great impetuosity. In the Chinese river Tsientang it rises to 30 feet in height, and travels at the rate of 25 miles an hour, sweeping everything before it. In the Amazon river, at the time of the equinoxes, bores of 15 feet in height follow each other in quick succession, and within the space of 200 miles five such mighty waves may be seen traveling simultaneously up the river. The Indians call it *pororoca*.

Bo'reas: in Grecian mythology, the personification of the north wind, the brother of Hesperus, Zephyrus, and Notus; was imagined to dwell in the caves of Thrace, and represented with snow-covered wings, hair, and beard.

Borecole: See KALE.

Borelli (in Lat. *Borellus*), GIOVANNI ALFONSO: physician and astronomer; b. at Naples, Italy, Jan. 28, 1608. He is called the founder of the iatro-mathematical school, which proposed to apply mathematics to medicine. He resided for many years in Rome, and was patronized by Queen Christina of Sweden. His most remarkable work is *De Motu Animalium* (1680). D. in Rome, Dec. 31, 1679.

Borers: a name applied to the larvæ of many insects which feed upon trees and vegetables, in which they eat holes. Their ravages are very great. The peach-tree borer is the larva of *Egeria exitiosa*, a lepidopterous insect; and species kindred to the last named attack the pear-tree, the currant bush, and many other useful plants. The locust-tree borer is the larva of a coleopterous insect, the *Clytus pictus*, which, with other larvæ, has seriously diminished the supply of this valuable timber tree. The apple-tree is especially attacked by the grub of the *Saperda bicinctata*. Borers are most easily destroyed by a wire or gonge while they are in their holes; and though many plans have been devised for preventing their ravages, none as yet are very successful.

Bor'gerhout: a flourishing town of Belgium; a suburb of Antwerp. It has bleachfields, dye-works, woolen factories, and corn-mills. Pop. (1891) 29,818.

Borghese, bōr-gā zā, CAMILLO, Prince; b. in Rome, July 19, 1775. He served in the French army in his youth, and married in 1803 Pauline, a sister of Napoleon. He was in 1806 created Duke of Guastalla. He sold the Borghese collection of antiquities and artistic treasures to Napoleon for 13,000,000 francs, but some of them were restored to him after the fall of the emperor. These had been collected by his father, Marc Antonio. D. in Florence, Apr. 9, 1832.

Borghesi, bōr-gā zōē, BARTOLOMMEO, Count; an Italian antiquary and numismatist; b. at Savignano, June 11, 1781. He formed a rich collection of medals and coins, and distinguished himself by his successful efforts to illustrate the military, political, and municipal institutions of ancient Rome. His chief work is *Nuovi Frammenti dei Fasti Consolari Capitolini* (2 vols., 1818-20). D. in San Marino, Apr. 16, 1860.

Borgia, bōr jā, CESARE, Duc de Valentinois; Italian cardinal and soldier; a natural son of Pope Alexander VI.; b. in Apr., 1476. He was raised to the rank of cardinal in 1492, and received from Louis XII. of France the title of Duc de Valentinois in 1498. He married a daughter of the King of Navarre in 1499. With the connivance of the pope, his father, he waged with success an aggressive war against several princes of the Romagna who were feudatories of the Roman see. He was guilty of many acts of cruelty and treachery, and procured the death of several persons by poison. He made himself master of the duchy of Urbino, but his prosperity was ruined by the death of Pope Alexander VI. in 1503, and the accession of Julius II., who was an enemy of Cesare Borgia. The latter was arrested and imprisoned in 1504, but he escaped in 1506 and joined the army of the King of Navarre. He was killed in battle, at Mendavia, Spain, Mar. 12, 1507. See Tomasi, *Vita del Duca di Valentino* (1655); *Leben des C. Borgia* (Berlin, 1782).

Borgia, LUCREZIA; b. in Rome, 1480; renowned for beauty, talents, and vices; a sister of Cesare Borgia, noticed above. She was married in 1493 to Giovanni Sforza, Lord of Pesaro; was separated from him, and given in 1498 to the Duke of Bisceglia, a son of the Duke of Ferrara, who was assassinated two years later; and then she married in 1501 Alfonso, Duke of Ferrara, of the house of Este. She

patronized Bembo and other literati, who complimented her in their works. She was accused by contemporaries of incest and poisoning, but several modern writers maintain that the charges against her character are greatly exaggerated. D. in Ferrara, June 24, 1519. See Gilbert, *Lucretia Borgia, Duchess of Ferrara* (2 vols., London, 1869); F. Gregorovius, *Life of L. Borgia* (Stuttgart, 1874, 2 vols.; 3d ed. 1875).

Borgne, bōrn; a lake or bay in the southeast part of Louisiana; 12 miles E. of New Orleans. It is 60 miles long, and 25 miles wide at the broadest part. It communicates with the Gulf of Mexico on the E., and is connected with Lake Pontchartrain by the Rigolets Pass, which is 10 miles long. The lake is surrounded to a great extent by marshes and cane-brakes, separated from it by a narrow ridge of shells. Steamers plying between New Orleans and Mobile traverse this lake.

Borgu': a kingdom in Central Africa; W. of the Niger; in about lat. 10° N., now in part in the British Niger protectorate (see map of Africa, ref. 4-C). The banks of the Niger are fertile and thickly populated, producing rice, indigo, grain, cotton, yams, lemons, bananas, honey, and game in abundance. The sorghum-fields yield five hundred-fold. The forests are full of elephants of immense size. The population consists of the original inhabitants and Fulahs, and a Mohammedan conquering tribe speaking a language cognate with the Yoruba tongues. The government is an hereditary monarchy.

Borissol': a town of Russia; on the Berezina; government of Minsk; 46 miles N. E. of Minsk (see map of Russia, ref. 7-C). Near this place the army of Napoleon suffered a great disaster in its passage of the Berezina in Nov., 1812. Pop. 6,500.

Bor'land, SOLOJ; general in the Confederate army, and former U. S. Senator from Arkansas; b. in Virginia, studied medicine and settled in Arkansas. In the Mexican war he served as major of volunteers, and was taken prisoner. He was elected to the U. S. Senate 1849, appointed U. S. minister to Central America 1853; and it was on his return home that the inhabitants of Greytown attempted to arrest him for having given asylum to an accused person, and for which the town was destroyed by Com. Hollins, U. S. N., acting under instructions of his Government. In Apr., 1861, and previous to the secession of Arkansas, he organized a force and captured Fort Smith; was appointed brigadier-general in the Confederate army. D. in Texas, Jan. 31, 1864.

Borlase, bōr'las, WILLIAM, F. R. S.; English antiquary; b. in Cornwall, Feb. 2, 1695; educated at Oxford; became vicar of Ludgvan, near Penzance, 1722, to which he added the vicarage of St. Just 1732; was a friend and correspondent of Pope. Author of *Observations on the Antiquities of Cornwall* (1754); *Natural History of Cornwall* (1758); and several religious treatises. D. in Ludgvan, Aug. 31, 1772.

Born, bōrn, BERTRAN, de; Count of Hautefort; b. before 1140; one of the most renowned Provençal poets of the Middle Ages, called by Dante (*de Vulg. Eloq.* ii. 2) the poet of arms in the great triumvirate of troubadours, of which Arnaut Daniel and Guirant de Bornel are the other members. He was, however, a poet of love as well, and his songs in honor, first, of Mathilde ("Maeuz" of the poems), wife of Talairand of Montignac, and later of a far more famous Mathilde, sister of Richard Lion-heart, wife of Henry the Lion and mother of the Emperor Otto, are not below the best level of such verse. In his war poetry, however, we undoubtedly get him at his best—an entirely mediæval character, passionate for war and arms and blood. Fortune enabled him to use his poetic art in affairs of great importance. He had a large and, on the whole, harmful influence in the struggles of the sons of Henry II. of England—Henry, Geoffrey, and Richard Lion-heart—against their father and then among themselves. Dante in a famous passage (*Inferno*, xxviii. 118, *seq.*) depicts the poet as compelled to carry in his hand his own head separated from his body, as he had himself separated a son (young Henry) from his father (Henry II.). Later, Bertran was for a time a violent adherent of Philippe Auguste in his struggles with Henry II. and Richard Lion-heart. Still later, however, he is found full of admiration for Richard and of scorn for Philippe Auguste. His sirventeses, or political poems, are therefore indispensable for the student of the social and political condition of the twelfth century. In his old age the poet en-

tered the monastery of Dalon. *D. circ.* 1215. See *B. de Bohn, sein Leben und seine Werke, herausgegeben v. A. Stimming* (1879); *B. de Born, poésies complètes* (publ. by A. Thomas, 1888); *Diez, Leben und Werke der Troubadours* (2d. ed. 1882); L. Clédat, *Du rôle historique de Bertrand de Born* (1878).

A. R. MARSH.

Bör'ne, LUDWIG; satirical writer; b. of Jewish parents at Frankfurt-on-the-Main, May 18, 1786; studied at Berlin and Heidelberg; adopted the Protestant faith in 1817; edited the liberal *Wage* and *Zeitschwingen*; published in 1826 his celebrated *Denkrede auf Jean Paul*. After 1830 he lived in Paris, was correspondent of the *Allgemeine Zeitung*, and edited *La Balance*. His *Briefe aus Paris* and other writings on political and æsthetic subjects are eloquent and witty, and display a singularly delicate critical sense, but are marked with bitterness of political feeling. *Sämmtliche Werke* (12 vols., 1862-63). D. in Paris, Feb. 13, 1837. See biographies by Beermann (1841), and Gutzow (1840), and *Heine über Boerne*.

Borneil, bōr nāl, GUIRAUT, de; Provençal poet; reckoned by Dante (*de Vulg. Eloq.* ii. 2) one of the three great troubadours, Arnaut Daniel and Bertran de Born being the other two. Dante also calls him the poet of uprightness, "rectitudinem." The precise dates of his career are not known, but it certainly fell between 1175 and *circ.* 1220. He was chiefly remarkable as a poet because of his profound belief in the art of poetry and in the chivalric ideals of his time. See *F. Diez, Leben und Werke der Troubadours* (Zwickau, 1829; 2d ed. Leipzig, 1882); also the Provençal life of the poet from the Cheltenham MS. 1910, printed in the *Revue des langues romanes* (3^e série, v. 275).

A. R. MARSH.

Bor'neo (called by the natives *Pulo-Kalantanin*): an island in the Malay Archipelago; extends from lat. 7° 1' N. to 4° 10' S., and from lon. 108° 50' to 119° 2' E. (see map of East Indies, ref. 6-E). Its length is 807 miles, and it is about 600 miles wide. The area of the island proper is 283,400 sq. miles; with the small islands adjacent, 284,500 sq. miles. Next to New Guinea (303,000 sq. miles), it is the largest island on the globe. The interior is traversed by chains of mountains not yet fully explored by Europeans. Near the northern extremity of the island is a peak called Kinibalu, which rises 13,680 feet above the sea. The maritime parts of the island are mostly marshes or low plains covered with dense forests. It is probable that a large portion of the interior consists of fertile valleys and plains. The outline is nowhere deeply indented by inlets. It is thought by many that the form of Borneo was formerly similar to that of Celebes, but that the bays have been filled up in the course of time, and now form those marshy districts on the coasts so unhealthy to the inhabitants. Borneo is watered by numerous navigable rivers—viz., the Kapuas, Barito, Mahakkam, Redjang, and others. These mostly enter the sea through extensive deltas, and their mouths are so obstructed that large vessels can not enter them; but they afford facilities for inland navigation. The climate in the low grounds is hot. The rainy season begins about October, and continues till April, during which period heavy rains fall. In the higher lands of the interior the climate is moderate and healthy. The mountains are chiefly formed of granite, syenite, limestone, and quartz. Among the mineral resources are gold, tin, antimony, zinc, diamonds, iron of fine quality, and coal, which latter is very abundant and is excellent and easily mined. The principal commercial supply of antimony is at present from Borneo. Diamonds are widely disseminated in the soil, at a depth of several feet. One diamond found in Borneo weighed 367 carats. The vegetation of Borneo is exceedingly luxuriant. Among the forest trees are the teak, the ironwood, the gutta-percha-tree, the ebony, the cocoa-palm, and various sagotrees. The island produces also cinnamon, camphor, betel, pepper, ginger, cotton, rice, and yams. The forests and jungles are infested with tigers, bears, leopards, buffaloes, and orang-outangs. The elephant also is found here. The population (estimated at 1,734,000) is chiefly of four races—Malays, Dyaks, Bugis, and Chinese. The Malays, who mostly occupy the maritime parts, are partly Mohammedans and partly pagans. The Dyaks, who live farther inland, are the aboriginal inhabitants, and are the most numerous of all the races in the island. They are divided into many tribes, and subsist mostly by hunting, fishing, and piracy. "They are not all," says Crauford, "in an equally abject condition; for while some are mere naked hunters, the ma-

nority have fixed abodes, and have made some progress in the useful arts. . . . With respect to religion, they have neither priests nor temples, nor do they pray or fast."

Borneo was in 1892 divided into the following governments: (1) *British North Borneo*, the northern end of the island from the Padas river on the west coast to the Sibuco river on the east coast. Area, 31,106 sq. miles, with a coastline of over 900 miles. Pop. 200,000, consisting of the aboriginal tribes inland and Mohammedan and Chinese settlers on the coast. The interior is mountainous; the most of the surface is covered by jungles. The territory is under the jurisdiction of the North Borneo Company. The laws are based on the Indian code and the Mohammedan law. The Government issues its own copper and paper money, which is in American dollars. Tobacco is planted on a large scale, and there is a flourishing timber-trade. Chief town, Kudat in the extreme north. (2) *Brunei*, a native sultanate, under British protection, on the west coast from British North Borneo to the Barram river. Area, 8,100 sq. miles. Pop. 50,000. It is similar to the territory to the north. Chief town, Brunei or Borneo. (3) *Sarawak*, a sultanate occupying the west coast from Brunei to Cape Datu and extending inland to the central mountain chain. It is under British protection. Area, 41,000 sq. miles. Pop. 320,000. It resembles North Borneo. Coal exists in large quantities, as well as gold, silver, and other metals. An Englishman, Sir James Brooke, obtained control of Sarawak as rajah in 1841. He was succeeded by his nephew, Sir Charles Johnson Brooke, in 1868. (4) *Dutch West Borneo* includes the southwestern part of the island S. of Sarawak and W. of about lon. 117° E., with all of the basin of the Kapuas river. Area, 59,700 sq. miles. Pop. 414,000. (5) *Dutch South and East Borneo*, including the parts of the island S. of North Borneo and E. of Brunei, Sarawak, and West Borneo. Area, 143,500 sq. miles, or more than all the rest put together. Pop. 750,000. The chief towns of Dutch Borneo are Pontianak (west coast, on the Kapuas river) and Banjarmasin (South Borneo, on the Barito river).

History.—Borneo was discovered in 1518 by the Portuguese, who formed a settlement at Bandjermassin in 1690. The Dutch, who first visited the island in 1598, made a treaty of commerce with the Sultan of Sambas in 1609. They erected a fort and a factory at Tatis in 1643, and another at Pontianak in 1778. The first British settlement was at the northeast angle in 1756. Sir James Brooke first visited the island in 1838. The island has never, since known to geographers, had any political unity, and has, therefore, no proper history.

REFERENCES.—*Handbook to British North Borneo* (1890); Temple, *Private Letters of Sir J. Brooke* (1853); Wallace, *Malay Archipelago* (1865); Poschwitz, *Borneo, its Geology and Mineral Resources* (translated from the German, 1892).

M. W. HARRINGTON.

Bornu', or **Bornon** (native *Kanoura*): a state of Central Africa; in the Sudan; bounded N. by the Sahara Desert, N. E. by Lake Chad, E. by Bagirmi, on the S. by Adamawa, and on the W. by Sokoto (see map of Africa, ref. 4-D). Area about 50,000 sq. miles. The surface is mostly level; the soil is fertile, producing maize, millet, rice, cotton, indigo, pulse, etc. Cattle, horses, and sheep form a large part of the riches of the Bornuese. The climate is excessively hot, the thermometer often rising to 105° F. in the shade. The rainy season lasts from October to April. The principal rivers of Bornu are the Shari and Yeou, which flow into Lake Chad. A large portion of the country is inundated in the rainy season. Lions, panthers, and other beasts infest the forests, which occur only in the vicinity of the rivers. Minerals are said to be rare in Bornu. The natives manufacture cotton cloth and coats-of-mail, which they use in warfare. The chief exports formerly were slaves and gold-dust. The dominant race, called Shonas, are of Arab descent and are bigoted Mohammedans. Chief town, Ngornu. Pop. about 5,000,000.

History.—Bornu was formerly a part of the kingdom of Kanem, which, founded in the ninth century, rose to its highest point of power in the twelfth. At the end of the fifteenth century, King Ali-Dunamami founded Bornu. It attained its greatest power under Edriss Alaoma (1571-1603), who conquered all the surrounding tribes, and even extended his territory to the shores of the Atlantic. Under his peaceful and extravagant successors the power of Bornu again declined, until in 1808 it could no longer resist the continued attacks of the Fellatah, who took and de-

stroyed the old capital, Birni. The king then established himself at Kuka. An Arab from Fezzan, however, soon defeated the Fellatah at Ngornu. His son Omar removed the old dynasty, and ascended the throne himself in 1855. Although not as strong and determined against his neighbors as his father, his rule has been extremely beneficial for the country, as he has encouraged trade and industry. He also assisted, as much as was in his power, the European travelers who visited his country, among them Denham, Clapperton, Beumann, and Rohlfs, the last of whom says in his account, "No European prince could have assisted a traveler more than Omar, the Negro prince of Sudan, assisted me, the white Christian."

Revised by M. W. HARRINGTON.

Bo'ro Bud'nr, or **Bo'ro Bo'do**: an ancient Buddhistic temple of Java: on the river Probo; 25 miles N. W. of Yugyakarta; believed to be the most elaborate specimen of Buddhist architecture now existing, and to have been built in 1350 A. D. It is a square pyramid, with nine terraces or stories (116 feet high, in all) and 400 feet square at the base, each terrace covered with cells or small houses for monastics, and the whole covered with profuse carvings.

Borodino, bō-rō-dee nō; a village of Russia; government of Moscow; on the Kolocza river; 70 miles W. S. W. of Moscow (see map of Russia, ref. 7-10). It is celebrated as the scene of a great battle between the army of Napoleon (125,000 strong) and the Russian army, of about 130,000 men, commanded by Gen. Kutusof, Sept. 7, 1812. The French remained masters of the field and claimed the victory, but they lost nearly 30,000 men. The loss of the Russians was still greater; some say 50,000 killed and wounded. The French took Moscow a few days after this battle, which they call the battle of the Moskwa; this is the name of a river near the battle-field.

Bor'on [Mod. Lat., formed from *borax*]: an element which Sir Humphry Davy discovered about 1808 by exposing boracic acid to the action of a galvanic battery. Its chemical symbol is B; atomic weight 11; and specific gravity about 2. Combined with oxygen and hydrogen it forms boracic acid, and it occurs in nature only in combination with oxygen, generally in the form of that acid or of BORAX (*q. v.*). Boron is obtained in the form of an olive-brown powder, which is infusible, and has neither taste nor smell. It is not used in the arts in a separate state. It may also be obtained in a graphitoid form in six-sided crystals. Crystallized boron is one of the most unalterable and indestructible of all simple substances. Wöhler and Deville have obtained boron by heating in a crucible a mixture of pure dry boracic acid with the metal aluminium, when the latter unites with the oxygen, leaving the boron as minute quadrate octahedral crystals, called boron diamonds. These rival the real diamond in luster and refractive power, and are scarcely inferior to it in hardness. They scratch glass and the corundum. No acids, pure or mixed, have any effect upon the boron diamond, nor can it be oxidized even when raised to a high temperature.

Revised by IRA REMSEN.

Borough: in England, formerly, a fortified town; an incorporated town; any populous place or a town in general. By a gradual restriction of sense the term borough has come to be used only to designate a town possessing a municipal corporation, and a town which returns one or more members to Parliament. There are often municipal and parliamentary boroughs of the same name, but differing in territorial extent. In Scotland the borough is called a burgh, which term is now used to designate a town having a charter of incorporation. There are royal burghs, with a charter from the king, burghs of regality, with a charter from a lord of regality, and burghs of barony, with a charter from a baron. Of these formerly only royal burghs sent members to Parliament. The citizens or freemen of a borough (called burgesses) formerly might become such by birth, marriage, apprenticeship, and various other ways, according to the custom of the borough. The privileges of the burgesses, which were of very considerable value, and varied with the locality, included such as the right of participation in the income of the corporation, the exclusive right of trading, etc. The possession of these privileges, the restrictions upon the right of citizenship, and the power acquired by the guilds gave rise to corruption and flagrant abuse in government, and they have been swept away by the Reform Act of 1832, the Municipal Corporations Act of 1835, and other subsequent acts. Burgesses are now simply the electors of municipal corporations, and the statutory qualifica-

tions necessary to entitle a person of age to become a burgess are, in general, the occupation of a house or other building and residence within the borough for a stated time, and the payment of poor and borough rates. The representatives of a borough in Parliament are often called burgesses, and by analogy in some of the American colonies the members of the lower house of the legislature were called burgesses. In the U. S. the term borough has no technical meaning except in the States of Connecticut, Minnesota, New Jersey, and Pennsylvania, in which it is used to designate an incorporated town or village of a lower grade than a city. In New Jersey and Connecticut the borough is a part of the township in which it is situated, but in Pennsylvania and Minnesota the boroughs have independent municipal organizations.

P. STURGES ALLEN.

Borough English: a custom existing in some boroughs in England by force of which the youngest son of a person dying intestate inherits all the realty which belonged to his father within the borough. A special modification exists in some boroughs by which land descends to the younger son if he be not of the half-blood, and if he be, then to the eldest son. This custom obtains in the manor of Lambeth, Surrey, in Hackney, St. John of Jerusalem in Islington, Heston, and Edmonton, and in Middlesex, and in other counties.

Borromeo's Islands: a group of four small islands of Northern Italy; in Lago Maggiore. They derive their name from the family of Borromeo. In 1671 Count Borromeo covered them with soil, and converted them from barren rocks into gardens. Their beauty is such that they are sometimes called the "Enchanted Islands." The largest of them is named Isola Madre, and is covered with orange-trees and exotic plants. The most celebrated of the group is the Isola Bella, occupied by a beautiful palace of the Borromeo family, and a garden which rises in ten terraces, presenting the form of a truncated pyramid. Many tropical flowers are cultivated here.

Borromeo, bor-rō-may ō (in Lat. *Borromæus*), CARLO, Saint; b. at Arona, on Lago Maggiore, Oct. 2, 1538; a nephew of Pope Pius IV.; appointed a cardinal and archbishop of Milan in 1560. His diocese was haunted by all the vices of the Charch of Rome and vehemently stirred up by the invasion of the Reformation, whose ideas were poured into the country from Switzerland and found ready acceptance among the excited population, but, placing himself at the head of the Roman Catholic reaction and supported by the Jesuits, he succeeded in reforming his clergy and suppressing the Reformation. He also distinguished himself by the purity and devoutness of his personal life, and was in 1610 canonized by the pope. He wrote several religious works (5 vols. fol. Milan, 1747). D. in Milan, Nov. 3, 1581. See his biography by G. P. Giussano (Rome, 1610; Germ. trans. Regensburg, 3 vols., 1837); C. A. Jones (London, 1877); Charles Sylvain (Milan, 3 vols., 1884).

Bor'row, GEORGE HENRY: author; b. in East Dereham, near Norwich, England, July 17, 1803. He became master of several modern languages, for learning which he had remarkable talents. In his youth he associated with the gypsies. As an agent of the British and Foreign Bible Society he traveled through many countries of Europe. He published in London in 1841 *The Zigeant, or an Account of the Gypsies in Spain*, and in 1843 *The Bible in Spain, or Journeys, Adventures, and Imprisonment of an Englishman in an Attempt to Circulate the Scriptures in the Peninsula*, which is a graphic and interesting work (n. c. 1892). His next work, *Lavengro, the Scholar, the Gypsy, and the Priest* (3 vols., 1851), is regarded as an autobiography, and to it as sequel he added *The Romany Rye* (1857); *Wild Wales* (1862), etc. D. at Oulton, July 30, 1881. See Theo. Watts, *Reminiscences of George Borrow* (Atheurum, Sept., 1881).

Bor'rowstownness', or **Boness'**: a seaport-town of Scotland; in Linlithgowshire; on a low peninsula in the Frith of Forth; 17 miles W. N. W. of Edinburgh (see map of Scotland, ref. 11-11). It has a safe harbor, and manufactures of soap, salt, malt, vitriol, and earthenware. Here are coal mines which extend under the bed of the Forth. Limestone and ironstone are found in the parish, which is traversed by the Roman wall of Antoninus. Pop. (1891) 4,579.

Borsip'pa (in Gr. Βόρσιππα): an ancient city of Babylonia (according to Strabo), but there has been much doubt as to its exact situation. Stephanus calls it a city of the Chaldeans. It was probably situated near Babylon. Strabo states that it was sacred to Apollo and Diana. Some mod-

ern writers believe that Borsippa is represented by the remarkable mound called Birs-Nimrud, 5 miles S. W. of Hillah, the site of Babylon proper. See BABYLON and BABEL.

Borsod, bor'shod: a county of Hungary; bounded N. by the counties of Torna and Gümör, E. by Alba-Ujvar and Szabolcs, and S. and W. by Heves. Area, 1,370 sq. miles. The county consists chiefly of vineyards and wooded hills, except in the S. E., which is a plain traversed by several small rivers, while the Theiss forms the eastern boundary. The chief products are fruit, hemp, tobacco, and wine, that of Miskolcz being the best in Hungary. Copper, iron, and coal are found in the mountains. Pop. (1890) 217,166. Chief town, Miskolcz.

Bory de Saint-Vincent, bō'ree'de-sān'vān'sān', JEAN BAPTISTE GEORGE MARIE, BARON: French naturalist and traveler; b. at Agen in 1780. He explored the island of Mauritius about 1800, and published a *Voyage among the African Islands* (3 vols., 1804). He afterward served as a captain in the army at Austerlitz and in other battles, and became an exile in 1815. With the aid of Van Mons he edited at Brussels the *Annales des Sciences Physiques*, 8 vols. He had the chief command of a scientific expedition which the French Government sent to Algeria in 1839. D. in Paris, Dec. 22, 1846. See Héricart de Thury, *Notice sur le Baron Bory de Saint-Vincent* (1848).

Bos [Lat. ox, cow]: the systematic name for the genus of ruminant animals which comprises the ox, buffalo, etc. See BOVIDÆ and Ox.

Bo'sa: a seaport-town of the island of Sardinia; on the west coast, at the mouth of the Termo; in the province of Cagliari; 30 miles S. of Sassari (see map of Italy, ref. 7-B). Its harbor is safe, but admits only small vessels. It is the seat of a bishop, and has a cathedral, an old castle, and several churches. Pop. 6,706.

Bose, LOUIS AUGUSTINE GUILLAUME: naturalist; b. in Paris, Jan. 29, 1759; educated at Dijon; was an earnest student of botany; held office for a time, but shortly after the fall of Robespierre set out to explore the natural riches of America. He edited the *Dictionnaire raisonné et universel d'agriculture*, and was one of the editors of the *Annales de l'agriculture française*. D. in Paris, July 10, 1828.

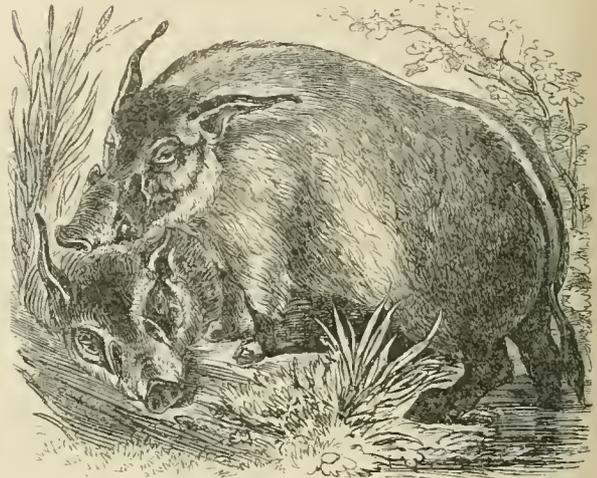

Boscan, bōs-kaan', JUAN: poet; b. at Barcelona about the year 1493. Of his early life little is known, except that he first followed the military career and afterward traveled for several years, spending a considerable part of his time in Italy, devoted to the study of literature and the humanities. In his early poetical efforts he used the Castilian meter, but after 1526, through the influence of his friend Andrea Navagero, then Venetian ambassador to Spain, he began to use the measures of Petrarca, the sonnet and the canzone, and thus introduced the Italian measures in Spanish poetry. His poetical works were published by him in 1543, and embrace his verse in Castilian measure written before 1526, his sonnets and canciones dating from 1527-37, and his larger compositions, such as *Leandro y Hero*, in Italian blank verse, *La Alegoría*, in the octave stanza. Navagero also induced Bosean to translate into Spanish Castiglione's important didactic prose work *The Courtier* (Il Cortegiano). Boscan died in Apr., 1542. The best edition of his poetical works, with a good biographical account, is by W. T. Knapp, *Las Obras de Juan Boscan* (Madrid, 1875). HENRY R. LANG.

Boscawen, EDWARD: English admiral; son of Viscount Falmouth; b. Aug. 19, 1711. He served with distinction under Anson at Cape Finisterre, May, 1747, and commanded an expedition to the East Indies in 1748. He became a vice-admiral of the blue in 1756, was sent to North America, and gained several victories over the French in 1758. In Aug., 1759, he defeated the French fleet in the Bay of Lagos. He received for this service an annual pension of £3,000. D. in Hatchlands Park, Surrey, Jan. 10, 1761. See Campbell, *Lives of the British Admirals*.

Bosch-bok [Dutch, bush-buck; *bosch*, wood, bush]: the *Tragelaphus sylvaticus*, a South African antelope; almost always found in thick underbrush which is not easily penetrated by man. When surprised in the open country it is easily caught, and is prized for its fine venison. It is about 4 or 5 feet long, and has a voice like the barking of a dog. Several other African antelopes have this name.

Bosch-vark [Dutch, bush-pig; *vark*: O. H. G. *farh*; Eng. *farrow*; cf. Lat. *porcus*]: a wild hog of Southern and Western Africa; in size and habits much resembling the common

hog. It has long, pointed ears, a long tail, and is of a dull red color, with white marks. It goes in herds, and the stroke

Bosch-vark, or Guinea hog.

of the boar's tusks is much dreaded. It is the *Potamocheerus africanus*.

Bos'cobel: city; Grant co., Wis. (for location of county, see map of Wisconsin, ref. 7-C); on railroad and Wisconsin river; 70 miles W. of Madison. Pop. (1880) 1,428; (1890) 1,570; (1895) 1,479.

Bos'covich, RUGGIERO GIUSEPPE, F. R. S.: astronomer and natural philosopher; b. at Ragusa, in Dalmatia, May 18, 1701. He entered the order of Jesuits in 1725; became Professor of Mathematics and Philosophy in the Roman College in 1740. He was one of the first on the Continent who adopted the Newtonian philosophy. His Latin poem *On the Eclipses of the Sun and Moon* (1764) was much admired. He wrote various scientific works, among which may be mentioned *Philosophia Naturalis Theoria* (1758) and *Opera Pertinentia ad Opticam et Astronomiam* (5 vols., 1785). The latter is a collection of treatises on optics and astronomy. D. in Milan, Feb. 12, 1787. See Fabroni, *Vita Italorum doctrina excellentium*; Ricca, *Elogio storico dell' Abate R. G. Boscarich* (1789).

Bosio, bō'zē-ō, FRANÇOIS JOSEPH, BARON: sculptor; b. at Monaco, Mar. 19, 1767. He worked in Paris, and was patronized by Napoleon I., for whom he executed busts of Josephine and her daughter Hortense; also the bas-reliefs of the column of the Place Vendôme. Among his masterpieces are the *Hyacinth*, in the Luxembourg; *Cupid Darling Arrows*, and the *Nymph Salmaeis*. His works are remarkable for grace and harmony. He was a member of the French Institute and director of the Academy of Fine Arts. D. in Paris, July 29, 1845.

Bosjesmans: See BUSHMENS.

Bosna-Serai: See SERAJEVO.

Bos'nia: a province of Turkey in Europe; inhabited by a Slavonic tribe akin to the Servians; formerly an independent kingdom; from 1522 to 1878 a province of Turkey, and since that time under the administration of Austria-Hungary; bounded N. by the river Save, E. by the Drin, S. by Albania, and W. by Dalmatia. Area of Bosnia and Herzegovina, 23,262 sq. miles. The surface is for the most part mountainous, and the Dinaric Alps extend along the western border. Some peaks of this range rise about 7,000 feet above the level of the sea. The largest rivers, besides the Save, are the Bosna, the Verbas, the Narenta, and the Drin (or Drina). The mountain-slopes are covered with forests of oak, beech, chestnut, and other trees. The soil of the plains and valleys is fertile, and produces good crops of maize, wheat, hemp, and various fruits. Cattle-grazing is an important industry. Bosnia is rich in coal, iron, lead, and other metals, but the mines are not worked to a great extent. This province has few manufactures except firearms, sabers, and knives. There are 342 miles of railway and 1,743 miles of telegraph lines. The population is a mixture of Bosnians, Croats, Morlaks, Turks, Illyrians, Jews, gypsies, etc., the majority being of the Slavic race. Capital,

Sarajevo; other important towns, Mostar and Baniiluka. Pop. in 1885, 1,148,517, and of Herzegovina, which is generally associated with it, 187,574, making a total of 1,336,091, of whom 492,710 were Mohammedans (not Turks, but Bosniaes, or of Slavonic race), 571,250 Bosniaes of the Greek Orthodox Church, 265,788 Roman Catholics, and 5,805 Jews. Jan. 1, 1888, the population was estimated at 1,404,000.

History.—Settled by Slavs in the fifth or sixth century, it was under the sway of the Byzantine empire for several centuries; at one time a powerful kingdom, it was, both before and after, in turn the prey of Hungary, Servia, the German empire, and the popes; its inhabitants, largely Protestants, repelled the attempts of all to convert them, and maintained their own faith amid terrible persecutions, till at last, in sheer despair, they surrendered to the Turks in 1463 to 1483, and their children were made Mohammedans by force. In the Russo-Turkish war of 1877-78 they opposed Turkey, and were finally annexed to Austria. See *Through Bosnia and the Herzegovina*, by A. J. Evans.

Revised by C. K. ADAMS.

Bosphorus, or Bos'porus, (Gr. Βόσπορος; popularly, if not properly, interpreted as ox-ford); the strait which connects the Black Sea (Pontus Euxinus) with the Sea of Marmora (Propontis); forms part of the boundary between Europe and Asia. It is about 16 miles long, and varies in width from $\frac{1}{2}$ a mile to 2 miles. The Bosphorus is deep, and flows between high shores and cliffs which present much picturesque scenery, the beauty of which is enhanced by many ancient ruins. Constantinople stands at the southwest end of the Bosphorus, which is sometimes called the Strait of Constantinople. It was also called the Thracian Bosphorus, to distinguish it from the Cimmerian Bosphorus, the modern name of which is the Strait of Yenikale.

Bosphorus, Cimne'rian (Gr. Βόσπορος Κιμνέριος): the ancient name of the Strait of Yenikale (or Strait of Kaffa); connects the Black Sea with the Sea of Azov (Palus Mæotis). The width of the narrowest part is about 3½ miles. On the west side of it was a Milesian colony and the city of Panticapæum, which was the capital of a kingdom founded by the Archaeanactide in 480 B. C. This kingdom endured several centuries under various dynasties, whose dominions were on both sides of the strait. A bridge across the Bosphorus from Scutari to Stamboul was projected in 1892.

Bosquet, bos'kē', PIERRE FRANÇOIS JOSEPH: French general; b. at Mont de Marsan, Nov. 8, 1810. He served in many campaigns in Algeria, became a general of brigade in 1848 and a general of division in 1853. In the Crimean war he commanded a division at Alma, and rendered important services at Inkermann 1854, for which he received the thanks of the British Parliament. He was disabled by a wound at the siege of Sebastopol, Sept., 1855, but was, on account of his great merits, made a senator and marshal of France in 1856. He took, however, no part in politics. D. Feb. 5, 1861.

Boss, Lewis: astronomer; b. at Providence, R. I., Oct. 26, 1846; graduated at Dartmouth College in 1870; in 1872 became astronomer of the U. S. northern boundary commission, a position which he held during four years. His duty was to prepare the data for a very accurate determination of the latitudes of the various points of observation on the boundary line, and in order to do this he prepared a catalogue of the declinations of 500 of the principal fixed stars. This work was done with such thoroughness and ability that it at once gave the author, who was previously unknown, a European reputation, and has since been adopted as the standard by the office of the American Ephemeris. In 1876 he was appointed director of the Dudley Observatory, Albany, N. Y., where he undertook the preparation of one of the catalogues of stars which were being prepared by co-operation among several of the leading observatories of Europe. He pushed this work with such energy that, although he was the last to enter the field, his completed work was the first to be published. In 1882 he went to Santiago, Chili, as chief of the U. S. party to observe the transit of Venus. In 1889 he was elected a member of the National Academy of Sciences, and in 1890 an honorary foreign associate of the Royal Astronomical Society.

S. NEWCOMB.

Bossi, bos'scē', LUIGI: Italian antiquary and historian; b. in Milan, Feb. 28, 1785. He was appointed prefect of the archives of the kingdom of Italy by Napoleon. Among his numerous works are a *History of Italy* (19 vols., 1819-

23) and an *Introduction to the Study of the Arts of Design*. D. in Milan, Apr. 10, 1835. See G. B. Carta, *Crani biografici intorno al Cavaliere L. Bossi* (1835).

Bossuet, bos'sū'ay', JACQUES BÉNIGNE, D. D.: French pulpit orator and theologian; b. at Dijon, Sept. 27, 1627. He entered in 1642 the College of Navarre in Paris, where he studied Greek, Latin, philosophy, and theology. In 1652 he was ordained a priest, received the degree of doctor of divinity, and became Canon of Metz. Having become renowned as a pulpit orator, he was appointed to preach the Advent sermons before the king and court in 1661. In the ensuing years he preached in many churches of Paris, and converted Marshal Furenne to the Catholic communion. He was appointed Bishop of Condom in 1669; preceptor to the dauphin in 1670; and Bishop of Meaux in 1681. For the dauphin he wrote a *Discourse on Universal History* (Paris, 1681; latest Eng. trans. London, 1810), which marks a new stage in the study of the philosophy of history. He was also the author of four articles which were adopted by an assembly of French clergy in 1682, and which secured the liberties of the Gallican Church against papal aggression. Against the Protestants he wrote his eloquent *Exposition of the Doctrines of the Catholic Church on Subjects of Controversy* (1671; latest Eng. trans. London, 1841), but his principal polemical work against the Protestants is his *History of the Variations of the Protestant Churches* (2 vols., 1688; latest Eng. trans. Dublin, 1836, 2 vols.). It is an attempt to argue from the alleged contradictory teachings of Protestantism, as shown in the various confessions of the sixteenth and seventeenth centuries, in favor of the Church of Rome, which has doctrinal stability. But the polemic is often partisan. He was involved in a controversy with Fénelon, whom he censured for his defense of Madame Guyon and her quietism, and whom he treated in an arrogant and supercilious way without understanding him. He applauded the Revocation of the Edict of Nantes (1685). He was very learned, and particularly well read in the Bible. D. in Paris, Apr. 12, 1704. Among his most admired compositions are his *Funerel Orations on the Prince of Condé, on the two Henriettas of England, and other eminent persons* (Eng. trans.). His complete works were published at Bar-le-Duc in 10 vols., 4to, 1877; and some recently discovered at Paris, 1883, 2 vols. See L. F. de Bausset, *Histoire de Bossuet* (4 vols., Versailles, 1814; 2d ed. Besançon, 1846, 3 vols.); l'Abbé François le Dieu, *Mémoires et Journal sur la Vie et les Ouvrages de Bossuet* (4 vols., Paris, 1856-57); A. Floquet, *Études sur la Vie de Bossuet, jusqu'à son entrée en fonctions en qualité de précepteur du dauphin 1627-1670* (3 vols., 1855); same author, *Bossuet précepteur du Dauphin et Evêque à la Cour 1670-1682* (1864); H. L. Farrer [Lea], *Bossuet and his Contemporaries* (London, 1874; 2d ed. 1877); G. Lanson, *Bossuet* (1891). Revised by S. M. JACKSON.

Bossut, bos'sū', CHARLES: French geometer; b. near Lyons, Aug. 11, 1730; was a friend of Fontenelle. He was admitted into the Academy of Sciences in 1768. Among his works are a *Treatise on Mechanics and Dynamics* (1763); a *Complete Course of Mathematics* (7 vols., 1795-1801); and an *Essay on the General History of Mathematics* (2 vols., 1802). He published an edition of Pascal's works. D. Jan. 14, 1814. See J. B. J. Delambre, *Éloge de Bossut*.

Bostan, Al: See ALBISTAN.

Boston: a complex but exceedingly interesting game of cards, played with two packs, which count as in whist. The players bid in turn for the privilege of undertaking to do any one of fifteen different things, which rank in the order of difficulty, and vary from taking all the tricks to playing with hand open on the table and taking no tricks. There are, consequently, no poor hands, as in whist. For the somewhat complicated details of the game, see *Hoyle's Games*.

Boston [perhaps degenerated from Botolph's Town]: an ancient borough and seaport of Lincolnshire, England; is on both sides of the river Witham (see map of England, ref. 8-J). It is on the Great Northern Railway; 107 miles by rail N. of London. Vessels of 300 tons can ascend the river to this place, which is supposed to be identical with Icanhoe, where St. Botolph founded an abbey in 654 A. D. About 1200 Boston was one of the chief seaports of England. Here is the parish church of St. Botolph, built in 1309, 245 feet long, with a tower 290 feet high, surmounted by a lantern which is visible nearly 40 miles at sea. Boston has

manufactures of canvas, iron, brass, ropes, hats, leather, etc. Pop. (1891) 14,593.

Boston: the capital of Massachusetts, in Suffolk co. (for location, see map of Massachusetts, ref. 3-1), and the metropolis of New England; situated at the west extremity of Massachusetts Bay, about 450 miles by railroad N. E. of Washington, and 232 miles N. E. of New York: the State-house is in lat. 42° 21' 27.6" N., lon. 71° 3' 30" W. Founded in 1630 by Puritan colonists from England under the lead of John Winthrop and Thomas Dudley.

Original Site.—The site was originally a pear-shaped peninsula, in its extreme length less than 2 miles, and its greatest breadth a little more than 1, bounded N. and W. by the Charles river, expanded into a broad estuary in its northwest sweep into the deep water of the harbor. It was attached to the mainland at Roxbury by a slender stem or neck a mile in length, so low and narrow between tide-washed flats that it was often submerged. The water on the N. of this isthmus was an inlet of the Charles nearly a mile wide, called the Back Bay, and that on the S. was an inlet of the harbor, named the South Bay. The peninsula was deeply indented by coves and bordered by salt-marshes, and its surface was abrupt, irregular, and diversified by three hills. Such essentially were the natural features of Boston of a hundred years ago, with its narrow, crooked streets, lanes, alleys, and its detached buildings, only four being of stone, of which King's chapel alone remains, and comparatively few of brick, including Faneuil Hall, the Town (now Old State) house, Christ church, and the Old South meeting-house, still preserved as historic landmarks. At the time of the Revolution it was the richest and most populous city in the U. S., yet it contained only 2,000 buildings and less than 20,000 inhabitants.

Modern Changes.—Excepting three ancient burying-grounds and a dozen or so old buildings, not a vestige of the town as it appeared a century ago remains. The original site has been completely transformed. Every part has been graded, the steep hills having been reduced or wholly removed. The highest remaining eminence, Beacon Hill, crowned by the State-house (built in 1795), the loftiest peak of which once rose 138 feet, is now but 110 feet high.

State Capitol, Boston, Mass.

The coves, inlets, creeks, and marshes of the northerly borders have been converted into solid land covered with thoroughfares and business blocks, and fringed with wharves and docks; the broad bays on the opposite side have been filled, and thousands of acres and flats on the E., W., and S. have been reclaimed and covered by streets, squares, warehouses, and dwellings, so that where the area was the narrowest it has become the widest; and thus the original 783 acres of solid land comprised in the old peninsula have become 1,829. This constitutes the present city proper, so called. In the meantime additional territory has been acquired by the annexation of neighboring cities and towns, and through the reclamation of the flats of what are now South Boston and East Boston, earlier absorbed, increasing the aggregate area within the city limits to 23,707 acres (37.01 sq. miles)—more than 30 times as great as the original area. The extreme length of Boston from N. to S. is now 11 miles, and the breadth E. to W. 9 miles. South Boston was formerly Dorchester Neck, a part of Dorchester, annexed to Boston in 1804, and East Boston was Noddle's

island. The other territorial acquisitions, called districts, are Roxbury, annexed in 1868; Dorchester in 1870; and Charlestown, West Roxbury, and Brighton, in 1874.

Streets and Buildings.—The watercourses around Boston proper are spanned by numerous bridges, East Boston only being reached by ferry, that the harbor may be open to the navy-yard in Charlestown. Washington Street (originally a series of streets bearing different names), now extending from Haymarket Square to and through the Roxbury dis-

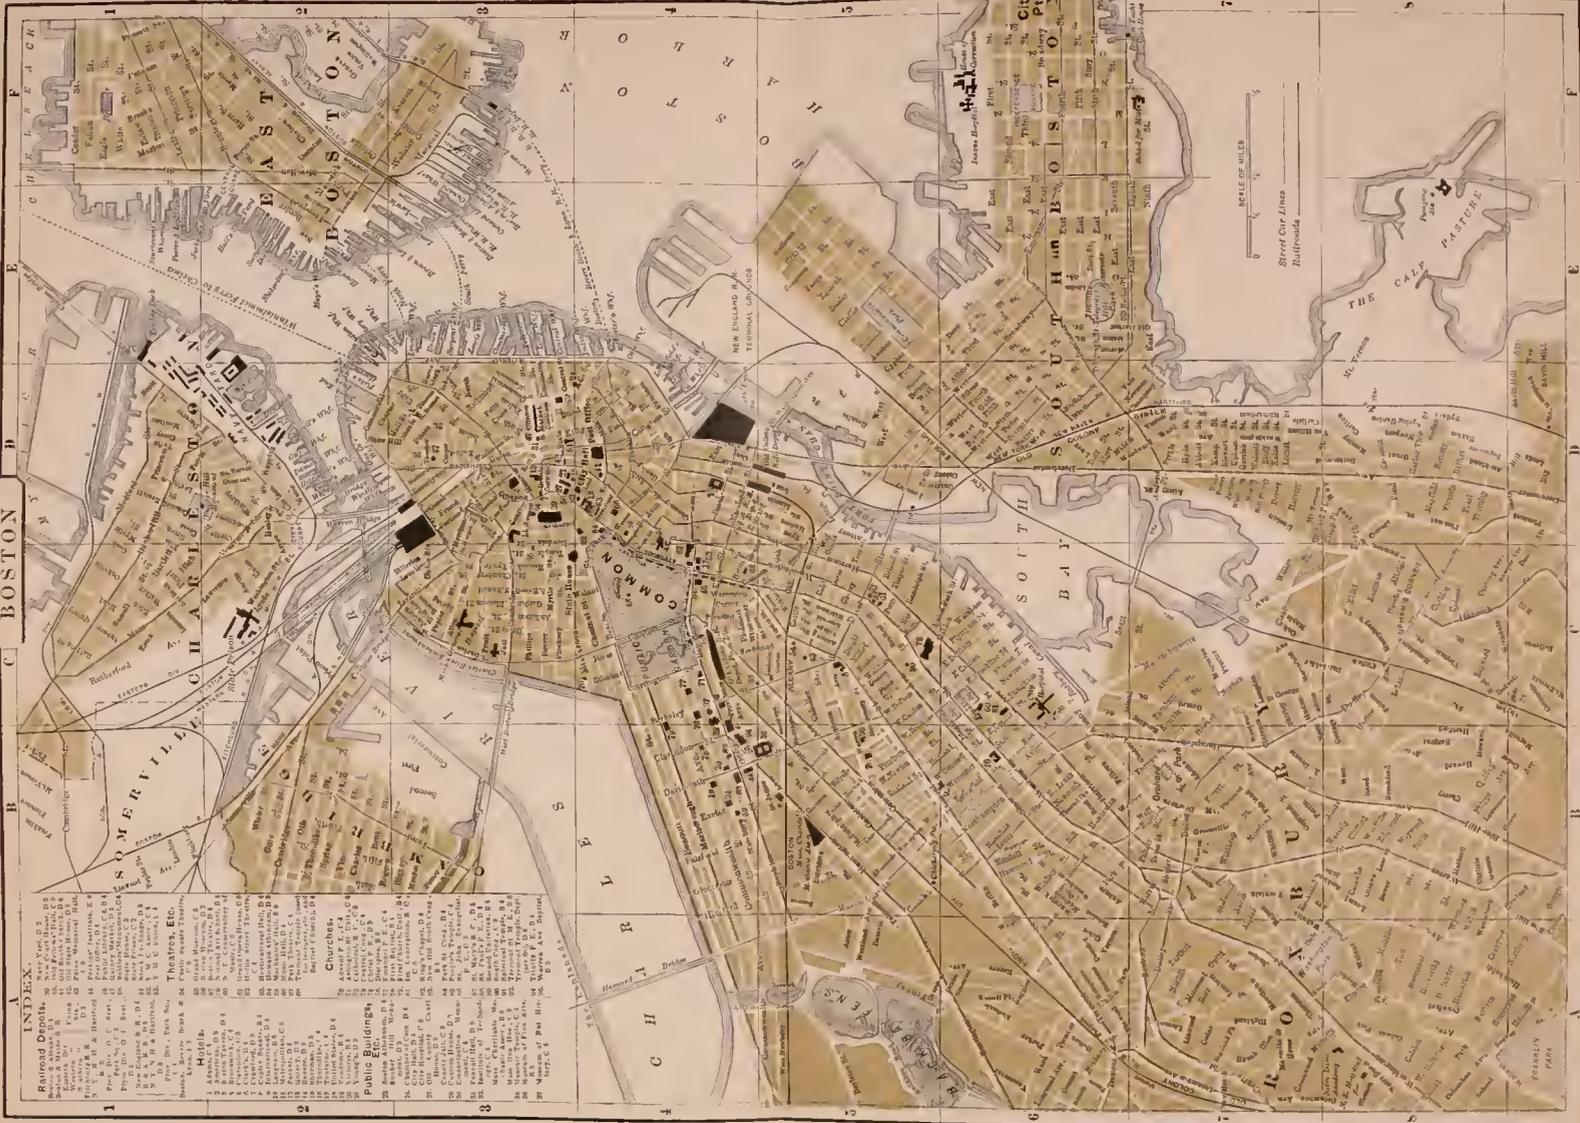

The City Hall.

trict, has always been the main thoroughfare. Tremont Street, from Scollay Square also to Roxbury, is another important artery. State Street is the financial center. Atlantic Avenue, 100 feet wide, extends along a portion of the water-front at the head of the principal wharves. Many of the old streets have been straightened, widened, and extended at enormous expense; and in place of the waters of the Back Bay has grown up the "New West End," a region of broad streets and stately avenues, lined with costly and often elegant dwellings, noble churches, fine public and private buildings, famous institutions, great hotels and apartment-houses; remarkable especially for the taste displayed in its embellishment and the richness and variety of its architecture. Beacon Street, sweeping over Beacon Hill, for years the finest residential quarter, is now continued across the Back Bay into the Brighton district. Commonwealth Avenue, 250 feet wide, with a mall in the center, also extending through the Back Bay section, is one of the finest boulevards in the world. Near the heart of Boston proper is the Common, set apart for public use by the first settlers, a rare old park (43½ acres), with broad malls and pleasant by-paths shaded by elms, lindens, and other graceful trees; and beyond, separated from it by a single street, is the exquisite Public Garden (24 acres), the gateway to the Back Bay quarter. In these and other public places are numerous statues and monuments, of which the most noted is the equestrian statue of Washington, by Thomas Ball, in the Public Garden. The greater public-park system consists of a chain of parks beginning with the Back Bay Fens, extending through parkways to Franklin Park (520 acres) in the West Roxbury district, and along the shores of Dorchester Bay to the Marine Park at South Boston. The system also includes an embankment with a series of parks and boulevards along the city shore of the Charles river, and independent parks in East Boston and Charlestown. The city has thus far expended in this enterprise upward of \$7,000,000. The street railway system is extensive, and electric cars are employed. The five great trunk-lines radiating from the city connect it with all parts of New England, and the far West, South, and East.

Public Free Schools and Libraries.—The system of public free schools has long been the special pride of the city. It comprises kindergarten, primary, grammar, high, Latin, normal, and special schools, in which 67,022 pupils are taught by 1,577 teachers. The 188 school-houses, contain-

Railroads

ing 1,427 school-rooms, are valued by the assessors at \$8,574,500. The total school expenses for 1891-92 were about \$2,000,000. The system is wholly supported by money drawn from the general tax levy of the city. The school board is composed of the mayor, who is president, and 24 members chosen by the citizens for three years. The supervision of the schools is exercised by a superintendent and 6 supervisors, salaried officials. In the number and extent of its libraries Boston stands at the head of American cities. The Boston Public Library, opened in 1854, is wholly free, and is supported by the city at an annual expense of about \$125,000. It is the largest library in the world for free circulation. With its 10 branches it contains 556,280 volumes, and the annual circulation is over 1,000,000 volumes. Its executive force consists of 140 persons. A new public library building on Copley Square, Back Bay, costing upward of \$2,225,000, has been provided. It is a monumental structure, of elegant proportions, the interior especially enriched by some of the best of modern decorative work. Among other notable libraries are those of the Boston Athenæum (founded in 1807), the Massachusetts Historical Society (founded in 1791), N. E. Historic-Genealogical Society, Boston Society of Natural History, and Massachusetts Horticultural Society. The literary, scientific, and other learned societies of the city are numerous; and conspicuous among the higher institutions for instruction are the Massachusetts Institute of Technology, the Boston University, the Boston College (Roman Catholic), the medical and dental schools connected with Harvard University, the Massachusetts Normal Art School, and the New England Conservatory of Music. The Boston Museum of Fine Arts (organized 1870) ranks among the most important in the world.

Commerce and Finance.—Boston has been from the first a leading commercial city. Its advantageous situation upon a harbor, deep, secure, unobstructed by sand-bars, and containing nearly 60 sq. miles of anchorage, was early appreciated by the people, and the shipping interests were rapidly extended. There are nine different steamship lines to Europe and several important coastwise lines. Boston is the principal mart of the country for the sale of wool, shoes, and leather, and it is the business and financial center of most of the manufacturing establishments of New England. The first bank in America was established here in 1686, and the first savings institution in 1816. There were in 1892 in the city 60 national banks with a cash capital of \$53,400,000, and a surplus amounting to \$20,161,475. The clearing-house business amounts to \$5,000,000,000 yearly. The valuation of taxable property in 1800 was \$15,095,700 and the tax levy \$80,000; in 1892 the valuation was \$911,638,887 and the tax levy \$14,366,489.50; the valuation in 1893 was \$1,093,145,989. The total net funded debt, Jan. 1, 1893, was \$30,539,289.67. The works for the water-supply are elaborate and extensive. Cochituate Lake works were completed in 1848; thirty years later the Sudbury river works were added, which more than doubled the original capacity of the system; and with the annexation of Charlestown came the Mystic Lake works, constructed in 1864. The cost of construction of these combined works was upward of \$23,000,000.

Manufactures.—The State census of 1885 reported 5,199 manufacturing establishments, embracing a great variety of articles; capital, \$73,346,258; hands employed, 57,607; wages paid, \$27,035,571; value of products, \$144,376,202. According to the U. S. census of 1890, Boston had in that year 7,915 manufacturing establishments, with a capital of \$116,644,890, employing 90,198 persons; wages paid, \$54,636,695; value of product, \$208,104,683.

History.—Boston remained for nearly two centuries under the simple form of a town government by all the citizens assembled in "town-meeting." The city charter was granted in 1822. The present government is composed of a mayor, 12 aldermen, and a common council of 72 members annually elected. There are commissioners for fire, water, health, streets, parks, public institutions, and police, and boards for various other departments of the public service. In and near Boston were enacted the first scenes of the drama of the Revolution. From the old town the British troops went out to meet the "embattled farmers" at Lexington and Concord, and to fight the battle of Bunker Hill, the site of which is now within the city limits; then followed the "siege of Boston" and the evacuation by the British, forced by Washington, Mar. 17, 1776. On the evening of Nov. 9, 1872, the great Boston fire broke out and destroyed

the most substantial business portion of the city, sweeping over 65 acres, covered mostly with wholesale warehouses, nearly all being of brick or granite, involving a loss of over \$75,000,000. In a little more than two years afterward the whole "burnt district," with widened and improved thoroughfares, was again covered with solid business edifices. Pop. (1800) 21,937; (1880) 362,839; (1890) 448,477; (1895) 496,920.

Revised by EDWIN M. BACON.

Boston University: chartered by the Legislature of Massachusetts in 1869, is in organization and in its affiliations unique. There are two departments, admission to which does not presuppose a preliminary collegiate education, and these are called the Colleges of Liberal Arts and Agriculture respectively. There are three for students who have completed a course in the liberal arts—viz., the Schools of Theology, Law, and Medicine. All these colleges and schools have separate faculties and separate administrations. There is also a department of general post-graduate study in language, philosophy, and science, known as the School of All Sciences. The university council consists of the president of the university and the deans of all the colleges and schools. The university senate consists of all members of the university council, together with all regular professors in the different faculties. The corporation consists of not less than ten nor more than thirty trustees, each elected for a term of five years. Property to the amount of \$1,492,000 is held by this body. The three original incorporators were Isaac Rich, Esq., the Hon. Lee Claflin, and the Hon. Jacob Sleeper, all of whom had held responsible positions in the government of one or more of the older New England colleges, and the last of whom had served as a State-appointed overseer of Harvard University for twelve years. The governor of the commonwealth who officially approved and signed the charter was a son of the second of the original incorporators. Sixty-four free scholarships in the College of Liberal Arts have been established in honor of Isaac Rich, first founder and the chief benefactor of the university. Two fellowships and more than 200 other scholarships have been founded in the university. The place of the College of Agriculture is supplied by the Massachusetts Agricultural College, at Amherst, Mass. By virtue of a special arrangement, the faculties of the National University, at Athens, and of the Royal University, at Rome, are so associated with the School of All Sciences that students in the latter can receive instruction in those universities without charge, and on returning and passing the requisite examination be promoted to advanced degrees in Boston University. The number of instructors in 1892 was 118 and of students 1,069.

WILLIAM F. WARREN.

Bos'tra, or Bots'rah, sometimes spelled **Boz'rah**: formerly a great city of Arabia, now in ruins; in an oasis of the Syrian desert, about 75 miles S. of Damascus, and about 40 miles E. of the Jordan. It was in the southern part of the district of Auranitis, the modern Hauran, of which it was the capital in the Middle Ages. It was beautified by Trajan, who made it the capital of the Roman province of Arabia about 105 A. D. The Roman Emperor Philip gave it the title of *Metropolis*, probably because it was his native place. It was described as a great and populous city about 300 A. D. The important ruins of Bos'tra are described by Burekhardt in his *Travels* and Robinson in his *Biblical Researches* (vol. iii.). *Bos'tra*, though sometimes called *Boz'rah*, must not be confounded with the Idumean city of that name. See BOZRAH.

Bos'well, JAMES, of Auchinleck; biographer of Dr. Johnson; b. at Edinburgh, Oct. 29, 1740. He studied law, and in 1763 became acquainted with Dr. Johnson; in 1773 was chosen a member of the literary club established by the latter in London. He diligently noted and recorded the sayings, opinions, and actions of Dr. Johnson, of whom he was an intimate associate. His *Life of Samuel Johnson* (2 vols., London, 1791) is a remarkable, and in many respects an admirable, biography; best ed. by George Birkbeck Hill, 1887, 6 vols. D, in London, May 19, 1795. See Macaulay's review of Boswell's *Life of Johnson* in the *Edinburgh Review* for 1831, and *Life* by Percy Fitzgerald, 1891, 2 vols.

Boswel'ia (named in honor of John Boswell, a physician) a genus of trees of the family *Bursaceae*, natives of India, Persia, and Arabia. The flowers have five petals and a crenulated granular disk. The fruit is a triangular capsule with three valves, three cells, and one seed in each cell. The number of known species is small. The *Boswellia serrata* is a large tree with pinnate leaves, each of which has

about ten pairs of hairy, serrate leaflets and one odd leaflet. It has small pink flowers in axillary racemes. This tree yields the fragrant resin called *olibanum*, which is believed to be identical with the frankincense of the ancients. See *OLIBANUM*.

Bos'worth: a market-town of Leicestershire, England: on an eminence 10 miles W. of Leicester (see map of England, ref. 9-H). On a moor near this town was fought in Ang., 1485, the battle of Bosworth, or Bosworth Field, in which Richard III. was defeated and killed. This battle terminated the civil war of the Roses, and raised Henry VII. to the throne.

Bosworth, JOSEPH, D. D., F. R. S.: philologist; b. in Derbyshire, England, 1789; took degree of M. A., and later LL. D., at Aberdeen; studied at Trinity College, Cambridge; was ordained priest 1815; became vicar of Horwood Parva, in Buckinghamshire, 1817; resided in Holland as British chaplain 1829-40; became vicar of Waith, Lincolnshire, 1840; rector of Water Shelford, Buckinghamshire, 1857; Rawlinson Professor of Anglo-Saxon, Oxford, 1858. D. at Water Shelford, May 27, 1876. He devoted much time to the study of Anglo-Saxon, and published a *Dictionary of the Anglo-Saxon Language* (1838), an enlarged edition of which, by T. N. Toller, is now being published at Oxford (1882-1892).

Botanic Garden: a garden in which collections of growing plants are reared for the purpose of instruction or scientific study. Such collections have been made and temporarily maintained from time to time in the past. It is said that Mithridates and Attalus established botanic gardens in Pontus and Pargamus more than 2,000 years ago, in which poisonous plants were reared and experiments made with others as antidotes to poisons. Modern botanic gardens are usually connected with universities, or are under government control for economic purposes. The most noted are the Royal Gardens, at Kew, near London, which originated about 200 years ago on a private estate, afterward becoming a royal property, which was transferred to the Government in 1841 with the present title. Other botanic gardens are now maintained in Cambridge, Oxford, Edinburgh, and Dublin, the whole number in Great Britain being 11. In France there are 19 botanic gardens, of which the Jardin des Plantes in Paris is the most noteworthy. Germany has 25, nearly every important city or university town maintaining one. Austria-Hungary has 14; Switzerland, Belgium, Holland, and Scandinavia, 4 each; Italy, 21; Russia, 2; Roumania and Portugal, 2 each; Greece, Servia, Spain, and Denmark, 1 each. The total number in Europe is about 125. In many of the British colonies botanic gardens are maintained by the Government, there being in the West Indian region 3; in the Cape region, 8; Australian, 6; East Indian, 8; Canada, 1. The Dutch Gardens at Buitenzorg, in Java, are noted. There are 5 botanic gardens in South America—viz., in Rio de Janeiro, Quito, Lima, Santiago, and Buenos Ayres.

In the U. S. there are many considerable collections of plants grown for instruction and study, but few bear the name of botanic gardens. Many of the larger universities, and usually all of the agricultural colleges, have such collections, which are, in fact, botanic gardens in everything but the name. Some of the public parks, e. g. in Boston, New York, and Chicago, contain excellent botanic gardens, although they do not bear that name in published reports. The botanic garden and the Arnold Arboretum of Harvard University, the botanic gardens of the U. S. Department of Agriculture at Washington, and the Missouri Botanic Garden in St. Louis are the most extensive plant collections in this country.

CHARLES E. BESSEY.

Botany [formed from Gr. *βοτάνη*, plant]: the science of the vegetable kingdom. It includes all inquiries as to the structure, physiology, development, classification, and distribution of all those living (or once living) things which we call plants.

Plant Defined.—It is no easy task to trace the line which separates plants from animals. They are unlike enough in their higher forms, but many of the lower plants and animals are so much alike that naturalists are by no means agreed as to whether they are to be placed in this or that kingdom. We can not at present frame a definition which will certainly include all plants and exclude all animals. The most we can do is to bring together those characters which separate the greater number of plants from animals, and then to associate with the plants so set off such of the

remaining organisms as appear to be more plant-like than animal-like. Accordingly, we may say that, for the most part, plants are cells inclosed in walls of cellulose, or aggregates of such cells, all or part of which contain chlorophyll, by means of which they are able to appropriate carbon from inorganic matter (carbon dioxide). The organisms so set off constitute the bulk and mark the principal divisions of the vegetable kingdom.

There are, however, many plants which have suffered more or less degeneration through having become parasitic or saprophytic; these are colorless, and are incapable of appropriating carbon from carbon dioxide; they are often greatly reduced as to their vegetative organs, and in many cases even their reproductive organs have suffered great degeneration. These degraded plants must be assigned to such positions in the vegetable kingdom as will best show their relationships. It may be remarked in passing that in many attempts to define plants the true relation of these degenerated ones has been overlooked, and they have been treated as though they represented separate types instead of degradations from chlorophyll-bearing types, thus leading to no little confusion of ideas, and to a serious misunderstanding of the true nature of plants.

Anatomy and Physiology.—If we examine under a microscope some of the green shiny coating growing on the north side of a tree or wall, we find it to be composed of minute balls of soft matter (here colored green), each surrounded by a harder coat. The soft matter is known as protoplasm and its cover as the cell-wall; the protoplasm and wall are called a cell. Similar examination of a bit of compressed yeast will show similar roundish balls of soft matter, each surrounded by a cell-wall. Here, however, the protoplasm is not green, and we find on further investigation that plant protoplasm is itself not green, and that the green color is imparted by a stain to which the name chlorophyll has been given. These cells, whether green or not, freely absorb watery solutions, which are transformed into cell-matter by the protoplasm. Green cells supplied with water and carbon dioxide make the carbon compound, starch, ($C_6H_{10}O_6$) when in the sunlight, and this is afterward transformed into cell-matter. Colorless plants can not make starch, and are dependent upon other organisms for their supply of carbon. Thus while the green cell supplies itself with carbon in the starch which it makes, the yeast cell is dependent upon the starch in flour (made by some cereal). See *CELL* and *PROTOPLASM*.

Now, all plants are made up of cells having essentially the structure of those here described. In many plants all the cells are green, and able to make starch; in many others some of the cells are green, while the remainder are colorless, in which case the latter are dependent upon the former for their carbon; in still others all the cells of the plant are colorless, resulting in the complete dependence of the plant upon some other organism (parasitically or saprophytically).

In few-celled plants the cells may be alike in form and function, but as the number of cells is increased there is always a differentiation both in form and function. In the higher plants we have masses of similar cells occupying particular portions of the plant body, and having similar functions. Such cell-masses are known as tissues, and may be briefly designated as follows:

- I. Soft tissue (*parenchyma*), of short, thin-walled cells.
- II. Thick-angled tissue (*collenchyma*), of elongated cells whose angles are thickened.
- III. Stony tissue (*sclerenchyma*), of short, thick-walled cells.
- IV. Fibrous tissue, of elongated, usually pointed, thick-walled cells.
- V. Milk tissue (*laticiferous tissue*), of elongated cells, or rows of cells, containing a milky fluid.
- VI. Sieve tissue, of rows of enlarged and elongated cells, connected by perforated walls.
- VII. Tracheary tissue, of enlarged and elongated cells with their walls thickened in rings, spirals or reticulations.

Soft tissue may be regarded as typical plant-tissue, inasmuch as it constitutes the essential part of every plant. All assimilating, growing, and reproductive organs are composed of parenchymatous cells. The other tissues are accessory, and serve to protect, strengthen, or connect the masses of soft tissue.

The simplest plants are composed entirely of soft tissue, although even here the cells may show some differentiation. In large plants there must be some means for supporting and strengthening the plant-body. This is accomplished by

the development of fibrous or stony cells, that is, by thick-walled cells, which may be long or short. These may de-

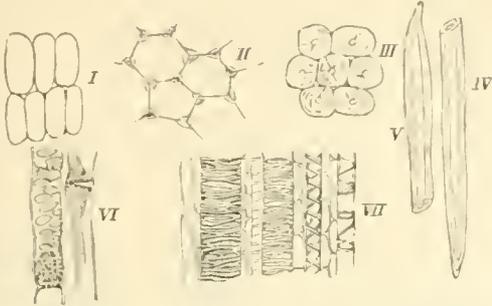

FIG. 1.—Illustrations of tissues, highly magnified: I. Soft tissue from a leaf; II. Thick angled tissue; III. Stony tissue from hickory nut; IV, and V, Fibrous tissue in longitudinal section; VI. Sieve tissue from squash stem; VII. Tracheary tissue of various forms.

velop in the boundary region, or in the axial. In the simplest cases these strengthening cells form poorly defined bundles of elongated cells with

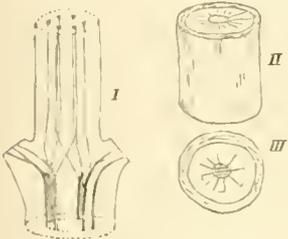

FIG. 2.—Illustrations of fibro-vascular systems: I. Diagrammatic figure showing the courses of the bundles in an herbaceous stem; II, and III. Fibro-vascular system in a woody plant, consisting of a woody cylinder with pith in the center, and surrounded by bark.

The *plant-body* in the simplest plants is the cell itself. Where the plant consists of a row of cells, there is very commonly a distinct base which is prolonged into root-like "hold-fasts," while the opposite end of the cell-row is as distinctly apical in structure. The cell-layers or masses (*thallomes*), branched or not, so common in the lower water-plants, and in some terrestrial plants, e. g. liverworts, have a marked axial polarity, and usually are distinctly bilateral. The *plant-body* in higher plants (*shoot* and *root*) exhibits axial polarity, and is usually polysymmetrical.

The *plant-body* is thus either (1) a *cell*, (2) a *filament*, (3) a *thallome*, or (4) a *shoot* (with *root*).

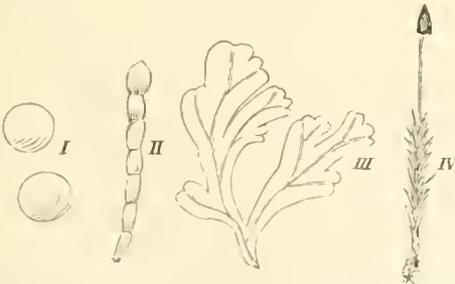

FIG. 3.—Illustrations of the plant-body: I. Simple cell of Protococcus, magnified; II. A filament, or chain of cells of Eulogonum, magnified; III. A thallome of Marchantia, natural size; IV. A shoot of a moss, slightly reduced.

All these types of *plant-body* may remain simple, or they may become more or less branched. Moreover, the line of demarcation between one and the other is very poorly defined. Thus a few cells may be feebly connected, forming a weak filament which very easily breaks up into separate cells. In like manner a number of filaments may cohere into a kind of weak thallome, and the thallome by lateral

lobing (forming *leaves*) may approach and gradually merge into the shoot.

Terminology.—In the accurate description of plants it is necessary that many terms should be used with fixed and exact meanings. This has given rise to a myriad of technical terms which constitute the glossology or terminology of the science. It is unfortunate that these terms have been needlessly multiplied, each branch of the vegetable kingdom having, to a great extent, its special terminology. It would be out of place in this article to attempt to give a complete account of the terms used in all departments of botany. Nor is it desirable to take up those only which relate to the flowering plants, as is so frequently done, inasmuch as it would tend to confirm the too common impression that botany is essentially the study of flowering plants.

Branching.—In the branching of the *plant-body* there are two types, viz., terminal and lateral. In the first the

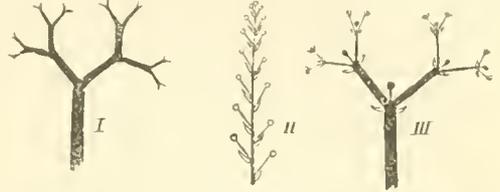

FIG. 4.—Illustrations of branching: I. Terminal (dichotomous) branching; II. and III. Lateral (monopodial) branching; II. Indefinite (or racemose); III. Definite (or cymose).

branches arise at the growing apex of the body, usually in two (dichotomous branching), or occasionally in three (trichotomous), or even in four (tetrachotomous). In the second (monopodial) the branches always arise on the sides of the body, but even here they usually originate near to the growing apex. In a series of branches on the side of the *plant-body* those toward the base are usually the oldest, while those nearest the apex are the youngest. Occasionally a branch originates, and after a short growth ceases to de-

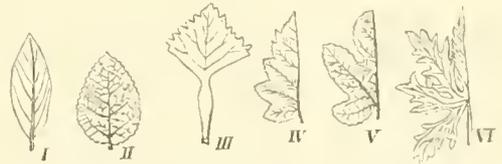

FIG. 5.—Illustrations of the branching of flat structures: I. Entire margin; II. Serrate; III. Dentate; IV. Incised; V. Lobed; VI. Parted.

velop further for a considerable period, even after the neighboring branches have become well grown. When such "latent" branches renew their growth they are apparent, but not real, exceptions to the rule that branches arise acropetally.

In many plants where lateral branches arise, the apex of the original *plant-body*, or axis, continues to grow, thus producing an *indefinite* branching system (a *racemose* system); in other cases the apex soon ceases to grow, producing a

FIG. 6.—Illustrations of compound leaves: I. Palmately compound (three leaflets); II. Palmately compound (seven leaflets); III. Pinnately compound, with terminal leaflet; IV. Pinnately compound, with tendrils at the end.

definite branching system (a *cymose* system). All forms of both terminal and lateral branching are subject to unsymmetrical development, thus partially obscuring the plan of growth.

The branching of flat structures, as thallomes and leaves,

has given rise to a multitude of terms. When such structures have made no beginning in branching, the margins have an *entire* outline. When branching has barely begun, the margin may be *sinate*, or *serrate*; when the branches have grown further, the margins may be *dentate*; or still further, *incised*; or more still, *lobed*, then *parted*, and *divided*.

In leaves where the branching has gone so far that the leaf-branches are distinct and separable, we use the term *compound*. Where the leaf-branches arise very near together, the leaf is said to be *palmately compound*; where they arise at considerable intervals, it is *pinnately compound*.

Surfaces.—In plants consisting of cell-masses the external cells are always more or less modified by contact with the surrounding medium. They usually contain less protoplasm, and quite commonly have thicker walls; this is especially true of terrestrial plants, although it may be seen in aquatics to a less degree. This outer layer is known as the epidermis. It is frequently *smooth* externally, the outer walls of the contiguous cells forming an even surface. In other cases the cells may project more or less, or they may develop short points which project above the surface and make it *rough*. These projections may be so extended as to form a *hairy* surface.

It frequently happens that a mass of cells in or beneath the epidermis grows out into a sharp, broad-based point, a *prickle*, as in the roses and raspberries, whose stems are

FIG. 7. I. Prickles on a rose-stem, superficial, not connected with the woody part of the stem; II. A thorn on a plum-stem, evidently a reduced branch.

prickly. Prickles are to be distinguished from spines and thorns, the former of which are allied to hairs, being essentially superficial in structure, while the latter are stunted stem-branches, pointed and usually leafless.

Shoots.—The stem with its leaves is the shoot. It is clearly derived from, and in its simplest cases merges into, the thallome. In higher plants the stem (*axis* or *caulome*) and the leaves (*phyllomes*) are distinct, but among mosses and scale-mosses, as well as in still lower plants, this is not always the case. Where the leaves are distinct from the stem they arise as lateral outgrowths upon its growing apex, observing the law of acropetal development. As the axis elongates, leaves grow upon its newest portions. The youngest leaves are at the summit of the stem, simply because that part of the stem is the youngest.

When the stem grows rapidly in length at the same time that the leaves are growing, the latter are soon separated by considerable distances, but when the stem-growth is slow the leaves are more or less crowded. Most stems elongate rapidly during a part of the growing season, in which case the leaves are farther apart, but when the stem-growth is retarded, as it is later in the season, the leaves meanwhile continuing to grow, the result is the formation of a more or less compact cluster of leaves, termed a *bud*. A bud is thus a condition of a shoot, brought about by a retardation of stem-growth. When the stem-growth is resumed, the bud gradually disappears. See BRD.

It remains to speak briefly of the anatomy of leaves which grow in the air. The greater part of the leaf is composed of cells of soft tissue (parenchyma) containing chlorophyll. These are loosely arranged, so that there are many intercellular spaces between them. The outer cells constitute a close sheet (the epidermis) in which occur many pores (stomata). These pores may close entirely, when the interior cells of the leaf are completely cut off from the external air, or they may open, allowing free communication between the interior and exterior. The framework, which gives stiffness to the leaf, is composed of fibro-vascular bundles, which are continuous with the bundles in the stem. In the leaf the bundles are variously disposed, dependent mainly upon its shape and mode of growth. The details of the bundle-arrangement (called *venation*, from vein (Lat.

vena), which name the bundles usually have) need not be taken up here. See LEAF and VENATION.

Roots.—True roots exist only in the flowering plants and the fernworts. In the mosses, the lower part of the stem produces hairs which have the function, but not the structure, of roots. Some of the algae have hold-fasts which approach roots in structure, and possibly are to be regarded as the foreshadowings of them.

A root is an axial structure closely allied to the stem, of which it is often the downward extension. It is always of a simpler structure than the stem, and its tissues are usually

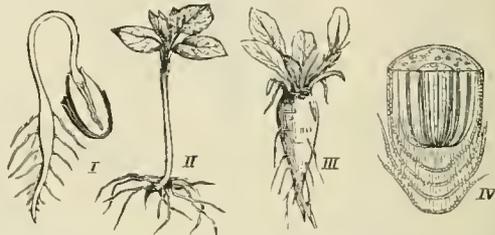

FIG. 8.—Illustrations of roots: I. Root and rootlets of young castor-oil plant; II. Roots of melon; III. Root of turnip; IV. Diagrammatic section of the tip of the root of the screw-pine (*Pandanus*), showing the root-caps in several layers.

less well marked. The boundary layer of cells (epidermis) is not as well marked as is usually the case in the stem. The absence of leaves and the rarity of shoot-buds are also noteworthy. The development of a mass of cells, the root-cap, in advance of the growing tip, is perhaps the most characteristic structure of the root.

Physiology of Larger Plants.—Enough has been said of the mode of life of single-celled or few-celled plants. In larger plants, where there are masses of cells, the physiological processes are somewhat more complicated. Food is absorbed by the cells in contact with it. In aquatics, all (or nearly all) external cells absorb watery solutions. In terrestrial plants the external root-cells absorb the watery solutions in the soil. Cells in contact with the air may absorb gases. In all cases the active agent in absorption is the living protoplasm. Some food-matter is converted into cell-matter in the cell which absorbs it from without, but much more is absorbed by neighboring cells. Thus cell No. 1 may absorb food matter from the surrounding medium (water or air); cell No. 2 may absorb nearly all of it from No. 1; so cell No. 3 may take from No. 2, and so on. In this way food-matter may be transferred rapidly from the cells in contact with the food-supply to those a long distance from it, and in this way cells obtain much of the material which they need for their sustenance and growth. It is pretty certain that the nitrogenous constituents of cells are obtained by the protoplasm directly from various nitrates and the salts of ammonia dissolved in the water. In like manner, the lime, potash, sulphur, etc., are appropriated directly by the protoplasm of the cells.

There is one process, however, viz., the assimilation of carbon (starch-making), which can be performed only in those cells of the plant which contain chlorophyll. To such cells water and carbon dioxide must be transferred from the points where they are absorbed. In a common land plant, as a tree, for example, the chlorophyll-bearing cells are confined to the leaves and young branches; the water is absorbed by the roots, while the carbon dioxide is absorbed directly by the green cells of the leaves. When a molecule of starch is made, the water is taken from the supply at hand in the cell, and this loss is made up by absorption from the neighboring cells; these again absorb from others, until finally the root-supply is reached. This hydrocarbon (starch) is now a food-matter for the cells of the plant. It is transformed into a soluble substance (often sugar), and is absorbed from cell to cell until all parts of the plant are supplied. See ASSIMILATION.

The total food-supply for the cells of a plant is thus: (1) water, (2) solutions which are used directly by the cells, (3) the hydrocarbon made by the green cells, to which may be added (4) oxygen, which is freely absorbed by the active cells. On this food-matter the cells live and grow as so many little organisms, each with its own wants and needs. When a cell has made a sufficient growth it may divide (see CELL), and when this takes place in a considerable number of the cells of a plant we say that it grows. The growth of

the plant is but the aggregate of the growth and division of its cells.

It is a common occurrence that cells do not themselves use the food-matter which they absorb, but store it for future use. Thus they often store starch, as in many seeds and tubers, but in all cases it is eventually used by growing cells (of the young plant, in the seed; of the new shoots, in the tuber).

It may be noted in passing that "sap" as commonly understood (i. e. as a kind of vegetable blood) has no existence except in imagination. Likewise the "circulation of sap" in plants, especially in trees, has no existence. It follows that the terms "crude sap" and "elaborated sap" are founded upon error. There is water in every living cell; when active it may contain from 75 to 95 per cent. of water, or even more in some cases. So a living plant is a watery thing, and this water contains food-matters in solution. These are absorbed from cell to cell as there may be demand. So there are movements of food-matters in plants, but they are not of the nature of currents streaming through particular tracts.

The evaporation of water from the exposed surfaces of plants gives rise to a movement (usually upward) of the water in the roots and stems. While the leaves and young stems are covered with an epidermis for checking evaporation, much water escapes through the stomata when they are open to allow an interchange of gases. This water-loss from the exposed cells is followed by absorption of water from deeper-lying cells, and these again draw from others, and so on. This movement of the water, which is purely a physical phenomenon, has doubtless been taken for a "sap circulation."

Reproduction.—The lowest plants merely divide themselves into two or more parts, each of which becomes a new individual. This is the non-sexual (asexual) method, and there are few (if any) plants which do not at some time give rise to new individuals in essentially this way. In many of the simpler plants single cells are spontaneously separated from the plant-body, which on germination produce new plants. These are the asexually formed spores, commonly called conidia, summer spores, tetraspores, etc. In higher plants single cells do not separate in this way, but masses of cells, buds, leaves, and shoots sometimes spontaneously fall away and give rise to new plants.

Sexual reproduction, in which the new individual is produced as a result of the union of two cells (male and female), is pretty general throughout the vegetable kingdom. The lowest plants, the water slimes, reproduce asexually only. In those a little higher, confervas, water flames, etc., two similar cells (similar in size, shape, and activity at least) unite their protoplasts, the resulting mass forming a spore. From this sexually produced spore a new plant arises upon germination. In the green felts the two uniting cells are manifestly different, the larger being the female and the smaller the male. In red seaweeds the union of the male and female protoplasts no longer results in the production of one spore; here the female cell after fertilization sends out branches, each of which produces one or more spores. In the mosses the female cell is inclosed within a flask-shaped organ, the archegone; after fertilization it produces a many-celled growth, which eventually develops spores from some of its internal cells, thus constituting the spore capsules. Ferns have archegones similar to those in mosses; after fertilization these give rise to leafy shoots, which eventually produce spores. The germination of the spores gives rise again to the sexual plant, the so-called prothallium. The archegones of flowering plants are feebly developed, in most cases consisting of little more than the female cell. In pines and their allies, where they are best developed, they are produced in minute dependent plants (prothallia) in the interior of the ovule. Fertilization is followed by the growth (as in ferns) of a leafy shoot (the new plant) for a time inside of the ovule (seed state), and afterward in the earth and air. In the higher flowering plants the reduction of the archegones and prothallia is carried still further. See REPRODUCTION (in plants).

The Classification of Plants.—There are so many kinds of plants in the world that it becomes necessary for us to classify them in order that we may be able to study them intelligently, and communicate our results to others. For this purpose alone any system will suffice which enumerates all plants and designates each kind with ease and certainty. Such a system was that devised by Linnæus a little more than one hundred and fifty years ago, and used for a century

or more in Europe and America, although it brought together plants of very unlike characters. That it served the general purpose of classification referred to above is proved by the fact of its long use during a period in which the study of plants made great progress.

But it is not enough to arrange plants for our convenience; we wish to make our classification show also the natural relationships which exist between plants and groups of plants. In such a classification the kinds of plants "are arranged according to the totality of their morphological resemblances" (Huxley), and not upon resemblances in single and relatively unimportant structures. Moreover, these resemblances are not confined to the adult plant, but include also those observed in its early (embryonic) life. To these we must bring such aid (all too little as yet) as we may obtain from a study of the ancestral vegetation of the globe. Such a natural system, when perfected, will not only show present resemblances, but it will indicate genetic relationships. It is perhaps needless to say that no system yet proposed approaches this ideal. It will be long before vegetable embryology will have supplied us with all the embryonic characters, and it will be still longer before phytopalæontology (fossil botany) will have traced for us the lines of descent for the vegetation of to-day. See PLANTS (Fossil).

Species.—In the examination of living things in any particular locality it is readily seen that there are different kinds, whose individuals resemble one another more than they do the individuals of other kinds. It is observed, moreover, that in reproduction the individuals of a particular kind always give rise to new ones of the same kind. Thus seeds of purslane always produce purslane plants, and while they may not be (and generally are not) exactly alike, they are unquestionably purslans. By the observation of many such cases we arrive at the ordinary conception of kinds of plants, that is, of species. This appears to have been the conception of species held by Linnæus and many of his followers down to about the middle of the present century.

With the advent of the idea of evolution came a change in our conception of species. We no longer conceive species as a fixed group of essentially similar organisms running back in time unchanged to a definite beginning, and forward as unchanged to a definite end only in extinction. The history of the past shows us that species have come into existence and after a time have disappeared, but it suggests that they have arisen by modifications (variations) of pre-existing species, and that often they have disappeared, not by extinction, but by undergoing considerable modifications. There may have been, and probably was, much of actual extinction of species, but it is equally certain that in many a case the species disappeared in name only, and that the succession of organisms continued in unbroken lines. The modern conception of species is that it is composed of similar but not identical organisms, forming many adjacent or contiguous genetic lines, in which the individuals are the successive points. This living stream does not necessarily maintain a fixed position in the vegetable kingdom, but may drift more or less in this or that direction.

Genera.—There are few species which do not resemble other species. Observation has shown us that this resemblance is often so close as to make a natural group of species. Thus all the kinds of violets are readily recognized as violets, while they are also as readily recognized as different species. Such groupings of species are *genera*.

Families and Orders.—Related genera are grouped into *families*, and related families into *orders*. In most English and American works on systematic botany "family" and "order" have been made synonymous, or perhaps it may be better to say that families have been called orders, while the orders have been called *cohorts*. In zoölogy families and orders stand as separate groups, and no good reason has been assigned for a different practice in botany.

Classes.—Related orders are grouped into *classes*, which thus usually include great numbers of species. It is possible now to group all known plants into about fifteen classes, viz.: (1) *Schizophyceæ*, (2) *Chlorophyceæ*, (3) *Phaeophyceæ*, (4) *Coleochaetæ*, (5) *Ascomycetes*, (6) *Basidiomycetes*, (7) *Floridæ* (or *Rhodophyceæ*), (8) *Charophyceæ*, (9) *Heplidæ*, (10) *Musci*, (11) *Filicina*, (12) *Equisetina*, (13) *Lycopodiæ*, (14) *Gymnospermæ*, and (15) *Angiospermæ*. Two of these, viz., *Ascomycetes* and *Basidiomycetes*, are composed of degraded plants only, and are doubtfully entitled to class rank.

Branches or Divisions.—The foregoing classes may be grouped into branches or divisions in various ways, according to the views of the student. There is little question

nowadays as to the disposition of the higher classes (ninth to fifteenth inclusive), nor is there any doubt that the first class constitutes the lowest branch of the vegetable kingdom. There is, however, much doubt as to the proper disposal of the second to the eighth classes. See VEGETABLE KINGDOM.

The Distribution of Plants.—Ordinary observation shows us that the spores and seeds of plants are readily distributed over the earth's surface. They are blown by the winds and carried by the water, and often by animals of various kinds. Seeds are especially provided in many cases with structural devices for wind carriage, as in the milkweed and cottonwood, where a spreading tuft of long hairs enables the seed to be floated in the air for many miles. Many fruits are winged or provided with hair tufts, so that as they are carried away by winds their contained seeds are carried also. Again, many seeds serve as food for various animals, as squirrels, rats, mice, and some birds, which often make great stores of edible seeds for their winter food-supply. Still again many fleshy fruits are eaten by animals, the seeds often being rejected or passed through the alimentary canal uninjured. Some seeds and fruits attach themselves to passing animals by means of hooks or other devices, and are carried to considerable distances. On the Western plains the whole plant, in some cases, separates from the root, and is rolled and tumbled over the prairies for many miles, dropping here and there its burden of seeds. Similar "tumble-weeds" are to be found upon the plains of South America and Southeastern Europe.

These, in brief, are the ways in which the spores and seeds of plants become distributed over the face of the earth. They may spring up into plants which may become permanent residents in the new localities, or they may fail to find the proper conditions for growth and so disappear. The discussion of these conditions belongs to GEOGRAPHICAL BOTANY (*q. v.*).

HISTORY OF BOTANY.—The following summary by Mr. Roscoe Pound gives in one view the main facts in the history of botany. Theophrastus (B. C. 300), Dioscorides (*cir.* A. D. 64), and Pliny (a little later) were the principal writers on botany in ancient times. They enumerated and described medicinal and useful plants, and explained their supposed properties. Little or nothing more was done for over a thousand years. The first after the ancients is Otto Brunfels, a German monk (d. 1534). Fuchsius (1501-66) and Clusius (de l'Écluse—1526-1609) are some of the greater names in mediæval botany. These men and their contemporaries collected extensively, and published drawings and descriptions of plants, with notes of their properties. They did not classify, but some sort of conscious arrangement is to be seen in their works.

The first classification was made by Andrea Cesalpino (Cesalpinus), an Italian physician (d. 1602). His system contains fifteen classes based on the fruit. Cesalpino was strongly imbued with scholasticism, and founded his system on predetermined marks obtained by reasoning from the supposed nature of plants. Classification down to Jussieu was based on single characters after Cesalpino. Of later botanists, Caspar Bauhin (1560-1624) and John Ray (1628-1705) deserve especial mention. Many terms in common use were first used by them or their contemporaries; e. g. monocotyledons, umbelliferae, polypetale.

Marcello Malpighi, an Italian (1628-94), and Nehemiah Grew, an Englishman (1628-1711), founded vegetable anatomy. Marriotte, a Frenchman (d. 1684), and Stephen Hales, an Englishman (1677-1761), founded vegetable physiology. R. J. Camerarius, a German (1665-1721), demonstrated by experiment the sexuality of plants. Camerarius approached the subject in true scientific manner, as would be done today. His contemporaries and botanists long after him attempted to prove sexuality by abstract reasoning without experiment.

Joseph Pitton de Tournefort is the founder of genera. He was the last to classify plants as herbs, trees, and shrubs. Johann Jacob Dillenius, a German, afterward professor at Oxford (1684-1747), and Pietro Antonio Michel, an Italian gardener (1679-1736), are the pioneers of cryptogamic botany.

Carl von Linné (Linnaeus, 1707-78) invented the binomial nomenclature, reorganized nomenclature, revised the genera of flowering plants, and fixed species about in their present form. He was no experimenter, relied on abstract reasoning more than on observation, and fastened scholasticism on systematic botany. He was an admirer of Cesalpino, and founded a system based on the stamens. At the same time he made a provisional natural system. At the beginning of this century A. L. de Jussieu took it up and greatly developed

it. He is called the founder of the natural system. A. P. De Candolle (1778-1841) put Jussieu's system on a permanent basis.

Robert Brown, between 1800 and 1830, discovered the nature of the gymnospermous flower, and called attention to the cell contents. C. H. Persoon (*Synopsis Fungorum*, 1801) put mycology on a lasting basis. Von Mohl and Naegeli, between 1820 and 1860, made vegetable anatomy what it now is. Hofmeister about the same time worked out the development and embryology of pteridophytes and gymnosperms. Tulasne and De Bary, before 1860, studied the development of fungi, and caused their classification to be remodeled. Schwendener discovered the true nature of the lichens about 1868.

About 1860 the Darwinian theory put the natural system on a sure foundation by explaining the relationships on which it was based. Systematic botany is, however, very conservative, and the full effect of this has not yet been felt.

In 1874 Sachs discarded fungi and algae as definite groups, and co-ordinated the subdivisions of the cryptogams with the phanerogams. Henceforth cryptogam, like invertebrate, is a word of convenience only.

The Study of Botany.—Some knowledge of plants should be possessed by every one. Aside from its purely utilitarian importance in agriculture, horticulture, and medicine, botany when properly studied may become an important part of the general culture of the educated man. It should therefore occupy a proper place in the course of study pursued by pupils in the schools, and the teacher should be prepared to give instruction in accordance with the present state of the science. It is unfortunately true, however, that much of the study (and teaching) of botany is a full century behind the modern science, and the culture which it should give is wanting.

In beginning the study of botany it must be clearly understood that it is only by the study of *plants* that we can know plants. It is not a "book study," but rather a laboratory study, in which much of the laboratory is to be found in the fields and forests. The beginner should first of all make the acquaintance of a good number of representative plants. This he should accomplish by actual examination himself, with not too much in the way of suggestion from teacher or books. It is a good plan for the beginner to early set about the making of a collection of the plants in his neighborhood. In so doing he will learn much about their structure, habits, and reproduction. When he has acquired some familiarity with the general structure and physiology of plants in the principal groups of the vegetable kingdom, he may profitably spend a little time in learning the details of descriptive and systematic botany in some group, commonly the flowering plants. Should he have access to descriptive manuals of other groups, it will be well for him to use these enough to give him some familiarity with them.

This accomplished, he should take up the deeper study of structure, using a compound microscope capable of magnifying fully 600 diameters. He should become acquainted with protoplasm, and the various cells and tissues it builds in simple and complex plants. He is then prepared to take up the study of the particular structure of representative plants in the principal classes and orders of the vegetable kingdom. Should he desire to pursue the subject further, there open to him now many lines of work. Thus he may take up the structure and physiology of a single plant, or he may undertake some physiological investigation, or he may turn to some department of systematic botany, etc.

See ALTERNATION OF GENERATIONS, ANCESTRY OF PLANTS, ASSIMILATION, EMBRYOLOGY (in plants), GEOGRAPHICAL BOTANY, FERTILIZATION (in plants), HERBARIUM, HISTOLOGY, VEGETABLE; LEAF, MORPHOLOGY, VEGETABLE; REPRODUCTION (in plants), PHYSIOLOGY, VEGETABLE; VEGETABLE KINGDOM; and VENATION.

BIBLIOGRAPHY.—Only general works on botany will be noted here. See the bibliographies under the special topics. Baillon, *Dictionnaire de Botanique* (3 vols., 1876-92); Balfour, *Manual of Botany* (5th ed., 1875); Bentley, *Manual of Botany* (4th ed., 1882); Bessy, *Botany for High School and Colleges* (7th ed., 1892); Duchartre, *Éléments de Botanique* (3d ed., 1885); Goebel, *Outlines of Classification and Special Morphology of Plants* (1887); Goodale, *Physiological Botany* (1885); Gray, *Structural Botany* (1879); Jackson, *Guide to the Literature of Botany* (1881); Le Maout and Decaisne, *General System of Botany* (1876); Laerssen, *Handbuch der Systematischen Botanik* (2 vols., 1879-82); Mohl, *The Vege-*

table Cell (1852); Pritzl, *Thesaurus Literaturæ Botanicae* (1872); Sachs, *Text-book of Botany* (1882); Sachs, *Lectures on the Physiology of Plants* (1887); Vines, *Lectures on the Physiology of Plants* (1886).
CHARLES E. BESSY.

Botany Bay: a bay of Australia; in New South Wales. It was discovered by Capt. Cook in 1770, and received its name from Joseph Banks, the botanist of the expedition, in allusion to the great number of new plants found there. It is 5 miles S. of Sydney, in lat. 34 2 S. and lon. 151 13 E. A colony of British convicts was planted here in 1787, and was removed to Port Jackson in 1788, but the penal colony long continued to retain the name of Botany Bay. The transportation of criminals to New South Wales was discontinued in 1840, on account of the often-repeated protests of the colonists.

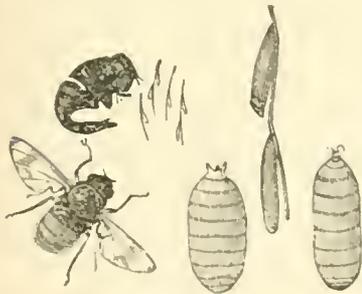

Botelho de Oliveira, bō-tāl yō-lā-ō-kē yā-ee rāa, MA-NOEL; Brazilian poet; b. at Bahia in 1636; d. Jan. 5, 1711. He was educated in Portugal, in the University of Coimbra, and there became an enthusiastic admirer of the Spanish poet Góngora, whose works were the rage in both Spain and Portugal. He returned to Bahia and there followed the career of advocate. In 1705 his poems were published in Lisbon by the printer of the Inquisition, Manescal, under the title: *Musica do Paraíso, dividida em quatro côros de rimas portuguezas, castelhanas, italianas e latinas, com seu descante comico reduzido em duas comedias.*

A. R. MARSH.

Botero, bō-tā-yō, GIOVANNI, surnamed BEXISUS; Italian ecclesiastic and writer; b. at Bene, Piedmont, in 1540. He was secretary to St. Carlo Borromeo, and became in 1599 tutor to Charles Emmanuel's children. He wrote a noted political treatise, *Della Ragione di Stato.* D. in 1617.

Bot'etourt, NORBONNE BERKELEY, Lord; b. in England about 1734. He was appointed royal Governor of Virginia in 1768, and dissolved the Assembly of Burgesses in 1769 because they passed a remonstrance against some acts of the British Parliament. D. in Williamsburg, Va., Oct. 15, 1770.

Bot-fly: any dipterous insect of the family *Æstridae*, but in the U. S. generally restricted to the horse bot-fly, *Gastrophilus equi*. The fly lays her eggs upon the hairs of the horse, and after laying her eggs almost immediately dies. The eggs, conveyed to the horse's stomach, are hatched, and the larvæ are provided with mouth-hooks, by which they hang on to the coats of the stomach. In about a year's time they are discharged with the excrement, and in one month they are changed into perfect flies.

When very numerous there is reason to believe that bots are very injurious to the horse; but there is some dispute among horse-breeders as to the extent of the injury done by them.

Both'nia (in Swed. *Botten*): formerly a country of Northern Europe, which belonged to Sweden, and was situated on both sides of the Gulf of Bothnia. The eastern portion is now comprised in Finland, and the western forms the Swedish provinces of Pitea and Umea.

Bothnia, Gulf of: the northern portion of the Baltic Sea; extends from Tornea southward to the island of Åland; is about 400 miles long and from 60 to 130 miles wide. It is bounded on the E. by Finland and on the W. by Sweden. Its greatest depth is about 50 fathoms. The navigation of it is rendered difficult by many small islands and sandbanks near the shores. The gulf is usually frozen in winter so that sledges can cross it.

Bothriocephalus [from Gr. *βοθρον*, little trench + *κεφαλή*, head; in allusion to the depressions on each side of its head]; a genus of cestoid intestinal worms, formerly confounded with the *Tenia*, or common tapeworm. Two species occur in man, *Bothriocephalus latus* and *Bothriocephalus cordatus*. The former is common only in Switzerland, Russia, Sweden, Norway, Lapland, Finland, and Poland. It is from 6 to 20 feet in length; composed of numerous flat and wide segments, and an elongated, compressed, ob-

tuse head, having an elongated slit-like sucker on each side. The eggs are oval, with a hood-shaped lid at one end, and are found numerous in the stools of infected persons. They develop in fresh water into an embryo having six hooklets and a ciliated covering. These enter certain fishes, especially the pike and eel-pout, where they become encysted in the tissue as cysticerci. Man is infected by eating the diseased fish. The symptoms produced are those of tapeworm in general, but occasionally a severe form of anæmia, "progressive pernicious anæmia," results. *Bothriocephalus cordatus* has been found to inhabit the human intestines only in North Greenland. In that country it is quite common in dogs. It is about a foot in length, and receives its name from the cordate or heart-shaped head. (Cobbold, *Proceedings of the Zoological Society*, London, 1862.) The means of destroying or expelling the "broad tapeworm," as this parasite is sometimes called, are the same as in the case of *Tenia*. See TAPEWORM.

Revised by WILLIAM PEPPER.

Bothwell: a small village of Bothwell parish, Lanarkshire, Scotland; situated near the river Clyde, about 8½ miles S. E. of Glasgow (see map of Scotland, ref. 12-G). In the vicinity are the ruins of Bothwell Castle. The Covenanters were utterly routed by the troops of the Duke of Monmouth, June 22, 1679, at Bothwell Bridge. Pop. 2,600.

Bothwell: a post-town of Zone township, Bothwell electoral district, Ontario, Canada; on the Great Western Railway; 23 miles N. E. of Chatham (see map of Ontario, ref. 6-B). It has numerous petroleum-wells, and a trade in cattle, grain, and lumber, the latter being extensively manufactured here. Pop. 1,000.

Bothwell, JAMES HEPBURN, Earl of; b. about 1536; inherited the title and large estate of his father in 1536. In 1562 he was imprisoned for a conspiracy to seize the queen's person, but he escaped to France, after which he was outlawed. He returned in 1565, and became an enemy of Regent Murray and a favorite adviser of Queen Mary. The murder of Lord Darnley (1567) is generally imputed to him. He was indicted for this crime, but as he came to court with 4,000 followers he was acquitted. In Apr., 1567, many nobles signed a bond or document in which they commended Bothwell as a fit husband to the queen, whom he carried to Dunbar Castle. He married her in May of the same year. A strong party soon took arms against Bothwell, who fled to Denmark, where he was imprisoned. D. in the prison at Drangholm, Zealand, Apr. 14, 1578. See Burton, *History of Scotland* (vol. iv.); Robertson, *History of Scotland*; and the dramas of Swinburne and Björnstjerne Björnson.

Botocudo's, or **Ayoro's;** a native tribe of Brazil. They live in the forests on the Rio Doce, along the boundary of the provinces of Espírito Santo and Minas Geraes, and are said to resemble the Chinese. They are brave, but treacherous, and have caused the Government considerable trouble. They number about 4,000, and are rapidly dying out. They pierce the lower lip and insert a block of wood in the hole, from which comes their Portuguese name (*botoque*, a block of wood).

Botoshani, bō-tō-shaa'neē; a town in Roumania; on the Schiska; 60 miles N. W. of Jassy (see map of Austria-Hungary, ref. 6-M); carries on a considerable trade with Germany in cattle, wine, wool, tobacco, etc. Pop. 40,000.

Bo-tree, or **Pec'pul:** the *Ficus religiosa*, or sacred fig-tree of Hindustan and Ceylon; greatly venerated by the followers of Vishnu (who was born under this tree), and especially by the Buddhists. It is a large tree, whose sap abounds in caoutchouc, and which yields a small edible fig, not much valued. Great amounts of lac are gathered from its branches, for it is one of the favorite abodes of the lac insect. The famous bo-tree of Anarajapura in Ceylon is believed, on apparently good grounds, to have been planted in 288 B. C.

Botrychium, bo-trik'i-um [Gr. *βότρυχος*, vine-stalk; *βέτρον*, cluster of grapes, in allusion to the appearance of the spore-bearing leaves]; a genus of adder-tongue ferns (*Ophioglossaceæ*) represented in the U. S. by seven species and several additional varieties. The most common species is *B. virginianum*, which occurs also in Europe and Asia. Other species—e. g. *B. lucaria* and *B. ternatum*—are widely distributed, occurring in North and South America, Europe, Asia, and Australia. See FERNSWORTS and VEGETABLE KINGDOM.
CHARLES E. BESSY.

Botry'tis: See MILDEW.

Bots'ford, AMOS EDWIN: Canadian Senator; b. at St. John, N. B., Sept. 25, 1804, and educated at Sackville, N. B. He has been a member of the Executive Council of New Brunswick; a member of the Legislative Council of that province 1833-67; and in 1867 was called to the Canadian Senate and has been its speaker. He has been for fifty-nine consecutive years a member of the legislature of his country; has been prominent in military and judicial affairs; and, in addition to various other important missions assigned to him, was a delegate to Washington respecting a reciprocity treaty in 1852. He was appointed a privy councillor of Canada May 30, 1891. NEIL MACDONALD.

Botsrah: See BOSTRA.

Bot'ta, ANNE CHARLOTTE LYNCH: poet; b. at Bennington, Vt., in 1820. She was married to Vincenzo Botta in 1855. She published a volume of poems (1848-84) and a *Handbook of Universal Literature* (1860-87). D. in New York city, Mar. 28, 1891.

Botta, CARLO GIUSEPPE GUGLIELMO, M. D.: an eminent Italian historian; b. at San Giorgio, in Piedmont, Nov. 6, 1766. He studied medicine, and served as surgeon in the French army in 1795-96. In 1803 he was elected to the French legislative body. He published in 1809 a *History of the American War of Independence*, and in 1825 a *History of the Nations of Italy from Constantine to Napoleon* (3 vols.). His most important works are a *History of Italy from 1789 to 1814* (Storia d'Italia dal 1789 al 1814, 4 vols., 1824) and his *Continuation of Guicciardini's History of Italy to 1789* (10 vols., 1832). He died in Paris, Aug. 10, 1837. See F. Becchi, *Elogio storico di C. Botta* (1839).

Botta, PAUL ÉMILE: archaeologist and traveler; a son of the preceding; b. in Turin, Dec. 2, 1802; d. in Achères, near Poissy, Mar. 29, 1870. He entered the service of Mehemet Ali of Egypt as a physician about 1830, and became French consul at Alexandria. Having visited Arabia in 1837, he published in French a *Narrative of a Journey to Yemen, etc.* (1844). He was next sent as consul to Mosul, and in 1843 began to excavate the mound at Khorsabad near the Tigris for monuments of ancient Assyria, and there discovered the palace of Sargon (King of Assyria, 722-705 B. C.) with statues and cuneiform inscriptions. With the aid of the artist Flaudin, he published in French a magnificent work entitled *Monuments of Nineveh, Discovered and Described by M. Botta, with Designs by Flaudin* (5 vols. folio, 1847-50). Revised by D. G. LYON.

Botta, VINCENZO, Ph. D.: b. near Turin, Italy, Nov. 11, 1818; became Professor of Philosophy at Cuneo, and afterward at Turin; a member of the parliament in 1849; in 1850 inspected the educational system of Germany, and in 1853 that of the U. S., and became Professor of Italian Literature in the University of the City of New York. Among his works are a *Life of Cavour* (New York, 1862); *Dante as Philosopher, Patriot, and Poet* (1865); and a history of modern philosophy in Italy. D. in New York, Oct. 5, 1894.

Bottesini, bot-tā-see nēē, GIOVANNI: musician; celebrated not only as a composer but also as the most remarkable performer on the double-bass ever known; b. at Crema, in Lombardy, Dec. 24, 1822; admitted to the Milan Conservatory when eleven years old, and took up the double-bass as a solo instrument; visited the U. S. with Arditi, and made a successful tour. His first opera, *Christophe Colomb*, was produced in Havana in 1846. Visited England in 1849, and conducted the Italian opera in Paris 1855-57, and afterward conductor at the Italian opera, Cairo, Egypt. His opera *L'Assedio di Firenze* was produced in Paris in 1856; *Ali Baba*, London, 1871; *Ero e Leandro*, Turin, 1879; and at the Norwich festival of 1887 his oratorio *The Garden of Olives*, libretto by Joseph Bennett, was successfully sung. He died in 1889. D. E. HERVEY.

Bött'ger, written also **Bött'cher**, or **Bött'tiger**, JOHANN FRIEDRICH: a German alchemist; noted as the inventor of Meissen porcelain; b. at Schleiz, Feb. 4, 1682. He spent much time and money in the search for the philosopher's stone. D. in Dresden, Mar. 13, 1719.

Botticelli, SANDRO: See FILIPEPI.

Böttlicher, PAUL: See LAGARDE, PAUL DE.

Bottle Gourd, or **Cal'abash:** a plant of the genus *Lagenaria* and order *Cucurbitacea*; nearly allied to plants of the genus *Cucurbita*, in which it was formerly included. The *Lagenaria vulgaris*, or common bottle gourd, is a

native of India, but is cultivated in many warm climates. It is a climbing annual, having white flowers, and a large bottle-shaped fruit with a hard rind, which is called a *calabash*, and is used for holding or dipping water. This fruit is sometimes several feet long. Some varieties of *Lagenaria* have an edible pulp, which is an important article of food.

Bottle-nose Whale, sometimes called **Bottlehead** (*Hyperoodon rostratus*): a cetaceous mammal of the family *Ziphiidae*. It inhabits the North Atlantic and sometimes ascends rivers. It reaches a length of about 25 feet, and is remarkable for its bottle-shaped head. The name of **BOTTLE-NOSE DOLPHIN** is applied to another mammal, the *Tursiops tursio*, abundant in the North Atlantic.

Bottom Heat: a term applied in horticulture to the temperature communicated to certain soils, either by fermenting and decomposing substances placed underneath them, for which purpose leaves, fresh dung, and the refuse bark of the tanyard are often used, or by means of flues or hot-water apparatus. The system is applied to the cultivation of pineapples, grapes, melons, cucumbers, and other plants grown in hothouses, pits, or frames. It is one of the most important agents in the artificial cultivation of tender plants of whatever kind, whether flower or fruit bearing.

Bottomry [deriv. of *bottom*, lower part of hull, hull; imitation of Dutch *bodmerij*, so Germ. *Bodmerei*, Fr. *lome-rie*]; the act of lending money on the pledge of a ship or on the bottom of a ship. It may be considered under the following divisions: 1, the nature of the contract; 2, its form; 3, by whom made; 4, the mode of its enforcement.

1. *The Nature of the Contract.*—It is a maritime contract, and in the nature of a wager. The substance of the contract is that if the ship returns, the loan is to be repaid with interest. If it is lost in the course of navigation, the debt is discharged, though the borrower may have abundant means for repayment. The principal of the loan being thus put at risk, the case does not come within the operation of the usury laws. Large interest is sometimes exacted—15 or 20 per cent., or even a larger rate. The proper court, however, has power, in extreme cases of excessive interest, to grant relief. Should the ship deviate from her voyage and be lost, the lender would not take that risk upon himself, but the borrower would still be liable. So if the ship be lost by the wrongful act of the borrower or the master, instead of the perils of the sea. It has been decided that the doctrine of constructive loss which applies in insurance law does not extend to a bottomry loan. This loan is not within the act of Congress, which requires mortgages and conveyances of vessels to be registered for the purpose of giving notice to subsequent grantors or to creditors. Should the ship return, the loan becomes due, and the principal and maritime interest together form a new principal, on which ordinary interest will be calculated until payment. A bottomry loan is strictly on the ship. A corresponding loan on the cargo is termed *respondentia*. It is governed by rules closely resembling those applicable to bottomry. A bottomry loan has this marked peculiarity, applicable, however, to other maritime liens: that where there are two or more in succession, the latest may have the preference, as it may be the price of the safety of the ship. In liens created regularly upon property on land it is a well-known general rule that the earliest has the preference.

2. *The Form of the Transaction.*—There is usually executed a bottomry bond. This is not, however, absolutely essential. The courts do not look so much at the technical forms as at the intent of the parties. Even if there were a sale intended as a security for a loan, evidence to show the true nature of the transaction could be adduced, and it would be enforced accordingly.

3. *By Whom Given.*—A bottomry bond may be executed either by the owner or the master of the ship in the owner's absence. The owner can execute it, in general, whenever he sees fit, so long as the transaction is in its nature maritime. A master of a ship, on the other hand, is governed by special rules. His leading duty is to navigate the ship, not to pledge nor to sell it. These latter powers are conferred upon him in extraordinary emergencies, where the exigencies require it. The lender must be prepared to show that the case is one which justifies the loan, such as stress of weather, necessity of repairs, and the like. Due measures must be taken to communicate with the owner where such communication is feasible. At the present time the

telegraph must be resorted to where it is accessible. The power of the master may in like manner in extraordinary cases extend to a pledge, or even a sale, of the cargo. The general test of his authority in all these cases is that he must exercise the diligence of a prudent owner, and that there must be an apparent necessity for the pledge or sale.

4. *Enforcement*.—A bottomry bond is enforceable in a court of admiralty—in this country in the district courts of the U. S. A proceeding is instituted against the ship, or, in technical language, *in rem*. If necessary, the ship may be sold, and the claim paid out of its proceeds. The borrower is also personally responsible. The lien of seamen for subsequent wages is superior to that of the bottomry lender. Should the latter, in order to preserve his own claim, discharge that of the seamen, he could have a lien upon the proceeds of the ship for his reimbursement, as well as a personal claim against the owners; or, in other words, he would be allowed to stand in the place of the seamen.

It may be added that if a ship, having incurred a bottomry loan, does not set out on her intended voyage, the property will not have incurred any maritime risk, and consequently the maritime interest can not be exacted, but only ordinary interest. T. W. DWIGG.

Botts, Jony Mixor: statesman; b. at Dumfries, Prince William co., Va., Sept. 16, 1802; lost both parents by a theater fire in Richmond 1811. He was elected to Congress as a Whig in 1839, and re-elected several times, and denounced Mr. Tyler's breach with the party which had elected him Vice-President. In 1844 he supported Mr. Clay for the presidency. He opposed the repeal of the Missouri Compromise in 1851, was a firm adherent of the Union during the civil war, and afterward favored the Republican party, having suffered much inconvenience and a short imprisonment for his opinions at the hands of the Confederates. He wrote *The Great Rebellion* (1866). D. in Culpeper, Va., Jan. 8, 1869.

Botzen, or Bozen (It. *Bolsano*): a trading town of the Austrian Tyrol; at the junction of the river Tapp with the Eisach; 33 miles by rail N. N. E. of Trent (see map of Austria-Hungary, ref. 7-B). It is situated in a hilly or mountainous district, is well built, and contains a gymnasium, a Gothic cathedral, and a castle; also manufactures of silk, linen, hosiery, etc. It has four annual fairs, and is an entrepôt of the trade between Italy, Germany, and Switzerland. Pop. (1890) 11,655.

Bouchard, boo'shaar', HENRI DÉSIÈRE ABEL: French physician; b. Dec. 18, 1833; M. D., University of Strassburg, 1856; appointed Professor of Anatomy in the Medical Faculty of Bordeaux 1878; author of *Essai sur les gaines synoviales tendineuses du pied*; *De l'issu connectif*; *Nouveaux éléments d'anatomie descriptive et d'embryologie*; *Précis d'anatomie descriptive et d'embryologie*.

Boucher, bo'cher, JONATHAN: philologist; b. in Blencow, Cumberland, England, Mar. 12, 1758. He removed to Virginia in 1756, when but sixteen years old. Nominated to the rectorship of Hanover parish before he was in orders, he was ordained in England March 26, 1762. In 1768 he was appointed by Gov. Eden to St. Anne's, Annapolis, and afterward to Queen Anne's, Prince George County. Sympathizing with the motherland at the breaking out of the Revolution, he returned to England in 1775, and compiled a *Glossary of Archaic and Provincial Words*. In 1797 he published *A View of the Causes and Consequences of the American Revolution*. This work was dedicated to Washington, with whom he had been personally acquainted. D. in Epsom, England, Apr. 27, 1804.

Revised by W. S. PERRY.

Boucher de Crèvecoeur de Perthes, boo'shay de-krov-kör-de-pert', JACQUES: a French archaeologist and naturalist; b. at Rethel, Sept. 10, 1788. His principal works are *The Creation* (5 vols., 1839-41), his principal publication; *Celtic and Antebullician Antiquities* (1847); and *Antebullician Man and his Works* (1860). He is regarded as the founder of the science of archæo-anthropology. D. in Abbeville, Aug. 9, 1868.

Bonches-du-Rhône, boosh'dü-rôn': a department in the southeast part of France; formerly included in Provence. Its area is 1,971 sq. miles. It is bounded N. by the Durance, which separates it from Vaucluse, E. by Var, S. by the Mediterranean, and W. by Gard. It is intersected by the Rhône, which enters the sea by several mouths, and

forms a delta called the "Île de la Camargue." The surface in the east part is lilly, and is elsewhere diversified by plains, heaths, forests, and saline lakes. The grapevine and olive flourish here, and large numbers of silkworms and sheep are raised in this department. Among the public works are several canals, a railway connecting Marseilles with Lyons, and an aqueduct, 50 miles long, from the Durance to Marseilles, which is the capital. It has manufactures of cloth, hats, perfumes, wine, brandy, sugar, salt, soap, olive oil, and chemical products. It is divided into three arrondissements. Pop. (1881) 589,028; (1891) 630,622.

Boucléte, JOSEPH: b. in Canada in 1774. In 1790 he entered the surveyor-general's office for British America, and afterward served in the volunteers and in the navy of the lakes. In 1804 he became surveyor-general. He served against the U. S. in the war of 1812. As surveyor-general he was afterward employed in establishing the southern boundary of Canada. He published (1816) a topographical and geographical description of Canada; *The British Dominions of North America* (1831); and a *Topographical Dictionary of Lower Canada* (1832). D. at Montreal, Apr. 9, 1841.

Boucault, boo'scö-kö', DIOX: playwright; b. in Dublin, Ireland, Dec. 26, 1822; educated by his guardian, Dr. Dionysius Lardner, and at the London University, as University College was then called. His first successful play was *London Assurance*, which he wrote in conjunction with John Brougham, and which was acted in 1841 at Covent Garden, London. He was married to Miss Agnes Robertson; removed to the U. S. in 1853, and remained till 1860, when he returned to London and brought out, at the Adelphi theater, his first, and still famous, Irish play, *The Colleen Bawn*. This is founded on Gerald Griffin's novel of *The Collegians*. In 1861 was produced at the same theater his play of *The Octoroon*, which vigorously illustrated, and by implication denounced, the evils of slavery in the Southern U. S. He remained in Great Britain till 1872, and furnished to the London stage a number of plays, among which were *The Relief of Lucknow* (1863); *The Streets of London* (1865); *Arrah-na-Pogue*; *Rip Van Winkle*; *The Flying Scud*; *The Long Strike* (1867); *How She Loves Him!*; *Foul Play* (written in collaboration with the novelist Charles Reade, 1868); *After Dark* (1869); *Formosa*; and *Kerry*. In the autumn of 1872 he appeared at Booth's theater, New York, as Shaun in *Arrah-na-Pogue*. In 1873 he produced, at Booth's theater, his beautiful Irish play of *Daddy O'Dowd*; at Wallack's theater, his *Mora* and his *Mimi*. On Dec. 25, 1873, he opened, in conjunction with Mr. William Stuart, the New Park theater, on Broadway, near Twenty-second Street, New York. *The Shaughraun*, produced at Wallack's theater in 1876, was one of his most successful dramas. He went on a professional tour to Australia, and married in 1889 Louisa Thorndyke, a young American actress. The question of the validity of the divorce proceedings with Agnes Robertson Boucault was undetermined at the time of his death. Among his earlier works, prior to his first visit to America, were *Old Heads and Young Hearts*; *The Irish Heiress*; *The Willow Copse*; and *The Vampire*. The dramas of Boucault are seldom, if ever, original in plot, but they are often original in action, treatment of incidents, and are bright in dialogue. He has been the means of great improvement and elevation to the Irish drama, having replaced the "runting, roaring Irishman," with stuffed stick and black bottle, by genuine men of the Emerald Isle, such as Myles-na-Coppaleen, Shaun the Post, Kerry, and Daddy O'Dowd. As an actor, Mr. Boucault's best successes were won in personating eccentric characters, such as Mantilini, and rustic old Irishmen, such as Daddy O'Dowd. He will also be remembered for having made dramatic authorship a remunerative profession to authors in Great Britain. This he did by asserting, maintaining, and finally establishing the principle that among theatrical attractions the play should be made predominant, and should be suitably recompensed. The change in practice that ensued may be inferred from the fact that whereas, in the earlier part of his career, Mr. Boucault received but \$300 for his *Corsican Brothers*, he obtained, in 1866, for his *Flying Scud*, \$32,500. Boucault was educated as an architect and civil engineer. As a manager he established a theater in Washington, D. C., in 1858; reconstructed the Metropolitan theater, New York, and converted it into the Winter Garden in 1859; remodeled Astley's circus and built the Westminster theater—both in London—in 1862.

He was the author of numerous newspaper essays and letters on dramatic subjects. D. in New York, Sept. 18, 1890.

Revised by B. B. VALLENTINE.

Boudinot, boo di-not, ELIAS, LL. D.; philanthropist; b. in Philadelphia, May 2, 1740. He practiced law in New Jersey, and supported the popular cause in the Revolution. He was a member of the Continental (later U. S.) Congress in 1778-79, 1781-84; its president in 1782, in which capacity he signed the treaty of peace with Great Britain, and was director of the mint at Philadelphia from 1795 to 1805. In 1813 he was a founder of the American Board of Commissioners of Foreign Missions. In 1816 he became the first president of the American Bible Society, and so remained till his death. He wrote several works, and gave large sums of money for charitable purposes. His wife was a sister of Richard Stockton. D. in Burlington, N. J., Oct. 24, 1821.

Boufflers, boo flär', LOUIS FRANÇOIS, Duke de; French general; b. Jan. 10, 1644. He served under Turenne and Catinat; distinguished himself at Steenkerke in 1692, and became a marshal of France in 1693. He commanded at Namur when it was besieged by William III, of England in 1695, and defended Lille with success in 1708 against Prince Eugène. He commanded a wing at Malplaquet (1709), from which he made a masterly retreat. D. in Fontainebleau, Aug. 20, 1741. See *Vie du Maréchal de Boufflers* (Lille, 1852).

Bougainville, boo'gän veel', LOUIS ANTOINE, de; navigator; b. in Paris, Nov. 11, 1732. He was aide-de-camp to Montcalm in America in 1756; served with distinction in Germany in 1761; founded a colony in the Falkland islands, which was sold in 1766 to Spain; performed a voyage round the world in 1767-69, and discovered several islands in the South Sea, being the first Frenchman who had circumnavigated the globe. In 1771 he published a narrative of that voyage. During the American Revolution he had a high command in several naval battles between the French and British. D. Aug. 31, 1811.

Bough, bö, SAMUEL, R. S. A.; landscape-painter; b. at Carlisle, England, Jan. 8, 1822; at first a scene-painter; learned to work in oil and water-colors chiefly by self-instruction. Among his oil paintings are *Royal Volunteer Review* (1860); *Edinburgh from the Canal* (1862); *The Vale of Leith* (1866). Glasgow Institute possesses over 200 of his works. D. at Edinburgh, Nov. 19, 1878.

Bought Note: a memorandum given by a broker who effects a sale to the purchaser, in which the latter is notified that the property therein described has been bought for him of the seller, the price and terms being stated. A similar memorandum given to the seller is called the *sold note*. Both these memoranda and the broker's book entry should be signed, in order that they may not be excluded as evidence under the Statute of Frauds. In case of a discrepancy among them it becomes a question of fact what the real contract was. If the notes agree they will be taken to represent the contract; if they disagree, but one agrees with the entry, the contract will be presumed to be represented by the entry and the agreeing note.

Revised by F. STURGES ALLEN.

Boughton, baw'ton, GEORGE HENRY; genre-painter; b. near Norwich, England, in 1834. When he was three years of age his parents went to Albany, N. Y.; he early took up the study of art without a master. In 1853 he made a sketching trip in Great Britain; returned to the U. S., and removed from Albany to New York in 1858. In 1860 he went to Paris, and thence to London in 1861, where he has since resided. National Academician 1871; associate Royal Academy, London, 1879. His subjects are taken from the Puritan days in New England, "Knickerbocker" life in the early history of New York, and modern English scenes. His work is extremely popular both in the U. S. and in Great Britain, and a considerable number of his pictures are well known by engravings. The *Edict of William the Testy* (1877) is in the Corcoran Art Gallery, Washington. Studio in London.

WILLIAM A. COFFIN.

Bongie, boo'zee [Fr., wax-candle; cf. Ital. *bugia*, Span. *bugia*, so named from *Bugia*, Arab. *Bijiyah*, an Algerian port from which wax was formerly exported in large quantities]; a slender surgical instrument designed to be introduced into the male urethra. It is usually made of gum-elastic or gutta-percha, but may be made of other flexible substances. Bongies are often medicated, but more commonly they are designed to act mechanically upon a con-

tracted passage. They are sometimes made of a larger size for the rectum or for the œsophagus.

Bouguereau, boo'gay'fō', ADOLPHE WILLIAM; one of the most famous contemporary French painters; b. in La Rochelle, Nov. 30, 1825; pupil of Picot and winner of the Grand Prix de Rome in 1850. Member of the Institute; commander of the Legion of Honor 1885; medal of honor, Paris Exposition, 1878; medal of honor, Paris Salon, 1885. With the exception of Meissonier and Gérôme, his work is probably more widely known than that of any painter of the modern French school. Many of his pictures are owned in the U. S., and a number of them have become popular through engravings and other reproductive processes. He is chiefly celebrated as a painter of the nude figure, is a most skillful draughtsman, a delicate, but not forceful colorist. His *Youth of Bacchus* (1884) is one of the best of his compositions, and his *Madonna of Consolation* (1874) and his *Birth of Venus* (1879) are in the Luxembourg gallery. A picture called *Nymphs and Satyr*, painted in 1873, a fine example, is in the Hoffman House, New York. Most of the pictures by him in the U. S., however, are weakly sentimental figures of women and children, which detract from the reputation he achieved by his serious work. His abilities have been the subject of considerable difference of opinion among artists, the majority conceding him only powers of the second order. Studio in Paris.

WILLIAM A. COFFIN.

Bouillé, boo'lay', FRANÇOIS CLAUDE AMOUR, Marquis de; general; b. in Auvergne, France, Nov. 19, 1739; served in the Seven Years war; governor of Guadeloupe 1768; during American Revolution captured several British islands in the West Indies; member of Assembly of Notables 1787-88; commander-in-chief of the army of the Meuse, Saar, and Moselle 1790; aided Louis XVI. in his attempt to escape from Paris; served under Gustavus III. of Sweden 1791; later under Prince of Condé; d. in London, Nov. 14, 1800. Author of *Mémoires sur la Révolution Française*.

Bouillon, Godefroi de: See GODFREY OF BOUILLON.

Boulac: See BULAK.

Boulangier, -lään'zhay', GEORGES ERNEST JEAN MARIE; French soldier and politician; b. at Rennes, April 29, 1837; appointed sub-lieutenant in First Regiment of Algerian Tirailleurs in 1856; received the decoration of the Legion of Honor in 1859; chief of battalion in the army of Paris during the Franco-Prussian war; appointed brigadier-general in 1880; sent to the U. S. as head of the mission to the Centennial Celebration in 1876; appointed French Minister of War Jan. 7, 1886. An energetic and capable organizer, he became the idol of the populace and the rising hope of the radicals, but eventually he brought forward measures for the reorganization of France which were accepted by Bonapartists, monarchists, clericals, and socialists. The movement known as Boulangism attracted all the malcontents, who elected him deputy for Nord by 100,000 majority, and for a time seriously disturbed political affairs in France. He fought a duel with Prime Minister Floquet, and was severely wounded, in 1888. Accused of violating his parole and conspiring to overturn the republic, he fled to Great Britain in order to avoid arrest. His trial proceeded in his absence, and he was sentenced to transportation for life. It was shown that the Duchess d'Uzès had supplied him with 3,000,000 francs for his political purposes. On Sept. 30, 1891, he shot himself on the grave of his mistress, Mme. de Bonne-main, who had followed him in exile and had supported him on her bounty during two years. C. K. ADAMS.

Boulder: same as BOWLDER (*q. v.*).

Boulder: a city and railroad center; capital of Boulder co., Col. (for location of county, see map of Colorado, ref. 2-E); situated at the east base of the Rocky Mountains, on both sides of Boulder creek, which flows through the famous Boulder Cañon. The State University is located here. Boulder has flouring-mills, smelting and sampling works, excellent public schools, and a complete system of water-works (the reservoir of which is fed by pure mountain-streams), and electric lights; is the center of both the agricultural and mining interests of the county, the great telluride belt of mines being only 6 to 8 miles distant, the free gold mines only 8 to 14 miles, and the famous silver mines of Caribou only 22 miles away. Coal and iron mines abound in the valley within 4 to 6 miles. This is a favorite resort for tourists and invalids. Pop. (1880) 3,069; (1890) 3,330.

EDITOR OF "HERALD."

Boulder-clay: same as BOWLDER-CLAY (*q. v.*).

Bou'le [Gr. *βουλή*, council]; the name of the ancient Athenian senate; instituted by Solon as a check on the *ecclesia* (*ἐκκλησία*), which was an assembly of the whole people. The boule was at first composed of 400 members, but Cleisthenes increased the number to 500 when he divided the Athenians into ten tribes. The number was subsequently raised to 600. All free-born Athenian citizens above thirty years of age were eligible to this council.

Boule, or **Boule-work**: See **Buhl**, or **Buhl-work**.

Boulevard' [Fr., loan-word from Germ. *Bollwerk*; Eng. *bulwark*, So. Russ. *bolwerk*]; originally a kind of fortification introduced in France by the Normans after their conquest of Normandy. In France and Germany these defensive works have been generally leveled and turned into public promenades or avenues lined with trees. The Inner Boulevards of Paris form a magnificent central thoroughfare, lined on each side by a double row of trees, under which is a wide and elevated pathway, and bordered by elegant shops and mansions, the whole presenting a scene of gayety and splendor which no other capital can equal.

Boulogne, boo lōn', or **Boulogne-sur-Seine**, boo lōn' sūr-sayn'; a town of France; department of the Seine; on the right bank of the river Seine; 5 miles W. of Paris, from which it is separated by the Bois de Boulogne (*q. v.*). A fine stone bridge connects it with the ruined palace of St.-Cloud. It is surrounded by beautiful scenery. Pop. (1886) 30,084; (1891) 32,569.

Boulogne, or **Boulogne-sur-Mer**, -sūr-mär'; a seaport of France; department of Pas-de-Calais; on the English Channel; at the mouth of the Liane; 158 miles by rail N. N. W. of Paris and 27 miles by rail S. W. of Calais; lat. 50° 44' N., lon. 1° 37' E. (see map of France, ref. 1-E). The railway which connects Calais with Amiens passes through it. It is divided into two parts—the upper and lower town, from the former of which the English coast is visible. The upper town has beautiful promenades, an old Gothic cathedral, an hôtel de ville, and an episcopal palace. The lower town is newer, more regular, and more populous. It contains a hospital, a theater, a museum, a public library, and an exchange. Boulogne derives much of its prosperity from English residents and visitors, who are very numerous. Steamers ply twice a day between this port and Folkestone. The harbor will admit large vessels during high water, and has been improved by the construction of vast moles at a cost of \$5,000,000. Here are manufactures of linen and woolen goods, sailcloth, cordage, bottles, etc. It occupies the site of the ancient *Gesoriacum*, which after the time of Constantine the Great was called *Bononia Oceanensis*. Several centuries later the name was changed to *Bolonia*. At this place Napoleon assembled in 1804 an army of 180,000 men and a flotilla of 2,400 transports for the invasion of England. To commemorate this design, which, however, was never executed, a column 164 feet high was erected. Pop. (1891) 45,205.

Boulogne, Étienne Antoine: French prelate; b. in Avignon, Dec. 26, 1747; edited during the Revolution the *Annales religieuses*, which was several times suppressed and revived with altered title. Under the empire he, as Bishop of Troyes, was imprisoned with two other bishops for declaring that the emperor had no authority to confine a bishop without the approval of the pope. He was made an archbishop in 1822. His works appeared in 1826-28, 8 vols. D. in Paris, May 13, 1825.

Boul'ton, Matthew: inventor; b. in Birmingham, England, Sept. 3, 1728. He was noted for his energy and enterprise as a manufacturer, and he became a friend and partner of James Watt. He established at Soho, near Birmingham, a manufactory of steam-engines in 1765. Boulton invented an improved apparatus for coining money and a new mode of making steel. He was a man of generous disposition. D. in Soho, Aug. 18, 1809. See *Life of M. Boulton* (Birmingham, 1809), and S. Smiles, *Lives of Boulton and Watt* (1865).

Bou-Maza, surnamed Si MOHAMMED BEN ABDALLAH: an Arab chief; b. about 1820; followed for three years the austere life of a dervish; then, proclaiming that he was an emissary of heaven, he stirred up the Kabyles, the warlike inhabitants of Dahra in Algiers; preached the extermination of Christians, and waged war upon the allies of France, Hadj-Achmed and Sidi-Darrihi. He surrendered after a protracted conflict with Gen. Herbillion, Jan. 13, 1847, and

was conveyed to Paris. He afterward entered the service of the Porte, and attained the rank of colonel.

Bound, or **Bownde**, NICOLAS, D. D.; a clergyman of the Church of England; educated at Cambridge; fellow of Peterhouse 1570; became rector of Norton, Suffolk, 1585; minister of Church of St. Andrew the Apostle, Norwich, and there he was buried Dec. 26, 1613. He published his famous work *The Doctrine of the Sabbath* (London, 1595); enlarged edition with partial Latin title, *Sabbatum Veteris et Novi Testamenti; or the True Doctrine of the Sabbath* (1606), in which the Puritan doctrine of the Lord's Day was for the first time broadly and prominently asserted. He also was an advocate of *The Holy Exercise of Fasting* (Cambridge, 1606).

Bound-bailiff: See **BAILIFF**.

Bound Brook: borough; in Bridgewater township, Somerset co., N. J. (for location of county, see map of New Jersey, ref. 3-C); 31 miles W. S. W. of New York. It is pleasantly situated on the Raritan river and the Delaware and Raritan Canal. It has seven churches and important woolen, engine, brass, and paint manufactures, and its trade in lumber is very extensive. Washington's army was encamped here for two winters. Pop. (1880) 934; (1890) 1,162; (1895) 2,030. EDITOR OF "CHRONICLE."

Bounty [from Fr. *bonté*, goodness, kindness; < Lat. *bonitas*]; a premium given by a government to foster some branch of industry, or to encourage enterprises which are believed to be of national importance and conducive to the public interests. The British Government formerly gave bounties to encourage the herring fisheries and the exportation of grain and Irish linen, and for other purposes. The modern political economists reject this factitious method of fostering commerce, agriculture, etc., and argue that it promotes a misdirection of capital, talent, and industry. The impolicy of giving bounties for such purposes appears to be now generally admitted, but they are still continued in France to promote ship-building and the production of sugar. They are often given, particularly in new countries, for the destruction of ferocious animals, as wolves, bears, etc. The general Government and some of the U. S. give bounties for tree-planting. Subsidies to sugar-planters, steamship companies, and land grants to railways are common in the U. S.

A bounty in money is also often given to induce men to enlist in the army and navy. The amount of this money varies according to the exigency and the difficulty of obtaining recruits. In 1812 the British Government offered a nominal bounty of £23 17s. 6d., but this was subject to large deductions and drawbacks. The bounty given in Great Britain at present is about one pound sterling. In the American civil war the recruits of the Union army received in some cases a bounty of \$500 or more. Many of these recruits deserted soon after they had received the bounty; these were called "bounty-jumpers."

Queen Anne's Bounty is a fund applied in England by a corporation of *ex-officio* governors to the augmentation of the incomes of the poorer clergy of the Church of England. Henry VIII. annexed to the crown the first fruits or the first year's income to a new incumbent of a benefice, and the tenths, which had previously gone to the pope. In 1703 Parliament, with the consent of Queen Anne, set aside the revenues from these sources for the increase of poor livings. In 1890 these amounted to \$884,480, and the board of governors appropriate the revenue under a long series of statutes to promote private benefactions or endowments, or building of parsonages, by giving an equal sum not exceeding \$1,000 to benefices having a yearly income of this amount or less.

Bounty, MUTINY OF THE: See **BLIGH, WILLIAM**, and **PITCAIRN ISLAND**.

Bouquet de la Grye, boo'kay' de-la-gree', JEAN JACQUES ANATOLE: hydrographical engineer; member of the Institute; commander of the Legion of Honor; b. in Thiers, Puy-de-Dôme, May 20, 1827; studied at the Polytechnic School, graduating in 1847 in the hydrographical engineers, of which he became engineer-in-chief in 1886. He is member of the bureau of longitudes; vice-president of the committee on hydrography; elected member of the Academy in 1884 in place of Yvon Villarceau. He is the ardent promoter of the project to make Paris a seaport by means of a ship-canal and the improvement of the Seine. Author of *Pilote des Côtes Ouest de la France; Notes sur la Sondage*

à la mer; *Étude hydrographique sur la baie de la Rochelle; Régime de la Loire maritime; Paris, Port de mer.*

W. R. H.

Bouquetin, boo'ke-tān', or **Ibex of the Alps** (in Germ. *Steinbock*); a species of wild goat (*Capra ibex*) formerly found on the Alps, and which ascends to the limit of perpetual snow. It is larger than the common goat, and has large horns which curve backward. The horns of the male are sometimes 20 inches long or more. It has no beard except a few hairs in winter. The color of the hair is mostly brown. This animal feeds on shrubs, lichens, and the scanty herbage which is found on the confines of vegetation. It has an extraordinary power of bounding from crag to crag, and of climbing precipices which are almost perpendicular. The bouquetin can be tamed if it is taken young, and it will breed with the common goat. The bouquetin is now extinct in the Alps, except possibly near Courmayeur. There are still probably forty or fifty on the mountains S. of the Dora Baltea. The bouquetin is preserved by law.

Bourbaki, boor'baa'kee', CHARLES DENIS SAUTER: French general; b. in Pau, Apr. 22, 1816; took part in the wars in the Crimea and in Italy; and in the German-French war of 1870 he commanded the imperial guards before Metz. After the deposition of Napoleon he organized the Army of the North under Gambetta; then tried with disastrous results to break the German line at Belfort. He attempted suicide, and gave up the command to Clinchant, who crossed the Swiss frontier with 84,000 men, Feb. 1, 1871. In 1873 he commanded an army-corps at Lyons; was retired from active duty in 1881.

Bourbon: a French island. See RÉUNION.

Bourbon: town; on railroad, Marshall co., Ind. (for location of county, see map of Indiana, ref. 2-E); 53 miles from Fort Wayne and 95 from Chicago. It has three churches, a graded school, including high-school department, wagon manufactories, a large roller flouring-mill, several boot and shoe manufactories, and various other mechanical enterprises. The surrounding country is very fertile, and some valuable timber, such as walnut, poplar, oak, maple, beech, etc., is yet standing. Large quantities of butter, eggs, poultry, wool, horses, cattle, hogs, sheep, wheat, oats, clover-seed, lumber, etc., are annually exported. Pop. (1880) 1,056; (1890) 1,064. EDITOR OF "MIRROR."

Bourbon (Fr. pron. boor'bōn'): the name of a family which reigned over France from 1589 to 1792, and from 1815 to 1848. A prince of the Bourbon dynasty also obtained the throne of Spain in 1700, and another that of Naples and Sicily in 1735. The Bourbons derive their name from the castle of Bourbon, which was built in the thirteenth century, and was situated in the old province of Bourbonnais, 16 miles W. of Moulins. The heiress of the seigniorship was married in 1272 to Robert, a younger son of King Louis IX. The seigniorship was erected into a duchy, and Louis, a son of Robert, became about 1327 the first Duke of Bourbon. He died in 1341, and was succeeded by his son Pierre, who was killed at Poitiers in 1356. Louis, a son of Pierre, became the third Duke of Bourbon. He was one of the most powerful vassals of the crown of France, and made large additions to the duchy by his marriages. D. in 1410. His son Jean, b. in 1381, was the fourth duke. He was taken prisoner by the English at Agincourt, and detained until his death (1434). He was succeeded by his son Charles, b. in 1401. He died in 1456, leaving a son Jean, who became the sixth Duke of Bourbon and constable of France. See BOURBON, CHARLES DE.

Among the collateral branches of the Bourbon family were those of Vendôme, Condé, Montpensier, Orléans, Conti, and Soissons. Antoine de Bourbon, Duke of Vendôme, became by marriage King of Navarre. His son, Henry of Navarre, was the first French king of the house of Bourbon, and began to reign as Henry IV. in 1589. He had two sons, Louis XIII. and Gaston, Duke of Orléans; a daughter, Elizabeth, who was married to Philip IV. of Spain, and Henrietta, who became the queen of Charles I. of England. Louis XIII., who died in 1643, left two sons, Louis XIV. and Philip, Duke of Orléans, who was the ancestor of King Louis Philippe. The dauphin, the eldest son of Louis XIV., d. in 1711, leaving three sons—1, Louis, Duke of Burgundy; 2, Philip, Duke of Anjou, who became King of Spain as Philip V.; 3, Charles, Duke of Berry. Louis of Burgundy, who died in 1712, was the father of Louis XV., who succeeded his great-grandfather, Louis XIV., in 1715. Louis XV. had one

son, Louis, who died before his father, leaving three sons, who all reigned successively—namely, Louis XVI., Louis XVIII., and Charles X. Louis XVI. left one son, who by the royalists was recognized as Louis XVII., but perished as a child during the French Revolution. As the circumstances of his death remained unknown, many adventurers claimed to be Louis XVII. Louis XVIII. had no issue. Charles X. had two sons—Louis Antoine, who died without issue in 1844, and Charles Ferdinand, Duke of Berry. His only son, Henri, Duke of Bordeaux, styled Count de Chambord, was the heir to the throne, according to the Legitimists, who gave him the title of Henry V. See CHAMBORD.

The House of Orléans is called the younger branch of the royal family of Bourbon, and is descended from Philip of Orléans, a younger brother of Louis XIV. His son Philip was regent of France during the minority of Louis XV., and left a son, Louis Philippe, Duke of Orléans. This last was the grandfather of the Duke of Orléans who figured in the Revolution as Citizen Egalité, and was father of Louis Philippe, who became King of the French in 1830. This king had five sons—the Duke of Orléans, the Duke of Nemours, the Prince de Joinville, the Duke of Anmale, and the Duke of Montpensier. The Count of Paris, the son of the eldest of these five, is regarded as the heir to the throne by the Orleanist party.

Philip, Duke of Anjou, who was placed on the throne of Spain in 1700, was the founder of a Spanish dynasty, which reigned in Spain until the dethronement of Queen Isabella in 1868, and regained the crown in 1875 through Alfonso XII. Philip of Anjou was also the ancestor of the Bourbon dynasties of Naples and Parma. Francis II., who was dethroned in Sept., 1860, was the last Bourbon monarch of Naples (or the Two Sicilies). The Bourbons have also ceased to reign in Parma, which was annexed to the kingdom of Italy in 1859. Louise of Bourbon, a daughter of the Duke of Berry and sister to the Count of Chambord, b. in 1819, d. in 1864, was married in 1845 at Frohsdorf to Charles III. of Parma, who descended from the Spanish line of the Bourbons. Charles III. was violently reactionary in his policy, and was assassinated Mar. 26, 1854. Louise immediately assumed the regency in the name of her minor son, Robert I., and she developed extraordinary energy and made great personal sacrifices in order to gain the confidence of the Italians and bring back order and peace. She was not altogether unsuccessful in her endeavors, but the tendency of the time pointed another way. See Achaître, *Histoire Chronologique et Généalogique de la Maison Royale de Bourbon* (2 vols., 1825); Coxe, *Memoirs of the Kings of Spain of the House of Bourbon* (3 vols., 1813).

Bourbon, CHARLES, Duc de, usually styled CONSTABLE BOURBON (Connétable de Bourbon): French general; b. Feb. 17, 1489; son of Gilbert Bourbon, Count of Montpensier. He married the heiress of the Duke of Bourbon—Suzanne, a daughter of Pierre de Bourbon, who died in 1503—and became the owner of the vast estates of both branches of the Bourbons. But his brilliant military successes aroused the jealousy of Louis XII., who refused to make him commander-in-chief. Francis I., however, followed another policy. Charles was appointed constable of France in 1515, and was one of the generals who gained a victory at Marignano in that year. He was very popular with the soldiers and with the court, but his popularity caused his fall. The mother of Francis I. was enamored of him, but her overtures having been rejected, she became his enemy. At her instigation, the estates which he had acquired by marriage were seized by the king after the death of Suzanne. Other insults were heaped upon him. In the campaign against Charles V. the command of the vanguard was given to the Duc de Alençon. His official salaries and the sums he had borrowed for his war expenses were not paid, and he, the richest man in France, was actually reduced to beggary. Bourbon deeply resented this injury, renounced his allegiance to the King of France in 1523, and became the ally of the Emperor Charles V., for whose services he raised about 6,000 Germans. He contributed largely to the victory which the imperial army gained over the French at Pavia in 1525. It appears that he was distrusted by Charles V., who neglected to pay Bourbon's German mercenaries, and these consequently became mutinous. However, the emperor made him Duke of Milan and commander of his mercenaries in Northern Italy in 1526, and with them he conducted a daring enterprise against Rome, in which he displayed great military talent. His army

took Rome by assault May 5, 1527, but he was killed as he mounted the wall by a pistol-shot, fired, it is said, by Benvenuto Cellini. In German there is a biography by Schwartzeman (Berlin, 1852). The Constable Bourbon is a prominent character in Byron's drama *The Deformed Transformed*.

Bourdaloue, boor dā'loo, LOUIS; French pulpit orator; b. in Bourges, Aug. 20, 1632. He entered the order of Jesuits in 1648, and became professor of rhetoric and the humanities. In 1669 he removed to Paris, where he preached for many years before Louis XIV. and the court. He was distinguished for the dignity of his manner, the wisdom of his words, and the earnestness of his piety. His style of eloquence was less inflated and more direct than that which then prevailed in France. He was a general favorite with the common people, as well as the learned and higher classes. D. in Paris, May 13, 1704. His sermons were published in 16 vols., 1707-31. Perhaps the most famous among them are the sermon of the Passion; that on the Conception; and that on the Last Judgment. Eng. trans. of select sermons (n. e. London, 1884). See A. Feugère, *Bourdaloue, sa prédication et son temps* (Paris, 1874; 5th ed. 1889); M. Lauras, *Bourdaloue, sa vie et ses œuvres* (Paris, 1881).

Revised by A. R. MARSH.

Bourdon [Fr., pilgrim's staff]: in music, the humming sound produced by blowing through a long hollow staff. Hence the name given to the stop of low pitch found in all pipe-organs.

Bourg: a place of refuge or fortified place; the name of about forty villages and towns in France. The most important is **Bourg**, or **Bourg-en-Bresse**, boorg'ān-bres'; a town of France; capital of the department of Ain; pleasantly situated on the Reyssouse; 57 miles by rail N. N. E. of Lyons (see map of France, ref. 6-II). Several railways connect it with Lyons, Mâcon, and Besançon. It is well built, has a college, a museum, a large hospital, and a public library of about 20,000 volumes. Here are manufactures of linen, cotton stuffs, hosiery, etc. Pop. (1891) 18,968.

Bourgeois, būr-jois': the name of a type used in printing. It is one size larger than brevier, and one size smaller than long primer. See PRINTING.

Bourgeois, boorzhwa'ā: a French word signifying a citizen or resident of a city; a commoner, as distinguished from a nobleman; a civilian, as distinguished from a soldier. A citizen of the state or republic is called *citoyen*.

Bourgeoisie, boorzhwa'āzē: a French term; is also much used in English, defined in dictionaries as "citizens," "citizenship," "commonalty." It is applied to the great middle class of French society, composed mostly of merchants, manufacturers, master mechanics, lawyers, etc., who live in towns and cities. They are inferior in rank to the aristocracy, and superior to the peasantry and to the *prolétaires* of the towns.

Bourges, boorzh' (anc. *Avaricum*, afterward *Bituriges*): a city of France; near its center; capital of the department of Cher; is situated in a fertile plain at the confluence of the Auron and the Eure, 146 miles by rail S. of Paris (see map of France, ref. 5-F). It is connected by railway with Paris, Orléans, Moulins, and other cities. It was inclosed by ramparts now converted into promenades or boulevards bordered with chestnut and walnut trees. The streets are crooked and the houses mostly antique. Bourges has a college, a normal school, a public library of about 25,000 volumes, a fine hôtel de ville, and a magnificent Gothic cathedral, which is considered one of the finest in Europe. It is the see of an archbishop. This town was formerly the seat of a celebrated university founded in 1463 and suppressed in 1789. It has manufactures of cutlery, woolen stuffs, etc. *Avaricum*, which occupied this site, was a very ancient town, and was the capital of Celtic Gaul about 500 B. C. It was the chief town of the Bituriges in the time of Julius Caesar, who besieged and took it in 52 B. C., after which it became the capital of the Roman province of Aquitania. During the Middle Ages seven councils of the Church were held here, and in 1438 the Pragmatic Sanction of the Gallican Church was established here. Pop. (1886) 42,829; (1891) 45,432.

Bourget, boorz'hay, PAUL; French novelist and critic; b. at Amiens, Sept. 2, 1852; devoted himself early to journalism and literature. He has attracted much attention, on the one hand, by his work in criticism, *Études de Psychologie contemporaine* (2 series, 1883-85); *Études et Portraits*

(1889); and, on the other hand, by his novels, in which the sad conclusions of so-called realist or naturalist psychology and the pessimism of the *fin de siècle* are embodied in delicate and subtle art. Among these novels the following have perhaps had most repute; *Cruelle Énigme* (1885); *Un Crime d'amour* (1886); *André Coruëlis* (1887); *Mensonges* (1887); *Le Disciple* (1889). He has published also several volumes of verse: *La vie inquiète* (1875); *Edet* (1878); *Les ayeux* (1882); *À bord de la mer, etc.* (1885). A. R. MARSH.

Bourgoing, boor'gwān', JEAN FRANÇOIS, Baron DE: French diplomatist; b. in Nevers, Nov. 20, 1748; was ambassador at different courts. During a nine years' residence in Spain he wrote, among others, a thorough book upon it, *Nouveau voyage en Espagne, etc.* D. in Carlsbad, July 20, 1811.

Bourignon, boor'ron'yōn, ANTOINETTE; a Flemish visionary; b. at Lille, Jan. 13, 1616; professed that she received special revelations; found asylum in a convent. Having left the convent and renounced Catholicism, she traveled in foreign countries; wrote several religious works; gained many converts to her sect; it especially prospered in Scotland. She was an eloquent speaker and writer. D. in Franeker, Friesland, Oct. 30, 1680. See a *Life of Antoinette Bourignon*, prefixed to her works (Amsterdam, 25 vols., 1676-84). Peter Poiret was the chief expounder of her mysticism. Some of her writings appeared in English within thirty years of her death. See LABADIE, JEAN, de.

Bourinot, JOHN GEORGE, C. M. G., LL. D.: Canadian publicist; b. at Sydney, Nova Scotia, Oct. 24, 1838; educated at Trinity College, Toronto; engaged in journalism; established the *Hullifax Reporter*, and was its editor for many years. After holding various appointments in the senate, he became clerk of the Dominion Parliament in 1880; created by the Queen a companion of the Order of St. Michael and St. George in 1890; and in 1892 was elected president of the Royal Society, Canada. He has contributed extensively to the magazines on both sides of the ocean. Among his works are: *Intellectual Development of Canadian People* (Toronto, 1880); *Parliamentary Practice and Procedure* (Montreal, 1884); *Constitutional History of Canada* (1887); and *Parliamentary Government in Canada* (1892).

NEIL MACDONALD.

Bourmont, boor'mōn', LOUIS AUGUSTE VICTOR, de: Comte de Ghaïsne; a French general; b. in Anjou, Sept. 2, 1773; was a royalist in the Revolution; fought against the republic in 1794-96; entered the service of Napoleon about 1809. Having served with distinction in Russia, he was raised to the rank of lieutenant-general in 1814. During the Hundred Days, 1815, he deserted Louis XVIII. and Napoleon by turns. He became Minister of War in 1829, and commander-in-chief of the army sent against Algiers in 1830. He conquered Algiers, and was rewarded in July, 1830, with the bâton of a marshal of France. Being devoted to Charles X., he was deprived of his command by the revolution of 1830, and went into exile, and fought for Dom Miguel in Portugal. D. in Anjou, Oct. 27, 1846. See De Lansac, *Notice sur le Comte de Bourmont* (1847).

Bourne: town (incorporated Apr. 2, 1884); Barnstable co., Mass. (for location of county, see map of Massachusetts, ref. 5-K); on Old Col. R. R. (Cape Cod Div.); 56 miles from Boston. The town has 6 churches and 11 schools, including a high school; its principal industries are freight-car manufactory, iron foundry, art-works, oystering, and line-fishing. Bourne was set off from Sandwich, and a large part of its territory borders on Buzzard's Bay. It is a popular summer-resort, and has many elegant summer residences. Pop. of township, including 8 villages (1890) 1,442; (1895) 1,580.

DAVID D. NVE.

Bourne, HUGH; preacher; b. at Fordhays Farm, in the parish of Stoke-on-Trent, Staffordshire, England, Apr. 3, 1772; was one of the founders of the sect of Primitive Methodists. He was by trade a wheelwright; joined the Wesleys in 1799; started camp-meetings in imitation of the American practice 1807; was in consequence "cut off" from the Wesleyan connection in 1808. His new sect was organized in 1810. He visited the U. S. 1844-46. D. in Bemersley, Staffordshire, Oct. 11, 1852. He wrote a history of the Primitive Methodists (Bemersley, 1825). See his *Life*, by J. Walford (London, 1855), and METHODISM.

Bourne, VICENT; English scholar and Latin poet; b. about 1695. He was an usher of Westminster School; graduated at Trinity College, Cambridge, and became a fellow in 1720; passed the rest of his life as a master in

Westminster School. He wrote several short original Latin poems, which are remarkably graceful, and produced Latin versions of English ballads, which are felicitous. These were published under the title *Pœmata* (1734; another edition, with a memoir by Mitford, 1840). Cowper translated some of his original Latin poems. D. Dec. 2, 1747.

Revised by HENRY A. BEERS.

Bournemouth: a health-resort of Hampshire, England; on Poole Bay, English Channel. It is in the borough of Christchurch; 37 miles S. W. from Southampton (see map of England, ref. 14-G). The suburbs in Bourne Brook valley are laid out in pine groves and parks; there are here a national sanitarium, homes for consumptives and incurables, and other health establishments, a town-hall, and St. Peter's church, with a memorial to Keble. It was a coast-guard station until about 1840, when it began to grow rapidly on account of its benign climate. Pop. (1891) 37,650.

Bour'nonite, or **Endel'ionite:** a triple sulphide of copper, antimony, and lead; composed of 41.8 per cent. of lead, 26 of antimony, 19.4 of sulphur, and 12.8 of copper. It occurs in crystals, and massive.

Bouro: See BERU.

Bourrienne, boor'ri-en', LOUIS ANTOINE FAUVELET, de; a French diplomatist; b. at Sens, July 9, 1769. He was a fellow-student and friend of Bonaparte at the school of Brienne. They met at Paris in 1792, and renewed their intimacy. In 1796 Bourrienne became private secretary to General Bonaparte, whom he followed to Egypt. In 1804 he was sent as minister to Hamburg, but he was accused of peculation, and was recalled in 1811 and forced to refund 1,000,000 francs. Having deserted Napoleon in 1814, he was appointed Minister of State by Louis XVIII. in 1815. He published an interesting work entitled *Memoirs upon Napoleon* (10 vols., 1829-31), which is an important contribution to the history of the times. Died in an asylum in Caen, Feb. 7, 1834. See Boulay de la Meurthe, *Bourrienne et ses Erreurs* (2 vols., 1830).

Bourse: See EXCHANGE.

Bousbecq, AUGIER GHISLEN: See BUSBECQ, AUGIER GHISLEN.

Boussingault, boos'sün'gō', JEAN BAPTISTE JOSEPH DIEUDONNÉ; chemist; b. in Paris, Feb. 2, 1802; educated at the mining school of St. Etienne; was an officer under Bolivar in South America in his youth. Returning to France, he was made Professor of Chemistry at Lyons, and in 1839 was elected a member of the Academy of Sciences and given the chair of Agriculture in the Paris Conservatory of Arts and Trades. He was made commander of the Legion of Honor in 1857, and promoted to the rank of grand officer of that order in 1876. In 1844 he published a valuable work, *Treatise on Rural Economy* (2 vols.). Among other works, he wrote *Annals of Physics and Chemistry*. He was a moderate republican member of the National Assembly in 1848. D. in Paris, May 12, 1887.

Boustrophe'don [Gr. *βουστροφῆδον*, turning like oxen in plowing; *βοῦς*, ox + *στροφή*, turn]: a mode of writing practiced by the ancient Greeks until about 450 B. C.—namely, in alternate lines from right to left and from left to right, as fields are plowed in furrows, having an alternate direction.

Boutelle, CHARLES ADDISON; Congressman; b. at Damariscotta, Me., Feb. 9, 1839; educated at Yarmouth Academy; entered the shipping business; volunteered in the navy in 1862, and served with distinction to the close of the war; assumed the management of the Bangor *Whig and Courier* in 1870; unanimously nominated for Congress in 1880, and since renominated and elected seven times; represented Maine on the Republican national committee in 1884; chairman of the committee on naval affairs in the Fifty-first Congress, and in this capacity drafted the bill providing for the first heavy battle-ships for the new navy.

C. H. THURBER.

Butterwek, boot'er-vek, FRIEDRICH; philosopher and critic; b. near Goslar, in Hanover, Apr. 15, 1766. He wrote several poems and a romance called *Count Donamar* (3 vols., 1791). He became Extraordinary Professor of Philosophy at Göttingen in 1797 and ordinary professor in 1802. He published several works on philosophy and a *Treatise on Esthetics* (1806). His reputation is founded on his excellent *History of Modern Poetry and Eloquence* (12 vols., 1801-19). D. in Göttingen, Aug. 9, 1828.

Boutmy, boot'mee', ÉMILE; publicist; b. at Paris, April 13, 1835; director of the *École libre des Sciences politiques*, and since 1880 member of the Academy of Moral and Political Sciences. M. Boutmy's chief works are: *Quelques observations sur la réforme de l'enseignement supérieur* (1877); *Études de droit constitutionnel: France, Angleterre, États-Unis* (1885), an original and highly suggestive book, of which an English translation by E. M. Dicey was published at New York in 1891; and *Le développement de la constitution en Angleterre* (1886; English translation by J. M. Eaden, New York, 1891). C. H. T.

Boutou, NATHANIEL, D. D.; b. in Norwalk, Conn., June 29, 1799; graduated from Yale College 1821, and from Andover Theological Seminary 1824; settled as pastor of the Congregational church in Concord, N. H., Mar. 23, 1825, and so remained till 1867; received the honorary appointment of State historian of New Hampshire; was corresponding secretary of New Hampshire Historical Society and one of its most prominent members. Among his principal works are *History of Concord, New Hampshire* (Concord, 1856), and 10 volumes of *Provincial Records* (of New Hampshire). D. in Concord, N. H., June 6, 1878.

Bout'well, GEORGE SEWALL, LL. D.; lawyer and cabinet officer; b. in Brookline, Mass., Jan. 28, 1818. His education was partly obtained in the public schools and by a course of prolonged private study. He taught school in his youth; was admitted to the bar at the age of twenty-eight; entered political life in 1840 as a disciple of Van Buren; was thrice defeated for Congress and twice for Governor of his native State; but in 1851 and 1852 was chosen chief executive of Massachusetts. He was long a member of the Massachusetts Board of Education, of which he was secretary for five years. He organized the internal revenue department of the U. S. Government, and in 1862 became its first commissioner. He was a member of Congress from Massachusetts 1863-69, and Secretary of the Treasury 1869-73 under President Grant. In 1873 he was chosen U. S. Senator from Massachusetts for the term ending 1877 in place of Hon. Henry Wilson, Vice-President of the U. S. Wrote treatises on education and taxation in a conservative spirit.

Bouvar'dia [named in honor of Bouvard, physician of Louis XIII.]; a genus of plants of the family *Rubiaceæ*; allied to the trees from which Peruvian bark is obtained. The corolla is tubular, four-lobed, and has four stamens included in it. The fruit is a capsule, two-celled. The species of this genus are natives of Mexico. Many species are cultivated in gardens for their beautiful flowers.

Bouvier, JOHN; jurist; b. in Codogno, province of Milan, Italy, in 1787; emigrated to the U. S. in 1802, and practiced law in Philadelphia. In 1838 he became a judge of the criminal court of that city. He published a *Law Dictionary* (1839), and *Institutes of American Law* (4 vols., 1851), which were long standard reference-books. D. in Philadelphia, Nov. 18, 1851.—His daughter HANNAH, b. in 1811, published *Familiar Astronomy* (1857), which won encomiums from eminent men.

Bovia'num: an ancient city of Italy; of the Samnites or near the site of the modern Bojano; surrounded by high mountains. According to Livy it was a wealthy and powerful city. It was besieged and taken by the Romans in 311 B. C. In the second Punic war it was several times headquarters of the Roman army. During the Social war it was capital of the confederates.

Bo'vidæ [from Lat. *bos, bovis*, ox]: the ox family; an important family of ruminant mammals; rich in species, and including a large number of those most useful to man. They vary greatly in form, the average type, or that represented by the greatest number of species, being exemplified in the antelopes, while extremes are represented by the oxen, the sheep, and the goats. The head is narrowed forward, the nose generally naked, and the nostrils large and open. The teeth are of the typical ruminant type, no incisors being present in the upper jaw; and the upper canines also are usually lacking, though sometimes well developed. In the lower jaw are three incisors on each side, and in contact with them a canine shaped like an incisor and often mistaken for one. The horns are always developed in the males, and frequently in females. They are of the "hollow" type, each horn consisting of a solid process of the frontal bone, the "core," enveloped in a fibrous sheath of true horn; and they are not periodically shed as in the related deer family. The latter grows slowly, but continuously, from the base

and wears away at the tip. The family includes all the hollow-horned ruminants except the prong-horn of America and *Saiga* of the plains of Western Asia, each of which represents apparently a distinct family. The genera still embraced are quite numerous, and are susceptible of being grouped into several sections or sub-families. See CATTLE, and ADDAX, ANOVA, ARNEE, BISON, BLAUW-NOG, BLES-NOG, BUFALO, CHAMOIS, ELAND, GAYAL, GAZELLE, GNU, GOAT, IBEX, KOOBOO, MUSK-OX, SHEEP, SPRING-BOK, STEIN-BOK, URUS, YAK, and ZEBU.

Revised by DAVID S. JORDAN.

Bovino, *bō-vee'nō* (anc. *Vibinium*): a fortified town of Italy; province of Foggia; 14 miles S. S. W. of Foggia (see map of Italy, ref. 6-G). It has a cathedral and several churches. The imperialists defeated the Spaniards here in 1734. Pop. 8,000.

Bow and arrow: one of the oldest of missile weapons. Bows have been made of various materials and different sizes and powers from prehistoric times, and were the favorite and generally used projectile weapon until the introduction of small arms.

The English long-bow, which accomplished such remarkable results in the fourteenth and fifteenth centuries, was usually about 5½ feet long and was made of yew, although elm and wych-hazel were also used. The arrow was 3 feet long, feathered, and furnished with a steel head. In the hands of a good archer it was accurate, and had sufficient penetration to inflict fatal wounds up to 240 or 250 yards, with an extreme range of 300 to 400 yards, and a capacity of from eight to twelve shots per minute.

The cross-bow, which was a bow attached to a stock resembling a musket, was shorter and stiffer, and was sometimes drawn by a small windlass attached to the stock. It discharged a shorter and stouter arrow, called a "quarrel," and was of slower fire than the long-bow.

The shorter bows in different ages have been made of steel, horn, and other elastic materials, and the arrows have sometimes been poisoned, particularly by savages. See ARCHERS and ARCHERY.

JAMES MERCUR.

Bowdich, THOMAS EDWARD: an English linguist and traveler; b. in Bristol, June 20, 1791. Having visited Ashanti in 1816, he published a *Mission from Cape Coast Castle to Ashanti* (1819). He undertook an exploring expedition into the interior of Africa in 1822, but he died of fever on the river Gambia, near its mouth, Jan. 16, 1824. Of this exploration his wife edited his account (1825).

Bowditch, HENRY INGERSOLL: physician; son of Nathaniel, named below; b. in Salem, Mass., Aug. 9, 1808; d. in Boston, Jan. 14, 1892; graduated at Harvard 1838; studied medicine in Cambridge; Professor of Clinical Medicine in Harvard 1859-67; announced a law of soil-moisture as a cause of pulmonary disease; first practiced puncturing the chest cavity to remove pleural effusions; was an active abolitionist; translated from the French the treatises of Louis on *Typhoid* (Boston, 1836) and on *Phthisis* (1836), and of Maunoir on *Cataract* (1837); wrote papers for medical societies and journals.

Bowditch, HENRY PICKERING, M. D.: b. in Boston, Mass., Apr. 4, 1840; grandson of Nathaniel; graduated from Harvard College 1861; entered the army as second lieutenant in November of the same year; rose to the rank of captain; was discharged Feb., 1864; in March commissioned major, and served at the front through the rest of the war, entering Richmond at its evacuation; attended the Harvard Medical School 1865-66; M. D., Harvard, 1868; studied several years in Germany, and during the winter of 1868-69 in France; devoted himself especially to physiology under Prof. Ludwig at Leipzig; assistant Professor of Physiology, Harvard Medical School, 1871; full professor 1876; dean of the faculty, Harvard Medical School, 1883; author of numerous papers and reports on physiological subjects. See *Fifth Report, Harvard Class of 1861*.

C. H. THURBER.

Bowditch, NATHANIEL, LL. D., F. R. S.: mathematician; b. in Salem, Mass., Mar. 26, 1773. He made several long voyages as an officer or supercargo of a merchant vessel, and learned Greek and Latin without a teacher. He published a valuable work called *The Practical Navigator*, which remained the standard among American seamen for eighty years. His greatest work was a translation of the celebrated *Mécanique Céleste* of Laplace, which he enriched with a commentary explaining the complicated mathematical operations of the work. He also published many papers on mathematical astronomy in the *Memoirs* of the Ameri-

can Academy and elsewhere. He was a fellow of the Royal Society of London, and a member of a large number of the learned societies of Europe and America. D. in Boston, Mar. 16, 1838. See a *Memoir of N. Bowditch*, by his son, N. I. Bowditch (1839).

Bowditch, NATHANIEL INGERSOLL: b. in Salem, Mass., Jan. 17, 1805; graduated at Harvard in 1822. He was called to the bar in Boston in 1825, but became a conveyancer, acquiring great reputation for accuracy and industry. He wrote much for periodicals, and published a *Memoir of N. Bowditch* (1840); a *History of the Massachusetts General Hospital* (1851); and *Suffolk Surnames*. Gave \$70,000 to Harvard College for the endowment of scholarships. D. in Brookline, Apr. 16, 1861.

Bowdler, THOMAS: English expurgator; b. near Bath, July 11, 1754; educated at St. Andrews and at Edinburgh (M. D. 1776). He is chiefly noted for *The Family Shakespeare* (10 vols., 1818), in which he omitted from the original text "those words and expressions . . . which can not with propriety be read aloud in a family." He also prepared an edition of Gibbon's *History* "with the careful omissions of all passages of an irreligious or immoral tendency," published by his nephew (6 vols., 1826). D. in Rhydydings, Feb. 24, 1825.

Bowdoin, bōd'n, JAMES, LL. D.: a Governor of Massachusetts; b. in Boston, Aug. 8, 1727; graduated at Harvard in 1745. He was president of the convention which in 1778 formed the constitution of Massachusetts; was chosen Governor of that State in 1785, and again in 1786. He suppressed Shay's rebellion in 1786. D. in Boston, Nov. 6, 1790.

Bowdoin, JAMES: son of the preceding; b. in Boston, Sept. 22, 1752. He graduated at Harvard in 1771; was sent in 1805 on a mission to Spain, to procure the cession of Florida to the U. S., and to obtain indemnity for injuries to commerce of the U. S. He was a benefactor of Bowdoin College, to which he gave 6,000 acres of land and £1,100, besides bequeathing to it his collections of books, minerals, and paintings, and the island of Naushon, in Buzzard's Bay, his summer residence, where he died Oct. 11, 1811.

Bowdoin College: the oldest college in Maine; chartered in 1794; opened in 1802 at Brunswick, Cumberland County. It was named in honor of Gov. James Bowdoin, of Massachusetts, whose son gave to the college, with gifts of land and money, his valuable library and collection of paintings. Connected with the college is the Medical School of Maine, founded in 1820. The college buildings, eleven in number, include a finely equipped gymnasium, and offer accommodation for various scientific collections and a library of 50,000 volumes. The faculty consists of 25 persons—17 professors, including the president, 6 instructors, a librarian, and a director of the gymnasium. The number of students in 1892 was 270. Rev. William De Witt Hyde, D. D., has been president since 1885. Its graduates, among whom may be mentioned Longfellow and Hawthorne, Chief Justice Fuller, and ex-Speaker Reed, number upward of 4,000.

Revised by GEORGE T. LITTLE.

Bowell, MACKENZIE: Canadian statesman; b. at Rickingham, Suffolk, England, Dec. 27, 1823. He removed to Canada with his parents in 1833; engaged in journalism, and was editor and proprietor of the *Bellefleur Daily* and *Weekly Intelligencer* for a long period. He was elected to Parliament in 1867, and re-elected to every succeeding Parliament up to and including that following the general election of 1891. He became a member of the privy council and Minister of Customs Oct. 19, 1878, a portfolio which he held continuously till Jan. 25, 1892, when he was appointed Minister of Militia and Defense. In Jan., 1895, upon the death of Sir John Thompson at Windsor Castle, he became Prime Minister.

NEIL MACDONALD.

Bowen, bō en, Rt. Hon. Sir CHARLES SYNGE CHRISTOPHER, D. C. L., LL. D., F. R. S.: judge; b. in Wollaston, Gloucestershire, England, 1835; educated at Rugby and at Balliol College, Oxford, taking three of the great university prizes; called to the bar 1861; judge of the Queen's Bench Division of the High Court of Justice 1879; Lord Justice in the Court of Appeal and privy councillor 1882. D. Apr. 9, 1894.

Bowen, FRANCIS, LL. D.: writer; b. at Charlestown, Mass., Sept. 8, 1811; graduated at Harvard in 1833. He edited the *North American Review* about eleven years (1843-54); opposed Kossuth's mission in the U. S., which delayed his confirmation as professor for four years, and became in 1853 Professor of Natural Religion, Moral Phi-

losophy, etc., at Harvard University. Among his works are *Lives of Baron Steuben, James Otis, and Benjamin Lincoln*, which were published in Sparks's *American Biography*, and a treatise on *Political Economy*; assailed the speculative systems of Kant, Fichte, Comte, J. S. Mill; also published a *Treatise on Logic* (1864); *Modern Philosophy from Descartes to Schopenhauer and Hartmann* (1877); and *Gleanings from a Literary Life* (1880). D. in Cambridge, Jan. 21, 1890.

Bowen, Rt. Hon. Sir GEORGE FERGUSON, D. C. L., LL. D.: English colonial statesman; b. 1821; educated at the Charterhouse and at Trinity College, Oxford; chief secretary to the Government of Ionian islands 1854-59; appointed governor of Queensland 1850; of New Zealand 1868; of Victoria 1873; of Mauritius 1875; of Hongkong 1883; royal commissioner to establish a new constitution for Malta 1888. Author of *Murray's Handbook for Travelers in Greece*; *Mount Athos, Thessaly, and Epirus* (1852); *Ithaca in 1850*; *Imperial Federation* (1886). In S. Lane-Poole's *Thirty Years of Colonial Government* (London, 1890) a biography of him may be found.

Bowen, NATHANIEL, D. D.; b. in Boston, Mass., June 29, 1779; graduated at Charleston College, South Carolina, in 1794; held pastorates in Protestant Episcopal churches at Providence, R. I., Charleston, S. C., and New York city; Oct. 18, 1818, was consecrated Bishop of South Carolina. D. in Charleston, S. C., Aug. 25, 1839. He wrote *Christian Consolation* (Charleston, S. C., 1831); *Private Prayers* (1837); and two volumes of his sermons were published after his death.

Bowyer, ARCHIBALD; writer; of Roman Catholic parentage; b. at Dundee, Scotland, Jan. 17, 1685-86; educated at Douay; joined the Jesuits 1706; became counselor in the court of the Inquisition at Macerata; in alleged horror renounced in England the Roman Church 1726; rejoined the Jesuits 1745; and again became a Protestant 1747. His *History of the Popes*, in seven quarto volumes (1748-66; ed. S. H. Coxe, Philadelphia, 1844-45, 3 vols.), is characterized by great partisan bitterness. D. in London, Sept. 3, 1766.

Bower-bird; a name given by Gould to certain birds which construct bowers wherein the males disport themselves to attract the females. These structures have nothing to do with the nests, and are built by the males alone. The bowers or "runs" are made of small twigs or pieces of stiff grass, so arranged as to form a walk from 1 to 3 feet long and 7 or 8 inches wide. The spotted bower-bird (*Chlamydera maculata*) decorates both interior and exterior with pebbles, bits of bone, shell, etc.; the satin bower-bird (*Ptilorhynchus violaceus*) uses parrot feathers, and the regent bird (*Sericulus melinurus*) confines itself almost entirely to snail shells. With two exceptions, the fourteen species of bower-birds are confined to Eastern Australia, and are partial to the thick woods. They are birds of moderate size, 8 to 10 inches long, and the males are usually much gayer in plumage than the females. F. A. LUCAS.

Bowers, THEODORE S.; soldier; b. in Pennsylvania, Oct. 10, 1832. A printer by trade, he subsequently edited a paper in Illinois; entered the service in Oct., 1861. He served continuously in the field and afterward at Washington, on the staff of Gen. Grant, from Apr., 1862, to Mar. 6, 1866, when he was accidentally killed by being thrown under a train at Garrison's station, New York. Brevet lieutenant-colonel, colonel, and brigadier-general U. S. army for gallant and meritorious services during the war.

Bowie; town (incorporated in 1884); Montague co., Tex. (for location of county, see map of Texas, ref. 2-11); on Fort Worth and Den. City, and Chi., R. I., and Tex. railways; 68 miles from Fort Worth; has 5 churches and 4 schools. Bowie is situated in the midst of the fruit-belt of Texas, and is the trading center for Montague and adjacent counties. Pop. of judicial district, including Bowie (1890) 1,486; (1893) estimated, 3,200. EDITOR OF "CROSS TIMBERS."

Bowie, JAMES; soldier; b. in Burke co., Ga., about 1790; settled in Chatahoula parish, La., in 1802; in 1827 was involved in a *mêlée* which grew out of a duel opposite Natchez, and resulted in the death of six persons and the wounding of fifteen, Bowie having killed Norris Wright with a rude knife after he himself had been shot. This knife was remodeled by a Philadelphia cutler, and became the murderous bowie knife of frontier fame. Bowie removed to Texas, and engaged in the revolt of that State from Mexico in 1835, attaining the rank of colonel. In Jan., 1836, he

was ordered to Bexar, and three months later was at Alamo with Crockett and Travis, and perished Mar. 6, 1836, in the massacre which Santa Anna inflicted on the garrison of that post.

Bowlder, bōl'der, or **Boulder**: a large, rounded mass or fragment of rock. Bowlders are usually rounded by attrition. In many cases they have been transported hundreds of miles by the action of icebergs or glaciers. Large masses of Scandinavian rocks are scattered over the plains of Denmark and Northern Germany. The pedestal of the statue of Peter the Great at St. Petersburg was hewn out of an erratic granite bowlder 42 feet long, 27 feet broad, and 21 feet high. In the Western States occur many granite bowlders which probably came from Canada. They abound along the coast of New England, where they often are so large as to form a prominent feature in the landscape. The famous Plymouth Rock is a bowlder of syenite. See DRIFT.

Bowlder-clay: See DRIFT and GEOLOGY.

Bowles, bōlz, FRANCIS TIFFANY; naval architect; b. in Springfield, Mass., Oct. 7, 1838; entered the navy as a cadet engineer in 1857; graduated at the Naval Academy of Annapolis with distinction; entered the school of naval architecture at the Royal Naval College at Greenwich, England; on his return from England, Nov. 1, 1881, was appointed assistant naval constructor in the U. S. navy, and assigned to duty as secretary to the naval advisory board at Washington 1882-86; since has been six years in charge of construction and repair department of Navy-yard at Norfolk, Va.; promoted to naval constructor 1888; is member of Institution of Naval Architects, England.

Bowles, SAMUEL; journalist; b. in Springfield, Mass., Feb. 9, 1826. From 1844 to 1878 he was principal conductor of the *Springfield Republican*, one of the most successful newspapers in the U. S., and which he made a type of independent journalism. He published *Across the Continent* (1865); *The Switzerland of America* (1869); and other works. D. in Springfield, Mass., Jan. 16, 1878. See his *Life and Times*, by George S. Merriam (1885).

Bowles, WILLIAM LISLE; English clergyman and poet; b. at King's Sutton, Northamptonshire, Sept. 24, 1762. He was educated at Winchester School and Trinity College, Oxford; was rector of several parishes and canon residentiary of Salisbury Cathedral (1828). D. in Salisbury, Apr. 7, 1850. He wrote much on antiquarian and ecclesiastical themes, but his most memorable publications were a volume of *Sonnets* (1789), which had great influence on Coleridge, and his edition of *Pope* (1806), that led to a controversy in which Byron, Campbell, and others took part. His sister, Caroline Bowles, was married to Robert Southey.

HENRY A. BEERS.

Bowling Green; capital of Warren co., Ky. (for location of county, see map of Kentucky, ref. 5-F); on L. and N. R. R., and on Barron river; 113 miles S. by W. of Louisville and 72 miles from Nashville. It is at the head of navigation, and has an active trade in pork, tobacco, lumber, etc. Here are Ogden College, Potter Female College, and several mills and factories. Steamboats navigate the river. Pop. (1880) 5,114; (1890) 7,803, local estimate 9,794.

EDITOR OF "PARK CITY TIMES."

Bowling Green; town; capital of Pike co., Mo. (for location of county, see map of Missouri, ref. 3-1); on C. and A. and St. L. and H. R. Rs.; 12 miles W. of Louisiana; has mining and agricultural industries. Pop. (1880) 1,067; (1890) 1,564; (1893) local estimate, 2,138.

EDITOR OF "TIMES."

Bowling Green; town; capital of Wood co., O. (for location of county, see map of Ohio, ref. 2-D); on Western Division of the T. and O. C. R. R., and a branch of the C., H. and D. R. R.; 20 miles from Toledo; has 3 schools and 6 churches; principal industry of the county is agriculture and the production of oil and natural gas, the Wood County oil-field being one of the largest in the world. First settlement, at Perrysburg, about 1812. Pop. (1880) 1,539; (1890) 3,467; (1893) estimated, 4,200.

PUBLISHERS OF "SENTINEL."

Bowls and **Bowling**: Two games are known as bowls, one an indoor game played on a long wooden alley, and the other an outdoor game played on a level grass-plat or bowling-green. The indoor game (called also *tenpins* and *skittles*) is played with lignum-vita balls rolled on a long alley floored with ash or maple boards 1 inch in thickness laid on

their edges. The regulation alley of the present time is required to measure not less than 75 feet in length (permitting a run of 15 feet for the bowler before he reaches the delivery-line) and not less than 41 nor more than 42 inches in width. In the best alleys the boards are bolted through and through at each 3 feet of their length, and are laid on cross-ties set in a bed of concrete, and the surface made by their exposed edges is smoothed with a plane. The object of the game is to knock down a number of wooden pins arranged at one end of the alley in a triangular form, the apex of which is toward the player, who stands at the other end of the alley. The game of bowling at pins was formerly played with nine pins, set in the shape of a diamond, and was called ninepins, but to evade a law prohibiting the playing at ninepins a tenth pin was added, and they were set in a triangular frame, and the game became known as tenpins.

At the sides of the alley are gutters, which at the corner pin must be 4 inches deep, into which unskillfully bowled balls drop when they leave the alley before reaching the pins. The balls are returned to the players' end from the pit into which they and the pins drop by an elevated run or trough directly above the gutter, sloping slightly downward. The score is recorded on a blackboard ruled off into squares. The pins now used in the regulation game as played in the U. S. are ten in number, are made of maple-wood, are 15 inches in height, 15 inches in circumference at a point $4\frac{1}{2}$ inches from their base, and $2\frac{1}{4}$ inches across at the base, and are placed 12 inches apart. Regulation balls do not exceed a circumference of 27 inches. This size weighs about 15 $\frac{1}{2}$ lb. The game as played in the U. S. consists of 10 frames of 10 pins each; 3 balls of any size within the regulation limits are allotted for each frame. Should the player bowl down all the pins with a single ball, the play is called a "ten strike," or double spare, meaning that the player is entitled to roll two spare balls at a new frame in order to complete the frame and his aggregate score for the inning when he secured the strike. Should the player continue to make "ten strikes" to the end of the game, he will secure the maximum score of 300 pins. Should the player bowl down all the pins with two balls, such play is called a "spare," which means that the player is entitled to roll one additional ball to complete the frame in which he secured the spare. Each pin bowled down counts one for the player. Each "strike" and "spare" counts ten, with the addition that to the "strike" is added all the pins which the player bowls down with two spare balls, and to the "spare" is added all the pins which he bowls down with one spare ball.

The games which gave origin to the modern bowling at pins have been traced back to the Middle Ages. The open-air game is the more ancient, and was early known under various names, such as "casting the stone," "bowles," French *boules*, *carreau*, etc. Stone bowls were used, and as these were not perfect spheres they described a curved line as they speeded down the "green" toward the mark bowled at, which was a cone. Two cones were used, one at each end of the rink, and bowled at alternately. The object of the player was to roll his bowl so that when it came to rest it would lie as near as possible to the cone. The object of the opposite side was to strike their opponents' bowls away from the cone and interpose their own bowls, or roll them nearer to the cone than the adversary. He whose bowl rested nearest the cone scored one point. Later stone bowls were supplanted by lignum-vite balls, the wood being cut from the outside of the tree; the heart, heavier than the outside, gave the desired bias to the bowl. Later the ball was loaded with lead to give it the required bias; or one side was cut a perfect half sphere, and the opposite side oval. The skill requisite in playing at bowls was that of the art of mastering the bias of each particular bowl. The cones were superseded by a stone or earthen ball about 3 $\frac{1}{2}$ inches in diameter, called the "jack," this ball being rolled down the "green" at least a distance of 21 feet by the player who had won the toss, as a mark to bowl at. The bowling-green on which this game is played must be dead-level. It usually measures from 90 to 150 feet on a side, according to the limits of the ground, and is kept smooth by frequent rolling and the use of a scythe or lawn-mower.

Bowling on a "green" seems to have been in considerable vogue in New York and elsewhere in colonial days. In an old map of the city of New York, prepared about 1728, a "bowling-green" is shown on the north side of the public garden situated on "the King's Farm" (near the foot of Murray and Warren Streets). We also find that in 1732 the

locality called "Bowling Green," at the foot of Broadway, was leased at a yearly rental of a pepper-corn, by John Chambers, Peter Bayard, and Peter Jay, and by them inclosed and laid out as a bowling-green.

Bowls as an indoor game had its origin in several games, variously styled club-kayles, cayles, kayle, keiles (French *quilles*), skittles, loggats, and skayles. In the kayle games and at loggats conical pins made of bone were used. These were set up in rows of six and eight, and were struck down by hurling clubs or "sheepes-joyntes" at them. Bowling down pins with a bowl or ball was the invention of a later period. In the French games of *carreau* the bowls were rolled at a fixed mark, while in the games called kayle, kayles, cayles, keiles (French *quilles*), closh, cloish, closunge, kettles, kittles, skittles, Dutch-pins, four corners, half-bowl, rolly-polly, and ninepins, the bowls were rolled at pins. The earliest mention of bowls being played on an alley and under cover occurs in William Fitz-Stephen's *Survey of London*, about the twelfth century. The game was introduced into America by the English colonists. It is on record that a match was played on the "Knickerbocker Alley" in New York city, Jan. 1, 1840. Down to 1875, while clubs were numerous, there was great diversity as regards the length of the alley; the pins were of great size, and were set so close together that the falling of a single pin often caused the entire frame to collapse, and it was easy to run up a score of 300 in a very short time. In that year delegates representing nine clubs in New York and its vicinity formed a national bowling association, and framed laws for the regulation of the game. These related (1) to the size of the bowls, which were restricted in circumference to 27 inches; (2) to the distance from the pins at which the player was to halt and deliver his bowl (60 feet); and (3) to "dead-wood" or fallen pins, which were directed to be removed from the alley and gutters. Fifteen years later the American Amateur Bowling League was organized, afterward called "Union" instead of league. See *The American Bowling League Guide* (Brunswick-Balke-Collender Company, New York).

MORTIMER T. HUMPHREY.

Bowman, bō'mān, ALEXANDER HAMILTON; soldier; b. in Wilkesbarre, Pa., May 15, 1803, graduated at West Point in 1825; lieutenant-colonel of engineers Mar. 3, 1863. He served as assistant professor at the Military Academy 1825-26; in building defenses and improving rivers and harbors on the Gulf of Mexico 1826-34; in constructing Memphis and St. Francis military road 1834-39; in the improvement of Cumberland and Tennessee rivers 1834-38; on the defenses of Charleston Harbor, S. C., 1838-53; as instructor of practical military engineering at the Military Academy 1851-52; in charge of improvement of Charleston harbor 1852-53; chief engineer U. S. treasury department and treasury building extension 1853-61; member of lighthouse-board 1857-59; superintendent of Military Academy 1861-64; member of engineer boards 1847-65. D. at Wilkesbarre, Pa., Nov. 11, 1865.

Bowman, EDWARD MORRIS; musician; b. in Barnard, Vt., July 18, 1848, receiving his first musical instruction in the village where he went to school. In 1863 he went to Minneapolis, Minn., as a teacher and organist. In 1866 he studied under William Mason and the late John P. Morgan in New York; in 1872 went to Europe and studied in Berlin and Paris; on his return settled in St. Louis and began his career as a professional musician; again visited Europe in 1881, and while in London was made an associate of the College of Organists. In 1882 he was elected to the presidency of the Music Teachers' National Association, and again in 1892. He was the founder in 1884, and from the beginning has been the president, of the American College of Musicians; has been organist of churches in St. Louis, Mo., and in Newark, N. J., where he organized the Creolian Choir of 100 voices; Professor of Music in Vassar College, succeeding the late Dr. F. L. Ritter, and from 1892 in Evelyn College, Princeton, N. J.

D. E. HERVEY.

Bowman, SAMUEL, D. D.; Protestant Episcopal bishop; b. in Wilkesbarre, Pa., May 21, 1800; studied law, but was ordained a deacon of the Protestant Episcopal Church in 1823, and a priest in 1824. He was long settled in Lancaster, Pa., 1827-58. In 1847 he was chosen Bishop of Indiana, but declined. In 1858 he was consecrated assistant Bishop of Pennsylvania. Died suddenly when on a visitation, near Butler, Pa., Aug. 3, 1861.

Bowman, THOMAS, D. D., LL. D.; bishop in the M. E. Church; b. at Berwick, Pa., July 15, 1817; graduated at

Dickinson College 1837; organized and was president of Dickinson Seminary, Williamsport, Pa., 1848-58; president of Indiana Asbury (now De Pauw) University 1858-72; chaplain U. S. Senate 1864-65; elected bishop of the M. E. Church 1872; retired 1896.

Bowman, Sir WILLIAM PAGET, M. D., LL. D., F. R. S.; ophthalmologist; b. at Nantwich, England, July 20, 1816; studied in Leyden, Amsterdam, Bonn, Heidelberg, Munich, Vienna, and Berlin; became Demonstrator of Anatomy and Curator of the Anatomical Museum in London 1838; honorary M. D., Dublin, 1867; LL. D., Cambridge, 1880, and Edinburgh, 1881; member of a large number of learned societies in various parts of Europe; author of *Lectures on the Parts Concerned in the Operations of the Eyes; Observations on Artificial Pupil; The Physiological Anatomy and Physiology of Man* (with Dr. Todd), etc. He was made a baronet in 1884. D. in London, Mar. 29, 1892.

Bowmanville: a port of entry; Darlington township, Durham co., Ontario, Canada; on the Grand Trunk Railway, 43 miles N. E. of Toronto (see map of Ontario, ref. 4-E). It has good water-power, and manufactures of furniture, pianos, organs, agricultural machinery, and flour. It has a good harbor, and is daily visited by steamers during the season of navigation. Pop. (1881) 3,504; (1891) 3,377.

Bowne, BORDEN PARKER, LL. D.; professor of philosophy; b. in Leonardville, N. J., Jan. 14, 1847; A. B., University of City of New York, 1871; studied at universities of Halle, Göttingen, and Paris 1873-75; religious editor New York *Independent* 1875-76; Professor of Philosophy, Boston University, since 1876; author of *The Philosophy of Herbert Spencer* (N. Y., 1874); *Studies in Theism* (1879); *Metaphysics* (1882); *Introduction to Psychological Theory* (1886); *Philosophy of Theism* (1887); *Principles of Ethics* (1892). C. H. THURBER.

Bowring, Sir JOHN; author and linguist; b. in Exeter, England, Oct. 17, 1792. He was an intimate friend of Jeremy Bentham, and was well versed in modern languages, especially the Slavonic. In 1825 he became editor of the *Westminster Review*. He collected and translated into verse the ancient and popular poems of almost all the countries of Europe. In 1835 he was elected to Parliament; in 1854 became governor of Hongkong, China; received the honor of knighthood in 1854; in 1856 ordered the bombardment of Canton in consequence of the Arrow affair. In 1859 he retired on a pension. Among his works is *The Kingdom and People of Siam* (2 vols., 1857). He wrote a description of his visit to the Philippine islands (1859). He also wrote some excellent hymns, including *In the cross of Christ I glory*. D. in Exeter, Nov. 23, 1872. See his *Autobiographical Reminiscences* (1877).

Bowsprit, bō'sprit, or bow'sprit; a large spar which projects over the stem or bow of a ship. It serves to support the foremast, which is fastened to it by large stays or ropes; also to carry sail forward, as a means of counteracting the effect of the after sails and keeping the sail power well balanced. In many cases the bowsprit rises at an angle of about 45 degrees. It supports the jib and flying-jibbooms.

Bowstring-hemp: the fiber of the *Sansevieria zeylanica*, a plant of the family *Hamodraceae*; native of the East Indies. The Hindu name is *moerva*. This fiber, which is white, silky, and elastic, is used to make bowstrings. A similar fiber is obtained from the leaves of *Sansevieria roburghiana*, a perennial Indian plant which has leaves about 3 feet long, and from other Asiatic and African species.

Box: an evergreen shrub or small tree of the genus *Buxus* and family *Euphorbiaceae*, with opposite leaves entire at the margins. It has staminate and pistillate flowers growing on the same plant. The staminate flower is a perianth with four stamens, and the pistillate flower is a perianth with an ovary surmounted by three styles. The most important species is the *Buxus sempervirens* (common box), which is a native of Europe and Asia, has oval, shining, and deep-green leaves, and is remarkable for its compact habit of growth. In Southern Europe it grows 20 feet high or more. A variety called dwarf box, which is only 2 or 3 feet high, is extensively cultivated in gardens, and is used to form edgings of flower-beds and gravel-walks, being reduced by clipping to the height of a few inches. The wood of the box, which is very hard, heavy, compact, and fine-grained, is the best of all materials for wood-engraving, and is highly prized by turners. It is also commonly used to make flutes and other wind instruments. It is of a pale-

yellow color, admits of a beautiful polish, and is not liable to be worn-eaten. Large quantities of boxwood are exported from Spain and Turkey. See SPURGEWOODS.

Revised by CHARLES E. BESSEY.

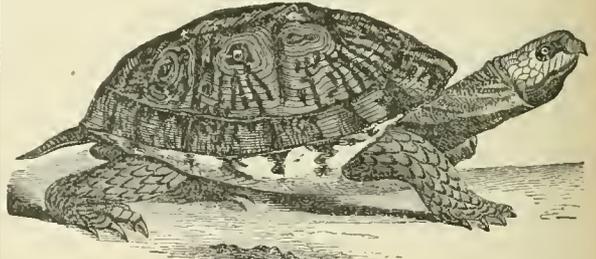

Box-elder, or **Ash-leaved Maple**: a small tree of the family *Sapindaceae*, the *Acer negundo* or *Negundo aceroides*, which grows from Florida to Pennsylvania and westward, especially along the banks of streams. It is very beautiful, and is one of the characteristic trees of the far West. In Minnesota, Nebraska, etc., it is tapped like the sugar-maple, for its sap, which affords sugar of good quality.

Box-hauling: a method of working a ship from one tack to the other, characterized by the bracing of the head yards *aboz*, or *aback*, either after luffing into the wind as in tacking, or at once without deadening the headway. The latter is sometimes called *wearing short round*. See TACKING AND WEARING.

Boxing the Compass: a nautical phrase, meaning an enumeration of the thirty-two points of the mariner's compass in their proper order, as *north, north by east, north-northeast*, and so on around till north is reached by way of the south and west quadrants. This enumeration may be considerably varied by beginning at any other point and going around both ways in turn. S. B. LUCE.

Box'tel: a village of Holland; in North Brabant; on the river Dommel; 6 miles S. of Bois-le-Duc (see map of Holland and Belgium, ref. 7-G). The river flows through the streets and affords passage for boats. Fine diaper is manufactured here. Pop. 5,700.

Box-tortoise, or **Box-turtle**: popular names of the *Cistudo carolina*; an American tortoise, characterized by the division of the plastron into two parts by a crosswise divi-

Box-tortoise.

sion, united, however, by a ligament which serves as a hinge on which the parts of the plastron turn, thus enabling the animal to shut himself entirely up in his shell. These tortoises are very timid and of gentle disposition. Their legs are longer and their speed greater than is usual among tortoises. Revised by D. S. JORDAN.

Boyaca, bō-yāu-kaa': one of the states of Colombia; bounded N. E. and E. by Venezuela, S. and S. W. by Cundinamarca, and N. W. by Santander. Area, 33,351 sq. miles. While in the west the state is exceedingly mountainous, the east consists of a hot, dry plain. Copper and precious stones are found in the mountains. Capital, Tunja. Pop. 702,000.

Boyaca: a small village in the state of Boyaca, Colombia; about 20 miles S. of Tunja. It was the scene of a battle (Aug. 7, 1819) in which Bolivar, with about 2,000 patriots, defeated the superior Spanish force of Barreiro, took him prisoner, with most of his army, and forced the Spaniards to leave the country, then called New Grenada. H. H. S.

Boyar, boi'yar, or bō-yar' [from Russ. *boyarin*, lord]: a title given in ancient Russia to those who distinguished themselves in war. This afterward came to be the title of the nobility, who under the Grand Duke of Moscow formed an aristocracy with powers differing according to the character of the monarch, but which were so considerable that even Ivan the Terrible in his ukases added to the words "The czar has commanded," also "The boyars have approved." The last boyar died in 1750.

Boy-bishop: During the Middle Ages the custom grew up of allowing the choristers of cathedrals to choose yearly one of their number to act the part of the bishop. The election generally took place on Dec. 6, St. Nicholas's Day, after which the boy-bishop was vested in the episcopal attire, with

miter, ring, and pastoral staff. He held office till Dec. 28 (Holy Innocents' Day). The practice was permitted probably from the same motives which suffered the mummeries of the Abbot of Unreason (a graphic account of which may be found in Sir W. Scott's romance of *The Monastery*). If the boy-bishop died within his short period of office, he was buried in his episcopal robes. A tomb with the effigy of a boy so clothed may be seen in Salisbury Cathedral, England.

W. S. PERRY.

Boyce, HECTOR: See BOECE, HECTOR.

Boyce, JAMES PÉTRICU, D. D., LL. D.: b. in Charleston, S. C., Jan. 11, 1827; graduated at Brown University 1847, and at the Theological Seminary in Princeton, N. J., 1849-51; became pastor of a Baptist Church at Greenville, S. C., 1851; Professor of Theology in Furman University, Greenville, S. C., 1855; Professor of Theology in the Southern Baptist Theological Seminary (formerly Greenville, S. C., now Louisville, Ky.) 1859. He published several sermons, addresses, and articles, which have largely contributed to mold the opinions of the Southern Baptists, and held, as president of the Southern Baptist Convention, a position of commanding influence. D. in Pau, France, Dec. 28, 1888.

Boyce, WILLIAM: English composer; b. in London, 1710; in 1736 appointed composer and in 1758 organist to the Chapel Royal; composed a number of anthems; the serenade *Solomon* (1743); and published *The Cathedral Music of the English Masters of the Last Two Centuries* (3 vols., 1760). D. in Kensington, London, Feb. 7, 1779.

Boy'cotting: a combining of persons or a concerted action to restrain from or prevent social or business intercourse with another. The term was coined from the name of a Capt. Boycott, an agent in Ireland of Lord Erne's Lough Mask estate, who in 1880 evicted a large number of tenants. These and their neighbors refused all intercourse with him and his family, and would not work for him or trade with him, or allow others to do so. He was aided in the harvesting of his crops by the Orangemen, and was obliged to work under military protection. When the combination amounts to a conspiracy to wrongfully prevent or restrain another from carrying on a legitimate business, or to accomplish any unlawful purpose, it is a criminal offense. See CONSPIRACY. Revised by F. STURGES ALLEN.

Boyd, ANDREW KENNEDY HUTCHISON, D. D., LL. D. (whose pen-name was for some time *A. K. H. B.*); minister of the Church of Scotland; b. at Auchinlech, Ayrshire, Scotland, Nov. 3, 1825, where his father was parish minister. He was educated at King's College, London, and at Glasgow University; B. A. 1846. He was ordained in 1851; after having charge of several parishes, became minister of St. Andrews 1865. He has published over twenty volumes of contemplative essays and sermons, of which the *Reverations of a Country Parson* (1859-78, 3 series) has been especially popular. He published his reminiscences, *Twenty-five Years of St. Andrews, Sept., 1865, to Sept., 1890* (London, 1892, 2 vols.). HENRY A. BEERS.

Boyd, JOHN PARKER: general; b. in Newburyport, Mass., Dec. 21, 1764; entered the U. S. army as ensign in 1786. A spirit of adventure led him to India in 1789, where he commanded mercenaries, raised by himself and others, in the Mahratta service of native princes, and rose to the rank of commander. He returned to the U. S. in 1808, and was commissioned colonel of the Fourth U. S. Infantry. In the war with Great Britain he was a brigadier-general; distinguished himself at Tippecanoe, at the capture of Fort George, Canada, and Chrysler's Field. In 1830 President Jackson appointed him naval officer of the port of Boston, Mass. D. in Boston, Oct. 4, 1830.

Boyd, LINN: statesman; b. in Nashville, Tenn., Nov. 22, 1800; member of Congress from Kentucky for twenty years, being first elected in 1835. During his last term he served as Speaker of the House of Representatives. D. in Paducah, Ky., Dec. 18, 1859.

Boy'dell, JOHN: engraver and patron of art; b. in Dorrington, Shropshire, England, Jan. 19, 1719; became a print-seller in London, and amassed a large fortune. He promoted the improvement of British art by his liberal patronage of native engravers and painters. He employed Opie, Reynolds, Northcote, West, and other painters to illustrate Shakspeare's works. The result was the *Shakspeare Gallery*, from which was engraved a volume of admirable plates (1803). He was lord mayor of London in 1790. D. there Dec. 11, 1804.

Boyer, bwañ yā, ALEXIS, Baron de; surgeon; b. in Limousin, France, Mar. 1, 1757; son of a tailor; acquired his profession under great drawbacks. He was surgeon to Napoleon I. and Chirurgical Professor of the University of Paris. His main works are *Traité complet d'anatomie* (4 vols., 1797-99) and *Traité des maladies chirurgicales et des opérations qui leur conviennent* (8 vols., 1814-22). D. Nov. 25, 1833.

Boyer, JEAN PIERRE: president of Hayti; b. at Port-au-Prince, Feb. 28, 1776; was a mulatto. He entered the French army in his youth, and as an officer in the army of Pétion fought against Dessalines and Christophe when he declared himself emperor. On the death of Pétion he was elected president of the republic in 1818. By partiality to the mulattoes and arbitrary measures he offended the Negroes, who revolted and expelled him from the island in 1843. D. in Paris, July 9, 1850.

Boyertown: borough (founded in 1800, incorporated as a borough in 1866); Berks co., Pa. (for location of county, see map of Pennsylvania, ref. 5-1); on branch of Phil. and Reading R. R.; 17 miles from Reading, 48 miles from Philadelphia. Cigar-making and iron-mining are the chief industries of Boyertown, over 500 persons being employed in the former industry. There are 6 graded schools and 6 churches. The population is largely American-born Germans. Pop. (1880) 1,099; (1890) 1,436; (1893) with suburbs, over 3,000. EDITOR OF "DEMOKRAT."

Boy'esen, HJALMAR HJORTH: Norse-American author and scholar; b. at Fredericksvam, Norway, Sept. 23, 1848. He was educated at Leipzig and the university in Christiania; removed to the U. S. in 1868; edited *The Fenad*, a Norwegian paper, in Chicago; was Professor of German in Cornell University (1874-80) and in Columbia College, New York, from 1880 till his death, Oct. 4, 1895. He published, among other things, *Gunnar, a Norse Romance* (1874); *A Norseman's Pilgrimage* (1875); *Falconberg* (1878); *Goethe and Schiller, their Lives and Works* (1878); *Ilka on the Hill-top* (1881), which has been dramatized; *Queen Titania* (1882); *A Daughter of the Philistines* (Boston, 1883), which had great vogue in Europe and the U. S.; *Essays on German Literature* (1892); and *Boyhood in Norway* (1892). Several of his books have been translated into German and Norwegian. His fictions have usually a social or political bearing.

HENRY A. BEERS.

Boyl, Boil, or Buell, ANTONIO: Spanish Benedictine monk; b. in Catalonia about 1450. He was an inmate of the Convent of Montserrat when, in 1493, the pope appointed him apostolical vicar of the New World. With eleven other monks he accompanied Columbus to Hispaniola, where he acted as official counselor as well as religious leader. He showed a bigoted and unrelenting spirit toward the Indians, advising Columbus to put the chief Guacanagari to death; later he joined the malecontents against the admiral and his brothers, and in 1494 went to Spain to prefer charges against them; he was long one of the bitterest and most dangerous enemies of Columbus. He did not return to Hispaniola, but was made abbot of the Cuxa convent, where he died in 1520. HERBERT H. SMITH.

Boyle, ROBERT: celebrated experimental philosopher; b. in Lismore Castle, Ireland, Jan. 25, 1627; seventh son of Richard, the first Earl of Cork. He was educated at Eton and Geneva; took no part in political contests, but devoted himself to the cultivation of science, especially chemistry and natural philosophy. He became a resident of Oxford in 1654, and was one of the founders of the Royal Society. To qualify himself to defend the Christian religion, he learned the Hebrew and Greek languages. He improved the air-pump, and made important discoveries in pneumatics. Among his works are a *Disquisition on Final Causes*; a *Discourse of Things above Reason*; *Excellency of Theology*; and *Hydrostatical Paradoxes*. He declined a peerage which was repeatedly offered to him. He was remarkable for his benevolence and charity. It was through his Christian liberality that Eliot's Indian Bible was published; and it was by his exertions that the funds of the Society for the Propagation of the Gospel in New England, originally a Puritan organization, were preserved at the Restoration for their sacred uses. By his last will he endowed the BOYLE LECTURES (*q. v.*). D. in London, Dec. 30, 1691. His complete works, with a *Life*, in 5 vols. fol., were published by Thomas Birch (London, 1744).

Revised by WILLIAM STEVENS PERRY.

Boyle Lectures: called from Robert Boyle, who bequeathed an annual salary to be paid to some clergyman for preaching eight sermons in a year in order "to prove the truth of the Christian religion against Atheists, Deists, Pagans, Jews, and Mohammedans, not descending to any controversies among Christians themselves." The first person selected to deliver the "Boyle Lectures" was the celebrated Richard Bentley (1691), who directed his arguments against atheism. In 1739 three volumes of the lectures were published, and nearly sixty volumes since then. The "Boyle Lectures" are still maintained.

Boyle's Law: a statement of the fact that "the volume of a gas is inversely as the pressure"; that is to say, if we double the pressure upon a gas we reduce its volume to one-half; if we make the pressure three times what it was at first, the bulk of the gas is reduced to one-third. More commonly called **MARIOTTE'S LAW** (*q. v.*).

Boyne: the most important river in the E. of Ireland; rises in the Bog of Allen; flows northeastward through Kildare, King's County, Meath, and Louth; enters the Irish Sea after a course of 65 miles. Many ruins of monasteries and castles are found on its banks. An obelisk 150 feet high, nearly 3 miles from Drogheda, commemorates the great battle of the Boyne, in which William III. defeated James II., July 1, 1690.

Boyn-ton, EDWARD CARLISLE: b. in Vermont about 1825; graduated at West Point in 1846. He entered the artillery; was severely wounded at Churnubusco; breveted captain; assistant Professor of Chemistry, etc., at West Point (1848-55); Professor of Chemistry, etc., in the University of Mississippi (1856-61); and breveted major in 1865. He published a *History of West Point* (1863) and a *History of the United States Navy*. D. in Newburg, N. Y., May 13, 1893.

Boyn-ton, JAMES STODDARD: b. in Henry co., Ga., May 7, 1833; practiced law; served as colonel in the civil war; resumed the profession of the law; was elected to the Legislature and became president of the Senate, which office he held at the death of Gov. Alexander H. Stephens, Mar. 4, 1883; became acting Governor of Georgia Mar. 5, 1883. His successor, Henry D. McDaniel, was elected Apr. 24, 1883, and inaugurated May 9, 1883.

Boze-man: city; capital of Gallatin co., Mon. (for location of county, see map of Montana, ref. 7-F); on Northern Pacific R. R. and an affluent of Gallatin Fork of Missouri river; 98 miles S. S. E. of Helena and 65 miles N. of Yellowstone National Park. It has several banks, and its coal mines supply the Northern Pacific R. R. from Billings, Mon., to Portland, Or.—over 1,200 miles. It is the center of an agricultural community whose products for 1892 were valued at \$3,000,000; has grazing and stock interests yielding over \$500,000 annually; and gold and silver mining interests, \$300,000 per annum. It has graded schools, an academy, a university school, flouring and planing mills, sash and door factory, numerous churches, etc. Pop. (1880) 894; (1890) 2,143, local census, 2,796.

EDITOR OF "AVANT COURIER."

Bozen: See **BOTZEN**.

Boz-rah: an ancient city of Idumæa (Edom), often mentioned in the Bible. (See Genesis xxxvi.; Isaiah xxxiv. and liii.) It was situated to the S. E. of the Dead Sea, about halfway between the latter and Petra. Its site is probably occupied by the modern *Buseirih*, a poor village of about fifty wretched huts.

Bozzaris, bot'sa-ris, or Botzaris, MARCO: a Greek patriot; b. at Suli, in Albania, about 1788. He enlisted in the French army about 1808, and served several campaigns. When the Greeks took arms against the Turks in 1820, Bozzaris became the leader of a band of Sulliot, and gained several victories. He defended Missolonghi against the Turks in 1822. Aug. 20, 1823, he attacked and defeated a superior force at Carpenisi, near where the battle of Plataea was fought, but was killed in the action.

Bra: a town of Italy; province of Cuneo; on the river Stura; 38 miles S. S. E. of Turin (see map of Italy, ref. 3-B). It has manufactures of silk and metal-foundries; also a trade in grain, cattle, and wine. Pop. of commune, 15,000.

Brabancons, brañ'bañ'son': a class of mercenary soldiers chiefly from Brabant, whence they took their name. They served principally in the armies of England and France from the eleventh to the thirteenth centuries.

They had little discipline, and were not much better than robbers.

Brabant, braa'bant, or brañ'bañ' (Fr. pron. brañ'bañ'): a former duchy of the Low Countries. In the sixth century it was conquered by the Franks. During the Middle Ages it changed masters very often, until in the fifteenth century it came to the House of Hapsburg. Charles V. left it to his son, Philip II., under whom the provinces revolted, but only the northern part succeeded in gaining its independence, and joined the Netherlands in 1648, while South Brabant remained with the Spanish-Austrian line until 1714, when it passed into the possession of the imperial line of Austria. It was conquered by the French in 1794, and divided into two provinces; in 1810 Napoleon also conquered the Dutch part of Brabant. In the treaty of Paris of 1814 Brabant became a part of the Netherlands, and was divided into the provinces of North Brabant, Antwerp, and South Brabant. In consequence of the Belgian revolution of 1830, Antwerp and South Brabant passed to Belgium, while North Brabant remained with Holland. The inhabitants in the N. are Dutch, in the center Flemish, and in the S. Walloons. The boundary-line between the Germanic and French idioms runs S. of Brussels, past the villages of Braine l'Alleud, Waterloo, Wavre, and Sodoigne.

Brabant: a province of Belgium; bounded N. by Antwerp, E. by Limburg and Liège, S. by Namur and Hainaut, and W. by East Flanders. Area, 1,268 sq. miles. Capital, Brussels. The principal rivers are the Dyle, Demer, and Senne. The surface is partly hilly and partly level; the soil is generally fertile and highly cultivated. This province contains extensive forests, mines of iron, and quarries of stone. It is intersected by several railways and canals. It has important manufactures of cotton and woolen fabrics, fine laces, hats, leather, jewelry, fine linens, ribbons, paper, machinery, etc. This is one of the most densely peopled districts in Europe. Pop. (1891) 1,128,728.

Brabant, North: a province of Holland; bounded N. by the river Meuse (or Maas), Holland, and Gelderland, E. by Limburg, S. by Belgium, and W. by Zeeland. Area, 1,980 sq. miles; Capital, Bois-le-Duc. It is drained by the Dommel, the Aa, and the Lintel. The surface is flat; the soil is generally fertile. The province is deficient in minerals and timber. Many cattle and sheep are raised here. It has manufactures of cotton, linen, and woolen goods. Pop. (1891) 574,075.

Brabourne, bray'būrn, EDWARD HUGESSEN KNATCHBULL-HUGESSEN, Lord: b. at Mersham Hatch, Kent, England, Apr. 29, 1829; educated at Eton, and at Magdalen College, Oxford; entered the House of Commons in 1857 as a Liberal; joined the Conservatives in 1885 through disaffection toward Gladstone's Irish and Transvaal policy; was a Lord of the Treasury 1859-66; Under Secretary of State for the Home Department 1868-71; for the colonies 1871-74; sworn of the privy council Mar. 24, 1873; elevated to the peerage in 1880; author of many tales for children, among which are *Stories for my Children* (1869); *Crackers for Christmas* (1870); *Uncle Joe's Stories* (1878); *The Truth about the Transvaal* (1881); *Friends and Foes from Fairyland* (1885), etc. He edited the *Letters of Jane Austen* (1885), his grand-aunt. D. Feb. 6, 1893. C. H. THURBER.

Brace, CHARLES LORING: philanthropist and writer; b. in Litchfield, Conn., June 19, 1826; graduated at Yale in 1846. Having traveled in Europe, he published *Hungary in 1851: Home Life in Germany* (1853); *Norse Folk; Races of the Old World* (1863); *Gesta Christi* (1882); *The Unknown God, or Inspiration among the Pre-Christian Races* (1890); and other works. He was the principal founder and first secretary of the Children's Aid Society of New York (1853), which has placed over 80,000 homeless children in rural Western homes and provided industrial schools, saving societies, and lodges for street children of the city. D. in Camper, in the Engadin, Switzerland, Aug. 11, 1890.

Revised by HENRY A. BEERS.

Brachet, brañ'shay', AUGUSTE: French Romance philologist; b. in Tours, July 29, 1845; studied under Diez; became in 1870 Professor of Romance Philology in the Ecole des Hautes Études at Paris; but since 1873 he has had no official position. Among his works are *Dictionnaire des doublets* (1867); *Grammaire historique de la langue française* (1867); *Dictionnaire étymologique de la langue française* (1870); a translation, with G. Paris and A. Morel

Fatio, of Fr. Diez's *Grammaire comparée des langues romanes* (1873-76).

A. R. MARSH.

Brachial Artery [*brachial* is from Lat. *brachialis*, deriv. of *brachium*, arm]; the main artery of the arm, a continuation of the axillary, as the latter is of the subclavian trunk. The brachial vessel lies upon the inside of the *humerus* or arm-bone, just back of the biceps muscle; near the elbow it passes forward and divides into the radial and ulnar arteries. Before this it gives off four smaller branches. The position of the brachial artery makes it quite practicable to compress it firmly against the bone in case of serious bleeding from a wound of the arm, forearm, or hand.

Brachiopoda [from Gr. *βράχιον*, arm + *πούς, ποδός*, foot; in allusion to the ciliated arms]: a group of marine animals provided with bivalve shells, which in the fossil state form one of the most characteristic features of the Palaeozoic rocks. They are represented by comparatively few living forms. The shells resemble somewhat those of the bivalve mollusks, with which these animals have usually been associated, but the two halves, or valves, of the shell are dorsal and ventral instead of lateral, and each valve is divisible into symmetrical halves. The ventral valve is usually the larger and more convex, and often serves directly for attachment of the animal to foreign bodies. In other cases attachment is brought about by means of a short stalk or peduncle, which passes either through a perforation in the ventral valve, or between the valves. Two long spirally coiled arms spring from the sides of the mouth, and are usually supported by a calcareous framework attached to the dorsal valve of the shell. These arms are grooved and ciliated, and serve to produce currents in the water, and thus bring food-particles to the mouth. Researches in the embryology of the Brachiopods have indicated their relationship with the *Bryozoa*, and have shown that their affinity is rather with the annulate worms than with the mollusks.

DAVID S. JORDAN.

Brachis'tochrone [from Gr. *βράχιστος*, shortest + *χρόνος*, time]: the plane curve down which a material particle must slide without friction in order to pass in the shortest possible time from the upper to the lower of two given points not in the same vertical line. It is the common cycloid. The problem of the brachistochrone is celebrated in the history of mathematics. It was first proposed by John Bernoulli in 1696, and was solved by Sir Isaac Newton and James Bernoulli. It is often called "the curve of quickest descent."

Revised by S. NEWCOMB.

Brachvogel, *brakh fō-gel*, EMIL ALBERT: German novelist and dramatist; b. in Breslau, Apr. 29, 1824. Among his principal works are the novels entitled *A New Falstaff* (1862); *Beaumarchais* (1864); *The German Michael* (1868); and *Narcissus*, a drama. D. in Berlin, Nov. 27, 1878.

Brachycephalic: See DOLICHOCEPHALIC.

Brachyn'ura [from Gr. *βραχύς*, short + *οὐρά*, tail]: the crabs; a tribe of decapod crustacea with the abdomen or tail short, without caudal fin, and folded beneath the thorax. See CRAB.

Brack'ebury, HENRY: soldier; b. at Bolingbroke, Lincolnshire, England, Sept. 1, 1837; served in the suppression of the Indian mutiny in 1857-58; in the Ashanti campaign in 1873-74; as chief of staff in the Zulu war; deputy adjutant-general of the Nile expeditionary force in 1884; succeeded Gen. Earle in command of the river column; made major-general June 15, 1885; lieutenant-general 1888. Author of *Faults and Ashanti*; *Narrative of the Ashanti War*; *The River Column*; and of pamphlets. C. H. TURNER.

Brack'enridge, HENRY MARIE: judge and writer; b. in Pittsburg, Pa., May 11, 1786; son of Hugh Henry, named below. He held judgeships in Louisiana and Florida; was U. S. commissioner to the South American republics (1817-19). Among his numerous writings are *History of the Late War between the United States and Great Britain* (about 1816); a *Voyage to South America* (1820); and *Recollections of Persons and Places in the West* (1834). He was elected to Congress from Pennsylvania in 1840. D. in Pensacola, Fla., Jan. 18, 1871.

Revised by HENRY A. BEERS.

Brackenridge, HUGH HENRY: the father of Henry Marie; b. near Campbellton, Scotland, in 1748. He emigrated to the U. S. in childhood; graduated at Princeton in 1771; became a judge of the Supreme Court of Pennsylvania in 1799. He wrote a satirical work called *Modern*

Chivalry, or Adventures of Captain Farrago (1796-1806). D. in Carlisle, Pa., June 25, 1816.

Bracket: a projecting arm of wood or metal employed to support a shelf or gallery. Also one of two marks [] used in printing to inclose a word, remark, explanation, etc. When a word in a classical work is included in brackets it implies that the word so inclosed does not properly belong to the original text, but has been either introduced by a mistake of the copyist, or has been inserted to supply an omission, correction, or explanation.

Brack'ett, ALBERT GALLATIN: soldier; b. in Cherry Valley, N. Y., Feb. 14, 1829. He served during the Mexican war as first lieutenant Fourth Indiana Volunteers; appointed captain Second U. S. Cavalry Mar., 1855; engaged principally on frontier duty against hostile Indians in Texas prior to 1861, when, on Twiggs's surrender, he effected his escape, and was in command of cavalry at Blackburn's Ford, Va., July 18, 1861; commissioned colonel Ninth Illinois Volunteer Cavalry Aug., 1861; served during the civil war in the Western and Southwestern armies. He was promoted to be major First Cavalry, U. S. army, July 17, 1862; lieutenant-colonel Second Cavalry June 9, 1868; colonel Third Cavalry Mar. 20, 1879. Since the close of the war he has been in command of various departments, and actively engaged in operating against hostile Indians. He is author of *Lane's Brigade in Mexico* and *History of the United States Cavalry*.

Brackett, ANNA C.: American educator; b. at Boston, 1836; educated at Framingham Normal School, Framingham, Mass.; taught with great success in large cities; translated the *Pädagogik's System* of Rosenkranz; author of *The Education of American Girls* (1874); *Poetry for Home and School* (1876).

Brackettville: capital of Kinney co., Tex. (for location of county, see map of Texas, ref. 5-F); in the southwest part of the State, about 30 miles from the Rio Grande. Pop. (1880) 1,126; (1890) 1,649.

Braet [from Lat. *bractea*, a thin leaf of metal]: a floral leaf, or an altered leaf, placed at the base of a flower on the outside of the calyx. It is a leaf from the axil of which a flower or floral axis is produced, instead of an ordinary leaf-bud or branch, and is regarded as the first attempt made by the leaves to change into floral organs. The braet is sometimes large and brightly colored. In several species of *Arum* it constitutes the large enveloping-leaf called a spathe. An involucre is a collection of braets arranged in a whorl.

Brac'ton (properly **Bratton**), HENRY, de: a distinguished English ecclesiastic and jurist, of whose life little is known. He was made archdeacon of Barnstaple in 1264, and later in the same year chancellor of the cathedral, which office he probably held till some time in 1268, when he is supposed to have died. For many years he was a justice in eyre and a justice of assize. His principal work, *De Legibus Angliæ et Consuetudinibus*, is a systematic treatise on jurisprudence and legislation, the plan or framework of which is borrowed from the Institutes of Justinian. The subject matter also in those branches of the law (e. g. the laws of personal property) which were still undeveloped in the common law were taken almost verbally from the Institutes or the Digest. Though this work is a landmark in the history of English law, no even tolerably reliable edition exists. In 1569 Richard Tottell edited an edition which is full of corruptions and mistranslations, and Sir Travers Twiss's edition is practically a reprint of this. The work was probably completed about the year 1258. See F. W. Maitland's *Bratton's Note-book* (London, 1887); and T. E. Scrutton's York prize essay of Cambridge University on the *Influence of the Roman Law on the Law of England* (Cambridge, 1885).

F. STURGES ALLEN.

Brad'bury, WILLIAM BATCHELDER: musician and composer; b. in York, Me., Oct. 6, 1816; received musical instruction from Sumner Hill, of Boston, while still working at his trade as a shoemaker. In 1833 he attended Dr. Lowell Mason's singing-school and the Boston Academy of Music; was organist in several churches, and taught a singing-school in Machias, Me., for about a year and a half; traveled considerably, and in 1841 settled in the vicinity of New York city, teaching singing, organizing and conducting juvenile musical festivals, and composing and writing music for Sunday-schools. In 1847 he went to Leipzig, and studied there for two years. In 1849 he held his first musical con-

vention in Somerville, N. J., and in 1854 was associated in the Normal Musical Institute, North Reading, Pa.; in the same year became a partner in the piano manufacturing firm of Light, Newton & Bradbury. His principal books are *The Oriole* (1859); *The Golden Chain* (1861); *The Golden Shower* (1862); *The Golden Censer* (1864); *Fresh Laurels*; *The Shawm*; *The Jubilee*; and *The Keynote*. D. in Montclair, N. J., Jan. 7, 1868. D. E. HERVEY.

Brad-dock: borough (founded in 1867): Allegheny co., Pa. (for location of county, see map of Pennsylvania, ref. 5-A); on B. and O. Pa. and Pittsburg and Lake Erie R. Rs., and on Monongahela river; 10 miles from Pittsburg; has 2 public schools, 4 parochial schools, steel-works, wire-mills, a furnace and a forge. Pop. (1880) 3,310; (1890) 8,561; (1892) estimated, 11,000. EDITOR OF "NEWS."

Braddock, EDWARD: British general; b. in Perthshire, Scotland, about 1695. He commanded in a war against the French and Indians in North America. As he was marching to attack Fort Duquesne he was surprised by the Indians near Pittsburg, and was defeated and mortally wounded. D. at Great Meadows, 60 miles from the battle-field, July 13, 1755.

Braddon, MARY ELIZABETH: See MAXWELL.

Bradford: an important manufacturing town in the West Riding of Yorkshire, England; on a small branch of the Aire, and on the Leeds Railway; 9 miles by rail W. of Leeds (see map of England, ref. 6-II). It is situated at the meeting of three vales, and is built of stone. It returns three members to Parliament. Among the principal buildings are a handsome exchange, an elegant public hall, the parish church, erected in the reign of Henry VI., and a cloth-hall. The Saltaire alpaca and mohair mills, which are 3 miles from Bradford, were said to be the most splendid manufactories in England, but the industry has fallen away. Bradford is the chief seat in England of the manufacture of worsted fabrics, alpaca, mohair, etc. Broadcloths and cotton goods are also made. Mines of coal and iron are worked in this vicinity. Baptist, Independent, and Wesleyan colleges are near this city. Pop. (1891) 216,361.

Bradford: town; Essex co., Mass.; on the south bank of the Merrimack river, 32 miles N. of Boston (see map of Massachusetts, ref. 1-1). A bridge and a railway viaduct connect it with Haverhill. It is the seat of Bradford Female Academy. Pop. (1890) 3,720; (1895) 4,736.

Bradford: village (1861); in Darke and Miami counties, O. (for location, see map of Ohio, ref. 5-C); situated at terminus of three branches of Pa. R. R.; 83 miles W. of Columbus; has high school, railroad repair-shops, printing and shoe factories. The contiguous territory is settled with Dunkards. Pop. (1890) 1,338. EDITOR OF "SENTINEL."

Bradford: city (settled 1823; incorporated 1879); McKean co., Pa.; on tributary of the Allegheny river, 11 miles distant; and on the Erie, Buffalo, Roch. and Pitts., Brad. Bord. and Kinzua, Allegheny and Kinz., West N. Y. and Penn., and other railways, and connected by electric railway (21 miles) with Olean, N. Y.; 79 miles S. of Buffalo (see map of Pennsylvania, ref. 2-D). It stands in the center of the most productive oil-field in the U. S. (1,550 to 2,550 feet above sea-level), and has large oil-refineries, oil-well supply shops, railroad shops, glass-works, extensive lumber interests and immense wood-working establishments, and vitrified, pressed, and enameled brick, and acid and wood alcohol works near the city; paved streets, electric lights, natural gas for light and fuel (domestic and manufacturing), fire department with 7 companies, gravity water system (springs, artesian wells, and watershed owned by the city); 19 churches, 8 large school buildings and a parochial school, and 3 daily, 3 Sunday, and 2 weekly newspapers. Pop. (1890) 10,514; (Mar., 1897) 16,663. F. A. CHURCHILL, ED. "EVENING STAR."

Bradford: village; Orange co., Vt.; on railroad and the Connecticut river; 29 miles S. E. of Montpelier (see map of Vermont, ref. 5-C). It has an academy and several factories. Pop. (1880) 619; (1890) 1,103.

EDITOR OF "UNITED OPINION."

Bradford, ALDEN, LL. D.: b. in Duxbury, Mass., Nov. 19, 1765; graduated at Harvard in 1786, was a tutor there 1791-93; was successively a Congregational minister in Wisconsin (now in Maine), a clerk of the Massachusetts Supreme Court, a bookseller, secretary of State for Massachusetts (1812-24), and a journalist. Author of a *History of Massachusetts from 1764 till 1829* (Boston, 1822-29), and other works. D. in Boston, Oct. 26, 1843.

Bradford, AMORY HOWE, D. D.: Congregationalist; b. at Granby, Oswego co., N. Y., Apr. 14, 1846; graduated at Hamilton College 1867; studied at Auburn Theological Seminary, and finished his course at Andover Theological Seminary 1870; has been pastor at Montclair, N. J., since 1870. He is the author of *Spirit and Life* (1888); *Old Wine: New Bottles* (1892); and of numerous articles in various reviews. He is an editorial writer in *The Christian Union*; also secretary of the American Institute of Christian Philosophy. He was Southworth lecturer on Congregationalism at Andover for 1892 and 1893.

GEORGE P. FISHER.

Bradford, AUGUSTUS W.: b. in Maryland about 1805; studied law; entered politics as a Whig; was a firm Unionist; a delegate to the peace congress 1861, and was chosen Governor of Maryland, holding the office until 1866. He was largely influential in securing the new constitution of Maryland (1864), by which slavery was abolished. In July, 1864, his house was burned by Confederate raiders. He was surveyor of Baltimore under President Johnson, and declined a position in the custom-house offered to him by President Grant. D. Mar. 1, 1881.

Bradford, EARLS OF, and Viscounts Newport (1815, in the United Kingdom): Barons Bradford (1794, in Great Britain), and baronets (1660); a prominent family of Great Britain.—ORLANDO GEORGE CHARLES BRIDGMAN, the third earl, was born Apr. 24, 1819, and succeeded his father in 1865. He was member of Parliament for South Shropshire 1842-65.

Bradford, JOHN: a distinguished preacher and martyr of the Church of England; b. in Manchester, England, about 1500; entered Catharine Hall, Cambridge, 1548; was ordained 1550. He became a chaplain to Edward VI., and after the accession of Mary was burned at the stake in Smithfield, London, July 1, 1555. He wrote many theological treatises which are published in the collections of the Parker Society. See William Stevens's *Life of John Bradford* (1832). W. S. PERRY.

Bradford, JOSEPH M.: captain U. S. N.; b. in Sumner co., Tenn., Nov. 4, 1824; entered the navy as a midshipman Jan. 10, 1840. From Nov., 1863, to June, 1865, he served as fleet-captain of the South Atlantic blockading squadron, during which period he was frequently in battle, and was highly commended by Rear-Admiral Dahlgren, in his "general order" of June 16, 1865. D. at Norfolk, Va., Apr. 14, 1872.

Bradford, WILLIAM: one of the Pilgrim Fathers; b. in Ansterfield, Yorkshire, England, in 1589 (was baptized Mar. 19, 1589-90). He emigrated to New England in the Mayflower in 1620, and was elected governor of Plymouth Colony in 1621. Having been re-elected annually, he held the office till his death, except five years, when he declined the election. A patent or charter for the colony was granted in 1630 to William Bradford, his heirs and associates. D. in Plymouth, Mass., May 9, 1657. He left a *History of Plymouth Colony*, which was printed in 1856.

Bradford, WILLIAM: the first printer in Pennsylvania; b. in Leicester, England, May 20, 1660; d. in New York, May 23, 1752. Being a Quaker he emigrated in 1682, and landed on the spot where Philadelphia was afterward built. In 1685 he began printing under the patronage of the Friends. His first work was the publication of an almanac in 1686, the *Kalendarium Pennsylvaniese*. In 1692 he incurred the displeasure of the dominant party in Philadelphia, through his sympathy with George Keith, and was imprisoned for libel. In 1693 he was induced by Gov. Benjamin Fletcher to remove to New York to become printer to their Majesties King William and Queen Mary. In that year he printed (1) *A Journal of the late actions of the French at Canada, with the manner of their being repulsed by His Excellency Benjamin Fletcher*; (2) the laws of the colony, commonly known as "Bradford's Laws." On Oct. 16, 1725, he began the publication of the *New York Gazette*, the first newspaper printed in New York city. In 1728 he established a paper-mill at Elizabethtown, N. J. He was printer to the government of New York for more than fifty years, and for more than thirty years the only one in the province. He was a warden of Trinity Church, in whose churchyard he lies buried. He had two sons, the younger of whom, Andrew, made a comfortable fortune as a printer and publisher in Philadelphia, where for a time he was a competitor of Benjamin Franklin. A. GROWLL.

Bradford, WILLIAM: marine-painter; b. in New Bedford, Mass., about 1830; d. in New York, Apr. 25, 1892. Began painting without instruction at Fairhaven and Lynn, and afterward on the coasts of Labrador and Nova Scotia. He accompanied Dr. Hayes, the Arctic explorer, on several of his voyages and painted pictures of the icy scenery of those regions. He exhibited a number of his works in London, and his *Steamer Panther in Melville Bay under the Light of the Midnight Sun* was exhibited at the Royal Academy in 1875 by order of the Queen, who purchased it. He disposed of other pictures at high prices, and soon became well known on both sides of the Atlantic. His works are interesting principally from the novelty of their subjects, and are not remarkable technically considered. He was elected an associate of the National Academy, New York, in 1874.

WILLIAM A. COFFIN.

Bradford, Great: a market-town of Wiltshire, England; on the river Avon; on the Kennet and Avon Canal; 10 miles by rail E. S. E. of Bath (see map of England, ref. 12-6). It has a fine old church, and manufactures of broadcloth, kerseymeres, and india-rubber goods. Pop. 5,000.

Brad'ke, PETER, von, Ph. D.: German philologist; b. in the Russian province of Livonia, June 27, 1853; studied at Dorpat and Tübingen; is Professor of Sanskrit and Comparative Philology in the University of Giessen, Hesse, Germany. Besides minor essays in periodicals, he has published *Studien und Versuche auf dem Gebiete alt-indo-germanischer Religionsgeschichte* (1885); *Beiträge zur Kenntniss der vorhistorischen Entwicklung unseres Sprachstammes* (1888); *Ueber die arische Alterthumswissenschaft und die Eigenart unseres Sprachstammes* (1888); *Ueber Methode und Ergebnisse der arischen Alterthums-wissenschaft* (1890).

Brad'ish, LUTHER, LL. D.: b. in Cummington, Mass., Sept. 15, 1783; graduated at Williams College in 1804. He studied law; was employed as a Government agent in affairs relating to Levantine commerce; settled in Franklin co., N. Y.; became prominent in State politics; was Lieutenant-Governor (1829-43), and under Fillmore was assistant U. S. treasurer at New York. He was prominent in religious, educational, and other charitable and benevolent enterprises. D. in Newport, R. I., Aug. 30, 1863.

Brad'laugh, CHARLES: republican reformer and antic-socialist; b. in the East End of London, Sept. 26, 1833; educated at Bethnal Green and Hackney Road elementary schools until he was eleven; afterward successively errand-boy, coal-dealer, and free-thought lecturer; began to speak before street audiences at the age of fifteen; enlisted in 1850 in the army, and served for some time in Ireland; became clerk in a solicitor's office in 1853, and began to write under the pseudonym "Iconoclast"; edited successively the *Investigator* (1858-59), and the *National Reformer*; in 1868 began his efforts to enter Parliament, being then widely known throughout the country; contested Northampton three times in vain, but was finally returned for that borough in 1880, his colleague being Mr. Labouchere; his refusal to take the oath of allegiance, and his demand to be permitted to affirm instead, led to several exciting scenes in Parliament; thrice he lost his seat on this account, and was as many times re-elected, and in the new Parliament of 1885 he was allowed to take his seat. In 1888 he carried a bill through Parliament allowing all persons to affirm instead of taking the oath. He was also successful in moving to establish a labor bureau, and was recognized as one of the best informed men on East Indian affairs in Parliament. His personal influence grew in Parliament, where he became greatly respected by all parties for his good sense, eloquence, and kind disposition. In 1873 Mr. Bradlaugh lectured in the U. S., and was warmly received. In 1876 he joined with Annie Besant in republishing an old pamphlet on population, for which they were brought to trial and sentenced to a fine and imprisonment—a judgment overruled on appeal. In his *Impachment of the House of Brunswick* he advocated the repeal of the Hanoverian settlement of the crown as soon as the Queen should cease to reign. D. in London, Jan. 29, 1891.

Brad'ley, EDWARD (better known as "Cuthbert Bede"); novelist and humorist; b. in Kidderminster, England, in 1827; was educated at Durham University; B. A. 1848; entered the Anglican ministry, and received a number of church preferments; at the time of his death had been rector of Lenton, near Grantham, since 1883. He was the author of many volumes of prose and verse, chiefly novels,

of which his first venture, *Verdant Green*, a humorous story of Oxford life (London, 1853-57, 3 parts), is the best known. He contributed largely to periodical literature. D. in Lenton, Dec. 12, 1889.

Bradley, GEORGE GRANVILLE, D. D., LL. D.: Dean of Westminster; b. in High Wycombe, Dec. 11, 1821; educated under Dr. Arnold at Rugby, and at University College, Oxford, where he was a pupil of Dean Stanley; B. A. 1844; fellow of University College 1841-50; became assistant master of Rugby 1846; head-master of Marlborough College 1858; master of University College, Oxford, Dec., 1870; appointed to succeed Dean Stanley in the Deanery of Westminster Aug., 1881. Has published *Recollections of Arthur Penrhyn Stanley* (London, 1882), and lectures on *Ecclesiastes* (1855) and on *Job* (1887).

Bradley, JAMES, D. D., F. R. S.: astronomer; b. in Sherbourn, Gloucestershire, England, Mar., 1693; excelled as an observer and as a theorist. He graduated at Oxford; B. A. 1714; was ordained as a priest, and obtained several livings, but resigned them when he became Savilian Professor of Astronomy at Oxford in 1721. In 1729 he announced the important discovery of the aberration of light, which serves to demonstrate the earth's motion around the sun. In 1742 he was appointed astronomer-royal, and began to make observations at Greenwich. His next discovery, announced 1748, was that the inclination of the earth's axis to the ecliptic is not constant, a fact which explained the precession of the equinoxes and the nutation of the earth's axis. This discovery forms an important epoch in astronomy. D. at Chalford, July 13, 1762, leaving in manuscript thirteen volumes of observations, which were published in 1798-1805. See his *Miscellaneous Works and Correspondence*, with memoir ed. by L. P. Rigaud (Oxford, 1832).

Bradley, JOSEPH P., LL. D.: associate justice of the U. S. Supreme Court; b. at Berne, Albany co., N. Y., Mar. 11, 1813; graduated at Rutgers College, New Brunswick, N. J., with honors, in 1836; admitted to the bar in 1839 at Newark, N. J. He married in 1844 a daughter of Chief Justice Hornblower. Besides his labors in every branch of his profession, he devoted much attention to mathematics and the study of law as a science, extending his researches to the civil law—researches which have been of great service in his judicial duties in Louisiana and Texas. Engaged in many important causes in the State and U. S. courts, he took but slight part in politics. He was formerly a Whig; warmly sustained the national cause in the civil war; headed the electoral ticket for Grant in 1868; ranked as a moderate Republican. He was appointed to the bench of the U. S. Supreme Court Mar. 21, 1870. He was a member of the electoral commission which seated Hayes in the presidential chair, and it was his vote that decided the issue. D. in Washington, D. C., Jan. 22, 1892.

Bradshaw, HENRY: English scholar; b. in London, Feb. 2, 1831; entered King's College, Cambridge, 1850; fellow 1853; B. A. 1854; dean 1857-65; proctor 1868. Mar. 8, 1867, he was appointed librarian of the Cambridge University library, with which he had been connected in one or another capacity for over ten years, and he held this office at the time of his death, Feb. 10, 1886. His unsurpassed knowledge of manuscripts and early printed books and his stores of general and special information—literary, bibliographical, and antiquarian—were always at the service of students and investigators, in assisting whom he spent his time without stint. His studies in Chaucer, of whom he projected an edition, were of much importance; but only his *Skeleton of the Canterbury Tales* (printed 1868, issued in 1871 as No. 4 of his *Memoranda*) and two short notes were published. His most elaborate bibliographical work is a list of the editions of the *Sarum Breviary*, etc., in Procter and Wordsworth's *Breviarium secundum usum Sarum* (1886). He also issued a series of bibliographical *Memoranda* (1868-85) and contributed many short papers to the *Communications of the Cambridge Antiquarian Society*, etc.; but the amount of his publication bears no proportion to his learning and his influence on contemporary scholarship. His edition of the *Liber Niger* of Lincoln Cathedral, unfinished at his death, was completed by C. Wordsworth (*Statutes of Lincoln Cathedral*, part i., Cambridge, 1892). His services to liturgy were commemorated in 1890 by the founding of the Henry Bradshaw Society "for the editing of rare liturgical texts." See G. W. Prothero, *A Memoir of Henry Bradshaw* (Cambridge, 1888); *Collected Papers of Henry Bradshaw* (Cambridge, 1889). G. L. KITTRIDGE.

Bradshaw, JOHN: one of the English regicides; b. at Wibersley Hall, Cheshire, 1602 (baptized at Stockport church, Dec. 10, 1602); became in 1627 a barrister; chief justice of Chester in 1647; sergeant-at-law in 1648; and in 1649 president of the High Court which condemned Charles I. He conducted that cause with unfeeling sternness and severity, but with dignity, and probably with a conscientious desire to do justice to the king and the country. He afterward opposed Cromwell's ambitious designs, and the latter unsuccessfully tried to remove him from his chief justiceship. He later held various important positions. D. in London, Oct. 31, 1659, and was buried with great pomp. At the Restoration his body was exhumed from Westminster Abbey, along with those of Cromwell and Ireton, and the three bodies were hanged at Tyburn in their collins (Jan. 30, 1660-61); the heads were then cut off and exposed in Westminster Hall, while their bodies were buried beneath the gallows.

Bradstreet, ANNE: first American versifier; wife of Simon Bradstreet; daughter of Thomas Dudley; b. in Northampton, England, in 1612; removed to Massachusetts probably in 1630. Her father and her husband were both governors of the colony. She published a volume of poems in London in 1650 entitled *The Tenth Muse Lately Sprung Up in America*. These poems and her other writings have been several times reprinted (the last and best edition in 1867). D. Sept. 16, 1672. See her complete works edited by J. H. Ellis (Charlestown, Mass., 1868). Revised by HENRY A. BEERS.

Bradstreet, JOHN: major-general; b. in Horbling, England, in 1711; d. in New York city, Sept. 25, 1774. When a young man he removed to America and entered the colonial army; in 1745, as lieutenant-colonel in Pepperell's (York, Me.) regiment, he figured prominently in the expedition against Louisburg. In the fall of the same year he was made a captain in the regular army, and on Sept. 16, 1746, was appointed lieutenant-governor of St. John's, Newfoundland. In the French and Indian war he fought at Ticonderoga, Fort Frontenac, and Crown Point; negotiated a treaty with the Western Indians at Detroit in 1764. Was commissioned a major-general in 1772.

Bradstreet, SIMON: colonial Governor of Massachusetts; b. at Horbling, Lincolnshire, England, in Mar., 1603. He studied at Cambridge, and was for a time the steward of the Countess of Warwick; removed to Salem, Mass., in 1630, as an assistant judge; was one of the founders of Cambridge and Andover, and resided also at Ipswich and Boston. Besides holding other important positions, he was Governor (1679-86 and 1689-92). D. in Salem, Mass., Mar. 27, 1697.

Bradwardine, THOMAS: English prelate and scholastic theologian; called THE PROFOUND DOCTOR; b. in Chichester in 1290; educated at Oxford, and attained high rank as a scholar. He became confessor to Edward III. 1338; was consecrated Archbishop of Canterbury at Avignon, July 19, 1349. His principal work, *De causa Dei contra Pelagium et de virtute causarum*, is a masterly argument for the doctrine of Augustine. He was an able mathematician of Oxford University. D. in London, Aug. 26, 1349, of the plague. See notice of his *Life* by Sir Henry Savile in his edition of Bradwardine's *De causa Dei*, etc. (London, 1618).

Brady, JOHN RIKER: jurist; b. in 1822 in New York city. In 1856 he was elected a justice of the New York court of common pleas, and in 1869 was made a justice of the Supreme Court of the State, and in 1877 was unanimously re-elected to the position. D. Mar. 16, 1891.

HENRY WADE ROGERS.

Brady, NICHOLAS, D. D.: b. at Bandon, Ireland, Oct. 28, 1659; educated at Oxford and Dublin; sided with King William against James II., and in consequence was made chaplain to the king. He received several English church preferments, but is best known for his share in the metrical version of the *Psalms* (London, 1695), which he made in conjunction with Nahum Tate (1652-1715), the poet laureate. *Tate and Brady's Psalms*, though justly ridiculed for their clumsiness, quaintness, and bombast, have some noble passages. Brady also published a *Translation of the Æneid* (4 vols. 8vo, 1726). D. in Richmond, Surrey, May 20, 1726.

Brady, WILLIAM MAZIERE, D. D.: b. in Dublin, Ireland, in 1825, of a prominent family; graduated at Trinity College with honor. Entering the Irish State Church, he received lucrative appointments, which he hazarded, and in part lost, by his many bold and able attacks upon the Church establishment to which he himself belonged. He was one of the foremost leaders of the movement which re-

sulted in the disestablishment of the Irish Church. In 1873 he entered the Roman Catholic Church. He is the author of several works, chiefly upon the ecclesiastical history and antiquities of Ireland and Great Britain, and has written a learned work on *The Episcopal Succession in England, Scotland, and Ireland, A. D. 1400 to 1875* (Rome, 1876-77, 3 vols.); also *Annals of the Catholic Hierarchy in England and Scotland* (London, 1883); *Anglo-Roman Papers* (1890).

Braga, braa'gã (anc. *Bracara Augusta*): a town of Portugal; capital of the province of Minho; on an eminence near the river Cavado; 39 miles N. N. E. of Oporto (see map of Spain, ref. 14-B). It is the seat of an archbishop. It has a fine Gothic cathedral and a college. Braga is inclosed by old walls and defended by a castle. Here are manufactures of linen, cutlery, firearms, jewelry, etc. It is a very ancient town, and has the ruins of a Roman temple and amphitheater. It was the capital of Lusitania after the latter had been conquered by the Suevi. Its archbishop is titular primate of Portugal. Church councils were held at Braga in 563, 572, and 672 A. D. Pop. 19,755.

Braga, THEOPHILO: Portuguese critic and philologist; b. in San Miguel (St. Michael), Azores, Feb. 24, 1843; educated at the University of Coimbra, and since 1872 Professor of Literature in the Curso Superior de Letras at Lisbon. He has been one of the most voluminous and at the same time influential (at least in his own country) of modern authors. A recent list of his productions embraces over ninety titles. In Portugal, Braga has been mainly influential as a democrat in politics and a positivist in philosophy. Among his works is the capacity of leader of the Portuguese Republicans are *Soluções positivas da Política portuguesa* (1879); *Dissolução do Sistema constitucional* (1881). As positivist, Braga has published *Tragos gerues de Philosophia positiva* (1877); *O Positivismo* (a review, 1878-79-80); *Historia universal, esboços de Sociologia descriptiva* (1879-82); besides great numbers of isolated articles and addresses. Outside of Portugal, however, Braga is chiefly known as philologist and historian of Portuguese literature. In this field his activity has been almost incredible; and, if his work suffers often from haste and impetuosity, yet, on the other hand, his contributions to our knowledge of the origins and development of the literature of the Spanish peninsula have been very important. Only a few of his works in this field can be mentioned here: *Historia da Poesia popular portugueza* (1867); *Historia da Poesia moderna em Portugal* (1869); *Historia do Theatro portuguez* (1870-71); *Historia dos Quinhentistas* (1871); *Theoria da Historia da Litteratura portugueza* (1872); *Travadores Gallego-portuguezes* (1871); *Manual da Historia da Litteratura portugueza* (1875); *Borage, sua Vida e Epoca litteraria* (1877); *Cuncioneiro da Vaticana* (1878); *Historia do Romantismo* (1880); *Retrato e Biographia de Camos* (1880). Braga is also a poet, and several volumes of his verse have appeared. *Folhas verdes* (1858) and *Visão dos Tempos* (1864) are perhaps the most remarkable.

A. R. MARSH.

Bragança, braã-gaan'sã: a seaport-town of Brazil; province of Pará; on the river Cate, near its mouth; 106 miles E. N. E. of Pará (see map of South America, ref. 3-G). It has a trade in sugar. Pop. 10,000.

Braganza, braã-gaan'zã: a fortified town of Portugal; province of Tras-os-Montes; on a small stream 35 miles N. W. of Mirandi (see map of Spain, ref. 13-C). It has a citadel, a college, and a castle partly ruined, which was the seat of the Dukes of Braganza. It is the seat of a Catholic bishop. The name of the reigning family of Portugal, the house of Braganza, is derived from this town, which has manufactures of velvet and other silk fabrics. Pop. 5,495.

Braganza, or Bragança: the name of the royal family of Portugal and the late imperial family of Brazil, which is descended from Afonso, Duke of Braganza, a natural son of John I., King of Portugal. He died in 1461. The first member of this family that became King of Portugal was the eighth duke, who began to reign as John IV., in 1640. The first Emperor of Brazil was Dom Pedro I., the eldest son of King John VI.

Brage, brau'ge [derivation uncertain, but cf. O. Eng. *bregu*, princeps]: in Scandinavian mythology a son of Odin. He is the god of poetry and eloquence, and is one of the twelve chief gods in Asgard. He is not only eminently skilled in poetry, but the art itself is from his name called

Brage, which epithet is also used to denote a great poet. He is represented as an old man with a long flowing beard, and persons with heavy beard are called after him beard-brage (skergg-bragi). His wife, Idun, keeps in a box the apples which the gods, when they feel old age approaching, have only to taste of to become young again. In this manner they preserve their youth until Ragnarok. The giant Thjasse once captured Idun with her apples and carried her to Jotunheim. This made the gods turn wrinkled and gray, but they compelled Loke to bring her back to Asgard. (See IDUN.) *Bragarvǫdur*, in the Younger Edda, gives a description of a banquet to Æger, the god of the sea, in Asgard, where Brage at the request of Æger tells how Idun was captured by Thjasse. At feasts given after the death of a king or jarl it was customary among the old Scandinavians for the heir of the deceased to occupy a lower bench in front of the high-seat until Brage's bowl was brought in. Then he arose, made a pledge, and drank the cup of Brage (*bragafull*).—BRAGE THE OLD is occasionally quoted in Old Norse literature as an ancient skald, but his existence is doubted. It is fair to assume that the god Brage has been changed into an historical person, and that poetry of which the authorship was unknown was ascribed to him. See Thorpe's *Northern Mythology*; Keyser's *Religion of the Northmen*; Anderson's *Norse Mythology*; and Bugge, *Der Gott Bragi*, in Paul and Braune's *Beiträge*, xiii. 187 ff. BRAGE is sometimes spelled BRAGI (*g. v.*).

RASMUS B. ANDERSON.

Bragg, BRAXTON: soldier; b. in Warren co., N. C., Mar. 22, 1817; graduated at West Point in 1837; became captain June 18, 1846, in the Third Artillery; and served with distinction at various posts until Jan. 3, 1856, when he resigned with the rank of brevet lieutenant-colonel. In the civil war he was in command of the forces of the Southern army at Pensacola operating against Fort Pickens 1861; of Second Corps at Shiloh 1862, being promoted to general on the death of Gen. A. S. Johnston; moved against Buell into Kentucky 1862, whence he was compelled to retire after defeat at Perryville Oct. 8, 1862; defeated at Murfreesboro Jan. 2, 1863; after a brief arrest overthrew Rosecrans at Chickamauga Sept. 20, 1863; relieved from command Dec. 2, 1863, for loss of Mission Ridge in the battle of Chattanooga Nov. 25, 1863; led a small force from North Carolina to Georgia in 1864; became chief engineer to State of Alabama, and made improvements in Mobile harbor. D. in Galveston, Tex., Sept. 27, 1876.

Bragg, WALTER L.: lawyer; b. in Lowndes co., Ala., Feb. 25, 1838; graduated at Harvard in 1858. He was a captain in the Confederate army. At the close of the war he settled in Alabama and practiced law, and was the first president of its State bar association. He was president of the Alabama railroad commission and in 1877 was appointed a member of the Interstate Commerce Commission, being reappointed in 1880. D. at Spring Lake, N. J., Aug. 21, 1891.

HENRY WADE ROGERS.

Bra'gi: god of poetry in the northern mythology. See especially Bugge, *Der Gott Bragi* (in Paul and Braune's *Beiträge*, xiii. 187 ff.); and the article BRAGE.

Bragi the Old, or Bragi Boddason: Norwegian poet; celebrated as the most ancient skald whose name is known. He is commonly thought to have lived about 770-850, though some regard this date as too early. The meager fragments of his verse that have come down to us have been edited by H. Gering (Halle, 1886). See also Vigfússon, *Corpus Poeticum Boreale*, ii. 2 ff.

G. L. KITTEDGE.

Bra'he, Tycho (Dan. pron. braæ): astronomer; b. in Knudstrup, Scania, Sweden, Dec. 14, 1546, which at that time was a province of Denmark. He studied at Copenhagen, Leipzig, and Wittenberg, where his face was disfigured in a duel; was early fascinated with astronomy, and in 1563 began the correction of the *Alphonsine Tables*. The king, Frederic II., gave him the island of Høfne, in the Sound, about 1575, where he built the finest observatory (Urnenborg) which ever had been erected in Europe. He enriched the science of astronomy very much, partly by his very numerous observations, partly by inventing new instruments. He formed a catalogue of 777 stars, increased by his pupil Kepler to 1,000 from the records which he left behind, and his recorded observations of the planet Mars furnished to the same distinguished successor the material from which he deduced his famous "Laws." An uncle who died in 1565 left him an estate. Having passed several years in Augs-

burg, he returned to his native country in 1570. He rejected the Copernican system, which in his time was not supported by the conclusive evidence we now have in its favor. In fact, Tycho's theory, which made the sun move round the earth, and all the other planets round the sun, explained all the phenomena then known equally well. After the death of his royal patron in 1588 he was first neglected, and then so persecuted by the court that he emigrated to Germany in 1597, and was induced by the Emperor Rudolph to settle at Prague, where he died Oct. 24 (N. S.), 1601. He published, besides other works, *Astronomia Instaurata Progmnasmata* (1587-89). "As a practical astronomer," says Sir David Brewster, "Tycho has not been surpassed by any observer of ancient or modern times. The splendor and number of his instruments, the ingenuity which he exhibited in inventing new ones, and his skill and assiduity as an observer, have given a character to his labors and a value to his observations which will be appreciated to the latest posterity." See Brewster's *Martyrs of Science* (1841), and his *Life* by Frijs (Danish, 1871). Cf. J. L. E. Dreyer, *Tycho Brahe, Scientific Life and Work in the Sixteenth Century* (London, 1890).

Brahma [occurs in Hindi in two forms: (1) *Brahmā*, nom. sing. neut., and (2) *Brahmā*, nom. sing. masc. of a Sanskrit crude form *brahman*, meaning growth, increase, or expansion; probably from a root *br̥h*, or *vr̥h*, to grow or increase. The form *Brahmā* is not found in the Vedas or Brāhmanas]; in philosophical Brahmanism the form *Brahmā* is used to designate the supreme, self-existent, and all-pervading soul of the universe, from which all things emanate, and to which they return. *Brahmā* is the Supreme Spirit, regarded as impersonal, and divested of all quality and action. It is described as absolute, eternal, without beginning or end, immaterial, invisible, and inappreciable by the senses until "the film of mental blindness has been removed." It receives no worship, but is an object of abstract meditation, the only means by which absorption into it can be attained. (See BRAHMANISM.) In Hindu mythology this impersonal Supreme Being, when dominated by Activity (one of the three eternal principles or binding qualities by the equipoise of which, according to the Sankhya philosophy, nature exists), becomes *Brahmā*, the Creator, the first member of the Hindu triad of gods (the others being Vishnu and Siva), and the lord and father of all creatures. (See VISHNU, SIVA, and TRIMURTI.) He is said to live for one hundred divine years of three hundred and sixty divine days and nights. A day and a night make a kalpa, which is equal to 4,320,000,000 mortal years. When created by *Brahmā*, the world remains unaltered for one of his days (2,160,000,000 mortal years). It is then consumed by fire, only the elements, the gods, and the sages surviving. When he wakes up at the beginning of the next kalpa, the process of creation is repeated, followed by a night of decay; and this takes place 36,000 times, when he expires and everything comes to an end. *Brahmā* is represented as of a red color, and with four heads and four arms. His vehicle is a swan. He is never worshiped by the people, and only one temple is known to have been erected in his honor. His consort is Sarasvatī, the goddess of learning, who is also known as *Brāhmī*.

R. LILLEY.

Brahman: a member of the sacerdotal caste among the Hindus. See BRAHMANISM and CASTE.

Brahmanism, brah-man-izm: the religion of the Hindus, established by the Brahman priests upon the basis of the *Vedas*.

All Brahmanical beliefs are founded upon the *Vedas*, the earliest literary productions of India. The literature of the *Vedas* consists of various strata. The lyric parts, the so-called *Mantras*, are prayers or hymns addressed to the personified forces of nature. Agni, the fire (*ignis*), the heavenly messenger, the heavenly guest, the carrier of the sacrifice to the gods; Indra, the Hercules, the demiurge, who is inspired by the intoxicating drink *soma* to give fight and slay the cloud-demons; Sūrya and Ushas (*sol* and *aurora*); Dyāus (*Zeus*) and Prithivi, the shining sky and the earth; Rudra and the Maruts, the storm-god and his companions; Varuna (*Uranos*), the encompassing, all-seeing sky, he who has his spies everywhere to ferret out the wrongs done by men, etc.

In connection with the worship of these divinities there grew up a vast system of sacrificial ritualism and theosophic speculation laid down in texts called *Brāhmanas*, *Sūtras*, and *Upanishads*. The *Upanishads* especially have remained the foundation of all the higher thought in Brah-

manism up to our day. They are the first exponents of Hindu pantheism. Nothing really exists, they affirm again and again, but the one Universal Spirit (called *ātman*, the self, or *brahma*, the spiritual essence), and whatever appears to exist independently is identical with that spirit. Even the earlier gods of the Vedic hymns are but manifestations of this all-power. No real self can exist separately from the one self-existent supreme self, and when by an act of that self the individualized spirits of men are allowed for a time an apparent separate existence, the ultimate end and aim of such spirits should be to attain complete reunion with the one eternal self in entire self-annihilation. Coupled with this is the doctrine of transmigration of souls (metempsychosis), which seems to rest upon a more popular foundation than pantheism, but which fused very readily with it. Metempsychosis implies the belief that every creature is born again and again in any of the countless possible forms which lie between the great self-existent and the most insignificant living atom in the universe. Every creature is again and again the prey of death until he accomplishes the union with Brahma. And the Hindus assign a reason for this distressing indestructibility of individual existence. It is desire during life. Desire, they say, produces deeds or action, and action, whether good or bad, is by its very nature finite, and holds the actor within the chains of finite existence. Only he who knows this and acting upon this knowledge eradicates every desire by separation from the world attains to Brahma—that is, to release from the chain of finite existences.

Brahmanical pantheism is necessarily the special property of the spiritually enlightened, the Brahmans. Prior to the appearance of Boddha these ideas remained the property of learned schools solely. To the people the Brahman philosophers gave nothing but a polytheistic worship, which kept on changing the attractive early Vedic beliefs into an idolatry growing more and more grotesque at every stage of its development. The Brahmanical priests, holding in their hands the knowledge of the sacrifice, grew into a hierarchy whose power has never been exceeded. They kept on strengthening the system of castes which even to-day is the most significant social factor in Hindu life. A disjointed mass of sacred writings full of heterogeneous doctrines has grown up, based in a large measure upon Vedic beliefs, but absorbing also at the same time much of the fetishism of the aborigines of India; it has stooped to appropriate and naturalize the adoration of the fish, the boar, the serpent, the monkey, rocks, stones, and trees. At present the essentials of Brahmanical belief may be summed up in two conditions: the admission of the spiritual supremacy of Brahmans, and obedience to the caste-rules concerning food, intermarriage, and professional pursuits. One may say that the practical religion of the 150,000,000 or more Brahmanical Hindus now living is the law of caste. The more general and abstract laws of religion and worship of the gods and idols are not ignored, but they take a distinctively secondary place. The highest law which concerns the Hindu is to eat correctly, to drink correctly, to marry correctly—that is, in accordance with the rules that obtain in his caste. See *Barth, The Religions of India* (Boston, 1882); *Monier-Williams, Brahmanism and Hinduism* (4th ed. New York, Macmillan & Co.). See also SANKHYA and CASTE.

MAURICE BLOOMFIELD.

Brahmapu'tra, also written **Burrampooter** (anc. *Dyandanes* or *Edanes*): a great river of Asia. It rises in Tibet, where it first has a southerly course, and is known as the Kharta; then it has a long course eastward as the Sanpu, flowing in the valley between the Himalaya and Gangri Mountains. Opposite Eastern Bhutan it turns S. E., and is known as the Dihong river. In Northeast Assam it receives its largest tributary, the Burang river, when it becomes the Brahmaputra. Its general direction is then nearly W. S. W., until it passes through Assam and enters Bengal. It flows southward through Bengal, and enters the Bay of Bengal with the Ganges. It is connected with the Ganges not only by a common delta, but by a large branch or channel called the Jenna, which leaves the Brahmaputra about lat. 25° N. After receiving the tributary called the Meghna on the eastern side, it takes the name of that stream, and so remains to its mouth. It thus has five different names in its course. The identity of the Sanpu and Brahmaputra was long doubted by geographers, but is now settled. Its entire course is estimated at 1,800 miles. It inundates the level tracts of Bengal from April to September, and is said

to discharge into the sea more water than the Ganges. The violence of its current and its *bore* (an upward wave caused by the sudden influence of the tide) render navigation difficult.

Brahmin: a member of the sacred or sacerdotal caste among the Hindus. See CASTE.

Brah'mo So'maj [the Bengali form of Sanskr. *brahmasamāja*, meeting or society for worship]: a society of Theists in India. Founded in 1830 by Rammohun Roy, it increased in numbers and activity after 1842, under the leadership of Debendro Nath Tagore, who succeeded in emancipating it from Vedantism. In 1859 a new impulse was given to it by the ability and enthusiasm of Keshub Chunder Sen, who effected the separation of those who were willing to abolish caste in their communion, as the "Brahmo Somaj of India." The more conservative members remained in the Somaj or Church of Calcutta. Many of them are young Hindus educated at the English colleges. The first building for public worship of the progressive Brahmos was opened at Calcutta in 1869. The number of avowed Brahmos is probably not more than between 4,000 and 5,000, but large numbers of the educated natives sympathize with the movement. Keshub Chunder Sen, in his sermons and published tracts, avowed a belief in the unity of God, in immediate revelation, in the necessity of a new birth, in the immortality of the soul, and in the efficacy of prayer. His morality was pure, and he inculcated reverence for the character of Jesus Christ, but repudiated the doctrines of his divinity, mediation, and atonement as taught in the New Testament. This "Unitarian Theism" is said to resemble the theological rationalism of Theodore Parker. See *Six Months in India*, by Miss Mary Carpenter; *Hours of Work and Play*, by Miss F. P. Cobbe; an article in the *Contemporary Review on Indian Theism*, etc. (1869); Dr. Jardine's paper in *Proceedings of the Allahābād Conference* (1872); *Mozoomdar's Life and Teachings of Keshub Chunder Sen* (1888); the English work of Rammohun Roy (*q. v.*) (1888).

Revised by C. K. ADAMS.

Brahms, braams, JOHANNES; musician; b. in Hamburg, Germany, May 7, 1833; studied first under his father, and, being encouraged by Schumann in 1853, resolved to devote himself to a musical career. In 1861 left Hamburg for Vienna, where he made his residence, and died there Apr. 3, 1897. His principal works are four symphonies for full orchestra, several overtures, and other orchestral works; *Riualdo*, a cantata (for male voices); *Noenia*; *Song of Destiny*; *German Requiem*; *Song of the Fates* (for six-part chorus); *Rhapsodie* (for alto solo and male chorus); *Song of Triumph*; *Ave Maria* (for female voices); *Funeral Hymn*; *Thirteenth Psalm* (for female voices). These choral works are all exceedingly difficult, but very effective when well sung. The admirers of Brahms consider him the true successor to Beethoven, and his first symphony was considered so fine by some critics as to rank after Beethoven's *Ninth*, and was called the *Tenth Symphony*. His orchestral works are much more frequently heard than his choral compositions, owing to the great difficulties in the latter. He also wrote many songs, ballads, and small choruses.

D. E. HERVEY.

Braidwood: city (founded in 1860); Will co., Ill. (for location of county, see map of Illinois, ref. 3-G); on Chicago and Alton R. R.; 58 miles from Chicago; has 5 churches, 5 public schools, coal-mining and agricultural industries. Pop. (1880) 5,524; (1890) 4,641. EDITOR OF "BULLETIN."

Braila, brai-e-la (Turk. *Ibraila*): a fortified town of Roumania; on the left bank of the Danube; about 100 miles from its mouth and 102 miles N. E. of Bucharest (see map of Austria-Hungary, ref. 8-N). Large quantities of grain and other produce are shipped at this place, which is the chief port of Roumania. Pop. 29,000.

Braille Alphabet: See BLIND, EDUCATION OF THE.

Brain: the *encephalon* or contents of the cranium; the material instrument of thought, impulse, and perception in man and the higher animals. Only vertebrates have a true brain; in others ganglia or nerve-centers exist, but the "cephalic ganglia" of insects and other invertebrate animals are not strictly homologous with the brain.

The central nervous system of vertebrate animals consists of the *spinal cord* (see MEDULLA SPINALIS), contained within the spinal canal of the vertebral column, and the expanded and highly differentiated *encephalon*, lying within its protecting bony case, the cranium. Disregarding the

exceptions presented by certain species and individuals, the development of the brain advances from the lowest class of vertebrates, the fishes, through amphibians, reptiles, birds, to mammals, reaching its culmination in man. On the one hand, the *amphioxus*—a peculiar fish, regarded as the lowest vertebrate, and remarkable for the rudimentary condition of its organs—possesses the least developed brain, this important organ being represented by an imperfectly differentiated cerebral vesicle in which the anterior end of the spinal cord ends; so immature is the brain in this animal that it was formerly regarded as entirely absent. In man, on the other hand, the brain attains its highest development, especially in those peculiarities indicative of intellectual power.

The ratio between the weight of the encephalon to that of the entire body increases as the zoological scale is ascended; thus in fishes the average ratio is (according to Leuret) about as 1 to 5,668; in reptiles, 1 to 1,321; birds, 1 to 212; mammals, 1 to 186; in man, 1 to 36. The elephant has the largest brain, in actual weight, of all animals, sometimes reaching 9 or 10 lb.; next is that of the whale, about 5 lb. The heaviest human brains have never weighed so much as this, yet the proportion of weight of the brain to the whole body of the elephant is but as 1 to 500. In some small animals and birds the ratio is relatively high; as in the marmoset, 1 to 22; field-mouse, 1 to 31; linnet and canary-bird, 1 to 20; and the blue-headed tit, 1 to 12. But it must be remembered that the *kind* of brain varies also; while the sensory-motor portions of the brain are of much greater relative size in the lower animals than in man, those parts associated with the highest intelligence, as the cerebral hemispheres, are especially conspicuous in the human brain. There is an obvious connection between the degree of cerebral development in the different groups of animals and their intelligence; the brain of man is greatly superior to any other in its development. As Huxley has pointed out, the difference in the *structure* of the brains of men and of the higher apes is not very marked, and the disparity in *size* is less than between the highest and the lowest of the quadrumana. But the gap is a wide one, since an average European child of four years old has a brain twice as large as an adult gorilla, whose weight is perhaps four times as great.

An appreciation of the plan upon which the primitive nervous system is formed is essential to a correct understanding of the adult brain. The earliest representative of the cerebro-spinal axis is the *neural tube*, formed by the folding in of the outer layer of the embryo along its dorsal surface. Later, the anterior end of the neural tube expands into three primary *cerebral vesicles*—anterior, middle, and posterior; the anterior and posterior of these subsequently subdivide, five partially constricted sacs, known as fore-brain, inter-brain, mid-brain, hind-brain and after-brain, now representing the future encephalon. These vesicles, together with the neural canal, constitute a single thin-walled tube, whose relatively large original lumen becomes proportionately reduced by the growth, thickening, and differentiation of its walls, being represented in later life by the ventricles of the brain and the central canal of the spinal cord.

In the typical vertebrate brain certain divisions are recognized, which correspond to its primitive condition; these are:

- (1) *Prosencephalon*, comprising the structures of the cerebral hemispheres, together with the olfactory lobes;
- (2) *Thalamencephalon*, including the thalami optici and the other parts about the third ventricle;
- (3) *Mesencephalon*, embracing the structures around the Sylvian aqueduct, with the crura cerebri below and the optic lobes, or corpora quadrigemina, above;
- (4) *Epencephalon*, corresponding to the cerebellum and pons Varolii;
- (5) *Metencephalon*, consisting principally of the medulla oblongata.

In fishes, those parts which represent the cerebral hemispheres are generally no larger than the optic lobes; a condition to which, at a certain stage of development, the brain of the human embryo presents a near resemblance. In amphibia and reptiles there is not much advancement, but the cerebral hemispheres are larger and the cerebellum smaller. Birds have a considerable increase in the size of the hemispheres, which, in them, cover the olfactory ganglia in front and the optic lobes behind; the cerebellum in them is large. To each of these the embryonic human brain has, at certain stages, a resemblance.

Mammals present great diversity, from the smooth-brained (*Lissencephala* of Owen) *Monotremata*, *Marsupialia*, and *Rodentia*, up through the other groups to the highly convoluted (*Gyrencephala*) and otherwise complex brains of the anthropoid apes, as the gorilla and chimpanzee. In the higher apes the cerebral hemispheres roof over and partly conceal, when looked at from above, the cerebellum behind, as well as the olfactory bulbs in front; in the lemurs, however, the cerebellum is uncovered, and the surface of the cerebellum is almost devoid of convolutions.

In the human brain, the arrangement of its parts is so profoundly modified by the excessive development of the cerebral hemispheres that the correspondence between the typical vertebrate brain and the adult human organ becomes masked.

The average weight of the adult human brain in the male is about 49½ oz. (1,400 grammes), or slightly more than 3 lb. avoirdupois; in the female, about 44 oz. The usual difference of 4 to 6 oz. between the two is to be attributed to the lesser general body-weight in the female, and not to inferiority of cerebral development, since the ratio of the brain-weight to that of the entire body has been shown to be practically identical in both sexes. The proportionate weight of the brain to that of the body is greatest at birth, being then about as 1:6 (Tiedemann), diminishing gradually to the tenth year, when the ratio is 1:14; at the twentieth year, 1:30; after that period, 1:36.5. The brain attains its greatest weight at about the fortieth year; after that time a diminution is said to take place at the rate of about 1 oz. for each decade.

The relation between brain-weight and intelligence also must be admitted with reservations. While it may be accepted that in general heavy brains are associated with high intelligence, as in the comparison of nations and races, yet brain-weight can not be relied upon as the index of mental capacity in individuals, notwithstanding the conspicuous correspondence between intellectual endowment and high brain-weight in the well-known examples: Cuvier, 1,861 grammes (65.7 oz. avoirdupois); Byron, 1,807 grammes (63.8 oz.); Schiller, 1,580 grammes (55.8 oz.); Gauss, 1,492 grammes (52.7 oz.); Dante, 1,420 grammes (50.2 oz.), and others. On the other hand, the brains of men of acknowledged intellectual superiority have weighed less than the average, while some of the heaviest brains recorded have belonged to ignorant and illiterate individuals. Weight alone, therefore, may be regarded as suggestive, but by no means conclusive, evidence of intelligence; the development of the cerebral convolutions, the amount of cortical gray matter, and the number of ganglion nerve-cells are all factors to be considered in drawing accurate comparisons between brains.

The capacity of the cranium closely corresponds with the central development; the average capacity of the normal cranium is about 1,400 cubic cm. (85 cubic inches). Skulls have been divided into three classes: those belonging to a middle group, or *mesocephalic*, with a capacity of from 1,350 cubic cm. (82 cubic inches) to 1,450 cubic cm. (88 cubic inches); those below 1,350 cubic cm. capacity being *microcephalic*; those above 1,450 cubic cm., *macrocephalic*. The Eskimo and European possess the largest cranial capacity; the Hindu the smallest. The cranium of idiots may be reduced to correspond to a brain-weight of only 23 oz.

It is usual to describe the human encephalon as composed of four chief divisions—*cerebrum*, *cerebellum*, *pons*, and *medulla oblongata*. These are enveloped within the skull by protecting membranes, which, from without inward, are the *dura*, *arachnoid*, and *pia*. The *dura* (mater) is the outer dense fibrous investment, closely adhering to the cranial bones in many places, and sending vertical partitions between the hemispheres of the cerebrum and cerebellum, and supporting and separating the hind part of the former from the latter by a horizontal septum. The *arachnoid* is an extremely delicate, web-like structure, usually so closely applied to the *dura* that it is frequently overlooked. The *pia* (mater) is the vascular tunic of the brain, supporting and conveying the blood-vessels supplying the nervous tissue, lying closely applied and following all the irregularities of its surface.

The cerebrum in the human brain greatly exceeds the other parts both in volume and weight, constituting about 87 of the entire brain-weight. It consists of two *hemispheres* (Fig. 1, *a* and *b*) divided by a deep median cleft, the *longitudinal fissure* (*c*), in which the sickle-like fold of *dura*, the *falx*, projects; the separation of the hemispheres in front and behind is complete, the two halves, however, being connected by a transverse bridge, the *corpus callosum*, situated

at the bottom of the fissure, and occupying a little more than half its length.

The surfaces of the hemispheres in the adult human brain present a complicated arrangement of *convolutions* and in-

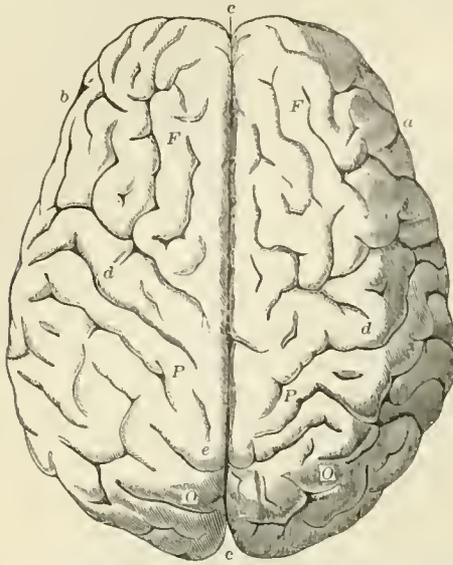

FIG. 1.—Brain viewed from above, showing some of the principal fissures and convolutions: *a, b*, cerebral hemispheres, separated by *c*, the longitudinal fissure; *d*, placed at the anterior border of the central fissure; *e*, part of parieto-occipital fissure; *F, P, O*, frontal, parietal, and occipital lobes.

tervening *fissures* (Fig. 1), resulting from the extensive folding of the cerebral surface taking place during the growth of the organ, greatly increased superficial area being thereby secured without undue augmentation of volume. While on cursory examination the convolutions seem disposed without order, comparison shows that they are grouped according to definite plans for each class of animal.

The under and outer surface of each hemisphere of the cerebrum of man presents a deep oblique incision, the *fissure*

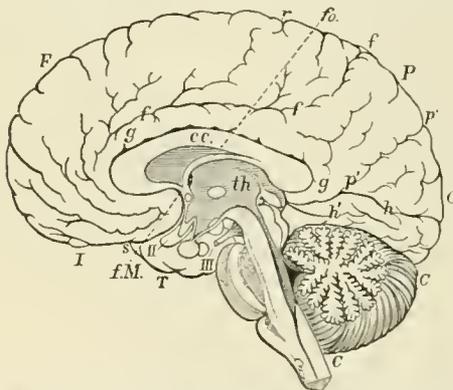

FIG. 2.—Median section through the brain, exposing mesial surfaces. *F, P, T, and O*, the frontal, parietal, temporal, and occipital lobes; *C*, cerebellum; *cc*, corpus callosum; *th*, thalamus (the letters are placed in third ventricle, seen in longitudinal section); the Sylvian aqueduct, shown leading from third to fourth ventricle; *f. M.* foramen of Monro, the communication between the lateral and third ventricles.

of *Sylvius* (Fig. 3, *a*), which begins on the base of the brain and passes outward, upward, and backward, to become a conspicuous landmark on the lateral aspect of the cerebrum. The less marked but important *central* or *Rolando's* fissure runs more nearly vertical, extending from close to the fissure of Sylvius almost to the superior margin of the hemisphere (Fig. 1, *d*). A third important incision, the *parieto-occipital* fissure (Fig. 1, *e*), is scarcely seen on the lateral or external surface, but appears on the inner or mesial as a cleft extending from the upper margin of the hemisphere, about midway between the central fissure and the posterior end of the brain, downward and forward for a variable distance.

These cardinal fissures divide each hemisphere into five

principal divisions—the *frontal, parietal, occipital, temporo-sphenoidal, and central lobes*. The frontal lobe (Fig. 1, *F*; Fig. 3, *e*) includes the anterior part of the hemisphere, its posterior boundary being the fissure of Sylvius and the central fissure. The parietal lobe (Fig. 1, *P*) lies between the central fissure in front, the parieto-occipital fissure behind,

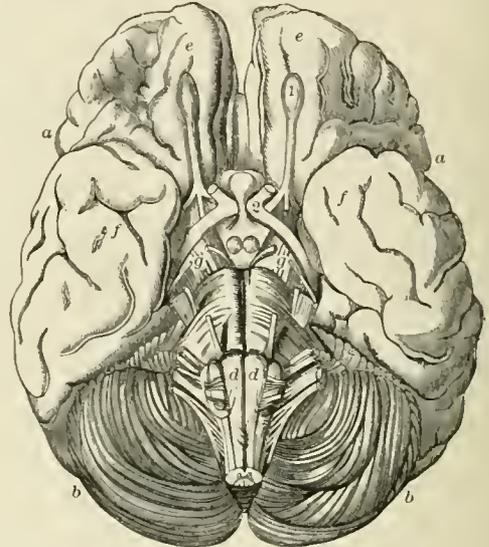

FIG. 3.—The base of the brain: *a*, opposite Sylvian fissure; *b*, hemispheres of cerebellum; *c*, pons; *d*, medulla (the latter is on the anterior pyramids); *e, f*, frontal and temporo-sphenoidal lobes; *g*, crura of cerebellum; *1*, olfactory bulb; *2*, optic chiasm. Cranial nerves seen emerging from sides of pons and medulla.

and the Sylvian fissure below. The occipital lobe (Fig. 1, *O*) includes the part of the hemisphere lying behind the parieto-occipital fissure, being separated by the latter from the parietal lobe above, but fusing with this and the temporo-sphenoidal lobe below and in front. The most dependent portion of the hemisphere, limited in front and above by the fissure of Sylvius and fusing behind with the parietal and occipital lobes, constitutes the temporo-sphenoidal lobe (Fig. 3, *f*). At the bottom of the Sylvian fissure, covered in and masked by the overhanging parts of the frontal and parietal lobes, lies the central lobe or island of Reil. Each of these lobes is subdivided by secondary fissures into a number of convolutions. The convolutions bordering the central fissure (Fig. 1, *d*)—ascending frontal (precentral) and ascending parietal (post-central)—are of especial interest as being the areas presiding over the motion of certain important regions of the body, as will be presently described.

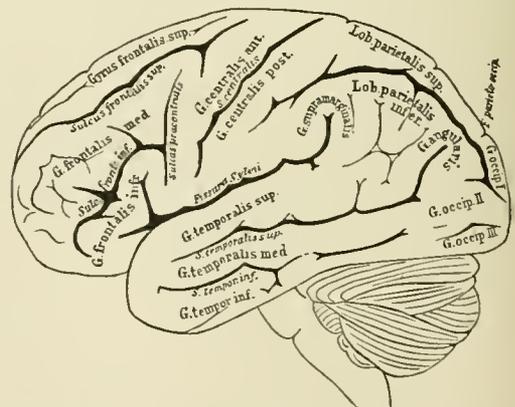

FIG. 4.—Lateral view of brain, showing the principal fissures and convolutions of the cerebral hemisphere, the cerebellum, pons, and oblongata in outline.

Without here considering the minute structure of the organ under consideration (for which see *HISTOLOGY*), it must be remembered that the brain and spinal cord are composed of two kinds of nervous tissue—gray and white matter. The gray matter is the principal seat of the ganglionic nerve-

cells, hence its importance for the origination of impulses; the white matter, on the contrary, is chiefly composed of tracts of nerve fibers. In the cerebrum and cerebellum, the gray matter forms a continuous external or cortical layer, usually some 3 to 4 mm. thick, in which the nerve fibers, establishing communication with more or less remote parts of the body, end. In addition to the gray matter of the cortex, other large masses of this tissue, as the corpus striatum and optic thalamus, lie within in cerebrum, where they form the so-called "basal ganglia."

In order to examine the interior of the cerebrum, successive horizontal slices may be removed from the upper part of the hemispheres. Above the level of the transverse bridge, or corpus callosum (Fig. 5, *a*), the sections show large solid areas of white matter bordered by the gray cortical layer. On removing the corpus callosum, two large intracerebral cavities, the lateral ventricles, are exposed (Figs. 5 and 6), one in either hemisphere. These are irregular cavities, prolonged by their anterior, posterior, and lateral horns or cornua, respectively, into the frontal, occipital, and temporosphenoidal lobes. The ventricles, of which there are four true ones—the two lateral, the third and the fourth, together with the so-called fifth ventricle, which does not correspond with a true ventricle, being a space really without the neural tube—represent the remains of the cephalic divisions of the primitive neural canal.

Certain irregularities project into the sides and floor of the lateral ventricles. The most important and conspicuous are the corpus striatum (Fig. 6, *b*), occupying the sides and floor of the anterior portion of the cavity, and the optic thalamus (Fig. 6, *a*), situated behind and to the inner side of the former. The striatum comprises masses of white and gray matter; of the latter are the intra-ventricular portion, or caudate nucleus, appearing within the lateral ventricle, and the extra-ventricular part, or lenticular nucleus; these two are separated by a conspicuous tract of white matter, the internal capsule, composed of bundles of nerve fibers passing from the cerebral cortex to the deeper basal ganglia and to the tracts connecting the cerebrum with the subjacent divisions of the brain.

The third ventricle is a T-shaped cavity, the vertical arm being a narrow cleft (Fig. 6, *d*) between the mesial surfaces of the thalami (Fig. 6, *a*), while the horizontal limb extends over the upper surface of the latter, being roofed in by the delicate vascular membrane, the velum interpositum, an

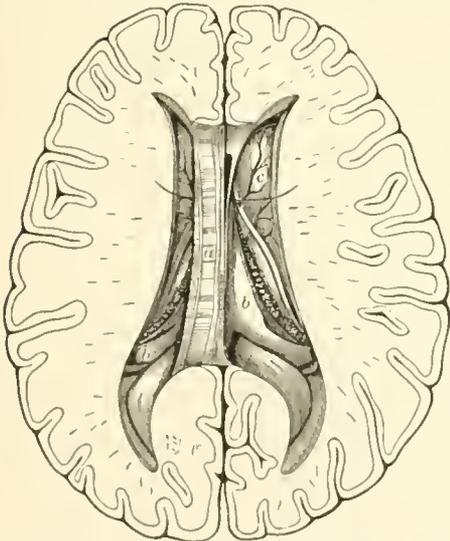

Fig. 5.—Horizontal section of the brain, about at the level of the corpus callosum (*a*), which has been partly removed to expose the underlying lateral ventricles, whose anterior and posterior horns extend into the frontal and occipital lobes.

extension of the pia. Three connecting bands—anterior, middle, and posterior commissures—bridge the cleft of the ventricle and connect the two thalami; the middle commissure is composed of gray matter, the other two of white. The thalami are composed largely of gray matter interspersed with bundles of fibers. At the extreme anterior end of the third ventricle a Y-shaped opening, the foramen of Monro, establishes communication between the lateral and

third ventricles, while at its posterior extremity the narrow aqueduct of Sylvius leads from the third to the fourth ventricles. The so-called fifth ventricle (Fig. 6, *f*) is a narrow slit, included within the septum lucidum, separating the lateral ventricles and roofed in by the corpus callosum above; it does not correspond to a true ventricular cavity, having no communication and being really a cut off portion of the great longitudinal fissure.

Immediately behind the third ventricle and above the aqueduct of Sylvius four tuberosities are seen (Fig. 6, *g*), arranged as upper and lower pairs; these are the corpora quadrigemina of the human brain, and correspond to the singly paired optic lobes, which in other classes, especially in fishes and amphibia, constitute very conspicuous parts of the brain, sometimes even exceeding the cerebral hemispheres. Above the corpora quadrigemina is situated a peculiar cone-shaped organ, the pineal body (Fig. 6, *h*), whose significance was for centuries a riddle. Among other theories as to its function, Descartes regarded it as the seat of the soul. Recent comparative researches justify the belief that this body represents in man and the higher animals the degenerate remains of what, in past ages, in lower classes was a functioning third organ of sight—the pineal eye.

The cerebellum, or little brain, weighing about one-eighth as much as the cerebrum and contributing about one-tenth of the weight of the entire brain, occupies the posterior fossa of the cranium. In man it is completely covered in above by the highly developed cerebral mantle, being separated from the cerebrum by the great transverse (Bichat's) fissure, and the horizontal partition of dura, the tentorium.

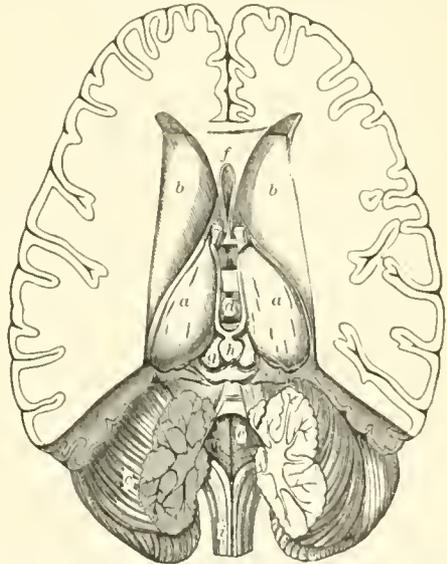

Fig. 6.—Horizontal section of the brain below the level of corpus callosum, exposing lateral (*b, b*), third (*d*), and fourth (*e*) ventricles; *f*, cleft within septum lucidum called fifth ventricle; *b, b*, inter-ventricular surface of striatum, corresponding to nucleus caudatus; *a, a*, upper surface of thalamus; *g*, corpora quadrigemina; *h*, pineal body. Posterior parts of hemispheres have been removed to show cerebellum (*c*), the median portion of the latter cut away to expose fourth ventricle (*e*) and medulla (*i*).

The cerebellum consists of two hemispheres (Fig. 3, *b, b*), partially separated by a deep valley traversed by various commissural tracts. In addition to the separation into an upper and lower portion effected by the great horizontal fissure, each hemisphere is divided into a number of lobes by secondary fissures, on the upper surface there being two, on the lower five, such lobes. The exterior of the cerebellum presents numerous thin folds or lamina, which, on transverse section, exhibit a characteristic foliated appearance—the arbor vita of the older anatomists—of the cortical layer of gray matter covering in the central white stems of nerve fibers. By means of a pair of anterior stalks, or peduncles, the cerebellum directly communicates with the anterior division of the encephalon, through the posterior peduncles, with the subjacent medulla, while the transverse fibers of the pons constitute the commissure uniting the hemispheres.

The remaining divisions of the brain—the pons and medulla—contain chiefly white matter, being made up largely of bundles of nerve fibers passing from the spinal

cord to higher portions of the nervous axis. The *pons* (Varoli) (Fig. 3, c) unites the various segments of the encephalon, connecting the cerebrum above, the cerebellum behind, and the medulla below. It appears as a quadrate body lying above the medulla, between the hemispheres of the cerebellum, and beneath those of the cerebrum. Alternate layers of transverse and longitudinal fibers, together with a limited amount of gray matter, constitute its mass; the transverse bundles connect the cerebellar hemispheres, while the longitudinal contain the fibers passing to and from the higher centers. At the upper border of the pons the longitudinal fibers are collected into two rounded stalks, the *cerebral crura* (Fig. 3, g), which diverge and enter the base of the hemispheres, forming the immediate bond of union between the cerebrum and pons, and constituting the great highway for the conveyance of nervous impressions to and from the cerebrum.

The *medulla oblongata* (Fig. 3, d), the most dependent division of the brain, extends from the lower border of the pons to become continuous with the spinal cord below. It is composed principally of the tracts of nerve fibers of the spinal cord (see MEDULLA SPINALIS), which are continued into the medulla to become rearranged as the *anterior pyramids*, *lateral tracts*, *restiform bodies*, and *posterior pyramids*. The most conspicuous of these are the anterior pyramids (d), which include the fibers derived from the anterior and lateral columns of the cord; at the lower end of these pyramids a crossing or *decussation* of part of the bundles takes place, by which arrangement fibers connected with one hemisphere pass to the opposite half of the cord and body, a fact of importance in explaining the phenomena of palsy. On the posterior surface of the medulla the *restiform bodies* are the largest tracts, collecting the fibers from the posterior and lateral columns of the cord, and becoming the posterior peduncles of the cerebellum. The *olivary bodies* are two prominent oval masses situated on the anterior surface of the medulla, near its upper part, between the anterior pyramids and the lateral tracts. The space included between the upper surface of the pons and medulla below, and the cerebellum and its attachments above, is the *fourth ventricle* (Fig. 6, e), continuous with the third through the Sylvian aqueduct in front, and with the central canal of the spinal cord behind. The floor of the fourth ventricle contains a layer of gray matter, derived practically as the continuation of that of the cord from below; this sheet of gray substance is of especial interest and importance on account of its relation to the deep origin of many important cranial nerves.

On examining the exterior of the base of the brain (Fig. 3), in addition to the lobes, convolutions, fissures, pituitary and mammillary bodies, and other details of its surface, there is seen the superficial origin of the twelve pairs of cranial nerves, named in the order, from before backward, in which they emerge from the surface of the encephalon. The *first* or *olfactory* nerves extend along the under surface of the frontal lobe, parallel with the median fissure, terminating in bulbous expansions (Fig. 3, 1), and represent the olfactory lobes of many animals. The *second* or *optic* nerves diverge outward and forward from the point of their junction and decussation, the *chiasm* (Fig. 3, 2), the widely expanded *optic tracts* winding backward across the crura to end in the thalami and corpora quadrigemina. The *third* or *motor oculi* nerves appear at the inner borders of the crura, while the *fourth* or *pathetic* wind round the crura from without in, usually lying close to the anterior border of the pons. The *fifth* or *trifacial* nerves, among the most important of those given off from the brain, are seen emerging on either side from the anterior part of the pons. The *sixth* or *abducent* nerves appear at the lower border of the pons in the depression between the pons and medulla. Beginning at the upper end of the latter, groups of fibers, composing the *seventh* (*facial*), *eighth* (*auditory*), *ninth* (*glossopharyngeal*), *tenth* (*pneumogastric*), and *eleventh* (*spinal accessory*) nerves, escape from the group between the restiform body behind and the olivary body and lateral tract in front. The *twelfth* or *hypoglossal* nerve arises superficially from the anterior surface of the oblongata between the pyramids and olivary bodies. For many other details of the complex structure of the brain, which must be here omitted, the reader is referred to special works on anatomy.

As has been stated already, the central masses of white matter, contributing so large a portion of the bulk of the brain, are composed of bundles of nerve fibers. The arrangement of these fibers is very complex, and the accurate

determination of their course is a subject of great difficulty. Only a brief outline of the general plan of their distribution is here possible. The nerve fibers of the cerebrum are arranged in four principal groups: (1) those uniting the various parts of the same hemisphere; (2) those connecting identical areas of the two hemispheres, being the fibers composing the callosum and the anterior commissure; (3) fibers passing between dissimilar points of the two hemispheres; (4) those extending from the cortex directly or through the basal ganglia, into the crura, and *vice versa*, by their diverging course forming the *corona radiata*. Numerous fiber-tracts are found within the cerebellum, the principal ones affording connections with the adjacent parts, as well as uniting the various points of the cerebellum itself.

Regarding the *functions* of the structures constituting the encephalon, much uncertainty still exists; it may be assumed, however, that, in the present state of our knowledge, the cerebral hemispheres are the seat of all psychological activities involved in the processes of thinking, feeling, and willing. After destruction of these parts, the functions essential to the maintenance of life are carried on uninterruptedly, but without the accustomed guidance of intelligent volition. Both hemispheres participate in these psychical activities, so that impairment of one may be overcome by the other. From the anatomical peculiarities already described, it will be readily appreciated that the connection of the cerebral cortex with the other parts of the brain is essential for the exercise of will power and intelligence. It may be regarded as highly probable that every voluntary act influencing a given part of the body is under the control of some definite area of the cerebral cortex. Such areas have been determined with accuracy by experiment and disease for some few functions; among these, that the movements of the lower extremity, upper limb, and face are controlled respectively by the upper, middle, and lower thirds of the cortical substance bounding the central fissure—that is, of the ascending frontal and parietal convolutions. The area for speech is situated chiefly at the posterior part of the inferior frontal convolution of the *left* hemisphere, the central lobe, or the island of Reil, at the bottom of the Sylvian fissure, being also probably involved. Hearing is attributed to the upper temporal convolution, while sight is probably connected with a center situated within the occipital lobe (*cuneus*), embracing possibly the neighboring part of the parietal. Smell and taste seem to be associated in their areas, their joint center being ascribed a position on the inner and under side of the temporal lobe. Integrity of the paths conducting impulses from the cortical centers is, of course, essential for the performance of function; when the uniting tract of nerve fibers is damaged, as by an apoplectic clot, the stimulus is interrupted, and those parts beyond the obstruction, supplied by the affected fibers, remain unresponsive to volition, or paralyzed. Regarding the functions of the striatum and thalamus very little is known with certainty. The corpora quadrigemina are believed to be intimately concerned in maintaining co-ordination of movement and equilibrium, as well as connected with the deep origin of the nerves of sight. The cerebellum apparently exercises great control over exact co-ordination of movement; neither psychical activity, volition, nor consciousness is disturbed by injuries limited to this part of the brain. The medulla contains the areas presiding over many reflex acts, among these being the centers controlling respiration, coughing, sneezing, swallowing, vomiting, and others. In conclusion, it may be repeated that every part of the body influenced by will probably is supplied by nerves, which, in addition to the communication with ganglion-cells of the basal ganglia or spinal cord, are connected with some definite presiding cortical area, although our present knowledge of these intricate relations enables us to locate but few of the many controlling centers which undoubtedly exist. See LOCALIZATION, PHYSIOLOGY, and PSYCHOLOGY. G. A. PIERSON.

Brain'ard. JOHN GARDINER CALKINS; poet; b. in New London, Conn., Oct. 21, 1796. He graduated at Yale in 1814. He published a volume of poems in 1825, and was for six years editor of the *Connecticut Mirror*. D. in New London, Sept. 26, 1828. See *Memoir of Brainard*, prefixed to his works, by J. G. Whittier, 1832.

Brain-coral: one of several species of massive actinoid coral in which the furrowed surface of the coral resembles the convolutions of the brain. "Over the curved surface of a live 'brain-stone' are stretched the soft organic parts of the coral, while in the superficial furrows lie the stomachs which

have a similar serpentine form to the convolutions in which they lie. Upon the surface of the brain-stone, arranged in lines, are found rows of mouths, each opening into that stomach or part of the stomach which lies just beneath them." (Fewkes, in *Standard Natural History*.)

DAVID S. JORDAN.

Braine, DANIEL LAURENCE: rear-admiral U. S. navy; b. in the city of New York, May 18, 1829; entered the navy as a midshipman May 30, 1846. In 1861-62 he commanded the steamer Monticello, taking part in the engagement with the battery at Sewell's Point, near Norfolk, Va., May 19, 1861, and in the capture of Forts Hatteras and Clark, N. C., Oct. 5 of the same year. Retired May 18, 1891.

Braine-le-Comte, brân le-kônt': a town of Belgium; province of Hainault; on the railway from Brussels to Valenciennes (see map of Holland and Belgium, ref. 11-D); has a church built about 1300, also cotton-mills and dye-works. Fine flax is raised in the vicinity. Pop. (1890) 776.

Brain'erd: city; capital of Crow Wing co., Minn. (for location of county, see map of Minnesota, ref. 6-D); on Northern Pacific R. R. and Brainerd and Northern, and on east bank of Mississippi river; 136 miles N. of St. Paul, 115 miles W. of Duluth; has 8 public-school buildings, 15 churches, mammoth shops of Northern Pacific R. R., water-works, electric lights, electric street railway, and immense saw-mills, now (1892) being constructed. The surrounding district is good farming land. Pop. (1880) 1,865; (1890) 5,703; (1895) 7,031.

EDITOR OF "TRIBUNE."

Brainerd, DAVID: missionary; b. in Haddam, Conn., Apr. 20, 1718. He entered Yale College in 1739, but was expelled in 1742 for an offense growing out of an excess of religious zeal. It is probable that his ardent evangelistic efforts were offensive to his college superiors. In 1743 he began his famous labors among the Indians in a village about halfway between Stockbridge, Mass., and Albany, N. Y. The year following he went among the Delawares in Pennsylvania, and afterward to Crossweeksung in New Jersey, where he had his most signal success. In the summer of 1747 he returned to Massachusetts in broken health, and died at Northampton, Oct. 9, 1747. Jonathan Edwards, to whose daughter he was engaged to be married, and at whose house he died, published a memoir of him in Boston, 1749; new edition, with his journals, by Sereno E. Dwight, in New Haven, 1822; best edition by Sherwood (New York, 1884).

Brainerd, JOHN: a younger brother of David Brainerd; b. at Haddam, Conn., Feb. 28, 1720; graduated at Yale College in 1746; and was for a time successor to his brother as missionary among the Indians in New Jersey. In 1757 he was settled at Newark, and in 1777 at Deerfield, N. J., where he died Mar. 18, 1781. See his *Life*, by Thomas Brainerd (Philadelphia, 1865).

Brainerd, THOMAS, D. D.: of the same stock as David and John Brainerd; b. at Leyden, N. Y., June 17, 1804; graduated at Andover Theological Seminary, Massachusetts, in 1831. From 1831 to 1833 he was pastor of the Fourth Presbyterian church in Cincinnati, O.; from 1833 to 1836 edited the *Cincinnati Journal* and *Youth's Magazine*; from 1837 till his death was pastor of the Pine Street church, Philadelphia. He was a leader of the New School party. He published in 1865 the *Life of John Brainerd*, etc. D. in Scranton, Pa., Aug. 21, 1866. See his *Life* by Mary Brainerd (Philadelphia, 1870).

Brain-fever: a popular name for CEREBRAL MENINGITIS (*q. v.*), a dangerous disease, characterized in its earlier stages by very high fever and intense headache, usually followed by delirium and death. Inflammation of the brain itself (encephalitis) is less common, but is even more fatal than the former. It is not easy to discriminate between the two during life. Cold applications to the head and mild but persistent derivative treatment are generally indicated.

Brain'tree: town; Norfolk co., Mass. (for location of county, see map of Massachusetts, ref. 3-1); on Old Colony R. R.; 10 miles S. of Boston. Here are manufactures of machinery, woolen goods, boots and shoes, paper, tacks, cordage, etc. Pop. (1880) 3,948; (1890) 4,848; (1895) 5,311.

Braize, or **Becker**, or **Porgy**: names applied in Great Britain to *Sparus pagrus*; a sea-fish allied to the American scup, and valued as food.

Brake: a thicket; a place overgrown with shrubs, brambles, or ferns. In the U. S. a thicket of canes is called a

"canebrake." The name is also applied to *Pteris aquilina* and many other large ferns.

Brake: an instrument used to break flax or hemp; the hand or lever by which a pump is worked; a large harrow used in agriculture; a sharp bit or snaffle (of a bridle).

Brake: a machine attached to the wheels of heavy carriages and railroad cars, which, when pressed against the wheels, retards or stops their motion by friction. Patents have been obtained in the U. S. for numerous machines or inventions for this purpose. Among these are "steam car-brakes," in the use of which the friction is produced by steam-power, and the engineer of a locomotive applies the brakes by the turning of a cock; and the "Westinghouse air-brake," also controlled by the engineer, now extensively used. See RAILWAY EQUIPMENT under RAILWAYS.

Bra'ma: a genus of fishes of the family *Chatodontidae* having the body very deep and compressed, a single elongated dorsal fin, and a forked tail, the points of which are widely divergent. The *Brama raii*, sometimes called *bram*, is common in the Mediterranean, and is highly esteemed for food.

Bramah, bray ma, JOSEPH: machinist and inventor; b. in Stainborough, near Barnsley, Yorkshire, England, Apr. 13, 1749. He carried on business in London, and gained distinction by numerous and valuable inventions, among which are a safety lock, a hydrostatic press, and improvements in fire-engines and steam-engines. D. in Pimlico, London, Dec. 9, 1814.

Bramah's Press: See HYDROSTATIC PRESS.

Bramante: architect. See LAZZARI.

Brambling, **Bramblefinch**, or **Mountain Finch**: a small bird (*Fringilla montifringilla*); nearly allied to the chaffinch, than which it is rather larger. The predominant colors of the upper parts are black and brown, with white bands on the wings. The belly is white, and some of the wing-coverts are yellow. It breeds in the northern parts of Sweden and Norway, and visits England, Italy, and other countries as a winter bird of passage.

Bramhall, JOHN: Anglican prelate; b. at Bramhall Hall, Cheshire; baptized at Pontefract, Nov. 18, 1594; educated at Cambridge; B. A. 1612; became Bishop of Derry 1634; imitated Laud's policy of intolerance, which lost Ulster to the king and drove the bishop to take refuge in France; while in Paris engaged in a losing controversy with Hobbes on the question of freedom of the will; at the Restoration made Archbishop of Armagh 1661. D. at Armagh, June 25, 1663.

Brampton: town; capital of Peel co., Ontario, Canada (for location, see map of Ontario, ref. 4-D); situated at junction of Can. Pac. and Grand Trunk Railways; 21 miles W. of Toronto; has manufactures of flour, farming implements, gas-pipe, chandelier, pumps, etc., and a large trade. Pop. (1881) 2,920; (1891) 3,252.

EDITOR OF "CONSERVATOR."

Bram'well, SIR FREDERICK JOSEPH, BART., D. C. L., F. R. S.: b. in London in 1818. From his earliest boyhood he evinced a great interest in mechanics. In 1834 he was apprenticed to John Hague, mechanical engineer, with whom he continued a few years as principal draftsman; in 1853 commenced business on his own account as a civil engineer; in 1856 was elected associate of the Institution of Civil Engineers, in 1862 to full membership; in 1867 was member of the council; in 1884-85 was president. From 1871 to 1875 he was president of the Society of Mechanical Engineers. In 1881 was knighted for his services in the promotion of technical education; in 1886 received the honorary degree of D. C. L. from Oxford; in 1889 he was created a baronet. W. R. H.

Bran: the husk or outer covering of wheat, which in the process of flouring is separated from the fine flour. In 100 parts of bran there are of water, 13.1; albumen, 19.3; oil, 4.7; husk (with a little starch), 55.6; ash or saline matter, 7.3. Calico-printers use bran and warm water to remove coloring-matter from those parts of their goods which are not mordanted. Bran and the flour united—i. e. unbolted wheat flour—make a good bread, which is considered more digestible than that made of fine white flour. See FLOUR.

Branch (in botany): a part of any organ or member of the plant-body which has grown out from another similar organ or member. Thus we have root-branches and stem-branches, branches of leaves, branches of stamens, branches

of hairs, etc. Among the lower plants we find branching cells, branching threads, branching thallomes, etc. Popularly the term is often erroneously restricted to stem-branches.

In systematic botany *branch* is a great division of the vegetable kingdom; thus we speak of the branch of *Proto-phytes*, the branch of *Bryophytes*, etc. See VEGETABLE KINGDOM.

Branch, JOHN: b. at Halifax, N. C., Nov. 4, 1782; graduated at the University of North Carolina in 1801; became a lawyer; was made a judge of the superior court; Governor of North Carolina (1817-20); U. S. Senator (1823-29); Secretary of the Navy (1829-31); member of Congress (1831-33); Governor of Florida Territory (1844-45); besides holding other important offices. D. at Edgefield, N. C., Jan. 4, 1863.

Branch, LAWRENCE O'BRIEN: son of the preceding; b. in Halifax co., N. C., July 7, 1820; graduated at Princeton in 1838; was a Democratic representative in Congress from 1855 to 1861. He was made a brigadier-general in the Confederate army in 1861, and was killed at Antietam, Sept. 17, 1862.

Branchiop'oda [from Gr. *βράχχια*, gills + *πούς, ποδός*, foot]: a sub-order of entomostracous *Crustacea*, deriving their name from the peculiarity of having the gills, which are numerous, attached to the feet. They are, small, many of them almost microscopic, and abound in stagnant fresh waters. A few are found in brine pools. They possess distinctly segmented bodies, and have numerous pairs of flattened swimming-feet. The carapace is flat and shield-shaped, or more frequently takes the form of a bivalve shell. They are enormously reproductive by parthenogenesis. Revised by D. S. JORDAN.

Branchios'toma [from Gr. *βράχχια*, gills + *στόμα*, mouth]: the lancelets; the only genus of the vertebrate class LEPTOCARDI (*q. v.*). The name *Branchiostoma* is prior to that of *Amphioxus*, and should be used rather than the latter.

Brand, Sir HENRY: See HAMPDEN, VISCOUNT.

Brande, WILLIAM THOMAS, F. R. S.: chemist; b. in London, England, Feb. 11, 1788. He lectured with success on chemistry at the Royal Institution, and filled for many years an important office in the mint. Among his works are a valuable *Dictionary of Science, Literature, and Art* (1842, n. e. 1875) and a *Manual of Chemistry*. D. Feb. 11, 1866.

Brand'enburg: the most important province of Prussia, and that which formed the nucleus of the Prussian kingdom. It corresponds nearly to the old *Mark* of Brandenburg, and has an area of 15,376 sq. miles. It is mostly a level plain which has but little elevation above the sea. It contains numerous lakes, is intersected by the Oder, and also drained by the Warthe, the Spree, the Havel, and the Elbe, which latter forms part of its W. boundary. The soil is sandy and moderately fertile. The province is traversed by several canals and railways. It has extensive manufactures of cotton, wool, linen, silk, paper, leather, sugar, etc. The chief towns are Potsdam, Königsberg, and Frankfort-on-the-Oder. The inhabitants are mostly Protestants. It is divided into two regencies (*Regierungsbegirke*) and thirty-three circles. This country was conquered by Charlemagne in 789 A. D. The first Margrave of Brandenburg was Albert the Bear, who is called the founder of the house of Brandenburg. He began to reign in 1134. Early in the fifteenth century the margrave became an elector of the German empire, and took the title of Elector of Brandenburg. Frederick William, who became elector in 1640, added the duchy of Prussia and part of Pomerania to his dominions, and his son took the title of King of Prussia in 1701. Pop. (1890) 2,541,783.

Brandenburg (anc. *Brennaborch* or *Brennabor*): a town of Prussia; in province of same name; on both sides of the river Havel, and on the Berlin and Magdeburg Railway; 38 miles by rail W. S. W. of Berlin (see map of German Empire, ref. 3-F). It is inclosed by walls, and divided by the river into the old and new town, between which, on an island, is a quarter called "Venice," containing a castle and a mediæval cathedral. The town has a riding academy, a gymnasium, a Realschule, and a public library; also manufactures of woolen and linen goods, hosiery, paper, leather, etc. Pop. (1880) 28,685; (1890) 37,823.

Brandenburg, New: a town of Mecklenburg-Strelitz; near the N. end of Tollensee; 18 miles N. N. E. of Strelitz and 53 miles W. N. W. of Stettin (see map of German Empire, ref. 2-G). It has wide and regular streets, and is said to be the most beautiful town in Mecklenburg-Strelitz. It

has a grand-ducal palace, and manufactures of cotton and woolen goods, damasks, paper, and chemical products. Pop. (1890) 9,323.

Brand'es, CARL EDVARD COHEN: Danish journalist, politician, and dramatic writer; b. in Copenhagen, Oct. 21, 1847. In political and literary principles he is in full sympathy with his brother, GEORG BRANDES (*q. v.*). Of his plays may be mentioned *Et Besøg* (A Visit, 1882); *En Fortøvelse* (A Betrothal, 1884); *Kærlighed* (Love, 1887); *En Politiker* (A Politician, 1889). He has published two works on the drama: *Dansk Skuespilkunst* (Danish Dramatic Art, 1880) and *Fremmed Skuespilkunst* (Foreign Dramatic Art, 1881). G. L. KITTREDGE.

Brandes, GEORG MORRIS COHEN: Danish critic and literary historian; b. in Copenhagen, Feb. 4, 1842. Brandes is a radical in religion and politics, and the energy with which he proclaimed his views in his lectures and writings led to his withdrawing from Denmark and settling in Berlin (1877). In 1883 he was induced to return to Copenhagen by an association of private persons, who assured him a yearly salary of 4,000 crowns for ten years as public lecturer on belles-lettres. To his influence is ascribed in great part the "realistic" movement in recent Danish literature. His chief work, *Hovedstrømningar i det 19de Aarhundredes Litteratur* (The Main Currents in the Literature of the Nineteenth Century), appeared in six volumes, 1872-90. Other works of importance are: *Kritiker og Portræter* (Critiques and Portraits, 1870; 2d ed. 1885); *Danske Digter* (Danish Poets, 1877); *Moderne Geister* (1882; translated by R. B. Anderson as Eminent Authors of the Nineteenth Century); *Mennesker og Værker i nyere europæisk Litteratur* (Men and Works in Modern European Literature, 1883); *Det moderne Gjenmenbruds Mand* (Men of the Modern Awakening, 1883; 2d ed. 1891); *Berlin som tysk Righovedsted* (Berlin as Imperial Capital, 1884-85); *Ludvig Holberg* (1885); *Indtryk fra Polen* (Impressions of Poland, 1888); *Indtryk fra Rusland* (Impressions of Russia, 1888); *Essays* (2 vols., 1889). G. L. KITTREDGE.

Branding: a mode of punishment formerly practiced in Greece and Rome upon slaves and convicts. Under Constantine the face was protected from such disfigurement. It was a mark of degradation provided for in the canon law, and in France galley-slaves could be branded down to 1832. In England vagabonds, gypsies, and brawlers might be burnt in the cheek or forehead from the days of Edward VI, to 1636. From the time of Henry VII. this penalty was inflicted in the case of all clergyable offenses (see BENEFIT OF CLERGY), but it was abolished by an act of Parliament in 1822. Branding had then become obsolete, except in the case of deserters from the army, who were marked with the letter D, not by a hot iron, but by ink or gunpowder. By the British Mutiny Act of 1858 it is enacted that the court martial, in addition to any other punishment, may order the offender to be marked on the left side, 2 inches below the armpit, with the letter D, such letter to be not less than 1 inch long, but the practice was abolished in 1879.

Brand'is, CHRISTIAN AUGUST: professor at Bonn University; b. at Hildesheim, in Hanover, Feb. 15, 1790; son of Joachim Dietrich Brandis, a celebrated physician. He edited, with Emmanuel Bekker, a critical edition of *Aristotle*. He was the secretary of King Otho in Greece. His main work was a history of the Greek and Roman philosophies (2 vols., 1835-44; the third volume appeared in 1860-66), and a *History of the Development of Greek Philosophy* (2 vols., 1862-64). D. in Bonn, July 24, 1867. Cf. Bursian's *Geschichte der Classischen Philologie in Deutschland*, p. 917 ff. (Munich, 1883).

Brandis, Sir DIETRICH, Ph. D.: forester; b. in Bonn, Germany, Mar. 31, 1824; took his degree as doctor of philosophy at Bonn in 1848; appointed superintendent of forests in Pegu 1856; spent his life from that time to 1883, when he retired, in the care of the forests in the British possessions in India and Burma. He wrote numerous important monographs on the forests of India, and organized schools there for the instruction of the natives in their preservation. In 1887 he was made knight commander of the order of the Indian Empire.

Brandis, JOHANNES: metrologist; first decipherer of the Cypriote inscriptions; b. in Bonn, Germany, Dec. 14, 1830; d. in Linz, July 8, 1873. Author of *Das Münz-Mass- u. Gewichtswesen in Vorderasien bis auf Alexander d. Gr.* (Berlin, 1866). See E. Curtius, *Alterthum u. Gegenwart*.

Brandon: town; province of Manitoba, Canada (for location, see map of Canada, ref. 9-11); on Can. Pac. and N. P. and Man. Rys. It is surrounded by prairies, and the chief industries are stock-raising and farming. Pop. (1891) 3,778.

Brandon: township; Rutland co., Vt. (for location of county, see map of Vermont, ref. 7-B); on Cent. Vermont R. R.; near Otter Creek; 16 miles N. N. W. of Rutland. It has a graded academy, two parks, and manufactures of iron castings, carriages, flour, lime, lumber, paint, marble, etc. An elegant hotel was built in 1892. Pop. (1880) 3,280; (1890) 3,310. EDITOR OF "UNION."

Brandt, HERMANN CARL GEORGE, M. A.: philologist; b. in Vilsen, Germany, Dec. 15, 1850; graduated at Hamilton College (1872); studied in Auburn Theological Seminary, and in Göttingen, Strassburg, and Freiburg, Germany. Instructor in Hamilton College (1874-76); associate professor in Johns Hopkins University; Professor of French, German, and Philology in Hamilton College (since 1882). Besides contributions to periodicals and to journals of societies, he has published an edition of Lessing's *Nathan der Weise* (1879); *German Grammar for High Schools and Colleges* (1884; 6th ed. 1892); *German Reader* (1889; 3d ed. 1892).

Brandy [abbreviation of *brandewine*, *brandy-wine*, from Dutch *brandewijn*, lit., burnt wine; so Germ. *Braunwein*]; the liquid obtained by distilling the fermented juice of the grape. It is generally manufactured from white and pale-red wines. White wine yields a richer brandy than red wine, as it contains more of the essential oil of grapes, to which the flavor of the brandy is due. The peculiarities of the wine pass to a certain extent to the brandy. Wines which taste of the soil communicate the same taste, the *goût de terre*, to the brandy distilled from them. Wines of Sellaie in Dauphiny yield a brandy having the odor and taste of Florentine iris; those in St.-Pierre in Vivarais give a spirit which smells of violet. The stronger the wine the greater the yield. The wines of the south of Europe, being richest in alcohol, yield the most brandy. The usual yield is from 100 to 150 gal. from 1,000 gal. of wine. The best brandy, that distilled in the department of Charente, known as *cognac* and *armagnac* (names of towns), is made from very choice wines. Inferior brandies are distilled from dark-red wines of France, Spain, and Portugal; also from the fermented *marc* or refuse of the grape, and from the lees of wine and the scrapings of the casks. The catawba brandy, made from the lees of catawba wine in Ohio, is a very good brandy, though it has the peculiar flavor of this wine. The brandy distilled from catawba marc has an unpleasant taste, and contains much fusel oil. The wines of California yield brandy abundantly and of good quality. Various other liquors are known as brandies, such as "cider brandy" or "applejack," distilled from cider or from the "pomace" or refuse ground apples from the cider-press. This, when new, is a harsh, fiery liquor, but is much improved by age. "Peach brandy" is extensively made from the pulp of ripe peaches in some of the Southern States.

Fresh brandy is colorless, and remains so in glass vessels. The sherry-wine color which brandy generally exhibits is either derived from the cask or from burnt sugar purposely added. Brandy is almost pure alcohol and water, the percentage of alcohol varying from 48 to 56 per cent. It has an agreeable vinous, aromatic odor, and a peculiar well-known taste. Its specific gravity is from 0.902 to 0.941. Besides alcohol and water it contains the volatile oil of the wine, a little acetic acid, acetic ether, aldehyde, etc., together with the coloring-matter and tannic acid derived from the cask.

Brandy for medical use should be free from disagreeable odor and taste, and should be at least four years old. The advantage of keeping brandy a few years in the cask is due to the oxidation and removal of the ranker fusel oils, and to the precipitation of possible traces of copper or lead derived from the still by the tannic acid of the cask.

The greater part of the brandy and cognac of commerce is made from alcohol derived from Indian corn—rectified and deodorized whisky. This is diluted to proof, 50 per cent., and flavored with acetic ether, amanthic ether, oil of grapes, argol, and tannin, and colored with burnt sugar. It is improved by the addition of a little real brandy, and by keeping it a few years in the cask. The following recipe for cognac brandy is taken from the circular of a New York firm, whose business it is to supply the necessary materials to the manufacturers of wines and liquors: "To 40 gal. of spirit, double distilled and free from odor, and reduced to

proof with distilled water, add $\frac{1}{4}$ oz. of our best cognac oil distilled from grapes, $1\frac{1}{2}$ pt. burnt-sugar coloring, and $\frac{1}{2}$ oz. of tannin." At the prices charged for the materials this choice brandy would cost the compounder \$1.25 per gal., and would sell at from \$10 to \$25.

Brandy is an esteemed cordial and stomachic. It is frequently given in the sinking stages of low fevers and to convalescents, and to check diarrhœa. C. P. CHANDLER.

Brandy Station: on railroad; Culpeper co., Va. (for location, see map of Virginia, ref. 5-G); 56 miles S. W. of Alexandria; the scene of conflicts between the Federal and Confederate forces on Aug. 20, 1862, June 9, Sept. 13, and Oct. 11, 1863. Pop. (1880) 201.

Brandywine Creek: formed by East and West branches, which unite in Chester co., Pa. It flows southeastward into the State of Delaware, and enters the Christiana creek near Wilmington. It furnishes water-power for numerous mills. On its banks, in Chester County, the British general Howe defeated Washington, Sept. 11, 1777.

Brantford: borough; New Haven co., Conn. (for location, see map of Connecticut, ref. 11-G); in Brantford township; on N. Y. and N. H. R. R. (Shore Line Div.), and on Long Island Sound, 8 miles E. S. E. of New Haven. The harbor admits vessels of 300 tons. Its principal industries are agriculture, quarrying, and the manufacture of locks and malleable-iron fittings; is a place of summer resort. The Blackstone Memorial Library (cost, \$300,000) was opened June, 1896. Pop. of township (1880) 3,047; (1890) 4,460. EDITOR OF "OPINION."

Branks: an instrument formerly used in England and Scotland for the punishment of scolding women. It was of various forms, but consisted essentially of a bridle of iron or leather, to which was attached a piece of iron which held the tongue firmly. It is asserted that in some obscure places in England its use came down to quite recent times.

Brant'nan, JOHN MILTON: soldier; b. in the District of Columbia in 1819; graduated at West Point in 1841; colonel Fourth Artillery Mar. 15, 1881; Sept. 28, 1861, brigadier-general U. S. volunteers. He served in suppressing Canada border disturbances 1841-42; in the war with Mexico 1846-48; engaged at Vera Cruz, Cerro Gordo, La Hoya, Contreras, and Churubusco (brevet captain), and the city of Mexico (severely wounded at Belen Gate); adjutant First Artillery 1847-54; in Florida hostilities 1856-58. In the civil war he served in command of the department of Key West, Fla., 1862; in the department of the South 1862-63; on expedition to St. John's River, Fla. (brevet lieutenant-colonel); at Pocotaligo, S. C., and several minor actions; in Tennessee campaign 1863; engaged at Hoover's Gap, Tullahoma, Elk river, and Chickamauga (brevet colonel); as chief of artillery department of the Cumberland 1863-65; engaged at Missionary Ridge; in the various operations of the Atlanta campaign 1864 (brevet brigadier-general); in command of the district of Savannah, and temporarily of department of Georgia 1865-66. Brevet major-general Mar. 13, 1865, for meritorious services in the field. Retired Apr. 19, 1882. D. in New York city, Dec. 16, 1892.

Brant, JOSEPH THAYENDANEGA: a Mohawk Indian chief; b. in 1742; sent to the Indian school which grew into Dartmouth College; fought in the British army in the war of the Revolution; distinguished himself in Col. Leger's expedition against Fort Stanwix and at Oriskany in 1799. He prepared a version of the *Gospel of St. Mark* in Mohawk, which was published with the Mohawk *Book of Common Prayer* in 1787. D. Nov. 24, 1867. A colossal statue erected in memory of him was unveiled at Brantford, Ontario, Oct. 13, 1886. See W. L. Stone's *Life of Brant* (1838).

Brant, braant, SEBASTIAN: German poet; b. at Strassburg in 1458. He was appointed an imperial counselor by the Emperor Maximilian. He wrote a satirical poem entitled *Das Narrenschiff* (The Ship of Fools, 1494), a Latin translation of which (1497) made Brant famous throughout Europe. He held up to ridicule the vices and follies of his time, although without direct religious intention. Alexander Barclay made an English translation of it (London, 1509; best ed. by T. H. Jamieson, 1874, 2 vols.). Though not possessed of great poetical gifts he was one of the most influential authors of his time who may be classed among the forerunners of the literature of the Reformation. D. in Strassburg, May 10, 1521. See Zarncke's excellent edition of the *Narrenschiff* (Leipzig, 1854). Revised by JULIUS GOEBEL.

Brantford: a city of Ontario, Dominion of Canada; capital of Brant County; on Grand river and the Grand

Trunk and the Brantford, Waterloo and Lake Erie Rys.; 24 miles W. S. W. of Hamilton and 84 miles S. E. of Goderich (see map of Ontario, ref. 5-1D). Here are large railway machine-shops and engine-houses, and manufactures of brass and iron castings, and farming implements: center of magnificent agricultural country. Pop. (1881) 9,616; (1891) 12,753. EDITOR OF "EXPOSITOR."

Brant Goose: See BARNACLE GOOSE.

Brantôme. brañ'tóm', PIERRE DE BOURDEILLES, Abbé and Seigneur de: French historian; b. of a noble family at Périgord about 1540. He served in the army in several campaigns, and gained the favor of Charles IX., at whose court he passed some years. He wrote *Les Vies des Hommes Illustres et grands Capitaines*, etc., a work of high reputation. His style is charming, vivacious, naïf, sometimes descending to gossip, and sometimes rising to eloquence. Another work of his is *l'ies des Dames galantes*. D. July 15, 1614.

Bra'shear City, now MORGAN CITY, La. (q. v.).

Bras'idas (in Gr. Βρασιδης): a Spartan general in the Peloponnesian war which began in 431 B. C. He relieved Megara in 424, and gained several victories over the Athenians. He was killed in 422 B. C. at Amphipolis, where he was opposed to the Athenian general Cleon. His memory was long honored by annual sacrifices.

Brass [O. Eng. *bræs*; origin obscure]: an important alloy of copper and zinc, extensively used for a great variety of purposes in the arts on account of the ease of working and its acceptable color. It is made (1) by fusing in crucibles copper and zinc, placing the latter below; considerable of the zinc is lost during the operation, owing to its volatility; (2) by heating copper in grains or sheets with oxide of zinc and charcoal; (3) the ancient method, by heating copper with calamine, a native ore of zinc, and charcoal. Different varieties of brass adapted to special uses are obtained by varying the proportions of the component metals. Common brass for ordinary purposes, which is cast in molds and finished by turning and filing, contains about 70 parts of copper and 30 of zinc. *Muntz* or *yellow metal*, which is rolled into sheets and used for sheathing ships, contains from 50 to 63 parts of copper and 37 to 50 of zinc. *Tombac*, *pinchbeck*, *prince's metal*, *Mannheim gold*, *mosaic gold*, *similtor*, etc., contain 80 parts or more of copper to 20 or less of zinc. A little lead diminishes the ductility, while tin increases the hardness of brass. Articles of brass are cleaned by immersion in *aqua fortis* (nitric acid), and lacquered with shellac in alcohol. Brass is harder than copper, is malleable and ductile, and can be readily cast, rolled, stamped, and turned in the lathe. Next to iron in its different forms, it is the most important metal used in the arts.

Brasses, Monumental: sheets or plates of brass, upon which are engraved figures of men and women, in attempted portraiture of the dead, accompanied by heraldic devices, etc. Many still exist in England, which date from the latter part of the Middle Ages; some in their original position, let into the floor or wall, and others preserved in churches and museums. They are valuable for the study of mediæval art, of costume, arms, and heraldry. RUSSELL STURGIS.

Brasseur de Bourbourg. braäs'ser' de-boor' boor', CHARLES ETIENNE: a French abbé; b. in Bourbourg, Sept. 8, 1814; lived for a long time and traveled extensively in North and Central America; held various half-ecclesiastical positions in Mexico, and published *Histoire de Canada* (2 vols., 1851); *Histoire des nations civilisées du Mexique et de l'Amérique Centrale* (4 vols., 1857-59); *Gramatica de la lengua Quiché* (1862); and others relating to the Mayas civilization. D. in Nice, Jan. 8, 1874.

Brassey, THOMAS: railroad contractor; b. near Chester, England, Nov. 7, 1805; apprenticed to a land-surveyor; obtained in 1834 his first contract through George Stephenson to build a viaduct between Stafford and Wolverhampton; built the Great Northern Railway, the Grand Trunk in Canada, besides lines in Italy, the Crimea, Denmark, the Argentine Republic, France, Australia, and India. His operations were on an enormous scale, and he accumulated an estate valued at \$35,000,000. D. at Hastings, Dec. 8, 1870. See his *Life*, by A. Helps (1872).—His son, Lord THOMAS: b. in Stafford in 1836; educated at Rugby and at University College, Oxford; sat in the House of Commons from 1865 to 1886; an admiralty lord; was made baron in the latter year. He greatly improved the naval administration, about which he published valuable treatises, and was

an enthusiastic yachtsman, visiting all parts of the world in the Sunbeam. His wife, a granddaughter of the Earl of Essex, published several narratives of these voyages, and died Sept. 14, 1887, on her trip home from Australia, and was buried at sea.

Bras'sica: a genus of herbaceous plants of the family *Crucifere*; distinguished by a round and tapering two-valved pod (*siliqua*), globose seeds in one row in each valve, and conduplicate cotyledons. The species of this genus, which comprises the cabbage, cauliflower, broccoli, turnip, rape, etc., are natives of the temperate and cold regions of Europe and Asia. The species just named are extensively cultivated in gardens and fields. See CABBAGE and TURNIP.

Brathwaite, RICHARD (1588-1673); poet; educated at Oxford and Cambridge. Wrote *The Golden Fleece* (1611); *The Poet's Willow* (1614), pastorals; a collection of satirical verses; and *Barnabee's Journal* in doggerel and Latin rhymes, which came to its eleventh edition in 1876. His *Life* is prefixed to the ninth edition in 1818.

Brattleboro: town; Windham co., Vt. (for location of county, see map of Vermont, ref. 9-C); on Cent. Vermont and Vermont Val. R.Rs., and on Connecticut river; 60 miles N. of Springfield, Mass. It is the seat of the Vermont Asylum for the Insane, and the trade-center of Southeastern Vermont, and has the Brooks Library, bestowed by George J. Brooks in 1887. The Estey Organ Company is the leading manufacturing establishment. West Brattleboro has an academy. The town is noted for its beautiful natural scenery. Pop. of township (1880) 5,880, including 4,471 in village; (1890) 6,862; village, 5,467. EDITOR OF "PUENIX."

Brauns'berg: a town of Prussia; province of East Prussia; on the river Passarge; about 35 miles S. W. of Königsberg (see map of German Empire, ref. 2-J). It has manufactures of woolen and linen goods, and an active trade. Pop. (1890) 10,851.

Bravo-Murillo, braa'vō-moo-reel'yō, JUAN GONZALEZ: a Spanish statesman; b. in province of Badajoz, June, 1803; became in 1847 minister of justice; then of public instruction and of the finances. In 1851 he became the head of a new cabinet, in which position he followed a reactionary policy. In Apr., 1868, he again became president of the cabinet. On the expulsion of the queen in 1868 he followed her to Bayonne. D. in Madrid, Jan. 11, 1873.

Brawn: a preparation of food obtained from the flesh of the wild boar or of swine. After removing the bones and squeezing out much of the fat, the flesh is rolled and bound with a string. It is then successively stewed and baked with various preparations of herbs, wines, and spices, after which it is steeped in a solution of brine. Mock brawn is the flesh of the pig's head and feet cut into small pieces, boiled, pickled, and finally pressed into the shape of a collar. The term also denotes the muscular part of the human body.

Braxton, CARTER: planter; b. in Newington, Va., Sept. 10, 1736. He graduated at William and Mary College in 1756; was elected to the Continental Congress in 1775; signed the Declaration of Independence. D. in Richmond, Va., Oct. 10, 1797.

Bray (anc. *Bibracte*): a small parish in Berkshire, England; 22½ miles W. of London. Pop. 5,750. Famous for its vicar, who changed his religion three times during the reigns of Henry VIII., Edward VI., Mary, and Elizabeth, that he might "live and die the vicar of Bray."

Bray [in ancient Gaelic *Bray* meant marsh]: a fashionable watering-place of Ireland; at the mouth of the river Bray; 12 miles S. E. of Dublin; partly in the county of Dublin, but chiefly in the county of Wicklow (see map of Ireland, ref. 9-J); connected by 2 railways with Dublin; has 2 hotels, 6 churches and chapels, a bank, a court-house, a dispensary, a savings-bank, a newspaper, and some trade by sea. Pop. 6,600.

Brazen Sea: a great bowl of cast metal, probably of copper or bronze, which stood in the priests' court in Solomon's temple. (1 Kings vii. 23-26; 2 Chr. iv. 2-5; Josephus's *Antiquities*, viii. 3, 5). Its purpose was to hold water for the ablutions of the priests—e. g. their hands and feet (Ex. xxx. 18, *sqq.*). The brazen sea stood upon twelve oxen, the latter facing outward. The exact shape and size of the brazen sea are not known, but the best commentators think its contents exceeded 11,000 wine gal. It was broken up by the Chaldeans at the destruction of the temple, and the pieces taken to Babylon (2 Kings xxv. 13; Jer. lii. 17).

Brazen Serpent: the name of a copper or bronze figure of a serpent erected by Moses during the journey of the Israelites from Egypt to the land of promise, for the miraculous cure of those who had been bitten by venomous serpents (Num. xxi. 5, *sqq.*). This brazen serpent became an object of superstitious worship among the Israelites, and was consequently destroyed by Hezekiah (2 Kings xviii. 4). In accordance with John iii. 14, the brazen serpent is regarded as a type of Christ.

Brazil, United States of (Port. pron. *brãz-zeel'*): the largest country of South America, occupying about two-fifths of the continent in the central and eastern parts; bounded E. by the Atlantic, and N. W. and S. by all the other South American countries except Chili. Length from N. to S. over 2,600 miles; greatest breadth, probably 2,700 miles. The extreme latitudes claimed are 5° 10' N. and 33° 45' S.; the extreme longitudes, 34° 40' and about 74° W. Area by official figures (1892), 3,209,878 sq. miles; but this includes large tracts claimed by Venezuela, Colombia, and Bolivia. The northern and a part of the western boundaries are all uncertain and mostly in unexplored regions.

Topography.—Three main divisions are at once apparent: 1, the Brazilian plateau, with the coast and central mountains; 2, the great depressions of the Amazon and Paraguay, meeting in the center of the continent, and framing the first division on the northern and western sides; 3, a strip of land N. of the Amazon, forming a part of the Guiana plateau. This view of the surface will be clear if we imagine the continent to sink six or seven hundred feet; the ocean would then fill the Amazonian and Paraguayan depressions, leaving Central and Eastern Brazil as a great island, while Guiana would be another island to the N.

Mountains.—The Brazilian mountains border the southeastern edge of the first division, sending branches into the interior. Structurally the coast range begins in Uruguay, but it only takes a decidedly mountainous form from about lat. 29° 30' S.; thence it follows the coast northeastward in a strip 50 miles wide, rapidly broadening from lat. 24° S., until, near Rio de Janeiro, it attains its extreme width of about 250 miles. Here there are two well-marked parallel chains: the Serra do Mar, ending on the coast near the mouth of the Parahyba, and the Serra da Mantiqueira; the latter range again divides N. of the Parahyba, and the branch nearest the coast dies out near Bahia; the other and higher one skirts the eastern side of the São Francisco valley to where that river turns eastward. Beyond the São Francisco there are isolated low ranges nearly to Cape São Roque. The average height of the coast range is perhaps 5,000 feet. Itatiaia, in the Mantiqueira sub-chain, attains 8,900 feet, and is probably the highest point in Brazil; the Organ Mountains in the Serra do Mar, at the head of Rio de Janeiro Bay, have peaks over 7,000 feet high. The scenery, especially on the coast from Cape Frio southward, is indescribably grand and beautiful.

The Serra dos Vertentes is a spur or ridge stretching westward from the Mantiqueira range and separating the head-waters of the Paraná from those of the São Francisco. Two mountain-chains extend northward from it over the plateau: the Serra da Canastra between the São Francisco and Tocantins river systems, ending about lat. 10° S., and the Goyaz or Pyrenees Mountains, between the Tocantins and Araguaya. This latter range is of unknown northward extent; it contains peaks said to be over 7,000 feet high. The above enumeration includes all the true mountains in Brazil.

The Brazilian Plateau.—This extends from the mountains to the great river-depressions, and is separated from the northeastern coast only by a strip of low land 30 to 50 miles wide; it is partly divided by the Canastra, Goyaz, and Vertentes ranges. The average elevation is probably about 2,700 feet higher toward the mountains, falling gently northward to 700 or 800 feet as it approaches the Amazon. The surface is sometimes flat, oftener hilly or rolling. Nearly everywhere the outer edges are cut down abruptly, appearing from below like mountains, and the plateau itself is excavated by numerous deep river-valleys, the sides of which present similar escarpments. The bluffs are commonly but wrongly represented on our maps as mountain-ranges, seeming all Central and Eastern Brazil.

The Paraguayan Depression.—The Upper Paraguay flows through a vast swampy plain, the Brazilian portion of which is some 250 miles wide, and only 400 feet above the sea. (See PARAGUAY.) There are some isolated hills, the Serra dos Dourados, skirting the west shore of the river on

the borders of Bolivia, and a similar chain crosses the river about lat. 21° S., passing into Paraguay.

The Amazonian Depression.—Along the lower Amazon this is a plain from 50 to 150 miles wide; above the Rio Negro and Madeira it spreads out so as to include, probably, all Northwestern Brazil. This upper portion, so far as we know, is a perfectly flat expanse, nowhere more than 200 or 300 feet above sea-level; the flood-plain itself is in parts 150 miles or more wide, narrowing below. The Brazilian plateau does not appear to be continued beyond the Madeira, and the Amazonian depression, following that river and the Madeira, is hardly separated from the Paraguayan swamps.

The Guiana Plateau.—The Brazilian portion stretches from the Rio Negro to the Atlantic, its southern edges appearing as the "table-topped hills" of Almeirim and Velha Pobre, 20 miles N. of the Amazon. These are about 2,000 feet high, nearly flat above, and resemble the Brazilian plateau in structure and appearance.

Islands.—The only outlying islands are the volcanic rocks of Trindade and Fernando de Noronha, with the neighboring islets. Fernando de Noronha is used as a penal settlement; the others are desert. The Abrolhas and Rocas are dangerous reefs near the coast, the former with a few inhabitants. Santa Catharina, São Sebastião, and many smaller islands on the southeastern coast, and Maranhão on the northeast, are high islands separated from the mainland only by narrow channels. Marajó, at the mouth of the Amazon, is essentially an alluvial formation, and there are numerous low islands in the river estuary.

Harbors.—The southeastern coast has many excellent landlocked harbors, as well as the channels sheltered by São Sebastião and Santa Catharina islands. The whole northeastern coast is essentially without harbors, except the Bay of Maranhão and the Pará estuary.

Rivers.—The Amazon and its tributaries form the finest system of navigable rivers in the world. Ocean-steamer can ascend to Peru, and smaller ones far beyond. The Purús, Içá, and most of the upper Brazilian affluents are unobstructed almost to their sources; the Madeira and Negro have rapids in their middle courses, but are navigable above; the Tapajós, Xingú, and many smaller rivers and secondary branches admit steam-navigation in their lower courses. The Tocantins has an open channel for about 150 miles; above it is obstructed by rapids, but small steamers now ply on the upper Tocantins and Araguaya. The most important eastern river of Brazil is the São Francisco, about 1,800 miles long. Steamers ascend to the Paulo Afonso cataract, 148 miles; and above the falls a free course of 1,000 miles is now navigated. The Uruguay and upper Paraná, where they border on Brazil, are more or less obstructed; but the Paraná, with its Brazilian tributaries, promises to be of great importance in the future. Large steamers ascend the Paraguay to Corumbá (lat. 19° S.), and beyond that the river and its tributaries are navigated by smaller vessels. These channels form the principal outlet of Eastern Brazil.

Lakes.—Brazil has no large interior lakes. The Lagoa dos Patos and the Lagoa Merim of the S. are large, fresh-water estuaries, with a narrow outlet, the Rio Grande do Sul. These lakes and the river Guahyba and its branches form an internal waterway of great value for this part of Brazil. The numerous lakes of the Amazonian and Paraguayan flood-lands are shallow but sometimes quite large. There are numerous lagoons along the coast.

Climate.—Generally speaking, Brazil has a moderately warm and very healthful climate. The heat is nowhere excessive, being modified by the regular winds and the elevation of the plateau. The warmest region is in the Paraguayan depression. On the Amazon the temperature rarely rises above 93° F. in the hottest hours, and the nights are cool. The mountain region is moderately warm on the coast, temperate at greater elevations, and the southern extremity of Brazil has a mild winter from May to September, with occasional slight snow. Rains are abundant nearly everywhere, but especially on the Amazon and in the coast range, where the dry season is only marked by less plentiful showers. The great plateau has perhaps the most delightful climate in the world. Here the months from May to October are cool, and nearly or quite rainless. A portion of Northeastern Brazil (Ceará, Rio Grande do Norte, Parahyba, and portions of Maranhão, Pernambuco, and Bahia) is less abundantly watered, and is subject to periodical droughts, sometimes lasting several years; that of 1877-80 depopu-

lated a large region, and caused the death of 500,000 persons.

Yellow fever appears in some of the coast cities almost every year during the warmer months; but severe epidemics of it are only occasional, principally at Santos and Rio de Janeiro. Malarial fevers are local and seldom severe.

Distribution of Plant Life.—The warm and damp Amazonian depression is covered with a thick tropical forest, with long extensions lining the affluents. Eastward the forest land is narrower and much broken by open lands. The coast range forms another forest region, the higher portions southward being composed of *Araucaria* pines. There is a third large forest region on the upper Paraná, and a coast strip from Pernambuco southward. The southern end of Brazil, from lat 30 S., is mostly open grassland. The Brazilian and Guiana plateaus are partly open, partly covered with a peculiar scattered growth of low trees, bushes, and grass called *cerrado*; but there are numberless small patches of forest on the hillsides, about streams and springs, and lining the ravines. The Paraguayan swamps are generally open, with a rank growth of grass.

Geology.—The coast range and interior mountains are formed of very ancient metamorphic rocks and granites. There are no recent volcanoes, but ancient volcanic rocks have been reported. The great plateau is composed of nearly horizontal strata, among which the Devonian, Carboniferous, and Cretaceous seem to be most widely spread. These reappear on the Amazon and in Southern Brazil. In the Amazonian depression these older rocks are covered with sandstones and clays, partly, at least, of later Tertiary age. Immense quantities of bones of quaternary animals have been found in caves in the southeastern portion of the plateau.

Minerals.—For more than a century Brazil was the principal gold and diamond producing country of the world. The most productive regions for both were Minas Geraes, Matto Grosso, Goyaz, and Bahia. The gold was obtained from surface washings, which are now nearly abandoned; but several quartz mines are worked productively in Minas Geraes and elsewhere. The lowering of the market price for diamonds, caused by the discovery of South African mines, made the Brazilian washings unproductive. They are now worked only on a small scale. It is the opinion of experts that the riches of Brazil, in both gold and diamonds, are far from being exhausted. Silver, copper, and lead ores have been reported, but not in paying quantities; the immense and very rich deposits of iron are as yet nearly useless, owing to the lack of coal. Coal occurs in Southern Brazil, and is mined on a small scale, but the quality is inferior. Rock crystals, or "Brazilian pebbles," are exported from Goyaz and Bahia, and agate, carnelians, and petrified wood from Rio Grande do Sul.

Fauna and Flora.—These are both extremely rich, Brazil being the most characteristic portion of the great neo-tropical region. (See AMERICA, SOUTH.) Among the important forest products may be mentioned rubber (Amazon and Ceará), Brazil-nuts (Amazon and Maranhão), sarsaparilla, Tonka beans, various vegetable oils, and drugs. There are a vast number of beautiful cabinet woods, but almost the only one exported is rosewood, and this in small quantities. Among the larger Brazilian animals are tapirs, jaguars, stags, ostriches, alligators of several kinds, and large water-snakes. The fisheries of the Amazon and coast are very productive.

Agriculture.—Brazil has a large amount of fertile land, especially in the southeastern portion and on the Amazon; but a great portion of the plateau is probably only fitted for grazing. By far the most important product is coffee, in which Brazil stands first in the world. It constitutes more than half of her exports, the principal coffee region being in the coast range of São Paulo, Minas Geraes, Espírito Santo and Rio de Janeiro. Sugar is largely produced in Pernambuco, Bahia, Ceará, and elsewhere, and tobacco in Bahia. The cotton crop is now insignificant. Cacao is one of the principal products of the lower Amazon. Mandioca, maize, beans, rice, and tropical fruits and vegetables are largely raised for home consumption. The most important grazing districts are Rio Grande do Sul and Northeastern Brazil from Pernambuco to the Amazon; the herds of the interior are still small.

Manufactures.—Generally these are on a small scale, though collectively important. Cigars are largely manufactured at Bahia, and paper, furniture, saddles, hats, beer, rum, and many other articles in the southern cities.

Railroads and Transportation.—In 1893 there were over 6,000 miles of railroads, the most complete systems being in the coffee regions of São Paulo, Minas, and Rio; a large portion of these roads were constructed with a Government guarantee of interest on the outlay. So far only a few of them have much more than paid expenses, and they are a heavy financial burden. All the large rivers have regular steam-navigation, with excellent vessels, and there are several Brazilian lines of coasting steamers. The country has nearly 10,000 miles of telegraph lines; there is a submarine cable to Europe, and one is projected to the U. S. Good common roads are only found near the coast.

Education.—Primary education is general throughout Brazil, but the country schools are poor; in the cities and larger towns there are excellent schools (called *collegios*), and provisions for the study of law, medicine, and theology. Most of the cities have libraries, and some of them museums. Young Brazilians seeking higher education generally go to Portugal or France. See PORTUGUESE-BRAZILIAN LITERATURE.

Government.—It is a federal republic, very similar in form to that of the U. S. The president and vice-president are elected for four years, and can not be re-elected for the next succeeding term; senators are elected for nine years, and deputies, or members of the lower house, for three years. The states are completely independent in matters of their own internal administration. Freedom of religious worship is guaranteed by the Constitution. The president and congress are elected by practically universal suffrage. There are twenty states and a federal district (Rio de Janeiro).

Population.—This was estimated in 1896 at 16,300,000, and is probably too large. Over one-third are classed as white, but this includes a large number mixed with Indian and a smaller proportion with Negro blood. One-fifth are Negroes and as many more mulattoes; about 400,000 are civilized Indians; the remainder mixed races. The official estimate of 600,000 wild Indians is greatly exaggerated; the tribes are small, and altogether probably do not number 250,000. (For ethnology, see INDIAN TRIBES OF SOUTH AMERICA.) The great mass of the population is gathered in Southeastern Brazil. The interior and the Amazon valley are very thinly settled, and only partially explored. The largest cities are Rio de Janeiro, the capital, estimated, 350,000; Pernambuco, 190,000; Bahia, 80,000; Pará, about 50,000; São Paulo, Fortaleza, Maranhão, Parahyba, and Porto Alegre, all above 35,000. The whites are mainly of Portuguese descent, but in Southern Brazil there are several hundred thousand German colonists.

History.—Before Brazil was discovered, Spain and Portugal had regulated their claims of conquest by the treaty of Tordesillas. (See TORDESILLAS.) By this all new lands E. of about lon. 50° W. were assigned to Portugal. Accordingly, when the Spaniard Vicente Yanez Pinzon discovered the northeast coast of Brazil (Feb. and Mar., 1500), he did not take possession, and his voyage has little historical importance. The same year a Portuguese fleet was dispatched to India under Pedro Alvarez Cabral. For some reason he stood far out in the Atlantic, and on Apr. 22 fell in with the Brazilian coast S. of Bahia. He took possession for Portugal, followed the coast for some distance, and then proceeded on his course to India, first sending back a ship with tidings of his discovery. Some other explorations were made, but Portugal was so much occupied with her Indian conquests that Brazil was long neglected. The first colony, São Vicente, S. of Rio, was formed by Martin Affonso de Souza in 1532; and about this time the coast was divided into sections, which, as hereditary captaincies, were granted to distinguished Portuguese on the agreement that they should settle them. These correspond to the modern coast provinces, now states of Brazil. Bahia was founded in 1549, and became the capital. Spain did not dispute the rights of Portugal to Brazil, but other nations made attempts to colonize it. Such were the short-lived French colonies at Rio de Janeiro (1555-60) and Maranhão (1612-14). Attempts of the Dutch commenced in the Amazon early in the seventeenth century. They seized Bahia (1624) and held it for a year, and in 1631 they took Pernambuco and formed a powerful colony around it. Constantly at war with the Portuguese, they were finally driven out in 1654. After 1640 Brazil was governed by viceroys, and in 1762 the capital was changed from Bahia to Rio de Janeiro. During the eighteenth century the colonies developed rapidly, owing to the increasing importance of the sugar industry, and the discovery of rich gold and diamond mines in the interior. Armed expeditions in search of mines and of Indian slaves penetrated far into the interior,

founding towns in Goyaz, Matto Grosso, and even on the head-waters of the Madeira. Some of them attacked the Spanish missions of PARAGUAY (*q. v.*). The armies of Napoleon drove the prince regent, Dom John, out of Portugal, and he took refuge in Brazil (1808), making his capital at Rio de Janeiro. He succeeded to the Portuguese throne in Mar., 1816, and in Apr., 1821, returned to Portugal, leaving his son, Dom Pedro, as regent in Brazil. The prince placed himself at the head of the movement for independence, and on Sept. 7, 1822, definitely refused obedience to Portugal; a constituent assembly was convoked; Brazil was declared an independent empire, and on Dec. 1, 1822, Dom Pedro was crowned as Emperor Pedro I. of Brazil. There was some opposition and fighting, principally in the northern provinces, which did not entirely cease until 1837. For political reasons Pedro I. was compelled to abdicate Apr. 6, 1831, in favor of his son, Pedro II. The latter being a minor, the country was governed by a regency. His majority was proclaimed, and he assumed the crown in 1840.

Uruguay had formed a part of Brazil from 1821 to 1825, under the name of the Cis-Platine state. The dictator Rosas, of Buenos Ayres, having attempted to annex that country, Brazil made war on him, defeating him in 1852, and Uruguay remained independent. The war with Paraguay (1865-69) was brought on by the dictator Lopez of that country, and ended in his defeat and death. (See PARAGUAY.) Brazil was the last slave-holding state in America. A gradual emancipation law was passed in 1871, but the final extinction of slavery was due to a remarkable popular movement. Probably 200,000 slaves were freed by private means, and two provinces were emancipated before the abolishment of slavery was decreed (May 13, 1888) by an almost unanimous vote of parliament. In 1889 a sudden revolution forced the Emperor Pedro II. to abdicate; a provisional government under Fonseca succeeded; a federal constitution was adopted Feb. 24, 1891, Fonseca being first president. He was deposed in Nov., 1891, and succeeded by Floriana Peixoto, against whom several states and the navy rebelled in 1893-94, but this movement collapsed in Mar., 1894, when Prudente Moraes was elected president.

LITERATURE.—This is very extensive. Special students should consult the *Catálogo da Exposição de Historia do Brazil* (Rio de Janeiro, 1881, 2 vols.), which is a very complete bibliography of the country.

General and Geographical Works.—Wappaus, *Handbuch der Geographie und Statistik des Kaiserreichs Brasilien* (Leipzig, 1871); *O Brazil Geographico e Historico* (Rio de Janeiro, 1881, *et seq.*), founded on Wappaus, but with extensive additions by Brazilian scholars; Macedo, *Corographia do Brazil* (Rio de Janeiro, 1873); *Brazil* (Bulletin No. 7 of the Bureau of American Republics, 1891); *The Mapa Geral do Brazil*: the works of Denis, Carvalho, and Andrews. **History.**—Porto Seguro, *Historia Geral do Brazil*; Southey, *History of Brazil*. The works of Pereira da Silva, Capistrano de Abreu, Macedo Teixeira de Mello, and Abreu e Lima.

Ethnology.—Martius, *Ethnographie Amerikas zumal Brasilien* (Leipzig, 1867); Brinton, *The American Race* (New York, 1891).

Geology.—Hartt, *Geology and Physical Geography of Brazil* (Boston, 1870). The works of Derby, Gorceix, Land, and Eschwege.

Zoölogy and Botany.—Wallace, *Geographical Distribution of Animals*; Martius, *Flora Brasiliensis*.

Travels.—Bates, *Naturalist on the Amazon*; Martius, *Reise in Brasilien*; Burton, *The Highlands of the Brazil*; Biggs-Wither, *Pioneering in South Brazil*; Wells, *Three Thousand Miles through Brazil*; the narratives of Saint-Hilaire, Castelnau, Gardner, Koster, and Agassiz.

HERBERT H. SMITH.

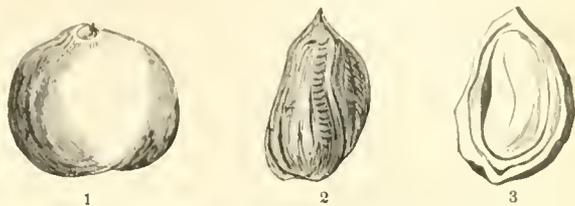

Brazil: railroad junction; city, and capital of Clay co., Ind. (for location of county, see map of Indiana, ref. 8-C); 16 miles E. N. E. of Terre Haute. It is an important center of the block coal and iron business. Pop. (1880) 3,441; (1890) 5,905.

Brazil Cabbage: a Calla-like plant with large arrow-shaped leaves (*Xanthosoma sagittifolium*), of the family *Araceae*, native of the West Indies, and now cultivated in Brazil for its thick, erect, nutritious rhizome, as well as for its foliage, which is cooked for food. This and other species of the genus are commonly grown in conservatories for ornamental purposes. C. E. B.

Brazilian Grass: popular name of a substance used in the manufacture of hats, sometimes called chip hats. It is not grass, but the leaves of a species of palm (*Chamodrops argentea*) which are imported from Cuba.

Brazilian Literature: See PORTUGUESE LITERATURE IN BRAZIL.

Brazil-nuts: the seeds of the *Bertholletia excelsa*, a beautiful tree of the family *Myrtaceae*. This tree, which

Brazil-nut: 1, represents the round woody pericarp, about one-fifth the natural diameter of an example of moderate size; 2, one of the nuts or seeds, half the natural length; 3, section of the same.

attains a height of 100 feet or more, abounds on the banks of the Orinoco and in the northern parts of Brazil, and bears a round woody pericarp nearly as large as a man's head. This pericarp contains about twenty-four seeds or nuts, which have the form of a triangular prism, and a hard shell inclosing a white kernel, which is very agreeable when fresh, but soon becomes rancid. They yield a large quantity of oil, which is valuable for burning in lamps. Many Brazil-nuts are exported from Pará to Europe and the U. S.

Brazil-wood: an important dyewood obtained from the *Cesalpinia crispera*, a tree of the family *Leguminosae*. There

are several varieties, known as Pernambuco, Lima, Santa Martha, Sapan or Japan, etc. The wood contains a colorless principle, *brazilin* ($C_{16}H_{14}O_6H_2O$). This changes by oxidation to *brazilein* ($C_{16}H_{12}O_6$), the red coloring-matter which gives the wood its value. Pernambuco and Lima wood contain as high as 27 per cent. of brazilein. Sapan 15, and Santa Martha (also called Peach or Nicaragua) still less. Brazil-wood is very heavy and hard, is pale when freshly cut, but becomes red by exposure to the air. The coloring-matter is soluble in water, but more so in alcohol or ammonia. Brazil-wood has been largely supplanted by artificial dyes. It is used in calico-printing and in wood-dyeing, but it is not satisfactory.

Brazil-wood.

Revised by IRA REMSEN.

Brazos: one of the largest rivers of Texas; rises in the high table-land in the northwest part of the State; flows first nearly eastward to Baylor, then S. E. for about 200 miles, and subsequently S. S. E. till it enters the Gulf of Mexico. Its whole length is estimated at 900 miles. In the rainy season, from February to May inclusive, it is navigable for steamboats about 300 miles from its mouth.

Brazos Santiago: an inlet and seaport of Texas; in Cameron County (for location of county, see map of Texas, ref. 8-H); between the north end of Brazos island and the south extremity of Padre island. It has some trade, but it has a bad and shifting bar. The settlement is on Brazos island, in lat. 26° 04' N., lon. 97° 12' W.

is said to have been extensively used in London; its use being now forbidden by law, lime-water was recommended by Liebig, and is largely used by the Glasgow bakers. Sulphate of copper is a poisonous salt, said to be used in Belgium, $\frac{30000}{10000}$ being sufficient for the purpose. Mege-Mouries announced some years ago (*Comptes Rendus*, xxxvii. 775; xxxviii. 351, 505; xlii. 1122; xlv. 40, 419; xlvii. 126; xlviii. 431; l. 467) the discovery of a body, "cerealine," found almost wholly in the bran, which possesses properties similar to those of diastase. He devised means for getting rid of this agent, or at least of its effects, and the following method of bread-making bears his name. It is assumed that 100 kilog. of wheaten meal have given

72 kil.	750 grammes	finest white flour,
15 "	750 "	dark groats,
11 "	500 "	bran.

1. At six o'clock in the afternoon take 40 liters* of water at 18° R. (72½ F.), add 70 grammes of pure yeast, or 700 grammes common grocer's yeast, and 100 grammes of starch-sugar. (Instead of the yeast and sugar, take, if necessary, 26 grammes of tartaric acid.) The place where the mixture is set aside must be maintained nearly at the temperature of 18° R. 2. The next morning, at six o'clock, the fluid will be saturated with carbonic acid. Stir in the 15 kilog. 750 grammes of groats. Fermentation will commence immediately. 3. At two o'clock in the afternoon add 30 liters of water, and pass the whole through a very fine silk or silver-wire sieve, to separate the fine bran. 4. The 70 liters with which the groats have been treated, after passing through the sieve, will be reduced to about 55 liters, with which the 72 kilog. 750 grammes of white flour and 700 grammes of salt are to be kneaded into a dough. (The bran is again extracted with 30 liters of water, and the extract employed in the next batch.) 5. The dough is then placed in baking-pans to ferment. 6. When raised, it is placed in the oven.

The baking of bread can be effected at 212 F., but no crust will be formed; to secure the best result a temperature of 350 to 570 F. should be employed. A high heat should be avoided at first, lest a hard crust be formed, while the interior of the loaf remains unbaked. One hundred pounds of flour yield from 125 to 135 lb. of bread, the increase being due to the water added. The most common faults of wheat bread are due to its being (1) *sour*, from the flour having been partly spoiled, the yeast or leaven having been too old, or the dough having been allowed to stand too long before baking; (2) *bitter*, from excess of yeast or bad yeast; (3) *heavy*, from insufficient kneading, raising, or bad leaven; (4) *muddy*, from the flour having been kept too long in a damp place.

Graham bread is made from the unbolted meal of wheat, a mixture of bran and flour; it is used by dyspeptics. *Rye bread* is largely used in Northern Europe, and to some extent in the U. S. It is dark-colored, is harder than wheat bread, and has a peculiar taste.

2. *Substitutes for Fermentation*.—Carbonic acid may be developed in the dough by the decomposition of bicarbonate of potassa (saleratus) or of bicarbonate of soda by some acid. Sour milk, hydrochloric acid, tartaric acid, bitartrate of potassa (cream of tartar), and the acid phosphate of lime have been used for this purpose. They give rise respectively to lactate, chloride, tartrate, double tartrate (Rochelle salt) of potassium or sodium, or to (in the case of the last mentioned) a mixture of phosphate of lime and soda or potassa. As neither of these agents causes fermentation, none of the elements of the flour is lost, and a greater yield of bread is claimed. This saving is, however, very trifling, as the loss in fermentation is small. The use of the acid phosphate of lime, suggested by Prof. Horsford, is claimed to restore to the flour the phosphates of the wheat which were removed in the bran. The process has been commended by Liebig. One strong recommendation for these "baking-powders" is the fact that bread may be mixed and baked at once, without the delay of several hours which is necessary where fermentation is resorted to. As cream of tartar and acid phosphate of lime do not act on bicarbonate of soda in the absence of water, either of these acid salts may be mixed with the flour, together with the bicarbonate, thus producing what is now extensively sold in the U. S. under the name of "self-raising flour," which is already salted, and merely requires to be mixed with water and baked to produce a palatable loaf. Carbonate of ammonia (sal volatile) is sometimes used alone to raise bread; being very volatile, it is

* A liter of water weighs 1,000 grammes = 1 kilog. = 2.2 lb. avoirdupois.

converted into vapor during the baking, and raises the loaf to a light sponge. Mr. Daughlish introduced *aerated bread*, which is prepared by kneading flour in a closed vessel with water supersaturated under pressure with carbonic acid gas. On bringing the dough into the air, the carbonic acid gas set free by the removal of the pressure expands it into a sponge. "Sponge cake" is raised by means of air which is incorporated with the flour by first beating eggs to a froth, stirring in the flour, and quickly baking. "Pastry" is made flaky, but not really spongy like bread, by mixing flour and water to a dough, rolling it out into sheets, applying butter liberally, doubling over the sheet, rolling it out again, and again applying butter. These operations are repeated till the dough becomes a sheet of innumerable layers of dough alternating with a thin coating of butter. On exposing this to the heat of the oven, the different layers of dough separate, either from the expansion of the imprisoned air or from steam, and the mass becomes light and flaky.

C. F. CHANDLER.

Breadal'banc, MARQUES OF: Marquises of Breadalbane 1885, Earls of Holland, Viscounts of Tay and Paintland, Lords Glenorchy, Benederaloch, Ormelie, and Wreik (1677, in Scotland), and baronets (1625, in Scotland), a prominent family of Scotland.—GAVIN CAMPBELL, the seventh earl and first marquis, was born in 1851, and succeeded his father in 1871.

Breadfruit-tree: an important tree (*Artocarpus incisa*) of the family *Artocarpaceae*; a native of Southern Asia, of the islands of the South Pacific, and of the Indian Archipelago, now naturalized in some of the West Indies. This tree

Breadfruit.

grows to the height of 40 or 50 feet, and has large, glossy, dark-green leaves, which are pinnatifid or deeply divided into pointed lobes. The leaves are sometimes 18 inches long. The fruit, which is a *soros*, is nearly spherical, and is covered with a rough rind, which is marked with small irregularly hexagonal divisions, having each a small prominence in the middle. The fruit sometimes weighs 4 lb. or more, contains a large portion of starch or fecula, and is a principal part of the food of the natives of the South Sea islands. The pulp is juicy and yellow when it is fully ripe, but it is in a better condition for eating before it arrives at that stage of maturity. When it is gathered before ripeness and baked, the pulp is white and mealy, very nutritious, and resembles wheat bread. The usual practice is to cut the fruit into three or four slices, and bake them in an oven. Sometimes the people of a village join to make a huge oven—a pit 20 or 30 feet in circumference—in which several hundred breadfruits are baked at once on heated stones. Baked in this mode, the bread will keep good for several weeks. The tree produces two or three crops in a year. It has been introduced into the West Indies with some success. The timber, which is light and of a rich yellow color, is used in building houses and for other purposes, but if exposed to the weather is not very durable. A sort of cloth is made of the fibrous inner bark. The tree abounds in a glutinous milky juice, which, when boiled with coconut oil, is used as a cement and as birdlime. Revised by CHARLES E. BESSEY.

Breadnut: the fruit of the *Brosimum alicastrum*, a tree of the family *Artocarpacææ*; a native of Jamaica. It is allied to the breadfruit. The genus *Brosimum* has staminate and pistillate flowers on separate trees in globose catkins. Its fruit is a one-seeded drupe, which is edible, and is used instead of bread after it has been boiled or roasted. The tree has ovate, lanceolate, evergreen leaves, and abounds in a gummy milk.

Revised by CHARLES E. BESSEY.

Breakwater: a structure designed solely to tranquilize the surface of a body of water by preventing the entrance or formation of waves from the sea. It is intended primarily to provide shelter from storms, and must therefore be so placed as to bear the shock of the waves, winds, and currents tending to destroy it. Its function is therefore different from that of a mole, jetty, quay, or sea-wall, which has to fulfill other conditions, but often under more favorable exposures.

The fundamental purpose of a breakwater being protection, its location, plan, sections, dimensions, material, and mode of construction must be influenced to a great extent by the physical features and forces existing at the site of the proposed artificial harbor, advantage being taken of any natural formations which would reduce cost and increase stability.

This class of structure applies chiefly to artificial harbors, but the same general requirements exist with reference to the entrances to many natural harbors, especially where they are located inside of the general coast-line. It will therefore seem more appropriate to defer to their special headings the general consideration of the several forces involved in the problem, and to describe here only the various types and precedents found in our principal ports.

For this purpose breakwaters may be grouped into (a) those which project from a cape or headland, and are consequently *attached*; (b) those which are isolated, *insular* or detached; (c) those which are rigidly supported on the bed of the sea, *permanent*; (d) those which are upheld by the water, *floating*; (e) those which perform the double purpose of breaking the force of the waves by the outer slope, while they regulate the currents on the inner, *reaction*; (f) and those which require to be combined to produce a sufficiently tranquilizing effect, *composite*.

Instances of most of these types may be found in the various forms of sandy islands, spits, and hooks which bestud an alluvial coast, and a study of which will convey a good idea of the best forms and sections for similar materials and exposures, but as the engineer is required to apply wood, stone, or metal, the slopes and dimensions must be modified accordingly. To secure the desired protection, two methods are available. The first is to oppose the force of the waves by a resistance *en masse*; the second, by a neutralization of surface movements by disintegration and deflection. Both of these are in use, but the former is in general far more effective, as it is also more expensive.

An instance of the application of both methods is found in the history of the breakwater of Cherbourg, on the north coast of Normandy, where the tide rises 18 feet. The crescent-shaped bay is embraced between Cape de la Hogue and Barfleur, and contains several rocky islands, which do not afford sufficient shelter. The French Government, after mature consideration and experiments made at Havre, decided to adopt the plans of M. Louis Alexander de Cessart, of building ninety large timber cones, having a diameter of 142 feet at base, 113 feet at top, 65 feet high, and weighing 1,000 tons net, to be floated by large casks from the ways to the site, sunk, and ballasted with rock. The depth from low water varied from 6 to 7 fathoms, hence the tops would project from 8 to 10 feet above high water. The first cone was placed in position June 23, 1786, and the last June 19, 1788, or two years later. Twenty-one cones were made, but only eighteen were used, the others being sold during the Revolution. The intervals between them were quite variable. The first space, between centers, was 513 feet; the second, 159;

the third, 184, etc., some of the distances being as great as 1,845, 1,630, and 1,310 feet; so far apart, in fact, as to be inoperative, and to defeat the object of their existence; hence it happened that in a few years they were destroyed by the waves. The total length of this breakwater between the centers of the extreme cones was 12,470 feet (nearly $2\frac{1}{2}$ miles). The gap between the first cone and the fort on Île Pelée was 3,269 feet, while that at the western end was 7,685 feet, making the total width of the bay 23,424 feet, or nearly $4\frac{1}{2}$ miles.

These cones were ballasted by throwing into and around them 3,703,703 cubic yards of stone, at a cost of \$3,100,000, which was subsequently utilized in the riprap breakwater of later date. The total cost of this original work was \$4,512,200, or nearly \$362 per lineal foot, proving it to be a very expensive experiment.*

The rubble mound which remained had been cut down by storms to 14 feet below low water, having an inner slope of one on one (45 degrees) and an outer or sea slope of one on ten. The National Assembly of 1791 authorized De Cessart to raise it to high water, but it was not done at that time. In 1804 a number of large blocks were placed on the center, and the battery replaced upon them.

Thereafter until 1830 little was done except to preserve the central battery, and to raise the remainder by means of rubble to low-water level; but finding it extremely difficult to maintain it in that position, and feeling that, in order to secure the desired tranquillity within the roadstead, it was necessary to raise the superstructure at least from 9 to 10 feet above high water of spring-tides, it was finally resolved, at the recommendation of several engineers, to construct a wall of solid masonry, with almost vertical sides, from low water upward, upon the top of the rubble base: this upright wall extends from thence up to the full height of 6 feet above the level of high water of spring tides; it is composed of rubble masonry faced with granite ashlar or dressed stone, in horizontal courses from 18 inches to 2 feet thick, and 3 to 4 feet wide, set in mortar. This part of the work is 36 ft. 3 in. wide at the base, and 29 ft. 3 in. wide at the top, the outer slope being 6 to 1, and the inner slope nearly the same: on the outside of this superstructure there is a solid parapet 8 ft. 3 in. thick, 6 feet high, and 8 ft. 6 in. wide at the top. The exterior base of this wall is founded on a bed of beton or concrete, set in wooden boxes or cases 10 feet long, 6 ft. 6 in. wide, and 3 ft. 3 in. deep, dove-tailed together, and well bedded in and covered with large blocks of rubble stone.

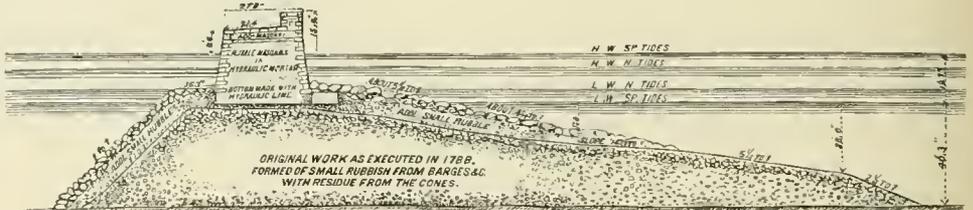

FIG. 1.

No sooner was this vertical wall raised above the level of high water than it presented such a sudden resistance to the waves, rolling upward along the rubble slope, that they broke against the face of the vertical wall with the greatest violence, and rising perpendicularly against it, fell down upon the rubble, undermining the base of the vertical wall and threatening to overwhelm it entirely. To obviate this, it became necessary to raise the rubble slope still higher, and to cover the surface with large heavy blocks, well wedged together: still this only partially remedied the evil, for, notwithstanding this casing, during heavy N. W. and N. E. gales at high water the waves beat with such violence against it that heavy masses of water wash over the top, so as to render it both difficult and dangerous to walk along it, although nearly 10 feet above high water of the highest tides; and it was proposed in 1850 to carry the rubble slope still higher in front of it; also to raise the wall 8 feet higher.

Sir John Rennie draws the following "conclusions" from the experience furnished by this structure:

"First. The plan of making the *digue* or breakwater isolated or detached from the shore is the best, and, if carried into effect with greater judgment, would have been more advantageous to the harbor.

* For a detailed account, see Cresy's *Enc. of Civil Eng.*

"Secondly. The cone system, although ingenious, was inapplicable and failed.
 "Thirdly. The rubble system for the mass of the work is correct, and if blocks of greater size had been employed the result would have been more advantageous in economy of time, labor, and materials.
 "Fourthly. The vertical wall system is inferior to the flat slope."

As this breakwater was designed to fulfill the double purpose of defense from the sea and from the enemy, it involved the combination of rubble mound and masonry superstructure with parapet and fortification, which increased the cost over that having to meet but a single condition.

The experience of the ancient Phoenicians and of the Sidonians, Egyptians, Romans, and Carthaginians, who built extensive moles of large masses of rock, has not been utilized in the modern structures which have been developed during the past century to meet the modified requirements of an extensive commerce operated by steam, and of the greater exposures to violent forces to which they are subjected.

These requirements have led to important modifications in the design and section of the breakwater, whereby the height of the rubble work is limited to from 15 to 25 feet below the surface of mean low water, that it may be kept below the disturbing action of storm-waves, and the capping thereof by a high wall of masonry extending above high water and sufficiently thick to resist the impact of the sea.

In plan it is important that there should be no re-entrant angle or convergent walls to compress the waves, and it is often necessary on exposed sea escarpments to deposit large concrete or natural blocks, weighing from 10 to 50 tons, to resist the force of the sea. These are known as *wave-breakers*.

Engineers at present have the benefit of an extended experience, and in consequence can approximate their designs to those which have withstood the tests of time and the elements under similar conditions of material and exposures.

The result is that, in general, for a riprap breakwater the estimates are based upon a section of from 12 to 30 feet in width on top, rising to from 5 to 12 feet above high water, and having slopes of one on one on the harbor, and one on two or one on three on the sea side, capped by a revetment of rocks weighing from 2 to 10 tons each, laid as closely as possible above mean low water, and sometimes filled in with cement. The mean section of the breakwater at the mouth of Delaware Bay, resulting from an exposure to the easterly storms of the Atlantic for upward of fifty years, has the

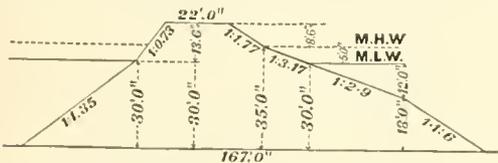

FIG. 2.—Mean section of present breakwater.

form shown in Fig. 2, where it will be seen that the bottom slope below the twelve-foot plane is 1 to 1.6 outside, and 1 to 1.3 inside. Within the wave-zone it is about 1 to 3, and above that level it increases again to 1 to 1.7. This section for a depth of 32 feet mean low water would contain 495.3 square yards, and require 165.1 cubic yards for each lineal foot of the work. At this site it was found that for this part of the work each cubic yard of volume, *in situ*, was equal to 1.5 gross tons of stone.

As the harbor formed by this breakwater is one of the oldest of its kind in the U. S., a brief reference to its plan will prove instructive. It was authorized by act of Congress passed May 24, 1828, and was designed upon the experience derived from Cherbourg and Plymouth. The first load of stone was delivered Apr. 18, 1829. It is located on the west bank of Delaware Bay in the lee of Cape Henlopen, lat. 38° 47' N., lon. 75° 06' W.

It is an artificial harbor formed by a breakwater of *pierre perdue*, 2,558 feet long on top, and extending in a straight line tangent to the cape at the time of its inception. The nearer extremity was 4,200 feet from the beach. There is an ice-breaker 1,259 feet long, making an interior angle of 146° 15' with the axis of the breakwater, which latter would cut it at its middle point if produced. Thus between the ice-breaker and breakwater there was left a gap of nearly a quarter of a mile. Their tops were about 14 feet above mean low water. The stones vary in weight from 1/4 to 7 1/2 tons. By the year 1839 there were deposited 835,000 tons, at a cost

of \$1,880,000, giving a rate of \$2.25 per ton in place, but the structure was not said to have been completed until 1869, when the total volume was estimated to be 892,528 tons and the cost \$2,123,000.

The structure itself has withstood very well a number of severe storms, but its defective location, with reference to the currents, has caused injurious shoaling throughout the protected area, which will be more fully described under HARBORS. To provide additional shelter, as well as to improve the depths, the operation of closing the gap has been in progress for some years. A mattress-sill, 2 feet thick and 100 wide, has been laid as a foundation for a riprap mound which it was intended to raise to a height of 12 feet below the plane of mean low water, with a top width of 48 feet and slopes of 1/2. This was to have been capped by a concrete monolith, having the dimensions shown in Fig. 3.

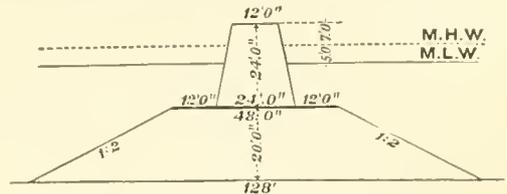

FIG. 3.—Section of the project of 1882.

This project was the result of a mature and careful digest of the more modern structures under similar exposures, made by Mr. Louis Y. Schermerhorn, C. E., from whose condensed report the following extracts are taken:

Description of breakwaters consisting of a concrete superstructure founded upon a random stone substructure.

Such breakwaters have been built at the following localities:

LOCALITY.	Latitude north.	Longitude east.
Colombo, Ceylon, Indian Ocean.....	7°	80°
Madras, India, Indian Ocean.....	13°	80°
Mormugao, India, west coast.....	23°	69°
Manora, India, Arabian Sea.....	25°	67°
Kustendjie, Turkey, Black Sea.....	44°	26°
Odessa, Russia, Black Sea.....	46°	31°
Fiume, Austria, Adriatic Sea.....	45°	15 1/2°
Ymuiden, Holland, North Sea.....	52 1/2°	4 1/2°

The following table gives the principal dimensions of these breakwaters:

LOCALITY.	Base of super-structure below M. L. W.	Top of super-structure above M. L. W.	Total height of super-structure.	Width of super-structure.	Range of tides.	Height above high water.	Depth of water over site.
Colombo.....	* 20	12	32	34	2 0	10	18-40
Madras.....	22	8	30	24	3 3	4 7	24-45
Mormugao.....	† 18	† 20	38	30	6 0	14	20-28
Manora.....	15	9	24	24	8 7	0 3	18-30
Kustendjie.....	† 16	12	28	12-18	12	12-20
Odessa.....	22	10	32	22-28	10	20-30
Fiume.....	† 22 1/2	24	23 1/2	1 5	20-70
Ymuiden.....	† 25	18	43	28-38	5 5	12 5	10-30

* Rubble and 10-ton bags of concrete extend about 5 feet above the base.

† Sea face and slope protected with large concrete blocks.

‡ Includes a parapet 7 feet high and 15 feet thick.

The exposure to which these breakwaters are subjected may be divided into two classes, the five subjected to ocean exposure falling into the first class, and the remaining three into the second class. In the first group the foundations of the concrete superstructure are placed from 15 to 25 feet below mean low water. This might have been adopted for two reasons, viz.: (1) economy of construction; (2) stability of the work.

In the case of Ymuiden breakwater, where the rubble base was only 3 1/4 feet in thickness, it seems highly probable from the known absence of stone within reasonable distance from the site of the work that the depth of 25 feet was chosen from grounds of economy. Excluding Ymuiden, for the remaining four works the depth of the concrete foundation varies from 15 feet at Manora to 22 feet at Madras.

The radical difference between the action of a vertical wall and that slopes of random stone has resulted in material changes of opinion as to the limiting depth of wave disturbance, and where a depth of 12 feet was formerly considered

sufficient to place rubble-stone beyond the action of waves, depths of 18 and even 22 feet are now advocated and used.

At Alderney the rubble base was originally placed at 12 feet below mean low water, but before a condition of stability was attained the top of the rubble mound at the base of the superstructure had been reduced to a depth of between 15 and 18 feet, and even at this depth it was necessary to maintain the top of the rubble with added material to replace that which was swept away. There is most manifest economy in either placing the rubble so low at the first as to secure its stability, or else protecting it with stone too large to be removed. Otherwise the stability of the whole work is endangered, or else a large annual expense must be incurred to supply the waste and thereby insure the work.

At Tynemouth, where the superstructure is founded at a depth of 20 feet below mean low water, it has been necessary to protect the top of the rubble mound on the sea-face with a double row of large concrete blocks.

At Colombo the base of the superstructure at 2,000 feet from the shore, and in water 30 feet deep, is placed 16 feet below mean low water, but the sea-face of the work is protected by large rubble-stone raised to a height of 5 feet above the base, and such stone further protected with a close layer of 10-ton bags of concrete. At 3,000 feet from the shore, and in water 40 feet deep, the superstructure is carried to a depth of 20 feet below mean low water, and then protected by large rubble and concrete bags.

At Madras the base of the superstructure, founded 22 feet below mean low water, seems to have been sufficiently deep to protect the top of the rubble base from the effect of wave recoil. Nevertheless, in the amended project for the extension of the Madras breakwater, a wave-breaker is provided along the sea-face of the superstructure, consisting of large random blocks of concrete piled against the sea-face and extending to the plane of high water.

At Mormugao the base of the superstructure, founded 18 feet below mean low water, has been protected on its sea-face by a wave-breaker consisting of 20-ton concrete blocks extending above the plane of high water.

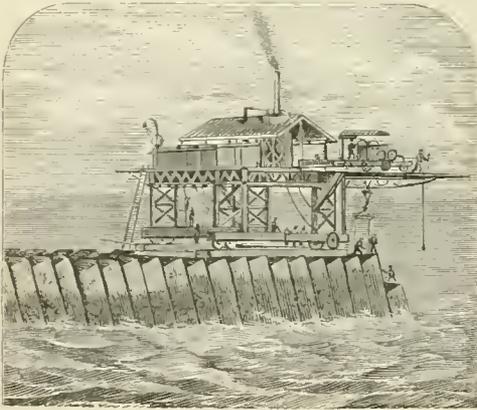

FIG. 4.—Manora breakwater.

At Manora the superstructure, founded at 15 feet below mean low water, has not suffered from any reduction of the rubble base. This is probably due to the reduced exposure of the locality, joined with the fact that the superstructure is so low, practically the plane of mean high water, that the seas easily pass over the work, and consequently greatly reduce the back draught or recoil of the waves.

At Kustendjie the superstructure, founded at 16 feet below mean low water, is protected on the sea-face with large random stone blocks, which extend about 8 feet above the base of the superstructure.

At Odessa, where the superstructure is founded 22 feet below mean low water, the rubble base has not required protection.

At Ymuiden, although the superstructure is founded at a depth of 25 feet below mean low water, the sea-face is provided with a wave-breaker of large concrete blocks extending above the plane of high water. This added precaution was probably made necessary for the reason that the rubble base was only 3½ feet in thickness, and being founded on yielding sand, it became imperatively necessary to protect the sea-face from currents which would produce scour and the consequent settlement of the entire work.

With the exception of the Manora breakwater, the top of which is not above mean high water, we find that even when the base of the superstructure is placed at from 18 to 22 feet below mean low water it has been considered necessary to give increased assurance to the rubble base by special protection. While the formation of wave-breakers undoubtedly strengthens an otherwise weak superstructure, it is highly probable that the expenditure of a less amount of money applied toward placing the foundations at a lower level, or in giving increased thickness to the superstructure, would produce better results.

From the foregoing it may be inferred that, in localities subject to ocean exposure, the best modern practice would place the base of the superstructure at from 15 to 22 feet below mean low water, and even then give the top of the rubble mound additional security by the use of large stone or concrete blocks.

The novel feature of construction in the breakwaters at Colombo, Madras, Mormugao, Manora, and Kustendjie consists in the inclination of the blocks at various angles to the horizon, that they might settle independently without destroying the integrity of the structure. The original design

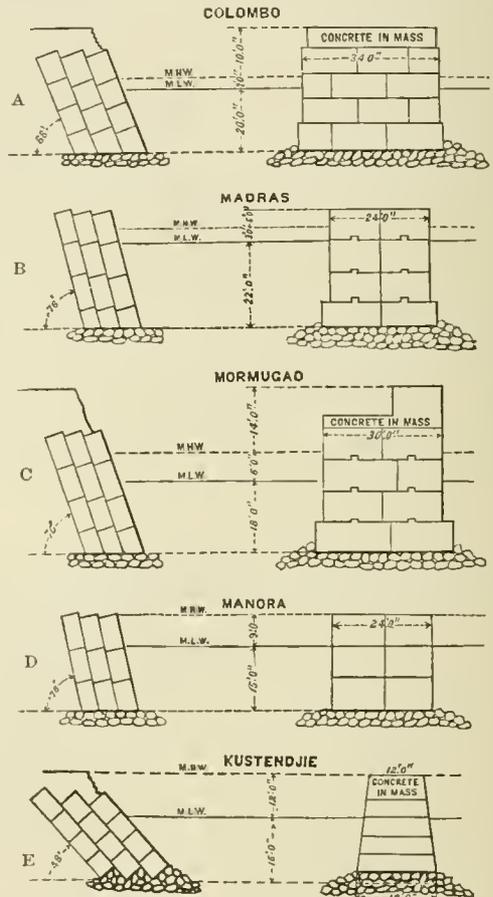

FIG. 5.

is attributed to Mr. Parkes, member of the Institute of Civil Engineers, London, and it has been successfully applied in the structures cited. The inclinations adopted are shown in the accompanying figures, as well as the depths, heights, and widths.

The cost of these several works was affected by a number of variable elements.

Thus at Colombo the ordinary labor was performed by prisoners, who received 37½ cents per day of eight hours. The cement, tools, and machinery, and skilled supervision were brought from England. Stone was carried 12 miles by rail, and the breakwater was connected with the shore and the quarries by a track. The cost, exclusive of dredging and reclamation, but including administration, was \$2,430,000. The rubble mound was in part made by dumping from steam-barges, and was leveled by divers. The

total length was 4,212 feet for the western breakwater, and it was proposed to erect a rubble mound between its extremity and the shore 2,000 feet long, and having a harbor entrance at its western end of 800 feet in width to be capped by heavy blocks. The commerce of this port had increased from 446,100 tons in 1869 to 1,205,900 in 1879.

The Madras work cost \$2,402,000; that at Manora \$529,000; and that of Mormugao \$420,000.

The average progress at Colombo was 150 linear feet per month of superstructure, 34 feet wide and from 24 to 28 feet high, or about 8,000 tons per working month. On one occasion 720 tons were set in twelve hours. At Madras the average rate was 7,000 tons per month; at Manora it was but 6,000 tons.

In considering the question of the proper dimensions to be given to a breakwater superstructure, more valuable indications are to be obtained from the cases of failures of works than in those which have proven successful.

The Madras breakwater failed entirely from an error in the details of construction, by which no bond was given to the blocks of the superstructure in a direction transverse to the axis of the breakwater. The Manora breakwater contained the same source of weakness, but its reduced height (the plane of high water) saved the superstructure from a fate similar to that of Madras.

Of the remaining breakwaters which have been considered Colombo furnishes the only case of partial failure which could be used as a valuable indication of the necessary section of a breakwater to withstand the action of an exposure similar to that of Colombo. As originally designed, the breakwater was rectangular in section, with the dimensions shown in A, Fig. 5.

The breakwater was given a width of 50 feet, so as to utilize the top as a quay. This width of 50 feet consisted of a sea-wall 24 feet thick, hearting-wall of rubble-stone 14 feet thick, and a harbor-wall 12 feet thick. In the construction of the work the sea-wall was kept about 700 feet in advance of the harbor-wall.

In July, 1878, when the breakwater had attained an extension of about 1,300 feet from the shore, and when the 24-foot thick sea-wall was 700 feet in advance of the harbor-wall, an unusually heavy southwest monsoon caused a horizontal displacement of the outer end of the advanced sea-wall "to the extent of 15 inches, pivoting on a point 150 feet landward, and lowering the outer end 12 inches, diminishing to nothing 450 feet inshore. . . . The signs of weakness which indicated the inadequacy of the sea-wall to sustain unaided the thrust of the sea" led to a modification of the hitherto adopted plan. The use of the breakwater as a quay was abolished, because it was found that the waves swept over the top of the work with too much force to permit its use for such a purpose. The failure of a superstructure 24 feet in thickness to withstand the shock of the seas had been demonstrated; consequently the further progress of the sea-wall was delayed until the harbor-wall could be brought up to its outer end. Then the dimensions of superstructure were modified by omitting the rubble-hearting between the sea and harbor walls, and uniting the two walls in one section 34 feet in thickness. This width was continued for the remaining 3,000 linear feet of the breakwater.

At the time of this failure of the sea-wall the top of the concrete blocks had not yet been covered with the monolith of concrete 4 feet in thickness, which, after all settlement had ceased, was finally placed so as to unite the tops of the blocks. Although an increased stability would have been given to the wall by this concrete capping, yet, on the other hand, the added height of 4 feet would have subjected the superstructure to an increased displacing force from the waves. This experience at Colombo was most valuable, and indicates that under a similar exposure the thickness of the superstructure to insure stability must be something greater than 24 feet. With the wall 34 feet in thickness, no difficulty has subsequently occurred, and of course it is not demonstrated that a less thickness than 34 feet would not have insured stability. The failure of the wall when 24 feet thick and the success of the wall when 34 feet thick simply indicates that somewhere between these limits assured stability was reached.

At Colombo five joggles are cut in the blocks to prevent transverse movement.

At Madras the blocks of each sloping section are connected by a mortise and tenon $4\frac{1}{2}$ inches wide by $2\frac{1}{2}$ deep, but there was at first no lateral connection between the blocks, so that the breakwater was broken in 1881.

At Mormugao, in addition to the mortise and tenon, there were vertical joggles 15 inches square extending through the two upper courses, and the top course was united by cramps of 2-inch square iron and by vertical dowels 7 feet long. At Kustendjie the blocks extended through the entire width, and were not connected by any binding materials.

In these four places, after settlement had ceased, a coping of concrete in mass was spread over the upper ends of the blocks to protect them from the recoil of the falling waves.

At Mormugao there was a slight tendency for the angle of the slope to flatten and become concave at the second or third courses above the base.

At Colombo, Madras, and Manora no such tendency toward the slipping of the lower blocks and consequently flattening of the slope is alluded to in the description of these works.

At Colombo the ultimate settlement of the tops of the blocks was from 8 to 18 inches. This was allowed for by keeping the outer end of the work slightly higher when first laid.

At Madras the settlement was from 6 inches to 4 feet, the latter being over a yielding bottom of sand and mud.

At Manora the settlement was excessive, and was from 5 to 4 feet. At this locality the deposition of the rubble mound but slightly preceded the construction of the superstructure, and its settlement was not complete before the superstructure was added. In addition to this the sand bottom yielded to the rubble to an unexpected degree.

At Mormugao the settlement of the superstructure was from $1\frac{1}{2}$ to 2 feet, and quite even in extent.

The principle of using sloping blocks, arranged in more or less vertical sections independent of each other, was devised to overcome the difficulty of adhering to settlement and the resulting dislocation of blocks bonded and arranged in horizontal planes. Again, in the system of ordinary horizontal bond the outer end of the work required to be left in an unfinished condition from the necessity of stepping back the successive courses of masonry on each other. With the system of sloping blocks the outer end of the work is at all times in a closer and more secure condition.

The sloping-block system was first adopted at Manora in 1870, and directly afterward at Kustendjie, then at Madras and Colombo, and lastly at Mormugao in 1880.

Vernon-Harcourt, in discussing the various forms of breakwaters, says: "The mixed system (an upright wall founded upon a rubble mound) will probably have the most extended application; and of all varieties of the type the best appears to be a superstructure founded some 20 feet below low water, upon a simple rubble base, formed of large concrete blocks laid with overhanging cranes upon the sloping-block principle, securely connected vertically and horizontally, and capped with concrete in mass after settlement has ceased."

In setting concrete blocks two methods have been used—viz., from staging and from cranes. The great advantage possessed by cranes over staging upon exposed sites is that, while the latter must be left exposed to storms, the former can always be run back into shelter. And although the first cost of suitable cranes for handling heavy blocks is quite large, their use dispenses with the great labor, ultimate cost, and delay incident to the use of staging.

The advantage seems so entirely in favor of cranes that they have practically taken the place of staging in modern works. At Kustendjie alone staging was used, but the total length of the breakwater was only 253 linear feet, and the work would not have economically carried any large expenditure for plant.

Notwithstanding the success of these several precedents and the determination to use this method of closing the gap at the Delaware breakwater, a change of executive officers, involving a review of the project, has resulted in a return to the riprap mound, based upon its simplicity and economy. It was found that in the more recent work 104,743 gross tons of stone have made 86,700 cubic yards of fill, giving only 1.17 gross ton required per yard, as contrasted with 1.5 in the older parts of the work. This was tested by stones weighed into barges, resulting in 1.15 tons per yard. The usual unit being 100 lb. per cubic foot for broken stone of average specific gravity, it would give 1.18 tons to the cubic yard, thus confirming the later estimate of material. On this basis to complete the closure of the gap there would be required 79,000 tons below low water at \$3.00, and 27,000 tons above at \$4.00, with contingencies, amounting to \$400,000 as compared with a minimum of \$500,000 for the mixed rubble and block system. The section of the present proj-

ect, as approved by the division engineer, Col. William P. Craighill, is illustrated in Fig. 6.

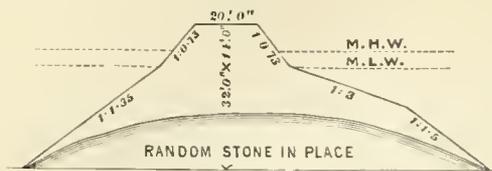

FIG. 6.

It is expected that the work will be completed in two years, and that the shoal, now stretching from the shore to the breakwater with depths of less than 15 feet, will be cut asunder by the currents aided by dredging.

Many other instances of riprap breakwaters might be cited, but they are mere modifications of those already alluded to. Probably one of the most important for its size and cost is that at Block Island, at the eastern end of Long Island Sound, 14 miles from Montauk Point and 10 miles from Rhode Island mainland. The structure is only 1,000 feet long, having a gap 200 feet wide left between 300 and 500 feet from its outer end, which is to be closed. It was built between 1870 and 1879 at a cost of \$354,125.59. This cost includes also the small inner harbor used by coasters and fishermen.

The Plymouth breakwater on the south coast of England was built in 30 feet of water at a cost of \$1,470 per lineal foot. Between its commencement in 1812 and 1847, 3,600,000 tons of stone have been placed in the work, at a total cost, including the lighthouse, of \$7,500,000. The breakwater is 5,100 feet long on top. The opening left on the western end is 4,300 feet and that on the eastern end is 2,200 feet wide, with depths of from 5 to 7 fathoms.

At Portland, England, the depth is twice as great (60 feet), but, the exposure being less, it has not been found necessary to cap the mound. The mean tide is $6\frac{3}{4}$ feet and the total height is 72 feet. The breakwater is massive, having a base of 340 feet, and containing 545 cubic yards per lineal foot. It was built under favorable circumstances, at a cost of \$625 per foot, or \$1.15 per cubic yard. The inner arm extends 1,700 feet to a gap of 400 feet, beyond which there is the outer mole, 6,400 feet in length, extending northward and inclosing an area of 2,130 acres, which constitutes the harbor. In this case one ton of the Portland stone was found to measure 20 cubic feet in the mound; hence one cubic yard would require 1.35 tons of stone.

Between 1849, when the work was commenced, and 1871, 5,731,000 tons were placed in the work. The mound was built from staging 18 feet above high water, supported on screw piles and carrying five lines of rails. The labor was furnished by convicts.

To reduce the quantity of material required for the mound, M. Poirel substituted concrete block at Algiers in 1834. Here a small island had been connected with the mainland in 1530 by a rubble mound 574 feet long and 118 feet wide on top. A rubble breakwater extended southward from the island 410 feet, inclosing a harbor of about 11 acres. But these structures required constant renewals. After the capture of Algiers by the French in 1830, concrete blocks, containing

FIG. 7.—Section of the Plymouth breakwater.

from 13 to 26 cubic yards, were used to protect the mole, and subsequently in reconstructing it a row of blocks in place was first laid in sizes varying from 80 to 260 cubic yards. Outside of this a row of heavy blocks was deposited, and the space between was filled with rubble. Behind this protecting mound a trench was excavated to $6\frac{1}{2}$ feet below low water, which was filled with concrete in mass. It cost \$400,000 for a length of 650 feet. The seaward extension of the northern breakwater was made by sinking blocks of 13 cubic yards directly in the sea. The outer slope was $\frac{1}{2}$, the inner $\frac{3}{4}$. Since 1840 the harbor has been extended by curving the northern breakwater eastward 2,300 feet, and by building a southern wing out to meet it, leaving an open-

ing of 1,115 feet in width for an entrance. The outer end of the breakwater is in 10 fathoms of water and the harbor covers 220 acres.

In other situations destitute of suitable stone another form, the vertical-wall system, is adopted. In this mode the walls are built upright from the bottom, and as all the material below low water is put in place by diving apparatus, and is of an expensive nature, the cost of a work executed in this way is very great. The Dover breakwater is the most prominent example. It is built up solidly from the bottom of the sea, the exterior facing being of ashlar granite blocks, and the hearting of rectangular blocks of concrete, built in the same way as ashlar masonry up to the level of high water, above which it is filled in with concrete.

Concrete blocks are a costly substitute at best for rough quarry stone (when that is at hand), and with a system of construction which requires each block to be "laid" (under water) the expense must be very great. The Dover breakwater has cost over \$2,000 per lineal foot.

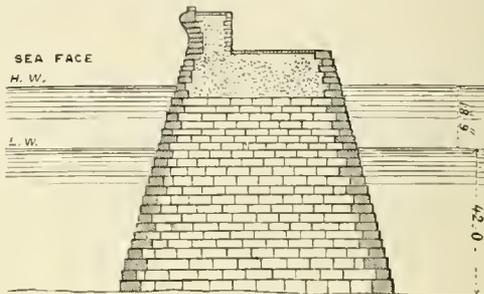

FIG. 8.—Dover (West) breakwater.

This method is only applicable where there is a good foundation sufficiently hard to resist the wave recoil and scour.

FLOATING BREAKWATERS.—Opinions differ greatly as to the utility of structures of this class, and the experience thus far is not very satisfactory, being based mainly upon wooden towers chained together and anchored. Many iron and steel forms have been patented, but not tried; among these may be mentioned that of the late Mr. Greenway Thomas, who designed floats in the form of a triangular prism with concave sides of 10 feet width and height, capped by a triangular pyramid. These buoys were anchored at three points and placed at intervals of 12 feet apart. Thus they were expected to decompose the waves and produce smooth water. An occasional expedient at sea is to lash spars and sails into a huge raft, in lee of which protection may be found. The use of oil is a well-known resort in severe storms, but these are temporary expedients belonging rather to the navigator than to the engineer.

In other cases floating iron caissons or cylinders have been suggested, revolving about horizontal axes, and having fins or langes to check the rotation—but these only exist on paper. The estimated cost of these floating structures is about \$100,000 per mile, so that if efficient they have much to commend them, as they can be placed in position rapidly, and may be shifted or removed without injury to channels or currents. The main objection urged to their use is the liability to break loose and injure shipping or other property.

CAISSONS OR CRIBS.—In fresh water, as on the Great Lakes, most of the breakwaters are composed of cribs framed on shore, and then towed to the site of the work and sunk. These are then filled with stone and covered with planks and caps, making piers as well as breakwaters. Where there are no teredo to eat up the timber, they form comparatively durable structures, but in sea water they will only last a few years, and hence are inapplicable. Here a temporary caisson may be used, filled with concrete or lined with walls, leaving cells to be filled with sand ballast. These large masses, weighing 400 to 500 tons, form a core, which may be prepared in a sheltered cove, and be towed in train to the work, and be settled, filled, and covered by riprap, making a rapid and cheap mode of construction, capable of be-

ing carried on continuously by day and night, and avoiding the scour incidental to the embankment method of building out. A breakwater constructed on this plan could be built for less than \$1,000,000 per mile in 30 feet depth.

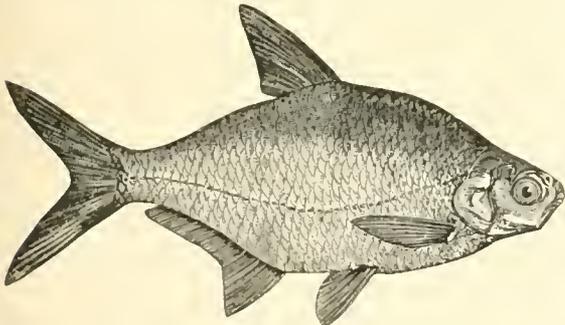

Foundations for breakwaters upon shifting or irregular bottoms have been constructed of concrete in bags, deposited from large hollow barges capable of handling masses weighing from 50 to 100 tons at a time, and upon these have been erected monoliths of concrete in mass, with parapet and covered way, as at Newhaven, Aberdeen, Finne in Austria, etc.

Bréal, br'è-al, MICHAEL JULES ALFRED: French philologist; b. in Landau, Rhenish Bavaria, Mar. 26, 1832; studied in Germany with Bopp; became in 1866 Professor of Comparative Grammar in the Collège de France; in 1875 director of the École des Hautes Études. He has published *Étude des origines de la religion Zoroastrienne* (1862); *Hercule et Cæus, étude de mythologie comparée* (1863); a translation of Bopp's *Grammaire comparée des langues indo-européennes*, with introduction and additions (5 vols., 1867-74); and various works upon education in France.

A. R. MARSH.

Bream [Fr. *brème* < O. Fr. *bresme*; of Germ. origin]: a name given to several species of fishes. One is a fresh-water fish of the family *Cyprinidae*, the *Abramis brama*. It is

The bream.

found in many rivers and lakes of Europe. Related species (*Notemigonus*) occur in North America. The name sea-bream is given to various European fishes of the genera *Pagellus*, *Spondyliotoma*, *Brama*, etc. The name bream or brim is also often applied in the East and South to species of *Lepomis*, or sunfish (see SUNFISH), fresh-water fishes of the U. S., remarkable for beautiful colors, and esteemed for food.
Revised by DAVID S. JORDAN.

Breast: See MAMMARY GLANDS.

Breast, Abscess of: chiefly due to infection through fissured nipple of a breast overfilled with milk. It is prevented by care and cleanliness, and best treated by a brisk purge, support to the breast, quinine, fofrifuges and the unloading of the breast, thorough rubbing, and inunctions of warm camphorated oil. When abscess is formed, it must be poulticed or incised.
Revised by WILLIAM PEPPER.

Breast Wheel: in hydraulics, a water-wheel so placed as to be struck by the stream of water nearly on a level with the axle, the lower quadrant of the circumference on the side opposed to the stream being placed in a race or channel concentric with the wheel, through which the water is conducted in its descent. See WATER-POWER.

Breastworks: See FORTIFICATIONS.

Breath: See RESPIRATION.

Brechin, bré-chin: a town of Forfarshire, Scotland; on the left bank of the South Esk; 38 miles by rail S. S. W. of Aberdeen (see map of Scotland, ref. 9-1). It stands on an abrupt declivity, and some of the streets are very steep. It has a cathedral, part of which was built in the thirteenth

century, now used as a parish church. Adjacent to this church is a remarkable round tower 85 feet high, and surmounted by a spire of 25 feet. Here are manufactures of linens and sailcloth, bleaching-works, etc. It is the seat of a bishop of the Scottish Episcopal Church. Pop. (1891) 8,955.

Breck, JAMES LLOYD: Episcopal clergyman and pioneer educator; b. in Philadelphia, June 27, 1818; educated at Flushing, L. I., by Dr. Muhlenberg, and at the General Theological Seminary, New York; with two or three others formed an ascetic associate mission for frontier work; they founded Episcopal schools at Nashotah, maintained at first by receipts through the mail. In 1850 Dr. Breck moved to Minnesota, and founded at Crow Wing a mission to the Chippewas; eight years later he began the church schools at Faribault; in 1867 went to California, opened an associate mission at Benicia, and founded schools for youth of both sexes; here he died Mar. 30, 1876. He was an advanced High Churchman of monastic spirit and unusual zeal.

Breck'enridge: village and railroad junction; capital of Wilkin co., Minn. (for location of county, see map of Minnesota, ref. 6-A); on the Red River of the North; 217 miles W. N. W. of St. Paul. Steamers ply between this point and the Manitoba settlements. Pop. (1890) 655.

Breckenridge, JOHX, D. D.: Presbyterian divine and polemic; b. at Cabell's Dale, Ky., July 4, 1797; graduated at the College of New Jersey, Princeton, in 1818; studied at the Princeton Theological Seminary 1819-21; was tutor in the college 1820-21; chaplain to Congress 1822-23; pastor in Lexington, Ky., 1823-26; in Baltimore, Md., 1826-31; corresponding secretary of the board of education 1831-36; Professor of Pastoral Theology in Princeton Theological Seminary 1836-38; secretary of board of foreign missions 1838-40; president of the African Colonization Society; and at the time of his death president-elect of Oglethorpe University, Georgia. D. in Cabell's Dale, Ky., Aug. 4, 1841.

Breckenridge, or **Breckinridge**, JOHX CABELL: statesman and general; grandson of John, noted above; b. near Lexington, Ky., Jan. 21, 1821. He studied law; practiced at Lexington, and was elected to Congress by the Democrats in 1851. He was chosen Vice-President of the U. S. in 1856, when James Buchanan was elected President. In 1860 he was nominated for the presidency by the Anti-Douglas Democrats who seceded from the convention that met at Charleston. His competitors were Abraham Lincoln, John Bell, and Stephen Douglas. Breckenridge received seventy-two electoral votes, being supported by all the Southern States except Virginia, Kentucky, Tennessee, and Missouri. Having been elected to the U. S. Senate, he took his seat in Mar., 1861, but he joined the Confederate army in the autumn of that year. He served as major-general at the battle of Stone river, which ended Jan. 2, 1863, and at Chickamauga, Sept. 19 and 20 of that year. In May, 1864, he defeated Gen. Sigel at Newmarket, in Virginia. He became secretary of war at Richmond in Jan., 1865; visited Europe about five months later; returned to the U. S. in 1868. D. in Lexington, Ky., May 17, 1875.

Breckenridge, ROBERT JEFFERSON, D. D., LL. D.: Presbyterian minister; b. at Cabell's Dale, Ky., Mar. 8, 1800; an uncle of the preceding. He graduated at Union College in 1819; practiced law in Kentucky eight years (1823-31); then turned to theology, and was pastor in Baltimore 1832-45; president of Jefferson College 1845-47; became pastor in Lexington, Ky., in 1847. Professor of Theology at Danville in 1853; resigned 1869. He published *Travels in Europe* (Philadelphia, 1839) and several works on theology. His principal work is in two volumes, *The Knowledge of God, Objectively Considered* (New York, 1857), and *The Knowledge of God, Subjectively Considered* (1859). He was a loyal friend of the Union in the civil war and presided over the convention in Baltimore which in 1864 renominated Mr. Lincoln. D. in Danville, Ky., Dec. 27, 1871.

Breckinridge, WILLIAM CAMPBELL PRESTON, LL. D.: Congressman; b. in Baltimore, Md., Aug. 28, 1837; studied at Centre College, Danville, Ky.; became a lawyer; served in the Confederate army as colonel of the Ninth Kentucky Cavalry; was afterward Professor of Equity Jurisprudence in Cumberland University; elected to Congress as a Democrat in 1884, '86, '88, '90, and '92.

Breckinridge, Gen. JAMES: a soldier of the Revolution; b. near Fincastle, Botetourt co., Va., Mar. 7, 1763; graduated at William and Mary College in 1785; became an eminent Federalist lawyer in Virginia. He was a member of

Congress (1809-17), and co-operated with Jefferson in establishing the University of Virginia. He was one of the originators of the Chesapeake and Ohio Canal. D. in Fincastle, Va., Aug. 9, 1846.—His brother JONX (1760-1806), a U. S. Senator from Kentucky, Attorney-General to President Jefferson, and a supporter of his measures, was the ancestor of the Kentucky Breckenridges named above.

Brecon, or Brecknockshire: an inland county of South Wales; area, 719 sq. miles. It is bounded N. by Radnor, E. by Hereford, England; S. by Glamorgan, and W. by Caermarthen. The surface is occupied by several mountain-ranges and deep, beautiful, and fertile valleys. The highest point of this county is Brecknock Beacon, which has an altitude of 2,862 feet. Old red sandstone underlies the southern and middle parts of the county, and Silurian rocks are found in the N. The chief rivers are the Wye (which forms the N. E. boundary), the Usk, Elan, and Tawe. The staple products are oats, barley, wheat, and cattle. It has extensive iron-works. The climate is moist, but temperate and salubrious. Capital, Brecon. The other principal towns are Builth, Crickhowell, and Hay. The Welsh language is still that of the peasantry and of the middle class. Pop. (1891) 57,031.

Brecon, Brecknock, or Aber-Honddu: a town of Wales; capital of county of same name; finely situated in a valley on the river Usk; at the mouth of the Honddu; 38 miles by rail W. S. W. of Hereford (see map of England, ref. 11-E). It has beautiful promenades, an old castle, a collegiate church, and a college; also considerable manufactures. Pop. 6,500.

Breda': a town of Holland; in North Brabant; situated at the confluence of the navigable rivers Aa and Merk; 16 miles S. S. E. of Dordrecht (see map of Holland and Belgium, ref. 7-E). It is connected by railway with Antwerp and The Hague. It has a castle built in 1350, a Gothic cathedral, the spire of which is 362 feet high, and a magnetic observatory; also manufactures of linens, carpets, hats, soap, leather, etc. This town can be protected against an invading army by inundating the country around it. It is celebrated as the scene of the "Compromise of Breda," by which the patriots protested against the tyranny of Philip II. in 1566, and as the place from which Charles II. issued the "Declaration" which preceded his restoration in 1660. Pop. (1891) 22,536.

Bredahl, bray'-daal', CHRISTIAN BYVID: Danish poet; b. Oct. 30, 1784; d. Jan. 16, 1860. *Dramatic Scenes*, in six parts, appeared, the first in 1819 and the last in 1833. This is his chief work, and there are passages in it that by their glowing pathos and powerful diction remind us of Shakspeare. He wrote several dramas that were well received by the public. RASMUS B. ANDERSON.

Bredero, GERBRAND ADRIAENSZ: Dutch poet and playwright; b. in Amsterdam, 1585; d. in Amsterdam, 1618. He belonged to the middle class, and his education was comparatively meager. Like Shakspeare, he knew "small Latin and less Greek." He was trained to be a painter, but his heart was in literature. The defects of his education were in a measure made good by association with the best spirits of his time—Grotius, Heinsius, Scriverius, Vondel, Coster; and his talents were such that he became the best writer of comedy Holland has produced. Still, his lack of the classics made him essentially mediæval and romantic in his sympathies, as is shown by the themes of his plays. These fall into two classes: tragi-comedies (essentially *comedias de capa y espada*)—*Roderijk ende Alphonsus* (1611); *Griane* (1612); *Lucele* (1616); *de Stomme Ridder* (1618)—and pure comedies: *de klucht van de Koe* (1612); *Symen sonder soeticheyt* (1612); *van de Meidenwer* (1613); *Het Moortje* (based on the *Eucuchus* of Terence, 1615); *de Spaensche Brabander Jerolimo* (based on a French trans. of Hurtado de Mendoza's *Lazarillo de Tormes*, 1617). The last piece is commonly regarded as Bredero's *chef d'œuvre*. Besides his plays, Bredero wrote poems in a singularly direct and imaginative style; and these were published in 1622 under the title *Buerligh amourens ende awduchtigh groot liedboek*. His complete works were published in Amsterdam, 1638, and often since. See J. ten Brink, *G. A. Bredero, hist.-aesth. studie van het nl. blijspel der XVII. eeuw* (Utrecht, 1859). A. R. MARSH.

Bree, bray, MATHIEU IGNAÇE: Flemish historical painter; b. at Antwerp, Feb. 22, 1773. Among his works are *Rubens Dictating his Last Will* (in the Antwerp Museum); *Entrance of Napoleon into Antwerp*; and *Van der Werff Addressing the Famished Populace during the Siege of Ley-*

den, 1574. He was director of the Academy of Fine Arts in Antwerp, where he died Dec. 15, 1839.

Breeches Bible: See BIBLE (*Modern Versions*).

Breech-loading Firearms are those which are loaded by putting the cartridge directly in at the breech instead of ramming it in at the muzzle. It is said that breech-loading guns were used early in the reign of Henry VI. of England, and it is certain that they were used in Scotland about that time. There are several ancient specimens in the Tower of London. Many attempts to improve this kind of arms have been made, and of late with much success. Among the most celebrated weapons of this character are the Armstrong and Whitworth guns, the Krupp steel guns, the *mitrailleuse*, and among small-arms the needle-gun and the Chassepot, Enfield, Greener, Lebel, Martini, Mauser, Sharps, Snider, Spencer, Ward-Burton, and Remington rifles.

Breed: a variety produced in any animal species in consequence of domestication, by changes somewhat analogous to those which occur in cultivated plants. The changes originated by breeding (artificial selection) are in some species, as in the dog and pigeon, very marked, producing external, and even structural, differences which, if they were permanent and originated by natural and unexplained causes, would confessedly be regarded as sufficient to establish difference of species or even genus. But the fact that thoroughbred animals, when neglected or allowed to go wild, tend to revert to the original type, and the not less important fact that animals of the most widely different varieties of the same species will (with a few possible exceptions) breed freely with each other, producing fertile young (which is rarely the case with those of different species), are by many held to show a radical difference between varieties or breeds and species. The study of the variations produced by artificial selection suggested to Darwin the name "natural selection" as applied to analogous processes in nature.

Some of the results of artificial selection on animals are truly marvelous. The numerous varieties of the dog and the pigeon have been, to a great extent, produced by design; animals being bred to develop certain desired peculiarities, the principle being that "like produces like," or that certain qualities possessed by the parent may be perpetuated and increased in the offspring. The milk-producing qualities of the Ayrshire cow, the butter-making excellence of the Jersey breed, the long-wooled Cotswold sheep, and the new breeds of easily fattened swine, afford illustrations of the industrial importance of this remarkable plasticity or adaptability of the various domestic animals—an adaptability which has only of late been scientifically studied, and the limitations of which are as yet not well known. See Darwin, *Domesticated Animals and Cultivated Plants* (1867). Revised by DAVID S. JORDAN.

Breed, DAVID RIDDLE, D. D.: Presbyterian minister; b. in Pittsburg, Pa., June 10, 1848; graduated at Hamilton College (1867), and from Auburn Theological Seminary (1870); pastor in St. Paul, Minn. (1870-85), and in Chicago, Ill., from 1885; has published several little books, one of which, *More Light*, has a very wide circulation in a number of languages. He has also published *Abraham, the Typical Life of Faith* (Chicago, 1886); *A History of the Preparation of the World for Christ* (1891); and *Heresy and Heresy* (1891).

Breese, KIDDER RANDOLPH: captain U. S. navy; b. in Philadelphia, Apr. 14, 1831; entered the navy as a midshipman Nov. 6, 1846. At the close of 1861 he commanded the third division of Porter's mortar flotilla; took part in the bombardment of Forts Jackson and St. Philip; participated in the attacks on Vicksburg during June and July, 1862; took part in nearly all the severe engagements on the Mississippi and its tributaries during 1863 and 1864; was engaged as fleet-captain in the naval assault on Fort Fisher of Jan. 15, 1865, and commanded the storming party. D. at Newport, R. I., Sept. 13, 1881.

Breese, SAMUEL LIVINGSTON: rear-admiral U. S. navy; b. in New York in 1794; entered the navy in 1810; served against Great Britain and Mexico; became captain in 1841, and rear-admiral in 1862. D. at Mt. Airy, Pa., Dec. 17, 1870.

Breese, SIDNEY: b. at Whitesboro, Oneida co., N. Y., July 15, 1800, graduated at Union College in 1818. In 1821 he was called to the Illinois bar; attained distinction, an officer in the Black Hawk war, U. S.; State attorney 1822-27; appointed U. S. attorney for Illinois; U. S. Senator from Illinois (1843-49); speaker of the Illinois Legislature

in 1850. He was made circuit judge in 1855, and again in 1855, becoming chief judge of that bench. He was one of the originators of the Illinois Central R. R. D. at Pinckneyville, Ill., June 27, 1878.

Breeze: a soft wind, a gentle gale. *Land and Sea Breezes.*—In a fair day, near the seashore, an hour or two after sunrise, a gentle wind begins to blow from the sea toward the land, gradually increasing in force during the day. With the declining sun the sea-breeze loses its power, and dies out before sunset. A lull then ensues, after which a land-breeze sets in from the land toward the sea, and continues all night until before sunrise, when another calm occurs. The cause of these alternate winds is to be found in the fact that the land is more readily heated by the rays of the sun, and more quickly cooled in their absence, than the sea. In an island, for instance, in proportion as the sun rises above the horizon the land becomes warmer than the neighboring sea. Their respective atmospheres participate in these unequal temperatures: the fresh air of the sea rushes from all directions in the form of a *sea-breeze*, which makes itself felt along the whole coast, and the warmer and lighter air of the island will ascend into the atmosphere. During the night it is the reverse. The island loses heat by radiation, and cools quicker than the sea. Its atmosphere, having become heavier, flows into that of the sea in the form of a *land-breeze*; and this interchange lasts until the temperature, and consequently the density, of the two atmospheres has again become the same. This is the phenomenon observed almost daily on nearly all the seaboards.

Mountain-breezes.—Similar alternate breezes are observed to play between the great mountain-chains and the neighboring plains, as in the Alps. On a fair day strong breezes rush up the valley toward the overheated mountain-slopes, and descend with equal force during the night; for during the day the mountains absorb more heat than the neighboring free atmosphere, and radiate more during the night. See WINDS.

Brehm, braym, ALFRED EDMOND: b. at Rentendorf, Saxe-Weimar, Feb. 2, 1829; studied natural history under his father, the famous ornithologist, Christian Ludwig Brehm; traveled in Egypt, Nubia, and the Sudan; visited Spain and Norway; went once more to Africa in 1862 in company with Duke Ernst of Saxe-Coburg-Gotha; was made director of the zoological garden in Hamburg 1863, and removed in 1867 to Berlin, where he founded the great aquarium. He published *Illustrirtes Thierleben* (6 vols., 1863), which was translated into French, and of which a new edition in 10 vols. appeared in 1868; *Das Leben der Vögel, Die Thiere des Waldes*, etc. D. in his native place, Nov. 15, 1884.

Brehon Law: the law by which Ireland was governed generally before the conquest, and to some extent as late as the eighteenth century. It was so called from the brehons who expounded it, and who were a class of jurists or law professors existing among the Irish according to a system common to the Gauls, Britons, and other Celtic nations. The office of brehon was often hereditary in families, and was of great importance, partly because the brehons preserved the laws in written form and not by tradition, as was the case with the bards, who also were clothed with a certain legal authority. The brehons were still in the full exercise of their functions as late as the reign of Elizabeth, as is shown by the Government records at Dublin, and traces of them are found in the early part of the eighteenth century. The largest body of these laws is preserved in a Gaelic manuscript called *Sluachas Mór*, which was compiled in the first part of the fifth century. This manuscript, together with others, has been published in fac-simile and translated by a royal commission appointed in 1852, not, however, without numerous errors, owing to a lack of profound knowledge of old and modern Gaelic, and to the obscurity of the subject-matter. These show us that there existed in ancient Ireland a system of laws in which the property and personal rights of individuals were minutely regulated. There was a complicated system of land-tenure from monarch to slave through landlords and tenants, under which much of the land was held in common for tillage or pasturage. There were petty kingdoms, and divisions and sub-divisions of these, held together in a system not unlike the feudal system of England, but more loosely organized. The grades of rank were numerous, and the right to claim a certain rank depended upon the possession of a fixed amount of cattle, agricultural implements, and household

goods. The laws governing marriage allowed great liberty to the husband in contracting irregular relations. They gave to the wife the right to alienate a portion of her separate estate, and to control to some extent her husband's right of alienation. The provisions governing the distribution of the estates of deceased persons were very minute, but obscure by reason of the technicality of the language employed. The putting out of children to be nursed and educated, which was practiced by the rich, was regulated with great particularity by laws which prescribed the fees to be paid, the instruction to be given to the children, the conditions upon which they could be returned before the end of pupillage, etc. In the law of torts all offenses, except murder, were condoned by fines or mulcts, and the amounts of these fines and the persons responsible for their payment were prescribed, in some cases the family being made liable therefor, and in other cases sureties somewhat after the manner of the old English institution of frank-pledge. The nature of the courts by which these laws were enforced was not clearly stated; the process, however, is more fully outlined, and included distress and other proceedings, in principle resembling the common law of England. This ancient body of laws is valuable for the light it throws upon the customs of the people and their household and public life, and upon the history of totemism, feudalism, the evolution of the clan, tribe, and state, and other kindred subjects. See Sir Henry S. Maine's *Lectures on the Early History of Institutions*.
F. STURGES ALLEN.

Breitfeld: German village; 5 miles N. of Leipzig; the scene of two victories of the Swedes over the Imperialists, the first by Gustavus Adolphus over Tilly, Sept. 17, 1631, the second by Torstenson over Archduke Leopold and Piccolomini, Nov. 2, 1642. It also figured in the battle of Leipzig, Oct. 16, 1813.

Breitinger, JOHANN JACOB: German critic; b. in Zurich, Mar. 1, 1701. He was a friend and a collaborator of Bodmer. His chief work is the *Critische Dichtkunst* (Zurich, 1740), in which he expounds the aesthetic principles which helped to revolutionize German poetry. See Braitmaier, *Geschichte d. poet. Theorie*, etc., 1888. D. in Zurich, Dec. 15, 1774.

JULIUS GOEBEL.

Breitman, HANS: See LELAND, C. G.

Bremen: a state and free city of Germany; on both sides of the river Weser; about 45 miles from the sea and 60 miles S. W. of Hamburg; lat. 53° 4' 36" N., lon. 8° 48' 54" E. Area, 99 sq. miles (see map of German Empire, ref. 3-D). The city is divided into the old and the new town, the former of which is on the right bank of the river, and has narrow, crooked streets. The new town, which is connected with the old by two bridges, is more regular. The old ramparts have been leveled and converted into beautiful promenades and pleasure-grounds. The most remarkable edifices are the cathedral, built about 1,100; the fine old Gothic town-hall, with a famous wine-cellar; the exchange, the museum, and the observatory of Olbers. Bremen has a large public library, a normal school, a theater, and a hospital; also manufactures of woolen and cotton goods, beer, liquor, sugar, paper, starch, and cigars. As a commercial city this is one of the most important of Germany, having an extensive foreign trade, especially with the U. S., to which it ships about half of the total German emigration. It is connected by railway with Hanover, Bremerhaven, and other towns. Vessels drawing 7 feet of water can ascend to this point; large ships stop at Bremerhaven. The trade of Bremen has increased rapidly in the last fifteen years. The chief articles of export are woolen goods, linens, glass, hemp, hides, rags, wooden toys, and wool. The imports consist of cotton, coffee, sugar, rice, tobacco, wines, dyewoods, oil, tea, etc. Ship-building is carried on here extensively. The imports in 1890 amounted to 749,938,507 marks, and the exports to about 706,600,000 marks. The number of emigrants that embarked here in 1890 was 110,410. Pop. of city proper (1890) 124,887.

Bremen was founded before 788 A. D., and was made a bishopric by Charlemagne. It was one of the chief towns of the Hanseatic League. In 1815 it was admitted into the Germanic confederation by the Congress of Vienna. In 1888 it joined the German Zollverein. The government of this city and the territory attached to it is a nominal republic, the total population of which in 1890 was 180,443. It is governed by a senate, forming the executive, and a house of burgesses, invested with the power of legislation.

Revised by C. K. ADAMS.

Bremen: town; Marshall co., Ind. (for location of county, see map of Indiana, ref. 2-E); on Balt. and Ohio R. R.; 13 miles N. E. of Plymouth, the capital of the county. It is a manufacturing town in an agricultural and lumbering district. Pop. (1880) 1,028; (1890) 1,076.

Bremer, FREDRIKA: a popular Swedish novelist; b. in Åbo, Finland, Aug. 17, 1801. She was educated at Stockholm, and became in early youth familiar with German literature. Her first story, *Årel and Anna*, appeared in 1828 as No. 1 of *Sketches from Every-day Life (Tekningar ur hvardagsliforl)*, a general title under which she continued to publish stories until 1848. Some of the best known of these sketches are *The President's Daughters (Presidentens dottrar, 1834); Nina (1835); The Neighbors (Grannarne, 1837); Home (Hemmet, 1839); Brothers and Sisters (Syskonlif, 1848); The Bondmaid (Träslinnan, 1840)* is in another style. Miss Bremer visited the U. S. in 1849, and after her return to Sweden published *The Homes of the New World (Hemmen i den nya världen, 1853-54)*. *Hertha* appeared in 1856, and *Father and Daughter (Fader och Dotter)* in 1858. D. at Arsta, near Stockholm, Dec. 31, 1865. Most of Miss Bremer's stories have been translated into English, French, and German. See her *Life, Letters, and Posthumous Works*, edited by her sister Charlotte (New York, 1868).

Bremerha'ven: a town and port of Germany; on the right bank of the Weser, near its mouth; about 35 miles N. N. W. of Bremen (see map of German Empire, ref. 2-D). It is a part of the state of Bremen. It has an outer and an inner harbor, built by the citizens of Bremen (1827-30) for the accommodation of large ships which can not ascend the river. Pop. (1890) 16,335.

Brendan: See ST. BRENDAN.

Brenham: city; capital of Washington co., Tex. (for location of county, see map of Texas, ref. 5-1); on Hous. and Tex. Cen. and Gulf, Col. and Santa Fé R. Rs.; 70 miles S. W. of Houston. It is in a fertile region adapted to the growth of cotton, corn, and small grain; has fine public school, large cotton-seed oil-mill, 2 cotton compresses, 2 foundries, electric-light system, and a number of small factories. Pop. (1880) 4,101; (1890) 5,209; (1893) estimated, 7,000.

EDITOR OF "BANNER."

Bren'er Pass: lowest pass in the main chain of the Alps; on the route between Innsbruck and Botzen; 4,775 feet above the level of the sea. The mountains on each side rise about 7,500 feet above the pass, which is open at all seasons of the year. In 1868 a railway was opened through this pass from Innsbruck to Botzen, at which point it connects with the railways of Germany and Italy. At the summit of the pass is the small village of Brenner.

Bren'us [Celt. king]: a famous chief of the Senones, a tribe of ancient Gauls who crossed the Apennines in 390 B. C., invaded the Roman state and defeated its army. Brennus then captured Rome, except the capitol, which he besieged for about six months. During this siege he attempted to surprise the garrison by night, but he was repulsed by Manlius, who was awakened by the cackling of some geese. The Romans purchased peace by the payment of 1,000 pounds of gold. To increase the price Brennus is said to have thrown his sword on the scale. See, on this subject, Arnold's *History of Rome*.

Brennus: a Gallic chief who invaded Greece with a large army about 280 B. C., and ravaged Macedonia and Thessaly. He was defeated at Delphi by the Greeks, who were said to have been aided by an earthquake.

Brenta'no, CLEMENS: German novelist and dramatist; b. in Frankfort-on-the-Main, Sept. 9, 1778. He was a brother of Goethe's friend, Bettina von Arnim; was a romanticist, and with unsettled mystic tendencies, so that for six years his dominant task was recording the revelations of the nun of Dülmen. He produced dramas entitled *Ponce de Leon (1804)* and *The Foundation of Prague (1816)*. Among his admired novels is *The History of Caspar the Brave and the Fair Anneli*. In conjunction with Arnim he published the collection of ballads called *Des Knaben Wunderhorn (1806-08; 2d ed. 1815)*. D. in Aeschaffenburg, June 28, 1842.

Brentano, LUJO: economist; b. in Aeschaffenburg, Bavaria, Dec. 18, 1844; educated at Dublin and at German universities; professor in Breslau 1872, in Strassburg 1882, in Vienna 1888, in Leipzig 1889, in Munich 1891. Author of work on *English Guilds (1870); Die Arbeitergilden der Gegenwart (1871-72); Das Arbeitsverhältnis gemäss dem*

heutigen Recht (1876); Die Arbeitsversicherung (1879); and other works on English and German social questions.

Brentford: a market-town of England; capital of Middlesex; on the Thames; at the mouth of the Brent; 7 miles W. S. W. of London (see map of England, ref. 12-J). It is connected with Kew by a bridge across the Thames; has large gin-distilleries and the works of the West London Water Company. It consists mostly of one long street. The town is rich in historical interest, and has frequently been alluded to by Shakspeare and other dramatists. Pop. (1891) 13,736.

Brenton, WILLIAM: colonial Governor; emigrated to Boston from Hammersmith, England; held important offices in Massachusetts and Rhode Island, where he was several times Lieutenant-Governor. He was President of Rhode Island (1660-61) and Governor (1666-69); acquired large estates as a surveyor; name perpetuated in Brenton's Reef. D. in Newport, 1674.

Brenz (in Lat. *Brentius*), JOHANN; German reformer; b. at Weil, in Swabia, June 24, 1499; was educated at Heilidelberg, and became a Protestant under Luther's influence. He was a popular preacher at Halle, in Swabia, from 1522 to 1546, until, with the outbreak of the Smalcald war, he became an exile. Called by Duke Christopher to Stuttgart in 1553 as provost of the cathedral church, he thoroughly reorganized the Würtemberg Church, giving it its Church Orders, Confession, and Catechism. He participated in many theological conferences, and wrote extensive volumes of expository lectures. In his defense of Luther's doctrine of the Lord's Supper he is sometimes charged with being a Ubiquitarian. D. in Stuttgart, Sept. 17, 1570. See his *Life* by J. Hartmann (Elberfeld, 1862).

Revised by HENRY E. JACOBS.

Bres'cia: a province of Lombardy, Italy; bounded N. by the Tyrol, E. by Lago di Garda and Verona, S. by Cremona, and W. by Bergamo. Area, 1,644 sq. miles. The soil is fertile. Silk and wool are among the staple productions. It has manufactures of woolen goods, firearms, and cutlery of superior quality. Capital, Brescia. Pop. (1890) 501,531.

Brescia (anc. *Brixia*): a handsome city of Lombardy, Italy; capital of province of same name; pleasantly situated on a wide plain and on the river Garza; 62 miles by rail E. N. E. of Milan (see map of Italy, ref. 2-C). It is on the railway which connects Milan with Venice. It has an old cathedral, a mediæval structure, and a new marble cathedral (Duomo Nuovo) commenced in 1604; also many churches richly adorned with works of art by celebrated masters, an episcopal palace, a college, a renowned public library (Biblioteca Quiriniana), a museum of antiquities, a botanic garden, and a theater. The Temple of Hercules, dating from the second century, was excavated in 1822, and is an archaeological museum. Here are manufactures of cutlery, silk, linen, and woolen fabrics, paper, and wine. The streets and public squares are adorned with numerous fountains. Brixia was a very ancient town, and was the capital of the Cenomanni, a Gallic tribe. It was plundered by Attila, but soon recovered from this injury. The Emperor Otho I. declared it a free city about 936. It was bombarded and taken by the Austrian general Haynau in 1859. Pop. (1890) 43,354.

Bres'lan, or Breslaw (in Lat. *Bratislavia*; Polish *Wrocław*): a large city of Prussia; capital of Silesia; on the river Oder; at the mouth of the Ohlau; and on the railway from Berlin to Vienna; 221 miles by rail S. E. of Berlin; lat. (of observatory) 51° 6' 56.5" N., long. 17° 2' 18" E. (see map of German Empire, ref. 5-1). It is, next to Berlin, the most populous city of Prussia. It is divided by the Oder into the old and new towns, which are connected by numerous bridges. The new town has wide and regular streets. It is the seat of a Roman Catholic bishop. The most remarkable edifices are a cathedral founded in the twelfth century, St. Elizabeth's church, the theater, the Rathhaus, exchange, mint, and university buildings. The university has a library of 350,000 volumes. Breslau contains other public libraries, an observatory, a botanic and zoological garden, four gymnasias, and numerous other schools of different kinds. It has an extensive trade, and is the greatest market for wool in Germany. It has manufactures of woolen, linen, cotton, and silk fabrics, broadcloths, lace, jewelry, soap, earthenware, starch, and ardent spirits. The number of distilleries in it is about 100. Railways extend to Dresden, Posen, Warsaw, and Vienna. Breslau is first mentioned by Dit-

mar, the chronicler, in 1000 A. D., and it seems to have been founded about that date. It became the seat of a bishop in 1052, and the capital of an independent duchy in 1163. Reduced to ashes by the Mongolians in 1241, it recovered, and in 1261 joined the Hanseatic League. In 1335 it came under Bohemia, and after the battle of Mohacz it passed to Austria. In 1741 it was taken by Prussia. Pop. (1890) 335,186.

Brest (Lat. *Brestum*): a fortified city and seaport of France; department of Finistère; 314 miles W. of Paris (see map of France, ref. 3-A); said to be the strongest military port in France. It is on the north shore of the road of Brest, in lat. 48° 23' N., lon. 4° 29' W. Its outer harbor is one of the best and most capacious in Europe, having ample room for 500 ships of the line. The harbor or road communicates with the ocean by a single channel called the Goulet, which is 1,750 yards wide. In the middle of this channel are the Mignan rocks, which render the entrance of hostile ships very difficult and dangerous. The outer harbor or roadstead is about 6 miles long, and is defended by powerful batteries. The inner harbor is also secure and spacious. From its natural advantages and the strength of its defensive works, Brest is considered one of the first naval stations of Europe. Here are five large basins, extensive quays, an arsenal, vast magazines, large barracks, and a prison, the Bague, which can accommodate 4,000 convicts. Brest is the western terminus of a railway which extends to Paris via Rennes and Le Mans. The city is built on the slopes of several hills, and is divided into two parts, which can communicate only by boats. It is encircled by ramparts, which, being planted with trees, form pleasant promenades. It has a naval school, a medical school, a communal college, besides numerous other schools, a public library, a botanic garden, an observatory, etc. This port has little trade except for the supply of the naval department, and its industry is confined to the equipment of the navy. This place was not of much importance until Cardinal Richelieu commenced in 1631 the fortifications, which were completed by Vauban. A submarine telegraph cable connects this harbor with Duxbury, Mass. Pop. (1881) 66,110; (1891) 75,854.

Brest Litovsk': a town of Russia; province of Grodno; 92 miles S. of Grodno (see map of Russia, ref. 8-B). It has several factories and considerable river trade, and is the seat of a United Armenian bishop. Pop. 39,901.

Bretagne (in Lat. *Britannia Minor*), usually called **Brittany** in English, or **Little Brittany**: a former province of France; extensive peninsula; bounded N. by the English Channel, and W. and S. W. by the Atlantic Ocean. It is now comprised in the departments of Finistère, Côtes-du-Nord, Morbihan, Ille-et-Vilaine, and Loire-Inférieure. It was divided into Haute-Bretagne (Upper Brittany), capital Rennes, and Basse-Bretagne (Lower Brittany), capital Vannes. Among the other towns are Brest, Quimper, and St. Malo. The surface is partly mountainous, and the scenery wild and beautiful. This province, which in ancient times was called *Armorica*, was settled by the Cymri, a Celtic race to which the ancestors of the Welsh belonged. It contains large tracts of heath nearly uncultivated, and extensive forests. The outline is indented with numerous bays and inlets, which afford facilities for navigation and commerce. Brittany abounds in ancient monuments and cromlechs, which are ascribed to the Druids. The modern Bretons are tenacious of their ancient customs and peculiarities, and are generally Catholics. They are more loyal and devout than the majority of the French. Their language (the Armorican) is peculiar, and closely resembles the Welsh. This region and its people have a special interest for antiquarians. It became subject to the Franks in the time of Charlemagne. In 848 A. D. Nominoë, an Armorican chief, assumed the title of King of Bretagne, and defeated the army of King Charles the Bald. The Normans conquered it in the tenth century.

Geoffroi, Count of Rennes, became in 992 the first Duke of Bretagne, which continued to be an almost independent feudal duchy until it was annexed to France in 1531. Pop. (1891) 3,162,272. See Daru, *Histoire de Bretagne* (1826); Courson, *Histoire des Peuples Bretons, etc.* (1847).

Brethren: See PLYMOUTH BRETHREN (so called); also DUNKERS and UNITED BRETHREN IN CHRIST.

Brethren and Sisters of the Free Spirit: a sect of extremely pantheistic and immoral semi-monastic enthusiasts, which probably originated in the sect of Almericians, fol-

lowers of Amalric of Bena, who died in 1209. Their principal doctrines were, according to the testimony of their Catholic prosecutors, our only source of knowledge: (1) God is all that is; (2) man is therefore God; (3) through sin (origin unexplained) there has come about a separation between man and God; (4) the reunion comes when man recognizes this union with God; (5) when he does, then he knows himself as God does, is perfect, and sin is impossible. The consequence was of course the grossest immorality. They suffered much from the severity of the authorities, but became very numerous in Germany, France, and Italy. The sect lasted till about 1450. They were otherwise known as *Hominibus Intelligentibus* (men of understanding), also as Adamites, Turlupins, Schwestriones, Picards, etc.; and it is believed that the immoral "Adamites" now existing in Bohemia are their descendants.

Brethren of the Christian Schools: same as BROTHERS OF THE CHRISTIAN SCHOOLS (*q. v.*).

Brethren of the Common Life (in Lat. *Fratres Vitæ Communis*): an association of pious men founded in Deventer, Holland, by Gerhard Groot about 1376. They had all possessions in common, wore a uniform dress, ate at the same table, and pursued the same tasks. They took the three monastic vows of obedience, poverty, and celibate chastity, but discipline was maintained, generally according to the rule of St. Augustine, without lifelong vows. Later, "Sisters of the Common Life" appeared. They lived in special houses, the sexes apart. The head of each band of brothers was called the rector; of sisters, the Martha; the head of all the brothers, the "father," who lived at Deventer; of the sisters, the "head Martha," who lived at Utrecht. The brothers supported themselves by teaching and copying manuscripts. They were forbidden to beg. For this reason the mendicant orders opposed them. In the popes they found, however, supporters, and the Council of Constance indorsed them. From Holland they spread to Northern Germany, Italy, and Portugal. In 1460 they numbered 130 houses. Their schools were famous. Thomas à Kempis belonged to them, and Wessel and Erasmus were educated by them. Luther and Melancthon esteemed the brotherhood highly, and many of them became Protestants; others connected themselves with the Jesuits and other Roman Catholic orders, and before 1650 the fraternity was extinct. See S. Kettlewell, *Thomas à Kempis and the Brothers of the Common Life* (London, 1882, 2 vols.; 2d ed. 1884).

Revised by S. M. JACKSON.

Breton, *bre-tôn'*. ÉMILE ADELARD: landscape-painter; brother and pupil of Jules Breton; b. at Courrières, Pas-de-Calais, France; first-class medals, Paris Expositions, 1878 and 1889; Legion of Honor 1878; medals at Centennial Exhibition, Philadelphia, 1876, and Vienna Exposition 1873. A fine winter landscape by him is in the Luxembourg Gallery, Paris. W. A. C.

Breton, JULES ADOLPHE: painter of French peasant-life in village and field; b. at Courrières, May 1, 1827. He was a pupil of Félix de Vigne and of Drölling, and began exhibiting at the Salon about 1850. His first recompense was a third-class medal at the Paris Exposition of 1855, and in his artistic career since then he has been plentifully besprinkled with honors. He received the medal of honor at the Salon of 1872, and was made commander of the Legion of Honor in 1889; member of the Institute 1886. His pictures are excellent from the technical point of view, and his earlier work particularly evinces true poetic sentiment. In later pictures, however, the sentimental side of his art is sometimes too prominent, and the sturdy vigor of his earlier period is lacking. *Blessing the Harvest* (1857), *Calling Home the Reapers* (1859), *Evening* (1861), and *The Gleaner* (1877), all in the Luxembourg Gallery, are among his best works, *Blessing the Harvest* being one of the works with which he first attracted wide public notice. *Evening in a Hamlet of Finistère*, a picture of rare poetic quality, was sold in the Seney sale in New York in 1885 for \$18,000, considered at that time a very high price for a picture by a modern artist, but it was surpassed by the price paid for his picture *The Communicants*, at the Morgan sale a few years later, which brought \$45,000. His pictures are very popular in the U. S., and some important ones are owned by collectors in that country. WILLIAM A. COFFIN.

Bretonic Language: The Bretonic or Armorican language is one of the few surviving remnants of the Celtic stock. The language of Basse-Bretagne, like its population, is an immi-

gration from England, and is therefore most closely related to the Welsh and the extinct Cornish; in fact, in the earliest records scarcely distinct from them. It is now divided into several dialects, of which the chief are those of Léon, of Tréguier, of Cornouailles, of Vannes. They are all more or less mixed with French loan-material, and are gradually yielding place entirely to the French. The orthography of Bretonic is essentially the French. The scanty earliest monuments of the language date from the eighth century, and consist almost entirely of glosses to Latin texts and proper names in mediæval documents. With the end of the fifteenth century begins the Bretonic literature proper, which is almost exclusively religious in content: hymns, lives of saints, etc., especially a series of religious dramas, or the so-called Mysteries. The nineteenth century presents also several secular poets. The most important element of the literature is constituted, however, by the tales and songs collected from popular tradition. The best survey of the development of language and literature is obtained from J. Loth's *Chrestomathie bretonne* (1890). See also CELTIC LANGUAGES.

R. THURNEYSEN.

Breughel, brü'gél, JAN: Flemish painter; b. in Brussels in 1568; called VELVET BREUGHEL, in reference to the material of his clothing. He painted landscapes, animals, flowers, and small figures, which are finely finished. Among his chief works are several pictures of *Adam and Eve in Paradise*, which are in the museums of the Louvre, Berlin, and The Hague. The figures of these were painted by Rubens. D. in Antwerp, Jan. 13, 1625.

Breughel, PIETER: Flemish painter; father of the preceding; b. at Breughel, near Breda, about 1520. He painted with success village festivals, comic subjects, and the amusements of rustic life. D. in Brussels in 1569.

Brevard, EPHRAIM, M. D.: b. in Mecklenburg co., N. C., about 1750; graduated at College of New Jersey in 1768; educated for a physician, and practiced at Charlotte, N. C.; became secretary of the noted Mecklenburg convention, which met in May, 1775, and was one of the committee to prepare resolutions. As such he participated in drafting its resolutions, which after 1819 were reputed to contain a famous declaration of independence, nearly fourteen months before Congress took a like step. He died in Charlotte, N. C., in 1783, but nothing was found in his papers corresponding to the declaration, although he was the secretary of the convention. He and six brothers entered the continental army; he was taken prisoner at Charleston, S. C., in 1780, and never recovered from the hardship of his imprisonment. See MECKLENBURG DECLARATION OF INDEPENDENCE.

Breve: in music, a note formed thus \square , or \square , or \square , and equivalent to two minims. The note for a whole bar in modern notation is called a semibreve. The breve is now used only in *alla capella* movements, psalm-tunes, and figures or at the close of a composition.

Brevet [Fr. letters patent, hence, commission; liter., a short writing, from Lat. *brevis*, short]: a military term applied to a class of commissions granted to officers of the U. S. army, and to the army and navy officers of Great Britain. Formerly in Great Britain a general brevet was issued upon special occasions, such as coronations, the end of a great war, the birth of an heir to the throne, etc., and when no occasion of this kind occurred they were issued at intervals of about six years, for the purpose of giving to officers a rank and pay commensurate with their length of service. From the time of James II. this general brevet formed a part of the military system of England and was an implied condition upon an officer entering the service. The brevet advanced all officers of the army above the rank of lieutenant one grade in rank and pay, i. e. a captain became a major, a major became a lieutenant-colonel, etc. The officers of the navy received a similar advance. Brevets based upon some of the above-mentioned occurrences were issued in 1837, 1838, 1841, 1846, 1851, and 1851. Brevets were also conferred upon officers for acts of conspicuous gallantry in the field. In 1854 this system was changed and restricted. A brevet, without increase of pay, is now conferred upon an officer after five years' service as lieutenant-colonel, and, with a limited increase of pay and right to command, upon officers of lower rank for distinguished services in the field. In the U. S. brevets may be conferred for distinguished services upon officers of all ranks, by nomination by the President and confirmation by the Senate, in the same way that other appointments are made. Brevets, however, give no additional

pay, and confer upon the officer the right to command according to his brevet rank only upon special assignment by the President. In the U. S. army a relation between pay and length of service is established by allowing to officers of the lower grades a certain increase of pay for each five years' continuous service.

JAMES MERCUR.

Breviary [from Lat. *breviarium*, abridgment, summary, deriv. of *brevis*, short]: an abridgment or epitome; also a book containing the daily service of the Church of Rome or of the Greek Church. It is so called, probably, because it was abridged from another service-book, called *Plenarium officium*, the "full service." The Roman Catholic Church has several breviaries, some being used in particular dioceses or in special monastic orders, but the *Breviarium Romanum* (Roman Breviary) is the most generally used, and is rapidly taking the place of the others throughout the Latin rite, and it has been translated into some of the Eastern rites. It is in four parts, the Psalter, or psalms for canonical hours; the *Proprium de Tempore*, for festivals in honor of Christ; the *Proprium de Sanctis*, for festivals of special saints; and the *Commune Sanctorum*, for other days. The Greek Breviary (*ἑρολόγιον*) or "diak" is used in the Greek Church and the Roman Catholic churches of the Greek rite. (See CANONICAL HOURS and LITURGY.) There is a translation of the *Roman Breviary* by John, Marquis of Bute (2 vols., Edinburgh and London, 1879).

Brevier: in typography, a type which is larger than minion and one size less than bourgeois. This cyclopædia is in brevier. See PRINTING.

Brevipennis [from Lat. *brevis*, short + *penna*, wing]: in the system of Cuvier, that tribe of birds which comprises the ostrich, cassowary, emu, rhea, etc. They have wings so short that they are not fit for flight, but they serve to accelerate the speed with which the birds run on the ground. Their sternum (breast-bone) has no keel or ridge, a character now used to define the sub-class *Ratite*. The gigantic *Dinornis* and some other fossil birds exhibit the characters of the brevipennes. Birds of this tribe flourish only in solitudes and deserts, and are destined to extinction, as the progress of population is hostile to their increase or existence. See CURSORES.

Revised by D. S. JORDAN.

Brewoor, JAMES RENWICK: landscape-painter; b. in Westchester co., N. Y., July 20, 1832; pupil of Thomas Cummings; National Academician 1863. He lived for a long time in Florence, and painted Italian scenery; visited Holland and Switzerland also, and painted subjects which he found in those countries. Studio in New York. W. A. C.

Brewer: city; Penobscot co., Me. (for location of county, see map of Maine, ref. 8-E); on Boston and Maine R. R., and on Penobscot river, opposite Bangor, with which it is connected by a bridge. Pop. (1880) 3,170; (1890) 4,193.

Brewer, DAVID JOSIAH: jurist; b. in Smyrna, Asia Minor, June 20, 1837; graduated at Yale College in 1856, and at the Albany Law School in 1858; judge of the Supreme Court of Kansas 1870-81; and of the circuit court of the U. S. for the eighth circuit from 1884 until his appointment by President Harrison in 1889 as associate justice of the Supreme Court of the U. S. Jan. 1, 1896, Mr. Cleveland made him a member of the Venezuela boundary commission, and he became its president.

Brewer, EBENEZER COBHAM, LL. D.: Church of England clergyman and author; b. in London, May 2, 1810; educated at Trinity Hall, Cambridge; ordained in 1836. Author of *Guide to Science* (1850), translated by author into French; *Dictionary of Phrase and Fable* (21st ed. 1888); *Reader's Handbook* (12th ed. 1888); *Theology in Science* (1863); *History, Political and Literary, of France* (1863); *History of Germany* (1881); *Dictionary of Miracles* (1884); *Historic Note-book* (1891); about thirty educational works, and numerous pamphlets under various pseudonyms.

Brewer, LEIGH RICHMOND, D. D.: Missionary Bishop of Montana; b. in Berkshire, Vt., Jan. 20, 1839; graduated at Hobart College 1863; and at the General Theological Seminary 1866; ordained deacon July 1, 1866; was rector at Carthage and Watertown, Central New York; chosen to the missionary episcopate at the general convention of 1886, and was consecrated Dec. 8 of that year.

Brewer, THOMAS MAYO, A. M., M. D.: b. in Boston, Mass., Nov. 21, 1814. His grandfather, Col. James Brewer, was a well-known patriot of the Revolution and a leader in the "Boston tea-party" of 1773. Dr. Brewer graduated at

Harvard College in 1835, and at the Massachusetts Medical School in 1838. After two years of professional labor, in 1840 he became editor of the *Boston Atlas*, then a leading Whig paper; in 1857 became a partner in the publishing-house of Brewer & Tilden. Dr. Brewer was actively engaged for a lifetime in professional and business duties, but was best known as a thorough and enthusiastic ornithologist. In 1839 he edited a new edition of Wilson's *Ornithology*, for which he prepared a synopsis of all North American birds then known. He was a personal friend of Audubon. One volume of a fine work of his on the *Ornithology of North America* was published by the Smithsonian Institution, but the publication was suspended on account of its great cost. He also wrote most of the biographical portion of the *History of North American Birds*, of Baird, Brewer, and Ridgway (3 vols. of which were published by Little, Brown & Co. in 1874). D. in Boston, Mass., Jan. 23, 1880.

Brewer, WILLIAM HENRY; b. at Poughkeepsie, N. Y., Sept. 14, 1828; educated at the scientific school of Yale College and at the universities of Heidelberg and Munich; Professor of Chemistry and Geology in Washington College, Pa. (1858-60); first assistant in the geological survey of California (1860-64); Professor of Chemistry in the College of California; Professor of Agriculture in the Sheffield Scientific School, New Haven, Conn., since 1864. He prepared *Botany of California*, etc.

Brewerton, HENRY, LL. D.; soldier; b. at Newburg, N. Y., Sept. 25, 1801; graduated at West Point 1819; colonel Corps of Engineers Apr. 22, 1864; served as assistant professor at the Military Academy 1819-21; in construction of fortifications 1821-32; Cumberland road 1832-36; improvement of Hudson river 1836-42; building Fort Montgomery, N. Y., 1841-45; superintendent of the Military Academy 1845-52; constructing defenses of Baltimore harbor 1852-64; of the Delaware 1862-64; of Point Lookout, Md., 1864-65; and of Hampton Roads 1861-70; improvements of harbors in Maryland 1852-64; and member of engineer and other boards 1839-67. Brevet brigadier-general Mar. 13, 1865, for long, faithful, and meritorious services, and retired from active service Mar. 7, 1867. D. at Wilmington, Del., Apr. 17, 1879.

Brewing: See BEER.

Brewster, BENJAMIN HARRIS, LL. D.; b. in New Jersey, Oct. 13, 1816; was seriously hurt by fire when a child; graduated at Princeton 1834; admitted to the Philadelphia bar 1838; soon appointed by President Polk to pass upon the claims of the Cherokee Indians against the U. S.; in 1867 appointed attorney-general of Pennsylvania; had a large practice, and was noted for the force and grace of his pleas. In Dec., 1881, he was appointed by President Arthur Attorney-General of the U. S., and held that office till Mar., 1885. D. in Philadelphia, Pa., Apr. 4, 1888.

Brewster, Sir DAVID, LL. D., D. C. L., F. R. S.; natural philosopher; b. in Jedburgh, Scotland, Dec. 11, 1781. He was educated at the University of Edinburgh, and became in 1808 editor of the *Edinburgh Encyclopaedia*, for which he wrote many articles. He received in 1815 the Copley medal of the Royal Society for an *Essay on the Polarization of Light by Reflection*. He invented the kaleidoscope in 1816. In conjunction with Prof. Jameson he founded the *Edinburgh Philosophical Journal* in 1819. As his relations as an editor brought him into frequent communications with the most eminent scientific men, and he was naturally one of the first to recognize the benefit which would accrue from regular intercourse among laborers in the same field, he, in articles in the *Quarterly Review*, threw out a suggestion which became the cause of the formation of the British Association for the Advancement of Science. It held its first meeting at York in 1831, and Brewster and Herschel had the chief part in shaping its constitution. About this date the Royal Society awarded to him the Rumford gold and silver medals for his discoveries in optics. He was knighted in 1832, and elected in 1849 one of the eight foreign associates of the French Institute. In 1850 he invented the telescope. Among his works are a *Treatise on Optics* (1831); *More Worlds than One* (1854); and *Memoirs of the Life and Writings of Sir Isaac Newton* (2 vols., 1855). In 1859 he was chosen principal of the University of Edinburgh. His wife was a daughter of Macpherson, the author of Ossian's poems. D. near Melrose, Feb. 10, 1868.

Brewster, WILLIAM; one of the Pilgrims of Plymouth; b. at Scrooby, England, in 1560; was educated at Cambridge; entered the public service; became a Nonconform-

ist, and in 1607 was imprisoned at Boston, Lincolnshire. He was liberated with great expense and difficulty, and went to Leyden, where he taught English. In 1620 he removed to America on the Mayflower's first voyage. He was ruling elder of the Church, preaching frequently, but never administering the sacraments. D. at Plymouth, Mass., greatly venerated, Apr. 10, 1644. See his *Life* by A. Steele (Philadelphia, 1857).

Brewton; town; capital of Escambia co., Ala. (for location of county, see map of Alabama, ref. 7-C); on L. and N. R. R.; 100 miles S. of Montgomery, near Conecuh river; has a collegiate institute, five churches, large lumber-mills, sash and door factory, and vegetable farms, the produce of which is sent to Northern markets. Pop. (1890) 1,115; according to local enumeration (1893) 2,500.

EDITOR OF "STANDARD GAUGE."

Brialmont, bréâā mōn', ALEXIS HENRI; engineer and military writer; b. in Venloo, province of Limburg, the Netherlands, May 25, 1821; entered the military school of Brussels in 1839; graduated as *sous-lieutenant du génie* (engineers) in 1843. Entered the staff corps (*l'état-major*) as captain 1855; became colonel 1868; chevalier of the order of Leopold 1846—officer 1859, commander 1870; major-general Mar. 25, 1874; member of the Belgian Academy of Sciences in 1865. He is now a lieutenant-general retired. As an officer of engineers he participated in the fortification of Antwerp and Diest, and when the present magnificent system of fortifications was decided upon he had the distinguished honor of planning works "unrivaled in Europe in the intelligent application of true principles of art to a great practical example." Col. Brialmont became an acknowledged authority on the modern art of fortification. His military publications are numerous; among the most important may be named: *Précis d'Art Militaire* (1850, 4 vols., 12mo); *Considérations Politiques et Militaires sur la Belgique* (1851-52, 3 vols., 8vo); *Histoire du Duc de Wellington* (1856-57, 3 vols., 8vo); *Études sur la Défense des États et sur la Fortification* (1863, 3 vols., 8vo, with atlas); *Études sur l'organisation des Armées* (1867, 1 vol., 8vo); *Traité de Fortification Polygonale* (1869, 3 vols., 8vo, with atlas); *La Fortification à Fossés Secs* (1872, 3 vols., 8vo, with atlas); *Études sur la Fortification des Villes Capitales* (1873); *Les Régions Fortifiées; Tir plongeant et obus torpilles; La Fortification du Temps Présent* (1885). He is the author of the article on ISTRIBERED CAMPS in the present work.

Brianchon's Theorem; in conic sections, the reciprocal of Pascal's theorem; first discovered by Brianchon. It was thus enunciated: "The three diagonals of every hexagon circumscribed to a conic meet in a point."

Briançon, bréââni'sōn (anc. *Brigantium*); a town of France; in the department of Hautes-Alpes; on the river Durance; 56 miles S. E. of Grenoble, and near the Italian frontier (see map of France, ref. 7-D). It is strongly fortified; is the principal French arsenal among the Alps, and is considered almost impregnable. Pop. (1891) 6,580.

Briansk'; a town of Russia; government of Orel; on the river Desna; 74 miles W. N. W. of Orel (see map of Russia, ref. 8-D). It has several churches, a cannon-foundry, an imperial building-yard, and a manufactory of small-arms. Pop. 15,000.

Bribery [from O. Fr. *bribe*, piece of bread, a gift to a beggar]; in criminal law, a taking or giving of a reward or consideration with the intent to corruptly influence a person in the performance of the duties of a public office or function, judicial or otherwise. The offense is completed by the corrupt taking or giving, whether the act contemplated be legal or illegal or be performed or not. An unaccepted offer to give or receive a consideration with such a corrupt intent constitutes an attempt to bribe. Both these acts were indictable offenses at the common law; but by statute in many cases acts have been made bribery which were not punishable as such at common law. A mere present after the performance of the act desired, without a previous corrupt understanding, does not constitute bribery. The giving or receiving of a consideration to corruptly influence a voter in a public election is bribery at common law as well as under the statutes, by which this subject is now generally regulated. The bribing of a juror is comprehended in the term EMBRAYERY (*q. v.*). Bribery is a serious offense against public probity, and the U. S. Constitution declares that the President and other civil officers are liable to im-

peachment for "treason, bribery, and other high crimes and misdemeanors." Revised by F. STURGES ALLEN.

Brice, CALVIN STEWART: U. S. Senator; b. at Denmark, O., Sept. 17, 1845; A. B., Miami University, 1863; LL. D., 1892; served in the Union army 1862-65, after which he was admitted to the bar at Cincinnati 1866; on the Tilden electoral ticket in 1876 and the Cleveland electoral ticket in 1884; delegate-at-large from Ohio to the St. Louis Democratic national convention 1888; chairman of Democratic national committee 1889. In 1890 he was elected U. S. Senator from Ohio to succeed Henry B. Payne.

Brick: a species of artificial stone made by molding plastic clay into blocks, and burning them. A very inferior quality of bricks is made by simply drying the blocks in the sun. The earths most employed in brickmaking are (1) the plastic clays, composed principally of silica and alumina in varying proportions; (2) the loams or sandy clays; and (3) the marls, which are either sandy, clayey, or calcareous, according as silica in the form of sand, alumina, or carbonate of lime preponderates in the mixture. These brick-clays almost always contain a small percentage of oxide of iron, carbonate of lime, soda, and carbonate of magnesia. The purer clays contain about 1 part of alumina to 2 of silica, with a percentage of water varying greatly among the different clays. They all mix up freely with water in either large or small proportions, and are characterized by a tenacious plasticity. If molded and baked, they shrink and warp greatly out of shape, and crack. Hence these rich clays all have to be tempered with sand, ashes, or cinders before they can be used for bricks. Some clays contain too much sand, and are weak and brittle after burning; these must be mixed with the richer clays. From the greatly varying character of the raw material, it results that the methods pursued in brickmaking must vary among different localities. Some clays require but very little change in the natural proportion of their ingredients, and but very little labor to prepare them for molding into bricks, it being merely necessary to add the requisite quantity of water to render the clay plastic; while others, such as the fire-clays and some of the marls, have to be pulverized by machinery before they can be reduced to a sufficiently plastic condition. The red color of burnt bricks is caused by the presence of a small percentage of oxide of iron, generally the protoxide. When there is more than 10 per cent. of iron oxide present the clay burns to a blue and almost a black color. A large percentage of iron, if lime also or an excess of silica be present, renders the clay fusible. Some clays contain lime and very little or no iron. These burn white, and require a less intense heat than any other clays to produce hard brick, the lime being a flux on the silica. When carbonate of lime, whether as chalk, marl, nodules of calcareous petrifications, or in any other form, is present in the clay, it is converted into quicklime in burning, and only such portions of it will combine with the silica and alumina as come into actual contact with them. The balance remains quicklime, which will slake when the bricks become wet, and destroy them. Hence clay containing too much carbonate of lime is unfit for bricks. Other clays contain iron and lime with an excess of the latter, in which case the bricks burn to a light dun or a whitish color. Magnesia generally produces a brown color.

The presence of iron pyrites is objectionable, for the burning expels the sulphur, leaving oxide of iron or a basic sulphate, which occupies less volume than the original pyrites, and makes the bricks porous and weak. Vegetable remains, such as roots, grass, etc., should be excluded for a similar reason.

It is impossible to ascertain, by chemical analysis alone, whether or not a given clay or any mixture of two or more clays will make good bricks. The best chemical tests will furnish only a close approximation. The composition of four clays—two suitable for common bricks and two for fire-brick—is given below. Nos. 3 (from Stourbridge, England) and 4 are the fire-brick clays:

COMPONENTS.	No. 1.	No. 2.	No. 3.	No. 4.
Silica.....	50.40	49.44	51.80	58.40
Alumina.....	34.26	34.26	30.40	35.78
Oxide of iron.....	24.00	7.74	4.14	3.02
Carbonate of lime.....	2.70	1.48
Carbonate of magnesia.....	1.30	5.14	0.30	2.72
Water, etc.,.....	21.60	1.94	13.11
Totals.....	100	100	99.75	99.92

Some of the fire-clays contain as high as 65½ to 66 per cent. of silica, 27½ to 26½ per cent. of alumina, and 5½ to 6 per cent. of oxide of iron, the balance being the alkalis and water.

Fire-bricks are used for lining furnaces, kilns, ovens, etc., subjected to an intense heat that would destroy common bricks or stone. The Stourbridge fire-bricks are noted for their excellence. The clay is dug up and exposed from three to eighteen months, according to the weather, in "spoil heaps," spread over as large an area as practicable, until thoroughly disintegrated by weather and frost; in winter three months will suffice. The clay weighs 6 tons to 7 cubic yards, and some of the spoil heaps contain 10,000 tons. After weathering, the clay is ground in a circular pan under two cylindrical stone rollers, each weighing 2½ to 3½ tons, and faced with iron. After grinding, the clay is carried on an endless band to a "riddle" of 4 or 6 meshes to the inch for fire-bricks, 6 to 10 meshes for fine cement clay, and 12 to 14 meshes for glass-house or pot clay. After passing the riddle the clay is tempered with water to a suitable degree of plasticity, and is then passed through a cylindrical cast-iron pug-mill, where it is cut and stirred by revolving helicoidal blades, which force it out through an opening at the bottom in the form of a bar, which is received and carried by an endless band to the molding-shed. The fire-bricks are molded by hand in the usual manner, dried in artificially heated sheds at a temperature of 60° to 70° F., or by the sun in clear weather. They are burned in circular domed kilns or cupolas called ovens, where they remain from eight to fourteen days, being subject to the intensity of flame or white heat for about four days and three nights. In burning, the heat is slowly increased and gradually lowered, and the burnt contents require seven days to cool. Most of the kilns contain 12,000 bricks—some, exceptionally, 30,000 to 35,000. The chimney-stack is on the outside, and the flame burns with a down draught, descending through holes in the floor. Coal is used for fuel.

Excellent fire-bricks are made in New Jersey at Perth Amboy, Woodbridge, South Amboy, Trenton, and other places in the vicinity. The process of manufacturing is essentially the same as for common bricks. The fire-clays of these localities contain generally more alumina and less silica than those of Stourbridge, England, and are therefore richer, the alumina reaching in some cases as high as 37½ to 39½ per cent., with only 43½ to 45½ per cent. of silica. The composition of the bricks consists of about ½ raw clay, ¼ cement, ¼ kaolin, and ¼ fine sand. The cement is fire-clay that has been burnt; the kaolin is a clay consisting of very fine sand, mica, and fire-clay, found in the vicinity, and the fine sand is clean, coarse, angular-grained quartz, found remarkably pure near by.

The leading type of the machines used at Haverstraw, N. Y., and vicinity for the manufacture of common bricks, where about 2,000,000 per day are made during the working season, is shown in Fig. 1, and is known as the "Vervalen machine." The object of this machine is merely to fill the molds more rapidly than could be done by hand, and not to produce a pressed brick.

A is a wooden box or tub about 3 ft. 4 in. square inside, and from 4 ft. 6 in. to 5 feet high, into which the clay to be molded is cast. B is a vertical iron shaft about 5 inches in diameter, geared with the engine shaft C, which imparts to it a horizontal rotary motion. The lower end of B is provided with a heavy casting, shaped like the letter S, called the *wiper*, which sweeps the clay through a lateral opening in the front side of A into the cast-iron box D.

The shaft B is provided with a number of projecting arms, from fourteen to twenty-two, which clear the sides of the tub by about an inch, and serve to mix the ingredients before they are expelled by the wiper. When, however, the clay is previously mixed by a tempering wheel, these arms are removed, leaving only the wiper, and the tub then serves merely as a hopper. The bottom of the cast-iron box D is provided with six openings, through which the prepared clay is forced into corresponding openings in the mold E. A sort of rectangular piston works up and down in the box D by means of a connecting-rod, F, run by a drum, G. A crank at the end of the drum-shaft H communicates a stroke of about 7 inches to the piston, which stroke, however, can be diminished at pleasure by shifting the position of a pin at the lower extremity of F. The bottom of the piston does not come nearer than about 6 inches to the bottom of the box D.

The action of the machine will now be readily understood. The prepared clay is swept by the wiper out of A into D,

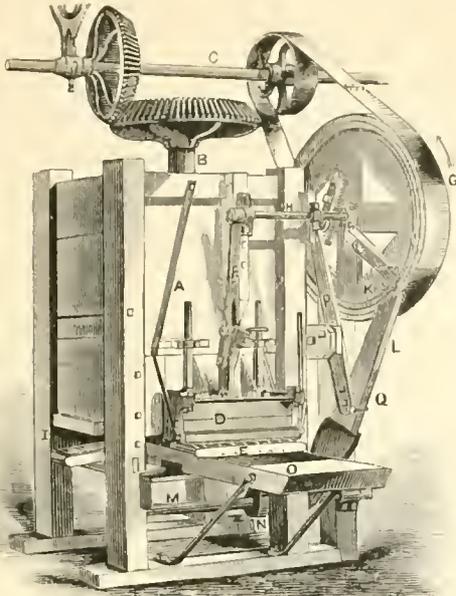

FIG. 1.—Vervalea machine.

whence it is expelled by a down stroke of the piston into a mold placed under it. While this mold is being filled an empty one is inserted behind it through the aperture I. The drum G continuing its revolution in the direction of the arrow, a cam, K, strikes the lever L, throwing it forward, as shown in the figure. It carries with it the shaft M, which by means of a horizontal rod attached to two cranks (one of which is shown partially in the figure at N) and passing behind the empty mold, forces it forward, thrusting out the full one upon the table O, and placing the empty mold in position to be filled. The drum G continuing its revolution, another cam, placed so as to clear the top of the lever L, strikes the upper arm of the lever P, causing it, by means of the projection Q, to return L to its primitive position. A check prevents L from falling too far back. And so on.

Whenever the nature of the materials used admits, the mixture of the ingredients is made by the pug-mill working in the tub. In this case a rectangular pit is prepared directly behind the machine, capable of containing the amount of clay required for a day's work. The clay is placed overnight in this pit, and is wet down with a certain amount of water, varying according to the nature of the clay used. In the morning the other ingredients, consisting of sand and anthracite coal-dust, are carted to the pit and roughly mixed by two spaders, who afterward throw it up into the tub, where the pug-mill completes the mixing.

The proportion of sand used varies according to the quality of the clay and the relative proportions in which the two are found in the bank. It may be taken, on an average, at one-third sand to two-thirds clay. The Haverstraw sand is of excellent quality, and, more than the clay, gives the bricks of this locality their peculiar character. Coal-dust is used in the average proportion of 3 pecks to the 1,000 bricks. For burning properly in the kilns, a certain number of what are called *double-coal* bricks is required, in which the proportion is about 5 bush. of dust per 1,000 bricks. When mixed in a circular pit by means of a "tempering-wheel," the clay and coal-dust are disposed in alternate layers and cut up by the wheel. The sand is then added and incorporated by the wheel. The operation consumes the entire day.

When the molds, which are made mostly of cherry or locust wood, and contain six bricks each, are thrust from under the press upon the table, they are placed on trucks and wheeled under the drying-shed. The bricks are thrown out upon the flat. When sufficiently dry they are "edged up" by means of an instrument called an *edger*, then "spatted," or tapped with a flat board called a "spatter," to give them a clear edge, and then "hacked up," or placed in long and narrow rows on edge. When dry enough—that is, in one to three days, according to weather—they are built

up in "arches," set on edge in the order called "three over one." The arches contain 28,000 to 35,000 bricks each, and are 6 bricks or 4 feet wide, about 44 bricks or 30 feet deep, and from 45 to 55 courses high. Each arch has an opening at the bottom—hence the name—in the center of its width, in which the wood used in baking is placed. On the outside are placed the "double-coal" bricks, to the number of about 3,000 per arch. Bricks containing only the usual proportion of coal would not burn properly at this distance from the fire.

A number of arches, five, ten, or more, are built up contiguously, so as to form a solid mass. The whole is then covered with a dry wall of baked bricks, the lower courses being one brick thick and the rest half a brick. At the bottom they leave a vacancy between the wall and the face of the arch, which gives a batter to the covering wall, and affords a better draught. Arch-irons or cast-iron frames having an opening of about 1 sq. foot are inserted in the openings, and the whole is smeared over with clay. The heap so prepared is called a kiln. This system of burning is pursued rather than that with permanent kilns, on account of the greater number of bricks which may be burned in a given space. At Haverstraw yards controlling only 200 feet frontage can thus make from 5,000,000 to 6,000,000 bricks per season of 150 working days.

About four cords of wood are used per arch, and the burning requires six days, fires being lit on Monday morning and drawn on Saturday evening. Molding is usually carried on during the forenoon of each day—about five to six hours—the rest of the day being spent in "hacking up," etc.

The machines above mentioned turn out, in ordinary working, ten molds or sixty bricks per minute, or 18,000 to 20,000 per forenoon. They require the following plant and help per machine: 25 molds, 4 trucks, and 8 men. If operated by steam, a machine turning out 18,000 per day requires 8 horse-power nominal, high pressure.

The standard of full work in this section is to turn out 1,000 bricks per day for every soul employed, from the time the clay is dug till the bricks are loaded in the vessels. Thus an establishment employing forty hands, all told, should turn out 40,000 bricks per day.

The Morand brick-machine, Fig. 2, consists essentially of a pug-mill, under which revolves a horizontal iron table, in which there are eight openings or molds of the size of a brick. The mill mixes the clay, and forces it downward by its helicoidal arms through a slot in the bottom of the mill, thus filling the molds as they pass under the slot. Each mold then passes under a pressure-plate, which confines the clay on top,

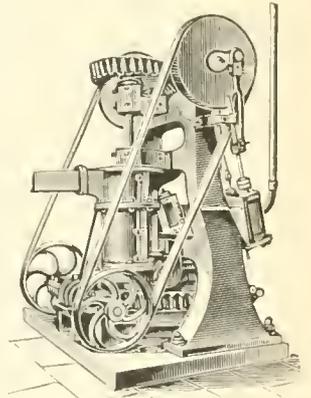

FIG. 2.—Morand brick machine.

while a movable plate, which closes the mold at the bottom, is forced up by passing over a cam. This compresses the plastic brick, forcing out the air and excess of clay through a small hole in the pressure-plate. After passing the pressure-plate the bricks are thrust up to the top of the table, and then moved automatically to an endless band, which carries them away. From the band they are loaded upon cars, which convey them into drying-ovens. They go to the kiln the next day. See KILNS.

Three qualities of brick are taken from the kiln. Those forming the top and sides of the arches are called *arch brick*, those from the interior of the pile are *body brick*, and those from the exterior are *soft brick*. The arch bricks are hard and often brittle and weak from overburning; the soft bricks are underburned, and fit only for backing and filling. The body brick is of the best quality. Good bricks should be of regular shape, have parallel surfaces, plane faces, and sharp edges and angles. They should be of uniform texture, and should ring when struck a sharp blow with a hammer. The amount of water absorbed is an index of the durability of brick, and the best qualities should not absorb more than 10 per cent. of their weight of water after seven days' immersion. The higher the specific gravity the better is the quality of the brick, as a general rule.

The compressive strength of brick is extremely variable. A mean value may be stated at 2,500 lb. per square inch, but soft brick will scarcely bear more than one-tenth of this, while the best pressed brick will stand 7,000 lb. per square inch, or more. It is a general rule that the durability of brick increases with both its tensile and compressive strength. Compressive tests of brick are not easily made so as to give reliable results, owing to the difficulty of securing specimens with surfaces truly parallel. Tests for transverse or flexural strength are easier to make, and in general more satisfactory. These can well be executed by supporting the middle of the brick upon a fixed bar as a fulcrum, and hanging stirrups upon the ends to support a barrel for carrying the loads. Let *l* be the length of the brick from the center of one stirrup to that of the other, *b* the breadth and *d* the depth of the brick, and *W* the load which is placed in the barrel to cause rupture. Then if *S* be computed from the formula

$$S = \frac{3Pl}{bd^2}$$

this gives the quantity called the modulus of rupture. If *b*, *d*, and *l* be taken in inches, and *P* be in pounds, then *S* is in pounds per square inch, and the higher the value of this the better, other things being equal, is the brick.

The following are the average results of some of the tests made upon different qualities of brick used in the arch lining of the Vosburg tunnel on the Lehigh Valley R. R. The compressive strengths here given are comparative only as

MAKER AND NUMBER OF TESTS.	Class.	Per cent. of water absorbed to original weight.	Compressive strength, pounds per sq. inch.		Modulus of rupture, pounds per sq. inch.
			Cracked.	Crushed.	
C., 24 tests.	Very hard.	12.6	823	3,060	445
	Hard.....	13.6	1,408	2,541	530
	Medium....	17.2	795	1,274	290
E., 50 tests.	Very hard.	6.4	3,870	5,537	1,583
	Hard.....	15.4	1,960	3,063	893
	Medium....	18.9	2,695	4,287	641
	Soft.....	22.2	1,102	2,205	269

they were made in a wheel press which gave a shock to each brick as the stress was applied. It is interesting to note that the bricks began to crack under about one-half the stress which caused final rupture.

The paving-brick used in Western cities is made of fire-clay containing about 69 per cent. silica, 15 per cent. alumina, 5 per cent. of water chemically combined, 3 per cent. lime, 2.5 per cent. iron, and 2.5 per cent. magnesia. Such brick is semi-vitrified, has a specific gravity of over 2, is very tough, and often makes a good pavement for light traffic. The best qualities of such brick will absorb less than 5 per cent. of their weight of water after ten days' immersion. The following are mean results of a few tests of paving-brick for absorption, made by C. P. Chase in 1890, and also for com-

NAME.	Specific gravity.	PER CENT. OF ABSORPTION AFTER—		
		Three days.	Five days.	Ten days.
		Ottawa, Ill.....	2.35	3.11
Burlington, Ia.....	2.28	1.62	1.79	1.84
Clinton, Ia.....	2.27	2.56	2.76	2.83
Galesburg, Ill.....	2.24	4.46	4.58	4.62
Bardolph, Ill.....	2.07	2.68	3.04	3.18
Common red.....	1.82	15.13	16.06	16.50

parison results for a common red brick. It is stated that the percentage of absorption varied almost directly with the degree of vitrification. The average compressive strength of paving-brick is about 7,000 lb. per square inch, but some varieties tested have given, for small specimens cut from the brick, results as high as 10,000 and 12,000 lb. per square inch. See the articles MASONRY and PAVEMENTS; also Baker's *Masonry Construction* (1891), and, on the manufacture of brick, several discussions in *Transactions of the American Society of Civil Engineers for June, 1888*.

Revised by MANSFIELD MERRIMAN.

Brick, Archaeology of: The use of clay as a building material, in the form of bricks dried in the sun or kiln-burnt, dates from the earliest antiquity, not only in the Tigris-Euphrates valley, but in Egypt and other countries (Gen. xi. 3; Ex. i. 14; v. 7, 8). The great pyramid of Sakarah, supposed by Mariette to be the oldest in Egypt, and attributed by Maspéro to the fifth and sixth dynasties (more than 3,000

years B. C.), is of brick, as are many other lesser pyramids. Sun-dried brick was used by Osirtasen III. (twelfth dynasty) in his fortresses at Koummeh and Semneh, and by later monarchs for the circuit-walls of their temples, while burnt bricks served for the construction of dams, dikes, granaries, and other public works.

In the valley of the Tigris-Euphrates brick was practically the only building material, sun-dried brick forming the whole mass of the enormous terraces and thick walls of Assyrian and Chaldaean architecture. Scarcity of fuel in Assyria compelled an economy in the use of burnt brick, which was less pressing in Chaldaea, where some even of the most ancient terraces, as at Warkah and Mugheir, are faced with enameled or glazed bricks of brilliant colors. To preserve these enormous clay mounds from destruction by the infiltrations of rain-water, they were provided with elaborate drains, which offer us some of the earliest examples of arched construction. They were built without centerings by ingenious processes still in vogue in those regions, and their decay accounts for the ruin of the terraces and palaces above them. It was customary to stamp the bricks with the name of the reigning monarch, a fact of the greatest service in archaeological investigations.

The Romans, however, deserve the credit of the greatest advances in the use of brick, which was by them very generally employed to face their concrete masonry, the facings being first built and the spaces between filled with concrete or beton. The Roman vaulting was of concrete, poured upon a skeleton of brick ribs, or over a thin shell of flat tiles laid edge to edge upon the centerings. Brick thus played a large part in the development of Roman architecture. The Byzantine architects also used brick as a material of construction, occasionally allowing it to appear externally in red bands alternating with bands of stone, a practice afterward copied by the Arab architects of Cairo. In the Middle Ages brick fell into general disuse, the settling of brick masonry and the massiveness it requires making it undesirable for the lofty vaulted structures of the Gothic architects, with their striving after slenderness and general lightness in the supporting masses. In Lombardy, however, and in Venice, it found more favor, and the use of terra-cotta in conjunction with brick supplied the element of grace and elegance otherwise lacking.

In New Mexico, Arizona, and Mexico, *adobe*, a species of unburnt brick, was used, not only by the Spaniards but by the Pueblos and other native races long before the advent of the Spaniards. Excellent bricks are found in Peru, and the Chinese and the people of India and Persia have also shown high skill both in the making and in the artistic use of plain and enameled or glazed bricks.

A. D. F. HAMLIN.

Bridge, JOHN FREDERICK: musician; b. in Oldbury, Worcestershire, England, Dec. 5, 1844; educated first by his father, and then by Mr. Hopkins, of Rochester cathedral; studied composition under Sir John Goss. His first appointment was, at the age of twenty-one, as organist of Trinity church, Windsor. In 1868 he took the degree of Mus. Bac. at Oxford; in 1869 was appointed organist of Manchester cathedral; in 1874 took the Mus. Doc. degree at Oxford, for which, as a degree exercise, he wrote the oratorio *Mount Moriah*. He was then appointed deputy organist of Westminster Abbey, and on the death of James Turle became full organist. His next work was the cantata *Boadicea*, followed by a setting of the *Hymn of St. Francis d'Assisi*. For the Birmingham festival of 1885 he set Gladstone's Latin version of *Rock of Ages*, as a motet for baritone solo and chorus. At the Queen's jubilee in 1886 he composed the jubilee anthem, by royal command. His oratorio *The Repentance of Nineveh* was composed for the Worcester festival of 1890, and the cantata *Callirhoe* for the Birmingham festival of 1888. For the Gloucester festival of 1892 he composed a short cantata on Dante's paraphrase of the Lord's Prayer, in the *Purgatorio*, canto xi. Dr. Bridge's church music is very much in favor, and he has also written some very fine songs, part-songs, and madrigals, both for male and mixed voices.

D. E. HERVEY.

Bridge, JOSEPH COX: musician; brother of Dr. John Frederick Bridge; b. in Rochester, England, Aug. 16, 1853; chorister and subsequently assistant organist at the cathedral; studied under his brother and John Hopkins, and took the degrees B. A. 1875, Mus. Bac. 1876, M. A. 1878, and Mus. Doc. 1879, from Oxford; appointed organist of Chester cathedral in 1879, where he still remains; revived

the Chester music festival in 1879, and at the festival of 1885 produced his oratorio *Daniel*. He is the conductor of several societies at Chester and Bradford. His compositions are chiefly for the church. D. E. HERVEY.

Bridge, Magnetic: a device for the application of the principle of Wheatstone's bridge (see BRIDGE, WHEATSTONE'S) to the measurement of magnetic resistances. See also MAGNETISM OF IRON.

Bridge, Wheatstone's: See WHEATSTONE'S BRIDGE.

Bridge of Allan: town of Stirlingshire, Scotland; so named from the bridge across the river Allan, which bounds it on the W.; situated at the southern base of the western termination of the Ochil Hills (see map of Scotland, ref. 11-G). Pop. 3,500. It has several elegant churches, fine hotels, and numerous lodging-houses. About 50,000 visitors frequent it annually on account of its mineral waters and mild and salubrious climate.

Bridgeport: a city, custom-house port, and important railroad and commercial center; one of the county-seats of Fairfield co., Conn. (for location, see map of Connecticut, ref. 12-E). The township was founded in 1821, and the city charter granted in 1836. It is situated on an inlet of Long Island Sound; at the mouth of Pequonock river, which is bridged in many places; 58 miles N. E. of New York and 18 miles W. S. W. of New Haven; lat 41° 10' 30" N., lon. 73° 11' 46" W. It has lines of steamboats connecting it with New York, and a small steamer plying between it and Port Jefferson, L. I. It is on the N. Y., N. H. and H. R. R., and is a terminus of the Naugatuck and the Housatonic R. Rs. It now (1893) has an area of nearly 45 sq. miles, including East Bridgeport (or the part east of the Pequonock river), and Black Rock at the other side of the city. Black Rock harbor is a favorite stopping-place for yachting squadrons, and will accommodate large vessels. Bridgeport has a fine school system; a large and well-managed public library (richly endowed by private bequest); a scientific society, having a fine collection of Indian relics; historical society, hospital, orphan asylum, energetic board of trade, and other public institutions and societies. There are many large and beautiful buildings, among which are U. S. post-office and custom-house, Y. M. C. A. building, the Barnum Memorial Institute (bequeathed to the Scientific and Historical Societies), and the Fairfield County court-house. It has three fine parks, of which Seaside park has a sea-wall and shore-drive 2 miles long. Here is a statue of Elias Howe, the inventor of the sewing-machine.

Industries.—According to the U. S. census report for 1890 it is the chief manufacturing city in the State, having 555 industrial establishments with a capital of \$19,094,180, giving employment to 12,763 persons, and paying in wages annually \$7,492,092. The cost of the materials employed is \$10,173,212, and the value of the product \$21,829,776. The assessed valuation in 1890 was \$21,942,282. The industries which are especially noteworthy are the manufacture of carriages and wagons, corsets, sewing-machines, hardware, articles of aluminium and aluminium bronze, articles of brass, and forging. Here is a large grain elevator. The city has an ample water-supply, electric lights and gaslight system, and such other equipments as are necessary for an enterprising manufacturing and commercial city. Pop. (1870) before the annexation of Black Rock, a part of Fairfield, 18,969; (1880) 27,613; (1890) 48,866; (1893) estimated, 55,000. Editor of "EVENING POST."

Bridgeport: railroad junction; Belmont co., O. (for location of county, see map of Ohio, ref. 5-4); on the Ohio river, opposite Wheeling, with which it is connected by a bridge. Pop. (1880) 2,395; (1890) 3,369.

Bridger's Pass: a defile in the Rocky Mountains; in the south part of the State of Wyoming. The overland mail route passed through it before the Pacific R. R. was opened. It is "a narrow gallery, walled by noble precipices of red granite and metamorphic sandstone, rising directly from the traveler's side to the almost perpendicular height of from 1,000 to 2,500 feet, and is several miles in length."

Bridges: A bridge is a structure spanning a valley, river, or other space, and intended to serve for the passage of men, animals, or vehicles. The most obvious and simple bridge is a tree thrown across the stream, and hence, says Rankine, "the first man who bridged a torrent with a fallen tree had in him something of the engineer." Another primitive method, practiced in some mountainous regions of South America, and also in China, is the suspension of a

rope across a stream, to which a hammock is so hung that it can be drawn across from shore to shore; these are made of such stability that even mules are carried over in the hammocks. The fallen tree is the prototype of the modern girder, or truss bridge, and the rope is the germ from which the suspension bridge has been developed. Pontoons, or floating assemblages of boats, were constructed by the ancient Egyptians, and in modern times are of much use in military operations. See BRIDGES, MILITARY.

A bridge consists of a substructure and a superstructure, the former being the abutments and piers, which are usually of masonry, and the latter being the timber or metal framework which is supported by them. There may be two abutments and one span of a superstructure, while for two spans an intermediate pier is required. The number of spans and piers will be determined in any given case by local conditions, the general problem being to devise such an arrangement that the total cost may be the least possible. As a rough rule it may be said that the greatest economy will be attained when the cost of the substructure is equal to the cost of the superstructure. The methods of constructing piers and abutments are described in the articles FOUNDATION and MASONRY, while here the superstructure, or bridge proper, receives chief attention.

Bridge structures are formed of arches springing from one abutment to another, or of trusses and girders resting upon the abutments, or of chains or cables suspended from towers. Thus arises the fundamental classification into arch bridges, truss bridges, and suspension bridges. But before considering the different forms under each of these classes an historical review of their development is perhaps best secured by dividing them into stone, timber, and iron structures. Truss bridges are far more numerous at the present day than any other form, and these may be built as fixed independent spans, as continuous over several spans, as drawbridges, and as cantilever structures. The articles FLEXURE, MOMENT, STRESSES, and STRENGTH OF MATERIALS deal with some of the mechanical principles employed in the computation and design of bridges.

The total length of a bridge is an index of its magnitude, but the length of its greatest span more often indicates the difficulty of its construction and its rank as an engineering work. The following is a list of the total lengths of several of the longest and most important bridges of the world:

	Feet.
New Tay bridge, Scotland.....	10,780
Ohio river bridge, Cairo, Ill.....	10,560
Forth bridge, Scotland.....	8,295
Missouri river bridge, Kansas City, Mo.....	7,633
Poughkeepsie bridge, N. Y.....	6,770
Victoria bridge, Montreal, Canada.....	6,520
New Susquehanna bridge, Havre de Grace, Md.....	6,215
East river bridge, New York.....	5,989
Cincinnati and Newport bridge, Ohio river.....	5,925
Cincinnati and Covington bridge, Ohio river.....	5,360
Rapperswyl bridge, Lake Zurich.....	5,333
Ohio river bridge, Louisville, Ky.....	5,280

In general, these lengths include masonry or viaduct approaches as well as the main spans. In the following description of bridges of different classes those of longest span and of the greatest importance as engineering constructions at the time of their erection will, as a rule, receive principal attention.

Stone Bridges.—These were first constructed by the Romans, and eight over the river Tiber are described in history. Ruins of bridge structures are now found in different parts of the ancient Roman empire. The greater portion of the bridge of Alcántara upon the Tagus still remains as a fine example of masonry construction. It had six arches, the whole length being 670 Spanish feet, and the roadway being 205 feet above the bottom of the river. During the Middle Ages there existed a fraternity known as "Brothers of the Bridge," originally formed to secure the safe passage of travelers over rivers, which erected many stone bridges in France. The first stone bridge in London was begun in 1176 by Peter of Colechurch, a priest, and its construction occupied thirty-three years; it had nineteen arches of small span, with very wide piers. Few important structures were built, however, from the time of the Roman decadence until the middle of the eighteenth century. The Westminster bridge completed in 1750 had fifteen spans, the largest being an arch of 76 feet width. The finest of the earlier French bridges is that by Perronet, over the Seine at Neuilly, completed in 1771. It

consists of five arches, each 128 feet in span and 32 feet rise. The soffits of the arches are constructed of a conoidal form, perhaps to allow the easy passage of water in times of flood. Other stone bridges are mentioned in the article ARCH.

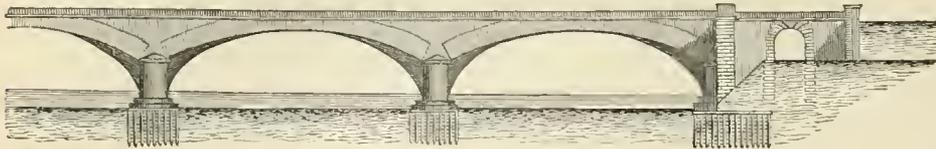

FIG. 1.—Perronet's bridge at Neuilly, 1774.

Culverts are small masonry bridges which allow the passage of streams through embankments. Excluding these, comparatively few stone bridges will be found on the railroads in the U. S. The Black Rock tunnel bridge, built in 1836 by Moncreur Robinson, on the Philadelphia and Reading R. R., has five arches of 72 feet span and 16½ feet rise. The Pennsylvania R. R. has a number of stone bridges on its line between Harrisburg and Pittsburg, some of which have spans of nearly 100 feet. The cheapness of timber during the first half of the present century, and the great development of iron bridge construction since, have prevented the erection of the more costly stone structures. As it is found, however, that the life of iron bridges is much less than was at first supposed, stone bridges are now regarded with more favor on account both of durability and expense of maintenance.

Timber Bridges.—The oldest wooden bridge on record is the pons sublicius which was built at Rome across the Tiber, 621 B. C. It is celebrated for the combat of Horatius Cocles, a Roman knight, who saved the city by his noble defense of this bridge. The word *sublicius* is believed to imply wooden piers or piles. We have no satisfactory description of this structure, or of other ancient bridges, until 55 B. C., when Cæsar constructed a trestle or pile bridge across the Rhine near Bonn, the following account of which is given in his *Commentaries*:

"Timbers of a foot and a half thickness, sharpened at the foot, and of a length corresponding to the depth of the river, were assembled in couples, allowing an interval of 2 feet between them. Thus united by means of suitable apparatus, they were let down into the water, not vertically like ordinary piles, but inclined in the direction of the current, and thus driven. Another couple with opposite inclination was then fixed (or driven) 40 feet below the first. These double pieces, thus disposed, received at their extremity a beam of 2 feet thickness, which filled the interval between the pieces of each pair, and which was thus supported at each end by double ties. This framework composed of pieces inclined in opposing directions, strongly connected with each

the assemblage. After making a number of similar structures, placed at equal distances and extending from shore to shore, a continuous flooring was added composed of beams covered with fascines. Besides these arrangements inclined (brace) piles were driven on the lower side and connected with the rest of the work, forming a whole capable of resisting the greatest impetuosity of the current."

This description clearly indicates a trestle bridge composed of bents protected by fenders. The cut is one of Rondelet's "restorations" of this interesting structure; its length was probably about 1,800 feet, and Cæsar says that ten days were occupied in its construction.

The longest timber span on record was built about 1760 by Ulric and John Grubenmann, over the Linmat river, near Baden. Its span was 366 feet, without intermediate support. This structure, like all other wooden bridges erected before the present century, was constructed with little regard to the principles of the economic disposition

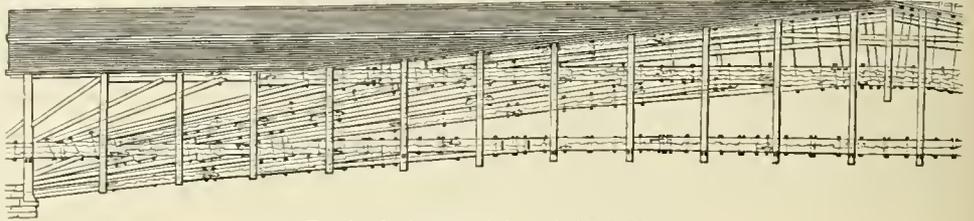

FIG. 3.—Grubenmann's long timber bridge.

of materials, although it shows much skill in details of carpentry. It was destroyed by the French in the campaign of 1799. The cut shows one-half of the span only.

The germs of the theory of trusses, and the definite division of a bridge into an upper chord, a lower chord, and inclined web members, are seen in bridges erected by Theodore Burr and by Timothy Palmer early in the present century. The oldest bridge now standing in the U. S. was

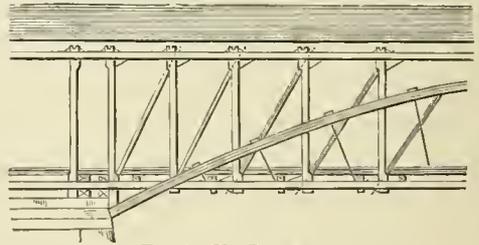

FIG. 4.—The Burr truss.

built by Burr at Waterford, N. Y., in 1804, and consists of four spans of 154, 161, 176, and 180 feet in the clear; the timber is hewn yellow pine. In 1805 Palmer built the bridge over the Delaware river at Easton, Pa., which has three spans of 163 feet in the clear, or 195 feet between centers of piers; this bridge is also still in use, and only about one-sixth of the original timber has been renewed. Palmer also built in 1806 a bridge over the Schuylkill at Philadelphia, known as "the permanent bridge," which had two side spans of 150 feet and a central span of 195 feet. This bridge, like others of this period, was covered with boards to protect the framework from the weather. Palmer was a "self-taught architect," of Newburyport, Mass., but his structures display genius as well as practical knowledge. Burr's bridges are likewise noteworthy, particularly the one at Trenton, N. J., having five spans, the longest of 203 feet, and the one at Harrisburg, Pa., consisting of twelve spans of about 210 feet each; a portion of this last bridge is still in use. Previous to the year 1816 there were fourteen bridge patents issued by the U. S. patent office, but the nature of most of them is unknown, as the records were destroyed by fire.

Thomas Pope, "architect and landscape gardener," published, in New York in 1811, the first American book on bridge construction, which, while giving descriptions of many European structures, is mainly devoted to advocating

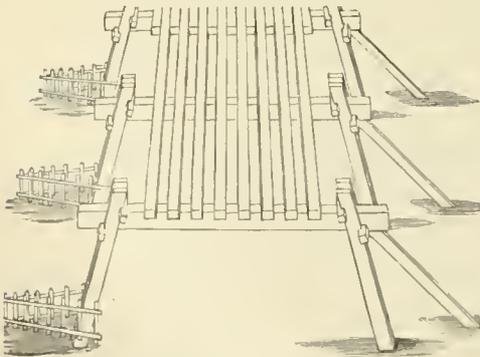

FIG. 2.—Cæsar's bridge over the Rhine.

other, formed a very solid combination: for the property of such a disposition of materials is that the force of the current adds to its stability by exerting a strong pressure on

a scheme of his own called "the flying pendant lever bridge," and which boldly sets forth a plan for a span of 1,800 feet

than upon the clear recognition of the function of counter braces in stiffening the structure, "whether loaded or unloaded." Among other wooden bridge trusses devised after this time, should be mentioned those of Herman Haupt (1839) and D. C. McCallum (1851), the latter of which had a curved upper chord and the counter braces so arranged that the bridge could be stiffened by lengthening them when it was loaded. But about this time timber began to give way to iron. Details regarding early American timber bridges may be found in Duggan's *Stone, Iron, and*

Fig. 5.—Palmer's bridge at Philadelphia, 1806.

over the Hudson river. The inventor gives his plan of construction in great detail, together with a view twice repeated of the entire bridge. But, as it was to be built out from its abutments without aid of false works, he has given a view (Fig. 6) of the half bridge thus projected, with the motto:

Like half a rainbow rising on yon shore
While its twin partner spans the semi o'er
And makes a perfect whole that need not part
Till time has furnished us a nobler art.

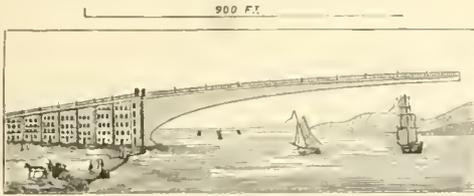

Fig. 6.—Thomas Pope's flying bridge.

The plan of building out arms from shore abutments and uniting them at the middle is a distinctive feature of the modern cantilever bridge. Pope had the idea, but built only a model of 50 feet span. It would not be possible, however, to erect a long span bridge with his details of construction.

In 1812 Lewis Wernwag built a bridge called "the Colossus" over the Schoenkill river at Fairmount, which had a clear span of 340 feet. As its rise was 38 feet, it acted like an arch as well as a truss, and, in fact, the upper part of one of the abutments is said to have moved 3 or 4 inches

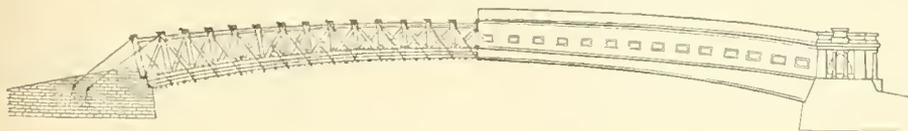

Fig. 7.—Wernwag's Colossus

under the thrust. The double diagonal bracing connecting the upper and lower chords shows that its builder had considered the distorting action of moving loads. The lattice truss of Ithiel Town, introduced about 1820, was a form easy to construct for short spans, being made mostly of plank, but its use added little to the science of bridge construction.

In 1830 Col. S. H. Long, of the U. S. engineers, took out a patent for a truss, of which Fig. 8 shows one-half of the original drawing of the side elevation. In 1836 he published at Concord, N. H., a pamphlet of 75 pages, describing the features of his system. It had the great merit of providing

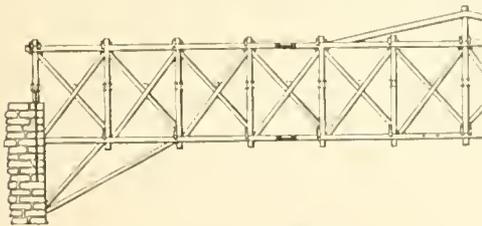

Fig. 8.—Long's truss, 1830.

diagonal counter braces to stiffen the truss under the action of the moving load, and these were fastened by wooden keys or wedges which were made adjustable, so that the structure could be stiffened at any time. The first bridge on this plan was on the Washington road, 2 1/4 miles from Baltimore, which had 109 feet span, and others were probably built on the Baltimore and Ohio R. R. Long's influence upon bridge building depends less upon bridges actually constructed by him

than upon the clear recognition of the function of counter braces in stiffening the structure, "whether loaded or unloaded." Among other wooden bridge trusses devised after this time, should be mentioned those of Herman Haupt (1839) and D. C. McCallum (1851), the latter of which had a curved upper chord and the counter braces so arranged that the bridge could be stiffened by lengthening them when it was loaded. But about this time timber began to give way to iron. Details regarding early American timber bridges may be found in Duggan's *Stone, Iron, and*

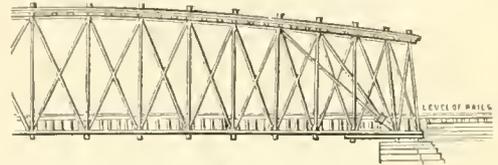

Fig. 9.—McCallum's truss.

Wood Bridges of United States Railroads (New York, 1850), and in Haupt's *General Theory of Bridge Construction* (New York, 1851).

Combination Bridges.—A combination truss is one which has some members made of timber and others of iron. William Howe in 1840 patented such a bridge, having its chords and diagonal braces of timber, and the vertical members of wrought iron. The braces butt at each end against cast-iron angle blocks, and the vertical ties have nuts at each end so that they can be firmly tightened. This bridge became very popular on account of facility of construction, satisfactory action under the passage of loads, and cheapness, and it was extensively built for highway and railway service. The cut shows one-half of a bridge whose span is about 140 feet. For railroad bridges greater in span than this the trusses were usually stiffened with arches, after the style of the Burr bridge. Many bridges were built on the Howe plan with spans of 200 feet or more. One of the most notable was the bridge on the Philadelphia, Baltimore and Wilmington R. R. over the Susquehanna river at Havre de Grace, which was completed in 1850. This had a total length of about 3,500 feet, there being thirteen spans of 250 feet each, and a draw span of 176 feet. The construction of this bridge occupied five years, and its cost was nearly \$2,000,000. The figure shows an elevation of the drawbridge and of one of

which was completed in 1850. This had a total length of about 3,500 feet, there being thirteen spans of 250 feet each, and a draw span of 176 feet. The construction of this bridge occupied five years, and its cost was nearly \$2,000,000. The figure shows an elevation of the drawbridge and of one of

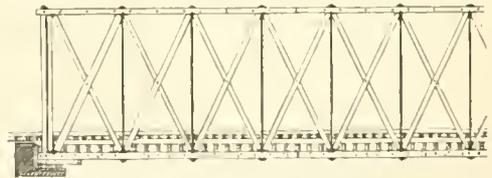

Fig. 10.—The Howe truss, 1840.

the fixed spans. Most of the Howe truss bridges in the Eastern and Middle States have been replaced by iron structures, but numbers of them are found in the Southern and

Fig. 11.—Havre de Grace bridge, 1850.

Western States, and they are still frequently built in localities where timber is cheap. For the greater part of the U. S., however, iron bridges are cheaper for spans of over 150 feet, and they are not only of longer life under natural wear, but are far less liable to decay and to destruction by fire.

In 1844 Thomas W. and Caleb Pratt patented a truss hav-

ing the upper and lower chords and the vertical posts of timber, while all the inclined members, except the two end ones, were made of adjustable iron rods. A skeleton diagram of the Pratt truss closely resembles one of the Howe truss, yet the principle of transmission of the stresses and the details of construction are quite different. As a combination bridge it never attained a popularity equal to that

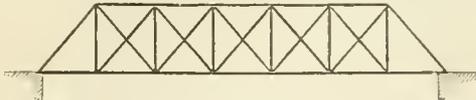

FIG. 12.—The Pratt truss.

of the Howe, as its methods of connecting the timber and iron members are quite complicated. Soon after 1850, however, it began to be constructed entirely in iron, and in this form has probably been more extensively built than any other one kind of truss. The Howe truss, on the other hand, is not well adapted for construction wholly in iron, and but few were ever built. The ill-fated Ashtabula bridge, which failed Dec. 29, 1876, causing the death of about ninety persons, was an iron Howe truss of 154 feet span.

Metallic Bridges.—Cast iron was employed during the latter part of the eighteenth century in the construction of several arched bridges in England (see ARCH). Owing to the cheapness of timber in America, iron was little used prior to 1850, the first iron bridge erected being in 1840 over the Erie Canal. This had cast-iron girders, which were strengthened by wrought-iron suspension rods, and the span was about 77 feet. In the same year Squire Whipple built a truss with curved upper chord of cast iron and a straight lower chord of wrought iron, forming what is now called the bowstring truss. A number of these with spans of 100 feet and over were built in subsequent years. A truss invented by Wendell Bollman and another by Albert Fink were introduced soon after 1850, and extensively built in Maryland, Ohio, and westward; these had chords and posts of cast iron, and tension rods of wrought iron. Fig. 13 shows part of the old bridge between Louisville, Ky., and New Albany, Ind., where several Fink trusses are seen, the long channel span being a Warren truss with auxiliary verticals inserted. It will be noticed that the Fink truss has a pair of long tension rods running from the abutments to the

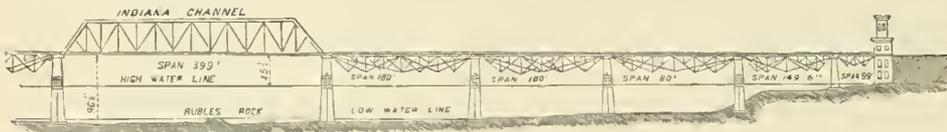

FIG. 13.—Louisville bridge, 1869.

foot of the central post, then each half span is subdivided by a post to whose foot a shorter pair of rods are connected, and so on with smaller divisions, thus forming a structure without a lower chord. It has not proved an economical truss, and could not be used for long spans, so that now it is rarely or never built.

In 1853 Squire Whipple built near Troy, N. Y., a railroad bridge of 146 feet clear span, the top chord and posts being of cast iron, and the lower chord and diagonal rods of wrought iron. This is the Pratt type, with a double system of posts and diagonals, usually called a double intersection truss, or more often a Whipple truss. This form has been extensively used in wrought iron, particularly for long spans, until about 1885, when it began to go out of use. Figs. 18 and 22 show the Whipple truss, and it will be observed that by its use the panel lengths can be made shorter than in the Pratt form of Fig. 12, with the same inclination of diagonals. This is advantageous in lessening the cost of the floor system, and the truss is only going out of use because other methods of securing the same results have been devised.

The forms of trusses which had been used for combination bridges, and for compound structures of cast and wrought iron, suffered more or less modification when wrought iron alone came to be employed, and some of these will receive mention below. The Howe truss, as an iron structure, proved an uneconomical and inconvenient arrangement, notwithstanding its great success as a combination bridge, while the Pratt truss, which was little built in wood and iron, proved admirably adapted for the use of wrought-iron connections. Under the sharp competition of

bridge-builders every advantage that theory could indicate or that experience could suggest was seized upon to render structures both safe and economical.

Cast iron did not prove a satisfactory material for railroad bridges on account of its liability to failure under repeated stresses and sudden shocks. As we have seen, wrought iron was employed for tensile members in the first American bridges, but it was not until 1863 that a structure wholly of wrought iron was built. This was a bridge for the Lehigh Valley R. R. at Mauch Chunk, Pa., and even in this cast-iron joint details were employed. After this date the use of wrought iron increased with great rapidity, and at the present time cast iron would not be allowed except for highway bridges of short span and light traffic. Standard specifications for railroad bridges forbid the use of cast iron even for small joint blocks and bridge seats, although such are often allowed for highway structures.

Steel as a material for bridge construction began to be used about 1870, the first extensive application being in the great St. Louis arches in 1873, and later in the trusses of the suspension bridge over the East river between New York and Brooklyn. It is now extensively used in the form of plates for floor beams and of eye bars for the tensile members, and many entire bridges have been made of mild steel, the mechanical properties of which do not greatly differ from those of wrought iron. As steel is stronger than wrought iron, and qualities of suitable ductility and resilience can now be readily obtained at about the same cost per pound, its use is steadily increasing.

Classification.—In dealing with the subject from an historical point of view, and in tracing the development of different forms, a classification of bridges into stone, timber, and metallic, such as is given above, is very useful. But a comprehensive survey must include a division according to the principles employed in their construction. It is true that some structures exist in which the principles are so combined that their classification is quite difficult, but it has been found as a general rule that composite systems are not economically advantageous, and the tendency has long been toward simplicity of arrangement under forms which are capable of definite computation. For instance, Fig. 11 shows an arch combined with a truss, an old arrangement which is now universally abandoned except as a temporary expedient, for it is quite impossible to determine what proportions of the load are carried by the two different systems.

The three broad fundamental principles under which bridges may be classified are those of the beam, the arch, and

the rope, which give rise respectively to the girder or truss bridge, the arched bridge, and the suspension bridge. The first of these exerts only vertical pressure upon its piers or points of support, while the second and third bring either outward thrusts or inward pulls upon the abutments or anchorages.

The words girder and truss are often used synonymously; but the first properly refers to a structure in one piece, or made of several pieces riveted together, so that it acts like a solid beam. For spans less than 30 feet bridges are often made by using solid iron or steel I beams, which are now rolled in sizes as high as 20 inches in depth. For spans between 30 and 90 feet plate girders are extensively used; these are made of iron plates and angles riveted together so as to form one solid structure. Lattice girders are also riveted, but instead of a plate connecting the flanges, diagonal pieces crossing each other are used. Box or tubular girders are formed by arranging iron plates, angles, and other shapes so as to inclose a hollow rectangular space, as seen in Fig. 20.

A truss consists of an upper chord, a lower chord, and of diagonal members connecting them, the whole forming an open framework so arranged that the principal members are subject only to tensile or compressive stresses. A truss having numerous diagonal members riveted to the chords is called a lattice girder. A truss having its members connected by pins at all principal joints is a pin bridge.

A girder or truss bridge is called simple, or independent, when supported only at each end, and it is continuous when it extends over more than two supports. A drawbridge is one that can be moved, usually by swinging around a cen-

tral pivot, so as to allow vessels to pass the structure. A cantilever was primitively any beam or truss projecting out from a wall, but a cantilever bridge now means a structure formed by two trusses extending from opposite abutments over two piers and united by another shorter simple truss.

In Europe the riveted system of construction now generally prevails. In this system the web members are connected to the chords by means of rivets, many plates being used at each joint to render this possible. In the U. S., however, the system of pin connections for these principal joints is universally used for bridges greater in span than 150 feet. Riveted trusses require much work in the field, while for pin trusses the erection is far simpler. It is claimed that riveted structures are less liable to failure than pin-connected ones; while, on the other hand, it is claimed that the stresses in the latter are more determinate, so that the material can be proportioned to give greater uniform security in all parts. Good bridges can be made upon either system, and considerations of economy will generally decide which is to be adopted in any given case.

Theory and Design of Trusses.—Bridge trusses erected prior to 1810 were rarely well arranged to carry the stresses that were brought upon them. The first publication in the U. S. dealing with the theory of the computation of stresses, but a brief popular statement of a few fundamental principles will be useful before taking up the description of the great bridges of the world.

A Howe truss (Fig. 10) is formed by an upper chord which is always in compression, a lower chord always in tension, and certain web pieces which connect them. Of these web members the vertical ones are under tensile stress and the inclined ones under compressive stress. In the Pratt truss (Fig. 12) and in the Whipple truss (Fig. 18) the web members are arranged so that the vertical ones take the compression and the inclined ones the tension; this is a better arrangement than in the Howe truss, since a long bar or column is liable to bend under compressive stress, and must be stiffened to prevent this by the use of extra material. In the Howe truss one series of web braces provides for the action of the dead or permanent load, while the smaller ones, known as counter braces, prevent the distension under the live or rolling load. So in the Pratt and Whipple trusses there are main ties and counter ties which act in a similar manner. The stresses in the chords are greatest near the middle of the truss, as are also the stresses in the counters; the stresses in the main members of the webbing, however, are greatest near the ends of the truss. Now, to insure economy of material, the sizes of members must be proportional to the stresses that they are to carry; hence it is that the chords of a simple truss are smallest at the ends and greatest at the middle of a bridge, while the main bracing is greatest in size at the ends and least at the middle. The stresses in the chords under a given load vary with the height of the truss, the higher the truss the less being the stresses. Thus, as far as the chords are concerned, economy is secured by making a truss very high; but as the length of the web members increases with the height a limit exists, and this in practice results in making the height usually less than one-fifth of the span, or for long bridges one-tenth of the span.

The triangular truss, in which the webbing consists of members forming a series of equilateral triangles, each member being adapted for both tension and compression, was proposed in 1846 by Noville, a Belgian engineer, but was first built in England by Capt. Warren about 1850, and is hence called the Warren truss. In Fig. 14 is shown a skele-

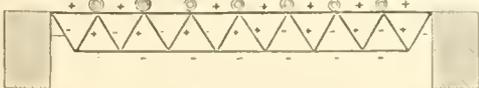

FIG. 11.—The Warren truss.

ton diagram with spheres at the several apex points of the upper chord to represent the loads, the mark + denoting the compressive stress under a uniform load, while the

mark — denotes tensile stress. In 1851 a railroad bridge on this system was built over the Trent, having a span of 240 feet, cast iron being used for compression members and wrought iron for tension members. In 1853 the Crumlin viaduct, formed of ten spans of 150 feet each, was erected on the same system, using wrought iron throughout. The piers of this structure were made of cast-iron posts with wrought-iron braces, the height of the highest pier being 150 feet, the whole forming a handsome structure.

The bowstring truss, one form of which is shown by Fig. 15, originated in an attempt to economize material by making the chords of uniform section throughout. If this were done in a truss with parallel chords the end chord members

FIG. 15.—Inverted bowstring truss.

would have an excess of material, but by making one of the chords curved the stresses were rendered approximately uniform; for a parabolic curve the straight chord is strained alike throughout its entire length. The form in Fig. 15 is really an inverted bowstring truss, the name being originally applied to the case where the upper chord was curved and in compression and the lower one straight and in tension. Bridges with such trusses were first built by Laves in France about 1835 of timber and iron, and later they were erected of cast and wrought iron in England by Brunel, and in the U. S. by Whipple. This principle of construction has proved an economic one, and it is used to a greater or less extent in some of the longest truss bridges ever erected (see Fig. 23).

The lenticular truss has both upper and lower chords curved either in parabolic or circular lines. Such bridges were erected soon after 1840 in France, and were developed about 1850 in England and about 1860 in Germany into an important economic system of design. The horizontal line

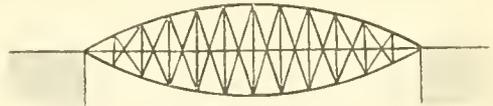

FIG. 16.—Lenticular truss.

in Fig. 16 indicates the position of the floor of the bridge, and does not represent a chord, the functions of these being fulfilled by the curved members alone. By properly proportioning the depths at the various panels the strains in the chord members can be made nearly equal, so that they can be of uniform section throughout; the web members are also found to vary less in size than in trusses where the chords are parallel. It is probable that this form of truss is the one which will ultimately be found to afford the greatest degree of economy as far as material alone is concerned. The longest one yet constructed is that designed by Brunel, and completed in 1859, to carry a railway across the Tamar river at Saltash, near Plymouth, England; this is 455 feet in span, and at that date was an engineering work of great magnitude. In this bridge the roadway was hung below the lower chord (see Fig. 21), but it is also sometimes placed above the upper chord.

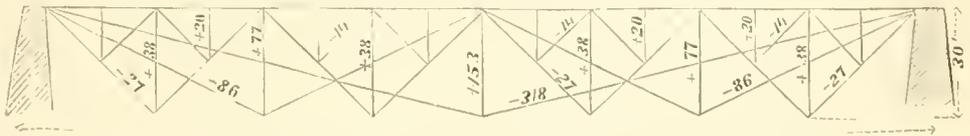

FIG. 17.—Fink truss.

The loads which the trusses are to carry are known in advance, and from these the stresses are computed by the principles of statics. (See GRAPHIC STATICS AND STRESSES.) The live load is that of a crowd of people on a highway bridge and of a train on a railroad bridge. The dead load is the weight of the bridge itself. It was formerly the practice to take the live load for a railroad bridge as a uniform rolling weight of about 2,000 lb. per linear foot per track, the exact figure being somewhat greater for short spans than for long ones on account of the greater shock due to the passage of trains, and most of the structures erected prior to 1875 were designed under such an assumption. From these loads the stresses are computed and written on a diagram called the

strain-sheet. In Fig. 17 is shown a strain-sheet of a Fink truss of 242 feet span and 30 feet depth, where are given the stresses due to a live load of 1.3 tons per foot and a dead load of 1.25 tons per foot, tensile stresses being marked with a minus sign and compressive stresses with a plus sign. The stress in the upper chord is compression, and is uniform throughout.

The Whipple truss, shown in the skeleton diagram of Fig. 18, consists of a double system of diagonals each of which

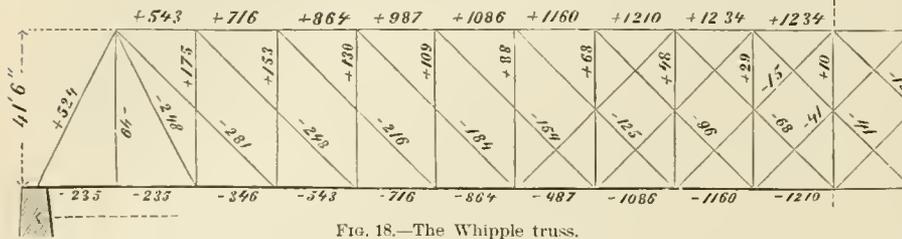

FIG. 18.—The Whipple truss.

is separately computed for the loads that come upon it. The cut gives the strain-sheet of the bridge built at Cincinnati in 1872, the span being 415 feet and the depth 41½ feet. This bridge carries a single track railroad on its lower chord, and outside of each truss is a highway track supported by projecting floor beams. The dead load was taken as 2½ tons per linear foot, and the live load at 1½ tons for the railroad and ¾ tons for the highway (see Fig. 22).

About 1875 the practice arose of taking a greater load per linear foot for the locomotive than for the train. For example, in the long span built over the Ohio at Cincinnati in 1877 it was required that the stresses should be computed for two locomotives coupled together, each of them weighing 36 tons on a 12-foot wheel base, or with tender 66 tons on a base of 50 feet, followed by cars weighing 0.9 ton per linear foot. About 1880 this method began to go out of use, and the practice was introduced of taking the actual wheel loads of a locomotive in their actual positions, the carload being, as before, considered as uniformly distributed. Theoretically the static stresses are more determinate under the assumption of exact concentrated loads than if they be regarded as distributed; but when the increased dynamic stresses due to the sudden application of the load are considered, which are indeterminate and can only be allowed for approximately, it is doubtful if these refinements of computation are either necessary or advantageous.

In Fig. 19 are shown the stresses on a drawbridge truss of 358 feet total length and 26 feet depth, caused by a dead load of 6.95 ton per linear foot and a live load of 1.25 tons

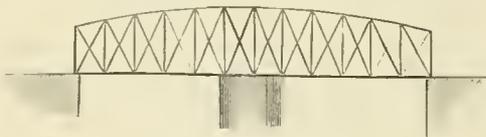

FIG. 19.—Drawbridge truss.

per linear foot. It is seen that the chords take both tension and compression, one kind of stress occurring when the draw is open and the other when it is closed and subjected to the live load. This truss is also of the Whipple type.

Tubular Bridges.—The Britannia bridge over the Menai Straits, in Wales, designed by Robert Stephenson, was completed in 1850. It has two spans of 460 feet and two of 230 feet, made of cast and wrought iron, forming a rectangular tube 1,380 feet long, 28 feet in depth, and 13 ft. 8 in. wide in the clear, through which a single track passes. Fig. 20 shows a section of the structure, but in reality there are two independent tubes side by side for the passage of trains in opposite directions. The shore spans of 230 feet were built in place on false works, but the long central spans were built on shore, floated out on pontoons, and lifted into place by hydraulic presses. The cost of the bridge, inclusive of substructure, was about \$3,000,000.

The Victoria tubular bridge across the St. Lawrence river at Montreal, Canada, also designed by Robert Stephenson, was completed in 1860, having occupied six years in construction. It has twenty-five spans, the middle one being 330 feet, and each of the others 242 feet long, the whole, with abutments, being nearly 1¼ miles long. The tubing of

this bridge is not cellular at top and bottom, as is the Britannia. The ironwork was made in England, even to the punching of the rivet-holes, and each span was built in place on false works. The cost was about \$7,000,000.

Although these tubes form very strong and stiff bridges, yet it is now universally recognized that their erection was an error of judgment which retarded the development of economic bridge design. The train passes through the tube, as through a tunnel, in darkness and smoke, so that from

the point of view of a traveler they are unfavorably regarded. Their great weight and the large amount of workmanship render them the most costly of all structures; indeed, both the Britannia and the Victoria bridges proved ruinous to the companies that built them. Simultaneously with the attempt to bridge large spans by the tubular plan in England

and Canada the suspension principle was being applied for the same purpose in the U. S., although it had been rejected by the British engineers when considering the designs for the structure over the Menai Straits.

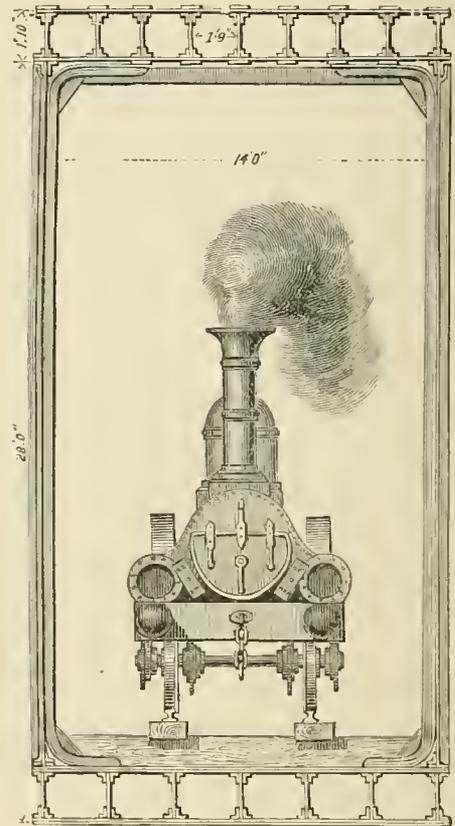

FIG. 20.—The Britannia tube, 1850.

Simple Truss Bridges of Long Span.—A bridge of more than 300 feet span is usually regarded as "long," but the number of these has become so great that a mere enumeration would occupy too much space. The following descriptions are, as a rule, limited to those spans which exceed 400 feet, and from these are selected such as are noteworthy on account of new principles of design, difficulties of construction, or special engineering features of interest.

The Saltash bridge has already been mentioned as an example of the application of the lenticular system to long spans. The whole structure has nineteen spans, two of 455 feet from center to center of piers and the others are 69½ feet each, making a total length of 2,240 feet. The main piers are 190 feet in height from the top to the foundation,

and they were sunk in open wrought-iron caissons. The upper chord, or arch as it is sometimes improperly called, is

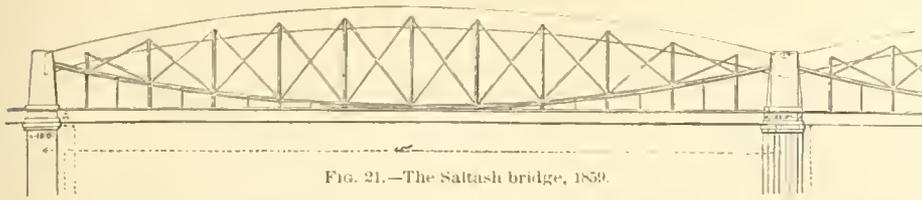

Fig. 21.—The Saltash bridge, 1859.

made of wrought-iron plates, forming a hollow tube of an elliptical cross section; its width being 16 ft. 9 in. and its depth 12 ft. 3 in. The lower chord is formed of suspension chains, and its horizontal pull counteracts the thrust of the upper chord, so that the resultant pressures on the supports are vertical. Each of the main trusses was constructed entire on shore, floated out on pontoons, and raised into place by hydraulic presses.

The Ohio river bridge at Louisville, Ky., designed by Albert Fink and completed in 1869, has a channel span of 400 feet, another fixed span of 370 feet, a draw span of 264 feet, and twenty-four other spans, the total length being 5,218 feet. A part of this bridge is shown in Fig. 13. At the time of its erection the channel span was the longest in America, and the whole bridge was regarded as an engineering work of great magnitude. The long channel spans were arranged with through trusses, while the others had deck trusses, the clear headway below the latter being 90 feet above low water. The extreme rise of the Ohio river is about 40 feet, and on this account the construction of foundations and the erection of false works are often attended with great danger.

The bridge over the Ohio river between Newport and Cincinnati, built in 1872 by the Keystone Bridge Company, J. H. Linville chief engineer, has a channel span of 420 feet,

525 feet from center to center of piers. Since that date the development of the cantilever system has somewhat interfered with the design of simple trusses of long span, yet at least four over 500 feet in length have been erected. The bridge of the Baltimore and Ohio R. R. over the Susquehanna river at Havre de Grace, Md., includes two spans of 375 feet each, four spans of 475 feet each, and two spans of 515 feet each. The channel span of the Ohio Connecting Railway bridge at Pittsburg is 523 feet, and special interest attaches to this, as it was built on false works on shore and then the whole floated across the river on barges into its place on the piers. The bridge of the Norfolk and Western Railroad over the Ohio river at Cerado, West Va., completed in 1892, has two spans of 301 feet each, two of 304 feet each, and one span of 521 feet, all being with bowstring trusses, and similar in general style to those in Fig. 23.

In 1886 occurred an interesting international competition for the erection of a bridge structure 2,900 feet long over the Hawkesbury river in New South Wales, Australia. Plans and proposals were submitted by fourteen bidders, two from Australia, one from France, eight from England and Scotland, and three from the U. S., the lowest bid being \$1,364,600 and the highest \$3,413,590 for both foundations and superstructure. The contract was awarded to the Union Bridge Company, of New York, and the work completed in

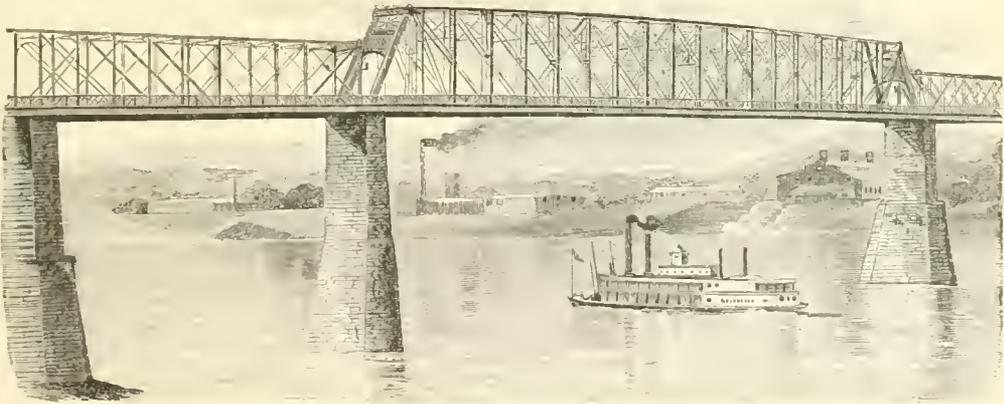

Fig. 22.—Cincinnati and Newport bridge, 1872.

which is shown in Fig. 22. The style of construction is that of the Whipple truss, which has also been extensively used for other long-span bridges. The entire structure ranks among the longest in the world, having twenty-three spans, aggregating 5,925 feet in length.

The Kuilenburg bridge, built by G. Van Dienen over the Leek, in Holland, in 1866, has one span of 515 feet between centers of piers. This is a lattice girder with a triple system of webbing, the upper chord being curved, and the truss resembling in general outline that shown in Fig. 9. For a number of years this span stood at the head as the longest of simple truss bridges.

In 1877 another bridge over the Ohio river at Cincinnati was completed by the Keystone Bridge Company, which had five spans aggregating 1,600 feet, the channel span being 519 feet between centers of piers, or 515 feet between centers of end pins. The general style and appearance of this span is like that shown in Fig. 22. The depth of this truss was 51½ feet and its width 20 feet, it being for a single-track railway. The lower chord was 106 feet above low-water mark. The weight of iron in one of the 300 feet spans was 657,400 lb., while that in the channel span of 515 feet was 2,634,400 lb., or nearly four times as much. In the progress

of the design and construction of this bridge tests of materials and members were made upon an extensive scale, and knowledge thus obtained which proved of great value to the engineering profession.

In 1885 the bridge over the Ohio river at Henderson, Ky., was completed, which has a total length of 3,688 feet, and is composed of sixteen spans, the longest being 525 feet from center to center of piers. Since that date the development of the cantilever system has somewhat interfered with the design of simple trusses of long span, yet at least four over 500 feet in length have been erected. The bridge of the Baltimore and Ohio R. R. over the Susquehanna river at Havre de Grace, Md., includes two spans of 375 feet each, four spans of 475 feet each, and two spans of 515 feet each. The channel span of the Ohio Connecting Railway bridge at Pittsburg is 523 feet, and special interest attaches to this, as it was built on false works on shore and then the whole floated across the river on barges into its place on the piers. The bridge of the Norfolk and Western Railroad over the Ohio river at Cerado, West Va., completed in 1892, has two spans of 301 feet each, two of 304 feet each, and one span of 521 feet, all being with bowstring trusses, and similar in general style to those in Fig. 23.

In 1886 occurred an interesting international competition for the erection of a bridge structure 2,900 feet long over the Hawkesbury river in New South Wales, Australia. Plans and proposals were submitted by fourteen bidders, two from Australia, one from France, eight from England and Scotland, and three from the U. S., the lowest bid being \$1,364,600 and the highest \$3,413,590 for both foundations and superstructure. The contract was awarded to the Union Bridge Company, of New York, and the work completed in

all 20,360,000 lb. were used. The erection was accompanied with difficulties on account of unusual floods in the river, and the false works of one of the spans, together with about 700,000 lb. of iron and steel members, were swept away in a complete wreck. As an illustration of the perfection of American methods of construction and erection, it may be mentioned that the actual shop-work on the superstructure

The Lachine bridge, designed by C. Shaler Smith, and erected by the Dominion Bridge Company in 1887 over the St. Lawrence river at Montreal, is shown in Fig. 24. It consists of two central through spans of 408 feet each, and two side deck spans of 260 feet each, forming a continuous truss over five supports. The structure has great interest on account of the graceful and pleasing manner in which the

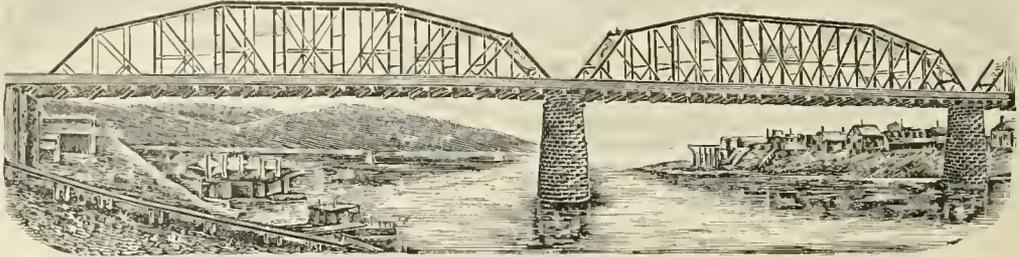

FIG. 23.—Cincinnati and Covington bridge, 1888.

began in Mar., 1888, and that the last of the three spans was coupled and traffic passed over on Dec. 25 of the same year.

The bridge over the Ohio river at Cairo, Ill., opened in 1889, includes two through spans of 518½ feet, seven of 400 feet, three deck spans of 240 feet, and thirty-eight spans of viaduct structure, making a total length of 10,560 feet. The cost of the substructure was \$1,189,744 and of the superstructure \$765,616.

Continuous Bridges.—A continuous truss extends over three or more supports, so that a load placed on one of the spans causes stresses in the other spans. Many such bridges have been erected in Europe, but the system has found little favor in the U. S. In a simple truss the stresses in the members are not affected by slight changes in level of the supports, but in a continuous truss they would be materially altered. A simple truss has the upper chord always in compression and the lower chord always in tension, but in a continuous truss the upper chord is in tension and the lower one in compression for some distance on each side of a pier (see FLEXURE), and a portion of each chord is liable to receive either kind of stress under the action of a passing load. Theory indicates that when several spans are to be bridged the continuous system requires less material than simple trusses, but this is apparently overbalanced by the uncertainties arising from the causes just mentioned.

Among the continuous bridges in England may be mentioned that over the Wye at Chepstow, having three spans of 100 feet each and one span of 305 feet. In Ireland the Boyne viaduct at Drogheda, built in 1855, has three spans of 141, 267, and 141 feet. In Germany is found the bridge over the Weichsel at Dirschau, having six continuous spans of 397 feet each. The Victoria tubular structure at Montreal, Canada, is continuous over one pier and disconnected at the next, thus making continuous bridges of two spans, each of 242 feet in length.

The bridge designed and built by C. Shaler Smith in 1877 over the Kentucky river is an interesting one, as it forms one of the connecting links between the continuous and the cantilever systems. The distance to be bridged was 1,125 feet at an elevation of 275 feet above the low-water level of the river, and it was divided into three spans of 375 feet each by two piers. As false works were impracticable, the structure was built out from each shore abutment, one panel after the other, until the piers were reached, and the process was then continued until the two halves met over the middle of the river, where they were united. Thus a continuous bridge of three spans was formed, but on account of the great height of the iron piers, and their alteration in length under changes of temperature, the chords were cut at a distance of 300 feet from each abutment, and the webbing was so arranged that horizontal stresses could not be transmitted. Thus the structure was converted into two simple trusses, each 300 feet in length, and a central truss 525 feet long. Each of the simple trusses was supported at one end by the shore abutment and at the other end by the projecting or cantilever part of the central truss. The disadvantages of permanent continuity were thus avoided, while all the advantages of this method of erection were secured.

transition from the deck to the through span is made, as well as for its low cost when compared with its neighbor, the Victoria tubular bridge. The following comparative details of these structures are valuable, as showing the prog-

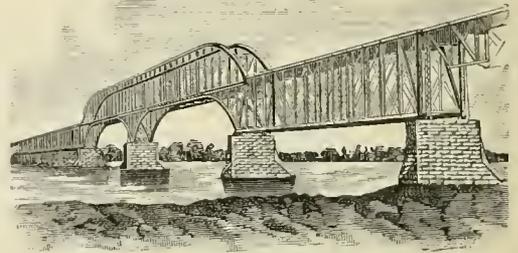

FIG. 24.—Lachine bridge at Montreal, 1887.

ress made in the science and art of bridge design and erection during the short space of thirty years:

ITEMS.	Lachine.	Victoria.

Cost per linear foot.....	\$354	\$1,073

Drawbridges.—The usual type of drawbridge in the U. S. is that shown in Fig. 19. The truss is symmetrical, and rests on a turntable on the central or pivot pier. Two equal openings are provided when the draw is turned. When it is shut, the truss is a continuous one of two spans, and liable to be acted upon by the live load. When the draw is swung open the live load can not come on it, and it consists of two semi-girders or cantilevers, connected together over the pivot pier. In the first case the upper chord is under tension for a certain distance over the pivot pier, and under compression throughout the rest of its length, and the reverse holds for the lower chord. In the second case the top is in tension and the bottom is in compression. It is therefore necessary to make these chords so that they will resist both kinds of stress.

The practice among American bridge-builders is to consider the permanent load as at all times supported by the pivot pier, whether the draw be open or shut. The live load is provided for by considering the draw as a continuous girder on three supports. The depth of drawbridges is generally made greater over the pivot pier than at the ends. This gives an increase of depth where it is needed, while the truss is kept shallow at the ends, where any increase of weight

beyond what is absolutely needful is injurious, as increasing the stresses when the draw is open. Drawbridges are turned by gearing on the circumference of the pivot pier worked by hand or by steam.

The span of a drawbridge is usually estimated from end to end, and thus includes the space occupied by the center pier. A large number of such drawbridges with spans exceeding 300 feet have been built over the navigable rivers in the U. S. The Missouri river has several with openings of 160 feet in the clear. On the Mississippi river there is one of 362 feet span at Quincy, one of 380 feet span at Keokuk, and one at Louisiana, Mo., which has a span of 444 feet with two openings of 200 feet each in the clear.

The Arthur Kill drawbridge on the Baltimore and Ohio R. R., over the arm of the sea between Staten Island, N. Y., and the mainland of New Jersey, was built in 1888 by the Keystone Bridge Company. It is a single track draw of 496½ feet between centers of end piers, 54 feet deep at the middle, and 30 feet deep at the ends, and gives a clear waterway of 206 feet on one side and 214 feet on the other. The weight of the draw is supported by a rim-bearing turntable with 54 cast-steel rollers turning in a track 24 feet in diameter. When the draw is closed the ends are lifted by wedges, so that each half is independent of the other, and the structure becomes two simple trusses instead of being continuous. The ends can be lowered and the draw be swung open in three minutes.

The longest drawbridge yet constructed is that designed by Alfred P. Boller, and built in 1890 by the Union Bridge Company as a part of the railroad bridge over the Thames

ranged with sliding joints near *C* and *D*, so that no horizontal stresses can be transmitted. A load placed anywhere on *A B* is supported at *A* and *B*; a load placed on *B C* causes a downward pressure at *B* and an upward pull at *A*, and a load placed anywhere on *D F* can produce no effect at either *A* or *B*. A load placed on the central span *C D* is, however, carried to *C* and *D* in proper proportions, just as if *C* and *D* were the abutments of a simple truss, and then these proportions are transferred to the left and right respectively. The arm *B C* is the cantilever part of the truss *A C*, and from this circumstance arose the term "cantilever bridge."

Germs of the idea of a bridge with a projecting or cantilever arms are seen in the design made by Thomas Pope in 1811, and in a patent granted to A. Canfield in 1833. The Kentucky river bridge of 1875, often quoted as an application of the cantilever principle, can not be so regarded except in the method of its erection; it is rather a continuous bridge, modified by making permanent points of inflection according to principles which were well known. But the very great advantage of being able to erect a truss system over a deep chasm without the use of false works, which is a feature of both systems, has caused them to be sometimes confounded in principle. In 1870 Prof. W. P. Trowbridge proposed a design for a bridge across the East river at Blackwell's island, in which is seen a central truss supported by two cantilever arms, and in 1876 Charles Macdonald made plans for the same bridge showing similar features. In these designs the object appeared to be to modify the suspension system by avoiding the cables and the horizontal tensions caused by them.

Fig. 25.—Thames river bridge, New London, Conn., 1890.

river at New London, Conn. In Fig. 25 are seen at the ends two deck spans of 150 feet each, then two through spans of 310 feet each, and in the middle the draw span of 503 feet, whose upper chord is reversed in curvature from the usual practice, the whole presenting a most graceful appearance. The draw is noteworthy not only on account of its length, but it carries two tracks, and each truss is proportioned for a moving load of two 86-ton locomotives followed by a train-load of 3,000 lb. per linear foot. The central height of the draw is 71 feet, the end height is 25 feet, the clear distance between tresses is 26 feet, and its weight is 1,300 tons.

Cantilever Bridges.—This type of truss bridge, which has been introduced and perfected since 1882, will be understood by a consideration of Fig. 26, which gives a skeleton diagram of the Niagara cantilever. *A C* is a truss having a shore arm, *A B*, and a river arm, *B C*; it is supported by the anchorage *A* and the tower *B*. On the other side of the river is a similar truss, *F D*, supported at *F* and *E*. Connecting

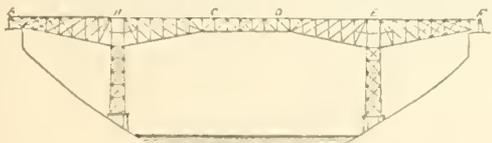

Fig. 26.—Niagara cantilever bridge, 1883.

these two is a simple independent truss, *C D*. In the figure the chords appear continuous, but, in reality, these are ar-

A cantilever bridge was designed by Charles C. Schneider in 1882, and erected over the Niagara river during the following year, within 7½ months from the date of its commencement. Its total length is 910 feet, span of the shore arm 195 feet, length of the river arm 175 feet, length of the central truss 175 feet, and clear span between the towers 470 feet. The bridge is 245 feet high above the surface of the river, and the steel towers are 130 feet high. The erection was effected by constructing false works under the shore arms, and, when these were completed, building out the trusses, panel by panel, until they met over the middle of the river. The upper and lower chords were then disconnected near *C* and *D*, making *C D* a simple truss, independent of the rest of the bridge. The cost of the bridge, exclusive of approaches, was about \$600,000.

In 1885 a steel cantilever was erected over St. John river, New Brunswick, which has a total length of 813 feet, a clear central span of 477 feet, a shore arm of 191 feet, a river arm of 191 feet, and a central truss of 144 feet. The great advantage of the method of erection was here again demonstrated, so that since 1885 cantilever bridges have been built in such numbers as almost to escape record. For short spans they have not been able to displace simple trusses, but for spans between 400 and 800 feet, where false works are difficult of erection, they seem to be more economical than the simple truss, the arch, or the suspension system.

The bridge over the Hudson river at Poughkeepsie, completed in 1889, has a total length of 6,767 feet, the five spans over the river being 548, 525, 546, 525, and 548 feet between

centers of piers. Of these the first, third, and fifth are true cantilever spans, having a central truss connecting the arms which project in each direction from the second and fourth spans. Fig. 27 shows one of these fixed connecting spans, and also one of the cantilever spans. In this method of

made, having two suspension spans of 1,600 feet each, and the contract was awarded, but financial reasons necessitated its abandonment. In 1881 a design on the cantilever plan was made by the engineers, Benjamin Baker and John Fowler, having projecting arms 615 feet long, and a central

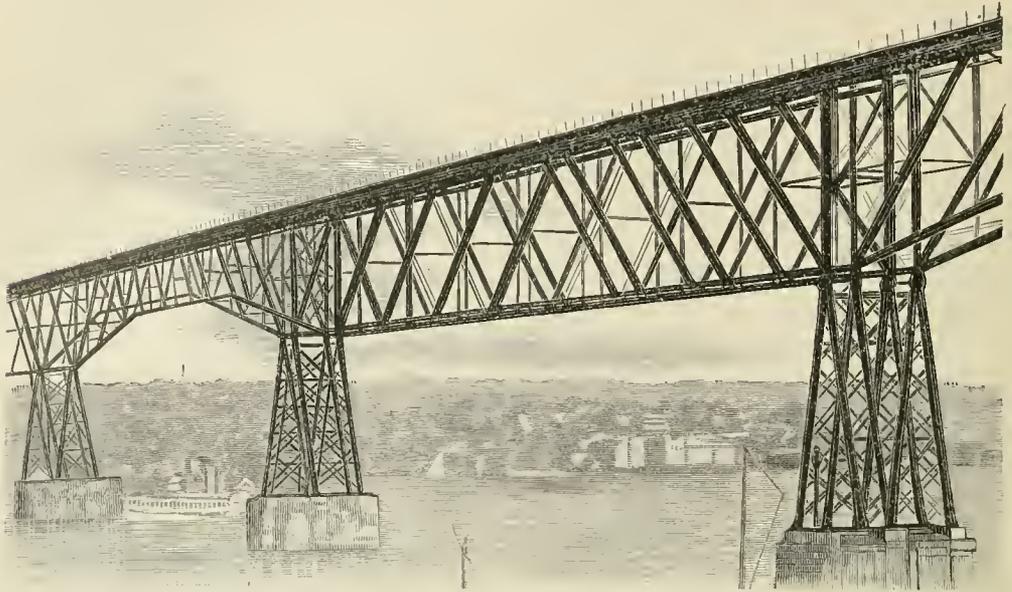

FIG. 27.—Foughkeepsie cantilever bridge, 1889.

construction the fixed spans are erected upon false works, and their projecting arms are then built out in both directions. The economy of the cantilever system in erection is thus gained only for each alternate span, but for the fixed spans the advantage of the continuous system is gained without its disadvantages. This bridge is also noteworthy on account of the great depth of the foundations of the piers. See FOUNDATION.

The bridge across the Colorado river at Red Rock, Cal., was built in 1890 by the Phoenix Bridge Company, and carries a single-track railroad. At that time it was the largest span of the cantilever type in the U. S. Its general arrangement is like that of the Niagara cantilever, except that it is a through bridge. The shore arms and the river arms are of the same length, 165 feet each, while the central truss is 330 feet long, thus making the distance between the piers 660 feet, and the total length 990 feet. The entire weight of iron and steel in the structure is 3,500,000 pounds, and it was erected in eighty working days, the total cost, exclusive of masonry work, being \$230,160.

The bridge over the Mississippi river at Memphis, Tenn., designed by George S. Morison, and completed in 1892, contains two cantilever spans and one fixed span longer than any heretofore constructed in the U. S., and next to the Forth bridge they are the longest truss spans in the world. The fixed span is 621 feet in length, and the cantilever spans are each 790 feet, consisting of two cantilever arms 169 feet long and a central truss of 452 feet. The bridge is a through railroad structure 78 feet high and 30 feet wide between centers of trusses, and the clear height of the lower chord above low water is 110 feet. The bridge proper is 2,600 feet long, and the iron viaduct approach is 2,300 feet in length. The material is mostly steel, and some of the pins used are 14 inches in diameter and nearly 5 feet long.

truss 500 feet long. The general features of this plan were adopted, and under it, with some modifications, the structure was built. Work was begun in 1883, and the bridge was opened for traffic early in 1890. It consists of two shore arms, each 680 feet long, and two main spans, each 1,710 feet long. Fig. 28 shows one shore arm and one main span, with the middle pier, or a little more than one-half of the whole cantilever structure. Beginning at the end the successive distances are, in order, a shore arm of 680 feet, a tower of 155 feet, a cantilever arm of 680 feet, a central truss of 350 feet, a cantilever arm of 680 feet, and the middle tower of 270 feet length; then follows the other cantilever span of the same dimensions and its shore arm, the whole forming a structure symmetrical with respect to the center of the middle tower. Each of the towers has the great height of 343 feet, and they rest upon low masonry piers placed 120 feet apart transversely across the bridge. The width of the bridge at the central truss is, however, only sufficient for two railway tracks, so that the cantilever trusses are not parallel, but converge toward the ends; and as the tops of the towers are nearer together than the bases, the members of the truss do not lie in a plane, but in a warped surface. The compression members are, as a rule, tubular, the principal ones being 12 feet in diameter, while the tension members are mostly lattice girders. The whole structure is of steel, of which 51,000 tons were used on the main spans, and the cost, without the approaches, was about \$13,000,000.

Arched Bridges.—The truss bridges above described form a distinct class intermediate between the arch and suspension systems. In a truss bridge one chord is in tension and the other in compression, while the points of support receive only vertical pressures. In a suspension bridge the main cables are in tension, and a horizontal pull is brought upon

FIG. 28.—The Forth cantilever bridge, 1890.

The Forth bridge, famous as having the longest spans in the world, remains to be noticed. In 1880 a design was

made, having two suspension spans of 1,600 feet each, and the contract was awarded, but financial reasons necessitated its abandonment. In 1881 a design on the cantilever plan was made by the engineers, Benjamin Baker and John Fowler, having projecting arms 615 feet long, and a central

receive a horizontal thrust in addition to the vertical pressures. Some arched bridges have been described near the beginning of this article, and under Arch those of widest span will be found mentioned. An arch is usually more graceful in appearance than a truss, and it seems to produce on the mind of the traveler a feeling of greater security. In the neighborhood of cities the question of aesthetics is an important one that can not be overlooked, and hence an arched bridge is sometimes preferred when a simple truss of equal strength could be erected for much less money.

The great arched bridge at St. Louis, of which an illustration is given in the article Arch, has two spans of 497 feet and one of 515 feet in the clear, and a total length, including abutments, of 1,700 feet, and it carries two railroad tracks, together with a highway on the upper deck. Its cost was about \$5,300,000, or \$3,150 per linear foot, while that of the Poughkeepsie cantilever bridge, which has two railroad tracks only, was about \$840 per linear foot. The steel for the St. Louis arches was, however, very costly, and at the present time a similar bridge could be erected at a much lower figure.

The Washington bridge over the Harlem river, shown in Fig. 29, is a highway structure of beautiful and imposing

different systems, the arch and the simple truss stand at present on a close equality, the former having 541 feet and the latter 550 feet: but these distances are far surpassed by the suspension system with 1,695 feet, and by the cantilever system with 1,710 feet. See ARCH, AQUEDUCTS, and VIADUCT.

Suspension Bridges.—The modern suspension bridge consists of a platform hung from cables, which are stretched across a river, being supported by two towers and anchored at abutments. The platform is the roadway over which the traffic passes, and this is usually stiffened by a truss. Statements regarding ancient suspension bridges in China of several hundred feet in length are found in the writings of travelers, but definite descriptions are lacking, and probably, like the rope and chain bridges of the eighteenth century, most of them were arranged with the roadway platform laid directly on the chains. In 1741 such a chain bridge was erected in England over the Tees. It was a rude foot-walk of 70 feet span and 2 feet width only, and exercised no influence on the development of the present system. The main span of a modern suspension bridge is the distance between the towers, and there are usually two side or shore spans.

The first true suspension bridge having the roadway hung

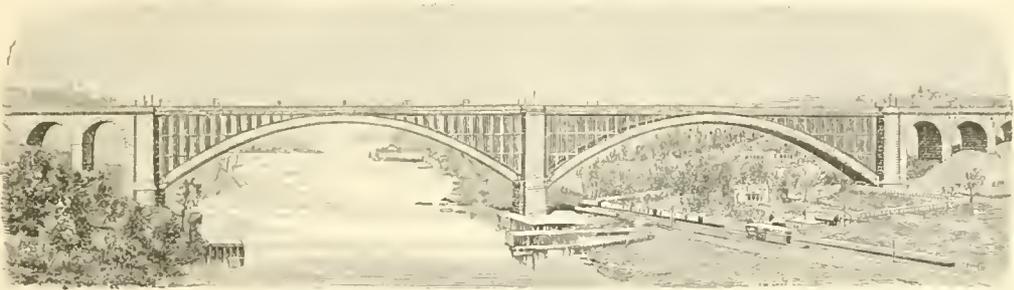

FIG. 29.—The Washington bridge at New York, 1889.

appearance. It has two metal arches, each 510 feet in clear span, and seven masonry arches each of 60 feet, the total length being 2,375 feet. The width of the roadway is 80 feet, and its height above mean high tide is 151 feet. Work was commenced in July, 1886, and the structure was completed in Feb., 1889, at a cost of \$2,850,000, or \$1,200 per linear foot. The webbing of the arches is formed by solid plates with radial stiffness at intervals, thus giving them an appearance as if made of masonry voussoirs. This structure was built by the city of New York, William R. Hutton being the engineer.

The word viaduct is applied to a bridge where the towers are high, crossing a valley or chasm. Some viaducts are also supported by one or more metallic arches. The great arch of the Garabit viaduct, 541 feet in span and 169 feet in rise, is shown in Fig. 30, which indicates also the method of erection, it having been built out from the abutment piece by piece and supported by cables fastened to the tops of the towers; the suspension rope shown above the span was used in transporting the materials from the completed roadway

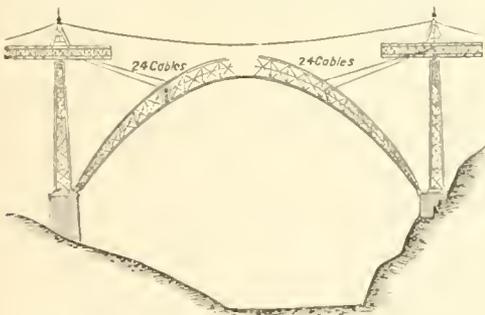

FIG. 30.—Arched viaduct at Garabit, France, 1885.

of the viaduct to their places in the arch. A method of erection somewhat similar was used in the St. Louis bridge, but the arches of the Washington bridge were built on timber false works. In general, it may be said that the erection of arched bridges is more difficult and costly than that of other kinds. In regard to the limiting spans possible under

from cables was erected by Jacob Finlay in 1801 over Jacob's creek, near Greensburg, Pa. It had two chains, one on each side of the bridge, with links of the same length as the distance between the floor joists. These chains passed over towers, and each was bolted to four large anchor stones at the ends. The span between the towers was 70 feet, and the width of the roadway was 12½ feet. A patent was granted to Finlay in 1808, but before this date eight of these bridges had been erected, the longest being over the Schuylkill river, with 306 feet span, "aided by an intermediate pier." Others were built at Cumberland, Md., at Wilmington, Del., at Brownsville, Pa., and one over the Potomac above Washington, which is shown in Fig. 31. This

FIG. 31.—Potomac bridge, 1805.

had a span of 130 feet, a roadway 15 feet wide, and the chains were made of 1½-inch wrought-iron bar. These bridges are mentioned in the book of Thomas Pope, published in 1811, and it has been thought by some writers that the knowledge of the system was thus introduced into Europe.

In 1809 John Templeman built a suspension bridge near Newburyport, Mass., having 240 feet span and two road-

ways each 15 feet in width. In 1815 one was constructed over the Lehigh river at Allentown, Pa., which had two spans of 230 feet each and a roadway 30 feet wide. This was badly damaged by fire in 1828, and soon after was carried away by a flood. All suspension bridges built up to this date had cables made of chains or links of bar

port of railroad trains as well as common travel." In 1847 he built a foot-bridge of about 800 feet span across the Niagara river 2 miles below the falls. In 1848 he constructed the Wheeling bridge over the Ohio, remarkable at the time as the longest span in the world, 1,010 feet; it was 24 feet wide, having both a roadway and a foot-walk, and had

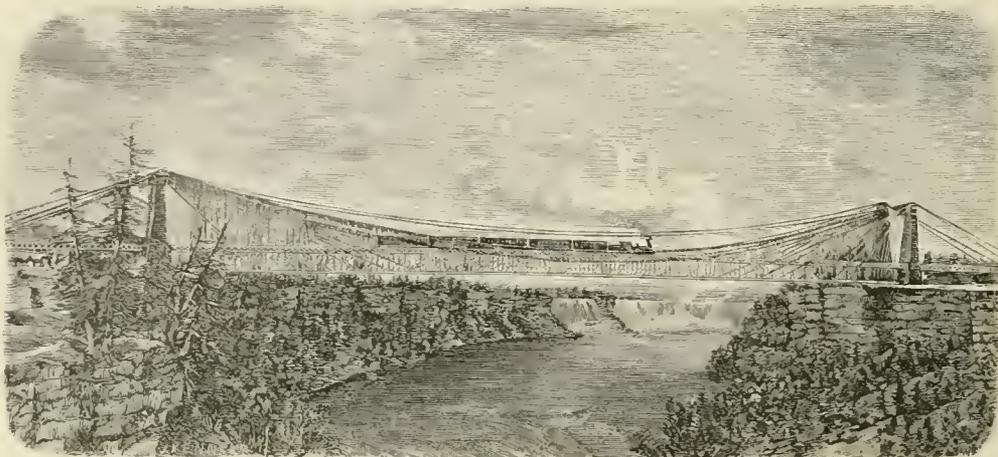

FIG. 32.—Niagara suspension bridge, 1854.

iron. In 1816, however, White and Hazzard constructed a foot-bridge across the river at the falls of the Schuylkill, above Philadelphia, whose cables were made of six wires, $\frac{3}{8}$ of an inch in diameter, and thus a new epoch of development was instituted. The span of this structure was 408 feet, its cost was \$125, a toll of one cent was charged for passage, and only eight persons were allowed upon it at one time.

The suspension system received no serious attention in Great Britain until 1814. In that year Telford instituted experiments on the tenacity of wrought iron, and concluded that it was possible to bridge spans of 1,000 feet on the suspension plan. In 1819 Samuel Brown built a bridge of 449 feet span across the Tweed, and in 1826 Telford completed the Menai chain bridge, which had a total length of 1,710 feet and a span of 580 feet. The Conway bridge, completed about the same time, had a span of 327 feet, and the Montrose bridge, finished in 1829, had a span of 432 feet. All of these structures had chains composed of straight bars several feet long, united by coupling bolts, the Menai bridge, for instance, having sixteen such chains, each of five wrought-iron bars, 9 feet long, $3\frac{1}{2}$ inches wide, and 1 inch thick. They were deficient in rigidity, and indeed the one over the Tweed was blown down six months after its erection, so that the system was gradually abandoned in England, and about 1850 the tubular girder was regarded as best adapted to long spans.

Suspension structures were built soon after 1820 in France, Belgium, and Germany, and a high degree of development was reached in 1834, when the long bridge at Freiburg in Switzerland was completed. This has a span of 870 feet, and is suspended at the height of 167 feet above the river. It is thus 319 feet longer than the Menai bridge, and 65 feet higher. It is supported on four cables of iron wire, each containing 1,056 wires, the united strength of which is capable of supporting three times the weight which the bridge will ever be likely to bear. It was subjected to several severe tests; for instance, 15 pieces of artillery, drawn by 50 horses, and accompanied by 300 people, passed over it at one time, and were collected in as close a body as possible, first on the center and then at the two extremities. A depression of $39\frac{1}{2}$ inches was thus produced, but no sensible oscillation was occasioned.

To resume the history of the development of the suspension system in the U. S., the name of Charles Ellet first claims notice. In 1842 he built a bridge of wire cables, 358 feet in span, over the Schuylkill river, to replace the wooden one erected thirty years before by Wernwag. In 1846 he built the Monongahela bridge at Pittsburg, which consisted of eight spans of 188 feet each, and at this date he expressed the conviction that "any span within 1,500 feet, with the usual deflection, can be made perfectly safe for the sup-

port of railroad trains as well as common travel." In 1847 he built a foot-bridge of about 800 feet span across the Niagara river 2 miles below the falls. In 1848 he constructed the Wheeling bridge over the Ohio, remarkable at the time as the longest span in the world, 1,010 feet; it was 24 feet wide, having both a roadway and a foot-walk, and had

twelve cables containing a total of 6,600 wires. This bridge was blown down in 1854, nearly all the cables breaking at the anchorage.

The perfection of the suspension system and its adaptation to railroad bridges of long span is due to John A. Roebling. The defect of the system was the lack of rigidity and the oscillations produced by wind. This he remedied by using deep stiffening trusses at each side of the roadway, aided by horizontal and vertical stays extending out from the towers. His first great work, the Niagara bridge, completed in 1854, has a span of 821 feet and a width of 15 feet, and carries two decks, the lower for highway and the upper for railway traffic. Each deck is supported by two cables $10\frac{1}{2}$ inches in diameter, composed of seven strands of 520 wires each. The trusses had wooden chords and posts, and wrought-iron diagonals, and the towers were of stone. In 1881 these trusses were replaced by new ones of steel and iron, and in 1887 the stone towers were taken out and wrought-iron ones erected. This bridge demonstrated the feasibility of the system for long spans under railroad traffic, but a few years after it had been rejected by the English engineers in favor of the tubular plan. Among the other bridges designed by Roebling space only permits a notice of two. The Cincinnati and Covington bridge, completed in 1867, has a span of 1,057 feet and a total length of 2,252 feet. This carries roadway traffic only, and is supported by two wire cables of $12\frac{1}{2}$ inches diameter. The greatest of all, however, is the East river bridge, connecting the cities of New York and Brooklyn, which has a main span of 1,595 feet and two side spans of 930 feet each, and carries two tracks of a cable railway, two roadways, and a foot-walk. The article BROOKLYN gives a description and illustration of this grand structure, and the difficult work of sinking the piers is recorded in the article FOUNDATION.

Methods of stiffening a suspension bridge by trussing the cables have also been employed, the most notable being the Point Street bridge at Pittsburg, Pa., designed by E. Hemberle, and built in 1878, which has a span of 800 feet and a deflection of 88 feet. In the common suspension system the cables pass over the towers on saddles which may have a slight horizontal motion, but in the stiffened system the plan of fastening them rigidly to the towers may be used. Two cables connected by bracing may be employed, thus forming an inverted rigid arch, as in the Grand Avenue bridge at St. Louis, built in 1891, which has a main span of 400 feet. A design for a bridge of this character over the Hudson river, between New York and Jersey City, has been made by Gustav Lindenthal. Its main span is to have the great length of 3,100 feet, which is nearly double that of the East river bridge, and the shore spans will be 1,800 feet each. The cables, four in number, are to be in pairs, and each will be about 50 inches in diameter. They will be

hinged to the towers by pins of hollow forged steel 25 feet long and 40 inches in diameter, and being braced together the calculation will be analogous to those of the elastic arch with hinged ends. The stiffening trusses will be used on the roadway as in the common system for the distribution of the locomotive loads, but these will act only incidentally to prevent the deformation of the cables, that function being performed by the bracing which connects them.

Fig. 33 shows a view of this proposed stupendous structure, which, as a whole and in detail, far exceeds anything yet attempted in bridge construction. It will be a railroad bridge exclusively, and be able to carry fourteen tracks, eight on the lower and six on the upper deck, the latter ones to be added when the need for them arises in the future. The towers will be nearly 600 feet in height, or more than twice the height of those of the East river bridge, and, indeed, exceeding in height anything yet constructed, except the Eiffel tower in Paris. The right to build the bridge was granted by Congress in 1890, and five years were given for

The bridge was a deck structure, 157 feet in span, of the Howe truss type, built all of iron. The report of a committee appointed by the Ohio Legislature to investigate the failure concluded that the bridge went down under an ordinary load by reason of defects in its original construction, and that these defects could have been discovered at any time after its erection by careful examination.

The Tariffville bridge, over the Farmington river, in Connecticut, went down on Jan. 15, 1878, while an excursion train was passing over it at slow speed, and thirteen persons were killed. It was a through Howe truss of the common pattern with two spans, each of 165 feet. The coroner's jury reported that the wrought-iron vertical rods were too small, and that the timber of the chords had become weakened by decay to such an extent as to render the bridge unfit for use.

The Tay bridge, in Scotland, was blown down on Dec. 28, 1879, while a train was passing over it in a violent storm of wind, and all on board—about seventy-five in number—

FIG. 33.—Proposed Hudson river bridge.

preliminary surveys and designs before beginning work, but it is thought that actual construction will begin in 1894, and that with the present manufacturing facilities of the steel-works of the U. S. it will be completed in 1899. The estimated cost is about \$30,000,000, the interest on which is about \$5,000 per day. As about 150 express and 680 local trains arrive at and depart from the Jersey side every day, bringing 75,000 passengers by ferries into New York and taking away an equal number, it is plain that the need for such a bridge is pressing, and that, like the Brooklyn bridge, the traffic over it would continually increase.

Failures of Bridges.—At the present day the science of the theory of stresses and of the properties of materials is so exact that a bridge, designed and erected by competent engineers, has perfect security in all its parts under the heaviest loads that can come upon it, and during the most severe storms of wind. This science becomes more and more exact every year as respects both strength and economy, and the study of the causes of bridge disasters has had much influence in modifying the methods of design. For instance, failures of bridges due to the derailment of trains have caused the floor systems to be strengthened in a manner which ordinary computations could never have indicated. The subject of failures of bridges and of the causes of failure is hence one of great importance to a bridge engineer. Here it is only possible to briefly mention a few of those most important on account of the loss of life and of the lessons which they teach. At the present time, as in the past, it is unfortunately true that bridge disasters occur, but it is also true that nearly all of them could have been prevented by an efficient system of inspection. A few, indeed, such as those caused by cyclones and earthquakes, can not be avoided by human foresight; but careful and constant inspection is a factor of as great importance in preventing accidents as sound theory and thorough construction.

According to a table compiled by T. Appleton in 1878, there occurred in the U. S. during the five years 1873-77 a total of 183 failures of railroad bridges, of which thirty-five were caused by fire, hurricane, and flood, and the remainder fell under service. By these accidents 197 persons were killed and 485 were injured.

On Dec. 20, 1876, the Ashtabula bridge, in Ohio, on the Lake Shore R. R., fell while an express train was passing over it, and about eighty of the passengers and seven of the crew were killed out of a total of 158 persons on board.

The bridge was the longest in the world, having eighty-five spans, with a total length of 10,321 feet, and thirteen spans and their piers were blown down. The piers were mostly made of cast-iron columns connected by horizontal braces. The board of inquiry reported that the failure was caused by the insufficiency of the cross-bracings and their fastenings to sustain the force of the wind, and that no understood rule and no requirements existed in Great Britain regarding computations for wind-pressures, although in France 55 lb. per square foot and in the U. S. 50 lb. was generally used. It is scarcely necessary to remark that careful computations of wind-stresses were made for the new Tay bridge.

On July 1, 1884, occurred at Morelos, Mexico, the most fatal bridge accident on record, whereby 247 soldiers were killed, 40 were injured, and only 20 escaped uninjured of all those on the train.

The necessity of careful inspection, as plainly emphasized by the disasters of Ashtabula and Tariffville, led to a thorough overhauling of old railroad bridges during the following years. Accidents, however, still occurred, but none involving great loss of life. In 1886 there were reported twenty-two failures of bridges in the U. S., by which thirty-five persons were killed. Of these twenty-one persons perished in the wreck of a bridge at Opelika, Ala., whose abutments are said to have been weakened by a freshet.

The Bussey bridge, at Roslindale, Mass., fell on Mar. 14, 1887, whereby 26 passengers were killed and 115 injured. The bridge was of 125 feet span, and of an unusual form of construction. The railroad commissioners reported that it was built practically without superintendence, and that the only inspection had been that made by a machinist who had regularly passed over vital parts of the bridge without realizing that they were important or defective. The lesson taught by this accident is that important constructions should be built and inspected by educated and trained engineers, if safety as well as economy is to be secured.

The accident at Chatsworth, Ill., on Aug. 10, 1887, may here be mentioned, although properly it was not caused by a bridge failure. A small wooden trestle, only 30 feet in length, had caught fire, and before an excursion train could be stopped it became wrecked, and 73 persons were killed and 374 injured.

In 1889 C. F. Stowell, bridge engineer of the New York State railroad commission, compiled a table showing the

bridge failures in the United States and Canada during the ten years 1879-88, which gives a total of 265 bridges. Of these, 27 were due to fire, 39 to freshet, 8 failed while undergoing repair, 60 were knocked down by derailed trains, and 34 fell with trains passing normally over them. This does not include trestles and culverts, or failures occurring without accident to a train. The most serious accident during 1889 was at St. George, Ontario, where a derailed train knocked down one span of a bridge, and 13 deaths and 29 injuries resulted. In 1890 a drawbridge was left open at Oakland, Cal., and a train plunged into the water, drowning thirteen persons; other serious disasters of this kind are also on record, but these are properly classed as due to negligence of operation.

On June 14, 1891, a small bridge of 134 feet span at Mönchenstein, Switzerland, failed while a passenger train was crossing it, by which 74 persons lost their lives and about 200 others were injured. The bridge had riveted lattice trusses, and had been in service for sixteen years. A commission of experts concluded that the bridge was faultily constructed and weak in some of its parts; that the iron was generally of poor quality; and that injury had occurred several years before by the sinking of one of the abutments during a freshet.

Statistics.—No statistics have ever been collected regarding the number of bridges of different kinds and lengths of spans. But figures obtained by Theodore Cooper in 1889 for 26,228 miles of railroad in the U. S. showed, excluding trestles and spans under 20 feet, 446,488 linear feet of bridges. Using this as a basis of estimate for the 160,000 miles of railroad in the U. S., he found the following distribution:

Spans from 20 to 50 feet.....	121 miles =	18,150 spans.
" " 50 " 100 "	130 " =	9,100 " "
" " 100 " 150 "	190 " =	8,000 " "
" " 150 " 200 "	109 " =	3,300 " "
" " over 200 feet.....	56 " =	1,150 " "
Total.....	606 " =	39,700 " "

These include both wood and iron bridges, and for the iron bridges he gives the following estimates:

Spans under 20 feet.....	17 miles =	5,100 spans.
" " from 20 to 50 feet....	86 " =	12,900 " "
" " 50 " 100 "	66 " =	4,600 " "
" " 100 " 150 "	93 " =	3,600 " "
" " 150 " 200 "	69 " =	2,100 " "
" " over 200 feet.....	49 " =	950 " "
Total iron spans.....	380 " =	29,550 " "

LITERATURE.—The first book on bridge construction published in the U. S. was Thomas Pope's *Treatise on Bridge Architecture* (New York, 1811), which has already been alluded to as advocating the advantages of his "flying pendant lever bridge," but which devotes 196 pages to "an historical account and description of different bridges erected in various parts of the world." Mention has also been made of a pamphlet issued by Col. S. H. Long in 1836, but nothing further is known to have been published until 1847, when Squire Whipple issued at Utica, N. Y., a book entitled *A Work on Bridge-building*, consisting of two essays, the one elementary and general, the other giving original plans and practical details for iron and wooden bridges. This work gave methods for computing stresses in trusses, but its circulation was very small. In 1851 appeared *General Theory of Bridge Construction*, containing demonstrations of the principles of the art and their application to practice, by Herman Haupt, A. M., which gave an excellent discussion of the resistance of materials, the flexure of beams, and the theory of stresses, as well as examples of timber bridges for railroad service. Little literature appeared in this country between 1850 and 1870, but since 1870 a large number of books have been issued. The following are the titles of the several standard technical works, with the date of the first edition: Wood, *Treatise on the Theory of the Construction of Bridges and Roofs* (1873); Greene, *Trusses and Arches Analyzed by Graphic Methods* (1879); Burr, *Stresses in Bridge and Roof Trusses* (1880); Du Bois, *Strains in Framed Structures* (1883); Waddell, *Design of Highway Bridges* (1884); Bender, *Principles of Economy in Design of Metallic Bridges* (1885); Johnson and Bryan, *Modern Framed Structures* (1893). Monographs in book form have also appeared on the construction of the Niagara

suspension bridge, the St. Louis and Illinois bridge, the Washington bridge in New York, and others, while the columns of engineering journals and of the *Transactions of the American Society of Civil Engineers* contain many valuable papers, both theoretical and descriptive. Almost the only books of an historical and descriptive nature published in the U. S. are Boller, *Iron Highway Bridges* (1876), and Cooper, *American Railroad Bridges* (1890).

Among foreign books the following may be noted as containing drawings and descriptions of bridge structures: Gauthey, *Traité de la construction des ponts* (Paris, 1809); Miller, *Die Brückenbaukunde* (Leipzig, 1860); Humber, *Cast and Wrought Iron Bridge Construction* (London, 1864); Maw and Dredge, *Road and Railway Bridges* (London, 1872); and Heinzerling, *Die Brücken in Eisen* (1874). Of the large number of foreign theoretical works, Fidler's *Practical Treatise on Bridge Construction* (London, 1887) may be mentioned as perhaps likely to be most serviceable to students.

MANSFIELD MERRIMAN.

Bridges, LAWS GOVERNING THE ERECTION OF: In England at the common law no one can build a public bridge without a license. In the U. S. the building and maintaining of bridges upon the highways is a duty that is included in that usually imposed by statute upon the municipal corporations to maintain the highways in a condition reasonably safe and convenient for public travel. The right to erect a bridge over navigable waters may be conferred by State law, subject, however, to the exercise of the power conferred by the Constitution upon Congress to regulate navigation. In pursuance of this power Congress has passed a law (26 Stat. at large, 453) which provides that whenever the Secretary of War shall have good reason to believe that any bridge is an unreasonable obstruction to navigation he shall, after giving the parties opportunity to be heard, give notice to alter it, specifying the changes to be made. Failure to remove is a misdemeanor, and on conviction a fine not exceeding \$5,000 may be imposed, each month of default being deemed a new offense. The custom is to obtain the consent both of Congress and of the State Legislature before bridging navigable waters.

F. STURGES ALLEN.

Bridges, Military: Wherever warfare has been so far reduced to a system and a science as to call into the field, for protracted campaigns, large and organized armies, the very necessities of the case call for some systematic method of passing streams, and, as belonging to it, special organizations of men (*personnel*) for making bridges, and a portable bridge apparatus.

The bridge of boats of Xerxes for passing the Hellespont, the timber-pile bridge of Cæsar (of which an account is given in the article BRIDGES), were not ordinary, but extraordinary constructions necessitated by the magnitude of the obstacles; and they owe their record probably to that peculiarity. It is quite likely, however, that during ages when roads for wheeled vehicles scarcely existed, and, on the other hand, forest timber was abundant, the felled tree (elaborated into a rude bridge), or some such improvised expedient, could generally be resorted to, and that a regular "bridge equipage," in the modern sense of the term, did not exist. The Romans are known to have had a species of "ponton" (as we now call it) to carry with their armies. In fact the wooden boat has naturally offered the readiest means of support to portable bridges; but these, generally large and heavy, are with difficulty transported. Hence various expedients for creating a vessel of considerable flotation power, yet lighter and more portable than ordinary boats (such as framework, covered by skins, canvas, etc.) have been resorted to. The French, the systematizers of the modern art of war, were naturally the first to provide a regular organization and established type of construction for the military bridge, and to organize a *personnel* by which it should be operated.

Their first *ponton* was of copper. Their system has undergone successive modifications and improvements, and instead of metal, wood is used in their ponton. As fixed in 1853 the French ponton, as described by Gen. Cullum in his work on military bridges, is a flat-bottomed wooden boat, 31 feet long, the middle part or body of which, for a length of 16 feet, has a trapezoidal section of 5 7" width at top and 4' 4" at bottom, and 2 7" deep; the fore part, 8' 9" long, diminishes to 2' 6" in width at the bow, and has a sheer of 5 1/2"; and the aft part, 6 3' long, diminishes to 4 7" in width at the stern, and has a sheer of 3'. Each ponton weighs 1,455 lb., is borne on the shoulders of 17 to 20 men, has a flotation of 18,600 lb., car-

ries 25 infantry soldiers, is convenient for disembarking troops, and can be easily navigated in a rapid current by five men.

The material for the French bateau bridge for an army consists of 8 abutments, 8 trestles, 32 bateaux, 4 mooring-boats, 339 balks (84 abutment, 24 claw, and 231 bateaux), 784 chesses, 32 anchors, and all the accessories for forming a bridge of 41 bays, 262 yards long, and 12 9/17 wide. This train may be divided into 4 divisions, each containing the material for a complete bridge.

The Russians have a somewhat lighter equipage; the ponton (of canvas) is a flat-bottomed bateau, having, except at the ends, a rectangular section. The length at top is 21 feet, and at bottom 18 4/5; the width 5 4/5; and the depth 2 4/5. The skeleton consists of two side-frames, connected by movable transoms—all of 4-inch scantling. The canvas cover is 10' 8" wide, 30 feet long in the middle, and 23' 3" along the edges; both sides being tarred or painted black with a composition, applied hot, composed of hempseed oil, strong loam, india-rubber, soap, wax, and soot. The cover is brought over the ends of the frame, and lashed to the top transoms; it is secured, along the sides, to the top string-pieces of the side-frames by small nails passing through eyelet-holes along the edges of the cloth. A plank is laid on the bottom for the pontoniers to stand upon. The canvas ponton, frame and cover complete, weighs 718 lb., and has a flotation of 13,428 lb.

The complete bridge is composed of 32 canvas pontons, with bridge-flooring and accessories for 33 bays; and a section of the Birago equipage, consisting of 8 trestles and 15 wooden pontons (8 bow and 7 body pieces), with a bridge-flooring for 8 bays.

The Austrians, after satisfactory trials in the passage of the broad, deep, and rapid current of the Danube, adopted, in 1841, a system named from its inventor, Col. Birago, of the Austrian Imperial Engineers. This system was somewhat modified in 1859.

This equipage has fixed and floating bridge-supports, the former consisting of abutments and trestles, and the latter of pontons of two pieces assembled together according to the requirements of the bridge for the passage of infantry, cavalry, or artillery, and whether designed for one, two, or three distinct roadways.

The pontons are flat-bottomed bateaux of sheet iron, of one piece, or from two to six assembled together, end to end, by suitable bolts and fixtures. The Birago trestle is composed of a *cap* and two *legs*, to the lower ends of which *shoes* are attached to increase their bearing surface, and give greater stability to the trestle. The *cap* is *adjustable*, being partly supported at the proper height by *suspension* chains, at one end of which are large rings passed over the tops of the legs, the free ends being run through suspension rings on the upper side of the cap. After the chains are made taut, and the cap is at its proper height, the latter is held in place by the *toggles* inserted in the last link which has passed through the suspension rings.

Nothing like a "bridge equipage" had belonged to our military service until 1846. The Engineer Department had long foreseen the necessity of a corps of well-drilled pontoniers and a bridge equipage for our army, and year after year had urged their great importance upon the attention of Congress, but not until May 15, 1846, was its sanction given to the project of the department, and when too late to aid the passage of the Rio Grande by our forces then invading Mexico.

With the sanction of Congress finally obtained, a company of sappers, miners, and pontoniers was organized as part of the Corps of Engineers, and an india-rubber ponton bridge of 46 pontons was prepared by direction of the chief of engineers, but under the superintendence of the late Major-Gen. G. W. Cullum, then a captain in the Corps of Engineers. Another of 36 pontons was subsequently dispatched with the army under Gen. Scott. Owing to the lightness of these pontons only *thirty-five six-horse carriages* were necessary to transport, over the worst roads, a complete train for the formation of a bridge of 200 yards. For the French bateau bridge of nearly 240 meters *seventy-seven six-horse carriages* are used.

The rubber pontons in use for drill purposes at West Point having become unserviceable, and it having become evident that rubber was not adapted to their construction, experiments were undertaken by the then instructor of practical engineering, Capt. J. C. Duane, now brigadier-general and chief of engineers, U. S. army, retired.

The immense trains with which our armies are unavoidably encumbered, the long marches to be made, and the numerous wide and rapid rivers to be crossed, demand an equipage of the most substantial character. On the other hand, the extended expeditions of light columns, which necessarily attend our military operations, require a train light enough to keep pace with the most rapid cavalry movements.

Hence we require both a reserve and advance-guard train. The experiments included the trial of the bridge equipages used by those European armies most experienced in the art of military bridge-building.

Pontons were constructed after the models of the French bateau, the Austrian sectional ponton, and the Russian canvas boat. Corrugated-iron boats were procured, corresponding as nearly in form and dimensions to the French and Austrian boats as the nature of the material would permit. A number of Birago trestles were also constructed. All of the above material, with the exception of the iron boats, was prepared by the enlisted men of the Engineer Company (A) then stationed at West Point.

The bridges formed of this material were exposed as much as possible to the action of heavy loads, storms, the tide, and floating ice. The material was also packed on carriages of various patterns in order to ascertain the best form, both of bridge material and of carriage, for transportation.

The selection of the French, Russian, and Austrian trains for these experiments was made after a careful study of the various equipages used by the armies of Europe. These three nations alone appeared to have definitely settled on their systems, and this after much experience and thorough research.

After experimenting for two years, the conclusion was arrived at that the French ponton should be adopted. Experiments followed to determine the *material* of which the ponton should be made. Life-boats having been successfully made of corrugated iron, it was presumed it might be, with equal advantage, applied to pontons. It was not only found that to get adequate strength the weight must be increased beyond that of the wooden ponton, but that iron failed in other respects. In fact, it would not bear land transportation, as, in traveling over a rough road, the joints open by the yielding of either the rivets or sheet iron. When in the bridge, if the boat grounds on an uneven or rocky bottom, a hole is frequently punched through it, and such injuries can not be repaired in the field. The wooden ponton is not only much less liable to such accidents, but can be readily repaired when they do occur.

See *Organization of the Bridge Equipage of the United States Army*.

Previous to the battle of Gettysburg a ponton bridge over the Potomac at Harper's Ferry was destroyed, the pontons being scuttled and set adrift above the rapids. About three weeks after the water having fallen, the boats were recovered, repaired with pieces of hard-bread boxes obtained from the commissary, and used in constructing a bridge at Berlin, over which the entire army passed into Virginia.

With regard to the canvas boat, it soon became apparent that it was precisely what we required for our advance-guard train. It is light, simple, strong, easily repaired, and when packed can safely be transported with the superstructure of the bridge as rapidly as any column of troops can move. A strong argument in favor of its adoption was that it had been used successfully by the Russians for more than 100 years, under every variety of circumstances likely to occur in this country.

The French ponton wagon not being adapted to our rough roads, further experiments ensued to fix upon the selection of a proper carriage for transporting our bridge equipage.

Through the information gained by these experiments resulted the system of bridge equipage adopted at the commencement of the civil war.

During the winter of 1861-62 five trains were constructed, each composed of 34 pontons and 8 trestles—the pontons being nearly of the same form and dimensions of the French bateau. The frame was somewhat different, the ribs being entire and strongly ironed, and the ironing stronger throughout. The stern was provided with a locker. There were also other alterations in the details of construction. The balks were stronger, and the Birago trestle was modified by substituting built beams, instead of solid timber, for the trestle caps and balks.

"At the same time several canvas trains were organized. In constructing the ponton frame the dimensions and form of the Russian boat were exactly retained. The scantling for the frame was considerably lighter, but, being strongly braced and ironed, the strength was about the same. One train was composed of canvas boats and trestles, being, in truth, a trestle train, with auxiliary pontoons to be used only where the depth of water or muddy bottom prevented the use of trestles.

"In the month of Feb., 1862, a ponton bridge, composed of about sixty boats of the reserve train, was thrown across the Potomac at Harper's Ferry. The river was then a perfect torrent, the water being 15 feet above the summer level, and filled with driftwood and floating ice. The greatest difficulty was experienced in pulling the pontoons into position, and it was necessary to make use of ship anchors and chain cables to hold them in place. Notwithstanding these unfavorable circumstances, the bridge was completed in about eight hours, and the corps commanded by Gen. Banks, with all its trains and artillery, passed over it without accident or delay.

"Several of these trains accompanied the army in the Peninsular campaign. The pontoons were used in discharging quartermaster and commissary stores at Ship Point, in disembarking Gen. Franklin's command at West Point (York river), and in constructing bridges over Hampton creek, the streams in front of Yorktown, and the Upper Chickahominy. Finally a bridge was built over the Lower Chickahominy, about 2,000 feet long, over which nearly the whole Army of the Potomac, with its immense trains, artillery, and cavalry, passed with promptness and safety.

"After the army had passed, the bridge was dismantled and the balks, eesses, etc., packed into the pontoons, which were formed into rafts and towed by steamers to Washington. The bridge trains were next transported to Harper's Ferry, where a bridge was constructed a second time, but under entirely different circumstances from that built during the previous winter. The water was now not deep enough; and, as it continued to subside shortly after the bridge was laid, many of the pontoons grounded on a very uneven and rocky bottom. Some of them were completely out of water, yet the heavy trains continued to move over the bridge without seriously injuring them; and when the water rose, most of them floated as well as ever.

"Discovering in this way that the boats were much stronger than we had supposed, we were enabled to improve the method of bridging tidal streams.

"It had formerly been considered necessary to build out to low-water mark with trestles, so that the ponton should always be afloat. The bridge is now commenced at high-water mark, building with pontoons alone. As the water subsides, the pontoons nearest shore ground successively, forming a gentle ramp from the abutment to the floating portion of the bridge, instead of making the descent in 20 feet, as formerly. This method of course applies only to wooden pontoons, and to cases where the bottom is favorable.

"During the Fredericksburg campaign it became necessary to force the passage of the Rappahannock. The enemy, having intrenched themselves on the bank, prevented for some time the construction of the bridge; until at length troops were embarked in the pontoons and ferried across, where they stormed the rifle-pits, and held them until the bridge was completed.

"During the year 1863 the ponton trains accompanied the army in all its marches backward and forward through Virginia, frequently bridging the Potomac, Rapidan, and Rappahannock. In the latter stream the bridges remained in position all winter; and, notwithstanding the frequent floods and the quantity of ice formed, but few interruptions occurred on these thoroughfares.

"During the campaign of 1864 trains, composed of fourteen pontoons and two trestles, accompanied each of the three army-corps of the Army of the Potomac. These trains attended their corps in the long march from Culpeper to the James river, and, although the roads were frequently very bad, in no instance did they delay the march of the troops or arrive late when a bridge was to be laid.

"The headquarters train was followed by a canvas train; which, when a crossing was to be made by surprise, was sent forward with the cavalry, who covered the construction of the bridge and held the position till the main body arrived.

"On reaching the James river, a bridge was laid opposite Charles City Court-house (at a point selected by the writer of this article), about 2,000 feet in length. The water

was so deep and rapid that the pontoons could not be held by their own anchors, and it was found necessary to attach their cables to schooners anchored above and below the bridge. . . . For the next 40 hours a continuous stream of wagons passed over the bridge, from 4,000 to 6,000 wagons, some said 50 miles of wagons, and nearly all the artillery of this army, and by far the larger portion of the infantry and all its cavalry present, and even to its heads of 3,000 or more of beef cattle—the most injurious of all—without an accident to man or beast." (*Report of Gen. Benham*.) The length of the bridge was made up of 200 feet in trestlework and 2,000 feet in pontoons (101 in all); depth of the river, 85 feet.

"Thus the wooden ponton train through four years of war, during which the bridges constructed were without parallel in number and magnitude, amply fulfilled all the requisites of a good bridge equipage. The frequent crossing of the Potomac, Chickahominy and James rivers proved that, even under the most unfavorable circumstances it could furnish a bridge capable of passing a large army, with its heaviest trains over wide and rapid streams, with safety and dispatch.

"Its capabilities in ferrying troops were shown at Ship Point, West Point, and Fredericksburg; and of the mobility of the equipage there was abundant proof in the long marches during the last two years of the war.

"The canvas equipage, also, was perfectly successful as an advance-guard train. In the cavalry raids it was always able to keep pace with the columns; and, although they frequently marched hundreds of miles, it was invariably ready to furnish a prompt and secure means of crossing all the streams on their route. It also often furnished bridges for the heavy trains of the army over streams of moderate width and rapidity.

"The only part of the bridge equipage which did not realize all our expectations was the Birago trestle.

"As already stated, a train was organized early in the war on the Austrian principle, in which the trestle is the main dependence, the ponton being merely auxiliary. It was supposed that many streams would be encountered which would be bridged best with trestles alone, but none such were met with. In fact, when a stream is more than 2 feet deep, a ponton bridge may be laid; when less than that depth, if the bottom is hard, it may be forded, and no bridge is required; should the bottom be soft, the trestle legs will usually settle so as to render the bridge unsafe. As it was not deemed advisable to transport with the army a train which could only be used in exceptional cases, this description of equipage was abandoned. The trestle was, however, very useful as an auxiliary, especially with the canvas train; for, as these boats when in the bridge should never be allowed to touch the bottom, it is frequently necessary to build out several bays from the shore before sufficient depth of water can be obtained to float the ponton—and for this purpose nothing could be better than the Birago trestle, which is also equally useful for a similar purpose with the reserve train, when the river bottom is rough near the shore.

"The canvas train was extensively used by the Western army, and with such success that it was proposed to employ it exclusively. Experience, however, in the East has clearly proved that this train can not fulfill all that is required of the bridge equipage of a large army. The bridges of the Potomac and James rivers could not have been built with canvas boats, which will not resist ice and driftwood; neither are they suited to the disembarkation of troops or the passage of a river by force.

"Experience would therefore lead us to concur with Gen. Barnard in his remarks on this subject, viz.:

"The numerous proposers of "flying" bridges forget that if a military bridge is intended to be *carried* with an army, it is also intended to *carry* an army, its columns of men, its cavalry, its countless heavy wagons, and its ponderous artillery. It must carry all these, and it must do it with certainty and safety, even though a demoralized corps should rush upon it in throngs. No makeshift expedient, no "ingenious" invention not tested by severe experiment, no light affair of which the chief merit alleged is that it is light, will be likely to do what is required, and what the French ponton has so often done."

The experienced engineer officers from whose *Introductory History* we quote constituted a board which, in 1870, established the present authorized organization. It was based upon the experience we have described in their language.

As now fixed the U. S. bridge equipage is composed of reserve and of advance-guard trains. The former are intended to accompany large bodies of troops in the field, and are provided with the material necessary for the construction of bridges of sufficient capacity to pass large armies with their heaviest trains over rivers of any size and rapidity.

The advance-guard equipage is intended for the use of light troops, such as advance guards, cavalry expeditions, etc. It is organized, both as regards material and carriages, with a view to rapidity of movement. At the same time it is capable of furnishing a bridge which will fulfill all the requirements of troops engaged on such service.

The basal elements of these distinct equipages—the French wooden bateau and the Russian canvas ponton—are of dimensions very nearly corresponding to those (already given) of their original prototypes; but with modifications in details of construction derived from our own experience.

The reserve equipage is divided into trains, each of which is composed of four ponton divisions and one supply division. Each division is accompanied by a tool wagon and traveling forge.

Each ponton division is complete in itself, containing all the material necessary for constructing a bridge of eleven bays, or 225 feet in length.

Each of these divisions is subdivided into four sections, two of which are ponton and two abutment sections; the former contains 3 ponton wagons and 1 chess wagon; the latter, 1 ponton, 1 chess, and 1 trestle wagon each.

The ponton section contains the material for three bays, and should never be subdivided. The division may be increased or diminished at pleasure by changing the number of its ponton sections.

The supply division is provided with articles necessary to replace material lost or worn out, such as balk, chess, spare parts of carriages, a few complete carriages, etc.

The carriages of this division consist of ponton, chess, and tool wagons, and of forges. Their number and proportion will be determined by the nature of the country in which the army is operating, and by the proximity of the main dépôt.

The trains of the advance-guard equipage are composed of 4 ponton divisions, each of which consists of 8 ponton, 2 chess, and 2 trestle wagons.

The ponton wagon carries all the material necessary for constructing a complete bay. The division may therefore

be increased or diminished by one or more ponton wagons without disorganizing it. When a forced march is to be made, and it is desirable to lighten the loads, the chess may be removed from the ponton wagons, the rope from the trestle wagons, and the load of the chess wagons be reduced to 40 chess. The number of the latter wagons in this case must be increased to 5.

The ponton wagons of reserve train are drawn by 8 mules or 6 horses, those of the advance-guard train by 6 mules or 4 horses, the "loads" being about 3,000 and 2,000 lb, respectively. It would be out of place to enter more

fully into this subject in this work; but these historical details concerning the development of the military-bridge system of the U. S.—a matter in which the country had no experience whatever—during the war can not fail to be interesting.

Railway Bridges.—Another interesting branch of the subject—the remarkable constructions applied to the improvisation of railroad bridges in place of destroyed ones, and the noteworthy system of repair and construction introduced into our military railway service, can only be al-

luded to. The military railroad construction and repair corps were a part of the quartermaster's department, which organized, hired, and paid all their members, and bought and paid for all the material, and possessed and operated the railroads at an expense which at one time amounted to about \$2,000,000 per month. Under the chief of that department, and especially charged with this duty, the principal organizer and conductor of military railroad transportation and repairs was Brig.-Gen. D. C. McCallum (who has since made a valuable report on this subject), well known as an able civil engineer and inventor of the "inflexible arch truss"; but the credit of the military railroad operation, and repair and success, belong to no individual altogether, but to the quartermaster's department, and to the body of railroad engineers, superintendents, and operatives who came into its service to aid the country during the war.

In the occupation, for protracted periods, of the same ground (as in investments, sieges, etc.), military bridges assume frequently a semi-permanent character.

Thus while the Army of the Potomac occupied a position near Richmond (May and June, 1862) its wings were separated by the formidable barrier of the Chickahominy rivulet and swamp. One of the bridges is thus described in the report of the chief of engineers of the Army of the Potomac:

"The bridge was built over the stream upon frame trestles; through the swamp it was supported by cribs. The approaches to the bridge over the low bottom-lands were either raised corduroy or (on the north side) simply earth raised 2 or 3 feet (the soil being here sandy), with a layer of brush 1 foot below the upper surface, deep lateral ditches being made. The whole structure of the bridge and approaches was about 1,400 yards long. The trestlework and crib-work bridge was mostly done by troops of the engineer brigade under Gen. Woodbury; the approaches on the north by the 9th and 22d Massachusetts regiments (Cols. Cass and Gove, both of whom were killed in the battles following), and those on the south side by the 3d Vermont. The bridge was ready for the passage of teams on the 14th, covered with earth, and the approaches entirely completed on the 17th. The bridge proper was 1,080 feet long; roadway, 11 feet wide; number of cribs, 40; of framed trestles, 6." (Fig. 1.)

The combined armies under Gen. Grant occupied positions before Petersburg and Richmond from June, 1864, to Apr., 1865. The James river separated the Army of the

FIG. 1.—Woodbury and Alexander's bridge.

James (in its final position) from the center and left. An assured communication was indispensable, and at the same time one which would not impede the navigation for Federal vessels, whether transports or armed.

Col. P. S. Michie, chief of engineers, Army of the James, designed and submitted for approval a timber-pile bridge with a floating draw (the floats being ordinary pontoons), of which an elevation of a portion, including the "draw," of pontoons is here given. (Fig. 2.)

The piles of trestles were guarded against ice (which in the winter forms freely in the upper James) by highly in-

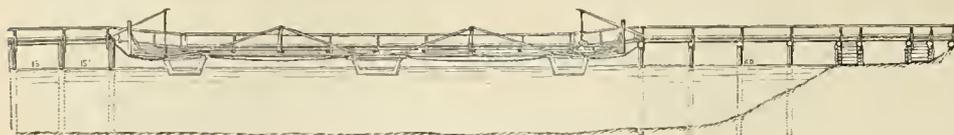

FIG. 2.

clined guard-pieces, the feet of which were secured to piles in the bed of the river. Each trestle was made up of a cap-piece and six piles (in pairs) driven into the bed of the river.

This bridge, which was constructed late in the year 1864, was in use down to the close of the civil war. During the period above indicated the gap in our lines made by the Rappahannock was occupied by one or more ordinary ponton bridges. See Haupt's *Military Bridges* (1867).

Revised by JAS. MERCUR.

Bridget (or **Brigit**), SAINT, or **Saint Bride**: one of the three patron saints of Ireland; b. at Fochart, now Faugher, 47 miles N. W. of Dublin, 453; early showed a character of great energy, courage, generosity, unselfishness, and holiness; became a devotee, and founded a monastery of the Columbian order at Kildare, 30 miles W. S. W. of Dublin; and there died Feb. 1, 523. The name Brigit means "the fiery arrow." Her day is Feb. 1.

Bridget, SAINT (of Sweden): See BIRGITTA, SAINT.

Bridgeton: city, railroad center, and port of entry, the capital of Cumberland co., N. J. (for location of county, see map of New Jersey, ref. 7-B); is situated on both sides of Cohansey river, a tide-water stream; 20 miles from Delaware Bay, 37 miles S. of Philadelphia, and 127 miles S. of New York. Its area is 15.39 sq. miles, or 9,849 acres. As a port of entry it is second in the State. The leading articles received are coal, pig iron and iron ore, lumber, lime and shells, fertilizers, and manufactured goods. The principal shipments are nails, gas and water pipe, canned fruits, woolen goods, window-glass, hollow-ware, and grain, potatoes, etc. It is the leading city of Southern New Jersey in the variety and value of its manufactured products. Educational facilities are fine. The South Jersey Institute for both sexes, opened in 1870 on a commanding site, has a handsome and well-appointed building which cost over \$65,000. The West Jersey Academy occupies a fine building in a beautiful location. Ivy Hall, a select boarding-school for girls, has a high reputation. There are also public schools of a high order. It has a flourishing board of trade, building and loan associations, a large number of benevolent societies, and good county buildings. Pop. (1800) about 400; (1880) 8,722; (1890) 11,424; (1895) 13,292.

EDITOR OF "NEWS."

Bridgetown: the capital of the island of Barbados; on its west coast, and extends along the north side of Carlisle Bay, which forms its roadstead; lat. 13° 4' N., lon. 59° 38' W. (see map of West Indies, ref. 8-M). It is the residence of the Bishop of Barbados and the governor of the Windward islands, and has an arsenal and barracks in the vicinity. Pop. (1891) 21,000.

Bridgewater: a town and river-port of England; in Somersetshire; on both sides of the river Parret; 33 miles by rail S. W. of Bristol (see map of England, ref. 13-F). It is neatly built, and the houses are mostly of brick. Vessels of 200 tons can ascend the river to this town. Here is St. Mary's church, which has a remarkable and lofty spire. This is the native place of Admiral Blake. Bridgewater became a free borough in 1200. Pop. (1891) 12,429.

Bridgewater: a post-village of New Dublin township, Lunenburg County; 12 miles from Lunenburg, Nova Scotia (see map of Quebec and Nova Scotia, ref. 3-B); has manufactures of lumber, etc. Pop. 4,000.

Bridgewater: town; Plymouth co., Mass. (for location of county, see map of Massachusetts, ref. 4-I); on Old Col. R. R., 27 miles S. of Boston. It contains a State normal school, State almshouse, extensive iron-works, cotton-gin, and other manufacturing establishments, and is the seat of the county agricultural fair. Pop. of township (1880) 3,620; (1890) 4,249; (1895) 4,686. EDITOR OF "INDEPENDENT."

Bridgewater, FRANCIS HENRY EGERTON, eighth Earl of; b. in London, Nov. 11, 1756; son of John Egerton, Bishop of Durham. He inherited the earldom in 1823, and died un-

married in Paris, Feb. 11, 1829. By his last will he left £8,000 to be paid to the author of the best treatise *On the Power, Wisdom, and Goodness of God as Manifested in the Creation*. He was an Anglican priest, very eccentric. Thus he had his house in Paris filled with dogs and cats. Some, dressed

up like human beings, were taken riding with him and fed at his table.

Bridgewater Treatises: a series of works named in honor of the Earl of Bridgewater. (See preceding article.) The trustees who had the control of his bequest of £8,000 placed it at the disposal of Gilbert Davies, president of the Royal Society, who appointed eight gentlemen to write separate treatises illustrative of the power, wisdom, and goodness of God. They are arranged as follows in the collected edition: Vol. i., by Sir Charles Bell, F. R. S., *The Hand as Evincing Design* (1832; 7th ed. 1860); ii., iii., by Rev. William Kirby, M. A., F. R. S., *Power, Wisdom, and Goodness of God in the Creation of Animals* (1835); iv., by John Kidd, M. D., F. R. S., *Adaptation of External Nature to the Physical Conditions of Man* (1833); v., by Rev. William Whewell, M. A., F. R. S., *Astronomy and General Physics with Reference to Natural Theology* (1833); vi., by Rev. Thomas Chalmers, D. D., *Adaptation of External Nature to the Moral and Intellectual Conditions of Man* (1833); vii., by William Prout, M. D., F. R. S., *Chemistry, Meteorology, and Digestion with Reference to Natural Theology* (1834; 4th ed. 1855); viii., ix., by Rev. William Buckland, D. D., F. R. S., *Geology and Mineralogy with Reference to Natural Theology* (1836); x., xi., by Peter Mark Roget, M. D., F. R. S., *Animal and Vegetable Physiology with Reference to Natural Theology* (4th ed. 1869).

Bridgman, FREDERICK ARTHUR: genre and portrait painter, principally of Oriental subjects; b. at Tuskegeit, Ala., Nov. 10, 1847; pupil of Gérôme, Paris; National Academician 1881; member of the Society of American Artists 1880; medal at the Centennial Exhibition, Philadelphia, 1876; third-class medal, Salon, 1877; second-class medal and Legion of Honor, Paris Exposition, 1878; second class-medal, Paris Exposition, 1889; medal at Munich Exposition 1888. His picture *Procession of the Bull Apis* is in the Corcoran Art Gallery, Washington; his *Roumanian Lady*, in the Temple collection, Pennsylvania Academy, Philadelphia; and *Diligence in the Pyrenees*, in the Permanent Gallery, Liverpool, England. Many of his works are owned in the U. S. His pictures display very clever technique, and are generally brilliant in color. Studio in Paris.

WILLIAM A. COFFIN.

Bridgman, LAURA: a blind deaf-mute; afforded a remarkable instance of the development of intellectual and moral powers under the most adverse circumstances. She was born at Hanover, N. H., Dec. 21, 1829. When two years old she lost her sight, hearing, and smell through a severe illness, her sense of taste being at the same time greatly impaired. At the age of eight she was placed under the instruction of Dr. Howe, of Boston, principal of Perkins Institution. She soon learned to read and spell with a manual alphabet, and afterward learned to write and to sew, acquired very considerable information, and was an object of great interest to psychologists and to those interested in the education of persons of defective senses. She was a teacher in the Perkins Institute, and composed religious verse. D. May 24, 1889. See Mary S. Lamson's biography of her (Boston, 1878).

Bridgnorth (anc. *Bruges* or *Brugia*): a town of Shropshire, England; on both sides of the Severn; 19 miles S. E. of Shrewsbury, and 123 miles N. W. of London (see map of England, ref. 9-G). The upper part of the town is picturesquely built on a rock 60 feet higher than the river. It has an old castle, almshouses, a public library, a bluecoat or charity school, a handsome bridge, and manufactures of carpets, nails, tobacco-pipes, boats, and worsted stuffs. It has a heavy commerce upon the river, and is supposed to have been founded by a daughter of Alfred the Great. Pop. (1891) 5,723.

Bridgton: town; Cumberland co., Me. (for location of county, see map of Maine, ref. 10-B); on Bridgton and Saco

River R. R.; 38 miles from Portland. It has 5 churches, 5 graded schools, woolen mills, and other manufactories, and is accessible by steambot from the foot of Sebago Lake. Pop. of township (1880) 2,863; (1890) 2,605.

EDITOR OF "NEWS."

Bridlington, or Burlington: market-town in the East Riding of Yorkshire, England; on the North Sea; 51 miles by rail E. by N. of York (see map of England, ref. 6-J). Here are remains of a rich priory founded by a grand-nephew of William the Conqueror. Numerous ancient tumuli or barrows occur in this vicinity. Bridlington Quay, a seaport and bathing-place, is on the sea, 1 mile S. E. of the town. It has a chalybeate spring and several hotels; also an active trade in corn, which is exported from it. This place is noted for chalk-flint fossils. Pop. of Bridlington and Quay (1891) 6,611.

Bridport: a seaport-town of Dorsetshire, England; on the Brit or Bride river; 16 miles N. W. of Dorchester (see map of England, ref. 14-F). It is surrounded by hills, and consists chiefly of three spacious streets. It has a Gothic church, an alms-house, a town-hall; also manufactures of cordage, sail-cloth, shoe-thread, and fish-nets. The vicinity is celebrated for its butter and cheese. Pop. 7,500.

Brief [O. Fr. *brief*, *brief* < Lat. *breve*, a short list, note, dispatch, neut. of *brevis*, short]; in law, an abridged statement of the plaintiff's or defendant's case, prepared by his attorney for the use of the barrister or counsel. (See ATTORNEY.) It should contain a summary of the pleadings, a concise statement of the facts involved, the names of the witnesses, the substance of their testimony, and usually observations by the attorney in the nature of suggestions to counsel.

In the U. S., where the same person performs the functions of both attorney and counsel, the word "brief" is used to denote the sketch of the argument of counsel, with or without a statement of facts, which is either used by him or submitted to the court under its rules. "Brief" is also sometimes employed in the sense of *breve*, to denote one of the writs by which all suits in the higher courts were originally begun.

Revised by P. STURGES ALLEN.

Brief, Papal: a letter addressed by the pope to temporal princes or communities on subjects of discipline or public affairs. It differs from the papal bull in several respects, giving decisions on matters of inferior importance, which do not require the deliberations and assent of a conclave of cardinals. It is not signed by the pope, but by the segretario de' brevi, an officer of the papal chancery. It is written on thin parchment, in current Latin characters, begins with the name of the pope, is dated after the modern and not, as in bulls, after the Roman fashion, and sealed in red wax with the pope's private seal, called the "Fisherman's Ring" (Annulus Piscatoris).

Brieg, breech: a town of Prussia; in Silesia; on the Oder, and on the railway from Breslau to Oppeln; 29 miles by rail N. of Neisse (see map of German Empire, ref. 5-1). It is well built, and has a gymnasium, a good library, and manufactures of hosiery, ribbons, linens, and woollens. Pop. (1890) 20,154.

Briel, or The Brill: a fortified seaport-town of Holland; province of South Holland; near the mouth of the river Meuse; 13 miles S. S. W. of The Hague; lat. of lighthouse 51° 54' 11" N., lon. 4° 9' 51" E. (see map of Holland and Belgium, ref. 6-D). It has a good harbor, is intersected by several canals, and contains several magazines. The capture of this town by William de la Marek in 1572 was the first important event in the long contest between the Dutch and Philip II. of Spain. Van Tromp and De Witt were born here. Pop. 4,600.

Brienne, or Brienne-le-Château, brē en le-shāā'15', called also **Brienne-Napoléon**, -nāā pō lā ōn': a small town of France; department of Aube; on the river Aube; 23 miles E. N. E. of Troyes (see map of France, ref. 4-G). Here was a military school in which Napoleon I. was educated. The place derived its name from a château built by the last Count de Brienne. In Jan., 1814, a battle was fought here between Napoleon and the allies commanded by Blücher and Schwarzenberg, in which the latter were victorious. Pop. (1891) 1,732.

Brienz, bree'enz, Lake of (Germ. *Brienzer-See*); in Switzerland; is formed by the river Aar, at the foot of the Hasli valley. It is 8 miles long, 2 miles wide, and from 500 to 2,100 feet deep. The surface is 1,847 feet above the level of

the sea. It is surrounded by high mountains, one of which, called the Rothhorn, commands a grand view of the Alps. The surplus water of this lake flows through the Aar into Lake Thun. A small steamer plies on the lake daily.

Brierre de Boismont, brē ar'de-bwaā'mōn', ALEXANDRE JACQUES FRANÇOIS: a French physician; b. in Rome, Oct. 18, 1797; published numerous treatises on medico-psychological subjects; among others, *De l'Ennui*; *Sur le Suicidé* et *la Folie-suicidé* (rev. ed. 1865); and *Des Maladies Mentales* (1866). D. in St.-Mandé, Dec. 25, 1881.

Brigade [Fr., from Ital. *brigata*, crew, company]: a group of regiments or battalions combined into one body. In the British army it denotes a body formed by the union of two or more regiments or battalions under one commander, called a brigadier. It is a temporary grouping which can be broken up whenever the commander of the army thinks proper. In the U. S. army two or more regiments of infantry or squadrons of cavalry may constitute a brigade. A brigade of cavalry is usually eight or ten squadrons. The term is often applied to uniformed bodies acting under authority in a semi-military way, as "fire brigade." The Royal Guard in Great Britain, consisting of three cavalry and three infantry regiments, is known as the Household Brigade.

Brigadier', or Brigadier-general: the commander of a brigade; an officer who is one degree higher than a colonel, and one lower than a major-general. In the British army a brigadier is an officer (usually a colonel) who for a limited time and for a special service is appointed to the command of a brigade. When this is broken up he either falls back to his colonelcy or is raised to the rank of major-general.

Brig'andage: highway robbery by organized gangs, who make their home in secure places in the forests or among the mountains, from which they issue forth to seize and rob wayfarers or to hold them for ransom. In a period of barbarism, when might is the only right, brigandage has its rise. The heroes of Greece distinguished themselves by suppressing brigandage. Theseus, Perseus, and Hercules purged the country of these robbers who had taken refuge in caverns, and also of the princes who practiced the same trade. Cities pillaged each other. The Palatine Hill, the cradle of Rome, was originally a refuge for the brigands of the Campagna; during the whole period of the Roman republic the Italian peninsula was full of brigands. The fugitive slaves and the inhabitants of conquered cities who had escaped the Roman sword continually increased the number. The Cimian forest was their headquarters, and this has remained until our time a most dangerous place for travelers from Florence to Rome. The civil wars increased the numbers of the brigands; Roman citizens were carried away almost under the eyes of the soldiers and held in prison until they paid a high ransom. Still the brigands, even at that period, were not without sentiment. Pакemon, the celebrated grammarian, having fallen into their hands, was sent away without harm as soon as they had heard his name. Fifteen centuries later Ariosto paid his ransom on almost the same spot by reading a few stanzas of his poem.

The vast forests that covered Gaul and Germany furnished a natural refuge for brigands; continual wars favored them, and the whole feudal system in many of its features was little better than respectable brigandage. In France the system survived longer than in Germany. The eighteenth century furnishes two famous names in the annals of brigandage in France, Cartonche and Mandrin. Napoleon having firmly established the security of the roads, since his day brigandage has practically been unknown in that country. Italy, always the classic home of brigands, and Spain, her rival in this respect, continued for many years to give a home to these romantic criminals. The outlaws were generally in league with the authorities, and were never betrayed except for vengeance; this was particularly the case in Southern Italy. The ordinary line of operations of the brigands extended from Vienna to Naples, covering the lofty mountains of Aquila and Aquino, E. of Rome. These are covered with dense forests, which support numerous goats, on which the brigands subsisted. Brigandage was entirely consistent with religion. A man took his gun and went upon the highway to collect money to pay his taxes or his church assessments. Napoleon waged a fierce war against this system in Italy, and during all his domination no assassination or theft was allowed to go unpunished. This was one great cause of the popular hatred against him. One of the most famous of the Italian brigands was Fra Diavolo, who played an important part in the revolution of Naples

in 1799, was received with great favor at the court, and given the title of colonel by Queen Caroline. Spain has had much the experience of Italy. No government has ever been strong enough to track the malefactors to their mountain fastnesses and exterminate them. Here, as in Italy, brigandage seemed rather chivalry. José Maria, the most celebrated of the Spanish contrabandists, is said never to have taken a ring from a lady's hand without saying "Madam, so fair a hand has no need of ornament." Other countries preserve tender recollections of these happy times. Schinderhannes is still popular along the Rhine; Chaudor is as celebrated for his filibustering exploits as for his share in the revolution of 1848. In Albania this form of plunder still exists. A characteristic feature of brigandage everywhere is the holding of captives for a ransom. The brigand has furnished many heroes to literature and opera. Hernani, the hero of Victor Hugo's great drama, is one of the most celebrated. About's *Roi des Montagnes* is a well-known and delightful tale based upon brigandage in Greece. See Larousse, *Dictionnaire du XIX^e Siècle* (upon which this article is largely founded); Baedeker's *Guide to Southern Italy*. C. H. THURBER.

Brigan'tes: a powerful nation of ancient Britain, inhabited what is now the north of England, including the counties of Cumberland, Westmoreland, Durham, York, and Lancaster.

Briggs, CHARLES AUGUSTUS, D. D.: theologian and scholar; b. in New York city, Jan. 15, 1841; studied at the University of Virginia 1857-60, the Union Theological Seminary of New York 1861-63, and the University of Berlin 1866-69; was pastor of the Presbyterian church at Roselle, N. J., 1870-74; in 1875 was chosen Professor of Hebrew and the Cognate Languages in the Union Theological Seminary of New York; in 1891 was transferred to the newly endowed Edward Robinson chair of Biblical Theology. His inaugural address was the occasion of his trial for heresy by the Presbytery of New York, on the ground that it maintained the following errors: (1) that Reason is a fountain of divine authority which may and does savingly enlighten men; (2) that the Church is a fountain of divine authority which, apart from the Holy Scripture, may and does savingly enlighten men; (3) that errors may have existed in the original text of Holy Scripture, as it came from its authors; (4) that Moses is not the author of the Pentateuch; (5) that Isaiah is not the author of half the book that bears his name; (6) that Sanctification is not complete at death. The trial lasted for some six weeks (during November and December, 1892), and resulted in the acquittal of the accused on every count. It was shown to the satisfaction of the majority of the presbytery that he never maintained the error stated in the first two counts, and in regard to the others that it was allowable in a Presbyterian minister to hold the opinion sought to be condemned. The decision of the presbytery was appealed to the General Assembly. He was the editor of the *Presbyterian Review*, 1880-89, and author of *Biblical Study* (New York, 1883; 3d ed. 1888); *American Presbyterianism* (1885); *Messianic Prophecy* (1886); *Whither?* (1889); *The Bible, the Church, and the Reason* (1892). The University of Edinburgh gave him the degree of D. D. in 1884.

Briggs, CHARLES FREDERICK: journalist; b. at Nantucket, Mass., in 1804. He established the *Broadway Journal* in 1844, and was afterward associated editorially with *Putnam's Magazine*, the *Independent*, and the *New York Times*. He published, besides other works, *The Adventures of Harry Franco: a Tale of the Great Panic* (1839); *The Haunted Merchant* (1844); and *The Trippings of Tom Pepper* (1847). D. in Brooklyn, N. Y., June 20, 1877.

Briggs, GEORGE NIXON, LL. D.: lawyer and judge; b. in Adams, Mass., Apr. 13, 1796; became a lawyer in 1818 in Berkshire County; distinguished himself in defense of an Indian charged with murder in 1827; from 1831 was a member of Congress for twelve years, and Governor of Massachusetts from 1844 to 1851, during which time he refused to pardon Prof. Webster, the murderer of Dr. Parkman. He was a common pleas judge 1851-56; also a trustee of Williams College for sixteen years, and a distinguished philanthropist, and for many years president of the Baptist Missionary Union. D. in Pittsfield, Sept. 12, 1861. See his memoir under title *Great in Goodness* (Boston, 1866).

Briggs, HENRY: mathematician; b. near Halifax, Yorkshire, in 1551; educated at St. John's College, Cambridge. He became in 1619 Savilian Professor of Astronomy at Oxford. He made important contributions to the theory of

logarithms, in which the logarithm of ten was taken as unity, and published in 1624 a great work entitled *Arithmetica Logarithmica*, giving the logarithms of natural numbers from 1 to 20,000, and from 90,000 to 100,000, calculated to 14 places. His *Trigonometria Britannica* (London, 1633) contained *Tables* of natural sines, tangents, and secants with logarithms to the hundredth part of a degree. D. in Oxford, Jan. 26, 1630.

Brigham, AMARIAH, M. D.: b. near New Marlborough, Mass., Dec. 26, 1798; practiced medicine in Hartford, Conn., where his opposition to revivals on hygienic grounds brought him obloquy. He became superintendent of the lunatic asylum at Utica, N. Y., in 1842. Among his works is *The Anatomy, Physiology, and Pathology of the Brain* (1840). D. in Utica, Sept. 8, 1849.

Brigham, CHARLES HENRY: b. in Boston, Mass., July 27, 1820; graduated at Harvard; became in 1844 pastor of the First Congregational church in Tamnton, Mass., and in 1865 pastor of the Unitarian church at Ann Arbor, Mich. After 1866 he was Professor of Biblical Archaeology and Ecclesiastical History in the Meadville (Pa.) Theological School. He was a prominent member of the American Oriental Society, of the Philological Society, and of the American Association for the Advancement of Science, and was the author of many contributions to periodical literature. D. in Brooklyn, N. Y., Feb. 19, 1879. See his *Memoir* by E. B. Willson, Boston, 1881.

Brigham: city; capital of Box Elder co., Utah (for location of county, see map of Utah, ref. 2-L); on Cent. Pac. and on branch of Union Pac. R. Rs.; 60 miles N. of Salt Lake City, near the northern shore of Salt Lake. There are here churches of three denominations, and 4 district and 3 sectarian schools; farming and fruit, cattle, and sheep raising are the chief occupations of the people. Pop. (1880) 1,877; (1890) 2,139; (1895) State census, 2,722.

EDITOR OF "BUGLER."

Bright, JOHN: orator and statesman; b. near Rochdale, Lancashire, England, Nov. 16, 1811. He was a member of the Society of Friends. About 1840 he became a personal and political friend of Richard Cobden, and gained distinction as an orator of the Anti-Corn-Law League, in advocacy of which he addressed many public meetings. He was elected a member of Parliament for the city of Durham in 1843, and was returned for Manchester in the general election of 1847. Cobden and Bright became the principal leaders of the Manchester school or party, which was not identified with either of the great political parties, but advocated a pacific foreign policy and electoral reform. He was defeated in the election of 1857, because he had opposed the Crimean war against Russia and the Chinese war, but was elected in the same year by the Liberal voters of Birmingham, whom he continued to represent for many years. During the great civil war in the U. S. he expressed his sympathy with the Union cause in several eloquent speeches. After the Reform bill of Russell and Gladstone had been rejected by the House of Commons in 1866, Mr. Bright advocated the cause of electoral reform by vehement speeches at immense public meetings in London, Manchester, Birmingham, and other places. In 1867 the friends of reform triumphed, and procured the passage of a bill granting the right of suffrage to every householder in a borough. He entered the cabinet formed by Mr. Gladstone in Dec., 1868, as president of the Board of Trade, and resigned office on account of ill health about Mar., 1871; again a member of Mr. Gladstone's cabinet of Apr. 28, 1880; he resigned July 14, 1882, announcing in the House of Commons that he retired because he differed from his colleagues of the cabinet on their Irish home-rule and their Egyptian policy. He was elected lord rector of the University of Glasgow Nov. 15, 1880. A collection of his speeches was published in two volumes in 1868. D. in London, Mar. 27, 1889.

Bright, MARSHAL H.: b. at Hudson, N. Y., Aug. 18, 1834; educated at Lawrence Scientific School, Cambridge, 1852-53; reported in New York Senate 1854; associate editor *Albany Argus* same year; served in the civil war; appointed on the staff of Gen. Robert Anderson, Oct., 1861; served successively on staffs of Gens. W. T. Sherman, D. C. Buell, W. S. Rosecrans, and George H. Thomas 1861-65; participated in several engagements; breveted major for valuable and meritorious services; resigned his commission at close of the war 1865; engaged in silver mining in Nevada; became managing editor of *Christian at Work*, New York, 1873, and

editor-in-chief 1880. He has contributed to numerous periodicals on theological, scientific, and philosophical subjects, and delivered various addresses.

Bright, WILLIAM, D. D.: Canon of Christ Church and Regius Professor of Ecclesiastical History, Oxford; b. in Doncaster, England, Dec. 14, 1824. Educated at Rugby and at University College, Oxford; graduated B. A. 1846; fellow of his college 1847; ordained 1848 and 1850; Canon Christ Church and regius professor 1868. Author of *Ancient Collects* (1857; 2d ed. 1861); *History of the Church from the Edict of Milan to Council of Chalcedon* (1860; 5th ed. 1888); *Sermons of St. Leo the Great on the Incarnation*, trans. with his *Tome and Notes* (2d ed. 1885); *Faith and Life* (1864; 2d ed. 1866); *Hymns and other Verses* (1866; 2d ed. 1874); *Chapters of Early English Church History* (1878; 3d ed. 1889); *Notes on the Canons of the First Four General Councils* (1882); *Lyons and other Poems* (1886); *Addresses on the Seven Sayings from the Cross* (1887); *Sermons on the Incarnation* (1889); *Lessons from the Lives of Three Great Fathers* (1890); *The Roman Claims Tested by Antiquity* (1877). Editor of Eusebius's *Ecclesiastical History* (1872; 2d ed. 1882); St. Athanasius's *Orations against the Arians* (1873; 2d ed. 1883); *Socrates's Ecclesiastical History* (1878); select *Anti-Pelagian Treatises of St. Athanasius*, in The Library of the Fathers.

Brighton, formerly **Brighthelmstone**: a town and fashionable watering-place of England, in Sussex; on the English Channel; 50 miles S. of London (see map of England, ref. 14-J). It is the southern terminus of the London and Brighton Railway. Lat. of lighthouse, 50° 50' N., lon. 0° 8' W. It extends 3 miles along the coast, and is sheltered on the N. and N. E. by the South Downs. To resist the inroads of the sea, which formerly undermined the chalk-cliffs at Brighton, a sea-wall of great strength has been constructed. It is 60 feet high and forms an admirable promenade. In the middle of the town, in an open space called the Steyne, is the pavilion or Marine Palace, a fantastic structure of Oriental style built by the Prince of Wales (George IV.). It was finished in 1827, and is now owned by the corporation of Brighton. The town is well built, and consists mostly of new and elegant streets and terraces. It is a favorite resort for the aristocracy and the opulent classes, has numerous magnificent hotels, two theaters, assembly-rooms, and many boarding-schools. Among its institutions are Brighton College, founded in 1847 for the education of the sons of noblemen, a hospital, and the Sussex Literary and Scientific Institution. Brighton returns two members to Parliament. Steamers ply between this place and Dieppe. A fine terrace, called the Marine Parade, extends about a mile between the Steyne and Kempton, an eastern suburb of Brighton. It has little or no maritime trade, and owes its rapid increase to the salubrity of the air and its attractions to persons in pursuit of health and pleasure. It entertains annually about 80,000 visitors. Pop. (1881) 107,528; (1891) 115,402.

Bright's Disease, or **Nephritis** (named after the famous English physician, Dr. Richard Bright, who studied this disease in the early part of the nineteenth century): essentially a degeneration of the kidney structure. In consequence of this, the normal excretory processes are not accomplished, and various poisonous substances meant for excretion are retained, to the impairment of the general health. The causes of this disease, or more properly group of diseases, for under the term Bright's disease are included various degenerations of the kidneys, are extremely varied. Infectious diseases, particularly scarlet fever, wet and cold, gout, syphilis, excessive use of alcohol, and many other causes, may bring about disease of the kidneys. Bright's disease may be acute or chronic. The former is the form commonly observed after infectious disease or exposure, and in a fair proportion of cases terminates happily. The latter is the result of more slowly acting causes, and may be accompanied by a great variety of symptoms. The first effect of degeneration of the kidney substance is alteration in the character of the urine. The presence of albumin in the urine, though by no means always indicative of Bright's disease, rarely fails to be a symptom of the disease. At the same time there may be seen by the microscope certain small "casts" or molds of the urinary tubules of the kidneys. The latter are considered absolutely indicative of the disease whereas ALBUMINURIA (*q. v.*) may occur in other conditions. Of the other symptoms derangement of the digestive system, headache, progressive weakness and anæmia,

dimness of vision, and finally dropsy are important. In exacerbations these symptoms may become intensified, causing vomiting, diarrhoea, entire loss of vision, widespread dropsy (anasæra), and finally convulsions or coma. It is important to remember that Bright's disease as a rule is a wholly painless disease. The pains in the back and side so frequently attributed to this disease are usually muscular or rheumatic, sometimes they are expressions of disturbance or irritation of the intestines, but very rarely can they be attributed to Bright's disease. Stone in the kidney does cause such pains, but these are more acute than the dull ache spoken of, and are apt to be so severe as to lead to an early recognition of their true cause. The outlook in chronic Bright's disease is always gloomy, though many persons reach an old age totally unaware of the fact that they had the disease during many years, and others live long periods in comparative comfort after having discovered the disease. The best treatment is the hygienic, consisting of carefully regulated diet, avoiding meat and other albuminous foods as far as possible, the restriction of alcoholic drink to the minimum, moderate exercise, and careful avoidance of cold and wet. During the acute attacks medicinal treatment may be needed to compensate the improper excretion of urine. If dropsy is pronounced, active purgation or sweating may be required; if weakness and anæmia are great, iron will be found efficacious, or it may be necessary to administer other tonics. See ALBUMINURIA.

WILLIAM PEPPER.

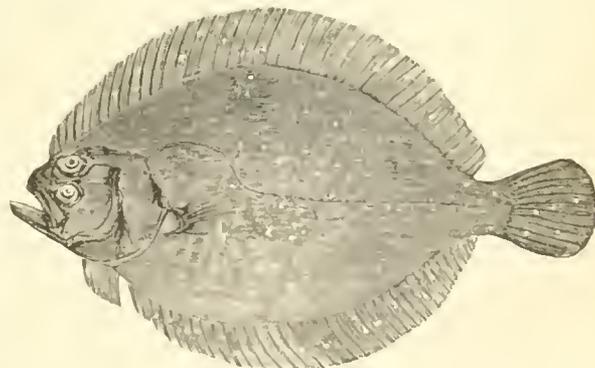

Brigitta: See BIRGITTA.

Brigittines, **brij-it-inz**, or **Order of the Saviour**: a monastic order affiliated with the Augustinians; founded by St. Bridget (or Birgitta) of Sweden in 1344. It originally included monks and nuns, who lived in the same house, but were forbidden to see each other. There are at present few if any Brigittine monks, and not many nuns. Sion House was the only English convent. Cæcolampadius, the Reformer, was once a Brigittine monk.

Brigus: a port of entry and post-town; capital of Brigus district, Newfoundland; is about 35 miles N. W. of St. Johns. It has a small but good harbor, having over 820 cod-fishing boats and 30 trading vessels, and is visited by steamers from St. Johns. It has a convent of Sisters of Mercy and a jail. It has considerable agriculture. Pop. about 2,000.

Bril, PAUL: landscape-painter; b. in Antwerp in 1556. He was a pupil of his brother Mathews, and worked for many years in Rome, where he died Oct. 7, 1626.

Brill: a flounder (*Bothus rhombus*); found on the coasts of Europe, and esteemed as food, though inferior to the turbot which it much resembles, but from which it may be

The Brill.

distinguished by its want of tubercles on the upper surface, and by the color, which is a reddish sandy brown on the upper side, varied with darker brown, and sprinkled with white pearly spots. It seldom weighs more than 8 lb.

Brimstone: a commercial and common name for SULPHUR (*q. v.*).

Brindaban, **brin-da-baan'**, or **Bindrabund** (anc. *Trindavana*): a sacred town of British India; in Northwestern Provinces; on the river Jamna; about 40 miles N. N. W. of Agra and 7 miles from Muttra (see map of N. India, ref. 6-E). It has several temples of Krishna, one of which is a remarkably massive structure. This town is visited by multitudes of pilgrims from distant parts of India, and

their munificence is the chief support of the place. Pop. (1890) 21,467.

Brin'disi: a fortified seaport of Italy; province of Lecce; situated at the head of a bay of the Adriatic; 38 miles by rail N. N. W. of Lecce; lat. of fort. 40° 39' N., lon. 18° 1' E. (see map of Italy, ref. 6-11). The ancient *Brundisium* was taken from the Sallentines by the Romans in 267 B. C., and was afterward the principal naval station of the Romans on the Adriatic. It had an excellent landlocked harbor, and was long one of the most important maritime cities of Italy. It was the port from which the Romans embarked on the voyage to Greece. Vergil died here in 19 B. C. The crusaders used it as their chief port of embarkation to the Holy Land. The harbor having become choked with sand, its importance greatly declined. Here is a mediæval cathedral and an ancient castle. The large steamers of the Peninsular and Oriental Company now enter this port, which has recently been improved. Since 1860 the government has dredged the harbor, so that a depth of nearly 6 fathoms has been obtained, and has constructed two breakwaters and about 3,000 feet of quay. The position of Brindisi has been rendered very advantageous for commerce by the opening of the Suez Canal. A railway extends from this town along the coast to Ancona, Milan, etc. Pop. 16,719.

Brine Shrimp, a small entomostreous crustacean of the order *Phyllopoidea*; found in salt pools and salt lakes. The American species, *Artemia gracilis*, is common in many places and especially abundant in the Great Salt Lake, Lake Mono, and other salt or alkaline lakes of the Great Basin. The European species, *Artemia salina*, is of especial interest, from the fact that it is known to produce several broods parthenogenetically, and also that it has been known to vary very much in form with the degree of concentration of the brine in which it lives.

DAVID S. JORDAN.

Brink, BERNHARD AEGIDIUS KONRAD TEN; philologist; b. at Amsterdam, Jan. 12, 1841. He was educated in Germany, and was Professor of Modern Languages in the University at Marburg 1870-73. In 1873 he was called to the University at Strassburg, then just reorganized, as Professor of English Philology, and he held that position till his death, Jan. 29, 1892. Ten Brink was not only a broad and accurate scholar, but a man of distinguished literary taste, and master of an attractive and elegant style. His principal work, *Geschichte der englischen Literatur* (pt. i., 1877, English translation, 1883; pt. ii., 1889-93, English translation, first half, 1893), comes down to the Reformation. Other important works are *Chaucer: Studien zur Geschichte seiner Entwicklung und zur Chronologie seiner Schriften* (1870); *Chaucers Sprache und Verkunst* (1884); *Böwulf* (1888), being No. 62 of *Quellen und Forschungen zur Sprach- und Culturgeschichte der germanischen Völker*, an important series of monographs begun in 1874, of which Ten Brink was one of the founders and editors.

G. L. KITTEDGE.

Brinkley: town (founded in 1874); Monroe co., Ark. (for location of county, see map of Arkansas, ref. 3-E); on Ark. Midland, Little Rock and Mem., St. Louis S. W., and Wh. and Bl. Riv. Val. R. Rs.; 68 miles from Memphis. Brinkley is situated in the fertile southern timber belt, and is the chief railroad center and manufacturing town of Eastern Arkansas; it has car-works, railroad machine and repair shops, oil-mill, two stove-factories and cooperage works, ice-factory, very large lumber-mill, water-works, electric lights, and two banks. There are seven churches and good public schools. The recent rapid growth of the town is due to the completion of the railroads centering here. Pop. (1880) 325; (1890) 1,510; (1893) estimated, 3,100. EDITOR OF "ARGUS."

Brinton, DANIEL GARRISON, M. D.; archaeologist and ethnologist; b. at Thornbury, Chester co., Pa., May 13, 1837; A. B., Yale College, 1858; M. D., Jefferson Medical College, Philadelphia, 1860; studied in Paris and Heidelberg; entered the army as a surgeon, serving as medical director of the Eleventh Army-corps, and later as superintendent of hospitals at Quincy and Springfield, Ill.; edited the *Medical and Surgical Reporter* 1867-87; appointed Professor of Ethnology at the Academy of Natural Sciences in Philadelphia 1881; Professor of American Linguistics and Archaeology in the University of Pennsylvania 1886; author of *The Floridian Peninsula* (1859); *The Myths of the New World* (1868); *American Hero Myths* (1882); *Essays of an Americanist* (1870); *Races and Peoples* (1890); *The American Race* (1892). *The Library of Aboriginal American Literature* (8 vols.), of which he is the editor, is a reproduction of

aboriginal legends, thought, and customs, as authentic material for linguistic study. He has contributed largely to the study of American archaeology, ethnology, and linguistics.

Brión, bré'ón', GUSTAVE; genre-painter, principally of Alsatian life; b. at Rothau, Alsace, Oct. 24, 1824; d. in Paris, Nov. 4, 1877. His *Pilgrims of St. Odile*, painted in 1863, is in the Louvre. He received the Legion of Honor and a first-class medal at the Salon of 1863, and the medal of honor in 1868. Knight of the Order of Leopold of Belgium. A good many of his works are in American collections.

WILLIAM A. COFFIN.

Brisbane: city and seaport, and the capital of Queensland, Australia; on Brisbane river; about 20 miles from its entrance into Moreton Bay, and about 600 miles N. by E. of Sydney (see map of Australia, ref. 5-J). Wool and other products are exported from this place. It is connected by rail with Sydney, Melbourne, and Adelaide, and is in direct steamship communication with London and Liverpool. The Houses of Parliament meet in an expensive and handsome structure, and the public buildings are for the most part impressive. It is the seat of an Anglican and a Roman Catholic bishop. Settlement began here with a penal colony in 1825, which was broken up in 1839; was incorporated as a city in 1859 and made the capital of the Moreton Bay district, and subsequently of Queensland; was inundated and severely injured by a flood in the river early in Feb., 1893. Pop. (1881) 31,109; (1891) 55,959, including suburbs.

Brisbane, Sir THOMAS MACDOUGALL, G. C. B.; astronomer and general; b. in Largs, Ayrshire, Scotland, July 23, 1773; commanded a brigade in the Peninsula 1812-13; governor of New South Wales 1821-25, who improved the penal colonies and promoted the commerce of the colony. The river and town of Brisbane perpetuate his name. He catalogued 7,385 stars while in Australia, and on his return built an observatory on the Tweed; was made a baronet in 1836; succeeded Sir Walter Scott as president of the Royal Society of Edinburgh. D. in Largs, Jan. 27, 1860.

Brisson de Warville, bré's'sō' de-viâr'vè'l', FÉLIX SATURNIN; painter of landscape and sheep (contemporary French school); b. at Sens, Yonne; d. in Paris, July, 1892. He was a pupil of Léon Cogniet, and obtained a second-class medal at the Salon of 1882. His work is notable for vigorous execution and excellent drawing of animals, especially sheep, which he particularly loved to paint.

WILLIAM A. COFFIN.

Brisson de Warville, JEAN PIERRE; French Girondist and political writer; b. near Chartres, Jan. 14, 1754. He published in 1780 a *Theory of Criminal Laws*. In 1785 he was unjustly imprisoned in the Bastille for about four months. With the aid of his friends he founded about 1788 the Society of the Friends of the Negroes, and visited the U. S. to promote the abolition of the slave-trade. After his return to France he founded and edited the *Patriote Français*, an able republican journal. In 1791 he was elected to the National Assembly by the voters of Paris. He was so prominent a leader of the Girondists that they were often called the Brissonins. Having been elected to the convention, he opposed the execution of the king. He was guillotined in Paris, Oct. 31, 1793. See Brisson's *Mémoires pour servir à l'Histoire de la Révolution*, published by his son (4 vols., 1830), and his own memoirs entitled *Legs à mes enfants* (1885).

Bristed, CHARLES ASTOR; son of the John mentioned below; b. in New York, Oct. 6, 1820; educated at Yale College, New Haven, and Trinity College, Cambridge; author of an edition of Catullus (1849); *Five Years in an English University* (1851; revised 1872); *The Upper Ten Thousand* (1852); *Pieces of a Broken-down Critic* (1858); *The Interference Theory of Government* (1867); *Anacrentics* (1872); and was a frequent contributor to leading periodicals. D. at Washington, D. C., Jan. 15, 1874.

Bristed, JOHN; an Episcopal clergyman; b. in Dorsetshire, England, in 1778; educated at Winchester School; removed to the U. S. in 1806; practiced law in New York; married a daughter of John Jacob Astor; studied divinity and was ordained in the Episcopal Church. He was author of *Critical and Philosophical Essays* (1804); *Resources of the United States* (1818), reprinted in London with the title *America and her Resources*, the same year; and *Anglo-American Churches* (1823). D. at Bristol, R. I., Feb. 23, 1855.

Revised by W. S. PERRY.

Bristle-tail: an insect of the sub-order *Cinura*; an agile creature of low structure and without wings, found in damp rooms, and often feeding on tapestry or clothing. The long bristles at the tail suggest the name. A common species is *Lepisma saccharina*.

Bristol: maritime city of England; situated on the Avon at its confluence with the Frome; 8 miles from the sea; 11½ miles by rail N. W. of Bath, and 118 miles by rail W. of London; lat. 51° 27' N., lon. 2° 35' W. (see map of England, ref. 12-F). It is chiefly in the county of Gloucester, and partly in Somersetshire, and occupies several hills and valleys. It is the terminus of the Great Western, the Bristol and Exeter, and the Midland Railways. Bristol returns four members to Parliament. Among its remarkable buildings are the cathedral, which was founded about 1150; the fine church of St. Mary Redcliffe, which was completed in 1376; the Temple church, which has a leaning tower; the guildhall; the exchange, used as a corn-market; and the new general hospital. The modern portions of Bristol, including Clifton and other suburbs, consist of handsome residences in squares, terraces, crescents, and detached villas. This city has a public library, a bishop's college, a medical school, an infirmary, an asylum for the blind, an asylum for deaf-mutes, and other benevolent institutions. The Avon here, though narrow, is deep enough for large vessels. About £650,000 have been expended in turning this river into a new course, and its old channel now forms a harbor furnished with locks and quays 6,000 feet long. Bristol was the first British port between which and the U. S. a regular communication by steam was established. It has an extensive trade with Canada, the U. S., the West Indies, France, Russia, the shores of the Mediterranean, etc. The chief articles of export are copper, iron, brass, coal, salt, and manufactured goods. The manufactures of this city are chiefly cotton goods, refined sugar, glass, woolen goods, chemical products, machinery, and earthenware. Here are extensive ship-yards, which turn out excellent vessels. This place was called *Caer-odor* by the Britons, and *Bristowe* or *Bristow* by the Anglo-Saxons. A fortified town existed here as early as 500 A. D. It was formerly the second commercial city in England. During the civil war it was taken alternately by Royalists and Roundheads. Pop. (1881) 206,503; (1891) 221,665.

Bristol: town (incorporated 1785); Hartford co., Conn.; on N. E. R. R., 18 miles S. W. of Hartford (for location, see map of Connecticut, ref. 9-G); has 9 churches and 13 schools, including a high school, a free public library, a national and a savings bank, 2 stockinet factories, foundries, manufactories of brass goods, clocks, bells, hardware, steel fishing-rods, etc. The borough of Bristol (1893) has an estimated population (Jan. 1, 1896) of 6,127. It is connected with New Britain and Plainville by an electric tramway. Sewage is disposed of by irrigation system. Pop. of town (1890) 7,382; (1896) estimated, 8,711.

Bristol: town (incorporated in 1819); Grafton co., N. H. (for location of county, see map of New Hampshire, ref. 7-E); is terminus of Bristol branch of Concord Division of B. and M. R. R.; 32 miles from Concord, and is situated at the junction of Pemigewasset and Newfound rivers. Bristol has 6 schools, 3 churches, a public library, and manufactories of flannels, paper, wood-pulp, and wooden-ware. It is a place of summer resort. Pop. (1880) 1,352; (1890) 1,524.

EDITOR OF "ENTERPRISE."

Bristol: borough; Bucks co., Pa. (for location of county, see map of Pennsylvania, ref. 5-J); on railroad and on the Delaware river; 19 miles above Philadelphia, and nearly opposite Burlington, N. J. Its industries are iron-founding and manufactures of flour, machinery, worsted, and furniture. Here is a valuable mineral spring. Pop. (1880) 5,273; (1890) 6,553.

Bristol: port of entry; capital of Bristol co., R. I. (for location of county, see map of Rhode Island, ref. 9-O); on P. W. and Bristol R. R., and on Narragansett Bay; 15 miles S. S. E. of Providence, and 7 miles S. W. of Fall River. It has a good harbor, which is easy of access, and will admit large vessels. It has two yacht-building establishments, and manufactures of cotton goods, rubber goods, worsted, etc. Bristol has 17 public schools, including a high school, 8 churches, a free library of about 12,000 volumes with brown-stone library building. The town's charter was granted in 1680. Pop. of township (1880) 6,028; (1890) 5,478; (1895) 6,730.

EDITOR OF "PHENIX."

Bristol: city; Sullivan co., Tenn., and Washington co., Va. (for location of county, see map of Tennessee, ref. 5-K). The State division-line between Tennessee and Virginia runs E. and W. along the main street, and Bristol, Va., was formerly called Goodson. Bristol has King College for young men, Sullins College and Southwest Virginia Institute for young ladies, good public schools, 2 tobacco-factories and warehouses, 2 flooring-mills, an iron furnace, veneer-factory, cotton-factory, planing-mill, ice-factory, car-works, etc. Pop. (1880) 3,209; (1890) 6,226; (1892) estimated about 9,000.

EDITOR OF "COURIER."

Bristol: town (founded in 1789); Addison co., Vt. (for location of county, see map of Vermont, ref. 5 B); is E. terminus of Bristol R. R., and 31 miles S. of Burlington; has a graded school and 7 district schools, and churches of 4 denominations. Its industries are principally farming (in which one-third of the population are engaged), and the manufacture of burial-caskets, beekeepers' supplies, and wooden mailing-boxes. Pop. (1880) 1,579; (1890) 1,828; (1893) estimated, 2,000.

EDITOR OF "HERALD."

Bristol. GEORGE PRENTICE: scholar; b. at Clinton, N. Y., June 21, 1856; graduated at Hamilton College 1876; assistant Professor of Greek in Hamilton 1882-88; appointed associate Professor of Greek in Cornell University in 1888. Editor of *Selected Orations of Lysias* (1892). B. I. W.

Bristol. JOHN BUNYAN: landscape-painter; b. at Hillsdale, N. Y., Mar. 14, 1826. Studied at Hudson, N. Y., under Henry Ary, and first came into notice by the exhibition of landscapes which he had painted in Florida about 1860. National Academician 1875; honorable mention, Paris Exposition, 1889; medal of honor, Centennial Exhibition, Philadelphia, 1876, for his picture entitled *Mount Oxford*. Studio in New York.

WILLIAM A. COFFIN.

Bristol. MARQUESSES OF (1826, in the United Kingdom), Earls of Bristol (1714, in Great Britain), Earls-Jermyn (1826, in the United Kingdom), and Barons Hervey (1703, in England), a noble family of Great Britain.—FREDERICK WILLIAM JOHN HERVEY, the third marquess; b. June 28, 1834; succeeded his father in 1864. He was member of Parliament for West Suffolk 1859-61.

Bristol Brick, or Bath Brick: a variety of brick used for scouring steel table-cutlery and other polished steel surfaces. It is made at various places in England and the U. S., a peculiar fine sand being used in the manufacture.

Bristol Channel: an inlet of the Atlantic Ocean; in the southwest part of England; bounded on the N. by Wales and on the S. by Somerset and Devonshire. At the E. end it communicates with the estuary of the Severn. It is the largest inlet of Great Britain, and has a coast-line of 220 miles. The tides rise to an extraordinary height—at Bristol about 40 and at Chepstow sometimes 70 feet. The principal bays are Swansea Bay, Caermarthen Bay, Cardiff Roads, the Severn Estuary, and Barnstaple Bay.

Bristow. BENJAMIN HELM: b. at Elkton, Todd co., Ky., in 1833; studied law, and practiced his profession successfully in Kentucky till 1861, when, on the outbreak of war, being of strong Union sentiments, he volunteered his services, and as major of the Twenty-fifth Kentucky Volunteers was engaged at Fort Donelson and as lieutenant-colonel at Shiloh, in command of the regiment, being wounded in the last-named battle. Afterward, as colonel of the Eighth Kentucky Cavalry, he served throughout the war with distinction. About the close of the war he received the appointment of U. S. district attorney for the Louisville district. The ability here exhibited led to his appointment as solicitor-general on the organization of the department of justice in 1870. After two years' service he resigned and became attorney of the Texas Pacific R. R., which position he held but a short time when he returned to the practice of his profession at Louisville, Ky.; was appointed attorney-general in 1873; and was Secretary of the Treasury in 1874-76. D. in New York, June 22, 1896.

Bristow. GEORGE FREDERICK: musician; b. in Brooklyn, N. Y., Dec. 19, 1825; studied principally under his father, an English musician and composer; became one of the earliest members of the New York Philharmonic Society; composed for this society his concert overture in E flat, op. 3, in 1846; his *Jullien* symphony, op. 24, in 1855; symphony in F sharp minor, op. 26, in 1858; overture *Columbus*, op. 34, in 1866; symphony *Arcadian*, op. 50, in 1873. His oratorio *Praise to God*, op. 32, was produced by the New York Harmonic Society in 1866. His opera *Rip Van Winkle*

was produced by the Pyne-Harrison company at Niblo's Garden, New York, in 1853, and had a long and successful run. This was rewritten to a new libretto in 1880. He was conductor of the Harmonic Society, the Mendelssohn Union, and the Centennial Choral Union; was for many years director of the music in the New York public schools. In addition to the works mentioned, he has composed an opera, *Columbus*, 1878; an oratorio, *Daniel*, 1867; a cantata, *The Great Republic*, 1862, besides much church music and many songs and piano pieces. He lives in New York city.

D. E. HERVEY.

Bristow Station, now **Bristoe**: Prince William co., Va. (for location of county, see map of Virginia, ref. 4-H); on the Richmond and Danville R. R.; 4 miles W. S. W. of Manassas Junction. A severe engagement took place here the afternoon of Aug. 27, 1862, between the U. S. forces under Gen. Hooker and the Confederates under Gen. Ewell, darkness closing the conflict, with severe loss on both sides. On Oct. 14, 1863, the Confederate general A. P. Hill attacked the force under command of Gen. G. K. Warren, U. S. army, at this place; the attack was repulsed by Warren, who captured several pieces of artillery and many prisoners.

Brit: a name applied to young herrings.

Britannia: the ancient name of the island of Great Britain. It was inhabited by rude, uncivilized tribes of Britons (Lat. *Britanni*), who were perhaps, but not probably, the aborigines when Julius Cæsar invaded the island in 55 B. C. Their religion was a sanguinary Druidism. Many of the Britons were Cymric Celts, while those of the northern part were probably largely Gaelic. (See BRITTON.) They obstinately resisted the Roman invaders, but without success, and the southern half of the island was conquered by the armies of Vespasian. In the reign of Domitian, Agricola extended Roman power to Scotland, and erected a chain of forts between the friths of Clyde and Forth about 84 A. D. The northern part of the island was inhabited by the Caledonians and Picts, whom the Romans failed to subdue. These warlike barbarians made frequent inroads into the southern province, to obviate which the Romans built the wall of Antoninus about 140 A. D. Another rampart, called the Wall of Hadrian, extending from Solway Frith to the mouth of the Tyne, was completed by Severus about 210 A. D. The part of the island S. of this wall was for several centuries under the dominion of the Romans, who founded many towns (*municipia*), and diffused Roman culture, arts, and civilization in the country. They made numerous roads from London to the provinces, the remains of which are still visible. Many parts of England abound in Roman antiquities, including remains of camps, baths, mosaic pavements, weapons, ornaments, utensils, pottery, sculptures, and coins. It appears that the Romans intended to keep Britain as a permanent conquest, but in consequence of the internal disorders and external dangers that menaced the stability of the Roman empire the legions were withdrawn from the island about 420 A. D., soon after which it was invaded and conquered by the Saxons. It is said that Cæsar was the first who gave the name *Britannia* to this island, which before his time was called *Albion*. The name *Britannica Insula*, however, was applied to the British islands collectively before Cæsar invaded Albion. Britannia is usually personified in the fine arts as a woman seated on an insulated rock, leaning on a shield and holding in her hand a spear or trident. See Camden's *Britannia*.

Britannia Metal: an alloy of tin with a little antimony, zinc, and copper; largely used in the manufacture of coffee-pots, tea-pots, and other vessels. It is harder than pewter, and not so easily indented or bent. The proportions of the metals combined to make this alloy are various. The average composition in 100 parts is—tin, 85½; antimony, 10½; zinc, 3; and copper, 1. The present composition of the alloy used at Birmingham, England, is stated to be 90 of tin, 8 of antimony, 2 of copper.

Britannicus: a surname which, on account of some alleged victories in Britain, the Roman senate bestowed in 42 A. D. on the Emperor Claudius and his newly born son by Messalina, Claudius Tiberius Germanicus, and which afterward became the distinguishing appellation of the latter. In 48 Messalina was executed, and Agrippina, the second wife of Claudius, induced him to exclude Britannicus from the throne and appoint Nero, her son by her

former husband, successor. After the accession of Nero, however, Agrippina used Britannicus as a means of intimidating him, and to get rid of his rival Nero poisoned him Dec. 15, 55.

British America: a name which in its widest sense comprises all British possessions in the western hemisphere. It is usually applied, however, to the territory embraced since 1873 in the Dominion of Canada and to Labrador and Newfoundland. See these headings respectively.

British Association for the Advancement of Science: a society for promoting the mutual acquaintance of scientific men, the interchange of scientific ideas, and the solidarity of the great body of scientific workers, founded in 1831 at a memorable meeting held in the city of York. With admirable prescience it was given so comprehensive an organization that only minor changes have been found necessary in subsequent years. Its annual meeting, held in the summer season, occupies a week. Each year a new meeting-place is chosen, and towns vie with one another for the privilege of entertaining the society. The proceedings consist chiefly of the announcement and discussion of results of scientific work, and for this purpose the association is divided into eight sections, meeting in separate halls. The field of Section A is mathematical and physical science; of B, chemical science; of C, geology; of D, biology; of E, geography; of F, economic science and statistics; of G, mechanical science; and of H, anthropology. The membership is about 4,600, the usual attendance about 2,000. A large income from dues yields a surplus which is devoted to the aid of special researches conducted by committees of the association. The grants for such purposes amount annually to about £1,000.

The example of Great Britain in founding this institution has been followed in Germany, France, and the U. S. See AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

G. K. GILBERT.

British Columbia: a province of the Dominion of Canada; bounded S. by the U. S. (Washington, Idaho, and Montana), N. by Northwest Territory, E. by Athabasca and Alberta, and W. by the Pacific Ocean and Alaska. The northern boundary is the parallel of 60° N. It includes the important islands of Queen Charlotte (*q. r.*) and Vancouver (which last was, in 1849, made a crown colony, and in 1866 united to the present province, *q. r.*). British Columbia was united to Canada in 1871. The soil of portions of the province near the sea is good, and the climate mild, though rainy; but in the interior the surface is extremely rugged, and the climate is severe. The coast-line is characterized by remarkable fiords, called "canals," which are often walled in by mountains of moderate elevation known as the Cascade Range. The same feature is seen to an unusual degree in the lakes of the province. These are generally very long and narrow, lying between parallel ranges of mountains. The highest peaks in the Rocky Mountains of this province are Mt. Brown (about 16,000 feet) and Mt. Hooker (about 15,700 feet). Furs are largely exported. There is much valuable timber, and the fisheries have become important. Cod, haddock, herring, halibut, trout, sturgeon, anchovies, and especially salmon, abound. There is much fine grazing-land. Large amounts of gold have been obtained here, and silver, copper, zinc, mercury, coal, iron, and marble are found. Manufactures in 1891 embraced 755 establishments, \$14,342,149 invested capital, 11,473 employees, and a production valued at \$11,916,928. Education is compulsory. Religiously, the inhabitants in 1891 were divided into Anglicans 23,600, Roman Catholics 20,367, Presbyterians 15,281, Methodists 14,298, pagans (chiefly Indians and Chinese) 12,691, and of all other denominations 11,376. Area, 382,300 sq. miles. Capital, Victoria. The principal towns are Victoria and Nanaimo, on Vancouver Island, and Vancouver and New Westminster, on the mainland at the terminus of the C. P. R. R. Total pop. (1891) 97,612, of whom 42.4 per cent. were of foreign birth, though chiefly from Great Britain and the U. S., including about 25,000 Indians and 6,000 Chinese. The best harbor is at Esquimault. British Columbia has an Anglican bishop, whose seat is at New Westminster.

Certain islands in the Strait of Juan de Fuca, having been claimed by both the U. S. and Great Britain, were held under joint military occupation until Oct., 1872, when, by a decision of the Emperor William I. of Germany, to whom the dispute was referred, they became U. S. territory. These islands, of which San Juan is the most important,

are ten in number. Their entire population, now embraced in the county of San Juan, in 1880 was 948; (1890) 2,072.

British Honduras: See **HONDURAS, BRITISH**.

British India: See **INDIA**.

British Museum: in London; was established in 1753 by act of Parliament in pursuance of a bequest of Sir Hans Sloane to the nation of his cabinets of natural history and his library, numbering 50,000 volumes, in return for a sum of £20,000 to be paid to his heirs, and was opened in 1759. The palace of the Duke of Montague on Great Russell Street was purchased for the reception of the collection. In 1801 the Elgin marbles, in 1823 the library of George III., containing 80,000 volumes, were added to the museum, and it has been subsequently enriched by the Granville library, the Sir William Temple coin cabinets, the Layard and Loftus collection of Assyrian, and the Lady Webster collection of Mexican, antiquities, and other extensive accessions. The building in 1823-47 was enlarged and renovated at a cost of £150,000, and an additional wing was built in 1883 with the funds left by Mr. William White. The library numbers 1,600,000 volumes, besides many thousands of MSS., documents, and state papers. The collections of antiquities are altogether the completest in Europe. The museum contains also the finest collection of vases, among them the famous Portland vase, and the largest collections of Greek and Roman sculpture in the world, and the cabinets of natural objects embrace every province of science. A catalogue is now being printed, but will not be finished until 1900.

British New Guinea: See **NEW GUINEA**.

British North Borneo: See **BORNEO**.

Briton: a native or citizen of ancient Britain or **BRITANNIA** (*q. v.*). When Cæsar invaded Albion in 55 B. C., he found in it two different peoples. The interior was occupied by the primitive or indigenous Celtic inhabitants, who had been driven back from the coasts by a people of probable Gothic descent. The latter had colonized the southeast part of the island, and were less numerous than the Celtic Britons. The language of the Southern Celtic Britons was very similar to the present Welsh. "The Gaels and Britons," says R. G. Latham, "are the fundamental populations of the British isles. The Picts were either aboriginal or intrusive. If aboriginal, they were like the Gaels and Britons, Celtic." (See **PICTS**.) When Cæsar invaded the island, the Britons were divided into a number of petty kingdoms or states. Some of these were called *Salures*, *Brigantes*, *Ordovices*, *Trinovantes*, and *Cantii*. Their religion was Druidism. (See **DRUIDS**.) The primitive Britons were brave and warlike, but, in consequence of their divisions, they were conquered by the Romans without much difficulty. They were rude barbarians, who painted their bodies blue. The term Briton is often applied to a modern inhabitant of Great Britain.

Brittany: See **BRETAGNE**.

Brittle-star: a starfish of the order *Ophiuroidea*, called also serpent-star. The brittle-stars possess a distinctly outlined central disk, in which is the stomach. The arms, usually five in number, spring abruptly from the disk. The umbilacal groove is covered by a series of plates, causing the umbilacal feet to extend from the sides of the arms. The arms are cylindrical and flexible, and do not contain any appendages of the stomach, as do those of true starfishes. The arms are unbranched in all but the family *Astrophyllidae*, to which the basket-fish and Gorgon's-head belong. There are about 500 species of brittle-stars, certain ones being very common on most coasts.

DAVID S. JORDAN.

Britton, NATHANIEL LORD, E. M., Ph. D.: botanist; b. on Staten Island, N. Y., Jan. 15, 1859; graduated from Columbia College, in which he is now Professor of Botany. As botanist of the State geological survey he published a *Catalogue of the Plants Found in New Jersey* (1889). He is editor of the *Bulletin of the Torrey Botanical Club*. He has published technical papers on certain genera of sedges, *Cyperus*, *Scleria*, and *Eleocharis*, South American plants, Arizona plants, etc.

CHARLES E. BESSEY.

Brive, or Brives-la-Gaillarde, brév' la-ñ-gã yaard': a town of France; department of Corrèze; situated in a rich plain on the river Corrèze; 44 miles by rail E. of Périgueux (see map of France, ref. 7-E). It has manufactures of muslins, woolen stuffs, silk handkerchiefs, etc.; also a college and public library. Pop. (1891) 6,803.

Brix: See **BRUX**.

Broach (sometimes written *Barach*): a district and city in the North Division of Bombay, British India. The district is on the east side of the Gulf of Cambay, and S. of the river Mahi. Area, 1,453 sq. miles, consisting chiefly of the alluvial plain at the mouth of the river Nerbudda. The land is rich and highly cultivated, and though without forests is not destitute of trees. Agriculture is the almost exclusive industry. Pop. 327,000, about three-fourths Hindus. The chief town is Broach, situated on an elevated mound, supposed to be artificial, on the right-hand bank of the Nerbudda, 30 miles from its mouth. It has a considerable trade, and exports annually large quantities of raw cotton. It is probably the *Barygaza* of Ptolemy and Arrian. It first came into British possession in 1772. Pop. 38,000. It has two steam cotton-gins. It has also a Brahminical hospital for sick and disabled animals; even insects are received. On an island near Broach is the largest banyan-tree in India. It is said to have once sheltered an army of 7,000 men.

M. W. HARRINGTON.

Broad Arrow: a government mark used as a means of identification upon British Government stores of every description, and so called as being likened to the head of a broad arrow. It is a felony to obliterate or deface this mark; and the unlawful placing of it upon goods involves a penalty of £200 and the forfeiture of the goods. The mark is supposed to be of Celtic origin, and by some identified with a Druidical letter typical of superiority in rank, authority, or holiness, and also believed to have stood for king or prince. It was used as the cognizance of Henry Viscount Sydney, Earl of Romney, Master-General of Ordnance from 1693 to 1702, and was first used as a government mark in his time.

Broad Mountain: a high ridge in the anthracite-coal region of Pennsylvania, in Carbon and Schuylkill Counties. It has an altitude of about 2,000 feet above the sea, and is nearly 50 miles long. Its direction is nearly N. E. and S. W. The Mine Hill R. R. crosses this mountain.

Broad River: a river of the U. S., rising at the foot of the Blue Ridge, in the western part of North Carolina. Having entered South Carolina, it flows in a S. S. E. direction through fertile uplands, and unites with the Saluda at Columbia to form the Congaree river. Total length estimated at 150 miles.

Broad Top Mountain: a mountain of Pennsylvania; in the northeast part of Bedford County, and the south part of Huntingdon County. It rises about 2,500 feet above the level of the sea. Here are extensive beds of bituminous coal, for the transportation of which a railroad has been opened from this mountain to Huntingdon.

Broad'us, JOHN ALBERT, D. D., LL. D.: Baptist educator and author; b. in Culpeper Co., Va., Jan. 24, 1827; educated at the University of Virginia; assistant instructor at the University of Virginia; chaplain of the University of Virginia; pastor of churches in Charlottesville, South Carolina, and Kentucky. In 1859 he became professor in the Southern Baptist Theological Seminary, and upon the death of Dr. Boyce was chosen to be president of that institution. D. in Louisville, Ky., Mar. 16, 1895. He published *Preparation and Delivery of Sermons* (Philadelphia, 1870); *Lectures on Preaching* (New York, 1876); *Commentary on Matthew* (Philadelphia, 1886); *Sermons and Addresses* (1886); and *Jesus of Nazareth* (New York, 1890).

Broca, brô kaa, PAUL: French surgeon and anthropologist; b. at St. Foy-la-Grande, Gironde, June 28, 1824; Professor of Surgical Pathology at Paris; founded the Paris Anthropological Society; Legion of Honor 1868; president International Congress of Anthropology at Paris 1878; since 1872 published the *Revue d'Anthropologie*. Among his voluminous works are *Sur l'Anesthésie Chirurgicale Hypnotique* (1859); *Études sur les Animaux Ressuscités* (1860); *Traité des Tumeurs* (1865-69); *Mémoires sur les Caractères physiques de l'Homme Préhistorique* (1869); *L'Anatomie comparée de l'Homme et des Primates* (1869); *Mémoires d'Anthropologie* (1871-88); and *Correspondance* (1886). D. in Paris, July 9, 1880.

Brocade (Span. *brocado*; Ital. *broccata*, embossed material; deriv. of Ital. *brocca*, boss, stud; cf. Eng. *brooch*): a silk fabric variegated with gold and silver threads, or a silk fabric on which figures of flowers, foliage, or other objects are formed by the threads of the warp and woad being raised by the Jacquard loom or other means. Brocade bears nearly the same relation to silk textures as damask to linen fabrics.

Broca's Convulsion: See SPEECH.

Brock, Sir ISAAC: British soldier; b. in the island of Guernsey, Oct. 6, 1769; entered the army and rose by services in the West Indies, Holland, and Denmark to the command of a regiment, which was ordered to Canada in 1802. Here in 1803 he suppressed a threatening mutiny; in 1810 was made Lieutenant-Governor of Upper Canada; and in 1812 captured Detroit from Gen. Hull. He was killed in the battle of Queenstown, Oct. 13, 1812. He was then a major-general. Parliament pensioned his family, and monuments were erected to him in St. Paul's, London, and on Queenstown Heights, which are still standing. His name is perpetuated in that of Brockville, Ontario.

Brocken, The, or **Blocksberg** (anc. *Mons Bruclerus*): a mountain of Prussia; province of Saxony; 20 miles W. S. W. of Halberstadt; the highest summit of the Hartz Mountains, and 3,740 feet above the level of the sea. It is cultivated nearly to the top, which commands a fine view in clear weather. The Brocken is the cradle of many popular superstitions. It is, according to an ancient belief, the scene of the annual dance of the witches on Walpurgis night (May 1). This superstition in all probability owes its origin to the phenomenon known as "The Specter of the Brocken," seen here and elsewhere, which is simply the shadow of a man or other object on the fog, best seen at sunrise. The apparent enlargement of the figure is an illusion, and the shadow can be seen only by the one who makes it or some one very close to him.

Broekes, brok'es, BARTHOLD HEINRICH: German poet; b. in Hamburg, Sept. 22, 1680. He was the first poet who turned away from the conventional classicism and dry learning of German poetry during the latter part of the seventeenth century, and who urged, especially in his *Idisches Vergnügen in Gott* (Hamburg, 1721), a more thorough study and contemplation of nature. D. in Hamburg, Jan. 16, 1747. See Alois Brandl, *B. H. Broekes* (Innsbruck, 1878).

JULIUS GOEBEL.

Brock'ett, LINUS PIERPONT: historical and miscellaneous writer; b. at Canton, Conn., Oct. 16, 1820. He published among other works, a *History of Education* (1859); *History of the Civil War* (1866); *Men of Our Day* (1868); *The Year of Battles* (1874); and *Epidemic and Contagious Diseases* (1873). D. in Brooklyn, Jan. 13, 1893.

Brockhaus, FRIEDRICH ARNOLD: German publisher; b. at Dortmund, May 4, 1772. He was the founder of the firm of Brockhaus in Leipzig, and published six editions of the *Conversations-Lexikon*. He was distinguished for his literary culture, enterprise, and patriotism. He became a citizen of Leipzig in 1817. D. Aug. 20, 1823.—HEINRICH: son of the preceding; b. in Amsterdam, Feb. 4, 1804. He succeeded his father as proprietor of the publishing-house, and published new editions of the *Conversations-Lexikon*. D. in Leipzig, Nov. 15, 1874.—BERMANN: the brother of Heinrich; b. in Amsterdam, Jan. 28, 1806; was educated at Leipzig, Göttingen, and Bonn. He lived for a time in France and England; became professor at Jena in 1839, and at Leipzig in 1841, where in 1848 he was made Professor of Sanskrit Speech and Language, and there he died, Jan. 5, 1877. Among his publications are editions of the *Zendavesta* and the *Verduldité Sâde*, in Latin (Leipzig, 1850); of the *Kathû-Sarît-Sâgara*, or collection of fables of Somadeva Bhatta (2d ed. Leipzig, 1866); of the Persian compilation, *The Books of the Seven Wise Masters* (1845); and of a critical edition of the *Songs of Hafis* (1854-60).—HEINRICH EDUARD: b. in Leipzig, Aug. 7, 1829; son of Heinrich; educated at Leipzig, Heidelberg, and Berlin; a member of the Reichstag 1871-78; succeeded his father in 1874 at the head of the publishing-house.—His brother HEINRICH RUDOLF: b. in Leipzig, July 16, 1838; brought up to his father's business; became Eduard's partner. This firm has had in hand since its commencement in 1818 the publication of the enormous *German Encyclopædia of Learning and Art*, of Ersch and Gruber, which in 1888 had reached 168 volumes and was still incomplete.

Brockport: village: Monroe co., N. Y. (for location of county, see map of New York, ref. 4-D); on the N. Y. Cent. R. R., and on the Erie Canal; 17 miles W. of Rochester; is in the heart of a wealthy and populous farming country. Brockport has electric lights, water-works, eight churches, a State normal school, mower and reaper works, flour-mills, shoe-factory, and other manufactories. The manufacture of reapers began here in 1846, and subsequently the first reapers with circular platform and sweep-rake were constructed here. Pop. (1870) 2,817; (1880) 1,974; (1890) 3,742. EDITOR OF "REPUBLIC."

Brockton: city (formerly North Bridgewater, incorporated in 1874); Plymouth co., Mass.; on the N. Y., N. H. and Hart. Railroad; 20 miles S. of Boston (for location, see map of Massachusetts, ref. 4-J). It is one of the first cities in the county for wealth and population, and is an important trading-center. The manufacture of boots and shoes is the principal industry, there being invested in the various branches of this industry a capital of over \$6,500,000, according to the U. S. census report for 1890; furniture, carriages, needles, and shoe-tools, paper boxes, candy, etc., are also manufactured. It has a public library. Pop. (1880) 13,608; (1890) 27,294; (1895) 33,165. EDITOR OF "ENTERPRISE."

Brock'ville: a port of entry of Ontario, Canada; capital of the county of Leeds; on the St. Lawrence river and the Grand Trunk Railway; 125 miles by railway S. W. of Montreal, and 75 miles by railway S. of Ottawa (see map of Ontario, ref. 3-11). Hardware, chemicals, white lead, gloves, farming tools, steam-engines, and machinery are manufactured here. It is the southern terminus of the Brockville and Ottawa Railway. It is connected by ferry with Morris-town, N. Y. Pop. of district, 13,000.

Brockway, ZEBULON REED: penologist; b. in Lyme, New London co., Conn., Apr. 28, 1827; clerk Connecticut State-prison 1849-50; assistant superintendent, Albany, 1854-61, under Pillsbury; opened Detroit House of Correction and conducted it 1861-73; organized and since 1876 controlled Elmira penitentiary, New York; founder in the U. S. of indeterminate sentence and penal-reform methods; has written much for the magazines on penological questions, and is author of numerous papers in the *Proceedings of the National Prison Association of the U. S.*

Broderick, DAVID COLBRETH: U. S. Senator from California; b. in Washington, D. C., Feb. 4, 1820; educated in New York city; apprenticed to a stone-cutter; defeated as candidate for Congress in 1846; removed to California in 1849; served as U. S. Senator from California from 1857 to his death; fought a duel with Judge D. S. Terry, of the State Supreme Court, and was killed, near Lake Merced, Sept. 16, 1859.

Brod'head: Green co., Wis. (for location of county, see map of Wisconsin, ref. 7-D); beautifully situated on railroad and on Sugar river; 90 miles W. of Milwaukee; has a large graded school, a foundry, machine-shops, wagon and carriage factories, large flouring-mills, etc., and an extensive trade. The surrounding country is exceedingly fertile. Pop. (1880) 1,254; (1890) 1,461; (1895) 1,717.

Brodhead, JOUX ROMEXX, LL. D.: historian; son of Rev. Dr. Jacob Brodhead; b. in Philadelphia, Jan. 2, 1814; graduated at Rutgers College in 1831, and was admitted to the bar in New York city in 1835. After two years he began to devote himself to the study of American history. In 1839 he went to Holland as secretary of the U. S. legation at The Hague. In 1841 he was appointed by Gov. Seward to search out and copy documents relating to the early history of New York. When he returned in 1844 he brought with him more than 5,000 separate documents, which led Mr. Bancroft to say that "the ship in which he returned was more richly freighted with new materials for American history than any that had ever crossed the Atlantic." These documents were afterward published in eleven quarto volumes. From 1846 to 1849 he was secretary of legation under Mr. Bancroft in London. From 1853 to 1857 he was naval officer of the port of New York. Years of patient labor were bestowed upon his *History of the State of New York*, the first volume of which appeared in 1853, and the second in 1871. D. in New York city, May 6, 1873.

Bro'die, Sir BENJAMIN COLLINS, D. C. L., F. R. S.: surgeon; b. in Wiltshire, England, June 9, 1783; became in 1832 surgeon to William IV.; was created a baronet in 1834. Among his works are *Lectures on Local Nervous Affections* (1837) and *Psychological Inquiries as to the Mental Faculties* (1854). He received the Copley medal of the Royal So-

ciety in 1811 for his contributions to physiology. D. near London, Oct. 21, 1862. See his *Autobiography* (1865).

Brodrick, Hon. GEORGE CHARLES, D. C. L.; educator; b. in Norfolk, England, May 5, 1831; educated at Eton, at Balliol College, Oxford, and at University of London; called to the bar 1859; member of school board for London 1877; member of governing body of Eton College; warden of Merton College 1881; has contributed to leading periodicals, and has published *Political Studies* (1880); *English Land and English Landlords* (1881); *Memorials of Merton College*; and a *History of the University of Oxford*.

Brody (formerly called **Lubicz**); a trading-town of Austria, in Galicia; near the Russian frontier; 50 miles E. N. E. of Lemberg (see map of Austria-Hungary, ref. 3-1). It has an imperial chamber, a theater, and a castle; also manufactures of linen and leather. The majority of its inhabitants are Jews. Pop. (1890) 17,475.

Broglie, brô yee', ACHILLE LÉONCE VICTOR CHARLES, Duc de; statesman; b. in Paris, Nov. 28, 1785. He married in 1816 the daughter of Madame de Staël. He was a friend of Guizot, and co-operated with him as a leader of the party called Doctrinaires. He was Minister of Foreign Affairs from Oct., 1832, to Apr., 1834. In 1849 he was a conservative member of the Legislative Assembly. He was elected to the Academy in 1856. D. in Paris, Jan. 25, 1870.

Broglie, JACQUES VICTOR ALBERT, Duc de; statesman and author; b. in Paris, June 13, 1821. Having kept aloof from public life during the second empire, he was appointed minister to London by M. Thiers in Feb., 1871; became Minister of Foreign Affairs in the MacMahon administration in 1873-74; Minister of Justice in 1877, but his exertions in behalf of the constitutional monarchy ended with the downfall of MacMahon. His principal works are *l'Église et l'Empire romain au quatrième Siècle* (1856, 6 vols.); *La Souveraineté Pontificale et la Liberté* (1861); *Frédéric II. et Marie Thérèse* (1882); *Frédéric II. et Louis XV.* (1885); *Marie Thérèse impératrice* (1887); *Maurice de Saxe et le Marquis d'Argenson* (2 vols., 1891).

Broiling: the process of cooking meat or fish by the direct action of heat over or in front of a clear fire. The food to be cooked is placed upon a gridiron. By this method the albumen on the outside of the food becomes coagulated at the outset, and forms a crust which prevents the juices flowing out.

Broken Bones: See FRACTURE.

Broken Bow: city; capital of Custer co., Neb. (for location of county, see map of Nebraska, ref. 10-E); is situated in a stock-raising and agricultural region. Pop. (1885) 212; (1890) 1,647.

Broken Breast: a condition occurring in abscess of the breast. See BREAST, ABSCESS OF.

Broken Wind: a disease of the horse, the nature of which is not well understood, though it is characterized by difficulty in the act of expiration, the horse making a spasmodic effort to expel the air from the lungs. The symptoms are best observed when the horse is exercised, the breathing becoming labored, the nostrils dilated, the eyes bloodshot, showing imperfect purification of blood in the lungs. A broken-winded horse has a bad hollow cough. When the animal is oppressed by work, the pulse is excessively rapid and the heart beats energetically. From this circumstance it is regarded by some as a disease of the heart. Low-bred horses are especially liable to broken wind if fed on imnutritious and bulky food, and at the same time kept at hard work. The treatment is unsatisfactory, and we can only hope for palliation by keeping the alimentary canal in order, administering occasional purgatives, and feeding on a proper quantity of the best oats, which should always be bruised; also allowing the best hay in spare quantities—10 to 12 lb. daily. The hay should be cut and wet. Fresh grass in its season is the proper food. Dusty hay and dry meal as food should especially be avoided.

Broker [from O. Fr. *broccor*, *brocheor*, tapster, wine-retailer; deriv. of vb. *brochier*, tap, Eng. *broach*]; in general, a species of agent employed to act as a middleman or negotiator between distinct parties, such as buyer or seller, though this statement would not include a pawnbroker. He differs from a factor, since he does not have possession of the property with which he deals. He is in a certain sense the agent for both parties, though primarily of the party by whom he is employed. Accordingly, until he

closes the negotiation he is the agent of the party who employs him. If he were employed to buy, he could not sell his own goods, but must buy of a third person, even though his engagement be gratuitous. Regularly, a broker discloses his agency on the face of the transaction; should he fail to do so, he would, by the general principles of the law of agency, make himself personally liable. When he has closed the negotiation, he usually gives to either party a memorandum of the transaction, and in the case of the sale of goods gives a "bought-and-sold note." For the purpose of complying with the rule of law requiring in certain sales a written memorandum, he is the agent of both parties. A broker is to be distinguished from an auctioneer; a broker may both sell and buy—an auctioneer only sells. A broker buys and sells at private sale—an auctioneer only sells at public sale. His compensation is usually derived from commissions upon the transaction, termed "brokerage." The commission is earned when the negotiation is completed. The real inquiry in such a case is, Did the broker's services result in bringing the buyer and seller together? If that be the case, he will be entitled to his commissions, though the contract, from subsequent causes, was not in fact carried out. On the other hand, if the negotiation failed at the time, and the parties were subsequently brought together by other means, his commissions would not be payable.

In the large cities brokers form a distinct class of persons, devoting themselves to special departments of agency, such as insurance-brokers, stock-brokers, real-estate brokers, produce-brokers, and the like. A person may, however, act as a broker in a single transaction without following the business, and will be governed in the main by the rules already stated. See AGENT. T. W. DWIGHT.

Bro'mal: $C_2HBr_3O = C_2Br_3O.H$; a compound analogous to chloral, produced by the action of bromine on alcohol.

Bromberg, brom bähreh (Polish *Bydgoszcz*); a town of Prussia; province of Posen; on the river Brahe; about 6 miles from its junction with the Vistula, and 65 miles N. E. of Posen (see map of German Empire, ref. 3-1). It is on the railway from Berlin to Dantzic, and on the Bromberg Canal, which connects the Vistula with the Oder. It has a normal school and a gymnasium; also manufactures of linen and woolen fabrics, tobacco, Prussian blue, etc. Here are several distilleries, potteries, and breweries. Pop. (1885) 36,269; (1890) 41,451.

Brome, RICHARD; English dramatist; at first a servant of Ben Jonson; wrote twenty-four popular plays, fifteen being comedies. The best are *The Northern Lass* and *The Jovial Crew*. His dramatic works were reprinted in 1873. D. about 1652.

Brome-grass: a grass of the genus *Bromus*, which comprises numerous species, natives of both hemispheres. The *Bromus mollis* grows well on poor soils, and is readily eaten by cattle, but is not much esteemed by farmers. The tall brome grass (*Bromus giganteus*), a native of Europe, grows nearly 5 feet high, and affords a large bulk of foliage, not much relished by cattle. The *Bromus secalinus*, commonly called chess or cheat, is a troublesome weed which infests grain-fields both in Europe and the U. S. In the latter it is a naturalized exotic. It resembles rye (*secale*) when it is young, hence the specific name *secalinus*. The seeds retain their power of germinating for years. This weed is so common in wheat-fields that many farmers believe that wheat will turn into chess. *Bromus briza formis* is grown in gardens for use in dry bouquets.

Brome'lia: a genus of plants of the family *Bromeliaceæ*; named after the Swedish botanist Brönel; natives of tropical America, though many have naturalized themselves in Asia and Africa. The fruit is succulent, and the leaves have spiny serratures on the margins. The genus comprises a number of species, the fibers of which are used for cordage, ropes, nets, etc. Among them are *Bromelia pigma*, which abounds in the Philippine islands, and is cultivated for its fiber by the Chinese; and the *Bromelia pinguis* of the West Indies, from the fruit of which a vinous liquor is prepared.

Bromelia Family (*Bromeliaceæ*): monocotyledonous plants, natives of tropical climates. They have six stamens and a single style, with a three-celled ovary. The leaves are hard, rigid, channeled, and often spiny. Some of the species have beautiful flowers. The order comprises more than 350 species, among which are the pineapple (*Ananas sativus*) and the *Tillandsia usneoides*, which is called Spanish moss

or old man's beard. It grows in the Southern U. S. on forest trees, from the branches of which it hangs down in long gray threads. The fiber of this is used to stuff mattresses. Many of the species are epiphytic, growing on trees, and are capable of vegetating for a long time without contact with the earth, and will flower if suspended in the air after being severed from their roots. The leaves of some are so formed as to retain near their base a quantity of water, and thus supply travelers with refreshment. Many plants of this order afford valuable fibers, which are used in making cordage, cloth, etc. The fiber of the leaves of *Ananas sativus* has been made into a fabric resembling white muslin.

Bromidrosis: See SKIN DISEASES.

Bro'mine, or Bro'mium [from Gr. *βρῶμιος*, foul odor]: a chemical element discovered in 1826 by Balard. Its chemical symbol is Br, and atomic weight 80. It resembles chlorine in chemical habitudes, and exists in minute quantity in sea-water and the ashes of marine plants. It is also found in many mineral springs, especially those of Kissingen, Krenznach, and Arnstadt (3.6 grains per imperial gallon), in Germany. Tenbury in Worcestershire (12½ grains), Saratoga and Ballston, N. Y., and in many brines, especially those of Pennsylvania and West Virginia, and in the waters of the Dead Sea (121 grains). Bromine also occurs as a bromide of silver in the mines of Chili and other countries. It is usually extracted from the mother-liquors or bitters of brines, or from the purification of rock salt and chloride of potassium by the agency of chlorine or of binoxide of manganese and sulphuric acid. Formerly, most of the bromine was obtained at Schönebeck, Prussia: since the discovery of the Stassfurt deposits larger quantities (260 tons per annum) have been made there. In the U. S. much bromine is made at Tarentum, Sligo, and Natrona, Pa., at Pomeroy, O., Pittsburg, Pa., Syracuse, N. Y., and Kanawha, West Va.; also in Michigan. The total product of the U. S. was estimated at 388,000 lb. for 1890. To obviate the danger attending the transportation of bromine, much of the bromine of Stassfurt is shipped as ethyl bromide, from which it is easily set free.

Bromine is a dark reddish-brown liquid, having a powerful suffocating odor and emitting heavy red fumes. Its specific gravity is 2.976; it boils at 145.4° F., and freezes at 19.4°. It is very poisonous; is soluble in alcohol and ether, slightly so in water. It combines readily with metals; forms hydrobromic acid (HBr) with hydrogen, and with oxygen bromic acid (HBrO₃) and hypobromous acid (HBrO), all of which are analogous in their properties to the corresponding compounds of chlorine. Bromine possesses bleaching and disinfecting properties. It is used to a limited extent as a disinfectant, but its most important application is for the manufacture of bromide of potassium (KBr), which is used in medicine and in photography. Bromide of ammonium, cadmium, etc., are also prepared for the latter purpose. Bromine is also used extensively in the manufacture of aniline dyes.

Revised by IRA REMSEN.

Bro'moform (or *tribrom-methane*, CBr₃): a compound analogous to chloroform and iodoform. It is a heavy, volatile liquid.

Bromsgrove: a market-town of Worcestershire, England; 16 miles by rail S. W. of Birmingham; in a richly wooded valley; on the Birmingham and Bristol Railway (see map of England, ref. 10-G). It has a fine old church, and a grammar school founded by Edward VI.; also manufactures of buttons and nails. Pop. (1891) 7,934.

Bronchi, bron'g'kī [pl. of Lat. *bronchus*, from Gr. *βρόγχος*, windpipe]: the divisions of the trachea or windpipe through which the air is conveyed into the lungs. The trachea divides into a right and left bronchus similar in structure to itself. The right is the shorter of the two and is rather larger in caliber than the other. Within the lung the bronchi divide and subdivide, forming minute tubes. These are lined with epithelium of ciliated type, and their walls are composed of fibro-muscular tissue strengthened with rings or plates of cartilage. The terminal bronchi divide into bronchioles, which again open into the alveoli or respiratory part of the lungs.

Bronchi'tis [from Gr. *βρόγχος*, trachea + suffix *-itis* (Gr. *-ίτις*): a diseased condition characterized by inflammation or hyperæmia (congestion) of the mucous membrane lining the air-passages, and usually accompanied by a more or less excessive secretion of mucus from that membrane. Young

children, old people, and those who are feeble or ill-nourished are especially liable to it. More or less bronchitis is usually associated with pulmonary consumption, with obstructive heart disease, and with asthma. It is often seen in patients with intermittent fever, typhoid, measles, and small-pox. Perhaps the most fruitful cause is exposure to sudden and extreme changes of the weather, leading primarily to that form of acute bronchitis which is known as a "cold on the lungs." Influenza is an epidemic bronchitis, the cause of which is undecided, but is probably some unknown influenza existing in the air.

The symptoms of bronchitis are of various character, varying according as the disease is seated in the larger or the smaller bronchi; the disease is also much more formidable in young children and in aged persons than in others. There is especial danger in the case of infants that collapse of small portions of the lung may ensue. Bronchitis may be either chronic or acute. Uncomplicated chronic bronchitis may require the use of sedatives or tonics, with systematic exercise and careful attention to the other hygienic conditions, but the treatment of individual cases will vary with the circumstances and special condition of the patient. The inhalation of medicated vapors and atomized liquids is especially recommended in some cases. Acute bronchitis is in general to be treated by expectorants or emetics, to remove the secretion, and by diaphoretics and counter-irritants, such as mustard, on the extremities and the chest, to relieve the congested blood-vessels of the bronchi. When the case is extreme and suffocation threatened, an infant may be often relieved by a warm bath. There are other special remedial measures which may be resorted to under the advice of the physician.

The diagnosis of bronchitis may be somewhat obscure, but to the practitioner the stethoscope reveals the extent and character of the disease by signs which to the untrained observer might appear insignificant. It may be observed that, except in children and old persons, the great proportion of cases of acute bronchitis recover spontaneously.

Bronchocele, bron'g'kō-sēel: See GOITRE.

Brøndsted, brön'sted, PETER OLUF: b. at Fruering, Nov. 17, 1780; studied at the University of Copenhagen, then in Paris 1806-08; undertook extensive explorations in Greece and Asia Minor from 1810 to 1813. In the latter year he was made Professor of Philology in Copenhagen, but went in 1819 to Rome, and resided there till 1823, visiting Southern Italy, Sicily, the Ionian islands, and Malta. He spent some time in England and in Paris, 1828-32. Returning to Copenhagen in 1832 as director of the royal numismatical collections and Professor of Archaeology, he died there June 26, 1842. His principal work is *Voyages dans la Grèce, accompagnés de recherches archéologiques et suivis d'un aperçu sur toutes les entreprises scientifiques qui ont eu lieu en Grèce depuis Pausanias jusqu'à nos jours* (Paris, 1826-30, 2 parts). He also wrote *Bidrag til den danske Historie af udenlandske Manuskriptsamlinger* (1817-18); *Description of Thirty-two Ancient Greek Painted Vases* (1832); *The Bronzes of Siris* (1836); and finally published a very fine Danish translation of Æschylus's *Agamemnon* (1842), leaving in MS. a version (published 1844) of the rest of the trilogy.

Revised by G. L. KITTEDGE.

Brongniart, brōn'ni-aar', ALEXANDRE: savant; b. in Paris, Feb. 5, 1770. He became in 1800 director of the porcelain manufactory at Sèvres. In 1815 he was admitted into the Institute. He wrote, besides other works, an *Elementary Treatise on Mineralogy* (1807) and a *Treatise on the Art of Pottery* (1845). He classified reptiles, to the divisions of which he gave the names of Saurians, Batrachians, Chelonians, and Ophidians, and laid the foundations of a systematic study of Trilobites. D. in Paris, Oct. 7, 1847.

Bron'te: a town of Sicily; in the province of Catania; near the west base of Mt. Etna; 28 miles N. N. W. of Catania (see map of Italy, ref. 9-F). It has manufactures of paper and woolen goods. Pop. 17,395.

Bron'te, ANNE: sister of Charlotte Brontë; b. at Haworth, Yorkshire, England, Mar. 25, 1820; wrote, under the pen-name *Acton Bell*, two novels, *Agnes Grey* (1847) and *The Tenant of Wildfell Hall* (1848), besides a number of poems. D. in Scarborough, May 28, 1849. HENRY A. BEERS.

Brontë, CHARLOTTE (*Currer Bell*): novelist; b. at Thorn-ton, in Yorkshire, Apr. 21, 1816. Her eccentric father, Patrick Brontë, originally *Prudy*, became curate of Haworth,

Yorkshire, in 1820. She lost her mother in 1821, and was sent to a boarding-school, where her health was impaired by impure air and unwholesome food; and then taught until in 1842 she and her sister Emily went to Brussels to learn French. In 1846, Charlotte and her sisters, Emily and Anne, published a volume entitled *Poems by Currer, Ellis, and Acton Bell*. Her first successful work was *Jane Eyre, an Autobiography, edited by Currer Bell* (1847), which was very popular. Her other chief works are *Shirley* (1849) and *Villette* (1852). She was married in 1854 to the Rev. A. B. Nichols, her father's curate, and d. Mar. 31, 1855. See E. C. Gaskell's *Life of Charlotte Brontë* (2 vols., 1857), and another life of her by T. W. Reid, 1877.

Brontë, EMILY JANE: sister of Charlotte; b. at Thornton, Yorkshire, England, Aug. 20, 1818. Her life was spent at her father's parsonage at Haworth, where she wrote, under the pen-name *Ellis Bell*, her strong but painful novel *Wuthering Heights* (1847), and a number of poems. She is the original of Shirley in Charlotte Brontë's novel of that name. D. in Haworth, Dec. 19, 1848. HENRY A. BEERS.

Brontotherium: See TITANOTHERIUM.

Bronze: an alloy of copper and tin in variable proportions; harder and more fusible than copper, but less malleable. Bell-metal is a variety of bronze, and the cannon commonly called brass are made of this alloy. Bronze was used by the ancients for weapons and utensils before the art of working iron had been invented. The metal which the Romans called *æs* was probably bronze. The brass mentioned in the Bible is supposed to have been either pure copper or an alloy of copper and tin. Bronze is extensively used in statues, machinery, and ordnance. The French and English have issued bronze coins for currency. Tempering produces on bronze an effect directly opposite to that on steel. To render bronze malleable it must be heated to redness and quenched in water. A mixture of 90 parts of copper with 10 of aluminium produces "aluminium bronze," a valuable alloy which is used as a substitute for bronze. "Manganese bronze" contains manganese in substitution for tin, up to 10 and even 20 per cent. Phosphor bronze is any standard bronze fluxed with phosphorus, and usually retains a small proportion of that element. All these alloys are usually stronger and sounder than the pure bronze. The varieties of bronze are composed of the following proportions: Bronze cannon, copper 9, tin 1; Chinese gongs, copper 5, tin 1; musical bells, copper 6, tin 1; house bells, copper 4, tin 1; large bells, copper 3, tin 1; bronze for wheels, copper 10, tin 1; telescope or speculum metal, copper 2, tin 1; mathematical instruments, copper 12, tin 1.

Bronze-brass alloys (kaleoids, as the writer has called them) are ternary alloys of copper, tin, and zinc. Their properties were investigated by the writer for the U. S. board appointed to test iron, steel, and other metals, 1875, by special processes devised for the purpose. (See *Report of United States Board*, R. H. Thurston, ed., Washington, 1878-80.) To represent with satisfactory precision, completeness, and intelligibility a series of researches on the character of triple alloys of all desired proportions appeared, at first, a most difficult, if not insolvable, problem. A very satisfactory method was, however, finally devised.

In any triangle, as at A, Fig. 1, let fall perpendiculars upon the three equal sides. The area of the whole triangle B, C, D, is measured by the product of the altitude, C E,

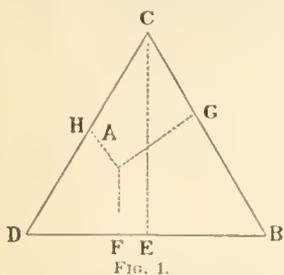

FIG. 1.

by one-half the base, B D. Draw lines A B, A C, A D, to the vertices of the triangle, thus forming three smaller triangles, the sum of which equals, in area, the original triangle. We now have: $C E \times 1-2 B D = A F \times 1-2 B D + A G \times 1-2 B C + A H \times 1-2 C D$; or, the sides of the triangle being equal, $C E \times 1-2 B D = (A F + A G + A H) 1-2 B D$. Hence $A F + A G + A H = C E$.

But the area of the whole triangle may be conceived to represent a ternary alloy composed of the three components in proportions represented by the areas of the three several small triangles which together make up its total area. But these smaller triangles have areas proportional, as has just been seen, to their altitudes, A F, A G, A H; the proportions in which the three metals are combined to form the given

alloy may therefore be measured by the ratio of their representative triangles to the whole triangle in area and in altitude. Then, dividing the height of the large triangle into one hundred equal parts, the altitudes of the small triangles, measured in the same units, will represent the percentages of the three elements in the given alloy.

Every point in the triangle thus represents some certain triple alloy; there is no possible ternary alloy which has not its representative point in the triangle. We now have before us a field which exactly defines our research, and we may attempt its exploration with a clear understanding of what is to be done.

The result of an investigation such as has just been described may be very beautifully exhibited to the eye by making a *model* (Fig. 2) of the surface thus determined. In carrying out these researches the writer found the following plan perfectly satisfactory:

Layout a triangle, as above described, upon a surface of sheet brass. At the points at which determinations have been made erect wires of which the lengths have been made carefully proportional to the ordinates of the representative surface at those points, screwing them firmly, or otherwise fixing them, in their places. When all the wires are in place and are found to be of the exact length required, place bits of board along the outside to form the boundaries of the triangle, and pour in plaster-of-Paris until the wires are all covered. When the plaster has set, remove the boards and carefully cut away the upper part of the plaster, working carefully down to the tops of the wires, just exposing their points. The surface thus produced is a model of the strength, or other quality represented, of all the alloys.

Similarly a model may be made to represent any other quality, as elasticity, ductility, malleability, resilience, or the total. (*New Plan of Representing Researches*, etc., R. H. Thurston, Proc. Am. Assoc. for Advancement of Science, 1887, vol. xxvi.)

The result of this investigation was the determination of the tenacities and other properties of all possible alloys of copper and zinc, copper and tin, and copper, zinc, and tin, and of the discovery of the existence and the location of a "maximum alloy," represented by the highest point on the model, of the highest tenacity attainable in this system of alloys; which alloy contains about 55 parts copper, 43 zinc, and 2 of tin, and has a tenacity of from 70,000 to 85,000 lb. per square inch (4,850 to 5,500 kilog. per square centimeter), according as it is well or badly fluxed. If t and z are the percentages of zinc and of tin, the alloys should have not less than the following tenacities in pounds on the square inch. (*Materials of Engineering*, R. H. Thurston, vol. iii., art. 255.)

For bronze, in British and metric measures, respectively:

$$T = 30,000 + 1,000 t,$$

$$T_m = 2,100 + 70 t, \text{ nearly.}$$

For brass:

$$T = 30,000 + 500 z,$$

$$T_m = 2,100 + 35 z, \text{ nearly.}$$

The best alloys in this respect have a composition—

$$Z + 3t = 55, \text{ nearly,}$$

and their tenacity is not far from

$$T = 40,000 + 500 z,$$

$$T_m = 2,800 + 35 z, \text{ nearly,}$$

when the proportion of tin exceeds about 1 per cent. The strongest alloys are deficient in ductility, however, as a rule, and lie on the margin of a field of *gray* alloys, in which all are too brittle for common use in the arts. With phosphorus used as a flux, the writer found it possible to secure tenacities, for alloys from copper 100, to $4t + z = 50$,

$$T = 60,000 + 1,000 t + 500 z,$$

$$T_m = 4,200 + 70 t + 35 z, \text{ nearly.}$$

Many exceptionally strong alloys are now known to fall into this class, or nearly so: as Fairbairn's, copper 37, tin 1; British naval bronze, copper 87.65, tin 8.32, zinc 4.03; Tobin's alloys, used by the U. S. Navy Department, copper 58.22, tin 2.30, zinc 39.48, the atomic proportions of these elements. These alloys have tenacities ranging up to 70,000 lb. per

square inch, will work well either hot or cold, can be forged and rolled and make good castings. Cold-rolling increases tenacity greatly, while reducing their ductility and resilience, and this process was employed by Dean in the production of bronze ordnance, and also later by Uchatius for the Austrian army. R. H. THURSTON.

Bronze, Age of: It is held by some archeologists that, when primeval man began to become civilized, the first weapons of war and utensils for industry were made of stone; that in the next stage of progress (in most nations before the beginning of history) there succeeded a time when copper and its alloys were used in the place of stone for many purposes, as is known to have been true among the Peruvians, and also among some of the ancient races of North America; and that in the third stage men learned how to smelt and work iron. Hence these three hypothetical stages are respectively termed the Age of Stone, the Age of Bronze, and the Age of Iron. These terms are convenient, though it is certain that the so-called ages interpenetrated and overlapped each other. In Denmark and Scandinavia especially there have been interesting and extensive collections made of the relics of the Age of Bronze, and it appears certain that a large part of these curious weapons and tools (which are in many cases finely wrought) were made in prehistoric times; nevertheless there are many able men who deny that the facts, so far as known, sustain the above-mentioned theory of the origin of civilization.

Bronzed Skin: See ADDISON'S DISEASE.

Bronze-wing, or Bronze-pigeon: one of several species of pigeons; natives of Australia; mostly belonging to the genus *Phaps*. They have the wing coverts marked with lustrous bronze-colored spots. The common bronze-wing (*Phaps chalcoptera*) is distributed over all the Australian colonies. It weighs about 1 lb., and is esteemed as food.

Bronzing: the covering of articles made of clay, metal, wood, or other material with a substance which gives them the appearance of being made of bronze. Sometimes bronze or some other alloy of copper is actually spread upon the articles to be bronzed, which may be done by the electrotype process, or by applying the powdered alloy by means of *gold size*, which is a mixture of linseed-oil and gum animé. There are also certain chemical reagents which when applied to various metals will give them a bronzed appearance.

Brooke, GUSTAVUS VAUGHAN: tragedian; b. in Dublin, Ireland, Apr. 25, 1818; was educated for the law; went upon the stage in 1833; attained eminence as a tragedian, playing with success in the principal cities of Great Britain and the U. S. He was lost on the steamer London while on a voyage to Australia, Jan. 11, 1866.

Brooke, HENRY: dramatist and novelist; b. in the County of Cavan, Ireland, in 1703; educated at Trinity College, Dublin; was a friend of Pope. He wrote, besides other works, *Universal Beauty*, a poem; tragedies entitled *the Earl of Essex*; *Gustavus Vasa* (1739), which was produced in Ireland as *The Patriot*; and a novel called *The Fool of Quality*, of which an edition appeared in 1859, with encomiums from Charles Kingsley for its permanence of pure and elevating thought. D. in Dublin, Oct. 10, 1783.

Brooke, Sir JAMES: Rajah of Sarawak; b. of English parents in Benares, India, Apr. 29, 1803; educated in Norwich. He served in the Burmese war of 1825, and was badly wounded; inherited from his father in 1835 an estate of \$150,000; formed a project to suppress piracy in the Malay archipelago; went to Borneo in 1838. He rendered some service to the Sultan of Borneo, who in 1841 appointed him governor of Sarawak. He framed a code of laws for the natives of Sarawak, and displayed great energy in the extirpation of pirates. His coadjutors received £20,000 as head-money for the pirates whom they killed, but on parliamentary investigation he was exonerated from profiting by the bloody business. From 1848 to 1857 he was British governor and consul-general in the island of Labuan. In the latter year he repulsed a desperate attack of Chinese on his estates, and drove them from Borneo, and he lived to achieve the independence of Sarawak. In 1847 he was created a knight by Queen Victoria. D. at Burrator, Devonshire, England, June 11, 1868, and was succeeded as rajah by a nephew. See *St. John's Life of Sir James Brooke* (1879).

Brooke, STOPFORD AUGUSTUS: clergyman and author; b. at Letterkenny, Ireland, Nov. 14, 1832; was educated at

Trinity College, Dublin; held various London livings in the Church of England, becoming in 1872 a queen's chaplain; in 1880 he became a Unitarian because he had ceased to believe in a miraculous incarnation; officiates in Bedford chapel, Bloomsbury, London. He is the author of many volumes of sermons, mostly promulgating advanced Broad Church views, besides *Poems* (1888); *Theology in the English Poets* (1847); a very popular primer, *History of English Literature* (1876); *The Early Life of Jesus*; and the best edition yet extant of *The Life and Letters of Frederick W. Robertson* (1865). HENRY A. BEERS.

Brook Farm: a community established in West Roxbury, Mass., in 1841, as an experiment in "plain living and high thinking." The articles of association provided that the name and style of the community should be the "Brook Farm Institute of Agriculture and Education," and defined its object to be the establishment of an "agricultural, literary, and scientific school or college." The head of the community was George Ripley, formerly a Unitarian minister in Boston, who had been in 1836 one of the founders of the Transcendental Club, with Emerson, Hedge, Alcott, and others; and in 1840 had established the transcendentalist organ, *The Dial*, in connection with Emerson and Margaret Fuller. Associated with Ripley in the Brook Farm enterprise were Nathaniel Hawthorne, Charles A. Dana, John S. Dwight, and other well-known men. They bought a farm comprising some 200 acres, about 9 miles from the city of Boston. Several trades besides agriculture were carried on, and a number of children were received as pupils, instruction being furnished in ancient and modern languages, history, mathematics, moral philosophy, music, drawing, etc. It was designed to substitute co-operation for selfish competition, and to dignify bodily labor by uniting it with the intellectual and spiritual life. The community was at first organized as a joint-stock company, each subscriber being guaranteed 5 per cent. per annum on his shares. In 1844, mainly owing to the influence of Albert Brisbane, it was reorganized on a Fourieristic plan, as a "phalanstery," and incorporated in 1845 under the title of the "Brook Farm Phalanx." In the latter year the phalanstery building, an uncompleted wooden structure designed to lodge the entire community, was burned; and in 1847 the experiment, having proved a failure financially, was given up.

Life at Brook Farm, especially during the first years of enthusiasm, had idyllic and romantic aspects, of which Hawthorne availed himself in his *Bithedale Romance*. In its palmiest state the community, including school children and boarders, numbered about 150 souls. Kitchen and table were in common; very little help was hired, but philosophers, clergymen, and poets worked at the humblest tasks, milking cows, pitching manure, cleaning stables, etc., while cultivated women cooked, washed, ironed, and waited at table. All work, manual or intellectual, was credited to members at a uniform rate of ten cents an hour. Among many persons of note who took an interest in Brook Farm, and were frequent visitors (though not residents there, were Emerson, Theodore Parker, Margaret Fuller, Bronson Alcott, Orestes A. Brownson, Rev. W. H. Channing, and Christopher P. Cranch. The *Harbinger*, a weekly journal devoted to the principle of association, was issued from Brook Farm from 1845 to 1847, and, after the break up of the community, transferred to New York. It numbered among its contributors, exclusive of Brook Farmers, writers like Lowell, Whittier, Greeley, Higginson, Story, and Curtis. See Hawthorne's *American Note-books*; O. B. Frothingham's *Life of George Ripley*; T. W. Higginson's *Life of Margaret Fuller*; the *Atlantic Monthly* for Oct., 1878; and *Old and New* for Feb., Apr., and Sept., 1871, and May, 1872.

HENRY A. BEERS.

Brookfield: town; on railroad; Linn co., Mo. (for location of county, see map of Missouri, ref. 2-F); is the central station and division headquarters of the Hannibal and St. Joseph R. R. Several of its officers, its round-house, and extensive shops are located here. There is a coal mine near the town. Pop. (1880) 2,264; (1890) 4,547.

Brookhaven: city; capital of Lincoln co., Miss. (for location of county, see map of Mississippi, ref. 8-F); situated at junction of Ill. Cent. and Mer., Brookhaven and Natchez R. Rs., 54 miles S. by W. of Jackson. The city has 9 churches, a fine public school, and is the seat of Whitworth Female College, one of the most flourishing institutions of learning in the South; it has a foundry, machine-shops, and 2 planing-mills. The principal industries of the surround-

ing country are lumbering and agriculture, and Brookhaven is an important trading-center for the products, about 13,000 bales of cotton being marketed annually. Pop. (1880) 1,615; (1890) 2,142; (1893) with suburbs, about 3,000.

EDITOR OF "LINCOLN COUNTY TIMES."

Brookings: city; capital of Brookings co., S. D. (for location of county, see map of South Dakota, ref. 6-G); on Chicago and N. W. R. R.; in the fertile Sioux valley. Here are South Dakota Agricultural College and U. S. Agricultural Experiment Station, large flouring-mill, large town-mill, five churches, commodious school building, electric lights, and water-works. Pop. (1890) 1,518; (1895) 1,743.

G. A. WEST, SUPT. OF SCHOOLS.

Brookite: a mineral named in honor of Brooke, the crystallographer; pure native titanic anhydride. It occurs in reddish, yellowish, or hair-brown crystals, which are more or less translucent, and have a brilliant luster, inclining to metallic. It is found in Perthshire, Scotland, at Tavistock, in Savoy, and other places. A variety found in the Ozark Mountains, Arkansas, is called *arkansite*.

Revised by C. KIRCHHOFF.

Brooklime (*Veronica beccabunga*): a perennial plant; native of Europe; grows in ditches and wet places. It has a procumbent stem and elliptical serrate leaves, which are succulent, and are used in England as an ingredient in spring salads. In the U. S. is found a similar plant, the *Veronica americana*, or American brooklime.

Brookline: a township in Norfolk co., Mass. (for location of county, see map of Massachusetts, ref. 5-1); on the Charles river, which separates it from Boston and Cambridge. It is connected with Boston by steam and street railways, and is almost wholly a place of residence. It has many fine villas and country seats, and, with its meandering and well-kept streets winding among lawns and terraced grounds, under fine old trees and amid ornamental shrubbery, presents the appearance of a park. A small part of this township has been annexed to Boston since the census of 1870. Brookline has a public library building costing \$50,000, and a granite town-house costing \$150,000. Pop. (1880) 8,057; (1890) 12,103; (1895) 16,164.

EDITOR OF "CHRONICLE."

Brooklyn: city (formally laid out in 1855); Poweshick co., Ia. (for location of county, see map of Iowa, ref. 5-1); on Ch., Rk. I. and Pac. R. R.; 72 miles E. of Des Moines, 104 miles W. of Davenport. It has graded schools, six churches, several grain elevators, and a flour-mill, and is a division station of the Ch., Rk. I. and Pac. R. R. The surrounding country is rich farming land, with many elegant farm-houses. Pop. (1880) 1,234; (1890) 1,202; (1895) 1,244.

EDITOR OF "CHRONICLE."

Brooklyn: a city, seaport, and county-seat of Kings co., N. Y.; situated at the west end of Long Island; on New York Bay and on the East river, an estuary separating Long Island from Manhattan Island, and connecting Long Island Sound with New York Bay; lat. (at Navy-yard) 40° 51' 30" N., lon. 73° 59' 30" W. of Greenwich. The ground on which it is built rises with a steep grade from the bay and river to a ridge which extends eastward through the island. At its highest point it is about 175 feet above tide water, and commands an extended view of New York Bay. Its elevated and rolling surface gives to the city a healthful and picturesque location. Exclusive of the districts annexed by acts of the Legislature in May to July, 1894 (see below), the city has an area of 31½ sq. miles, has 9 miles of water-frontage, and 657 miles of streets, of which 397 are paved and 183 lined with shade trees. Brooklyn is an aggregation of villages which have gradually coalesced; the city as a whole therefore lacks unity of design. The streets and avenues are broad and cross each other at right angles, except along the boundaries of the original villages. Miles of immense retail establishments, many of them unsurpassed in their size and appointments by any stores in the country, line Fulton Street, Broadway, Myrtle Avenue, etc.

The city is supplied with water from ponds, streams, and artesian wells on Long Island, covering a drainage area of 60½ sq. miles. The water is pumped into the reservoir at Ridgewood, and thence distributed through 416 miles of mains. The works cost \$18,386,662, and have a storage capacity of 1,180,000,000 gal. The average daily consumption is about 50,000,000 gal.

Parks.—Brooklyn has 16 parks, with an area of 754 acres. The principal one is Prospect Park, area 516½ acres, includ-

ing 110 acres of woodland, 77 acres of lakes and water-courses, 70 acres of meadows, 259½ plantations, 8¼ miles of drives, 3½ miles bridle-roads, and 10½ miles of walks. It is situated on the highest ground of the city, and affords extended views of bay, ocean, and island. It is a beautiful breathing-place for the inhabitants of this great city. It cost \$9,159,334, and over 16,000,000 visitors were estimated in 1891. The most noted of the other parks is Washington Park (Fort Greene), 30 acres of beautiful grounds, where are entombed 11,000 victims of the Revolutionary war prison ships. Among the monuments of the city may be mentioned an imposing Soldiers and Sailors' Memorial Arch on the Prospect Park Plaza, built of white marble, and dedicated in 1892; a statue of Abraham Lincoln on the plaza, and one of Henry Ward Beecher in front of the City-hall; and busts of Thomas Moore, Washington Irving, and John Howard Payne, in Prospect Park.

Cemeteries.—Five cemeteries lie wholly or partly within the city. Greenwood, S. W. of and not far from Prospect Park, has an area of 474 acres. It is the resting-place of about 265,000 dead, and is widely known for the beauty of its grounds and monuments. Evergreens, at the north-east corner of the city, covers 375 acres, and is also a beautiful place, and contains the remains of about 125,000 persons.

Means of Communication.—The first horse-car of Brooklyn began to run July 4, 1854. Now (1894) there are 30 railways operated by horses, cables, electricity, or steam, having one or both termini in the city; the length of those within the city exceeds 160 miles, and includes 24 miles of elevated railway. In 1892 200,545,494 passengers were carried by these railways.

The first ferry between Manhattan and Long Island was established in 1642, about where Fulton ferry now is. The first steam-ferry was opened May 10, 1814. In 1836 the receipts on the New York side were less than \$100 per day; in 1893 the earnings of the five lines of the Union Ferry Company alone aggregated \$847,922, and they carried over 35,626,600 passengers. Seventeen ferries between convenient points ply day and night at frequent intervals.

The New York and Brooklyn Bridge.—This is a suspension bridge over the East river, and connecting New York and Brooklyn. The plans and estimates were made by John A. Roebling, who was its chief engineer till his death in 1869. He was succeeded by his son, Washington A. Roebling, under whose direction it was finished. The construction was begun Jan. 2, 1870, and the bridge opened to the public May 23, 1883. The length, with extensions, is 6,537 feet. It has 2 granite towers 278 feet high, one on either shore. The horizontal section of these towers at high-water mark is 140 by 59 feet, and at the top 136 by 53 feet. The depth of the tower foundations below high water is, on the New York side, 78 feet, and on the Brooklyn side, 45 feet. The length of the river span is 1,595½ feet. The bridge is supported by 4 great cables, and by many stays extending from the towers. Each of the cables contains 5,296 parallel galvanized steel, oil-coated wires, closely bound up into a solid cable 15¼ inches in diameter. Each wire is 3.578¼ feet long. The clear height of the bridge above high water is 135 feet in center of river-span, and at the towers 119½ feet. The bridge is 85 feet wide, and contains 5 parallel avenues. The central avenue, 15½ feet wide, is for foot-passengers; those on either side of the footway are for passenger-cars, drawn by a cable 11,600 feet long. The outermost avenues, each about 19 feet in width, are for vehicles. The permanent weight suspended from the cables is 14,680 tons. The original cost of construction was \$15,000,000. The cars began running over it on Sept. 24, 1883, and between that time and Dec. 1, 1893, carried 301,875,286 passengers. The total receipts from the bridge for the year ending Dec. 1, 1893, were \$1,590,140.03.

Among the principal buildings are the City-hall, Court-house, Municipal Building, Hall of Records, Federal Building, Academy of Music, Academy of Design, Brooklyn Library, Long Island Historical Society, Packer, Polytechnic, and Pratt Institutes, and many large buildings for office and commercial purposes.

Churches.—The city contains 307 Protestant churches, with a membership of 99,940, owning property valued at \$12,422,000, and having 317 schools, aggregating 121,256 pupils; 61 Roman Catholic churches, with parishioners to the number of 244,200, owning property valued at \$6,589,000, and having in their Sunday-schools 24,300 children; 19 missions, 33 city missionaries, 43 religious societies, and

a Young Men's Christian Association, with 5 branches and a membership of 4,230.

Education.—The public schools consist of 2 high schools, one for boys and one for girls; a training-school for teachers, 84 day and 16 evening schools, and 10 industrial and asylum schools. The number of children on register in 1893 was 102,468. The cost of the schools in 1893 was \$2,449,735.33. There are 4 private institutions of high order, viz.: the Polytechnic, Packer, and Pratt Institutes, and the Adelphi Academy; also 2 colleges, 2 medical colleges, 3 business colleges, and many excellent seminaries and academies. There are 3 large and 8 smaller libraries, having an aggregate of 460,000 volumes: of these 73,500 are in free libraries; also a museum of art and science, museums of natural history, antiquities and mechanical arts, an academy of design, and 2 art associations.

Newspapers.—Brooklyn has 5 dailies, 3 weeklies, and many papers of irregular issue, and 3 of the large New York dailies publish a Brooklyn edition.

Charitable Institutions.—For general or special relief, supported mainly by contributions, number 118, among which are 20 hospitals, 11 homes for the aged, a maternity hospital, 11 orphan asylums, 6 nurseries, 24 dispensaries, a home for incurables, a home for consumptives, and several industrial schools and agencies.

Finances, Banks, etc.—Net city debt, May 1, 1894, \$46,283,540. Valuation for 1893: real estate, \$486,531,506; personal estate, \$19,523,170; total, \$506,054,676. There are 23 banks of deposit, 14 savings-banks, 7 trust, 4 safe-deposit, 9 gas-light, 14 electric-light, and 4 title-guarantee companies.

Courts.—U. S. circuit and district courts; circuit, special, and general terms of the New York Supreme Court; county court; court of sessions; city court; surrogate's court; 3 district justices and 4 police justices.

Manufactures.—According to the census of 1890 there were in the city of Brooklyn 229 industries, and 10,561 industrial establishments, with a capital of \$125,849,052, and giving employment to 103,683 persons at the aggregate annual value of \$61,975,702. The cost of the materials used was \$137,325,749, and the value of the product \$248,750,184. The values of the annual product of the principal individual industries are as follows: Sugar and molasses refining, 18 establishments, \$16,629,982; foundries and machine-shops, 169 establishments, \$15,350,776; slaughtering and meat-packing, 63 establishments, \$13,317,789; coffee and spice, 13 establishments, \$12,247,162; chemicals, 36 establishments, \$10,467,109; cordage and twine, 3 establishments, \$5,625,792.

Commerce.—Though pre-eminently a city of homes for men doing business in New York, Brooklyn has developed a commerce which is now of great proportions. The wharves and docks of the city have a water-frontage of over 25 miles, lined with great warehouses and elevators. The warehouses have a storage capacity of over 90,000,000 cubic feet, and the grain elevators a storage capacity of 19,850,000 bush, and a transfer capacity of 127,000 bush, per hour. Each elevator is capable of emptying a canal-boat containing 8,000 bush, in two hours, and of loading a ship at the rate of 8,000 bush, per hour.

The export of grain from Brooklyn exceeds that from New York, Jersey City, and Hoboken combined: the export of potatoes, flour, provisions, cotton, sugar, and petroleum is also extensive.

The principal articles of regular importation at Brooklyn piers are coffee, sugar, green and dried fruits, rubber, and sulphur. In 1887 90 per cent. of the coffee and sugar imported into the U. S. was received there: in round numbers, 2,500,000 bags coffee, 900,000 tons sugar, besides 2,000,000 boxes of lemons, 50,000 tons rubber, and 40,000 tons of sulphur.

Thirty-six regular lines of steamships and a great number of "tramp" steamers and sailing vessels dock in Brooklyn.

Along the water-front are also extensive basins, one covering 40 acres and accommodating 500 vessels at one time, ship-yards, dry docks, and marine railways. There also is the Brooklyn Navy-yard, the most important station in the U. S., where four-fifths of the stores for the entire navy are handled, and war-ships are built, repaired, and fitted out for sea service.

The Wallabout Market, established in 1884, covers 17,500 acres, and was the rendezvous in 1891 for 41,201 farmers' wagons from Long Island. A large wholesale trade in provisions and fruits is carried on there.

History.—Brooklyn was named from Breuckelen (marsh land), in the province of Utrecht in Holland, 6 miles from

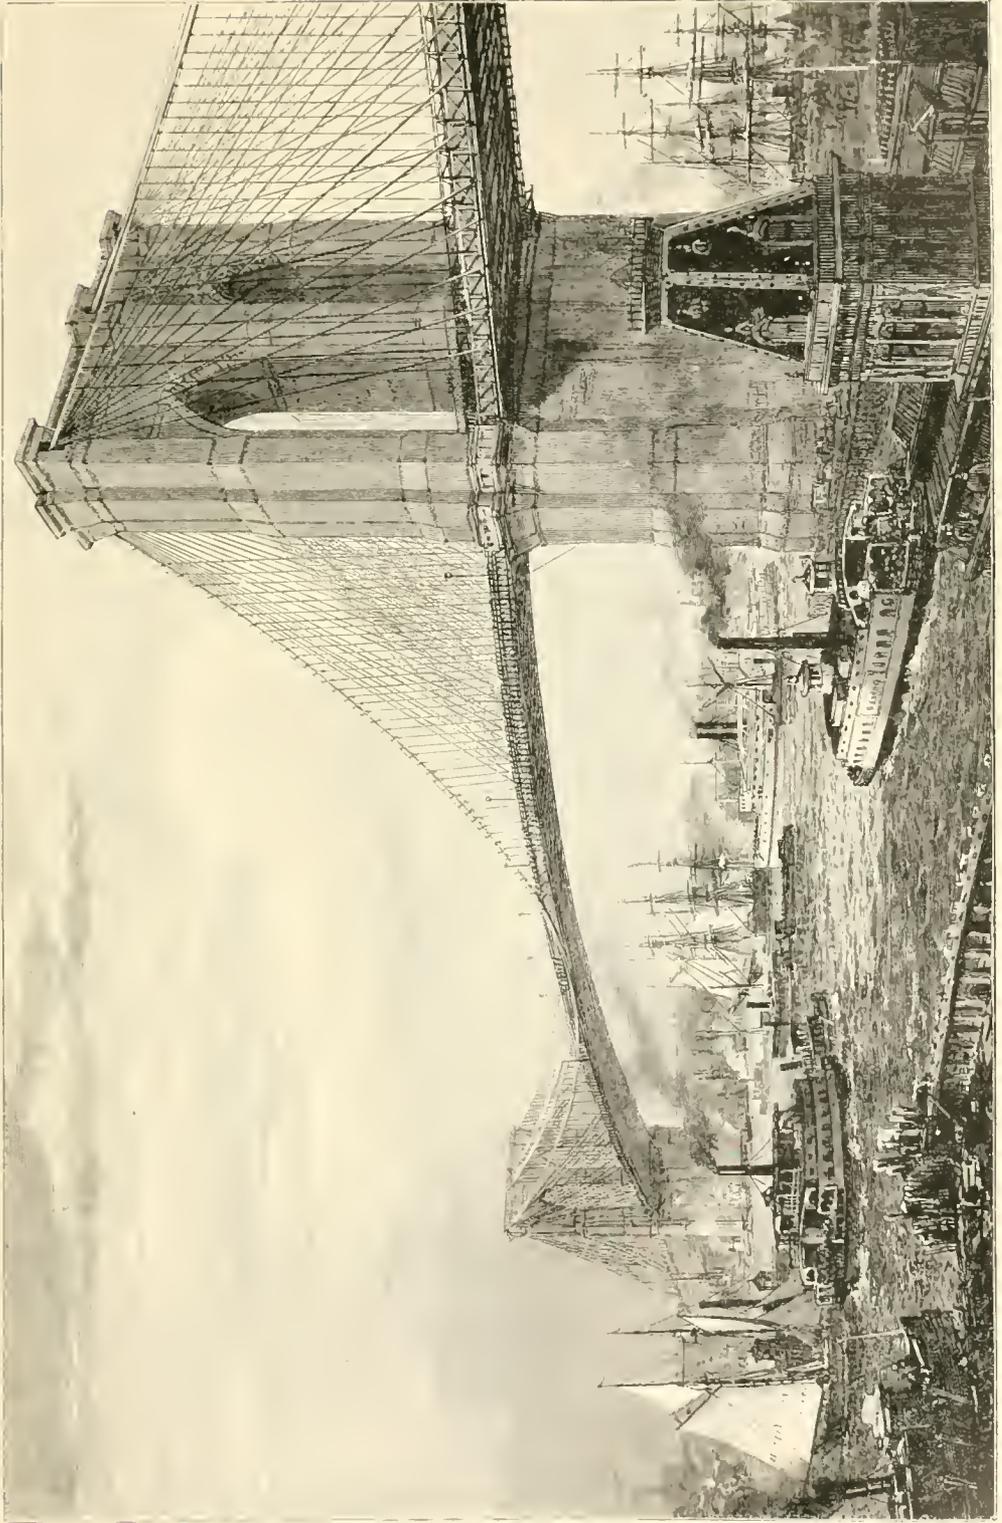

the city of Utrecht, from which some of its early settlers came June 16, 1637. Long Island was originally occupied by 13 tribes of Indians belonging to the Algonquin nation, one of which, the Canarsie, occupied the west end of the island, including the ground now covered by Brooklyn. The first step toward the settlement of the city was the purchase from the Indians in 1636, by William Arianse Bennet and Jaques Bentyne, of a tract of 630 acres, lying at Gowanus, between Twenty-seventh Street and the New Utrecht line; the second step, the purchase by Joris (George) Jansen de Rajulje of 325 acres at the Wallabout Bay, June 16, 1637. In 1642 there were at the west end of the island 5 hamlets—"The Ferry"; "Breuckelyn," near the present Hoyt and Fulton Streets, where stood the church; "Gowanus," around Gowanus Bay; "Bedford," inland; and "The Wallabout," around Wallabout Bay.

Immediately upon the establishment of the ferry, grants of building-lots at that point began, and that locality, as well as the other hamlets, increased. The union of the 5 hamlets into one village called Breuckelen took place in 1646. In 1653 it received a Dutch charter, in 1665 an English charter, and in 1788 was organized as a town under State law. On Apr. 12, 1816, Brooklyn village was incorporated, and on Apr. 8, 1834, it was incorporated as a city. An act consolidating Brooklyn, Williamsburg, and Bushwick was passed Apr. 17, 1854, and went into effect Jan. 1, 1855. A new charter was granted in 1873, and amended in 1880 and 1881. In June, 1888, a bill was passed by the Legislature "to revise and combine in a single act all existing special and local laws affecting public interests in the city of Brooklyn."

The township of New Lots was annexed to Brooklyn in 1886, and forms its Twenty-sixth ward. An agitation for the consolidation of the cities of Brooklyn and New York resulted in the passage by the Legislature in May, 1894, of a bill providing for the submission of the question to popular vote. At the same session of the Legislature bills were passed annexing the towns of Flatbush, Gravesend and New Utrecht to Brooklyn, and providing for the annexation of the town of Flatlands (Jan. 1, 1896). This action made the city of Brooklyn and the county of Kings coextensive, abolished the Kings County board of supervisors, and vested the authority formerly held by it in the board of aldermen. It also gave the city thirty-one wards, the Twenty-seventh and Twenty-eighth being constituted from the old Eighteenth. Flatbush becoming the Twenty-ninth, New Utrecht the Thirtieth, and Flatlands and Gravesend together the Thirty-first. The enlarged city extends from the Atlantic Ocean at Coney Island to the East river and New York harbor, has an area of 66.39 sq. miles, and is thus the largest city in the State. According to the State census of 1892, Brooklyn had a population of 957,958; Flatbush, 12,625; New Utrecht, 9,129; Gravesend, 8,418; and Flatlands, 4,234—a total of 992,364, excluding 2,912 inmates of county institutions. A conservative estimate in 1894 placed the total population at 1,000,100. The annexation of Gravesend brought into Brooklyn's limits all the beach hotels and the shore resorts on Coney Island, and the race-courses of the Coney Island and the Brooklyn Jockey Clubs and of the Brighton Beach Racing Association. The government of the city is vested in a board of aldermen, called the common council, the majority of whose members are elected in aldermanic districts and the remainder from the city at large; terms of all members, two years. The administrative power is vested in the mayor and heads of departments, all of whom (except those of the department of finance, audit, and public instruction) are appointed by the mayor. Over the ground now occupied by the city of Brooklyn, on Aug. 7, 1776, was fought the first great battle of the Revolution after the Declaration of Independence, the battle of Long Island.

For the result of the movement in favor of consolidation, see the article NEW YORK. GERRIT SMITH.

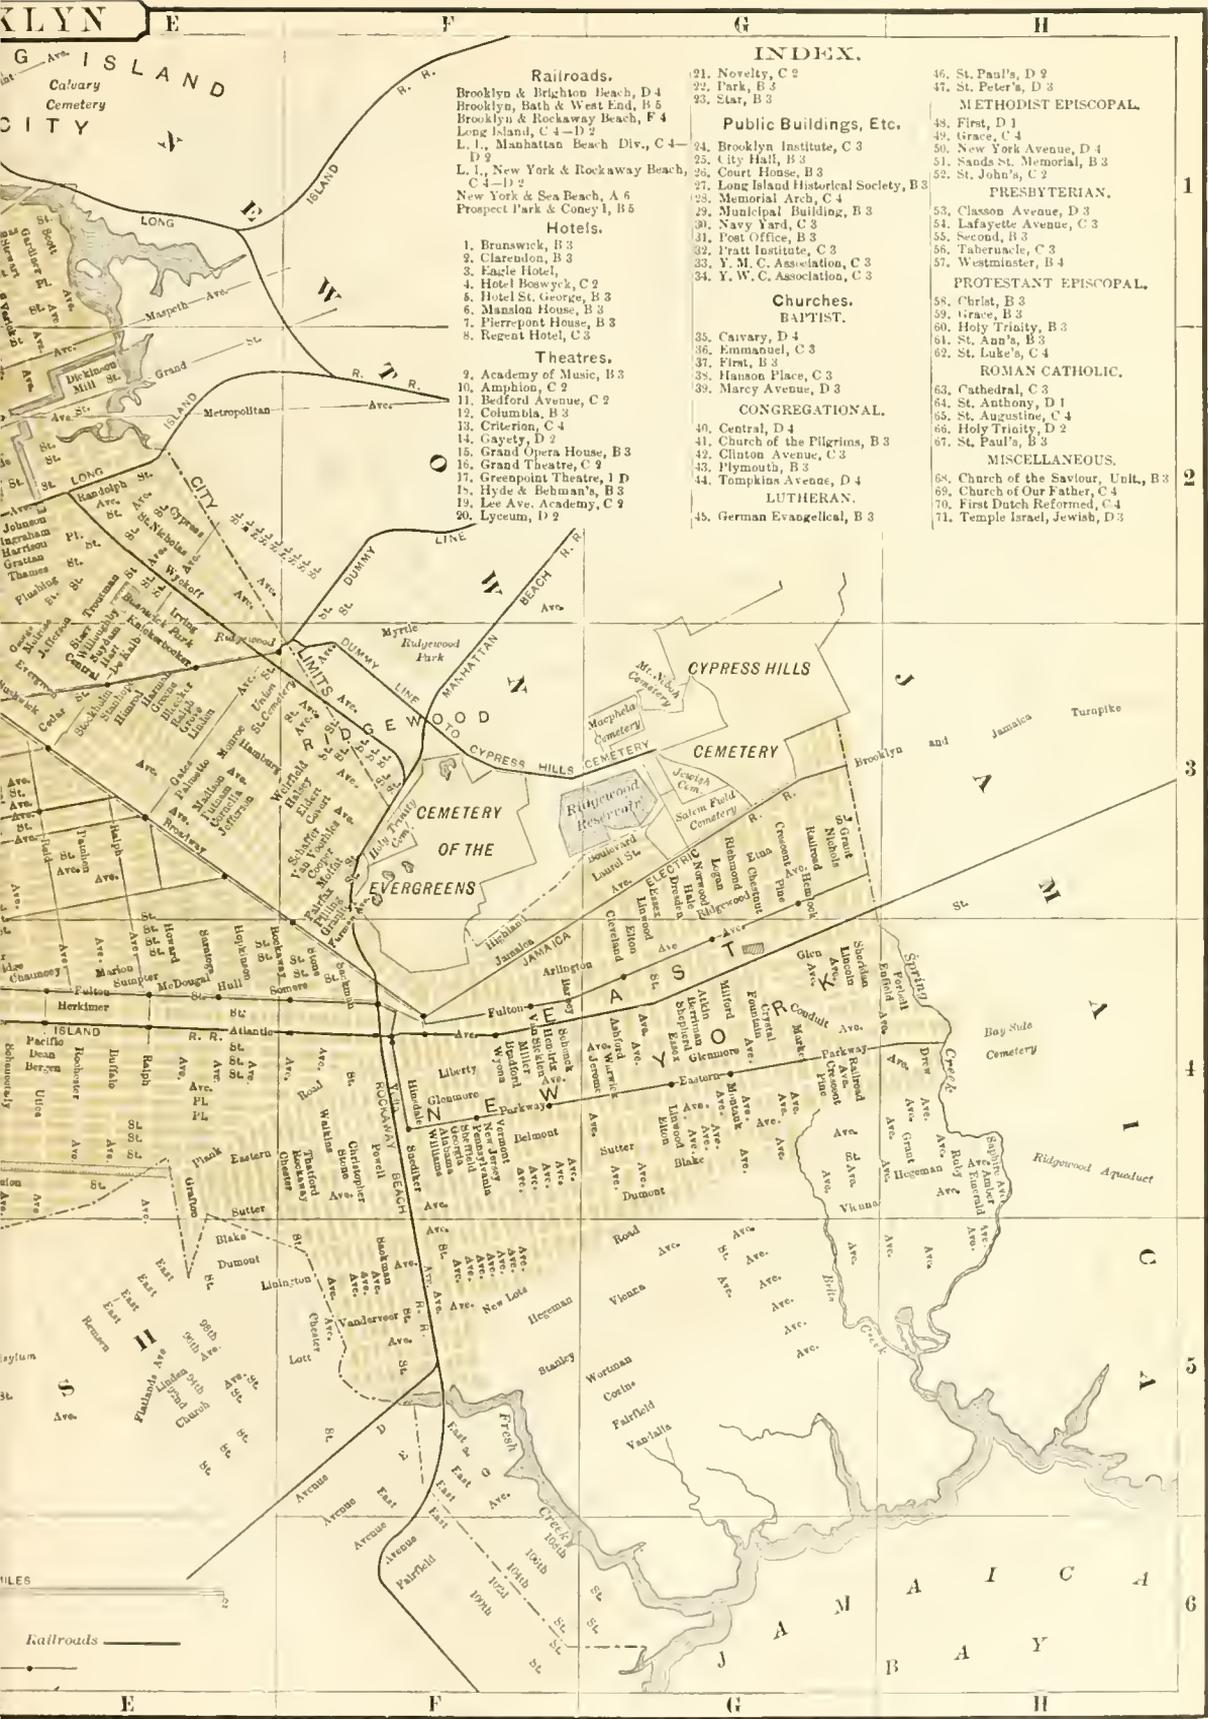

Brooks, CHARLES WILLIAM SHIRLEY: journalist, lecturer, dramatist, and novelist; b. in London, England, Apr. 29, 1816; became a newspaper reporter and writer; was sent by the *Morning Chronicle* to the East to report on the condition of labor, and produced the *Russians of the South* (1856). He produced the dramas *The Creole, Our New Governness*, etc. Among his novels are *Aspen Court* (1857); *Gordian Knot* (1860); *The Silver Cord* (1861); and *Sooner or Later* (1868). He became connected with *Punch* in 1851, and on the death of Mark Lemon in 1870 succeeded him as editor. D. in London, Feb. 23, 1874.

THE APPROACH TO THE EAST RIVER BRIDGE—(NEW YORK SIDE).

Brooks, CHARLES TIMOTHY: Unitarian minister and poet; b. at Salem, Mass., June 20, 1813; graduated at Harvard in 1832, and was pastor at Newport, R. I., from 1837 to 1873. He translated *Faust, Hesperus, Titan*, and many small poems from the German. His *Poems, Original and Translated*, were published with a memoir by Charles W. Wendte (Boston, 1885). D. in Newport, R. I., June 14, 1883.

Brooks, ELBRIDGE GERRY, D. D.: b. at Dover, N. H., July 29, 1816; studied law (1833-35) with Chief Justice Tenney of Maine; began preaching in 1836; became Universalist pastor in West Amesbury, Mass., 1837, East Cambridge 1838, Lowell 1845, and Lynn, Mass., 1850, New York city 1859, resigned 1867, Philadelphia, Pa., 1868. He was general secretary of the Universalist general convention 1867-68. D. in Philadelphia, Pa., April 8, 1878. See his *Life* by E. S. Brooks (Boston, 1888).

Brooks, ERASTUS: journalist; b. at Portland, Me., Jan. 31, 1815; educated at Brown University; was the coadjutor and partner of his brother JAMES (*q. v.*) on the *New York Express*, and its proprietor until 1877; State Senator 1853-57, becoming involved in a controversy with Archbishop Hughes on account of his efforts to divest Roman Catholic bishops of the power to hold real estate in trust for the Church; Assemblyman and Democratic leader 1878-79 and 1881. D. Nov. 25, 1886.

Brooks, JAMES: editor and politician; b. in Portland, Me., Nov. 10, 1810; graduated at Waterville in 1831. He was educated by his own industry. He studied law with John Neal the novelist; taught school, and at the same time engaged in political journalism. When twenty-one years of age he was elected to the State Legislature, and in the following year became a newspaper correspondent at Washington. He afterward traveled in the South and in Europe. In 1836 he established the *New York Express*. He was a member of Congress 1849-53, 1865-67, his seat being at last successfully contested by Hon. W. E. Dodge, and 1869-73. He was one of the leaders of the Know-nothing party, and during the war a peace Democrat; was censured in Congress for participation in the *Crédit Mobilier* corrupt practices. D. in Washington, Apr. 30, 1873.

Brooks, JOHN, M. D., LL. D.: b. in Medford, Mass., May 31, 1752; practiced medicine at Reading; fought with the greatest honor as an officer at Lexington, White Plains, Saratoga, Monmouth, etc., becoming a colonel and adjutant-general. He practiced medicine at Medford, Mass., after the war, and was a member of the State convention which adopted the Federal Constitution. He was Governor of Massachusetts (1816-23), and president of the Massachusetts Medical Society (1817-25). D. Mar. 1, 1825.

Brooks, KENDALL, D. D.: b. in Roxbury, Mass., Sept. 3, 1821; graduated at Brown University 1841; Newton Theological Institute 1845; tutor in Columbian College 1841-43; pastor of the Baptist church at Eastport, Me., 1845-52; Professor of Mathematics and Natural Philosophy in Waterville College 1852-55; pastor at Fitchburg, Mass., 1855-65; editor of the *National Baptist*, Philadelphia, 1865-68; and president of Kalamazoo College, Michigan, 1868-87.

Brooks, MARIA GOWEN: poet; b. in Medford, Mass., about 1795. She was married young to a Mr. Brooks, a merchant of Boston. Her chief work is *Zophiel, or the Bride of Seven*, the first canto of which was published in 1825, and the complete poem in London in 1833, under the supervision of Robert Southey, who gave the author the sobriquet MARIA DEL OCCIDENTE (Maria of the West). D. at Matanzas, Cuba, Nov. 11, 1845.

Brooks, NOAH: journalist and author; b. at Castine, Me., Oct. 30, 1830. He has been engaged in newspaper work since 1850, first in Boston, afterward in California, Washington, and New York, where he was one of the editorial staff of the *Tribune* and the *Times*. In 1884-1893 he edited the *Daily Advertiser* of Newark, N. J. He has published a *Life of Abraham Lincoln* (1888) and a number of books for boys, such as *The Boy Emigrants* (1876) and *The Fairport Nine* (1881).

HENRY A. BEERS.

Brooks, PHILLIPS, D. D., Oxon.: author, preacher, and Bishop of Massachusetts; b. in Boston, Dec. 13, 1835; graduated at Harvard in 1855. He studied in the Episcopal Theological Seminary at Alexandria, Va.; was ordained in 1859; became the same year rector of the Church of the Advent in Philadelphia, and in 1862 of the Church of the Holy Trinity, where he remained until 1869, when he accepted the rectorship of Trinity church in Boston. In 1886 he was elected

in Philadelphia assistant bishop in Pennsylvania, but declined the office. Elected Bishop of Massachusetts on Apr. 30, 1891, he accepted the appointment, and was consecrated in his own church Oct. 14 of the same year. He published five volumes of sermons; *Lectures on Preaching*, delivered before the Divinity School of Yale College; several orations, short poems, carols, etc., all of which have been issued in repeated editions. He was a Broad Churchman, and was regarded in England and the U. S. as the greatest preacher of his Church. He was a man of noble stature, rapid in utterance, averse to polemics, but a great spiritual leader. D. in Boston, Mass., Jan. 23, 1893. A statue of Bishop Brooks is to be erected in Copley Square, Boston, overlooking the scenes of his rectorate at Trinity church. Three of Bishop Brooks's brothers entered the Episcopal Church ministry.—FREDERICK: b. in Boston, Mass., Aug. 5, 1842; graduated at Harvard 1863; studied theology at the Episcopal Divinity School, Philadelphia; ordained in 1866; was rector of churches in Des Moines, Ia., and Cleveland, O.; drowned by stepping through an open draw at night in the bridge over Charles river, Boston, Sept. 15, 1874. Posthumous volume of sermons (1875), with introduction by Phillips Brooks.—ARTHUR: b. in Boston, June 11, 1845; graduated at Harvard 1867; studied theology in Andover and Philadelphia; took orders in 1870; rector in Williamsport, Pa., of St. James's church, Chicago, and of the Church of the Incarnation, New York, 1875. D. at sea July 10, 1895. He published *Sermons* (1886; English ed. *Christ for To-day*).—JOHN CORCORAN: b. in Boston, Aug. 29, 1849; graduated at Harvard 1872; studied theology at Andover and Philadelphia; ordained 1875; rector in Bristol, Pa., 1876; Providence, R. I., and of Christ church, Springfield, Mass., 1878.

Brooks, WILLIAM KEITH, Ph. D.: b. in Cleveland, O., Mar. 25, 1848; graduated from Williams College 1870; took the degree Ph. D. at Harvard University 1874; was assistant in the Boston Society of Natural History 1874-75; became associate of Johns Hopkins University 1876; and in 1883 Professor of Morphology there. Dr. Brooks is a member of the National Academy of Sciences and of several foreign scientific societies. In 1878 he organized the Johns Hopkins summer marine laboratory, which has won a reputation for itself by the class of students who study there, and the publications which are the result of their work. His most important works are *Handbook of Invertebrate Zoölogy* (1881, 400 pp., 300 cuts); *Heredity* (1883, 300 pp.); and *The Development and Protection of the Oyster in Maryland* (192 pp. quarto, 13 plates, 3 charts, 1884). Besides these, he has published *Leucifer, a Study in Morphology* (1881), and a monograph on *Stomatopoda* (1886) in *Transactions of the London Royal Society*, and other papers on marine forms.

Brooks, WILLIAM THOMAS HARRAUGH: soldier; b. in New Lisbon, O., Jan. 28, 1821; graduated at West Point in 1841; major Eighteenth Infantry Mar. 12, 1862; and Sept. 28, 1861, brigadier-general U. S. volunteers. He served in the Florida war 1841-42; on frontier duty 1843-45; in the military occupation of Texas 1845-46; in the war with Mexico 1846-48; was engaged at Palo Alto, Resaca de la Palma, Monterey (brevet captain), Vera Cruz, Cerro Gordo, Contreras, Churubusco (brevet major), and the city of Mexico, as aide-de-camp to Brevet Maj.-Gen. Twiggs 1848-51; in active operations in New Mexico in 1868, and engaged in several skirmishes against the Navajos. In the civil war he served in the Virginia Peninsula campaign 1862; engaged at Yorktown, Golden's Farm, Savage Station (wounded), and Glendale in the Maryland campaign 1862; engaged at Crampton Pass and Antietam (wounded); commanded division in the Rappahannock campaign 1862-63; in command of the department of the Monongahela 1863-64, when Pittsburg was threatened by a raid; in command of the Tenth Corps before Richmond 1864; engaged at Swift's Creek, Drury's Bluff, Bermuda Hundred, Cold Harbor, and the siege of Petersburg. Failing health from exposure and wounds caused him to resign from the army, July 11, 1864, and in 1866 he retired to a farm in Huntsville, Ala., where he resided till his death, July 19, 1870.

Brookville: town; on railroad; capital of Franklin co., Ind. (for location of county, see map of Indiana, ref. 8-G). It has great water-power, paper-mills, flouring-mills, etc., and contains Brookville College. Pop. (1880) 1,813; (1890) 2,028.

Brookville: borough and capital of Jefferson co., Pa.; on railroad and on Red Bank creek (for location of county, see

map of Pennsylvania, ref. 3-C). Pop. (1880) 2,136; (1890) 2,478.

Broom: any one of several shrubs of the family *Leguminosæ*. They belong to the allied genera of *Spartium*, *Genista*, and *Cytisus*. The common broom of Europe (*Cytisus scoparius*) grows on dry and sandy soils and heaths, and bears handsome yellow flowers. The branches, which are very tough and angular, are used for making brooms. The young tops and seeds, being strongly diuretic, are used in medicine, and are beneficial in dropsy. All kinds of broom have long, slender branches. The Spanish broom (*Spartium junceum*) grows wild in the south of Europe, and possesses medical properties like the common broom. The fiber of its branchlets is used in Italy and Spain for making cloths and ropes. The *Cytisus albus*, or white broom, also a native of Europe, is cultivated in England as an ornamental shrub, and bears white flowers which are much admired. It sometimes attains a height of 15 feet or more. The broom (Fr. *genêt*) gave name to the royal family of Plantagenet, one of its ancestors having the broom for his crest.

Broom-corn: a plant of the order *Graminæ*; native of the East Indies; cultivated in the U. S. It is a variety of the same species which produces sugar-cane, durra-corn, and other plants (*Sorghum saccharatum* or *Saccharum officinarum*). It has a jointed stem, which grows to the height of 8 or 10 feet, and bears spikelets, two and three together, on the ramifications of an open panicle. Only the middle or terminal one of these is fertile; stamens three. The panicle is extensively used in the manufacture of brooms. It is stated that this plant was first introduced into the U. S. by Dr. Franklin, who, finding a seed on a whisk that had been imported, planted it and propagated it. It succeeds best in alluvial soils, but will generally produce a fair crop on any land that is adapted to maize. Broom-corn is largely cultivated in the Mohawk Valley of New York, in Nebraska and Kansas, and other regions. It is planted in rows about 3 feet apart, and in hills about 18 inches apart. The average produce of an acre is about 500 lb. of the brush or material for brooms. The brush, or stems of the panicle, grow straighter if the panicle stands in a horizontal or drooping position. The stalks are therefore broken over when the panicle is nearly full grown, at a point a foot or a foot and a half below the head. Two rows are ordinarily broken toward each other. This operation is called "tabling." The seed of broom-corn is often fed to chickens, but it has comparatively little value. The brush is not harvested until the seed is nearly ripe, and by this time the herbage is so hard that it has little value for fodder. Revised by L. H. BAILEY.

Broome, Sir FREDERICK NAPIER, K. C. M. G.: British colonial statesman and author; b. in Canada, 1842; educated at Whitechurch Grammar School, Shropshire, England; emigrated to New Zealand 1857; returning to England, was on the staff of *The Times* 1869-73; colonial secretary of Natal 1875; of Mauritius 1877; lieutenant-governor of Mauritius 1880. As governor of Western Australia, 1882-90, he did much to promote the interests of the colony. Besides contributions to magazines, he was author of *Poems from New Zealand* (1868) and *The Stranger of Seriphos* (1869). D. in England, Nov. 26, 1896.

Broome, JOHN L.: lieutenant-colonel U. S. M. C.; b. Mar. 8, 1824, in the State of New York; was appointed a second lieutenant in the marine corps Jan. 12, 1848. He served with the marine battalion in Mexico during the Mexican war. While in command of the marine guard of the Hartford during 1862 and 1863 he participated in the attacks on Forts St. Philip and Jackson and capture of New Orleans, and in all the many actions of that famous vessel in the waters of the Mississippi. Retired Mar. 8, 1888.

Brosböll, brosböll, JONAS CARL CHRISTIAN: Danish novelist; b. in Fridericia, Aug. 7, 1820. Under the pseudonym *Carit Ellar* he published many volumes of novels and tales, as well as some poems and dramas. His best stories are scenes either from Danish history or from peasant-life in Jutland. His works were collected in twenty-four volumes (*Skrifter*, 1859-68); an additional collection (*Ny Samling*) appeared 1873-79 (five volumes), and a new edition of his works was published in 1887, ff. G. L. K.

Brother Jonathan: See TRUMBULL, JONATHAN.

Brothers of the Christian Schools: an order in the Roman Catholic Church; founded in 1679 at Rheims by the Abbé La Salle, and confirmed in 1725 by Benedict XIII. Its members are not allowed to enter the priesthood. They

devote themselves to teaching, and especially to the instruction of the poor, mostly in rudimentary branches, but sometimes in more advanced studies. They are numerous in France, Ireland, Italy, the U. S., and most other countries.

Brough, JOHN: b. in Marietta, O., Sept. 17, 1811; was a printer in his youth; studied at Ohio University. He edited several political journals; became a powerful Democratic orator; held important public offices. In 1846 he became a lawyer. In 1848 he left political life for a time to preside over a railroad. In 1864 he became Governor of Ohio, receiving the joint vote of all parties who were in favor of prosecuting the war against the insurgent States. D. in Cleveland, Aug. 29, 1865.

Brougham, broō'am, HENRY, Lord; orator, lawyer, and writer; b. in Edinburgh, Scotland, Sept. 19, 1779. His mother was a niece of Dr. Robertson, the historian. He graduated in the University of Edinburgh, studied law, and was admitted to the Scottish bar in 1800. He was intimate with Francis Jeffrey and Sydney Smith, whom he aided in founding the *Edinburgh Review* in 1802, and he continued to contribute to that review for many years. In 1808 he removed to London, and was called to the English bar. He became a Whig member of Parliament in 1810, and soon acquired a high reputation as a debater as well as a forensic pleader. As a parliamentary orator he was distinguished for vehemence and energy, and the rather free use of sarcasm and invective. He represented Winchelsea from 1816 to 1830. Among his famous performances as an advocate was his defense of Queen Caroline (1821), by which he gained great popularity. He distinguished himself as a promoter of popular education, as a reformer of laws, and a friend of political reform and progress. In 1825 he published *Practical Observations on the Education of the People*. He took a prominent part in founding the Society for the Diffusion of Useful Knowledge, of which he became in 1827 the first chairman. He made a powerful speech against slavery in 1830, soon after which he was returned to Parliament by the great popular constituency of Yorkshire. In the same year he was appointed Lord Chancellor in the new Whig ministry, and was raised to the peerage as Baron Brougham and Vaux. He retired from office with his colleagues in Nov., 1834, after which he ceased to act with the Whigs, without joining any other party, but pursued an independent political course.

Among his writings are a *Treatise on the Objects, Advantages, and Pleasures of Science*; *Sketches of Statesmen of the Time of George III.* (3 vols., 1839-43); *Political Philosophy* (3 vols., 1840-44). He died at Cannes, in France, May 9, 1868. He had published an edition of his collected works in 10 vols., 1857. See Lord Campbell's *Life of Lord Brougham*.

Brougham, JONAS: actor and playwright; b. in Dublin, Ireland, May 9, 1810; educated to be a surgeon, but reversed led to a change of plan, and he entered the stage at the Tottenham theater, London, in 1830. Afterward he was engaged by Madame Vestris to act in her stock company at the London Olympic theater. His first dramatic composition was a burlesque, written for William E. Burton. It succeeded, and he wrote many similar pieces of a light description. It was at this period that he wrote, in conjunction with Dion Boucicault, the comedy of *London Assurance*. A little later he undertook the management of the London Lyceum, and for this stage he wrote several plays.

In 1842 Brougham removed to the U. S.; acted at the Park theater, and made a professional tour of the theatrical cities of the U. S. He then settled down as a member of the stock company of Burton's theater, New York. Here he wrote *Vanity Fair*; *The Irish Yankee*; *Benjamin Franklin*; *The Irish Emigrant*; a dramatization of *Dombey and Son*; and other dramas. He then undertook the management of Niblo's Garden. On Dec. 23, 1850, he opened Brougham's Lyceum, which afterward became Wallack's theater. Brougham did not keep it long, but while there he wrote, among other pieces, a dramatization of *David Copperfield*, and a new version of *The Actress of Padua*. His next venture was made at the Old Bowery theater (1856-57), where he produced *The Pirates of the Mississippi*; *The Red Musk*; *Tom and Jerry in America*; *The Miller of New Jersey*, all dramas of a common sort, but profitable. Then he accepted an engagement at Wallack's theater, and while there he wrote a version of *Bleak House*; *Pocahontas*; *The Ruling Passion*; and *Playing with Fire*. A little later he left Wallack's and rejoined Burton at the Metro-

politan theater, and here he produced his burlesque of *Columbus*.

In 1861-62 Brougham went to London, where he remained upward of four years. During this time he wrote *The Duke's Motto* and *Bel Demonia*, and dramatic versions of two novels by Miss M. E. Braddon called *Lady Audley's Secret* and *Only a Clod*.

In 1869 he opened Brougham's theater, in Twenty-fourth Street, New York. His management in this house was of short duration. His last appearance on the stage occurred on Oct. 25, 1879, at Booth's theater, New York. He was one of the founders of the Lotus Club, of New York, and for some time its president.

Brougham started in New York a comic paper called *The Lantern*, and he was author of two volumes of miscellaneous writings entitled *A Basket of Chips* and *The Bunsby Papers*. He was separated from his first wife in 1845. His second wife, Miss Nelson, whom he wedded in 1847, died in 1870. D. at New York, June 7, 1880.

Revised by B. B. VALLENTINE.

Broughton, RHODA; novelist; b. at Segwyd Hall, Denbighshire, Wales, Nov. 29, 1840. Among her novels are *Not Wisely, but Too Well* (1867); *Cometh up as a Flower* (1867); *Red as a Rose is She* (1870); *Good-bye, Sweetheart* (1872). Miss Broughton has lived much at Oxford, the scene of her novels *Belinda* (1883) and *Doctor Cupid* (1886).

HENRY A. BEERS.

Broussa, or **Brussa** (anc. *Prusa ad Olympum*); a city of Asia Minor, in Anatolia; pleasantly situated at the north base of Mt. Olympus; about 60 miles S. by E. from Constantinople (see map of Turkey, ref. 4-E). It is on a beautiful and fertile plain, and presents a magnificent external appearance, having more than 200 mosques and minarets, some of which are very handsome. The streets are narrow, but are kept clean by running water. Here are many colleges and schools, several Armenian churches, and large bazaars supplied with European goods. Broussa is one of the most commercial cities in Asiatic Turkey, and raw silk is the chief article of export. It has manufactures of silk, satin, gauze, cotton cloths, and tapestry. The silks of Broussa are highly esteemed in the European markets. A superior article of China was formerly manufactured here, but the art is now lost. Here are warm mineral springs which were celebrated in ancient times. *Prusa* was the capital of ancient Bithynia. It was taken by the Turkish Sultan Orkhan in 1326, after which it was the capital of the Turkish empire until 1453. Feb. 28, 1855, the town was nearly destroyed by an earthquake. Pop. reported 37,500 in 1885, but since the Russo-Turkish war it has grown rapidly, and was (1891) estimated at 100,000.

Broussais, broo'say', FRANÇOIS JOSEPH VICTOR; physician; b. in Saint-Malo, department of Ille-et-Vilaine, France, Dec. 17, 1772; educated in the public school of Dinan and under the supervision of his father, who was a country physician. On the outbreak of the Revolution he joined the army as a volunteer, but was discharged on account of sickness; studied medicine; obtained a commission as surgeon, first on a ship of war, afterward at Brest, and went in 1799 to Paris to pursue a regular course of medicine. In 1801 he was appointed military surgeon to the camp of Boulogne, and accompanied this division of the French army till 1808. After the publication in that year of his *Histoire des Phlegmasies chroniques*, he was made chief physician to one of the divisions of the French army in Spain, and remained there till 1814. After the end of the war he was made assistant professor at the military hospital of the Val de Grâce in Paris; published in 1816 *Examen de doctrine médicale généralement adoptée*; in 1824 *Traité de la physiologie appliquée à la pathologie*; in 1829 *Commentaires des propositions de pathologie consignés dans l'examen*; in 1832 *Le cholera morbus épidémique*, and was in the same year appointed Professor of General Pathology in the Academy of Medicine, which office he held till his death, Nov. 17, 1838. He was the founder of the physiological system of medicine.

Brousson, broo'son', CLAUDE; b. in Nîmes, France, in 1647; studied law, and was a celebrated advocate in Toulouse when the persecutions began against the Huguenots, to whose sect he belonged. After the Revocation of the Edict of Nantes in 1685, when the churches of the Huguenots were interdicted, their ministers exiled, and their books burnt, Brousson assembled from time to time his co-religionists in his house, and endeavored to uphold their courage and strengthen their power of resistance. These reunions

caused finally a popular outbreak in Toulouse, and Brousson was compelled to flee to Switzerland. Here he was consecrated to the ministry, and although the governor of the province of Languedoc put a price of 10,000 livres on his head, he returned to France, and lived up to 1693 as an itinerant priest in the Cévennes, where he preached in the caves and crags to those who gathered around him, forming the famous *assemblées du désert*. After a short residence in the Netherlands, he re-entered France by the way of the Jura Mountains, and began once more to preach in the Cévennes, but was caught, brought to Montpellier, tried on a charge of co-operating with Count Schomberg in a scheme of invading France, and broken on the wheel Nov. 4, 1698. His influence, both as a preacher and a writer, was very great, and he is considered one of the martyrs of the French Reformed Church. He wrote *L'état des réformés de France* (3 vols., The Hague, 1684); *Lettres au clergé de France* (1685); *Lettres des Protestants de France à toutes les autres Protestants de l'Europe* (Berlin, 1688); *Lettres aux Catholiques romains* (1689); *Relation sommaire des merveilles que Dieu fait en France dans les Cévennes* (1694); *La manne mystique du désert* (published in 1695 by the synod of Harlem), etc.

Broussone'(tia); a genus of trees allied to the mulberry. It comprises the paper mulberry (*Broussonetia papyrifera*), the fibrous bark of which is used by the Chinese and Japanese in the manufacture of paper. It is a small tree with deciduous leaves of variable shape. It is planted as a shade tree in some American cities.

Brown (in Fr. *brun*); in painting, a dark dusky color, inclined to red, of various degrees of depth. It belongs to the tertiary colors known as russets and olives, in which the hue is modified by an admixture of black or a dark pigment. Among the brown pigments are bistre, umber, raw and burnt sienna, and brown madder.

Brown, AARON VENABLE; statesman; b. in Brunswick co., Va., Aug. 15, 1795; graduated at Chapel Hill in 1814; removed to Tennessee in 1815; partner of James K. Polk; member of Congress 1839-45; and was elected Governor of the State in 1845. He became Postmaster-General of the U. S. in 1857 under Buchanan. D. in Washington, D. C., Mar. 8, 1859.

Brown, BENJAMIN GRATZ; b. in Lexington, Ky., May 28, 1826; graduated at Yale in 1847. He began the practice of law at St. Louis, Mo.; was a member of the State Legislature (1852-58); edited the *Missouri Democrat* (1854-59). On the breaking out of the war in 1861 he raised a regiment and fought on the side of the Union; afterward commanded a brigade of militia. He was among the most active and influential in procuring the adoption of the ordinance of freedom in 1864 by the State of Missouri. He was U. S. Senator in 1863-67, and was made Governor of Missouri in 1871. He was nominated at the Cincinnati convention, May, 1872, for the office of Vice-President of the U. S., Horace Greeley being the nominee for President. D. in St. Louis, Dec. 13, 1885.

Brown, CHARLES BROCKDEN; novelist, and the first professional man of letters in the U. S.; b. in Philadelphia, Jan. 17, 1771. His life was spent in New York and Philadelphia, where he edited *The Literary Magazine and American Register* (1803-08). His romances, *Wieland* (1798), *Ormund* (1799), *Edgar Huntley* (1799), *Arthur Mervyn* (1800), *Jane Talbot* (1801), and *Clara Howard* (1801), are weird and mysterious, dealing with the phenomena of sleep-walking, ventriloquism, etc. D. Feb. 22, 1810. See Prescott's *Life of C. B. Brown*, in Sparks's *American Biography*, vol. i.; W. Dunlap's *Life of Charles B. Brown*, prefixed to an edition of his works (1827); C. I. Stevenson's *Life*, announced (1893).

HENRY A. BEERS.

Brown, FORD MADDOX; decorative and genre painter; b. of English parents at Calais, France, Apr. 16, 1821; pupil of the academies of Bruges and Antwerp. Notable among his works is a series of frescoes in the town-hall of Manchester, illustrating the history of the city. He generally held aloof from public exhibitions. D. in London, Oct. 6, 1893.

WILLIAM A. COFFIN.

Brown, FRANCIS, D. D.; b. in Chester, N. H., Jan. 11, 1784; graduated at Dartmouth College in 1805; tutor from 1806 to 1809; settled over the Congregational church in North Yarmouth, Me., in 1810; chosen president of his alma mater in 1815. It was during his presidency that the famous Dartmouth College case was carried up to the U. S.

Supreme Court. Jeremiah Mason and Daniel Webster admired the ability with which he served them in their management of the case, which was won for him, and he was reinstated as college president in 1819. D. July 17, 1820.

Brown, FRANCIS, Ph. D., D. D.: grandson of Francis Brown; b. in Hanover, N. H., Dec. 26, 1849; graduated at Dartmouth College in 1870; tutor there 1872 to 1874; graduated at the Union Theological Seminary in 1877; spent two years in Germany; in 1879 was appointed instructor, in 1881 Associate Professor, in Biblical Philology in the Union Theological Seminary, New York; in 1890 was transferred to the chair of Hebrew and the Cognate Languages. He edited Lenormant's *The Beginnings of History* and (with Dr. R. D. Hitchcock) the *Teaching of the Twelve Apostles*. He wrote *Assyriology, its Use and Abuse in Old Testament Study* (1885). Revised by GEORGE P. FISHER.

Brown, GEORGE: commodore U. S. navy; b. June 19, 1835, in Indiana; entered the navy as a midshipman Feb. 5, 1849. He was in command of Admiral Porter's flag-ship, the *Octorora*, at the attack on Vicksburg, June 28, 1862. On the night of Feb. 24, 1863, Brown, in the steamer *Indianola*, defended his vessel for an hour and twenty-seven minutes against the rams *Queen of the West* and *William H. Webb*, and two large "cotton-clads," surrendering the *Indianola* only when she was fast filling with water. He commanded the steamer *Itasca* at the battle of Mobile Bay, Aug. 5, 1864, and during the subsequent operations against the defenses of Mobile. On Jan. 25, 1890, he was assigned to the command of the Pacific station, with the rank of rear-admiral while holding that command.

Brown, GEORGE: Canadian statesman; b. in Edinburgh, Scotland, Nov. 29, 1818. He was educated in his native city, and in early manhood removed with his parents to New York. In 1843 he proceeded to Toronto, and in 1844 established the *Globe* newspaper, which has been ever since the leading Liberal paper of Canada. He entered Parliament in 1852; formed the Brown-Dorian administration Aug. 2, 1858, but resigned with his colleagues after holding office for a few days in consequence of adverse vote passed by the Assembly. He was leader of the Reform section of the coalition government from 1864 till 1865, when he resigned owing to the policy of the Government relative to a reciprocity treaty with the U. S. He was a delegate to the Charlottetown conference in 1864; to that at Quebec the same year; went to London on public business in 1865; and to Washington in 1874 as joint plenipotentiary with Sir Edward Thornton to negotiate a commercial treaty with the U. S. On Mar. 25, 1880, he was shot in the leg by a discharged employe, and died in consequence May 9 following. See Hon. Alexander Mackenzie's *Life and Speeches of the Hon. George Brown* (Toronto, 1882).

NEIL MACDONALD.

Brown, GEORGE LORING: landscape-painter; b. in Boston, Mass., Feb. 2, 1814; pupil of Washington Allston, and Isabey, Paris. Most of his works are owned in Boston and vicinity. His *Crown of New England* was purchased by the Prince of Wales when he visited the U. S. in 1860, and his *Bay of New York* was presented to the Prince of Wales in the same year by a number of New York merchants. Studio at Malden, near Boston. W. A. C.

Brown, GEORGE WILLIAM: jurist; b. in Baltimore, Md., Oct. 13, 1812; graduated at Rutgers College in 1831. In 1867 he was a member of the Maryland constitutional convention, and from 1873 until 1888 was chief justice of that State. He was one of three compilers of the first *Digest of the Decisions of the Maryland Court of Appeals*. He was mayor of Baltimore at the time the mob of that city attacked the Sixth Massachusetts Regiment on its way to the defense of Washington, Apr. 19, 1861. D. at Lake Mohonk, N. Y., Sept. 6, 1890. HENRY WADE ROGERS.

Brown, GOULD: grammarian and teacher; b. in Providence, R. I., Mar. 7, 1791; taught an academy in New York for twenty years. He published *Institutes of English Grammar* (1823) and *Grammar of English Grammars* (1850). D. in Lynn, Mass., Mar. 31, 1857.

Brown, HARVEY: soldier; b. in Rahway, N. J., in 1795; graduated at West Point in 1818; colonel Fifth Artillery May 5, 1861. He served chiefly at seaboard posts 1818-61; as aide-de-camp to Maj.-Gen. Brown 1824-25; on quartermaster duty 1826-29; in the Black Hawk expedition 1832; in the Florida war 1836-38; engaged at Wahoo Swamp; suppressing Canada border disturbances 1839-41;

in the war with Mexico 1846-48; engaged at Monterey, Vera Cruz, Cerro Gordo, Contreras (brevet lieutenant-colonel), Molino del Rey, and the city of Mexico (brevet colonel); on recruiting service 1848-52; superintendent 1851-52; in Florida hostilities 1852-53; in command of the artillery school for practice 1857-58; inspector of artillery 1859-60. In the civil war he was engaged in the defense of Fort Pickens, Fla., 1861-62 (brevet brigadier-general); and as military commander of the city of New York, Jan. 15-July 16, 1863, suppressed the draft riots (brevet major-general). Retired from active service Aug. 1, 1863. D. at Clifton, Staten Island, N. Y., Mar. 31, 1874.

Brown, HENRY BILLINGS, LL. D.: jurist; b. in Lee, Mass., Mar. 2, 1836; graduated at Yale in 1856; studied law; removed to Michigan; became U. S. district judge in 1875; appointed associate justice of the Supreme Court of the U. S. in 1890, succeeding Samuel P. Miller.

HENRY WADE ROGERS.

Brown, HENRY KIRKE: sculptor and painter; b. in Leyden, Mass., Feb. 24, 1814. Among his best works are the equestrian statue of Washington in Union Square, New York; a colossal bronze statue of Gov. Clinton at Greenwood Cemetery; the *Angel of the Resurrection*, also at Greenwood; and a colossal equestrian statue of Gen. Winfield Scott. His statue of Gov. Clinton at Washington is perhaps the finest. He was the first American to use bronze in sculpture, made much portrait statuary, and was also a painter of no mean ability. D. in Newburg, N. Y., July 10, 1886.

Brown, JACOB: b. in Bucks co., Pa., May 9, 1775; removed to New York in 1798. He joined the army in 1812, and defended Sacket's Harbor in 1813. Having been raised to the rank of major-general, he invaded Canada in the spring of 1814, and commanded with success at Chippewa and Niagara Falls in July of that year. He became commander-in-chief of the U. S. army in 1821. D. in Washington, D. C., Feb. 24, 1828.

Brown, JAMES: merchant; b. in Providence, R. I., Mar. 22, 1698. He was in the third generation of descent from CHAD BROWN, who immigrated to New England in 1638; became pastor in succession to Roger Williams of the First Baptist church in Providence; was known as the "Peacemaker" of the colony, and died about 1665. James was the father of four sons who were benefactors of BROWN UNIVERSITY (*q. v.*), founders of the prosperity of Providence, and of a very wealthy family in Rhode Island. D. Apr. 27, 1739.—His son NICHOLAS; b. in Providence, July 28, 1729; d. there May 29, 1791. He was a zealous Baptist, and greatly increased his fortune by commerce.—The second son, JOSEPH; b. in Providence, Dec. 3, 1733; on acquiring a fortune, gave much time to mechanics and astronomy. He made observations of the transit of Venus in 1769, and published his observations; was Professor of Natural Philosophy in Rhode Island College from 1784; alone of the brothers became a communicant in the Baptist church; d. Dec. 3, 1785.

—JOHN; b. in Providence, Jan. 23, 1736; was the more enterprising of the house; opened trade with China and the East Indies; led the raid upon the British sloop of war *Gaspee*, 1772; imported and supplied ammunition to the army under Washington while at Cambridge; representative in the Sixth Congress; laid the corner-stone of Rhode Island College when it was removed to Providence; was its benefactor and treasurer from 1783; d. in Providence, Sept. 20, 1803.—MOSES, youngest of the brothers; b. in Providence, Apr. 4, 1738; had mercantile experience in the family business; withdrew in 1773; became a Quaker, a patron of Friends' schools, and an abolitionist; d. in Providence, Sept. 6, 1836.—NICHOLAS, who bore his father's name (as above); b. in Providence, Apr. 4, 1769; is the member of the family for whom Rhode Island College in 1804 changed its name to Brown University. Inheriting wealth and a trading business, he took his brother-in-law into partnership, and thus formed the powerful house of Brown & Ives, now engaged in textile manufactures. He took some representative part in Whig politics, gave about \$100,000 to the college, endowed the Providence Athenaeum and an insane asylum; d. in Providence, Sept. 27, 1841.—His son was JOHN CARTER BROWN; bibliophile; b. in Providence, Aug. 28, 1797; graduated at Brown University 1816; partner in his father's business; gathered a library of Americana prior to 1800, rich in Canadian, New England, Spanish, and Portuguese documents and books; celebrated among scholars for its completeness; catalogued by J. R. Bartlett (4 vols., 1871). Mr.

Brown gave \$160,000 to Brown University, chiefly for library equipment. D. in Providence, June 10, 1874.

Brown, JAMES ALLEN, D. D., LL. D.: Lutheran divine; b. of Quaker parentage, in Lancaster co., Pa., Feb. 19, 1821; graduated at Pennsylvania College, Gettysburg, 1842; pastor in Baltimore, Md., and Reading, Pa.; Professor of Systematic Theology, Newberry, S. C., 1859-61, and at Gettysburg, Pa., 1864-79; author of *The New Theology* (1857), and editor of *Quarterly Review of Lutheran Church* (1870-79). D. in Lancaster, Pa., June 19, 1883.

HENRY E. JACOBS.

Brown, J. APPLETON: landscape-painter; b. at Newburyport, Mass., July 24, 1844; pupil of Benjamin C. Porter, Boston, and of Lambert in France; member of the Society of American Artists 1892. His pictures of springtime are sympathetically treated, and his landscape work in general is noteworthy on account of its delicate and tender color. Most of his artistic career has been passed in Boston, but he removed to New York in 1891.

W. A. C.

Brown, JAMES BALDWIN: Congregationalist; b. in London, England, Aug. 19, 1820; d. in London, June 23, 1884. He graduated at University College, London, 1839. He first studied law and afterward theology. He became a minister at Derby (1843), and then was pastor in London, in the Clapham Road (1846). From there he removed with his congregation to Brixton (1870). He had great influence in the Christian communion to which he belonged. He was a prolific author on a variety of theological and ecclesiastical topics. One of his principal works is *The Doctrine of Annihilation in the Light of the Gospel of Love* (London, 1875; 2d ed. 1878).

GEORGE P. FISHER.

Brown, JOHN: a religious writer; b. at Carpow, in Perthshire, Scotland, in 1722. He studied theology under Ebenezer Erskine, of Stirling, in connection with the Associate Burgher Synod, and in 1751 became pastor of the Associate congregation at Haddington, and so remained till his death. He had a high reputation for piety and learning. It is stated that he knew nine languages. Among his works are a *Dictionary of the Bible* (Edinburgh, 1769) and a *Self-interpreting Bible* (1778, 2 vols.). D. in Haddington, June 19, 1787.

Brown, JOHN, M. D.: a physician; author of the Brunonian system of medicine; was born in Bunkle parish, Berwickshire, Scotland, in 1735. He published in 1780 *Elementa Medicinæ*, in which he propounded his new system, in which diseases were classified as the consequence of an excess or deficiency of excitement, or as sthenic and asthenic. This was received with favor by many physicians. His favorite medicines were alcohol and opium. D. in London, Oct. 17, 1788.

Brown, JOHN: patriot; b. in Sandisfield, Mass., Oct. 19, 1744; graduated at Yale in 1761; became king's attorney in the New York colony; afterward practiced law at Pittsfield, Mass. In 1774 and 1775 he operated for the cause of freedom in Canada; aided in the capture of Ticonderoga; took Fort Chambly; fought at Quebec; became a lieutenant-colonel; and in 1777 surprised the outposts at Ticonderoga, and made important captures. He was killed by the Indians in the Mohawk Valley campaign, Oct. 19, 1780.

Brown, JOHN, M. D.: physician; a son of Rev. Dr. John Brown, of Haddington (1784-1858); b. in Biggar, Scotland, Sept. 22, 1810. He practiced in Edinburgh, and published *Horæ Subsecivæ* (1858), containing the well-known *Our Dogs, Rab and his Friends*, and *John Leech and Other Papers* (1882). He wrote but little, and only of animals and things he loved. Pathos and humor are his characteristics. He suffered much from periods of depression. D. in Edinburgh, May 11, 1882.

Brown, JOHN, of Ossawatimic: a zealous opponent of slavery; b. in Torrington, Conn., May 9, 1800. He removed to Ohio in early youth, married, and worked at the trade of a tanner. His life was always unsettled and adventurous, but as upright and resolute as an old Covenanters. He was twice married and had twenty children, and the whole family made sacrifices to sustain his enterprises. In 1855 he emigrated to Kansas, where he fought against the pro-slavery party, and lived at Ossawatimic. His house was burned and a son killed in the border wars of Kansas, and he made bloody reprisals. He was the master-spirit of the convention which met at Chatham, Canada, in May, 1859, and organized an invasion of Virginia in order to liberate the slaves. In July of that year he rented a farmhouse

about 6 miles from Harper's Ferry. On Oct. 16, aided by twenty-two associates, of whom six were Negroes, he surprised Harper's Ferry, and captured the arsenal and armory. He and his party were overcome the next day by a detachment of U. S. troops, and Brown and his surviving followers were given up to the State authorities for trial. He was hanged at Charlestown, Va., Dec. 2, 1859, exhibiting great serenity and elevation of mind. His adventure was influential in disclosing and intensifying the feeling between the North and the South, and a popular song concerning him was an inspiring tune in all the Union camps during the civil war. See Redpath, *Life of Captain John Brown* (1860), and the fuller work of F. B. Sanborn, *Life and Letters of John Brown* (1885).

Brown, JOHN G.: genre-painter; b. at Durham, England, Nov. 11, 1831; pupil of the Academy at Edinburgh, Scotland, and afterward, when he removed to the U. S., studied in the schools of the National Academy, New York, in 1853; National Academician 1863; honorable mention, Paris Exposition, 1889. The subjects of his works are scenes of country life and single figures. His portrayals of the New York bootblacks and street urchins are widely known and very popular. He is president of the American Water-color Society, and paints skillfully in oil and in water-color. Studio in New York.

WILLIAM A. COFFIN.

Brown, JOHN HENRY HOBART, D. D.: first Protestant Episcopal bishop in Fond du Lac, Wis.; b. in New York city, Dec. 1, 1831; graduated at the General Theological Seminary 1854; took orders 1855; served parishes in New York State; consecrated bishop Dec. 15, 1875; d. at his see May 2, 1888.

Brown, JOHN LEWIS: French painter of genre and outdoor life, principally hunting scenes; b. at Bordeaux, Aug. 16, 1829. He became identified with the impressionists, and his pictures give evidence of careful and artistic observation and talent in the representation of atmospheric effects. Pupil of Roqueplan and of Belloc; first-class medal, Paris Exposition, 1889; Legion of Honor 1870. Studio in Paris, d. in 1892.

W. A. C.

Brown, JOSEPH EMERSON, LL. D.: statesman; b. in Pickens co., S. C., Apr. 15, 1821; educated at Calhoun Academy, S. C., and in law at Yale College 1846; settled in Canton, Ga.; engaged in politics and served in the Legislature; superior court judge of Blue Ridge circuit 1855; elected Governor in 1857 and for three succeeding terms; as war Governor of Georgia seized the Savannah forts before his State seceded; disputed with Mr. Davis the Confederate conscription laws; opposed Sherman's march through Georgia with 10,000 recruits gathered from exempt classes, but refused to send them out of the State; prisoner of war in 1864; acquiesced in reconstruction laws, and supported Grant for the presidency at the cost of popularity at home; chief justice of Georgia 1868; president of Western and Atlantic R. R. from 1870; U. S. Senator in 1880 to fill vacancy caused by resignation of Gen. Gordon; retained in the Senate by the Legislature until 1890, when he declined re-election; gave \$50,000 to Southern Baptist Theological Seminary, and as much more to the Georgia State University. D. in Atlanta, Ga., Nov. 30, 1894. See his *Life and Times*, by H. Fielder (Springfield, Mass., 1883).

Brown, ROBERT: founder of the Brownist sect, or INDEPENDENTS (*q. v.*); b. in Tothorpe, Rutlandshire, England, about 1550; probably graduated at Corpus Christi College, Cambridge, 1574; taught school in Southwark, and preached in the fields; went to Norwich and organized a Congregational church in 1581, publishing his views of church polity; took refuge in Holland and distributed tracts in England, for which two men were hanged; tried for heresy in Scotland 1583; preached in Northampton; got into jail for it; was excommunicated by the Bishop of Peterborough, having never separated entirely from the establishment; conformed in 1591, and for forty years was rector of Achurch-en-Thorpe, diocese of Peterborough; left treatises, of which three are extant, teaching Congregationalism as practiced in the U. S.; said he had been "in thirty-two dungeons"; d. in 1633, and, it is reported, in Northampton jail.

Brown, ROBERT, M. A., Ph. D.: traveler and scientist; b. in Campster, Caithness, Scotland, Mar. 23, 1812; studied at Edinburgh, Leyden, Copenhagen, and Rostock; visited Jan Mayen, Spitzbergen, Greenland, and western shore of Baffin's Bay (1861); the Pacific islands, Alaska, Venezuela, and Bering seacoast and Vancouver (1863-66); Greenland

a second time and North Africa since 1867; removed to London, 1876 in order to devote himself to literary work; member of numerous learned societies; author of twenty-six volumes, including *Peoples of the World* (6 vols.); *Countries of the World* (6 vols.); *Manual of Botany; Our Earth* (3 vols.); and *Science for All* (5 vols.); a large number of scientific memoirs, and some 3,000 articles and reviews in various languages. D. Oct. 26, 1895.

Brown, Robert, F. R. S., D. C. L.: botanist; b. at Montrose, Scotland, Dec. 21, 1773. He studied medicine in the University of Edinburgh and was naturalist to the expedition which Capt. Flinders conducted to Australia in 1801. In 1805 he returned with a collection of 4,000 species of Australian plants, and in 1810 he published a *Prodromus Florae Novae Hollandiae*. He also wrote *General Remarks, Geographical and Systematical, on the Botany of Terra Australis* (1814). His discovery of the gymnospermy of the conifers was published in 1825. In 1827 he became keeper of the botanical department of the British Museum. D. in London, June 10, 1858.

Brown, Sir Samuel: naval officer and civil engineer; b. in London, England, in 1776. He served on the sea in the Napoleonic wars; invented a method of manufacturing chain cables which led to their introduction into the navy; in 1819 built the first suspension bridge in England. Made a Hanoverian knight in 1838. D. in Blackheath, Mar. 15, 1852.

Brown, Samuel Gilman, D. D., LL. D.: son of President Francis Brown; b. in North Yarmouth, Me., Jan. 4, 1813; graduated at Dartmouth College in 1831, and at Andover Theological Seminary in 1837; traveled in Europe from 1838 to 1840; was professor in Dartmouth College, first of oratory and belles-lettres, from 1840 to 1863, then of intellectual philosophy from 1863 to 1867, and was president of Hamilton College from 1867 to 1881. Besides numerous addresses and articles in reviews, he published a *Biography of Self-taught Men* (1847) and *The Life of Hon. Rufus Choate* (1862). He also lectured on *British Orators*. D. in Utica, N. Y., Nov. 4, 1885.

Brown, Thomas, M. D.: metaphysician; b. in Kirkcubrightshire, Scotland, Jan. 9, 1778. He was a pupil of Dugald Stewart in Edinburgh. In 1798 he published a refutation of Darwin's *Zoönomia*. Having studied medicine, he graduated in 1803, and practiced medicine about seven years. In 1810 he was appointed colleague of Dugald Stewart as Professor of Moral Philosophy in the University of Edinburgh. He was very popular as a lecturer, and published *Lectures on the Philosophy of the Human Mind* (4 vols., 1820). His other chief work is *Observations on the Relation of Cause and Effect* (1805; 3d ed. enlarged, 1818). His chief contribution to psychology is an explication of the sixth or muscular sense. Died while on a visit in London, Apr. 2, 1820. See Dr. Welsh, *Account of the Life and Writings of Thomas Brown* (1825).

Brown, Thomas: English humorist; b. at Shifnal, in Shropshire, in 1663; educated at Christ Church, Oxford. He was a wag and miscellaneous scribbler, and his writings consist largely of satires, epigrams, lampoons, farces, and sketches of low life in London, such as *Amusements, Serious and Comical* (1700); *A Wall Round London and Westminster*. D. in London, June 16, 1704. HENRY A. BEERS.

Browne, Charles Farrar (known as *Artemus Ward*): humorous writer; b. at Waterford, Me., Apr. 26, 1834. He learned the business of a printer; removed to Ohio, and about 1858 began contributing to the *Cleveland Plaindealer* a series of humorous *Letters from Artemus Ward, Showman*. In 1860 he went to New York and joined the editorial staff of *Vanity Fair*. He became a popular lecturer; visited California in 1863 and London in 1866. D. at Southampton, England, Mar. 6, 1867. He published *Artemus Ward, his Book* (1862), and other works. See his *Complete Writings*, with biography, by M. D. Landon (New York, 1875).

Browne, Edward Harold, D. D., D. C. L.: Bishop of Winchester, England; b. at Aylesbury, Buckinghamshire, Mar. 6, 1811; educated at Emmanuel College, Cambridge, 1832; took orders in 1836; consecrated Bishop of Ely 1864; translated to Winchester 1873; resigned 1891. Bishop Browne took a great interest in the Old Catholic movement, and attended the Old Catholic congress at Cologne in 1872. He was a member of the O. T. Company of Revision of King James's Version. He was the author of *An Expo-*

sition of the XXXIX. Articles (2 vols., 1850-53; 13th ed. in 1 vol., 1887); *Sermons on the Abatement and other Subjects* (1859); *Messiah Foretold and Expected* (1862); *The Pentateuch and the Elohistic Psalms in reply to Bishop Colenso* (1863); *The Strife, the Victory, the Kingdom* (1872); *Position and Parties of the English Church* (1875); *Commentary on Genesis in the Speaker's Commentary*, together with numerous charges, addresses, etc. D. Dec. 19, 1891.

WILLIAM STEVENS PERRY.

Browne, Sir J. C.: See CRICHTON-BROWNE.

Browne, John Ross: Irish-American writer and traveler; b. in Ireland in 1817. Among his works are *Etchings of a Whaling Cruise* (1846) and *Yusef, or the Journey of the Fragi* (1853). He was minister to China in 1868-70. D. in Oakland, Cal., Dec. 9, 1875.

Browne, Samuel J.: b. in England, Mar. 19, 1788; became in 1798 a resident of Cincinnati, O., where he grew rich by investments in land. He was long a minister of the United Brethren, and afterward of the Presbyterians. D. in Harrison Junction, O., Sept. 10, 1872, leaving a large amount of money to found a church, a university, and a free school.

Browne, Sir Thomas, M. D.: English philosopher and writer; b. in London, Nov. 19, 1605. He practiced medicine at Norwich for many years; published, besides other works, *Religio Medici* (1642); *Inquiries into Vulgar and Common Errors* (1646); and *Urn Burial* (1658), all written in a quaint, highly latinized style, and displaying a most peculiar imagination. He was knighted by Charles II. in 1671. D. Nov. 19, 1682.

Browne, William: pastoral poet; b. at Tavistock, Devonshire, England, in 1591. He was educated at Exeter College, Oxford; afterward entered himself at the Inner Temple. His best-known works are *Britannia's Pastorals* (1613-16) and *The Shepherd's Pipe* (1614). D. about 1643.

HENRY A. BEERS.

Brownell, Henry Howard: b. in Providence, R. I., Feb. 6, 1820; graduated at Trinity College, Hartford, Conn., in 1841; wrote a number of popular histories; a volume of *Poems* (1847); *Lyrics of a Day* (1864); *War Lyrics* (1866). In the civil war he was a volunteer naval officer, serving on Farragut's staff. He lived mainly at East Hartford, where he died Oct. 31, 1872.

Brownell, Thomas Church, D. D., LL. D.: Bishop of Connecticut; b. at Westport, Mass., Oct. 19, 1779; graduated at Union College in 1804. He held various professorships in the college until 1816, when he took orders in the Protestant Episcopal Church. In 1819 he was consecrated Bishop of Connecticut, and was the first president of Trinity College, Hartford (1824-31). He was largely instrumental in providing liberal endowments for its professorships, and in securing important additions to its general fund. In 1852 he became presiding Bishop of the Protestant Episcopal Church in the U. S. He published an *Expositor of the New Testament: a Commentary on the Book of Common Prayer; Religion of the Heart and Life* (5 vols., 1839-40); *Consolation for the Afflicted; Christian's Walk and Consolation*; and several other works. D. in Hartford, Conn., Jan. 13, 1865. A bronze statue of the bishop stands on the campus of Trinity College, Hartford, the gift of his son-in-law, Gordon W. Burnham, of New York.

Brownian Movements (Pödesis): those movements seen with the microscope among minute particles (not living) in a liquid. Robert Brown, the botanist, first described them in 1827. These movements have often been mistaken for vital motions. When bacteria or other minute organisms in a solution are observed through a microscope they are found to be in motion. After the liquid has been sterilized by heat or otherwise, motion still goes on, but in a manner obviously different from that due to living organisms. The same phenomena can be exhibited by rubbing fine powder of gamboge, carmine, lampblack, or pumice-stone in water. Indeed, as Jevons has shown, all solid matter when very finely divided, and in suitable liquid, shows this motion. Beale considers of the same nature the motions of very minute bubbles ($\frac{1}{7000}$ of an inch in diameter) within certain crystals. These movements have not been satisfactorily explained. Beale suggests their possible connection with heat. See Jevons, *Quarterly Journal of Microscopy*, viii. (1878), p. 172; also Carpenter, *The Microscope*, 7th ed., p. 373.

E. L. NICHOLS.

Brownie: a spirit of the fairy order in the old superstitions of Scotland. The tradition is that he was a good-humored goblin, who attached himself to farmhouses, and occupied himself when the family were in bed in performing any work, such as churning, threshing, etc.—a spirit not seen or spoken to, and only known by the performance of voluntary labors. In Cornwall a goblin known as Brownie is called to assist at the swarming of bees.

Browning, ELIZABETH BARRETT: the greatest English poetess; b. in Carlton Hall, Durham, Mar. 6, 1806. Her father, Edward Moulton, took the name Barrett on the inheritance of some estates in Jamaica. She was liberally educated, and studied the Greek and Latin languages with success. She published in 1826 a volume entitled an *Essay on Mind, and other Poems*, and in 1833 translated from the Greek of Æschylus *Prometheus Bound*. Her health having been impaired by the rupture of a blood-vessel in 1837, she passed several years in seclusion. In 1846 she was married clandestinely to the poet Robert Browning, and went with him to reside in Italy. Among her poems are *The Searphim and other Poems* (1838); *The Ransom of the Page* (1839); *A Drama of Ecile* (1844); *Aurora Leigh* (1856); *Poems before Congress* (1860); and *Last Poems* (1861). Many of Mrs. Browning's poems, such as *Casa Guidi Windows* (1851), relate to Italy and the Italian aspirations for liberty and unity. *Aurora Leigh* (1856), in which she embodies her philosophy of life and art, is a novel in verse, dealing with contemporary thought in 12,000 lines of blank verse. *Sonnets from the Portuguese* (1850) contains some of the finest love poetry in the language, and is not, in fact, a translation, as the title implies, but original with Mrs. Browning. She died in Florence, June 30, 1861.

Revised by HENRY A. BEERS.

Browning, ORVILLE HICKMAN: statesman; b. in Harrison co., Ky., 1810; educated at Augusta College; studied law; called to the bar in 1831; removed to Quincy, Ill. He served in the Black Hawk war; became a prominent State politician; was U. S. Senator (1861-63); Secretary of the Interior (1866-68); acting Attorney-General of the U. S. under President Johnson (1868-69). D. in Quincy, Aug. 10, 1881.

Browning, ROBERT: the foremost of psychological poets; b. at Camberwell, a suburb of London, May 7, 1812. His early education, up to the age of fourteen, was got in private schools and at home; subsequently a private tutor was employed for some years. His father, a clerk in the Bank of England and a scholar of the old-fashioned classical type, was an enthusiastic collector of scarce and curious books, and his house was filled with them. These the young Browning voraciously devoured, and from them, and the inspiration of his book-loving father and of a mother of whom Carlyle spoke as "the true type of a Scottish gentlewoman," and the poet himself as "a divine woman," he derived an education of a kind which, no doubt, better fitted him for his future work than any he could have derived from either of the great universities at the time. In a private letter he says: "I could never have done much by either process," meaning that of public school or university.

In his eighteenth year he attended for only a term or two the London University, now University College, where he studied Greek chiefly, an ardent love of which he had imbibed from his father. The winter of 1833-34 he spent in Russia, and was much impressed with Russian life and Russian winter scenery. It does not seem that, up to this time, he had pursued any strictly scientific studies, though his knowledge of various sciences appears, from his poetry, to have become later quite extensive. Throughout his works there are many evidences of a deep insight into the phenomena of nature. But the human soul was ever his ultimate interest; in his own words, "little else is worth study" than what bears upon its development. His early work, *Paracelsus* (1835), showed the transcendental character of his genius, and struck the key-note of his subsequent poetry—namely, that "truth is within ourselves," meaning spiritual and absolute truth, the greatest agency for the awakening of which being great personalities.

He married in 1846 the poet Elizabeth Barrett. Their married life of fifteen years (she died in 1861) was spent in Italy, and chiefly in Florence, golden records of which are his *One Word More* and *O Lyric Love, Half Angel and Half Bird*. A son, Robert Wiedemann Barrett Browning, who has attained to considerable distinction as an artist, was born Mar. 9, 1849.

Italy was ever Browning's "land of lands," and his poetry

is informed throughout with its spirit, and exhibits a subtle knowledge of the Italian character in all its phases. "Open my heart and you will see graved inside of it 'Italy.'" After the death of Mrs. Browning he took up his abode in London, making annual summer visits to the Continent till the end of his life, especially to his beloved Venice.

Of his voluminous poetry space allows mention of only the more important works, or collections published under general titles: *Stratford; an Historical Tragedy* (1837); *Sordello* (1840); *Bells and Pewee-granates*, in 8 nos. (1841-46), containing many of his most popular compositions; *Christmas Eve and Easter Day* (1850) give the poet's attitude toward Christianity; *Men and Women* (1855); *Dramatis Personæ* (1864); the last two collections will continue perhaps to be most read; *The Ring and the Book* (1868-69), his masterpiece, and the greatest poetical achievement of the century; *Balaustion's Adventure, including a Transcript from Euripides* (1871); the *Transcript* is a paraphrase of the *Alkestis*, informed with the idea of the regenerating power of personality; *Fifine at the Fair* (1872); *Red Cotton Nightcap Country* (1873); *Aristophanes's Apology* (1875); *La Saisiaz* (1878). "the poet's musings on death, God, the soul, and the future state"; *Dramatic Idylls* (1879; 2d series 1880), etc. His last volume, *Asolando*, was published in London on the day of his death, which took place in Venice, in the Palazzo Rezzonico, Dec. 12, 1889. His body rests in Poets' Corner, in Westminster Abbey.

By far the largest portion of his voluminous poetry is dramatic monologue—a difficult art-form which he made peculiarly his own, in bringing it into the service of that "worthier stage, the soul itself, its shifting fancies and celestial lights."

After nearly fifty years of noble poetic productiveness, which was unattended by any conspicuous recognition, the poet at last received a portion of the payment in the public estimation which had been so long due him. The Browning Society of London was founded in 1881 by Dr. F. J. Farnival for the study and discussion of his works, the publication of papers on them, etc. A large body of valuable criticism has been since published by the society, and an interest has been awakened which has resulted in the publication of many works of various kinds on his poetry, and in the establishment of Browning clubs all over the English-speaking world—an interest which, by reason of its solid basis, will be perpetuated and increased.

HIRAM CORSON.

Brownists: See BAPTISTS.

Brownlow, WILLIAM GANAWAY: Methodist divine and politician; b. in Wytbe co., Va., Aug. 29, 1805; removed to Tennessee, where he edited the *Knoxville Whig*, in which his caustic writing earned him the sobriquet of "the fighting parson." In 1856 he published *The Iron Wheel Examined and its False Spokes Extracted*, in reply to an assault on Methodism. After the breaking out of the war in 1861 he was a firm adherent of the Union party, in consequence of which he suffered arrest and imprisonment, when the Confederate government in 1862 sent him within the Union lines. He then lectured in Northern cities to large audiences, but in 1864 returned to Knoxville, and in 1865 was elected Governor of Tennessee by the Republicans; re-elected in 1867. He was a member of the U. S. Senate from 1869 to 1875. D. in Knoxville, Tenn., Apr. 29, 1877.

Brownlow: Earls, and Viscounts Alford (1815, in the United Kingdom), Barons Brownlow (1776, in Great Britain), and Baronets (1677), a prominent family of Great Britain.—ADELBERT WELLINGTON BROWNLOW, the third earl, born Aug. 19, 1844, succeeded his brother in 1867. He was member of Parliament for North Shropshire 1866-67.

Brown-Séquard, brown-se-kar', C. ÉDOUARD, M. D.: physiologist and neurologist; b. in the island of Mauritius in 1818. He was the son of Edward Brown, a Philadelphian, and a French lady *nee* Séquard. He studied in Paris, where he graduated as M. D. in 1840. He gained distinction by experiments on blood, animal heat, and the spinal cord. These highly important researches are believed to have thrown as much light as those of any other observer upon the physiology and diseases of the nervous system. In 1869 he was appointed professor in the School of Medicine in Paris. His researches have done much to elucidate the relations of the sensor to the motor nerves and the gray matter of the brain. He was a lecturer in Harvard University 1864-68; a practitioner in New York 1873-75; the founder of several medical journals in Paris; Professor, from

1878, of Experimental Medicine in the Collège de France. Late in life he announced the discovery of an *elixir vita* prepared from the genitals of sheep for inoculation, but to the detriment of his reputation. He resided chiefly in Paris. His principal works are *Physiology and Pathology of the Nervous System* (1860); *Paralysis of the Lower Extremities* (1860); *Lectures on Nervous Affections* (1873); articles in medical journals. D. in Paris, Apr. 1, 1894.

Brownson, NATHAN: a physician and statesman of Georgia; graduated at Yale in 1761; member of the Provincial Congress (1775); surgeon of the Revolutionary army; member of the Continental Congress (1776 and 1778); Governor of Georgia in 1781. D. in Liberty co., Ga., in 1796.

Brownson, ORESTES AUGUSTUS, LL.D.: journalist and theologian; b. in Stockbridge, Vt., Sept. 16, 1803. He founded in 1838 *The Boston Quarterly Review*, known later as *Brownson's Quarterly Review* (New York), and nearly all written by him; discontinued in 1873; was a frequent contributor to the *Democratic Review*. He became a Roman Catholic in 1844, having previously been a Presbyterian, Universalist, and Unitarian. He published a novel, *Charles Elwood, or the Infidel Converted* (Boston, 1840), and other works. D. in Detroit, Mich., Apr. 17, 1876. See his *Works* (New York, 1883-85, 19 vols.).

Brown's Valley: village; Traverse co., Minn. (for location of county, see map of Minnesota, ref. 8-A); is terminus of Brown's Valley branch of Great Northern R. R.; has four churches, a good school, a grain elevator, and a flouring-mill. Its water-supply is mostly derived from an artesian well. It is situated in a fine agricultural district between the sources of Big Stone and Traverse Lakes, which form the boundary between Minnesota and South Dakota for over 70 miles. Pop. (1880) 64; (1890) 498.

EDITOR OF "INTERLAKE TRIBUNE."

Brownsville: Lonoke co., Ark. (for location of county, see map of Arkansas, ref. 3-D); 27 miles E. of Little Rock. Here an engagement took place, Aug. 25, 1863, between a division of U. S. cavalry and the Confederates, who were quickly driven from the town.

Brownsville: borough; Fayette co., Pa.; on railroad and the Monongahela river; 35 miles S. of Pittsburg (for location of county, see map of Pennsylvania, ref. 6-B); has large glass-factories, coal mines, iron-foundries, machine-shops, planing-mills, etc. Pop. (1880) 1,489; (1890), 1,417.

EDITOR OF "CLIPPER."

Brownsville: city; capital of Haywood co., Tenn. (for location of county, see map of Tennessee, ref. 7-B). The city is in the midst of a rich cotton-growing district, and its principal industries are connected with the shipping and manufacture of cotton. Pop. (1890) 2,516.

Brownsville: a river-port and city; on railroad; capital of Cameron co., Tex. (for location of county, see map of Texas, ref. 8-11); on the left bank of the Rio Grande, opposite Matamoras, Mexico. It has steam-navigation on the Rio Grande and an extensive trade with Mexico. Here are a custom-house, 6 churches, 9 schools, and a Roman Catholic college. Brownsville was taken from the Confederates by Gen. Banks in Nov., 1863. Pop. (1880) 4,938; (1890) 6,134.

EDITOR OF "COSMOPOLITAN."

Brown University: an institution of learning founded in 1764 at Warren, R. I., and removed to Providence, its present seat, in 1770. Its first name was Rhode Island College, but in 1804 it received its present name, in honor of Nicholas Brown, one of its chief benefactors. Its presidents have been James Manning, 1765-90; Jonathan Maxey, 1792-1802; Asa Mosser, 1802-27; Francis Wayland, 1827-55; Barnes Sears, 1855-67; Alexis Caswell, 1868-72; Ezekiel G. Robinson, 1872-89; E. Benjamin Andrews, 1889-. The corporation consists of 12 fellows and 36 trustees, of whom a slight majority, including the president, must be Baptists, while the rest *can not* be, except that the 4 fellows not required to be Baptists may be members of any denomination, though as a matter of fact these places have never been filled by Baptists. The administration is most liberal and catholic. The statistics for 1892-93 show 62 members of the faculty and 549 students, of whom 88 are graduate students. The library has 80,000 volumes. The 13 university buildings are all substantial and in good order, and several of them new and of superior architecture. The gymnasium is exceptionally beautiful and well equipped. The observatory contains one of the finest telescopes in America. The university's invested funds amount to about \$1,300,000.

The buildings and grounds have an assessed valuation of half a million more. Courses of study are provided for the degrees of A. B., B. P., B. S., C. E., and M. E. The studies for the first year are usually prescribed, the rest nearly all elective. Of the graduate students ten are candidates for the degree of Ph. D. About half the students are from Rhode Island, about a fourth from Massachusetts and Connecticut. In the remainder nearly all the States are represented, as well as Canada. Revised by E. B. ANDREWS.

Brownwood: city; capital of Brown co., Tex. (for location of county, see map of Texas, ref. 3-G); on Gulf. Col. and Santa Fé and Fort Worth and Rio Gr. R. Rs.; 370 miles from Galveston and 140 miles from Austin; has 6 churches, 2 public schools, Daniel Baker College (Presbyterian), and Howard Payne College (Baptist). Its principal industrial establishments are a cottonseed-oil mill, roller flouring-mills, ice-factory, wire-fence, iron-cornice, and saddle and harness manufactories, and coal mines. The city has a thriving trade in wheat, cotton, hay, pecans, cattle, and hides. Pop. (1880) 725; (1890) 2,176; (1895) estimated with suburbs, 6,000.

PROPRIETOR OF "BANNER."

Brozik, VACLAV: painter of historical subjects and genre; b. at Tzemoschna, near Pilsen, Bohemia, in 1852; pupil of Piloty and of Munkacsy; second-class medal, Salon, 1878; officer Legion of Honor 1890. His best work is the *The Imperial Counselors Martiniz and Slavata thrown out of the windows of the Chateau of Hradschine at Prague by Count Thurn, in 1618*, which is dramatically composed, and fairly good in color and drawing. The large picture of *Columbus before Ferdinand and Isabella*, in the Metropolitan Museum, New York, is much inferior to it. Studio in Paris.

WILLIAM A. COFFIN.

Bruce: the name of a noble family of Scotland; descended from Robert de Bruis (or de Bruns), a Norman knight who followed William the Conqueror to England in 1066. He derived his lineage from Brusi, a Northman, a son of the famous Sigurd. His younger son, Adam, who acquired a large estate in Yorkshire, left a son, Robert, who received from David I. of Scotland a grant of the lordship of Annandale, held by the tenure of military service. He died in 1141, and left a son Robert, who was the second Lord of Annandale. This second lord had a grandson, Robert, who was the fourth Lord of Annandale. He married Isabel, a daughter of David, Earl of Huntingdon, younger brother of King William the Lion, and thus laid the foundation for the royal house of Bruce. He died in 1245. Robert de Bruce, a son of the preceding, and the fifth Lord of Annandale, was born in 1210. When the Scottish throne became vacant by the death of Queen Margaret in 1290, this Robert de Bruce and Baliol claimed the throne. The dispute was referred to Edward I. of England, who decided in favor of Baliol. Robert died in 1295, leaving a son, Robert, who by his marriage with the Countess of Carrick obtained the title of Earl of Carrick (1274). He fought in the English army against Baliol at the battle of Dunbar. D. in 1304, and left a son, Robert, who became King of Scotland.

Bruce, ALEXANDER BALMAIN, D. D.: theologian; b. in the parish of Aberdalgie, Perthshire, Scotland, Jan. 30, 1831; studied in Edinburgh; was settled in Cardross, Dumbartonshire, in 1859; was translated to Broughty Ferry, Forfarshire, in 1868; and in 1875 was made Professor of Apologetics and New Testament Exegesis in Free Church College of Glasgow. Has published *The Training of the Twelve Apostles* (Edinburgh, 1871; 3d ed., 1883); *The Humiliation of Christ* (1876; 2d ed., 1881); *The Chief End of Revelation* (London, 1881); *The Parabolic Teaching of Christ* (1882; 3d ed., 1887); *The Galilean Gospel* (Edinburgh, 1882); *The Miraculous Element in the Gospels* (London, 1887); *The Kingdom of God* (Edinburgh, 1889); *Apologetics* (1892); and some minor works. S. M. JACKSON.

Bruce, DAVID: See DAVID II.

Bruce, EDWARD: King of Ireland; younger brother of Robert, King of Scotland; fought for Scottish independence; landing in Ireland with 6,000 men in 1315, wrested Ulster from the English, and was crowned King of Ireland 1316; defeated and slain in battle of Dundalk, Oct. 5, 1318.

Bruce, SIR FREDERICK WILLIAM ADOLPHUS: a British diplomatist; b. in Broomhall, Fifeshire, Scotland, Apr. 14, 1814; brother of Lord Elgin; graduated at Oxford 1834. He was consul-general in Egypt in 1849; minister to China 1861; and in 1865 succeeded Lord Lyons as ambassador at Washington. D. in Boston, Mass., Sept. 19, 1867.

Bruce, GEORGE: b. in Edinburgh, Scotland, June 26, 1781; removed in 1795 to the U. S., and learned to be a printer in Philadelphia. In 1803 he became publisher and printer of the New York *Daily Advertiser*; in 1806, with his brother David, he began printing books; in 1812 they introduced stereotyping into the U. S., and soon after established an extensive type and stereotype founding business. George, with his nephew David, invented a successful type-casting machine. D. in New York, July 6, 1866.

Bruce, Sir GEORGE BARCLAY: b. in Newcastle-on-Tyne in 1821. He was trained for the profession of a civil engineer as a pupil of Robert Stephenson, on whose recommendation he obtained appointments on the Newcastle and Darlington, the Northampton and Peterborough, and the York, Newcastle and Berwick Railways, and became resident engineer of the Royal Border bridge, a work nearly half a mile long, carrying the last-named railway over the Tweed at Berwick. This bridge was opened by the Queen with considerable state in 1850. Shortly afterward Mr. Bruce went to India, and in 1853 became chief engineer of the Madras Railway. He laid out and constructed the original line, 500 miles long, on the departmental system, i. e. dispensing with a contractor, a proceeding which was reckoned a bold experiment in those days. He became consulting engineer to what is now the South Indian Railway, of 600 miles, which was carried out on the same system as the Madras line. In addition, he was engineer also to some East Prussian railways, and to the Government of New Zealand for its lines, as well as to those constructed in Spain and the Spanish-speaking republics, among the most notable being the Rio Tinto and the East Argentine lines. On June 6, 1887, he was elected president of the Institution of Civil Engineers, and again on May 29, 1888. Shortly afterward he received the honor of knighthood, as having been president at the time of the jubilee of the Queen. Sir George has been moderator of the English Presbyterian Synod. WM. R. HURROX.

Bruce, JAMES: traveler; b. in the county of Stirling, Dec. 14, 1730. He was appointed consul-general at Algiers in 1763, after which he studied several Oriental languages, and explored the antiquities of Barbary. In 1768 he departed from Cairo on a journey to Abyssinia, in order to discover the source of the Nile. Passing through Sycue, Cosseir, and Jidda, he reached Gondar in Feb., 1770. He discovered the source of the Blue Nile in November of that year, and remained about two years in Abyssinia, the king of which treated him kindly. He passed through great dangers and hardships in his return, and arrived in England in 1774. In 1790 he published *Travels to Discover the Source of the Nile* (5 vols.). His veracity was at first doubted by many, but his statements have been confirmed by Salt, Belzoni, and others. D. at Kinnard, Apr. 27, 1794. See A. Murray, *Life of Bruce*.

Bruce, MICHAEL: Scottish poet, whose productions (mostly hymns) are characterized by singular pathos and beauty; b. at Kinneswood, in the county of Kinross, Mar. 27, 1746. He died of consumption July 5, 1767. In 1770 his "friend," the Rev. John Logan (1748-88), published what purported to be his literary remains. In 1781 this same Logan published another volume of poems, which he called his own. The best of these, it is now almost absolutely certain, came from the pen of Michael Bruce. A baser act of literary piracy was never perpetrated. See *The Works of Michael Bruce*, edited by Rev. Alexander B. Grosart, Edinburgh, 1865.

Bruce, ROBERT: an heroic King of Scotland; b. Mar. 21, 1274; son of Robert de Bruce, Earl of Carrick. In 1296, as Earl of Carrick, he swore fealty to Edward I. of England, but he soon joined the Scottish leaders who were fighting for the independence of Scotland. Having made peace with Edward I. he became in 1299 one of the four regents who ruled the kingdom. In 1305 he was involved in a quarrel with the Red Comyn, who was a nephew of Baliol, and was a claimant of the throne. Bruce killed Comyn, and then assembled his vassals, and was crowned at Scone in the spring of 1306. His small army was soon defeated by the English, and he was compelled to take refuge in the island of Rathlin, on the coast of Ireland, where he remained all winter. Renewing the contest in the spring, he defeated the English at London Hill in May, 1307. In less than two years he made himself master of nearly all Scotland, and in 1309 he drove back an invading army of Edward II. The latter invaded Scotland again in 1314 with an army of about 100,000 men. Bruce, who had less than half as many,

gained a complete victory at Bannockburn, June 24, 1314. In 1318 the Scots invaded England, and after several other campaigns the war was suspended in 1323 by a truce. By a treaty of peace concluded at Northampton in 1328 the English king recognized the independence of Scotland. Bruce died June 7, 1329, and was succeeded by his son David.

Brucea: a genus of shrubs of the family *Rutaceæ*. One species of this genus, a native of Abyssinia, is called *Brucea anti-dysenterica* because its leaves have astringent properties of great value in diarrhoea and dysentery. In Sumatra and China another species, the *Brucea sumatrana*, is used for the same purpose as the species just named. H. A. H.

Bruce Mines: a part of entry of the Algoma district, Ontario, Canada; near the north end of Lake Huron; 35 miles below Sault Ste. Marie (see map of Canada, ref. 10 K). It has productive copper mines, and exports large quantities of fish. Pop. 1,500.

Bruch, brookh, MAX: musician; b. in Cologne, on the Rhine, Jan. 6, 1838; early showed musical talent, in which he was directed by his mother. By the time he was fourteen years old he had already written nearly seventy compositions, among them being a symphony, which was performed in Cologne in 1852. He then studied, first under Ferdinand Hiller, and later at Leipzig. In 1859 he returned to his native city, and began his professional career. Among his early compositions is his *Jubilate, Amen*, which has been sung with great success by choral societies. His first great work was the opera *Loreley*, composed to the text which Geibel wrote for Mendelssohn. This was produced in Mannheim in 1863, and is a standard work in the German operatic repertory. In 1864 he produced his cantata for male voices, *Erilthjof*, at Aix-la-Chapelle. In 1873 his opera *Hermione*, based on Shakspeare's *Winter's Tale*, was produced at Berlin and Dresden. Other important compositions are *Salamis*; *Norman Expedition*; *Roman Song of Triumph* (a particularly fine work); *Fair Ellen*, on the story of the siege of Lukenow; *Odyssæus*; *Lay of the Bell*; *Achilleus* and *Arminius*. This last is a special favorite in the U. S., having been sung twice at the Worcester festivals, and also in Philadelphia. Bruch also composed symphonies and overtures, and a few violin concertos, but is better known by his vocal music. D. E. HERVEY.

Bruch'sal: a town of Germany; in Baden; on the river Salzbach; and on the railway from Heidelberg to Karlsruhe; 14 miles by rail N. E. of the latter (see map of German Empire, ref. 6-10). It is the northwestern terminus of a railway which extends to Friedrichshafen on Lake Constance. It has an old castle of the twelfth century, a fine palace, a gymnasium, and a paper-mill. Pop. (1885) 11,657; (1890) 11,902.

Bruçia, or Bruçica: a bitter and poisonous vegetable alkaloid found in *Strychnos nux vomica*. It is characterized by giving a blood-red color with concentrated nitric acid. It was discovered in bark incorrectly supposed to be that of *Brucea antidysenterica*, whence its name. Its toxicological effects are like those of strychnia, but it is far less active.

Bruçite: the native magnesic hydrate, MgH₂O₂. It is found in serpentine at Hoboken, N. J. The finest specimens occur in the chrome mines of Texas, Pa.

Brück'e, ERNST WILHELM: physiologist; b. at Berlin, Germany, June 6, 1819; became in 1846 teacher of anatomy at the Berlin Art Academy; in 1849 Professor of Physiology in Vienna. He is the author of *Anatomische Beschreibung des Augapfels* (1847); *Grundzüge der Physiologie und Systematik der Sprachlaute* (1856; 2d ed. 1876); *Neue Methode der phonetischen Transcription* (1863); *Physiologie der Farben für die Zwecke der Kunstgewerbe* (1866); *Die physiologischen Grundlagen der neuhochdeutschen Verskunst* (1871); and *Vortessagen über Physiologie* (1885). D. in Vienna, Jan. 7, 1892.

Brucker, brooker, JOHANN JAKOB: a German historian and Protestant minister; b. in Augsburg, Jan. 22, 1696; studied at Jena; became pastor in Augsburg 1744. Among his works is a *Critical History of Philosophy* (in Latin, 5 vols., Leipzig, 1741-44), which has a high reputation. It contains valuable biographical materials, but is deficient in critical analysis. D. in Augsburg, Nov. 26, 1770.

Bruck-Lajos, LOUIS: genre-painter; b. at Papa, Hungary, Nov. 3, 1846; pupil of the Vienna Academy and of Munkacsy; formerly a frequent exhibitor in the Paris

Salons, but has resided of late years in London, and his work is more often seen there. Well known to American collectors. W. A. C.

Bruckner, brook'ner, ANTON; musician; b. at Ausfelden, Austria, Sept. 4, 1824; was a chorister and subsequently organist of the Institute of St. Florian; in 1855 became organist of Linz cathedral; continued his studies under Sechter and Kitzler; succeeded Sechter as organist of the Hof Kapelle, Vienna, at the death of the latter in 1867. He was a famous organist, and in late life became a composer, and produced three grand masses, seven symphonies, and many other works, all of which are marked by profound learning. His romantic symphony in E flat (No. 4) was performed in New York by the Philharmonic Society, Mar. 16, 1888; his symphony in D minor by the Symphony Society in 1885; and his symphony in E major (No. 7) by the Philharmonic Society in 1886. D. Oct. 11, 1896. D. E. HERVEY.

Bruges, broo'jez (Dutch *Brugge*, or *Bruggen*, i. e. bridges, Lat. *Bruga*); a fortified city of Belgium; capital of the province of West Flanders; situated on a fertile plain about 8 miles from the ocean, and 64 miles by rail N. W. of Brussels; lat. 51° 12' N., lon. 3° 14' E. (see map of Holland and Belgium, ref. 9-B). The railway from Ostend to Brussels passes through Bruges, which is connected with the ocean by several canals. It derives its name from the numerous bridges (about fifty-four) which here cross the canals. It contains many fine Gothic edifices, some of which were built in the fourteenth century, and are richly adorned with works of art. Among these are the Church of Notre Dame, which has a spire 450 feet high, and contains a splendid monument of Charles the Bold; the town-hall, with a lofty tower and a celebrated chime of forty-eight bells; and the Cathedral of St.-Sauveur, furnished with paintings of eminent artists. Memling's *Shrine of St. Ursula* and his other works at Bruges are of great importance in the history of mediæval painting. Bruges has an academy of painting, a public library, a museum, an episcopal college, a hospital, a school of surgery, and an institution for the blind. Here are manufactures of cotton, linen, and woolen fabrics, lace, leather, cordage, tobacco, and soap. Several thousand women are employed in the manufacture of lace of fine quality. Bruges was an important commercial town before the Norman conquest (1066), after which it continued to increase in riches and population. In the thirteenth century it was the great central mart of the Hansatic League. Its manufactures were also very extensive. The tapestry and cloths of Bruges were celebrated for their excellence. The population once exceeded 200,000. Its prosperity was injured by a popular revolt in 1488, and by persecutions and vexations under Philip II. of Spain. Pop. (1891) 47,331.

Brugmann, brooh'män, FRIEDRICH KARL; philologist; b. at Wiesbaden, Germany, Mar. 16, 1849; studied at Halle and Leipzig 1867-71; taught in the gymnasium at Wiesbaden 1872-73, at Leipzig 1873-77. In 1877 he became a privat-docent in the University of Leipzig; in 1882 assistant professor; in 1884 was called to the professorship of Comparative Philology at Freiburg; in 1887, after the death of Georg Curtius, was called as his successor to Leipzig. Brugmann is distinguished not only for his scientific attainments, but for his skill as a teacher, and his clearness and force as a lecturer and writer. His investigations in the field of Indo-European vocalism have done much to bring about the great changes of theory and method which characterize the history of the science in the last fifteen years. Especially rich in its results was his article on *Nasalism sonans*, published in vol. ix. of *Curtius's Studien*, of which Brugmann was at the time joint-editor. Though the position taken in this article was so radical as to call forth a disclaimer and rebuke (see note at end of *Studien*, ix.) from his co-editor, Prof. Curtius, and led ultimately to a personal rupture between the two men, it proved itself to be nothing less than a turning-point in the history of the science. Its essential results are to-day universally accepted. The association of Brugmann with Hermann Osthoff in the publication of the *Morphologische Untersuchungen* (vols. i.-iv., 1878-84, vol. v., 1890) was especially significant, these writings characterizing the period of transition. The chief work of Brugmann is that in which he brings together and classifies with a masterly control of the difficult material involved the whole body of results in the field of Indo-European grammar from the sides of phonology and inflection, *Grundriss der vergleichenden Grammatik der indogermanischen Sprachen* (3 parts appeared, 1886-90; English translation). Among

his other works are: *Ein Problem der homerischen Textkritik* (1876); *Litauische Volkslieder und Märchen*, with A. Leskien (1882); *Griechische Grammatik*, in vol. ii. of *Müller's Handbuch der Albertinus Wissenschaft* (2d ed. 1890); *Zum heutigen Stand der Sprachwissenschaft* (1885). He is also, in company with W. Streitberg, editor of the *Indogermanische Forschungen*. BENJ. IDE WHEELER.

Brugsch, brook'hsh, HEINRICH KARL; Egyptologist; b. at Berlin, Feb. 18, 1827; studied at Berlin; made his first scientific journey to Egypt in 1853; became privat-docent in Egyptology in Berlin 1854; accompanied the Prussian embassy into Persia 1860; returned 1861; he was appointed Prussian consul to Cairo in 1864; in 1868 the khedive made him director of the museum of Boulak; became Professor of Egyptology at Göttingen 1869. In 1885 and 1886 he was again in Persia for a stay, but from 1886 he lived in Berlin, where he lectured in the university. In 1891 he took 3,000 papyrus rolls with him from Egypt. Among his numerous writings, all of which are of the first rank, may be mentioned: *Grammaire démotique* (Berlin, 1855); *Hieroglyphisch-démotische Wörterbuch* (Leipzig, 1867-82, 7 vols.); *Geschichte Ägyptens unter den Pharaonen* (1877; Eng. trans. *History of Egypt under the Pharaohs*, 1879; 2d ed. by Mary Brodrick, 1891); *Religion und Mythologie der alten Ägypter* (1884); *Thesaurus inscriptionum ægypticarum* (1883-91, 6 parts); *Steinschrift u. Bibelwort* (Berlin, 1st and 2d ed. 1891). D. in Berlin, Sept. 10, 1894.

Brühl, HEINRICH, Count von; German statesman; b. in Weissenfels, Aug. 13, 1700; prime minister to Augustus III. of Saxony and Poland 1746; impoverished the country in slavishly supplying his master's and his own extravagance; gained wealth and titles. The Royal Library in Dresden contains his collection of 62,000 volumes. D. in Dresden, Oct. 28, 1763.

Brule Indians: See SIOUAN INDIANS.

Brunaire, brü'mär; second month in the calendar of the French republic; derived from *brume*, a mist, a fog, Lat. *bruma*, winter. It comprised the time from Oct. 23 to Nov. 21. See CALENDAR.

Brummell, GEORGE BRYAN; "Beau Brummell," a famous fop; b. in London, June 7, 1778; schooled at Eton and for a while at Oxford. He had elegant taste in dress, became intimate with the Prince of Wales, lived in sumptuous style, and associated with the nobility on equal terms; was recognized as an oracle in questions of etiquette and dress; squandered a fortune; went into exile in 1815; and died at Caen in a pauper lunatic asylum, Mar. 29, 1840. See his *Life* by Jesse (new ed. 1886).

Bruck, RICHARD FRANÇOIS PHILIPPE; classical scholar; b. at Strassburg, Alsace, Dec. 30, 1729. He was liberally educated in Paris, and became an ingenious critic and bold emendator of the classics. He edited Anacreon, Aristophanes, Sophocles, and Terence, and published *Annecta Veterum Poetarum Græcorum* (1772-76). In the French Revolution he warmly supported the popular cause. D. June 12, 1803.

Brundisium: See BRENDISE.

Brunehaut, brün'hō, or **Brunehilde**, brün'hēld; a famous queen; daughter of Athanagildus, King of the Visigoths. She was married in 568 A. D. to Sigebert, King of Austrasia. She was beautiful, ambitious, and high-spirited. Her husband was assassinated in 575 by the order of Fredegonda, Queen of Neustria. She afterward governed the kingdom with ability, and obtained an ascendancy over her son Childebert, who was the nominal king. Having been defeated in battle and captured by Clotaire II., she was murdered in 613 A. D.

Brunei, or **Borneo**; a seaport-town on the northwest coast of Borneo; capital of the sultanate of Brunei (see map of East Indies, ref. 5-P), a territory of 3,000 sq. miles and 50,000 inhabitants which came under British protection in 1888. The houses are built on posts, and canals pass through all the streets. Pop. about 25,000.

Brunel, ISAMBARD KINGDOM, D. C. L., F. R. S.; engineer; b. in Portsmouth, England, Apr. 9, 1806. He was employed under his father as assistant engineer of the Thames tunnel, in the construction of which he displayed great energy and ability. In 1833 he was appointed chief engineer of the Great Western Railway. He was the designer and engineer of the Great Western steamship and of the Great Eastern, said to be the largest vessel ever built,

and of the Royal Albert bridge, Saltash. (See BRIDGE.) D. Sept. 14, 1859. See *Life* (1870) by his son.

Brunel, Sir MARK ISAMBARD, F. R. S.; engineer; b. near Rouen, in France, Apr. 25, 1769; father of the preceding. Driven from France by the Reign of Terror, he removed to New York in 1793, and designed the Bowery theater of that city. In 1799 he went to England, and married a Miss Kingdom. He was distinguished for his mechanical ingenuity, and invented a machine for making block pulleys, for which the Government gave him \$85,000, and other useful machines. His most important work is the Thames tunnel, which was commenced in 1825 and opened in 1843. D. Dec. 12, 1849. See R. Beamish, *Life of M. I. Brunel*.

Brunelleschi, broo-nel-les-kée, FILIPPO; architect and sculptor; b. in Florence in 1377. He promoted the restoration of the ancient style of architecture as a substitute for the Gothic, which in his youth prevailed in Italy. The first church built in Europe in the revived classical style was the Church of San Lorenzo in Florence, designed by him. About 1418 he was appointed architect of the Cathedral of Florence (Santa Maria del Fiore), which had been commenced about 1296, and was unfinished. He raised over it a grand and beautiful dome, which is one of the largest in the world. Among his other works is the Pitti Palace of Florence. D. in Florence, Apr. 16, 1446. See Baldinucci, *Vita di F. di Ser Brunellesco* (1812).

Brunel, brū'nay', JACQUES CHARLES; bibliographer; b. in Paris, Nov. 2, 1780; d. there, Nov. 14, 1867. He was the son of a bookseller, and was brought up among books. He prepared numerous catalogues, and contributed largely to the science of bibliography. His great work was the *Manuel du Libraire et de l'Amateur de Livres* (first published in 1810; 5th ed., Paris, 1860-65, 6 vols., 3 supplements, 1870-80).

Brunetière, brū'ne ti-ār', FERDINAND; French critic; b. in Toulon, July 19, 1819; became in 1886 Lecturer on the French Language and Literature in the École Normale Supérieure at Paris, and a member of the Academy June 8, 1893. As a contributor to the *Revue des Deux Mondes* he has distinguished himself for his defense of the classic French tradition in literature, and for his sharp criticism of realism, naturalism, determinism, and similar literary and ethical doctrines in great vogue. Among his works are *Études critiques sur l'histoire de la littérature française* (3 series, 1880-82-87); *Le Roman naturaliste* (1883); *Histoire de Littérature* (1884-86); *l'Évolution des Genres dans l'histoire de la Littérature* (vol. i., 1890). A. R. MARSH.

Brunhilda, or **Brunchild** of Norse mythology; See BRYNHILD.

Broni; See ARETINUS.

Brunlees, Sir JAMES, F. R. S.; past president of the Institution of Civil Engineers; b. at Kelso, Roxburghshire, Scotland, in 1816; educated there and at the University of Edinburgh. He practiced as a surveyor, and in 1838 became assistant engineer on the Bolton and Preston Railway, one of the first lines constructed in England. From 1841 to 1850 he carried out the extensive works of the Lancashire and Yorkshire Railway system, with Sir John Hawkshaw as chief engineer. In 1850 he constructed the Londonderry and Coleraine Railway, in 1852 undertook the difficult Ulverston and Lancaster Railway across Morecambe Bay; was engaged in other engineering work in England and abroad, and as arbitrator in the settlement of disputed contracts. Among his works are the Solway Junction Railway, Clifton Extension Railway, Mersey Tunnel Railway, the Avonmouth, King's Lynn, and Whitehaven docks. He was associated with Sir John Hawkshaw as engineer of the proposed Channel tunnel. He constructed in Brazil the São Paulo, the Minas and Rio, and the Porto Alegre railways, and received the decoration of the Brazilian order of the Rose. He also built the Central Uruguay and the Bolivar railways. He was knighted by the Queen at Windsor in 1886. He became a member of the Institution of Civil Engineers in 1853, and its president in 1883. He wrote upon piles, railways, sea embankments, land reclamation, iron viaducts, etc. D. June 2, 1892.

WM. R. HUTTON.

Brünn (Slavic *Bruno*, the ford): a fortified city of Austria; the capital of Moravia; beautifully situated at the confluence of the Schwarza and the Zvitawa; 91 miles by rail N. N. E. of Vienna, and 159 miles by rail S. E. of Prague; lat. 49° 11' 39" N., lon. 16° 36' 39" E. (see map of Austria-Hungary, ref. 4-F). Here is the castle of Spielberg, used as

a state prison. Among the remarkable public buildings are the cathedral, the Gothic Church of St. James, the *Laudhaus*, formerly a rich Augustine convent, several palaces of the nobility, and a theater. Brünn also contains a museum, a public library, and a botanic garden. It has important manufactures of woolen, cotton, and silk fabrics, ribbons, glass, soap, and tobacco. It is the seat of the highest civil and military authorities of Moravia and Austrian Silesia, and of a Roman Catholic bishop. Its manufactures of woollens are said to be the most extensive in the Austrian empire. Over 15,000 persons are employed in the factories. Napoleon used Brünn as his headquarters before the battle of Austerlitz. Pop. (1880) 82,660; (1891) 95,342.

Brunn, HEINRICH, von; archaeologist; b. in Wörlitz, Jan. 23, 1822; pupil of Weleker and Ritschl; Professor of Archaeology in the University of Munich; author, among other works, of *Geschichte der griech. Künstler* (2 vols., Stuttgart, 1853-59; 2d ed. 1888-89). D. July 23, 1894.

Bruno (in Lat. *Brunus*), GIORDANO; philosopher; b. at Nola, in the kingdom of Naples, in 1548, and entered the Dominican order in 1563. He was a man of independent and speculative spirit, and rejected the orthodox doctrines of the Church. On account of his opinions he was obliged to leave his monastery in 1576, and afterward led a wandering life. He fled first to Geneva; a few years after he removed to Paris; passed some time in England. His principal works are *Spaccio della Bestia trionfante* (1584); *Della Causa Principio e Uno: Del Infinita Universo e Mondi*. About 1592 he returned to Italy and became a resident of Venice. Having been accused of heresy, he was imprisoned at Rome for seven years, and was burned there as a heretic Feb. 17, 1600. On June 9, 1889, a monument to him was unveiled on the same spot where he died. He was an advocate of the Copernican system on speculative and not scientific grounds. He declared the universe to be everlasting, complete, and to be God. Nature is the self-evolution of God. Fr. H. Jacobi and Schelling first called the attention of the modern world to his views. His Italian works were edited by P. Lagarde (Göttingen, 1888, 2 vols.), and his Latin works by Tocco (Florence, 1889, 1891). His *Della Causa Principio e Uno* was translated into German in J. H. Kirchmann's *Philosophische Bibliothek* (Leipzig, part 184, 1873), and his *Reformation des Himmels* (1889).

Revised by S. M. JACKSON.

Bruno, SAINT; founder of the Carthusians; b. in Cologne about 1030. His parents were prominent persons, and his education was the best the times afforded. In 1057 he became master of the cathedral school in Rheims. In 1082 he retired from the world, and with a few friends began to live in solitude at Saisse-Fontaines; in 1084 he withdrew to La Grande Chartreuse, and founded there the order of Carthusians, who adopted the rule of St. Benedict. The monastery of La Grande Chartreuse was afterward built at the same place. In 1090 he obeyed the papal summons and went to Rome as papal adviser, but finding court life distasteful he sought and obtained means to build another monastery at Della Torre (1094); subsequently another was built (1097). D. at Della Torre, Italy, Oct. 6, 1101. He was canonized 1628. (See CARTHUSIANS.) See his *Life* by D. M. Tappert (Luxemburg, 1872).

Bruno the Great; Archbishop of Cologne; b. 925; a younger brother of the Emperor Otto I. He was a man of great talents, virtue, and learning, and had a powerful influence in the Church and state. He became lord high chancellor of the empire 940; Archbishop of Cologne 953. D. in Rheims, Oct. 11, 965.

Brunn, PAUL VICTOR, von; b. in Brunswick, Aug. 9, 1812; studied at Brunswick, Tübingen, and Berlin. He was the author of several surgical treatises and handbooks, and made a special study of diseases of the larynx, for the treatment of which he invented a new and effective throat-mirror. He was one of the highest surgical authorities in Germany. His work on laryngoscopic surgery gained for him the grand prize of 20,000 marks, offered by the Academy of Turin. D. in Tübingen, Mar. 19, 1883.

Brunswick; a duchy of the German empire; consists of three larger parts and several enclaves. Area, 1,124 sq. miles. The larger part, containing the capital, is entirely surrounded by Prussia. The chief mountain-range is a part of the Hartz Mountains in the S., the highest point of which in the duchy is the Wurmberg, 3,245 feet high. It is traversed by the Ocker in the N., and the Leine, Aller, and

Bode. The chief products are grain, flax, and hops. Among the mineral products are silver, lead, iron, copper, coal, alabaster, alum, salt, etc. It has extensive manufactures of linen, wooden wares, glass, sugar, tobacco, paper, cloths, etc., also large beer-breweries. It has 5 gymnasia, 1 polytechnic school, a theological seminary, 2 normal, and numerous other schools. The government is a constitutional monarchy, and the supreme power is vested in a duke and a legislative body of 46 members. The receipts and expenses for 1891-92 were each estimated at 12,400,000 marks. The public debt in 1891 amounted to 28,371,588 marks. Brunswick is represented by 2 members in the Bundesrath of the empire, and 3 deputies in the imperial Reichstag. Its contingent to the German army forms part of the Tenth Army-corps. Pop. in 1890, 403,029.

History.—Brunswick formed originally a part of the duchy of Saxony, and was given in 1194 to Henry the Lion. His grandson Otto became first Duke of Brunswick in 1235. After having been divided and reunited by the descendants of Otto, they were again united under Ernest the Confessor (d. 1546). His two sons, Henry and William, again divided the country, and formed the two branches Brunswick-Oels and Brunswick-Lüneburg, the latter of which reigned as electors of Hanover, and in the person of George I. succeeded to the British throne. Brunswick was annexed to the kingdom of Westphalia in consequence of the treaty of Tilsit, but in 1813 it again became an independent state under Frederick William, who was killed in the battle of Quatre Bras in 1815. He was succeeded by his son Karl, who was expelled from the country in 1830, and was succeeded by his brother Wilhelm, who died Oct. 18, 1884. Brunswick joined the German customs-union in 1844, assisted Prussia in the war of 1866, joined the North German Confederation in the same year, and became a member of the German empire upon its revival in 1870. With the death of Duke Wilhelm the ducal line of Brunswick became extinct, Duke Charles having died in Aug., 1873, without issue. Prince Albrecht, b. May 8, 1837, son of the late Prince Albrecht of Prussia, was unanimously elected regent of the duchy by the Diet, Oct. 21, 1885; accession Nov. 2, 1885. The heir to Brunswick is the Duke of Cumberland, excluded owing to his refusal to give up his claim to the throne of Hanover.

Revised by C. K. ADAMS.

Brunswick (Germ. *Braunschweig*; anc. *Brunonis Vicus*); a city of Germany; capital of the duchy of the same name; on the river Oker; and in a level district; 47 miles by rail E. S. E. of Hanover; lat. 52° 16' 11" N., lon. 10° 32' 09" E. (see map of German Empire, ref. 4-E). The old fortifications have been demolished and converted into pleasant promenades. It contains a magnificent ducal palace, an ancient cathedral, the Church of St. Andrew with a steeple 316 feet high, a mint, an opera-house, a town-hall, and a museum which contains paintings by Albert Dürer, Rembrandt, Holbein, and other great masters. Railways extend from this town to Hanover, Magdeburg, and other places. Here are manufactures of linen and woolen goods, lacquered wares, papier-maché, tobacco, hardware, etc. A great annual fair is held here. Among its institutions are a college, a gymnasium, a Realschule, and an asylum for deaf-mutes. This is a very old town. It was enlarged and beautified by Henry the Lion in the twelfth century. It formerly belonged to the Hanse League. Pop. (1885) 85,174; (1890) 101,047.

Brunswick; city; railroad junction, and port of entry; capital of Glynn co., Ga. (for location of county, see map of Georgia, ref. 7-K); on St. Simon's Sound; 8 miles from the Atlantic Ocean, and 80 miles S. S. W. of Savannah. It has a first-class system of public schools. There are here a safe and spacious harbor, a large manufacture and export of yellow-pine lumber, and a large export trade in cotton. At the south end of St. Simon's island, and on the north side of the entrance to the sound, is St. Simon's lighthouse. It is of brick, and is 108 feet high. Pop. (1880) 2,891; (1890) 8,459. Editor of "Times."

Brunswick; town; Cumberland co., Me. (for location of county, see map of Maine, ref. 10-B); on railroads connecting it with Portland, Augusta, and Bath; on Androscoggin river at head of navigation; 29 miles N. E. of Portland; connected by bridge with Topsham. Falls in the river furnish ample water-power. The town is the seat of Bowdoin College (*q. v.*); its industries are flour, cotton and paper mills, tannery, shipping, etc. Pop. (1880) 5,384; (1890) 6,012.

Brunswick; town; Chariton co., Mo. (for location of county, see map of Missouri, ref. 3-F); on Wabash R. R., and on the north bank of the Missouri river; 90 miles E. by N. by railroad from Kansas City; has excellent public school, saw and planing mill, cigar-factory; is good wheat and corn shipping-point. Pop. (1880) 1,801; (1890) 1,748.

Editor of "BRUNSWICKER."

Brunswick-Bevern. AUGUST WILHELM, Duke of; a Prussian general; b. Oct. 15, 1715; took part in the wars of Frederick the Great against Austria. He distinguished himself in the battles of Lowasitz, Reichenberg, Prague, and Kollin. He was defeated and taken prisoner at Breslau in 1757, and was released in 1758. D. Aug. 1, 1781. He was the tallest soldier of his time in the Prussian army.

Brunswick Black; a varnish used for the purpose of giving a bright polished appearance to coarse iron-work, such as grates and fenders. It is chiefly composed of bitumen, lampblack, and turpentine, and is applied with a brush.

Brunswick Green; an oxychloride of copper, used as a pigment in the arts. It is obtained by exposing metallic copper to the action of ammonium chloride, or by mixing sulphate of copper and common salt into a paste with water. It is also generated by the action of sea-water on copper, and occurs native in Atacama in the form of green sand, hence called atacamite.

Brunswick-Lüneburg. KARL WILHELM FERDINAND, Duke of; a German general; b. Oct. 9, 1735; nephew of Frederick the Great; eldest son of Duke Karl. He fought for his uncle in the Seven Years war, and succeeded to the dukedom in 1780. He became in 1792 commander-in-chief of the allied armies of Austria and Prussia, which invaded France and were repulsed by Dumouriez. In 1793 he resigned the command. He took command of the Prussian army in 1806, and was defeated by the French at Jena in October of that year. In this battle he was mortally wounded. D. Nov. 10, 1806.

Bruschius. broo'shi-us, or **Brusch**, broosh, GASPARD; German historian; b. at Schlackenwald, Bohemia, Aug. 19, 1518; in 1552 made a count palatine and poet laureate by Ferdinand, King of the Romans. He favored Luther and Melancthon, and in 1559 was murdered in a forest by some gentlemen who thought themselves satirized by him. His chief historical works are *De Germaniæ episcopatus epitome* (1549) and *Monasteriorum Germaniæ præcipuorum Chronologia* (1551).

Brush; name of instruments for removing dirt from various surfaces by friction, for adjusting the hair, for polishing, for applying paints, whitewashes, and the like. Hog's bristles furnish a large part of the material for the friction surface of the best brushes; but for delicate work camel's, badger's, sable's, and rabbit's hair is used. Wire brushes are used in various departments of manufacturing industry. Split whalebone is sometimes employed as a substitute for bristles. Broom-corn and twigs of trees are often employed for stiff brushes, and the coarse instruments used in cleaning streets are partly made from bass or piassaba and other imported palm fibers. Most brushes are made by joining some of the above materials to a stock of wood, leather, bone, or metal, by various methods—a business which gives employment to many thousands in Europe and the U. S. Ingenious machines have been invented for the performance of various parts of the work of making brushes; and these machines have greatly reduced the labor and expense of manufacture.

Brush (in dynamo-electricity): a device for making electric contact with the moving parts of a generator or motor. Brushes consist of strips of copper or brass, or of bundles of wire held with suitable pressure by means of a spring in contact with the commutator or other moving part with which connection is sought. Carbon plates or pencils are largely used instead of metallic brushes. In static electricity a brush is the name given to certain forms of silent discharge through the air, the illumination from which is so faint as to be clearly visible only in a darkened room. See DYNAMO ELECTRIC MACHINES and ELECTRIC DISCHARGE.

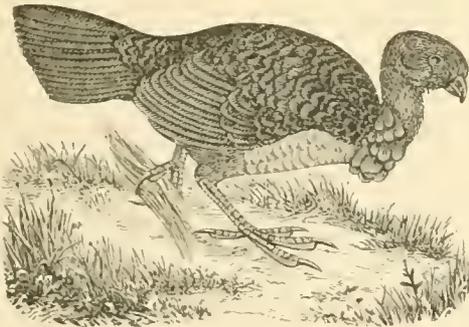

Brush. CHARLES FRANCIS; best known as the inventor of the Brush dynamo for arc lighting, and of a lamp that worked uniformly on a large circuit supplying many lights; b. in Euclid, O., Mar. 17, 1849, and graduated at the University of Michigan in 1869. He is also the inventor of a great number of devices which have been of practical value in the development of the electric light. In 1881 he was

made chevalier of the Legion of Honor in France. Resides in Cleveland.

Brush, GEORGE DE FOREST; painter of figure-subjects; b. at Shelbyville, Tenn., in 1855; pupil of Gérôme, Paris; member of the Society of American Artists 1880; associate National Academy of Design; first Hallgarten prize, National Academy, 1888. His pictures of Indian life in the West attracted notice in the New York exhibitions about 1883, and some of his most successful works are among those of that class of subjects. Latterly he has spent some years in Paris again, and at the Society of American Artists in 1892 exhibited two remarkable works, *The Portrait* and *Ossian the Bard*. His work is especially good in drawing, and presents some points of similarity in technical method to that of Gérôme, but is entirely individual in character. *Mourning her Brave* and *An Aztec Sculptor*, two of his best pictures, are in the collection of Thomas B. Clarke, New York. Studio in New York. WILLIAM A. COFFIN.

Brush, GEORGE JARVIS; mineralogist; b. in Brooklyn, N. Y., Dec. 15, 1831; educated at Yale College, at the University of Munich, the Mining Academy of Freiberg, Saxony, and the School of Mines in London. He became in 1855 Professor of Metallurgy in Yale, to which the professorship of mineralogy was added in 1864. He is executive officer of the Sheffield Scientific School, has published numerous papers in the *American Journal of Science*, and is author of parts of the fifth edition of Dana's *Mineralogy*. See *Popular Science Monthly* for Nov., 1881.

Brush-turkey, sometimes called **New Holland Vulture**; a bird (*Talegalla lathami*) of Australia, remarkable for the peculiar manner in which its eggs are hatched. Several pairs of these birds, having united to build a nest, collect leaves, grass, etc., into a heap, sometimes to the amount of several cart-loads. In this mass the several females deposit their eggs, where they remain till hatched by

Brush-turkey.

the artificial heat of the mound. The bird is about the size of the common turkey, and has wattles on its head and neck. When pursued, it endeavors to make its escape by running through the tangled brush or by flying into the low branches of a neighboring tree.

Besides the above, there are several other species and genera, all Australian, and nearly all closely resembling the above bird in its peculiar habits. These now constitute the family *Megapodidae* (q. v.). The birds are edible, and are much sought as game.

Brusoni, GIROLAMO; Italian historian and poet; b. in Legnano, Dec. 10, 1610. He wrote many Latin and Italian poems; was for a time confined in prison at Venice for assuming improperly the dress of a Carthusian monk. He wrote many historical and other works, of which the best known is *Istoria d'Italia* (1656-80). D. after 1679.

Brussa: a city of Asia Minor. See Broussa.

Brussels (in Dutch, *Brussel*; Fr. *Bruxelles*); capital of Belgium; in the province of Brabant; on the river Senne; 27 miles by rail S. of Antwerp, and 227 miles by rail N. N. E. of Paris; lat. 50° 51' 40" N., lon. 4° 22' 13" E. (see map of Holland and Belgium, ref. 10-D). It is built partly on the slope of a hill which rises 220 feet above the level of the sea, and partly on a fertile plain. The upper town on the hill is the most modern and fashionable, and contains the royal palace, public offices, and the finest hotels. Brussels is the most important and populous city of Belgium, is remarkable for the number and richness of its antique buildings, and ranks among the finest cities of Europe. The walls

which formerly surrounded this city have been converted into broad promenades lined with double rows of shade trees. The Allée Verte is a fashionable promenade along the Scheldt Canal, and extends to the royal palace of Laeken, about 3 miles N. of the city. The principal public squares are the Place Royale, the Grande Place, in which stands the hôtel de ville, and the Place de la Monnaie, which contains the mint, the theater, and the exchange. Among the remarkable edifices of the city are the hôtel de ville, a fine Gothic structure with a spire 364 feet high, in the grand hall of which the Emperor Charles V. abdicated in 1555; the Gothic Cathedral of St. Gudule, which was built about 1270 and is celebrated for its painted windows, numerous statues, and carved pulpit; the Church of Notre Dame de la Chapelle commenced in 1134; the royal palace; the modern Church of Notre Dame de Bon Secours; the former palace of the Prince of Orange; and the Palace of the Fine Arts, which contains a large collection of paintings of the Flemish school; the Palais de Justice, built in 1866-83 at a cost of nearly \$10,000,000, situated in the upper part of the city on a commanding eminence, and one of the most strikingly handsome buildings in Europe. Brussels has a public library (Royal) of 350,000 volumes; a botanic garden; an astronomical observatory, one of the finest in Europe; a magnetic observatory; a free university, founded in 1834, with four faculties—viz., law, medicine, mathematical, and physical sciences, and belles-lettres; a normal school, a polytechnic school, and institutions for the blind and for deaf-mutes. The only mint of the kingdom is situated here. In 1888 a world's exhibition was held in this city. Brussels is one of the great centers of Belgian industry, and is celebrated for the manufacture of lace which is considered the finest in the world. The other chief products of its manufactories are fine linens, damasks, ribbons, gold and silver embroidery, glass mirrors, jewelry, paper, porcelain, hats, mathematical and musical instruments, carriages, and chemical products. Its trade is facilitated by a canal which connects it with Antwerp, and by railways which radiate in many directions. About one-third of the people of this city speak French, and the others Flemish or Dutch. Brussels was the seat of the International Monetary Conference, called by the U. S. to discuss the position of silver, which met in Dec., 1892. Pop. (with suburbs) (1880) 394,940; (1885) 438,843; (1891) 482,268; of the city proper (1891) 182,305.

Brussels Conference; a conference of delegates from the principal military powers, called by the Emperor of Russia in 1874, to prepare the way for an agreement upon a code of rules to govern civilized warfare. It met in Brussels July 27 of that year. Delegates from Russia, Germany, France, Austria, Great Britain, the Netherlands, Belgium, Italy, Spain, Denmark, Norway and Sweden, the Swiss Confederation, and Greece were present. The single English delegate attended under express stipulations that the rules of naval warfare should not be discussed. The U. S. were not represented, alleging the lateness of the invitation.

The draft of a code had been submitted before this to the governments invited, and many of its rules, embodying the best modern usage, were acceptable to all the delegates. Thus there was a substantial agreement on the subjects of lawful weapons, care of the wounded, pillage, sieges, armistices, prisoners of war, spies, treatment of public and private property, capitulations, duties of neutral states in case troops are driven across their frontiers, and flags of truce.

The chief points of difference related to the topics of "occupation of territory" and the "levée en masse." Here the interests of the great and of the smaller military powers proved irreconcilable. On the one side it was argued that a portion of the enemy's territory once occupied by an invader, its defenders having been arrested or driven out, remains lawfully in the hands of that invader as occupied territory, even though his forces may have advanced and left it vacant. In the opinion of the smaller states, occupation was held a question of fact, not of construction; it must be substantiated by the constant presence of an invading force strong enough to keep its people from rising.

In like manner the *levée en masse*, or popular rising against an invader in unoccupied territory, was held by one set of delegates to be lawful only when these irregular forces were properly officered, bore arms openly, and wore such a badge or uniform as to be recognizable at a distance. Such conditions were believed by the other set to be inconsistent with a popular rising for defense, a measure upon which states with no compulsory military service must rely in case

of invasion. The subject of what could be lawfully exacted from conquered territory under the head of requisitions and contributions was also in dispute.

Although thus failing of adoption, the Brussels conference was not without value. It brought out clearly the points at issue, and the necessity for compromise in regard to them. It was a promising step in a right direction. A later attempt to codify the laws of war was made in 1880 by a committee of the Institute of International Law, with the Brussels code as a basis. It legalizes the *levée en masse* on the sole condition that the rules of war be adhered to, and defines occupied territory as a region where the former sovereign has ceased to exercise authority and the invading power alone finds itself able to maintain order. This Oxford code is reasonable, and worthy of a recognition which it has not yet received from any government.

THEODORE S. WOOLSEY.

Brussels Sprouts: like the CABBAGE (*q. v.*), a form of *Brassica oleracea*. It takes its name from Brussels, Belgium, and from the term "sprouts," which is used for kale-like plants. It differs from the cabbage in forming little heads (or buds) in the axils of the leaves nearly the whole length of the stem. As these buds develop the leaves are cut away until only a crown is left at the top of the stem. These little heads attain a diameter of an inch or two. Brussels sprouts is grown for a fall crop, the seeds being started out of doors; the subsequent treatment is similar to that of cabbage.

L. H. BAILEY.

Brutus, Lucius Junius: Roman patriot; son of Tarquinia and nephew of Tarquin the Proud. According to tradition, that tyrant was about to put him to death, but he saved his life by feigning idiocy, which was the origin of his surname *Brutus*. When the tragic fate of Lucretia had prepared the people to revolt, Brutus led them, expelled the Tarquins from Rome, and founded a republic (509 B. C.). He was then elected one of the consuls. He ordered the execution of his own sons, Titus and Tiberius, who were convicted of treason. About 507 he was killed in a battle against the Tarquins.

Brutus, Marcus Junius: a Roman republican; descendant of the preceding; b. in 85 B. C. He married Portia, the daughter of Cato Uticensis, who was his maternal uncle. In the civil war he fought under Pompey against Caesar, but after the battle of Pharsalia he was kindly treated by the dictator, with whom he entered into friendly relations; he was appointed Governor of Cisalpine Gaul. His zeal for republican liberty and the influence of his friend Cassius induced him to join the conspiracy against Caesar; both took part in his murder; became prominent leaders of the republican party; led an army against that of Antony and Octavian at Philippi (42 B. C.), and after the reverse of Cassius Brutus killed himself on the field.

Bryan: village and capital of Williams co., O. (see map of Ohio, ref. 1-C); on Lake Shore and M. S. R. R.; 53 miles W. S. W. of Toledo. Has machine-shop, graded schools, and several churches. Pop. (1880) 2,952; (1890) 3,068.

Bryau: village and capital of Brazos co., Tex. (for location of county, see map of Texas, ref. 4-I); on Houston and Texas Cent. R. R.; 100 miles N. W. of Houston. Industries are saw and grist mill, carriage and wagon shop, chair-factory, etc. Near by is the Agricultural and Mechanical College of Texas, at College Station. Pop. (1890) 2,979.

Bryan, William Jennings: lawyer, politician, and journalist; b. at Salem, Ill., Mar. 19, 1860; educated at Whipple Academy and Illinois College, Jacksonville, Ill., where he graduated with honor in 1881; studied law at Chicago for two years; returned to Jacksonville, where he began practice; married a year later, and in 1887 removed to Lincoln, Neb.; was a delegate to the Democratic State convention at Omaha 1888; declined the nomination for lieutenant-governor 1889; in 1890 elected as a Democrat to Congress; became a member of the ways and means committee; advocated "tariff for revenue only" and attracted attention as a speaker, being frequently spoken of as the "boy orator of the Platte"; re-elected to Congress in 1892 and became a champion of "free silver." At the end of his second term he returned to Nebraska and became editor of the *Omaha World-Herald*. In 1896 he received the nomination for President of the U. S. of both the Democratic and the People's Party national conventions on a free-silver platform, but received only 176 electoral votes of the 244 necessary to a choice.

Bryanites: followers of William O'Bryan, who separated from the Wesleyans in 1815. See BIBLE CHRISTIANS.

Bryant, William Cullen: poet and journalist; b. in Cummington, Hampshire co., Mass., Nov. 3, 1794; educated at Williams College, which he entered in 1810. He studied law, and in 1815 was admitted to the bar, but after practicing successfully for ten years, first at Plainfield and then at Great Barrington, removed in 1825 to New York, and became an editor. In 1826 he became connected with the *Evening Post*, of which he was the editor-in-chief from 1828 till his death. Mr. Bryant visited Europe several times and presented the literary fruit of his travel in a series of *Letters of a Traveler* (1852 and 1859), *Letters from Spain and other Countries*, and *Letters from the East* (1869), which rank high in literature of their class. Bryant's career as a poet began very early. He contributed verses to the county gazette before he was ten years old; in his fourteenth year he published a political satire, *The Embargo*, together with another long poem, *The Spanish Revolution*, which in a twelvemonth reached a second edition. *Thanatopsis*, perhaps the most impressive and most widely known of his pieces, was produced in his nineteenth year. He published the first volume of poems, *The Ages*, in 1821 at Cambridge, and the first complete collection in 1832 at New York. Nevertheless, his poems are not many, nor are they the product of a facile muse; the principal characteristic of his poetry being thoughtfulness. His translations of the *Iliad* and *Odyssey* into blank verse were published in 1870 and 1871. He responded to frequent invitations to make ceremonial addresses—a duty that he discharged with rare felicity. His efforts in this kind have been collected in a volume of *Orations and Addresses* (1873). An edition of his works complete in four volumes was published in 1883-84, edited by his son-in-law, Parke Godwin. D. at New York city, June 12, 1878. See his *Life* by Parke Godwin (New York, 1883, 2 vols.). Revised by HENRY A. BEERS.

Bryce, George, LL. D.: Canadian clergyman; b. at Mt. Pleasant, Brant co., Ont., April 22, 1844. He graduated at Toronto University in 1869, at Knox College in 1871, and the latter year was elected as assistant and successor in Chalmers's church, Quebec. The same year he was authorized by the Presbyterian General Assembly to establish a college among Selkirk settlers on Red river, and also to organize a Presbyterian church in Winnipeg, Manitoba, all of which he successfully accomplished. The college was incorporated in 1883, and in 1884 was removed to Winnipeg. He was one of the principal founders of Manitoba University in 1871; appointed inspector of Winnipeg schools in 1877; examiner in natural science in Manitoba University in 1878; and moderator of first Presbyterian synod of Manitoba and Northwest Territories in 1884. Among his works are *Manitoba, its Infancy, Growth and Present Condition* (London, 1882); *Canada and the Northwest* (1887); and *A Short History of the Canadian People* (1886).

NEIL MACDONALD.

Bryce, James, M. P.: statesman and author; b. in Belfast, Ireland, May 10, 1838; educated at the High School and University of Glasgow, and at Trinity College, Oxford, graduating at the latter in 1862 with a double first; appointed Regius Professor of Civil Law in Oxford University 1870; elected to Parliament in 1880; Under Secretary of State for Foreign Affairs in Mr. Gladstone's government in 1885. Author of *The Holy Roman Empire* (9th ed. 1888); *Transcaucasia and Ararat* (1877; new ed. 1897); edited *Two Centuries of Irish History* (1888); *The American Commonwealth* (1888); and many essays and magazine articles. He has been interested in various political and social subjects; is a finished scholar and able writer. His *American Commonwealth* is the best known of his works in the U. S., and is generally regarded as the best description of the political and social institutions of the U. S. ever written. In 1892 he was appointed Chancellor of the Duchy of Lancaster, with a seat in the cabinet of Mr. Gladstone. C. K. ADAMS.

Brydges, Sir Samuel Egerton: English writer and bibliographer; b. in Kent, Nov. 30, 1762; published, besides many novels, letters, poems, etc., *Censura Literaria, Containing Titles and Opinions of Old English Books* (10 vols., 1805-09); *The British Bibliographer* (4 vols. 8vo, 1810-14); and *Res Literaria* (3 vols., 1821). He claimed that he was the lawful heir to the barony of Chandos, but his title was not recognized. D. at Geneva, Sept. 8, 1837. See his *Autobiography* (2 vols., 1834).

Bryen'nios, PHILOTHEOS: Greek Catholic bishop; b. in Constantinople, Mar. 26, 1833; educated at Chalee and in Germany; became Professor of Theology at Chalee 1861; metropolitan of Serrae, in Macedonia, 1875; of Nicomedia 1877. In 1873 he discovered the famous *Teaching of the Twelve Apostles* in the Jerusalem monastery in Constantinople, and published it first in 1883. See Dr. Schaaf's edition (3d ed. 1888).

Bryen'nius, NICEPHORUS: Byzantine historian and general; a minister of Alexis Comnenus, whose daughter, Anna Comnena, he married. D. about 1137. His *History of Constantinople* was edited by Meineke (1836).

Bryn'hild, or **Brynhil'da**: a beautiful maiden, celebrated in the Norse mythology. Though called a valkyria, she is evidently the same person as the Princess Brunhild of the *Nibelungen Lied*. See Thorp's *Northern Mythology*, vol. i.; also NIBELUNGEN LIED, in this work.

Bryn Mawr College (at Bryn Mawr, on the Pennsylvania R. R., 10 miles W. of Philadelphia): founded by Joseph W. Taylor, M. D., a member of the Society of Friends, who died in 1880, having bought the land, about 42 acres, and begun the erection of the college buildings during his lifetime. The college is intended to give to women of intelligence and refinement the best opportunities for culture, combined with Christian influences and social amenities. Its distinctive features are a high standard of preparation for admission; a system of studies which combines required courses for general culture with varied elective groups of two chief studies in fixed combinations and other free electives; graduate courses in all subjects offered to undergraduates; fellowships of \$525 each, nine in number, open to graduates who have already distinguished themselves in particular branches of study, namely, Greek, Latin, English, German, Romance languages, history, mathematics, biology, and chemistry. A fellowship is also offered yearly to a graduate of the college to enable her to pursue studies at some European university. M. Carey Thomas, LL. D., is president (1894).

Bry'ony: a tendril-bearing, climbing, herbaceous plant of the genus *Bryonia*, of the *Cucurbitacea* or Gourd FAMILY (*q. v.*). The genus contains about twenty species. They are natives of temperate and tropical regions. Two species (*B. dioica* and *B. alba*) occur in Europe, and from the roots of these is obtained the drug "Bryonia," a drastic hydragogue cathartic, now much less used than formerly. Some of the species are quite ornamental, and are desirable climbers since their tuberous roots are perennial, the stems and leaves only dying at the end of the year. The cut-leaved bryony of Ceylon is now assigned to the genus *Bryonopsis*.

Bryony, **Black**: a pretty, twining, tuberous-rooted plant (*Tamus communis*) belonging to the Yam family, and native of Europe, North Africa, and temperate Asia. It is somewhat cultivated for its beautiful foliage of heart-shaped, bright green leaves and bright red (but inedible) berries. A second species occurs in the Canary islands.

Bry'ophytes [from Gr. *βρύον*, moss + *φυτόν*, plant]: the mossworts (*Bryophyta*); one of the branches of the vegetable kingdom, characterized by the production of antherids and archegones, the latter after fertilization developing a more or less stalked, leafless *spore-fruit*. They are readily separated into two classes, viz.: (1) the liverworts (*Hepaticea*), which are mostly thalloid plants, with splitting spore-fruits, containing elaters; (2) the mosses (*Musci*), leafy-stemmed plants, with spore-fruits mostly opening by a lid, and containing no elaters. See PLANTS (Fossil). C. E. BESSEY.

Bryozo'a [from Gr. *βρύον*, moss + *ζῷον*, animal]: group of animals of doubtful affinities, being placed by some zoölogists as one of the classes of the *Molluscoida*, the *Brachiopoda* being the other class; by others as one of the orders of the class *Prosoparia*, of the branch *Vermes*. (See WORMS.) They are very small, and moss-like or polyp-like in appearance, usually united together in colonies, mostly marine, but some species live in fresh water. They are also known as POLYZOA (*q. v.*). J. S. K.

Bry'son, ANDREW: rear-admiral U. S. navy; b. in New York, July 25, 1823; entered the navy 1837; commanded the ironclad *Lehigh* in 1863 and 1864 at the reduction of Fort Macon, and was in all the important fights with the defenses of Charleston harbor; became commander 1873; rear-admiral 1880; retired 1881. D. in Washington, D. C., Feb. 7, 1892.

Bu'balus [Gr. *βούβαλος*, a species of antelope]: a genus of *Bovidae*, the species of which constitute the buffaloes of India and Africa. See BUFFALO.

Bubas'tis (the *Pi-beseth* of Scripture and modern *Tel-basin*): a ruined city of Lower Egypt; in the delta of the Nile; about 75 miles a little E. of N. from Cairo; lat 30° 36' N., lon. 31° 33' E. The site is now occupied by extensive mounds containing the remains of brick houses and broken pottery. See *Herodotus* ii., 137, 156.

Bubastis: a goddess of ancient Egypt; a deification of the moon corresponding to the Greek Artemis; said to signify literally "she who multiplies her aspects"; so called in allusion to the changes of the moon. According to other authorities, Bubastis was the deification of the cat, which animal, as is well known, was an object of worship in ancient Egypt. Her name, according to modern Egyptologists, was *Pecht* or *Pusht*.

Bubble: a globular film or vesicle of water or other liquid inflated with air, vapor, or gas. The study of bubbles has added much to our knowledge of capillarity and of molecular action in liquids. The thickness of the soap-bubble film, determined by means of the interference of light, to which the bubble owes its transcendent coloring, has furnished physicists with a means of estimating the probable size of the molecule. Soap films have been observed the thickness of which was certainly less than $\frac{1}{1000000}$ of an inch. It is certain that a molecule of water can not exceed such a film in thickness, and there are reasons, on the other hand, for thinking that its diameter can not be less than $\frac{1}{1000000000}$ E. L. N.

Bubon'ic Plague: See PLAGUE.

Bucaraman'ga: the capital of the department of Santander, republic of Colombia; lon. 73° 10' W., lat. 7° N.; on the east side of the main mountain-range (see map of South America, ref. 2-C). There are extensive gold, copper, and iron mines in the vicinity. Pop. 16,000.

Buccaneer' [from Fr. *boucanier*, deriv. of *boucaner*, to smoke meat on a *boucan*, a native So. Amer. name for a wooden grate or framework used in drying meat]: a name originally applied to French hunters in Hayti who brought their meat to market cured; then to the famous adventurers or filibusters who in the sixteenth and seventeenth centuries infested the West Indies and the Spanish colonies of South America. They were mostly English and French, and were united by a common hostility to the Spaniards, to plunder whom was their principal object and business. For mutual protection against the cruelty of the Spaniards, they organized themselves into an association or community bound by a simple code of laws. The island of Tortuga was at one time occupied by them, and was their chief base of operations. They took immense booty from the Spanish galleons which conveyed precious metals to Spain, and often attacked towns on the coasts. Among the famous and able leaders of the buccaneers were the French Montbar, surnamed THE EXTERMINATOR, and Henry Morgan, a Welshman, who was born about 1637. The latter organized fleets and armaments, took fortresses, and displayed remarkable military talents. He was knighted by Charles II., and made governor of Jamaica, already in possession of his confederates. The navigator Dampier also took part with the buccaneers in some expeditions against the Spaniards. The wars of William III. with France dissolved the confederation, and in 1701, treaty of Ryswick, the buccaneers lost their political character, and were replaced by a set of marine thieves or vulgar pirates. See James Burney, *History of the Buccaneers* (1816); Thornbury, *Monarchs of the Main* (1855); and *Les Filibustiers au XVII^e Siècle* (1884).

Buccina'tor [Lat. deriv. of *buccina're*, to blow the trumpet, Lat. *buccina*]: a muscle situated in the substance of the cheeks; so called because, when the cheeks are distended with air, the contraction of the buccinator muscle forces it out. Its principal use is to hold the food between the teeth during mastication.

Buc'cinum [Lat., trumpet]: a genus of gasteropod mollusks known as the whelks; characterized by a shell with a smooth nonplicated columella, and with a fissure or short respiratory canal inflected toward the left. The shape of some species of this genus resembles that of a trumpet. *Buccinum undatum* is one of the most common of the species, and is a typical representative of the genus. Most of the living species are found in the cold zones; many are fossil.

Buc'clench, DUKES OF (1663): Dukes of Queensberry, Marquesses of Dumfriesshire, Earls of Drumlanrig and Sanguhar (1684), Earls of Buccleuch (1619), Earls of Dalkeith (1663), Viscounts of Nith, Torthorwald, and Ross, and Barons Douglass (1684), Barons Scott of Buccleuch (1606), Barons Scott of Eskdale (1619), Lords Scott of Winchester (1663, in Scotland), Earls of Doncaster, and Barons Tynedale (1662, in England); a noble family of Scotland, descended from Sir Walter Scott of Branxholm and Buccleuch, a brave and powerful chieftain who lived in the reign of James V. He fought at the battle of Pinkie in 1547, and died in 1552. Some incidents of his life formed the subject of Scott's poem, *The Lay of the Last Minstrel*. His great-grandson, also named Sir Walter, was raised to the peerage as Lord Scott of Buccleuch in 1606. The first duke was beheaded in 1685, but the duchess retained the title and estates. Henry, the third duke, born in 1746, was a pupil and friend of Adam Smith. He distinguished himself by his efforts to improve his extensive estates by planting trees, enriching the soil, making roads, and improving the breed of sheep. D. in 1812. —His grandson, WALTER FRANCIS, b. Nov. 25, 1806, the fifth Duke of Buccleuch and the seventh of Queensberry, is said to have spent £320,000 in improving the harbor of Granton, about 2 miles from Edinburgh, the greatest public work ever executed in Scotland by an individual at his own expense. He succeeded his father in 1819; was Lord Privy Seal 1842-46; and president of the council in 1846. D. in 1884. —The sixth duke, WILLIAM HENRY WALTER, b. in 1831, was M. P. for Midlothian 1853-68 and 1874-80.

Bucen'taur (It. *Bucentoro*): name of a celebrated Venetian galley which was gilded and sumptuously furnished, and was used only once a year in a splendid aquatic procession, when the doge performed the ceremony of espousing the Adriatic on Ascension Day by dropping a ring into the water. It was about 100 feet long, and in the annual procession was followed by many gondolas and feluccas. It was burned in 1797, having been kept for this service since 1177.

Buceph'alus [Gr. *Βουκέφαλος*, ox-head, probably applied to a horse branded with the mark of an ox-head]; the favorite horse of Alexander the Great, who rode on him in all his campaigns. He was purchased in Thessaly by King Philip, and cost, according to Pliny, 16 talents, equal to nearly \$20,000 of our money. The royal grooms were unable to manage him, but Alexander, then very young, tried and succeeded; and Bucephalus would never permit any one but Alexander to ride him. Bucephalus died in India from the effects of wounds received in battle about 326 B. C., and Alexander built in his honor the city Bucephala on the Hydaspes.

Bu'eer [from Gr. *βόης*, cow + *κέρας*, horn; being a literal translation of his German name, *Kuhhorn*], MARTIN; German Reformer; b. in Schlettstadt, near Strassburg, in 1491; was for a time a Dominican friar; became a Protestant in 1521; a friend of Luther; studied Greek and Hebrew at Heidelberg. He introduced the Reformed doctrines at Strassburg 1523, and was for many years Professor of Theology at that city. When dissensions arose between Luther and Zwingli, Bu'eer acted the part of mediator. At first he openly repudiated Luther's doctrine. He composed the Tetrapolitan Confession, which was offered at Augsburg alongside of that of the Lutherans. In 1536 he went to Wittenberg to effect a reconciliation. The result was *The Wittenberg Concord*, in which he indorsed Luther's doctrine of the Real Presence, but denied that unbelieving communicants received Christ's body. This appears to have remained his position to the end. In 1543 he co-operated with Melancthon in the preparation of the Formula for the Reformation of Cologne by Archbishop Hermann, a document whose chief significance is the important part which it bore in the preparation of the English *Book of Common Prayer*. At the invitation of Archbishop Cranmer he went to England in 1549, and became Professor of Theology at Cambridge, prominently participating in the reforms made by Cranmer, especially in the liturgical sphere. Of this activity his *Censura on the Prayer-book* (1550), and the other writings contained in his *Scripta Anglicana* (Basel, 1577) are memorials. D. in Cambridge, England, Feb. 28, 1551. See his biography by J. W. Baum (Elberfeld, 1860) and in Stephen's *Dictionary of National Biography*. HENRY E. JACOBS.

Bucero'rida [from Gr. *βούκερας*, ox-horned], or **Horn-hills**: a family of the *Picaria*, remarkable for the excessive size of the mandibles, of which the upper usually supports a large horn-like protuberance. The feet are strong and short, the wings short; size large.

Buch, bookh. LEOPOLD, von; geologist; b. at Stolpe-on-the-Oder, Prussia, Apr. 25, 1774; studied mineralogy under Werner at Freiberg; explored the geology of many countries of Europe, generally traveling on foot. In 1805 he witnessed an eruption of Mt. Vesuvius, which converted him to the Plutonic theory. Among his principal works are *Geognostic Observations during Travels in Germany and Italy* (2 vols., 1802-09); *Travels in Norway and Lapland* (1810); and *On the Mountain Systems of Russia* (1840). He published an excellent geological map of Germany (1824); was author of the doctrine of the slow upheaval of continents. D. in Berlin, Mar. 4, 1853. See the English translation of Flourens's *Enology on L. von Buch*, in the Smithsonian Report for 1862, p. 358.

Buchan, būk'h'an; a district of Scotland; in the north-eastern part of Aberdeenshire; consists of about one-fourth of the county lying between the Doveran and the Ytham.

Buchan'an; village (incorporated in 1858); Berrien co., Mich. (for location of county, see map of Michigan, ref. 8-G); on the St. Joseph river, and on railroad; 87 miles E. of Chicago and 197 miles W. of Detroit. Buchanan has a graded school and six churches; it is situated in the midst of a rich agricultural and fruit region, has a large trade, and a variety of manufactures. Pop. (1880) 1,894; (1890) 1,994; (1894) 1,895. EDITOR OF "RECORD."

Buchanan, byū-kan'an, CLAUDIUS, D. D.; clergyman of the Church of England; b. at Cambuslang, near Glasgow, Scotland, Mar. 12, 1766; educated at Queen's College, Cambridge, England. He was professor in the College of Fort William in Bengal (1799-1807); returned to England 1808; wrote *Christian Researches in Asia* (1811), a work that contributed largely to awaken the missionary spirit of the present time. D. in Broxbourne, Hertfordshire, Feb. 9, 1815. See *Memoirs*, by Dr. Hugh Pearson (London, 1819; 5th ed. 1846).

Buchanan, FRANKLIN; b. in Baltimore, Md., Sept. 18, 1800; became a midshipman of the U. S. navy in 1815; passed through the various grades of the service, becoming a captain in 1835. In 1861 he resigned, intending to enter the Confederate service, but subsequently he asked to be restored. His request was refused, and he then joined the Southern navy. He commanded the Merrimack frigate after she was fitted up as an ironclad, and with her engaged and sunk the wooden frigates Congress and Cumberland. Being wounded in this affair, the command of the Merrimack in the encounter with the Monitor devolved upon Lieut. Catesby Jones. For this service Buchanan was made a Confederate admiral; was defeated and made prisoner by Farragut in Mobile Bay Aug. 5, 1864, having fought on board the ironclad Tennessee, and lost a leg. President of the Maryland Agricultural College after the war. D. in Talbot co., Md., May 11, 1874.

Buchanan, GEORGE; Scottish poet and historian; b. at Killearn, Stirlingshire, Feb., 1506. He was well educated in Paris, and became a professor in a college of that city. Having adopted the Reformed doctrines, he returned to Scotland in 1537, and wrote *Somnium*, a satire against the monks, for which he was persecuted. He took refuge in England, and passed over to France about 1540. He was employed as a teacher in Bordeaux and Paris for several years, during which he wrote some Latin tragedies; also taught three years in the Portuguese university in Coimbra, where he was driven by persecutions for suspected heresy. After several changes of residence and adventures, he returned to Scotland in 1560. In 1562 he was appointed classical tutor to Mary Queen of Scots. His religious and political principles rendered him in the civil war that ensued a supporter of Regent Murray, who made him principal of St. Leonard's College, St. Andrews. Lennox made him preceptor to the young king, James VI., in 1570, and Keeper of the Privy Seal in the same year. D. in Edinburgh, Sept. 28, 1582. As a scholar he was almost unrivaled by any of his contemporaries. He wrote Latin verse with great purity, and was humorous, sarcastic, and profound. His chief works are a *History of Scotland* (Rerum Scoticarum Historia, 1582); a metrical Latin version of the Psalms (1570); *Franciscanus*, a poetical satire; and a posthumous tract, *De Jure Regni*, affirming that kings exist by will of the people, which had great influence in the politics of the next century. See his *Autobiography*, 1608; David Irving, *Memoirs of the Life of George Buchanan* (1817).

Buchanan, ISAAC: Canadian politician; b. in Glasgow, Scotland, July 21, 1810; became a leading merchant and president of the board of trade in Hamilton, Ontario. He was active in putting down the rebellion of 1837, and was for many years prominently engaged in public affairs. He published *The Relations of the Industry of Canada with the Mother Country and the United States*. Elected to the Canadian Parliament in 1841 for the city of Toronto, he helped to secure responsible government for the people and to procure the reduction of the duty on Canadian wheat. In 1843 he supported Lord Metcalf's administration at the head of the Constitutional or order party. For many years he held a seat in the executive council of the province. D. Oct. 1, 1883.

Buchanan, JAMES: fifteenth President of the U. S.; b. near Mercersburg, Franklin co., Pa., Apr. 23, 1791; graduated at Dickinson College, Carlisle, in 1809; admitted to the bar in 1812. He was a Federalist in his youth, but supported the war of 1812-15, which he thought glorious to the people but disgraceful in the extreme to the administration. The death of his betrothed led him into politics as a distraction from his grief, and in 1820 he went to Congress, where he served ten years, turning Democrat on questions of internal improvement. Here he was especially conspicuous on bills reorganizing the judiciary and fixing its appellate jurisdiction. In 1828 he supported Gen. Jackson for the presidency, who sent him in 1831 as minister to Russia, where he concluded a favorable commercial treaty; was U. S. Senator 1834-45, when he took an influential position, defending the executive prerogatives of veto and of removing civil-service officials at will, urging spoliation claims against France, and also the expunging from the record of the senatorial censure of Jackson. While defending the right of petition, he declared against the power of the Government to interfere with slavery in the States. At this time his separation from Whig doctrines became complete, and he refused to be a candidate for the presidency, after having been a conspicuous supporter of Van Buren, that the nomination might go to James K. Polk, who appointed him his Secretary of State. The questions he confronted then were the northwest boundary-line of Oregon, the Mexican war, and the application of the Monroe doctrine to California and Central America, with a view to prevent British acquisitions there. Mr. Buchanan formulated the policy of the administration on these points. During the Taylor-Fillmore government he established himself at Wheatlands, near Lancaster, and received his niece, Harriet Lane, and a nephew in their orphanage into his family. Here he opposed the Wilmot proviso, and supported the compromises of 1850. After four years of private life he was sent by President Pierce, with whom he had contested the nomination for presidency, as minister to England in 1853. He then joined in the Ostend manifesto, proposing the acquisition of Cuba by treaty or otherwise. It was his bid for the Democratic nomination, and it won. He was nominated by the Democrats, and elected President of the U. S. in 1856. The other candidates were John C. Fremont, Republican, and Millard Fillmore, "American." Mr. Buchanan received 174 electoral votes. His cabinet contained Howell Cobb, J. B. Floyd, Jacob Thompson, and Isaac Toucey, who proved to be secessionists and labored to weaken the Government, but Mr. Buchanan perceived this reluctantly and tardily. He blamed the North for its abolitionism as a cause of sectional hatred, supported the Lecompton Constitution for Kansas, and directed a government controlled by the Southern Democracy, even to the extent of using his influence against the nomination of Douglas. The problem of his administration was to prevent the division of the Democratic party, and in this he utterly failed, becoming a partisan of the Southern wing. When secession came on he was tortured between his subservency to the conspirators in his cabinet and among his counselors and his desire to postpone the collapse of the Union under his administration. His final position was announced in a feeble message of Dec., 1860, in which he blamed the Northern people for the disruption of the Union, and affirmed that the executive had no power or right to prevent the secession of a State. He published in 1866 *Mr. Buchanan's Administration*, a work in defense of his policy as President. Events forced the disunionists to leave the cabinet, and they were replaced by loyal men who passed the possession of the Government over to Mr. Lincoln with only seven States in secession. In his retirement Mr. Buchanan supported the war for

the Union. D. near Lancaster, Pa., June 1, 1868. See his *Life* by G. T. Curtis (New York, 1883).

Buchanan, ROBERT CHRISTIE: soldier; b. in Maryland about 1811; graduated at West Point in 1830; Feb. 8, 1864, colonel Tenth Infantry. He served in Black Hawk war 1832; in command of gunboats in the battle of Bad Axe river; as adjutant Fourth Infantry 1835-38; in Florida war 1836-48—1841-42; in the military occupation of Texas 1845-46; in the war with Mexico 1846-48 under both Taylor and Scott; in command of district of Oregon and Northern California 1856; against Rogue river Indians; superintendent of Western recruiting 1857-59. In the civil war he served in the Virginia Peninsula 1862; Gaines's Mill (brevet colonel), Malvern Hill (brevet brigadier-general); in Northern Virginia campaign 1862; engaged at Antietam and at Fredericksburg (brevet major-general); assistant provost-marshal, etc., for New York 1864, and member of commissions 1865-68. Retired from active service Dec. 31, 1870. D. in Washington, D. C., Nov. 29, 1878.

Buchanan, ROBERT WILLIAMS: poet and romancer; b. at Glasgow, Aug. 18, 1811; educated at Glasgow University; went to London in 1860. He has published some forty volumes in prose and verse, consisting of novels, plays, poems, and critical essays. Among these are *Hyls and Legends of Inverburn* (1865); *David Gray and Other Essays* (1868); *The Drama of Kings* (1871); *The New Abelard, a Romance* (1884). He attacked Rossetti, Swinburne, and others in an article in the *Contemporary Review* entitled *The Fleshly School of Poetry* (1872). He visited the U. S. in 1884-85.

HENRY A. BEERS.

Buchanan, THOMAS MCKEAN: lieutenant-commander U. S. navy; b. at Bellefonte, Pa., Sept. 10, 1837; graduated at the Naval Academy in 1855. He was in many engagements on the lower Mississippi in co-operation with the Union army, and on Jan. 15, 1862, fell, shot through the head, while "encouraging in his own person his officers and men to fight courageously" in the sharp action at Bayou Têche.

Buchanites, búkhan-its: a Scotch fanatical sect, now extinct; derived its existence (in 1783) and its name from a Mrs. Buchan, whose maiden name was Elspeth Simpson; b. at Fatmucken, between Banff and Portsoy, in 1738; married Robert Buchan, but separated from him; in 1781 removed to Glasgow, and in 1783 to Irvine, where she, with Rev. Hugh White, founded the sect, which ultimately numbered forty-six. White claimed that Mrs. Buchan was the woman mentioned in Rev. xii., and she that he was the man-child. The sect was expelled for immoral practices in 1784, and established the farm of New Cample, in the parish of Closeburn, Dumfriesshire. Mrs. Buchan professed to give the Holy Ghost by breathing. She died May, 1791—a disproof of their claim that they would be living on the earth when Christ came. The last of the sect died in 1848. See Train, *The Buchanites from First to Last*, Edinburgh, 1846.

Buchares' (i. e. City of Joy): the capital of Roumania; situated in a fertile plain on the river Dimbovetza, about 140 miles N. W. of Varna; lat. 44 25 30 N., lon. 26 5 24' E. (see map of Austria-Hungary, ref. 9-M). The houses are mostly mean, and the streets dirty and not well paved. It contains over 100 churches, a college, a public library, several hospitals, and an excessive number of gaming-houses. This city has the reputation of being the most dissolute capital in Europe. It is the entrepôt for the trade between Austria and Turkey, the chief articles of which are grain, wool, salt, building-timber, cattle, and wax. The treaty of peace by which the sultan ceded Bessarabia and part of Moldavia to Russia was concluded here in May, 1812. Pop. (1876) 221,000; (1892) probably 250,000.

Bucheler, FRANZ: classical philologist, eminent authority in the domain of early Latin; b. in Rheinberg, June 3, 1837; professor in Bonn since 1870. Among his works are *Grundriss der lateinischen Declination* (1879); *Frontinus, de aquis urbis; Periclitium Veneris; Petronius* (ed. mai. 1862; together with *Liber Priaporum*, Varro's *Sabara Menippa*, and the *Apocryphodesis* of Seneca, 1882); *Quinti Cicronis reliquæ* (1869); *Herodas* (1892); and numerous articles on early Latin in the *Rheinische Museum* and elsewhere.

A. G. DELMAN.

Buchez, bú'shay, PHILIPPE JOSEPH BENJAMIN: philosophical writer and republican; b. in Mortagne, Ardennes, France, Mar. 31, 1796. He studied medicine, and took part in several plots against the Bourbons. He wrote, les@les

other works, *The Science of the Development of Humanity* (1833), and a *Complete Treatise on Philosophy from the Catholic and Progressive Point of View* (3 vols., 1840). Buchez and Roux Lavergne published *The Parliamentary History of the French Revolution* (40 vols., 1833-38). He was president of the National Assembly in May, 1848. D. in Rhodes, France, Aug. 12, 1865.

Büchner, FRIEDRICH KARL CHRISTIAN LUDWIG; b. in Darmstadt, Germany, Mar. 20, 1824; a leading advocate of "humanitarian," materialistic, and atheistic opinions. His best-known work is entitled *Kraft und Stoff* (Force and Matter, 1854). He has written also two volumes with the title *Physiological Pictures* (1861): one on *Natural Philosophy: Six Lectures on Darwin* (1868); and a work on *Man in the Past, Present, and Future* (1869-70). The latter has been translated (1872) into English by W. S. Dallas, F. L. S. With considerable acquaintance with recent science, an easy style, and some ingenuity of argument, the principal attraction of Büchner's works to most readers is, probably, his audacity. In 1872-73 Büchner made a lecturing-tour in the U. S., under the auspices of the German Turverein, but without marked results in the propagation of his opinions.

Buchtel College (Akron, O.): Its corner-stone was laid July 4, 1871, and it was opened for the reception of students Sept. 11, 1872. It was founded by the Ohio Convention of Universalists, and named Buchtel College in honor of John R. Buchtel (1820-1892), whose benefactions to the college are estimated at \$500,000. It is open to men and women on equal terms, and offers three courses of study—the classical, the philosophical, and the scientific—leading respectively to the degrees of A. B., Ph. B., and B. S. Besides the main college building it has an astronomical observatory and a gymnasium.

Buchu, bu yu kyü [a South African word]: the leaves of *Barosma crenata*, *crenata*, and *serratifolia*, and of other strong-smelling South African plants used in medicine for their diuretic properties. They belong to the family *Rutaceæ*, and are used by the Hottentots for many diseases. The natives also prize them for their fragrance, and use them in perfuming their bodies. In commerce the various kinds of buchu are known as "round" and "long" buchu, etc. They all contain a volatile oil.

Buck, the male of the fallow deer and of other species of deer; also the male of sheep, goats, antelopes, and rabbits. The term is not properly applied to the male of red-deer or American deer, which is called a stag. The term doe is applied to the females of those species of deer the males of which are called bucks.

Buck, DUDLEY; organist and composer; b. in Hartford, Conn., Mar. 10, 1839; studied first at home and later in Leipzig. On his return was appointed organist of Park church, Hartford, and a few years later went to St. James's church, Chicago. The great fire of 1871 having destroyed his home there, he returned East, and was for a short time organist of the great organ in Music Hall, Boston; soon went to New York, and acted as substitute conductor of Thomas's Central Park Garden concerts; was appointed organist of St. Ann's church, Brooklyn, and later of the Church of the Holy Trinity, Brooklyn, where he still remains. Buck is one of the finest organists in the U. S., and as a composer is also very eminent. In 1876 he was selected to compose the cantata for the opening of the Centennial Exhibition in Philadelphia. His cantata *Scenes from Longfellow's Golden Legend* took the \$1,000 prize at the Cincinnati festival of 1880. He has also composed the following cantatas: *Forty-sixth Psalm; The Legend of Don Munito; Voyage of Columbus* (for male voices); *The Light of Asia* (text by Edwin Arnold); *Hymn to Music; The Nun of Nidaros* (for male voices); *King Olaf's Christmas* (for male voices); *Chorus of Spirits and Hours*, from Shelley's *Prometheus*, besides an opera, *Deseret*, and another in manuscript and unproduced, together with numerous songs and part songs, for both male and mixed voices, and very many pieces for the organ, and almost numberless pieces of church music. He is the conductor of the Apollo Club of Brooklyn, a society of male voices, and has frequently officiated as judge in musical competitions. His music is very popular, being full of beautiful melody. He has also composed several works for full orchestra, including several symphonies, a concert overture, *Marmion*, and some smaller works. His cantata *The Story of the Cross* was published in 1891. D. E. HERVEY.

Buck Bean, or **Marsh Trefoil** (*Menyanthes trifoliata*): a plant of the family *Gentianaceæ*. It is indigenous in Europe and the U. S., and is widely distributed in the colder parts of the northern hemisphere. It grows in bogs and marshes, hence also called *bog-bean*. The leaves are ternate, the corolla funnel-shaped and five-parted, and the fruit is a pod or two-valved capsule. A bitter extract obtained from the leaves is a valuable remedy for dyspepsia and disorders of the bowels. The whole plant is tonic, and is used in Germany as a substitute for hops.

Buckeye: the popular name of certain American exogenous trees and shrubs of the genus *Æsculus* and the family *Sapindaceæ*. The Ohio buckeye (*Æsculus glabra*), growing in the valley of the Mississippi, is a large tree with a strong-smelling bark, small obscure flowers, and prickly fruit containing the seed, a large nut resembling that of the horse-chestnut tree, which is a near relative of this buckeye. The sweet buckeye (*Æ. octandra*), a tree, sometimes a shrub, of a range rather more to the south than that of the preceding, has yellow or sometimes dull purple flowers. The red buckeye (*Æ. parva*) has a still more southern habitat. It is generally small, and has bright-red flowers. The California buckeye (*Æ. californica*) is a tree 30 to 40 feet in height, growing on the Coast Range Mountains and the western slopes of the Sierra Nevada. There are various other species in Asia. Revised by CHARLES E. BESSEY.

Buckhan'non: town; capital of Upshur co., West Va. (for location of county, see map of West Virginia, ref. 7-II); on W. Va. and Pitts. R. R., and on Buckhannon river; 41 miles from Clarksburg. Here are flouring, saw, and woolen mills, tannery, a furniture-factory, and two colleges. Pop. (1880) 761; (1890) 1,403.

Buckingham, GEORGE VILLIERS, Duke of; favorite of James I. of England; b. in Leicestershire, Aug. 20, 1592. He became in 1617 a gentleman of the bedchamber, and obtained in the space of two years the titles of baron, viscount, and earl. In 1616 he was appointed lord admiral of England. He accompanied Charles, Prince of Wales, when he went to Madrid in 1623 to obtain in marriage the infanta of Spain. The failure of this suit was ascribed to the arrogance of Villiers, who in his absence was created Duke of Buckingham. He negotiated the marriage of the prince with Henrietta of France; contrived a disastrous expedition against Cadiz and an impotent one against Rochelle, from which he returned in disgrace. After the death of James I. he became the favorite and prime minister of Charles I., but he made himself odious to the nation. He was assassinated in Portsmouth while embarking for a second raid on Rochelle by John Felton, Aug. 23, 1628.

Buckingham, GEORGE VILLIERS, Duke of; b. in Westminster, Jan. 30, 1627. He was an adroit courtier, but profligate and unprincipled. On the defeat of the royalist party in 1651 he went into exile. At the Restoration (1660) he became a member of the privy council and an enemy of Lord Clarendon, after whose fall (1667) he was a confidential minister of Charles II. He was the president of the ministry called the "Cabal." He wrote the *Rehearsal*, a burlesque on the heroic plays of Dryden and other Restoration dramatists, produced at the King's theater in 1671, with immense success, and other plays. D. in Kirby Moorside, Yorkshire, Apr. 16, 1688.

Buckingham, JOSEPH TINKER; writer; b. at Windham, Conn., Dec. 21, 1779; published *Specimens of Newspaper Literature* (1850) and *Personal Memoirs* (1852); became successively editor of the *New England Galaxy*, the *Boston Courier*, and the *New England Magazine*. D. in Cambridge, Mass., Apr. 11, 1861.

Buckingham, WILLIAM ALFRED; war Governor of Connecticut; b. in Lebanon, Conn., May 28, 1804; brought up on a farm; became a manufacturer in Norwich, of which city he was mayor for four terms; was nine times successively elected Governor of his native State (1858-66); sent 55,000 troops to the Union army without drafting, an excess of the quota of the State by 6,000; U. S. senator 1869 to his death; eminent in temperance and missionary projects, and in Congregational councils; gave \$25,000 to Yale Theological Seminary; d. in Norwich, Conn., Feb. 3, 1875. A statue of him is in the State-house at Hartford.

Buckinghamshire (England): See Bucks.

Buckingham and Chandos, DUKES of; Marquesses of Chandos and Earls Temple of Stowe (1822, in the United Kingdom), Marquesses of Buckingham (1784), Earls Tem-

ple (1749), Viscounts and Barons Colham (1718, in Great Britain), Earls Nugent (1776, in Ireland), Barons Kinloss (1601, in Scotland), a noble family of Great Britain.—**RICHARD PLANTAGENET CAMPBELL TEMPLE NUGENT-BRYDGES CHANDOS GRENVILLE**, the third duke of this family, b. in 1823, succeeded his father in 1861. He was lord president of the council 1866-67, Secretary of State for the Colonies 1867-68, and became Lord-Lieutenant of Bucks; governor of Madras 1875-80; chairman of committees of House of Lords, D. Mar. 27, 1889, and the dukedom was extinguished with him.

Buckinghamshire, EARLS OF (1746, in England): Barons Hobart (1728, in Great Britain), and baronets (1611, in England), a noble family of Great Britain.—**AUGUSTUS EDWARD HOBART**, the sixth earl, b. Nov. 1, 1793, succeeded his brother in 1849, and d. in 1885. Present earl is **SIDNEY CARR HOBART-HAMPDEN**, b. in 1860.

Buckland, **CYRUS**: inventor; b. in Manchester, Conn., Aug. 10, 1799; became a machinist, and found employment in the Springfield armory. He invented a machine for turning gun-stocks finished from the rough block; also perfected the interchangeability of the parts of a musket, reducing the cost one-half. Received \$70,000 from Congress for his inventions; retired in broken health in 1859; d. Feb. 26, 1891.

Buckland, **WILLIAM**, D. D., F. R. S.: geologist; b. in Tiverton, England, in 1784; educated at Corpus Christi College, Oxford; reader on geology on royal foundation at Oxford in 1819; author of a distinguished work in geology, *Reliquie Diluvium* (1 vol., 1823). His principal work is the Bridgewater Treatise entitled *Geology and Mineralogy, Considered with Reference to Natural Theology* (2 vols., 1836). In 1825 he became a canon of Christ church, Oxford; Dean of Westminster in 1845. D. Aug. 14, 1856.—**FRANCIS TREVELYAN**, his son; b. in Oxford, Dec. 17, 1826; a pisciculturist; became inspector of British salmon and herring fisheries; wrote treatises on his favorite pursuits; d. Dec. 19, 1880. See his *Life* by J. C. Bompas (London, 1885).

Bucklan'dia: a large and beautiful evergreen tree of the family *Hamamelaceae*; native of the Himalaya Mountains. The trunk is sometimes 7 feet in diameter at 5 feet from the ground, and grows to the height of 40 feet before it branches. The foliage is thick and glossy, but the timber is not very valuable.

Buckle, **GEORGE EARLE**: English journalist; b. June 10, 1854; educated at Oxford; was called to the bar at Lincoln's Inn, 1880; entered the office of *The Times* in 1880, and became its editor in 1884. Married in 1885 a daughter of James Payn.

Buckle, **HENRY THOMAS**: philosophical historian; b. at Lee, in Kent, Nov. 24, 1822. His father was a merchant, at whose death he came into the possession of an ample fortune, and was enabled to gratify his fondness for books, forming, it is said, one of the finest private libraries to be found in all Europe. He published in 1857 the first volume of the *History of Civilization in England*, a work displaying great boldness as well as affluence of thought, and characterized by an easy and vigorous style. It proposed to introduce a new method of studying and writing history which should raise history to the rank of a real science. The second volume appeared in 1861. He taught that skepticism was the source of progress and credulity retarded it, working out his conclusions often in a one-sided way and with boldness offensive to conservative minds. Mr. Buckle set out on an Eastern tour in 1861, and died at Damascus, May 29, 1862. The three volumes of *Miscellaneous and Posthumous Writings* were edited by Miss Taylor (1872). See his *Life* by A. H. Huth (1880).

Buckley, **JAMES MONROE**, D. D., LL. D.: editor and minister of the Methodist Episcopal Church; b. at Rahway, N. J., Dec. 16, 1836; educated at Pennington Seminary and Wesleyan University; entered the ministry 1858; editor of *The Christian Advocate* (New York since 1880); author of *Two Weeks in the Yosemite and Vicinity* (New York, 1873); *Christians and the Theater* (1875); *Supposed Miracles* (Boston, 1875); *Midnight Sun, the Year and the Nihilists* (Boston, 1886); *Oats or Wild Oats* (New York, 1885); *Faith Healing* (New York, 1892).

Buckley, **SAMUEL BOYSFORD**, Ph. D.: b. in Torrey, Yates co., N. Y., May 9, 1809; graduated at Wesleyan University in 1836; traveled extensively, chiefly in the Southern States,

as a student of botany, malacology, geology, geodesy, etc.; was assistant naturalist and geologist in the State survey of Texas 1860-61; was connected with the U. S. sanitary commission 1862-65; State geologist of Texas 1866-67; was 1871-72 editorially connected with the *State Gazette*, Austin, Tex.; was author of many scientific and other papers, and prepared a work on the trees and shrubs of the U. S. He discovered the flowers and fruit of the shrub or small tree *Buckleya distichophylla*, named in his honor by Dr. Torrey. D. in Austin, Tex., Feb. 18, 1884.

Buckminster, **JOSEPH**, D. D.: an orthodox divine; b. at Rutland, Mass., Oct. 14, 1751; graduated at Yale in 1770; became pastor of a church at Portsmouth, N. H., in 1779; and was an eloquent and popular preacher. D. in Readsboro, Vt., June 10, 1812. See his *Memoirs* (Boston, 1851), by his daughter, Eliza B. Lee.

Buckminster, **JOSEPH STEVENS**, D. D.: b. at Portsmouth, N. H., May 26, 1784; son of Joseph mentioned above; graduated at Harvard in 1800, and in 1804 became pastor of the Brattle Street church in Boston. He had great oratorical ability, and as a member of the Anthology Club and contributor to the *Monthly Anthology* he was one of the founders of Boston's literary reputation, and especially one of those who first gave the preaching of his time a literary form where it had been merely expository and hortatory, strewn thick with Scripture texts with which chapter and verse were given. He was of the Liberal Christian party of his day, which became distinctly Unitarian shortly after his death. In the pulpit he was Channing's rival, and no less on this account his valued friend. His literary tastes were likely to draw him from the pulpit to secular scholarship, when his brilliant career was cut short by epilepsy. D. June 9, 1812. See his *Memoirs* (Boston, 1851), by his sister. **JOHN W. CHADWICK**.

Buckner, **SIMON BOLIVAR**: Confederate general; b. 1823 in Kentucky; graduated at West Point in 1844; in infantry 1844-52; subsequently commissary of subsistence; served at frontier posts 1844-52; assistant professor at the Military Academy 1846; in the war with Mexico 1846-48 under both Taylor and Scott; quartermaster Sixth Infantry; assistant instructor at the Military Academy 1848-50; on commissary duty at New York city 1852-55; resigned Mar. 26, 1855. He was superintendent of construction of Chicago custom-house 1856; adjutant-general, rank of colonel, of Illinois 1857; farmer near Louisville, and inspector-general commanding Kentucky home guards 1860-61; joined the Southern army in the civil war; was in command of Bowling Green, which he evacuated on the capture of Fort Henry, falling back on Fort Donelson (surrendered Feb. 16, 1862, to Gen. Grant, with 16,000 troops and vast stores); prisoner of war at Fort Warren till Aug., 1862; in command of a division of Hardee's corps in Bragg's army in Tennessee; as major-general assigned to third grand division; engaged at Murfreesboro and Chickamauga, and included, May 26, 1865, in Kirby Smith's surrender to Gen. Canby. He was elected Governor of Kentucky Aug. 1, 1887. Nominated for Vice-President by the Sound-money Democrats Sept. 3, 1896.

Bucks, or **Buckinghamshire**: an inland county of England; bounded N. by Northampton, E. by Bedford and Hertford, S. by Berks, and W. by Berks and Oxford. It has an area of 746 sq. miles. The surface is diversified by valleys and hills of moderate height. The Chiltern range of chalk-hills, about 900 feet high, extends across the county in a N. E. and S. W. direction. Near the middle of the county is the fertile Vale of Aylesbury, which is farther N. than the Chiltern Hills; the soil is generally fertile, and contains a large portion of clay. It is drained by the Ouse, the Thames, and other smaller rivers. The staple products are wheat, beans, butter, cattle, and mutton. The sheep of the Vale of Aylesbury are noted for their fine and heavy fleeces. Bucks County is intersected by the Great Western and North-western Railways. The chief towns are Aylesbury, Buckingham, and Marlow. Pop. (1891) 185,190.

Bucksport: township; terminus of Bucksport branch of Maine Central R. R.; Hancock co., Me. (for location of county, see map of Maine, ref. 8-E); on left (east) bank of Penobscot river; 18 miles S. of Bangor. It derives its support principally from ship-building, fisheries, tanneries, saw-mills, and ice business. Just out of the village are U. S. salmon-breeding houses and pond. It has daily stage connection with outlying towns. Bucksport has three churches, and is the seat of the East Maine Conference Seminary.

Pop. of township (1880) 3,047; (1890) 2,921; (1893) estimated, 3,000.

EDITOR OF "CLIPPER."

Buckthorn: a shrub or small tree of the genus *Rhamnus* and family *Rhamnaceæ*; distinguished by a bell-shaped calyx which is four or five cleft, and petals which are small and sometimes wanting. The fruit is a berry-like drupe, containing two to four separate seed-like nutlets. The species are numerous, and natives of many temperate and tropical regions. The common buckthorn (*Rhamnus catharticus*) is a deciduous shrub, a native of Europe, and naturalized in the U. S. It has spiny branches, ovate leaves, and small black berries (or drupes) which are nauseous and purgative, and which yield the pigment called sap-green (or bladder-green). This shrub is planted for hedges in the U. S. The Atlantic States have two native species. The alder buckthorn (*Rhamnus frangula*) is a European shrub which is not armed with spines, and has ovate, entire leaves. The berries are violently cathartic. The bark has been employed in medicine, and is used for dyeing yellow. The unripe fruit of dyer's buckthorn (*Rhamnus infectorius*), a shrub which grows in Southern Europe, yields a bright yellow dye. The so-called French or Avignon berries used by dyers are the fruit of the last and other species.

Buckwheat [*buck-* has same root as *beech*: Germ. *Buche*, without umlaut; cf. Germ. *Buchweize*] an annual plant (*Fagopyrum esculentum*, or *Polygonum fagopyrum*); of the order *Polygonaceæ*; said to be a native of Central Asia and Manchuria. It is cultivated for food in Europe and the U. S. It grows to the height of 2 feet or more. It has triangular, heart-shaped or halberd-shaped leaves. The seeds are triangular, and resemble a beech-nut in form. Cakes of buckwheat eaten warm are a favorite article of food, and very nutritious. Buckwheat meal contains about 10 per cent. of gluten and 50 per cent. of starch. Bees are partial to the flowers of this plant, which secrete a large portion of honey, not of the first quality. Buckwheat comes to maturity in a shorter time than most other grains, and may be sown late. In the U. S. the seeds are usually sown broadcast. The quantity of seed required for one acre is a bushel or one bushel and a half. It requires little nitrogenous or coarse, heavy manure. A good crop of this grain yields about 30 bush, on an acre, and a bushel of it weighs from 45 to 48 lb. Formerly buckwheat was grown mostly as a late-season and "catch" crop, but it now receives more systematic treatment in many parts of the country. Another species, called Tartarian buckwheat (*Fagopyrum tartaricum*), is a hardy native of Siberia, and is adapted to cold climates. It is distinguished from the common buckwheat by the toothed edges of its seeds, and is inferior in quality.

Revised by L. H. BAILEY.

Buckwheat Family (*Polygonaceæ*): apetalous, dicotyledonous herbs, shrubs, or even trees; with a superior one-celled ovary, containing an erect, straight ovule. They are related to the amaranths, chenopods, and pinkworts. There are about 600 species, widely distributed throughout the world. The most important genera are: *Eriogonum*, containing about 100 species, all American; *Polygonum*, with 150 species; *Rumex*, with 130 species; and *Coccoloba*, with 80 species. *Fagopyrum esculentum* of Asia is the well-known buckwheat; *Rheum raphaniticum*, *R. undulatum*, and *R. officinale* are known as rhubarb, and supply the drug bearing that name, while the petioles of the first and second are used for pies, tarts, sauces, etc. CHARLES E. BESSEY.

Buckwheat-tree: a small tree or shrub of Georgia and the Gulf States (the *Clethra ligustrina*); a smooth, elegant evergreen of the family *Cypripellaceæ*. It has clusters of white, fragrant blossoms in March, April, and May. It grows around swamps, ponds, and streams, and is often called *titi*. Its pendulous-winged fruit is sometimes shaped like a kernel of buckwheat; whence the name.

Bucolic [from Gr. *βουκολικός*, deriv. of *βουκόλος*, herdsman]; pastoral or pertaining to herdsman. This term is applied to a kind of pastoral poetry written in hexameter verse. The poems of Theocritus and the *Erglogues* of Vergil are the most perfect models of bucolic poetry.

Bucyrus: city; capital of Crawford co., O. (for location of county, see map of Ohio, ref. 3-P); on Pa. and Ohio Central R. Rs., and on Sandusky river; 62 miles N. of Columbus. It is the seat of a large farming and manufacturing community; has large union school-house, gas and electric lights, good sewerage system, and pavements of

vitrified brick in many of its streets. There are mineral springs in the town and neighborhood. The skeleton of a mastodon was found in the vicinity in 1838. Pop. (1880) 3,835; (1890) 5,974.

EDITOR OF "FORUM."

Bud (in plants): In the growth of a shoot it frequently happens that the elongation of the stem is checked for a time, while the leaves continue their growth for a while longer. The result is a collection of leaves, mostly closely packed together into a pretty solid mass, and this we call a *bud*. Usually the leaves are considerably modified, the outer ones soon becoming hard and scale-like, constituting the so-called "bud scales." When the elongation of the stem is resumed the leaves are separated, and the bud disappears. A bud is thus a quiescent state of a shoot. In popular botany buds are distinguished as "leaf-buds" and "flower-buds," the former developing leafy shoots and the latter one or more flowers. Inasmuch as flowers are themselves transformed shoots, all buds are, strictly speaking, essentially alike.

Sometimes the word *bud* is applied to particular outgrowths in the lower plants, especially when these have to do with the production of new plants. Thus we speak of the buds on the yeast plant, the buds of liverworts, etc. This use of the word should be abandoned, as it tends to confusion.

CHARLES E. BESSEY.

Buda, boo'da: city of the Austrian empire; formerly a capital of Hungary. From its hot springs Buda derives its German name of *Ofen*—i. e. oven. Buda is on the right bank of the Danube opposite to Pest, with which it is now incorporated as one city, styled BUDAPEST (*q. v.*). Pop. (1880) of Buda alone, about 60,000.

Budæus (*Budé*), GUILLAUME: philologist; b. in Paris, 1467; d. there Aug. 23, 1540; employed by Louis XII. and Francis I. in Roman embassies and other public business; instigated the founding of the Collège de France; obtained license for printing in opposition to the Sorbonne; was royal librarian when he died. His best-known works were *Annotations in xiv. libros Pandectorum* (1508); *De Asse et partibus ejus* (1514); and *Commentarii Lingue Græcæ* (1519); suspected of secret predilections for Lutheranism. See his *Life* by E. de Budé (Paris, 1884), and his *Lettres inédites* (Paris, 1887). D. in Paris, Aug. 22, 1540.

Buda, Old (in Ger. *Alt Ofen*; Hun. *O' Buda*): a municipal town of Hungary, in the county of Pest, on the Danube, almost adjoining the suburbs of Buda (see map of Austria-Hungary, ref. 6-H). It is supposed to be the ancient *Sicambria*. Pop. 16,000.

Budapest, boo'da-pest: capital of the kingdom of Hungary; is composed of Buda, on the right bank of the Danube, and Pest, on the left bank, the two being connected by several handsome bridges, one a suspension bridge 1,200 feet in length (see map of Austria-Hungary, ref. 6-H). Buda and Pest were independent of each other up to 1873. The population of the two cities in 1848 was scarcely 100,000. Their growth was not marked until the formation of the new constitution of the Austro-Hungarian empire in 1868. Hungary then became practically an independent kingdom, and Budapest, as co-ordinate capital with Vienna of the empire, and the center of the growing national life, entered upon a new and magnificent era. Its growth in the two decades from 1870 to 1890 rivals, and in some respects surpasses, that of the great Western cities of the U. S. Buda, formerly the more important, has been outstripped by Pest in this advance. Buda is strikingly picturesque. A rock, springing abruptly from the river, and rising to a height of nearly 1,000 feet, is crowned by the now useless citadel; a neighboring but lower eminence affords a striking site for the imposing royal palace; and the city forms itself in an amphitheater about the base. Pest is situated on a sandy plain, but its location gives it marked commercial advantages. Budapest is the greatest grain-market of the empire. Vast fleets of grain-boats ply upon the Danube, and the milling industry is of great extent. Many of the improvements in flour-milling, including the roller-process, originated here. The city council numbers 400, doubtless the largest body of the kind in the world; but the government is efficiently carried on by a small number of municipal officials. Sanitary improvements have reduced the death-rate from 50 per 1,000 to 29. The old streets have been straightened so far as possible. Andrassy Strasse is the finest street of the city, and by reason of its length (2 miles), its width, paving, and the uniformly handsome buildings that line it, has a claim

to be considered among the great streets of the world. The quays that confine the Danube for a distance of 3 miles, lined with fine buildings, are a striking part of the city. Radiating thoroughfares, intersected by the so-called *Ringsstrassen*, have been introduced. Near the Blocksberg on the Buda side, on which is the observatory, are three celebrated sulphur springs, much resorted to for certain diseases, and contributing not a little to the natural advantages of the city. Budapest has a flourishing university, an academy of sciences, a polytechnic school, and is well provided with other educational institutions. Besides the buildings already mentioned, the cathedral, city-hall, national theater, and university church are among the most important. The Margareta island in the Danube has been transformed into a park. Wine of a superior quality is produced in the vicinity (the Ofner). The Imperial Parliament meets in alternate years at Budapest and Vienna, and the emperor and court spend much time in the Hungarian capital. The history of the city is most interesting; it was once the site of a Roman colony; was long regarded as the citadel of Christendom against the Turks; belonged to the Turks, 1529-1686; in 300 years the citadel was besieged twenty times. The election of the Hungarian kings formerly took place on the Rakós, a neighboring plain, and here as many as 100,000 men often encamped for months. The new Budapest is the center of the political, commercial, literary, and artistic life of a progressive and ambitious people numbering 17,000,000, and as such is reasonably sure of maintaining and improving its position among the great cities of the world. Pop. (1890) 506,061. See *Budapest, the Rise of a New Metropolis*, by Albert Shaw, *The Century*, June, 1892. C. H. THÜRBER.

Budd, JOSEPH LANCASTER: Professor of Horticulture and Forestry in the Iowa Agricultural College; b. in Peekskill, N. Y., July 5, 1835; known for his efforts to secure hardy fruits for the Northwest, particularly through his travels in Russia with CHARLES GIBB (*q. v.*), and the introduction of many Russian fruits and ornamental trees. The papers and library of the late Charles Downing were bequeathed to him.

Budde'us, JOHANN FRANZ: Lutheran theologian and philosopher; b. in Anclam, in Pomerania, June 25, 1667. He was elected in 1692 Professor of the Greek Language at Coburg; in 1693 was invited to take the chair of Moral Philosophy at Halle; in 1705 became Professor of Theology at Jena. His position was one which harmonized orthodoxy and pietism. His erudition was enormous (he was the most universal scholar among the theologians of his time), yet accurate, and his judgment was of the most solid kind. He wrote more than a hundred books, most of which are still sought by scholars, and several of which are acknowledged standards. His more important books were: *Institutiones Theologiae Moralis* (Leipzig, 1171); *Institutiones Theologiae Dogmaticae* (Leipzig, 1728); *Historia Theologiae Dogmaticae et Moralis* (Frankfort, 1725). In philosophy he was an eclectic. D. in Gotha, Nov. 19, 1729.

Revised by HENRY E. JACOBS.

Buddha or Boodha: a Sanskrit word meaning "awakened, enlightened, illumined." It is applied to a man who has attained to perfect knowledge of the truth; who by good works through countless existences has at length become released from the bonds of existence; and who, before entering into NIRVANA (*q. v.*) preaches the truth to mankind for its redemption. Innumerable Buddhas have already appeared. The Buddha of the present dispensation—the historical Buddha—was born of the Kshatriya tribe of Çākya (Sakyas), and called in his youth Siddhattha. After attaining enlightenment, he was called Gotama (or Gautama) Buddha; also Samana Gotama, "the Gotamid ascetic," Çākya-muni (Sakyamuni), "Çākya-sage," and Çākya-singha, "Lion of the tribe of Çākya," are mere epithets, like "Prophet of Nazareth." See GĀUTAMA. C. R. LANMAN.

Buddhism: a complex, many-sided religious system which originated in India, probably about 500 B. C., and flourished there for sixteen centuries alongside of BRAHMANISM (*q. v.*), from which it may be said to have been evolved, and with which it had many things in common. By the thirteenth century of our era it had practically disappeared there, losing itself in that development of Brahmanism which is known as Hinduism, and to which it had itself contributed. From India the system was carried southward to Ceylon about 250 B. C.; thence to Burma in the fifth century of our era, and to Siam in the seventh. As it now exists in these countries it adheres more closely to the primitive system than

does that which prevails elsewhere, and is known among scholars as southern Buddhism. About 245 B. C. it was carried northward by missionaries to Kashmir, whence it spread to Nepal, Tibet, China, Korea, and Japan. In these countries it received so many new developments that in some important respects it bears little resemblance to the original. Northern Buddhism adheres in the main to the expanded form of doctrine promulgated by Nagarjuna, the fourteenth Indian patriarch, called the *Mahāyāna*, or "Great Vehicle or Conveyance," as distinguished from the more primitive doctrines of the southern school, called *Hināyāna*, the "Little (or Inferior) Vehicle or Conveyance." The form of Buddhism which prevails in Tibet and Mongolia is called Lamaism. See all these titles and the countries named.

Its Founder.—Buddhism originated in the ethical and philosophical teachings of an ascetic and reformer known among southern Buddhists as Gautama, or Gotama (the sacerdotal name of the family to which he belonged), among northern Buddhists as Sakyamuni (the "Sakya Sage"), and generally among Europeans as the Buddha, or simply Buddha, the "enlightened" one, referring to the perfect insight which came to him as he sat under the BO-TREE (*q. v.*) pondering in rapt meditation on the problem of life and its attendant miseries. Son of a wealthy Sakya chieftain (whose seat was at Kapilavastu, near the foot of the Himalayas), reared in luxury and surrounded with all the pleasures and seductions of an Eastern court, he seems to have reached the age of twenty-nine before making acquaintance with human suffering, or realizing its universality, depth, and intensity. The story is that on four different occasions, while driving through the city, this was presented to him in four "visions." One of the devas appeared to his gaze first as a decrepit and wrinkled old man, tottering along with the help of a staff; next as a loathsome leper, writhing by the wayside in the agonies of disease; on the third occasion as a putrid corpse being carried to the grave. Profoundly saddened and impressed by these sights, and by the knowledge which inquiry brought him, that these were no uncommon occurrences but the lot of all without reference to sex, caste, or condition, he was prepared for the fourth vision, a Brahmanical recluse, who had abandoned the world and its fleeting pleasures in order that by meditation and mendicancy he might find a way of escape from the ills of life. This seemed to Gautama to point to a way of deliverance, so forsaking his home, his wife, and the boy born to him that very day, he assumed the garb of a mendicant, and set out to find salvation for himself and all mankind. Disappointed with the Brahmanical teaching which he first tried, he plunged into the forest, and for six years unavailingly sought by increasingly vigorous austerities and self-mortification to find the peace and deliverance he desired. At last almost in despair he flung himself down beneath a bo-tree, and there, after forty days and nights of fixed contemplation, enlightenment came to him, and the problem was solved.

Doctrinal Basis.—His solution of the problem is expressed in the Four Verities or Noble Truths, regarded as fundamental by all Buddhists of whatever school. They are: 1. Suffering exists wherever sentient being exists. 2. The cause of suffering is desire, a craving for pleasure or for existence. This leads to rebirth, and rebirth is suffering. 3. Deliverance from suffering can be effected only by the extinction or "blowing out" of desire. This is NIRVANA (*q. v.*). 4. This cessation of suffering and entrance into Nirvana can be attained only by walking in the Path of Buddha, or the Noble Eightfold Path. This comprises right views (as to the nature and cause of suffering); right thoughts; right words; right actions; right means of livelihood—that is, as a mendicant monk, living in celibacy and on offered alms; right application of the spirit to the study of the law; right memory, or freedom from error in recollecting the law; and right meditation. The last four of these apply particularly to the community of monks which he founded; the first four to both monks and laymen.

In this Eightfold Path there are four distinct stages. He who has arrived at a just perception of the four verities and enters upon "the stream of holy conduct," successively becomes free from the first three of the ten fetters which bind us to life with its sorrows, viz., from delusion in regard to self, from doubt as to Buddha and his law, and from dependence on works, or a belief in the efficacy of rites and ceremonies. By perseverance throughout the second stage lust, hatred, and delusion are reduced to a minimum, and the disciple attains to the degree of saintship, which in-

volves only one more return to this world. By perseverance in the third stage sensuality and ill-will are entirely destroyed, and he is freed from all necessity of ever returning to this world. When the fourth stage is completed he is set free from all error; he has burst the remaining five fetters, viz., love of life on the earth, desire of life in heaven, pride, self-righteousness, and ignorance—the first link in the twelve-linked chain of cause and effect. See NĪDĀNA.

Upon the Four Noble Truths and this Eightfold Path has been reared the whole elaborate superstructure of Buddhist doctrine and practice, with its TRANSMIGRATION; its six GĀTĪ, or conditions of sentient existence; its twelve NĪDĀNAS, or links in the chain of causation; its five Skandhas, or bundles of material and abstract qualities, by the union of which personality is produced; its PARAMĪTAS, or cardinal virtues, by means of which one may pass across the great sea of life and death to the shores of NĪRVĀNA; its DHYĀNA, or fixed contemplation; its Brahmālokas and its Devalokas; its heavens of TUSHĪTA and SWARGA; its SĪKHĀVĀTĪ, or PARADISE OF THE WEST; its hot and cold hells (see NĀRAKA); its SANGHA, or order of monks; its VIHĀRAS, or monasteries; and its numerous sects and developments, some account of all of which is necessary to any adequate presentation of Buddhism, but which can not be dwelt on within the limits of a single page. See all the above titles in the order here given. See also TSING-TU (or JOPO) and SHINSHIT.

In its primitive form Buddhism was essentially atheistic. The gods, equally with men and animals and all the other forms of sentient existence, were subject to change—to decay, death, and rebirth. Hence sacrifice and all forms of worship were useless, and a priesthood unnecessary. Later, however, the worship of various deities was introduced, and Buddha himself, as well as MAITREYA (*q. v.*), the coming Buddha; Adibuddha, the origin of all things; the DHYĀNI-BUDDHAS, or impersonations of abstract thought; Amitabha, the Buddha of "Boundless Light" who presides over the Paradise of the West; Avalokiteshvara, the god (or goddess) of mercy (see KWAN-YIN); and many others, are objects of worship throughout some section of the northern school. It also denied the existence of the soul, and, indeed, of everything except body, mind, and sensation, of heaven, earth, and hell, all of which, however, are described as characterized by impermanency, and subject to continual disintegration and reintegration. Man is conceived of as a combination of five skandhas, or bundles of material qualities, sensations, abstract ideas, tendencies of mind, and mental powers. The breaking up of these is death. A force, however, is left behind, and under the influence of this there is a tendency in these five elements to recombine and form a new personality or individual. This force is called Karma, the consequence of the acts, words, and thoughts of the individual during the continuance of the combination of qualities which has come to an end. It is this accumulation of merit or demerit which determines the nature and condition of the new personality, but it can not be said to be a soul. See KARMA.

The Brotherhood or Saugha.—A very important feature of the system of Buddha was the community or brotherhood of converts which grew up around him. At first it consisted of himself and his first five converts, the ascetics, with whom he had lived in the forests before he discovered that austerities were useless in bringing deliverance from the ills of life. As converts increased they joined this band of disciples called Bikshas and Bikshunis (male and female mendicants), and bound themselves to chastity and a life of self-denial. Conduct was regulated by a simple code of ten prohibitions. Not to kill (or even injure *any* living thing, no matter how lowly); not to steal, or commit adultery, or lie (and this included abstention from all manner of improper speech); not to use strong drink, or take repasts at improper times; not to look at dances and plays, or have costly raiment, perfumes, or ornaments; not to have a large bed or quilt; and not to receive gold or silver. In addition to these, twelve observances were enjoined on recluses, who were required to use clothes made of rags picked up in burying-grounds or on the road; to have only three such coats, all made by the wearer's own hands; to have a cloak of yellow wool to cover all, and made in the same way; to live exclusively on food given in charity and without asking; never to eat or drink after midday; to live in the forests or jungles; to have no roof but the foliage of the trees; to sit with the back supported by the trunk of a tree; to sleep sitting and not lying; never to change the position of the mat or quilt when once it had been spread; and lastly

to go once a month to the cremation or burying grounds to meditate on the vanity of life. As his doctrines spread, and it was found impracticable for all to join this brotherhood, the first five injunctions (as the first four of the eight noble paths) were made obligatory on the masses. The one great redeeming and commendable feature of Buddhism is its charity, its kindness toward and its care for the welfare of all living things, and its sympathy with sorrowing humanity; and its spread is perhaps more due to this than to any other feature. As it now exists its many votaries in its temples and monasteries are perhaps the only real *Buddhists*, but its moral teachings exercise considerable influence over a very large proportion of the inhabitants of Asia, from Ceylon to Japan. For Esoteric Buddhism, see THEOSOPHY; for Buddhist Cosmogony, see JAMBUDVĪPA and SUMERU; and for an account of its scriptures (which are voluminous), see TRIPITAKA.

The following works on Buddhism may be consulted with profit: *Introduction à l'histoire du Bouddhisme Indien*, by Eugene Burnouf (1844-76); *Le Lotus de la Bonne loi*, by the same author (1852); *A Manual of Buddhism*, by R. Spence Hardy (2d ed. 1880); *Eastern Monachism* (1860) and *Legends and Theories of the Buddhists* (1866), both by the same author; *Religion des Buddha*, by Koeppen (vol. i. deals with *Southern Buddhism* (1857) and vol. ii. with *Lamaism*, 1859); *Buddhism in Tibet*, by Schlagintweit (1863); *The Wheel of the Law*, by Alabaster (1871); *Legend of the Burmese Buddha*, by Bishop Bigandet (1858); *Buddagoshu's Parables* (from the Burmese), by Capt. Rogers, with Introduction by Max Müller (1870); *Der Buddhismus, seine Dogmen und Literatur*, by Wassilief (1869); *A Catena of Buddhist Scriptures*, by Beal (1871); *Texts from the Buddhist Canon, commonly known as Dhammapada*, translated from the Chinese by the same author; *Chinese Buddhism*, by Edkins (1880); *Buddhism* (1880), and the *Hilbert Lectures* (1881), by T. W. Rhys Davids; *Buddhism in its Connection with Hinduism*, by Monier-Williams (1889); and *Buddhism, Primitive and Present, in Magadha and Ceylon*, by Bishop Copleston (1892).
R. LILLEY.

Budding, or Inoculation. is a mode of propagating improved and choice varieties of fruit which can not be reproduced by seeds. It is the best mode of propagating peaches, and is convenient in the case of plums, cherries, apples, pears, roses, etc. The best time for budding is the last half of summer. The operation is performed by opening the bark of the stock with a vertical and transverse cut, nearly like a letter T, and inserting into it a leaf-bud of another variety. The length of the bark and wood cut off with the bud is about an inch. These buds are taken from a branch formed in the present or preceding year. They should be cut squarely at the top, so as to fit the transverse section of the bark of the stock. The leaf growing close to the bud should be cut off. The process is finished by tying the bud with bass matting, soft cotton twine, or woolen yarn. The operation just described is called "shield-budding," and is more rapidly performed than grafting.

Bude-light: a brilliant light invented by a Mr. Gurney, of Bude, in Cornwall, England. He introduced a stream of oxygen into a flaming jet of oil or gas. The expense of this system has prevented its general use. The same name is sometimes inappropriately given in Great Britain to other similar inventions.

Budissin: See BAUTZEN.

Buel, SAMUEL, D. D.: theological writer and professor; b. in Troy, N. Y., June 11, 1815; graduated at Williams College 1833; rector of parishes in Michigan, Pennsylvania, Maryland, and New York; Professor of Ecclesiastical History and subsequently of Divinity in the Seabury Divinity School, Fairbault, Minn., 1886; of Systematic Divinity and Dogmatic Theology in the General Seminary, New York city, 1871. He translated the *Report of the Union Conferences held August 10-16, 1875, at Bonn* (New York, 1876). He wrote *The Apostolical System of the Church Defended* (Philadelphia, 1844); *Eucharistic Presence, Sacrifice, and Adoration* (New York, 1874); and *A Treatise of Dogmatic Theology* (1890, 2 vols.). Died in New York city, Dec. 30, 1892.

Buell, DON CARLOS: soldier; b. near Marietta, O., Mar. 23, 1818; graduated at West Point in 1841; after serving in the infantry till 1848, became, July 17, 1862, assistant adjutant-general U. S. A., rank of colonel, and Mar. 21, 1862, major-general U. S. volunteers. He served in the

Florida war 1811-42; on frontier duty 1843-45; in the military occupation of Texas 1845-46; in the war with Mexico 1846-48, and was wounded at Churubusco; adjutant of the Third Infantry 1847-48; assistant adjutant-general at Washington, D. C., 1848-49; at headquarters of various departments 1849-61. In the civil war he was in command of the department and army of the Ohio 1862; engaged at the battle of Shiloh, siege of Corinth, operations in Northern Alabama, and the retreat to Louisville to cut off the army of Bragg, which he drove from Kentucky; was before a commission to investigate his operations 1862-63. He resigned from the army June 1, 1864, and in 1865 became president of the Green River (Kentucky) Iron-works.

Buena Vista (Sp. pron. bwā nā-vee'tāñ): a hamlet in Mexico; about 90 miles S. W. of Monterey and 7 miles S. of Saltillo; famous for the battle fought in its vicinity between the U. S. forces under Gen. Zachary Taylor and the Mexican army under Santa Anna, Feb. 22-23, 1847. Gen. Taylor, having become assured, from reconnoissances on Feb. 20, that the enemy was in heavy force at Encarnación, 30 miles in front of Agua Nueva, with the evident intention of attacking his position, withdrew his army on the 21st from the camp at Agua Nueva, which could be turned on either flank, and took up a strong line a little in front of Buena Vista. A cavalry force left at Agua Nueva to cover the removal of supplies was driven in during the night, and on the morning of the 22d the Mexican army appeared immediately in front of Buena Vista, and at 11 a. m. (Feb. 23) a flag was sent from Santa Anna with a summons of unconditional surrender, to which Gen. Taylor laconically replied that he "declined to accede to the request."

The line occupied by the U. S. troops was one of remarkable strength. The road at this point becomes a narrow defile, the valley on its right being rendered impracticable for artillery by a system of deep and impassable gullies, while on the left a succession of rugged ridges and precipitous ravines extends back toward the mountain which bounds the valley. The features of the ground were such as nearly to paralyze the artillery and cavalry of the enemy, while his infantry could not derive all the advantage of his numerical superiority. The action was commenced about three o'clock in the afternoon of the 22d, between the light troops on the left, and skirmishing continued till dark, but no serious attack was made until the morning of the 23d. During the night of the 22d the Mexicans had occupied the mountain-side by light troops, with the intention of forcing the left flank of the U. S. army, and it was here that the action commenced on the 23d, and an obstinate and sanguinary conflict was maintained, with short intervals and varying success, throughout the day, resulting in the repulse of the enemy from Taylor's lines, which, however, had been much contracted since morning. An attack of cavalry upon Buena Vista and a demonstration upon Saltillo were also repelled, and during the night Santa Anna abandoned his position and fell back upon Agua Nueva. A reconnoissance made on the 26th disclosed the fact that the retreat had been continued in the direction of San Luis Potosi, and Gen. Taylor resumed his former camp at Agua Nueva on the 27th.

The U. S. force engaged was about 5,200, while the Mexican army was stated by Santa Anna in his summons to be 20,000 strong. The loss in U. S. troops was 746, of which 267 were killed; the Mexican loss in killed and wounded was about 2,000.

Buen Ayre: See **BONAIRE**.

Buendia, bwen-dee'ñ, **JUAN**: Peruvian general; b. at Lima, 1814. He early entered the army as an artillery cadet, ascending by regular grades to the rank of general; in 1874 he commanded the force which crushed the insurrection of Pierola. When the Chilean war broke out in 1879 he was put in command of the army of the south at Tarapaca. With 7,000 Bolivians and Peruvians, very badly equipped, he attacked 10,000 Chileans on the heights of San Francisco, near Pisagua (Nov. 8, 1879); he was defeated with terrible loss, and retreated to Tarapaca, where the Chileans attacked him, but were repulsed (Nov. 27), losing most of their artillery. Buendia then continued his retreat to Arica. He was court-martialed, but exonerated, and served in the defense of Lima. After the war he retired to private life.

HERBERT H. SMITH.

Buenos Ayres: a province of the Argentine Republic; bounded N. E. by the Rio de la Plata, E. and S. E. by the

Atlantic Ocean, and S. W. by the Rio Negro, which separates it from Patagonia. The area is estimated at 63,000 sq. miles. The surface is an alluvial plain, in which timber and stones are scarce; the soil is mostly fertile. Here are vast treeless, grassy plains, called *pampas*, which afford pasture to immense herds of cattle and horses. These constitute the principal riches of the inhabitants. This province is not liberally supplied with rivers or running streams, but contains a great number of salt lakes. The principal river besides the Paraná (La Plata) is the Rio Colorado, which traverses the S. W. part of the province. The climate in the N. part is mild, and has a mean summer temperature of 90° F. It became independent of Spain in 1810, seceded from the Argentine Republic in 1853, and was reunited to it in June, 1860. A large number of Europeans have emigrated to this province. Pop. (1895) 921,222. Capital, La Plata (founded in 1884), and situated about 40 miles S. E. of the city of Buenos Ayres.

Buenos Ayres: a seaport of South America; capital and largest city of the Argentine Republic; on the right bank of the La Plata; lat. 34° 36' S., lon. 58° 22' W. (see map of South America, ref. 8 F). It is nearly opposite to Montevideo, which is 100 miles distant. The streets cross each other at right angles, are paved with granite, and bordered by low brick houses, which usually have each a garden adjoining. The principal public buildings are a large cathedral, numerous churches, the House of Representatives, and a college, with which are connected a large library, an observatory, and a normal school. The adjacent country is alluvial, and nearly destitute of timber. The climate is dry and healthy. Many fine public buildings have lately been completed, and others are in progress. Its trade and prosperity are impeded by the want of a safe and commodious harbor. The chief exports are hides, beef, grain, wool, tallow, horns, and skins. It is rapidly growing in importance. Pop. (1882) 295,000; (1892), 549,307; (1895) 665,243.

Buvarik, or **Boofarik**, boo-fā-reek: a village of Algeria; 18 miles S. S. W. of Algiers; on the road from Algiers to Blidah and Oran; an important military station. It has a trade in cotton, grain, olives, oranges, and an important weekly market. Pop. (1891) 8,064.

Buffalo: either of two species of ruminant animals of the family *Bovidae*, the *Bubalus buffelus* and *Bubalus capifer*. The former is a native of India, where it has been long domesticated, and is an important and useful animal. It is generally used as a beast of burden in India and also in Italy, where it was introduced about 600 A. D. It is larger and more powerful than an ox, and has a larger head in proportion to the size of the body; the dorsal line rises into a considerable elevation above the shoulders. It has large crooked horns, which are curved first outward and downward, and next backward and upward. The buffalo is partial to marshy places, and is addicted to wallowing in the mud and shallow water. Its flesh is inferior to that of the ox, but the milk of the female is said to be excellent in quality. The tame buffaloes of India are easily managed and guided by a mere rope, and the driver often rides on their backs. The jungles of India are also infested by wild buffaloes of the same species, sometimes called *arna* or *arnce*, a fierce and dangerous animal, which is more than a match for a tiger. The Cape buffalo (*Bubalus capifer*) is a native of South Africa, and has not been domesticated. It has large horns, the bases of which are close together. The horns spread or diverge laterally, are next bent downward, and have the point curved upward and inward. The animal measures about 8 feet from the base of its horns to its tail, and is about 5½ feet in height. It is a dangerous animal, and will attack men without provocation, but it is sometimes mastered by the lion. Its hide is so thick and tough that the Caffers make shields of it. Vast herds were formerly found in South Africa. For the American buffalo, see **BISON**.

Cape buffalo.

Revised by D. S. JORDAN.

Buffalo: a city; port of entry, and important railroad and commercial center; capital of Erie co., N. Y. (for location of county, see map of New York, ref. 5-4); in lat. 42° 53' N., lon. 78° 55' W.; at the foot of Lake Erie and head of

Niagara river. It is also the western terminus of the Erie Canal. In population and wealth it is the third city in the State. The city is delightfully situated, having a navigable water-front of about 7 miles, with numerous substantial and extensive piers, breakwaters, basins, and canals, constructed at an expense of several millions of dollars, partly by the Federal Government and partly by the State and municipal authorities. It has one of the finest harbors on the lakes, formed by the Buffalo river, navigable for about 2 miles from its mouth. The entrance is protected by extensive breakwaters. The city extends down the Niagara river and Lake Erie about 9 miles, and at right angles with it the same distance. The Niagara is here crossed with a fine iron truss railroad bridge, completed in 1873 at a cost of \$1,500,000.

Buffalo is noted for its wide and beautiful streets, and the profusion of trees and shrubbery with which they are decorated. The report of the State assessors for 1891 puts the valuation for the purpose of taxation at \$179,957,350; exempt from taxation, \$19,736,615. The bonded debt of the city Jan. 1, 1892, was \$10,079,399.63, an increase during the year of \$32,663.37. The city treasurer received from all sources \$7,613,374.78.

The extensive water-works are the property of the city. There are several gas companies, three electrical lighting companies, natural gas, a magnificent park and boulevards almost surrounding the city, a State normal school and school of practice, a central high school, and sixty district schools, besides many other educational establishments. The City and County Hall, built of granite, was completed in 1876 at a cost of \$1,400,000. The State has erected an insane asylum, which accommodates 1,500 patients; it cost over a million dollars. The city contains a free charity institute and hospital and *crèche* for the care of poor children (endowed by the late Benjamin Fitch), a music hall, and a merchants' exchange (these last two being both magnificent structures). There are 4 large markets, 45 grain elevators, a stone post-office belonging to the U. S. Government, and a new \$2,000,000 post-office building has been arranged for; a State armory and arsenal, a commodious hall and library building belonging to the Young Men's Association, and one belonging to the Young Men's Christian Association. There are 155 church edifices. Of the latter, two (one Roman Catholic and the other Episcopalian) are imposing cathedrals. With literary, benevolent, and educational institutions Buffalo is well supplied. Among them are the Young Men's Association, with a library of 50,000 volumes, and real estate and buildings worth \$350,000; the Society of Natural Sciences, with an extensive collection, and a large museum of casts of fossil remains; an art gallery, an historical society, law library, decorative art society, mechanics' institute, Grosvenor Library (free), 5 hospitals, 2 orphan asylums, 2 medical colleges, a female seminary, and several Catholic colleges. Buffalo has over twenty cemeteries, and a crematory. It has 30 newspapers and periodicals, 10 of them dailies. There are 18 banks of discount, with an aggregate capital of \$4,600,000; and 5 savings-banks, with deposits amounting to about \$27,000,000. The building and loan association movement has been extensively developed.

Manufactures.—According to the census of 1890, Buffalo had 3,559 manufacturing establishments, with a capital of \$67,867,154, employing 49,998 persons, who received \$24,617,408 in wages, the total value of the product being \$96,448,654.

Commerce.—Buffalo is the great E. terminus of the lake traffic, especially of the grain, cattle, and lumber trade. In 1891 grain receipts by lake were 163,855,445 bush. (including flour estimated as wheat), and 16,416 carloads by rail (estimated). The lumber-trade is very extensive. Imports of all kinds of coal in 1891 were 6,000,000 tons; exports by lake, 2,365,895 tons; and the coal-trade is rapidly increasing. The receipts of live stock in 1891 were 696,534 cattle, 3,299,577 hogs, 1,536,420 sheep. In 1891 the arrivals and departures of vessels were 10,879, with nearly 1,600,000 tonnage.

In Dec., 1813, the village, then containing about 200 inhabitants, was burned by the British. After the war it speedily began to increase, and in 1828 contained about 7,000 inhabitants, the completion of the canal in 1825 giving a strong impetus to its growth. It became a city in 1832, and then had 15,000 inhabitants. Pop. (1835) 15,700; (1880) 155,134; (1890) 255,664; (1892) 278,796; (1895) 335,709.

MARK S. HUBBELL.

Buffalo: city; capital of Johnson co., Wyo. (for location of county, see map of Wyoming, ref. 8-J); has electric lights

and water-works. Farming, stock-raising, and mining are its principal industries. Pop. (1890) 1,087.

Buffalo-berry (*Shepherdia argentea*): a large shrub of the family *Oleaster* or *Élaagnaceæ*; dioecious flowers and silvery-scurely opposite leaves; introduced to cultivation as a fruit-plant in 1890. It bears small, ovoid, scarlet, acid berries in clusters. It is native to the interior region E. of the Sierra Nevadas and W. of the Mississippi, extending from Saskatchewan to the mountains of New Mexico.

Buffalo-fish: any one of the large suckers (*Ictiobus* and *Scerogomthus*); of the family *Calostomida*; found in the Mississippi valley. They reach a weight of 10 or 12 lb., but are not much valued as food, being flavorless and full of bones.

Buffet, LOUIS JOSEPH: politician; b. in Mirécourt, Vosges, France, Oct. 26, 1818; elected to the Chamber of Deputies from the Vosges in 1848; Minister of Commerce and Agriculture under Louis Napoleon; Finance Minister in the Ollivier cabinet 1870; elected president of the National Assembly, to succeed M. Jules Grévy, Apr. 4, 1873; vice-president of the council and Minister of the Interior 1875; elected life senator June 16, 1876.

Buffon, büf fōñ, GEORGES LOUIS LECLERC, Comte de: naturalist and philosopher; b. in Montbar, in Burgundy, Sept. 7, 1707. He was liberally educated, and traveled in his youth in Italy and England. In 1739 he was elected to the Academy of Sciences and appointed intendant of the royal garden in Paris. He published in 1749 the first three volumes of his *Natural History*, in which he was assisted by Daubenton. Twelve other volumes of it appeared between 1749 and 1767. This work, which made an epoch in the study of the natural sciences, displays a brilliant imagination and presents many ingenious ideas. He was admitted into the French Academy in 1753. Among his most admired works is the *Epochs of Nature* (*Époques de la Nature*), which appeared in a supplement to his *Natural History*. He received from the king the title of Count de Buffon in 1776. D. in Paris, Apr. 16, 1788. See Condorcet, *Éloge de Buffon*; Cuvier, *Éloge de Buffon*, prefixed to an edition of the *Natural History* (36 vols., 1826); Flourens, *Buffon; Histoire de sa Vie, etc.* (1844).

Bufon'ida: See TOAD.

Bu'ford, JOHN: soldier; b. in Kentucky in 1826; graduated at West Point in 1848; served on frontier duty 1848-61; quartermaster of the Second Dragoons 1855-58; in the Sioux expedition 1855; engaged at Blue Water in quelling the Kansas disturbances 1856-57; on the Utah expedition 1857-58. In the civil war he served as assistant inspector-general (major), making inspections 1861-62; in command of cavalry brigade in Northern Virginia campaign 1862; engaged at Madison Court-house, Kelley's Ford, Thoroughfare Gap, and Manassas (wounded); chief of cavalry of the Army of the Potomac in Maryland campaign; engaged at South Mountain and Antietam; in Rappahannock campaign, commanding cavalry brigade 1862-63; engaged at Fredericksburg, Stoneman's raid, and Beverly Ford; in command of a division of cavalry in the Pennsylvania campaign 1863; engaged at Gettysburg and numerous skirmishes in Central Virginia 1863; engaged at Culpeper, Bristow Station, and numerous movements and skirmishes. He was an admirable cavalry officer; rose to be major-general of volunteers, died from the effects of exposure and wounds, Dec. 16, 1863, at Washington, D. C.

Bu'ford, NAPOLEON BONAPARTE: soldier and engineer; b. in Woodford co., Ky., Jan. 13, 1807; graduated at West Point in 1827; and Apr. 15, 1862, brigadier-general U. S. volunteers. He served on garrison and topographical duty; as assistant professor at the Military Academy till Dec. 31, 1835, when he resigned and entered upon railroad and banking business chiefly at Rock Island, Ill. In the civil war he was colonel of the Twenty-seventh Illinois Volunteers till promoted brigadier-general; engaged in the battle of Belmont; attack of Island No. 10; capture of Union City, Ky.; siege and battle of Corinth, Miss.; siege of Vicksburg; in command of Helena, Ark. Brevet major-general U. S. volunteers Mar. 13, 1865, and Aug. 24, 1865, mustered out of volunteer service. He was superintendent of a mining company in Colorado; special U. S. Indian commissioner 1867-68; Union Pacific Railway commissioner 1868-69. D. Mar. 28, 1883.

Bug, or Bog: a river of Russian Poland; the southern of the two rivers with this name rises in Galicia; flows nearly

northward and northwestward; after a course of about 450 miles enters the Vistula at the fortress of Modlin, about 18 miles N. W. of Warsaw.

Bug, or Bog (anc. *Hypanis*): a river of Russia; the northern of this name rises in Poland; flows nearly southeastward, and enters the estuary of the Dnieper 30 miles W. of Kheron. Its whole length is estimated at 500 miles. It is navigable for small vessels from its mouth to Vosnesensk, upward of 100 miles.

Bug Bible: See BIBLE.

Bugeaud, bü'zhö, THOMAS ROBERT, Duc d'Isly; general; b. in Limoges, France, Oct. 15, 1784; rose in the Napoleonic wars to a colonelcy. Soon after the revolution of 1830 he was created a marshal of France. Having won several victories in Algeria, he was appointed governor-general of the same in 1840. He defeated the army of the Emperor of Morocco at Isly in 1844. During the revolution of Feb., 1848, he commanded the army at Paris. D. from cholera in Paris, June 10, 1849. See his *Memoirs* by Comte d'Iderville (Eng. trans. 1882).

Bugenhausen, böo'gen-häü'-gen, JOHANN, surnamed POMERANUS, or Dr. Pommer; learned German Protestant Reformer; b. at Wollin, Pomerania, June 24, 1485. He was converted to the doctrines of Luther in 1520, and became pastor at Wittenberg in 1522. He was a devoted friend of Luther, whom he assisted in the translation of the Bible. His chief works are a *Commentary on the Psalms* (Basel, 1524), and an arrangement of the *Passion History*. He organized the Lutheran Church in Pomerania, Hamburg, Brunswick, and Denmark. D. in Wittenberg, Apr. 20, 1558. See his *Life* by J. B. Vogt (Elberfeld, 1867) and by H. Hering (Halle, 1888). His correspondence, edited by J. B. Vogt, appeared in Stettin in 1888.

Bug-lish: the menhaden (*Brevoortia tyrannus*); a hering-like fish of the Atlantic coasts of the U. S.; so called from the fact that a small crustacean (*Oniscus prægustator*) is often to be found living in the fore part of its mouth.

Bugge, böüg'ge, ELSER'S SONNUS; philologist; b. in Laurvik, Norway, Jan. 5, 1833; appointed lecturer in the university at Christiania in 1864, and professor in 1866. Bugge's contributions to almost all branches of philology have been important. He is an eminent runologist and Biowulf scholar. His great edition of the *Poetic Edda* appeared in 1867 (Norræn Fornkvæði). His *Studies Concerning the Origin of the Northern Mythology*, etc. (Studien over de nordiske Gude- og Heltesages Oprindelse, 1881-89; Germ. trans., Studien, etc., by O. Brenner, 1881-89), are revolutionary in tendency and have provoked violent opposition. (See NORTHERN MYTHOLOGY.) Of his other works may be mentioned his collection of Norse ballads (*Gamle Norske Folkeviser*, 1858), and his edition of the *Volsunga* and other sagas, *Norræne Skrifter of Saphistorisk Luthold* (1864-73). Much of his most important work has appeared in learned periodicals.

G. L. KITTEDGE.

Bu'gis: a people of the Malay Archipelago; chiefly inhabiting Celebes and Macassar. They are noted for their commercial enterprise, and own many vessels employed in the navigation of the East Indian seas. They are muscular, middle-sized, and of a light-brown color, and have made considerable progress in civilization. They manufacture cotton cloth, build durable sailing-vessels, and are said to be skillful workers in copper and iron.

Bugle: a brass musical wind instrument; has been improved by keys so as to be capable of all the inflections of the scale. In its original form the bugle is the signal horn for the English infantry, as the trumpet for the cavalry. Five sounds only are required for the various calls. This instrument is never used in the orchestra.

Bugle: a plant of the genus *Lycga* which contains about fifty annual or perennial herbaceous plants of the *Labiata* or *MINT FAMILY* (*q. v.*), bearing whorls of very irregular flowers. None are natives of North America. Half a dozen species have been introduced into flower-gardens, where they are quite ornamental and easily grown. C. E. B.

Bu'gloss [yü' Fr. and Lat. from Gr. βούγλωσσος, ox-tongued; βοῦς, ox + γλῶσσα, tongue, perhaps from the shape and roughness of its leaves]; a common name given to several species of plants of the family *Boraginacea* and of the genera *Anchusa* and *Lycopsis*. The *Lycopsis arvensis* is a common weed in the grain-fields of Great Britain. The *Lycopsis* has a funnel-shaped corolla with a curiously curved

tube. The *Lichium vulgare*, called viper's bugloss, is a native of Europe and naturalized in the U. S.

Büh'ler, GEORG; Indologist; b. at Berstel, in Hanover, July 19, 1837; studied at Göttingen, Paris, and London, and became professor in Elphinstone College, Bombay, in 1863. He made many expeditions in search of Sanskrit manuscripts, exploring the libraries of Gujerat, Rajputana, etc., and even Kashmir; made valuable reports to Government upon his work; and purchased many old manuscripts, which are now in the Dekkan College, Puna, accessible to scholars. He also purchased for the libraries of Oxford, Cambridge, and Berlin. With Kielhorn he founded in 1868 the Bombay Sanskrit Series, a very useful collection (to date, 40 vols.). In 1880 he was called to the University of Vienna, where, with his colleagues of the Oriental Institute, he established in 1887 the *Wiener Zeitschrift für die Kunde des Morgenlandes* (to date, 6 vols.). His studies in Hindu law appeared in the *Digest*, in translations of Manu and other law-books, vols. xxv., ii., and xiv. of Max Müller's *Sacred Books of the East*, and elsewhere. His achievements in Indian epigraphy and chronology (in the *Indian Antiquary* and *Epigraphia Indica*), literary and religious history, are of great importance. C. R. LANMAN.

Buhl-work: a Germanized form of Boule or Bouille work; a form of decorative inlaying for cabinet work, brought to perfection by André Charles Boule (1642-1732), a French cabinet-maker, whose name was given to this form of art. He used brass, tortoise-shell, ivory, and gold, working out designs of flowers, landscapes, and even hunting scenes, and invented a process of multiplying copies of his designs and obtaining figures and matrices by one operation. The work is done with veneers. For centuries inlaid work came chiefly from the East, and consisted of geometric patterns. Certosina-work, named for the Carthusian monastery near Pavia, is an inlay of ivory on solid cypress or walnut wood. Reiser-work is a German form of decoration named for its inventor, in which woods of different color and grain are used to bring out patterns.

Buhrstone: See BURSTONE.

Building and Loan Associations: societies established for the purpose of enabling persons of moderate means to become the owners of homes by a succession of small payments; called also *Building Societies* (in Great Britain and Pennsylvania); *Co-operative Banks* (Massachusetts); *Co-operative Savings and Loan Associations* (New York).

The first of these associations was established at Birmingham, England, in 1781. In 1836 they had become so numerous and important that a Building Societies act (now superseded by that of 1874) was passed in that year. The first American society seems to have been organized at Frankford (now a part of Philadelphia) in 1831. The system has flourished most in Pennsylvania, but has spread itself all over the country, as will be seen from the following table, compiled from the ninth annual report of the U. S. Commissioner of Labor, which deals entirely with Building and Loan Associations, and gives the figures for Jan. 1, 1893:

New England.....	182	Southern Atlantic States....	222
New York.....	418	Territories.....	10
New Jersey.....	288	Arkansas, Kansas, and Colorado.....	150
Delaware, District of Columbia, and Maryland.....	200	Kentucky, Tennessee, and West Virginia.....	282
Illinois.....	669	Michigan, Minnesota, and Iowa and Nebraska.....	214
Indiana.....	445	Idaho, Montana, Nevada, Ohio.....	721
Missouri.....	366	Utah, and Wyoming.....	25
Ohio.....	721	Pennsylvania.....	1,059
Pennsylvania.....	1,059	Gulf States.....	128
Gulf States.....	128	Pacific States.....	167
Pacific States.....	167	Total.....	5,838

Of these 5,598 were local and 240 were national associations, with a total membership of 1,745,725 (over 1,500 associations not reporting), the total dues paid on shares in force, plus profits, amounting to \$450,667,594. Reports for 1894 show 2,767 associations in the United Kingdom, with 587,856 members, and funds amounting to £51,546,007. Similar associations exist in the British colonies.

The capital of a building association is provided by the issue of shares ordinarily worth \$200 each. These are not sold outright, but are paid for in installments at the rate of \$1.00 a month. If there were no such thing as interest it would of course take 200 months, or nearly seventeen years, to pay for a share; but the money thus paid in is loaned out and the subscribers are credited with the interest, so that the time is much shortened. If the money is so invested as to earn 6 per cent. above expenses, the shares will mature in

126 months or about ten and a half years; that is, 126 monthly payments of \$1.00 each will entitle the holder, at the end of that time, to \$200 in the treasury of the society.

But how is this money invested? It is loaned to members in sums not exceeding the maturity value of their shares to assist them in owning their homes. If a man is making payments on one share he is entitled to become a borrower to the extent of \$200; if he is making payments on five shares he may borrow \$1,000, and so on—provided, of course, that he can show that the money is to be safely invested. Only it will generally happen, in the early stages of a society's life, that there are more men who want to borrow than there are funds available. In this case, who shall have the preference? Sometimes this is decided by order of subscription to the shares: sometimes by lot; but in most societies the loan is awarded to the man who will bid the highest premium for the privilege of having it, and these premiums form an important part of the society's profits. Sometimes this premium is paid in the form of a gross sum deducted from the principal of the loan; more commonly it takes the form of a small monthly payment in addition to the interest itself. Thus a man who had subscribed to five shares, and secured a loan of \$1,000 at a premium of 40 cents a share per month, would have to pay each month as follows:

Subscription to five shares	\$5 00
One month's interest on \$1,000 at 6 per cent.	5 00
Premium on loan of \$1,000 (five shares)	2 00
Total	\$12 00

This sum of \$12.00 per month he would continue to pay until his shares matured, that is, until they were worth \$200 each. At that time, probably some twelve and a half years from the date of the original organization, he would own five full-paid shares of \$200 each, which would stand to his credit on the books of the association, and which would, without further transactions, cancel the principal of his debt. At this same time those who had been subscribers and not borrowers would find that they had credits without corresponding debts, and the treasurer of the association would pay them in full from the funds which the financial operations just described would have enabled him to accumulate. When this was done the affairs of the association would be said to be wound up.

In the older building societies affairs were actually managed in this way. All the payments were begun at the same date; all the shares matured at the same date, and at this time the affairs of the association were absolutely closed. This was not without its advantages. The complete winding up insured a certain plainness and straightforwardness of accounts which it was harder to secure as certainly in any other fashion. But the advantage was rather dearly purchased. In the first place, the system made it hard for new members to enter the association after it was once established. They could only do so by paying in a lump sum the amount which they would have contributed month by month, with the addition of the profits which such contributions would have earned during the time which had elapsed since the association was organized. In the second place—and this was much more serious—it was necessary to accumulate a good deal of cash for the purpose of winding up any such association all at once. The non-borrowing shares had to be paid in full, and these were often very numerous. To accumulate this cash it was necessary to keep much money comparatively idle for months before the winding up of the association, for it was impossible to find borrowers for short-time loans as freely as for long-time loans in the early period of the society's life. Of course, any such failure to realize profits told upon the gains of the investors as a whole. To meet these difficulties, inherent in the "terminating" plan just described, the system of series of shares was invented. Under this system the society is not arranged for winding up at a definite time, nor do all the shares mature at the same date. If a number of men want to come in a year after the society is started they are encouraged to do so; and instead of being compelled to pay back dues in a lump sum they are allowed to subscribe to new shares which will mature a year later than the old ones. We thus have successive series of shares, usually, though not always, bearing dates one year apart, and maturing at similar intervals one after another, whose accounts and profits are kept separately. If a non-borrowing member in an older series wishes to become a borrower, he is encouraged to draw out the amount due to his credit on the older series and let his

shares in that series be canceled; and then he subscribes to shares in a new series as a basis for whatever further money he needs in the way of loans. As the shares of the older series approach maturity, opportunities are given for voluntary withdrawal on the basis of the profits already earned, and in some societies authority is given for the compulsory retirement, at proper valuation, of non-matured shares. The object of all these provisions is to avoid the necessity of accumulating large sums of idle cash for the exigencies of any single moment, which would be a source of loss and of danger. In England this difficulty is sometimes obviated by providing that certain shares are to be reinvested instead of being paid up, and in the German *Baugenossenschaften* this principle appears to have been carried yet further. Such methods tend to create a separate body of non-borrowers, who furnish no small part of the capital, and deprive the scheme of some of its essentially co-operative character. The extreme of this deprivation is seen in the building societies of France, which are generally managed by representatives of the lenders alone. The workman pays for his home by installments, as in Great Britain or the U. S., but he does not furnish the bulk of the capital by such payments, nor does he control its management and disposition. Under such circumstances much of the educational value of these institutions is lost.

In case the subscriber to a non-borrowing share is unable to keep up his payments he is generally allowed to withdraw and receive back the money that he has paid in, provided the society has funds available for that purpose. Whether he should be allowed the full share of profits already earned, or only a part of them, is a disputed question. As the shares approach maturity it is generally well to encourage voluntary withdrawal for reasons just given, and in that case full profits should be allowed. At earlier periods in the life of the shares it is thought better to hold back a part of the profits, as penalty for too early withdrawal.

The mechanism of these societies is simple. Their affairs are controlled by a president and board of directors; but the most active officials are the secretary and treasurer. At the monthly meetings, which are held regularly, the secretary takes the names of applicants, receives the fees of members and hands them over to the treasurer. At each of these meetings the amount available for loaning is announced, and public bids are made for the award. The loan is granted to the highest bidder, subject to the approval of the "property committee" of the board of directors, whose duty it is to see that the borrower does not invest the money in an unsafe manner. If he wishes the loan to buy a house already built, they have to see that the price is not in excess of the permanent value of the property; if he wishes to build, they may examine into the character of the real estate, house-plans, etc. In cases of the latter class the money is not generally paid to the borrower in a lump sum, but given by the treasurer to the contractor from time to time, as the building progresses. If the committee reports unfavorably on the security, the loan is of course awarded to some one else. The treasurer, who may have large amounts of money to handle, is, in all well-managed societies, an official under bonds. He is assisted in his duties by a "finance committee" of the board of directors, distinct from the property committee just described. Further details and suggestions as to organization and management are given in Judge Seymour Dexter's excellent little book *Co-operative Savings and Loan Associations* (New York), also in the *Report of the Pennsylvania Bureau of Industrial Statistics* for 1888. So economical is the administration of these societies that the more recent Pennsylvania reports show current expenses of about 1 per cent. of the moneys handled.

The advantages of societies of this kind are very great; but they are not to be sought in the most obvious lines, or in the ways which are ordinarily assumed. To begin with, these societies do not always or generally furnish a means by which an intelligent workman can get his home cheaper than by dealing with reputable savings-banks. The financial statements purporting to show comparative cost by different methods of payment are often misleading. So well informed a writer as Mr. Linn, whose articles in *Scribner's Magazine* have been a most useful means of disseminating information on this subject, presents an illustration of economy which starts from an absolutely false assumption as to the possible relations between interest-rate, premium, and time of maturity. A man who puts his money in a savings-bank at 4 per cent. until he accumulates a fund large enough to enable him to borrow the balance of what he needs at 6

per cent., with the right to make partial payments on the principal, gets his house cheaper than he can through the agency of any ordinary building society. For the neighborhood of Philadelphia, where the system is so well established that a great deal of capital stands constantly at the disposal of these societies, this statement should perhaps be modified; but for the country as a whole, it is a safe one to make; at any rate, wherever the interest which a man pays on savings-bank loans is only about 2 per cent., greater than that which he can receive on savings-bank deposits.

The shorter the time in which the shares mature the worse is the economy for the borrowers as a class. If the shares mature in less than eleven years, it shows as a mere matter of arithmetic that the non-borrowers are making *ten* per cent. on the money advanced, a rate of profit which in these days is quite excessive. The borrowers as a class must pay this. But the answer is made that the borrowers gain, along with the rest, by the fact that the period of payment is shortened by the more rapid maturity of the shares. The speciousness of this argument constitutes one of the dangers of this form of association. The borrowers apparently share in all the profits; they do not see that if the non-borrowers furnish two-thirds of the capital, the borrowers pay the whole extra profit by excessively high premiums and only get one-third of it back. The temptation to make premiums too high is one that is very difficult to avoid; and few members of a building society have the financial knowledge to resist it. If the shares of a society mature in less than twelve years, with the rates of interest prevailing in some U. S. cities, it may be confidently stated that the borrowers have sacrificed their own commercial advantage.

Another claim urged in behalf of these associations is that they stimulate the habit of saving by making it compulsory. It is said that a man will save more when he is compelled to put it in a building society than when he simply has the option of putting it in a savings-bank. This is doubtless true, but the gain is attended with certain serious losses. In case of sickness this compulsory saving, instead of being a help to a man, may be the worst possible burden. If he has been attracted into paying a high premium, he may find that this burden becomes enormously heavy, and unless the administration of the society is unusually intelligent the danger from this source is very great indeed. If a man's earnings and expenses are perfectly regular, regular saving furnishes the best possible check against extravagance; but if he is brought face to face with unexpectedly increased expenses and unexpectedly diminished earnings, it adds to a load which is heavy enough at best.

A more unmixed gain to the community as well as to the members lies in the fact that these societies enable workmen to become owners of real estate sooner than any other means which has yet been devised. The combination of payments in the share with security for the loan makes it possible for these societies to advance up to 70 or 80 per cent. of the value of the property, while the savings-banks are restricted to 50 per cent. However the account may stand in the matter of dollars and cents, the workman is a great gainer in happiness and self-respect in becoming a real-estate owner as soon as possible. The "magic of property" will enable him to work harder and feel the load less. Even when he is paying an unduly high premium, he is paying it under conditions which make him feel its burdens least and its benefits most. And besides the gain to the individual house-owners and their families, there is a tremendous gain to the community in having the ownership of real estate widely distributed. It puts every owner more completely on the side of law and order than he ever was before. He feels himself an integral part of the state more fully, and is the more ready to take the full share of his responsibilities as a citizen.

The association also has a strong educational effect on its members in teaching them practical lessons concerning the conduct of business. They learn to provide for a future debt by constant investment of their savings in an attractive form. They find out about the handling of money; about interest and the laws which govern it; about the relation between values in the present and future; and a thousand other things which lay the foundation for business success. They also learn about the conditions and methods of building; they learn to buy and build with better judgment than their unaided knowledge would have taught them. So great have been the gains of this sort that there are not a few such societies in which rich men take part as means of both learning and teaching—an interchange of suggestions

as to the better ways of utilizing money in building houses. This educational influence is not the result of any machinery; it comes from the contact of man with man. It is not found in the "national" loan associations, which simply provide a means of investment and borrowing—too often under disadvantageous conditions. Even at their best the national associations are subject to most of the special dangers of the local ones, with few of their distinctive advantages. The co-operative character and the educational influence which this involves are either absent from the national associations or present only in name. The expense of advertising connected with such associations is large; the effective control by investors or any one else is small. In fact, the moment a building association goes outside of certain narrowly defined lines of business, there are great opportunities for abuse of power. The recent history of building societies in England has furnished a conspicuous example of this. Many of them entered upon banking transactions for which they had neither the proper organization, the proper oversight, nor the proper cash reserve. In some cases their methods of business were legitimate enough, and the public suspicion of their characters proved to be unjustified; but not a few were unsound from beginning to end. In his report for 1892 the registrar of friendly societies wisely insists upon constant inspection of the accounts by the investors themselves as the only effective safeguard against abuse of power by the building society officials.

ARTHUR T. HADLEY.

Building-stone: stone suitable for building purposes. The varieties of stone most commonly employed for building purposes may be grouped under the general names of granite, marble, limestone, and sandstone, though other rocks, such as the serpentines, trapps, porphyries, and recent volcanics, are not infrequently utilized when their colors are suitable, or where, on account of locality or means of transportation, they are to be had at a less cost than other stone.

It may be well, before proceeding to describe in detail the various stones used in architectural application, to call attention briefly to the essential qualities which such stone should possess. These qualities, named in the order of their importance, are as follows, regard being had to their use in ordinary building:

(1) Durability. (2) Permanency of color. (3) Crushing strength and elasticity. (4) Cheapness.

Durability.—Not all stones are equally durable, and this is due to a variety of causes. Taken from its quarry-bed and placed in the wall of a building a stone becomes exposed to the constant variations of temperatures, to the chemical action of acid rains and atmospheres, to the combined chemical and physical action of growing organisms, to the compressive weight of the overlying material, and perhaps to the mechanical action of wind-blown sand or the wear of passing feet. To these must be added the destructive action of artificial heat, as when a building is injured by fire. The constant expansion and contraction produced by variations in temperature are perhaps more trying than is ordinarily supposed. Stones, as a rule, possess but a low conducting power. They are aggregates of minerals, more or less closely cohering, each of which possesses its own degree of expansion and contraction. As temperatures rise, each constituent expands, crowding with resistless force against its neighbor; as temperatures fall a corresponding contraction takes place. A slow and gradual weakening and disintegration is the inevitable result. Artificial heat, as produced by a burning building, is necessarily more injurious in proportion as the temperature is higher. Sufficient data are not at hand for estimating accurately the comparative fireproof properties of various stones, but it is an assured fact that granite in this respect ranks extremely low, while the fact that certain siliceous sandstones are used for furnace backings would seem to show that they are at least very nearly if not quite fireproof. Up to the temperature at which it is converted into quicklime, ordinary limestone has been found more durable than granite. The durability of color of any stone depends mainly upon the presence or absence of ferruginous and carbonaceous matter. Stone containing iron in the form of sulphide or protoxide carbonate compounds is liable to change from a white or blue-gray to a buff, yellow, or brown-red color. Where this change takes place uniformly throughout a stone it is often beneficial, changing a cold gray to a warm buff tint. Such a change is spoken of as "mellowing"; frequently, however, the ox-

ilation takes place in spots or streaks, and the result is unsightly. Carbonaceous material, which imparts a dark color to the stone, may in time bleach out to a dirty whiteness.

When a stone becomes saturated with water from rain or other causes, and is then subjected to freezing temperatures, an energetic agent for disintegration is brought into play. Water passing from a liquid to a solid state exerts a pressure of 138 tons to the square foot of surface. It is therefore not surprising that a small amount of water confined within the pores of a stone produces in time very disastrous results.

The water from rainfalls passing through the atmosphere takes up a small amount of carbonic acid. This when brought in contact with stone in the walls of a building is productive of a slight solvent action, particularly in marbles and limestones, or in sandstones with calcareous cements.

In certain cases the crushing strength and elasticity of stone are matters of importance. It must, however, be admitted that these qualities have in times past been greatly overestimated. It is a rule among builders never so to place a stone that it shall be subjected to more than one-tenth or even one-twentieth the pressure it is known to be capable of sustaining. Under such circumstances there are few kinds of stone that are not strong enough for all ordinary purposes of construction, and the test of ratio of absorption, resistance to freezing, and permanency of color, are of vastly greater importance than that of compression. The relative cheapness of materials and their color are still, and perhaps must always be, the controlling factors in deciding what materials shall be used in the greater number of cases. Cheapness is necessarily dependent upon abundance, proximity of quarries to market, and ready means of transportation, together with the ease with which a stone may be quarried and worked. The last quality, unfortunately, not infrequently leads to the selection of a soft, porous, and inferior article.

Testing.—The tests which thus far have been made upon stone to ascertain their fitness for any particular form of architectural application were made mainly with a view of ascertaining their crushing strength and resistance to action of frost. The crushing strength is tested by means of machines, in which small cubes are submitted to a measured force until they are crushed. Such machines are manufactured by Fairbanks & Co., of New York, and the Riehle Bros., of Philadelphia. There is also a remarkable testing-machine, invented by A. H. Emery, in use at the Watertown arsenal in Massachusetts. A large number of such tests have been made under the direction of Gen. Q. A. Gillmore at Staten Island, N. Y., by Gen. Franklin at the Navy-yard in Washington, by engineers at the Watertown arsenal, and others. The results obtained by these investigators do not afford very satisfactory data for a comparison of the relative strength of the different materials, owing presumably to a lack of uniformity in the methods employed and in preparing the cubes to be experimented upon. Enough, however, has been done to warrant the assertion that in other than very exceptional circumstances no further tests of this nature are needed, since under the conditions ordinarily existing a very weak stone will prove sufficiently strong for all practical purposes.

The question, indeed, is no longer what will a carefully prepared cube of the stone bear to-day, but rather how will it endure the vicissitudes of a trying climate, and what will it bear after years of exposure to the action of heat and frost. To these questions the ordinary tests give us no clew. The following figures indicate the range in compressive strength and weight per cubic foot among various rocks so far as they have been ascertained:

DESCRIPTION.	Strength in lbs. per cubic inch.	Weight in lbs. per cubic foot.
Granite	15,000 to 25,000	165 to 170
Trap (diabase)	20,000 " 30,000	175 " 185
Marble (crystalline limestone)	6,000 " 12,000	165 " 170
Marble (crystalline dolomite)	8,000 " 13,000	168 " 175
Limestone	5,000 " 14,000	145 " 170
Sandstone	5,000 " 17,000	130 " 160

For a single test, the best that can be applied to stone is one to ascertain its power to resist the action of frost. This can best be done by actually freezing prepared cubes when saturated with moisture. Chemical methods, as saturating with a solution of sulphate of soda, which is then allowed to crystallize, have proved unsatisfactory and unreliable. The

power of stone to resist the action of an acid atmosphere was tested by Prof. N. H. Winchell at Minneapolis, Minn., by placing prepared cubes in a dish of water through which carbonic acid was kept constantly bubbling. The resistance to heat was tested by placing the specimen in a muffle, raising to a white heat, and noting the change in color and disintegration, if any. While still hot the cubes were dropped into cold water and the effect noted.

None of the tests that can be made in the laboratory are equal for practical results to an examination of the old exposures in a quarry or of stone as it appears in the walls of a building of long standing. Any serious disintegration or discoloration will here have made itself apparent.

"A good building-stone, whatever its kind, should possess a moderately fine and even texture, with the grains well compacted; should give out a clear ringing sound when struck with a hammer; and show always a clear, fresh fracture. It should also be capable of absorbing only a proportionately small amount of water."

GRANITE has ranked from time immemorial as one of the strongest and most desirable of building materials. Unfortunately, its great hardness has until recently proved a serious drawback to its use in other than the most massive structures. The invention of machines for cutting, grinding, and polishing, has, however, very largely done away with this difficulty, and the stone is now in very general use, not merely for house walls and massive masonry, but in turned and polished columns, pilasters, balustrades, monuments, and tombstones. Commercially, the name granite is made to include a variety of siliceous rocks having only a massive and granular crystalline structure in common: the diabases and gabbros are thus included under the name of *black granite*. Properly the name is restricted to eruptive rocks consisting essentially of the minerals quartz, potash feldspar, and one or more minerals of the mica, hornblende, or pyroxene group. The prevailing color of granite is some shade of gray, though pink and red colors are common. The gray hues are due to the prevalence of mica or hornblende; the pink and red to the prevailing pink and red feldspars. The ordinary grays are used mainly for general building, curplings, and pavements, while the darker colors, as those of Quincy (Mass.), and the pink and red varieties, are utilized in ornamental work and for the bases of statues. Granites occur in all the States bordering upon the Appalachian Mountain system, but are more extensively quarried in Maine and Massachusetts than elsewhere, a fact due to the excellent facilities for shipping as much as to the quality of the material. The most noted granites of the U. S. are those of Hallowell, Red Beach, Vinahaven, Dix's and Hurricane islands, and adjacent localities on the coast of Maine, Concord, N. H., Quincy and Cape Ann, Mass., Westerly, R. I., Richmond, Va., Iron County, Mo., and East St. Cloud, Minn. Good granites abound in the Rocky Mountain region, but are as yet undeveloped, excepting to a slight extent in Colorado and California. Among other noted stones belonging to this class are the red granites from the Bay of Fundy, Nova Scotia, and from near Peterhead, Scotland. A gray granite with pink crystals of porphyritic feldspar is obtained in Shap, Westmoreland co., England, and a coarse, dark red-brown variety in Sweden.

MARBLE.—The term "marble" as ordinarily used includes any stone composed essentially of carbonate of lime alone, or the carbonate of lime and magnesia in varying proportions, and which, owing to its color and texture, is sufficiently beautiful for a high grade of building material, or for monumental or decorative work. In color marbles vary from pure white, through all shades of gray, to black; yellow, pink, brown, and red are by no means uncommon, the gray and black hues being, as a rule, due to carbonaceous matter, and the others to iron oxides. In texture they vary from finely and coarsely granular to compact and apparently amorphous, at times highly fossiliferous. A high grade of marble for polished interior decorative work should be so compact as to yield under the hands of the workman a close, enamel-like surface with little if any granulation. For building and statuary purposes, on the other hand, a granular stone is the most desirable, giving in tool-dressed or rock-faced work an effect much more pleasing to the eye than do the compact varieties.

The principal sources of American marbles are at present the beds of Silurian limestone and dolomite which border the Appalachian Mountain system. Vermont produces some 60 per cent. of the entire output. Coarse dolomite marbles eminently suited for constructive purposes occur in

Western Connecticut and Massachusetts, and in Southeastern New York; a coarse building-marble is also quarried in Northern Georgia. Pink and chocolate variegated marbles suitable for furniture and interior decorative work occur abundantly in Eastern Tennessee, and have been quarried for many years. This is now the chief source in the U. S. for colored decorative marble. Good marbles are known to occur in the Rocky Mountain region, but as yet they have come into but little use, owing to their inaccessibility. Recent developments in Colorado and California are, however, very promising.

The principal foreign sources of marble are Northern Italy, the French Pyrenees, Belgium, Germany, and Algeria; Spain and Portugal are also productive. The most noted of these are the white statuary marble of Carrara, the black and gold and Sienna marbles of Italy; the so-called Numidian marbles of Algeria; the *griotte* or French red from the Pyrenees; the St. Anne and Sarracolin from Belgium; the Formosa and Bougard from Germany; and the yellow from Portugal.

The so-called "onyx marble" is in reality a compact and very beautiful variety of travertine. This is by far the most beautiful and highly prized of all marbles. The principal sources of supply in times past have been Egypt and Algeria, more recently Mexico, and still more recently high-grade material of this nature has been found in Arizona and California in the U. S. Extensive deposits are also reported in the desert region of Lower California. The verd antique marbles, so called, are mentioned under the head of SERPENTINE (*q. v.*).

LIMESTONES.—Limestones vary in color and texture, as well as in durability for constructive purposes, as do the marbles. They may be compact and amorphous, finely or coarsely crystalline, or fossiliferous. Some, like the Florida coquina, are mere aggregates of more or less comminuted shells. The limestones as a rule are less desirable for constructive purposes than are the granites, marbles, or sandstone; this on account of their colors and poor working qualities. There are, however, important exceptions. The most important of the limestones used for constructive purposes are the oolites or oolitic limestones from the sub-carboniferous beds of Southern Indiana and adjacent portions of Kentucky; these are of a white or cream color, fine grained and readily wrought. They are eminently suited for finely carved and ornate styles of architecture. In color and texture they correspond closely with the Jurassic oolites of England, which have been in use in that country since early in the twelfth century. The dolomitic Silurian limestone underlying the city of Chicago, and adjacent portions of Will and Cook Counties, is another important source of material for both building and flagging purposes. In many instances the stone contains sufficient bituminous matter to discolor and impart to it a peculiar antique look which is much esteemed by some. Important beds of limestone for structural purposes also occur in Iowa, Kansas, and Missouri. Ohio also has many quarries of local importance, but few of them are known beyond the limits of the State.

SANDSTONES are among the most variable of natural building materials. As the name denotes, they are composed essentially of consolidated sand, but the composition, texture, and color of this sand may vary almost indefinitely. As a rule, the predominating constituent in a sandstone is the mineral quartz, in rounded or more or less angular grains. Feldspar and minerals of the hornblende, pyroxene, or mica group are, however, common. The usual cementing or binding constituent in sandstone is silica, carbonate of lime, iron oxide, or clayey matter. The durability of the stone, as well as its working qualities, is dependent more upon the character of this cement than upon that of the grains composing the stone itself. Of all cementing materials the siliceous is the most durable, and the clayey the least so, since the first is less susceptible to the solvent action of water from rainfalls. Both ferruginous and calcareous cements are slightly soluble and liable to slow removal, whereby the stone becomes friable and slowly disintegrates. The clayey cement is a source of weakness on account of its tendency to absorb water, whereby the stone is rendered liable to injury by freezing. In color sandstones are as variable as in texture. The prevailing hues are some shades of gray, buff, drab, red, or brown, the coloring-matter being mainly iron in some of its forms. A white color denotes the absence of iron. The red is due to anhydrous iron sesquioxide; brown to a hydrous sesquioxide; the gray color may be due to iron in the form of a protoxide carbonate,

Such stones are liable to turn yellowish on exposure. In certain of the Ohio quarries the stone is brown in color as exposed in the surface outcrops, but dark blue-gray below the water level, the change being due to the oxidation in the upper layers of the protoxide carbonate. In many sandstones the cementing silica has so orientated itself around the original quartz granules as to convert the stone into a granular aggregate of imperfect crystals. Such stones are properly quartzites, and rank among the most indestructible of building-stones, though unfortunately they are extremely hard to work. The well-known Potsdam sandstone of St. Lawrence co., N. Y., is one of the best examples of this phenomenon.

All stone are softer and most readily worked when first quarried than after seasoning, but this characteristic is most strongly marked in sandstone. This is due to the fact that the stone as it lies in the ground contains a small amount of sap, or quarry water, as it is called, and this carries the cementing material in solution, to be deposited on evaporation. So abundant is this quarry water in many sandstones that the rock is liable to serious injury if frozen without previous seasoning. On this account many quarries in northern latitudes can be worked only during the warmer seasons of the year.

The favorite sandstones for constructive purposes in the U. S. are the Ohio freestones, or Berea grits, from the Waverly division of the sub-carboniferous formations in Ohio, and the brown and red freestones from the Triassic formations of the Atlantic States and eastern slopes of the Rocky Mountain range. The first is a fine light drab, gray, or buff siliceous sandstone, very readily wrought, and, when properly laid, very durable. The best-developed quarries are in the towns of Berea, Amherst, East Cleveland, Illyria, and Independence, in Lorain and Cuyahoga Counties. The Triassic stone is of a prevailing brown or red-brown color, and has been used frequently in New York and other Eastern cities in the form of ashlar blocks for house fronts. Unfortunately, little judgment was exercised in either the selection of the material or its preparation and laying in the wall. Serious disintegration has not infrequently resulted and the stone been brought thereby into undeserved disrepute. The principal quarries in the East are along the Connecticut valley in Massachusetts and Connecticut, particularly at Portland in the last-named State, and in various towns in Passaic, Essex, Hunterdon, and Mercer Counties in New Jersey, and at the mouth of Seneca creek in Maryland. Extensive quarries are also operated at Hummelstown, in Dauphin co., Pa. Within a few years operations have begun in Triassic beds forming the eastern foothills of the Rocky Mountains near Golden, Col., and Flagstaff, Arizona. Beds of Medina sandstone of a red-brown and gray color in Western New York furnish also a high-grade building and paving stone. Thin bedded blue-gray aluminous sandstones belonging to the Hamilton group are admirably suited for pavements, steps, sills, and lintels, and are extensively quarried in Albany, Green, and Ulster Counties in this same State, and in Luzerne, Wyoming, and other counties in Pennsylvania. The stone is popularly known as "bluestone" or "flagstone," on account of its color or the prevailing use to which it is put. Silurian sandstones, also of a brown or red color, are found in the northern part of the upper peninsula of Michigan, and are being worked at various points in Marquette, Baraga, and Houghton Counties to furnish materials to cities along the lakes. A dense quartzite of Potsdam age occurring near Sioux Falls, in South Dakota, has been worked for building and paving materials, and to a slight extent for ornamental work, such as turned columns and polished tiling. A beautiful light-buff stone from sub-carboniferous beds near St. Genevieve, Mo., has been utilized to some extent. The sandstones of the Pacific coast have been as yet but little developed, as there has been until recently but small demand for such materials. Large quantities occur around the Bay of San Francisco, in California; in Douglas co., Ore., and on Cheuk-aunt Bay, in Washington.

The most noted of foreign sandstones which are brought into the U. S. are the pale olive green Coal Measure stones from the vicinity of Dorchester, New Brunswick, and the bright-red "Corsehill stone" from near Annan, in Dumfriesshire, Scotland. A brown-red Potsdam stone is also imported to some extent from Verde island, Nipigon Bay, Lake Superior.

PORPHYRY, as the name is ordinarily used, includes any rock with a porphyritic structure. The quartz porphyries

of Eastern Massachusetts are of exceptional beauty when polished, but their intense hardness prohibits their extensive use. The green antique porphyry, or *Marmor Lacrdæmonium viride* of the ancients, is a porphyritic diabase, while the red Egyptian porphyry, or *Rosso antico*, is, according to Delesse, a porphyrite.

ALABASTER, a fine translucent variety of gypsum, is little used for other work than that of making small stands, vases, and statuettes. It is too soft for use where exposed to wear. No alabaster of importance is produced in the U. S., the chief source of supply being Northern Italy, whence it is exported in the manufactured form under the name of "Florentine marble."

SERPENTINOUS ROCKS are abundant in numerous localities along the Appalachian and Coast Range belts of mountains, but are at present in little demand owing to the fact that the colors are cold and do not readily harmonize with their surroundings. The rock is as a rule, moreover, badly jointed, and this renders the procuring of large slabs or blocks a matter of great difficulty. Serpentine of compact texture and susceptible of a light lustrous polish occur at Deer Island, Maine; near Roxbury, in Vermont; Lynnfield, Mass.; Milford, Conn.; Essex co., N. Y.; in Harford co., Md.; on the Gila river, Grant co., New Mexico; and near Victor, in San Bernardino co., Cal. A coarse, porous, light-green serpentine rock is quarried in Chester co., Pa., and furnishes a cheap and durable building material for the many cities and towns in the vicinity.

The most noted of foreign serpentines, or verd antiques, are those of the Lizard district, in Cornwall, England; the "Connemara green" from County Galway, in Ireland; and the serpentine *brescia* from near Genoa, Italy.

TRAP is a term used to include a number of igneous rocks which may be more accurately described under the names of diabase, dolerite, basalt, melaphyr, diorite, and gabbro. These rocks are little used for building or decorative purposes, owing to their somber hue and poor working qualities. They are, however, exceedingly strong and often very durable. The Mesozoic traps of the Atlantic border are extensively used for road ballast and street pavements, and more rarely for bridge work and general constructive purposes. Gabbros from the coast of Maine, and near Duluth, Minn., are also in great favor for monumental work, acquiring a high polish, and being dark gray or nearly black in color; such are commercially known as "black granites." A norite from Keeseville, N. Y., is used for similar purposes, and a coarse granitic diorite from near Croton Landing on the Hudson river in the same State is utilized for building. A greenish melaphyr, or *amygduloid*, from Brighton, Mass., furnishes excellent foundation material. The basalts are little utilized as yet for other than paving purposes.

Buildings. Warming and Ventilation of: See WARMING AND VENTILATION OF BUILDINGS.

Bujalance, boo-ahá-lan-tháy: a town of Spain; province of Cordova; about 25 miles E. of Cordova (see map of Spain, ref. 18-E). It is surrounded by a wall flanked with old towers, and has an old Arabian castle and a college. Here are manufactures of woolen goods, glass, and pottery. Pop. 10,500.

Bukovina, boo-kō-vee'na: a province of Austria; bounded N. by Galicia, E. and S. by Roumania, and W. by Hungary, and Galicia (see map of Austria-Hungary, ref. 5-1). Area, 4,035 sq. miles. With the exception of both banks of the Pruth, its chief river, the country is mountainous throughout. The climate is severe, but healthful. It has very little commerce and industry. The chief occupations of the inhabitants are agriculture and cattle-raising. Iron, copper, and rock-salt are mined in large quantities. Bukovina was originally a part of Transylvania, with which country it passed under Turkish rule in 1529; ceded to Austria in 1777; united with Galicia in 1786; organized as a separate crownland in 1849. Pop. (1891) 646,591.

Bulak, or **Boulae**, boo-laak': a town of Egypt; on the right bank of the Nile; about a mile from Cairo; at the branching of the Pelusiac arm of the Nile. It formerly stood on an island. The vessels navigating the Nile discharge their cargoes at Bulak, which is the port of Cairo, and contains a custom-house. It has manufactures of cotton and silk, a Government printing-office, and a very valuable museum of Egyptian antiquities. Pop. about 13,000.

Bulb [from Lat. *bulbus*, from Gr. *βοῦβός*, onion]: in botany, a generally rounded or ovoid structure consisting of a short stem, upon which are attached many thickened bases of leaves, usually in the form of concentric layers. For the most part bulbs are subterranean, or partly so, and from the lower part of the short stem roots grow out and downward into the soil. The onion is a good example of a bulb, and in it the little stem may be easily seen by making a vertical section, while the arrangement of the layers may be best seen in a cross-section. By a close comparison of bulbs and buds it is readily seen that their structure is similar. Each is but the quiescent state of a shoot, in which by the checked growth of the axis the leaves are developed in close proximity. Thickened stems are sometimes erroneously called bulbs, as in the crocus, gladiolus, etc., where they are more properly called *corms*. Thickened roots of particular shapes are often termed *bulbous roots* in allusion to their resemblance to bulbs in form, although there is otherwise no similarity. C. E. B.

Bul'bul: the Persian name of the nightingale; sometimes used by English poets. The same name is given by the people of India to a different species of bird, the *Pycnonotus hæmorrhous*. It is a small bird of brilliant plumage, and remarkable for its pugnacity and its lively manners. It likes to build near houses. Its constant singing is described as pleasant, but hardly musical, at least not to be compared with that of the true nightingale.

Bulgaria (anc. *Mæsia Inferior*): a principality of Europe; bounded N. by the Danube, E. by the Black Sea, S. by the Balkan Mountain range, and W. by Servia (see map of Turkey, 3-D). Area, 24,360 sq. miles. The surface is level in the N. and mountainous in the S., and is generally well wooded. The soil in some parts is fertile. It is drained by numerous small tributaries of the Danube. The chief articles of export are horned cattle, grain, wine, iron, wood, hides, wax, and attar of roses. The principal towns are Rustchuk (Russe), Plevna, Razgrad, Scvliovo, Rahova, Vratya, Varna, Vidin, Sofia, and Schuunla. The Bulgarians belong to the Greek Church, but for many years endeavored to become independent of the patriarchate of Constantinople, and to have all the Bulgarian dioceses of Turkey united under one Bulgarian exarch. The demand was granted by the Turkish Government in Apr., 1870. The people are of the Finnish-Ugrian race, but adopted very early the Slavonian language. This country was conquered by the Turks in 1396. By the treaty of Berlin in 1878 (see BERLIN CONGRESS), it was made an autonomous and tributary principality under the Sultan of Turkey. Pop. (1888) 2,193,934. Capital, Sofia. In Oct., 1885, Eastern Roumelia (area about 13,500

sq. miles, with 960,441 pop. in 1888) was annexed to Bulgaria. Prince Alexander of Bulgaria abdicated Sept. 7, 1886. Ferdinand, Duke of Saxony, was elected Prince of Bulgaria by the National Assembly July 7, 1887, and assumed the government Aug. 14, 1887. His election and the union of Eastern Roumelia to Bulgaria have not yet (1896) been confirmed by the great powers. See ARMY, and Jirceek, *Das Fürstenthum Bulgarien* (1891).

Bulgarian Language: See SLAVIC LANGUAGES.

Bulgarian Literature: The literature of Bulgaria falls into two distinct and widely separated periods. The first of these extends from the ninth to the fourteenth century, the date of the conquest of the Bulgarians by the Turks; the second comes wholly within our own century. The literary language of the two periods is different, and the very alphabet has changed. In the early period the so-called Cyrillic alphabet obtained, being the alphabet given to the Slavic race by Cyril and Methodius, the apostles to the Slavs, who were themselves Bulgarians from Salonica and began the spreading of the Orthodox Greek faith among the Slavs from Bulgaria. There, too, they designed the Slavic alphabet, and translated the Scriptures and various Church books; and the ancient Bulgarian dialect and style of writing are both called Cyrillic. Being then of all the Slavs nearest to and most in contact with the Byzantine Greeks, the Bulgarians advanced in literature more rapidly than any other Slavic nation. Most of the literary production of that time, however, was theological in its character. The Gospel of Ostromir is taken as the purest standard, for style and also for orthography, of the Cyrillic or Old Bulgarian literature. The language compares favorably with Latin and Greek for richness and pliability, and translations were freely made from these tongues. Many manuscripts containing such translations are preserved in the great libraries of Europe, though unfortunately few have as yet been published. Scholars have, however, derived important aid from them for the study of the originals. Old Bulgarian literature reached its zenith during the reign of the Tzar Simeon (latter part of the tenth century). Though consisting, as has been indicated, largely of translations, it well deserves study for the light it throws upon the general literary relations of mediæval Europe.

After the conquest of Bulgaria by the Turks (1396), the Greek subjects of the Turkish Government succeeded in prejudicing their rulers against the sturdy Bulgarians, and in obtaining the right themselves to invade the country with their churches, schools, and language. Speedily the Greek tongue replaced the Bulgarian in religion and education. The Greek bishops, with intent to Hellenize the Bulgarians, destroyed the public, and even private, libraries in which were Bulgarian books, so that only scattered manuscripts were preserved.

The gap in Bulgarian literature from the fourteenth to the nineteenth century is bridged by a single class of literary productions, popular ballads, tales, and proverbs; and these are rarely other than modern in the form we have. Still they are in substance traditional, and give us much information as to the life of Bulgaria during these centuries. The ballads often make use of Bulgarian history under the tzars, especially the last, Tzar Shishman; but for the most part they describe the wrongs suffered from the Turks and Greeks, and the deeds of the heroic avengers of these wrongs. There are love ballads also. All are sung to melancholy, long-drawn airs, said to have been adopted after the Turkish conquest. In the heroic ballads, the chief figures, represented as banner-bearers of bands of Haiducs, are the leaders of bodies of insurgents; and the Bulgarian heroes are often confused with the ballad heroes of Servia and Montenegro. There are many collections of these ballads, of which the following may be named, those of Bezsonoff, the brothers Miladinoff, Kachanofski, Verkovich, Hieff, and Shapkareff. See BALLAD POETRY.

Modern Period.—The first Bulgarian book of the new epoch was published in 1806. Certain Bulgarians educated in Russia formed a club in Odessa for the purpose of reviving Bulgarian literature, and also with the intent to make Bulgaria an independent exarchate. The last point was not gained until Apr., 1870, after many and severe trials. But long before this, local revolts against the Greek patriarchate had banished the Greek bishops, with their books and language, from most of the Bulgarian churches and schools. About the middle of the century, a gymnasium was established at Bolgrad, in Bessarabia; and the brothers Apriloff, of Odessa,

had endowed another in their native town in Bulgaria, Gabrova. Text-books and periodicals began to be published in Bulgarian. At first an attempt was made to preserve the Old Bulgarian alphabet and language—or at least, as Rakóvski advocated, to adopt an intermediate dialect, which should serve as a medium for all Slavs, as Old Bulgarian had formerly done. It was found, however, that the language had undergone such modifications that the modern form of it was related to the old form much as modern to ancient Greek, or Italian to Latin. Accordingly, the old idiom, with the Russisms it had acquired from the printing of the Church books in Russia, was consigned to the use of the Church, while the living language was adopted for the schools and for literary purposes. The old accentuation and abbreviations and from eleven to sixteen letters of the old alphabet have been abandoned; and the calligraphic handwriting and the smooth Russian type are employed. These changes, however, have not been thoroughly or systematically carried out; and the tendency to adopt the phonetic system of writing, advocated especially by Prof. Drinoff, causes great confusion in Bulgarian orthography.

The following writers of the new epoch deserve to be mentioned: P. R. Slavéicoff, I. Grúeff, Neófit Rilski, Láben Karavéloff, and S. Rakóvski. Though not writers of cosmopolitan training or European reputation, these men have done much for the literary future of their race. Slavéicoff, especially, the most productive of all, has proved himself a born poet and a sharp satirist. His *Sméshen Kalendár*, *Nova-modá Kalendár*, and his periodical *Gáida* have been the principal factors in the overthrow of the Greek hierarchy and the awakening of independent Bulgarian life. Slavéicoff has also translated many novels and poems into Bulgarian, and has edited several periodicals. Grúeff has worked mainly as a teacher through the schools. He has composed and translated many text-books. Rilski, first a teacher and then hegumenos of the monastery of Rila, has translated the New Testament, and composed the first Bulgarian dictionary and grammar, but only the grammar was published in 1835. Karavéloff is a noted novelist and journalist.

Education is making greater progress in Bulgaria than in any other Slavic country. Missionaries from the U. S. have contributed much to this, and, indeed, to the development of Bulgarian literature. Dr. Riggs published in 1844 a Bulgarian grammar, and Mr. Morse in 1839 the first vocabulary. Bulgaria has now a university at Sofia, 7 gymnasias for boys and 6 for girls, 2 normal schools, 1 commercial, 2 agricultural and 1 technical, all under the care of the Government, and very prosperous. The exarchate supports also a gymnasium in Salonica and many grammar schools in Macedonia. For professional training, Bulgarians must still go to foreign countries.

In the way of periodicals, Bulgaria has eleven magazines or reviews, of which the *Sbornik*, edited by the Ministry of Education, *Periodichesko Spisanie*, and *Trud* are very good; and twenty-eight newspapers, of which two are dailies.

E. S. YOVTCHEFF.

Bulgarin. FADDEÏ VENEDEIKOVITCH; Russian writer; b. in the department of Minsk, in Lithuania, 1789; d. near Dorpat, Sept. 13, 1839. In his youth he served in the Russian army against Napoleon, and in Finland; but in 1810, having withdrawn from the Russian service, he joined the famous Polish legion at Warsaw, and served under Napoleon in Italy, Spain, and Germany (1810-14). After the conclusion of peace he entered the Russian administration, and at the same time began to write. In 1825 he founded with Gretch the journal *Ssverennaja Pchelá* (*Northern Bee*), for which he wrote many years. He was an able writer, but unjust, servile, and venal. In politics and literature both he was a fierce absolutist and reactionary; and as such he enjoyed the special favor of the Russian Government. His feud with the Russian romanticists, especially Pushkin, was of the bitterest. He is now chiefly remembered for his novels, which have undeniable power, and which have been translated into most of the languages of Europe. The chief of these are *Ivan Vaishigin, or the Russian Gil Blas* (1829); *Demetrius* (1830); *Maçappa* (1832); *Peter Ivanovitch Vaishigin, sequel to the Russian Gil Blas* (1834). Besides these novels, Bulgarin wrote a great work, *Russia, Geographical, Statistical, and Literary* (6 vols., St. Petersburg, 1836), and *Memoirs (Vospominaniia)*, 6 vols., St. Petersburg, 1814-49; Germ. trans. by Reinthal and Clemenz, 6 vols., Jena, 1858-61). A. R. MARSIN.

Bulkeley, MORGAN GARDNER, A. M.: Governor of Connecticut; b. in East Haddam, Conn., Dec. 26, 1837; educated in Hartford High School; mayor of Hartford 1880-88; elected Governor of Connecticut in 1889; and in 1891 held over with the aid of the House of Representatives, owing to alleged defects of election returns, although he had not been a candidate for the office.

Bulkhead: on board ship, a partition separating the cabins and staterooms on the same deck, as *cabin bulkhead*, *wardroom bulkhead*, etc. Water-tight bulkheads are transverse partitions of iron dividing the holds of the modern steamship into compartments. Transverse and longitudinal bulkheads increase the structural strength of a ship, and, by confining a fire or a leak to one compartment, add to her safety.

A *collision bulkhead* is a transverse partition in the fore body of a ship. Should the bow be stove in by a collision, it confines the water to the forward compartment. The name is also applied to a structure of wood or stone, to hold back earth, as on a water front, in a mine, etc. S. B. LUCE.

Bull (in Lat. *taurus*, Fr. *taureau*): the male of animals belonging to the family *Bovide* and genus *Bos*. The name is also applied to the males of some other animals, such as the elk, sea-lion, seal, whale. (See *BOVIDÆ*.) Also the name of one of the twelve signs of the Zodiac, and of a constellation which does not coincide with the sign. (See *Taurus*.) In conversation, a ridiculous speech defined by Sydney Smith as "an apparent congruity and a real incongruity of ideas suddenly discovered." The use of the term was known as early as the fourteenth century.

Bull, or **Papal Bull** [from Lat. *bulia*, knob, seal]: an ordinance or decree of the pope, equivalent to the edicts, proclamations, or letters-patent of secular sovereigns, some of which were formerly called bulls. (See *BULL GOLDEN*, below.) All bulls are written in Latin, except those addressed to the United Greek churches. They are generally designated by the first words of the text: thus the bull issued in 1536 against heretics was called the bull "In Cæna Domini," and that directed against the Jansenists in 1713 was the bull "Unigenitus." The publication of a bull is termed fulmination (from the Lat. *fulvino*, *fulminatium*, to "hurl a thunderbolt," *fulmen*). Bulls are written on parchment, and a leaden seal is appended to every bull by means of a silken cord if the object of the bull be the granting of a favor; but if it be a matter of justice, the cord is of hemp. Revised by JOHN J. KEANE.

Bull Golden: a term applied to a decree or enactment of Charles IV., Emperor of Germany, published in 1356, in two diets held in succession at Nuremberg and Metz, in order to fix the laws in the election of emperor and to regulate the number and privileges of electors. It is preserved at Frankfort-on-the-Main. Another "golden bull," of Andrew II. of Hungary, in 1222, fixed the privileges of the nobles, and was regarded as a national constitution.

Bull, OLE BORNEMANN: Norwegian violinist; b. at Bergen, Feb. 5, 1810. He visited Paris in his youth, and afterward performed in Italy and England with great success. In 1845 he removed to the U. S., purchased a large tract of land in Pennsylvania, and founded the colony of Oleana. This proved to be a failure, and he returned to Europe, but subsequently visited the U. S. several times. D. at Bergen, Norway, Aug. 18, 1880.

Bulla: a genus of molluscs belonging to the order of *Opisthobranchs* (see *GASTEROPODA*) and family *Bullidae*.

Bulla velum.

which receives its name from the swollen globular shell with which all the species are provided. The whorls of the shell are few in number, the outer ones greatly swollen, and the spire is frequently covered by the outer whorl. The animal has a broad, flat head, which is united to the fleshy tentacles to form a frontal disk. Gills occur only on the right side. The species, of which over fifty are known, are all marine, and are mostly inhabitants of warmer seas, especially those with sandy bottoms. Fossil species occur in Cretaceous rocks.

Bull-baiting: a sport formerly common in England, but illegal since 1835. The bull was baited by inciting dogs to attack him, and in order that the bull's temper might be ex-

cited his nose was blown full of pepper. Sometimes the bull was fastened by a rope, and bulldogs were set at him, one at a time, to fasten themselves on his nose, which operation was called pinning the bull. The sport, however, chiefly consisted in seeing the dogs tossed.

Bulldog [so called from the practice of *BULL-BAITING* (*q. v.*)]: a variety of dog especially bred in Great Britain. It is remarkable for its courage, faithfulness, persistency, and strength. It is now much less frequently bred than in past times. The size of the neck and fore quarters of this dog is quite in excess of the development of the other parts. The bulldog is one of the most fierce, and even dangerous, of his species. Its chief value at present is for crossing with other breeds. The greyhound, the terrier, and the pointer, each have their courage and persistency much improved by this cross, if judiciously made.

Bulldozing, **Bulldozer**, or **Bulldozen**: a slang term of Louisiana origin, having as yet a variable significance. Its first use was in the parishes of Feliciana and Baton Rouge, in 1876, to describe the doings of a band of a dozen Regulators styled the "Union Stop," who undertook, in the absence of law, to check the stealing and killing of stock, which were destroying the cattle and hogs of that region. The punishment of offenders was with the well-known bull-whip—a hickory handle of 12 or 15 inches and a plaited thong of 3 to 5 feet. A dozen lashes (or the dozen composing the band) gave the name to the process or dose of strapping, and it was called "bulldozing" or "bulldozing." It soon was applied to all summary punishment not authorized by law. More recently it became a political term, particularly as applied to the influencing of negro voters by those of their own color; but bulldozing has become a term used to describe all the various kinds of intimidation, real or imaginary, used at elections.

Buller, Lieut.-Gen. Sir REDVERS HENRY: English soldier; b. in Devonshire in 1839; entered the army in 1858; served with distinction in China, the Ashanti war, the Zulu war, the Boer war, the Egyptian war of 1882, and the Sudan campaigns of 1884-85; lieutenant-general 1887.

Bullet (in Fr. *balle*; Germ. *Kugel*): a projectile of lead to be discharged from various kinds of small-arms. For smooth-bore arms bullets are usually spherical, but for rifled musketry various forms of the elongated bullet are used. Most of these bullets have an expansive base, either hollow or plugged with wood, the design being to force the soft lead outward, so as to cause it to fit the grooves of the rifle, and thus give the bullet a rotation around its long axis during the motion forward. This rotation, as is well known, increases the range and precision. Bullets were formerly always cast, but now they are more frequently stamped in steel dies.

Bulletin [Fr.]: in diplomacies, a term equivalent to schedule, and variously applied to different public acts. In recent times the word is often used to denote an official report, a dispatch of a military commander, and in a wider sense any public notice or announcement, especially of recent events. In France the ticket or slip of paper which each elector uses in voting at elections is called a bulletin. In the U. S. official bulletins of the weather are issued daily by the Weather Bureau of the Department of Agriculture.

Bull-fighting (in Sp. *corrida de toros* or *fiesta de toros*): a contest between men and bulls carried out as a show for the public entertainment. Bull-fights were introduced at Rome by Julius Cæsar, and were popular during the reigns of the emperors. They were introduced into Spain by the Moors in the eighth century. They were abolished there by Philip V., but were revived early in the nineteenth century. They are now a popular sport in Spain as well as in Spanish America. Lately efforts have been made to introduce them into the south of France, but have met with some opposition. At the present time bull-fights are carried out by private individuals or for the benefit of hospitals or other public institutions. In Madrid the fights take place in the Plaza de Toros, an arena round which the seats are ranged as in an amphitheater, with rows of boxes at the top. It is said there is room for 10,000 spectators. The actors in the bull-fight are generally professionals, but amateurs are sometimes permitted to take part. The fight is divided into three acts. In the first act the *picadors* take part, in the second the *chulos*, and the third act is reserved for the *matador*. The *picadors*, who are dressed like the knights of ancient times, are mounted and armed with lances (hence

the name, from Spanish *pica*, a pike or lance. They take their place at the center of the arena. The chulos, who are on foot, are dressed in colored cloaks. The matador is on foot, and carries a sword and a *muleta*—a stick with a piece of red silk fastened to it. When the magistrate gives the signal a bull is let out into the arena. If the bull is a brave one, the picadors assume a defensive attitude; but if he is sluggish, they attack him vigorously. If they fail in irritating him, the animal is stabbed in the back of the neck. Whenever a picador's horse is wounded or he himself is thrown, the chulos advance and distract the bull's attention with their cloaks. The bull generally kills some of the horses, and on rare occasions one or two men. When the bull becomes exhausted, the picadors are succeeded by the chulos with *banderillas*—small barbed darts—to which fire-crackers are sometimes attached. These the chulos discharge at the bull to stimulate his flagging energies. In the last act the matador enters alone. The bull being enraged by the sight of the *muleta* makes a dash for it, and the matador standing aside drives his sword in front of the left shoulder. A team of mules then enters, and the dead body of the bull is quickly carried away. The matador is greeted with cheers, but the populace is equally well satisfied should the bull be the victor, when another matador enters the arena.

Bullfinch (*Pyrrhula europæa*): a European bird of the family of *Fringillidae*; about the size of the common sparrow; often kept as a cage-bird, especially by the Germans.

Bullfinch.

It is easily trained. The plumage is bluish gray above, the breast is of a bright tile red, and the crown of the head and the greater wing-coverts are black. It builds on bushes or trees near the ground, and feeds chiefly on seeds, berries, and buds. Its song is not naturally very agreeable, but it can be improved by education, and trained bullfinches are sold for high prices. The pine bullfinch (*Pinicola enucleator*) is a beautiful northern bird of both hemispheres. The male is of a splendid red, the female an orange green.

Bullfrog (*Rana catesbeiana*): a frog found in the U. S.; of olive-green color; generally 8 to 12 inches long, though in some cases it attains the length of 19 to 24 inches. It derives its name from the remarkable loudness of its voice, which is of a deep bass, and resembles the bellowing of a bull. It is almost wholly aquatic. The hind legs of this frog are often used as food.

Bullhead: the popular name of small fishes of the genus *Callas*, of which there are several species in Europe and America. Another name commonly given them is MILLER'S-BUMM (*q. v.*). *Ameiurus nebulosus* and occasionally other species of fish are locally known as bullheads in the Northeastern States.

Bullinger, *boilling* or *Heinrich*: Swiss reformer; b. in Bremgarten, in the canton of Aargau, near Zurich, July 18, 1504; d. in Zurich, Sept. 17, 1575; studied theology in Cologne, and became a teacher in the convent at Koppel 1523; by the writings of Luther, Melancthon, and Zwingle led to embrace the Reformation. In 1529 he was chosen pastor of his native city, and married, and in 1531 he succeeded Zwingle as pastor of Zurich. He wrote with great dignity against Luther in the controversy concerning the Lord's Supper, but he finally came to an agreement with Calvin; and he drew up the Second Helvetic Confession

1566, the most elaborate Reformed creed. Of his numerous writings—commentaries, sermons, dogmatical expositions, polemical treatises against the Lutherans, the Anabaptists, etc.—there is no collected edition; but they enjoyed great authority in their time. His *Reformationsgeschichte*, edited by Hottinger and Vögel, appeared first in 3 vols. (Frauenfeld, 1838–40); his sermons, the so-called *Deudes*, were early translated (London, 1577; new ed. Cambridge, 1819–52, 4 vols.) and their reading was enjoined by convocation of the inferior ministers. See his *Life*, by C. Pestalozzi (Elberfeld, 1858) and by Roget (Christoffel) (Zurich, 1875); also G. R. Zimmermann, *Die Züricher Kirche und ihre Antistes* (Zurich, 1877).

Bullion: gold or silver in mass, and hence gold or silver without reference to the shape or form in which it is made. The term is ordinarily used of uncoined gold and silver, but is sometimes applied to coined metal when sold by the bulk instead of according to its face value, especially when worn, or depreciated by alloy. Gold and silver are called bullion when smelted from the ore and not perfectly refined, or when perfectly refined but melted down into ingots or bars, or in any uncoined form.

Bullock, CHARLES: Anglican clergyman; b. in 1829; educated in St. Bee's College, Cumberland; was appointed rector of St. Nicholas, Worcester, 1860; removed to Blackheath in 1874; founded and edited several popular religious periodicals—*The Fireside*, *Home Words*, *The Day of Days*, and *Hand and Heart*, afterward called *The Church Standard*; he also published *England's Royal Home*, *The Home Life of the Prince Consort*, etc.

Bullock, REUF'S BROWN: first Governor of Georgia under the new constitution adopted in pursuance of the reconstruction measures of Congress; b. in Bethlehem, Albany co., N. Y., Mar. 28, 1834; educated at Albion Academy; sent to organize a Southern express business at Augusta, Ga.; was a member of the State constitutional convention which was called in 1867. In the ensuing election in 1868 the constitution formed by this convention was ratified; and he was declared to be duly elected Governor of the State. This office he held until the fall of 1870, maintaining in the face of great obloquy the rights of Negro representatives in the Legislature, and appealing to Congress for support. When a new Legislature strongly opposed to his policy was elected, he resigned office and retired to Atlanta. The courts vindicated him from every allegation of corrupt practices. He greatly extended the railroad and traffic systems of Georgia.

Bullock, WILLIAM A.: inventor; b. in Greenville, Greene co., N. Y., in 1813; became a machinist; founded the *Banner of the Union* (Philadelphia, 1849); removed to Catskill, and invented a press to print his paper; constructed a "planetary press" for Frank Leslie, which worked with unmatched speed; improved his invention until he had produced the self-feeding, automatic-adjusting, and printed sheet delivering web-press, capable of turning out 30,000 newspapers, cut apart and folded, in an hour; injured while setting up one of his own presses in Philadelphia, and d. there Apr. 11, 1867.

Bull Run, Battle of: a battle which has been classed as one of the decisive battles of the civil war in the U. S. As the *first* pitched battle—the first trial of strength between the North and South—its inception and issue were pregnant with grave consequences to the future of a struggle in which the two combatants were yet hesitating to engage. In its purely *military* results it has been well said that "the cannon of Bull Run echoed henceforth on every battle-field of the war." The bombardment of Fort Sumter found the Government completely destitute of an organized force—the army scattered on distant frontiers (a large portion indeed captured through the agency of its commander), and the navy dispersed to remote quarters of the earth. For no inconsiderable period the possession of the national capital seemed to be due rather to the hesitation or irresolution of the Confederates than to its capability of vigorous defense. But the President's call for 75,000 volunteers for "three months" (his power to call out the militia to "suppress insurrection" being thus legally limited) had assembled in Washington and elsewhere a large militia force which, strengthened by such portions of the regular force as could be made available, had been diligently trained under direction of army officers.

Simultaneously with the occupation of the Virginia shore

of the Potomac by the Union army, the Confederates had established themselves at Manassas Junction, a point on the railroad 25 miles W. from Alexandria, and the junction of the great Southern railroad route (connecting Wash-

of the old army, it was composed wholly of raw volunteers, none of whom had been in a soldier's garb more than two or three months, and at least half of whom were enlisted only for a term of three months, then just about expir-

Map of the battle of Bull Run, July 21, 1861.

ington with Richmond and the South) and the Manassas Gap R. R., leading to the valley of the Shenandoah, where another Confederate force under Johnston confronted Patterson, who had recently crossed the Potomac at Harper's Ferry.

The occupation of Manassas was recommended to the Confederates by the fact that it controlled the railroad routes, and was itself a strong position. An elevated plateau in the crotch formed by the Occoquan and its principal tributary from the north, Bull Run, of which the beds are canal-like cuts in horizontal strata of red sandstone, it was of difficult approach to an attacking army, while the general character of the country, broken, wooded, with few roads fit for the movement of troops, was favorable to the defense.

Leading almost directly W. from Alexandria, diverging slightly to the north from the railroad, a macadamized road passed through Centerville, 22 miles distant.

From Centerville, a little W. of S. and 6 or 7 miles distant, lay Manassas Junction. About midway between these two points flowed the rivulet of Bull Run (the real defensive line of the Confederates) in a general direction from N. W. to S. E.

A road led from Centerville almost directly to the Junction, crossing Bull Run 3 miles from Centerville at E. Mitchell's Ford, a short distance below which is Blackburn's Ford. The turnpike before mentioned continued its westerly course toward Warrenton, in a nearly straight line beyond Centerville, crossing Bull Run at the Stone Bridge, 4 miles distant. Somewhat eastwardly of S., a country road from Centerville crossed Bull Run and the railroad at Union Mills.

The Confederate force was distributed along Bull Run from Union Mills to the Stone Bridge (nearly 8 miles), with reserves and a fortified position at or near the Junction.

The line was a strong one, for the stream, though containing but little water at that season, was, owing to the character of the bed and to the abrupt and wooded slopes of its right bank, a formidable obstacle.

The army of Gen. McDowell, which marched to the attack of this position, numbered about 30,000 men. Save perhaps 700 or 800 regular troops (fragments of regiments)

by that general on his memorable march to Fort Duquesne in 1754, which terminated in his disastrous defeat and death.

The "plan" of the campaign organized by Gen. McDowell had been carefully studied by him in conjunction with his staff officers for a week or two before the movement commenced. It was a feature of it, after reaching Fairfax Court-house, to make a sudden movement to the left, crossing the Occoquan just below the junction of that stream with Bull Run, aiming at the enemy's railroad communications. His personal reconnoissances in that direction, made on the 18th, led him to consider the country impracticable for the operations of his army.

However imperative it was (for many reasons) to lose no time (a regiment, the term of which expired on the eve of the battle, actually marched "to the rear," as Gen. McDowell expressed it, "to the sound of the enemy's cannon") it was out of the question to attack until some plan could be devised which would promise success. A day was accordingly spent in reconnoissances.

The Stone Bridge, already mentioned as forming the left of the enemy's defensive position, was a single-arched structure over the narrow stream. The passage was found to be guarded by field-guns, and the road and adjacent ground beyond obstructed by formidable abattis. Several roads were ascertained to lead to fords between Blackburn's and the Stone Bridge, but they were mere by-paths, the opposite banks of the stream generally steep and tangled, and probably obstructed.

It was found that a couple of miles above the Stone Bridge there was a good ford at Sudley Springs, which was but slightly guarded, and that above that point the stream was, almost everywhere, easily passable. No continuous road communicated from the turnpike with the Sudley ford, but reconnoissances showed that the intervening country was almost everywhere practicable to all arms.

The writer finds in his note-book the following memorandum of a "plan of battle" or attack, which, founded upon the above results of reconnoissance, was submitted to Gen. McDowell.

1st.—One division to advance on Warrenton Turnpike at 3 o'clock to-morrow morning. The leading brigade to threaten the bridge over Bull Run—throwing skirmishers

ing. Such an army as this was certainly not the best suited for an offensive campaign. Troops utterly raw; brigades and divisions, the component parts of which had never been brought in contact before, commanded by officers who, though generally of ability, were for the first time exercising these extensive commands, and who had hardly even seen the troops they commanded.

Such was the army which marched from the banks of the Potomac on the afternoon of July 16. It moved in four columns, one by the turnpike, one by the lateral country roads on the left of the railroad, and another between the turnpike and railroad, following what is known as the "Brad-dock" road, from its having been made

into the woods on both flanks. No serious effort will be made on the bridge, but artillery may be opened upon it, as if to open the way for an assault, and the operation to be conducted as if an assault were intended.

The 2d, 3d, and 4th brigades to turn to the right at the road $\frac{1}{2}$ to $\frac{3}{4}$ of a mile beyond Cub Run. On reaching the forks to the two fords a brigade will turn off on the left fork, advancing on it just enough to clear the route for the passage of the two following brigades, which take the right fork toward Sudley Springs. The ford at Sudley Springs will be turned by a march around and some 200 yards above it. The leading brigade will be followed by the one in rear, and the whole force advance rapidly by the road from Sudley Springs southward to reach the Warrenton Pike by the shortest route. The brigade left on the road to the lower ford will then pass over. Detachments from the advanced brigades should be sent to take in rear the defenders of the lower ford and Warrenton Pike bridge. The brigade left at the Stone Bridge will cross over and join the other two.

2d.—Another division should follow to take position behind Bull Run, to be ready to pass over if necessary—but, unless ordered from headquarters, to remain on the east side.

3d.—Another division should, simultaneously with the commencement of the first operation, commence the semblance of an attack on Blackburn's Ford. Every appearance of a formidable assault should be made, but no attempt to force the passage, unless the enemy shows unmistakable signs of retiring.

4th.—Another division should remain in reserve at Centreville.

This plan was adopted by the general, modifying the composition only of the different columns thus:

One division under Col. Miles to remain in reserve at Centreville, and to make, with one of its brigades, a false attack on Blackburn's Ford; another division (Tyler's) to move by the turnpike up to the Stone Bridge and threaten that point, and, at the proper time, to carry it and unite with the principal column, which, consisting of the two divisions of Hunter and Heintzelman (about 12,000 men), was to diverge from the turnpike, and, by a flank movement, reach the Sudley Ford, and descending the right bank of the stream, take the defenses of the Stone Bridge in the rear. The united force would then give battle, strike at the enemy's railroad communication, or act otherwise, as circumstances might dictate.

This plan was carried out in its main features, but it failed in one important particular. It was calculated that the marching column should diverge from the turnpike by early daylight (the route being so wooded that a night march was deemed imprudent) and reach Sudley Ford by 6 or 7 A. M. The Stone Bridge division did not clear the road over which both, for a certain distance, had to pass, so that the column could take up its march until near 6 o'clock. The route through fields and woods to Sudley proved to be far longer and more difficult than was believed. The column did not reach the Sudley Ford till near half-past nine, three or four hours "behind time." When it reached the ford the heads of the enemy's columns were visible, on the march to meet the attack.

This loss of time caused the loss of the battle. It might have been unwarrantable to have counted on punctuality in an army so utterly inexperienced in tactical maneuvers and in marching; nevertheless the immediate end aimed at was gained—the passage of Bull Run was accomplished and the Confederate left turned, while the appearance of Tyler's column in the front of the Stone Bridge had disconcerted their plan of attacking our left by crossing at the lower fords. Hunter, having crossed at Sudley Springs, led his column down to take in reverse the Stone Bridge position. Evans, who held the Confederate left at that point, had had his attention occupied through the morning hours by Tyler in his front; but the march of Hunter's column became evident long before the ford was reached, and ere it reached the bridge Evans, sending for reinforcements, had formed *en potence* across Hunter's line of march. A sharp combat ensued, which resulted in forcing the Confederate position and in opening the Stone Bridge to Tyler's division; two of the brigades (W. T. Sherman's and Keyes's) immediately passed and joined their force with Hunter's. Thus had been gained the *immediate* end of the tactical plan of the operation. The Confederate left had been turned, the Warrenton Turnpike taken from them (opening to us the Stone Bridge); and their line had been driven back a mile and a half. Gen. McDowell

had thus brought nearly all his three divisions into position on the enemy's left flank, and was advancing nearly 18,000 strong. The Confederate left (all his troops that had been engaged) had been thrown into confusion. Gen. Johnston and Beauregard hastened to the scene, ordering up to their routed left all the brigades which could be spared from the center and left of their line. "We came," says Johnston, "not a moment too soon," for "the long contest had greatly discouraged the troops of Bee and Evans." He found "that the aspect of affairs was critical," but by great efforts "and some example" the "battle was re-established," and, after a time, "many of the broken troops, fragments of companies, and individual stragglers, were re-formed and brought into action."

The position on which a stand was now made was a table-land in which the slopes from Young's creek (crossing the Union line of march at right angles and emptying into Bull Run near the Stone Bridge) terminate in the general level of the country. To carry the position, McDowell advanced the brigades of Wilcox and Howard on the right, supported by part of Porter's brigade and the cavalry under Palmer; the brigades of Franklin and Sherman in the center and up the road, and Keyes's brigade on the left. Schenck's brigade (of Tyler's division) was still at Centreville; but the positions of these troops, coupled with the demonstrations made, still detained several Confederate brigades confronting them.

A severe contest ensued for this position, with varying success, the result of which was, at 3 P. M., the possession of the hill, the fighting having commenced at 10.30 A. M. of a July day. The men, who had been up since 2 o'clock in the morning, were exhausted by fatigue, want of food and water, and somewhat demoralized by the vigorous resistance they had encountered.

"It was at this time," says Gen. McDowell, "that our adversary's re-enforcements came to his aid from the railroad train, understood to have just arrived from the valley with the residue of Johnston's army. They threw themselves in the woods on our right and toward the rear of our right, and opened a fire of musketry on our men, which caused them to break and retire down the hill-side. This soon degenerated into disorder, for which there was no remedy. Every effort was made to rally them, even beyond the reach of the enemy's fire, but in vain." According to the statement of the Confederate commander, it was not wholly "re-enforcements just arrived from the valley" via Manassas Junction—Elzey's brigade, under Gen. E. K. Smith—which at *this* critical moment "threw themselves on our right, etc.," with consequences described by Gen. McDowell. In fact, our extreme right was flanked by Early's brigade of Beauregard's forces, which, having been employed in partial execution of his plan of attack on the Union left and rear at Centreville, had been thus brought up when that plan failed by the miscarriage of his orders to Ewell (who was to begin the movement from his extreme right), coupled with the development of our attack on his left.

Enough has been written to show how greatly misrepresented and misunderstood has been this battle. It was one (and the first) of the few battles of the whole war deliberately *planned* beforehand, *executed* (except as to punctuality in time) in full accordance with its plan, and *successful* up to a point at which it was believed the final result must be decided. That the success so far accomplished did not, as it should have done, prove decisive, was due to causes inherent in the raw and otherwise unsuitable character of the attacking force for tactical movements and long-continued *aggressive* action. The battle was pronounced by the Confederate President, himself a soldier, who at Buena Vista had learned the meaning of such words, "a hard-fought field."

On the authority of Gen. Jordan, Beauregard's chief of staff, Ewell's, Longstreet's, Jones's, Holmes's, and half of Bouham's brigades, not engaged at all, Early's and Elzey's brigades and other regiments, some newly arrived—in all over 15,000 men—were "in excellent condition"; the real obstacle to an advance after the battle was "the lack absolutely of one day's rations, coupled with insufficient transportation for the indispensable small-arms and artillery ammunition—as the advance would have been, not upon the Federal position at Arlington, but by crossing the Potomac somewhere about Edward's Ferry, and taking Washington in reverse." On the Union part, Miles's whole division, in reserve at Centreville, and Runyon's, 7 miles farther back, guarding communications, had been unengaged, while Howard's and Keyes's brigades were nearly

fresh. Both sides had received severe handling, and the language already quoted from Gen. Johnston shows the critical aspect and gloom on the Confederate side of the field up to the moment when the elation of scarcely expected victory came to dispel it.

And concerning the "panic" which, although *military* writers have generally been free from this injustice, has been so commonly held up as *the* picture of the battle, the instances even with armies of veteran troops like Napoleon's (Albuhera and Vittoria, etc.) are so numerous that the exceptional case of Bull Run, when the Union army was almost wholly made of three-months men, should excite no surprise: it was not such as to prevent a stand at Centreville, "the apparent firmness" of which, says Gen. Johnston, "checked our pursuit." The disorder and mob-like appearance was rather, as described by Major (afterward Major-General) H. J. Hunt, the result of "sheer fatigue." They were, says he, "foot-sore, hungry, and tired; but had we been attacked I have little doubt that a stout resistance would have been made." Revised by JAMES MERCUR.

Bull Run, Second Battle of: While the Army of the Potomac, under Gen. McClellan on the Peninsula, was operating against Richmond, Gen. Pope, June 26, 1862, took command of the troops in Northern Virginia, then unopposed by any forces N. of Richmond. To draw from Richmond some of Lee's army, and thereby relieve the Army of the Potomac of resistance to its operations against that city, Pope collected his scattered forces and placed them S. of the Rappahannock, along the Orange and Alexandria R. R. and from Sherryville to Culpeper Court-house, with directions for the cavalry to be rapidly pushed to Gordonsville and Charlottesville, and to destroy the railroad connecting those places with Richmond and the West. These movements, however, were so slow that Lee, informed of their purpose, hastened Jackson and Ewell to Gordonsville and thwarted them.

In the meantime the authorities at Washington decided to form a junction on the Rappahannock of the forces under McClellan and Pope, and, Aug. 3, ordered McClellan to transfer his army from Harrison's Landing via Accquia Creek to Falmouth, where Burnside's corps had arrived. To quickly withdraw the Army of the Potomac, with its very limited supplies of land and water transportation, involved abandonment to the enemy of thousands of sick and wounded, the destruction of enormous supplies of arms and ammunition, provisions, tents, etc., demoralization to the army, and injury to the Union cause. Without any loss of material the army as a body (some having gone) at the earliest moment (Aug. 14) moved to Yorktown and Fort Monroe, whence, for want of water transportation, it was slow to embark and reach its destinations. July 30 Pope joined his army in the field, and continued concentrating his forces, the advance of which (Banks's corps) had reached Cedar Mountain. Jackson, with Ewell, on Aug. 8 and 9, moved on Cedar Mountain, where, Aug. 9, he was attacked with great spirit by Banks, who, unsupported, was repulsed with heavy losses. Jackson, on the 11th, fearing attack by Pope's combined superior forces, withdrew to Gordonsville.

Lee, seeing the withdrawal of McClellan relieved Richmond of all danger, determined to crush Pope before he could be re-enforced by the Army of the Potomac, and, on the 13th and 14th, pushed forward the van of his army under Longstreet, Hood, and Stuart, and crossed the Rapidan on the 20th. Reliably informed of Lee's intentions, Pope retired behind the Rappahannock. Lee, unable to cut Pope off from Fredericksburg, moved up the river to turn his right flank. On the 22d Stuart crossed the river, passed through Warrenton to Catlett's Station, where he captured Pope's papers and baggage, and destroyed many wagons. On Stuart's return, informed of Pope's forces and locations, Lee commenced moving to Pope's right, sending forward Jackson and Stuart, 23,000 strong, to push across the mountains to Pope's rear, capture the dépôt at Manassas, and break communication with Alexandria—concealing his intentions by threatening Pope at river crossings with his main forces, 25,000 strong, under Longstreet. Jackson succeeded the night of the 26th. Pope, while on the Rappahannock, knew of a large body going to his right, but at 10 a. m. on the 27th did not know what force was in his rear other than cavalry, and "considered it doubtful if the enemy means to attack us or not," but that "he might attempt to keep us in check, and throw considerable force across the Potomac in direction of Leesburg." Up to this time Pope, then at War-

renton Junction, had been joined by corps and divisions under Reno, Reynolds, Heintzelman, and Porter, and the brigade of Pratt under Sturgis, making his total strength about 63,500 against Lee, then about 56,000.

Early on the 27th Pope decided to interpose between the enemy and Manassas, and form a line E. of Thoroughfare Gap, so as to be readily re-enforced from Washington and to fall upon the enemy's flank, or to retire behind Bull Run, if necessary. McDowell, at Buckland Mills, was ordered with Reynolds and Sigel to Gainesville that night, Reno and Kearny to Greenwich, where Porter at Warrenton Junction with Piatt was to follow on the 28th, when relieved by Banks. At 3 p. m. Pope withdrew along the railroad, following Hooker, who had been sent toward Manassas to re-open communication. Hooker, near Bristoe Station, encountered Ewell, who, after a short engagement, retired behind Broad Run and joined Jackson at Manassas. Pope joined Hooker at sunset, and then learned that Jackson and Stuart were between him and Washington. Pope determined to destroy Jackson or "to bag the whole crowd" before Lee could rescue him, and ordered Porter to march from Warrenton Junction at 1 o'clock and join him at day-break on the 28th; Reno and Kearny to join him at dawn, and McDowell with Sigel to march on to Manassas with his right on Manassas R. R., and left extending N. Pope stated in orders to Porter: "The enemy has been driven back, but is retiring along the railroad. We must drive him from Manassas, and clear the country between that place and Gainesville, where McDowell is." The night was very dark, the road narrow and through timber, crossed by streams without bridges, and by a railroad with cars running, and also crowded by the entire wagon-train of the whole army. Porter knew this, and that it was impossible to reach Pope (10 miles distant) any earlier by marching at 1 o'clock than at 3, and on arrival had his command in condition to pursue the retreating enemy 10 miles further.

Porter started at 3 a. m., and, though greatly obstructed, reached Pope at 8; was not wanted, and was twice ordered to remain at Bristoe, for "when wanted, you will be sent for." Jackson had retired from Manassas during the night, and on the 28th had his command strongly posted behind the railroad embankment between Sudley Springs and Groveton, prepared to resist attack and to await the arrival of Lee, who he knew was close by at Thoroughfare Gap. Pope, misled to the belief that Jackson was at Centreville by some of his troops going toward Centreville, followed with Heintzelman and Reno, and called McDowell to him, thus leaving open the road between Lee and Jackson. McDowell sent Sigel and Reynolds to Manassas as directed, but, knowing Lee was coming through Thoroughfare Gap, sent Ricketts's cavalry to resist his advance. Under subsequent orders he sent King up the Warrenton Pike toward Centreville, while he went to join Pope. King before dark had a severe contest with Jackson W. of Groveton. Having no instructions and no support, he moved that night to Manassas. Ricketts, repulsed by Lee, marched to Groveton via Greenwich and Manassas, reaching there at dark on the 29th. Lee (or Longstreet), thus unopposed, joined Jackson by 10 a. m. on the 29th, and was in position on his right at Groveton by 12 m. McDowell went to Manassas to advise Pope, but the latter had gone to Centreville. Hearing the sound of King fighting with Jackson, he started through the woods to find him, but got lost and did not join his command till the 29th.

On the morning of the 29th Jackson was strongly posted behind the railroad embankment and in the woods between Sudley Springs and Groveton. Longstreet had arrived at 10 a. m., and by 12 m. formed on Jackson's right, extending S. beyond Manassas-Gap R. R. Sigel N. and Reynolds S. of Warrenton Pike, at Groveton, engaged Jackson with skirmishers and artillery at long range. They were joined by noon by Heintzelman and Reno, pushed forward by Pope at Centreville. Porter, N. of Manassas, was hastening under orders to Centreville, "where it was very important to be at an early hour. A severe engagement is likely to take place, and your presence is necessary," when at 9 a. m. he was ordered to take King at Manassas, and "move on Gainesville." Ricketts, with Buford's cavalry, was en route from Gainesville, via Greenwich, to Manassas. Banks at Bristoe guarded the army trains. Porter reached Dawkin's Branch at 11.30 a. m., and found Longstreet taking position on the west bank twenty-four to thirty-six hours earlier than Pope announced his expected arrival. He was preparing to attack Longstreet when McDowell arrived

and, under authority, assumed command, stopped all offensive operation and, withdrawing King beyond support, retired, via Sudley road, to take position on Porter's right and "establish communication with the forces at Groveton," as ordered. Porter, knowing that Longstreet was more than twice his strength and well protected, and that whichever one attacked by crossing the open valley between them would meet with disaster, posted his forces to invite and risk attack, and, at times, threatened it—each with the object of holding Longstreet from attacking Pope or assisting Jackson. So successful was Porter that Longstreet, anticipating attack, drew Wilcox's division at about 4 p. m. from Jackson's support, and retained him till too late to support Hood when sent back. Porter all day and till 3.30 a. m. on the 30th held his troops facing Longstreet and protecting his flank and rear along the road to Bethlehem Church, constantly expecting information or orders from McDowell or Pope, but receiving none till too late to be executed.

Pope at 1 p. m. joined the forces opposing Jackson and stopped the skirmishing and the artillery duels at long range going on all the morning and at 3 p. m. ordered Hooker to attack. Grover, of Hooker's division, vigorously attacked and broke Jackson's first and second lines and penetrated to the third, but, unsupported, was flanked and driven back with heavy loss. Hearing of McDowell's approach, Pope at 4.30 sent orders to Porter to attack Jackson in flank and, if possible, his rear, and in due time for simultaneous action directed Kearny to attack his left flank. Porter received his order at dusk, too late to execute, even if Longstreet had not been between him and Jackson. McDowell had not informed Pope of Longstreet's arrival, nor forwarded Porter's dispatches giving the state of affairs in his front. Kearny vigorously and gallantly attacked, but was repulsed with heavy losses. At sunset, on McDowell's arrival, Pope ordered him to push King's division after the "retreating" foe. The division was met by Hood advancing to attack and was badly defeated. Night closed the contest, each army holding its own ground.

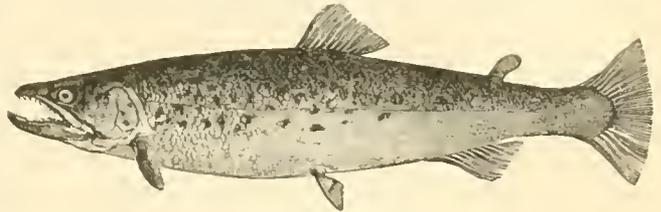

Pope's army on the 29th was much cut up, weakened, had no hope of support, distant from food for men and horses, and all were greatly fatigued. Lee's army was re-enforced that night, making it stronger than Pope's, which till then was about its equal. Pope, however, determined to renew the struggle on the 30th, and by noon had gathered all his forces, Banks excepted, N. of Warrenton Pike, facing Jackson. Believing that "Jackson was retreating to the mountains to unite with Longstreet," who he would not acknowledge had arrived, Pope assigned "McDowell to the command of the pursuit," and ordered him "to push forward Porter's corps on the Warrenton Pike, followed by King and Reynolds, in pursuit of the enemy, and to press him vigorously during the whole day." Ricketts and Heintzelman were ordered to move on the road from Sudley Springs to Haymarket, held by Jackson on the 29th. Porter's advance, under Butterfield, vigorously assaulted Jackson, and at once developed the enemy's united army posted and prepared for any emergency, and turning Pope's unprotected left flank. Beyond driving the enemy behind the railroad embankment and developing their positions, Porter's attack accomplished nothing. As line after line advanced, the enfilading fire of the enemy's batteries on the left, together with the infantry fire in front, almost annihilated the attacking force and compelled withdrawal. Sykes went to the Henry Hill, and Butterfield, having expended his ammunition, to the rear. Warren, of Porter's corps, seeing Reynolds removed to the rear from the most important defensive point S. of the pike, and the flank exposed, at once hastened to reoccupy it with his small brigade, and, although almost annihilated by Longstreet's advance, held it long enough for Reynolds's and Ricketts's divisions and portions of Sigel's corps to form on his left and with Sykes's regulars on the Henry Hill to save Pope's line of retreat from seizure by Longstreet. This position was firmly held against vigorous attacks till, under cover of darkness, Pope's army retired unmolested across Bull Run and took position on the heights of Centreville. The army was withdrawn from Centreville the night of Sept. 1, and took position in the defenses of Washington, fighting *en route* with Jackson the battle of Chantilly. The command of the army was then transferred to McClellan. FITZ JOHN PORTER.

Bull's Eye: in architecture, the technical name given to a glass lens used for the purpose of concentrating the light

of a given center upon an object. It is also applied to a circular window of plain glass. On shipboard the bull's eye is a small pulley in the form of a ring, with a rope spliced round the outer edge, and another sliding through a hole in the center. In rifle practice, the small black center in the circle on the target is called the bull's eye. In astronomy, the bull's eye is Aldebaran, a bright star in Taurus.

Bull-terrier: a dog bred by a cross, more or less remote, between the bulldog and some one of the terriers; frequently uniting in a remarkable degree the courage and strength of the bulldog with the docility, activity, quick scent, and intelligence of the terrier. This little animal is especially famous for its zeal and success in killing rats.

Bull-trout, Gray-trout, Whittling, or Sewen: names applied in England to the salmon trout (*Salmo trutta*); a

Bull-trout (male).

large trout found in the mouths of rivers approaching the salmon in size and habits, but inferior as food. The name bull-trout is applied in Oregon to the Dolly Varden trout (*Salvelinus malma*).

D. S. JORDAN.

Bulnes, boof-néz, MANUEL: Chilean general and statesman; b. at Concepcion, Dec. 25, 1799. When only sixteen years old he was imprisoned by the Spaniards for eight months, owing to his revolutionary ideas; released by the advance of San Martin, he joined his army (1818) and served as colonel in most of the battles of the Chilean revolution. From 1820 to 1823 he commanded a force against the Araucanian Indians, and completely subdued them; was made brigadier-general in 1831, and in 1838 commanded the Chilean army of 5,000 men sent against Santa Cruz in Peru; he took Lima, won the battles of Huarez and Puente del Bumin, and finally, in conjunction with Gamarra's Peruvians, routed Santa Cruz at the Pan de Azucar, near Arequipa (Jan. 19, 1839). This drove Santa Cruz from the country, and the Peru-Bolivian confederation was broken up. For this victory Bulnes was created marshal of Ancahuco by Gamarra, and Chili made him a lieutenant-general. He was elected president of Chili in 1841, and re-elected 1846, serving for ten years; his administration was prosperous throughout, and marked by great material and intellectual progress. Gen. Bulnes was afterward senator and councillor of state. D. at Santiago, Oct. 18, 1866. HERBERT H. SMITH.

Bülow, FRIEDRICH WILHELM, Baron von: b. on the paternal estate of Falkenberg, Prussian province of Brandenburg, Feb. 16, 1755; entered the army in 1769; was a lieutenant-general at the opening of the war of independence in 1813. Twice he defeated Oudinot in minor encounters, and by his victory over Ney at Dennewitz (Sept. 6, 1813) he prevented the French from pushing onward to Berlin. In the battle of Leipzig he took a conspicuous part; then drove the French out of Westphalia, Holland, and Belgium, joining the allies in Paris, where the Prussian king made him Count of Dennewitz and gave him estates worth \$150,000. He also distinguished himself at Waterloo, finishing the campaign by occupying Montmartre at Paris. D. at Königsberg, Feb. 25, 1816.

Bülow, HANS GEORG, von: musician; b. at Dresden, Jan. 8, 1830; studied law in Leipzig and Berlin; determined, under the influence of Richard Wagner and Liszt, to devote himself exclusively to music; studied under Liszt at Weimar 1851-53; settled in 1854 in Berlin, where he was made Professor of the Piano at the Conservatory of Music in 1855. Having made several concert-tours in Germany and Russia, and acquired a great reputation as a pianist, he removed in 1867 to Munich, where he became chapel-master to the king. After that time he made two concert-tours in the U. S., and also acted as orchestra conductor in Berlin, Hamburg, and other large German cities. Von Bülow was a man of great intellect, but eccentric and self-opinionated to the verge of insanity. His annotations of Beethoven's sonatas and of other older classical piano compositions are valuable. He

composed several pieces both for the pianoforte and orchestra, and wrote much for the *Neue Zeitschrift für Musik*, and both his compositions and his writings show enthusiasm for the ideas of Wagner. D. in Cairo, Feb. 13, 1894.

Bulwark (in Fr. *boulevard*): in fortification, a rampart or bastion; an outwork for defense; that which secures against an enemy; a shelter or means of protection. On shipboard a bulwark is the parapet raised round the deck for the purpose of protecting men and goods from slipping overboard, and of excluding the waves from the deck. In ships of war the bulwark is sufficiently high and solid to afford the crew some protection against the shot of the enemy.

Bulwer, EDWARD GEORGE EARLE LYTTON (Baron Lytton): English novelist: b. in London, May 25, 1803; in 1826 graduated at Trinity Hall, Cambridge. He soon after visited France, and published after his return his novel of *Fatland* (1827), which was followed by *Pelham*, or *the Adventures of a Gentleman* (1828); *The Disowned* (1828); *Devereux* (1829); *Paul Clifford* (1830); *The Siamese Twins*, a poem, (1831); and *Eugene Aram* (1832). In 1831 he was returned to Parliament for St. Ives, and from 1832 to 1841 he represented the city of Lincoln. He published in 1833 *England and the English*; the same year visited Germany and Italy. He produced in rapid succession *The Pilgrims of the Rhine*; *The Last Days of Pompeii*; *Rienzi*, *the Last of the Tribunes* (1835); and *The Student*, a series of contributions to the *New Monthly Magazine*, of which he was for some time editor. His drama entitled *The Duchess of La Vallière* (1836) was not well received. In 1837 he brought out *Athena*, *its Rise and Fall*, and *Ernest Maltravers*, a novel, which was continued under the title of *Alice*, or *the Mysteries*. His dramas entitled *The Lady of Lyons* (1838) and *Richelieu* were very successful, as well as the comedy of *Money*, which came out soon after. His *Night and Morning*, a novel, published in 1841, was followed by *Zanoni* (1842); *The Last of the Barons* (1843); *Lucretia*, or *the Children of the Night* (1846); and *Harold*, *the Last of the Saxon Kings* (1848). His novels entitled *The Caxtons* (1850), *My Novel* (1851), and *What Will he Do with It?* (1858), first appeared in *Blackwood's Magazine*, to which Bulwer was a frequent contributor. A *Strange Story* came out in *All the Year Round* in 1861. Although his reputation rests chiefly on his novels, he distinguished himself in various departments of literature. His translations of Schiller's poems (1844) were received with favor, and he published original poems—*O'Neil*, or *the Rebel* (1827); *The New Timon* (1846); and *King Arthur* (1848). His novels have great popularity throughout the English-speaking world, as well as on the Continent of Europe, and have been translated into several languages. Bulwer was made a baronet in 1838, and in 1844, on the death of his mother, came into possession of the Knebworth estates and assumed the name of Bulwer-Lytton. He had published in 1835 a Liberal political pamphlet entitled *The Crisis*, which caused a great sensation. He was elected lord rector of the University of Glasgow in 1856, and in 1858 he held for a time the office of Secretary of State for the Colonies. He was made a peer in 1866, with the title of Baron Lytton. In 1827 he married Miss ROSINA WHEELER, of Limerick (1802-82), who wrote *Cherely*, or *the Man of Honor* (1839); *Bianca Capello*; *The Budget of the Bubble Family*, etc. The union was unhappy, and the parties separated in 1836. D. at Torquay, Jan. 18, 1873.

Bulwer, EDWARD ROBERT: See LYTTON, EDWARD ROBERT BULWER-LYTTON.

Bulwer, WILLIAM HENRY LYTTON EARLE (Baron Dalling and Bulwer): English diplomatist and author; a brother of Bulwer-Lytton the novelist; b. in London, Feb. 13, 1801; was elected to Parliament in 1830; sent as ambassador to Madrid in 1843, where he opposed Narvaez, who ordered him home. In 1849 he was transferred to Washington, where he negotiated the Bulwer-Clayton treaty guaranteeing the neutrality of interoceanic routes across Central America; in 1851 was created a Knight Grand Cross of the Bath. He became minister plenipotentiary at Constantinople in 1858. He was afterward ennobled. Among his works are *France, Social and Literary* (1834); a *Life of Lord Byron* (1835); one of Palmerston (1870); and *The Monarchy of the Middle Classes*. D. in Naples, Italy, May 23, 1872.

Bulwer-Clayton Treaty: See CLAYTON-BULWER TREATY.

Bummalo'ti: the local name for *Harpodon nehereus*, a fish of the family *Synodontida*, abundant at certain seasons

on the coast of India. It has a long body covered with thin, translucent scales, a thick head, wide mouth, and slender, recurved teeth. It is dried and exported in considerable quantities from Bombay and parts of the adjacent coast, being known in commerce as *bummalah* or Bombay duck.

Bum'stead, FREEMAN JOSIAH, M. D.: b. in Boston, Mass., Apr. 21, 1826; graduated at Williams College in 1847; studied medicine in Paris; became a practitioner in New York, where he was appointed Professor of Venereal Diseases in the College of Physicians and Surgeons; also surgeon to the Eye and Ear Hospital and the Charity Hospital. He published *Pathology and Treatment of Venereal Diseases* (1861), and valuable translations from Ricord and Cullerier. D. in New York, Nov. 28, 1879.

Bunee, FRANCIS M.: captain U. S. navy; b. in Hartford, Conn., Dec. 25, 1836; graduated at the Naval Academy in 1857; had charge of the naval howitzers in the combined army and navy expedition of July 10, 1863, which resulted in the capture of a part of Morris island; participated in all the important attacks on the defenses of Charleston harbor during the summer and fall of 1863; was in the disastrous assault upon Fort Sumter of Sept. 18, 1863, where, for his "gallant support and zealous co-operation," he received the thanks of his commanding officer, Capt. Thomas H. Stevens. Apr. 1892, in command of the U. S. naval training station, Newport, R. I. Revised by S. B. LUCE.

Bunee, OLIVER BELL: publisher and author; b. in New York, Feb. 8, 1828. He was for some years editor of *Appleton's Journal* and published a number of books, among which are *Bachelor Bluff* (1882) and *Don't* (1884), a manual of etiquette which has had an immense sale. D. in New York, May 15, 1890. HENRY A. BEERS.

Bunee, WILLIAM GEDNEY: painter of Venetian scenes and landscapes; b. in Hartford, Conn., Sept. 19, 1842; pupil of William Hart, Andreas Achenbach, Düsseldorf, and P. J. Clays, Brussels; member of the Society of American Artists 1879. His pictures are notable for tender and delicate color-schemes, but are not realistic. He spends most of his time abroad, principally in Venice; has painted lately at Biarritz, France, and when in the U. S. has a studio in New York. WILLIAM A. COFFIN.

Bun'combe: a district of North Carolina. The phrase "talking for Buncombe," often heard among politicians, was first used by a member of Congress from that district. During a long speech which he made several members, who had not patience to listen, retired from the hall. He then told the remaining members that they also might go, for he "was only talking for *Buncombe*."

Bundelkhand', or **Bandelkhand**: territory of Central India; bounded N. E. by the river Jumna. It extends from lat. 24° to 26° 26' N., and from lon. 78° to 81° 36' E. Area about 10,241 sq. miles, of which about 8,700 sq. miles are subject to the British, while the rest of the country is governed by numerous native princes, who are tributary to the British. It is said to contain diamonds and rich beds of iron ore. The chief towns are Calpe, Banda, Jhansi, and Callinger. Pop. 1,403,000.

Bun'di, or **Boondee**: a native state, Rajputana, British India; between 24° 58' and 25° 55' N. lat., and 75° 23' and 76° 36' E. lon. Area, 2,300 sq. miles. It is generally hilly and wild, and is much infested by robbers. Principal crops, maize, wheat, pulse, and oil-seeds. It is watered by the Chambia and Nij. Pop. 255,000. British protectorate was assumed in 1818, and costs the chief \$20,000 annually. Chief town, Bundi; pop. 31,000.

Bungay, GEORGE WASHINGTON: journalist; b. in Walsingham, England, July 22, 1818; removed to New York when nine years of age; was for a time on the *Tribune* with Horace Greeley; wrote many poems, the best-known being *The Creed of the Bells*; had a wide acquaintance with statesmen and authors; was a popular lecturer. D. July 10, 1892.

Bunion, or **Bunyion** [cf. *bunny*, lump, swelling]: a painful inflammation of the bursa or membranous sac of the joint which connects the great toe with its metatarsal bone. The pressure of a boot causes this bursa to inflame and swell, and this may go on to suppuration. Rest and poulticing are generally sufficient to subdue the attack, and wearing a shoe which is so constructed as to save the bunion from pressure will generally prevent a recurrence.

Bunka'ra, or **Blue River**: a stream of Colorado; rises near South Park, among the Rocky Mountains; unites with

the Grand river about 20 miles W. of Hot Sulphur Springs. Total length estimated at 100 miles.

Bun'ker, DENNIS MILLER; genre, landscape, and portrait painter; b. in New York, Nov. 6, 1861; d. in Boston, Dec. 28, 1890. He began his art education in 1878 in the National Academy schools, afterward attending the classes at the Art Students League; went to Paris in 1881, where, after spending three months in the Académie Julian and the class of Hebert in the École des Beaux-Arts, he became a pupil of Gérôme, and worked under his instruction until 1884, when he returned to New York. His first pictures were exhibited at the Academy and elsewhere in New York several years before he went abroad, and while he was a student he painted and sold a good many pictures. The first picture he exhibited after his study in Paris was a figure of a young man in a studio playing a guitar and entitled *Bohémia*. For this picture he received the third Hallgarten prize at the National Academy in 1885, and the same year was elected a member of the Society of American Artists. He was the principal instructor in the Cowles Art School in Boston from 1886 to 1889, and while there painted a number of excellent portraits. For his beautiful picture *The Mirror* (Society of American Artists, 1890) he was awarded the James W. Ellsworth prize of \$300 at the exhibition of the Art Institute of Chicago (1890). His work, though not lacking in refinement and delicacy, is essentially robust and virile. In *The Mirror* (engraved in the *Century Magazine*, Feb., 1891) sincerity and grace are happily blended, and the picture is especially notable for elegance of line and beauty of expression. A portrait of the artist's wife, the last work he completed, is in the Metropolitan Museum, New York.

WILLIAM A. COFFIN.

Bunker Hill: a rounded eminence in Charlestown, now a part of Boston, Mass. It is about 110 feet high and connected by a ridge with another small eminence 700 yards distant called Breed's Hill. These two elevations are famous for the battle fought here between the British and American forces June 17, 1775. The American redoubt was on Breed's Hill, but by common usage the event is known as the battle of Bunker Hill.

After the stirring events of the spring of that year the troops organized in New England had taken up a line extending from Roxbury to Cambridge under command of Gen. Artemas Ward; Putnam, Starke, Prescott, Gridley, and Pomeroy were there, and by the middle of June not less than 20,000 men had assembled.

Gen. Gage was in chief command of the British at Boston, and had been recently largely re-enforced by Gens. Howe, Burgoyne, and Clinton.

It having been ascertained by the provincial army that Gage meditated seizing and fortifying Bunker Hill and the heights of Dorchester on the night of the 18th, it was determined by the Americans to forestall this design, and on the night of the 16th a detachment of 1,000 men, under command of Col. William Prescott, was dispatched from Cambridge to Charlestown for the purpose of fortifying Bunker Hill. They were joined at Charlestown Neck by Gen. Putnam and Major Brooks, and at a council it was decided to fortify Breed's Hill, not as high as Bunker Hill, but nearer Boston. By daybreak a formidable work had been thrown up on the spot now marked by the Bunker Hill Monument. This being discovered by daylight, the Lively opened fire upon it, which soon extended to all the shipping and the battery on Copp's Hill in Boston; the British troops were called to arms and preparations for an attack were made; Prescott meanwhile continued to strengthen his position and sent to Cambridge for re-enforcements. The entire American force engaged, however, did not probably exceed at any time 1,500.

A force of British under Gens. Howe and Pigot, covered by the guns of their shipping, had embarked in boats and landed at Morton's Point, E. of the foot of Breed's Hill. This movement produced the greatest excitement in Cambridge and re-enforcements were hastened to Charlestown, Gens. Warren and Pomeroy arriving at 2 p. m. at the moment Howe, whose force by this time had been increased to about 4,000, began his advance around the eastern slopes of Breed's Hill and along the Mystic river with the intention of gaining the rear of the American lines; but, this movement having been anticipated, Knowlton had taken up a position near Bunker Hill and thrown up a breastwork nearly 250 yards in length, and another line had been built in front of a stone and rail fence, between which was placed

new-mown hay, and between the breastwork and the rail fence the artillery was placed. The Connecticut and New Hampshire troops were W. of the redoubt, and a force was posted at the foot of the southwest side of Breed's Hill, near Charlestown, and a work had been commenced on Bunker Hill. Gen. Warren, who was with Prescott in the redoubt, refused to take command from either Prescott or Putnam, saying he came to fight as a volunteer. Howe was foiled in his flank movement and compelled to make a direct attack, and, having ordered the guns of the shipping and the battery at Copp's Hill to open fire on the redoubt, moved forward under its cover up the slopes of Breed's Hill in two wings, the right under his own command, the left under Pigot; Gen. Howe with his command to carry the position at the rail fence, while Pigot attacked the redoubt. Prescott's orders to his men were to reserve their fire on the advancing columns till the whites of the men's eyes could be seen. The British opened fire when within gunshot, but no reply was heard from the breastworks till they were within close range, when volley after volley was poured into their ranks, causing them to fly in disorder toward their boats. Howe succeeded, however, in quickly rallying his troops, and being re-enforced by some 400 marines and provided with artillery, of which latter they were deficient in the first attack, a second advance was made over the same ground.

In the mean time re-enforcements had been sent to Prescott, but those sent from Cambridge were prevented from crossing Charlestown Neck by the severe fire of the batteries and shipping of the British, and but few additional troops reached the redoubt before the second attack.

As before, the Americans reserved their fire till the British line was at short range, when it was delivered with the same deadly effect.

Hot shot from Copp's Hill having meanwhile set fire to some houses in Charlestown, the whole town was soon in flames, and Gen. Howe hoped to storm the redoubt under cover of the smoke; but a light wind which had just sprung up cleared away the smoke and disclosed the advancing columns, which were again broken and driven in confusion by the fatal fire from the patriots within the redoubt. Howe was now re-enforced by Clinton, and a third attack was made upon this little band, whose ammunition was now nearly exhausted, and Howe, having discovered the weakness of this part of the line, attacked the position between the rail fence on the E. of the redoubt and the breastwork, sweeping it with his artillery and forcing its defenders within the redoubt. The ammunition of the Americans was now completely exhausted, and the British, advancing, sealed the work, but were met by the Americans with muskets clubbed, and a hand-to-hand conflict ensued. But the superiority of the British in numbers was too great, and Prescott was compelled to order a retreat, himself and Warren being the last to leave the works. Stark and Knowlton maintained their position at the rail fence until the retreat had been effected, when they retired slowly and in good order. Warren had hardly left the redoubt when he fell, shot through the head; Prescott escaped unharmed. Falling back across Bunker Hill, Putnam here made an ineffectual attempt to rally the retreating army within the partially finished works. The retreat continued across Charlestown Neck, where many were killed by a severe fire from the shipping and batteries; but the British did not continue their pursuit beyond this point.

The British loss in killed and wounded was about 1,050; the American loss was not over 450.

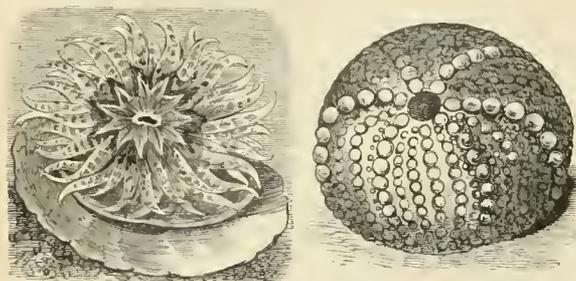

A granite obelisk, 221 feet in height, now marks the scene of this important struggle on Breed's Hill, and is known as Bunker Hill Monument. Gen. Lafayette laid the cornerstone June 17, 1825, and Daniel Webster delivered one of his most memorable orations on the occasion. The monument was completed in 1842, and was dedicated June 17, 1843, in the presence of the President of the U. S. and his cabinet, Daniel Webster being, as before, the orator of the occasion.

Bunker Hill: city (founded in 1836); Macoupin co., Ill. (for location of county, see map of Illinois, ref. 8-D); on (Clev., Cin., Ch. and St. L. R. R.; 37 miles N. E. of St. Louis, Mo.; has seven churches, public school with high-school course, academy, military school, flouring-mills, and coal mine. The raising of grain, fruit, and cattle and dairy-farming are the principal industries of this section, which is the largest milk-producing point tributary to St. Louis. Pop. (1880) 1,441; (1890) 1,269; (1892) by school census, 1,340.

EDITOR OF "GAZETTE."

Bunner, HENRY CYLER: journalist and author; b. in Oswego, N. Y., Aug. 3, 1855. He was editor of the comic weekly *Puck* from its establishment in 1877 until his death. Published a volume of poems, *Airs from Arcady* (1884); and several novels, *A Woman of Honor* (1883); *The Midge* (1886), etc. D. at Nutley, N. J., May 11, 1896.

Buno'des gemma'cea: called in English *gem pimplet*: a species of *ACTINIDÆ* (*q. v.*). When open it bears a striking resemblance to a flower, but when closed it assumes a

Bunodes, open.

Bunodes, closed.

spherical form, having the appearance of an echinus stripped of its spines. The generic name is from the Greek *βουνόδης*, signifying "resembling an eminence or a woman's breast" (referring to its form when closed); the specific name is from the Latin *gemma*, a "bud," or small protuberance, and has allusion to the wart-like protuberances on the exterior surface.

Bunsen, CHRISTIAN KARL JOSIAS, VON, Ph. D., D. C. L., Chevalier; writer and diplomatist; b. at Corbach, in Westphalia, Aug. 25, 1791. He studied theology and the Oriental languages at Marburg and Göttingen, and especially in Paris; was appointed, at Niebuhr's suggestion, secretary to the Prussian embassy at Rome in 1818, where he remained many years and devoted much time to philology and historical research. In 1827 he succeeded Niebuhr as Prussian minister at Rome. In 1838 he was recalled, and in 1839 became Prussian ambassador to Switzerland. He was sent as ambassador to London in 1841, and acquired a greater influence and a higher position in English society than any German diplomatist had ever enjoyed. His principal works are *Die Verfassung der Kirche der Zukunft* (Hamburg, 1845); *Ägyptens Stelle in der Weltgeschichte* (5 vols., Gotha, 1845-57; Eng. trans. *Egypt's Place in Universal History*, London, 1848-67); *Christianity and Mankind* (7 vols., London, 1854); *Gott in der Geschichte* (3 vols., Leipzig, 1857-58; Eng. trans. *God in History*, London, 1868-70, 3 vols.); and *Vollständiges Bibelwerk für die Gemeinde* (9 vols., Leipzig, 1858-70; only the first, second, and fifth were completed by him; the others are from his notes by Holtzmann and Kamphausen). He had a high reputation as an Egyptologist, and was liberal in religion and politics. He was recalled from the court of St. James in 1854, and was raised to the peerage as Freiherr (baron) in 1858. D. in Bonn, Nov. 28, 1860. A monument was erected to him at Corbach on Aug. 25, 1891. See *Memoirs of Baron Bunsen*, by his wife (2 vols., London, 1868).

Bunsen, ROBERT WILHELM: German chemist; b. in Göttingen, Mar. 31, 1811; succeeded Wöhler in the Polytechnic Institution of Cassel; became in 1851 Professor of Chemistry at Breslau, and in 1852 at Heidelberg. He is the author of several works, the most important perhaps being on gas analysis. His investigations on organic compounds of arsenic, kakodyl, etc., in 1841, attracted much attention. He has invented important pieces of apparatus, several of which bear his name, as the Bunsen battery, gas-burner, photometer, filter pump, etc. His most brilliant discovery was probably that of spectrum analysis and the *SPECTROSCOPE* (*q. v.*), made in connection with Kirchhoff. This instrument established a new era in astronomy, and has already led to most valuable discoveries in chemistry. By its aid Bunsen himself discovered two new alkaline metals, *caesium* and *rubidium*, and Lamy and Crookes discovered *thallium* and Riche and Richter *indium*. He also devised a new system of analysis by flame reactions. His laboratory was a favorite resort for persons from the U. S. studying chemistry in Europe.

Bunsen Burner: a gas-burner; the invention of Robert Wilhelm Bunsen; intended to secure perfect combustion,

By it air is caused to mix with the gas before ignition, thus producing a smokeless, sootless flame of little light, but of great heating power. The appliance has been much improved, and is of great importance in the laboratory, workshop, and kitchen.

Bunt: See *SMUTS*.

Bun'ter Sand'stein (variegated sandstone): a German name for the "new red sandstone"; the lowest portion of the Triassic series; called *grès bigarré* by French geologists. As the Trias is more perfectly developed in Germany than in Great Britain, the German beds are considered the typical group of the Triassic period. Large quantities of bunter sandstein flank the Vosges Mountains. It is there generally a fine-grained, solid sandstone, useful as a material for building, and is often of a blue, red, or greenish tint. The most remarkable fossils of this formation are the remains of huge batrachians, including the *Labyrinthodon*.

Bunting: a name properly given to numerous small streaked sparrows of the genera *Emberiza*, *Euspiza*, *Plec-*

The cirl bunting (*Emberiza cirlus*).

trophæus, etc. These birds are mostly European, but some are found in America. One of their number is the ortolan of Europe, so highly prized for the table. The bobolink is sometimes called rice-bunting, and several other birds are often improperly called buntings.

Bunting, Jabez, D. D.: Wesleyan minister; b. in Manchester, England, May 13, 1779; entered the ministry 1799; gained distinction as an eloquent preacher; had so great influence in his denomination that he has been called "the second founder of Methodism." D. in London, June 16, 1858. See his *Life*, by T. P. Bunting and G. S. Rowe (London, 1887).

Bunyan, JOHN: author of *Pilgrim's Progress*; b. at Elstow, near Bedford, England, in Nov., 1628 (baptized Nov. 30), and learned the trade of a tinker; enlisted in the army of the Parliament, probably (the point is curiously enough uncertain) about 1645; soon quitted the army, and married at about the age of twenty. After passing through severe spiritual conflicts, he attained inward peace and profound religious views. He joined the Nonconformists in 1653; in 1655 he removed to Bedford, and began to exhort; in 1657 he was regularly recognized as a preacher, but still continued to practice his trade. He conducted services in Bedford and other places. In 1660 for so doing he was confined in Bedford County jail, and there remained till 1672. In 1675 he was again in prison, but only for six months. It was during this time that he wrote the *Pilgrim's Progress*, which he published in 1678, and a second edition the same year, and a third in 1679, much enlarged. The second part appeared in 1684. His preaching tours were made from

Belford, and were not without risk. He went frequently to London to preach, and wherever he went had large congregations. In the spring of 1688 he had the "sweating sickness"; later caught a severe cold by riding through heavy rain to London from Reading, whither he had gone to, and did, reconcile a father and son. In London he lay for a while sick of a fever, and finally died there Aug. 31, 1688. His masterpiece, *The Pilgrim's Progress*, is the greatest of allegories, and one of the religious classics of the English tongue, and by means of translations more widely spread than any book save the Bible. It betrays a mind fairly saturated with the Bible and such books as *Fox's Martyrs* and *Bagley's Practice of Piety*. While so simple as a story that a child can understand and enjoy it, it is so profound in its doctrines that the trained theologian best appreciates it. His second famous allegory is *The Holy War*, first issued in 1682. It has no rival in any language save his own *Pilgrim's Progress*. Among his other writings, which are numerous, many dating from his long imprisonment, should be mentioned *Grace Abounding to the Chief of Sinners* (1666), his spiritual autobiography, which recounts how he became a holy man from being a careless sinner; *The Life and Death of Mr. Badman* (1680); *The Jerusalem Sinner Saved* (1688), a remarkable sermon; *The Heavenly Foolman* (1698). There are innumerable editions of these works of Bunyan, but no complete edition worthy of his fame has recently been printed. The life of Bunyan has been exhaustively treated by Rev. John Brown (London, 1885; 2d ed. 1887); readable is the shorter work by E. Venables (1888). SAMUEL MACAULEY JACKSON.

Bunyon: See **BUNION**.

Bunzlau, bönts'low; a town of Prussia; in Silesia; in the Bober; 28 miles by rail W. N. W. of Liegnitz (see map of German Empire, ref. 4-11). It has a normal school, and manufactures of woolen goods, hosiery, linens, etc. Pop. 11,600.

Bunzlau, Jung, yöng bönts'low (i. e. Young Buntzlau): city of Bohemia; on the river Iser; 37 miles N. E. of Prague. It has an old castle, a gymnasium, and manufactures of cotton and woolen fabrics, leather, and soap (see map of Austria-Hungary, ref. 3-E). Pop. (1890) 11,518.

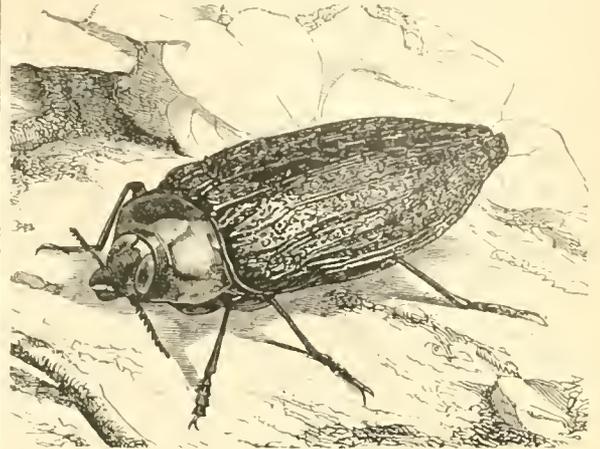

Buoy, bwoi, or boi: a floating body usually intended as a mark for the guidance of mariners. It is made either of wood or metal, and is often hollow. Buoys are generally moored by chains to the bed of the channel. They are of various shapes, sizes, and colors to distinguish them one from another, and indicate to the mariner each a specific instruction. Starboard buoys, usually red, are on the right of a vessel ascending the channel, or on the coast going with the flood-tide current; port buoys, usually black, are on the left in the same circumstances; spherical buoys, striped, indicate the end of a shoal; a hollow conical buoy is called a "can-buoy"; a double conical buoy is called a "nun-buoy"; a floating wooden spar is a "spar-buoy." The bell-buoy is a contrivance for rendering a buoy audible, whether it is visible or not; it is flat on top, where a bell is mounted, the clapper of which is set in vibration by undulations of the water. The Courtenay buoy is surmounted by a whistle connected with a hollow tube long enough to reach stiller water beneath. As the buoy rises and falls on the waves the water in the tube correspondingly changes, so that the air rushes in or out of the whistle as the air in the tube expands or is compressed. Lighter buoys are used to mark river channels. A common shape for buoys to be used to mark shoals in rivers or in other sheltered places is that of a frustrum of a cone. They are anchored point downward, with the name of the buoy on the top. In laying submarine telegraphs buoys are used when cables are cut and abandoned during rough weather, afterward to be picked up and repaired, when the work of laying the cable goes on as before the storm.

A buoy-rope on shipboard is the rope which connects the anchor with a buoy floating above it. It is simply intended to point out the locality of the anchor, but if it be strong it is useful in assisting to raise the anchor at times when the proper cable is cut or injured.

Buphaga: See **BEEF-EATER**.

Bupres'tis [from Gr. βούρησσις, an insect whose sting is said to have caused cattle to swell up; βούρ, ox + πρήθειν, puff up]; a genus of coleopterous insects of the family *Buprestidae*, which includes more than 1,000 species. They are remarkable for the splendor and richness of their colors.

They are found in North America, but are more abundant in tropical countries. The *Buprestis gigas*, of Cayenne, is

The giant buprestis.

about 2 inches long, and is larger than any of the North American species.

Bur: a rough, prickly covering (involucre) of the seeds of some plants, as the chestnut. The term is also applied to the flower-head or involucre of the *Arctium lappa* (burdock), the prickles of which are hooked at the point. In engraving on steel or copper, bur is a slight ridge raised on the edges of a line by the graver or the dry-point.

Bur'bage, RICHARD: actor; one of Shakspeare's associates; b. about 1567. He seems to have belonged to one of those companies of traveling actors which, under the name of "Englische Comödiachen," now and then visited the Continent, more especially North Germany, Holland, and Denmark; exercised considerable influence on the development of the drama and the theater in those countries; inherited a share in the Blackfriars, and, with Shakspeare, Hemming, and others as partners, built the Globe theater, where he took leading parts in all sorts of plays until he died. He played Richard III. and other tragic rôles with great spirit. D. in London, Mar. 13, 1618-19. See Collier's *History of English Dramatic Poetry* (1879).

Bur'beck, HENRY: soldier; b. in Boston, Mass., June 8, 1754. He was a soldier in the Revolution, and was appointed captain under the Confederation May 1, 1787. In 1789 he was commissioned a captain of artillery, major in 1791, lieutenant-colonel in 1798, and colonel in 1802. He served with distinction in the Revolutionary war, in that of 1812 with Great Britain, and on frontier service. He was breveted brigadier-general 1813, and retired from the army June, 1815. D. in New London, Conn., Oct. 2, 1848.

Bur'bridge, GEORGE WHEELOCK, D. C. J.: Canadian jurist; b. in Canning, New Brunswick, Feb. 6, 1847; educated at Mt. Allison Wesleyan College; admitted to the bar in 1872; appointed queen's counsel in 1885. He practiced his profession at St. John; was secretary of the commissioners for consolidating the laws of New Brunswick; a commissioner to revise and consolidate the statutes of Canada in 1883; Deputy Minister of Justice for the Dominion from May, 1882, until appointed judge of the Exchequer Court of Canada Oct., 1887. This court, which consists of but one judge, has exclusive original jurisdiction in respect of any matter which might in England be the subject of an action against the crown. NEL MACDONALD.

Bur'bot (*Lota lota*): a fish of the rivers and lakes of the arctic and subarctic regions of both hemispheres; is the only

The burbot.

fresh-water species of the family *Gadida* or codfishes. It reaches a weight of 8 or 10 lb. It has two dorsal fins, the

second of which is very long, and a very long anal fin. Its flesh is white, firm, and is not highly esteemed as food. It is capable of living a long time out of water. It is also known in the U. S. as eel-pout, cusk, and ling.

Bur'bridge, STEPHEN GANO; general of volunteers; b. in Scott co., Ky., Aug. 19, 1831; educated at Georgetown College and at Kentucky Military Institute, Frankfort; studied law in the office of the late Senator Garrett Davis at Paris, Ky. In 1849 he returned to Georgetown, D. C., and engaged in mercantile business till 1853, when he turned his attention to farming, and at the outbreak of the civil war was conducting a large farm in Logan co., Ky. He espoused the cause of the U. S., and raised the famous Twenty-sixth Kentucky, which he led until the battle of Shiloh, where he was promoted to be a brigadier-general of U. S. volunteers; fought to expel Bragg from Kentucky in 1862; ordered to join the expedition against Vicksburg; led the charge at Arkansas Post and at Port Gibson, being among the first to enter each place; commanded the military district of Kentucky, and during this time drove John Morgan into Tennessee. For this service he was breveted major-general. Resigned in 1865. D. in Brooklyn, Dec. 1, 1894.

Burek'hardt, JOHANN LUDWIG; Swiss traveler; b. at Kirehgarten, near Lausanne, Nov. 24, 1784. After studying at Leipzig and Göttingen he went to London in 1806, carrying with him a letter of introduction from the celebrated Blumenbach to Sir Joseph Banks, and entered the service of the African Association, which in 1809 sent him to explore the interior of Africa. He spent about two years in Syria; prepared himself by the study of Arabic and medicine, muring himself to all kinds of hardships and privations. He traveled through Cairo and Nubia to Mecca, where he arrived in 1814. Disguised as a Moslem hâjî, he made a pilgrimage to Mt. Ararat and to Medina with peril to his life. D. in Cairo, Oct. 15, 1817, and bequeathed his Oriental MSS. to Cambridge University. His *Travels in Nubia* (in English, London, 1819); *Travels in Syria and the Holy Land* (1822); *Travels in Arabia* (1829); *Notes on the Bedouins and Wahabys* (1830); and *Arabic Proverbs; or the Manners and Customs of the Modern Egyptians, Illustrated from their Proverbial Sayings* (1830), are highly esteemed. See his *Life*, prefixed to his *Travels in Nubia*.

Burden, HENRY; inventor and ironmaster; b. in Dumblane, Scotland, Apr. 20, 1791; removed to the U. S. in 1819; set up business as a farm-tool manufacturer, and made the first cultivators; in 1825 invented a process of making railroad spikes which greatly cheapened railway construction; in 1822 was an ironmaster, and eventually the head of one of the largest rolling-mills and iron and steel establishments in the U. S., located near Troy, N. Y.; especially famous for his machine which turns iron bars into finished horseshoes at the rate of sixty a minute; grew very rich; d. in Troy, N. Y., Jan. 19, 1871.

Burden of Proof: the obligation or necessity of proving the fact in dispute in an issue joined in a court of justice. The general rule is that the burden of proof rests upon the party who asserts the affirmative of the issue. The same rule is applied if he grounds his case on a negative statement or allegation. If, however, the proof by which this negative allegation may be disproved is peculiarly within the knowledge of the opposite party, a *prima facie* case is established by its simple assertion. In general, the party upon whom rests the burden of proof has the privilege of opening and closing the case. In most civil causes judgment must be given for the party establishing a preponderance of evidence, but in criminal cases the accused must be acquitted unless the jury are satisfied of his guilt beyond a reasonable doubt. Hence the rules concerning the burden of proof are of great importance in criminal prosecutions. The burden of proof is on the government throughout the whole case. Revised by F. STURGES ALLEN.

Burdett, SIR FRANCIS; a popular and liberal English legislator; b. Jan. 25, 1770. In 1793 he married a rich heiress, Sophia Countess. He was elected to Parliament about 1795; became an effective speaker; advocated parliamentary reform for a while, during which time he was twice arrested, once imprisoned and fined for criticisms of the Government; turned Conservative in 1835. He represented Westminster for many years (1807-37), and then Wiltshire until his death; was the idol of the London populace. D. Jan. 23, 1844.

Burdett-Couffs, ANGELA GEORGIANA, Baroness; daughter of Sir Francis Burdett; b. Apr. 21, 1814; gained distinction

by the liberal use of her vast fortune. She built churches, among which is the beautiful St. Stephen's at Westminster; endowed the bishoprics of Adelaide, Cape Town, and British Columbia; aided emigrants on a great scale, and provided a "Home" at Shepherd's Bush for such women as had lapsed into evil ways. In 1871 she was made a baroness in her own right. Ten years later she married William Lehman Ashmead Bartlett (b. in New Brunswick, N. J., in 1851), who took her name, whereby she lost some part of her inheritance.

Burdette, ROBERT JONES; humorist and journalist; b. at Greensboro, Pa., July 30, 1844; removed to Peoria, Ill., in his youth; enlisted in Forty-seventh Illinois Volunteers in 1862 as a private, and served through the war; became one of the editors of the Peoria *Transcript* in 1869; in 1874 associate editor of the Burlington *Hawkeye*, his humorous contributions to which made him famous. He has delivered various lectures on facetious subjects and published *Hawkeyes* and other comic books.

Burdiek, FRANCIS M., A. M., LL. B., LL. D.; professor of law; b. at De Ruyter, N. Y., Aug. 1, 1845; was educated at Hamilton College and at Hamilton College Law School, Clinton, N. Y.; practiced law in Utica, N. Y., 1872-83, and was mayor of the city 1882-83; was Maynard-Knox Professor of Law and History in Hamilton College 1882-87; Professor of Law in Cornell University Law School 1887-91; and became Dwight Professor of Law in Columbia College Law School, New York, in 1891. Dr. Burdick has published *The Study of Law as a part of a General Education* (Albany, 1887), and *Cases on Torts* (New York, 1891; new ed. 1895). In 1894 he succeeded Henry Wade Rogers as associate editor in charge of the department of law in this encyclopædia, and has contributed many important articles to it. Received the degree of LL. D. from Hamilton College in 1895.

Burdoek (*Arctium lappa*): a plant of the family *Compositæ*; has a globular involucre with imbricated coriaceous scales, each tipped with an abrupt and spreading, awl-shaped, hook-pointed appendage. This involucre, which is called a *bur*, catches hold of the clothes of persons who come into contact with it. The burdoek is a native of Europe and naturalized in the U. S., growing as a weed in waste places, fence-corners, and near dwellings. It is used in medicine as a diuretic and diaphoretic.

Burdwan, or **Bardwan**: a town of Bengal, India; capital of a division and district of the same name; on the Dummodah, and on the Grand Trunk Road; 68 miles by rail N. W. of Calcutta (see map of N. India, ref. 7-1). It has manufactures of silk and cotton fabrics, and a large palace, but the houses are generally rather mean. Pop. 35,000.

Bure: See BURI.

Bureau Veritas: an institution for the classification of the steamships and sailing-vessels of all nations; used by underwriters, maritime insurance agents, etc. It was founded at Antwerp in 1828, by Charles Bal. During the revolution of 1830, which separated Belgium from Dutch rule, the Bureau Veritas was removed to Paris, France, where it was long known as the French Lloyd's. In the Franco-German war of 1870-71 the bureau was finally located at Brussels, in Belgium. Its surveyors and agents are found in the seaports of all maritime countries, and their ratings of vessels are the fruit of the utmost severity in examination.

Burg, böörkh: a town of Prussian Saxony; on the river Hile; 17 miles by rail N. E. of Magdeburg. It was settled by French and Walloon colonists, and has been for many centuries celebrated for its manufactures of woolen cloth. Here are also manufactures of linen, machinery, pottery, etc. Pop. (1890) 17,572.

Burgdorf, böörkh'dörf (in Fr. *Berthoud*): a town of Switzerland; canton of Berne; on the river Emmen; 13½ miles by rail N. E. of Berne (see map of Switzerland, ref. 4-E). It has a castle and manufactures of ribbons and silk. Pestalozzi opened a school here in 1798. The Sommerhaus baths are in the vicinity. Pop. (1888) 6,876.

Bür'ger, GOTTFRIED AUGUST; German poet; b. near Halberstadt, Dec. 31, 1747. He studied at Göttingen, and his literary career was greatly influenced by reading Shakspeare and *Percy's Relics of Ancient Poetry*. His works consist chiefly of ballads and songs, which, though very popular, did not relieve him from poverty. Among his best productions are *Lenore* (1772) and the *Wild Huntsman*. D. in Göttingen, June 8, 1794. See Pröhle's *G. A. Bürger* (Leipzig, 1856).

Bur'ges, TRISTAM, LL. D.: statesman and orator; b. in Rochester, Mass., Feb. 26, 1770; graduated at Brown University in 1796; studied law, which he practiced with success at Providence, R. I., and became a leader of the Federal party. He was for a time chief justice of Rhode Island, and afterward a professor in Brown University. In 1825 he was elected a member of Congress, in which he continued ten years, and gained a high reputation. He was eminently logical and terribly sarcastic. D. in Providence, Oct. 13, 1853.

Burgess, ALEXANDER, D. D., LL. D.: Bishop of Quincy, Ill.; b. in Providence, R. I., Oct. 31, 1819; graduated at Brown University 1838, and the General Theological Seminary, New York city, 1841; ordained 1842; held parochial charges at East Haddam, Conn.; Augusta and Portland, Me.; Brooklyn, N. Y.; and Springfield, Mass. Consecrated Bishop of Quincy, May 15, 1878; published a memoir of his brother, the Bishop of Maine, carols, hymns, special sermons, charges, etc.

Burgess, GEORGE, D. D.: Bishop of Maine; b. at Providence, R. I., Oct. 31, 1809; graduated at Brown University in 1826; was a tutor there for a time; studied in Germany two years; rector of Christ church, Hartford, Conn. (1834-47); and was, Oct. 31, 1847, consecrated Bishop of Maine, acting also as rector of Christ church, Gardiner. He went to Haiti to found a mission, and died there of apoplexy Apr. 23, 1866. He published *Pages from the Ecclesiastical History of New England* (Boston, 1847); *The Last Enemy Conquering and Conquered* (Philadelphia, 1850); a volume of sermons; a metrical version of the Psalms (New York, 1840); and other works.

Burgess, JAMES, LL. D.: archaeologist; b. in Kirkmahoe, Dumfriesshire, Scotland, 1832; went to Calcutta as Professor of Mathematics, 1855; engaged in educational work in Bombay 1861-73; published the monthly *Indian Antiquary* 1872-85; in 1873 was put in charge of the archaeological survey of Bombay; in 1885 appointed director-general of the archaeological survey of India, retiring in 1889. Editor of *Epi-graphia Indica* and author of various works on the temples of India.

Burgess, JOHN WILLIAM, LL. D.: educator; b. at Cornersville, Giles co., Tenn., Aug. 26, 1844; educated at Cumberland University, Lebanon, Tenn., and Amherst College, Mass., whence he graduated in 1867; was admitted to the bar of Massachusetts in 1869; appointed Professor of English Literature and Political Economy at Knox College, Galesburg, Ill., in 1869; in 1871 studied history and public law at Göttingen, Leipzig, and Berlin; was appointed Professor of History and Political Science at Amherst College in 1873; Professor of Political History and Public Law at Columbia College, New York, in 1876, and of Constitutional and International History and Law in 1880.

Burgher and Antiburgher: See ASSOCIATE PRESBYTERY AND PRESBYTERIAN CHURCH.

Burgkmair, böörk mîr, HANS: a noted German painter and engraver on wood; b. in Augsburg in 1472. He was a friend of Albert Dürer. His paintings are in galleries at Munich, Berlin, Augsburg, and Vienna. In 135 wood-cuts he depicted *The Triumph of the Emperor Maximilian*, for which the emperor wrote the text. D. in 1531.

Burglary [Anglo-Fr. *burglarie*, origin obscure]: in criminal law, the act of breaking and entering into a dwelling-house of another or a church in the night-time, with intent to commit a felony therein. There are four circumstances necessary to constitute the offense, referring to place, time, the acts done, and the intent. The place is a dwelling-house or a church. It is not necessary, in order to constitute a "dwelling-house," that there should be any person residing in the house at the time. It is enough if it be habitually used as a dwelling, though it may at the time be closed, as in the case of a person having two or more residences. Difficult questions sometimes arise as to buildings connected with the house and within the curtilage, and as to the case of lodgers having separate rooms and entering by a common door. In the last instance the inquiry would be whether each lodger has a distinct dwelling-house. Consult Bishop or Wharton on *Criminal Law*.

As to time, the rule is that the offense must be committed by night. The better opinion is that both the breaking and entering must be by night, though the two acts, so far as they are distinct in their nature, may be committed on separate nights. It is held to be night when a person can

not by the light of the sun clearly discern the face of another. This is quite indefinite, and as burglary is a heinous offense some fixed though arbitrary rule seems desirable. In some of the States the time is fixed by statute. The fact that the face can be seen by moonlight does not affect the question.

The acts to be done are breaking (actual or constructive) and an entry. The word "breaking" is not to be construed so as to require any great degree of force or violence. Unlatching a door or raising a window is sufficient. If a door or window be left open, an entry through them would not be a breaking, though the act of coming down a chimney would be. Any entry will suffice, such as thrusting the hand or an instrument to be used in the commission of a felony, through a broken pane of glass. The thrusting or forcing in of an instrument to be used in breaking only does not of itself constitute a burglarious breaking and entry. The act of discharging a loaded pistol or gun through a door or the glass of a window with a felonious intent would be both a breaking and an entry. It is sufficient if the entrance be procured through fraud or intimidation. It is doubtful whether the act of *breaking out* of a house will be sufficient, though the other ingredients of the offense, except breaking in, be present.

Finally, there must be an intent to commit a felony. If a felony be actually committed, the intent may be inferred. It will be immaterial whether the felony exists at common law or is created by statute. An intent to commit a trespass will not suffice.

The common-law ingredients of this crime have been modified in the U. S. by statute. Burglary is sometimes divided into degrees; some of these degrees would include breaking and entry in the daytime, or into buildings other than dwelling-houses and churches, or breaking out of a building, as well as into it. In some of the States, statute law makes the intent to commit any crime sufficient.

T. W. DWIGHT.

Burgomaster: the great ice-gull, *Larus glaucus*, of the arctic regions of both hemispheres.

Burton, JOHN WILLIAM: Dean of Chichester, England; b. in Smyrna, Asia Minor, Aug. 21, 1813; educated at Worcester College, Oxford; B. A. 1845; wrote the Newdigate prize poem 1845; fellow of Oriel College 1846; took holy orders 1848; Gresham lecturer in Divinity 1868; vicar of St. Mary the Virgin, Oxford, 1863; Dean of Chichester 1876; author of *The Life and Times of Sir Thomas Gresham* (2 vols., 1830); *Peira, a Poem* (1846); *Oxford Reformers* (1854); *A Plain Commentary on the Four Holy Gospels* (8 vols., 1855; new ed. 4 vols., 1875); *Historical Notices of the Colleges of Oxford* (1857); *Plain Commentary on the Book of Psalms*, Prayer-book version (2 vols., 1857); *Inspiration and Interpretation* (1861); *Letters from Rome* (1862); *A Treatise on the Pastoral Office* (1864); *Ninety-one Short Sermons* (2 vols., 1867); *Disestablishment, the Nation's Formal Rejection of God and Denial of the Faith* (1868); *England and Rome: Three Letters to a Pervert* (1869); *The Last Twelve Verses of the Gospel according to St. Mark Vindicated* (1871); *The Athanasian Creed* (1872); *A Plea for the Study of Divinity in Oxford* (1875); *The Revision Revised* (1883); *Poems* (1885); *Lives of Twelve Good Men* (1888; 2 vols., 3d ed., 1889). D. in Chichester, Aug. 6, 1888. See his *Life* by E. M. Goulburn (London, 1892, 2 vols.).

Burgos, boör'gôs: a province of Spain, in Old Castile; bounded N. by Santander, E. by Biscay, Alava, and Logroño, S. E. by Soria, S. by Segovia, and W. by Valladolid and Valencia. Area, 5,651 sq. miles. It is drained by the Douro and the Ebro, which rises within its limits. The surface is partly mountainous. Gold, silver, copper, iron, and lead are found in it. Pop. (1887) 237,822.

Burgos (Lat. *Burgi*): a city of Spain; capital of province of same name; on the river Arlanzon; at the foot of the Sierra de Oca; 140 miles by rail N. of Madrid; lat. 42° 20' N., lon. 3° 45' W. It was formerly the capital of Old Castile, and was far more populous than it is now. It was founded in 844 A. D., and has many antique buildings. The court was removed from Burgos to Madrid in the sixteenth century, after which the importance of the former declined. The most remarkable edifice here is the cathedral of brown stone, which is one of the noblest specimens of Gothic architecture in Europe. This was commenced in 1221. Burgos is the seat of an archbishop, and has a college and some manufactures of woolen and linen fabrics. The rail-

way which connects Bayonne with Valladolid passes through this town. Pop. (1887) 31,301.

Burgos, LAWS OF: a system of laws for the regulation of Indian labor in America, promulgated at Burgos, Spain, Dec. 27, 1512. They were the result of an attempt by the Dominicans of Hispaniola to protect the Indians; the monks were opposed by the colonists, and King Ferdinand referred the question to a special junta which prepared these laws. They provided that the Indian laborers should have houses, land for planting, and a *peso* of gold annually to buy clothes; religious instruction was secured to them; regular inspectors of the mines were created, and it was forbidden that the Indian miners should be forced to work more than five months consecutively; every effort was to be made to attract the Indians by gentle means. These humane laws caused much dissatisfaction and soon became a dead letter.

HERBERT H. SMITH.

Burgoyne, JOHN: British general and dramatist; b. Feb. 24, 1723; commanded a force which captured Alcántara, in Spain, in 1762; was sent to the American colonies in 1775; fought under Carleton to expel the insurgents from Canada. In the summer of 1777 he took command in Canada of an army of 8,000 men, which was ordered to enter New York State and advance to Albany to meet Clinton, who was to ascend the river, thus cutting the colonies in twain. He was repulsed at Stillwater in September, and was captured with his whole army at Saratoga in Oct., 1777, by the army under Gen. Gates; returned home in 1778, and wrote a vindication of his campaign entitled *A State of the Expedition* (1780). (See SARATOGA, BATTLE OF.) He wrote successful dramas called *The Maid of the Oaks* (1780); *Bon Ton*; and *The Heiress* (1786). D. in London, Aug. 4, 1792.

Burgoyne, Sir JOHN FOX: field-marshal; son of Gen. John Burgoyne, and godson of Charles James Fox; b. in London, July 24, 1782; entered the Royal Engineers as second lieutenant in 1798. During a period of seventy-three years' service he slowly but steadily ascended, until at an age far beyond the scriptural limit of the life of man he reached that summit of his professional career which, in a published letter, dated Wilhelmshöhe, Oct. 29, 1870, earned for him from the French emperor, Napoleon III., the designation of "Le Moltke de l'Angleterre." He served as commanding engineer under Gen. Frazer at the assault of Alexandria and siege of Rosetta, Egypt, in 1807; and under Sir John Moore in his Portuguese campaign and retreat in 1808. Through the Peninsular war he took a prominent part, as an engineer officer, in its greater sieges and battles, e. g. the siege of Ciudad Rodrigo, the two sieges of Badajoz; as commanding engineer at the desperate siege of Burgos and of that of Sebastian (shot through the neck in the assault), and the battles of Busaco, Salamanca, Bidassoa, Nivelle, etc. He came out of the Peninsular war aged thirty-two and the senior officer of engineers who had been engaged in the sieges of Spain. As commanding engineer under Gen. Pakenham he was present at the assault of Gen. Jackson's lines below New Orleans, Jan. 8, 1815, as also at the capture of Fort Bowyer (Mobile Point), Feb. 11. He was called again to the field (aged seventy-two) for the Crimean war. Against the opinion of the French engineers he pointed out at the beginning the Malakoff as the proper and decisive object of the siege operations. On his recall he resumed his position at the War Office as inspector-general of fortifications, to which place he had been appointed in 1845. His services in this capacity and his various reports and official writings were deemed to justify the publication of a work entitled *Military Opinions of Sir John Burgoyne* (London, 1859). After seventy years' service he retired in 1868 with promotion to the rank of field-marshal, and the appointment of constable of the Tower of London. Though then aged eighty-six, his physical powers were good and his mind unimpaired. He died Oct. 7, 1871, at the age of eighty-nine, and was buried in the historic Tower of London.

Bur'gundy (in Fr. *Bourgogne*; Lat. *Burgundia*): one of the most important of the former provinces of France; now forms the departments of Côte d'Or, Saône-et-Loire, Yonne, part of Ain, and part of Aube. The whole population of the departments of Ain, Saône-et-Loire, Côte d'Or, Yonne, Aube, Haute-Marne, and Haute-Saône amounted in 1891 to 2,477,921. The name was derived from an ancient German tribe called in Latin *Burgundi* or *Burgundiones*, who settled in this part of Gaul about 408 A. D. Gondemar, King of Burgundy, was defeated and killed in 534 by the Franks, who then obtained possession of Burgundy. The kingdom

of Burgundy, re-established in 561, was much more extensive than the province of that name, and its extent varied in different periods. It included the provinces of Burgundy, Franche-Comté, Dauphiné, a part of Switzerland, Lyonnais, and nearly all the basin of the Rhône. In 879 A. D. Burgundy renounced its allegiance to the weak Carlovingian king, and became an independent state ruled by King Boso. It afterward in part belonged to the kingdom of Arles (933-1032). Upper Burgundy was a kingdom from 888 to 933. In these ages there were often several lines of princes claiming the title of King of Burgundy, and ruling over parts of the country. King Rudolf III., dying without male issue in 1032, bequeathed his kingdom to the Emperor Conrad II. Conrad's son Henry erected it into a duchy, feudal to Germany, sometimes called Little Burgundy. Meanwhile the northwestern portion of old Burgundy remained a fee of the French crown, governed by a line of dukes. This line became extinct in 1361, but John II. of France made his son, Philip the Bold, duke in 1364. After this Burgundy became an important state, which was much of the time virtually independent. Several of the dukes who reigned over it were powerful and famous princes. On the death of Charles the Bold, in 1477, the ducal line became extinct, and the duchy was annexed to France. From 915 to 1384 Franche-Comté was under a line of counts of Burgundy, but Philip the Bold made it a part of his dominions in 1384. See De Barante, *History of the Dukes of Burgundy* (13 vols., 1826); Dubois, *La Bourgogne depuis son Origine* (2 vols., 1867).

Burgundy, DUKES OF: See CHARLES THE BOLD, PHILIP THE BOLD, and PHILIP THE GOOD.

Burgundy, LOUIS, Duke of: Dauphin of France; b. in Versailles, Aug. 6, 1682; grandson of Louis XIV. and the father of Louis XV. He was a youth of violent passions and extremely haughty, but his character was, it is said, reformed by Fénelon, who was his preceptor. He married Adelaide of Savoy about 1698. On the death of his father he became dauphin and heir-apparent to the throne. D. of scarlet fever, Feb. 18, 1712.

Burgundy Pitch (*Pice Burgundica*): a resinous concrete exudation from the *Abies excelsa* or Norway fir. It is rendered commercial by melting it in hot water, by which process part of its volatile oil is separated from it. By straining it through a coarse cloth some impurities are removed. It is of a yellowish-white color, is hard and brittle when cold, but is softened by a moderate degree of heat. It has a pleasant resinous odor and a slightly bitter taste. It is used in medicine as an external application in the form of a plaster. The Burgundy pitch of commerce comes chiefly from the neighborhood of Neuchâtel, Switzerland.

Burgundy Wines: the name of French wines produced in the former province of Burgundy, the best coming from the range of hills called Côte d'Or, between Dijon and Châlons. These hills are about 800 to 1,000 feet high, and the finest vineyards are about half way up. The wines are celebrated for richness of flavor and perfume. The best red wines of Burgundy are called Clos-Vougeot, Chambertin, Romané-Conti, Volnay, Pomard, and Richebourg. The white wines of Burgundy are said to be the finest in France, but the quantity produced is less than that of the red.

Burhanpur', or Barhanpur (Hindi, *Barhanpura*): a city of Nimar district, Central Provinces, British India; the ancient capital of the Kandesh; on the river Tapti; 309 miles by rail N. E. of Bombay (see map of S. India, ref. 2-D). It is on the Great Indian Peninsular R. R. It is one of the largest and best-built cities of the Deccan, and has wide and regular streets and brick houses. Among the remarkable buildings is a mosque built by Aurungzebe, and an old royal palace which is nearly ruined. This city was taken by Akbar about 1600. It has manufactures of gold and silver thread for brocade. Pop. 30,017.

Bu'ri, or Bure: the first of the gods of the Norse mythology (Æsir). It is related that when the mythic cow Audhumla (whose name, from *andr*, desert, and *lum*, darkness, may be said to symbolize the original chaotic darkness) began to lick the frost-covered rocks of the primeval chaos, there came forth a beautiful and mighty being in human form called Buri, whose son Borr (that is born, and hence, like the Latin *natus*, signifying a son) was the father of Odin.

Buri: a species of palm; native of the Philippine islands. Its trunk is employed in the construction of houses; sugar and spirituous liquors are made of the sap; the pith yields a

valuable article of food (sago); and mats and sails are made from its fiber. This palm is the *Arenga saccharifera*.

Burial: See FUNERAL.

Burial Societies: See FRIENDLY SOCIETIES.

Bur'idan (Fr. pron. bū ri-dān'), JEAN: scholastic philosopher; b. at Béthune, Artois, France, about 1300. He was a pupil of Occam; lectured at Paris; belonged to the Nominalist school. He wrote commentaries on Aristotle's *Metaphysica*, and other works, and was the reputed author of a celebrated sophism called "Buridan's Ass," but it is not found in his books. The subject of this was an ass placed between two equidistant and equal bundles of hay, and starving on account of the equal balance of the two motives. For some unknown reason he left Paris for Vienna, and was instrumental in founding the university there. D. after 1358.

Bur'in: a post-town and port of entry of Newfoundland; capital of district of same name; has a fine harbor on the west side of Placentia Bay, and a jail. Pop. 2,000.

Burins: See CHIZERROOTS.

Burke, EDMUND, LL. D.: statesman, orator, and writer; b. in Dublin, Ireland, Jan. 1, 1728, or, according to some writers, in 1730. At an early age he became the pupil of Abraham Shackleton, a Quaker of superior attainments and excellent character, who taught a school at Ballitore. Having entered Trinity College, Dublin, he devoted himself to history, philosophy, the classics, etc., not neglecting poetry and other works of imagination. He afterward studied law at the Middle Temple, London, but returned to Ireland in 1751, and took the degree of A. M. His *Vindication of Natural Society*, an ironical criticism of Lord Bolingbroke's attacks on Christianity, came out anonymously in 1756. This was followed by a *Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful*, which was highly commended by Dr. Johnson. Burke married, in 1757, Mary Jane, daughter of Dr. Nugent, of Bath, and the union appears to have been a very happy one. Soon after this he formed an intimacy with Dr. Johnson and Garrick; the former, from his first acquaintance with Burke, felt the warmest admiration for his talents, and was accustomed to say that "no man of sense could meet Mr. Burke by accident under a gateway, to avoid a shower, without being convinced that he was the first man in England." In 1759 Burke became private secretary to William Gerard Hamilton, through whose influence chiefly he received a pension from the Government of £300 per annum; but finding that his political independence would be compromised by its acceptance, he threw it up at the end of the year. He was returned to Parliament for Wendover, in Buckinghamshire, about 1765, and re-elected in 1768. Having soon after purchased an estate, he wrote to his friend Shackleton: "I have made a push with all I could collect of my own, and the aid of my friends, to cast a little root into this country. I have purchased a house with 600 acres of land in Buckinghamshire, 24 miles from London." His *Thoughts on the Cause of the Present Discontent* came out in 1770, and in 1771 he was appointed agent of the colony of New York. In 1772 Sir Charles Colebrook, in the name of the directors of the East India Company, offered to Burke, who had already considerable knowledge of Indian affairs, "the first position in a supervisorship of three, empowered to trace out in detail the whole administrative system of India, and to remedy all they could find amiss." This offer he declined, feeling perhaps unwilling to leave Parliament at a time when American affairs were becoming more complicated, and the condition of France filled him with anxious forebodings. Soon after his return from a short residence in Paris, he said in a speech in Parliament, "I see propagated principles which will not leave to religion even a toleration, and make Virtue herself less than a name." In April, 1774, he made a speech on American taxation, and he appears to have been the only member of Parliament who fully comprehended the dangers which threatened the American colonies. In Nov., 1774, Burke represented the city of Bristol in Parliament, and in Mar., 1775, made an admirable speech in favor of conciliatory measures toward the American colonies. Fox said of this oration: "Let gentlemen read this speech by day and meditate upon it by night; they would there learn that representation was the sovereign remedy for every evil." In 1780 he delivered his speech *On the Economical Reform*, and in 1782 became a privy-councilor and paymaster-general of the forces under the Rockingham ministry. His speech on the East India Bill in Dec., 1783, is esteemed

one of his best. Burke retired from office soon after the accession of Pitt as Prime Minister, and held no position afterward under the Government. In Feb., 1785, he made a speech on the debts of the Nabob of Arcot, which, says Prior, "was one of those outpourings of a fertile and vigorous intellect which on an unpromising theme seemed to combine all that could instruct, dazzle, and even overpower the reader." His prosecution of Hastings, the most arduous enterprise of his life, was commenced in Jan., 1786, and he conducted the impeachment. On Feb. 15, 1788, Burke made his memorable speech in Westminster Hall, in the presence of an immense assembly. Although a verdict of acquittal was passed in 1795, the noble efforts of Burke led the way to great reforms in the Government of India. In 1790 Burke published his *Reflections on the Revolution in France*, of which more than 30,000 copies are said to have been sold within a few months. It was translated into French, and received with enthusiasm in all parts of Europe. Soon after this he published *An Appeal from the New to the Old Whigs*, in which he refutes the charge brought against him by Fox of having abandoned the principles of his party. About 1795 Burke received considerable pensions granted at the desire of the king, and without solicitation on his part or that of his friends. His acceptance of these well-merited rewards exposed him to severe attacks upon his character, in reply to which he wrote his *Letter to a Noble Lord*, which was received with great favor. Burke's only son, Richard, a young man of great promise, had died in 1794, and this affliction probably hastened the father's death, which took place July 9, 1797. He was buried at Beaconsfield, near his estate. See Prior, *Life of Burke* (London, 1854); Dr. Geo. Croly, *Political Life of Edmund Burke*; Lord Jeffrey, *Miscellanies*; John Morley, *Edmund Burke* (1867).

Revised by C. K. ADAMS.

Burke, JOHN: genealogist; b. near Parsonstown, County Tipperary, Ireland, in 1786; settled in London, and published, besides other heraldic and genealogical works, a *Dictionary of the Peerage and Baronage of the British Empire* (1826). The twentieth edition was published by his son. D. in Aix-la-Chapelle, Mar. 27, 1848.—His second son, Sir JOHN BERNARD BURKE, LL. D.; b. in London in 1815; became in 1853 Ulster King of Arms, and was knighted in 1854; governor of the National Gallery of Ireland 1874. He wrote many works on heraldry and kindred subjects, e. g. *Anecdotes of the Aristocracy* (1849-50); *The Landed Gentry*; *Reminiscences, Ancestral and Anecdotal*. D. in Dublin, Dec. 13, 1892.

Burleigh, or Burghley, WILLIAM CECIL, LORD: statesman; b. at Bourne, Lincolnshire, England, Sept. 13, 1520; graduated at St. John's College, Cambridge, studied law; married Mary Cheke, sister of the great humanist, in 1541, who died in three years, leaving an only son; and in 1545 Mildred, daughter of Sir Anthony Cook. In 1548 he was appointed Secretary of State. As he was a Protestant, he resigned office on the accession of Queen Mary in 1553, but by conformity to the Roman Catholic Church escaped persecution in that reign, although he succeeded in defeating a bill to confiscate the property of Protestant refugees. He was again appointed Secretary of State by Queen Elizabeth in Nov., 1558, and was virtually Prime Minister for forty years from that date. In 1571 he received the title of Baron Burleigh, and in 1572 became Lord Treasurer. According to Hume, "he was the most vigilant, active, and prudent minister ever known in England." D. in London, Aug. 4, 1598, and left no less than 300 landed estates. His tomb is in Westminster Abbey. From him through his second son have descended the Earls and Marquises of Salisbury. Lord Burleigh's government was in a critical time, and had to be carried on under a penurious and capricious queen, but one who had the discernment to keep him employed. He employed spies freely, was shrewd, tortuous, patriotic, and what political glory attaches to the reign of Elizabeth he is entitled largely to the credit of. See Arthur Collins, *Life of William Cecil* (1732); Motley, *History of the United Netherlands*, chaps. vi., viii., and xviii.; Froude, *History of England*, vol. v.

Burleson, RUFUS C., D. D., LL. D.: one of the earliest educators in Texas; b. near Decatur, Ala., Aug. 7, 1823; spent seven years in Nashville University; taught in Mississippi and in the Theological Institute, Covington, Ky.; graduated June 10, 1847. A few months later he became pastor of the First Baptist church, Houston, Tex. He filled that position three and a half years, and was then

unanimously elected president of BAYLOR UNIVERSITY (*q. v.*) His great life purpose has been to elevate the Baptist denomination, and especially to found a great Texas Baptist university.

Burlingame: city and railroad junction; former capital of Osage co., Kan. (for location of county, see map of Kansas, ref. 6-1); 24 miles S. S. W. of Topeka. Coal is found in abundance here, also a fine quality of fire-clay. The surrounding country is unsurpassed in productiveness. Pop. (1880) 1,370; (1890) 1,472.

Burlingame, ANSON, LL. D.: diplomatist; b. at New Berlin, Chenango co., N. Y., Nov. 14, 1822; graduated at Harvard in 1846. He became a lawyer and a resident of Boston, and represented the fifth district of Massachusetts in Congress from 1854 to 1860. For denouncing the assault made upon Senator Sumner he was challenged by Preston S. Brooks, and selected rifles for the weapon and Canada for the rendezvous, but Brooks refused to travel through the angry North. He acted with the Republicans, and gained distinction as an orator. In 1861 he was sent as commissioner to China, and in 1867 was appointed ambassador from China to the U. S. and the great powers of Europe, negotiating treaties of amity and commerce. D., while engaged in the Chinese service, in St. Petersburg, Russia, Feb. 23, 1870.

Burlington, England: See BRIDLINGTON.

Burlington: city, important railroad center, and river-port of Iowa; capital of Des Moines co. (for location of county, see map of Iowa, ref. 7-K); situated on the Mississippi river; 207 miles W. S. W. of Chicago, 250 miles by water above St. Louis, and 296 miles by railroad E. of Omaha. The river is here a broad, deep, and beautiful stream. The plan of the city is regular, and the houses are mostly of brick or stone. Many of the private residences are built on high bluffs which afford extensive views of river scenery. This place is the seat of Burlington University, and contains about twenty-five churches and numerous manufactories. Here occurs a valuable variety of carboniferous limestone. (See BURLINGTON LIMESTONE.) Burlington is sometimes called the "Orchard City." Pop. (1860) 6,706; (1880) 19,450; (1890) 22,565; (1895) 25,246.

EDITOR OF "GAZETTE."

Burlington: railroad junction; a city; capital of Coffey co., Kan. (for location of county, see map of Kansas, ref. 6-1); on the right bank of the Neosho river; 28 miles S. E. of Emporia and 65 miles S. of Topeka. It has an abundant water-power, a public-school house costing \$30,000, and first-class mills. Pop. (1880) 2,011; (1890) 2,330.

Burlington: city and railroad center, of Burlington co., N. J. (for location of county, see map of New Jersey, ref. 5-D); on the Delaware river, nearly opposite Bristol; 20 miles above Philadelphia and 12 miles S. W. of Trenton. The river is here nearly a mile wide, and incloses an island of 300 acres. The city is the seat of St. Mary's Hall (an Episcopalian school for girls) and Burlington College; contains an opera-house, has gas and water systems, and a public library. The principal industries are the manufacture of shoes, canned goods, iron pipes of all sizes, stoves, heaters, and carriages. The town was settled as New Beverly in 1667; incorporated with its present name in 1784; has fine and shaded streets and many old mansions. Pop. (1880) 6,090; (1890) 7,264; (1895) 7,844.

MANAGER OF "DAILY ENTERPRISE."

Burlington: city; railroad center; capital of Chittenden co., Vt. (for location, see map of Vermont, ref. 4-B); on Burlington Bay of Lake Champlain; 40 miles W. from Montpelier, the capital of the State. It was incorporated as a city in 1865, and is the largest place in the State. Pop. (1840) 4,271; (1880) 11,365; (1890) 14,590. Area of original township, 6 sq. miles; about two-fifths were included in the municipal limits, the rest forming a new town called South Burlington.

The heaviest trade in the city is in lumber. The capital invested is over \$1,000,000. There are large quarries of building-stone, of limestone, and of fine marble within or near the city limits; lime-kilns and brick-yards are in active operation, and steam marble-mills, machine-shops, foundries, sash, chair, furniture, patent-medicine, and shoe factories, paper-mills, and many smaller manufacturing trades are thriving. On the northeast limit of the city the abundant water-power of the Winooski is utilized for woolen and cotton mills, flour-mills, machine-shops, chair factories,

etc. A line of passenger steamers and a large fleet of tugs and barges ply between Burlington and every port on the lake.

The University of Vermont and State Agricultural College is situated here; it was chartered in 1791, has a flourishing medical department, and ranks as one of the best institutions in the country. Since 1872 young women have been admitted to the classical and scientific departments on the same terms as young men. The college buildings stand on the crown of the hill on whose side the city is built, in a most beautiful and commanding position overlooking the lake. The library is in a handsome stone building, and another edifice contains a museum and an art-gallery. A park of 7 acres lies in front of the college buildings, and lands of the university are in the rear. The city schools are under control of a board of commissioners elected by the people. The high-school building, erected in 1871 at a cost of \$20,000, is one of the best in the State. There are also two large Roman Catholic schools, an Episcopal institute for boys, and several private schools within the city limits. St. Mary's (Roman Catholic) cathedral is one of the finest church edifices in this part of the country. There are two orphan asylums—one Roman Catholic and one Protestant. The chief public buildings are the city-hall, the county court-house (a handsome stone building, erected in 1872), the county jail, the U. S. post-office and custom-house (a brick building, erected in 1858), and Y. M. C. A. building. The libraries are the University Library, Young Men's Christian Association Library, and the Fletcher Free Library, which last is under control of the city.

The city is supplied with water from the lake, raised by steam-pumps to a reservoir on the hill, which gives a head of 280 feet; the water-works are under the control of the city. Lakeview Cemetery, opened by the city in 1868, on the bluff overlooking the lake, is already a beautiful spot, and Green Mount Cemetery, on the eastern side of the city, overlooking the valley of the Winooski, contains a monument to Ethan Allen, who was one of the early settlers and buried here—a shaft of granite surmounted by an heroic statue of Allen in marble, which was unveiled with imposing ceremonies July 4, 1873.

Burlington was first settled in 1773, but no permanent residences were made till the close of the Revolutionary war, and in 1800 the population was 600. The principal streets are 4 rods wide, laid out at right angles, many of them well shaded with elm and maple trees. The location of the city is unequalled in this part of the country, and the beauty of its scenery unsurpassed anywhere. The geographical position of the city, midway of the eastern shore of Lake Champlain, and the facilities for transportation by rail and water make the whole valley of the lake tributary to it in the way of business.

EDITOR OF "FREE PRESS."

Burlington: village (settled in 1837); Racine co., Wis. (for location of county, see map of Wisconsin, ref. 7-F); on Wis. Cent. and C. M. and St. P. R. Rs., and on Fox river; 27 miles W. by S. of Racine. It has seven churches, a graded school, and manufacturing and agricultural industries. Pop. (1880) 1,611; (1890) 2,043; (1895) 2,428.

Burlington Limestone: a formation of the carboniferous period, occurring in Missouri and Illinois, adjacent to the Mississippi river. It affords a valuable building-stone, and is peculiarly interesting to naturalists. The upper bed is of a light-gray color, and is nearly pure carbonate of lime. The lower bed contains more magnesia. "It is," says A. H. Worthen, "exceedingly rich in fossils, especially Crinoidea, and has afforded a greater number both of species and individuals than all the other Paleozoic rocks of this continent combined."

Burma: the largest province of the British Indian empire; stretches from lat. 28° N. far up in the mountains of Tibet, southward in a long strip on the west coast of the Malay peninsula to lat. 10° N.; its greatest breadth is in lat. 21° 30' from lon. E. 92° to 103°; bounded N. W. by Assam and Manipur, W. by Hill Tipperah, Manipur, and the Bay of Bengal, which also forms its southern boundary, E. by Siam, Tonquin, and China. Area, Lower Burma, 87,220 sq. miles; Upper Burma, 68,922; total, 156,142 sq. miles. Pop. (1891) Lower Burma, 4,569,680; Upper Burma, 2,984,730; total, 7,554,410. Contains 35 administrative districts. Provinces of Lower Burma are Arakan, Irawadi, Pegu, and Tenasserim, covering the entire seacoast. The Mergui Archipelago

(see Mergu) is part of, and lies off the lower coast of, Tenasserim. Portions of old Burma have not yet been incorporated into British India, but are frontier territory. Total area estimated at 280,000 sq. miles.

Physical Aspects.—The Yoma Mountains are a coast-range along the east boundary of Arakan, and form a continuation of the Barail and Patkoi range, an off-shoot from the Himalayas. Blue Mountain, one of its peaks, is said to reach an elevation of 8,000 feet. On its west side lies the valley of the lower Koladan. E. of it is the basin of the great Irawadi, which receives the large affluent Kyen-duen about 80 miles below Mandalay. The Pegu Yoma range separates the Irawadi from the Sittang valley on the E.; and Pong-Loung range, which crosses the Shan States and has peaks about 7,000 feet high, divides the Sittang from the Salwin valley. The Tenasserim Mountains are on the eastern boundary of the province of the same name, rise 5,000 feet, and are covered with a dense and solitary jungle. The Mekong or Cambodia river passes across the eastern part of Upper Burma from N. to S. N. of the Pegu district the country slopes upward through a rolling country, broken here and there by ranges of hills for 300 miles, and then becomes mountainous, wild, and little known to geographers. The Irawadi and Salwin are the largest rivers; the former navigable for large vessels above Bhamo, 700 miles from the sea, and furnishing the highway of commerce to the Chinese border; the latter navigable for only 80 miles from the coast. The Kyen-duen, also known as the Chindwin, can be ascended 300 miles from its confluence with the Irawadi. All the Burman rivers are subject to great fluctuations of water, and in the dry season (December to July) navigation above the tide-reaches is much impeded. During the rest of the year the alluvial plains are subject to inundations, when the streams are covered with boats of every description and commerce is active. The upper river courses have a less overflow, though fed from the Himalayas, and they force their way through rugged and grand defiles. A canal runs from the Pegu to the Sittang river. Lakes are Thoo, Lahyin, and Kaudagee.

The rainfall on the coast exceeds at places 200 inches a year, but diminishes rapidly as the country is ascended, except that in the Shan States and at Bhamo it is excessive (from 80 to 100 inches). At Prome it is 42 inches. The rainy season lasts from five to seven months. The temperature is tropical, but the nights are cool and there are no siroccos. Going to the interior the temperature moderates with the ascent, but at Mandalay the dust and glare in the spring are oppressive. In the ruby district, 5,600 feet above sea-level, the summer heat is moderate (86 max.), and a sanitarium is here established for European troops.

Flora and Fauna.—The alluvial districts produce rice in many varieties (the staple of the country), maize, millet, wheat, tobacco, and sugar (mostly produced from a variety of the palm), cocoa, and in the hill country varieties of the tea plant. Cotton is widely cultivated, but chiefly on uplands. Indigo is indigenous, but is crudely made, and aniline dyes have destroyed its importance. The mango, orange, citron, yam, custard-apple, papaya, capsicum, and plantain are common. The forests are magnificent, and comprise all Indian varieties of trees. Teak abounds especially in Pegu, and stick-lac, with other lacquer gums, is sent down from the Shan and upper districts.

The forests are coverts for many animals. The elephant, and single and double horned rhinoceros haunt the jungles; the tiger, wild hog, and several species of deer are hunted; fish are abundant, and furnish a welcome dietary to the people; the abundant jungle fowl is domesticated; plumage birds enliven the forests; aquatic birds, as geese, ducks, adjutants, cormorants, waders, and sand-birds, are numerous. Domesticated animals are the ox, buffalo, horse, and a few elephants.

Minerals.—Burma is rich in mineral products, but the natural deposits are almost an unworked field. A binoxide of tin is common in the lower Tenasserim region, but the rich ore is crudely reduced. In the same region are coal and lead, antimony, and manganese. In Upper Burma placer gold is found; also silver, copper, tin, antimony, amber, bismuth, petroleum products, fine building-stones, and gems. Iron abounds to the N. of Pagan, the old capital; petroleum is an article of export; amber comes from the upper valley of the Kyen-duen. The gems of Burma are chiefly sapphire and ruby. The richest mineral districts are in Upper Burma toward the Chinese frontier, across which trade has passed for centuries. Jade comes from this

border, and its production is farmed out. The sapphire district, some 70 miles N. E. from Mandalay, extends over an area of 100 sq. miles, and is worked from pits. The gems were a crown product, and, according to color, are sold as ruby, amethyst, topaz, and chrysoleryl.

People.—The inhabitants are chiefly Mongoloid. From their own name, Ba-ma as understood by Europeans, comes the name of the country. Generally they are well-formed, dark, active, with lank black hair and slight beards, like the Siamese. There are other tribes, as the Karens in the E., the Palonggs, the Kakhyens or Singphos, a predatory people on the N., and the Shans on the E., who change allegiance as suits their convenience. All are fond of attack. Religiously the people in Lower Burma are divided in order of importance as Buddhists (the dominant faith), Mohammedans, Hindus, Christians, and about 4 per cent. diversified faiths. Their government was purely despotic, tinged with a religious reverence for officials. The king's subordinates were provincial governors, equipped with arbitrary powers. They had no salaries, but lived by farming the revenues and by fees. Justice was lucrative to its dispensers. The administration was little better than Oriental extortion. Heredity counted for nothing. A kind of Chinese officialism fixed a man's precedence and authority with badges, costumes, buttons, and girdles, and this was carried to a great detail of color, form, and habit. The priests were mendicants, wore yellow garments; nuns were not bound by irrevocable vows. Theoretically all the people were slaves, and could not migrate without permission. Outcasts, lepers, executioners, pagoda slaves, and undertakers were treated with contempt and cruelty. Women were not secluded; their embraces might be sold for a time without dishonor, but prostitutes were infamous.

The people have a monosyllabic, flexible speech, used for secular purposes, written with circular letters of Indian and Buddhist origin, but Pali is the sacred language. The literary form is almost wholly dramatic, and the plays are consonant with Occidental morals. Incident and scenic effects are merely suggested, but the production of a play spins out beyond any Greek trilogy. Monastic libraries are common; paper is of bamboo or palm-leaf production. Chronicles are of ancient composition, but unauthentic. *Judson's Dictionary* (1852) and Bastian's *Sprachvergleichende Studien* (1870) are the keys to the language. See also Col. Yule's *Narrative of a Mission to the Court of Ava* (1858).

Industrial Aspects.—Native taxes formerly repressed all industries, the rich paying an annual quit-rent and the poor suffering extortion. The houses are built upon piles in the inundated and most populous districts, and are of wood; brick is common in temples, and arches, pointed, flat, and circular, with domes, abound in public buildings, while carving, gilding, and fantastic ornamentation give them an appearance of barbaric gorgeousness. The loom lingers in families all over the country, and its products are silk fabrics and cotton goods. Porcelain, pottery, bells, lacquered ware, cutlery, personal weapons of steel, rice, and preserved fish are common products. The country exports much to China of the native products named, and receives artistic manufactures in return. In Lower Burma the principal products are rice, lumber, pottery, textile fabrics, salt, cotton, lacquered and gilt work, dyes, cutch, and gold and silver bowls. The British exports from Burma in 1890 were \$17,701,325. There were then 1,092 miles of railway completed, Mandalay being connected with the coast thereby.

Weights and Measures.—Lead is used for small coins; money transactions are by weight; the coinage is in confusion. The ball and the dain are the purest silver coins.

(1) Weight: The seeds of a little black pea (*Abrus precatorius*) supply the unit, and weigh from 1 to 2 grains; 8 make a pae, 16 a mat, 64 a kyap, 100 kyaps a piessa or viss. The viss of Rangoon = 3333 $\frac{1}{2}$ lb. av. = 1511966 kilgm. Multiple, 150 viss = 1 candy = 500 lb. av. = 226-7959 kilgm. Sub-multiples, $\frac{1}{10}$ viss = 1 tical; $\frac{1}{100}$ tical = 1 moos.

(2) Length: The tain or cubit of Rangoon = 18 inches = 1572 mm. Sub-multiple, $\frac{1}{2}$ tain = 1 paulgat = 1 English inch. Also, 22 paulgats = 1 saundaung, or royal cubit. For road-measure, 7 saundaungs = 1 dha or bamboo; 1,000 bamboos = 1 dain or taing = 24306 miles = 39115 km.

(3) Volume: Commodities of all kinds, liquid or dry, are sold by weight.

Government.—A chief commissioner, under the Viceroy of India, rules the province. Under him are eight deputies for as many districts, who are invested with police, judicial, and revenue powers. Beneath them are township officers, of like but

subordinate functions. The country is controlled by 20,000 troops, and a police officered by Indian and Burman leaders. Revenue is derived from the teak forests, a capitation tax, a land tax ranging from half a rupee (17 cents) an acre to 2½ rupees on rice lands, the industry that immensely surpasses all others. Revenue in 1890 nearly \$16,000,000, and expenditures a little over \$13,000,000.

History.—The early chronicles are not trustworthy. The dominant race probably came 2,000 years ago from Central Asia down the Irawadi valley. In the eleventh century the Buddhists are known to have been established at Prome, a civilization was developed, and the cities of Pagan, Pegu, Sagain, Prome, and Ava were in an advanced architectural stage. The Shans and Talains invaded the country, but did not destroy its monuments. European settlements began in the seventeenth century with French and English factories. In the middle of that century a native dynasty of peasant origin brought all Burma under one rule. When the British subdued Assam, friction arose on the Burman borders, and in 1824 Ava, with Arakan and Tenasserim, was ceded to Great Britain. In 1830, on pretext of harassed trade, Great Britain annexed Pegu. The final conquest came in 1885 in retaliation for King Thebaw's proposed alliances with China and his nulets on a British trading company operating in Upper Burma. On Nov. 28 the Burmese laid down their arms at Ava; Mandalay capitulated, and Thebaw was carried captive to India. The next year all his dominions were annexed to the Queen's empire. See Forbes, *British Burma* (1876); Sir Arthur Phayre, *History of Burma* (1883); Wayland, *Life of Judson* (1853); Anderson, *Expedition to East Yunnan via Bhamo* (1871); Scott ("Slway Yoe"), *The Burman, His Life and Notions* (1882), and *Burma as it was, is, and will be* (1886). W. W. H.

Burmann, PETER: philologist; b. in Utrecht, July 6, 1668; became Professor of History, Eloquence, and the Greek Language at Leyden in 1715; edited Horace, Ovid, Vergil, Quintilian, Lucan, and other classics, and wrote several works, among which is a treatise *On the Revenues of Rome* (De Vectigalibus Populi Romani, 1694). His writings were esteemed for their accurate erudition. D. in Leyden, Mar. 31, 1741.

Burmeister, KARL HERMANN KONRAD: a German naturalist; b. in Stralsund, Jan. 15, 1807; d. in Buenos Ayres, May 1, 1891. Educated at Greifswald and Halle; for a time Professor of Zoölogy at the University of Halle. In 1850 he resigned, and made a journey to Brazil; returned to Europe; in 1856 again visited South America, and passed four years in the Argentine Republic. In 1861 he was made director of the National Museum in Buenos Ayres, a position which he held until a severe accident compelled him to relinquish it, when he was pensioned by the Government. Besides a large number of papers on entomological and kindred subjects, he published *Systematische Uebersichte der Thiere Brasiliens* (Halle, 1856); *Description physique de la République Argentine* (Paris, 1876); and *Annates del Museo Público de Buenos Aires* (1864-74). D. at Buenos Ayres, May 2, 1892. F. A. LUCAS.

Bur'naby, FREDERICK GUSTAVUS: soldier and traveler; b. in Bedford, England, Mar. 3, 1842; author of *A Ride to Khiva* (3d ed. 1876); *On Horseback through Asia Minor* (7th ed. 1877); *A Ride Across the Channel* (1882), an account of a balloon trip. Fell in the battle of Abu Klea, in Nubia, Jan. 17, 1885.

Bur'naud, FRANCIS COWLEY: English humorist and journalist; b. Nov. 29, 1836; educated at Eton and at Trinity College, Cambridge, 1858; studied for the Church; became a Roman Catholic, and was called to the bar; since 1880 editor of *Punch*; author of numerous parodies, theatrical burlesques, and other facetiæ, the best known of which are his comedy *The Colonel*, a satire on the aesthetes; his travesty of Douglas Jerrold's *Black-eyed Susan*; *Happy Thoughts* (1868); *More Happy Thoughts* (1871). HENRY A. BEERS.

Burne-Jones, EDWARD: painter of figure subjects and designer of decorative work; b. in Birmingham, England, Aug. 28, 1833; pupil of Dante Gabriel Rossetti; belongs to the romantic school of English artists, and is notable more for his conceptions of his subjects and for his peculiar compositions in the treatment of them than for the possession of technical merits. He was elected an associate of the Royal Academy in 1885. At the Paris Exposition in 1878 his pictures, including the *Beguiling of Merlin* (1877), attracted much notice from continental critics, and at the exposition of 1889 he was awarded a first-class medal for the

only picture he exhibited, *King Cophetua and the Beggar Maid* (1884). Studio in London. WILLIAM A. COFFIN.

Burnes, Sir ALEXANDER: traveler and Orientalist; b. at Montrose, Scotland, May 16, 1805. He entered the army of India in his youth, and by his knowledge of Oriental languages gained a rapid promotion. In 1832 he started from Lahore on an exploring expedition in Central Asia, and visited Balkh, Bokhara, Astrabad, Teheran, etc. Having returned to England in 1833, he published *Travels into Bokhara*. In 1838 he was sent on a mission to Cabul, where he passed some years as political resident. He was murdered there Nov. 2, 1842, by the Afghan insurgents.

Bur'net: the popular name of plants of the genus *Poterium*, belonging to the family *Rosaceæ*. The great burnet (*Poterium officinale*) is cultivated in Germany as a forage-plant, and yields a good crop on poor soils. A similar species grows wild in North America. The common burnet (*Poterium sanguisorba*) furnishes valuable pasturage for sheep on the English downs. It is sometimes seen in American gardens, and is used in salads.

Burnet: town; capital of Burnet co., Tex. (for location of county, see map of Texas, ref. 4-II); on Aust. and N. West. R. R.; 45 miles N. W. of Austin, and 10 miles E. of the Colorado river; has 6 churches, a high school, 2 gins, and a roller flouring-mill. Its interests are chiefly agricultural. Burnet was founded, about 1840, as Fort Croghan, but has been known as Burnet since 1852. Pop. (1880) 490; (1890) 1,454. EDITOR OF "BULLETIN."

Burnet, GILBERT, F. R. S.: historian and prelate; b. in Edinburgh, Scotland, Sept. 18, 1643. He became Professor of Divinity in the University of Glasgow in 1669, resigned that chair in 1674, and removed to London. In 1679 he published the first volume of his *History of the Reformation in England* (3 vols., 1679-1714). He refused a bishopric which was offered to him by Charles II. He was a courageous and able assenter of civil liberty in the important crisis which preceded the revolution of 1688, and gained the favor of William III., who appointed him in 1689 Bishop of Salisbury. He made a model bishop. Among his works are a *Life of Sir Matthew Hale* (1682), and a *History of his Own Times* (2 vols., 1723-34), his most important work. See the biography by his son in the last-named work. D. in London, Mar. 7, 1715.

Burnett', FRANCES ELIZA (Hodgson): novelist; b. in Manchester, England, Nov. 24, 1849; came to the U. S. at the close of the civil war, and lived in Knoxville, Tenn., until her marriage, in 1873, to Dr. S. M. Burnett; since has resided mainly at Washington. Among her novels of English life are *That Lass o' Lowrie's* (1877); *Haworth's* (1879); of American life, *Louisiana* (1880); *Through One Administration* (1883). A number of her stories have been successfully dramatized, *Little Lord Fauntleroy* (1886), in particular, being one of the greatest hits of the day.

HENRY A. BEERS.

Burnett, JAMES: See MONBODDO.

Burnett Prizes: founded by James Burnett, a philanthropist, born in Aberdeen, 1729; died there Nov. 9, 1784. He made a competence in stocking-weaving and salmon-fishing. By his will part of his estate was used for the benefit of the poor of Aberdeen and neighborhood; part was a fund to defray the expense of inoculation (later used for vaccination), and the remaining interest was to be allowed to accumulate for forty years or until £1,600 had accrued, and then to be paid in prizes of £1,200 and £400 respectively to the best and next best "treatises on the evidence that there is a Being all-powerful, wise, and good, by whom everything exists; and particularly to obviate difficulties regarding the wisdom and goodness of the Deity, and this independent of written revelation and of the revelation of the Lord Jesus; and from the whole to point out the inference most necessary and most useful to mankind." The first award was made in 1815, when William Laurence Brown received the highest prize for his *Essay on the Existence of a Supreme Creator, possessed of Infinite Power, Wisdom, and Goodness* (2 vols., Aberdeen, 1816); and John Bird Sumner the second for *A Treatise on the Records of the Creation, and on the Moral Attributes of the Creator; with Particular Reference to the Jewish History, and to the Consistency of the Principle of Population with the Wisdom and Goodness of the Deity* (2 vols., London, 1816; 2d ed. 1818). The second and final award was in 1855, when Robert Anchor Thompson (*Christian Theism*, 2 vols., London, 1855; n. e. 1863) and John

Tulloch (*Theism*, Edinburgh, 1855) were the prizemen respectively. Since 1883 the fund has been used to support a lectureship on natural theology in the University of Aberdeen, and no further prizes will be given.

Burnett's Disinfecting Fluid: a solution of considerable strength, containing, as its chief constituent, chloride of zinc and a comparatively small amount of iron, which is always diluted to the extent of about 1 to 5 gal. when used for disinfecting purposes. As a matter of fact it is not a true disinfectant, but only a deodorant and antiseptic, inhibiting the growth of disease germs, but not destroying them. For this reason it has been largely supplanted by chlorinated lime or corrosive sublimate for disinfecting purposes. It is sometimes used for the purpose of preserving timber, and this process is called burnettizing. Another name for Burnett's fluid is Crewe's disinfecting liquid.

Burney, CHARLES, F. R. S., Mus. D.: composer; b. at Shrewsbury, England, Apr. 17, 1726; was a friend of Dr. Johnson and Edmund Burke; wrote, besides other works, a *General History of Music from the Earliest Ages* (4 vols., 1776-89), which is highly esteemed; a *Life of Handel*; one of *Metastasio*; composed *Alfred*, *Robin Hood*, and *Queen Mab* for Drury Lane theater. He was the father of Madame d'Arblay. D. in Chelsea Hospital, where he was organist, Apr. 12, 1814. His library was bought for \$67,500 by the British Museum. See his *Life* by his daughter.

Burney, FRANCES: See D'ARBLAY, MADAME.

Burney, STANFORD GUTHRIE, D. D., LL. D.: minister in the Cumberland Presbyterian Church; b. in Robertson co., Tenn., Apr. 16, 1814; educated at Cumberland College, Princeton, Ky.; began preaching at the age of twenty. He was president of Union Female College, Oxford, Miss. (1852-62); Professor of English Literature and of Metaphysics in the University of Mississippi (1865-73); of Biblical Literature in Cumberland University (1877-80); since Professor of Systematic Theology there. He published *Treatise on Election* (Nashville, 1879); *Baptismal Regeneration* (1881); *Atonement and Law Reviewed* (1887); *Soteriology* (1888); *Chart of Duty*; *Studies in Moral Science* (1890); *Studies in Psychology* (1890); *Studies in Theology*, ready for the press, 1892. He has been active in all movements of the Cumberland Church for closer union with other Presbyterian churches. W. J. BEECHER.

Burnham Industrial Farm: near Canaan Four Corners, Columbia co., N. Y.; on the borders of Lake Queecy; incorporated in 1887. The farm was a Shaker settlement which was purchased by Frederic G. Burnham, who gave it to be used as an institution for saving unruly boys. It is 580 acres in extent. Up to 1889 it was run on ordinary institutional lines. Not having been entirely successful it was then put in charge of Mr. W. M. F. Round, who had always been one of its trustees. Mr. Round conceived the idea of uniting the system of the Raube Haus in Germany and of that at Mettray, France. To accomplish this he organized the order of St. Christopher. This order is made up of consecrated young men of various religious denominations, who are in training for lives of institutional usefulness. At present (1892) eight brothers are engaged in carrying on the work of the Burnham Industrial Farm, but after a period of three and a half years' training they may be sent by the director to take care of other institutions. Boys may be sent from all parts of the country to the farm in three ways—first, by renunciation of the boys by their parents; second, when committed by magistrate; third, by transfer from other institutions. They may be kept during their minority, but are ordinarily retained not more than two and a half years. They are taught simple trades, gardening, and farming. The farm has no endowment, but is entirely supported by voluntary subscriptions. In 1892 it had 70 boys, but the plan provides for 1,200.

Burning-bush: See SPINDLE-TREE FAMILY.

Burning-glasses and Burning-mirrors: glasses or mirrors so formed as to collect the sun's rays which fall on them into a point or focus, and thereby produce intense heat. The rays of light or heat may be concentrated either by refraction or reflection; in the former case they must pass through a transparent refracting substance, as glass formed into a proper shape; in the latter they fall on a concave polished surface of silvered glass or bright metal.

The method of exciting heat or producing fire by the concentration of the sun's rays was known from remote an-

tiquity, as is proved by the very ancient although doubtful story that Archimedes burned by means of mirrors the Roman fleet in the harbor of Syracuse. The celebrated Buffon, with 168 mirrors, each about 6 inches square, set fire to planks of beech 150 feet distant, and this with the faint rays of the sun at Paris in the month of March.

In preparing a burning-glass the first thing to be considered is the figure necessary to collect all the rays into the smallest possible space. Descartes, in his *Optics*, showed that a disk of glass, convex on the one side and concave on the other, the convex side being a portion of an elliptic surface and the concave a portion of a sphere, would cause parallel rays falling on its convex side to converge in a single point. But as the practical difficulties of forming a glass accurately into this shape are insuperable, both sides are ground into portions of a sphere. In a lens the focal length depends on the curvature, or the radius of the sphere, and on the refractive power of the substance of which the lens is formed.

The proper form for a burning-mirror is the parabola, but as a parabolic curve is exceedingly difficult to obtain either upon metal or glass, opticians frequently rest content with a spherical curvature of long focus. Recently burning-mirrors have been constructed of glass upon the curved surface of which pure silver is precipitated by chemical means. By this plan the curved surface is produced upon glass, and thus becomes permanent, while the reflection is effected by the polished surface of the silver, which can be easily renewed from time to time. The focus of a burning-mirror is one-half of the radius of curvature.

Among those who have experimented in modern times upon the effects of burning glasses or mirrors are Baron Napier, the illustrious inventor of logarithms, Kircher, Dr. James Gregory, Sir Isaac Newton, and many others. The most powerful solid lens ever constructed was the work of Mr. Parker, an ingenious London artist. It was made of flint glass, was 3 feet in diameter, $\frac{3}{4}$ inches thick at the center, its focal distance 6 ft. 8 in., the diameter of the burning focus 1 inch, and its weight 212 lb. The rays refracted by this lens were received on a second, the diameter of which in the frame was 13 inches, and its focal length 29 inches. The diameter of the focus of the combined lenses was half an inch; consequently, by the addition of the second lens, the burning power was increased 4 times. With this lens some of the most refractory substances were fused in a very short space of time; for example, 10 grains of common slate in 2 seconds; 10 grains of cast iron in 3 seconds; 10 grains of lava in 7 seconds; 10 grains of jasper in 25 seconds, etc. One account says "the most infusible metals were instantly melted and dissipated in vapor." This glass was afterward carried to China by one of the officers who accompanied Lord Macartney, and left at Peking. A remarkable lens, formed by bending or molding two plates of glass over a parabolic mold, and filling the cavity between with 90 qts. of spirits, was constructed by Rossini, of Gratz, in Styria. The diameter of the plates was 3 ft. 3 in., and they were united by a strong ring of metal. The whole was mounted on a heliostat. In its focus a diamond was instantly kindled and dissipated, and a piece of platinum 29 grains in weight was melted and thrown into violent ebullition. This lens now belongs to the French Government. In France, particularly, the practical application of burning-mirrors to the utilization of the sun's rays in driving heat-engines and in cookery has been extensively studied, with a view to the use of such devices in Northern Africa and other tropical regions. Revised by E. L. NICOLS.

Burn'ley: a market-town of Lancashire, England; on the Brun; near its entrance into the North Calder; 20 miles N. of Manchester (see map of England, ref. 6-4). It is connected by railway with Blackburn, Liverpool, and other cities. It has manufactures of cotton and woolen fabrics, calico-printing works, brass and iron foundries, machine-shops, tanneries, and rope-walks. Its prosperity is partly derived from the collieries in the vicinity. Pop. (1891) 87,058.

Burnouf, bü rnoof, EUGÈNE: Indologist; b. at Paris, Apr. 8, 1801; one of the founders of the Société Asiatique; became its secretary in 1830; member of the Academy of Inscriptions in 1832; soon after Professor of Sanskrit at the Collège de France. His Sanskrit studies furnished him the key not only to the sacred language of Boddhism, the Pali (*Essay on the Pali*, 1826), and to that of the Avesta (*Vedidud Sade*, 1829-43; *Commentary on the Yagna*, 1833, etc.), but

led him also to the decipherment of the cuneiform inscriptions. His *Introduction to the History of Buddhism in India* (1844) put the study of this great religion on a scientific basis. D. in Paris, May 28, 1852, his works, like his life, unfinished; but his masterful control of facts, coupled with the brilliancy of his imagination—in a word, his genius for discovery—and, above all, his self-forgetting love of truth, make him one of the heroes of "the heroic age of Oriental studies." See J. Mohl, *Vingt-sept ans d'histoire des études orientales*, i. 458-469. C. R. LANMAN.

Burns, ANTONY: a fugitive slave; b. in Virginia about 1830; d. in St. Catharines, Canada, July 27, 1862. Escaping from slavery, he was arrested under the fugitive slave law in Boston, May 25, 1854, an event which created an intense excitement, in which Theodore Parker, Phillips, Higginson, and other eminent citizens participated. A meeting was held in Faneuil Hall to protest against his rendition; the court-house was assaulted by a mob to rescue him; he was sent back South on a revenue cutter; afterward gained his liberty; studied at Oberlin; became a Baptist minister to a colored congregation in St. Catharines. The interest in the case grew out of the exhibition of the determination in the North to uphold the common law and State statutory safeguards of personal liberty against the fugitive slave law compromise, which transferred the trial of a Negro's freedom to the courts of the State where the claimant resided, and in slave States no such safeguards existed for a person of African descent.

Burns, FRANCIS, D. D.: colored bishop of the Methodist Episcopal Church; b. in Albany, N. Y., Dec. 5, 1809; sent as missionary to Liberia, Africa, in 1834; taught in a school at Cape Palmas; joined the Liberia Conference in 1838; founded the Monrovia Academy in 1851; ordained bishop of his denomination in Liberia in 1858; and, after nearly five years of service, d. in Baltimore, Md., Apr. 18, 1863.

Burns, Sir GEORGE: baronet; one of the founders of the Cunard line of steamers; b. Dec. 10, 1795; entered into partnership with his brother James in Glasgow about 1818; co-operated with Samuel Cunard and others in founding the Cunard line of steamers in 1838, as the result of a general invitation from the British Government for tenders for the conveyance of American mails by steam-vessels; created a baronet in May, 1889. D. June 2, 1890, and was succeeded in the title and estate by his eldest son, Sir John Burns, of Castle Wemyss, Renfrewshire.

Burns, JOHN: English labor organizer and leader; b. in Vauxhall, London, 1858, in very humble circumstances; attended school until he was ten, when he entered a candle-factory. He afterward apprenticed himself to an engineer at Millbank, and worked as foreman engineer for twelve months on the Niger in West Africa. On his return he made a six-months tour through Europe. During his youth he was an omnivorous reader, and is said to have imbibed his socialistic theories from a Frenchman who was employed in the same shop with him. He addressed audiences of workmen for years, and was probably the most prominent labor agitator in Great Britain. In 1885 he was the socialist candidate for Parliament for the western division of Nottingham, but was defeated. He was prominent in the agitation of the unemployed in 1886. In 1887 he contested the right of public meeting in Trafalgar Square, and suffered six weeks' imprisonment for resisting the police. During the great dock strikes in London (Aug. 15, 1889-Sept. 14, 1889) he was one of the most influential leaders of the strikers, and was a member of the Mansion House committee of conciliation which brought about the settlement of the difficulties and the end of the strike. He was also prominent in the Scotch railway strike in 1891. Mr. Burns is a member of the London County Council, and was elected (July 6, 1892) a member of Parliament for Battersea. His sincerity and ability are unquestioned. C. H. THURBER.

Burns, ROBERT: the national poet of Scotland; b. near the town of Ayr, Jan. 25, 1759. His father was a yeoman farmer. Although his life seems to have been one long struggle with misfortune, Burns's father was at great pains to give his children a good education. When he was able he sent them to school; and not unfrequently when the day's work was ended he taught his children himself. Burns was early familiarized with those trials and hardships to which the poor are so often exposed, and to which he sometimes alludes with such power and pathos in his poetry. The poet had a robust frame and active body, as well as a strong

intellect and acute sensibilities. He is said to have done at the age of fifteen the work of a man.

In the case of Burns, as in that of Sappho, it was love that taught him song. A little before he reached his sixteenth year he "first committed the sin of rhyme." A "bonnie, sweet sonesie lass" had been associated with him in the labors of the harvest-field. Her singing "made his heart-strings thrill like an Æolian harp," and first inspired him with the idea of writing songs. An irresistible attraction toward what he calls the "adorable half of the human species" was perhaps his most remarkable characteristic; and hence it was as an amatory poet that he was especially distinguished, though patriotism, friendship, conviviality, and the rural life of the Scotch peasantry are constant motives in his poetry. Unlappily, this remarkable susceptibility to the tender passion degenerated, under the influence of evil company, from its first purity, and led him into illicit amours, which were the cause of his principal misfortunes. In proportion as he cast off the restraints of morality, he seems to have lost his reverence for religion. With his other faults and vices, intemperance went hand in hand. But he had too much sense of right and too much feeling to be able to drown altogether the reproving voice of conscience.

He had formed in 1785 a *liaison* (which was, according to the usage of Scotland, virtually a marriage) with Jean Armour, a person somewhat above his own position in life. She bore him twins, and although he had previously given her a written acknowledgment of marriage her father was greatly incensed against the poet, so that he determined to leave Scotland and seek his fortune in the New World. But before quitting his native country forever, he resolved (1786) to publish his poems. The success of the experiment induced him to change his plans. He was encouraged to visit Edinburgh, where he made the acquaintance of many men at that time distinguished in literature, including Dugald Stewart and Dr. Blair, besides many others. It was during Burns's visit to the capital that Scott, then a very young man, had an opportunity of beholding and listening to the gifted stranger. He has left a very interesting account of Burns's appearance.

Among men of rank who interested themselves in the poet, Lord Glencairn was especially prominent. Burns always remembered his kindness with the most heartfelt gratitude, and afterward dedicated to his memory the beautiful and touching lines entitled the *Lament for James, Earl of Glencairn*. Soon after his visit to Edinburgh he published (1787) a new edition of his poems. In 1788 he openly declared his marriage with Jean Armour, and about this time was appointed an officer of the excise, with a salary of £50 a year; it was subsequently increased to £75. His intemperate habits, which had been aggravated by the excitement and irregularities of his recent life in Edinburgh, and his subsequent pecuniary distresses gradually gained a great ascendancy over him, but rarely if ever to the extent of rendering him incapable of performing the duties of his office. He removed in 1791 to Dumfries, where he passed the remainder of his life. D. July 21, 1796. Nearly twenty years after his death a splendid mausoleum was erected to his memory in the churchyard at Dumfries, whither his remains were removed on June 5, 1815. See Lockhart's *Life of Burns* (1828); Currie's *Life of Burns*, prefixed to the *Correspondence of the poet*; A. Cunningham, *Life and Land of Robert Burns* (1840); Carlyle, *Miscellanies*; a *Life*, by Principal J. C. Shairp, in the English Men of Letters Series; and the complete collection of his works (1877-82, 7 vols.) by Douglas and Nichol.

Burns, ROBERT FERRIER, D. D.: Canadian clergyman; b. in Paisley, Scotland, Dec. 23, 1826; educated at Glasgow University and at New College, Edinburgh; removed to Canada in 1845, completing his course at Knox College, Toronto. Previous to his appointment as pastor of the Fort Massey Presbyterian church, Halifax, in 1875, he held pastorates in Kingston, St. Catharines, Chicago, and Montreal, in the order named. He was a delegate to the Pan-Presbyterian Council held at Philadelphia in 1880, and to that held at Belfast in 1884. Among his published works are *Maple Leaves for Grave of Lincoln* (St. Catharines, 1865); *Maine Law* (Halifax, 1875); *Modern Babylon* (1876); and *Confession and Absolution* (1883). His father, Robert Burns, D. D., was Professor of Church History and Apologetics in Knox College, and was the most distinguished minister of his time in Canada. NEIL MACDONALD.

Burns, WILLIAM WALLACE: general: b. in Co-shocton, O., Sept. 3, 1825; graduated at West Point in 1847; became a brigadier-general of volunteers in 1861; major-general volunteers in 1862; and brevet brigadier-general U. S. army in 1865. He served in the Army of the Potomac until 1863. Reverting to his position as an officer in the subsistence department he served until Sept. 19, 1889, when he retired for age with the rank of colonel. D. suddenly at Beaufort, S. C., Apr. 19, 1892.

Burns and Scalds: in *medicine*, injuries caused by dry heat (burns), or by moist heat, such as that of hot water or steam (scalds). In both cases the results are quite similar. Various degrees of burns are described according to the depth to which the injury penetrates. Thus in cases of the first degree there may be merely redness and slight inflammation of the skin. In those of the second, third, or higher degrees the skin is destroyed, and the underlying tissue and muscles are implicated. Where large parts of the body exceeding half of the whole surface are involved death is almost inevitable. The immediate effect of the burn is great shock, followed by complete collapse if relief is not afforded. Occasionally disturbances of internal structures results from extensive burns, as, for instance, ulceration in the duodenum or Bright's disease.

The treatment consists in the application of soothing lotions or ointments, the use of anodynes for the pain, and stimulants in case of threatened collapse. A mixture of lime-water and sweet oil, which is generally known by the name of Carron-oil, is very useful. In slight burns the pain may be relieved by dusting baking-soda upon the surface.

W. P.

Burnside, AMBROSE EVERETT: military officer and Governor; b. in Liberty, Ind., May 23, 1824; graduated at West Point 1847; as lieutenant of artillery served in war with Mexico 1847-48; on frontier duty in New Mexico 1849-50, engaged with Jacarillo Apaches (wounded); with Mexican boundary commission 1851-52; resigned Oct. 2, 1853; manufacturer at Bristol, R. I., 1853-58, of breech-loading rifles, which he had invented; cashier of land department Illinois Central R. R. Company 1858-59; treasurer Illinois Central R. R. Company 1860-61. In the civil war, as colonel of Rhode Island three-months volunteers, he served in Maj.-Gen. Patterson's operations about Cumberland, Md., and in the Manassas campaign, 1861, was engaged at Bull Run. Appointed brigadier-general U. S. volunteers, Aug. 6, 1861, and promoted to major-general May 18, 1862; he served in organizing the coast division and in command of department of North Carolina 1862; engaged at Roanoke Island, Newbern, Camden, and Fort Macon; in command of Ninth Army-corps at Newport News and Fredericksburg 1862; in Maryland campaign engaged at South Mountain and Antietam, in command of left wing; in general charge of Harper's Ferry 1862; in command of Army of Potomac Nov. 7, 1862, to Jan. 28, 1863; defeated at Fredericksburg; in command of department of Ohio 1863; engaged against Morgan's raiders; captured Cumberland Gap; occupied East Tennessee after several actions and sustained a siege at Knoxville; in command of Ninth Corps in Richmond campaign 1864; engaged at Wilderness, Spottsylvania, North Anna, Totopotomy, Bethesda Church, and Petersburg, including mine assault; resigned Apr. 15, 1865, from volunteer service. Civil engineer 1865-66; president of Cincinnati and Martinsville R. R. Company in 1865; of Rhode Island Locomotive Works in 1866, and of Indianapolis and Vincennes R. R. Company in 1867; Governor of the State of Rhode Island 1866-69. He was elected U. S. Senator from Rhode Island in 1875, and re-elected in 1880. D. in Bristol, R. I., Sept. 13, 1881.

Burnt Offerings: See SACRIFICE.

Burnt Sienna: a pigment made by heating raw sienna to a high temperature. Raw sienna occurs in nature, and owes its color to the presence of compounds of iron. Both pigments are used in oil, water, and fresco.

Burnt Umber: a pigment made by heating raw umber to a high temperature. Umber was formerly obtained from Umbra, in the Papal States, whence its name. It is a compound of silica, iron, and manganese. Burnt umber is used in oil and water colors, and is highly valued.

Bur Oak, or Burr Oak (*Quercus macrocarpa*): a species of oak of medium size found in the U. S., principally E. of the Rocky Mountains. It is also called over-cup oak and mossy-cup oak. Its timber is valuable.

Burr, AARON: scholar; father of the Vice-President; b. in Fairfield, Conn., Jan. 4, 1716; graduated at Yale in 1735; licensed to preach in 1736; settled over the Presbyterian church in Newark, N. J., in 1738; chosen president of the College of New Jersey, Princeton, N. J., in 1748; d. there Sept. 24, 1757. In 1752 he married Esther, daughter of the elder President Edwards. She died Apr. 7, 1758, in the twenty-seventh year of her age. They left two children—a daughter, who married Hon. Tapping Reeve, chief justice of the Supreme Court of Connecticut, and a son, Aaron, noticed below. Dr. Burr was a scholarly and eloquent man. He published a Latin grammar (1752) known as *The Newark Grammar*; a pamphlet on *The Supreme Divinity of our Lord Jesus Christ*, reprinted in 1791, and several discourses.

Burr, AARON: politician and Vice-President of the U. S.; b. in Newark, N. J., Feb. 6, 1756; son of the preceding; graduated at Princeton in 1772; joined the provincial army at Cambridge, Mass., in 1775; served as a private soldier, and afterward as aid to Montgomery on the Quebec expedition; served on the staffs of Arnold, Washington (whom he disliked), and Putnam, becoming a lieutenant-colonel, and commanding a brigade at Monmouth. He resigned from the army by reason of ill-health in 1779; practiced law at Albany in 1782, and in New York city in 1783; became Attorney-General of New York in 1789; was a Republican U. S. Senator 1791-97. In 1800 he and Jefferson each had seventy-three electoral votes for the office of President of the U. S. The choice was thus left to Congress, which, on the thirty-sixth ballot, chose Jefferson for President and Burr for Vice-President. In 1804 he mortally wounded in a duel his rival Alexander Hamilton, and in consequence lost greatly in political and social influence, and soon after embarked in a wild attempt upon Mexico and, as was asserted, upon the southwestern territories of the U. S., thereby involving in ruin his friend Blennerhasset. He was in 1807 tried at Richmond, Va., on a charge of treason, but was acquitted. To escape his creditors he retired to Europe for a time, but returned to New York in 1812, and again practiced law. D. on Staten Island, Sept. 14, 1836. Burr was a man of much ability and very brilliant and popular talents, but his influence was destroyed by his unscrupulous political acts and his grossly immoral conduct in private life. See his *Life*, by M. L. Davis (1836-37); by James Parton (1857).

Burr, Enoch FITCH: mathematical and religious author; b. at Green's Farms, Fairfield, Conn., Oct. 21, 1818; graduated at Yale in 1839; spent several years in New Haven in scientific and other studies; was settled over the Congregational church in Lyme, Conn., in 1850. Since 1868 he has been a lecturer on the Evidences of Religion at Amherst College. He has published, among other works, *A Treatise on the Application of the Calculus to the Theory of Neptune* (New Haven, 1848); *Ecce Colum* (1867); *Pater Mundi* (1870); *Doctrine of Evolution* (1873); *A Song of the Sea* (an illustrated poem, 1873); *The Voyage* (1874); *Diotheo Athenian* (1881); *Celestial Empires* (1885); *Universal Beliefs* (1887); *Long Ago* (1888); *Practical Relations* (1889); *Alph, the Chaldean* (1891).

Burr, GEORGE LINCOLN, A. B.: professor of history; b. at Oranget, N. Y., Jan. 30, 1857; educated at Cortland Academy, Cornell University, universities of Leipzig and Zurich, and the Sorbonne and the École des Chartes, Paris; instructor in history, Cornell University, 1881-84; engaged in historical study and research, mainly abroad, 1884-88; librarian of the President White Library, Cornell University, since 1878; Professor of Ancient and Mediaeval History, Cornell University, 1892; author of *The Literature of Witchcraft* (New York, 1890); *The Fate of Dietrich Flade* (New York, 1891); *Charlemagne* (Heroes of History Series); and various magazine articles and reviews.

Burr, JONATHAN KELSEY, D. D.: minister of the M. E. Church; b. at Middletown, Conn., Sept. 21, 1825; educated at Wesleyan University; filled some of the most important pulpits in the Newark and New Jersey conferences; author of *Commentary on the Book of Job*; and articles on *Incar-nation and Krishna* in *McClintock and Strong's Biblical Cyclopedia*; member of the American Committee of Revision of the New Testament. D. at Trenton, N. J., Apr. 24, 1882.

Burr, WILLIAM HUBERT: civil engineer; b. in Watertown, Conn., July 14, 1851; graduated in 1872 at Rensselaer Polytechnic Institute, Troy, N. Y.; was Professor of Ra-

tional and Technical Mechanics at Rensselaer Polytechnic Institute 1876-84; engineer of construction and general manager of the Phenix Bridge Company 1884-91; vice-president of Soovsmith & Co., contracting engineers, 1891-92. In Jan., 1893, he was appointed Professor of Civil Engineering in Columbia College, New York city. He is the author of *Stresses in Bridge and Roof Trusses, Arched Ribs and Suspension Bridges* (New York, 1879); *The Theory of the Masonry Arch* (1881); and *The Elasticity and Resistance of the Materials of Engineering* (1883).

Bur'rage, HENRY SWEETSER, D. D. (Brown Univ., 1883); Baptist minister and author; b. at Fitchburg, Mass., Jan. 7, 1837; graduated at Brown University 1861, at Newton Theological Institution 1867; studied at the University of Halle 1868-69; pastor of a church in Waterville, Me., 1870-73; editor of *Zion's Advocate*, Portland, Me., since 1873. Besides a large number of review articles and historical papers, Dr. Burrage published the following works: *The Act of Baptism in the History of the Christian Church* (Philadelphia, 1879); *History of the Anabaptists in Switzerland* (Philadelphia, 1883); *Baptist Hymn-writers and their Hymns* (Portland, 1888). In addition, Dr. Burrage has edited the following: *Brown University in the Civil War* (Providence, 1868); *Rosier's Relation of Waymouth's Voyage to the Coast of Maine, 1605, Gorges's Society* (Portland, 1887).

Burrampooteer: See BRAHMAPÛTRA.

Burrard Inlet: narrow inlet in the southwest corner of British Columbia; 9 miles long; forms one of the best harbors on the Pacific coast. On its north shore is Vancouver, the western terminus of the Canadian Pacific R. R.

Burriana, boor-ri-a-na-na: a town of Spain; province of Castellon de la Plana; on the Rio Seco; near the Mediterranean (see map of Spain, ref. 16-1). It exports wine, oil, and fruit. Pop. 10,000.

Bur'riell, THOMAS JONATHAN, Ph. D.: botanist; b. at Pittsfield, Mass., Apr. 25, 1839; Professor of Botany in University of Illinois; published many reports and papers, principally on fungi. The more important are: *The Bacteria* (1882); *Parasitic Fungi of Illinois* (1885-87).

CHARLES E. BESSEY.

Bur'ritt, ELIHU: reformer and linguist; called THE LEARNED BLACKSMITH; b. in New Britain, Conn., Dec. 8, 1811. He worked for many years at the trade of a blacksmith, and became a self-taught master of many ancient and modern languages. As a public lecturer he advocated temperance and peace in the U. S. and in England. Among his works are *Sparks from the Anvil* (London, 1848); *Thoughts on Things at Home and Abroad* (Boston, 1854); *Walk from John o'Groat's to Land's End* (London, 1864); *Walks in the Black Country* (1868); *Chips from Many Blocks* (1878). D. in New Britain, Conn., Mar. 7, 1879. See his *Life*, by Charles Northend (New York, 1879).

Burr Oak: See BUR OAK.

Bur'roughs, GEORGE: the only clerical victim of the Salem witchcraft delusion; b. about 1650; graduated at Harvard College in 1670; was a preacher in Falmouth (now Portland), Me., in 1676, and in Salem, Mass., 1680. In 1683 he went back to Falmouth, where he remained until the Indians sacked the town in 1690; returning to Salem, he was accused in 1692 of witchcraft, placed on trial, and, owing to the infatuation then prevailing, was declared guilty of exercising diabolical powers, and executed Aug. 19, 1692. At the scene of execution he declared his innocence, his appeal moving the spectators to tears; and though he repeated the Lord's Prayer, which no witch was supposed to be able to do without mistake, he was doomed to suffer.

Burroughs, JOHN: essayist; b. in Roxbury, N. Y., Apr. 3, 1837. From 1863 to 1872 he was in the Treasury Department at Washington, and then a national bank examiner. Since 1873 he has resided at West Park on the Hudson, and has published many volumes of out-door papers, such as *Winter Sunshine* (1875); *Birds and Poets* (1877); *Locusts and Wild Honey* (1879); *Pepacton* (1881); *Fresh Fields* (1884); *Signs and Seasons* (1886). His sympathy with animal life is expressed in a charming style.

HENRY A. BEERS.

Burrowing Owl, called also **Coquimbo Owl**: a remarkable bird (*Spyrotyto cucularia*), which, "disdaining all the traditions of its family," hunts for its prey (consisting chiefly of beetles and other insects) in broad daylight, facing the

glare of the noonday sun without any inconvenience. It is a small, lively bird, and is found in many parts of America, being especially abundant W. of the Mississippi, and inhab-

Burrowing owls.

iting the same localities as the marmot (or prairie dog), whose dwelling it often shares, the rattlesnake sometimes also occupying the same abandoned burrows. Although the burrowing owl prefers to dwell in the holes already excavated by the prairie dog, it will, if obliged to do so, dig burrows for itself; but these are not so deep or so neatly made.

Revised by D. S. JORDAN.

Bur'rows, WILLIAM: a naval officer; b. near Philadelphia, Pa., Oct. 6, 1785. He entered the navy at the age of fourteen; served on the Barbary coast; on the outbreak of war with Great Britain (1812), while on his way to the U. S., he was taken prisoner. He reached home in June, 1813, and immediately resumed his duty. He commanded the brig Enterprise in an engagement with the British brig Boxer off Portland, Me., Sept. 5, 1813, during which he was mortally wounded. He lived, however, long enough to receive the surrender of the British vessel. His remains were interred in Portland by the side of BLYTHE (*q. v.*), the commander of the Boxer, who was also killed in the same action.

Burrstone, or **Buhrstone**: a cellular siliceous rock of fine texture, used for millstones. The siliceous material does not consist of grains cemented together as in sandstones, but appears to have been deposited from solution, either chemically or through the agency of minute organisms. The cavities giving the cellular structure are molds of small shells, shell fragments, or seeds which were dissolved out after the formation of the rock. Burrstone has been obtained from Eocene formations of France, Belgium, North Carolina, and Alabama. Its value for the grinding of grain depends on its open texture, which prevents the surface from becoming smooth by wear. The best grades are usually found only in small pieces, and a number of these are combined to make a millstone. They are fitted together, set in a matrix of plaster of Paris or other cement, and the whole bound with an iron hoop. Since the introduction of the roller process in flouring-mills the use of burrstone has diminished. The American quarries are not now worked, and the value of imported stones fell from a maximum of \$125,000 in 1880 to about \$18,000 in 1894. Certain sandstones quarried in New York, Pennsylvania, Virginia, etc., are commercially known as burrstones, and these are still used for the grinding of the coarser grains.

Bursian, boor-si-an, CONRAD: archaeologist and classical philologist; b. in Mützschen, Saxony, Nov. 14, 1830; took his degree in Leipzig in 1852. After traveling in Greece and Italy for a number of years, he occupied professorships in Leipzig, Tübingen, Zurich, Jena, and finally in Munich, where he died Sept. 21, 1883. Among the most valuable of his numerous publications may be mentioned *Sevena Rhetor* (Leipzig, 1857); *Geography of Greece* (2 vols., 1867-72); *History of Classical Philology in Germany* (1883). He is also the author of excellent reports on the history of philology in the *Jahresberichte über die Fortschritte der classischen Alterthumswissenschaft*, of which he was the founder and editor. For an account of his life and a complete list of his writings, see *Biograph. Jahrbuch*, vi. (1883), p. 1-11.

ALFRED GUDEMAN.

Burs'lem: a market-town of Staffordshire, England; 2½ miles N. W. of Newcastle-under-Lyne; on an eminence near

the Trent Canal (see map of England, ref. 8-G). The occupation of the inhabitants is earthenware manufacture, and it is the principal place in the district called the Potteries. Pop. (1891) 30,862.

Burt, ARMISTEAD; b. in Edgefield co., S. C.; received a liberal education; admitted to the bar in 1823; settled at Abbeville, where he practiced law until his death. He was member of Congress 1843-53; during part of the Thirtieth Congress acted as Speaker to the House of Representatives. He was an ardent secessionist, and a member of the State Legislature in 1865 which enacted "the Black Code." In 1876 he took an active part in the revolution which made Hampton Governor. Mr. Burt was one of the ablest advocates in the State. D. Oct. 30, 1883.

Burt, WILLIAM A.; b. in Worcester, Mass., June 13, 1792; became a surveyor of Erie co., N. Y.; in 1824 removed to Michigan; surveyed Northern Michigan (1840-47), introducing important improvements in surveying. At the World's Fair in London, 1851, he obtained a medal for his solar compass. He was for a time judge in one of the Michigan State courts, and one of the originators of the canal at Sault Ste. Marie. D. Aug. 18, 1858.

Burton, ASA, D. D.; b. in Stonington, Conn., Aug. 25, 1752; graduated at Dartmouth College in 1777; Jan. 19, 1779, was settled over the Congregational church in Thetford, Vt., 1779, where he died May 1, 1836. He was the champion of the so-called "Taste scheme," in opposition to the "Exercise scheme" of Dr. Emmons, and conducted the controversy with great ability. Besides occasional sermons, he published at Portland, Me., in 1824, a volume of *Essays on Some of the First Principles of Metaphysics, Ethics, and Theology*. See his memoir by Thomas Adams.

Burton, Sir FREDERICK WILLIAM, LL. D., R. H. A., F. S. A.; artist; b. in Ireland, 1816; educated in Dublin; from 1851 till 1858 was in Munich and Nuremberg. He has exhibited often in London at the Royal Academy and at the Dudley Gallery. Since 1874 he has been director of the National Gallery.

Burton, JOHN HILL, LL. D., F. R. S. E.; historian and advocate; b. in Aberdeen, Scotland, Aug. 22, 1809; published, besides antiquarian books on Scotch law and history, *The Life and Correspondence of David Hume* (2 vols., 1816); *Political and Social Economy* (1849); and *The History of Scotland from Agricola's Invasion to the Revolution of 1688* (1867), which is highly esteemed; a *History of Queen Anne's Reign* (1881); and *The Book Hunter* (2d ed. 1882). D. near Edinburgh, Aug. 10, 1881.

Burton, NATHANIEL JUDSON, D. D.; Congregationalist; b. at Trumbull, Conn., Dec. 17, 1824; graduated at Wesleyan University, Middletown, Conn., 1850, and at the Yale Divinity School, New Haven, Conn., 1853; pastor at Fair Haven, Conn., 1853-57; at the Fourth Congregational church, Hartford, Conn., 1857-70; the Park church, Hartford, Conn., from 1870 until his death there Oct. 13, 1887. Since his death a volume of his Yale lectures on preaching has been published. GEORGE P. FISHER.

Burton, Capt. Sir RICHARD FRANCIS; traveler and Orientalist; b. in Hertfordshire, England, of Scottish parentage, Mar. 19, 1821. Having served many years in the East Indian army, he published in 1851 *Sindh, and the Races that Inhabit the Valley of the Indus*. Disguised as a Mussulman he performed a perilous exploration of Arabia in 1853, and published a *Personal Narrative of a Pilgrimage to El Medinah and Meccah* (3 vols., 1856). He served in British consulates from 1861 until his death, chiefly in the countries of which he wrote. He also undertook extensive explorations in Central Africa, along the Congo, in the highlands of Brazil, etc., and published *The Lake Regions of Central Africa* (1860); *The Highlands of Brazil* (2 vols., 1869); *Zanzibar* (2 vols., 1872); *Two Trips to Gorilla Land and the Cataracts of the Congo* (1875); *The Gold Mines of Midium* (1878); *The Gold Coast* (1882). Capt. Burton's works, which number nearly fifty volumes, include, besides travels and grammars of several East Indian dialects, versions of the poems of Camoens, and an important translation of the *Arabian Nights* (1885-88, 16 vols.). D. in Trieste, Oct. 20, 1890. See his *Early Private and Public Life*, by P. Hitchman (2 vols., London, 1887).

Burton, ROBERT; clergyman; b. at Lindley, in Leicestershire, England, Feb. 8, 1576; educated at Brasenose College, Oxford. He became vicar of St. Thomas's, in Oxford, 1616; after 1630 rector of Segrave, keeping both benefices

until his death. He was author of a quaint and popular work entitled *The Anatomy of Melancholy; what it is, with all the Kinds, Causes, Symptoms, Prognostics, and several Cures of it: Philosophically, Medicinally, Historically Opened and Cut up, by Democritus Junior* (1621). It is an amusing medley of quotations and reflections made by a man of rare genius and learning. D. in Oxford, Jan. 25, 1640. There are many editions of the *Anatomy of Melancholy*, the sixth, which contains changes by the author, was published shortly after his death. There is a more modern edition, in 3 vols., in which the quotations are translated.

Burton, WILLIAM EVANS; comedian and writer; b. in London, Sept. 24, 1804. He acted with distinguished success both in Great Britain and in the U. S. While in the former country he wrote a drama, *Ellen Warcham*, which for a time enjoyed a great popularity. He compiled the *Cyclopaedia of Wit and Humor*. He was also very successful as a manager. He built the National theater in Philadelphia, and in New York purchased Palmé's opera-house, and afterward the Metropolitan theater on Broadway. D. in New York, Feb. 10, 1860.

Burton-on-Trent; a town of England; in Staffordshire; on the river Trent; 11 miles by rail S. W. of Derby (see map of England, ref. 9-H). The Trent is here crossed by a stone bridge of 29 arches, which in 1864 replaced one of 36 arches, and 1,545 feet long, built before the Norman conquest. Burton has large breweries of celebrated ale; also iron-works and manufactures of cotton goods. It is on the Grand Trunk Canal. Pop. (1891) 46,047.

Buru, Booro, or Booro; an island of the Malay Archipelago; about 60 miles W. N. W. of Amboyna; between lat. 3 and 4 S., and between lon. 126 and 127 E. Area, estimated at 3,284 sq. miles. The surface is mountainous, but the soil is fertile. It contains Mt. Dome, which is said to be 10,400 feet high. Cajeli Bay, on the north side, affords good anchorage. Pop. about 20,000, mostly Malays and Alfuros.

Burugird', or Boorogird; a town of Persia; province of Irak-Ajence; in a fertile valley; about 184 miles N. W. of Ispahan and 74 miles S. S. E. of Hamadan. It has a castle and several mosques. It has an extensive trade in cotton goods, of which it is said to export over \$200,000 worth annually. Pop. about 20,000.

Bury, berri; a manufacturing town of Lancashire, England; on the river Irwell; 10 miles by rail N. W. of Manchester (see map of England, ref. 7-G). It is on a railway which connects it with Bolton and Liverpool. It contains more than twenty churches and Dissenting chapels, several public libraries and literary institutions. Here are important manufactures of cotton and woolen goods, machinery, and paper, also calico-printing works and dye-works. Mines of coal and quarries of good freestone have been opened in the vicinity. Bury returns one member to Parliament. The eminent statesman Sir Robert Peel was born near here. Pop. (1891) 57,206.

Burying-beetles; certain beetles of the order *Coleoptera* and family *Sylphidae*; famous for their habits of interring the bodies of dead animals. When the carcass of a mouse or other small animal is found, several of them collect around it, and by digging the earth from beneath gradually sink it several inches below the surface. In it the female deposits her eggs, and when the larvae are hatched they find themselves in the midst of suitable food.

Bury St. Edmunds, or St. Edmundsbury; an ancient borough of England; county of Suffolk; finely situated on the river Lark; 26 miles by rail N. W. of Ipswich and 95 miles by rail N. E. of London (see map of England, ref. 10-K). It is well built and remarkably clean. It has a botanic garden, a guildhall, a fine Gothic church (St. Mary's), a celebrated grammar school founded in 1550, and some remains of a large Benedictine abbey (505 feet by 212), which was founded by Canute, and became the richest (except one) in England. Here is an old belfry or quadrangular tower about 85 feet high, which is one of the finest remains of Saxon architecture extant in Britain. Parliaments were held here in 1272, 1296, and 1446. Bury has a large trade in wool, butter, grain, and cheese. It returns one member to Parliament. Sir Nicholas Bacon was born here. Pop. (1891) 16,630.

Busbecq, or Bonsbecq, ARGUER GUILLES, de Lat. Busbequius; Flemish scholar and traveler; b. at Comines in 1522. He was employed on several important diplomatic missions, and was sent as ambassador from the Emperor

Ferdinand to Solymán II. of Turkey. He wrote a valuable account of this embassy, entitled *Legationis Turcicae Epistolæ Quatuor* (1589). D. near Rouen, Oct. 28, 1592. See Forster and Daniel, *Life and Letters of Ogier Ghiselin de Busbecq* (London, 1880).

Busby, bûz'bi, Dr. RICHARD: a famous schoolmaster; b. at Lutton, Northamptonshire, England, Sept. 22, 1606. He was head master of Westminster School for about fifty-six years (1640-95): was a very successful teacher and a strict disciplinarian. He is said to have educated a larger number of eminent men than any other teacher who ever lived. D. Apr. 6, 1695.

Bûsch'ing, ANTON FRIEDRICH: geographer; b. in Schaumburg-Lippe, Germany, Sept. 27, 1724. He became in 1761 minister of a Protestant congregation in St. Petersburg; in 1766 removed to Berlin, where he was employed as director of a gymnasium; published a *Description of the Earth* (1754), which was the most complete work on geography that had then appeared; also a *Magazine of History and Geography* (25 vols., 1767-93). D. in Berlin, May 22, 1793.

Busen'to (in Gr. *Πυζός*; Lat. *Buxentum*): a river of Italy; in the province of Salerno; empties into the Gulf of Italy; to the city of Policastro. Upon the death of Alaric, the Visigoth king, his followers turned the course of the river, and after having buried him again led the river into its old course, thus covering all trace of Alaric's grave from the eyes of his enemies.

Bush, GEORGE: biblical scholar; b. in Norwich, Vt., June 12, 1796; graduated at Dartmouth College in 1818; studied at Princeton Theological Seminary 1820-22, in the same class with Albert Barnes; from 1824 to 1829 was pastor of a Presbyterian church in Indianapolis, Ind. He became in 1831 Professor of Hebrew and Oriental Literature in the University of New York; was converted to the doctrines of Swedenborg in 1847; left his professorship and was pastor of a New Church Society in New York 1848-52; stated supply of one in Brooklyn, N. Y., 1854-59. Among his works are a *Life of Mohammed* (New York, 1832); a *Hebrew Grammar* (1835); and *Bible Commentaries* (8 vols., 1840, et seq.). D. in Rochester, N. Y., Sept. 19, 1859. See his memoir by W. M. Fernald (Boston, 1860).

Bush-buck: See BOSCH-BOK.

Bushel (in Fr. *boisseau*): an English measure of capacity, containing 8 gal. or 4 pecks. Each gallon holds 10 lb. avoirdupois of distilled water, and measures 277.274 cubic inches; consequently the imperial bushel contains 80 lb. of distilled water, and is equal to 2,218.192 cubic inches. The old Winchester bushel contains 2,150.42 cubic inches. The State of New York, by statute of 1829, adopted the imperial bushel, but in the revised statutes of 1851 this was abolished and the Winchester bushel substituted. By law in some parts of the U. S., and in commercial usage, a bushel of grain and of other staple commodities is reckoned in pounds avoirdupois; a bushel of wheat has 52 lb. weight. See GALLON.

Bushire, or **Aboo-shehr**: a seaport of Persia; on the Persian Gulf; about 120 miles W. S. W. of Sheeraz; lat. 29 N., lon. 50° 50' E. It is at the northern extremity of a sandy peninsula, and is the principal commercial emporium on the coast of Persia. The anchorage, which is the best on the coast, consists of an outer harbor, exposed to the N. W. winds, and a safe inner harbor. It has a large trade with British India, from which it imports rice, indigo, sugar, and English cotton goods. The chief articles of export are raw silk, shawls, horses, carpets, silk goods, grain, Sheeraz wine, pearls, dried fruits, etc. Pop. 27,000.

Bushman, or **Bosjesmans**, bosh'ez-manz: a name given to some roaming tribes of savages who live in Southern Africa, along the Orange river. They are similar to the Hottentots; are very diminutive in stature, and of a dark-brown complexion. They build no houses and have no tents. They are malicious and intractable, and live by hunting and robbery.

Bushnell: a city; McDonough co., Ill. (for location of county, see map of Illinois, ref. 5-C); on Chic. Bur. and Quincy and Tol., Peoria and West. R. Rs.; 70 miles N. of Quincy and 192 miles S. W. of Chicago. There are here good public schools, a normal college, manufactories of pumps, small hardware, and fine brick. The city has water-works and electric lights. The city is situated in the midst of a high, rich, prairie agricultural district, and has ample

supplies of timber and coal. Pop. (1880) 2,316; (1890) 2,314; (1893) estimated, 2,387. PUBLISHER OF "RECORD."

Bushnell, HORACE, D. D., LL. D.: Congregational minister; b. in Litchfield, Conn., Apr. 14, 1802; graduated at Yale College in 1827; was tutor from 1829-31. Having previously studied law, he turned to theology, and was settled over the North church in Hartford, Conn., from 1833-59, when the failure of his health compelled him to resign his pastorate, though he was still able to do literary work and to preach occasionally. He was distinguished for the originality and boldness of his thinking, and for the brilliancy and vigor of his style. Among his published works are a Phi Beta Kappa oration in 1837 on *The Principles of National Greatness*; *Christian Nurture* (Hartford, Conn., 1847; n. c. New York, 1860); *God in Christ* (Hartford, Conn., 1849); *Nature and the Supernatural* (New York, 1858); *The Vicarious Sacrifice* (1865; revised in 1873); *Forgiveness and Law* (1874). He was also the author of numerous discourses and essays on theological and literary themes, all of which have the stamp of genius. His select works were published in New York in eight volumes (1876-77), and in 1881 three additional volumes of *Miscellanies* from his pen were issued. He exerted a stimulating and widely extended influence in the field of religious thought. He was one of the most attractive preachers of his day. With a vivid imagination and talents for speculation, he combined singular practical good-sense in every-day affairs. See his memoir by his daughter (New York, 1880). D. in Hartford, Conn., Feb. 17, 1876.

Revised by GEORGE P. FISHER.

Bushwhackers (in the language of the U. S. civil war) were those men who rarely or never wore a uniform, and claimed to be peaceful farmers or herdsmen when in presence of a superior hostile force, but had firearms concealed at a convenient distance, and did not scruple to use them on any opportunity to pick off from an ambush a soldier while he was moving in fancied security. Bushwhackers were especially murderous in Missouri, and were often treated, when they were captured, with unrelenting severity.

Business Colleges: schools in which young men and women are trained for business careers. Commercial teaching was first attempted in the U. S. in private schools established for the purpose. These have grown from scattered schools of little repute, for instruction in bookkeeping, writing, and arithmetic, to well-organized institutions, with courses adapted to training their pupils for every department of business activity. The time of study necessary for graduation in the business colleges of the U. S. is from four to twenty-five months in day courses and from four to thirty-six months in evening courses. The demand for stenographers and typewriters has much increased the attendance on the business colleges. Most of the colleges give the student practical knowledge of how business is transacted in the large cities in banking, insurance, real estate, and commercial houses, by means of the college bank, college jobbing-house, etc. The student is required to act as cashier, paying teller, receiving teller, shipping clerk, salesman, and bookkeeper. He buys, sells, makes deposits, draws checks, and sustains in general the same relation to the college bank and jobbing-house that the merchant has in the outside world. Commercial law, commercial calculations, and frequently the tariff laws of different nations, also form a part of the course. According to the annual report of the U. S. commissioner of education for the school year 1890-91, there were 250 business colleges, which had 1,586 instructors, 81,898 students (of whom 68,093 attended day schools and 13,805 attended evening schools), and 9,159 graduates of the year. The importance of commercial training has become so generally recognized that business courses are now provided in the regular systems of public education in many countries. The addition of such a course to the curricula of the higher public primary schools has been indorsed at several international educational congresses, notably at Paris in 1889. In 1890-91 there were 36,564 students in the commercial departments of city, normal, and secondary schools and colleges in the U. S. C. H. THÜRBER.

Busi'ris (in Gr. *Βούσιρις*): in Greek mythology, a fabulous personage; supposed to have been a son of Neptune, and a King of Egypt, who sacrificed all the foreigners entering his dominions, and was killed by Hercules.

Busken-Huet, CONRAD: See HUET, CONRAD BUSKEN.

Buskin: a covering for the leg or for the ankle and foot; a shoe reaching up to the middle of the calf and tightly laced. The word buskin is used by English writers as a translation of Latin *cothurnus*, which was a high shoe worn by ancient tragic actors, and had thick cork soles. The term is also used to denote the tragic drama or tragic style, having been used in contradistinction to *soecus*, a sock or flat-soled shoe worn by comedians.

Bussang (also **Boossa**): a town of Central Africa; in the Sudan; on an island in the Niger; lat. 10 14' N., lon. 6 11' E. It is inclosed by a wall, and is within the limits of the British Niger protectorate. Pop. estimated at 12,000. Mungo Park died here.

Bussey, BENJAMIN; b. in Canton, Mass., Mar. 1, 1757; served in the Revolutionary army at Burgoyne's capture. He was a silversmith of Dedham, Mass., and afterward a very successful merchant of Boston. D. in Roxbury, Mass., Jan. 13, 1842, leaving \$350,000 to Harvard University, half to found the Bussey School of Agriculture, and half to sustain the Law and Divinity Schools.

Busson, büs'sôn', CHARLES; landscape-painter; b. at Montoire, Loir-et-Cher, France, July 15, 1822; pupil of Rémond and of François; first-class medal, Paris Exposition, 1878; officer of the Legion of Honor 1887. His work belongs to the style of the school founded on Poussin, and has little in common with modern landscape-painting as interpreted by the masters of the "Fontainebleau group" and their followers. It is not without dignity, and is sincere and more notable for composition than for actual truth to nature. WILLIAM A. COFFIN.

Bus'su Palm: the *Municaria saccifera*, of the family *Palmeæ*; a tree 15 to 20 feet high, with large, rigid, suberect leaves, which are at first entire. It is a native of the lower Amazon region. The large leaves are used by the natives of the region in building their huts, while the spathes are easily transformed into receptacles for containing food or other articles. The fruits have no economic value. This palm is related to the toddy-palm (*Caryota*), piassabe-palm (*ATTALEA, q. v.*), and *Cococact* (*q. v.*), with which it is associated in the sub-family *Ceroryllinæ*. It has long been grown in conservatories. See PALM FAMILY. C. E. B.

Bust (in Ital. *busto*; Fr. *buste*): a sculptured representation of the head and upper part of the human body. Those made by the Greek sculptors are generally worked in the upper part of an upright block of stone or marble, usually of the height of a person of proportionate stature. The busts of later times are sometimes the complete representation of the head and body down to the line where it is cut off evenly; but more often they consist of the head and shoulders only, raised upon a somewhat ornamental base or foot. Portrait busts were extremely common under the Roman empire, and again in the fifteenth and sixteenth centuries. RUSSELL STURGIS.

Bustamente, boos-ta-mente, ANASTASIO; Mexican revolutionist and statesman; b. at Tiquilpan, province, now state, of Michoacan, July 27, 1780. He entered the Spanish army as a subaltern officer in 1808, and in the first struggles fought against the revolutionists; but in 1821 he joined Hurbide, commanded a division in the march on Mexico, and was a member of the provisional junta before Hurbide was declared emperor. With the fall of that chief (1822) he was sent for a time into retirement; but in 1829 he was elected vice-president in the Guerrero administration, and commanded the army. After a few months he revolted against Guerrero, heading the Centralist party, which aimed to overturn the federal form of government. The success of this movement made Bustamente acting president of Mexico in 1830. In 1832 Santa Anna headed a revolt against him; in the war which followed Bustamente personally led his troops in several actions, but was finally beaten and forced to resign; he was imprisoned, and in 1833 banished. The capture of Santa Anna in the Texas war (1836) brought the Centralists again into power; they called Bustamente back, and in 1837 he was elected president of Mexico. During his administration there was a brief war with France (1838), and disorders which broke out in 1840 finally forced Bustamente to give up the presidency to Santa Anna (1842). He traveled for some time, but returned to take part in the war with the U. S., and served with the army until 1848. D. at San Miguel Allende, Feb. 6, 1853.

HERBERT H. SMITH.

Bustamente, CARLOS MARIA, de; Mexican politician and historian; b. in Mexico city in 1774. He studied law, became an advocate in 1801, and was editor of the *Diario de Méjico* from 1805. Taking part in the earlier revolutionary movements, he commanded a regiment under Morelos (1812), was captured and imprisoned at Vera Cruz; released by Santa Anna, he marched with him to the capital (1821). From this time he took a prominent part in political life, being member of congress, holding various offices, and writing so boldly that he was several times imprisoned. In the intervals he published various historical works on the war of independence and the subsequent period. As he was an eyewitness, and a fluent and careful writer, his works are of great value. Among them are *Cuadro historico de la Revolución de la América Méjicana* (1823-32, 6 vols.); *Historia del emperador Agustín de Iturbide*; and *Historia del gobierno del general Santa Anna*. D. at Mexico, Sept. 24, 1848. HERBERT H. SMITH.

Bustard: a bird of the genus *Otis* and order *Carsores*. The bustards have three toes, which are all directed forward, long naked legs, and bills of moderate length. They are mostly inhabitants of open plains, to which all their habits are adapted. Although they are capable of flying, they often endeavor to escape from danger by running. The great bustard (*Otis tarda*) is the largest of European land birds, and sometimes weighs 30 lb. It is found in the eastern and southern parts of Europe, and abounds in the open plains or steppes of Tartary. The plumage is of a pale chestnut color on the upper parts, finely variegated with black. The wings are diversified with black and white, and the tail is tipped with white. The male has on each side of the chin or neck a tuft of feathers nearly 9 inches long, under which is a spot of naked skin, and in the throat a sac or pouch capable of holding 3 or 4 pints of water. Their flesh is highly esteemed as food. The little bustard (*Otis tetrax*) is common in Southern Europe and Northern Africa, and is not half so large as the *Otis tarda*. South Africa produces a species called *Otis kori*, or Kori bustard, which is 5 feet high or more, and is a noble-looking bird. Its flesh is good. Macqueen's bustard is a fine Asiatic bird. Several other bustards are known, all Old World species, except one, which is Australian.

Busto Arsiz'io: a town of Italy; province of Milan; 23 miles by rail N. W. of Milan; on a fertile plain (see map of Italy, ref. 2-B). It has several churches, one of which is adorned with fine old frescoes by Ferreri. Here are manufactures of cotton thread. Pop. 13,500.

Butcher, SAMUEL HENRY, LL. D.; professor of Greek; b. in Dublin, Ireland, Apr. 16, 1850; educated at Marlborough College; fellow and assistant tutor at Trinity College, Cambridge, 1874-76; fellow and lecturer at University College, Oxford, until 1882; was then made Professor of Greek at Edinburgh University. Joint author of *Transalation of the Odyssey* (1879); author of *Demosthenes* (1881); and his inaugural address, *What we owe to Greece* (1882).

Butcher-birds: the *Laniidæ*, or *Shrikes*. See SHRIKE.

Butcher's Broom (*Ruscus aculeatus*): a biennial evergreen plant of the family *Liliacæ*; has a stem from 1 to 3 feet high, and ovate, alternate, sharp-pointed leaves. The fruit is a red berry nearly as large as a wild cherry. It is indigenous in the south of Europe, and is cultivated for ornamental purposes. The root is aperient and diuretic.

Bute: an island of Scotland; in the Frith of Clyde; separated from the mainland by a narrow strait called the Kyles of Bute, which is about a mile wide. The island is about 15 miles long, and has an area of nearly 60 sq. miles. The mildness of the climate renders it a favorite resort for invalids. The chief town is Rothesay. Here are Rothesay Castle (in the burgh of Rothesay), and Dunnagoil, a vitrified fort on the southwest coast. The seat of the Marquis of Bute, called Mountstuart House, is on the east coast.

Bute, or **Buteshire**: a county in the southwest part of Scotland; comprises the islands of Bute, Arran, the Cumbries, Holy Isle, Pladda, and Inchmarnock. Area about 225 sq. miles, or 143,977 acres, of which 22,966 are cultivated. Pop. (1891) 18,408.

Bute, MARQUESSSES OF: Earls of Windsor and Viscounts Mountjoy (1796); Barons Mountstuart (1761); Barons Cardiff (1766, in Great Britain); Earls of Dumfries (1633); Earls of Bute (1703); Viscounts of Ayr (1622); Viscounts Kincaith, Lords Mountstuart, Cumbrae, and Inchmarnock (1703); Lords Crichton and Cummoek (1633); Barons Cricht-

ton of Sanquhar (1488, in Scotland), and baronets (1627, in Scotland).—JOHN PATRICK CURTIS STUART, the third marquis, born Sept. 12, 1847, succeeded his father in 1848. In 1868 he joined the Roman Catholic Church, and he has published a translation of the *Breviary* (2 vols., 1879).

Bute, JOHN STUART, Earl of; a minister of state; b. in Scotland in 1713; was educated at Eton; married a daughter of Lady Mary Wortley Montagu. He became groom of the stole to the Prince of Wales, who was afterward George III., over whom he acquired a great influence. In Mar., 1761, he was appointed one of the principal Secretaries of State; May 29, 1762, he became Prime Minister, and held office until the following April. His policy was peace with France and royal absolutism at home. He resigned because of his unpopularity, but for twenty years was suspected of and hated for a secret intimacy with the king. He traveled on the continent of Europe, then retired to his estate in Bedfordshire, and occupied himself with building and studies, astronomy and natural history. D. Mar. 10, 1792.

Butea: a genus of handsome evergreen trees and climbing shrubs of the family *Papilionaceæ* (see LEGUMINOSÆ), nearly related to the beans proper (*Phaseolus*), and dedicated to John, Earl of Bute (*q. v.*), a patron of botany. The flowers are in racemes, scarlet or orange, and with a large keel and recurved banner. The leaves are trifoliate, and the leaflets large and ovate in outline. Some of the species yield lac and kino, while from their flowers a dye is made. Five species are known, all natives of Southeastern Asia. *B. frondosa* and *B. superba* are grown in conservatories, and are regarded as possessing high ornamental value. C. E. B.

Butin, bü'tän', ULYSSE LOUIS AUGUSTE: painter of genre, principally of the life of fishermen and sailors; b. at St. Quentin in 1838; pupil of Lemâle, of Picot, and of Pils; second-class medal, Salon, 1878; Legion of Honor 1881. His pictures are notable for sound technique and truthfulness in the rendering of out-of-doors effects. *Burial of a Sailor at Villerville*, an excellent example, is in the Luxembourg Gallery, Paris. D. in Paris, Dec. 9, 1883. W. A. C.

Butler: town: De Kalb co., Ind. (for location of county, see map of Indiana, ref. 2-6); on Lake Shore and Wabash R. Rs.; 72 miles W. of Toledo, O.; has Wabash R. R. repair-shops and a wind-engine factory. The surrounding country is fine agricultural land. Pop. (1880) 1,056; (1890) 2,521.

EDITOR OF "RECORD."

Butler: capital of Bates co., Mo. (for location of county, see map of Missouri, ref. 5-13); on Mo. Pac. R. R.; in a fertile prairie, 75 miles S. by E. from Kansas City. Butler, which was founded in 1857, burned during the war of the rebellion and afterward rebuilt, has seven churches, good public schools, mills and grain-elevators, water-works, and electric lights. The principal industry is agriculture. Pop. (1880) 2,162; (1890) 2,812; (1893) with suburbs, 3,750.

EDITOR OF "BATES COUNTY DEMOCRAT."

Butler: borough; on railroad; capital of Butler co., Pa. (for location of county, see map of Pennsylvania, ref. 4-B); on the Conoquenessing creek; 31 miles N. of Pittsburgh; has three extensive glass-manufactories (two for bottles and one for plate glass); natural gas is used in all of them. It has also a large planing-mill, several oil-well-supply manufactories, a number of flouring-mills, etc., and is the center of prolific oil-fields. It has a fine court-house and public-school buildings. Pop. (1880) 3,163; (1890) 8,734.

EDITOR OF "TIMES."

Butler, ALBAN: Roman Catholic divine; b. at Appletree, in Northampton, England, 1710; studied at Douay, in France; was professor there; later president of the English Catholic College of St.-Omer, in France. D. at St.-Omer, May 15, 1773. He is best known in the world of letters by his *Lives of the Fathers, Martyrs, and other Principal Saints* (London, 1756-59, 4 vols.), a work of great learning and judicious criticism. See Charles Butler's *Life of the Rev. Alban Butler* (Edinburgh, 1799). JOHN J. KEANE.

Butler, BENJAMIN FRANKLIN, LL. D.: lawyer, general, and politician; b. at Deerfield, N. H., Nov. 5, 1818; son of Capt. John Butler, who commanded a company of dragoons in the war of 1812, and served under Jackson at New Orleans. Reared by an excellent mother, B. F. Butler graduated in 1838 at Waterville College, Maine; in 1840 was admitted to the bar in Lowell, Mass., where he rapidly advanced to an extensive and lucrative practice, in which he acquired a considerable fortune. He served in the State militia through all grades from private to brigadier-general. A Democrat

by inheritance and conviction, he took an active part in politics, and in 1853 represented Lowell in the Legislature, where he lent powerful aid to the bill for reducing the hours of labor in the factories of the State from thirteen to eleven. In 1853 he was a member of the constitutional convention; in 1859 a member of the Senate of Massachusetts. In the national Democratic convention of 1860 in Charleston, S. C., he voted over fifty times to give the nomination for the presidency to Jefferson Davis. On Apr. 15, 1861, upon a call for troops to hasten to the defense of Fortress Monroe and Washington, Brig.-Gen. Butler, who at 5 p. m. was in court in Boston trying a cause, issued the requisite orders for mustering the regiments of his brigade. Apr. 16, the Sixth Regiment left Boston, and on the 18th Gen. Butler, at the head of the Eighth, took his departure, having been ordered to proceed to Washington by way of Baltimore. Two regiments of his brigade had, in the meantime, sailed for Fortress Monroe, which they garrisoned and saved from falling into the hands of the enemy. Prevented from reaching Washington by way of Baltimore, in consequence of the burning of bridges, he seized Annapolis, repaired the railroad between that city and Washington, and thus the Eighth Massachusetts and Seventh New York reached the capital in time to prevent all attempts on the part of hostile forces to seize it. May 13, 1861, at the head of 900 men, he marched upon Baltimore, and encamped on Federal Hill, in the midst of the city, without opposition—a service immediately (May 16) rewarded by President Lincoln with the commission of major-general in the service of the U. S., and by assigning him to the command of Fortress Monroe, where he arrived May 22. He here refused to send back the runaway slaves to their masters, on the ground, originated by him, that the slaves were "property contraband of war." Feb. 23, 1862, he was assigned to the command of the troops, 18,000 in number, forming part of the expedition against New Orleans, Capt. Farragut commanding the naval force. After the heroic passing of the forts defending the Mississippi by Capt. Farragut, Gen. Butler (May 1, 1862) landed and took possession of the city, where he remained until Dec. 16 following, when he was relieved by Maj.-Gen. N. P. Banks. During Butler's administration of the department of the Gulf he taxed the wealthy Confederate citizens to support the thousands of inhabitants reduced to destitution by the war, enforced a thorough sanitary system, and governed the city with an ability and justice never surpassed. Nov., 1863, he was appointed commander of the department of Virginia and North Carolina. In the winter he conceived the project of attacking Richmond from City Point and Bermuda Hundred. On May 5, 1864, he occupied City Point and Bermuda Hundred, and intrenched himself upon that peninsula in a position strong for defense, but from which he could not advance, holding it with supplies, and subsequently aiding the movement of Gen. Grant upon Petersburg, after the repulse of the Wilderness and Cold Harbor. He went with a detachment of his forces in Nov., 1864, to New York during the presidential election, a rising being expected in that city by which the election was to be carried by the Democracy. With a small force he held the city in peace and quiet, and compelled an orderly election. He was sent against Fort Fisher in Dec., 1864, where he first exploded a powder-boat without effect; subsequently landed his troops for an assault after a severe bombardment by the fleet; but upon the advice of his chief engineer, who considered the works impregnable by assault, he withdrew his forces. Before the second expedition Gen. Butler was relieved of his command. In 1866 he was elected to Congress from the Essex district in Massachusetts. He was nominated Sept. 19, 1882, by Massachusetts Democratic Convention for Governor, and was elected Nov. 7, 1882; was defeated Nov. 6, 1883, and was "Greenback" candidate for President of the U. S. in 1884. He published *The Autobiography and Personal Reminiscences of Maj.-Gen. Benjamin F. Butler* (1892). D. in Washington, D. C., Jan. 11, 1893.

Revised by JAMES MERCUR.

Butler, CHARLES: nephew of Alban Butler; jurist and writer; b. in London, England, Aug. 14, 1750; was a Roman Catholic. He wrote, besides other works, *Horæ Biblicæ* (London, 1797); *Historical Memoirs respecting the English, Irish, and Scottish Catholics* (1819-21, 4 vols.); and a continuation of his uncle's *Lives of the Saints*. D. in London, June 2, 1832.

Butler, CLEMENT MOORE, D. D.: divine and scholar; b. in Troy, N. Y., Oct. 16, 1810; graduated at Washington (now

Trinity College, Hartford, Conn., 1833, and at the General Theological Seminary, New York city, 1836. He was ordained in 1836; rector of St. John's church, Georgetown, D. C., 1841-44; of Grace church, Boston, 1841-47; of Trinity church at Washington 1847-54; chaplain of the Senate of the U. S., 1849-53. He was subsequently rector of the Protestant Episcopal Church at Rome (in Italy) 1862-64; in the last-named year he was appointed Professor of Ecclesiastical History in the Episcopal Divinity School in West Philadelphia; resigned in 1881. Besides numerous sermons and lectures, Dr. Butler published *The Book of Common Prayer Interpreted by its History* (Boston, 1846; 2d ed. Washington, 1849); *Old Truths and New Errors* (New York, 1850); *The Flock Fed* (1859); *St. Paul in Rome* (Philadelphia, 1865); *Inver Rome* (1866); *Manual of Ecclesiastical History from the First to the Thirteenth Century* (2 vols., 1868); also a *Continuation of the same from the Thirteenth to the Eighteenth Century*; *The Reformation in Sweden* (New York, 1883); and various other works. D. in Philadelphia, Mar. 5, 1890.

Butler, ELIZABETH SOUTHERDEN THOMPSON; military painter of the contemporary English school; b. at Lausanne, Switzerland, of British parents about 1844. She received her art education at the South Kensington Museum Schools and in Florence, where she was a pupil of Giuseppe Bellucci. At the Royal Academy, London, she exhibited a picture entitled *Missing*, which attracted notice for its strong, vigorous painting, and followed it the next year with *The Roll Call*. She at once obtained a wide reputation as an artist of original and striking ability, and her work became popular in England. *The Roll Call* was purchased by the Queen, and is now at Windsor Castle. Miss Thompson married Major William Francis Butler of the British army in 1877, and has continued to paint, but has not exhibited much of late years. Her pictures are especially notable for their excellent composition and dramatic force. Some of her principal works, besides the two above mentioned, are *Remnants of an Army* (1879); *Scotland for Ever*; *Defense of Rorke's Drift* (1881); *Fluvial Etoua*; and *Charge of the Scots Greys at Waterloo* (1882). Studio in London.

WILLIAM A. COFFIN.

Butler, FRANCES ANNE KEMBLE: See KEMBLE.

Butler, GEORGE B.; genre and portrait painter; b. in New York; contemporary; pupil of Couture, Paris; National Academician 1873; member of the Society of American Artists 1880; lived a number of years at Capri, Italy, and painted pictures there. He has devoted himself mostly to painting portraits. Studio in New York.

WILLIAM A. COFFIN.

Butler, HENRY MONTAGU, D. D.; master of Trinity College, Cambridge; b. in Harrow, 1833; graduated at Trinity College, Cambridge, 1855; ordained 1859; head master of Harrow 1859-85; select preacher, Oxford, 1877-78, and 1878-80-82; Cambridge 1879-85; Dean of Gloucester 1885-86; master of Trinity College 1886; vice-chancellor of university 1889. Author of *Sermons Preached in the Chapel of Harrow* (1861; 2d series, 1869).

Butler, HOWARD RUSSELL; landscape, marine, and portrait painter; b. in New York, Mar. 3, 1856; pupil of Dagnan-Bouveret and of Gervex, Paris; member of the Society of American Artists 1889, and of the Architectural League, New York; honorable mention, Salon of 1886; Temple silver medal, Pennsylvania Academy, Philadelphia, 1888; third-class medal, Paris Exposition, 1889. As president of the American Fine Arts Society he devoted much of his time to the organization of that institution, which is composed of a union for exhibition purposes in its building in West Fifty-seventh Street, New York, of the Society of American Artists, the Architectural League of New York, and the Art Students League; graduated in the scientific course at Princeton College in 1876, and practiced law in New York before he began the study of painting in 1883.

WILLIAM A. COFFIN.

Butler, JAMES GLENTWORTH, D. D.; Presbyterian minister; b. in Brooklyn, N. Y., Aug. 3, 1821; studied at the New York University and at Union (1846-47) and Yale (1848-49) Theological Seminaries; was pastor of the Walnut Street Presbyterian church, Philadelphia, 1852-68; secretary of the American and Foreign Christian Union 1868-71; pastor in Brooklyn, N. Y., 1871-73. Of late years he has devoted himself to his great commentary *The Bible Work*, by which he is chiefly known. Of the New Testament part, vol. i, ap-

peared in 1878, vol. ii, in 1879. On the Old Testament, vol. i, appeared in 1886, vol. ii, in 1888, vol. iii, in 1889, and vols. iv., v., vi, in 1892. Vols. vii, and viii, are nearly ready (1893). In 1890 he published *The Fourfold Gospel*.

Butler, JONAS JAY, D. D.; a Free-will Baptist minister; b. at Berwick, Me., Apr. 9, 1814; graduated at Bowdoin College in 1837; studied theology at Andover, Mass., 1841-44; Professor of Sacred Literature in Whitestown Theological Seminary (1844-54); of Systematic Theology at the Theological School of New Hampton, N. H., (1851-70); Professor of Sacred Rhetoric and Homiletics in Bates College Theological Seminary, Lewiston, Me.; and since 1873 of Sacred Literature, Hillsdale College, Mich. For many years he has been connected with the *Morning Star*, a religious paper of Dover, N. H. He has published several commentaries on parts of the Bible, and a work on natural and revealed theology.

Butler, JOSEPH; bishop and writer; b. at Wantage, Berkshire, England, May 18, 1692. About 1711 he wrote an able refutation of Dr. Samuel Clarke's celebrated *a priori* argument; graduated at Oriel College, Oxford, 1718; was appointed preacher at the Rolls chapel in 1719; obtained the rich benefice of Stanhope in 1725; became chaplain to Lord Chancellor Talbot in 1733; Bishop of Bristol in 1738. In 1750 he was translated to the see of Durham. A sermon by Bishop Butler before the Society for Propagating the Gospel in Foreign Parts awakened no little interest from its strenuous advocacy of the work of the society in the American colonies; while a MS. plan for the introduction of bishops into America, written by him in 1750, and first published by the Rev. East Apthorp in a controversy with the Rev. Dr. Mayhew some years later, connects this distinguished prelate with the civil and ecclesiastical history of America. His chief work is *The Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature* (London, 1736). D. in Bath, unmarried, June 16, 1752. See T. Bartlett, *Memoirs of the Life of Joseph Butler, Bishop of Durham* (London, 1839). The best edition of his works is that issued in two volumes from the Oxford University Press (1849), with a preface by Bishop Halifax.

Butler, MATTHEW CALBRAITH; U. S. Senator; b. near Greenville, S. C., Mar. 8, 1836; educated at South Carolina College; admitted to the bar in 1857; served in the Confederate army during the war; elected to the Senate in 1876; re-elected 1882, 1888.

Butler, NICHOLAS MURRAY, Ph. D.; educator; b. in Elizabeth, N. J., Apr. 2, 1862; educated in the public schools of Paterson, N. J., Columbia College, N. Y., University of Berlin, and University of Paris; in 1887 organized the New York College for the Training of Teachers; in 1888 became Professor of Philosophy and Education in Columbia College; dean of the university faculty of philosophy since 1890; editor of *The Educational Review* 1891; author of *Harvard Mann and American Systems of Education*, and essays on manual training and allied subjects. W. T. HARRIS.

Butler, PIERCE MASON; son of William, a Senator named below; colonel, and former Governor of South Carolina; b. in Edgefield district, S. C., Apr. 11, 1798; entered the army in 1819 as second lieutenant of infantry; promoted to first lieutenant 1822; captain 1825; resigned from the army in 1829; president of a bank at Columbia until 1836; accepted the appointment of lieutenant-colonel in Goodwin's regiment of South Carolina volunteers, and served against the Seminole Indians in Florida. On his return was elected (1838) Governor of South Carolina; at the end of his term became Indian agent, and was acting as such at the outbreak of the Mexican war, when he was elected colonel of the "Palmetto regiment" of South Carolina volunteers, which he led to the seat of war, distinguishing himself at Cerro Gordo and subsequent battles; at Churubusco, Aug. 20, 1817, he continued to lead his men after being wounded, when he was shot a second time, through the head, and killed.

Butler, SAMUEL; an English poet; b. in Worcestershire, Feb. 8, 1612; was liberally educated, and became in early youth clerk to a justice of the peace; afterward entered the service of Sir Samuel Luke, who is supposed to be the prototype of Hudibras. He published in 1663 the first part of *Hudibras*, a witty poem satirizing the Puritans, which obtained great popularity, and thus furnished a multitude of proverbial sayings, such as:

He that complies against his will
Is of the same opinion still.

The second part appeared in 1664, and the third in 1678. D. in London, Sept. 25, 1680. See A. Ramsay's *Butler and his Hobbies*.

Butler, WILLIAM, D. D.: missionary of the Methodist Episcopal Church; b. in Dublin, Ireland, Jan. 31, 1818; graduated at Didsbury College, near Manchester, England, 1844; entered the ministry of the Wesleyan Church, and served in the New England conferences; became secretary of the American and Foreign (Christian Union of the Methodist Episcopal Church 1869; resigned in 1873; founded Methodist Episcopal missions in India (1856) and Mexico (1857); author of *Methodist Episcopal portion of Cyclopaedia of Missions: The Land of the Veda* (New York, 1872); *From Boston to Bareilly and Back* (1885); *Mexico in Transition from the Power of Political Romanism to Civil and Religious Liberty* (New York, 1892).

Butler, WILLIAM: b. in Prince William co., Va., in 1759; graduated as student of medicine at South Carolina College; became a lieutenant in Gen. Lincoln's army in 1779; was engaged at Stono; served in Pulaski's corps until the death of the latter; afterward served with Gens. Pickens, Lee, and Greene; became commander of a body of mounted rangers, and was engaged in many battles with the Tories. Shortly after the war he was appointed brigadier-general, and in 1796 major-general, of militia; member of convention in 1787 to decide on the adoption of the Federal Constitution; member of convention which adopted the constitution of South Carolina; member of the Legislature; M. C. 1801-11; commanded South Carolina troops in 1812. D. in Columbia, S. C., Nov. 15, 1821.

Butler, WILLIAM ALLEN: lawyer and poet; b. in Albany, N. Y., 1825; graduated at the University of New York in 1843. He wrote, besides other works, the very popular satirical poem, *Nothing to Wear, an Episode of City Life* (1857); also a biography of *Martin Van Buren* (1862), and *Domesticus* (1886), a tale of labor troubles.

Butler, WILLIAM ARCHER: philosopher; b. in Annerville, near Clonmel, Ireland, in 1814; educated at Trinity College, Dublin, where he became Professor of Moral Philosophy in 1837, and in the same year was ordained. In 1842 he became, in addition to being professor, rector of Raymoghly, and played a prominent part in the Roman Catholic controversy. He had brilliant gifts, and his fame, which was mainly posthumous, is permanent. He was admired as a preacher equally by the simple and the learned. His chief work is *Lectures on the History of Ancient Philosophy* (2 vols., 1856). Other works are *Sermons, Doctrinal and Practical* (Dublin, 1849; 2d series, Cambridge, 1856); *Letters on the Development of Christian Doctrine*, in reply to Newman (Dublin, 1850). (See his memoir in the first series of his sermons.) D. in Dublin, July 5, 1848.

Butler, WILLIAM ORLANDO: general; b. in Kentucky in 1793; served in the war of 1812 and the Mexican war; became a major-general in 1846. He was the Democratic candidate for the office of Vice-President in 1848, but was not elected. D. in Carrollton, Ky., Aug. 6, 1880. See his *Life* (1848) by F. P. Blair, Jr.

Butler, ZEBULON: soldier; b. at Lyme, Conn., in 1731; served in the French war and in the expedition to Havana; became captain in 1761; settled at Wyoming, Pa., in 1769; was lieutenant-colonel of Connecticut troops serving in New Jersey 1777-78; became colonel Mar. 13, 1778. He commanded the small garrison at Wyoming, Pa., at the time of the massacre, July 3, 1778 (see WYOMING VALLEY); and served bravely in Gen. Sullivan's expedition against the Indians of the Six Nations at Newtown (now Elmira), N. Y., in 1779, and during the whole of that Indian war. D. at Wilkesbarre, Pa., July 28, 1795.

Butte, BUTTE, CITY: on railroad; capital of Silver Bow co., Mon. (for location of county, see map of Montana, ref. 6-E); was settled in 1864 as a gold-placer camp. Within 4 miles of the court-house are many gold and silver mines; product of the county in 1889, \$9,135,728. There are 9 silver mills with 375 stamps, reducing over 700 tons of ore per day. There are 5 smelters (1 silver and 4 copper) besides the one at Anaconda, which is capable of reducing 2,000 tons of Butte copper ore per day. The city has a fine court-house, a city-hall, an opera-house, telegraph and telephone service, street railroads, water-works, gas, electric lights, etc., and a public library of about 2,000 volumes. Pop. (1874) about 50; (1880) 3,363; (1890) 10,723.

EDITOR OF "INTER-MOUNTAIN."

Butter [from Lat. *bu'tyrum*, from Gr. *βούτυρον*]: the fatty substance extracted from milk. In ancient times the Hebrews made use of butter as food, but the Greeks and the Romans used it only as an ointment in their baths; and it is probable that the Greeks obtained their knowledge of the substance from the Scythians, Thracians, and Phrygians, while the Romans obtained it from Germany. In Southern Europe, at the present time, butter is very sparingly used, olive oil often taking its place; and in Italy, Spain, Portugal, and Southern France it is sold by apothecaries as a medicinal agent for external application. In the East Indies the natives use *ghee*, which is butter clarified by boiling. Butter is usually made from cow's milk, which has the following average composition:

Fat (butter).....	per cent.	3.50
Casein.....		3.80
Albumen.....		0.75
Sugar (lactose).....		4.25
Salts (alkaline and earthy).....		0.70
Water.....		87.00
Total.....		100.00

The composition varies widely with the food, breed, age, and individuality of the cow, the age of the calf, the time and frequency of milking. The last milk drawn at a milking is richer in butter than the first. (See MILK.) The casein, sugar, and the salts are in solution, while the fat is in suspension in the form of minute globules, which are readily seen by the aid of the microscope. They vary in size from $\frac{1}{100000}$ to $\frac{2}{30000}$ of an inch in diameter. They are quite transparent, refract light strongly, and give the milk its white color. It was formerly supposed that each globule was covered with a thin membrane or envelope, but this has been disproved by Von Baumhauer and F. Knapp, and by Dr. S. M. Babcock, who has shown that the fat globules of milk behave in all respects like the globules of artificial emulsions of other fats and oils. The globules are composed of a mixture of several neutral fats or glycerides, chiefly the liquid fat olein and the solid fats palmitin and stearin, with small quantities of butyric, myristin, caproin, caprylin, and caprin. The small amount of these latter fats gives to butter its characteristic odors and flavors; beside these, it is pretty certain that many of the volatile fats of the food may pass directly into the butter globules without change. In this way not only are the delicate desirable flavors of the sweet-scented grasses and clovers transmitted to the butter, but also the less desirable ones that are characteristic of onions, turnips, cabbage, etc. Moreover milk, and particularly the fats in the milk, readily absorbs odors and taints from the atmosphere surrounding it; so that in order to make butter of the finest quality and flavor, not only must the animal be supplied with clean, wholesome food and water, but the atmosphere surrounding the animal and the milk during all the process of manufacture must be pure, and all surroundings and utensils kept as nearly absolutely clean as possible.

Cream.—Cream is that part of milk into which a large proportion of its fat has been gathered. It is composed of the same constituents as milk, but they are not in the same or any constant relative proportion. Analyses have shown from 8.17 to 70.2 per cent. of fat in cream. Dr. Voelcker gives the composition of cream as follows:

Fat (butter).....	per cent.	33.43	25.40
Casein.....		2.62	7.61
Sugar.....		1.56	2.19
Salts.....		0.72	2.19
Water.....		61.67	64.80
Totals.....		100.00	100.00

A cream containing 30 per cent. of fat is considered rich. Cream is separated from milk wholly as a matter of convenience. Butter may be made from whole milk as well as from cream. The separation is effected by means of the difference in specific gravity between the fat globules and the milk serum, but the separation is never complete. Some of the milk serum adheres to and is carried up with the larger globules, and some of the smaller globules are held back by the serum, which is always more or less viscous, so that the cream always contains some milk serum, and there is always some fat remaining in the skim milk. The completeness with which the fat is removed from the skim milk is one of the most important economies in the manufacture of butter, as under different systems of separation the loss of fat in the skim milk may be from 6 to 40 per cent. of the whole. In practice, the separation of the cream is effected either by the force of gravity acting upon the fat globules in the milk when set at rest, or by centrifugal force acting upon the

globules in a rapidly revolving cylinder constructed for the purpose. The oldest and still the most common way of separating the cream is to set the milk in shallow pans from 2½ to 4 inches deep, in a room at a temperature, if possible, not above 60 F. In the course of thirty-six to forty-eight hours the cream will have more or less completely risen to the surface and can be removed by skimming. Milk on standing becomes sour; that is, it undergoes a fermentation by means of which a part of the milk sugar is changed to lactic acid, and this acid acting upon the casein causes it to coagulate or thicken; when this thickening takes place any remaining fat globules are prevented from rising, so that the completeness of the creaming depends somewhat upon the length of time which the milk may be kept sweet after it is set. The difficulty in keeping the milk sweet for a time sufficient for all the fat globules to rise led to the practice of surrounding the milk, as it was set, with cold water, and it was subsequently found that when this was done the depth of the milk could be greatly increased. The practice of cold deep setting, as finally developed, is to place the milk, as quickly as possible after it is drawn from the cow, into cans 8 inches in diameter and 20 inches deep. These cans are set or even submerged in water which is as nearly as possible the temperature of melted ice. It has been found that under these conditions not only does the cream rise in a shorter time, but much more completely than when set in pans. Since it would ordinarily be expected that increasing the depth of the milk would increase the time required for the cream to rise, and also interfere with the completeness of the creaming, several theories have been put forward to account for this quicker and more complete creaming. The one most commonly held has been that the serum of milk being a better conductor of heat than the fat, it cools more rapidly when placed in contact with cold water, and this more rapid cooling, causing a greater contraction, would increase the difference in specific gravity between the fat globules and the serum, and so aid in their separation. But this has been shown to be fallacious, for, though it is true that water is a better conductor of heat than fat, the small size of the fat globules (their diameter being about $\frac{1}{1000}$ of an inch) renders it impossible that, under any circumstances, there can be more than a small fraction of a degree difference between the temperature of the fat and that of the milk serum. Moreover, within the limits of temperature practical for creaming (90 F. to 40 F.), the coefficient of expansion of butter fat is more than three times as great as that of water, so that, in order to maintain the same relative difference in their specific gravities when the temperature is falling, the milk serum must cool more than three times as rapidly as the fat. In other words, when the milk serum has cooled from 90 F. to 40 F., or through 50 F., the fat globules should have lost less than 17 F., and should still have a temperature of over 73 F. Such a condition is manifestly impossible; but any less difference than this would cause the fat to become relatively heavier than at first, and would operate against the creaming.

Dr. Babcock, by the discovery of fibrin in milk, has offered a more rational theory. Fibrin upon exposure to the air coagulates or forms clots, and it does this more readily at a temperature at or near blood heat. These clots forming in the milk tend to prevent the rising of the fat globules. The rapid reduction of the whole mass of the milk to a temperature below 50 F. prevents the formation of fibrin clots, and so renders the separation of the fat globules from the milk serum easier and more complete.

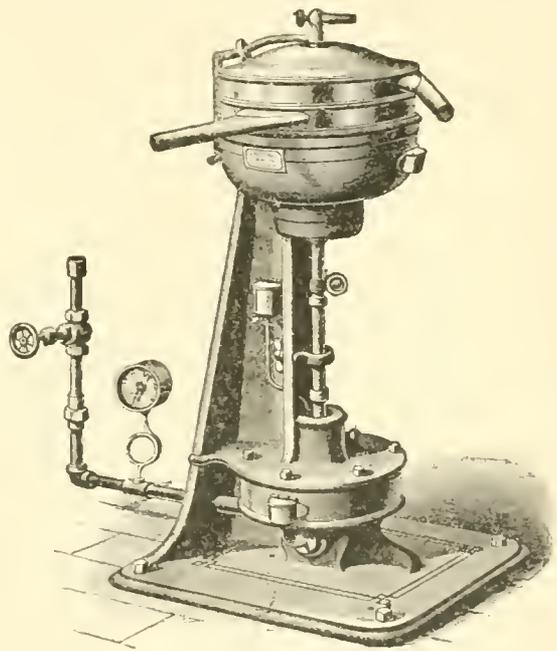

In 1877 a patent was granted to Lefeldt and Lentsch for a machine which should separate the cream from milk by centrifugal force. Since then the early machine has been much improved by De Laval and others, until at the present time the most effective means of cream separation is afforded by the use of these machines. Briefly, the machine is composed of a strong steel bowl or cylinder, so arranged that it may be made to revolve at a speed of 6,500 to 7,500 revolutions per minute. The milk being introduced at the center of the cylinder, the centrifugal force causes it to be carried to the sides, and, acting with greater force upon the heavier particles or serum of the milk, separates the milk in the bowl into a layer of skim milk next the wall and cream nearer the center. Exits are so arranged that any desired proportion may be constantly drawn off from both the skim milk and cream layers, and the whole milk constantly flowing into the bowl the operation is continuous. By regulating the speed of the machine and the rate of inflow the fat of the milk may be almost completely gathered

into the cream, and only the very smallest globules left in the skim milk. For the best results the milk should be at a temperature of 86 to 90 F. The inflow should be regular, and the number of revolutions not fall below 6,500. The larger power machines have a capacity of 3,000 to 4,000 lb. of milk per hour, and smaller hand-power machines have a capacity of 250 to 350 lb. per hour.

Under ordinary conditions the comparative loss of fat in the skim milk by these different systems of separation will be about as follows with milk containing 3.5 per cent. of fat:

SYSTEMS OF SEPARATION.	Per cent. of fat in skim milk.	Total loss of fat, per cent.
By setting in shallow pans	0.70	20
" " " deep cans	0.56	16
" the centrifugal machine	0.14	4

Cream may be churned into butter as soon as it is removed from the milk and while it is still sweet. Such butter, known as sweet-cream butter, is of a peculiar flavor, and at the present time is only in limited demand in the markets of the U. S. The more usual practice is to "ripen" the cream before it is churned. By ripening is meant the development of a mild degree of acidity. The cream that is to be churned at one time is brought to a temperature of about 70 F., at which temperature it is kept for twelve to twenty-four hours.

De Laval creamer

During this time it should be frequently stirred, and many believe that it is of great advantage if it can be freely exposed to a pure atmosphere. At the end of twelve to twenty-four hours lactic acid will have developed in sufficient quantity to cause a slight coagulation of the casein, and at the same time the characteristic flavors will have developed; the cream is then ready for the churn.

Churning.—By agitating cream or milk at a proper temperature, the fat globules may be made to unite and separate from the watery serum, which is called buttermilk. This is commonly done in a wooden vessel—a churn. Formerly the churn was simply a small barrel-shaped vessel supplied with a cover and a wooden dash or plunger. This is known as the dash-churn, and the agitation of the cream is effected by moving the dash or plunger rapidly up and down through the cream. Innumerable contrivances have been invented for effecting this agitation, and the Patent Office is filled with models of various sorts of churns; but there is no churn better than a plain box or barrel without inside dasher, floats, or contrivances of any sort. The necessary agitation is produced by the concussion of the particles of cream upon each other by either revolving the box or barrel, or swinging it from side to side. The matter of causing the fat globules to unite into butter is largely one of temperature, and, as has been shown by the churning of artificial emulsions of various

fats and oils, the proper temperature for churning bears a definite relation to the melting-point of the fat to be churned. Ripened cream may be churned at any temperature between 56° and 70° F., according to circumstances. In a great majority of cases 62° to 64° F. is the best temperature at which to churn. Sweet cream should be churned at a temperature six to eight degrees lower than ripened cream of the same character. If the churning temperature is too low, the fat globules are so hard that they will not stick together. If the churning temperature is too high, the fat globules are so soft that they do not readily unite, and the butter is of a very soft, oily nature. Below 50° and above 80° F. but very little butter can be obtained from churning; while above the melting-point of butter fat (93° to 96° F.) the fat globules, instead of uniting upon agitation, are broken up into still smaller particles. The time required for churning depends largely upon the temperature, the ripeness of the cream, and the rate of agitation. A high temperature and an advanced stage of ripeness shorten the process. A speed of about 700 feet per minute is considered to be the best. It is best to churn at such a temperature that from forty-five minutes to one hour will be required before the butter separates, or "breaks," as it is called. When the globules have united into masses the size of kernels of wheat, the churning should be stopped; the butter, being lighter, will rise to the top, after which the buttermilk may be drawn off. The butter should then be washed, until all traces of buttermilk are removed, in water at a temperature of 45° to 50° F. If too cold water is used in washing, the delicate flavoring-oils will be carried off in the wash water and the quality of the butter injured. After the butter is washed it should be salted with clean, fine, pure salt, usually an ounce to the pound, and the surplus water removed. The salting and removal of the moisture are done by working the mass thoroughly with a wooden paddle or lever upon a smooth wooden table. Various forms of workers are in use, but those are best which remove the moisture and work in the salt by means of direct pressure upon the mass rather than by a grinding motion. When the moisture is sufficiently removed, and the salt is completely dissolved, the butter is packed in tubs or printed in molds, and is ready for market. Working is best done at a temperature of 50° F. The complete removal of the buttermilk plays an important part in the keeping qualities of the butter. Pure butter fat may be kept for months without becoming rancid, but if any buttermilk is left in the butter, the casein of the buttermilk acts as a ferment upon both the sugar and the butter fat. The former is changed to lactic acid, and a little of the latter to free, fatty acids and glycerin. Salt tends to prevent this fermentation, and sometimes white sugar and saltpeter are added for the same purpose, but the complete removal of the buttermilk is of much more importance than the addition of preservatives. When freshly made from the milk of cows that are fed upon grass or succulent food, butter is of a golden yellow color and granular texture; but upon dry food, especially upon the poorer kinds, the butter is paler, even to whiteness. The texture depends upon the size of the granules when churning is stopped, and upon the care used in working. Certain breeds of cows, notably those of the Channel islands, Jersey and Guernsey, impart a high color to the butter made from their milk. The poorer and paler kinds of butter are often artificially colored, usually with an extract of annatto ground in oil. Butter varies very much in composition, mainly in the proportions of fat and water, and these are largely dependent upon the care taken in working it. Butter of good quality should have a composition about as follows:

Fat.....	per cent.	84
Casein.....		2
Ash (including salt).....		3
Water.....		11
Total.....		100

The proportion of fat in butter may vary from 77 per cent. to 95 per cent.; it should not be less than 80 per cent., and the percentage of water should not exceed 15. Butter melts at from 93° to 96° F., and the melting-point or hardness is an important point in the quality of butter. The hardness varies with the varying proportions of olein, palmitin, and stearin in the butter, and these vary with the individuality and breed of the cow, with the kind of food, and with the length of time the cow has been in milk. With cows fresh in milk in the spring, and fed on fresh grass, the olein, stearin, and palmitin are usually found in the proportion of about 50, 30, and 20. Later in the season, when the cows are

further advanced in milk, and the pastures drier and harder, the proportions may be found to have changed to 30 of olein, 50 of stearin, and 20 of palmitin.

The Butter Business.—The average yield of butter is 1 lb. from 22 to 25 lb. of milk. The average milk yield of the cows of the U. S. is from 3,000 to 3,500 lb. per annum. This would indicate a butter yield of 120 to 150 lb. per cow per annum, and is probably not far from the amount actually produced. There are, however, numerous dairies scattered throughout the whole country where the butter yield amounts to 300 lb. and over per cow per year, and individual instances are on record where single cows have produced 700, 800, 900, and in one case 1,153 lb. 15½ oz. in a single year. Such records serve to show that the butter-producing capacity of the cows of the country is capable of a much higher development than that now attained. A great stimulus to the production of butter, and an important factor in the improvement of its quality, was the establishment of butter factories, or creameries, as they are called. They have been in successful operation now for about twenty years, and are scattered throughout the whole of the U. S., but are found in greatest numbers in the States of Wisconsin, Illinois, Iowa, and Minnesota. In these factories it is possible to make up the butter from a large number of cows owned by many patrons, under the supervision of a single man, with the greatest skill and with the most approved machinery. The direct effect is to remove from the farm, and particularly from the farmhouse, a large amount of drudgery, to economize the labor and minimize the cost of production, and to manufacture a product of a uniformly high quality. These factories are often co-operative, and so return to the patrons the largest possible net amount from the raw materials. In some of the factories the milk is brought to the factory and the cream separated by large centrifugal machines; in others, the milk is set for creaming at the farm, usually by a cold, deep-setting process, and only the cream taken to the factory by wagons that go about from farm to farm for the purpose of gathering it. The pooling of milk, and particularly of cream, from a large number of patrons, usually varying quite widely in quality, gave rise to some difficulty in the matter of making a just and equitable division of returns. At first, the milk was paid for, or the dividends made on the basis of the weight or measure of the milk or cream. This was soon found to be unsatisfactory, particularly to those patrons who furnished the best quality of either milk or cream, and various means were devised for quickly and easily determining the true butter-producing value of any given sample of milk or cream. None of these were entirely satisfactory, and it was not until 1890 that Dr. Babcock hit upon a means, partly chemical, partly mechanical, and known as the "Babcock test," by means of which the percentage of fat in milk may be easily, quickly, cheaply, and accurately determined. In a large number of factories this method is now used with the best satisfaction for determining the percentage of fat in each patron's milk each day, and the dividends are apportioned among the several patrons, not on the basis of the quarts or pounds furnished, but upon the pounds of fat present in the milk. While there is nothing about the process of manufacturing butter in large quantities in butter factories that of itself should make the butter of any better quality or even so good as can be made with the same care upon the farms where the milk is produced, still, from the fact that upon a large majority of farms sufficient care is not exercised, and because of the advantages which the factory has in marketing large amounts of butter of a uniform quality, the factory system is usually found to be the most satisfactory way in which the producer of the milk may turn it into butter with the largest recompense in money.

Fraudulent preparations are often widely advertised and extensively sold among the unsophisticated for largely increasing the yield of butter. These preparations are usually known as butter powders, and are largely composed of alum or some similar substance, whose effect is to coagulate the casein and enable the operator to mix it with the butter, forming a frothy mixture of sour curd and butter fat. The directions for the use of a certain one of these, composed of equal parts of alum and sugar, are typical of all: "To a quart of milk twelve hours old add 1 lb. of butter; warm by setting the churn in blood-warm water. Add a teaspoonful of the powder and churn as usual. You will have 2½ lb. of delicious fresh butter." It is needless to say that such a mixture is not butter at all, and is anything but delicious.

The *adulterations* most frequently found in butter are excess of water and salt. They may be detected and esti-

mated by melting a weighed quantity of the butter and allowing them to settle out. Lard and other inferior fats are sometimes mixed with butter by unscrupulous grocers, but are easily detected. The chief competitor, however, of butter is known as

Artificial Butter.—Artificial butter, whose base is suet, is usually known in the market as *oleomargarine*; that made from the fat of swine is called *butterine* or *sucine*. (See BUTTER, ARTIFICIAL, below.) With improved processes the production largely increased, and oleomargarine became a very serious competitor of real butter in the markets. While there is no doubt that it is a good and cheap substitute for the poorer grades of butter, still from the facts that impure and often diseased materials were used in its manufacture, that oleomargarine is believed by many to be less digestible in the human stomach than pure butter, and, most important of all, that oleomargarine was fraudulently put upon the market as pure butter, Congress, at the earnest solicitation of dairymen and against the most vigorous efforts of the oleomargarine manufacturers, on Aug. 2, 1886, passed a law, known as the Oleomargarine Act, the provisions of which were as follows: A special tax of \$600 is levied on manufacturers, a tax of \$480 on wholesale dealers, and a tax of \$48 on retail dealers. Besides this, a stamp tax of two cents per pound is assessed on every pound, or package containing a fraction of a pound, manufactured in the U. S.; and upon that imported from other countries a tax of fifteen cents a pound is levied, besides any customs duty. For the fiscal year ending June 30, 1891, \$1,077,924 were collected by the internal revenue department under this act. The effect of this law has not been such as was hoped by its framers—to prohibit the manufacture of oleomargarine—for the amount manufactured has actually increased since the passage of the act. The law, however, has not failed in noteworthy results. It has helped to raise the price of butter, especially that of good butter, by preventing oleomargarine from masquerading as a more expensive article. It has kept the price of oleomargarine down, greatly to the advantage of consumers, by compelling it to be sold under its own name. It has relieved that product from the reproach of being a fraudulent article, and has given it an honorable position in commerce as a legitimate means of utilizing waste products, and as a cheap, wholesome substitute for an expensive necessity. Besides the national act, many of the States have also passed laws governing the manufacture and sale of artificial butter, and some of them, notably New York, have gone so far as to actually prohibit them. The New York law has been in operation for several years; it was bitterly attacked by the manufacturers of oleomargarine, but has been declared constitutional by the highest State court.

Vegetable Butters.—The name "butter" is applied to several vegetable fats, such as palm, cacao, coconut, nutmeg, and shea butter. The latter is made from a nut like the olive, and is used in Africa as a substitute for butter.

Metallic Butters.—In chemistry the name butter was formerly applied to certain oily compounds which resembled melted butter; as the butter of antimony, bismuth, zinc, and tin, which were the chlorides of the respective metals. *Boj butter* is a fossil butter found occasionally in the Irish peat-bogs. It is believed to have been made by man. *Rock butter* is an iron alum which appears as a pasty exudation on alum slates.

HENRY H. WING.

Butter, Artificial. Butterine, Oleomargarine: mixtures of various fats prepared as substitutes for butter. A French chemist, Mège-Mouries, first devised a method of making artificial butter on the large scale, which he described in 1870 as follows: "The fat of best quality from recently killed bullocks is finely cut in a kind of sausage-grinder in order to break up the membranes. The fragments fall into a tank heated with steam, which for every 1,000 parts of fat contains 300 parts of water and 1 part of carbonate of potash, and two stomachs of sheep or pigs. The temperature of the mixture is raised to 45° C. After two hours, under the influence of the pepsin in the stomach, the membranes are dissolved and the fat melted and risen to the top of the mixture. The fat is next drawn off into a second tank, kept at a somewhat higher temperature, and 2 per cent. of common salt added. After two hours more the fat becomes clear and takes on a yellow color, and acquires somewhat the taste and odor of fresh butter. The fat is now drawn off into vessels and allowed to cool. It is then cut into pieces, wrapped in linen, and put in a hydraulic press and kept at a temperature of about 25° C. By pres-

sure the fat is separated into two portions, viz.: stearin 40 to 50 per cent., and fluid oleo 50 to 60 per cent. The stearin remaining in the presses is used in candle-making."

Since 1870 many patents have been issued for the preparation of artificial butter, and large quantities are manufactured. All the methods have this in common, that they involve the use of animal fats other than butter. In some of them COTTONSEED OIL (*q. v.*) is used. One of the largest manufacturers of artificial butter in the U. S. thus describes the process:

"The fat is taken from the cattle in the process of slaughtering, and, after thorough washing, is placed in a bath of clean, cold water, and surrounded with ice, where it is allowed to remain until all animal heat has been removed. It is then cut into small pieces, . . . and cooked at about 150° F. until the fat, in liquid form, has separated from the fibrin or tissue; then settled until it is perfectly clear. Then it is drawn into graining-vats and allowed to stand a day, when it is ready for the presses. The pressing extracts the stearin, leaving the remaining product, which is commercially known as oleo oil, which when churned with cream or milk, or both, and with usually a small proportion of creamery butter, the whole being properly salted, gives the new food-product *oleomargarine*. . . . In making butterine we use neutral lard, which is made from selected leaf lard in a very similar manner to oleo oil, excepting that no stearin is extracted. This neutral lard is cured in salt brine for forty-eight to seventy hours, at an ice-water temperature. It is then taken, and, with the desired proportion of oleo oil and fine butter, is churned with cream and milk, producing an article which, when properly salted and packed, is ready for market. In both cases coloring-matter is used, which is the same as that used by dairymen to color their butter. At certain seasons of the year, viz., in cold weather, a small quantity of salad oil made from cottonseed is used to soften the texture of the product, but this is not generally used by us."

It is the general opinion of those who have studied the subject that artificial butter is a wholesome article of food. Its composition is very similar to that of natural butter, and experiments have shown that the two are about equally digestible. The prejudice against oleomargarine is largely due to ignorance. Methods of analysis have been devised by which it is possible to determine whether a given specimen is natural or artificial butter.

IRA REMSEX.

Buttercup: See RANUNCULUS.

Butterfield, DANIEL, b. in Utica, Oneida co., N. Y., Oct. 31, 1831; educated at Union College; went into mercantile pursuits; became colonel of a militia regiment which he led to Washington and to Patterson's Shenandoah army on the breaking out of the civil war; was made brigadier-general of volunteers Sept., 1861; major-general Nov., 1862, and at the same time colonel of the Fifth Infantry in the regular army; took part in many actions under Gen. McClellan, Pope, and Burnside; was chief of Gen. Hooker's staff at Chancellorsville and Lookout Mountain, and in the campaign to Atlanta. He was breveted major-general in the regular army; resigned in 1869; sub-treasurer of the U. S. in New York; then in the express business. Published *Camp and Outpost Duty* (1862).

Butter-fish: a small silver flat-bodied fish of the family *Stromateidae* (*Stromateus trinecanthus*) found along the Atlantic coasts of the U. S. Its flesh is fat, whence the name, and it is much valued as food. The name is applied to other fishes, as the gunnel (*Muraenoides guanelus*) of the North Atlantic.

Butterfly: the common name of the *Rhopalocera* or day-flying LEPIDOPTERA (*q. v.*). They are distinguished from the other Lepidoptera (moths) by the diurnal habits, the antenna enlarged or clubbed at the tip, and by holding the wings, when at rest, folded vertically over the back. Other characters must be sought in entomological treatises. Butterflies are usually divided into five "families." In the *Hesperidae*, commonly called skippers on account of their jerky flight, the antenna are bent or hooked at the tip. These are mostly small, dark-colored forms, with large abdomens, more like those of moths than of other butterflies. In the four other families distinguished from one another by characters too technical for consideration here, the club of the antenna is not bent. The *Papilionidae* includes the swallow-tailed butterflies, large forms of remarkable beauty, of which about twenty-five species occur in the U. S. The larvæ of these are noticeable from the fact that they possess two pro-

trusible fleshy horns which emit a disagreeable odor, thus serving as organs of defense. The *Pieride* are smaller forms, white, yellow, or orange in color. Here belong the CABBAGE BUTTERFLIES (*q. v.*). The *Lycenidae* are still smaller, and our common species are usually divided into the blues, the coppers, and the hair-streaks, according to the color and ornamentation of the wings. There are about 125 species known in the U. S. The largest family of butterflies is the *Nymphalidae*, the members of which vie with the swallow-tails in size. In these the fore legs are so reduced in size that they are of no use in walking. Most striking of the family are the large *Morphos* of Brazil, with an eyelike spot on each hind wing. The *Heliconias* of the same regions should also be mentioned. These are strong-flying, narrow-winged forms, which are protected from birds, etc., by their disagreeable odor and taste. In the same regions are numerous *Pierids* which have no such protection, but which so closely resemble the *Heliconias* in form, color, and mode of flight, that no bird having once tasted a *Heliconia* would be apt to take one of them. Some species of *Nymphalidae* have a wide distribution. Thus the morning cloak or Camberwell beauty (*Vanessa antiopa*) is common to the north temperate regions of both hemispheres, while the *Vanessa cardui* occurs in all parts of the globe except South America and the Arctic regions.

A remarkable feature in the history of butterflies is the DI- or POLYMORPHISM (*q. v.*) existing in many species. Thus the swallow-tail *Papilio ajax* of the U. S. passes the winter in the chrysalis state. Those which emerge from the chrysalis early in spring have the markings of the form earlier known as *P. marcellus*, while those that emerge in the summer are known as *P. telamonides*. Both of these lay eggs, from which are developed in the same season butterflies of the *ajax* type, and from these come the chrysalids.

In spite of their beauty butterflies must be regarded as pests, since their larvae feed upon vegetation, and sometimes occur in such numbers as to do great damage. They have always been favorites with collectors. See LEPIDOPTERA, and Kirby's *Synonymic Catalogue of Diurnal Lepidoptera* (London, 1871-77). J. S. K.

Butterfly-weed: the *Aselepias tuberosa*: an herbaceous plant which is indigenous in many parts of the U. S., and is sometimes called **Pleurisy Root**. It has nearly sessile leaves, varying from linear to oblong-lanceolate, and has showy, orange-colored flowers. The root is diaphoretic and expectorant, and has been used in medicine. See ASCLEPIAS.

Butterine: See BUTTER, ARTIFICIAL.

Buttermilk: the part of milk that remains after the butter has been separated from it. It contains casein, sugar, water, and all the original ingredients of milk, except the greater part of oily matter. It is a nutritious beverage, and is extensively used in many places as food.

Butternut, or White Walnut: the *Juglans cinerea*, and its fruit, which is indigenous in the U. S. The tree grows to the height of from 50 to 75 feet, with gray bark and widely spreading branches, and has oblong-lanceolate downy leaflets, which are serrate, pointed, and rounded at the base. The petioles and branchlets are downy also, and have clammy hairs. The fruit is oblong and clammy, and contains an oily, eatable kernel. The nut is deeply sculptured and rough with ragged ridges, and is two-celled at the base. The wood is valuable in the arts, and contrasts finely with black walnut. The nuts, if gathered in June, can be made into fine pickles. The name *Butternut* is given also to a South American tree, *Caryocarp nuciferum* (family *Ternstroemiaceae*), which bears large drupes containing four one-seeded edible nuts. Revised by CHARLES E. BESSEY.

Butter, Shea: See BASSIA.

Butter-trees: species of East Indian trees of the genus *Bassia* and family *Sapotaceae*, so named on account of the butter-like fat obtained from their seeds, and used as food. There are other fat-yielding trees which bear this name.

Butterwort: an herbaceous plant of the genus *Pinguicula* and family *Lentibulariaceae*; distinguished by a two-lipped calyx the upper lip trilobed, the lower bifid; and a spurred corolla, two-lipped and gaping, the upper lip arched. The *Pinguicula vulgaris* is a small stemless perennial, growing in marshes and on wet rocks in Europe and the U. S. It has the power of coagulating milk, and is used for that purpose by the Laplanders. Revised by CHARLES E. BESSEY.

Butterworth, HEZEKIAH: journalist; b. in Warren, R. I., Dec. 22, 1839. Became assistant editor of the *Youth's Com-*

pasion, Boston, in 1871, and has published much popular juvenile literature, such as *Zigzag Journeys* (1878-90) etc.

Buttlar, boot'lar, Eva, von: b. at Eschwege, in Hesse, in 1670; in 1687 married to De Vésias, a French emigrant who lived at the ducal court of Eisenach as dancing and fencing master and tutor to the pages; lived here for several years; in 1697, having met with the famous Pietist, Vockerodt of Gotha, she changed the whole character of her life, left her husband, and returned to her native town. Her religious enthusiasm soon degenerated into fanaticism and blasphemy. On Jan. 2, 1702, a new "Christian" congregation was formed at Allendorf, in Hesse, in which she was worshiped first as the Holy Ghost, afterward as the mother of the Lord, who should give birth to the new Christ. In spite of the public indignation aroused by many immoral practices, the congregation maintained itself for some twelve years. The movement cast reproach upon all Pietists. D. at Altona, near Hamburg, about 1717. See E. F. Keller, *Die Buttlarische Rotte* in *Niedner's Zeitschrift für hist. Theologie* (1845); and M. Goebel, *Geschichte des christlichen Lebens in der rhein-westphäl. evang. Kirche* (2 vols., Coblenz, 1852 ii. 728-809); and her *Life* by Ludwig Christiany (Stuttgart, 1870).

Buttmann, boot man, PHILIPP KARL: philologist; b. at Frankfurt-on-the-Main, Germany, Dec. 5, 1764; was appointed secretary of the Royal Library of Berlin in 1796, and chief librarian of the same in 1811. He was a friend of Niebuhr, and an excellent Greek scholar. He edited several Greek classics, and published, besides other works, a *Greek Grammar for Schools* (1792); a large *Greek Grammar* (Ausführliche Griechische Sprachlehre, unfinished); and *Lexilogus, or Explanation of the Greek Words* (1818). D. in Berlin, June 21, 1829.

Büttner, CHRISTIAN WILHELM: b. at Wolfenbüttel, Brunswick, Germany, in 1716; was for many years professor in the University of Göttingen; died at Jena in 1801. He traveled extensively, and made very comprehensive studies of languages and of natural history. He gave the first idea of a glossography, or geography of languages, and formed rich collections of natural history. In honor of him Leopling named a species of plants belonging to the sixteenth class of the system of Linnaeus, and comprising several tropical shrubs related to the cocoa-tree, *Büttneria*.

Button [from O. Fr. *boton*, bud, knob, button; Ital. *bottone*; Span. *boton*; deriv. of O. Fr. *bouter* > Mod. Fr. *bouter*, shoot, thrust, a word of Teutonic origin; cf. O. Il. G. *bāzan*, beat; O. Eng. *bēatan* > Eng. *beat*]: an article of dress of various forms, used either for ornament or for fastening together the parts of a dress by means of a loop or worked buttonhole. Buttons are used for various articles of male and female apparel, and for hats, bonnets, shoes, and gloves. The word is also applied in *carpentry* to a flat oblong piece of wood or metal, turning on a nail or screw, to fasten doors and the like; and in *assaying* to a round mass of metal remaining in the cupel after fusion; but the use of the word in relation to articles of dress is the one of most importance. The button is generally considered a sign of civilization. The savage fastens his blanket or tunic, his leggings and mocassins, with strings, and has no idea of buttonhole or button; and it is only when a considerable degree of civilization is attained that we find buttons taking the place of strings or lacings, while fashion, in the artificial condition of society in great cities, requires a profusion of buttons, not so much for use as for ornament. Except the occasional use of a gem to fasten the toga at the neck, the Greeks and Romans seem to have had no idea of buttons, as indeed their flowing robes did not require them. They were first applied to dresses (probably in the thirteenth or fourteenth century) for purposes of ornament only, but somewhat later the buttonhole, an expansion of the idea of the loop, was invented, and the button became indispensable for the dress. In the beginning of the seventeenth century the manufacture of buttons had attained some importance in England, Birmingham being then, as now, its principal seat. These buttons were of cloth, covering a wooden disk, of gold, steel, and ivory, the last three the work of the goldsmiths, who were very expert in the arts of chasing and carving metals. Some of the steel buttons made at the Soho works about this time were sold at 140 guineas the gross, or almost \$5 the button. About 1745 Matthew Boulton made many improvements in inlaid and steel buttons. Gilt buttons came into use soon after the accession of George III. in 1760, and John Taylor, of Birmingham, originally a cabinetmaker, patented many improvements in gilt, plated, and lacquered

buttons. The making of the shanks or eyes of these buttons was improved by Ralph Heaton, also of Birmingham, not far from 1800. This is still a separate branch of the business at Birmingham. From 1760 to the present time the manufacture of buttons has been a constantly growing industry in Great Britain, France, Switzerland, and the U. S. All descriptions of buttons may be classed under three distinct heads—viz., shank buttons, hole buttons, and covered buttons—but each kind is made of a great variety of materials and an almost infinite diversity of forms. The covered buttons, having a basis of wood, brass, zinc, or tin, have their covering of farmer's satin, prunella, broadcloth, brocade, velvet, silk, mohair, grenadine, twist, linen, cotton, and in short, every description of textile fabric. Both the shank and the covered buttons are to a considerable extent made on the *shell* plan—i. e., the face of the button is stamped out of a thin sheet of metal—and may have a flat, oval, or round surface, as desired; and the back or under surface is also stamped, and, its edges being turned, it is pressed into the upper shell and locked there by the pressure. The principle on which all shell buttons are made was first devised by B. Sanders, a Dane, who had lost most of his property in Copenhagen in the bombardment of that city in 1807, and removed to Birmingham, England, where he commenced the manufacture of buttons. He applied it only to covered buttons, which he made of sheet brass or tin in two parts, the upper blank or disk having its edge turned up and being covered with cloth, silk, or lasting, and the under blank, which was smaller than the upper and convex in form, having a wire shank, and the cloth and paper or cardboard which was to keep it in place put inside of it, and the two were pressed together, the turned edges interlocking so as to make a perfect button. An improvement was made in these by a son of Mr. Sanders, the lower blank having a circular hole in it (and receiving in consequence the name of "collet"), through which in the act of pressing the two blanks together a portion of the cloth or textile inside of the collet was thrust, so as to make a flexible cloth shank in place of the wire one. Other modifications were made by other inventors which reduced the price and greatly increased the facility of production. One of these was the production of what is known as the silk-back button, which dispenses with the collet, though it substitutes for it a round piece of sheet iron smaller than the upper blank. The so-called silk-back is a very thick heavy cloth having a silk face, which is cut out of the proper size, by a die, its back having first been coated with a heavy sizing; a filling of soft spongy paper is placed upon this sizing, and the back is then gathered over the small blank of sheet iron and pressed into the upper blank or shell, which had previously been covered with the proper material, and the button is completed, no metal appearing upon either surface. In the shell-covered buttons sheet iron is now used for the blanks, and where the metal shows, as in the ordinary flexible shank buttons, it is lacquered. The process for making the metallic shell buttons is different, though the principle is the same. These buttons, whether of flat or oval surface, and whether figured or plain, are made from rolled brass plate; originally the flat buttons were solid and struck out as blanks from a thick plate, the eye or shank soldered on, and the whole finished, polished, and gilt, or silvered by the old cream-of-tartar process for silvering or the mercury amalgam for gilding. It was said that by this latter process six cents' worth of gold would suffice for gilding a gross of buttons. Both processes have been superseded by electro-plating. (See GILDING and ELECTRO-PLATING.) When buttons began to be made on the shell plan the upper blank was forced by the falling of a heavy weight into a finely engraved die of hardened steel, which gave it the oval form and the beautifully ornamented surface, and the under blank into another die, which stamped upon it the maker's name or trade-mark, and at a later date riveted the shank (which before had been soldered to it) into this plate; a filling of stout paper or binder's board was then placed upon it. The two plates were then pressed together by a fly-press, and the button was trimmed and ready for the gilding. When gilt it was burnished and set on cards containing a dozen, when it was ready for market. Subsequent improvements have combined and simplified these processes, so that now a single machine completes the button except the gilding, burnishing, and carding; and the last process is also performed by a machine. Embossed buttons have been made of horn softened by heat, dyed, and pressed in a die of *bois brulé* (sawdust and shellac heated), and of india-rubber and gutta-

percha vulcanized, which were for some years very popular. These have now mostly given place to oval and flat buttons of ivory, bone, vegetable ivory, mother-of-pearl, and celluloid. The ivory, bone, and vegetable-ivory buttons are engraved and dyed in a variety of patterns and checks. The mother-of-pearl may be either of the ordinary color of pearl or what is known as smoked pearl. The celluloid buttons are made in molds and dies, like the vulcanite and horn. Those made of VEGETABLE IVORY (*q. v.*) are cut from slabs sawed out of the vegetable ivory-nut by bits attached to spindles and made to turn very rapidly, and are then turned, polished, dyed, and worked in figures in a lathe. They are then carefully sorted and put upon cards. The hole buttons, when made of ivory, vegetable ivory, pearl, malachite, onyx, etc., are cut by a tubular saw or bit revolving with great rapidity; the eyes are made by fine revolving drills. Pearl shirt buttons are made in great quantities both in the U. S. and Europe, and many of them are made of cheap substitutes for pearl. Azate or feldspar buttons for under-clothing, as well as clay buttons, pressed into molds and baked and glazed like porcelain, are mostly made in Europe, requiring very cheap labor for their production. The greater part of the trouser buttons in use are made either from japanned iron stamped out by a heavy die or embossing swedge, or are made as shell buttons, with the back of paper or wood, and the whole button made by one machine and almost by a single blow. They are afterward japanned. Fancy and ornamental buttons for ladies' dresses are sometimes made of combinations of cloth and glass, or papier-mâché, pearl, metal, or choice woods, sometimes of vulcanite, glass, pearl, or Whitby jet, but oftener at the present day of silk, velvet, silk cords and figures, or what is known as passementerie, or of brocade and embroidered silk. These are usually made upon a wood foundation, especially if they are oval or of fanciful shape. Their manufacture is often carried on in connection with other dress trimmings.

The manufacture of covered buttons, except in its simpler forms of hand-made covered buttons, was not attempted in the U. S. earlier than 1825 or 1826. Samuel Williston, who was the founder of the covered-button business in his country, commenced covering buttons by hand at Easthampton, Mass., in 1826, and by the gradual introduction of machinery and a consolidation of his methods and machines with those of the Haydens at Haydenville in 1834 (the Haydens had been making buttons in a small way after the Sanders patterns from 1831), laid the foundations of the extensive works of the National Button Company, which employs 175 hands and can turn out 2,500 gross per day. Waterbury, Conn., was one of the early seats of the manufacture, but has been largely occupied with the production of metal buttons. In Great Britain five-sevenths of the manufacture are concentrated in Birmingham. France and Austria have great numbers of factories where dress buttons are made in connection with other dress trimming.

In China the knob of gold or of some precious stone worn at the top of the official hat is called a button, and is used to indicate rank. There are nine grades, each indicated by some special color or material. The highest is transparent red (a ruby); the second opaque red (coral); the third transparent blue (sapphire); the fourth opaque blue (lapis lazuli); the fifth transparent white (crystal); the sixth opaque white (stone); the seventh plain gold; and the eighth and ninth worked gold. These are again divided into two classes, distinguished as *principal* and *subordinate*, the latter having the Chinese character for "old age" engraved on them. The ninth button has two such characters engraved on it, and is the button worn by every one who has taken the *sin-tsai*, or bachelor's degree. Revised by R. LILLEY.

Button-bush (*Cephalanthus occidentalis*): a shrub of the *Cinchona* family, with a white flower in globose heads, whence its name. When in flower it is much frequented by bees.

Buttonwood: See PLAKE-TREE.

Buttress [from Fr. *bouter*, thrust, push]: a projection built against a wall or other structure for the purpose of strengthening it, especially where exposed to a horizontal thrust or pressure, as in terrace-walls or in walls supporting heavy vaults or roofs. Rudimentary buttresses are found in Chaldæa, but the buttress never became an architectural feature until the introduction of vaulting by the Romans compelled them to thicken the masonry at the points where the thrust was exerted, and to carry the resisting mass above the roofs of the wings of the building, as in the great halls of the

thermæ. The Gothic architects developed from this device the *flying buttress* (Fr. *arc-boutant*), in which a half-arch, springing from a heavy pinnacled buttress on the line of the outer side-aisle wall, rises to the level of the nave-vaulting above the clerestory, and transfers its enormous thrust downward to the exterior buttress. The earliest buttresses were broad and simple; with the development of Gothic architecture they became narrower but deeper, were broken into receding steps or stages, adorned with gables, and terminated in lofty pinnacles; while the flying arches became extremely elaborate in France, especially where the vaulting was loftier and bolder than elsewhere. In the perpendicular and flamboyant styles the buttress was sometimes richly paneled over its whole surface. A. D. F. HAMLIN.

Butyric Acid [from Lat. *butyrum*, BUTTER (*q. v.*)] : occurs in the combination with GLYCERIN (*q. v.*), in the form of a fat in butter, and is one of the members of the series of so-called "fatty acids." When the fat of butter is treated with an alkali, it is saponified, and a salt of butyric acid is obtained. From this, by treatment with any one of the ordinary acids, the butyric acid can be set free. It is formed most readily by fermentation of sugar and of starch. Rancid butter contains it in the free condition together with other acids, and the peculiar odor and taste of such butter are due, to some extent, to the presence of these acids. Butyric acid is a colorless transparent liquid at ordinary temperatures. When cooled down to a very low temperature it solidifies. It is manufactured on the large scale for the purpose of preparing BUTYRIC ETHER (*q. v.*).

Butyric Ether : a substance belonging to the general class of ETHERS (*q. v.*) which are formed by the action of alcohols on acids. Butyric ether is made by treating a mixture of butyric acid and ordinary alcohol with sulphuric acid, and heating. The ether separates as a layer that can easily be removed and purified. Like most of the substances belonging to the same class, this ether has an agreeable odor. The odor in this case is like that of pineapples, and the ether, which is a colorless liquid, is manufactured and sold under the name of pineapple oil. It is used extensively in perfumery. Whether the odor of pineapples is due to the presence in these of butyric ether has not been determined. The quantity present is, in any case, very small.

Buxbaumia : a genus of mosses (named in honor of J. C. Buxbaum, a German botanist), of which only two species are known. *Buxbaumia aphylla* occurs in Europe and America, and is apparently destitute of leaves; the part of it visible above the ground is merely the little capsule, surrounded with minute scales.

Buxton : a town and watering-place of Derbyshire, England; in a deep valley near the source of the Wye; 32 miles N. W. of Derby, and 160 miles N. N. W. of London (see map of England, ref. 8-G). Here are calcareous and chalybeate springs, which are annually visited by about 14,000 persons. Buxton is surrounded by beautiful scenery, has several good hotels, and baths which are regarded as among the finest in Europe. One of the Dukes of Devonshire expended £120,000 here in the erection of a pile of stone buildings called the Crescent. Buxton was once the residence of Mary Queen of Scots, then a captive. The inhabitants manufacture ornaments from alabaster and spar, and excellent lime is burned at the quarries near Poole's Hole, an immense stalactite cave about half a mile distant. Near this town is Diamond Hill, famous for its crystals. Pop. (1891) 7,424.

Buxton, SIR THOMAS FOWELL : philanthropic brewer; b. in Earl's Colne, Essex, England, Apr. 1, 1786; was the son of opulent parents; studied in Trinity College, Dublin. He married in 1807 Hannah Gurney, a sister of Joseph John Gurney and of Mrs. Fry; was elected a member of Parliament in 1818 by the voters of Weymouth, which he represented nineteen years; was made a baronet in 1840. He was an eminent advocate of the abolition of slavery, the improvement of prison discipline, and other humanitarian measures, and had much influence in public affairs. D. Feb. 19, 1845. See his memoir by his son, Sir Charles (London, 1848; n. e. 1872).

Buxtorf (in Lat. *Buxtorfius*), JOHANN : scholar; b. at Kaumen, in Westphalia, Dec. 25, 1564; was well versed in the Hebrew language and rabbinical literature. In 1591 he became Professor of Hebrew at Basel. His chief works are a *Lexicon Hebraicum et Chaldaicum* (1607) and *Biblia Hebraica Rabbinica* (1618). D. at Basel, Sept. 13, 1629. See his *Life* by E. F. Kautzsch (Basel, 1879).

Buxus : See BOX.

Buys-Ballot, bois-bûil lôt, CHRISTOPHORUS HENRICUS DEDERICUS, Ph. D. : meteorologist and author of the well-known *Buys-Ballot's Law*, expressing the relations of the wind-directions to the position of the storm center; b. in the small village of Kloetinge, province of Zeeland, Holland, Oct. 10, 1817. He obtained the degree of Ph. D. from the University of Utrecht, in which institution he soon became a professor (1847), remaining in this position for forty years. He was, in some sense, the creator of the Dutch meteorological service, of which he was the director until his death. On leaving his professional chair a special medal was struck in his honor. He was an honorary member of the Royal Meteorological Society and of the Austrian Meteorological Society, and knight or commander in orders in Austria, Holland, Portugal, and Russia. He was a prolific writer not only in Dutch, but also in English, German, and French. His earliest papers were upon chemistry and physics, but for the last forty years of his life they were devoted to meteorology. D. in Utrecht, Feb. 2, 1890.

M. W. HARRINGTON.

Buzancais, bü'zãñ'sã : a town of France; department of Indre; situated partly on the banks of the river Indre and partly on the islands in its channel; 46 miles S. E. of Tours (see map of France, ref. 5-E). Here are extensive iron-works. Pop. (1891) 5,027.

Buzzard : a bird of the genus *Buteo*, order *Raptores* and family *Falconidae*; having a small bill, which bends from the base and is not notched. The buzzards resemble the eagle and falcon in form, but are inferior in size and courage. The common buzzard (*Buteo vulgaris*), a native of Europe, measures nearly 4 feet from tip to tip of the wings. It is sluggish and inactive compared with other birds of prey. The prevailing color of its plumage on the upper parts is brown, with a mixture of black. The rough-legged buzzard (*Archibuteo lagopus*) may be distinguished by its having the tarsi feathered to the toes. It is widely distributed in Europe and Africa, and is found in North America. Among the other species of this genus is the red-tailed hawk or chicken hawk of the U. S. (*Buteo borealis*), which often kills poultry. The American bird called turkey-buzzard belongs to the genus CATHARTES (*q. v.*).

Buzzard's Bay : in the south part of Massachusetts; is 30 miles long; has an average width of 7 miles; contains the harbors of New Bedford, Fairhaven, and Wareham. It is sheltered from the ocean by the Elizabeth islands.

By-bidding : bidding at an auction sale by a person on behalf of the owner of the property sold, and with no intent of purchasing it. In the U. S. some authorities have held that a single by-bidder may be employed to prevent the property from being sacrificed below a given price, but that the employment of a number to create a false appearance of competition is a fraud. When there has been fraudulent by-bidding a *bona-fide* bidder may refuse to take property knocked down to him, or may claim property knocked down to the by-bidder when his own bid was the highest *bona-fide* bid. By-bidders are often called "puffers." See AUCTION. Revised by F. STURGES ALLEN.

Byblos, or **Byblus** (in Gr. *Βύβλος*) : an ancient city of Phœnicia; on the Mediterranean; about 22 miles N. N. E. of Berytus; called *Giblah* by the Hebrew writers. It was near the base of Mt. Lebanon, and was said to be the native place of Adonis or Thammuz. This site is occupied by the modern town of Jubel and ruins of a Roman theater.

Byblos : an ancient town in the delta of Egypt; celebrated for its manufacture of papyrus, the chief writing-material of the civilized world. It stood in a marshy tract which produced in abundance the byblus or papyrus plant (*Cyperus antiquorum*).

Byerly, WILLIAM ELWOOD, Ph. D. : b. in Philadelphia, Pa., Dec. 13, 1849; graduated at Harvard College 1871; received Ph. D. from same 1873; was appointed Assistant Professor of Mathematics at Cornell University 1873-76; held the same position at Harvard 1876-81; was appointed full professor there 1881. In 1878 he was elected fellow of the American Academy of Sciences. He has published *Elements of Differential Calculus* (1879); *Elements of Integral Calculus* (1881); and several syllabi of mathematical courses given at Harvard.

Byfield, NATHANIEL : b. at Long Ditton, Surrey, England, in 1653; removed to Boston, N. E., 1674, and became a

prominent merchant; was the principal settler of Bristol, R. I.; returned to Boston in 1724; became Speaker of the House of Representatives; was judge of the Bristol County court of common pleas for thirty-eight years, and of Suffolk County 1730-32; member of the council and judge of the vice-admiralty 1704-15 and 1729. D. in Boston, June 6, 1733.

Byford, WILLIAM HEATH, M. D.; physician; b. in Eaton, Proboscis co., O., Mar. 20, 1817; was self-educated; became an active practitioner in Chicago; president of faculty and Professor of Clinical Surgery in the Women's Hospital Medical College; twice president of the American Medical Association; author of *Practice of Medicine and Surgery Applied to Diseases and Accidents Peculiar to Women* (rev. ed. 1871); *Theory and Practice of Obstetrics* (New York, 1870).

By-laws; originally laws (now usually called ordinances) made by a community or municipal corporation for the purpose of local government; by extension, rules or laws made by any corporation under authority conferred by its charter or by statute, or made by an unincorporated association with the consent of its members, for its own government or that of its members. It is a general rule that the power to make by-laws is incidental to the existence of a corporation. This power is sometimes expressly conferred upon the corporation in its charter, or vested in a select body, such as a board of directors. Where the charter is silent, however, the power appertains to the corporation itself, except in the case of charitable corporations which, in general, have no such implied authority. By-laws must be reasonable and consistent with law, and be enacted within the State where the charter is in force. A written entry is not essential to their validity, and their existence may be established by custom. The by-laws of a municipal corporation govern all persons within its jurisdiction; those of a private corporation have no force as such over persons not members, but the members are presumed to know them, and are bound by them. A penalty for their breach may be collected by an action at law. The by-laws of a municipal corporation are enacted in the exercise of a quasi-legislative capacity, and the corporation is not liable for damages resulting from the acts of citizens by whom they are broken.

Revised by F. STURGES ALLEN.

Byles, MATHER, D. D.; clergyman and wit; b. in Boston, Mass., Mar. 26, 1706. His father was a native of England; on his mother's side he descended from the Rev. Richard Mather and the Rev. John Cotton. He graduated at Harvard College in 1725; was ordained first pastor of Hollis Street church, Boston, 1733; soon attained eminence in his profession; also attracted considerable attention by his poetical talents. He continued happily with his parish till the excitement preceding the Revolution created a distrust against him, and he was accused of being a Tory and separated from his parish. Charges were afterward made against him that he prayed for the king and received visits from British officers, and in May, 1775, he was publicly denounced in town-meeting. On June 2 following he was placed on trial, pronounced guilty, and ordered to be confined on a guardship, and in forty days to be sent to England with his family; this sentence, however, was not executed, but he was confined to his own house, over which a guard was placed, afterward removed, but again replaced and again dismissed, causing him to say that he was "guarded, reguarded, and disregarded." His literary talent was recognized by many men of genius in England. He continued to reside in Boston, but was not again connected with any parish. D. in Boston, July 5, 1788.

Bylot's Bay: See BAFFIN'S BAY.

Byng, GEORGE; b. in Wrotham, England, Jan. 27, 1662-63; went to sea at the age of fifteen; in 1703 became rear-admiral of the red. Served in 1704 under Sir Cloudesley Shovel, and reduced Gibraltar; also distinguished for his services at battle of Malaga and off Messina, where, July 31, 1718, he dispersed the Spanish fleet. He was afterward made rear-admiral of Great Britain, member of the privy council, Baron Byng, Viscount Torrington, and Knight Companion of the Bath. In 1727 he became First Lord of the Admiralty. D. Jan. 17, 1733.

Byng, JOHN; admiral; son of Viscount Torrington; b. in 1704; gained the rank of admiral of the red in 1748. In 1756 he commanded an expedition sent to relieve Minorca, then blockaded by the French. He failed, and was accused of cowardice by the ministers, who sought to divert atten-

tion from their own inefficient measures by sacrificing him to the public indignation. He was tried by a court martial and shot on board the *Monarque*, at Portsmouth, Mar. 14, 1757.

Byng Inlet; a port of entry of the province of Ontario, Canada; on the north side of Georgian Bay, Lake Huron (see map of Ontario, ref. 1-4); has very extensive saw-mills, whence 20,000,000 feet of lumber are yearly sent to the U. S. It is visited in winter by dog-sledges, and in summer by regular steamers. Pop. about 200.

Byrd, WILLIAM; composer. See BIRDE.

Byrd, WILLIAM, F. R. S.; author; son of William Byrd, a wealthy collector of manuscripts; b. at Westover, Va., Mar. 16, 1674; studied law in London; long held important offices in Virginia. He was a patron of literature, and laid out in 1733 the towns of Petersburg and Richmond. He wrote many valuable sketches of his travels in Virginia. Some of his writings were published by Edmund Rudin as *The Westover Manuscripts* (1841), and more completely in 1866 as the *History of the Dividing Line and Other Tracts*. They contain the *Records of the Virginia Company* (1619-24), purchased in England by him. D. in Westover, Va., Aug. 26, 1744.

Byron, GEORGE NOEL GORDON, Lord; poet; b. in London Jan. 22, 1788. He belonged to an ancient Norman family, whose name was variously written Burin, Biron, and Byron. JOHN BYRON (*q. v.*), the poet's grandfather, was a noted English admiral. Capt. Byron, the son of the admiral, married Catherine Gordon, a Scottish heiress, who had only one son, the subject of this notice. Capt. Byron was distinguished for nothing but his vices. Having squandered a large portion of his wife's property he deserted her, after which she retired to Scotland, and resided for some time at Aberdeen, where young Byron received the first rudiments of his education. Before he was seven years old, with his mother he visited the Highlands, the picturesque beauty of which, even at that age, made, it is said, a powerful impression on his mind. When he was ten years old he succeeded to the estate and title of his grand-uncle, William, fifth Lord Byron, who had resided at Newstead Abbey, where he died in 1798. The poet had a congenital deformity of his feet, which rendered him lame, and which was during his whole life a bitter mortification to him. When he was about twelve years old he was sent to school at Harrow. While here he became acquainted with Miss Chaworth, for whom he conceived a romantic and passionate love. She was the heiress of Annesley, which was adjacent to Newstead, the estate to which Byron had succeeded. This appears to have been one of the truest and deepest attachments of his life, and he seems to have fully persuaded himself that if he had married Miss Chaworth he would have been a far better as well as a happier man. He went in 1805 to Cambridge, which he left two years afterward without taking a degree. While at the university he published (1807) a volume of poems, *Hours of Idleness*, which was criticised in the *Edinburgh Review*. This critique was written by Mr. (afterward Lord) Brougham, but Byron always supposed that Jeffrey was the author. In retaliation he wrote *English Bards and Scotch Reviewers*, which may be said to have laid the foundation of his fame. This satire, though evincing great talent in its way, is in many parts egregiously unjust, as, for example, where the satirist speaks of Scott. It is but just to add that Byron himself afterward deeply regretted the publication of the poem, and did everything in his power to suppress it.

In 1809, in company with his friend Mr. Holhouse, Byron commenced his travels through different parts of Europe—Spain, Portugal, European Turkey, and Greece. After an absence of about two years he returned to England, and published the first two cantos of *Childe Harold's Pilgrimage*, which were received with extraordinary favor, so that, as he himself informs us, he "awoke one morning and found himself famous." He soon after took his seat in the British House of Peers. At one time it would appear that he thought seriously of giving himself up to politics, but he soon changed his purpose, and turned his attention again to poetry. Within the next two or three years he produced several minor poems of exquisite beauty—namely, *The Giaour*, *The Bride of Abydos*, *The Corsair*, *Lara*, *The Siege of Corinth*, *Parisina*, and *The Prisoner of Chillon*. On Jan. 2, 1815, he was married to Miss Isabella Millbanke, only daughter of Sir Ralph Millbanke, afterward Noel. She was regarded as a great heiress. But, if Byron may be believed, his fortune was but little improved by this marriage.

He says: "All I have ever received or am likely to receive (and that has been twice paid back, too) was £10,000." The union was a very unhappy one, as well on account of Lord Byron's licentious habits as the incompatibility of temper of the two parties.

Lady Byron gave birth to a daughter, Ada, who became afterward the Countess of Lovelace. She was Lord Byron's only legitimate child; he addresses her in *Childe Harold* as "sole daughter of my house and heart."

Not long after the birth of Ada his wife left him, and, taking the child with her, went to her father's. He left England early in 1816, resolved never again to return to his native land. Passing through Belgium, he visited the field of Waterloo; he subsequently went to Switzerland, and resided near Geneva. Here he wrote the third canto of *Childe Harold*. He afterward abode some time in Venice. He next visited Ravenna, where he formed a *liaison* with the Countess of Guiccioli, whose sprightly and imaginative character, no less than her personal beauty, powerfully attracted him. While at Pisa in 1822 he experienced great sorrow in the tragic death of his friend, the poet Shelley. Early in 1822 Byron, Shelley, and Leigh Hunt were associated in the publication of a journal styled *The Liberal*, but Byron and Hunt quarreled soon after the death of Shelley, and *The Liberal* was discontinued.

While in Italy Byron wrote several of his most admired poems, including the fourth canto of *Childe Harold*, *Mazeppa*, *Manfred*, *Cain*, a *Mystery*, *Marino Faliero*, *The Two Foscari*, *Sardanapalus*, *Werner*, and *Don Juan*. He espoused with enthusiasm the cause of Greek independence, and in 1823 passed over from Italy to Cephalonia, where he spent several months. In the early part of 1824 he arrived at Missolonghi. He took, Apr. 9, a severe cold, which caused his death on Apr. 19, 1824.

Byron's poetic genius was of a very high order, but more distinguished for clearness and intensity than for breadth or versatility. His intellect partook in a remarkable degree of the character of his emotional nature. It was only under the influence of intense feeling or passion that he could put forth his poetical powers with any success. And hence it is that everything he has written is so strongly colored with his own personal feelings. He was perhaps the most intensely subjective of all the great poets that ever lived. This explains why he had no genius for dramatic composition. He could only represent successfully those characters which resembled his own. His soul was not capacious nor calm enough to reflect without distortion the infinitely varied pictures presented by the comedy and tragedy of human life. Wit and understanding, rather than imagination, were his leading intellectual traits. His most remarkable characteristic, as a poet, was his power of expressing intense passion, particularly of the darker and fiercer kinds. "Never," says Macaulay, "had any writer so vast a command of the whole eloquence of scorn, misanthropy, and despair." See Moore's *Life of Byron* (1830); *Recollections of the Last Days of Shelley and Byron*, by E. J. Trelawney (1858). Revised by HENRY A. BEERS.

Byron, HENRY JAMES: writer of burlesque dramas; b. in Manchester, England, 1834; was a lawyer by profession; contributed much to London *Fun*, of which he was for a time the editor. His principal works are travesties of various popular and standard dramas and operas—*Fra Diavolo*, his first effort (1858); *The Lady of Lyons*, etc.—but he produced several comedies, pantomimes, and novels—*Paid in Full* (3 vols., 1865); *Old Sailors*, first brought out in 1874; and *Our Boys* (1878). He also acquired distinction as an actor in London. D. in London, Apr. 11, 1884.

Byron, JOHN: vice-admiral; grandfather of the poet; son of the fourth Lord Byron; b. at Newstead, Nov. 8, 1723; entered the navy; served in Anson's expedition of 1740; also against Louisburg in 1760; circumnavigated the globe (1764-66); fought D'Estaing off Granada, July 6, 1779, in the American war; was long known in the navy as "Foul Weather Jack," on account of the ill-luck attending his early service. D. Apr. 10, 1786.

Byssus: a bundle of silky or shining, semi-transparent, horny filaments by which many bivalve mollusks attach themselves to rocks or other fixed substances. These filaments are secreted by a gland at the base of the foot of the animal. They are guided to their place by the foot, and expand into a sort of disk at the point of attachment. An example of the byssus may be seen in common mussels.

The *Pinna* of the Mediterranean produces long and strong filaments of a silky luster, which can be woven into cloth. This cloth is highly prized, but the *Pinna* has become so rare that it can not be produced in large quantities.

Byzantine, or Bezant [from Byzantium, the old name of Constantinople]; in numismatics, is a term applied to a coin of the Byzantine empire. These coins were of gold, silver, and bronze; bore impressions distinct from the earlier Roman coins; were copied in several countries. They were current in the north of Europe, and even in India. The silver bezant was worth about 10s. sterling. The gold bezant was worth at one time £15 sterling.

Byzantine Art: the peculiar phase of art-development which originated in Byzantium. The city of Byzantium, or Constantinople, owing to its geographical situation was peculiarly open to mingled art influences, and developed out of Roman traditions, modified by the Greek taste and a liberal admixture of Oriental elements, a new art called Byzantine. It is the first distinctively Christian national art; is especially rich in decorative detail and in the use of color, and displays the failings as well as the merits incident to its transitional character. It flourished from the time of Constantine, 330 A. D., nearly to the fall of Constantinople in 1204, by which time, however, it had lost its original vigor and perfection. It strongly influenced the art of Venice and Northeastern Italy. Its architecture was based on a mingling of Roman and Oriental constructive principles, treated with Greek freedom, but it gave birth to few monuments of great size. Its noblest production, the Church of the St. Sophia (or Divine Wisdom) in Constantinople, now a mosque, was built in 532-538 under Justinian, and was the first great pendentive-domed church ever erected; it still remains one of the most imposing and beautiful structures in existence, resplendent with its unrivaled mosaics, superb columns of jasper and porphyry, and its majestic outlines. St. Mark's in Venice, though built nearly 500 years later by Byzantine architects, in imitation of the Church of the Apostles at Constantinople, is a magnificent example of a later phase of Byzantine architecture, and Ravenna is also rich in splendid Byzantine monuments. The dome is a distinctive feature of all Byzantine religious architecture. The most highly developed of Byzantine arts was that of mosaic; but ivory-carving, the illumination of MSS., and the production of splendid fabrics, were almost equally advanced. In Russia and Greece the traditions of Byzantine art are not yet wholly extinct. A. D. F. HAMLIN.

Byzantine Empire; also called **Eastern or Greek Empire**: the name of a former empire of Europe which came into existence in 395 A. D., upon the death of the Roman Emperor Theodosius the Great, who divided his empire between his two sons, Arcadius and Honorius. While the latter received the western half as his portion, Arcadius became ruler of the eastern empire, then comprising Syria, Asia Minor, Pontus, Egypt, Thrace, Mesia, Macedonia, and Greece, with the capital at Constantinople. The history of the Byzantine empire extends from 395 A. D. to 1453. During the reign of Arcadius ambitious politicians wielded an unlimited power, and oppressed the people to satisfy their rapacity. Arcadius was followed by his seven-year-old son, Theodosius II. (408-450), for whom a prefect ruled with wisdom and strength. In 415 he took his sister Puleheria as co-regent, who from that time took charge of the entire administration. Peace and prosperity reigned during Theodosius's rule, and were only interrupted by a short war with Persia in 422, which led to the acquisition of a part of Armenia. But peace with Attila, King of the Huns, could only be purchased by large tracts of land on the Danube and large sums of money. Upon the death of Theodosius he was succeeded by his sister Puleheria. She married the senator Marcianus, who reigned until 457. Under Justinian (527-565), who became famous by his legislation and the victories of his generals, Belisarius and Narses, the Byzantine empire gained great influence and power among the other nations, while in the interior the dissensions of the parties were quelled effectually. Under the nephew and successor of Justinian (Justinus II., 565-578) the empire suffered from invasions of the Lombards and Persians. In 718 Leo III. ascended the throne, and continued to sustain himself in spite of the contest concerning the worship of images which continued for over a century, and of the attacks of the Arabs. He died in 741, having wrested Phrygia from the Arabs, but lost the last rem-

nant of territory in Italy. Basilius I. Macedo, the founder of the Macedonian dynasty, ascended the throne in 867. He introduced reforms in all branches of the administration, and revised the laws of Justinian. He was succeeded by his son, Leo VI. who called upon the Turks to aid him against the Saracens, and thus opened the way for the Turks. After the extinction of the Macedonian dynasty in 1057 Isaac Comnenus was raised to the throne by the unanimous vote of the army. He introduced many reforms, and entered a monastery in 1059. Among his successors Alexius I., who began to rule in 1081, was the most important. He increased the area of the empire considerably. The dynasty of the Comnenian emperors continued to rule until 1204. In 1204 Constantinople was taken by the French and Venetians (called the Latins), who then became masters of the whole empire. They divided it into four parts, giving the first with the capital to Baldwin, Count of Flanders, who was made emperor, and whom the other participants in the expedition recognized as their sovereign. The Venetians received as their share the countries bordering on the Adriatic and Aegean Seas, a part of the Morea, together with several islands; Bonifacius, Count of Montferrat, received Macedonia and part of Greece; dukedoms, countships, principalities, etc., were established at various places; while a number of Greek princes maintained their independence. Under Theodoros Lascaris, who had been elected emperor at Constantinople, an empire was formed at Nicea (Nicc). In Trebizond Alexius Comnenus ruled with absolute power. One of his successors, John Comnenus, became Emperor of Trebizond. Neither Baldwin nor his successors could do anything to avert the impending ruin. Baldwin was taken prisoner by the Bulgarians, and died in 1206. His brother Henry ruled bravely and wisely till 1216, when the empire became a prey to utter anarchy.

The dynasty of the Palaeologi began with Michael VIII. Palaeologus, who, by the help of the Genoese captured Constantinople in 1261. Michael, the first of the Palaeologi, was an able prince, but offended both clergy and people by an attempt to unite the Greek and Latin Churches. Andronicus III., a great-grandson of Michael, became emperor in 1328. During his reign the Turks took Nicea and Nicomedia and devastated the European coasts. In the reign of his son, Johannes V., the Turks began to gain ground in Europe, and in 1362 Sultan Amurath had made Adrianople his capital. Under the following rulers the empire rapidly declined, giving way more and more to the advancing forces of Turks, until on May 29, 1453, with the capture of Constantinople by Mohammed II. and the death of Constantine XI., the Byzantine empire came to an end, and the Turkish rule was, after centuries of fierce warfare, firmly established in Europe.

Revised by C. K. ADAMS.

Byzantine Historians: Greek writers who have treated of the history of the Byzantine empire. They fall into two groups, historians proper and chroniclers. The historians deal with contemporaneous events and special epochs, follow classical models, and write for a cultivated public. The chroniclers deal with universal history, write for the people, and dwell on matters that appeal to the popular taste, such as plague, pestilence, and famine, comets and earthquakes, great buildings, and famous chariot-races. The church makes itself felt throughout, and the language, if not exactly the language of the people, is one the people can understand. The historians constitute the best part of Byzantine literature, but they have no new critical method, no new conception of history. They move along the lines of old formulae, and the old tradition persists in the representation of life as in the character of the language. They are not uncritical, as antiquity counted criticism, and they show a laudable desire to gather information from living sources. They do not neglect geography or ethnology, and, as many of them were men of high official station, there is no lack of original state papers, of original letters for the substantiation and illustration of the narrative. Despite the artificiality of the language, the character of the period is mirrored in the great space given to diplomatic and theological quarrels, and if the pressure of Byzantine despotism has proved fatal to veracity here and there, if the narrative is colored at times by personal sympathies and personal antipathies, yet on the whole there is a recognition of the historian's duty to be impartial and to be truthful. Of the multitude of authors, only a few can be mentioned here. Among the most important of the historians are Procopius, Agathias, Theophylactus, Constantine Porphyrogenitus, Leo Diaconus,

Nicephorus Bryennius (see BRYENNUS) and his wife, the famous Anna Comnena, all mentioned in their proper places. Among the chroniclers may be noted Johannes Antiochenus, Johannes Malalas, Theophanes Confessor, Xiphilius, and Zonaras. Much remains unpublished.

EDITIONS.—The Paris *Corpus*, edited by Labbé, 1648–1711, in 42 parts; reprinted with additions at Venice, 1729–1733; the Bonn *Corpus*, 1828–78, 49 volumes, much of which has been taken up into Migne's *Patrologia Graeca*. See Krumpholtz, *Geschichte der byzantinischen Literatur* (Munich, 1891).

Byzantine Recension: a Greek text of the New Testament; used in Constantinople after it became a metropolitan see in the Eastern Church. It is cited by several Greek Fathers, and was used as the basis of the old Slavic version. It corresponded quite nearly with the present "received text" and with many existing MSS.

Byzantium (in Gr. Βυζάντιον): an ancient Greek city; situated on the Thracian Bosphorus, and on the site of the modern Constantinople. It is said to have been founded by a colony of Megarians in 667 B. C. It increased rapidly, and soon became an important commercial city. Few cities could boast so magnificent a position. Commanding as it did the two shores of both Europe and Asia, at the same time secure and advantageously situated for commerce, it had at its command the choicest gifts of nature and the most charming scenery. Byzantium was very evidently the site of extensive tunny-fisheries, the fishes visiting the port periodically in immense numbers, as they do at the present day. The fish were salted and exported. The name "Golden Horn," still applied to a part of the channel of Constantinople, was probably derived from the great revenue flowing from this fishery. The Byzantines also levied a considerable toll on vessels passing from sea to sea. The levying of these tolls once involved them in war with the Rhodians. They also derived much profit from their rich corn-fields not far from the city. On the S. it was bathed by the Propontis (Sea of Marmora), and on the N. by the waters of the Golden Horn. Having been captured by a general of Darius Hystaspis, it was liberated by Pausanias about 478 B. C. A few years later Byzantium became an ally or tributary of Athens, against which it revolted in 440 B. C. It was besieged and taken by Alcibiades in 408. Philip of Macedon besieged it in 340 B. C., but Demosthenes persuaded the Athenians to send a fleet which compelled him to raise the siege. This repulse of Philip was one of the proudest feats of the great orator, who often recurs to it in his speech *On the Crown*. Byzantium was for ages especially exposed to the attacks of barbarians, but the long wars did not beget much valor in the people. From their great commercial prosperity they early became corrupted, and they were proverbially indolent, cowardly, and luxurious. Byzantium was probably either a kingdom or the seat of a tyrannus; afterward it became an aristocracy, and later a crude democracy.

The Byzantians suffered much from the predatory incursions of the Gauls, and, being unable to resist them in battle, agreed about 279 B. C. to pay them an annual tribute. This city supported Pescennius Niger in the civil war against Septimius Severus, who captured it in 196 A. D. after a brave resistance of three years' duration. He then reduced it almost to ruin, but afterward relented and partially restored it. The name of *Augusta Antonina* was given to it in his time. The Greek Christians ascribe the foundation of the Byzantine Church to the labors of St. Andrew the apostle, but this statement is unsupported by trustworthy evidence. It is, however, certain that soon after 200 A. D. there were numerous Christians in the city. In 330 A. D. Constantine the Great selected this place as the capital of his empire, and founded a new city, which he intended should rival Rome, and to which he gave the name of New Rome. This city of Constantine was much more extensive than Byzantium, which occupied in all probability only the most eastern of the seven hills on which the modern capital is built. See CONSTANTINOPLE.

Bzovius, or Bzowski. Bzhovské, ABRAHAM; a Roman Catholic historian; b. at Proczowice, Poland, in 1567. He was a zealous Dominican prior; was called to Rome by Pius V., where he wrote in Latin 9 volumes of a continuation of the *Annals of Baronius*; an *Ecclesiastical History* (2 vols. fol., Rome, 1616); and other historical works, besides numerous sermons and biographies of several popes. D. in Rome, Jan. 31, 1637.

the third letter of most European alphabets; is in English either a palatal explosive, with the sound of *k*, a sound which it has before *a*, *o*, *u*, and the consonants (except *h*), unless marked with the cedilla, thus, *ç*, as in *façade* and other words, mostly from the French and Portuguese. When marked with the cedilla, or when occurring before *e*, *i*, or *y*, it has the sibilant sound of *s*. *Ch* has (1) the Spanish sound, as in the word *church*; (2) the French sound (equivalent to *sh*, the German *sch*), as in *chaise*; and (3) the hard sound, equivalent to *k*, as in *chord*. The German guttural *ch* is never used in English. *C* in music is the first note of the "natural" diatonic scale, which scale is so called because it requires neither flats nor sharps in its signature. In the ancient Greek system of tonality the scale of which *C* forms the initial note was called Ionic. *C* in Latin stood for 100, and also for the prænomen Caius. In chemistry it is the symbol of carbon; and *c. c.* is an abbreviation for "cubic centimeter."

Caaba: See KAABA.

Caating-whale, kawing-hwāl [Scottish, driving-whale]: the *Globicephalus melas*; a large porpoise which abounds in herds on the coasts of Great Britain, North America, Iceland, etc. It takes its name from the fact that when one of the herd is stranded the rest all follow it, sometimes as many as 100 at once rushing to their own destruction in this manner. They are the source of rich booty to fishermen. Other species of the genus inhabit the Mediterranean, the Pacific, etc. It is one of the black-fish whales of North America, and is most frequently caught off the coasts of Scotland.

Cabal' [from Fr. *cabale* < Late Lat. *cabbala* < Heb. *gab-bālāh*, tradition; hence the secondary meaning of *cabbala*, secret doctrine or art]; a secret council formed under the reign of Charles II. (1667); consisted of the following members: Sir Thomas, afterward Lord Clifford, Lord Arlington, the Duke of Buckingham, Lord Ashley, afterward Earl of Shaftesbury, and the Earl of Lauderdale. The Cabal was dissolved in 1674. The prevailing opinion that the word was formed from the initials of the names of its members is perhaps erroneous, as it had been used before to denote a secret cabinet, and is said to be derived from the Hebrew (see CABBALA), but this accidental association of the initial letters may have suggested this particular application of the name.

Cabalero, kā-ba-lō-yā-rō, FERNAN (pseudonym of *Cecilia Böhl von Faber*): Spanish novelist; b. of German parents resident in Cadiz, Dec. 25, 1796. She made a wide reputation by her stories describing the local customs of various parts of Spain. She was a devout Roman Catholic, and on this ground also very popular. Among her novels the following are worth mentioning: *La Gaviota*; *Un Verano en Bornos*; *Pobre Dolores*; *Clemencia*; and the collections of tales called *Relaciones* and *Cuadros de Costumbres*. D. Apr. 7, 1877. The best edition of her works is that of Madrid, 18 vols., 1855-67; another excellent one is that of Brockhaus, 11 vols., Leipzig, 1860-82. A. R. MARSH.

Cabanus: See CAVANAS.

Cabanel, kā-bri-nel', ALEXANDRE; painter of genre, history, and portraits; b. at Montpellier, France, Nov. 28, 1823; d. in Paris, Jan. 23, 1889; was a pupil of Picot; won the Grand Prix de Rome in 1845; was a perfect type of the artist whose methods are founded on the classicism of David in his historical work, and only in his portraits, of which he painted a large number, did he show that he was affected by more modern influences. He was for many years one of the Professors of Painting in the École des Beaux-Arts, and among his pupils are some of the most famous French artists. His list of honors is a long one, including a first-class medal at the Paris Exposition of 1855; the medal of honor at the Salon of 1865; medals of honor at the Universal Expositions in 1867 and 1878; member of the Institute 1863; commander Legion of Honor 1884. His *Death of Moses*

(1852) is in the Coreoran Gallery at Washington; his portrait of Miss C. L. Wolfe is in the Metropolitan Museum, New York; and five of his works, including the *Apotheosis of St. Louis* (1855) and the *Birth of Venus* (1863), are in the Luxembourg Gallery, Paris. In the Panthéon at Paris are his frescoes depicting the life and education of St. Louis. Many pictures and portraits by him are owned in the U. S. His portraits of men are lacking in virility and vigor, but his portraits of women are distinguished and refined, though often somewhat insipid. He was a graceful and accurate draughtsman. Replicas of his *Birth of Venus* are in the collections of John Wolfe, New York, and H. C. Gibson, Philadelphia.

WILLIAM A. COFFIN.

Cabanis, kā-ba-nēe', PIERRE JEAN GEORGE; philosopher and physician; b. at Cosnac, Charente-Inférieure, France, June 5, 1757. He was a friend and political partisan of Mirabeau, whom he attended in his last illness. He was admitted into the Institute in 1796, and became Professor of Medicine in Paris in 1797. In the early part of his life he was an atheist. His principal work is the *Relations between the Physical System and Mental Faculties of Man* (*Rapports du Physique et du Moral de l'Homme*, 1802), in which he maintained that "the brain secretes thought as the liver secretes bile." But he afterward changed his opinions in this respect, and adopted theistic views. D. near Meulan, May 5, 1808.

Cabbage [from Old French *cabus*, dialectally *caboche*, a cabbage; from Lat. *caput*, a head]: a garden esculent of the mustard family. The cabbage in some of its forms has been cultivated from prehistoric times. It is a native of Europe, where the wild plant is still to be found upon certain sea-coasts. *Brassica oleracea*, the species to which the cabbage belongs, is supposed to have given rise to the cauliflower, kales, and Brussels sprouts, and some botanists even suppose that some of the turnips have had a similar origin. In English there is no generic name to cover all these forms as there is in French in the word *chou*. The cabbages are commonly divided into two general groups, the common smooth sorts and the Savoys, which are characterized by blistered leaves. The common cabbages are again grouped according to the shape of the head, as spherical, oblong, conical, and flat; and there are also green and red varieties. Col-lards is a kale-like vegetable belonging to this same species, or sometimes young cabbage plants, which are used for "greens," are so called. The cabbage is an important crop in temperate climates. In 1890 77,094 acres were devoted to it in the truck-farms of the U. S., and 1,268 acres were devoted to the growing of seed. Seed for early cabbages is sown in hotbeds, but that for the late crops is sown in seed-beds in the open, or sometimes even planted in the position in which the plants are to grow. Cabbages demand a deep and rich soil, and one which is not liable to injury from drouth. Over 100 varieties are now known and cultivated in the U. S. L. H. BAILEY.

Cabbage Butterfly: any one of those butterflies the larva of which feed upon cabbage and allied plants. These are mostly confined to that group called *Pierida*, the prevailing color of which is yellow or white. Two of the most common species (*Pieris rapae* and *Pontia protodice*) are natives of North America, but they seem to be lessening in numbers since the advent of the European form, *Pieris rapae*, which was introduced some thirty years ago. They are difficult pests to deal with since the larvæ bore into the heads of the cabbage, and hence poisons can not be used conveniently.

Cabbage-fly (*Anthomyia brassicæ*): a fly of the same family with the house-fly, flesh-fly, etc., of which the maggots often do injury to the roots of cabbages. It is of the same genus with the turnip-fly, onion-fly, etc. They are found in America and Europe, and are very destructive. The larvæ are a dull-reddish color, and the round of metamorphoses is about eight weeks. Lime-water destroys them.

Cabbage-palm, or Cabbage-tree: one of several species of palm, the great terminal bud of which is eaten like cabbage, and also bears nuts of which the kernel is sweet. The

cabbage-palm of the West Indies is the *Enterpe oleracea*, which grows to the height of 120 feet or more. The palmetto (*Sabal palmetto*) is sometimes called cabbage-palm.

Cab'bala, or **Kabbalah** [Late Lat., from Heb. *gabbālāh*, what is received, tradition]: an ancient Jewish system of religious philosophy or theosophy. Those who have studied the subject with the greatest care are not fully agreed among themselves as to its origin and character. The Cabbala attempted to explain the nature of God and of the universe. Some of the late writers of this school taught that God has neither will, intention, desire, nor action, but that ten *Sephiroth*, or intelligences, emanated from God. The first *Sephiroth* is called the *Insuperable Height* (from which the second was derived, as the third from the second, and so on). The names of the other intelligences in order are wisdom, intellect, grace, power, beauty, firmness, splendor, foundation, and authority. As God became active in these *Sephiroth*, so these become externally manifested in the universe.

The psychology of the Cabbala teaches the doctrine of the transmigration of souls, but as the literature of the system is immense, and its teachings recondite and often puerile, it is difficult and unnecessary to state exactly what this philosophy taught. It probably was influenced by the Greek philosophy known as Neo-Platonism. According to recent authorities it originated among Jewish thinkers of the tenth century. See Knorr von Rosenroth's *Cabbala Denudata*, or its English translation, *The Cabbala Unveiled*, by S. L. M. Mathers (London, 1887), containing three books of the Zohar. Revised by W. T. HARRIS.

Cabbalists: those Jews who believe in the Cabbala, or traditional interpretation of the Pentateuch, said to have been received by Moses from God on Mt. Sinai. See preceding article.

Cabeiri: See **CABIRI**.

Cabell Court-house: See **BARBOURSVILLE**.

Cabell, WILLIAM: member of a family eminent in the annals of Virginia; b. in Licking Hole, Va., Mar. 13, 1730; eldest son of William Cabell, surgeon, who emigrated from England to America in 1723, and obtained extensive grants of land on the James river. William Cabell, Jr., was sheriff of Albemarle County 1751; "his majesty's presiding justice" and member of the house of burgesses 1757; commissioner for settling military claims 1758; member of the house of burgesses when the colonies revolted; member of the committee that prepared the "bill of rights"; first presiding magistrate for the U. S. after the Declaration of Independence; unanimously chosen presidential elector in 1789. He left an estate of 20,000 acres. D. at Union Hill, Va., Mar. 23, 1798.

Cabestaing, GUILLEM, de: a famous Provençal poet; lived and wrote in the second half of the twelfth century. Little is known of his life except the improbable tale of the end of it. This is, in brief, that having loved Margarida, wife of Count Raymond of Roussillon, he was slain by the latter, and his heart was offered by the angry lord to his wife to eat. She, having eaten of it, declared that it was the sweetest morsel she had ever tasted, and that she would never eat other food after it. So she threw herself from the turret of the castle and was killed. This tale was very widely known in the Middle Ages, and was used by Boccaccio. See Diez, *Leben und Werke des Troubadours* (2d ed. 1882); Franz Hüffer, *Der Troubadour Guillem de Cabestanh, sein Leben und seine Werke* (1869); E. Besnoidt, *Die Biographie des Troubadours G. de C., und ihr historischer Werth* (1879). A. R. M.

Cabet, kaā bā', ÉTIENNE: socialist; b. in Dijon, France, Jan. 2, 1788. He was a radical democrat in politics and a leader of the Carbonari. In 1832 he published a romantic work called *Travels in Icaria*, which was very popular among the workmen of Paris. He planted in 1846 a colony on the communist system on the Red river in Texas, from which he and his followers removed in 1849 to Nauvoo, Ill., after that town had been deserted by the Mormons. D. in St. Louis, Mo., Nov. 9, 1856. His colony, which had never enjoyed much prosperity, was broken up in 1857.

Cabeza de Vaca: See **VACA, ALVAR NUÑEZ**, etc.

Cabin: a small room or inclosure; a cottage, small house, or rudely built temporary residence. Also an apartment in a ship or steambout for the use of the officers and passengers. These apartments in steambouts are often called saloons. In ships of war the rooms of the admirals and captains are called cabins, and are fitted up with much elegance.

Cabinet: specifically, a body of counselors, generally composed of the heads of executive departments, on which the responsibility of government devolves. The name is taken from the cabinet or private apartment where a king was accustomed to meet his privy council in secret conference. Before the modern cabinet was developed the term was used reproachfully, as implying a government by intrigue of court favorites. It is not now a body known to the law in either the United Kingdom or the U. S. Under the Tudors and Stuarts the privy council was the council of state. The modern cabinet began under William III., who placed the ministry on a parliamentary basis and required party unity among its members, and he and Queen Anne were wont to preside over its meetings. Under the first two Georges, who scarcely understood English, the cabinet acquired independence of the crown, and no subsequent monarch has been able to regain control, so that it is a maxim of the British Government that the monarch shall not attend the discussions of his advisers. He may dismiss his ministry, however, and appeal to Parliament, and even to the country, but the proceeding has become hazardous and is not attempted. The Prime Minister selects from the chief officers of the Government, whose names he submits to the crown, those whom he will have in his cabinet, and he is not restricted as to their number nor their division between the two Houses of Parliament, except that prescription has fixed the number at not less than eleven, viz.: First Lord of the Treasury, Lord Chancellor, Lord President of the Council, Lord Privy Seal, Chancellor of the Exchequer, First Lord of the Admiralty, and the five Secretaries of State. This body is the responsible Government of the United Kingdom, and stands or falls together. Its meetings are secret, no record of its proceedings is kept, it is dishonorable to divulge its deliberations, each member is bound by its decisions or must resign his office in the ministry, and in practice he is a member of Parliament.

In the U. S. the cabinet is composed of the chiefs of the eight executive departments created by acts of Congress, viz.: the Secretaries of State, Treasury, War, Attorney-General, Postmaster-General (created in 1789), Secretary of Navy (1798), Secretary of Interior (1849), and Secretary of Agriculture (1889). Their meeting as advisers of the President is unknown to the law or constitution, and their conclusions in cabinet have no binding force, except that a dissenting member would resign office if he could not conform. By act of 1886 members of the cabinet in the order named, except the Secretary of Agriculture, succeed to the performance of chief executive functions when by removal, death, resignation, or disability, the offices of President and Vice-President are both vacant, until the disability is removed or a President is elected. In this event Congress must be assembled within twenty days. See **CAMARILLA**. C. K. ADAMS.

Cabi'ri, or **Cabeiri** (in Gr. *Kάβειροι*): ancient divinities worshiped in Samothrace, Phoenicia, Greece, and other countries. The myth of the Cabi'ri is obscure, and not well explained by ancient writers. Their worship was performed with much solemnity and mystery. The earliest mention of them in literature is in a drama by Æschylus, entitled *Kάβειρος*, in which they are represented as beneficent beings who mingle freely with the Argonauts during the visit of the latter to Lemnos.

Cable: a rope or a chain mostly employed on shipboard to connect the ship with her anchors. The name is often applied to wire ropes, especially such as are used in suspension bridges and to submarine telegraph lines, etc. Rope cables are made of the best hemp, of manilla, or of coir. The circumference varies from about 12 inches to 26. A number of yarns are twisted to form a *lissum*; three lissums, twisted in an opposite direction, form a *strand*; and three strands twisted in the direction of the yarns in a lissum form a *cable*. The strength of a cable varies according to the square of the diameter. On shipboard, cables receive the names of *sheet cables*, *bower cables*, etc., according to the anchor to which they are attached. Hempen cables have been superseded by chain. Chain cables consist of links the length of each of which is about six diameters of the iron of which it is made, and the breadth about three and a half diameters. See **ROPE** AND **ROPE-MAKING**. Revised by S. B. LUCE.

Cable, Electric: a conductor or set of conductors for the electric current, in which protection from injury is provided for by surrounding the insulating coat with a sheath or armor. Cables for use underground, where the chief sources of injury are of a chemical nature, are commonly surrounded

with a sheath of lead. Submarine cables, which are subject to continual abrasion, are incased in an armor of steel wire.

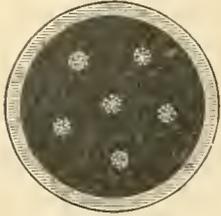

FIG. 1.—Underground cable, containing six-stranded conductors for electric lighting.

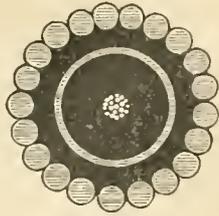

FIG. 2.—Submarine cable, with one-stranded conductor.

For the sake of greater flexibility, cables, even when they contain but a single circuit, are usually made up of many strands.

Cable. GEORGE WASHINGTON: novelist; b. in New Orleans, Oct. 12, 1844; served in the Confederate army during the civil war, after the close of which he returned to New Orleans; engaged in surveying, journalism, and various mercantile occupations until 1879, when he began to devote himself wholly to literature. He gave readings from his stories in Northern cities, and since 1885 has resided in Connecticut and in Northampton, Mass. His fictions relate mainly to Louisiana life, and illustrate Creole dialect and character. Among them are *Old Creole Days* (1879-83); *The Grandisimes* (1880); *Madame Delphine* (1881); *Dr. Sevier* (1885); *Bonaventure* (1888), etc. He also wrote essays on the penal systems and the condition of the colored race in the Southern States.

HENRY A. BEERS.

Cabot, JAMES ELLIOT: b. in Boston, Mass., June 18, 1821; writer for *The Dial* in 1844; edited *The Massachusetts Quarterly* 1848-50; edited *Audubon's Birds of America*; contributor to the *Atlantic Monthly*, *The North American Review*, and other magazines; undertook on invitation of R. W. Emerson the editorship of his writings; published in 1887 *A Memoir of Ralph Waldo Emerson*. W. T. HARRIS.

Cabot, JOHN: a foreign merchant of Bristol who, after the discovery of America by Columbus, was placed in command of a fleet of five vessels, which sailed in the spring of 1497. They reached the coast of Newfoundland (according to Sebastian Cabot's map, found in the geographical cabinet of the National Library in Paris) on June 24, and were in England again in August. Nothing is heard of him after 1498, and he is supposed to have died about that time. The date of his birth is not known.

Cabot, SEBASTIAN: navigator; son of the preceding; b. in Bristol, England, 1477. He is supposed to have been with his father in the voyage of 1497, and there are some indications that he visited the North American coast in 1503. In 1517 he commanded an English expedition in search of a Northwest passage, discovering the entrance of Hudson's Bay and penetrating to lat. 67° 30' N. Invited by Charles V. to Spain, he was made Grand Pilot of Castile (1518), and in this capacity commanded four ships which left San Lucar in Apr., 1526, to follow Magellan's route to the Moluccas. Touching on the coast of Brazil, he entered the Plata, ascended the Paraná and Paraguay to the site of Asencion, and, abandoning the Molucca voyage, built the fort of Espíritu Santo on the Paraná, thus founding the Spanish colonies in this region. Receiving no aid from Spain, he returned in 1530, leaving a garrison. He remained in the Spanish service until the end of 1546, when he went to England. Edward VI. granted him a pension, and he was influential in promoting English commercial enterprises, especially to the Baltic. D. in London, 1557. A map of the world, published in Holland in 1544, is ascribed to Cabot. See Biddle, *Sebastian Cabot* (1831); HARRISSE, *Jean et Sebastien Cabot* (1882); Demersay, *Histoire du Paraguay*.

HERBERT H. SMITH.

Cabra, kaa'brañ (unc. *Agabrum*): a town of Spain; in the province of Cordova; 30 miles S. S. E. of the city of Cordova (see map of Spain, ref. 19-E). It has a college, a cathedral, a convent, and manufactures of linens, hats, soap, bricks, etc. The neighboring region is volcanic, and produces excellent wine. Pop. about 14,000.

Cabral, PEDRO ALVAREZ, or PEDRALVEZ: Portuguese navigator; b. about 1460. In 1500 he commanded a fleet of eighteen vessels destined to follow the route to India which had been opened by Vasco da Gama. Obeying his

instructions, he kept far out in the Atlantic, and thus, on Apr. 22, discovered the Brazilian coast about lat. 16° 20' S. (See BRAZIL.) Continuing his route, May 2, Cabral soon lost four ships in a storm; with the rest he proceeded to Mozambique and Calicut. A fort which he founded at Calicut was destroyed; he then made an alliance with the sovereign of Cochim, loaded his vessels with spices, and, losing one more ship on his return, reached Lisbon, July 23, 1501. Of Cabral's subsequent life nothing is known; he probably died about 1526. See Capistrano de Abreu, *Descobrimento do Brasil* (Rio de Janeiro, 1883); BARROS, *Decadas das Indias*.

HERBERT H. SMITH.

Cabrera, kaa-brá'ra, Don RAMON: general and Carlist; noted for his cruelty; b. in Tortosa, Catalonia, Spain, Aug. 31, 1810. In the civil war which began about 1834 he fought for Don Carlos against the Christinos, and became a leader of guerrillas. He gained a victory at Buñol in Feb., 1837, and took Valencia; but he was driven out of Spain by Espartero in 1840, and retired to France. He returned in 1848 and renewed the contest, but he was defeated and went into exile in Jan., 1849; supported the government of Alfonso XII. D. at Wentworth, England, May 24, 1876.

Cabrera Bobadilla y Mendoza, LUIS GERONIMO FERNANDEZ, de: fourth Count of Chinchon; Spanish administrator; b. about 1575. From Jan., 1629, to Dec. 18, 1639, he was Viceroy of Peru. His administration was a difficult one, owing to the constant demand from Spain for a larger revenue; he also had to deal with the Araucanian war in Chili, and with an insurrection of the Urus Indians of Lake Titicaca. The most memorable event of his term was the discovery of the medicinal properties of Peruvian bark, with which the viceroy's wife was cured of a fever. He died at his castle, near Madrid, in 1647.

HERBERT H. SMITH.

Cabul, ka-bool' (properly kaw'boöl): a fortified city of Afghanistan; on the Cabul river, here crossed by three bridges; 80 miles N. N. E. of Ghazni; about 6,400 feet above the level of the sea; lat. 34° 30' N., lon. 69° 6' E. (see map of Asia, ref. 5-D). The climate in winter is very severe. The citadel, called Bala Hissar, includes the palace of the Khan, the government offices, royal gardens, and numerous dwellings. The streets are narrow; the houses are two or three stories high, and have flat roofs. The public buildings are not remarkable. Cabul is widely celebrated for the variety and excellent quality of its fruits, apples, pears, pomgranates, grapes, etc. It has an extensive trade as an entrepôt between India and Turkestan. The people of Cabul are Mohammedans and a mixture of several races. Under the Emperor Báber, Cabul was the capital of the Mogul empire. It was taken by Tamerlane about 1400, and by Nadir Shah in 1738. The British captured it in 1839, but in Jan., 1842, the Afghans revolted and massacred the British army. Shere Ali took it from his revolted brothers in 1868; it was again captured in 1879 by Sir Frederick Roberts, in retaliation for the destruction of the British residency. Pop. 50,000 to 60,000.

Caca'o [Span. form of native Mexican name of the tree *caca-natl*]: the fruit of the *Theobroma cacao*, a tree of tropical America; of the family *Sterculiaceae*. Chocolate and cocoa are made of the roasted oily kernels of the cacao nut, which also yields cacao butter. This tree should not be confounded with the coconut tree, nor with the coca of Peru.

Cacao Butter: a fixed oil, hard and solid at ordinary temperatures; is yielded in large quantities by the fruit of *Theobroma cacao*. It is extracted by heat and pressure. It contains a very large proportion of stearin, with some olein and palmitin. It is largely used in the preparation of cosmetics, and is especially useful in pharmacy in the preparation of suppositories. The mafura tallow which is brought from Madagascar closely resembles the above in chemical and physical properties. Cacao butter is not to be confounded with cocoa butter, which is a kind of palm oil, used in the manufacture of soap.

Cacá'pon, or Great Cacapon: a river of West Virginia; rises near the south extremity of Hardy County; flows nearly northeastward through Hampshire and Morgan Counties, and enters the Potomac. Length about 140 miles.

Cáceres, kaa'thá-rēs: a province of Spain; bounded N. by Salamanca, E. by Avila, Toledo, and Ciudad Real, S. by Badajoz, and W. by Portugal. Area, 8,014 sq. miles. It is intersected by the river Tagus. The surface is diversified by several ranges of mountains. Capital, Cáceres. Pop. (1887) 339,793.

Cáceres (anc. *Castra Cæcilia*): a town of Spain: capital of province of same name; situated on high ground, 25 miles W. by N. from Trujillo (see map of Spain, ref. 16-C). It contains an old castle, an episcopal palace, several convents and hospitals, a theater, a Jesuits' college, and a bull-ring which is one of the largest in Spain. It has manufactures of linens, woolen goods, hats, soap, wine, etc. Interesting Roman and Moorish antiquities are found here. Pop. about 15,000.

Caceres, ANDRES AVELINO: Peruvian soldier and statesman; b. in Ayacucho, Nov. 11, 1838. He served as an officer under Castilla and Prado, and, on the overthrow of the latter, was imprisoned for a year. Under President Pardo he distinguished himself by quelling a mutiny. When the war with Chili broke out in 1879 he was a colonel. He served in most of the battles, became brigadier-general, and after the fall of Lima was chosen second vice-president in the provisional Calderon government, June, 1883. The captivity of Calderon and the absence of the first vice-president left Cáceres as acting president of Peru. Supported by the interior provinces, he held out against the Chilians, and declared against Iglesias, whom they had made president at Lima. An attempt of Cáceres to take the capital failed after a hard street-fight (Aug., 1884), but a second attempt succeeded without bloodshed (Dec. 1, 1885). Cáceres then agreed with Iglesias to refer their rival claims to a general election. This resulted in favor of Cáceres, who was inaugurated president of Peru, June 3, 1886. Under his administration the country began to recover from the ruin which had resulted from the war; the state railroads and guano beds were given up to a private company, which assumed part of the national debt. Gen. Cáceres went as Peruvian minister to France and Spain in 1891. In 1894 he again became president. HERBERT H. SMITH.

Cáceres, Nueva, *noo-ã vaã* (i. e. New Cáceres): a town of the Philippine islands; in Luzon; on its southeast coast, 184 miles S. or S. E. of Manila, a seat of a bishop (see map of East Indies, ref. 3-11). Pop., including suburbs, about 12,000.

Cachalot, *kash a-lot* [from Sp. *cachalote*, by way of Fr. *cachalot*]; a book-name for the sperm whale (*Physeter macrocephalus*), the largest of the toothed whales and of the family *Physeteridae*. It has a blunt head which forms nearly one-third of the total length; there is no back fin, but in its place a low hump; the paddles are short and squarish, and the tail or flukes broad and powerful. The right nostril is aborted, and the left opens by a long slit on the left anterior portion of the head, a conformation which causes the very characteristic "spout" of this species, resembling, as it does, a puff of smoke from a gun, and by which it may be readily recognized at a long distance. The upper jaw overhangs the lower and contains no teeth, although rudimentary teeth are present in the young, concealed beneath the gum. The two halves of the slender lower jaw are opposed for the greater portion of their length, and each contains about twenty-one conical teeth. The color is blackish, lighter beneath. Old males are said to attain a length of 70 feet, but 40 to 50 is the average size. The females are smaller and of more slender build; the year-old young is under 25 feet. The sperm whale is gregarious, associating in schools, or pods, of from four or five up to one hundred, or even more. The large schools are composed of females, young, and medium-sized males; the larger the individuals the smaller the size of the school, the very largest males being solitary in their habits. The males frequently indulge in combats with one another, and occasionally a whale is taken whose jaw is badly twisted out of shape as the result of some fight when young. The spermaceti, whence the species derives its name, is a whitish, oily liquid, hardening on exposure to the air, contained in a cartilaginous receptacle, the "case," in front of and above the skull. In large vessels the head is taken on deck, a hole cut in the "case," and the spermaceti bailed out with buckets. In small vessels the head is made fast alongside, and the operation performed there. Spermaceti is used in the manufacture of various ointments and cosmetics, and was formerly extensively employed for making candles. The blubber, or layer of fat surrounding the body, yields an excellent oil, and a grayish wax-like substance termed ambergris, the product of disease, is sometimes found in the intestine; it is of considerable value in the manufacture of perfumery. It possesses comparatively little odor in itself, and this is supposed to be in some way due to the squids on which the sperm whale feeds. It is, however, valuable as a

basis for other perfumes, and has the important property of rendering them more lasting. One of the largest, if not the very largest, pieces of ambergris on record weighed 185 lb., and was sold for about \$10,000. A very large whale may yield 10 barrels of spermaceti and 120 barrels of oil. The cachalot inhabits the warmer seas of the globe, favorite grounds being off New Zealand, the Cape de Verde islands, Hatteras, the Sooloo Sea, and Indian Ocean, where it was pursued by American whalers, the number of vessels engaged in the sperm-whale fishery being at one time over 300. The food of the species is fish and squids, and the existence of gigantic cuttle-fishes was known to whalers long before any entire specimens were discovered, from the fragments vomited up by whales in their death struggles. Quite recently several species of large squids, entirely new to science, were taken from a sperm whale killed near the Azores. The head and body of the whale bore marks of the large, toothed suckers with which the long arms of the squid are provided. The cachalot is a formidable adversary when wounded, not only striking with the tail, but biting with such terrible force that whaleboats have been cut in two at one stroke. Owing to the peculiar position of the jaw, the animal bites most effectively when lying on its back. The head is also used as a ram, and a few cases are on record where whale-ships have been attacked and sunk by large sperm whales, the most notable instance being that of the Essex. See the articles AMBERGRIS, OILS, SPERMACETI, WHALE, and WHALE-OIL; and for statistics, see the article WHALE-FISHERY. P. A. LUCAS.

Cachao: See HANCO.

Cache, *kaash*: a French word signifying a hiding-place; a name given in the Western U. S. to subterranean holes in which travelers and trappers hide provisions and other property, to preserve them from the depredations of the Indians and wild animals. They are made to closely resemble the surrounding earth. The name is also applied to marked mounds of stone on the shores of Arctic waters, within which whalers and explorers have deposited supplies of food for the use of distressed mariners.

Cache River: of Arkansas; rises near the northeast extremity of the State. It flows in a S. S. W. direction, and enters the White river near Clarendon. Length about 150 miles.

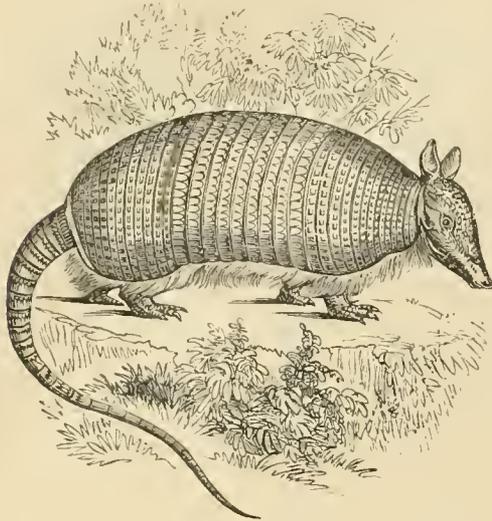

Cachet, Lettres de, *let' de-kaã'shã*: a term applied in France under the old *régime* to letters or orders signed with the private seal of the king and used as instruments of despotic power. Before the seventeenth century they were not often employed, but in the reign of Louis XIV. they became very common. Many persons were arrested by such warrants and imprisoned without trial in the eighteenth century. The chief of police kept forms of *lettres de cachet* signed and needing only the insertion of the name of the person to be arrested, and these were obtained by private persons in order to put out of the way troublesome relatives. About twenty such warrants were issued against Mirabeau. Sometimes they were used to shield offenders from proceedings before tribunals. It is stated that in the reign of Louis XV. *lettres de cachet* were sold by one of the mistresses of the king to any one who would pay money for them. They were abolished in Jan., 1790.

Cache Valley: a fertile valley of Northeastern Utah and Southeastern Idaho. It lies between northerly spurs of the Wasatch Mountains; is 60 miles long and from 10 to 20 broad; has a general altitude of 5,000 feet. The Bear river crosses it obliquely and receives a number of tributaries which are utilized for irrigation. Logan is the largest of its dozen villages.

Cachexia, *kã-keks-i-a* [from Gr. *καχεξία*, poor condition of body; *κακός*, bad + *ἔξις*, cf. *ἔξις*, condition; deriv. of *ἕξειν*, have, hold one's self]: a term applied in medicine to wasted and anæmic states of the system, due to various debilitating diseases. It is particularly applicable in cases of cancer or other malignant tumors, but in a general sense such terms as tuberculous cachexia, malarial cachexia, gony cachexia, and the like may be employed. The features present an anxious and aged appearance; the skin is dry, harsh, shriveled, and of an ashy grayish hue; and emaciation is usually marked.

Cachicama, *kãsh-i-kaa'ma*, called also *Taton-pe'ba*: the nine-banded armadillo (*Dasyppus novem-cinctus*), an edentate mammal found from Texas to Paraguay. It is 16 inches long, and has a long tail. Both body and tail are

covered with plates, those of the tail in horny rings, and those of the body (in part) disposed in nine bands, so united as to admit of some motion. This animal can be readily

Cachicama.

tamed. Its food is principally ants, but it also is fond of vegetables and of carrion.

Cachina: See PUEBLO INDIANS.

Cacholong, *kash'ō-long*: a beautiful mineral, sometimes called **Pearl Opal**: is a milk-white variety of opal, nearly allied to hydrophane. It is opaque and pearly, has a conchoidal fracture, and sometimes has a reddish tinge. The name is derived from the river Cach, in Bucharia, where it was first discovered.

Cae'odyl, **Cacodyle**, **Kakodyl**, or **Kakodyle**: also **Caeodylic**, or **Kakodylic Oxide** [from Gr. *κακός*, bad + *ὄδ-*, smell (cf. *κακῶδία*, stink) + suffix *-yl*, substance]: an extremely poisonous organic compound of carbon, hydrogen, and arsenic (C₄H₆As). Correctly speaking, the *fuming liquor of Cadet*; belongs, as it was originally applied by Bunsen, the discoverer of this baneful series of bodies in 1837, to the latter compound, which is also called *arsenic* (arsenical alcohol), though it is now known that the liquor of Cadet is always mixed with cacodyl itself. Cadet's liquor is obtained by distilling together white arsenic and potassic acetate. The mixed product is treated with hydrochloric acid, which gives cacodylic chloride, and this, treated in an atmosphere of CO₂, with metallic Zn, gives pure cacodyl.

Cacou'ua: a post-village and parish of Temiscouata co., province of Quebec, Canada; on the southeast bank of the St. Lawrence (see map of Quebec, ref. 3-E); the terminus of the Rivière du Loup Division of the Grand Trunk Railway; a place of summer resort for salt-water bathing, and for fishing and hunting. Pop. about 1,000.

Cacta'cea: the CACTUS FAMILY (*q. v.*).

Cactus Family (*Cactacea*): dicotyledonous herbs, shrubs, or trees; stems mostly succulent; leaves minute or wanting (in a few cases with ample leaves); ovary inferior; stamens numerous; floral leaves (sepals and petals) usually many. They are related to the myrtles, evening primroses, mentzelias, etc., and are to be regarded as specially modified from this general type for growth in hot, dry climates. About 1,000 species have been described, all natives of the New World, with a single exception (*Rhipsalis cassytha*, variety *mauritiana*). Some species, however, have become naturalized in many countries of the Old World. The most important genera are *Mammillaria*, with spheroidal stems covered with tubercles; *Echinocactus*, with spheroidal stems vertically ribbed; *Cereus*, with elongated, ribbed stems; *Opuntia*, with flattened, articulated stems. CHARLES E. BESSEY.

Cactus-wrens: wrens of the genus *Campylorhynchus*; found in Texas, Arizona, Mexico, and Central America. They live among the cactuses on which they build their nests; hence the name.

Cadhalso, *kaū-daal sō*, José, de: Spanish poet and dramatist; b. in Cadiz, Oct. 8, 1741; killed at the siege of Gi-

braltar, Feb. 27, 1782. He was educated in Paris; traveled in Italy, Germany, and England; and entered the army after his return. He made his *début* in literature with *Sancho García*, a tragedy (1771); followed the next year with *Eruditos à la Violeta*, a satirical epic which attracted much attention. A volume of poems appeared in 1773, and after his death his *Moorish Letters*, written on the model of *Lettres Persanes*. An edition of his collected works was published in three volumes in Madrid, 1818.

Cadam'ba, or **Kudum'ba**: an Indian rubiaceous tree which yields a handsome deep-yellow wood that is used for furniture and finishing. The different species to which the name is applied were formerly referred to the genus *Nauclea*, but that genus is now dismembered. The *Nauclea cadamba*, which is the tree to which the name cadamba is chiefly applied, now becomes *Anthocephalus morindufolius*. *N. cordifolia*, another cadamba-tree, is now known as *Adina cordifolia*. These plants are closely related to the American button-bush, or cephalanthus.

Cada Mosto, *kaa'dā-mōs'tō*, Luigi, da: navigator; b. in Venice in 1432. Having entered the service of Prince Henry of Portugal, he explored in 1455-56 the west coast of Africa as far as the mouth of the Gambia. He wrote a narrative of his voyage (1507). D. in 1480.

Cadastral Survey [*cadastral* is an adject. deriv. of Fr. *cadastre*, from Late Lat. *capitulum*, register of *capita* for taxation]: a survey made with great detail so that its results may be used in taxing property. Such a survey not only produces maps showing the roads, buildings, property lines, etc., but also books giving the names of the land-owners, the area of each parcel of ground, the character of the soil, its assessed value, and the tax payable upon it. A large part of the field work may be completed in connection with topographical surveying, but constant revisions of the cadastral books are necessary. These methods are carried to greatest perfection in Prussia and Saxony. The word cadastral is sometimes applied to any map on a large scale, e. g. the maps of the British ORDNANCE SURVEY (*q. v.*). M. M.

Caddice-fly, **Caddis-fly**, or **Case-fly**: a common name for insects of the order *Trichoptera*. (See ENTOMOLOGY.) The adult insects are moth-like in many respects, and are thought by many students to represent the ancestors of the *Lepidoptera*. They have four wings, with numerous longitudinal veins and but few cross veins, and are usually covered with hairs, which in some cases are scale-like, like those of the butterflies and moths. The mouth-parts are rudimentary, being neither well adapted for biting or for sucking. The common name comes from the peculiar habits of the larvæ. These are soft-bodied aquatic forms, which, for the protection of their whitish and delicate abdomens, spin tubes or cases of silk, strengthened by bits of stick or stones, and in these cases they live, crawling about like hermit-crabs or retreating into the tube at the approach of danger. Most larvæ are herbivorous, but some live on other insects. Some build nets to aid in catching their prey. The larvæ pass into a pupal stage, and from this into the adult. J. S. K.

Caddoan Indians: a family of North American Indians, the Caddos, whose name is said to be derived from a Caddo word, *ká-ede*, signifying chief.

The *Pawnee* and *Caddo*, now known to be of the same linguistic family, were supposed by Gallatin and by many later writers to be distinct, and accordingly both names appear in literature as family designations. The boundaries of the Caddoan family, as at present understood, can best be given under three primary groups—Northern, Middle, and Southern.

Northern Group.—This comprises the Arikara or Ree, now confined to a small village on Fort Berthold reservation, North Dakota, which they share with the Mandan and Hidatsa tribes of Siouan Indians. The Arikara are the remains of ten different tribes of "Pancas," who had been driven by the Dakotas from their country lower down the Missouri river. In 1804 they were in three villages, near their present location. According to Omaha tradition, the Arikara were their allies when these two tribes and several others were E. of the Mississippi river.

Middle Group.—This includes the four tribes or villages of Pawnee, the Grand, Republican, Tapage, and Skidi. The original hunting-ground of the Pawnee extended from the Niobrara, in Nebraska, S. to the Arkansas, but no definite boundaries can be fixed. In modern times their villages have been on the Platte river W. of Columbus, Neb. The

Omaha and Oto were sometimes S. E. of them near the mouth of the Platte, and the Comanche were N. W. of them on the upper part of one of the branches of the Loup Fork. The Pawnee were removed to Indian Territory in 1876.

The Skidi (Panimaha, or Pawnee Loup), according to Omaha tradition, formerly dwelt E. of the Mississippi river, where they were the allies of the Arikara, Omaha, Ponka, etc. After their passage of the Missouri they were conquered by the Grand Pawnee, Tapage, and Republican tribes, with whom they have remained to this day. De Lisle gives twelve Panimaha villages on the Missouri river N. of the Pani villages on the Kansas river.

Southern Group.—This includes the Caddo, Wichita, Kichai, and other tribes or villages which were formerly in Texas, Louisiana, Arkansas, and Indian Territory. The Caddo and Kichai have undoubtedly been removed from their prairie habitats, but the Wichita, judging from the survival of local names and the statement of La Harpe in 1719, are now in or near one of their early abodes. Sibley locates the Caddo habitat 35 miles W. of the main branch of Red river, being 120 miles by land from Natchitoches, and they formerly lived 375 miles higher up. The Wichita probably migrated from Northwestern Louisiana and Southwestern Arkansas to the Indian Territory.

Among the tribes which are included in this group is one known as the Adai. This name is from a Caddo word, *hadai*, meaning brushwood. From an examination of Dr. Sibley's vocabulary of about 250 words (gained at the beginning of this century), Gallatin reached the conclusion that the Adai language was distinct from any other known, an opinion accepted by most later authorities. The researches of the Bureau of Ethnology have assigned the Adai to the Caddoan family, instead of regarding them as constituting a distinct stock, which was before called the *Adaiyan*. The first historical mention of the Adai appears to be by Cabeza de Vaca, who in his *Naufragios*, referring to his stay in Texas, about 1530, called them *Atayos*. In 1792 there was a partial emigration of the Adai to a site S. of San Antonio de Bejar, Southwest Texas, where they probably amalgamated with the surrounding Indian population, as they have disappeared. The Adai who remained in their old homes numbered 100 in 1802, according to Boudry de Lozières. According to Sibley, in 1809 there were only 20 men of them remaining, but more women. In 1820 Morse mentions only 30 survivors.

After comparing the recorded statements about the several tribes, it would appear that the original habitat of the southern group of the Caddoan Indians was a section of country now embracing Northeastern and part of Eastern Texas, and adjacent territory in Arkansas and Louisiana, its boundaries being the Red, the Sabine, and the Brazos rivers.

The principal divisions of this family are: A. Pawnee, Grand Pawnee, Tapage or Tappas, Republican Pawnee, Skidi (Pawnee Loup); B. Arikara (Ree, Ricara); C. Wichita (a confederacy); D. Kichai; E. Caddo (Kädo, a confederacy).

Population.—The present number of the Caddoan Indians is 2,123, of whom 416 are on the Fort Berthold reservation, North Dakota, and the rest are in the Indian Territory, some on the Ponca, Pawnee, and Otoe reservations, the others on the Kiowa, Comanche, and Wichita reservation. The population of the tribes, officially recognized, taken from the *Indian Report for 1892*, is as follows: Arikara, 416; Pawnee, 798; Wichita (the leading tribe of the Wichita confederacy), 151; Towakarehu (a Wichita tribe, the Tawakoni) 133; Waco (a Wichita tribe), 41; Kichai, 51; Caddo, 530; total, 2,123.

Authorities.—Buschmann, *Spuren der aztek. Sprache*, pp. 424, 426, 441, 448 (1859); Gallatin, in *Trans. and Coll. Am. Antiq. Soc.*, ii., pp. 116, 117, 128, 306 (1836); Gallatin, in *Trans. Am. Eth. Soc.*, ii., pt. 1, pp. xcix., 77 (1848); Gallatin, in Schoolecraft, *Ind. Tribes*, iii., p. 102 (1853); Gatschet, *Creek Migration Legend*, i., pp. 41, 52 (1884); Hayden, *Contr. Eth. and Philol. Missouri Inds.*, pp. 232, 345 (1862); Keane, in Stanford's *Comp. Cont. and So. Am.*, p. 478 (1878); Latham, in *Trans. Philol. Soc.*, ii., pp. 31-59 (London, 1846); Latham, *Nat. Hist. Man.*, pp. 338, 342, 344, 349 (1850); Latham, in *Trans. Philol. Soc.*, pp. 101, 103 (London, 1856); Latham, *Opuscula*, pp. 290, 293, 366, 368 (1860); Latham, *El. Comp. Philol.*, pp. 470, 477 (1862); Prichard, *Phys. Hist. Mankind*, v., pp. 406-408 (1847); Turner, in *Pac. R. R. Rept.*, iii., pt. 3, pp. 55, 65, 70 (1856); J. OWEN DORSEY.

Cade, JACK: an Irishman who called himself MORTIMER; the leader of an insurrection which broke out in Kent in June, 1450. He marched with about 16,000 insurgents toward London, and encamped on Blackheath. Among their motives for rebellion was oppressive taxation. Having defeated a royal army which was sent against him, he entered London, in which he maintained strict order, but he caused Lord Say, a royal favorite, to be put to death. Many of his followers were induced to disperse by a promise of pardon. Cade fled, but was pursued and killed in Sussex, near London, July 12, 1450.

Cade, OIL OF (in Fr. *huile de cade*): a thin tar distilled from the wood of *Juniperus oxycedrus*; used in the medical treatment of diseases of the skin.

Cadell, FRANCIS: Australian explorer; b. at Coekenzie, near Edinburgh, in Feb., 1822; entered the service of the East India Company in 1836; became commander of a vessel in 1844. In 1848 he visited Australia, became convinced that the Murray river was navigable, and in 1850 returned to ascend that stream in a boat for several hundred miles. A navigation company was formed, and in 1853 and 1855 he made more extended explorations in a steamer, reaching a point 1,740 miles from the river's mouth. In 1858 he explored the Murrumbidgee river for a distance of 2,000 miles; in 1859 navigated the Darling river as far as Mt. Murchison. The company failed, and he took up farming, but returned to the business of trading, and during a voyage was murdered by a mutinous crew in June, 1879.

Cadence [Fr., from Ital. *vadenza* < Lat. **cadentia*, the proper Fr. representative of which is *chance*]: a fall, a decline, a state of sinking; a fall of the voice at the end of a sentence; a sound or tone. In horsemanship, an equal measure or proportion observed by a horse in all his motions.

Cadence: in music, "a harmonic formula or sequence of chords that expresses conclusion, finality, repose, occurring at the end of a phrase or period, and involving a clear enunciation of the tonality or key in which a piece is written." (*Century Dict.*). Cadences, in music, are four in number: 1. The complete (or perfect); 2. The half (or imperfect);

3. The interrupted (or deceptive); 4. The plagal (or ecclesiastical).

The appropriate use of these forms, in their various inversions, is to the composer what correct punctuation is to the literary workman. Popularly speaking, the perfect cadence (1) may be said to correspond to the "period"; the half or imperfect to the "comma" (2); and the deceptive (3) to various uses of "colons" and "semicolons," even including analogy with points of exclamation and interrogation. Technically, the perfect cadence, or complete close, is produced by the progression from the dominant to the tonic; the imperfect by progression to the dominant, and the deceptive by the unexpected rising of the bass a major or minor third instead of falling to the tonic, a fifth below, or rising to it a fourth above. The plagal cadence in its two forms (4) is to be classified as another form of complete cadence. We have retained it from the ancient church modes. It is not common in modern secular music, unless some peculiar shade of feeling is to be expressed. It will be noted that the progression of the plagal cadence is from the fourth of the key (subdominant) to the tonic.

DUDLEY BUCK.

Cadency: in heraldry, the method of distinguishing the escutcheon of one person from that of others who are entitled to bear the same escutcheon, as with the different sons of one father. No one of these would be entitled during the father's lifetime to bear exactly the same escutcheon as he, and their escutcheons are accordingly *differenced by marks of cadency*. During the early Middle Ages cadency, like other differencing, was often effected by a complete change, as in the tincture of the field or of the bearing. In later times it became customary to add some small bearing, and this system is still in force. The shield of the Black Prince is his father's shield charged with a label, and that of his younger brother, John of Gaunt, is the same shield, but with the label charged in its turn with ermine spots.

The differences used by the British royal family are found in some peerages. The label of the Prince of Wales is plain, while those of the other princes and princesses are charged with crosses, fleurs-de-lis, hearts, or other figures for the sake of distinction. Labels, crescents, mullets, martlets, etc., are the usual marks of cadency, and the rules governing their use are complicated and fanciful.

Caden'za: in music, an ornamental succession of notes in the nature of a flourish, introduced just prior to a final close. In a larger sense the cadenza appears in concertos and concert pieces for piano, violin, etc., at considerable length as a display point for the solo performer making use of the principal themes of the work. This was formerly expected to be impromptu. Since Beethoven, most composers have written their own cadenzas, leaving nothing to the will of the performer. **DUDLEY BUCK.**

Cadet' [Fr. *cadet*, fem. *cadette*; Proven. *capdet*, as if from Lat. **capitellum*, inferior head, i. e. younger son; dimin. of *caput*, head; *caudee* and *caddie* are variants, and *cad* a clipping of the same]; a younger son, younger brother; a military officer who is junior to another is a cadet in respect to him. The term is also applied in France and other countries to a student of the art of war and military science. The students of the Military Academy at West Point, N. Y., are called cadets, as are those of the Naval Academy at Annapolis. There are also medical cadets, recognized as of a distinct rank in the U. S. Army Regulations. See **MILITARY ACADEMY** (U. S.).

Cadet, Naval: the lowest grade of officer in line of promotion in the British navy. Cadets enter the naval service at thirteen to fourteen and a half years of age, and are nominated by the Admiralty, subject to the regulations for examination. They first pass two years on the training-ship in port to learn the rudiments of seamanship, and are thence transferred to sea-going ships. After the cadet has served one year at sea he is eligible for promotion to the rank of midshipman. By the act of Aug. 5, 1882, it is provided that all undergraduates at the U. S. Naval Academy shall "be designated and called 'naval cadets.'" See **NAVAL ACADEMIES**.

Ca'di, or **Kadi**: an Arabic word signifying judge or jurist; the title of an inferior judge among the Mohammedans. He must be chosen from the ranks of the priesthood, as the precepts of the Koran constitute the code of laws.

Cadillac': city; capital of Wexford co., Mich. (for location of county, see map of Michigan, ref. 5-11); on Gr. Rap. and Ind. and Tol., Ann Ar. and N. M. R. Rs.; 96 miles N. of Grand Rapids; has 9 churches, 5 schools, electric lights, water-works, and good sewerage. It is situated between two beautiful lakes (Big and Little Clam Lakes), in the midst of the largest belt of hard-wood timber in the U. S. In 1871 its site was a lumbering-camp. Pop. (1880) 2,213; (1890) 4,461; (1894) 5,105.

EDITOR OF "NEWS AND EXPRESS."

Cadiz (Sp. pron. *kaa'deeth*): a province which forms the southwest extremity of Spain; bounded N. by Seville, E. by Malaga, S. by the Strait of Gibraltar, and W. by the Atlantic and Huelva. Area, 2,809 sq. miles. Capital, Cadiz. Pop. (1887) 429,872.

Cadiz (anc. *Gades*): an important city and seaport of Spain; capital of province of same name; on the Atlantic Ocean and northwest extremity of the isle of Leon; about 94 miles by rail S. by W. of Seville; lat. 36° 32' N., lon. 6° 18' W. (see map of Spain, ref. 20-C). Its site is a long, narrow isthmus or tongue of land surrounded by water on three sides, having on the N. and N. E. an inlet called the Bay of Cadiz, which forms a good and capacious harbor. It is accessible from the mainland by a tongue of land, which in some places is only 200 yards wide, and is strongly defended by several forts. The houses, built of white freestone, present a bright appearance from the sea. The streets are narrow, but well paved and regular. Among the principal edifices are two cathedrals, an old and a new, the lighthouse of San Sebastian, 172 feet high, and a hospital called Casa de Misericordia. The convent of the Capuchins possesses two excellent pictures by Murillo. The city contains two theaters, a medical school, a botanic garden, and an academy of fine arts. Cadiz is one of the first commercial cities of Spain, but is probably inferior to Barcelona in the value of its imports. The chief articles of export are sherry wine, olive oil, salt, metals, and fruits. Among the imports are tobacco, sugar, coffee, hides, indigo,

cotton, dyewoods, fish, and coal. The commerce of this port is much less extensive than it was formerly. Cadiz is the southern terminus of a railway which connects it with Seville. The isle of Leon is separated from the mainland by a narrow channel, which is crossed by a bridge. Here are manufactures of mantillas, fans, glass, soap, cotton and silk stuffs, hats, etc. Cadiz, which is one of the most ancient towns of Europe, was founded by the Phœnicians, probably before the foundation of Rome. The Carthaginians became masters of it during the first Punic war, but the Romans obtained possession of it in 206 B. C., after which it became a city of great wealth and importance. It was taken and pillaged by the Earl of Essex in 1596, and was blockaded in 1656 by Admiral Blake, who captured two rich galleons. It was besieged by the French from Feb., 1810, until Aug., 1812, when the victories of Wellington rescued it. Pop. (1887) 62,531.

Cadiz: village; on railroad; capital of Harrison co., O. (for location of county, see map of Ohio, ref. 4-1); about 22 miles N. W. of Wheeling; 76 miles W. of Pittsburg. A branch railroad 8 miles long connects it with the Pan Handle route from Pittsburg to Cincinnati. It is the commercial center of a great wool-growing district. It has four national banks, doing a business of over \$2,000,000, and is a noted money-lending center. Pop. (1880) 1,817; (1890) 1,716. **PUBLISHER OF "REPUBLICAN."**

Cad'mium: a white metal having a slight bluish cast; discovered in 1817 by Stromeyer; also independently by Hermann; named from *cadmia fossilis*, a name given to an ore of zinc mentioned by Dioscorides and Pliny. The name is said by some to have come from that of Cadmus. Symbol, Cd.; atomic weight, 112; sp. gr. after fusion, 8.6; hammered, 8.7 (nearly). Cadmium is lustrous, takes a fine polish, and possesses a fibrous fracture. It tarnishes very slightly in the air, and only burns at a high heat. It is more tenacious than tin, though, like that metal, a bar of it gives a "cry" when bent. It melts below 260°, and volatilizes at about 360° C. It occurs in nature as the sulphide "greenockite" at Bishopstown, Renfrewshire, Scotland, and incidentally as a constituent of various zinc ores, as the carbonate, silicate, etc., as well as the sulphide in several localities. The zinc flowers in the flues of zinc-reducing furnaces contain even as much as 11 per cent. of cadmium. Commercial English zinc often contains cadmium. The metal is readily soluble in nitric acid, and but slightly so in other acids, except at a boiling temperature. It forms the oxide CdO. This varies in color from brownish to blackish yellow, according to the mode of preparation. It is infusible and not volatile. Its salts are mostly colorless, and when taken into the stomach act as emetics; their taste is disagreeably metallic. Cadmium is prepared by collecting the first products of distillation from the zinc ores containing it, and subjecting them, when mixed with charcoal, to two successive distillations in iron retorts at a low red heat. Instead of the last distillation, solution in acid and purification in the wet way are resorted to. The demand for cadmium is, however, so small that the working up of the furnace products containing considerable amounts of that metal has been discontinued in some places in Silesia. It is necessary, however, to remove it from the zinc, as it renders that metal brittle when 3 per cent. or more is present. Cadmium finds its chief application in the arts in the form of the sulphide, which has an intense yellow color, and is used for coloring soaps, and in paints, etc. It is known as cadmium yellow and *jaune brillant*. The iodide and bromide of cadmium are used in photography. The metal is used for forming a fusible alloy with lead, tin, and bismuth for filling teeth.

Revised by IRA REMSEN.

Cad'mus (in Gr. *Káduos*): in classical mythology, a son of Agenor, King of Sidon; a brother of Europa. After Europa had been carried off by Jupiter, Cadmus was sent in quest of her. According to tradition, he founded the city of Thebes, originally called Cadmeia, in Bœotia; sowed the dragon's teeth that sprang up into armed men; invented sixteen letters of the Greek alphabet, or introduced them from Phœnicia into Greece. He was the first who worked the mines of Mt. Pangæon.

Cadoudal, GEORGES: a leader of the Chouans; b. near Auray, in Brittany, Jan. 1, 1771. Taking up arms against the republic, he was captured in 1794 and imprisoned at Brest, whence he soon escaped to form an army in Brittany which withstood that of Hoche until 1796. After heading

an unsuccessful Bourbon conspiracy and revolt there in 1799-1800, he refused all Bonaparte's tempting offers, and escaped to England, where he plotted with Pichegru. Proceeding to Paris in 1803, he was condemned and executed June 25, 1804.

Caduceus: in classic mythology, the symbol and winged staff of Mercury (Hermes), to whom it was presented by Apollo. From this staff Mercury derived the surname of *Caduceifer*. The term caduceus was also applied by the ancients to a staff or rod of laurel or olive which was carried by ambassadors and heralds as a symbol of peace. It had the figures of two serpents twisted around it. Among the moderns the caduceus is used as an emblem of commerce, over which Mercury was supposed to preside. Still more frequently it is the emblem of health and of the healing art.

Cadwalader, Gen. George: b. in Philadelphia in 1804; practiced law; served as a brigadier-general in the Mexican war; was breveted major-general for services at Chapultepec. He was major-general of Pennsylvania troops 1861-62, and in 1862 became major-general of U. S. volunteers. D. in Philadelphia, Feb. 3, 1879.

Cadwalader or Cadwallader, John: soldier; b. in Philadelphia, Jan. 10, 1742. He served as a brigadier-general at the battles of Princeton, Brandywine, and Monmouth (1778); challenged and wounded Thomas Conway for conspiring against Washington's chieftainship. D. in Shrewsbury, Pa., Feb. 10, 1786.

Ca'dy, DANIEL: b. in Chatham, Columbia co., N. Y., Apr. 29, 1773; admitted to the bar in 1795; practiced with great distinction for over sixty years; was several times a member of the Legislature of New York and of Congress; for eight years judge of the Supreme Court and the court of appeals of New York. His wife was a daughter of Col. James Livingston, an officer in the army of the Revolution, and one of his five daughters is Elizabeth Cady Stanton, D. at Johnstown, N. Y., Oct. 31, 1859. A sketch of his life by his son-in-law, Henry B. Stanton, is contained in vol. xviii. of Barbour's *S. C. Reports*.

Cacel'ida [deriv. of Lat. *cacilia*, a kind of lizard (*cacens* serpens, Pliny); so named from smallness of its eyes; Lat. *cacens*, blind]; a family of *Batrachia* occurring in the tropics of both the Old and the New Worlds. They have an elongate, snake-like body, frequently ringed by the production of folds in the integument, and they differ from all other *Batrachia* in the recurrence of minute scales in the skin. The head is small, and the small size of the eyes gave rise to the name which implies that they are blind. Between the nose and eyes is a peculiar "tentacle," which is really the duct of certain glands. The habits and life-history have been most thoroughly studied by the consular Sarasin in the Ceylonese species, *Epicrion glutinosum*. This lives a burrowing life in the earth, feeding upon earthworms, etc. It lays long strings of eggs, which the female keeps coiled about the body; and the young in the egg possesses rudimentary hind legs and three pairs of external gills, the latter of which are lost upon hatching. As soon as the larva escapes from the egg it takes to the water, where it lives for some time before beginning its subterranean life. The *Cacelians* are good examples of DEGENERATION (*q. v.*), as their characters clearly show that they have descended from more typically constituted forms. They are sometimes referred to as *Gymnophiona*. J. S. KINGSLEY.

Cacel'ius (in Gr. *Κακλίδιος*), of Calacte, in Sicily; literary critic; friend and confidant of Dionysius of Halicarnassus about the beginning of our era; an important theorist, whose work is cited and criticised by (pseudo-) Longinus *On the Sublime*. B. L. G.

Cacilius Sta'tius: a Roman comic poet of high reputation; a native of Milan, and a friend of Ennius. He wrote nearly forty comedies, of which only small fragments are extant. D. in 168 B. C. He was regarded by ancient critics as a comic poet of the first rank. See O. Ribbeck's *Comitorum Romanorum Fragmenta* (pp. 35-81).

Cacina Alie'nus, AULUS, or A. Licinius Caccina: a Roman general who entered the service of Vitellius in 68 A. D., and obtained command of an army. In the year 69 Caccina and Vindex defeated the army of Otho at Bedriacum. He soon deserted Vitellius, and became an officer of Vespasian, but he formed a conspiracy against the latter, and was put to death in 79 A. D.

Cæcum [meat. of Lat. *cæcus*, blind, sc. *intestinum*]; literally the "blind intestine"; a sac or branch of an intestine having only one opening. In man there is only one cæcum, not very large, at the beginning of the colon, being that portion into which the small intestine opens. It terminates in the *appendix vermiformis*. In the herbivorous Mammalia it is greatly developed, being extended from the lower end of the colon. The cæcum is wanting in the bear and weasel families. Birds have two cæca, generally long and capacious in those that are omnivorous or granivorous. Reptiles seldom have a cæcum. Fishes have the cæca attached to the intestine at its uppermost part. The number of these is extremely various; sometimes there are only two, and sometimes more than a hundred. The number is different even in nearly allied species. In some fishes, as the cod, the cæca divide into smaller branches.

Revised by D. S. JORDAN.

Cadmon, kād mon: an ancient Anglo-Saxon poet; originally a cowherd attached to the monastery of Whitby, in England; when somewhat advanced in life he suddenly revealed poetic powers, became a monk in Whitby, and composed, professedly under divine inspiration, poems on religious subjects and (it is said) paraphrases of portions of Genesis, Exodus, and Daniel, which are thought to have influenced Milton in the composition of *Paradise Lost*. Some of these are the oldest extant specimens of Anglo-Saxon metrical composition. D. in Whitby about 680 A. D. Cadmon's works were first published by Franciscus Junius (Amsterdam, 1655); best edition by C. W. M. Grein, in *Bibliothek der angelsächsischen Poesie* (Göttingen, 1857; 2d ed. 1888); Eng. trans. by W. H. F. Bosanquet (London, 1860). His story is told by Bede, *Ecc. Hist.*, iv., 24.

Cælius Aurelianus: medical writer who belonged to the school of Methodici; b. at Sicea, in Africa. The period in which he lived is uncertain. His diction is rugged and obscure. He wrote two Latin works, *De Morbis Chronicis* (On Chronic Diseases) and *De Morbis Acutis*.

Caen, kân (Lat. *Cadomus*, or *Cadomum*); a city of France; capital of the department of Calvados; situated on the river Orne; 10 miles from the sea, and 148 miles by rail W. N. W. from Paris; lat. 49° 11' 12" N., lon. 0° 21' W. (see map of France, ref. 3-D). It was formerly the capital of Lower Normandy. It has wide, regular, and clean streets, several fine public squares, and many noble specimens of ancient Norman architecture. The houses are generally built of an excellent cream-colored freestone which is quarried in the vicinity and is called Caen stone. Caen is connected with Paris by a railway, and with the sea by a navigable canal. Among its remarkable edifices are the Cathedral of St. Étienne, founded by William the Conqueror; the Church of La Trinité, or Abbaye-aux-Dames, founded by Queen Matilda in the eleventh century; and the Church of St. Pierre, the tower or spire of which is much admired. The castle, commenced by William the Conqueror and finished by his son, Henry I., was partially destroyed in 1793. This city contains a large public library, a museum, a botanic garden, a custom-house, the hôtel of the prefecture, an academy of arts and sciences, a medical school, a normal school, and an asylum for deaf-mutes. It has manufactures of lace, crape, linens, cotton fabrics, porcelain, cutlery, flannels, hats, and gloves. Caen has long been celebrated for its manufacture of Angora and woolen gloves. This was an important place as early as 912, when it became subject to the Normans. It was the residence of William, Duke of Normandy, before he conquered England. In 1346 it was taken and pillaged by Edward III. of England. The poet Malherbe and Auber the composer were born here. Pop. (1891) 45,201.

Cænogen'esis [from Gr. *καὸς*, recent + *γένεσις*, origin, birth]; in biology, the changes which may occur in the embryological development of an animal by which this development differs from its ancestral development, these changes being adaptations to new conditions. The term is used in contradistinction to *palæogenesis*, the repetition in the individual development of the stages of ancestral development caused by inheritance.

Caerleon, ker-leon (anc. *Isea Silurum*); an old town of England; in Monmouthshire; on the river Usk, here crossed by a bridge; 2 miles N. E. of Newport (see map of England, ref. 12 F). It is supposed to have been the capital of the Roman province *Britannia Secunda* (modern Wales), and, according to tradition, was a residence of King

Arthur. Many Roman antiquities and relics have been found here, as baths, altars, statues, coins, inscriptions, and aqueducts. Here is also a ruined amphitheater 222 feet in length by 192 feet in width, which indistinctly shows the tiers of seats. The remains of a Cistercian priory are still visible. Pop. (1891) 1,411.

Cæsalpinia: a genus of trees of the family *Leguminosæ*; the type of the sub-family *Cæsalpinieæ*. This sub-family is characterized by irregular flowers which are not papilionaceous, and mostly separate stamens. It comprises numerous species, some of which have purgative properties, as senna (*Cassia*). Others bear edible fruits, as the tamarind and the carob. Among the products of the sub-family are COPAIBA, LOGWOOD, and BARWOOD (*g. v.*). They are mostly natives of warm climates. The genus *Cæsalpinia* has pinnate or bipinnate leaves, and ten stamens in each flower. The red dyewood called sappan-wood is obtained from the *Cæsalpinia sappan*. Other species yield the Brazil-wood of commerce. Among the species of the above sub-family that grow wild in the U. S. are the redbud (*Cercis canadensis*), the honey locust (*Gleditsia triacanthos*), and the Kentucky coffee-tree (*Gymnocladus dioica*).

CHARLES E. BESSEY.

Cæsar [Lat., appearing in Germ. as *Kaiser*, Russ. *Tsar*]: the cognomen of a patrician Roman family of the Julia gens; one of the most ancient in the state; claimed a descent from Iulus, a son of Æneas. The first member of the family mentioned in history is Sextus Julius Cæsar, who was prætor in 208 B. C. After the family had become extinct (at the death of Nero), the succeeding Emperors of Rome assumed the name of Cæsar as a title. It subsequently became the title of the heir-presumptive to the throne.

Cæsar, JULIUS; or, more fully, **CAIUS JULIUS CÆSAR**: soldier and emperor; one of the most remarkable men that ever lived; b. in Rome, July 12, 100 B. C.; belonged to the Julian tribe (gens Julia), which boasted its descent from Iulus (or Julius), son of Æneas. In 83 Cæsar divorced Cossutia and married Cornelia, the daughter of Cinna. This act offended Sulla (then in the height of his power), who commanded Cæsar to divorce the latter. He refused to obey and was proscribed. He was under the necessity of concealing himself for a time, but on the intercession of mutual and influential friends the dictator reluctantly pardoned him. Sulla is reported to have said, to some of his friends who interceded for him, that Cæsar would some day be the ruin of the aristocracy, adding, "In that young man there are many Mariuses." (Marius had proved himself the most formidable enemy that the aristocratic party had ever encountered.) Soon after, Cæsar went to Asia Minor, and served with distinction in the Roman army. Afterward, while on his journey to Rhodes with a view to study oratory under Apollonius Molo, he was taken by pirates. While detained by them he often threatened (in jest, as they supposed) that he would put them to death when he got his liberty. The required ransom having at last been paid, he manned some vessels, pursued and took the pirates, and crucified them all.

Having returned to Rome, he became a candidate for popular honors. He was elected quæstor in 68 B. C. This same year his wife Cornelia died, and the next he married Pompeia, a relative of Pompey the Great and a granddaughter of Sulla. This was done to ingratiate himself with Pompey, who, since the death of Sulla, was all-powerful at Rome. He was made an ædile in 65 B. C., and sought to render himself popular by the exhibition of public games which are said to have surpassed in magnificence everything of the kind ever before seen at Rome. He was elected pontifex maximus in 63 B. C. In 63 occurred the conspiracy of Catiline, and many suspected Cæsar of being accessory to it. When Cicero asked the opinion of the senate respecting the punishment which ought to be inflicted on the conspirators, all the senators gave judgment in favor of their death, until it came to Cæsar's turn to speak. He maintained that it was contrary to justice and highly inexpedient to put men of their rank to death without a full trial. His argument had great weight with the senators. But Cato followed in a powerful speech, accusing Cæsar of complicity with the conspirators, and carried a large majority of the senate with him. The conspirators were condemned to death; Cæsar himself narrowly escaped.

In 62 B. C. he was made prætor, and was sent the next year as propraetor to Spain, where he greatly distinguished himself both as a magistrate and general, and was saluted as *imperator* by the army. In 60 he was elected consul, L.

Calpurnius Bibulus being his colleague. One of his leading measures was to propose an agrarian law, by which a considerable tract of the public land was to be divided among the poorer citizens, particularly those who had a number of children. This measure was carried, in spite of the opposition of Bibulus. With a view to strengthen his interest with Pompey, Cæsar gave him in marriage his daughter Julia, though she had already been affianced to S. Cæpio. He formed in 60 B. C., with Pompey and Crassus, a secret alliance known in history as the first triumvirate. Supported by such powerful influence, Cæsar was enabled to carry through the senate whatever laws or measures he pleased. The government of Cisalpine and Transalpine Gaul having been decreed to him for five years, he left Rome in the spring (of 58 B. C.) and before the ensuing winter he had ended successfully two important wars in Transalpine Gaul—one with the Helvetii, a nation inhabiting what is now Switzerland; the other with Ariovistus, the king of a powerful German nation who had a few years before crossed the Rhine (for his bridge, see BRIDGES), and established themselves in Gaul. In the next seven years he not only subdued the greater part of Gaul, but crossed over (55 B. C.) into Britain, defeated Cassivelaunus, one of the kings of that country, took hostages, and fixed the tribute the Britons were to pay to Rome.

Cæsar's daughter Julia, whom he had given in marriage to Pompey, had died in 54 B. C. The triumvir Crassus had been killed in the war with the Parthians. A coolness gradually arose between Cæsar and Pompey. The latter appears to have become jealous of the new favorite of fortune, since all his own exploits, splendid and unparalleled as they were at the time they were performed, had been eclipsed by the more recent and more glorious achievements of his great rival. Pompey had succeeded to the position of Sulla as the leader of the aristocracy, while Cæsar's policy had been from the first to cultivate the favor of the common people. The two parties became more and more hostile to each other. Some of the more violent of the patricians were determined to crush Cæsar at all hazards. It was at length proposed in the senate, in 50 B. C., by Marcellus, that Cæsar, the Gallic war having been brought to an end, should lay down his command and disband his army; but Curio, a tribune whom Cæsar had gained over to his interests, vetoed the decision of the senate; Cæsar, however, was deprived of two of his legions. But desirous, by the moderation of his conduct, to fasten upon his opponents the responsibility and odium of beginning the quarrel, he sent a proposition to the senate that he would agree to dismiss his army if Pompey would do the same. But the senate even refused to consider the proposal. It was afterward decreed that Cæsar should disband his army by a certain day or be considered a public enemy. This was virtually a declaration of war, for no one could believe that Cæsar would thus tamely abandon the contest. On learning the decision of the senate, Cæsar assembled his army, and in an eloquent harangue inspired them with his own indignant spirit. Accompanied by only 5,000 infantry and 300 cavalry (for his other troops were beyond the Alps), he advanced to the river Rubicon, which then marked the limit between Italy and Cisalpine Gaul. After revolving in his mind for some time his perilous enterprise, he at length exclaimed, "The die is cast!" He instantly crossed the river, and proceeded with rapid strides through Ariminum, Arretium, and Ancona toward Rome. Every town seemed ready to open its gates as he approached. In the general consternation, Pompey, with the two consuls and many of the senators, fled from the city toward Brundisium, closely pursued by Cæsar. He passed over into Greece, whither Cæsar, for want of ships, was unable to follow him. Cæsar soon after set out for Spain, where Afranius and Petreius, Pompey's lieutenants, had a formidable army under their command. Having compelled them to sue for and accept peace on his own terms, and captured Massilia (Marseilles), he returned to Rome, whence he proceeded to Brundisium. After some delay he evaded the vigilance of Pompey's fleet, and succeeded in transporting his army into Greece. In his first engagement with Pompey, near Dyrrhachium, Cæsar was worsted, and was obliged to retreat. He withdrew, pursued by Pompey, to Thessaly. At length the two armies met on the plains of Pharsalia. Cæsar had only 22,000 foot-soldiers and 1,000 horse, while the army of Pompey amounted to 45,000 infantry and 7,000 horse. The latter sustained a disastrous defeat; 15,000 men fell in battle, and upward of 24,000 were taken prisoners. Pompey escaped to Egypt, where he was basely assassinated. (See POMPEY.) The power of his enemies having been utterly

broken in Greece, Cæsar followed Pompey to Egypt, where he was detained for a time, captivated by the charms of Cleopatra, whose pretensions to the throne of Egypt he supported against those of her brother Ptolemy. He next marched against Pharnaces, a son of Mithridates the Great, King of Pontus. Having defeated and destroyed the army of Pharnaces, he wrote to the senate his celebrated letter of three words only—*Veni, vidi, vici*. He next turned his arms against the Pompeians in Africa, who were under the command of Cato and Scipio, whose forces were defeated and almost exterminated at Thapsus, not far from Carthage (46 B. C.). Cæsar returned to Italy the undisputed master of the Roman world. But he had scarcely time to celebrate his recent triumphs when word was brought that the sons of Pompey, Cneius and Sextus, had collected a formidable army in Spain. Cæsar advanced to meet them with his usual celerity. After a severe and bloody battle he gained a complete victory. He said afterward to his friends that he had often fought for victory, but then only for his life.

Having thus risen to power on the ruins of the republic, Cæsar appears sincerely to have sought to promote the true interests of his country. He procured the enactment of several salutary laws. One of the subjects which claimed his earnest attention was the regulation of the calendar. His improvements have been adopted, with some modifications, by all the European nations. (See CALENDAR.) He is said to have contemplated the preparation of a complete digest of the Roman laws, the draining of the Pontine marshes, and other important public works, when death put an end to all his schemes. The senate had conferred upon him the title imperator (whence our emperor), for life; he was also made dictator and *prefectus morum* (chief or ruler of manners or customs), and *pontifex maximus*. To these dignities he wished to add that of king, that he might transmit his power to his successor. Having no legitimate children of his own, he had adopted his grandnephew, Octavius, the son of Attia, who was a daughter of Cæsar's sister Julia. On a certain public festival, the *Lupercalia* (sometimes called in English the *Lupercal*), Antony, a zealous adherent of Cæsar, publicly offered him a regal crown, but he, perceiving that it displeased the people, refused it, but very reluctantly, according to some accounts. From the time of Tarquin the Proud the name of king had always been particularly odious to Romans of every class. Cæsar's evident desire to be a king stimulated the hostility of his enemies, who were encouraged to hope that the taking of his life would be approved even by many of the people. A conspiracy in which sixty persons were implicated was formed. Cæsar had many warnings, it is said, of his approaching fate, but as he scorned to live in constant terror of death, he disregarded all the admonitions of his friends, saying it was better to die at once than to suffer the anguish of death many times by constantly fearing it. It had been planned that when Cæsar came into the senate on the ides of March, Cimber, one of the conspirators, should present a petition to him, and that while the paper was being read the others should crowd around, as if very anxious that Cimber should obtain his request, and make an attack upon their victim all at once. At first Cæsar resisted with great spirit, but when he perceived the number of his enemies he resigned himself to his fate, and, wrapping his toga about him, fell at the foot of Pompey's statue, the base of which was bathed in Cæsar's blood. One account states that he resolutely defended himself until he saw the dagger of M. Brutus among those of the other conspirators, when, exclaiming "Thou, too, Brutus!" he yielded without any further struggle. He was assassinated 44 B. C., in the fifty-sixth year of his age. In person, Cæsar was tall and of a commanding presence. His constitution was naturally delicate, but by exercise and exposure he became so hardy that none of his soldiers could better bear the fatigues and privations incident to a military life. He was sometimes, though rarely, subject to attacks of epilepsy.

As a general, Cæsar was probably superior in genius to every other commander of whom history makes mention, excepting, perhaps, Hannibal alone. (See HANNIBAL.) In the fertility of his resources, indeed, he appears to have surpassed all other generals that ever lived. It has been said that Napoleon taught his enemies how to conquer him, but Cæsar's enemies never learned how to conquer him, because he had not a mere system of tactics, but a new stratagem for every new emergency. He was not only a great general, but a pre-eminent statesman, and the greatest orator of his age except Cicero. Cæsar was also distinguished

as a historian; he wrote the first seven books of the commentaries treating of the Gallic war, and three books relating to the civil war. His style is remarkable for ease, clearness, and simplicity, and for its pure Latinity. A few fragments of his grammatical work, entitled *De Analogia*, have been preserved.

Referring to those remarkable men in history who have compelled "nations unaccustomed to control" to bow obediently to their will, Macaulay observes: "In this class three men stand pre-eminent—Cæsar, Cromwell, and Bonaparte; the highest place in this remarkable triumvirate belongs undoubtedly to Cæsar. He united the talents of Bonaparte to those of Cromwell, and he possessed also what neither Cromwell nor Bonaparte possessed—learning, taste, wit, eloquence, the sentiments and manners of an accomplished gentleman." See Merivale's *Fall of the Roman Republic*; Mommsen's *History of Rome*, vol. iv.; Froide's *Julius Cæsar*; and Long's *Decline of the Roman Republic*, vols. iii.–v. Revised by C. K. ADAMS.

Cæsare'a (in Gr. *Καζαρέα*; anciently called *Torris Strattonis*): an ancient city and seaport of Palestine, now in ruins; situated on the Mediterranean; about 37 miles N. of Jaffa, and 55 miles N. N. W. of Jerusalem (see map of Palestine, ref. 4 C). It was rebuilt by Herod the Great (22 B. C.), who erected here several magnificent edifices, and protected its port by a semicircular mole, which is said to have been one of the most wonderful works of antiquity. Cæsarea was the scene of several events recorded in the book of Acts, especially that of Paul's Syrian imprisonment. (See Acts, chaps. ix., xii., xxiii., xxvii.) It was taken by the crusaders in 1104. The site is now covered with shapeless ruins. Here Eusebius and Origen lived.

Cæsarean Operation: See HYSTEROTOMY.

Cæsare'a Philip'pi, or **Pa'neas**: an ancient town of Palestine; situated about 20 miles N. of the Sea of Galilee, and 45 miles W. S. W. of Damascus (see map of Palestine, ref. 4 B). It is mentioned in Matthew xvi. 13. This site is now occupied by the village of Banias, in which some ancient ruins are visible. Inscriptions found here show that the god Pan once had a sanctuary in this place. It was embellished by Herod and his son Philip; was once the seat of a bishop, but is now a miserable village.

Cæ'sium [neut. of Lat. *cæ'sius*, bluish gray]: an alkali metal discovered with the spectroscopy by Bunsen and Kirchhoff in 1860 in the water of some saline springs in Germany. Its chemical symbol is Cs, and its atomic weight 132.7. The salt spring of Dürkheim contains 0.17 parts of the chloride in 1,000,000. The hot spring of Wheel Clifford was found to contain 0.12 grains of the chloride in a gallon. Cæsium is widely diffused in nature, though in exceedingly small quantities; it has been found with rubidium in lepidolite (as at Hebron, in Maine), petalite, and some feldspars, and has never been isolated. The mineral *pollux* of Elba is reported to contain 34 per cent. of cæsium. In its chemical relations cæsium is closely analogous to potassium and rubidium. A fused mass of cæsium chloride may be decomposed by the electric current, but the cæsium rises to the surface and burns with a reddish flame. Bunsen obtained it as an amalgam with mercury, but even in amalgam or alloy it absorbs oxygen with great rapidity. The platinocloride is more insoluble than that of potassium, and this fact has formed the basis of its separation from that element. The spectrum of cæsium is characterized by two blue lines. Revised by IRA REMSEN.

Caffeine: an alkaloid existing in coffee, tea, Paraguay tea (*Ilex paraguayensis*), and guarana (*Guarana officinalis*, or *Paullinia sorbilis*); called also **Thoine** and **Guaranine**. Chemical formula, $C_8H_{10}N_4O_2$. It was discovered by Runge in 1820, and almost simultaneously by Pelletier, Caventon, and Robiquet. Oudry in 1827 extracted an alkaloid from tea which he supposed to be a distinct compound, and called it thoine, but in 1838 Jobst proved caffeine and thoine to be identical. Steinhilber extracted caffeine or thoine from the leaves and twigs of Paraguay tea, while Martins extracted it from the dry pulp of the *Paullinia sorbilis* or guarana, and called it guaranine, but afterward proved the alkaloid to be identical with caffeine. Van Corput first showed that the leaves of the coffee-plant, as well as the berries, contained caffeine. It probably also exists in other plants.

Caffeine occurs in the raw and also in the roasted coffee, the amount varying with the variety of coffee, the ripeness

of the sample, the season of the harvest, etc. The mean amount of caffeine, as determined by Stenhouse in samples of various coffees, was 0.8 to 1 per cent. Domingo coffee contains the least and Martinique coffee the most caffeine. Tea contains somewhat more caffeine than coffee, 2.5 to 3.4 per cent. It has been found in hyson tea, 2.2 to 4.1 in gunpowder tea, and 0.9 to 2.1 per cent. in various black teas. (*Stenhouse*.) Mean, about 2 per cent. The Paraguay tea used in several South American countries to prepare the drink known by the natives as *maté* contains 1.1 to 1.2 per cent. of caffeine. The guarana, which is a sort of chocolate, the seeds of the plant being roasted and ground to a paste with water, contains about 5 per cent. of caffeine. Guarana is used by the Brazilians to counteract dysentery, retention of urine, etc. Caffeine is supposed to exist in coffee-berries and tea-leaves, combined with tannic acid and potassa—i. e. as potassium *caffeo-tannate*.

When pure, caffeine appears in white silky needles having no odor, containing 8.4 per cent. of water of crystallization, which it parts with at 302° F.; sparingly soluble in cold water, and much more so in hot; less soluble in alcohol, and still less so in ether. It acts as a weak base, dissolving in acids, from which it may be crystallized by evaporation. Boiled with fixed caustic alkalies, it decomposes, giving methylamine. Heating with basic hydrate alters it to a stronger base—caffeine. Boiled with an excess of nitric acid, and then evaporated at a gentle heat, it gives a red color, resembling that obtained from nuxetide, on the addition of ammonia, which is quite characteristic. Caffeine is used in medicine as a powerful stimulant to the respiration and circulation, and it increases the rapidity of thought. It is valuable as a drug in certain cases of cardiac and renal disease, and in opium-poisoning.

Caffres: See KAFFIRS.

Cage-birds: See articles on the various birds, especially PARROT, COCKATOO, and CANARY-BIRD. Birds have in all ages been kept in captivity for their song and plumage. They are favorite household pets everywhere, but should be kept in well-ventilated and uniformly heated rooms, and not exposed to draughts.

Cagliari, *kaal'yā-rēō*: one of the two provinces into which the island of Sardinia is divided; bounded N. by the province of Sassari, and E., S., and W. by the Mediterranean Sea. Area, 5,257 sq. miles. The ground is marshy and the climate unhealthy. The chief articles of export are grain, oil, almonds, sugar, molasses, and wine. Chief town, Cagliari. Pop. (1890) 447,807.

Cagliari (anc. *Calaris*, or *Catalis*): a city of Sardinia; capital of province of same name; on a spacious bay on the south coast: lat. 39° 13' N., lon. 9° 7' E. (see map of Italy, ref. 8-B). It has a large and secure harbor, which is defended by several forts, and is the emporium through which nearly all the foreign trade of the island passes. It contains a cathedral, about thirty churches, numerous convents, a public library, several hospitals, an arsenal, a mint, and a college. Here are manufactures of cotton fabrics, soap, gunpowder, leather, and furniture. Among the articles of export are grain, wine, oil, salt, saffron, and rags. Pop. 39,300.

Cagliari, PAOLO: See VERONESE.

Cagliostro, *kāal'yōs'trō*, ALEXANDER, Count: Italian charlatan and impostor, whose proper name was GIUSEPPE BALSAMO; b. at Palermo, June 8, 1743. He learned a little chemistry and medicine in a monastery, where he was assistant apothecary. Having assumed the title of count and become a Freemason, he traveled through many countries, professing to be a physician and alchemist, and raising money by quackery and other forms of imposture. In some of his adventures he was attended by his wife, and traveled in his own coach in an ostentatious style. About 1780 he visited Paris, where he made many dupes among the higher classes, and revived an old Egyptian Masonic order, of which he became grand kophtha. He was patronized by Cardinal de Rohan, with whom he was implicated in the affair of the "diamond necklace," and was imprisoned in the Bastille in 1785. Having been liberated in 1786, he visited England, where he obtained little success. He afterward went to Rome, where he was arrested in 1789 as a Freemason, and condemned to imprisonment for life. D. in the fortress San Leone, near Urbino, Aug. 25, 1795. See Carlyle, *Miscellanies*, vol. iv.

Cagnola, *kān-yō hā*, LUIGI, Marquis: architect; b. in Milan, Italy, June 9, 1762. He became president of the Institute of Milan. His greatest works are two triumphal arches at Milan—viz., the Porto del Ticino (once called Porta di Marengo) and the Arco della Pace or Porta del Sempione, commenced in 1807 and finished about 1837. The latter is built of white marble, and is 78 feet high. D. in Inverigo, Aug. 14, 1833.

Cagots, *kāā'gō'* [Fr., of uncertain etym., perhaps connected with Breton *caead*, leprous. The explanation from *ca* (= *cauis*) + *got*, i. e. Gothic dog, is only a folk-etymology. Its mod. Fr. signif., hypocrite, is influenced by *bigot*]; a despised race of social outcasts (resembling in some respects the gypsies) who have wandered over parts of France for centuries, and were considered descendants of the Visigoths, whom Clovis nearly annihilated in battle in the fifth century. Before the great French Revolution they were bound by law to wear a peculiar dress, to live apart, to labor in none but menial occupations, and only to enter churches by a special door in each. The Revolution relieved them from all legal disabilities, but could not release them at once from social outlawry and general detestation. Vulgar prejudice still regarded them with abhorrence as foul and depraved, and they were still objects of aversion and loathing. Of late, however, they would seem to have sunk out of sight, being either absorbed into the lower class of the peasants or dwindled to a handful. See Michel, *History of Outcast Races* (1847); J. Hack Tuke, in *Journal of the Anthropological Society*, vol. ix. (1880).

Cahors, *kāā'ōr'* (anc. *Divona*): a town of France; capital of the department of Lot; on the river Lot; 57 miles N. of Toulouse (see map of France, ref. 8-E). The site is a rocky eminence, inclosed on several sides by the river. It contains a large cathedral, a college, a theater, a public library, and a normal school; and has manufactures of glass, paper, woolen goods, cotton yarn, etc. Here are remains of a magnificent Roman aqueduct. Pop. (1891) 15,369.

Caicos Islands: the southeasternmost of the Bahama islands; associated, with Turk's island, with the government of Jamaica. Total area, 212 sq. miles. Pop., with Turk's island, about 5,000. Caicos island proper is the easternmost of the larger Bahama islands; lon. 71° 50' W., lat. 21° 45' N.

Caillié, *kāā'cē'yā'*, or **Caillé,** *kāā'yā'*, RENÉ: traveler; b. in Deux-Sèvres, France, Sept. 19, 1799. He gained a prize of 10,000 francs which the Geographical Society of Paris offered to the first traveler who should visit Timbuctoo. He performed the journey from Sierra Leone to Timbuctoo in 1827-28, and published a narrative of his adventures (1830). D. near Paris, May 20, 1838.

Cain: the eldest son of Adam and Eve; a cultivator of the soil; slew his brother Abel in a fit of jealousy, caused by the rejection of his own sacrifice and the acceptance of his brother's; was condemned to be a fugitive on the earth. He then retired to the land of Nod, and built there a city which was called Enoch, after the name of his eldest son.

Cain, WILLIAM: civil engineer; b. at Hillsboro, N. C., May 14, 1847; graduated at North Carolina Military and Polytechnic Institute; practiced civil engineering eight years; after that was made Professor of Mathematics and Civil Engineering at the University of North Carolina. He is the author of *Theory of Voussoir, Solid and Braced Arches* (1874); *Maximum Stresses in Framed Bridges* (1878); *Solid and Braced Elastic Arches* (1879); *Symbolic Algebra* (1884); *Practical Designing of Retaining Walls* (1888); and of papers in *Van Nostrand's Engineering Magazine* and the *Transactions of the American Society of Civil Engineering*, among which may be mentioned *Theorem of Least Work* (1891) and *Transition Curves* (1892).

Caine, THOMAS HENRY HALL: novelist; b. of Manx parents at Runcorn, Cheshire, England, May 14, 1833; educated in Liverpool, and at fifteen was apprenticed to an architect and surveyor there. While still a youth he wrote much for the press, and contributed leading articles on building, land surveying, and architecture to the *Builder* and *Building News*. At twenty he returned to the Isle of Man and taught school for six months, but soon returned to Liverpool, where he worked until twenty-four. He then went to London and lived with Dante Rossetti until the poet's death in 1882. He has published *Sonnets of Three Centuries* and *Recollections of Rossetti* (1882); *Cobwebs of Criticism* (1883); *The Shadow of a Crime* (1885); *A Son of Hagar* (1886); *The Deemster* (1887); *The Bondman* (1890);

The Manxman (1894); and *The Christian* (1897). *Ben-my-Chree*, a dramatized version of *The Doomster*, was successfully produced May 14, 1888, and another of *The Manxman* was well received everywhere except in Manchester and New York. In 1890 he traveled in Iceland, in 1892 in Russia, and in 1895 in the U. S. and Canada. He lived for a time at Bexley Heath, in Kent; later at Keswick, Cumberland, and now makes his home at Peel, Isle of Man.

Cainites, or **Cainians**: a Gnostic sect of the second century, who maintained that Cain was superior to Abel, since the latter was easily overcome by him. They also professed reverence for Judas and all the worst characters mentioned in the Bible.

Cainozoic: See **CENOZOIC**.

Caird, EDWARD, LL. D.: b. at Greenock, Scotland, 1824; educated at Oxford University; fellow in Merton College, Oxford; became Professor of Moral Philosophy in Glasgow University 1866; and succeeded Prof. Jowett as Master of Balliol College, Oxford, in Nov., 1893. He published in 1877 *A Critical Account of the Philosophy of Kant*; in 1889 a revised and enlarged edition with the title *The Critical Philosophy of Immanuel Kant*; in 1883 a volume on Hegel in Blackwood's Philosophical Classics; in 1892 *Essays on Literature and Philosophy*, 2 vols.; in 1893 *The Evolution of Religion*. W. T. HARRIS.

Caird, Sir JAMES; agriculturist; b. at Stranraer, Scotland, in 1816; educated at the High School and University of Edinburgh; published in 1849 a treatise on *High Farming as the Best Substitute for Protection*, which attracted much attention; devoted himself to the investigation of questions connected with agriculture, and was engaged in many Government missions. As member of Parliament in 1864 he secured the passage of the bill providing for the collection of agricultural statistics in the United Kingdom. Author of *English Agriculture* (1852); *The Landed Interest; India, the Land and the People*, etc.; member of the new Board of Agriculture 1889. D. in London, Feb. 10, 1892.

Caird, JOHN, D. D., LL. D.: brother of Edward; b. at Greenock, Scotland, Dec. 15, 1820; graduated at the University of Glasgow 1845; ordained minister of Newton-on-Ayr 1845; and, after short pastorates in Edinburgh and Perthshire, settled over Park church, Glasgow, 1857. He was appointed Professor of Divinity in University of Glasgow 1862; principal of the university 1873. He published *Introduction to the Philosophy of Religion* (Glasgow, 1880; 2d ed. London, 1889); *The Religions of India, Brahmanism and Buddhism* (1881); *Spinoza* (Edinburgh, 1888). W. T. HARRIS.

Cairn [Mod. Scotch < Gael. *cairn*, heap]: applied to artificial and conical heaps of unhewn stones, which are frequently found in Europe on tops of hills. Many cairns are found near the circles of unhewn stone pillars which are sometimes called Druidical. In some cases the heaps of stones are griddled round by large unhewn stones set upright in the ground. It appears that the majority of them were raised as sepulchres and monuments for the dead. Human bones are often found buried under them, together with stone hammers, blunt arrow-heads, blunt axes, bronze weapons, etc. In Scotland and Ireland occur large cairns called "chambered cairns." The most remarkable of these is at New Grange, on the river Boyne, near Drogheda. It is 400 paces in circumference, about 80 feet high, and is supposed to contain about 180,000 tons of stones. It presents the appearance of a grassy hill partially wooded, but on examination the coating of earth is found to be superficial. An opening accidentally discovered is the external entrance of a gallery leading to a large cruciform chamber containing three granite basins or urns. The sides or walls of the chamber are formed of immense blocks of stone, some of which are covered with carved figures, supposed to be symbolical.

Cairnes, JOHN ELLIOT; economist; b. in Drogheda, County Louth, Ireland, Dec. 26, 1823; son of a brewer, in whose counting-room some of his youth was passed; graduated at Trinity College, Dublin, in 1848; was called to the bar; through Archbishop Whately's influence became in 1856 Professor of Political Economy in Trinity College; in 1857 published *Character and Logical Method of Political Economy*, expanding therein some of J. S. Mill's *Unsettled Questions*, and fixing the definition of law in economics; in 1861 became Professor of Economy and Jurisprudence in Queen's College, Galway; in 1865 was injured by a fall from his horse while hunting, and was made an invalid for life; in

1866 Professor of Political Economy in University College, London; retired as *emeritus* in 1872; d. in London, July 8, 1875. His *Logical Method* is the key-note to his speculations, and expands Ricardo's doctrine of rent (2d ed. 1875). He wrote for reviews on the depreciation of gold, showing that the losses would fall chiefly on raw materials and on labor; also on slave-labor, forecasting truly (1861) the issues of the civil war in the U. S.; produced *Political Essays* (1873) largely concerned with Irish problems. His remaining works are *Essays on Political Economy, Theoretical and Applied* (1873); *Political Economy and Laissez-Faire*; and his largest work, *Leading Principles of Political Economy Newly Expounded* (1874). He was one of the most acute and original thinkers of the English orthodox school. He insisted on the concrete-deductive method of economic studies, representing laws as only approximately true and in need of testing by facts; developed the incidence of the cost of production, expanding Senior's postulates; defined the limits within which competition was free by a real contribution to the progress of economics; and defended Mill's wages-fund theory earnestly, after its author had abandoned it.

C. H. THURBER.

Cairngorm Stones: a name given by jewelers to brown or yellow quartz or rock-crystal found at Cairngorm, in Aberdeenshire, Scotland. The color is produced by a little oxide of iron, or manganese. The yellow variety is often called topaz, but it is inferior to the true topaz in hardness and brilliancy.

Cairns, HUGH McCALMONT, Earl; orator and lawyer; b. in Cultra, near Belfast, Ireland, in 1819. He was returned to Parliament for Belfast in 1852; appointed Attorney-General by Lord Derby in 1866. He was Lord Chancellor of England from Feb., 1868, until December of that year, and was leader of the Conservative party in the House of Lords in 1869; again Lord Chancellor from 1874 till 1880. D. in Bournemouth, Apr. 2, 1885.

Cairns, JOHN, D. D., LL. D.: Scotch theologian; b. near Ayton, Scotland, Aug. 23, 1818; educated in the universities of Edinburgh and Berlin; minister of United Presbyterian church at Berwick-on-Tweed 1845-76; became Professor of Apologetics and Systematic Theology in the United Presbyterian Theological Hall, in Edinburgh, 1867. He was the author of *Life of John Brown, D. D.* (Edinburgh, 1860); *Unbelief in the Eighteenth Century* (1881); and of numerous tracts, reviews, and encyclopedia articles. D. in Edinburgh, Mar. 14, 1892.

Cairo (called by the Arabs *Al Masr* or *Musr*; also *Al Kahireh* (or *Qahera*), i. e. the victorious): a famous city; capital of modern Egypt; situated in a sandy plain on the right (east) bank of the Nile; 5 miles S. of the Delta; lat. 30° 3' N., lon. 31° 18' E. (see map of Africa, ref. 2-F). Elevation, 40 feet above the level of the sea. The climate is warm, dry, and healthy, with a mean annual temperature of about 72° F. The mean temperature of summer is 85°, and that of winter 58°. Cairo is bounded on the E. by the ridge of Mokattam, and surrounded by stone walls with antique battlements. The old streets are narrow, crooked, and ill-paved. The houses, which are built mostly of brick, are substantial buildings of two or three stories, have flat roofs, and are famous for their window-lattices of extraordinary richness in *moucharabiyeh*, or turned-work. The city is divided into quarters, occupied respectively by the Mussulmans, the Jews, the Christians, etc. These quarters are separated by gates, closed at night. Cairo is connected with Alexandria and Suez by railroad.

The architectural interest of Cairo centers in its mosques and tombs. Of the former, numbering some 350, the most ancient is that of Toulun, built 879 A. D., although parts of the still older mosque of Amrû still stand. These two mosques are of the columnar type, with many aisles of columns and pointed arches. Another type, represented by the mosque of Sultan Hassan, consists of a huge open, vaulted chamber on one side of the great court, flanked by smaller chambers, schools, etc. The later mosques, from the fifteenth century down, are domed structures, executed sometimes in stone and sometimes in lath and plaster; but almost invariably of great beauty, and adorned with one or two minarets of singular grace and elegance. The mosque of Kait-Bey is one of the finest of this type. The "tombs of the caliphs" and "of the mamelukes," in the same general style of architecture, are admirable specimens of Arab art. There are handsome public gardens with groves of orange, citron, and palm trees. Among the remarkable objects in

the vicinity of Cairo are the palace of the viceroy, the obelisk of Heliopolis, the old and celebrated Nilometer on the island of Rodah, a graduated column indicating the height of the inundations of the Nile, and most important of all, the Great Pyramids of Gizeh, about 15 miles S. W. of this city. (See PYRAMIDS.) Cairo has long been celebrated as a seat of Oriental learning and Mohammedan theology. It has a university or college which was attended in 1885 by about 7,700 students. There are numerous iron-foundries, calico-printing works, and extensive manufactures of cotton and silk fabrics. The Arabs are the most numerous of the races which compose the population. Cairo, which is supposed to occupy the site of the ancient *Latopolis*, was founded by the Arabs about 970 A. D. and was ruled by the Fatimite caliphs until 1171, when Saladin became master of Egypt. It was the capital of the Sultans of Egypt until it was captured by the Turks in 1517. Between the west side of the older city and the river Nile most of the ground has been laid out into building-lots, and much of it covered with regular rows of houses, forming the district of Ismaileyah. New streets have been cut through the crowded districts of the city, and the Ezbekeeyah, its principal square, transformed into public gardens. The boulevard Mehemet Ali traverses the city nearly N. and S. Pop. (1882) 368,108. Revised by A. D. F. HAMLIN.

Cairo, kã'rô: city, railroad center, and river-port of Illinois; capital of Alexander County (for location of county, see map of Illinois, ref. 12-E); situated at the southern extremity of the State, upon the point formed by the junction of the Ohio and Mississippi rivers, 175 miles below St. Louis. It is a market for the supply of a large portion of Southern Illinois, Southeast Missouri, and Western Kentucky, and is an important dépôt for the products of Northern Illinois, Iowa, and Wisconsin seeking Southern markets. Over 4,000 steamboats touch at its wharf annually. It has a considerable manufacturing industry, costly public-school buildings, and a fine custom-house. Pop. (1880) 9,011; (1890) 10,324. EDITOR OF "ARGUS."

Cairolî, kî-ro'leë, BENEDETTO: Italian statesman; b. at Pavia, Jan. 28, 1825; educated at the University of Pavia; fought against Austria in 1848 and 1859; wounded at siege of Palermo 1860; deputy and leader of the Left 1868; president of the ministry 1878 and 1879-81. On Nov. 17, 1878, he was severely wounded in preventing the assassination of King Humbert, who was riding in a carriage with him. D. in the royal villa, Lago di Monte, near Naples, Aug. 8, 1889.

Caisse: a French word, the primary meaning of which is a chest, box, case, or coffer. It has important applications in commerce, finance, etc. In mercantile business it signifies cash or cash-box. In anatomy, *caisse* is the drum of the ear. In financial affairs the term is applied to a fund; also to the pay-office. *Caisse d'épargne* signifies a savings-fund or savings-bank.

Caisson [Fr., large chest, deriv. of *caisse*, chest]: in architecture, a coffer, a sunken panel in a flat or vaulted ceiling, or in the soffit of a cornice. In civil engineering, an inclosure or large vessel in which the foundations of the piers of a bridge are built and gradually lowered to the bottom of a stream. Caisson is also a name given to a tumbrel or ammunition-cart used in the artillery service. In maritime affairs it is applied to an apparatus for lifting a vessel out of the water for repairs or inspection. It is usually a hollow structure which contains an air-chamber, and is sunk by letting water into it. After it has been placed under the vessel the water is pumped out, and the caisson rises with the vessel. See BREAKWATER and FOUNDATIONS.

Caite: See BRAGANZA.

Caith'ness: the northernmost county of Scotland; bounded W. by the county of Sutherland; by the ocean on the other three sides. Area, 697 sq. miles. The seacoast is bold and rocky, with many inlets or bays. The surface is nearly level, except a mountain-range formed of granite and gneiss, which extends along the western border, and rises to the height of 2,300 feet. A large part of the county is moorland, destitute of trees. The staple products of the soil are oats, potatoes, and turnips. Many of the inhabitants are employed in the herring, cod, and salmon fisheries, and over 150,000 barrels of cured fish are annually exported from this county. Chief towns, Wick and Thurso. In the Middle Ages the Kings of Norway ruled over this part of Scotland. Pop. (1891) 37,161.

Caithness Flagstones: a local name of the Old Red Sandstone as developed in Northern Scotland. The formation, which is about 16,000 feet thick, consists chiefly of argillaceous rocks, but includes also flaggy sandstones of considerable economic importance.

Ca'ius: See GARUS.

Ca'ius, keez (Lat. for *Kaye*, *Key*, or *Cay*). JOHN, M. D.: a learned physician; b. at Norwich, England, Oct. 6, 1510; educated at Gonville Hall, Cambridge, and at Padua in Italy; practiced medicine in Cambridge and London; was appointed physician successively to Edward VI., Queen Mary, and Elizabeth. In 1557 he obtained permission to enlarge Gonville Hall into Caius College, of which he became master in 1559. He wrote a *Treatise on the Sweating Sickness* (1552), etc. D. in London, July 29, 1572.

Caius Julius Cæsar: See CÆSAR, JULIUS.

Caivano, ki-vaa'nô: a town of Italy; province of Naples; 8 miles N. of Naples; was fortified in the Middle Ages. It has remains of its old walls and towers. It has a trade in wine, olives, cereals, and all sorts of fruit. Pop. 11,700.

Cajamarca, kã-khã-maar kã, or **Caxamarca** (i. e. a place of frost): a department of Peru; bounded N. by Ecuador, E. by Amazonas, S. by Libertad, and W. by Lambayeque and Piura. The department, with the exception of the extreme N., is crossed by mountain-ranges, in consequence of which the climate is cool and pleasant. It is irrigated by the Marañon, which flows along its eastern boundary. All products of the tropics and the temperate zones are raised here, as wheat, barley, potatoes, tobacco, etc. Chief town, Cajamarca. Area, 14,188 sq. miles. Pop. 244,895.

Cajamarca, or **Caxamar'ca**: town of Peru; capital of a department of same name: near the eastern foot of the Andes; about 83 miles N. N. E. of Trujillo (see map of South America, ref. 4-B). It has several churches, manufactures of cutlery and woolen cloth. Silver mines have been opened in the vicinity. Cajamarca is celebrated in the history of the Spanish conquest. The ruined palace in which Pizarro confined the inca Atahualpa is still to be seen. Pop. 12,000.

Caj'etan (It. *Cajetano* or *Cajetano*; Lat. *Cajetanus*): the surname of THOMAS DE VIO; an Italian prelate; b. at Gaeta (Caieta), Feb. 20, 1469; entered the order of St. Dominic in 1484, and became its thirty-ninth general in 1508. He was made a cardinal in 1517, and was employed on various political and religious missions of importance. He was papal legate in Germany when Leo X. commissioned him to invite Luther to retract. The meeting took place at Augsburg in Aug., 1518, but was fruitless. In 1519 he became Bishop of Gaeta, and died in Rome, Aug. 9, 1534. He was a man of fervent piety and stainless life. He procured the election to the papacy of the Hollander, Adrian VI. Cajetan was a voluminous writer. His views on the interpretation of Scripture and the future condition of unbaptized infants met with much contradiction. Some eighty of his essays and theses were published in 1581 at Lyons, and in 1612 at Antwerp. The best known and most durable of his works is the famous commentary on the *Summa Theologicæ* of St. Thomas Aquinas, which appeared between 1496 and 1509 at Brescia and Roue; one of the best ancient editions is that of Venice, 1596. The last reprint is found in the Leonine (Leo XIII.) edition of the works of St. Thomas (Rome, 1882).

JOHN J. KEANE.

Caj'uput-tree (spelled also **Cajeput**): a tree 15 to 20 feet high of the genus *Melaleuca*, of the family *Myrtaceæ*. While there are about 136 species in the genus, the name is mostly restricted to *M. leucodendron*, a native of Australia and the adjacent islands. It bears spikes of white flowers on pendulous branches, and its leaves are narrowly lanceolate and somewhat curved. From the latter a valuable oil is obtained, known in pharmacy as oil of cajuput. It is highly stimulant, and is much esteemed in the East, being regarded as a panacea by the Malays. In the U. S. it is used for many disorders—e. g. toothache, rheumatism, gout, dyspepsia, etc. On account of its high price, it is sometimes adulterated by the addition of oil of rosemary, turpentine, etc. The addition of iodine to the unadulterated oil results in the formation of a coagulum, which may be dried into a greenish-brown, brittle mass, thus distinguishing it from that which has been adulterated. C. E. B.

Cakchiquels: See INDIANS OF CENTRAL AMERICA.

Cake-urchin, or **Saud-dollar**: the test of the very much flattened forms of the group of sea-urchins, of the order

Clypeastridae. *Echinarchinus parva* is the common sand-dollar of the Atlantic coast, while *E. eccentricus* is the common cake-urchin of the Pacific coast from Monterey Bay to Alaska.

Calabar Bean: the seed of the *Physostigma venenosum*; a twining, half-shrubby leguminous plant; native of Western Africa. It belongs to the sub-order *Papilionacea*, and is nearly allied to the kidney bean. The bean is used as an ordeal among the Africans. It is very poisonous; fifteen of the beans have produced death in an hour. It is used by surgeons, in small amounts, to cause contraction of the pupil of the eye, the opposite of the effect of belladonna. It is also sometimes given in tetanus and some other diseases. It is a powerful depressant to nervous action.

Calabash: See BOTTLE GOURD.

Calabash-tree: an evergreen tree of the *Bignoniaceæ* or *Bignonia* family and genus *Crescentia*. It is notable for its large fruits, which are a foot in diameter, reminding one of the calabash or BOTTLE GOURD (*q. v.*). The common species (*C. cujelti*) is a native of tropical America, where the hard shells of the fruits are used as domestic utensils or carved into ornamental vessels, while its tough wood is useful for various purposes. The genus *Crescentia* contains fourteen species, all natives of tropical America. Some of these are occasionally grown in the larger conservatories. C. E. B.

Calabo'zo: city of Venezuela; in the state of Miranda, on the plains bordering the left bank of the river Guárico. Pop. in 1893 about 6,000. It is 327 feet above sea-level, and has a warm but not unhealthy climate. It is the center of a large grazing district, and has an important commerce in hides, cattle, mules, and horses. The exports are mainly by way of the Orinoco. Calabo'zo was founded in 1730.

HERBERT H. SMITH.

Calab'ria: the ancient name of the southeastern part of Italy, coinciding nearly with the modern province of Lecce. It was bounded N. E. by the Adriatic, S. W. by the Sinus Tarentinus (Gulf of Taranto), and N. W. by Apulia. Among its chief towns were Brundisium and Tarentum.

Calabria (anc. *Bruttium*): a region of Southern Italy; forming the southern part of the former kingdom of Naples; a long peninsula inclosed by the sea on all sides except the N.; separated from Sicily by the Strait of Messina. Area, 6,663 sq. miles. It is divided into three provinces, Cosenza, Reggio Calabria, and Catanzaro. It is traversed by the Apennines through its whole extent. These mountains, which are here nearly 4,000 feet high, are partly covered with forests of pine, oak, and beech trees. Between the Apennines and the sea are fertile and beautiful valleys, which produce wheat, cotton, rice, sugar, oranges, figs, grapes, and olives. This region is subject to earthquakes. Calabria has considerable fisheries of the tunny, swordfish, anchovy, and mullet. Agriculture is in a rude and barbarous state. Chief towns, Cosenza, Reggio, and Catanzaro. Pop. (1890) 1,309,554.

Calahorra, ka-lā-hā-ō'rā (anc. *Calagurris*): a town of Spain; province of Logroño; on the river Ebro; 19 miles E. S. E. of Logroño (see map of Spain, ref. B-G). It has an old cathedral and some ancient remains. It is the seat of a bishop. Quintilian was born here. *Calagurris* was taken by Pompey or Afranius about 78 B. C., after a long and famous siege. The sufferings of the inhabitants were extreme; hence the Romans gave the name "Calagurritan famine" to any severe famine. Pop. about 8,200.

Calais, ka-lā [Lat. *Calatum*, from the ancient tribe *Calati*]; a fortified seaport-town of France; department of Pas-de-Calais; on the Strait of Dover; 122 miles by rail N. N. E. of Amiens, 19 miles N. E. of Boulogne, and 26 miles E. S. E. of Dover; lat. of the lighthouse, 50° 57' 45" N., lon. 1° 51' 18" E. (see map of France, ref. 1-E). The town and harbor are defended by a castle and several forts, and can be rendered inaccessible by land by flooding the adjacent ground, which is low and marshy. The harbor, which is formed by two moles, is nearly dry at ebb-tide. The town is regularly built, mostly of brick, and has wide, well-paved streets. It has a Gothic cathedral, a public library, and a theater. A large portion of the English tourists who visit the Continent pass through Calais, which has daily communication with Dover by steamboats. Calais is the terminus of a railway which connects it with Amiens and Paris. Here are flourishing manufactures of hosiery, hosiery, soap, leather, etc. In 1347 this town was taken

after a long siege by Edward III. of England, who was then persuaded by his queen, Philippa, to spare the lives of six devoted citizens of Calais. It remained in the power of the English until 1558, when it was taken by the Duke of Guise. It is connected with Great Britain by submarine telegraph. The terminus of the proposed tunnel beneath the English Channel is near the village of Sangatte, 6 miles W. of Calais. Pop. (1886) 58,969; (1891) 56,867.

Calais, kal is: a city, port of entry, and capital of Washington co., Me. (for location of county, see map of Maine, ref. 7-G); on railroad and St. Croix river; at the head of navigation; 28 miles N. by W. from Eastport, and 264 miles N. E. of Portland. Bridges across the river connect it with St. Stephen's in New Brunswick. Calais derives its prosperity from the lumber-trade and ship-building. It has a public library, an academy, an opera-house, a dry dock, marine railways, machine-shops, foundries, and several shipyards. It is the southeast terminus of the St. Croix and Penobscot R. R. to Princeton. The river, which affords water-power, is part of the eastern boundary of the U. S. Pop. (1880) 6,173; (1890) 7,290.

Calaman'der-wood: a valuable cabinet-wood which resembles rosewood, but is far more beautiful and durable. It is produced by the *Diospyros hirsuta*, a tree of the family *Ebenaceæ*; native of Ceylon and Southern Hindustan; belongs to the same genus as the ebony and jersimmon tree. This wood is very dense, takes an exquisite polish, and exhibits great richness and variety of colors, among which is chocolate or fawn color. It is said to be so hard that it can not be worked with edge tools. The tree has become rare in consequence of the wasteful operations of the Dutch and British. Several similar species are found in the Indian Archipelago.

Calamary: a cuttlefish of the order *Dibranchiata*. The term is also applied to the pen or cuttlebone, the internal shell of the cuttlefish. See CUTTLERFISH and CEPHALOPODA.

Calamat'ta, LUIGI: a French engraver of Italian birth; b. at Civita Vecchia, June 12, 1802; engraved after Raphael, da Vinci, and Romano; was Professor of Engraving in Brussels and Milan. D. in Milan, Mar. 8, 1869.

Calamia'nes: a group of islands between Palawan and Mindoro in the Philippine Archipelago; extends between the parallels 11° 39' and 12° 20' N. and 119° 47' and 120° 23' E.; belongs to Spain. They are mountainous and abound in valuable timber, are fertile and sparsely inhabited. Rice, wool, cacao, beeswax, and edible birds'-nests are the chief products. The climate is generally hot and unhealthy. The chief islands are Busuanga, Calamian, and Linaoapan. Total area about 3,000 sq. miles. Pop. (1887) 14,291.

Calamieh'thys [Gr. *καλαμος*, reed + *ἰχθύς*, fish]: a ganoid fish found in the rivers of Western Africa. It takes its name from its slender, cylindrical form; is closely allied to the *Polypterus* of the Nile.

Calamine (*Lapis calaminaris*): an important and abundant ore of zinc; a native carbonate, containing, when pure, 52 per cent. of zinc. Crystals of this mineral are rare. It is opaque or translucent, has a vitreous luster, and occurs in kidney-shaped, botryoidal, cellular, and other imitative forms. It is found in veins, beds, and large deposits termed *pockets* in metamorphic limestone and in the Devonian and carboniferous formations. Large quantities of it are exported from Spain to the metallurgical districts of Europe. This ore is called Smithsonite by Dana and other mineralogists, who apply the term calamine to the silicate of zinc, the primary form of which is a rhomboid.

Calamint [M. Eng. *calament*, modified by false connection with *mint*; from Gr. *καλαμίνθη*, plant-name]: a plant of the genus *Calamintha* and family *Labiata*. The common calamint (*Calamintha officinalis*) is indigenous in England. It has serrated leaves, with an agreeable aromatic odor, and is used in domestic practice as a pectoral medicine. The U. S. have several species.

Calamite: the general name for certain great, tree-like fossil plants composing the order *Calamariales*, of which the principal genus is *Calamites*. They belonged to the class *Equisetina*, and were nearly related to the modern *Equisetum*, the horse-tails or joint-rushes. The remains of many species have been observed, chiefly in carboniferous strata (none later than the Permian) in both continents. These plants must have contributed largely to the production of coal.

CHARLES E. BESSEY.

Calamus (Gr. κάλαμος): a Latin word signifying a reed, a stalk (of a plant); was used by the ancient Romans to denote an arrow, a musical pipe, and a pen which was made of a reed. This reed is supposed to have been the *Arundo donax*. Calamus also denotes the golden tube through which, in some church services, the eucharistic wine is taken.

Calamus: the sweet-flag. See **ACORUS**.

Calamus: a genus of *Palmetaceæ* which yields a great part of the canes and rattans used in Europe and the U. S. for the seats of chairs and other purposes. Among the species of this genus are *Calamus rotang* and *Calamus ruminatis*, which are natives of the warm or tropical parts of Asia. The *Calamus rudentum* has been found 500 feet long (Humboldt). *Calamus draco* yields the best dragon's-blood. Several species are climbers.

Calamy, EDMUND: an English divine; b. in London in Feb., 1600; educated at Cambridge; became an eloquent Presbyterian minister; preached in London from 1639 till 1662. He was one of the authors of a famous treatise called *Smectymnus*, from the initials of its authors, S. Marshall, E. Calamy, T. Young, M. Newcomen, and W. Spurstowe (1641), intended as a reply to Bishop Hall's *Divine Right of Episcopacy*. He took middle ground during the civil war; opposed the execution of the king; kept as private as he could under Cromwell. He promoted the restoration of the monarchy, and was offered the bishopric of Coventry and Lichfield. He declined, and shortly after (1662) was ejected for Nonconformity. D. in London, Oct. 29, 1666.

Calamy, EDMUND: grandson of the preceding; divine; b. in London, Apr. 5, 1671; educated by various ejected divines; became Dissenting pastor in London 1692; d. there June 13, 1732. His fame will endure as the great biographical historian of Nonconformity. His first venture in the field which he made his own was by editing Baxter's *Narrative* (1696). This he abridged (1702), but in it he inserted his memorable account of the ministers and others who were ejected or silenced by the Act of Uniformity. This he afterward separately issued in revised and enlarged form (1713, 1727). See his *Historical Account of my own Life* (London, 1829, 2 vols.; 2d ed. 1830).

Revised by S. M. JACKSON.

Calancha, FRAY ANTONIO, de la: Peruvian Augustinian friar; b. in Chuquisaca, 1584. He was rector of the College of San Ildefonso in Lima, where he died Mar. 1, 1654. He wrote the *Crónica moralizada del orden de San Agustín en el Perú*, which is essentially a chronicle of his order for the whole of South America, and is of great value for civil and geographical history. It was published in Barcelona in 1638.

H. H. S.

Caland, KAA'LAANT, PIETER: an engineer of Holland; b. in Zierikzee in 1826. His father, A. Caland, was an engineer-in-chief of the Waterstaat of Holland, and author of a work on dike-construction. The son was educated at the Royal Military Academy at Breda; appointed a sub-engineer of the Waterstaat in 1845; passing through successive grades became engineer-in-chief of the second class in 1867; in 1873 promoted over the intermediate grade to be inspector (the highest grade, of which there are but two) of the Waterstaat. He is author of a work (in French), *Étude sur l'Effet des Marées dans la Partie Maritime des Fleuves*; also (in Dutch) of a work on the protection of the coast against the encroachments of the sea; Knight of the order of the Netherlands Lion; vice-chairman of the Royal Institution of Engineers of Holland. Mr. Caland's highest claim to fame as an engineer will be founded on the great seaport of Rotterdam, through the works giving an easy and direct water-communication with the sea, in place of the tedious and circuitous ones before available.

Calan'do [Ital., slackening; deriv. of *cala're* < Lat. *cala're*, *cala're*, slacken, from Gr. χαλάν, loosen]: an Italian musical term. It signifies diminishing gradually from forte to piano, and differs from *decescendo* and *diminuendo*, as the tempo at the same time is slightly retarded, but not so much as in *ritardando*.

Calanus (in Gr. κάλανος): an ancient Hindu philosopher; one of those whom the Greeks called Gymnosophists. According to Plutarch, his proper name was SPHINES. He passed some time in the camp of Alexander the Great in India. Having become sick at Pasargadae, he was at his own request burned alive.

Calapooya Indians: See **KALAPOOIAN INDIANS**.

Calatabelleto, kaa-laa'laa-bel-lō'tāā: a town of Sicily; province of Girgenti; 25 miles N. W. of the city of Girgenti. It is very near the site of the ancient *Tricala*, and is on the ancient river *Crimisus*. Here is a fine mediæval church. Pop. 5,500.

Calatafini, -fee'mēē: a town of Sicily; province of Trapani; in a fertile valley 5 miles S. W. of Alcamo. Here in 1860 Garibaldi defeated the royalist troops. Pop. 10,964.

Calatayud': a town of Spain; province of Saragossa; on the river Jalon; 45 miles S. W. of Saragossa (see map of Spain, ref. 14-II). It has an episcopal palace, a noble old castle, and several churches, convents, and hospitals; also manufactures of linen and woolen fabrics, paper, leather, etc. About 2 miles E. of this place is the site of the ancient *Bilbilis*, from the ruins of which Calatayud was mostly built. Pop. 11,512.

Calatrava la Viega, kaa-lāa-traa'vā-lāa-vee-ay'khāā, or **Old Calatrava**: a ruined city of Spain; on the Gaudiana river; about 12 miles N. E. of Ciudad Real; a strongly fortified place in the Middle Ages, but only a single tower now remains. Its defense against the Moors in 1158 is famous on account of its having originated the order of the Knights of Calatrava.

Calatrava. The Order of: founded in 1158 by Sancho III. of Castile, and confirmed by Pope Alexander III. in 1158. After the death of Sancho the knights elected as grand-master Don Garcia de Redon. For a long period the war against the Moors was carried on almost entirely by the Knights of Calatrava. In 1197 the order was nearly exterminated through rashness in war; transferred its seat to Salvatierra, and grew to opulence. The influence exercised by the grand-master in public affairs at length excited the jealousy of the king, and in 1523, by papal bull, the grand-mastership was united to the crown, and the knights permitted to marry. Since 1808 the order has been one of merit.

Calaveras: a small river in the N. central part of California; rises at the foot of the Sierra Nevada, in Calaveras County; flows nearly southwestward, and enters the San Joaquin river about 15 miles below Stockton.

Calbur'ga, or **Kulburga**: a town of India; in the Nizam's Dominions; on an affluent of the Beemah; 110 miles W. of Hajdarābād. It is now unimportant, but was formerly the capital of several Hindu and Mohammedan sovereigns.

Calcareous Spar, or **Calc Spar** [calcareous is from Lat. *calca'rius*; deriv. of *calx*, lime]: a common name of crystallized carbonate of lime; composed, when pure, of 44 per cent. of carbonic acid and 56 of lime. It is one of the most abundant of all minerals, and is found in every part of the world. The primary form of its crystals is a rhomb or rhombohedron. Its secondary forms are more numerous than those of any other mineral, and are said to amount to 700 or more. In a pure state this mineral is colorless and transparent, but it often contains impurities which render it red, green, brown, yellow, etc. Andreasberg, in the Hartz, and the Derbyshire lead mines are noted for fine large crystals. Some very fine crystals are from the Rossie lead mine of New York. The purest and most limpid variety of this crystal is called Iceland spar, which is found in Iceland, and exhibits double refraction in a remarkable degree.

Calcasien, käl'ka-shoo: a river of Louisiana; rises in the western part of the State; flows in a general S. S. W. direction through Calcasien parish, and enters the Gulf of Mexico. At its mouth stands an iron lighthouse 53 feet high; lat. 29° 45' N., lon. 93° 17' E. Length of river estimated at 200 miles, including Calcasien Lake, which is an expansion of the river. The lake is about 18 miles long and 5 wide, and the foot of it is nearly 5 miles from the Gulf of Mexico.

Calceola'ria [deriv. of Lat. *calce'olus*, little shoe; dimin. of *calceus*, shoe]: a genus of plants of the family *Scrophulariaceæ*, which comprises numerous species, natives of South America. They grow mostly on that part of the Andes which is more than 9,500 feet above the level of the sea; are herbaceous plants or shrubs with beautiful flowers. The corolla is two-lipped, and the lower lip is inflated, so as to form a bag which has some resemblance to a slipper. They are so abundant in some parts of Chili and Peru as to give a peculiar aspect to the scenery. Many species are

cultivated by florists in Europe and the U. S., and are easily propagated by cuttings. Some of the species are used in South America for dyeing.

Calcite [from Lat. *calx*, lime + suffix *-ite*]: a general term under which are comprised all the varieties of carbonate of lime.

Calcium [mod. deriv. (Sir H. Davy) of Lat. *calx*, lime]: a very widely distributed and abundant metal (symbol Ca, and atomic weight 40). Among the more common substances containing it are limestone, calcite, chalk, marble, calcium phosphate, gypsum, or calcium sulphate. It was isolated by Sir Humphry Davy in 1808 in his great investigation on the action of the electric current on chemical compounds, in the course of which he discovered the metals potassium and sodium. It is a yellowish-white, malleable metal. Among the compounds of calcium that find extensive application are lime, made by heating the carbonate, and plaster-of-Paris, made by heating the natural sulphate. IRA REMSEN.

Calc-spar: See CALCAREOUS SPAR.

Calculating-machine: a machine for performing arithmetical operations, or for computing logarithmic or other mathematical tables in which the successive results are to be obtained by substituting, in an invariable formula, the consecutive numbers of a simple series, uniformly increasing. The two kinds of work here mentioned are essentially different, and require different machinery. For simple arithmetic the most successful machine yet constructed is that of M. Thomas, of Colmar in Alsace-Lorraine. For tabular numbers the computations are made by the "method of differences"; and the machines are called "difference-engines." Such are those of Babbage (which was never finished) and of the Messrs. Schentz, of Stockholm, of which there is an example at the Dudley Observatory, Albany, and another in the office of the registrar-general, London. See MECHANICAL CALCULATION.

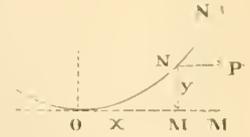

Calculus [Lat., pebble; stone used in reckoning, calculation; dimin. of *calx*, stone]: the term is derived from the ancient use of pebbles as *counters* or for making computations, and it, in general, denotes some particular method of performing mathematical investigations. Those e. g. of arithmetic, algebra, logarithms, etc., have received the name of *calculus*, as the *Arithmetical*, the *Algebraic*, the *Exponential*, the *Trigonometrical* (which latter, according to De Morgan, "contains that of *undulating magnitude*"; or of *Circular Functions*). In modern usage it is applied to mathematical methods of peculiar power involving unusual refinements of reasoning, or reference to relations of magnitude, which may be styled "transcendental." Among such are the *Ante-rdental Calculus* of Mr. Glenie,* the *Calculus of Derivations* of M. Arbogast, the *Calculus of Probabilities* (q. v.), and the more modern creation of Sir William Rowan Hamilton, *Quaternions*. But, pre-eminently, by the word calculus is denoted the Infinitesimal Calculus, including under this head the complementary branches of "Differential and Integral," of the Leibnitz system of symbolization, or the "Fluxions" and "Inverse Method of Fluxions" of the Newtonian. The calculi of Leibnitz and Newton are essentially the same, though the logical basis on which Newton places his method appears quite different from that of Leibnitz. The method of Leibnitz made its appearance before the public in 1684, earlier than that of Newton; but Newton's method of drawing tangents (wherein the method of fluxions was sufficiently explained) was communicated in a letter to a Mr. Collins in 1682. Upon the allegation that Leibnitz had seen this letter was based the charge (sustained by the Royal Society of London) that Leibnitz had plagiarized therefrom. This charge is now considered unfounded, and the glory is conceded to him of having been a contemporaneous discoverer of a calculus that has been styled "one of the greatest, most subtle, and sublime discoveries of this or perhaps of any age; opening a new world to us and extending our knowledge, as it were, to infinity, and carrying us beyond the bounds that seemed to have been prescribed to the human mind; at least, infinitely beyond those to which ancient geometry was confined."

The logic on which the operations of the calculus rest is so intricate that even mathematicians were slow in accepting it, and the methods were sometimes objects of ridicule.

* James Glenie, F. R. S., of London and Edinburgh, invented this calculus in 1771; it was published in 1794. According to the writer in Rees's *Encyclopaedia*, "both the differential and fluxional calculi may be derived from the doctrine of proportions (therein expanded) in a manner altogether unexceptionable."

Bishop Berkeley published a long paper criticising the method, and suggesting that differentials might be called the ghosts of departed quantities. At the present time, however, there is no real difference of opinion between professional mathematicians on the subject. We shall confine ourselves to such an outline of the first principles as may make them clear to the student.

Let OXN' be a curved line of any form—a parabola, for example. Let N and N' be two points upon the curve. If we take the horizontal and vertical line going out from the point O as axes of co-ordinates, then, in the language of co-ordinates, OM will be the abscissa of the point N , and MN its ordinate. See CO-ORDINATES.

OM will also be the abscissa of the point N , and MN its ordinate. If, as usual, we represent abscissas and ordinates respectively by the symbols x and y , then we may put $x = \text{abscissa } OM,$
 $y = \text{ordinate } MN.$

We also put

$$\Delta x = \text{excess of abscissa } OM' \text{ over } x = MM';$$

$$\Delta y = \text{excess of ordinate } M'N' \text{ over } y.$$

Now, suppose the point N' to move toward N , and let us study the ratio $\Delta y : \Delta x$. By trigonometry this ratio is the tangent of the angle which the straight line through N and N' makes with the axis of abscissas OM . It is evident that the nearer N' approaches to N , the more nearly the line NN' will approach the position of the tangent at N . We might say that if the point N' coincides with N , the secant NN' will coincide with the tangent at N . But when the two points coincide we can have any number of lines through them, because they will form but one point. The difficulty then is simply this: so long as N' is different from N , the secant will be different from the tangent; while if the two points coincide the secant will be indeterminate. To meet this difficulty the idea of an infinitesimal was introduced. It was supposed that the point N' might be so near N that the distance between them would be smaller than any finite quantity whatever, while the two points would still be distinct. Then the secant would be considered as coinciding with the tangent. This idea of infinitesimal quantities as smaller than any finite quantities whatever is no longer entertained by the best writers, but in lieu thereof the idea of a limit is introduced. The relation of the secant and tangent may be expressed as follows by the method of limits:

Let α be any angle whatever, as small as we please. Then the point N' may be taken so near the point N that the angle between the secant and tangent shall be less than α . This completely determines the tangent, because there is only one line of which this can be true. For if any other line passed through N , making an angle β with the tangent on the opposite side from the secant, then the latter would always make an angle greater than β with this line, and in consequence we could not make α less than β , and so could not make it as small as we please. We are thus led to the method of reasoning adopted by Euclid to prove the equality of a cone to one-third of the circumscribing cylinder. If the cone differs from one-third of the cylinder, he might say, let h be that difference. Take any value you please for h , and I will show that the difference is less than h ; therefore, if you suppose the two quantities to differ at all, you are led to the absurdity of saying that the difference is equal to h and less than h at the same time; therefore the cone and one-third of the cylinder do not differ at all.

Algebraically the matter may be expressed as follows:

Suppose the relation between x and y to be given by the algebraic equation $y = mx^2.$

We then have

$$y + \Delta y = m(x + \Delta x)^2.$$

By developing the square and subtracting we easily find for the quotient $\frac{\Delta y}{\Delta x} = 2mx + m\Delta x.$

Now, it is evident that by making Δx smaller and smaller we can bring this quotient just as near as we please to the value $2mx$. We express this fact by substituting the letter d for Δ , and writing the equation in the form

$$\frac{dy}{dx} = 2mx,$$

which, when properly interpreted, is a rigorous equation,

although Δx is dropped out entirely. It is rigorous because it is regarded not as an equation between any actual values of Δy and Δx , but only as expressing a limit toward which the ratio of these quantities approaches as they become smaller and smaller.

Besides the direct solution of problems, the calculus has been the most effective and indispensable of agents in widening the sphere of mathematical investigation, and in enhancing its power as an instrument. Most of the modern methods of analysis depend on it for their development.

The CALCULUS OF VARIATIONS, originating with Lagrange, is but an extension of the methods of the calculus to the discovering of functions, in cases in which, instead of the law of growth, some condition (such as that of producing a maximum or minimum under certain conditions), which the function when found must fulfill, is given.

The CALCULUS OF OPERATIONS is but an extension of algebra to the *symbols of operation* of the calculus; algebra itself being really a calculus of operations, since it deals only with symbols with a view to reduce the operations they indicate to their simplest expression.

The CALCULUS OF FUNCTIONS is a branch of modern mathematics concerned with the laws of functions of an imaginary variable.

The CALCULUS OF FINITE DIFFERENCES, invaluable in the practical application of analytic formulæ to numerical calculations, for the summation of infinite series, and for INTERPOLATION, is concerned with relations between finite increments or "differences," and is defined by Lacroix to have for its object "the determination of the values of increments, by deducing them not merely from the analytic expression of the functions, but also from their numerical (or particular) values, when that expression fails or is too complicated." Except a general similarity in notation and terms employed, it has little in common with the Differential Calculus; the fundamental element of the latter—the Differential Coefficient—having no place in it. Revised by S. NEWCOMB.

Calculus, or Stone: a hard concretion formed from the deposition of saline or other substances in various parts of the body. The most frequent position for calculi is the urinary tract, either in the pelvis of the kidney or in the bladder; but they are also found quite commonly in the gall-bladder or biliary ducts, and more rarely in other hollow tubes or viscera.

Urinary calculi are especially common in advanced life, and are more frequent in the male sex. A life of ease and luxury and sedentary habits strongly predisposes, and it is supposed that the character of water drunk in certain localities accounts for the greater frequency of stone in these places than elsewhere. Stone in the kidney is especially common in old men of gouty habit, and they are usually composed of uric acid or oxalate of lime. There may be merely small gritty particles which are passed from time to time, causing great pain and blood-stained urine. The terms

renal sand or gravel are applied to this form. Larger stones are apt to lodge in the pelvis of the kidney and may set up inflammatory disturbances, and from time to time as they attempt to escape attacks of intense renal colic.

Stone in the bladder occurs in cases in which there is some inflammatory disturbance of the bladder-walls, or in which there is repeated or constant retention of urine. These stones most frequently are composed of phosphate of lime or ammonia-magnesium phosphate. They may occasion no symptoms at all, but more frequently there is great pain, especially during urination. Calculi of various other kinds occur in the kidney or bladder, but are comparatively rare and unimportant.

Biliary calculi are formed in the gall-bladder, where they may remain without producing disturbances for a long period of time. Sooner or later they tend to escape through the duct of the gall-bladder and occasion sharp pain in the right side with jaundice (hepatic colic). The stone may lodge in the gall-ducts and occasion permanent jaundice and great disturbances of the general health. Gall-stones are more common in women than in men, and are more frequent after the age of forty than in younger persons. They are composed of thickened bile, around which cholesterol crystals (one of the components of bile) gather.

Salivary calculi are small concretions formed in the ducts of the salivary glands. They may cause obstruction and cystic dilatation of the ducts. A similar form of calculi occurs in the pancreatic duct and leads to similar results.

Enteroliths or *intestinal stones* are formed in cases of constipation or catarrhal diseases of the intestines, and are composed of mucus and earthy constituents derived from the food. They are especially common in the vermiform appendix, where they may play a part in causing appendicitis.

Lung-stones are formed in the bronchial tubes. *Phleboliths* are calcareous masses occurring in a vein as a result of clotting of the blood and secondary calcification of the clots. Stones are also found in the nasal chambers, in the tonsils, and even in the chambers of the heart.

In cases of calculi in any of the abdominal organs (kidney, gall-bladder, pancreas) attacks of severe pain or colic denote the attempt at escape of the stone, and such attacks are designated as colics. The pain is of great severity and prostrates the patient in a short time, and the appearance may be that of extreme collapse.

Opiates, chloroform, and hot baths may be required as relaxants and anæsthetics. The stone may escape through the duct in which it is lodged, or may recede to its place of origin. Surgical treatment becomes necessary when a stone is too large to escape, or when serious results are imminent from its lodgment. There is little reason to believe that remedies or waters vaunted as having powers to dissolve stones often act in this way. Occasionally they may do so, but stones occasionally break up and disintegrate spontaneously. The formation of stones may, however, frequently be prevented.
