size and shape, but if one throws them upon the surface of a table, or some large flat object, the task then becomes very simple. So it is with the bacteria: if they can be diffused in some medium that has the property of at one time being fluid and at another solid, they can be scattered so that each drop of the fluid will contain a few of these microscopic bodies. If now, while fluid, this diluted culture medium is poured out upon a large glass surface, the individual bacteria are more widely separated the one from the other, and if the medium possesses the property of solidifying when brought in contact with the cool surface of the glass plate, the bacteria are not only separated, but, as solidification occurs, are fixed in this separated condition. The media that are employed for this purpose are composed primarily of beef tea to which enough ordinary bone gelatin or vegetable gelatin (agar-agar of the Japanese) is added to permit of their being at one temperature fluid, and at a lower temperature solid. These media afford conditions favorable to the growth of bacteria, so that in the course of from twenty-four to forty-eight hours the organisms, separated by the process described above, begin to grow, and very quickly give rise to what are known as colonies of bacteria that can easily be seen with the unaided eye. Each colony represents the offspring from a single bacterium that was fixed at the point at which it appears. They are therefore each a pure culture of the organism from which they sprang. As colonies from different species of bacteria commonly present peculiar characteristics, it is usually possible to determine the number of particular species that were present in the original mixture by the appearance of the colonies developing from them. In some instances the resulting colonies will have a characteristic shape, being regularly round or oval in outline; again they will be irregular and ragged at their borders; in some instances they will be dense and non-transparent; and again very thin, delicate, and translucent. Some of them grow as dry lusterless patches, others as moist glistening islands that stand up above the surrounding medium. Many species of bacteria—the chromogenic varieties—possess the interesting property of producing brilliant pigments, by which they can readily be recognized. Just as some roses grow red, others white, and others yellow, so will the colonies resulting from certain of the chromogenic species be in one case red, in another yellow, and in still others violet in color, so that a plate that is made for the purpose of separating the individuals of a mixture containing, with other organisms, certain of these color-producers, will often present a most attractive array of these various pigmented colonies.

If now a portion from each representative colony is introduced into a tube or flask containing a sterile, nutrient medium, the growth that results will be a pure culture of the organism forming the colony from which the bit was taken. By this means it is a comparatively simple matter to separate from a mixture of bacteria the individuals that composed it. The process, as just described, represents the well-known method of Koch for the isolation and cultivation of bacteria on solid media.

Another means for distinguishing them is by their relation to bone gelatin. Some of them by their powers of peptonization cause the gelatin to become fluid, and in doing this so alter the chemical constitution of the medium that it can not again be rendered solid. Others never under any circumstances bring about this change.

Again, certain of them are characterized by their relation to oxygen. Most species—the aerobic forms—require this gas for their development, while others—the anaerobic forms—not only do not grow where it is present, but are directly destroyed through its influence.

Still another means of identification is by the nature of their chemical products, and finally, and most important to mankind, by the absence or presence of the power to produce disease.

With certain mixtures of bacteria, particularly those suspected of containing pathogenic (disease-producing) organisms, another method of separation is often resorted to: the inoculation of susceptible animals with the suspicious mixtures. The innocent saprophytes are quickly destroyed by the tissues of the animal, while the disease-producers will perform their specific function, and can often be obtained from the blood or organs in pure culture.

The life history of the parasites when outside of the body of their host is not only an interesting one, but to mankind a matter of great practical importance. When disease-producing bacteria are thrown off from the body of the affected animal or man, either with the intestinal evacuations, the

sputum, or from the skin, the conditions which they meet, though not sufficiently unfavorable in most cases to prevent the development of the ordinary saprophytes, are by no means favorable to the growth of the more delicate parasites, so that in the main they quickly lose their vitality. Where conditions of a more favorable character do exist, they are likewise those under which the saprophytic forms grow most luxuriantly, so that again the delicate disease-producers meet another element not favorable to their growth—the antagonism that is offered to them by the common organisms found upon the surface of the earth, in the water, etc. Were it otherwise, the causes of some diseases, such as typhoid fever, would be much more persistent and widespread than they seem to be at present.

By the methods described, with certain modifications, the details of which can hardly be given in an article of this character, a very large number of different species of bacteria have been isolated, and their peculiarities in cultures and their relation to changes going on about us and to diseases have been established.

At different places upon the earth's surface bacteriological analyses of waters have been made, and comparisons of the results reveal the interesting fact that there is a definite flora of bacteria from open watercourses over the entire earth. These water bacteria, as they are commonly called, are saprophytes, and do not possess the property of inducing disease. By their presence in water complex nitrogenous matter is converted into simpler forms, in which it is either taken up as food by the higher inhabitants of the water, or is precipitated to the bottom of the stream by chemical processes, or remains in solution in the water in the form of innocent inorganic salts.

No less interesting and instructive are the results of studies upon the soil. Here are found countless numbers of bacteria, the majority of which are those concerned in the great process of decomposition and disintegration constantly in progress. Of these certain species are, however, directly instrumental in a more or less specific feature of decomposition—nitrification, i. e. the production of soluble salts of nitric acid from the more complex forms of nitrogenous organic matter. It is through the agency of these organisms, most probably in combination with other organisms that are concerned in the primary process of decomposing the nitrogenous organic matter as such, that the purification of sewage by filtration through soil is mainly accomplished. It is also due to the activities of the same organisms that ammonia, nitrous and nitric acid are found in water polluted by nitrogenous wastes, and it is these microscopic creatures that are instrumental in perpetuating the niter or saltpeter beds of Chili and Peru, that are of such importance in commerce. It is interesting to note that, though the organisms of nitrification produce these characteristic end products from nitrogenous organic matter, they are still incapable of development in the nitrogenous nutritive media employed in general bacteriological studies. They can not be isolated by the ordinary methods from water or soil in which they are present, but require for their isolation media quite different from those utilized in the cultivation of any other known bacteria. Those who have worked with greatest success upon this organism have cultivated it only through the use of solutions of inorganic salts in distilled water, from which organic matter is absent. It is isolated from waters in which nitrification is in progress by a process of dilution. As other organisms that were originally present with the nitrifying bacillus do not retain their life properties in solutions favorable to the growth of this organism, it is a comparatively simple matter to exclude them after a few generations.

The nitrifying bacillus, when examined microscopically, is a short rod of a slightly oval shape. It varies in size from 1.1μ to 1.7μ in length, and from 0.8μ to 0.9μ in breadth. It stains with difficulty with the ordinary aniline staining reagents, and is, when examined fresh, seen to be without the power of independent movement. As found in cultures they are grouped very characteristically in irregular clumps, and are held together by a jelly-like material. These clumps are found usually at the bottom of the fluid. It is not improbable that there may be several closely allied, though not identical, organisms included in this term "nitrifying bacillus." The most remarkable feature of the organism, and that which distinguishes it from all other bacteria thus far studied, is its peculiar source of nutrition. The absence of chlorophyll from its tissues precludes the possibility of its obtaining the necessary carbon and nitrogen from such

simple substances as gaseous ammonia and carbonic acid, as do the more highly organized green plants; and its failure to grow in artificial cultures or media containing nitrogenous organic matter renders it somewhat enigmatical as to how its processes of nutrition are conducted. It is to be hoped that further studies upon this interesting and important organism will clear away some of these obscure points.

The disease-producing organisms are not very rarely found in the soil, and are for the most part those possessing the property of forming spores, by which they are enabled to resist those detrimental influences that result in the death of the less resistant, non-spore-forming organisms. Of these forms the most conspicuous are the bacillus of tetanus (lock-jaw) and the bacillus of malignant oedema.

The bacillus of tetanus is a delicate rod of about 1.0μ to 1.3μ in length, and of about 0.1 to 0.2μ in thickness. It possesses the property of forming spores, and when in this stage has somewhat the appearance of a miniature drum-stick, owing to the tendency of the spore to form at one end of the rod, at which point the rod becomes slightly enlarged. It is feebly motile. It is anaerobic, and will therefore not grow in the presence of oxygen. When this gas is rigidly excluded from the cultures, the organism grows well on the ordinary culture media after they have been rendered a little more alkaline than is necessary for the majority of other organisms. It grows best in those media to which a little (about 1 to 2 per cent.) of grape sugar has been added. It is not a rapidly growing organism, and thrives best at the temperature of the human body. It liquefies gelatin, and gives off a peculiar, unpleasant odor. It can be stained with the ordinary aniline dyes. It is most readily obtained in pure cultures from the soil or other materials in which it is present, after subjecting them for two or three successive days to a temperature of 80°C . (176°F .) for one-half to one hour, a temperature that destroys the other organisms present but is not harmful to the spores of the tetanus bacillus. When subjected to the temperature of steam (100°C . or 212°F .) for five minutes the organism and its spores are killed. When in the dried condition the spores of this organism have been known to retain their virulence for as long as sixteen months.

The animals that are susceptible to its pathogenic activities are horses, sheep, dogs, mice, rats, guinea-pigs, rabbits, and also man. As seen experimentally, the clinical manifestations and pathological alterations in this disease are due entirely to the absorption of the poisonous products of growth of the organisms located at the point at which they gained access to the tissues. In animals dead of this disease neither the bacilli nor their spores are ever found in the internal organs, and in many cases they are even absent from the seat of inoculation. The presence of this organism in the soil serves to explain the frequent appearance of tetanus as an accompaniment of wounds to which dirt and dust have had access—those wounds, for example, of individuals engaged in agricultural labors, street workmen, and crushed wounds from the wheels of engines and railroad cars.

The bacillus of malignant oedema (French, *Vibrio septicum*), another pathogenic organism found in the soil, is a rod-shaped organism of 3 to 4μ long and 1.0 to 1.1μ thick. It is sometimes straight and sometimes slightly curved in shape, and not infrequently grows as long threads. In the vegetative stage it is motile, but becomes motionless as the spores form within it. It is, strictly speaking, an anaerobic organism, and grows best in an atmosphere of hydrogen. It is not a gas-producer, and gives off when growing an unpleasant acid odor. On bone gelatin it produces liquefaction. It stains with the ordinary aniline dyes. It grows most luxuriantly at the temperature of the human body.

The animals that are susceptible to the action of this bacillus are guinea-pigs, mice, cattle, sheep, goats, pigs, chickens, and rabbits, though the intensity of the disease varies considerably with the animal affected. Guinea-pigs that have died as a result of subcutaneous inoculation with this organism present the condition of intense oedema of the subcutaneous and muscular tissues at and about the point of inoculation. The bacilli can easily be found in this oedematous fluid, and have been detected in the tissues of the mesentery. Horses, asses, and white rats when inoculated present only a very limited local swelling that quickly disappears without proving fatal, while hogs, dogs, cats, rabbits, ducks, chickens, and pigeons are practically susceptible to the disease. Aside from the importance of the relation of this organism to the lower animals, it is principally of interest historically as being the organism that was, prior to

the more exact methods of work of to-day, most frequently confounded with the bacillus of ANTHRAX (*q. v.*).

Bacteriological study of the air has shown that the number of organisms present are in proportion to the amount of floating matters, i. e. the amount of dust; and microscopic examination of these dust particles shows them to be covered in most cases with a group of adherent organisms. Individual bacteria alone are probably not present in the air, but, as stated, are deposited upon dust particles. The bacteria found in the air are most commonly the ordinary saprophytes, though under certain conditions disease-producing bacteria may be detected not in the open air, but in that of closed apartments occupied by persons or animals suffering from infectious diseases. In badly managed surgical wards of hospitals the bacteria concerned in ordinary suppurative processes have been detected; also the *Streptococcus* of erysipelas has in a few instances been found in the dust of these rooms. Though it has not been found floating in the air, still the bacillus of tuberculosis (consumption) has been found in quite a number of instances in the dust of apartments occupied by individuals suffering from this malady. This is particularly the case in those instances in which cleanliness is not rigidly observed—where the expectoration finds its way to the floor and is ground into dry dust by the feet of those walking about the room. As this expectoration contains the tubercle bacilli, frequently in very large numbers, it is easy to conceive of the danger of breathing the dust-laden atmosphere of such rooms. This source of infection can easily be eliminated by having the sputum from these patients collected in vessels containing water. The vessels, with their contents, should be boiled every morning. Bacteria can only be swept into the air from dry surfaces, and can not by ordinary means find their way into the air from moist surfaces. The characteristics of the pathogenic organisms named, that may under exceptional instances be present in the air of closed spaces, are as follows:

The ordinary organisms of suppuration, the pyogenic cocci, as they are called, comprise a group of micrococci that are distinguished from one another by the fact that they are of different degrees of virulence, produce different colors in the course of their artificial cultivation, and in the course of their growth are grouped differently. There are four different kinds of micrococci to which the term pyogenic is applied: The *Staphylococcus pyogenes aureus*, so called because of the golden color of its colonies; the *Staphylococcus pyogenes albus*, the colonies of which are white; the *Staphylococcus pyogenes citreus*, which grows in lemon-colored colonies; and the *Streptococcus pyogenes*, so called because it grows in chains consisting of several individual organisms joined together. The staphylococci of pus are very closely allied in their cultural peculiarities, and biologically are distinguished the one from the other only by the color of the pigments produced. They are all micrococci of about 0.87μ in diameter, grouped together like clusters of grapes. They are non-motile, and being of the micrococcus group do not form spores. They grow readily at the ordinary temperature of a room, about 68° to 70°F ., but most luxuriantly at the temperature of the body. They grow on all the ordinary culture-media—agar-agar, gelatin, potato, blood-serum, and bouillon. They liquefy gelatin, and can readily be stained with the ordinary aniline dyes. They may be found both microscopically and by culture methods in the pus from acute, circumscribed, suppurative processes, though the *Staphylococcus pyogenes aureus* is much more frequently present than either of the others. Suppurative processes similar to those from which these organisms are obtained can be reproduced in susceptible lower animals by the introduction of the organisms into the tissues; and, by the intravenous injection of the *Staphylococcus aureus* into rabbits, multiple abscess formations, most conspicuous in the muscles, the heart, and kidneys, can be produced.

The *Streptococcus pyogenes* is most commonly found in those suppurative processes which partake of the nature of erysipelas, i. e. those of a spreading tendency. As stated, this organism is grouped in the form of chains somewhat resembling strands of beads. In cultures it grows less luxuriantly than do the other pyogenic cocci, and is throughout a much less hardy organism, though the disease processes produced by it are usually of a more serious character than those resulting from the activities of the *Staphylococci*. It does not liquefy gelatin. It is not motile, and under artificial conditions not very tenacious of life. On the other hand, it appears to be of high vitality when once having gained

access to the tissues of susceptible animals, and particularly man. It stains readily with the ordinary staining reagents. This organism is so like the *Streptococcus* concerned in the production of erysipelas as in all probability to be identical with it. Inoculations of lower animals with this organism do sometimes, though not constantly, result in the appearance of a condition analogous to that from which the organisms were obtained.

The *Bacillus tuberculosis*, the other pathogenic organism that may possibly be present in the air of an inclosed space, is a rod-shaped bacillus of about 2 to 5 μ long and very slender. It is usually beaded in appearance and slightly curved or bent on its long axis. It forms spores. Under artificial conditions it grows very slowly, and either very slightly or not at all at a temperature lower than that of the animal body. It grows best on solidified blood-serum or nutritive agar-agar to which about 6 per cent. of glycerin has been added. Its growth on these media is characteristic, being very dry and coarsely granular, so that the point at which it is developing has somewhat the appearance of having been spread with dry meal. It grows also on glycerin-bouillon, forming a dry pellicle that floats upon the surface of the fluid. It does not develop upon gelatin, because of the low temperature at which this medium must be used. It does not stain by the ordinary methods, but requires a special process, so that it can be identified by this means. It is very difficult to stain, but when once stained is equally tenacious of its color.

These organisms are present in the sputum of all persons suffering from pulmonary tuberculosis, in the intestinal evacuations of all patients with tubercular enteritis, in serofulous glands, and in tuberculous bone troubles. They stand in direct causal relation to these processes. Tubercular infection can occur through the air-passages, the alimentary tract, and through wounds of the skin. The animals, including man, that are susceptible to the action of this organism are cattle, hogs, cats, rabbits, guinea-pigs, and field mice. White mice, rats, and dogs possess natural immunity.

In addition to the organisms mentioned, the bacillus of anthrax, that of typhoid fever, and that of Asiatic cholera are now and then found outside the body in either the soil or water. Besides these there are other pathogenic organisms whose relation to disease is established, but which have not been found outside of the diseased conditions with which they are associated. Of these may be mentioned the *Bacillus diphtherie* and the *Diplococcus lanceolatus* of pneumonia, an organism that, according to Sternberg, is found in the mouth cavity of about 20 per cent. of all healthy persons.

The *Bacillus diphtherie* is a rod-shaped organism of about the size of the tubercle bacillus, but very irregular in its morphology, which may be curved, straight, spindle or club shaped. It is always present in the false membranes in the pharynx of diphtheric patients, and rarely in the internal organs of individuals that have died of the disease. It can be isolated and cultivated upon artificial media, and when introduced into the tissues of guinea-pigs and kittens gives rise to alterations quite identical with those of diphtheria in the human being. Like tetanus, the symptoms and pathological lesions of diphtheria are due not to the dissemination of the bacteria through the body, but rather to the absorption of their poisonous products from the seat of activity in the throat.

The *Diplococcus lanceolatus* of pneumonia, though not fulfilling all the postulates necessary to prove absolutely its relation to acute fibrinous pneumonia, is nevertheless in all probability the etiological factor in the production of this disease. As its name implies, it is a coccus commonly found in pairs. It is an extremely delicate organism, so that it is with much difficulty that it can be cultivated for any length of time upon artificial media. It is possible to isolate it from pneumonic processes, however, and cultivate it artificially. When introduced into the tissues of susceptible animals, particularly mice and rabbits, the resulting process is not pneumonia, but a very acute and fatal form of septicæmia. This organism is present in the saliva of about 20 per cent. of all normal, healthy individuals.

The results of studies upon the *modus operandi* of infection lead us to believe that bacteria invade and destroy the vitality of tissues in which they are located, principally by the production of poisonous products that are of an albuminous nature. These products are the weapons, so to speak, of the invading foe and the result of the contest depends mainly upon the power of the tissues to resist the action of these agents: this they do through substances which

are chemically of a somewhat similar nature to the products of the bacteria, but which act as antidotes in neutralizing the poisons as fast as formed.

The study of bacteria in disease is by no means the only direction in which bacteriological research is being directed. The employment of bacteria in the industries is a very important problem. It is to the activities of peculiar species of bacteria that certain cheeses owe their flavor that gives to them their value as an article of food. It is by bacteria and closely allied forms that many of the organic acids are produced, and the part played by the yeast fungus, which, though not a bacterium, is usually considered with them, in the manufacture of beer, ale, and alcohol, is a very important one.

A. C. ABBOTT and J. S. BILLINGS.

Bact'rium, plural BACTERIA: See BACTERIA and BACTERIOLOGY.

Bac'tria, or **Bactria'na**: an ancient country of Central Asia, bounded N. by the river Oxus (Amoo or Gihon) and S. by the Hindu Koosh Mountains (anc. *Paropamisus*). Its boundaries are not perfectly known, but it is considered to be identical with the modern province of Balkh. This is supposed by some to have been the native country of the Aryan race. Bactria was the center of a powerful kingdom which flourished before the historical period. Its capital, Bactra, or Zariaspa, which stood on the site of the modern Balkh, was the headquarters of the Magi. In the time of Cyrus the Great, Bactria became a Persian province, and was conquered, with the rest of the Persian empire, by Alexander the Great. In the third century B. C., by the revolt of the satrap Diodotus, it gained independence, and was ruled by a dynasty of Greek origin, whose coins have not yet elucidated their succession. In the early Christian centuries it became a powerful seat of Buddhism. With Bokhara, to which it was subject, it passed under Russian control about 1868. This history of Bactria has recently been elucidated by numerous Græco-Bactrian coins and other antiquities found in the *topes* or burial-places of Afghanistan. Some of these coins present Greek letters, and also letters of a dialect of Sanskrit. See Wilson, *Ariana Antiqua* (1841); Lassen, *Indische Alterthumskunde* (1849); E. Thomas, *Bactrian Coins*, in *Journal of Royal Asiatic Society* (London, 1873).

Revised by D. O. KELLOGG.

Bac'tris [from Gr. *βάκτρον*, a stick]: a genus of palms, comprising about fifty known species, all natives of America. They are generally small trees, with slender stems and pinnate leaves. Some of them are spiny, and form thickets which are almost impenetrable. The *Bactris maraja*, or the maraja palm, bears clusters of fruit resembling small grapes, with a pulp of an agreeable flavor. The stems are used as walking-sticks.

Bactri'tes [from Gr. *βάκτρον*, a stick]: a genus of fossil *Nautiloidea*, with a straight shell, sutures simply curved, and siphon marginal. Classed with the *Orthoceras* by Zittel, but by Sandberger it was placed among the *Goniatites*. Several species from the Devonian and Silurian rocks are described.

H. S. WILLIAMS.

Bactri'tes [from Lat. *baculum*, stick]: a genus of fossil *Ammonoidea* (*q. v.*), with a straight shell with finely foliated sutures and marginal siphon. Characteristic of the Cretaceous. Though presenting some resemblance to the Palæozoic *Bactrites*, this genus is readily distinguished from it by the foliated sutures.

H. S. WILLIAMS.

Bac'up: a flourishing town of Lancashire, England; 22 miles by rail N. of Manchester (see map of England, ref. 7-G). It is situated in a beautiful valley, and is a terminus of a branch of the Lancashire and Yorkshire Railway. It has many churches and chapels, a fine market-house, and a literary institute. Here are extensive cotton-factories and several brass and iron foundries and dye-works. Coal mines are worked in the vicinity. Pop. (1891) 23,498.

Badag'ry: a seaport-town in the southwest angle of the British Niger Territory, Africa; 50 miles E. N. E. of Whydah (see map of Africa, ref. 5-C). The Portuguese once had several factories at this place, which was a market for slaves. Pop. about 10,000.

Badajoz, *va-da-khoth*, or **Badajos'**: a province of Spain; formerly known as Lower Estremadura; bounded N. by Cáceres, E. by Ciudad Real and Cordova, S. by Sevilla and Huelva, and W. by Portugal. Area, 8,687 sq. miles. It is for the greater part a poor and uncultivated region, and is chiefly used as pasture-grounds for immense herds of sheep and swine. Pop. (1887) 480,418.

Badajoz, or **Badajos** (anc. *Par Augusta*): a fortified town of Spain; capital of province of same name; situated on the left bank of the Guadiana; 132 miles by rail E. of Lisbon (see map of Spain, ref. 17-C). The river is here crossed by a good granite bridge of twenty-eight arches. The town contains an old cathedral, an arsenal, and a cannon-foundry. It has manufactures of soap, coarse woolen stuffs, and leather, and a brisk contraband trade. Badajoz was the native place of the painter Morales. It has been the scene of several important military events. It was besieged and taken by the French-Marshal Soult in Mar., 1811. Wellington attempted to retake it in April, but he failed. Having renewed the siege in Mar., 1812, he took it by storm on Apr. 6 ensuing, after a desperate contest, in which the British lost 4,824 men, killed and wounded. Pop. (1877) 22,965; (1887) 27,279.

Badakhshan, *bā-dākh-shān'*: a portion of Eastern Afghanistan, lying between Bokhara and Kafiristan, W. of the Pamirs and N. of the Hindu Kush Mountains. It includes several valleys of the head-streams of the Oxus. The surface is mountainous, and a great mountain-range extends along the eastern border. Here are ruby mines and massive cliffs or quarries of lapis-lazuli. Iron, salt, and sulphur are also obtained here. The inhabitants are Mohammedans. Capital, Faizabad.

Baddeck' (originally *Bedique*): a watering-place and shire-town of Victoria co., Cape Breton island, N. S.; 40 miles W. of Sydney. Pop. 1,900.

Badeau, ADAM: soldier; b. in New York city, Dec. 29, 1831. He received an excellent education, and devoted himself to literary pursuits. He was one of the first volunteers in defense of the Union, and became a captain in 1862. He served on Gen. Sherman's staff, and was wounded at Port Hudson (May 27, 1863). In 1864 he was appointed military secretary to Gen. Grant, with the rank of colonel. This position he held until Mar., 1869. After the close of the war he received a brevet as brigadier-general in recognition of "faithful and meritorious services." He published a *Military History of General Grant* (1867-81, 3 vols.; n. e. 1885), and became in 1869 secretary of legation, and afterward U. S. consul-general in London, and U. S. consul-general at Havana 1882-84. Author of *Conspiracy* (1885); *Aristocracy in England* (1886); and *Grant in Peace* (1886). D. at Ridgewood, N. J., Mar. 19, 1895.

Baden, *baa'den* (literally, baths; anc. called *Therma Helvetiorum*, i. e. Helvetican baths): a town and watering-place of Switzerland; canton of Aargau; on the Limmat; 14 miles by rail N. W. of Zurich (see map of Switzerland, ref. 2-F.). Tacitus mentions it (c. 67, *Histories*); the Goths spoiled it; the Hapsburgs held it until it became Swiss in 1415. The dispute of Zwingli and Geolampadius with Eck was held here (1526), and the treaty which ended the Spanish Succession war was made here (1714). In Jan., 1834, the "conference of Baden" was held here, in which the representatives of Lucerne, Aargau, Thurgau, Solenre, Berne, Basel city, and St. Gall met to settle the relations of the Catholic Church with these cantons. The temperature of the baths is about 117° F. Pop. (1888) 3,887.

Baden, Grand Duchy of: a state of Germany; bordering on Alsace and Switzerland; bounded N. by Hesse-Darmstadt, E. by Württemberg, and S. and W. by the Rhine. It has an area of 5,821 sq. miles. Pop. (1890) 1,656,817. The surface is mountainous. A long mountain-range called the Black Forest (Schwarzwald) extends along the eastern border. The highest point is the Feldberg, 4,886 feet high. The western part of Baden is a long plain extending along the Rhine from Basel to Mannheim. The chief rivers, besides the Rhine, are the Danube, which rises in Baden, and the Neckar. The valley of the Rhine has a mild climate and a very fertile soil, which is well cultivated. The grape and other fruits flourish here in abundance. Among the staple products are wheat, barley, rye, oats, pulse, potatoes, and tobacco. Good pine timber abounds in the Black Forest. The average quantity of wine produced annually is about 14,000,000 gal. The mineral produce consists almost solely of salt and building-stone. Baden is rich in mineral springs, which are much frequented as watering-places, as Baden-Baden, Badenweiler, etc. The principal manufactures are silk ribbons, hats, brushes, leather, paper, clocks, musical instruments, and machinery. The chief articles of export are wine and timber. The chief

towns are Mannheim, Carlsruhe (the capital), Freiburg, Heidelberg, Pforzheim, and Constance.

Religion and Government.—Two-thirds of the people are Roman Catholics and one-third Protestants. Baden has two universities (Heidelberg and Freiburg); an excellent system of public instruction, and the children are compelled to attend school. This state is governed by a hereditary grand duke, who in relation to foreign and military affairs is dependent upon the Emperor of Germany. He governs according to a constitution, which is among the most liberal in Germany. The parliament of Baden consists of a chamber of peers and one of sixty-three deputies. The public debt consists almost entirely of the railway debt, which at the beginning of 1891 amounted to 328,733,363 marks. The state then owned 836 of the total 907 miles of railway in the duchy. For 1891 the revenue was estimated at 65,952,000 marks, and the expenditure at 68,120,000. Hermann II., who died in 1130, was the first to assume the title of Margrave of Baden. The grand ducal family now reigning in Baden are his lineal descendants. In 1746 Charles Frederick became Margrave of Baden, which under his reign increased in extent and importance. He acquired the dignity of elector in 1803, and the title of grand duke in 1806. Having joined the Confederation of the Rhine, he gained a large accession of territory. His grandson, Charles Louis, granted in 1818 a charter which forms the basis of the present constitution. Under the impulse of the revolutionary movement which began in France in Feb., 1848, the popular party of Baden took arms to found a republic. The grand duke fled, and a constituent assembly was convened in May, 1849. By the aid of a Prussian army he was restored in July of that year. In Aug., 1866, Baden formed with Prussia a secret alliance, which was made public about Apr., 1867. Baden became in 1870 a state of the new German empire, in the federal council of which she has three votes, the whole number of votes being fifty-eight. The Grand Duke Friedrich I., born Sept. 9, 1826, came to the throne Sept. 5, 1856.

Revised by C. K. ADAMS.

Baden-Baden (anc. *Civitas Aurelia Aquensis*): a town and a celebrated watering-place in the grand duchy of Baden; is beautifully situated in the Oos valley at the foot of the Schwarzwald (Black Forest) Mountains; 23 miles by rail S. S. W. of Carlsruhe and 6 miles from the Rhine. It is on a branch of the Mannheim and Basel Railway. Here are warm saline springs, the temperature of which ranges from 117 to 154° F., which were much resorted to in the time of the Roman emperors. They are efficacious in cases of gout and chronic cutaneous diseases. Baden-Baden is frequented in summer by visitors from all parts of Europe and America, to the number of about 30,000 annually. In former years its gambling-hall was a great attraction, but upon the restoration of the German empire gambling here, as in the other watering-places, was suppressed. Relics of Roman sculpture and architecture have been found here. From the fourteenth century the margraves dwelt here; first in the old castle whose ruins crown the hill above the town. They removed (1479) to the new castle near the town, rebuilt in 1697, which still remains with its dungeons. The parish church was the sepulchre of the old margraves. Pop. (1890) 13,889.

Baden-bei-Wien, *baa'den-lü-reen* (anc. *Therma Cœlia* or *Pannonia*): a town and bathing-place of Lower Austria; on the river Schwachat; 12 miles by rail S. of Vienna. Here are warm mineral springs, which are frequented by the citizens of Vienna. Many of the Austrian nobility have mansions here, among them the imperial castle of Weillberg. Small steel tools are the principal manufacture. About 8,000 patients visit the waters annually. Pop. (1890) 11,262.

Baden-Powell, *bay den-pow d*, SIR GEORGE SMYTH, M. P., K. C. M. G., F. R. S.; British diplomat and author; b. in Oxford, Dec. 24, 1847; educated at St. Paul's School, Marlborough, and Balliol College, Oxford. Between leaving Marlborough and entering Balliol he traveled extensively in the colonial possessions of Great Britain, and published during the first year of his university career *New Homes for the Old Country: a Personal Experience of the Political and Domestic Life, the Industries, and the Natural History of Australia and New Zealand*, which has been called a cyclopædia of Australian knowledge. Commissioner to investigate West Indian affairs 1882-84; joined Sir Charles Warren in Bechuanaland 1884, and made a tour of investigation in Basutoland, Zululand, and other places in South Africa; and in 1886-87 came to Canada and the United

States to prepare a statement of the fishery dispute. Some of his other works are *Protection and Bad Times* (1879); *State Aid and State Interference* (1882); *The Truth about Home Rule* (1888); *The Political and Social Results of the Absorption of Small States by Large* (1876); *The Land Systems of India* (1892); and many essays and addresses. He was knighted in 1887. C. H. THURBER.

Badge [O. Fr. *bage*; possibly of Ger. origin]: anything worn as a distinguishing mark, to show that the wearer belongs to a certain body of men, society, rank, or the like; thus a white cockade was a badge of Jacobites in England, a cockade of red, white, and blue was the badge of the Revolutionists in Paris in 1789 and after. The badge has sometimes been a part of the heraldic bearings of the wearer, but more usually it was wholly separate. The same thing is seen in national badges; thus the rose, which is the badge of England, and the thistle, which is the badge of Scotland, do not appear in the royal arms of Great Britain. R. S.

Badger [probably from *badge*, in allusion to the stripes on its head]: a carnivorous animal of the family *Mustelidae*, belonging to the genus *Meles*, *Mydaus*, *Arctonyx*, or *Taxidea*. They attain the size of a cat or medium-sized dog, are plantigrades, have a pointed skull, and feet adapted for burrowing. They have anal glands, as in the closely related skunks, the secretion of which has a disagreeable odor. They live in deep burrows, going out at evenings in search of roots, fruits, insects, frogs, etc. The common badger of Europe (*Meles taxus*) is about the size of the common fox.

The European badger.

It was formerly, and is even now, kept for "badger-drawing." The animal is put into a barrel and assailed by numerous dogs, which are trained to pull the badger out. The animal resists obstinately until overpowered, when he is allowed a short rest and is then ready for another struggle with his enemies. The animal is quite harmless if not abused. Allied species are found in Asia. The East Indian badger (*Arctonyx collaris*) is a more formidable animal. The fur of the American badger (*Taxidea americana*) is fine and soft, and is used for muffs and rugs. The species is more carnivorous than the European badger, and is remarkable for its short ears, long hair, and the rapidity with which it burrows in the earth. Revised by D. S. JORDAN.

Badger, GEORGE EDMUND, LL. D.: statesman; b. in Newbern, N. C., on Apr. 13, 1795. He graduated at Yale in 1813, practiced law at Raleigh with distinction, and in Mar., 1841, was appointed Secretary of the Navy by President Harrison. He resigned in September of that year, because Tyler vetoed the bill to recharter the U. S. Bank. He was a Senator of the U. S. for about seven years (1846-53). He opposed secession. D. at Raleigh, N. C., May 11, 1866.

Badger, OSCAR C.: commodore U. S. N.; b. in Windham, Conn., Aug. 12, 1823; entered the navy as a midshipman on Sept. 19, 1841. In 1861-62 he commanded the steamer *Anacostia* of the Potomac flotilla, was engaged at various times with the batteries on the Potomac river, and the "precision" of the fire of his vessel is more than once referred to by the commanding officer of the flotilla, Lieut.-commanding Wyman, in his reports to the Navy Department. Badger was in command of the ironclads *Patapsco* and *Montauk* in their many engagements with the forts and batteries of Charleston harbor in the summer of 1863; as

fleet-captain was with Rear-Admiral Dahlgren on board the ironclad *Weehawken* in a night attack upon Fort Sumter, Sept. 1, 1863, when he received a severe wound in the right leg. His services, character, etc., are thus mentioned by Rear-Admiral Dahlgren, in his report to the Secretary of the Navy of Sept. 2, 1863: "I shall feel greatly the loss of Commander Badger's services at this time. He has been with me for more than eight years, and his sterling qualities have rendered him one of the very best ordnance officers in the navy." In 1872 he was made captain and in 1881 commodore. Retired 1885. Revised by S. B. LUCE.

Badham, CHARLES: Greek scholar; b. in Glasgow, Scotland, 1813; was in his early years a pupil of Pestalozzi in Yverdon. He was graduated at Oxford in 1837. After traveling in Germany, France, and Italy for seven years, he took holy orders in 1847. In 1867 he went to Sydney (New South Wales) as Professor of Classical Philology and Logic, where he remained till his death, Feb. 27, 1884. His work was chiefly confined to editions of Plato, notably the *Philebus*, *Laws*, *Euthydemus*, *Laches* and *Symposium*. In his critical methods Badham was strongly influenced by Porson and Cobet, for whom he professed an almost idolatrous admiration. ALFRED GUDEMAN.

Badia y Lablich, bāa-dee'a-ee-laab'leek, DOMINGO: traveler; b. in Barcelona, 1766; disguised as a Mussulman, and aided by a perfect knowledge of Arabic, he crossed to Africa, 1801, and after two years' residence in Morocco made a tour to Mecca, traveling through Barbary, Greece, Syria, and Egypt; first Christian to visit Mecca since the institution of Islam; returning to Spain, was appointed prefect of Cordova 1812; published *Voyage d'Al-Bēi en Afrique et en Asie* (Paris, 1814). D. in Syria on his way to Damascus, Aug. 30, 1818. C. H. T.

Badlam, STEPHEN: b. in Milton, Mass., Mar. 25, 1748; entered the army in 1775; commanded the artillery in department of Canada; became a Revolutionary officer, and was made brigadier-general of militia in 1779. D. at Dorchester, Mass., Aug. 24, 1815.

Bad-Lands (originally called *Mauvaises terres pour traverser* by the French explorers, from the extreme irregularity of the surface): Bad-lands are common in the arid Western regions of the U. S., where the absence of vegetation enables the scanty rains to wash away the fine unconsolidated sediments, often old lake-beds, and carve them into innumerable hills and ravines of ever-varying yet systematic form. They are generally best developed near the line of some relatively large stream, whose valley has been deepened on account of a general uplift of the land in recent geological time, thus enabling the small wet-weather branches to dissect the weak strata for several miles on either side in an effective manner. Many remarkable fossils of extinct mammals have been preserved in the sediments of extinct Western lakes; the discovery of the fossils is greatly aided in the bad-lands from the thorough dissection of the mass by ravines and by the barrenness of the surface. W. M. DAVIS.

Bad-Lands: as a specific geographical name, refers to an extensive region lying partly in South Dakota and partly in Nebraska, between the North Fork of the Platte and the South Fork of the Cheyenne rivers. It affords the refuge of a natural fortress to the great family of Sioux Indians in their wars with the U. S., but is more famous for the paleontological work done there by O. C. Marsh, D. D. Owen, E. D. Cope, and other geologists.

Badminton: seat of the Duke of Beaufort in the south of Gloucestershire, England, from which have been named a kind of claret-cup and a game somewhat resembling lawn-tennis, played with a shuttlecock instead of a ball.

Baedeker, bay'de-ker, KARL: German publisher; b. in Essen, Nov. 3, 1801; began publishing in 1827 at Coblenz, where he died Oct. 4, 1859. As the originator of a celebrated series of guide-books, his name is favorably known to all travelers. The first guide-book published by Karl Baedeker was a small book on the Rhine, 1839; the series now comprises admirable guides to every country much visited by travelers, and is published in all the principal languages. The business was removed to Leipzig in 1872. C. H. T.

Baehrens, bay'rens, PAUL HEINRICH EMIL, Ph. D.: classical scholar; b. at Bayenthal, near Cologne, Sept. 24, 1848; took his degree (Ph. D.) at Bonn in 1870; became Professor of Latin in Groningen 1877; d. there Sept. 26, 1888. He

was a man of wide erudition, astounding diligence, and great literary productivity. The permanent character of much of his work is, however, partially invalidated by the extreme recklessness of his critical method, and by the passionate invective against opponents which too often defaces his writings. His most valuable contributions to Latin philology, for he was but an indifferent Greek scholar, are *Poeta Latini minores* (5 vols.); *Catullus*, with commentary (2 vols.); *Fragmenta poetarum Romanorum*. ALFRED GÜDEMAN.

Baena, bañ-ay-mā: a town of Spain; province of Cordova; situated on the Marbella; 32 miles S. E. of Cordova (see map of Spain, ref. 18-E). It occupies the site of an ancient Roman town. Grain and oil are exported from this place. Pop. (1887) 12,036.

Baer, ba'er, KARL ERNST, von: a Russian naturalist of German extraction; b. in Piep, Esthonia, Feb. 17 (28), 1792. He became in 1819 Professor of Zoölogy at Königsberg. He wrote, besides other works in German, a *History of the Development of Animals* (2 vols., 1828-37). In 1831 he removed to St. Petersburg, and was appointed librarian of the Academy of Sciences. He made several discoveries in physiology and zoölogy. D. in Dorpat, Nov. 28, 1876.

Baeyer, bī-er, ADOLPH, von: chemist; b. in Berlin, Oct. 31, 1835. He was Professor of Chemistry in the Gewerbe Akademie at Berlin (1866), but afterward became professor in the University of Strassburg (1872), and, after Liebig's death, was called to Munich (1875). He has carried on many important investigations, particularly in the field of organic chemistry. Among the subjects to the development of which his work has largely contributed are indigo, the phthalens, benzene. He discovered a method for the artificial preparation of indigo.

Baeza, bañ-ay-tha (anc. *Beotia*): an old town of Spain; province of Jaen; 22 miles N. E. of the city of Jaen. It contains a cathedral and several monasteries in the Gothic style, which, with other buildings, present an imposing appearance. The university, established in 1533, has ceased to exist in recent times. Under the Moors the city was the capital of the kingdom of Bajasat, and is said to have had 150,000 inhabitants. Cloth, leather, and soap are made here. Pop. (1887) 13,911.

Baffa, baaf-fa (anc. *Paphos*): a seaport-town on the southwest coast of the island of Cyprus. It was once an important place, but is now ruined or decayed and nearly deserted. In ancient times Paphos was a beautiful city, having several temples, and was a famous place for the worship of Venus. Lat. 34° 47' N., lon. 32° 26' E.

Baffin, WILLIAM: English navigator; b. probably in London in 1581; accompanied James Hall in an Arctic expedition in 1612, and on a subsequent expedition discovered Ballin's Bay in 1616. He wrote two narratives of these voyages, and gave in the first a new method of ascertaining the longitude at sea by observation of the heavenly bodies. He was killed at the siege of Ormuz, May 23, 1622. See Clements R. Markham, *Voyages of William Baffin, 1612-22* (London, 1881, for the Hakluyt Society).

Baffin's Bay: a large gulf or inland sea of North America; communicates with the North Atlantic by Davis's Strait, and with the Arctic Ocean by Smith's Sound. It is about 950 miles long, and has an average width of about 300 miles. The greatest depth is about 1,050 fathoms. The shores are generally high and rocky, backed by ranges of snow-covered mountains. It was first explored by William Baffin in 1616. Whales abound here.

Bagatelle [Fr., from Ital. *bagatella*, trifle]: a game somewhat resembling billiards. A bagatelle-table is usually about 7 feet long and 21 inches wide, and is lined with cloth. The other apparatus of the game consists of small ivory balls and a mace or cue.

Bag'dad: a pashalic forming the S. E. portion of Asiatic Turkey, bordering on Arabia and Persia. It extends from the Persian Gulf northwestward about 600 miles, and is intersected by the Euphrates and the Tigris. It includes the ancient Chaldæa, Susiana, and Mesopotamia. The part which lies between the Euphrates and Arabia is a barren, sandy plain. The soil of some other parts is fertile. The population is a mixture of Turks, Arabs, Kurds, Armenians, etc. Area, 54,503 sq. miles. Pop. (1885) 850,000.

Bagdad: a celebrated city of Asiatic Turkey; formerly the capital of the empire of the caliphs, and now the capital of the pashalic of Bagdad; situated on both banks of the

Tigris; about 60 miles N. of Babylon; lat. 33° 20' N., lon. 44° 22' 38" E. The river is here about 700 feet wide, and is crossed by a bridge of boats. The appearance of the city at a distance is rendered picturesque by groves of palm-trees and numerous minarets, but the streets are narrow, crooked, and dirty. The dwelling-houses, having no windows on the side next to the street, present an unpleasing exterior, but the interiors are often richly decorated. Bagdad contains about 100 mosques, some of which have beautiful domes and lofty minarets. Here are large bazaars filled with the products of European and Turkish markets. It was formerly a very magnificent city, and was for many ages the great emporium of commerce of the surrounding countries, but its trade has declined. It has manufactures of silk and cotton stuffs and red and yellow leather. In 1831 an inundation destroyed a large part of the city. Bagdad was founded by the Caliph Almansur about 763 A. D., and built out of the ruins of Ctesiphon. In the ninth century it was enlarged by Haroun-al-Raschid, who built here a fine palace. In the tenth and eleventh centuries it is said to have had 2,000,000 inhabitants. It was sacked by Hulaku about 1258, and after several changes of masters was conquered by the Turks in 1638. Pop. (1885) 180,000.

Bagdad, or **Boca del Rio**, bō kāñ-del-ree'ō: a town on the Rio Grande, near its mouth, in the Mexican state of Tamaulipas; was during the civil war in the U. S. a place of great importance to blockade-runners, who carried on from this point a heavy trade with Western Texas (see map of Mexico, ref. 4-1).

Bagehot, bāj-ot, WALTER: an English publicist, whose writings went far to restrict the scope of deductive and enlarge that of historical economics. He was born in Langport, Somersetshire, Feb. 3, 1826; educated at Bristol and University College, Oxford, where he was graduated in 1848. Four years later he was called to the bar, but he entered then his father's banking-house, and made that his lifelong business. A witness in Paris of the *coup d'état* of Dec., 1851, he wrote a series of letters to a London paper defending the conduct of Louis Napoleon as advantageous to France. In 1858 he married a daughter of James Wilson, founder of *The London Economist*, and soon became editor of that periodical, continuing this duty until he died. His books are *The English Constitution* (London, 1867), a comparative treatment of its tendencies and utilities; *Physics and Politics* (London, 1872); *Lombard Street* (London, 1873; 8th ed. 1878), a treatise on money and its functions of great vogue; and *The Depreciation of Silver* (1877). Posthumously, under the editorship of R. H. Hutton, appeared *Literary Studies* (1879); *Economic Studies* (1880); and *Biographical Studies* (1881), a book of critical literary ability. A complete edition of his works was published about 1888 by an insurance company of Hartford, Conn. D. in Langport, Mar. 24, 1877. Bagehot in early life was a disciple of Ricardo, but an independent investigator, who gave a kindly reception to the historic school when it arose. He did much to clear the field for it. To him the "abstract economic man" of the English school was a good working hypothesis for highly organized industrial conditions, where competition effects prompt transfers of capital and labor from one employment to another. Such conditions he considered to be substantially realized for Great Britain. But the theory was limited, and did not apply to other countries and times; it was insular, and convenient for use in Lombard Street or in the great markets of the world. Outside of the abstractions of the orthodox school lay the concrete world, where quite other methods were requisite, which give rise to a general science of sociology. His influence was marked in showing the restrictions which rest upon the *a priori* method, and the necessity of the historical investigation of wealth as an instrument for the moral and material development of human societies. For this sort of research he displayed great ability, though he wrought in it only in a fragmentary way. His treatment of the "middleman," or the function of superintendence, was the amplest and clearest then extant, and throws light on practical industrial co-operation.

Baggesen, baag'ge-sen, JENS: Danish poet; b. at Korsør, in the island of Seeland, Feb. 15, 1764. He was highly gifted, but of a weak character; with a fine fancy, but of a restless spirit; excitable, but without passion; fantastic, but without imagination. Born between two periods, he could neither stay with the old nor march with the new. He was enthusiastically received by the educated, but he never

reached the great public. Born a Dane, and married first to a German, then to a French lady, he flattered from one country and language and literature to another—made a noise in all, and became great in none. Of his Danish writings, his *Komiske Fortællinger*, in verse (1785), and his *Labyrinthen*, in prose (1792-93, 2 vols.), are entertaining. Of his German writings, his *Hauideblumen* are not without merit. His letters, of which he wrote thousands in different languages, are very interesting. D. in Hamburg, Oct. 3, 1826.

Baginsky. *bañ-khin'skēe*, **ADOLF**: German specialist in children's diseases; b. at Ratibor, May 22, 1843; M. D., University of Berlin, 1866; became Lecturer on Diseases of Children, University of Berlin, 1882; author of *Handbuch der Schulhygiene* (Stuttgart, 1883); *Lehrbuch der Kinderkrankheiten* (Berlin, 1884; 3d ed. 1889); *Praktische Beiträge für Kinderheilkunde* (Tübingen, 1884); editor of *Archiv für Kinderheilkunde* (Stuttgart).

Bagirmi, *bañ-geer'mēe*, or **Baghirni**: a sultanate of Central Africa; southeast of Lake Chad; on the lower Shari river, between Bornu and Wadai. Area, 56,600 sq. miles. The greatest length is about 250 miles. Capital, Massenya. The surface is for the most part nearly level; the soil is the most fertile and the best watered of the Sudan. It was founded by a heathen chief about 300 years ago, but Mohammedanism soon became the ruling religion. It is tributary to both Bornu and Wadai. The natives are physically well-formed and warlike. Bagirmi was visited by Dr. Barth in 1852. Pop. about 1,500,000. See Barth's *Travels in Central Africa*.

Baglivi, *bañ-glee'vōe*, **GIORGIO, F. R. S.**: an Italian medical writer; b. at Ragusa, Sept., 1669. He became in 1692 the pupil of Malpighi at Rome, and subsequently Professor of Anatomy at the Collegio Della Sapienza in that city. He gained distinction as the author of the system of *Solidism*—i. e. the theory that diseases originate in the solids. He published *Opera Omnia Medico-practica* (1704). D. in Rome, Mar., 1707.

Bagnacavallo, **BARTOLOMEO RAMENGLI**: See **RAMENGLI**.

Bagnères de Bigorre, *bañ yā'r de bē'gōr'* (anc. *V'cus Aquensis*): a town and fashionable watering-place in the S. of France; department of Hautes-Pyrénées; on the river Adour; 14 miles by rail S. S. E. of Tarbes (see map of France, ref. 9-D). It is situated in the romantic valley of Campan, and is among the most frequented watering-places in France. It has a college, a public library, a theater, a museum, and good hotels. The springs, of which there are thirty-two, and whose temperature ranges from 72 to 124° F., are visited by about 25,000 persons annually. Barèges and woolen stuffs are made here. Pop. (1891) 8,638.

Bagnères de Luchon, *bañ yā'r de li'shōn'* (anc. *A'que Convenarum*): a town of France; department of Upper Garonne, and in the Pyrenees; 42 miles by rail from Bagnères de Bigorre (see map of France, ref. 9-E). It has sulphurous thermal springs, and is a place of summer resort. Pop. (1891) 3,528. About 10,000 patients visit the town annually.

Bagnes: a French word signifying "galleys": is now the name of the convict prisons of France in which criminals were confined and employed at hard labor, since the galleys were abolished in 1748. Large numbers of convicts were thus confined at Brest and Toulon, and were employed in mechanical and other work. Various trades or mechanical arts were taught to the convicts. In the reign of Napoleon III, the bagnés were gradually abolished, and the penal colonies substituted in their place.

Bagnes-le-Chable: a parish and village of Switzerland; in Valais, on the Dranse; 12 miles E. S. E. of Martigny. Pop. of the parish, which is coextensive with the Val-de-Bagnes, 4,256. This valley was inundated in 1818 by a *débâcle* which carried away 400 cottages.

Bago'sas: a Persian eunuch and soldier in the service of Artaxerxes Ochus. In 338 B. C. he poisoned that king and several of his sons. He raised to the throne of Persia Darius Codomannus, who put Bago'sas to death about 336 B. C.

Bag'ot, **Sir CHARLES**: an English diplomatist; b. in Blithfield, Staffordshire, Sept. 23, 1784. He was minister plenipotentiary at Washington 1816-19; ambassador to St. Petersburg 1820-24; to Holland 1824-34; to Austria 1834-42. He in 1842 became Governor-General of Canada, where he died May 18, 1843.

Bagot, LEWIS: b. in London, Jan. 1, 1740; was educated at Westminster School and Christ Church, Oxford, England. In 1777 he became dean of Christ Church, and was made Bishop of Bristol in 1782. He was transferred to Norwich in 1783, and to St. Asaph in 1790. D. in London, June 4, 1802.

Bagpipe: a wind instrument supposed to be of great antiquity. It consists of a leathern bag which the player inflates by blowing with his mouth through a tube, or, in some cases, by a bellows worked by the elbow. The music proceeds from three or four pipes, whose mouthpieces are inserted into the bag, the wind being forced out by pressing the bag under the arm. One of the pipes, called the "chanter," is pierced with eight holes, while the others, or "drones," sound each only one continuous low note. Though generally fallen into disuse, the bagpipe is still a popular instrument in the Highlands of Scotland and the west of Ireland, and the Highland regiments are always accompanied by their pipers, dressed in proper costume. The bagpipe is still used in Southern Italy, as formerly in Spain.

Bagradites: the name of a royal family of Georgia and Armenia; of Jewish extraction. In Armenia from a very early period it had the privilege of crowning the Armenian monarchs. In 748 it came to regal authority, and maintained it till 1079. In Georgia the Bagradites ruled the country from 574 till 994 in direct line, and in collateral branches till 1424.

Bagra'tion, **PETER IVANOVITCH**: a Russian general; b. in 1765; was descended from the noble Georgian family of Bagradites. He served with distinction under Suwarow in Italy in 1799. In Nov., 1805, he kept in check for six hours a superior force of French under Murat. He led the vanguard at Austerlitz, Dec., 1805, and rendered important services at Eylau and Friedland (1807). He was mortally wounded at Borodino, Sept. 7, and d. Oct. 7, 1812.

Bagshot Beds [named from Bagshot Heath, Surrey]: a British geologic formation of Eocene age. The Eocene rocks of England occupy two synclinal basins in the southeastern part of the island. The Bagshot beds constitute the upper part of the series in the London basin, where they rest on the London clay. They range in thickness from 200 to 700 feet, and consist chiefly of sand. In the lower part are clays and marls containing marine shells and the remains of sharks and turtles. They are ordinarily classified in three subdivisions, of which upper is referred to the newer Eocene, and the middle and lower to the Middle Eocene. The sandy beds are in the main unconsolidated or feebly coherent, but at a few horizons are cemented into firm sandstones. In districts where much of the formation has been eroded away, scattered blocks of the sandstone remain, and the distribution of these "Druid stones" is popularly ascribed to prehistoric races. See **STONEHENGE**.

Bahama, *ba-haa'ma*, **GRAND E.**: the most western island of the Bahama group, 57 miles E. of Florida. It is 74 miles long and 9 miles wide. Area, 428 sq. miles. The soil is moderately fertile. Pop. 1,020.

Bahama Islands, or **Lucayos**, *loo-kī'ōs*: a group of islands in the Atlantic Ocean; lying N. E. of Cuba, from which they are separated by the old Bahama Channel. They belong to Great Britain. They consist of 26 islands, 647 keys, and 2,387 reefs and cliffs, together 3,060 islands and islets, 25 of which are inhabited. They extend like a chain from lat. 21° to 27° 31' N., in a northwestern direction for a distance of about 700 miles. They are generally long and narrow, and have little elevation above the sea. The climate in winter is very mild and salubrious. The soil is thin, but produces maize, cotton, oranges, pineapples, etc. The area is 5,450 sq. miles. Capital, Nassau, in New Providence. In 1890 the receipts amounted to £54,826, and the expenses to £48,688. The value of the imports was £222,512, and of the exports £168,121. The names of the larger islands are Grand Bahama, Abaco, Eleuthera, New Providence, Andros, San Salvador (or Cat island), Exuma, Long island, Crooked island, Inagua, and Caicos. These are mostly covered with forests of the madder tree, the mastic, lignum vitae, etc. San Salvador (or perhaps Watling's island) was the first land discovered by Columbus in 1492. The Bahamas were then inhabited by a gentle race of aborigines, who were soon exterminated by the Spaniards. The English obtained possession of them in 1629. The chief island politically is New Providence (area, 85 sq. miles), on which is the capital, Nassau (pop. 12,000), a handsome city, and a winter health-re-

sort for Americans and West Indians. Among the exports are canella, arrowroot, sponges, salt, conch-shells, eleuthera bark, fresh and canned pineapples, etc. Pop. (1888) 48,000. Revised by M. W. HARRINGTON.

Bahia, bãa-ce-ã (i. e. bay): a state of Brazil; bounded N. by Pernambuco, E. by Sergipe and the Atlantic Ocean, S. by Minas Geraes and Espírito Santo, and W. by Goyaz. Area, 164,649 sq. miles. The large river São Francisco flows along or near the northwestern border of the province, which is traversed by a high mountain-range about 200 miles from the seacoast. The soil of the lowlands is fertile. The chief products are sugar, tobacco, cotton, rice, manioc, and coffee. Diamonds and gold are found in this province. Pop. (1888) 1,821,089.

Bahia del Almirante: See CHIRIQUI.

Bahia, or **São Salvador**, sowñ-saál-vã-dôr: an important maritime city of Brazil; capital of province of same name; situated about 740 miles N. N. E. of Rio Janeiro; lat. 13° S., lon. 38° 32' W. The name is derived from Bahia de Todos-os-Santos (All Saints' Bay), at the entrance to which it is pleasantly situated. The upper part of the city is several hundred feet higher than the lower, and presents a very fine appearance from the sea. The upper town is the most populous, most beautiful, and contains the important public buildings, among which are the governor's palace, the cathedral, the theater, the mint, and many fine churches and convents. It is the seat of the Archbishop of São Salvador. A public library was founded here in 1811. The harbor of Bahia is one of the best in America, and admits vessels of the largest size. It is defended by several forts, and has a lighthouse at the entrance. The chief exports of Bahia are sugar, cotton, coffee, tobacco, rum, dye-stuffs, hides, and horns. The commerce is almost entirely in the hands of Englishmen. Bahia is the oldest city of Brazil, having been founded in 1549, and was until 1763 the capital. It is, next to Rio de Janeiro, the largest commercial city of Brazil. The Bahia Steam Navigation Company, organized in 1861, has a large number of steamers in use here. Pop. estimated (1890) 80,000.

Bähr, bayr', or **Baehr**, JOHANN CHRISTIAN FELIX: an eminent German philologist; b. in Darmstadt, June 13, 1798, and educated at Heidelberg, where in 1826 he became Professor of Classical Literature. He published a *History of Roman Literature* (Karlsruhe, 2 vols., 1828; 4th ed. 1868-73; with supplement of Christian Latin literature, 3 parts, 1836-40), and edited several of Plutarch's *Lives*. He also published a Latin translation of Herodotus, with valuable notes (1856-61). D. in Heidelberg, Nov. 28, 1872.

Bahraich, bãa-rieh': city and district of Faizabad, Oudh, India. The district is in lat. 27° to 28° N., lon. 81° to 82° E. Area, 2,741 sq. miles; pop. 900,000. It is at the foot of the Himalayas, on the Gogra river. The city is 62 miles N. E. of Lucknow. It is a city of great activity, and has manufactures of fireworks and native cloth. Pop. 19,439.

Bahrđt, baart, KARL FRIEDRICH: German theologian; b. in Bisehofswerda, Aug. 25, 1741. A representative of extreme rationalism in religion, he occupied various positions as professor of theology and preacher. Died as an inn-keeper near Halle, Apr. 23, 1792. See J. LEYSER, *Karl Friedr. Bahrđt* (Neustadt, 1867; 2d ed. 1870). JULIUS GOEBEL.

Bahrein, bãa-rayn, **Islands** (anc. *Tylos* or *Tyros*): a group of British islands in the Persian Gulf; near the Arabian coast; about 200 miles S. of Bushire. The chief island is 27 miles long and 10 wide, and is surrounded by several small islands. Manama, the capital, on the northern extremity, has a good harbor. These islands derive their importance from their pearl-fisheries, the annual product of which is estimated at \$1,000,000. Area, 270 sq. miles. Pop. about 25,000.

Bahr-el-Abiad, baar'-el-ã-bë-ãd [Arab., white stream]: the old Arabic name of the White Nile, which is the main branch of the Nile after it receives the Bahr-el-Ghazal, and until it unites with the Blue Nile at Khartum. The river is said to be navigable 1,000 miles above Khartum. The upper divisions of the Nile above the confluence of the Bahr-el-Ghazal going south are Bahr-el-Jebel (river of the mountains), or the Kir, a name applied below the outlet of Albert Nyanza; and the Victoria Nile, which unites the Victoria and Albert Lakes. The White Nile also receives the eastern tributary, Sobat, about 90 miles below Bahr-el-Ghazal. See NILE.

Bahr-el-Azrek, baar-el-ãz-rek [Arab., blue river]: one of the two great branches of the Nile. It unites with the other branch, the Bahr-el-Abiad ("white river") in lat. 15° 37' N. Its sources are in lat. about 13° N. at the center of Tana Lake, and 37° 30' E. long., but its course, traced through all its windings, will probably exceed 1,000 miles. In this distance it descends with immense impetuosity from an elevation of 9,000 feet to one of 1,500 feet. The Blue river is navigable up to Fazogl, under the twelfth parallel, 1,500 miles from Rosetta. Its upper waters before it breaks through the mountains and reaches its confluence with Yabus river are known as the Abai, a rapid mountainous stream which makes an enormous fish-hook bend from Lake Tana to the Yabus, extending over three degrees of latitude and five of longitude, encircling the southern end of the Abyssinian mountains.

Bahr-el-Ghazal, baar-el-gã-zaal' (i. e. Gazelle river): a name applied to two distinct African rivers, and sometimes to the area of their basins, both in the Sudan. One in the Eastern Sudan joins the Bahr-el-Jebel to form the Bahr-el-Abiad, or White Nile. Its basin is very extensive, reaching from 5° to 15° N. lat. and 23° to 30° E. lon. It is very rich in river courses, some of which, however, come from the desert and do not bring down much water. The principal river contains much water, but has often no perceptible current, and is much obstructed by vegetable growths. The southern watershed of its valley forms the northeastern boundary of the Congo Free State. The basin includes the northwest of British East Africa, a large part of Dar-Fur, Dar-Fertil, and some unnamed territory. The second is a desert watercourse on the east side of Lake Chad. It lies in the district between Wadai and Borku, east of Kanem and northwest of Dar-Fur, between the parallels 13° and 18° N. and the meridians 16° and 22° E. It is a desert area, inhabited by Arabs, and is very little known. M. W. H.

Bahrens: See BAEHRENS.

Baiæ (mod. *Baja*, baayã): an ancient town of Italy; beautifully situated on the bay of same name, in Campania, 10 miles W. of Naples. It was the favorite watering-place of the ancient Romans, who were attracted by the beauty of its position and adjacent scenery, the amenity of the climate, and the virtues of its warm mineral springs. Julius Caesar and Pompey had country-houses at Baiæ, and Horace preferred it to all other places. The society of Baiæ was proverbially voluptuous and dissolute. Ruins of ancient temples and villas are visible in this vicinity. These include temples of Mercury, of Venus, and of Diana, all of which are in reality only parts of Roman baths.

Baier, bi'er, JOHANN WILHELM: German Lutheran theologian; b. in Nuremberg, Nov. 11, 1647; d. as court-preacher in Weimar, Oct. 19, 1695. His *Compendium theologicæ positivæ* (Jena, 1686; last ed. Berlin, 1864) was for long years a standard manual.

Baif, bãa'cef, JEAN ANTOINE, de: French poet; member of the PLÉIADE (*q. v.*); b. in Venice, Feb., 1532; d. in Paris, 1589. The son of Lazare Antoine de Baif, protonotary of Francis I. and ambassador to Venice, the young man had the best education possible in the Greek and Latin classics. He was a fellow-student of Ronsard, and helped the latter much in his Greek studies. In 1551 he published a French version of the Latin distiches written for the tomb of Marguerite de Valois. In 1552 appeared his *Ravissement d'Europe* and his *Amours de Hélène*; in 1555 his *Amours de Francine*. After a sojourn in Italy he translated the *Antigone* of Sophocles and the *Eunuchus* of Terence (1565). In 1567 he wrote *Le Brave*, a comedy in the manner of Plautus. In his later years he attempted to introduce ancient meters into French and to simplify French orthography. To this end he devised an academy of music and poetry, which was authorized by Charles IX. and endured twenty years (from Nov., 1570). In 1574 he published his *Étrennes de poésie française*, in which he used the orthographic system of Ramus. In 1576 he brought out two books of *Mimes*. See *Choix des poésies de Baif*, with introduction, by Becc de Fouquières (Paris, 1874); *Les Mimes, etc., de Baif*, ed. by Blanchemain (2 vols., Paris, 1880). A. R. MARSH.

Baikal, bi'kaal [Tartar, the rich lake], called also the HOLY SEA: a large lake in the southern part of Siberia, between Irkutsk and Transbaikal; an expansion of the river Angara. It is situated between lat. 51° 28' and 55° 41' N., and lon. 103° and 110° E. It is about 400 miles long, and has an average width of nearly 45 miles. Area, estimated at

13,200 sq. miles. It is in some places 300 fathoms deep, and lies in a depression or crevice, with the Baikal Mountains on the west and the Bargasinsk on the east, which approach the lake so as to divide it into the great and little parts. It receives the Selenga, Barguzin, and other rivers, and discharges its waters by the Angara, an affluent of the Yenisei. In summer steamboats navigate this lake, which is frozen from November to April. Here are valuable seal and sturgeon fisheries. The waters of this lake are said to have a curious ground swell called *zyb*, the nature of which has never been explained. One basis, among many, for the legend of Prester John, the mythical Christian king of the twelfth century in Parther India, has been found in Gur Khan of Kara-Khitai, whose dominions lay from Baikal Lake to the great Chinese wall.

Baikie, WILLIAM BALFOUR: traveler; b. at Kirkwall, Orkney, Aug. 27, 1825; assistant surgeon Royal Navy, 1848; surgeon and naturalist to the Niger expedition (1854), in which, after the death of the captain, he succeeded to the command of the *Pleid*, which was wrecked on the second expedition in 1857. He founded a settlement, built roads, opened the Niger to navigation, and collected a native vocabulary. D. at Sierra Leone, Dec. 12, 1864. Author of *List of Books and Manuscripts Relating to Orkney; Observations on the Haussa and Fulfulde Languages* (1861); and of works on natural history. C. H. T.

Bail [Old Fr. *bail*, power, custody; *bailler*, control, deliver]: The original signification of this word is to "deliver." It is used both as a noun and a verb, and refers to property, as well as to a person, in the custody of the law. It implies safe-keeping or delivery for a special purpose. It may signify the delivery of a person arrested, either on civil or criminal process, from the custody of the sheriff or some other officer of the law, into the safe-keeping of persons who bind themselves for his appearance in court or obedience to its processes. Again, it denotes the persons into whose keeping the party discharged from actual arrest is delivered, and sometimes the amount of security given or required for the defendant's appearance.

In all civil actions the defendant may give bail as a matter of right, and generally in criminal proceedings, unless he is charged with a capital offense. The amount of bail is in the discretion of the court, controlled by the somewhat vague constitutional provision that excessive bail shall not be required.

Bail *below*, or bail *to the sheriff*, is bail given to the sheriff to secure the appearance of the defendant in the action, or his putting in special bail on a required day. Bail *to the action*, or bail *above*, is given either to satisfy the judgment if one should be recovered, or to deliver up the defendant to custody. In some of the States the defendant when arrested gives bail to render himself at all times amenable to the process of the court, which takes the place of bail below and bail above.

Common bail is the formal entry of fictitious security with the clerk of the court. It is given for the appearance of the defendant and his future obedience in cases where he has not actually been arrested. Special bail is responsible bail, given when the defendant has actually been arrested. Bailors must in general possess certain prescribed qualifications. They must be *freeholders* or *householders*; must be within reach of the process of the court, and must not be privileged from arrest; must be competent to make a contract, and of sufficient means to pay the amount for which they become responsible. They can be compelled, on suitable application in the action, to justify; this means, to show by satisfactory evidence that they possess the qualifications required by law.

While the prisoner, when released on bail, is in fact generally allowed to go at large, he is regarded by the law as in custody of his bail. They can take possession of his person at any time or in any place, even though it is necessary to break into his house. By delivering him to the sheriff and complying with legal forms of surrender, they can discharge themselves from liability.

It should be remarked that when a prisoner is held under final process—that is, process to enforce a judgment of the court—he can not be released on bail. However, by statute law he is sometimes allowed in civil cases, on giving security of the nature of bail, to be released from strict confinement in jail, at the same time being partially restrained of his liberty by the action of rules defining territorial limits beyond which he can not lawfully go. T. W. DWIGHT.

Bailey, GAMALIEL, M. D.: b. at Mt. Holly, N. J., Dec. 3, 1807. In conjunction with J. G. Birney he founded in 1836 the *Cincinnati Philanthropist*, an anti-slavery journal. Although his press was destroyed by a mob, he continued the publication till 1847, when he issued the first number of the *National Era* at Washington. The celebrated novel *Uncle Tom's Cabin* first appeared in this journal. Died at sea, on his way to Europe, June 5, 1859.

Bailey, GILBERT STEPHENS, D. D.: b. at Dalton, Pa., Oct. 17, 1822; educated at Oberlin College, O.; pastor of a Baptist church in Cornwall, N. Y., 1845-46; pastor in Illinois 1846-63; superintendent of missions for the Baptist General Association of Illinois 1863-67; and from 1867 to 1875 secretary of the Baptist Theological Union at Chicago. He is the author of several works, mostly denominational. Dr. Bailey originated the system of "ministers' institutes" now prevalent in the Baptist denomination, holding the first at Chicago in 1864.

Bailey, JACOB WHITMAN: soldier and naturalist; b. at Ward (now Auburn), Mass., Apr. 29, 1811; graduated at West Point 1832; served as lieutenant of artillery in Charleston harbor (1832-33) during threatened nullification of South Carolina; at Bellona arsenal, Va., 1834-35; as assistant professor at Military Academy 1834-35, and acting Professor of Chemistry, Mineralogy, and Geology 1835-38, becoming, upon resigning his lieutenantcy, July 8, 1838, full professor, which position he held, to the great benefit of the academy and advantage to cadets, till his death. He was the inventor of *Bailey's Indicator*, and of many improvements in the microscope, in the use of which he achieved the highest distinction, particularly in the examination of infusoria, algæ, and the products of the deep-sea soundings of the coast survey, U. S. exploring expeditions, and the Atlantic telegraph plateau, of which he made valuable collections and numerous delineations, bequeathing them to the Boston Society of Natural History. He was president of the American Association for the Advancement of Science 1857, and member of various societies of savants at home and abroad, and author of over fifty able papers in various scientific journals. His health, always delicate, was completely shattered by exposure in the Hudson river while attempting to resene his wife and daughter, lost in the burning of the steamer Henry Clay. D. at West Point, Feb. 26, 1857.

Bailey, JAMES MONTGOMERY: editor of *The Danbury News*; a well-known humorist; b. in Albany, N. Y., Sept. 25, 1841; commenced journalism on the *Danbury Times* (afterwards *News*) in 1865, which paper soon acquired a celebrity throughout the U. S. from an incessant flow of humor which the pen of its editor imparted to its columns. He has published *The Danbury News Man* (1872), and *Life in Danbury* (Boston, 1873). D. in Danbury, Mar. 4, 1894.

Bailey, JOSEPH: soldier; b. in Salem, O., Apr. 28, 1827; served on the Federal side in the civil war, and distinguished himself by his successful attempt in 1864 to save thirteen gunboats, etc., of the Mississippi flotilla. The water of the Red river, La., having fallen so low that Admiral Porter's squadron was unable to pass the rapids, Col. Bailey in the course of eleven days constructed dams which, by raising the water, enabled the boats to descend safely, for which he received the thanks of Congress and was made a brigadier-general. He removed to Missouri, where he was shot by some ruffians near Nevada, Vernon County, Mar. 21, 1867.

Bailey, LIBERTY HYDE: horticulturist; an associate editor of this cyclopædia and editor of *American Gardening*; b. in South Haven, Mich., Mar. 15, 1858; graduated at the Michigan Agricultural College in 1882; two years assistant to the late Dr. Asa Gray at Harvard University; Professor of Horticulture and Landscape Gardening at the Michigan Agricultural College 1885-88; then Professor of General and Experimental Horticulture at Cornell University; employed in 1886 on the geological and natural history survey of Minnesota; has given particular attention to the genus *Carex*, upon which he has published a number of papers and two preliminary monographs; author of *Annals of Horticulture*, a yearly *résumé* of progress in horticulture, which has now reached four volumes; also *Talks Afield*, *about Plants and the Science of Plants*; *Horticulturist's Rule-book*; *Nursery-book*, or *Handbook of Plant Propagation and Pollination*; *Field Notes on Apple Culture*; *Cross-breeding and Hybridizing*; *American Grape Training*; also many special reports and monographs.

Bailey, NATHAN: an English lexicographer and classical scholar, who kept a school at Stepney, where he died June 27, 1742. In 1721 he published his *Universal Etymological English Dictionary*, the first English dictionary which aimed at completeness, and which was the basis of Dr. Johnson's more celebrated work (1755). He wrote also a *Domestic Dictionary* (1766), and other books on education. He was a Seventh-day Baptist.

Bailey, PHILIP JAMES: poet; b. in Nottingham, England, Apr. 22, 1816. He studied law, and was called to the bar in 1840. In 1839 he published *Festus* (8th ed. 1868), a poem which treats of the highest themes of philosophy and religion. It excited much admiration, and had a wide temporary success, to which its extravagance and defects contributed. He wrote other poems, entitled *The Angel World*, afterward incorporated with *Festus* (1850); *The Mystic* (1855); *The Age*, a satire (1858); and *The Universal Hymn* (1867).

Bailey, THEODORUS: b. in Dutchess co., N. Y., Oct. 12, 1758; member of Congress from New York 1793-97 and 1799-1803; U. S. Senator 1803-04, when he resigned, and was appointed postmaster of New York. D. in New York city, Sept. 6, 1828.

Bailey, THEODORUS: rear-admiral U. S. N.; b. at Chateaugay, N. Y., Apr. 12, 1805; entered the navy as a midshipman, Jan. 1, 1818. He did good service on the west coast of Mexico in the Mexican war, and during a part of 1861-62 commanded the frigate Colorado, western Gulf blockading squadron. On Apr. 24, 1862, he commanded the right column of Farragut's fleet in the passage of Forts St. Philip and Jackson, and at the capture of the Chalmette batteries and the city of New Orleans, where he led the fleet, and was conspicuous for his great gallantry and self-possession. From 1862 to 1865 he was in command of the eastern Gulf blockading squadron. D. in Washington, D. C., Feb. 10, 1877.

Bailey, WILLIAM WHITMAN, B. P.: b. at West Point, Orange co., N. Y., Feb. 22, 1843; was educated at Brown University, Providence, R. I., whence he graduated in 1864; was botanist of the U. S. geological survey of the fortieth parallel in 1867; deputy secretary of State of Rhode Island in 1868; assistant librarian of Providence Athenaeum 1869-71; then instructor (1877), but since Professor of Botany at Brown University. He published *Botanical Collector's Handbook* (Boston, 1881), and many contributions to periodical literature in prose and verse.

Baillie: a Scottish law-term having several applications. The most common and popular is to a superior officer or magistrate of a municipal corporation, with judicial authority within the city or burgh. In royal burghs the office is in some respects analogous to that of alderman in England.

Baillif [O. Fr. *baillif* < late Lat. *bafulivus*, adject. from Lat. *bafulus*, carrier, manager]: in Great Britain a deputy of a sheriff or of a local magistrate; also a magistrate of certain towns and a keeper of a castle. Baillif may be defined as the keeper or superintendent of some duty or charge legally imposed on him. As officers of the law, bailiffs arrest culprits, summon juries, and collect fines. There is a class of men employed by the sheriff on account of their adroitness and dexterity who are called bound bailiffs, because the sheriff being responsible for their official misdemeanors, they are annually bound in an obligation with sureties for the due performance of their service. The sheriff himself is the queen's bailiff. The term bailiff is seldom used in the U. S.

Baillie, JOANNA: poetess; b. in the manse of Bothwell, Lanarkshire, Scotland, Sept. 11, 1762. In early life she went to reside in London with her brother, Matthew Baillie, the celebrated physician. She published in 1798 the first volume of *Plays on the Passions*, which had great success. Several other volumes of the same appeared in 1802, 1812, etc. Among the most popular of her other works are *De Montfort*, a tragedy, and *Basil*, a drama. She wrote several ballads and songs which were much admired. She was an intimate friend of Sir Walter Scott, and her house was the resort of many other British and foreign literary celebrities. Her *Dramatic and Poetical Works Complete in one Volume* (London, 1851). D. in London, Feb. 23, 1851.

Baillie, MATTHEW, M. D.: a brother of the preceding, was born at Shots, in Lanarkshire, Scotland, Oct. 27, 1761. His mother was a sister of the great anatomists, John and William Hunter. He studied anatomy under his uncle, and

entered Oxford, where he graduated as M. D. In 1783 he succeeded Dr. Hunter as Lecturer on Anatomy in London. He acquired a high reputation as a teacher and expositor of that science. He published in 1795 an excellent work on *The Morbid Anatomy of Some of the Most Important Parts of the Human Body*, which had a remarkable influence on the study of medicine. He practiced medicine in London with great success, and was appointed physician to the king in 1810. D. at Duntisbourne, Gloucestershire, Sept. 23, 1823. See his *Life* by Wardrop prefixed to his *Works* (London, 1825, 2 vols.).

Baillie, ROBERT: an eminent Scottish Presbyterian theologian; b. in Glasgow in 1599. He was distinguished for his learning and moderation. He was one of the commissioners sent to London in 1640 to prepare charges against Laud; became Professor of Divinity at Glasgow in 1642; and was principal of the University of Glasgow after the Restoration. He wrote various works and letters. D. in Glasgow in July, 1662.

Baillie of Jerviswood, ROBERT: a Scottish patriot of excellent abilities and character. He opposed the tyrannical measures of the Duke of Lauderdale, and about 1676 was fined and imprisoned for four months. Having entered into a correspondence with Russell and Sidney, he was arrested and charged with complicity in the Rye House Plot. He was condemned on insufficient evidence, and executed, in Edinburgh, Dec. 24, 1684.

Bailly, JEAN SYLVAIN: French astronomer and statesman; b. in Paris, Sept. 15, 1736. He was admitted into the Academy of Sciences in 1763, and published in 1771 a remarkable *Treatise on the Light of the Satellites of Jupiter*. In 1775 he produced the first volume of his *History of Astronomy, Ancient and Modern* (4 vols., 1775-83), which by its eloquent diction and ingenious ideas obtained great popularity. He became a member of the French Academy in 1784, and of the Academy of Inscriptions in 1785. Fontenelle was the only Frenchman who before that time had had the honor to be a member of the three great academies of Paris. He was the first president of the States-General or National Assembly in 1789, and was elected mayor of Paris in July of that year. His influence was exerted to promote order and moderation. He offended the Jacobins by commanding the national guard to fire on a riotous crowd in July, 1791, and resigned his office soon after that date. During the Reign of Terror he was proscribed by the Jacobins, and after insulting treatment was guillotined, Nov. 12, 1793. Among his works is *Memoirs of the Revolution by an Eye-witness* (3 vols., 1804). See his *Life* by P. Arago (Paris, 1852; Eng. trans. in *Biographies of Distinguished Scientific Men*, Boston, 1859); J. P. Nourrisson (Paris, 1885).

Bailly, JOSEPH A.: a French sculptor; b. in Paris in 1825; emigrated to Philadelphia in 1850. Among his best works are *Adam and Eve*, a group of *Eve and her Two Children*, and a marble monument of *Washington* (1869), placed in front of the State-house in Philadelphia. D. June 15, 1883.

Bailment [O. Fr. *bailement*, deriv. of *bailler*, deliver]: a delivery of goods for some particular purpose, or on mere deposit, upon contract, express or implied, that after the purpose has been performed the identical goods shall be redelivered to the bailor, or otherwise dealt with according to his direction. If the contract permits the return of an equivalent instead of the goods bailed, there is no bailment, but the transaction constitutes a debt or some cognate engagement. Also a delivery of a thing in trust for some special object, and upon contract, express or implied, to conform to the object of the trust.

Bailment includes the borrowing, lending, hiring, or keeping of chattels, and the carrying or working upon them for another. The party making the delivery or *bailing* the property is termed the *bailor*; the party to whom it is delivered, the *bailee*.

Bailments have been classified as follows: 1. *Depositum*, or deposit; a delivery of goods to be kept by the bailee, and returned on demand, without recompense. 2. *Mandatum*, or mandate; where the bailee agrees to do something with or about the thing bailed, without recompense. 3. *Commodatum* (see LOAN); where the thing bailed is lent for use, without recompense. 4. *Pignus*, or pledge; where the thing bailed is security for a debt or other engagement. 5. *Locatio*, or hiring; where the use of something is to be

given, or labor performed about it, for a compensation. *Locatio* is subdivided as follows: *Locatio rei* (hiring of a thing) where the bailee by hire gains the temporary use of a thing; *Locatio operis faciendi* (hiring work to be done), where the bailee agrees to perform labor and services, or bestow care and attention upon the thing bailed, for a recompense; *Locatio operis mercium vehendarum* (hiring the work of carrying goods) where goods are delivered to a bailee to be transported to another place, for a recompense.

The question which most frequently arises and presents the greatest difficulty in the law of bailment relates to the responsibility which attaches to a bailee if the property is lost or injured, and the degree of care which he is bound to bestow upon it. With reference to this question, bailments have been divided into three groups: 1. Where the bailment is for the benefit of the bailor alone. This class includes deposits and mandates. Here, as the bailee receives nothing for his services, he is held only to the care which prudent men are supposed to give to their own affairs, and he is responsible only for such loss or injury as results from the absence of such care. The degree of care depends much upon the circumstances of each case; for example, upon the bulk of the article, its fragility, or its exposure to thieves from the dense population of a city as compared with the scanty population of a country district. In each case it is a question of fact whether the proper care was used. 2. Where the bailment is for the benefit of the bailee only. This class includes *commodatum*. Here the greatest care is required of the bailee, and he is responsible for the slightest negligence. It is also a rule that he must keep strictly within the privilege conferred on him with respect to the thing bailed, or he will be liable for any loss or injury to it, even though he is guilty of no negligence. 3. Where the bailment is for the benefit of both bailor and bailee. This is the case in *pignus* and *locatio*. Here the bailee is held to the exercise of the care and attention which prudent men under the circumstances would reasonably be expected to take.

There is a class of bailments of an exceptional nature, embraced under the head of *locatio*, where the policy of the law imposes upon the bailee responsibilities for loss or injury to the property delivered to his charge, entirely irrespective of the question of his care or negligence; this class includes innkeepers and common carriers, the liabilities of whom will be considered in another place. In these cases the bailees are often called insurers. See CARRIERS, HIRING, and INNKEEPERS.

The relation of bailor and bailee is largely one of trust, and the law requires good faith of each party. As a rule, the bailee will not be allowed to dispute the title of his bailor. He has a right to the possession of the thing bailed during the bailment, and in some instances a special property in it. In other cases he has a bare custody. This would enable him to maintain an action against any one who should unlawfully interfere with the chattel or deprive him of its possession. In such an action he would hold the proceeds beyond what was sufficient to indemnify him for his special interest as a trustee for the bailor.

T. W. DWIGHT.

Bai'ly, EDWARD HODGES: an English sculptor; b. in Bristol, Mar. 10, 1788; was a pupil of Flaxman. He gained the gold and silver medals of the Royal Academy 1809, and became a royal academician in 1821. Among his masterpieces are *Eve at the Fountain*, which is exquisitely graceful; *Apollo Discharging his Arrows*; *The Graces Seated*; *Eve Listening to the Voice*; and a statue of Lord Nelson. D. in Holloway, May 22, 1867.

Baily, FRANCIS, D. C. L.: English astronomer; b. in Newbury, Berkshire, Apr. 28, 1744; became a stock-broker in London 1799. He retired from business in 1825, and thenceforth devoted himself to science. He was one of the founders of the Astronomical Society (1820), and rendered important services to astronomy by the improvement of the *Nautical Almanac* and the production of the *Astronomical Society's Catalogue of Stars*. He wrote several standard works on life annuities, and a *Life of Flamsteed* (1835). D. in London, Aug. 30, 1844.

Bain, ALEXANDER, LL. D.: b. in Aberdeen, Scotland, in 1818; graduated as M. A. at Marischal College in 1840. In 1845 he was appointed Professor of Natural Philosophy in the Andersonian University at Glasgow; in 1857 Examiner in Logic and Moral Philosophy in the London University; in 1860 Professor of Logic in the University of Aber-

deen, of which he was elected lord rector in 1881. He has published *The Senses and the Intellect* (1855), *The Emotions and the Will* (1859), forming together a complete course of mental philosophy; *Study of Character, including an Estimate of Phrenology* (1861); *English Composition and Rhetoric* (1866); *Mental and Moral Science* (1868); *Logic, Deductive and Inductive* (2 vols., 1870); *Mind and Body: Theories of their Relation* (1873); *Education as a Science* (1879); *James Mill and John Stuart Mill* (1882); *Practical Essays* (1884); *Manual of Rhetoric* (part i, 1887; part ii, 1888). He belongs to the Spencerian or experimental school, and his psychology is physiological.

Bain'bridge: town and railroad junction; capital of Decatur co., Ga. (for location of county, see map of Georgia, ref. 7-G); on Flint river, 50 miles from its mouth and at the head of navigation; 236 miles W. S. W. of Savannah; has public and private schools, a cotton manufactory, and is a shipping-point for cotton and center of a great tobacco-growing region. Pop. (1880) 1,436; (1890) 1,668.

Bainbridge: on Susquehanna River and A. and S. R. R., Chenango co., N. Y. (for location of county, see map of New York, ref. 5-G); 32 miles E. of Binghamton. It has five churches and a beautiful park. It has various industries, including the manufacture of patent food-preparations, children's sleds and wagons, cigars, furniture, lumber, butter, cheese, etc. Pop. (1870) 681; (1880) 781; (1890) 1,049; (1892) 1,340. EDITOR OF "REPUBLICAN."

Bainbridge, WILLIAM: commodore; b. in Princeton, N. J., May 7, 1774. He obtained the rank of captain in 1800, and commanded the frigate *Philadelphia* in the war against Tripoli. This vessel, having run aground, was captured by the enemy Nov. 1, 1804. He remained a prisoner until peace was concluded, June, 1805, and was afterward raised to the rank of commodore. In Sept., 1812, he obtained command of a squadron consisting of the *Constitution*, of forty-four guns, the *Essex*, and the *Hornet*. In Dec., 1812, he captured the British frigate *Java*, mounting forty-nine guns. D. in Philadelphia, Pa., July 28, 1833. See his *Life* by Thomas Harris (Phila., 1837).

Baini, bā-ee'neē, GIUSEPPE: Italian musician; b. in Rome, Oct. 21, 1775; became director of the Papal Orchestra, 1814. D. May 21, 1844. Author of *The Biography of Palestrina*, numerous sacred compositions, and *History of the Papal Orchestra*. He is chiefly famous for his work in the history of music.

Bains, bāin (i. e. baths): the name of several watering-places in France. The most important of these is Bains-les-Bains, in the department of Vosges, 14 miles S. W. of Épinal, situated about 1,000 feet above the sea. The place has thirteen springs. Among these "La grosse source" has a temperature of about 120° F.

Bai'ram: a feast of the Mohammedans; begins at the end of the fast of Ramadan. It is inaugurated with great public rejoicings and illuminations. Its observance is commanded by the Koran. "Little Bairam" occurs seventy days later.

Baird, ABSALOM: soldier; b. in Washington, Pa., Aug. 20, 1824; graduated at West Point 1849 in artillery; captain and assistant adjutant-general Aug. 3, 1861; major and inspector-general Nov. 12, 1861; lieutenant-colonel June 13, 1865; brigadier-general U. S. vols. 1862-66. He served at various posts 1849-61; in Florida hostilities 1851-53; as assistant professor at military academy 1856-59; assistant adjutant-general at Washington, D. C., 1861; in Manassas campaign 1861; engaged at Blackburn's Ford and Bull Run; in the adjutant-general's office 1861; in the Virginia Peninsula campaign 1862; engaged at Yorktown and Williamsburg; in command of a brigade in the army of the Ohio, 1862; engaged in the capture of Franklin in Rosecrans' Tennessee campaign 1863; engaged at Tullahoma, Shelbyville, Dug Gap, Chickamauga (brevet lieutenant-colonel), and occupation of Chattanooga; in command of a division in the Fourteenth corps in the operations about Chattanooga (brevet colonel) 1863-64; engaged at Missionary Ridge and skirmished in pursuit of the enemy in the invasion of Georgia 1864; engaged at Resaca, Pine Mountain, Kenesaw, Vining's Station, Peach Tree Creek, Atlanta (brevet brigadier-general), Jonesboro; pursuit of Hood's army; in the "march to the sea" and surrender of Savannah; in the invasion of the Carolinas 1865; engaged at Bentonville, Raleigh, and surrender of Johnston's army at Durham Station. He was breveted major-general U. S. army

Mar. 13, 1865, for gallant and meritorious services in the field, and major-general U. S. vols., Sept. 1, 1864, for distinguished conduct in Atlanta campaign and at Savannah. Became inspector-general of army 1885. Retired Aug. 20, 1888.

Baird, Lieut.-Col. ANDREW WILSON, F. R. S.: b. in Aberdeen, Apr. 28, 1842; educated at Marischal College, Aberdeen University; obtained a commission in the corps of Royal Engineers 1861; entered the service of the Bombay Government 1864; was employed as field engineer in the Abyssinian expedition; employed on the great trigonometrical survey of India 1868; selected to superintend the results of the harmonic analysis of tidal observations in India, where, beginning at the Gulf of Cutch, he established over thirty tidal observatories from Aden to Burma; lieutenant-colonel 1888; mint master of Calcutta 1889; is especially noted for his collaboration with G. H. Darwin in producing *The Harmonic Analysis of Tidal Observations* (1885), presented to the Royal Society of London, for his account of the *Spirit-leveling Operations of the Great Survey of India*, and for his official reports upon these and kindred subjects. He is a fellow of the Royal Geographical Society.

Baird, HENRY MARTYN, Ph. D., D. D., LL. D.: son of the Rev. Robert Baird, D. D.; b. in Philadelphia, Jan. 17, 1832; graduated at the University of the City of New York 1850; attended lectures in the National University (then University of Ohio), Athens, Greece, 1851-52; studied theology in the Union Theological Seminary, New York, 1853-55, and Princeton, N. J., 1855-56. He was tutor of Greek in the College of New Jersey 1855-59, and in 1859 became Professor of the Greek Language and Literature in the University of the City of New York. In 1866 he was ordained as an evangelist. He has published *Modern Greece* (1856); *The Life of the Rev. Robert Baird, D. D.* (1866); *History of the Rise of the Huguenots of France* (1879); *The Huguenots and Henry of Navarre* (1886); *The Edict of Nantes and its Recall* (1886); and many articles in the quarterlies.

Baird, ROBERT, D. D.: theologian and writer; b. near Uniontown, Fayette co., Pa., Oct. 6, 1798. He graduated at Jefferson College, Washington, Pa., in 1818, and at Princeton Theological Seminary in 1822. He spent several years (1835 to 1843) in Europe, where he did much to promote Protestant Christianity and the temperance cause. He was corresponding secretary of the American and Foreign Christian Union 1849-55, 1861-63. Among his works are *History of the Waldenses, Albigenses, and Vaudois*; *History of the Temperance Societies* (French orig. Paris, 1836); *Religion in America* (Glasgow and New York, 1844). D. at Yonkers, N. Y., Mar. 15, 1863. See his *Life* by his son, Henry M. Baird (New York, 1866).

Baird, SPENCER FULLERTON, LL. D.: naturalist; b. in Reading, Pa., Feb. 3, 1823; entered Dickinson College in 1836, and graduated in 1840. He got his first love for natural history from his father, who was fond of out-of-door studies of nature, and he was greatly stimulated in this direction by an early acquaintance with Audubon, which he formed as early as 1838. From 1846 to 1850 he was Professor of Natural History in Dickinson College, and just before resigning this position he began his first important literary work—that of translating and editing the *Iconographic Encyclopedia*. In 1850 he was appointed assistant secretary of Smithsonian Institution, which position he held until the death of Prof. Henry, in May, 1878, when he succeeded to the position of secretary, and held it till his death. His most elaborate original memoirs are the catalogue of North American serpents (1853); *Mammals of North America* (1858); the *Review of North American Birds* (1864-66); and a *History of North American Birds* in connection with Mr. Brewer and Mr. Ridgway. From 1870 to 1878 he was scientific editor of the periodicals published by Harper & Brothers. In his writings Prof. Baird covered nearly every branch of natural history. In 1871 he was placed at the head of the newly created U. S. commission of fish and fisheries—an unsalaried office. Mainly through his exertions this commission was raised to its present important position. Not only was he honored by being made an honorary member of nearly every American scientific society, but he was also either a foreign or corresponding member of most of the important scientific societies in England, France, Germany, Austria, and Spain, and was a member of the council of the American National Academy of Sciences. In 1879 he was awarded the gold medal of the Société d'Acclimatation of France, and in 1880 the "erster

Ehrenpreis" of the Internationale Fischerei Ausstellung, at Berlin—the gift of the Emperor of Germany. In 1875 he received from the King of Norway and Sweden the decoration of "knight of the royal Norwegian order of St. Olaf." Other honors and medals were received by him. He was director of the National Museum, D. in Wood's Hole, Mass., Aug. 19, 1887.

Baireuth, or **Bayreuth**, bi'roit: a city of Bavaria; capital of the circle of Upper Franconia; on the Red Main; 126 miles by rail N. of Munich (see map of German Empire, ref. 6-F). It is pleasantly situated and well built, and has gardens and public fountains. The principal buildings are the new palace, the mint, opera-house, town-hall, and the theater built for Wagner, who is buried near here. Here are manufactures of cotton, woolen, porcelain, and leather. Pop. (1890) 24,364.

Bairut: See BEYROUT.

Bai'us (*Bajus*), the Latinized name of MICHAEL DE BAY: a Flemish theologian; b. in Melin, Hainault, in 1513. He became Professor of Divinity at Louvain in 1550, and in 1578 chancellor of that university. He adopted the doctrines of St. Augustine, and wrote works on free will and grace, which were condemned by Pope Pius V. in 1567. Baius retracted or submitted, but his doctrines were propagated in the Netherlands and afterward maintained by the Jansenists. He condemned the Jesuits as Pelagians. His works (Cologne, 1696, 2 vols.) were put in the *Index*. D. in Louvain, Dec. 16, 1589.

Baja: See BALE.

Baja, bö'yö: an important market-town of Hungary; in the county of Bács; on the Danube; 90 miles S. of Pesth (see map of Austria-Hungary, ref. 7-11). Here is an important market or annual fair for swine. Large quantities of grain and wine are produced in the vicinity. Pop. about 20,000.

Baja California: the Mexican territory comprising Lower California.

Bajada de Parana: See PARANA.

Bajazet: See BAYAZID.

Ba'ker, ABILAH RICHARDSON, D. D.: b. in Franklin, Mass., Aug. 30, 1805; graduated at Amherst in 1830; became a teacher in Medway, Dorchester, and Andover, Mass.; ordained pastor of a Congregational church in Medford, Mass.; and was subsequently settled in Lynn, Wellesley, and Boston. D. in Boston, April 30, 1876. He published a *School History of the United States*; *The Catechism Tested by the Bible*; an *Exposition of the Sermon on the Mount*, etc.—His wife, HARRIETTE NEWELL WOODS, a daughter of Rev. Dr. Leonard Woods, was born at Andover in 1815. She has published over 160 volumes, mostly for children, written under the pseudonym of "Madeline Leslie."

Baker, SIR BENJAMIN, F. R. S., Hon. LL. D., Hon. Master of Engineering, V.-P. Inst. C. E.: civil engineer; b. near Bath, England, in 1840. His professional training began with hammer and chisel in one of the oldest workshops in Wales. Thence he was articulated to Mr. H. H. Preece, in whose office and shops he obtained experience in foundry, forge, and manufacturing processes, and the designing of machinery. Three years later he obtained some experience in works of masonry. Going to London, he entered the office of Sir John Fowler, and took an active part in the many important engineering works then being carried out, including the Metropolitan Railway (underground) of London. It has fallen to him to repair and strengthen the three historical bridges of Telford, the Menai suspension bridge, the Buildwas cast-iron arched bridge, and the masonry bridge over the Severn, near Gloucester. In 1877 Mr. Baker designed the cylindrical ship in which Cleopatra's Needle was transported. He superintended the loading of the obelisk in Egypt and its re-erection in London. His great work is the Forth bridge, of which Sir John Fowler and himself were the engineers. He is consulting engineer to the Cape of Good Hope Government, the Chinese Government, and one of the consulting engineers of the Bristol Railway Company, of the Chignecto Ship-railway, and the Hudson River Tunnel, representing together a capital of \$750,000,000. Among his writings are *Long Span Iron Bridges*; *The Metropolitan Railway*; *The River Nile*; *Transportation and Re-erection of Cleopatra's Needle*; *The Strength of Beams*; *The Pressure of Earthwork*; *On Timber and Metal Arches*; *Rivets in Girder-flanges*; *Lattice*

versus Box Girders; Pin Connections versus Rivets; Victoria Bridge; Suspension versus Cantilever Bridges; Manufacture and Wear of Rails; Steel for Tires and Axles, etc.

WILLIAM R. HUTTON.

Baker, DANIEL, D. D.: Presbyterian minister; b. in Midway, Liberty co., Ga., Aug. 17, 1791; graduated at Princeton in 1815; was ordained to the Presbyterian ministry in 1818; was pastor at Washington, D. C., Savannah, Ga., Frankfort, Ky., Tuscaloosa, Ala., and Holly Springs, Miss.; was for a time president of Austin College, Huntsville, Tenn.; was a popular and successful preacher; and the author of several practical and polemical religious works. D. in Austin, Tex., Dec. 10, 1857.

Baker, WILLIAM MUMFORD: clergyman and author; son of Daniel Baker; b. in Washington, D. C., June 5, 1825; graduated at Princeton in 1846; is the author of a *Life of his father* (1858), and of several other popular works, such as *Inside, a Chronicle of Secession* (1866); *The New Timothy* (1870); and *His Majesty Myself* (1879). He was a Presbyterian minister in Galveston (1850) and Austin, Tex. (1850-65); at Zanesville, O. (1866-72); Newburyport, Mass. (1872-74); South Boston, Mass. (1874-81); Philadelphia, Pa. (1881); resigned shortly before his death in South Boston, Mass., Aug. 20, 1883.

Baker, Col. EDWARD DICKINSON: a lawyer; b. in London, England, Feb. 24, 1811; emigrated to the U. S. in his youth. He was M. C. from Springfield, Ill., 1844-46, 1849-51; removed to California in 1852, and became a popular orator of the Republican party. In 1860 he was elected U. S. Senator for Oregon. Having obtained command of a brigade of the Union army, he was killed at Ball's Bluff, Va., on the Potomac, Oct. 21, 1861.

Baker, GEORGE AUGUSTUS: portrait-painter; b. in New York in 1821, and died there Apr. 2, 1880. He was a student in the schools of the National Academy of Design, New York, and visited Europe in 1844, where he remained two years. He painted many portraits in New York, and was elected a National Academician in 1851. W. A. C.

Baker, IRA OSBORN, B. S., C. E.: b. in Linton, Ind., Sept. 23, 1853; graduated at University of Illinois 1874; was Assistant Professor of Civil Engineering in that institution 1874 to 1880, and Professor of Civil Engineering since 1880. Author of *Engineers' Surveying Instruments* (1886); *Treatise on Masonry Construction* (1889); and *Brick Pavements* (1891).

Baker, JOHN GILBERT, F. R. S., F. L. S.: botanist; b. in Guisborough, England, Jan. 13, 1834; educated at the Friends' schools at Ackworth and York. He is keeper of the herbarium and library of the Kew Gardens, and has published a new edition of Hooker's *Synopsis Filicum* (1883); a *Handbook of the Fern Allies* (1887); *Handbook of the Amurillidæ* (1888); *Handbook of the Bromeliaceæ* (1889); besides many papers on botanical subjects.

Baker, OSMON CLEANDER, D. D.: Methodist; b. in Marlow, N. H., July 30, 1812; studied at Wesleyan University, Connecticut; became teacher in the Newbury Wesleyan Seminary (Vermont) 1834, and its principal 1839-44. He was one of the founders of the Methodist theological schools, and professor in the Biblical Institute at Concord, N. H., 1847-52. In 1852 he was elected bishop. D. at Concord, N. H., Dec. 20, 1871. *Baker on the Discipline of the Methodist Episcopal Church* (New York, 1855) is a standard work.

Baker, Sir RICHARD: author of *The Chronicle of the Kings of England*; b. in Sisinghurst, near Cranbrook, Kent, 1568; educated at Oxford; put into the Fleet Prison, London, for debt in 1635, where he wrote his *Chronicle*. D. a prisoner and in poverty, Feb. 18, 1644-5.

Baker, Sir SAMUEL WHITE: explorer; b. in London, June 8, 1821; organized an extensive agricultural colony at Newerra Ella, in Ceylon, 1847, which afterward became a place of considerable importance. In 1861 he went to Africa, with the design of visiting the sources of the Nile. He fell in with Speke and Grant, and afterward explored the western arm of the Nile, and discovered the Albert Nyanza Lake. In 1869 he set out, under the direction of the Khedive of Egypt, with 1,000 picked men, with the design of suppressing the slave-trade and spreading the cultivation of cotton. In 1873 he returned from this expedition, reporting complete success. He has published *The Nile and Hownd in Ceylon* (1854, 1874); *Eight Years' Wanderings in Ceylon* (1855); *The Albert Nyanza* (1866, 2 vols.); *The Nile Tribu-*

laries of Abyssinia (1867); *Ismaïla* (1874, 2 vols.); *Cyprus, as I Saw It* (1879); *Wild Beasts and their Ways* (1891). D. Dec. 30, 1893.

Baker, WILLIAM, D. D.: head-master Merchant Taylors' School, London; b. at Reigate, Dec., 1841; educated at St. John's College, Oxford; prebendary of St. Paul's Cathedral, London, 1880; fellow of St. John's, Oxford (1860-70); author of *Manual of Devotion for Schoolboys* (1876); *Lectures on the Historical and Dogmatical Position of the Church of England* (1882); *A Plain Exposition of the XXXIX. Articles* (1883); *Daily Prayers for Younger Boys* (1886).

Baker, WILLIAM BLISS: landscape-painter; b. in New York in 1839; pupil of Albert Bierstadt, M. F. de Haas, and of the National Academy, New York. His landscapes are notable for almost photographic exactness, but are painted with breadth and much truth of observation. One of his best works, *Silence*, is in the collection of Thomas B. Clarke, New York. D. in Ballston, N. Y., in 1889. W. A. C.

Baker, WILLIAM HENRY, M. D.: gynecologist; b. in Medford, Mass., Mar. 11, 1845; graduated at Harvard Medical School; Professor of Gynecology in Harvard Medical School; visiting physician of gynecological department of Boston Dispensary; author of *The Treatment of Cancer of the Uterus; Diseases of the Urethra and Bladder, etc.*

Baker City: capital of Baker co., Or. (for location of county, see map of Oregon, ref. 3-I). It is situated on the east fork of Powder river, in a farming, stock-raising, and gold-mining region. Pop. (1880) 1,258; (1890) 2,604.

Baker's Creek, Battle of: See CHAMPION HILLS.

Baker's Falls: a cascade of the Hudson river, in Kingsbury township, Washington co., N. Y. The stream falls 56 feet in 60 rods, and the scene is one of remarkable beauty. The falls furnish a great water-power. Here are two machine-shops and some paper-mills.

Baker Island, or New Nantucket: a low coral island in the North Pacific. It is in lat. 0° 13' N., lon. 176° 29' E., E. of the Gilbert Archipelago and N. of the Phenix islands. It is a low coral island (20 feet high), and had a large deposit of guano, which was worked by the American Guano Company. Its surface is very nearly level, and it is devoid of vegetation except for a few patches of grass. The outline is quadrilateral, a mile long E. and W., three-quarters of a mile wide N. and S. Fresh water is not found, but must be obtained by distilling. The guano was worked out in 1872. The island is now uninhabited, though the wooden houses remain. M. W. H.

Baker Lake (Keewatin, Canada): an extension of Chesterfield inlet of Hudson Bay, with which it is connected by two channels; lat. 63° 50' N., lon. 98° W. It is 50 miles long E. and W., by 30 miles broad. It receives the drainage of many lakes, including the Doobanun on the W. and the Yathkyed on the S. There is said to be a fine waterfall in the river coming in from the west. It is within the sterile Arctic plains, beyond the timber line, which are destitute of agricultural possibilities. M. W. H.

Baker Mount: volcano in the Cascade Range, N. W. part of the State of Washington; height, 11,100 feet; frequently in eruption; very active in 1880.

Bakersfield: town; capital of Kern co., Cal. (for location of county, see map of California, ref. 10-E); is situated on Kern river, about 60 miles from Visalia. It is the center of a considerable cotton trade. Fruit-growing is a thriving industry. Pop. (1880) 801; (1890) 2,626.

Bake'well: an old market-town of Derbyshire, England; on the river Wye, near its confluence with the Derwent; 25 miles by rail N. W. of Derby. It has an ancient Gothic church, and chalybeate springs with warm baths, which are visited by many persons. Quarries of black marble and mines of coal and lead are worked in the vicinity. Chatsworth House, the splendid mansion of the Duke of Devonshire, is 3 miles from this town, which is surrounded by beautiful scenery. Pop. (1891) 2,748.

Bakewell, ROBERT: an English agriculturist; b. in Dishley, Leicestershire, in 1725. He gained distinction by his improvement of domestic animals, especially sheep and horned cattle. He originated a breed of sheep formerly called by his name, but now known as the Leicester breed. D. in Dishley, Oct. 1, 1795.

Bakhmut, baakh-moot': a Russian town; province of Ekaterinoslav; 127 miles S. E. of Kharkov. In the vicinity

are large coal mines. It manufactures much tallow, and is a market for meat and grain. Pop. (1882) 17,999.

Bakhebisarai, *baakh-shōō-sān-rī* (Turkish, The Garden Palace); a Tartar town of Russia; government of Taurida (Crimea); 15 miles S. W. of Simferopol. It was formerly the capital of the Tartar khans, whose palace is a remarkable Oriental edifice and in good repair, with spacious galleries, brilliant paintings, and pavilions of light and airy form. Pop. 13,500.

Bakhtegan, *baākh-tā-guan'*. **Lake**: in Persia: is 50 miles E. of Shiraz. It is 60 miles long, with an average breadth of 8 miles, and receives at its western extremity the river Bundemir (anc. *Araxes*). The lake yields large quantities of salt.

Bakhuysen, *baākh-hōi-zen*, or **Bachhuysen**, LUDOLF: a celebrated Dutch marine-painter; b. at Emden, Dec. 18, 1631. He was a close student of nature, and often ventured out to sea during storms. His paintings are said to express the poetry of the sea. Among his works is a marine view which the magistrates of Amsterdam presented to Louis XIV. of France, D. in 1709. Several of his best works are in the gallery of the Louvre at Paris.

Baking is the mode of cooking food in an oven usually nearly or quite air-tight. The term is also employed in the manufacture of bricks, porcelain, etc. (The baking of bread will be treated under BREAD.) In baking, strictly so called, the oven is so closed that the steam and aroma arising from the substances within are confined; but by opening ventilators a current of air may be produced, and then these ovens may be used for oven-roasting. The offensive taste that often characterizes baked dishes is thus avoided. Baking, although a convenient mode of cooking, is not so good a process for cooking meats as roasting. See COOKERY (*Roasting*).

Baking-powders: mixtures of substances prepared for use in bread-making (see BREAD) in place of yeast. In the fermentation caused by the yeast, carbon dioxide, or carbonic acid gas, is given off, and this makes the bread rise. Baking-powders are made of substances that give off carbon dioxide when they are brought together, and the effect thus produced upon the dough is the same as that produced by the carbon dioxide resulting from the action of the yeast. At the same time other slight changes are caused by the yeast that may be of importance in determining the quality of the bread. Most baking-powders are made of tartaric acid and bicarbonate of soda mixed with starch. When the tartaric acid acts upon the bicarbonate of soda, three products are formed, viz., water, sodium tartrate, and carbon dioxide. Cream of tartar, or acid potassium tartrate, is frequently used instead of tartaric acid. When this acts upon bicarbonate of soda, the products are water, carbon dioxide, and Rochelle salts. Instead of bicarbonate of soda, bicarbonate of ammonia is sometimes used. There is no good objection to the use of the latter substance, though the effort is sometimes made to convince the public that anything related to ammonia is highly objectionable, because ammonia is formed by the decomposition of animal matter. Such reasoning is absolutely worthless. It is only necessary to call attention to the fact that both water and carbon dioxide also are produced by the decomposition of animal matter. As substitutes for the somewhat expensive tartaric acid other substances are often used. Among these alum is perhaps the most prominent. When ordinary alum acts upon bicarbonate of soda the products are sulphate of soda, sulphate of potash, and hydrate of alumina, or aluminium hydroxide. It appears, however, that ammonia alum is used practically to the exclusion of potash alum, and therefore sulphate of ammonia instead of sulphate of potash is formed when the baking-powder is used. Again, most baking-powders contain acid phosphate of calcium ("superphosphate"), and this acting with the other ingredients gives some products in addition to those mentioned. There is no objection to the use of phosphoric acid or of acid phosphate calcium, but objection has frequently been made to the use of alum. Whether or not the use of alum in baking-powders is objectionable on sanitary grounds is difficult to decide positively. From investigations carried out by Prof. J. W. Mallet, of the University of Virginia, among other conclusions the following is drawn: "From the general nature of the results obtained the conclusion may fairly be deduced that not only alum itself, but the residues which its use in baking-powder leaves in bread, can not be viewed as harm-

less, but must be ranked as objectionable, and should be avoided when the object aimed at is the production of wholesome bread."

IRA REMSEN.

Bako'ny-Wald (forest of Bakony): a densely wooded mountain-range of Hungary; extends between the river Raab, the Danube, and Lake Balaton. It is a spur of the Styrian Alps, projecting into the largest plain of Europe, and is 56 miles long and 23 miles wide. The average height is 2,000 feet. Large herds of swine are annually driven hither to feed on mast (acorns). Quarries of good marble are worked in these mountains.

Baku, *baū-koo'*, or **Badku**: a seaport of Asiatic Russia; capital of a province or government of the same name; on the west shore of the Caspian Sea, and on the south side of the peninsula of APSTHERON (*q. v.*); 550 miles from Batoum on the Black Sea, with which it is connected by rail viā Tiflis (see map of Russia, ref. 12-II). In the immediate neighborhood are many naphtha springs, some of which ignite spontaneously, and this circumstance has caused Baku to be regarded as a holy city by the Parsis, who have built several temples here. In 1893 458 oil-wells were operated some part of the year, with a yield of 33,104,126 barrels (of 42 gal.) of crude oil, an increase over 1880 of over 31,000,000 barrels. The oil refineries here give employment to nearly 5,000 persons. In 1806 Baku became a Russian possession. For three hundred years before that it had been, with brief exceptions, under Persian control. The harbor, which is spacious and well sheltered, is strongly fortified. Pop. (1892) 107,761.

Bakunin, *baū-koo'neēn*, MICHAEL: Russian agitator and earliest advocate of Nihilism; b. in Torsheok, in the government of Tver, 1814, of a rich family of high rank. He graduated at the Military School of St. Petersburg, and was appointed ensign in the artillery, but resigned and devoted himself to science with great success. In 1841 he left Russia and went to Berlin, where he occupied himself with philosophy, especially Hegelianism; to Dresden, where he studied with Arnold Ruge; and finally (1843) to Paris, where he lived with the Polish emigrants. In Switzerland he became acquainted with the communistic and socialistic societies, and often attended their meetings. In 1847, in a speech at Paris, he advocated a Russian republic and a Russo-Polish fraternity, aiming to revolutionize Russia. On demand of Russia he was expelled from France, Jan., 1848. From this time he took part in all the revolutions of Europe, was put into prison in Saxony, sentenced to death in Austria, delivered up to Russia, and finally exiled to Siberia (1855). In 1860 he escaped to Japan, whence through the U. S. he returned to London. Here he took up again his revolutionary work, and advocated with fervor and boldness the overthrow of the contemporary government in Russia and the foundation of a great Slavonic federal republic. In a speech at Geneva in 1868 he announced himself the bearer of a new gospel. The next year he organized the Social Democratic Alliance, which was speedily absorbed in the International, and in turn he was expelled from the latter organization by the Marx faction in 1872 at The Hague Congress. He attempted to lead a revolt in Lyons (1870), and his views have perceptibly toned the socialism of Mediterranean Europe. His teachings involve a pure materialistic naturalism. Men free from every artificial or historical restraint will act in accordance with natural law, and nothing else is needed. His aim was to destroy the *Lie*; but the beginning of the *Lie* was God, the belief in whom we therefore were to get rid of. Having got rid of it, the next lie to be destroyed was *Right*; for *Right* was but a fiction invented by *Might*, simply in order to insure and strengthen her reign, and *Might* formed the sole groundwork of society, making and unmaking laws. "Therefore our first work," he said, "must be destruction and annihilation—destruction of everything as it now exists, the good with the bad; for if but an atom of this old world remains, the new will never be created." By these means he would secure perfect equality for all persons; the control of the natural sources of subsistence and of industry by the workers, and a solution of the social problem by ultimate solidarity of labor associations of all countries. Views like these form the very platform of the Russian conspiracy known as Nihilism. While Bakunin detested communism, he advocated the abolition of marriage and inheritance, and taught that conscience is a mere matter of education. D. in Bern, July 1, 1876. See his *Dieu et l'État* (God and the State).

Balaam [Heb. *Bileam*, devourer]: son of Beor, the prophet of Pethor, in Aram, by the river Euphrates, who was hired by Balak, King of Moab, to curse Israel, but who instead blessed them, and foretold a great future for them in words of wonderful eloquence. He later advised the Moabites to invite the Israelites to the licentious worship of their god Bael Peor. In punishment of their transgression God sent a plague which slew 24,000 Israelites. When the plague was stayed Israel fought Moab, and in the general overthrow Balaam fell. The narrative is found in Num. xxii-xxv., xxxi.; cf. Josh. xiii, 22; and its historicity is assumed in Dent. xxiii, 4, 5; Josh. xxiv, 9, 10; Neh. xiii, 2; Micah vi, 5. It is alluded to in the New Testament, wherein Balaam is a synonym for avarice, impurity, and impiety (2 Pet. ii, 15, 16; Jude 11; Rev. ii, 14). It is probable that he was a heathen prophet and necromancer of great celebrity, who was hired by Balak like any other diviner. He mistook the real divine possession for the "possession" with which his arts had made him cognizant, and thought not that he was but a tool in the hand of God. The story must have come from some Moabite captive.

The above interpretation is on the theory that the narrative is truthful and a unit. Many biblical critics of standing affirm that it is made up of different and contradictory elements, and contains at most only a modicum of truth. But to those who accept the testimony of the New Testament writers upon historical matters, their confirmation of the narrative will be entirely satisfactory, especially since Peter expressly states his belief in the only portion of the narrative—the speaking ass—which is antecedently improbable.

Josephus and Philo tell the story of Balaam, and the former (*Antiq.* iv, 6) considers him a prophet of the true God, but the latter as a necromancer. In the Talmud he is spoken of as a godless prophet. In the Fathers he is mentioned, of course, for the story is one of the most striking in the Bible. Origen (*Contra Celsum*, i, 59) applies Balaam's prophecy of the star out of Jacob (Num. xxiv, 17) to the star which the Magi saw. Tertullian, Augustine, Ambrose, Jerome judge him variously. He is alluded to in the Koran (Sale's trans., chap. vii, Al Araf), and the Mohammedans tell various tales about him, as that he was of the Anakim, the giants of Palestine, and that he learned the mystical name Jehovah from the books of Abraham, and by the use of it worked miracles. SAMUEL MACAULEY JACKSON.

Balanicep'ida: [from Lat. *balæna*, whale + *ceps* (*caput*), head]: See SHOE-BILL.

Balaghât, bâh-lâh-gawt' [Pers.-Hind. *Bâlâghât*, lit., upper plateaus]: a name applied to several sub-Alpine districts in India; but specifically to a district in Nagpur, Central Provinces, between parallels 21° and 23° N., and meridians 80° and 81° E. It is the eastern portion of the central plateau which divides Nagpur E. and W. These highlands remained desolate and neglected until 1866, when the Balaghât district was formed and immigration encouraged. It contains extensive forests, which, however, do not produce timber of value, and much of the area is covered by jungle and is incapable of cultivation. Rice, wheat, and other cereals, oil-seeds, sugar, and tobacco are raised. Iron ore exists and is smelted by the natives. There are no roads, and the towns are small. Although but lately an impenetrable waste, there are some evidences that this district once enjoyed a high civilization. Of such a character is a handsome Bûdhist temple of cut stone belonging to a period of which no historical traces remain. Area, 3,146 sq. miles. Pop. about 350,000. M. W. H.

Balaguer, bâh-lâh-gûr'. VICTOR: Spanish poet and historian; b. in Barcelona, Dec. 11, 1824; known principally for his investigations of the early literature and history of Catalonia. In 1854 he was appointed archivist of Barcelona, and soon after Professor of History in the university there. He was also in 1886 made Ministro de Ultramar in Sagasta's cabinet. Among his historical essays and works are *Estudios históricos y políticos* (1876); *Historia de Cataluña* (1878); *Historia política y literaria de los trovadores* (6 vols., 1878-80). As poet he has treated mainly subjects drawn from his native province. His *Tragedias* were published in 1879, and his *Poesías completas* in 1884. A. R. MARSH.

Balaklava, bâh-lâh-klav'a, or **Balaclava**: a small port and town of Russia, in the Crimea, and on the Black Sea, about 7 miles S. from Sevastopol; is separated from the harbor of Sevastopol by a rocky peninsula (see map of Russia, ref. 11-C). It has a good landlocked harbor, supposed to be the

port of the Læstrigianians at which Ulysses landed. The ruins of churches and mosques attest the ancient magnificence of this town. Pop. in 1882, 695. A few days after the battle of Alma, which occurred in Sept., 1854, Balaklava was occupied by the British army, and the harbor became the headquarters of the fleet. The British army suffered here great privations in consequence of the inefficiency of the War Office and the mismanagement of the commissariat. Soldiers perished with hunger and cold, while ample stores of food and clothing were in the holds of ships in the harbor. Here occurred the battle of Balaklava between the British and Russians, Oct. 25, 1854. The charge of the British cavalry in this action was a famous but unsuccessful exploit.

Balance [viâ Fr. from vulg. Lat. **bilancia*; cf. Lat. *bilanz*, adject. (sc. *libra*); *bi-*, two + *lanx*, pan]: a lever of the first kind, the fulcrum being between the power and the weight; used to ascertain the weight of bodies in standard units. The ordinary balance consists essentially of a metallic bar or lever, called the beam, either delicately suspended or supported on a stand by the intervention of a wedge-shaped prism, technically termed a knife-edge, exactly at its middle point. An index is fixed at right angles to the beam, and made to travel over a graduated arc, so as to show when the beam is horizontal. A scale-pan is suspended from each end of the lever. Since the arms of the balance are equal, it is plain that there can not be equilibrium unless the weights placed in each scale are also equal. When this is the case, the beam is perfectly horizontal and the index vertical. The balance is then said to be true. When the beam is horizontal with unequal weights, the balance is false. Thus it is easy to test the truth of a balance by first placing in the scales weights which apparently are equal, and then transferring each into the other scale. If the weights are not really equal, one of them will appear heavier than the other after the transfer. There are, however, two methods of finding the exact weight of a body by means of a false balance. The body may be weighed with standard weights in each scale successively, and the true weight is the mean proportional between the two apparent weights. Or the body (placed in one scale) may be balanced by a sufficient quantity of any convenient substance—sand, for instance—so that the beam is horizontal, and then replaced by standard weights until the sand is balanced: the weight thus obtained is the true one. A good balance must have its beam in stable equilibrium, for which purpose the center of gravity of the beam and its appendages must fall a little below the knife-edge. The points of suspension of the scale-pans and the fulcrum of the beam should be in the same straight line. Both when the scales are empty and when equal weights are placed in them the beam should be horizontal and the index vertical, the arms, of course, being exactly equal to one another. It is often of importance that the balance should be very sensitive and indicate very slight inequalities in the weights. The sensibility of a balance becomes greater, first, as the length of the arms is increased, which renders the movement about the fulcrum more obvious; and secondly, as the weight of the beam is diminished, for when the beam is displaced by the inequality of the weights, its own weight gives it a tendency to return to its first position. But this displacement is less for a given inequality in the weights as the weight of the beam is increased; so that the less the beam weight, the more sensitive the balance becomes. The sensitiveness of the balance also depends on the distance between the point of suspension and the center of gravity, the sensitiveness increasing as the distance diminishes.

The balance of a watch is a wheel nicely poised on its axis, the pivot-holes in which it turns being frequently formed in rubies or other jewels. The natural effect of an impulse given this wheel would be complete rotation, but this is arrested by the balance-spring, so that it recoils, and a vibratory motion results. The balance-spring is a coil of steel wire so fine and delicate that 4,000 springs weigh only about 1 oz. One of the extremities of the spring is fastened to a point independent of the balance, and the other end is attached near its axis. When the impulse is given to the balance, it moves round just so far as the impulse given is able to overcome the elastic resistance of the spring. When that resistance becomes equal to the impulse, the balance is driven back by the elastic recoil of the spring. In marine chronometers a cylindrical helical spring is used. See the articles TORSION BALANCE and WEIGHING-MACHINES.

Revised by E. L. NICHOLS.

Balance of Power [Fr. *équilibre politique*, i. e. political equilibrium or equilibrium of states]; a phrase used in modern European diplomacy to express a state of political equilibrium among neighboring powers, or a political system so arranged and counterpoised that no nation or monarch may be so powerful as to endanger the independence of other states. Such a balance was aimed at in the political combinations in behalf of Greece; in those of Italy just before the Reformation; in the policy of Europe under the lead of France against Austria and Spain; in the alliances against Louis XIV., against Napoleon I., and more recently against Russia in order to preserve the independence of Turkey. It was the characteristic justification of the foreign policy of William III. of Great Britain, who shaped it into a European principle. Its object is to prevent *political* aggrandizement only. There were in Europe, after the overthrow of Napoleon in 1815, five monarchies recognized as the great powers—namely: France, Austria, Great Britain, Russia, and Prussia, to which, in 1859, the kingdom of Italy was added. The victories of the Prussians in 1866 and 1870 established the German empire, and for a time prostrated the armies of France and Austria. But now the military and political re-establishment of these two powers has given rise to a fresh application of the balance of power principle. This is seen in the Tripartite alliance—a defensive treaty of alliance whereby Germany, Austria, and Italy on the one hand are balanced against France and Russia on the other. See INTERNATIONAL LAW. Revised by THEODORE S. WOOLSEY.

Balance of Trade: the difference in value between the exports and imports of a country. If the country's exports exceed the imports in value, the balance of trade is said to be in its favor, and it is assumed that such a country is growing rich, just as a man grows rich when he produces more than he consumes. In point of fact, a fall in imports does not denote prosperity, or at least not to the extent which is often assumed. In one important sense the true advantage of foreign trade to a country is found in the imports. By its means people obtain those things which they can not themselves produce, except at great sacrifice. The custom-house statistics are fallacious at this point, because they represent the value of the goods in the exporting country, not their value to the importing country. If we import British goods which cost \$100,000,000, and which sell for \$110,000,000, the advantage to us is measured by the latter figure, not by the former. In this sense both nations may gain, and generally do gain, by international trade.

The balance of trade does not consist of the simple difference between exports and imports. Many other elements enter into a nation's accounts. Some of the chief items are as follows:

INCOME.	EXPENSE.
Exports.	Imports.
Payments by foreigners to home ship-owners.	Payments to foreign ship-owners.
Interest from foreign investments.	Interest on securities owned abroad.
Receipts from foreign travelers and immigrants.	The expenses of travelers abroad.

The difference between these two is the balance of trade, properly speaking; but as this balance may be settled either in cash or by securities, another important factor is brought in. It will quite generally be found that the years when our balance of trade appears most favorable are those when Europe is sending our securities home to us in large numbers; and that the apparent favorable result means a loss, rather than a gain, in the productive resources of the country, because of the unwillingness of foreign investors to continue to aid us with their capital. See EXCHANGE.

A. T. HADLEY.

Balanoglossus [Mod. Latin, from Gr. *Bálavos*, acorn + *γλώσσα*, tongue]; a genus of worm-like forms belonging to the group of *Enteropneusta* (*g. v.*), the position of which is very uncertain. The larva presents many resemblances to those of echinoderms, and the adult has characteristics which elsewhere are found only in vertebrates. The animals live in the sand of the sea, are usually brightly colored, and in size might be compared to an earthworm.

Balanus [Gr. *Bálavos*, acorn]; a genus of barnacles, distinguished by the absence of a flexible stalk and the possession of a symmetrical shell. The name is derived from the Greek word for *acorn*, and the animals are commonly known as the "acorn-barnacles." The base is usually formed

of a thin calcareous plate, the sides of six valves; and four small valves form the operculum, exactly closing the aperture at the top. This genus comprises many species, which are found in nearly all seas, attached to stones, shells, and other objects. It is remarkable that in the early stage of their existence they are capable of active locomotion, and have large eyes which disappear, along with the organs of locomotion, when they become stationary. Some of the large species were esteemed a delicacy by the ancient Romans. The Chinese collect and eat the *Balanus tintinnabulum*, which is said to resemble lobster in taste; and *Balanus psittacus*, a South American species, is also eaten. This species is sometimes 4 inches in diameter and 8 or 9 inches in height. There are several species found in the U. S.

Revised by D. S. JORDAN.

Balasore, bū-lā-sōr': a district and city of the Orissa division, Bengal Province, British India. The district is a strip of alluvial coast-land, near the head of the Bay of Bengal, W. of the Gangetic delta, between the parallels 20' and 21' N. and the meridians 86° and 87' E. It runs to the hills behind the coast and varies from 9 to 34 miles in breadth. The coast strip proper is incapable of cultivation, but is used for the production of salt. Behind this comes the arable land, a characteristic feature of which is the numerous cup-shaped depressions which bear the finest crops. This is destitute of natural forests and passes gradually into the foothills, which are rocky and sterile. The district has several streams of considerable size, but they are subject to destructive floods. Area, 2,066 sq. miles. Pop. about 950,000.

The town of Balasore, capital of the district, is 8 miles from the seacoast, on the river Barabalang (see map of S. India, ref. 2-II). The English settlement here was made in 1642, and soon became a large trading-post, protected by a fortification. It was one of the seats from which the British Indian empire took its rise. The importance of the city rapidly declined in the eighteenth century, because of a bar which formed across the mouth of the river and which still remains. Pop. 20,000. M. W. H.

Balas-ruby: See SPINEL.

Balaton, Lake [Ger. *Platten-see*; Hun. *Balatony*; anc. *Pelso*]: the largest lake in Hungary; 55 miles S. W. of Pesth; is 51 miles long and 7 miles wide. The area is estimated at 450 sq. miles. It receives numerous streams, the largest of which is the Szala, and discharges its water through the Sio and Sarvitz into the Danube. Fish of various kinds are found here. This lake is often celebrated in the old romantic ballads of the Magyars.

Balbi, baal-bē, ADRIANO: an eminent Italian geographer; b. at Venice, Apr. 25, 1782. He became a resident of Paris, where he passed many years. He published in 1826 an *Ethnographical Atlas of the Globe*, which is highly esteemed. His other chief work is a *Compendium of Geography* (*Abrégé de Géographie*, 1 vol. 8vo), which was considered one of the best treatises on that science that had then appeared. His works are mostly written in French. He removed from Paris to Italy in 1832. D. at Padua, Mar. 14, 1848.

Balbi, GASPARO: Venetian merchant of the sixteenth century; in pursuit of his business he visited Aleppo; made a trip to India lasting several years, the published account of which (1590) was the first description of India beyond the Ganges.

Balbo, CESARE: Italian statesman and author; b. at Turin, Nov. 21, 1789. He was in government service 1807-21. He advocated the independence of Italy in a work called *Spemanzze d'Italia* (*Hopes of Italy*, 1843), which widely extended his reputation. As a moderate and liberal patriot he took a prominent part in the revolutionary movements of 1848. Among his works is a *History of Italy from the Beginning to 1814* (1849), which is highly esteemed. D. at Turin, June 3, 1853. See his life by H. Reuchlin (Nördlingen, 1861).

Balboa, VASCO NÚÑEZ, de: a famous Spanish navigator and explorer; b. at Xeres de los Caballeros in Estremadura in 1475. He emigrated to Hayti about 1500, and in 1510 accompanied Enciso in an expedition to Darien. Having quarreled with Enciso, Balboa obtained the chief command of the party, and Sept. 25, 1513, discovered the Pacific Ocean from the top of a mountain. He descended to the shore and took possession of the ocean in the name of his sovereign. In 1514 Pedrarias Dávila was sent from Spain to supersede Balboa, who was punished by a fine for his insubordination. He served as a deputy under Pedrarias, who,

actuated by cruelty and jealousy, accused Balboa of treasonable designs, and put him to death at Castilla de Oro, Darien, in 1517. See Irving, *Voyages and Discoveries of the Companions of Columbus*; M. J. Quintana, *Vidas de Españoles Celebres*; and Justin Winsor, *Narrative and Critical History of America*.

Balbuena, baál-bway'na, BERNARDO, de: Spanish poet; b. at Val-de-Peñas in 1568. He became Bishop of Porto Rico in 1620. Of his works only three have been preserved: *La grandeza Mejicana* (Mexico, 1609; Madrid, 1829); *El Siglo de Oro* (1608); and *El Bernardo*, an epic poem (1624 and 1808). D. at Porto Rico in 1627.

Bal'bus, L. CORNELIUS, surnamed MAJOR: a Roman officer; b. at Gades (Cadiz); became an intimate friend of Caesar, whom he accompanied to Spain in 61 B. C. In 40 B. C. he was chosen consul, being the first adopted citizen who received that honor. He wrote a diary of the events of his own and Caesar's life.

Balch, GEORGE B.: rear-admiral U. S. N.; b. in Tennessee, Jan. 3, 1821; entered the navy as a midshipman in 1837. From 1862 to 1865 commanded first the steamer Pocahontas and afterward the steamer Pawnee, South Atlantic blockading squadron, during which period, in co-operation with the army, he was almost constantly engaged with the enemy's batteries and forts on the Stone and Black rivers, S. C. He was superintendent of the Naval Academy at Annapolis (1879-81). Retired Jan. 3, 1883.

Bal'dachin [from Ital. *baldacchi'no*, deriv. of *Baldacco*, Ital. name of *Bagdad*, whence came the rich material of which the baldachins were made]: a canopy in the form of a crown or umbrella, made of costly materials, richly adorned, and raised over a throne, couch, pulpit, or altar. In the Church of St. Peter in Rome there is a magnificent baldachin cast in bronze, by Bernini, and supported by four twisted columns. The baldachin is used in processions of the Roman Catholic Church, one of silk or stuff supported on four poles being carried over the pope.

Bald Eagle: the *Halia'etus leucoceph'alus*; so called on account of the snowy-white color of the head and neck of the adult bird; a native of North America, where it is widely

Bald eagle.

distributed. The length of this bird is about 40 inches, the stretch of wing from 7 to 8 feet. The white feathers of the neck and tail are not acquired until the third year. The nest of the bald eagle is generally made upon some lofty tree, and sometimes becomes of great size, as the bird is in the habit of using the same nest year after year and making additions to it every season. The female bird generally lays her eggs in January, two or three in number and of a dull white color, and they are hatched by the middle of February. It is strongly attached to its young and will not forsake them, even if the tree on which they rest be enveloped in flames. The bald eagle will eat almost anything, even car-

tion, but it is especially fond of fish, which it steals from the osprey when practicable, but also takes them from the water with much skill. Young lambs, pigs, also ducks, geese, and gulls, are seized by the eagle with avidity. For an interesting description of the manner in which it takes its prey the reader is referred to the account given by Audubon. E. Coues speaks of it as a "piratical parasite of the osprey, otherwise notorious as the emblem of the republic."

Revised by D. S. JORDAN.

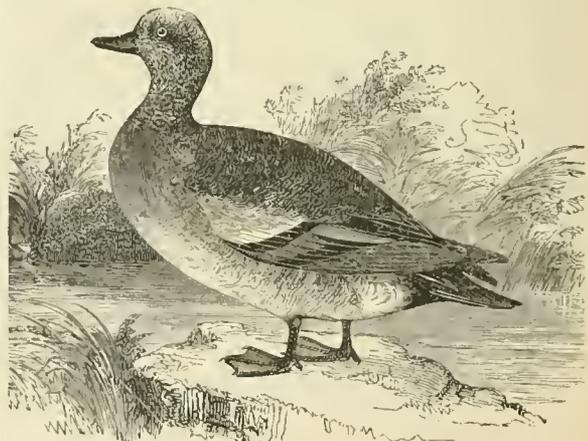

Balder: See BALDR.

Bal'derie, or **Baudry**, bō'dree': a French chronicler, Bishop of Dol; b. about the middle of the eleventh century. He took part in all the Church councils of the time, and made active efforts to restore the rigor of monastic discipline. He visited England and left an account of his travels. He wrote a chronicle of the first crusade, entitled *Historia Hierosolomytana*.

Baldi d'Urbino, baal'dēe-dōōr-bee'nō, BERNARDINO: mathematician and man of letters; b. at Urbino, June 6, 1553; accomplished as a writer and in science as well; under the tutelage of Commandino developed a remarkable zeal for the study of mathematics. He learned the Hebrew and Chaldean tongues the better to understand the Bible. He is said to have been acquainted with twelve languages. His multitudinous writings deal with almost every branch of science. Chief among his works are *Cronica de' Matematici* (Chronology of Mathematicians); *Nautica*, a didactic poem on navigation; an Arabic grammar and dictionary; and a translation of the *Targum* of Onkelos. He began the preparation of a geographic dictionary, but got no farther than the letter C. D. at Urbino, Oct. 10, 1617.

Baldness: same as ALOPECIA; the loss or absence of the hair of the scalp. There are some few cases on record in which the hair has never been developed. This is termed congenital baldness. Accidental baldness is caused by an atrophy of the hair-follicles. Baldness in the comparatively young may occur from wearing waterproof caps or unventilated hats, which, by preventing evaporation from the head, occasion an unhealthy state of skin. It may be complete or partial, occurring in patches. Senile baldness (*calvities*) arises, like the preceding variety, from an atrophy of those parts on which the hairs depend for nutrition. It generally commences on the crown of the head. Women are not so frequently bald as men. The causes of baldness are defective supply of nutrition, a hereditary tendency, dissipation, but especially old age. The hair falls off after severe illnesses or after other causes of general debility. Alopecia is sometimes the result of syphilis. The treatment consists in cleanliness, and in exciting the circulation of the scalp by using a hairbrush and the application of stimulants, as the Spanish-fly ointment, two drachms to an ounce of lard, mixed with the same quantity of pomatum, or some equivalent preparation. Any constitutional debility should be remedied. Shaving the head is sometimes resorted to and is often useful. FAVUS (*q. v.*) permanently destroys the hair.

Bald'pate, or **American Wid'geon** (*Marca americana*): a duck found throughout North America, breeding

The baldpate, or American widgeon.

to the southward, and prized for the delicacy of its flesh. It takes its name from its white crown. It is variously marked

with reddish brown, gray, white, and chestnut. The male has a green band running from the eyes to the nape.

Baldr, Balder, or Baldur: often called BALDR THE GOOD; the second son of Odin, in the Northern mythology. He was supposed to make all things bright and cheerful, and is identified by some scholars with the bright summer sun; hence he has been termed the "Apollo of the North." His abode was Breiðablik ("widely shining"), where nothing impure could enter. The account of his death, as given in the *Prose Edda*, is as follows: He dreamed one night that his life was in the utmost danger; and when he related this dream the gods were so distressed that his mother, Frigg, exacted an oath from all things, animate and inanimate, that they would not injure Baldr. She did not, however, exact any oath from the mistletoe, because it seemed so harmless and insignificant. Now the gods were accustomed to amuse themselves by shooting arrows and throwing stones at Baldr, to all of which he proved invulnerable. When Loki, the god of evil, found that the mistletoe had not taken the oath, he obtained the plant and went to the assembly of gods, where he found Baldr's brother Hödr, standing apart from the others. He asked him why he also did not throw something at Baldr. "Because I am blind," answered Hödr, "and have nothing to throw." "Come," said Loki, "do like the rest: show honor to Baldr by casting this trifle at him, and I will direct your hand." Hödr did as the tempter bade him, and Baldr, pierced through by the mistletoe, fell dead. So great was the grief of the gods that Hermödr visited the realms of death, and besought Hel to release her prey and allow Baldr to return to the dwelling of the gods. Hel answered that if everything mourned him, then he should return; but if anything whatever failed to weep, then Baldr must remain in the world of shades. All things animate and inanimate were requested by the gods to weep for Baldr, and all did so except a giant hag named Þökk, or Þökt (afterward found to be Loki himself, who had assumed this form in order to prevent Baldr from returning to life). She answered the request by jeers, and Baldr was accordingly forced to remain in the abode of the dead. It is possible that this story has been influenced by Christian teaching and Christian legend. In any case there is no certain evidence that a god Baldr was known to any Teutonic tribe outside of Scandinavia.

Revised by G. L. KITTRIDGE.

Baldung, baal doong, UANS: German painter and engraver; b. in Gmünd about 1475; d. in Strassburg, 1545. His best work is his engraving on copper, although this is marked by exaggeration and fantastic ornament. A number of his paintings remain, but are not of great value.

Baldur: See BALDR.

Baldwin: on railroad, Douglas co., Kan. (for location of county, see map of Kansas, ref. 5-4): 15 miles S. of Lawrence; has Baker University. The surrounding region is agricultural. Pop. (1880) 325; (1890) 935; (1895) 1,135.

Baldwin I.: King of Jerusalem; b. in 1058; was a brother of Godfrey of Bouillon. He joined the first crusade in 1096, and fought bravely against the infidels. He was chosen Count of Edessa by the Christian inhabitants of that city. On the death of Godfrey, in 1100, he succeeded him as King of Jerusalem. He defeated the Saracens in several battles, and captured Acre, Cæsarea, and Sidon. He was more ambitious and worldly than his brother Godfrey. D. in Egypt in Mar., 1118. See Gibbon, *Decline and Fall of the Roman Empire*.

Baldwin II. (BALDWIN DU BOURG): King of Jerusalem; was a cousin of Baldwin I., whom he succeeded in 1118. He waged war against the Saracens. During his reign the military order of Templars was instituted for the defense of the Holy Land. D. in Jerusalem, Aug. 21, 1131, and left the throne to his son-in-law, Fouques of Anjou.

Baldwin III.: the son of Fouques of Anjou; was born in 1129, and became King of Jerusalem in 1143. He defeated Noor-ed-Deen, the Sultan of Aleppo, at Jerusalem, in 1152 and 1157. He acquired much renown and influence, and was respected even by the Saracens. His wife was Theodora, a daughter of the Greek Emperor Manuel. D. at Tripolis, Syria, Feb. 10, 1162, and was succeeded by his brother, Amalric or Amaury.

Baldwin IV.: King of Jerusalem; surnamed THE LEPER; was born in 1160. He succeeded his father Amalric in 1174. He defeated the famous Saladin near Tiberias in 1182, but

was afterward defeated by that prince. D. in Jerusalem, 1186, and was succeeded by his nephew, Baldwin V., who died in childhood.

Baldwin I.: the first Latin Emperor of Constantinople; was born at Valenciennes in 1171. He was Baldwin IX., Count of Flanders, having inherited that title from his father, Baldwin VIII. He joined the fourth crusade in 1200, and co-operated with the Venetians in an enterprise against Constantinople, the throne of which was occupied by Alexis, an usurper. The crusaders defeated Alexis, captured the city, and elected Baldwin emperor in 1204. He was defeated and taken prisoner by the Bulgarians in 1205, and died in captivity, 1206, leaving the throne to his brother Henry. See A. Cahour, *Baudouin de Constantinople* (1850).

Baldwin II.: Emperor of Constantinople; b. in 1217; was a son of Peter de Courtenay, and a nephew of Baldwin I. He succeeded to the throne in 1228, and was placed under the guardianship of John de Brienne. He began to reign in 1237, and encountered much opposition from the Greeks and Bulgarians. In 1261 his capital was taken by Michael Palaeologus, and Baldwin fled to Italy, where he died 1273. The English family of Courtenay claims to be descended from the stock of this emperor.

Baldwin, CHARLES H.: rear-admiral U. S. N.; b. in the city of New York Sept. 3, 1822; entered the navy as a midshipman Apr. 24, 1839. He served on west coast of Mexico during Mexican war, and was in several sharp engagements with the enemy on shore near Mazatlan. He commanded steamer Clifton of mortar flotilla at passage of Forts St. Philip and Jackson by Farragut's fleet, Apr. 24, 1862, and at attack on Vicksburg, June 28, 1862. In command of Mediterranean squadron from Mar. 10, 1883, to date of his retirement, Sept. 3, 1884. D. in New York city, Nov. 17, 1888.

Revised by S. B. LUCE.

Baldwin, HENRY PORTER: b. at Coventry, R. I., Feb. 22, 1814; emigrated to Detroit in his youth; was Governor of Michigan (1869-73), and U. S. Senator (1879) for unexpired term of Senator Chandler, ending Mar. 4, 1881. He was for years a leading member and office-bearer of the diocese of Michigan, and repeatedly represented the diocese in the general convention, the Board of Missions, and other organized bodies of the Protestant Episcopal Church. D. at Detroit, Mich., Dec. 31, 1892.

Baldwin, JAMES MARK, Ph. D.: psychologist; b. in Columbia, S. C., Jan. 12, 1861; educated at Princeton College and Leipzig and Berlin Universities; instructor in French and German at Princeton 1886-87; Professor of Philosophy in Lake Forest University 1887-89, and in Toronto University 1889-93; Professor of Psychology at Princeton 1893-. He is coeditor of *The Psychological Review*, and author of *Handbook of Psychology* (2 vols., 2d ed. London and New York, 1889-91); *Elements of Psychology* (1893); a translation of Ribot's *German Psychology of To-day* (New York, 1886); various articles in *Mind*, *Philos. Review*, *Nation*, etc.

Baldwin, JOHN DENISON: b. at North Stonington, Conn., Sept. 28, 1810. After studying law and theology he became a journalist, and was long the editor and proprietor of the *Worcester Spy* (Mass.). He was a member of Congress from Massachusetts (1863-69), and has published *Raymond Hill and Other Poems* (1847); *Prehistoric Nations* (1869); *Ancient America* (1872). D. at Worcester, Mass., July 8, 1883.

Baldwin, JOSEPH G.: of Sumter, Ala.; was a native of Virginia. He was an able lawyer and active politician; author of *Flush Times in Alabama and Mississippi* and of *Party Leaders* (1840). He was judge of the Superior Court of California 1857-63, and chief justice of California in 1863. D. in San Francisco, Sept. 30, 1864.—His son, ALEXANDER W., was district judge for Nevada. D. Nov. 15, 1869.

Baldwin, ROBERT: Canadian statesman; b. in Toronto, May 12, 1804. He began the practice of law in 1825; was elected to the Upper Canada Assembly in 1829; and visited London in 1836 in the interest of responsible government for Canada, but failed in his mission. He became an executive councillor in 1836, solicitor-general in 1840, and in 1842 premier and attorney-general of Upper Canada, which offices he held till 1843. In 1848 he resumed office in the Baldwin-Lafontaine government; retired from official life in 1851. He is regarded as the father of the Reform party of Canada. D. in Toronto, Dec. 9, 1858.

NEIL MACDONALD.

Baldwin, STEPHEN LIVINGSTON, D. D.: secretary of the Missionary Society of M. E. Church; b. at Somerville, N. J.,

Jan. 11, 1835; educated at Newark Wesleyan Institute and Concord Biblical Institute; has been pastor in Newark and New England conferences, and superintendent of the Foochow (China) Mission. Author of a translation of *Judges* and *Daniel* into Foochow colloquial; article on *Confucianism* in Reid's *Doomed Religions*; editor of *Chinese Recorder*.

Baldwinsville: village forming part of Lysander and Van Buren towns, Onondaga co., N. Y. (for location of county, see map of New York, ref. 4-F); on Delaware, Lackawana and Western R. R., 12 miles N. W. of Syracuse, and on Seneca river, which furnishes excellent water-power; has graded schools and an academy and five churches. Baldwinsville is a manufacturing town, in a rich agricultural district; is center of the tobacco-raising industry of the Onondaga region. First settled in 1807, and named Columbia, then (1815) Baldwin's Bridge, and soon after Baldwinsville. Pop. (1880) 2,121; (1890) 3,040; (1892) estimated, 3,500.

EDITOR OF "GAZETTE AND FARMERS' JOURNAL."

Bâle, or Basle, French form of BASEL (*q. v.*).

Bale, bayl, Joux: English theologian and dramatist; b. at Cove, Suffolk, in Nov., 1495; became a Carmelite; was educated at Jesus College, Oxford; turned Protestant; and, after eight years of exile in Flanders, was made Bishop of Ossory, Ireland, in 1552. During the reign of Queen Mary he took refuge in Switzerland. On the accession of Elizabeth he was appointed a prebend in Canterbury Cathedral, and died in Nov., 1563. Besides numerous controversial writings, he published in Latin the first literary history of England, *Scriptorum Illustrum Majoris Britannie Catalogus* (1548-59), and wrote a number of interludes and morality plays in the Protestant interest, the most important of which was the historical play of *King John*. See his *Select Works* (Parker Society, Cambridge, 1849).

HENRY A. BEERS.

Balear'ic Craue (*Balvarica pannonica*): a beautiful crane found in Northern and Western Africa, conspicuous for its crown of golden plumes and its scarlet cheeks. It is readily tamed, often indulging in fantastic dances, running about

Balearic crane.

with great speed, and screaming with a harsh and ringing voice. It is of a bluish-slate color, and is 4 feet high. It is exceedingly gentle, and, unlike some other cranes, is quite harmless.

Balearic Isles (anc. *Baleares* or *Baleares Insula*): a group of five islands in the Mediterranean, forming a Spanish province, the area of which is 1,860 sq. miles. Pop. (in 1887) 312,646. Capital, Palma. Their names are Majorca, Minorca, Iviça, Formentera, and Cabrera. The soil is mostly fertile, though badly cultivated. The climate is very fine. Vegetation has a tropical aspect. The chief exports are olive oil, figs, oranges, wool, mules, wine, hats, brooms, brandy, capers, saffron, cheese, salt, woodenware, baskets, etc. The ancient natives of these islands were very expert slingers, and served in the Carthaginian army. The name is supposed to refer to their expertness through the Greek word βαλλειν, to sling. The Baleares were made an independent kingdom in 1256, but soon became feudal to Aragon, to which kingdom they were annexed in 1344. The Moors were long masters here, but were expelled in 1285.

The Kings of Spain long retained the title of "King of the Balearic Islands" as one of their secondary honors. The language is made up of various dialects (Mallorquin, Minorquin, etc.) of the Catalan, mingled with Arabic (and perhaps Punic) elements. The Archduke Ludwig Salvator is publishing (1893) an elaborate work on these islands. Vol. iv., *Minorca*, appeared in 1891. The work is not in the trade. See MAJORCA and MINORCA.

Baléchon, bāl'ā'shoo', JEAN JOSEPH NICOLAS: a very eminent French engraver; b. at Arles in 1715. He was the first burinist of his time. His works are remarkably neat, and his style brilliant, vigorous, and bold; but his drawing is often defective, and he paid too little attention to detail. His *Women Bathing, Storm,* and *Calvi* (after C. J. Vernet), *Saint Genéviève* (after Charles Vanloo), and his full-length portrait of Augustus, King of Poland, are his most famous works. The last mentioned is one of the great triumphs of the engraver's art. D. in Avignon, Aug. 18, 1764.

Baleen' [O. Fr. *baleine*, whale, whalebone < Lat. *balaena*, whale]: a substance commercially known as whale-fin and whalebone; procured from the mouth of the right whale, and various other species. It grows from the roof of the mouth of all the *Balenidae* or true whales, though in some it is too small to be of commercial importance. It is never found in the sperm whales or the dolphins. From single whales as much as 2 tons of baleen has been taken. It consists of horny plates of albuminous matter charged with phosphate of lime. Baleen takes the place of teeth, and serves as a strainer for separating from the water the little animals which serve as food for the whale. See WHALEBONE.

Balen, baal'en, or **Ballen,** baal'en, HENDRIK, van: a Flemish painter; b. in Antwerp in 1560; studied with Adam van Oort and in Italy, and was the first instructor of Vanduyck. In spite of a certain coldness and mannerism, his harmonious coloring, correct taste, and skillful composition have given him a more than respectable rank among painters. Of his numerous works, the best known are scriptural and ecclesiastical pieces. His nude figures are well executed. D. in Antwerp, July 17, 1632.

Balestier, bāl'es-teer, WOLCOTT: novelist; b. at Rochester, N. Y., Dec. 13, 1861. After a short course in Cornell University, and a trip to Colorado and Mexico, he went to New York and connected himself with the publishing-house of Lovell & Co. As London agent of that house he went to England in 1888. D. in Dresden, Saxony, Dec. 6, 1891. Balestier's fictions deal largely with frontier life in Colorado. They include, besides a number of short stories in the magazines and three early novels of inferior merit, *The Naulahka*, written in co-operation with his brother-in-law, Rudyard Kipling, and *Benefits Forgot*, written in 1885 and published serially in *The Century* (1892).

HENRY A. BEERS.

Bales'tra, ANTONIO: an Italian painter; b. at Verona in 1666. After his father's death he followed commercial pursuits until he came of age, when he went to Venice and became a pupil of Belucci (an able colorist), and afterward studied at Rome with Carlo Maratti. His *Defeat of the Giants* gained the prize at the Academy of St. Luke in 1694. Among his other famous pictures are a *Saint Theresa* at Bergamo, a *Virgin* at Mantua, a *Life of Saints Cosmas and Damian* at Padua, and his own portrait at Florence. He was one of the last able artists of the Venetian school, though not a slavish follower of any school. He was a skillful designer, a good colorist, a laborious and faithful student of his art, and was possessed of a vigorous hand and spirit. The works of Giovanni Balestra, a skillful engraver, are often incorrectly assigned to the subject of this notice. D. in Verona, Apr. 21, 1740.

Balfe, MICHAEL WILLIAM: opera-composer; b. in Dublin, Ireland, May 15, 1808, and d. at Rowney Abbey, Hertfordshire, England, Oct. 20, 1870. His first studies in music were as a violinist, and he appeared as a solo performer when a boy. He also studied the piano, but specially devoted himself to singing and dramatic composition, and became, while still young, one of the most popular stage composers of the period. From the beginning to the end of his career he had uninterrupted success. His operas were sung everywhere. The list is a long one, but the following include not only the best known but also the best works: *The Siege of Rochelle* (1835); *The Bohemian Girl* (1843); *The Daughter of St. Mark* (1844); *The Enchantress* (1845); *The Rose of Castile* (1857); *Satanella* (1858); *The Armorer of Nantes*

(1863); *Blanche de Nevers* (1863); *The Knight of the Leopard*, produced in Italian as *Il Talismano* (1874); and *Pillorc e Duca*, produced in English as *Moro, the Painter of Antwerp* (1881). Several of these attained wide popularity. *The Bohemian Girl* was performed in German as *Die Zigeunerin*, and in French as *La Zingarella*. This was in a special five-act version made by Balfe for the Paris Grand Opéra. Many of his songs have also become favorites. *Come into the Garden, Maud*, is a famous tenor show-song. He also composed several cantatas and concert choruses. A polacca which he composed for full orchestra, scoring it himself, was played in Dublin when he was seven years old. He was sometimes called the "English Rossini," and for fertility in genial melody he deserved the title, but his work lacked seriousness of purpose. D. E. HERVEY.

Balfour, bāl foof, The Right Hon. ARTHUR JAMES, P. C., LL. D., F. R. S.; British statesman; b. July 25, 1848; educated at Eton and at Trinity College, Cambridge; private secretary to his uncle, the Marquis of Salisbury (1878-80), as such attending the Berlin Congress; member of Parliament for Hertford 1879, and for East Division of Manchester 1885; president of Local Government Board, without seat in the cabinet, 1885; Secretary for Scotland, Aug. 3, 1886; admitted to the Cabinet, Nov. 19, 1886; Chief Secretary for Ireland, Mar. 5, 1887; First Lord of the Treasury, Nov., 1891, retiring on the accession of the Gladstone ministry in the summer of 1892, when he became leader of the Conservative opposition in the House of Commons. Author of *Defense of Philosophic Doubt* (London, 1879) and various magazine articles. His remarkable success in the administration of Irish affairs during a most trying period led to his selection as leader of the House of Commons on the decease of W. H. Smith. Up to 1878 Mr. Balfour was known only as a brilliant young scholar. His development of rare political capabilities has since been very rapid. C. K. ADAMS.

Balfour, FRANCIS MAITLAND; embryologist; brother of Arthur J. Balfour; b. at Edinburgh, 1851; educated at Harrow and at Trinity College, Cambridge; became Professor of Morphology at Cambridge after declining offers from Oxford and Edinburgh; published (1880-81) *Comparative Embryology*, on which his fame rests; lost his life July 19, 1882, in attempting to climb one of the spurs of Mont Blanc.

Balfour, ISAAC BAYLEY, M. A., M. D., D.Sc., F. R. S.; botanist; b. in Edinburgh, Mar. 31, 1853; educated in the universities of Edinburgh, Strassburg, and Würzburg; botanist to the transit of Venus expedition to Rodriguez 1874; leader of natural history exploration of Socotra 1879; Professor of Botany in University of Glasgow 1879-84; Professor of Botany in University of Oxford 1884-88; since then Professor of Botany in University of Edinburgh, keeper of Royal Botanic Gardens, and Queen's Botanist of Scotland. His principal publications are *Botany of Rodriguez* (Phil. Trans., 1879) and *Botany of Socotra* (Trans. Roy. Soc. Edin., 1888), and he was editor of the English translations of Goebel's *Outlines of the Classification and Special Morphology of Plants*; De Bary's *Comparative Morphology and Biology of Fungi, Mycetozoa, and Bacteria*; De Bary's *Bacteria*; and Solms-Laubach's *Fossil Botany*. Since 1887 he has been one of the editors of the *Annals of Botany*.

CHARLES E. BESSEY.

Balfour, JOHN BLAIR, Q. C., LL. D., P. C.; Scottish lawyer; b. at Clackmannan, 1837; educated at Edinburgh Academy and at University of Edinburgh; called to the Scottish bar 1861; Solicitor-General for Scotland 1880; privy councillor 1883; Lord Advocate for Scotland 1884-85, 1886, and again in Mr. Gladstone's cabinet of 1892.

Balfour, JOHN HUTTON, M. D., F. R. S.; botanist and physician; b. in Edinburgh, Sept. 15, 1808; nephew of Hutton, the geologist. In 1845 he became Professor of Botany at Edinburgh. He published a *Manual of Botany* (1849) and a *Class-book of Botany* (1852), and contributed the articles on botany to the eighth and ninth editions of the *Encyclopædia Britannica*. D. in Edinburgh, Feb. 11, 1884.

Balfour, THOMAS GRAHAM, M. D., F. R. S.; physician; b. in Edinburgh, Mar. 18, 1813; M. D., University of Edinburgh 1834; gazetted to the medical staff of the army 1836; promoted to be head of the newly formed statistical branch on the reorganization of the Army Medical Service in 1859; became surgeon-general in 1873; retired in 1876; represented the Army Medical Department in the International Medical Congress at London in 1880; member of numerous learned societies; author of five volumes of statis-

tical reports *On the Health of the Army* (with Sir A. Tulloch); of thirteen Annual Reports of the statistical branch, and of numerous articles. D. in Wimbledon, Jan. 17, 1891. C. H. THURBER.

Bali, baa lē, or **Bally**, baal lē; an island of the Malay Archipelago; about 3 miles E. of Java; area, 1,999 sq. miles. It is nearly 70 miles long and 35 miles wide. The chief exports are rice, cotton, coffee, tobacco, hides, etc. The island is divided into several small states, of which Badong is the chief. The Balinese mostly profess Brahmanism. They are said to be superior to the Javanese in mind and other respects. Their language resembles that of Java. Bali is a Dutch dependency. Pop. about 500,000.

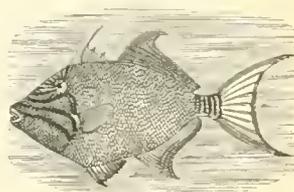

Baliol, or **Balliol**, JOHN; Lord of Galloway and King of Scotland; b. about 1259. He became the rival of Robert Bruce, and claimed the crown as a grandson of David, who was a brother of King William the Lion. The dispute was referred to Edward I. of England, as arbiter, who decided that Baliol was the rightful heir, and imposed the condition that he should do homage to the King of England. He was crowned in 1292, and swore fealty to Edward, but soon renounced his allegiance. Edward invaded Scotland, defeated Baliol's army, and compelled him to resign the crown July 7, 1296. After thirteen years' residence in Normandy he died in 1315.

Baliol, or **Balliol**, EDWARD; a son of King John Baliol; invaded Scotland in 1332 at the head of discontented barons. Having gained several victories over the Scottish army, he was crowned king at Scone in September of that year. About three months later he was surprised in his camp at Annan by Archibald Douglas, and lost his crown. His subsequent career was unfortunate. The last of his house, he died near Doncaster, 1367.

Baliol College: See OXFORD, UNIVERSITY OF.

Balis'tide: the trigger-fishes; a family of plectognath fishes with the pelvic bone well developed and movable.

without ventral spines, and with the spinous dorsal represented by at most three spines. They are mostly found in tropical or subtropical seas, and are divisible into two sub-families. The typical species (*Balistina*) have brilliant colors and a curious provision for fixing the first dorsal spine in an erect position or lowering it at will. For this reason they are sometimes called trigger-fishes. The fool-fishes (*Monacanthina*) are generally dull in color, and have one spine, supplemented by a second small one behind.

Trigger-fish: balistes.

Revised by D. S. JORDAN.

Balkan, bāil-kaan' (anc. *Haemus*); an important mountain-chain of Europe; extends from Sofia eastward to Cape Eminch on the Black Sea, and forms the southern boundary of the basin of the Danube. Some peaks of this range are over 5,000 feet high. The Balkan is connected with the mountains of Middle Europe by the ranges of Montenegro and Herzegovina. It is an important natural barrier, sloping abruptly to the S.

Balkan Peninsula: the easternmost of the southern peninsulas of Europe, so named from the Balkan Mountains within it. It lies between the Black and Aegean Seas on the E., and the Adriatic and Ionian on the W. The northern boundary is not well defined, but may conveniently be taken as the Danube river and its tributaries, the Save and the Una. Thus defined it is almost entirely surrounded by water, and includes Bosnia, Herzegovina, Montenegro, Servia, Bulgaria, Rumania, Turkey in Europe, and Greece. The peninsula is very mountainous, culminating in an elevated triangular plateau of which the angles are Sarajevo (capital of Bosnia), Sofia (in Eastern Bulgaria), and Metsovan (on the Grecian frontier). The climate is varied. It is rigorous in the Danubian plain of Bulgaria, but rapidly grows mild toward the south. Constantinople is celebrated for the mildness of the climate and serenity of its sky. The summers of Thrace and the lower plains of Macedonia are cooled and refreshed by sea-breezes. The winters are very severe in the north and over the central plateau. The population is turbulent, and very diverse as to race and religion. In Macedonia the races are confused, but elsewhere they are

more distinct. Bosnia, Servia, Herzegovina, and Montenegro are chiefly occupied by a branch of the Slavs called the Servo-Croats. In Bulgaria and Eastern Rumelia the dominant people is the Bulgarian, another branch of the Slavs. Albania is largely occupied by an aboriginal race, the Arnauts or Skiptars. Greece and a littoral band several leagues wide, extending from Salonica to Constantinople, are occupied by Greeks, the latter part being more distinctly Byzantine than the former, and there is a large population of Greeks in Constantinople, Adrianople, and other large cities of Thrace and Macedonia. The Turks are generally disseminated through the proper Turkish part of the peninsula, but are in the majority only in Stamboul (a quarter of Constantinople) and in Adrianople. In Salonica Jews of Spanish origin make up nearly two-thirds of the population. There are three principal religions: the Greek Orthodox, professed by the Greeks, Servians, Bulgarians, and Southern Albanians; the Roman Catholic, professed by the Bosnians and Northern Albanians; and Mohammedanism, professed by the Turks and some Bosnians and Albanians.

The Balkan Peninsula has played an important part in history. The Greeks, the Macedonians, the Byzantines, and the Turks have alternately advanced or retarded civilization within its borders. The Turks formerly controlled the whole peninsula. Successive revolts and invasions, especially during the nineteenth century, have generally given a more or less complete autonomy to the various races mentioned above. Servia, Montenegro, and Greece are independent; Bosnia and Herzegovina are controlled by Austria-Hungary; Bulgaria is nominally tributary to the Sultan of Turkey; the remainder of the peninsula is Turkish, but the Albanians are practically independent. MARK W. HARRINGTON.

Balkash, baúl-kaash' (Kalmuck, great lake; called by the Khirgiz *Ak Tenghiz*, i. e. white sea, or simply *Tenghiz Sea*); a large lake of Asiatic Russia having no visible outlet; is between the provinces of Semipalatinsk and Semiryetshensk, in lat. 45° N., lon. 79° E. Its length from N. E. to S. W. is 390 miles, and its greatest breadth 50 miles. Area, 7,120 sq. miles; elevation above sea-level, 781 feet.

Balkh, baalkh (anc. *Bactria*): a province of Afghan Turkestan between the Hindu Kush and Oxus. It is the best-watered and most fertile part of the country. The population is variously estimated, but probably does not surpass 500,000. Area about 3,000 sq. miles. Capital, Masar-i-Sherif.

Balkh [Turkish *balik*, city]: former capital (anc. *Zariaspa* and *Bactra*) of the province of Balkh; about 22 miles S. of the Oxus river, and 150 miles N. N. W. of Cabul. The ancient Bactra was an important city, the remains of which cover a space about 20 miles in circuit, and comprise eighteen aqueducts now in ruins. It was destroyed by Jengis Khan. The modern town is insignificant. Pop. about 2,000.

Ball, in military affairs: See BULLET.

Ball, GAME OF: This was a favorite gymnastic exercise among the ancient Greeks and Romans, the latter of whom called it *pila*. At Rome it was played by persons of all ages and by men of high rank. The Greeks prized the game as the means of giving grace and elasticity to their figures and motions. In the sixteenth century this game was fashionable in the courts of French and Italian princes. The French *jeu de paume* and English *tennis* were modifications of the game of ball. The ball was struck with a mallet (Fr. *mail* or *maille*; Eng. *mallet*), sometimes called pall-mallet or pell-mell, from the Italian *palla*, a ball. A form of this game, called *cricket*, is much played by the English at the present time. The popular game of the U. S. is *base-ball*. See BASE-BALL, CRICKET, and TENNIS.

Ball, GEORGE H., D. D.: b. at Oxford, Sherbrook co., East Canada, Dec. 7, 1818; studied at the Theological Seminary of New York, whence he graduated in 1847; was pastor of the Niagara Square Baptist church, Buffalo, N. Y., for about twenty years; pastor of Roger Williams church, Providence, R. I., for two years; editor of the *Baptist Union*, and published *Guide to the Lord's Supper, Christian Baptism*, etc.

Ball, SIR ROBERT STAWELL, LL. D., F. R. S.; astronomer; b. in Dublin, July 1, 1840; educated at Trinity College; Professor of Astronomy at Dublin and Astronomer Royal for Ireland 1874; knighted 1886. Author of *Experimental Mechanics* (London, 1871; 2d ed. 1888); *Elements of Astronomy* (1880); *The Story of the Heavens* (1885; 3d ed. 1890), etc., as well as numerous magazine articles.

Ball, THOMAS: sculptor; b. in Charlestown, Mass., June 3, 1819. Employed in the Boston Museum, he cleaned and imitated the pictures, and gradually passed on to miniature and then to portrait painting. During this period he sang in oratorios, his voice passing from soprano to a rich deep bass, effective in *Elijah*. His first published plastic work was a small bust of Jenny Lind during her visit to America, which was pirated by Italians and sold in vast numbers. His life-size bust of Webster, just after that statesman's death, led to a commission for a full statue, and launched him on his especial career. He went to Florence, opened a studio, and commissions flowed in upon him. For many years his time was passed in Italy, interrupted by visits to America. In 1865 he made an equestrian statue of Washington, cast in bronze and now in the Boston Public Garden. An heroic bronze statue of Webster by Ball stands in Central Park, New York. Boston has decorated her public buildings with busts or statues of Rufus Choate, Edward Everett, Gov. John Andrews, and other portrait work by the same artist. In idealization he produced a *Coriolanus*, with Edwin Forrest for a model, an *Eve*, and, besides many other pieces, a colossal group representing *Emancipation*, which is in Washington, D. C., and is the culmination of his art. His later years were passed in Boston. His *Three Score Years and Ten* (Boston, 1891), an autobiography, is a genial and rather garrulous collection of reminiscences of a life rich in acquaintance with artists and noted men.

Ballad Poetry: The word *ballad* in English signifies a narrative song, a short tale in lyric verse, which sense it has come to have, probably through the English, in some other languages. It means, by derivation, a dance-song, but though dancing was formerly, and in some places still is, performed to song instead of instrumental music, the application of the word in English is quite accidental. The popular ballad, for which our language has no unequivocal name, is a distinct and very important species of poetry. Its historical and natural place is anterior to the appearance of the poetry of art, to which it has formed a step, and by which it has been regularly displaced, and, in some cases, all but extinguished. Whenever a people in the course of its development reaches a certain intellectual and moral stage, it will feel an impulse to express itself, and the form of expression to which it is first impelled is, as is well known, not prose, but verse, and in fact narrative verse. The condition of society in which a truly national or popular poetry appears explains the character of such poetry. It is a condition in which the people are not divided by political organization and book-culture into markedly distinct classes, in which consequently there is such community of ideas and feelings that the whole people form an individual. Such poetry, accordingly, while it is in its essence an expression of our common human nature, and so of universal and indestructible interest, will in each case be differentiated by circumstances and idiosyncrasy. On the other hand, it will always be an expression of the mind and heart of the people as an individual, and never of the personality of individual men. The fundamental characteristic of popular ballads is therefore the absence of subjectivity and of self-consciousness. Though they do not "write themselves," as William Grimm has said, though a man and not a people has composed them, still the author counts for nothing, and it is not by mere accident, but with the best reason, that they have come down to us anonymous. Hence, too, they are extremely difficult to imitate by the highly civilized modern man, and most of the attempts to reproduce this kind of poetry have been ridiculous failures.

The primitive ballad, then, is popular, not in the sense of something arising from and suited to the lower orders of a people. As yet, no sharp distinction of high and low exists, in respect to knowledge, desires, and tastes. An increased civilization, and especially the introduction of book-culture, gradually gives rise to such a division; the poetry of art appears; the popular poetry is no longer relished by a portion of the people, and is abandoned to an uncultivated or not over-cultivated class—a constantly diminishing number. But whatever may be the estimation in which it may be held by particular classes or at particular epochs, it can not lose its value. Being founded on what is permanent and universal in the heart of man, and now by printing put beyond the danger of perishing, it will survive the fluctuations of taste, and may from time to time serve, as it notoriously did in England and Germany a hundred years

ago, to recall a literature from false and artificial courses to nature and truth.

Of the European nations the Spaniards and those of Scandinavian-German stock have best preserved their early popular poetry. We have early notices of the poetry of the Germans. Their ballads, mythical or historical, are several times spoken of by Tacitus, who says that these were their only annals. The earth-born Tuisco and his son Mannus were celebrated in the one, and the hero Arminius in the other. The historian of the Goths, Jornandes, writing in the sixth century, says that these people were accustomed to sing the exploits of their fathers to the harp, and seems to have taken not a little of his history from such songs. The like is true of Paulus Diaconus, the Lombard historian, who wrote in the eighth century, and mentions songs about Alboin (who died in 563) as existing among all the nations of German speech. Charlemagne had the old traditional songs of his people collected and committed to writing, and even made them one of the subjects of school instruction. Side by side with heroic ballads, social, convivial, and funeral songs (which may, to be sure, have been pretty much the same thing) seem to have been in use from the earliest recorded times. To all this popular poetry, by reason of its heathen derivation and character, the Christian clergy opposed themselves with the most determined hostility. Not succeeding in extirpating it by the use of the spiritual and legal means at their command, the German churchmen of the ninth century conceived the idea of crowding it out by substituting poetry of a Christian subject and tone—an expedient which has been tried more than once since then. Though popular song lived on in obscure places, the foreground of history is filled for 600 years with religious and courtly poetry, and with the chivalrous and native epic. Nothing is left of the old heroic songs but a fragment of the *Hildebrandslied*, from the eighth century (best known in a modernized form of the fifteenth century); and of the Christianized song we have also but a single specimen, the *Ludwigslied*, of the year 881. The former is in the ancient alliterative meter, the latter in the then newly introduced rhymed stanza. During the fifteenth and the early part of the sixteenth century a second growth of the genuine popular song appears, some of it springing, doubtless, out of shoots from the old stock which had lived through this long interval, some of it a fresh product of the age. These ballads were popular in the large and strict sense; that is, they were the creation and the manifestation of the whole people, great and humble, who were still one in all essentials, having the same belief, the same ignorance, and the same tastes, and living in much closer relations than now. The diffusion of knowledge and the stimulation of thought through the art of printing, the religious and intellectual consequences of the Reformation, the intrusion of cold reflection into a world of sense and fancy, broke up the national unity. The educated classes took a direction of their own, and left what had been a common treasure to the people in the lower sense, the ignorant or unschooled mass. German ballads have been collected in considerable numbers. The sources have been "flying leaves," manuscripts, printed song-books (mostly of the sixteenth century), and oral tradition. In interest they are decidedly inferior to the Scandinavian and English.

Christianity and foreign culture, which in different ways have been equally destructive in their effects upon ancient national poetry, were introduced into the Scandinavian countries much later than into Germany and England. In the Scandinavian countries, too, the peasantry long maintained a much higher position. They were not an oppressed and ignorant class, but free men, who shared fully in the indigenous culture, and so were well fitted to keep and transmit their poetical heritage. While, therefore, the heroic ballads of Germany and England have been lost—those of England utterly, those of Germany being preserved only in epic conglomerates like the *Nibelungenlied*—and while the mythical cycle in both countries is but feebly, if at all, represented, Scandinavia has kept a great deal of both. The story of Thor's Hammer forms the subject of a ballad still known in all the Scandinavian countries; a volume of ballads concerning Sigurd has been gathered from tradition in the Faroe isles within this century, and several ballads of this cycle and of that of Dietrich of Bern are found in Danish manuscript ballad-books. Svend Grundtvig, the editor of the still unfinished but truly magnificent collection of the old Danish ballads, has arranged them in four classes:

first, the Heroic; second, the Trylleviser, or ballads of giants, dwarfs, nixes, elves, mountain-spirits, enchantment, spells, and ghosts; third, the Historic; and fourth, ballads of Chivalry. The historic ballads (including their original, not their actual, form) mostly fall within the period from 1150 to 1300; the chivalrous are later, and the two other classes belong to a still earlier term, which may extend over the first half of the twelfth century, and into, or perhaps through, the eleventh—that is, to the epoch of the introduction of Christianity. Ballads are best preserved by oral tradition in Norway and the Faroe isles, but not at all, there, in old manuscripts; Sweden has a few manuscripts, and Denmark a great number, written mostly by noble ladies living on their estates, and giving the ballads as they were sung three or four hundred years ago, as well in the lord's castle as in the peasant's hut. The Danish ballads were collected in a printed form earlier than any others except the Spanish. Vedel published a hundred in 1591; another collection, called *Tengica*, or old Danish historic love-ballads, appeared at Copenhagen in 1657; and in 1695 Syv republished Vedel's ballads, with the addition of another hundred.

The English have preserved but a moderate number of very early ballads, and the date of many of these it is impossible to fix. There are some narrative poems in Anglo-Saxon which, without stretch of language, might be called ballads. The Norman Conquest, and the predominance of the French language for more than two hundred years, had of course momentous literary consequences, but there is no reason why the production of the native ballad should have stopped. The story of the Saxon outlaw Hereward, which begins with the second year after the Conquest, and has been handed down to us in Latin prose of the twelfth century, is full of such adventures as form the themes of ballads, and very likely was made up from popular songs. Such ballads, if they existed, are lost, but ballads concerning outlaws are among the earliest and best ones of the English. In place of Hereward of the Conqueror's time, and Fulk Fitz-Warin of John's time (whose history was also extremely popular), we have Robin Hood of uncertain time, Songs of Robin Hood and of Randolph, Earl of Chester (probably the third earl, who died in 1232), we know, from Piers Ploughman, were current among the lower orders at the middle of the fourteenth century, and one Robin Hood ballad exists in a manuscript which may be as old as the first quarter of the next century. Another occurs in a manuscript dated at about 1500, others in the Percy manuscript. The *Little Gest* of Robin Hood, which is a miniature epic made up of half a dozen ballads, was printed by Wynken de Worde, "probably," says Ritson, "in 1489." We may reasonably place the origin of the Robin Hood ballads as early as the thirteenth century. To the thirteenth century may belong Hugh of Lincoln, which is founded on an incident that occurred in 1255. An Anglo-Norman ballad on the same subject twice refers to a King Henry, and is therefore put within the reign of Henry III., which ended 1272. After this there are only one or two ballads with dates till we come to the Battle of Otterbourn, 1388, from which time we have a succession of ballads founded on ascertained events, down to the middle of the eighteenth century. Ballads like those of Grundtvig's second class exist in a small number; one of them in a manuscript of the middle of the fifteenth century. The little that we have of ballads of the Arthur cycle, and many of the best of all kinds, we owe to the Percy manuscript, written just before 1650. A few ballads besides those named have been gleaned from manuscripts and early prints, but a large part of our whole stock has been recovered within the last 130 years from the oral tradition of Scotland. The first impulse to the collecting of this poetry was given by the publication of Percy's *Reliques* in 1765. The *Reliques* inspired Bürger and Herder, through whom, and especially through Herder's *Vollstedler* (1778-79), that interest in the literature of the people was awakened in Germany which has spread over the whole of Europe, and has led to the collecting and study of the traditional songs and tales of all the European, and some of the Asiatic, African, and American races.

The Spanish alone of the Latin nations can boast a ballad poetry of great compass and antiquity. Following the law of analogy where documents are wanting, the origin of these ballads would be put between the years 1000 and 1200, the period when the Spanish nationality and language had been developed to that degree which invariably

incites and leads to expression in epic song. Some sort of popular poetry about the Cid (whose time is 1040-99) is known to have been sung as early as 1147; the poem of the Cid itself is placed about 1200. During the century that follows we find occasional mention of ballad-singers, but no ballads. As in Germany, the popular poetry, after the first bloom of the national genius, was supplanted by art-poetry, among the higher classes, and it passed out of notice for two or three hundred years. A reaction set in in the sixteenth century. This was the glorious period of Spanish history, and the return to the national poetry was a natural consequence of the powerful stirring of the national mind. Omitting "flying leaves" or broadsides, and a few ballads in the *Cancionero General* of 1511, the earliest collection of Spanish ballads is an undated *Cancionero de Romances*, printed at Antwerp about 1546; and this, it must be observed, is the first ballad-book printed in any language, and was gathered in part from the memory of the people. Other similar collections followed, from which was made in 1600 the great *Romancero General*. Toward the end of the seventeenth century the national ballads declined in favor, with a decline of national spirit, but since the beginning of the present century they have been restored to a high estimation at home, and have gained the admiration of the world. The oldest ballads are those which relate to the history and traditions of Spain, and recount the exploits of Bernardo del Carpio, Fernan Gonzalez, the Seven Lords of Lara, and the Cid. Then comes a variety of romantic and chivalrous ballads, and then ballads of the Carolingian cycle. These oldest and most characteristic of the Spanish ballads have been excellently edited by Wolf and Hofmann, and the entire body of this literature, amounting to more than 1,900 pieces, is included in the *Romancero General*, edited by Duran in 1849-51. The collections of ballads in the other Latin languages will be found below.

The ballads of other European nations are scarcely less interesting than those which have been noticed, and those of races which possess little or no other literature are peculiarly instructive, by reason of the light which they throw on the history of national poetry; for instance, the songs of the Slavie races. The Slavie songs as a class are distinguished from the Teutonic by the absence of the sentiment of *romantic* love and of *chivalrous* heroism. In their form, too, they are much less dramatic, and even the division of epic from lyric songs is not easy. Many songs begin with a few narrative verses, and then become entirely lyric, and the narrative part is almost always descriptive. The Servians—especially those of Turkish Servia, Bosnia, and Montenegro, who have not been much affected by civilization—afford a capital example of a race that has not outlived the ballad era. Vuk has collected many hundreds of their songs, one-third of them epic, and every one of them from the mouths of the people. A few of these are, in their actual form, as old as the fifteenth century, some belong to a remoter time, and indeed many retain marks of an ante-Christian origin. So far the Servians are like the German nations: the distinction is that the fountain of popular poetry still flows, and that heroic poems have been produced among the Servians in this century which are essentially similar to the older ones, and not at all inferior. We find the national poetry there in a condition closely resembling that in which it was among the races of Northern and Eastern Europe many hundred years ago. New songs appear with new occasions, but do not supersede the ancient ones. The heroic ballads are chanted at taverns, in the public squares, in the halls of chiefs, to the accompaniment of a simple instrument. Sometimes they are only recited, and in this way are taught by the old to the young. All classes know them: the peasant, the merchant, the hayduk (the klepht of the modern Greek, a sort of Robin Hood), as well as the professional bard. No class scorns to sing them—not even the clergy or the chiefs.

One or two general remarks are required to prevent misconceptions and to supply omissions. From what has been said, it may be seen or inferred that the popular ballad is not originally the product or the property of the lower orders of the people. Nothing, in fact, is more obvious than that many of the ballads of the now most refined nations had their origin in that class whose acts and fortunes they depict—the upper class—though the growth of civilization has driven them from the memory of the highly polished and instructed, and has left them as an exclusive possession to the uneducated. The genuine popular ballad had its rise in a time when the distinctions since brought about by ed-

ucation and other circumstances had practically no existence. The vulgar ballads of our day, the "broadsides" which were printed in such huge numbers in England and elsewhere in the sixteenth century or later, belong to a different genus; they are products of a low kind of *art*, and most of them are, from a literary point of view, thoroughly despicable and worthless.

Next it must be observed that ballads which have been handed down by long-repeated tradition have always departed considerably from their original form. If the transmission has been purely through the mouths of unlearned people, there is less probability of willful change, but once in the hands of professional singers there is no amount of change which they may not undergo. Last of all comes the modern editor, whose so-called improvements are more to be feared than the mischances of a thousand years. A very old ballad will often be found to have resolved itself in the course of what may be called its propagation into several distinct shapes, and each of these again to have received distinct modifications. When the fashion of verse has altered, we shall find a change of form as great as that in the *Hildebrandslied*, from alliteration without stanza to stanza with rhyme. In all cases the language drifts insensibly from ancient forms, though not at the same rate with the language of every-day life. The professional ballad-singer or minstrel, whose sole object is to please the audience before him, will alter, omit, or add, without scruple, and nothing is more common than to find different ballads blended together.

There remains the very curious question of the origin of the resemblances which are found in the ballads of different nations, the recurrence of the same incidents or even of the same story, among races distinct in blood and history, and geographically far separated. The Scottish ballad of May Colvin, for instance—the German Ulinger—is also found in Danish, Norwegian, Swedish, Icelandic, Dutch, Low German, Spanish, Portuguese, Italian, French, Polish, Servian, Bohemian, Wendish, Magyar, and there are traces of it in other languages. Some have thought that to explain this phenomenon we must go back almost to the cradle of mankind, to a primeval common ancestry of all or most of the nations among whom it appears. But so stupendous an hypothesis is scarcely necessary. The incidents of many ballads are such as might occur anywhere and at any time; and with regard to agreements that can not be explained in this way we have only to remember that tales and songs were the chief social amusement of all classes of people in all the nations of Europe during the Middle Ages, and that new stories would be eagerly sought for by those whose business it was to furnish this amusement, and be rapidly spread among the fraternity. A great effect was undoubtedly produced by the crusades, which both brought the chief European nations into closer intercourse and made them acquainted with the East, thus facilitating the interchange of stories and greatly enlarging the stock.

Some of the more important collections of popular ballads are:

English.—*Reliques of Ancient English Poetry*, by Thomas Percy, 1st ed. 1765, 4th improved ed. London, 1794, and often since then; *Ancient and Modern Scottish Songs*, by David Herd, 2d ed. 2 vols., Edinburgh, 1776; *Minstrelsy of the Scottish Border*, by Sir Walter Scott, 3 vols., Edinburgh, 1802-03, and often since then; *Popular Ballads and Songs*, by Robert Jamieson, 2 vols., Edinburgh, 1806; *Ancient Scottish Ballads*, by George R. Kinloch, Edinburgh, 1827; *Minstrelsy, Ancient and Modern*, by William Motherwell, Glasgow, 1827; *Ancient Ballads and Songs of the North of Scotland*, by Peter Buchan, 2 vols., Edinburgh, 1828; *The English and Scottish Popular Ballads*, by F. J. Child, Boston, 1882-92, 8 parts, and one to follow, which will contain a full bibliography.

Scandinavian.—*Danmarks Gamle Folkeviser* (The Ancient Ballads of Denmark), by Svend Grundtvig, 5 vols., the last half of the 5th, by Axel Olrik, unfinished, Copenhagen, 1853-90; *Jyske Folkeviser*, in *Jyske Folkeminder*, by E. T. Kristensen, vols. i., ii., x., Copenhagen, 1871-89; *Ancient Danish Ballads*, translated from the originals by R. C. Alex. Prior, 3 vols., London, 1860; *Norske Folkeviser* (Norwegian Ballads), by M. B. Landstad, Christiania, 1853; *Gamle Norske Folkeviser* (Ancient Norwegian Ballads), by Sophus Bugge, Christiania, 1858; *Svenska Folkeviser* (Swedish Ballads), by Geijer and Afzelius, 3 vols., Stockholm, 1814-16, improved ed. by Bergström and Ilöjjer, 3 vols., Stockholm, 1880; *Svenska Fornsånger*, by A. I. Ar-

widsson, 3 vols., Stockholm, 1834-42; *Färöiske Kræder* (Ballads of the Faroe Isles), by V. U. Hammershaimb, Copenhagen, 1854-55; *Færøsk Anthologi*, by the same, Copenhagen, 1886, 1891; *Islensk Fornkvæði*, by Grundtvig and Sigurdsson, Copenhagen, 1854-85.

High German.—*Des Knaben Wunderhorn*, Arnim and Brentano, 3 vols., Heidelberg, 1806-08, 4 vols., Berlin, 1853-54; *Alle deutsche Volkslieder in der Mundart des Köhlländchens*, J. G. Meinert, Vienna and Hamburg, 1817; *Oesterreichische Volkslieder*, Ziska and Schottky, Pesth, 1819; *Die Volkslieder der Deutschen*, F. K. von Erlach, 5 vols., Mannheim, 1834-36; *Deutsche Volkslieder*, A. Kretschmer and A. W. v. Zuccalmaglio, 2 vols., Berlin, 1840; *Schlesische Volkslieder*, Hoffmann von Fallersleben and Richter, Leipzig, 1842; *Alle hoch- und niederdeutsche Volkslieder*, L. Uhland, 2 vols., Stuttgart, 1844-45; *Die deutschen Volkslieder*, K. Simrock, Frankfurt-am-Main, 1851; *Deutsche Volkslieder*, F. L. Mittler, Marburg and Leipzig, 1855; *Fränkische Volkslieder*, F. M. von Dittfurth, 2 parts, Leipzig, 1855; *Schwäbische Volkslieder*, E. Meier, Berlin, 1855; *Westliche u. geistliche Volkslieder*, H. Pröhle, Aschersleben, 1855; *Deutscher Liederhort*, L. Erk, Berlin, 1856; *Die historischen Volkslieder der Deutschen*, R. von Liliencron, 4 vols., Leipzig, 1865-69; *Altd deutsches Liederbuch*, F. M. Böhme, Leipzig, 1877; *Westfälische Volkslieder*, A. Reifferscheid, Heilbronn, 1879.

Low German, Netherlandish.—Uhland, as above; *Oude Vlaemsche Liederen*, J. F. Willems, Ghent, 1848; *Niederländische Volkslieder*, Hoffmann von Fallersleben, 2d ed. Hanover, 1856; *Chants Populaires des Flamands de France*, E. de Coussemaker, Ghent, 1856; *Oude en nieuwe Liedjes*, P. A. Snellaert, 2d ed., Ghent, 1861; *Chants Populaires Flamands*, A. Lootens and J. M. E. Feys, Bruges, 1879.

Spanish and Portuguese.—*Romanceiro Catalán* (vols. x, and xvi, of *Biblioteca de autores Españoles*), Agustín Duran, Madrid, 1849, 1851; *Primavera y Flor de Romances*, F. J. Wolf and C. Hoffmann, 2 vols., Berlin, 1856; *Romanczen Asturiens*, u. s. w., José Amador de los Ríos, in *Jahrbuch für romanische- u. englische Literatur*, iii, 268, 1861; *Colección de los viejos romances que se cantan por los Asturianos*, J. M. Pidal, Madrid, 1885; *Cansons de la Terra*, *Cants populars Catalans*, F. Pelay Briz, 5 vols. (i, y Candi Candi, ii, y J. Saltó), Barcelona, 1866-75; *Romancillo Catalan*, M. Milá y Fontanals, Barcelona, 1882; *Romanceiro*, Almeida-Garrett, 3 vols., Lisbon, 1863; Th. Braga, *Cancioneiro Popular*, Coimbra, 1867, *Romanceiro Geral*, Coimbra, 1867, *Cantos Populares do Archipelago Açoriano*, Porto, 1869; *Romanceiro Portuguez*, V. E. Hardung, 2 vols., Leipzig, 1877; *Romanceiro do Archipelago da Madeira*, A. Rodrigues de Azevedo, Funchal, 1880; *Cantos pop. do Brazil*, S. Romero, 2 vols., Lisbon, 1883.

Italian.—*Canti popolari Toscani, Corsi, Illirici, Greci*, N. Tommaseo, 4 vols., Venice, 1841-42, 2d ed. of vol. I, 1848; *Canti pop. inediti l'umbri, etc.*, O. Marecaldi, Genoa, 1856; *Saggio di canti pop. Veronesi*, E. S. Righi, Verona, 1863; *Volkslieder aus Venetien, gesammelt von G. Widler*, ed. A. Wolf, Vienna, 1864; *Canzoni pop. Comasche*, G. B. Bolza, Vienna Academy, 1867; *Canti pop. Veneziani*, G. Bernoni, Venice, 1872; *Canti e Buccanti del Popolo Italiano*, D. Comparetti and A. d'Ancona, Turin and Florence, vols. i-v, viii, ix., 1870-91; *Archivio per lo Studio delle Tradizioni pop.*, Pitre and Imbriani, i-xi., 1882-92; *Canti pop. Umbri*, G. Mazzatinti, Bologna, 1883; *Canti pop. del Piemonte*, C. Nigra, Turin, 1888; *Canti pop. Siciliani*, G. Pitre, 2d ed. 2 vols., Palermo, 1891.

French.—*Instructions relatives aux Poésies populaires de la France*, J. J. Ampère, Paris, 1853; *Étude sur la poésie populaire en Normandie*, Eug. de Beauvergne, Avranches, 1856; *Chansons pop. des Provinces de France* (Jules Fleury), Paris, 1860; *Chants populaires du pays castrais*, A. Combes, Castres, 1862; *Noëls et Chants pop. de la Franche-Comté*, M. Buchon, Salins, 1863; *Chants pop. de la Provence*, Damase Arbaud, 2 vols., Aix, 1862-64; *Romanceiro de Champagne*, P. Tarbé, 5 vols., Reims, 1863-64; *Chants pop. recueillis dans le pays messin*, Comte de Paymaigre, Metz, 1865, 2d ed. 2 vols., 1881; *Chants et chansons pop. des provinces de Comest, Poitou, etc.*, J. Bujeaud, 2 vols., Niort, 1866; *Chansons pop. du Canada*, E. Gagnon, Quebec, 2d ed. 1880; *Chants pop. du Languedoc*, A. Montel et L. Lambert, Paris, 1880; *Chants pop. du Velay et du Forez* (Victor Smith), in *Romania*, Paris, 1872-81; *Poésies pop. de la Gascogne*, J. F. Bludé, 3 vols., Paris, 1881-82; *Chansons pop. de l'Ain*, C. Guillon, Paris, 1883; *Chansons pop. d'Ille-et-Vilaine*, L.

Decombe, Rennes, 1884; *Chansons et Ballades pop. du Valois*, Gérard de Nerval, Paris, 1885; *Vieux Chants pop. recueillis en Quercy*, J. Daynard, Cahors, 1889; *Chants pop. du Bas-Quercy*, E. Soleville, Paris, 1889; *Recueil de Chansons pop.*, 6 vols., E. Rolland, Paris, 1883-90; *Traditions, etc., des Ardennes*, A. Meyrie, Charleville, 1890.

Romanian.—*Ballade*, B. Alexandri, 2 vols., Jassy, 1853-54, and *Poesii Populare ale Romanilor*, Bucharest, 1866; *Ballades et Chants pop. de la Roumanie, recueillis et traduits par I. Alexandri*, Paris, 1855; *Romanian Anthology, National Ballads of Moldavia*, etc., H. Stanley, Hertford, 1856; *Poesia Populara, Balade*, Marienescen, Pesth, 1859; *Balade populaire române*, M. Pompiliu, Jassy, 1870.

Romanic.—*Chants populaires de la Grèce moderne*, C. Faurel, 2 vols., Paris, 1824-25; the same in German, by W. Müller, Leipzig, 1825; *Canti popolari Toscani, Corsi, Illirici, Greci*, N. Tommaseo, 4 vols., Venice, 1841-42; *Neugriechische Volks- u. Erzählungslieder*, D. H. Sanders, Leipzig, 1842; *Das Volksleben der Neugriechen*, etc., D. H. Sanders, Mannheim, 1844; *Τραγούδια ἔθνικὰ*, 2 parts, A. Manousos, Corcyra, 1850; *Chants du Peuple en Grèce*, Compte de Marcellus, 2 vols., Paris, 1851; *Ἕθνηματα δημοτικῶν Ἑλλάδος* (Popular Songs of Greece), Spyr. Zampelios, Corcyra, 1852; *Carmina popularia Graecia recentioris*, A. Passow, Leipzig, 1860; *Anthologie neugriechischer Volkslieder*, Th. Kind, Leipzig, 1861; *Συλλογὴ τῶν κατὰ τὴν Ἠπειρὸν δημοτικῶν ἀσμάτων*, G. Chr. Chasiotes, Athens, 1866; *Neugriechische Volks-gesänge*, J. M. Firmenich-Richartz, 2 parts, Berlin, 1840, 1867; *Δημοτικὴ Ἀνθολογία*, M. S. Lelakas, Athens, 1868; *Τὰ Κυπριακά*, 3d vol., A. A. Sakellarios, Athens, 1868; *Νεοελληνικά Ἀνάλεκτα*, Athens, 1871-81; *Recueil de chansons populaires Grecques*, E. Legrand, Paris, 1874; *Kretas Volkslieder*, A. Jeannarakis, Leipzig, 1876; *Griechische Märchen, Sagen, und Volkslieder*, A. Schmidt, Leipzig, 1877; *Συλλογὴ δημοτικῶν ἀσμάτων τῆς Ἠπειροῦ*, P. Arabantinos, Athens, 1880; *Τραγούδια τοῦ Ὀλύμπου*, A. K. Oikonomides, Athens, 1881; *Δελτία τῆς ἱστορικῆς καὶ ἐθνολογικῆς ἐταιρίας τῆς Ἑλλάδος*, Athens, 1883 ff.; K. N. Kamellakes, *Χιακὰ Ἀνάλεκτα*, Athens, 1890; *Ζωγραφεῖος Ἀγών*, vol. i, Constantinople, 1891.

Russian.—Bylina, Popular Epics, Heroic Ballads: the collections of Kirsha Danilof and Kalaidovitch, Moscow, 1818, 3d ed. 1878; of P. N. Rybnikof, vols. i, ii, Moscow, 1861-62, vol. iii, Petrozavodsk, 1863, vol. iv., St. Petersburg, 1867; of P. V. Kiryeevsky, ed. Bezonof, 10 parts, 2d ed., Moscow, 1868-75; of A. F. Ilfdering, St. Petersburg, 1873; *Untersuchungen über die Volksepik der Grossrussen*, W. Wollner, Leipzig, 1879; *The Epic Songs of Russia*, Isabel Florence Hapgood, New York, 1886. *Piesni russkogo naroda* (Songs of the Russian People), 5 vols., J. P. Sakharof, St. Petersburg, 1838-39, and his *Skazaniya r. n.*, 3d ed. vol. i, St. Petersburg, 1841; *Kalyki Perekhozhiv* (Wandering Psalm-singers), 2 vols., P. Bezonof, Moscow, 1861-62; *Russkiya narodnyya piesni*, P. V. Shein, Moscow, 1870.

South Russian (Little Russian, Ruthenian, White Russian).—*Piesni ludu ruskiego w Galicji*, Z. Pauli, Lemberg, 1839-40; *Piosnki wieśniacze z nad Niemna i Dzwiny*, J. Czeczot, Wilna, 1844, 1846; *Shornik ukraïnskikh pjesen*, M. A. Maksimovič, Kiev, 1849; *Narodnyya puzhnorusskiya piesni*, A. Metlinsky, Kiev, 1854; *Bielorusskiya piesni*, P. A. Bezonof, Moscow, 1871; *Bielorusskiya narodnyya piesni*, P. V. Shein, St. Petersburg, 1874; *Tselmaltzkiya narodnyya piesni*, I. Ya. Rudtchenko, Kiev, 1874; "Trudy" of the Russian Geographical Society, southwest division, vol. v., St. Petersburg, 1874; *Istoričeskiya piesni malorusskogo naroda*, V. L. Antonovitch and M. Dragomanof, vols. i, and ii, I. Kiev, 1874-75; *Narodnyya piesni galitzkoi i ugarskoi Rusi*, J. P. Golovatsky, 4 vols., Moscow, 1879. See also Polish, below.

South Slavic (Serbian, Croat, Illyrian, Slovenian).—*Narodne srpske pjesme* (Songs of the Serbian People), Vuk St. Karadžić, 3d ed. 5 vols., Vienna, 1841-65; *Volkslieder der Serben*, Talvj (Mrs. Robinson), 2d ed. 2 vols., Leipzig, 1853; *Die Gesänge der Serben*, S. Kapper, 2 parts, Leipzig, 1852; *Poesies pop. Serbes*, A. Dozon, Paris, 1859; *Picantija tzerwagnarska i hertzegovatchka*, S. Milutinovič, Vienna, 1833, Leipzig, 1837; *Srpske narodne pjesme iz Bozne i Hertzegovine*, B. Petranovič, Belgrad, 1867; *Srpske narodne pjesme*, K. X. Ristič, Belgrad, 1873; *Pjesme: s dodacima narodnih pjesamah puka hrvatskoga*, I. Kukuljevič, Agram, 1847; *Narodne pjesme* (Croat, Dalmatian, Bosnian, Serbian), L. Zupan, Agram, 1848; *Narodne pjesme izdala Matice Dalmatinska*, Zara, 1865; *Narodne pjesme*, V. Bogišić, Belgrad, 1878; *Jačke ili narodne pjesme puka hrvatskoga*, F. Kurelac, Agram, 1871; *Južno-slovjenske narodne po-*

piecke, Chansons nationales des Slaves du Sud, F. Kuhač, 4 vols., Agram, 1878-81; *Narodne pjesni ilirske* (Styria, Carinthia, West Hungary), Stanko Vraz (= Jacob Fras), Agram, 1839; *Volklieder aus Krain*, übersetzt von A. Grün (Count Auersperg), Leipzig, 1850; *Cvetje slovenskega naroda*, A. Janežič, Klagenfurt, 1852; *Narodne pesni koroskih slavencev* (Carinthian), J. Scheinigg, Laibach, 1889.

Bulgarian.—*Bolgarskiya pjesni*, P. Bezsonof, Moscow, 1855; *Bulgarski narodni pjesni*, D. and K. Miladinof, Agram, 1861, 2d ed., Sophia, 1891; *Chansons pop. bulgares inédites*, A. Dozon, Paris, 1875; *Sbornik zapadno-bolgarskih pjesen*, V. Katchanovski, St. Petersburg, 1882; *Sbornik of the Bulgarian Ministry of Public Instruction*, Sophia, 1889-91, vols. ii., iii., v.

Polish.—*Pjesni polskie i ruskie ludu galicyjskiego* (Polish and Russian people in Galicia), W. z Oleska, Lemberg, 1833; *Pjesni ludu bielo-chrobotow, mazorow, i rusi z nad Bugu* (White Chrobotians, Massovians, and Russians on the Bug), K. W. Wojecki, Warsaw, 1836; *Piosnki wiewniacze z nad Niemna*, J. Czeczot, Wilna, 1837; *Pjesni ludu polskiego w Galicji*, Z. Pauli, Lemberg, 1838; *Piosnki ludu wielkopolskiego*, J. J. Lipiński, Posen, 1842; *Pjesni ludu podhalan*, L. Zeiszner, Warsaw, 1845; *Pjesni ludu polskiego*, Oskar Kolbger, Warsaw, 1859, and in many of twenty subsequent volumes of his *Lud*, 1867-88, as also in his *Mazowsze*, 4 vols., Cracow, 1885-88, and his *Pokucie*, 4 vols., Cracow, 1882-89; *Pjesni ludu polskiego w Gornym Szlasku* (Silesia), J. Rogor, Wroclaw, 1863; *Lud, Pjesni*, etc., K. Kozlowski, Warsaw, 1869; *O Mazurach*, W. Ketrzynski, Posen, 1872; *Lud okolic Zarek*, M. Fedorowski, Warsaw, 1888-89; *Z Powrosci i Pjesni goral beskidowych*, R. Zawilinski, Warsaw, 1889; *Jugodne*, Z. Wasilewski, Warsaw, 1889.

Bohemian, Moravian, Slavonian.—*Slovanske narodni pjesni* (Bohemian, Moravian, Slavonian, and other), F. L. Celakovsky, 3 parts, Prague, 1822-27 and 1839-44; *Narodni zpiewanky vili pjesne swetske slowaku w Uhrach* (Popular Songs of the Slovaks in Hungary), J. Kollar, 2 vols., Buda, 1834-35; *Prostonarodni ceske pjesne*, etc., K. J. Erben, 3d ed., Prague, 1862-64; *Böhmische Granaten, Czechische Volkslieder*, M. Waldau, 2 vols., Prague, 1858-60; *Moravské narodni pjesne*, F. Sušil, 2d ed., Brunn, 1860; *Sbornik slovenských narodních pjesni*, etc., Matia Slovenská, Ture St. Martin, i. 1870, ii. 1, 1874; *Narodni pohadky pjesne*, etc., by the society "Slavia," Prague, 1873-75 (Národní písne, pohádky, etc.), 1877-78; *Nové narodni pjesne moravské*, F. Bartoš, Brunn, 1882.

Wendish.—*Volklieder der Wenden in der Ober- u. Nieder-Lausitz*, L. Haupt and J. E. Schmalzer, Grunna, 1841-43; *Delnjolužiske pjesne*, E. Muka, Bautzen, 1877; *Dotuok k ludowym pjesnjum*, E. Muka, Bautzen, 1883.

General Works.—*Geschichte der slavischen Literaturen*, von A. V. Pypin und V. D. Spasovič, übertragen von T. Pechl, 2 vols., Leipzig, 1880-84; *Historical View of the Languages and Literature of the Slavic Nations*, etc., Talvj (Mrs. Robinson), New York, 1850; *Slawische Volkslieder* (Russian, Bohemian, Slovak, Bulgarian), J. Wenzig, Halle, 1830; *Slawische Bulatiku* (Russian, Little Russian, Carniolan, Polish), W. v. Waldbrühl, Leipzig, 1843.

Breton.—*Barzaz-Breiz, Chants populaires de la Bretagne*, Th. Hersart de la Villemarqué, Paris, 1867; *Chants populaires de la Basse-Bretagne*, F. M. Luzel; Gwerziou Breiz-Izel, 2 vols., Lorient, 1868, 1874, *Soniou Breiz-Izel*, 2 vols., Paris, 1890; *Chansons et Danses des Bretons*, N. Quellien, Paris, 1889.

Of non-Indo-European races the more important collections are:

Finnish.—*Finnische Runen* (Finnish and German), by H. R. von Schröter, Stuttgart, 1834, Uppsala, 1819, Stuttgart, 1875; *Kantelehar*, E. Lönnrot, 2 vols., Helsingfors, 1840, in one vol., 1861; *Kalevala*, ed. E. Lönnrot, Helsingfors, 1849, 1866 (compounded from popular epic songs); *Les Variantes du Kalevala*, J. Krohn (1st part), Helsingfors, 1888. **Esthonian.**—*Esthnische Volkslieder*, original and translation, H. Neus, Reval, 1850-52; *Vana kannel, Vollständige Sammlung aller esthnischer Volkslieder*, 2 vols., J. Hurt, Dorpat, 1884-86. **Magyar.**—*Népdalok és Mondák* (Songs and Tales), J. Erdélyi, 3 vols., Pesth, 1846-48; *Ausgewählte ungarische Volkslieder*, translated and edited by K. M. Kertbeny, Darmstadt, 1851; *Vadrösök* (Wild Roses, a collection of Szekler Popular Poetry), J. Kriza, Klausenburg, 1863; *Magyar Népköltési Gyűjtemény* (Collection of Magyar Popular Poetry), L. Arany and P. Gyulai, 3 vols., Pest, 1872, 1882; *Koszorók* (Garlands from Alföld), L. Kalmány, Arad, 1877. **Turkish.**—*Proben der Volksliteratur*

der türkischen Stämme Süd-Siberiens, W. Radlof, 6 vols. of text and 6 of translation, St. Petersburg, 1866-86.

Of comprehensive works and collections the most noticeable are: *Stimmen der Völker in Liedern*, J. G. v. Herder, 1778, ed. by J. v. Müller, Tübingen, 1807; Talvj (Mrs. Robinson), *Versuch einer geschichtlichen Charakteristik der Volkslieder germanischen Nationen*, etc., Leipzig, 1840; *Hausschatz der Volkspoesie*, O. L. B. Wolff, Leipzig, 1853; *Volksgedichtungen nord-u. südeuropäischer Völker alter u. neuer Zeit*, J. M. Firmenich, 1867. F. J. CHILD.

Ballanche, biāl'lañsh', PIERRE SIMON; a French social theorist; b. at Lyons, Aug. 4, 1776; was at first a simple printer, but soon gave signs of a certain strange literary power. In 1812 Mme. Récamier made his acquaintance, and a deep, as well as lasting, friendship began between the two, which led Ballanche to sell his printing business and remove to Paris. Here he at once attracted attention because of his mystical speculations upon the course of human history, and his predictions of the speedy coming of a new order of things in society and government. Taking up Bonnet's theory of individual palingenesis, he transferred it to states, and brought it into the form of a system, which he developed in the following works: *Antigone* (1815); *Essai sur les Institutions Sociales* (1818); *Vieillard et jeune homme* (1819); *L'Homme sans nom* (1820); *Essai de palingénésie sociale* (never completed). His system bears the name of "Ballanchisme." See *Œuvres de Ballanche* (4 vols., Paris, 1830; *ibid.*, 5 vols., 1833); L. de Loménie, *M. Ballanche, par un homme de rien* (1841); Albert Aubert, *P. S. Ballanche* (1847). See his *Life* by J. J. Ampère, Paris, 1848. D. in Paris, June 19, 1847. A. R. MARSH.

Bal'lantine, WILLIAM; English lawyer; b. in London, Jan. 3, 1812; called to the bar 1834; created sergeant 1856; assisted in the famous Müller murder trial, the Tichborne case, and the defense of the Gaikwar of Baroda; said to have received a fee of 20,000 guineas for the latter case to induce him to visit India. Author of *Experiences of a Barrister's Life*, London (1882); *Old World and the New* (1884). D. in Margate, Jan. 9, 1887.

Ballantine, WILLIAM GAY; Congregationalist; b. at Washington, D. C., Dec. 7, 1848; graduated at Marietta College, Ohio, 1868, and at Union Theological Seminary, New York, 1872. He was professor at Ripon College (1874-76), at Indiana University (1876-78), and in Oberlin Theological Seminary from 1878 to 1889, when he was made president of Oberlin College. He is one of the editors of the *Bibliotheca Sacra*. GEORGE P. FISHER.

Ballantyne, JAMES; b. at Kelso, Scotland, 1772; d. in Edinburgh, Jan. 17, 1833; and JONH, b. at Kelso, 1774; d. at Edinburgh, June 16, 1821; Sir Walter Scott's printers. See *The History of the Ballantyne Press* (Edinburgh, 1871); and SCOTT, SIR WALTER.

Bal'larat; an Australian city and gold-field in Victoria; 75 miles W. N. W. of Melbourne (see map of Australia, ref. 8-II). The gold mines of this place, which were opened in 1851, are among the richest in the colony of Victoria. Surface digging is a thing of the past; many of the mines are hundreds of feet deep. Quartz reefs are also worked, and there is extensive crushing machinery for extracting the gold. Ballarat is unrivaled in the fineness of its gold, which averages 23½ carats, the pure metal being 24 carats. Pop. (1895) 45,326 (estimated).

Bal'last [nautical term common to most European languages. Perhaps from Scand. *bar*, bare, mere + *last*, load]; material carried by a ship or other vessel to increase its stability. Hence, in railroad engineering, material placed below and around the cross-ties of a railroad track, such as gravel, cinders, furnace slag, or broken stone. Its office is to make a solid roadway over which trains may pass smoothly, to secure quick and thorough drainage, and to prevent the formation of dust. On the best roads the depth of the ballast below the bottom of the ties is 12 inches, and, as the spaces around the cross-ties are filled in level with their tops, its total depth is 16 or 17 inches. Gravel and cinders, often used on light roads, make a ballast cheaper than broken stone, but it is liable to become dusty and also to heave under the action of frost. Furnace slag, in localities where it can be had, is extensively used, and makes a very smooth riding track. But broken stone best answers the requirements of a perfect ballast. It should be uniform in size, angular, and each piece should be able to pass in any way through a 1½-inch ring. By its use an even and

solid track is secured, together with perfect drainage, thus insuring long life to the cross-ties; it does not heave in winter, can be worked in both wet and dry weather, and is free from dust. Trap and hard sandstone rocks make good ballast, and also some limestones. MANSFIELD MERRIMAN.

Ballenstedt, baal'len-stet: town in the duchy of Anhalt; S. E. part of Harz Mountains. Pop. (1890) 4,779. The castle was, until 1863, the residence of the Dukes of Anhalt-Bernburg.

Ballet, baal'lay' [Fr., dimin. of *bal*, dance]: a dramatic or theatrical exhibition of dancing and pantomime, with music; a species of dance usually forming an interlude in theatrical performances, but confined principally to operas. The ballet has some resemblance to the pantomimic sacrificial dances of the ancient Greeks, among whom were dancers who expressed actions and passions by rhythm applied to gesture. The ballet was introduced into France under the auspices of Catherine de' Médiçis about 1580. Noverre about 1770 made improvements in it, to which he gave an independent dramatic form. The Vestris family were celebrated as performers in ballets. In recent times the public favor is almost exclusively bestowed on female dancers. The ballet has degenerated in many respects of late years.

Ballia: a district of Benares division, Northwestern Provinces, British India. It is at the eastern extremity of these provinces, between the Ganges and Goggra. Area, 1,145 sq. miles. Pop. about 1,000,000.

Ballina: a market-town and seaport of Ireland, partly in Mayo and partly in Sligo counties; on the river Moy; 7 miles from its entrance into Killala Bay, and 18 miles N. N. E. of Castlebar (see map of Ireland, ref. 6-D). The part of the town on the east bank of the Moy is called Ardarae. Ballina has manufactures of coarse linens and snuff; also an active trade in fish, provisions, etc. Pop. 6,000.

Balliol: See BALIOL.

Ballis'ta, or **Balis'ta** [Lat.]: a military engine used before the invention of gunpowder to propel large stones or other heavy missiles. It probably originated with the ancient Romans, who used it in the siege and defense of fortified places. The construction of the ballista is not well understood. It appears that the elastic force with which a twisted rope uncoils itself was commonly used as the propelling power, with which other forces were perhaps combined. For a vivid picture of the *effects* of the ballista, see Lucan's *Pharsalia*, lib. iii. l. 465 *et seq.*

Ballis'tic Galvanom'eter: a galvanometer which measures electrical quantity by means of its first oscillation, instead of measuring electric current by its permanent deflection. The term refers rather to the method of using a galvanometer than to the type of instrument employed, although the qualities sought for, viz., a long period of oscillation and an undamped movement of the needle, differ from those essential to the ordinary galvanometer. See ELECTRICITY and GALVANOMETER. E. L. NICHOLS.

Ballistic Pen'dulum: an instrument used to ascertain the velocity of projectiles and to prove the quality of gunpowder. In its simplest form it consists of a large block of wood suspended as a pendulum bob at that point in the path of the projectile for which the velocity is desired. When the angle through which the pendulum swings after impact with the shot, which lodges in the wooden bob, is known, together with the centers of suspension and oscillation of the mass, the velocity of the shot can be determined by calculation. The gun itself is also sometimes made a ballistic pendulum, being suspended, and its recoil observed. But these contrivances are both long since superseded by various electrical devices for determining the velocity of projectiles. E. L. NICHOLS.

Ballistics [from *ballista*, *q. v.*]: that branch of dynamics which treats of the circumstances of motion of projectiles from the instant of ignition of the powder charge to that at which the projectile comes to rest.

It is divided into "interior" and "exterior" ballistics.

Interior ballistics attempts to determine the intensity of the pressure of the powder gases in the bore of the gun, and the law of variation in this arising from differences in the quantity, composition, density, size of grain and density of loading of the powder, and the weight and frictional resistances of the projectile.

Also it attempts to determine the law of variation in the motion of the projectile and its velocity at any point of the

bore of the gun, under the varying pressure of the powder gas, the friction of the projectile, and the resistances of inertia arising from its acceleration in motion of translation and rotation.

Exterior ballistics deals with the circumstances of the motion of the projectile between the instants at which it leaves the muzzle of the gun and that at which it comes to rest. It seeks to determine the amount of and law of variation in the resistance of the atmosphere, and its effect in retarding projectiles of different weight and form, moving with different velocities; as well as in producing "drift" or lateral deviation in rifled projectiles; and from these elements to construct the actual trajectories described by projectiles fired from small arms and cannon of all kinds. The physical and mathematical discussion of this subject is very complicated. See GUNNERY and GUNPOWDER.

BOOKS OF REFERENCE.—Ingall's *Interior Ballistics*; Ingall's *Exterior Ballistics*; Noble and Abel's *Experiments on Fired Gunpowder*; Sarrau's *Researches on the Effect of Powder*. JAMES MERCUR.

Balloons: See AERONAUTICS.

Balloon-fish: a name of various fishes of the families *Tetraodontide*, *Diodontide*, and *Triodontide*. They are so named from the power which they possess of inflating their stomachs with air, and thus floating, belly upward, on the surface of the water for the purpose of evading pursuit. Many species are known, of which several are American. They are not used for food. Revised by D. S. JORDAN.

Ballot Reform [*ballot* is from Ital. *ballotta*, dimin. of *ballo*, ball]: such changes in the voting system as will best secure the secrecy of the ballot, and prevent fraud at the polls and in the count. The earliest and simplest form of election in all parts of the world has doubtless been *viva voce*, or by a showing of hands, as is now common in ordinary public meetings upon matters of lesser importance. It soon becomes evident, however, everywhere, that many persons have not the moral courage to express their opinions independently in the presence of others holding hostile opinions. Consequently, as in ancient Greece, in the case of ostracism, and in modern times in nearly all civilized countries in elections, the method of voting by ballot has been introduced in order to secure secrecy, and thereby independence. The form of the ballot at times has been a ball, a shell, colored beans, etc., but the most common form has doubtless been by written or printed ticket.

In all of the elections in the U. S., and in many foreign countries, it has been the custom for the candidate, or his party managers, to provide printed slips of paper containing the names of the candidates to be presented to the voters. The voter then, after making his selection among these tickets, could fold his ballot and present it to the election officers, or himself place it in the ballot-box without revealing its purport. The importance of the interests at stake, however, and the consequent influence that was brought to bear upon the voters, led in very many cases to intimidation and fraud, so that of late years, especially among the English-speaking races, some method of reform has been found necessary.

METHODS OF FRAUD.—The expense involved in the printing of tickets by political parties and by candidates led to the practice of raising large sums of money, ostensibly for the purpose of paying these legitimate expenses. The money, however, in the hands of campaign committees was frequently used for the purpose of renting unnecessary rooms, of hiring voters at enormous pay, for erecting campaign poles for banners, etc., for paying voters for guarding these poles, and for other methods more or less indirect and of purchasing votes. Perhaps the most common form in the U. S. has been that of hiring *ticket-peddlers*, that is, men whose business it is to stand at the polls and provide voters with tickets of the various candidates. The work seems a legitimate one under the old method of voting, but it was easy to hire an unnecessarily large number of men to do this work, and thus secure their votes. Another form of fraud at times practiced was the voting of *tissue ballots*. The ballots were printed on light but stiff tissue paper, so that a large number of ballots might be folded inside of one printed upon ordinary paper without detection. If they were not folded too closely the shaking of the box or a twisting of the ballots as they were dropped into the box would separate them, so that it was impossible to tell whether they were properly cast or not. When, at the close of the polls, it was found that more ballots had been cast than there

were voters in the district, the drawing out of the surplus ballots at random would still leave the advantage very largely with the fraudulent voter. The fact that it was possible to put a ticket into a voter's hand and keep him in view until it was safely deposited in the ballot-box made possible also the *direct purchase* of votes. In many cases voters have been corrupted by the dozen; tickets have been placed in their hands which were to be held in such position that a watcher could see them, and the men then marched in file to the ballot-box under careful supervision until each ticket was deposited, when they could be taken to a place free from observation and paid the reward of their infamy. In densely populated cities, where the number of voters at any polling-place was large, and where, consequently, it was practically impossible for all the voters in any one precinct to be personally known by any one man, "repeating" has been common. A man might vote readily in his own home district in the morning, then pass from voting precinct to voting precinct in the same city, casting a vote in every place with little danger of detection. So, too, it was possible for political managers to bring into the voting district men from elsewhere, not legitimate voters, and have them cast votes on election day.

REFORM MEASURES.—To check these methods of fraud the following methods of reform have been introduced in various places, with a large degree of success.

1. *Registration.*—To guard against "repeating" and the "importation" of voters, no method has been found so efficient as that of a previous registration. Under this system each voter is required to register his name with the election officers at certain fixed times, varying from ten days to four weeks before the election. These registration lists, when completely made up, are then opened to the inspection of the public; and agents of the various candidates, or other citizens, looking them through carefully with ample leisure for investigation, have full opportunity of detecting and exposing any illegal registration. On election day these registration lists are in the hands of the election officers, and no person whose name does not appear upon the list is permitted to vote. In country districts, where voters have frequently to go long distances in order to register, and where also, on account of the more intimate acquaintance of the voters one with the other, "repeating" or "importation" of voters is less likely to be successful, the system of registration seems at times to work hardship. A modification of this system, introduced in Indiana in 1889, has many commendable features. In that State the law does not require repeated registration of citizens who reside continuously in the same county; but registration is required of every person who moves into any county within six months preceding an election, and also of every person who, having once been a citizen of that State, shall have voted in another State, or shall have been absent from the State for a period long enough to lose his domicile, unless upon leaving the State he has declared his intention of still holding his citizenship and of returning within a specified period. The registration also is required to be made at a period (fifty-nine days) longer than usual before an election. This modification of the system seems to guard against fraud as well as the other, and to work much less hardship in ordinary cases.

2. The most efficient safeguard that has yet been attempted against the other methods of fraud mentioned seems to be the *Australian ballot system*.

The essential features of this system are the arrangement and control of the polling-places, the inclosed polling-booth, and the official ballot.

a. While usage in different places varies somewhat, it is customary for no electioneering to be permitted within 50 feet of the polls, and for each voter to approach the *polling-place* through a chute 50 feet long, formed of ropes or a light railing. In the voting-room only the officers of election and from one to three voters are permitted at a time. In this way the voter is protected from the importunities of electioneering agents while preparing his ballot.

b. The *booths* are small stalls arranged in some part of the voting-room, so that the voter, while preparing his ballot in

the booth, shall be entirely screened from observation. Each booth is provided with a shelf or counter at the proper height, and with all of the materials necessary for marking or otherwise preparing the ballot.

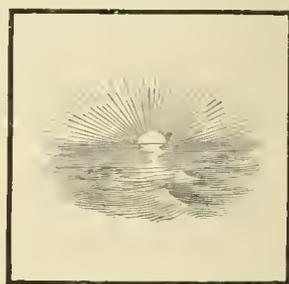

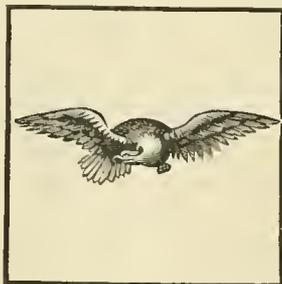

c. The expenses of preparing, printing, and distributing the *official ballots* are all borne by the state or the local government, thus removing from political parties in good part the necessity for the raising of large sums of money to be used as campaign funds. The system at its best permits the use of no ballots except the official ones; and these, prepared and printed under the direction of election officers, are given out only within the polling-place, one to each voter as needed. It is a crime in some States, punishable by fine and imprisonment, for any person to have an official ballot in his possession outside of the polling-place.

The original and perhaps the most common form of this ticket in the U. S. is that used in Massachusetts. There the names and addresses of all the candidates for each office are arranged in a column alphabetically, with a small blank space opposite each name. All the names for all the offices are thus grouped together upon one "blanket ballot."

In the United Kingdom and Canada, where usually very few officers are voted for at the same time, often only one, besides the name and residence of the candidate appears also his business. The voter designates the candidate for whom he wishes to vote by placing in the square opposite his name a small cross with a lead-pencil or a rubber stamp. In Missouri the names of those not voted for are to be erased, leaving untouched the name of the preferred candidate.

A second form of ballot that meets with more favor where party feeling is strong, and there is a large number of officers to be voted for at the same election, is that used in Indiana and other States. On this the names of all the candidates representing one political party are grouped together in one column, with the name of the political party which they represent at its head, and in the small square in line with that name the voting-mark is to be placed. Usually also at the head of the column will be placed some device, readily recognized by the illiterate voter, such as a domestic fowl, an eagle, or the like, as in the accompanying diagram. In order to prevent more effectively the use of any but official ballots, it is customary to place upon the back of the ballot some official designation, either a printed device or the name and number of the polling-district, or, more commonly, the written initials of the poll-clerks; and when voted the ballot must be so folded that, while the names of the candidates are all concealed, these initials or other devices shall be on the outside and visible to the inspector of elections.

In order to favor the illiterate voter still more, as well as to avoid the constitutional objections in the States providing for manhood suffrage, some of the States, notably New York, have provided that "paster ballots" may also be employed. These paster ballots may contain the names of any candidates for whom the voter may desire to cast his ballot, and may be prepared outside by any person and brought by the voter into the polling-place, and cast by pasting them upon

the face of the official ballot. It is claimed by many, with some justice, that without the use of the "paster ballot" many illiterate voters would be practically disfranchised. In most States, however, provision is made that any voter, by declaring his inability to read, or such physical disability that he can not prepare his ballot, may be accompanied to the booth by the election officers, who will give him needed assistance.

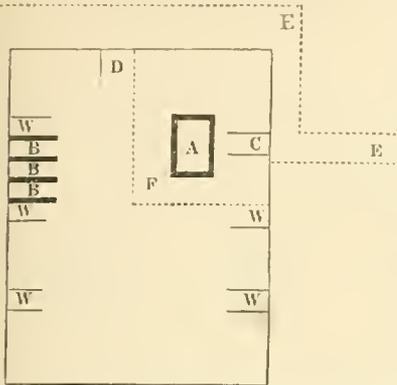

For the success of this system, as well as of a careful registration system, it is desirable that the election precincts be made small, so that the number of voters in each shall not be more than two or three hundred, in order that they may be readily known, and may all vote in one day without

undue haste. The accompanying diagram A will make clear the method of voting under the Australian election system.

The voter enters the chute E, E. Challengers, representing the leading political parties, standing outside of the polling-place by the window C, may challenge his vote if there is question as to his being a legal voter. A judge of election, from the inside, at the window D, and receives from one of the poll-clerks at the table A his official ballot and whatever explanations he desires with reference to the

method of voting. Entering then one of the booths, he prepares his ballot, screened from observation, and, folding it so that no one of the names on the ballot can be seen, he goes out of the booth, hands the ballot to the inspector, who places it, in his presence, in the ballot-box. He then withdraws immediately from the room, and gives place to another voter.

DIAGRAM A.—A. Table for election board. B, B, B. Booths where ballots are marked. C. Challenge window. D. Door. E, E. Chute through which the voter must enter. F. Railing separating the election board from the voters. W, W. Windows.

The Myers American ballot-machine offers, probably, the most effective way of insuring absolute secrecy of the ballot, with the additional advantage (no slight one) of readiness of counting. This ballot-machine consists of a cabinet some 7 feet high and 5 feet in width and depth. It is simply a light iron frame covered with heavy sheet iron, divided by a steel partition into a voter's compartment, 4 feet by 5 feet in size, and a counter compartment, 1 foot by 5 feet, in which are lever mechanical counters. The voter enters his compartment, and a door is closed after him, leaving him entirely alone. In the compartment are vertical rows or columns, 6 inches apart, of "ballot-pushers," nickel-plated knobs standing out 3 inches from the partition. To the left of each column of knobs are the permanent ballots of each particular party, containing in large print the name of the candidates and the name of the office for which each is intended to be chosen, and nothing else but a large index hand pointing to the proper knob. These ballots are arranged in the most convenient manner, with the most important office at the top. A man votes for any candidate whom he prefers by pushing inward for 2 inches the knob opposite his name. This act counts one for this candidate upon the hidden dial in the counter compartment, and at the same time locks out all other push-knobs of the other candidates for the same office. By pushing in these ballot knobs, in a few seconds a man may vote either a straight or a split ticket without possibility of mistake, and his votes are at the same time counted upon the unseen dials. After voting he goes out through the exit door, the closing of which returns the knobs ready for the next voter.

As there are models of the Keyboard of the machine placed in different situations about the polling-place, that may be studied before one enters the cabinet, an illiterate voter by counting the knobs, and even a blind voter by a sense of touch, may vote, it is claimed, with perfect accuracy without assistance. Immediately after the close of the election the counter compartment is unlocked by the inspectors of election, and they find the totals already recorded upon the dial opposite each candidate's name, so that within three minutes after the polls close the entire result is known, and there can be no error in the count. The machine is durable, cheap, may be used more rapidly than the present system, seems to be absolutely secret, and does its own counting. It has been tested in many places and seems to meet all the requirements for voting. The accompanying diagrams (B and C) show a section of the keyboard and of the concealed counter compartment.

These ballot-reform laws already described have doubtless done much to prevent corruption of the voters, but none of

them have proved entirely efficient. For the man who lacks the moral courage to vote as he wills in the presence of others, or who is likely to be terrorized by an employer or other person to whom he is under obligations, the Australian

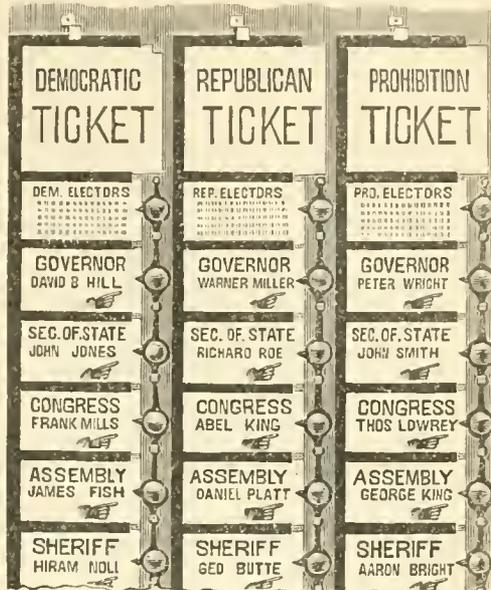

DIAGRAM B.

ballot or the Myers machine gives perfect security. But many voters who are willing to sell their votes, even though they can not be followed to the polls by the briber, have

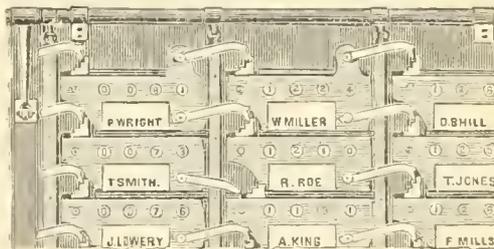

DIAGRAM C.

still honor enough left to cast their vote as they have agreed. So, too, at times, when election inspectors are not unwilling to tolerate corruption, the laws are in good part practically set aside by their lax enforcement by the election officers. Various devices to cheat the election officers have also been discovered in different places; but, on the whole, the Australian system has been very efficient, and has doubtless reduced vote-buying to a very great extent. The system is in use in all Australasia, where it was first used. Canada and all the States of the U. S. but fifteen have adopted some modification of the system, while in Europe Belgium, Italy, Greece, Norway, Great Britain, and Luxembourg have similar systems.

No ballot reform, however, is complete that deals only with the casting of the ballot. The method of making nominations (see PRIMARY ELECTIONS) must also be controlled, and efficient laws must be provided for inflicting severe penalties upon those violating election laws. The most efficient form of a Corrupt Practices Act is perhaps found in Great Britain.

Corrupt Practices Acts.—The first act for the prevention of corrupt practices in elections in the United Kingdom was passed in 1854, and this has since then been supplemented by others in 1858, 1863, 1882, and 1883. These acts give in the first place a very complete and thorough definition of bribery, both for the giver and the receiver, of treating, and of undue influence over voters. The law limits strictly the amount of money that may be expended at any election by any candidate, or by an agent in his behalf. It forbids the expenditure of money for many purposes that are common in other places; such as for the conveyance of electors to or from the polls by the hiring of horses or carriages, or pay-

ment of railway fares or otherwise, or for the use of committee-rooms or other buildings or premises beyond a certain fixed number, or for any entertainment (beyond a certain fixed amount for speakers and others), or for bands of music, torches, flags, badges, ribbons, etc., or for the employment of more than a designated number of agents and sub-agents for electioneering purposes. After the election an itemized statement of all the expenditures incurred on his account is to be made by the candidate and his agent under oath, and the further declaration that no expenses have been made contrary to the law or for purposes of bribery, direct or indirect. These reports must be public. "If it is found that a corrupt practice has been permitted with the knowledge and consent of the candidate, he is forever disqualified from holding office and is deprived of his franchise as an elector. If such corrupt practice is found to have occurred by the act of the agent, with or without the candidate's knowledge and consent, the candidate himself is disqualified from serving during the time for which he was elected, and can neither hold office nor act as an elector for seven years. Similar penalties are imposed on agents and sub-agents found guilty. These penalties are all in addition to penalties of fines and imprisonment for conviction on an indictment of bribery, undue influence, treating, illegal payments, or other corrupt practices."

Any unsuccessful candidate, if he has reason to believe that his successful opponent has employed corrupt practices of any kind, may by petition have a scrutiny, and, if he can prove his charge, may unseat his opponent and take the seat himself, unless it can be proved that he also has been guilty of corrupt practices, in which case a new election must be held. These acts in connection with the secret ballot have resulted in almost entirely suppressing corruption in elections in many parts of Great Britain and Canada, and have greatly decreased it wherever introduced. Similar acts, more or less complete, some covering only the expenses of the candidate, which may be evaded by giving a large sum to an irresponsible committee, others covering also the work of committees, have been passed in Massachusetts, New York, Minnesota, and other States. It is too soon yet to see the full effect here, but it will doubtless be good.

AUTHORITIES.—John H. Wigmore, *The Australian Ballot System* (Boston, 1889), and the statutes of the States mentioned above.

JEREMIAH W. JENKS.

Ballou', HOSEA: one of the fathers of the Universalist denomination in the U. S.; b. at Richmond, N. H., Apr. 30, 1771. His early education was acquired by his own efforts, though he had to contend with unusual obstacles. He began to preach when about twenty-one years of age, and labored in various places in New England. In 1807 he settled in Portsmouth, N. H., in 1815 in Salem, Mass., and in 1817 in Boston. In 1819 he became editor of the *Universalist Magazine*, and in 1831-32 was connected with the *Expositor*. He was a radical reformer of the Universalist theology, which, as shaped by Murray, the founder of Universalism in America, had been Calvinistic in its doctrines, with the exception that all were, as he thought, elect and consequently all saved. Ballou rejected Calvinism entirely, and the orthodox doctrines of the Trinity and Atonement by the vicarious sacrifice of Christ. He did this several years before it was done, at least openly, by the New England Unitarians. D. in Boston, June 7, 1852. Among his works are *Notes on the Parables* (1804), and an *Examination of the Doctrine of a Future Retribution* (1846); also, with a friend, a book of Universalist hymns, now very rare, remarkable for its lack of poetic merit. See his *Life*, by M. M. Ballou; another by T. Whittemore (1854), and one by O. F. Safford (1889). Revised by JOHN W. CHADWICK.

Ballou, HOSEA, D. D.: b. at Halifax, Vt., Oct. 18, 1796. He was a nephew of the foregoing. He entered the Universalist ministry in his youth, and preached at Stafford, Conn., and Roxbury and Medford, Mass. In 1822 became an editor of the *Universalist Magazine*, and was long connected with various journals of his denomination. He displayed much ability as editor of the *Universalist Quarterly*. He was (1854-61) the first president of Tufts College. He published *Ancient History of Universalism* (1829) and a hymn-book (1837). D. at Somerville, Mass., May 27, 1861.

Revised by JOHN W. CHADWICK.

Ballou, MATURIN MURRAY: journalist; son of Rev. Hosea Ballou; b. in Boston, Mass., Apr. 14, 1820; has edited *Ballou's Pictorial*, *The Flag of our Union*, *Ballou's Monthly*, and other periodicals; and has published a *History of Cuba*

(1854), *Biography of Hosea Ballou*, *Life-work of Hosea Ballou*, and a valuable compilation of quotations from a great number of writers. He became in 1872 one of the founders and the editor-in-chief of the *Boston Globe*. D. in Cairo, Egypt, Mar. 27, 1895. Author of *Due South; or, Cuba, Past and Present* (1885); *Due North* (1887), etc.

Ball's Bluff: Loudon co., Va.; on the right bank of the Potomac, about 33 miles N. W. of Washington. The bank here rises about 150 feet above the level of the river. It was the scene of a disastrous defeat of the U. S. forces under Col. E. D. Baker, Oct. 21, 1861. The hostile forces of the North and South had for several months confronted each other on opposite banks of the Potomac. On Oct. 19 and 20 reconnaissances were made in the direction of Dranesville and Leesburg by the Federal forces under Gen. McCall, without encountering any opposition. Gen. McClellan being anxious to ascertain the strength of the Confederates in these positions, on Oct. 20 (10:30 p. m.) instructions were sent to Gen. Stone at Poolesville, Md., directing him to keep a good lookout on Leesburg, to note the effect of this movement, and adding that "perhaps a slight demonstration on your (Stone's) part might have the effect to move them." Accordingly, Gen. Stone ordered the Fifteenth Massachusetts, Col. Devens, to be moved to Harrison's island in the Potomac, opposite the bluff, and about 100 yards distant from the Virginia shore; which was promptly effected in flatboats. At dark Devens sent a detachment of fifteen men under Capt. Philbrick to the Virginia shore to ascertain the whereabouts of the Confederates. After ascending the bluff they had proceeded but a short distance when they discovered what was supposed to be a camp, apparently but poorly guarded, which situation Philbrick reported to Col. Devens on his return. Devens forwarded this report to Gen. Stone, who immediately issued an order directing Col. Devens to land with five companies of his regiment and proceed to surprise the discovered camp at daybreak, and, after having accomplished this, to pursue as far as he deemed prudent, destroy the camp, and return to his position on the island, unless he saw a favorable position on the Virginia side which he could hold until re-enforced. At the same time Col. Lee (Twenty-ninth Massachusetts) was ordered to occupy Harrison's island with his regiment, and to throw one company across to the heights on the Virginia shore to cover Col. Devens's return. These orders were carried into effect, and at daylight Devens advanced only to find the reported camp to be, in fact, no camp, the detachment of the night before having been deceived in the moonlight, and mistaken the openings between the trees for tents. Col. Devens, however, advanced to within a mile of Leesburg, where he halted and, concealing his force in the woods, reported to Gen. Stone that he had met with no opposition, and asked for further orders. About 7 a. m. a body of Confederates appeared, but retired when approached, and cavalry were also seen on the Leesburg road; whereupon Col. Devens fell back to the bluff without interference, and reported to Gen. Stone, who directed him to remain, and that he would be re-enforced. At this time his force of officers and men was about 650. The position he had taken up was surrounded on three sides by woods, and here about noon he was attacked and fell back to a more secure position; being again attacked, he retired still farther, to the edge of the bluff, where he was re-enforced by Col. Baker with his regiment of First California Volunteers, and who by seniority of rank took command. Col. Baker's instructions were discretionary whether to remain or withdraw, but on finding an attack already commenced he decided to remain. The force at his command amounted to about 1,900 men; the Confederate force in the woods was reported at 1,700, not including, however, a regiment of Mississippi volunteers so stationed as to prevent succor to Col. Baker from Edwards's Ferry. Col. Baker had no more than disposed his men in line when he received a vigorous attack on his right, extending soon to his left and center. For two hours a desperate conflict was maintained, the Federals from their exposed position suffering by far the heaviest loss. Col. Baker, who displayed the greatest bravery, was killed about five o'clock, and the command devolved upon Col. Cogswell (New York Tammany Regiment). The severe fire to which the Federal troops had been subjected, and the fearful loss they had sustained, caused them to waver, and the only hope that appeared to be left was to endeavor to join Gen. Stone, who was known to have a strong force at Edwards's Ferry, about 2 miles away; but this

movement was met by a body of fresh Mississippi infantry, and under their attack the disheartened and reduced troops were routed, and, flying in great disorder down the bluff, were subjected to a galling fire from all directions. The boats to which they fled were upset or sunk by the Confederates' fire, and the few that escaped either swam out into the stream or concealed themselves along the banks of the river, reaching the Federal lines under cover of the darkness. In the meantime, Gen. Stone had ordered an advance across Edwards's Ferry to their assistance, but as they did not arrive on the field, they furnished no aid. The Federal loss in killed, drowned, and wounded exceeded, probably, 1,000 men; Gen. Evans, in command of the Confederate forces, reported his loss at 155. Much blame was attached to Col. Baker for recklessness, and Gen. Stone was subsequently arrested and confined in Fort La Fayette in New York harbor, but was afterward discharged, and at a later period again given a command.

Ballston Spa, sometimes called simply **Ballston**: a village on Del. and H. Canal Co. R. R., capital of Saratoga co., N. Y. (for location of county, see map of New York, ref. 4-J); 6 miles S. W. of Saratoga Springs. Here are mineral springs, which rise from the lower part of the Hudson river (Silurian) shales, and rank among the best acidulous chalybeate springs in the U. S. The village has several manufactories, including axe and scythe works, immense pulp and paper mills, and one of the largest tanneries in the world; five churches, and graded school-system with high school. Pop. (1870) 2,970; (1880) 3,011; (1890) 3,527; (1892) including suburbs, estimated, 4,850. EDITOR "DAILY NEWS."

Bally: See **BALI**.

Bally [from Gael. *baile*, Manx, *balley*, town]: a prefix signifying "town," entering into the composition of the names of a great number of places in Ireland and Scotland.

Ballyme'na: a market-town of Ireland: in the county of Antrim; on the river Braid, 2 miles above its junction with the Maine and 33 miles by rail N. N. W. of Belfast (see map of Ireland, ref. 4-I). It has large public schools, a cotton-spinning mill, and extensive bleaching-grounds, and is one of the greatest linen and flax markets in Ireland. Pop. 9,000.

Ballyshan'nou: a seaport-town of Ireland: in the county of Donegal; on the river Erne at its entrance into Donegal Bay; 120 miles N. W. of Dublin (see map of Ireland, ref. 4-F). A bridge of fourteen arches here crosses the Erne. It has six churches and chapels. Here is a valuable salmon-fishery in the Erne. Pop. 3,000.

Balm (*Melissa officinalis*): a perennial herbaceous plant of the family *Labiata*; a native of the south of Europe; is cultivated in American gardens, and prized for its lemon-scented leaves. The leaves, which are ovate and crenate, and the stem are occasionally used in medicine as a gentle aromatic, stimulant, and tonic. Its properties depend on an essential oil called oil of balm. An infusion of balm is an excellent beverage in febrile diseases.

Balmaceda, bañal-mañ-thay'da, JOSÉ MANUEL: president of Chili; b. in Santiago, 1840; committed suicide in the Argentine legation house there, Sept. 19, 1891. Educated for the priesthood; founded Reform Club (1868); deputy and senator in Chilean Congress; minister to Buenos Ayres; Minister of Interior (1882); president (1886) for five years. In 1890 he began intrigues to place one of his creatures in office as his successor; appointed an unpopular cabinet, prorogued Congress, and set on foot fictitious revolts in Valparaiso, which broke out in June. A junta was formed in Congress and the navy, which denounced Balmaceda, seized the best-armed vessels and the nitrate provinces, and marched south, beating the presidential forces as they advanced, until they appeared before Santiago, Aug. 27, 1891. The president fled, but returned to refuge with the Argentine minister. He was succeeded by Admiral Jorge Montt, provisionally at first, by election Nov. 6, 1891.

Balmés, JAYME LUCIO: a Spanish Catholic priest; b. at Vich, in Catalonia, Aug. 28, 1810. He was a remarkably precocious scholar. He wrote in reply to Guizot an able work entitled *Protestantism Compared with Catholicism in its Relations to European Civilization* (3 vols., 1848), which was translated into English, French, Italian, and German. Among his other works is *Filosofía Fundamental*, which was translated into English by H. F. Brownson (New York, 1857). D. at Vich, July 9, 1848. See Antonio Soler, *Biografía de D. J. Balmés* (1850); García de los Santos, *Vida*

de Balmés (1848); A. de Blanche-Raffin, *J. Balmés, sa Vie et ses Ouvrages* (1849).

Balm of Gilead: either of several quite distinct plants. In Great Britain it is a small shrub (*Cedronella triphylla*) of the mint family, and native of Canary islands. In the U. S. it is a species of poplar (*Populus balsamifera*, var. *candicans*). In Arabia the balm of gilead is *Commiphora opobalsamum*, var. *gileadensis*, a small tree of the family *Bursaceae*. CHARLES E. BESSEY.

Balmor'al Castle: the autumnal residence of Queen Victoria; is in a beautiful valley in Aberdeenshire, Scotland, on the river Dee, 48 miles W. S. W. of Aberdeen. It commands a magnificent prospect, and comprises 40,000 acres of beautiful grounds. Prince Albert purchased this estate in 1852 for £32,000, and erected a granite castle in the Scottish baronial style. It consists of two blocks of buildings united by wings, and a massive tower 35 feet square, rising to the height of 80 feet, and surmounted by a turret 20 feet high.

Balmav'es, HENRY, of Halhill: an eminent Scottish reformer and writer; b. at Kirkealdy in Fifeshire about 1520. He studied law, and became Secretary of State in 1540. In 1546 he, with other Protestants, took refuge in the castle of St. Andrews, and was declared a traitor. The castle was captured by the French, who took him, with Knox, to Rouen as prisoners. While in prison he wrote a *Confession of Faith*. He returned to Scotland in 1556. D. in Edinburgh, 1579.

Balsam (*Impatiens balsamina*) [Lat. *balsamum*, from Gr. *βάλσαμον*; of Semitic origin]: a well-known herbaceous annual belonging to the geranium family, and closely related to the touch-me-not. It is a native of India, and has been cultivated in European gardens for 300 years. It has developed many varieties. CHARLES E. BESSEY.

Balsam, Canada: the thick, terebinthine sap of *Abies balsamea*, which collects in blisters beneath the epidermis of the trunks of young trees. These blisters are punctured, and the balsam gathered as an article of commerce. It is used in medicines, for varnishes, for mounting microscopic objects, etc. *Abies grandis* of the west coast of North America furnishes a similar fluid.

Balsam Fir: See **ABIES**.

Balta, baal'ta: a well-built town of Russian Poland; in Podolia; on the Kodema river; 132 miles E. S. E. of Kamieniec (see map of Russia, ref. 9-C). It has over twenty factories of candles, soap, etc., and has an extensive trade in cattle, horses, hides, wool, and grain. Pop. (1888) 32,983.

Balti, baal'tée, **Baltistan**, baal'tée-staan', or **Little Tibet**: the upper end of the Indus valley, subject to Kashmir; having Chinese Tartary on the N., Afghanistan on the W., and Kashmir on the S., between lat. 34° 30' and 36° N., and lon. 74° 40' and 76° 30' E. The inhabitants are Shiite Mohammedans of Tibetan origin. The climate has greater extremes than that of Kashmir; the soil produces grains and fruits in abundance. Chief town, Iskardi. Area, 19,000 sq. miles.

Baltic, or **Baltic Sea** (in Germ. *Ostsee*; New Lat. *Mare Balticum* and *Sinus Coda nus*): an inland sea or gulf of Northern Europe; situated between Russia, Sweden, Germany, and Denmark, and connecting with the German Ocean and the Cattergat by the Sound and the Great and Little Belts. It is 830 miles long. Its greatest width is 420 miles, and the area 154,570 sq. miles. On account of the small proportion of salt it contains (not over 2 per cent.), the Baltic freezes much more easily and early than the ocean. It is not affected by the tide. The numerous sandbanks and islands, and the violent storms with sudden changes of wind, render the navigation of the Baltic dangerous. It receives several large rivers—namely, the Oder, Vistula, Niemen, Düna, Narva, Neva, Tornea, Dal, etc. No sea has in proportion to its size so great an influx of fresh water. The chief ports are St. Petersburg, Riga, Dantzic, Stralsund, Königsberg, Stockholm, and Copenhagen. A remarkable phenomenon connected with this sea is the slow and gradual rising of its shore in Sweden. A ship-canal connecting the Baltic Sea and the North Sea through the river Elbe was begun in 1891; opened for traffic June 20, 1895. It begins at Holtenau on Kiel Bay and reaches the Elbe 15 miles from the mouth of the latter. It is 61-31 miles long and needs no locks.

By some the word "Baltic" is derived from Lith. *baltas*, white, *balti*, be white; by others from the same source as

Lat. balticus, Eng. *balt*. According to an ancient tradition which has come down to us through Pliny, Baltia was the name of a great island situated at a distance of three days' sail from the coast of Scythia. This term is not found either in German or in any of the Scandinavian languages; the Baltic is there invariably called the "East Sea." It is an aid to the understanding of ancient geography to know that both terms were used in early days.

Baltic Languages: See LITHUANIAN, LETTISH, and OLD PRUSSIAN.

Baltimore: the chief city of Maryland; an important railroad and commercial center (for location, see map of Maryland, ref. 2-F); is in 39° 17' N. lat. and 0° 26' E. lon. (76° 37' 30" W. from Greenwich), at head of tide-water and navigation on Patapsco river, about 14 miles from Chesapeake Bay, and nearly 200 from the ocean by ship-channel. The Patapsco to this point is a broad estuary; above, a small and swift stream, furnishing water-power to many mills and manufactories. The harbor is spacious and secure, and its original depth of about 20 feet has been increased to the requirements of the ocean steamships by extensive dredging prosecuted at the expense of the U. S., the State, and the city governments. The city covers about 20,000 acres of land, and the surface of its site was originally very hilly.

The first steps for "erecting a town" on the Patapsco, to be called Baltimore Town, were taken by a legislative act in 1729, and it was laid out in half-acre lots in 1730. In 1752 it contained 25 houses and 200 persons; in 1765 the number had increased to 50 houses. After this the growth was more rapid, and in 1775 there were 564 houses and 5,934 persons. In Dec., 1776, the Continental Congress transferred its sittings from Philadelphia to Baltimore, and met here for about two months. In 1797 it was incorporated as a city. Pop. (1790) 13,503; (1870) 267,354; (1880) 332,313; (1890) 434,439.

The city is laid out, for the most part, at right angles, the streets having generally a width of about 60 feet, and the buildings are mostly built of red brick, many of them with white marble bases; granite and iron are, however, largely used in the construction of stores and warehouses, some of which are very fine. The bricks used for building are made from immense clay-beds adjacent to the city, and are of unsurpassed quality. The white marble, of excellent quality, is procured from inexhaustible quarries about 10 miles N. of the city; the granite from quarries about 15 miles W. Ship-building has always been one of the leading industries of the city, and the repairs of ships are greatly facilitated by an excellent dry-dock capable of receiving the largest ships that can enter the harbor.

Manufactures.—By the census of 1890 Baltimore had 5,258 manufactories, with \$82,526,344 capital, employing 83,091 hands; wages for the year, \$35,377,538; value of products, \$140,401,026. The principal industries are clothing, producing goods valued at \$15,997,924; tobacco, at \$5,906,333; foundries and machine-shops, \$4,718,189; meat packing, \$4,311,412; breweries, \$3,825,174; fertilizers, \$3,957,345; distilleries, \$2,085,560; patent medicines, \$1,947,950; brass-castings and finishing, \$1,903,850; and canning and preserving, \$8,516,799. There are forty establishments for packing oysters and fruits. This is a very important industry, and gives employment to 8,990 hands, consumes from 7,000,000 to 8,000,000 bushels of oysters, gathered from the Chesapeake Bay, in a year, and during the season—Sept. 1 to Apr. 1—often sends inland, packed raw, or cooked and hermetically sealed, from 40 to 60 rail-car loads a day. These industries find their outlet both by land and water communication. There are lines of steamships to Liverpool, Bremen, Boston, Providence, Wilmington (N. C.), Charleston, Savannah, Havana, New Orleans, etc., and steamboat lines to Norfolk, Richmond, Fredericksburg, Washington, and all points on the Chesapeake Bay and its many estuaries. A ship-canal across the State of Delaware gives the city a direct outlet for trade with Philadelphia. There are several excellent railroads, and they are rapidly multiplying. The Baltimore and Potomac R. R. (to Washington) passes by a tunnel 7,400 feet in length under the northwest part of the city; and the Northern Central R. R. (to Harrisburg) reaches tide-water by a similar tunnel 3,500 feet long, under the northeast section. Besides floating elevators for the transfer of grain, reaching the market by water, the railroads have at their termini six substantial elevators, with a storage capacity of 5,000,000 bushels, and others are projected.

Its sobriquet "Monumental City" was derived from the Washington Monument and Battle Monument, erected by the gratitude and patriotism of its citizens. The former, located at Mt. Vernon Place, North Charles Street, is a Doric shaft of white marble 180 feet high, surmounted by a statue of Washington 16 feet high, erected 1816-30. Access to the top is had by 220 winding stairs within the column. Battle Monument in Monument Square, North Calvert Street, is also of white marble, 52½ feet high. Wildey Monument on Broadway, of white marble, 52 feet high, was erected to Thomas Wildey, a citizen of Baltimore, who died in 1861, and was the founder of Odd Fellowship in America. There is also in Greenmount Cemetery a monument and statue to John McDonogh, who bequeathed to the city a large sum (amounting now to about \$1,000,000) to establish the McDonogh Institute "for the education of poor children." A monument in Harlem Park to James L. Ridgely, secretary of the Sovereign Grand Lodge of Odd Fellows, was unveiled Sept. 22, 1885. Greenmount and Loudon Park are two beautiful cemeteries, and there are several other minor ones. The city has about 160 churches and 6 Jewish synagogues. The first church founded in the city was St. Paul's (Episcopal) in 1731. The first Presbyterian church was erected in 1756; the first Roman Catholic, in 1770; the first Wesleyan Methodist, in 1773; the first Baptist, in 1780; the first Friends' meeting-house, in 1781. Several of the churches are imposing and beautiful structures. Among the most noticeable are the cathedral, St. Alphonsus's, and St. Martin's (Roman Catholic); Grace, St. Peter's, and Christ (Episcopal); the Mount Vernon (Methodist); Westminster, Brown Memorial, and First (Presbyterian); and the Unitarian.

The water-supply of the city until 1881 was taken from Jones's Falls, about 7 miles above the city, and was of good quality and ordinarily abundant. In that year a further supply was brought, at an expense of \$4,000,000, from the Gunpowder river by natural flow through a tunnel of 12 feet interior diameter, 7 miles in length, with capacity for daily delivery of 170,000,000 gal. The reservoirs upon the two systems have a storage capacity of 2,241,000,000 gal.; the average daily flow of the streams that supply them is 165,000,000 gal., and the aqueducts leading from the storage reservoirs have a capacity for delivering in the city 200,000,000 gal. a day. This is distributed everywhere in abundance, and there are about 1,000 fire-plugs for use in case of fire. The fire department is well organized, directed by a police and fire-alarm telegraph, and notably efficient. It has 23 steam fire-engines and 9 hook-and-ladder companies.

Numerous public squares add to the beauty and healthfulness of the city. Patterson Park, in the northeast section of the city, contains 54 acres. Druid Hill Park, in the northwest section, contain 704 acres of ground, with fine forests, lakes, and lawns, and about 20 miles of good carriage-drives.

Public Buildings.—First among the public buildings should be named the city-hall, built of white marble, occupying an entire square, and costing \$3,000,000; the Maryland Institute, of brick, 355 feet long; the custom-house, 240 feet long, with a dome 115 feet high; the court-house, and Odd Fellows' Hall, all of brick; the Masonic Temple, of white marble; the jail, of granite, is a remarkable structure. Outside of the city limits, but a part of its institutions, should be noted Bay View Asylum (city almshouse), 714 feet in length; the house of refuge, maintaining about 500 juvenile delinquents; Spring Grove Asylum, a State institution for the insane, of granite, with capacity for 300 patients; the Maryland Institution for the Blind, a beautiful white marble building, where about 50 of these unfortunates are instructed; and the Sheppard Asylum (for the insane), endowed by the will of Moses Sheppard with about \$1,000,000. A superb building for a post-office and the U. S. courts has been erected by the Government. The Peabody Institute of Baltimore was the recipient of over \$1,000,000 from the late George Peabody. It has, in its fine white marble building by the side of the Washington Monument, a free library of 121,993 books and pamphlets, an art-gallery, music conservatory, rooms for lectures, concerts, etc. The Hopkins Hospital has no superior in its appointments in this country—probably none anywhere. It originated in Mar., 1873, when John Hopkins, a merchant of the city, placed in the hands of trustees selected by him 13 acres of land in the eastern part of the city, with directions to establish thereon a free hospital for the "indigent sick of the city and its environs, without regard to sex, age, or color," guarantee-

ing it \$100,000 a year during his life, and endowing it with \$2,000,000 for its support thereafter.

Education, etc.—Johns Hopkins established by most liberal endowment the university bearing his name. It was opened in 1876, and has sub-graduate and post-graduate departments, with 55 instructors and over 400 students. Its buildings and equipments are valued at \$849,104, and its productive funds at \$3,000,000. There are 60,000 volumes in its library. Its medical school received an endowment from Miss Garrett of nearly \$400,000 on condition that its courses of instruction should be open to women, which was done in 1893. The general education of the city is provided for in 147 graded public schools, in which 53,203 pupils are taught by about 1,279 teachers. Loyola College, a Catholic institution under the general supervision of the Jesuits, and the seminary of St. Sulpice (St. Mary's College), a Catholic theological institution, are both in a flourishing condition, while the medical department of the University of Maryland takes very high rank, and the law department a respectable position among professional schools. The city has 24 national banks, 9 daily, 39 weekly, 8 monthly, and 4 semi-monthly newspapers.

In 1873 Enoch Pratt, a successful merchant of the city, established a free circulating library for the use of the citizens, which the city accepted and named the "Enoch Pratt Free Library." It has a central building on Mulberry Street and five branches in the different quarters of the city. The endowment consisted of these buildings and a sum of money so invested with the city as to yield perpetually an annual income of \$50,000; and its library now numbers 103,465 volumes. The other principal libraries of the city are—Peabody Institute, 121,993 books and pamphlets; Mercantile Library Association, 33,278; Maryland Institute, 15,600; Baltimore Bar Association, 7,500; Young Men's Christian Association, 2,500; Odd Fellows', 19,356; Maryland Historical Society, 13,366; Loyola College, 22,000.

HENRY STOCKBRIDGE.

Baltimore, Lord: a title of the Calvert family in the Irish peerage; created in 1625 by James I., who marked his confidence in Sir George Calvert by making him, though a Roman Catholic, Baron of Baltimore (Ireland). Calvert was born at Kipling, Yorkshire, England, in 1582. He graduated at Oxford; held several important public trusts; was knighted in 1617; became principal Secretary of State in 1619; member of Parliament 1620-21; and first Lord Baltimore 1625. By grant of James I. he became proprietary of Avalon in Newfoundland, endeavored to plant a colony there, and went thither himself in 1625. Owing chiefly to the unfavorable soil and climate, the colony was a failure. He then (1628) visited Virginia, met an ungracious reception, and returned to England. He seems then to have petitioned Charles I. for a charter for founding a new colony, and to have met with favor; but before the charter was issued he died in London, Apr. 15, 1632. The charter which he had secured was reissued in June, 1632, to his son Cecil, who became the second Lord Baltimore, and real founder of the colony of Maryland. The territory granted by the charter included the whole of the present State of Maryland. Cecil never visited it, but sent out an expedition in Nov., 1633, under the charge of his brother, Leonard Calvert, as governor. The Calverts have been much praised for their liberal and tolerant spirit, and their wise and equitable legislation in the colony. The successive Lords Baltimore were Charles (the third), Benedict-Leonard (fourth), Charles (fifth), and Frederick (sixth). Frederick died in 1771, leaving no legitimate children, and with him the title Lord Baltimore became extinct. See Fuller's *Worthies of England*; Bancroft's and Hildreth's *Histories of the United States*; J. P. Kennedy, *Character of George Calvert*; *Proceedings of Maryland Historical Society*; Sparks's *American Biography*, vol. ix. S. S.

HENRY STOCKBRIDGE.

Baltimore Oriole, also called **Golden Robin**: a well-known and conspicuously beautiful bird (*Icterus galbula*) of the New-World family *Icteridae*. This family, closely allied in structure and habits with the weaving-birds (*Ploceidae*) of Africa and Asia, displays an equally wonderful skill in the construction of pensile and intricately woven nests. Both are also distinguished by the brilliant contrast in the colors of their plumage. Black and yellow, the two colors of the coat-of-arms of Lord Baltimore, suggested the name of this species, which is the best known of the group. In the summer months the Baltimore oriole is found from

Florida to New Brunswick on the coast, westward, as far as the great plains, from the valley of the Saskatchewan on the N. to Louisiana and Texas. It is a winter resident of the West Indies and Central America as far S. as Panama. It is not found W. of the Rocky Mountains, where it is replaced by closely allied species, and is not at all common

The Baltimore oriole.

beyond the Mississippi, being found less numerous as we proceed W. As a vocalist it is a bird of rare power, combining beauty and variety in its notes. It arrives in New England with great regularity about May 10, but remains in song only about two months, rarely singing after the young are hatched. Its nest is a pendulous, cylindrical pouch, and is suspended from the extremity of a hanging branch. It is made by the interweaving into a homogeneous fabric, very strong and admirably adapted to its purpose, of the filaments of various flax-like plants. Audubon figures one made entirely of Spanish moss (*Tillandsia usneoides*), so conspicuous in Southern cypress-swamps. The eggs are from four to six in number; they hatch in 14 days. Baltimore orioles are devoted and courageous parents, and resolutely defend their young when in danger, fearlessly exposing themselves to death rather than forsake them. The mother-bird has been known to enter her nest when the branch to which it was attached was being severed from the tree, and to persist in remaining there until the nest had been taken into a house. It will follow its young when taken, and will feed them when in captivity. Reared from the nest, it may be completely domesticated, be allowed full liberty of the house, making no attempt to escape, and, like a spoiled child, delighting in occasional acts of mischief, such as putting its pointed bill through the meshes of lace curtains, and opening wide its beak, seeming to enjoy the noise made by the breaking of the threads. It feeds chiefly on insects, many of them highly injurious to vegetation, and is thus of immense service to the farmer, destroying the worst pests of the orchard. The parents feed their young chiefly with caterpillars, which they swallow and disgorge for this purpose. Besides the Baltimore oriole there are four other orioles common in the U. S.—Bullock's oriole of the Pacific coast, the orchard oriole of the Eastern States, and the hooded and Scott's orioles of Texas and Arizona.

Revised by D. S. JORDAN.

Baluchi, bā-loo'chē, or **Balnēi**, bā-loo'chē (also **Beloochee**, **Bilneli**): the language spoken in BALUCHISTAN (*q. v.*), a branch of the Iranian division of languages, which closely resembles modern Persian. Two dialectic groups are distinctly recognized; first, the northeastern or North Baluchi; second, the southwestern, the Makrāni or South Baluchi. The dialectic division is made by the interposed wedge of the Brāhūi tribes, a people of Dravidian stock and speech. The separation thus made is so marked that Southern Baluchi speech is sometimes almost unintelligible in the north. The South Baluchi dialect is more ancient in its character; the North Baluchi is marked especially by the use of spirants and aspirates.

Baluchi, like modern Persian, may be regarded as an analytic language. The noun-inflection consists chiefly in adding *a* to form the oblique case in the singular, and *ān*, or, in the oblique cases *āna*, in the plural. The verb system is comparatively meager in forms and inflection, and somewhat irregular.

Baluchi hardly possessed a written literature until recent

times, when the Persian script began to be used in recording it. There exists quite a rich store of popular songs and stories, on legendary, historical, religious, heroic, and amatory subjects. A number of these have already been collected, and some of them bear the name of Jām Durrak, a celebrated Baluchi poet of the eighteenth century. Riddles seem to have been an especially popular style of composition among the Baluchis.

Consult Pierce's *Mekranee Beloochee Dialect* (*Journ. Bombay Branch Roy. As. Society*, Bombay, 1876); Dames's *Northern Baluchi Language, Grammar, Vocabulary, Specimens* (*Journ. Roy. As. Society of Bengal*, Calcutta, 1881); and especially the contributions of Wilhelm Geiger, *Dielektspaltung in Balūči, Etymologie des Balūči, Lautlehre des Balūči* (Bayer. Akademie der Wiss., 1889-91, *seq.*). See also IRANIAN LANGUAGES. A. V. WILLIAMS JACKSON.

Baluchistan, bū-lū-chis-taan', or **Beluchistan**, be-lū-chis-taan' (from *Baluchi*, one of the races occupying the country); a maritime country of Asia; with Afghanistan on the N., British India on the E., the Arabian Sea on the S., and Persia on the W. It is an irregular rectangle in form, with a projection at the northeast angle which extends to lat. 32° N. The seacoast runs E. and W. for about 600 miles, but has no good harbor. Area about 130,000 sq. miles.

Topography.—The surface is rugged and elevated, generally barren, and deficient in water. The Herbie or Hala Mountains run N. and S., separating the country from India, and there are several parallel ranges in Eastern Baluchistan. The northeastern extension is very mountainous. The coast is bordered by a lower range at some distance inland, with parallel ranges farther in the interior. The northwestern quarter is a dry, elevated plateau, with many independent drainage basins, and includes a part of the great Sarhadd plateau of Persia, and a part of the periodically dry and overflowed territory, the most of which lies in Afghanistan and Persia. The drainage of the country is for the most part into this area, but a few short streams find their way into the gulf.

Inhabitants.—The total population is about 500,000. There are two distinct races occupying the country, the Baluch or Baluchi and the Brahūi. They are clearly distinguished from each other in language and appearance, and each is divided into an infinity of tribes. The Baluchis have a language allied to Persia, are handsome, active, tall, strong, with long visages and raised features, pastoral, predatory, and hospitable, warlike, but lazy. Their chief articles of food are milk and flesh, the latter, by preference, only half cooked. They keep many slaves, and usually the men have several wives. The Brahūis have a language strongly resembling the Hindu dialect spoken in the Punjab, are short and thick, with round faces and flat features. They are the dominant race, though the Baluchis were the earlier occupants of the country.

Productions.—The climate is various, but usually dry, and the soil generally unfertile, though there are regions where the most of the crops of India can be produced. The chief pursuit is that of camel-raising; the other domestic animals are the horse, mule, ass, buffalo, black cattle, sheep, goats, fowls, and pigeons. Especial attention is given to the culture of dates in Mekran, in the southwest. A great variety of ores have been found. Iron and lead are mined near Nal, 150 miles S. of Khelat. Coal has been found in several places. At Khost, on the Sind-Pishin Railway, it has been successfully worked for some years.

History.—The power of the Brahūi Khans of Khelat was founded toward the end of the seventeenth century. The previous dynasty was a Hindu one. Nasir Khan II. of the Brahūi dynasty was recognized by the British in 1841, and in 1854 a treaty was made with him, under the terms of which he received an annual subsidy of \$17,000. He was succeeded in 1857 by his brother Khudadad, who is the present khan. With him a fresh treaty was made in 1876, and the subsidy paid him was doubled. He turned over the district of Quetta to the British, for which he receives an annual quit-rent of \$8,000, besides \$10,000 per annum in lieu of his right to levy duty on merchandise in the Bolan Pass—making \$50,000 paid to him by the British annually. In 1888-89 the district of Khetran, between Quetta and India, was brought under British control, and the territory has since been extended.

Government.—Baluchistan, as it now (1893) stands, may be divided into three parts: (1) The districts to the northeast, for the most part formerly included in Afghanistan, now

under British rule, and forming British Baluchistan. (2) The districts of Quetta and Bolan, now administered by British officials on the khan's behalf. (3) The greater part of Baluchistan, composed of a confederation of chiefs under the suzerainty of the Khan of Khelat, and in a general way under British protection. The capital of this part of Baluchistan is Khelat. The British administrative center is Quetta. From Quetta, which is strongly fortified, a railway runs through the Kwaja Amran range toward CANDAHAR (*q. v.*).

LITERATURE.—Hughes, *The Country of Baluchistan* (1877); Floyer, *Unexplored Baluchistan* (1882); MacGregor, *Wanderings in Baluchistan* (1882); Oliver, *Across the Border, or Pathan and Biloch* (1891). MARK W. HARRINGTON.

Baluze, bū-lūz', ÉTIENNE: a French historian; b. at Tulle, Dec. 24, 1630; became in 1668 Professor of Canon Law in Paris, and in 1707 director of the Royal College under Louis XIV. Among his works are *Lives of the Popes of Arignon* (Paris, 1693), and *History of the House of Auvergne* (1708, 2 vols.), in which he endeavored to show that the House of Bouillon was descended from the ancient Dukes of Guienne, and therefore owed no allegiance to the King of France. The king suppressed this work, exiled the author, and confiscated his estates, but he was recalled in 1713. He published forty-five works, among which were *Capitularia Regum Francorum* (1677, 2 vols.); *Conciliarum Nova Collectio* (1685), etc. D. in Paris, July 28, 1718.

Balzac, bū-l'zak', HONORÉ, de: the most famous French novelist of the nineteenth century; b. at Tours, May 20, 1799; of plebeian origin, notwithstanding the *de* which he placed before his name. Coming early to Paris, he lived on to the age of nearly thirty with his head full of ambitions, but without achieving a success. In 1829 he published his *Dernier Chouan* (written, however, in 1827), the first of his novels to show real power. In 1829 (dated 1830) appeared his *Physiologie du mariage*, witty, acute, often gross—and his fortune was almost made. In 1831 it was quite made by his *Peau de Chagrin*, full of wise and just things, mingled with much that was the opposite. From this time till his death Balzac produced enormously—the list of his books from 1827-48 including ninety-seven titles. He early began to elaborate a new theory of novel-writing—that it should consist in giving documents from the life of the society in which the writer lives; and his enormous production purported to be the carrying into practice of this theory. In it he has been followed also by later novelists; and has thus become perhaps the most important influence upon the imaginative literature of the end of the nineteenth century. His total work he called the *Comédie humaine*, in contrast to the Dantesque *Divina Commedia*. Furthermore, he divided his stories into lesser groups—*Contes philosophiques, Scènes de la vie privée, Scènes de la vie de province, Contes drolatiques*, etc. Of single novels, besides those named above, the most famous are perhaps *Eugénie Grandet* (1833); *Seraphita* (1834); *Le Père Goriot* (1834); *La Recherche de l'absolu* (1834); *Le Lys dans la Vallée* (1835); *César Birotteau* (1837); *Béatrice* (1844); *Modeste Mignon* (1844). In conclusion, it may be said that most of the prevailing French theories about novel-writing—so-called "realism," "naturalism," etc.—go back to Balzac. His most popular novels have been translated into English by Miss K. P. Wormley, and published in Boston. D. in Paris, Aug. 18, 1850.

See George Sand, *Notice biographique de H. de Balzac* (1853); Vicomte de Spoelberch de Lovenjoul, *Histoire des Œuvres de H. de Balzac* (1886); A. Cerfbeer et J. Christophe, *Répertoire de la Comédie humaine de H. de Balzac* (1887); M. Barrière, *L'Œuvre de H. de Balzac* (1890); E. E. Saltus, *Balzac*, with full bibliography of his works (Boston, 1888). A. R. MARSH.

Balzac, JEAN LOUIS GUEZ, de, Seigneur; French writer; b. at Angoulême in 1597. He was patronized by Cardinal Richelieu, and was admitted into the French Academy in 1634. He did for French prose what Malherbe did for verse, i. e. purified it from the pedantries of the sixteenth century and the obscurities of a still earlier time. Almost all the great writers of the age of Louis XIV. show his influence. As Sainte-Beuve said: "He gave the French tongue a stiff course in rhetoric." Personally he was vain, uncertain, and vacillating. His youth was spent in dissipations, his age in devotions; but he had observed much, and reflected deeply upon the course of human life, and his works contain so much of human experience that they must long remain famous. His reputation mainly rests upon his *Letters*, the

first collection of which, after they had passed through many private hands, appeared in 1624. Besides these, he published several works avowedly written for the public at large—as his *Prince* (1631); *Socrate Chrétien* (1652); *Endretiens* (1657); *Aristippe* (1658). His collected works appeared 1665, 2 t. fol., and 1854. Many separate editions of his *Letters* have appeared, e. g. by P. T. de Larroque, Paris, 1874. D. at Angoulême, Feb. 15, 1654.

Revised by A. R. MARSH.

Bambar'ra: a large district in the Western Sudan, on both sides of the Upper Niger or Joliba, which flows in a N. E. direction through the middle of this state. Its boundaries are uncertain, but it lies entirely in the area claimed by the French. The soil is well watered and fertile. The rainy season lasts from June to November. Two crops of maize, cotton, and yams are raised annually. The baobab, butter-tree, and date-palm are found here. The wild animals are lions, elephants, leopards, panthers, etc. The population is composed mostly of Mandingoes. Area about 20,000 sq. miles.

Bamberg: a city of Bavaria, in Upper Franconia; is beautifully situated on the river Regnitz, 30 miles N. of Nuremberg and 3 miles from the river Main (see map of German Empire, ref. 6-E). It is connected by railway with Nuremberg and other towns. It is well built, and has spacious, well-lighted streets, which are lined with handsome houses. Among the remarkable public buildings are the magnificent cathedral (Domkirche) in the Byzantine style, founded in 1004 by the Emperor Henry II.; the old palace of the bishops of Bamberg; and the Jesuit church of St. Martin's. Bamberg contains a theater, a lyceum, a museum of natural history, and a royal library of 135,000 volumes. Here are manufactures of porcelain, jewelry, musical instruments, gloves, etc.; also numerous breweries, which produce beer of superior quality. It has numerous literary and charitable institutions. Pop. (1890) 35,248.

Bam'boo' (Fr. *bambou*): the common name of the arborescent grasses of the genus *Bambusa*, numbering forty-six species; natives of the tropical and warm parts of Asia and America, and grow to a large size. Some of the species are a foot in diameter and 120 feet in height. The bamboo is a plant of great utility and importance. It has a jointed and hollow stem, which is very hard and light, and is externally coated with silex. It has been called the national plant of China, the natives of which make from it a great variety of articles, furniture, weapons, etc. It is sometimes used for building houses and bridges and for water-pipes. The smaller stems are converted into walking-sticks, and are employed in wickerwork and the seats of chairs. Some species of *Bambusa* secrete a silicious, phosphorescent substance called tabasheer, to which remarkable properties have been attributed. See TABASHEER.

Revised by CHARLES E. BESSEY.

Bam'borough (or **Bambrough**) **Castle**: one of the oldest castles in Great Britain; is on the coast of Northumberland, 16 miles S. E. of Berwick. It stands on a basaltic rock 150 feet high, and accessible only on the southeast side. It was founded in 1070. Connected with this castle is an extensive public library, a dispensary, life-boats to save the crews of shipwrecked vessels, and other charitable institutions. Near the castle is a village of the same name.

Bambuk, **baām-book'**: a district in the French Senegal Territory, West Africa; on the Upper Senegal river, between it and its tributary, the Falemé. The surface is hilly, and the soil of the valleys fertile. It is inhabited by Mandingoes, who are said to be very ferocious. The baobab and other trees here attain an enormous size. Bambuk has long been celebrated for its rich gold mines. Pop. about 800,000.

Bamian, **bā-mē-ān'**: a valley and pass of Afghanistan; on the route from Cabul to Turkestan, and between the central and western ranges of the Hindu Kush Mountains; is at an elevation of 8,496 feet, and is important as the only known pass over the Hindu Kush Mountains that is practicable for artillery. The valley is covered with ruins of the city of Gulgūn, which was destroyed by Jengis Khan about 1220. Bamian was one of the chief centers of the Buddhist worship, and presents numerous caves with gigantic idols cut out of the rock. One of these is 160 feet high.

Bamo: same as **BRAMO**.

Bamp'ton Lectures: so called after the name of their founder, the Rev. John Bampton (1689-1751), of Trinity College, Oxford, Canon of Salisbury, who in 1751 left his "lands

and estates" to the University of Oxford for "the endowment of eight divinity lecture sermons," to be preached annually at "St. Mary's in Oxford." The subjects specified were: (1) "To confirm and establish the Christian faith, and to confute all heretics and schismatics; (2) upon the divine authority of the Holy Scriptures; (3) upon the authority of the writings of the primitive Fathers as to the faith and practice of the primitive Church; (4) upon the divinity of our Lord and Saviour Jesus Christ; (5) upon the divinity of the Holy Ghost; (6) upon the articles of the Christian faith as comprehended in the Apostles' and Nicene creeds." When the lectures commenced, in 1780, the income of the estate was £120 a year. Ever since then (except in the years 1834, 1835, and 1841) these lectures have been delivered. Some of the more noted of the earlier lecturers were Dr. White, in 1784, on *Christianity and Mohammedanism*; Dr. Nott, in 1802, on *Religious Enthusiasm*; Bishop Heber, in 1815; and Archbishop Whately, in 1822. Mansel, in 1858, on *The Limits of Religious Thought*, opened a new era in the history of the lectures. Since then we have had, among others, George Rawlinson in 1859, Farrar in 1863, Bernard in 1864, Mozly in 1865, Liddon in 1866, Irons in 1870, Jackson in 1875, Row in 1877, Wace in 1879, Hatch in 1880, John Wordsworth in 1881, Temple in 1884. Hurst's *Bibliotheca Theologica*, rev. ed., gives a complete list down to 1892.

Ban [a Teutonic word signifying proclamation, edict, prohibition, the verb of which, *banan*, exists in O. Eng., but which actually came into Eng. via Fr. Cf. root of Gr. *φάνα*, Lat. *far*], assert; a word which occurs in many modern languages, signifying an edict; a public order or prohibition; an interdiction; a notice of marriage; a curse or excommunication. In the former German empire to put a prince under the ban of the empire was to divest him of his dignities, and pronounce on him a sentence of outlawry.

Ban and Arrière Ban: military terms used in France under the feudal system. When the feudal barons were summoned to the service of the king in time of war, they were called the *ban*. Their tenants or inferior vassals formed the second levy, or *arrière ban*. The *ban* and *arrière ban* constituted the entire military force of France in feudal times.

Ban, or **Ba'nus** [Pers. *bān*, lord]: the title formerly given to military governors of certain districts, called *banats*, in the eastern part of Hungary. The ban was appointed by the king, with the consent of the Diet, and had formerly very extensive powers. In political, judicial, and military affairs his authority was supreme. In time of war he commanded the troops of his banat. The most important banats were those of Dalmatia, Croatia, Slavonia, Bosnia, and Makovia (or Machow), but their boundaries often changed, and they were at length united into the double banat of Dalmatia and Croatia.

Ban, **baan**, **MATĪJA**: Servian poet and writer; b. at Ragusa in Dalmatia, Dec. 18, 1818. He went to Constantinople in 1839, and was married there to a Greek lady in 1840. He studied at Greek and French colleges, and learned many languages and literatures. In 1845 he went to Belgrade in Servia, and settled there. From 1845 to 1849 he was tutor of the daughters of the Prince Regent of Servia. In 1848 he took vehement part in the revolution that broke out in Servia, as elsewhere in Europe, striving to unite Croats, Servians, and Dalmatians against the Hungarians. During these years he wrote the most famous of his tragedies—*Mejrima*, or *the Liberation of Bosnia* (1851). After the revolution he taught foreign literatures in the lyceum and the college in Belgrade. In 1860 he became Minister of Foreign Affairs for Servia; in 1868 he was given a national pension; in 1885 there was a magnificent celebration of the fiftieth year of his literary career.

Among his works may be mentioned: Dramas, *Miljenko*, *Dobriča*, *Dobroslavili*, *Jean Hus*, *Maračica Kaboga*; poems, *Rashiso pežino* (1853). He has written also many books and articles upon various aspects of the Eastern question. See SIMON Pjerotic, *Sulla vita e sulle opere di Matija Ban* (Zara, 1881).

A. R. MARSH.

Bana'na (*Musa sapientium*): a tropical fruit-tree (and fruit) of great importance in both hemispheres. It is an herbaceous plant with a strong rhizome, from which sprouts or suckers arise and propagate the species, for the fruit is nearly always seedless. The plant grows to a height of 10 to 20 feet, bearing enormous entire ascending leaves, and clusters containing from 50 to 150 fruits. A year or two after

a banana-plant becomes established it begins to flower, the fruit maturing in from 90 to 120 days thereafter. After the fruit is ripe, the plant dies to the ground and the younger shoots take its place. Two or three suckers are allowed to grow from a plant, the others being destroyed or transplanted. The suckers are transplanted when 2 or 3 feet high, and are set deep, as low as 2 feet in many cases. It is thought that the transplanted plants do not produce so well as the suckers which are undisturbed. Bananas are planted in rows about 8 feet apart, and the plants in adjoining rows alternate at a distance apart of about 9 or 10 feet. This method affords shade to the ground, while it does not keep the sun from the plants. The banana is now grown in Southern Florida with success. The varieties are numerous and various. Bananas are constantly gaining in popularity in this country as a common article of food. This is due in part to the better transportation facilities of recent years between the tropics and northern markets. The first bananas brought to this country are said to have come from Cuba in 1804, and the first full cargo (1,500 bunches) arrived in 1830. The annual importation is now (1893) not far from 10,000,000 bunches. See PLANTAIN. L. H. BAILEY.

Bananal, baã-naã-naal [said to be from *banana*]: an island of Brazil; in the river Araguay, and in the province of Goyaz. Its length from N. to S. is 290 miles, and its width about 35 miles. The soil is fertile and covered with a dense forest. There is a large lake near the middle of the island.

Banana-quil': one of a group of very small birds of the honey-creepers family (*Cerythidae*), found in tropical America. One species (*Certhiola bahamensis*) is found in Florida.

Banau: district or territory under a BAX (*q. v.*): especially the name of a territory of Hungary (distinctively pronounced baã-naat), embracing the counties of Temesvár, Torontál, and Krasso; principal town, Temesvár; originally a part of Hungary; belonged to the Turks 1652-1716; became united with Hungary 1779.

Banbury: small town of Oxfordshire; 78 miles N. W. of London (see map of England, ref. 11-H); returned a member to Parliament until 1885. Pop. (1891) 12,767; famous in Ben Jonson's day and at present for its cakes and ale.

Banc: in law, a term used in the phrases trial in banc, sitting in banc, meaning a trial or sitting at which the full number of judges are present, as distinguished from a trial or sitting *nisi prius* presided over by a single judge. See *NISI PRIUS*. F. STURGES ALEX.

Banca, baang-kaã, or **Bangka**: an island in the Malay Archipelago; belonging to Holland; about 10 miles E. of Sumatra, from which it is separated by the Strait of Banca (see map of East Indies, ref. 7-C). It is about 100 miles long, and has an area of 4,977 sq. miles. The surface is hilly, the soil mostly dry and stony, and the island to a great extent covered with forests. It is celebrated for its tin mines, which are very productive, about 4,700 tons having been produced in a single year. Copper, iron, and lead are also found here. Pop. (1890) 79,648.

Ban'co: the standard money in which a bank keeps its accounts, as distinguished from current money. The term is chiefly applied to the money in which the Hamburg bank keeps its accounts, which is not coined money. The Hamburg mark banco (= 1s. 5 $\frac{1}{4}$ d. sterling) is to the current mark (= 1s. 2 $\frac{1}{4}$ d. sterling) as 20 to 17.

Ban'croft, AARON, D. D.: Unitarian minister; b. at Reading, Mass., Nov. 10, 1755. He graduated at Harvard in 1778, and became in 1785 pastor at Worcester, where he remained upward of fifty years. Among his works, beside a great number of sermons, is a life of George Washington (1807), which was very popular. He was the father of George Bancroft, the historian. D. at Worcester, Mass., Aug. 19, 1839.

Bancroft, EDWARD, M. D., F. R. S.: b. at Westfield, Mass., Jan. 9, 1744; ran away from his native country in his youth; practiced medicine in Guiana, and resided long in England. He was a friend of Dr. Franklin, and professed to labor in behalf of America, but is believed to have been a spy of the British Government. He published several political works, a *Natural History of Guiana* (London, 1769), and *Researches Concerning the Philosophy of Permanent Colors* (2 vols., 1794-1813). D. in London, Sept. 8, 1820.

Bancroft, GEORGE, Ph. D., LL. D., L. H. D., D. C. L.: historian; a son of Aaron, noticed above; b. at Worcester, Mass., Oct. 3, 1800; graduated at Harvard College in 1817, and entered in 1818 the University of Göttingen, where he

studied history and philology under Heeren, Bunsen, and others. In 1820 he took the degree of Doctor of Philosophy at Göttingen. Having returned home in 1822, he published a volume of poems (1823) and a translation of Heeren's *Reflections on the Politics of Ancient Greece* (1824). In 1834 he produced the first volume of his *History of the United States*. He was appointed Secretary of the Navy by President Polk in Mar., 1845, in which year he founded the U. S. Naval Academy; resigned office in 1846, and was sent as minister plenipotentiary to England in the same year. He returned home in 1849, retired from the public service, and for several years resided in Washington, D. C. Appointed minister to the court of Berlin in 1867, he negotiated a treaty by which Germans emigrating to the U. S. are released from their allegiance to the Government of their native country. In 1871-74 he was minister plenipotentiary to the German empire, and rendered important services in settling the San Juan boundary question. His capital work is a *History of the United States*. The tenth volume, to the end of the Revolutionary war, appeared in 1874. The eleventh and twelfth volumes, giving the history of the Constitution, appeared in 1882. In the same year he began to issue his final revised edition of the whole work. This edition (last volume published in 1885) is completed in 6 vols. 8vo. The work is the most elaborate and carefully prepared history of the Colonial and Revolutionary periods yet published. It is the result of fifty years of labor on all available European and American sources. The style is stately and somewhat discursive. D. in Washington, D. C., Jan. 17, 1891.

Revised by C. K. ADAMS.

Bancroft, HUBERT HOWE: historical writer; b. at Granville, O., May 5, 1832; first went to California in 1852; established a book-store in San Francisco 1856, which developed into one of the largest book-stores and publishing-houses in the country; began (1859) collecting books in Europe and America concerning the Pacific coast, and gradually formed the Bancroft library (50,000 vols.), which occupies a substantial building erected by Mr. Bancroft on Valencia Street; resolved about 1871 to devote himself to the writing of the history of the Pacific slope. On account of the magnitude of the task he organized a large staff of literary assistants. His published works in thirty-nine volumes are: *Native Races of the Pacific States* (5 vols., 1875-76); histories of *Central America* (3 vols., 1882-83); *Mexico* (6 vols., 1883-85); *North American States* (2 vols., 1887); *California* (7 vols., 1886-90); *Oregon* (2 vols., 1886-87); *Northwest Coast* (2 vols., 1884); *British Columbia*; *Alaska*; *Utah*; *Nevada and Colorado*; *New Mexico*; *Popular Tribunals*; *California Pastoral*; *California under Ponce*; *Essays and Miscellany*; *Literary Industries*. The last named contains an interesting account of his methods of work. His avowed purpose was less to write history than to make accessible to students the vast accumulations of documents and information which he had gathered. C. H. THURBER.

Bancroft, RICHARD: Archbishop of Canterbury; b. at Farnworth, Sept., 1544; educated at Cambridge; chaplain to Archbishop Whitgift; consecrated Bishop of London 1597; attended Queen Elizabeth during her last illness; became Archbishop of Canterbury 1604; Chancellor of the University of Oxford 1608; bitterly opposed the Puritans; proclaimed the divine origin and prerogative of bishops; enforced conformity with a high hand; deprived forty-nine ministers of their livings for disobedience; was "chief overseer" of the commission which produced the King James version of the Bible. He was a resolute ruler and an eloquent preacher, and the High Church party of the Anglican Church dates from him. D. in London, Nov. 2, 1610.

Banda, ban'daã: a district and city of the Allahabad division, Northwestern Provinces, British India. It lies between the parallels 25 and 26° N., and meridians 80° and 82° E.; on the Jamma river. Area, 3,061 sq. miles. Pop. 700,000, nearly all of whom are Hindus. The surface is variegated and somewhat rocky, the Vindhya Hills forming the boundary on the S. E. The most important crop is cotton, and the district is so well known for this that its product is distinguished in commerce as Banda cotton. Millet, wheat, corn, barley, and rice are also raised extensively. Iron and building-stone are the only mineral products. Coarse cotton-cloth, sackcloth, and stone handles for knives are manufactured. The climate is cold in winter, but very hot in summer. Hot winds are a not unusual cause of death to natives exposed to them. The annual rainfall is about 50 inches. A branch of the East Indian Railway passes through the

district. Banda city (lat. 25° 28' N., lon. 80° 23' E.) (see map of N. India, ref. 6-F), on the river Ken, has a population of 29,000. The other towns are small. M. W. H.

Bandages [from Fr. *bandage*, a bandage, deriv. of *bande*, Eng. *band*; of Teutonic origin]: the bands used by surgeons to bind wounds or injured parts, or to retain dressings. The most common form of bandage is made of strips of muslin, linen, or the like, of varying width, and rolled longitudinally into a cylinder. The bandage is applied to a limb in a spiral manner, each turn overlapping one-third of the last, and where the limb is conical the bandage is folded back or reversed so as to exercise pressure equally. Pressure must be carefully regulated lest the circulation be obstructed, and, as has frequently happened, gangrene result. Special forms of bandages are used for different parts of the body. A large handkerchief may sometimes be used with advantage. Sometimes bandages are made to become immovable by first being soaked in starch or plaster-of-Paris. One of the most useful of bandages for emergencies is the "Spanish windlass," to check serious bleeding from any part of either extremity. It is merely a strip of muslin or a pocket handkerchief passed around the upper part of the limb, tied in a knot, and then twisted firmly by a stick or bayonet passed under it, so as to press with sufficient force to arrest the arterial circulation. It must not be left on many hours, but its temporary application has often saved life. In like manner, free bleeding from a wound of the scalp may be controlled by a compress and bandage tightly applied around the head. Revised by WILLIAM PEPPER.

Bandai-San, *biân-di-sân'*: a volcano of Japan; about 140 miles N. of Tokio. The summit includes several peaks, of which the highest rises 6,035 feet above the ocean and about 1,000 feet above the adjacent plain. On the morning of July 15, 1888, a tremendous explosion of steam occurred by which a side of the mountain was blown out, producing a crater more than a mile wide, with precipitous walls on three sides. The rock was broken into fragments and partly reduced to dust, and the *débris* rushed down the slope and over the adjacent plain, covering a district 27 sq. miles in area, burying a number of villages and killing 161 persons. The volume of the ejected material was about two-sevenths of a cubic mile. The eruption is described by S. Sekiya and Y. Kikuchi in vol. xiii. of the *Transactions of the Seismological Society of Japan*. G. K. GILBERT.

Banda Isles: a group of islands, about 50 miles S. of Ceram, forming part of the Molucca Archipelago; belonging to the Dutch (see map of East Indies, ref. 8-1); discovered in 1511 by a Portuguese, Antonio Abreu. Portugal took possession of the islands in 1524, and in 1599 they passed under the dominion of the Dutch, and as a Dutch province they now form the presidency of Banda, with an area of 7,150 sq. miles and a population of 111,000, of whom 6,000 are in Neira, the seat of government. They are lofty and volcanic; one of them, named Gumong Api, rises 7,880 feet above the sea, and is an active volcano. In the larger islands nutmegs and mace are grown exclusively. The name is sometimes, but improperly, applied to all the islands N. of the Banda Sea.

Banda'na, or **Bandan'na**: a silk or cotton handkerchief of East Indian origin, though now extensively manufactured in Great Britain. The cloth is dyed Turkey-red, and then the pattern is made by discharging the color with bleaching-liquor in a hydraulic press. The patterns of the real bandana are spots and diamond prints.

Banda (*ban'dā*) **Oriental**, i. e. the Eastern Shore, a name often employed for **UKRAÏN** (*q. v.*).

Bandel, *biân-del*, JOSEPH ERNST, von; b. at Aunsbach, May 17, 1800; received his artistic education at the academy of Munich; studied for several years in Rome, and settled in 1827 at Munich. In 1831 he moved to Hanover. His principal work is the Hermann monument in the Tentoburger-Wald, near Detmold. It was begun in 1838, but not finished until nearly forty years later, and consists of a figure representing Hermann, 90 feet high, of copper, and raised on a foundation of granite 93½ feet high. In 1846 the foundation was ready to receive the statue, but the reaction which in 1850 set in and swept through the whole of Germany made it impossible to carry out a plan like that of the Hermann monument. In 1862 an association was formed in Hanover for the purpose, but only an insignificant sum was raised; in 1869 the King of Prussia gave 2,000 thalers; but after the Franco-German war the Hermann monument became a na-

tional affair and was soon completed. D. at Neudlegg, near Donauwörth, Sept. 25, 1876.

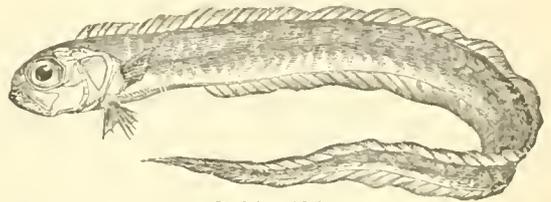

Ban-de-la-Roche: See OBERLIN, JEAN FRÉDÉRIC.

Bandelkhand: another spelling of **BUNDELKHAND** (*q. v.*).

Bandello, *biân-del'lo*, MATTEO; Italian story-writer; b. at Castelnuovo, Piedmont, in 1480; became a Dominican, and was teacher to Lucrezia Gonzaga. After the battle of Pavia he had to flee to France, and finally Henry II. made him Bishop of Agen (1550). He was living in 1561. His *Novelle* were famous over all Europe, and like the similar collection, the *Decameron*, served as a quarry for many succeeding writers, among them Shakspeare. There are 214 of these *Novelle* divided into four parts. The best edition is that of Sylvestri (Milan, 1813-14, 9 vols.). Some of them were translated by T. Roscoe in his *Italian Novelists* (vol. iii., London, 1825). Revised by A. R. MARSH.

Bandettini, *biân-det-tee'nēe*, TERESA; Italian poet and improvisatrice; b. at Lucca, Aug. 12, 1755; d. Apr. 5, 1837. She began life as a *danseuse*, and only by chance discovered her talent for poetical improvisation. Her success in the latter field was extraordinary; and the *Amarilli Etrusca*, as she was called, received distinguished honors in many parts of Italy. Of her verse we have in permanent form: *La Morb di Adonide*, a poem in four chants; *Il Polidoro*, a tragedy; *La Rosmunda*, a drama; besides many shorter pieces. A. R. MARSH.

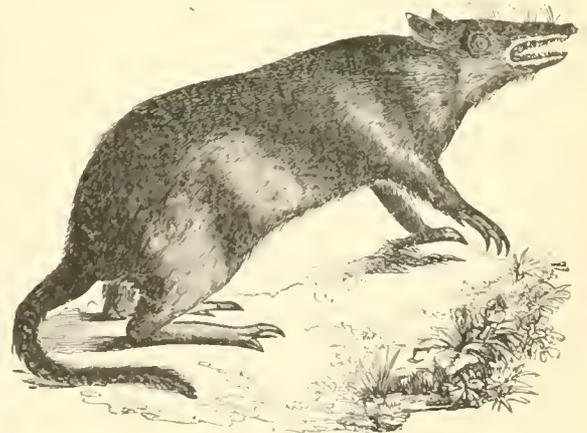

Bandfish: the *Cepola rubescens* or any allied fish having the body much elongated and compressed. The name

Red bandfish.

has also been given sometimes to other elongated and much compressed fishes. The red bandfish (*Cepola rubescens*) is about 15 inches long, and is found in the Mediterranean.

Ban'dicoot: a species of *Peramelide*, a family of marsupial quadrupeds, natives of Australia and Tasmania, having a long head and a pointed muzzle. They devour grain in

Long-nosed bandicoot.

granaries and potatoes in the field. The *Perameles nasuta* is about 18 inches long. The name is popularly extended to several kindred genera of marsupials.

Bandiera, *biân-dee-ay'ra*, ATRILIO and EMILIO; two brothers and Italian patriots; born respectively in 1817 and 1819; were sons of a vice-admiral in the Austrian service. In the year 1812 they opened a correspondence with Mazzini, and formed a design to liberate Italy by a conspiracy. They failed, and escaped to Corfu about Mar., 1841, but hearing a false or exaggerated rumor of a revolt in Naples, they returned with a few friends and landed in Calabria in June. They were executed in the public square of Cosenza, July

25, 1844, their letters to Mazzini having been opened by the British postmaster-general, and the contents communicated to the Austrian Government.

Bandinelli, bãan-dê-nel'leë. Baccio: sculptor and painter; b. 1493; d. at Florence, 1560. He was one of the more celebrated artists of the sixteenth century, but rather from the large amount of his generally skillful and popular work than by any lofty character or unusual excellence given to it. The *Hercules and Cacus* in the Loggia dei Lanzi at Florence, the tombs of the Popes Clement VII. and Leo X. in the Church of Santa Maria sopra Minerva at Rome, and the *Archangel Michael* on the top of the Castle of St. Angelo, also at Rome, are perhaps his best-known works. RUSSELL STURGIS.

Bandini, bãan-dê-nee'. ANGIOLO MARIA (1726-1803): classical philologist and librarian of the Laurentiana in Florence; made famous by his *Catalogue of the Laurentiana*, a monumental work of erudition and accuracy.

Bandit'ti [from Ital. *bundito*, proclaimed, outlawed, deriv. of *bandire* = Med. Lat. *bannire*, from Teutonic *ban*; cf. Eng. *ban*]: bands of robbers in the mountainous parts of Italy and Greece, who fall upon travelers and hold them captive for a ransom. In former times there existed in the larger towns of Italy organized associations of bandits, whose stilettoes were ready for hire to accomplish any deadly scheme. They were called euphemistically *bravi* ("brave men"), and were not exterminated until the modern improvements in police organization. Hired assassination (*homicidium conductum, assassinatus*) was a worse crime than ordinary murder, and punished by the wheel.

Band of Hope: See LOYAL TEMPERANCE LEGION.

Ban'don, or **Bandonbridge**: a town of Ireland; on the river Bandon; 20 miles S. W. of Cork (see map of Ireland, ref. 14-E). It is situated on both sides of the river, which enters the harbor of Kinsale. Bandon was formerly a prosperous manufacturing town, but its prosperity has considerably declined. Pop. 6,000.

Banér, bã-nâr', written also **Bannier**, or **Bannér**, JOHAN: a famous Swedish general; b. at Djursholm, near Stockholm, June 23, 1596. He commanded the right wing under Gustavus Adolphus at the battle of Leipzig in Sept., 1631. His conduct in this action was highly applauded. On the death of Gustavus Adolphus (Nov., 1632) he became the commander-in-chief of the Swedish army. He gained a brilliant victory near Wittstock, Oct. 4, 1636, and again defeated the imperial army near Chemnitz, Apr. 14, 1639, after which he overran a large part of Germany. D. at Halberstadt, June 20, 1641. Schiller represents him as great in adversity, and formidable even after defeat. See Schiller, *History of the Thirty Years War*; Carl Manderfeldt, *Éloge de J. Banér*, Copenhagen, 1787.

Banff, bãmf: an ancient seaport-town of Scotland; capital of Banffshire; at the mouth of the river Deveron; on Moray Frith; about 40 miles N. N. W. of Aberdeen (see map of Scotland, ref. 6-I). A bridge over the river connects it with Macduff. Here is Duff House, the seat of the Earl of Fife, with a park 14 miles in circumference. Banff has manufactures of leather, soap, iron castings, linen, sails, and cordage, and has important fisheries of salmon, cod, and herring, which, with agricultural products, are exported from this town by sea. Banff has a lighthouse in lat. 57° 40' N., lon. 2° 31' W. The harbor is shallow and poor. The town has numerous and excellent schools and charitable institutions. The river is liable to floods, which have sometimes been destructive. Pop. 8,000.

Banff'shire: a county of Scotland; bounded N. by Moray Frith, E. and S. by Aberdeenshire, and W. by Elgin and Inverness-shire, and partly by the river Spey, a very rapid stream. Area, 614 sq. miles. The surface is greatly diversified by mountains and valleys. Among its highest peaks is Cairngorm, 4,090 feet high. Granite, slate, old red sandstone, limestone, and serpentine occur here. The soil of the valleys is fertile. The breeding of cattle is the chief occupation of the farmers. Capital, Banff. Pop. (1881) 62,736; (1891) 64,167.

Bang, bãang, ANTON CHRISTIAN: a Norwegian author of a series of valuable works on church history; b. Sept. 18, 1810. His chief works are: *Hans Nielsen Haage og hans Santid* (2d ed. 1875); *Kirken og Rømerstolen indtil Constantin den Store* (1879); *Sultan den Frøfaldne* (1881); and

Udsigt over den norske Kirkes Historie efter Reformationen (1883). In recent years he has written some valuable pamphlets on Norse mythology. R. B. ANDERSON.

Bang, HERMAN; Danish novelist and poet; b. on the island of Alsén, Apr. 20, 1857. His masterpiece is perhaps *Ved Veien* (By the Roadside). Of his other works the following may be mentioned: *Haabløse Slægter* (Hopeless Generations); *Fædra*; *Eccentriske Noveller* (Eccentric Tales); *Stuk*; *Digte* (Poems); *Under Aaget* (Under the Yoke); *Ti Aar* (Ten Years)—all published since 1879.

G. L. KITTREDGE.

Bangalore, bãang-ga-lôr': a strongly fortified town of India; the capital of Mysore; on a high table-land; 71 miles N. E. of Seringapatam; lat. 12° 58' N., lon. 77° 38' E. (see map of S. India, ref. 6-E). It is the chief British military station in Mysore, and is much frequented by Europeans, attracted by the salubrity of the air. The temperature seldom exceeds 90° F. Here are important manufactures of cotton and silk. It was taken by storm by Lord Cornwallis in 1791. Pop. (1891) 179,670.

Bang-ka, baang'ka, or **Maung-ka**, maang'ka, the largest city of Northern Formosa (*q. v.*), on the Tamsui river, and about 13 miles from its mouth. A railway connects it with KILUNG (*q. v.*). Near Bang-ka is Twa-tu-tia, the great center of the tea-trade of Formosa, and the capital of the province of Taiwan (i. e. Formosa) from 1885 to 1896. Pop. variously estimated from 50,000 to 100,000.

Bang'kok', or **Bangkok**: a large commercial city; capital of Siam; situated on the river Meinam, about 20 miles from its entrance into the Gulf of Siam; lat. 13° 38' N., lon. 100° 34' E. (see map of East Indies, ref. 3-B). It is mostly built of wood, but has some brick and stone houses. Many of the houses are built on movable bamboo rafts on the river. The Chinese constitute a large part of the population, which is estimated at 600,000 to 1,000,000. Bangkok contains a large royal palace and numerous Buddhist temples, which are decorated in a gorgeous style. The stationary dwelling-houses are raised on piles 6 or 8 feet from the ground, in order to protect them from inundations. The river is navigable for vessels of 250 tons from its mouth to Bangkok, which has an extensive trade. The chief articles of export are sugar, pepper, rice, ivory, cardamoms, hides, tin, etc. Iron mines and forests of teak occur in the vicinity. It is the seat of Roman Catholic and of American Baptist and Presbyterian missions. It has some native Christians of Portuguese descent. See Sir John Bowring's *Siam*.

Bang'gor: an episcopal city and seaport of North Wales; county of Caernarvon; on the S. E. shore of Menai Strait; 2½ miles from the Britannia bridge, and 9 miles N. E. of Caernarvon (see map of England, ref. 8-D). It is on the railway which connects Chester and Holyhead, and is situated in a narrow, romantic valley. The grandeur and beauty of the scenery render it a favorite place of summer resort. Six miles from Bangor are slate-quarries which employ about 2,000 men. This city is very ancient. The famous monastery of Bangor was founded by Congall. The cathedral, originally founded in 525, has been twice destroyed (in 1071 and in 1402). Bangor has eight annual fairs, four of which are for cattle. They are visited by great throngs of buyers and sellers. The trade by sea is not important, the harbor not being accessible to large vessels. The diocese includes the island of Anglesea. Pop. (1891) 9,892.

Bangor: a city, port of entry, and important railroad and commercial center; capital of Penobscot co., Me. (for location, see map of Maine, ref. 6-E); on the right bank of the Penobscot river, about 60 miles from its mouth, and at the head of navigation. The Kenduskeag stream, navigable to the center of the city, runs directly through it, dividing the city into two nearly equal parts. The stream is spanned by a number of bridges, and on it are located several important manufacturing industries. The city is surrounded by an excellent agricultural country, which sends to Bangor large quantities of farming produce for export. There is a large business in insurance done here. Water is carried from the river by the Holly system to every portion of the city, supplying residences and stores, furnishing power for small industries, and an abundant supply for extinguishing fires. The dam, built at an expense of \$500,000, crosses the river at the water-works, and affords excellent power for manufacturing industries. Bangor has a fine granite custom-house, an elegant opera-house, and several first-class hotels. The streets are broad, well shaded, and lighted by elec-

tricity. There are 5 national, 2 savings, and several private banks.

Manufactures, etc.—The manufacturing industries of Bangor are diversified, including several large iron foundries, planing-mills, furniture, carriage, and trunk manufactories, and a number of boot and shoe manufactories. The city offers special inducements to manufacturers on account of the low cost of suitable locations and the cheapness of most of the necessities of life. The most magnificent water-power in New England is located a few miles above the city, and here extensive woollen mills are situated. Several pulp-mills are located along the river above the city, and in time this section is certain to be one of the most important manufacturing localities in New England. The lumber business is the principal industry, the amount surveyed here being 175,000,000 feet annually. The ice-business of Bangor has lately become important. The storage capacity of its ice-houses is about 425,000 tons. The ice cut in the Penobscot river is of the best quality.

Commerce, etc.—There is considerable commerce, coastwise and foreign; the average yearly arrivals are about 2,000. The foreign exports amount to about \$150,000 annually, of which spool-wood, shooks, and lumber form the principal part. The city has railroad and steamboat communication with all points east, west, and south. The completion of the Canadian Pacific Railway, connecting with the Bangor and Piscataquis R. R. at Brownsville, adds greatly to the advantages of Bangor as a commercial center. Bangor is the distributing point for travel to the summer-resorts of Eastern Maine, among the principal of which are Bar Harbor, which is within two hours' ride of the city, and Moosehead Lake. A new railroad, the Bangor and Aroostook, is now being constructed from Bangor to Northern Aroostook, a distance of 200 miles. The Bangor and Piscataquis has been leased by the new road.

Salmon-fishing.—In 1886 it was discovered that salmon could be taken with a fly in the river below the dam, and now salmon-fishing is very popular here. A fine clubhouse for sportsmen has been built.

Churches, Education, etc.—The city has 18 churches, and 3 daily papers with weekly editions. The city schools are among the best in the State, and the theological seminary has a high reputation. The fine public library has about 25,000 volumes. It is mainly supported by the income of a fund, amounting to \$112,000, established by citizens of Bangor, the greater portion of which (\$100,000) was given by the late Samuel F. Hersey.

History.—The French erected a fort on the present site of Bangor in 1656, and named it Noromberg. The place was settled in 1769, and was then called Kenduskeag. Its name was changed to Bangor by Rev. Seth Noble, in honor of a well-known psalm-tune of that name. In 1791 the village was incorporated as a town, and in 1834 it became a city. Its rapid growth since that time has been the result of its position, which combines the advantages of a noble and navigable tidal river with a large and constant water-power. It has in the upper waters of the Penobscot the means of very cheap transportation of logs from the boundless forests of Northern Maine. These advantages made it for a long time the greatest lumber-market in the world, and even now but few places excel it in the amount and value of lumber sawed and shipped. Pop. (1870) 18,289; (1880) 16,856; (1890) 19,103. Bangor, with its suburb, Brewer, with which it is connected by bridge and a steamer-ferry, had in 1890 a population of about 25,000 and a valuation of about \$12,000,000. EDITOR "DAILY COMMERCIAL."

Bangor: borough; Northampton co., Pa. (for location of county, see map of Pennsylvania, ref. 4-J); on N. J. Cent. and Bangor and Port. R. R.s., 15 miles N. of Easton. It has slate-quarries and manufactories. Pop. (1880) 13,328; (1890) 2,509.

Bangor Theological Seminary: chartered by the Legislature of Massachusetts in 1814; opened at Hampden in 1816, and removed to Bangor, Me., in 1819, where its first class graduated the next year. It is a Congregational institution, but its rooms and tuition are free to Christian young men. The regular course consists of three years' work. The library contains over 17,000 volumes, and the property of the institution is valued at \$275,000. In 1892 there were forty-one students at the seminary, and the graduates numbered 693.

Bangs, HEMAN: Methodist preacher; b. at Fairfield, Conn., Apr., 1790; joined the New York Annual Conference

in 1815. He labored effectively in the pulpits of his denomination in New York and Connecticut. He was one of the principal founders of the Wesleyan University at Middletown, Conn., and one of the most powerful preachers of Methodism. D. at New Haven, Conn., Nov. 2, 1869.

Bangs, NATHAN, D. D.: Methodist minister; b. at Stratford, Conn., May 2, 1778. He became editor of the *Christian Advocate and Journal* (1828), and president of the Wesleyan University at Middletown, Conn. (1841), but resigned the next year. He wrote, among other works, a *History of the Methodist Episcopal Church* (4 vols., New York, 1839-42), D. in New York city, May 3, 1862. See his *Life*, by Abel Stevens, New York, 1863.

Bangwe'lo, or Bem'ba: a large lake in South Africa; lat. 10° to 13° S., lon. 30° E.; about 150 miles long from N. to S., and half as broad; elevation above the sea about 4,000 feet. It was discovered by Livingstone in 1868. It is fed by several large streams, the principal being the Chambezi from the northeast. It is of very irregular outline and shallow. It empties at its southwestern extremity into the Luapula, and thence, probably, through Lake Moero, into the Congo river. M. W. H.

Baniäluka, bañ-ně-ää-loo'ka: a fortified town of Bosnia; on the river Verbas, 94 miles N. W. of Bosna-Serai (see map of Austria-Hungary, ref. 9-F). It has numerous mosques, many bazaars, a manufactory of gunpowder, hot springs, and Roman antiquities. Pop. (1879) 9,560; (1885) 11,357.

Banim, JOHN: Irish novelist; b. at Kilkenny, Apr. 3, 1798; excelled in the delineation of the life and character of the Irish peasantry. He published, with his brother, in 1825 *Tales of the O'Hara Family*, which was very popular. Among his other works are *The Battle of the Boyne* (1828); *The Denounced* (1830); *The Smuggler* (1831); and *The Mayor of Wind-gap*. D. at Wind-gap, near Kilkenny, Aug. 1, 1842. He has been called the "Scott of Ireland," but is deficient in humor, which is not to be wondered at, seeing he was a lifelong invalid. He wrote several successful plays. See his *Life*, by P. J. Murray, London, 1857. A new edition of the *O'Hara Tales* appeared in 1865; individual novels republished and reprinted frequently.

Ban'ister, JOHN: b. in England; came from the West Indies to Virginia, and settled in the neighborhood of Jamestown, devoting himself to botanical investigations. He contributed in 1680 a catalogue of Virginia plants to Ray's *History of Plants*. He published, among other works, *Observations on the Natural Productions of Jamaica, The Insects of Virginia, and Curiosities in Virginia*. The genus *Banisteria* was named in his honor. He was killed in Virginia, in 1692, in one of his botanical excursions, by a fall.

Banister, JOHN: son of preceding; b. in Virginia; was educated in England, and studied law there. He was colonel in the Virginia line; was prominent in the patriotic conventions of the Revolution; member of the Virginia Assembly; delegate from Virginia to the Continental Congress in 1778-79, and signed the Articles of Confederation. He was lieutenant-colonel of cavalry in 1781. D. near Hatcher's Run, Dinwiddie co., Va., 1787.

Baniwas: a tribe of South American Indians living on the Amazon and the Rio Negro. A vocabulary of their language is given by Alfred Wallace in *A Narrative of Travels on the Amazon and the Rio Negro* (1853, pp. 521-541).

Baniya: See BANYAN.

Banjarmassin, bañ-jar-maa'ssin, or Benjar-Massen (i. e. the river of plenty): a town on the river Banjar, 15 miles from its mouth, on the south coast of Borneo (see map of East Indies, ref. 7-F). Owing to the inundations of the river, the town is mostly built on piles. It has a considerable trade in gold-dust, precious stones, birds' nests, wax, resin, rubber, rattan, pepper, and steel of native manufacture and excellent quality. Many of the inhabitants are Chinese, and most of the trade is with China. The name is also given to the former sultanate, which comprises about 6,000 sq. miles, with 300,000 inhabitants, mostly Mohammedans. It has been tributary to the Dutch since 1787, and was annexed by them in 1857. Pop. of town, 30,000.

Bank [viâ Fr. *banque* and Ital. *banca*, loan from Teutonic; cf. O. H. Germ. *banch*, Eng. *bench*]. The special connection of signification with money is an Italian development; a credit institution or a dealer in credits. This credit is of various kinds. A SAVINGS-BANK (*q. v.*) receives

deposits, and loans them to investors for long terms, chiefly on real-estate mortgages. A loan and trust company advances money on pledges of stocks, bonds, or other securities. A banker deals chiefly with commercial papers, secured not by real estate or stocks, but by the business transactions of his customers. Some bankers make a specialty of foreign exchange business; but the great majority of the loans are made on ordinary commercial paper; i. e. on accepted bills. If A sells B a hundred dollars' worth of goods, B may not and generally will not pay for it in cash, but in an acceptance, which is virtually a promise to pay 30, 60, or 90 days afterward. But a business man wants the cash to use immediately. He therefore takes this bill to his bank, and has it discounted. The bank considers that a hundred dollars two months hence is worth ninety-nine dollars to-day, and offers that amount for it. If the bank (or broker) pays in specie, it has to charge an extra rate of interest to make a profit on the transaction. But it may make a profit at the ordinary rate of interest, either by paying in its own notes as a bank of issue or by simply crediting its customers with the ninety-nine dollars, and allowing him to draw checks on this credit from time to time, as he may have occasion—acting as a *bank of deposit*. The more advanced the commerce of a country, the more important does the last-named function become. Large payments are universally made by check; metallic money and its representative, the circulating note, are together only the small change of trade, employed in the settlement of balances and in the smaller purchases and payments. The operations of the New York Clearing-house are a good illustration of the small amount of money required in the transaction of business, the balances paid in money being only about 4 per cent. of the amount of the settlements.

The earliest banking institution in Europe was the Bank of Venice, founded A. D. 1171. It was based upon a forced loan of the republic. Funds deposited in it could not be withdrawn, but were transferable on the books at the pleasure of the owner—in this respect not unlike the perpetual annuities of the British debt. These inscriptions of credit were usually at a premium over current coins, which were worn and clipped and were of various countries and values. Except in so far as the transfers of credit on the books were concerned, the bank was only a fiscal agent of the government. It continued in operation until 1797, when it was overthrown by the Revolutionary army of France.

The Bank of Genoa went into operation in 1407. For centuries it was one of the principal banks of Europe. It was the first to issue circulating notes, which were negotiated or passed only by indorsement, not made payable to bearer. It is not known whether or not they were issued in small denominations. They were probably made for considerable amounts, and employed only, or chiefly, in large transactions. This was a large step in advance of the earlier system of deposit transfers, which was also employed by this bank. In 1800, when its circulating notes were at a large premium, it was pillaged by the French army, and thenceforth ceased to perform the functions of a bank.

The Bank of Amsterdam, established in the year 1607, was the earliest considerable institution of the kind which looked to the promotion of commerce. Its predecessors of Venice and Genoa were chiefly devoted to the management of state finances. It was plundered by the French army in 1794, when it was found that, with the reputation of fifty millions of dollars in its vaults, it had nothing, its capital having been loaned to the States-General, the East India Company, and to the city of Amsterdam. In this condition of its affairs it had done an immense business during the preceding fifty years.

The Bank of Hamburg, established in 1619, was a bank of deposit and circulation based upon fine silver bars. The deposits were confined to silver. This institution, like nearly all those of the time, had, as a principal object, the protection of the people from worn, sweated, clipped, and plugged coins, and from coins of the German empire secretly reduced in standard value. The remedy was that previously adopted by the Bank of Amsterdam—to lock up the debased and depreciated coins, and circulate the credit granted for them.

The Bank of England was established in the year 1694. Nearly all the paper money of England and Wales is issued by this bank, £15,000,000 being based on securities, the rest upon actual deposits of coin, like U. S. gold certificates. During the period of the Napoleonic wars and immediately afterward (1797–1822) specie payments were suspended, but at present such a contingency is wholly out of the question.

Its charter has been frequently renewed, and, although considered as perpetual, is subject to amendment.

Previous to the passage of the bank-charter act of 1844 any bank or private person could issue bank-notes, subject to the condition that they must be paid in coin on demand. By that act such issue, with but slight exceptions, was confined to the Bank of England. This was divided into two departments—the bank and the issue department. The bank department is as private as any bank corporation; the issue department is an office of the state. The bank receives from the state office 15 millions of pounds in currency, which amount is loaned or issued to the Government, on which the bank receives 3 per cent. interest. The bank, however, pays to the Government about £200,000 annually for this privilege, and the profit to the bank from this source, after deducting the expense of management, is estimated at only about £100,000 annually. The notes are a legal tender everywhere except in payments by the bank. Bank-notes in excess of 15 million pounds are furnished by the issue department upon the gold coin and bullion held by it, which amount is not included in the reserves and is not under the control of the bank. In 1847, 1857, and 1866 the act was suspended, and the bank issued notes without holding gold; but the amount issued has only once exceeded the amount allowed by the bank charter, and then the excess was but £800,000.

The bank rate of interest since 1865 has varied from 10 to 2 per cent. The average rate for 1866 was 7 per cent.; for 1875, 3½ per cent.; for 1880, 2.76 per cent. The rate was reduced in Mar., 1887, from 4 to 3½ per cent. Its usual dividends are 10 per cent. per annum. The total issues of the United Kingdom on Feb. 5, 1887, were: Bank of England, £23,682,138; 148 private and joint-stock banks, £2,652,765; Scotland, £5,686,201; Ireland, £6,132,129; total for the United Kingdom, £38,153,970.

There is a large number of joint-stock banks which are not banks of issue. The usual dividends of the London and Westminster, London and Joint Stock, London and County, and the Union, which are leading joint-stock banks, are 20 per cent. per annum, and their average deposits are about twelve times the amount of their capital. In 1887 11 joint-stock banks in England, with a capital of £11,305,000, had 426 branches. The total deposits of the joint-stock banks of the United Kingdom in 1891 amounted to £539,000,000.

The number of banks in the Dominion of Canada in 1890 was 39; capital, 59 millions of dollars; circulation, 32 millions; deposits, 136 millions.

The Bank of France was authorized in 1800. Since 1803 it has had the exclusive privilege in Paris, and since 1857 in France, of issuing notes payable on demand. The bank in Mar., 1876, had 74 branches in the departments, and 14 others were in course of organization. Its present charter extends to the year 1897. During the revolution of 1848 it was authorized to suspend specie payments and its notes were made a legal tender. The Bank of France is not a fiscal agent of the Government, as is that of England. It does not collect or disburse the revenues of the exchequer, but lends to it largely in its exigencies, while its credits, in the form of circulating notes and other acceptances, have borne the government safely through extraordinary needs. During the war with Prussia, which continued for ten months and terminated on May 10, 1871, it rendered unexampled service. According to the report of the Minister of Finance for 1873, the total expenditures arising out of the war to that date were 9,288 millions of francs, or (at 20 cents to the franc) about 1,857 millions of dollars—an amount equal to about two-thirds of the war-debt of the U. S. When the war began the circulation of the bank was 251 millions of dollars, and its specie 229 millions, or 90 per cent. of its circulation. In June, 1871, the capital of the bank was 36½ million dollars, its circulation 442 millions, and its specie 110 millions, or about 25 per cent. of its circulation. In Nov., 1873, the circulation reached its maximum, and was 614 millions, while its specie had increased to 146 millions, or 24 per cent. of its circulation. In Dec., 1874, the ratio of specie to circulation was 52 per cent., and in Sept., 1875, 70 per cent. Since that date the amount of the circulation has fluctuated, standing on Nov. 2, 1876, at 515 millions, and on Feb. 8, 1877, at 533 millions. The stock of specie has risen rapidly since Dec., 1874. On Mar. 30, 1876, the bank held 350 millions of specie (of which 250 millions was in gold), being 76½ per cent. of its circulation and 63 per cent. of its deposits and circulation. In 1877, Feb. 22, it held 446 millions of specie, being 84½ per cent. of its circulation, which

was 528 millions. The increase of the circulation from July, 1870, to Nov., 1873, was 351 millions, and the decrease in specie \$3 millions. The decrease in circulation from Nov., 1873, to Sept., 1875, when it reached its lowest point, was 135 millions, and the increase in specie in the same period was 179 millions. In Aug., 1870, the bank was again authorized to suspend specie payments and its notes were made a legal tender, but it has since paid out a large amount of coin. In 1875 it paid out 126 millions in gold and 96 millions in silver, and yet its stock of coin increased over 67 millions. Since the declaration of war in 1870 the bank loaned to the Government about \$600,000,000, and since the suspension of specie payments in 1870 the notes of the bank have, except during a brief period, remained at par. It resumed specie payments Jan. 1, 1878. In 1890 its circulation was \$572,000,000; its metallic reserve, \$474,000,000—not quite half of it silver.

The first organized bank in the U. S. had its origin in the formation of a banking company without charter, which was proposed in a resolution passed June 17, 1780, by citizens of Philadelphia. The first action in the Congress of the U. S. looking to the establishment of a bank was taken June 21, 1780, in reference to this proposed association. In the spring of 1781, Robert Morris, then superintendent of finance, submitted to Congress a plan for the establishment of the Bank of North America at Philadelphia, which plan was approved, and on Dec. 31 following a perpetual charter was granted to that institution. The bank opened for business on Jan. 2, 1782, and on Apr. 1 following the Legislature of Pennsylvania granted to the company a perpetual charter, which, though repealed in 1785, was subsequently renewed from time to time to the date of its last charter, on Dec. 3, 1854. On Feb. 7, 1781, the State of Massachusetts incorporated the Massachusetts Bank. The Bank of New York was chartered on Mar. 21, 1791, although it had since 1784 been doing business under "articles of association" drawn by Alexander Hamilton, who was a member of its first board of directors. All of the above-named institutions are still in a prosperous condition, and all have been converted into national banks.

The plan of establishing a Bank of the U. S. originated with Alexander Hamilton, then Secretary of the Treasury, and was first embodied in his report to Congress on Dec. 13, 1790. The capital of the proposed bank was fixed at \$10,000,000, one-fourth of the private and corporate subscriptions to be paid in gold and silver, and three-fourths in U. S. stocks bearing 6 per cent. interest. Two millions, to be subscribed by the U. S., were to be paid in ten equal annual installments by loans from the bank, or, as Mr. Hamilton describes the operation, "by borrowing with one hand what is lent with the other." This plan was adopted without material alteration by Congress, and approved by Washington, Feb. 25, 1791. During the years 1796-1802 the Government disposed of its stock in the bank at a considerable profit, 2,200 shares having been sold in the last-mentioned year at a premium of 45 per cent.

On Jan. 20, 1815, in accordance with the recommendation of Secretary Dallas, a bill was passed reorganizing the bank, many prominent members of both houses who had previously voted against a renewal of the charter now voting in its favor. President Madison ten days later returned the bill with his objections, but on Apr. 10, 1816, he approved a bill of substantially the same import; and this was the second and last charter of the bank granted by the general Government. The plan proposed by Mr. Dallas was modeled upon the charter of the first U. S. bank, and the act of incorporation, as finally passed, did not differ materially from the plan proposed by him. The charter was limited to twenty years, expiring on Mar. 3, 1836. The capital was fixed at \$35,000,000, seven millions of which was to be subscribed by the Government, payable in coin or in stock of the U. S. bearing interest at 5 per cent., and redeemable at the pleasure of the Government.

During the following year the currency was greatly depreciated; very many failures of State banks, corporations, and individuals had occurred, and the country had not yet recovered from the exhausting effects of its late war. In this emergency the bank attempted, by the importation of more than seven millions of dollars from Europe, at a cost of half a million, to restore soundness to the currency; but it became itself embarrassed, largely through the mismanagement of the branch at Baltimore, and was in danger of absolute failure. Its losses were reported to exceed three millions of dollars; but the bank, as well as the business of the country, eventually recovered. The industries of the

people and the finances of the Government prospered from 1820 to 1835. In this interval the national debt was paid, and the stock of the bank rose in the market until it commanded a premium of 20 per cent.

Congress having refused to recharter the bank, a bill was introduced in the Legislature of Pennsylvania to charter a State bank, to be called the U. S. Bank, which bill became a law just thirteen days before the expiration of the original charter. The circulating notes and the deposits of the Bank of the U. S. were eventually paid in full, and the accounts of the assignees were finally settled in 1856. The shares of the bank were quoted in 1837 at 125, in 1839 at 111, and in 1843, after its failure, at 1½ per cent. The shareholders received no returns on their stock in the final settlement, the whole twenty-eight millions invested by them having been a total loss. The treasury records show that the Government realized a profit of \$6,093,167 upon its investment in the stock of the bank.

State banks were organized in most of the States of the Union under special charters obtained from their several Legislatures. Many of the States, chiefly Southern and Western, authorized banking corporations, with the State as part or sole stockholder. The amount of currency issued by them was frequently twice, and in many instances three times, the amount of their nominal capital. These charters were valuable, and the State Legislatures were besieged by applicants for such special privileges. In 1814 a bill was passed, by a two-thirds vote over the second veto of Gov. Snyder, of Pennsylvania, authorizing forty-one banks, with an aggregate capital of \$17,000,000, of which only one-fifth part was required to be paid in. Charters of banks authorized by the New England and the Southern States in some instances were disposed of to non-residents, who organized banks of circulation with little or no capital, and the citizens of other remote States suffered great loss from the worthlessness of such bank issues. The charters of these banks were in the interest of individuals, and generally of the friends of the dominant political party in the Legislature which granted them. In many instances they were corruptly obtained. Gov. Tompkins, of New York, in the year 1813, under authority of a clause in the constitution of 1777, prorogued the Legislature of that State, assigning as one of the reasons for such action that bank applicants had used or attempted to use corrupt means to secure a charter; and a clause was inserted in the constitution of 1821 which required the assent of two-thirds of the Legislature to the incorporation of a moneyed institution. In 1804 and in 1818 restraining acts were passed by the Legislature of that State, the latter of which provided that no person or association, unless authorized by law, should open an office for the purpose of receiving deposits, discounting promissory notes, or issuing circulation. This act was not repealed until the year 1837. Specie payments were generally suspended in 1814, in 1837, and in 1857, but many of the banks, particularly in the Western and Southern States, which were authorized to issue currency without security, and without such judicious restrictions as should always accompany legislation of this kind, were in a continual state of suspension. The rates of exchange between the Eastern, Southern, and Western States were oppressive, and the losses to the bill-holders from this cause were estimated to be not less than 5 per cent. annually upon the circulation, and to equal in 20 years the entire amount of circulation outstanding.

In 1813 a movement toward a reform in bank currency began in Massachusetts. This system was more fully developed in 1825, when five Boston banks undertook its management. Its exclusive control was finally assumed by the Suffolk Bank, which association compelled the redemption at par in Boston of the notes of the New England banks by a system of assorting and returning the notes to the place of issue; and its operations were continued down to the establishment of the national bank system.

In 1829 Mr. Van Buren, then Governor of New York, recommended a "safety-fund" system as affording greater security to the creditors and bill-holders of chartered banks; and during that year a bill which embodied his recommendation passed the Legislature and became a law. The system continued in operation for nine years, and its chief features were subsequently copied by Ohio and other States of the Union.

Suggestions regarding the expediency of requiring security to be given for bank issues were made by financial writers as early as 1815, and by Mr. Gallatin in 1831. The latter proposed that existing bank-notes be taxed out of ex-

Fuller figures are given in the reports of the comptroller of the currency for successive years. See also CLEARING-HOUSE, CURRENCY, SAVINGS-BANKS.

Revised by A. T. HADLEY.

Bank Ban: ban of Hungary; flourished in the first half of the thirteenth century, and acquired a kind of romantic fame from the prompt revenge he took upon Queen Gertrude, the spouse of Andreas II., King of Hungary. The queen's brother, Eckart, seduced the wife of the ban, and the queen aided him in carrying out his evil design. But as soon as Bank discovered the queen's participation in the conspiracy he gathered a mob, stormed the palace, and killed the queen, though he knew that it would cost him his life. And so it did. When King Andreas II., who was absent on a campaign in Poland, returned, he immediately put Bank to death. The story has several times been made the object of dramatic treatment. Katona's drama *Bank-bán* (Klausenburg, 1827) is considered one of the best dramas the Hungarian literature has produced; it was translated into German by Dux (1858), and the genuine pathos of the characters and the scenic strength of the story made a great impression.

Banks, HENRY: b. in London, 1757; was educated at Westminster School and at Trinity College, Cambridge, and entered Parliament in 1780 for Corfe Castle, which place—the family borough—he continued to represent till 1826. He wrote *The Civil and Constitutional History of Rome from the Foundation to the Age of Augustus* (1818, 2 vols.). D. at Tregothnan, Cornwall, Dec. 17, 1834.

Bankhead, JONAS PINE: captain U. S. N.; son of Gen. James Bankhead, U. S. A.; b. in South Carolina, Aug. 3, 1821; entered the navy as a midshipman Aug. 6, 1838. He commanded the gunboat *Penhina* at the battle of Port Royal, Nov. 7, 1861, and during the subsequent operations on the coast of South Carolina; commanded the *Monitor* when she foundered off Hatteras on the night of Dec. 31, 1862, and displayed admirable coolness on that trying occasion. He was made captain in 1866. D. near Aden, Arabia, Apr. 27, 1869.

Bankrupt [orig. *banke rota*, from Ital. *banca rotta*, bank broken, but changed to *bankrupt* under influence of Lat. *ruplus*]; originally a merchant whose bench or counter had been broken by reason of inability to pay his debts. In its popular sense the word is now nearly synonymous with *insolvent*, and denotes any person unable to meet his liabilities. In England its legal signification is well defined. It embraces only traders, or persons whose business it is to buy and sell for gain, and the various statutes which have been enacted there since the reign of Henry VIII. in relation to bankrupts have been applicable to that class alone. By the English laws a bankrupt is a trader who has committed an act of bankruptcy, as defined by statute. A trader may have committed an act of bankruptcy, and have been formally adjudged a bankrupt, and yet be entirely solvent—that is, eventually able to pay his debts in full; and he may be wholly unable to pay his debts, and yet have committed no act of bankruptcy. A bankrupt was at first regarded as an offender against the law, and bankrupt laws were intended for the benefit of creditors. But at present they are founded on the interests of trade, and intended to be beneficial to both debtor and creditor. If the conduct of the bankrupt has been such as to entitle him to the consideration of the court, he is discharged forever from all debts owing by him at the time he became a bankrupt. The law is confined to traders, because they are regarded as possessing peculiar facilities for delaying and defrauding creditors; and, on the other hand, they are considered, generally speaking, the only class subject to heavy accidental losses, and to an inability to pay their debts without any fault on their part. The above statements must be qualified by the results of the statute 46 and 47 Vict., c. 52 of 1883, and 53 and 54 Vict., c. 71 of 1890. For other details, see *INSOLVENCY*.

In the U. S., Congress possesses the power, under the Constitution, to establish uniform laws on the subject of bankruptcies. Pursuant to this power, in the year 1800, Congress passed a bankrupt law, which by its own terms was limited to five years, but it was repealed in 1803. This law preserved the leading features of the English laws relating to bankruptcy. It could be enforced only on the application of creditors, and embraced only the mercantile class.

In the year 1841 the second bankrupt act was enacted by Congress. It could be taken advantage of by all persons whomsoever residing in the U. S. owing debts not con-

tracted in a fiduciary capacity, although it could be enforced at the instance of creditors only against merchants, bankers, brokers, factors, and underwriters. This extended exercise of the power over the subject of bankruptcy was violently opposed as unconstitutional, on the ground that Congress was confined to the well-recognized meaning of the term bankruptcies as understood in the English courts when the Constitution was formed. The law was repealed in Mar., 1843.

But by act approved Mar. 2, 1867, Congress passed a third bankrupt law, even more general in its scope than the preceding. Under it any person residing in the U. S. and owing debts to the amount of \$300 could, on his own application showing his inability to pay his debts in full, and his desire to surrender his property for the benefit of his creditors, take advantage of the act and be declared a bankrupt. So a debtor owing a specified amount could be forced to become a bankrupt upon the application of creditors if he has committed any of certain offenses or acts specified in the statute. The bankrupt, after the distribution of his property amounting to a fixed percentage of his debts, obtained a discharge from all his indebtedness existing at the time the petition was filed, except in certain instances specified in the act. This act has been in its turn repealed (chap. 160, laws of 1878).

The distinguishing feature of a bankrupt act is the summary seizure of all the debtor's property, and its division among his creditors in proportion to their claims. The race of diligence among creditors is entirely at an end, and all legal proceedings, except such as are in conformity to the statute, are stayed. It is against the policy of the bankrupt law to allow the debtor, in contemplation of bankruptcy, to give preference to one creditor over another. All such preferences are void, and an attempt to make them is of itself an act of bankruptcy.

The various States also possess the power to pass bankrupt laws, but no State bankrupt or insolvent law can impair the obligations of contracts. Hence they can not release a debtor from obligations incurred before the passage of such law, nor act upon the rights of citizens of other States. And when Congress sees fit to exercise the power over the subject of bankruptcies granted it by the Constitution, the State laws on the same subject are suspended. On the repeal of the Congressional law the State laws would revive. The power of Congress over the subject is plenary, and its law may affect existing debts as well as those which are contracted after its enactment.

The judicial business in bankruptcy is in the main transacted by the district court of the U. S., with officers called registers to conduct the administrative or non-contested business. The estate is managed by an assignee, who acts as a trustee, and is accountable to the court referred to.

T. W. DWIGHT.

Banks (named after Sir JOSEPH BANKS, *q. v.*): name of four single islands or groups: (1) An island off the coast of British Columbia, on the east side of Hecate Straits, in lat. 53° 30' N., lon. 130° 10' W.; 41 miles long by 5 to 10 broad; high, rocky, and wooded. (2) A large island in the Arctic Sea, north of British America, in about lon. 120° W. (3) A small island in Torres Straits, between New Guinea and Australia. (4) A group of islands in the South Seas, consisting of two larger and five smaller islands, the northern part of the New Hebrides cluster. M. W. H.

Banks, Sir JOSEPH, LL. D., F. R. S.: naturalist; b. in London, Feb. 13, 1743. He was educated at Oxford. He sailed with Capt. Cook in his voyage round the world in 1768, returning in 1771 with rich collections of plants, animals, etc. In 1778 he was chosen president of the Royal Society, over which he presided forty-two years. He contributed memoirs to the *Philosophical Transactions* and other publications. D. at Spring Grove, Isleworth, near London, June 19, 1820.

Banks, NATHANIEL PRENTISS, LL. D.: a statesman and general; b. at Waltham, Mass., Jan. 30, 1816. He learned the trade of a machinist, studied law, was elected to the Legislature as a Democrat in 1849, and was chosen Speaker of the House of Representatives of Massachusetts in 1851. Having been elected a member of the national Congress in 1852, he was separated from the Democratic party by his opposition to the extension of slavery, and in 1854 was returned to Congress by the Republicans and Know-nothings. In Feb., 1856, after an exciting contest which occupied two months, he was chosen Speaker of the House on the one

hundred and thirty-third ballot. He was elected Governor of Massachusetts in Nov., 1857, for one year, and was re-elected in 1858 and 1859. In May, 1861, he was appointed a major-general of volunteers, and soon obtained the command of an army on the Potomac. Having gained some advantage at Winchester, in Mar., 1862, he pursued the enemy to Harrisonburg. On May 24 he was attacked by Stonewall Jackson, and retreated rapidly to the Potomac. In Dec., 1862, he succeeded Gen. Butler as commander of the department of the Gulf. About the end of May, 1863, he invested Port Hudson, which was taken with about 6,000 prisoners July 9. In the spring of 1864 he conducted an expedition up the Red river, in which Rear-Admiral Porter co-operated with the gunboats. He ascended above Grand Ecore. After several battles at Pleasant Hill (April 9) and other places, being pressed by superior numbers, he retreated toward New Orleans, and was relieved from the command in May, 1864. He was chosen M. C. by the Republicans of Massachusetts in 1864, 1866, 1868, and 1870. He served as chairman of the Committee of Foreign Relations in the Fortieth and Forty-first Congresses. He advocated the election of Horace Greely as President, and was defeated for Congress in 1872, but was re-elected in 1874 and 1876. He was U. S. marshal at Boston, Mass., 1879-88; re-elected to Congress Nov. 6, 1888. D. in Waltham, Mass., Sept. 1, 1894.

Banks, THOMAS: the first great English sculptor; b. at Lambeth, Dec. 29, 1735. He gained the gold medal of the Royal Academy in 1770, and went to Rome in 1772. He remained for several years in Rome, and produced there *Caractacus Pleading before Claudius*, and an admirable statue of *Psyche and the Butterfly*, which was purchased by Catherine II. of Russia, at whose invitation he visited St. Petersburg in 1784. Among his masterpieces is the *Mourning Achilles*. He excelled in imaginative works. He became a member of the Royal Academy. D. in London, Feb. 2, 1805.

Banks, Savings: See SAVINGS-BANKS.

Bank Safes and Vaults: See SAFES, BURGLAR-PROOF.

Bank'sia: a genus of Australian shrubs and trees of the family *Proteaceae*, named in honor of Sir Joseph Banks; have hard, dry leaves, and an umbellate arrangement of branches bearing near the extremities oblong heads of numerous flowers, which secrete much honey. They are called honeysuckle trees, and abound in all parts of Australia. One species (*Banksia grandis*), found at Swan river, grows to a height of 50 feet.

Banks Land: island in western part of Arctic America; discovered by Parry 1819; separated by Banks Strait from Melville island on the N. W. and by Prince of Wales Strait from Prince Albert Land on the S. See map of North America, ref. 2-D.

Bankura: a district and town of Burdwan division, Bengal, British India; between the parallels 22° and 23° N. and the meridians 86° and 87° E.; N. W. from Calcutta, and between the Gangetic delta and the highlands. The fat paddy lands along the eastern margin gradually pass into the undulating forest tracts of the west. The district is noted for the fine colored silk cloths manufactured within it. The climate is fairly healthy. The winters are cool and bracing, but the summers are hot and oppressive. The rainfall is about 60 inches. The district suffered greatly from the famine of 1865-66. Area, 2,621 sq. miles. Pop., 1,000,000. Bankura city (see map of N. India, ref. 8-I) is the capital (lat. 23° 14' N., lon. 87° 7' E.); has a population of 19,000. Bishampur is about as large. M. W. II.

Bann: either of two rivers in N. E. of Ireland—the Upper Bann, 25 miles long, flowing into, and the Lower Bann, 40 miles long, flowing out of, Lough Neagh. The Lower Bann has important salmon and eel fisheries.

Bannatyne Club: a literary club deriving its name from George Bannatyne (1545-1608), who was born in Scotland. He compiled a collection of manuscripts called *Corpus Poeticum Scotorum*. This club was founded at Edinburgh in 1823 by Sir Walter Scott, its design being to promote the knowledge of Scottish history and antiquities, and to print rare works which tend to illustrate those subjects. The club originally consisted of thirty-one members, and gradually increased to one hundred, to which number it was finally limited.

Ban'neker, BENJAMIN: a Negro mathematician; b. at Ellicott's Mills, Md., Nov. 9, 1791. He was the author of an almanac (1792, *sqq.*), of which a copy was sent by Thomas

Jefferson to the secretary of the Academy of Sciences at Paris. Banneker assisted in laying out Washington city and running the boundary-lines of the District of Columbia, D. at Baltimore in Oct., 1806. See his *Life* by J. H. B. Latrobe (Phila., 1845), and by J. S. Norris (1854).

Ban'ner [O. Fr. *bannere*, formed with Lat. suffix *-aria* from a Teutonic loan-word; cf. Goth. *bandwō*, emblem, of same root with Eng. *band*]: a flag; that is to say, a piece of cloth attached to a spear or staff, and serving to denote the nationality of a company of soldiers, the character and purpose of a society, or the rank of a prince or chief. The modern use of the term for a flag which hangs from a cross-bar is not the original or proper meaning. In the Middle Ages the term denoted the square flag carried before a knight-banneret. In literature the term is used as synonymous with flag, but in a somewhat lofty or poetical sense.

RUSSELL STURGIS.

Ban'neret: See KNIGHT.

Ban'niester, HENRY, D. D.: b. at Conway, Mass., Oct. 5, 1812; graduated at the Wesleyan University, Conn., in 1836; studied at Auburn Theological Seminary; was teacher and principal of the Methodist Academy at Cazenovia 1838-56; and in 1856 was appointed Professor of Exegetical Theology in the Garrett Biblical Institute, which is now the Theological Department of the Northwestern University at Evanston, Ill. He was author of several able published sermons, addresses, and reviews scattered in various periodicals. He was also a highly esteemed professor, teacher, and lecturer. D. at Evanston, Ill., Apr. 15, 1883.

Ban'nockburn: a village of Scotland; in the county of Stirling, on the Bannock rivulet, 3 miles S. of Stirling (see map of Scotland, ref. 11-G). It was the scene of a famous and complete victory gained by Robert Bruce over the English army, led by the king, Edward II., on June 24, 1314. The English lost about 30,000 men. Here are important manufactures of woolens, especially tartans and carpets. Pop. about 2,600.

Banns (or Banns) of Marriage [for etymology see BAN]: a public notice of an intended marriage, given in a church or other place prescribed by law. The law of England requires that all banns of matrimony shall be published in an audible manner, according to the rubric prefixed to the marriage service in the Book of Common Prayer, after the second lesson at matins or evensong, upon three Sundays preceding the ceremony. This rubric is in the following terms: "I publish the banns of marriage between A, of —, and B, of —. If any of you know cause or just impediment why these persons should not be joined together in holy matrimony, ye are to declare it." The English law, however, dispenses with this preliminary publication if the parties obtain a license from the court of the bishop of the diocese or any of his surrogates, or from the Archbishop of Canterbury. A republication of the banns is necessary if the marriage is not solemnized within three months. The "bidding" of banns has fallen into disuse in the U. S., though it is still occasionally heard. The practice was first directed in the times of the Fathers, was enacted afterward by Odo, Bishop of Paris, about 1176, placed in the canon law in 1200 by the Synod of Westminster, and prescribed for the whole Latin Church by the Lateran Council in 1215. It is still required by the canon law of England and of the Roman Catholic Church. Revised by W. S. PERRY.

Bannu: See BANU.

Banswara, būn-swaara (i. e. the forest country): a feudatory state in Rajputana, British India; lat. 23° 30' N., lon. 74° 30' E.; area, 1,500 sq. miles. Pop. 105,000, of whom 48,000 are Bhils, a brave and warlike hill tribe of India, not disposed to agriculture. The country is arid.

Bantam, būn-taam': an old town of Java, on the north coast, 44 miles W. of Batavia (see map of East Indies, ref. 8-C). It was formerly a large city and great entrepôt of trade, but on account of the unhealthy climate is at present almost deserted. In the fifteenth century it was the chief town of a powerful Mohammedan empire of the same name, which at one time even comprised the southern part of Sumatra and the west coast of Borneo. In 1683 the Sultan of Bantam became a vassal of the Netherlands, and in the beginning of the present century the Dutch took possession of the sultanate. The town is in lat. 6° 2' S., lon. 106° 50' E.

Bantam: a name applied to the numerous dwarf breeds of the domestic fowl, many of which are of very recent

origin. Originally given to a small breed supposed to have been brought from Bantam, Java. Bantam fowls are remarkable for their courage and for consequential fussiness.

Ban'teng (*Bibos sondaicus*): a species of ox (*Borida*); a native of Java and Borneo, which in color, shape, horns, and want of dewlap bears some resemblance to the gaur of India. It has short and sleek hair, slender limbs, and a sharp muzzle. Though extremely wild, it is often domesticated by the natives, and becomes a very serviceable animal.

Ban'tingism: a regimen for the reduction of corpulence; so called after a London undertaker named William Banting (1797-Mar. 16, 1878), who introduced it (1863) as the result of his own experience. The regimen was suggested to him by Mr. William Harvey. In several weeks he reduced his weight from 202 lb. to 156 lb., and with marked gain to his health. The regimen consists essentially in the avoidance of food containing fatty matter, and of materials which may make fat in the body, as starch and sugar. Lean meat predominates in this diet; vegetables are almost excluded; butter, milk, sugar, and malt liquors are prohibited. With active exercise this method is often successful in reducing excessive weight.

Bantry Bay: a deep inlet in the south of Ireland, in Cork County; is 25 miles long and from 3 to 5 miles wide. It is one of the finest harbors in Europe, affording safe and commodious anchorage for ships of all sizes. The coast of the bay is high and rocky, consisting of Devonian strata, and exhibits some of the finest scenery in the island. Near the entrance of this bay occurred a naval action between the English and French in 1689.

Ban'tu: See AFRICAN LANGUAGES.

Bann, *baa'noo*, or **Bannu**: a district of the Darajat division of the Punjab, British India; situated between the parallels 32° and 33° N. and the meridians 70° and 72° E. Area, 3,868 sq. miles. Pop. 333,000, 90 per cent. of whom are Mohammedans. The Indus flows through the district, but its course is very capricious and it has a tendency to move eastward. During inundations it is a vast body of water, many miles across. The principal crops are the ordinary cereals, millet, sugar-cane, cotton, and oil seeds. The principal towns are Trakhel, pop. 7,500, and Kalabagh, 6,500. M. W. II.

Bauville, *baän'veel'*, THÉODORE FAULLAIN, de: French poet; b. at Moulins, Mar. 14, 1823; has obtained the admiration of a clique (*sai-disant* decadent) of French and other writers. In 1842 he published *Les Cariatides*, and *Les Statuéciles* in 1846; but he first attracted general attention by his *Odes funambulesques* (1857). Afterward he published many verses and wrote several plays. His poetic works have been published together in 3 volumes (1878-79); also his plays (except the opera-ballet *Les Nations*), under the title *Comédies*. A volume of recollections, *Mes Souvenirs*, appeared in 1882. D. in Paris, Mar. 13, 1891.

A. R. MARSH.

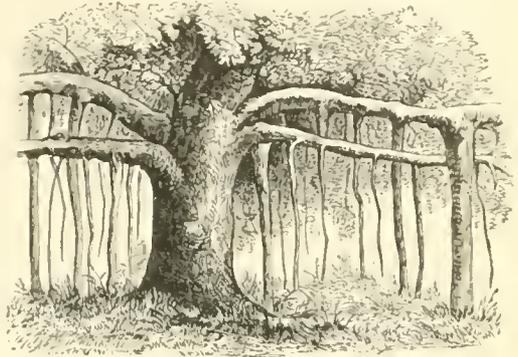

Baux'ring: an insectivorous quadruped, of the genus *Tupaia*; native of Sumatra, India, Borneo, etc. It climbs trees with agility, like the lemur and squirrels, and has an elongated muzzle and a long bushy tail.

Tupia, or banxring.

Ban'yan, Banian, or, in Bengalese form, **Baniya** [from Skr. *vanij*, a merchant]; a Hindu shop-keeper or merchant; especially one of the wholesale dealers and importers of Bombay, Surat, Cambay, etc., who carry on a trade with the interior of Asia by caravans and with Africa by ships. They usually belong to the caste called Vaisayas, and strictly abstain from animal food.

Banyan, or **Banian** [so called because frequently used as market-places by the banyans or merchants]: an East

Banyan-tree.

Indian tree (*Ficus indica*), remarkable for its mode of propagation by means of aerial roots, which, on descending to the ground and penetrating it, become stems or trunks. These roots at first hang like loose cords, but after they take hold they are gradually tightened, till they become almost as firm as a rod of iron. In this manner a single tree spreads over a large extent of ground, and endures for many centuries. One of these trees has been described as having 350 large stems, and occupying so large a space that many thousand persons might stand under its shade. It is a species of fig, and produces a fruit about as large as a cherry, and of a rich scarlet color. An abundance of gum-lac is procured from this tree, the bark of which is esteemed as a tonic by Hindu physicians. The above illustration may serve to give one an idea of a vigorous and comparatively young banyan-tree. In very old trees many of the stems often become almost or quite as large as the original trunk. Its wood is light, porous, and of little value.

Banz, *baans*: the name of one of the finest Benedictine abbeys known in history; situated in Bavaria in the midst of a beautiful landscape. The monks of this abbey were noted for their learning and humane spirit. It was founded in 1058. The convent was abolished in 1802, and is now the summer residence of the princes of Bavaria. Here is a museum which is especially rich in petrifications.

Ba'obab: See ADANSONIA.

Baour-Lormian, *baä'oor' lö'r-mi-sän*, PIERRE MARIE FRANÇOIS LOUIS: French poet of the first empire; b. at Toulouse, Mar. 24, 1770; translator of Tasso (1795) and Ossian (1801), and author of many tragedies in the severely classic style, which were greatly admired in their time; but before his death he saw himself one of the most despised of poets, the butt of numberless epigrams, and the especial detestation of the Romantics. He had been made a member of the French Academy (1815), however, and when he died this body, still a stronghold of the classicists, manifested their respect for him by unusual signs. Nisard, whose own classical sympathies were in the main with him, pronounced the funeral oration. D. in Paris, Dec. 10, 1854.

Revised by A. R. MARSH.

Baph'omet: a mysterious symbol of the Knight Templars, was a small human figure cut out of stone, having two heads, male and female. It was environed with serpents and astrological attributes, and marked with inscriptions, mostly in Arabic. The word is supposed to be a corruption of Mohammed or Mahomet (called by the Portuguese, Bafoma), to whose religion the Templars were suspected of leaning. Others derive it from Βαφή Μήτρως, the "bath of wisdom," a reputed name of the Gnostic baptism, often called in old writings "baphiometric baptism." Some explain it as a cabalistic term formed by writing backward, *tem. o. h. p. ab. i. e. templi omnium hominum pacis abbas*. Quite a number of baphomets are preserved in European archaeological collections.

Baptism [from Gr. *βαπτισμός*, subst. to *βαπτίζω*, baptize]: a sacrament and initiatory rite of the Christian Church. By whatever other ceremonies one may be advanced to the privileges of full membership, it has been universally held in Christendom, except among sects repudiating sacraments altogether, that a baptized person was by that rite incorporated into the Church which Christ and the apostles founded, or into the mystical "body of Christ." The authority for this rite rests upon the New Testament. (See Matt. xxviii. 18-20; Mark xvi. 16; Acts ii. 38, x. 44; Rom. vi. 4; Col. ii. 12, etc.) From these and similar texts a doctrine of baptism has been developed, as a common Christian heritage, although it has been variously modified by differing religious bodies.

It has been customary to find the antecedents of baptism in the rites with which it was alleged that the Jews received proselytes into their number, and also in the rite practiced by John the Baptist; but both of these subjects are very obscure. It is thought by some that the Jewish baptism of proselytes came into use after the final dispersion of the nation, and in imitation of Christian practice. As for John's rite, it is not known what formula he used, nor into what body he regarded it as an initiation, if any at all, nor what the inward benefits were which he attached to the ceremony, except that it was a symbol of repentance. For all purpose of argument or use, baptism must stand upon New Testament texts and the usages of the Christian Church.

Rites.—The practice of the early Christians as given in the New Testament was very simple. There is no evidence that Christ ever baptized, but he seems to have adopted the rite of his forerunner and to have lifted it into a higher significance. It was no longer a symbol merely of repentance, but also of a new life, a *patogenesis* wrought by the Holy Ghost, an assurance of forgiveness, and a badge of entrance into the "Kingdom of God." It is clear that the apostles (Acts ii. 38-41; viii. 16) and the evangelists (Acts viii. 37, 38; xix. 3-5) baptized, and in these two passages there is an intimation of the verbal formula at first used. Soon, however, it began to be held that the two outward essentials of baptism were the use of water and of the words of Christ as given in Matt. xxviii. 19. It is probable that the primitive rite was ordinarily performed by immersion, which became a trine immersion in respect to the three persons of the Trinity, but later the trine immersion ceased, as affording ground for questioning the unity of the Godhead. The Council of Ravenna, 1311, legalized the baptism of sprinkling, by leaving to the officiating minister the choice of the two modes of applying water; but the practice of "clinical" or bedside baptism had long been in use, and had spread from the sick-room to the churches. This practice received an impulse from the desire of catechumens to postpone their baptism, as was the case with Constantine, until the end of life drew nigh, that the recipient might receive the spiritual benefits involved at the latest moment, and when the danger was least of forfeiting baptismal grace by subsequent misconduct. By reason of this postponement Christians now and then died unbaptized, but if they departed this life as martyrs they were held to have received the "baptism of blood." St. Augustine speaks also of a "baptism of tears" as possible for the deeply penitent. Baptism of the dead was a rite received often by proxy, but was regarded as heretical. Lay baptism was long recognized as valid in the early and mediæval Church, as it still is by the Roman Catholics, although with the development of high views of the clerical function this practice was discouraged. In emergencies nurses and midwives and even unbaptized laymen, if their intent was right, could administer the sacrament. Among Protestants, however, lay baptism is scarcely recognized at all.

The early Church developed elaborate ceremonies in connection with baptism. Candidates for the rite were termed catechumens, and received by laying on of hands to a long course of instruction. At first they were not allowed to witness the mysteries (hence the term "mass" or *missa* for the Eucharist, which was celebrated after the dismissal of the general congregation). They were permitted to attend church, worship as witnesses at first, and then to take part in the responses and genuflections. From these the *electi* were taken, and baptism was administered at the great church festivals, especially Whitsunday. The catechumen was received; given a Christian name; turning to the west he renounced the "devil and all his works"; then he was exorcised, the priest laying his hands on him, breathing in

his face, and commanding the evil spirit to come out of him. The ceremony of opening the candidate's ears and nose followed, indicating that he was to receive the Word and Holy Spirit. He was then anointed with oil: sometimes an anointing followed the baptism itself. Then came an instruction, which ended with the rehearsal of the Lord's Prayer and Apostle's Creed by the catechumen. Often a whole day was passed in these preliminaries. In baptism the water was first consecrated. The rite was performed at the entrance of the church, and quite commonly after it the baptized received a white garment in token of his cleansing from sin. These garments were often laid up in the churches as witnesses, lest the baptized forget their vows.

Water is still variously applied: in immersion the person is submerged backward in the water; in pouring or affusion, water is poured from a vessel or a shell over the head; in aspersion or sprinkling the water is dropped from the hand upon the head. In primitive immersions the catechumen was submerged face downward. In the Church of England infant immersion, or dipping, was practiced until after the Reformation. In the Greek churches a form of immersion is still observed. In these two and in the Anglican communions the application of water is followed by the minister's making a sign of the cross upon the forehead of the baptized.

The practice of infant baptism gave rise to *Sponsors* (*g. v.*), or god-parents, who promised in the child's behalf faith and obedience, and on their own the child's Christian nurture.

Divergencies of views concerning baptism have arisen, extending from the *ex opere operato* theory found in St. Augustine, and the High-Church expansion of his views, to the Quaker contention that the inward witness of the Holy Ghost suffices without other ceremony. They arise over the mode of applying water and over the qualifications for it, from the baptism of infants to that of adults only, and then on a profession of repentance and faith. These characteristic views will be found stated in this work in the article *BAPTISTS* (*g. v.*) and under the titles of the various Christian denominations.

S. M. J.

Baptism from the Roman Catholic standpoint "is the sacrament of regeneration by water in the word." (*Catechism of the Council of Trent.*) 1. The matter of baptism is natural water poured on the head of the person to be baptized. But baptism by immersion or by sprinkling would be equally valid.

2. The form of words to be pronounced by the minister in the very act of pouring on the water is: "I baptize thee in the name of the Father, and of the Son, and of the Holy Ghost."

3. The ordinary minister of baptism is the priest; but any man or woman, heretic, Jew, or pagan can validly baptize, provided he applies properly the matter and form, and has the intention to do what Christ ordains.

4. The effects of baptism are in general regeneration, and in particular the infusion of sanctifying grace, the gifts of the Holy Ghost, faith, hope, and charity, etc., and the remission of all sin, original and actual, and of all penalties due to sin, both temporal and eternal. Baptism also imprints an indelible character, and makes the recipient a member of the Church of Christ.

5. Unless already validly baptized, any human being (even infants and idiots) is a *subject* capable of receiving baptism. Adults should have the proper dispositions.

6. Baptism is *necessary* to salvation. But in case of necessity the baptism of desire, or of blood, can, in the case of adults, supply the place of baptism by water.

JOHN J. KEANE.

Baptistery [from Gr. *βαπτιστήριον*, bathing-place, baptistery]: the building or chamber set apart for the administration of the sacrament of baptism. These buildings are either octagonal, polygonal, or circular. They are usually placed at the west end of the church or at the entrance, baptism symbolizing the entrance into the Church of Christ. They began to be erected probably in the time of Constantine. The baptistery of the Lateran in Rome (about 62 feet in diameter) is said to have been built by him. The baptistery of Florence, among the most celebrated, is an octagonal structure about 100 feet in diameter, standing in close proximity to the cathedral. It is built of black and white marble. The most remarkable features of this baptistery are the magnificent bronze doors, adorned with bas-reliefs by Ghiberti and others. In the center of each of these build-

ings erected for baptismal purposes is a font, which is often of considerable proportions—that at Ravenna being about 9 feet square, and that of the Lateran, at Rome, 37 inches or more in depth.

Baptists: a body of evangelical Christians numbering about 5,000,000 of communicants, who insist that believers are the only proper subjects, and that immersion is the only proper mode of baptism. They insist also on the Bible as the sole and sufficient rule of faith and practice, on the independence of the local church, the separation of the Church from the state, and the widest liberty of conscience. In America the large majority adhere to strict communion at the Lord's table. There are several divisions among them, but the largest division is Calvinistic in its type of doctrine. They are most numerous in Great Britain and North America, but are also represented in many other countries.

So far as present researches go, the name "*Baptist*," as applied to this body of Christian people, first appears in literature in the year 1614 in a volume entitled *The Anabaptists' Groundwork for Reformation*, page 23. Prior to that date they were without a name, and commonly designated themselves as "those who are unjustly called Anabaptists." (See ANABAPTISTS.) The new name gave offense; it was charged that "they arrogate to themselves the title of Baptists, as if none were baptized but themselves." Much speculation has been bestowed to determine why this more aggressive attitude should have been assumed about the year 1614. Some have fancied that the new title was claimed and maintained because of the change in the form of administering baptism, which is alleged to have occurred about the year 1611, when immersion was restored in the place of sprinkling and pouring. If these had been retained it would have been as impossible for them to shake off the name Anabaptist as it was in the case of the Anabaptists of Germany. After the restoration of immersion, it was easy to insist that those who practiced it were alone "baptized people," emphasis being laid not only upon the subjects as formerly, but also upon the mode of baptism. This latter emphasis was clearly indicated by the name Baptist.

In the year 1609 or 1610 a body of English Anabaptists was organized in Holland, which subsequently developed into the Arminian Anabaptist movement in England. After 1611, when believers' immersion was restored in England, this body of Arminian Anabaptists became known as General Baptists. No traces of believers' immersion have yet been discovered in England between 1509 and 1641. The Puritan movement was in progress; Ainsworth, Johnson, Clifton, and their adherents were already settled in Amsterdam, where they found refuge from their English persecutors. Possibly in 1606 John Smyth made his way to Amsterdam from Lincolnshire for the same purpose, with another party composed of about forty adults. Arrived in Amsterdam, Mr. Smyth shortly fell in with the Mennonites, and fell out with Ainsworth and the friends with whom he had hitherto co-operated. The Mennonites, who opposed infant baptism, persuaded Smyth that he had never been baptized. All of Smyth's company apparently joined him in this conviction, and decided to have themselves rebaptized. Smyth took the lead, and, after performing the ceremony in his own case, proceeded to baptize the others. The mode of this baptism, it is believed, was by sprinkling, since that had now become the general mode in England, and the Brownists do not appear to have used any other. Certainly there was no other mode among the Mennonites, and sprinkling had by this time become almost universal in every section of Holland and Germany.

Instead of welcoming this change the Mennonites criticised the action of Smyth and his people, asserting that they had no right to baptize themselves, for the reason that they had no succession in respect to baptism or the ordination of elders. Smyth was impressed by that reasoning, and shortly became assured that his new position was untenable. According to de Hoop Scheffer, it was in the year 1609 that he applied to be admitted to the Mennonite Church in Amsterdam, where he fancied was true succession both as regards ordinances and officers. Thirty-one of his followers united with him in that request. They were not immediately admitted, but remained on the threshold till the year 1615 before they were finally received. Smyth had passed away meanwhile, in 1612.

Four persons of the party of Smyth were unwilling to join him in seeking admission to the Mennonite Church, as-

serting that succession is a mark of the beast, and intimating that the Mennonites could not demonstrate their own succession. Their names were Thomas Helwys, William Piggott, Thomas Seamer and John Murton. Their protest was uttered on Mar. 12, 1609. Some time afterward, possibly before the close of the year, they concluded to organize themselves into a church, a step in which they may have been joined by their wives or other members of their families. De Hoop Scheffer suggests that as many as ten persons participated in founding this English Anabaptist Church. In the year 1611 appeared their earliest confession of faith, entitled *A Declaration of Faith of English People Remaining at Amsterdam, in Holland*. They shortly returned to England, and established their church at Newgate, in London. In the year 1626 there were five of these English Anabaptist churches in England, which comprised about 150 communicants. By the year 1644 the number of churches had increased to something over forty.

Though the company of Helwys and Morton had refused to enter the Mennonite communion, they had not escaped the influence of the Mennonites. They lost in Holland the assured faith which they had carried thither in the doctrines of the Calvinistic system, and became Arminians. The denomination which they founded later became known as General Baptists, owing to the fact that they believed in a general atonement. They also surrendered the Brownist ecclesiastical constitution, and borrowed from the Mennonites the constitution with elders and deacons which has now become almost universal among Baptists. They stoutly refused to accept the Mennonite opinion regarding oaths and the magistracy, but were disposed to favor the idea that it of churches is sinful for a Christian man to bear arms.

The other branch which, after 1641, became known as English *Particular Baptists*, had a different history. At the outset, all Brownists who could conveniently escape took refuge from persecution in Holland. By the year 1616, however, it was considered possible for them to remain at home, and in that year the oldest Independent church on English soil was established at London under Mr. Henry Jacob. In the course of time it was perceived that a portion of the members of Mr. Jacob's church denied the truth of the parish churches, while others conceded that point. This led to a peaceful separation, the seceding party organizing a new church on Sept. 12, 1633. A large portion of this seceding party also scrupled the baptism which they had received in infancy, and these submitted to adult baptism, apparently by sprinkling. Having had no kind of connection with Holland or the Mennonites, their Calvinism remained intact. Their church constitution was likewise at the beginning unaffected by the Mennonite scheme; they were in favor of the four grades of officers—pastors, teachers, elders, and deacons—which at that period prevailed among the Independents. In fact, so intimate and fraternal were the subsequent relations between the Particular or Calvinistic Baptists and the Independents, that the custom was shortly established of organizing mixed churches, composed in part of Independents and in part of Baptists, with a pastor selected indifferently from either denomination. The church over which Mr. Bunyan presided was of that sort, and there were many others. The lines between the two denominations are now more strictly drawn, but there are still numbers of these mixed churches in England. The Particular Baptists, having received no education in Mennonite views, did not, as the General Baptists are known to have done, feel any scruples touching the lawfulness of military service. That a Christian might become a magistrate, or incur the responsibilities of a judicial oath, was also never questioned among them.

Soon after the organization of this first Calvinistic Anabaptist Church a discussion was raised concerning the proper mode of administering baptism, and the conviction was at length established that immersion was the only scriptural mode. Much embarrassment resulted when they began to consult as to the wisest course of procedure. Mr. Spillsbury, the pastor, and most of the members, held the opinion that, since the circumstances were extraordinary, it was admissible for any minister to administer immersion even though he had not himself received the rite, arguing that neither John the Baptist nor the twelve apostles had been baptized before they commenced to baptize others. That position was approved by the larger number, and those who were accounted most judicious. Others were discontented, and insisted upon obtaining succession. Some of these were members of Mr. Spillsbury's flock, but it is supposed

that the majority still belonged to the Independent Church from which Spillsbury's church had separated. No succession could be obtained in England; they were aware of the existence of the Arminian Anabaptists, but as these were still in the practice of sprinkling they could afford no relief. Mr. Richard Blunt, who took an active part in favor of succession, was master of the Dutch language, and well acquainted with the condition of affairs in Holland. He cited attention to the Collegiants, who in the year 1620 had established the practice of immersion at Rhynsburg, and proposed to send thither and obtain succession from them. He was deputed to go abroad for that purpose, and, arriving at Rhynsburg, was courteously received by Mr. John Batten, successor of the brothers Van der Codde in the pastoral office there. In due time Batten consented to immerse him, and returning to England he administered the rite to the rest of his company. Thus the people now known as Particular Baptists became divided into two separate tendencies; the followers of Spillsbury laid no stress upon succession, his opponents regarded it as indispensable. The same division prevails at the present time.

If the Rhynsburgers introduced immersion only in the year 1620, it might be claimed that their succession was a mere myth, and that Blunt did not obtain what he went so far to seek. That question has been investigated in a special treatise by de Hoop Scheffer, entitled *Overzicht der Geschiedenis van den Doop bij Onderdompeling* (Amsterdam, 1882), in which he suggests that immersion had been brought out of Poland to Rhynsburg by Joannes Geesteranus. From the Polish Anabaptists it might also be traced back to Switzerland and the Reformation. Hence the friends of succession are not so hardly bested as might at first appear. Their case is stronger than some are aware of who oppose their claims.

As soon as they perceived this change, the English Arminian Anabaptists almost immediately accepted it, and so became English General Baptists. Mr. Edward Barber has the honor to have written the initial treatise in the long controversy in favor of the immersion of believers, entitled *A Treatise of Baptism or Dipping* (1641). The Particular Baptists, who had now increased to seven congregations, published their earliest confession of faith in 1644, and took pains to provide for immersion. This confession was to a degree dependent upon the confession of the Brownist churches, which had been issued in various editions in Holland. The confession of 1644 retains the Independent form of church constitution, providing for pastors, teachers, elders, and deacons; but when the edition of 1646 was issued they adopted the scheme derived by the General Baptists from the Mennonites. As already intimated, that scheme has become prevalent; but some of the older churches, as that of Mr. Spurgeon, still retain some features of the Independent scheme.

First Period of English Baptist History (1644-1750).—Having described above the beginnings of Baptist history in England, at least in so far as any organized churches are concerned, it is now in order to give a brief account of their early progress. Almost immediately after the two parties, General and Particular Baptists, had established themselves in the doctrines and usages which they were destined to maintain, the upheavals of the Revolution began to be observed. This movement was of special advantage to the Baptists, who flourished amazingly as long as it continued. Freedom of speech, freedom of the press, and freedom of many other kinds were enjoyed and improved. The Particular Baptists, however, reaped the highest benefits. They stood nearest to the Independents, who became the victorious party. Mr. Killin, their most prominent preacher and leader, was a person of wealth, energy, and experience in affairs, whose influence was felt in many quarters. When the Protector was distributing favors, a due share would go to his firm friends and allies of the Particular Baptists. A portion of their ministers were granted positions in the established church; others accompanied the army in the character of chaplains. Thousands of their adherents were in the ranks, and some few attained to prominence in official station. Indeed, when Richard Cromwell displayed his incompetency to succeed his father, it was for a season apprehended that the Baptists might come to the helm of state.

The General Baptists, on the contrary, were handicapped by the principle of opposition to the bearing of arms by Christian men which they had inherited from the Mennonites. That principle, however, was not universally accepted

by the General Baptists, since Gen. Desborough, one of their leaders, attained to prominence and influence in the army. It is also possible that not a few members of his communion may have served in the ranks. Yet the fact remains that the great body of the General Baptists abstained as far as possible from taking part in the triumphs of the military. This attitude toward Cromwell and the cause of the people condemned them to insignificance. During these convulsions was established the marked sympathy between the General Baptists and the Quakers that has been so frequently a matter of observation and remark. Both these parties alike were composed of men of peace, and they would naturally comfort and encourage each other by denouncing the men of the sword. It is suspected that this close contact with the Quakers might have been injurious to the General Baptists, who were commonly more enthusiastic and less safely poised than the Particular Baptists.

The numbers of the Particular Baptists at the Restoration in 1660 can not be definitely ascertained, but it is estimated that there may have been something like 100,000 of them; the General Baptists claimed "more than 20,000." Following the return of the king there was a season of repression and decay. The Particular Baptists are believed to have experienced the heaviest losses, due in part to the fact that multitudes had become attached to them during the Commonwealth period in the expectation that they would one day attain to supreme control in the government. When that hope was thwarted, there was no further incentive to profess their creed, and the floating element retired from their churches. The General Baptists issued a confession of faith in March, 1660, composed of twenty-five articles, in which that denomination as a whole committed themselves to the practice of immersion. After the overthrow of the Stuarts the Particular Baptists held a general assembly at London in Sept., 1689, in which they set forth a new confession for that party. It was based on the Westminster Confession. There were more than 100 churches in the General Assembly of 1689, and it is likely that they represented nearly all the Particular Baptists then in England. It is believed that 15,000 would be a fair estimate of the entire number of communicants. One of the leading items of the platform upon which this assembly stood is given in the following words: "That in those things wherein one church differs from another church in their principles or practices, in point of communion, that we can not, shall not impose upon any particular church therein, but leave every church to their own liberty to walk together as they have received from the Lord." This provision was indispensable for the accommodation of the mixed churches, as well as for the accommodation of such as did not receive a mixed membership and yet granted open communion at the Lord's table. Mr. Bunyan, as the leader of the mixed church contingent, was also the leader of the open communion party. Mr. Kiffin seems to have opposed mixed churches, and was the leader of the strict communion party. These two leaders had recently engaged in a controversy that was still unsettled, and the assembly found it impossible to take any decided position, either in its platform of organization or in the confession of faith which it indorsed. This open communion, however, was hardly intended to apply to any others than members of the Independent body; it did not embrace the General Baptists, who, having no mixed churches, were in their turn strict communionists at the Lord's table.

There was still further decay among the Baptists of England from 1689 to 1750. The seeds of Socinianism, which the General Baptists had brought over with them from Holland, came to ripeness during this period, and the denomination was almost desolated. The Particular Baptists drifted into Hyper-Calvinism; a portion of them likewise were infected by the Socinian leaven. A pretty reliable census of the Particular Baptists in 1750 showed 10,000 communicants. It is likely that the General Baptists did not then number more than 5,000.

Second Period of English Baptist History (1750-1897).—The denomination was at a low ebb at the beginning of this period, but the influences of the Great Awakening were already beginning to be felt among them. The ascendancy of Dr. Gill and of men yet more extreme was still acknowledged, but their views were beginning to be called in question. Finally Andrew Fuller appeared upon the scene with a modified and evangelical form of Calvinism which in the course of time broke the sway of Gill and the Hyper-Calvinists, bringing Baptists into cordial sympathy with the re-

vived religious life of the times. In 1792 was formed the Baptist Missionary Society, and the next year Carey and Thomas were sent as missionaries to India. During the long period of decay it is suspected that the strict communion element had gained some ground among Particular Baptists; but Robert Hall in 1815 took up the cause of Bunyan and secured the triumph of open communion. After that period the strict communion party retired from the fellowship of their brethren and maintained a separate existence. Much attention has been given to the interests of education, and there are several flourishing institutions of learning. Mr. Spurgeon and Robert Hall have been the most prominent ministers. The General Baptists took little part in the revival of religion. At length, however, Mr. Dan Taylor, of Yorkshire, who had been for some years connected with the Methodists, becoming persuaded that immersion was the proper mode of baptism, was immersed by a General Baptist minister in 1763. He continued in alliance with the General Baptists till 1770, but a deal of friction was occasioned by their Socinian tendencies. Finding it impossible longer to endure their heretical sentiments, he withdrew in 1770, and formed a new denomination called the General Baptists of the New Connection, who were somewhat decidedly Methodist in their doctrine and usages. The original denomination continued to exist, but it is believed that they are now nearly extinct. The General Baptists of the New Connection, on the contrary, are in a flourishing condition, numbering at present 203 churches, 134 pastors and missionaries, and 27,256 members. They are open communion in their practice. The Baptists of England, according to the latest statistics, embrace 360,112 communicants. They have been laborious and successful in the cause of missions in India, Ceylon, Burma, and the West Indies.

BAPTISTS OF AMERICA.—In 1636 Roger Williams, who had been banished from the colony of Massachusetts Bay, established a community at Providence, and set up a church. He preached with zeal and regularity until Mar., 1639, when it was decided to make a new departure. Williams, having become convinced of the error of infant baptism, concluded to obtain rebaptism. Eleven others joined him in this step. Ezekiel Holliman baptized Williams, and then Williams baptized the rest of the company, and so they became an Anabaptist church. The ceremony was most likely performed by sprinkling; the immersion of believers had not yet been restored in England; and there is no reason which renders it probable that Williams was in that regard in advance of the people with whom he now allied himself. John Clarke, who had likewise been driven from Massachusetts Bay, arrived at Newport in 1638. Like Williams, he was a zealous preacher and kept regular worship among his fellow-colonists. When Williams caused himself to be rebaptized in 1639, it is likely that Clarke and his people approved the change. In 1640 Gov. Winthrop announces that Clarke and divers of his associates had become Anabaptists. Possibly they were rebaptized by Williams or some of the men from Providence.

Restoration of Believers' Immersion.—In 1644 Williams returned from England with a charter for the colony. It is possible that Mr. Mark Lucar came over with him. Lucar had been a member of the church organized in England on Sept. 12, 1633. In the year 1641, when Mr. Blunt returned from Holland, Mr. Lucar is mentioned as one of the persons who received immersion. Upon his arrival in America he would be swift to advertise the brethren touching the change that had been enacted in England. His representations appear to have met with decided favor; for in the year 1644 the church in Newport was reorganized, with him as one of the most important members. This is believed to signify that they then received immersion at the hands of Lucar, and became for the first time a regular Baptist church in the sense now accepted. Probably the immersion of the Providence men followed in a short while. Mr. Lucar, who is understood to be the founder of believers' immersion in America, brought with him the ideas of succession that were so much valued in England, and many American Baptists have become committed to them. The relations between the Independents and the Baptists in America were very different from those that prevailed in England; by consequence there has never been anything like mixed churches here, and the tendency toward open communion has been very slight.

First Period of American Baptist History (1644-1750).—The earliest churches of Providence and Newport were both of the Particular Baptist persuasion, but the General Bap-

tists shortly appeared upon the scene. In 1652 a General Baptist church was formed at Providence by Chad Brown, Gregory Dexter, and William Wickenden, and in 1656 a similar church was established at Newport, making two rival and more or less hostile Baptist churches in each place. Throughout the period before us the General Baptists were in the ascendant. About the year 1718 the first church in Providence, of which Williams was the founder, became extinct, and the General Baptist church of the Browns triumphed over it. After that casualty only three Particular Baptist churches remained in New England, while the General Baptist churches were quite numerous, having a large and aggressive Yearly Meeting. In the Middle Colonies the forces seem to have been more evenly divided, there being many General Baptists in the Philadelphia Association, and also many Particular Baptists. The two parties appear to have watched each other narrowly and to have manoeuvred for the advantage, which in the end remained with the Particular Baptists. Philadelphia Association is suspected to have begun its history in the character of a Yearly Meeting, but in the year 1707 the other element rallied and gave it the title of Association, a Particular Baptist designation. Nevertheless, some of the churches appear to have been honeycombed by Arminian sentiments, so that it was impossible for the body to adopt a Calvinistic confession of faith before the year 1742. In the Southern Colonies the General Baptists prevailed almost exclusively, there being only a single Particular Baptist church. The Arminians, however, combined against this church in Charleston, S. C., and had well-nigh destroyed it before deliverance came. In North Carolina the General Baptist Yearly Meeting was perhaps the most prosperous, though not the most powerful, body of Baptist people then in existence.

Second Period of American Baptists (1750-1897).—The Particular Baptists were on the point of defeat in 1750; if succor had not been bestowed it is more than likely that the General Baptists would have controlled the destinies of the Baptists of America. But at an early stage of its progress the Great Awakening in America fell under Calvinistic auspices. Jonathan Edwards and George Whitefield took the lead, and, without intending to accomplish such a result, rescued the falling fortunes of the Particular interest. In 1742, shortly after Mr. Whitefield appeared upon the scene, the Philadelphia Association adopted the Philadelphia Confession of Faith, which was the banner of the Particular party in England, and prepared herself for action. In a few years this association acquired the hegemony of American Baptists, and has ever since maintained that dignity. It sent representatives to Maryland and Northern Virginia, where they speedily captured the Arminian churches that existed in that region. It also dispatched agents, men of admirable gifts and zeal, to North Carolina, where in 1755 they captured nearly the whole of the flourishing Yearly Meeting that had been cultivated with so much care by Rev. Paul Palmer. A few of Palmer's followers resisted, and still stand to their colors in that portion of the country, whence they sent forth colonies to the Cumberland country, which have grown to be a somewhat numerous people in Kentucky and Indiana. A Philadelphia minister went to Charleston in 1749, and, taking charge of the first church, soon succeeded in driving away the General Baptist opponent. In 1751 it was given to the exertions of Oliver Hart to lay the foundations of Charleston Association on the Philadelphia model and with the Philadelphia creed. The men of Philadelphia even ventured as far as Nova Scotia to preach the Word. Two of its most gifted young ministers also had the temerity to invade the General Baptist stronghold in New England, and to carry a college to Rhode Island, which at first scarcely anybody was prepared to receive. James Manning and Hezekiah Smith, however, persevered in their task, and at last earned for themselves a welcome. It is amazing the amount of work that was accomplished in the interest of Philadelphia within a period of twenty years. In 1751 Charleston Association was established. In 1765 Kehukee Association was built on the ruins of the General Baptist interest in North Carolina; in 1766 Ketocton was founded by a like process on the borders of Maryland and Virginia; in 1767 Manning and Smith, assisted by John Gano, Abel Griffith, and Noah Hammond, who had made a special journey from Philadelphia for the purpose, established Warren Association in Rhode Island. By this means the entire country was occupied by the Philadelphia Association and its allies. The General Baptists were driven back at every point; their cause was now lost. Their Yearly Meet-

ing in New England has perpetuated itself in a feeble way to the present time, reporting in 1896 only 10 churches and 741 members. They still retain the ancient designation of *Six-principle Baptists*.

The Gibraltar of the General Baptists, however, still held out; the church in Providence had not yet been directly assailed. In 1770 the labor of taking this stronghold was begun. Manning succeeded to admiration; in due time Samuel Winsor retired to Johnston with the original church, and the present First Baptist church of Providence was founded in 1771. Long years of patient education were required before the last vestiges of the old Arminian leaven could be eliminated; it was not until the year 1782 that Manning could induce the new church to attach itself to Warren Association; the Second church of Newport declined to take that step until the year 1801.

Separate Baptists.—Through the influence of Whitefield and Edwards Calvinism gained the victory among American Baptists, and Arminianism was defeated. While the conflict between these parties was going forward a dangerous rival to the Calvinistic interest appeared upon the scene. As a direct result of Whitefield's preaching, a new denomination of Christians had arisen in New England called Separates, from the circumstance that they had separated from the churches of the Standing Order. About the year 1750 numbers of these Separates became convinced of the correctness of Baptist principles, and had themselves immersed. By that means churches of Separate Baptists were constituted in many sections of the country. More than half the Baptists of New England are supposed to be of Separate Baptist extraction. Manning and Smith succeeded in conciliating Isaac Backus, the leader of the Separate Baptists in New England, at an early date, and their forces were thus united with those of Philadelphia. Owing to the intimacy of that union there has not been much friction between the two tendencies in the New England States. A handful of these Separate Baptists, under the lead of Shubael Stearns and Daniel Marshall, got abroad in North Carolina in 1755 and started a movement of gigantic proportions. In the year 1758 they established the first Separate Baptist Association at Sandy Creek, in North Carolina. Before the advent of the American Revolution they had captured nearly the whole of North Carolina, South Carolina, and Georgia for their party. They had also invaded Virginia and occupied nearly the whole of that State; the battle for religious liberty in Virginia was fought and won almost exclusively by Separate Baptists. It is estimated that about seven-tenths of the Baptist people of the Southern States are of Separate Baptist extraction. The power of the Separate Baptists was so marked in the South that the friends of Philadelphia were driven to assume a special designation, and so they called themselves Regular Baptists. But at length, after the Separate Baptists had achieved the triumph of religious liberty in Virginia, it became plain that they could not be despised, even though they might not be quite Regular. Both parties were Calvinistic, but the Separates were Calvinists of the Whitefield and not of the Philadelphia type. Nevertheless, a union was proposed by the friends of Philadelphia in Virginia, and it was happily accomplished in the year 1787. By that means the party who of late seemed destined to become formidable rivals of Philadelphia were brought into close alliance. Thenceforward the Baptists of the Southern States were known as United Baptists, a designation that is still often heard. A small faction of Separate Baptists declined to enter this union, and these have maintained an independent existence, mainly in Kentucky and Indiana, down to the present time. They embrace about six thousand communicants.

Free-will Baptists.—Since the Separate Baptists had no creed like the Regular Baptists, there were many shades and grades of Calvinism among them, and in some instances they veered round toward Arminianism. A community of Separate Baptists existed in New Hampshire who were so moderate in their Calvinism as to be almost Arminians. Benjamin Randall, who perhaps in some way had come under the influence of the Arminian Baptists of New England, succeeded in organizing these into a party, after the year 1780, who repudiated Calvinism. They have been quite successful in divers directions. In the year 1896 they reported 1,335 churches and 86,680 communicants. It is important to remember that they are of Separate and not of General Baptist extraction.

Primitive Baptists.—For a number of years after 1787

the United Baptists advanced with much harmony and success. But at length, in the year 1812, through the agency of Adoniram Judson and Luther Rice, the denomination was committed to the enterprise of promoting missionary work in foreign lands. From the outset persons were found who objected to that course, and the dissatisfaction continued to spread until about the year 1835, when a schism was begun in which the opponents of missions withdrew and founded another denomination which they called Primitive Baptists, but which is more commonly known by the name of Anti-Mission Baptists. They have been in a declining condition, and at present an active discussion is in progress among them which seems likely to result in a fresh schism. One of the parties, which advocates missions, Sunday-schools, and other agencies, is known as the party of Means; the Anti-Means party stand upon the platform which the denomination originally assumed. The Primitive Baptists in 1896 reported 3,536 churches, and 125,000 communicants.

Seventh-day Baptists.—These are distinguished by the fact that they keep the seventh day of the week as the Sabbath. Their first church in America arose in 1671 by means of a schism from Mr. Clarke's church in Newport, R. I. They have taken little part in the historical development of American Baptists. For the year 1896 they reported 105 churches and 9,173 communicants. Rev. A. H. Lewis, D. D., of Plainfield, N. J., is the leading figure among them.

Great progress has been made by the Baptists of America during the nineteenth century. In the year 1700 there were 6 Calvinistic Baptist churches, 6 Arminian Baptist churches, and in the limits of Philadelphia Association 4 that are supposed to have been doubtful. In addition to these there were 1 church of Seventh-day Baptists, 1 of so-called Rogerene Baptists, and 2 Indian churches. Reckoning all these as Baptists, there were 20 churches in the year 1700, with perhaps as many as 800 members. In 1784 there were 471 churches, 424 ministers, and 35,101 members. In 1896 there are reported in the U. S. 46,686 Baptist churches and 4,130,706 communicants. In Canada and Mexico there are 990 churches and 96,335 communicants. The press is represented in every State and Territory, and is prosperous and powerful. Their missionaries are found in nearly all heathen countries, and also in many regions where the Roman Catholic religion is predominant.

LITERATURE.—Thomas Armitage, *A History of the Baptists* (New York, 1887); Henry C. Vedder, *A Short History of the Baptists* (Phila., no date, but appeared in 1892), the first effort made by a Baptist writer to introduce historical criticism into Baptist history; J. M. Cramp, *Baptist History* (Phila., no date); Thomas Crosby, *The History of the English Baptists from the Reformation to the Beginning of the Reign of George I.* (4 vols., Lond., 1738–40); Joseph Ivimey, *A History of the English Baptists* (4 vols., Lond., 1811–30); H. M. Dexter, *True Story of John Smyth, the Se-Baptist* (Boston, 1881); H. M. Dexter, *Congregationalism as Seen in its Literature* (New York, 1880); Robert Barclay, *The Inner Life of the Religious Societies of the Commonwealth* (Lond., 1876); Isaac Backus, *A History of New England, with Particular Reference to the Denomination of Christians Called Baptists* (3 vols., Boston, 1777–96); David Benedict, *A General History of the Baptist Denomination in America* (2 vols., Boston, 1813); D. B. WILLIAM H. WHITSITT.

Bar: a long and narrow piece of wood, metal, or other solid substance, generally round, quadrangular, and other uniform section. **BAR**, in hydrography, is an accumulation of mud or sand in any navigable channel by which navigation is obstructed, but more particularly a similar formation almost universally found across and exterior to the mouths of rivers and harbors, rendering entrance difficult except to vessels of light draught. In music, the word **BAR** denotes a straight line drawn across the staff to divide the music into small portions of equal duration, and also comprises the musical notes written or played between such lines. **BAR**, in heraldry, is one of the important charges known as ordinaries. The bar is formed by two horizontal lines passing over the shield; it differs from the fess in size, the bar occupying only one-fifth of the shield. **BAR SINISTER** is a term misused for "baton sinister" to denote illegitimacy. In law **BAR** denotes: 1. A partition or railing intended to inclose that part of the court-room in which prisoners are arraigned or sentenced, and in which the members of the legal profession usually sit; hence this space itself. In Great Britain there are admitted within the bar only solicitors, queen's counsel, and some others having precedence, all others, including the great body of barristers (called *utter* or *outer barristers*), being obliged to stand behind it. Hence the word often collectively signifies lawyers, or persons admitted to practice in the courts; and in some cases it refers to or implies the presence of the court itself. A trial at bar is a trial before a full bench of judges, as distinguished from a *nisi prius* trial—that is, a trial before a single judge. Trials at bar in civil causes were abolished in Great Britain by the Judicature Act of 1875. 2. A complete defense to an action in law. A plea in bar is a plea which, if true, completely defeats the plaintiff's action. Revised by F. STURGES ALLEN.

Bar: a town of Russia; government of Podolia. In 1768 the Confederation of Bar was formed here by the nobility of Poland, to counteract the influence of Russia on King Stanislas Augustus. Bar was taken by the Russians in the same year, and the confederates were compelled to go to Wallachia. Here they declared the king dethroned, had him carried off from Warsaw in 1771, and were only suppressed by Russia after four years' hard fighting. Eleven fairs are held here every year (see map of Russia, ref. 9-B). Pop. 13,000.

Bär, K. E., von: naturalist. See **BAER**.

Bar'aba': a vast steppe of West Siberia, lying between the rivers Ob and Irtysh on the W., and the Altai Mountains on the S. E. Area about 55,000 sq. miles. It is very level, covered by recent deposits, fertile, with large forests separated by marshes and salt-lakes. It was colonized by the Russians in 1730. Pop. about 250,000; only 4,000 aborigines, the rest Russians.

Bara Banki, baa ra-baan kē: a district of Lucknow division, Oudh, British India; between parallels 26° and 28° N. lat., and meridians 81° and 82° E. lon. Area, 1,768 sq. miles. It is a level plain interspersed with marshes. The Gogra river forms the northern boundary. This is navigable, and a railway passes through the district. The population is about 1,000,000; about 85 per cent. Hindus. The largest town is Rudauli, with 12,000 inhabitants.

Bar'ahoo: city; on C. and N. W. R. R., capital of Sauk co., Wis. (for location of county, see map of Wisconsin, ref. 6-D); situated in Baraboo valley, on the Baraboo river; is noted for its beauty of situation and magnificent scenery, and is 3 miles from the famous Devil's Lake. It is in the center of a prolific fruit-growing district, has excellent water-power, paved streets, a fine city hall, 4 large and handsome school-houses, 3 magnificent iron bridges, water-works, electric lights, and gas-works. Pop. (1880) 3,266; (1890) 4,605; (1895) 5,484.

EDITOR OF "REPUBLIC."

Barab'ra, or **Berab'era**: a name applied by the Egyptians to the inhabitants of a small district in Upper Nubia. They are not the same as the Berbers, the latter having derived their name from the Arabians. They trade with the

Egyptians in cattle, which they pasture among the mountains beyond the Atbara and near the Red Sea.

Baracoa, bāa-ra-kō'a: a seaport on the northeast coast of Cuba (see map of West Indies, ref. 4-F); has considerable trade. In its vicinity is a remarkable mountain called the "Anvil of Baracoa."

Barada, bāa-ra-da: a river of Syria; probably the Abana of the Old Testament. Its remotest, though not its largest, source is a lake, some 300 yards by 50, in the plain of Zebdany (8 miles by 3), 3,349 feet above the level of the sea, in the heart of Anti-Lebanon. The stream flows south-eastward, passing the ruins of the ancient city of Abila, breaking through three ridges of the mountain, and reaching Damascus (23 miles from its source) after a descent of 1,149 feet. Then it flows on eastward some 17 or 18 miles farther, emptying itself into two marshy lakes, each about 20 miles in circumference. In going through the city and gardens of Damascus it is parted into at least seven streams, which afterward reunite. See Porter's *Damascus*.

Bar'adla Cave: a celebrated cave near AGTELEK (*q. v.*).

Baraga, bāa-ra-g'a, FRIEDRIC, D. D.: a Roman Catholic missionary; b. at Treffen, in Carniola, Austria, June 29, 1797. He was ordained 1823, came to America in 1830, devoted himself to missionary labor among the Indians of the Lake Superior region, and was made Bishop of Sault St. Marie 1857, of Sault St. Marie and Marquette 1865. He published numerous works in the Ojibway (or Chippewa) dialect; a *Grammar of the Ojibpewee Language* (1851); and a *Dictionary of the Ojibpewee Language* (1853). D. at Marquette, Mich., Jan. 19, 1868.

Baraguey d'Hilliers, bāa-ra-gā d'ēēl yā, ACHILLE, Count: a French general; b. in Paris, Sept. 6, 1795. Having served with distinction in Algeria, he obtained the rank of general of division in 1843. In the autumn of 1849 he became commander of the army that occupied Rome. He returned to France in 1850, and in the Crimean war commanded a corps which co-operated with the British fleet in the Baltic. He was made a marshal of France in 1854. D. at Amélie-les-Bains, France, June 6, 1878.

Baraguey d'Hilliers, LOUIS: a French general; the father of the preceding; was born in Paris, Aug. 13, 1764. He served in the Italian campaigns of 1796-97, soon after which he became a general of division. He commanded the dragoons of the grand army in Austria in 1805, and was appointed Governor of Venice in 1808. In the Russian campaign of 1812 he was taken prisoner, with all his division. D. in Berlin, Jan. 13, 1812.

Baranoff, bāa-ra-ōf, ALEXANDER ANDREYEVITCH: first Governor of Russia in America; b. 1746; established a colony on Bering Strait 1796; took possession of Baranoff island 1799. D. at sea, near Java, Apr. 28, 1819.

Barante, bāa-rānt', PIERRE AIMABLE PROSPER BRUGÈRE, de: a French statesman and historian; b. at Riom, June 10, 1782. He came of a literary stock, his father and his great-grandfather having distinguished themselves as writers. He was appointed collector-in-chief of customs in 1818, and became a peer of France in 1819. His chief works are a *History of the Dukes of Burgundy* (13 vols., 1826), and a *History of the National Convention* (6 vols., 1853). D. at Puy-de-Dôme, Nov. 21, 1866. See sketches by Guizot in *Revue des deux Mondes* (July, 1867), and E. de Mircourt (Paris, 1867).

Baratynski, bāa-ra-tēēn skēē, JEWGENIZ ABRAMOYITCH: Russian poet; b. in the government of Tambov, Russia, Mar. 2, 1800; d. in Naples, Italy, July 11, 1844. He was educated in St. Petersburg, and became an ordinary soldier in the guard. As early as the age of twenty, however, he had written interesting verse. In 1826, having become an officer, he resigned from the service. His last years were spent in Paris and Naples. He is chiefly known as a lyric poet, having issued various collections of his lyric verse, as: *The Banquets* (1826); *The Ball* (1828); *The Death of Goethe* (1832); *Twilight* (1842). His complete works were published (Moscow, 1868) by his son. A. R. MARSH.

Baran'ya: one of the most populous counties of Hungary; bounded N. by Tolna, E. by Bacs, S. by Slavonia, W. by Somogy; area, 1,966 sq. miles. It is partly mountainous, but is very fertile. The Danube forms part of the western boundary. Capital, Fünfkirchen. Pop. (1890) 321,435.

Barata'ria Bay: Louisiana; an inlet of the Gulf of Mexico, lying between the Mississippi and the Bayou la

Fourche; about 12 miles long from N. to S., and 5 or 6 miles broad, communicating with bayous and lakes of the interior. Its shores are marshes little elevated above the tides, which extend to the cypress swamps. Grande Terre island, a ridge of sand which lies across the mouth, was the headquarters of the brothers Laffite, the so-called "pirates." (See LAFFITE.) The entrance to the bay was fortified by the U. S. in 1840-50 by the construction of Fort Livingston on the west end of Grande Terre island. The bar has 7 feet of water. Barataria lighthouse, on Grande Terre island, is in lat. 29° 16' 47" N., lon. 89° 54' 33" W. It is of brick and 60 feet high.

Baratier, baā'ra-ti-ay', JOHANN PHILIPP: b. of French ancestry at Swabach, near Nuremberg, Jan. 19, 1721; when five years old spoke French, German, and Latin; when seven could repeat the Psalms in Hebrew; and when nine composed a Hebrew dictionary; when thirteen years old translated the *Itinerary* of Benjamin of Tudela. He wrote a reply to Crellius's *Artemonius*, called *Antiartemonius* (1735), and a *Disquisition on the Succession of the Roman Pontiffs in very Ancient Times* (1749). He was a Protestant, studied theology and law. D. in Halle, Oct. 5, 1740.

Barb [Fr. *barbe*, deriv. of *Barbarie*, Barbary]: name of a breed of horses which originated among the Moors of Barbary, who introduced it into Spain. Barbs are remarkable for their endurance, docility, and gentleness. The Carthaginian cavalry, which decided several victories over the Romans, are said to have been mounted on horses of this breed, which is a variety of the Arabian horse. The celebrated "Godolphin Arabian" was a barb, as were most of the progenitors of the thoroughbred horse of the present day.—Barb is also the name given in New Jersey to the kingfish (*Menticivrus saxatilis*).

Barbaena, bāur-bāu-thay'nā. FESBERTO CALDEIRA BRANT, Marquis of; a Brazilian soldier and diplomatist; b. at Sabora in 1772. He was appointed by the Emperor of Brazil to negotiate concerning the independence of that country with Portugal, and for his success was created a marquis. He was afterward twice Minister of Finance. He introduced steam-engines, steamboats, and the printing-press into Brazil. D. in Rio Janeiro, June 13, 1841.

Barbados, bāur-bay'dōs (perhaps from Spain, *barbado*, bearded, but it was early called St. Bernardo): the most easterly of the Caribbean islands (see map of West Indies, ref. 8-M); is a British colony. Its capital, Bridgetown, is situated in lat. 13° 4' N., and lon. 59° 37' W. The island is 21 miles long, 14 miles wide, and has an area of 166 sq. miles. It is nearly encircled by coral reefs, which are dangerous to navigation. The highest point of the island has an altitude of 1,104 feet. Destructive hurricanes often occur here. The soil is fertile, and produces sugar, cotton, arrowroot, etc. The population and prosperity of Barbados have increased since the abolition of slavery, Aug. 1, 1834. In 1890 the imports were \$6,000,000 and the exports \$5,900,000, and 85,261 bhd. of sugar were raised. There are 24 miles of railway and 58 miles of telephonic communication. In 1891 the public debt was \$150,000. Pop. (1891) 182,322—the most densely populated island in the world. The diocese of Barbados includes the Windward islands from St. Lucia to Granada, of which the see is Bridgetown, the capital; and it enjoys a legislative appropriation of \$50,000 annually. The public schools of Barbados are under Government control. It is headquarters for the British troops in the West Indies. M. W. II.

Barbados Cherry: the edible fruit of a small West Indian tree (*Mulpighia glabra*). Each fruit contains three seeds. The leaves of *Mulpighia urens*, which also has edible fruit, have stinging hairs on the lower side.

Barbados Gooseberry: the edible fruit of *Pereskia aculeata*, a shrubby plant of the family *Cactaceae*, having a round stem, thick, alternate leaves, and large spines. The fruit has expectorant properties. The plant grows in the West Indies.

Barbados Leg: See ELEPHANTIASIS.

Barbados Tar, or **Petroleum**: a black, opaque, inflammable liquid of the consistence of molasses. By distillation it yields naphtha and a residuum of asphaltum.

Barbara, SAINT: a virgin martyr of the ancient Church in regard to whom traditions clash. Baronius accepts the story of her martyrdom at Nicomedia in the reign of Maximinus (235-238), and says that she had been a pupil of Origen. Assemani thinks she suffered martyrdom under

Galerius, about 306, at Heliopolis in Cæle-Syria. She is the patron saint of artillery, and the protectress against lightning and fire. The powder-magazine on French men-of-war is still called "Sainte Barbe." She is commemorated Dec. 4.

Barbarian [from Fr. *barbarien*, deriv. of *barbarie*, land of barbarians; from Lat. *bar'barus*, Gr. *βάρβαρος*]: a term applied by the ancient Greeks to all foreigners and all who could not speak the Greek language. Plato divided the human family into two great classes—*Hellenes* (Greeks) and *Barbaroi* (barbarians). After the Persian invasion the Greeks used the word as a term of reproach, implying hostility to their own freedom and civilization. After the Romans had conquered Greece, and had become in some measure Hellenized, the word barbarian was applied to all nations except Greeks and Romans. St. Paul uses the word in this sense in Romans i. 14; see also Acts xxviii. 4.

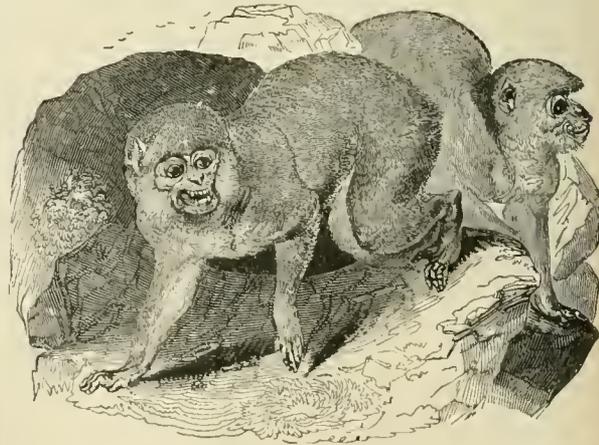

Barbaros'sa: the name of two brothers, renegade Greeks and natives of Mitylene, who became Turkish corsairs, and were the scourge of Christendom for many years (1510-46). The elder, Aruch (Horn or Ouradj), made himself master of Algiers, but was defeated by Charles V., captured and beheaded (1518). He was succeeded in 1518 as ruler of Algiers by his brother, Hayraddin, a Christian corruption for Khair-ed-Deen. He obtained Tunis by conquest in 1532, and became the chief admiral of Sultan Solyman in his war with the Emperor Charles V. D. in Constantinople, July 4, 1546.

Barbarossa, EMPEROR: See FREDERICK I.

Barbaroux, baār'-ba-roo', CHARLES JEAN MARIE: French Girondist and eloquent advocate; b. at Marseilles, Mar. 6, 1767. He was chosen a deputy to the Legislative Assembly in 1791, and a member of the National Convention in 1792. He denounced Robespierre, and on the trial of the king voted for an appeal to the people. He was distinguished for his energy and personal beauty. Having been proscribed by the Jacobins in May, 1793, he fled from Paris. He was guillotined at Bordeaux, June 25, 1794. See his *Mémoires* (1822).

Bar'bar'y [of Arab. origin]: an extensive region of Northern Africa, comprising the modern Barca, Tripoli, Tunis, Fezzan, Algeria, and Morocco; extending from Egypt to the Atlantic Ocean. It is included between lat. 25° and 37° N., and lon. 10° W. and 25° E. It included the ancient *Mauritania*, *Nomidia*, *Africa propria*, and *Cyrenaica*. Barbary is divided by the Atlas Mountains. The north side comprises Tunis, Tripoli, Morocco, and Algeria. The south is called Beled-el-Jereed (i. e. the country of dates). The soil is generally fertile. It was very rich and populous under the rule of the Carthaginians and of the ancient Romans, who became masters of this region about 146 B. C. It was conquered about 430 A. D. by the Vandals, who misgoverned it for a hundred years, and it fell under the domination of the Arabs in 647 A. D. The inhabitants are mostly Mohammedans.

Barbary Ape, **Pigmy Ape**, or **Magot**: one of a small species of tailless monkey (*Inuus caudatus*); found in but

The magot, or Barbary ape.

one place in Europe—the Rock of Gibraltar. It also abounds in Northern Africa, especially among rocky mountains and forests. It is gregarious, displays great agility in

passing from tree to tree, and usually walks on four feet. It is of a greenish-gray color, and rather larger than a large cat. Bands of these apes often plunder gardens. This species of monkey is frequently seen in captivity, and is capable of being trained to many tricks.

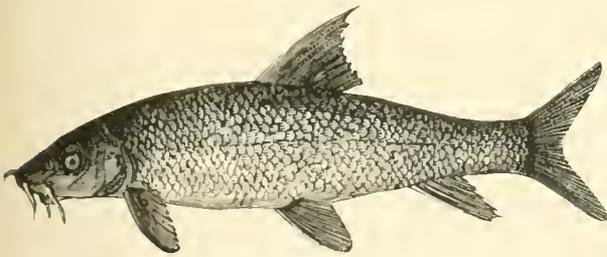

Barbauld, ANNA LETITIA: English authoress; b. in Kibworth, Leicestershire, June 20, 1743; was a daughter of Rev. John Aikin. She published a volume of poems in 1773, and was married in 1774 to Rochemont Barbauld, a Dissenting minister, with whom she taught a boarding-school for ten years at Palgrave, Suffolk. She published, besides other works, *Devotional Pieces* (1775) and *Early Lessons for Children*, and assisted her brother, Dr. John Aikin, in the composition of a popular work called *Evenings at Home*. D. at Stoke Newington, Mar. 9, 1825. She wrote also *A Legacy for Young Ladies*, published after her death. See a *Life of Mrs. Barbauld*, by Lucy Aikin, prefixed to her works (2 vols., 1825).

Barbecue [ultimately from Haytian *barbacou*, a framework of sticks set upon posts, generally for use in drying or smoking meat]; term originally applied, especially in the Southern States, to the practice of roasting an ox or other large animal whole; since applied in the U. S. to a social entertainment on a large scale, generally in the open air, where animals are roasted whole and provisions and drink provided in generous quantities. A barbecue was formerly a favorite means of celebrating political victories.

Barbed Wire: See WIRE AND WIRE-DRAWING.

Bar'bee, WILLIAM J., M. D.: b. in Winchester, Ky., in 1816; educated at Miami University, O.; practiced medicine ten years in Cincinnati, O., and became widely known as a teacher, author, and preacher among the Disciples of Christ. He has published *Physical and Moral Aspects of Geology, The Cotton Question*, and various religious and scientific and other works. He died at the residence of his eldest son in Kentucky, Oct. 27, 1892.

Bar'bel: a fish of the genus *Barbus*; of the carp family, or *Cyprinidae*. It resembles the American sucker, but is furnished with four soft barbels, pendent from the snout

Barbel (*Barbus barbus*).

and upper jaw, and suggesting the name; derived from the Latin *barba*, beard. The numerous species of barbel are all inhabitants of fresh water, and seek their food by inserting their snouts into the mud like swine. The common barbel is abundant in England, and affords sport to anglers, but is not much esteemed for food. It sometimes measures 3 feet long, and weighs about 16 lb. Another species called binny or barbel is abundant in the Nile and the Jordan, and is esteemed for food. It sometimes weighs 70 lb. D. S. J.

Barbé-Marbois, baâr-bay maâr-bwaâ, FRANÇOIS, MARQUIS DE: French statesman; b. at Metz, Jan. 31, 1745; consul-general to the U. S., and intendant of San Domingo (1785-90), where he introduced many reforms; returned to France, and in 1795 became a member of the council of elders, but was accused of various offenses and exiled; recalled in 1801, he became director of the treasury under Napoleon; negotiated the sale of Louisiana to the U. S.; was made a Senator in 1813, and Minister of Justice in 1816. He wrote *Complot d'Arnold* (1816); *Histoire de la Louisiane* (1828), etc. D. Jan. 14, 1837.

Barber [earlier *barbour*, from O. Fr. *barbeor*, as if from Lat. **barbatōr*, deriv. of Lat. *barba*, beard]; a person who shaves others and cuts their hair. This trade or profession is very ancient, and is mentioned by the prophet Ezekiel (chap. v. 1). In China and other Oriental countries barbers shave the whole or part of the head. The practice of shaving the beard was common among the ancient Egyptians, Greeks, and Romans. Among the ancient Israelites the re-

moval of the beard by shaving or plucking it out was a sign of mourning. In former times barbers served the public in the capacity of surgeons, and performed the operation of bleeding. The spiral red stripe seen on the barber's pole is said to symbolize the winding of a ribbon round the arm previous to letting blood. In London the barber-surgeons formed a corporation with certain privileges. They were incorporated in England in 1461, and were united with the surgeons in the reign of Henry VIII. The connection was dissolved in the reign of George II. by an act, the preamble of which affirms that the trade of a barber is "foreign to and independent of the practice of surgery." Quite recently the surgeons of the Swedish navy were also barbers for the crews. The barber's art was practiced in Greece about 420 B. C., and is said to have been brought from Sicily to Rome in 299 B. C.

Barber, FRANCIS: soldier and teacher; b. at Princeton, N. J., in 1751; graduated at Princeton in 1767. He entered the army in 1776 with the rank of major, and took part in the battles of Trenton, Princeton, Brandywine, Germantown, and Monmouth. He was afterward raised to the rank of colonel, and in 1781 was selected by Gen. Washington for the delicate duty of suppressing a mutiny of the troops, which he performed with success. He was killed accidentally by the fall of a tree at Newburg, Jan. 11, 1783.

Barber, JOHN WARNER: b. at Windsor, Conn., in 1798. He published a *History of New Haven* (1831); *Historical Collections of Connecticut* (1836), Massachusetts (1839), New Jersey (1844), Virginia (1844), Ohio (1847); *Incidents of American History* (1847); *Elements of General History* (1844); *Our Whole Country* (1861), and several other works. D. at New Haven, Conn., June, 1885.

Barberini, baâr-be-ree'nee, FRANCESCO: an Italian cardinal; nephew of Pope Urban VIII.; b. in Florence in 1597. He became librarian of the Vatican, and translated the twelve books of Marcus Aurelius from Greek into Italian. He was the founder of the great Barberini Library. D. in Rome in 1679.

Bar'berry: a plant of the genus *Berberis* and family *Berberidaceæ*; comprises many species, which are all shrubs and natives of temperate climates in both hemispheres. They have six stamens, which, when touched at the base, exhibit irritability. The fruit is a berry with two or three seeds. They are divided into two sub-genera, sometimes ranked as genera; those with simple leaves forming the *Berberis*, and those with pinnate leaves the sub-genus *Mahonia*. The barberries of Asia are numerous and important for their fruits. Those of our Pacific slope are *Mahonias*. The common barberry (*Berberis vulgaris*) is a native of Europe, sparingly naturalized in the U. S., a shrub armed with spines, and produces small oval red berries in pendulous clusters, which contain free malic acid, and are valuable for preserves and jelly. The bark is astringent, and is used in medicine, and the inner bark and root furnish a good yellow dye. On account of its yellow color the inner bark was formerly in much repute as a remedy for jaundice. Several fine species of *Berberis* grow in the central and western portions of North America. *B. aquifolium*, with spiny leaves and yellow flowers, is generally cultivated as an ornamental shrub. *B. pinnata* of Oregon bears blue, acid berries, and is sometimes called the *Oregon grape*. *B. canadensis* is a native of the Alleghanies. Parts of South America abound in native species of the barberry.

Barberry Family (*Berberidaceæ*): herbaceous or shrubby dicotyledons, with the parts of the flower all free from one another, and one or few simple pistils. Therefore related to buttercup, magnolia, and moonseed. There are about 100 species, widely distributed, especially in temperate regions. The barberry and May-apple are well-known members of this family. CHARLES E. BESSEY.

Barber's Itch: a term applied somewhat indiscriminately by the public and many physicians to two distinct diseases. 1. A majority of cases are instances of *syccosis non-parasitica*, or pustular eruption on the face, from the irritation of too frequent and close shaving. The face is inflamed, red, tender, and nodular, with numerous pustules of various size, discharging pus, which mats in the stumps of the beard and forms scabs. 2. The second form is the true barber's itch, or *Tinea syccosis*, contracted by contact of person or the soiled and contaminated razors and brushes of the barber. It is really "ringworm in the beard." Each hair of the infected beard is covered with a whitish powder of parasitic

scales or sporules. The parasitic vegetation is the *Trichophyton tonsurans*. In either the *syccosis non-parasitica* or the true *syccosis* the inflammation is to be removed by frequent applications of cold water, perfect cleanliness, and soothing lotions, as of glycerine, opium, and acetate of lead. With the first form such methods will suffice. In the second or parasitic form all the infected hairs should be pulled out with the depilation-forceps, and the parasites destroyed in the hair-follicles by parasiticide lotions or unguents. Chief of these are sulphurous acid, either pure or diluted, carbolic acid in glycerine, weak solutions of corrosive sublimate, and ointments of sulphur, nitrate of mercury, and white precipitate.

Revised by WILLIAM PEPPER.

Barbet [Fr. and O. Fr. *barbet*, from Lat. *barbatus*, bearded, deriv. of *barba*, beard]: a bird of the genus *Laimodon*; related to the *Picidae*, or woodpeckers. The barbets have a large conical beak surrounded with tufts of bristles; hence the name. They inhabit warm countries, particularly tropical Africa, and feed on insects.

BARBET is also the name given to birds of various genera, chiefly South American and Asiatic, allied to the kingfishers and the trogons.

Revised by D. S. JORDAN.

Barbet: a small variety of the poodle-dog, remarkable for its activity, intelligence, and fidelity to its master; but equally distinguished for its ill-temper and its dislike of all strangers. It is also very liable to disease, and hence is not a general favorite.

Barbey d'Aurevilly, bâr-bay'dô-re-vêe-lê', JULES AMÉDÉE: French novelist; b. at St. Sauveur-le-Vicomte, Nov. 2, 1808; wrote a great number of volumes of a character, on the whole, very brutal and perverse. He, however, attracted the attention of a certain noisy set of writers and readers. The most lauded of his productions are *Une vieille maîtresse* (1851, 5th ed. 1886); *L'Ensorecellée* (1854); *Les Œuvres et les Hommes, XIX^e Siècle* (7 parties, 1861-87); *Le Chevalier Destouches* (1864); *Memoranda* (1885). D. in Paris, Apr. 23, 1889.

A. R. MARSH.

Barbier, bâr'bi-ay', PAUL JULES: French dramatist of remarkable fecundity; b. in Paris, Mar. 8, 1825. His first work was *L'Ombre de Molière*, played at the Théâtre Français (Jan. 15, 1847). Since then he has written almost innumerable plays, besides librettos for both grand and comie opera. He has had many *collaborateurs*, among them Carré, Barrière, Deconcelle. His librettos have been set to music by Meyerbeer, Gounod, Thomas, Reyer, Saint-Saëns, and others.

A. R. MARSH.

Barbon, bâr'boo': name of a celebrated French family of printers, the descendants of John Barbon, of Lyons, who lived in the sixteenth century. His press published in 1539 a beautiful edition of the works of Clement Marot.—His son, HUGH BARBOU, having removed to Limoges, published his celebrated edition of Cicero's *Letters to Atticus*, 1580.—JOSEPH GÉRARD BARBOU, of the same family, settled in Paris, and continued in 1755 a series of Latin classics in duodecimo, begun in 1743 by Constelier. The series rivals the Elzevirs of earlier date, and is much prized for its elegance and correctness.

C. H. THURBER.

Barbour, JAMES: statesman; b. in Orange co., Va., June 10, 1775. He was Governor of Virginia 1812-14; author of Virginia anti-dueling law, and a Senator of the U. S. 1815-25. He voted to recharter the U. S. bank, and became president of the Senate *pro tem*. He was Secretary of War in the cabinet of John Quincy Adams (1825-27); was sent as minister to England in 1828, but was recalled in 1829. In 1839 he was president of the Whig national convention. D. in Orange co., Va., June 8, 1842.

Barbour, or **Barber**, JOHN: Scottish poet; a contemporary of Chaucer; b. about 1320. He became Archdeacon of Aberdeen in 1356, and went to Oxford in 1357 to complete his education. About 1374 he was appointed one of the auditors of the exchequer. His chief work is a natural epic called *The Bruce*, a history of Robert Bruce, which, in addition to its poetical merit, has much historical value. D. Mar. 13, 1396.

Barbour, JOHN HUMPHREY: divine, educator, and writer of the Protestant Episcopal Church; b. at Torrington, Conn., May 29, 1854; educated at Trinity College, Hartford, and at the Berkeley Divinity School, Middletown, Conn.; ordained priest in 1878. Rector of Grace Chapel, Hartford, Conn., 1876-89; librarian of Trinity College 1882-89; Professor of the Literature and Interpretation of the New Testament in the Berkeley Divinity School, and

librarian, since 1889. His *Beginnings of the Historic Episcopate* (New York, 1887) has reached a second edition.

WILLIAM STEVENS PERRY.

Barbour, JOHN S.: U. S. Senator; b. in Culpeper co., Va., Dec. 29, 1820; bore the name of his father (1790-1855), who served five terms in Congress (1823-33), and was a States-rights advocate; studied law at University of Virginia; served in the Virginia Legislature; president of the Orange and Alexandria R. R.; in Congress from 1881-87; chairman of the committee which overthrew the Mahone hold upon Virginia; U. S. Senator in 1889. D. in Washington, D. C., May 14, 1892.

Barbour, OLIVER LORENZO: lawyer; b. at Cambridge, Washington co., N. Y., July 12, 1811. He was reporter of the New York Court of Chancery from 1847-49; of the New York Supreme Court from 1849-76. Hamilton College made him LL. D. in 1859. D. at Saratoga, N. Y., Dec. 17, 1889.

Barbour, PHILIP PENDLETON: a jurist; b. in Orange co., Va., May 25, 1783; was a brother of James, noticed above. He gained distinction as a criminal lawyer; became a member of Congress in 1814; was chosen Speaker of the House (1821), resigned 1825; re-elected to Congress 1827, resigned again 1830. He was appointed an associate judge of the Supreme Court of the U. S. in 1836. D. at Washington, D. C., Feb. 24, 1841.

Barbour, WILLIAM McLEOD, D. D.: Congregationalist; b. at Pochabers, Scotland, May 29, 1827; graduated at Oberlin College 1859, and at Andover Theological Seminary 1861. He was pastor at South Danvers (now Peabody), Mass., 1861-68, professor in Bangor Theological Seminary 1868-77, and Professor of Divinity in Yale College from 1877 until 1887, and principal and Professor of Theology in the Congregational College in Montreal, Canada, 1887-96.

GEORGE P. FISHER.

Bar'boursville: capital of Knox co., Ky. (for location of county, see map of Kentucky, ref. 5-1); on L. and N. R. R., and on the Cumberland river, 116 miles S. E. of Frankfort. It is situated in a farming, mining, and lumbering region. Pop. (1880) 250; (1890) 1,162.

Barboursville, or **Cabell Court-house**: the capital of Cabell co., West Va. (for location, see map of West Virginia, ref. 8-D); on railroad and the Guyandotte river, 154 miles S. W. of Wheeling. It became the seat of a State normal school. July 13, 1861, it was the scene of a brilliant action in which the Federal troops were successful. Pop. (1880) 361; (1890) 1,838 in its magisterial district.

Barboza: Brazilian poet. See CALDAS BARBOZA, DOMINGOS.

Barbuda, bâr-boô'da (Fr. *La Barboude*): one of the British West India islands; 22 miles N. of Antigua (see map of West Indies, ref. 6-M). Its area is 60 sq. miles. It is of coral formation, has no harbor, and is partly covered with forests. It is a dependency of Antigua, in the colony of the Leeward islands. It belongs to the Codrington family, and has a local proprietary government.

Bar'ca (anc. *Cyrenaica*): a maritime district of Northern Africa; bounded N. by the Mediterranean, E. by Egypt, S. by the Libyan desert, and W. by Tripoli and the Gulf of Sidra; area about 60,700 sq. miles. It is deficient in permanent streams, and the southern part is a desert, but the soil near the sea is fertile. On the mountain-sides are pines, date-palms, and olive trees. The inhabitants are Arabs and Berbers, who are Mohammedans. Formerly it belonged to Tripoli, but since 1869 has been immediately dependent upon Turkey. Pop. estimated at 302,000. Capital, Benghazi.

Barcelona, bâr-se-lô'na, or bâr-thay-lô'na: a province of Spain; comprising the southeastern part of Catalonia, and sloping toward the Mediterranean. It has an area of 2,985 sq. miles. It is one of the most fertile and best-cultivated provinces of Spain. Pop. (1887) 899,264.

Barcelona [Lat. *Bar'cino*; Gr. Βαρκανών; name said to be from *Barca*, the surname of the Carthaginian general Hamilcar]; the most important manufacturing city of Spain; capital of the province of the same name; in Catalonia, beautifully situated on the Mediterranean; 113 miles E. of Lerida; lat. 41° 23' N., lon. 2° 11' E. (see map of Spain, ref. 14-K). Next to Cadiz, it is the most important seaport of Spain. Pop. (1887) 272,481. It is surrounded by a wall, and defended by a citadel and the strong fort of Montjoi. The city is divided into the old and the new town by a beautiful prome-

made called La Rambla. The streets of the new town are more spacious and regular than those of the old. Many of the houses are built of hewn stone, and have an imposing appearance. The most remarkable public edifices are the Gothic cathedral, which is about 600 years old, and the Audiencia, or Palacio de la Deputación which is now occupied by the courts of law. Barcelona has a university, several public libraries, a fine theater, an academy of arts and sciences, and two museums. Here are extensive manufactures of silks, woolen stuffs, calicoes or figured cotton stuffs, lace, shoes, and firearms, which, with copper, wine, and brandy, constitute the principal exports of the city. The harbor is commodious, but is obstructed by a bar which excludes vessels drawing more than 12 feet of water. This is the most populous city of Spain except Madrid. Barcelona is supposed to have been founded by Hamilear Barea. The Romans became masters of it at the end of the Third Punic war (146 B. C.). It was taken by the Saracens or Moors about 714 A. D., and became an independent state in 878. In the twelfth century it was annexed to Aragon. In 1714 it was taken by the Duke of Berwick after a long and heroic defense.

Barcelona: a town and seaport of Venezuela: capital of the state of Bermudez; on the Caribbean Sea; at the mouth of the river Neveri; lat. 10° 10' N., lon. 64° 48' W. (see map of South America, ref. 1-10). The houses are built of mud, and the climate is unhealthy. Pop. 13,000.

Barclay, or Barklay, ALEXANDER: British writer and translator; supposed to have been born in Scotland about 1175. He studied in one of the English universities, traveled on the Continent, and was made a priest in the College of Ottery St. Mary in Devonshire. He afterward entered the Benedictine monastery of Ely, probably in 1511, and on the dissolution of the monasteries, in 1546, he became Vicar of Much Badew, and in March Vicar of Wokey. The first named he held till his death; the second he resigned in 1552 to accept the rectory of All Hallows, Lombard Street, London. He wrote the lives of several saints, translated Sallust's *Jugurthine War* and a French poem called *The Castle of Labor* (1506). His most popular work is his *Ship of Fools* (1509), a free translation from the German of Sebastian Brandt. D. at Croydon; buried there June 10, 1552. See Jamieson's edition of the *Ship of Fools* (Edinburgh, 1874).

Revised by HENRY A. BEERS.

Barelay, JOHN: English satirist; b. at Pont-à-Mousson, Lorraine, Jan. 28, 1582; d. in Rome, Aug. 15, 1621. His celebrated work *Argenis* appeared in the same year. Cowper called it the best romance that ever was written. It has been translated into numerous languages. It is a political allegory, containing several allusions to the state of Europe.

Barelay, JOHN, M. D.: b. on a farm in Perthshire, Scotland, Dec. 10, 1758; was educated at the United College of St. Andrews, where he afterward studied divinity. He was licensed as a preacher by the Dunkeld Presbytery; he became tutor at Edinburgh in 1789 to the family of Sir James Campbell, and commenced the study of medicine; took the degree of M. D. in 1796. He became a noted lecturer on anatomy, commencing his lectures at Edinburgh in 1797, and continuing them until a short time before his death. D. in Edinburgh, Aug. 21, 1826, and left to the Royal College of Surgeons his anatomical collection, afterward called the Barelayan Museum.

Barelay, ROBERT: reformer, and apologist for the Society of Friends; b. at Gordonstown, in Morayshire, Scotland, Dec. 23, 1648. He was educated in Paris at the Scottish College, of which his uncle was rector, and learned to write and speak Latin correctly and fluently. He returned to Scotland in 1664, and became a member and minister of the Society of Friends in 1667. In 1670 he married Christian Mollison, and in the same year published a defense of his fellow-religionists, entitled *Truth Cleared of Calumnies*. He afterward published a *Catechism and Confession of Faith* (1673), and the *Anarchy of the Ranters* (1675). In 1677 he visited Germany on a religious mission in company with George Fox and William Penn. In addition to superior talents, he had moral courage, which qualified him for the part of a reformer. His principal work is *An Apology for the True Christian Divinity, as the same is held forth and preached by the People called in scorn Quakers* (1676), written and published in Latin at Amsterdam, and afterward (1678) translated by the author into English, and published in London (a standard book; many later editions and re-

prints). This work exhibits great logical acumen, and has been commended by eminent persons of different creeds. In 1679 he published a *Vindication* of his *Apology*, which had been criticised by several writers. He was appointed governor of the province of East Jersey—which had been set apart for a Quaker settlement wherein their doctrine of toleration could have free scope, and the persecuted for religion's sake might find an asylum—in 1682, but he never went to America. D. at Ury, Oct. 3, 1690. His *Catechism, Treatise on Church Government*, formerly called *Anarchy of the Ranters*, and *Apology* are reprinted by the Friends' Book Store, Philadelphia. See his *Life* by Joseph G. Bevan (London, 1802), and by Wilson Armistead (Manchester, 1850); cf. *The Histories of the Quakers*, by W. Sewell (London, 1722, repr. Philadelphia, 1841), and by F. S. Turner (London, 1889).

Revised by S. M. JACKSON.

Barelay de Tolly, baar'klay'de-tōl-lay, MICHAEL ANDREAS, Prince: a celebrated Russian general of Scottish extraction; was b. at Luhde-Grosshoff, Livonia, Dec. 16 (27) 1761. He fought against the Swedes in 1790, and against the Poles in 1792 and 1791. With the rank of major-general he led Bemingsen's advanced guard in 1806. In 1809, at the head of 10,000 men, he crossed the frozen Gulf of Bothnia, and advanced as far as Stockholm. In 1810 he was appointed Minister of War. He became in 1812 commander-in-chief of the Army of the West, but, having been defeated by the French at Smolensko in August of that year, in obedience to popular clamor the emperor reluctantly supplanted him by Kutuzof, but after his death (1813) he again obtained the chief command of the army, which he directed at Bautzen, Culm, and Leipzig. He was raised to the rank of field-marshal in Paris in 1814. D. at Insterburg, East Prussia, May 14 (26), 1818.

Barokh'eba, or Barkochba (i. e. son of a star), SIMON: a famous Jewish impostor, claiming to be the Messiah. The name by which he is known was given to him by Rabbi Akiba, the most noteworthy of his converts, who believed his Messianic claims and applied to him the prophecies Num. xxiv. 17; Haggai ii. 6, 7. In the reign of Hadrian (A. D. 132) he excited an insurrection among the Jews, and seized Jerusalem and many fortified places. After a long and bloody contest the city was retaken by the Roman General Julius Severus, and Barokheba was killed in the fortress of Bethar, tradition says, on the 9th of Ab (August), 135. His disappointed countrymen afterward changed his name to Bar-coziba (son of a lie). See J. H. Schwarz, *Der Bar-Cochba'sche Aufstand*, Brinn, 1885.

Revised by S. M. JACKSON.

Bard, SAMUEL, M. D., LL. D.: physician; b. in Philadelphia, Apr. 1, 1742; educated at Edinburgh, where he was an inmate in the family of Dr. Robertson, the historian. He practiced in New York city, and was the family physician of Gen. Washington. He published several medical works, and became president of the College of Physicians and Surgeons of New York. He was an active promoter of benevolent enterprises. D. at Hyde Park, N. Y., May 24, 1821. See his *Life* by Rev. John McVicker (New York, 1822).

Bardelen, baar-de-lay'ben, KARL: German anatomist; b. at Giessen, Mar. 7, 1849; studied in Greifswald, Heidelberg, Berlin, and Leipzig, taking the degree of M. D. at Berlin in 1871; appointed prosector and professor in the University of Jena 1873; author of *Beiträge zur Anatomie der Wirbelsäule* (1874); *Die Gesetzmässigkeit des Knochenbaues und seine allgemeine Bedeutung*; the anatomical part of his father's *Lehrbuch der Chirurgie*, etc.

Bardesa'nes of Edessa, properly Bar-Daisan (i. e. son of the river Daisan, because he was born on its banks); b. at Edessa, July 11, 155 A. D.; lived at the royal court in great favor; went as missionary to Armenia after the fall of his patron (217); d. perhaps at Edessa, 223. He is commonly but not quite justly called a Gnostic. He was an astrologer, and, although in the main an orthodox Christian, had peculiarities due to Valentinian Gnostic or pagan influences. The treatise attributed to him, *The Dialogue on Fate or Book of the Laws of Countries*, was written by some early follower. It was known only from the fragment of the Greek translation preserved in Eusebius's *Preparatio Evangelica*, vi. 9, 10, but the complete original Syriac text was brought by Archdeacon Tattam from the Syrian convent in the Nitrian desert in 1843; recognized by W. Cureton and published by him in 1855, with an English translation; re-published in the *Ante-Nicene Fathers*, vol. viii., 729-734

(New York, 1886). Ephraem Syrus, who flourished about two centuries later, says Bardesanes wrote also 150 hymns, which appear to have been more dualistic than the treatise just spoken of. The best compendious notice of Bardesanes is by Hort in Smith and Wace's *Dictionary of Christian Biography*. Revised by S. M. JACKSON.

Bardings, or Bard, or Barding: a bard is any piece of armor for a horse; hence, bardings are the protective trappings of a horse, whether housings made defensive by stuffing and quilting, or chain-mail or forged pieces of steel. Such defenses were not used in antiquity; they reached their greatest development at the end of the fifteenth century. A horse thus protected is said to be barded.

RUSSELL STURGIS.

Bardsley, CHARLES WAREING: b. at Keighley, Yorkshire, England, 1834; educated at Oxford 1858; ordained deacon 1870; Vicar of Ulverston with Osmotherley, diocese of Carlisle. Author of *English Surnames, their Sources and Significations* (3d ed. 1875); *John Lexley's Troubles* (3 vols., 1876); *Memorials of St. Anne's, Manchester* (1876); *Romanesque of the London Directory* (2d ed. 1879); *Curiosities of Puritan Nomenclature* (2d ed. 1880); *Chronicles of the Town and Parish of Ulverston* (1884); *Her Grandfather's Bible, a Tale of Furner's Fells* (2d ed. 1886).

Bardsley, JOHN WAREING, D. D.: Bishop of Carlisle; b. at Keighley, Yorkshire, England, 1835; educated at Trinity College, Dublin; ordained in 1860, and became Bishop of Sodor and Man in 1887, whence he was transferred to Carlisle in 1892. He has published *Counsels to Candidates for Confirmation* (1882), and *The Origin of Man* (1883).

Bardstown: town (founded in 1785); capital of Nelson co., Ky. (for location of county, see map of Kentucky, ref. 3-G); on branch of L. and N. R. R.; 39 miles S. E. of Louisville; has public schools (white and colored), several academies, and six churches. Its industries are distilling, milling, and coopering. Pop. (1880) 1,803; (1890) 1,524; (1892) estimated with suburbs, 2,000.

EDITOR OF "NELSON COUNTY RECORD."

Barebones, Barebone, or Barbon, PRAISEGOD: b. in London in 1596; was a leather-seller; became a Baptist and preacher. He defended pædolapitism. He preached in his own large house and was very popular. He was also wealthy. On July 4, 1633, he was summoned to Parliament by Cromwell, and his enemies called the Parliament "Barebones's," or the "Little Parliament." It was dissolved the same year, and Barebones did not sit again. When Gen. Monk came to London, Barebones headed a procession of the people, and presented a remonstrance to Parliament against the restoration of Charles II. (1659). He was in the Tower during 1662. D. in London, Dec., 1679. Revised by S. M. JACKSON.

Barefooted Friars [in Lat. *Discalceati fratres*]: an appellation of certain Roman Catholic monks who either wear sandals or go entirely barefoot. They are connected with various congregations of the strict observance in nearly all the orders. There are also barefooted nuns. In some places they wear shoes in severe weather.

Baregine, bār-ay'zhin: a mucus-like substance produced by the algae which grow in mineral springs. It abounds in the hot springs of Barrèges in France; hence the name. It is a substance resembling, to some extent, the white of an egg, imparts a flesh-broth flavor and odor to the water, and is prized for that reason.

Bareilly, bār-ray'lēe: a city of British India; in the Northwest Provinces; on the river Jua; 151 miles E. of Delhi; principal city of a district of the same name (see map of N. India, ref. 5-15). It contains a number of mosques, a college, and many Hindu schools. Here are manufactures of cutlery, carpets, brazen water-pots, tables, and ornamental chairs. Bareilly was a scene of outrage and rapine during the mutiny of 1857, when the Sepoys murdered a number of Europeans. Pop. (1891) 121,870.

Barentz, bār-rents, WILLEM: Dutch navigator; made repeated attempts to reach China through the Arctic Ocean; reached lat. 78 N. on his third expedition; d. near Nova Zembla on June 20, 1597. In 1871 Captain Carlsen found Barentz's winter quarters undisturbed after a lapse of 274 years. A part of his journals were recovered 1875. See Van Campen's *Barentz's Relics* (London, 1877).

Barère de Vieuzac, bār-rār' de-vi-ū-zaak', BERTRAND: a French demagogue and lawyer; b. at Tarbes, Sept. 10, 1755. He was elected in 1792 to the Convention, in which he voted

for the death of the king. In Apr., 1793, he was chosen a member of the Committee of Public Safety. He supported the Jacobins in their contest with the Girondists, and became the reporter of the committee which usurped supreme power in July, 1793. He was the first who proposed that "terror should be the order of the day," and he dressed the atrocious decrees of the committee in such flowery language that he was called the "Anacron of the guillotine." On the 9th Thermidor, 1794, he acted with the enemies of Robespierre. He was banished as a regicide in 1816, but was permitted to return in 1830. He has been called one of the most graceful and accomplished liars in history. D. in Paris, Jan. 13, 1841. See *Mémoires de Barère* (2 vols., Paris, 1834; 2d ed. 4 vols., 1843) and the notice of Barère in Ma-caulay's *Essays*.

Baretti, bār-ret-tēe, GIUSEPPE: Italian writer; b. at Turin, Apr. 25, 1719; removed to London in 1751, and became a teacher of Italian and a friend of Dr. Johnson. He published the *Italian Library* (1757); *Italian and English Dictionary* (1760); and *Travels through Spain, Portugal, and France* (1770), which is highly commended by Dr. Johnson; *Spanish and English Dictionary*, and many other works. D. in London, May 5, 1789. See G. Franchi's *Notizie intorno alla Vita di G. Baretti* (1790).

Barfod, baar fōd, PAUL FREDERIK: a Danish historian; b. at Lyngby, Jutland, Apr. 7, 1811; became assistant in the royal library in Copenhagen 1866. His *Fortællinger af Fædrelandets Historie* appeared in 1853 (4th ed. in 1874).

R. B. ANDERSON.

Barfurush, bār-foo-roosh' (i. e. the mart of burdens): important commercial town of Persia; province of Mazanderan; on the river Bahbul; 14 miles from its entrance into the Caspian Sea, and about 110 miles N. E. of Teheran (see map of Persia and Arabia, ref. 2-H). It has an extensive trade, and contains numerous colleges and caravanserais. The bazaars are large, and filled with a great variety of goods. A good road extends from this town to its port, Meshedi-Ser, on the Caspian. Pop. 50,000.

Bargain and Sale: the act of conveying and transferring real or personal property for a valuable consideration. The term is also employed to indicate the instrument by which the transfer is made. In the law of real estate this form of conveyance is in extensive use. The original mode of conveying corporeal real estate was by means of a ceremony termed *LIVERY OF SEISIN* (*q. v.*), in which the seller delivered to the purchaser some visible symbol, such as a clod of earth or twig of a tree, in the name of the property to be conveyed. This method of conveyance came to be regarded as cumbersome and inconvenient. It was governed by strict and technical rules, and the estates that could be created by it were inelastic—not readily molded to the demands of a growing civilization. The attention of conveyancers was attracted to other methods more suited to modern necessities. These methods were found in the doctrine of uses. (See *USES*.) A use in land was a notion derived from the Roman law, by means of which the formal title remained in one person, while the beneficial estate or enjoyment of the profits appertained to another. It corresponded in the main to the idea of trusts in modern law. (See *TRUST*.) A use could be created by a pecuniary or other legal consideration. For example, if an owner of land for a pecuniary consideration purported by present words to sell it, he would be at once converted into a formal owner, and the person advancing the money would be the beneficial owner, or, in technical language, would have "a use" in the land. He could become formal or legal owner by the action of a court of equity, which would, on application, direct that a conveyance should be made. While the law was in this condition an important statute was passed, 27 Hen. VIII., c. 10, called the *Statute of Uses*, the effect of which, in substance, was to declare that one who had acquired a use under certain prescribed conditions in an estate in land should be the legal or formal, as well as the beneficial, owner. One great consequence of this statute was to introduce new conveyances. The principal one was "bargain and sale." The sale of land for a consideration, as already explained, created a use, and the statute gave the owner of the use the title. A subsequent statute (known as the *Statute of Frauds*) requires conveyances to be in writing. This is the foundation of the modern system of conveyancing, both in England and the U. S. Other conveyances, proceeding either wholly or in part on the same theory, are "covenant to stand seised" and "lease and release." In the first of these the

consideration is the affection between near relatives, technically called a "good" consideration, as distinguished from "valuable." In the second, the doctrine of uses is resorted to to put the purchaser in constructive possession of an estate for years in the land, whereupon he may receive a release, and thus become complete owner.

T. W. DWIGHT.

Bargue, *banrg*, CHARLES; genre-painter; b. in Paris, and died there in 1883 in poverty when about twenty-five years of age. He was a pupil of Gérôme, painted only a few pictures, and never exhibited at the Salon. His works are highly prized by collectors for their minute finish and depth of color, and for their extreme rarity. *Playing Chess on the Terrace*, his last work, is in the collection of Mrs. William H. Vanderbilt, New York.

W. A. C.

Barham, *baar am*, RICHARD HARRIS (whose pen-name was *Thomas Ingoldsby*): English clergyman and humorist; b. at Canterbury, Dec. 6, 1788. He was educated at Brasenose College, Oxford; held various church livings, and in 1842 was appointed divinity lecturer at St. Paul's. His most noteworthy work is the *Ingoldsby Legends* (1840 and 1847), a series of comic tales in grotesque, irregular meters, frequently reprinted. D. in London, June 17, 1845. See his *Life* by his son (London, 2 vols., 1870; 3d ed. 1880).

HENRY A. BEERS.

Bar Harbor: a noted summer resort of Hancock co., Me. (for location of county, see map of Maine, ref. 8-F); situated on Frenchman's Bay and on east side of Mt. Desert island. Pop. of Mt. Desert town (1890) 1,355.

Bari, *baa'rae* (anc. *Barium*): a fortified city and seaport of Italy; capital of the province of Bari; situated on the Adriatic Sea, 58 miles by rail N. W. of Brindisi (see map of Italy, ref. 6-G). It is defended by a massive old castle of Norman origin. The harbor admits only small vessels. Bari is the see of an archbishop, and has some fine ecclesiastical buildings, among which is the priory of St. Nicholas, founded in 1087. It contains a cathedral, also manufactures of silk, cotton, linen, and glass. *Barium* was a very ancient city, and was flourishing as early as 200 B. C. Pop. of commune, 61,000.

Bari, or **Bari delle Puglie**, *baa'rae-del-le-pool'ye*: a province of Apulia, Italy; bounded N. E. by the Adriatic Sea, S. by Lecce and Potenza, W. by Potenza, and N. W. by Foggia; area, 2,293 sq. miles. The soil is very fertile, producing wheat, fruits, and wine. The climate is very hot in summer. Pop. (1891) 756,074. Capital, Bari.

Barilla: a crude, impure carbonate of soda, which is a considerable article of commerce, and is used in the manufacture of soap and glass. It is procured by burning plants of the genus *Salsola* or other plants which grow near the sea. Large quantities of it are exported from Spain and the Balearic isles. The *Salsola saliva* is cultivated on ground adjacent to the sea, by which it is occasionally submerged, the sea being admitted by flood-gates through an embankment. The *Salsola* is cut in September, is dried, and burned in a hole in the ground.

Barinas, *baa-ree'maas*, or **San Carlos**: a town in the state of Zamora, Venezuela; near the river Santo Domingo (see map of South America, ref. 1-C); founded in the sixteenth century; has suffered devastation twice within a century. It is noted for the exportation of the tobacco which bears its name. Pop. 4,000.

Baring, *bay'ring*, Sir FRANCIS: an English financier; b. at Larkbear, near Exeter, Apr. 18, 1740; was the father of Lord Ashburton, and the principal founder of the great banking-house of Baring Brothers & Co. of London. He was made a baronet in 1793. D. in London, Sept. 10, 1810. —His eldest son, THOMAS, b. June 12, 1772, was a member of the House of Commons 1830-32. D. Apr. 3, 1848. For his second son, Alexander, see ASHBURTON.

Baring-Gould, SABINE; clergyman and author; b. at Exeter, England, Jan. 28, 1834; was educated at Clare College, Cambridge; visited Iceland in 1862; took orders in 1865; was appointed curate of Horbury, subsequently of Dalton; rector of East Mersea 1871, of Lew Trenchard 1881; and published *Myths of the Middle Ages* (1868); *The Origin and Development of Religious Belief* (1870); *Legends of the Patriarchs and Prophets* (1871); *Lost and Hostile Gospels* (1874); *Lives of the Saints* (15 vols., 1872-75); *Tragedy of the Caesars* (2 vols., 1892); and other works to the number of about fifty, chiefly on religious subjects or

relating to folk-lore, legend, and popular superstitions. He also in later years became noted for his novels, as *Abhalak*; *Richard Cable*; *John Herring*; *Gaveerocks*.

Revised by HENRY A. BEERS.

Bari'tah: a large Australian bird belonging to the *Corvidae* (crow family). The bill is large and conical, the base

Baritah, or piping crow.

of it extending far backward on the forehead. The *Gymnorhina tibicen* (piping crow or piping grackle) has a melodious voice, is easily tamed, and learns to whistle tunes. There are several genera of these birds.

Baritone: See BARYTONE.

Barium [name devised by Davy from *baryta* (Gr. *βαρύς*, heavy), after the analogy of *rhodium*, *strontium*]: one of the alkaline earthy metals; chem. symbol, *Ba*; atomic weight, 137. It occurs in nature chiefly in the forms of sulphate, barite, barytes, or heavy spar, of carbonate, witherite, and of silicate, barmotome. It is very rarely prepared in the metallic state. Barium salts are prepared either from the native carbonate by the action of acids, or from the native sulphate by first reducing it to sulphide by treating with sawdust or some other reducing agent, then treating this with the proper acids. The most important salts are the chloride and nitrate; both are used as tests for sulphuric acid and soluble sulphates. The chloride is used as a preventive of boiler incrustations, owing to its action on the sulphate of lime of the feed-water. It is also extensively used for the preparation of an artificial sulphate known as *blanc fixe*, which is used in enameling paper. Barium forms a protoxide, BaO , called baryta, and a dioxide, BaO_2 . The latter is employed in the preparation of hydrogen dioxide, H_2O_2 . Baric hydrate, BaH_2O_2 , is the most soluble of the alkaline earthy hydrates; it is used in the laboratory as a test for carbonic acid, with which it forms a white precipitate. Baric sulphate is one of the most insoluble salts known. In its native form, barytes or heavy spar, it is extensively mined and used to adulterate white lead, an application for which it is specially adapted by its high specific gravity. The soluble barium salts are all poisonous. Any soluble sulphate, as sodic, Glauber's salt, or magnesia sulphate, Epsom salt, is an antidote.

C. F. CHANDLER.

Bark: the outer parts of the stem of plants, especially of trees. It is best developed on trees of cool climates, such as conifers, oaks, cottonwoods, maples, etc., but the name is also applied to the outer part of the stem in many herbaceous plants. The cortical part of the stem in a liana plant includes all the tissues outside of the woody cylinder. Here the inner bark consists largely of fibrous cells intermingled with sieve cells and soft tissue; next to this externally is a mass of soft tissue containing more or less chlorophyll, and external to this is the epidermis. This is essentially the structure of the cortex of the young stems of our trees, but as the stems become older the epidermis splits off, and soon the green parenchyma cells disappear also. The bark is henceforth composed of the aggregated annual layers of fibrous, sieve and soft tissue, intermingled with a greater or

less development of cork, i. e. modified soft tissue. (See HISTOLOGY, VEGETABLE.) The annual layers can not long be distinctly recognized in the bark, and in the older portions of trees the outer layers of bark, becoming dry and lifeless, are gradually shed or thrown off. The peculiar juices and characteristic properties of a plant are often most abundant in the true bark, which is the most important part of many medicinal plants, especially of *CINCHONA* (*q. v.*). In making leather, tanners prefer those kinds of bark which contain most tannic acid. Oak bark is chiefly used in the tanneries of Europe. In the U. S. the bark of several species of oak, and also that of the hemlock, is used. The Spaniards employ the inner layer of the bark of the cork-tree (*Quercus suber*), and the Australians that of the eucalyptus.

Revised by CHARLES E. BESSEY.

Bark-beetle, or Bark-chaffer: any one of several coleopterous insects, belonging to the family *Scolytidae*. They bore holes in bark, deposit their eggs in the inner bark, and often kill the tree. One species (*Tomicus typographus*, or the typographic beetle) infests the forests of Germany in great numbers. In 1783 it caused the death of a million pines or more in the Hartz Forest. It receives its name from the circumstance that the burrows formed by it in feeding upon the soft wood immediately within the bark often present a rude resemblance to printed characters. The U. S. have several destructive species.

Barker, A. S.: commander U. S. N.; b. in Massachusetts, Mar. 13, 1843; graduated at the Naval Academy in 1861. He served in the steamer *Mississippi* at the passage of Forts Jackson and St. Philip and capture of New Orleans, Apr. 24, 1862, and in the attack on Port Hudson, Mar. 14, 1863, where the *Mississippi* grounded and was destroyed; and afterward in the *Monongahela* at the siege of Port Hudson, and was in various engagements in her with batteries on the Mississippi river; was promoted to a captaincy May 5, 1892.

Barker, EDMUND HENRY: English philologist; b. at Hollym, Dec. 22, 1788; studied at Cambridge; edited numerous classical works, including the *Revision of Stephen's Thesaurus Linguae Graecae* (12 vols. folio); lost all he had in a lawsuit. D. in London, Mar. 21, 1839.

Barker, FORDYCE, M. D., LL. D.: b. at Wilton, Me., May 2, 1818; educated at Bowdoin College 1837, and studied medicine in Boston and Paris. He became in 1845 Professor of Midwifery in the Medical School at Brunswick, Me.; held the same position in the New York Medical College (1850-57), and in 1860 became Obstetric Physician and Professor of Midwifery at Bellevue Hospital Medical College, New York; published many papers on obstetrical and other kindred subjects, a treatise on *Seasickness*, and one on *Puerperal Diseases*. His private practice was large and lucrative. He was a model man in all the relations of life. He was president of the New York Academy of Medicine, and a leading man in his profession. D. in New York city, May 30, 1891.

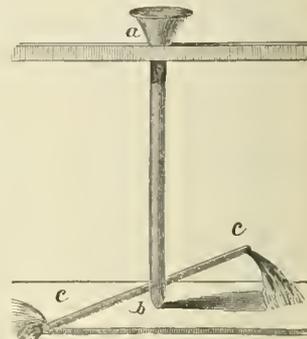

Barker, GEORGE FREDERIC, M. D.: chemist and physician; b. at Charlestown, Mass., July 14, 1835. He became an apprentice in 1851 in a philosophical instrument manufactory in Boston, where he remained until 1856, in which year he entered the Yale Scientific School, and graduated as Bachelor of Philosophy in 1858. He was chemical assistant for two winters (1858-61) in the Harvard Medical School. In 1861 he was appointed Professor of Chemistry and Geology in Wheaton College, Illinois, and was acting Professor of Chemistry in 1862-63 in the Albany Medical College, where he graduated as M. D. in 1863. Early in 1864 he became Professor of Natural Sciences in the Western University of Pennsylvania at Pittsburg, was instructor (1865) in the Yale Medical College, and was appointed Professor of Physiological Chemistry and Toxicology at Yale in 1867. In 1878 he was chosen president of the American Association for the Advancement of Science. In 1873 he became Professor of Physics in the University of Pennsylvania. In 1876 he was elected a member of the National Academy of Sciences. In 1881 he received the decoration of commander of the Legion of Honor from the French Government. He was one of the U. S. commissioners to the Paris Int. Elec. Exhibition in 1881, a delegate to the Int. Congress of Electricians, and a vice-president of the jury. He was appointed by President Arthur a member of the U. S. Electrical Commission in 1884. Among his various productions may be named a *Lecture on the Force of*

Nature, delivered (1863) before the Chemical Society of Union College, by whom it was published; and one on the *Correlation of Vital and Physical Forces*, delivered (Dec. 31, 1869) before the American Institute in New York; republished in France. He is the author of a *Text-book of Elementary Chemistry* (New York, 1870), which has already passed through twenty editions.

Barker's Mill, or Segner's Wheel: a hydraulic machine invented by Dr. Barker toward the end of the seventeenth century. It is a device in which the reaction due to two water jets, *c c* (see cut), is utilized to produce rotary motion. The tube from which the jets issue tends to revolve in the direction opposed to that of the water emitted. The machine is sometimes called the *centrifugal mill*.

E. L. N.

Barking-bird (*Hylætes tauri*): a small bird of the family *Pteroptochidae*, found in Chili; remarkable for its cry like the yelping of a small dog.

Barker's mill.

Barksdale, WILLIAM:

a brigadier-general in the Confederate service; b. in Ruthersford co., Tenn., Aug. 21, 1821; killed at Gettysburg, Pa., July 2, 1863. He was educated at Nashville University, removed to Mississippi, studied law, and was admitted to the bar. He served in the Mexican war. In 1853 he was elected to Congress from Mississippi, and resigned his congressional seat and became a brigadier-general in the Confederate army; and it was at the head of his brigade that he was killed on the second day of the battle of Gettysburg.

Bar'laam: b. at Seminara in Calabria, Southern Italy, near the end of the thirteenth century; was of Greek descent. He became a monk in a Roman Catholic monastery of the order of St. Basil; continued his studies afterward at Thessalonica, becoming proficient in theology, philosophy, and mathematics; went to Constantinople in 1327, where he joined the Greek Church, and was made Abbot of St. Salvador (1331). In 1339 he was sent by the emperor to Avignon to try to bring about a union between the Greek and Latin Churches, but the scheme failed. Being condemned for heresy, he returned to Italy and the Roman Church in 1341, and was made Bishop of Gerace in Calabria in 1342. He is chiefly known, however, as the person from whom Petrarch unsuccessfully endeavored to learn Greek. D. there in 1348.

Barlaam and Josaphat (or Joasaph): a Greek religious romance or legend, often erroneously attributed to Johannes Damascenus, a Byzantine theologian of the eighth century. According to the legend, Josaphat is the son of a heathen King of India. In consequence of an astrologer's prediction, he is shut up in a palace by his father, and surrounded with young and beautiful attendants, in order that he may learn nothing of misery, disease, or death. Later the prince is allowed to make excursions from his retreat, but the streets are carefully cleared of the sick and unfortunate. By accident, however, he sees on one occasion a blind man and a leper, and on another he meets a man broken down by age. These sights, and the explanation of them given him by his tutors, make him very thoughtful. Barlaam, an ascetic, gets admitted to the prince, and converts him to Christianity and the monastic ideal. The prayers and threats of the king and the temptations devised by the magician Theudas can not shake Josaphat's faith, and both the king and Theudas become converts. Forty days after his father's death Josaphat abdicates. After long and perilous wanderings he finds Barlaam, and joins in his ascetic devotions, remaining with him till the old monk dies, and continuing the same austerities till his own happy end. The narrative contains a number of parables (such as *The Trumpet of Death*, *The Caskets*, *The Fowler and the Bird*, *The Man in the Pit*), which became a part of the anecdotal literature of the later Middle Ages (see Benfey, *Pantschatantra*, i. 80; Brauholtz, in the bibliography at the end of this article; T. F. Crane, *Exempla from the Sermones Vulgares of Jacques de Vitry*, London, 1890; Oosterley, *Gesta Romanorum*, pp. 736, 739, 745, etc.). It also contains an elaborate exposition

of Christian theology (with a marked tendency to polemic against the Monothelite heresy) and of Christian ethics. The author is enthusiastic in his praise of the monastic life. His style is rhetorical, and shows the influence of John Chrysostom and Gregory Nazianzen.

Barlaam and Josaphat is really a Christian *rivaleto* of a lost Sanskrit or Pāli legendary biography of the Būddha, and most of the parables it contains are Būddhistie (see Liebrecht, who compares the *Lalitavistara*). The name *Josaphat* has even been identified with *Bodhisattva*, a title of the Būddha (*Zeitschrift der Deutschen Morgenländ. Gesellschaft*, xxiv, 489; Zotenberg, p. 68; Hommel, p. 178). Yet both Barlaam and Josaphat stand as saints in the Roman Martyrologium (Nov. 27) and the Greek Menæa (Aug. 26). The history of the passage of this Būddhist legend into Christian hagiology is obscure. The author of the Greek romance professes to have heard the story from certain pious (εὐλαβείς) men of India, who had translated it from trustworthy records or memorials. Zotenberg, combining this statement with another embodied in the title as given in most of the older MSS., thinks it likely that this Greek romance was written by John, a monk of the convent of St. Saba in Jerusalem, about 634, on the basis of communications from Nestorians from India. But one of the oldest MSS. (eleventh century) asserts that the book was translated from Iberian (i. e. Georgian, Grusinian) by Euthymius Iberus (d. 1026); and the discovery in 1887 of a Grusinian version has persuaded Rosen of the truth of this note. He supposes the monk John, who can not in any case be Johannes Damascenus, to have written the romance (probably in Syriac) in the first part of the seventh century, deriving his materials from Nestorian pilgrims. John's text, he conjectures, was turned into Grusinian by monks of the same convent, and this Grusinian translation was the source of the Greek romance, which he takes to be the work of Euthymius. The extant Grusinian version bears the name of Sophron Palæstinus, whom Hommel wishes to identify with Sophron, the friend of St. Jerome (fourth century). Hommel derives this text from a lost Syriac version of a Pehlevi translation (also lost) of the original Būddhist legend, and compares the literary history of the *Kalilah wa-Dimnah* (see PILPAY). He postulates a similar derivation for three non-Christian versions of the *Barlaam* that have come down to us: (1) Arabic, thought to be by the celebrated physician Rhazes (ar-Rāzī, ninth to tenth century), and preserved in an unpublished work of al-Kummī (d. 991) on the Mahdi and in an unpublished Persian translation; (2) Arabic, an anonymous abstract in a Halle MS., edited by Hommel, *Abhandlungen des VII. internat. Orientalisten-Congresses zu Wien*, 1887; (3) Hebrew, by Ibn Chisdai, a Spanish Jew (d. 1240), based on a lost Arabic translation. From these three versions, the relations of which have not been fully cleared up, it is possible partly to reconstruct the Būddhist form of the legend.

The Greek *Barlaam and Josaphat* was very popular. It was translated into Arabic (earliest MS. thirteenth century), and thence into Ethiopic (1553). A Slavonic rendering made it known to Serbia, Bulgaria, Roumania, and Russia. Fragments of a French version have been discovered. A Latin translation was made in the twelfth century, and this was inserted by Vincent of Beauvais (d. 1264) in his *Speculum Historiale* (bk. xv., ch. 1-63), was condensed by Jacobus a Voragine (1230-98) for his *Legenda Aurea* (see JACOBUS A VORAGINE), and has given rise, mediately or immediately, to prose or verse translations in almost all the tongues of Western Europe. Thus there are versions in French (poem of Gui de Cambrai, thirteenth century; poem of the Anglo-Norman Chardry, thirteenth century; prose, twelfth century; mystery, about 1400), Provençal (prose, MS. of 1343), Spanish, Italian (various prose texts; mystery), Rheto-Romanic (prose, seventeenth century or earlier), Czech (MSS. of fifteenth century), Middle High German (poem of Rudolf von Ems, thirteenth century; other fragments), Norse (*Barlaam og Josaphats Saga*, about 1200), Swedish (prose, fifteenth century), Icelandic (fifteenth century), Middle English (prose and verse), etc. A complete catalogue would take much space.

G. L. KITTEDGE.

Bar-le-Duc, baar'le-dük', or **Bar-sur-Ornain**, baar'sür-ör-nān'; a town of France; capital of the department of Meuse; is on the river Ornain, and on the railway which connects Paris with Nancy, 159 miles by rail E. of Paris (see map of France, ref. 3-H). It has a communal college, a normal school, and a public library; also manufactures of cotton stuffs, hosiery, and calicoes. Its trade is facilitated by a canal which connects the Marne with the Rhine. Pop. (1891) 18,761.

Barletta (anc. *Bardulum*): a fortified seaport of Italy; in the province of Bari; on the Adriatic, and on a rocky island 34 miles by rail W. N. W. of Bari; lat. 41° 20' N., lon. 16° 19' E. (see map of Italy, ref. 5-E). It is well built, has handsome stone houses, and wide, well-paved streets. It contains a fine cathedral, a college, a strong citadel or castle, and a colossal statue of the Emperor Heraclius, said to have been found in the sea. Grain, wine, oil, and fruits are exported from this town. Pop. 35,000.

Barley (in Lat. *hordeum*): a valuable cereal of the family *Gramineæ*; said to be more widely distributed than any other grain. It was cultivated by the ancient Hebrews, Greeks, and Romans, and was an important article of food in remote antiquity; mentioned in Exodus ix. 31. It is adapted to both cold and warm climates. Three species are known to agriculture, the common (*Hordeum vulgare*) two-rowed (*H. distichon*) and the six-rowed (*H. hexastichon*). Late writers regard these as forms of one species. Barley meal is used for bread in Northern Europe, but in many parts of the world this grain is mostly malted (*germinated*) for the manufacture of beer. It is also valuable as food for horses. When the pellicle of the grain is removed and the grain is rounded, it is called pearl-barley, which is used as food for invalids. The sprout or battledore barley (sometimes called German rice) is much esteemed in Germany. It has only two rows, and has widely spreading awns. The Nepal or Himalaya barley is well adapted for cold and mountainous regions, as it produces good crops at the height of 11,000 feet above the level of the sea. Barley is sown in the spring, and is cultivated in the same manner as spring wheat. Nearly all the American barley is used for malt.

Revised by L. H. BAILEY.

Barleycorn. JOUX; a personification of the spirit of barley or malt liquor; used in humorous poetical composition and in jocular parlance. There is an old whimsical English tract entitled *The Arraigning and Judicating of Sir John Barleycorn, printed for Timothy Toppot*, in which Barleycorn is described as of "noble blood, well beloved in England," etc.; but John Barleycorn is best known from Burns's humorous poem of that name.

Barlow, FRANCIS CHANNING; major-general; b. at Brooklyn, N. Y., Oct. 19, 1834; graduated first in his class at Harvard College in 1855; served in the Union army 1862-65. He was at Fair Oaks and in almost every subsequent battle of the Army of the Potomac, and won a distinguished reputation as a brave and able officer. He was Secretary of State

for New York in 1866-68, and was elected Attorney-General of New York in 1871. From 1873 he practiced law in New York city, where he died Jan. 1, 1896.

Barlow, JOEL: poet; b. at Redding, Conn., Mar. 24, 1754; graduated at Yale College in 1778. He served as chaplain in the army in the Revolutionary war, after which he studied law. He produced in 1787 *The Vision of Columbus*, a poem which was very popular, and which he expanded into an epic, *The Columbiad* (1807). Having visited Europe on business in 1788, he passed some years in Paris during the French Revolution, and amassed a competence by trade or speculation. He returned to the U. S. in 1805. He was sent as ambassador to France in 1811, and died near Cracow, Dec. 24, 1812, while on his way to Wilna, whither he had been invited to meet Napoleon. His best poem is *Hasty Pudding* (1793), a mock heroic. See *Life and Letters of Joel Barlow*, by Charles Burr Todd (New York, 1886). Revised by HENRY A. BEERS.

Barlow, WILLIAM HENRY, F. R. S.: civil engineer; past president of the Institution of Civil Engineers; hon. mem. Société des Ingénieurs Civils; son of Prof. Barlow. B. at Woolwich, England, 1812; educated at Woolwich; pupil of H. B. Palmer, M. I. C. E. In 1832 erected buildings and plant at Constantinople for reconstruction of Turkish ordnance for Messrs. Maudsley & Field; reported on lighthouse at entrance of Bosphorus; received the decoration of "Nishan." In 1833 was assistant engineer of the Birmingham and Manchester Railway, then resident engineer of the Midland Counties; became engineer of the Midland Railway when formed. In 1857 he took offices in London and became consulting engineer of the Midland Company. He made many of the new lines of the Midland Railway, including its London end and the St. Pancras station. He was joint engineer with Sir John Hawkshaw for the completion of Clifton bridge, a description of which he contributed to the Institution of Civil Engineers. He was associated with Sir John Fowler and Mr. T. Harrison to decide the general plan of the Forth bridge, and himself designed and constructed the new Tay bridge. He was one of the judges of the Centennial Exposition (Philadelphia, 1876), and vice-president of the Royal Society in 1881. He did much to facilitate the use of steel in constructions, and was a member of three Government commissions: 1. To decide the coefficient for steel to be used in engineering structures; 2. To ascertain the cause of the fall of the first Tay bridge; 3. To report on the provision against wind-pressures in engineering structures.

He was a member of the Ordnance Committee in 1881, which he resigned from ill health in 1888. He became a member of the Institution of Civil Engineers in 1845, and its president in 1880. His wife was Selina Crawford, daughter of W. Coffin, of the Royal arsenal. He has written several papers for the Philosophical Society, and taken part in numerous papers and discussions in the Institution of Civil Engineers upon almost every department of engineering.

Wm. R. HETTON.

Bar'mecides (sing. **Barmecide**): the name of a distinguished and powerful Persian family, which was derived from Barmak or Barmek. His son, Khâled-ben-Barmak, became the Prime Minister of the Caliph Al-Mansoor, and also of Al-Mahdi, who appointed him tutor to Haroun-al-Raschid. Yahya, the son of Khâled, was vizier under Haroun-al-Raschid, to whom he rendered important services. Yahya had four sons, named Fadhl, Mohammed, Musa, and Jaafar, who enjoyed the favor of the sovereign. Fadhl was vizier for some time. Haroun-al-Raschid, who was jealous of their power and popularity, ordered them to be put to death about 802 A. D. (See JAAFAR.) The virtues and misfortunes of the Barmecides have been celebrated by many Oriental poets and historians.

Barmecide's Feast: the name of a celebrated tale from the *Arabian Nights*; often applied to an ostentatious display of worthless bounty. The tale is as follows: Schacabac being reduced to great poverty, and having eaten nothing for two days together, made a visit to a noble Barmecide in Persia, who was very hospitable, but withal a great humorist. The Barmecide was sitting at his table, that seemed ready covered for an entertainment. Upon hearing Schacabac's complaint, he desired him to sit down and fall to. He then gave him an empty plate, and asked him how he liked his rice-soup. Schacabac, who was a man of wit, and resolved to comply with the Barmecide in all his humors, told him it was admirable, and at the same time lifted up the empty spoon to

his mouth [apparently] with great pleasure. The Barmecide then asked him if he ever saw whiter bread. Schacabac, who saw neither bread nor meat, answered, "If I did not like it, you may be sure I should not eat so heartily of it." Several other fine dishes were served up in idea, which both of them commended and feasted on after the same manner. This was followed by an invisible dessert; and Schacabac, at length being tired of moving his jaws up and down to no purpose, desired to be excused, for that really he was so full he could not eat a bit more. "Come, then," said the Barmecide, "you shall taste of my wines, which, I may say without vanity, are the best in Persia." He then filled their glasses out of an empty decanter. Schacabac would have excused himself from drinking so much at once, because he said he was a little quarrelsome in his liquor; however, being pressed to it, he pretended to take it off, having beforehand praised the color and afterward the flavor. Being plied with other imaginary bumpers of different wines, he pretended to grow flustered, and gave the Barmecide a box on the ear; but immediately recovering himself, "Sir," said he, "I beg ten thousand pardons, but I told you before that it was my misfortune to be quarrelsome in my drink." The Barmecide, who was pleased with the complaisance of his guest, then ordered a good substantial dinner to be served up.

Bar'men: a town and valley of Rhenish Prussia; on river Wipper; 17 miles by rail E. N. E. of Düsseldorf. The town is 3 miles E. of Elberfeld, or, according to one statement, is a continuation of Elberfeld, with which it forms one uninterrupted street 6 miles long (see map of German Empire, ref. 4-C). Barmen is the principal seat of the ribbon manufacture on the Continent, and its fabrics are distributed to all parts of the world. Here are also manufactures of cotton and linen goods, velvet, lace, hardware, and chemical products. The district which contains Barmen and Elberfeld is the most populous, industrious, and thriving in Germany. Barmen has a handsome church, an asylum for the deaf and dumb, an exchange, etc. Pop. (1885) 103,066; (1890) 116,248.

Bar'nabas [Gr. *Βαρνάβας*, from a Heb. word meaning son of consolation], SAINT; an early Christian and apostle; originally named JOSEPH; was born in the island of Cyprus. He was a companion and fellow-laborer of the apostle Paul on his first missionary journey, and appears to have been the principal founder of the church of Antioch, to which he was sent by the church of Jerusalem. "He was a good man, and full of the Holy Ghost and of faith" (Acts xi. 24). His falling out with Paul prevented his going with the latter on his second missionary journey (Acts xv. 39). He returned to Cyprus, and was still active in A. D. 57 (cf. 1 Cor. ix. 6). According to one tradition, he was the first Bishop of Milan.

Barnabas, Epistle of: an epistle of twenty-one chapters, which is supposed to have been written between 107-120 A. D. After having been lost sight of for several centuries, this epistle was first published in 1645, but the first four chapters and a part of the fifth were only in Latin. In 1859 Tischendorf discovered the whole in Greek MS. of the fourth century at Mt. Sinai, and it was published in 1862. Another MS. (dated 1056) was discovered at Constantinople by Bryennios in 1875. It was formerly ascribed to the apostle Barnabas, but it is evidently the work of another and later hand. It is frequently cited by the Fathers, and was by many regarded as being of authority in the Church, some even claiming for it a place in the sacred canon. It is chiefly directed against the Judaizing Christians, and its principal value now is in the light it throws upon the customs and doctrines of the Christians of that time. Several English translations have been published. The best recent editions of Barnabas are by Funk (1878) and Gebhardt and Harnack (1878), and that contributed by Rev. J. R. Harmer, Fellow of Christ Church College, Cambridge, to the edition of *The Apostolic Fathers*, issued by the trustees of the Lightfoot Fund (1891). This text and translation, prepared by the personal friend and *collaborateur* of the late Bishop of Durham, leaves nothing wanting for the critical study of this epistle.

Revised by W. S. PERRY.

Bar'nabites: an order of monks which was founded by Zaccaria at Milan in 1530, and were so called because they preached in the church of St. Barnabas. Their designation properly is "Regular Clerks of the Congregation of St. Paul." Their duties were to attend the sick, to preach, to instruct the young, etc. They became numerous, and established monasteries or colleges in Italy, France, Austria, and Spain.

Barnaby, Sir NATHANIEL, K. C. B.: chief naval architect and director of naval construction of the British navy; b. in Chatham in 1829, of a family which has produced many generations of shipwrights in the royal dockyards. Apprenticed to the trade of shipwright at Sheerness in 1843, in 1848 he won by competition an Admiralty scholarship in the school of naval architecture at Portsmouth. In 1854 he superintended the construction of two gun-vessels built for the royal navy. In 1855 he entered the designing-office at the Admiralty, and during the thirty years he served there he was concerned in the design and construction of all but three of the entire list of British sea-going fighting ships, armored and unarmored, in existence, or building at the time of his retirement in 1885. From 1863 to 1870 this office was under the control of Sir Edward J. Reed, who also is credited with the design of some 35,000 tons of ironclads during the first three years of his service. Mr. Barnaby was appointed chief naval constructor in 1872, after the retirement of Sir E. J. Reed. He aided in the substitution of steel for iron in ship-building. He initiated the Admiralty list of subsidized merchant ships, constructed with appreciable fighting or transportation value in time of war. One of the four founders of the Institute of Naval Architects in 1860, he has contributed many papers to its Transactions, and wrote the articles on the *Navy and Ship-building* for the *Encyclopædia Britannica*. He was made a Companion of the Bath in 1876, on the recommendation of Mr. Disraeli, and a Knight Commander of the Bath in 1885, on the recommendation of Mr. Gladstone.

WM. R. HUTTON.

Barnacle: See CURRIPEDIA and BALANUS.

Barnacle Goose, or **Brant Goose** (*Branta bernicla*): a bird which frequents the coasts of Britain in winter, and migrates northward in spring. It is smaller than the common wild goose, and is esteemed for food. The plumage of the upper part of its body is ash-gray and black, and that of the lower part white. The name of barnacle is sometimes applied to other species of wild geese. All of them are remarkable for powerful flight and distant migrations, and prized for the table. The barnacle goose is a winter bird of passage in the U. S. It takes its name from the old belief that barnacles were often transmuted into geese—a superstition which was once shared by learned and unlearned alike.

Revised by D. S. JORDAN.

Barnard, E. E.: astronomer; b. in Nashville, Tenn., Dec. 16, 1857. In his youth he learned the art of photography, and it was with the slender means gained by its practice that he was enabled to purchase his first telescope. About 1878 he began to search for comets, but it was not until September, 1881, that his efforts were rewarded with success. From this time until 1891 he found one, two, or three comets almost every year. In 1883 he entered the Vanderbilt University as Fellow in Astronomy, taking charge of their small observatory, and at the same time taking a course of instruction in the subjects most necessary to astronomical pursuits. Graduating in 1887, he resigned the position of instructor in astronomy to accept that of astronomer at the Lick Observatory. Here he showed himself one of the most zealous and enthusiastic of observers. In 1892 he was allowed to search the heavens with the great 36-inch telescope, and on Sept. 9 he found a new satellite of Jupiter, thus adding a fifth to the four which had been discovered by Galileo. In 1889 he received the degree of A. M. from the University of the Pacific, and in 1892 the Lalande medal of the French Academy was awarded him for the discovery of the new satellite of Jupiter.

S. NEWCOMB.

Barnard, DANIEL DEWEY, LL. D.: a lawyer and Whig politician; b. at Sheffield, Mass., July 16, 1797; graduated at Williams College in 1818, was admitted to the bar at Rochester, N. Y., in 1821; was county attorney in 1826, and a member of Congress from New York (1828-30 and 1839-45). He traveled in Europe in 1830-31, corresponding with a Rochester newspaper; removed to Albany in 1832; became noted in the Whig party, and as a member of the New York Assembly; and was U. S. minister to Prussia (1849-53). He was the author of many published reviews, speeches, etc., including *An Historical Sketch of the Colony of Rensselaerwick*. D. at Albany, N. Y., Apr. 24, 1861.

Barnard, FREDERICK AUGUSTUS PORTER, S. T. D., LL. D., L. H. D., D. C. L.: mathematician, physicist, educator, and divine; b. at Sheffield, Mass., May 5, 1809; graduated at Yale College in 1828; tutor there 1830; Professor of Mathematics and Natural Philosophy in the University of Ala-

bama 1837-48; Professor of Chemistry and Natural History in the same 1848-54; Professor of Mathematics, Natural Philosophy, and Civil Engineering in the University of Mississippi 1854-61; president of the University of Mississippi 1856-58; and chancellor of the same 1858-61. In 1854 he took orders in the Protestant Episcopal Church; resigned his chancellorship and his chair in the university in 1861 on account of the civil war; moved to Washington, D. C., and in 1863-61 was connected with the U. S. coast survey, in charge of chart-printing and lithography. In May, 1864, he was elected president of Columbia College, New York city, which he resigned in 1888 on account of failing health. He received the honorary degree of LL. D. from Jefferson College, Mississippi, in 1855, and from Yale in 1859; also degree of S. T. D. from the University of Mississippi in 1861, and that of L. H. D. from the regents of the University of the State of New York in 1872. In 1860 he was a member of the eclipse expedition sent to Labrador (Cape Chudleigh) by the U. S. Coast Survey; and during his absence was elected president of the American Association for the Advancement of Science. In the act of Congress establishing the National Academy of Sciences (1863) he was named as one of the original corporators, and was chairman of the physical section, 1870-72; in 1867 he was one of the U. S. commissioners to the Paris Exposition. He was also a member of the American Philosophical Society, an associate member of the American Academy of Arts and Sciences, corresponding member of the Royal Society of Liège, and member of many other scientific and literary associations. During his long residence in the South, Dr. Barnard was actively engaged in promoting public education, both primary and higher, encouraging and assisting in all departments of scientific research and literary culture. He was a persistent advocate of the higher education of women in the old colleges, and the Barnard annex for girls to Columbia College, New York, is named for him in recognition of his labors for its creation. His publications have related chiefly to scientific and educational subjects. Among these may be mentioned *Letters on College Government* (1854); *Report on Collegiate Education* (1854); *Art Culture* (1854); *History of the American Coast Survey* (an extended Report to the American Association for the Advancement of Science, 1857); *University Education* (1858); *Vibulatory Theory of Light* (1862); *Machinery and Processes of the Industrial Arts, and Apparatus of the Exact Sciences* (1868); *Metric System of Weights and Measures* (1871). D. in New York city, Apr. 27, 1889. See his *Memoirs*, by John Fulton (New York, 1896).

Barnard, HENRY, LL. D., L. H. D.: an eminent educator; b. at Hartford, Conn., Jan. 24, 1811; graduated at Yale in 1830; called to the bar in 1835; while in the Legislature of Connecticut (1837-40) he reorganized the public schools. He was secretary of the board of school commissioners (1838-42); school commissioner of Rhode Island (1843-49); superintendent of schools in Connecticut (1850-54); president State University of Wisconsin (1856-59), and of St. John's College, Annapolis, Md. (1865-66). The normal-school system found in him one of its earliest and most efficient promoters. He published, besides other works, *The Connecticut Common School Journal*, which had reached several volumes in 1855; *Normal Schools in the United States and Europe* (1851); *Education in Factories* (1842); *School Libraries* (1854); *Hints and Methods for the Use of Teachers* (1857); and *National Education in Europe* (1851), when he commenced the publication of the *American Journal of Education*. He was U. S. commissioner of education 1867-70. In 1886 he began the publication of *The American Library of Schools and Education*, which was to comprise the 800 reports, treatises, and studies which came from his pen.

Barnard, JOSEPH, a famous minister of Marblehead, Mass.; b. in Boston, Nov. 6, 1681, and graduated at Harvard in 1700. He was a chaplain in the Port Royal expedition of 1707, of which he wrote an unpublished account. Visiting England, he was offered a chaplaincy to Lord Wharton, but refused to conform. He was ordained colleague minister of Marblehead in 1716, and there remained for life. He took great pains in establishing the fisheries and commerce of his people. He published *A History of the Strange Adventures of Philip Ashton* (1725); a version of the Psalms; sermons, etc. D. at Marblehead, Mass., Jan. 24, 1770.

Barnard, JOSEPH GROSS, LL. D.: military engineer; b. in Sheffield, Mass., May 19, 1815; was a brother of the president of Columbia College, New York; graduated at U. S. Military Academy 1833; commissioned as brevet second lieutenant in

the corps of engineers. In 1835 was sent to the Gulf coast, where he served seventeen years as an assistant or principal engineer for the fortifications of Pensacola and New Orleans, and on works of harbor improvement. During the war with Mexico he was twice called to the field, and received the brevet of major "for meritorious services while serving in the enemy's country." In 1850 he was named by the President (Taylor) as chief of a scientific commission for the survey of the Isthmus of Tehuantepec, with the view of establishing a route of commerce and travel to our newly acquired Pacific possessions. The report drawn up by J. J. Williams (1852) gives the first full account of that isthmus ever published. In 1854 Barnard was in charge of the construction of the new fortifications of San Francisco, Cal.; in 1855-56 superintendent of the U. S. Military Academy. Subsequently, till 1861, he was in charge of the fortifications of New York harbor. Serving as chief engineer under Gen. McDowell in the first Bull Run campaign, he was present on the field of that battle, as also at the earlier combat at Blackburn's Ford, the very first of the inchoate "Army of the Potomac." As chief engineer (with the rank of brigadier-general) of the Army of the Potomac in the Virginia Peninsula campaign of 1862, he directed the siege operations at Yorktown and before Richmond; and subsequently, as "chief engineer of the defenses of Washington," the extensive works for the defense of the national capital. In the campaign of 1864-65 he served on the staff of Lieut.-Gen. Grant as "chief engineer of the armies in the field," until the surrender of Lee's army at Appomattox Court-house, at which he was present. He was breveted through several grades, and finally received the brevet of major-general U. S. army "for gallant and meritorious services in the field"; also breveted July 4, 1864, major-general U. S. volunteers "for meritorious and distinguished services." From the close of the civil war he served as senior member of the board of engineers for permanent fortifications, and as a member of the U. S. lighthouse board. He was a member and original incorporator of the National Academy of Sciences. The degree of A. M. was conferred upon him by the University of Alabama in 1838, and of LL. D. by Yale College 1864. He was a member of the American Institute of Architects, and an honorary member of the American Society of Civil Engineers. His principal publications are *The Phenomena of the Gyroscope Analytically Examined* (1858); *Notes on Sea-coast Defense* (1861); *Reports of the Engineer and Artillery Operations of the Army of the Potomac* (1863); in conjunction with Gen. W. F. Barry, chief of artillery, *Report on the Defenses of Washington* (1871); *Report on the Fabrication of Iron for Defensive Purposes*, etc. (1871), made in conjunction with Gen. H. G. Wright and Col. P. S. Michie; *The North Sea Canal of Holland, and Improvement of Navigation from Rotterdam to the Sea; Problems of Rotary Motion Presented by the Gyroscope, the Precession of the Equinoxes, and the Pendulum*. In May, 1864, he was nominated brigadier-general and chief of engineers. The nomination was withdrawn at his own request. Retired with rank of colonel of engineers Jan. 2, 1881. D. at Detroit, Mich., May 14, 1882.

Barnaul, bair'-nowl': a town of Siberia; government of Tomsk; at the junction of the Barnaul with the river Ob; 230 miles S. S. W. of Tomsk (see map of Asia, ref. 3-F). It has a mining-school, four churches, and several hospitals. All the gold of the Altai Mountains is brought here to be smelted. A magnetic and meteorological observatory was established here about 1841. Pop. 18,000.

Baruave, bair'naav, ANTOINE PIERRE JOSEPH MARIE: a French revolutionist and advocate; b. at Grenoble, Oct. 22, 1761. He was elected in 1789 to the States-General, and became a leader of the popular party. As a member of the National Assembly he opposed the absolute veto, and advocated the confiscation of church lands and the abolition of convents. He was a member of the committee appointed to attend the king on his return from Varennes to Paris in 1791, after which he became a more moderate reformer, and even defended the royal cause. This change of course rendered him unpopular. He retired to private life in Sept., 1791, and was guillotined in Paris, Nov. 29, 1793. According to Macaulay, he was "the best debater in the National Assembly, but he flinched before the energy of Mirabeau." He left several political treatises, among which is *Réflexions politiques*. See *Life of Baruave*, by M. de Salvandy, and *History of the Girondists*, by Lamartine.

Barnburners: a nickname given to that portion of the Democratic party of the State of New York which opposed the extension of slavery and supported Van Buren against Cass for President in 1848. They were esteemed too radical by their adversaries, one of whom illustrated his meaning by a story of a farmer who was so greatly annoyed by the rats who devoured his grain that he burned his barn to get rid of them. The barnburners, led by Col. Samuel Young, Hon. Silas Wright, Michael Hoffman, etc., opposed further borrowing for the improvement or extension of their State canals, and were hostile generally to public debts, corporate privileges, etc.

Barnby, SIR JOSEPH: musician; b. at York, England, Aug. 12, 1838; studied at the Royal Academy of Music, London. In 1875 he was appointed successor and director of musical instruction at Eton, which position he held till appointed head of the Guildhall School of Music in London in 1892. He was conductor of the oratorio concerts in London established by Messrs. Novello, Ewer & Co., and has been the conductor of the Royal Albert Hall Choral Society since its establishment. His compositions have been chiefly of a sacred character, and include many church services, anthems, hymn tunes and chants. He edited *The Hymnary: a Book of Church Song*, published in 1872, which contains sixty-three tunes of his composition. Sullivan's *Church Hymns with Tunes* contains fourteen of Barnby's composition, and *Hymns Ancient and Modern* fourteen. His cantatas *Rebekah* and *The Lord is King*, the latter composed for the Leeds festival of 1883, are two examples of larger form. Barnby's music is immensely popular both in England and the U. S., many of his songs and part songs, as well as his church music, being as well known here as there. He was knighted in Aug., 1892. D. in London, Jan. 28, 1896. D. E. HERVEY.

Barnegat' Bay: Ocean co., N. J.; connects with the Atlantic by an inlet over a mile wide. The bay extends 23 miles N. to the mouth of the Meteteunk river. There is a lighthouse 150 feet high on the south side of the inlet, with a flashing white light; lat. 39° 45' 48" N., lon. 74° 6' 3" W. Barnegat Bay is separated from the ocean by Squan Beach and Island Beach.

Barnes, ALBERT: Presbyterian divine; b. at Rome, N. Y., Dec. 1, 1798. He graduated at Hamilton College in 1820; became in 1830 pastor of the First Presbyterian church at Philadelphia, where he remained until 1867. He declined the degree of D. D. and was much opposed to its use. As a commentator on the Scriptures, Mr. Barnes was popular with the religious community on both sides of the Atlantic. The circulation of his *Notes on the New Testament* (in eleven volumes) is said to have reached more than a million volumes. He commented also on *Isaiah* (1840), *Job* (1844), *Daniel* (1853), and the *Psalms* (1871). Among his other works may be named *The Church and Slavery* (Phila., 1857); *The Atonement in its Relations to Law and Moral Government* (1859); *Lectures on the Evidences of Christianity* (1868); *Life at Threescore and Ten* (1869). He was tried for heresy because he maintained an unlimited atonement; was acquitted, but the tension produced resulted in the dismemberment of the Presbyterian Church (1837), and he became one of the most prominent advocates of the New School doctrines. He did not love controversies, however, and so rejoiced in the union of the Old and New School branches in 1870. D. in Philadelphia, Dec. 24, 1870.

Revised by S. M. JACKSON.

Barnes, CHARLES RIED, M. A., Ph. D.; botanist; b. in Madison, Ind., Sept. 7, 1858; educated in Hanover College and Harvard University; Professor of Botany and Geology in Purdue University 1879-87; Professor of Botany in University of Wisconsin 1887 to present. He is one of the editors of the *Botanical Gazette*, and in conjunction with Dr. Coulter and Dr. Arthur published a *Handbook of Plant Dissection* (1886). He has written papers upon North American mosses, including *Keys to Genera and Species of North American Mosses* (1890). CHARLES E. BESSEY.

Barnes, JAMES: soldier and engineer; b. at Boston, Mass., in 1806; graduated at West Point in 1829; was a lieutenant of artillery till he resigned from the army July 31, 1836; served at Military Academy as assistant instructor 1829-30, and 1833-36; at Fort McHenry, Md., 1830-32; in Black Hawk expedition 1832; and at Charleston harbor 1832-33, during the threatened nullification of South Carolina. He was a prominent civil engineer (1836-57), and constructed

many important railroads. At the beginning of the civil war he resumed the military profession as colonel of Eighteenth Massachusetts volunteers; was appointed Nov. 29, 1862, brigadier-general U. S. volunteers, and served in the Virginia peninsula 1862, Northern Virginia campaign 1862, in Maryland campaign 1862, and at Antietam; in Rappahannock campaign 1862-63, at Fredericksburg and Chancellorsville, in Pennsylvania campaign, in several skirmishes, and at the battle of Gettysburg (wounded); was in command of the defenses of Norfolk and Portsmouth, Va., 1863-64, of St. Mary's district 1864-65, and Point Lookout camp for prisoners of war 1864-65. Brevet major-general U. S. volunteers Mar. 13, 1865, for meritorious services, and mustered out of service Jan. 15, 1866. With health destroyed he remained at his home in Springfield, Mass., where he died Feb. 12, 1869.

Barnes, JOSEPH K.; brigadier-general and surgeon-general U. S. army; b. in Philadelphia, July 21, 1817; educated in Philadelphia, receiving his degree of M. D. from the medical department of the University of Pennsylvania, class of 1838. He followed the practice of his profession in the hospitals and as physician to the outdoor poor of Philadelphia till June 15, 1840, when he was appointed an assistant surgeon in the army, and a surgeon Aug. 29, 1856. In 1863 (Feb. 9) he was appointed medical inspector, and Aug. 10 medical inspector-general, with the rank of colonel. On Aug. 25 he was placed in charge of the surgeon-general's office, and Aug. 22, 1864, received the appointment of surgeon-general until retired, June 30, 1882, having administered the responsible duties of his department with marked ability. D. in Washington, D. C., Apr. 5, 1883.

Barnes, JOSUA; b. in London, Jan. 10, 1654; studied at Cambridge, England; became professor of Greek there 1695. He was highly esteemed as a scholarly editor of *Euripides* (Cambridge, 1694), *Ancæon* (1705), and *Homer* (1710); but his scholarship was inexact, and so his works have little permanent value. D. in Cambridge, Aug. 3, 1712.

Barnes, THOMAS; b. about 1785; educated at Christ's Hospital, London, and at Pembroke College, Cambridge. He became chief editor of the London *Times* 1817, and finally one of the proprietors. He placed it beyond reach of competition. D. in London, May 7, 1841.

Barnes, WILLIAM; philologist, clergyman, and poet; b. in Dorsetshire, England, about 1810; published a number of works, among which were a *Philological Grammar* and *Poems of Rural Life*, written in the Dorsetshire dialect. D. as rector of Winterbourne Came, Oct. 7, 1886.

Barnesville; town; Pike co., Ga. (for location of county, see map of Georgia, ref. 4-G); on Ga. Cent. R. R., 60 miles S. by E. of Atlanta; has two large buggy-factories and a cotton-factory. Appropriations have been made (1892) for water-works and electric lights. Barnesville is the seat of Gordon Institute. Pop. (1880) 1,962; (1890) 1,839; (1892) estimated, with suburbs, 2,500. EDITOR OF "GAZETTE."

Barnesville; city; Clay co., Minn. (for location, see map of Minnesota, ref. 5-A); 218 miles from St. Paul, on Gt. Northern R. R., the division headquarters and shops of which are located here. Pop. (1890) 1,069; (1895) 1,238.

Barnesville; village; Belmont co., O. (for location of county, see map of Ohio, ref. 5-1); 32 miles W. of Wheeling, on B. and O. R. R. It has a variety of manufactures, is the commercial center of a large and wealthy agricultural district, and is noted for its superior strawberries and tobacco. Pop. (1880) 2,435; (1890) 3,207.

Barnet, or Chipping Barnet; market-town of Hertfordshire, England; 11 miles N. N. W. of London. Great cattle fairs are held here. The famous battle of Barnet was fought near here in 1471 between the Yorkists and Lancastrians, in which the latter were routed. The Earl of Warwick, "the king-maker," their leader, was killed. The result of this battle was to firmly establish Edward IV. Pop. 4,500.

Barnett, JOHN; musician; b. near Bedford, England, July 15, 1802, of German parentage. When ten years old, having a remarkable contralto voice, he was article to Samuel James Arnold, manager of Drury Lane theater, London, where he sang in many English operas. Studied first under C. E. Horn and Price, and later under Perez, Ferdinand Ries, Schneider and Kalkbrenner. His first musical dramatic work, a musical farce, was produced in 1825; his oratorio *The Omnipresence of the Deity* in 1829;

Mountain Sylph, his most famous work, in 1834; *Fair Rosamond* in 1836; and *Farinelli* in 1838. In 1841 he retired from public life, and lived at Cheltenham till his death, Apr. 17, 1890. He wrote much miscellaneous music, including upward of 2,000 songs, and several operas and other works were left in manuscript. D. E. HERVEY.

Barnett, JOHN FRANCIS; musician; son of Joseph Alfred Barnett; professor of music, and nephew of John Barnett, the composer of *The Mountain Sylph*; b. in England in 1837; studied first under his parents, both being excellent musicians; then under Dr. Henry Wylde; next at the Royal Academy of Music, London, where he won the Queen's scholarship; and finally at the Leipzig Conservatory under Hauptmann, Rietz, Plaidy, and Moschles. He returned to London in 1861, and has since pursued a successful career as composer. His chief works are *The Raising of Lazarus* (1873), which was originally sketched out during his student career; *The Ancient Mariner*, for the Birmingham festival (1867); *Paradise and the Peri*, Birmingham festival (1870); *Lay of the Last Minstrel*, Liverpool festival (1874); *Good Shepherd*, Brighton festival; *Building of the Ship*, Leeds festival (1880); *Harvest Festival*, Norwich festival of 1881. He has also composed many smaller works both for voices and instruments, together with a symphony, and overture for full orchestra, and trios, quartets, and quintets for pianoforte and string instruments. He also completed the orchestration of Schubert's unfinished symphony. D. E. HERVEY.

Barneveldt, JOHN VAN OLDEN; an eminent Dutch statesman; b. at Amersfoort in Utrecht, Sept. 14, 1547. He was a member of an important embassy sent to England in 1583, and after his return was appointed advocate-general of Holland. He was an adversary of the Earl of Leicester, and became the head of the republican party, while Maurice of Nassau was the chief of its opponents. Barneveldt opposed the ambitious designs and warlike policy of Maurice, and in 1609 concluded a truce with Spain for twelve years. He was for many years grand-pensionary of Holland. The animosity between the two parties was aggravated by religious dissension. Barneveldt favored the Arminians or Remonstrants, while Maurice patronized the intolerant Gomarists, who were also supported by the majority of the army, the clergy, and the populace. The Synod of Dort having condemned the Arminians in 1618, Barneveldt was accused of treason, unjustly convicted and beheaded at The Hague, May 13, 1619. See Motley's *Life of Barneveldt* (New York, 1874).

Barn-owl; one of certain species of owls, in which the facial disk is long and subtriangular in form, constituting the genus *Strix*. *S. flammca* is the common European species. The closely related American species is *Strix pratineola*. This solemn-looking and fierce little owl is more abundant southward and westward than along the Atlantic States. See OWL. D. S. J.

Barnsley; a market-town of England; in the West Riding of Yorkshire, on the river Dearne, 11 miles N. of Sheffield, on the North Midland Railway (see map of England, ref. 7-II). It is situated on a hill, has coal and iron mines, and manufactures of linen, glass, etc. The damasks and drills of Barnsley were considered to be unrivaled. Here are also bleaching and dye works and iron foundries. Pop. (1891) 35,427.

Barnstable; port of entry and capital of Barnstable co., Mass. (for location of county, see map of Massachusetts, ref. 5-K); on Old Colony R. R. and Barnstable Bay, 72 miles S. S. E. of Boston. The inhabitants are principally engaged in maritime pursuits and cranberry culture. The southerly portion of the township, on Vineyard Sound, is a noted place of summer resort, and contains Hyannis, Hyannis Port, Cotuit, Wimino, Craigville, Osterville, and Centerville. Pop. of township (1880) 4,242, including 780 in village; of township (1890) 4,023; (1895) 4,055. EDITOR OF "PATRIOT."

Barnstaple; a town and seaport of Devonshire, England; on the river Taw; 6 miles from its mouth, and 40 miles by rail N. W. of Exeter (see map of England, ref. 13-D). The Taw is here crossed by an old bridge of sixteen arches. Barnstaple is pleasantly situated and well built, and has manufactures of pottery, lace, etc. The harbor has been filled with sand, so that it will not admit large vessels. Pop. (1891) 13,058.

Barnum, PHINEAS TAYLOR; showman; b. in Bethel, Conn., July 5, 1810; d. in Bridgeport, Conn., Apr. 7, 1891.

His father kept an inn and a country-store, and died poor in 1825. Barnum wandered about, and was in business in Brooklyn, New York, and other places. Having saved a little money, he returned to Bethel, opened a small store, took the agency of a State lottery for building the Groton Monument, moved into a larger store and failed. He married in 1829, and soon after started a weekly newspaper called *The Herald of Freedom*; was prosecuted for libel, and imprisoned for sixty days. He went to New York and Philadelphia in 1834. In the latter city he bought for \$1,000 a colored slave woman, Joyce Heth, represented to be the nurse of George Washington and 161 years old; from her exhibition his receipts soon reached \$1,500 a week. She died a year after, but her venerable age was more than doubtful. In 1841, without any funds, he bought Scudder's American Museum in New York, which he called Barnum's Museum; and with his profits paid his indebtedness the first year. In 1842 he introduced the dwarf, Charles S. Stratton (Gen. Tom Thumb), whom he exhibited in the U. S., France, and England. In 1849 Barnum engaged JENNY LIND (*q. v.*) to sing in America for 150 nights, at \$1,000 a night. The gross receipts in 1850-51 in nine months were over \$712,000. In 1856-57 he indorsed notes for nearly \$1,000,000, which went to protest, and wiped out all of his estate except a fortune settled on his wife. He again visited England in 1857 with Tom Thumb, and gave lectures. His museum in New York was burnt July 13, 1865. Another one was also destroyed by fire Mar. 3, 1868. Afterward, in the spring of 1871, he established his "Greatest Show on Earth," the firm being Barnum, Bailey & Hutchinson. He was four times a member of the Connecticut Legislature, and was mayor of Bridgeport. His benefactions were large and numerous. He wrote *Humbugs of the World* (New York, 1865); *Lion Jack, a Story* (1876); and an autobiography (1855, n. e. 1869 and later).

B. B. VALLENTINE.

Barnwell, ROBERT WOODWARD, LL.D.; statesman; b. at Beaufort, S. C., Aug. 10, 1801; graduated at Harvard in 1821. He studied law; was a member of Congress from South Carolina (1829-33); U. S. Senator in 1850; and member of the Confederate Congress. He was president of South Carolina College (now University of South Carolina) (1835-41); and after the civil war held the same position until 1873. D. at Columbia, S. C., Nov. 25, 1882.

Baroach': See BROADCH.

Barocchio, or **Barozzi**, GIACOMO DA VIGNOLA: See BAROZZO.

Barocci, *bā-rof'chē*, or **Baroccio**, *bā-rof'chi-ō* (FIORI FEDERICO D'URBINO): a famous Italian painter; b. at Urbino in 1528. Among his best works are a *Descent from the Cross*, at Perugia, and a *Holy Family*, in the Museum at Naples. He also engraved in excellent style a number of his pictures. D. in Urbino, Sept. 30, 1612.

Baroche, *bā-rōsh'*, PIERRE JULES: a French advocate and minister of state; b. in Paris, Nov. 18, 1802. He became a member of the Constituent Assembly 1848-49, and was Minister of the Interior in 1850; Minister of Foreign Affairs in 1851 from April to October. He was appointed president of the council of state immediately after the *coup d'état* of Dec., 1851, and became Minister of Justice and Keeper of the Seals in 1863. Senator in 1864. D. in St. Helier's, Jersey, Oct. 29, 1870.

Baroda, *bā-rō'da*: a tributary state in Northern Bombay, British India. It is in several distinct irregular patches, the largest of which is between Ahmadabad and Palanpur, and includes the towns of Patan, Sidhpur, Barnagarh, and Maisana; a second is about the city of Baroda, and a third in the S. of the peninsula of Kathiawar. Total area, 8,569 sq. miles. Pop. (1891) 2,414,200. These districts are under a Mahratta prince called the Guicowar, or Gaikwar, of Baroda. It came into dependence on Great Britain in 1802. In 1874 the ruling Gaikwar, Malhar Rao, was tried for attempting to poison the British resident, and, though not convicted, was deposed. The districts of Baroda are very fertile, producing cotton, grain, tobacco, flax, and indigo. Baroda city is the capital. M. W. H.

Baroda: a city of Hindustan; in Guzerat; situated about 90 miles by rail N. N. E. of Surat; lat. 22° 16' N., lon. 73° 14' E. (see map of N. India, ref. 8-C). It is the residence of the Gaikwar, a Mahratta prince, and has an extensive trade, for which its position is advantageous. A railroad extends from Baroda via Surat to Bombay, 231 miles. It is a rich city in proportion to its size. Pop. (1891) 116,460.

Barom'eter [from Gr. *βάρος*, weight + *μέτρον*, measure]: an instrument for measuring the weight or pressure of the atmosphere. If a tube of uniform bore be bent into the form of the letter U, and partially filled with a liquid, the height of the liquid column, as measured above the bend, will be found to be the same in both branches. This will continue to be true though the air be withdrawn from above the liquid on both sides—a thing which may easily be effected by suitably connecting the two extremities of the tube with an air-pump. But if, while things are in this condition, the air be gradually readmitted to one of the branches and not to the other, the column in that branch will steadily sink, and that in the other will correspondingly rise. Arresting this process at any moment, we may say that the difference of height of the two liquid columns is a measure of the pressure of the air on the surface of the lower; or that the *weight* of a column of the liquid having a height equal to this difference is just equal to the pressure on that surface. In this experiment it would be easy to expel the liquid entirely from one branch of the tube, without establishing an equilibrium with the column in the other, unless the apparatus should be of inconveniently large dimensions, or the liquid employed should be one having great specific gravity. Mercury, in fact, which is nearly fourteen times (13.6) heavier than water, is the only liquid convenient for the purpose of the experiment; and if this be used, the difference of height of the columns in the two branches will be found to be about 30 inches when the full pressure of the atmosphere is admitted to one branch, while it is wholly withdrawn from the other. The weight of a vertical column of mercury, therefore, of uniform horizontal section, 30 inches in height, is equal to the mean pressure of the atmosphere at the surface of the earth on an area equal to the base of the column. The same fact is demonstrated more expeditiously by simply taking a straight tube 32 or 33 inches in length (Fig. 1), closed at one extremity and open at the other, filling it entirely full of mercury, placing the thumb firmly on the open end, inverting it and plunging this extremity beneath the surface of mercury in a basin, and finally removing the thumb. The column will fall, and stand as before at about 30 inches above the level of the mercury in the basin. This is the original experiment of Torricelli, made early in the seventeenth century, by which he furnished the first satisfactory explanation of the phenomena which the old philosophers vaguely ascribed to nature's abhorrence of a vacuum.

If the pressure of the atmosphere were invariable, the barometer would be an instrument of no practical use, and would simply serve to illustrate an interesting physical truth. But this pressure is constantly fluctuating, and its fluctuations are measured by the varying heights of the Torricellian column. All that is necessary to form a barometer, therefore, is to connect with the tube and basin of Torricelli some kind of scale suitable to measure these variations. In the barometers commonly used in Great Britain and the U. S. this scale is divided into inches and decimals; in France, and in continental Europe generally, into millimeters. If the instrument is to be stationary, the scale need only have a range of 3 or 4 inches, since even in localities where the fluctuations are largest they never transcend these limits. The divisions directly marked on the scale are made sufficiently large to be read by the unassisted eye. For smaller divisions a vernier must be employed. (See VERNIER.) In the best instruments the height of the column may be read by means of the vernier to the $\frac{1}{1000}$ th of an inch. Some little practice is required in order to learn to read with accuracy. The vernier carries a horizontal index which moves close to the glass tube containing the mercurial column; but the top of the column is rounded, so that the highest point is distant from the index by half the exterior diameter of the tube. Ordinarily the bore of the tube is small, not exceeding three-sixteenths to three-eighths of an inch; but in large standards a tube an entire inch in bore is often employed, and in such instru-

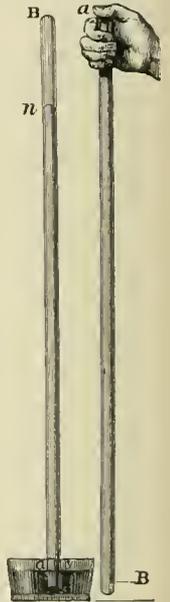

FIG. 1.

ments the index is a ring or thimble surrounding the tube entirely.

The height of the column must be measured from the surface of the mercury in the basin; but the level of this surface itself varies with the rising and falling of the column in the tube. To provide against error from this cause, the whole scale is in some barometers made movable, and is raised or depressed, as may be necessary, by means of a thumb-screw, before observation. An ivory point directed downward from a short projecting arm carried by the scale is brought so as exactly to meet its image reflected in the mercury of the basin, and this indicates that the zero of the scale is in its true position. In other instruments, and generally in those in common use, the adjustment is made by raising or depressing the level of the mercury itself while the scale remains fixed. Instead of the ivory point, an ivory float is sometimes used, carrying an upright stem on which is a fiducial mark designed to be brought, in the adjustment, into coincidence with a similar fixed mark.

In tubes of small bore the mercurial column does not reach the full height due to the pressure, owing to the effect of CAPILLARY ACTION (*q. v.*). A small correction is therefore necessary on this account, which depends on the diameter of the tube. With tubes of large dimensions this effect is insensible; and it may in any case be completely eliminated by giving to the barometer the form shown in Fig. 2, called a siphon barometer, in which the basin is dispensed with, and the tube is bent upward at the bottom, the recurved part serving as a substitute for the basin. In this form of the instrument, if the bore be uniform throughout, every fluctuation of pressure occasions equal and opposite movements of the two surfaces of mercury; and the reading on a fixed scale will change only half as much as in the common instrument. The whole scale should therefore be movable; or if a fixed scale only be used, the divisions should be made of only half their nominal magnitude. Barometric indications of fluctuating atmospheric pressure are sometimes magnified by transforming the vertical movements of the mercurial column into rotary movements of a long index upon a dial. The siphon barometer presents a convenient means of doing this. A float introduced into the open short arm of the siphon, and connected by a silk thread with a small pulley on the axis of the index, will render conspicuous even a very minute change in the altitude of the column. The uncertain action of this apparatus, however, owing to friction and other causes, is such as to deprive it of any scientific value.

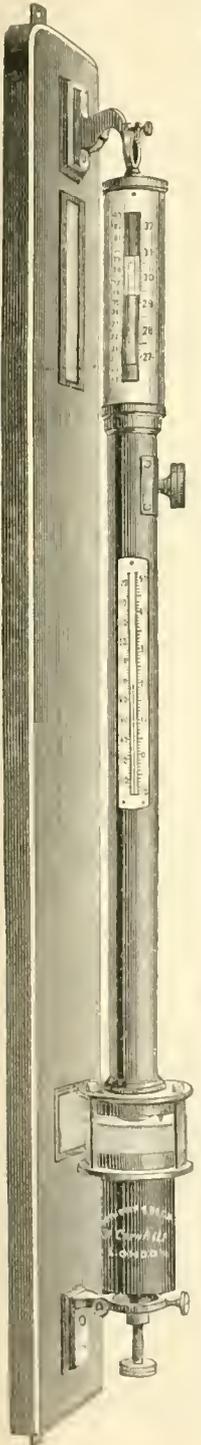

FIG. 3.

The form of barometer now most generally approved, constructed originally by Fortin, of Paris, and since adopted by Casella, Beck, and others of London, and by James Green, of New York, who has made in it important improvements, is shown in Fig. 3. In this the glass tube is entirely surrounded by a protecting tube of brass, somewhat

enlarged at the top, for convenience in applying a scale and vernier, and having a vertical opening at the same part to allow the summit of the mercurial column to be seen. The cistern at the bottom, which is of boxwood except the upper portion, which is a short glass cylinder, is similarly protected—the glass portion, however, being uncovered, in order to allow the surfaces of the mercury in the cistern to be visible. The cistern has a bottom of flexible leather, which rests on a broad disk of metal supported by a vertical screw, of which the milled head is represented in the figure below the instrument. By turning this screw the level of the mercury in the cistern is brought to the true zero of the scale, indicated by a fixed fiducial point of steel or ivory seen within the cistern.

Since the barometer measures the pressure of the atmosphere, and since this pressure is simply the weight of a vertical column of the aerial ocean above the level of the place of observation, it follows that, if we carry the instrument from a lower to a higher level, the barometric column will fall. One of the most important uses of the barometer, therefore, is as a means of determining heights. (See *HYPSOMETRY*.) But a barometer intended for this purpose, or a so-called "mountain barometer," must have a construction in a number of respects differing from the barometer in common use. It must have, of course, a much larger range of scale, and especial care must be taken to guard it against the danger of fracture in transportation. If it is a cistern barometer, the cistern should be air-tight, and should have no communication with the atmosphere, except through an aperture which may be stopped by a closely fitting screw or cock; and the adjusting screw at the bottom should have so large a range of movement as to allow all the air of the cistern to be expelled by raising the leather bottom, so that the cistern and tube may be both entirely filled with the mercury. The danger of fracture from the oscillations of this dense liquid may thus be avoided. The best mercurial mountain barometer, however, is the siphon barometer of Gay-Lussac, shown in Fig.

FIG. 2.

4, *a*, without its scale or mounting. In this instrument a tube bent in the manner shown, and closed at both ends, has two straight portions, of small but equal bore, connected by an intermediate portion so much smaller that when, after being filled with mercury, it is reversed, as shown in Fig. 4, *b*, the mercury will be held in the bend by capillarity. The only communication with the air is by the aperture *o*, which is so small that any drops of mercury which may fall into the short arm from the bend, when the instrument is reversed, can not escape. The design, however, is to have no excess of mercury beyond what will be held by capillarity in the position *b*. This tube is suitably supported throughout its whole length, and protected by a surrounding tube of brass. The zero of its scale is at the middle of the length, and it reads

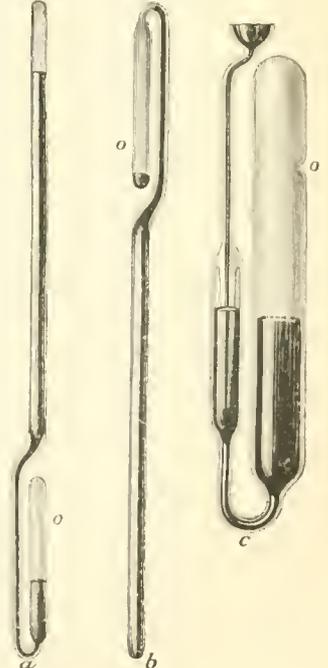

FIG. 4.

from this zero both upward and downward. The readings are taken at both surfaces of the mercury, and their sum gives the true barometric height. The scale is usually inscribed on the tube itself. In transporting the instrument it is carried in the inverted position, where the mercury, filling the whole tube, is necessarily prevented from oscillating. It is usually carried by the mountaineer in a leather case swung over his back, and when set up for observation is suspended in gimbal rings, supported by a tripod.

When a barometer of this kind is carried from place to place, subject to occasional jars and concussions, sometimes perhaps in a horizontal position, there is a possibility that

minute portions of air may now and then intrude into the tube, between the mercury and the glass. An effectual contrivance for preventing these from making their way into the Torricellian vacuum was devised by M. Buntin, which is represented in Fig. 4, c. The capillary part of the tube is divided; the extremity of the upper portion is drawn out to a minute orifice; that of the lower is widened, so as to form a globular or cylindrical chamber contracted at the mouth; and then the two are united again by fusion in the manner shown in the figure. Any air which may make its way into the tube from below is caught in this chamber, and afterward, when the instrument is inverted for transportation, it escapes by the way it entered. The invention evinces a high degree of ingenuity.

When scientific accuracy is necessary in barometric observations, all mercurial barometers require that their readings should be corrected for temperature. According to Regnault, the absolute dilatation of mercury between 0° and 100 C. = 32° and 212 F., is 0.01813, or about $\frac{1}{55}$ th of its bulk. This corresponds to $\frac{1}{44175}$ th of the bulk for each degree of Fahrenheit's thermometer, which would be equal, for the mean column of 30 inches, to an increase of altitude of about $\frac{1}{44175}$ ths, or $\frac{1}{3333}$ th per degree. Assuming the height at 32° F., therefore, to be the normal height, the reading at 54° F. will be $\frac{2}{3333}$ ths, or $\frac{1}{1666}$ th inch too great; at 76° F., or so-called "summer-heat," $\frac{4}{3333}$ ths, or $\frac{1}{833}$ th inch too great; and at 98° F., $\frac{6}{3333}$ ths, or 0.2 inch too great. The correction for any temperature may be made by calculation from the data here given; but it is more convenient to be provided with a table which has been calculated in advance for all the temperatures to which the observation is likely to extend.

The process of filling the mercurial barometer is one which requires great care. In pouring mercury into a long and narrow tube it is almost impossible to avoid introducing along with it some bubbles of air, which adhere with tenacity to the sides of the tube, but which, after the tube is inverted, gradually find their way into the space above the column and vitiate the vacuum. These may be expelled by boiling the mercury in the tube before inversion, when they will be carried off with the vapor. The operation is attended with some danger to the tube, the boiling-point of mercury being about 360° C., and the concussions of the heavy column in ebullition violent. It is expedient, therefore, to introduce at first only a small quantity, and after boiling that to add more, and so proceed till the tube is filled, always applying the heat at a point but a few inches below the top of the column. Mr. Green, however, recommends filling the tube completely before beginning the operation, then boiling downward from the top, and finally upward from the bottom.

It is of the highest importance that the mercury used in barometers should be quite pure. To be entirely safe on this score, the metal should be distilled before using. The effect of the presence of impurities is to diminish the specific gravity of the fluid, and therefore to make its indications uncertain; but it is also to tarnish the tube, and to render observation after a time difficult or impossible.

Other fluids besides mercury may, of course, be employed in the construction of barometers, but the height of the column will in every case be greater in proportion as the specific gravity of the liquid is less. Water, for example, requires a column of 34 feet, mean height. Very few water barometers have ever been constructed. The first of the kind was erected by Otto Guericke, the inventor of the air-pump, in his house at Magdeburg. The upper portion of the tube only, to an extent of about 6 feet, was of glass, and this was but partially exposed to view, the rest being concealed behind the woodwork of the apartment. Floating on the top of the liquid the inventor had introduced a diminutive figure of a man, which, with the rising of the column in fair weather, presented itself to view, but with the approach of foul weather retreated out of sight. On the other hand, the fluctuations of height of the water column are proportionally large, and serve to render conspicuous slight changes of pressure, which, in the mercurial barometer, are nearly or quite imperceptible. It is an objection, however, to the water barometer that its indications are largely affected by the vapor from the liquid which occupies the space above the column, and that the error thus arising varies with the temperature. Thus at 70° F. the column is depressed by this cause 10 inches; at 80° F., 14 inches; and at 90° F., nearly 20 inches; while even at 32° F., the freezing-point, below which the water barometer is unavailable, the depres-

sion from the same cause is no less than 2½ inches. There are water barometers in the rooms of the Royal Society of London, and in the theater of the natural philosophy class in the University of Edinburgh. About the middle of the nineteenth century a barometer of large dimensions, in which the fluid used was sulphuric acid, was set up at the Smithsonian Institution in Washington by James Green, of New York, under the direction of Prof. Henry. This liquid is free from the objection of forming vapor in the Torricellian void; and owing to its large specific gravity a column of it less than 20 feet high suffices to balance the mean atmospheric pressure. Such, however, is the avidity with which this acid absorbs watery vapor that its exposed surface must be in some manner protected from direct contact with the atmosphere. The protection used in this case was a balloon of india-rubber firmly secured to the short arm of the siphon barometric tube. But, though moisture was thus excluded, air was found to make its way gradually into the void above the column, and the instrument was finally disused and taken down.

A description of barometer known as the aneroid barometer, employing no liquid, has come extensively into use. It is the invention of M. Vidi, a physicist of France.

The instrument itself consists essentially of a flat cylindrical box formed of thin corrugated metal, from the interior of which the air has been nearly exhausted; the immediate effect being to bring the top and bottom into contact with each other by atmospheric pressure. The touching surfaces are then separated by means of a strong spring attached to the center of the upper surface, while the lower is held down, the whole being placed within a larger box properly adapted to receive it. With the varying pressure of the atmosphere the separation of the surfaces is greater or less, or the spring is more or less bent, and the movements thus occasioned are transmitted by proper multiplying-apparatus to an index which traverses a dial like that of a watch (Fig. 5). Aneroid barometers often perform very well, and perform well for long periods; but in time the spring is liable to lose its elasticity, so as to render the indications untrustworthy. These instruments should therefore be occasionally compared with standard mercurial barometers. They are very convenient for transportation, being constructed of various dimensions, from 8 or 10 inches in external diameter down to 2, and are often graduated to serve as mountain barometers for heights as great as 12,000 or 16,000 feet.

Another form of barometer without liquid, and in external appearance resembling the aneroid, is Bourdon's metallic barometer, improved by M. Richard, of Paris. In this, a broad and nearly flat tube of thin metal, bent into the form of a horseshoe, having been exhausted of

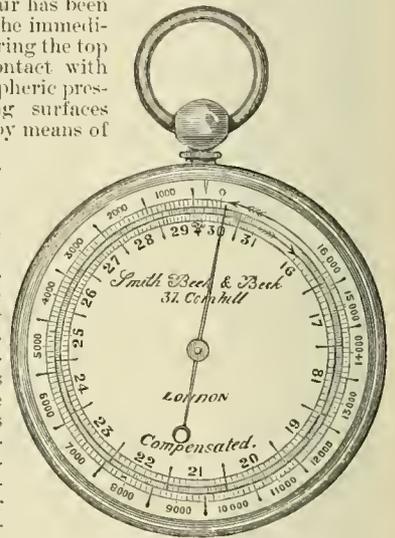

FIG. 5.—Aneroid mountain barometer.

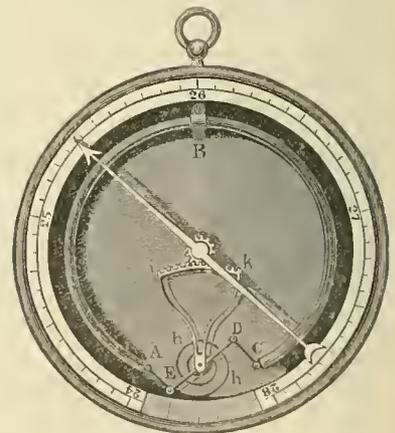

FIG. 6.

barometer without liquid, and in external appearance resembling the aneroid, is Bourdon's metallic barometer, improved by M. Richard, of Paris. In this, a broad and nearly flat tube of thin metal, bent into the form of a horseshoe, having been exhausted of

air, is secured by the middle part of the box inclosing it, while the ends left free are connected by delicate chains or wires with the apparatus controlling the index (Fig. 6). The effect of increased atmospheric pressure upon an exhausted tube of this form is to bring the extremities nearer together, and that of diminished pressure to cause them to recede; and these changes are shown by the index on the dial.

Long-continued observations of the barometer have demonstrated that there are certain fluctuations of atmospheric pressure which are periodical and regular, though not large; while such as are noticeable for their magnitude are subject to no obvious law. Of periodical fluctuations there is a semi-diurnal inequality having its maximum at about ten o'clock morning and afternoon, and its minimum at four, afternoon and morning. Its magnitude varies with the latitude, being greatest (0.104 inch) at the equator. In lat. 40° it is 0.05 inch, and in lat. 70° only 0.003 inch. There is also an inequality dependent on the seasons, which in some parts of the earth is large, and in others almost or quite imperceptible. Where it is noticed, the highest reading occurs in January, and the lowest in July, or a little later. At Peking, in China, the mean pressure for the first of these months is three-fourths of an inch greater than that for the second. A large part of Asia is similarly affected. At Havana the fluctuation is hardly a quarter of an inch, the minimum seems not to be reached before the month of August, and the decline of the monthly means is not regular. At Boston and at London the monthly means throughout the year scarcely differ from each other by the tenth of an inch, and an annual inequality can hardly be said to exist. The position of the moon seems to have a slight influence on atmospheric pressure, but this, even where most observable, is little more than half a hundredth of an inch.

The non-periodic fluctuations of pressure are very much greater than the periodic. If we call the difference between the greatest and least readings of the barometer within any month the *monthly oscillation*, and combine the observations of many years for the same month, we shall obtain the mean monthly oscillation. This is least near the equator, and increases toward the poles. At the equator it hardly exceeds 0.1 inch; in lat. 30° it is 0.4 inch; in lat. 45°, over the Atlantic, it is 1 inch; in lat. 65° it is $1\frac{1}{2}$ inches. During the three winter months the mean is about one-third greater. On the continents bordering the Atlantic the means are usually less than over the intervening ocean. The extreme fluctuations of the barometer, however, very much exceed these means. In Boston the greatest height observed in thirty-seven years is 31.125 inches, and the least, 28.47 inches—difference, 2.655 inches. The greatest observed range at London is 3 inches; at St. Petersburg, 3.5 inches. Within the tropics the range is small. At Christiansborg, near the equator, the greatest range observed in five years was 0.47. Loomis's *Meteorology*.

The barometer is often spoken of as a weather-glass; and the scale of the instrument is often inscribed with words indicative of the weather which may be expected when the head of the column stands opposite them. This is, however, apt to convey very erroneous notions; for neither the actual nor the approaching weather can be correctly inferred from a knowledge of only a single one of the conditions which determine meteorological phenomena. The indications of the thermometer, the anemometer, and the hygrometer, and the progressive changes denoted by those instruments, are quite as important to the prediction of the weather as those of the barometer. Moreover, the prognostications derived from these instruments which would be justified in one part of the world would not be at all so in another where the physical conditions are different. One remark, however, is true generally. Inasmuch as there can be no considerable change in the condition of the atmosphere as to heat or moisture or movement which is not accompanied or immediately preceded or followed by a change of pressure, therefore when the barometer continues steady, whether it be high or low, the actual state of the weather, whatever it may be, is likely to last. It may be added that a rapid movement of the barometer upward or downward, say three-fourths of an inch in twenty-four hours, is of unfavorable augury. Also that a very rapid fall will probably be followed by a violent wind. A slow movement upward gives assurance generally of fair weather.

While observation enables us thus, in some manner, to connect the fluctuations of the barometer with the varying conditions or aspects of the weather, it is not easy in all cases to assign satisfactory causes for the fluctuations them-

selves. The low state of the column which is commonly observed to accompany the formation of heavy clouds and the fall of rain or snow shows that the popular language, which speaks of the atmosphere at such times as "heavy," is scientifically incorrect. Many hypotheses, among them some which, in the present state of science, would be pronounced absurd on the face of them, have been proposed to account for the phenomena; but the true reason of at least the more conspicuous variations of atmospheric pressure must be looked for in rarefaction by heat, of which the ultimate source is the sun. Different portions of the earth's surface become unequally heated by the solar radiation. The heat thus acquired is imparted by the earth to the atmosphere above it, of which the portions most heated are also most dilated, and, in consequence of their diminished specific gravity, tend to rise. In rising they are further dilated by diminished pressure, and their temperature consequently falls until their contained vapor is condensed to cloud, with evolution of its latent heat. The heat evolved increases the rarefaction, and the upward movement continues. The rarefied column is not changed in weight by the mere fact of its rarefaction; but as its altitude is increased it necessarily overflows at top upon the surrounding air, of which the pressure is thus augmented, while its own is correspondingly diminished. As a necessary consequence, the barometer below it falls; and as rain naturally follows the precipitation of vapor, the rain-area will usually be found to correspond with the area of low barometer. Of periodical oscillations, the diurnal are in like manner traceable to heat. Those of longer period depend on causes less easy to ascertain.

For fuller information as to the barometer and its uses, see *Smithsonian Miscellaneous Collections*, vol. i., p. 693, by Prof. Guyot and J. W. C. Coffin (1862); also *Manual of the Barometer*, by J. W. Belville (London, 1849); also the *Smithsonian Annual Reports* of the years 1855, 1856, 1859, and 1867. The report of 1856 has a detailed description of the construction of Green's standard barometer; that of 1867 contains an important memoir by Marshal Vaillant on the horary variations. Loomis's *Meteorology* and Reid's *Law of Storms* may also be consulted with advantage. See also GAS.

Revised by E. L. NICOLS.

Barometric Light: See ELECTRIC DISCHARGE.

Bar'ometz, sometimes called **Tartarian** (or **Seythian**) **Lamb:** the prostrate stem (rhizome) of a fern (*Aspidium barometz*) which grows in salt plains near the Caspian Sea. It is covered with a shaggy, silky down, and has some resemblance to an animal. It was anciently believed to be half plant, half animal. It was also known as *baranetz*.

Baron: the title of the lowest degree of hereditary peers in Great Britain and Ireland; is the next below that of viscount. The word was formerly used to include the whole English nobility, because all noblemen were barons. The distinction between the greater and lesser barons seems to have been made at an early period in most of the countries of Europe. The greater barons, who were the king's chief tenants, held their lands directly, or *in capite*, of the crown; while the lesser held of the greater by the tenure of military service. The greater barons had a perpetual summons to attend the parliament or great councils of the nation. The practice of conferring the rank of baron by letters-patent, and as a mere title of honor apart from the possession of land, originated in 1387. Barons are sometimes created by writ, but this mode is nearly obsolete, and creation by patent is the surest way of insuring the hereditary character of the peerage. On great occasions a baron wears a coronet adorned with six pearls set at equal distances on the chaplet. He is addressed as "my lord" or "your lordship," and is styled "right honorable." In France and Germany and in many other countries a baron is a nobleman next in rank to a count. Formerly in Scotland a baron was not necessarily a nobleman, but was a holder of land in what was called baronial right. There are at present several classes of barons: (1) barons of England; (2) barons of Great Britain; (3) barons of the United Kingdom (all the members of these classes have seats in the House of Lords); (4) barons of Scotland; and (5) barons of Ireland; the members of the two latter classes have no seat in the House of Lords unless chosen as representative peers. The life peerage, rarely conferred, does not entitle to a seat in the House of Lords. Certain judges of the exchequer courts of England and Ireland are called barons of the exchequer.

Baron, baŭ'rōn', originally **Boyrton**, MICHAEL: French actor; b. in Paris, Oct. 8, 1653. His father, a leather-mer-

chant, having fallen in love with a very beautiful traveling actress, left his business and entered the same troupe. The actress became the mother of Michael Baron. Going to Paris in after years, Michael, a very handsome young man, attracted the attention of the great Molière, who became his friend and instructor. Baron rose rapidly to the first rank of his profession, and was as eminent in tragedy as in comedy. He was with justice called "the honor and the marvel of the French stage." As a writer of plays he was very prolific. His beauty and talents caused his name to be mixed up with much of the gross scandal of the time. His personal vanity was very great. He used to say, "Every century might produce a Caesar, but it took ten thousand years to produce one Baron." It is commonly reported that he died upon the stage, but in reality, though stricken with apoplexy on the stage, he lived after that event more than two months. D. in Paris, Dec. 3, 1729. Revised by B. B. VALLENTINE.

Baron, PIERRE, called **Peter Baro**: b. in Étampes, France, Dec., 1534; became a Protestant, and escaped to England in Queen Elizabeth's time. In 1574 he was appointed Lady Margaret Professor of Divinity at Cambridge, an office which he held till 1596, notwithstanding the strong opposition which his doctrinal teachings encountered. He was an opponent of Calvinism, then strongly maintained at the university and by the Archbishop of Canterbury—Dr. John Whitgift. Baron was therefore subject to many vexatious annoyances, and was openly accused of heresy and of endeavoring to carry the university back to Romanism. He held to his course with great persistency, and even had the courage to preach against the famous Lambeth Articles, which had been drawn up to oppose him and his party. He was consequently forbidden to engage in polemics, and was made so uncomfortable that he was obliged to resign his position (1596) and retire to London, where he died, April, 1599, leaving a number of Latin treatises, since published in English.

Baronet [dimin. of baron]: a title of honor which is hereditary. A baronet is next lower than a baron, compared with whom, however, he is very inferior in rank. Baronets were first created in 1611 by James I., whose object was to raise money especially for the reduction of Ulster, but the money went mostly into the king's purse. The creation of baronets is limited only by the will of the sovereign, who confers the rank either by patent or by writ. A baronet is entitled to the prefix *Sir* to his name, and has precedence of all knights except bannerets, knights of the Garter, and privy councilors. Baronets are of four classes—those of Ulster, England, Nova Scotia (or Scotland), and the United Kingdom. James, having promised not to create more than 200 baronets in England, extended the title to Nova Scotia to raise money for its reduction, and this is the origin of the Scotch baronets. Sir William Alexander (Earl of Stirling) was the first American baronet. This process in Nova Scotia stopped in 1629, when the province was sold to France. No baronets of Scotland have been created since 1799.

Baronius, CESAR: Roman Catholic Church historian; b. in Sora, near Naples, Oct. 30, 1538; was a disciple of St. Philip of Neri. He became cardinal (1596), and librarian of the Vatican (1597). His celebrated *Ecclesiastical Annals* from the birth of Christ to 1198 A. D. (Rome, 1588-93, 12 vols. fol.; Antwerp, 1589-1603; Mayence, 1601-05, rev. ed.) was the result of twenty-seven years' labor. The annals of Baronius are continued by Reynolds to 1565, by Caderchi to 1571, and by Theiner to 1584 (in 1856). In 1864 Theiner began a new edition of the annals, but died suddenly in 1874. Baronius was a brilliant dialectician and stylist, but has been charged with many blunders, owing to his ignorance of Greek. Notwithstanding these errors and his strong partisan spirit, his *Annals* are conceded to possess very great learning and value. They were written in reply to the *Magdeburg Centuries*. He published a number of other works, characterized by the same faults and the same great learning as marked his *Annals*. D. in Rome, June 30, 1607.

Barony: the rank, title, or dignity of a baron; the territory or jurisdiction within which a baron exercises his lordship; specifically, the territory over which a court baron has jurisdiction, the court baron originally being a court in which the free tenants, or the freeholders, of a manor were the judges, and the steward of the manor the registrar. It anciently had jurisdiction in suits concerning lands held in the manor, and some other matters; but such courts are now rarely held, except with regard to certain fines, heriots, etc.

Barozzo, bãa-rod zô, or **Barocchio, bãa-rot chi-ô**, IACORO: an illustrious Italian architect; b. at Vignola, near Modena, Oct. 1, 1507, from which fact he is often called VIGNOLA. He studied painting at Bologna, but was so fascinated by the study of perspective that he abandoned painting for architecture, in which art he attained a great reputation. He was employed by an association of antiquaries in Rome to take measurements and execute models of the remains of the ancient statuary of Rome. These models were afterward cast in bronze. In 1541 he went to Paris to superintend the casting of his copies, and while there was engaged in architectural pursuits. In 1550 he became architect to Pope Julius III. He designed the splendid palace of Cardinal Farnese (Caprarola), in which were placed some of his own pictures. He was engaged upon this work from 1555 to 1573. Meanwhile, upon the death of Michael Angelo in 1564, he succeeded the latter as architect of St. Peter's church. He published several valuable works on architecture, among which the best known is *Regole de' cinque ordini d'architettura* (1563), illustrated by engravings. This was long the standard authority in classic architecture. He was one of the designers of the Escorial Palace in Spain. D. in Rome, July 7, 1573.

Barquisimeto, bãar-kêe-sêe-may tō: a city of Venezuela; capital of the state of Lara; on a branch of the river Portuguesa, a part of the Orinoco system (see map of South America, ref. 1-C). It is the fourth city in size in the republic. It was almost destroyed by an earthquake in 1812, previous to which it had about 15,000 inhabitants. It has a college, and is situated in a fertile and well-cultivated district. Pop. 32,000.

Barr: a town of Lower Alsace, Germany; 23½ miles by rail S. W. of Strassburg; situated on the east slope of the Vosges, at the mouth of the Uhlrichtal (see map of German Empire, ref. 7-D); has numerous vineyards, distilleries, manufactures of leather, arms, etc., and three annual fairs. Pop. (1890) 5,674.

Barr, AMELIA EDITH (Huddleston): Anglo-American novelist; b. at Ulverstone, Lancashire, England, Mar. 29, 1831; married Robert Barr in 1850, and has resided in the U. S. since 1854, first in Texas and afterward (1869) in New York State. Her husband died in 1867. Among her novels, which are largely historical, are *Romance and Reality* (New York, 1872); *Young People of Shakespeare's Time* (1882); *The Hallam Succession* (1884); *Jan Vedder's Wife* (1885); *A Daughter of Fife* (1886); *A Bow of Orange Ribbon* (1886); *Friend Olivia* (1891); *Beads of Tasmer* (1891); *Sister to Esau* and *A Rose of a Hundred Leaves* (1892). Scotch, north of England, and Dutch New York tales, with a plot of religious persecution, are her finest fields of invention. HENRY A. BEERS.

Barrackpur, bãr-rak-poor': a town and military cantonment of British India; on the left (or east) bank of the Hugli; about 15 miles above Calcutta (see map of N. India, ref. 8-I). It contains the country residence of the Governor-General of India, and many elegant mansions of the European citizens of Calcutta, who are attracted by the salubrity of the place. The adjacent country is covered with beautiful forests and a luxuriant tropical vegetation. Here is a noble park of 250 acres, which exhibits an admirable specimen of landscape-gardening. Barrackpur was called the cradle of the Sepoy mutiny (*q. v.*) of 1857. Several regiments of native troops were stationed here. They objected to biting off the ends of the cartridges for the Enfield rifle, believing the paper to be polluted with animal fat. A Sepoy named Mungal Pandey wounded an officer in Feb., 1857, whose blood was the first that was shed by the mutineers. Pop. (1891) 57,330.

Barracks: buildings for the habitation of troops. The word is sometimes applied to any collection of buildings densely occupied by human beings.

The experience of the civil war in the U. S. has demonstrated that ventilation, abundance of pure air, is more important to the health of man than complete protection from extremes of cold and heat. While soldiers camped in small and crowded tents, kept closed to exclude the cold, suffered from typhoid fever, the sick and wounded in hospital tents and in the light and open wooden barracks established as general hospitals, recovered more rapidly and certainly than those in what are called better buildings, closer and more substantial.

There are few large masonry barracks in the U. S., such

as are found on the continent of Europe in almost every large town. Most of the military posts are beyond the frontier which separates the country of civilization and cultivation from the region occupied, or rather traversed, by the nomadic Indian tribes, and the scarcely less nomadic white miner and hunter. A very few of these posts built on the open prairies, where timber is scarce and costly, have been constructed of stone or brick; some are of sun-dried bricks, called *adobes* by the Mexicans, and within recent years a few have been reconstructed in a more permanent manner. But the greater part of them are of wood—log houses in the timbered country, light frames covered with boards in the prairies. The open joints of the board wall-coverings and roofs and floors make it impossible to exclude fresh air, and they insure a circulation of air, notwithstanding the efforts of the occupants of the building to close all ventilating openings.

The principal and more permanent barracks of the U. S. are Madison barracks, Sackett's Harbor, N. Y.; Jackson barracks, New Orleans, La.; Jefferson barracks, St. Louis, Mo.; and Columbus barracks, Ohio, now used as recruiting dépôts; Fort Sheridan, Ill.; Mt. Vernon barracks, Mississippi; Benicia barracks, California; Vancouver barracks, Washington; Omaha barracks, Omaha; Fort Leavenworth, Kansas; Newport barracks, Kentucky; Presidio of San Francisco, Cal.; Ringgold barracks and Fort Brown, on the Rio Grande, Tex.; and Plattsburg barracks, Lake Champlain. In the official list published in the *Army Register* there are 140 military posts, including 19 arsenals, ordnance, and powder dépôts, 3 recruiting dépôts, and 1 engineer dépôt, at all of which there are barracks either owned or rented by the U. S.

At most of the U. S. navy-yards there are barracks for the marines, generally of masonry. Among them are the marine barracks of Washington, Charlestown, Brooklyn, Pensacola, and Benicia.

Since the Revolution, Paris has been enriched with very fine buildings as barracks. Those of the Prince Eugène, the Napoleon barracks, and the new barracks on the Île de la Cité, are noble and beautiful buildings. But it seems impossible to so arrange these great buildings as to secure thorough and satisfactory ventilation. Without fresh air, and disturbed by the movement which must take place night and day among large bodies of men occupying large rooms, these palaces are not believed to have as low rate of mortality as the temporary cheap structures in which the U. S. army lives on the frontier.

There are large barracks in all the great European capitals. Stuttgart, St. Petersburg, Paris, Naples, Rome, are noted for the beauty and extent of their barracks. The Museo Borbonico at Naples was built for a cavalry barrack; in it are now collected the many remains of Roman and Greek art unearthed at Pompeii and Herculænum.

The Romans, who conquered the known world and held it by military occupation, built strong barracks wherever they established a permanent post. They had no firearms, and a small garrison depended upon the strength of their walls to resist the attacks of barbarians. The remains of such barracks, nearly perfect, have been found of late years at ancient Roman stations in the wilderness of Syria and Palestine. While the Roman legionary was trained and practiced at hard work, he did not hesitate to use in all such constructions the forced labor of his captives of whatever rank or station. Our troops were obliged generally to build their own barracks, but, armed with rifles of long range, they depended upon their superior knowledge and discipline, and seldom fought the savages from behind their barrack-walls.

There are two uses to which barracks are put: one is protection during a siege and bombardment from the missiles of the enemy; the other, and far more constant use, is protection mainly from the weather.

Many of the seacoast forts of the U. S. make ample provision in vaulted casemates for the garrison during a siege, but such barracks in the climate of the coasts of the U. S. should never be occupied in time of peace. They are dark, damp, ill-ventilated, and unhealthy, and provision should be made for shelter outside the ramparts for the peace garrison in all cases. In the climate of Spain and Italy, of the West Indies, and of Mexico, it is probable that the custom of the tropics of living in rooms roofed with earth or masonry has not such disadvantages as farther north.

European practice allows from 420 to 1,200 cubic feet of space per man in barracks and hospitals; and the latter is

better than the former; but in practice the air-space is limited by the appropriations which the government grants. Thorough drainage of the buildings and of the sites is essential to health. Temporary cantonments should never remain long in one place. The troops should remove to fresh ground, and the old site should not be reoccupied until time and frost have thoroughly destroyed the effete animal and vegetable matter which collects about any large body of men.

All barracks are liable, on any temporary increase of the garrison, to overcrowding. In well-built houses each man should have at least 800 cubic feet of air-space, and in hospitals at least 2,000. In a room intended to be occupied by thirty men, at least 60,000 cubic feet of fresh air per hour should be admitted from the outside, and as much more as can be borne without inconvenience, a safe rule being that each man should have one cubic foot of fresh air per second. But all ventilating arrangements are liable to be obstructed by those for whose benefit they are intended, unless made on the most extensive and elaborate scale, and placed entirely beyond their control. A man feels the cold sensation from a draught more distinctly than the headache or oppression resulting from a close and impure atmosphere. He knows that if he stops the ventilating inlet near him he will get rid of the draught. He does not realize that at a future time his health may break down as a consequence of this interference. Practically, therefore, the most efficient barrack ventilation, except in the palaces of masonry built in Europe and ventilated by steam-power, is that inseparable from the imperfect construction of the building itself. These defects, beyond the skill and power of the soldier to remedy, save his health by supplying him continually with fresh air against his will.

The War Department has of late years adopted an iron barrack-bunk to be occupied by a single man, which gives space for circulation of air, and has abolished the use of the two-story double wooden bunks in which soldiers formerly slept.

BOOKS OF REFERENCE.—*Reports of the British Barrack Commission* (London, 1861); *Circulars Nos. 3 and 4 of the Surgeon-General of the United States*; *Reports on Barracks and Hospitals*; *Outline Description of Military Posts and Stations*, published in 1871 by the quartermaster's department. Revised by JAS. MERCUR.

Barraenda, bār-ra-koo'da, or **Barracouta** [native name]: a fish of the family *Sphyrænidæ*, notably *Sphyræna picuda*, *S. sphyraena*, and *S. argentæa*, which are long, slender, very voracious fishes of the West Indian and other warm seas, highly valued as food.

Barrande, bār-rañd, JOAQUIM: eminent French paleontologist; b. at Sangués, Haute-Loire, France, Aug. 11, 1799. D. near Vienna, Austria, Oct. 5, 1883. His great work, *Système silurien du centre de la Bohême*, occupying nearly 6,000 quarto pages, is one of the most important single treatises on Palæozoic fossils. His *Theory of Colonies*, devised to explain the sporadic occurrence of fossil species or groups of species in formations older or younger than that of which they are characteristic, was an important contribution to the philosophy of geologic correlation. See PALEONTOLOGY. G. K. G.

Barrantes y Moreno, bār-rah'tay-scē-mō-ray'nō, VICENTE: a Spanish poet and publicist; b. at Badajoz in Estremadura, Mar. 24, 1829. In 1848 he went to Madrid, and in 1850 he became a writer for the journals *La Ilustración* and *Las Novedades*. In 1851 appeared his novel *Siempre tarde*, which attracted general attention. His *début* as poet was soon after made with his *Baladas Españolas*. From 1851 he engaged also in politics, and his satiric articles entitled *Pildoras* brought a heavy fine upon him for their audacity. In 1859 he abandoned the Liberals and joined the New Catholic Conservatives—a change already prefigured in his novel *Juan de Padilla* (1855), in which he attempted to rehabilitate the old Spanish ideals of life and government. In 1866 he was made secretary to the Government for the Philippine Islands, and in 1872 he became a member of the Spanish Academy. Among his works are: *La Joven España* (1854); *Narraciones extremeñas* (1872-73); *Viaje á los infiernos del sufragio universal*, etc. (1873); *Diccionario biográfico de hombres célebres extremeños*.

A. R. MARSH.

Barras, brā'tar, PAUL FRANÇOIS JEAN NICOLAS, COMTE DE: a French Jacobin and regicide; b. at Fox-Amphoux, in Provence, June 30, 1755. He was chosen a deputy to the

States-General in 1789, and a member of the National Convention in 1792. He acted with the party called the Mountain, voted for the death of the king, and joined the enemies of Robespierre on the 9th Thermidor, 1794, in which crisis he was commander of the national guard. On the 13th Vendémiaire (Oct. 5, 1795) he was again appointed commander of the troops by the Convention. With the aid of Bonaparte he defeated the royalist insurgents of Paris on that day. He was one of the first five members of the Directory appointed in Nov., 1795, and acted a prominent part in the conflict of the 18th Fructidor (Sept. 4, 1797), after which he was perhaps the most powerful of the Directors. He was venal and dissolute, and abused his power. His political career was ended by the ascendancy of Bonaparte in 1799. D. in Paris, Jan. 29, 1829. See Thiérs, *History of the French Revolution*; C. Doris, *Amours et Aventures du Vicomte de Barras* (4 vols., 1816).

Bar'ratry [from O. Fr. deriv. of *barat*, fraud; etym. obscure]; any distinct, unlawful, or dishonest act committed by the master or mariners of a vessel, tending to their own benefit and to the injury of the owner of the vessel. A mutiny of the crew, and forcible dispossession by them of the officers from the ship, would be a form of barratry.

HENRY WADE ROGERS.

Bar're: a village (and township); on B. and M. R. R. and on Ware river, Worcester co., Mass. (for location of county, see map of Massachusetts, ref. 3-F); 24 miles N. W. of Worcester; has an institute for feeble-minded children, and cotton, woolen, and straw factories. It was named in honor of Col. Isaac Barré. Pop. of township (1880) 2,419; (1890) 2,239; (1895) 2,278.

Barre: city (chartered 1894); Washington co., Vt. (for location of county, see map of Vermont, ref. 4-C); on railroad, 6 miles S. E. of Montpelier. It is the seat of Goddard Seminary, and has four churches; is the center of a large granite industry, and has manufactures of agricultural tools and castings. Pop. of village (1890) 4,146; of township, 6,812. EDITOR OF "ENTERPRISE."

Barre, baar, ANTOINE JOSEPH LE FÈVRE, de la: French naval officer; b. about 1625; Governor of Guiana in 1663; retook Cayenne from the Dutch in 1667; was made lieutenant-general in 1667, and was Governor of Canada 1682-85. D. in France, May 4, 1688.

Barré, baar-ray', Col. ISAAC: b. in Dublin, Ireland, in 1726, of French parents; entered the British army, where he served with great distinction, receiving a wound at Wolfe's victory at Quebec (1759), in consequence of which he ultimately became blind. He entered the British Parliament in 1761, where for years he nobly defended the rights of the American colonists. D. in London, July 20, 1802.

Barred-owl: a species of owl (*Syrnium nebulosum*) found in Eastern North America. The noisiest of our owls, but rather mild in temper.

Barrèges, baar-resh', or **Barèges**: a celebrated watering-place of France; department of Hautes-Pyrénées, 23 miles S. of Tarbes (see map of France, ref. 9-D); 3,240 feet above the level of the sea. Here are warm sulphurous springs having a temperature of about 104° to 122° F., which are esteemed efficacious in cases of scrofula, gout, etc.

Barrel: a large wooden vessel for holding liquids or solids; bound with hoops, and formed of staves, which are wider in the middle than at the ends, and have beveled edges, which render the joints tight. Each end of the barrel is closed by a circular head. The arched arrangement of the staves enables it to resist pressure from without. The term is also applied to the quantity contained by a barrel, which varies for different substances. A barrel of flour in the U. S. is equal to 196 lb., and a barrel of pork or beef contains 200 lb. In wine measure, 31½ gal. make a barrel. A barrel of beer in England is equal to 36½ imperial gal.

Barrett, BENJAMIN FISK: Swedenborgian theologian; b. in Dresden, Me., June 24, 1808; educated at Bowdoin College (1832) and Harvard Divinity School (1838); adopted Swedenborgian views and held pastorates of the "New Church" in New York city (1840-48); in Cincinnati till 1850; worked at a trade four years in Chicago to recover his health; settled as a pastor in Philadelphia in 1855, and editor of the *New Church Monthly*; founded the Swedenborgian Publication Society (Philadelphia) in 1885, and presided over it until his death in Germantown, Aug. 6, 1892. Besides many pamphlets and periodical articles, he pub-

lished a *Life of Swedenborg; Doctrines of the New Jerusalem Church* (New York, 1842); *New Dispensation and Letters on the Divine Trinity; The Golden Reed* (New York, 1855); *Catholicity of the New Church and The Visible Church* (1856); *On Future Life* (1872); *The New Church: its Nature and Whereabout; Swedenborg and Channing; and a New View of Hell* (1872). He edited the *Swedenborg Library* (12 vols., 1876). See his collected works (Philadelphia, 1876).

Barrett, LAWRENCE: actor; b. in Paterson, N. J., Apr. 4, 1838. He first appeared in Detroit in 1853 in *The French Spy*. He played leading parts at the Boston Museum in 1858. At the Winter Garden in New York he acted Othello to Edwin Booth's Iago, and it was considered a most striking performance. He was a captain in a Massachusetts regiment during the civil war. In 1872 he played Cassius to Booth's Brutus. As Lanciotto in *Francesca di Rimini* he made a great success. In 1884 he played in London and was favorably received. Wrote a *Life of Edwin Forrest* (Boston, 1881). D. in New York, Mar. 20, 1891.

B. B. VALLENTINE.

Barrhead: a manufacturing town of Renfrewshire, Scotland; 7 miles S. W. of Glasgow (see map of Scotland, ref. 12-F). It has cotton-mills, a machine-shop, print-works, bleaching-works, etc. Pop. 8,000.

Barrias, baar-rée-aäs', FÉLIX JOSEPH: historical painter; b. in Paris, Sept. 13, 1822. He was a pupil of Léon Cogniet, and was awarded the Grand Prix de Rome in 1844; Legion of Honor 1859; first class medal, Paris Exposition, 1889. Painted frescoes in the churches of St. Eustace and La Trinité, Paris. One of his compositions, *Landing of the French Troops in the Crimea*, is in the museum at Versailles. His work is academic and conventional, but sound in method.

W. A. C.

Barriade: a military barrier or defensive work, employed to obstruct the passage of an enemy through a road or a street of a city, or to protect troops against the fire of the enemy. Such works are formed of trees, wagons, paving-stones, chains, palisades, etc. They have been often used in popular revolts and street-fights, especially by insurgents in Paris. In 1588 the Roman Catholic faction raised barricades in Paris against Henry III., who was compelled to save himself by flight. A great number of barricades were erected in Paris by the popular party in the revolution of July, 1830, when Charles X. was dethroned. In June, 1848, the streets of Paris were again obstructed by barricades, and a bloody battle was fought between the government of Cavaignac and the Socialists or Communists, who were defeated. In order to counteract such operations, Napoleon III. widened and macadamized the principal streets of his capital, but barricades were again employed by the Communist insurgents in the spring of 1871.

Barrie: capital of Simcoe co., Ontario (Canada); at the western extremity of Lake Simcoe, and on the Northern and Northwestern Division of the Grand Trunk Railway; 65 miles N. N. W. of Toronto (see map of Ontario, ref. 3-D); has excellent schools, including a collegiate institute, 9 churches, a large trade, manufactures of woolen goods, and 3 weekly papers. Steamboats ply on the lake. The town was founded in 1832, and was incorporated as a town in 1871. Pop. (1881) 4,854; (1891) 5,550.

EDITOR OF "EXAMINER."

Barrie, JAMES MATTHEW: novelist; b. in Kirriemuir, Forfarshire, Scotland, May 9, 1860; educated in Dumfries and at Edinburgh University (1882); was journalist in Nottingham and London. His first tale was *Better Dead* (1887), a satire on London life. Next followed *Auld Licht Idylls* and *When a Man's Single* (1888); then *A Window in Thrums* (1889); *My Lady Nicotine* (1890); *The Little Minister* (1891); and a comedy (1892), written for J. L. Toole. *Sentimental Tommy* and *Margaret Ogilvie* appeared in 1896. Barrie's delineations of Scotch life in his native region are vivid and pathetic.

Barrier Act: the common name of an act passed by the General Assembly of the Church of Scotland, Jan. 8, 1697, intended as a barrier against innovations and an obstruction to precipitate legislation.

Barrière, baar-ri-ër', JEAN FRANÇOIS: French writer; b. in Paris, May 12, 1786; edited (with Berville) *Mémoires relatifs à la Révolution Française* (47 vols., 1822 et seq.) and (alone) *Mémoires relatifs à XVIIIème Siècle* (29 vols., 1846-64). D. in Paris, Aug., 1868.

Barrière, Théodore: French dramatist and satirist; b. in Paris, 1823; author of *Filles de marbre* (1853) in opposition to Dumas's *Dame aux Camélias*; *L'ange de métal* (1861); *Malheur aux vaincus* (1872), etc. D. in Paris, Oct. 16, 1877.

Barrier-reef, The Great: a vast coral-reef situated off the northeast coast of Australia, and extending from lat. 24 30 S., lon. 158 20 E., to Bristow island, on the coast of the island of Papua, lat. 9 15 S., lon. 143 20 E., nearly 1,300 miles. It is at a distance varying from 10 miles to over 100 miles from the coast, and rises, generally precipitously, from a great depth. It has a number of breaks or passages.

Barrier Treaties: the name given to several treaties between Great Britain and foreign powers; the first between Great Britain and the Netherlands, negotiated by Lord Townsend in 1709. The Dutch pledged themselves to maintain the Queen of England's title and the Protestant succession, while the British engaged to assist the Dutch in preserving their barrier-towns. The second was concluded between the same powers at Utrecht in 1713. The third was signed at Antwerp in 1715, between Great Britain, the Netherlands, and the Emperor Charles VII.

Barringer, Daniel Moreau: politician; b. in Cabarrus co., N. C., in 1807; graduated at the State University in 1826, and became a lawyer. He was several years in the State Legislature; represented the State in Congress for six years (1843-49); was U. S. minister to Spain from 1849 to 1853; a delegate to the Peace Congress of 1861, and to the national union convention at Philadelphia in 1866. D. at White Sulphur Springs, Va., Sept. 1, 1873.

Barrington: a post-village of Barrington township, Shelburne co., Nova Scotia; on the Atlantic coast (see map of Quebec, ref. 3-A); has thriving fisheries, ship-building, and coasting trade.—**BARRINGTON PASSAGE,** another village of the same township, has extensive fisheries, and is connected with Cape Sable island by ferry. Pop. of Barrington, 1,000.

Barrington: township; Bristol co., R. I. (for location of county, see map of Rhode Island, ref. 8-O); on Old Col. R. R., 8 miles from Providence. Brick-making is the chief industry. Pop. (1880) 1,359; (1890) 1,461; (1896) 1,668.

Barrington, Hon. Daines: an English jurist and naturalist; brother of Shute Barrington (1734-1826); for thirty-five years Bishop of Durham; b. in 1727. He published *Observations upon the Statutes, chiefly the More Ancient, from Magna Charta to the 21 Jac. I. c. 27* (1766), a standard work; wrote a *Dissertation on the Linnet System*, and other works. D. in London, Mar. 14, 1800.

Barris, Willis Hervev, D. D.: theologian and scientist; b. at Barrisville (formerly Zilienople), Beaver co., Pa., July 9, 1821; educated at Allegheny College and General Theological Seminary, New York; ordained deacon 1850; leading clergyman in Iowa; for twenty years president standing committee of diocese, and for a quarter of a century Ely Professor Ecclesiastical History in the theological department of Griswold College, Davenport, Ia.; acting Professor of Hebrew and Biblical Exegesis, and dean of the faculty; interested in the study of geology and palaeontology. His chief publications, other than sermons, essays, and reviews, are a series of articles on local geology contributed to the *Proceedings of the Davenport Academy of Natural Science*. His work on the *Blaschkeidea of the Hamilton Group* was republished in vol. viii. *Illinois State Geological Survey*. Dr. Barris's collection of erinoids was secured by Prof. Agassiz for the Peabody Museum of Harvard College. W. S. PERRY.

Barrister: in England, a lawyer who has been called to the bar, and who conducts the trial and argument of causes in court, as distinguished from an attorney, whose duty it is to draw the pleadings and prepare the case for trial. See ATTORNEY. H. W. R.

Barrois, brâr wâü, Charles, Dr. Sc.: geologist; b. at Lille, France, Apr. 21, 1851; educated at the University of Lille, and afterward Professor of Natural Sciences in the same institution. In the organization of the official geological corps of France he has charge of the work in Brittany. His publications on the geology of France are both numerous and voluminous, and are at once distinguished by their ability and by their wide range of topics, which include stratigraphy, mountain structure, metamorphism, petrography, and several branches of palaeontology. He is Bigsby

metallist and foreign member of the Geological Society of London, and was a vice-president of the International Congress of Geologists at the Washington meeting (1891). Among his greater memoirs are *Le Terrain crétacé supérieur de l'Angleterre et de l'Irlande* (1876); *Les Terrains anciens des Asturies et de la Galice* (1882); and *Faune du calcaire d'Erbray* (1889). G. K. G.

Barron, James: naval officer; b. in Virginia in 1769; served in the navy under his father, who was a "commodore of all the armed vessels of the Commonwealth of Virginia"; was commissioned lieutenant in the U. S. navy in 1798, and in 1799 was promoted to be a captain. He was employed on sea-service in the Mediterranean and other waters until 1807, and had acquired a high reputation for seamanship and discipline when the affair of the Chesapeake cast a shadow over his life. On June 22, 1807, the Chesapeake, bearing the pennant of Commodore Barron, sailed from Hampton Roads for the Mediterranean. The British war-vessel Leopard, about three o'clock in the afternoon, bore down upon and hailed the Chesapeake, informing Commodore Barron she had a dispatch for him. A boat being sent alongside, the message proved to be the instructions of Admiral Berkeley of the British navy to search the Chesapeake for deserters. This Commodore Barron refused to permit, and he wrote to Captain Humphreys, commanding the Leopard, that he knew of no deserters on the Chesapeake, and that his orders would not permit his men to be mustered by any other than their own officers. The lieutenant who had brought this dispatch to Commodore Barron returned to the Leopard, and shortly after this vessel opened fire on the Chesapeake, which proved to be entirely unprepared for battle. But one gun was discharged from the Chesapeake before she struck her colors. Three deserters were found on board, and taken to the Leopard, Commodore Barron being permitted to retain his ship, with which he at once returned to Norfolk. Barron was court-martialed for neglect of duty, found guilty, and suspended from the service for five years. Although restored to his rank and placed in responsible positions ashore, he never again did sea-service. A long correspondence with Commodore Decatur on the Chesapeake affair terminated in a duel between them at Bladensburg, Md., in 1820, in which both were severely wounded, Decatur mortally. Barron lived to be the senior officer in the U. S. navy. D. in Norfolk, Va., Apr. 21, 1851.

Barros, baar rōs, João, de: one of the most eminent of Portuguese historians; b. at Viseu in 1496. He was appointed governor of the Portuguese possessions in Guinea in 1522. His greatest work is entitled *Asia, or the History of the Discoveries and Conquests of the Portuguese in the East Indies* (1552-62). He wrote only three decades of this work, which was continued by Diego de Couto to the twelfth decade. This history is admired for elegance of style and other merits. D. in Pombal, Oct. 20, 1570. See Manoel Severim de Faria, *Vida de João de Barros* (1621).

Barrow: a river of Ireland; rises in Queen's County, on the northeast slope of the Slieve Bloom Mountain. It flows in a general southward direction, passes by Carlow and New Ross, divides the counties of Kildare, Carlow, and Wexford from the counties of Queen's and Kilkenny, and, after uniting with the Suir, enters the sea through Waterford harbor. It is about 100 miles long, and is next in importance to the Shannon among Irish rivers. It is navigable for ships of 300 tons to New Ross, 25 miles from its mouth.

Barrow [O. Eng. *beorg*, mound; Germ., Dutch *berg*, hill]; a name of artificial mounds which are found in many countries, and were erected in ancient times in honor of eminent persons or for monumental purposes. They are formed of earth or stones, and contain in some cases human bones, with armor and utensils. In Great Britain there are numerous barrows, which are supposed to have been raised before the island was conquered by the Romans. One of the largest oarrows in Europe is Silbury Hill, in Wiltshire, which has a vertical height of 170 feet and covers 5 acres. Many artificial mounds occur in the U. S., as at Grave Creek, West Va., and near Marietta, O.; also in Central America. See MOUND-MONUMENTS.

Barrow, Isaac, D. D., F. R. S.: English pulpit orator and mathematician; b. in London, Oct., 1630. He graduated at Cambridge as M. A. in 1652, and became Professor of Greek in that place in 1660. He was appointed Lucasian Professor of Mathematics in 1663, but resigned that chair in favor of his pupil, the illustrious Newton, in 1669. In 1672 he was

appointed master of Trinity College, Cambridge. He published, besides other able works, *Lectures Opticæ* (1669) and *Lectures Geometricæ* (1670). His reputation as a theologian rests chiefly on his sermons, which were edited by Dr. Tillotson (3 vols., 1685). They are very remarkable specimens of clear and exhaustive argument. "The sermons of Barrow," says Hallam, "display a strength of mind, a comprehensiveness, and fertility which have rarely been equaled." Frequently reprinted is his *Treatise on the Pope's Supremacy* (London, 1680); e. g. 1851. D. in London, May 4, 1677. His personal character was noble. See Arthur Hill, *Life of Barrow*, prefixed to his collected works (1685); Ward, *Lives of the Professors of Gresham College*; biography by W. Whewell in vol. ix. of Napier's edition; Barrow's *Theological Works* (Cambridge, 1859, 9 vols.).

Barrow, Sir Joun, Bart., F. R. S.: traveler; b. in Lancashire, England, June 19, 1764. As secretary to Lord Macartney he went to China in 1792, and to the Cape of Good Hope in 1797. He was secretary to the Admiralty for nearly forty years, and rendered many services to geographical science by promoting scientific expeditions. He was the chief founder of the Royal Geographical Society. Among his works are *Travels in South Africa* (2 vols., 1801-04); *An Account of the Mutiny of the Bounty* (1831); and *Voyages of Discovery and Research within the Arctic Regions* (1846). D. in London, Nov. 23, 1848. See his *Autobiographical Memoir* (1847).

Barrow, Washington: b. in Davidson co., Tenn., Oct. 5, 1817; became a lawyer; was for several years editor of the *Nashville Banner*, and a leader of the Whig party; State Senator in 1861. In 1841 he was appointed *chargé d'affaires* to Portugal, and was a Representative from Tennessee in Congress 1847-49. During the civil war he was arrested for alleged disloyalty, but was released soon after by order of President Lincoln. D. in St. Louis, Oct. 19, 1866.

Barrowe, Henry: English Nonconformist; called to the bar in 1576. After a licentious youth he was converted, and abandoned the law. Being attracted to John Greenwood, he became interested in Church reform. Robert Brown influenced them in favor of independency, and Barrowe was illegally arrested Nov. 19, 1586. He was charged with publishing seditious books against the queen and Government, and spent the rest of his life in Fleet Prison. He was condemned with John Greenwood, and they were hanged Apr. 6, 1593. Barrowe wrote *A Brief Discovery of the False Churches*.

Barrow-in-Furness: a seaport and important town of Lancashire, England; on the Irish Sea, 18 miles W. N. W. of Lancaster (see map of England, ref. 6-E). It is on the peninsula of Furness, and is the western terminus of a railway which extends to Dalton, and connects Barrow with the whole railway-system of England. It is separated by a narrow channel from Barrow island, and has a good harbor, formed by the island of Walney, which is 8 miles long. This place, which in 1845 was only a small fishing-village, derives its prosperity from rich mines of iron ore (red hematite) and manufactures of iron and steel, and it has increased with great rapidity. The Barrow Hematite Steel Company has twelve blast furnaces in operation, and the quantity of ore taken from the mines is 500,000 tons annually. This ore yields about 57 per cent. of iron. The steel-works of Barrow are said to be the largest Bessemer steel-works in Britain. About 20,000 tons of slate are annually quarried in the vicinity. Barrow has a town-hall, a public library, and numerous churches. Large sums of money have been expended in converting the channel between the town and Barrow island into docks. Pop. (1891) 51,712.

Barrows, ELLAH PORTER, D. D.: b. at Mansfield, Conn., Jan. 5, 1805; graduated at Yale in 1826; taught school in Hartford 1826-31; was ordained in 1832; pastor of the first Free Presbyterian church, New York city, 1835-37; Professor of Sacred Literature in Western Reserve College 1837-52, and of Hebrew Language and Literature at Andover Theological Seminary 1853-66. In 1872 he entered the same professorship in Oberlin Theological Seminary. He published a *Memoir of Erverson Judson* (Boston, 1852); *Companion to the Bible* (New York, 1869); *Sacred Geography and Antiquities* (1872). He was one of the authors and editors of the *Bible with Notes* (American Tract Society), and published many articles in the *Bibliotheca Sacra*.

Barrows, JOHN HENRY, D. D.: Presbyterian minister; chairman of the General Committee on Religious Congresses in connection with the Columbian Exposition of 1893; b. in Medina, Mich., July 11, 1847; was educated at Olivet College, Mich., and at Yale, Union, and Andover Theological Seminaries. Since 1881 he has been pastor of the First Presbyterian church in Chicago. He published a history of that church (1883); *The Gospels are True Histories* (Boston, 1891); *I Believe in God the Father Almighty* (Chicago, 1892); and *Henry Ward Beecher, the Pulpit Jupiter* (New York, 1893). W. J. BEECHER.

Barrows, SAMUEL JUNE: Unitarian minister and editor; b. in New York, May 26, 1845; educated at Harvard Divinity School and Leipzig University; became a Baptist minister, but soon exchanged that connection for Unitarianism; secretary to William H. Seward 1867-69; pastor of First Parish, Dorchester, Mass., 1876-80; editor *Christian Register* 1881; author of *The Doom of the Majority* (Boston, 1883); *A Baptist Meeting-house* (1885); *The Slaybacks in Camp* (1888); editor of various volumes of essays and sermons; noted as an earnest worker in educational and penal reforms, and for his linguistic attainments. His wife, BELLA C. BARROWS, has assisted him in his literary work.

Barrundia, báar-roon'dé-ó-ná, JOSÉ FRANCISCO: a statesman; b. in Honduras in 1779; raised the standard of revolt against the Spanish Government, and was chosen in 1829 president of the republic. As a member of the first republican assembly, in 1824, he introduced and carried a decree for the abolition of slavery. In 1854 he was minister to the U. S., and d. Aug. 4, 1854, in New York city.

Barry: city (founded in 1836); Pike co., Ill. (for location of county, see map of Illinois, ref. 7-B); on Wabash R. R., 18 miles E. of Hannibal, Mo., 30 miles S. E. of Quincy, Ill. Barry has a high school, three churches, woolen-mill, flour-mill, and pork-packing establishments. The surrounding country is agricultural. Pop. (1880) 1,392; (1890) 1,354; (1892) estimated, 1,500. PUBLISHER OF "ADAGE."

Barry, ALFRED, D. D.: late Bishop of Sydney; b. in London in 1826; educated at Trinity College, Cambridge; ordained in 1850, and became Bishop of Sydney, Metropolitan of New South Wales, and Primate of Australia in 1884; Principal of King's College, London, 1868-83; Canon of Worcester 1871-81; Canon of Westminster 1881-83; but resigned in 1889, and in 1891 was appointed Canon of Windsor. Besides sermons and commentaries, he has published a *Life of Sir C. Barry*, his father; *What is Natural Theology?* (1876); *The Teacher's Prayer-book* (numerous editions); *The Parables of the Old Testament* (1889); *Christianity and Socialism* (1891). W. S. PERRY.

Barry, Sir CHARLES: English architect; b. at Westminster, May 23, 1795. He visited Italy, Greece, and Egypt about 1818. He designed the Manchester Athenæum and the grammar school of Edward VI. at Birmingham. In 1841 he became a royal academician. His design for the new Houses of Parliament was preferred to those of his competitors, and the work was commenced in 1840. D. in Clapham, London, May 12, 1860; buried in Westminster Abbey. See *Memoir of Sir Charles Barry*, by his son, the Rev. Alfred Barry (1867).

Barry, EDWARD MIDDLETON: b. in London, 1830; son of Sir Charles Barry, whom he succeeded as architect of the Houses of Parliament; also architect of the National Gallery and other prominent buildings. D. in London, Jan. 29, 1880.

Barry, JAMES: historical painter; b. in Cork, Ireland, Oct. 11, 1741; was patronized by Edmund Burke. He passed about five years at Rome, and became a member of the Royal Academy of London, but he was expelled from the same in 1797 on account of differences of opinion on methods of art-teaching. His masterpiece is *The Victors at Olympia*. D. in London, Feb. 6, 1806. See Cunningham, *Lives of Painters and Sculptors* (*Edinburgh Review* for Aug., 1810).

Barry, JOHN: naval officer; b. in Tacumshane, County Wexford, Ireland, in 1745; emigrated to America about 1760. He became commander of a U. S. frigate in 1776, and captured the British vessel *Atlanta* in May, 1781. After the reorganization of the U. S. navy he was appointed senior officer, and selected to command the frigate *United States*. D. in Philadelphia, Sept. 13, 1803.

Barry, JOHN WOLFE, M. Inst. C. E.: civil engineer; engineer of the extension of the Metropolitan District and Inner Circle (underground) Railways of London; youngest

son of the late Sir Charles Barry, R. A.; b. in 1836; educated at Trinity College, Glenalmond, Perthshire, and at King's College, London; studied first with Lucas Brothers, afterward articulated to Sir John Hawkshaw. While with the latter he was resident engineer on the Thames bridges and the Charing Cross and Cannon Street stations. Leaving Sir John Hawkshaw in 1867, he commenced work on his own account. He built the Lewes and East Grinstead Railway, the Ealing and Fulham extensions of the Metropolitan District Railway, the Inner Circle Railway (these being extensions of the Underground Railway of London), the new Blackfriars bridge over the Thames, the Barry dock near Cardiff, and the railways to connect it with South Wales; engaged in the construction of the new Tower bridge for the corporation of London. In 1872 he visited the Argentine Republic, and laid out a railway from Buenos Ayres to Rosario. In 1886 he was appointed by the Government on the Royal Commission on Irish Public Works; in 1889 on a commission to settle important matters in connection with the river Ribble; and again in the same year on the Western Highlands Commission, having duties similar to those of the Irish Commission. Mr. Barry is member of the Council of the Institution of Civil Engineers, member of the Institution of Mechanical Engineers, Fellow of the Royal Institute, author of *Railway Appliances*, and of a course of lectures with Sir F. J. Bramwell on *Railway and Locomotive* (1882). Wm. R. HUTTON.

Barry, Patrick: horticulturist; b. near Belfast, Ireland, in May, 1816. At the age of twenty he removed to the U. S., and in 1840 moved to Rochester, where he died June 23, 1890. In his earlier life he was editor of the *Horticulturist* and also of the *Genesee Farmer*. His book called the *Fruit Garden* has long been an authority upon pomological matters. He was well known from his connection with the nursery firm of Ellwanger & Barry.

Barry, William Farquhar: soldier; colonel of the Second Artillery and brevet brigadier-general U. S. army; b. in New York city, Aug. 18, 1818; graduated at West Point in 1838. His first active services were in the war against the Indians in Florida 1852-53, when he was advanced to a captaincy. In the Mexican war he acted as aide-de-camp to Maj.-Gen. Worth. He served in the difficulties with the Indians in Dakota in 1856, and took part in the Utah expedition 1858. When the civil war broke out he was appointed chief of artillery of the army of the Potomac, with the rank of major and brigadier-general of volunteers. His gallant and meritorious conduct in the capture of Atlanta won him the brevet titles of colonel U. S. army and major-general of volunteers, Sept. 1, 1864. Mar. 13, 1865, he was breveted brigadier-general U. S. A. for gallant services in the campaign terminating in the surrender of the army under Gen. J. E. Johnston, and was made brevet major-general U. S. A. in 1865. Gen. Barry organized the entire artillery of the Army of the Potomac, and served in the field with that army as chief of artillery from Mar., 1862, to Sept., 1862, participating in the siege of Yorktown and the Seven Days' battles ending with Malvern Hill. He subsequently commanded the artillery serving in the defenses of Washington 1861-63, and served as chief of artillery in the armies commanded by Gen. Sherman. He was a member of various boards, and after the war was assigned to the command of the northern (lake) frontier for the preservation of the national neutrality; in 1867 appointed to command the U. S. Artillery School at Fortress Monroe. Gen. Barry was the author of *Engineer and Artillery Operations of the Army of the Potomac, A. D. 1861-62*, in conjunction with the writer, and *A System of Tactics for the Field Artillery of the United States*, in conjunction with Maj.-Gen. W. H. French and H. J. Hunt. D. near Baltimore, July 18, 1879.

Barry, William Taylor: b. in Lunenburg, Va., Feb. 5, 1784; graduated at William and Mary College in 1803; became a lawyer; was member of Congress from Kentucky (1810-11); served in the war of 1812; was U. S. Senator (1814-16); was in turn a judge, lieutenant-governor, State secretary, and chief justice of Kentucky; Postmaster-General under Jackson (1828-35); and d. in Liverpool, Aug. 30, 1835, while on his way to Spain as U. S. minister.

Barry, Countess de: See DE BARRY.

Barry Cornwall: See PROCTOR, BRYAN WALTER.

Bars, bôrsh: a county of Northern Hungary; area, 1,032 sq. miles. With the exception of a small part in the S., the country is mountainous, and is traversed by the Gran and

the Zsitva. The soil of the plain in the southern part is very fertile, and produces chiefly grain. Pop. (1890) 153,053. Chief town, Kremnitz.

Barse, George R., Jr.: figure-painter; b. in Detroit, Mich., July 31, 1861. Pupil of Cabanel, Boulangier, and Lefebvre, Paris; member of the Society of American Artists 1889. His pictures latterly have been painted from motives found in Capri, Italy, where he went to reside in 1890, and his work is generally decorative in character. W. A. C.

Bar-sur-Aube, bâr'sür-ôb (Lat. *Bar ram ad Albulam*): an ancient town of France; department of Aube; on the river Aube; 33 miles by rail E. S. E. of Troyes (see map of France, ref. 4-G). It has a trade in wine, hemp, grain, and wool. The allied sovereigns held a council here Feb., 1814, and here, in the same year, occurred two battles between the allies and the French. Pop. (1891) 4,312.

Bar-sur-Seine, bâr'sür-sayn' (Lat. *Bar ram ad Sequanum*): a town of France; department of Aube; on the river Seine; 17 miles S. E. of Troyes (see map of France, ref. 4-G); was important in the Middle Ages. The allies defeated the French here in 1814. Pop. (1891) 3,237.

Barter: the exchange of one commodity for another, as distinguished from the exchange of a commodity for money. This is a primitive method of trading commonly practiced by barbarous peoples, but inadequate to the needs of the commerce of civilized nations, which demands a standard of value or money. (See MONEY.) Ships sailing to uncivilized countries often carry weapons, tools, or ornaments to be used in barter with savages. Farmers in the U. S. also often barter their produce for goods at the stores.

Revised by F. STURGES ALLEN.

Barthfeld, baart felt, or Bartha: an old town of North Hungary, in the county of Saros, on the river Toppa, 20 miles N. of Eperies (see map of Austria-Hungary, ref. 4-J). It has mineral baths, which are much frequented, and a considerable commerce in wine, brandy, linen, etc. Pop. 5,403.

Barth, baart, or Bardt: a seaport-town of Prussia, in the province of Pomerania, on the Binnensee, 15 miles W. N. W. of Stralsund (see map of German Empire, ref. 2-F). It has ship-building docks, and a trade in grain and wool. Pop. (1890) 5,578.

Barth, Caspar, von (1587-1658): classical philologist; spent his life as a scholarly man of leisure in Halle and Leipzig. A prolific author, and much admired in his own day for his erudition and critical acumen; now chiefly remembered as an unscrupulous fabricator of text readings which he pretended to have discovered in neglected MSS.

ALFRED GUDEMAN.

Barth, Heinrich: an enterprising German explorer; b. in Hamburg, Feb. 16, 1821. He traveled in Northern Africa in 1845, after which he extended his explorations to Palestine, Arabia, and Asia Minor, and published *Wanderings along the Shores of the Mediterranean* (1849). He joined Richardson and Overweg in an expedition to Central Africa, but they died in 1851, and he explored that country alone for about five years. In 1863 he became Professor of Geography in Berlin. He published *Travels and Discoveries in Central Africa* (5 vols., 1858), which is a very valuable work. D. in Berlin, Nov. 25, 1866.

Barthélemy, bâr'tây'l mee, JEAN JACQUES: French antiquary; b. near Aubagne, in Provence, July 20, 1716. He learned the Greek, Hebrew, Arabic, and Chaldean languages, and became keeper of the royal cabinet of medals in 1753, after which he traveled in Italy and collected many medals. He wrote several treatises on numismatics and ancient inscriptions. His principal and most popular work is *Travels of Anacharsis the Younger in Greece* (*Voyage du jeune Anacharsis en Grèce*, 4 vols., 1788), in which a young Scythian describes his observations in Greece in the fourth century B. C. It has been translated into many languages. He was admitted into the French Academy in 1789. D. April 30, 1795. See Mancini-Nivernais, *Essai sur la vie de J. J. Barthélemy* (1795); Villenave, *Notice sur les ouvrages de J. J. Barthélemy* (1821), in connection with a complete edition of his works in four volumes.

Barthélemy Saint-Hilaire, bâr'tây'l mee sâh-tê-lâr, JULES: French scholar and journalist; b. in Paris, Aug. 19, 1805. He was an editor of the *National* and other liberal journals. In 1838 he became Professor of Greek and Latin Philology in the College of France; translated the works of Aristotle (4 vols., 1839-44), and wrote several works, among

which is *Du Bouddhisme* (1855). He was elected a member of the National Assembly in 1848. He was secretary to President Thiers in 1872-73. D. in Paris, Nov. 25, 1895.

Barthez, bār'thez', or **Barthès**, PAUL JOSEPH, M. D., LL. D.: French physician and writer; b. in Montpellier, Dec. 11, 1734. He became Professor of Medicine in that city in 1759, and removed to Paris in 1780, after which he was consulting physician to the king and a member of the council of state. He wrote, besides other works, *New Elements of the Science of Man* (1778). D. in Paris, Oct. 15, 1806. See Lorient, *Mémoires sur la vie de P. J. Barthez* (1818).

Bartholdi, bār'tōl-dee', FRÉDÉRIC AUGUSTE; sculptor; b. at Colmar, in Alsace-Lorraine, Apr. 2, 1834; first studied painting under Ary Scheffer in Paris, but afterward devoted himself exclusively to sculpture, and began to exhibit in 1847. Among his best-known works are the busts of Eckmann and Chatrian, the statues *La Malédiction d'Alsace*; *Lafayette Arriving in America*; and *Liberty Enlightening the World*, the colossal figure of the goddess of Liberty (a complete lighthouse, see NEW YORK CITY) which the people of France presented to the U. S. Bartholdi is author of a description of this statue, published in 1885, was present at its unveiling, Oct. 28, 1886, and has been promoted to the rank of commander of the Legion of Honor.

Bartholin, bār'tō-lin, CASPER; b. in Malmö, Sweden, in 1585. He was famous for his precocity and learning; entered the University of Copenhagen when about eighteen, and afterward studied at Rostock and Wittenburg; was Professor of Medicine in the University of Copenhagen 1613 to 1624. He afterward became Professor of Divinity; wrote about fifty works, mostly on medical subjects. D. in Sorø, July 13, 1630.

Bartholin, THOMAS, M. D.: physician; son of Casper above; b. in Copenhagen, Oct. 20, 1619. He became in 1647 Professor of Mathematics, and next year of Anatomy, at Copenhagen, and wrote, among other works in Latin, one on the lymphatic vessels (the discovery of which he claimed); a treatise on the functions of the liver; and *Anatomia* (1641), which passed through many editions and obtained a high reputation as a text-book. His house, library, and MSS. were burned in 1670. Thereupon he was made physician to the king and librarian of the university. Grand counselor of Denmark in 1675. The Bartholin family produced many eminent physicians. D. Dec. 4, 1680.

Bartholin, THOMAS; b. April 8, 1659; d. Nov. 15, 1690. One of the founders of the study of northern antiquities. His chief work, *Antiquitatum Danicarum de Causis contemplata Davis adhuc Gentilibus Mortis Libri Tres*, was published at Copenhagen (where he was professor) in 1689. G. L. KITTRIDGE.

Barthol'omew: a bayou in Arkansas and Louisiana; rises in Jefferson County in the former State, flows nearly southward into Louisiana, and enters the Washita river at Washita city. It is navigable for steamboats for 250 miles.

Bartholomew [in Gr. Βαρθολομαῖος; in Lat. *Bartholomæus*]; saint, one of the twelve apostles; supposed to be the same as the Nathanael mentioned in John i. 45-49. We have no authentic information respecting his labors or his death. According to tradition, he preached the gospel in India.

Bartholomew, EDWARD SHEFFIELD; sculptor; b. in Colchester, Conn., in 1822. He practiced dentistry for a time, and then learned painting, but afterward became distinguished as a sculptor. From 1845 to 1848 he was in Hartford, and after two years spent in New York he went to Italy, where he died at Naples, May 2, 1858. Some of his works are greatly admired. Among them are *The Shepherd Boy*; *Youth and Age*, a monument to Charles Carroll; *Ganymede and the Eagle*, etc.

Bartholomew Fair: a great English market held annually in West Smithfield, London, on the festival of St. Bartholomew (Aug. 24, old style). The charter of this fair was granted by Henry I. in 1133. It was originally connected with the Church, under whose auspices miracle-plays, mysteries, and moralities were represented at the fair. In the first centuries of its existence this was the chief cloth-fair of the kingdom. Leather, pewter, and live cattle were also sold here. Crowds of people were attracted to it by a variety of popular amusements and the exhibitions of acrobats, tumblers, mountebanks, mummers, and merry-andrews. Having

ceased to be a place of traffic and become a nuisance, it was abolished in 1855. See Henry Morley, *Memoirs of Bartholomew Fair* (1859).

Bartholomew's Hospital, London: founded in 1102 by Rahere, the king's minstrel; was at first connected with a priory established by the same person. It was made a sanctuary by Edward II., but hospital and priory were both dissolved by Henry VIII., who founded the hospital anew, giving 500 marks yearly for its maintenance, on condition the city should give the like sum. There is a medical school attached to it, and the hospital relieves about 70,000 patients annually.

Bartholomew, St.: an island of the West Indies. See ST. BARTHOLOMEW.

Bartholomew, St. Massacre of: the massacre of French Protestants which commenced at Paris in the night of the 23d and 24th of Aug., 1572. During the minority of Charles IX. and the regency of his mother, Catherine de Médicis, a long civil war raged in France between the Catholics and Huguenots, whose leaders were the Prince of Condé and Admiral Coligny. In 1570 the court made to the Huguenots overtures which resulted in a treaty of peace. Charles invited Coligny and other leaders of that party to court, and received them with warm demonstrations of friendship, which were probably perfidious. The false security of the Huguenots was increased by a marriage between Henry of Navarre and Margaret, who was a sister of Charles IX. Many Huguenots went to Paris to attend the wedding in Aug., 1572. Probably the principal instigator of the massacre was Catherine de Médicis. Admiral Coligny was wounded by a shot from a window of the royal palace on the 22d. The general massacre commenced at two o'clock on Sunday morning, Aug. 24, and continued for several days. The provinces followed the example of the capital, with some exceptions. In regard to the number of victims there is no certainty. Estimates have varied from 1,000 to 10,000 for Paris, and from 2,000 to 100,000 for the whole of France. Naturally, in that age when the idea prevailed that religious dissidents were properly to be put to death as foes of God, and persecution was justified on all hands, the news of the massacre occasioned joy in Rome. A medal struck at the time is monumental proof of this. See Sismondi, *History of France*; H. Martin, *History of France*; De Thou, *Historia sui Temporis*; *The Massacre of St. Bartholomew*, by Henry White (London, 1868); especially H. M. Baird, *The Rise of the Huguenots* (New York, 1879, 2 vols., vol. ii.)

Bar'tizan: a term in architecture, first used by Sir Walter Scott, and employed by him to mean sometimes a balcony (as in *Waverley*); sometimes a fortified turret or flanking projection (as in *The Lay of the Last Minstrel* and in *The Eve of St. John*). Scott uses the participle "bar'tized" in the sense of embattled, or furnished with battlements (as in *The Heart of Midlothian*). In this sense it has been used by other writers, but the word has no authority and no positive signification.

Bartlett, EDWARD TOTTERSON, D. D.: Professor of Ecclesiastical History, and dean of the Episcopal Divinity School, Philadelphia; b. in Philadelphia, July 25, 1843; was graduated at University of Pennsylvania 1865; received D. D. from his *alma mater* 1887; studied theology at Andover 1865-68; ordained 1869-70; professor and dean 1884. Chief literary work, other than occasional sermons, reviews, etc., is the third volume of *The Scriptures, Hebrew and Christian*, 1892; published in connection with the Orientalist, Rev. Prof. John Punnett Peters, Ph. D., formerly Professor of Hebrew in the Philadelphia Divinity School. Bartlett's contribution to this work was the New Testament volume.

Bartlett, ELSHA, M. D.: physician; b. in Smithfield, R. I., Oct. 6, 1804. He was the first mayor of Lowell, Mass.; delivered many medical lectures; became Professor of Medicine in the University of Maryland in 1844, and took the same position in the University of New York in 1850, which he left in 1852 to become Professor of Materia Medica and Medical Jurisprudence in the College of Physicians and Surgeons of the same city. Among other medical works, he wrote an *Essay on the Philosophy of Medical Science*. D. in Smithfield, July 18, 1855.

Bartlett, JONAS R.: U. S. naval officer; b. in Providence, R. I., Sept. 26, 1843; entered the naval academy Nov. 25, 1859; a commander in 1877; chief hydrographer to Bureau of Navigation, Washington, D. C., June 22, 1883, and was promoted to the rank of captain July 1, 1892.

He served in the steamer *Mississippi* at the passage of Forts Jackson and St. Philip and capture of New Orleans, Apr. 24, 1862. While attached to the steam-sloop *Susquehanna* he took part in both attacks on Fort Fisher, and was one of the assaulting party of Jan. 15, 1865, and was specially mentioned in the reports of Com. Godon and Lieut.-Com. Blake.

Bartlett, JOHN RUSSELL: writer; b. in Providence, R. I., Oct. 23, 1805; was one of the founders of the American Ethnological Society. He was appointed in 1850 commissioner to determine the boundary between Mexico and the U. S. He published, besides other works, a *Narrative of Explorations and Incidents in Texas and New Mexico* (2 vols., 1854); *Progress of Ethnology* (1847); *Dictionary of Americanisms* (1848); *Bibliotheca Americana* (4 vols., 1865-70); many records of Rhode Island from original documents; historian of the State's part in the civil war; local genealogies, and *Primeval Man* (1868). Secretary of State for Rhode Island 1855-72. D. in Providence, May 28, 1886.

Bartlett, JOSIAH, M. D.: physician and chief justice of New Hampshire; b. in Amesbury, Mass., Nov. 21, 1729. He signed the Declaration of Independence, and was a member of the Continental Congress in 1776-78. He became president of New Hampshire in 1790, and Governor of that State under the new constitution in 1793. D. in New Hampshire, May 19, 1795.

Bartlett, SAMUEL COLFORD, D. D., LL. D.: b. in Salisbury, N. H., Nov. 25, 1817; graduated in 1836 at Dartmouth College, where he was afterward tutor, and at the Andover Theological Seminary in 1842. In 1843 he was settled over the Congregational church in Monson, Mass.; in 1846 became Professor of Intellectual and Moral Philosophy in Western Reserve College; in 1852 took charge of the Franklin Street church, Manchester, N. H.; in 1857 became pastor of the New England church, Chicago, Ill.; and in 1858 was made Professor of Biblical Literature in the Chicago (Congregational) Theological Seminary. In 1873 he had leave of absence for a year to travel in the East. In 1877 he was made president of Dartmouth College, which office he resigned in 1892. He has published *Life and Death Eternal*; *Sketches of Missions of the American Board*; *Future Punishment*; besides a goodly number of sermons, orations, addresses, and articles in the leading reviews. He contributed to the American edition of Smith's *Dictionary of the Bible*.
Revised by GEORGE P. FISHER.

Bartlett, WILLIAM ALVIN, D. D.: Presbyterian minister; b. in Binghamton, N. Y., Dec. 1, 1834; educated at Hamilton College, Union Theological Seminary, and the universities of Halle and Berlin, Germany. Before entering upon his present charge as pastor of the New York Avenue Presbyterian church, Washington, D. C., he was successively pastor of Congregational churches in Owego and Brooklyn, N. Y., and Chicago, Ill., and of the Second Presbyterian church in Indianapolis, Ind. He has published a serial story, *The Lost Image*, and contributed largely to periodical literature.
WILLIS J. BEECHER.

Bartlett, WILLIAM FRANCIS: volunteer soldier; b. in Haverhill, Mass., June 6, 1810; graduated at Harvard University in 1861. On the outbreak of the civil war he entered the service as a private soldier, and was appointed captain in the Twentieth Massachusetts July, 1861; at the siege of Yorktown, Apr., 1862, he lost a leg; was commissioned colonel of the Forty-ninth Massachusetts Infantry, which regiment he led in the assault on Fort Hudson, La., May 27, 1863, where he was wounded in the leg and arm. On this occasion he displayed such daring, and was so conspicuous a mark, being mounted, that the Confederate officers gave orders not to shoot at him. Colonel of the Fifty-seventh Massachusetts Veteran Regiment, Aug., 1863; wounded in the battle of the Wilderness; brigadier-general of volunteers June 22, 1864, for conspicuous gallantry. He led the assaulting column at the explosion of the mine near Petersburg, July 30, 1864, and was wounded and taken prisoner. Brevetted major-general U. S. volunteers. D. in Pittsfield, Mass., Dec. 17, 1876.

Bartlett, WILLIAM HENRY: artist and writer; b. in London, England, Mar. 26, 1809. He traveled in many parts of Europe and America, and visited Egypt and Palestine. He published numerous popular works, illustrated with engravings designed by himself. Among his works are *Walks in and about Jerusalem* (1844), and *The Nile-boat, or Glimpses of the Land of Egypt* (1849). D. at sea, between Malta and Marseilles, Sept. 13, 1854.

Bartlett, WILLIAM HENRY: contemporary landscape-painter of the English school; b. in London; pupil of Bouguereau and of Tony Robert Fleury. Received a second-class medal at the Paris Exposition, 1889, for his picture *Return from the Fair*. Has exhibited at the Royal Academy and at the Grosvenor Gallery, London. Studio in London.
W. A. C.

Bartlett, WILLIAM HOLMS CHAMBERS, LL. D.: soldier and scientist; b. in Lancaster co., Pa., 1809; graduated at West Point in 1826. He served, while lieutenant of engineers, as assistant professor at the Military Academy 1827-29; in the construction of Fort Monroe, Va., and Fort Adams, R. I., 1828-32; as assistant to the chief engineer at Washington, D. C., 1832-34; and as acting Professor of Natural and Experimental Philosophy at the Military Academy 1834-36. On resigning his lieutenancy, Apr. 20, 1836, he was appointed full Professor of Philosophy, continuing as such till retired from active service, Feb. 14, 1871. He is author of a *Treatise on Optics* (1839); of *Synthetical Mechanics* (1850-58); of *Acoustics and Optics* (1852-59); of *Analytical Mechanics* (1853-59); and of *Spherical Astronomy* (1855-58). He was a member of several scientific associations, corporator of the National Academy of Sciences from its formation, and became in 1871 actuary of the Mutual Life Insurance Company of New York city. D. at Yonkers, N. Y., Feb. 11, 1893.

Bartol, CYRUS AUGUSTUS, D. D.: Unitarian preacher and author; b. in Freeport, Me., Apr. 30, 1813. He graduated in Bowdoin College in 1832, at the Cambridge Divinity School in 1835; settled as colleague pastor of West church, Boston, in 1837. A member of the famous Transcendental Club. His principal writings are *Discourses on the Christian Spirit and Life* (1850); *Discourses on the Christian Body and Form* (1854); *Pictures of Europe* (1855); *Radical Problems* (1872); and *The Rising Faith* (1873). His contributions to periodical literature are numerous and valuable, being characterized by a style at once homely and unique, and deep religious feeling. Retired from the ministry after a pastorate of fifty years.

Revised by JOHN W. CHADWICK.

Bartoli, baar tō-lōc, ADOLFO: philologist and historian of Italian literature; b. in Fivizzano, Nov. 19, 1833; since 1874 Professor of Italian Literature in the Istituto di Studi Superiori in Florence. His first important work was *I primi due secoli della letteratura italiana* (Milan, 1875-80), of great influence upon the study of early Italian literature. Since this he has published *I precursori del Boccaccio* (1876); *I precursori del Rinascimento* (1876); and, chief among his works, *La storia della letteratura italiana* (7 vols., 1878-89).
A. R. MARSH.

Bartoli, TADDEO: Italian painter of the Sicilian school; b. 1362; d. 1422; chief work, *Life of the Virgin*, in the Palazzo at Sicma.—DANIELLO: Jesuit scholar; b. in Ferrara, Nov. 12, 1608; d. Jan. 13, 1685, as rector of the Jesuit College in Rome; chief work, *History of the Society of Jesus*.—PIETRO SANTI: called Perugino; painter and etcher; pupil of Nicholas Poussin; b. in Barotola, Perugia, 1635; d. in Rome, Nov. 7, 1700.

Bartolini, biār-tō-lee'nōc, LORENZO: an Italian sculptor; b. in Vernio, Tuscany, Jan. 7, 1777. He studied and worked in Paris, and was patronized by Napoleon, who in 1808 directed him to found a school of sculpture at Carrara. In 1815 he removed to Florence, where he worked for many years. Among his masterpieces are a colossal bust of Napoleon I., the group of *Heracles and Lichas*; *Faith in God*; and a group called *Charity*. His works are characterized by a classic repose and simplicity. He is ranked by the Italians as second only to Canova. D. in Florence, Jan. 20, 1850.

Bartolommeo, biār-tō-lom-may ō, Fra (whose true name was BACCIO DELLE PORTA); b. in Savignano in 1475; studied under Cosimo Rosselli and Leonardo da Vinci, and had already acquired a great reputation as a painter when the condemnation and execution of his friend Savonarola caused him to give up his art and retire to a Dominican convent in 1500. In 1506, however, he again took up painting, and he subsequently visited Rome in order to study the works of Michael Angelo. Most of his life he spent in Florence, where he died Aug. 3, 1517, and here are his most celebrated pictures, the *Nativity*; *Circumcision*; *Virgin on the Throne*, in the public gallery; the *St. Mark* and the *Descent from the Cross*, in Palazzo Pitti; and *Last Judgment*,

in chapel of Santa Maria Nuova. His *St. Mark* and *St. Sebastian* were painted to prove that he did not lack power, and are his best works.

Bartolozzi. baar-tō-let sē. FRANCESCO; an Italian engraver; b. in Florence, Sept. 21, 1728; was a scholar of Ferretti and Joseph Wagner. He lived many years in London, and exerted a bad influence by spreading the stippled manner. His works are very numerous. D. in Lisbon, Portugal, about 1816.

Bart'on: village, on railroad, Orleans co., Vt. (for location of county, see map of Vermont, ref. 2-D). The fertile soil and abundant water-power of the township make agricultural and manufacturing business profitable. The chief article of manufacture is lumber; a large factory for making underwear was built in 1892. It has graded schools, an academy, and a library. Pop. of township (1880) 2,364. Pop. of village (1880) 742; (1890) 778; (1892) estimated, 865. EDITOR OF "ORLEANS COUNTY MONITOR."

Barton. BENJAMIN SMITH; physician and botanist; son of Thomas (1730-80), an Episcopal clergyman, and of a sister of David Rittenhouse; b. in Lancaster, Pa., Dec. 19, 1766; educated at York, Pa., and at what now is the University of Pennsylvania; studied medicine at Edinburgh and Göttingen; and became a practitioner in Philadelphia. He was Professor of Natural History and Botany in the college where he graduated 1789, of *Materia Medica* 1795, and succeeded Dr. Benjamin Rush in its medical school 1813. President of the Philadelphia Medical Society; promoter and officer of the American Philosophical Society, contributing to its *Transactions*. He wrote treatises on natural history, aboriginal American ethnology, and on *materia medica*. His most memorable book was *Elements of Botany* (Philadelphia, 1803), which was reprinted and for many years a standard text-book. D. in Philadelphia, Dec. 19, 1815. See *Biography*, by his nephew, W. P. C. Barton (Philadelphia, 1815).

Barton. BERNARD; known as the "Quaker poet"; b. in London, England, Jan. 31, 1784; was a member of the Society of Friends. He became a clerk in a bank at Woodbridge. He published *Poems* (1820); *Napoleon, and other Poems* (1822); *Devotional Verses* (1826); *The Reliquary* (1836); *Household Verses* (1845); and other works. Sir Robert Peel procured for him a pension of £100. His works are pervaded by pious sentiment and tenderness. D. at Woodbridge, Feb. 19, 1849. See *Memoirs and Letters of Bernard Barton*, edited by his daughter.

Barton. CLARA; b. about 1830 on a farm at Oxford, Mass.; a daughter of Capt. Stephen Barton, and educated at Clinton, N. Y. Early in life she engaged in teaching, and founded a free school at Bordentown, the first in New Jersey, which she opened with six pupils, but which numbered nearly 600 when, in 1854, she went to Washington. Here she was appointed clerk in the department of patents, but on the outbreak of the civil war she resigned her clerkship and devoted herself to the alleviation of the sufferings of the soldiers, serving not in the hospitals, but on the battle-field. She was present at several battles, and after the close of the war originated, and for some time carried on at her own expense, the search for missing soldiers. Having lectured (1866-67) on *Incidents of the War*, she went to Europe for her health, and settled in Switzerland, but on the outbreak of the Franco-German war she accepted the invitation of the Grand Duchess of Baden to aid her in the establishment of her hospitals; and she afterward followed the German army, and was decorated with the Golden Cross by the Grand Duke of Baden, and with the Iron Cross by the Emperor of Germany. In 1881 she organized the American Red Cross Society, and, becoming its president, succeeded in procuring an international treaty granting it protection. In 1883 she was appointed superintendent of the Reformatory Prison for Women at Sherborn, Mass., and in 1884 was chosen delegate to the International Peace Convention at Geneva. In 1883, at the request of a committee of Congress, she prepared a *History of the Red Cross*, which was published by the Government at Washington.

Barton. DAVID; b. about 1785; one of the earliest emigrants to Missouri Territory; president of the convention in 1820 to form a State constitution; Senator in Congress from Missouri 1824-31; and chairman of the committee on public lands. D. at Booneville, Mo., Sept. 28, 1837.

Barton. ELIZABETH; See MAID OF KENT.

Barton. WILLIAM; a Revolutionary general; b. in Warren, Bristol co., R. I., May 26, 1748. As lieutenant-colonel of the Rhode Island militia he captured Gen. Prescott July 10, 1777. He was wounded and disabled in 1778 at Bristol Ferry. Congress gave him a colonel's commission and a sword, and he received a grant of land in Vermont. He was many years imprisoned in Vermont for debt, but was liberated in 1825 by La Fayette, who paid the demand against him. D. at Providence, Oct. 22, 1831.

Barton. WILLIAM PAUL CRILLON, M. D.; a botanist; nephew of Dr. B. S. Barton; b. in Philadelphia, Pa., Nov. 17, 1786; graduated at Princeton in 1805; received his degree of M. D. at the University of Pennsylvania in 1808; surgeon in U. S. navy, and organizer of its bureau of medicine and surgery; Professor of Botany in University of Pennsylvania 1815, and in Jefferson Medical College. He published *Flora Philadelphica* (1815-25); *Flora of North America* (3 vols., 1821-23); *Materia Medica; Medical Botany; Plan for Marine Hospitals* (1817); *Biography* of his uncle (1815); and several other works. D. in Philadelphia, Pa., Feb. 29, 1856.

Barton-on-Humber: a market-town of North Lincolnshire, England; situated on the south side of the Humber river, 6 miles S. W. of Hull, with which it has steam-communication (see map of England, ref. 7-J). It is a very ancient place, and was one of the principal ports of the Humber river before Hull was settled. It was once surrounded by a rampart and ditch to protect it against the attacks of the Danes and Saxons, and has manufactures of ropes, sacking, bricks, pottery, and whiting; also quarries of chalk and oolite. St. Mary's church is a fine building, erected in the fourteenth century. The ruins of Thornton Abbey, founded in 1139, are about 3 miles to the southeast. Pop. 5,300.

Barton's Buttons (called also *Iris Ornaments*): by means of a dividing-engine, Mr. John Barton succeeded in engraving lines on steel and other surfaces not more than from the $\frac{1}{10000}$ th to the $\frac{1}{100000}$ th of an inch apart. These, owing to the action of grooved surfaces on light, shine in the light of candles or lamps with all the colors of the spectrum. From steel dies thus prepared impressions were stamped upon buttons and other articles, forming ornaments rivaling in colors the brilliant flashes of the diamond.

Bartow. baar-tō; capital of Polk co., Fla. (for location of county, see map of Florida, ref. 6-J); in the phosphate belt, on Southern Florida and Florida Southern R. Rs., 76 miles N. E. of Punta Gorda. It has manufactories and orange groves. Pop. (1880) 77; (1890) 1,386.

Bartow. FRANCIS STEBBINS; b. in Savannah, Ga., Sept. 6, 1816; graduated at Franklin College, Georgia, 1835; studied law at the law school, New Haven, Conn.; became a prominent member of the Savannah bar; was a member of the Georgia Legislature, of the Senate, and of the Confederate Congress. During the civil war he entered the army as captain of the Oglethorpe Light Infantry, was appointed colonel of Eighth Georgia Infantry, and brigadier-general C. S. A. Killed at Manassas, July 21, 1861.

Bartram. WILLIAM; an American botanist, who may also be classed among the earlier ornithologists; b. Feb. 9, 1739. He spent five years in the Southern States drawing and collecting specimens of natural history, and published the results of his observations in a work entitled *Travels through North and South Carolina, Georgia, etc.* (Phila., 1791). This book, which passed through several editions and was translated into French and German, is called by D. Coues "the starting-point of a distinctively American school of ornithology." It contained a catalogue of the birds of the Eastern U. S., in which many species are named as new which later on were fully described by Wilson, who was aided by Bartram in the earlier portion of his book. D. July 22, 1823. F. A. LUCAS.

Bartsch. KARL FRIEDRICH ADOLF KONRAD; philologist; b. in Sprottau, Prussian Silesia, Feb. 25, 1832; educated at the gymnasia of Gleiwitz and Breslau, and at the Universities of Breslau and Berlin. In 1853 he went to Paris to study the manuscripts of Provençal poetry, and also visited libraries at London and Oxford in the same year. In 1855 he received an appointment at the library of the Germanic Museum at Nuremberg; was professor at Rostock from 1858-71, and at Heidelberg from 1871-88. His untiring industry combined with natural talents obtained for him a high rank among specialists in the mediæval languages and

literatures of both Germany and France, and he displayed an astonishing activity in publishing editions of texts, and in producing investigations on metrical and literary subjects connected with them. His most important work in the Germanic field was his *Untersuchungen über das Nibelungenlied* (1865), followed by the edition of the poem *Der Nibelungen Nôt*, with the readings of all the manuscripts and a lexicon (1870-80). As a Romance scholar he is most widely known through his books for beginners in the study of Old French and Provençal, the *Chrestomathie de l'ancien français* (1st. ed. 1866) and *Chrestomathie provençale* (1st. ed. 1868), both of which, however, even in the latest editions, still contain errors due to a lack of thoroughness in some details. In 1887 he published with A. Horning a work for the study of Old French on a similar plan, *La langue et la littérature française* (ninth to fourteenth centuries). He contributed many articles on various subjects to philological periodicals, and was since 1869 the editor of one of the most important, the *Germania*. Among his other publications may be mentioned: *Karl der Grosse von dem Stricker* (1857); *Albrecht von Halberstadt und Ovid im Mittelalter* (1861); *Ueber Karlweinet* (1861); *Deutsche Liederdichter des XII. bis XIV. Jahrhunderts* (1864; 2d ed. 1879); *Kudrun* (1865); *Das Nibelungenlied* (1866); *Das Nibelungenlied* (a translation into modern German, 1867); *Herzog Ernst* (1869); *Allfranzösische Romanzen und Pastorellen* (1870); *Wolframs von Eschenbach Parzival und Titurel* (1870-71); *Grundriss zur Geschichte der provenzalischen Literatur* (1872); *Das Rolandlied* (1874); a translation of Dante's *Divina Commedia* (1877); a second edition of Diez's *Leben und Werke der Troubadours* (1882); and of Diez's *Die Poesie der Troubadours* (1883); *Die Alldutschen Handschriften der Universitäts-Bibliothek in Heidelberg* (1886). D. in Heidelberg, Feb. 19, 1888. E. S. SHELTON.

Baruch, bay rook; a Hebrew scribe; friend and companion of the prophet Jeremiah, whom he served as amanuensis. Shortly after 586 B. C. he accompanied Jeremiah to Egypt, Jer. xliii. 6, 7. His subsequent history is unknown. The *Book of Baruch*, which the Roman Catholics admit into the canon of the Holy Scripture, is considered apocryphal by Protestants and Jews, as it forms no part of the Hebrew canon. It was written originally in Hebrew, and was probably the joint composition of several persons. Baruch had nothing to do with it. As a whole, it dates from the third century B. C. The so-called *Epistle of Jeremiah*, which is of later, though very ancient, date, appears sometimes as its sixth chapter. The *Apocalypse of Baruch* was published in a Latin translation from the Syriac by Ceriani in 1866, and the Syriac itself (by Ceriani) in 1871. Kneucker's edition appeared in 1879. The book was written originally in Greek. There is a pseudepigraphic *Epistle of Baruch* in the Syriac language, probably a monastic forgery, and certainly worthless. See PSEUDEPIGRAPHIA.

Barwood, or **Camwood**: a red dyewood from the western coast of Africa. It is the wood of *Baphia nitida*, a leguminous tree. Its coloring principle is slightly soluble in boiling water, freely in alcohol and alkaline solutions.

Bary, baar'ee, HEINRICH ANTON, de; German botanist; b. in Frankfort-on-the-Main, Jan. 26, 1831; educated in the gymnasium of his native city and in the universities of Heidelberg, Marburg, and Berlin. He was Professor of Botany successively in the universities of Freiburg, Halle, and Strassburg. His more important works are: *Die Mycetozoen* (1859); *Beiträge zur Morphologie und Physiologie der Pilze* (1864-81); *Die Morphologie und Physiologie der Pilze, Flechten und Mycomyceten* (1866); *Vergleichende Anatomie der Vegetationsorgane der Phanerogamen und Farne* (1877); *Vergleichende Morphologie und Biologie der Pilze, Mycetozoen und Bacterien* (1884); *Vorlesungen über Bacterien* (1885). The last three have been translated into English. D. Jan. 19, 1888. CHARLES E. BESSEY.

Barycentric Cal'culus: an application to geometry of the mechanical theory of the center of gravity, executed in two distinct ways, according as metrical or descriptive geometrical properties are to be investigated. It was developed almost completely by Möbius in his *Der barycentrische Calcul* (1827).

Barye, baä'ree, ANTOINE LOUIS; sculptor; b. in Paris, Sept. 24, 1795; apprenticed to an engraver; served in the army 1812-14; studied drawing and modeling under Bosio and Baron Gros; began to exhibit his sculptures in 1827; achieved a great reputation, especially by his statuettes, and

groups of beasts, reptiles, etc., in vigorous action—a deer stepping high through the grass, an elephant in full charge, a jaguar devouring a gazelle, the lion and the serpent; became a member of the Academy of Fine Arts in 1868. D. in Paris, June 25, 1875. Copious collections of his works may be seen in Baltimore, in New York, and in the Corcoran Art Gallery in Washington.

Bary'ta, or **Bary'tes** [mod. from Gr. *βαρύς*, heavy]; the oxide of barium; an alkaline earth and a virulent poison (BaO, sp. gravity 4.5). It is an ingredient in sulphate of baryta, or heavy spar, from which it is obtained, but it is not useful for any purpose except chemical analysis. A solution of baric hydrate is used by the chemist as the best test of the presence of carbonic acid. Barium sulphate, or heavy spar, is a common crystallized mineral which is mixed with white lead and used as a pigment under the name of *permanent white*. Several mixtures of this sulphate and white lead are manufactured and known in commerce. *Venice white* contains 1 part of the sulphate and 1 part white lead. *Hamburg white* contains 2 parts of the sulphate and 1 part white lead. *Dutch white* contains 3 parts of the sulphate and 1 part white lead. The native sulphate was employed by the celebrated potter Wedgwood in the manufacture of jasper-ware and for the formation of white figures, etc., on colored jars and vessels. It is extensively used for adulterating white lead and for giving weight to paper. Baryta is produced, according to the census of 1890, as follows: Illinois, 200 tons; Missouri, 7,558 tons; North Carolina, 3,000 tons; Virginia, 10,702 tons; aggregate value, \$106,313.

Bary'tone, written also **Baritone** [from Gr. *βαρύφωνος*, deep-sounding; *βαρύς*, heavy + *φώνος*, tone. The spelling *baritone* represents introduction via Ital. *baritono*, and is the older]; the tone of a man's voice, about half-way between the bass and tenor. It generally extends in compass from low A of the bass clef to high F above the staff, and occupies the same position as the *mezzo soprano* of the female voice. In Greek grammar, words with an unaccented final syllable are called barytones.

Basalt' [from Lat. *basaltus*]; an ancient term used by Pliny and said to be of African origin. In common usage it includes part of the fine-grained, dark-colored igneous rocks which are common in all geological horizons. In this sense it is nearly synonymous with trap (Swed. *trappa*, stairs), a term first used in Scandinavia in allusion to the step-like appearance produced by intrusive sheets of this rock in softer strata. A common feature of basalt or trap is its tendency to divide, by contraction due to cooling, into polygonal columns, whose position is in the main normal to the cooling surface. These may therefore be vertical, radiating, or, in dykes, horizontal. This columnar parting sometimes occurs in other igneous rocks, but is so characteristic of basalt that it is often called "basaltic structure." Basalt is usually compact and heavy, but it may be vesicular or amygdaloidal.

In a more restricted and scientific sense basalt is used to denote an igneous rock composed essentially of a triclinc feldspar (labradorite), augite, olivine, and magnetite, with more or less glassy base. Its silica percentage is low (45-53). Basalt was formerly applied only to rocks of tertiary age, its coarser varieties being called *dolerite*. The corresponding pretertiary rocks were known as *melaphyre* and *olivine-diorite*. Now, however, it is preferable to use the term basalt without reference to age for all the finer and partly glassy varieties, reserving the terms diabase and dolerite for those that are coarser and holocrystalline.

Basalt occurs in surface flows, intrusive sheets, and dykes. When molten it is very fluid, and often spreads over large areas in thin sheets. According to Von Richthofen's law (see ANDSITE), basalt, in virtue of its basic character, is one of the youngest products of volcanic activity. By virtue of their durability, basalt flows protect softer rocks beneath them from erosion, and in regions undergoing rapid surface waste they frequently constitute the caps of mesas and plateaus. See GIANT'S CAUSEWAY and ROCKS.

GEORGE H. WILLIAMS.

Bas'anite: See JASPER.

Bas'com, HENRY BIBLEMAN, D. D., LL. D.; bishop of the Methodist Episcopal Church South; b. at Hancock, Delaware co., N. Y., May 27, 1796. He was licensed to preach in 1813, and in 1823 was chosen chaplain to Congress; was president of Madison College, Pa., 1827-29; Professor of Morals, Augusta College, Ky., in 1832, and in 1842 president of Transylvania University, Ky. From 1846 to 1850 he was

editor of the *Quarterly Review* of his Church. In 1850 he was made a bishop. D. in Louisville, Ky., Sept. 8, 1850. In one of his earlier years he preached 400 times, and received a salary of \$12.10. Bishop Bascom was an extremely popular speaker. His complete writings were published in 1856.

Bascom, John, LL. D.; author and scholar; b. at Genoa, N. Y., May 1, 1827; graduated at Williams College in 1849; studied law and theology, the latter at Andover Theological Seminary. In 1855 he became Professor of Rhetoric in Williams College; president of the University of Wisconsin 1874-87. He has published *Political Economy for Colleges* (1859); *Esthetics* (1862); *Elements of Psychology* (1869); *The Philosophy of English Literature* (1874); *Problems in Philosophy* (1886); *Sociology* (1887); and other works.

Base [viâ Fr. from Lat. *basis*, from Gr. *βᾶσις*, step, base, pedestal, from same root as *βαίω*, to go]; a term having important applications in architecture, chemistry, geometry, heraldry, and music (It. *basso*). Base in general signifies the bottom of anything considered as its support, as the base of a mountain. In architecture it denotes the lower part of an architectural composition, as of a pier, column, or pilaster; and also of a complete structure, as of a whole building or one face of it. In these different senses it is often used loosely; thus a base of a wall may be understood as a bottom of the foundation or as the lowest part of the decorative structure above ground. The base of a column is the member which interposes between the shaft and that upon which the column rests as the pedestal or stylobate. In classical architecture the true Doric column of Greece had no base; the Ionic and Corinthian orders had bases of convex and concave moldings, sometimes enriched with sculpture. In European mediæval architecture the columns and piers usually had bases, and these are of endless variety.

RUSSELL STURGIS.

In chemistry it signifies a substance that has the power to neutralize acids and form salts with them. The terms *acid* and *basic* are complementary. The common bases are compounds consisting of a metal in combination with hydrogen and oxygen. Thus the base potassium hydroxide, or hydrate, or caustic potassa, or caustic potash, consists of the metal potassium in combination with hydrogen and oxygen, as expressed in the formula, KOH. So, too, sodium hydroxide, NaOH, ammonium hydroxide, NH₄OH, calcium hydroxide, Ca(OH)₂, barium hydroxide, Ba(OH)₂, cupric hydroxide, Cu(OH)₂, ferric hydroxide, Fe(OH)₃, aluminium hydroxide, Al(OH)₃, etc., are bases. In general terms, whenever a base acts upon an acid a salt is formed. Thus when potassium hydroxide acts upon nitric acid, the salt potassium nitrate or saltpeter, KNO₃, is formed. Similarly sodium hydroxide and sulphuric acid form the salt sodium sulphate.

The above refers to oxygen bases. But there are similar substances containing sulphur, and when these act upon corresponding sulphur acids, salts containing sulphur instead of oxygen, but analogous to the oxygen salts, are formed. It appears also that chlorine, bromine, iodine, and fluorine take the place of oxygen in acids, bases, and salts, and form the well-known compounds commonly called double chlorides, double iodides, double fluorides, etc.

By the expression *organic base* is meant a compound like aniline, which is related to ammonia. There are many of these substances known to chemists. See ALKALOIDS.

IRA REMSEN.

The military term *base of operations* denotes, in contradistinction to *line of operations*, the (usually) contiguous and well-guarded (by our own or allied forces) region upon which an army depends for its supplies, re-enforcements, etc., to which it sends back its sick and wounded, and upon which it (generally) would fall back in case of reverse and retreat. Much pedantry is expended upon these phrases in what were recognized as standard military treatises. The *essential* thing is that an army *have* a base, though it may temporarily abandon one to acquire another; or in rare cases it may so thoroughly control the hostile region in which it operates as to use it for most of the purposes of a base.

JAMES MERCUR.

Base, in music: See **BASS**.

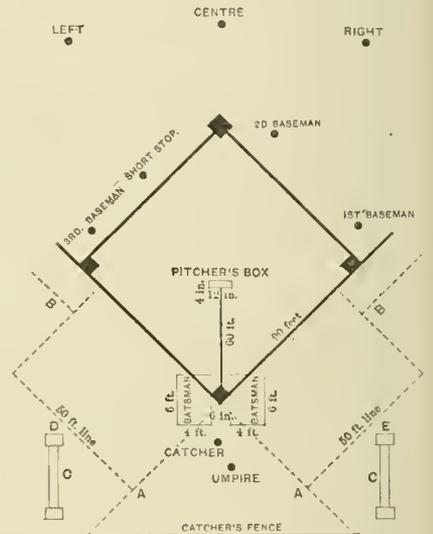

Base-ball: the national out-door game of the U. S.; reputed to be a development of the English game of "rounders," but it has little about it now to suggest a kinship, except it is played with bat and ball. The game has developed from the crudest of games in 1845, when little skill was required to play it and only the simplest rules governed the

play, into one of the most scientific and exciting of the world's sports. It has brought into its development the in-born craving of youth to strike hard blows; the playing at catching ball, a pastime of primitive nations; running, in which swiftness is at a premium; throwing for distance, speed, and accuracy; individual chances for brilliant progress in making scores; and the whole combined in such a way that individual skill and judgment are closely joined with team-play.

The first real step toward progress in the development of base-ball was made by the Knickerbocker Club of New York city, which organized in 1845, and soon after prepared a code of playing rules. Up to 1858 the clubs were wholly amateur, but after that date professional clubs were formed, and the game took on new development, which culminated in its present perfected state. There are now hundreds of amateur and professional clubs throughout the U. S., separated into different leagues. First and greatest among these is the National and American Association League, which pays its players salaries varying from one to several thousand dollars for the season.

The game was introduced into Great Britain by players from the U. S. in 1874, and, although it failed at first to excite much interest, it increases steadily in favor, while the same is true of Australia, into which it was introduced in 1888.

The playing-rules regulate the size of balls and bats, as well as define the way the ground shall be laid out. A level plot of land 450 feet square will be sufficient for the best games. The bases are placed on the four corners of a square with

A A, ground reserved for batsman, umpire, and catcher; B B, for captain and assistant; C C, players' benches; D, bat-rack for visiting players; E, for home players.

The pitcher delivers the ball to the batter from a defined "box" distant 60 feet from home base. The first, second, and third basemen attend to their respective bases. The short-stop plays anywhere between second and third bases. The left, center, and right fielders take positions outside the diamond and usually in the direction which their name indicates.

The players are divided into three distinct groups, the pitcher and catcher forming the "battery"; the first, second, and third basemen and short-stop composing the "infield"; and the left, center, and right fielder completing the "outfield."

These three groups have specialized duties, the players being selected and placed according to their skill in performing these. The battery attends to the work of trying to keep the batter from reaching first base, through the pitcher using every art and strategy he possesses in delivering the ball to him, and the catcher receiving and holding the ball when not struck. The pitcher is helped in his work by being allowed perfect freedom in throwing underhand or overhand, being the gradual development from a simple pitch or toss through restricted underhand throwing to the present freedom; by the discovery that a ball can be made to curve when given a revolving motion on its own axis as

it is thrown from the hand, the direction of the curve depending on the direction and velocity of the axis twist; and by acquired muscular co-ordination and control, whereby he deceives the eyes of the batter by varying the speed of the ball without an apparent change of delivery.

The infield attends mostly to fielding balls hit along the ground and throwing the runner out at first base, but frequently at other bases. One-half to two-thirds of the twenty-seven or more put-outs in a game are made by the infield.

The outfield has mostly to do with fielding balls hit into the air. From one-fifth to one-third of the batters are caught out by the outfield.

Eighteen players in all take part in a game. A recent rule allows a change battery to exchange places with the one already playing. By toss of a coin, or by previous arrangement, one captain has the right to decide for his team to "take the bat" or "the field." Then each player takes his turn in striking at the ball until three batters are "out," when the nines exchange places. The order of strikers is previously arranged by the captain. When the other side has had a turn at the bat and been put out, one inning has been played. Nine innings constitute a game, unless at the end of that time the two nines are tied in number of runs or in failure to score any, when the game continues until one side exceeds the score of its opponents on even innings.

The batter takes a position at the home base ready to hit the ball which the pitcher throws. His limitations are that while standing within a defined position he must strike at every ball coming over the home plate between his shoulders and knees or lay himself open to having a "strike" "called" by the umpire. Three strikes put the batter out, except when there is no runner on base, or when one is on second or third base, or when two are out, the catcher has to hold the third strike or throw him out at first base. If, however, four "balls"—i. e. pitched balls not coming under the rule of a strike—have been called by the umpire while the batter is striking, the latter is given his base by forfeit. Should the batter strike the ball so that it touches the ground and remains within bounds until it passes first or third base, the ball is fair and he becomes a "base-runner." Batted ground balls outside the foul lines are "foul," and no base can be run until the base which the runner occupied when the ball was hit is touched after the ball is held by the pitcher in his box. If the ball is struck into the air and falls inside the foul lines again, the batter becomes a base-runner, unless the ball is caught by some fielder. The batter also becomes a base-runner when his person—excepting his hands and forearm, which makes the ball a "dead ball," when no bases can be run—is struck by a pitched ball, unless the umpire decides that the batter intentionally permitted himself to be hit.

The aim of a runner on base is to score a run, which is done when he touches first, second, third, and home base in their order without being put out. He is helped in this by the time given him during the delivery of a ball to the batter to make an attempt to reach the next base; by the ball sometimes being pitched wildly or passing the catcher; by being forced on to give room for some one who has been given first base by a base on balls; or by being struck by a pitched ball; by a pitcher's balk, which is a feint with all the appearances of an intention to pitch the ball, allowing a base-runner an additional base; and by safe hits between the fielders or by batted balls not fielded. All balls batted into the air and caught allow the base-runner to take a base at his risk, provided he leaves his base after the ball is caught.

Base-runners must return to their bases after a foul ball, and remain there until the pitcher receives the ball in his position (in case of a foul or fair fly ball they need remain there only until the ball is caught by the fielder); when the ball becomes dead by hitting the batter's bat or person or the umpire, or when the batter strikes when outside his position, called a foul strike; or when another runner is hit with a batted ball.

The aim of the nine in the field is to put out the batsman and base-runners. The batter is out when he has had three strikes as explained above; when he is discovered having batted out of order; when he makes a foul strike; when attempting to interfere with a catcher in fielding or throwing; when he makes an intentional foul hit after he has had two strikes.

Base-runners are declared out when hit with a batted ball while at the bat and about to run; when they attempt to hinder the catcher from fielding a muffed third strike; when

hit by a batted ball while running for a base; when a ball batted into the air is momentarily held by a fielder before touching the ground or any object other than a fielder; when after three strikes or a fair hit he be touched with the ball in the hands of a fielder, or when the ball is securely held by a fielder while touching first base before the runner reaches the base; when he runs more than 3 feet out of line to dodge a fielder trying to touch him out; when intentionally obstructing a fielder in fielding a ball; when touched by the ball in the hands of a fielder unless his person is touching a base he is entitled to occupy, except he may overrun first base if he turns to the right in returning to the base when on fair ground; when a fair or foul ball is caught and then held by a fielder on the base occupied by the runner when the ball was struck, or if the runner be touched by the ball in the hands of a fielder before he returns to the base; when a fielder holds the ball while touching a base before a runner, who is forced on by another runner, reaches the base, except in the case of a base on balls, or when a batter is hit by a pitched ball; when he fails to touch a base in regular order in running or on the return, except in the case of foul balls, provided he be touched by the ball in the hands of a fielder, or the ball be held at the base he failed to touch.

A. ALONZO SLAGG.

Basedow, JOHANN BERNHARD; educational reformer; head of the so-called Philanthropin; b. Sept. 11, 1723, in Hamburg; educated at Leipzig; professor in the academy at Soroe, Denmark, 1753; transferred by the Government, on account of the opposition raised against his unorthodox writings, to the Gymnasium of Altona 1761. Inspired by Rousseau's *Emile*, he turned his attention about this time to educational reform, and soon published the *Address to Philanthropists and Men of Property on Schools and Studies, and their Influence on the Public Weal*, in which he called upon all who loved their fellow-men to contribute to aid him in publishing his book. Among those who responded were the Emperor Joseph II., the Empress Catherine II., King Christian VII. of Denmark, and numerous other celebrities. With the \$10,000 thus received he published in 1774 his *Elementary (Elementarwerk)*, in four volumes, with 100 copper-plate illustrations. In the same year he was called to Dessau by Prince Leopold to take charge of the famous Philanthropin, founded as an ideal school, to be conducted entirely upon his improved principles. While never largely attended, the school excited the greatest interest throughout Germany. Kant prophesied that quite another race of men would grow up now that the Philanthropin had introduced a new system of education. Basedow soon retired (1776) from its management, and, after an irregular life, died in 1790 at Magdeburg. The keynote of Basedow's system was *everything according to nature*. Language he would teach by the conversational method; object lessons and pictures were to be largely employed. His famous *Elementary* contains a large amount of information about various topics arranged as a dialogue, interspersed with tales and poetry, and illustrated by a set of engravings. The natural desires and inclinations of children were to be educated and directed aright, but never suppressed. The accounts of those who visited the Philanthropin are mostly favorable. The teachers used originality in their teaching, and the brightness and animation of the children were noticeable. "Children love motion and noise; here is a hint from nature," said Basedow. The development of the body was specially cared for; gymnastics were for the first time introduced into modern schools, as well as the practice of taking long excursions on foot, now so general in Germany. Kant's expectations, noted above, were generally shared by the friends of humanity throughout Europe. The Philanthropin disappointed these expectations, but it unquestionably introduced valuable new ideas and methods, and, through the teachers who had been connected with it, disseminated new doctrines which had great influence in calling attention to the neglected field of education, and stimulating thought in that direction. Basedow was a bold and fearless innovator, who lacked the personal qualities to embody successfully the ideas he struck out. His character was in many respects unlovely. (See sketch by Goethe in *Wahrheit und Dichtung*.) He had no tact, and was anything but a suitable person for the head of a model school. German education, in Kant's words, needed "not reformation, but revolution." Basedow is a notable revolutionist. See Quick's *Educational Reformers*; Williams's *History of Modern Education*. C. H. TURNER.

Basedow's Disease, called also **Graves's Disease** and **Exophthalmic Goitre**: a disease more common among women than men, and characterized by prominent eyeballs, enlarged thyroid gland, palpitation of the heart, and generally by anæmia. Basedow's disease sometimes, though very rarely, ends in recovery. Its cause is stated by Niemeyer to be probably a paralysis of the vasomotor nerves, but others look upon it as a disease of the sympathetic nerves or a general neurosis. It is best treated by electricity, digitalis, ergot, good food, gentle exercise, and hygienic measures.

Basel, *baazel*, or **Bâle**, *bad* (Fr. *Bâle* or *Basle*; Germ. *Basel*; anc. *Basili'a* or *Basile'a*, i. e. royal city): an important city of Switzerland; beautifully situated on both sides of the Rhine; 65 miles by rail N. of Bern, and about 3 miles from the frontier of Alsace; lat. 47° 34' N., lon. 7° 36' E. The Rhine, here crossed by a bridge, divides it into two parts, named "Great Basel" and "Little Basel." Basel is at or near the head of navigation on the Rhine, and is the most important commercial and manufacturing city of Switzerland. It was more populous in the Middle Ages than at present. An œcumenical council was held here, opening July 23, 1431. Among its public buildings is a fine cathedral, built by the Emperor Henry II. between 1010 and 1019, with towers 218 feet high, which were not completed till 1500. The University of Basel, founded in 1459, once had a high reputation, and was one of the centers of the Protestant Reformation, Erasmus and Ecclampadius dying while in its service. Luther's writings were printed here from 1519. This city also contains a valuable museum of natural history, a botanic garden, and the university library of 160,000 volumes and 4,000 MSS. The museum of art is noteworthy for its fine collection of the works of the younger Holbein. A large majority of the inhabitants are Protestants. Basel has extensive manufactures of ribbons, printed cottons, paper, gloves, jewelry, etc. It was first mentioned in 372 A. D., was destroyed by the Huns, and rebuilt by Henry I. in 917. The city, with its 14 sq. miles, since 1833 has formed a separate part of the canton, known as "Basel-Stadt." Pop. (1888) 73,749.

Basel, or **Bâle**: canton of the Swiss Confederation; confronting Alsace on the W., and Baden on the Rhine frontier. It has an irregular dumb-bell sort of shape, and comprises 177 sq. miles. The Rhine tributaries of this canton are the Birz and the Ergolz. On the northern slope of the Jura Alps, which here reach an altitude of 3,400 feet, the region is one of hills and valleys, where cattle pasture and vineyards and orchards abound. The manufactures are ribbons (large), woollens, linens, and leather-work. After union with Switzerland the city engrossed the places of influence and authority, lost its preponderance during the first French Revolution, regained supremacy in 1814; but in the civil war of 1831-32 the union troops took possession of the canton, and the Diet in 1833 divided it into independent parts—the Basel-Stadt and Basel-Landschaft. The latter division contains 163 sq. miles. Together they send seven representatives to the Nationalrath. Pop. of Basel-Landschaft, exclusive of city (1888) 61,941. The capital of Basel-Landschaft is Liesthal.

Basel (or **Bâle**), **Council of**: a memorable œcumenical council of the Church held in Bâle: summoned by Pope Martin V., who died (Feb. 21, 1431) before the appointed time of its meeting. It was opened July 23, 1431, under the pontificate of Eugenius IV. (elected Mar. 3, 1431). It was the result of the decree of the Council of Constance, and was a response to the general demand for reform in the Latin Church, and the termination of the Bohemian schism. The position it immediately took of superiority to the pope naturally excited the latter's dislike and fear. So the pope tried repeatedly to dissolve the council, but in vain. It endeavored to end the Bohemian troubles by granting the cup to the laity (Nov. 30, 1433), and its action was ratified by the pope Dec. 15, 1533. A quarrel in regard to the manner and place of holding negotiations with the Greek Church led finally to a split. Many bishops, and all the cardinals but one, went off with Julianus Cesarini, the pope's legate, first to Ferrara (Jan. 1438), and thence to Florence (Feb., 1439). Those who remained chose a new president, and went on with their work. Excommunicated by Eugenius, they elected a new pope, Felix V., Nov. 17, 1439. Very few acknowledged him. This blunder broke the moral power of the council. Its forty-fifth and last formal session was held May 16, 1443, though the council was not technically "dissolved" till May 7, 1449, when it gave in its adhesion to Nicholas V., the suc-

cessor to Eugenius IV. The Roman Catholic Church acknowledges only the first twenty-five sessions of the council, before the split. See Wessenberg, *Die Allgemeinen Concilien des 15ten and 16ten Jahrhunderts*, 2 vols. (Constance, 1770); also Hefele's *Conciliengeschichte* (vol. vii.).

Revised by JOHN J. KEANE.

Basel (or **Bâle**), **Treaty of**: the name of an important treaty of peace signed at Basel, Apr. 5, 1795, between the French republic and Prussia. The latter then agreed to abandon the coalition against France, and to give up her possessions on the left bank of the Rhine. In July, 1795, another treaty was here concluded between France and Spain.

Base Level: the level below which a stream can not erode by reason of the height of its point of discharge. When the degradation of a region has progressed so far that all its slopes are very gentle, running water has but little erosive power, and the region is said to be reduced to base level or to have become a base-level plain. G. K. G.

Basel'la: a genus of tropical plants; order *Chenopodiaceæ*. The *Basella alba* and *rubra* have twining stems, and are commonly used as potherbs in the East Indies. In the vicinity of Paris they are raised in hotbeds, transplanted to borders, and used as a substitute for spinach. The *Basella rubra* yields a rich purple dye.

Ba'shan [Heb. בָּשָׁן, of disputed significance]: a district in Palestine; E. of the Jordan; most of it high table-land, extending from Mt. Hermon in the N. to Gilead in the S., the Yarmuk (Hieromax), which enters the Jordan just below the Sea of Galilee, being the boundary between Bashan and Gilead. At the time of the Exodus it was occupied by Amorites ("highlanders") whose king, Og, was slain in battle with the Israelites, his people overpowered, and the whole territory assigned to the half-tribe of Manasseh. After the Captivity, Bashan consisted of four provinces: (1) Golan (modern Jaulan); (2) Argob, or Trachonitis (modern Lejah); (3) Hauran (name unchanged); (4) Batanea (modern Bethanyeh). Iturea (now Jedur) in the N. W. was not strictly a part of Bashan, though taken by the Israelites. The whole district was, and still is, exceedingly fertile, and was famous for its oaks and its cattle. Remarkable ruins of ancient cities are found there. See Porter's *Damascus* (1855); Wetstein's *Reisebericht über Hauran und die Trachonen* (1860); Porter's *Giant Cities of Bashan* (1865); and Selah Merrill's *East of the Jordan* (1884). The antiquity of these ruins is disputed; recent explorers have claimed that they are not earlier than the first century A. D.

Bashaw: See PASHA.

Bashford, JAMES WHITFORD, Ph. D., D. D.: president Ohio Wesleyan University; b. at Fayette, Wis., May 25, 1849; A. B., University of Wisconsin 1873, and A. M. 1876; Ph. D., Boston University 1880; held pastorates of M. E. churches at Harrison Square, Jamaica Plains, and Auburndale, Mass., and at Portland, Me.; in present position since 1889; contributor to periodical literature and author of numerous published sermons.

Bash'i-Bazonks [Turk., head-turned]: certain irregular troopers, ununiformed and generally mounted, in the service of the Turkish sultan. They serve without pay, except maintenance, are often under the municipal governors, and are wild, turbulent men much addicted to plundering.

Bashkirs, *baash'keerz*: a Tartar-Finnish race; a mixture of Ostyaks and Tartars, inhabiting the slopes of the Ural Mountains and neighboring plains in the governments of Orenburg, Perm, Samara, and Viatka, European Russia. They first appeared in the tenth century, and formed originally a powerful independent state, but in 1556 submitted to Russia. They still preserve some elements of independence, and are governed by their own officials. A part are settled and engaged in cattle-rearing and agriculture; the remainder are still nomads. They are usually very poor and improvident, often suffering from famine. They are lazy and predatory, yet hospitable and good-natured, strong, and muscular, capable of enduring great hardships and privations. They are professed Mohammedans. They number about 760,000. M. W. H.

Bashkirtseff, *baash'keert-sef*, or **Bachkirtsey**, MARIE: Russian artist; author of a diary of some celebrity; b. at Gayotsi (district of Poltava), Nov. 11, 1860; d. in Paris, Oct. 31, 1884. She was well-born and received an extended education, learning Latin and Greek, as well as all the more

important modern languages. In 1878 she went to Paris and entered the studio of Rodolphe Julian. Her talent rapidly developed, and in 1880 she was able to exhibit a picture in the Salon. From this time till her death she worked eagerly at her art, and regularly exhibited. Soon after she died her family published her diary, kept by her in French from the age of thirteen. Here she appeared as one of those vehement, sensitive, emotional natures which use themselves up in their own passionate eagerness to live. On neither art nor literature, however, has she left a permanent impression. One of her pictures, *The Meeting*, has been purchased by the French Government and placed in the Luxembourg.

BIBLIOGRAPHY.—*Journal de Marie Bashkirtseff* (2 vols., Paris, 1887); *Catalogue des œuvres de Mlle. Bashkirtseff, avec préface de François Coppée* (Paris, 1885).

A. R. MARSH.

Basidiomycetes [from *basidium* (dimin., from Gr. *βάσις*, base) + Gr. *μύκης*, a mushroom]; in fungology, a class of (mostly) saprophytic plants, related to the ASCOMYCETES (*q. v.*), from which they are apparently derived. Like the *Ascomycetes*, they produce large end-cells; these, however, do not divide internally into spores, but produce spores by means of protrusions from the surface, these becoming extended and finally enlarged at their extremities, the enlargement eventually separating as a spore. The spores thus formed are known as basidiospores, and the large end-cells from which they grow are *basidia* (sing. *basidium*). The class is naturally divided into two orders, viz.: (1) the puff-balls (*Gasteromycetes*), and (2) the toadstools (*Hymenomyces*), each containing a number of families. Between 9,000 and 10,000 species of the higher fungi are known, many of which are very common. The mushroom (*Agaricus campestris*) and the larger puff-ball (*Calvatia murina*) are familiar examples.

CHARLES E. BESSEY.

Basil: an herb or shrub of the genus *Ocimum* and family *Labiatae*; natives of tropical and other warm regions; generally have an aromatic smell and taste. The *Ocimum basilicum* (sweet basil) is an annual plant, a native of the East Indies, and is cultivated in Europe, where it is used to season food. The *Ocimum minimum*, or bush basil, another East Indian plant, is cultivated for the same use. The *Ocimum campechianum* is a native of Florida and of tropical America. Basil is also a common name for *Pycnanthemum*, a North American genus with numerous species, all erect, rigid herbs; also of the *Calamintha clinopodium* of Europe and North America, and other labiate herbs.

Basil, or **Basilianus**, **SAINT** (SURNAMED THE GREAT): an eminent Greek Father of the Church; b. at Caesarea, in Cappadocia, about 329 A. D. He was older by about two years than his brother, Gregory of Nyssa, and was an intimate friend of Gregory Nazianzen. From 351 to 355 he was a student at Athens. Then he traveled extensively. Afterward he spent some seven years of monastic retirement in Pontus. In 370 he succeeded Eusebius as Bishop of Caesarea, and died there Jan. 1, 379, worn out by his ascetic habits. His works (in 3 vols., J. Garnier's ed., Paris, 1721-30; n. e. 3 vols., 1839; reprinted in Migne, *Patrologia Graeca*, XXIX.-XXXII.) consist of treatises, homilies, and letters. He excelled as a letter-writer. He was the author of monastic rules and a liturgy which bears his name, and is still used in the Russian Church. See G. Hermant, *Vie de Saint Basile* (1674); J. E. Feisser, *Dissertation de Vita Basilii Magni* (1828); Klose, *Basilus der Grosse nach seinem Leben* (1835); Scholl, *Die Lehre des heil. Basil von der Gnade* (1881); and Hammond's *Liturgies, Eastern and Western* (1878).

Basil I. (SURNAMED THE MACEDONIAN): Emperor of the East; b. in Macedonia in 820 A. D. His origin was obscure. He gained the favor of the Emperor Michael III., who appointed Basil his own colleague in the empire in 866. After Michael was assassinated in 867, Basil became emperor. He obtained Asia Minor by conquest from the Saracens, whom he also drove out of Italy. He was an able ruler. D. Aug. 29, 886 A. D., and left the throne to his son, Leo VI. See G. Impanciantì, *Basilio il Macedone*, 2 vols., 1809.

Basil II.: Emperor of the East; a son of Romanns II.; b. in 958 A. D. He began to reign, in conjunction with his brother Constantine, in 975. He was an able commander, and waged war with success against the Caliph of Bagdad and the Bulgarians. He completed the conquest of Bulgaria in 1018. D. in Dec., 1025.

Basilean Manuscript [Lat. *Codex Basiliensis*, from *Basilea*, the Lat. name of Basel, Switzerland]: the name of two very valuable manuscripts of the Greek New Testament, now in the library of Basel: 1. A nearly complete uncial copy of the Gospels, lacking only Luke iii. 4-15; xxiv. 47-53. It is technically known as E in the list of uncials. It is believed to belong to the eighth century, and to have been written at Constantinople. 2. A beautiful cursive manuscript of the whole New Testament except the Apocalypse. It dates from the tenth century.

Basilian Manuscript (*Codex Basilianus*): an important uncial manuscript of the Apocalypse, now in the Vatican library, technically known as B of the Apocalypse. It takes its name from the Basilian monastery at Rome, to which it once belonged. It is referred to the eighth century.

Basilian Monks, or **Monks of St. Basil**: a religious monastic order founded by St. Basil the Great in 361 A. D., and the exclusive order of the Greek Church. He composed a system of monastic discipline which was practiced by great numbers of monks both in the churches of the East and the Latin or Western Church. Spain, Italy, Asia Minor, and many other countries contain monasteries of this order at the present time. Those of Italy are chiefly of the Greek rite, and those of Spain, etc., of the Latin rite. In Asia Minor the United Melchite Greeks have many Basilian monks. There are convents of Basilians in Toronto and Sandwich, Canada. The monks of the Russo-Greek Church nearly all follow the rule of St. Basil, variously modified, even the so-called monks of St. Anthony following what is substantially the Basilian rule. The Armenian Church has also an order of Basilian monks. In 1557, at Tardon in Spain, Matteo de la Fuente established the Reformed Basilians, or Tardonites.

Basilian Nuns: founded by Macrina, the sister of St. Basil, and governed by a rule written by him, spread into the Occident, but scarcely exists there now. It is a contemplative order.

Basilica [Lat., from Gr. βασιλική (sc. *στοά*), royal, femin., of an adject. deriv. of βασιλεύς, king]; among the ancient Greeks and Romans a public hall or court-house in which princes and magistrates administered justice. Among the Romans it attained the greatest importance, and became, besides a court of justice, a market-place and exchange. The first basilica mentioned in Roman history was the Basilica Porcia, built about 182 B. C. Great numbers were subsequently erected in Rome, and each provincial town had its basilica, which was usually adjacent to the forum. The most ancient basilicas were open to the external air, and surrounded by a peristyle of columns, for which an external wall was afterward substituted. After the reign of Constantine I. some basilicas were converted into Christian churches. The term basilica is still applied to the five great patriarchal churches in Rome and to several smaller ones, among them the cathedral in Quebec, Canada.

Basilica: a code of laws, the compilation of which was commenced by Basil I., Emperor of the East (867-886 A. D.), and completed by his son Leo. It is considered valuable for the interpretation of the Roman *corpus juris*, but a portion of it is lost. The *Basilica* was published by Heimbach (5 vols., 1833-50).

Basilica'ta (anc. *Lucania*): a province of Italy; bounded N. W. by Campania, N. E. and E. by Apulia, S. by the Gulf of Taranto, and S. W. by Calabria. It is also called Potenza. Area, 4,122 sq. miles. The surface is mountainous. It contains a large fertile plain next to the Gulf of Taranto. Wine, grain, tobacco, and hemp are the staple products. Capital, Potenza. Pop. (1890) 538,707.

Basil'icou Do'ron [Gr., royal gift]: the title of a work which James I. of England wrote for the instruction of his son Henry (1599). It is interesting chiefly as a literary curiosity.

Basilicou Ointment, sometimes written **Basilicum** [Gr. βασιλικόν (sc. φάρμακον, drug), royal, so named from its supreme virtue]: the *Cera tum rosina* of the pharmacopias, is composed of 5 parts of resin, 8 of lard, and 2 of yellow wax. It is much used as a stimulating application to ulcers, burns, etc.

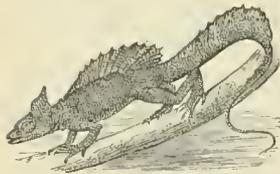

Basil'ides (in Gr. Βασιλειδης): a Gnostic, and founder of a sect called Basilidians; lived in Egypt in the reigns of Trajan and Hadrian, about 100-140 A. D. The events of

his life are not known. Like Zoroaster, he taught the existence of two independent creative principles or powers—Good, or Light, and Evil, or Darkness. See GNOSIES.

Basilio da Gama, bā-see-hō-ō da-gaa'mā, José: Brazilian poet; b. at S. José do Rio, 1740; d. at Lisbon, July 31, 1795. He was one of the poets of Minas Geraes and one of the founders of the Arcadia Ultramarina. He studied in Rome, and in 1763 was made a member of the Roman Arcadia, with the name of Termino Sepilio. From Rome he went to Lisbon, and attracted there the attention of Pombal. When the latter fell in 1777, the *protégé* was obliged to withdraw to Brazil; but here, too, he was rendered unhappy by the persecutions of his enemies. Once more he went to Lisbon, where he died in retirement. He is chiefly known for his epic *Uruguay*, an account of the contest between the Portuguese and Spanish troops under Gomes Freyre de Andrade, and the natives of Paraguay, incited by the Jesuits (1756). He wrote also a shorter epic, *Quitubia*, and a poem entitled *Cantico aos Campos Elysios*. The *Uruguay* was often printed, but perhaps best in Varnhagen, *Épicoes brasileiros* (Lisbon, 1845). A. R. MARSU.

Basilis'cus (in Gr. βασιλίσκος): Emperor of the East; was a brother of Verina, the wife of Leo I. In 468 A. D. he commanded a large armament which Leo sent against Genesire the Vandal, by whom he was totally defeated. He usurped the throne in 474, but was defeated and deposed by Zeno in 476. D. in 477 A. D. See Gibbon, *Decline and Fall of the Roman Empire*.

Bas'ilisk [from Gr. βασιλίσκος, little king; name of a serpent, dimin. of βασιλεύς, king]; a lizard of the genus *Basiliscus* and family *Iguanida*; natives of the tropical parts of America. The basilisks are characterized by a thin triangular fold of skin rising from the occiput and inclined backward. They also have an elevated crest along the back

Basilisk.

and tail, capable of being erected or depressed at pleasure. They are well adapted for swimming and for climbing trees, and are innocuous and inoffensive animals. The tail is much longer than the body. The *Basiliscus mitratus* is from 25 to 30 inches long, including the tail. The term basilisk was also applied to a fabulous monster by ancient and mediæval writers, who supposed that it had the form of a snake or lizard, that it infested the deserts of Africa, and that it was hatched by a toad or serpent from an egg laid by a cock. According to popular opinion, its breath poisoned the air and burned up vegetation, and the glance of its eye was fatal to men and other animals. It was sometimes called cockatrice and the king of dragons. The only creature who could face the basilisk and live was believed to be the cock; and travelers were advised to carry loud-crowing cocks with them, for the basilisk was believed to stand in great dread of his near relative, the cock, and the crowing of the cock was considered the only means of driving him away.

Ba'sin (in Fr. *bassin*): in geography, a great natural depression or concavity on the earth's surface, without reference to the stratification. The basin of a river is the whole tract of land drained by that river and its tributaries. The basin of the Mississippi, for example, is coextensive with all the country between the Rocky Mountains and the Appalachian chain. The area of this is estimated at 1,244,000 sq. miles. The basin of a lake includes, besides the space occupied by the lake, the land drained by the rivers that flow into it. The highest line between two basins is the water-parting or divide. See VALLEYS.

BASIN, in geology, is applied to depressions in the strata in which beds of a later age have been deposited. Thus the site of the city of London, called the London basin, consisting of tertiary sands and clays, occupies a hollow in the chalk, which is bounded by the North Downs on the S. and by the chalk-hills of Berks, Wilts, and Bucks on the N. The term is also applied to synclinal depressions of strata, especially in the coal-fields.

Basingstoke: a town in Hampshire, England; on the London and Southwestern Railway; 46 miles W. S. W. of London (see map of England, ref. 12-11). It has, in grain, malt, coal, and timber, considerable commerce, facilitated by the Basingstoke Canal. Here is a church built at the time

of Henry VIII. Basingstoke has been a market-town ever since the Norman Conquest, and was anciently of more importance than at present. Pop. (1891) 7,960.

Bas'kerville, Joux: an English printer and letter-founder; b. in Wolverley, Worcestershire, England, in 1706. He made great improvements in typography. From his press came editions highly prized of Vergil (1756), Milton, and the New Testament (1763), besides many other beautifully printed works. D. in Birmingham, Jan. 8, 1775.

Bas'ket [etymol. unknown]: a vessel made of willows, twigs, or splints interwoven. Baskets have been in use from very early ages. The monuments of ancient Egypt abound in representations of baskets. They are frequently mentioned in the Bible. The ancient Britons were remarkably expert in the manufacture of baskets, which were much prized by the Romans for their neatness and elegance. The process of basket-making is very simple, and appears to be well known among the rudest peoples—even among the aborigines of Van Dieman's Land—and many tribes of American Indians display great skill and taste in making and ornamenting them. Willow, oak, and ash are chiefly made use of in the manufacture of baskets. In the U. S. the rattan, oak, willow, and black ash are employed extensively. The Chinese export many beautiful baskets made of finely split bamboo.

Basket-fish: any species of the genus *Astrophyton*, of the order *Ophiuroidea*; a group of brittle stars in which the arms are greatly branched, in some species the subdivisions of the arms being many thousands.

Basking-shark (*Cetorhinus maximus*): the largest of the sharks and the largest of fishes; the type of a peculiar family (*Cetorhinidae*). It attains a length of nearly 40 feet, but its teeth are very small, and it feeds on small animals and is harmless to man. It is a sluggish animal, found in the northern seas, and is often captured by whalers. A large specimen will yield six or more barrels of oil from the liver. It is also known as bone-shark, elephant-shark, etc.

Basnage de Beauval, bā'naazh'de-bō'vāil', JACQUES: a French scholar and theologian; b. at Rouen, Aug. 8, 1653. In 1676 he became a Protestant minister at Rouen, whence he emigrated to Holland in 1685, on the Revocation of the Edict of Nantes. Among his works are a church history in reply to Bossuet (Rotterdam, 1649, 2 vols.), and a *History of the Jews*, in continuation of Josephus (1766, 5 vols.; Eng. trans. London, 1708), both of which he brought down to his own day. D. at The Hague, Dec. 22, 1723. See his life by E. A. Maillot, Geneva, 1880.

Basque Provinces (Sp. *Vascongadas*): a part of Spain; bounded N. by the Bay of Biscay, comprises the four provinces, Navarre, Biscay, Guipúzcoa, and Alava. These coincided with the ancient *Cantabria*. Area, 6,827 sq. miles. Pop. (1887) 814,459. The surface is mountainous and presents much picturesque scenery. The tops of the hills are mostly covered with forests of oak, chestnut, beech, etc. Among the mineral resources are copper, tin, iron, marble, and porphyry. The chief towns are Bilbao, Tolosa, and Vittoria.

Basques [Fr.]: the name of a people speaking a peculiar language and now occupying a small extent of territory in and near the Pyrenees Mountains, about the bend of the Bay of Biscay. This territory includes a small portion of Southwestern France and a larger part of Spain; the provinces in which it lies are Vizcaya (Biscay), Guipúzcoa, Alava, Navarra in Spain, and Labourd, Basse-Navarre, Soule in France (in the department of the Basses-Pyrénées), the coast-line running approximately from Bilbao in Spain to Bayonne in France. The people call themselves Eskalkunac or Euskaldunac, and their language Eskara or Euskara, names which have been connected with the name (in Latin authors) *Ausei*, applied to a people of Aquitania. The name Basques is connected with *Vascones*, the Latin form of a name corresponding to the modern name Gascons, and applied to a people dwelling in Spain. The *Vascones* were probably a branch of the Iberian stock which once occupied a large part of Spain and Southwestern France, and the Basques are accordingly in all probability a remnant of the old Iberians, and their language is the only surviving form of the old Iberian speech. The Basques numbered in 1875 about 620,000, of which number 500,000 were in Spanish territory. Pride and a strong local patriotism are among their marked characteristics, and they have shown repeatedly evidences of a bold and adventurous spirit. It is of in-

terest to recall the defeat of Charlemagne's rear-guard by the Basques in the valley of Roncesvalles (Roncevaux), while his army was returning from an expedition into Spain in 778; for this defeat, with the death of Hroldand (Roland), furnished the basis for the most famous work of Old French literature, the *Chanson de Roland*. The independent spirit of the Basques is further shown by the special privileges (*fueros*) which they long enjoyed in Spain, by virtue of which they held in many respects, as in matters of taxation, finance, and military service, a semi-independent position. These privileges were not finally and entirely abolished until 1876.

The Basque language, which, as said above, is probably a modern form of Iberian, is peculiar in its vocabulary and its grammatical structure, and stands in an entirely isolated position, surrounded, except on the sea side, by languages belonging to the Indo-European family, to which it is wholly unrelated, and indeed it has not yet been shown to be related to any other language now spoken in Europe or elsewhere. As no early monuments of the language have been preserved, it is impossible to tell whether it has changed much or little since the time when we first learn of Iberians in Spain, and our knowledge of ancient Iberian is practically nothing. At present the language exists in several dialects, the phonology or sound system of which appears to resemble considerably that of Spanish, though there are differences. The following features may be mentioned: There is a cerebral *s* (the letter *z* is written for the sound *s*), the sound *f* is nearly or quite confined to words of foreign origin, instead of *v* (which seems to be lacking) occurs a bilabial spirant, perhaps the same as the Spanish sound of *v*, *h*, and there are two *r* sounds (perhaps like the two recognized in Spanish), neither of which ever begins a word. Some dialects have the aspirated sounds *kh*, *th*, *ph*, pronounced like *k*, *l*, *p*, followed by *h*. There exist also palatalized *l* and *n*, presumably pronounced like Spanish *ll* and *ñ* respectively. The written *ch* is pronounced as in Spanish and English, except in dialects in France, where the sound is that of *ch* in French. The written *j* represents different sounds in different dialects; sometimes it means the sound of German *j* or English *y*, sometimes that of the modern Spanish *j*, and sometimes that of modern French *j*. The words of the language seem to be in general developed from monosyllabic roots, noun roots and verb roots being distinct. Numerous suffixes are in use, some of which correspond to declensional endings in the Indo-European languages. There is an article, developed from an older pronoun, which is suffixed to the noun (*or*, water, *ura*, the water), or, when an adjective follows, to the adjective. The singular subject of transitive verbs often appears with a peculiar suffix *k*, which is not added to the subject of intransitive verbs. Nouns have no grammatical gender. The inflexion of verbs is the most difficult part of the grammar, on account of the perplexing combinations of pronouns and suffixes and prefixes, which produce many forms very difficult to analyze and explain. Auxiliary verbs combine with verbal adjectives or nouns and with pronominal forms, and this periphrastic conjugation is now the commonest. There exist also special forms for three moods, indicative, imperative, and optative, and two tenses, present and imperfect. A few examples (taken from Gerland) will illustrate some of these features. *Ekarri* (properly a verbal adjective), to carry; *dakar*, I carry it (the prefixed *d* = *it*, the suffixed *-t* = *l*); *uenkarren*, I carried; *iduki* (verbal adj.), to have; *dat*, I have it; *naca*, I had; *ni*, I am (the prefixed *n* = *l*); *ethorzen ni*, I come (am in coming, the ending *-en* = *in*); *ethorrico ni*, I shall come (am for coming); *ethorri ni*, I have come (*ethorri* is the verbal adj.); *ethorzen nitzak*, I come to thee (man); *ethorzen nitzan*, I come to thee (woman); *ethorzen nitzakun*, I was coming to thee (man or woman). For the vocabulary of the language it should be added that there is a considerable number of words from other languages, naturally for the most part from the adjacent Romance languages or dialects. The Basque has also contributed somewhat to the vocabulary of the neighboring languages, particularly Spanish, though the number of these words is not very large, and in some cases the borrowing is perhaps rather from the old Iberian than from the modern Basque.

The native Basque literature is naturally not very large, nor are there any monuments which can be traced farther back than the fifteenth century. The most interesting productions are proverbs, lyric poems, satirical verses, historical ballads, certain dramatic works somewhat resembling

the mediæval mystery-plays, the subjects of which are taken from the Bible or from legends, stories, or history, and comedies and farces are also found. For further information on all the subjects treated in this brief sketch, reference may be made to the following works: G. Gerland, *Die Basken und die Iberer*, in Gröber's *Grundriss der romanischen Philologie*, i. 313-334; this is the main source for the present sketch, and contains most of the needed references to authorities. See also Schuchardt's review of this in *Literaturblatt für germanische und romanische Philologie*, ix. 225-234; Larramendi, *El imposible vencido, Acte de la lengua Bascongada* (1729), and his *Diccionario del Castellano, Bascuener y Latin* (1745); W. v. Humboldt, *Berichtigungen und Zusätze zum ersten Abschnitte des zweiten Bandes des Mittheilungen über die Cantabrische oder Baskische Sprache* (1816), and his *Prüfung der Untersuchungen über die Urbewohner Spaniens vermittelt der Vaskischen Sprache* (1821); Francisque Michel, *Le pays basque* (1857); C. A. P. Mahu, *Denkmäler der baskischen Sprache* (1857); Prince L.-L. Bonaparte, *Carle des sept provinces basques* (1863), and his *Le verbe basque en tabourne* (1869); W. J. van Eys, *Dictionnaire basque-français* (1873), and his *Grammaire comparée des dialectes basques* (1879), and *Outlines of Basque Grammar* (1883); P. Broca, *Sur l'origine et la répartition de la langue basque* (1875); A. Luchaire, *Les origines linguistiques de l'Aquitaine* (1877); J. Vinson, *Essai sur la langue basque par François Ribéry, traduit du hongrois avec des notes complémentaires, etc.* (1877), and his *Les Basques et le pays basque* (1882), *Le folk-lore du pays basque* (1883), and *Essai d'une bibliographie de la langue basque* (1891); A. Caupion, *Gramática de los cuatro dialectos literarios de la lengua enskara* (1884); Aizquibel, *Diccionario basco-español* (1882-85); Friedrich Müller, *Grundriss der Sprachwissenschaft*, iii. ii. (1887); H. Schuchardt, *Romano-baskisches in Zeitschrift für romanische Philologie*, xi. 474-512; and various articles in the *Revue de Linguistique* and other philological journals.

E. S. SHELTON.

Bas-relief, *bas rē-leef*, or **Basso-rilievo**, *bas sō-rēl-ē-vā vō* [Fr. *bas-relief*, It. *basso-rilievo*, low relief]; a term applied to that kind of sculpture in which the figures have but slight projection from the background. (Compare ALTO-RILIEVO.) The slabs of alabaster which lined the halls of Assyrian palaces were covered with elaborate bas-reliefs representing deities and their worshippers and scenes of hunting and war. In Egyptian monuments bas-reliefs are common, and some of these are of a peculiar character called enco-relievo, that is, having the whole figure in relief kept below the general surface; a groove or channel being cut all around the figure, so that the relief occupies a sunken panel of exactly its own size and shape. The most famous bas-reliefs in the world are those which formed the frieze of the cella wall of the Parthenon at Athens. The sculptors of the fifteenth and sixteenth centuries in Italy produced bas-reliefs in which the figures have but the slightest projection, and reached very great excellence in these, both in truth of modeling and in expression. The most familiar bas-reliefs are the figures on coins, which are very low indeed.

RUSSELL STURGIS.

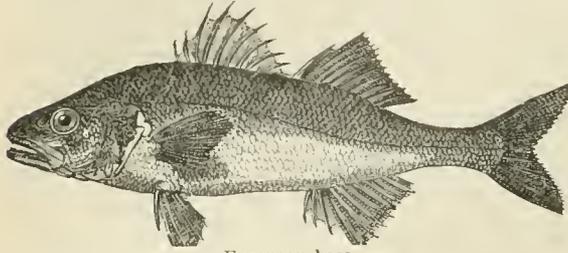

Bas-Rhin, *bas rān* (Lower Rhine): a former department of France, in the northern part of Alsace, which was annexed to Germany in 1871. See ALSACE.

Bass, *bāys*, or **Base** [same as adj. *bas*, but differentiated in spelling under infl. of Ital. *basso*: from Fr. *bas*, low]; in music, is the deepest or lowest part. In respect to harmony the base is the most important part in music, containing more frequently the fundamental notes of the chords, while on it is formed that important and effective figure in music called "organ-point." The term is also applied to the deepest and gravest quality of the human voice, the usual compass of which is from E or F below the bass staff to D or E above it. See PICTURED BASS.

Bass, *bās*, or **Basswood** [for *bas*, the inner bark of linden. O. E. *bast*; Germ. *Bast*]; a tree (*Tilia americana*), also called **Linden** or **Lime-tree**. It is common in the U. S.; has serrate leaves, which are more or less heart-shaped, and bears a woody globular nut one-celled and one or two seeded. The wood is light, soft, and not of much value for fuel. It is used in carriage-building. Several species of *Tilia* are found in the U. S., one of which, the *Tilia heterophylla*, or white basswood, is found in the West and South, and sometimes grows to an immense size and height. The flowers of the basswood abound in honey of

excellent quality, and are eagerly sought by bees. The European linden (*Tilia europaea*) is planted as an ornamental tree in many cities of Europe and the U. S. This species yields the bark which is made into Russia matting. See **BAST** and **LINDEN**.

Bass, or **Bars** [also *Base*, and in dial. *Barse*; O. Eng. *bærs*; Germ. *Barsch*]: the name of many species of fish of

European bass.

various genera, but appropriately belonging to the genus *Labrax*, of the perch family, and other closely allied genera. The typical species is a European sea-fish, which is as food, *Labrax* (or rather *Dicentrarchus lupus*). The striped bass of the Eastern U. S. (*Roccus lineatus*), often called rock-fish, affords a valuable supply of food. It ascends rivers, and is caught in both salt and fresh water, and has been successfully introduced into the waters of the Pacific coast. The white bass or perch of the Great Lakes (*Roccus chrysops*), the white perch (*Morone americana*), the yellow bass (*Morone interrupta*) of the Mississippi, are examples of true bass. Equally well known are the two species known as black bass, of the rivers of America (*Micropterus dolomieu* and *Micropterus salmoides*), among our very best game-fishes. The grass bass (*Pomoxis sparoides*), the rock bass (*Ambloplites rupestris*), etc., are allied species. There are also several marine fishes known as sea bass (*Centropristis*), stone bass (*Polyprion*), etc., and the name bass is also applied to some fishes which have no claim to the name.

DAVID S. JORDAN.

Bass, EDWARD, D. D.: the first Protestant Episcopal Bishop of Massachusetts; b. at Dorchester, Mass., Nov. 23, 1726; graduated at Harvard in 1744. He was ordained in England in 1752 by Bishop Sherlock. During the Revolution, at the request of the wardens and vestry of his church (St. Paul's, Newburyport, Mass.), he saved his parish from disruption by omitting those parts of the public prayers which relate to the royal family and Government of Great Britain. He was also dismissed from his position as a missionary of the Society for Propagating the Gospel, for his supposed sympathy with the American cause. He was consecrated Bishop of Massachusetts May 7, 1797, and his episcopal authority was afterwards extended over Rhode Island and New Hampshire, 10, in Newburyport, Sept. 10, 1803.

Bass, EDGAR W.: soldier and scientist; b. in 1843 at Prairie du Chien, Wis. In 1862 he enlisted in the Eighth Minnesota Volunteers and as quartermaster-sergeant served against the hostile Sioux Indians until 1864, when he was appointed a cadet. Graduating at West Point in 1868, he was promoted to lieutenant of engineers. He twice served with the engineer battalion at Willets Point as lieutenant, adjutant, and commanding a company, and in the scientific work of the school of application. He was twice on duty at the Military Academy as instructor in the Department of Natural and Experimental Philosophy. He served as assistant astronomer to observe the transit of Venus 1875, and resigned his commission as lieutenant in order to accept the professorship of mathematics at the Military Academy, to which he was appointed in Apr., 1878. Author of *Introduction to the Calculus and Differential Calculus*.

JAMES MERCUR.

Bassano, bās-sa'nō: a town of Northern Italy; province of Venice; on the river Brenta; 19 miles N. E. of Vicenza (see map of Italy, ref. 2-D). It stands on an eminence near the foot of the Alps, in a country which produces excellent wine and fruits. It is well built, has many churches and several fine palaces, also a theater, a picture-gallery, a bo-

tanic garden, and the celebrated old printing-establishment of Remondini. Bonaparte here defeated the Austrian general Wurmser, Sept. 8, 1796. Pop. 15,000.

Bassano, DUKE DE: See **MARET**.

Bassano, or **Ponte**, JACOPO, da: painter; b. in Bassano in 1510; educated by his father, Francesco (1475-1530), himself a pupil of Gio. Bellini, and in Venice. Settled in Bassano in 1510; was one of the earliest Italian genre-painters; excelled in chiaroscuro, color, and perspective; at first imitated his father, then studied the works of Titian; is said to have been prolific of paintings, but his genuine works are scarce. His latest manner is the best. He was extensively copied by two of his four artist sons, namely, Giacomo (1553-1613) and Girolamo (1560-1630). His best work is an altar-piece, in Bassano, of *The Nativity*. Others of his canvases are *The Entombing of Christ*, at Padua; a *Family Concert*, in Uffizi gallery, Florence; and the *Mourning Mariæ*, at Chiswick, near London. D. Feb. 19, 1592.

Bassaris [from Gr. *Bassaraps*, a fox]: the only genus of the North American family *Bassaridae*, including only two species, and mostly nearly related to the raccoons. The *Bassaris astuta*, known as civet-cat or cacomixtle, is found in Mexico, Texas, California, etc. These animals are about the size of a common cat, and very playful and easily tamed.

The ring-tailed bassaris.

They live in trees, catching rats, mice, and birds. The tail is bushy, and marked with rings like that of the raccoon.

Bassain, bās-sayn: a city of British Burma; on an arm of the Irrawaddi, which joins the Bay of Bengal S. of Cape Negrais (see map of S. India, ref. 4-L). It is 90 miles from the sea, and large ships ascend to the city. Much rice is exported hence. Pop. (1881) 28,147.

Basselin, bās-lān, OLIVIER: a French popular poet; b. at Vire, in the valley of the river Vire (*Val de Vire*), in Normandy, late in the fourteenth or early in the fifteenth century. He is chiefly notable as the inventor of the joyous popular song known originally from the place where it was written as *Yau de Vire*, which name was later corrupted into *Yaulerille*. Little is really known of Basselin's life. From a study of the documents, however, M. Armand Gasté thinks the following facts to be pretty well made out: Basselin was a fuller by trade; owner of a fulling-mill near Vire, in the Val, or Vau, de Vire; he was a merry and dissipated fellow, the chief of a band of jolly comrades, who in time of peace composed and sang drinking and love songs of a popular kind, but in time of war campaigned it to the tune of their own patriotic songs; he was killed by the English either in the battle of Formigny (1450), or in an ambuscade shortly before this battle. Several editions purporting to be of the poems of Basselin have been published in the nineteenth century (1811, 1821, 1833, 1858); but it is probable that none of the poems so printed are really by him.

The author of them was Jean le Houx, a poet of Vire belonging to the end of the sixteenth century, who wrote *Vaux de Vire nouveaux*, which he dared not sign because of the religious troubles of his time, and which were soon attributed to the great originator of such songs. Probably the only veritable remains of Basselin's works are to be found in three MSS. of the Bibliothèque Nationale in Paris, of which the first two were published by M. Armand Gasté in 1866, the third by M. Gaston, Paris (*Soc. des anc. textes fr.*, 1875).

BIBLIOGRAPHY.—Eug. de Beaurepaire, *Étude sur Basselin, Jean le Houx et le Vau de Vire normand* (*Mém. de la Soc. des Antiq. de Normandie*, t. xxiii.); A. Gasté, *Chansons normandes du XI^e Siècle*, Caen, 1866; A. Gasté, *Étude sur Olivier Basselin, etc.*, Caen, 1866; A. Gasté, *Olivier Basselin et le Vau de Vire*, Paris, 1877. A. R. MARSH.

Basses-Alpes, baas zaalp' (i. e. Lower Alps); a department in the southeast part of France; bounded N. by Hautes-Alpes, E. by Italy and Alpes-Maritimes, S. by Var, and W. by Vaucluse. Area, 2,685 sq. miles. The surface is mostly mountainous, with some fertile valleys. It is drained by the river Durance. Pop. (1881) 131,918; (1891) 124,285. Capital, Digne.

Basses-Pyrénées, baas pœ'r-nây-mây' (i. e. Lower Pyrenees); a frontier department of France; bounded N. by Landes, E. by Hautes-Pyrénées, S. by Spain, and W. by the Atlantic. Area, 2,945 sq. miles. It is intersected by the river Gave de Pau, an affluent of the Adour, which forms its northwest boundary. The surface is partly mountainous; the soil of the lowlands is fertile. Copper, iron, and marble are found here. The chief towns are Bayonne and Pau. Pop. (1881) 434,366; (1891) 425,027.

Basse-Terre, baas târ (i. e. low land); a seaport; capital of the French island of Guadeloupe; on the southwest coast; lat. 15° 57' N., lon. 61° 44' W. (see map of West Indies, ref. 7-M). It is the residence of a bishop, and has a botanic garden. It has no harbor. Pop. 9,500.

Basse-Terre; a town of the British West Indies; capital of St. Christopher (or St. Kitts); on the west coast (see map of West Indies, ref. 6-L). It has a harbor and an active trade. Pop. 8,500.

Basset Horn (lt. *cor no di bassetto*); the richest and softest of all wind instruments; invented in Passau in 1770, and afterward improved. It is similar to a clarinet in tone and fingering, and its compass is two and a half octaves. It is, however, nearly obsolete in modern orchestration. Mozart has made fine use of two basset horns in his celebrated *Requiem*.

Bassett, James; missionary; b. in town of Glenford, near Hamilton, Ont., Jan. 31, 1831; graduated at Lane Theological Seminary in 1859. He served in the U. S. volunteer army 1862-63; held pastorates in Presbyterian churches of Newark and Englewood, N. J., 1863-71; and the latter year became a missionary for the Presbyterian Board. He has traveled extensively in Europe; passed many years in Turkey and Persia; and, as a pioneer of missionary work in the latter country, gained an accurate knowledge of its people and languages. He was the first American to visit the tomb of Haroun al-Rashid in Eastern Khorassan, and the appointment of a legation of the U. S. to Persia was largely due to his publications and efforts. He established the mission in Central and Eastern Persia, but since 1881 has resided in the U. S. Among his works are: *Among the Turcomans* (London, 1880); *Hymns in Persian* (Teheran, 1884); *Grammatical Note on the Simnani Dialects of the Persian* (London, 1884); *Persia, the Land of the Imams* (New York, 1886).

NEIL MACDONALD.

Bassett, Richard; a statesman of Delaware; was a member of Congress in 1787, and of the convention of the same year which framed the U. S. Constitution. He was U. S. Senator (1789-93), Governor of the State (1798-1801), and U. S. district judge (1801-02). He was the father-in-law of Hon. James A. Bayard. D. in Sept., 1815.

Bassia; a genus of plants of the family *Sapotaceæ*; comprises several species of trees, natives of tropical or sub-tropical countries. It produces flowers remarkable for their fleshy corolla, and a pulpy fruit inclosing three or four seeds, which contain an abundance of oil or butyric-acid fat, which is used as food and for other purposes. The *Bassia latifolia*, an East Indian tree called madhuen or mahowa, is valuable for timber, and bears seeds from which oil is obtained. The Galam or Shea butter, an important article of commerce in Central Africa, which is procured from the

seeds of *Bassia parkii*, is more solid and more palatable than the butter of cow's milk. It is asserted that it will keep for a year without salt.

Bassompierre, baäs-sôn pi-är', FRANÇOIS, Baron de; a French general; b. at Harnel, in Lorraine, 1579. He was an accomplished courtier, greatly addicted to intrigues, and gained the favor of Louis XIII., who raised him to the rank of marshal of France in 1622, and sent him on embassies to La Rochelle and England. He fought against the Huguenots at La Rochelle. Having offended Cardinal Richelieu, he was confined in the Bastille about twelve years (1631-42). He died Oct. 12, 1646, leaving interesting *Mémoires* (2 vols., 1665), which were written in the Bastille, and are commended as attractive in style. See Puymaigre, *Vie de Bassompierre*, 1848.

Bassoon' [Fr. *basson*, deriv. of *bas*, low]; a wind instrument which consists of a perforated tube of wood in several pieces, which are fastened together, so as to bring the holes and keys within the reach of the fingers. At the end is attached a small tapering, crooked brass tube, at the termination of which is placed a reed to produce the tone. It has a compass of three octaves, from double B flat to B flat in alt.

Bassora, baas sô-ra, or **Basra**, baas'ra; a city of Asiatic Turkey; province of Irak-Arabi, Mesopotamia; on the Euphrates (here called Shat-el-Arab); 70 miles from its mouth (see map of Turkey, ref. 8-L). It is surrounded by a brick wall nearly 8 miles in circuit, which incloses gardens, rice-fields, and groves of the date-palm. The houses are mean and the place is unhealthy. About half of the inhabitants are Arabs. Bassora has an extensive trade, being an entrepôt for the exchange of the productions of Turkey and Persia for the commodities of India. The river is navigable to this point for ships of 500 tons. Among the exports are horses, dates, raw silk, and precious metals. Bassora was founded by the Caliph Omâr about 636 A. D., and was once a rich and populous city. Pop. 40,000.

Bassora Gum; a whitish or yellowish opaque substance resembling gum-arabic, but differing from it by being mostly insoluble in water. It was introduced into commerce from the vicinity of Bassora, on the Persian Gulf.

Basso-relievo; same as **BAS-RELIEF**.

Bass Rock; remarkable island-rock near the mouth of the Firth of Forth, composed of volcanic material; about a mile in circumference; nearly round; 343 feet high; inaccessible on all sides except the south; cavern, accessible at low tide, tunnels the rock from east to west. St. Balthere, or Baldred, died here in a hermitage 1756; Charles II. purchased it for £4,000 in 1671, and in its dungeon many of the most eminent Covenanters were confined during his and the succeeding reign. Four young Jacobite prisoners captured and with twelve more held the rock for King James from June, 1691, till Apr., 1694, against all the force sent against them by William III., surrendering at last on honorable terms. See *Bass Rock*, by Hugh Miller and four others (1848), and *Pictorial History of England*.

Bass's Strait; separates Australia from Tasmania, and is about 140 miles wide. It was first explored in a whaling-boat by a surgeon, George Bass, in 1798, who sailed from Port Jackson, Australia. Prior to Bass's discovery Tasmania was thought to be part of Australia, and so appears in Capt. Cook's charts. The navigation of this strait is obstructed by small islands and coral reefs.

Bast, or **Bass** [O. E. *bast*, Germ. *Bast*, inner bark of linden]; the fibrous inner bark of dicotyledonous plants (called also *liber* and *endophloem*), consists mostly of fibers and sieve vessels. It is sometimes valuable for medicinal purposes, and is often used in the fabrication of cloths, ropes, mats, sacks, etc. The Russians apply the name bast especially to the inner bark of the linden tree (*Tilia europæa*), which is extensively used for making ropes, mats, and shoes. The trees are cut down in spring when the sap abounds. This matting is extensively imported, and used in packing furniture and other articles, for covering tender plants in gardens, etc. See **FIBER**.

Bast, baast, **FRIEDRICH JACOB** (1771-1811); Hessian ambassador in Vienna and Paris. Noted author of a work on Gregorius Corinthius, with a learned and still valuable paleographical commentary.

Bastard [O. Fr. *bastard*, Mod. Fr. *bâtard*, deriv. of O. Fr. *bast* (also M. Eng.), pack-saddle used as bed by mule-

teers in inns); cf. proverb *fils de bast*, illegitimate child]; in law, a person born of parents not married to each other. It includes several distinct cases, as where the mother is unmarried, or she is a married woman, or where she was married at the time of conception, but not married at the time of birth—e. g. being then divorced from the bonds of matrimony or a widow. By the rules of the common law the fact of the marriage of the parents at the time of birth is the test of legitimacy, even though such marriage may have immediately preceded the birth. By the civil or Roman law, intermarriage after birth has a retroactive effect, and makes the child legitimate. This rule prevails in Scotland. This difference presents frequently an interesting question in private international law. Thus if a person owning both land and personal property in England should become domiciled in Scotland, and there marry the mother of his bastard child, the marriage would make the child legitimate, so that he could succeed to the personal property in England, but he would not inherit the land there situated. Some of the States in this country follow the common-law rule, while others by statute have adopted the Scotch, so that the same point may arise in our interstate jurisprudence. In the case where the mother is a married woman, and it is claimed that a child is the offspring of an adulterous connection, it will not be enough that the adulterer may have been the father. It must be proved that the husband could not have been, either by absence from the country or other sufficient reason. The presumptions of law favor legitimacy, and public policy requires that these should only be overcome by the most satisfactory proof. (For the details of this branch of the law, see Nicholas, *Law of Adulterine Bastardy*.) Public policy also requires that the mother should not be allowed, for the purpose of bastardizing the issue, to be a witness to prove want of access on the part of the husband. In the special case where the mother is at the time of the child's birth a widow, a question may arise as to the effect of the time intervening between the death of the husband and the birth of the child in raising a presumption of illegitimacy. No precise time is fixed by law, and the testimony of experts must be resorted to. Statutes sometimes fix a period after which the presumption of illegitimacy will arise. A similar question may arise after a divorce from the bonds of matrimony for the husband's fault. In the case of a divorce from bed and board, where a child is subsequently conceived it is presumed to be illegitimate, as it will be supposed that the parties have obeyed the decree of the court, and have lived apart. This presumption may be rebutted by satisfactory evidence.

By the common law, a parent is not bound to sustain an illegitimate child. By a series of statutes in England, commencing in the reign of Queen Elizabeth, the duty of support is imposed on the supposed father as well as the mother. This legislation proceeds upon the theory that it is a criminal act to bring such a child into the world and to cast its support upon the public. Accordingly, an inquiry is had before magistrates into the facts of the case, and if parentage is established an order is made for a periodical allowance for the child's support. Should the parent abscond, his or her property may be sequestered. Due provision is made for a review of the order of the magistrates. These statutes are substantially re-enacted in this country. This class of children do not have the same civil rights in all respects as those who are legitimate. They can not inherit land from either father, mother, or collateral relatives, or transmit land to them. Natural ties are, however, regarded, it being the same crime for bastard relatives to intermarry as for those who are legitimate. Such a child has no name except as it may acquire it by reputation. It is deemed to have its domicile of origin at the place of its birth. These disabilities in this country are to some extent modified by statutes in the respective States. Thus in New York an illegitimate child may inherit from its mother, in default of legitimate descendants; so the mother may in like circumstances inherit from the child. A bastard child may be made legitimate by a special act of the legislature both in England and in this country. Such an act can not, however, in the U. S. interfere with vested rights of others. It could not divest property which had been previously transmitted to legitimate relatives.

T. W. DWIGHT.

Bastia, *bās'tee'a*: a fortified seaport of Corsica; on the northeast coast; 75 miles N. E. of Ajaccio; lat. 42° 42' N., lon. 9° 27' E. (see map of France, ref. 2-K). It is the rich-

est and most populous town in the island, of which it was formerly the capital. It is picturesquely situated on the slope of a hill which rises in the form of an amphitheater. It has a harbor which admits small vessels, and has a considerable trade in leather, wine, oil, coral, etc. Here are numerous tamerics. Bastia dates from 1383. Pop. (1891) 23,397.

Bastian, *baas'tē-an*, ADOLF: German traveler and anthropologist; b. June 26, 1826, in Bremen; made an extensive journey to Australia, America, Asia, and West Africa 1851-59; traveled in the East 1861-65; in North and South America 1875-76; traveled through Asia, Pacific Ocean, North America, and the West Indies 1878-80; through Turkestan, Zanzibar and Australia 1889-91; professor in the University of Berlin and president of the Museum of Anthropology; president of the Geographical Society; joint editor of the *Zeitschrift für Ethnologie* 1869. His most important writings are: *Der Mensch in der Geschichte* (3 vols., 1860); *Die Völker des östlichen Asien* (6 vols., 1866-71); *Ethnologische Forschungen* (2 vols., 1871-73); *Schöpfung und Entstehung* (1875); *Die Vorstellungen von der Seele* (1875); *Vorgeschichte der Ethnologie* (1881); *Allgemeine Grundzüge der Ethnologie* (1884); *Religions-philosophische Probleme* (1884); *Der Fetisch an der Küste Guineas* (1885); *Indonesien oder die Inseln des Malatischen Archipels* (1884-89); *Allerlei aus Volks- und Menschenkunde* (2 vols., 1888). No equally well-equipped ethnologist has ever traveled so extensively, and it is difficult to overestimate his services to science.

C. H. THURBER.

Bastian, HENRY CHARLTON, M. D., F. R. S.: b. at Truro, England, Apr. 26, 1837; was noted for a time as an advocate of the doctrine of the spontaneous generation of living organisms. He early gained fame as a pathologist. He has since his twenty-third year been officially connected with the London University, and in 1871 became Professor of Pathological Anatomy, and in 1887 of Clinical Medicine, in University College. He has published *Modes of Origin of Lowest Organisms* (1871); *The Beginnings of Life* (1872); *Evolution and the Origin of Life* (1874); *The Brain as an Organ of Mind* (1880), translated into French and German; *Paralysia* (1886); and important monographs on free and parasitic nematoids. He supplied many articles on nervous diseases to Quain's *Dictionary of Medicine*.

Bastiat, *bās'tē-aa'*, FRÉDÉRIC: French political economist and advocate of free trade; b. at Bayonne on June 29, 1801. He wrote against the protective system in the *Journal des Économistes*. During a visit to England he became acquainted with Cobden, and on his return (1845) he produced translations of the speeches of British free-traders; was chosen a member of the Constituent and Legislative Assemblies of 1848 and 1849. His chief work is *Harmonies Économiques* (1849), in which he made unacknowledged use of the speculations of Henry C. Carey. D. Dec. 24, 1850.

Bastide, *bās'tēed'*, JULES: a French republican and journalist; b. in Paris, Nov. 22, 1800. He became chief editor of the *National* about 1836, and founded the *Revue Nationale* in 1846. He was Minister of Foreign Affairs under Cavaignac in 1848. He published important educational and historical works. D. Mar. 3, 1879.

Bastien-Lepage, *bās'ti-ään' le-paazh'*, JULES: painter; b. at Damvillers, Meuse, France, Nov. 1, 1848; d. at Paris, Dec. 10, 1884. He was a pupil of Cabanel and one of the ablest men in the Government School of Fine Arts, but though he entered the competition for the Grand Prix de Rome, and, in the opinion of many artists and critics, was plainly the candidate with the best claim for the prize, his work was not considered quite conventional and academic enough by the classic-loving members of the Institute who made the awards, and he received only a second prize. He created a genuine sensation at the Salon of 1874 by the exhibition of the *Portrait of My Grandfather*, a picture of an elderly man painted in out-of-doors effect, and following it in succeeding Salons with such works as *The Haymakers*, *Portrait of My Parents*, *The Potato Gatherers*, and *Jeanne d'Arc*, he was soon recognized as a *chef d'école*. His influence on modern painting was far-reaching and beneficial. His methods have been imitated by a host of men. Bastien's small portraits—the marvelous one of his brother Émile, the architect, seated at a table with his drawing instruments, and those of the Prince of Wales and Sarah Bernhardt and Albert Wolf—have had the effect of stimulating this

style of portraiture, and the work of such excellent painters in this field as Chartran and Friant is directly traceable to him. In his pictures of outdoor life, those remarkable effects in *plein air*, he no doubt drew something from Courbet and from Manet; but he is decidedly original, and his work is distinguished from theirs by infinitely better drawing, and by a research for color that goes beyond Courbet and that Manet never approached. In the portrait of his parents, again, Bastien, with the most exquisitely sensitive drawing and an abundant sense of color, reaches a very high level. In the portrait of his mother, particularly, there is an exactness that is worthy of Holbein, with an unaffected sentiment that we find nowhere outside of the work of the great Dutch masters. Painted out of doors, as these portraits were, in the diffused light, there is an original side to them that is found in nobody else's work. The *Portrait of My Grandfather* is equally remarkable, and indeed says the last word in sincerity and truth in the outdoor school of painting. In *The Haymakers*, *The Potato Gatherers*, *The Woodman*, and other pictures of peasant life, while there is a different sort of sentiment from that which makes Millet's interpretations of similar themes such beautiful works of art, there is a sympathetic comprehension of the poetry of the life of the fields, and the most healthful, robust methods in representing it in pictorial form. In the picture of *Jeanne d'Arc*, where the young girl is seen standing under an apple-tree in a garden, listening to the voices of vision-like figures in armor, indicated as floating in the air behind her, Bastien attempted something more than truthful rendering of peasant character, and the figure of Jeanne d'Arc is a beautiful creation. This picture was purchased by Erwin Davis, of New York, and presented to the Metropolitan Museum in that city, where it may now be seen. It is the work of a master, and one in which the painter's surpassing qualities may be studied in one of the most complete manifestations of his talent. Bastien received medals at the Salons of 1874 and 1875 and at the Paris Exposition of 1878, and the Legion of Honor in 1879; but the full recognition of his ability did not come until the latter days of his short career. He is now considered one of the great painters of the century, and his advent really marked an important "movement" in the progress of modern art. See *Therriët's Life* (Paris, 1892).

WILLIAM A. COFFIN.

Bastile, bäs'teel' or bäs'téel [Fr. *bastille*, from Late Lat. *bastir e*, build]: a name at first applied to fortified buildings forming part of a system of defense, and once in general use in Paris. In 1369, by order of Charles V., Hugues Aubriot, provost of Paris, began to convert the two towers which flanked the gate of St. Antoine into a fortress of eight towers, connected by thick-curtained walls, the whole being surrounded by a moat 25 feet wide. Later alterations left the main features of the structure still dominant, and to this fortress the name "bastille" gradually became restricted. For many years its principal use was for military purposes, although state prisoners were occasionally confined here, according to a general French use of fortifications. The Frondeurs held possession of it for three years from 1649, and it was here that the great Condé took refuge when Turenne attacked Paris in 1652. Henry IV. had used the edifice as a royal treasury, and given its command to the Duc de Sully. Among the early traditions of the place is the story that its architect, Aubriot, was incarcerated for heresy within its walls. The Duc de Nemours was confined here thirteen years in an iron cage. During the reign of Louis XIII. it became the receptacle for state prisoners. It had accommodations for about eighty persons in its cells and dungeons, and it was often overcrowded during the reigns of Louis XIV. and XV. The stories of the cruelties practiced here are not well borne out by recent investigation. There were two classes of prisoners committed here by summary process: those detained as a precaution or for discipline in loyalty, and those against whom specific but untried

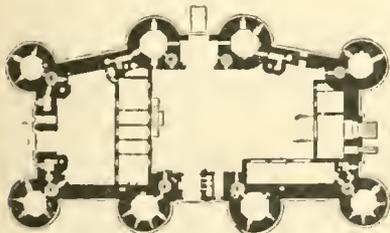

FIG. 1.—Plan of Bastille.

charges were laid. The term of incarceration which might elapse before a prisoner was released, either by royal command or by trial and acquittal, was undetermined, and occasionally some poor fellows grew old in the cells without learn-

ing why they were detained. Convicts were treated with the strictness and brutality of the times. The better class of prisoners, except in cases of state importance, had considerable comfort, could receive visitors under certain regulations, played games, and had open air exercise on the galleries and in the courts of the building. Among the famous inmates of this prison during the reigns of the two Louises named were the "Man of the Iron Mask," Fouquet, the Marshal Richelieu, De Saey, Voltaire, Labourdonnais, Cardinal Rohan, and La Chalotais. There were incarcerations of able and upright men under arbitrary rule which were cruel and unjust, and in this way the Bastille became a symbol of despotic government in the revolutionary year of 1789. It was attacked by the Paris insurgents July 14, who killed Delamoy, the governor, and several officers, and captured the place. Three unknown prisoners and four forgers were set free. The next day the demolition of the fortress by the mob began. A bronze column on the site commemorates the destruction, while the day of its fall has become a national *fiête* day. The historical documents of the prison which escaped destruction were stored in the Arsenal library, and have to some extent been elucidated by François Ravaisson in *Les Archives de la Bastille* (Paris, 6 vols., 1866-73). Carlyle has graphically described the downfall of this prison in his *French Revolution*.

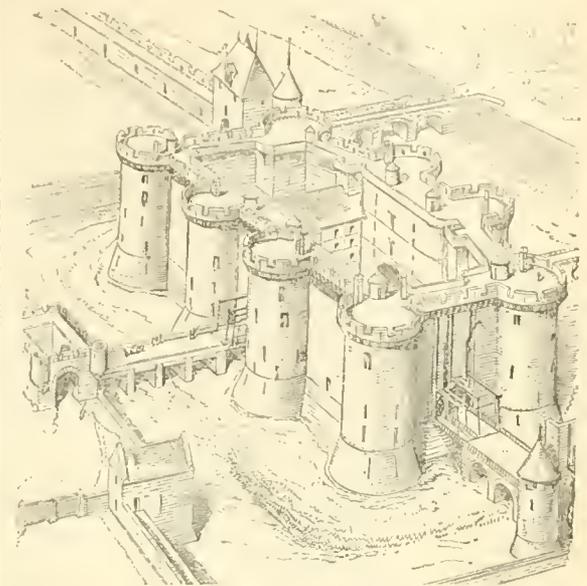

FIG. 2.—The Bastille.

Bastina'do [from Span. *bastonado*, deriv. of Span. *baston*; Ital. *bastone*; Fr. *bâton*, stick]: a name given by Europeans to a form of punishment which is common in Turkey and several Oriental countries, and was practiced by the ancient Egyptians. It consists of blows inflicted with a stick on the soles of the feet.

Bastion [Fr. deriv. of *bastir*, *bâtir*, build]: a bulwark; a projecting tower erected to defend the wall of a town or fortification. An unbroken wall enveloping a city or other place for its defense would be unseen at its foot; hence during ancient times and the Middle Ages towers of various kinds projected at intervals, from which the intermediate portions of the wall could be observed and reached by defensive projectiles (i. e. flanked). The invention of gunpowder made it necessary to cover enveloping walls (the *enclave*) by earth in the form of a glacis in front of the ditch, and to enlarge these flanking towers to receive artillery. Thus enlarged, their own walls would have been undefended had not their outline been so contrived that they should *flank* each other. Hence arises the *bastion*, the two faces of which, directed upon the inner extremities of the flanks of the adjoining bastions, are *flanked* (that is, defended) by them; hence a bastion has two faces and two

flanks; the fifth side of the figure, called the *gorge* (between the extremities of the *curtain* and toward the interior of the place), is usually open. That portion of the enceinte which fills the interval between two bastions, uniting with the inner extremities of their flanks, is called the *curtain*. The *ensemble* of a curtain and two half-bastions is called a *bastioned front*. See FORTIFICATION.

Bastrop: town; capital of Bastrop co., Tex. (for location of county, see map of Texas, ref. 5-11); on Colorado river; 35 miles E. S. E. of Austin City. It is in a corn and cotton growing district. Pop. (1880) 1,546; (1890) 1,634.

Basutoland, ba-soo-tō-lānd: a British crown colony near the east coast of South Africa; on the N. E. of Cape Colony. It is an irregular oval, about 160 miles long by 100 broad, on both sides of the Maluti Mountains, inclosing the head-waters of the south branch of the Orange river, with Orange Free State on the W. and N. W., Natal on the N. E., Kaffraria on the S. E., and Cape Colony on the S. W. Area, 9,720 sq. miles. The country is elevated and rough, has a fine climate, is well watered, produces abundant grass for its immense herds of cattle, and is capable of great production of grain. The productions are wool, wheat, mealies, and Kaffre corn. Coal is produced for local supply. The colony was annexed to Cape Colony in 1871, but placed directly under authority of the crown in 1884. The revenue in 1890-91 was \$208,000, the expenditure about \$5,000 less. Pop. (1891) European, 578; native, 218,324. European settlement is now prohibited. In 1891 the colony possessed 81,000 horses, 321,000 cattle, 10,000 plows and 800 wagons. M. W. H.

Bas'yle [from Gr. *βάσις*, base + *ύλη*, wood, stuff (as in benzoyl)]: the name given by Graham to a substance, whether simple or compound, which can unite with oxygen to produce a base. Thus all the metals are examples of simple basyles, while ammonium, ethyl, methyl, etc., are compound basyles.

Bat (in Lat. *vespertilio*): an animal belonging to the order *Cheiroptera*, mammals possessing a fold of skin which commences at the neck and extends

Flying fox bat.

on each side between the fore legs or arms and the posterior limbs, serving as wings which enable the animal to fly. Bats are the only mammals which have the power of flight. The anterior extremities and digits are usually very long, the eyes small, ears large, thumbs short and armed with a hook-like nail, as are each of the toes of the hind feet. The clavicle is generally long. Some species have a spur on the heel. Bats fly for the most part only in the night, living by day in hollow trees, caves, and dark buildings. Even when their eyes have been destroyed they can fly through narrow and tortuous passages without hitting. This is probably owing to their delicate sense of hearing and touch. Except in tropical climates they hibernate in cold weather.

Vampire bat

Bats are divided into two groups: the so-called frugivorous and the insectivorous bats. The former are found only in the Old World tropical regions. They feed chiefly on fruits, but also eat birds, small mammals, etc. They number forty or more species, and include the rousettes, kalongs, "flying foxes," etc.

Long-eared bat.

Some of them can spread their wings 5 feet from tip to tip. The principal genus is *Pteropus*, and its species are remarkable as having only twenty-four vertebrae, a smaller number than any other known mammal possesses. The insectivorous bats are by far the most numerous, some 300 species being described. The most formidable of these are the vampires—tropical American bats of the genus *Desmodus*, having a leaf-like membrane

on the end of the nose. They are famous for their habit of fastening upon sleeping animals and men for the purpose of sucking their blood. Such witnesses as D'Azara, Tschudi, Waterton, and Darwin confirm this disputed statement. The bats of the U. S. are not very numerous in species, though abundant in individuals. They are of the genera *Vespertilio*, *Atalapha*, *Plecotus*, etc. Europe is much more rich in species, the "long-eared bat," *Plecotus communis*, being one of the most common. Bats are extremely useful in destroying insects, and their excrement so accumulates in certain caves, as in Farther India, in Tennessee, Arkansas, etc., as to promise to become an important source of guano. See VESPERTILIONIDÆ. DAVID S. JORDAN.

Bata'tas E'dulis: See SWEET POTATO.

Bata'vi: an ancient German tribe or nation who inhabited the country now called Holland, especially an island called *Batavia* or *Insula Batavorum*, which was inclosed by the Rhine, the Waal (Vuhalis), the Meuse (Mosa), and the ocean. They were conquered by Germanicus, and became loyal subjects of the Roman empire. They were exempted from the payment of taxes. The Batavian cavalry served in the Roman armies, and had a high reputation.

Bata'via (formerly *Jacatra*): a city in the province of that name, and a seaport of Java; capital of the Dutch possessions in the East Indies; on the northern coast of the island and on the Java Sea; lat. 6° 8' S., lon. 106° 50' E. (see map of East Indies, ref. 8-C). It consists of the old and new towns. The latter is about 2 miles inland, and contains the government offices and residences of the merchants, and is beautifully and healthfully situated among groves and avenues of trees. The former is flat and marshy, intersected by canals, and was formerly very unhealthy, but has been improved by draining. The temperature is almost uniform throughout the year, the average being 78° F. It has a fair harbor, and is the greatest commercial emporium of the Malay Archipelago, though Singapore is a powerful rival. It has a stadt-house, an exchange, numerous churches, several Chinese temples, banks, a school of arts and sciences, and a botanic garden. A telegraphic cable connects it with Singapore, about 600 miles distant. The chief articles of export are coffee, sugar, pepper, indigo, hides, cloves, nutmegs, mace, tin, rice, and rattans. Among the imports are various articles of European manufacture. Pop. 96,000, of whom 8,000 are Europeans. This city was founded by the Dutch in 1619.

Batavia: town; Kane co., Ill. (for location of county, see map of Illinois, ref. 2-F); on branch lines of Chicago and Northwestern and Chicago, Burlington and Quincy R. Rs., and on Fox river; 38 miles W. of Chicago. Batavia has 8 churches, 6 public schools, an institute for the insane, city-hall, windmill-factories, wagon-factories, stone-quarries, and electric lights. Founded in 1834; incorporated as a village in 1856. Pop. (1880) 2,639; (1890) 3,543.

EDITOR OF "NEWS."

Batavia: railroad center and capital of Genesee co., N. Y. (for location of county, see map of New York, ref. 4-1); on the Tonawanda creek, 36 miles E. of Buffalo and 32 miles W. of Rochester; on the main line of the New York Central and Hudson River R. R. The Lehigh Valley and New York, Lake Erie and Western R. Rs. also pass through Batavia, while it is the terminus of the Canandaigua, Niagara Falls, and Attica branches of the Central. It contains several important manufactories, including harvester-works, gun-works, carriage-wheel and wood-working factories, shoe-factories, plow-works, and a canning-factory, and has a high school, four handsome ward schools, public library, the building for which was donated by the widow of the late Dean Richmond, and the State institution for the blind. Pop. (1870) 3,890; (1880) 4,845; (1890) 7,221.

EDITOR OF "THE DAILY NEWS."

Batavian Republic: Holland having been conquered by the French in 1795, the Prince of Orange was deposed and a new government was established, with the title of the Batavian Republic. This was an ally or tributary to the French republic, and as such was involved in a war against the British, who nearly ruined the Dutch navy. In June, 1806, this republic was converted into a kingdom, of which Louis Bonaparte became king.

Bate'man, KATE JOSEPHINE: actress; b. in Baltimore, Md., Oct. 7, 1842; daughter of H. L. Bateman and Mrs. Bateman, both well known in theatrical circles. Her sister Ellen (Mrs. Greppo) was also an actress before her marriage. The sisters were brought up almost from infancy upon the

stage. In 1862 Kate Bateman appeared at Boston as Leah, her greatest character, and won great applause in the U. S. and Great Britain. In 1866 she was married to George Crowe, a former editor of the *London News*.

Revised by B. B. VALLENTINE.

Bateman, NEWTON, LL. D.: b. July 27, 1822, in Fairfield, N. J.; removed to Illinois with his parents in 1833; entered Illinois College in 1840, and graduated in 1843; studied at Lane Theological Seminary a short time; traveled extensively in the U. S.; taught private school in St. Louis; Professor of Mathematics 1847-51 in St. Charles College, Missouri, and then became principal of public free school of Jacksonville, Ill.; was at the same time superintendent of schools for the city and commissioner of schools for the county; became principal of Jacksonville Female Academy in 1858, and before the close of the year was elected State superintendent of public instruction. He served five terms of two years each, and was actively engaged in establishing the Normal University. He published a valuable report each term. In 1862-64 he had charge of the correspondence of the provost-marshal-general of the State, and then resumed the State superintendency of public instruction. From 1875 to 1892 he was president of Knox College, Illinois.

Bates, ARLO: author; b. in East Machias, Me., Dec. 16, 1850; graduated at Bowdoin College 1876; editor *Boston Sunday Courier* (1880); author of *Patty's Perversities* (1881); *The Pagans* (1881); *A Wheel of Fire* (1885); *Berries of the Brier* (poems, 1886); *A Lad's Love* (1887); *Sonnets in Shadow* (poems, 1887); *The Philistines* (1888); *Prince Vance* (with Eleanor Putnam, 1888); *Abrecht* (1890); *A Book o' Nine Tales* (1891); *The Poet and His Self* (poems, 1891); *Told in the Gate* (1892), Oriental stories in verse.

Bates, CYRUS STEARNS, D. D.: clergyman and educator; b. at Chester, O., Dec. 31, 1840; graduated at Cincinnati Law College 1865, and at the Theological Seminary of the Diocese of Ohio at Gambier 1873; ordained 1873, and became rector Newark, O., 1873; Professor of Systematic Divinity in the Theological Seminary of the Diocese of Ohio 1878-84; rector St. Paul's, Cleveland, 1884.

Bates, EDWARD, LL. D.: lawyer and attorney-general of the U. S.; b. at Belmont, Goodland co., Va., Sept. 4, 1793; emigrated to Missouri in his youth. He became a political friend of Henry Clay, and was elected a member of Congress in 1827. He presided at the national convention of the friends of internal improvement which met at Chicago in 1847; opposed the repeal of the Missouri Compromise in 1854; Mar., 1861, President Lincoln appointed him Attorney-general of the U. S.; resigned in 1864. D. in St. Louis, Mar. 25, 1869.

Bates, JOSHUA: b. in Weymouth, Mass., in 1788. He removed to London in 1826, and became a partner and eventually the head of the banking-house of Baring Brothers & Co.; was umpire in the contested international claims arbitration growing out of the war of 1812-15. He was the principal founder of the Boston Free Library, to establish which he gave \$50,000, on the condition that it should be "perfectly free to all, with no other restrictions than may be necessary for the preservation of the books." Bates Hall in the library perpetuates his name. He afterward contributed books to the value of \$50,000. D. Sept. 24, 1864. See *Memorial of Joshua Bates* (1865).

Bates, JOSHUA, D. D.: b. at Cohasset, Mass., Mar. 20, 1776; graduated at Harvard in 1800; was ordained pastor of the Congregational church at Dedham, Mass., in 1803; was president of Middlebury College, Vt. (1818-39); was for a time chaplain of the U. S. Senate; and pastor in Dudley, Mass. (1843-54). He published various discourses, sermons, and other writings. D. in Dudley, Mass., Jan. 14, 1854.

Bates, SAMUEL PENNINGMAN, LL. D.: b. at Mendon, Mass., Jan. 29, 1827; graduated at Brown University in 1851; principal of Meadville Academy, Pa. (1852-57), where he did much to stimulate the cause of education. In 1857 he became superintendent of schools in Crawford co., Pa.; in 1860 deputy State superintendent; in 1866 State historian of Pennsylvania. He has published various works, among which are a *History of Pennsylvania Volunteers* (5 vols., 1873); *History of the Colleges of Pennsylvania*; *School Laws of Pennsylvania*. He also prepared *Armour's Lives of the Governors of Pennsylvania* (1873); *Battle of Gettysburg* (1878); *Life of Gen. O. B. Knowles* (1878); *Battle of Chambersville* (1882).

Bates, WILLIAM, D. D.: one of the most ornate and learned of the English Nonconformist writers; was b. Nov., 1625, and d. in Hackney, July 14, 1699. He assisted at the Savoy Conference for reviewing the Liturgy. Soon after the restoration of Charles II. he was made one of His Majesty's chaplains, and but for his Nonconformity might have become a bishop. His contemporaries called him the "silver-tongued." In 1681 he published (anonymously) *Vita Selectorum Aliquot Virorum*. His most valuable treatise is *The Harmony of the Divine Attributes in the Contrivance and Accomplishment of Man's Redemption*. His collected works were published in 1700, again in 1723, and again in 1815, the last time by Farmer, in 4 vols. 8vo.

Batesville: capital of Independence co., Ark. (for location of county, see map of Arkansas, ref. 2-E); on railroad and White river; 90 miles N. N. E. of Little Rock. It is the seat of Arkansas College. The river is navigable for steamboats to this point, and part of the year for 200 miles above. Batesville has woolen manufactures, flouring-mills, furniture-factory, and lumber-mills. Pop. (1880) 1,264; (1890) 2,150; (1892) town census, 2,700. EDITOR OF "GUARD."

Batesville: town; Ripley co., Ind. (for location of county, see map of Indiana, ref. 8-G); on C., U., C. and St. L. R. R.; 50 miles W. of Cincinnati, O.; has a graded school and 2 parochial schools, 7 furniture-factories, and a candy-factory. Pop. (1890) 1,169; (1892) estimated, 2,000.

EDITOR OF "INDEPENDENT RECORD."

Batfish (*Malthe respertilio*): a fish of the West Indies and Florida waters, remarkable for its peculiar shape. Its pectoral and ventral fins resemble the legs of a frog. Its mouth is small, and its skin rough, with bony tubercles. It is of no value.

Bath: the application of water or other liquid, or of spray or vapor, to the body for the purpose of cleansing the surface or of preserving or restoring health. Water employed in the bath is an important agent in the treatment and prevention of disease. In ancient Greece, Rome, Germany, and Judea, in Mohammedan lands (by religious precept), as in modern Finland and some other countries, bathing may be regarded as almost universal, though in desert countries the Moslems use sand instead of the water which is there so precious. Some of the American Indians, though not otherwise remarkably clean, practiced bathing in water or steam even to excess. Surf-bathing is a nearly universal pastime on many islands of the Pacific. The ancient Romans had extensive public baths—institutions which of late have been revived in Europe and America on a smaller scale, but in a manner not liable to the serious abuses which disgraced the Roman baths. See ROMAN ARCHEOLOGY.

The "hot" bath and vapor bath are above 99° F., the normal heat of the blood; warm, tepid, and cold baths being of lower temperature. The vapor bath of water or alcohol accelerates the heart's action, softens the skin, and produces profuse sweating, and is useful in various skin diseases, in chronic rheumatism, and in some diseases of the kidneys, etc. The hot bath is also stimulant. Locally applied, it relieves pain and allays inflammation. The hot bath is often employed in the convulsive diseases of children, but its effect may be a profound one; and the tepid or warm bath is much safer, since the skin of a child is extremely sensitive to heat and cold. The hot bath sometimes causes a sense of choking, and a degree of giddiness or headache. When its action is favorable, profuse sweating results, and on this account it is sometimes a most valuable adjunct in the treatment of kidney disease when the excretion of urine fails. The warm bath is a sedative, usually inclining one to inactivity or sleep. It is useful in feverish or restless conditions and in eruptive diseases, but is not to be recommended in acute diseases of the chest, which may be aggravated by it. The cold and tepid baths are those most generally to be employed. Cold bathing ought never to be practiced while the person is exhausted or perspiring freely; and there are many nervous, thin, and sensitive persons who can not safely endure the shock and loss of heat which it occasions. It is also dangerous in old people, in whom the sudden shock with revulsion of the blood to the interior from contraction of the blood-vessels of the skin may cause rupture of fragile vessels of the brain. In a healthy person with good powers of reaction, and followed by vigorous friction, there is probably no greater general stimulant to healthy nutrition, no better tonic than the cold bath. In disease it has in recent years assumed a place of most positive value, and especially is this true of typhoid fever. Its general tonic influence, its effect

on temperature and on the nutritive processes, rob this disease of many of its untoward symptoms and of much of its danger. The mortality from this disease has been reduced from 15 to 20 per cent. to 5 per cent., and in one series of over a thousand cases less than 1 per cent. died. The apparent cruelty of plunging a fevered patient in a cold bath, and the involuntary groaning of the patient while being bathed, have militated against the acceptance of the bath by the public and some physicians; but those who have compared the method with the old plan of treatment, and statistics, give evidence to the relief of bad symptoms and the great decrease of mortality secured. Ten per cent. of all cases of typhoid fever now die who might be saved could physicians have the entire co-operation of the public in instituting this plan of treatment with cold baths. What has been said of typhoid fever applies also to other fevers, not excepting pneumonia. In cases of great prostration or other conditions rendering cold baths impracticable, cold sponging or the "cold pack" may be employed. The "cold pack" is given by wrapping the patient in wet sheets, and then covering him with a blanket.

Hip baths, foot baths, and other local baths are occasionally required. The hot foot bath especially has received popular and scientific sanction in "colds." Various sulphur and other springs have a direct effect in skin diseases, and useful saline and other principles are no doubt capable of absorption into the system by the skin. Various drugs are used in vapor baths, and act upon the patient after absorption. Sea-bathing has a peculiar tonic effect upon some patients. Besides the above, the "Turkish" and "Russian" baths have been devised, which combine a thorough and direct detergent effect upon the skin with the various advantages of the warm and tepid bath, adding thereto the often invaluable results of manipulation or "kneading" the patient, a process the importance of which in selected cases can hardly be overestimated. "Wine baths," "mud baths," and other devices have been tried in different diseases, often with more or less benefit to the patient.

Revised by WILLIAM PEPPER.

Bath (anc. *Aquæ Solis*): a city of England; capital of Somersetshire; beautifully situated in a valley on the river Avon; 20 miles from its mouth and 102 miles by rail W. S. W. of London; lat. 51° 23' N., lon. 2° 22' W. (see map of England, ref. 12-G). The houses are mostly built of white freestone, "Bath oolite," quarried in the vicinity. Bath presents perhaps a finer appearance than any other city of England, which is partly a consequence of the configuration of its site. This is in the form of an amphitheater, on the declivity of which the finest streets extend in successive terraces. The principal public buildings are the Abbey church, in the latest Gothic style, 210 feet long; St. Michael's church, the guild-hall, an elegant theater, a masonic temple, and the assembly and concert rooms. The beauty of the situation, the mildness of the climate, and the curative efficacy of its hot saline springs render Bath a fashionable place of resort. The temperature of the springs, four in number, varies from 97° to 117° F. They rise on the bank of the river, and discharge 184,320 gal. daily. This water is recommended for serofula, palsy, gout, cutaneous diseases, etc. This city sends two members to Parliament. The Romans erected baths at this place in the first century, and called it *Aquæ Solis*. Numerous Roman antiquities have been found in and near Bath. Pop. (1891) 51,843.

Bath: city and railroad center; capital of Sagadahoc co., Me. (for location of county, see map of Maine, ref. 10-C); on the right (west) bank of the Kennebec river; 12 miles from the ocean, 30 miles S. of Augusta, and 36 miles N. E. of Portland. It is built on uneven ground, is lighted with gas and electricity, is advantageously situated for navigation, and has steamboat communication with Boston and Portland. The principal business of Bath is ship-building, and a large iron ship-building plant has been established and has received several Government contracts. There are also many extensive manufactories of lumber, a large one of oil-cloth, a large iron-foundry, brass-foundry, cordage-factory, and machine and boiler shops. Bath has long been noted for the excellence of its schools, and has a fine system of water-works. Pop. (1890) 8,723. Editor of "TIMES."

Bath: railroad junction and capital of Steuben co., N. Y. (for location of county, see map of New York, ref. 6-E); on the Cohocton creek, and the main line of the D., L. and W. R. R., on the Rochester branch of the N. Y., L. E. and W. R. R.; 99 miles E. of Buffalo, 74 miles S. S. E. of Rochester,

36 miles W. of Elmira, and 310 miles from New York. It has a jail and court-house, six churches, a free library and reading-room, a soldiers' home, an orphan asylum, and shoe, sash, blind, door, harness, and other factories. Pop. (1880) 3,183; (1890) 3,261. Editor of "FARMERS' ADVOCATE."

Bath Brick: See BRISTOL BRICK.

Bath, Knights of: a military order in Great Britain deriving its name from the ceremony of bathing which was performed at the initiation of the knights. The earliest authentic instance of this ceremony was at the coronation of Henry IV. (1399). The last occasion on which this ceremony was used was the coronation of Charles II. in 1660, after which the order fell into oblivion until it was revived by George I. in 1725. It is second in rank among the orders of England, the order of the Garter being first.

Bathometer [from Gr. *Bathos*, depth + *μέτρον*, measure]; any apparatus for the measurement of depths of water. In many cases it consists of a very elaborate system of sounding machinery and apparatus, and depths in the Pacific Ocean of 4,655 fathoms and over have been determined by such instruments with what is thought to be very considerable precision. The depth is indicated in some cases by the compression of a mass of air within a closed chamber, reached only by the pressure of the surrounding water through a narrow passage filled with oil, mercury, or water; in other instances by the use of other equivalent devices. The pressure-gauge thus made is sunk to the bottom by a sounding-line, and is again brought to the surface either by the line by which it is let down or it is detached at the bottom by contact with the earth and floats to the surface by its own levity. For considerable depths the sounding-line is of fine steel wire, and a steam-engine is employed to drive the windlass by means of which it is lowered and raised. See DEEP-SEA EXPLORATION.

Bathori, *baa'tō-rèc*: name of a noble family of Hungary. —ELIZABETH, wife of Count Nádasdy, is infamous on account of her cruelty. She was shown to have murdered no less than 650 maidens for the purpose of renewing her youth from time to time by bathing in their warm blood. She was condemned in 1610 to imprisonment for life, and shut up in her fortress of Csej, where she died 1614. See Baring-Gould's *Book of Werewolves* (1865).

Bathurst: a thriving town of New South Wales; capital of Bathurst County; on the Macquarie river; 98 miles W. N. W. of Sydney (see map of Australia, ref. 7-1). It is connected with Sydney by a fine road leading over the mountains. It is in a mining as well as a pastoral district of New South Wales. Mr. Hargreaves, a California digger, first discovered gold on Bathurst Plains, Feb. 12, 1851. The diocese includes 120,000 sq. miles of New South Wales. Pop. (1891) 9,069.

Baths: See THERMÆ.

Bathurst: a port of entry; capital of Gloucester co., New Brunswick; on the Bay of Chaleurs; 175 miles N. by E. of St. John; has a good harbor and an extensive trade in lumber, trout, and salmon. Pop. 3,000.

Bathyl'ius [mod. from Gr. *Bathús*, deep + *βίος*, life]: a name given by Huxley to a granular gelatinous substance of supposed albuminous or protoplasmic nature, which is believed to cover large areas of the ocean's bed, and to represent a very low form of animal life. Its existence is now generally denied.

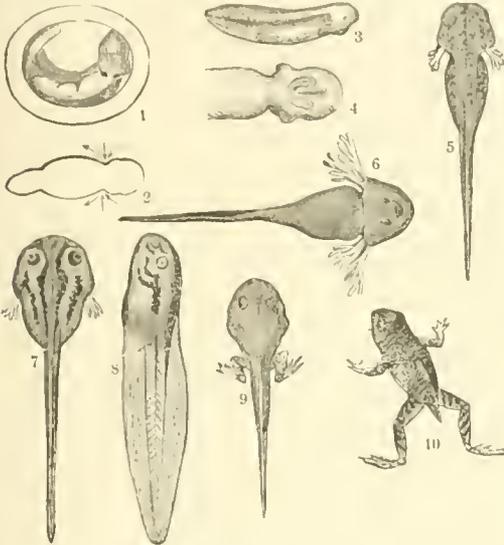

Baton Rouge, *bát'ün-roozh*: capital of Louisiana and of the parish of East Baton Rouge (for location of county, see map of Louisiana, ref. 10-E); on the left (east) bank of the Mississippi, 120 miles above New Orleans by river (89 by rail and 72 as the crow flies); on the Louisville, New Orleans and Texas and the Texas and Pacific R. R.s.; lat. 30° 28' N., lon. 91° 11' W. It stands on a bluff which rises about 25 feet above the highest inundations. The river below the city is bordered by plantations of sugar-cane, groves of tropical fruit-trees, and handsome villas and gardens. The seat of government was established here in 1847. The Capitol was completed in 1852 at a cost of \$216,000. It contains a State-house, which was burned by Federal troops during the civil war, but rebuilt in 1882 and now occupied by the officers of the State government, a State university, a collegiate institute, a seminary for young ladies, public and private schools, an institute for the deaf and dumb, a school and industrial home for the blind, two orphans' homes, a Catholic academy for young ladies, and a penitentiary, in which are about 800 convicts. A convention,

which met here Jan. 21, 1861, on the 26th adopted the ordinance of secession. The city was taken by the U. S. forces May 7, 1862. On Aug. 5, 1862, a Confederate force, numbering 5,000, under Gen. John C. Breckenridge, attacked the garrison under Gen. Thomas Williams, but was repulsed after a fierce contest of two hours' duration, in which Gen. Williams was killed. The place was shortly after evacuated by the Union forces, but about a month afterward was reoccupied, and held by Federal troops to the close of the war. The arsenal has been broken up. For several years from the close of the civil war New Orleans was the seat of the State government. Pop. (1870) 6,498; (1880) 7,197; (1890) 10,478. EDITOR "CAPITOLIAN-ADVOCATE."

Batoo Khan: See **BATU**.

Batoom, or Batoum: See **BATUM**.

Batra'chia [from Gr. *βάτραχος*, frog]: one of the classes of vertebrate animals, including salamanders, frogs, toads,

Hatching and progress of the frog (from 1 to 10).

etc. Used in this sense, the name is synonymous with *Amphibia* (q. v.). Batrachians are cold-blooded and oviparous, and in most living species are without scales, and the blood is partly aerated through the skin. The young, for the most part, breathe by gills like those of fishes. They generally have limbs, but not always. The young assume a fish-like form (as the tadpole), and finally, when adult, with few exceptions, lose their gills and commence breathing by lungs.

Revised by D. S. JORDAN.

Batrachida: See **TOAD-FISH**.

Bat'rachomyoma'chia [from Gr. *βάτραχος*, frog + *μῦς*, mouse + *μάχη*, battle]: the name of a mock-heroic poem, the subject of which was the battles of the frogs and mice.

Bataks, called also **Battas**: a native race in the interior of Northern Sumatra. They are only partly subjugated by the Dutch, an independent territory still remaining between the parallels 2° N. and 4° N. They claim to be the aborigines, are brave but peaceful, and number in all about 300,000. They are cannibals, but those under the Dutch are easily dissuaded from this practice. They have little knowledge of the arts, but can usually read and write and have a literature. The books are written on bark or bamboo staves, are generally in prose, and relate to witchcraft and incantations, or consist of stories, riddles, etc. The language is poor in general terms but very rich in inflections, and it is doubtful whether most nearly related to the old Javanese or to the Malay. M. W. H.

Battal'ion (Fr. *bataillon*): a tactical unit of infantry; a body of infantry amounting to nearly 1,000 men. In the American cavalry and artillery service eight (in infantry ten) companies constitute a battalion. The full complement of a battalion of British troops is usually ten companies. The British infantry regiments in time of peace have each one battalion, but the regiment of the continental powers is mostly so large as to comprise several battalions. In the U. S. army an infantry regiment has one battalion, while regiments in the other arms of the service have two. A de-

tachment of infantry of more than one company, and less than one regiment, is sometimes called a battalion.

Battel [orthographical variant of *battle*]: an ancient mode of trial by single combat, usually called "wager of battle." It had its origin among the German tribes, and was introduced into England by William the Conqueror at the time of the Norman Conquest. It was used, however, in only three cases—in the court of chivalry, in appeals of felony, and in the issue joined in a writ of right to determine the title to real property. In criminal cases the accuser and the accused fought in person; in civil cases, by champions. The leading reason for requiring a champion in civil cases was that if the parties should engage in combat, and one of them should be killed, the proceeding would terminate by his death, and the object of the contest would be frustrated. This barbarous mode of trial, which was based on the idea that heaven would give the victory to the injured or innocent party, though for a long time practically disused, continued to be recognized as part of the law of England till the year 1819, when it was abolished by statute. The details of the method of proceeding in the case of a writ of right will be found in the third book of Blackstone's *Commentaries*, p. 337.

Battering-ram (in Lat. *aries*): an engine of war used by the ancient Greeks and Romans to make a breach in the wall of a town or fortress. It consisted of a heavy beam of wood nearly 100 feet long, one end of which was armed with a mass of iron or bronze in the form of a ram's head. It was suspended by a chain or rope from a crane or trivet, and was made to swing backward and forward in a direction nearly horizontal. Sometimes a huge mass of stone, armed with a ram's head and placed on wheels, was driven against the walls with great force. About 100 men were employed in impelling it against the wall. To protect these men a wooden roof (*testudo*) was constructed, and the whole machine was mounted on wheels. The blows of the ram were directed against the same point with gradually increasing momentum, which, if continued long, hardly any wall could resist. These engines continued to be used in the Middle Ages until superseded by cannon.

Battershall, JESSE PARK, Ph. D.: b. in Troy, N. Y., May 26, 1851; began his chemical education 1867 at School of Mines, Columbia College, New York; studied under Prof. Wöhler at the University of Göttingen, Germany, for a year, passed a semester at the University of Leipzig with Prof. Kolbe; spent two years under Prof. Fittig at the University of Tübingen, Württemberg, where he received the degree of doctor of natural sciences; his inaugural dissertation is a description of several new derivatives of naphthalene, including the aldehyde of isonaphthoic acid (C₁₁H₈O), its amido-compound, hydroisonaphthamide (C₁₁H₈N₂), sulpho-naphthoic and isosulphonaphthoic acids (C₁₁H₇O₂S) and salts, and several isomeric oxynaphthoic acids (C₁₁H₈O₂). After attending the chemical course of Prof. Marignac in Geneva he returned to the U. S., where he was engaged as analytic and consulting chemist; an English translation by him of Naquet's *Legal Chemistry* has been published. D. Jan. 12, 1891.

Batterson, HERMON GRISWOLD, D. D.: b. at Marble Dale, Conn., May 28, 1827; ordained 1861; has held charges in Texas, Minnesota, Pennsylvania, and New York; published *The Missionary Tune-book* (1867; 10th ed. 1870); *The Churchman's Hymn-book* (1870); *Sketch-book of the American Episcopate* (1878; 3d ed., enlarged, 1891); *Christmas Carols, and other Verses* (1878); *The Pathway of Faith* (1885; 2d ed. 1886).

Battery [Fr. *batterie*; from *battre*, beat, from L. *battuere*, beat]: a military term used in various senses. A battery employed in the defense of a fortress is a row of heavy guns mounted on an earthwork or other platform; any one of the lines of a fortress which is armed with siege-guns. If they have a bomb-proof cover, they are casemated batteries. A battery used in attacking a fortified place is a number of siege-guns or mortars placed in a line and covered with a parapet. These batteries receive various names, expressing their design, position, etc. In field operations a battery is a number of guns, with the necessary horses, gun-carriages, artillerymen, and officers to manage the guns. The Austrians and Italians have eight pieces to a battery, and so likewise do the Russians, except for their horse-batteries, in which six are used. All other nations have six pieces to a battery. In reference to the weight of the ordnance,

they are divided into *heavy batteries* and *light batteries*. The term battery is also applied in a narrower sense to the *personnel* or complement of men and officers who serve a set of guns.

Battery, in law: See ASSAULT AND BATTERY.

Battery, VOLTAIC OR GALVANIC: a device for the generation of the electric current by chemical action. The essential parts of the voltaic cell are: (1) A liquid capable of electrolytic conduction; (2) two metal terminals, submerged in the liquid and not in contact with each other below the surface. One of the metals must be acted upon chemically by the liquid.

Under these conditions there will be a difference of potential between the metals, and when they are connected with each other a current will flow through the circuit thus formed. In spite of this flow of electricity, the difference of potential between the terminals of the cell will be maintained by the chemical action going on within the cell, the activity of which will continue until the materials are exhausted.

A typical case is that of zinc and copper in dilute sulphuric acid. When the external circuit of a cell of which these are the active parts is closed, the following reactions occur:

The zinc is thus converted into zinc sulphate, and hydrogen is set free at the copper pole. The result of this reaction is to give the copper a positive charge, with respect to the zinc, and to send a current through the outside circuit from copper to zinc. This is the simplest of voltaic cell reactions. In practice it is necessary to modify it. On the one hand, the zinc must be protected from attack during such times as the cell is resting. This is done by amalgamating it. On the other hand, the presence of free hydrogen at the copper pole creates a counter electro-motive force, which soon overcomes the proper voltaic action. To prevent this "polarization of the cell" some substance rich in oxygen and capable of giving up its oxygen to the nascent hydrogen is introduced. Nitric and chromic acids are excellent "depolarizers." Dioxide of manganese and the black oxide of copper are also used. The depolarizer is frequently placed in a porous cup, with the positive terminal of the cell surrounded by it or submerged in it. Platinum or carbon is substituted for copper whenever the latter metal is liable to be attacked by the depolarizer. The number of combinations in use for the production of voltaic electricity are too numerous to be mentioned in detail here.

Voltaic cells are divided into three groups: (1) Open-circuit cells, which are designed to furnish a current for a moment only at a time, as in ringing electric bells, etc., but which should remain in working condition for a long time without attention or replenishing; (2) closed circuit cells, which are intended to furnish a current continuously for long intervals of time; (3) standard cells, which are not constructed for the generation of appreciable currents, but are used as standards of electro-motive force. Accumulators or storage batteries are "secondary" voltaic batteries, in which the chemical conditions necessary to the production of current have been obtained by previous electrolytic action within the cell itself. See ACCUMULATOR.

Strictly speaking, the term battery should not be applied to a single voltaic cell, but to a number of such cells used in combination. See ELECTRICITY AND ELECTROLYSIS; also Carhart, *Primary Batteries* (Boston, 1891).

E. L. NICHOLS.

Bat'tey, ROBERT, M. D.: b. in Augusta, Ga., Nov. 26, 1828; took his degree in medicine at the Jefferson Medical College; practiced his profession in Rome, Ga., and by his contributions to the journals (one to the London *Lancet* on vesico-vaginal fistula) soon acquired reputation; was called to the chair of Obstetrics in the Atlanta Medical College; claimed to have first performed strict ovariectomy or oöphorectomy (1872), an operation confined to ovarian tissue. D. at Rome, Ga., Nov. 8, 1895.

Batthyányi, báñt yaan-yeé, LOUIS, Count: a Hungarian patriot; b. at Presburg in 1806. He favored the liberal cause, and was appointed president of the ministry formed in Mar., 1848. Finding his position untenable, he resigned about six months later. After his friends had been defeated in battle by the Austrians, he was tried by a court martial, and, though his conduct had been moderate, he was shot Oct. 6, 1849. See Horvath, *Louis Batthyányi, ein politischer Märtyrer* (1850).

Battle: See TACTICS.

Battle: a town of Sussex, England; about 7 miles N. W. of Hastings (see map of England, ref. 13-K); in a valley enclosed on three sides by wooded hills. It is noted for the manufacture of gunpowder. Pop. 3,500. It derived its name from the great battle (usually called the battle of Hastings, and sometimes the battle of Senlæ) which was fought near it on Oct. 14, 1066, between William the Conqueror and the Saxon King Harold. The victorious Norman erected here a large abbey, called Battle Abbey, now in ruins.

Battle-axe: weapon used in warfare from the earliest times, but not by all peoples or at all epochs. The early Greeks used a double-axe (bipennis), which they seem to have borrowed from the Asiatics. Among the northern nations of Europe the single-bladed axe was used from the earliest times; this was at first made with a stone head, then with one of bronze, and finally with a head of iron or steel; the weapon being, in fact, merely the utensil modified. The battle-axe as used by foot-soldiers had naturally a long handle of wood, and was called pole-axe; that used by horse-men, requiring to be swayed by one hand alone, was, later, shorter and sometimes made entirely of metal.

RUSSELL STURGIS.

Battle Creek: city and railroad center; Calhoun co., Mich. (for location of county, see map of Michigan, ref. 8-I); at the confluence of the Kalamazoo and Battle Creek rivers, 120 miles W. of Detroit. It contains Battle Creek College, controlled by the Seventh-day Adventists, whose headquarters are here. It has also a large sanitarium, and its manufactures are extensive, especially in threshing-machines and farm implements. It has good water-power and several flouring-mills, etc. Pop. (1880) 7,063; (1890) 13,197; (1894) 15,222. EDITOR OF "DAILY MOON."

Battledoor, or **Battledore** [probably from Sp. *batidor*, an instrument of the same shape used in beating clothes in washing]: an instrument with a handle and a flat board, or piece of leather or network stretched tightly on a frame, and used to strike a ball or shuttlecock. Battledoor and shuttlecock, played with the above instrument, has been a favorite amusement in Europe since the fourteenth century or earlier.

Battleford: important trading-post in Saskatchewan, Northwest Territories of Canada; at the junction of the Battle river with the Saskatchewan; 70 miles N. of the Canadian Pacific Railway (see map of Canada, ref. 8-F); 1876-83, capital Northwest Territory. The insurrection of 1885, headed by Louis Riel, who was executed for his part in it, occurred near Battleford.

Battle-ground: on railroad, Tippecanoe co., Ind. (for location of county, see map of Indiana, ref. 5-C); where the celebrated battle of Tippecanoe was fought between Gen. Harrison and the Indians under Tecumseh and his brother, the "Prophet," Nov. 7, 1811.

Batu (**Baton** or **Batoo**) **Khan**, báa-too'kaän: nephew of Ogdai Khan and grandson of Gengis Khan; a Mongolian chief and governor in Kipchak. He was put in command, 1235, of the Mongol army ordered to advance into Europe. Crossing the Volga river, he appeared before Riazan, took it by assault, Dec. 21, 1837, and sacked it with savage slaughter; then he laid waste Moscow; at Kozelsk, near Kaluga, he held a "carnival of death"; razed Kieff to the ground. He now led his troops into Hungary as far as Pesth and Gran, inflicting a terrible defeat on the Hungarians near Tokay, Dec., 1241. Here he was recalled by the death of his uncle into Mongolia. He was rewarded with the government of the vast plains from the Carpathian Mountains to Balkash Lake. He established his headquarters on the Volga, and from his embroidered and gilded tent arose the Golden Horde. D. in 1255.

Bat'tue [Fr. *femin. of partie, of battre*: used subst., a beating]; a mode of hunting wild animals or killing game on a large scale. A number of men, arranged at equal distances, by beating the bushes drive the animals toward a stationary party of hunters, who are waiting to shoot them. Sometimes the array of beaters is circular, and they drive the game from different parts of a large tract of forest to a common center. Battues in Great Britain are chiefly practiced in extensive preserves of pheasants, rabbits, and hares.

Batum, báa-toom', or **Batoum**: important seaport on the southeast coast of the Black Sea; 110 miles S. E. of

Trebizond, 4 miles N. of the mouth of the Tchouk river (see map of Russia, ref. 12-E). It formerly belonged to Asiatic Turkey, but by the treaty of Berlin, July 13, 1878, it became a free Russian port. It was closed by Russia in 1886. It has considerable trade and the best harbor on the east coast of the Black Sea. Immense quantities of Russian petroleum are exported. It is the terminus of a railway to the Caspian, and is provided with enormous storage accommodations for the oil. Pop. about 25,000.

Baudelaire, bôd'lä'r', CHARLES PIERRE: French poet; b. in Paris, Apr. 9, 1821. In 1857 his volume of poems *Fleurs du Mal* caused a commotion by its entire disregard of moral distinctions and its extreme frankness of style. In the second edition (1861) several poems had to be suppressed. Other productions were *Théophile Gautier* (1859); *Les paradis artificiels, opium et haschich* (1860); *Richard Wagner et Tannhäuser* (1861), etc. His translation of the works of Edgar Allan Poe into French (3 t., 1856-58) introduced this American author to his now numerous circle of French admirers. He is at his best in *Petits Poèmes en Prose*, while his *L'Art romantique* is a collection of essays in subtle and raffiné criticism. Since Baudelaire's death, his *Souvenirs Correspondances, etc.* (1872), and his *Œuvres complètes* (4 t., 1869) have appeared. He is still worshiped by the so-called naturalist and decadent schools of French writers. D. in Paris, Aug. 31, 1867. See Ch. Assolméau, *Charles Baudelaire, sa vie et son œuvre*, Paris, 1869. A. R. MARSH.

Baudelocque, bôd'lok', JEAN LOUIS: a skillful French surgeon; b. in Heilly, Picardy, in 1746. He was selected by Napoleon to attend the Empress Marie Louise as first accoucheur. He wrote an able work on the *Art des Accouchements* (2 vols., 1781). D. in Paris, May 1, 1810.

Baudissin, bow'dis-sin, WOLF HEINRICH FRIEDRICH KARL, Count: German author; b. in Rantzau, Jan. 30, 1789. He translated, together with Tieck, a number of Shakespeare's works. Under the title of *Ben Jonson und seine Schule* (2 vols., 1836) he published translations of the works of other English authors. He also made translations of Molière's comedies (1865-67). D. in Dresden, Apr. 4, 1878.

Baudissin, WOLF WILHELM FRIEDRICH, Graf von: German theologian; b. in Sophienhof, Holstein, Sept. 26, 1847; studied at Erlangen, Berlin, Leipzig, and Kiel; became professor extraordinary in the theological faculty at Strassburg 1876; ordinary 1880; at Marburg 1881; known chiefly by his *Studien zur semitischen Religionsgeschichte* (Leipzig, 2 vols., 1876-78); and *Die Geschichte des Alttestamentlichen Priestertums untersucht* (1889). A. R. MARSH.

Baudrillart, bôd'rê'lä'r', HENRI JOSEPH LÉON: French political economist; b. in Paris, Nov. 28, 1824; became professor in Collège de France 1852; Professor of the History of Political Economy 1866; editor *Journal des Economistes* 1855-92; d. Jan. 24, 1892. Author (in French) of *Philosophy of Political Economy* (2d ed., 1883); *History of Private and Public Luxury* (1878-80); *The Agricultural Population of France* (1880-88).

Baudry, bôd'ree', PAUL JACQUES AUBÉ: b. at La Rochesur-Yon, France, Nov. 7, 1828; d. in Paris, Jan. 17, 1886; one of the great artists of the modern French school; pupil of Drölling; Grand Prix de Rome 1850; first-class medal, Salon 1857; commander of Legion of Honor 1875; medal of honor, Salon 1881; member of the Institute 1870. Baudry is pre-eminently a stylist, and his work shows his love of the classic. It may be said of him that he was inspired chiefly by the great masters of the Italian Renaissance, and was faithful to the precepts upheld by M. Ingres, though, like most artists of his time, he also felt the influence of Delacroix. His greatest decorative works are those in the foyer of the Grand Opera-house in Paris, on which he spent some of the best years of his life (1866-74). He painted a number of beautiful pictures of nude figures and compositions, one of the finest (1857) of which is *Fortune and the Child*, in the Luxembourg Gallery. *St. John* (1861) and *The Wave and the Pearl* (1863) are two of his most beautiful works. His ceiling *Glorification of the Law* is in the Palace of Justice, Paris. Baudry is a portrait-painter of elegant taste and a technician of wonderful brilliancy. His full-length portrait of Gen. Cousin Montauban, Count of Palikao (1875), standing beside his horse, with his right arm resting on the saddle and his sword held with the butt of the scabbard resting on the ground, is such a work as can only be compared with the masterpieces of Velasquez or Van

Dyke. Baudry was a colorist of great distinction, and his drawing is subtle and refined. WILLIAM A. COFFIN.

Bauer, bow'er, BRUNO: a German rationalistic theologian and biblical critic; b. in Eisenberg in Saxe-Altenberg, Sept. 6, 1809; was the son of a painter on porcelain, and studied theology and philosophy in the University of Berlin, in whose theological faculty he became privat-docent 1834; professor extraordinary at Bonn 1839. He was a pupil of Hegel, and at first belonged to the right wing of the Hegelians, holding to the idea that science and revelation, philosophy and theology, could be brought into perfect harmony with each other. His *Kritische Darstellung der Religion des alten Testaments* (Berlin, 1838, 2 vols.) was based on this view. But his critical studies of the Bible led rapidly to a rupture, as shown by his *Die evangelische Landeskirche Preussens und die Wissenschaft* (Leipzig, 1840); *Kritik der evangelischen Geschichte Johannes* (Bremen, 1840); and *Kritik der evangelischen Geschichte der Synoptiker* (Leipzig, 1841-42, 3 vols.). Then followed an equally boisterous breaking away from Hegel: *Passion des jüngsten Gerichts über Hegel, den Atheisten* (1841), and *Hegels Lehre von Kunst und Religion* (1842). The personal result of his extremely free biblical criticism was his deposition from his professorship in 1842. He then removed to Berlin, and produced book after book full of learning and full of speculation, but those on religious matters are almost worthless. He became a by-word for learned trifling carried to the verge of insanity. In 1843 he wrote *Das entdeckte Christenthum*, which was suppressed before its publication, and published a general critical review of the German radicalism of the period. In connection with Jungwitz and his brother Edgar he published *Geschichte Deutschlands und der Französischen Revolution unter der Herrschaft Napoleons* (Charlottenburg, 1846, 2 vols.). But after spending several years on political and historical researches, producing, beside the book named, *Geschichte der Politik, Cultur und Aufklärung des 18 Jahrhunderts* (1843-45, 4 vols.); *Die bürgerliche Revolution* (Berlin, 1849); *Der Untergang des Frankfurter Parlaments* (1849), etc., he returned to the field of biblical criticism; if possible, still more antagonistic to the reigning views than formerly he had been. In his *Kritik der paulinischen Briefe* (Berlin, 1850), he attempted to show that the four leading Epistles, which had never before been questioned, were the production of the second century. According to his later works (e.g. *Christus und die Caesaren*, Berlin, 1877; 2d ed., 1879, etc.) Seneca was the real founder of Christianity! D. in Rixdorf, near Berlin, Apr. 13, 1882. Revised by S. M. JACKSON.

Bauer, GEORG LORENZ: a German theologian and linguist; b. in Hilpoltstein, near Nuremberg, Aug. 14, 1755. He became Professor of Oriental Languages at Altdorf in 1789, and in Heidelberg in 1805. Among his works are *Hermeneutien Sacra Veteris Testamenti* (Leipzig, 1797), and *Biblische Theologie des neuen Testaments* (4 vols., 1800-02). He was a rationalist, and maintained that the Bible should be interpreted by grammatical and historical principles, as the ancient classics are. D. in Heidelberg, Jan. 12, 1806.

Bauer, WILHELM: a German inventor; b. at Dillingen, Dec. 23, 1822. He constructed a diving-boat for submarine operations, with which several successful experiments have been made. He also made improvements in torpedoes for the destruction of ships and in the firing of guns under water. Bauer served with distinction in the Schleswig-Holstein war of 1850, and afterward engaged in the service of Russia. D. in Munich, June 18, 1875.

Baunersfeld, bow'em-felt, EDUARD, von: Austrian poet and dramatist; b. in Vienna, Jan. 13, 1802; perhaps the most prolific playwright of modern Germany. As a young man he took part in the political agitations, culminating in 1848, for a reform of the Austrian administration. Of his works we may cite *Vermischte Gedichte* (1852); *Gesammelte Schriften* (12 vols., 1871-73); *Die Verlassenen*, a romance (1875). D. in Vienna, Aug. 9, 1890. A. R. MARSH.

Baughner, HENRY LOUIS, D. D.: Lutheran divine; b. at Abbotstown, Pa., about 1803; Professor of Greek and Belles-Lettres (1832-50) at Pennsylvania College, Gettysburg, and its president (1850-68). D. in Gettysburg, Apr. 14, 1868.

Baughner, HENRY LOUIS, JR., D. D.: Lutheran divine; b. in Gettysburg, Pa., Aug. 6, 1840; educated at Pennsylvania College, and its seminary in Gettysburg, Pa., and at Andover, Mass.; pastor in Wheeling, West Va., Norristown, Pa., Indianapolis, Ind., and Omaha, Neb.; Professor of Greek

Language and Literature in Pennsylvania College 1869 to the present, with the exception of three years in the pastorate, and as Professor of the Greek Language in Howard University, Washington, D. C. He supplied temporarily the chairs of Greek Exegesis (1870-74) and of Systematic Theology (1883-84) in the seminary at Gettysburg. Member of international committee on Sunday-school lessons since 1879, and from 1875 to the present has been editor of *The Augsburg Teacher*, Philadelphia. HENRY E. JACOBS.

Bauhin, bö'äh', GASPARD: a Swiss botanist and anatomist; b. in Basel, Jan. 17, 1560. He became Professor of Anatomy and Botany in his native city in 1588. He wrote valuable medical and botanical works, among which were *Prodromus Theatri Botanici* (1620), and *Pinnæ Theatri Botanici* (1623). D. in 1624. His brother John was collaborator with him, and the *Bauhinia* genus of plants with its two-lobed leaves was named for them.

Baum, HENRY MASON, D. C. L.: editor of *The Church Review* since 1881; b. at Earl Schuyler, Herkimer co., N. Y., Feb. 24, 1848; ordained 1870; held pastoral charges in Western New York, Wyoming, New Jersey, Central Pennsylvania; published *The Rights and Duties of Rectors, Churchwardens, and Vestrymen in the American Church* (1879); editor of *Church Reunion Discussed on the Basis of the Lambeth Propositions of 1888*. Reprinted from the *Church Review* for Apr. and Oct., 1890.

Baumé, bö'may', ANTOINE: French chemist; b. at Senlis, Feb. 26, 1738. He improved the manufacture of porcelain, made several inventions, and simplified several processes in industrial chemistry. Baumé's hydrometer is in general use among chemists. Among his works is a *Manual of Chemistry* (1763). D. Oct. 15, 1804. See Cadet de Gassicourt, *Éloge de Baumé*, 1806.

Baumgarten, bowm'gär-ten, ALEXANDER GOTTLIEB: a German philosopher; b. in Berlin, July 17, 1714; a disciple of Wolf. He became Professor of Philosophy at Frankfort-on-the-Oder in 1740; was one of the first of moderns to give scientific form and place to aesthetics. He published, besides other works, *Metaphysica* (1739) and *Æsthetica* (2 vols., 1750, unfinished). D. in Frankfort-on-the-Oder, May 26, 1762. See G. F. Meyer, *Leben A. G. Baumgarten's* (Halle, 1763), and J. Schmidt, *Leibnitz und Baumgarten* (Halle, 1875).

Baumgarten, MICHAEL: a German theologian; b. in Haseldorf, Holstein, Mar. 25, 1812; became Professor of Theology in Rostock in 1850. He published many books and periodicals in opposition to the State Church of Mecklenburg, in consequence of which he was removed from his professorship in 1858, and, afterward continuing his attacks, was imprisoned and fined. He was a founder of the Protestantverein (1865), which, however, he left in 1877, and an earnest advocate of disestablishment. He sat in the Reichstag in 1874, 1877, and 1878. He published many polemical writings and popular appeals in behalf of a people's Church; but of more account are his *Apostelgeschichte* (Halle, 1852, 2 vols.; 2d ed. Brunswick, 1859; Eng. trans. *The Acts of the Apostles*, Edinburgh, 1854, 3 vols.), and *Schleiermacher als Theologe für die Gemeinde der Gegenwart* (Berlin, 1862). D. at Rostock, July 21, 1889. See his *Life*, by H. H. Studdt, Kiel, 1891.

Baumgartner, ANDREAS, von: a German savant and minister of state; b. at Friedberg, in Bohemia, Nov. 23, 1793. He became Professor of Physics at Vienna in 1823, and Austrian minister of trade and public works in 1851. About this date he was chosen president of the Academy of Sciences in Vienna. He published a work called *Naturlehre* (1823). D. near Vienna, July 30, 1865.

Baumgartner, GALUS JACOB: a Swiss politician of the liberal party; b. in Altstätten, Zurich, Oct. 18, 1797. He took part in the revision of the constitution of St. Gall, and promoted the separation of the canton into Basel country and Basel city. He founded, Oct., 1842, the *Neue Schweizer Zeitung*, and published, among other works, *Die Schweiz in ihren Kämpfen und Umgestaltungen, 1830-50* (4 vols., 1853). D. in St. Gall, July 12, 1869.

Baumgarten-Crusius, LUDWIG FRIEDRICH OTTO: a German theologian; b. in Merseburg, July 31, 1788; became Professor Extraordinary of Theology at Jena 1812, and ordinary 1817. He played a prominent part as the defender of Schleiermacher's supernaturalism. Of his books may be mentioned *Lehrbuch der christlichen Sittenlehre* (Leipzig, 1827); *Lehrbuch der Dogmengeschichte* (Jena,

1831-32, 2 vols.), and *Kompendium der christlichen Dogmengeschichte* (ed. by Hase, Leipzig, 1840-46, 2 vols.). D. in Jena, May 31, 1843.

Baur, bowr, FERDINAND CHRISTIAN: Protestant theologian and historian; b. in Schmiden, near Cannstadt, Württemberg, June 21, 1792. He studied theology in the Blaubeuren Theological Seminary 1805-09, and in the University of Tübingen 1809-17; became Professor of Theology in the former 1817, and in the latter 1826. With the latter institution his fame is bound up, for there he produced those works in New Testament interpretation which for a time produced consternation in the conservative ranks, and created the Tübingen school of destructive criticism, which had its day. He had been a disciple of Schleiermacher, but became a Hegelian and applied Hegel's philosophy to Church history. The most striking statement of the school is that in the primitive Christian Church there was a feud between the followers of Peter (Judaic Christianity) and those of Paul (progressive Christianity), but it was not till the second century that there arose the Catholic Church, the resultant of the opposing forces. The New Testament, he claimed, bears witness to this struggle. The only portions of it produced before 70 A. D. were the four chief Pauline Epistles (Romans, 1 and 2 Corinthians, and Galatians)—the only ones whose Pauline origin he granted—and the Revelation, in which this alleged antagonism showed itself. The rest of the New Testament dates from the second century, and is "tendency-writing"—i. e. intended to promote unity. To this end the Acts and the Gospel of John especially were written. Even Matthew and Luke betray, he claims, the hand of partisans, while Mark is the bridge between them in the interest of peace. This theory is worked out with great learning and acuteness in Baur's *Paul* (Stuttgart, 1845; 2d ed. Leipzig, 1866-67, 2 vols.; Eng. trans. Lond., 1873-75, 2 vols.) and *Church History* (Eng. trans. covers only the first three centuries, 1878-79, 2 vols.; the orig., Tübingen, 1853-62, 5 vols., goes down to 1848). Of his untranslated works the chief are *Die christliche Lehre von der Dreieinigkeit und Menschwerdung Gottes* (Tübingen, 1841-43, 3 vols.); *Lehrbuch der christlichen Dogmengeschichte* (Stuttgart, 1847; 3d ed. Leipzig, 1867); and the posthumous *Vorlesungen über die christlichen Dogmengeschichte* (1865-67, 3 vols.). See Baur himself, *Die Tübingen Schule* (Leipzig, 1859); R. W. Mackay, *The Tübingen School* (London, 1863). D. at Tübingen, Dec. 2, 1860.

S. M. JACKSON.

Bautain, bö'täü', LOUIS EUGÈNE MARIE: a Roman Catholic philosopher and theologian; b. in Paris, Feb. 17, 1796. He became Professor of Philosophy at Strassburg 1819; suspended in 1822 on account of his advocacy of Fichte's views; turned priest 1828; ultimately was a popular preacher at Paris; became director of the Collège de Juilly in 1849, and Professor of Moral Theology in the Sorbonne 1853. He published numerous discourses and *Philosophie du christianisme* (Paris, 1835, 2 vols.); *La philosophie morale* (1840, 2 vols.); and especially *Étude sur l'art de parler en public* (1856; 2d ed. 1863; Eng. trans. *The Art of Extempore Speaking*, London, 1858; 6th ed. 1878; repr. New York, 1859; London ed. 1874). D. in Virolloy, near Versailles, Oct. 18, 1867.

Bautzen, bowt'sen, or **Budissin**, boo'dis-sin: a town of Saxony; on the Spree; and on the railway from Dresden to Görlitz; 35 miles E. N. E. of Dresden (see map of German Empire, ref. 5-6). It has a royal palace, a cathedral, two public libraries; also manufactures of woollens, linens, leather, hosiery, paper, etc. Pop. (1890) 21,517. Here occurred a great battle (May 20 and 21, 1813) between Napoleon and the allies, who finally retreated. The loss of the allies is estimated at 13,000, and that of Napoleon at 20,000 men.

Bava'ria [New Lat. from Med. Lat. *Boiaria*, i. e. the country of the *Boi'i* or *Boiarii*; in Ger. *Bayern* or *Bai'ern*]; a kingdom forming part of the German empire. It is, next to Prussia, the largest German state.

Geography.—It consists of two isolated portions: the eastern and larger portion is bounded N. by Prussia, Saxe-Meiningen, Saxe-Coburg-Gotha, Renss, and Saxony; E. and S. by Austria; W. by Württemberg, Baden, and Hesse-Darmstadt; the western and smaller portion, known as Rhenish Bavaria or the Palatinate, is bounded by Prussia, Alsace, Hesse-Darmstadt, and Baden. Area, 29,282 sq. miles. The larger portion of the country is mountainous, the principal mountains being the Algiä and Bavarian Alps in the S., the former of which reach an elevation of 9,000 feet; the Bohemian and Bavarian

Mountain forests on the eastern frontier; the Fichtel Mountains in the N. E.; the Franconia, Jura, and the Hardt. The main rivers are the Danube, which receives in Bavaria thirty-nine affluents, and the Main in the N. The Rhine forms part of the frontier of the Palatinate. The Danube and the Main are connected by the Ludwig's Canal. The number of lakes, most of which are alpine, amounts to about fifty. The climate is, on the whole, temperate and healthy, but rough and severe in the mountains. The soil is fertile and rich in products, particularly in corn and cattle. There are celebrated mineral springs in Lower Franconia and Upper Bavaria (Kissingen and Brückenau).

Population.—The total population, according to census of Dec., 1890, was 5,589,382, of whom rather more than seven-tenths are Roman Catholics, and about one-fourth are Protestants. The Jews numbered 53,697 in 1885. It is divided into eight provinces, which, according to census of 1890, had the following population: Upper Bavaria, 1,102,027; Lower Bavaria, 664,131; Palatinate, 728,422; Upper Palatinate, 537,217; Upper Franconia, 572,189; Middle Franconia, 699,928; Lower Franconia, 617,680; Suabia, 667,788. As regards the descent of the inhabitants, about 1,820,000 are Bavarians (Old Bavarians or Bavarians proper), 2,330,000 Franconians, and 650,000 Suabians.

Education.—Bavaria has 3 universities—at Munich, Würzburg, and Erlangen—9 lycæums, 28 gymnasia (colleges), 10 normal schools, polytechnical institutions at Munich and Nuremberg, and about 7,200 public schools (school attendance is compulsory here from six to fourteen); also Latin, technical, and special schools. All the Kings of Bavaria have been liberal patrons of science and art. There is an academy of science and an academy of plastic arts in Munich, which is also celebrated for its rich collections of works of art.

Industries.—The principal occupations of the inhabitants are agriculture and the breeding of cattle; the latter chiefly in the mountainous districts, the former in the plains. Among Bavaria's chief products are cereals, fodder, potatoes, hops, tobacco, wine (in the Palatinate and in the region of the Main). About 10,000 sq. miles are covered with wood, one-half of which belongs either to the state or to the communities. The culture of the forests is well regulated and profitable. The most active industry is found in the provinces of Middle Franconia, Suabia, and the Palatinate. Prominent among the industrial cities are Augsburg, Kempten, Nuremberg, Fürth, Schwabach, Bairneth, Würzburg, Bamberg, Erlangen, and Hof. The most celebrated branch of Bavarian industry is the brewing of beer. The average quantity manufactured annually is 278,000,000 gal.; of this, however, only about 27,900,000 gal. are exported. Bavaria has also flourishing manufactures of linen, woolen, iron, and wooden ware, numerous glass-works, manufactories of paper, chinaware, and guns, and celebrated melting-houses at Oberzell. The manufactories of tobacco produce annually large quantities of tobacco and cigars. The total value of its leading mining products in 1889 was 6,548,577 marks.

Commerce.—The most important commercial cities are Nuremberg and Augsburg (bills of exchange), Hof, Bamberg, Schweinfurt, Würzburg, Speier, Munich, Ratisbon, Püssan (navigation of the Danube). Bavaria in 1891 had 3,485 miles of railroad, of which 2,982 miles belonged to the state. The navigation of the Danube, the Rhine, and the Inn employs large numbers of vessels, including numerous steamboats, especially on the Danube and the Rhine. The chief articles of export are beer, corn, wood, cattle, wine, and hops.

Weights and Measures.—The metric system has been established in Bavaria, as in other parts of Germany, since Jan. 1, 1872.

Government.—Bavaria is a constitutional monarchy, the fundamental law of the state bearing date of May 26, 1818, and the electoral law now in force having been adopted on June 4, 1848. The crown is hereditary in the male line only, according to the right of primogeniture. The king exercises the administrative power; the legislative he shares with a legislature consisting of two chambers. The upper chamber, or chamber of the Reichsräthe (counselors of the empire), had, in 1889, 71 members, of whom 49 were entitled to a seat as being chiefs of noble families, and 7 by their office, while 15 were life-members appointed by the crown. The lower chamber, or chamber of representatives, had, in 1889, 159 members, who are elected for a term of six years. The chambers must be convoked at least once every three years. There are eight courts of appeal, and one supreme court of appeal in Munich. The receipts and expenditures of the state amounted in 1891 to 280,291,642 marks; the public debt to 1,333,

189,690 marks; the civil list and appanages to 5,404,850 marks. The Bavarian army, according to the treaty of Nov. 23, 1870, forms two army-corps of the imperial army of Germany under the independent military administration of the King of Bavaria, though under the chief command of the emperor. The capital is Munich; the most important towns next to it are Nuremberg, Augsburg, Würzburg, Ratisbon, and Bamberg.

History.—Old Bavaria, or Bavaria proper, was originally inhabited by the Boii, a Celtic tribe. Under Augustus it constituted the Roman province of Noricum. During the great migration of nations in the fourth and fifth centuries the country was occupied by Germanic tribes, from which the confederation of the Boiarii arose, which, though governed by its own princes, was dependent upon the Kings of Austrasia. At the head of the confederation was the family of Agilolfingians, who are mentioned for the first time in 556, and were deprived of the dual dignity by Charlemagne in 777. From this time until 911, when the Carolingian house died out, Bavaria belonged to the Franconian empire. During the following 250 years Bavaria was disturbed by endless civil wars. In 1180 the Count Palatine, Otto von Wittelsbach, was invested with Bavaria. His descendants, with but short interruptions, have remained the rulers of the country to this day. Two of them were elected German emperors—Louis the Bavarian (as Emperor Louis IV., 1314–47) and the Elector Charles (as Emperor Charles VII., 1742–45). From 1255 the country was generally divided between two lines—the Counts of the Rhenish Palatinate and the Dukes of Bavaria. The electoral dignity repeatedly passed from one branch to the other, until the peace of Westphalia (1648) conferred the fifth electoral dignity permanently upon the Dukes of Bavaria, while an eighth electoral dignity was expressly created for the Palatine line. In 1777 the line of the electors of Bavaria became extinct, and the elector of the Rhenish Palatinate, Charles Theodore, became ruler of Bavaria. Austria, however, claimed a large portion of the country, and the weak elector was willing to concede this claim; but Frederick the Great supported the protest of the next agnate—the Duke Charles of Zweibrücken, against this arrangement, and thus the bloodless "war of the Bavarian succession" arose, which was ended May 13, 1779, by the treaty of Teschen, which gave to Austria the region of the Inn, with the town of Braunau, and guaranteed the succession in the remainder of the dominions of Charles Theodore to the Duke Charles of Zweibrücken. In 1784 the Emperor Joseph I. made a new attempt to obtain the whole of Bavaria, by offering to the Elector Charles Theodore, in exchange for Bavaria, the Austrian Netherlands, with the title of king; but again the plan was foiled by the opposition of the Duke of Zweibrücken and Frederick the Great. Charles Theodore died Feb. 16, 1799, and, as in the meanwhile the Duke Charles of Zweibrücken had died childless, his brother (Maximilian IV.) Joseph, Duke of the Palatinate-Zweibrücken, became Elector of Bavaria and the Palatinate. In the history of Germany the Dukes of Bavaria are chiefly noted for the leading part which they took in the defense of the Catholic Church against the Reformation. Throughout the sixteenth, seventeenth, and eighteenth centuries they were the heads of the Catholic party among the princes and states of the empire. The Elector Maximilian lost in the peace of Lunéville the Zweibrücken Palatinate, but in place of these districts received a number of secularized bishoprics, the change adding to his dominions 2,100 sq. miles, with nearly 200,000 inhabitants. In the war of 1805 the elector joined France against the Emperor of Germany, and received a further increase of about 8,000 sq. miles and 800,000 inhabitants. On Jan. 1, 1806, the elector assumed the title of king, and in July of the same year he joined the Rhenish Confederation, which he left again in 1813, in order to unite with the allies against Napoleon. The peace of Paris and that of Vienna regulated the territory of Bavaria as it has remained since, with the exception of a very small district which in 1866 was ceded to Prussia. In 1818 the constitutional form of government was introduced. Louis I. (1825–48), the successor of Maximilian, was a liberal patron of the arts, and at the same time greatly favored the interests of the Catholic Church. His relation to the notorious Lola Montez led in 1818 to disturbances, in consequence of which he abdicated. The support which he had given to the insurrection of the Greeks against the rule of the Turks had secured the election of his second son, Otto, as King of Greece. In Bavaria he was succeeded by his eldest son, Maximilian II. (1848–64), who, like his father, liberally patronized science and art, but in politics had throughout his reign anti-liberal cabi-

nets. In the Schleswig-Holstein question the Bavarian Government acted as an ardent champion of the cause of German nationality. Maximilian, who died Mar. 10, 1864, was succeeded by his son, Louis II., who in 1866, in the war between Austria and Prussia, sided with Austria, and at the conclusion of peace had to pay 30,000,000 florins as expenses of war, and to cede a small district to Prussia. At the same time an offensive and defensive alliance was concluded with Prussia. The Catholic party was greatly opposed to the foreign policy of the Prime Minister, Prince Hohenlohe (appointed at the close of 1866), and still more to the educational and other reforms which he endeavored to introduce. When the new elections in 1869 gave to the Catholic party (the "Patriots") a majority in the second chamber, Prince Hohenlohe resigned (Jan., 1870). The new Prime Minister, Bray, remained, however, faithful to the treaties with Prussia, and after the outbreak of the war between France and Prussia, Bavaria at once joined Prussia, and placed two army-corps under the command of the Crown Prince of Prussia. In Nov., 1870, the Bavarian Government concluded a treaty providing for the entrance of Bavaria into the German empire, and in Jan., 1871, the treaty was ratified by both chambers. King Louis II. died June 13, 1886. Prince Luitpold was made regent during the occupation of the throne by King Otto, the insane successor of Louis II. Revised by C. K. ADAMS.

Bax'ter, DE WITT CLINTON: volunteer soldier; b. in Dorchester, Mass., Mar. 9, 1829; entered the army in 1861 as lieutenant, and passed through the successive grades to that of colonel of "Baxter's Fire Zouaves" (brevet brigadier-general U. S. volunteers). Wrote *Baxter's Manual and Company Tactics*, and was naval officer of the port of Philadelphia 1869-71. D. May 9, 1881.

Baxter, RICHARD: Nonconformist theologian; b. in Rotton, Shropshire, England, Nov. 12, 1615. He was not educated at any college. Having been ordained in 1638, he became Vicar of Kidderminster in 1641, and gained distinction as an eloquent preacher. He was the means of working there a moral reformation of a most thorough and permanent character. He was neutral or moderate in the civil war, being friendly to the Puritans, but favorable to a monarchy. In 1650 he produced the *Saint's Everlasting Rest*, which is highly esteemed. He took up his residence in London in 1660, just prior to the Restoration. Charles II. appointed him one of his chaplains, and Clarendon offered him the bishopric of Hereford, but he declined it. In consequence of the passage of the Act of Uniformity, 1662, he seceded from the Anglican Church. He continued to preach to the Nonconformists, and several times was persecuted and arrested. The notorious Judge Jeffries in 1685 fined him 500 marks on a charge of sedition, which was founded on a passage in his writings, which was construed into a libel on the Church of England. For failure to pay the fine he was imprisoned nearly eighteen months. D. in London, Dec. 8, 1691. He was a voluminous writer, having published 168 treatises. Among his numerous works are a *Call to the Unconverted* (1669); *Methodus Theologicæ* (1674); and *Catholic Theology*. See his *Autobiography*; *Reliquia Baxterianæ* (London, 1696); and the biographies by E. Calamy (1713); W. Orme (1830); G. D. Boyle (1883). Revised by S. M. JACKSON.

Baxterians: the term formerly applied to the adherents of Baxter's theological system, the doctrines of which were—1, that though Christ died in a special sense for the elect, yet he also died in a general sense for all; 2, the rejection of the dogma of reprobation; 3, that it is possible for even saints to fall away from saving grace. Dr. Isaac Watts and Dr. Philip Doddridge were noted Baxterians.

Baxter Springs: city; on railroad; Cherokee co., Kan. (for location, see map of Kansas, ref. 8-K); 159 miles S. of Kansas City, Mo.; 1½ miles from the State line. It has lead-smelting works, and is a shipping-point for Texas cattle. The principal minerals are lead, zinc, and coal. On Oct. 6, 1863, Quantrell, with 600 guerillas, attacked a U. S. escort and encampment of three companies at this place. The escort was dispersed and all the wounded murdered; the attack on the encampment was repulsed. Pop. (1880) 1,177; (1890) 1,248; (1895) 1,566. EDITOR OF "NEWS."

Bay (Fr. *baie*): in geography, an inlet of the sea, or a portion of the sea extending into the land. The terms *bay* and *gulf* are vaguely and promiscuously applied to bodies of water of various forms and dimensions. Hudson's Bay, for example, might properly be called a gulf. The word *bay* is generally applied to smaller portions than *gulf*.

Bay, or Bay-tree: the laurel-tree (*Laurus nobilis*); sometimes called sweet bay. The *Prunus lanroceranus* is sometimes called bay-laurel. Several other trees are popularly called *bay*. The "sweet bay" of the U. S. is the *Magnolia glauca*, which has fragrant flowers. The "red bay" of the South is the *Persea carolinensis*, an evergreen laurel-tree with fine red timber. The "loblolly bay" (*Gordonia lasianthus*) is a fine tree of the Southern States, with mahogany-colored wood. A smaller species (*Gordonia pubescens*) is cultivated at the North as a shrub, and has large and fragrant white blossoms. Some of the rhododendrons and azaleas are called rose bays. The leaves of the bay have long been subjects of popular superstition, and have been used with other evergreens to decorate churches at Christmas. *Bays* in the plural signifies an honorary garland or crown, bestowed as a prize for victory or meritorious action. It is not known what kind of tree is meant by the word in the Bible translated "bay-tree."

Ba'ya (*Ploceus philippinus*): a small East Indian bird of the family of *Ploceidæ*, and allied to the weaver-bird. It has a large conical beak. Its color is yellow, spotted with brown. It builds a curious nest, shaped like a Florence flask, and suspended from a small twig of a high branch. The entrance is in the lower part of the nest. The baya can be easily tamed and trained to obey commands.

Bayadere' [Fr. from Port. *baiadeira*, danseuse, from *baïlar*, dance; akin to E. *ball*, a dance]; a name given to the dancing-girls of India. The nautch (Sanskrit *nāṭya*, pantomimic dance), as an adjunct of social entertainment, is of great antiquity, being mentioned in the early legends of Buddha. The nautch-girls go about in small troupes from place to place. Their "dance" consists in slow, legato movements of hands, arms, head, body, and feet, which are said to require great technical skill and suppleness of joint, and remind one somewhat of the results of the modern Delsarte system, but whose general effect is, to Occidental taste, very dull indeed. Their pantomime, and the accompanying songs, portray despondent or exultant love and the like. In Southern India especially are found *Devā-dāsīs* (slaves of the god), who are regularly attached to some temple to sing and dance before the idol, and who correspond to the temple prostitutes of antiquity, Phœnician *Kēleshoth* and Greek *Hierodules*. C. R. LANMAN.

Bayard, bī'ard, Gen. GEORGE DASHIELL: b. in Seneca Falls, N. Y., Dec. 18, 1835; removed in boyhood to Iowa; graduated at West Point in 1856. He entered the U. S. cavalry, and became, after the civil war broke out, colonel of the First Pennsylvania Cavalry. In 1862 he was made brigadier-general of volunteers. He served with the highest honor in the Army of the Potomac, and was killed at the battle of Fredericksburg, Dec. 14, 1862, where he fought with the left wing, under Franklin.

Bayard, JAMES ASHETON: U. S. Senator and lawyer; b. in Philadelphia, July 28, 1767; graduated at Princeton in 1784. He began to practice law in Delaware, and in 1796 became a Federalist member of Congress, in which he attained eminence as an orator. The contest between Jefferson and Burr in 1801 was decided in favor of the former by the votes of the Federalists, acting under the influence of Mr. Bayard. He was elected U. S. Senator for Delaware in 1804, and remained in that body until 1813. He was one of the commissioners that negotiated the treaty of Ghent in 1814. D. in Wilmington, Del., Aug. 6, 1815.

Bayard, JAMES ASHETON, second: b. in Wilmington, Del., Nov. 15, 1799; graduated at Princeton; was U. S. Senator from Delaware (1851-64 and 1867-69), twice resigning this office, to which he was four times elected, and once appointed to fill a vacancy. D. at Wilmington, Del., June 13, 1880.

Bayard, bā'yaar', JEAN FRANÇOIS ALFRED: French littérateur; b. in Charolles, Mar. 17, 1796; wrote over 200 popular comedies and vaudevilles, among which were *La reine de seize ans*, and *Les gamins de Paris*, which was performed with great success 463 times in succession. D. Feb. 19, 1853.

Bayard, PIERRE DU TERRAIL, Chevalier: an heroic French knight; called "le chevalier sans peur et sans reproche" (the knight without fear and without reproach); was b. at Castle Bayard, near Grenoble, in 1475. He was remarkable for his modesty, piety, magnanimity, and his various accomplishments. He served under Charles VIII. in his expedition against Naples in 1494, and distinguished himself at

the battle of Tornovo. After the accession of Louis XII. of France, Bayard performed several remarkable exploits in war against the Spaniards and English. In the service of Francis I. he took Prosper Colonna prisoner, and gained a victory at Marignano in 1515. He defended Mézières with success against the invading army of the Emperor Charles V. in 1522, and for this important service was saluted as the saviour of the country. He was killed in battle at the river Sesia, Apr. 30, 1524, having won the reputation of being a model of nearly every virtue. See Symphorien Champier, *La Vie et les Gestes de Bayard* (1525); W. Gilmore Simms, *Life of Chevalier Bayard* (New York, 1847).

Bayard, b'fard, RICHARD HENRY; son of James A. Bayard; b. at Wilmington, Del., in 1796; graduated at Princeton in 1814, became a lawyer, was U. S. Senator from Delaware (1836-39 and 1841-45), and U. S. *chargé d'affaires* at Brussels in 1850. D. in Philadelphia, Mar. 4, 1868.

Bayard, THOMAS FRANCIS, LL. D.; b. in Wilmington, Del., Oct. 29, 1828; in 1869 succeeded his father (J. A. Bayard) in the U. S. Senate, and was re-elected for a second and a third term; and in 1876-77 was one of the Electoral Commission to determine who was elected President. Was elected president *pro tem.* of U. S. Senate Oct., 1881. He was Secretary of State during Cleveland's first administration, 1885-89, and was one of the commissioners appointed by the President to confer with a commission sent to Washington for the settlement of the Canadian fisheries dispute. In 1893 he was appointed first ambassador to Great Britain.

Bayazid, bañ-yañ-zeed (often called **Bajazez**) **I.**; Sultan of the Turks or Ottomans, surnamed **LİBERTİ** (i. e. the lightning); b. in 1347. He succeeded his father, Amurath (or Murad) I., in 1389, and soon conquered Bulgaria, the greater part of Asia Minor, and part of Greece. In 1396 he gained a victory at Nicopolis over Sigismund, King of Hungary (afterward emperor), and his allies, the Poles and French. His career of conquest was arrested by Tamerlane (or Timur), who invaded Asia Minor, and defeated Bayazid near Angora in June, 1402. Bayazid was taken prisoner here, and confined until he died, Mar. 9, 1403. See Von Hammer, *Geschichte des osmanischen Reichs*.

Bayazid II.; Sultan of the Turks; b. in 1447. He ascended the Ottoman throne on the death of his father, Mahomet II., in 1481. He built many mosques in Constantinople, his capital. He was involved in almost continual war against the Hungarians, Poles, Persians, and Venetians. D. near Adrianople, May 26, 1512.

Bayberry; the fruit of the bay tree; also the fruit of the wax-myrtle (*Myrica cerifera*), a shrub which produces a kind of wax, sometimes called "bayberry tallow," and used in pharmacy. It is also called candleberry, as it has also been employed in making candles. The bayberry grows chiefly along the U. S. Atlantic coast, becoming an evergreen tree in the South. It has active medicinal qualities. The wax is found on the outside of the berries, and is obtained by boiling.

Bay Bulls; a port of entry and post-town of Newfoundland; 19 miles S. of St. John's; lat. 47° 18' N., lon. 52° 47' W. (see map of Canada, ref. 8-0). It has an excellent harbor, which is much frequented as a port of refuge. Fishing and agriculture are carried on. Pop. 734.

Bay City; an important railroad center; capital of Bay co., Mich. (for location of county, see map of Michigan, ref. 5-3); on the right (east) bank of the Saginaw river; 4 miles from its mouth, and at the head of navigation. Its principal trade is in lumber and salt, immense quantities of which are produced. It has excellent schools, four parks, Holly water-works, and important manufacturing interests. Several lines of steamers connect it with all lake points. The census of 1890 showed 299 manufactories; capital, \$8,993,879; average number of persons employed, 4,356; wages paid during the year, \$1,870,036; value of products, \$8,600,385. Pop. (1880) 20,693; (1890) 27,839; (1892) estimated, 31,678; (1894) 30,039. Editor of "Times."

Bayer, b'f'r, JOHANN; b. in Rhain, Bavaria, 1572; a zealous Protestant pastor, but chiefly noted as the author of the excellent work *Uranometria*, containing fifty-one astronomical charts, and followed by explanations in his *Explicatio Characterum Zonis Tabulis Insculptorum*. He introduced the method of designating the stars of a constellation by means of letters, naming the largest star of the constellation by the first letter of the Greek alphabet, and the others, in

the order of their brilliancy, by the succeeding letters. D. in Augsburg, 1660.

Bayeux, ba'yü' (anc. *Baiens* *see*): a city of France; in Normandy, and in the department of Calvados; is on the river Aure, 21 miles by rail W. N. W. of Caen (see map of France, ref. 3-D). It has manufactures of porcelain, lace, damasks, calico, and leather. Pop. (1891) 8,102. Here is a majestic cathedral which is said to be the oldest in Normandy, in which was preserved for a long time the famous Bayeux tapestry.

Bayeux Tapestry; a web of canvas or linen cloth 214 feet long by 20 inches wide, on which is embroidered, with woolen threads of various colors, a representation of the invasion and conquest of England by the Normans. According to tradition, it was embroidered by Matilda, the wife of William the Conqueror. Some persons believe that she directed the work, which was performed by her maids or the ladies of her court. It is considered a valuable historical document, as it gives a correct and minute portraiture of the manners and customs of that age and of the Norman costumes. It contains the figures of 625 men, 200 horses, 55 dogs, 40 ships and boats, and numerous quadrupeds, birds, etc. The tapestry was discovered in the cathedral of Bayeux about 1730, and is now preserved in the hôtel de ville of that place. See Bruce, *Bayeux Tapestry Elucidated* (London, 1855); Ducarel, *Anglo-Norman Antiquities* (1767).

Bayfield; city and township; formerly capital of Bayfield co., Wis. (for location of county, see map of Wisconsin, ref. 2-C); on an arm of Lake Superior, 200 miles N. E. of St. Paul, Minn., and 281 miles N. N. W. of Madison, Wis.; is terminus of Chicago, St. Paul, Minneapolis, and Omaha and Bayfield Harbor, and Great Western R. Rs. It has one of the best harbors on the Great Lakes. Pop. of city (1880) 495; (1890) 1,373; (1895) 1,368.

EDITOR OF "BAYFIELD COUNTY PRESS."

Bayfield, HENRY WOOLSEY; rear-admiral of the British navy; entered the service in 1806; served against the U. S. in 1814 on the Great Lakes; surveyed the lakes, the St. Lawrence river and gulf (1815-27), of which he published valuable charts. D. in England, Feb. 12, 1885.

Bay Islands; a group of small islands in the Bay of Honduras. Ruatan, the largest, is about 30 miles from the north coast of Honduras. The other islands are named Bonacca, Utila, Barbareta, and Holena. This group became a British colony in 1854, but in consequence of a protest of the U. S. they were restored to Honduras in 1856.

Bayle, bayl, PIERRE; a celebrated French philosopher and critic; b. at Carlat, now in Ariège, Nov. 18, 1647; son of a Protestant preacher. He studied at the College of Toulouse, and was employed for some years as a private tutor at Geneva and Rouen. In 1675 he obtained the chair of Philosophy in the Protestant College of Sedan, which was closed or suppressed by the Government in 1681. He then became Professor of Philosophy and History at Rotterdam, and commenced in 1684 a critical monthly review called *Nouvelles de la République des Lettres*, which he continued to edit until 1687. Instigated by Jurieu, who accused Bayle of heretical or unsound opinions, and of being a secret agent of France, the magistrates of Rotterdam deprived him of his professorship in 1693, and even of his right to teach privately. Bayle was a skeptic, an eloquent advocate of religious liberty, and a very independent thinker. His most important work is a *Dictionary, Historical and Critical* (*Dictionnaire historique et critique*, Rotterdam, 2 vols. folio, 1696; 11th ed. Paris, 1820 24, 16 vols.; Eng. trans. London, 1710, 4 vols.; 3d ed. 1734-38, 5 vols.), which exercised a great influence over literature and philosophy, and had a European reputation. Bayle was fond of paradox, was a subtle reasoner, a witty writer, and an excellent dialectician. He was amiable, courageous, and disinterested. According to Warburton, he had "a soul superior to the sharpest attacks of fortune, and a heart practiced to the best philosophy." D. in Rotterdam, Dec. 28, 1706.

Baylen, bi-len, or Bailen'; a town of Spain; province of Jaen; 22 miles N. N. E. of Jaen (see map of Spain, ref. 18-F). It has manufactures of linen, glass, soap, bricks, etc. The Spanish general De Castaños here gained a victory in July, 1808, over the French general Dupont, and took 18,000 prisoners. Pop. (1887) 8,580.

Bayley, Most Rev. JAMES ROOSEVELT, D. D.; a grandson of Dr. Richard Bayley and nephew of Mother Seton (who

founded the original American Congregation of Sisters of Charity); b. in New York city, Aug. 23, 1814; graduated at Trinity College, Hartford, Conn., in 1835; was for a short time a clergyman of the Protestant Episcopal Church, but became a Roman Catholic 1842; studied theology in Paris and Rome, and was ordained a priest in 1844. He became Professor of Belles-Lettres at St. John's College, Fordham, and was its president (1845-46). In 1853 he became Bishop of Newark, N. J., and in 1872 Archbishop of Baltimore, Md. He published *Sketch of the History of the Catholic Church on the Island of New York* (New York, 1853; rev. ed. 1869); *Memoirs of Bishop Brulé* (1860); and other works. D. in Newark, N. J., Oct. 3, 1877.

Bayley, RICHARD: physician; b. in Fairfield, Conn., in 1745; began the practice of medicine in 1772. He introduced a new method of treating the croup, which was extensively used. He became in 1793 Professor of Surgery in Columbia College, New York, and was the first health officer of New York. D. on Staten Island, N. Y., Aug. 17, 1801.

Baylies, WILLIAM, M. D.: b. in Uxbridge, Mass., Dec. 5, 1743; graduated at Harvard in 1760; practiced medicine many years at Dighton, Mass., of which town he was a representative in the General Court; member of the three Provincial Congresses of Massachusetts and of the State convention which adopted the Federal Constitution; State Senator 1783; was for a number of years a judge of the court of common pleas for Bristol co., Mass., and register of probate for that county; member of Congress 1805-09; member of Academy of Arts and Sciences, of Massachusetts Historical Society, and one of the founders of the Massachusetts Medical Society. D. at Dighton, Mass., June 17, 1826.

Bayliss, JEREMIAH HENRY, A. M., D. D., LL. D.: minister of the M. E. Church; b. at Wednesbury, England, Dec. 20, 1835; educated at Genesee College, New York; served with distinguished success in pastorates at Park Avenue and Trinity churches, Chicago; Roberts Park and Trinity churches, Indianapolis; Central church, Detroit; and Walnut Hills church, Cincinnati; elected editor of *Western Christian Advocate* in 1884 and 1888. D. at Bay View, Mich., Aug. 14, 1889.

Baylor University: chartered by the republic of Texas in 1845; named in honor of Hon. Robert Emmett Bledsoe Baylor, LL. D. (1793-1874), former member of Congress from Alabama and for twenty-five years a judge in Texas. It was situated in Independence, Tex. A university curriculum and classes were established in 1851 by Rev. Rufus C. Burleson, D. D., who presided over it from 1851 to 1861, when he and the entire faculty resigned and inaugurated Waco University at Waco, Tex. In 1882 the two universities were consolidated at Waco under the name Baylor University, with Dr. Burleson as president. The university is under the auspices of the Baptist denomination. The total number of students is (1893) about 600, and of instructors 25. Large additions have recently been made to the endowment.

Bayly, Miss ADA ELLEN: See LYALL, EDNA.

Bayly, LEWIS: Bishop of Bangor in Wales; worthy of mention as the author of *The Practice of Piety*, one of the most popular religious books ever written. It is mentioned by Bunyan as one of the books owned by his wife. In 1714 it had passed through fifty-one editions in England, besides several translations published in foreign lands. Eliot, the Indian apostle of Natick, Mass., translated *The Practice of Piety* into the Indian language, and it was published for circulation among his converts. Bayly was born at Caermarthen; educated at Oxford, and consecrated as bishop in 1616. D. in Bangor, Oct. 26, 1631. He must not be confounded with Thomas Bayly, Anglican Bishop of Killala in Ireland, who died in 1670.—Bishop Lewis Bayly had a son THOMAS, who became a zealous Roman Catholic, and published *The End of Controversy* (Douai, 1654), besides other works.

Bayly, THOMAS HAYNES: *littérateur*; b. near Bath, England, Oct. 13, 1797; was the son of a wealthy solicitor, and was educated at Oxford. He is best known by his very numerous songs, some of which will always be popular, though few are of a very high literary order. Among them are *Oh no, we Never Mention Her, The Soldier's Tear, Why Don't the Men Propose?* and *I'd be a Butterfly*. D. Apr. 22, 1839. See his *Songs, Ballads, and Other Poems*, with a memoir, London, 1844.

Bayne, PETER, LL. D.: journalist and author; b. at Foderty, Ross-shire, Scotland, Oct. 19, 1830; educated at Marischal College, Aberdeen; was successively editor of the *Glasgow Commonwealth*, *Edinburgh Witness*, *London Dial*, and *Weekly Review*; author of *The Christian Life in the Present Time* (1855); *Life and Letters of Hugh Miller* (1871); *The Chief Actors in the Puritan Revolution* (1878); *Life of Martin Luther* (1887); besides numerous contributions to current periodicals. D. at Upper Norwood, London, Feb. 10, 1896.

Baynes, ROBERT HALL: b. in Wellington, Somersetshire, England, Mar. 10, 1831. He was educated at Bath and at St. Edmond's Hall, Oxford, where he took his master's degree in 1859. He received a number of English church preferments. He is the author of numerous religious works, among which are *Lyra Anglicana* (1862); *Autumn Memories and Other Verses* (1868), etc.

Baynes, THOMAS SPENCER, LL. D.: b. in Wellington, Somersetshire, England, Mar. 24, 1823. He was educated at a private school in Bath, at Bristol College, and at the University of Edinburgh; was Professor of Logic in the latter institution 1851-55; assistant editor of the London *Daily News* 1857-64; contributed many articles on the civil war in the U. S. to the *Daily News*, and was also a contributor to the *Literary Gazette*, the *Athenaeum*, etc.; became Professor of Logic, Rhetoric, and Metaphysics in the University of St. Andrews 1864; published a translation of *Port Royal Logic* in 1851, and an *Essay on the New Analytic of Logical Forms* (1852). He was editor of the ninth edition of the *Encyclopaedia Britannica*, for which he wrote the article on Shakspeare. He contributed regularly to the *Edinburgh Review* (1869-75), and was also a contributor to the *North British Review*, *Fraser's Magazine*, *Pall Mall Gazette*, and the *Saturday Review*. D. at St. Andrews, May 29, 1887.

Bay of Islands: a large bay on the west coast of Newfoundland. It abounds in islands, and its scenery is very fine. Good timber, gypsum, and marble abound. About 30,000 barrels of herring are annually taken here, besides cod and other fish. Agriculture is pursued to some extent. Pop. of settlements, 947.

Bayonet [Fr. *batonnette*, also formerly *bayonnette*; so called, it is said, because invented or first used at Bayonne, in France, about the middle of the seventeenth century]: a thrusting weapon attached to the muzzle of a musket or rifle. The bayonet, first used in France, A. D. 1671, had a solid handle which was inserted in the bore of the gun. This was succeeded by that with a hollow handle fitting over the barrel, and which allowed the gun to be fired without removing it. The introduction of the bayonet enabled the musket to be used as a pike also, and led to the abandonment of the latter. The blade of the common bayonet is of triangular cross section, and about 16 to 20 inches long; but various other forms have been and are now used, such as the "sword" or "saber bayonet," in the form of a short, straight sword, effective either as a sword or bayonet; the "trowel bayonet," designed to be used as a bayonet when fixed, and as an trenching tool when unfixed; the "ramrod bayonet" or "rod bayonet," made by sharpening the end of the wiping-rod of the modern breech-loader, and fitting it with a catch which holds it in place when drawn out so as to project 8 to 10 inches. Many modern military writers have recommended the entire abandonment of the bayonet, considering it a useless addition to the modern rifle; but the great moral effect of a bayonet charge (which is still looked forward to as the culmination of an infantry attack) is urged by its advocates as sufficient reason for its retention, and it is an important feature in the arms of those nations which have been involved in the most recent great wars. See PIKE.

JAS. MERCUR.

Bayonne, bañ'yün' [Basque *bayon*, *bayona*, a port]: a fortified city of France (anc. *Lapurdum*), near its southwest extremity; department of Basses-Pyrénées; on the river Adour; about 3 miles from the Bay of Biscay and 66 miles W. N. W. of Pau; lat. 43° 29' N., lon. 1° 29' W. (see map of France, ref. 9-6). It is pleasantly situated near the foot of the Pyrenees, at the mouth of the river Nive, and is well built. It has an old cathedral, a citadel built by Vanban, a mint, a theater, and schools of commerce and navigation. Here are shipyards, glass-works, sugar-refineries, and distilleries. The chief articles of export are timber, tar, corks, liquors, hams, etc. Here occurred an interview between

Charles IV. of Spain and Napoleon I., who extorted from the former and his son a renunciation of the crown in 1808. Pop. (1891) 27,192.

Bayonne, *bā-yon*: city; on railroad, Hudson co., N. J. (for location of county, see map of New Jersey, ref. 3-E); formed by the consolidation of the villages S. of Jersey City on the peninsula between the Raritan and New York upper bays; has large Standard oil refineries on New York Bay, with pipe-lines to New York, Philadelphia, Baltimore, Pittsburgh, Cleveland, etc. Pop. (1885) 13,080; (1890) 14,033; (1895) 19,856. EDITOR OF "HERALD."

Bayou, *bī oo* [corrup. of Fr. *bayou*, gut]: strictly, a stream which is not fed by springs, but flows from a lake or other stream. It is very often used in the Southern U. S. as synonymous with "creek," and for tidal channels.

Bayreuth: See BAIREUTH.

Bay Roberts: a port of entry of Newfoundland; 5 miles S. of Harbor Grace, on Conception Bay. Its inhabitants are chiefly engaged in the Labrador fisheries. It is visited by regular lines of coasting steamers, and has considerable imports. Pop. 2,600.

Bay Rum [*Spiritus myrciæ* of U. S. Pharmacopœia]: a fragrant liquid obtained by distilling with rum the leaves of the *Myrcia acris*, and probably of other trees of the genus. These are large trees growing in Jamaica and other West India islands, and belonging to the *Myrtaceæ*. Bay rum is imported in large quantities, and is used as a perfume and as a cosmetic.

Baza, *baa'thāa* (medieval *Bastiana*): a city of Spain; province of Granada; about 52 miles N. E. of Granada; in a fertile plain (see map of Spain, ref. 19-G). It is famous for its red wine. In 1489 it was taken from the Moors by the Spaniards after a long siege. The French marshal Soult here defeated the Spaniards, Aug. 10, 1810. The principal trade of the place at present is in hemp. Under the Moors it was an important city with a population of 50,000—now 13,000.

Bazaar, or **Bazar** [Pers. *bāzār*, market]: an Oriental market-place, either open or covered with a roof; an Oriental assemblage of shops in which goods of various kinds are exposed to sale. Each bazaar is occupied by a number of retail traders, and is often divided into streets or passages having on each side a row of small shops, stands, or counters. The term is also applied in European and Western cities to a hall or suite of rooms fitted up with counters or stands for the sale of goods (mostly fancy articles).

Bay Saint Louis: capital of Hancock co., Miss. (for location of county, see map of Mississippi, ref. 10-G); on L. and N. R. R., and on Mississippi Sound, Gulf of Mexico; 52 miles from New Orleans; has an academy and a business college, three churches, custom-house, oyster and shrimp canning factory, woolen-factory, and fruit and vegetable farms. The city is a popular summer resort, and has a shell road on the beach 8 miles long. It was founded about 1790 by the French. Pop. (1880) 1,978; (1890) 1,974, including suburbs. 2,100; summer population about 8,000.

EDITOR OF "GULF COAST PROGRESS."

Bay Shore, or **Bayshore**: village; Suffolk co., Long Isl. and N. Y. (for location of county, see map of New York, ref. 8-D); on Montauk Div. of L. I. R. R., and on Great South Bay; 41 miles from New York city; has graded schools, five churches, large hotels, a bank, electric lights, and water-works. Here are the South Side Field Club (athletic), Bay Shore Yacht Club, Great South Bay Yacht Club, and the Olympic Club. Bay Shore is a summer resort, and is the nearest village to Fire island and its fishing-grounds for bluefish. Pop. (1880) 1,615; (1890) 2,290; (1892) estimated, 2,800. EDITOR OF "BAY SHORE JOURNAL."

Bazaine, *baā'zayn'*, FRANÇOIS ACHILLE: b. in Versailles, Feb. 13, 1811; and, after passing through all the intermediate grades, marshal of France, Sept. 5, 1861. The son of a prominent and wealthy officer, he could have readily obtained an officer's commission, but he declared it his pride to seek his marshal's bâton from the knapsack, in which for "every French soldier" the proverb potentially places one; and that bâton, when found, bore the inscription "Simple soldat en 1831, Maréchal de France en 1864."

He served with distinction in Algeria, Spain, the Crimea, Italy, and in setting up the Maximilian empire in Mexico. He received the cross of the Legion of Honor in 1836; was promoted to commander of the Legion in 1856; received

the Grand Cross in 1863; and in 1869 became commander-in-chief of the imperial guard.

On the breaking out of the war with Prussia, Marshal Bazaine was at first in command of a single corps, but after the disasters of Woerth and Forbach, compelling the emperor to relinquish the command, he succeeded to the command of the Army of the Rhine. Reorganization and concentration compelled a falling back upon Metz, and thence upon Verdun, where the shattered commands of MacMahon's corps and the reserves of France were concentrating. His army was delayed in its movements by the battles of Borny (Aug. 14, 1870) and Mars-la-Tour (Aug. 16), and finally, in the battle of Gravelotte (Aug. 18) suffered a serious defeat, and was obliged to retire to Metz, which was immediately invested by the Germans under Prince Frederick Charles. Failing in all attempts to break the line of the besiegers, the marshal surrendered, on Oct. 27, 1870, an army of 160,000 men, Metz, "la Pucelle," and its fortifications, and 1,800 pieces of artillery.

He was arraigned Oct. 10, 1873, before a court consisting of the Duc d'Aumale (president), General de la Motte Rouge, Baron de Chabaud-Latour, Generals Trippier, Martimprey, Princeteau, and Martinez-Dechesez, charged:

First—With having capitulated to the enemy, and surrendered the fortress of Metz, of which he had the superior command, without having exhausted all the means of defense.

Second—With having, as the head of the army before Metz, signed a capitulation in the open field, the result of which was to cause his troops to lay down their arms; and with not having done everything which he was bound by duty and honor to do before treating verbally and by writing—offenses punishable by articles 209 and 210 of the Code of Military Justice.

After a trial of two months' duration he was unanimously pronounced guilty, sentenced to be degraded and shot. His sentence was promptly commuted by President MacMahon to twenty years' imprisonment in a fortress, without military degradation.

On Aug. 9, 1874, Bazaine, aided by his wife, escaped from his fortress prison, Île Ste. Marguerite, pleading in justification (*Letter addressed to the Minister of War*), while alleging that "respect for the military uniform which he has very honorably worn for nearly half a century," would have deterred him from this step but for the "humiliating régime to which he was subjected, from which his past career ought to have saved him," that maxim of public law, that "no sentence is legal unless pronounced by the peers of the accused." Gen. Bazaine resided in Madrid, Spain, from Nov., 1874, till his death, Sept. 23, 1888.

That his conduct of the military operations from Aug. 13 to Aug. 18 was inefficient; that his so-called sorties had scarce the energy in them to reveal a serious intention to go out; that he allowed himself to waste the last precious days of his army's efficiency in what were futile—and some would call treasonable—attempts to negotiate with the empress; and finally crushed the rising and the last hopes of France by a premature surrender at the very moment when a protraction might have modified the history of the war, must be the conviction of all who have impartially studied his career.

Bazalgette, Sir JOSEPH WILLIAM, C. B.: an English civil engineer of French descent; b. in Enfield, Middlesex, 1819. He won great fame in the construction of sewers, street alterations, and other departments of city engineering. As engineer-in-chief to the Metropolitan Board of Works, London, he constructed many hundreds of miles of sewers and river embankments, and introduced subterranean passages for the carrying of gas and water pipes and telegraph wires, so that it is not necessary to break up the pavements for repairs. He planned and executed the Thames embankments of London, and bridged that river in three places with granite or iron structures. D. in London, Mar. 1, 1891.

Bazan, EMILIA PARDO: See PARDO-BAZAN, EMILIA.

Bazancourt, *baā'zāān' koo'*, CÉSAR, BAFON de: a French historian; b. in 1810; wrote a *History of Sicily under the Norman Rule* (2 vols., 1846); histories of the Crimean, Italian, Chinese, and Cochinchinese wars of Napoleon III. Under Louis Philippe, De Bazancourt was a director of the library of Compiègne, and under Napoleon III, he was official historiographer. D. at Paris, Jan. 25, 1865.

Bazard, SAINT-AMAND: founder of French Carbonarism; b. in Paris, Sept. 19, 1791. He organized societies of Carbonari about 1820, and afterward became a disciple of Saint-

Simon the Socialist, and editor of the *Producteur*, a Saint-Simonian journal. After the death of Saint-Simon (1825) Bazard and Enfantin were the chief priests of the sect, and they published an *Exposition of the Doctrine of Saint-Simon* (1828-30). Bazard became disgusted with the extreme innovations of Enfantin (who advocated a community of wives), and he seceded from the sect in 1831. D. in Courtry, near Montfermeil, July 29, 1832. See Michand et Villenave, *Histoire du Saint-Simonisme* (1847).

Bazigars, bā-zee-garz: the gypsies of India; usually nomadic, and clearly distinct from the Hindus, with whom they do not intermix. They are scattered throughout the whole of India. Their chief occupation is the performance of feats of address and agility to amuse the public, the men as athletes, the women as dancers. Many are Mohammedans, some profess no religious faith, and a particular association among them has the fame of making human sacrifices. Their reputation is generally bad. They present many features analogous to the Western gypsies. Keeping themselves distinct from the people among whom they dwell, they have their own chiefs or kings, and a peculiar language which has a decided analogy to that of the gypsies. There are several groups of them known under different names, but the Bazigars are the best known and most civilized.

M. W. H.

Bazin, ANTOINE PIERRE LOUIS: b. Mar. 26, 1799; was a professor of the Chinese language, and published in 1856 a grammar of the Mandarin dialect. He also made many translations from the Chinese. D. in Jan., 1863.

Bazin, HENRI: inspector-general of bridges and roads, officer of the Legion of Honor; b. Oct. 20, 1829; graduated from the School of Bridges and Roads in 1851; was assigned to the railway from Tours to Bordeaux, in the department of Charente. In 1856 he was engineer in the department of Côte d'Or, on the Burgundy Canal, and matters connected with the inundations of the Saône, and in the same year was made assistant to Darcy in his experiments upon the flow of water in open channels. Henri Darcy first, in the water-works of Dijon, discovered and published the fact that the velocity of flowing water was affected by the degree of roughness of the bed and sides of the channel, which up to that time had not been admitted. Extensive experiments were made by him upon the water-pipes of Paris, and published by him in 1854. Those upon the flow of water in open channels were commenced in 1856, with Bazin as his assistant. The preparations were made, the channels constructed, and some experiments commenced when in 1858 Darcy died. The work was continued by Bazin, and completed by an analysis and discussion of the experiments in a memoir presented to the Academy, and published in 1865 with a *résumé* by Gen. Morin, who characterizes it as most valuable to the engineer, and which can not fail to be appreciated by the Academy. It is, indeed, the most valuable contribution to the science of the flow of water. The second part of the *Experiments* was published by the Academy in 1865. It treats of the "propagation of waves." Since 1886 he has been inspector-general of the fifth inspection department and a member of the Council of Bridges and Roads.

His published works are *Expériences sur l'écoulement des eaux dans les canaux découverts; Sur la propagation des ondes*; and numerous papers on kindred subjects in the *Annales des Ponts et Chaussées*. W. R. HUTTON.

Bazley, Sir THOMAS, Bart.: b. at Gilnow, Lancashire, England, in 1797. He learned cotton-spinning in his youth; went into business on his own account at Bolton in 1818; removed in 1826 to Manchester, where his manufactory of fine cotton and lace thread was the largest in the world, employing more than 1,000 persons, for whom he established schools, free lectures, and reading-rooms. An early anti-corn-law man and free-trader, he became a prominent Liberal politician, first entering Parliament in 1858. In 1862 he retired from business, and in 1869 became a baronet. D. Mar. 18, 1885.

BdePium (Gr. βδέλλιον): a gum-resin resembling myrrh, but weaker and more acrid; esteemed by the ancients for its supposed medicinal virtues. It is not often used by modern physicians. Two varieties of bdellium are obtained from the *Amyris commiphora* of India and the *Hendelotia africana*, a tree or shrub of Senegal. It is used in both human and veterinary pharmacy in India, and for incense in temples.

Beach: the sloping surface of the land above low-water mark; covered with stones and sand brought by waves and

currents from neighboring cliffs or ledges, or from the bottom off-shore. A beach begins on a wave-cut bench under a cliff or ledge and extends along shore in the direction of the controlling current, often swinging in a smooth curve around the head of a bay or cove between two rocky points. As a headland is cut back into an even line, its beach may be prolonged as an embankment across the adjoining bay, thus simplifying the shore-line, as on the south side of Martha's Vineyard. The embankment is called a spit, or bar. Beach is also applied to the long off-shore bars or barriers now used as summer resorts on the coast of New Jersey, built of sand raised by storm waves from the shallow bottom, and now receiving additions on the outer side, while the inclosed lagoons and mainland are protected from the sea. Bars of the same kind on the coast of Carolina are locally called "banks." See COAST, DUKE.

W. M. DAVIS.

Beach, ABRAHAM, D. D.: a Protestant Episcopal divine; b. in Cheshire, Conn., Sept. 9, 1740; graduated at Yale College in 1757, and ordained by the Bishop of London in 1767. He was until 1783 rector of a church at New Brunswick, N. J., and afterward an assistant minister of Trinity church, New York, for thirty years (1783-1813). D. near New Brunswick, N. J., Sept. 14, 1828.

Beach, JOHN: Protestant Episcopal divine; b. in 1700; graduated at Yale in 1721; and was for some years Congregational minister of Newtown, Conn. He joined the Anglican Church in 1732; was ordained by the Bishop of London, and was for fifty years a minister of the Church of England, at Newtown and Reading, in Connecticut. He published sermons and polemical tracts. D. Mar. 8, 1782. In the church recently erected at Newtown a handsome tablet commemorates his half-century's service.

Beach, JOHN WESLEY, D. D., LL. D.: preacher of the Methodist Episcopal Church; b. at Trumbull, Conn., Dec. 26, 1825; graduated in 1845 at Wesleyan University, Middletown, Conn.; was for nine years a teacher; and in 1854 entered the ministry. His labors have been mostly in New York city and vicinity. In 1872 he received the degree of D. D. from his *alma mater*; in 1873 became pastor of a church in New Haven, Conn.; and was president of the Wesleyan University, Connecticut, 1880-87.

Beach, MOSES YALE: an inventor and publisher; b. at Wallingford, Conn., Jan. 7, 1800. He learned the trade of a cabinet-maker in youth, and afterward experimented in machines for propelling balloons. He invented a rag-cutting machine, now in general use in paper-mills. In 1835 he became interested in the *New York Sun*, and is regarded as a pioneer in the penny newspaper business. In 1857 he left his profession and retired to his native town, where he died July 18, 1868.

Beach Plum: See PLUM.

Beachy Head: the highest headland on the south coast of England: 2½ miles S. S. W. of Eastbourne, Sussex. It consists of perpendicular chalk cliffs 564 feet high, forming the east end of the South Downs. Here is a lighthouse 285 feet high. The French fleet defeated the Dutch and English near this point in 1690.

Beacon [M. Eng. *bekene* < O. Eng. *bēacn*, a sign; akin to Eng. *beckon*]: Before other means of rapid telegraphy were invented, fires, kindled on the tops of mountains or prominent points of the coast, were an obvious resort as alarm-signals, giving warning of the approach of hostile fleets or armies. So, too, as a guide to mariners, for whom the dangers of a contiguous coast are enhanced by darkness, blazing fires or "lights" of some kind (see LIGHTHOUSE) were ever the most obvious beacons; hence a "fiery signal" is associated with the classic signification of the word. The word *beacon* (in a special signification) is now almost exclusively restricted to the last mentioned uses, denoting a mark or sign erected on coasts for guiding and preserving vessels at sea by night or by day. Practically, it is still further restricted by being divested, almost entirely, of reference to "light" or "fire," and applied to fixed structures or material marks erected on rocks or shoals in harbors or narrow channels; nevertheless, a small light-tower erected for no other than this limited purpose is sometimes called a *beacon-light* (as distinct from the lighthouse proper); while fixed un-illuminated signal structures are called "day-beacons."

Beaconsfield, bek ūnz-fēld: small town in Buckinghamshire; 10 miles N. of Windsor (see map of England, ref.

12-1); notable as the home and burial-place of the poet Walter and of Edmund Burke, and as having given his earl's title to Benjamin Disraeli. Pop. about 1,500.

Beaconsfield, LORD: See DISRAELI.

Bead [M. Eng. *bede*, prayer, prayer-bead; O. Eng. *bed*, *gebod*, prayer]; in Old English, a prayer, and hence one of the small perforated balls, of whatever material, used for keeping an account of the number of prayers repeated. Beads are small perforated globular bodies worn as ornaments by women and children around the neck and on other parts of the person, for which purpose they are arranged on strings. They are made of various materials—gold, amber, coral, pearl, crystal, glass, etc. More beads are made of glass than of any other material. They are often used in the ornamentation of slippers, purses, and other articles. The ancient Egyptians understood the art of making glass beads, which are now extensively manufactured at Murano, near Venice, and in China.

Bea'dle, WILLIAM H. H., LL. D.: b. at Liberty, Parke co., Ind., Jan. 1, 1838; educated at Rockville and in University of Michigan; entered the army in 1861 as first lieutenant of the Thirty-first regiment of Indiana infantry; served throughout the whole war, and was in 1864 brevetted a brigadier-general. After the war he studied law and began to practice in Wisconsin, when, in 1869, he was appointed U. S. surveyor-general over the Territory of Dakota. From that time he devoted his whole energy to the development, material as well as moral, of the Territory, as a member of the Legislature, and more especially as superintendent-general of public instruction (1879-83), in which last position he succeeded in organizing the whole school system of the Territory.

Bead-tree: See CHINA, PRIDE OF.

Beagle: a small variety of hound, formerly employed in Great Britain for hunting hares, but now nearly supplanted by the harrier. The beagle is about 10 inches high at the shoulder, is compactly formed, and has long pendulous ears and smooth hair. It is remarkable for its keenness of scent and perseverance. During the chase it utters a musical cry. A small variety is used as a lap-dog.

Beak, or Rostrum [from Fr. *bec*; Ital. *becco*, a word of Celtic origin, *bucca*, hook]; the bill of a bird; in other words, the hard, horny mouth of a bird, consisting of two parts, called the upper and lower mandible. (See BILL.) The term is also applied to the sharp projecting part of the bow of modern ships of war used for ramming, and to the similar construction on the prows of ancient war-galleys.

Beal, WILLIAM JAMES, M. A., Ph. D.: botanist; b. in Adrian, Mich., Mar. 11, 1833; educated in University of Michigan and Harvard University. He was for two years Professor of Natural History in Chicago University, until he became Professor of Botany (in 1870) in the Michigan Agricultural College. He has written many papers on economic botany. His principal publications are *The New Botany* (1881) and *The Grasses of North America* (vol. i., 1887).

CHARLES E. BESSEY.

Beale, LIONEL SMITH, F. R. S.: an accomplished microscopist and physiologist; b. in London, 1828; graduated M. B. at the University of London in 1851, in which institution he was afterward appointed professor. Many remarkable books and monographs upon histology and biology have been published by Dr. Beale. His papers, written against the Darwinian hypothesis (1870), have attracted much attention. Among his numerous works are *How to Work with the Microscope* (1858); *The Structure of the Tissues of the Body* (1861); *Protoplasm* (1870); *Life Theories, their Influence on Religious Thought* (1871); *Our Morality and the Moral Question* (1887); in collaboration with others *The Physiological Anatomy and the Physiology of Man*, besides treatises on urinary and hepatic disorders.

Beam: any large piece of timber; the principal piece of timber in a building, that lies across the walls and serves to support the rafters; also a collection of luminous rays emitted from the sun or other luminary. The word has several technical applications. The part of a balance from the ends of which the scales are suspended is called a beam; a weaver's beam is a wooden cylinder on which the web is wound. The term is also applied to the part of a steam-engine to which the piston is sometimes attached to transfer motion to the crank shaft. In ships, a beam is a great main cross-timber, extending across the hull, supporting the deck, and preventing the sides from collapsing. Each of

these beams is made of one solid piece of good timber, if possible, and is upheld at or near the middle by a pillar or pillars. In large steamships iron beams are often used instead of wood. A ship is said to be "on her beam ends" when so much inclined to one side that the beams become nearly vertical. The word also occurs in the phrase "on the starboard beam," which is applied to the position of an object at sea which is seen toward the right by a person whose face is turned toward the bow. See FLEXURE and BRIDGES.

Beamsville: a post-village of Clinton township; Lincoln co., Ontario, Canada; on the Great Western Railway; 11 miles W. of St. Catharines (see map of Ontario, ref. 5-E); has manufactures of farming tools, carriages, etc. Pop. 1,000.

Beam-tree, White (*Pyrus aria*): a tree which is a native of Europe and Asia, and grows to the height of from 25 to 40 feet. It has ovate and serrate leaves, which are white and downy beneath, flowers in terminal corymbs, and bears a scarlet fruit about as large as a pea. This fruit, which is sometimes called sorb or service-berry, is acid and astringent, and is used to make beer. The hard, fine-grained wood is useful for cog-wheels.

Bean: a plant of the family *Leguminosæ*. The true bean of Europe is an upright plant with stiff and nearly straight stems, white black-eyed flowers in thick clusters and large broad pods. The beans are large and more or less flattened, often angular or even nearly square. This plant is the *Vicia faba* (or *Faba vulgaris*). It is sometimes grown in this country under the name of English bean, most frequently as the Broad Windsor and Mazagan varieties. It does not succeed in the hot and dry summers of America. The common garden and field beans of America belong to the species *Phaseolus vulgaris*, although some botanists think that they represent several confused species. In Europe they are known as kidney-beans or haricots. About 150 varieties of these beans are now grown in this country, a few being grown for field crop and the product sold as dry beans, but the greater part being grown in the garden for "string" or "shell" beans. Beans demand a warm loose soil, and they are very susceptible to injury from frost. In 1890 12,607 acres were devoted to beans in the U. S., as a truck-garden crop, and 12,905 acres were devoted to beans for seed. The original home of the common bean is unknown. It has been cultivated from remote times. The Lima bean (*Phaseolus lunatus*) is a climbing species which is sparingly cultivated in the northernmost States, but which succeeds well from New Jersey southward, and is grown in great quantities in California, whence most of the seed now comes. The species is supposed to be native to South America. The soy-bean (*Soya hispida*) is the popular bean of China and Japan, and is somewhat known in the U. S., especially in some parts of the Southern States. See SOY-BEAN.

Several beans are grown for ornament, as the scarlet-runner (*Phaseolus multiflorus*) and species of *dolichos*, especially *Dolichos lablab*. Some species of *dolichos* are grown for culinary uses, especially the asparagus-bean (*Dolichos sesquipedalis*). The cow-pea also belongs to this genus (*D. chinensis*). See LEGUMINOSÆ.

L. H. BAILEY.

Bean, TARLETON HOFFMAN, M. D., M. S.: ichthyologist; b. at Bainbridge, Lancaster co., Pa., Oct. 8, 1846; graduated at Columbian University, Washington, D. C.; was principal of Smyrna Seminary, Del., and of the high school of Wilkesbarre, Pa. In 1874 he accepted a position in the U. S. Fish Commission, and has been actively associated with its work ever since. In 1884 visited Alaska to investigate the shore fisheries, and again in 1889 to study and report on the salmon fishery. Dr. Bean is curator of the department of fishes, U. S. National Museum, ichthyologist and assistant in charge of the division of fish culture, U. S. Fish Commission, and editor of its publications. He has published numerous papers on fishes in the publications of the U. S. Fish Commission and U. S. National Museum; a *Report on the Fishes of Pennsylvania*; and, in conjunction with Dr. G. Brown Goode, an important memoir on the *Deep-sea Fishes of the Atlantic Basin*. He has also contributed many articles to *Forest and Stream*, of which he is editor of sea and river fishing.

FREDERIC A. LUCAS.

Bear [in Lat. *ursus*, female *ursa*]; a quadruped of the genus *Ursus* and order *Carnivora*; the type of the family of *Ursidae*. Bears walk on the soles of their feet, have five toes on each foot, and have claws which are not retractile, but are

adapted for digging in the earth or climbing trees. Their tails are very short. They have six cutting teeth in each jaw, and one canine tooth on each side in each jaw. Bears are found both in warm and cold climates in Europe, Asia, and America, but are scarce in Africa. The *Helarctos erowtheri* occurs in the Atlas Mountains. The species that inhabit cold climates are generally more fierce and carnivorous than those of tropical regions. Some species pass the winter in a state of torpidity and hibernation, during which they eat nothing and remain stationary in hollow trees or holes in the ground.

The brown bear (*Ursus arctos*) is widely distributed over the continents of Europe and Asia, but it has been extirpated from the British islands. It is generally believed to be the only European species. It is solitary, infests mountains and forests, eats fish and other animals, and subsists partly on fruits and vegetable food. The flesh of this bear is eaten by the people of Kamchatka and other regions.

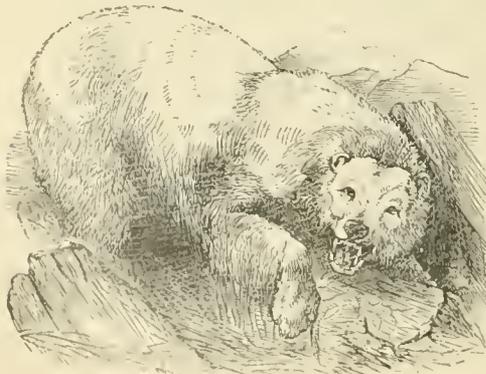

The black bear (*Ursus americanus*) is found in all parts of North America. Its total length is about 5 feet. It prefers vegetable food, but when pressed by hunger will kill and eat small animals. It kills its prey by hugging or squeezing with its fore paws. Great numbers of black bears are killed for their skins, which have a smooth, glossy fur, and are valuable for cloaks, caps, etc. This animal is an expert climber, is very fond of honey and green corn (maize), and is less fierce and dangerous to man than the brown bear.

The Rocky Mountains and adjacent parts of North America are infested by the grizzly bear (*Ursus horribilis*), which

Grizzly bear.

is much larger and more carnivorous than the black bear. It sometimes measures 9 feet from the nose to the tail, which is very short. The hair is long, and its color is a mixture of brown, white, and black. This bear, which is very tenacious of life, is the most formidable beast of prey on the continent of America. It is able to master a bison and carry away its

Polar bear.

huge carcass. It is stated that it hunts for prey both by day and night. It can run swiftly, but does not climb trees.

The largest of all the family of *Urside* is the polar bear (*Thalarectos maritimus*), called also the white bear, the fur of which is an impure white. It sometimes measures nearly 10 feet long and 5 feet high. It is strictly marine in its habits, is never found far from the sea, and inhabits the most northern shores of Greenland, Asia, etc. It subsists chiefly on animal food, and pursues seals and fishes both on the ice and in the water. These bears display a remarkable affection for their cubs.

The bear mentioned in the Bible was probably the Syrian bear (*Ursus syriacus*), which resembles the brown bear in its habits, and has a stiff mane of erect hairs between the shoulders. The color of its hair is mostly dingy white or brown. Among the other species is the *Ursus labiatus*, or long-lipped bear of the East Indies, an inoffensive and gentle animal, which is often led about by Indian jugglers for exhibition. Among the Andes of Chili occurs the *Ursus ornatus*, called spectacled bear, which is black except two semi-circular yellow marks above its eyes. Remains of several extinct species of bears have been found in caves in England and Germany. Of these, *Ursus spelæus*, called the cave bear, is the best known. Revised by D. S. JORDAN.

Bear-baiting: A custom was formerly prevalent in many countries of baiting bears with dogs. The place in which the bears were kept was called a "bear-garden." Bear-baiting was a favorite sport in England, not only for the common people, but also for the higher classes. Queen Elizabeth is said to have enjoyed it. It was hated by the Puritans, Macaulay wittily says, "not because it gave pain to the bear, but because it gave pleasure to the spectators." This coarse and inhuman entertainment gradually died out, and was finally prohibited by act of Parliament, Sept. 9, 1835.

Bear'berry (*Arctostaphylos uva-ursi*): a trailing shrub, with elliptical, evergreen leaves and red berries, found in the Northern U. S., Europe, and Asia. It is a member of the heath family, and is closely related to the madroña and still more closely to the manzanita of California.

CHARLES E. BESSEY.

Beard: a name applied to the hair which grows upon the lower part of the face of a man, and in exceptional cases upon the faces of women, or even children. The wearing of the beard is universal in the East, where it has long been regarded as a mark of honor and dignity. Some races of men, like the American Indians, carefully pluck out the beard, which with them and others, such as the Mongolians and Bedouins, is scanty. Most white races have beards with hairs differing decidedly in structure and appearance from those of the scalp. The wearing of beards in European nations has been regulated partly by fashion and partly by legal enactments for or against the practice. The beard is believed to protect the throat and chest from colds.

Beard, CHARLES, B. A., LL. D.: Unitarian minister and scholar; b. in Manchester, England, July 27, 1827; educated at Manchester New College and Berlin University; minister of Gee Cross chapel, Cheshire, and Renshaw Street chapel, Liverpool; editor of *The Theological Review* 1864-79; author of *Outlines of Christian Doctrine* (1859); *The Soul's Way to God* (1875); *The Hibbert Lectures* (1883); *The Universal Christ* (1888); *Martin Luther* (1889). His *Hibbert Lectures* are one of the most important courses given on a foundation that has been productive of the highest things. D. in Liverpool, Apr. 9, 1888.

Beard, GEORGE MILLER, M. D.: physician; b. at Montville, Conn., May 8, 1839; was educated at Phillips Academy, Andover, and at Yale, where he graduated 1862; attended one year at medical department of Yale, and, coming to New York, graduated from College of Physicians and Surgeons 1866, having for eighteen months (1863-64) been assistant-surgeon on the gunboat New London in the Western Gulf blockading squadron; commenced practice at once in New York, and with Dr. A. D. Rockwell made electrotherapeutics and nervous diseases his specialty; wrote many works, among them *American Nervousness, with its Causes and Consequences*; *The Scientific Basis of Delusions, being a New Theory of Trance and its Bearing on Human Testimony*; *Clinical Researches in Electro-surgery* (together with Dr. Rockwell); *Medical Uses of Electricity*; and *The Physiology of Mind-reading*; 1863-64 was acting assistant-surgeon in U. S. navy; in 1868 became lecturer in New York University on nervous diseases; gave special attention to mesmerism, and lectured in 1881 on *Artificial Trance*. D. in New York, Jan. 23, 1883.

Beard, JAMES HENRY: animal, genre, and portrait painter; b. in Buffalo, N. Y., in 1814; settled in Cincinnati and painted portraits in the earlier part of his career, including those of Henry Clay, John Quincy Adams, and Presidents W. H. Harrison and Taylor. National Academician 1872. D. in Flushing, N. Y., Apr. 4, 1893. W. A. C.

Beard, RICHARD, D. D.: a clergyman of the Cumberland Presbyterian Church; b. in Sumner co., Tenn., Nov. 27, 1799. His early education was not without care, yet limited. His education preparatory to the ministry was conducted better than usual for the time in his church. He was licensed and commenced preaching in 1820, and was several years exclusively devoted to the work of the ministry. His health failing, he spent two or three years teaching. He was two and a half years at Cumberland College, Princeton, Ky., and graduated (1832). He was immediately appointed Professor of Languages in that college. He afterward spent five years at Sharon, Miss., in connection with Sharon College (1838-43). In 1843 he became president of Cumberland College, Ky., and remained there ten years and a half, giving a great impetus to the classic training of young men, especially those seeking the ministry. In 1854, when the Cumberland Presbyterian Church established a chair of Systematic Theology in Cumberland University, Lebanon, Tenn., his high character as a scholar and educator at once called him to that position, which he held till his death. He gave to the Church an able and standard work on *Systematic Theology*, in 3 vols. 8vo. It is regarded as the crystallization of Cumberland Presbyterian thought and faith. He published two octavo volumes of biographical sketches of ministers. Also *Why am I a Cumberland Presbyterian?* (1 vol.). His contributions to the *Quarterly* and general literature of the Church were constant and most valuable. He was the leading theologian of the denomination. His great dignity, purity, and gentleness of character marked him as a representative man, calling him frequently to the moderator's chair. His books were published at Nashville, Tenn. D. at Lebanon, Tenn., Dec. 2, 1880.

Beard, WILLIAM HOLBROOK: animal-painter; b. at Painesville, O., Apr. 13, 1825. He visited Europe in 1857 and studied and painted in Germany, Italy, and France. National Academician 1862. His work is principally of a humorous character representing animals, such as bears, rabbits, and monkeys dressed as men and women, and depicted as acting under human impulses. Studio in New York.

WILLIAM A. COFFIN.

Beards'ley, EBEN EDWARDS, D. D., LL. D.: b. in Fairfield co., Conn., 1808; graduated at Trinity College, Hartford, in 1832, where he was for two years a tutor. He was for a time principal of the academy at Cheshire, Conn.; took orders in the Protestant Episcopal Church in 1835, and became rector of a church in New Haven in 1848. He was the author of a *History of the Episcopal Church in Connecticut; a Life of Samuel Johnson, D. D.; a Life of Samuel Seabury, D. D., First Bishop of Connecticut;* and a *Life of William Samuel Johnson, LL. D., Dron.*, all valuable works. D. in New Haven, Conn., Dec. 21, 1891.

Beardsley, SAMUEL, LL. D.: jurist; b. in Hoosac, Rensselaer co., N. Y., Feb. 9, 1790; practiced law in Rome and Utica, N. Y.; held various State offices, as district-attorney of Oneida County 1821-25, as State Senator 1823, as U. S. district-attorney for the northern district of New York; was a member of Congress from New York (1831-36 and 1843-45); attorney-general of the State (1837); became a judge of the State Supreme Court in 1841, and its chief justice in 1847. D. in Utica, May 6, 1860.

Beardsley, SIDNEY BERR: jurist; b. in Monroe, Conn., Aug. 20, 1822. In 1874 he became a judge of the Superior Court of Connecticut, and in 1877 a judge of the Supreme Court of Errors of that State, resigning in 1889 on account of ill health. D. in Bridgeport, Conn., Apr. 24, 1890.

HENRY WADE ROGERS.

Beards'town: city; Cass co., Ill. (for location of county, see map of Illinois, ref. 6-C); situated on the bank of the Illinois river; 90 miles S. of Peoria, and 111 miles N. of St. Louis; is the official headquarters of St. Louis Div. of C., B. and Q. R. R., and terminus of O. and M. R. R.; has 6 churches, 3 large schools, including a high school, 2 banks, 2 flouring-mills, saw-mill, cooperage-works, baking-powder factory, screen-factory, feed-cutter factory, large machine-shops, shops of St. L. Div. of C., B. and Q. R. R., and water-works. The celebrated "Lithia Springs" are here.

There is a fine park near the business portion of the city. A railroad-bridge, with iron piers, crosses the river at this point, and is a fine structure, costing some \$300,000. Pop. (1880) 3,135; (1890) 4,226; (1892) estimated, 5,000.

EDITOR OF "ILLINOIAN."

Bear River: a port of entry of Digby co. and township, Nova Scotia; at the head of navigation (for location of county, see map of Quebec, ref. 3-A); has quite extensive manufactures of lumber, leather, etc.; ship-building is also carried on. It has a large trade in firewood and lumber, which are sent to the U. S. and West Indies. Pop. about 900.

Bear River: a river of the U. S.; rises in the N. part of Utah, flows northward into Idaho, and changes its course abruptly toward the S. Having again crossed the south boundary of Idaho into Utah, it flows southwestward, and enters Great Salt Lake about 25 miles N. W. of Ogden. The total length is about 400 miles.

Bears and Bulls: a phrase often used in connection with the purchase and sale of stocks; and applied to persons who speculate in Government securities and in the stocks of railroads and other corporations. The "bears" are those who wish to depress the value of stocks, and the "bulls" are those whose interest prompts them to act in the other direction. If two men have contracted, the one to deliver and the other to take a certain stock at a specified price on an appointed future day, the former will naturally belong to the bears and the latter to the bulls. See STOCK-EXCHANGE.

Bear's Grease, or Bear's Oil: said to be efficacious in promoting the growth of human hair. The genuine article being insufficient to supply the demand, perfumers and others sell under the name of bear's oil large quantities of beef-marrow, hog's lard, spermaceti, etc.

Beas'ley, FREDERICK, D. D.: a clergyman of the Protestant Episcopal Church; b. near Edenton, N. C., in 1777; graduated at Princeton in 1797; and was provost of the University of Pennsylvania from 1813 to 1828. Among his works, which attracted attention in Europe, are *A Search of Truth in the Science of the Human Mind* and a *Reply to the Views of Dr. Channing*. D. at Elizabethtown, N. J., Nov. 2, 1845.

Beasley, Gen. NATHANIEL: b. in 1751; was a pioneer of Ohio, and a noted Indian-fighter and scout; was in the campaigns of St. Clair and Wayne, and afterward settled in Chillicothe, O.; member of Ohio Legislature, a canal commissioner, and for many years major-general of militia. D. in Knox co., O., Mar. 27, 1835.

Beast-Fables: the general name given to short stories, whether of popular or learned origin, in which the lower animals appear (usually by themselves, but sometimes in connection with men) associating with each other as reasonable beings endowed with the virtues and vices of humanity. Such stories are found everywhere, in all ages, and among races of all degrees of civilization. Their rationale is to be sought in the "animistic" philosophy of savage man, who makes no essential distinction between his own mental and moral faculties and those which he ascribes to other living creatures—not lower animals to him. (See ANIMISM; Tylor, *Primitive Culture*, i. 422 ff.; G. A. Wilken, *Het Animisme bij de Volken van den Indischen Archipel*, 1884-85.) In this stage of thought the savage, of course, feels no improbability in such a story about beasts as would seem to him credible if told about men.

Of the considerable number of beast-tales that have been collected, some may no doubt be myths in embryo or the detritus of myths; but any general application of the hypotheses of solar or meteorological mythology to this class of stories is now thoroughly discredited. Countless examples of this learned trifling may be seen in the *Zoological Mythology* of A. de Gubernatis (2 vols., London, 1872), where a day-and-night interpretation is devised for many stories which are obviously post-"mythopoeic." Others of these beast-tales are clearly totemistic, owing their origin or their point to a supposed relation of descent between the tribe or family of the narrator and the animal that formed the tribal or gentile cognizance. (See J. G. Frazer, *Totemism*, Edinburgh, 1887; examples in Chamberlain, *Nonihocton in Siouan Mythology, Journal of American Folk-lore*, v. 293 ff.) But a larger number fall into the two classes of (1) tales told merely for amusement, and (2) tales told to explain phenomena of the animal world.

(1) To the former class belong the exploits of the jackal (in Bleek, Koelle, Theal, Basset, etc.), the hare (in Casalis, Harris, Jones, Baissac, Steere, etc.), the tortoise (in Bleek, Hartt, Roméro, Harris, etc.), the spider (in Dasent, Schlenker, Milne-Home). These narratives are not properly moral (except that they celebrate the savage virtue of subtlety), nor are they in any just sense satirical. They chiefly aim to amuse, but are also meant to appeal in some sort to the intellect. Thus The Lion and the Jackal, we are informed, is often told by the Hottentots "to show how clever and wily the jackal is" (*Folk-lore Journal*, Cape Town, ii. 53). Such stories easily pass into satire; the narrator has but to call up in his hearers, by a tone or a turn of phrase, the reflection, "And this is the way of the world." But the very easiness of the transition makes the category *beast-satire* hard to define or establish. The great mediæval "beast-epic" *Reynard the Fox* is commonly regarded as satirical, but many of the adventures that compose it do not differ in kind from the jackal and tortoise tales of Africa and Brazil, which apparently have no such purpose.

(2) Tales of the second class, *les pourquoi*, are very numerous. Thus Georgia Negroes explain why the alligator never sleeps far from the river-bank (Jones, No. 1, p. 1), and why he does not molest the moor-hen (ib., No. 11, p. 24); the Iroquois, why the chipmunk has a black stripe on his back (Smith, p. 80); the Eskimo, why the raven is all black (Boas, *Report of Bureau of Ethnology for 1884-85*, p. 64); the Pawnees, why the deer has no gall and the antelope no dew-claws (G. B. Grinnell, *Pawnee Hero Stories and Folk-tales*, New York, 1889, p. 204); the Hottentots, why the hyæna's left hind leg appears to be shorter than his right (Bleek, No. 7, p. 14); Madagascar natives, why there is a deadly feud between the snake and the frog (*Antananarivo Annual*, 1877, p. 113), and so on. Like tales of the first class, *les pourquoi* do not die out with the animistic stage of thought. The folk-lore of civilized countries is full of them (see, for example, *Les pourquoi du coucou*, *Revue des Traditions Populaires*, iii. 262 ff.; cf. iii. 267, vi. 314), and they show an interesting tendency to become legends, explaining the *why* of this or that phenomenon by reference to a miracle of Christ or some saint (see examples in Ralston, *Russian Folk-tales*, pp. 330 ff.; and cf. *Mélusine*, ii. 43).

So far the term *beast-fable* has been used in its popular acceptance as equivalent to *beast-tale*. In a narrower sense the term is restricted to such beast-tales as are in some measure allegorical or at least have a moral purpose, tacit or outspoken. The step from the beast-tale pure and simple to the beast-apologue is the easy, perhaps the inevitable, result of the growth of reflection. It is difficult to conceive a beast-tale, of whatever origin, that might not lend itself to moralizing. The process may be illustrated by the anecdote of the wife who contradicted her husband, as told by the Knight de la Tour-Landry (ed. by T. Wright for the Early English Text Society, 1868). We might imagine the knight's daughters asking him why a certain lady has a broken nose and getting in reply a bare statement of facts: how the lady had made herself so troublesome by her bad habit that at last her husband, finding expostulation useless, knocked her down, inflicting the injury in question. This answer would be paralleled, in the realm of beast-fable, by the story of the jackal's neglecting to break the fall of the hyæna, told to satisfy an inquiry about the hyæna's limping with his left hind leg (Bleek, No. 7, p. 14). Instead of such a report of facts, however, the knight reads his daughters a lecture on the enormity of insubordination on the part of a wife, and uses the unfortunate lady as a deterrent. This would be paralleled if the mishap of the hyæna were told to exemplify the dangers of bad company or to enforce the thesis that there is *no* honor among thieves. The remark that hyænas still limp might then be omitted. If retained, it would serve merely as a means of heightening the effect: the victim of bad company received an incurable injury which he has handed down to all his posterity. Once established, the allegorical or moralizing beast-fable would, of course, tend to draw into its circle other beast-tales, whatever their origin, and would, in addition, propagate its kind. On the completion of this process we have the didactic fable, as known to ancient and modern literature, firmly established.

The importance of this distinction between tale and fable is insisted on with much cogency by Mr. Joseph Jacobs in his brilliant *History of the Æsopic Fable* (vol. i. of his edition of Caxton's *Æsop*, London, 1889, pp. 204 ff.); but Mr.

Jacobs, in his desire to restrict as far as possible to Greece and India all claim to fable literature, is too much inclined to rule all savage beast-tales out of the category of fable. The line can seldom be drawn with certainty. The *Uncle Remus* stories, for instance, appear in many cases to be purely beast-tales: yet they sometimes lend themselves, in the mind of the narrator, to a more or less distinctly uttered didactic purpose. Mr. Harris, who collected them and who knows the Negro so well, will not venture to say how far they were all felt as embodying a moral, but suspects some such tendency. To some of Col. Jones's *Negro Myths* a rudimentary moral is appended: "Careless man like Buh Turkey Buzzard" (No. 2, p. 4); "Bad plan to hunt for trouble" (No. 18, p. 40). The application of the Zulu story that the hyrax has no tail because he sent for one instead of going himself is hard to miss (Callaway, i. 355; the same fable among the Basutos, Jacottet, *Revue des Traditions Populaires*, iv. 110). It is difficult to escape the moral of the Brazilian (Indian) story of The Opossum and the Man (Roméro, *Contos populares do Brazil*, p. 191); or the North American Indian story of The Eagle and the Owl (Petitot, *Traditions Indiennes du Canada Nord-Ouest*, Paris, 1886, p. 276). It is, then, unsafe to assert that the beast-tales of any given people have no claim to be regarded as fables merely because they have no formal moral, or because no traveler has ever heard them told except for amusement. It is obvious that the tale and the fable may exist side by side, the tale sometimes being used as a fable, the fable sometimes losing its moral and being told as a tale, as boys read Æsop and as the mediæval congregations often took the "examples" in their preachers' sermons. Further, there is no reason why the beast-tales of one race should not become the beast-fables of another.

The diffusion of beast-tales is a complicated subject. When we examine such of these stories as have been taken down from the lips of savage or half-civilized races, we observe at once two distinct classes: those that are apparently indigenous, and those that are identical with European tales, popular or literary. The latter class are in almost every instance certainly borrowed directly or indirectly from the whites, and such borrowing is easily accounted for. Nothing travels further or faster than a good story. The white man has carried his Æsop and his *Reynard the Fox* to the ends of the earth, and by means of the slave-trade has brought the ends of the earth to his own door. A few examples will illustrate these points. The diverting story of how the fox stole the butter, of which Col. Jones gives an excellent version from Georgia (No. 24, p. 53), occurs in Meyrac, *Traditions des Ardennes*, p. 458; in Bladé, *Contes populaires de la Gascogne*, iii. 195; in Gitté and Lemoine, *Contes populaires du Pays Wallon*, p. 159; in Radloff, *Proben der Volksliteratur der türkischen Stämme Süd-Siberiens*, iii. 369, and elsewhere. The details are too remarkable to admit of accidental coincidence. The Æsopic fable of the Fox and the Crane turns up among Negroes in Brazil (Roméro, p. 159). Reynard's device for stealing fish from the wagon is found in South Africa (Bleek, No. 8, p. 16), and, combined with the trick by which the bear lost his tail, among the Iroquois (Smith, p. 77). In the thirty-second of Col. Jones's *Negro Myths* (p. 73) we actually recognize the Herodotean romance of the Egyptian king's treasure-chamber transmogrified into a tale concerning "Buh Lion, Buh Rabbit, Buh Fox, and Buh Roceoon." The facility with which literary matter becomes a part of popular tradition when once made known, in whatever way, to a tale-telling people, has been a fruitful source of perplexity to students of folk-lore. Besides this borrowing from civilized masters or visitors, savage or half-civilized races have, of course, borrowed largely from each other. This exchange may be observed in those countries in which an African slave population has been brought in contact with the aborigines. On the composite character of the folk-lore of such countries the Portuguese scholar Theophilo Braga has made many excellent observations in his essay *Sobre a Novellística Brasileira*, prefixed to Roméro's *Contos populares do Brazil* (Lisbon, 1885). For a discussion of the beast-epic and of the theories relating to a Northern and a Southern cycle of beast-tales, see article REYNARD THE FOX in this encyclopædia.

The oral literature of modern Europe abounds in unmoralized beast-tales differing in no essential from those of uncivilized races. Some of these are clearly wild-shoots from Æsop or *Reynard the Fox*; others are survivals or modern representatives of the indigenous European stories

to which *Reynard* and probably much of Æsop owe their existence; others are doubtless imitations of old models. The beast-tales included in Asbjörnson and Moe's *Norske Folkeeventyr* (2d ed., Copenhagen, 1852), in Bladé's *Contes populaires de la Gascogne* (Paris, 1886), in Crane's *Italian Popular Tales* (Boston, 1885), in Coelho's *Contos populares Portuguezes* (Lisbon, 1879), and in that corpus of zoological superstitions, Rolland's *Faune populaire de la France* (Paris, 1877 ff.), will serve as examples. Russia is particularly rich in such narratives; see A. Gerber, *Great Russian Animal Tales*, in the *Publications of the Modern Language Association of America*, 1885 (chiefly from Afanasiev's collection). Specimens of gypsy stories may be seen in H. von Wilslocki, *Volksdichtungen der sibirischen und süd-ungarischen Zigeuner* (Vienna, 1890).

Clearly, then, a people may outlive the animistic stage of mental development without ejecting unmoralized beast-tales from its oral literature. But in *written* literature it is only in the form of the apologue that such tales can win or maintain a place. In this form, in the collection known as the Fables of Æsop, they have had no small influence on the mental and moral life of ancient, mediæval, and modern Europe. The history of this collection is inextricably bound up with the history of Hindu fables, and the two may be briefly sketched together.

Stainhöwel's Latin and German Æsop (about 1480), of which Caxton's Æsop is an English translation made through the medium of Machault's French version, goes back in general, though not without intermediaries, to the Latin fables of Phædrus (about 25 A. D.; see PHÆDRUS) and the Greek mythiambi of the Roman Babrius (about 230 A. D.; see BABRIUS). The Greek prose fables of Æsop are merely paraphrases of Babrius. The history of Greek fable before Phædrus and Babrius is obscure. Of the date and nationality of Æsop we have no satisfactory information. We can not even be sure that he is an historical person, though that is probable. It is certain, however, that from the time of Aristophanes the Greeks regularly referred to him the fables which they used in writing and conversation. About 300 B. C. Demetrius Phalerens made a collection (*ἄδων Ἀισωπέλων συναγωγή*, Diogenes Laertius, v, 80), now lost, of these floating stories, and it is not improbable that this, in a later recension, was the original of our Phædrus (Jacobs, *History of the Æsopic Fable*, p. 35). The immediate source of Babrius was perhaps the *Δεκαμυθία* of Nicostratus (second century of our era), doubtless a handbook for rhetorical teaching (Rutherford, *Babrius*, p. xl.). What relation this bore to the compilation of Demetrius is purely a matter of conjecture.

The question whether the Æsopic fables of Phædrus and Babrius (which show many correspondences) are native Greek or borrowed from India has been much discussed. The Indian documents most concerned are the Pāli Jātakas, or birth-tales (about 400 B. C., though not put into their present frame till perhaps 500 A. D.; see PĀLI LITERATURE), and the so-called *Fables of Bidpai*. In the Jātakas various beast-fables (in the narrower sense) are strung together as accounts of the incarnations of the Buddha. In the *Fables of Bidpai* (lost in its original form, but preserved in whole or in part in several translations, Syriac, Arabic, Tibetan, etc., and in the Sanskrit abridgment entitled PACHATANTRA, *q. v.*) similar, and in some cases identical, stories are used to make up a Buddhist *De Regimine Principum*. The date of the original work is unknown, but may be put at about 300 A. D. A considerable portion of its contents reappears in the *Hitopadesa* and the *Kathā-saril-sāgara* (see SANSKRIT LITERATURE). The many correspondences between Phædrus-Babrius and the Bidpai collection make borrowing certain. Benfey was of the opinion that the Indians had borrowed largely from the Greeks; but the early date of the Jātakas proves that the former had a large stock of beast-fables of their own, and the appearance of several of the Jātakas among the Æsopic fables suggests an Indian source for such other of the Phædrus-Babrius apologues as are found in the Bidpai collection. It is therefore pretty certain that not a few of Æsop's fables came from the East. That all of them are of Oriental origin is, however, improbable. Unless the Greeks were different from the rest of mankind, they must have had their own primitive beast-tales, and some of these they would inevitably have moralized. Besides, we have a few specimens of Greek fable (in the narrower sense) that date from a time so early as to make borrowing unreasonable. The Hesiodic apologue of the hawk and the nightingale (*Works and Days*, 203 ff.) is an

example (see Rutherford's *Babrius*, p. xxvii., and cf. Joseph Jacobs, *Æsopic Fable*, pp. 26-29). Except the Indians and the Greeks, no ancient nation can be said to have made important original contributions to fable literature.

The history of the Æsopic fable in the Middle Ages is full of difficulties. A tenth-century version of eighty-three fables of Phædrus, which is ascribed in the manuscripts to "Romulus," was the medium through which the Latin fabulist became known to a large part of Western Europe. Most of the Old French "Ysopets," for example, go back to it, though not immediately. Babrius became known through the incomplete Latin translation by Avianus (about 380 A. D.; see AVIANUS). The celebrated Marie de France translated into Norman French of the twelfth century more than a hundred fables, which she ascribed to King Alfred. For a very ingenious conjectural genealogy of her collection the reader may consult Mr. Joseph Jacobs's *History of the Æsopic Fable* (vol. i. of his edition of Caxton's Æsop, London, 1889). This is a work which goes over all the questions of Greek, Latin, and Oriental fable afresh (with abundant references to the investigations of Benfey, Hervieux, Rutherford, Mall, and other scholars), and contributes to the subject many facts and much interesting theory.

We have already seen that the oral traditions of modern Europe possess many tales which may be recognized as Æsop's fables without their morals. A fruitful source for the introduction of these stories from written literature into oral literature was certainly the *exempla* of mediæval sermons (see T. F. Crane, *The Exempla of Jacques de Vitry*, London, 1890; and the article EXAMPLE-BOOKS). The people have kept the tales but discarded the *hæc fabula docet*.

The *Fables of Bidpai* was translated into Latin (from a Hebrew version of the Arabic) by John of Capua in the latter part of the thirteenth century under the title of *Directorium Vitæ Humana* (edited by Derembourg, Paris, 1889), and this version (first printed in 1483) did not fail of its influence on the literature of the fourteenth, fifteenth and sixteenth centuries. The Spanish *Calila e Dimna* (about 1250; edited by Gayangos, 1860) is an independent rendering from the Arabic. The *Directorium*, however, never became popular in the sense in which the fables of Æsop were popular. Sir Thomas North's version (*The Morall Philosophie of Doni*, 1570; excellently edited by Joseph Jacobs, London, 1888) has special interest for the student of English letters.

The only great fabulist of modern times is La Fontaine (1621-95), whose exquisite art made the Æsopic apologue his own, without robbing it of its individuality. The *Fables* of Lessing (published 1759) are still read with pleasure, but can not be compared with the masterpieces of La Fontaine. Of other fabulists only the Englishman Gay, the German Gellert and the Russian Krilof need be mentioned. The fable is still used to some extent for ephemeral purposes, as, for example, in political campaigns, but can hardly be expected ever to regain a place in literature.

BIBLIOGRAPHICAL NOTE.—Materials for the study of the beast-tales of savage or semi-civilized races may be found scattered up and down in the anthropological, ethnological, and folk-lore journals. (See FOLK-LORE.) The following books and articles will also be of service: Émile Alain, *Contes Indiens du Brésil*, recueillis par M. le Général Couto de Megalhães (Rio, 1883); H. N. Allen, *Korean Tales* (New York, 1889); C. Baissac, *Le Folk-lore de l'Île Maurice* (Paris, 1888); René Basset, *Contes populaires Berbères* (Paris, 1887); L. J. B. Bérengar-Pérand, *Contes de la Sénégambie* (Paris, 1885); W. H. A. Bleek, *Reynard the Fox in South Africa* (Lond., 1864; in German, Weimar, 1870); the same, *A Brief Account of Bushman Folk-lore* (London and Cape Town, 1875); D. Brauns, *Japanische Märchen und Sagen* (Leipzig, 1885); H. Callaway, *Nursery Tales of the Zulus* (Natal and London, 1868); E. Casalis, *Les Bassoutos* (Paris, 1859); Sir G. W. Dasent, *Anansi Tales*, appended to his *Popular Tales from the Norse* (2d ed., London, 1859); G. Dumoutier, *Les Chants et les Traditions populaires des Annamites* (Paris, 1890); Alce Fortier, *Bits of Louisiana Folk-lore*, in *Transactions of the Modern Language Association of America*, iii, 100 ff.; W. E. Griffis, *Japanese Fairy World* (Schenectady, N. Y., 1850); J. C. Harris, *Uncle Remus, his Songs and Sayings* (New York, 1880); the same, *Nights with Uncle Remus* (Boston, 1883); the same, *Daddy Jake* (New York, 1889); the same, *Uncle Remus and his Friends* (Boston, 1892); C. Beat: in Alabama and Mississippi, a primary division of a county; a precinct.

Beat, Number of the: See APOCALYPTIC NUMBER.

Beatification [Lat. *beatifica'tio*; *bea'tus*, blessed + *fa'cere*, make]: in the Roman Catholic Church, the solemn act by which the pope declares "blessed" a deceased person who lived and died in the odor of sanctity as proved by the testimony for his virtues, or by his martyrdom, and confirmed by miracles wrought after his death through his intercession. Beatification is a step toward CANONIZATION (*q. v.*).

JOHN J. KEANE.

Beatific Vision: or the direct vision of God; a Christian doctrine directly founded on Scripture (1 Cor. xiii. 12; 1 John iii. 2; Rev. xxii. 3, 4), and universally accepted by the Churches. The time, however, at which the beatific vision is to take place has been the subject of some dispute. The Greek Church puts it after the day of judgment, and among the Protestant Churches this view has been adopted by both the Calvinists and the Lutherans. But it was condemned by the Council of Florence, 1439, which determined that "the souls of those who have remained pure and spotless after baptism, and of those whose sins after baptism have been pardoned, either in this life or in the next, are immediately received into heaven, and behold plainly the triune God as He is"; which decision was confirmed by the Council of Trent.

Beating the Bounds: a popular phrase used in England to denote the periodical survey or perambulation by which the boundaries of parishes are preserved. It is the custom that the clergyman of the parish, with the parochial officers and the boys of the parish school, should march to the boundaries, which the boys strike with willow rods. The boys themselves were sometimes whipped in proximity to an important landmark, in order to impress the subject durably on their memories.

Bea'ton, **Beaton**, or **Bethune**, DAVID: Scottish cardinal; b. in Fife, Scotland, 1494; a zealous opponent of the Protestant Reformation. He was appointed Lord Privy Seal in 1528, and was sent as ambassador to France in 1533. He became a cardinal in 1538, and succeeded his uncle as Archbishop of St. Andrews in 1539. On the death of James V., in 1542, Beaton produced a forged will of that king, appointing himself, with three others, regent of the kingdom; but his article failed, and the Earl of Arran became the regent. Cardinal Beaton was a cruel persecutor of the Protestants, and caused George Wishart to be burned at the stake. He was assassinated in his own castle in St. Andrews by Norman Leslie and others, May 29, 1546. See Knox, *History of the Reformation in Scotland*; Froude, *History of England*, vol. iv.; Robertson, *History of Scotland*.

Bea'trie: city and railroad junction; capital of Gage co., Neb. (for location of county, see map of Nebraska, ref. 7-K); on Big Blue river; 90 miles S. S. W. of Omaha. It has a public library, 2 opera-houses, 7 fine schools, 13 churches, Holly system of water-works, extensive manufactures, etc.; \$100,000 court-house, new \$60,000 Government building, 7 miles of brick-paved streets, electric lights, electric motor street railway; 7 lines of railway, including Rock Island main line, Union Pacific, C., B. and Q., and minor lines; is the third city in the State in population, second in manu-

factures; has 2 daily and 5 weekly newspapers. It is noted for its fine water-power and excellent building-stone. Pop. (1890) 13,836. EDITOR OF "EXPRESS."

Beatrice Portinari, baï-ā-tree chay pōr-tēe-nau'rēe: See DANTE.

Bea'tie, JAMES, LL. D., D. C. L.: poet; b. in Laurencekirk, Kincardine, Scotland, Oct. 25, 1735. In 1760 he became Professor of Moral Philosophy in Marischal College, Aberdeen. To refute the doctrines of Hume he published his *Essay on Truth* (1770), which was extremely successful. His most popular poem is *The Minstrel* (1771-74). D. in Aberdeen, Aug. 18, 1803. See Sir William Forbes's *Life of James Beattie* (2 vols., 1806); Alexander Bower's *Life of James Beattie* (1804).

Beatty, JOHN, M. D.: b. in Bucks co., Pa., Dec. 10, 1749; graduated at New Jersey College in 1769; studied medicine with Dr. Rush, but entered the army early in the Revolutionary war, and became lieutenant-colonel in the Pennsylvania line in Sept., 1776; was taken prisoner at the capture of Fort Mifflin, and, having been exchanged, was appointed commissary-general of prisoners in 1778, with rank of colonel; resigned in 1780, and engaged in the practice of medicine at Princeton, N. J.; was delegate to the Continental Congress 1783-85; often a member of the State Legislature; was Speaker of the House; member of convention which adopted the Federal Constitution; member of Congress 1793-95; Secretary of State for New Jersey 1795-1805; president of Trenton bank 1815-26. D. in Trenton, May 30, 1826.

Beatus Rhenanus: See RIENANUS BEATUS.

Beaucaire, bō'kār' (i. e. *Bellum Quadrum*, the beautiful square): a town of France; department of Gard; on the right (west) bank of the Rhône, and on a railway from Certe to Tarascon; 15 miles by rail E. of Nîmes (see map of France, ref. 8-G). A bridge nearly one mile long here crosses the Rhône. It has an active trade, which is facilitated by a canal extending to the Mediterranean. Here is held annually a great fair (July 25-28), which was formerly perhaps the largest in Europe. It is said to have been instituted by Count Raymond II. of Toulouse in 1217, although we do not find it mentioned until 1315. It has declined in modern times, but it is still frequented by merchants from all parts of Europe and the Levant. The number of annual visitors was formerly estimated at 100,000, but has greatly declined. The chief articles sold at this fair are silks, wine, oil, drugs, wool, leather, and spices. Pop. about 10,000.

Beauchamp, bō'shaān'. ALPHONSE, de: a French historian and publicist; b. at Monaco, in Italy, in 1767; resided in Paris. He contributed to the *Moniteur* and the *Gazette de France*, and published many works, among which are a *History of La Vendée* (3 vols., 1806); a *History of Brazil* (1815); and a *Life of General Moreau* (1814). D. in Paris, June 1, 1832.

Beauchamp, Bee'cham, EARLS OF: Viscounts Elmley (1815); Barons Beauchamp (1806, in the United Kingdom), a noble family of Great Britain.—FREDERICK LYGON, the sixth earl, was born Nov. 10, 1830, and succeeded his brother in 1866. He was Lord of the Admiralty in 1859, member of Parliament for Tewkesbury 1857-63, and for West Worcestershire 1863-66. He died Feb. 19, 1891, and was succeeded by William Lygon, the seventh earl, b. 1872.

Beauchamp, RICHARD: Earl of Warwick; b. about 1380; served as general of the English army in France under Henry V., and succeeded the Duke of Bedford as regent in France, D. at Rouen in 1439.

Beauclerk, bō'klaark', TOPHAM: friend of Dr. Johnson; b. Dec., 1739; only son of Lord Sydney Beauclerk. D. in London, Mar. 11, 1780. After his death Johnson wrote to Boswell: "Poor dear Beauclerk, his wit, his folly, his acuteness and maliciousness, his merriment and reasoning are now over. Such another will not often be found among mankind."

Beaufort, bō'fort: a port of entry; capital of Carteret co., N. C. (for location of county, see map of North Carolina, ref. 4-J); at the mouth of Newport river, about 4 miles from the ocean and 168 miles E. S. E. of Raleigh. Its harbor is the best in the State, and is defended by Fort Macon. There is a lighthouse 156 feet high at Cape Lookout, 11 miles S. E. of Beaufort, in lat. 34° 37' 16" N., lon. 76° 31' 07" W. Pop. (1880) 2,009; (1890) 2,007.

Beaufort, byu'fort: on railroad; a port of entry; capital of Beaufort co., S. C. (for location of county, see map of South Carolina, ref. 8-E); on Port Royal island, and on an arm of the sea called Port Royal river, about 55 miles W. S. W. of Charleston. It has a good harbor, with nearly 16 feet of water over the bar at the entrance. Lumber, rice, and cotton are exported. Pop. (1880) 2,549; (1890) 3,587.

Beaufort, HENRY, Cardinal: an English prelate; b. about 1375; was a natural son of John of Gaunt and half-brother of King Henry IV. He became Bishop of Lincoln in 1398, Bishop of Winchester in 1405, Lord Chancellor in 1403, again in 1413, and a third time in 1424. He acted a prominent part in political affairs, for which he had superior abilities. During the minority of Henry VI. he was very powerful, and was a rival of his nephew, the Duke of Gloucester. He was suspected of complicity in the murder of that rival, but the insinuation is baseless. He was present at the Council of Constance, and voted for Martin V., who, in return for his services, made him a cardinal (1417), but the king (Henry V.) would not allow him to accept the position. In 1426 he was again nominated, and, Henry VI. not opposing this time, he realized his ambition. He was extremely wealthy. D. in Winchester, Apr. 11, 1447. See Lord Campbell, *Lives of the Lord Chancellors*.

Beaufort, bō'fōr', FRANÇOIS DE VENDÔME, Duc de: b. in Paris in 1616; a grandson of Henry IV. of France, and a son of César de Vendôme. He was a leader of the malcontents or opponents of the court in the civil war of the Fronde. Having returned to his allegiance, he was appointed commander of the fleet by Louis XIV. about 1662. He was killed at the siege of Candia in 1669.

Beaufort, DUKES OF (1682): Marquesses of Worcester (1642); Earls of Worcester (1514); Earls of Glamorgan, Viscounts Grosmont, and Barons Beaufort (1642); Barons Herbert (1461); Barons Herbert of Ragland, Chepstow, and Gower (1506); Barons Bottetourt (1308, in England), an old and prominent family of Great Britain.—HENRY CHARLES FITZROY SOMERSET, the eighth duke, was born Feb. 1, 1824, and succeeded his father in 1853. He was member of Parliament for East Gloucestershire 1846-53; master of the horse 1858-59 and 1866-68; and lieutenant of Monmouthshire.

Beaugency, bō'zhāñ'sē: an old town of France; department of Loiret; on the right bank of the Loire, and on the railway from Paris to Bordeaux, 16 miles S. W. of Orléans (see map of France, ref. 4-E). It has manufactures of woolen and leather goods, and a trade in wine, grain, and wool. In the fighting here, Dec. 7 to 10, 1870, the Grand Duke of Mecklenburg was victorious over the French army of the Loire. Pop. (1891) 4,313.

Beauharnais, bō'āir'bay', ALEXANDRE, Vicomte de: French soldier and statesman; b. on the island of Martinique, May 28, 1760; fought under Rochambeau in America; married (1779) Josephine Tascher de la Pagerie, afterward wife of Napoleon I.; member of the National Assembly 1789, and twice its president; general in the Army of the North 1791; general of the Army of the Rhine 1793; accused of participation in the surrender of Mainz; executed in Paris, July 23, 1794.

Beauharnais, EUGÈNE, de: son of Vicomte Alexandre de Beauharnais; b. in Paris, Sept. 3, 1781. His mother, Josephine, became the wife of Bonaparte, whom he accompanied to Egypt in 1798. He was rapidly promoted in the army, was appointed Viceroy of Italy in 1805, and married the Princess Amalie Augusta, a daughter of the King of Bavaria, in 1806. His functions as viceroy were performed with ability, prudence, and moderation. He also displayed superior military talents in the campaign against Austria in 1809 and in the invasion of Russia in 1812. Having obtained command of the army in Russia after it had suffered great disasters, he acted with remarkable firmness and constancy, and made a masterly retreat. After the battle of Lützen, May, 1813, in which he took part, he went to Italy, which he defended against the Austrians until the deposition of Napoleon. He afterward resided at Munich, and obtained from the King of Bavaria the title and estate of Duke of Leuchtenberg. D. in Munich, Feb. 21, 1824. One of his sons married Dona Maria, Queen of Portugal, in 1835. See Léonard Gallois, *Histoire du Prince Eugène de Beauharnais* (1821); A. Aubriet, *Vie de Eugène de Beauharnais* (1824).

Beauharnais, HORTENSE: See HORTENSE.

Beauharnais, JOSEPHINE: See JOSEPHINE.

Beauharnois, bō'āir'nwāi': capital of Beauharnois co., Quebec; on branch of Grand Trunk Railway, and on St. Lawrence river; 27 miles S. W. of Montreal (see map of Quebec, ref. 5-B). It has flax-mills, potteries, and factories. Pop. (1881) 1,499; (1891) 1,590.

Beaujour, bō'zhōor', LOUIS FÉLIX; b. in Provence, France, in 1765; entered the diplomatic service in 1788, and in 1804 became consul-general and *chargé d'affaires* to the U. S.; wrote *A Sketch of the United States at the Commencement of the Nineteenth Century*; returned to France in 1814; became consul-general at Smyrna in 1816, and inspector-general for all the Levant in 1817; was made baron in 1819. D. July 1, 1836.

Beaumarchais, bō' māār'shāy', PIERRE AUGUSTIN CARON, de: a French dramatist remarkable for his wit and versatility, whose adventurous career and vicissitudes of fortune obtained for him great celebrity; b. at Paris, Jan. 24, 1732; was the son of a clockmaker. Although sent to the college (Anglicè, *school*) at Alfort, he was at the early age of thirteen apprenticed to his father. He soon discovered a decided taste for literature and an excessive fondness for music, in which art he became so proficient that he was enabled to procure an introduction to the court of Louis XV., and was employed to teach the princesses, his daughters, to play upon the harp, in the performance upon which he was skilled, and in the pedals of which he introduced an improvement. At the concerts given at the court he made the acquaintance of Duverney, the celebrated financier of that period, whom he was enabled to aid, by his influence with the princesses, in the accomplishment of certain projects in which the banker was at that time engaged. In return, Duverney instructed him in the affairs of finance, and aided him with funds and credit. The first literary production which attracted attention to Beaumarchais was his drama of *Eugénie*, published in 1767, which, however, did not meet with success. In Nov., 1768, Beaumarchais's second wife died, and in July of the same year Duverney. Although one-half of his wife's fortune was in a life-annuity, and the settlement of Duverney's affairs discovered a balance in favor of Beaumarchais, a rumor prevailed that he had poisoned his wife, and he was accused by Comte de la Blache, Duverney's heir, of embezzlement, fraud, and forgery. A seven years' litigation in securing the amount due him from Duverney was the occasion of his masterly *Mémoires* in his defense, which obtained for him great notoriety. These productions are admitted to be masterpieces in their way, and the interest and excitement produced by them is described as magical and electrical. Although thus occupied in the law and in his favorite literary pursuits, Beaumarchais was still actively engaged in various business speculations. He was prompt to foresee the success of the American Revolution, and engaged by connivance with, though unaided by, the French Government in supplying the Americans with arms and ammunition.

In the midst of his manifold labors he undertook at this time an expensive reproduction of the works of Voltaire, one edition of which was to be in seventy-two volumes, by which he sustained a very heavy loss. Notwithstanding he gave his support to the principles of the French Revolution, and imported firearms for the use of the French, his property was confiscated, and he was for a time an exile from his native land. After undergoing persecution and accusation, he returned to France when the Revolution was over. His sufferings during this period were described by him in a published work entitled *Mes Six Épouques*. He recovered possession of his beautiful villa at Fambourg St. Antoine, where he remained till his death. The evening of May 17, 1799, he passed with his family and a few friends; on the morning of the 18th he was found dead in his bed.

Besides the works already mentioned, he was also the author of various dramatic productions. *Le Mariage de Figaro*, his masterpiece, produced the greatest excitement in Paris, and his *Barbier de Séville*, which preceded it, was also a great success. The first formed an epoch in the dramatic, social, and political annals of France, and was styled by Napoleon "the Revolution already in action." It is but proper to add that no conception of its wit, vivacity, and telling social and political allusions and sarcasms can be had at the present day, especially from the opera librettos with which we are familiar. See L. de Loménie's *Beaumarchais, sa Vie et son Temps* (1852); St.-Marc Girardin, *Notice sur la Vie de Beaumarchais* (1835); E. Berger, *Essai sur la*

Vie et les Ouvrages de Beaumarchais (1847); E. Lintilhac, *Beaumarchais et ses Œuvres* (1887).

Beaumaris: a seaport of Wales; capital of the island and county of Anglesea; on the east coast of the island; 3 miles N. of Bangor, and about 2 miles from the north end of Menai Strait (see map of England, ref. 8-D). It is a favorite place of resort for sea-bathing. The Bay of Beaumaris affords safe anchorage. Here is a ruined castle built by Edward I. Pop. (1891) 2,202.

Beaumont: city and railroad junction; capital of Jefferson co., Tex. (for location of county, see map of Texas, ref. 5-K); 83 miles E. by N. of Houston, and 68 miles N. E. of Galveston, and at head of tide-water navigation on Neches river, which is navigable for 331 miles from the sea by steamers. The yellow pine and cypress lumber and shingles manufactured on the Neches river (which has four mills) are shipped by Southern Pacific R. R. and in steamers and schooners from Beaumont via Sabine Pass. An average of 1,720 car-loads a month is shipped by rail through Texas, etc. Beaumont has fine water-works, electric-light, ice-works, refrigerating company, furniture-factory, foundry, steam-laundry, street-cars, etc., and is one of the most progressive lumber and shingle manufacturing towns in the South. Pop. (1890) 3,296; (1892) 4,928.

EDITOR OF "ENTERPRISE."

Beaumont, FRANCIS: dramatic poet; b. at Grace Dieu, in Leicestershire, England, in 1584; educated at Oxford. He was an intimate friend of John Fletcher, in partnership with whom he wrote about a third of the fifty-two plays which pass under their joint names, among which are the excellent tragedies and tragi-comedies, *Philaster*, *The Maid's Tragedy*, and *A King and No King*. D. Mar. 6, 1616, and was buried in Westminster Abbey.

Beaumont, bō'mōn', GUSTAVE DE LA BONNIÈRE, de: French publicist; b. in Beaumont la Chartre, Feb. 16, 1802; sent to America with De Toqueville in 1831 to study the U. S. prison system; member of the Chamber 1840; ambassador to London under Cavaignac. D. in Tours, Apr. 2, 1866. He was author of *Traité du système pénitentiaire aux États-Unis et de son application en France*; *Marie, ou l'esclavage aux États-Unis*; *L'Irlande sociale, politique et religieuse*.

Beaumont, WILLIAM, M. D.: surgeon; b. at Lebanon, Conn., in 1785. While in the U. S. army in 1825 a young man (Alexis St.-Martin) was brought to him who had received a wound from a musket discharged at the distance of only a few feet. The wound headed, and left an aperture about 2½ inches in diameter, through which the process of digestion could be seen. Dr. Beaumont availed himself of this to make various experiments on digestion, the results of which are extremely interesting and of great importance to physiological science. They were published in 1838. D. in St. Louis, Mo., Apr. 25, 1853.

Beaune, bōn (anc. *Yelluodunum*): an old town of France; department of Côte d'Or; on the river Bonzoise, and on the Paris and Lyons Railway; 23 miles by rail S. S. W. of Dijon (see map of France, ref. 5-G). It has the beautiful Church of Notre Dame, and a splendid hospital founded in 1443, which retains nearly unchanged its original Gothic buildings. Here are manufactures of woolen cloth, cutlery, leather, etc. Good burgundy wine is produced in this vicinity. Pop. (1891) 12,470.

Beauport': a post-village and parish of Quebec co., Quebec, Canada, 3½ miles N. E. of Quebec; on north shore of St. Lawrence river (for location of county, see map of Quebec, ref. 4-B). It has extensive manufactures and trade in flour, lumber, nails, etc., and is the seat of Beauport Lunatic Asylum, a large and well-conducted institution. Pop. 4,800.

Beaurain, bō'rān', JEAN, de: b. at Aix-en-Essart in 1696; appointed royal geographer in 1721. His best work is *Topographical and Military Description of the Campaigns of Marshal Luxembourg from 1690 to 1694*. D. 1771.

Beauregard, PIERRE GUSTAVE TOUTANT: soldier and engineer; b. near New Orleans, May 28, 1818; graduated at U. S. Military Academy July 1, 1838; second lieutenant of engineers July 7, 1838; was distinguished at the siege of Vera Cruz, in reconnaissances before the battle of Cerro Gordo, and in battles in the valley of Mexico, for which twice breveted; wounded in assault on Belen Gate, Sept. 13, 1847; captain of engineers Mar. 3, 1853; in charge of defenses in Louisiana 1853-60; appointed superintendent of U. S. Mil-

tary Academy Nov., 1860, but held this position a few days only. Resigned Feb. 20, 1861, and was made brigadier-general in Confederate army, in which capacity he directed the operations against Fort Sumter which opened the civil war. He commanded subsequently the forces which defeated Gen. McDowell at Bull's Run, July 21, 1861, for which victory he was next day made general; was second in command at the battle of Shiloh, Apr. 6, but opposed the plan of advance, and on Johnston's death assumed chief command, holding his ground until 2 P. M. next day against the Federal forces, re-enforced by the army of Gen. Buell; he then withdrew to Corinth, which place he held against the forces of Gen. Halleck till May 30, when he evacuated it, retreating to Tupelo. He subsequently commanded, with headquarters at Charleston, the defense of the Southern coast, signalized by the unsuccessful attack, Apr. 7, 1863, of Admiral DuPont's squadron, and by the combined operations of sea and land forces under Admiral Dahlgren and Gen. Gillmore. In 1864 he commanded in Virginia, successfully resisting Gen. Butler's forces at Drury's Bluff, and later, with a force of 5,700 men, increased to 10,500, resisted Gen. Grant's front attack upon Petersburg, holding that place till re-enforced by part of Lee's army, thus compelling the long-protracted siege. Was subsequently charged with resisting Gen. Sherman's march to the sea, having but 5,000 men, partly militia. The skillful withdrawal of Gen. Hardee's army from Savannah, invested by Sherman, to Pocotaligo, was due to Beauregard. At the time of the surrender of Gen. Johnston's army Beauregard was voluntarily assisting him. After the war he was engaged in railroad management. In 1866 the chief command of the Roumanian army was tendered him, and in 1869 that of the army of the Khedive of Egypt, both of which he declined. Became adjutant-general of Louisiana 1878, and eventually served the Louisiana State Lottery. D. in New Orleans, Feb. 20, 1893.

Revised by C. K. ADAMS.

Beauvais, bō'vay' (anc. *Bellovacum*): an old city of France; capital of the department of Oise; situated on the river Thérain, and in a rich valley inclosed by wooded hills; 64 miles by rail N. N. W. of Paris (see map of France, ref. 3-F). It has a fine large but unfinished Gothic cathedral, a public library, a museum, and a college. Here are extensive manufactures of woolen cloths, flannels, shawls, Gobelin tapestry, printed cottons, and carpets. Pop. (1891) 19,382. It was the chief town of the Bellovacii in the time of Cæsar. In 1443 it was besieged in vain by the English. The citizens of Beauvais, aided by the heroine Jeanne Lainé, surnamed La Hachette for her daring, and other women, repulsed Charles the Bold, Duke of Burgundy, who besieged the city in 1472 with 80,000 men.

Beaver (in Lat. *castor*): a remarkable quadruped (*Castor fiber*) of the order *Rodentia*; a native of Europe, Asia, and North America. Beavers were once abundant in the U. S., but they have gradually disappeared before the advance of civilization. They are characterized by industry, sagacity, and instinctive skill in building dams and houses. They have strong incisors or cutting teeth, in which a sharp, chisel-like edge is always preserved by the unequal abrasion of the hard enamel and the other part, which is softer. The body of the beaver is about 2 feet long. The toes of the hind feet are long, spreading, and webbed to the nails.

Beaver.

Among its remarkable characteristics is a tail of an oval form, about 10 inches long, horizontally flattened, and about 3 inches wide. This is covered with horny scales, but the

body is clothed with a very fine and valuable fur, the color of which is sometimes chestnut-brown; this fur is used for making hats and caps. The food of the beaver consists of bark of trees, leaves, roots, and berries. Its favorite haunts are rivers and lakes which are bordered by forests. "Their work is all performed in the night," says Dr. Godman. When they find a stream that is not sufficiently deep for their purpose, they build a dam across it with wonderful ingenuity and industry. The dam, which is formed of sticks, roots, stones, and mud strangely combined, is water-tight, and presents a convex surface toward the current. To obtain material for it they cut down the trees growing on the margin of the stream above the dam, and float them down. They prefer small trees, but sometimes fell those that are 10 inches or more in diameter. It is stated that they have built dams nearly 300 yards long. The sides of the dam incline toward each other, so that the bottom of it is much thicker than the top. There is a popular opinion that beavers use their tails as trowels in plastering. It is more probable that the tail serves as a prop or support when they work with their fore feet or carry burdens with them. They pass the winter in houses or lodges which are 2 to 3 feet high, are built on the edge of the water, and afford them protection from wolves and other wild beasts. They also have holes or burrows in the ground (adjacent to their lodges), with entrances under the water, in which they take refuge if their lodges are destroyed or become untenable.

The houses or huts of beavers are not built of sticks first and then plastered, but all the materials, sticks, mud, and stones, are mixed together, and this composition is employed from the foundation to the summit. "The tops of the houses," says Godman, "are generally from 4 to 6 feet thick at the apex of the cone." "The outside of the hut is covered or plastered with mud late in the autumn, and after frost has begun to appear. By freezing it soon becomes almost as hard as stone, effectually excluding their great enemy, the wolverine, during the winter. The door or hole leading into the beaver-hut is always on the side farthest from the land, and is near the foundation of the hut or at a considerable depth under water." When they are much disturbed by the presence of hunters and settlers, beavers renounce their original programme, cease to build dams and houses, and, adapting themselves to their altered circumstances, excavate in the banks of rivers holes for their residence—a signal manifestation of sagacity.

Beavers are easily tamed, but no wooden cage will keep them confined, because they gnaw through. Many of them are caught in traps by the Indians and other trappers. In 1820 60,000 beaver skins were sold by the Hudson's Bay Company. Their numbers are rapidly diminishing in consequence of the exterminating warfare waged against them by hunters, who often kill the young before they have attained half their growth. The bait which is used to entice beavers is prepared from the substance called castor (*castoreum*), obtained from glandular pouches connected with the reproductive organs of the male beavers. "The only species of beaver known," says Dr. Godman, "is the one we have described," but others believe the Old World and New World beavers to be distinct species. The so-called extinct giant beaver, known as the *Castoroides ohioensis*, is not related to the beaver, but to the South American octodonts, a group represented by the *Coyu* (*q. v.*). It was first described by Col. J. W. Foster, and by him was called *Castoroides*. See Morgan, *The American Beaver* (1867).

Beaver: borough; on railroad; capital of Beaver co., Pa. (for location of county, see map of Pennsylvania, ref. 4-A); on the right bank of the Ohio river, 2 miles below the mouth of the Beaver river, and 27 miles N. W. of Pittsburgh. It is the seat of Beaver College, a female seminary, an academy, and has good union schools; has water-power and natural gas. There is a fine park in the center of the village. Pop. (1880) 1,178; (1890) 1,552.

Beaver: city; capital of Beaver co., Utah (for location of county, see map of Utah, ref. 6-L); on Beaver river; about 50 miles S. by W. of Fillmore. The chief productions are the cereals and wool. Copper and lead are found in the vicinity. Pop. of precinct, including Beaver city (1880) 1,911; (1890) 1,752; (1895) 2,043.

Beaver Dam: on railroad; a city of Dodge co., Wis. (for location of county, see map of Wisconsin, ref. 6-E); on Beaver Dam creek; 61 miles N. W. of Milwaukee. Beaver Dam is the seat of Wayland University, and has a fine water-power, two woolen factories, a large seeder establishment,

etc. It is situated in an agricultural district, and is a place of summer resort. Pop. (1880) 3,116; (1890) 4,222, to which the enveloping township added 1,341; (1895) 5,042.

Beaver Falls: borough; on railroad; Beaver co., Pa. (for location of county, see map of Pennsylvania, ref. 4-A); on Beaver river, 4 miles above its junction with the Ohio; 31 miles N. W. of Pittsburgh. It has Geneva College, important manufactures, natural gas, plenty of coal, and water-power. Pop. (1880) 5,104; (1890) 9,735. Editor of "TRIBUNE."

Beaver Islands: a group of islands in the north part of Lake Michigan; a part of Manitowish co., Mich. (for location, see map of Michigan, ref. 3-H). St. James, on Big Beaver island, is the chief town. Here a branch of the Mormons under Joseph Strong settled in 1846.

Beber, *bebber*, WILHELM JAKOB, van, Ph. D.; German meteorologist and author; forecaster for the Seewarte meteorological service; b. at Grieth-am-Niederrhein, Rhine Province, Prussia, July 10, 1811; educated at the gymnasium at Emmerich, the academy at Münster, and the university at Bonn. After teaching for some years he became in 1875 rector of the Realschule at Weissenburg-am-Saand, and in 1879 chief of the division of weather-telegraphing of the German Seewarte at Hamburg, which position he still holds. Prof. van Beber issues daily the weather forecasts for the German and other European coasts, and part of the interior. He has also found time to prepare 130 or more publications of some length, besides very many briefer notices. Among these are two well-known and valuable books: *Handbuch der ausübende Witterungskunde* (2 vols., 1885 and 1886) and *Lehrbuch der Meteorologie* (1890).

M. W. HARRINGTON.

Bebec'ria, or **Bebec'rine** ($C_{19}H_{21}NO_3$): a vegetable alkali or alkaloid obtained from the bark of the bebecru, or green-heart, a tree of British Guiana. It is used in medicine as a substitute for quinine, which it resembles in properties.

Bebec'ru, **Bibiru**, or **Bibisi** (*Nectandra rodia*): a tree of British Guiana; the timber is known in commerce by the name of green-heart. It is of the family *Lauraceae*. See GREEN-HEART.

Behel, *bay bel*, FERDINAND AUGUST; German socialist; b. in Cologne, Feb. 22, 1840; learned the turner's trade; settled in Leipzig; became prominent in labor organizations; associate editor of the *Volksstaat*, and later of *Vorwärts*; member of the North German Parliament 1867, of the German Parliament 1871-81 and 1883-; member of the Legislature of Saxony from 1881 to 1894; frequently sentenced to imprisonment; a gifted orator; author of *Our Aims* (10th ed.); *The German Peasant War* (1876); *Woman* (10th ed., 1894), etc.

C. H. THURBER.

Behel, HEINRICH; German humanist; b. in Ingstetten, 1472; Professor of Oratory and Poetry at Tübingen in 1497; poet-laureate by the Emperor Maximilian in 1501. He is the author of numerous poems, mostly written in Latin and in praise of the German emperor. His love for popular traditions and poetry is shown by his collections of German proverbs (*Proverbia Germanica*), and of popular jokes and stories which he published under the title *Faetiv*, and which were read extensively, being directed chiefly against the Roman Catholic clergy. D. in Tübingen, 1518. See his *Life* by G. W. Zapf (Augsburg, 1802). JULIUS GOEBEL.

Beccaleo, bek-ka-fee-kō [Ital., fig-pecker]; any one of several small European birds which feed or are supposed to feed on figs, as the BLUE-THROAT (*q. v.*) and especially *Carruca hortensis*; a small bird of the family of *Sylviidae* or warblers, sometimes called the garden-warbler. It is abundant in Southern Europe as a summer bird of passage. The flesh of it is esteemed as a delicate food by the Italians. It has an agreeable song.

Beccaria, bek-ka-fee-ān, CESARE BONESANA, Marquis di; an eminent Italian economist and writer on penal laws; b. in Milan, Mar. 15, 1738. His principles were formed by the influence of Montesquieu. His most important work is a *Treatise on Crimes and Punishments* (*Trattato dei Delitti e delle Pene*, 1764), in which he advanced eloquent arguments against the severities and abuses of criminal law. It obtained great popularity, and was translated into many languages. Voltaire admired it, and wrote a commentary on it. In 1768 he was appointed Professor of Political Philosophy at Milan. D. in Milan, Nov. 28, 1794. See C. P. Villa, *Vita del Marchese C. Beccaria* (1821); P. Custodi, *Vita di C. Beccaria*.

Bêche-de-Mer, baysh'de-mär' [Fr., sea-spade]: also called **Trepang**; a name given to the dried bodies of several species of *Holothuria*, or sea-cucumber, which are abundant in shallow lagoons and on reefs between Australia, the Fiji islands, and the southeast coasts of Asia. They are esteemed as an article of food by the Chinese. The Malay divers catch them and prepare them in large quantities for the Chinese market. This animal is usually about 9 inches long, but sometimes measures 2 feet. It is stated that 8,000 cwt. of the trepang are annually exported from Macassar to China. See **HOLOTHURIDÆ**.

Becher, bech'ér, JOHANN JOACHIM: a German chemist; b. at Speyer in 1635; is called the author of the first theory of chemistry. He became aulic counselor at Vienna, but soon fell into disgrace, and removed to Mayence. He was addicted to speculation, and wrote, besides other works, *Physica Subterranea* (1669). His theory was the basis of that which was developed by Stahl. D. in London, Oct., 1682.

Becher, SIEGFRIED: political economist; b. at Plan, in Bohemia, Feb. 28, 1806; became Professor of History and Geography in the Polytechnic Institute in Vienna in 1835. D. in Vienna, Mar. 4, 1873. Among his works are *Das Oesterreichische Münzwesen von 1524-1838* (2 vols., Vienna, 1838); *Organization des Gewerbesens* (Vienna, 1851); and *Die Volkswirtschaft* (Vienna, 1853).

Bechman, GEORGES: civil engineer; in charge of the water-supply and sewerage of the city of Paris; b. in Paris, Jan. 1, 1848. In 1869 he finished his studies at the Polytechnic School, and entered the School of Bridges and Roads. Here he graduated in 1873, having lost one year by serving a term in the army during the Franco-Prussian war. After varied service on harbors and other works, he was attached to the water-supply of Paris. In 1886 he reached the grade of engineer-in-chief of bridges and roads, remaining still connected with the works of the city of Paris under M. Alpland. He designed the new water-supply of the city, to be brought from the department of the Eure. During the exposition of 1889 he constructed the illuminated fountains of the Champ de Mars. Since the death of Durand-Claye he has had charge also of the sewerage of Paris, and is the author of the great works for utilizing the sewage on the plain of Asnières, which are an extension of those of Gennevilliers, and those of the plain of Méry, which are now in course of execution. He has been often consulted upon the sewerage of other cities, among them Messina, Turin, Toulon, etc. He is an officer of the Legion of Honor, and member of many foreign orders. W. R. HURTOX.

Bechuana, bet-shwaa'na: an African race occupying the interior of South Africa, between the parallels 22° S. and 28° S., and the meridians 22° E. and 29° E., a nearly treeless area, including a large part of the Kalahari desert. The race numbers about 200,000. They are not nomadic, but live in towns of considerable size. They are industrious and bright, alive to whatever will increase their property or comfort, and many migrate for a time to Cape Colony, where they are highly prized as servants. While not exactly warlike, they are inured to warfare, but they have been unable to withstand the more savage Kaffres, Zulus, and Matabele on the E. They are well formed, dark brown or bronze: the lips are thicker and nostrils wider than with the Europeans, but they are not of a marked African type, and are often handsome. The hair is frizzled, but not kinky. They possess some of the arts, and the women practice agriculture to some extent. They have no particular religious system, but believe in witchcraft and practice circumcision. Rain is scanty with them, and the rainmaker is an important personage, whose commands are implicitly obeyed, but sometimes, when he fails, he is sacrificed to their wrath. The language is copious, and, like the Kaffre and Zulu, belongs to the Bantu family. Theodore Bent suggests that their name may be a corruption of *Baqraina* (i. e. children of the *quaina*, or crocodile), the native name of one of the most powerful tribes, whose totem is the crocodile. M. W. H.

Bechuanaland: a British protectorate in the interior of South Africa, extending (since Nov., 1895) from the Molopo river, the present northern boundary of Cape Colony, northward over the Kalahari desert as far as the Zambesi, and having Matabeleland and the Transvaal on the E. and German Southwest Africa on the W., the twentieth meridian (E.) being for the most part the dividing line; area, about 386,200 sq. miles. The British crown colony of the same name which lay S. of the Molopo river, and had an area of

51,574 sq. miles and a population (1891) of 72,736, was incorporated into Cape Colony on Nov., 1895. Within the limits of the protectorate are included the domains of the native chiefs Khama, Sebele, and Bathoen, each of whom rules his own people under the protection of the Queen, and with the assistance of a resident, and continues to enjoy the hunting privileges he has hitherto possessed. With these exceptions the whole region is administered by the British South Africa Company. A railway extending from Capetown, through Kimberley, Vryburg, and Mafeking, has now (1897) reached Palapye, the capital of Khama's country (pop. 25,000), and is being pushed on to Buluwayo and Fort Salisbury in Mashonaland. A telegraph line has already been established as far as Fort Salisbury. A tax of \$2.50 is levied on each native hut. Cattle-rearing and agriculture are the chief industries, and the natives are peaceable.

Beck, JAMES B.: U. S. Senator; b. in Dumfriesshire, Scotland, Feb. 13, 1822; emigrated with his parents to Lexington, Ky.; admitted to the bar 1846; served in Congress as a Democrat 1867-75; elected to U. S. Senate 1877; re-elected 1882 and 1888. D. in Washington suddenly, May 4, 1890.

Becker: See BRAITZ.

Becker, bek'ér, GEORGES: French figure-painter of note; b. in Paris in 1845; pupil of Gérôme; second-class medal, Paris Salon, 1872; Legion of Honor 1889; well known in the U. S. as the painter of a large picture, *Rizpah Protecting the Bodies of her Sons*, exhibited at the Centennial Exhibition, Philadelphia, 1876. Studio in Paris. W. A. C.

Becker, bek'ér, HERMANN EILNRICH: a German politician, called DER ROTHE BECKER (i. e. the Red Becker, on account of his extreme radical views in politics); was b. in Elberfeld, Sept. 15, 1820; took part in the revolutionary movement in 1848, and was imprisoned for several years. In 1862 he was elected a member of the Prussian House of Deputies, and in 1867 and 1868 of the North German Parliament; became a recognized leader of the Liberal party; mayor of Dortmund 1870; of Cologne 1875. D. Dec. 9, 1885.

Becker, KARL FRIEDRICH: b. at Berlin in 1777; studied philosophy and history at Halle; was a teacher in Berlin, but gave up all kinds of business on account of ill health, and d. Mar. 15, 1806. From 1801 to 1805 he published his *Weltgeschichte für Kinder und Kinderlehrer* (9 vols., Berlin, 1801-05), which has been often reprinted and translated into other languages. On account of a singular felicity both in arrangement and style, it was to young readers a very pleasant and useful book, but since the death of the author it has been so much augmented, continued, corrected, and changed as to become nearly valueless.

Becker, MAX J.: civil engineer; b. in Coblenz in Rhenish Prussia, June 1, 1827; came to the U. S. in 1850. From 1856 to 1858 he was engineer of the board of public works of Ohio, and later engaged in railroad construction. Since 1867 he has been chief engineer of the Pittsburg, Cincinnati and St. Louis R. R. During 1889 he was president of the American Society of Civil Engineers.

Becker, THOMAS A.: first Roman Catholic bishop of the diocese of Wilmington, Del.; b. of German Protestant parents in Pittsburg in 1832; studied in Munich, where he joined the Catholic Church, and at the Propaganda in Rome; was ordained 1859. After serving as professor in St. Mary's College, Emmitsburg, Md., he was consecrated as Bishop of Wilmington, Aug. 23, 1868; transferred to the see of Savannah, May, 1886.

Becker, WILHELM ADOLF: German author; b. at Dresden in 1796. He attempted to reproduce the social life of ancient Rome in *Gallus* (1838), and that of ancient Greece in his *Charicles* (1840), both of which were translated into English by Metcalf. His chief work is *Handbuch der röm. Alterthümer* (1843-46). D. in Weissen, Sept. 30, 1846.

Beckerath, bek'ke-rät, HERMANN, von: Prussian statesman; b. Dec. 13, 1801, in Crefeld; made a fortune as a banker; advocated German unity; member of National Assembly at Frankfort 1848; Minister of Finance 1848-49. D. in Crefeld, May 12, 1870.

Becket, THOMAS A': Archbishop of Canterbury; b. in London, Dec. 21, 1118; studied at Oxford and Paris, and was appointed High Chancellor in 1155, being the first native Englishman after the Conquest who filled a high office. His style of living was sumptuous in this part of his life, but when he became Archbishop of Canterbury in 1162 a remarkable change took place in his habits and deportment. He

practiced or affected great austerity, and appeared as a zealous champion of the Church against the aggressions of the king, whose policy tended to keep the clergy in subordination to the civil power. Becket having been involved in a conflict with Henry II., escaped in 1164 to France, and appealed to the pope, by whom he was supported. Henry confiscated his property and sequestered the revenues of his see, and received in return a menace of a papal interdict. In 1170 a formal but hollow reconciliation was made between the king and the obstinate and haughty prelate, who returned to England and resumed his office. He also renewed his defiance of the royal authority, but on Dec. 29, 1170, at the altar, in the cathedral in Canterbury, was assassinated by four knights, servants of the king. He was regarded as a martyr by many patriotic Saxons, as well as by the zealous votaries of the Church. He was canonized by the pope in 1173, and his bones were deposited in a splendid shrine at Canterbury, which became the object of one of the great pilgrimages of Christendom. Henry VIII. destroyed the shrine and scattered Becket's ashes. See *Lives* by J. C. Robertson (London, 1859); R. A. Thompson (1888); and *Materials for the History of Thomas Becket* (1875, sqq., 8 vols.); and *Chronicles and Memorials of Becket* (1880).

Beckford, WILLIAM: an English author; b. at Fonthill, Wiltshire, Sept. 29, 1759. He inherited from his father an immense fortune, including the estate of Fonthill. His annual income was about £100,000. He married in 1783 Lady Margaret Gordon, a daughter of the Earl of Aboyne. In 1784 he published his principal work, *Vathek*, an Eastern tale (written in French), which was highly commended by Lord Byron. He was elected to Parliament in 1790, resided some years in Portugal, and expended an enormous sum in the erection of Fonthill Abbey, which he filled with rare and expensive works of art. In 1822 he sold this palace and the estate of Fonthill, with all its collections, to Col. Farquhar for £330,000, and built another palace at Bath. He published in 1834 a series of letters entitled *Italy, with Sketches of Spain and Portugal* (2 vols., 1834), and *Memoirs of Extraordinary Painters* (1835). He was a witty and graphic writer, and had much talent for sarcasm. D. May 2, 1844. See *Memoirs of William Beckford*, by Cyrus Redding (London, 2 vols., 1859); *Quarterly Review* (for Mar. and June, 1834).

Beckwith, JAMES CARROLL: portrait and genre painter; b. at Hannibal, Mo., Sept. 23, 1852; pupil of Carolus-Duran, Paris; honorable mention, Paris Salon, 1887; third-class medal, Paris Exposition, 1889; associate member of National Academy of Design, member of the Society of American Artists (1881), and American Water-color Society. He began his studies in the school of the Academy of Design in Chicago about 1869, studied two years in New York in the academy schools, and went to Paris in 1873. He returned to New York in 1878, and has been a regular exhibitor at the Academy, the Society of American Artists, and other places ever since, sending pictures also from time to time to the Salon. He exhibited also at the Royal Academy, London, in 1892. He is a draftsman of great skill, and a painter of much more than ordinary cleverness. His portraits are notable for sound construction as well as truth of line. Studio in New York.

WILLIAM A. COFFIN.

Beckwith, JOHN WARREN, D. D.: second Bishop of Georgia; b. in Raleigh, N. C., Feb. 9, 1831; graduated at Trinity College, Hartford, Conn., in 1852; ordained deacon in 1854, and priest in 1855. He ministered in North Carolina, Maryland, Mississippi, Alabama, and Louisiana, and was consecrated Apr. 2, 1868. D. in Atlanta, Ga., Nov. 23, 1890. Bishop Beckwith was distinguished for the brilliancy of his rhetoric, the splendor of his eloquence, and for his simplicity of character.

Bequerel, bek'rel', ANTOINE CÉSAR: French savant; b. at Chatillon-sur-Loing, Loiret, Mar. 8, 1788. He served in the army as an officer of engineers from 1810 till 1815, after which he gave special attention to the study of electricity, and made discoveries in electro-chemistry. He refuted and exploded Volta's theory of contact, and constructed the first constant pile. In 1837 he received the Copley medal of the Royal Society of London. He invented a method of electrotyping. He published, besides other works, *Traité expérimental de l'électricité et du magnétisme* (7 vols., 1834-40). He became a member of the Academy of Sciences in 1829. D. Jan. 19, 1878.—His sons, ALEXANDRE EDMOND (b. Mar. 24, 1820; d. May 12, 1891), a physicist, and LOUIS ALFRED, a physician (b. in 1814; d. in 1862), both attained distinction as scientific men.

Beese, bech'e, OLD (Hun. *O'Beese*): a market-town of Hungary; in the county of Baes; 48 miles S. of Szegedin; on the Theiss (see map of Austria-Hungary, ref. 8-II). Pop. 16,850. *New Beese*, which has a population of 7,193, is in the county of Torontal; on the Theiss; 8 miles E. of Old Beese.

Beeskerek, Nagy, noj bech-ká-rek' (Great Beesker-k): a town of Hungary; county of Torontal; on the left bank of the Bega; 59 miles S. W. of Temesvár, with which it is connected by a canal (see map of Austria-Hungary, ref. 8-I). It has a considerable trade. Pop. (1890), 21,934.

Bed: in geology, a stratum, or layer of stratified sedimentary rock of variable thickness. A bed often consists of numerous thin lamina or plates, resulting from intermissions in the supply of the materials, produced by such causes as the ebb and flow of the tide, and variable degrees of the turbidness of the water under which they were deposited. A thin bed, if different in kind from its neighbors, is sometimes called a seam. For an aggregate of several beds of the same kind of rock the term formation is used.

Bed-bug: a well-known hemipterous insect, the *Acanthia lectularia*, known to the Greeks as κῆπος, infesting beds and houses, and it is said also dove-cotes, and the nests of swallows, bats, etc. The eggs are oval and white; the young vermin flat and transparent. In eleven weeks the insect reaches its full size. It is tenacious of life, and has been kept alive more than a year in a sealed bottle without food. Cockroaches devour them in large numbers. Mercurial solutions, benzine, etc., will extirpate these vermin, but prevention by cleanliness is best.

Bedchamber, Lords of the: twelve officers of the British royal household who in the reign of a king wait in turn on the person of the sovereign. They are under the groom of the stole, who attends his majesty only in public ceremonies and on occasions of state. During the reign of a queen these offices are performed by ladies of the bedchamber and the mistress of the robes, who is substituted for the groom of the stole. Queen Victoria has about eleven ladies and extra ladies of the bedchamber. These offices are usually filled by the "prime nobility" of the kingdom, who are appointed by the sovereign, and are not removed on each change of the ministry.

Beddoes, THOMAS, M. D.: an eminent English physician and writer; b. at Shiffnal, in Shropshire, Apr. 13, 1760. He was educated at Oxford, and was well versed in the Latin and other languages. He married Anna, a sister of Maria Edgeworth, and in 1788 was appointed to the chemical lectureship in the University of Oxford. In 1792 he resigned this position. He wrote for the benefit of the working-classes a popular work called *The History of Isaac Jenkins*. In the year 1798 he opened at Clifton a hospital for the cure of disease by medicated gases, in which Humphry Davy was his assistant. Among his works is *Hygeia, or Essays, Moral and Medical* (3 vols., 1802). D. Dec. 24, 1808. See E. Stock, *Life of T. Beddoes* (London, 1811).

Beddoes, THOMAS LOVELL, M. D.: poet; son of Thomas Beddoes and nephew of Maria Edgeworth; b. at Clifton, England, July 20, 1803. He studied medicine and anatomy at Göttingen, and resided many years in Germany. In 1822 he produced *The Bride's Tragedy*. Among his poems is a tragedy called *Death's Jest-book* (1851), which displays great richness of imagery and passionate eloquence. He died at Basel, Jan. 26, 1849, in consequence of a dissection-wound received in 1848.

Bede (in Lat. *Bēda*): surnamed THE VENERABLE; English scholar and monk; b. in Wearmouth, county of Durham, in 673 A. D. He was ordained a priest at the age of thirty, and devoted much time to study and literary pursuits. His name is regarded as the greatest in the ancient literature of Britain. He wrote on astronomy, grammar, music, etc. His most important work is an *Ecclesiastical History of the English Nation (Historia Ecclesiastica Gentis Anglorum)*, which King Alfred translated into Anglo-Saxon, and which has often been reprinted. D. in the monastery of St. Paul's, in Jarrow, May 26, 735 A. D. His whole works were published by Dr. Giles (London, 6 vols., 1844), including an English translation of his *Ecclesiastical History*; a better one is that by L. Gidley, 1870. See Gebhe, *De Beda Venerabilis Vita et Scriptis* (1838); J. A. Giles, *Life of Bede*, prefixed to his complete works (1844); and G. F. Browne (1879).

Bedeau, *be-dō*, MARIE ALPHONSE: general: b. in Vertou, near Nantes, Aug. 10, 1804. He served with distinction in Algeria (1836-47), and became a general of division in Sept., 1844. He had the command (under Bugeaud) of the troops in Paris when the Parisians revolted in Feb., 1848, and under the new republican *régime* he became commander-in-chief of that city. As a member of the National Assembly (1849-51) he acted with the republicans; opposed Louis Napoleon, and went for a time into exile. D. in Nantes, Oct. 29, 1863.

Bed'egar, or **Bedeguar** [viâ Fr. from Pers. *bādāwar*, wind-brought]: a gall (sometimes called sweet-brier sponge); found on the branches of the sweet-brier and other species of rose. It is produced by the *Rhodites rosea* and other insects, and is often one inch or more in diameter. It was once used in medicine. See GALL INSECTS.

Bed'del, TIMOTHY: a Revolutionary patriot; b. in Salem, N. H.; removed to Haverhill, N. H., and was a lieutenant in 1760, serving in Canada. He became in 1775 a captain of rangers, and in 1776 colonel of the first regiment of New Hampshire troops; served at Montreal and under Schuyler, and afterward was major-general of New Hampshire militia. D. at Haverhill, N. H., in Feb., 1787.

Bedell, GREGORY THURSTON, D. D.: the third Bishop of Ohio; b. in Hudson, N. Y., Aug. 27, 1817; was educated at Flushing, L. I., and Bristol College, Pennsylvania. After a rectorate at the Church of the Ascension, New York city, he was consecrated assistant bishop of the diocese of Ohio, Oct. 1859; bishop in 1873; resigned his see in 1889, from which the diocese of Southern Ohio was set off in 1875. D. in city of New York, Mar. 11, 1892. Author of *The Divinity of Christ*; *The Profit of Godliness*; *Sacredness of the Grave*; *The Principles of Pastorship*; *The Age of Indifference*; *Episcopacy—Fact and Law*; *A Canterbury Pilgrimage*; *A Volive Pillar*; *Memorial of Bishop McIlvaine*; and *Pastoral Theology*. Some of his sermons were published in Scotland as well as in the U. S.

Bedell, GREGORY TOWNSEND, D. D.: an Episcopal clergyman; b. on Staten Island, N. Y., Oct. 28, 1793. He graduated at Columbia College in 1811, was greatly admired as a pulpit orator, and wrote, among other religious works, *Onward, or Christian Progression*; *Renunciation*; and two volumes of sermons. He was the father of the bishop named above. D. in Baltimore, Aug. 30, 1834. See his *Life*, by Rev. Dr. Tyng, 1836.

Bedell, WILLIAM: a prelate of the Church of Ireland; distinguished for his wisdom and virtue; b. in Essex, England, in 1571. He went to Venice in 1604 as chaplain to Sir Henry Wotton, the English ambassador, and remained there eight years. In 1627 he was elected provost of Trinity College, Dublin, and in 1629 became Bishop of Kilmore and Ardagh. He reformed abuses in his diocese, and acquired much influence by his acts of charity and his other virtues. He procured the translation of the Old Testament into Irish. D. at Drumlor, Feb. 7, 1642. See Burnet, *Life of Bishop Bedell* (1685); H. J. Monck Mason, *Life of W. Bedell* (1842); *Life* published by the Camden Society (1872).

Bedford: an old market-town of England; capital of Bedfordshire; on the river Ouse, here crossed by two bridges; 48 miles by rail N. N. W. of London (see map of England, ref. 10-J). Several railroads pass here. It has more charitable institutions and public endowments, in proportion to its size, than any town in England. It has several fine Gothic churches, a public library, a famous grammar school, a lunatic asylum, a jail, a penitentiary, numerous schools and charities, including about sixty almshouses. Bedford has manufactures of farming implements, lace, and straw hats, and a trade in corn, malt, and timber. John Bunyan wrote *Pilgrim's Progress* in Bedford jail. Pop. (1891) 28,023.

Bedford: town; Missisquoi co., Quebec, Canada (for location, see map of Quebec, ref. 6-B); on Can. Pac. Ry.: 18 miles from St. Johns; has manufactories of knitting-machine needles, paints, gloves, and farming implements. It has excellent water-power. Pop. (1881) 1,080; (1891) 1,571.

Bedford: railroad junction; capital of Lawrence co., Ind. (for location of county, see map of Indiana, ref. 9-D); 76 miles N. of Louisville, Ky.; has 3 public schools, an opera-house, 24 stone-quarries employing over 1,000 men, and a stone court-house. Pop. (1880) 2,198; (1890) 3,351; (1892) estimated, including suburbs, 7,000.

EDITOR OF "DEMOCRAT."

Bedford: town; on railroad; capital of Taylor co., Ia. (for location of county, see map of Iowa, ref. 7-E); is on a prairie and on the river One-Hundred-and-Two, about 100 miles S. W. of Des Moines, and has considerable trade. Pop. (1880) 1,763; (1885) 1,742; (1890) 1,643; (1895) 2,070.

Bedford: village; Cuyahoga co., O. (for location of county, see map of Ohio, ref. 2-II); on the C. and P. and C. C. and S. R. Rs., 5 miles S. E. of Cleveland. Bedford has graded schools, 3 churches, a fine public hall, 6 chair-factories, a grist-mill, feed-mill, saw-mill, and lumber-yard. Dairying is a thriving industry. The town was first settled in 1813, and organized as a municipality in 1823. Pop. (1880) 766; (1890) 1,045; (1892) school-census, 1,200.

EDITOR OF "NEWS REGISTER."

Bedford: railroad junction; capital of Bedford co., Pa. (for location of county, see map of Pennsylvania, ref. 6-D); on the Raystown Branch of the Juniata, and on Bedford Division of Pennsylvania R. R.: 94 miles W. S. W. from Harrisburg. Has 8 schools, including a high school, and 8 churches. Agriculture is the principal industry of the community. Bedford was laid out as a town in 1766. It contains several historic houses—the residence of Gen. Arthur St. Clair when he was prothonotary of the county; the house in which Gen. Washington, Gen. Knox, Alexander Hamilton, and others stopped when on the march to suppress the Whisky Rebellion of 1794 in Western Pennsylvania. Bedford Springs, about a mile distant, is a fashionable place of summer resort. Iron ores abound, and iron is here manufactured. Pop. (1880) 2,011; (1890) 2,242.

EDITOR OF "GAZETTE."

Bedford, DUKES OF (1694); Earls of Bedford (1550); Marquess of Tavistock (1694); Barons Russell of Cheneys (1539); Barons Russell of Thornough (1603); Barons Howland (1695, in England), a prominent family of Great Britain.—GEORGE WILLIAM FRANCIS SACKVILLE RUSSELL, the tenth duke (of this family), was b. Apr. 16, 1852, and succeeded his father Jan. 14, 1891; was M. P. for Bedford 1875-85; succeeded by his brother, Lord Herbrand Arthur, Mar. 24, 1893.

Bedford, GUNNING: a patriot of Delaware; b. in Philadelphia, about 1730; served against the French in 1755; an officer of the Revolutionary army; wounded at White Plains; became muster-master-general in 1776; was a member of Congress (1783-85); Governor of Delaware (1796-97). D. in Newcastle, Del., Sept. 7, 1797.

Bedford, GUNNING: cousin of the preceding; b. in Philadelphia in 1747; graduated at Princeton in 1771; member of Congress from Delaware (1785-86), and of the convention (1789) that formed the U. S. Constitution. He was U. S. district judge (1789-1812). D. in Wilmington, Mar. 30, 1812.

Bedford, GUNNING S., M. D.: physician; b. in Baltimore in 1806, and graduated at Mt. St. Mary's College in 1825. After serving as professor in Charleston, S. C., and at Albany Medical College, he settled in 1836 in New York city, where he was Professor of Midwifery in the University of New York (1840-42). He published an excellent treatise on obstetrics and *Lectures on the Diseases of Women*, besides valuable translations from the French. D. in New York, Sept. 5, 1870.

Bedford, JOHN PLANTAGENET, Duke of: third son of King Henry IV. of England; b. in 1389. He was created Duke of Bedford in 1414; was commander-in-chief of the forces in England during the absence of Henry V., who was his brother. After the death of Henry V. (1422) the Duke of Bedford was regent of France, and waged war with success against the French dauphin. He gained a victory over the French at Verneuil in 1424, but his conquests were soon checked by Joan of Arc. D. in Rouen, Sept. 19, 1435. See Hume, *History of England*.

Bedford City (formerly **Liberty**): the county-seat of Bedford co., Va. (for location of county, see map of Virginia, ref. 6-E). It is situated in a beautiful rolling country, at the eastern base of the Blue Ridge Mountains, at an elevation of 1,000 feet above the level of the sea. It is a regular market for leaf tobacco raised in the surrounding country; has a number of factories for the manufacture of plug and smoking tobacco and cigars; a successful woolen-mill, a knitting-mill, foundry, planing-mills, two flouring-mills, and other industries. In recent years it has assumed importance as an educational center. In it are located Randolph Macon Academy (under control of the Methodists), Belmont Seminary for young ladies (Presbyterian), St. John's (Episcopal)

Institute for girls, and the Jeter Female Institute (Baptist) for young ladies. Pop. (1880) 2,191; (1890) 2,897.

EDITOR OF "BEDFORD DEMOCRAT."

Bedford Level, or The Fens: a tract of flat land in the eastern part of England; bounded on the E. by the German Ocean; comprises parts of Huntingdon, Northampton, Cambridge, Lincoln, Norfolk, and Suffolk. Its inland boundary is a range of highlands in the form of a horse-shoe. Nearly all the marshy district called The Fens is included in the Bedford Level, which is intersected by the Cam, Ouse, Nene, and Welland rivers. It was formerly a vast morass, and was named in honor of Francis, Duke of Bedford, who in 1634 undertook to reclaim it, and expended £100,000 in draining it. The work was completed by his son, William, Duke of Bedford, who spent £300,000 on it. This tract now produces good crops of grain and flax, and grass for pasture. Its drainage has been improved in the present century.

Bedlam, or Bethlehem (of which *bedlam* is a corruption): a hospital for the insane in London, which was originally the priory of St. Mary of Bethlehem. When Henry VIII. suppressed the religious houses, this one, coming into the control of the corporation of London, was converted in 1547 into an asylum for the insane. In 1814 the insane patients were removed to a new asylum in St. George's Fields, Southwark, which has good accommodations for almost 500 patients, and is managed in an excellent manner. Bedlam is sometimes used as synonymous with a mad-house, or a place of uproar.

Bedloe's Island: an island in New York harbor; in the city of New York; 1½ miles S. W. of the Battery. It was named from a former owner. In 1800 it was ceded to the U. S. Government, and in 1841 Fort Wood, mounting seventy-seven guns, was erected upon it. Bartholdi's colossal statue of *Liberty Enlightening the World*, presented to the U. S. by the French people, now stands within the fort, the U. S. Government having allowed this island to be used for the erection of the statue. See NEW YORK CITY.

Bedmar, bād-maar, ALFONSO DE LA CUEVA, Marquis de; a Spaniard; b. in 1572. He was sent as ambassador to Venice by Philip II. in 1607, and formed a daring and nefarious plot to betray the Venetian city and state into the power of the King of Spain. The plot was detected one day before that appointed for its execution, and Bedmar was expelled from Venice. He became a cardinal in 1622, and died in 1655. His conspiracy is the subject of Otway's *Venice Preserved*. See BARN, *Histoire de Venise*; Saint-Réal, *Conspiration contre Venise*.

Bed of Justice (in Fr. *lit de justice*): a term applied to the seat or throne occupied by the King of France when he was present at a session of Parliament; also to such a session, or the conference of the Parliament with the king, who came to overrule the decisions of Parliament and enforce edicts or ordinances to which that body was opposed. Decrees promulgated at such a session were more authoritative than the ordinary decisions of Parliament. The ceremony became synonymous with an act of arbitrary power. The last "bed of justice" was held by Louis XVI., in 1787.

Bedos de Celles, bā dōs dē-sel, JEAN FRANÇOIS; a French Benedictine monk; b. at Caux in 1706. He made several good organs at Toulouse, and wrote a work called *L'Art du Facteur d'Orgues* (4 vols., 1766-78), which is highly commended. He wrote also *L'Art du rebueur et du doreur des livres*, and an excellent *Grammaire* (1760). D. 1779.

Bed'ouin, or Beduin, written also *Bedaween* and *Bedawee* (inhabitants of the desert); nomadic Arabs; according to tradition, the descendants of Ishmael and the aborigines of Arabia. They are a pastoral people, having no houses but tents, and no permanent places of residence. They form the greater portion of the population of Arabia, but are not confined to that country. Though they are not united by a strong national organization, they have never been entirely subjugated by any foreign conqueror, as the desert into which they can retreat forms an almost insuperable obstacle to an invading army. They are now widely distributed over Northern Africa, Syria, etc. As they have no general government or political institutions, religious traditions and customs form the only bond of order and union among them. They are divided into tribes, each of which is ruled by a sheik, whose authority is patriarchal. Their riches consist chiefly in flocks of sheep, camels, horses, goats, etc. They are ignorant, fierce, depraved, addicted to robbery and fighting, and reckless of the rights of property. They profess the Mohammedan religion, but are not very strict in the

practice of its discipline. Their complexion is brown of various shades. They are generally lean, sinewy, and active. An admirable picture of Bedouin life and character may be found in Palmer's *Desert of the Erodus* (1871), and in Selah Merrill's *East of the Jordan*.

Bed-straw (*Galium*): name of a genus of herbaceous plants of the family *Rubiaceæ*; distinguished by a wheel-shaped corolla, and a fruit which is dry or fleshy, two-lobed, separating when ripe into two seed-like, indehiscent, one-seeded carpels. It comprises numerous species, natives of Europe, Asia, and the U. S. The roots of several species, as *Galium verum*, *Galium tinctorium*, etc., contain a red coloring-matter which is said to be equal to madder. The *Galium verum*, which is a common weed in England, is sometimes called cheese rennet, because it has the property of curdling milk. It is naturalized to some extent in the U. S. The *Galium tuberosum* is cultivated by the Chinese, who eat its farinaceous roots. *Galium aparine*, or cleavers, is a valuable diuretic.

Bee (Gr. μέλισσα; Lat. *apis*; Fr. *abeille*; Germ. *Biene*): an insect of the order *Hymenoptera*, which feeds its helpless larvæ on pollen, honey, or food digested or secreted by the adult. There are two large families, *Andrenida* and *Apida*. To the former of these belong all those which live solitary, tunneling out galleries in the soil or boring out the dead stalks of pithy plants, as the sunac or blackberry. These they divide into several distinct compartments, placing in each a small ball of pollen, on which the egg is laid and on which the larva feeds. The species belonging to this family consist of two classes, males and females. The solitary bees can be distinguished from the social bees by their shorter tongue or labium. They are frequently called miner-bees or carpenter-bees. To the *Apida* belong the social bees, or those in which the tongue or labium is greatly elongated. It includes the parasitic and true honey-producing bees. The former are not parasites in the strict sense of the word, but they intrude themselves in the nests of other bees, being protected by their form and protective coloring. They are better known as *Inquilines*. Of these, as of the *Andrenida*, there are but two classes, males and females. The honey-producing bees, to which the common honey-bee belongs, live in immense colonies, in holes in the ground, hollow trees, old stumps, or hollow logs. There are three classes, males, females, and workers or sterile females.

Linnaeus included all bees in the genus *Apis*, but systematists are now agreed in restricting this term to the honey-bee. There is still great difference of opinion as to whether all of the varieties should be recognized as a single species or as several species. If naturalists were to find all the forms of pigeons that have been produced by breeding in nature, they certainly would recognize them as distinct species. As a species is only an idea, it seems best to recognize the several races as distinct species. Some excellent authorities consider them all as varieties of *mellifica*, the black-bee; others recognize as many as sixteen species. The genus *Apis* is a native of Europe, but has become, through the agency of man, almost cosmopolitan.

We should probably look for the type form in *Apis mellifica*, the black, brown, or German bee, which is found in its original condition in Middle and Northern Europe. This species is recognized by its brownish-black body, pilose with lighter hairs, together with its much shorter tongue. Under domestication it is known for its irritable temper, making it dangerous to handle; it is quarrelsome with neighboring bees and does not offer a good barrier against robbers; but it is a good honey-gatherer, excels as a comb-builder, and is less liable to swarm out, leaving unfinished sections.

There are several varieties of the German bee, of which probably the Carniolan, Krainer, or Hungarian is the best. Its distinctive character is the lighter rows of hairs, to be considered, perhaps, as a kind of albino. The queens are a little larger than those of typical *mellifica*. They winter well, having strong constitutions, are mild-tempered, good honey-producers, but free swarmers. They are natives of Southwestern Austria. Another variety, not differing in marking from the German bees, is found in Northern Germany, and is known as the heath-bee. It differs only in its swarming more frequently.

The Ligurian, Italian or yellow Alp bee, *Apis ligustica*, is easily recognized by the yellow-banded abdomen. This species is a native of Southern Europe, and is found as far E. as Asia Minor. There are two varieties of the Italian, but the differences shade insensibly into each other. In the Italians the abdominal segments two to five are trans-

versely banded with yellow hairs, while the first three rings beneath the hairs are yellow. In *mellifica* the black segments of the abdomen are banded with hairs not quite as light as in *ligustica*. The Italians are smaller than *mellifica*, the tongue is longer, the abdomen flatter and more pointed. The drones are not so yellow above as the workers, but are almost wholly yellow beneath. The queens vary from very light to almost as dark as those of *mellifica*. The Italians excel in their milder temper, making them much easier to handle; in the fruitfulness of the queens; in being excellent defenders of their stores; in their excellence as honey-gatherers, and in their industry. They are not so able to withstand severe winters as *mellifica*; the comb honey is not so fine in appearance; unless watched they are liable to convert great quantities of their stores into nursery food, and on slight encouragement to become robbers. It certainly produces a superior race to cross them with the Germans.

Another race, probably equaling either of the others in importance, is the Cyprians. They are natives of the island of Cyprus; are noted for their activity, the fertility of the queens, their industry as honey-gatherers, the production of queen-cells, and as rapid comb-builders. The serious objection to the Cyprians is their demoniacal temper when aroused; but with practical beekeepers they seem to be in favor. The Cyprians are smaller than the Italians, with more intense or brighter colors, though the arrangement of the markings is the same. The dorsum of the thorax and the scutellum is a brighter yellow. A variety found in the Holy Land and Syria, and claimed by some to be the progenitors of the Italians and Cyprians, does not differ materially from the Cyprians, although the colors are not so bright, and they are a little larger. Their tempers vary, but they are excellent foragers. Like the Cyprians they produce a great number of queens, one author recording over 150 queens from a single colony.

The Egyptian bees, *Apis fasciata*, date the time of their domestication before the building of the Pyramids, there being hieroglyphic writings concerning them near this time. They are in all probability the species kept by the ancient Egyptians on their floating apiaries or boats, in which they ascended the Nile, and, slowly drifting down, followed the growth of melliferous flowers produced by the annual inundations. They are blackish brown, with an abundance of whitish hairs. The wings are infuscated, the second and third abdominal segments in part dark orange. They are excessively vicious, and frequently produce fertile workers. Besides the above-named species or varieties there are several others which are not so well known. In Southern Africa there are two species, *Apis caffra* and *Apis scutellata*. The former is black, the second abdominal segment red at base; the latter has the abdomen brown, with the base of the segments grayish pubescent. They have a serious fault of producing many fertile workers, which are liable to find their way into other colonies. *Apis nigritarum* is found in the Congo region. It has the antennæ black, at base yellow; abdomen black, grayish pilose, first abdominal segment and the second in part yellowish. In Senegal is found *Apis adansonii*. The natives, when they collect the honey, stifle the bees, and hang the emptied hives in the trees, awaiting the arrival of a new swarm. They are similar to the Italians, but smaller. *Apis unicolor*, in which the abdomen is shining black, unifasciate, is a native of Madagascar, where it is domesticated, and has been introduced in the isle of Bourbon and Mauritius, also the Canary islands. The honey is unwholesome. *Apis indica* is indigenous to Hindustan and the East Indian Archipelago. It is small, black, pilose with grayish hairs, two basal segments of abdomen reddish brown. It has been cultivated by Europeans; the natives make rude hives of bamboo which are placed under the eaves of the houses. Although *indica* is generally a poor honey-producer in nature, it increases remarkably by domestication. The Bhootan bee is larger than *indica* and probably distinct. It is very dark, with light-colored hairs, and has an exceedingly mild temper. *Apis dorsata*, found in India, Sumatra, and Java, is the largest species of the genus, the smallest of the workers being larger than the largest of the Italians or Germans. The thorax is yellowish above, with brownish triangular spots; black beneath, with reddish hairs. In nature they build under the boughs of trees, frequently in caves. All attempts at colonizing have been futile. *Apis florea*, on the other hand, is the smallest species; the drones are strongly differentiated from the queen and workers.

As has been already stated, each colony is composed of three classes: the drones, or males; the queen, or fertile female; the workers, neuters or sterile females.

FIG. 1.—a, worker; b, queen; c, drone.

The males are usually present in the hive from May to November, but may be found at any time of the year. They are shorter than the queen, longer than the worker, and stouter than either. Their wings are larger, their flight more awkward, producing a loud, buzzing noise. The labium and maxillæ are shortened, the mandibles have a rudimentary tooth, the posterior tibia and metatarsus are convex, the pollen-basket being absent. The webbed hairs and the sting are wanting. The eyes are large and prominent. The antennæ are long and broad, and well supplied with olfactory cavities and sensory hairs. The wax glands and the pollen-digesting glands are wanting. The drones, though surrounded by an abundance of honey, would starve to death unless fed by the workers. The sole object of the drone is the fertilization of the queen. This always takes place on the wing outside the hive, and always results in the death of the male. When the supplies of the colony get low, or nectar is scarce, or just before winter sets in, the workers, either by constantly biting and worrying them or by withholding their food, kill off the drones. Neither the eggs, young larvæ, nor the chrysalis escape extermination. The longevity of the male, with the exceptions just stated, depends on accident. The eggs intended to produce drones are always unimpregnated, and are laid in cells that are deeper and broader than those of the workers. These are called drone-cells, and when not filled with young are used for storing honey.

The queen is a fully developed female and the mother of the colony. She is larger than either the drones or the workers; her abdomen is long and slender; wings short, reaching but little beyond the third abdominal segment. The labium and maxilla are similar to those of the male. Although the posterior tibia is broad and flattened, it does not have the cavity and surrounding hairs, as in the workers. The webbed hairs are also wanting. The sting is longer than that of the worker, and is curved. It is very rarely used, except in contests with rival queens. The eyes are not as large as those of the drones, and do not meet above. She is followed, guarded, and fed by the workers. The function of the queen is the production of eggs for the perpetuation of the colony. During the summer a queen may lay over 3,000 eggs in a day, or over 1,000,000 during a lifetime. An egg is about $\frac{1}{16}$ of an inch in length; and if all the eggs produced by a queen were placed end to end, they would reach over a mile. Queens are developed only from impregnated eggs, and in cells prepared especially for them, which are usually on the edge of the comb or around an opening in it, extending vertically or diagonally downward. These cells are constructed of pieces of wax cut from old cells, and are very rough, much resembling a peanut. There are several things that may induce a colony to build queen-cells, as the loss of a queen, crowded quarters, poor ventilation, or inability of the queen to lay impregnated eggs. There is no difference in the eggs from which workers and queens are developed; the difference is wholly in the food. A queen can be produced from an egg or from a worker larva not more than four days old. To do this the workers remove the partitions of the adjoining cells, surround the larva by a royal cell, and feed it an abundance of rich food, called royal jelly. It usually takes from ten to twelve days to produce a queen from a worker larva; three to six days later she goes forth, if the day be sunny, on her marriage flight. The success of the queen is marked by the appendages of the drone which will be hanging to her. If the queen fails to mate the first day, she will go forth again and again; but if impregnation does not take place before the fifteenth day, she is likely to remain a virgin queen, and will lay only unimpregnated eggs which will produce only drones or males. After this the queen never

leaves the hive except with a swarm. Two or three days after impregnation the queen begins to lay worker eggs. The queen is longer lived than either drones or workers, living from three to five years. If the queen ceases to lay fertile eggs, the workers, before all the worker eggs are gone, raise a new queen and destroy the old one. If from some accident, however, a colony lose its queen and does not have any worker larvae of the proper age, it will dwindle and die out, if another queen is not introduced.

The workers are the most numerous individuals of the hive, a good colony having from 15,000 to 40,000. They are developed only from impregnated eggs, which are usually laid in the small horizontal cells. The egg hatches in three days into a small, white, footless maggot. After this has been fed grudgingly for five days by the workers, the cell is capped over. The adult larva, having lapped up all the food placed before it, spins a silken cocoon, changes to a pupa, and emerges in about twenty-one days as an adult bee. The workers never attain an old age, their age depending on the season of the year in which they emerge; those emerging at the most active honey-gathering period wear out in about a month. As already stated, the workers are undeveloped females. When a colony becomes hopelessly queenless (and occasionally at other times), there appear workers that have the ovaries somewhat developed and are able to lay eggs. These eggs, of course, always produce drones, and such workers are called "fertile workers." No tenable explanation has yet been made of this fact, though many theories have been advanced. Upon the workers fall all the labor of the colony. The young bees do not go forth for a week or more after emerging as imagoes, but build the comb, feed the larvae, drones, and queens, cap the cells, and ventilate the hive. Upon the old bees devolve the duties of collecting the honey, the pollen, and the propolis, defending the hive against intruders, destroying the drones and worthless queens, and leading forth a portion of the bees when circumstances impel them to swarm.

Nature never produces new organs for new functions she wishes performed, but modifies an already existing organ so as to perform the new function. So it is with the honey-bee. The work it does is varied, yet it does not differ from insects in general in the plan of its structure. In a grasshopper the mandibles are stout and toothed, the labium

muscles which move the ligula, and the salivary duct, which opens by a valve at its base. Other than this the mentum has no opening and is not tubular. At each side of the mentum are the maxillæ, which are attached to the head by slender pieces, the stipes and the lacinia. At the base of the lacinia are the rudimentary maxillary palpi. The stipes and lacinia are hollowed out, fitting close against the sides of the labium, while the labial palpi embrace the tongue or ligula before and behind respectively, forming with the maxillæ a tube in which is situated the ligula and which has the power of moving from side to side. The ligula is covered with transverse rows of hairs and spines, while scattered among these hairs are sensory hairs or papillæ. When a bee desires to feed on honey or other liquids the apical part of the epipharynx closes down on the opening left between the bases of the maxillæ; the labial palpi lie close together beneath and between the over-folding maxillæ; the maxillæ are alternately arched and flattened, causing the palpi to recede from and approach to the maxillæ. The nectar flows into the space thus made, and when the maxillæ contract flows on into the pharynx.

The numerous hairs on the ligula are a great aid to the bee in sucking up liquids when they are present in abundance; but when it desires to collect them in much smaller quantities, as in sipping the nectar of flowers, it must have recourse to another method, else the nectar would be evaporated before reaching the pharynx, cementing together the parts and clogging up the tube. If we examine a trans-section of the ligula, we will find on the under side a slit or opening which is continuous, extending the entire length of the ligula and opening at its base. There extend on each side of this slit within the walls of the ligula two lateral pouches or side ducts, which are convoluted and covered with minute hairs. Immediately above the slit and above the side ducts there is a small, rounded, trough-like hollow, its lower approximated edges being lined with a row of stiff bristles, forming a false tube. The bee in feeding on the nectar of flowers takes up the smaller drops by means of the subdivided hairs on the apex of the tongue, transferring them to the side ducts or the central duct, according to the amount of the liquid for transportation to the pharynx. It is claimed by some authorities that the ligula contains a closed duct. That there is no such duct can be easily demonstrated by taking a worker bee and squeezing its thorax so as to force the blood into the tongue, thus distending it. The two margins of the ventral slit will be spread apart, the side ducts forced out between them, and the central duct drawn down to the lower edge, where it can be seen to be composed of a groove edged with bristles. By the above operation the ligula has not been subjected to unnatural methods, as it is in this way that the worker bee is enabled to clean these ducts of grains of pollen; while if it had been a closed tube the grains would entirely clog it up.

When the food reaches the pharynx it is there mixed with saliva, which is secreted by salivary glands located in the head and thorax, and opening by ducts at the base of the mentum and in the pharynx. This changes the cane-sugar to the grape-sugar of honey. The liquid on leaving the mouth is carried by a long slender oesophagus through the head and thorax into the abdomen, where it is stored in a muscular sac or pouch, the "honey-stomach" or "sucking-stomach." While

short, the maxillæ short and fitted for biting and tearing. In the mouth-parts of the honey-bee we find the same identical parts, but here they are modified so as to serve as a sucking organ, and have been specialized into a long tube for sipping various saccharine juices, such as the nectar of flowers, the juices of ripe fruits, the sap of trees, or the honey-dew of aphids. The form of this tube is very complex. The apex of the epipharynx projects beneath the labium, forming the upper part of the mouth opening. The labium, or under lip, forming the underside, is composed of a number of pieces. The largest part is the mentum, which is at the base and bears at its apex the four-jointed labial palpi, and the ligula, which is a long, slender tongue placed between the palpi. On each side of the ligula and attached to the mentum is the paraglossa. The mentum lies a little behind and beneath the head, and can be moved backward and forward. At its base there is a small triangular sclerite, the submentum, by which it is attached to the head. In the mentum are located the strong

in this sac the liquids are not changed except by being mixed with the saliva. The honey is kept from passing into the chyle stomach by the stomach-mouth, which is a small cylindrical organ at the end or bottom of the honey-sac. Its upper surface is divided into four triangular lips, which close the opening and separate the pollen from the honey. When the bee returns to the hive, it goes to the empty honey-cells, the strong muscles of the honey-sac contract, and it regurgitates the honey into the cell.

In the legs we find many interesting developments. Situated here are the organs used in cleaning the antennæ and in collecting and carrying the pollen. On the outer edge of the anterior metatarsus there is a row of long stiff bristles, which are used to comb out of the hairs placed between the facets of the eyes any grains of pollen or foreign substance that would impede vision. At the base of the metatarsus and on the opposite side is the antenna-cleaner. This consists of a deep, curved recess in the metatarsus, and an especially adapted spine or velum attached to the apex of the

tibia. This mechanism is found not only in the workers, but also in the queen and drones. If the curved recess be examined carefully, there will be found many slender teeth in each comb. At the base of the middle tibia there is a long slender spine, by means of which the pollen mass is removed. The middle legs are brought back over the pos-

terior ones, and the spine, entering at the top, passes down behind the mass and turns it out. It is also used in cleaning the wings, and is present in the queen and drones. The posterior legs are the most specialized. The femora, as well as the anterior pairs of legs and the body, are covered with ciliate hairs which are useful in collecting the grains of pollen. The tibia is triangular, and meets the oblong metatarsus in a right angle. On the apical outer edge there is a row of strong spines, which fasten the metatarsus to the tibia by shutting down over a flattened plate in the former. On the under side of the metatarsus there are stiff combs, the teeth of which are straight, horny spines arranged in transverse rows. By means of these combs the pollen collected by the ciliated hairs is combed out, and when the combs are filled the pollen is transferred to the hollow side of the tibia. This cavity is glabrous; while the sides and bottom are lined with two rows of stiff bristles, a third bends over the front. This is the corbicular or pollen-basket. The pollen on the right metatarsus is transferred to the left tibia, and vice versa.

Propolis or bee-glue is carried in the same way as pollen. It is collected by the bees from resinous buds, such as the hickory and horse-chestnut, and is used to glue the combs to their supports, to fill all cracks, and to lessen the place of exit. Alcohol, ether, and chloroform dissolve it.

If the abdomen of a worker be elongated by gently separating the segments, and examined, there will be found at

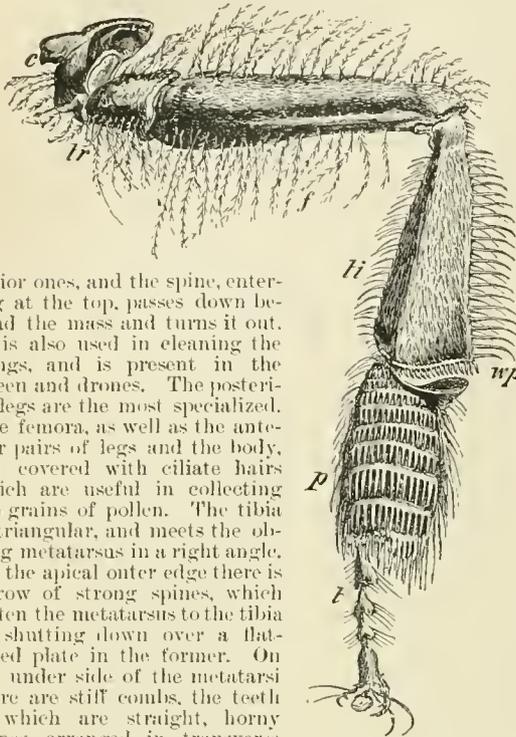

FIG. 3.—Under side of right posterior leg. *c*, coxa; *f*, femur with ciliate hairs; *p*, metatarsus; *t*, tarsus; *ti*, tibia with lateral spines; *tr*, trochanter; *wp*, wax pincers.

the base of abdominal segments two to five, two smooth plates, called the wax-plates. These plates are smooth, and are strengthened by rims of chitine, which also give them a definite outline. The apex of each segment projects over the wax plates of the next posterior segment, and is

covered with webbed hairs. The true wax glands are situated beneath, the wax passing through by osmosis. A marked peculiarity of these glands is the great abundance of trachea or air-tubes with which they are supplied. Wax is like all animal secretions—the silk of spiders, for example—liquid at first. It is derived from the blood by cell

action, solidifying when brought in contact with the air. If a colony is placed in an empty hive, they climb the sides, the upper ones firmly securing themselves to the sides of the hive by means of their claws, and the next bee hooking its front claws into the hind claws of the one above, until the ladders of bees reach the bottom of the hive. Before leaving its old home the bee gorges itself with honey; this is now used in producing the wax. When the above arrangement is complete the bees remain perfectly still, and the wax flows over the thin membrane of the pocket. The wax having been secreted, a single bee starts the comb. The scales are removed by means of the stiff bristles at the apex of the posterior tibia, which are passed beneath the wax scales, scooping them out. By prolonged chewing it is made into plastic material, which is attached to a middle wall or the midrib, forming the base or end of the layer of cells covering it on each side. Wax can be produced only at the expense of many times the weight of the bee in honey or sugar. The bees, realizing this, economize, 35,000 or more worker cells being molded from a single pound of wax. The sides of the cells are liquid proof. If water mixed with dyes be placed in worker or drone cells adjacent to those containing clear water, they will not intermingle.

Swarming is the result of natural increase. The queen, in the spring or early summer, begins making preparations by the laying of drone eggs. When the drone brood is well under way queen-cells are started, the number varying with the race or variety of bees from three to fifteen, and in some varieties to over 100. When the queens begin to mature they are guarded by the workers, as the old queen would sting them to death. If the colony is crowded, the ventilation insufficient, or the hives unshaded, some sunny day, generally about eleven o'clock, there is a great uproar in the hive, the workers fill their honey-sacs, and the bees—queen, workers, and drones—come out with a rush. The swarm usually cluster upon the limb of a tree, or on a fence-post near, where they remain a short time. It is claimed by some that the workers look out a new home the day before swarming, by others while they are clustered. It is always the old queen that goes with the first swarm, and if the swarm miss the queen after leaving the hive they will return. In about one week the first queen will emerge; in two or three days she will or may lead a new colony forth. This is preceded by the peculiar note of the queen, known as the "piping of the queen." This noise is thought by some to be produced by rubbing the abdominal segments together, and is made sometimes before the queen is out of the cell. Swarms will issue in periods of from one to two days. As many as eight after-swarms have been recorded as issuing from the old home. If the swarming is not interfered with by man, the workers may destroy the queen-cells and drive the drones from the hive. See APICULTURE.

ALEX. D. MACGILLIVRAY.

Bee, BARNARD E.; Confederate general; b. in South Carolina 1824; graduated at West Point 1845 in the artillery; served with distinction throughout the Mexican war (wound-

ed at Cerro Gordo), his gallant conduct being recognized in his native State by the presentation of a sword of honor. He was on frontier duty principally from 1848 to Mar. 3, 1861, when he resigned, and was appointed a brigadier-general in the Confederate army. At the first battle of Bull Run, July 21, 1861, he was killed.

Bee'he, BEZALEEL: b. at Litchfield, Conn., Apr. 28, 1741; a Revolutionary officer; joined the Rogers Rangers in 1758; became a captain Jan., 1776; was taken prisoner at the capture of Fort Washington; was exchanged, and became major in 1777, lieutenant-colonel in 1780, colonel in 1781, and afterward commanded the Connecticut troops raised to defend the seacoast; was often a member of the Connecticut Legislature between 1781 and 1795. D. in Litchfield, May 29, 1821.

Beech [O. Eng. *bēc*, a deriv. from word appearing in O. Eng. *bāc*; O. N. *bök*; O. H. G. *buohha* (> Germ. *Buche*); c. f. Lat. *fagus*, Gr. *φηγός*]; a tree of the genus *Fagus*, and family *Cupulifera*; natives of Europe, America, and Australasia. The sterile flowers have a bell-shaped calyx five to seven cleft, with eight to sixteen stamens. The fertile flowers grow on the same tree, the fruit of which is a triangular or sharply three-sided nut, two of which are inclosed in an urn-shaped, coriaceous involucre or husk. These nuts, called beechmast, are edible, and are valuable as food for swine. They yield a large proportion of a bland fixed oil which is used as food and burned in lamps by Europeans; the husks contain a volatile, narcotic, poisonous principle called *fagine*. The genus comprises several species of beautiful forest trees, with a close and smooth ash-gray bark and a light horizontal spray. The *Fagus sylvatica*, or common beech of Europe, forms whole forests in many parts of that continent. It grows to the height of about 100 feet, and sometimes has a diameter of 4 feet, and is a very ornamental tree, especially when it stands alone. The wood is hard and valuable for fuel, and, being durable under water, is employed in the erection of mills. The French use it extensively in the manufacture of *sabots* or wooden shoes. The *Fagus ferruginea* (American beech) is abundant in the Northern U. S., sometimes growing gregariously in forests which contain few other trees. Its leaves are oblong-ovate, taper-pointed, distinctly and often coarsely toothed or serrate. This is an ornamental tree, which sometimes attains a height of 100 feet, and surpasses most trees in the depth of shade produced by its rich green and shining foliage. The wood is hard, heavy, good for fuel, plane-stocks, shoe-last, tool-handles, and other purposes. The color of the wood is a light brown or reddish. Among the other species is the myrtle-tree of Tasmania (*Fagus cunninghamii*) a very large and ornamental tree, with evergreen and coriaceous leaves, which resemble birch leaves in form. *Fagus procera*, which attains a lofty stature in the Andes of Chili, is a valuable timber tree. The *Fagus antaretica* is a characteristic tree or shrub of far antaretic regions, and is said to be found farther south than any other shrub.

Beech Drops: See CANCER-ROOT and EPIPHEGUS.

Beecher, CATHARINE ESTHER: eldest daughter of Lyman; b. at East Hampton, Long Island, Sept. 6, 1800. She conducted a female seminary at Hartford, Conn., 1822-32, and for two years afterward was at the head of an institution in Cincinnati, O., for female education. For many years afterward she was employed in developing a plan for female Christian education, which included the training and subsequent employment of teachers. She published, besides other works, *Domestic Service*; *Treatise on Domestic Economy*; *True Remedy for the Wrongs of Women*; *Manual of Arithmetic*; *Elementary Book of Instructive Theology*; *Physiology and Calisthenics*; and *Common Sense Applied to Religion*. D. in Elmira, May 12, 1878.

Beecher, CHARLES: preacher and writer; b. at Litchfield, Conn., Oct. 7, 1815; was ordained in 1844 pastor of a church at Newark, N. J., and was settled at Georgetown, Mass., in 1857; from 1870-77 he resided in Florida; became stated supply at Wysox, Pa., 1885. Among his works is *Ten Pictures of the Bible* (New York 1855). He edited the *Autobiography* of his father, Lyman Beecher (1864, 2 vols.).

Beecher, EDWARD, D. D.: brother of Charles Beecher; b. at East Hampton, L. I., Aug. 27, 1803; graduated at Yale in 1822; was pastor of Park Street church, Boston (1826-39); president of Illinois College from 1831 to 1844; pastor of Salem Street church, Boston, from 1846 to 1856; editor

of *The Congregationalist* (1849-53); pastor in Galesburg, Ill., 1856-71, and of Parkville Congregational Church 1885-89. D. in Brooklyn, July 29, 1895. He published *The Conflict of Ages* (Boston, 1853; 5th ed. 1855) and other works, including an able work on Baptism (New York, 1849); *History of Opinions on the Scriptural Doctrine of Retribution* (1878).

Beecher, HARRIET ELIZABETH: See HARRIET BEECHER STOWE.

Beecher, HENRY WARD: author and divine; son of Dr. Lyman Beecher; b. at Litchfield, Conn., June 21, 1813. At an early age he had a strong predilection for a seafaring life, which, however, he renounced in consequence of the deep religious impressions which he experienced during a revival. Having graduated at Amherst College in 1831, he devoted himself to the study of theology at Lane Seminary under the tuition of his father, who was then president of that institution. He was pastor at Lawrenceburg, Ind., 1837-39; then at Indianapolis, Ind., until 1847, when he was installed as pastor of Plymouth (Congregational) church in Brooklyn, where his genius and remarkable eloquence continued to attract one of the largest congregations in the U. S. He was equally successful as a lecturer and a popular orator. He was editor of the *Independent* from 1861 to 1863, when he visited Europe for the benefit of his health. His earnest addresses to large audiences on the subject of the civil war in the U. S. appear to have had considerable influence in turning the current of public opinion in Great Britain in favor of the Union cause. Mr. Beecher was also long a prominent advocate of anti-slavery and of temperance reform, and at a later period of the rights of women. He delivered three courses of lectures on *Preaching* (1872-74) at the Yale Divinity School, on the "Lyman Beecher" foundation. Among his principal works are *Lectures to Young Men* (1850); *Star Papers* (1855); *Life Thoughts* (1858); *Royal Truths* (1864); a novel, *Norwood* (1864); *Life of Christ* (vol. 3, 1871); *Evolution and Revolution* (1884); *Sermons on Evolution and Religion* (1885); and about twenty other volumes of sermons. He was founder and editor of the *Christian Union* (1870-81). D. in Brooklyn, N. Y., Mar. 8, 1887. See his *Biography* by William C. Beecher and Rev. Samuel Scoville, assisted by Mrs. Henry Ward Beecher (1888). His widow, Eunice White Bullard Beecher (b. Aug. 26, 1812), d. at Stamford, Conn., Mar. 8, 1897.

Beecher, LYMAN, D. D.: theologian; b. at New Haven, Conn., Oct. 12, 1775; graduated at Yale College in 1797; studied theology under President Dwight; and became in 1810 minister of the Congregational church at Litchfield, Conn. He was a popular preacher, and acquired great influence among the orthodox churches. To oppose the rapid progress of Unitarian doctrines he removed to Boston about 1826, and preached in the Hanover Street church. He was president of Lane Seminary at Cincinnati 1832-51. Here he was brought to a stormy trial for heresy, and, although not condemned by the presbytery, this event was one of the great factors in the separation of the New from the Old School Presbyterians in 1837. He published, beside other works, *Views in Theology and Sermons on Temperance*, which had a great circulation. He was a man of very energetic character. D. at Brooklyn, N. Y., Jan. 10, 1863. His works were published in 3 volumes (Boston, 1852). See his *Autobiography* and *Correspondence*, edited by his son, Charles Beecher (2 vols., 1864-65).

Beecher, THOMAS KENNICOTT: Congregational minister; son of Lyman Beecher; b. in Litchfield, Conn., Feb. 10, 1824; graduated at Illinois College (Jacksonville, Ill.) in 1843. He is the author of *Our Seven Churches*, a volume of discourses (1870). He became (1854) pastor of a church in Elmira, N. Y.

Beecher, WILLIS JUDSON, D. D.: Professor of Hebrew Language and Literature in Auburn Theological Seminary; b. in Hampden, O., Apr. 29, 1838; graduated at Hamilton College (1858) and Auburn Seminary (1864). Before entering upon his present work, in 1871, he had held two brief pastorates, and had been for three years teacher in Whites-town Seminary, N. Y., and for four years Professor of Moral Philosophy and Belles-Lettres in Knox College, Illinois (1865-69). He published many pamphlets and articles, mostly on sociological, statistical, and exegetical subjects; the most important being the series of Old Testament articles in the *American Supplement to the Encyclopædia Britannica* (1883-89), and three series of articles in the *Old and New Testament Student* (1885-90).

Beech'ey, **FREDERICK WILLIAM**: English navigator; b. in London, Feb. 17, 1796. He accompanied Sir Edward Parry in an Arctic expedition in 1819, and explored the northern coasts of Africa in 1821. He commanded an exploring expedition to the Polar Sea via Bering Strait; discovered Port Clarence and Port Grantley; returned in 1828, and published a narrative of his voyage in 1831. He became a rear-admiral of the blue in 1854. D. Nov. 29, 1856.

Beechey, **SIR WILLIAM, R. A.**: an English portrait-painter; father of Frederick William Beechey, the navigator; b. in Burford, Oxfordshire, Dec. 12, 1753. He became a pupil at the Royal Academy in 1772; was employed by the nobility; and in 1793 was made portrait-painter to Queen Charlotte and associate of the Academy. D. in Hampstead, Jan. 28, 1839.

Beeder: same as **BIDAR**.

Bee-eater: a bird of the family *Meropidae* allied to the kingfishers. The genus *Merops* comprises numerous species, found in Asia, Africa, and Europe, which feed on bees and other hymenopterous insects. The common bee-eater (*Merops apiaster*) abounds in the south of Europe as a summer bird of passage. It seizes bees as they fly in the

The Namaqua bee-eater.

air, and watches for them near their hives. It breeds in holes which it excavates in the banks of rivers. There are several other genera called bee-eaters. The Namaqua bee-eater (*Rhinopomastus cyanomelas*) is a West and South African bird.

Beef-eater: a bird of the genus *Buphagus*, belonging to the family of starlings; sometimes called ox-pecker. The beef-eaters are exclusively African, and have a remarkable habit of running over the backs of oxen, buffaloes, camels, etc., in order to feed on the larvæ of flies which they find in their hides, and which is said to be their principal food. This genus includes the South African species called buffalo-bird.

Beef-eaters [the common derivation from a supposed *buffetier (buffet, sideboard) is groundless]: jocularly, one of certain British functionaries belonging to the yeomen of the guard, who form part of the train of royalty, and attend the sovereign at royal banquets, coronations, etc.

Beef Tea: an article of diet important in the treatment of the sick and the nurture of infants. To prepare palatable beef tea is a matter of some difficulty, but the following rules are excellent and easy to follow: Take 1 lb. of juicy, lean beef from the shoulder or the round, and mince it with a sharp knife on a board or a mincing-block. Put it with its juice into an earthen vessel containing a pint of tepid water, and let it stand for two hours. Strain off the liquid through a clean cloth, squeezing well the meat, and add a little salt.

Place the whole of the juice thus obtained over the fire, but remove it as soon as it has become browned. Never let it boil, otherwise most of the nutritious matter of the beef will be thrown down as a sediment. A little pepper or allspice may be added if preferred.

Beefwoods (*Casuarinaceæ*): a family of trees numbering twenty-three species, all of one genus (*Casuarina*): natives mostly of the Australasian region. Treub's recent studies of the ovules of *C. suberosa* appear to indicate that beefwoods are related to the gymnosperms, although they have usually been associated with the oaks, gallworts, etc.

CHARLES E. BESSEY.

Beelzebub [i. e. the god of dung or of flies; Gr. Βεελζεβούβ, *Beelzeboul*, or *Beelzebub*]: properly Baalzebub; a god worshiped by the people of Ekron, in Philistia (2 Kings i. 3). The name of Beelzebub came in course of time to be commonly applied to a prince or chief of evil spirits, and in this sense it is employed in the Gospels (Matt. x. 25, xii. 24, 27; Mk. iii. 22; Luke xi. 15, 18, 19). This name is found only in the New Testament. The original and authorized spelling is Beelzebub, which appears to have been afterward changed so as to resemble Baalzebub, which was the proper name of the heathen divinity.

Beer [O. Eng. *bēor*; Germ. *Bier*; probably connected ultimately with name for barley; cf. O. Eng. *bēo*): the fermented infusion of malted barley, flavored with hops. In a wider sense the term *beer* is applied to beverages prepared from cereals, barley, rye, wheat, Indian corn, millet, etc., the chief constituent of which is starch. The treatment involves the preliminary operations of *malting* and *mashing*, or changing the starch to gum (dextrin) and sugar (glucose) by the aid of the natural process of germination. The term *wine*, on the other hand, is restricted to alcoholic liquids obtained by fermenting the saccharine juices of fruits, as the grape, apple, pear, currant, and gooseberry, or the sap of such plants as the sugar-cane, palm, American aloe, etc. There are, however, many beverages of inferior quality called beer, which consist of saccharine liquors more or less completely fermented, and flavored with various substances, such as spruce beer, ginger beer, root beer, etc.

The manufacture of beer from barley is divided into two distinct processes—*malting* and *brewing*—which are conducted in different establishments, the *malt-house* and the *brewery*; the brewer often purchasing his malt from the maltster.

Malting consists of four successive operations: (1) *Steeping*. The barley is placed in wooden cisterns, covered with cold water, and allowed to soak for two or three days, when the water is drained off. By this operation the barley absorbs from 10 to 50 per cent. of water, softening and swelling up at the same time. (2) *Couching*. The softened barley is thrown out upon the floor of the malt-house in heaps or *couches*, where it heats spontaneously and begins to germinate, throwing out rootlets or *radicles*, and shoots or *aerospines*. At the same time it evolves a portion of its water, the operation being called *sweating*. (3) *Flooring* is resorted to in order to check the germination by reducing the temperature. It consists in spreading the barley over the floor, and repeatedly turning and respreading it over a constantly widening area in layers of diminishing thickness. When the process of germination has proceeded as far as is desirable, it is completely stopped by (4) *Kiln-drying*. This is effected in a large room with brick or tile floors, the *kiln*, which is heated to the desired temperature. Here the germinated barley is rendered perfectly dry and crisp. It is then *malt*. The appearance of the malt, and the color of the beer made from it, depend upon the temperature of the kiln. At between 90° and 100° F. pale malt results; at 120° to 125° amber malt; 150 to 170°, brown malt for porter and stout. Black malt is prepared by roasting the malt in cylinders, at 360 to 400° F., such as are used for roasting coffee. It is used as a coloring for porter. During the process of malting the barley increases in volume and diminishes in weight; 100 measures of barley yield 101 to 109 of malt, but 100 lb. yield only about 80 lb. of malt. The loss in weight is due largely to the perfect drying in the kiln, fresh barley containing 10 to 16 per cent. of water.

The object of changing the barley to malt is to render its constituents soluble, and bring them into a condition suitable for fermentation. During germination the albuminous substances are changed to *diastase*, a body which exerts a wonderful action upon starch. One part of diastase is said to change 2,000 parts of starch (which is insoluble) to dex-

trin (gum), and then to glucose (grape-sugar), both of which are soluble in water.

The diastase of malt is capable of changing to glucose a much larger quantity of starch than exists in the barley; hence unmalting grain is sometimes added to the malt during the subsequent operation of mashing. In Belgium potato-starch is largely employed.

Brewing.—The first operation of the brewer is the *bruising* or crushing of the malt, which is accomplished by passing it between iron rollers. It is then placed in the mash-tub with warm water, and raised gradually to about 167° F. It is here that the starch is transformed into dextrin and glucose, which, with the soluble albuminous and saline constituents, are taken into solution by the water. From 1 to 4 bush. of malt are used for each barrel of beer. When the price of malt is high, a portion of it is replaced by cheaper amylaceous or saccharine substances, such as potato starch, or glucose prepared from it by the action of sulphuric acid. The insoluble residuum from the malt is sold under the name of brewer's grains for feeding cows. The infusion is allowed to stand for a few hours to clarify or set, and the sweet *clear wort* is then drawn off into a copper boiler, when it is boiled with the hops. From 1 to 5 lb. of hops are added for each barrel of beer, the quantity varying with the strength of the beer, the length of time it is to be kept, and the climate to which it is going. The hops are the female flowers of the *Humulus lupulus*; they contain a peculiar essential aromatic oil, a bitter principle, *lupuline*, tannic acid, resin, etc. They communicate an agreeable flavor to the beer, add to its tonic and stimulating properties, aid in clearing it by the action of the tannic acid on the albumin, and diminish its liability to spoil on keeping. See Hops.

The boiled wort is cooled as quickly as possible, either by placing it in shallow vessels or passing it over a series of tubes through which cold water circulates. It is then run into the fermenting vats or tuns, which in large breweries sometimes have a capacity of 1,200 or 1,500 barrels. The temperature of the wort best suited to successful fermentation depends upon the season. In summer, with the atmosphere at 75° F., it should stand at about 55°; with air at 55°, at 60°; while in the winter it should have a temperature of at least 64°. If a very quick fermentation is desired, it may be considerably higher. For every 100 gal. of wort about 1 gal. of yeast is added, which has been produced in a previous brewing of the same kind of beer. The yeast is usually mixed with a little wort, and left in a warm place till it begins to ferment. This *lobb*, as it is called, is then added to the tun. More yeast is employed in winter than in summer; twice as much at 50° F. as at 68°. In six or eight hours fermentation becomes active; the wort begins to work, the glucose, under the influence of the active ferment, *yeast*, undergoes decomposition, yielding alcohol and carbonic acid, the latter escaping in bubbles, and bearing to the surface particles of yeast, which form a scum. The yeast itself, being a plant, develops rapidly, largely at the expense of the nitrogenous albuminous matters of the wort, which are thus withdrawn. The temperature rapidly increases, rising many degrees. This fermentation continues for six or eight days. When it has reached the proper point, the beer is separated from the yeast, and transferred to the *cleansing butts*. Here a slow, almost imperceptible, fermentation takes place. The solid particles of the yeast rise to the surface and escape through the bung-holes of the casks. Finings are sometimes added to clear the beer; they generally consist of isinglass dissolved in a little sour beer. The beer is then transferred to store-casks, where a slow fermentation occurs, which produces no perceptible quantity of yeast; the beer develops its finer qualities, and is here finished for use. See FERMENTATION.

The composition of the water used in brewing is believed to exert an important influence on the success of the process. Lime salts are said to aid in clearing the beer, as they form insoluble compounds with some of the acids present. Sulphate of lime, or gypsum, is sometimes added to the water. The spring water at Burton-on-Trent is said to contain considerable sulphate of lime. The strength and taste of beer depend upon the quantities of malt and hops employed and the mode of conducting each of the several operations, especially the fermentation. *Strong* beers contain much alcohol; *substantial* beers are those which have not been fermented so thoroughly, and which consequently contain more of the extractive matters of the malt. Bitter beers contain more of the hop extract.

Ale is prepared from pale malt, and the active fermenta-

tion is checked while there still remains a considerable quantity of sugar unchanged. This, by subsequent fermentation in the barrel or bottle, keeps up the briskness. *Pale ale* is made from malt dried in the sun or by steam. It is not allowed to rise above 72° during the fermentation. The formation of acetic acid is thus prevented, and the unpleasant flavor due to the solution of the yeast by the alcohol is avoided. *Scotch ale* is a sweet strong ale. *Small beer* is a weak liquor made by using little malt, or by mashing with fresh water the malt residuum left after the wort for ale or porter has been drawn off. *Porter* is a dark-colored beer made from a mixture of pale, amber, brown, and black malt. *Stout* is strong porter. *Berlin white beer* (*weiss beer*) is prepared by quick fermentation from a mixture of 1 part of barley malt and 5 parts of wheat malt with half a pound of hops per bushel.

Lager Beer.—The beer of Bavaria, which has of late years been so extensively manufactured in the U. S. under the name of *lager beer*, owes its name (from *lager*, a store-house) to the fact that it is stored in cool cellars or vaults for several months before it is used, and its remarkable keeping qualities and highly prized properties to the peculiar kind of fermentation by which it is produced. The fermentation of ordinary beer and ale takes place at high temperatures; it is consequently rapid, and the carbonic acid, evolved in bubbles, carries a portion of the yeast to the surface, forming a thick scum. This scum protects the beer from the oxygen of the air. The fermentation of lager beer is conducted at a low temperature—between 40° and 50° F. It proceeds more slowly, and the carbonic acid does not carry the yeast to the surface. Consequently the air has a freer access, and the gluten is more completely converted. This beer is usually fermented in the winter, or, if in summer, in rooms cooled by ice. This is called *sedimentary* or *under-fermentation*, to distinguish it from the ordinary surface fermentation. The yeast, called *bottom yeast*, is quite different from ordinary yeast, and has a tendency to induce the kind of fermentation by which it was produced. The following is a brief outline of the process employed at one of the largest lager-beer breweries in New York. The barley is soaked two or three days, changing the waters; it germinates six to ten days, till the radicles are brownish; it is then kiln-dried. It is crushed between rollers, mashed at 120° to 140° F., the temperature being raised by the addition of boiling water to 160° or 170°. By adding hot water to the residue a second wort is obtained. The first wort is boiled with the hops; the second wort is let in, and the whole is boiled three or four hours. After cooling to between 44° and 50° F., it is run into open fermenting tuns. One gallon of yeast is added for every twenty to twenty-five barrels. Fermentation continues from ten to twenty days. There is a heavy froth at first, which subsides, leaving the surface clear. It is racked off into hogsheads, when the yeast is found at the bottom of the tuns. It stands in these hogsheads with the bung open. A few days before it is to be put in barrels for use the bung is driven in to accumulate carbonic acid for *life*.

Three varieties of this beer are made: (1) "*Lager*," or summer beer, for which 3 bush. of malt and 1½ to 3 lb. of hops are used per barrel, and which is not ready for use in less than from four to six months. (2) "*Schenk*," winter or present-use beer; 2 to 3 bush. malt and 1 lb. hops per barrel; ready in four to six weeks. (3) *Bock* beer, which is an extra strong beer, made in small quantity and served to customers in the spring, during the interval between the giving out of the *schenk* beer and the tapping of the *lager*. In its manufacture 3½ bush. of malt and 4 lb. of hops per barrel are used, and it requires two months for its preparation.

The barrels for lager are coated with pitch on the inside, to prevent the beer soaking into the wood and giving rise to acetic acid when they are empty. Lager is therefore the product of a peculiar slow under-fermentation, which takes place at low temperatures.

Chica, or maize beer, was used by the South American Indians before the Spanish conquest. *Bourza*, or millet beer, is made by the Crim Tartars. *Quass*, or rye beer, is a sharp acid beverage prized by the Russians. *Koumiss*, or milk beer, is prepared by the Tartars from mare's milk, which they dilute and ferment.

Composition of Beer.—The stimulant and tonic properties of beer are due to the alcohol and the bitter principle of the hop, while its nutritive value is ascribed to the extractive matters derived chiefly from the malt. The exact

character of many of the constituents of beer is not known. Besides water, alcohol, dextrin, and grape-sugar, the following substances have been identified: glycerin, succinic, acetic, lactic, propionic, glucic, and carbonic acids, albumen and albuminous principles, bitter and resinous matters and essential oil from the hop, and alkaline and earthy salts. The latter, which amount to from 0.15 to 0.28 per cent. of the beer, are from one-half to two-thirds alkaline and earthy phosphates. The unrecognized constituents of beer are grouped under the term extractive matters. In the following table the term *extract* includes all the substances left when the alcohol and water are removed by evaporation:

ANALYSIS OF BEER.

KINDS.	PERCENTAGES.		CONTENTS PER IMPERIAL PINT.	
	Alcohol.	Extract.	Alcohol, fl. ounces.	Extract, ounces.
Burton ale (Allsopp's).....	8.25	13.32	2.16	2.77
Bass's barley wine.....	8.41	11.75	2.18	2.42
Edinburgh ale.....	4.41	3.58	1.12	0.72
Guinness's stout.....	6.81	6.17	1.74	1.25
Truman, Hanbury & Co.'s porter.....	4.02	5.12	1.03	1.01
Whitbread's porter.....	4.28	5.15	1.09	1.03
Hoare's porter.....	4.18	5.04	1.06	1.03
Perry's ale.....	3.87	3.65	0.98	0.73
Munich lager.....	4.70	6.10	1.19	1.22
New York lager.....	5.86	4.32	1.48	0.88
Munich schenk.....	3.90	5.7	1.00	1.16
Munich bock.....	4.60	9.2	1.17	1.90

Adulteration of Beer.—There is a popular impression that beer is extensively and injuriously adulterated; that potato-starch, grape-sugar, glycerin, and molasses are added as substitutes for malt; pine bark, quassia, walnut leaf, wormwood, bitter clover, aloes, picric acid, cocculus indicus, and strychnine as substitutes for hops; and various chemicals to neutralize acidity or conceal dilution. A few of the first mentioned would not be unwholesome, and it is not probable that many, if any, of the others are ever used. Glucose, or grape-sugar, made from corn-starch, is extensively used whenever the relative prices of barley and grape-sugar make it profitable to do so. Grape-sugar is in no way unwholesome, but it is a very poor substitute for barley. It yields alcohol by fermentation, but does not contain the albumen, extractive substances, and inorganic salts which are contained in barley; consequently the beer is poor. It has been customary of late to omit the storage of beer before it is sold; the beer is sent to the consumers without waiting for the after-fermentation in the barrels; and to produce the effervescence which formerly came from fermentation compressed disks of sodium bicarbonate are introduced into the kegs and barrels through the bung-hole.

Revised by IRA REMSEX.

Beers. HENRY AUGUSTIN; b. at Buffalo, N. Y., July 2, 1847; graduated at Yale College 1869; spent two years in New York in the study of law; was appointed tutor in Yale in 1871, and Professor of English in 1875. Besides stories, essays, and sketches in the magazines, and special contributions to dictionaries, encyclopedias, and other reference books, has published the following books: *Odds and Ends* (verse, 1878); edited *A Century of American Literature* (1878); *Life of N. P. Willis* (1885); edited *Prose Writings of N. P. Willis* (1885); *The Thankless Muse*, a volume of poems (1885); *An Outline Sketch of English Literature* (1886); this was reprinted, with appendix, as *From Chaucer to Tennyson* (1890); *An Outline Sketch of American Literature* (1887); this was reprinted as *Initial Studies in American Letters* (1891).

Beer'sheba (i. e. the well of the oath, or well of the seven): an ancient frontier place of Palestine, situated about 50 miles S. S. W. of Jerusalem, and near the border of the desert. Abraham, Isaac, and Jacob often dwelt there. The phrase "from Dan to Beersheba" was used proverbially to express the whole extent of the land of Israel. There are still to be seen seven wells of ancient masonry, from 5 to 12½ feet in diameter; but only two of them now contain water.

Beestings: See COLOSTRUM.

Beeswax: a substance manufactured or secreted by the honey-bee; the material of which its cells and combs are constructed, and an important article of commerce. Purified beeswax is tasteless, odorless, and colorless. Its specific gravity is about .960. It fuses at 145 F., is insoluble in

water, and partly soluble in boiling alcohol. Beeswax is extensively used in the manufacture of candles and tapers, and for other purposes. It consists of (1) myricin, which is insoluble in boiling alcohol, and is chiefly myricyl palmitate, $C_{30}H_{61}.C_{16}H_{31}O_2$; (2) cerotic acid, $C_{27}H_{54}O_2$, which dissolves in boiling alcohol, but crystallizes out on cooling; (3) cerolein, which remains dissolved in the cold alcohol.

Beet (*Beta vulgaris*): a plant allied to spinach, and belonging to the family *Chenopodiaceae*. It is native to the Mediterranean basin and western temperate Asia, and has been in cultivation for two thousand years or more. The beet is cultivated in five forms: (1) As an ornamental plant, it is grown for the rich markings of the leaves. A number of varieties have been produced for this purpose, with large leaves marked with several shades of red, orange, and silver-white. (2) As a leaf-vegetable in the form of Swiss chard. The leaf-stalks have been much broadened by selection, until, in rich soil, they reach a width of 2 or 3 inches. These thickened petioles are used as a boiled or pot vegetable. The young leaves of various kinds of beets are also much used for "greens." (3) As a root-vegetable, and this is probably its best-known form. It runs into several types, characterized by the shape and color of the root, but the commonest classification of the garden varieties is into the turnip-beets, which are comparatively small, rounded, and early, and the long-beets, which are usually late. About fifty varieties of garden beets are grown in the U. S. The beet demands a loose, rich soil. It can be sown early, even before the latest frosts are past. (4) As mangolds or mangel-wurzels, which are very large beets grown for cattle-feeding purposes. They demand the same culture as the ruta-bagas or Swedish turnips, although they are usually sown earlier. (5) As sugar-beets, an important source of cane-sugar. (See SUGAR.) These are very extensively grown in Central Europe, and the industry is now assuming some importance in many parts of the U. S., as California, Nebraska, and Kansas. It is probable that the range of adaptability of the sugar-beet in the U. S. is greater than has been supposed. Dr. Wiley writes: "It has been found in general that the coast valleys of California, and probably large areas near the coast in Oregon and Washington, certain parts of the Dakotas and Nebraska, localities in Minnesota, Iowa, Wisconsin, and Michigan, parts of Northern Illinois, Indiana, Ohio, and New York, present favorable conditions for sugar-beet culture, but in the localities thus broadly intimated there are certain restricted areas most suitable to the sugar-beet, and it is only these restricted areas to which we must look for success." See the *Annual Reports of the United States Dept. of Agr.*; *Special Rep. 28* (U. S. Dept. Agr.); *Bulletins 5, 27, 30*, Division of Chemistry (U. S. Dept. Agr.); and the bulletins of the experiment stations of California, Utah, Colorado, Nebraska, Kansas, Missouri, Iowa, South Dakota, Minnesota, Wisconsin, Indiana, Michigan, New York (Cornell).

L. H. BAILEY.

Beet. JOSEPH AGAR, D. D.; English Wesleyan theologian; b. in Sheffield, Sept. 27, 1840; graduated in Wesley College, Sheffield, and Wesleyan Theological College, Richmond, near London; entered the ministry, and in 1885 became Professor of Systematic Theology in his theological *alma mater*. He wrote the excellent commentaries upon Romans (London, 1877), Corinthians (1882), Galatians (1885), Ephesians, Philippians, Colossians to Philemon (1890), and other works, including *Through Christ to God: A Study in Scientific Theology*, 1892.

S. M. JACKSON.

Beethoven. bay'tō-ven, LUDWIG, van; musical composer; b. at Bonn, Dec. 17, 1770. He was the second of four children, of whom the first died an infant. His father, Johann van Beethoven, tenor singer in the chapel of the elector, being poor, mainly in consequence of bad habits, discerned the remarkable musical talents of his son, and prepared early to press them into service by teaching him to play the harpsichord before he was five years old. Having outgrown his father's instruction, the lad was put under the tuition of Pfeiffer, oboist in the chapel, and then under that of Van der Eder, reputed the best organist in Bonn. At the age of eleven he was transferred from Van der Eder to his successor in the chapel, Neefe, who spoke warmly of the boy's proficiency and mastery of the music adapted to the harpsichord. The master himself seems to have given him special instruction in the science of composition, and even had published some of his compositions. At this period the lad dedicated to the elector three pianoforte sonatas, which also were printed. From this time his reputation increased,

and his prosperity, under the auspices of eminent patrons, brightened. When but fourteen he was made assistant court-organist, and three years later was sent to Vienna, at the elector's expense, to pursue his studies under the direction of Mozart, then at the height of his fame. In Vienna he finally made his home, after an incidental residence of several years in Rome, where his efforts were required to support his two younger brothers. On his return to Vienna he studied hard with Haydn and Albrechtsberger, the celebrated contrapuntist, making himself perfect master of the science of musical composition. His favorite instrument at this time was the pianoforte, on which he soon rivaled the best performers. His technical education being completed, his powers trained, his method formed, works came from his hand with astonishing rapidity. There is difficulty in fixing the dates of his compositions, but before he was thirty years old he had published as many as 20 sonatas for the pianoforte, 9 for piano and instruments, 2 concertos for piano and orchestra, trios, quartets, quintets, septets, a ballet, *The Men of Prometheus*, and two orchestral symphonies. At this period he moved in the best society, was noticed by persons of rank, and recognized by all as a genius of the first order. These were his happy, hopeful days, but they did not last long; they were soon clouded by the one great calamity of his life—a misfortune that to a musician would seem almost fatal to achievement. Already in 1800 he speaks sadly of a defect in his hearing which occasioned serious inconvenience. It increased so rapidly that before long, in the course of two or three years, during which he had a violent sickness, he became totally deaf. This affliction clouded his inner life, made him distrustful, restless, suspicious, melancholy, and unsocial. From this time books, meditation, and solitary walks in the country were his sole recreation. His society was limited to a few select friends, with whom he could forget himself. He lived in his work, and his work went on increasing in volume, gaining in power, and deepening in intensity from year to year. The achievements of his genius can not be described in a few words. In less than five years were produced the *Heroic Symphony*; *Fidelio*; *Fourth, Fifth, and Sixth Symphonies*; with the grand mass in C. In 1813 came the *Seventh Symphony*; three years later the *Eighth*; in 1824 the *Ninth or Choral Symphony*, by many thought the most wonderful of all—by Beethoven himself regarded as the most significant; and in the intervals between these gigantic creations was produced some of his most perfect music. To give here any account of these works is impossible; they can not so much as be named, for they cover nearly every species of composition, and are so remarkable that nearly every one merits special notice. They are as extraordinary for their wealth of thought and feeling as for their mastery of the laws of composition. They constitute a musical library by themselves. The nine symphonies and the grand sonatas for the pianoforte are monuments of genius which alone would give immortality to their creator.

Beethoven died Mar. 26, 1827, of dropsy, following a violent inflammation of the lungs. His constitution, naturally strong, had been tried by severe shocks of illness. His life was solitary; he was never married. His strongest natural attachment was for a nephew who proved unworthy of his uncle's devotion. Though his deafness made him a recluse, he was not selfish, sordid, or narrow-souled. On the contrary, his human feeling was of the deepest, and though he could never have been rich, he showed himself capable of generosity. An enthusiastic republican in his belief, and an ardent sympathizer with his countrymen in their struggles for political liberty, Beethoven suffered bitterly for the woes of his Fatherland, and poured out through his music the passion of his proud, agonized heart. There are worlds of sorrow in his compositions. They are, in every sense of the words, modern and living. Though so thoroughly accomplished in musical science, Beethoven was never scholastic; though so deeply charged with emotion, he was never sentimental. His works convey the profound, various, comprehensive feeling which was natural to a sensitive spirit, keenly responsive to all the joy and sorrow of the new age. To this is due their extraordinary hold on people who are quite unable to appreciate their technical excellence.

That Beethoven was a man of vast intellect his compositions testify. But he was something besides a musician. He read much and thought much; he was by no means unfamiliar with the literature of Germany, and even with Italian letters. When interested, his conversation was animated, brilliant, and instructive.

In person Beethoven is said to have been of middle size, stout, and apparently strong. His statues, busts, and portraits represent him with a massive head, broad brow, a dignified, somber expression of countenance, and features of harsh but heroic cast. The bronze statue erected in the public square of his native city in 1845 is of majestic aspect. His latest and most careful biographer, however, Mr. A. W. Thayer (1876-79), describes him as looking much like a mulatto, short and sallow, with wide nostrils and projecting teeth, heavy lips, and high cheek-bones. A great deal has been written about him. Until the biography of Mr. Thayer the authorities were his contemporary, Moscheles, and Schindler. See *Grove's Dictionary of Music and Musicians*.

Beetle: a common name given to insects of the order *Coleoptera*. They may be recognized by the much thickened horny anterior pair of wings (elytra), which meet in a straight line down the back and conceal the second membranous pair of wings, the true organs of flight. The young hatch as grubs, and undergo a complete metamorphosis, and the mouth parts are in the form of jaws, fitted for biting. Many beetles are remarkable for their singular forms and the brilliant colors and ornamental markings of their elytra. See *COLEOPTERA* and *SCARAB*.

Beet-root Sugar: sugar made especially in France and Germany from beets. The beet-root contains about 10 per cent. of saccharine matter, which is only about two-thirds that of the cane, and the juice is highly charged with impurities. The Prussian chemist Achard was the first who succeeded in extracting sugar from beets. Beet-sugar is extensively manufactured in Europe. Chemically it is the same as ordinary cane-sugar. See *SCGAR*.

Beets, NICOLAAS: Dutch poet and writer; b. in Haarlem, Sept. 13, 1814. He studied at Leyden, and became in 1840 pastor at Heemstede; in 1854 he was established as pastor in Utrecht, and in 1875 he became Professor of Theology in the University of Utrecht. Happy in his married life, in his success as a pastor, and in the respect of his countrymen, his career has been on the whole quiet and uneventful. As a writer he has passed through three somewhat different phases. As a youth he felt powerfully the influence of Sir Walter Scott, and his first publications show this. He made his poetical *début* in 1831 in the *Muson-Almanak*, with a poem on the death of a lady named Bilderlijk-Schwieckhardt. This was followed by other poems, and by translations from Scott. Soon, however, he fell under the influence of Byron, though in a somewhat superficial fashion. Beginning with slight translations of Byron, in 1834 he published his *Jose, een Spaansch verhaal*, in which he attempted to give expression to his admiration for *Childe Harold* and *Manfred* by imitating them. In the same vein were his *Kuser* (1835), *Guy de Vlaming* (1837), and *Ada van Holland* (1840). The last poem, however, was his last Byronic experiment. Already the influence of the English poet had begun to pass, and already he had won wide reputation in another line. In 1837 he had begun to write, over the name "Hildebrand," striking sketches of Dutch life in prose. In 1839 these sketches were published in a volume entitled *Camera Obscura*, and were at once felt by the public to be original and powerful. To them Beets's fame is chiefly due. He continued, however, to write verse. In 1838 had appeared a volume called *Gedichten*; in 1853 he issued a new volume of poems, *Korenbloemen*; in 1857, *Nieuwe Gedichten*; in 1863, *Verstrooide Gedichten*; in 1869, *Madelieven*. His collected poems appeared in three volumes, Amsterdam, 1873-76. He has achieved success as a critic also in his *Verpoozingen op letterkundig gebied* (1856) and *Verscheidenheden meest op letterkundig gebied* (1859). Finally, a work on religious history has gone through several editions, *Paulus in de gewichtigste oogenblikken van zijn leven en werkzaamheid voorgesteld*, 1853 (5th ed. 1887).

A. R. MARSH.

Beeville: town; capital of Bee co., Tex. (for location of county, see map of Texas, ref. 6-11); on San An. and Aransas Pass and a branch of Southern Pac. R. Rs.; 96 miles S. of San Antonio, and 56 miles from the coast; has five churches, graded schools, and high school. Beeville is situated in the same latitude as Tampa, Fla., in a region where oranges and bananas may be grown, and well adapted to market-gardening. Pop. (1880) 208; (1890) 1,311; (1892) estimated, 1,954.

PUBLISHER OF "BEE."

Beg: See *BEY*.

Begas, bay'gās, KARL: German painter; b. at Heinsberg, Sept. 30, 1794. He became about 1818 a resident of Berlin and court-painter to the King of Prussia. He painted *The Finding of Moses* and many other scriptural subjects; also excellent portraits of eminent authors and artists, including Humboldt and Schelling. D. Nov. 23, 1854.

Beggar: a person who solicits charitable aid from the public at large. In all ages and countries persons have practiced various arts in order to enlist the sympathies of the benevolent. Severe enactments have from time to time been made against them. By a law of Richard II. (1388) able-bodied beggars were punished and compelled to labor, and provision was made for the helpless. By an act of Henry VIII. (1530) licenses were given to poor persons to beg within fixed limits, but unlicensed beggars were whipped, and all persons giving alms to such forfeited ten times the amount given. By an act of the reign of Elizabeth (repealed in 1593) beggars were grievously whipped, burned through the ear with a hot iron, and for the third offense put to death. The best method of regulating and suppressing the practice of begging is a matter much discussed and still unsettled. See CHARITY ORGANIZATION.

Begging Friars: See FRIARS, DOMINICANS, etc.

Beg'hards [O. F. *begard*; M. H. G. *behart*, derived from name of Lambert le Bègue; cf. *Béguine*]: name applied to semi-monastic societies of men, originating in the Netherlands, and dating from the early part of the thirteenth century, or not very long after similar societies of women (the *Béguines*) had been formed, and spreading over Germany, France, and Italy. At first distinguished for piety and works of beneficence, they quickly degenerated into mere pious beggars. They were also joined by heretics of every description, and so fell under the ban of the church in the fourteenth century, and were severely handled by the Inquisition, but continued down to the Reformation. See Mosheim, *De Beghards et Beguinibus Commentarius* (Leipzig, 1790); Hallmann, *Geschichte d. Ursprungs d. belgischen Beghinen* (Berlin, 1843); L. Keller, *Die Reformation und die älteren Reformparteien* (Leipzig, 1885).

Begharmi: same as BAGIRMI.

Begonia: a genus of herbaceous ornamental plants, comprising between 300 and 400 species. The genus contains several well-marked sections. A rough classification of the garden kinds groups them into the "foliage" begonias (as shown in *Begonia rex*), the small-leaved flowering non-tuberous sorts and the tuberous species. The *rex* or foliage section comprises some of the choicest of ornamental-leaved plants. Some of the dark-leaved varieties are known as "beefsteak geraniums." They all demand a shaded situation in the greenhouse or window-garden. They are propagated by seeds and stem-cuttings, and many of them grow readily from leaf-cuttings. The tuberous-rooted section is gaining rapidly in public favor. The species are adapted both for indoor and outdoor cultivation. They profit by a partially shaded location. The flowers are very variable in size, shape, and color, sometimes attaining a diameter of over 4 inches. The tuberous begonias are grown from the tubers, from seeds, and from stem-cuttings, although the last method is perhaps not generally advisable with amateurs.

L. H. BAILEY.

Begonia'cea [so named from *Begonia*, one of the genera]: a natural order of exogenous plants, mostly herbaceous; have alternate leaves, oblique at the base, and cymes of unisexual pink flowers, with a colored perianth and numerous stamens. There are also white and deep scarlet varieties. They are nearly all tropical plants, but one species of *Begonia* grows on the Himalayas 11,500 feet above the sea. The order comprises about 160 species. Some of the Mexican species are used as drastic purgatives.

Béguines, bay'geen' [Fr. *Béguine*, a deriv. from the name of Lambert le Bègue, a priest of Liège in the twelfth century, founder of the order]: the name given to semi-monastic societies of women originating in Belgium, perhaps at Liège, about 1180 A. D. These societies grew in part out of the numerical inequality between the sexes caused by the crusades. The women, without assuming monastic vows, lived in houses by themselves, labored for their own support, and took care of the sick. They had similar fortunes with the BEGARDS (*q. v.*), but being worthier survived their persecutions. There are now in Belgium twenty of these establishments, with about 150 members. For literature, see BEGARDS.

Begnu, be-gūn' [from Turk. *bégin*, princess; cf. Eng. *beg*]: a title of honor given in the East Indies to princesses and the sultanas of seraglios. Among the charges against Warren Hastings was his cruelty to two rich begnuses of Oude, the mother and the wife of Sujah Dowlah. In order to extort money from them, Hastings or his agents invaded the privacy of their zenanas, and reduced them to the alternative of delivering their treasures or exposing their faces to the view of strange men. They preferred the former of these two evils.

Behaim, bay'him, or **Behem**, bay'hem, MARTIN: an eminent cosmographer and navigator; b. at Nuremberg about 1459. He became a merchant, and visited foreign countries in that capacity. In 1484 and 1485 he accompanied the navigator Diego Cam in a voyage of exploration along the west coast of Africa. He gained distinction as a maker of maps and globes. A large globe which he made in 1492 is still preserved by his descendants in Nuremberg, and is prized as a monument and record of the progress of geography. D. in Fayal, July 29, 1506. See Ghillany, *Geschichte des Seefahrers Ritter Martin Behaim* (1853); C. G. von Murr, *Diplomatische Geschichte des Ritters M. Behaim* (1778).

Behaim, MICHAEL: mastersinger; b. at Sulzbach, 1416; a weaver by trade; burgomaster of his native village, where he was murdered in 1474. Though he wrote numerous poems of all descriptions, he must be considered the representative of the greatest decline of the art of poetry in Germany during the fifteenth century. JULIUS GOEBEL.

Beham, bay'ham, BARTHEL, or BARTHOLOMEW: a German portrait-painter and engraver; b. in Nuremberg in 1502; a pupil of Dürer. D. in Italy in 1540. He was a master of copper-plate engraving, of which his *Emperor Charles V.* is a fine specimen.—His nephew, HANS SEBALD BEHAM; b. in Nuremberg, 1500; one of the best of the Nuremberg engravers, chose grotesque, sometimes coarse subjects. D. in Frankfort, Nov. 22, 1550.

Behar': a division of Bengal, British India; between the parallels 24° and 28° N., and the meridians 83° and 89° E., S. of Nepal and E. of the Northwestern Provinces. It is a generally flat country, divided by the Ganges into two nearly equal parts. Area, 44,163 sq. miles. Pop. (1891) 24,284,370, of whom 84 per cent. were Hindus and 13 per cent. Mohammedans. The population is rapidly increasing, and is now nearly 550 per sq. mile. Rice is the main staple of food; in elevated and drier localities, wheat, maize, millet, and pease are substituted. Potatoes and cabbages have been introduced by Europeans and are now largely grown. The commercial staples are oil-seeds, opium, indigo, sugar, cotton, and salt-peter, the opium being a government monopoly. The East Indian Railway runs through the division along the Ganges, and it is entered or crossed in part by several others. The climate is very hot from March to June, when the rains set in and last till the end of September. The rainfall is about 50 inches. The cool season lasts from October to March, and is the pleasantest part of the year.

Behar is the cradle of Bûddhism. From the fourth century before our era to the fifth after, it was a part of the splendid kingdom of Magadha. In 1202 it fell into the hands of the Mohammedans. In 1765 it was acquired by the East India Company. It is now divided into twelve districts, and contains many important cities, as Patna and Chapra. Behar city is in 25° 10' N. lat., 85° 35' E. lon. It was formerly the residence of a governor, and is now the capital of the district of the same name. Pop. about 53,000. MARK W. HARRINGTON.

Behheading: See CAPITAL PUNISHMENT.

Behem, MARTIN: See BEHAIM, MARTIN.

Be'hemoth: a huge animal described in the book of Job (xl. 15-24). Some critics consider the Hebrew term a plural noun for cattle in general. Others think some extinct species of animal is referred to. Others think the elephant is meant. But most writers, including English commentators generally, say the hippopotamus.

Behistun, bay'-his-toon' [Lat. *Bagistanus*, Pers. *Baghistan*, i. e. place of gardens]: an ancient and ruined town of Persia; in Irak-Ajemi, 21 miles E. of Kermanshah (see map of Persia and Arabia, ref. 5-1^o). Here is a remarkable limestone mountain (the ancient *Mons Bagistanus*, on the confines of Media), which rises to the height of 1,700 feet, and is almost perpendicular on one side. According to Dio-

dorus, the famous Semiramis, on her march from Babylon to Ecbatana, encamped here and prepared a residence, and having cut away the lower part of the rock of Bagistanus, caused her portrait to be carved or sculptured there. The geography of this locality has been carefully investigated by Rawlinson and Masson. A peculiar interest attaches to the rock of Behistun on account of its cuneiform inscriptions, which were made by order of Darius I., King of Persia, about 515 B. C., and have been deciphered by Sir H. Rawlinson. Close to these inscriptions are thirteen human figures, one of which represents Darius. "The labor," says Rawlinson, "bestowed on the whole work must have been enormous. . . . But the real wonder of the work consists in the inscriptions. For extent, for beauty of execution, for uniformity and correctness, they are perhaps unequalled in the world. It is evident that after the engraving of the rock had been accomplished, a coating of silicious varnish had been laid on to give a clearness of outline to each individual letter, and to protect the surface against the action of the elements. The varnish is of infinitely greater hardness than the limestone rock beneath it. It has been washed down in several places by the trickling of water for three-and-twenty centuries, and it lies in flakes upon the foot-ledge like thin layers of lava." (*Journal of the Asiatic Society*, vol. x.) The Persian inscriptions which Rawlinson deciphered are contained in five columns, one of which has ninety-six lines, and each of the others nearly as many. There are on the same rock inscriptions in the Median and Babylonian languages. See Rawlinson's *Herodotus*, vols. i. and ii.

Behm, baym, ERNST: geographer; b. in Gotha, Jan. 4, 1830; founded 1856 the *Geographisches Jahrbuch*; began in co-operation with H. Wagner the publication of *Die Bevölkerung der Erde* (1872); succeeded Dr. Petermann as editor of the *Mitteilungen* (1878); statistician of the *Almanach de Gotha* (1876). D. in Gotha, Mar. 16, 1884.

Behn, beh, APHARA, or APHRA (*Johnson*): an English dramatist; b. at Wye, Kent, in 1640; daughter of a barber. She was married (about 1658) to an English merchant of Dutch descent, named Behn, who died before 1666, and she was employed as a spy at Antwerp by Charles II. She wrote under the name of "Astræa" some seventeen plays and a number of poems, epistles, and novels, the most noteworthy of which is *Surinam*, the story of a native prince of Oroonoko, in South America, whose acquaintance she had made during a short residence in that province in her youth. Her writings are witty, but immoral; latest reprint London, 1871, 6 vols. D. in London, Apr. 16, 1689, and was buried in the Poets' Corner of Westminster Abbey.

Behrends, ADOLPHUS JULIUS FREDERICK, D. D.: Congregationalist minister; b. at Nymwegen in Holland, Dec. 18, 1839; graduated at Denison University, Ohio, 1862; studied theology at Rochester Theological Seminary; became pastor of the Baptist church at Yonkers, N. Y., 1868; of the First Baptist church, Cleveland, O., 1873; then pastor of the Union Congregational church, Providence, R. I., 1876; and of the Central Congregational church, Brooklyn, N. Y., 1883. He is the author of *Socialism and Christianity* (1886) and the *Philosophy of Preaching* (1890), and is a frequent contributor to theological journals.

GEORGE P. FISHER.

Behring: See BERING.

Beilan, bay'-lan': a town and pass of Northern Syria; on the east side of the Gulf of Iskanderoun; one of only two passes between Cilicia and Syria. It is thought by some to be the same as the ancient *Amianian Gates*. The town of Beilan is situated on a hill-crest 1,500 feet above the sea. Pop. about 5,000. It has numerous aqueducts.

Beilstein, bil'stîn', FRIEDRICH CONRAD: chemist; b. in St. Petersburg, 1838; professor in the Technological Institute in that city since 1866. He has done much valuable work in the field of organic chemistry. He is probably best known by his *Handbuch der organischen Chemie* (3d ed., 1894), a work highly prized by all engaged in higher work on the compounds of carbon.

Beira, bay'-ra, or **Beyra**: a province of Portugal; bounded N. by Entre-Douro-e-Minho and Trás-os-Montes, E. by Spain, S. by Estremadura and Alentejo, and W. by the Atlantic. Area, 9,244 sq. miles. Besides the Douro, which flows along its north boundary, and the Tagus, which touches it in the southeast corner, Beira is also drained by the Mondegos. The surface is mountainous; the soil is gen-

erally poor. Among the staple productions are wine, grain, and olives. Marble, iron, and coal are found here. Capital, Coimbra. Pop. (1881) 1,377,432.

Beirut, or **Bairut**: See BEYROUT.

Beit-el-Fa'kih, bayt'-el-fa-kih (i. e. house of a saint): a town of Arabia; in Yemen; on the Red Sea; 90 miles N. of Mocha (see map of Persia and Arabia, ref. 10-1D). The heat here is very great, the thermometer rising to 104° F. in the shade, and 145° in the sun. It has a citadel and a mosque. Pop. about 8,000. It is one of the largest marts in Arabia for coffee.

Beja, bay'zhaã (anc. *Pax Julia*): a town of Portugal; in Alentejo; 57 miles by rail S. of Evora (see map of Spain, ref. 18-1B). It has a castle, a cathedral, and manufactures of earthenware and leather. It is the seat of a Roman Catholic bishop. Two annual fairs are held here in the fall. Pop. 8,500.

Be'jan: name of the freshman class in universities of St. Andrews and Aberdeen, Scotland, and in earlier times in many of the continental universities.

Bejapoor: same as BHAPOOR.

Bejar, bay'-khaar': a Spanish town romantically situated on the Cuerpo de Hombre; 48 miles S. of Salamanca (see map of Spain, ref. 15-1D). It has manufactures of wool, and is noted for hams. There are thermal silicate springs in the vicinity which are much frequented. Pop. (1887) 12,120.

Beke, CHARLES TILSTONE: English traveler; b. in London, Oct. 10, 1800. He early attracted attention by his biblical and archaeological writings, and in consequence received an honorary Ph. D. from the University of Tübingen (1834). He explored Abyssinia (1840-43), and after his return published, besides other works, an *Essay on the Nile and its Tributaries* (London, 1847), and *On the Sources of the Nile in the Mountains of the Moon* (1848). He has since made other visits to Africa and Asia, and performed many eminent public services, especially in Abyssinia. He claimed (*Discoveries of Sinai in Arabia and of Midian*, 1878) to have discovered that Mt. Sinai was Jebel-el-Nur, a grand mountain with a broad plain at its base, near the Gulf of Akabah, on the E. D. in Bromley, Kent, July 31, 1874.

Bekes, bay'-kesh': a county of Central Hungary; bounded N. by the county of Szabolcs, E. by Bihar, S. by Csanaad, and W. by Csongrad. Area, 1,321 sq. miles. The country consists of a plain, and is watered by the Black, White, and Rapid Körös. The climate is unhealthy, but the soil is extremely fertile, yielding large quantities of wheat of the first quality. Pop. (1890) 257,888.

Bekes, or **Bekesvár**, -va'ar': a town of Hungary; capital of county of same name; at the confluence of the White and Black Körös; 62 miles S. W. of Debrezin (see map of Austria-Hungary, ref. 7-1D). It has considerable trade. Pop. 24,561.

Bek'ker, AUGUST IMMANUEL: philologist; b. in Berlin, May 21, 1785; was a pupil of F. A. Wolf at Halle. He became Professor of Philology at Berlin in 1810, and published *Anecdota Græca* (3 vols., 1814-21). He produced good editions of many classics, among which are *Plato* (10 vols., 1814-21); *The Attic Orators* (5 vols., 1823-24); and *Aristotle* (4 vols., 1831-36). D. in Berlin, June 7, 1871.

Bel: See BAAL.

Bela, bay-laa': name of four Hungarian kings of the Arpad dynasty. B. I. (1061-63) regulated the systems of measures, weights, and coinage, and introduced the representative system into the Diet.—B. II. The Blind (1131-41); addicted to drink; entirely dominated by his bloodthirsty wife, Helena.—B. III. (1174-96) introduced Byzantine customs and culture into the court.—B. IV. (1235-70); son of Andreas II.; fled before the Mongols to Austria 1241; afterward fostered the development of the country by the encouragement of colonists.

Belaia: same as BILAYA.

Bel Air: capital of Harford co., Md. (for location of county, see map of Maryland, ref. 1-F); on Balt. and Lehigh R. R.; 22½ miles N. of Baltimore. It is a manufacturing town, and trade-center of an agricultural district. Pop. (1890) 1,416.

Bel and the Dragon. History of: an apocryphal book of the Bible; regarded as a fable by St. Jerome and many eminent theologians. It is canonical in the Roman Catholic

Church, being part of the fourteenth chapter of Daniel in the Vulgate. By the Anglican Church it is recommended to be read for edification. It was written in Greek, probably in Alexandria, in the third century B. C. It has no historical value. Its object seems to have been to give a warning against idolatry. See PSEUDEPIGRAPHA.

Bel'cher, Sir EDWARD, F. R. S.: an English vice-admiral; b. in Halifax, N. S., 1799. As commander of the Sulphur, he sailed on a voyage around the world in 1836, and explored the western coasts of America. During this voyage he served in the naval operations against the Chinese in 1841. He became a post-captain in 1843, and commanded an expedition sent in search of Sir John Franklin in 1852. Returning without any success, and having lost his vessels, he was placed before a court martial, but acquitted. In 1864 he became rear-admiral of the red. He published, besides other works, a *Narrative of a Voyage round the World in the Sulphur*. D. Mar. 18, 1877.

Belcher, JONATHAN: merchant; b. in Cambridge, Mass., Jan. 8, 1681; graduated at Harvard in 1699. He was Governor of Massachusetts and New Hampshire from 1730 to 1741. Having been removed from office, he went to England to vindicate himself, and was appointed Governor of New Jersey in 1747. D. in Elizabeth, Aug. 11, 1757.

Belcher, JONATHAN: son of the preceding; b. at Boston, Mass., July 28, 1710; studied law at the Temple, London; was one of the first settlers in Chebucto, Nova Scotia; became lieutenant-governor of Nova Scotia in 1760, and chief justice in 1761. D. in Halifax, N. S., Mar. 29, 1776.

Bel'ding: city; Ionia co., Mich. (for location of county, see map of Michigan, ref. 7-1); on the D., L. and N. R. R.; 138 miles N. W. from Detroit. It is the seat of extensive manufacturing industries, the first silk-mill built in the West being placed here. There are now two silk-mills, employing over 600 operatives, mostly girls; a large refrigerator-factory, casket-factory, furniture-factory, basket-factory, washing-machine factory, a chemical fire-extinguisher factory, paper-box factory, besides other smaller concerns. Pop. (1880) 562; (1890) 1,730; (1894) 3,006.

PUBLISHERS OF "BANNER."

Bel'ed-el-Jereed' (i. e. the country of dates): an extensive region of Northern Africa; bordering on the Desert of Sahara; is bounded on the N. by Algeria, and on the W. by Morocco. The soil is mostly arid and sterile, except some oases which produce the date-palm, which affords the inhabitants their principal and often their only food.

Belem, bay-lei': a city of Brazil. See PARA.

Belem'nite [from Gr. *βέλεμον*, dart]: the common name of the internal *guard* of an extinct type of dibrancheate cephalopoda, of which the genus *Belemnites* is the main representative. See BELEMNITIDÆ.

Belemnitidæ: a family of extinct cephalopods of the sub-order *Decapoda*, of which *Belemnites* is the typical genus. The parts generally preserved in the fossil state are (1) the *guard*, a cylindro-conical, elongated calcareous shell, mainly solid, but with a shallow conical cavity in the larger end in which is inserted the *phragmacone*, (2) which is chambered and traversed by a marginal siphon on the ventral side; on the dorsal side the *phragmacone* is extended in a thin, extremely delicate plate (3) expanded and rounded in front, which is rarely preserved, representing the "pen" of the *Loligo*. This is called the *pro-ostreacum*. Occasionally traces of the "ink-bag" and impressions of the arms are preserved, showing the animal to have been constructed on the plan of the recent *Loligo*. In the latter genus the "pen," representing the pro-ostreacum of the *Belemnites*, is the only part of the internal skeleton developed.

The *Belemnitidæ* include the genera *Belemnites*, *Belemnitella*, *Xiphoteuthis*, *Beloptera*, *Spirulorostra*, and others, all of which are confined to the Mesozoic (Triassic, Jurassic, and Cretaceous) and the lower part of the Tertiary.

H. S. WILLIAMS.

Belfast': an important city and seaport of Ireland; in the county of Antrim and province of Ulster; situated on Belfast Lough (an arm of the sea), at the mouth of the river Lagan, 101 miles by rail N. of Dublin, and 118 miles S. W. of Glasgow; lat. 54° 35' N., lon. 5° 57' W. (see map of Ireland, ref. 5-1). The river is crossed by three bridges, the finest of which is the Queen's bridge. Railways extend from this point to Dublin, Armagh, and Londonderry. The site of the city is low and level, but is partly inclosed by the ridge

of Divis and Cave Hill, the former of which rises to the height of 1,567 feet. The houses are mostly of brick and are well built; the streets are regular, spacious, well-lighted, and macadamized. Belfast is the most prosperous commercial town of Ireland, except Dublin. The principal public edifices are Queen's College, a beautiful structure in the Tudor style (opened in 1849); a Presbyterian and a Methodist college; the Royal Academical Institution, affiliated to the London University; the museum, the theater, Linen Hall, the Corn Exchange, etc. It has about 80 churches, of which 28 are Presbyterian. Although the seat of the Roman Catholic bishop of Down and Connor, it is mostly Protestant, having only five Roman Catholic churches. The botanic garden of the Natural History Society occupies about 17 acres. Belfast is the chief seat of the Irish manufactures of linen and cotton, and is the great *dépôt* of the linen trade. The linen manufacture was established here in 1637. The other chief branches of industry are weaving of linen and cotton, bleaching, dyeing, calico-printing, and iron-founding. Numerous steamers, engaged in the Channel trade, ply regularly between Belfast and Liverpool, Glasgow, Dublin, London, etc. The chief articles of export are linens, cotton goods, grain, flax, cattle, and provisions. This city has also a large foreign trade. The adjacent country is extremely beautiful. Belfast returns four members to Parliament. It first became an important place about 1604, and was chartered in 1611. Pop. (1881) 207,671; (1891) 255,896.

Belfast: city and port of entry; capital of Waldo co., Me. (for location of county, see map of Maine, ref. 9-D). It is the terminus of the Belfast and Moosehead Lake R. R., and is situated at the head of West Penobscot Bay, 2 miles W. of Penobscot river, and about 30 miles S. by W. from Bangor. It has a spacious harbor, which is safe and sufficiently deep for large ships. Belfast has a good school system, including high school, public library of over 5,000 volumes in a handsome stone building, and churches of six denominations. The principal industries are the manufacture of shoes, patent medicines, doors, iron, and the quarrying of granite, and ship-building. It was first settled in 1770; was invested by the British in 1815; adopted a city charter in 1853. Pop. (1880) 5,308; (1890) 5,294; (1892) estimated, 5,500.

EDITOR OF "AGE."

Belford, JAMES B.: b. in Lewistown, Pa., Sept. 28, 1837; educated at Dickinson College; studied law; was appointed one of the judges of the Supreme Court of Colorado (1870-75). Since the admission of Colorado as a State he has been elected its representative in the 44th, 45th, 46th, 47th, and 48th Congresses, but was refused his seat by the Democratic majority in the 45th.

Belfort, bel'fôr': an important fortified town of France; at the foot of the Vosges and on the river Savoureuse; 60 miles by rail N. E. of Besançon (see map of France, ref. 4-1). Pop. (1891) 25,455. It has a citadel constructed by Vauban, a fine church, and a public library; also manufactures of iron, paper, and calico. It was ceded to France by Austria in 1648. In the winter of 1870-71 it was besieged by the Germans, and capitulated Feb. 16 with the sanction of the Government, but was afterward evacuated by the Germans. It once belonged to the department of Haut-Rhin; is now in the small territory of Belfort. Area, 235 sq. miles; pop. (1891) 83,670.

Bel'gæ: the name given by Caesar to the warlike tribes which in ancient times occupied one of the three great divisions of Gaul (*Gallia*). Their country, which was bounded on the N. W. by the ocean and on the E. by the Rhine, comprised the modern Belgium, part of Holland, and the northeast part of France. This region was sometimes called *Belgica* or *Gallia Belgica*. It was separated from the territory of the Celtae by the river *Sequana* (Seine) and its affluent the *Matrona* (Marne). Caesar represents the Belgæ as distinct from the Celtae proper and the Aquitani in language, usages, and political institutions. A part of the Belgæ were probably Germans or of German origin, and a part are believed to have been Cymric Celts. Some of the Belgæ had crossed the Channel and settled in the southern maritime parts of Britain, and were found there by Caesar when he invaded the island. The Belgæ were a brave, warlike people. See Caesar, *Commentaries on the Gallic War*; Smith, *Dict. of Ancient Geog.*

Belgaum, bel-gawm': a district and city of the Bombay Presidency, British India. The district is near the west coast, in lat. 16° N., northeast of Goa. Area, 4,657 sq. miles. The

chief occupation is agriculture, but there are considerable manufactures of cloth, wood, metals, and shoes. Among the agricultural products are rice, wheat, sugar-cane, barley, and tobacco. The population is about 870,000, 57 per cent. of whom are Hindus, 7 per cent. Mohammedans, and 5 per cent. Buddhists. The city of Belgium is in about lat. 15° 50' N., lon. 74° 40' E. It is the capital of the district. Pop. 35,000.

Belgiojoso, bel-jō-yō-sō, CRISTINA, Princess of; b. at Milan, June 28, 1808; a daughter of Marquis Geronimo Isidoro Trivulzio; married on Sept. 11, 1824, Prince Emilio Barbian e Belgiojoso. She embraced the Italian cause with great enthusiasm; was expelled from Italy by the Austrian Government in 1830, and settled in Paris, where her salon soon became the center of a most brilliant political and literary circle. In 1848 she returned to Italy, equipped a corps of volunteers at her own expense, and took part most actively in the revolution in Milan and Rome. But in 1850 she was once more exiled; visited Greece and Turkey, and settled in 1855 once more in Paris, still working indefatigably for the cause of her country. In 1861 she finally returned to Italy, and d. in Milan, July 5, 1871. Besides being a frequent contributor to various French and Italian journals, she published *Essai sur la Formation du Culte dogmatique* (1846); *Souvenirs d'Éril* (1850); *Emina, Récits turco-asiatiques* (2 vols., 1856); *Asie mineure et Syrie*; and *Scènes de la Vie turque* (1858); *Histoire de la Maison de Savoie* (1860); and *Réflexions sur l'État actuel de l'Italie*, etc. (1869).

Belgium: a kingdom of Europe; on the German Sea between Holland, Prussia, and France; has an area of 11,373 sq. miles, and (in 1890) a population of 6,147,041 inhabitants (see map of Holland and Belgium, under Holland). It is the most densely peopled country of Europe, having 540 inhabitants to the square mile. The soil is partly fertile, partly (in the E.) sandy and marshy. The only mountains are some offshoots of the Ardennes in the S. The coast has a length of 46 miles, and is flat and undiversified. The country is well watered by the Meuse and the Scheldt, and their affluents, the Sambre, Ourthe, Werze, Lys, Dender, and Rupel. There are no lakes of importance, but many canals. The climate in general is temperate. Among the chief products of Belgium belong cattle, fish, corn, fruit, wood; among those of the mineral kingdom, iron and coal. A coal region covering an area of 476 sq. miles traverses all Belgium, and embraces two large basins, one of which extends into France and the other into Prussia. Celebrated mineral springs are found at Spa. The people belong, in almost equal proportion, to two different nationalities, the Flemish (German) and the Walloon (French). The Flemish language, which is spoken by about 2,500,000, prevails in the provinces of East Flanders, Antwerp, Limburg, West Flanders, and Brabant, while the Walloon is the predominant language in the provinces of Liège, Hainaut, Namur, and Luxemburg, and is spoken by a population of about 2,000,000. The French, though the language of the minority, has since 1794 been the official language of the state authorities and the court; of late, however, the Flemings have begun an active agitation for the recovery of equal rights for their idiom. A considerable number of periodicals are published in the Flemish language. With the exception of about 15,000 Protestants and 3,000 Jews, the entire population belongs to the Roman Catholic Church, which has in Belgium one archbishop at Malines, and five bishops at Namur, Ghent, Bruges, Tournay, and Liège.

There are four universities—at Ghent, Liège, Louvain, and Brussels; the two first named are controlled by the state; the third by the Catholic bishops, and the last named by the Liberal party. Prominent among the other educational institutions of the country are the Academies of Fine Arts at Antwerp and Brussels, the Museum of Painting and Sculpture at Brussels, the Conservatories of Music at Brussels, Liège, and Ghent. The people are chiefly occupied with agriculture, and in this respect excel most nations of Europe. The working of mines is also a most important part of the national industry. First in order are the coal mines (with three great centers at Mons, Charleroi, and the city of Liège), which produced in 1890 20,366,000 tons. The annual production of the iron mines amounts to about 787,836 tons; 1,302,147 tons of pig and wrought iron were produced in 1890, exclusive of the production of the foundries. Wool is the object of an immense industry, and the Belgian woolen cloths are superior in quality. The linen

cloths of Belgium have long been highly valued; and the manufacture of lace, though now less prosperous than formerly, has nothing to fear from foreign competition. The breweries are very numerous, and beer is the common beverage of all classes. The commerce of the country is also in a very prosperous condition, being greatly promoted by a dense net of railroads, which in 1891 had an aggregate length of 2,830 miles. It is chiefly carried on with France, Holland, England, Prussia, North America, and Russia. The exports amount to about \$610,000,000, and the imports to a trifle more. The commercial fleet, in 1891, consisted of 56 vessels (46 steamers), with an aggregate of 75,946 tons. The aggregate length of the telegraph lines was, in 1891, 4,265 miles. The most important ports are those of Antwerp and Ostende; the most important centers of the commerce of the interior are Brussels, Ghent, Bruges, Liège, Namur, Courtray.

Government.—According to the constitution of Mar. 3, 1831, Belgium is a constitutional monarchy. The crown is hereditary, according to the right of primogeniture, in the male line only. The executive power is vested in the king alone; the legislative he shares with the Senate and the House of Representatives. The Court of Cassation at Brussels is the supreme court of the country; besides it there are three courts of appeal (Brussels, Ghent, and Liège). The jury has been introduced since 1831. The Code Napoléon is regarded as the judicial standard. The public budget for 1892 was, revenue, \$68,509,238; expenditure, \$67,900,539; public debt, \$414,712,000. The army on the war footing numbered (without officers) 154,780 men, 14,000 horses, and 240 pieces of ordnance; besides, the country has a civil guard consisting of 44,339 active and 90,000 non-active men. The navy is unimportant. The most important fortresses are Antwerp, Mons, Charleroi, Philippeville, Marienburg, Ath, Tournay, Menai, Ypres, Ghent, Namur. The measures and coins have been since 1817 the same as in France. In point of administration the country is divided into nine provinces: South Brabant, Antwerp, East and West Flanders, Hainaut, Namur, Liège, Limburg, Luxemburg. Brussels is the capital and residence of the king; during the summer months the king resides at Laeken. The national colors are red, yellow, and black, placed perpendicularly beside each other; the escutcheon, the lion of Brabant with the inscription, "L'union fait la force."

History.—In the time of the Romans, the present Belgium, which was then inhabited by Celtic and Germanic tribes, formed, under the name of Gallia Belgica, a part of Gaul. The treaty of Verdun in 843 united the southern districts with France, the northern with Germany. After the termination of the Carolingian rule, the French districts were gradually converted into duchies and counties. In 1385 the county of Flanders fell to the House of Burgundy, which in the early part of the fifteenth century gradually obtained possession of all the provinces of the Netherlands. The marriage of Maria of Burgundy, the last seign of her house, with the Emperor Maximilian I., incorporated the Netherlands with the extensive dominions of the House of Habsburg, and, under the name of the "Circle of Burgundy" (*Burgundischer Kreis*), with the German empire. When, after the abdication of Charles V. (1555), his states were divided, Belgium remained united with Spain, and this union continued after the northern provinces had successfully established their independence. Only from 1598 to 1621, Belgium constituted an independent state under the rule of Isabel, daughter of Philip II., and her husband, the Archduke Albert. In the course of the seventeenth century Spain had repeatedly to cede portions of Belgian territory to France. The peace of Utrecht in 1713 gave Belgium to Austria.

In the Austrian war of succession the whole country was conquered by the French, but it was restored to Austria in the peace of Aix-la-Chapelle (Oct. 18, 1748). In consequence of the unpopular reforms and innovations which Joseph II. undertook to introduce, an insurrection broke out against Austrian rule in Dec., 1789, and on Jan. 11, 1790, the Belgian provinces (with the exception of Luxemburg) proclaimed their independence under the name of "United Belgium," but in Nov., 1790, the rule of the Austrians was re-established. After the battle of Jemappes (Nov. 7, 1792), Belgium was occupied by the French, and in 1794 the country was ceded by Austria to France. It was then divided into nine departments, and the administration wholly assimilated to that of France. In 1814 the first treaty of Paris united Belgium with Holland into the kingdom of the Netherlands. The union lasted until Aug., 1830, when the whole country rose in revolution against the Dutch Government. On Sept. 20,

a provisional government was formed, which, on Oct. 4, after the evacuation of the capital by the Dutch, proclaimed the independence of Belgium. On June 4, 1831, Prince Leopold of Saxe-Coburg was elected king. The preliminary treaty of 1833 between England, France, and Holland put an end to the efforts of the Dutch Government for the recovery of Belgium, but the definite acceptance of the articles drawn up by the London Conference in 1831 for the regulation of the frontier between Holland and Belgium did not take place until 1838. The subsequent history of Belgium under Leopold I. (d. Dec. 10, 1865) and his son Leopold II. has been one of quiet and steady development. The administration has been sometimes in the hands of the Catholic and sometimes in those of the Liberal party, but the peace of the country has never seriously been disturbed, not even by the European revolution of 1848. See Juste, *Histoire de Belgique* (2 vols., 4th ed. 1868). Revised by C. K. ADAMS.

Belgorod; a town of Russia. See BIELGOROD.

Belgrade, bel-grayd' (anc. *Singidunum*; Servian *Bielgorod*, white town); an important fortified town; capital of Servia; on right bank of the Danube, at the mouth of the river Save, 42 miles S. E. of Peterwardein, 215 miles S. S. E. of Pesth, and 234 N. N. W. of Vranja (see map of Austria-Hungary, ref. 9-1). The citadel, which is very strong, is situated on a point of land between the rivers, behind which rises the city with antique German edifices, a cathedral, and a palace. Belgrade had formerly an Oriental appearance, but it has been abandoned by many wealthy Turks, and mosques are partly superseded by churches. Here are manufactures of arms, cutlery, silk goods, saddlery, and carpets. It has a good port and an active trade, being the entrepôt of the commerce between Austria and Turkey. It is the seat of the chief authorities of Servia. In consequence of its importance as a strategical point, Belgrade has been the scene of many famous sieges and battles. It was besieged without success by the Turks in 1456, and taken by the Sultan Solyman in 1522. In 1688 it was stormed and captured by the Elector of Bavaria, but it was recovered by the Turks in 1690. Prince Eugène here defeated 200,000 Turks in 1717, after which it changed owners several times. Taken by Austria in 1739, it was given up to Turkey in 1801. Insurgent Servians held it from 1806-12; the Turks bombarded the town from the citadel in 1862; made capital of Servia same year. The principality became independent on July 13, 1878. Pop. (1884) 35,726; (1891) 54,458.

Belgrand, bel-grāñ, EUGÈNE; civil engineer; constructor of the new water-supply and sewers of Paris; b. at Evry, Aube, April 23, 1810. From the Polytechnic School he entered the Ponts et Chaussées, being made engineer in 1836, chief engineer in 1852, inspector-general first class in 1875, member of the Institute of France, director of water-supply and sewers of Paris, and commander of the Legion of Honor. The system of sewers designed and executed by him is a truly gigantic work. So also are the water-works, supplying Paris with spring water from points distant 80 and 100 miles. He has published *La Seine; The Basin of Paris in Pre-historic Times; The Subterranean Works of Paris*, etc. D. April 8, 1878, in the midst of his most important work, the sewerage of Paris, a work to cost \$8,000,000. W. R. H.

Belial [Heb., worthlessness]: a term used in the Bible; frequently occurring in the phrase "a son of Belial," which, by a common Hebrew idiom, signifies merely a worthless or very bad person; but in 2 Cor. vi. 15, the only New Testament occurrence, it is used as a proper name of Satan. According to Westcott and Hort and other critical texts the reading is Beliar.

Bélibor, bay-lé-dōr', BERNARD FOREST, de; French military engineer and writer; b. in Catalonia in 1697. He served in the German campaign of 1742, and became a member of the Academy of Sciences. Among his works may be mentioned his *Hydraulic Architecture* (Paris, 1737); a *New Course of Mathematics for the Use of Artillery* (1757); a *Traité des Fortifications*; and *La Science des Ingénieurs*. D. in Paris, Sept. 8, 1761.

Belisarius [Slavic, white tsar or chief]: a celebrated general to whom Justinian was chiefly indebted for the military glory of his reign; b. in Germania, in Illyria, about 505 A. D. Having been appointed general-in-chief of the army of the East, he defeated the Persians at Dara in 530, and suppressed a formidable rising of the Green or anti-royal faction at Constantinople in 532. He gained two victories over the Vandals in Africa, and took their king, Geli-

mer, a prisoner, in 534 A. D., for which he obtained a triumphal procession, the first accorded to a subject since the reign of Tiberius. He obtained the office of consul in 535. He also commanded the army of Justinian in a long war against the Ostrogoths, who had made themselves masters of Italy. He occupied Rome in Dec., 536, and gained some other advantages, but was recalled in 540; after which he suffered adverse fortune through the enmity of the Empress Theodora. In 544 A. D. he was again sent to Italy to oppose the Gothic King Totila, but his army was so inferior in numbers that he could not gain a decisive victory, although he maintained the war for five years and reoccupied Rome. He resigned the command in 548, and passed nearly ten years in inaction. He served with success against the Bulgarians in 559, and was imprisoned in 563 on a charge of treason. D. Mar. 13, 565 A. D. He was distinguished for his loyalty, humanity, and other virtues. The tradition that he died poor and blind is without sufficient support, for after six months' incarceration he was restored to all his honors. See Lord Malon, *Life of Belisarius* (1829); Gibbon, *Decline and Fall of the Roman Empire*; C. F. Zeller, *Belisarius* (Tübingen, 1809); C. L. Roth, *Ueber Belisars Ungnade* (1846).

Belize, bel-eez' [a corruption of the Spanish *Wallis*, itself a corruption of the English *Wallace*, the name of an English pirate who infested that region]; See HONDURAS, BRITISH.

Belize: the capital of British Honduras; on the Bay of Honduras, at the mouth of the Belize river; lat. 17° 29' N., lon. 88° 8' W. There is no port in the proper sense of the word, as vessels have to lie far off from shore, and the only protection seaward is formed by the numerous cays which render navigation dangerous. The town is backed by swamps, and the land on which it is built is made from ballast and other like sources. The town, consisting of a principal street along the shore, with small offshoots, is generally well built, and, notwithstanding its surrounding, is healthful for the latitude. It has a considerable trade. Pop. about 6,000.

Belknap, bel-nap, GEORGE EUGENE; rear-admiral U. S. N.; b. in Newport, N. H., Jan. 22, 1832; entered the navy as a midshipman Oct. 7, 1847. In 1856, while attached to the sloop of war Plymouth, he took part in the assault and capture of the Barrier Forts at the mouth of the Canton river, China; was executive officer of the ironclad New Ironsides from 1862 to 1864 in her numerous engagements with the forts and batteries of Charleston harbor. He commanded the ironclad Canonicus in both attacks on Fort Fisher. In 1874 he commanded the Tuscarora while surveying the bed of the North Pacific to find a submarine cable route to Japan, and he invented improvements in the apparatus for deep-soundings. In 1885 he became superintendent of the U. S. Naval Observatory, and later president of the Board of Inspection and Survey.

Belknap, JEREMY, D. D.; b. in Boston, Mass., June 4, 1744; graduated at Harvard 1762; taught school four years; studied theology; was pastor of the Congregational church at Dover, N. H., from Feb. 18, 1767, until 1786, and of the Federal Street church at Boston from Apr. 4, 1787, for the remainder of his life; kept a diary in interleaved almanacs from his fifteenth year, and a series of MS. books called *Quotidiana Miscellanea*, in which he jotted down abstracts of his reading; was an active patriot during the Revolution, but declined the chaplaincy of the New Hampshire troops at Cambridge 1775; projected in 1790 the Massachusetts Historical Society, which recognizes him as its founder; delivered before it, Oct. 23, 1792, a tercentennial discourse on the discovery of America; devoted much of his life to historical and biographical labors, making good use of the library left by his early pastor, Rev. Thomas Prince, to the Old South church at Boston; received from the Legislature of New Hampshire a grant of £50 in aid of his publications, and became in 1792 an overseer of Harvard College. D. in Boston, of paralysis, June 20, 1798. Author of a *History of New Hampshire* (3 vols., 1784-92; new ed. 1813), which "has long ranked at the head of the local State histories of the country"; a *Discourse Intended to Commemorate the Discovery of America by Columbus, with Four Dissertations* (1792); *An Historical Account of those Persons who have been Distinguished in America*, etc. (vol. i. 1792; vol. ii. 1798), generally known as the *American Biography* (new ed. 3 vols.); and of a *Collection of Psalms and Hymns* (1796), etc. To him was attributed by Mr. Bryant "the high merit of being the first to make American history attractive." A *Life, with Selections from his Correspondence*, was published by a granddaughter (New York, 1847).

Belknap, WILLIAM GOLDSMITH; soldier; b. in Newburg, N. Y., Sept. 7, 1794; entered the service of the U. S. in 1813 as third lieutenant of infantry, and rose through successive grades to be lieutenant-colonel of the Fifth Infantry in 1817. He served with marked gallantry in the war with Great Britain (1812-15), in the Florida war against hostile Seminoles, and in the war with Mexico. For his services in Florida he was breveted lieutenant-colonel, and for gallant conduct in Mexico he won the brevets of colonel and brigadier-general; served on frontier duty from 1848 to 1851. D. near Fort Washita, Nov. 10, 1851.

Belknap, WILLIAM WORTH; son of Gen. William G. Belknap; b. in Newburg, N. Y., Sept. 22, 1829; graduated at Princeton 1848; studied law; settled at Keokuk, Ia., 1851; elected to the Legislature as a "Douglas Democrat" 1857; entered the army as major of Fifteenth Iowa 1861; served under Grant at Shiloh, Corinth, and Vicksburg; and was in Sherman's "march to the sea." At the battle of Atlanta, under McPherson, he so distinguished himself that he was promoted over his superior officers to be brigadier-general of volunteers; breveted major-general 1865; collector of revenue in Iowa 1866-69; and Secretary of War under Grant from 1869 to 1876, when he resigned, having been impeached in Congress on a charge of corruption, but the Senate held that its jurisdiction ceased with his resignation. His case in the civil court was dismissed. Committed suicide in Washington, Oct. 13, 1890.

Bell [O. Eng. and Low Germ. *belle*. Etym. uncertain, perhaps connected with E. *bell*, O. Eng. *bellan*, roar]; a hollow percussion instrument, usually metallic, and cup-like in form; so constructed as to yield a single dominant note. The history of bells is involved in obscurity. In the time of Moses (Exod. xxviii, 32, 35) bells of gold were used; and Layard discovered small bronze bells in the ruins of Nineveh. The Hindu and Burmese priests, as well as the Greeks and Romans, made use of bells in their temples. It is probable, however, that all the bells so used were insignificant in size. The large bells used in churches are supposed to have been invented by Paulinus, Bishop of Nola, about the year A. D. 400. We infer that they were introduced into England soon after, as they are mentioned by Bede in the seventh century, and as the Abbot of Croyland gave a large bell to the abbey in 870. Pope John XIII. consecrated a very large new bell in the Lateran Church in 968. In the twelfth century bell-founding flourished in the monasteries, and, as the badness of the roads interfered with the transportation of the completed bells, traveling bell-founders went about casting bells wherever they were needed. In the fourteenth century bells first began to reach a large size. The famous bell at Ronen, cast in 1501, weighed 36,364 lb., and one at Toulouse, cast a little later, weighed 66,000 lb. The largest bell in the world was cast in 1734 at Moscow, and is no less than 418,000 lb. in weight. Though the most celebrated bells and chimes are in Belgium and the Netherlands, excellent examples of the bell-maker's art are to be found in large numbers in France and in Great Britain. Bells cast in the U. S. are usually shorter than those of the same weight cast in Europe, and consequently are characterized by a somewhat different quality of tone. In the American bell the dominant overtone is a major sixth above the tenor note, instead of the minor sixth, as is usually the case in Europe. The major sixth gives to the bell a louder and more penetrating tone, but it generally lacks the softness and sweetness so often noticeable in the best bells of Europe.

The art of bell-making seems not to be a progressive art. It is impossible at the present day to make better bells than those cast one, two, or even three centuries ago. This inability is probably owing to the fact that the tone of a bell is dependent in part at least upon certain conditions that can not be controlled or even fully understood. The meaning of this statement will be comprehended if it is realized that the quality of a bell depends not only upon the perfection of its materials and workmanship, but also upon the exact relations of the numerous harmonics that go to make up the dominant note. A sensitive musical ear can detect in an ordinary church bell seven and sometimes as many as ten or more distinct tones, all of which in their blending go to make up the quality of the bell. When these harmonics seem to have been perfectly adjusted the result is that rich, soft, and perfect tone which is so delightful to the ear. But the conditions on which the relations of the harmonics depend are for the most part unknown. After every technical re-

quirement is satisfied in the making of a bell, there is still a large element of uncertainty in the result. If a bell once cast utters a jangling sound, indicating that the harmonics are wildly discordant, it is conceded at present that the fault is irreparable. There are, however, certain conditions that are considered indispensable to success in the making of a bell. The metal should consist of about four parts of copper to one of tin, and the thickness at the bow should be about one-thirteenth of its diameter. There is a fullness and softness in the sound of a thick bell which is never characteristic of a thin one. If the proper form and thickness are maintained, the weight of bells varies as the cube of their diameters. In a peal or chime an individual bell can be tuned so as to lower or raise the pitch of its note, though, as above stated, the quality of its tone can not be materially changed. The tone will be flattened by turning or filing off a small portion of the metal from the inside of the soundboard or thickest part, and will be sharpened by a filing from the outer edge so as to reduce the diameter of the mouth. A very excellent authority on this subject is Sir Edmund Beckett's treatise on *Clocks, Watches, and Bells*. See also numerous works by H. T. Ellacombe. In his book entitled *Chiming* Mr. Ellacombe has given an exhaustive catalogue of bell literature. See BELL-RINGING. C. K. ADAMS.

Bell, ALEXANDER GRAHAM; inventor of the speaking telephone; son of Alexander Melville Bell; b. in Edinburgh, Scotland, Mar. 3, 1817; educated at the high school and the university, and specially trained to follow his father's and grandfather's profession for the removal of impediments of speech. In 1872 he took up his residence in the U. S., and introduced his father's invention of visible speech in institutions for deaf mutes, and was subsequently appointed Professor of Vocal Physiology in Boston University. He occupied his leisure during many years in working out his telephonic discovery, and first exhibited it publicly, but in an imperfect form, at the Centennial Exhibition in 1876. His success is now established throughout the civilized world. He received in 1882 diploma and decoration of National Legion of Honor of France.

Bell, ALEXANDER MELVILLE; inventor of visible speech, a system of universal alphabets which has been successfully used for teaching the deaf (and dumb) to speak; b. at Edinburgh, Scotland, Mar. 1, 1819, and educated under his father, Alexander Bell, author of a method for the removal of impediments of speech. From 1843 to 1865 he held classes in connection with the Edinburgh colleges, and in 1865 was appointed lecturer in University College, London. In 1870 he removed to Canada, and was appointed register in Queen's College, Kingston, in 1877, but settled finally in Washington, D. C., in 1881.

Bell, ANDREW; a Scottish teacher; noted as the founder of the monitorial system (or Madras system) of education; b. at St. Andrews, Mar. 27, 1753, and studied at that university, from which in 1787 he received the degree of D. D., and after 1800 LL. D. from the same. He took orders in the Anglican Church, sailed for India in 1787, and in ten years obtained eight lucrative army chaplainships, all of which he held at the same time. Being appointed in 1789 superintendent of the Madras Male Orphan Asylum for the sons of military men, he employed the scholars in mutual instruction, and after his return to Britain published a treatise on his new method in 1797. He became rector of Swanage, Dorset, 1801; master of Sherburne Hospital, Durham, 1809; prebendary of Hereford 1818, and of Westminster 1819. His great rival was JOSEPH LANCASTER (*q. v.*), who had introduced a somewhat analogous system among the Dissenters, the success of which was the occasion for the formation of the National Society for Promoting the Education of the Poor in the Principles of the Established Church throughout England and Wales, of which Bell was the first superintendent. D. in Cheltenham, Jan. 27, 1832; and left £120,000 for educational purposes. See his *Life* by R. Southey (London, 1844, 3 vols.); better by J. M. D. Meiklejohn (1881).

Bell, Sir CHARLES, F. R. S.; British anatomist and physiologist; the youngest brother of Andrew Bell; b. in Edinburgh, Nov., 1774. He removed in 1804 to London, where he lectured on anatomy and surgery, and published a *System of Operative Surgery* (1807). In 1814 he was elected one of the surgeons of the Middlesex Hospital. He gained distinction as a surgical operator, and excelled in the treatment of nervous affections. He made the important discovery that the nerve filaments of sensation are distinct from those of motion, which is expounded in his *Anatomy*

of the *Brain* (1811) and *Nervous Systems* (1830), his greatest contributions to physiology. In 1836 he became Professor of Surgery in the University of Edinburgh. Among his works are an *Exposition of the Natural System of the Nerves of the Human Body* (1824), and *The Hand, its Mechanism and Vital Endowments as Evincing Design* (1834). The last is one of the Bridgewater Treatises. D. at Hallow Park, near Worcester, Apr. 28, 1842.

Bell, CLAIBORNE HAWLEY, D. D.: president of the Board of Missions of the Cumberland Presbyterian Church; b. near the present site of Aberdeen, Miss. He graduated from the Cumberland University in 1853; had three pastorates, combining with the first the principalship of an academy, and with the second the presidency of Union Female College at Oxford, Miss. Since 1881 he has given his time to the mission work of his Church, filling also the chair of Homiletics and Missions in Cumberland University, and being active in the general work of the Church. W. J. B.

Bell, Rev. GEORGE CHARLES, M. A.: educator and scholar; b. in Streatham, England, July 9, 1832; educated at Lincoln College, Oxford, 1851; mathematical lecturer of Worcester College 1857-65; head master of Christ's Hospital 1868-76; master of Marlborough College 1876, succeeding Archdeacon Farrar; has published two sermons, *Increase of Faith and Confidence in Christ*.

Bell, HENRY: Scottish engineer; b. in Linlithgowshire, Apr. 7, 1767; was the first who obtained success in steam navigation in Europe. He worked in London under Rennie. A small vessel called *The Comet*, with an engine constructed by himself, was launched on the Clyde in 1812. D. in Helensburgh, Nov. 14, 1830.

Bell, HENRY HAYWOOD: rear-admiral U. S. N.; b. in Orange co., North Carolina, Nov. 17, 1807; entered the navy as a midshipman Sept. 1, 1823; commanded a vessel in the attack on the Barrier Forts, Canton, in 1856. In 1861 he commanded the steamer *Brooklyn*, West Gulf blockading squadron. In 1862 he was selected as fleet captain by Rear-Admiral Farragut, and while acting in this capacity led the second division of gunboats at the attack upon Forts St. Philip and Jackson, and was deputed to take possession of New Orleans, where his sound judgment and coolness were conspicuously shown and highly commended by the whole fleet. In 1863 he commanded, during the temporary absence of Admiral Farragut, the West Gulf blockading squadron. In 1865 he was appointed to the command of the squadron in the East Indies. In 1866 he became rear-admiral, and was retired in 1867, but was drowned, Apr. 12, 1867, in an attempt to pass, in his barge, over the bar at the mouth of the Osaka river, Japan, before the arrival of Rear-Admiral Rowan, who was to succeed him. His death was much lamented.

Bell, JOHN: surgeon; b. in Edinburgh, May 12, 1763; elder brother of Sir Charles Bell. He began in 1786 to lecture on surgery, which he also practiced with success in his native city. He published, besides other works, a *System of the Anatomy of the Human Body* (2 vols., 1793-98), to which his brother Charles added two more volumes; and *The Principles of Surgery* (3 vols., 1801-07). He was a good classical scholar, and one of the most skillful operators of his time. D. in Rome, Apr. 15, 1820, leaving *Observations on Italy*, which was published by his widow in 1825.

Bell, JOHN: statesman; b. near Nashville, Tenn., Feb. 15, 1797. He graduated at the University of Nashville in 1814. He was elected a member of Congress in 1827, and by successive re-elections continued in that body about fourteen years. He supported Gen. Jackson for the presidency in 1832, but joined the Whig party in 1833, and was chosen Speaker of the House of Representatives in 1834. He was an earnest advocate of a protective tariff. In Mar., 1841, he was appointed Secretary of War by President Harrison; resigned that office with the most of the cabinet in Sept., 1841, because he disapproved the policy of Mr. Tyler. He was elected a Senator of the U. S. for Tennessee in 1847; re-elected in 1853; opposed the repeal of the Missouri Compromise in 1854, and the Kansas Lecompton constitution in 1858. He was nominated in 1860 for President of the U. S. by the Constitutional Union party, having Lincoln, Douglas, and Breckenridge as his competitors. He received thirty-nine electoral votes. D. at Cumberland Iron Works, Tenn., Sept. 10, 1869.

Bell, ROBERT: journalist; b. at Cork, in Ireland, Jan. 10, 1800; passed his mature life in London. In conjunction with Sir E. Bulwer and Dr. Lardner he founded in

1841 *The Monthly Chronicle*, which he edited. Among his numerous works are a *History of Russia* (3 vols., 1836-38); *Lives of the English Poets* (2 vols., 1839); a *Life of George Canning* (1846); and several dramas and tales. D. in London, Apr. 12, 1867.

Bell, ROBERT, LL. D.: Canadian surveyor; b. in the township of Toronto, June 3, 1841; graduated at McGill University as a civil engineer in 1861; received the degrees of M. D., C. M., from that university in 1878; and was Professor of Chemistry and Natural Science in Queen's University, Kingston, 1863-68. In 1883 he was appointed assistant director of the Geological Survey of Canada. His surveys and explorations have extended from Newfoundland to the Western plains, and from Lake Erie to Baffin's Bay. His reports to the Government have been published almost every year since 1857, about which time he was engaged as an assistant by Sir W. E. Logan. He acted as scientist and medical officer to the Hudson Bay expeditions of the Neptune in 1884, and of the Alert in 1885. In 1886 he went overland to Hudson Bay, being his ninth visit there, and made extensive surveys in the Albany and Severn districts. He is the author of numerous papers and essays in scientific journals; also annual reviews of mining in Canada from 1862, and of annual reviews of the progress of science in Canada, published in the *Dominion Annual Register* from 1878 to 1884. NEIL MACDONALD.

Bellacoo'la Indians: See SALISHIAN INDIANS.

Belladonna [Ital., literally, beautiful lady, possibly from the use of the plant as a cosmetic]: an herbaceous perennial plant (*Atropa belladonna*) of the natural order *Solanaceae*; sometimes called **Deadly Night-shade**. It is a native of Europe, has ovate leaves, bell-shaped flowers of a lurid, purple color, and berries which when ripe are black, shining, and sweetish in taste. All parts of the plant are narcotic and very poisonous, and contain an alkaloid called *atropia* or *atropine*, on which its active properties depend. The belladonna is considered a valuable medicine and a powerful remedy for certain nervous diseases, neuralgia, paralysis, etc. It is administered both internally and externally. There is an antagonism between atropia and morphia. When applied to the eye it has the remarkable property of greatly dilating the pupil, and it is often used by oculists both in examinations and operations. The medicinal preparation of belladonna commonly used in the U. S. is an extract from the leaves.

Belladonna Lily (*Amaryllis belladonna*): a beautiful rose-colored flower which grows wild about the Cape of Good Hope, and is cultivated in gardens. The drooping flowers are clustered at the top of a leafless stem, which is about 18 inches high, and which springs from an elongated bulb. It may be grown either in the window garden or in the open.

Bellaire': city and railroad center; Belmont co., O. (for location of county, see map of Ohio, ref. 5-1); on the Baltimore and Ohio, the Bellaire, Zanesville and Cincinnati, the Cleveland and Pittsburg, the Cleveland, Lorain and Wheeling R. Rs., and the Ohio river; 5 miles S. of Wheeling and 137 miles E. of Columbus. It has water, gas-works, and electric lights, and manufactures of glass, steel, iron, nails, etc. Coal, iron, cement, paving-brick clays, and limestone are abundant. Pop. (1880) 8,025; (1890) 9,934.

EDITOR OF "TRIBUNE."

Bellamij, bellā-mī, JACONUS: Dutch poet; b. in Flushing, Nov. 12, 1757. He published a collection of verses in 1782, and on the occasion of the war of 1785 a volume of patriotic poems (*Vaderlandse Gezangen*). Among his most popular works is *Roosje*, a poem. He had good taste and a glowing fancy, and contributed largely to the improvement of the national literature. D. Mar. 11, 1786. See Q. Knipers, *Notice sur Bellamy*.

Bellamy, EDWARD: journalist and romancer; b. at Chicopee Falls, Mass., Mar. 26, 1835; educated at Union College and in Germany; engaged in newspaper work in New York and in Springfield, Mass., from 1871 to 1876. Among his romances, which are ingeniously psychological and somewhat resemble Hawthorne's, are *Dr. Heidenhoff's Process* (1879); *Miss Ludington's Sister* (1884); *Looking Backward* (1888), a kind of socialistic Utopia, which had a sale of some half a million copies and has been translated into many languages. It led to the establishment of "Nationalist" societies and "Bellamy" communities, to the propagation of which, by periodicals and lectures, the author devoted him-

self. The book was written as a literary venture and with no anticipation of originating a socialistic agitation.

HENRY A. BEERS.

Bellamy, JOSEPH, D. D.: b. in North Cheshire, Conn., Feb. 20, 1719; graduated at Yale College (1735); and was pastor of the Congregational church at Bethlehem, Conn. (1740-90). He was a powerful preacher and a renowned teacher of theology. Among his published works are *True Religion Deified* (a refutation of Antinomianism, prefaced by Jonathan Edwards, Boston, 1750; repub. by Congregational Publication Society, Boston); *Theron, Paulinus, and Aspasia; or, Letters and dialogues upon the nature of love to God, faith in Christ, assurance of a title to eternal life* (1759); *An essay on the nature and glory of the Gospel of Jesus Christ* (a supplement to preceding, 1762); *Letters and Dialogues* (1761). D. in Bethlehem, Conn., Mar. 6, 1790. His *Complete Works* were published in 3 vols. (New York, 1811); also in 2 vols. (Boston, 1850), with a memoir by Rev. Dr. T. Edwards.

Bell-animalcule: a microscopic animal; a peritrichous ciliated infusorian, belonging to family *Vorticellidae*. The most common form consists of a bell-shaped portion attached to a stalk by the apex of the bell, the mouth of the bell being generally turned upward. When the bell is expanded its mouth is occupied by a broad disk, around the margin of which is a row of cilia. At the edge of the disk on one side is a funnel-shaped opening, by which food passes into the interior. The stalk can contract quickly, throwing itself into a spiral, thereby retracting the whole animal. The bell can so contract as to form a ball, the cilia being drawn in. When the bell is expanded the cilia keep up a rapid motion, by means of which currents of water are formed which drive particles of food into the funnel, from which from time to time they pass into the body. As complicated as is the animal, it consists of a single cell, which possesses a nucleus, a contractile vacuole, and reproduces itself by division. It is commonly found in water in which are decaying substances, and is frequently made use of in biological studies for illustration and experiments. D. S. JORDAN.

Bellarmino, ROBERT (in It. *Roberto Bellarmino*); a theologian and cardinal; b. at Monte Pulciano, near Florence, Oct. 4, 1512. He entered the order of Jesuits in 1560, and became Professor of Theology at Louvain in 1570, and in Rome 1576. He was a zealous champion of orthodoxy, and was highly distinguished as an able controversial writer against heretics. His principal work is *Disputatio de Controversiis christiæ Fidei adversus hujus Temporis Hæreticos* (Ingolstadt, 3 vols., 1581-92). He became a cardinal in 1599; Archbishop of Capua in 1602; resigned 1605, and became librarian of the Vatican. D. in Rome, Sept. 17, 1621. Complete editions of his works appeared in Cologne, 1619 (7 vols.), and in Naples (1872, 8 vols.), and Paris (1873-74, 12 vols.). He was a man of mild and pacific disposition. "The Church of Rome," says Hallam, "brought forward her most renowned and formidable champion, Bellarmine. . . . His abilities are best tested by Protestant theologians, not only in their terms of eulogy, but indirectly in the peculiar zeal with which they chose him as their worthiest adversary." (*Introduction to the Literature of Europe*.) See G. Fuligatti, *Vita del Cardinal R. Bellarmino* (Antwerp, 1624; Rome, 1624), a work based upon an autobiography; Daniello Bartoli, *Della Vita di R. Bellarmino* (Rome, 1678); P. Frizon, *Vie du Cardinal Bellarmin* (Nancy, 1708). Bellarmine's autobiography, which had been suppressed by the Jesuits, and had become very scarce, was republished by Döllinger and Reusch, with a German translation (Bonn, 1887).

Bellary, bel-laa rée, or Balla'ri': a town of India; capital of a district of the same name; province of Madras; 270 miles N. W. of Madras (see map of S. India, ref. 5-D); one of the chief military stations in the province, and has a fort on an abrupt rock 450 feet high. The climate is one of the worst in India. Pop. (1891) 59,770.

Bellay', JOACHIM, du: French poet; b. at Lyré, near Angers, 1525; d. in Paris, Jan. 1, 1560, and was buried in the cathedral of Notre Dame, of which he had been a canon. Though an interesting poet, he is chiefly famous as having issued the manifesto of the so-called Pléiade, the poetical school of which Ronsard was the chief. The title of the manifesto was: *La Deffence et illustration de la langue françoise* (1549, old style; Feb., 1550, new style). The treatise is a violent onslaught upon the mediaevalism of the followers of MAROT (*q. v.*), and a recommendation to French poets to turn to the

Greeks and Latins for guidance (*Ly donques, et rely premièrement à Poëte futur, feutlle de main nocturne et journalle, les exemplaires Grecz et Latins, puis me laisse toutes ces vieilles poésies françoises aux leur Florissur de Toulouz, et au Pay de Rouan*). Evidently this marks the triumph of the Renaissance in French literature. The application of the principle, however, both by Du Bellay and by Ronsard, was crude and often ridiculous, affording ample opportunity for the later satire of Boileau. Du Bellay made his *début* as poet, in the same year in which his *Deffence* appeared, with a volume entitled *Recueil de poésies*, in which the most notable things are certain odes in attempted illustration of the poet's doctrine as stated above. In 1551 he went with his cousin, Cardinal du Bellay, then French Ambassador at the Papal court, to Rome. His first pleasure at the sight of the remains of ancient Rome led to the composition of his *Premier livre des antiquitez de Rome* (publ. 1558; trans. into English by Edmund Spenser, 1591, under the title of *The Ruins of Rome*). Soon, however, the intrigues he saw about him turned his pleasure into sorrow, and he composed a series of satiric sonnets, entitled *Regrets* (first printed 1558), of real power. As if in contrast with this sad picture, he published in the same year (1558) his *Œuvres rustiques*, full of the charm of country things as seen by the poet. In 1555 Du Bellay had returned to France, but toward 1557, rather than curry favor with the great, he consigned himself to poverty and study. His contempt for the opposite course appeared in his *Poëte courtisan*, a sharp satire upon court-poets. Already his own health was broken, and he soon died.

BIBLIOGRAPHY.—*Œuvres de J. du Bellay*, ed. by Marty-Laveaux (2 vols., Paris, 1866-67); P. de Nolhac, *Lettres de J. du Bellay* (Paris, 1883); Sainte-Beuve, *Tableau de la poésie française au XVI^e Siècle*, edited by J. Trobat (2 vols., Paris, 1876); E. Lafargue, *Joachim du Bellay, etc.* (Angers, 1864); Léon Sédé, *Joachim du Bellay* (Paris, 1880).

A. R. MARSH.

Bell-bird: a bird of the genus *Chasmorhynchus*, native to the West Indies and South America. The bell-birds belong to the family *Cotingida*, and are allied to the fly-catchers. Their voice has a metallic sound, resembling the tolling of a bell, and can be heard, it is said, at a distance of 3 miles. It is distinguished by a broad and depressed bill, which is soft and flexible at the base. One of the species, the "Campanero" (*C. niveus*), has on its forehead a curious horn-like and tubular appendage, which when empty is pendulous, but when the bird is excited is filled with air and rises to the height of 3 inches. The Australian bell-bird (*Myzantha melanophrys*), "one of the honey-eaters," produces a peculiar tinkling sound; it is an entirely different species from the above.

Bell, Book, and Candle: a form of greater excommunication from the Church, of which the first recorded instances occurred about 1190. The symbolism was much elaborated and of appalling significance. It was formerly used in the Western Church. The priest or ordinary read from a book the anathema which was largely founded on Deut. xviii. 15, *seq.*, with monkish additions which transcended the principles of canon law as to the effect of excommunications. The book being closed, attendants threw lighted candles to the ground, thus extinguishing them, to denote the going out of grace in the soul, and bells were jangled as a token of the disorder fallen upon the excommunicated. The practice has long been discontinued as a customary mode of discipline.

Belleau, bel lō, REMI: French poet of the school of Ronsard; one of the Pléiade; b. at Nogent-le-Rotrou, 1528; d. 1577. He was tutor of Charles, son of Remi de Lorraine; and when his pupil became Duc d'Elbeuf and grand ogerry of France, he continued to live with him—a splendid but quiet life. He was called "*le gentil Belleau*," and by Ronsard "*le peintre de la nature*." His merit is to have introduced into French literature charming, jewel-like descriptions of the external world. His first collection of poems, entitled *Petites Inventions*, appeared in 1557. This was followed by his *Bergerie* (1565, and 2d part 1572), modeled upon the *Idyllia* of Sanazaro. His most original work, however, is his *Amours et nouveaux Eschanges des pierres précieuses, vertus et propriétés d'icelles* (1576), based upon the poems of the pseudo-Orpheus and the *Lapidarius* of Marbodius. Besides translations of little merit, Belleau wrote a comedy, *La Reconnoie* (1577).

BIBLIOGRAPHY.—*Œuvres de R. Belleau*, ed. by Gouverneur

(3 vols. (Bibl. Elzévir.), Paris, 1867); Sainte-Beuve, *Tableau de la poésie française au XVI^e Siècle* (2 vols., Paris, 1876).

A. R. MARSH.

Bellefontaine: railroad junction; capital of Logan co., O. (for location of county, see map of Ohio, ref. 4-D); about 110 miles N. of Cincinnati, and 55 miles N. W. of Columbus. The Cleveland, Cincinnati, Chicago and St. Louis R. R. Co. has graded a tract of about 70 acres for car-shops, round-house, switch-yard, etc. It has the highest elevation of any town in the State, has a good trade, a fine court-house, and is noted for its healthfulness and beauty. Pop. (1880) 3,998; (1890) 4,245.

EDITOR OF "REPUBLICAN."

Bellefonte: borough; capital of Center co., Pa. (for location of county, see map of Pennsylvania, ref. 4-E); is beautifully situated at the foot of Bald Eagle Mountain, 87 miles N. W. of Harrisburg. It has a celebrated spring, and the surrounding scenery is very fine, and is a place of summer resort. It has 2 furnaces, 3 rolling-mills, 2 foundries, an axe-factory, car-works, glass-works, a number of smaller manufactories, and 7 newspapers. It is the starting-point of the Buffalo Run R. R., and the terminus of the Lewisburg R. R. Pop. (1880) 3,026; (1890) 3,946.

EDITOR OF "NEWS."

Belle-Isle, bel'el', CHARLES LOUIS AUGUSTE FOUQUET, Duke of; marshal of France; b. in Villefranche, Aveyron, Sept. 22, 1684; conducted the celebrated retreat of the French from Bohemia 1742; commander of the army of Italy 1748; Minister of War 1757. D. Jan. 26, 1761. He negotiated (1735) the treaty by which Lorraine was united to France.

Belle-Isle-en-Mer, bel'-eel'-aän-mär': an island in the Atlantic belonging to the French department of Morbihan. It is 8 miles from the shore, and has an area of 32 sq. miles. Pop. 10,000, mostly engaged in the pilchard-fishery. Excellent horses and grain are raised here. Here is a fortified seaport named Le Palais.

Belle Isle: a fertile island, 9 miles long and 3 broad, in Conception Bay, Newfoundland. It has considerable fishing interests. Pop. 500. **BELLE ISLE, NORTH**: An island in the strait of the same name, between Newfoundland and Labrador; is 21 miles in circuit, and has a small harbor; lat. 52° 13' N., lon. 55° 19' W. **BELLE ISLE, SOUTH**: an island at the entrance of White Bay, on the northeast side of Newfoundland; lat. 50° 49' N., lon. 55° 29' W. It is a fishing-station. Pop. 53.

Belle Isle, Strait of: between Labrador and Newfoundland; is 80 miles long, 12 miles wide, and dangerous of navigation.

Bellenden, or **Ballantyne**, JOHN: Scotch poet, whose personal history is obscure; b. near the close of the fifteenth century. D. about 1550; became Archdeacon of Moray about 1536; translated Boece's *History of Scotland* and the first five books of Livy from the Latin into Scotch prose, prefixing poetical prologues to both works. His works are interesting as specimens of the prose of the time.

Bellenden, WILLIAM: a Scottish author of whose personal history little is known. He was born probably in Lasswade, near Edinburgh, about 1555, and died about 1633; went to France in the train of Mary Queen of Scots, where he became a professor in the University of Paris, and was distinguished for the elegance of his Latin. He published in 1608 at Paris a compilation from the works of Cicero, entitled *Cicconis Princeps*. Among his other works are *De Statu Præci Orbis* (On the Condition of the Primitive World, 1615), and *De Tribus Luminibus Romanorum* (1634), his master-work, treating of Seneca, Cicero, and Pliny. Middleton plagiarized from him for his *Life of Cicero*, was accused of it by Warton, and convicted by Parr. Hallam regarded him as among the earliest of philosophical historians. His three principal works were reprinted in 1787, with a Latin preface by Dr. Parr. The preface was noted for its elegant Latinity and its allusions to contemporary politics.

Belle Plaine: Benton co., Ia. (for location of county, see map of Iowa, ref. 5-I); on C. and N. W. R. R. Division and terminus of O. C. F. and M. R. R., and on Iowa river; 116 miles W. of Mississippi river, 257 miles W. of Chicago. Here are 3 school-buildings, 6 churches, 2 opera-houses, a city hall, numerous flowing wells (one the noted "gusher" "Jumbo"), round-house and machine-shops, furniture-factory, grist-mill, large creamery, foundry, house-heating manufactory, and broom-works. Founded 1862,

and named after the Indian trapper's name for the valley. Pop. (1880) 1,689; (1890) 2,623; (1895) 3,256.

EDITOR OF "UNION."

Bellerophon [Gr. Βελλεροφόντης, slayer of Bellerus]: originally called **Hipponeus**, hip-pon'ō-ūs; a personage of the Greek mythology; son of Glaucus, King of Corinth. Having killed Bellerus by accident, he fled to Prætus, King of Argos, who was instigated by his wife in revenge for the rejection of her advances to send him to Iobates, King of Lycia. He carried a sealed letter requesting Iobates to kill him, but that king imposed on him the dangerous mission of fighting with the Chimæra. Mounted on the winged Pegasus, he slew the monster in mid-air, defeated the Amazons, and destroyed an ambuscade of Lycians, thus escaping three plotted snares. He figures in Homer and in Pindar, who tell the story of his attempted ascent to Olympus on Pegasus, his fall to the earth, and blindness. The myth of Bellerophon was worked over in the tragedies of Sophocles and Euripides.

Bellerophon: a genus of fossil univalve gasteropod mollusks. The shell is symmetrically convolute, with few and occasionally sculptured whorls, globular or discoidal, and having a dorsal keel, which terminates in a deep notch. Many species of it have been found in the Silurian, Devonian, and carboniferous rocks in various parts of the world.

Bellerose, JOSEPH HYACINTHE: Canadian senator; b. at Three Rivers, P. Q., July 12, 1820, and educated at the colleges of Nicolet and St. Hyacinthe. He held for a short time a captaincy in the 100th regiment; was commander of the whole militia force in military district No. 8 in 1859; subsequently commanded the Laval reserve militia. He represented Laval in the Canadian Assembly 1863-67, and the same constituency in the Dominion Parliament from that date until called to the Senate in 1873. He was member for Laval in Quebec Assembly 1867-75; on two occasions declined important appointments under the Government of Canada; refused a cabinet office after the death of Sir George L. Cartier. He was president of the Union Navigation Company, and was prominently connected with financial and other institutions.

NEIL MACDONALD.

Belle Vernon: borough; Fayette co., Pa. (for location of county, see map of Pennsylvania, ref. 6-B); on Pa. R. R., and on Monongahela river, 42 miles from Pittsburg. It has extensive manufactories, and is situated in an extensive natural gas region. Pop. (1880) 1,164; (1890) 1,147.

Belleville, bel'veil': eastern suburb of Paris, now inclosed by the line of fortifications. Largely inhabited by the poorer classes, it is a center of communistic activity.

Belleville: a port of entry; the capital of Hastings co., Ontario, Canada; on the Bay of Quinté, and on the Grand Trunk Railway, 113 miles E. N. E. of Toronto, and in the heart of the dairying interests of Canada (see map of Ontario, ref. 3-F). It is a beautiful city, and has fine public buildings, including a court-house, a jail, numerous public and private schools, churches, and a custom-house. It is the seat of Albert University (Methodist Episcopal), which consists of Albert College for young men and Alexandra College for women. One mile W. of the town is the deaf and dumb asylum, a fine building opened in 1870. The river Moira furnishes water-power, and the lumber-trade is very extensive. There are various other manufactories. Pop. (1881) 9,516; (1891) 9,914. EDITOR OF "INTELLIGENCER."

Belleville: city and railroad center; capital of St. Clair co., Ill. (for location of county, see map of Illinois, ref. 9-D); 14 miles S. E. of St. Louis. It contains numerous manufactories of almost every description, and one of the largest rolling-mills in the West; also a fine convent, many churches, and splendid school-houses. It is in a region abounding in coal. Pop. (1880) 10,683; (1890) 15,361.

EDITOR OF "NEWS DEMOCRAT."

Belleville: city; capital of Republic co., Kan. (for location of county, see map of Kansas, ref. 4-G); on Chicago and R. I. R. R., 206 miles from Kansas City; has 7 churches, 9 schools, and a court-house. The surrounding region is agricultural. Pop. (1880) 238; (1890) 1,868; (1895) 1,445.

EDITOR OF "FREEMAN."

Bellevue: city and railroad junction; Jackson co., Ia. (for location of county, see map of Iowa, ref. 4-L); beautifully situated on a high, gravelly bank of the Mississippi river, 24 miles below Dubuque, and 12 miles S. of Galena;

has beautiful high school building, five church buildings, manufactories of lumber, pumps, flour, wagons, baskets, butter, and iron-works. Water-works are now (1893) in course of construction. Founded in 1835. Pop. (1880) 1,581; (1890) 1,394; (1895) 1,533. EDITOR OF "LEADER."

Bellevue: borough; Allegheny co., Pa. (for location of county, see map of Pennsylvania, ref. 5-B); on Pa. R. R., 6 miles N. W. of Pittsburg; is in a mining region. Pop. (1880) 915; (1890) 1,418.

Bellevue: village; Huron co., O. (for location of county, see map of Ohio, ref. 2-F). It is situated at junction of three railroads, 45 miles S. E. of Toledo; is a manufacturing town, and a shipping-point for an extensive fruit and grain region. Pop. (1880) 2,169; (1890) 3,052.

Belligerency: the state of being actually engaged in war. As regards its recognition by neutral states, no question will arise here in case of war between two sovereign powers; but when rebellion breaks out within a country, or a colony revolts against its mother country, every other power which regards the interests and trade of its subjects must define the new state of things. This state is somewhat indefinite. For this is a contest between a sovereign state, a friend of the neutral, and a revolutionary body which is not yet a state, but only trying to become one. It has therefore no international standing. Now, as has been said, the first duty of the neutral is to his own trade; to define on what terms it shall continue. It next owes the duties which humanity prescribes to both combatants. It will also possibly have to lay down the rules it intends to observe regarding the war operations of the non-sovereign combatant, how its ships shall be received, how its flag shall be regarded, whether or not the rights of war shall be accorded to it.

All such questions are settled by a proclamation which recognizes its belligerency. The expediency of this act must be governed by the seriousness of the struggle. The test is whether an actual state of hostilities exists, not trifling or localized, or likely to be temporary, but serious enough to affect the interests of other states. It thus becomes to a certain extent a question of probability, while the recognition of independence involves purely a question of fact, whether the attempt of the parent state to coerce its rebellious member has ceased.

The recognition of belligerency is by no means one-sided in its operation. It gives rights to both combatants. To the insurgent it grants the rights of belligerents, the recognition of its flag, a right to raise loans, a quasi-political status without diplomatic standing. The parent state, on the other hand, can no longer be held responsible for the acts of its rebellious subjects. It can employ the rights of blockade, of capture for carrying contraband, of search against its enemy, thus affecting neutral commerce. In short, all parties recognize as a fact that a war exists between two combatants, the subsequent question of independence being yet in abeyance. Judged by these tests, the recognition of the belligerency of the Southern Confederacy by Great Britain and France in 1861 was proper and necessary. The recognition of its independence was at no time justifiable.

THEODORE S. WOOLSEY.

Bellingham, RICHARD: lawyer; b. in England in 1592; emigrated to America in 1634. He was Lieutenant-Governor of Massachusetts for thirteen years, and Governor for ten years, first elected in 1641, in opposition to Gov. Winthrop; then in 1665 as successor to Endicott, continuing in office by annual elections until his death; refused in 1664 to obey a summons to England to give account of his administration; left his property to the support of a Congregational minister, but in the interests of his family the will was set aside. A widowed sister was hanged as a witch in 1650. D. Dec. 7, 1672.

Bellingham Bay: in the northern part of the State of Washington, Whatcom co.; is 14 miles long, 3 miles wide, with a depth of from 3 to 20 fathoms. Great quantities of lignitic coal are mined here, the shaft being only a quarter of a mile from the harbor. It is generally considered the best coal on the Pacific coast. Whatcom is the chief point of this coal-trade.

Bellini, bel-lee'nōē, GENTILE: painter; b. in Venice in 1421; d. 1507; elder son of Jacopo. He was a pupil of his father and of Gentile da Fabriano, for whom he was named. He was employed by the Venetian Government in company with his brother. He went to Constantinople in 1479 on the invitation of the sultan, Mohammed II., and at the wish of

the Venetian authorities he returned to Venice bringing pictures of men and scenes in the Turkish empire of great, and at that time unique, interest. Some of these remain in tolerable preservation. We have also of his work several important scenes in Venice. Costume, splendid architecture, and stately ceremonies had great attractions for him. Perspective drawing, too, then a newly invented process, he had studied carefully, and excelled in. His paintings, though less lofty in character than his brother's, and marked with some of the stiffness of drawing of an immature style, are full of interest and beauty of composition and color. His most noted picture was *The Preaching of St. Mark*, in the duomo of Venice. RUSSELL STURGIS.

Bellini, GIOVANNI: painter; b. in Venice about 1428; d. 1516. He worked under his father Jacopo and his brother Gentile. During Gentile's absence in Turkey he continued the work in the ducal palace at Venice, which the two brothers had undertaken together, all of which was destroyed by a fire in 1577. Giovanni was especially a student of the art of oil-painting on canvas, which he was of the first to master completely. Moreover, he was a painter of religious subjects of the statelier and more monumental kind, in which he preserved a gentle and refined feeling, while combining it with splendor of color and grace of composition beyond his time. He was in this way the true forerunner of the still more powerful artists of the next generation, Titian, Paul Veronese, and Giorgione, and yet he kept much of the simple and frank religious concentration of earlier work, which those great men nearly abandoned. He is one of the small class of entirely great painters, an unsurpassed master of the art. Examples of his work may still be seen in Venice and Naples; his *Blood of the Redeemer* is in the London National Gallery. RUSSELL STURGIS.

Bellini, Jacopo: painter; b. in Venice, 1395; d. 1470; he was a pupil of Gentile da Fabriano, who came to Venice when he was very young, and went thence to Florence in 1422, taking Bellini with him. During the first half of the fifteenth century the art of painting was backward in Venice, and it seems clear that Bellini was a powerful aid in its advance from about 1430 until his old age, although he can hardly have reached the skill of either of his sons, Gentile and Giovanni. Almost nothing of his larger work remains to us, but his style can be judged from the drawings contained in a book preserved in the British Museum, and admitted to be his own handiwork. RUSSELL STURGIS.

Bellini, VINCENZO: Italian composer; son and grandson of musicians of moderate ability; b. at Catania, Sicily, Nov. 3, 1802. He was a pupil of Zingarelli. In 1827 he produced *Il Pirata*, an opera which was performed at Milan with great success. His fame was widely extended by *La Straniera* (1828); *La Sonnambula* (1831); and *La Norma* (1831); which latter two works were represented on every opera-stage in Europe. He afterward went to Paris and London, where he was warmly applauded, and composed *I Puritani* (1834). D. in Paris, Sept. 24, 1835. See A. Pougin, *Bellini, sa vie, ses œuvres* (Paris, 1868), and Hiller's *Künstlerleben* (Cologne, 1880).

Bellinzo'na (Germ. *Bellenz*): a town of Switzerland; one of the capitals of the canton of Ticino; on the river Ticino, here crossed by a bridge; 16 miles N. of Lugano (see map of Switzerland, ref. 7-11). It is defended by several old castles, and has an active transit trade. Pop. (1882) 3,302.

Bellman, bel'män, KARL MICHAEL: b. in Stockholm, Feb. 4 (15 N. S.) 1740; received a rather desultory education; vacillated for several years between business and literature; received in 1755 a small office in the state lottery from Gustavus III., but hired another to perform its duties, and gave himself up to his passion for gay company and poetry. D. in Stockholm in poverty and melancholy, Feb. 11, 1795. His works consist for the most part of songs, many of them set to music by Bellman himself. In some of these he gives a burlesque representation of the companions of his nightly revelries, and of their exploits. But these characters are drawn with the most exquisite elegance; their extravagances are blended with something which is exceedingly sweet and innocent; and the whole is remarkable for its joyous melody, in which, however, a peculiar undertone of romantic sadness now and then becomes very perceptible. These songs have made his name one of the most celebrated within the Scandinavian countries. They have been printed over and over again, and are sung at the courts and by the peasants. In Sweden they have given rise to a very rich song-literature of

considerable merit, both poetically and musically, and to innumerable and generally excellently trained singing associations which form a characteristic feature of Swedish social life. His statue has been raised in Djurgården, near Stockholm, and July 26 is celebrated there with an annual festival in his honor.

Revised by G. L. KITTREGE.

Bell Metal: a hard, dense, brittle, and sonorous alloy of copper with tin, zinc, or some other metal. The proportion in English bells is usually 75 per cent. of copper and 25 of tin. The bell metal of commerce usually contains 80 of copper to 20 of tin, or else 78 of copper to 22 of tin.

Bello'na: the goddess of war in the ancient Roman mythology: was represented as the companion and sister or wife of Mars. She was described by poets as armed with a scourge and holding a torch in her hand. Her priests were called *Bellonarii*.

Bellot, bel'ô, JOSEPH RENÉ: Arctic explorer: b. in Paris, Mar. 18, 1826; lieutenant in the French navy; joined expedition in search of Sir John Franklin sent out by Lady Franklin, May, 1851; afterward joined Inglefield's expedition, and perished in a storm near Cape Bowden, Mar. 21, 1853. He discovered Bello's Strait on the north coast of North America, 1852.

Bellotto, BERNARDO: See CANAL OF CANALETTO.

Bellows [M. Eng. *bellu*, plur. *bellues*; since the sixteenth century only the plural in use; the word is really an abbreviation of O. Eng. *blæsbelig*, cf. Germ. *Blasebalg*]; a very ancient contrivance for producing a blast of air. It consisted in its rudest form of a bag which was compressed, allowed to become full, compressed again, and so on. Representations of bellows have been found in some of the earliest Egyptian sculptures, and Sir Gardiner Wilkinson believes he has found a valve as early as the time of Moses. The natives of India and China have employed the bellows from time immemorial. Rude forms of the bellows are found in many of the lowest tribes of Africa. Ordinary bellows, as now used, are practically leather bags which are compressed and then expanded so as to allow air to enter through a valve opening inward, which on compression of the bellows allows no air to escape, except through the nozzle. The Chinese bellows consists of a rectangular chamber in which a close-fitting piston moves, and as it is withdrawn from the nozzle, valves open in the front of the chamber, admitting the air. The blacksmith's bellows supplies a continuous current. It consists of a top, center, and lower boards, the two latter being pierced with valves. The lower board is weighted, and automatically takes in air as it falls. The lever is attached to the lower board, and as it is raised the air is forced into the upper chamber, and the delivery continues while the lower chamber is again being replenished. See BLOWING-MACHINES.

Bellows, ALBERT F.: genre and landscape painter; b. at Milford, Mass., Nov. 29, 1829. D. in Auburndale, Mass., Nov. 24, 1883; pupil of the Antwerp Academy; also studied in Paris and in England. National Academician 1861; honorary member, Royal Belgian Water-color Society, 1868. His pictures in oil are mediocre productions technically considered, though interesting in their subjects, which are mostly drawn from scenes of New England life. His water-color painting was of better quality, and he was one of the first American artists who successfully practiced that branch of art.

W. A. C.

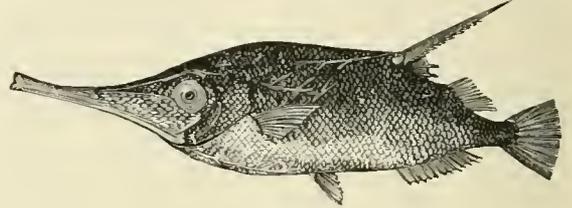

Bellows, HENRY WHITNEY, S. T. D., LL. D.: Unitarian minister; b. in Walpole, N. H., June 11, 1814; graduated at Harvard in 1832; in 1838 became pastor of the First Unitarian church in the city of New York, now called the Church of All Souls. He gained distinction as an eloquent public speaker, and lectured on a variety of subjects, especially social, educational, and patriotic enterprises. In 1846 he was one of the founders of the *Christian Inquirer*, and he was one of its editors for many years. Among his works are *Lectures on the Treatment of Social Diseases* (New York, 1857) and *The Old World in its New Face* (1868). He was the principal promoter and first president of the U. S. Sanitary Commission, established in 1862; was the prime mover in the organization of the "National Conference of Unitarian and other Christian Churches" in 1865, and later of the Unitarian Ministers' Institute. He had great organizing genius, and was an extemporaneous speaker of most brilliant power. There is a posthumous volume of his sermons (New York, 1886), and an earlier one, *Restatement of Christian Doctrine* (Boston, 1860). D. in New York city, Jan. 30, 1882.

Revised by JOHN W. CHADWICK.

Bellows Falls: railroad junction; Windham co., Vt. (for location of county, see map of Vermont, ref. 9-C); on the west bank of the Connecticut river; 53 miles S. E. of Rutland, 114 miles N. W. of Boston, Mass. The location is picturesque and furnishes excellent water-power. Paper manufacturing is the chief industry, but there are here a very large dairy-utensil manufactory and a very fully equipped machine-shop. Communication by direct lines to important points gives good shipping facilities. Pop. (1880) 2,229; (1890) 3,092; (1891) local census, over 3,400.

EDITOR OF "TIMES."

Bellows-fish, or Trumpet-fish (*Macrorhamphosus scolopax*): a spiny-finned fish of the family *Cedricidae*; feeds upon small animals found at the bottom of the sea, chiefly

Bellows-fish.

in the Mediterranean and on the west coasts of Europe. It is good eating, though small, seldom exceeding 5 inches in length.

Bello y López, bel yō-ee-lō'peth, ANDRES: Spanish American poet and writer; b. in Caracas, Venezuela, Nov. 29, 1781; undoubtedly the most important author Spanish America has had in the nineteenth century. His intellectual career dated from his acquaintance with Alexander von Humboldt during the latter's famous journey through South America in 1799. Bello shared several of Humboldt's expeditions in Venezuela, and through him his interest was aroused in the literary and scientific movements of Europe. He acquired the French, German, and English tongues, and was thus enabled in 1808 to serve as secretary and interpreter for the Governor and Council of Venezuela, then still under the control of Spain. In 1810 he took part in the revolt of Venezuela from Spain, along with his friend and former pupil, Bolívar. In the end of 1810 Bolívar was sent as representative of the country to Great Britain, and took Bello with him as secretary of legation. The next nineteen years of the latter's life were spent in Europe, chiefly in London. He endured great hardships, owing to the varying fortunes of his country's cause. At one time he was obliged to earn a living by giving lessons; at another he was employed by James Mill to decipher the MSS. left by Bentham. He made many interesting friends, however, among them Blanco White, Olmedo, and Fernández Madrid, and especially became known to the more influential of the large group of Spanish Americans then living in exile or quasi-exile in England. He was connected with several periodicals designed for these persons and to advance the cause of South American freedom, and thus he became a recognized leader of the Spanish American patriots. At the same time he was training himself to be a poet and scholar, studying the ancient literature of Spain and the new romantic literature of Europe. In 1829, after many hesitations, Bello decided to accept an offer made him by the Government of Chili, and thenceforth his career was indissolubly connected with that republic. He soon became a power in his new home, especially in everything connected with higher education. When the University of Chili was founded in 1843 he became its first rector—a position he held many years. He wrote extensively and on many different subjects, yet valuably upon all. As a lover and defender of the use of pure Castilian he wrote his *Principios de la Ortología y Métrica de la Lengua castellana* (1835); his *Análisis ideológica de los Tiempos de la Conjugación castellana* (1841); and his *Grammática castellana*, recognized in Spain itself as the best (1847). As jurist he published *Principios de Derecho de Gentes* (1832), and practically wrote the *Código Civil* adopted by Chili in 1855. His *Filosofía del Entendimiento* (published after his death, 1881) showed him to have reflected long and deeply upon philosophical questions. Finally, as poet (and this is his best title to fame) he has left a considerable body of work pure in style, elevated in manner, and full of a certain American spirit very distinct from anything to be found

in the poets of Spain or even in those romantic poets of France (André Chénier and Victor Hugo) whom Bello most loved and admired.

When Bello died the whole Chilean people mourned for him. In 1872 the Chilean Congress voted the publication of an edition of his works at the national expense (*Obras completas*, 8 vols., Santiago de Chili, 1881-85). In 1881 the hundredth anniversary of his birth was celebrated, especially in Santiago, with great splendor. A statue of him has been erected by popular subscription before the main entrance of the Congress in Santiago. See *Vida de D. Andres Bello*, por Miguel Luis Amunátegui (Santiago de Chili, 1882). The poems and several prose works of Bello are also published in Madrid in the *Colección de Escritores castellanos* (1882, seq.). D. Oct. 15, 1865. A. R. MARSH.

Belloy, bel wā', PIERRE LAURENT BUIRETTE, de: French dramatist; b. at St.-Flour 1727; went on the stage in St. Petersburg; returned to France and produced his tragedy *Titus* 1758; returned to St. Petersburg; again visited France 1762; wrote several successful tragedies. D. at Paris, Mar. 5, 1775.

Bell-ringing: There are two ways to ring a bell or a set of bells. In one the bells are stationary, and are struck either on the inside or outside near the rim with a hammer. In the other the bells are in motion, being swung with rope and wheel, or other contrivances, or being shaken by the hand. The desirable thing in ringing bells is to get a clear tone and a vibration that shall be resonant and shall reveal the full tone-qualities of these most common and most useful musical instruments. To obtain this tone circumstances alone must decide whether the bell shall be fixed or in motion. Bell-ringing requires a skill that comes only from long practice. It is an art also. The latter consists of making the vibrations constant and regular. This is especially sought for in ringing carillons, or peals of bells, known in the U. S. as chimes. In ringing one bell it is probable that a clearer note may be obtained by swinging it. Whether stationary or fixed, it is desirable that the hammer shall remain in contact with the bell for only the shortest space of time, and shall drop away or be lifted almost instantly after the sharp blow is given, so as not to dull or interfere with the vibrations that result. In ringing chimes it is therefore preferable that there shall be no long notes, or intervals between the notes, and it is better that a long note should be broken up into two or more shorter ones than that the vibrations should strike the ear of the listener at irregular intervals. The most successful bell-ringers employ this method, knowing that the finest effect is produced thereby.

On the Continent of Europe bells in sets are almost entirely stationary, and are called carillons, from the Italian *quadriglio*, or quadrille, "a dreamy kind of dance music" first played upon them. A carillon consists of from twelve to forty bells arranged in the diatonic scale. They are usually rung by one man. To ring them an instrument called the clavecin is often used. It is a sort of rough keyboard fashioned somewhat like that of a piano. The player strikes the keys with a gloved fist, and by a mechanical contrivance the hammer falls on the rim of the bell and at once is lifted away. In the U. S., where bells in sets are usually stationary, a series of levers is used. By pushing down the levers sharply the clapper or hammer inside the bell is drawn against the rim, and it drops away quickly of its own weight.

Another instrument in ringing carillons in general use on the Continent, and being developed greatly in England where the carillons rarely consist of more than twenty bells, is what is called the tambour, or "barrel." It is a contrivance on the principle of the cylinder of the well-known music-box. A large number of wooden pegs are fixed on a revolving drum, which loosens the hammers and drops each one on its bell at the proper time. This device is automatic, of course, and, although the resulting notes are not as clear as when struck by hand, it is possible to arrange more difficult music for it than one man can produce by the method of hand striking. The carillon, whether played by the clavecin or by the barrel, reached its highest development in the eighteenth century, in Belgium—still the home of the best bells—and probably the best performer that ever lived was the famous Matthias van den Gheyn, whose original music, found in Louvain long after his death, rivals in subtlety that of Bach, Mozart, and others, and which no one has since been able to play upon bells.

In England for several centuries the swinging method has

been used in ringing chimes, or peals, as they are known there. In the U. S. a peal would be a set of three or more bells, each bell tuned to itself and to the others. Eight or more bells similarly tuned would be called a chime. In England, with one man to each bell and a leader to give the signals for swinging, the development of that peculiar kind of bell-music called "changes" resulted. Changes (or change-ringing) consist of striking a set of bells in every possible order. Thus three bells may be struck in six ways without any repeat. Four bells may be struck in 24 ways without repetition; five bells in 120 ways, and so on until with ten bells we have 3,628,800 changes. To ring all these changes at the usual rate of speed would require one year and 105 days of constant performance. With twelve bells in the peal, to ring all the possible changes would require 37 years. These changes are based on that simple branch of mathematics known as combinations.

To many of these changes names have been given, and expert individual bell-ringers know just when and how often to strike their bells when any one of these figures is announced to be played. The most common of these changes are known as "plain-bobs," "bob-triples," "bob-majors," "bob-minors," "grandsire-triples," "grandsire bob-cators," and so on. In ringing the bells such methods as "hunting," "dodging," and "snapping" are used. Each man must not only ring his bell at the right time, but he must get the right expression and best tone from it.

In Great Britain the clavecin method of ringing bells, with electricity as the striking power, is now used to a considerable extent. With this contrivance perfected any ordinary piano performer may sit down at a keyboard, and by touching the keys ring the bells in the belfry and produce a high order of music.

In the U. S., as has been explained, the chimes are almost universally stationary, the usual number of bells being ten or twelve. When the levers connecting with the inside hammers of the bells are pushed down with skill, it is probable that better results follow than by any other method of ringing, except when there is a man to each bell.

In selecting a chime the fundamental bell, or key-note bell, must be first chosen. This must be true to itself first—that is to say, the note that results from striking it on the rim must be exactly an octave lower than the note obtained by striking it at the top at the center of the curve. The third and fifth octave tones, found by striking the bell at the required place along its length, must be true also. In addition to the combination of all these tones, the "drone" note or hum of the bell, a tone one-third lower usually than the key-note, and one usually overlord, must be in harmony with the dominant note of the bell. Each of the other bells must be in harmony with the key-note bell and thus an approximately correct chime, peal, or carillon is secured.

ALBERT F. MATTHEWS.

Bells: in nautical language has a peculiar meaning, and is used as a substitute for these expressions by which people on land indicate the hour. The sailor's day or night is divided into watches or periods, each of four hours' duration, except the two "dog watches," which are two hours each, viz., from 4 to 6 and from 6 to 8 p. m., and the bell is struck once at the expiration of each half hour. The number of strokes denotes the number of half hours that have elapsed in that particular watch. If the watch commences at 8 p. m., eight bells would be a signal for the end of the watch at midnight.

Belluno, bel-loo nō (anc. *Bellunum*): a city of Italy; capital of province of same name; on the Piave; 49 miles N. of Venice (see map of Italy, ref. 2-1). It is a bishop's see; has a cathedral designed by Palladio, a rich hospital, a public library, a handsome aqueduct, and a beautiful triumphal arch; also manufactures of silk stuffs, hats, leather, and earthenware. Pop. 16,000.

Bellwood: borough (organized in 1888); Blair co., Pa. (for location of county, see map of Pennsylvania, ref. 5-1); on Penn. R. R. and Penn. and N. W. R. R.; 6 miles E. of Altoona; has a good school, six churches, and an opera-house. The chief industrial establishments are railroad-car repair-shops, foundries, etc. Pop. (1880) 366; (1890) 1,146; (1892) estimated, with suburbs, 3,500.

EDITOR OF "BULLETIN."

Bellworts (*Campanulaceæ*): a family of mostly herbaceous dicotyledons, with inferior ovaries and gamopetalous corollas. They are related to the cucurbits, composites, honeysuckles, etc. There are about 1,000 species, very wide-

ly distributed. As here considered, this family includes the lobelias, often separated as a distinct family (*Lobeliaceae*). *Campanula*, the principal genus, contains 230 species.

CHARLES E. BESSEY.

Bel'mont: a post-village of Mississippi co., Mo. (for location, see map of Missouri, ref. 7-K); on railroad and the Mississippi river, opposite Columbus, Ky., 197 miles S. S. E. of St. Louis. In 1861 this place was occupied as a Confederate camp. On Nov. 6 Gen. Grant, in command at Cairo, descended the river with about 4,000 troops, remaining over night about 10 miles above Columbus, Ky. On the morning of the 7th this force was debarked on the Missouri shore a short distance above Belmont, and at once moved forward to the capture of the Confederate camp, supposed to contain about 3,000 men. After several hours' severe fighting, the Federal troops forced their way through the obstructions on either side. An irresistible charge carried the camp, drove the Confederates in all directions, and left the field in possession of the Federals. The Confederate camp, with all its supplies, ammunition, and baggage, was fired and destroyed. The defeated Confederates were, however, strongly re-enforced by Maj.-Gen. Polk from Columbus, and in turn drove the Federal troops back to their boats, fighting all the way against a now vastly superior force, while the batteries on the Kentucky side kept up a damaging fire which could not be returned. By 5 p. m. the troops were all on board their boats, without the loss of a gun, while they had with them two guns captured from the Confederates. The Federal loss was 120 killed, 383 wounded, and 104 captured or missing; total, 607. The Confederate loss is stated at from 500 to 600, killed and wounded.

Belmont: capital of Allegany co., N. Y. (for location of county, see map of New York, ref. 6-D); on the Genesee river and on Erie R. R., 92 miles W. by N. of Elmira, and 94 miles E. S. E. of Dunkirk. It contains a fine union school building, 6 churches, county court-house, 2 flouring-mills, machine-shop, and foundry. The surrounding country is principally agricultural. Pop. (1870) 795; (1880) 804; (1890) 950.

EDITOR OF "DISPATCH."

Beloit': city and railroad junction; capital of Mitchell co., Kan. (for location of county, see map of Kansas, ref. 4-F); on Mo. Pac. and Union Pac. R. Rs., and on the north bank of Solomon river, 184 miles W. of Missouri river; has State Industrial School for Girls, excellent graded and high schools, extensive mills and manufactures, and is an important business center. Pop. of township (1880) 2,793, including 1,835 in city; of city (1885) 2,003; (1890) 2,455; (1895) 2,039.

EDITOR OF "GAZETTE."

Beloit: city; Rock co., Wis. (for location of county, see map of Wisconsin, ref. 7-E); on Northwestern and C. M. and St. P. R. Rs., and on Rock river, 91 miles N. W. of Chicago and 47 miles S. S. E. of Madison; is on the south boundary of the State. It is partly built on a plain which is about 70 feet higher than the river, and is the seat of Beloit College. It has considerable manufactures of paper, paper-machinery, windmills, steam-engines, shoes, plows, water-wheels, etc. Founded in 1836 by settlers from Colebrook, N. H. Pop. (1880) 4,790; (1890) 6,315; (1895) 7,786.

EDITOR OF "FREE PRESS."

Beloit College: Beloit, Wis.; founded by the Congregationalists and Presbyterians of Wisconsin and Northern Illinois; received charter from Territorial Legislature of Wisconsin 1846. First building erected and first college class entered 1847. Jackson J. Bushnell (Yale, '41) and Joseph Emerson (Yale, '41) appointed professors 1848; Rev. Aaron L. Chapin (Yale, '37) elected president 1849; succeeded in 1886 by Rev. Edward D. Eaton (Beloit, '72).

The institution is of the New England type, and has from the first maintained a high standard of scholarship. About 3,500 young men have received education here; 442 having graduated.

The faculty numbers 20 members, besides lecturers. There are about 400 students. The college has a beautiful campus of 25 acres overlooking Rock river; also an athletic field of 16 acres. Of the ten buildings the most important are: Memorial Hall Library (erected 1868, containing 18,000 volumes); gymnasium (1874); Smith Observatory (1881); Scoville Hall (1889, for preparatory department); Chapel (1891); Chapin Hall (1891, dormitory); and Pearsons Hall (1892), containing extensive and well-equipped laboratories for physical science.

EDWARD D. EATON.

Belon, bay'lōn', PIERRE: French naturalist; b. at Soullétière, Maine, 1518; traveled extensively; murdered by robbers, April, 1564, in the Bois de Boulogne; established homologies of vertebrate skeletons. He formed two botanical gardens more than a century before the establishment of the Jardin des Plantes, and planted the first cedar in France.

Beloochistan: See BALUCHISTAN.

Belot, bay'lō', ADOLPHE: French dramatist and novelist; b. in Ponte à Pitre Nov. 6, 1829. Among his very numerous novels may be mentioned: *Mademoiselle Giraud, ma femme* (1870); *La Reine de Beauté* (1883); *La Princesse Sophie* (1883); *Alphonsine* (1887). Of his plays, *Le Testament de César Girodot* (1859) has been one of the most successful of modern plays, more than 800 representations having been given of it at the Odéon and the Comédie Française. Most of his novels have also been dramatized. D. in Paris, Dec. 18, 1889.

Bel'per: a market-town of Derbyshire, England; on the Midland Railway; 10 miles by rail N. of Derby (see map of England, ref. 8-II). It has several churches, a public library, and a stone bridge over the river Derwent. It has large manufactures of silk and cotton hosiery. Pop. (1891) 10,420.

Belpre': village; Washington co., O. (for location of county, see map of Ohio, ref. 7-II); on B. and O. S. W. R. R., 194 miles from Cincinnati, 36 miles from Athens. It has good schools, and manufactures of wool, flour, etc. Pop. (1880) 901; (1890) 1,007.

Belshaz'zar [*Bel-shar-uzur*; Fr. *Balthasar*]: son of Nabonidus (Labyntus), the sixth and last king of the second Babylonian period. His mother was a daughter of Nebuchadnezzar, and probably the widow of Neriglossar, the fourth king of the period. When of sufficient age he was associated with his father on the throne, and in the Book of Daniel is therefore called king. At the fall of Babylon in 538 B. C. he was slain, and his father, Nabonidus, then at Borsippa, was taken prisoner.

Bel'tane, or **Beltein** [Scottish from Gaelic *bealltainn*, Nabo-day]: heathen festival once common to all Celtic nations, traces of which have survived to the present day. The great ceremony of this cult was held in the beginning of May, and a somewhat similar one apparently early in November, that is, at the beginning and end of summer. The ceremony was marked by the extinguishing of all the fires in the district, after which the *need fire* was kindled with great solemnity, and from it the domestic fires were relighted. The earliest mention of the Beltane is made by Cormac, Archbishop of Cashel, early in the tenth century. Two fires were lighted side by side. Men and cattle then passed between the fires, which were supposed to give them protection from accident and disease. Domestic animals are driven through the flames at Cornac in Brittany, and in the Irish South islands of Arran, at the present date with the same object. This worship of Beil is connected with similar worship among the Slavs, Scandinavians, and Teutons. Indeed, worship of the personification of the sun and light by kindling fires in similar ways was universal over all Europe in heathen times. The survival of this fire-worship is seen in the periodical lighting of bonfires.

C. H. THURBER.

Bel'ton: city; on R. R.; capital of Bell co., Tex. (for location of county, see map of Texas, ref. 4-H); situated on Leon river, 60 miles N. E. of Austin City; has cottonseed oil-mill, cotton compress, roller flouring-mills, and several small manufactures; also fine public and private schools. Baylor Female College, the oldest in the State, is here. Pop. (1880) 1,797; (1890) 3,000.

EDITOR OF "JOURNAL."

Belts, Great and Little: two straits which connect the Baltic with the Cattegat. The former separates the island of Fünen from Seeland, is 36 miles long, and has an average width of about 18 miles. The depth ranges between 6 and 26 fathoms, and the current is so strong that the Belt is seldom frozen over. The navigation of both Belts is dangerous or difficult. The Little Belt separates Fünen from Jutland. It is 32 miles long. The widest part of it is about 10 miles, and the narrowest about 2,500 feet. From these Belts (Lat. *ballet*) the Baltic Sea is supposed to take its name.

Beluchistan: See BALUCHISTAN.

Belu'ga: a generic name formerly applied to dolphins of the genus *Delphinapterus*, distinguished by a blunt and broad head and the absence of a dorsal fin. They abound in the Arctic seas, are gregarious, and afford to the Green-

landers an important article of food. The white whale of the St. Lawrence (*Delphinapterus leucus*) is common in northern waters. It is caught in the St. Lawrence and the Saguenay, is from 10 to 15 feet long, and is prized for its excellent oil and its skin, which makes a very fine leather.

The name Beluga is often applied to a large sturgeon of Southern Russia (*Acipenser huso*), which affords great quantities of isinglass and caviare. See STURGEON.

Belus (in Gr. Βήλος); in classic mythology a King of Phœnicia; said to be a son of Neptune, a brother of Agenor, and the father of Egyptus. He is considered by some persons as identical with BAAL (*q. v.*).

Belus [in Gr. Βήλος, now called *Nahr Naaman*; perhaps the *Bealoth* of the Hebrew text of the Bible]; a small stream of Palestine, which enters the sea near Acre. On its banks it is said that the art of glass-making was invented by the Phœnicians.

Belus, Temple of: a famous temple of enormous size in the city of Babylon; rebuilt by Nebuchadnezzar shortly after 604 B. C. According to some authorities, it was destroyed by Xerxes, King of Persia. Some writers identify its ruins with *Birs-Nimrud* (a huge mound 6 miles S. W. of Hillah), which appears to have been originally about 156 feet high. Others identify its ruins with *Babil* (another mound some 6 miles N. of Hillah), whose height is about 140 feet.

Belvedere, bel-vē-deer', Ital. pron. bel-vāy-day'ray (i. e. fair view): an Italian word applied to a pavilion on the top of a house, or a structure designed to afford a fine prospect of the surrounding country; also an artificial eminence in a garden if so arranged as to command a prospect. In France and other countries of Europe the term is often used as the name of a palace, villa, or summer-house, but always with the general idea of something which commands a fine view. The famous statue called the Apollo Belvedere, also the Belvedere Torso, and other works of sculpture, derived their appellative from a court in the Vatican surrounded by galleries and bearing that name. RUSSELL STURGIS.

Belvidere: city and railroad junction; capital of Boone co., Ill. (for location of county, see map of Illinois, ref. 1-E); on Chicago and N. W. R. R., and on the Kishwaukee river, 78 miles W. N. W. of Chicago. It has elegant churches, and fine schools, flouring-mills, and manufactories of butter, cheese, sewing-machines, woven-wire mattresses and springs, shoes, etc. Pop. (1880) 2,951; (1890) 3,867; (1893) estimated, 5,500. EDITOR OF "NORTH-WESTERN."

Belvidere: town and railroad junction; capital of Warren co., N. J. (for location of county, see map of New Jersey, ref. 2-C); on the Delaware river, 13 miles above Easton, and 95 miles N. of Philadelphia. The Pequest creek enters the river here, and affords a valuable water-power. Belvidere has an academy, several mills, and a cotton-factory. Pop. (1880) 1,773; (1890) 1,768; (1895) 1,834.

Belvisia: See NAPOLKONA.

Belzo'ni, GIOVANNI BATTISTA: Italian traveler; b. at Padua, Nov. 5, 1778; emigrated to England in 1803, and gained a subsistence as an athlete. In 1815 he visited Egypt at the invitation of Mehemet Ali, who desired him to construct a hydraulic machine. He soon directed his attention to the exploration of Egyptian antiquities. He removed to England the colossal bust called *Young Memnon* which is now in the British Museum. He opened the temple of Ipsambul and the pyramid of Cephren (or the second pyramid of Gizeh). He published in 1821 a very interesting *Narrative of the Operations and Recent Discoveries within the Pyramids, Temples, Tombs, etc., in Egypt and Nubia*. He undertook a journey to Timbuctu, but died near Benin, Dec. 3, 1823.

Bem, JOSEPH: a Polish general; b. at Tarnov, in Galicia, in 1795. He served in the Polish army in the revolution of 1830, after which he passed some years in France. In 1848 he joined the Hungarian patriots, and obtained command of the army of Transylvania. He defeated the Austrians in several actions, and took part in the battle of Temesvár (1849), which was disastrous to Hungary. Having fled to Turkey and conformed to Islamism, he was raised to the rank of pasha. D. Dec. 10, 1850. See PATAKY, *Bem in Siebenbürgen* (1850); N. N. Lajos, *Le Général Bem* (Paris, 1851).

Bem'ba: African lake. See BANGWEULO.

Bembecida, bem-bes-i-dē [from Gr. βέμβιξ, a top]; a family of hymenopterous insects, the popular name of which

is "sand-wasps"; mostly natives of warm climates. They resemble wasps or bees in appearance, and the females make burrows in sandy banks, in which they deposit their eggs. Some of them emit an odor like that of roses. The U. S. have several species.

Bem'bo, PIETRO: Italian scholar and cardinal; b. in Venice, May 20, 1470. He removed to Rome in 1512, and became secretary to Pope Leo X. 1513. There he met Morosini (d. 1535), who bore him two sons and a daughter. In 1520 he removed to Padua, and lived in princely style. In 1539 he was raised to the dignity of cardinal. He then entered the priesthood, radically altered his mode of life, and studied the Fathers and not the classics. He was made Bishop of Gubbio (1541) and of Bergamo, but he did not leave Rome. He wrote, besides other works, a Latin *History of Venice* (1531). D. in Rome, Jan. 18, 1547. As a humanist he is famed for his pure Latinity. His collected works were published at Venice in 4 vols., 1729. See L. Beccadelli, *Vita di P. Bembo* (Venice, 1718); J. delle Casn, *Vita Bembi* (same vol.); cf. J. A. Symonds, *Renaissance in Italy*, ii. pp. 409-15.

Bement': village (located in 1854); Piatt co., Ill. (for location of county, see map of Illinois, ref. 6-F); on Wabash R. R., 21 miles W. of Decatur. Bement has three large school-buildings, electric lights, creamery, brick, and tile works. The surrounding region is devoted to the raising of wheat, corn, oats, and broom-corn. Pop. (1880) 963; (1890) 1,129. EDITOR OF "REGISTER."

Bemis, EDWARD WEBSTER, Ph. D.: economist; b. at Springfield, Mass., Apr. 7, 1860; A. B., Amherst College, 1880, Ph. D., Johns Hopkins University, 1883; gave at Buffalo, St. Louis, and Canton, O., the first courses in the U. S. to which the term University Extension was applied, 1887-88; Professor of Economics and History, Vanderbilt University, Nashville, Tenn., 1889-92; Associate Professor of Economics, University of Chicago, 1892-95. Author of *History of Co-operation in the United States* (1888); *Municipal Ownerships of Gas in the United States* (1891); *Relation of Labor Organization to the American Boy and to Trade Instruction* (Philadelphia, 1894), etc.

Bemis's or Bemus Heights: a post-village of Stillwater township, Saratoga co., N. Y. (for location of county, see map of New York, ref. 4-I); on the Champlain Canal, and near the Hudson river; was the scene of the first battle of Stillwater with Burgoyne, Sept. 19, 1777.

Ben: a term derived from Gaelic *bann*, "peak," prefixed to the names of many mountains of Scotland, most important of which are: BEN LAWERS in Perthshire; flanking the northwest shore of Loch Tay; easy of ascent; rich in Alpine plants; height, 3,984 feet.—BEX LEID in Perthshire; 4½ miles N. W. of Callender; celebrated in Scott's *Lady of the Lake*; height, 2,875 feet.—BEX LOMOND in the northwest of Stirlingshire; on the east side of Loch Lomond; the most famous of the Scotch mountains; summit commands a magnificent view, including the Lothians, the Firth of Clyde, the islands of Arran and Bute, the Irish coast, and Bens Lawers, Voirlach, Ledi, Nevis, and others; height, 3,192 feet.—BEX MACPENT; one of the Cairngorms, in the S. W. of Aberdeenshire; height, 4,296 feet; formerly supposed to be higher than Ben Nevis.—BEX NEVIS; the highest point in Great Britain; in the county of Inverness; formerly very difficult of ascent; summit commands a magnificent view; height, 4,406 feet. A road was built in 1883 to the top, where a meteorological observatory was then erected. There is also at present a shelter for travelers. C. H. TURNER.

Ben: a Hebrew word signifying "son"; equivalent to the Arabic *Ibn*; forms the first syllable of many scriptural names, as Ben-hadad, Benjamin, etc. *Beni*, the plural of Ben, occurs in the names of many Arabian tribes.

BEN. OIL OF: a fixed oil extracted by pressure from the fruits of *Moringa aptera* and other species; leguminous trees growing in the Levant and the East and West Indies. It is colorless or slightly yellow, and odorless. It is used to extract the odoriferous principles of fragrant plants.

Benares, ben-aar-ēz (anc. *Varanashi* and *Kasi*): a famous and populous city of Hindustan; capital of a division and district of the same name, and the most populous city in the Northwestern Provinces of British India; on the left bank of the Ganges; about 428 miles by rail N. W. of Calcutta, and 477 miles by rail S. E. of Delhi (see map of N. India, ref. 7-G). It is the holy city of the Brahmans, the chief seat of their science, and may be called the Hindu capital of

India. Flights of stone steps called *ghāts* lead down the steep banks of the Ganges, which is here about half a mile wide. The external appearance of the city, as seen from the river, is rendered very imposing by the minarets of about 300 mosques and the pinnacles of nearly 1,000 pagodas. The streets are very narrow, and the houses, which are mostly built of stone, are generally lofty, some of them six stories high. Among the remarkable public edifices are the great mosque of Aurungzebe, 232 feet high, many Hindu temples, a vast and old astronomical observatory, and the Hindu Sanskrit College, the chief seat of native learning in India. As the holy city of the Hindus and the central seat of Brahmanical learning, Benares attracts on the occasion of certain festivals an immense multitude of pilgrims, estimated at 100,000. Benares is a wealthy and industrious city, having extensive manufactures of silk, cotton, and woolen stuffs. It is a great emporium for the shawls of the north and the diamonds of the south, and, when they were produced, it was the chief market for the famous native muslins of Dacca and the eastern provinces. The Hindu Sanskrit College was founded here in 1791, and an English department was added to it about 1827. The residences of the Europeans are mostly at Secrole, which is 3 miles from Benares, and contains many fine mansions. It is connected by a railway with Calcutta and Delhi. A mutiny of Sepoys broke out here in June, 1857, but was soon quelled. Pop. (1881) 207,570; (1891) 222,520.

Benbow, John: an English admiral; b. in Shrewsbury, England, in 1653; entered the navy in 1678 as master's mate. He became a rear-admiral in the reign of William III., who reposed great confidence in him. On Aug. 19, 1702, he encountered a superior force under the French admiral Du Casse, near Jamaica. He maintained a running fight for four days with his own ship alone, the captains of the rest of the squadron refusing to support him, for which two of them were shot. He was mortally wounded, and died at Port Royal, Jamaica, Nov. 4, 1702. See Campbell, *Lives of the British Admirals*.

Bench [O. Eng. *benic*; O. H. Germ. *banch* > Mod. Germ. *Bank*; appears as loan-word in the Romance language; Ital. *banco, banca*; Fr. *banic, banque*]; in law—1. A court or tribunal for the administration of justice. The word originally meant the seat occupied by the judges in court. In England two of the leading courts are termed the king's or queen's bench and common bench. The latter tribunal is also called the court of common pleas. (See COURT.) The word is also used to designate the judges as contrasted with the practitioners in their court, as in the phrase "the bench and the bar." Revised by F. STURGES ALLEN.

Bench Warrant: an order issued by or from a bench for the arrest of a person, either in case of contempt or after an indictment has been found, or from a judge to apprehend a person charged with an offense.

Bench'ers: principal officers of the English inns of court, intrusted with their government and with the power of admitting persons to the bar, and of disbarring practitioners, though the exercise of these powers is subject to the supervision of the judges of the higher courts.

Bencool'en: a Dutch seaport-town on the southwest coast of Sumatra; lat. 3° 48' S., lon. 102° 3' E. (see map of East Indies, ref. 8-B). Pop. estimated at 5,000. It was founded by the English in 1685, but was ceded to Holland in 1825 in exchange for Malacca. The climate of the city is exceedingly unhealthful. Pepper is the chief article of export.

Ben'der, or Ben'dery: a fortified town of Russia; in Bessarabia; on the right bank of the Dniester; 65 miles N. W. of Odessa (see map of Russia, ref. 10-C). Bender has several paper-mills, forges, and tanneries. It was captured in 1770 by the Russians, who massacred the population; was restored to the Turks in 1774; stormed again and again by the Russians, into whose possession it permanently passed with Bessarabia in 1812. Pop. (1892) 46,408.

Bendigo: See SANDHURST.

Bendire, CHARLES EMIL: captain U. S. army; ornithologist; b. near Darmstadt, Germany, Apr. 27, 1836; removed to the U. S. in 1852; entered the army in 1854 as private in the First Dragoons. He remained in the army throughout the civil war, and during this time received his commission in the First Cavalry. At the close of the war he was transferred to the West, where he passed a great portion of the time until his retirement as captain, Apr. 24, 1886. During

this period he devoted much time to natural history, especially ornithology, and collected a large amount of material in various branches of natural history, most of which was presented to the U. S. National Museum. In 1870 he began the formation of a collection of eggs of North American birds, which ultimately contained over 8,000 specimens, and this unrivaled collection he presented to the U. S. National Museum, the only condition being that it should remain intact. Capt. Bendire is the leading authority on North American oölogy, and honorary curator of the section of oölogy U. S. National Museum. He has published many ornithological papers, and since his retirement from service has devoted his time to the preparation of a comprehensive work entitled *The Life Histories of North American Birds, with Special Reference to their Breeding Habits and Eggs*. The first volume, published by the Smithsonian Institution and U. S. National Museum, appeared in 1892.

FREDERIC A. LUCAS.

Bendix, JOHN E.: b. on board the steamer Sarah on the St. Lawrence river, Aug. 28, 1818; learned the trade of a machinist in New York; joined the Ninth regiment, State militia, in 1847; organized the Seventh regiment of volunteers in 1860; took part in the battles of the Wilderness, Antietam, Fredericksburg, etc., and was made a brigadier-general in 1865. D. in New York, Oct. 8, 1877.

Bend Sin'ister: a heraldic bearing, like the bend, but reversed, and reaching from the sinister chief to the dexter base. It is the most common mark of illegitimate descent, and as such is the only *abatement* in use. See ABATEMENT and HERALDRY.

Benedek, bay'ne-dek, LUDWIG, von: an Austrian general; b. at Ödenburg, Hungary, in 1804; fought with the rank of colonel against the Italians in 1848; became a major-general in April, 1849; after which he served with distinction against the Hungarian patriots. He directed a corps in the Italian campaign of 1859 and at Solferino. In June, 1866, he took the command of the operations of the grand Austrian army in Bohemia, and was defeated by the Prussians at the decisive battle of Sadowa, July 3, 1866. D. Apr. 27, 1881.

Benedetti, bay'ne-det'teé, VINCENT, Count: a French diplomatist; b. in Bastia, Corsica, Apr. 29, 1817; entered the diplomatic service, and held consulates in Cairo, Palermo, Malta, and Tunis. He was sent as ambassador to the kingdom of Italy in 1861, and to Berlin 1864. In 1870 he was employed by Napoleon III. in secret negotiations with the court of Prussia, and it was an alleged affront from William I. of Prussia, offered him at Ems, which Napoleon made a pretext for declaring war.

Benedicite, ben-e-dis'i-te: the Latin title of the hymn which is found in the Septuagint version of the Book of Daniel and also in the Apocrypha, and is said to have been sung by Ananias, Azarias, and Michael (called in Daniel, Shadrach, Meshach, and Abednego), when they were cast into the furnace of fire (Dan. iii.). The *Benedicite* bears a close resemblance to the 148th Psalm, and is considered by some to be its expansion. It was probably used in the Jewish worship, and so passed into use in the early Church. It was liturgically used in the days of St. Athanasius (A. D. 325-60); and St. Chrysostom (A. D. 425) calls it "that admirable and marvelous song, which from that day to this has been sung everywhere throughout the world, and shall yet be sung by future generations." It is found in the *Book of Common Prayer* of 1549, with the following rubric prefixed: "After the first lesson shall follow *Te Deum laudamus* in English daily throughout the year, except in Lent, all the which time in the place of *Te Deum* shall be used *Benedicite omnia opera Domini* in English, as followeth." In the first Prayer-book of King Edward VI. the hymn ran thus: "O all ye works of the Lord, speak good of the Lord; praise Him and set Him up forever." In the second Prayer-book of King Edward VI. (A. D. 1552) it was changed to its present form, and the restriction as to its use removed. It is generally sung from Septuagesima to Easter, and also during Advent. W. S. PERRY.

Ben'edict (in Lat. *Benedictus*), SAINT: an Italian ascetic; called the founder of monachism in the West; b. in Nursia, Umbria, in 480 A. D. He renounced the world in early youth (494), passed three years in solitude in a cave, hence called The Holy Grotto, near Subiaco. His hiding-place was discovered, and he acquired a wide reputation for sanctity. He was compelled to undertake the spiritual direction of hundreds, whom he organized into separate societies of twelve,

each with an abbot. In 515 he composed as a substitute for the Oriental rule of Basil a system of monastic rules, which was largely adopted by the Western monks, and was known as the Rule of St. Benedict. Under this system the monks were employed in manual labor and in the instruction of the young. In 529 he founded the famous monastery of Monte Cassino, near Naples, and died there Mar. 21, 543 A. D. His life was written by Gregory the Great (Eng. trans. by P. W. Luck, London, 1880). His *Rule* has been several times translated (e. g. London, 1886). Cf. F. C. Doyle, *The Teachings of St. Benedict* (1887), and J. G. Waitzmann, *Leben und Wirken des heiligen Benedict* (Augsburg, 1835). See BENEDICTINES.

Benedict I. became Pope of Rome in 574 A. D. D. in 578.—**Benedict II.**, a native of Rome; was elected pope in 683 A. D. D. in 685.—**Benedict III.**, succeeded Pope Leo IV. in 855. D. in 858, leaving a good reputation for piety.—**Benedict IV.** was elected pope in 900, as the successor of John IX. D. in 903.—**Benedict V.** was chosen pope in 964, but was banished from Rome by the Emperor Otto I. Leo VIII. was pope at the same time with him, and both are recognized by Roman Catholic historians. D. in 966.—**Benedict VI.** was elected pope in 972, and was killed by the rebellious Romans in 974.—**Benedict VII.**, succeeded Pope Benedict VI. in 974. He is said to have ruled with ability. D. in 983.—**Benedict VIII.**, a son of the Count of Tusculum, became pope in 1012. He crowned the Emperor Henry II. in 1013, and defeated the Saracens, who had invaded the papal states. D. in 1024.—**Benedict IX.** (THEOPHILACTUS OF TUSCULUM), sometimes called the "boy-pope," was chosen pope in 1033. He was extremely licentious, and was expelled by the Romans. Sylvester III. became anti-pope. Benedict was deposed by the Emperor Henry III. about 1048. D. 1055.—**Benedict X.**, called THE STUPID, was chosen pope in 1058, removed through the influence of Hildebrand in 1059, and died in prison in the same year.—**Benedict XI.** (Saint), b. in 1240; native of Treviso; succeeded Boniface VIII. in 1303; noted for humility. D. in 1304.—**Benedict XII.** (originally JACQUES FOUQUER), native of France; chosen pope in 1334. He was the third pope who reigned at Avignon, and was eminent as a canonist and theologian. He wrote several works. D. in 1342, and was succeeded by Clement VI. Pope Benedict XII. was an excellent man.—**Benedict XIII.**, succeeded Innocent XIII. in 1724. He was distinguished for moderation and other virtues, and promoted the peace of Europe. D. in 1730. (See Clemente da Cruz, *Vida de Benedicto XIII.*, 1739).—**Benedict XIII.** (anti-pope) (PEDRO DE LUNA), b. in Aragon; elected pope by certain cardinals at Avignon in 1394. Another party elected Boniface IX. at Rome, and a schism of the Church ensued. This Benedict was deposed by the Council of Constance in 1417. D. in 1424.—**Benedict XIV.** (PROSPERO LAMBERTINI); b. at Bologna in 1675; was a man of superior talents. He was well versed in history, theology, and classical learning. He succeeded Clement XII. in 1740, and showed himself a liberal patron of literature and science. He was also distinguished for his moderation and enlightened piety, and was the author of several esteemed religious works, and especially of the standard authority on beatification, *De beatificatione* (Bologna, 1734-38; Eng. trans. in parts, *Heroic Virtue*, London, 1850, 3 vols.). D. in 1758. See Fabroni, *Vita di Benedetto XIV.*, 1787.

Benedict, Sir JULIUS; musician; b. at Stuttgart, Nov. 27, 1804; studied under Hummel at Weimar, and also under Weber. When nineteen years old conducted a series of opera performances at Vienna, and next at Naples, where his first work, *Giacinto ed Ernesto*, was produced in 1827. His second opera, *I Portoghesi in Goa*, was produced in Stuttgart in 1830. In 1836, on the advice of Malibran, visited London, where he remained till his death, as conductor, composer, pianist, and teacher. When Jenny Lind came to the U. S., Benedict came with her as pianist and accompanist. As a composer he was prolific and successful. His principal works are *A Year and a Day* (1836); *The Gypsy's Warning* (1838); *The Bride of Venice*, *The Crusaders*, *The Lily of Killarney* (1862), *The Bride of Song* (1864), all operas produced in England; *Undine*, a cantata for the Norwich festival (1860); *Richard Cœur de Lion*, cantata for the Norwich festival (1863); *St. Cecilia*, cantata for the Norwich festival (1866); *St. Peter*, oratorio for the Birmingham festival (1870); *Graziella*, cantata for the Birmingham festival (1882); besides several symphonies and overtures, many songs, part songs, and much piano music. He was knighted Mar. 24,

1871. He also received numerous orders and decorations from European sovereigns. D. in London, June 5, 1885.

D. E. HERVEY.

Benedict, LEWIS; lawyer and general of volunteers; b. in Albany, N. Y., Sept. 2, 1817; graduated at Williams College; studied law, and was admitted to the bar in 1841. He was actively engaged in politics for many years and held various important local offices. He entered the army as lieutenant-colonel Seventy-third New York volunteers; engaged at Yorktown; captured at Williamsburg; exchanged Sept., 1862; appointed colonel 162d New York volunteers, and was attached to the Army of the Gulf. He was in command of a brigade at the battle of Port Hudson and during the Red river expedition, where he greatly distinguished himself. Killed at battle of Pleasant Hill, La., Apr. 9, 1864, while leading his brigade to a charge. Brevet brigadier-general U. S. volunteers for gallant conduct.

Benedict, MORIZ; German neurologist; b. at Eisenstadt, Hungary, July 6, 1835; M. D., University of Vienna, 1859; Professor of Nervous Pathology, University of Vienna, 1868; author of *Elektrotherapie* (1868); *Nervenpathologie* (1874); *Anatomische Studien an Verbrechergehirnen* (1881); and a large number of monographs and articles on neurological subjects.

Benedictine Editions of the Fathers: The following is a complete list of these highly esteemed and now very costly works: 1, *Barnabas* (Menard), 4to, 1642; 2, *Lanfranc* (D'Achery), fol., 1648; 3, *Bernard* (Mabillon), 2 vols. fol., 1667; 4, *Anselm* (Gerberon), fol., 1675; 5, *Augustine* (Delfan and others), 11 vols. fol., 1679-1700; 6, *Cassiodorus* (Garet), 2 vols. fol., 1679; 7, *Ambrose* (Du Frische and Le Nourri), 2 vols., 1686-90; 8, *Hilary* (Constant), fol., 1693; 9, *Jerome* (Martiany and others), 5 vols. fol., 1693-1706; 10, *Athanasius* (Montfaucon), 3 vols. fol., 1698; 11, *Gregory of Tours* (Ruinar), fol., 1699; 12, *Gregory the Great* (De Sainte-Marthe), 4 vols. fol., 1705; 13, *Hilbert* (Beaugendre), fol., 1708; 14, *Irenaeus* (Massuet), fol., 1710; 15, *Lucius* (Carclius (Le Nourri), 8vo, 1710; 16, *Prosper Aquitanus* (Maretti and Manceant), fol., 1711; 17, *Chrysostom* (Montfaucon), 13 vols. fol., 1718-38; 18, *Cyril of Jerusalem* (Toulcée and Maran), fol., 1720; 19, *Basil* (Garnier and Maran), 3 vols. fol., 1721-30; 20, *Cyprian* (Maran), fol., 1726; 21, *Justin Martyr* (Maran), fol., 1742; 22, *Origen* (De la Rue), 4 vols. fol., 1733-59; 23, *Gregory Nazianzen* (Clement), 1 vol. fol., 1778; 2d vol., 1842.

Benedictines, or **Benedictine Order:** monks who observe the rule of St. Benedict. This order was one of the most ancient and learned religious orders of Western Europe. The first Benedictine monastery was that founded by St. Benedict on Monte Cassino, near Naples, in 529 A. D. The order spread rapidly and widely in several countries of Europe, and it is said had at one period 37,000 monasteries. The Benedictines boasted that their order had produced 24 popes, 200 cardinals, 4,000 bishops, 1,500 saints. The rule of St. Benedict was less severe than that which the Eastern ascetics practiced. It required that the monks should live frugally, avoid laughter, hold no private property, and be industrious. To them we are especially indebted for the preservation and transmission of many of the ancient classics through the Dark Ages down to the present time. Among the most celebrated houses or societies of this order was the Congregation of Saint-Maur (dating from 1621), on the river Loire, to which all the Benedictine houses in France were affiliated. Connected with it were many learned men, including Mabillon, Montfaucon, and Sainte-Marthe. They published good editions of the Fathers (see above), and numerous valuable works, among which are *L'Antiquité Expurgée* (15 vols. fol., 1719-24); *Veterum Scriptorum Spiegelium* (13 vols., 1653-77); *Acta Sanctorum S. Benedicti* (9 vols., 1688-1702); and *Histoire Littéraire de la France* (9 vols. 4to, 1733-49). The Cistercians, Carthusians, Camaldules, Clunians, Celestines, and Trappists were branches of the Benedictine order. There are also Benedictine nuns, with twelve convents, in the U. S. See *Annales Ordinis S. Benedicti* (6 vols., 1713-39); Tassin, *Histoire de la Congrégation de Saint-Maur* (1770); Montalembert, *The Monks of the West* (5 vols., 1860).

Benediction [from Lat. *benedicere*, deriv. of *benedicere*, praise, wish well, bless; *bene*, well + *dīcere*, speak. *Benison* is from the same Lat. source via O. Fr. *beneisson*]; a solemn invocation of the divine blessing upon men or things; the ceremony is as ancient as religious feeling. The custom

was sanctioned by Christ, and in the primitive Church was greatly developed in various forms. In Protestant churches some form of benediction usually closes religious services. In the Roman Catholic Church the ceremony is more elaborate, and generally accompanied with the sprinkling of holy water, use of incense, and making the sign of the cross. On Easter Sunday in Rome the Pope pronounces after mass a solemn benediction *urbi et orbi* (on the city and the world). The papal benediction conveyed to a dying person carries with it a plenary indulgence. The name is also given in some countries to a brief and popular service of comparatively modern origin in the Roman Catholic Church.

C. H. THURBER.

Ben'edix, JULIUS RODERICK: a German author; b. in Leipzig, Jan. 21, 1811. He wrote very many successful plays, mostly humorous, among them *Bemoostes Haupt*; *Der Steckbrief*; *Der Störenfried*; *Mathilde*, etc., and a novel, *Bilder aus dem Schauspielerleben*. D. in Leipzig, Sept. 26, 1873.

Ben'elice [O. Fr., from Lat. *beneficium*, favor]; originally a bounty in land given to a meritorious Roman soldier. In mediæval history the term denoted an estate in land conferred by a superior by way of recompense for service. As late as the twelfth century the word was used synonymously with *fædum*. The earlier historians of the Middle Ages adopted the view that benefices were given successively, as revocable, as temporary, as estates for life, and finally as estates in perpetuity. This view has been refuted by Guizot (see *Civilization in France*, vol. iii.). In the canon law the word "benefice" designates a right inhering in a clergyman of sharing the income of church property in return for the performance of spiritual duties. The Roman Catholic Church includes all clerical offices, even the papal, among benefices; but the Church of England, which long made the term include all preferments except bishoprics, now excludes also all cathedral preferments, such as deaneries, canonries, archdeaconries, etc. The term "dignity" is applied to bishoprics, deaneries, archdeaconries, and prebends; the term "benefice" to parsonages, vicarages, and donatives. For the right of presentation to benefices, see ADVOWSON.

Benefit of Clergy: in English criminal law the privilege of the clergy, a clerk's privilege. During the Middle Ages benefit of clergy in various European countries extended to a total exemption in favor of clergymen from the process of a secular judge in criminal cases. In England, however, it was not carried beyond an exemption from capital punishment in felony and petit treason. It was never granted in cases of high treason or offenses below felonies. Offenses were thus divided into those which were clergyable and not clergyable. This exemption, at first allowed only to clergymen, soon was extended to all the officers and clerks of the church, and then to every one who could read, an ability to read being confined almost wholly to those in the service of the church. But when learning became more generally diffused, a distinction was made between those in orders and laymen who could read, the latter being allowed the privilege only once, and then (unless they were peers or peeresses) being branded in the left thumb. A woman, unless she was a peeress, could not claim this exemption, though this inequality was rectified by statute. At first, the criminals who were allowed this privilege were handed over to the ordinary or bishop to be dealt with according to the canons of the Church; but in the reign of Elizabeth it was enacted that they should be discharged from prison, with the proviso that the court might in its discretion keep the offender in prison for a year; and by subsequent statutes various punishments, such as whipping, fine, and imprisonment, were imposed on criminals entitled to benefit of clergy, who were practically all convicts. Whenever Parliament desired to make an offense strictly capital, the practice was to introduce into the enactment the words "without benefit of clergy." By statute of 7 Geo. IV., c. 28, s. 6, benefit of clergy was abolished. Its retention for so long a time was plainly owing to the fact that it could be used to mitigate the rigor of the English criminal law. For details as to this exemption, consult 4 Blackstone's *Commentaries*, 365.

T. W. DWIGHT.

Benefit Societies: See CO-OPERATIVE INSURANCE SOCIETIES.

Bencke, bay ne-ke, FRIEDRICH EDUARD: a German philosopher; b. in Berlin, Feb. 17, 1798. He became Extraordinary

Professor of Philosophy in the University of Berlin in 1832. Among his works are *Psychological Sketches* (2 vols., 1825-27); a *System of Logic* (2 vols., 1842); and *Pragmatic Psychology* (1850). His system of psychology is called "empirical." Raue's *Elements of Psychology* gives a good view of his system. He disappeared Mar. 1, 1854, and his body was found in a canal in June of the same year.

Revised by W. T. HARRIS.

Benét, ben-ay', STEPHEN VINCENT; b. at St. Augustine, Fla., Jan. 22, 1827; educated in Alexandria, Va., at the University of Georgia, and the U. S. Military Academy at West Point, N. Y., where he was graduated July 1, 1849. In 1853 he published a translation of Jomini's *Political and Military History of the Campaign of Waterloo*; assistant Professor of Ethics and Law at West Point (1859-61); instructor of ordnance (1861-64); inspector of ordnance (1864); commander of Frankford arsenal; major of ordnance corps (1866); chief in 1874; retired Jan. 22, 1891. Published *Military Law and the Practice of Courts Martial* (1862), a text-book at West Point; and *Electro-ballistic Machines and the Schultze Chronoscope* (1866).

Benevento, bay-nay-ven'tō: a province of Italy; bounded N. by Campobasso, E. by Foggia, S. by Avellino, W. by Caserta. Area, 688 sq. miles. The country is level, and the soil generally fertile. The chief articles of export are cattle, grain, wine, oil, etc. It has changed masters very often, and was annexed by Italy at the same time as Naples. Pop. (1890) 244,464.

Benevento (Lat. *Beneventum*): a walled city of Southern Italy; capital of the province of the same name; situated on a hill or declivity by the river Calore; 33 miles N. E. of Naples (see map of Italy, ref. 6-F). Pop. 22,700. It has a citadel or castle, a fine old cathedral, several palaces, and churches. It is the see of an archbishop, and has several annual fairs. Among the many ancient remains found here is the magnificent Arch of Trajan, erected in 114 A. D., now nearly perfect. Benevento is a place of great antiquity, having become a Roman town as early as 274 B. C., and it was an important city during the Roman empire. It was conquered in the sixth century by the Lombards, under whom it continued to flourish, and became the capital of the powerful duchy of Benevento. The city, with some adjacent territory, was given to the pope in 1053, and governed by a cardinal-legate with but small intermissions until 1860, when it was united to the kingdom of Italy. In 1806 it was erected into a principality by Napoleon, who gave Talleyrand the title of Prince of Benevento.

Benezet, ANTHONY: a philanthropist; b. in St. Quentin, France, Jan. 31, 1713. He joined the Society of Friends, and emigrated in 1731 to Philadelphia, where he taught school for many years. He was eminent as an opponent of the slave-trade and slave-holding, and as a benefactor of the Negroes. He wrote several tracts on the subjects. D. in Philadelphia, May 3, 1784. See Vaux, *Memoir of A. Benezet* (1817).

Ben'fey, THEODOR: Sanskrit scholar; b. at Nörten, near Göttingen, of Jewish parents, Jan. 28, 1809; became privat-docent of Sanskrit at Göttingen in 1834, and in 1848 extraordinary professor; full professor in 1862. He published *The Hymns of the Sāma-Veda* (1848); a Sanskrit reader and grammar; *Pantschatantra* (Leipzig, 1859), a work of prime importance for the origin and spread of the fables and tales of India; a great *Sanskrit-English Dictionary* (London, 1866); a *History of Philology (especially Oriental) in Germany* (Munich, 1869); and other books; also very many minor treatises. Many of the last, selected and edited by Bezzenberger, have been republished (Berlin, 1890-92) as *Kleinere Schriften* (with biography). He was a man of vast learning; but a lack of terse, lucid, and orderly statement lessens the usefulness of much of his work. D. in Göttingen, June 26, 1881.

C. R. LANMAN.

Bengal, ben-gawl': the largest and most populous of the local governments of British India; bounded N. by Nepal and Bhutan, E. by Assam and Burma, S. by the Bay of Bengal and Madras, and W. by the Northwestern and the Central Provinces. Area, 149,725 sq. miles. The greater part of Bengal consists of the alluvial plain or valley of the Ganges and Brahmaputra. The combined delta of these great rivers commences 280 miles from the sea, near which the delta islands, here called Sunderbunds, are covered with a very dense vegetation, and infested by serpents, crocodiles, and tigers. Farther N. the country is marvelously prolific of

rice, cotton, opium, sugar, indigo, and a great variety of tropical fruits. The chief exports are opium, saltpeter, rice, hides, and indigo. The climate of Bengal is subject to great extremes of heat, and is very destructive to the health of both Europeans and natives; but in this respect great improvement is reported in the last few years. Pop. (1891) 66,589,553. See FAMINE.

Among the most important cities of Bengal province are Calcutta, the capital, Delhi, Benares, Patna, Agra, and Murshidabad. The people are Hindus, Mohammedans, Sikhs, and various wild tribes in the hill-country. The native Bengalese are a facile, deceitful, cowardly race. Their morals are much debased. The English first established themselves in Bengal in 1656. From the smallest beginnings their great empire of the East has grown up. The Bengalese language has a basis of Sanskrit, but is modified by words of Arabic, Malay, and Persian origin. Its literature has been much neglected till of late. Since 1858 the history of Bengal has been one of steady and peaceful progress. Its external trade is practically confined to Calcutta. Chittagong is the rice port.

Bengal, Bay of (anc. *Gangeticus Sinus*): a part of the Indian Ocean extending between Hindustan and Farther India. Its southern boundary is variously placed by geographers. According to some it is a line about 1,200 miles long drawn from Coromandel to the peninsula of Malacca. Others assign as its southern limit a line drawn from the delta of the Godavery to Cape Neagrais. Its chief affluents are the Ganges, the Brahmaputra, and the Irrawaddy. There are no good harbors on the western coast, but several safe ports occur on the east side, as Aracan, Cheduba, Neagrais, etc. The tide sometimes rises to the height of 70 feet in this bay. The northeast monsoon prevails here in summer and the southwest monsoon in winter. In this bay are the Andaman and the Nicobar islands.

Bengali, ben-gaw'lee, Lan'guage: the Aryan language of Eastern Bengal, the district about the mouths of the Ganges, of which Calcutta is the metropolis. It belongs to that group of neo-Sanskrit languages now spoken in Northern and Central Hindustan, which bear a relation to the Sanskrit quite similar to that of the Romance languages to Latin. These languages are: 1. The Bengali (or Bangali). 2. The Hindi, occupying a vast territory in Northern Hindustan, stretching from the Himalayas south to the Nerbudda and from the lower Ganges westward nearly 1,200 miles to the valley of the Indus, estimated in all at about 248,000 sq. miles. Hindustani is a *lingua franca* based largely on Hindi. 3. The Oriya, the language of Orissa, to the south of Calcutta. 4. The Marathi, the language of ten million people in the province of Bombay, and to the eastward in the Nizam's Dominions and the Central Provinces. 5. The Gujarati of Gujerat, on the west coast, north of Bombay. 6. The Sindhi along the lower Indus. 7. The Panjabi in the Punjab, the district of the "five rivers." 8. The Cashmiri of Cashmere. 9. The Sinhalese of Southern Ceylon. Other divisions are of secondary importance, or may be like Nepali and Assamese, subdivisions merely. Among all these the Bengali ranks next to Hindi in extent and importance. It is spoken by about seventeen million people. Its colloquial form appears in many rather ill-defined dialects, from which the literary language of Calcutta has widely departed under the influence of a strong archaizing tendency. The necessities of its vocabulary in meeting the demands of modern life have been supplied by free recourse to the Sanskrit, which has also exercised an influence upon inflexion and syntax.

Calcutta, 1861); Yates-Wengler, *Introduction to Bengali Language* (2 vols., Calcutta, 1874); Beames, J., *Grammar of the Bengali Language* (London, 1891); Haughton, G. C., *Bengali, Sanskrit, and English Dictionary* (London, 1833); cf. also Beames, J., *Comparative Grammar of the Modern Aryan Languages of India* (London, 1875); Cust, R. N., *The Modern Languages of the East Indies* (London, 1878); Blunhardt, J. F., *Catalogue of the Bengali Books in the British Museum* (1886).

BENJAMIN IDE WHEELER.

Bengal Light, or Blue Light: a brilliant signal-light used at sea during shipwreck, and in ordinary pyrotechny for illuminating a tract of country. It is produced by the combustion of a mixture of niter, sulphur, and trisulphide of antimony. These materials are first reduced to a fine powder, then dried and mixed in the proportions of 6 lb. of niter, 2 of sulphur, and 1 of the trisulphide.

Bengel, beng'el, JOHANN ALBRECHT, D. D.: German Lutheran theologian; b. at Winnenden, in Württemberg, June 21, 1687. He was probably the first Protestant who treated the exegesis of the New Testament in a thoroughly critical spirit. His edition of the Greek Testament (1734) is the foundation of modern criticism of the New Testament text. He wrote the celebrated *Gnomon Novi Testamenti* (1742) and an *Exposition of the Revelation of St. John* (1740), etc. D. in Stuttgart, Nov. 2, 1752.

Benghazi, ben-gaa'zee (anc. *Berenice*): a seaport-town of Northern Africa; capital of Barca; on the east coast of the Gulf of Sidra; 420 miles E. S. E. of Tripoli (see map of Africa, ref. 2-B). The port is shallow, and nearly filled with sand. It has some trade in oxen, sheep, corn, and wool. It is supposed by some to be the site of the ancient *Hesperis* and the Gardens of the Hesperides. Pop. estimated at from 6,000 to 7,000.

Benguela, ben-gay'laa: a district of the Portuguese West African province of Angola. It is bounded on the N. by the Coanza river, which separates it from Angola proper, S. by Mossamedes, and W. by the Atlantic Ocean. The eastern limit is not definitely fixed. It is watered by numerous small rivers, which flow westward into the Atlantic. The surface is mountainous. The soil is fertile, and produces a very luxuriant and varied vegetation. The climate is hot, humid, and unhealthy, especially near the coast. The forests are infested by lions and other beasts of prey. Capital, Benguela (see map of Africa, ref. 7-D).

Benham, HENRY W.: military engineer; b. at Cheshire, Conn., 1816; graduated at West Point in 1837; colonel of engineers, brevet major-general U. S. A.; has had charge of the principal engineer works on the Atlantic coast, of the Potomac aqueduct, and of the coast survey office; member of commission for New York docks 1855; engineer of New York quarantine commission 1859; was wounded and breveted captain at Buena Vista 1847; breveted colonel as commanding at the rout of Garnett, Carrick's Ford, July, 1861; as brigadier-general volunteers commanding leading brigade at Carnifex Ferry, Sept., and at rout of Floyd through Fayetteville Nov., 1861; commanding district and troops at capture of Fort Pulaski, Apr., 1862; commanding engineer brigade, laid several ponton-bridges under fire during Chancellorsville battles, his horse being shot under him; constructed and commanded defenses at City Point, 1864; breveted major-general volunteers and brigadier and major-general U. S. army for gallant conduct, etc., Mar., 1865; senior engineer Boston; president of engineer boards; devised picket shovel and rapid construction of ponton-bridges by "simultaneous bays." Retired 1882. D. in New York, June 1, 1884.

Beni, bay'nee: a river of South America; in Bolivia; rises on the east slope of the Andes, and is formed by the junction of the Chuqueapo and Mapiri. It flows northward into the Madeira or Mamore after a course of about 650 miles.

Beni: a department of Bolivia; bounded N. and E. by Brazil, S. by La Paz, Cochabamba, and Santa Cruz, and W. by Peru. Area, 100,551 sq. miles. It comprises the whole northern part of the republic, and with the exception of a small part in the southwest corner, and a part of the province of Menos in the E., is entirely an unknown region, inhabited only by wild Indians. Chief town, Trinidad. Pop. (1888) 16,744 whites, and about 100,000 Indians.

Benicarlo, bee'nee-kaar'lo: a seaport-town of Spain; province of Valencia; on the Mediterranean; about 82 miles N. N. E. of Valencia (see map of Spain, ref. 15-I). It is meanly built, and has a ruined castle and a fishing-port. A strong wine is made here and exported to Bordeaux, where it is used to adulterate claret. Pop. (1887) 7,916.

Benicia, bee'nis'ia: city; on railroad; Solano co., Cal. (for location of county, see map of California, ref. 7-C); on the north side of the Strait of Carquinez (which connects San Pablo and Suisun bays); 30 miles by rail and 28 miles by water N. E. of San Francisco. It was incorporated in 1850, and was formerly the capital of the State. The strait is nearly 2 miles wide, and is navigable for large vessels. Benicia has a law school, a girl's seminary, a convent, a U. S. arsenal and barracks, ship-yards, two very large tanneries, fruit and fish packing establishments, pottery and cement works, gas and electric lights. It is the seat of St. Augustine College (Episcopalian). The land in the vicinity is adapted to the growing of almonds and grapes. Pop. (1880) 1,794; (1890) 2,361. Editor of "NEW ERA."

Benign Growths, or Tumors: See TUMORS.

Beni-Hassan, bay nê-hâs san; a village of Central Egypt; on the right bank of the Nile; 23 miles S. S. E. of Minieh. Here are twenty-two grottoes or catacombs excavated in a calcareous bank or hill. They are supposed to have been used as tombs by the people of Hermopolis, which stood on the opposite side of the river. Here are apartments 60 feet long and 40 feet wide, in which are pillars of the native rock 16 ft. 8½ in. in height and 5 feet in diameter. The sides of the grottoes are covered with paintings designed with skill and good taste. These tombs are among the most remarkable in Egypt. The earliest bears the date of the forty-third year of Ositarsen I., not far from 1800 B. C. Says J. P. Thompson: "I found one tomb, some 200 feet above the level of the river, almost a Doric temple hewn from the solid rock. . . . This chamber was cut from the solid rock with perfect precision; no modern square or line or plummet could make it more true."

Beni-Israel (sons of Israel); remarkable people, apparently of Jewish origin, in the W. of India, chiefly in Bombay and some coast towns. They acknowledge the law of Moses and retain many of the Jewish customs, although conforming to some of the idolatrous practices of the Hindus. Some of them know Hebrew, but Marathi is their ordinary language, and in it they have some literature. They rarely intermarry with ordinary Jews or with the Hindus.

Beni Khaibir': a tribe in Arabia, supposed by some, but without sufficient reason, to be a remnant of the ancient ascetic Rechabites. They number about 60,000. See RECHABITES.

Benin, ben-ee'n': a maritime district of Western Africa; in Upper Guinea; W. of the river Niger, N. E. of the Bay of Benin; in the territory of the Royal Niger Company. Its limits in some directions are not well defined or ascertained. The interior is elevated and hilly, and mostly covered with forests. The soil is fertile, and supports a dense population. Sugar, rice, yams, palm oil, and cotton are the staple productions.

Beniu: a town of Africa; on a river of the same name; 73 miles from the ocean (see map of Africa, ref. 5-C). The houses are built of clay. Pop. estimated at 15,000. Belzoni died near this town in 1823.

Benin, Bight of: portion of the Gulf of Guinea (*q. v.*), bordering on the above district.

Beni-Souef, ben'cê-swef': a town of Central Egypt; on the Nile; 62 miles S. S. W. of Cairo. It has cotton-mills and quarries of alabaster, and is the entrepôt of the produce of the fertile valley of Fayoom. Pop. 7,000.

Benjamin: youngest son of the patriarch Jacob and of Rachel (who called him BENONI). He was his father's favorite child, and the head of one of the twelve tribes of Israel. The territory of this tribe was bounded on the N. by that of Ephraim, on the E. by the Jordan, on the S. by the land of Judah, and on the W. by that of Dan. Its soldiers were distinguished as archers and noted for left-handed slingers. The tribe was nearly extirpated in the days of Phinehas, son of Aaron, by the other confederate tribes, for a gross breach of hospitality, but 600 men who had escaped were supplied with wives, partly by rapine at Shiloh, and thus it was re-established (Judges xix.-xxi). The first King of Israel, Saul, was a Benjamite. After the death of Solomon the tribes of Benjamin and Judah remained loyal to his dynasty when the other ten tribes revolted.

Benjamin, JUDAH PHILIP: a jurist and politician of Jewish extraction; b. in St. Croix, West Indies, Aug. 11, 1811. He practiced law in New Orleans; was elected a Senator of the U. S. for Louisiana in 1852; and re-elected in 1859. He acted with the Democrats, and became a secessionist. He was Secretary of War (1861), and Secretary of State of the Confederate States from Feb., 1862, until the collapse of that power in 1865. At the close of the civil war he fled to England and began the practice of law in London, England, where he rose to great fame and fortune. His *Law of Sale* (1883) is an authority in English courts. D. in Paris, May 7, 1884.

Benjamin, PARK: poet, journalist, and lecturer; b. at Demerara, in Guiana, Aug. 14, 1809. He graduated at Trinity College, Hartford, Conn., in 1829; and in 1840 became associated with R. W. Griswold as editor of the *New World*, a literary journal published in New York. He

wrote, besides many lyrical poems, a *Poem on the Meditation of Nature*. D. in New York, Sept. 12, 1864.—His son, **PARK**; b. in New York, May 11, 1849; entered the navy (1867); became a lawyer (1870); then a patent expert. Besides some tales and slight humorous essays, he edited *Appleton's Cyclopadia of Applied Mechanics* (1880).

Benjamin, SAMUEL GREENE WHEELER: traveler, artist, and author; b. at Argos, Greece, Feb. 13, 1837. He was educated at Williams College; was for some time assistant librarian in the State Library, Albany, N. Y.; and from 1883 to 1885 U. S. minister to Persia. Has published a number of works on art, including *Art in America* and *Contemporary Art in Europe* (1877), as well as poetry; *Constantinople* (1860); *Persia and the Persians* (1886), etc.

HENRY A. BEERS.

Benjamin-Constant, bañ'n'zha-măñ' kôn'stăñ', JEAN JOSEPH: painter of portraits and of Oriental subjects; b. in Paris, June 10, 1845; pupil of Cabanel; officer Legion of Honor 1884; awarded a first-class medal at the Paris Exposition of 1889, but refused to accept it. He has visited the U. S. several times, and has painted portraits in New York and other cities. He is an artist with a strong sense of color and a brilliant technician. *The Cherifas*, exhibited at the Salon of 1885, is one of the best of his pictures of life in the East, and is in the museum at Carcassonne. He painted three large decorative panels for the New Sorbonne in Paris, viz., *Literature*, *The Academy of Paris*, and *Science*, which show intelligent artistic intention and a desire to obtain color-harmony in painting on a large scale without sacrificing local tints. He has painted a large number of pictures, and in some of them has not attained the level that made his earlier works so notable. Many of his pictures are owned in the U. S. Studio in Paris.

WILLIAM A. COFFIN.

Benjamin Gum: See BENZOIN GUM.

Benjamin of Tudela: a Jewish rabbi and traveler; commenced about 1159 a journey through Palestine, Persia, and Egypt, in which he passed fourteen years. He wrote an account of his travels, which was translated into Latin, English (London, 1840), and French. D. in 1173. See E. Carmoly, *Notice sur B. de Tudèle et ses Voyages* (Brussels, 1837, 2d ed., 1852, 2 parts).

Benjamin-tree: See BENZOIN ODORIFERUM.

Ben'kelman: capital of Dundy co., Neb. (for location of county, see map of Nebraska, ref. 11-C); situated in a rich agricultural district; on Bur. and Mo. R. R., and on Republican river; 89 miles from Akron, Col.; has fine school-building, and three churches. Was first settled about 1880. Pop. (1890) 357; (1892) estimated, 600.

Benloew, Louis: philologist; b. in Erfurt, Germany, Nov. 15, 1818; studied at the universities of Berlin, Leipzig, and Göttingen. Most of his life was, however, spent in France, and from 1847 he was connected with the Faculty of Letters of Dijon, becoming later the dean of the faculty. D. in 1884. His works are numerous. Among them may be mentioned *De l'accentuation dans les langues indo-européennes, tant anciennes que modernes* (1847); *Théorie de l'accentuation latine* (with Weil, 1855); *Aperçu général de la science comparative des langues* (1858); *Précis d'une théorie des rythmes* (1862); *De quelques caractères du monde primitif* (1862); *Les Sémites à Ilion* (1863); *La Grèce avant les Grecs, étude linguistique et ethnographique* (1877); *Les lois de l'histoire* (1881). B. I. W.

Beune-plant: See SESAME.

Bennett, CHARLES WESLEY, D. D., LL. D.: Methodist Episcopal minister and educator; b. at East Bethany, N. Y., July 18, 1828; educated at Wesleyan University, where he graduated in 1852; was teacher and principal in several schools 1852-61; joined East Genesee Conference 1862; studied in Berlin 1866-69; principal for the second time of Genesee Wesleyan Seminary 1869-71; Professor of History and Logic in Syracuse University 1871-85; and Professor of Historical Theology in Garrett Biblical Institute, Evanston, Ill., 1885-91. He published *National Education in Italy, France, Germany, England, and Wales, Popularly Considered* (Syracuse, 1878), and *Christian Art and Archaeology of the First Six Centuries* (New York, 1888). D. at Evanston, Apr. 17, 1891.

ALBERT OSBORN.

Bennett, EDMUND HATCH, LL. D.: jurist; b. at Manchester, Vt., Apr. 6, 1824; graduated at the University of Vermont 1843; admitted to the bar 1847; resided at Taun-

ton, Mass., 1848-84; judge of probate and insolvency for Bristol County 1858-83; mayor of Taunton 1865 and 1867; lecturer in Harvard Law School 1870-72; since 1876 professor in and dean of the Boston University Law School; has published *Bingham on Infancy*; *Greenleaf's Reports* (9 vols.); *English Law and Equity Reports* (3 vols.); seven editions of Justin Story's works; *Massachusetts Digest of Decisions* (3 vols.); *Fire Insurance Cases* (5 vols.); *Blackwell on Tax Titles*; *Goddard on Easements*; *Pomeroy's Constitutional Law*; *Indermayer's Principles of the Common Law*; *Cushing's Reports of Massachusetts Decisions* (3 vols.); *Benjamin on Sales*; *Story on Sales*; *Leading Cases in Criminal Law*, etc.

Bennett, JAMES GORDON: journalist; b. near Keith, Scotland, Sept. 1, 1795; educated for the Roman Catholic priesthood; emigrated to the U. S. in 1819; took to newspaper work, and was for several years connected with several journals published in the city of New York; became chief editor in 1833 of the *Pennsylvanian*, a daily paper of Philadelphia. In 1835 he founded the *New York Herald* as a penny paper, into which he introduced the features of news-gathering, special correspondence, telegraphic reporting, and distribution by carriers, subsequently common features of journalism. D. in New York, June 1, 1872.—His only son, of the same name, b. in New York, May 10, 1841, who resides chiefly in Paris, is distinguished for fitting out the Jeanette polar expedition, for sending H. M. Stanley to search in Africa for Livingstone, and for establishing in connection with J. W. Mackay a new line of submarine cable between Europe and the U. S.

Bennett, Sir JAMES RISON, M. D., F. R. S., LL. D.: ex-president of the Royal College of Physicians; b. at Romsey, Hampshire, England, in 1809; M. D., University of Edinburgh, 1833; appointed assistant physician to St. Thomas's Hospital, London, 1843; elected president of the College of Physicians in 1876, and annually re-elected until 1881; knighted in 1881; has published translations from the German of Kramer on *Diseases of the Ear*; *An Essay on Acute Hydrocephalus*, etc. C. H. THURBER.

Bennett, JOHN HUGHES, M. D.: physician and medical writer of Edinburgh; b. in London, Aug. 31, 1812; took his degree at Edinburgh in 1837, and in 1848 was made Professor of the Institutes of Medicine in that city. Dr. Bennett was especially distinguished for his studies in histology and therapeutics, and his advocacy of the expectant treatment of disease. Among his works are *Clinical Medicine* (1856); *Practice of Medicine*; *Treatment of Pulmonary Consumption*; *Text-book of Physiology* (Edinburgh, 1871). D. at Norwich, Sept. 25, 1875.

Bennett, JOSEPH: journalist and music-critic; b. in Berkeley, Gloucestershire, England, Nov. 29, 1831; studied music in early life, especially the organ, violin, viola, and violoncello; went to London in 1855, and wrote for the *Sunday Times*, the *Musical Standard*, and since 1876 to the present for the *Daily Telegraph*. He edited Novello's *Concordia* (May 1, 1875, to Apr. 22, 1876), and has for years written largely for Novello's *Musical Times*. He has furnished the librettos for Barnett's *Good Shepherd*; Mackenzie's *Rose of Sharon*, *Story of Sayid*, *Dream of Jubal*; Cowen's *Ruth*, *Thorgrim*, and *St. John's Eve*; Bottesini's *Garden of Olives*; Madame Sainton-Dolby's *Thalassa*; Williams's *Gethsemane* and *Last Night at Bethany*; and Sullivan's *Golden Legend*, adapted from Longfellow. Some of his studies of The Great Composers in the *Musical Times* have been put in book form. In 1885 he visited the U. S., and made a musico-literary tour, afterward publishing his impressions in London. D. E. HERVEY.

Bennett, Sir WILLIAM STERNDALE: musician; b. in Sheffield, England, Apr. 13, 1816. When eight years old he became a choir-boy at King's College, Cambridge, and two years later was taken to London to study in the Royal Academy of Music, remaining there from 1826 to 1836. He was then sent to Leipzig, and associated with Mendelssohn, Schumann, and Ferdinand Hiller. While there he composed considerable music, including his very beautiful *Naiades* overture. In 1856 he was appointed conductor of the London Philharmonic Society, but soon relinquished the post. In the same year he was appointed Professor of Music in Cambridge University, from which he received the Bachelor and Musical Doctor's degrees. Oxford made him a D. C. L. In 1858 he produced his cantata *The May Queen*, for the Leeds festival, and in 1867 his *Women of Samaria*

was produced at the Birmingham festival. In 1871 he was knighted, and on Feb. 1, 1875, he died in London at the early age of fifty-nine. He composed much, mostly in the instrumental field. His two cantatas mentioned, four church anthems, and a setting of Tennyson's *Ode on the Death of the Duke of Wellington*, and Charles Kingsley's *Ode on the Duke of Devonshire*, comprise most of his vocal music, but his works for orchestra and solo instruments are in the front rank. From 1868 till his death he was the principal of the Royal Academy of Music. D. E. HERVEY.

Ben Nevis: a mountain of Scotland. See BEN.

Ben'nigsen, or Benningsen, LEVIN AUGUST THEOPHIL, Count; Russian field-marshal; scion of a noble Hanover family; b. in Brunswick (Lüneburg) in 1745; brought up at court; married an Austrian and lost his employment; became an adventurer, and obtained a commission in the Russian army in 1773. Catherine II. employed him in Poland and promoted him. He joined the Pahlen conspiracy against Paul I., and actually strangled him. He distinguished himself at the head of an army-corps at Pultusk (1806); was given the command of the army opposing Napoleon in the following winter, broke through the French lines, separating his foes, and forcing Napoleon to take the field with re-enforcements. He chose the position at Eylau, and at night, after the desperate battle of Feb. 8, 1807, held his position. He retired for the sake of supplies. He fought as a subordinate commander at Friedland and Borodino; beat Murat at Tarantino, Oct. 12, 1812; commanded the Russian army of reserve at Leipzig, and for his impetuosity and skill in the great battle was made a count on the field. In 1818 he retired to his Hanover estates. D. in 1826.

Bennington: on railroad; capital of Bennington co., Vt. (for location of county, see map of Vermont, ref. 9-B); 55 miles S. W. of Rutland, and 36 miles from the Hudson river at Troy. The town contains three villages—Bennington, North Bennington, and Bennington Centre—the latter being Station A of the Bennington post-office. Gen. Stark, at the head of a column of "Green Mountain Boys" (New Hampshire and Massachusetts troops), defeated a British detachment in force, commanded by Lieut.-Col. Baum, sent from Gen. Burgoyne's army to capture the public stores near North Bennington, Aug. 16, 1777; 600 British prisoners were captured. The dedication ceremonies of the Bennington Battle Monument (301 ft. 10½ in. high) and centennial of the admission of Vermont into the Union were celebrated Aug. 19, 1891. The town contains extensive graded schools, large manufacturing of knit goods, and one of the largest woolen-factories in the country. Bennington is one of the largest manufacturing villages in the State, and has a soldiers' home. Pop. of township, including village (1880) 6,333; (1890) 6,391; of village (U. S. census) 3,971; local census, 4,125.

EDITOR OF THE "BANNER."

Benoît, bay dwâñ, PIERRE LEOPOLD LEONARD; musician; b. in Harelbeke, West Flanders, Belgium, Aug. 17, 1834; one of the most remarkable of the extreme modern school composers. Educated at the Brussels Conservatory, studying under Fétis; composed his first opera in 1857. Produced his opera *Le Roi des Aulnes* in Paris 1861; returned to Belgium, and has since produced many important and remarkable works, both sacred and operatic; was appointed in 1867 director of the Flemish School of Music in Antwerp, which position he still retains. His *Lucifer* (1866); *L'Eseul* (1869); *Drama Christi* (1871); *La Guerre* (1873), are among his greatest oratorios; besides which he has composed several cantatas and operas. He is a strong advocate of a strictly national Flemish school of music. D. E. HERVEY.

Benoît de Sainte-More, or Sainte-Maure: mediæval French poet. Little is known of his life. He was probably a Norman by birth, although attempts have been made to prove him a native of Sainte-More in Champagne, and also of Sainte-More in Touraine. He attached himself to the court of Henry II. of England; and he is probably the Benevit of whom Wace somewhat enviously speaks (*Roman de Rou*, vv. 16526-31) as having at Henry's command written the long versified history, of some 43,000 lines, known as the *Chronique des ducs de Normandie*—being preferred for the task to his older contemporary and rival, Wace himself (*q. v.*). He is chiefly famous, however, for his *Roman de Troie*, one of the most popular poems of the Middle Ages. Though Benoît in this work speaks admiringly of Homer, he really found his material in the *De excidio Troje* of PARES (*q. v.*) and the *Ephemerides belli Trojani* of DICTYS (*q. v.*). He by no means, however, followed closely even

these authorities. He gave to the whole story a frankly mediæval and chivalric character; and he enlarged, or even added, wherever his fancy suggested. Some of these additions proved the most attractive parts of his poem—e. g. the episode of Troilus and Briseida (vv. 13235, *seq.*)—and were subsequently used by famous writers. Boccaccio told the tale of Troilus in his *Filostrato* (Briseida becoming Griseida); Chaucer also in his *Troilus and Criseyde*. Shakspeare made, or helped make, a play on the subject. But the whole *Roman de Troie* was also imitated and translated into other languages. The German poet, Herbert von Fritzlar, made it the basis of his *Lied von Troie* (twelfth century); the Sicilian Guido delle Colonne (thirteenth century) rendered it into poor Latin, but without naming his original, and succeeded in passing for many centuries as the true author; Binduccio dello Scelfo turned it into Italian (thirteenth century); and there were at least two Italian versions of Guido's Latin. A Dutch version was made by Jacob van Maerlant (thirteenth century), and it was even translated into Greek (fourteenth century). In the fifteenth century, perhaps earlier, it was turned into French prose, and supplied material for dramatic compositions—e. g. *Le Mystère de la destruction de Troie la Grant*, by Jacques Millet.

Another poem of 10,000 verses, the *Roman d'Énéas*, though anonymous in the MSS., is so similar in language, style, and execution to the *Chanson de Troie* that it is commonly attributed to Benoît. It is based upon the *Æneid* of Vergil, but again freely mediævalized. This work also had great popularity, and was translated into German (1175-84) by Heinrich von Veldeke, the first poet of courtesy (*courtoisie*) north of the Rhine.

The *Roman de Thèbes*, based upon the *Thebais* of Statius, has also been assigned to Benoît. In all probability, however, it was written by some poet eager to win fame by imitating the assured success of the *Roman de Troie*. Nor is it correct to attribute to Benoît, as has sometimes been done, the metrical *Life of St. Thomas of Canterbury*.

BIBLIOGRAPHY.—*La Chronique des ducs de Normandie*, par Benoît, etc., ed. by Fr. Michel (3 vols., Paris, 1836-44); *Benoît de Sainte-More et la Roman de Troie*, etc., ed. by A. Joly (2 vols., Paris, 1870-71); Fr. Settegast, *Benoît de Sainte-More*, etc. (Breslau, 1876); G. Paris, in *Romania*, v. p. 389, and viii. p. 300; K. Frohmann, *Herbert von Fritzlar und Benoît de Sainte-More*, in *Germania*, ii. (1857); Hertzberg, *Der Troilus-Fabel von Homer bis zu Shakspeare*, in *Shakspeare Jahrbuch*, bd. vi. (1871) pp. 169-225; W. Greif, *Die mittelalterlichen Bearbeitungen der Trojanersage* (Marburg, 1886).
A. R. MARSH.

Benouville, bay'noo'veel', JEAN ACHILLE: French landscape-painter; pupil of Picot; b. in Paris, July 15, 1815; celebrated for his pictures of views of the Campagna. First-class medal, Paris Salon, 1863; Legion of Honor 1863. D. in Paris, Feb. 6, 1891.
W. A. C.

Benozzo Gozzoli: See GOZZOLI.

Benseler, ben'se-ler, GUSTAV EDUARD: Greek scholar and lexicographer; b. in Freiberg, Saxony, Feb. 28, 1806; d. in Leipzig, Feb. 1, 1868. Best known by his work on the Attic orators (especially Isocrates, Demosthenes, and Æschines), and as the author of *Hiatus in the Attic Orators* (1841).

Ben'son, EDWARD WHITE, D. D.: Archbishop of Canterbury and Primate of all England; b. near Birmingham, England, July 14, 1829; graduated at Cambridge in 1852; was for several years assistant in Rugby School; head-master of Wellington College from its establishment in 1858 to 1872; chancellor of Lincoln Cathedral 1872; consecrated Bishop of Truro 1877, where he raised nearly \$500,000 for the erection of his cathedral; became Archbishop of Canterbury, England, Dec., 1882; author of various sermons and essays: *Work, Friendship, Worship* (1871); *Boy Life, or Sundays at Wellington College* (1874); *Single-heart* (1877); *The Cathedral, its Necessary Place in the Life and Work of the Church* (1879); *The Seven Gifts* (1885); *Communings of a Day* (1886); *Christ and His Times* (1889). D. at Hawarden, while on a visit to Gladstone, Oct. 11, 1896.

Benson, EOBERT, LL. D.: born in New York city, June 21, 1746; graduated at Columbia College in 1765; was an eminent lawyer; a member of Congress (1784-88, 1789-93, and 1813-15); a regent of the university (1789-1802); judge of the Supreme Court of New York (1794-1801); and of the U. S. Circuit Court. He published a *Findication* of the captors of André (1817), and a *Memoir on Dutch Names*. D. in Jamaica, L. I., Aug. 24, 1833.

Benson, FRANK WESTON: genre and portrait painter; b. at Salem, Mass., Mar. 24, 1862; pupil of the Museum of Fine Arts, Boston, and of Boulanger and of Lefebvre, Paris; third Hallgarten prize, National Academy (1889); Clarke prize, National Academy (1891); member of the Society of American Artists (1888). His pictures, which are principally of figures painted in out-of-doors effects, are marked by good qualities of color, and show truth of observation in the study of nature; his portraits are good in drawing and refined in character. Studio in Salem.
W. A. C.

Benson, HENRY C., D. D.: preacher and writer in the Methodist Episcopal Church; b. near Xenia, O., in 1815; joined the Indiana Conference in 1842; was elected Professor of Greek in Indiana Asbury University in 1850; went to California in 1852; was editor of the *Pacific Christian Advocate* at Portland, Or., from 1864 to 1868; elected editor of the *California Advocate* in 1868, in which office he long continued. He is author of *Life among the Choctaws*, among whom he labored for some time as a missionary.

Benson, JOSEPH: Methodist minister; b. in Cumberland, England, Jan. 25, 1748; acquired much influence in the Church. He was a popular preacher, and author of numerous works, among which are an *Apology for the Methodists* (1801); a *Life of the Rev. John Fletcher*; and a *Commentary on the Holy Scriptures* (5 vols., 1811-18), which is highly esteemed. D. in London, Feb. 16, 1821.

Bent-grass: any grass of the genus *Agrostis*, which comprises numerous species, natives of Europe, the U. S., and many other countries. The *Agrostis vulgaris* or *A. alba*, forms a principal part of the pasture in the more elevated districts of England, and resists drought better than some other grasses. It is called "fiorin" or "redtop" in the U. S., where it is an important meadow grass.

Bentham, ben tam or ben tham, GEORGE, F. L. S., F. R. S.: English botanist, and nephew of Jeremy; b. in what is now a part of Portsmouth, Sept. 22, 1800; educated on the Continent of Europe; secretary to his uncle (1826-32); wrote a *New System of Logic* (1827), in which he clearly anticipated Hamilton's doctrine of the "quantification of the predicate," but the publishers failed, and the credit of the discovery was delayed until 1850. He abandoned law for botany; catalogued the flora of the Pyrenees, of Hongkong, and of Australia. Gave his collections to the Kew Gardens, and passed his later years there. The *Genera Plantarum* (1862-83) was the joint work of Bentham and Sir Joseph Hooker, and is an exhaustive summary of botanical science to its date. His most important publications are *Labiatum Genera et Species* (1832-36); *Flora Hongkongensis* (1861); *Flora Australiensis* (1863-70). D. in London, Sept. 10, 1884.

Bentham, JEREMY: philosopher and reformer; apostle of the modern school of utilitarianism; b. in London, Feb. 15, 1748. He graduated at Queen's College, Oxford, in 1766; studied law and was called to the bar in 1772, but he never practiced that profession. He published in 1776 an acute and critical *Fragment on Government*, which abounds in sound and original ideas, and in 1787 an exhaustive argument entitled a *Defense of Usury*. His next important work was his *Introduction to the Principles of Morals and Legislation* (1789). He adopted the theory that "utility is the test and measure of virtue," and that laws should promote "the greatest happiness of the greatest number." He devoted his time and talents chiefly to the reform of legislation and government, and advocated universal suffrage, the vote by ballot, etc. He inherited from his father an easy fortune. About 1792 he formed a friendship and literary partnership with M. Dumont, who translated into French several of Bentham's works—namely, *Treatise on Civil and Penal Legislation* (3 vols., 1802) and *Theory of Penalties and Rewards* (1811). Among his other works are *Panopticon* (1791), which treats on prison discipline, and *The Rationale of Judicial Evidence* (5 vols., 1827). By habitual temperance, activity, and self-control he prolonged his life to the age of eighty-four. D. in London, June 6, 1832. He has great merits in the English jurisprudence, "which," as Macaulay says, "he found a gibberish and left a science." But on the public in general his influence was small, on account of the unreadableness of his writings. He represents French ideas, especially those of the French Revolution. His works were more admired on the Continent than in England. See *Memoirs of Jeremy Bentham*, prefixed to his works by Dr. Bowring; John Hill Burton, *Benthamiana*; Sir James

Mackintosh, *View of the Progress of Ethical Philosophy; Edinburgh Review* for Oct., 1843.

Bent'inck: English noble family; the most notable members were: WILLIAM, first Earl of Portland; b. in Holland, 1649, of a noble family which had migrated from the Palatinate to Gelderland in the fourteenth century, where it is still represented by a younger line. He was the favorite and friend of William III., by whom he was constantly employed in military and diplomatic services. D. 1709.—WILLIAM HENRY CAVENDISH, third Duke of Portland; b. Apr. 14, 1738; became Prime Minister and First Lord of the Treasury 1783; distinguished as Pitt's Home Secretary, and as charged with Irish affairs in the turbulent times of 1794-1801; again Prime Minister in succession to Grenville, and First Lord of the Treasury 1807; d. Oct. 30, 1809.—WILLIAM HENRY CAVENDISH, son of the preceding; b. Sept. 14, 1774; served with distinction as an army officer in Flanders, Egypt, Italy, Portugal, and Sicily; Governor of Madras (1803-07), of Bengal (1827-33), when he was made Governor-General of India, and served till 1835; distinguished in India for suppressing suttee and thuggism, for developing systems of internal transportation, and for engaging natives in Government service; d. in Paris, June 17, 1839.—WILLIAM GEORGE FREDERICK CAVENDISH, nephew of the preceding; b. Feb. 27, 1802; entered the army; private secretary to his uncle, George Canning; member of Parliament 1826; was greatly engaged in horse-racing, which he did much to make respectable, and to other field-sports. He joined the party of country squires, who were Conservative, during Peel's administration, and was offered a seat in his cabinet, but declined. On the repeal agitation (1845) of the corn-laws he was made the leader of the protectionists, and suddenly assumed great importance. As a parliamentary leader he struck hard, evinced a mastery of details unexpected in a man of his tastes, kept his party compact, and contributed materially to Peel's overthrow in 1846. In religious politics he advocated the removal of disabilities from Jews, and an endowment of the Irish Catholic Church. D. suddenly near Welbeck Abbey, Nottinghamshire, Sept. 21, 1848. Earl Beaconsfield wrote a life of him (8th ed. 1872).

Bent'ley, RICHARD, D. D.: critic and classical scholar; b. at Oulton, in Yorkshire, England, Jan. 27, 1662. He entered St. John's College, Cambridge, in 1676, and having taken the degree of bachelor became in 1683 tutor to Dr. Stillingfleet's son, with whom he went to Oxford. He was ordained a priest in 1690. In 1692 he was appointed to deliver the Boyle lecture on the evidences of religion, and in 1694 became keeper of the Royal Library. He published in 1699 a celebrated *Dissertation on the Epistles of Phalaris*, which procured for him a European reputation. He maintained that these Epistles were spurious, which involved him in a controversy with Atterbury, Charles Boyle, Pope, and other writers, who resorted to sarcasm and personality. Bentley defended himself in another *Dissertation on the Epistles of Phalaris* (1699) to the confusion of his adversaries, and by it he established his place as the first in time and learning of English historical critics. He was appointed master of Trinity College, Cambridge, in 1700, and married Joanna Bernard in 1701. In 1711 he published a good edition of Horace. His arrogance and their traditionalism provoked a series of quarrels and litigations with the fellows of Trinity College. He was appointed Regius Professor of Divinity in 1717, and was deprived of all his academic degrees and honors by the senate of the university in 1718, but he was reinstated by a mandamus of the court of king's bench in 1724. Among his productions was an edition of Homer, which he left unfinished. He proposed to revise and correct the text of the Greek Testament by comparing it with all the manuscripts. He failed to perform this task, but his principles of criticism have since been adopted, and have triumphed over all opposition. He died in Cambridge, July 14, 1742. His daughter was the mother of Richard Cumberland, the dramatist. See his *Life* by J. H. Monk (London, 1830) and R. C. Jebb (1882).

Bentley, ROBERT, F. L. S.: medical botanist; b. at Hitchin, England, Mar. 25, 1821; member of Royal College of Surgeons 1847; president of the British Pharmaceutical conferences 1866-67; was member of many English and American pharmaceutical and botanical societies. Author of *Manual of Botany; Text-book of the Organic Materia Medica*, etc. D. in London, Dec. 28, 1893.

Benton, JAMES GILCHRIST: soldier; b. in Lebanon, N. H., Sept. 15, 1820; graduated at West Point in 1842; major of

ordnance, Sept. 15, 1863. He served at various arsenals and on special duties 1842-57; as member of the ordnance board 1854-56; at Military Academy as instructor of ordnance and gunnery 1857-61. In the civil war he was an assistant in the ordnance bureau at Washington 1861-63; in command of Washington arsenal till June 14, 1864, and since of Springfield armory, Mass. Brevet lieutenant-colonel and colonel Mar. 13, 1865, for faithful and meritorious services in the ordnance department. He made great improvements in the Springfield rifle, sea-coast gun-carriages, and the system of loading barbette guns under cover; also invented the Benton electro-ballistic pendulum, a velocimeter, a spring-dynamometer, and minor devices in the use of arms. His reports to the Government on his experiments were valuable in their time. He was author of *A Course of Instruction in Ordnance and Gunnery for the use of the Cadets of the United States Military Academy* (1860). D. in Springfield, Mass., Aug. 23, 1881.

Benton, THOMAS HART: Senator; b. near Hillsborough, N. C., Mar. 14, 1782. He removed to Tennessee, where his father, then dead, had acquired a vast tract of land; studied law, and began to practice at Nashville about 1810. In the war of 1812 he served as colonel under Gen. Jackson. He became a resident of St. Louis, Mo., in 1815, and was elected a Senator of the U. S. for Missouri in 1820. Having been re-elected in 1826, he supported Gen. Jackson, opposed the U. S. bank, and advocated a gold and silver currency, for which reason he was often called "Old Bullion." For many years he was the most prominent public man of Missouri. He was a member of the National Senate for thirty years, and opposed the extreme State Rights policy of Calhoun. In 1852 he was elected to the House of Representatives, in which he opposed the repeal of the Missouri Compromise. He was opposed by a powerful party of State Rights Democrats in Missouri, who defeated him as a candidate for Governor in 1856. His life in Tennessee was turbulent with hot-blood, and involved a bitter quarrel with Gen. Jackson. In the Senate he was a persistent advocate of opening the public lands of the West to actual settlers; promoted surveying and exploring expeditions, foreseeing a great empire to grow up even to the Pacific. He introduced the "expunging resolutions" which removed from the Senate record its censure of President Jackson; opposed Polk's 54° 40' N. boundary line for Oregon, and facilitated the settlement on the existing line; resisted Calhoun's influence, and the two contended bitterly in the forum and in political combination. He was the father-in-law of J. C. Fremont, but opposed his candidacy for the presidency in 1856 as promoting sectional politics. He published a *Thirty Years' View, or a History of the Working of the American Government for Thirty Years, 1820-50* (2 vols., 1854-56). D. in Washington, D. C., Apr. 10, 1858. See his life by Theodore Roosevelt in American Statesman Series, 1887.

Benton Harbor: city and railroad junction; Berrien co., Mich. (for location of county, see map of Michigan, ref. 8-G); on Ch. and W. Mich. and Ch., Cin., Ch. and St. Louis R. Rs., and on the east side of St. Joseph's river, and the Benton Harbor ship-canal; 1½ miles from Lake Michigan, and about 60 miles E. by N. from Chicago. It has a large trade in grain and lumber, and an immense one in fruit, large manufacturing of fruit packages, wood and iron machinery, furniture, flour, barrels, vinegar, pickles, cider, vehicles, and canned fruit, and an undeveloped water-power. Regular lines of steamers and sailing vessels connect it with Chicago and Milwaukee. Pop. (1880) 1,230; (1890) 3,692; (1894) 5,314. EDITOR OF "PALLADIUM."

Bentonville: town; connected by a branch road with St. Louis and San Francisco R. R.; capital of Benton co., Ark. (for location of county, see map of Arkansas, ref. 1-A); 170 miles N. W. of Little Rock. It is the center of a fruit-growing country; has an active trade in tobacco, etc., and has a large fruit-evaporating industry. Here are nine churches (two colored) and a public school. Pop. (1880) 696; (1890) 1,677; (1892) estimated with suburbs, 2,500. EDITOR OF "DEMOCRAT."

Bentonsville: a post-village of Johnston co., N. C., in a township of its own name; about 17 miles W. of Goldsboro. After the battle of Averysboro (Mar. 16, 1865) the army of Gen. Sherman advanced toward Goldsboro, but Gen. Johnston, who had been concentrating at Smithfield, N. C., slipped out at night in light marching order, expecting to crush the left wing of Sherman's army, under Gen. Slocum, before support could reach him. Gen. Slocum, marching toward

Goldsboro, struck Johnston at about 6 A. M., Mar. 19, and was at first driven back, but throwing up rifle-pits, assumed the defensive, Kilpatrick with his cavalry supporting his left. Johnston failed to dislodge the veterans of Slocum from their position, while the artillery fire upon the Confederates was very damaging. By morning re-enforcements had arrived to Slocum's aid, and during the day the original line was reoccupied and strengthened. The Confederates spent the day in fortifying their position. On the morning of the 21st the right wing arrived, and the day was spent in placing it in position on three sides of Johnston and pressing the troops close to his works, but Johnston hastily retreated during the night of Mar. 21 on Smithfield and Raleigh. The Federal loss was upward of 1,600, killed and wounded; the Confederate loss is reported as 239 killed, 1,694 wounded, and 673 prisoners; total 2,696. Pop. of township (1880) 1,076; (1890) 1,004. Revised by JAS. MERCUR.

Benu'e (i. e. the mother of waters); a large river of Central Africa; the principal tributary of the Niger or Quorra. It rises in the mountains of Adamawa and flows nearly westward, making the southern boundary of Sokoto, and enters the Niger at Lokoya, about 300 miles from its mouth. Dr. Barth in 1851 crossed it near lon. 12° 30' E., and found it there about 800 yards wide. Dr. Baikie in 1850 ascended the Benue to Dulti or Dolti, which is about 400 miles from its mouth. A second expedition to explore this river was undertaken by Dr. Baikie in 1861. In 1867 Gerhard Rohlfs traveled up this river from Dagbo to its entrance into the Niger at Lokoya, a distance of about 150 miles.

Benwood: town; Marshall co., W. Va. (for location of county, see map of West Virginia, ref. 4-G); on B. and O. and O. River R. R.s.; 4 miles S. of Wheeling, in the midst of an iron-mining region. Pop. (1890) 2,934.

Benyowsky, báý-ně-óv-skěe, MACRICE AUGUSTUS, Count de; Hungarian adventurer; b. at Werbo, 1741; taken prisoner 1761 while fighting for the Polish confederation; banished to Kamtchatka; tutor in the family of the governor; gained the affections of the governor's daughter, who assisted him to escape after a struggle in which the governor was killed; with ninety-six companions sailed in a ship well armed and provisioned, and reached France in 1772; invited by the French Government, he sailed to Madagascar to found a colony, and was there made king in 1776, adopting the native costume; becoming involved in difficulties with the French, he was killed in battle, May 28, 1786. See *Memoirs and Travels of Benyowsky*, written by himself (1790).

Ben'zene, or **Ben'zol**: C_6H_6 ; the first member of an important series of compounds containing carbon and hydrogen (hydrocarbons), other members being toluene, C_7H_8 , xylene, C_8H_{10} , mesitylene, C_9H_{12} , etc. It was first found in iron vessels in which coal-gas was kept under pressure. It was afterward made by distilling benzoic acid with lime, but is now obtained in enormous quantities from coal-tar, an extremely complex mixture of organic compounds formed in the distillation of coal for the manufacture of gas. When coal-tar is distilled, the oil that first passes over floats on water and is hence called "light oil." It is from this that benzene is obtained.

Benzene is a colorless liquid, of pleasant odor, that boils at 55° C. When cooled down to about the freezing-point of water it solidifies, forming a mass of crystals. It burns easily with a bright flame. It is a good solvent for caoutchouc, gutta-percha, wax, and fatty substances. With nitric acid it forms nitrobenzene, from which in turn aniline is made. All aniline used in the arts is made in this way.

IRA REMSEN.

Benzert: See BIZERTA.

Benzidine: a base made by heating NITROBENZENE (*q. v.*) with caustic soda and zinc-dust. The nitrobenzene is thus converted into hydrazobenzene. When this is treated with strong hydrochloric acid it is transformed into benzidine. There is a close relationship between this compound and ANILINE (*q. v.*). The latter is an amido derivative of BENZENE (*q. v.*), and is represented by the formula $C_6H_5.NH_2$. Benzidine is an amido derivative of the hydrocarbon diphenyl, C_6H_5 , and is represented by the formula $C_6H_4.NH_2$. Valuable dyes are obtained by converting it into a diazo compound, and treating this with phenols and amido compounds. See BENZIDINE DYES.

IRA REMSEN.

Benzidine Dyes: products of the action of various PHENOLS (*q. v.*) and amido compounds on the diazo compounds

obtained from BENZIDINE (*q. v.*) and TOLIDINE (*q. v.*). The first important dye of this class known was Congo-red, which is prepared by the action of diazotized benzidine on naphthionic acid. (See NAPHTHALENE.) Congo-red and the other benzidine dyes dye cotton without the aid of a mordant, and are known as *substantive dyes*. Other dyes belonging to this class are *chrysumine*, formed from diazotized benzidine and salicylic acid; and *benzopurpurin*, formed from diazotized TOLIDINE (*q. v.*) and naphthionic acid. (See NAPHTHALENE.) This is one of the most extensively used dyes.

IRA REMSEN.

Benzine: See PETROLEUM.

Benzo'ic Acid: a substance, $C_7H_6O_2$, first obtained from gum benzoin. It occurs also in a number of natural resins, and in some sweet-smelling flowers. It is now prepared from gum benzoin, from the urine of the cow or horse, and from toluene. In the urine of herbivorous animals there is a compound known as hippuric acid, which breaks down easily by putrefaction or by treatment with hydrochloric acid into benzoic acid and glycoecoll or glycine. TOLUENE (*q. v.*) is a hydrocarbon closely allied to benzene, and obtained like it from coal-tar. By oxidation, or, better, by treatment with chlorine and subsequent oxidation, toluene yields benzoic acid, and most of the acid that comes into the market at the present time is obtained from toluene. Benzoic acid crystallizes in lustrous leaflets; it is easily sublimed. It is used in medicine, the natural product from gum benzoin being alone suitable for this purpose. The artificially prepared acid is used in the manufacture of aniline blue.

IRA REMSEN.

Benzo'in, or **Gum Ben'jamin** (Lat. *benzo'mum*): a fragrant resinous substance; is the concrete juice of a tree called *Styrax benzoin*, which is a native of Sumatra, Siam, and Borneo, and belongs to the natural order STYRACACEE (*q. v.*). The resin is obtained by making incisions in the bark of trees which are cultivated for that purpose. It is extensively used as incense in Roman Catholic and Greek churches; is also used in perfumery, and in medicine as a stimulant, emetic, and styptic. A tincture of benzo'in is sometimes applied to wounds, and is employed in making a cosmetic called virgin's milk.

Benzo'in odoriferum: a shrub more correctly called *Lindera benzoin*, of the family Lauraceae, a native of the U. S., popularly called benjamin-tree, spice-bush, etc. Its bark is aromatic, stimulant, and tonic, and has been used as a remedy for intermittent fevers.

Benzol: See BENZENE.

Benzopurpurin: See BENZIDINE DYES.

Beothkan Indians: the Beothuks; a linguistic stock or family of North American Indians which, so far as is known, consisted of a single tribe. Their only known habitat was the valley of the Exploits river in Newfoundland. It is, however, probable that the entire area of Newfoundland was in their possession at the time of its discovery by Cabot in 1497. The name Beothuk, or Beothik, is derived from a native word meaning "men," or perhaps "human beings"; but King reported that *Shawatharott* was the name which these Indians claimed for themselves. They were also called by Latham the "Good-night" Indians, from a mistranslated word which resembled the term Beothuk in sound. The term "Red Indians," or, better, "Red-men," is a literal rendering of a Micmac name for them, bestowed from the fact that the Beothuks painted their bodies and their property with red ochre.

Before the examination by Mr. Gatschet, of the U. S. Bureau of Ethnology, of the scanty accessible material of their language established its position as constituting a distinct linguistic stock, it had been considered as distantly related either to the Eskimaun or to the Algonquian family, although the appearance, manners and customs, lodges and canoes of the people as described distinguished them from the tribes of either of the families mentioned.

Owing to wars with the Micmaes, and to famine, the Beothuks became extinct, or were absorbed by other tribes, within the decade ending with 1830. See INDIANS OF NORTH AMERICA.

GARRICK MALLERY.

Berabera: See BARABRA.

Be'owulf: the title of a celebrated Anglo-Saxon poem, written not later than the eighth century, and having for its subject a semi-fabulous hero of Denmark. There is only one MS. of it in existence; this belongs to the tenth century, and is in the British Museum. It was first edited by Thor-

kelin (Copenhagen, 1815); by Harrison and Sharp (Boston, 1883; 3d ed. 1888); Eng. trans. first by Kemble (1833); other trans. by H. W. Lumsden (London, 1881; 2d ed. 1883); J. M. Garnett (Boston, 1882).

Béranger, bá'y-rañ'zhav', JEAN PIERRE, de: French lyric poet; b. in Paris, Aug. 19, 1780. He passed about three years as an apprentice to a printer, and never received a very liberal education. He was neglected by his father, and spent many of his early years with an aunt, who imbued his mind with virtuous and republican principles. His first essays in verse, which were written under the pressure of poverty, obtained for him in 1804 the patronage of Lucien Bonaparte. He was employed for nearly twelve years as a clerk or subordinate secretary in the University of Paris. He published in 1815 a volume of songs (*Chansons morales et autres*) which became very popular. Some of his verses were political, and contained satirical passages which were offensive to the royalists, then the party in power. Having produced another volume of poems in 1821, he was prosecuted and sentenced to an imprisonment for three months. This increased the popularity of his songs, but failed to restrain the freedom of his satire or abate the ardor of his republicanism. He published a third volume in 1825, and in 1828 a fourth volume, for which he was sentenced to pay a fine of 10,000 francs and to be imprisoned for nine months. In 1830, however, convinced that the time had not yet come for a republic, he did much by his advice to his friends, the leaders of the revolution of July, toward establishing Louis Philippe on the throne. He refused to accept royal favor as a reward, nevertheless; and, with the exception of the brief episode of his unwilling election to the Assembly in 1848, he spent the rest of his life in retirement, revising his poems, preparing his memoirs, and corresponding with many of the best spirits in France. His songs, which had so remarkable an influence over his countrymen, are wonderful for the clearness and perfection of their style, at the same time that they are beautifully various with gayety and with pathos. D. in Paris, July 16, 1857. See his memoirs, *Ma Biographie* (1858); his *Correspondance* (1860); P. Boiteau, *Vie de Béranger* (1861); A. Arnould, *Béranger, ses amis, ses ennemis, et ses critiques* (1864); J. Janin, *Béranger et son Temps* (1866); Sainte-Beuve, *Portraits Contemporains* (vol. i.).
Revised by A. R. MARSH.

Berar, bá'y-raar', or **The Berars'**: a commissionership of Central India; between lats. 19° 30' N. and 21° 46' N., and longs. 76° and 79° 13' E.; bounded on the N. and E. by the Central Provinces, on the S. by Haiderabad, and on the W. by Haiderabad and the Bombay Presidency. Area, 67,714 sq. miles. It falls into two distinct sections—the lowlands of the north and the Balaghat or highlands of the south; the first are fertile, but unattractive and nearly treeless; the second picturesque and with forests, but not so suitable for cultivation. Cotton is the chief crop, and is of fine quality; millet, wheat, rice, linseed, the castor-plant, and the sugar-cane are also cultivated. There is little manufacturing—chiefly cotton-cloth of poor quality, carpets, and saddlery. The Nagpur branch of the Great Indian Peninsular Railway traverses the province from east to west. The Berars were ceded to the British by the Nizam of Haiderabad in 1853 as payment for a debt. Pop. (1891) 2,896,670, of whom about 86 per cent. are Hindus. The principal towns are Elichpur, a former capital, Amraoti, Akat, Akola, and Karinja.

M. W. H.

Beral': a town of European Turkey; in Albania; on the river Ergent, here crossed by a bridge; 30 miles N. E. of Avlona (see map of Turkey, ref. 4-B). It contains a citadel, several Greek churches, and a number of mosques. It is the seat of a Greek archbishop. The population is estimated at 12,000, a majority of whom are Greeks.

Bérand, bá'y-rô', JEAN; genre-painter of subjects taken almost exclusively from Parisian life, and an artist of much talent, whose work is notable for good drawing and great truth of observation; b. at St. Petersburg of French parents about 1845; pupil of Bonnat; first-class medal, Paris Exposition, 1889; Legion of Honor 1887. His latest works (1890-92) have been modernized conceptions of scenes in the life of Christ. *La Madeleine* represents a woman in the costume of to-day at the feet of Christ, who sits at a table in a supper-room in a Paris restaurant, and the scene of *The Descent from the Cross* is placed on Montmartre overlooking the city of Paris, with a group of people who are working men and women of the vicinity. Studio in Paris.

WILLIAM A. COFFIN.

Ber'ber, or **El Mesherif**: a town of Nubia, on the Nile (see map of Africa, ref. 3-G). Roads lead from here to Egypt and Khartum. It has considerable trade. Pop. 8,000.

Ber'bera: a seaport station of Eastern Africa, in Somali; on the Gulf of Aden, 160 miles E. S. E. of Zeyla (see map of Africa, ref. 4-II). Here is held an annual fair, which is attended by 10,000 to 20,000 persons from various foreign countries. They bring coffee, gold-dust, ivory, slaves, cattle, etc., to exchange for cotton, rice, and Indian piece-goods. The fair begins in November, and continues nearly six months. It has an excellent and capacious harbor.

Berberida'cea: See BARBERRY FAMILY.

Berbers [from the Arabic name, *barbar, berber*]: a name given to the uncivilized, nomadic tribes of aborigines who inhabit the mountainous regions of Barbary and the northern part of the Desert of Sahara. They include the Kabyles, Tuaregs, and other Saharan peoples. They are the descendants of the aboriginal or ancient inhabitants of Northern Africa, who occupied the country before it was conquered by the Arabs, and they are the most numerous part of the present population. The Berbers vary in complexion with situation. Those who inhabit the high valleys of the Atlas have light hair and eyes, while those who occupy the oases of the Sahara are dark, approaching the Negroes in complexion, though their features are entirely unlike theirs. Their language is allied to the Semitic in type, and has received from F. W. Newman the name of sub-Semitic. Language, customs, and physical type seem to indicate affiliation with the Semitic races of Asia and Eastern Africa. They are warlike, cruel, and very tenacious of their independence. In religion they are bigoted Mohammedans. They keep cattle and sheep, cultivate fruit-trees, and practice agriculture in a rude manner. Many of them live in tents or in clay huts.

Berbiée, ber-bees: the eastern division of BRITISH GUIANA. See GUIANA.

Berchta, bärch'ta: name given in south of Germany and Switzerland to a spiritual being apparently the same as the Hulda of Northern Germany. This being represented originally one of the kindly aspects of the unseen powers, and Hulda is still so traditionally represented; but Berchta developed rather into an object of terror used frequently to frighten children. She has the oversight of spinners. The last day of the year is sacred to her, and if on that day she finds any flax left on the distaff she spoils it. She is represented as having a long iron nose and an immensely large foot. She is the original of all the myths of the White Lady.
C. H. THURBER.

Berchtesgaden, bärch'tez-gaaden: county in the Salzburg Alps in the S. E. of Bavaria. Area, 155 sq. miles. The country is mountainous and unproductive, but extremely picturesque. Formerly an ecclesiastical territory, it became in 1803 a principality of the Electorate of Salzburg, and since 1810 has belonged to Bavaria. The capital, of the same name, much visited by travelers, has a royal château, interesting salt mines, and is celebrated for the manufacture of toys and articles of wood, iron, and ivory, and other things famous as *Berchtesgaden* wares. Pop. of town (1890) 2,300.
C. H. THURBER.

Bereck'mans, PROSPER JULES ALPHONSE, A. M.: one of the leading horticulturists of the U. S., and president of the American Pomological Society; was born at Aerschot, Belgium, Oct. 13, 1830. His father was author of *Album de Pomologie*, a leading Belgian work. He removed to the U. S. in 1850, and in 1857 moved to Georgia, where he has since resided. He was one of the commissioners of the World's Exposition at New Orleans in 1884.

Berdiansk, bär-dë-ansk': a seaport-town of Russia; government of Taurida; on the north shore of the Sea of Azof; 184 miles N. E. of Simferopol (see map of Russia, ref. 10-D). It has a good roadstead and an active trade, and has been remarkable for its rapid growth. It was founded in 1827, was recognized as a town in 1835, and became capital of a circle in 1842. Its principal industries are the boiling of tallow and the manufacture of bricks, tiles, and macaroni. It derives its prosperity partly from the coal mines and salt lakes of the vicinity. Pop. (1882) 20,849.

Berditchef: a town of Russia; province of Kiev; 194 miles N. W. of Elisabetgrad (see map of Russia, ref. 9-C). It is mainly built, but is an important commercial town,

having four annual fairs, held between Aug. 15 and Sept. 15. The value of the goods, cattle, corn, wine, etc., sold here annually is estimated at \$3,000,000. Pop. (1882) 52,563; (1889) 77,287, mostly Jews.

Bere'a: village (founded in 1829); Cuyahoga co., O. (for location of county, see map of Ohio, ref. 2-H); on Cl., Cin., Chi. and St. Louis and Lake Sh. and Mich. S. R. R.s.; 12 miles S. W. of Cleveland, to which an electric street-railroad is now (1893) being constructed. Berea is noted for its extensive quarries of sandstone, 18,000 carloads having been shipped in a year. It is the seat of Baldwin University and German Wallace College, both Methodist Episcopal; has excellent public schools and seven churches; is lighted by natural gas and electricity. Pop. (1880) 1,682; (1890) 2,533; (1893) including suburbs, estimated 3,500.

EDITOR OF "ADVERTISER."

Berea College: in the southern part of Madison co., Ky.; 40 miles S. of Lexington. Its founders and promoters were Rev. John G. Fee and Rev. J. A. R. Rogers, natives, respectively, of Kentucky and Connecticut. It long enjoyed the fostering care of the American Missionary Association. For twenty years from 1869 Rev. E. H. Fairchild was president. Always anti-slavery in character, its leading friends were driven from the State just before the war. At its close some returned. A college charter was obtained, and since 1873 classes have been graduated yearly. There are three courses: classical, philosophical, and scientific (for males and females). White and colored are admitted, the colored slightly predominating. In 1892 about 400 students were on the roll, with 18 professors and teachers, of whom 11 are women. Endowment, \$100,000; value of buildings, about the same. L. V. DODGE.

Bere'ans: an obscure sect seceding from the Established Church in Scotland; founded by Rev. John Barclay (b. in Muthill, Perthshire, 1734, d. in Edinburgh, July 29, 1798) in 1773. They take their name from Acts xvii. 11; deny natural theology; make all the Psalms Messianic; hold assurance to be of the essence of faith, and unbelief the unpardonable sin. Their numbers are small and diminishing. Barclay's *Works*, with memoir, were published, Glasgow, 1852. Revised by S. M. JACKSON.

Beregh, *baŷ-reg'*: a county of Hungary; bounded N. E. by Galicia, E. by the county of Marmaras, S. by the counties of Ugocsa and Szatmar, W. by the county of Szabolcs, and N. W. by the county of Ungvar. Area, 1,440 sq. miles. The country is mostly mountainous, and produces wine. Pop. (1890) 179,208. Chief town, Munkacs.

Berenga'rius of Tours: a mediæval theologian; b. at Tours about 1000; d. in the neighboring island of St. Cosme, 1088; a pupil of Fulbert of Chartres; became in 1031 the director of the cathedral school in his native place, and in 1040 Archdeacon of Angers. He was a man of both talent and learning, and he soon brought the school into a most flourishing condition. But he was an independent character, of a somewhat rationalistic turn of mind. Concerning the Lord's Supper he held views very different from those which, since the days of Paschasius Radbertus (ninth century), had become generally adopted by the Church, preferring the older view advocated in the same century by Ratramnus. He ascribed to this sacrament only the character of a commemorative act, decidedly rejecting the idea of its being a constantly renewed sacrifice; and the change which the elements were believed to undergo during the celebration he considered to be merely symbolical, declaring the doctrine of transubstantiation an absurdity. People soon became aware that the great teacher of Tours deviated from the commonly accepted course of the Church, and Berengarius himself contributed much to call forth a conflict by his letter to Lanfranc. His view was condemned by the synods of Rome and Vercelli, both in 1050, and he was for a time imprisoned. Hildebrand (later Gregory VII.) came to his aid, and persuaded the Council of Tours (1054) to accept a general statement that the elements after consecration were the Body and Blood of Christ. In 1059 he was forced in a synod in Rome to retract his real views, but on his return to Tours renewed their advocacy. In 1079 he was by another synod in Rome compelled to retract a second time. Again when safe home he repented of his recantation, and recalled it, but, convinced that he could not make headway against the reigning theory, he retired to the island of St. Cosme, and lived in solitude, but he had, nevertheless, many followers. His works are in Migne, *Pal. Lat.*, CLXXVIII,

sep. ed. by A. F. and F. T. Vischer of his chief book *De sacra cœna* (Berlin, 1834). See H. Sundendorf, *Berengarius Turonensis, oder eine Sammlung ihre betreffender Briefe* (Berlin, 1850); cf. Hefele, *Konciliengeschichte* (vol. 5, 2d ed. 1886). Revised by S. M. JACKSON.

Bereni'ce: a daughter of Magas, King of Cyrene; married to Ptolemy Energetes, King of Egypt. During his absence on a military expedition she made a vow to sacrifice her hair to Venus for his safe return, which vow she performed. The hair having disappeared over night, the astronomer Conon reported that Jupiter had transformed it into the constellation now called *Coma Berenices* (Berenice's Hair). She was put to death by her son, Ptolemy Philopator, in 222 B. C. See Carl W. Ranler's *Ptolemæus und Berenice* (1765).

Berenice (called **Bernice** in the New Testament): a daughter of Agrippa I., King of Judea; b. in 28 A. D. She was married to her uncle, Herod, King of Chalcis, and, after his death, to Polemon, King of Cilicia. During a visit to Rome she captivated Titus, the son of the Emperor Vespasian, as she had done Vespasian himself. She was a sister of King Agrippa, before whom St. Paul spoke in his own defense. See Acts xxv. 13, 23; xxvi. 30.

Berenice: an ancient city of Egypt; on the Red Sea; 20 miles S. W. of Ras Bernass. It was founded by Ptolemy Philadelphus, who named it after his mother, and was a great emporium of the trade with India. The modern name is *Sakayt-el-Kublee*. Here are the ruins of a temple of Serapis and other interesting antiquities.

Beresford, *ber'es-fürd*, WILLIAM CARR, Viscount; general; b. in Ireland, Oct. 2, 1768; a natural son of the first Marquis of Waterford. He took command of the Portuguese army in Feb., 1809, and fought against the French in the Peninsula. In May, 1811, he defeated Soult at Albuera. He received the title of Duke of Elvas in Spain; was created a viscount in 1823, and was master-general of the ordnance in 1828-30. D. Jan. 8, 1854.

Berezina, *baŷ-re-zee'naä*, or **Beresina**: a river of Russia; rises in the government of Minsk, flows southward, and enters the Dnieper above Rechitza. Its length is about 325 miles. It is navigable, and is connected with the Düna by a canal which opens a communication between the Baltic and Black seas. The French army, retreating from Moscow in Nov., 1812, suffered a great disaster in the passage of this river. The French constructed hastily two bridges over the river, but while they were crossing they were attacked by the Russians, who took about 16,000 prisoners. The French loss, besides the prisoners, amounted to nearly 12,000, many of whom were drowned in the river.

Bergaigne, ABEL: Orientalist; b. at Vimy, Pas-de-Calais, Aug. 31, 1838; became Professor of Sanskrit at the Sorbonne. He devoted himself to the criticism and exegesis of the *Vedas*, and published *La religion védique* (Paris, 1883). D. Aug. 6, 1888. C. R. LANMAN.

Ber'gama (anc. *Pergamum* or *Pergamus*): a ruined city of Asia Minor; in Anatolia; situated in a beautiful valley, on the river Caius; 46 miles N. N. W. of Smyrna (see map of Turkey, ref. 5-D). Pop. about 6,000. The ancient city was the capital of the kingdom of Pergamus, and the seat of one of the seven churches of the Apocalypse. Here are extensive ruins of a palace, temple, amphitheater, and other edifices.

Bergamo, *bär'gä-mö*: a province of Italy; in Lombardy; bounded N. by Sondrio, E. by Brescia, S. by Cremona, and W. by Como and Milan. Area, 1,088 sq. miles. The northern part is mountainous. The soil of the plains and valleys is fertile. Silk is among the products. Pop. (1890) 412,393. Capital, Bergamo.

Bergamo (anc. *Bergomum*): a city of Italy; capital of province of same name; on several low hills, 39 miles by rail N. E. of Milan (see map of Italy, ref. 2-C). It presents a very picturesque appearance, and is well built. It has a castle, a cathedral, a college, a library, a theater, many convents and churches; also extensive manufactures of silk, cotton, linen, and woolen fabrics. *Bergomum* was destroyed by Attila in 452 A. D., after which it became an important city of the Lombard kings. Pop. 39,000.

Ber'gamot: the fruit of a tree which is a species or variety of the genus *Citrus*; also called **Bergamot Orange**, or **Mellaro'sa**. According to most botanists, it is a variety of the orange (*Citrus aurantium*). It is cultivated in the

south of Europe. The fruit is pear-shaped, of a pale yellow or green color, and has a green, sub-acid, and fragrant pulp. From its rind is obtained by distillation the oil of bergamot, which has a very agreeable odor, is extensively used in perfumery, and is an ingredient in eau-de-cologne and several fragrant essences. *Wild bergamot* is a name applied to the *Monarda fistulosa*, a common wild mint, because of its odor.

Berge, bär'ge, WILLIAM: organist; b. in Witzzenhausen, Hesse-Cassel, Germany, in 1824; studied under his father, Spohr, and Volekmar. When seven years old he played the organ in church. Studied first for the ministry in the Reformed Church, but afterward became a Roman Catholic. Moved to New York in 1846, and was appointed organist of several churches, finally becoming organist of St. Francis Xavier church in Sixteenth Street, remaining there till within two years of his death, which occurred on Apr. 6, 1883. In 1847 appointed Professor of Music in the College of the Sacred Heart; founded and conducted the Berge Choral Union, which produced Beethoven's *Ninth Symphony* with Thomas's orchestra in 1866. He composed some organ pieces and several masses. His playing was brilliant, quick, and accurate, and his sight-reading remarkable. D. E. HERVEY.

Bergen, bär'gen: an important city and seaport of Norway; capital of province of Bergen; at the head of a deep bay (fiord) of the Atlantic; 184 miles W. N. W. of Christiania; lat. 60 24 N., lon. 5 18 E. (see map of Norway and Sweden, ref. 10-A). It is picturesquely situated at the foot of a mountain, and inclosed on nearly all sides by water. The harbor is deep and safe, and is defended by several forts. Bergen is well built, has a cathedral, several hospitals, a theater, a public library, a national museum, and a college. It is the seat of one of the three public treasuries, and is probably the most commercial town of Norway. A large portion of the population is employed in the fisheries, and fish and cod-liver oil form the chief articles of export. It is stated that in the spring 600 fishing-vessels may be seen at once in the harbor. These vessels bring cargoes of fish, caught in the preceding winter on the northern shores. Bergen was founded in 1070, and was once a Hanse town. Pop. (1891) 53,686.

Bergen-op-Zoom, bär'gen-op-zōm', or **Berg-op-Zoom**: a strongly fortified town of Holland; in North Brabant; on the river Zoom, at its junction with the East Scheldt; 27 miles by rail W. S. W. of Breda (see map of Holland and Belgium, ref. 8-D). It is important as a military position, and has often been besieged. The Spaniards made unsuccessful attempts to take it in 1588, in 1605, and in 1622. In the last-named year General Spinola lost about 10,000 men in the siege. It was taken by the French in 1747, and again in 1794. A British army attacked it without success in Mar., 1814. Pop. (1890) 12,667.

Berger, bär'zhay', GEORGES: French civil engineer and administrator; b. in Paris, 1834; began life as a mining engineer, but soon left that career to devote himself to the fine arts, developing his tastes by many travels in Egypt and the East. His erudition was both varied and profound, and so great that he was selected to organize the foreign section of the Exposition of 1867. In the Exposition of 1878 he was in charge of the same section; and was director-general of the Exposition of 1889. He has also organized other expositions. He was in 1876-77 adjoint professor at the School of Fine Arts. He has published his views on the *Exposition internationale* of 1869; *Projet d'organisation administratif* (1885); and *L'École française de peinture depuis ses origines jusqu'à la fin du règne de Louis XIV.* (1879). W. R. H.

Berger, PHILIPPE: French Semitic scholar; b. in Beaucourt, Sept. 15, 1836; studied theology under the Protestant faculty at Strassburg; became Professor of Hebrew in the Faculty of Protestant Theology at Paris 1877. He has taken part in the editing of the *Corpus Inscriptionum Semiticarum*, and is the author of various articles and books, of which may be mentioned *L'Arabie avant Mahomet d'après les inscriptions* (Paris, 1885). C. H. TOY.

Berger, SAMUEL: brother of the preceding; b. in Beaucourt, May 2, 1843; studied at Strassburg and Tübingen; became assistant preacher in the Lutheran Church in Paris 1867; librarian to the Faculty of Protestant Theology there 1877. Of his works may be mentioned *La Bible au seizième Siècle* (Paris, 1879); *La Bible française au moyen-âge* (1884); *Le palmipède de Fleury* (1889).

Bergerac, bär'zhay'raak': a town of France; in Dordogne; situated in a fertile plain on the right bank of the river Dordogne, here crossed by a fine bridge of five arches; 27 miles S. W. of Périgueux, and 51 miles E. of Bordeaux (see map of France, ref. 7-E). It has a college, a public library, and manufactures of paper, hosiery, serges, and copper-ware. The Bergerac wine produced in this vicinity is highly esteemed. Pop. (1891) 14,735.

Bergerac, SAVINIEN CYRANO, de: French dramatist; b. in Périgord about 1620; served in the army; a celebrated duelist; author of *Agrippina*, *Le Pédant joué*. D. in Paris, 1655.

Bergh, HENRY: philanthropist; b. in New York, 1823; educated at Columbia College; author of *Lore's Alternative*, a drama; *Married Off*, a poem; *The Perilous Telegram*; *The Ocean Paragon*; *The Streets of New York*, etc. In 1863 Mr. Bergh was made secretary of legation to Russia, and also acted as vice-consul there. He was the founder and first president of the American Society for the Prevention of Cruelty to Animals. The society was incorporated Apr. 10, 1866, and there are in all thirty-eight States and Territories of the U. S. and Canada which have followed the example of New York. The crowning act of Mr. Bergh's life was the establishment of the Society for the Prevention of Cruelty to Children, which has its duplicate in every State and Territory of the U. S. D. in New York city, Mar. 12, 1888.

Berghaus, bärch'how, HEINRICH: German geographer; b. at Clevos, May 3, 1797; geographical engineer in the War Department at Berlin 1816; Professor of Mathematics, Academy of Architecture, 1824; published *Elements of Geography* (1842); *Ethnography* (1846); *Nations of the Globe* (1845); German edition of Catlin's *Indians of North America*. D. in Stettin, Feb. 17, 1884.

Berghaus, HERMAN: cartographer; nephew of the preceding; b. at Herford, Westphalia, Germany, Nov. 16, 1828; entered the Geographical Institute of Justus Perthes at Gotha in 1850. Among his numerous publications may be mentioned his *Karte des Oetzthales Gletschergebietes* (1861); *Chart of the World* (1863), which has gone through many editions; *Physikalische Wandkarte von Europa* (1875); *Karte der Alpen* (1878); *Physikalische Wandkarte von Afrika* (1881); *Berghaus's Physikalischer Atlas* (still in process of publication 1893). In the last he was aided by all the best scientific men of German speech. D. at Gotha, Dec. 3, 1890.

Berghem, bärch'hem, NIKOLAAS: Dutch landscape-painter; original name *Van Haerlem*; b. in Haarlem, 1625; pupil of Van Goyen, Jan Wils, and Weenix; painted with great facility and on a great variety of subjects. His pictures are noted for graceful touch, harmonious coloring, and natural composition. D. in Haarlem, 1683.

Bergk, bärch, THEODOR: classical scholar and critic; b. in Leipzig, May 22, 1812. He studied in his native city from 1830-35, and took his degree in Rostock in 1836. Called in 1842 as Professor of Classical Literature to Marburg, and in 1857 to Halle. Continued illness compelled him to resign his position in 1867. He died in Ragatz, July 20, 1881. Among his most noteworthy publications are his work on Aristophanes, his edition of the Greek lyric poets, and an unfinished history of Greek literature (4 vols.). See A. Schäfer, *Biogr. Jahrb.*, iv., pp. 105-110 (1881).

Bergmann, bärch'män, CARL: musician; b. at Ebersbach, Saxony, Apr. 11, 1821, and when six years old was placed under the instruction of Adolf Zimmermann. His parents moved to Hesse, and there he continued his studies, becoming a proficient performer on the violoncello, and afterward a leader of the orchestra. Having taken part in the rebellion of 1848, he was forced to leave Germany, and came to New York in the autumn of 1849. He became leader of the Germania Society, and a few years later was chosen conductor of the Philharmonic Society, which position he retained until his death in Aug., 1876. He was also elected leader of the Arion Society in 1855, and in the season of 1865 he conducted the opera in the Academy of Music. He also conducted several singing festivals. He was one of the earliest advocates of Wagner's music in this country. He composed an opera, a symphony, and some concert pieces before he had attained his twenty-seventh year, but it is as a conductor of eminence that his fame is secure. D. E. HERVEY.

Bergmann. ERNST, von; German surgeon; b. in Riga, Dec. 16, 1836; studied in Dorpat, Vienna, and Berlin; served with the armies of Prussia and Baden in the wars of 1866 and 1870; Professor of Surgery in University of Würzburg 1878-82; appointed Professor of Surgery and director of the surgical clinic, University of Berlin, 1882. Among his more important writings are *Über Fettinbolie*; *Das putride Gift*; *Das Sepsin*; *Zur Lehre von der putriden Intoxication*, etc.

Bergmann. TORBERN OLOF, Ph. D.; a Swedish chemist; b. at Catherinberg, West Gothland, Mar. 20, 1735. He was educated at the University of Upsal, and devoted himself to natural history, physics, and mathematics. He obtained the chair of Chemistry at Upsal in 1767. He discovered sulphuretted hydrogen, and first obtained important results from the use of the blowpipe. He laid the foundation of the science of crystallography. Among his works are an *Essay on Electric Affinities* (1775) and *Opuscula Physica et Chemica* (6 vols., 1779-90). D. in Medevä, on the Wettersee, July 8, 1784. See P. F. Anrivilius, *Aminnelse-Tal öfver T. O. Bergmann* (1785); Biot, article in the *Biographie Universelle*.

Bergmehl. bärch'mäyl [Germ., mountain-meal]; an extremely fine powder found in geological strata of recent (Eocene) formation, and composed of effete and indestructible silicious frustules of *Diatomaceæ*, which are microscopic plants of the class *Algæ*. Vast beds of these fossils occur in Germany, Lapland, Virginia, Maryland, Vermont, New Hampshire, and other regions. This powder is mixed with flour, and used as food by the people of Sweden and Norway in seasons of scarcity. It is used in making water-glass and the floating bricks of Southern Europe, and as polishing powder.

Bergslien. bärj slæen. BRYNJULF; a Norwegian sculptor; b. in Vors, Norway, Nov. 11, 1830; a pupil of Jerichan and Bissen. His best-known work is his bronze statue of Karl Johan in Christiania. R. B. ANDERSON.

Bergslien. KNUT; a Norwegian painter; brother of the sculptor; b. in Vors, May 15, 1827. His pictures of the early history of Norway have given him a wide reputation. R. B. ANDERSON.

Bergsøe. bärj'sö. JØRGEN VILDELM; Danish author; b. in Copenhagen, Feb. 8, 1835; was in youth a zoölogist, and as such attained distinction. But in consequence of the failure of his eye-sight, and of a long and severe illness, he was disqualified for his favorite study, and went to Italy for his health. He became a successful writer of romances. His first venture, *Fra Piazza del Popolo* (1866), had great success. He has also published *Fra den gamle Fabrik* (The Old Factory, 1869); *I Sabinerbjergene* (In the Sabine Hills, 1871); *Bruden fra Rørvig* (The Bride of Rørvig, 1872); *Gjengangsførtællinger* (Ghost Stories, 1872); *Italienske Noveller* (Italian Tales, 1874); *Fra gamle Dage* (From Old Days, 1885); *Fra sollyse Strande* (From Sunny Shores, 1886); and other volumes, including several collections of poems. His most ambitious work is *Rome under Pius IX.* (1874-77). Revised by G. L. KITTEDGE.

Berhampur. ber-äm-poor'; a town of British India; in the presidency of Bengal, on the Bhagirathi river; 6 miles S. of Murshidabad, and 118 miles by land N. of Calcutta (see map of N. India, ref. 7-1). It is one of the principal British military stations in India, and has an appearance of grandeur and importance. Sanitary improvements have rendered it one of the most healthy places in Bengal. Pop. 24,000.

Bering. bay ring (commonly but incorrectly spelled *Behring*). VITUS; a Danish navigator; b. in Jutland in 1680. He entered the Russian navy at an early age, and fought with distinction against the Swedes. In 1725 he was appointed the commander of an expedition sent to explore the Sea of Kamtchatka. During this voyage, which occupied several years, he discovered Bering Strait (1728), and ascertained that Asia was not joined to America. In a subsequent voyage he was wrecked on Bering's island, where he died Dec. 8, 1741. See his *Life* by P. Lauridsen (Chicago, 1889).

Bering (or *Behring*), bay'ring, **Sea** (also called *Sea of Kamtchatka*); the most northern part of the Pacific Ocean, extending between the peninsulas of Alaska and Kamtchatka. It is connected by Bering Strait with the Arctic Ocean.

Bering (or *Behring*) **Strait**; connects the Pacific Ocean with the Arctic Ocean, and separates Asia from America.

It was discovered by Vitus Bering in 1728. Its width is about 45 miles at the narrowest part, between East Cape (Asia) and Cape Prince of Wales (America). The depth of this strait near the middle is about 30 fathoms.

Bering Sea Controversy; a question in dispute between the U. S. and Great Britain in regard to certain rights connected with seal-fishing in Bering Sea. An understanding of the controversy requires a brief description of the points at issue. The seal-fisheries of the Alaskan coast form the most important item in the commercial activities of that Territory. It was largely in consideration of this fact that the Government of the U. S. acquired possession of Alaska by purchase from Russia in 1867, and since the acquisition of the Alaskan territory the seal-fisheries have afforded a very considerable revenue to the Government. But in order that this revenue may be continued the fishing industries must be protected; and such protection, owing to the peculiar habits of seals, came to involve the international question at issue. The home of the seals is upon the Alaskan coast, which is unmistakably within the domain of the U. S. At a certain season of the year, however, the seals are in the habit of going in great numbers to the Pribyloff islands for the purpose of breeding. These islands also belong to the U. S., having been ceded as a part of Alaska by Russia. But in crossing from the mainland to the islands the seals are obliged to cross Bering Sea, when they are subject to interception by fishing vessels from Canada and elsewhere. In this way great depredations have been committed. Many of the seals killed at this season of the year sink in the sea and are lost, while many of those recovered are of inferior value. These depredations very greatly reduced the value of the industry to the U. S. The Secretary of State, in a dispatch published in 1890, made the statement: "From 1870 to 1885 the seal-fisheries, carefully guarded and preserved, yielded 100,000 skins a year. The Canadian intrusions began in 1886, and so great has been the damage resulting from the destruction of seal life in the open sea surrounding the Pribyloff islands that in 1890 the U. S. limited the Alaska Company to 60,000 skins, but the company was able to secure only 21,000 skins."

The question presented was whether the U. S. Government had a right to protect its property in waters that would ordinarily be regarded as a part of the open sea, where, according to international usage, every nation and people ordinarily has the right to hunt and fish according to its own free will. The claim of the U. S. to this right was asserted in 1887; but in order to avoid a diplomatic issue a proposal was made to Great Britain that a convention should be entered into between the two nations, in which Russia should be invited to join, limiting the periods in the year in which seals might be taken, and prescribing a time covering the period of breeding during which they should not be molested. The expediency of the convention was at once conceded by Great Britain, and the U. S. was invited to prepare and furnish a draft of such regulations as were deemed necessary to accomplish the object. Such a draft was prepared and transmitted, and no question arose as to details. The Russian Government accepted the invitation to join in the convention, and there was every reason to anticipate that the whole question would be satisfactorily adjusted. But an unexpected obstacle arose. It came to be understood that Canada, whose people were profiting by the depredations, declined to assent to the proposed restrictions. As the objections of Canada could not be overcome, the attempt to secure a convention came to an end. The U. S. Government was thus driven to assert its rights under international law or to abandon its claims.

The claim set forth by the U. S. was that the waters in which the depredations were committed are not a part of the open sea but are within the jurisdiction of the U. S. It was evident, however, that this claim must be established, if at all, on unusual grounds; for Bering Sea is more than half as large as the Mediterranean, and is accessible through Bering Straits by a passage more than 30 miles in width and by still wider passages from the S. By ordinary international usage, therefore, Bering Sea, except within a 3-mile line from the shore, would be open to the fishermen of all nations. But the question was complicated by claims set up by Russia, and to some extent admitted in the early part of this century. By general consent all the rights of Russia passed to the U. S. at the time of the purchase. As early as 1799 the Russian Government issued a ukase which

claimed exclusive jurisdiction over Bering Sea down to the fifty-fifth degree of north latitude, and under the protection of this ukase the Russian American Company was formed. It does not appear that any power entered a protest against this claim. But in 1821 the edict of 1799 was reaffirmed by Russia, and was so far enlarged as to extend the claim down to the fifty-first degree. Against this ukase of 1821 both Great Britain and the U. S. entered formal protest; but whether the protest related to the general claim maintained by Russia, or merely to an extension of the limit from the fifty-fifth to the fifty-first degree, is one of the questions involved in the controversy which can not be determined by documentary evidence. As a consequence of these protests Russia made important concessions in the treaties of Apr. 17, 1824, and Feb. 28, 1825. It was agreed that for ten years the contracting powers should have the right to visit the "interior seas, gulfs, harbors, and creeks for the purpose of fishing and trading." At the end of ten years, however, Russia refused to renew the agreement, and consequently, since 1834, the owners of the region have rested upon the rights maintained prior to the treaties of 1824 and 1825. In the treaties of 1843 and 1859 between Russia and Great Britain the privileges of the Russian American Company were specifically recognized, but nothing in the treaties throws any light on the question as to the geographical limits of Russia's claim. In 1870, three years after the purchase of Alaska by the U. S., the Government gave to the Alaska Commercial Company the privilege of killing annually 100,000 seal on the Pribiloff islands. It was subsequently found, however, that the seal in their passage to and from the islands were interfered with by poachers. Accordingly, Congress, by special enactment, declared that the U. S. had jurisdiction over all the "mainland, islands, and waters" ceded by Russia to the U. S., and that "no person shall kill any otter, mink, marten, or fur seal, or other fur-bearing animal within the limits of Alaskan territory or the waters thereof." In this law there was no statement as to whether the waters referred to included the whole of the region lying between the Pribiloff islands and the mainland. While the U. S. has never formally claimed that the whole of the waters involved are a part of a "closed sea," Great Britain has maintained that the special rights of the U. S. are limited by the 3-mile line prescribed by ordinary international law. If this position is admitted, the claim of the U. S. must rest upon the question whether seal in passing through open waters from one part of U. S. territory to another are entitled to exemption from molestation. The contention of the U. S. might be thus stated. The right to fish in the open sea is not disputed. But the seal is not a fish. On the contrary, it has its abiding-place on the land, to which it regularly resorts and where it may be said to belong. It thus becomes the property of the owner of the land on which it lives, and in passing to the open sea it is entitled to the same protection as any other property. Moreover, even if the seal were to be regarded as a fish, it would be entitled to exemption from pursuit by any method that would result in its extermination. The methods resorted to by the poachers between 1886 and 1890 threaten such extermination. In preventing such a disaster Great Britain is as much interested as the U. S., inasmuch as all sealskins, though belonging to people of the U. S., are taken to London to be dressed and dyed. It was further urged that the sea is not and never has been absolutely free for any purpose whatever that is injurious to the rights, the property, and the honor of a nation that is able to defend itself. It is held that no nation has more frequently or more resolutely asserted this principle than Great Britain, and instances are cited for the purpose of showing that she has never permitted any abstract theory of freedom on the high sea to become a justification for inflicting serious injuries upon her interests or her property for the sake of the profits to be realized by the assailant. In answer to these contentions the Government of Great Britain expressed a willingness in 1891 to submit several of the questions at issue to arbitration by other friendly governments. There was much diplomatic discussion over the questions to be submitted, but the terms of arbitration were finally agreed upon. The Government of Great Britain agreed to a *modus vivendi* for one year to prevent depredations upon the seals. At the end of the year, the matter in arbitration not yet having been settled, she declined to renew the *modus vivendi*. After some correspondence, however, the British Government consented to a renewal in modified form after the U. S. Senate should have ratified the treaty providing

for submitting the questions involved to arbitration. The treaty ratified by the Senate Mar. 29, 1892, provided for submitting the questions in dispute to a commission of seven persons, two appointed by the President of the U. S., two appointed by the Queen of England, one by the King of Sweden, one by the President of the French Republic, and one by the King of Italy. For the outcome of the whole matter, see *FISHERY RELATIONS OF THE UNITED STATES*. The subject is best studied in the diplomatic correspondence; in *Harper's Weekly* for Mar. 7, 1891; in *The Forum* for Nov., 1889; and in *Harper's Monthly Magazine* for Apr., 1891. C. K. ADAMS.

Berja: a town of Spain; province of Almeria; on the south slope of the Sierra de Gador; 22 miles W. S. W. of Almeria (see map of Spain, ref. 20-F). It is in the midst of lead mines, and has manufactures of linen, hats, hardware, etc. Pop. 16,000.

Berke'ley: town; on railroad; Alameda co., Cal. (for location of county, see map of California, ref. 7-C); the seat of the University of California, five preparatory schools, the State Agricultural College, and the California Institution for the Deaf, Dumb, and Blind; is 9 miles E. of San Francisco, across San Francisco Bay, and 5 miles N. of Oakland. Pop. (1880) not given in census; (1890) 5,101; (1893) estimated, 9,000 (increase partly due to annexation of territory).

EDITOR OF "ADVOCATE."

Berkeley, baar'kle, GEORGE; philosopher and bishop; b. at Killerin, Ireland, Mar. 12, 1684. He studied at Trinity College, Dublin, where he formed a friendship with Dean Swift, and became a fellow of that college in 1707. He published in 1709 his *Essay towards a New Theory of Vision*, a work of wide reputation. He propounded his celebrated theory of idealism in a *Treatise Concerning the Principles of Human Knowledge* (1710), in which he affirmed that there is no proof of the existence of a material world. The objects of which we are conscious in perception he called "ideas." Their presence he held to be due to the constant agency of the Almighty, who causes them to pass in a real and orderly succession before the mind. His views are the result of the application of rigid logic to the principles which Locke and his school had adopted from Descartes. His method was allied to that of Malebranche, though his conclusions were drawn with a boldness from which the French philosopher recoiled. As distinguished from the egoistic system of Fichte, Berkeley's views have been called theistic idealism. His object was to undermine materialism and counteract skepticism, and he laid the basis of that intuitional philosophy which has ever since been the basis from which Christian metaphysics have opposed the reasoning of inductive skepticism. In 1713 he removed to London, and wrote several essays for the *Guardian*. He accompanied Lord Peterborough as chaplain to Italy, and returned to London in 1720, and to Ireland in the autumn of 1721. In 1724 he became Dean of Derry, worth £1,500 a year. His abundant charity and zeal induced him to engage in an enterprise for the conversion of the American savages, for which purpose he proposed to found a college in America for the education of missionaries. Having received a promise of pecuniary aid from the Government, he married Anna, a daughter of John Forster, Speaker of the Irish House of Commons, in 1728, and sailed to Rhode Island. He purchased a country seat and estate about 3 miles N. E. from the State-house, Newport, within the limits of the present town of Middletown. Naming his place Whitehall, he resided here for two years and a half. About a mile and a half from his house he had his chair and writing apparatus placed in a natural alcove among the hanging rocks on the beach, and in this natural retreat he wrote the greater part of *The Minute Philosopher*. During his residence in Rhode Island he officiated in Trinity church, Newport, and on his return to England in 1733 he sent to the parish an organ, still preserved. His library was distributed among the neighboring clergy. He gave to Yale College a thousand volumes of valuable works and the deed of his farm, the rents of which were to be appropriated to the support of three post-graduate students. He did not succeed in his enterprise because the ministers failed to perform their promise, and he returned to London 1732, and was appointed Bishop of Cloyne in 1734. Among his works are *Alciphron*, or *the Minute Philosopher* (1732); *The Analyst* (1734); *a Word to the Wise* (1749); and several books on the virtues of tar water, in whose curative qualities he had great faith. He died at Oxford, Jan. 23, 1753, leaving an excellent reputation as a model of virtue. See Dr. Stock's *Life of Berke-*

ley, prefixed to his works (2 vols. 4to, 1784); G. M. Wright's *Life of George Berkeley* (prefixed to his works, 1843). Berkeley's works have been edited, with a life annexed, by Prof. A. C. Fraser, in 4 vols (Oxford, 1871).

Revised by WILLIAM STEVENS PERRY.

Berkeley, Rev. MILES JOSEPH, F. L. S.: English botanist; b. in Oundle, Leicestershire, in 1803; educated at Rugby and Christ's College, Cambridge. He obtained several Church preferments, but his chief distinction was won in science. He published *Gleanings of British Algae* (1833); the last volume of the *English Flora* (1836); *Handbook of Cryptogamic Botany* (1857); *British Fungology* (1860); *British Mosses* (1863); besides many minor papers on fungi. D. in his rectory, Sibbertoft, July 30, 1889.

Berkeley, Sir WILLIAM: colonial governor and proprietor; b. near London about 1610. He was appointed Governor of Virginia in 1641, and held that office for many years. He was a royalist in the civil war, and was removed from power in 1651 by Cromwell, but became Governor again in 1660. He rendered himself unpopular by his cruelty in putting to death the adherents of Nathaniel Bacon. D. in England, July 13, 1677. See BACON'S REBELLION.

Berkeley, EARLS OF, and Viscounts Dursley (1679): Barons Berkeley (1416, in England); a prominent family of Great Britain.—THOMAS MORETON FITZ-HARDINGE BERKELEY, the sixth earl, b. Oct. 19, 1796; d. Aug. 27, 1822; his father died in 1810, leaving his estates to his oldest son, born before the marriage (1796) of the countess. The title was adjudged to Thomas Moreton, the first child born in wedlock; but he did not assume it until 1881. D. in 1882, and was succeeded by RANDAL MOWBRAY THOMAS BERKELEY, b. 1865.

Berkley, Sir GEORGE: civil engineer; b. in London, Apr. 26, 1821; educated in private schools; in 1835 apprenticed to Samuda Brothers, with whom he worked in the shops and on designs of atmospheric railways, steam-engines, etc. From 1841 to 1849 he was assistant to Robert Stephenson, during which time he was engaged on experiments with locomotives, change of gauge, and rolling-stock of the Eastern Counties and Northeastern Railways. From 1849 to 1859 he was engaged on examinations for the water-supply of Liverpool for Robert Stephenson, the engineer to the London and Blackwall, the North and the Southwestern Junction, and other railways. In 1851 he represented Robert Stephenson as engineer of the Great Indian Peninsular Railway, and upon the death of Stephenson in 1859 took his place. In 1874 he was made one of the consulting engineers to the Colonial Office for Railways in Natal, and for viaducts in Cape Colony, in 1885 consulting engineer to the Indian Midland Railway, and in 1887, with his son, became engineer to the Argentine Northeastern Railway. He entered the Institute of Civil Engineers as an associate in 1845, was made full member in 1861, and president in 1892. He was one of the managers of the Royal Institution. He wrote for the institution upon atmospheric railways in 1845, and upon the strength of iron and steel in 1870, bridges founded upon brick walls, communications in Brazil, etc. Knighted in May, 1893; d. Dec. 20 same year.

W. R. HUTTON.

Berkley: town; Norfolk co., Va. (for location of county, see map of Virginia, ref. 7-J); on Nor. Southern R. R., and on Elizabeth river; has ship-building, cotton, and lumber industries, and is connected with Norfolk, a mile distant, by ferry. Pop. (1890) 3,899.

Berkley Springs: a village of Morgan co., W. Va.; 2½ miles S. of the Potomac river and the Baltimore and Ohio R. R., at Sir John's Run; 128 miles W. N. W. of Baltimore (for location, see map of West Virginia, ref. 5-M). Here are medicinal springs, which are much frequented, and have a temperature of 74° F. They are useful in rheumatic, calculous, nervous, and catarrhal diseases. It has a large tannery. Pop. (1880) 534; (1890) not separately returned, being included in that of the district of Bath, which in 1890 was 1,529.

Berkshire: an inland county of England; bounded N. by Oxford and Bucks, E. by Surrey, S. by Hampshire, and W. by Wiltshire; area, 722 sq. miles. The river Thames forms its entire boundary on the N. and N. E. The surface is beautifully diversified by hills and valleys. In the S. E. is Windsor Forest and Park. Wheat, oats, horses, and swine are the staple products. Pop. (1881) 218,363; (1891) 238,446. Capital, Reading.

Berlad, bār'laat': a town in Roumania; on the Berlad; 63 miles S. of Jassy (see map of Austria-Hungary, ref. 7-II). It is an entrepôt for grain. Pop. 26,568.

Berlichingen, bār'lich-ing-en, GÖTZ or GOTTFRIED, von: famous German knight; surnamed THE IRON HAND; b. in 1480 at Pfasthausen, in Württemberg. He lost a hand at the siege of Landshut, and supplied its place by an iron hand. He was a daring and turbulent subject, was involved in several feuds with neighboring barons, and fought for the insurgent peasants against the nobles in the Peasants' war, which closed in 1525. For this offense he was placed under the ban of the empire by Maximilian I. He died in 1562, and left an autobiography (1731). His exploits form the subject of Goethe's drama of *Götz von Berlichingen*.

Berlin, bër-lin': the capital of the Prussian monarchy and of the German empire; the third largest city of Europe; on the river Spree, in lat. 52° 30' N., lon. 13° 24' E. (see map of German Empire, ref. 3-G). The city during the Middle Ages was the capital of the Mark of Brandenburg, and became chief city of the consolidated territory of Brandenburg and Prussia when these were united into a kingdom. The city received an important impulse from its connection with the Hansatic League, and from the remarkable political and military activity of the Great Elector. Under Frederick the Great the population increased, until at his death it numbered about 115,000. In 1817 it had grown to 188,000; in 1844 to 311,000; in 1851 to 426,000; and in 1867 to 702,000. The greatest impulse, however, was given to the city when, in consequence of the Franco-Prussian war of 1870-71, it became the capital of the new German empire. In the next twenty years its growth was so rapid that in 1891 the population was 1,579,244. Of these, about 135,000 were Roman Catholics and 80,000 Jews. The others were Protestants, and, for the most part, members of the United Evangelical State Church. Pop. (1895) 1,674,112. The principal streets are the Unter den Linden, with its four rows of lime-trees and stately Brandenburg gate, the Wilhelmsstrasse, the Königsstrasse, and the Leipzigerstrasse. The city abounds in public places of unusual interest, among which may be mentioned the Opera-house, the Old Palace, known as the Schloss, the Lustgarten, the Gensdarmenplatz, the Wilhelmplatz, the Thiergarten, the Belle Alliance Platz, the Leipziger Platz, the Pariser Platz, and the Charlottenburg Mausoleum. The statue of Frederick the Great, by Rauch, at the head of Unter den Linden, is one of the most imposing ever erected. In other parts of the city are to be seen statues of Schwerin, Winterfeld, Seidlitz, Keith, Zieten, Von Bülow, Leopold of Dessau, and the Great Elector. The Castle Bridge, built in 1824 upon two massive stone arches, is decorated with eight interesting allegorical groups in marble. The Old and the New Museums have many features that are unsurpassed in the world. What is known as the Old Museum was built in 1828 by Schinkel, and contains the celebrated picture gallery, which is rich, not only in early Italian and German masters, but also in collections of ancient sculpture and other antiquities. The New Museum, erected nearly twenty years later, contains a remarkable collection of Egyptian antiquities brought together by Lepsius.

Institutions of Learning.—The most renowned of the institutions of Berlin is the University, which was established in 1810, under the direction of Wilhelm von Humboldt, and an account of which is given below. The Royal Library numbered in 1890 about 900,000 volumes and more than 18,000 manuscripts; and the library of the University has about 300,000 volumes. The Polytechnicum, erected with a part of the indemnity money received from France after the war of 1870, is one of the most elaborate and imposing educational structures in the world. Other important institutions of learning are the Academy of Science, the Building Academy, the Naval Academy, the Mining Academy, the Pharmaceutical School, the Artillery School, the Singing School, and several institutions for the deaf, dumb, and blind. The city contains ten colleges of the rank of gymnasia and Real schools for the preparation of students for the University and Polytechnicum.

Methods of Administration.—The government of Berlin is republican, but with a method of organization which places virtual control of the city in the hands of those who own the property. Every male inhabitant of Berlin who is a Prussian and twenty-four years of age is a voter, provided: (1) he has lived in the city for one year; (2) is not dependent upon a father or guardian, and enjoys control over his

own household and property; (3) has for a year received no alms from public funds; (4) has paid all his municipal taxes during the last year; (5) (a) possesses a house, or (b) pursues a trade with two employees, or (c) pays an income tax, or (d) pays a class tax. The proportion of the inhabitants who under these regulations have the right to vote in the city is about one in seven, or 13 per cent. less than those who have the right to vote at the imperial elections. The most noteworthy characteristic of the government of Berlin, however, is the method by which the voters are divided into classes in such a way as to give to the men of wealth a predominant influence in the government. The voters are divided into three groups or classes, according to the amount of their taxes. The highest taxpayers, beginning with the citizen who pays the highest tax, include so many of the richest men as pay a sum total equal to one-third of all the taxes paid by the citizens of the municipality. The second class begins where the first leaves off, and goes far enough down the list to include those who pay the second third of the entire tax. The remaining citizens form the third class. The first class embraces about $2\frac{1}{2}$ per cent. of the voters and the second about $7\frac{1}{2}$ per cent. The remaining 90 per cent. constitute the third class. Each class elects one-third of the city council. In other words, $2\frac{1}{2}$ per cent. of the citizens elect one-third of the city government, the next $7\frac{1}{2}$ per cent. elect one-third, while the 90 per cent. belonging to the third class elect one-third. The city assembly, consisting of 108 members, is elected for six years, the term of one-third expiring every two years. The office of city assemblyman or councilman is considered one of honor, and no salary is received. The assembly meets every Thursday afternoon, and its meetings are public. The executive branch of the government is in the hands of the mayor and a body of thirty-four magistrates. One-half of the magistrates receive salaries, and are expected to give their whole time to the work. The mayor and paid magistrates are elected for twelve years, and have the right to a pension in case they are not re-elected. The other members of the magistracy are elected for six years. The municipal assembly has the ordinary functions of a legislative body. It discusses matters pertaining to administration, but is not allowed to enter upon executive work, this being left exclusively to the mayor and magistrates. The higher city officers are appointed for life, invariably after a long term of service in subordinate positions. The mayor himself must have graduated in law from a German university. The system of civil service in the various bureaus provides for permanence of tenure, and for punishing and even dismissing officers who do not discharge their duty in every respect. Under such a system of civil service, leading as it does to promotion, it is manifestly not for the interest of an officeholder to be dishonest. The salaries paid in the bureaus and the city treasury range from \$1,275 to \$1,500, while several hundred secretaries and assistants receive no more than from \$450 to \$1,000. But the offices are considered desirable on account of their permanency.

Condition of the Streets and Drainage.—The excellence and thoroughness of the government of Berlin is in no way more conspicuously shown than in the habitual cleanliness of the streets, and in the admirable system of drainage. The streets are every day cleaned between midnight and daybreak; and the stranger is everywhere impressed with the thoroughness with which the work is done. Berlin is less advantageously provided with natural drainage than almost any other of the world's great cities. Paris is drained by the Seine; London by the Thames; Vienna by the Danube; and New York is surrounded by deep water. In Chicago alone of the world's large cities is the drainage question so awkward as it is in Berlin. So long as the city was small, the diminutive and sluggish river Spree sufficed fairly well to carry off refuse matter. Underground sewerage was not well developed, and the houses were provided with cess-pools and underground vaults, rather than with modern plumbing and sewer connections. But the recent development of the capital of the new German empire made it imperatively necessary that something should be done that should be adequate to the situation. Obviously the removal of waste water by a large swift-flowing channel to disinfection and disappearance in salt water was quite out of the question. Sewage farms had been tried experimentally and with some success elsewhere, particularly at one or two places in England. The Berlin municipal council gave the matter much scientific consideration, and at length hit upon a general plan embodying the following essential features: The city should be provided with a complete modern system

of underground sewers, with which all the houses should be brought into direct connection. The city should be divided into some twelve drainage districts, regard being had to the minor topography of Berlin. Each of these districts should have a complete sewer system of its own, which should be called Radial System No. 1, No. 2, and so on. The sewers of each radial system or district should be made to converge to the district pumping station, so that each district should be wholly independent of all the rest. At the lowest point in a given drainage district it was decided to locate a large receiving station for the reception and partial filtration of the sewage, and at some point to locate powerful pumping machinery. From each one of these pumping stations there should be a large tunnel of sufficient size to carry off the regular sewage of the entire district, and through this tunnel the pumping machinery should force the sewage out of the city into receiving and subsidence tanks located upon tracts of land purchased by the authorities as sewage farms. These farms are considerable areas of what was almost waste and worthless land, lying at different distances but at an average perhaps of from 7 to 10 miles out of Berlin in several different directions. As rapidly as a district of the city was prepared, the system was put into operation for that particular district. It is only since 1890 that the entire system has been in operation, after perhaps ten years spent in making the great transformation. It is now the completest and most satisfactory system for the disposition of liquid waste that any great city possesses. A scientific agriculture is practiced upon the farms, and by a system of irrigation—a description of which would involve merely technical considerations—it is found possible to make the soil swallow up and disinfect without offense to surrounding farms and villages the entire sewage product of the great metropolis. The system is capable of expansion at both ends to meet the enlarged requirements of the future. From an engineering point of view it is highly successful, while from an economic point of view it has carried with it as little cost as any system that could be devised for the accomplishment of this necessary service. From the sanitary point of view it is above all praise. It is administered as a distinct department of the municipal government with great thrift and success. The waste lands have been made highly productive, and the municipality of Berlin puts upon the market a very large quantity of garden products. Even the water of the sewage, after it has been disinfected, is so perfectly pure as to be brought back to the city for ordinary use. The best account, in English, of the government of Berlin will be found in an article in the *Contemporary Review* for 1884, p. 769, by Prof. Rudolph Geisler, who has been a member of the Berlin city government more than forty years. A more elaborate account will be found in the regular reports annually published by the Berlin city magistracy. See also Von Möller's *Preussisches Stadtrecht*.

C. K. ADAMS.

Berlin: the capital of Waterloo co., Ontario, Dominion of Canada; on the Grand Trunk R. R.; 62 miles W. of Toronto, at the junction of the Galt, Waterloo, and Elmira branches (see map of Ontario, ref. 4-C). It has many important manufacturing interests, including 6 furniture and chair factories, 2 immense tanneries, 3 boot and shoe factories, 2 shirt-factories, piano, button, suspender, glue, and box factories, 5 printing establishments, water-works, electric light, street-cars, a Catholic college, 14 churches, elegant business blocks, and splendid hotels. Pop. (1881) 4,056; (1891) 7,425; (1892) about 8,000. Editor of "News."

Berlin: city; on railroad; Green Lake co., Wis. (for location of county, see map of Wisconsin, ref. 6-E); on Fox river; 94 miles N. W. of Milwaukee. Steamboats ply between this point and Green Bay, etc. Berlin has eight churches, and good graded schools. Its industries are diversified, and include flouring-mills, foundry, and manufactures of turbine-wheels, woolen goods, the manufacture of gloves, whips, washboards, brooms, shoes, the quarrying of granite, canning of fruit, marketing of produce, etc.; and it has water-works and electric lights. The vicinity produces largely cranberries and dairy products. Pop. (1880) 3,353; (1890) 4,119; (1895) 4,279. Editor of "EVENING JOURNAL."

Berlin Blue: See PRUSSIAN BLUE.

Berlin Congress: the meeting in Berlin in 1878 of the plenipotentiaries of the great powers of Europe to decide certain important questions growing out of the Russo-Turkish war of the preceding year. The occasion of the congress was what was regarded as the threatening attitude of Russia

in the East, in consequence of her victory and the Treaty of San Stefano. The general fear was that Russia had acquired a preponderance of power over the Northern Turkish provinces, which might ultimately threaten Constantinople and the approaches to the Black Sea. As this fear involved also the question of controlling the mouth of the Danube, the nation most immediately interested was Austria. But the interests of Great Britain, though more indirect, were not less positive and important, inasmuch as, since the treaty of Paris in 1856, Great Britain had maintained such relations with Turkey as enabled the British Government to have very large influence, and in some respects even control, over Turkish affairs. While the preliminary arrangements for the congress were progressing, Lord Carnarvon probably gave expression to British opinion and feeling when he pointed out to the House of Lords "how convenient for a time it had been to have a power commanding the Dardanelles and the Bosphorus which was not strong enough to stand alone, but was strong enough to stand by the aid of Great Britain, and how hopeless it would be to find any exact equivalent for such an arrangement." He further said that the only substitute would grow up gradually in the general improvement and increasing power of the subject races of Turkey, and it was their interest which Great Britain ought to go into the congress to guard. These two sentences well expressed the spirit of Great Britain in going into the congress. The initiative suggestion of the congress was made by Austria. The place indicated was Berlin and the president Prince Bismarck. Those responding to the suggestion generally recognized the fact that the interests of Europe were so involved in the condition of Turkey and the dependent provinces that all the details of the Treaty of San Stefano (Mar. 3, 1878) might properly come before the congress for review. But at first there were difficulties in the way. At length, however, Russia, owing to the urgent representations of Count Schouvaloff, agreed that the whole Treaty of San Stefano might be submitted for consideration. Accordingly, Germany, acting upon Austria's suggestion, invited the European powers to a congress at Berlin for June 13. On the 15th of that month the plenipotentiaries of Germany, Great Britain, Austria, Russia, France, Italy, and Turkey met at the palace of Prince Bismarck, and organized by the appointment of Prince Bismarck as president. The congress was made up of the most distinguished officials of the several governments. Great Britain was represented by Lords Beaconsfield and Salisbury, and Mr. Odo Russell (afterward Baron Ampthill); Russia by Prince Gortschakoff, Count Schouvaloff, and Baron d'Onbril; Germany by Prince Bismarck, Prince Hohenlohe, and Gen. Von Bülow; Austria by Count Andrassy, Count Karolyi, and Baron Haymerlin; France by M. Waddington and the Comte de Saint-Vallier; Italy by Counts Corti and Launay; and Turkey by Caratheodori Pasha, Sadoullah Bey, and Mehemet Ali Pasha.

It was evident from the first that the congress would work toward peace. A sensation was produced when it came out that in May a treaty had been signed between Russia and England agreeing to a settlement of one of the most important questions in dispute. By this treaty Bulgaria was to be divided into two provinces, the northern of which should be independent, and the southern should be governed like a British colony, the governor being appointed for five or ten years with the consent of Europe. Southern Bulgaria was not to reach the Ægean, nor were Turkish troops to enter Bulgaria except in case of war or threatened insurrection. In consideration of Russia's assent to these articles, Great Britain agreed "not to dispute the articles of the preliminary Treaty of San Stefano." When the Bulgarian question, which touched so closely the interests of Austria and Turkey, as well as those of Russia, came before the congress, it was finally settled by the formation of an independent Bulgaria extending from the Danube to the Balkans, with an elective prince and an army of its own, and with the control of all the fortifications. Turkey was given the control of the Balkans, with as many fortifications as she desired. In the region south of the Balkans, "Eastern Rœmelia" was established, to be governed by a hospodar, to be appointed for five or ten years, and to be nominated by the sultan and the powers. It was decided to intrust Austria with the task of occupying Bosnia and Herzegovina in the interests of European peace; but the duration of Austrian occupation was not determined. This plan for Austrian occupation was reluctantly accepted by Italy and Turkey. Serbia received independence with a territorial extension. The Montenegrin question was settled by giving

to the little state a considerable increase of territory and access to the sea. The Greek question evoked much interest and discussion, but the congress limited itself to passing a resolution recommending an extension of Hellenic territory, inviting the Porte to come to an understanding with the Greek Government in regard to the frontiers, and tendering the good offices of the powers in case of disagreement. In the course of the meetings of the congress a second great sensation was created by the revelation that on June 4 Great Britain had signed a secret treaty with Turkey by which the two contracting powers entered into mutual obligations, Great Britain, on the one hand, agreed for all future time to defend the Asiatic dominions of the Ottoman empire "by force of arms," while Turkey, on the other, promised, first, to introduce all necessary reforms, as agreed upon with its ally, and, secondly, to assign the island of Cyprus to be occupied and administered by Great Britain, so long as Russia should occupy Batum, Ardahan, and Kars.

It was universally conceded that the part of Great Britain in the congress was played with great skill and brilliancy. By the terms finally adopted the Dardanelles were restored to their condition before the recent war; the stability and ultimate independence of the Northern Turkish provinces were secured; Russia was required to destroy her fortifications at Batum; Turkey was required to reform her government; while Great Britain, by establishing herself in Cyprus, assumed virtual control of the eastern part of the Mediterranean Sea. Many of the most influential newspapers of Europe regarded the results of the congress as henceforth securing the preponderance of British influence in Asia. At the final sitting of the congress it was determined, on motion of Prince Bismarck, that each power should watch over the execution of the clauses agreed upon affecting itself, and should be at liberty to address the Porte such personal observations as it might deem advisable. The congress concluded its work on July 13, just one month from the date for which it was called. The treaty, which is said to be the longest ever written, was signed by a larger number of plenipotentiaries than had ever before fixed their names to a treaty. C. K. ADAMS.

Berlin, Treaty of: See BERLIN CONGRESS.

Berlin, University of: founded soon after the crushing defeat of Prussia by Napoleon at Jena, at a time when it seemed as though the national life and spirit were at their lowest ebb. Under the inspiring leadership of men like Fichte and Humboldt, however, the country set about recovering its lost prestige with a wisdom and determination that has perhaps never been equaled in history. The inauguration of the great Prussian school-system dates from this period, and of this system the University of Berlin may very properly be considered the crown. The university was founded in 1809 and opened in 1810. The faculty was recruited from the most eminent scholars of Germany, and such leaders as Niebuhr, Wilhelm von Humboldt, Ritter, Fichte, Hegel, Neander, and Schleiermacher soon attracted the attention of Europe to the young institution. The reputation thus established has been maintained by men like Ranke, Mommsen, Curtius, DuBois-Raymond, Helmholz, Virchow, Droysen, Von Sybel, and Koch. The main building of the university is the old palace of Prince Henry, brother of Frederick II., erected in 1754-64, and appropriated to the use of the university in 1809. It stands on Unter den Linden, opposite the Royal Library and the Opera-house. This building contains some of the museums and scientific collections. The garden in front is adorned with statues of Wilhelm and Alexander von Humboldt. The university also occupies some seven or eight other buildings in adjacent parts of the city. The university library, containing 300,000 volumes, is supplemented by the Royal Library of 900,000 volumes, just across the street, to which students have easy access.

Instruction.—Instruction is given mainly by lectures and in the laboratories. There are also several seminaries. There are four faculties: *Theology*, with 17 professors; *Jurisprudence*, with 26 professors; *Medicine*, with 112 professors; and *Philosophy*, which includes all branches of learning pertaining to general culture and not to professional training, with 181 professors. Using the word professor to indicate instructor of whatever order, there are then 336 professors in these four faculties. No fewer than 757 courses of instruction were offered during the year 1890-91. Of these, 30 were in the Oriental languages. The year is divided into two terms or semesters, the winter semester extending from

the middle of October to the middle of March, and the summer semester from the middle of April to the middle of August.

Students.—The number of matriculated students in 1891 was 5,527. Of the total number, some 400 are usually from the U. S. The expenses are not high. Many of the courses are free. For the others, the fees average about five dollars for a course of four hours a week through one term. In medicine and in the laboratories they are somewhat higher. The use of the academic reading-room, with 250 newspapers, 200 magazines, and 3,000 volumes, costs seventy-five cents a semester.

Graduation.—The German term is "promotion" (to the doctorate), not graduation. The degree conferred is that of Doctor of Medicine, Philosophy, etc. The candidate for the degree of Doctor of Philosophy must present a thesis that shows satisfactory original investigation, must undergo an oral examination, and must maintain his thesis in an open disputation. With his application for a degree the candidate must present a petition to the faculty for admission to this honor, and a short history of his life, both in Latin, a certificate of ripeness for admission to the university from a gymnasium, a certificate of honorable dismissal from the university, a certificate of three years' attendance upon a university, and his dissertation, which, in cases where it would be proper, must be in Latin. The oral examination is public. Certain professors are designated by the faculty to conduct it, but any one present may put a question to the candidate. The disputation is also open, and the candidate has to maintain his position against at least three opponents. There are four degrees of success, designated as *summa cum laude*, *magna cum laude*, *cum laude*, and simply *sustinuit*. Two hundred and fifty copies of the thesis or dissertation and 100 copies of the diploma are printed at the expense of the candidate. The total cost of a "promotion" is about ninety dollars. The regulations in regard to the degree of Doctor are more strict at Berlin than anywhere else, and are more rigidly enforced. Consequently, a degree from Berlin is highly esteemed. C. H. THURBER.

Berlioz, bär'li-ōz', HECTOR LOUIS; French musical composer; b. at Côte-Saint-André, Isère, Dec. 11, 1803; a physician's son; sent to Paris to study medicine; entered the Conservatory, following a passionate bent for music. He composed *Symphonic fantastique*; overtures to *Waverley* and *King Lear*; *Harold* (1833) and *Romeo et Juliette* (1839), symphonies; *Benvenuto Cellini*, an opera in two acts; *Symphonic Funèbre et Triumphale* (1840); *Damnation de Faust* (1846), a symphony; *Eufonie de Christ*, a trilogy (1854); and *Les Troyens*, a grand five-act opera, played without success in 1863. His works bespeak an ardent and independent genius, and have elicited diverse criticism. So far as purely musical invention is concerned, Berlioz can scarcely be ranked with the great tone-poets. But in the science of orchestration, more especially in novel combinations and effects, he remains a supreme master and worthy colleague of Wagner in this specific sense. He was also a talented author and critic, and has published *Traité d'instrumentation et d'orchestration moderne* (1844); *Voyage musicale en Allemagne et en Italie*; *Études sur Beethoven, Gluck, et Weber* (1845); *Soirées de l'orchestre* (1853); *Les Grotesques de la musique* (1859); and *Mémoires* (1870). D. in Paris, Mar. 8, 1869. Revised by DRIMLEY BUCK.

Bermuda Grass (*Cynodon dactylon*): a grass extensively cultivated in India (where it is called *dhub*), and which has been introduced into the West Indies, Europe, the Southern U. S., and the Sandwich islands. It is valuable both for pasture-grass and for hay, and is especially prized in warm climates, where the grass crop is generally poor; but in light soils, especially northward, its perennial roots cause great trouble to the farmer.

Bermuda Hundred: in Chesterfield co., Va.; on the right bank of the James river, just above the mouth of the Appomattox, and 1½ miles above City Point (for location of county, see map of Virginia, ref. 6-11). The tortuous course of the James river here incloses a neck of land which Gen. Butler occupied and fortified in May 6, 1864, and from which he was to co-operate with Gen. Grant by menacing Richmond and Petersburg. On the morning of May 16, 1864, Gen. Butler, who had moved out of his works, was fiercely attacked by the Confederate force under Beauregard, and after a severe struggle, which lasted till noon, driven back into his intrenchments with severe loss. Beauregard erected a line of works across the peninsula in front of Butler's. Subse-

quent expeditions were made from these works, and the line finally formed a part of the investment lines of the combined armies against Petersburg.

Bermuda Islands, or **Bermudas**; also called **Somers's Islands**: a group of small, low islands in the Atlantic Ocean, belonging to Great Britain (see map of North America, ref. 7-1). They take their name from Juan Bermudez, who discovered them in 1522. They are about 624 miles E. S. E. of Cape Hatteras, which is the nearest land, and are in lat. 32° 20' N., and lon. 64° 50' W. The extent of the group is only 19 miles by 6 miles, although the number of islets is nearly 400. Area, 20 sq. miles. They derive importance from the commanding position which they occupy between the West Indies and the other parts of British America. They are inclosed on several sides by formidable coral-reefs, which are said to be the only coral-reefs occurring in the central expanse of the Atlantic. The climate is so mild and delightful that these islands are covered with perpetual verdure. Between December and March the temperature ranges from 60° to 66° F. The chief articles of export are potatoes, onions, and arrowroot. The largest of these islands are Bermuda, 15 miles long; St. George's, 3½ miles; Somersct, 3 miles; and Ireland, 3 miles. Capital, Hamilton, on the isle of Bermuda. St. George's isle has a good, landlocked harbor, which is defended by strong batteries. These isles are separated by narrow and intricate channels, and have no streams, and but few pools of fresh water. Many of the inhabitants are employed in building cedar vessels, which are durable and swift. Pop. (1891) 15,884.

Bermudez, bär-moo'dayth; a maritime state of Venezuela; extending from the peninsula of Paria to the Orinoco river; bounded N. by the Caribbean Sea, E. by the Gulf of Paria and the delta of the Orinoco, S. by Bolívar, and W. by the state of Guzman Blanco. It is also called the Estado de Oriente, or Eastern State. Its eastern boundary is the Rio Manamo, the westernmost mouth of the Orinoco, and on the latter river it extends westward to the Rio Suata. It includes the former provinces of Cumana and Barcelona. Chief towns, Cumana and Barcelona (ports), and Maturin. Area, 32,243 sq. miles. Pop. 297,466. M. W. H.

Bernadotte, Charles XIV., JOHN; King of Sweden; a French marshal; b. at Pau, Jan. 26, 1764. His original name was JEAN BAPTISTE JULES BERNADOTTE. He enlisted as a private in the army in 1780; served as general of division under Kléber and Jourdan in Flanders in 1794, and under Bonaparte in 1797. In 1798 he was French minister at Vienna, and married Mademoiselle Clary, a sister of Joseph Bonaparte's wife. He was Minister of War for a short time in 1799. Napoleon created him a marshal of France in 1804, and in June, 1806, Prince of Pontecorvo. He fought at Austerlitz in 1805, and defeated the Prussians at Halle in Oct., 1806. He quarreled with Napoleon, who censured his conduct at Wagram (1809), and he resigned his command just after that battle. In Aug., 1810, the Swedish Diet elected Bernadotte as heir to the throne of Sweden, then occupied by Charles XIII., who had no son, and he was immediately associated with the old king in the exercise of royal power. Early in 1812 Bernadotte, who took the name of Charles John, negotiated with Russia a secret treaty of alliance against Napoleon. He openly joined the coalition of the allies in the spring of 1813, and led an army of about 28,000 men into Germany. His army defeated Oudinot at Gross-Beeren in Aug., 1813, but his conduct was considered equivocal and lukewarm by the allies. He forced Prince Christian of Denmark, who had proclaimed himself King of Norway, to resign, and on Nov. 4, 1814, Charles XIII. was proclaimed king, and Bernadotte crown prince. When the allies entered France in 1814, he led his army back to Sweden and conquered Norway. He began to reign alone on the death of Charles XIII. in Feb., 1818, after which a long peace ensued. D. in Stockholm, Mar. 8, 1844, and left the throne to his son, Oscar I. See Erik G. Geijer, *Konung Karls XIV. Johan Historia* (1844); W. G. Meredith, *Memorials of Charles (XIV.) John, King of Sweden* (1829).

Bernard, CLAUDE; French physiologist; b. at Saint-Julien, in dept. of Rhône, July 12, 1813. He wrote *Researches on the Uses of the Pancreas*, which gained the grand prize of the Institute in 1849. He was admitted into the Institute in 1854, and became Professor of Physiology in the College of France in 1855. Bernard discovered the glyco-genic function of the liver. He was created grand officer of the Legion of Honor in 1862. Among his works are *Leçons de*

Physiologie (1855) and *Mémoire sur la Chaleur animale* (1856). D. in Paris, Feb. 10, 1878.

Bernard, Sir FRANCIS; lawyer; b. in Nettleham, Lincolnshire, England, 1714; became Governor of New Jersey in 1758, and of Massachusetts in 1760. After nine years of successful administration, during which he acquired Mt. Desert island, he became unpopular in Massachusetts because he brought troops into Boston and opposed liberal measures. He was accused of misconduct, recalled, and made a baronet in 1769. D. in Aylesbury, England, June 16, 1779. His *Letter-books* are in Harvard Library.

Bernard, bār'naar', SAINT; Abbot of Clairvaux; mediæval theologian, and a doctor of the Western Church; b. in his father's castle at Fontaines, near Dijon, in 1091. He became an inmate of the monastery of Cîteaux in 1113, and founded in 1115 a community of the Cistercian order at Clairvaux, in Champagne, of which he was the first abbot. His ascetic life and eloquence and combination of piety, mysticism, and sound practical sense rendered him a very influential and powerful person in the Church. He was regarded as an oracle by all Christendom, and was consulted and obeyed in politics as well as in Church affairs. He did much to encourage monasticism, and founded many monasteries. Yet intensity of conviction made him a persecutor; so he appears as an implacable adversary of Abelard, whose condemnation at the Synod of Paris (1140) was effected by his influence; of Arnold of Brescia, a pupil of Abelard, whom he drove out of France and Switzerland; of the Cathari; and of Gilbert of Portiers. In 1128 he drew up the rule for the new order of Knights Templars. The same intensity led him to arouse Europe to the second crusade, that of 1146, which failed disastrously. Bernard in consequence was denounced, and his disappointment and chagrin hastened his death at Clairvaux, Aug. 20, 1153. He was canonized 1173. His works are numerous. He wrote five famous and beautiful Latin hymns, including the *Jesu dulcis memoria* and the *Salve mundi salutare*, portions of which appear in all hymn-books—in English as *Jesus, the Very Thought of Thee*, and *O Sacred Head! Now Wounded*, respectively. See his complete works (ed. Mabillon, repr. by Migne, *Pat. Lat. CLXXXVIII-CLXXXV*. Eng. trans. by S. J. Eales, London, 1889, *seq.*). The best modern lives are by A. Neander (Berlin, 1813; 3d ed. 1865; n. e. Gotha, 1889; a classic Eng. trans., London, 1843); J. C. Morison (London, 1863; 3d ed. 1877); M. T. Ratisbonne (Paris, 1841; 9th ed. 1883; Eng. trans., New York, 1878); S. J. Eales (London, 1890); R. S. Storrs (New York, 1892). Revised by S. M. Jackson.

Bernard, STONOR; French engineer; b. at Dôle, Apr. 28, 1779; aide-de-camp to Napoleon I.; employed by him in important duties incidental to his branch of the service. He was invited to this country by President Madison in 1816 to assist in the organization of a system of seacoast defense by fortification. The chief engineer, Gen. Swift, and another officer, Col. McRee, sent in their resignations, and Col. W. K. Armstrong succeeded as chief engineer. As "assistant engineer," Gen. Bernard was associated with Col. (subsequently general and chief engineer) J. G. Totten, constituting a "permanent board," upon which the labor of working out the fundamental principles of the system and of elaborating the projects of defense for the great seaports devolved. Bernard also had part in the inauguration of some of our earlier works of civil engineering, e. g. the Chesapeake and Ohio Canal, the Delaware breakwater, etc. He resigned in 1831, and returned to France; became aide-de-camp to Louis Philippe, and subsequently Minister of War of France. D. in Paris, Nov. 5, 1839.

Bernard, THOMAS DERANT; clergyman and author; b. in Clifton, Bristol, England, Nov. 11, 1815; was educated at Oxford, and ordained 1840; select preacher at Oxford 1856, 1862, 1882, and Bampton lecturer 1864. Became canon residentiary at Wells Cathedral in 1868, and chancellor in 1880. Author of *The Witness of God*, University sermons (1863); *The Progress of Doctrine in the New Testament*, Bampton lectures (1861; 4th ed. 1878); *Before His Presence with a Song* (1885); *Central Teaching of Jesus Christ* (1892).

Bernard, Great St.; a famous mountain-pass of the Pennine Alps; upward of 8,000 feet in height; between the Swiss canton of Vaud and the valley of Aosta. Near the summit is the celebrated hospice, said to have been founded in 962 by St. Bernard of Meuthon in Savoy for the succor of travelers crossing the mountain. In the humane efforts of the monks of this hospice the valuable dogs known as the

St. Bernard breed, and noted for their size and sagacity, were valuable assistants. In 1800 Napoleon crossed the Alps here with an army of 30,000 men, with cavalry and artillery.

Bernard of Cluny; not to be confounded with his more celebrated countrymen and contemporary, Bernard of Clairvaux; b. at Morlaix, in Brittany, of English parents, probably not far from the year 1100. He was a monk at Cluny under Peter the Venerable, who was abbot there from 1122 to 1156. He wrote a poem, *De Contemptu Mundi*, in about 3,000 lines, portions of which were translated by the Rev. John Mason Neale (1818-66) in 1851 and 1862. Dr. Neale pronounces these verses of Bernard "the most lovely, in the same way that the *Dies Iræ* is the most sublime, and the *Stabat Mater* the most pathetic, of mediæval poems." Hymns taken from this poem, such as *The World is Very Evil*, *Brief Life is Here Our Portion*, and *Jerusalem the Golden*, are among the finest gems in recent English and American collections.

Bernardo del Carpio, bār-naar' dō-del-kaar' pēō-ō; Spanish hero of the ninth century; nephew of Alfonso the Chaste; displayed brilliant courage in the war against the Moors; according to tradition, defeated Roland at Roncesvalles; and the hero of several dramas by Lope de Vega and of many Spanish ballads.

Bernay, bār'nay': a town of France; department of Eure; on the railway from Paris to Caen; 25 miles W. N. W. of Evreux (see map of France, ref. 3-E). It has a college, and manufactures of woolen cloths, linens, paper, and leather. A horse-fair, the largest in France, is held here annually. Pop. (1891) 8,016.

Bernardin, bār-naar'dān', SAINT, of Siena; b. at Massa, near Siena, Sept. 8, 1380; entered the order of St. Francis in 1402; visited the Holy Land, and became famous throughout Italy as a preacher; was made vicar-general of his order in 1437. D. May 20, 1444, and was canonized in 1450. His works, strongly mystical, appeared last at Venice (1745, 4 vols.); his biography by J. P. Toussaint (Regensburg, 1873) and by L. Bianchi (3 vols., Siena, 1888).

Bernays, ALBERT JAMES, Ph. D.; chemist; b. in London, Nov. 8, 1823; educated at King's College School and University of Giessen; Lecturer on Chemistry at St. Mary's Hospital Medical School 1854-60; since that time at St. Thomas's Hospital; author of *Household Chemistry*; *Science of Home Life* (1862); *Notes on Analytical Chemistry for Students in Medicine* (3d ed. 1889); *Food* (1876).

Bernays, bār'nīs, JACOB; classical philologist and brilliant stylist; b. in Hamburg, Sept. 18, 1824, of Jewish parents. He took his doctor's degree in 1848, and began his academic career as privat-docent in Bonn at the urgent request of his teacher, Fr. Ritschl. In 1854 he was appointed professor extraordinary and librarian, which positions he retained till his death there, May 26, 1881. Bernays's work was chiefly confined to ancient Greek philosophy, and possesses permanent value. His most noted publications are his treatises on Aristotle's theory of the drama, on the Dialogues of Aristotle, on Phocylides, Theophrastus, the apocryphal letters of Heraclitus, and a masterly biography of Scaliger. His opuscula have been collected and edited by Usener (1885). For an account of his life and a full list of his writings, see C. Schaarschmidt, *Biogr. Jahrb.* IV., p. 65-83 (1881).

ALFRED GUDEMAN.

Bernburg, bār'n boor'kh; a town of Germany; formerly capital of the duchy of Anhalt-Bernburg; on the river Saale, here crossed by a bridge; 24 miles S. S. W. of Magdeburg. It is connected by railway with Berlin and Dresden. It has a gymnasium, a Realschule, a valuable library, a ducal castle, and manufactures of porcelain, paper, and starch. Pop. (1880) 18,593; (1885) 21,464; (1890) 28,257.

Berne, bār'n (Fr. *Berne*; Germ. *Bern*; Lat. *Berna*); the most populous canton of Switzerland, and the most extensive except the Grisons. It is bounded N. by Alsace, E. by Basel, Soleure, Aargau, Lucerne, Unterwalden, and Uri, S. by Valais, and W. by Vaud, Fribourg, Neuchâtel, and France. Area, 2,657 English sq. miles. It is traversed by the river Aar, and also drained by the Emmenthal. The Air expands into two lakes called Brienz and Thun. The surface is mountainous, and the northern part is occupied by the Jura Mountains. Several high peaks of the Alps—namely, the Finsteraarhorn, 14,032 feet, the Jungfrau, 13,514 feet, Schreckhorn, 13,393 feet—are in Berne. The valleys of the Simmenthal, Lauterbrunnen, and Grindelwald in the Bernese Oberland are celebrated for their beauty. The valleys

of the Aar and Emmen are fertile and adapted to pasturage. Among the mineral resources of the canton are copper, lead, iron, marble, and granite. It has important manufactures of watches, paper, woolen goods, linens, etc. It is intersected by several railroads. Capital, Berne. Pop. (1880) 530,411, of whom 66,015 were Roman Catholics; (1888) 536,679.

Berne, or **Bern** [said to be derived from the Germ. *Bären*, "bears," figures of which are on the armorial bearings of the city]: a city of Switzerland; capital of the canton of Berne; situated on the river Aar, which incloses it on three sides; 65 miles by rail S. of Basel and 92 miles by rail N. E. of Geneva (see map of Switzerland, ref. 4-10). Berne is the seat of the federal government of the republic, and is considered to be the finest city in Switzerland. It is built of freestone, and the houses are massive structures, resting on arcades which form covered promenades on both sides of the streets. Magnificent Alpine scenery is visible from this point. Berne has a Gothic cathedral, a public library, a university, a museum of natural history, a mint, and an arsenal. One of the finest buildings is the new federal palace. The river is here crossed by four large bridges. Several railroads connect it with Geneva, Basel, and other towns. Berne was founded in 1191, and became a free town of the empire in 1218. It joined the Swiss Confederation in 1352. In 1849 it became the permanent capital of the whole republic. Pop. (1880) 44,087; (1885) 47,793; (1888) 46,009.

Berne-Bellecour, bärn'bel'koor, ÉTIENNE PROSPER; genre and military painter; b. at Boulogne, June 29, 1838. Pupil of Picot and Barrias; first-class medal, Paris Salon, 1872; Legion of Honor 1878; second-class medal, Paris Exposition, 1889. His pictures of episodes in the Franco-Prussian war have gained him an excellent reputation, second only to such masters as De Neuville and Detaille, and a considerable number of his works are in American collections. Studio in Paris. WILLIAM A. COFFIN.

Berners, JULIANA; reputed author of the *Boke of St. Albans* (1486); a collection of treatises on hawking, hunting, and heraldry. To the edition of 1496, printed by Wynkyn de Worde, was added a *Treatyse on Fysshynge with an Angle*. During the sixteenth century the *Boke* was very popular, and was often reprinted. The authorship of it is uncertain, and the traditional life of Dame Juliana is probably mythical. HENRY A. BEERS.

Bernhard, bärn häärt, Duke of Saxe-Weimar; German general; b. in Weimar, Aug. 6, 1601; was a younger son of John III. of Saxe-Weimar. He fought for the Protestant cause in the Thirty Years' war; distinguished himself at Wimpfen in 1622; became a colonel in the army of Denmark, which he quitted in 1628. In 1631 he joined the standard of Gustavus Adolphus. The victory which the Swedes gained at Lützen in 1632 is attributed to the skill and energy of Bernhard, who in 1633 was appointed to the command of the Swedish army. Having made a personal treaty of alliance with France in 1635, he afterward commanded a French army and defeated the imperialists. D. in Neuburg-on-the-Rhine, July 8, 1639. See Schiller, *History of the Thirty Years' War*; J. A. C. von Helffeld, *Geschichte des Bernhard des Grossen*, etc. (1797); Bernhard Roese, *Herzog Bernhard der Grosse von Sachsen-Weimar* (2 vols., 1828-29).

Bernhardt, bärn häärt, ROSINE, better known as SARAH; French actress; b. in Paris, Oct. 22, 1844. Her Jewish parents, after she had passed some years with her grandfather, an Amsterdam optician, placed her in a convent at Versailles, where her ambitions fluctuated from theatrical prominence to the nun's veil. At fourteen, however, she entered the Paris Conservatoire, took prizes in tragedy and comedy, made her *début* in 1862 as Iphigénie in Racine's tragedy at the Théâtre Français, and acted the leading rôle in Scribe's *Valérie*. Received without interest, she withdrew for study, but acted in burlesque in the comic theaters. In Jan., 1867, she took up legitimate comedy, and by the impersonation of the Queen in *Ruy Blas* at the Odéon gained such renown that she was recalled to the Français, and began a career recognized as foremost in French tragedy. In 1879 a company from the Français, of which she was a member, played with brilliant results in London. Bernhardt soon after withdrew from the Théâtre Français, for which breach of contract she was mulcted in the courts in \$20,000; but her tours in Italy, Russia, and the Americas replenished her purse. She played in New York in 1880,

1887, and 1891, and went in the latter year to Australia. In 1882 she married in London M. Danala, a Greek stock-actor, from whom she was soon divorced. She has exhibited pictures and statues by her own hand in the Paris Salon, and written a play, *L'Arca* (produced in 1888). She has impersonated the title rôles of Racine's great plays, acted Shakspearean characters, and plays have been written to elicit her highest powers.

Bernhardy, bärn-haar'edē, GOTTFRIED; German classical scholar of encyclopaedic erudition; b. Mar. 20, 1800; privat-docent and professor extraordinary at Berlin 1823-25. In 1829 he was called to Halle as the successor of Reisig, where he remained till his death, May 14, 1875. Author of a *History of Greek Literature*; of *Roman Literature*; *Erastothénica*; *Wissenschaftliche Syntax der griech. Sprache*; and of a monumental edition of *Suidas*. Cf. R. Volkmann, *G. B.* (Halle, 1887).

Berni, bär-nēē, FRANCESCO; Italian satiric poet; b. about 1496; known chiefly by his satiric *rifacimento* of Boiardo's *Orlando Innamorato*. (See BOIARDO.) This was first published in 1541, and soon quite eclipsed the fame of the original. His *Rime Burlesche* (Venice, 1538) were very famous in their time. From him a burlesque style is called by the Italians "Bernesque." See Antonio Virgili, *Francesco Berni, con documenti inediti*, Florence, 1881; *Opere di F. Berni*, 5 vols., Milan, 1806. D. May 26, 1535. A. R. MARSH.

Bernice: See BERENICE.

Bernier, bär ni-ay', CAMILLE; landscape-painter; b. at Colmar, France, 1823; pupil of Léon Fleury; Legion of Honor 1872; medal of honor, Paris Exposition, 1889. An artist of real merit, who has painted numerous excellent pictures. One of the best of his works is *The Abandoned Lane* (1879), in the museum at La Rochelle. Studio in Paris. W. A. C.

Bernina, bär-nee'nā; an imposing mountain-group in the Swiss canton of Grisons; rises 13,307 feet above the level of the sea, and has a remarkable glacier. The Pass of Bernina, the altitude of which is 6,671 feet, affords a communication between the Upper Engadine and the Valtelline.

Bernini, bär-nee-nēē, GIOVANNI LORENZO; an Italian architect and sculptor; b. in Naples, Dec. 7, 1598; lived at Rome. His works, the best among which are the colonnade to St. Peter's church, the Scala Regia of the Vatican, and the Barberini Palace at Venice, possess some excellences, but show the beginning of the decline of art into the *baroque* or Jesuit style, to which his influence greatly contributed. D. in Rome, Nov. 28, 1680.

Bernoulli, bär'noo'lee, or **Bernoulli**, DANIEL, F. R. S.; mathematician and philosopher; b. in Groningen, Feb. 9, 1700; son of Jean (1667-1748). He became in 1733 Professor of Anatomy and Botany at Basel, where he afterward obtained the chair of Physics and Speculative Philosophy. He gained many prizes of the French Academy of Sciences, and wrote in Latin and French many scientific works. He was one of the three greatest members of this famous family. D. in Basel, Mar. 17, 1782. See Condorcet, *Éloge de Daniel Bernoulli* (1782).

Bernoulli, JACQUES; a mathematician; uncle of the preceding; b. in Basel, Dec. 27, 1654. He became Professor of Mathematics in that city in 1687. He solved Leibnitz's problem of the isochronous curve, discovered the properties of the logarithmic spiral, and wrote several treatises on mathematics, etc. D. in Basel, Aug. 16, 1705. See Battier, *Vita Jacobi Bernoulli* (1705).

Bernoulli, JEAN or JOUIN; one of the mathematicians of the Bernoulli family; b. in Basel, July 27, 1667. He was the father of Daniel and brother of Jacques (1654-1705). He discovered the exponential calculus, and ascertained the curve of swiftest descent. In 1705 he succeeded his brother Jacques as Professor of Mathematics at Basel. His works were published in 4 vols., 1742. D. in Basel, Jan. 1, 1748.

Bernoulli, JEAN; son of the preceding; b. in Basel, May 18, 1710. He became Professor of Mathematics at Basel in 1748, and wrote several treatises. D. July 11, 1790.—BERNOULLI, JEAN; b. in Basel, Nov. 4, 1741; son of the preceding. He became astronomer royal at Berlin in 1764, and wrote various works. D. July 13, 1807.—BERNOULLI, JÉRÔME; naturalist; b. in Basel, 1745; d. in 1829.—BERNOULLI, NICOLAS; son of Jean and a brother of Daniel, noticed above; b. in Basel, Jan. 29, 1695. He was Professor of Mathematics at St. Petersburg, where he died, July 26,

1726.—BERNOULLI, NICOLAS, LL. D., F. R. S.; cousin of the preceding; b. in Basel, Oct. 10, 1687. He made several discoveries in mathematics. D. in Basel, Nov. 29, 1759.

Bernstorff, bärn'störf, ALBRECHT, Count; a Prussian diplomatist and statesman; b. Mar. 22, 1809; became in 1857 Prussian ambassador in London; Minister of Foreign Affairs from 1861 to 1862; returned to London in 1862, and represented the German empire in the London Conference of 1871. D. in London, Mar. 26, 1873.

Bernstorff, JOHANN HARTWIG ERNST, Count von; statesman; b. in Hanover, May 13, 1712. Having entered the civil service of Denmark, he was appointed Minister of Foreign Affairs (prime minister) in 1761. He was a liberal patron of learning and the arts, and he promoted the commerce and manufactures of Denmark. He retained power till 1770. D. in Hamburg, Feb. 19, 1772. See G. H. Ahle-mann, *Ueber das Leben und den Charakter des Grafen von Bernstorff* (1777); G. Navarro, *Vie du Comte J. H. E. Bernstorff* (1822).

Beroaldo, bär-y-rō-aal'dō, FILIPPO (1453–1516); professor at Bologna, his native city. Editor and commentator of Plautus, Cicero, and of numerous post-classical Latin writers. See Roscoe's *Life of Leo X.*; Burckhardt's *Die Cultur der Renaissance*.

Berœe: a genus of jellyfishes belonging to the class *Ctenophora*, and notable for the absence of tentacles. They are phosphorescent marine animals, with an oval or nearly globular body of a delicate jelly-like substance, the whole body cavity serving as a stomach. As in all the other members of the class, the sides of the body are provided with eight rows of vibratile plates, by which the animal is propelled through the water.

DAVID S. JORDAN.

Berœa, or **Berea**: a large and ancient city of Macedonia; situated at the foot of Mt. Bermius; about 30 miles from Pella. It was attacked by the Athenians in the war which began about 430 B. C. St. Paul visited Berœa, and preached there. (See Acts xvii. 10.) Its site is occupied by the modern town of Veria, 35 miles W. of Salonica. See VERIA.

Berœus (in Gr. Βερωεύς); historian; priest of Bel in Babylon; b. under Alexander the Great; dedicated his history of Chaldaea (Χαλδαϊκά) in three books to Antiochus Soter, who reigned 280–261 B. C. His accounts have been largely confirmed by the cuneiform inscriptions. Fragments in Müller's *Fragmenta Historicorum Græcorum*, ii. 495–510.

Berquin, bär-kän', LOUIS, de; b. at Passy, France, about 1490; studied law and became a counselor of Francis I.; was a friend of Erasmus and active in circulating his works; accused of Lutheranism and imprisoned in 1523, 1526, and 1529; condemned first to imprisonment for life, then to be burned alive; the last sentence was executed in Paris, Apr. 17, 1529, and he became the first Protestant martyr in France.

Berri: See BERRY.

Berrien, ber'ri-en, JOHN McPHERSON, LL. D.; lawyer and politician; b. in New Jersey, Aug. 23, 1781. He removed to Georgia, and was elected a Senator of the U. S. in 1824. He was Attorney-General under President Jackson in 1829–31, and was again chosen Senator in 1840 and 1846. D. in Savannah, Jan. 1, 1856.

Berry: a fruit which consists of a pulpy pericarp without valves, containing seeds, which have no covering except the pulp or rind; as the grape, gooseberry, currant, barberry, service-berry, and cranberry. Some of them have the calyx adherent to the ovary and the placenta parietal, as the gooseberry. Others have the ovary free and the placenta in the center, as the grape. The term berry is popularly applied to several small fruits which are not berries in the scientific sense, as the strawberry, which bears seeds (*achenia*) on the external surface of an enlarged and pulpy receptacle. The orange is a berry with a leathery rind, and is also called a *hesperidium*.

Berry, or **Berri**: a former province of France, near its center; now forms the departments of Cher and Indre. Capital, Bourges. Berry was erected into a duchy about 1360, after which it was held by many princes of the royal family of France. The last Duke of Berry was the younger son of Charles X.

Berry, or **Berri**, CHARLES FERDINAND, Duc de; b. at Versailles, Jan. 24, 1778; the second son of Charles X. He emigrated with his father in 1793; returned to France in

1814, and married in 1816 Caroline Ferdinande Louise, a daughter of the King of Naples. He was assassinated by Louvel, in Paris, Feb. 14, 1820. He was the father of the Count de Chambord (Henry V.), who was recognized by the Legitimist party as the heir to the French throne. See Chateaubriand, *Mémoires touchant la Vie et la Mort du Duc de Berry* (1820).

Berry, HIRAM G.; major-general of U. S. volunteers; b. at Rockland, Me., Aug. 27, 1824; killed at the battle of Chancellorsville, Va., May 2, 1863. He was a member of the Maine Legislature several times, mayor of his native city, and president of Lime Rock bank. At the first call for troops to suppress the Confederate movement he raised three full companies, and himself entered the service as colonel of the Fourth Maine volunteers. He was made a brigadier-general Mar. 17, 1862, and major-general Nov. 29, 1862. Killed at the head of his division by a shot while leading a bayonet charge on the morning of May 2, 1863.

Berryer, bär-i-ay', ANTOINE PIERRE; French orator and lawyer; b. in Paris, Jan. 4, 1790. He defended Gen. Cambonne about 1815, gained distinction as an advocate of defendants in political trials, and was elected to the Chamber of Deputies in 1830. After Charles X. had been dethroned (July, 1830), he remained in the Chamber as the orator of the Legitimist party, although the other members of that party all retired. He made an eloquent speech against the abolition of hereditary nobility in 1831. During the first years of the reign of Louis Philippe he was regarded as the foremost orator in the Chamber. In 1840 he defended Louis Napoleon, who was tried for his attempt to excite a revolution at Boulogne. He was elected to the Constituent Assembly in 1848, and the Legislative Assembly in 1849. In 1850 he went to Wiesbaden to offer homage to the Count de Chambord. He opposed the republic, and protested against the *coup d'état* of Dec., 1851, after which he retired from political life. In 1852 he was elected a member of the French Academy. D. in Paris, Nov. 29, 1868. See Louis Marie de la Haye de Cormenin, *Biographie parlementaire de M. Berryer* (1837).

Ber'ryville: on railroad; capital of Clarke co., Va. (for location of county, see map of Virginia, ref. 3-G); is situated 5 miles W. of the Shenandoah river and 10½ E. of Winchester. It contains an academy, and is often called "Battle-town," owing to the many contests there of Gen. Morgan of Revolutionary fame. Washington, in surveying the lands of this county when it was a part of Frederick, had his headquarters at a beautiful spring just beyond the town. Pop. (1870) 580; not given in census later.

Bersaglieri, bär-säl-yä-rée; the Italian name of the rilleman or sharpshooters who served in the army of Victor Emmanuel when he was King of Sardinia. They took part in the Crimean war, 1854–55, and fought against Austria in 1859. They wear a dark-green uniform.

Ber'serker [Icel. *berserkr*, probably meaning bear-coat]; a hero of Scandinavian mythology, who fought without coat of mail. He was the grandson of Starkader, and overcame all opponents by his irresistible valor. The name has also been given to a class of warriors who fought naked and performed extraordinary feats under the influence of a kind of demoniac possession.

Bert, bär, PAUL; b. at Auxerre, in the department of Yonne, France, Oct. 17, 1833; studied medicine in Paris; was appointed professor in the faculty of sciences at Bordeaux 1866, and Professor of Physiology in Collège de France 1869; achieved a great reputation by his interesting physiological researches, and more especially by his bold experiments for ascertaining the conditions of human existence at different altitudes, for which he received in 1875 the grand biennial prize of the Académie des Sciences (20,000 francs). See his *Notes d'Anatomie et de Physiologie comparées* (1867–70); *Recherches sur le Mouvement de la Sensitivité* (1867–70); *Recherches expérimentales sur l'influence que les modifications barométriques exercent sur les phénomènes de la vie* (1874); *La Pression barométrique* (1874). He also took a part in politics; was prefect of the department of Le Nord in 1871; elected a member of the Chamber of Deputies in 1872; joined the *Union républicaine*; spoke with great ardor in favor of making elementary instruction compulsory and secular; was Minister of Public Instruction in Gambetta's cabinet. See his *La Morale des Jésuites* (6th ed. 1880); *La première année d'enseignement scientifique et instruction civique à l'École* (1882). D. in Hanoi, Nov. 11, 1886.

Berthelot, bär'te-lô, MARCELLIN PIERRE; chemist; b. in Paris, Oct. 25, 1827; Professor of Chemistry in the Collège de France in his native city. He has contributed largely to our knowledge of synthetical processes, and especially of the relations between the phenomena of heat and of chemistry. His principal larger works are: *Chimie organique fondée sur la synthèse* (1860); *Mécanique chimique fondée sur la thermochimie* (1879); *Les origines de l'alchimie* (1885); *Chimie des anciens* (1889).

Berthier, bär'ti-ay, LOUIS ALEXANDRE; Prince of Wagram; general; b. at Versailles, Nov. 20, 1753. He served as captain under La Fayette in the U. S. 1778-82. In 1796 he became general of division, and chief of the staff of Bonaparte's army of Italy. He gained the confidence of the general-in-chief, retained for many years the position of chief of the staff, and accompanied Bonaparte to Egypt in 1798. About the end of 1799 he was appointed Minister of War. He became a marshal of France in 1804, and rendered important services in the campaign against Austria, 1805. He usually rode in the carriage of Napoleon, whose plans he digested, and whose orders he dispatched with remarkable rapidity and precision. For his conduct at the battle of Wagram (1809) he received the title of Prince of Wagram. He entered the service of Louis XVIII. in 1814, but when Napoleon returned from Elba, Berthier preferred neutrality and retired to Bamberg, where he was killed by a fall from a window, Jan. 1, 1815.

Berthierite, or **Hardingerite**: a steel-gray, bronzy mineral containing $\text{FeS} + \text{Sb}_2\text{S}_3$.

Berthold, bär'tôlt, von **Regensburg**: the greatest German preacher of the Middle Ages; b. probably in Regensburg about 1220; d. there Dec. 13, 1272. His sermons are valuable not only as specimens of early German pulpit oratory which he created, but also as documents of early German prose. See Franz Pfeiffer, *Berthold von Regensburg Predigten* (Vienna, 1862); Franz Göbel, *B. v. R. Missionspredigten* (1873); Unkel, *B. v. R.* (Cologne, 1882). J. G.

Berthollet, bär'to-lay', CLAUDE LOUIS, M. D., Count; chemist; b. in Talloire, Savoy, Nov. 9, 1748. He discovered the composition of ammonia, and invented the process of bleaching by chlorine, that of filtration through charcoal, and several fulminating powders. Author of *The Elements of the Art of Dyeing* (1790), and *Essai de statique chimique* (1803). He was associated with Lavoisier in forming a new chemical nomenclature, and was one of the chief originators of modern chemistry. D. near Paris, Nov. 6, 1822.

Bertholletia: a genus of trees of the family *Myrtaceae*. It contains *B. excelsa*, which produces BRAZIL-NUTS (*q. v.*).

Bertillon, ALPHONSE; anthropologist; b. in Paris, 1853. In 1880, as chief of the identification bureau of the police service of Paris, he established a system of measurements that made the recognition of recidivists or lapsed criminals practically a certainty. Of the 700 identifications, which had been transmitted by him to the examining magistrate during the preceding six years, not a single error had been found. His method was adopted throughout France, with a central bureau in Paris, where there occurred a speedy and most marked decrease in the number of professional criminals, who by various disguises had hitherto been able to elude identification by photograph. Belgium and adjacent countries soon adopted the method in self-defense, and it is now general in Europe. It was adopted in Chicago during the World's Fair in 1893 with good results. The principles upon which in practice the system rests take a threefold form: (1) *Anthropometric* (see ANTHROPOMETRY), consisting of measurements of the body and least changing parts of the adult—e. g. the length and breadth of the head, length of the spine, forearm, finger, nose, ear, etc.; (2) *descriptive*, giving color and other characteristics of the eye, color and quality of the hair, etc.; and (3) *pathological*, giving marks resulting from disease, wounds, or tattooing, warts, moles, etc. These are recorded in a regular order, and by clever abbreviations written on cards and filed away in groups according to some prominent measurements. The chances of error in identification are one in 13,000,000. The system has been used to some extent in the U. S., but a central bureau is needed where duplicates of every case may be kept. The advantages are self-evident; photographs are uncertain, as all men are subject to change in face and appearance whereas the bony parts and iris of the adult never change; photographs can not be sent by telegraph, while these measurements can be sent cheaply and

correctly, the order of facts being the same everywhere. Bertillon has written several works on the subject of criminal anthropology. See his *Identification Anthropométrique* (1893); and *The Theory and Practice of Anthropometric Identification*, by R. W. McClaughy (Chicago and New York, 1896). W. M. F. ROUND.

Bertin, bär'tän, LOUIS FRANÇOIS; called **Bertin l'Ainé**, bär'tän; journalist; b. in Paris, Dec. 14, 1766. He founded in 1800, together with his brother (LOUIS FRANÇOIS, surnamed DE VEAUX), the daily *Journal des Débats*, a literary and political journal, which obtained great influence and success. He was hostile to Napoleon, who banished him. On Napoleon's fall he returned and revived his journal in 1814, and continued to edit it until his death, Sept. 13, 1841. —His son LOUIS MARIE ARMAND, b. Aug. 22, 1801, succeeded him as editor. D. in Paris, Jan. 12, 1854.

Bertramus: See RATRAMNUS.

Bertrand, bär'trân, HENRI GRATIEN, Count de; a French general; b. at Châteauroux, Mar. 18, 1773. He followed Napoleon to St. Helena in 1815. D. in Châteauroux, Jan. 31, 1844, leaving *Memoirs of the Campaigns of Egypt and Syria, Dictated by Napoleon at St. Helena* (2 vols., 1847).

Berwick-on-Tweed (often called simply **Berwick**): a fortified seaport-town of England; in Northumberland; on the left (north) bank of the Tweed, at its entrance into the North Sea; 58 miles by rail E. S. E. of Edinburgh; lat. 55° 46' N., lon. 1° 59' W. (see map of England, ref. 2-G). The river is here crossed by an old stone bridge of fifteen arches, 924 feet long, and by a magnificent viaduct, over which the trains of the North British Railway pass. It is crossed by the Northeastern, the Midland, and the Great Northern Railways. It has a Gothic church, a theater, a public library, a town-hall, also large manufactures of steam-engines, mill-machinery, etc. Coal mines are worked in the vicinity. Pop. (1891) 13,378. The history of Berwick is full of interest. It was one of the chief seaports of Scotland in the Middle Ages, and in the border wars was often taken and retaken by the English and Scotch, who regarded it as an important military position. It was finally ceded to England in 1502, and became by treaty a free town, independent of both states. These privileges were confirmed on the accession of James I. to the English throne. Down to the time of George II. it was customary in parliamentary statutes to mention specifically their application to "Berwick-on-the-Tweed."

Berwickshire: a county of Scotland; forming its south-east extremity; bounded N. by Haddington, N. E. by the German Ocean, and S. E. by the river Tweed, which separates it from England, S. by Roxburgh, and W. by Edinburgh. Area, 463 sq. miles. It is drained by the Blackadder, the Whiteadder, and the Eye. The surface is partly hilly in the northern part, occupied by the Lammermuir Hills. The Merse district in the south part, and near the Tweed, is nearly level, and is one of the most fertile and well-cultivated tracts in Great Britain. Carboniferous limestone, porphyry, and old red sandstone occur here. Pop. (1891) 32,398. Capital, Greenlaw.

Beryl (Gr. *βήρυλλος*): a mineral (silicate of beryllia) which crystallizes in six-sided prisms, generally green, varying to blue, yellow, or even colorless. The sides of the prisms are often striated longitudinally, but the terminating or truncating planes are generally smooth. The hardness is 7.5 to 8. Those that have clear tints of sky-blue or sea-green form, when transparent, beautiful gems, called by jewelers aqua marine. The clear yellow ones are also used as gems, under the name of golden beryl. The deep rich green variety is the EMERALD (*q. v.*). Beryls are not uncommon in regions of metamorphic rock (gneiss, mica-slate, etc.), such as New England. Gigantic crystals occur at Acworth and Grafton, N. H.—in one case 4 feet long and weighing over a ton, but rough and opaque. Beryls of fine quality occur in Brazil, the Urals, North Carolina, Maine, Colorado, and at other localities. See EMERALD. GEORGE F. KENZ.

Beryx: name of a genus of fishes of the family *Berycidae*, of which few species are living in the present seas, while a large number are found fossil. It begins with the first of the teleosts in the chalk. Three species are found in the chalk of England, and several in the tertiary, especially in the fish-beds of Monte Bolca, near Verona in Italy. This is therefore one of the oldest genera of living fishes.

Berzelius, JOHAN JACOB, M. D., P. R. S., Baron; Swedish chemist; b. in East Gothland, Aug. 20, 1779. He stud-

ied medicine and chemistry at the University of Upsal, and published in 1606 a *Treatise on Animal Chemistry* (2 vols.). He acquired great excellence as an analyst, and made important discoveries in chemistry. He was the author of the system of chemical symbols, and he discovered the elements selenium and thorium. His most important work is a *System of Chemistry* (Lärobok i Kemien, 3 vols., 1808-18), which was translated into every European language. He was Professor of Medicine and Pharmacy at Stockholm 1807-32. He contributed largely to *Memoirs of Physics, Chemistry, and Mineralogy* (6 vols., 1806-18), a work founded by Berzelius and Hisinger. D. Aug. 7, 1848. See G. Forchhammer, *J. J. Berzelius* (1849).

Besa: an ancient city of Egypt, on the site of which the city of Antinoöpolis was built by the Emperor Hadrian in honor of Antinous. It was situated on the east bank of the Nile, near the modern village of Abade.

Besançon, baï zāñ-sōñ' (anc. *Fesoulis*): a city of France; capital of the department of Doubs; on the river Doubs; 58 miles by rail E. of Dijon (see map of France, ref. 5-11). It is connected with Paris and Lyons by several railways, is well built and strongly fortified, having a citadel which is considered impregnable. It was formerly the capital of Franche-Comté. The most remarkable edifices are a Gothic cathedral, a town-hall, a theater, the palace of Cardinal Granvelle, and the prefecture. It has also a college, a public library, a museum, an academy of sciences and arts, and extensive manufactures of watches, jewelry, porcelain, carpets, etc. *Fesoulis* was an important town in the time of Cæsar, who in 58 B. C. expelled the Sequani from it. It has Roman antiquities and the remains of an amphitheater and aqueduct. Pop. (1891) 56,065.

Besant, the coin: See BEZANT.

Besant, WALTER: novelist; b. at Portsmouth, England, in 1838; graduated at Christ's College, Cambridge; was chosen to a professorship in the Royal College of Mauritius, and afterward served as secretary to the Palestine Exploration Fund. In conjunction with James Rice he published between 1871 and 1882 some dozen novels, including *Ready Money Mortiboy* (1871); *The Monks of Thelema* (1878); *By Celia's Arbour* (1878); and *The Seamy Side* (1880). Since the death of his collaborator in 1882 he has published a number of novels, some of which have dealt with social problems and others with English life in the seventeenth and eighteenth centuries. Among the most popular of these are *All Sorts and Conditions of Men* (1882), which dealt with the social problems of cities and led to the establishment of a public hall modeled on descriptions contained in the book. It was erected in the East End of London to commemorate the Queen's Jubilee. He also published *Dorothy Foster* (1884) and *Children of Gibeon* (1886). He was founder and first president of the Society of Authors. Knighted May 24, 1895.

HENRY A. BEERS.

Besnard, bes'nar', PAUL ALBERT: contemporary figure-painter of the French school; pupil of Cabanel, and winner of the Grand Prix de Rome in 1874. He is identified with the most advanced "impressionists" in his methods, and is an artist of great individuality and surpassing technical skill. His portraits are remarkable for beauty and harmony of color, and he has done notable work in decoration. He is one of the most original figures in modern art, and is considered a master by those most in sympathy with his artistic purposes. Second-class medal, Salon, 1880; Légion of Honor 1888. Studio in Paris. W. A. C.

Bessarabia (after Prince Bessaraba): a province in the southwest part of Russia; bounded N. by Podolia, E. by Podolia, Cherson, and the Black Sea, S. W. and W. by Roumania and Galicia. Area, 17,619 sq. miles. By the treaty of Paris (1856) part of Bessarabia adjacent to the Black Sea was ceded to Turkey, but by the treaty of Berlin in 1878 it was ceded to Russia again. The surface is mostly low and flat; the soil is fertile, producing wheat, barley, maize, tobacco, etc. The chief articles of export are cattle, wool, tallow, and salt. The most of the land is in pasturage. The population is composed of Russians, Germans, Bulgarians, Moldavians, Greeks, Jews, Poles, etc. Pop. (1887) 1,588,329. Capital, Kishinef.

Bessa'ron, JONAS: Greek cardinal; b. in Trebizond in 1403; was a disciple of Gemistus Plithon in philosophy. He favored the union of the Latin and Greek Churches; accompanied the Greek Emperor John II. to the Council of Ferrara (1438-39); was appointed a cardinal in 1439 by Pope

Eugenius IV., and Bishop of Frascati by Nicholas V.; received in 1463 the title of patriarch of Constantinople *in partibus*. He wrote several works in defense of the philosophy of Plato, translated the *Metaphysics of Aristotle* into Latin, and was an efficient promoter of Greek learning in Italy. At his death he left his library to Venice, and it became the basis of the Library of St. Mark. D. in Ravenna, Nov. 19, 1472. See A. Bandini, *De Vita et Rebus gestis Bessarionis Cardinalis* (1777); also G. Voigt, *Die Wiederbelebung des classischen Alterthums* (2d ed. 1880); Vast, *Le Cardinal Bessarion* (1878); E. Legrand, *Bibliographie helvétique* (2 t., 1885).

Bess'borough, EARLS OF (1739): Viscounts Duncannon (1723), Barons of Bessborough (1723, in Ireland), Barons Ponsonby (1749, in Great Britain), Barons Duncannon (1834, in the United Kingdom), a prominent family of Great Britain.—JOHN GEORGE BRABAZON PONSONBY, the fifth earl; b. Oct. 14, 1809; succeeded his father in 1847. He was member of Parliament for Bletchingley in 1831, for Ilgham Ferrers in 1831, and for Derby 1834-37. D. Jan. 28, 1880.

Bes'semer: town; Jefferson co., Ala. (for location of county, see map of Alabama, ref. 3-C); on Queen and Crescent Route, and Louis, and Nash, R. Rs.; 11 miles from Birmingham. Bessemer is in an iron and coal mining district, and its principal industry is iron-working; it has also brick-making and wood-working industries. Pop. (1890) 4,544.

Bessemer: city (founded in 1880); Pueblo co., Col. (for location of county, see map of Colorado, ref. 5-E); on Rio Grande R. R. and on Arkansas river, joining Pueblo on the south. The city has 4 public schools and 5 churches; its principal industry is furnished by a great steel-works, employing 1,200 men, with a monthly pay-roll of \$100,000. Pop. (1890) 3,317; (1893) estimated, 5,000.

EDITOR OF "INDICATOR."

Bessemer: city (founded in 1884); capital of Gogebic co., Mich. (for location of county, see map of Michigan, ref. 2-D); on Du., So. Sh. and At., Mil., L. S. and W., and Wis. Central R. Rs.; 47 miles from Ashland, Wis., in a district noted for its beautiful scenery. Bessemer has a fine high school, six churches, and a stone court-house costing \$50,000. Its industries are chiefly manufacturing and iron-mining. Pop. (1890) 2,566; (1894) 2,528.

EDITOR OF "PICK AND AXE."

Bessemer, SIR HENRY: an English inventor, whose name is coupled with a revolution in the manufacture of steel. He was born at Charlton, in Hertfordshire, Jan. 13, 1813; the youngest son of Anthony Bessemer, a French refugee. Beginning life in London at the age of eighteen as a modeler and designer, he turned his attention first to improving the method of stamping deeds, which was adopted without compensation to Bessemer by the English Stamp Office. He successively turned his inventive skill to devising machinery for making figured Utrecht velvet, to working out a type-casting machine, and to the manufacture of bronze powder. The latter proved a conspicuous commercial success, and is still produced by his successors. Between 1844 and 1853 a series of other inventions occupied his attention. In 1854 he brought before Emperor Napoleon an invention relating to projectiles. This brought him into contact with the manufacture of steel, and led him to make a series of experiments at an old factory at St. Pancras, which led to the invention of the pneumatic process bearing his name. The first public announcement of it was made on Aug. 11, 1856, at the Cheltenham meeting of the British Association. It was received with skepticism and ridicule by the majority of iron-makers. Experiments which proved successful in some localities were discredited by disastrous failures in others. A series of laborious and costly investigations followed, which proved that the pig iron to be used must be low in phosphorus, and that a manganese carbon alloy must be added at the end of the operation, the latter discovery having been made by Robert Mushet. Again Bessemer came before the public, reading a paper on May 24, 1859, before the Institution of Civil Engineers. It was not until he had established works at Sheffield, and had become an active and dangerous competitor, that other makers availed themselves of the process. It made such rapid progress that ten years after the first announcement Bessemer was deriving from it an income of £100,000 per year, his total revenue from the patents having been £1,057,748. The Sheffield works yielded in fourteen years eighty-one times the origi-

nal investment. In 1869 he entered a new field of invention, aiming to check the rolling motion of vessels and prevent seasickness. A vessel with a swinging saloon was launched in 1874, but after a few voyages she was abandoned. Later he devoted himself to the improvement of telescopes.

Bessemer's Process for Refining Iron: See BESSEMER, HENRY, and STEEL.

Bes'cer, WILLIAM FREDERICK, D. D.: Lutheran preacher and commentator; b. at Warnstedt, in the Harz, Sept. 27, 1816. He was a pupil of Tholuck, Hengstenberg, and von Gerlach. The most of his life was spent in the pastorate in Pomerania and Silesia. From 1853-57 he was associate director of the Leipzig Society for Foreign Missions. He was a preacher of great power who sought to faithfully expound the meaning of the text of the Bible, and whose expository lectures (*Bibelstunden*) cover nearly all the books of the New Testament. They are extensively read in devotional meetings in Germany. Several volumes have been translated into English: *Christ the Light of the World; Christ the Life of the World*, an exposition of the Gospel of John (Edinburgh, 1861); an admirable translation by Mrs. Huxtable. D. in Niederlössnitz, near Dresden, Sept. 26, 1884.

HENRY E. JACOBS.

Bes'sey, CHARLES EDWIN, Ph. D.: botanist; b. in Milton, Wayne co., O., May 21, 1845; educated in the common schools and academies of Ohio, in Michigan Agricultural College, and in Harvard University; Professor of Botany in Iowa Agricultural College 1870-84; Professor of Botany in University of Nebraska 1884; associate editor (botany) of *American Naturalist* 1880; president of Iowa Academy of Sciences 1875-84; president of Society for the Promotion of Agricultural Science 1883-85; president of Nebraska Academy of Sciences 1891; acting chancellor of University of Nebraska 1888-91; fellow of American Association for the Advancement of Science; principal publications are *Reports on Insects* (1873-74); *Geography of Iowa* (1876); *The Erysipthei of North America* (1877); *Botany for High Schools and Colleges* (1880); *Essentials of Botany* (1884); *Reports of the State Botanist of Nebraska* (1887 to 1892); *Preliminary Report on the Native Trees and Shrubs of Nebraska* (1891); associate editor of *Johnson's Universal Cyclopedia*, in charge of the department of Botany, 1893.

Bessières, DES SIÈRE, JEAN BAPTISTE: Duke of Austria; French marshal; b. near Cahors, Lot, Aug. 5, 1768. He entered the army as a private in 1792, served with distinction in Italy and Egypt, became a general of division in 1802, and marshal of France in 1804. He rendered important services at Austerlitz, Jena, Friedland, and Eylau. Having obtained in 1808 command of an army in Spain, he gained a victory at Medina del Rio Seco. He had the chief command of the cavalry of the grand army in 1813, and was killed on the day before the battle of Lützen, May 1, 1813. See Miramont, *Vie de J. B. Bessières; Victoires et Campagnes des Français*.

Best, WILLIAM THOMAS: organist; b. in Carlisle, England, Aug. 13, 1826; devoted himself to the study of the organ, and received his first appointment in 1840 in Liverpool, where with few intervals he has since remained. Since 1855 he has been organist of St. George's Hall there. He is one of the most remarkable organists of the century. His compositions include a few church services and anthems, and an immense number of organ pieces, original and arranged, a few pieces for pianoforte, and two or three orchestral pieces.

D. E. HERVEY.

Besti'aris: books treating of beasts. See PHYSIOLOGIA'S.

Betanzos, bay-taan thōs (anc. *Fla viam Brigantium*): a town of Spain; province of Corunna; 12 miles S. E. of Corunna (see map of Spain, ref. 12-B). It is said to be the oldest town in Galicia, and has remains of ancient fortifications. Here are manufactures of linen, leather, and pottery. Pop. (1887) 8,122.

Bet'el, or Pawn: a narcotic stimulant extensively used as a masticatory by Oriental peoples, especially by tribes of the Malay race. It consists of a portion of the nut of the *Areca catechu* (called the betel-nut or *pinang*), rolled up with lime in the leaf of the *Piper betel* or other species of pepper. The leaf is plucked green, and is smeared with moistened quicklime before the slice of areca nut is wrapped in it. This mixture is chewed continually by men, women, and children, and the use of it is so general that a Malay presents his betel-box as a European offers his snuff-box.

This practice appears to be very ancient, having prevailed before the Christian era. The betel causes griddiness in those who are not accustomed to chewing it. The habitual use of it blackens the teeth, and perhaps destroys them. According to Sir James E. Tennent, the betel is beneficial, acting as a tonic, antacid, and carminative.

Beth: a Hebrew noun, meaning "house" or "habitation"; employed some fifty times in the Scriptures as a prefix in naming places, such as Bethel, Bethlehem, and Bethany.

Betham-Edwards, Miss MATHILDA BARBARA: author; b. at Westerfield, England, 1836; has contributed to *Punch, Graphic, Macmillan's Magazine*, and other periodicals, and published numerous novels which have been reprinted in other languages, *The White House by the Sea* appearing in 1855. In 1885 she published a volume of poems, and in 1889 edited Arthur Young's *Travels in France*.

Beth'any [Heb., house of dates]: a village of Palestine; on the east slope of the Mount of Olives, nearly 2 miles (15 stadia) E. of Jerusalem. As the home of Mary, Martha, and Lazarus, it was the scene of interesting events in sacred history. (See Matthew xxi. 17; xxvi. 6; John xi. and xii.; Luke xix. 29.) From some point near the village Christ ascended into heaven. (Luke xxiv. 50.) Here is a cave or excavation in a rock, which, according to a worthless tradition, is the grave of Lazarus. The descent into it is effected by twenty-six steps cut into the solid rock. The modern village contains about forty families of Moslems.

Bethany: town; capital of Harrison co., Mo. (for location of county, see map of Missouri, ref. 1-3); on Chicago, Burlington and Quincy R. R.; 62 miles N. E. of St. Joseph; is in an agricultural and stock-raising district, and has wagon, broom, and canning factories. Pop. (1880) 994; (1890) 1,105.

Bethany: a village of Brooke co., West Va. (for location of county, see map of West Virginia, ref. 3-11); on Buffalo Creek; 7 miles from the Ohio river, and 16 miles N. E. of Wheeling. It is situated in a beautiful and fertile region, and is the seat of Bethany College, established in 1841 by Alexander Campbell. (See DISCIPLES OF CHRIST.) Pop. (1880) 335; (1890) about 400.

Beth'el (Arab. *Beitin* or *Beiteen*): an ancient town of Palestine; noted as the scene of the dream of the patriarch Jacob; was 10 or 12 miles N. of Jerusalem. It was near the boundary between Judea and Samaria. Here are ruins of ancient churches and other buildings.

Bethel: borough; Fairfield co., Conn. (for location of county, see map of Connecticut, ref. 11-D); on branch of Housatonic R. R.; 62 miles from New York city; has large hat-shops, farming industries, and street railroad to Danbury, 3 miles distant. Pop. (1880) 1,767; (1890) 2,335.

Bethel: on railroad; Windsor co., Vt. (for location of county, see map of Vermont, ref. 7-C); 25 miles N. W. of White River junction; has manufactures of lumber, leather, flour, shoes, meal, etc. Pop. of township (1880) 1,693; (1890) 1,448.

EDITOR OF "COURIER."

Bethel College: in McKenzie, Tenn.; an institution of learning founded, with a liberal charter, in 1850. Obligated to close its doors during the civil war, it was successfully reorganized at its close, and has since had a successful career. The college is under the control of the Synod of West Tennessee of the Cumberland Presbyterian Church. A liberal Christianity and a high standard of moral character are inculcated, yet no peculiar sectarian or political principles are allowed in the literary department. Candidates for the ministry of all denominations receive tuition free of charge. Both sexes are admitted. The course of study is thorough and of an eminently practical character. The Rev. J. L. Dickens is president. At present (1893) there are 6 teachers in all departments, 3 permanent lecturers, and 306 students.

Bethes'da [Heb., house of mercy]: a pool or tank at Jerusalem where the lame man was miraculously healed (John v. 1-9). Some identify it with Birket Israil, a large reservoir inside the city walls, near St. Stephen's Gate; others with the Fountain of the Virgin (intermittent), about 300 yards S. of the Temple area; and others with the pool of Siloam, about 300 yards farther S.

Beth'lehem [Heb., house of bread; so called from its fertile soil]: a town frequently mentioned in both the Old and New Testaments, and especially distinguished as the

birthplace of our Saviour, as well as of his ancestor, King David (see map of Palestine, ref. 10-10). Anciently it was called "Bethlehem Judah," to distinguish it from another Bethlehem in the northern part of Palestine (Josh. xix. 15). It is mentioned as existing in the time of Jacob, but was probably never very large or commercially important. It has at present about 5,000 inhabitants, all Christians. The principal trade of the place is in crosses, beads, and relics. Here are Greek, Latin, and Armenian convents; and the monks show a cave which they claim to have been the stable where our Lord was born. See Robinson's *Biblical Researches*; Hackett's *Illustrations of Scripture*; Ritter's *Geography of Palestine*.

Bethlehem: borough and railroad junction: Northampton co., Pa. (for location of county, see map of Pennsylvania, ref. 4-J); on the left bank of the Lehigh river, 57 miles N. of Philadelphia and 5 miles E. of Allentown. It is pleasantly situated on the slopes of several hills. Two bridges across the river connect it with South Bethlehem, the seat of Lehigh University, founded by Asa Packer in 1866, and richly endowed, having fine stone edifices on a high and commanding position. Bethlehem was founded in 1741 by the Moravians, who have here a large stone church 142 feet long, a theological seminary, an ancient chapel, a young ladies' seminary, and an extensive parochial school. There are a large number of manufactories, chiefly in South Bethlehem, including three silk-mills, several foundries, the Bethlehem Iron Company's rolling-mills, machine-shops, etc.—one of the largest establishments of the kind in the U. S.; Lehigh Zinc Company's rolling-mill, zinc oxide and spelter works; Lehigh Brass-works, gas-works in both boroughs, etc. South Bethlehem also contains the main offices of the Lehigh Valley Railroad Company. Pop. (1880) 5,193; (1890) 6,762; of South Bethlehem borough (1880) 4,925; (1890) 10,302. EDITOR OF "TIMES."

Bethlehemites: an order of monks established at Cambridge, England, in 1257; also an order of monks and nuns instituted at Guatemala about 1665. They are found in Central and South America and the Canary islands.

Bethlen-Gabor, bet'en-gaa bōr: Magyar general and ruler; b. 1580; through aid of the Turks was chosen Prince of Transylvania 1613; aided the Bohemians in defense of their religious and political rights against Austria 1619; King of Hungary 1620, but soon abdicated, receiving important concessions from Ferdinand II. of Austria; took part in the Thirty Years war. He did much to advance the cause of learning. D. 1629.

Bethmann-Hollweg, bāt'maän-hōl'vāeh, MORITZ AUGUST: jurist and statesman; b. at Frankfort-on-the-Main, Apr. 8, 1795. He was Professor of Civil Law at Berlin, and subsequently at Bonn, and was Prussian Minister of Public Instruction from 1858 to 1862. He published several valuable legal works. D. in his castle, Rheineck, on the Rhine, near Andernach, July 14, 1877.

Beth'phage [Heb., house of figs]: a locality in Palestine, near Jerusalem; appears to have been on or near the Mount of Olives. The name occurs in Luke xix. 29 and Matthew xxi. 1. Its site has not been exactly ascertained.

Bethsā'ida [Heb., fish-houses]: an ancient town in Palestine; on the west shore of the Lake of Galilee, the home of Andrew, Peter, and Philip (John i. 44). Dr. Robinson identifies it with Ain-et-Tabigbah, in a little bay or cove between Khan Minyeh (Capernaum?) and Tell Hum (Chorazin?). Another Bethsaida, afterward called *Julias*, was situated near the head of the lake, on the east side of the Jordan, about 2 miles from its mouth. It was near this Bethsaida that Christ fed the 5,000. (Luke ix. 10-17.)

Beth'shemesh [Heb., house of the sun]: the name of four places mentioned in the Scriptures, the most important of which was a sacerdotal city of Judah, about 15 miles W. S. W. of Jerusalem, and about 2 miles from the great Philistine plain. It was here the ark rested on its way home from Ekron (7 miles). It was here that Amaziah, King of Judah, was worsted and taken prisoner by Jehoash, King of Israel (2 Kings xiv. 11-13). In the reign of Ahaz it was captured by the Philistines (2 Chron. xxviii. 18), and is not again mentioned in sacred history. It stood on a low ridge. Only ruins now mark the spot, which bears the name of *Ain-Sheems* (fountain of the sun). The greater part of Samson's exploits were in its immediate neighborhood.

Béthune, bay'tūn: a fortified town of France; department of Pas-de-Calais; near the river Lave and the canal of Aire; 23 miles by rail N. N. W. of Arras (see map of France, ref. 2-F). It has a fine castle, a college, and a Gothic church; also manufactures of oil, soap, and woolen goods. It was taken from the Spaniards in 1645, retaken by Prince Eugène in 1710, and restored to France in 1713. Pop. (1891) 11,098.

Bethune, GEORGE WASHINGTON, D. D.: divine and poet; b. in the city of New York, Mar. 18, 1805; graduated at Dickinson College 1823, and studied at the Princeton Theological Seminary in 1823-25. In 1827 he became pastor of a Dutch Reformed church in Rhinebeck, N. Y. He was afterward settled in Utica, and still later in Philadelphia. In 1851 he removed to Brooklyn, N. Y., and 1859 to New York as associate pastor of the Twenty-first Street church. He was a distinguished orator and most lovable man, a poet and a wit. In 1861 he went to Europe for the benefit of his health, but died at Florence, Apr. 27, 1862. He published an edition of *Walton's Complete Angler* (N. Y., 1846); *A Commentary on the 130th Psalm* (1847); and *Lays of Love and Faith* (1847). Several of his hymns are widely used. See his life by A. R. Van Nest (New York, 1867).

S. M. JACKSON.

Betlis: See BITLIS.

Béton, bay'tōn': an artificial stone made by the thorough mixing of sand and hydraulic cement. It was invented by François Coignet, and is hence often called *Béton-Coignet*. The word has been sometimes used as synonymous with concrete, but this designation is now mostly abandoned. See CEMENT, CONCRETE, and STONE.

Betterments: improvements put on real estate which enhance its value more than mere repairs. According to the common law, if a *bona fide* holder of real estate under a defeasible title made improvements while in possession of the land, they became a part of the realty, and could not be removed therefrom without the consent of the lawful owner, neither could any compensation be had therefor. Where the true owner, in an ejectment suit, asked judgment for mesne profits, the *bona-fide* disseisor was allowed to offset the same by a claim for his improvements. In some States statutes have been passed under which the disseisor is now allowed to bring an original action to recover the value of his improvements. Statutes will be found in the several States which provide that after recovery in ejectment, if the improvements were made in good faith, the defendant shall be entitled to recover of the plaintiff the value of the same; but the plaintiff is given the right to elect to have the value of the land without the improvements assessed, and the defendant must then purchase the same at the price assessed within a given time or lose the benefit of his claim for improvements. HENRY WADE ROGERS.

Betterton, THOMAS: English actor; b. in London in Aug., 1635. He performed with great success the parts of Hamlet, Macbeth, and Othello. He was the chief ornament of the English stage for nearly fifty years. His wife was a popular actress. D. in London, Apr. 28, 1710. See Charles Gildon, *Life of T. Betterton* (1710).

Betting, or **Wagering**: the laying or making of a bet or wager. (See WAGER.) This is a vicious practice which prevails more or less in all countries. The English are addicted to betting on horse-races to a ruinous extent. The British Parliament passed an act, 16 and 17 Vict. c. 119, to suppress the haunts of betters, called betting-houses, which it declares to be a common nuisance and contrary to law. But it provides that its enactments shall not extend to stakes or deposits due to the winner of any race or lawful sport. The U. S. laws prohibit betting on elections.

Betts, BEVERLEY ROBINSON, A. M.: b. in the city of New York, Aug. 3, 1827; graduated at Columbia College in 1846, and at the General Theological Seminary of the Protestant Episcopal Church in that city in 1850; ordained in 1850. After a short charge of Trinity church, Rockaway, he was in 1855 made rector of St. Saviour's church, Maspeth, Long Island, which position he held for nearly fourteen years; in 1865 he was appointed librarian of Columbia College; prepared for the press a full catalogue of the library of the college (1874); has been a frequent contributor to Church review and journals. He retired from the librarianship in 1883.

Betts, SAMUEL ROSSITER, LL. D.: jurist; b. in Richmond, Mass., June 8, 1787; graduated at Williams College in 1806;

practiced law in Sullivan co., N. Y.; served in the war of 1812; became judge advocate; was a member of Congress (1815-17). He was a judge of the circuit court of the State (1823-26), and U. S. district judge (1826-67). D. in New Haven, Conn., Nov. 2, 1868. He published a treatise on *Admiralty Practice* (1838).

Betul, bay-tooool : a district of Nerbudda, Central Provinces, British India; the westernmost part of the great Satpura plateau; between the parallels 21° 20' N. and 22° 35' N., and meridians 77° 20' E. and 78° 35' E. It is a hilly highland tract, averaging 2,000 feet above the sea. The northern and southern parts are sparsely settled and comparatively sterile, while the central portion has a very rich soil, is well watered, and densely populated. Wheat and pulses form the principal crops, while cotton, rice, sugarcane, and opium are raised to some extent. Coal occurs in many parts, but is not worked. Extensive forests occupy about one-fifth of the area, and yield much good timber. Area, 3,905 sq. miles. The climate is comparatively salubrious, but fevers of a severe type prevail in the jungles. The rainfall is about 40 inches per year. Pop. 300,000. The aboriginal Gonds can still be found in the jungle towns.

Bengnot, bôn'yô', ARTHUR AUGUSTE, Comte de; writer and liberal statesman; b. at Bars-sur-Aube, Mar. 25, 1797. He wrote an *Essay on the Institutions of Saint Louis* (Paris, 8vo, 1821); *The Jews of the West* (Paris, 8vo, 1824); and a *History of the Destruction of Paganism in the West* (2 vols., 1835). He became a peer of France in 1841. As a member of the Legislative Assembly of 1849 he promoted freedom in public instruction. D. in Paris, Mar. 15, 1865.

Benlé, bö'lay, CHARLES ERNEST; a French archaeologist; b. in Saumur, June 29, 1826; took part in 1849-53 in the excavations of the Acropolis in Athens, and became in 1854 Professor of Archaeology in the Imperial Library in Paris. He wrote, among other works, *L'Acropole d'Athènes* (2 vols., 1854); *Études sur le Péloponèse* (1855); *Fouilles de Carthage* (the results of his excavations in Carthage in 1858); and *Auguste, sa Famille*, etc. (1867). D. in Paris, Apr. 1, 1874.

Beurmann, boir'mann, KARL MORITZ, von; explorer; b. in Potsdam, July 28, 1835. In 1860 he attempted to explore the country of the Bogos, but did not succeed in reaching it until Mar., 1861. In Dec., 1861, he was engaged to look for Vogel, who, it was supposed, had been murdered in Wadai. Beurmann was to start from Tripoli, while at the same time Heuglin should attempt to reach Wadai from Abyssinia. He reached Kuku in Bornu in Aug., 1862. As it was impossible to reach Wadai at that time, he made a trip to Jacoba in Bantchi, from which he returned to Kuku Dec. 13. Soon after he attempted the voyage to Wadai, and, having succeeded after several futile attempts, he was murdered in Feb., 1863, in Moa, in the most western province of Wadai, by the command of the governor.

Beust, boist, FRIEDRICH FERDINAND, Comte von; b. in Dresden, June 13, 1809. He studied law and political economy at Leipzig and Göttingen; entered the diplomatic service of Saxony in 1831; was made minister of foreign affairs in 1849. In this position he made himself noticed by his opposition to Prussia, which often assumed the aspect of mere rivalry with Bismarck. After the battle of Sadowa he resigned his position, and removed to Vienna; in 1867 he was made chancellor of the Austrian empire, notwithstanding his Protestant faith. The complete reorganization of the empire—political, financial, military, etc.—was the problem placed before him, and the present constitution, which made great concessions to the Magyars, placing them on an equal footing with the Germans, but paying little regard to the Slavs, was his work. Following his advice, Austria simply canceled the concordat with the Pope in spite of the protest of the Curia, removed Jewish disabilities, and authorized civil marriages. In 1871 he went to London as Austrian ambassador; he remained till 1876, when he was appointed Austrian ambassador at Paris; held the office till 1882. D. in Vienna, Oct. 21, 1886. See his *Memoirs* (Eng. trans. by H. de Worms, London, 2 vols., 1887).

Beuthen, boi'ten; a town of Prussia; in Silesia; 50 miles E. S. E. of Oppeln (see map of German Empire, ref. 5-4); has manufactures of woolen cloth, zinc-ware, and pottery. Pop. (1880) 22,823; (1890) 30,823.

Beveridge, WILLIAM; Orientalist and bishop; b. at Barrow, Leicestershire, England, early in 1636-37 (baptized

Feb. 21), and was educated at Cambridge. He was a man of great learning, and of profoundly religious character. He published a *Treatise on Chronology* (1669); a work *On the Canons of the Greek Church* (1672); and several devotional treatises. In 1701 he was appointed Bishop of St. Asaph. D. in London, Mar. 5, 1707-08. See Thomas H. Horne's *Memoir of Bishop Beveridge*, prefixed to an edition of his works (9 vols., London, 1824); another edition was published in twelve volumes of the Anglo-Catholic Library at Oxford (1842-48). His favorite production, *Private Thoughts upon Religion*, appeared posthumously (1709); often reprinted (e. g. 1871).

Beverland, bev'er-lünt, ADRIAAN; a Dutch classical scholar and heterodox writer; b. at Middelburg about 1654; was a friend of Isaac Vossius. He wrote *Peccatum Originale* (place of publication called "Elentheropolis in Porto Hesperidum," 1678; 2d ed., Leyden, 1679; French translation in Paris, 1714; 6th ed. 1774); *De fornicatione cavenda* (Angsburg, 1697; 2d ed., Amsterdam, 1698); and other works which were censured for impiety. He wrote also *De stobale virginitalis jure* (Leyden, 1680). He was banished from Utrecht, and removed to England, where he died insane in 1712. S. M. JACKSON.

Beverley; a market-town of Yorkshire, England; 1 mile W. of the river Hull, and 10 miles N. N. W. of the city of Hull (see map of England, ref. 6-4). It is the chief town of the East Riding of Yorkshire, and is handsomely built. The origin of the name is said to be *Beverlac*, a "lake or dam of beavers." It has an ancient and beautiful Gothic minster, called the Church of St. John, which exhibits several styles of Gothic architecture, and ranks next to York Minster among the ecclesiastical structures of England. The oldest part of this was erected in the thirteenth century. A priory was founded here about 700 A. D. Beverley has an active trade in corn, coals, and leather, and is on the railway from Hull to York. It was made a suffragan episcopal see in 1889. Pop. (1891) 12,539.

Beverly; city; on main line of B. and M. R. R., Essex co., Mass. (for location, see map of Massachusetts, ref. 1-1); is on a small inlet of the ocean, 2 miles N. N. E. of Salem and 18 miles N. N. E. of Boston. A bridge across the inlet connects it with Salem. It derives its prosperity chiefly from manufactures of shoes, oiled clothing, leather belting, carriages, and other staple merchandise. Has a high school, fine system of water-works, a well-equipped fire department, and two street-railway systems. Its tax valuation in 1891 was \$13,168,155. Pop. of township (1880) 8,456; (1890) 10,821; (1895) 11,806. EDITOR OF "CITIZEN."

Beverly; a city of Burlington co., N. J. (for location of county, see map of New Jersey, ref. 5-14); on railroad and the Delaware river; 15 miles above Philadelphia. It has a woolen mill, an oil-cloth factory, a very extensive rope-walk, and is a place of summer resort. Pop. (1880) 1,759; (1890) 1,957; (1895) 1,924.

Bewick, bynik, THOMAS; English engraver; b. near Newcastle-on-Tyne, Aug. 12, 1753; a pupil of Beilby. He was the founder of the modern English school of wood-engraving, and none of his numerous pupils has excelled him. He illustrated Gay's *Fables* (1779). Beilby and Bewick published in 1790 a *History of British Quadrupeds*, with engravings, which procured for Bewick a high reputation. He was assisted by his brother John in the designs of Goldsmith's *Traveller and Deserted Village*. Among his best works are *Æsop's Fables* and a *History of British Birds* (2 vols., 1804). D. at Gateshead, Nov. 8, 1828. See Dobson, *Bewick and his Pupils* (1881).

Bey, or **Beg** [Turk., prince, governor]; a title of the Turkish empire. The ruling officers of Tripoli and Tunis are beys, and the same title is given to some local magistrates, to colonels and generals of the army, and to the sons of pashas. In other cases it is a merely honorary title.

Beyle, bayl, MARIE HENRI; French *littérateur*, who wrote under the assumed name of *Stendhal*; b. at Grenoble, Jan. 23, 1783. He held several high civil offices under Napoleon. Among his chief works are a *History of Painting in Italy* (2 vols., 1817); *Le Rouge et le Noir*, a novel; a *Life of Rossini* (1821); *Memoirs of a Tourist* (1838); *Rome, Naples, and Florence*; and a novel called *The Carthusian Nun of Parma* (1839). He passed many years in Italy. D. in Paris, Mar. 23, 1842. See Honoré de Balzac, *Études sur M. Beyle*.

Beyrout, or **Beyrut**, **Beirut**, or **Bairut**, pronounced in Arabic bay-root, but in Turkish bi-root [supposed by some

to be identical with the *Berothai* of 2 Sam. viii. 8, and the *Berothah* of Ezek. xlvii. 16; (Gr. Βηρυτός; Lat. *Berytus*); a flourishing commercial town and seaport of Syria; finely situated on the Mediterranean, at the foot of Mt. Lebanon, 58 miles W. N. W. of Damascus (see map of Palestine, ref. 2-E). The harbor admits only small vessels, but in the bay about 3 miles from the city there is good anchorage for large ships. This is the chief seaport of Damascus and Syria, and has an extensive commerce, which is increasing. French steamers ply weekly between Beyrout and Marseilles, and British steamers ply regularly between this city and Liverpool. The chief articles of export are madder, silk, wool, olive oil, and gums. Here are important manufactures of silk stuffs. Pop. about 85,000. *Berytus* was besieged and taken by Baldwin, King of Jerusalem, about 1110, and retaken by the Saracens in 1187. American missionaries have been there since 1823. The Protestant Syrian College was opened in 1866.

Be'za (Fr. *De Bèze*), THEODORE; Calvinistic theologian; b. in his father's castle in Vezelay, Burgundy, June 24, 1519. In his youth he enjoyed two benefices in the Catholic Church, and lived in Paris the careless life of a Humanist and poet; but he was converted in 1548 and went to Geneva, where he avowed himself a Protestant. He became Professor of Greek at Lausanne 1549, and an intimate friend of Calvin. In 1554 he published a treatise, *De Hereticis a Civili Magistratu Punientis*, in which he defended the burning of Servetus. He removed to Geneva in 1558, and became Calvin's ablest coadjutor, and his successor as Professor of Theology in 1564. He afterward ruled the Geneva Church with energy for forty years. At the same time he played a very prominent part in French religious history, for which his aristocratic birth, courtly bearing, and rare learning fitted him. He was the chosen spokesman of the Huguenot party, and frequently appeared in their behalf before kings and other potentates. After Calvin's death he was recognized more than ever as the great Reformed theologian. But he lacked Calvin's genius, and made his system too inflexible. Thus he prepared the way for the reaction which Arminius, one of his pupils, brought about. The Calvinistic party in the Church of England revered Beza and sat at his feet. One of his great services was the completion of Clement Marot's French translation of the Psalms (1560), which furnished the Huguenots with their song-book; another was his editions of Stephen's Greek Testament (Geneva, 1565, *sqq.*), with a superior Latin translation, first issued separately 1557, and notes; all of which were popular and affected King James's revisers. He also presented to the University of Cambridge the uncial codex D (1581). Among his other works are a *Life of Calvin*, the best of the contemporary biographies of the Reformers (Eng. trans. Edin. 1844). The *History of the Reformed Churches in France from 1521 to 1563* (3 vols., 1580), attributed to Beza, is his only in the sense that he suggested it, edited and supplied matter for it anonymously; but he was not the writer of the greater part of it (best ed. by Baum, Cunitz, and R. Reuss, Paris, 1883-89, 3 vols.; there is no Eng. trans.). D. in Geneva, Oct. 13, 1605. See Baum, *Th. Beza* (2 vols., 1843-51); Heppel, *Th. Beza* (1861). SAMUEL MACAULEY JACKSON.

Bezant' or **Besant'** [O. Fr. *besan*, plur. *besanz*, from Lat. *hycaulius*, *sc. nummus*, coin, Byzantine]; a gold coin struck at Byzantium, or a circular piece of gold or silver without any impression; supposed to be a part of the old coinage of Byzantium. Some of these were brought home by the crusaders, and were current in England. Their value was 10s. sterling, but some gold bezants were worth £15 sterling. They occur in heraldic charges, especially Cornish coat-armor, and in the arms of banks or bankers (hence the "three balls" of the pawnbroker's shop). *Bezant* in heraldry is a globe or, or a circle argent.

Béziers, bay'zhay' (anc. *Betar'ra*); a city of France; in the department of Hérault; on the river Orb and the Canal du Midi; 27 miles by rail E. S. E. of Cette (see map of France, ref. 9-F). It is on the railway which connects Montpellier with Toulouse, and has a delightful situation, with a mild climate. Among its antique and interesting edifices are a noble Gothic cathedral and the church of La Madeleine. It has a college, a public library, a theater; also manufactures of silk, hosiery, gloves, glass, soap, brandy, and leather. Béziers has some Roman remains. It was the scene of a massacre of the Albigenes in 1209. Pop. (1886) 42,785; (1891) 45,475.

Bezique, be-zee'ek [from Fr. *bésigue*; etymol. unknown]; game at cards; played by two persons with a double pack,

containing only the aces, tens, kings, queens, knaves, nines, eights, and sevens, which rank in the order named. Eight cards are dealt each player, and after each trick each player draws one from the top of the stock, the winner of the trick drawing first. Trump is determined either by the suit of the first marriage or sequence scored, or by turning the top card of the stock, which is then placed right side up beside the stock and constitutes its bottom card. The lead belongs to the non-dealer for the first trick; thereafter to the winner of the previous trick. The leader wins the trick unless his opponent plays a higher card of the same suit or (when trump is not led) a trump. After the stock is exhausted, the second player must follow suit if possible and take the trick if possible; before this he is under no restriction whatever as to what card to play.

He who first scores 1,000 points wins the game; if his opponent has scored less than 500 the game counts double; a *partie* is the best three games of five. The winner of the last trick of each hand scores 10; each brisque (ace or ten) taken in a trick counts 10; and if trump is turned, 10 each is scored for turning the seven, for exchanging from one's hand a seven of trumps for a turned trump not a seven, and for declaring the second seven of trumps. Besides this, certain combinations of cards when declared count as follows: Class I.—Marriage (king and queen of the same suit), 20; royal marriage (same for trump suit), 40; sequence of five highest trumps (i. e. ace, ten, king, queen, and knave), 250. Class II.—Bezique (queen of spades and knave of diamonds), 40; double bezique (both queens of spades and knaves of diamonds), 500. Class III.—Any four aces, 100; any four kings, 80; any four queens, 60; any four knaves, 40. Except for the seven of trumps, a declaration is made by placing the declared cards (which still form part of the player's hand) face up on the table, where they remain until played, or until the stock is exhausted. A declaration (or exchange of the seven of trumps) can be scored only after winning a trick and before drawing, and only one can be scored at a time. It can not be scored after the stock is exhausted. After a card has scored in one combination, it may form a part of other combinations, with the restriction that it can not be used in an *equal* or *inferior* one of the same class. A player is not obliged to declare or score any combination he may hold, but after each trick he should repeat what he has to score for new combinations of declared cards.

RUBICOX BEZIQUE is a modification of the above game played with four packs instead of two, and differing somewhat in its method of counting.

Bezoar [via Span. and Arab. from Pers. *pādzahr*, antidote]; a calculeous concretion found in the stomachs or intestines of goats, deer, and other ruminant animals; formerly prized for its supposed medicinal virtues and as an antidote to poisons. That of the antelope was especially prized. The bezoar is usually composed of phosphates of lime. It is quite worthless as a medicine.

Bezold, bay'tsolt, JOHANN FRIEDERICH WILHELM, von, Ph. D.; meteorologist; director of the German Meteorological Institute and professor in the University of Berlin; b. at Munich, Bavaria, June 21, 1837; educated at the Gymnasium in Munich and at the universities of Munich and Göttingen; became privat-docent, then professor at the former university, from which station he was called to Berlin as professor in the university there and director of the official meteorological institute. Dr. von Bezold is a physicist as well as a meteorologist, and he holds an eminent position as a student of the more abstruse problems of meteorology. His publications have been very numerous; among them may be mentioned *Die Farbentheorie im Hinblick auf Kunst und Kunstgewerbe* (Brunswick, 1874; Boston, 1876); *Beobg. der met. Stationen im König. Bayern* (6 vols., 1879-84; with Dr. Lang); *Ergebnisse der met. Beobg. in Preussien* (1885-91); many publications in Poggendorff's and Wiedenmann's *Annalen*, more especially on electricity and physiological optics; *Beobachtungen über die Dämmerung* (Pogg. *Annalen*, 1864); *Ein Beitrag zur Gewitterkunde* (ib., 1869); *Die Kälteerückfälle im Mai*, Abhandlungen d. Bayer. Akad. (1883); four papers *Zur Thermodynamik der Atmosphäre*, in the *Sitzungsberichte der Berliner Akad.* (1888-92); *Zur Theorie der Cyclonen* (ib., 1890). MARK W. HARRINGTON.

Bezenberger, bet'sen-bürch-er, ADALBERT; philologist; b. in Cassel, Germany, Apr. 14, 1851; educated at gymnasium in Cassel and universities of Göttingen and Munich; tutor and assistant professor in University of Göttingen; professor in University of Königsberg. Author of *Beiträge*

zur Geschichte der litauischen Sprache (1877); *Litauische Forschungen* (1882); *Lettische Dialektstudien* (1885); *Über die Sprache der preussischen Letten* (1888); *Die urische Nehrung und ihre Bewohner* (1889).

Bhagalpur, bah-gal-poor, or **Bhagulpur** (also *Bogli-poor*): a city of India; capital of a district of the same name; in Bengal; on the right bank of the Ganges, here several miles wide in the rainy season (see map of N. India, ref. 7-11). It is about 265 miles by rail N. W. of Calcutta. It has several mosques and an English seminary; also manufactures of coarse silk fabrics. Here are two curious round towers, the origin of which is unknown. Pop. (1881) 68,238; (1891) 68,780.

Bhagavad-Gītā, bhā'ga-vad-gē-tā (song of the Exalted One, i. e. of Krishna or Vishnu); a Sanskrit theosophic poem, very celebrated in India, which is loosely interpolated into the MAHA-BHARATA (*q. v.*). Its authorship is unknown; its date is perhaps not very far either way from the time of Christ. It teaches the unity of the Supreme Spirit; and inculcates devotion thereto by renunciation of all worldly attachments and aversions. It has much that is lofty and spiritual; but is in nowise a coherent system. Its correspondences with the New Testament are indeed striking, but of no necessary significance. Edited by Schlegel and Lassen (1846). English translations by Davies (Trübner's Oriental Series) and by Edwin Arnold (metrical, Boston, 1885). See SANKHYA KARIKĀ. C. R. LAMMAN.

Bhamo, b'mō, or **Bhamo**; a decayed city of Burma; on the Irawadi; in lat. 24 16 N., 300 miles above Mandalay (see map of N. India, ref. 7-A). It is still a local capital and the seat of a considerable trade. Large caravans laden with silk and other goods arrive here from October to May. Large quantities of raw cotton are also exported from this place. It was formerly the chief town of a Shan principality. Pop. 2,500. See Anderson's *Expedition to Western Yunnan* (1871).

Bhandara, bhān-dān-rāc': a district and town of Nagpur, Central Provinces, British India; about midway across the peninsula, between parallels 20° and 22° N., and meridians 79° and 81° E. It abounds in small lakes and tanks, and hence is called the lake region of Nagpur. It is not well watered otherwise, but these afford means of irrigation. Area, 3,922 sq. miles, one-third of which is under jungle and uncultivated. The agricultural products are rice, wheat, pulses, peas, sugar-cane, oil-seeds, and cotton. Native cloth, baskets, and brass-ware are the chief manufactures. The climate is unhealthy; fever, smallpox, and cholera are common. Pop. about 700,000, of whom 84 per cent. are Hindus. The inhabitants are rude, unpolished, and unthrifty. The aboriginal Gonds are common. The chief town is Bhandara, 38 miles E. of Nagpur city; pop. 12,000. M. W. II.

Bhartpur, bhārt-poor, or **Bhartpore**; a "protected" state of British India; between 26 30 and 27 50' N. lat., and between 77 and 78° E. lon. Area, 1,974 sq. miles. Good crops of cotton, sugar, and grain are produced. The heat in summer is extreme. Pop. about 800,000.

Bhartpur, or **Bhartpore**; a large town of India; capital of state of same name; in a plain 33 miles W. of Agra; lat. 27 12' N., lon. 77 33' E. (see map of N. India, ref. 6-11). Pop. (1891) 67,560. It was formerly fortified by a mud wall, and a ditch which could be filled with water from a lake, Lord Lake, having assaulted this town in 1805, lost 3,000 men. It was besieged and taken by the British in 1826.

Bhartri-hārī: Hindu poet, referred doubtfully to the first century A. D.; reputed author of the *Three Centuries* or *Hundreds* of Sanskrit apothegms upon love, wise conduct of life, and renunciation of the world, the concern respectively of youth, manhood, and old age. Best edition by K. T. Telang, in the Bombay Sanskrit Series (see BÜHLER). Translations by C. H. Tawney, metrical (Calcutta, 1877), and B. H. Wortham (London, 1886).

Bhargulpur: See BHAGALPUR.

Bhannagar: feudatory state and city of Kathiawar, Bombay, British India. The state lies just W. of the Gulf of Cambay, and is the most important of the peninsula of Kathiawar (see map of S. India, ref. 2-15). Area, 2,860 sq. miles. Pop. 400,000. The city of Bhannagar lies on the west shore of the Gulf of Cambay, in about lat. 21 40' N. Pop. (1891) 55,640.

Bhawalpur, bah-wāl-poor': a feudatory state of the Western Plains district, Punjab, British India; S. of the In-

du and Sutlej rivers; from 69 30 to 73 58' E. lon., and from 27 41' to 30 25' N. lat. It is remarkably level, except for numerous sandhills 50 or 60 feet high. The cultivable part is confined to a strip along the above-named rivers, about 10 miles wide. Beyond this is a desert of loose, moving sands, almost devoid of vegetation, though the empty beds of great rivers can still be traced. Total area, 17,285 sq. miles; only one-sixth part cultivable. The principal products are woolen, cotton, and silk cloths, indigo, cereals, alum, and salt-peter. The rains are very scanty and the wells deep. The state has prospered greatly under British management. Pop. (1881) 573,494; (1891) 648,900, mostly Mohammedans, consisting of Jats of Hindu descent, Baluchis, and Afghans. The city of Bhawalpur, the capital, is situated on a branch of, and not far from, the river Sutlej (see map of N. India, ref. 5-13); pop. 14,000. Other principal towns are Ahmadpur, Uch, and Khanpur. M. W. II.

Bhilsa: same as BILSA.

Bhoj: same as BHUJ.

Bhopal: a British political agency, native state, and city of Central India. The agency comprises 31 native administrations, with a total population of 1,900,000. The state is one of the dependencies under this agency, in lat. 22 32' N. to lat. 23 46' N., and between longs. 76 25 and 78 50' E., north of the Nerbudda river. Area, 6,764 sq. miles. The surface is mountainous, being traversed by the Vindhya range, and inclines to the N. The population is about 700,000, including many of an aboriginal tribe called the Gonds. The principal crops are wheat, maize, oil-seeds, pulses, and opium. Bhopal was founded in 1723 by Dost Mohammed Khan, an Afghan invader. Since 1818 it has been steadily loyal to the British. The city of Bhopal, capital of the state, in lat. 23 20' N., lon. 77 20' E., is inclosed by a dilapidated stone wall, outside of which are some large pools and a fort. Pop. (1891) 70,630. M. W. II.

Bhoj, booj: a fortified town of Hindustan; capital of Cutch; 170 miles S. E. of Haidarabad (see map of N. India, ref. 7-A). It has numerous temples or pagodas, mosques, and a beautiful mausoleum of Rao Lakka, a former ruler of Cutch. Its manufactures of gold and silver are widely celebrated. Pop. 25,000.

Bhurlpore: See BHARTPUR.

Bhutan, boo-tan', or **Bhofan** (also *Boolan*): a state in the Eastern Himalayas, India; bounded N. by the Himalaya Mountains, which separate it from Tibet, E. by Tibet, and S. and W. by Bengal. Area about 16,800 sq. miles. The Peak of Shumalari on the north border rises about 27,000 feet above the sea. Wheat, barley, rice, and maize are cultivated here. The religion of Bhutan is Buddhism. The people practice polyandry and polygamy. Pop. about 200,000.

Bi [Lat. *bi-*, *bis*, twice, doubly]: a prefix which occurs in many chemical and other scientific terms, and denotes duality or the number 2, as *bivalve*, "having two valves"; *bicarbonat*, a salt in which two equivalents of carbonic acid are combined with a base; *biceps*, "double-headed."

Biafra, Bight of: a bay of the Atlantic Ocean; on the west coast of Africa; is the eastern portion of the Gulf of Guinea, and lies between Cape Formosa and Cape Lopez. It incloses the island of Fernando Po and other smaller isles. The largest rivers which flow into the bight are the Niger (or Qurra), the Calabar, and the Cameroen.

Bialystok: same as BIELOSTOK (*q. v.*).

Biancavilla, bē-nan-kā-vee-la (i. e. white town): a town of Sicily; province of Catania; on the southwest declivity of Mt. Etna; 13 miles N. W. of Catania (see map of Italy, ref. 10-17). Grain, cotton, and silk are exported from it. Pop. 14,000.

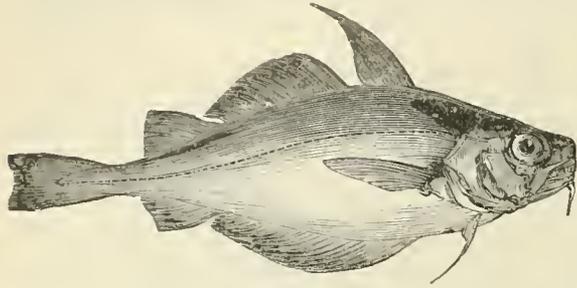

Bianchini, bē-nān-kee-nee, FRANCESCO: Italian astronomer and antiquary; b. at Verona, Dec. 13, 1662. He lived mostly at Rome, and enjoyed a rich benefice, the gift of Pope Alexander VIII. He published, besides other works, a *Universal History, Proved by Monuments and Illustrated with Symbols of the Antique* (1694). He spent several years in an effort to draw a meridian line from the Adriatic to the Mediterranean, but failed to complete it. He succeeded in drawing a meridian line through the Church of Santa Maria degli Angeli, D. in Rome, Mar. 2, 1729. See Fontenelle, *Éloge de Bianchini* (1757); A. Mazzoleni, *Vita di F. Bianchini* (1755).

Biarritz, bē-ār-rēt's': a village and fashionable watering-place of France; on the Bay of Biscay; department of

Basses-Pyrénées: 5 miles S. W. of Bayonne (see map of France, ref. 9-C). Here are several curious grottoes and mineral springs. The situation is pleasant and healthful. This was once the summer residence of Napoleon III. Pop. (1891) 9,177.

Bias: one of the Seven Sages of Greece; a native of Priene, and a contemporary of Ctesus, King of Lydia. He lived about 570-550 B. C. He was distinguished for eloquence as well as wisdom, and was employed as a legal and political adviser or advocate. Besides other pithy sayings is ascribed to him this: "I carry all my goods (or riches) with me."

Bib, called also **Pont** or **Whiting Pont** (*Gadus luscus*): a fish allied to the cod and haddock; is found on many parts of the British coasts and farther N. It is seldom more

The bib.

than a foot long, and is remarkable for the depth of its body, which equals one-fourth of its length. It is esteemed for food.

Bibaud, beë'bō', FRANÇOIS MARIE UNCAS MAXIMILIEN: Canadian author; b. in Montreal in Nov., 1824; son of Michel Bibaud, the historian. He has been for many years Professor of Law in the Jesuit College of Montreal. Among his works are *Discours historique sur les races sauvages de l'Amérique* (Montreal, 1846); *Dictionnaire historique des hommes illustres du Canada et de l'Amérique* (1857); *Tableau historique des progrès matériels et intellectuels du Canada* (1858); and *Panthéon Canadien* (1858).

NEIL MACDONALD.

Bibaud, MICHEL: b. at Côté des Neiges, near Montreal, Canada, Jan. 20, 1782; was educated at College of St. Raphael, and wrote much in defense of the nationality of Canada and for the conservation of the French language. He wrote the first French history of Canada since its British conquest. D. in Montreal, Aug. 3, 1857.

Bibb, GEORGE M.: b. in Virginia in 1772; graduated at Princeton in 1792; became a prominent lawyer of Kentucky; was several times chosen chief justice of that State, and once chancellor; was U. S. Senator (1811-14 and 1829-35); Secretary of the Treasury under Tyler. He published four volumes of Kentucky *Law Reports* (1815-17). D. in Georgetown, D. C., Apr. 14, 1859.

Bibb, WILLIAM WYATT, M. D.: b. in Virginia, Oct. 1, 1780; member of Congress from Georgia (1806-13); U. S. Senator (1813-14); Governor of Alabama Territory (1817-19); and first Governor of the State of Alabama (1819-20). D. near Fort Jackson, Ala., July 9, 1820.

Biber, bee'ber, GEORGE EDWARD, LL. D.: a clergyman of the Church of England; b. at Ludwigsburg, Württemberg, Sept. 4, 1801, and educated at the University of Tübingen; formerly associated with Pestalozzi in educational enterprises; was author of several pedagogic works. He took an active part in Church controversies, publishing a number of volumes, the most important of which were *The Standard of Catholicity* (1840); *English Church on the Continent* (1846); *Sermons, Occasional and for Saints' Days* (1846); *The Seven Voices of the Spirit* (1857); *The Communion of the Faith Essential to the Celebration of the Holy Eucharist* (1863); *The Veracity and Divine Authority of the Pentateuch Vindicated* (1863); *The Supremacy Question* (1865); *On the Unity of the Church* (1871). This last work was an English version of a Latin correspondence with Dr. Michaelis, one of the leaders of the Old Catholic movement, previously published in the original. D. at his rectory of West Allington, near Grantham, Jan. 19, 1871.

W. S. PERRY.

Biberach, bee'ber-akh: a town of Württemberg; in a charming valley, and on the river Riss; 23 miles by rail

S. S. W. of Ulm (see map of German Empire, ref. 8-E). It has a Realschule, a beautiful church, built in 1110, manufactures of paper, linen goods, leather, etc. Pop. 8,263. The French general Moreau here defeated the Austrians under Latour in Oct., 1796, and the Austrian general Kray in 1800. In 1803 it was deprived of its imperial freedom, and it was transferred to Württemberg in 1806. The poet Wieland was born near Biberach.

Biberich, bee'ber-ich, or **Biebrich**, bee'brich: a village of Prussia; province of Hesse-Nassau; on the right bank of the Rhine; 3 miles S. of Wiesbaden (see map of German Empire, ref. 6-10). It has a dual residence which is said to be the finest palace on the Rhine. The river-scenery here visible is almost unrivaled. Pop., including Mosbach (1890), 11,023.

Bibiru: See BEBEERU.

Bible [from Fr. *bible* < Late Lat. *biblia*, fem. sing. < Class. Lat. *biblia*, neut. pl. = Gr. τὰ βιβλία, the books], popularly known also as the **Holy Bible** and **Holy Scriptures** in (Gr. ἡ γραφή, αἱ γραφαί; Lat. *Scriptura sacra*): a collection of ancient writings, from the age of Moses down to the death of the apostle John at the close of the first century, thus embracing fourteen centuries. It is divided into two parts, the Old and New Testaments; the first is regarded by the Jewish Church, and both are regarded by the Christian Church, as the inspired record of divine revelation. With respect to the more precise definition and character of the Bible, the views are diverse in the different Churches. The Greek and Roman Catholic Churches put ecclesiastical tradition, as determined by general councils and creeds, on a par with the Bible as a rule of faith and conduct, and claim the sole right of authoritative explanation. The Protestant Churches make the Bible the only and sufficient rule of faith, and give to tradition a subordinate place. They are generally agreed in regarding the Scriptures—1, as of divine authority; 2, as containing all knowledge necessary to salvation; 3, as the appropriate form of a divine revelation (as opposed to tradition or the inner light); 4, as the heritage of all Christians—i. e. it is the right and duty of all to read and become acquainted with the teachings of the Bible. As regards inspiration, opinions are divided between the theories of verbal or literal, plenary, and dynamic inspiration. The creeds and confessions of faith teach or imply the *fact* of inspiration, but do not define the *mode* and the *degrees*. The first theory was prevalent in the seventeenth century, but is now abandoned by the great majority of Protestant divines; the last is advocated by most German divines.

OLD TESTAMENT.

The Old Testament was originally written in Hebrew (some portions in Aramaic), but of course the Hebrew manuscripts which we possess are separated by a long interval and many vicissitudes from the original handiwork of the authors. The oldest complete codex dates from the year 1009.

The History of the Hebrew text is briefly as follows: I. *First Period* (536-180 B. C.)—The Babylonian captivity (from 586, the chief deportation, to 536, the first return) forms an epoch in the history of the Jews. It is a gulf dividing the independent from the subject position of the nation. It was under the former that they had original and productive power and a living revelation. After the captivity, when the Jewish nation had been purified by adversity, they turned back to them with new interest. They were able to see that Isaiah and Jeremiah had been the only men of their times who had truly had "the mind of the Spirit." They desired to restore the ancient law, worship, and traditions. To this end the collection and preservation of the ancient writings, which served as the authority for, or bore witness to, the former observances, became an object of great interest and importance. With this movement, however, the nation entered on a new stage. Its work was not original and creative, but preservative and reconstructive.

In the work which now began Ezra had a prominent part. He is called a second Moses and the restorer of the law. He was the first "scribe," and raised the scribe above the priest. He collected and arranged the ancient writings, and so laid the foundation of the canon (see below, section on the *Canon*); and from this point the history of the written codex begins. The books were at this time written in the ancient Phœnician characters which appear on some ancient Phœnician inscriptions, on the Moabite Stone, on some coins of the Asmoneans, and in the Samaritan Pentateuch. The letters

had no variation of form or shape for capitals and small letters, and neither words, verses, nor chapters were marked off in any way. Some of the books which now appear separately were then united, and a few which are now found in the canon had not yet been written. The work, however, which was now to be done extended beyond the collection, arrangement, and preservation of the ancient Scriptures. The Hebrew language was already a dead language. The popular dialect was the Aramaic, and the Hebrew of Moses, David, and the prophets had become a sort of classical and sacred language, known only to the oldest and to the learned. It was an object of academical acquisition. It was therefore necessary to explain and translate or expound the writings. This task naturally devolved upon such as possessed the requisite knowledge, and they constituted an informal body for this purpose. So much is no doubt true, and it forms the historical basis of the rabbinical tradition about the "Great Synagogue" which was said to have done this work.

When this much is said of the commencement of this period, we have in fact told nearly all which is known about it. We can only infer from what we know of its beginning and what we find at its close, that the following movements were in progress: 1. The college of interpreters, though not a formally or legally constituted body, and though their business was primarily literary or academical, were gaining in authority and dignity, and acquiring a certain official character from general consent. The "elders" came to have civil and judicial authority from the lack of others to fill these functions. Possibly the Sanhedrin was an outgrowth of this body. 2. The canon (see below) was being formed; the idea of *Holy Scripture* was being elaborated and formulated; the respect for the traditional writings, and the disposition to set them by themselves, were gaining ground; the doctrine of inspiration took its rise. At the close of this period the canon is formed and these doctrines are established dogmas. 3. The form of the letters was undergoing a change. At the period referred to, the square letters which are represented in our printed texts had become established in use.

II. *Second Period* (180 B. C. to 500 A. D.).—The "schools" begin with Simon the Just, in 180 B. C. These schools produced the Talmud (i. e. body of doctrine, from *tamad*, to teach), an immense work in a dozen folio volumes, containing a commentary on the Mishna, which is itself a "repetition" of the "Law." It was completed in the fifth century. The Talmudic scholars developed intense zeal for the text of the Scriptures—a zeal which, though frivolous and fanatical in many of its manifestations, has been of immense value to biblical scholarship. They spent unwearying labor in the establishment of the consonant text; they separated the words by spaces (but characteristically ordained just how great the space should be). They probably also introduced the verse-mark (v), and therefore the division into verses. The preservation of the text from corruption in copying was secured by counting the letters or by other devices, and by crabbéd, rigid, and minute rules. This work exercised its legitimate influence on the characters of those who did it; it made them punctilious about trifles and negligent of "the weightier matters"; but it preserved the Old Testament text from corruption, and handed it down to us in a comparatively pure and trustworthy form. In their exegesis the Talmudists were generally guided by arbitrary rules, by dogmatic prepossessions, by a view of the Bible which made it a storehouse of occult wisdom, only to be unlocked by cabalistic and allegorical treatment. It is asserted by some who are well acquainted with the Talmud that it contains valuable geographical, ethnological, historical, and exegetical information for the elucidation of the Bible, but the commentaries of Jews and Christians alike fail to bear witness to the truth of the assertion.

The Targums.—One result of the zeal of the Jews for the original Hebrew was the publication of paraphrases in the Aramaic or popular dialect, which were called *Targumim* (from a root signifying to "interpret"). They present the rabbinical and traditional interpretation of the Scriptures. Their origin is very obscure. See TARGUM.

III. *Third Period* (500–1488 A. D.).—The Talmud, having grown by the work of successive generations for three or four centuries, closed about the year 500—i. e. the last of the commentators whose sayings are included in it lived at that time. Then a new work began. The Jewish nation had long been broken up and dispersed. Christianity had grown into a powerful opponent. The latter fact had led

the Jews to abandon the Septuagint Greek version of the Old Testament (see below, on the *Versions of the Old Testament*), and the former fact made it necessary to provide still further for the preservation of the Hebrew text. The pronunciation of a language written only with consonants must, of course, be very uncertain; that of the Hebrew had been preserved in the rabbinical schools by tradition. There seemed to be danger that it would now be lost if no means of recording it were devised. The Syriac language had shortly before been provided with points to designate the vowel sounds, and to make the written language a complete representation of the spoken. The chief seats of rabbinical learning at this period were Tiberias, in Galilee, and Sora, in the Euphrates valley, and the scholars are known as the Massoretes. The Massorah was a mass of notes, comments, emendations, and corrections of various kinds, which the Talmudists had adopted, committed to memory, and handed down by tradition, but which they had not ventured to mark in any way upon the pages of the sacred text. The Massoretes now undertook to do this. They marked in the text—1, the vowels, the shades of pronunciation of the consonants, and the diacritical points which distinguish two sounds expressed by one character; 2, the accents, which are partly marks of pronunciation, and partly serve the purpose of musical notes, marking the intonations of the chant; 3, the emendations and corrections which the Talmudists had adopted. These they mark on the margin by a peculiar device, which leaves the consonants as they were, but suggests those which should be read. Here, again, the superstitious reverence of the rabbis for the text served the purpose of a true biblical science, since their proposed amendments are still open to criticism and review. It is difficult to pass a summary judgment on their emendations, but perhaps in a majority of cases modern scholars retain the original reading and reject the Massorah.

The work of the Massoretes did not begin before the sixth century, and it was finished before 1109, the date of the oldest manuscript now known to exist. This manuscript presents the Massoretic text. The work certainly covered a long period, and was done by many different hands. It was not possible, even with the minute and stringent rules which were adopted, to prevent errors in copying, and our manuscripts, all of which belong to the period between 1106 and 1488, offer many variants. The Jews continued to use in the synagogues copies of the Scriptures containing only the consonant text.

IV. *After the art of printing* was invented some books of the Old Testament were printed separately. In 1488 the first edition of the whole Hebrew Bible was printed at Soncino. The second, based on the first, was published at Brescia in 1494. This was the one used by Luther. An independent text appeared in the Complutensian Polyglot, 1520. A collection of variants was made from 615 manuscripts by Kennicott, Oxford, 1780, and a better one by De Rossi, 1788. The Hebrew Bibles in use are scarcely more than reproductions of the two first printed editions. They possess some critical advantages, but generally the excellence of a subsequent edition over the former consists in typographical accuracy and neatness. A satisfactory critical edition, with a full account taken of the variants, is yet to be prepared. The best editions are those of Hahn, Theile, and especially Baer (with preface by Delitzsch, Leipzig, 1869, *sqq.*). The most complete collection of Massoretic material is by Ginsburg, *The Massorah, Compiled from MSS., Alphabetically and Lexically Arranged* (London, 1880–86, 4 vols.).

V. *The Old Testament in the Christian Church*.—The Church of the first and second centuries based the authority and truth of its doctrines on the Old Testament, just as it is used in the New Testament. The Church of the third and fourth centuries wavered between acquiescence in the authority ascribed to the Old Testament by our Lord and his apostles, and hatred and suspicion of all things Jewish. No Christians save converted Jews knew Hebrew, and of these very few were of the class who "knew the Law." The Septuagint Greek version (see below) was the form in which the Christians became acquainted with the Old Testament. The first Christian scholar who undertook to learn Hebrew was Origen (d. 254 A. D.). He prepared a *Hexapla*, containing the Hebrew and five versions, which unfortunately is lost, except some fragments. We possess, however, his commentaries, which show that he had borrowed from the rabbis, but especially from Philo of Alexandria, the allegorical and mystical methods of interpretation. He is counted

among the Fathers of the Eastern Church, and is the first biblical scholar of whom that Church can boast.

Jerome (d. 419 A. D.) endeavored to learn Hebrew of a Jew, and did learn as much as his teacher could or would teach him. His method of treating the Old Testament shows the influence of his teacher. Through him the rabbinical ideas of inspiration, etc., found their way into the Western Church. His translation of the Scriptures (see *Vulgate*, in the section below on the *Versions*) was regarded as a finality, and all interest in the original text died out. In 1311 Clement V. ordered that Hebrew should be studied at the universities, but no results followed. Nicholas de Lyra (1340) was, perhaps, a converted Jew. At all events, he knew Hebrew and used the Jewish commentators. His commentaries carried great authority among Christians, and influenced Luther so much that a popular saying arose: "If Lyra had not played the lyre, Luther would not have danced." (*Si Lyra non lyruisset, Lutherus non saltasset.*) But the father of Hebrew learning among Christians is Renchlin (d. 1522), who wrote the first Hebrew grammar and dictionary, 1506 (on the basis of Kimchi). The Reformers returned with zeal to the study of the Hebrew. That pursuit participated in the general revival of learning, and in the most recent times it has been wonderfully advanced by the development of philological and historical science. It is probably not too much to say that the Hebrew language is more at the command of this generation than of any other since the Babylonian captivity.

It follows from the above—1. That the only text we can hope to establish on manuscript authority is that of the Massorettes, but it can be greatly improved from the Septuagint. 2. We have no manuscript, even of this text, older than 1009. We shall see below, under *Versions*, what means we have of learning what the text was at an earlier date. 3. The vowel-points, accents, word, verse, and chapter divisions are all many centuries more recent than the original writings. Even the consonant text has been transliterated. The chapter divisions were made in the thirteenth century, and applied to the Vulgate. In the sixteenth century it was asserted that the vowels, etc., were of later origin than the text. This assertion was considered heterodox, as it was inconsistent with the prevailing theory of inspiration. It is only in the most recent times that this fact has been admitted, and it is now undisputed. 4. The crude and superstitious theories of inspiration which have prevailed to some extent in the Christian Church are of rabbinical manufacture. They were introduced into the Christian Church first as attaching to the Old Testament, and then extended over both in their purest and most original form. See W. Robertson Smith, *The Old Testament in the Jewish Church* (London and New York, 1881; 2d ed. 1892), and especially Ludwig Diestel, *Geschichte des Alten Testaments in der Christlichen Kirche* (Jena, 1869).

VI. *The Canon and the Apocryphal Books.*—As we said above (A, 1.), when the period of creation and production was ended, and the period of conservation and reflection and application began, one of the first ideas which was elaborated from the crude into the dogmatic form was that of the Scriptures in their sacred character and divine authority. Hence the terms Holy Scripture, Word of God, etc. When this doctrine was established, the necessity of defining and limiting its application at once made itself felt. What books come under this designation? What is the standard by which they must be tested in order to answer this question? It is certain that these questions never received any authoritative answer. Ezra made a collection of books, but he did not include those books which were not yet written. The Hebrew Bible as we now possess it is divided into three parts: 1, the Torah (i. e. Law—Pentateuch); 2, the Nebim (Prophecies, including Joshua, Judges, First and Second Samuel, and First and Second Kings); 3, the Chetubim ("Writings," "Hagiographa," including the poetical and all the other books in the English Version of the Old Testament). The addition of the third part can not be historically accounted for. The form of the collection, as a whole, bears witness to successive collections and successive gradations of authority. This gradation may be traced still further. Besides and beyond the Chetubim were a number of books which were on the line, not accepted and not definitely rejected. Still again, beyond these were others which were positively set aside. The translators of the Septuagint included in their collection a number which do not appear in the Hebrew collection (they form the Apocrypha of the English Bible). The Ethiopic version contains others which belong even to the class of the totally rejected. Thus one

who knew only the Septuagint version would find the book of Exodus and the book of Tobit side by side, presented to him as of equal authority. Ethiopian Christianity would give the same authority to the book of Adam as to the book of Genesis. Thus it is certain that, when these versions were made, the strict definition of the books to which standard authority belonged was not yet established. Fürst has even shown from the Talmud (*Kanon des Alten Testament*, p. 25) that this idea of the canon was not so definitely established at the time of our Lord but that the rabbis ventured to propose to exclude the book of Ezekiel from the canon, on account of its contradiction to the Pentateuch. Here, then, we have the idea of the canon. It is the limited collection to which, and to which only, authority as the inspired word of God appertains. The works which were in circulation, and to which this authority was denied, were called *apocryphal*, from a Greek word meaning "to withdraw," because they were withdrawn from use for public instruction. The third class, the *pseudepigraphs*, were so called because many of them bore names which were forged. In 2 Maccabees ii. 13 we read: "The same things are narrated in the writings and memoirs of Nehemiah, and how he collected the books about the kings and prophets, and those of David, and the letters of the kings in regard to offerings." The Pentateuch had been restored to authority and use by Ezra in 444 B. C. (Nehemiah viii). Nehemiah added the "Nebim," which are distinctly described in this passage ("kings and prophets"), and the Psalms, which are the nucleus of the Chetubim. The "letters" are those of the Persian kings, such as we find in the books of Ezra and Daniel. The subsequent omission of these letters from the canon bears witness to the soundness of the standard by which its formation was governed. The Massorettes were finally called upon to decide what books they would recognize as canonical, but in this, as in other things, they no doubt confined themselves to the establishment of the tradition which they had received. In the Christian Church the influence of the Septuagint secured the introduction of the Apocrypha with full canonical authority. Jerome translated all into the Latin Vulgate. They thus remain in authority in the Greek and Roman Churches. Luther adopted the Hebrew canon, but translated the apocryphal books, setting them by themselves, and giving them a heading which recommended them for edification, though not for dogmatic definition. The English translators followed the same policy. Of late, however, the Apocrypha have been omitted from the popular editions of the English Bible, because the presence in the volume of works which formed a grade between it and ordinary works seemed to detract from the supreme and isolated position of Holy Scripture.

The Apocrypha and Pseudepigrapha are both quoted in the New Testament. See Jude 9 (Translation of Moses); Jude 14 (Book of Enoch); 1 Corinthians ii. 9 (said by Origen to be from a lost apocryphal writing under the name of Elijah). Compare also James iv. 5, John vii. 38, and Luke xi. 40—citations which we can not identify with passages in any known book.

It appears from the above—1. That the canon was fixed only after long experience, and by the general consent of successive generations, who bore testimony, by their esteem and veneration for particular books, to their intrinsic authority and profitableness. 2. There is no broad and distinct line of demarcation between the canon and the Apocrypha. If we allow ourselves to form estimates of the comparative value of various books we shall find that the first book of Maccabees compares very favorably, as an edifying religious history, with the book of Esther, and that the book of Jesus the son of Sirach compares favorably with Ecclesiastes as a book of religious instruction. On the Jewish canon see the works of Fürst (1867); Samuel Davidson (1877); Wildeboer (1889); Buhl (1891); and H. E. Ryle (*The Canon of the Old Testament*, London, 1892).

VII. *The Order of the Books of the Old Testament.*—In the arrangement which has been adopted there appears to have been an effort to conform as far as possible to chronology, not only in regard to the historical, but also the legal and prophetic portions. The following are the principal divisions:

1. Law (in Hebrew, תּוֹרָה, *Torah*; Gr. νόμος) or Pentateuch (Gr. πεντάτευχος), because it consisted of five parts.
2. Prophets (Heb. נְבִיאִים; Gr. Προφήται).
3. Holy Writings or Hagiographa (Gr. ἁγιόγραφα), called in Heb. כְּתוּבִים, *Chetubim*—i. e. the "writings," *par excellence*.

The Law included—1, Genesis or "origin"; 2, Exodus, or the "going out"; 3, Leviticus, or the book relating to the Levites; 4, Numbers, so called because Moses was commanded to "take the sum of all the congregation of the children of Israel" (Numbers i, 2); 5, Deuteronomy (from the Gr. *δεύτερος*, "second," and *νόμος*, "law"), because it was the second laying down (or the repetition) of the Law.

The Prophets were divided into the Former or Earlier (*Præiores*), including Joshua, Judges, First and Second Samuel, First and Second Kings; and Later (*Posterioriores*), comprising the greater prophets (except Daniel, viz., Isaiah, Jeremiah, and Ezekiel, and the twelve minor prophets, Hosea, Joel, Amos, etc.

The Holy Writings, or Hagiographa, included the Psalms, Proverbs, Job, The Song of Songs, Ruth, Lamentations, Ecclesiastes, Esther, Daniel, Ezra, Nehemiah, First and Second Chronicles. For a more particular notice of the different books the reader is referred to their respective heads.

VIII. *Versions of the Old Testament*.—As we saw above, the oldest manuscript of the Hebrew Scriptures which we possess dates from 1009 A. D., and presents the Massoretic text. If we wish to go back of this to reach something nearer to the original work of the authors, and to eliminate errors which may have crept in, we have one means of doing so—viz., the ancient translations which were made from the text at a remote date.

1. The first and most important of these is the Greek version, called the *Septuagint* (LXX).—Passing over the fables of the Jews and early Christians in regard to this version (such as that it was made on a set occasion by seventy-two men, six from a tribe, chosen by the high priest, and sent to Egypt for the purpose—that they each separately translated the whole, but that, by virtue of divine inspiration, the seventy-two translations were identical), we state only the best-assured facts in regard to it. The Pentateuch was translated by Alexandrian (not Palestinian) Jews, but by how many is unknown. It was a result of the enlightened interest of the Ptolemies (Lagus and Philadelphus) in all literary and scientific progress. It was made about 285 B. C. The work thus begun was carried on by various persons at various times until all the canonical and apocryphal books were translated. Some originally written in Greek were added. The parts vary in fidelity to the original and in literary excellence. Job and Isaiah are so poorly translated that one must know Hebrew to see the sense of the Greek; Ecclesiastes is faithfully and correctly rendered. At this time Greek was the language of popular intercourse. The Jews of the time of Christ neglected the Hebrew, and generally relied on the Septuagint version. It is the form in which the Old Testament is quoted by Mark, Luke, Peter, and, for the most part, by Paul. Matthew, John, and Paul show acquaintance with the Hebrew, but they also use the Septuagint. Its influence was at this time paramount. It passed into the Christian Church as the authoritative form of the Old Testament. It soon began to be asserted, however, by the Jews, when the Septuagint was quoted in controversy by the Christians, that it was not a faithful rendering of the original. Hence the Jews abandoned it and returned to the Hebrew, and the most scholarly of the Christians attempted to acquire that language. Nevertheless, the Septuagint remains the authority of the Greek Church to this day. Other Greek versions which need only be mentioned are those of Aquila, Theodotion, and Symmachus. The best editions of the Septuagint are by Tischendorf, Lagarde, and Swete; but a thoroughly critical edition with textual apparatus is still a desideratum.

2. *The Peshito* is a Syriac version, whose name signifies "simple" or "faithful," because it is a literal translation, not a paraphrase. It includes the New Testament. Its origin is obscure. It was in use in the time of Ephraim Syrus (378 A. D.).

3. *The Vulgate*.—Augustine says (*De Doctr. Chris.*, ii, 11), in regard to the early Latin versions, that "in the first days of the faith, if any one obtained a copy of the Greek Scriptures, and gave himself credit for any knowledge of the two languages, he ventured to translate." He recommends only one of the versions existing at the time—viz., the Itala. This is now lost, except in fragments as quoted by the earlier Latin fathers, but seems to have been made from the Septuagint. Jerome (d. 419) undertook to learn Hebrew, in order to make a new translation from the original. History repeats itself with regard to all new translations of the Bible. This one was made avowedly in order to meet the wants of the common people, and it was called the "Vulgate" be-

cause written in the popular Latin. It was met by the most violent opposition, by all the arguments of tradition and prescription, and by all the considerations of policy and expediency, which suggest themselves in such a case. It was finally adopted, and now it has itself become sacred in the Latin Church. The Council of Trent (1546) put it on a par with the original. The text of the Vulgate became so corrupt by repeated copyings that, on the invention of printing, the true text seemed lost in a chaos of variants. An attempt to revise it resulted in an arbitrary decree of Sixtus V. (1598) deciding what it should be, and this text is now the "received text" in the Roman Church. A text having critical and scientific authority is still a desideratum.

NEW TESTAMENT.

With the advent of our Lord the fountain of divine revelation once more began to flow. Mankind once more received an original and creative revelation, not whimsical traditions or weary reflections on the record of past thought and life. The Greek language, which, as we saw above, was at this time the medium of popular and literary intercourse, became the vehicle of the new revelation. The Gospel of Matthew was probably originally written in Aramaic, but the remainder of the New Testament was certainly Greek from the very hands of the authors.

1. *History of the Greek Text*.—The original handiwork of the writers soon perished. We have no record or tradition of the original manuscripts, and no tradition to bear witness to any care for them. Copies were made from them, and by the middle of the second century the interest in them had become so great as to lead to extensive multiplication of copies. The oldest manuscripts which we possess date from the fourth century. (See articles CODEX BEZÆ, CODEX SINAITICUS, etc.) From that time on the number of manuscripts which we possess increases as we come down, but as the copies increase in number so also do the variants. When printing was invented one of the first uses to which it was put was the printing of the Greek Testament. This art gave ground to hope that the text-copies might be multiplied for the future without the errors inseparable from manual copying. The first printed text was contained in the Complutensian Polyglot, prepared under the patronage of Cardinal Ximenes, at Alcala (the ancient Complutum), in Spain, in 1514, but not published till 1520. It is not known what manuscript served as copy for this edition. Erasmus prepared a very faulty text, published at Basel in 1516. These two editions from late manuscripts taken at hazard served as the basis of succeeding ones (Stephanus, 1546; Beza, 1565; Elzevir, 1624, 1633). The last of these (chiefly on account of its convenience of form and typographical beauty) became the "received text." The doubt between various authorities was settled in this case, as in so many others, not by thoroughly investigating the matter, but by giving arbitrary sanction to one. The Elzevir remained supreme until the time of Griesbach (1812). Here again we come to a department in which the credit for what has been done belongs chiefly to German scholars. Griesbach, and after him Lachmann (1854), and Tischendorf have prosecuted the tedious labor of comparing the variants and weighing the authorities. They were followed in England by Tregelles, Scrivener, Westcott and Hort. The effort can not be defined as one to re-establish the text of the apostles, for that may be pronounced hopeless, but to recover the text to which the oldest and best manuscripts bear witness. The scholars mentioned form a succession in which this aim has been prosecuted with intelligence, zeal, and consistency. The best attainable text is presented by Tischendorf's eighth critical edition (with apparatus and the *Prolegomena* of Gregory), and by Westcott and Hort (the Harper ed., with introduction by Schaff, 1881; third revision 1892).

The dialect of Greek in which the New Testament is written is what is called the Hellenistic. It was based upon the Attic dialect, and was spoken by the Jews with a strong infusion of a Hebrew spirit and Hebrew modes of speech. Hence the Hebraistic character of the Septuagint and the Greek Testament. Though differing from classical Greek in grammatical purity and accuracy, this dialect was best adapted to express the ideas of the Christian revelation to the primitive Christians, and has an undying beauty and force of its own.

The order of the books in the Greek differs from that in the English version, in that the catholic Epistles follow the Acts.

II. *Respecting the Separate Books of the New Testament.*—The following account includes such facts as can be relied on, omitting questions involved in controversy.

The Gospels.—We possess a fourfold record of the life and teachings of our Lord. It strikes the attention of the reader at once that the first three contain many passages which are almost identical. On the other hand, each differs from each in a manner equally remarkable. From the earliest times efforts have been made, without much success, to harmonize them into one consistent narrative. Within a century these phenomena have again been examined with great zeal. The question is raised: Do not these resemblances point to an interdependence between the synoptical Gospels? If so, which is the original? If one served as the original, how is it that the authors of the others, in using it, failed to transfer passages of high interest? In fact, the phenomena of identity and difference are so perplexing that these questions seem unsolvable. The prevailing opinion of scholars at the present time appears to be that the Gospel of Mark presents the nearest approach to the original of the synoptical Gospels; that Matthew was originally written in Aramaic. That Luke is a subsequent compilation of the gospel-material is certain. It was written before the year 70 or 80. Before the historic interest in the Gospels arose, and before the movement toward a New Testament canon began, the Gospels no doubt exerted great influence on each other.

The Gospel of John is clearly independent of the others in its material, scope, and purpose. It takes up the life of our Lord not so much pragmatically as philosophically and mystically—in its religious rather than its historical aspect. It has been vigorously attacked by the negative and rationalistic school of critics (especially by Baur and his followers), and is held by them to be the product of an anonymous Christian Plato after the middle of the second century. These opinions, however, rest chiefly on philosophical and historical dogmas which are set up as postulates; and one who refuses to admit the necessary *a priori* truth of these postulates finds that the true critical grounds on which this opinion rests are meager and insufficient. The recent discoveries of Tatian's *Diatessaron* (1888) and of a fragment of the Gnostic Gospel of Peter (1892) prove the existence and use of John's Gospel before the middle of the second century. Conservative scholars of every grade (Meyer, Lange, Weiss, Beyschlag, Godet, Lightfoot, Westcott, Salmon, Sanday, Gloag, and many others) admit the authenticity of the book. One of the ablest defenses is Ezra Abbot's *Authorship of the Fourth Gospel* (1880, republished in his *Critical Essays*, Boston, 1888).

III. *The Canon.*—The first century of the Christian era produced a large number of literary works beyond those contained in the New Testament. The idea of the canon therefore came to be applied here once more (see above, *Canon of the Old Testament*). Such of these works as were of genuine apostolic origin, or were faithful representatives of Christian truth, must be separated and recognized apart from all others. Here once more the same phenomenon appeared as in the Old Testament. There was no distinct dividing line to be drawn. The division did not make or suggest itself. The whole body of works might be graded from the Gospel of Matthew down to the most gross and contemptible product of superstition, but the stages were gradual all the way. Different persons differed in their comparative estimate of a few (e. g. the Epistle of Barnabas and the Epistle of Jude, the Shepherd of Hermas and the Epistle to the Hebrews), though they agreed in the general range of estimate. Down to the middle of the second century the Christians used the Old Testament for their apologetics and their polemics. Moreover, the tradition was still so fresh that literary authority was not needed. We do not find in any writers earlier than Irenæus (d. 202) references to the New Testament writings as authoritative, or as inspired in any such sense as the Old Testament was believed to be inspired. From this time on the chief interest of the Christian Church is rapidly transferred to the New Testament. The books are collected and studied and compared. Their respective authority is determined. The informal verdict of the Church accepted certain books and rejected others, but there were a number which were on the line or in doubt. These were the Epistle of Jude, the Second of Peter, Second and Third of John, the Epistle to the Hebrews, the Shepherd of Hermas, and the Epistle of Barnabas. In the third century considerable disfavor to the book of Revelation was manifested in the Western Church, though earlier it had been very popular. To go into details of various au-

thorities would lead us too far. Eusebius (d. 340 A. D.) bears witness that the matter stood, in his time, in just about the position above described. Not only the above-mentioned doubtful books, but others also which had become familiar and gained a footing in popular affection, were retained, as the Apocrypha is still sometimes retained in our Bibles. The Synod of Laodicea (360) made the first official list (omitting the Apocrypha), and forbade the public reading of uncanonical books. The Councils of Hippo (393) and Carthage (397) under the influence of St. Augustine fixed the canon as it now stands and is accepted by all the Churches. On the canon of the New Testament, see the works of Reuss, Westcott (6th ed. 1889), and Zahn (1890).

LITERATURE.—The literature on the Bible is immense. On the general questions discussed in this article, see the historico-critical introductions to the *Old Testament* by De Wette (8th ed. by Schrader, 1869); Bleek (revised by Wellhausen, 5th ed. 1885); Reuss (2d ed. 1890); Keil (3d ed. 1873); Riehm (1869); Reusch (1875); Kuenen (Dutch, 1885); Cornill (2d ed. 1892); Wright (2d ed. 1892); and Driver (3d ed. 1892). On the *New Testament*, Hug (Rom. Cath., 1820); De Wette (8th ed. by Schrader, 1869); Bleek (4th ed. by Mangold, 1860); Reuss (6th ed. 1887; Eng. trans. 1884); and Salmon (7th ed. 1894); and especially Weiss (2d ed. 1889; Eng. trans. 1888) and Holtzmann (3d ed. 1892). The last two represent the latest state of New Testament criticism—Weiss on the conservative, Holtzmann on the other side. Prof. F. Godet, of Neuchâtel, issued in French an *Introduction to the New Testament* (1893, seq., 3 vols.; Eng. trans. 1894, seq.). See also Schaff, *Companion to the Greek Testament and the English Version and Revision* (New York, 4th rev. ed. 1892), and the articles HEXATEUCH and HIGHER CRITICISM.

Revised by PHILIP SCHAFF.

MODERN VERSIONS OF THE BIBLE.

English.—The earliest known version in a Teutonic language is the Mæso-Gothic of Ulphilas, made from the Greek in the fourth century; extant portions are the Gospels and various fragments. The English have a better right than the Germans, the Dutch a better right than either, to claim this as the first version in their language. The early English or Anglo-Saxon versions are from the Vulgate, the earliest extant being the paraphrase of Cædmon. The earliest recorded translators are Aldhelm and Guthlac, each of whom made a version of the Psalms, probably now lost; Bede, who translated the Gospel of John, and King Alfred, who prefixed to his laws an abridged translation of the Ten Commandments, and is said to have been engaged on the Psalter at the time of his death. In the tenth century or a little later a large number of books were translated, the Gospels apparently in three distinct versions. In the ages following the Norman Conquest considerable portions were translated into Norman French. The most memorable and conspicuous is the version completed by John de Wycliffe in 1382, with the subsequent aid and revision of several others. Many manuscripts remain exhibiting great variations. It was not printed till 1850, when an edition was published at Oxford presenting two texts in parallel columns with variants from some sixty manuscripts. The first English translation from the Greek and the basis of all subsequent ones was the New Testament of William Tyndale (martyred in 1536). This was printed in 1526 at Cologne. The books were burned at Oxford and London, and six editions were dispersed before 1530. In 1535 the first complete English Bible, by Miles Coverdale, was printed, probably at Antwerp. Next followed *Matthew's Bible* (Thomas Matthew a pseudonym for John Rogers); then in 1539 Richard Taverner's *The Great Bible*, so called from its size, was revised mainly by Coverdale from preceding versions, sometimes called *Cranmer's Bible*, and sometimes *The Chained Bible*, because chained in churches for public reading. The *Genevan Bible*, the sweetest of all English versions, was produced at Geneva by the exiles sent over by "Bloody Mary" in 1557. Its expense was defrayed by John Bodley, father of the founder of the Bodleian Library. It was the most popular Bible till superseded by the authorized version, and was that brought to America by the Pilgrim Fathers; sometimes called the *Breeches Bible* because of the rendering of Genesis iii. 7, which says that Adam and Eve "sewed figge-tree leaves together, and made themselves breeches." This rendering, however, occurs in several earlier versions. The *Bishops' Bible*, under Queen Elizabeth's license, was printed in 1568, favored and in part made by the bishops. Some editions of it are called the *Treacle Bible*, reading "treacle" for "balm" in

Jeremiah viii. 22. Another name, *The Bug Bible*, from Psalm xci. 5, belongs to several versions. The *Douay Bible* (1609) was translated by the Roman Catholics from the Vulgate, and owes much to Tyndale and other versions, often called the *Rosin Bible*, from Jeremiah viii. 22. In 1611 the *Authorized Version*, or King James's, appeared, prepared by various companies under the king's instructions, in two editions, better known as the "He" and "She" Bibles from the different renderings in Ruth iii. 15. Various editions have been termed *The Vinegar Bible* from the misprint vinegar for vineyard in the page-heading at Luke xx.; the *Wicked Bible*, which omitted the *not* in the Seventh Commandment. Since the issue of the authorized version a large number of versions have been printed, among which the most notable are *The Revised Version of the New Testament*, published in 1881, the whole Bible in 1885 (see BIBLE REVISION below), and the Baptists' versions, using the word *immersed* instead of *baptized*. Among other versions used in Great Britain may be mentioned the Welsh, dating back to 1527, the standard version being completed in 1601. It was the demand for this Bible that occasioned the institution of the British and Foreign Bible Society in 1804. The Gaelic version for the Highlanders of Scotland dates back to 1767; a Roman Catholic translation in 1796. The first New Testament in Erse was early in the fourteenth century; a number of later versions have been published. A Manx version was published in the latter part of the eighteenth century.

French.—There have been a great number of French versions, all (Protestant as well as Roman Catholic) based on one made from the Vulgate by Jacob Faber Stapulensis, at Antwerp, 1512-30. The most important versions are Olivetan's, of which the most prominent edition was called the *Geneva Bible*; Martin's version and Osterwald's revision. Of Roman Catholic versions the most important are De Saey's, Orsini's, and Lassere's. The last, published in 1887, under the authority of the Archbishop of Paris, has reached more than twenty editions. These are all in the standard French; other versions are in the Vaudois, Provençal, and Mauritian dialects. Akin also to the French are the Breton and Basque versions, the last in three forms—French, Spanish, and Guipúzcoan. The Flemish version used in Belgium dates back to the year 1477. Later revisions and editions have been published at Louvain, Cologne, and The Hague.

Dutch.—The first complete edition of the Scriptures in Dutch was published in 1526. Lutherans of Holland still use a translation according to Luther's version, published in 1648. Others have followed, including a revised edition circulated at the present time.

German.—In Germauy, after the version of Ulphilas, there were a large number of glosses and translations of single books. The earliest translation of the whole Bible was probably about the beginning of the fifteenth century, and early in the sixteenth century fourteen different editions had been published. These were all replaced by Luther's version, 1522-32, which has remained the standard until the present day, a revision of it having been completed in 1892.

Other European Versions.—Akin to the German also are Danish, Icelandic, and Swedish versions. There is also a Gospel of Matthew in Finnish. The Wends have the Scriptures in the Upper, Lower, and Hungarian dialects, and in Eastern Switzerland there are three versions of the Romansch Scriptures, the Upper and Lower Engadine and the Oberland. In Eastern Europe there are numerous Slav versions based entirely upon the Slavonic version of Cyril's translation, the most ancient manuscript of which is the Ostromirov's Gospel, written in 1053 for a Russian prince. The various dialects in which these have been supplied are the Czech or Bohemian, dating to the latter part of the fifteenth century; the Slovak, Servian, Croat, Slovenian, Ruthenian, Russian, and Bulgarian. The present Russian versions are one completed early in the present century under the auspices of the Holy Synod, and one prepared by the British and Foreign Bible Society, completed in 1876. The best of Slavonic versions is the Bulgarian, prepared by Dr. E. Riggs, missionary of the American Board in Constantinople, Turkey. The Magyars, or Hungarians, and the Roumanians each have versions in their own language, as have also the Lithuanians, Letts, and other members of the Finnish race, one of the most prominent being the Estonian, recently prepared by the American Bible Society. There are also versions in Albanian. Versions of the Bible in the modern Greek or Romaine date back to 1638. Several revisions have followed, the latest having been completed early in the nineteenth century.

In Southern and Southwestern Europe there are versions in Italian, Spanish, Portuguese, and Gitano. That in Italian dates from 1471. The most important translation was that of Diodati, published at Geneva in 1607, and which has been the basis of all subsequent revisions. The Spanish versions also date from the middle of the fifteenth century, in the Castilian and Lemosinian dialects; the most important versions are those of De Reyna, Valera, and Seoio. There have been revisions, especially with reference to use in Spanish America, and one is now (1893) being completed under the auspices of the American Bible Society.

Asia.—In Western Asia the three most important versions for Moslems are the Arabic, Persian, and Turkish. The earliest Arabic version was made by John, Bishop of Seville, in 750; then followed that of Rabbi Sandia and others. The most important was that begun in Beyrout by Dr. Eli Smith, of the American Board, in 1837, and completed by Dr. C. V. A. Van Dyck in 1864; published by the American Bible Society, and circulated wherever the Arabic language is known in Asia or Africa. There is another version prepared by the French Roman Catholic priests, published in Beyrout, and said to be excellent. The earliest Persian version known was published in Constantinople for Persian Jews, early in the sixteenth century. Different translations have been made, one of the New Testament by Henry Martyn, and of the Old Testament by Archdeacon Robinson and the Rev. W. Glen. A revision of Henry Martyn's version, under the auspices of the Church Missionary Society and the American Presbyterian Board, has been made. There are a large number of Turkish versions in dialects used in Russia, Siberia, and Central and Western Asia. In Osmanli Turkish, spoken by the Turks of the Ottoman empire, there were two translations about the middle of the seventeenth century, by Seaman and Ali Bey respectively. The latter was revised early in the present century by Mr. Redhouse, the Turkish scholar and lexicographer. A practically new translation has been prepared by the missionaries under the auspices of the British and American Bible Societies. The work was begun by the Rev. Dr. W. G. Schauffler, and completed by a committee. There are also editions in the Armenian character, called Armeno-Turkish, and in the Greek character called Græco-Turkish or Caramanlija, from the province of Asiatic Turkey where it is chiefly used. A complete translation into Azerbaijani-Turkish, the dialect used in the Caucasus and Northern Persia, has also been prepared. The Armenians use an ancient version prepared by Mesrop in the fifth century. Various editions of this have been issued, and a revision is now (1893) in preparation under the auspices of the American Bible Society. The first edition in the modern language was published in Paris in 1825; another edition by Dr. E. Riggs, at Constantinople in 1845, subsequently revised by him. Portions have been translated into the Kurdish, used by the mountaineers between Turkey and Persia. A Georgian version dates from the eighth century. It was revised in the eighteenth century, and is now printed in the common character by the Moscow and the British Bible Societies. The Nestorians and Syrians of Mesopotamia still use the ancient Peshito in their churches. A modern Syriac version was prepared by Dr. Justin Perkins, revised later by the Rev. Dr. Benjamin Labaree.

In British India the Bible has been translated in whole or in part into almost all the languages and dialects of the empire, the impulse toward translation being chiefly given by the labors of Carey at the beginning of the nineteenth century at the Danish settlement of Serampore. His early editions have been largely set aside by subsequent revision and translation. Only a few of the more important can be noticed. A Sanskrit version was published at Serampore in 1818, an improved translation in 1873. It is in three forms—Bengali, Devanagari, and Uriya. There are versions in Punjabi, or Sikh, and some of the associated dialects. The Hindi Scriptures include the Standard—those in the Hindi language—prepared originally by Carey and subsequently revised in 1883 by a large committee. Allied to this are the versions in the Hindustani or Urdu, originally by Schultze. There are also several other dialects allied to the Hindi-Bengali. A version in the Standard was prepared by Dr. Carey, subsequently revised, and now (1893) in the hands of a revision committee. The Mussulman-Bengali version was begun in 1855, but not completed for several years. There are important versions also in Marathi, Gujarathi, Sindhi, Telugu, Tamil, Santal, and a large number of other dialects. For the Burmans there are versions in the Burman and Karen languages, prepared by the Baptist missionaries. The

Karen versions are in four forms—Bghai, Sgau, Pwo, and Paku. There are also versions in Siamese, Lao, Shan, and Annamese, all prepared by the missionaries. In Ceylon there are the Sinhalese and Pali versions. In the Indian Archipelago there are versions in the various Malayan dialects—the standard and low Malay, the Batta, Java, Sunda, and other dialects. There are also two versions for the Dyaks.

No translations of the Scriptures have required more scholarship or been a more eloquent tribute to the work of missions than those for the Chinese. While portions seem to have been translated by the earlier Roman Catholic missionaries, all of those now existing belong to the nineteenth century. The classical versions are Dr. Marshman's, 1806-22, published at Serampore; Morrison's and Milne's, 1807-23, published at Malacca; the Delegates' version, by a committee of delegates from the several missions in China, and published at Shanghai in 1852. Unfortunately unanimity in regard to the terms for *God* and *Spirit* could not be secured; soon after the completion of the Delegates' version, what is known as the Bridgman-Culbertson version was begun by the Rev. E. C. Bridgman and M. S. Culbertson and others, and completed in 1863. These different versions are in what is called Wên-li, or the "book-style," and can be understood only by persons of fair education. A version of the New Testament in "Easy Wên-li" has been prepared for the National Bible Society of Scotland by Dr. Griffith John, of Hankow, and now committees have been appointed to select three corps of revisers to make a standard version for China (1) in the Wên-li or ordinary book-style, (2) in Easy Wên-li, a simplified book-style, and (3) in the Mandarin colloquial, the every-day speech of three-fourths of the people of China proper. These versions are to take the place of all existing versions that are not mere dialectal versions, of which there are many both in the Chinese characters and in Roman letters. There are also two Mandarin versions of the New Testament, one by Dr. Medhurst, called the Nanking or Southern Mandarin, and another by the late Bishop Schereschewsky, called the Pekingese or Northern version. There is also a Manchu version, and in Central Asia there are several Mongol versions—the Literary, prepared by the missionaries of the London Missionary Society; the Northern or Buriat; the Southern or Kalkhas; and the Western or Kalmuk. The only complete and usable Japanese version is that prepared by a committee of missionaries, chiefly from the U. S., completed in 1888, the expense being shared by the American Bible Society, the British and Foreign Bible Society, and the National Bible Society of Scotland. Dr. Bettelheim, a missionary who had settled in the Loo Choo islands, had previously prepared a Japanese version of the Gospels and Acts of the Apostles, which was printed at Vienna, but it proved to be of little value.

In the Pacific, translations of the Scriptures have been made for most of the islands—Polynesia, Melanesia, and Micronesia—by the missionaries of Great Britain and the U. S. Among the most prominent are the Hawaiian, Samoan, Tahiti, Tonga, Maori, Aneityum, Tanna, Eromanga, the Gilbert islands, the Ruk, and many others.

Africa.—In Africa the Arabic versions of the Scriptures are very largely used. The Copts of Egypt have their ancient version used in their churches, made probably in the second or third century. The Abyssinians use the Amharic. A "Jesuit" version is spoken of in the seventeenth century, but the one in use now was published early in the present century by the British and Foreign Bible Society, revised by Dr. Krapf. There are also versions in Tigre, Bogos, and Falasha-Kara, and the Galla. The latter is in three forms. Portions have also been prepared in a number of Central African dialects. In the South there are the Zulu, Kafir, Tonga, Hottentot, and other dialects, all prepared by missionaries, many of them requiring the reduction of the language to written characters. The same is true of the dialects of Western Africa. Among the more important are the Congo, Yoruba, and Benga. While there is no completely accurate list, there are certainly sixty versions in these African dialects, and the number is being increased every year.

America.—On this continent the work of translating the Scriptures and of providing the Bible for the Indian tribes began with the labors of Eliot, "the Apostle to the Indians," and has been carried on by various missionaries engaged in the work. Twenty-six different versions are in use in the U. S. and Canada, and eleven in South America, all produced by the missionaries, and published by the Bible socie-

ties of Great Britain and the U. S. There are also three versions for the Esquimaux of Greenland, Labrador, and Hudson's Bay, the first having been prepared originally by Hans Egede at the beginning of the eighteenth century, since revised and published by both the Danish and the British Bible Societies. E. M. BLISS.

Bible Christians, or Bryanites: a Christian sect, followers of William O'Bryan, of Cornwall, England, a Wesleyan local preacher, who on account of his being a married man could not be received as an itinerant minister among them, and seceded about 1815. The first society formed was in a farm-house in Shebbear, Devon, when twenty-two gave in their names: these all had hitherto been constant attendants at the parish church. The first conference was held at Baddash, Launceston, Cornwall, Aug. 17-26, 1819, and was attended by twelve preachers. Their doctrines are identical with those of the Wesleyan body; their government and methods are similar to those of the Primitive Methodists, and, like them, they license women to preach. They had in Great Britain in 1891, 180 ministers, 1,463 lay preachers, 584 chapels, and 27,121 communicants; besides scores of churches and thousands of members in Australia, Canada, Prince Edward Island, and in Ohio and Wisconsin.

Bible Communists, or Perfectionists: See ONEIDA COMMUNITY.

Bible Revision: such changes in any version of the Bible as may be called for by changes in the language of the version itself, or by the advance of scholarship. The greatest modern revision of the English Bible was inaugurated on May 6, 1870, when the Convocation of Canterbury appointed a committee of eminent biblical scholars and dignitaries of the Church of England to revise the Authorized English Version of 1611, and to associate with them representative biblical scholars of other Christian denominations using that version. This committee was divided into two companies—one for the Old Testament and one for the New—which held regular meetings in the Jerusalem Chamber in the deanery of Westminster, London. On the invitation of the British committee, a committee of U. S. scholars and divines was organized in 1871, and began active work in Oct., 1872. This was likewise selected from different denominations, and divided into two companies, which met once a month for several days in their own rooms in the Bible House at New York. Virtually, these two committees formed one organization, with the same principles and objects, and were in constant correspondence with each other. The intention was not to furnish a new version, but simply to adapt King James's version to the present state of the English language, without changing the idiom and vocabulary, and to the present standard of biblical scholarship, which, since 1611, has made very great advances in textual criticism, in Greek and Hebrew philology, in biblical geography, and in archaeology. The two committees consisted of 79 members—52 in Great Britain, and 27 in the U. S. The first result of their labor, the revised New Testament, was published in 1881. The revised Old Testament was published in 1885. See BIBLE and REVISED VERSION.

Revised by R. LILLEY.

Bible Societies: societies for the dissemination of the Holy Scriptures. While the sixteenth century is distinguished for the labor spent upon numerous translations of the Holy Scriptures into the languages of Christian nations, the nineteenth is no less memorable for the multiplication of Bible societies as a means of securing the widest diffusion of the Bible, not only in civilized lands and among Christian communities, but throughout the world. Priority of date belongs to the Canstein Bible Institute in the Orphans' Home in Halle, which was founded in 1710 by Karl Hildebrand, Marquis of Canstein, for the purpose of putting the Word of God into the hands of the poor at a low price. Before the death in 1719 of the founder, 40,000 Bibles and 100,000 Testaments had been printed. During the first century of its existence more than 3,000,000 copies of the Scriptures, in different languages, had been distributed, and its total circulation up to the year 1879 was reported to be 6,100,000. The British and Foreign Bible Society was established in London, Mar. 7, 1804. Previous to that time eight societies in Great Britain had been engaged in publishing or distributing Bibles, though only three, the Naval and Military Bible Society (1780), the Dublin Association (1792), and the French Bible Society (1792), had made this their principal work, and these, it is believed, did not long survive. The great destitution which was found to prevail in the princi-

pality of Wales in 1802, and the utter inability of existing societies to supply the demand for Bibles, led to the organization of the British and Foreign Bible Society, with the sole object of encouraging a wider dispersion of the Scriptures, first in the British dominions, and then, according to its ability, in other countries, Christian, Mohammedan, and pagan. Three hundred persons of different religious denominations united in organizing it, and £700 were at once subscribed. Its entire receipts the first year fell a little short of £5,600.

The American Bible Society was founded in the city of New York, May 14, 1816, with the sole object, as announced in its constitution, of encouraging "a wider circulation of the Holy Scriptures without note or comment." This society had, however, been preceded by fifty or sixty others, which had come into being at one point and another in the U. S. after the organization of the British and Foreign Bible Society. The first of these was founded at Philadelphia in 1808; the second at Hartford, Conn., in 1809. Next came the Massachusetts Bible Society, at Boston, the New York Bible Society, and the New Jersey Bible Society, at Princeton. Such local societies accomplished much good within their own bounds; but, having no bond of union, their operations lacked efficiency and economy, and it soon became apparent that a combination of effort was essential for thorough work. Thirty-five local organizations sent delegates to the convention which founded the American Bible Society, and eighty-four became auxiliary to it during the first year of its existence. Among the delegates were representative men of the leading denominations—Baptist, Congregational, Reformed Dutch, Methodist Episcopal, Protestant Episcopal, Presbyterian, and the Society of Friends; but, every sectarian jealousy and party prejudice being laid aside, all united with perfect harmony and cordiality in the single object of "disseminating the Scriptures in the received versions where they exist, and in the most faithful where they may be required." The announcement of this organization brought from the British and Foreign Bible Society the expression of their warmest congratulations, and the offer of a gift of £500. At an early date Bible societies were formed on the Continent of Europe, as at Basel (1804) and Berlin and Ratisbon (1805), and nearly fifty others, chiefly in the north of Europe, before 1816. At that time, also, two had been established in Africa, five in Asia, and others in Nova Scotia, Canada, and the West Indies. About seventy principal societies may be named as having been actually engaged in the manufacture and publication of Bibles. Auxiliary and branch Bible societies and associations have been very extensively formed, with a view of enlisting local sympathies, collecting funds from churches and individuals, maintaining depositories, and looking after the circulation of the Scriptures among the needy. The American Bible Society has more than 2,000 auxiliary societies, and with them are connected nearly 5,000 branches. Such societies are expected to supply the wants of their field from their own resources, if possible, though receiving aid from the national society when necessary, and paying over their surplus funds annually into its treasury. The British and Foreign Bible Society has also not far from 1,200 auxiliaries and branches, as well as 3,131 Bible associations, in the management of which women have a principal part. Besides these home institutions it has many colonial auxiliaries, and also foreign agencies superintending its depositories of Bibles in the chief cities of Europe. Not far from 16,000 smaller organizations are thus connected with the two principal Bible societies of the world; and when it is remembered that many of the continental societies also have adopted the auxiliary system, it is very clear that this multiplication of associations for the distribution of the Scriptures is one of the phenomena of the age.

The National Bible Society of Scotland, the third in importance, was formed in 1861 by the union of Edinburgh Bible Society with the leading Scottish societies of the time. It has issued nearly ten million copies or portions of the Bible.

The American and Foreign Bible Society was founded in New York in 1836 by representatives of the Baptist denomination, owing to the refusal of the American Bible Society to apply its funds to print and circulate versions of the New Testament made by American Baptist missionaries, in which *βαπτίζω* and its cognate terms were literally translated, not transferred. The American and Foreign Bible Society, thus inaugurated, instructed its translators "to endeavor to ascertain the exact meaning of the original text, to express that

meaning as literally as the nature of the languages into which they should translate the Bible would permit, and to transfer no words which were capable of being literally translated." Some of the members of this society were earnest advocates of the publication of a new version of the English Scriptures on the same principle as that which governed its translations into foreign tongues; and on its refusal to authorize such a revision the American Bible Union was formed (1850)—a society which has published a revised version of the New Testament, Psalms, Job, Genesis, and other portions of the Old Testament in conformity with the principle indicated—translating *βαπτίζω* by "to immerse," etc. Although some of the most eminent scholars among the Baptists have been employed on the versions of this society, it has never received the support of the great body of American Baptists.

In general, several characteristics of Bible societies are to be noted. They are voluntary associations, being neither close corporations nor under ecclesiastical direction, and the privileges of membership are secured by the payment of money. They are unsectarian, inviting all men to common efforts on the simple basis of the Scriptures of the Old and New Testament without note or comment. They are Protestant organizations, however, because the rules of the Roman Catholic Church are opposed to the free circulation of the Scriptures without admixture of comment. They are strictly benevolent societies, publishing not for profit, but at prices as low as possible, and making large grants, as their receipts may allow, for the supply of the destitute. Their work is exceedingly helpful to Sunday-schools and to various forms of missionary effort at home and abroad; and their influence has been most happy in promoting Christian union, and presenting a form of religious activity in which all denominations might participate without the sacrifice of principle.

The work of Bible societies has constantly encountered difficulties of one sort and another. The circulation of the Bible in all lands creates a demand for new versions, the preparation of which involves many nice points, while the revision of existing versions can hardly fail to occasion complaint. Even the determination of the canon of the Scripture is not universally agreed on. The most violent controversy in the British and Foreign Bible Society turned upon the question whether the Apocrypha should be published and circulated. The controversy continued for years; and when in 1826 it was finally decided to withhold all aid from associations circulating the uncanonical books, fifty auxiliaries on the Continent withdrew from the parent society. The Edinburgh society, which had earnestly opposed the circulation of the Apocrypha, also withdrew and stood aloof. The proposal to combine men of different persuasions in Bible effort, and to circulate the Bible without the Book of Common Prayer, encountered some opposition in England at an early date, which after a few years died away. The Russian Bible Society at St. Petersburg (founded 1813) flourished until 1826, when its operations were summarily suspended by the Emperor Nicholas, on the ground that it belonged to the Church, rather than to a secular society, to furnish the people with the Word of God.

In the American Bible Society differences of opinion concerning the principles which should govern translations into foreign tongues led to the formation of the American and Foreign Bible Society in 1836; and at a later period (1858) its harmony was again imperiled for a time in consequence of dissatisfaction at some attempted modifications (numerous though generally slight) in the English editions of the society—a dissatisfaction which was allayed by abandoning the proposed changes.

The work accomplished by Bible societies in the nineteenth century is vast in extent and of unspeakable usefulness. In 1892 the receipts of the American Bible Society for the year ending Mar. 31, applicable to its general purposes, were \$556,527.29. The same year it had issued 1,298,196 volumes, including Bibles, Testaments, and integral portions of Scripture. The British and Foreign Bible Society reported its issues for 1892 as 3,989,215 volumes, of which 823,313 were Bibles. Its total issues from 1801 to 1892 are 131,844,796 volumes, and the total issues of the American Bible Society from 1816 to 1892 are 55,531,908. It is a low estimate that 235,000,000 volumes of the Bible or separate books of the Bible have been issued by Bible societies since the tears of a little girl in Wales in 1802 led Thomas Charles to ask what could be done to secure Welsh Bibles for his congregation. The aggregate number of volumes issued by no

means measures the results of Bible society work. From motives of benevolence the prices of Bibles have been determined by the cost of materials and of manufacture, without regard to profit. The British and Foreign Bible Society has its work done by contract; the American Bible Society manufactures its publications on its own premises, and in so doing gives constant employment to about 250 persons. Besides the books which are sold at unremunerative prices a large part of the publications each year are given away to destitute families and individuals, to charitable institutions, Sunday-schools, missionary societies, soldiers, seamen, immigrants, travelers, prisoners, and other classes of persons. Four times in seventy-six years the American Bible Society and its auxiliaries have made an extensive canvass of all parts of the U. S., in the effort to reach every destitute family in the land with the offer of a Bible, and they are now engaged in a similar effort to supply every Sunday-school scholar with a Bible. It also has twelve agents in foreign lands, under whose direction 323 persons were employed in 1891 to distribute the Scriptures. It has distributed the Scriptures in about eighty different languages and dialects, and in many new versions which have been made in the present century. The circulation of the Scriptures has been promoted by the British and Foreign Bible Society in about 300 languages and dialects.

For further information respecting Bible societies reference may be had to the following works: Owen's *History of the British and Foreign Bible Society* (1817); Browne's *History of same* (1859); Dudley's *Analysis of the System of Bible Societies* (1821); *Jubilee Memorial of British and Foreign Bible Society* (1854); *Jubilee Commemoration at Bombay* (1854); Strickland's *History of American Bible Society* (1856); *Jubilee Memorial* (1866); *Manual of American Bible Society* (1887); *Memoirs of S. H. Turner, Gardiner Spring, and John C. Brigham*; numerous controversial pamphlets; *Bible Society Record*, and *Annual Reports* of each Bible society. E. W. GILMAN.

Bib'lia Pau'perum [a Latin term signifying "the Bible of the poor"]; the work known to bibliographers under this name is one of the earliest "block books" printed before the use of movable type, probably about 1420. The work consists of a series of thirty-four to fifty cuts illustrating the history of our Lord, each with representations of those Old Testament events which were considered to have been their types. The descriptive text is in abbreviated Latin. It has different titles, but Heineken gave it the name which he found attached to a copy which he described. It would seem ill adapted to the wants of the ignorant laity of that time, when few among them were equal to the task of deciphering the letterpress, and without this the engravings would have been meaningless. There seems good reason for the opinion of Jackson and Chatto (*History of Wood-engraving*) that the work was prepared to aid the mendicant friars in their preaching—the text forming the topic for their sermons, and the pictures an excitement for their imaginations. Facsimile reprints have appeared, London, 1859, 1877, 1884; and from a German original, Vienna, 1890.

Biblical Archaeology: See ARCHEOLOGY, BIBLICAL.

Bibliog'raphy [from Gr. βιβλιογραφία; βιβλίον, book + γράφειν, write]: the science which treats of books in all their aspects; therefore peculiarly the science of booksellers and librarians. Pure bibliography concerns itself with the external features of books; applied bibliography takes cognizance of their contents. A bibliography is also a classified list of the works in some particular department of knowledge, as a bibliography of political economy. The first book published on this subject was the *Bibliotheca bibliothecarum*, by the Jesuit P. Labbé (Paris, 1664). Conrad von Gesner compiled the *Bibliotheca Universalis* (4 vols., Zurich, 1545–55); to-day, so far from any one attempting a "universal" bibliography, it is sometimes the work of a lifetime to trace the history of a single book or series of books. Of general bibliographies, some of the most important are Brunet's *Manuel* (9 vols., incl. supplement, Paris, 1860–80); Graesse, *Trésor* (7 vols., Dresden, 1859–69); Ebert, *Allgemeines bibliographisches Lexikon* (2 vols., Leipzig, 1821–30; Eng. translation by A. Brown, 4 vols., Oxford, 1837); Watt, *Bibliotheca Britannica* (4 vols., Edinburgh, 1824). The *American Catalogue* (3 vols., N. Y., 1890–91) gives under an author and a title index the titles of all books published in the U. S. on sale in 1876, and which appeared up to June 30, 1890, and is supplemented by an annual volume. The new books are

noted as they come out in the *Publishers' Weekly* (N. Y.), from which the *Catalogue* is made up. Works published in Great Britain are found in the *English Catalogue* (1835–89), with annual supplements, and in the weekly *Publishers' Circular*; for French literature the *Catologue de la librairie française*, by Lorenz, is the standard. It extends from 1840 to the present time, and the periodical *Bibliographie de la France* has been published since 1811. German authorities are Hinrichs, *Verzeichniss*; Reinius, *Bücherlexikon* (1700–89); Kayser, *Vollständiges Bücherlexikon* (1750–1890); and the *Gesammt Verlags Katalog des deutschen Buchhandels*. Dutch literature has been catalogued in the periodical *Nederlandsche Bibliographie* since 1854, the best catalogues being those by Brinkmann; Belgium has had the periodical *Bibliographie de Belgique* since 1875; the *Bibliographie Nationale* covers the ground since 1830. There are also special catalogues in all the other leading modern tongues. English periodical literature is catalogued in the great *Index* of W. P. Poole (first published in 1853; new ed. Boston, 1882; supplements published every five years, first in 1888). This is supplemented by the *Co-operative Index to Periodicals*, edited by W. I. Fletcher, published quarterly in New York since 1885. Every department of learning, as well as every nation, has its special bibliography. In this cyclopaedia a brief bibliography is appended to all the leading articles. Pure bibliography is closely related to library management. (See LIBRARY.) An index society was founded in London in Dec., 1877, for the purpose of forming indexes to rare and important books, and a bibliographical society in 1892. Petzholdt's *Bibliotheca Bibliographica* (1864); Vallée's *Bibliographie des Bibliographies* (1883), with supplement (1887); British Museum *Hand-list of Bibliographies* (1881); Wheatley's *How to Form a Library* (1886).

C. H. THURBER.

Bibliomaney [from Gr. βιβλίον, book + μαντεία, divination]: a mode of divination used in both ancient and modern times by opening the Bible and observing the first passage which occurred, or by entering a church and taking note of the first words of the Bible heard after entering. It seems to have originated with the pagans, who employed Homer or Vergil in like manner, and to have been adopted from them by the Eastern Christians. The application either depended upon the sound of the words or upon the signification of the passage. Prayer and fasting were used as a preparation for consulting the divine oracles. Bibliomaney was prohibited, under pain of excommunication, by the Council of Vannes, 465 A. D., and by succeeding councils. It continued, however, to prevail for many centuries thereafter. It came into use in the Gallican and Greek Churches in the choice of bishops, and prevailed in some places for centuries. Many eminent Protestant Christians have made use of this practice in times of perplexity, for instance John Bunyan and John Wesley.

Bibliomania [from Gr. βιβλίον, book + μανία, madness]: the passion for acquiring and possessing books. Bibliomanias are governed in their selection by all sorts of curious fancies, for books of a certain binder, of a certain press, early and rare editions, *éditions de luxe*, uncut copies, illustrated copies, etc. Extraordinary prices are often paid; Bernard Quaritch paid what is said to be the largest sum recorded for a single volume, £4,950 for the *Psalterium Codex*. Over \$10,000 was paid for a copy of the first dated *Decameron*. In 1884 a Mazarin Bible (one of the twenty-five copies of the first printed Bible, date 1450, known to have belonged to Cardinal Mazarin) brought £3,900. High prices are often paid for books containing certain faults or misprints. The bibliomania is governed in his choice mainly by incidental and often trifling considerations; whereas the bibliophile, or book-lover, collects books with some specific literary or scientific purpose, seeking to bring together everything pertaining to a given author or subject. Dibdin, *Bibliomania* (1841); Andrew Lang's *Books and Bookmen* (1887). C. H. THURBER.

Bibliotheca [Lat. from Gr. βιβλιοθήκη; βιβλίον, book + θήκη, chest, repository]: the Latin word signifying library, a collection of books; often used, like our word "library," as a name for publications of various kinds, as *Bibliotheca Hispana*, *Bibliotheca Sacra*, etc.

Bice [from Fr. bis, dark-colored, brown; Ital. bigio < a deriv. of Lat. bombyx = Gr. βόμβυξ, silkworm]: the name of two blue and green pigments; native carbonates of copper, used by painters from very early times. The blue bice is sometimes called mountain-blue and ongaro. The syno-

nymys of green bice are Hungarian green, verdetto, malachite green, mountain green, etc.

Biceps [Lat., double-headed; *bi-*, twice + *caput*, head]: the large round muscle lying upon the front of the arm. Above, it consists of two portions or heads—whence its name—one being attached to the coracoid process of the scapula, the other to the margin of the shallow socket for the head of the humerus. The former is the short, the latter the long, head of the biceps. They unite to form a fleshy belly, which terminates in a rounded tendon inserted into the tubercle of the radius. The action of the biceps is to bend the forearm. Another biceps is found on the outer and posterior aspect of the thigh. Its long head arises from the tuberosity of the ischium; its short head, from the *linea aspera* of the thigh-bone. Its tendon is the outer hamstring.

Bicêtre: the name of an old castle, a hospital, and a fort in the department of Seine, in the southern environs of Paris. The castle, which is very large, has been converted into a hospital for old men and for lunatics. Here the prisoners sentenced to death or to the galleys were formerly kept until the sentence was executed. But in 1837 this prison was transferred to La Roquette. Situated on an eminence, it commands a fine view of Paris and the Seine. Here are accommodations for about 900 male lunatics, who receive gentle treatment. The name is said to be a corruption of *Winchester*. Its castle was founded in 1290 by John, Bishop of Winchester.

Bichat, MARIE FRANÇOIS XAVIER: French anatomist and physiologist; b. at Thoirette, in Jura, Nov. 11, 1771. In 1797 he began to lecture on anatomy, surgery, etc., in Paris. He published *Researches on Life and Death* (1800), and an excellent and profound work entitled *General Anatomy Applied to Physiology and Medicine* (4 vols., 1801). He simplified anatomy and physiology by reducing the complex structures of the organs to the simple or elementary tissues, and he was the first to recognize the importance of the distinction between the organic functions and the animal or vital functions. Having impaired his health by close application, he died before the age of thirty-one, July 22, 1802.

Bickaneer: same as **BIKANIR**.

Bick'erstaf, ISAAC: Irish dramatist; b. in Ireland about 1735; was in his early life an officer of marines. He produced several popular comedies and comic operas, among which are *The Maid of the Mill*; *The Pullock*; *Love in a Village* (1763); and *The Captive*. D. after 1787. Steele's *Tatler* was published under the assumed name of Isaac Bick'erstaf, which often occurs in the papers of that work.

Bick'ersteth, EDWARD: an English theologian; b. in Kirkby Lonsdale, Westmoreland, Mar. 19, 1786. He took orders in the Anglican Church (1815), and was sent by the Church Missionary Society to Africa in 1816 to reorganize their mission stations. On his return the same year he was chosen secretary to that society, and ably served it until 1830, when he became rector of Watton, in Hertfordshire. He was one of the leaders of the Evangelical party in the Church of England, and one of the founders of the Evangelical Alliance in 1845. Among his works, which are highly esteemed, are *Help to the Study of the Scriptures* (1811); *The Christian Student*; *A Treatise on Baptism*; and *The Promised Glory of the Church of Christ*. D. at Watton, Feb. 28, 1850. His collected works were published in 16 vols., 1853. See T. R. Birks, *Memoir of the Rev. E. Bickersteth* (2 vols., 1851).

Bickersteth, EDWARD HENRY, D. D.: a poet and bishop of the Church of England; b. at Islington, Jan. 25, 1825, and was educated at Trinity College, Cambridge. Ordained deacon in 1848, and priest the following year. He was consecrated Lord Bishop of Exeter, Apr. 25, 1885, in St. Paul's cathedral, London. He has published, besides numerous other works, *Poems* (1849); *The Rock of Ages* (1859); *Yesterday, To-day, and For Ever* (1866; 18th ed., 1886), which has had a great success; *The Two Brothers*, and *Other Poems*; and *The Hymnal Companion to the Book of Common Prayer*, of which numerous editions have appeared.

Bick'more, ALBERT SMITH, Ph. D.: naturalist; b. in St. George's, Me., Mar. 1, 1839, and graduated at Dartmouth in 1860. He studied under Agassiz at Cambridge, and in 1865 sailed for the Dutch East Indies for the purpose of collecting shells. He also traveled in China, Japan, Manchuria, Siberia, and Russia. He became in 1870 Professor of Natural History in Madison (now Colgate) University, and has

devoted much time to the Museum of Natural History founded by him at the Central Park, New York, and of which he is superintendent. He has published *Travels in the East Indian Archipelago* (1869).

Bick'nell, GEORGE AUGUSTUS: jurist; b. in Philadelphia, Pa., Feb. 6, 1815; graduated at the University of Pennsylvania, and from the Yale Law School. In 1876 and 1878 he was elected a member of Congress from Indiana. In 1881 he was appointed commissioner of appeals in the Supreme Court of Indiana. From 1861 to 1870 he was Professor of Law in the Indiana State University. D. in New Albany, Ind., Apr. 11, 1891.

HENRY WADE ROGERS.

Bicycle [from Lat. prefix *bi-*, having two + Gr. *kóκλος*, wheel]: a form of velocipede which began to appear in England in 1867 with two wheels arranged one in front of the other, and which is kept upright by its own motion. The wheels differ in diameter from the earlier forms, when the trailing-wheel had less than a third of the diameter of the driving-wheel, to the safety with both wheels of like dimension. They are propelled by pedals moved by the feet, and acting sometimes directly upon a crank, and again by gearing. They have rubber tires of varied character, and are very light, strong, and swift. See **CYCLING** and **VELOCIPEDE**.

Bidar, bee'dar: a fortified city of Hindustan; capital of a native state of the same name; near the Manjira river and in the Nizam's Dominions; about 75 miles N. W. of Hyderabad (see map of S. India, ref. 3-D). It was formerly an important place, but is now chiefly remarkable for the manufacture of tutenag wares of an alloy of tin and copper.

Bidassoa, bee-dá-sso-á: a small river forming part of the boundary between France and Spain. It rises in Spain, and enters the Bay of Biscay at Eucntarabia. On the Isle of Pheasants, in this river, the treaty of the Pyrenees was concluded in 1659. In Aug., 1813, Wellington defeated the French marshal Soult at San Marcial on the Bidassoa.

Bid'deford: a city and railroad center, York co., Me. (for location of county, see map of Maine, ref. 11-B); on Saco river, 9 miles from its mouth. It was named from the city of Bideford, England. The first settlement was made at the "Pool" (at the mouth of the river) by Richard Vines in 1616-17. It was settled by a patent to John Oldham and Vines in 1630. York County originally embraced all of the province of Maine, and while settlements were made at a very early date along the seacoast (none earlier than this) to the Piscataqua river, Bideford or Biddeford for a long series of years was the chief settlement and center. Here are inexhaustible ledges of granite, which ranks among the best in the world, and is largely exported. The business of the place is principally the manufacturing of cotton cloth. A large amount of lumber is also manufactured. Pop. (1880) 12,651; (1890) 14,443. EDITOR OF "JOURNAL."

Bidding-prayer [the original meaning of *bidding* was "praying"; cf. *beads*—*bidding*; cf. O. Eng. *biddan*, bog; Germ. *Bitten*; Goth. *bidjan*, now confused with descendants of O. Eng. *bīdan*; Germ. *Bielen*; Goth. *biulan*, offer, proclaim, command]; a formula of public prayer found in the ancient Greek liturgies, in the Gallican liturgy, and in the English service-books, in which the priest recites in detail what the people are to pray for, and closes with the Lord's Prayer, in which all the previous petitions are considered to be summed up. Canon 55 of 1603 (the Church of England) directs that before all sermons, lectures, and homilies, not delivered in the course of divine service, the preacher shall move the people to devotion by the use of the bidding-prayer, a form of which is given. In Dr. Henderson's *Manuale et Processionale ad Usum Insuper Ecclesie Eboracensis*, App. x. (Surtees Soc., 1874-75), are forms of bidding-prayers from the eleventh to the fifteenth centuries, and a sixteenth-century form is given among the *Preces in Dominicis dicende* (*Manuale*, etc., p. 123). Notes and illustrations of the York bidding-prayers are found in Canon Simmons's *Lay Folks' Mass-book* (Early Eng. Text Soc., 1870). See Rock, *Church of our Fathers*, ii. 352-378; Maskell's *Man. Ritualia*, iii.; and Wheatley on *Bidding of Prayers before Sermons*, . . . in *Hist. View. of the 55th Canon* (now ed. 1845).

WILLIAM STEVENS PERRY.

Bid'dle, CLEMENT: a soldier; b. in Philadelphia, May 10, 1740. He was appointed deputy quartermaster-general of the militia of Pennsylvania and New Jersey; fought with the rank of colonel at the battles of Trenton, Princeton, Brandywine, and Monmouth; quitted the army in 1780; became quartermaster-general of the State Sept. 11, 1781.

He was a friend and correspondent of Gen. Washington, who appointed him marshal of Pennsylvania. D. in Philadelphia, July 14, 1814.

Biddle, EDWARD: brother of Nicholas Biddle; b. in 1739; was an officer in the French war (1756-63), and became a noted lawyer of Reading, Pa.; was member and speaker of the Assembly, and was a delegate from Pennsylvania to the Continental Congress 1774-76 and 1778-79. He was a leading advocate of independence. D. in Baltimore, Md., Sept. 5, 1779.

Biddle, JAMES: a naval officer; b. in Philadelphia, Feb. 28, 1783; educated at the University of Pennsylvania, and entered the navy in 1800. He served against Tripoli, where he was a prisoner nineteen months. In the war of 1812 he served with distinction in several engagements, and while commanding the Hornet captured the brig Penguin, receiving a wound in the action Mar. 23, 1815. For his services he received a gold medal from Congress, besides other honors. He became a captain in 1815. He was afterward commissioner to Turkey, China, etc., and held other important positions. D. in Philadelphia, Oct. 1, 1848.

Biddle, JOHN: an early English Unitarian; b. at Wotton-under-Edge, in Gloucestershire, in 1615 (baptized Jan. 14); graduated at Oxford, and became an eminent tutor there; then in 1641 a schoolmaster in Gloucester. He was prosecuted about 1645 for the expression of heterodox opinions respecting the personality of the Holy Spirit, and after a formal trial by Parliament was condemned to imprisonment for five years. While in prison he published in 1648 a *Confession of Faith Concerning the Holy Trinity*. He was liberated about 1652, and gathered a congregation of his fellow-believers. He was subsequently persecuted and imprisoned twice during the Commonwealth. He was protected by the friendliness of Cromwell, whose toleration was equal to the widest differences of belief. At the Restoration his persecution was renewed, and he died in prison in London, Sept. 22, 1662. See his *Life* by Joshua Toulmin, London, 1789.

Biddle, NICHOLAS: a naval officer; b. in Philadelphia, Sept. 10, 1750. He entered the royal navy in 1770, and once served in a ship of which the famous Nelson was mate. He obtained the rank of captain in the U. S. navy in 1776, and took several prizes from the British. Early in 1777 he took command of the Randolph, a frigate, which encountered the Yarmouth, a 64-gun ship, Mar. 7, 1778, near Charleston, S. C. During the action that ensued the magazine of the Randolph exploded, and killed Capt. Biddle, with nearly all his crew.

Biddle, NICHOLAS, LL. D.: financier; a nephew of Nicholas Biddle; b. in Philadelphia, Jan. 8, 1786. He was a son of Charles Biddle, who was vice-president of Pennsylvania in 1786-87; graduated at Princeton in 1801; was elected to the Legislature of Pennsylvania in 1810; appointed a director of the U. S. Bank by President Monroe in 1819. In 1823 he became president of that bank, the affairs of which he managed with great ability and success for many years, so that it supplied the country with a sound and uniform currency. The bill to recharter the bank having been vetoed by President Jackson in 1832, the bank was closed in 1836 by the limitation of its charter. He was soon elected president of a new State bank, called "The United States Bank," which was chartered by the Legislature of Pennsylvania. This bank became insolvent in the financial crisis of 1841. He was president of the trustees of the fund (\$2,000,000) which Stephen Girard left to found a college for orphans. "To his exertions alone," says Judge R. T. Conrad, "the country owes one of the most beautiful structures of modern times, the Girard College. He proposed the present plan, and in the midst of wild political excitement and opposition persisted firmly, and secured a building which every citizen now not only approves, but applauds." D. in Philadelphia, Feb. 27, 1844. See a *Memoir of N. Biddle*, by R. T. Conrad, in the *National Portrait Gallery*, vol. iv., 1839.

Biddle, RICHARD: lawyer and writer; a brother of the preceding; b. in Philadelphia, Mar. 25, 1796; practiced law at Pittsburg; a member of Congress (1837-41), and wrote a *Memoir of Sebastian Cabot, with a Review of the History of Maritime Discovery* (1831). D. in Pittsburg, July 7, 1847.

Bid'eford: a seaport-town of Devonshire, England; on the river Torridge; $\frac{1}{2}$ miles from its entrance into the estuary of the Taw; 30 miles N. W. of Exeter (see map of England, ref. 13-D). It has a stone bridge of twenty-four arches,

about 680 feet long, a town-hall, a hospital, and manufactures of ropes, sails, earthenware, and leather. Among the articles of export are linen and woolen goods, iron, sails, and naval stores. Vessels of 500 tons can go up to the center of the town. It had a great trade in the sixteenth and seventeenth centuries. Pop. (1891) 7,918.

Bidpai, bid'pī: See PANCHATANTRA.

Bidwell, DANIEL D.: general of volunteers; b. at Black Rock, now part of Buffalo, N. Y., Aug. 12, 1816; held important local offices; identified with the militia organizations of the city for many years. On the outbreak of the civil war he enlisted as a private soldier; promoted to be captain in the Sixty-fifth, and subsequently colonel of the Forty-ninth New York volunteers. He was engaged in the various actions of the Peninsula campaign, in the battles of South Mountain and Antietam, Fredericksburg, and Chancellorsville, and before Richmond and Petersburg, being most of the time in command of a brigade. In July, 1864, he was commissioned a brigadier-general of volunteers, and assigned to a command under Gen. Sheridan in the Shenandoah Valley, participating in the battle of Cedar Creek, Oct. 19, 1864, where he was mortally wounded while leading his brigade.

Biebrich: See BIBERICII.

Bie'dermann, ALOYS EMANUEL: a German rationalistic theologian; b. at Oberrieden, Mar. 2, 1819. He studied at Basel and Berlin; became professor extraordinary of Theology at Zurich 1850; ordinary 1864. D. at Zurich, Jan. 25, 1885. He wrote *Die freie Theologie* (Tübingen, 1844); founded the *Kirche der Gegenwart* (1845; 2d ed. Berlin, 1884-85, 2 vols.); published in 1869 at Zurich his *Christliche Dogmatik* (2d ed. 2 vols. Berlin, 1884-85), one of the most important emanations of recent rationalistic theology.

Biedermann, FRIEDRICH KARL: German journalist and author; b. at Leipzig, Sept. 25, 1812; became Professor of Philosophy there in 1838, but was dismissed in 1845 on account of his advanced political opinions; played a conspicuous rôle in the Parliament at Frankfort 1849; was reinstated as professor, but was again dismissed in 1853 for political reasons. From 1863-66 he edited the *Deutsche Allgemeine Zeitung*; also founded and edited several other liberal papers. Among his works are *Wissenschaft und Universität* (Leipzig, 1838); *Die deutsche Philosophie von Kant bis auf unsere Tage* (1842-43, 2 vols.); *Vorlesungen über Socialismus und sociale Fragen* (Leipzig, 1847); *Erinnerungen aus der Paul's Kirche* (Leipzig, 1849).

Biel, GABRIEL: erroneously called "the last of the Schoolmen"; b. at Spire, in Germany, after 1442; studied at Heidelberg and Erfurt; became cathedral preacher in Mainz; provost of Urach 1477; was adviser in the establishment of the University of Tübingen which occurred about this time; became Professor of Theology there 1484. D. in Tübingen, 1495. Although a devout and earnest Catholic, he sided with the Council of Basel against the pope, and deplored the corruptions and abuses of his time. He is worthy of note as having rejected the doctrine of sensible and intelligible species so widely prevalent among the Schoolmen.

Revised by W. T. HARRIS.

Biel: See BIENNE.

Biela, WILHELM, Baron von: German astronomer; b. at Roslau, Prussia, Mar. 19, 1782; discovered in Josephstadt, in Bohemia, in 1826, the comet known by his name. D. in Venice, Feb. 18, 1856.

Biela's Comet: a comet of short period ($6\frac{2}{3}$ years); discovered by Baron von Biela in 1826. It was observed apparently unchanged at various returns, but at its return in 1845-46 it was found to have separated into two parts, both of which were observed in 1852. It was due in 1865, and again in 1872, but no trace of it could be found; in November of the latter year the earth crossed its path, and a shower of meteors was observed, which is now supposed to have been due to fragments of the lost comet.

Bielau: See LANGENBIELAU.

Bielaya, bé-ay-l'ya, or Bielaia: a river of Russia; rises in the Ural Mountains; flows through Orenburg, and, after a very tortuous course of about 650 miles, enters the river Kama.

Bielaya Tserkov: a village of Russia; one of the principal commercial centers of the government of Kiev; 44 miles S. S. W. of the city of Kiev. It has eleven annual fairs, three of which last for ten days. Great quantities of

grain and cattle are disposed of by these fairs. Pop. about 12,000.

Bielefeld: a town of Prussia; in Westphalia; finely situated on the Minden and Cologne Railway; 20 miles S. W. of Minden (see map of German Empire, ref. 4-D). It has manufactures of woolen stuffs, leather, soap, and meerschauum pipes. Its principal industry, however, is linen-weaving. It is, indeed, the center of the whole Westphalian linen-trade. The origin of this industry dates back to the thirteenth century, but it was greatly extended during the sixteenth and seventeenth centuries by refugees from Holland. Here is the old castle of Spaurenberg, now used as a prison. Pop. (1880) 30,679; (1890) 39,942.

Bielgorod, bē-eĭ gō-rod (i. e. White Town): a Russian town; in the government of Kursk; on the Donetz; 80 miles S. of Kursk (see map of Russia, ref. 9-D). There are three annual fairs here. Pop. 22,000.

Bielitz: a town of Austrian Silesia; on the river Biala, and opposite the Galician town Biala; 48 miles S. W. of Cracow, with which it is connected by rail (see map of Austria-Hungary, ref. 3-11). It has an active trade in woolen cloths and cassimeres. Here is a castle of Prince Sulowsky. A bridge across the river connects Bielitz with Bialia, in Galicia. Pop. (1880) 13,060; (1890) 14,499.

Biella, bē-ē-la: a town of Italy; in the province of Novara; on the Cervo; 38 miles by rail N. E. of Turin (see map of Italy, ref. 3-B). It has manufactures of paper, hats, and woolen goods. Pop. 15,000.

Bielopol, bē-ay-lō pō-lē: a town of Russia; government of Kharkof; on the Vira; 118 miles N. W. of Kharkof (see map of Russia, ref. 9-D). It is on the railway from Orel to Kiev. It has a considerable trade and several distilleries. Pop. 12,236.

Bielostok, bē-ay-lō-stok (in Pol. *Białystok*): a fortified town of Russia; government of Grodno; on the river Bialy; 52 miles by rail S. W. of Grodno (see map of Russia, ref. 7-B). It is well built and handsome, has several churches, and a palace with a park, which have been called the "Versailles of Poland." Here are a gymnasium and manufactures of woolen goods, hats, leather, and soap. It is on a railway from Warsaw to Grodno. Pop. (1882) 36,252, a large proportion being Jews.

Bielozero, bē-ay-lō-zay-rō (the White Lake): a lake about 25 miles long and 20 miles broad in the government of Novgorod, Russia; lat. 60° 10' N., lon. 37° 30' E. Its bottom of white clay gives to the water during stormy weather a milky appearance, which was doubtless the cause of its name, White Lake. It receives many small streams; is of considerable depth; abounds with fish. It is connected by the Shkсна river with the Volga and united by canals with the Onega, Sukona, and Dwina. The old town of Bielozersk, situated on the south shore of the lake, was formerly the capital of an ancient principality bearing the same name, and has considerable trade in cattle, corn, and pitch, also manufactures of candles. Pop. (1882) 5,982.

Bienne, bē-ne (Germ. *Biel*): a town of Switzerland; in the canton of Berne; at the northeast extremity of the Lake of Biemme; 13 miles W. S. W. of Soleure (see map of Switzerland, ref. 4-D). It is beautifully situated at the foot of the Jura; is inclosed by old walls, and is connected by railways with Berne and Lausanne. Here are manufactures of watches, cotton goods, etc. Many Roman coins have been found at Biemme, which is a place of great antiquity. Pop. (1888) 15,407.

Bienne, Lake of: in the Swiss canton of Berne. It is 10 miles long, 3 miles wide, and 250 feet deep; is near the base of the Jura Mountains, and has an elevation of 1,419 feet above the sea. The Thiele passes through it before joining the Aar. It incloses the island of St. Pierre, which was the residence of J. J. Rousseau in 1765. In digging peat, which is extensively procured from its marshy border, the remains of a prehistoric village of lake-dwellings have been found on the southeast side of the lake.

Biennial Plants: all plants which live longer than annuals, and not so long as perennials. They grow the first season without flowering, and produce flowers in the second season, at the end of which they die. Such are the turnip, parsnip, beet, and many other plants which are cultivated. Many biennials, if sown early in the spring, will flower in the summer or autumn of that year, and become annuals.

Bienville, bi-ān veel', JEAN BAPTISTE LEMOINE, de: a French officer and pioneer; b. in Montreal, Feb. 23, 1680; was a brother of Lemoine d'Iberville. He accompanied the latter in an expedition to the mouth of the Mississippi in 1699, and was three times appointed colonial governor of Louisiana. He founded New Orleans in 1718. D. in France in 1768.

Bierstadt, beer-stāt, ALBERT; landscape-painter; b. in Düsseldorf, Germany, Jan. 7, 1830. He was brought by his parents when he was only a year old to New Bedford, Mass., where he lived until he went to Düsseldorf in 1853, to continue the study of painting, which he had taken up by himself at home. He visited Rome also, and returned to the U. S. in 1857. He then began to paint pictures of Rocky Mountain scenery, making frequent visits to the West, and has returned to Europe for short visits a number of times. His name is widely known, and his pictures have been exhibited in all the important cities of the U. S. His *Discovery of the Hudson River* is in the Capitol at Washington. Most of his works are of large size and are often panoramic in style. He has received various medals at exhibitions in Austria, Germany, and Belgium, and the Legion of Honor at the time of the Paris Exposition in 1867. He was elected a National Academician in 1860. Studio in New York.

WILLIAM A. COFFIN.

Bies-Bosch: a marshy lake of the Netherlands; between the provinces of North Brabant and South Holland, and formed in 1421 by an inundation which destroyed 72 villages and 100,000 people. It forms the part of the estuary of the Maas which is called Holland's Dip, and contains a number of islands.

Bifrost: in Scandinavian mythology, the trembling way; the beautiful many-colored bridge which the ass built between heaven and earth. It is the rainbow. The red in it, says the Younger Edda, is fire, which keeps the frost-giants away from it. In Ragnarok it breaks.

Biga (or **Biga**, a plural form with the same signification): a term applied by the ancient Romans to a vehicle drawn by two horses abreast; a two-horse chariot used in processions and games. Like the Greek war-chariot, it had two wheels, was low and open behind, and higher and closed in front. Figures of the biga are often found upon ancient coins.

Bigamy [Fr. *bigamie*, deriv. of *bigame*, from Lat. *bi-gamus*; bi-, twice + Gr. *-γαμος*, wedded]; the offense of contracting a marriage while a former marriage is still subsisting. The more proper term for this offense is "polygamy." It is governed by statute. It is usual to provide that if a husband or wife shall remain absent for a specified number of years (generally seven) without being heard from or being known to be living, and the other party shall marry again, no crime will be committed, though the absent party be alive. A party who has obtained a divorce from the bonds of matrimony is free to marry again as if no previous marriage had existed; the conditions upon which the divorcee may remarry vary in different States. Bigamy, it is generally held, consists in the act of marrying; so that if the parties marry in one State and cohabit in another, the crime is committed solely in the place of the marriage, and can only be prosecuted there; but the State laws differ on this point. In a prosecution for bigamy, an *actual* marriage must be established. Evidence of reputation, or even of cohabitation, will not suffice. It does not follow that proof of a ceremonial marriage is necessary. The laws of the States differ upon that point, some holding that a case may be established by proof of consent before witnesses, without any ceremony. Such is the law in New York.

GEORGE CHASE.

Big Bethel: the name given to the action of June 10, 1861. Gen. Butler, who had taken possession of and fortified Newport News a few days previously, found the Confederates under Gen. Magruder in possession of all the commanding points in his front; he accordingly directed a reconnaissance in force to be made, with the object of surprising and capturing the position called Little Bethel; and to make the expedition more certain of success two regiments, Duryea's Zouaves and the Third New York under Col. Townsend, were to start about midnight of the 9th, and gain the rear of the position to prevent retreat, while a battalion of Vermont troops, Col. Phelps, and a New York regiment, Col. Bendix, were to be ready to attack in front by daybreak of the 10th. Though various precautions had

been taken against mistake, the commands of Cols. Bendix and Townsend approaching each other near daybreak, Col. Bendix's command opened fire on the Third New York, killing two men and wounding a considerable number, and throwing the whole command into confusion before the mistake was discovered. The Confederates, being thus notified, retreated to Big Bethel, where they hastily threw up breastworks behind a deep creek. Gen. Pierce, who was in command of the Federal expedition, after being re-enforced, and finding Little Bethel deserted, advanced toward Big Bethel, a few miles to the N., where he found a Confederate force, estimated at 1,800, under the command of Col. J. B. Magruder, a graduate of West Point, protected by the hastily constructed earthworks. Gen. Pierce ordered an attack, which was continued nearly four hours, during which time the Federal troops were exposed to a deadly fire, while the Confederates were almost entirely protected. Later in the day a more general assault was made, led by Maj. Theodore Winthrop, in which he was instantly killed while encouraging his men to the assault. Gen. Pierce finally ordered a retreat, which was effected in good order, the Confederates following at some distance with cavalry. Lieut. John T. Greble, of the Second U. S. Artillery, was killed while covering the defeated troops. The Confederates, fearing re-enforcements of the Federals from Fortress Monroe, fell back that night to Yorktown. The Federal loss in killed and wounded was about 100 men; the Confederate loss was said to be only 1 killed and 7 wounded.

Big Black : a river of Mississippi; rises in Choctaw co., flows southwestward, and enters the Mississippi at Grand Gulf. Length about 200 miles. It is navigable for steamboats for 50 miles. Gen. Grant's army, moving to the scene of Vicksburg, defeated the Confederates on the Big Black, nearly 15 miles E. of that town, May 17, 1863. The morning after the battle of Champion Hills, May 16, 1863, found the Confederate forces under Pemberton strongly posted on both banks of the Big Black river. The works were successfully assaulted, and all the troops on the east bank, with seventeen pieces of artillery, captured, the remainder of Pemberton's army retreating to the fortifications of Vicksburg.

Big Black River : See BLACK RIVER.

Big Bone Lick : a salt "lick" or spring in Boone co., Ky., which takes its name from the fossil bones of the mastodon and other animals which are thought to have resorted to this place to "lick" the salt earth, and to have perished in the marshy soil, where their bones are now found.

Bigelow, ERASTUS BRIGHAM, LL. D. : inventor; b. in West Boylston, Mass., Apr. 2, 1814. While a mere boy, he invented a loom for suspender-weaving and other machines, and wrote a book on shorthand writing. He subsequently invented looms for counterpanes (1838-40), another for coach-lace, and in 1839 brought out his well-known carpet-loom. He was one of the principal manufacturers in Clinton, Mass. He published *The Tariff Question* (1862) and other works. D. in Boston, Dec. 6, 1879. Memorial sketch by R. C. Winthrop in 1886.

Bigelow, FRANK HAGAR, A. M., B. D. : student of terrestrial magnetism and allied subjects; b. at Concord, Mass., Aug. 28, 1851; educated at the Boston Latin School, Harvard College, and Episcopal Theological School at Cambridge, Mass., and has taken orders as a clergyman. He was for some years assistant astronomer at the Argentine National Observatory at Cordoba, then Professor of Mathematics at Racine College, Wisconsin, then assistant in the *Nautical Almanac* office in Washington, and finally (1891) Professor of Meteorology in the U. S. Weather Bureau, which position he now (1893) holds. His name is especially associated with an instrument for the photographic record of the transit of stars and with some novel studies by which the solar corona, the aurora, and terrestrial magnetism are shown to be associated. The theory involved, though still (1893) new, has met with a favorable reception in scientific circles. He has published many articles on the solar corona, terrestrial magnetism, the aurora, and astronomical instruments and photography. The most important is a monograph on the solar corona, published by the Smithsonian Institution in 1889. M. W. HARRINGTON.

Bigelow, JACOB, M. D., LL. D. : physician and botanist; b. in Sudbury, Mass., Feb. 27, 1787; graduated at Harvard in 1806. He became Professor of Materia Medica and Clinic

Medicine at Harvard, and president of the Massachusetts Medical Society. He practiced medicine in Boston many years, founded the Mt. Auburn Cemetery, and laid out the grounds with much taste. Among his works are *American Medical Botany* (3 vols. 8vo, 1817-21); an able *Discourse on Self-limited Diseases* (1835); *Nature in Disease* (1854); and *History of Mt. Auburn* (1860). D. in Boston, Jan. 10, 1879.

Bigelow, JOHN, LL. D. : an author and diplomatist; b. in Malden, N. Y., Nov. 25, 1817; graduated at Union College in 1835. He contributed many articles to the *Democratic Review*, and in 1850 became managing editor of William C. Bryant's journal, the *New York Evening Post*. Having visited Jamaica in that year, he published *Jamaica in 1850, or the Effects of Sixteen Years of Freedom on a Slave Colony*. He was appointed U. S. consul at Paris in 1861, and minister plenipotentiary at that court in Apr., 1865. He resigned his position in 1866, and was Secretary of State for New York 1867-68. He published in Paris *Les États-Unis d'Amérique en 1863*. He has also edited the *Autobiography of Franklin* (1868), from the original manuscript which he found in France. Among his other works are *Some Recollections of Antoine Pierre Beryer* (1869); *France and Hereditary Monarchy* (1871); *The Wit and Wisdom of the Haytiens* (1877); *Molinis the Quietist* (1882); and a *Life of William Cullen Bryant* (1890). In 1885 he published *The Writings and Speeches of Samuel J. Tilden*; and in 1888 *The Complete Works of Benjamin Franklin*.

Bigelow, MELVILLE M., Ph. D. : legal author and teacher; b. in Eaton Rapids, Mich., Aug. 2, 1846. He received his education at the University of Michigan and at Harvard. For a number of years he has been a lecturer on law in the Boston, Northwestern, and Michigan University law schools. He has written a number of legal treatises, the more important of which are those on estoppel, fraud, and torts. He is the American editor of *Jarman on Wills*.

Bigelow, THOMAS : b. in Worcester, Mass., Aug. 12, 1739; a blacksmith who became a member of the Provincial Congress of 1774-75; entered the Revolutionary army as captain of minute-men in 1775; was captured at Quebec, became a colonel of Massachusetts troops, serving at Stillwater, Valley Forge, etc. D. in Worcester, Mar. 31, 1790.

Bigger, SAMUEL : b. in Warren co., O., about 1800; educated at Athens University; studied law at Lebanon, and commenced practice in Indiana; was member of Congress 1834-35; and subsequently judge of the circuit court; elected Governor of Indiana for 1840-43 by the Whigs. D. at Fort Wayne, Ind., 1845.

Big-horn, or **Rocky Mountain Sheep** (*Ovis montana*) : a large sheep native in the Rocky Mountains. It has enormous horns about 4 feet long and from 18 to 20 inches in circumference. It is about 4 feet high, has coarse hair, and moves with great agility.

Big Horn : a river of the U. S.; the largest affluent of the Yellowstone. It rises in the State of Wyoming, among the Wind River Mountains; flows in a generally northward direction; crosses the southern boundary of Montana; enters the Yellowstone at Big Horn City, in Montana. Entire length, estimated at 450 or 500 miles. The upper part or head stream of it is called Wind river.

Biggs, ASA : b. at Williamston, Martin co., N. C., Feb. 4, 1811; educated at an academy; studied law; was admitted to the bar in 1831; was elected member of the constitutional convention of North Carolina in 1835, and of the State Legislature in 1840, 1842, and 1844. He was a member of the Twenty-ninth Congress, and in 1850 was one of the commissioners appointed to revise the statutes of the State. In 1854 he again became a member of the State Senate; elected a Senator in Congress in 1854 for six years; resigned in May, 1858, and was appointed judge of the U. S. district court of North Carolina. D. in Norfolk, Va., March 6, 1878.

Bigler, JOHN : b. in Cumberland co., Pa., Jan. 8, 1804; a brother of Gov. William Bigler of Pennsylvania; became a printer, a journalist, and subsequently a lawyer. He removed to Illinois in 1846, and to California in 1849, where he was a prominent Democratic politician, and was known as "Honest John Bigler." He was Governor of California (1852-56). D. Nov. 13, 1871.

Bignon, bēn'yōn', LOUIS PIERRE ÉDOUARD : a French statesman and historian; b. at La Meilleraye, Jan. 3, 1771. He was elected to the Chamber of Deputies in 1817, and be-

came a peer of France in 1837. He wrote a *History of France from the 18th Brumaire to the Peace of Tilsit* (7 vols., 1827-38), and other works. Napoleon I. bequeathed him 100,000 francs. D. in Paris, Jan. 5, 1841.

Bigno'nia [named by Tournefort in honor of the Abbé Bignon, the librarian of Louis XIV.]: a genus of plants, the type of the family *Bignoniaceæ*, natives of the tropical and sub-tropical parts of America. Many of them are climbing plants, with compound leaves terminating in a tendril, and handsome trumpet-shaped or bell-shaped flowers, which are five-lobed, or rather two-lipped. The *Bignonias* are probably the handsomest twining plants known. The trumpet-creeper or trumpet-flower of the U. S. is the *Bigonia radicans* (or *Tecoma radicans*). It has a large and showy orange and scarlet corolla, funnel-shaped and five-lobed, with four stamens.

Bignonia Family (*Bignoniaceæ*): mostly trees and shrubs (often climbing), dicotyledonous, gamopetalous, with superior ovaries. They are related to the *Acanthus* family, the fig-woods, bladderworts, etc. There are about 460 species known, natives, mostly, of warm climates. *Bignonia*, *Tecoma*, and *Catalpa* are representative genera. CHARLES E. BESSEY.

Big Rapids: city and railroad center; capital of Mecosta co., Mich. (for location of county, see map of Michigan, ref. 6-1); on the Muskegon river, 56 miles N. of Grand Rapids and 55 miles N. of Muskegon. It has Holly water-works, extensive water-power (the river being dammed in two places), a heavy lumber trade, and manufactories of furniture, coiled elm hoops, and sash, doors and blinds. Pop. (1880) 3,552; (1890) 5,303; (1894) 5,202.

EDITOR OF "PIONEER."

Big Sandy River: an affluent of the Ohio; the boundary between West Virginia and Kentucky. It is navigable for more than 100 miles for steamboats. Its main stream, or Tug Fork, rises in the S. of West Virginia. Its West Fork flows through Eastern Kentucky. Its valley abounds in coal, timber, and mineral wealth.

Big Spring: town (founded in 1882); capital of Howard co., Tex. (for location of county, see map of Texas, ref. 3-E); on Texas and Pacific R. R., 270 miles W. of Fort Worth; has churches of five denominations, graded public school, private school, and shops of Tex. and Pac. R. R. The industries of the town are principally farming, sheep-raising, and cattle-raising. Pop. (1890) 1,158; (1893) estimated, 1,500.

EDITOR OF "PANTAGRAPH."

Big Trees of California: See SEQUOIA.

Big Vermilion River: See VERMILION RIVER.

Big Wood (Boisé or Boisée) River: of Idaho; rises in or near the Salmon Mountains; flows westward, and enters the Lewis or Snake river on the line between Idaho and Oregon. Gold is found near this river.

Bihar, béé-haar': a county of Hungary; bounded N. by the counties of Hajduken, Szabolcs, and Szatmar, E. by Szilagy and Klausenburg, S. by Arad, and W. by Bekes. Area, 4,279 sq. miles. The eastern part is mountainous, while the western is a plain, consisting alternately of swamps, sandy plains, and fertile ground, traversed by numerous small rivers. All kinds of grain abound, especially wheat of an excellent quality. Wine and tobacco are also raised in great quantities. Pop. (1890) 516,853. Chief town, Grosswardein.

Biisk, beesk: a fortified town of Siberia, in the government of Tomsk; 300 miles S. of Tomsk (see map of Asia, ref. 3-F). Pop. 17,560.

Bijapur, béé-ja-poor, or **Bejapoor** (i. e. the victorious or unconquerable city): a city of India; in the presidency of Bombay; 245 miles S. E. of Bombay (see map of S. India, 4-D). It was formerly the populous capital of the powerful Hindu kingdom of the same name, which was founded by Tasnef (d. 1510); conquered by Aurungz-be in 1686; and afterward a part of the empire of the Grand Mogul. According to tradition, it contained 100,000 houses, but is at present in ruins. It presents a magnificent external show of domes and minarets, temples and mausoleums, some of which display exquisite workmanship; and lofty walls of hewn stone inclose this scene of splendid desolation. Among the ruins, which are of great extent, is a mausoleum of Mahmud Shah, the dome of which is visible at a distance of 14 miles. Here are several brass cannon of enormous size.

Bikanir, bik-a-neer', or **Biekaneer**: a native state of Rajputana, British India; situated between lat. 27° 30' and 29° 55' N., and between lon. 72° 30' and 75° 40' E. Area,

23,340 sq. miles. The soil is poor, consisting almost entirely of deserts. The inhabitants are mostly Rajputs. Pop. 510,000.

Bikanir, or **Biekaneer**: a fortified town; capital of state of same name; in an arid and desolate tract 240 miles W. S. W. of Delhi; lat. 28° N., lon. 73° 22' E. (see map of N. India, ref. 5-C). It is surrounded by a battlemented wall 3½ miles in circuit, and has a citadel, several temples, and lofty buildings, but the streets are dirty and most of the houses mean. Pop. (1891) 55,640.

Bikelas, DEMETRIOS: modern Greek poet and translator; b. in 1835; has translated into modern Greek Shakspeare's *Romeo and Juliet*, *Hamlet*, *Macbeth*, *Othello*, *Merchant of Venice*, and *Lear*. He has published a romance, *Loukís Laras*, 1879, and has written much upon mediæval Greek history and literature. His best-known historical work is *Les Grecs au Moyen Âge* (French translation, 1878). A collection of his poems appeared in 1862; another in 1885.

A. R. MARSH.

Bilaspur, béé-las-poor': a district of Chhatisgarh division, Central Provinces, British India; between parallels 21° 45' and 23° 16' N., and meridians 81° 30' and 83° 15' E., forming the upper half of the basin of the Mahanadi river. Area, 7,798 sq. miles. It is inclosed by ranges of hills, except on the south, where it is open and easily accessible. It has abundant natural waters, and also abounds in tanks. Rice, wheat, oil-seeds, and cotton are the chief agricultural staples, and it is so productive that it is popularly called the "land of plenty." Cotton and silk cloths are manufactured in considerable quantities. The climate is relaxing, but not oppressive. Cholera, fever, and smallpox prevail. Pop. 1,000,000, of whom 61 per cent. are Hindus, and 38 are members of aboriginal tribes. Among the Hindus the Chamars, or shoe-making caste, here form a separate religious body. A similar religious body is that of the Pankas, or weaver caste. Both have customs which now distinguish them from the Hindus. Bilaspur is also the name of a native hill state in the Punjab. Area, 448 sq. miles. Pop. 90,000. MARK W. HARRINGTON.

Bilbao, béé-laa'ô (often written in English *Bilbo'a*): a seaport-town of Spain; capital of the province of Biscay; on the river Nervion, near the Bay of Biscay, and 28 miles N. W. of Vitoria; lat. 43° 15' N., lon. 2° 51' W. (see map of Spain, ref. 13-G). It is partly inclosed by high mountains, and is well built. Small vessels can ascend the river to this point, which is here crossed by several bridges. Bilbao has a cathedral and a number of convents; also manufactures of hardware, bats, leather, paper, and earthenware. The chief articles of export are grain and flour, iron, oil, and fruits. This town was founded in 1300, and was first called *Belvaio*, and about 1500 was the seat of a famous commercial tribunal. It has steam communication with London and Liverpool. Was besieged by the Carlists in 1835 and 1874. Pop. (1887) 50,772.

Bilberry, or **Whortleberry**: the fruit of various small shrubs of the genera *Vaccinium* and *Gaylussaria*, and of the natural order *Ericaceæ*, natives of North America and Northern Europe. These fruits, under the name of huckleberries and blueberries, are extensively used in the Northern U. S. and Canada.

Bilderdiijk, bil'dér-dik, WILLEM: Dutch poet and philologist; b. in Amsterdam, Sept. 7, 1756; a man of great erudition and versed in many languages and sciences. He studied law and practiced as an advocate at The Hague. About 1805 Louis Bonaparte appointed him secretary of the Institute of Holland. He was the author of many poems, tragedies, and prose works, which had a high reputation and display a remarkable mastery of form. Among his poetical works are *Het Buitenleven* (1803); *Holland's verlossing* (1813); *Vaderlandsche nithoezmingen* (1815); and the fragment of an epic entitled *De ondergang der eerste wereld*. Among his philological works, his *Taal- en dichtkundige verscheidenheden* (4 vols., 1820-23) and *Nieuwe taal- en diebt. verscheidenheden* (4 vols., 1824-25) are of value. His *Geschiedenis des vaderlands* (13 vols., 1832-53) has considerable importance, though written from the absolutist point of view. Bilderdiijk's works appeared in Haarlem, 15 vols., 1856-59. See Isaac da Costa, *De mensch en de dichter Bilderdiijk*, 1859. D. in Haarlem, Dec. 18, 1831.—W. Bilderdiijk's wife, KATHARINA WILHELMINA BILDERDIJK, b. in The Hague, July 3, 1777, d. in Haarlem, Apr. 16, 1830, was also a well-known poet. See her *Dichtwerken* (3 vols., 1858-60). For further details, see Gorter, *Bilderdiijk* (Amsterdam, 1871). Revised by A. R. MARSH.

Bile (Lat. *bilis*): the secretion of the liver in animals. In all vertebrates it is formed chiefly from the blood of the portal vein, which is mingled, however, to some extent with that of the hepatic artery. It is secreted slowly during the intervals of digestion, attaining its maximum (according to Dalton) about an hour after eating. It is in man a golden-red, viscid fluid, with a bitter taste and a peculiar smell. In carnivorous animals it is brownish yellow; in herbivorous, greenish. From 20 to 50 ounces of it are secreted daily in a man. A portion of bile is commonly detained in the gall-bladder, where it becomes more dense by the loss of water and the addition of mucus.

Bile contains certain coloring and saline and other constituents. The "bile salts" consist of cholic (glycocholic) and taurocholic acids, combined in man with soda. These acids are formed in the liver, not being present in the blood, unless from absorption after their elaboration in the liver. Cholesterin, the only alcohol existing free in the body, is present in notable quantity. It is found in the blood in small quantity. Of the bile pigments, *bilirubin* and *biliverdin* are the principal, and are derived from the coloring-matter of the blood.

Entering by the common biliary duct into the duodenum, the bile aids in the digestion of food, especially of fat, and the greater part of it is then reabsorbed from the small intestine. A portion, however, is excreted with the fecal discharge. Bile stimulates the peristaltic muscular action of the bowels, being the natural laxative. It acts also as an antiseptic to the almost putrescent contents of the large intestine. Solidification of the components of the bile (especially of cholesterin) causes gall-stones, the passage of which through the duct often produces extreme pain.

The bile of salt-water fishes contains potash in place of soda, although from their being surrounded by much common salt (chloride of sodium) in the sea-water, we should naturally expect to find soda in abundance; and the bile of land and fresh-water animals contains soda, while, considering diet and habitat, potash might more naturally be looked for.

Revised by WILLIAM PEPPER.

Bilin, *bě-leen'* (in Lat. *Bolina*): a town of Bohemia; beautifully situated in the valley of the Biela; 17 miles W. of Leitmeritz (see map of Austria-Hungary, ref. 2-1). Near it are the celebrated mineral springs which are much frequented, and from which about 2,000,000 bottles of the well-known Sauerbrunnen water are annually exported. The well-known polishing-powder of Bilin is *Bergmehl*. Pop. (1890) 6,493.

Bilious Colic: See LIVER, DISEASES OF.

Bilious Fever: See FEVER.

Bill, or **Beak** (in Lat. *ros'trum*; Fr. *bee*): the hard, horny mouth of birds, consisting of two parts called the upper and lower mandibles, which may be regarded as mere extensions of the upper and lower jaws. Among existing birds the bill is never furnished with teeth, but in a number of fossil forms teeth are present. The bill is the principal weapon of offense and defense of many birds, and is an important character in the classification of the group. The forms of bills are especially adapted to the nature of the food on which the bird subsists, and to the operations by which that food must be procured. In birds of prey (*Raptores*) the upper mandible is hooked and sharp, and the whole bill is adapted for seizing animals and tearing their flesh; birds that feed on seeds have short, strong, and conical bills; while humming-birds have long, straight, and slender bills, fitted to insert into long, tubular corollas. Many aquatic birds, as ducks and geese, have broad, obtuse, and comparatively soft and sensitive bills, with laminae on the inner margin in order to strain the mud in which they find their food.

Bill: in law, a formal statement or declaration in writing. It is commonly used in connection with some descriptive word, as in the phrases bill in equity, bill of credit, bill of exchange, bill of rights, bill of sale, etc. (*q. v.*) The principal uses of the word without other words of description are as applied to (a) a draft of a proposed law pending before a legislature, as "bills for raising revenue." After such a bill becomes a law, it is usually termed an "act" or "statute." (b) One of the forms of pleadings by which a common-law action was anciently commenced, answering to the modern declaration or complaint. Also the statement of facts and prayer for relief of the complainant in a suit in equity, usually called a bill in equity (*q. v.*). (c) An itemized statement of the claims of a creditor.

Revised by P. STURGES ALLEN.

Bil'lerica: town (founded about 1650); Middlesex co., Mass. (for location, see map of Massachusetts, ref. 2-H); beautifully situated 20 miles from Boston; on B. and M. R. R. Pop. of township (1880) 2,000; (1890) 2,380; (1895) 2,577.

Billet, *bě'la'*, PIERRE: contemporary French painter of landscape and figures, and of the life of fisher-folk, whose work is marked by simplicity of drawing, good color quality, and virile technique; b. at Cantin, Nord; pupil of Jules Breton; second-class medal, Paris Salon, 1874; second-class medal, Paris Exposition, 1889. Studio at Cantin.

W. A. C.

Billfish: any one of several fishes with jaws elongated into a bill or beak. Among these are species of the genus *Tylosurus*, known also as "garfish" and "needlefish," very common along the Atlantic coast of America; also the fresh-water garfishes of the genus *Lepidosteus*, common in the larger streams of North America, and the spearfish, *Tetrapturus albidus*, allied to the common swordfish.

Billiards [Fr. *billard*; Norman French, *billiard*; the stick or staff with which the ball is struck, from Fr. *bille*, a block of wood, hence *billet*]: an indoor game played by driving balls, usually of solid ivory, according to certain rules over the surface of a specially adapted table, called a billiard-table.

Origin and Early Development.—This game, which is now practiced by the people of all civilized countries, was developed out of an outdoor game played upon the grass or ground with two round stones; later with balls of lignum vitæ or other hard, heavy substance. A cone and port were also used, and afterward a cone and an iron or ivory loop, arch, or port, the balls being driven with a mace through the loop, arch, or port, and around the cone and port, in a way similar to the game of croquet. Afterward the game was played indoors in a similar form upon a table. The outdoor game was probably a modification of the ancient game of "bowls," which was played upon the ground with round stones thrown from the hand.

Billiards was known in England in the Middle Ages, having been introduced by the Knights Templars on their return from the second crusade, and the game was common in the monasteries of Europe. It was introduced into France during the reign of Louis XI. (1461), and into America by the Spaniards who settled in St. Augustine, Fla., in 1565.

The earliest authentic mention of the game appears in Reilly's English translation of the Abbé McGeoghegan's *History of Ireland*, in which is given the substance of the will of Cathine More, a sub-king of Ireland, who ruled the district of Leinster in the early part of the second century A. D. The following is a quotation from his will: "To Dri-moth I bequeath fifty billiard-balls of brass, with the pools and cues of the same material."

In Great Britain there were added to the loop, arch, or port, and the post and king, three pockets of netting, all on one side of the table, two at the corners and one midway. Then to the square table was added a fourth pocket, and the pockets were placed one in each corner. Later the table was made oblong, and an additional pocket (or sometimes more than one) was placed midway of each long or side cushion-rail, making six pockets, as in the pool-tables of the present day. During the eighteenth century the loop, arch, or port, and the post and king were discarded, and the game was played wholly by pocketing the object-ball, each player playing in turn and taking but one stroke. The practice of each playing until he fails to score is an innovation of more modern times.

In France a hole was cut through the center of the bed of the table and the object-ball was driven into it by causing the ball to rebound from a cushion or by "banking" the cue-ball to a cushion, so that on the rebound it would strike the object-ball and drive it into the hole, from which a groove conducted the ball under the table to an opening at the side. Later no hole was cut in the center of the bed of the table, but six holes were cut in the bed, one at each corner and one midway of each of the long or side cushions. These holes were cut immediately in front of the cushions, but did not extend through the cushions, as do the pockets in the present style of pool-table. The game as played upon these tables was called "doublet," and long continued to be its most popular form in France.

Two white balls were generally used in all countries, the object in playing being to pocket or "kill" the ball of the opposing player. Each player had three "lives," and to the player who remained in the game the longest was awarded

the victory. In the U. S. this game was known in later times as "two-ball pool."

A further improvement in the game was made by the French shortly after the middle of the eighteenth century by the introduction of a third or red ball called the *carambole*, thus inventing the *carom* game. In France with the introduction of the third ball the play was called a *carambole* or *carombolage*; in Great Britain *cauon*, and in the U. S. *carom*. Upon the introduction of the third ball, the game consisted of "both hazards" (i. e. pocketing the balls and making *caroms* on both object-balls), and was at that period the popular game in France. Soon afterward it became the game of winning and losing hazards and *caroms* in Great Britain, and this game now (1893) remains the standard there.

Cues and Cue-playing.—In the early part of the eighteenth century cue-playing was first introduced into France and England, the ball being struck with the flat end of the cue. With the flat-pointed cues, however, the cue-ball had to be struck exactly in the center, or a "miscue" would result. The first departure from the flat-pointed cues was the use of cues having a beveled end for striking the cue-ball below the center. Soon, however (about 1790), the end of the cue was rounded off, as it was found that so there was less chance for a miscue, and that certain extraordinary effects could be produced by striking the ball with a rounded cue-point.

From thus rounding the cue-point the side-stroke, twist, or "English" was developed, and soon chalk was applied to the rounded wooden ends of the cues, thus lessening the chance of the cue-point slipping, and the players were able to accomplish better and more remarkable effects.

About 1807 cue-tips were invented by a Capt. Mingaud, a Frenchman who had been imprisoned on account of some political offense. During Mingaud's imprisonment he was allowed the use of a billiard-table, and he experimented for the purpose of devising a covering, or tip, for the end of his cue to obviate the frequent disappointment caused by the wooden point of the old-fashioned cue slipping from the ball, and he soon invented a cue-tip with which he could twist and "draw" the cue-ball in an astonishing manner, so that it seemed to defy all laws of motion. When liberated from prison, Mingaud visited the *cafés* of Paris and astonished the frequenters of those places with his marvelous execution. Thus was the game of billiards revolutionized, and Capt. Mingaud's cue-tips soon superseded the old-fashioned implements previously used, and rapid improvement in the game soon followed. These cue-tips were introduced into the U. S. about 1823, but as their fame had long preceded them, some of domestic make were already in use.

Soon after the introduction of cue-tips in France the *carom*-game became popular, and the scoring of hazards or pockets was gradually abolished, and *carom*-tables were there introduced. These have the *carom*-rail continuous on the sides and ends, and are without pockets.

The game of billiards is played in the U. S. almost exclusively upon the *carom*-table, while tables with six pockets, one at each corner and one at the center of each side, and those with four pockets, one at each corner, are used for fifteen-ball pool.

Billiard-tables.—The present shape and construction of billiard-tables are the result of much experiment and observation. They have been made square, round, oval, octagonal, and last and best in the shape of an oblong rectangle. The frames are made of hard wood, as rosewood, walnut, maple, oak, etc.

The beds were at first made of wood, soft pine being used, then oak and other hard woods, the beds being made in small panels to prevent warping. When they became indented after considerable use the cloths were taken off and the beds planed down. About 1827 marble beds were introduced, but marble was soon superseded by slate, which, not being porous, does not gather moisture and rot the cloth, and is also not so brittle as marble, and therefore not as liable to be broken.

Generally three or four slabs, an inch in thickness, are used, and over this bed is stretched fine, green Simonis broadcloth. The table being made perfectly level, this gives a smooth, even surface for the balls to roll upon. Around this bed, and rising about 2 inches above it, are rails bearing the cushions, the top surface of which is 34 inches above the floor. The edge of the cushion where the ball comes in contact with it is $1\frac{1}{8}$ inches above the slate, and is, or should be, slightly pitched to prevent the ball from jumping and to permit the cue to strike the ball at the proper point. This

height is adapted to the billiard-ball of regulation size. For balls of a different size the elevation of the cushions should be changed so that they come about a quarter of an inch above the center of the ball.

Upon the cushion much of the success of the stroke depends, and to insure the best results it should be made as nearly perfect as possible, combining qualities that will assure durability and accuracy; it should possess that nice degree of elasticity, the exactness of which requires long experience to learn, that will insure a proper angle when the ball rebounds; it must be unaffected either by damp or dry weather or by changes of temperature.

In 1835 cushions of india-rubber were introduced into both Great Britain and the U. S., which, on account of their elasticity, created great enthusiasm.

No other notable improvements were made until about thirty years later, when a vulcanized cushion (which was a combination of pure elastic and hard rubber) was introduced, the hard rubber being set on the front of the cushion to stiffen its face against the impingement of the balls. These cushions, on account of the correctness of the angles at which the balls rebounded and their elastic and wearing qualities, became a complete success, and are now in general use.

Since 1855 numerous improvements have been made in the construction of billiard-tables; and the skill of the manufacturers of the U. S. now leaves little further to be desired.

For a 5 by 10 table the cross-arms of the gas-pendant should measure from light to light 28 inches, and the long arms 56 inches. The standard size of the billiard-table used by the experts of the U. S. for all match games is 5 feet wide by 10 feet long, but for private houses and public billiard-rooms the smaller table, $4\frac{1}{2}$ by 9 feet, has become more popular and the 4 by 8 feet table is frequently used. In Great Britain the standard size of table is 6 by 12 feet, the balls used on them are $2\frac{1}{16}$ inches in diameter, and the pockets are $3\frac{1}{2}$ inches wide where the slate is cut away.

Billiard-rooms.—An apartment to accommodate a billiard-table should be of sufficient size to afford space for the free exercise of the cue. For tables 5 feet by 10 feet the room should be at least 15 feet by 20 feet. Architects in their plans for modern mansions now make suitable provision for this amusement. The light, if possible, should come from above, so as to prevent any shadow being thrown from the balls or cushions. The gaslight should be raised about 3 ft. 2 in. from the bed of the table and supplied with horizontal burners, as by such an arrangement no shadow is thrown from the pipe.

Modern Billiards.—As a game for both sexes billiards, as now played, is one of the best of all indoor pastimes. Its attractions are enhanced by the fact that it may be played by more than two persons, for billiard-games are varied, and several have been invented to accommodate party-playing. The use of the cue brings into gentle action all the muscles of the body, and it is said that an active player will walk a mile or two during the playing of a single game.

Proficiency in playing billiards calls for a quick eye, a steady hand, an exact measurement of distance and angles upon the table; it requires a deft and delicate touch in order to manipulate the cue and the cue-ball; great judgment is required in properly estimating the strength of stroke to be delivered to accomplish the different shots which present themselves, and correct judgment in this respect is as important as is correctness in the aim. The necessary force of stroke also depends upon the humidity of the atmosphere, as in damp days the cloth absorbs moisture and offers greater resistance to the ball. Scholars may in playing the game find mathematical, geometrical, and algebraic problems constantly arising before them for their solution.

The original American game was known as the American four-ball game of *caroms* and hazards, and was played on a 6 by 12 six-pocket table. This game was played in France before it was known in the U. S., and was called "The game of the Revolution." Variety was probably the aim of those who devised the game and it was a combination of the French game and the Russian game of "Carlina." The former was composed of *caroms* and hazards and was played with three balls, while the Russian game was composed of hazards and *caroms* and was played with five balls: a clear white ball, a spotted white, a yellow or black ball, which was called the "Carlina" and which was spotted in the center of the table; a red ball, which was spotted at the foot of the table, as in the American and French games, and a blue ball which was spotted at the head of the table.

The American four-ball game of caroms and hazards is played with two white balls (one of which has a small black spot to distinguish it from the other white ball), a light-red and a dark-red ball. The light-red is "spotted" at the head of the table and the dark-red ball at the foot of the table. The game is opened by "stringing" for the lead and choice of cue-balls. The player who strikes his ball from within the string-line, i. e. all that part of the table behind the spot at the head of the table, causes it to hit the cushion at the foot of the table, and lands it nearest the cushion at the head of the table, wins the lead and the choice of balls, and can choose the first shot or compel his opponent to play first. The white ball of the non-striker can be rolled down the table, through a stroke with the cue, past the dark-red ball at the foot of the table, and must come to a rest below that ball, or the non-striker may place his ball upon the white-ball spot at the foot of the table, 5 inches from the foot cushion and directly on a line with the other spots. In opening the game the player must strike his opponent's white ball before striking any other ball with his own. In the early American game a carom from white to red or from red to white counted two; from red to red three; from white to red, then to the other red, five, or *vice versa*; pocketing the opponent's white two; pocketing the red three; pocketing both reds six; pocketing the white and both reds eight; pocketing the three object-balls, after making a carom on all three, scored thirteen for the striker. Should the white cue-ball go to pocket from the white object-ball, or either before or after striking a red ball, the striker forfeited two; should the white cue-ball go to pocket off a red ball, the striker forfeited three. The game consists of 100 points. Playing the "spot-ball," i. e. scoring a succession of pockets without a miss, or without resorting to a carom, had been so perfected by the experts of the time (previous to 1854) that runs in the hundreds were common, and Lynn Higham, of Albany, N. Y., professionally known as the "Albany Pony," was credited with a run of 2,400 points off the spot-ball, scored without resorting to a carom and counting three for each pocket. In the fifties it became popular to make it conditional in regard to pocketing the red ball off the spot, and the play was limited to three strokes off the spot; then a carom was required. Later once off the "spot" became a common requirement among the better class of players. About this time the expert amateur and professional players abolished the pocketing of balls from the American four-ball game and resorted to caroms altogether, and in 1861 6 by 12 foot four-pocket tables were introduced, and the American four-ball carom game continued to be the common game of billiards in the U. S. until 1876. In April of that year the final public championship contest was played at that particular game.

As an offset to spot-ball play, the nursing of balls became so perfected by the great experts of the sixties and the early seventies, and such extraordinary runs were scored, that a game of 1,500 points was never held safe by a player who might, perhaps, be in the lead by several hundred points. In April, 1869, the American four-ball, bar-push game was inaugurated through a tournament which was held in Irving Hall, New York. Four changes were made in the rules in this tournament: The "push" shot was officially excluded; the table was reduced in size from 6 by 12 to 5½ by 11. The table was, as before, a four-pocket, but the size of the jaws of the pockets was made to measure 4 inches, and not more than three successive caroms could be made with the balls in the jaw. The system of counting and scoring the game was so changed that each single carom counted three and each double carom six, where formerly from white to red had counted two and from red to red three, and what was known as the "Diamond Cue Championship" was established through this tournament.

Further changes in the playing of the game occurred in 1873. The expert amateur and professional players had been favoring and gradually in their practice-playing drifting toward the three-ball carom game, and match contests at three-ball carom billiards, played on 5 by 10 tables, had become matters of record. In June, 1873, the first tournament for the championship at regular three-ball billiards on 5 by 10 table was inaugurated in Irving Hall, New York, and what became the "Challenge Cup Championship of the World" was inaugurated. A new set of rules to govern three-ball billiards was approved of by practical critics and experts, which, upon being submitted to a congress of experts and the players who were to participate in the tournament, were adopted as the standard rules to govern contests

for the cup trophy which was to become emblematic of the championship of the world at regular three-ball billiards. All games were to be played on a 5 by 10 table. Each carom was made to count one; the crotching of balls was barred, and object-balls whose centers were both within a square of 4½ inches at either corner of the table were considered to be within the line. When the object-balls were so within a square three counts only would be allowed, unless at least one of the object-balls was forced out of it. In case of failure by a player to dislodge an object-ball from the square, his hand was out and the next player played with the balls as he found them.

Regular three-ball billiards was so mastered by the great experts that in 1880 a record at run-getting was established by Vignaux, in a match contest in Paris, of 1,531. In 1879 restrictions were placed upon the rail-nursing of balls, through the introduction of triangular spaces in each corner of the table, through a line drawn upon the surface of the cloth from a point on the face of the end cushions measuring 14 inches out from the corner of the cushions to a point on the face of the side cushion measuring 28 inches out from the corners. But three strokes were permitted with both object-balls within any of these triangular spaces without driving at least one ball out. These spaces were first used, but in a diminutive form, in the Vignaux (New York) tournament of 1874, they measuring in that tournament 5½ inches out on each cushion rail from the corners of the cushions. The games in the tournament with the larger triangular spaces (14 by 28) established a championship at "The Champions' Game," as it was called, but the game was short-lived, and there were but four public contests for the trophy emblematic of the championship of that game.

Meantime the amateurs of the world continued to practice the regular game of three-ball billiards, and mostly upon 4½ by 9 tables, and amateurs left to the professional experts the restricted games of billiards where lines and spaces were marked out on the cloth.

In 1883 the balk-line game came to the front through a professional tournament in Chicago. The lines in this tournament were made 8 inches from the cushions, and were drawn lengthwise of the table and across the table at the ends. Eight restricted spaces were thus formed, four being in the corners of the table and four along the side and end cushions. But two counting-strokes were allowed with both object-balls within any of these restricted spaces. The 8-inch balk-line game was, however, soon mastered by the great experts of the day, and in order to bring the non-nursing experts, who were known as "cushion-carom" players, and the nursing experts of the time together on equitable terms it was thought advisable to inaugurate a tournament at 14-inch balk-line billiards, and in Apr., 1885, the 14-inch balk-line game was formally introduced to the public. It was not until Dec., 1890, that a championship was established at 14-inch balk-line billiards, and this special restricted game of billiards remains the standard game for the expert "professional" players. Amateurs practice the regular three-ball carom game throughout the U. S. and Canada, France, and some other countries, and without regard to the restricted balk-lines.

For the rules of billiards and pool in all games, and for instructions how to play the games, see *Modern Billiards*, published by the Brunswick-Balke-Collender Company, New York.

MORTIMER T. HUMPHREY.

Bill in Equity: a statement of the plaintiff's case in a suit in court of equity, corresponding to the "declaration" or "complaint" in the common law. The defendant's reply is called the "answer." It is not necessary to adhere to a prescribed form in drawing up a bill in equity, as it is in the case of a common-law complaint; and the essence of a bill in equity is the statement of the facts and the prayer for relief or otherwise. (See PLEADING.) A bill is either original or not original. An original bill initiates the suit; a bill not original, as a cross-bill, a supplementary bill, etc., is used to controvert or suspend or revise a proceeding in the cause, as a decree or order, or for cross-litigation. In particular suits the bill receives special names, such as "bill of peace," "bill of interpleader," "bill of discovery," "cross-bill."

Revised by F. STURGES ALLEN.

Billings: city; capital of Yellowstone co., Mon. (for location of county, see map of Montana, ref. 6-II); on Northern Pacific R. R., and Yellowstone river, which furnishes water-power; chief distributing and shipping point for the great stock-ranges of Eastern Montana and Northern

Wyoming, and the wool-market of Montana. It is the terminus of a railroad to the largest and best coal-field in Montana, and has fine stone-quarries. Pop. (1890) 836.

Billings, JOHN SHAW, M. D., LL. D., D. C. L.: surgeon; b. in Switzerland co., Ind., Apr. 12, 1838; graduated at Miami University 1857; at the Ohio Medical College 1860; appointed acting assistant surgeon in the U. S. army 1861; served through the war, being with the Fifth Corps at the battles of Chancellorsville and Gettysburg; from Dec., 1864, connected with the surgeon-general's office in Washington; appointed surgeon, with the rank of major, in the regular army Dec., 1876; retired in 1895; in the same year became Pepper Professor of Hygiene in the University of Pennsylvania, and in 1896 was appointed director of the New York Public Library (Astor, Lenox, and Tilden foundation). He is the author of *Report on Hygiene of the United States Army* (1875); *Principles of Ventilation and Heating* (1884); *Mortality and Vital Statistics of the United States* (2 vols., 1885); *Index Catalogue of the Library of the Surgeon-General's Office* (12 vols., royal 8vo., 1880-92); *The National Medical Dictionary* (2 vols., 1889); *Description of Johns Hopkins Hospital* (1890); and of numerous papers in scientific and medical periodicals.

Billings, JOHN: See SHAW, HENRY WHEELER.

Billingsgate: a wharf and fish-market of London; below London bridge; was made a "free and open market for all sorts of fish" in 1699. It is the only wholesale fish-market in London, and all fish, fresh or cured, if imported in British vessels, are admitted free of duty. All fish are sold here by tale, except salmon and eels, which are sold by weight; oysters are sold by measure. No fish are sold on Sunday, except mackerel. The women who vended fish here were formerly notorious for ribaldry and vituperative personalities, so that "Billingsgate" became a synonym of vulgar and foul expressions.

Billion: in the French system of enumeration, in use in the U. S., a thousand millions. In Great Britain a billion is a million millions—1,000,000,000,000.

Billiton, bi-lée-ton', or Billeton: a Dutch island in the East Indies; situated between Borneo and the southeast end of Sumatra, and separated from Banca by Clement's (or Gaspar) Strait. It is about 3° S. lat., and 108° E. lon. (see map of East Indies, ref. 7-D). Area, estimated at 1,860 sq. miles. Iron ore and good timber abound here. Trepanng, tin, birds' nests, and tortoise-shells are exported from it. Pop. (1890) 37,803, of which about 10,000 are Chinese and 100 Europeans.

Bill of Attainder: a legislative enactment declaring the attainder of one or more persons. (See ATTAINDER.) Formerly persons were often attainted of high treason in England by act of Parliament, and during the war of the Revolution bills of attainder were frequently passed in this country. The Constitution of the U. S. provides that neither a State nor Congress shall pass bills of attainder. Such a bill is usually opposed to sound legislation in four principal respects: It is adopted by the legislature, instead of being a sentence by the judiciary; it departs from judicial rules in establishing the commission of the alleged criminal act, having no regular methods of trial or rules of evidence; it may declare an act to be a crime which was not so when committed; and it admits of the infliction of cruel and unusual punishments. Thomas Wentworth, Earl of Strafford, was attainted in 1641, but the matter ceased to be important in Great Britain by Acts of Parliament, 1870.

Bill of Credit: in law. (1) In mercantile law, a letter written by one person to another authorizing or requesting him to give credit to a third or his order, or to bearer. Such a letter is general when addressed to any one who may see fit to give the proposed credit, and who on giving credit may have recourse to the writer of the letter. On such a letter several persons may successively give credit. The letter is special when addressed to specified persons, so that they alone can give the credit. (2) The U. S. Constitution provides that no State shall "emit bills of credit." This expression is construed by the courts to mean instruments issued for the payment of money—issued on the credit of the States as such, payable at a future day, and intended to circulate as money. The clause does not prevent a State from issuing bonds for the payment of its indebtedness, payable at a future day; nor does it prohibit the creation of banks which issue currency. The provision aims at the use of the credit of the States in their corporate character, and was made in pursuance of the general policy which

took from them the power to coin money, and restricted their power over the legal tender.

Revised by F. STURGES ALLEN.

Bill of Exceptions: a formal statement in writing of exceptions taken to the judge's opinion, decision, or direction upon matters of law during a trial. It sets forth the proceedings at such trial, the decision or ruling made, and the exception thereto, signed and sealed by the judge in testimony of its correctness. The object of a bill of exceptions is to bring the alleged error of the judge before the proper court for review, and it usually contains only such portion of the proceedings and evidence taken at the trial as is necessary for that purpose. Formerly the right to a bill of exceptions did not exist in cases of treason or felony, but now the defendant has this right in most of the United States.

Revised by F. STURGES ALLEN.

Bill of Exchange: an open letter of request, whereby one person requests another to pay a third or his order, or to bearer, a sum of money, absolutely and at all events. The person who writes the letter is called the *drawer*; the one to whom it is addressed is termed the *drawee*; and the person who is to receive the money is the *payee*. A bill of exchange is either inland or foreign. Where the parties are in the same State, it is inland; where the drawee resides in a State or country different from that of the drawer, or in any case where the bill is drawn in one State upon a person in another, it is foreign. A bill may be considered under the following heads: 1, its nature; 2, indorsement; 3, acceptance; 4, presentment for payment, and steps to be taken to charge drawer and indorsers.

1. A bill of exchange having all the requisites referred to in the definition as above given is *negotiable*, unless some other requisite is prescribed by statute, as is sometimes the case. Thus in some of the U. S. the receipt of a valuable consideration must be expressed. By this word is meant that a transfer of it in good faith before maturity will give the purchaser a right of action in his own name in a court of law, as distinguished from a court of equity; and he accordingly takes a title free from defenses that may have existed between the original parties. But if any of the qualities referred to in the definition are wanting, *negotiability* does not exist. The paper becomes assignable, and the defenses between the original parties are let in. Negotiability, however, assumes that the instrument has a legal existence as to its outward form, and is accordingly executed by a person competent to contract. A bill of exchange drawn by or upon a married woman or an infant would not create a valid obligation even as to a purchaser in good faith; nor if the instrument were declared void by statute, as is sometimes the case when infected with usury or given for a gaming consideration. Under these rules, if an instrument otherwise in the form of a bill of exchange were payable in something other than money, or upon a contingency, or from a special fund, or to a particular person, without the addition of the words "order" or "bearer," it would not be negotiable. The law presumes that a bill is given for a valuable consideration. Evidence may be offered as between the original parties, and as to all who can not insist upon the protection of negotiability, that there is no consideration. An important distinction thus arises between what may be called business paper and accommodation paper. The former is given for a valuable consideration as between the original parties, such as for money lent or goods sold. In accommodation paper there is no such consideration, but the person who makes it intends to lend his credit to some person. Every party to a bill may hold this relation to it. Thus there may be an accommodation acceptor, drawer, or indorser. This kind of paper must be distinguished from that which is simply without consideration, in which there is no *intent* to have the credit of the party who makes it used. A single illustration will show the distinction. If a person should draw a bill in favor of his friend on account of his affection, it would be simply without consideration; if under the same circumstances it was drawn with intent to have it discounted by a bank, it would be "accommodation paper." In the one case, if a purchaser should acquire it with knowledge of all the circumstances, he could not enforce it, while in the other case he could, by reason of the intent. When accommodation paper has been acquired for value, it is substantially equivalent, as far as the holder is concerned, to business paper. Between the original parties it would have no validity, and could

not supply the basis of an action. On the contrary, if an accommodation party to the bill is obliged to pay, he has his remedy against the party in whose favor he acted, either on the bill or on an implied contract, as the case may be. Thus an accommodation acceptor could not bring an action upon the bill against the drawer whom he had accommodated, but would be driven to an action on an implied contract on the part of the drawer to repay money which had been paid for the drawer's use and benefit. When one party gives his acceptance to another in return for the other's acceptance, it is not a true case of an accommodation acceptance, though sometimes so called. These "cross" acceptances are based upon a consideration, the one promise being a consideration for the other. They are certainly dangerous contracts, as either party may be called on to pay to a holder not only his own acceptance, but that of the other party. Without further pursuing this distinction, attention should be called to a peculiarity in this branch of the law which shows its close connection with the subject of currency. It is a well-settled general rule of the common law that a person having no title to goods can transfer none, even to a purchaser in good faith. A thief or a finder, for example, can create no better title than he possesses. There is a marked exception to this rule in the case of money. One who has stolen money may give a perfect title to one who takes it in good faith and for value. This exception is demanded by the necessities of commerce. The rule is extended to negotiable paper, payable to bearer, or even to order, when so indorsed as to pass from hand to hand without further indorsement.

It is plain that a bill when drawn imposes no obligation upon the drawee. It is necessary that he should assent to it in some legal form before he becomes liable. This act is termed "acceptance." Before acceptance the only person liable to the payee is the drawer. His liability is a contingent one, and implied by law. There is thus a marked distinction between the liability of a drawer and acceptor—one is implied, and the other is express and created by contract. The implied obligation of the drawer is created by the custom of merchants, and is conditional. It requires certain acts to be performed as a condition precedent to recovery of the amount of the bill, such as presentment either for acceptance or payment, and due notice to be given of a failure to accept or pay, as the case may be. This distinction between the implied liability of the drawer and the express contract of an acceptor is of great consequence, and must be carefully attended to. The same remark may be made as to the liability of an indorser. This is also implied and conditional. The nature of a check upon a bank should be referred to. It resembles a bill of exchange, though it is not precisely equivalent to it. The check, according to the better opinion, creates no obligation against the bank in favor of the holder without acceptance. In mercantile phrase, a check when accepted by the act of an officer, such as a teller, is said to be "certified." The bank after such an act is liable to the holder. The drawer of a check having funds on deposit has an action against the bank for damages for a refusal to honor his check, on the ground of an implied obligation to pay checks according to the usual course of business. While checks are usually drawn payable immediately, they may be made payable at a future day (being then called "post-dated checks"), when their resemblance to a bill of exchange is still more close.

2. *Indorsement.*—The payee of a bill may transfer it by writing his name upon the back of it. He is then termed an indorser. When the name is simply written the indorsement is said to be "in blank"; when some person is pointed out to whom payment is to be made, it is said to be "in full." When a bill is indorsed in blank, it will pass from hand to hand, as though payable to bearer; when indorsed in full, an indorsement by the person to whom it is transferred will be necessary to its further transfer. There may be a series of indorsers, called first, second, third, etc., indorsers. Under these rules no holder can claim a title to a bill payable to order except through an indorsement made by the very person to whom it is payable, or some one holding under him, such as his executor, administrator, or assignee in bankruptcy. Accordingly, if it should come into the possession of another person of the same name as the owner, but acting without authority, he could give no title to one acting in good faith. When an owner of a bill indorses it for value, he can impose upon the purchaser no valid restriction preventing its further transfer. The right of sale is an inseparable incident to

ownership. On the other hand, if a person indorse a bill to an agent, he may place valid restrictions upon the agent's authority to sell. These, if incorporated in the indorsement, will bind all purchasers. Where a bill is payable to several persons, all must, in general, unite in an indorsement. The regular effect of an indorsement is twofold; one consequence is to transfer the indorser's interest, and the other is to create an implied obligation on his part to pay the bill in case that the drawee does not accept or pay at maturity, and proper steps are taken to charge him. In an accommodation indorsement, as there would be no ownership, the sole effect would be to create an obligation to pay. This obligation closely resembles that of suretyship. Thus when a bill is accepted the acceptor is primarily liable, and the indorser is, as it were, a surety. The rules governing suretyship may in the main be invoked in his favor. An indorser may avoid this liability by making use of suitable words in his indorsement, such as "without recourse." The indorsement would then simply operate as a transfer of such interest as he might have. Indorsers are commonly liable in the order of time of their indorsements. Thus if there were three indorsers, if the third (or last) was compelled to pay, he would be entitled to sue the second or first, and recover in full. A holder need not pursue any prescribed order as between the indorsers. He may select any one, who, if he pays, will be entitled to proceed in the same way as to any one preceding him. If, however, the bill is made payable to several payees, who indorse, they are liable jointly and not successively, and each, as between themselves, would be liable only for their respective shares. Every indorsement is a new contract. One of the consequences of this rule is, that though the original bill may be void, the indorser will still be liable, as if the bill be void for usury or be made by a married woman. Another consequence is that the rules of private international law may cause a different effect to be given to the respective indorsements. Thus if A should indorse in one State or country, and B should indorse the same bill in another, each indorsement would be governed as to its effect by the law of the State or country where it was made. The mere act of writing one's name is not an indorsement; there must also be a delivery. Accordingly, if one should write his name and die before delivery, an executor could not deliver the bill so as to make a valid "indorsement." The proper course would be for the executor to indorse it in his representative character.

3. *Acceptance.*—The object of acceptance is to show the assent of the drawee of the bill to pay it according to its terms. Without such assent he would not be liable. He is allowed a reasonable time after the presentment of a bill within which to decide whether to accept it or not, which time has been held to be twenty-four hours. The regular and formal method of acceptance is to write the name of the drawee upon the front of the bill. But no particular mode of acceptance is necessary. It may be made by a writing separate from the bill or orally. It may sometimes be implied, as, for example, by a detention on the part of the drawee beyond a reasonable time. It may be either absolute or conditional. A conditional acceptance may be illustrated by one purporting to be made "on the consignment of goods to the drawee." A holder could not collect in such a case if there was no such consignment. An acceptance should not differ from the terms of the bill. A holder may decline to take such an acceptance, and treat the ease as though there was no acceptance. Should he assent to it, he would thereby discharge the drawer and existing indorsers. It is not always necessary that there should be presentment for acceptance as distinct from one for payment, though in some cases it is requisite. Where a bill is payable a fixed number of days "after sight," the word "sight" means acceptance, and it would be necessary to present it once for acceptance, and, if that act took place, again for payment. If, on the other hand, the bill were payable a certain number of days "after date," it would only be necessary to present it once for all for payment, though it would usually be an act of prudence to present it for acceptance, as the holder would, in case of acceptance, have an additional person to whom he could have recourse, and in case of non-acceptance he could take immediate steps to charge the other parties to the bill. There has been great controversy on the question whether bills payable "at sight" must be presented for acceptance as well as payment. In some of the States the doubt is settled by legislation. The effect of acceptance is to make the drawee the

principal debtor. The other parties stand in relation of sureties, and if they are compelled to pay, they have their remedy over against the acceptors. This is clearly the case in business paper; in the case of an accommodation bill the position of the parties is of course reversed, so that the acceptor, as already explained, has his remedy on an implied contract against the person to whom he lent his credit, though as to the holder of the bill he holds the place of a principal debtor. Under these rules an acceptor is bound to know the handwriting of the drawer, and if that be forged he is still liable to the original holder. If acceptance is refused, the proper course, in the case of foreign bills, is to have a protest made, and prompt notice sent to the drawer and indorsers. In case of inland bills, protest is not essential, though presentment and notice are. Statutes usually allow protest in case of inland bills as a convenient medium of proof that the necessary steps have been taken to charge the parties to the bill. The term "protest" is applied to an official act by an authorized person (notary public), whereby he affirms in a formal or prescribed manner, in writing, that the bill has been regularly presented for acceptance or payment, as the case may be, and that it has been refused. It is used as presumptive evidence at a trial to establish the facts in question. The office of a "notice" is to give immediate information to the drawer or indorsers of failure of acceptance, so that they may take such steps as they deem necessary for their protection. The protest and notice are thus entirely distinct acts for different purposes, and must not be confounded. Assuming that acceptance has been refused and due protest made, mercantile law allows any person to intervene and accept a bill "for the honor" of a drawer or indorser. A holder is not bound to take such an acceptance, though it is valid if assented to. It takes place before a notary public, and is termed an acceptance "*supra protest*." The person thus intervening states for whose honor he accepts. In case he pays, he becomes the creditor of that party, and may also have recourse to all who precede him on the bill, in opposition to the general rule of law that one can not become the creditor of another without his consent. When the bill matures it is again presented to the original drawee for payment, who may in the meantime have been placed in funds, and may now be willing to take up the bill. Should he again refuse, it is protested and presented to the acceptor *supra protest* for payment, and if he then refuses to make payment, another and final protest will be necessary to charge drawer or indorsers.

4. *Presentment for Payment.*—It is a general rule that as between debtor and creditor no presentment for payment is necessary. It is the duty of the debtor to seek the creditor, and if the day for payment elapses without it there is an immediate remedy by action. The better opinion in the U. S. is that this rule applies to an acceptor of a bill of exchange, even where it is payable at a particular place, such as a specified bank. On this view it would not be necessary for the holder to prove a presentment, but the acceptor might show in his defense any facts that would relieve him or diminish liability, such as that he had left funds with the bank, which had failed. But to charge drawer and indorsers the case is entirely different. These enter into no absolute engagement, but only into an obligation implied by law. It is a part of the implied contract that presentment for payment shall be made, and protest, where that is necessary, and notice given. These acts must be alleged in the pleadings, and proved at the trial as conditions precedent to a right of recovery. The modes of performing these various acts branch out into much detail, and only the leading ones can be brought within the compass of this article. The general rule is that the bill, when payable without designation of place, must be presented, when it matures, to the acceptor, either at his residence or place of business, and, if at the place of business, within business hours. If a particular place, as a bank, is designated, presentment must be made there within the usual hours devoted to banking business. This duty continues, though the place of business be closed or the acceptor be notoriously insolvent. In the case of an accommodation acceptance no presentment is necessary in behalf of the person to whom the accommodation is given, since he could have no action against such an acceptor. The duty of presentment, as well as of the performance of the succeeding acts, may be waived by a party to the bill by appropriate acts. This waiver may take place either before or after maturity of the bill. An instance would be a writing on the bill, "I hereby waive demand of the within bill," or "I hereby waive notice of de-

mand." The latter expression would be imperfect, since a waiver of notice does not dispense with the necessity of presentment, while a waiver of demand is, from the nature of the case, a waiver of notice.

A bill does not ordinarily actually mature on the day on which it apparently falls due. Three days are allowed, termed "days of grace." These have become so fully a part of the contract that the presentment before the last day of grace is nugatory. Should the last day fall on Sunday or a public holiday, the bill matures on the preceding day, except in New Jersey, where it falls due the day after. This matter is sometimes regulated by statute. If presentment is made and refused, protest should take place in the case of foreign bills, as already explained in reference to non-acceptance, and notice given to the parties to be charged. The subject of notice requires a fuller explanation than what has been given in connection with non-acceptance. The object of notice is to give information to the respective parties, to the end that they may protect themselves from loss. The test of its sufficiency is whether it gives the requisite information. No particular form is necessary. It may be either oral or written. It is a common practice to reduce it to writing, and either to give it to a party personally, or to send it to him by mail. By the general rule of law the mail can only be used for the purpose of transmission, and, accordingly, can not be resorted to where the holder and the person to be notified obtain their letters from the same post-office, though it is in some instances otherwise by statute. The law requires extreme diligence in dispatching the notice. It should be sent as early as the next day, and some authorities require by the first convenient mail on the next day. If the notice is properly sent by the mail, it will suffice, though never received. Any indorser receiving notice has a day to send it to one preceding him. After notice the rights of the holder are fixed, and it is not necessary for him to bring his action any earlier than he would be required to do by the statute of limitations. Delay to collect the bill from the acceptor does not of itself discharge the drawer and indorsers. If, however, a bargain (based upon a consideration) is made between the holder and acceptor, whereby the time of payment is extended, the drawer and indorsers are discharged, unless their consent is obtained. The drawer is not only liable for the face of the bill, but for damages incidental to non-payment. These damages are in some cases fixed by statute. It is sometimes necessary to take into account the difference in exchange between two countries; as, if a bill drawn in New York were payable in London, exchange being in its favor, and the action on the bill were brought in New York, and it cost a certain per cent. to place the funds in London, that amount should be included in the recovery. See PROMISSORY NOTE and EXCHANGE. T. W. DWIGHT.

Bill of Lading: the written evidence of a contract for the carriage of goods by water. It is usually signed by the master of the vessel, either in duplicate or triplicate, acknowledges the receipt of the goods from a person (called the consignor), and undertakes to deliver them to a designated person (the consignee) or his assigns at a specified place, for the compensation and on the conditions therein specified. An indorsement of the bill of lading transfers the title to the goods, and, if made in good faith and for a valuable consideration, cuts off the right of stoppage *in transitu*. For most purposes, a bill of lading is assignable, and an assignee takes it subject to any defense existing between the original parties. For the single purpose of shutting out the right of stoppage *in transitu* it is negotiable. (See STOPPAGE IN TRANSITU.) This instrument consists of two parts—a receipt and a contract. That portion of it which is a receipt can be contradicted, as between the original parties, by parol evidence. For example, if it were stated that the goods were in good order, evidence may be adduced to show the contrary. This proposition would not extend to a person who had made advances on the faith of the statement, as he could invoke the doctrine of estoppel. (See ESTOPPEL.) The part of the bill which is a contract can not be contradicted by parol evidence, even as between the original parties. Although the term was originally applied only to a memorandum of a contract for transportation by water, it is now frequently used to denote the memorandum given by any carrier of the terms on which he agrees to carry the goods received. T. W. DWIGHT.

Bill of Pains and Penalties: a special act of the legislature declaring a person guilty of some offense, without

any conviction in the regular course of judicial proceedings, and inflicting upon him some punishment less than death. It differs from a strict bill of attainder in that the punishment inflicted by the latter is death. Bills of pains and penalties are within the provision of the U. S. Constitution that neither Congress nor a State shall pass a bill of attainder or an *ex post facto* law. Thus a law of Congress disqualifying all attorneys of the Supreme Court who refused to take an oath that they had not been engaged in rebellion was accordingly held to be void. *Ex parte Garland*, 4 Wallace, R., 333. Revised by F. STURGES ALLEN.

Bill of Particulars: a written statement of the particulars of the demand for which an action at law is brought, or of a defendant's set-off against such a demand.

Bill of Peace: a bill in equity by which a person seeks to prevent a multiplicity of suits involving the same point, brought by a numerous class insisting upon the same right or by an individual attempting to establish an unsuccessful claim. An injunction is granted on the principle that equity will grant relief to prevent useless or oppressive litigation or irreparable mischief. A bill of peace is analogous to a bill *quia timet*, but is generally distinguished from it by the fact that it is brought only after the commencement of adverse proceedings. F. STURGES ALLEN.

Bill of Rights: an English statute enacted at the time of the accession of William and Mary to the throne. It declared, among other things, the right of the subject to petition the king, freedom in the election of members of Parliament, and freedom of speech in Parliament. It affirmed that standing armies without the consent of Parliament are illegal, that the king had no power of suspending or dispensing with laws, nor of levying taxes without the consent of Parliament. It provided that excessive bail should not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted, and for the right of Protestant subjects to bear arms for their defense. The provisions of this act have had great influence in the U. S., and are deemed of high consequence, as securing liberty to the individual. A number of them are literally inserted among the amendments to the U. S. Constitution, and are also found in State constitutions. Bills of rights were favorite enactments of the conventions in France following the revolution of 1789. The phrase "bill of rights" is frequently employed in the U. S. to designate all those portions of a constitution, State or national, designed to secure liberty to the individual.

Bill of Sale: a writing under seal conveying the title to goods and chattels. The seal by the common law is conclusive evidence of consideration. Accordingly, a bill of sale formally executed passes the title without any consideration or delivery of the property. Where there is no seal, there must be a consideration or delivery. A delivery without consideration would amount to a gift. A bill of sale may pass a title which would be valid as between the parties, and yet not of force as to creditors or purchasers, as if one who was indebted should make a bill of sale without actual consideration, or should sell, even with consideration, and still retain possession of the goods. The transaction might be regarded as infected with fraud, even though there were no fraudulent intent actually embodied in it. (See FRAUD.) English cases speak of the transfer of the ownership of a ship at sea by the assignment of the "grand bill of sale," but no distinction is made in the U. S. As to the general law concerning sales of chattels and the requisites to their validity, see SALE. In a more popular sense, a bill of sale is any written instrument, though not under seal, executed as evidence of a sale.

Revised by F. STURGES ALLEN.

Billroth, bil rōt, CHRISTIAN ALBERT THEODOR; German surgeon; b. in Rügen, Apr. 26, 1829; studied at the universities of Greifswald, Göttingen, and Berlin, taking the degree of M. D. at the latter in 1852; professor and director of the surgical clinic, University of Zurich, 1860-67; after 1867 he held the corresponding chair in the University of Vienna. His contributions to professional literature are very numerous and important, and have been translated into all the leading modern languages. D, Feb. 6, 1894.

Bill'ney, THOMAS; English martyr; b. about 1495; ordained 1519. He was a fellow of Trinity Hall, Cambridge, and preached there and in London and many other places. He opposed the Schoolmen's formal "good works" and the worship of saints and relics, and he converted Hugh Lati-

mer and others to these views. Arraigned in 1527, he recanted and escaped with a year's imprisonment in the Tower; but having begun to preach again in the fields of Norfolk, he was condemned and burned at Norwich, Aug. 19, 1531.

Bilox'i: city; on railroad; Harrison co., Miss. (for location of county, see map of Mississippi, ref. 9-11); 79 miles E. N. E. of New Orleans, and on Biloxi Bay; lat. 30° 23' 8" N., lon. 88° 53' 1" W.; is a place of summer and winter resort. It has an iron lighthouse, with a fixed white light 62 feet above the level of the sea. Biloxi is a manufacturing and shipping point, and, besides fruit and vegetable canning industries, has an oyster-packing business second in extent only to that of Baltimore. Fine schools, numerous churches, electric lights, artesian water-works, and over 25 miles of shell-roads are among the advantages of the city. The first settlement made upon the Mississippi by white men was made here in 1699 by Pierre Lemoyne d'Iberville. Pop. (1880) 1,540; (1890) 3,234; (1893) estimated, 5,000.

EDITOR OF "HERALD."

Biloxi Indians: See SIOUAN INDIANS.

Bilqula Indians: See SALISHAN INDIANS.

Bil'son, THOMAS; English prelate; b. in Winchester in 1546-47; studied at Oxford; became a prebendary of Winchester 1576; Bishop of Worcester 1596; translated to Winchester the year following. Bilson was a man of great learning, and a zealous defender of the Church of England against the Puritans. He was, along with Miles Smith, the final reviser of the Authorized Version of the Bible, and prepared the chapter headings. He wrote, among other works, *The True Difference between Christian Subjection and Unchristian Rebellion* (Oxford, 1585), prepared at Elizabeth's command in answer to W. Allen's *Defense of English Catholics*, and *The Perpetual Government of Christ's Church* (London, 1593; n. e. Oxford, 1842), which is considered an able defense of the doctrine of apostolic succession; but his *magnum opus* was *The Survey of Christ's sufferings for Man's redemption and of his descent to Hades or Hell for our deliverance* (1604). D. in London, June 18, 1616.

Bils'ton: a market-town of Staffordshire, England; 2 miles by rail S. E. of Wolverhampton (see map of England, ref. 9-6). It forms part of the parliamentary borough of Wolverhampton, and is an important center of the hardware trade. It is situated between numerous iron and coal mines, and has large manufactures of japanned ware. Pop. (1891) 23,453.

Bilnehistan: See BALUCHISTAN.

Bi'mana [quasi-Lat., from Lat. *bi-*, double + *manus*, hand]; an order of mammals proposed for the reception of man (see HOMINIDÆ) as distinguished from the apes and lemurs (*Quadrumana*). See QUADRUMANA and MAN.

Bi-metallism: See MONETARY STANDARDS.

Bin, bin, JEAN BAPTISTE PHILIPPE ÉMILE; historical and decorative painter; b. in Paris, Feb. 10, 1825; pupil of Gosse and of Léon Cogniet; Legion of Honor 1878. His *Prometheus Chained* (1867) is in the museum at Marseilles. Decorated the Polytechnicon in Zurich (1865-70). Style academic and formal. Bin has taken an active part in Paris politics, and has been mayor of the Eighteenth (Montmartre) Arrondissement. WILLIAM A. COFFIN.

Binary Stars: See BINARY SYSTEM and DOUBLE STARS.

Binary System: a pair of stars revolving around a common center of gravity. The only distinction we can make between an ordinary double star and a binary system is that motion has been detected in the case of the latter, whereas in the case of the former the relative position of the two bodies appears to remain invariable. There can be no doubt, however, that all double stars, properly so called—that is to say, all stars which are actually very near together—revolve around each other; their mutual attraction alone would necessarily change their relative position. But the period of revolution is usually many centuries, frequently several thousand years. Hence when first discovered no change can be observed, but the longer observations are continued the greater are the number of cases in which some change is found to be going on.

The first exact estimates of the relative positions of such objects were made by Sir William Herschel toward the close of the last century, and the next by Struve, of Dorpat, about the first quarter of the nineteenth century. As ob-

servations of the bodies noted by Herschel and Struve are continued, more and more of them are found to be in motion. The most remarkable binary systems are those which are discovered by the spectroscope, in cases where the motion is too small to be detected by any other means. Thus it is found that the star Algol has an invisible companion revolving around it, which partially eclipses it at every revolution. See ALGOL.

S. NEWCOMB.

Binary Theory: See CHEMISTRY.

Bindrabund: same as BRINDABRAN.

Bindweed Family (*Convolvaceae*): herbaceous, shrubby, or rarely arboreous dicotyledons, gamopetalous, with superior ovaries. They are related to the nightshades, borages, phloxes, etc. There are 800 species, mostly natives of warm climates. *Ipomoea*, the morning-glories, and *Convolvulus*, the bindweeds, are representative genera. *Cuscuta*, the dodders, is a genus of degraded parasitic species.

CHARLES E. BESSEY.

Binet, de *Be'nyay'*, VICTOR JEAN BAPTISTE BARTHÉLEMY: contemporary landscape-painter; b. at Rouen, March 17, 1849. First-class medal, Paris Exposition, 1889. A realistic painter, whose work is notable for good drawing and truth of atmospheric effect, but is lacking in color quality. *The Plain at St. Aubin-sur-Quillbœuf* (1886) is one of the best of his pictures, and is in the museum at Amiens. Studio in Paris.

WILLIAM A. COFFIN.

Bingen (anc. *Vincum* or *Bingium*): a town of Germany; in Hesse; finely situated on the left bank of the Rhine; at the mouth of the Nahe; 20 miles by rail W. of Mentz (see map of German Empire, ref. 6-D). The Nahe is here crossed by an old bridge supposed to have been built by the Romans. Wine of superior quality is produced in the vicinity. Near Bingen the Rhine passes through a narrow channel called *Bingerloch* (i. e. the hole of Bingen), in which the rocks and rapid current once rendered the navigation dangerous, but in 1834 the obstruction was mostly removed. Bingen is opposite Rüdelsheim, from which it is separated by the Rhine. It has manufactures of bannel, fustian, and leather. Here are interesting ruins of an old castle, Klopp, originally founded by Drusus, and of the celebrated chapel of St. Roch on the Rochus-berg. A little farther to the south, between Bingen and Bingerloch, rises in the middle of the stream a high rock, the so-called tower of Bishop Hatto. An heroic statue of *Germania* in the Niederwald commemorates the German victories of 1870-71. The surrounding scenery is highly picturesque. Pop. (1890) 7,654.

Bing'ham, Rev. HIRAM: b. in Bennington, Vt., Oct. 30, 1789; graduated at Middlebury College in 1816; at Andover in 1819; and was one of the first Congregational missionaries sent to the Sandwich islands, where he long exercised a powerful influence. He returned to the U. S. in 1841. D. in New Haven, Conn., Nov. 11, 1869.

Bingham, JONAS A.: politician; b. in Mercer, Pa., in 1815; removed to Ohio. He was elected a member of Congress by the Republicans of the Western Reserve in 1854, and was often re-elected. He was chairman of the managers who conducted the impeachment of Andrew Johnson in Apr. and May, 1868. He was again elected to Congress in 1870. Was U. S. minister to Japan (1873-85).

Bingham, JOSEPH: Church of England antiquary; b. in Wakefield, Yorkshire, in Sept., 1668; d. at Havant, near Portsmouth, Aug. 17, 1723; studied at Oxford and became a fellow of University College (1689), but in 1695 was compelled to give up his fellowship and leave the university on account of a sermon he preached on the meaning of the word "person" when used by the Fathers, and which brought upon him the false charge of heresy. In the same year, however, he was made rector of Headbourn Worthy, whence he was transferred to Havant in 1712. His great work *Origines Ecclesiasticæ; or, The Antiquities of the Christian Church*, first appeared in English (London, 1708-22, 10 vols.). It has often been reprinted, and has not yet been superseded. The best edition is that included in the complete edition of his works by Richard Bingham (London, 1821-29, 9 vols.; n. e. by J. R. Pitman, 1838-40; reprinted Oxford, 1855, 10 vols.). The *Antiquities* are separately published in the Bohn Series (1815, 1852, 2 vols.). It was translated into Latin by Griseovius (Halle, 1724-38, 10 vols.), and into German, but in the interest of the Roman Catholic Church (Augsburg, 1788-96, 4 vols.). See his *Life* by Richard Bingham, Jr., in his complete works. Revised by S. M. Jackson.

Bingham, KINSLEY S.: b. at Camillus, Onondaga co., N. Y., Dec. 16, 1801; studied law; went to Michigan in 1833; was a judge of probate, Speaker of the House of Representatives, member of Congress (1849-51), Governor (1855-59), and U. S. Senator (1859-61). D. at Green Oak, Livingston co., Mich., Oct. 5, 1861.

Binghamton: city and railroad center; capital of Broome co., N. Y. (for location of county, see map of New York, ref. 6-G); was incorporated as a city in 1867. It is pleasantly situated in a hilly, agricultural country, devoted principally to the dairy industries. The altitude of the city at the river is 859 feet above tide-water. The Susquehanna and Chenango rivers form a junction within the city. The Susquehanna is spanned by two iron carriage bridges and a foot bridge; the Chenango is spanned by a handsome and wide full-deck wagon bridge, which mites sections of the principal business street, and by a suspension bridge. All the carriage bridges are crossed by electrical street railroads. The rivers, and the land sloping gently toward them from all directions, are objects of natural beauty and are decorated by works of art, so that Binghamton has acquired the name of "Parlor City."

The national census of 1890 showed 702 establishments carrying on 93 industries, including the manufacture of leather, boots, shoes, clothing, cigars, chairs, wagons, carriages, cutters, children's carriages and sleighs, scales, furniture, glass, combs, buttons, brushes, engines, machinery, carriage and harness trimmings, barrels, doors, sash, blinds, flexible shafts, soap, and refined oils. The capital invested in manufacturing industries was in 1890 \$9,022,851, and \$4,306,862 was paid to 10,077 employees. The cost of materials used was \$7,583,413, and the finished products were worth \$14,932,001.

Among the conspicuous buildings, besides the business blocks, are 8 large churches, Central High School, county court-house, Federal Government court-house and post-office, State armory, State insane hospital, 9 large ward-school buildings, opera-house, and 2 orphan's homes. The new Stone opera-house is one of the finest theaters in the State, having a front of 70 feet width, of brown-stone, and a depth of 200 feet. The insane hospital consists of the very large building erected for an inebriate asylum, and a cluster of smaller buildings, all capable of accommodating about 2,000 patients. The city is well equipped with first-class hotels.

Binghamton is at the intersection of two trunk lines (New York, Lake Erie and Western, and the Delaware, Lackawanna and Western). The D., L. and W. has branches to Syracuse and to Utica. The Albany and Susquehanna R. R., owned by the Delaware and Hudson Canal Company, connects here with the other roads.

The incorporated limits of the city contains 6,400 acres. There are 83 miles of streets, lighted by a private electric plant. The bonded debt is \$310,000. The total property valuation for 1892 was \$18,792,210, and the city taxes were \$268,719.

There is a very efficient volunteer fire department, having 2 steamers, 2 chemical engines, an aerial truck, and 6 hose-carriages and trucks.

There are 17 public schools, good private schools, Protestant and Catholic, and a fund of \$80,000 has been left by will for the establishment of an industrial school. The public library contains 7,827 volumes.

The city contains 26 churches and 5 chapels, making 31 houses of worship.

Water is supplied by the Holly system. The capacity of the works is 18,000,000 gal. in 24 hours. There are 50 miles of water-pipes. The works are valued at \$1,500,000.

The financial institutions consist of 3 national banks, 2 State banks, 1 trust company, 2 savings banks, and 3 banking houses. There are also 1 safe deposit company, 2 building and loan fund associations, and an associated bank.

Ross Park, containing about 100 acres, is equipped with driveways and summer buildings. Bennett Grove, of about 50 acres, owned by private parties, is thrown open to the public for a park. The Binghamton Association Driving Park and the Stow Park and Exposition ground are also private property devoted to public use. Annual fairs are held upon the Exposition ground.

There are 20 miles of street-car lines, running out to 12 suburbs. All but one line of about 5 miles is consolidated under the Binghamton Railroad Company, and operated by electricity. The rapid growth of the city between 1880 and 1890 is attributable largely to rapid-transit facilities as well

as to the prosperity of local industries. The workmen live largely in cottages of their own, built upon lots 50 feet front and from 100 to 200 feet deep.

Pop. (1870) 12,692; (1880) 17,317; (1890) 35,005.

ASSOCIATE EDITOR OF "DAILY REPUBLICAN."

Bing'ley: a town in the West Riding of Yorkshire, England; situated on an eminence on the river Aire; 15 miles W. N. W. of Leeds (see map of England, ref. 6-G). The Leeds and Liverpool Canal passes by it. Here are manufactures of worsted goods, paper, etc. Pop. (1891) 10,023.

Bin'ney, AMOS, M. D.: naturalist; b. in Boston, Oct. 18, 1803; graduated at Brown University in 1821; was the owner of an ample fortune. He was a liberal patron of artists and men of science, and was president of the Boston Society of Natural History. He wrote *Terrestrial and Air-breathing Mollusks of the United States* (finely illustrated), D. at Rome, Feb. 18, 1847.—His son, W. G. BINNEY, is also a distinguished conchologist.

Binney, HIBBERT, D. D.: b. in Nova Scotia, Aug. 12, 1819; educated in London and Oxford, graduating at the latter university in 1842. In 1851 he was consecrated Bishop (Anglican) of Nova Scotia and Prince Edward Island, which was the first bishopric founded by England in her colonial dependencies, originally including not only Nova Scotia and Prince Edward Island, but also New Brunswick and parts of Lower Canada. Bishop Binney was a visitor at the General Convention of the Protestant Episcopal Church held at Chicago in 1886. D. in 1887.

Binney, HORACE, LL. D.: lawyer; b. in Philadelphia, Jan. 4, 1780. He graduated at Harvard College in 1797, and divided the first honors with his classmate, the late Judge White, of Salem, Mass. Having studied law with Jared Ingersoll in Philadelphia, he was admitted to the bar in 1800, and rose in a few years to the highest rank in his profession. He declined high judicial positions which were offered him, but as a lawyer he took a prominent part in important cases in the higher courts of Pennsylvania, and was several times called to the Supreme Court of the U. S. Elected to Congress in the latter part of Jackson's first administration, he distinguished himself by his eloquence and ability. In 1843 he made his celebrated argument in the Supreme Court of the U. S. in the case of *Vidal versus the mayor of Philadelphia*. This admirable argument is often cited by the bench and bar of the U. S. as authority on questions involving the law of charitable uses, and has been referred to by eminent English jurists in the highest terms of praise. Mr. Binney appeared for the last time before his legal brethren on the occasion of the death of his friend, the Hon. John Sergeant, whose character he delineated in terms of deep feeling and eloquence. Mr. Binney's principal works, besides the argument in the *Vidal* case, are *An Inquiry into the Formation of Washington's Farewell Address* (1859); eulogiums on Chief Justice Tilghman (1827), and Chief Justice Marshall (1836); and *Reports of Cases in the Supreme Court of Pennsylvania* (6 vols.). D. in Philadelphia, Aug. 12, 1875.

Binney, THOMAS, D. D., LL. D.: an English Dissenting minister; b. at Newcastle-upon-Tyne, Apr. 1798; educated at the Theological Seminary at Wymondley, Hertfordshire; became pastor in Newport, Isle of Wight, 1824; pastor of King's Weigh-house chapel, London (1829-69); wrote many controversial papers, *Conscientious Clerical Nonconformity*; *Service of Song*; and several books for young men, besides several volumes the products of a controversy with the Bishop of Adelaide, and the familiar hymn *Eternal light! eternal light!* D. in London, Feb. 24, 1874.

Binnie, ALEXANDER R., F. G. S., F. R. M. S.: engineer to the London County Council; b. in London in 1839; educated at private academies; pupil and assistant to the celebrated J. P. La Trobe Bateman, F. R. S.; in early life was engaged in railway construction in England and Wales. By public competition he entered the Public Works Department of India in 1868, where he remained six years, discovering coal in the Central Provinces. He designed and constructed the works for supplying Nagpur with water, and for a short time was acting secretary of the department. He was engineer to the Bradford Corporation in England for fifteen years, designing and constructing many large works, among them a reservoir embankment 125 feet in height. He also designed a large extension of the water-works in the Nidd valley. He designed and is now constructing a tunnel under the Thames at Blackwall, to be built by means of a shield through water-bearing ballast,

and lined with brick inside of a heavy cast-iron shell. Author of a paper on Nagpur water-works, which obtained from the Institution of Civil Engineers the Telford medal; lectures on water-works at Chatham; and *Heat in its Relation to Coal*, an address as president to the Bradford Philosophical Society.

WILLIAM R. HUTTON.

Binocular Telescope [*binocular* is from Lat. *binī*, two each + *oculus*, eye]: a combination of two telescopes the distance of whose parallel central axes is equal to that between the eyes, so that both eyes may be applied at once. An object may then be observed with both eyes at the same time, one looking through each tube. There are also binocular microscopes, having two tubes, one for each eye. In some kinds of work they possess superior defining power.

Binomial [formed from Lat. *bi-*, having two + *nōmen*, name, term]: in algebra, an expression having two terms joined by the sign + or -. The "binomial theorem" has for its object the expression of the law for the formation of any power of a binomial. By means of this theorem any power of $x + a$ can be at once written down without going through the actual multiplication. The older mathematicians were acquainted with this method of finding such powers, but Newton first demonstrated the universality of its application. This is considered one of his greatest discoveries, and the formula was placed upon his tomb. It is usually written thus:

$$(x + a)^m = x^m + \frac{m a x^{m-1}}{1} + \frac{m(m-1)}{1 \cdot 2} a^2 x^{m-2} + \frac{m(m-1)(m-2)}{1 \cdot 2 \cdot 3} a^3 x^{m-3}, \text{ etc.}$$

BINOMIAL COEFFICIENTS: the coefficients of the powers of quantities which occur in the binomial theorem, as

$$\frac{m(m-1)}{1 \cdot 2}; \frac{m(m-1)(m-2)}{1 \cdot 2 \cdot 3}, \text{ etc.}$$

Binomial Nomenclature: the system of naming animals and plants introduced by Linnaeus near the middle of the last century, and now in universal use among scientific men. In this system the species or different kinds of animals or plants are gathered together in larger groups or genera. The name of the genus is a Latin substantive, that of the species is adjective or a noun having the force of an adjective.

The genus may contain one or many species, and with the progress of exact knowledge of species the tendency has been to split the genera into smaller and smaller groups by more rigorous definition.

Examples of binomial nomenclature are *Quercus alba*, the white oak; *Felis leo*, the lion; *Sparisoma abildgaardii*, Abildgaard's parrot-fish; *Abies pechinata*, the balsam-fir of Eastern North America.

D. S. JORDAN.

Bintang' (Malay *Bentan*, called by Marco Polo *Pentam* and by Camoens *Binlão*): an island on the south side of the Straits of Singapore; central lat. 0° 52' N., long. 104° 26' E.; surrounded by rocks and small islands, making navigation dangerous. Area, 440 sq. miles. It is low and swampy, and produces much gambir, for which it is visited by Malay and Chinese traders. It was formerly a nest of pirates, but is now claimed by the Dutch, who founded on it a port, Rhio or Rionw, intended to become a rival for Singapore.

Binturong' (*Arctictis binturong*): one of the largest of the *Viverrida*, or civet-cat family; a native of Borneo, Java, Sumatra, and Malacca. Its body and tail are covered with harsh, bristly, black fur. It possesses a long, tapering prehensile tail, which exceeds in length that of any other of the *Eluroidea* (cats, civets, and hyenas) except the tiger.

D. S. JORDAN.

Bio-Bio, bee'ō-bee'ō: the largest river of Chili; rises in the Andes, and enters the sea at Concepcion, after a course of 200 miles.

Bio-Bio: an interior province of Chili; in lat. 37° S.; on a river of the same name; between Argentina and Arauco, with Concepcion and Nuble on the N. and Malleco on the S. Area, 4,158 sq. miles. It is traversed by a north and south railroad. Capital, Angeles. Pop. (1891) 122,729.

Biogenesis [from Gr. *bios*, life + *gēveais*, birth]: the origin of living organisms from living organisms by some form of reproduction either asexual or sexual; a term used in opposition to *abiogenesis*, or the origination of living things from non-living matter. The term is also applied to that body of doctrine pertaining to the reproduction and development of living things, both with reference to the individual and with reference to the race, of which the fundamental doctrine is held to be that "ontogeny," the history of the

development of the individual, is a short recapitulation of the history of the race, which is called in turn "phylogeny." In other words, the individual in coming from the ovum to the adult stage passes through a series of forms which indicate in a more or less abbreviated way the ancestral forms along the line of its descent. Biogenesis includes investigations of the development of organisms from this doctrine as a basis.

D. S. JORDAN.

Biographical Dictionaries: The earliest known book at all resembling our modern biographical dictionaries is the *Elucidarius carminum et historicarum*, compiled by Herman Torrentinus (Van Beeck), and published in Deventer in the year 1498. Its popularity during the sixteenth century is attested by more than forty editions. Meanwhile improved dictionaries, likewise containing geographical and other articles, as well as biographies, were made by Robert Estienne (1st edition 1541), by Charles Estienne (1553), and by Louis Moreri (1674). Moreri's book passed through more than twenty revised editions, and remained the standard work for nearly a century, the volumes of Bayle (1697), Chaufepié (1750-56), and Marchand (1758-59) being avowedly but supplements to it. The first comprehensive dictionary exclusively biographical was a meager and inaccurate compilation by the Abbé L'Avocat, published in 1752. It was soon superseded by the *Nouveau Dictionnaire Historique Portatif*, purporting to be compiled by "une société des gens de lettres," and to be published at Amsterdam. In fact, its sole author was the French Benedictine Dom Chaudon, who wished to avoid the press-censorship, and the book was actually printed at Avignon in 1766. Chaudon's work, frequently revised, maintained its position as the biographical dictionary until the beginning of the present century. The earliest important English work was *The New and General Biographical Dictionary* of 1761 in 11 volumes 8vo. Upon a later edition of this book was founded *The General Biographical Dictionary*, edited by Thomas Chalmers (1812-17, 32 vols. 8vo), which, in spite of the publication in 1840-47 of *A New General Biographical Dictionary*, by H. J. Rose (in 12 vols. 8vo), remains to this day one of the best comprehensive biographical dictionaries in English. Among its chief rivals are *The Imperial Dictionary of Universal Biography* (Glasgow, 1865, 3 vols. 8vo), and Dr. J. Thomas's *Universal Pronouncing Dictionary of Biography* (Philadelphia, 1886, 2 vols. 4to), which are later and more concise than Chalmers. But none of these books approach in merit either the *Biographie Universelle Ancienne et Moderne*, published by Michaud (first edition 1811-53, 79 vols.; second, greatly improved edition, 1843-65, 45 vols. 8vo), or the *Nouvelle Biographie Générale* (1852-77, 46 vols. 8vo), edited by Dr. Hofer, but frequently called by the name of its publisher, Didot. The more important of the above mentioned books are indexed in Phillips's *Dictionary of Biographical Reference* (third edition, Philadelphia, 1889), which contains 100,000 names. Even more comprehensive, but likewise exceedingly brief, is Oettinger's *Moniteur des Dates* (Leipzig, 1869-82, 2 vols. 4to). Extensive and valuable biographical dictionaries are also included in the chief encyclopedias, as *Johnson's Universal Cyclopaedia*; likewise Knight's *English Cyclopaedia* (1861-62); *Appleton's American Cyclopaedia* (1881); *Chambers's Encyclopaedia* (1888-93); Larousse's *Grand Dictionnaire Universel du XIX^e Siècle* (1866-78); and in the *Conversations-Lexica* of Brockhaus and of Meyer.

In addition to the general biographical dictionaries there are numerous excellent books confined to biographies of persons: (1) of a single nation, e. g. Englishmen; (2) of a single period, e. g. the present century; or (3) of a single class, e. g. musicians. Among the more important books of the first class are the following: For Americans, *Appleton's Cyclopaedia of American Biography*, edited by J. G. Wilson and J. Fiske (1886-89, 6 vols. 8vo), which has almost completely superseded the earlier books by Drake (1872) and Allen (third edition, 1857). For Great Britain, the *Dictionary of National Biography*, begun in 1885 under the editorship of Leslie Stephen, and to be completed in about 60 volumes. For Scotchmen, see J. Irving's *Book of Eminent Scotsmen* (1881); for Irishmen, A. Webb's *Compendium of Irish Biography* (1878); for Germans, the *Allgemeine deutsche Biographie*, begun in 1875, and now (1893) extending in 34 vols. 8vo to the letters "Spa"; and for Austrians, Wurzbach's *Biographisches Lexikon des Kaiserthums Oesterreich* (1856-91, 61 vols. 8vo). The following are the editors of the chief biographical dictionaries for the countries mentioned: for Holland, Van der Aa; for Belgium, the

Brussels Royal Academy; for Denmark, Bricka; for Sweden, Pambald; for Russia, Vengerov, also Gennadi; for Spain, Antonio. For Frenchmen the best books are Michaud and Didot. There is no satisfactory book for Italians of all the provinces.

Of books about persons of a single period the most useful are: Dr. William Smith's *Dictionary of Greek and Roman Biography and Mythology* (1844-49, 3 vols. 8vo); Smith and Wace's *Dictionary of Christian Biography* (1877-84, 4 vols. 8vo), reaching to 800 A. D.; and Chevalier's *Répertoire des Sources Historiques du Moyen Âge: Bio-Bibliographie* (1877-88, 2 vols. 8vo), which gives no biographies itself, but indexes the biographical material contained in several thousand volumes in various languages so far as it refers to persons living in the Middle Ages. For contemporary and recent biography the best works are: L. C. Sanders's *Celebrities of the Century* (1887, 8vo); *Men and Women of the Time* (thirteenth edition, by G. W. Moon, 1891); Vapereau's *Dictionnaire des Contemporains* (sixth ed. 1892-93); and Boase's *Modern English Biography* (1st vol. 1892). The biographical reference books for persons of single classes are extremely numerous. Among the more important are:

For authors, S. A. Allibone's *Critical Dictionary of British and American Authors* (1858-73, 3 vols. 8vo, and supplement by J. F. Kirk, 1891, 2 vols.); De Gubernatis, *Dictionnaire International des Écrivains du Jour* (1888-90, 2 vols. 8vo); and Brümmer's *Deutsches Dichter-Lexikon* (1876-77, 2 vols. 8vo).

For artists, Champin and Perkins's *Cyclopaedia of Painters and Paintings* (1887, 4 vols. 8vo), and M. Bryan's *Dictionary of Painters and Engravers* (new edition by Graves, 1888, 2 vols. 8vo).

For musicians, Grove's *Dictionary of Music and Musicians* (1879-89, 4 vols. 8vo); Champin and Ajdhorp's *Dictionary of Music and Musicians* (1890, 3 vols. 8vo); and Fétis's *Biographie Universelle des Musiciens* (second edition, 1860-65, 8 vols. 8vo, with supplement by Pougin, 1878-81, 2 vols. 8vo).

For medical men, Thatcher's *American Medical Biography* (1823, 2 vols. 8vo, with supplement by S. W. Williams, 1845); Atkinson's *Contemporary Physicians and Surgeons of the United States* (1878); and Hirsch's *Biographisches Lexikon der hervorragenden Aerzte aller Zeiten und Völker* (1880-89, 9 vols. 4to).

For theologians, W. B. Sprague's *Annals of the American Pulpit* (1865-73, 11 vols. 8vo); Philip Schaff and S. M. Jackson's *Encyclopaedia of Living Divines* (1887, 4to, being a supplement to the Schaff-Herzog *Cyclopaedia of Religious Knowledge*, 1882-85, 3 vols. 4to, which also contains biographies); P. Lichtenberger's *Encyclopédie des Sciences Religieuses*, tome 13, containing a *Dictionnaire des Contemporains* (1882, 8vo).

In general those biographical dictionaries are most satisfactory which contain signed articles, and indicate sources of further information. Consult on biographical dictionaries *Quarterly Review*, vol. clvii., pp. 187-230, and *Library Journal*, vol. xiv., pp. 7-20.

C. H. HULL.

Biography [from Late Gr. βιογραφία, or formed from Gr. βίος, life + γράφειν, write]: literature which treats of the lives of individual persons. Anciently, the leading incidents of a man's life were narrated in their historical sequence, without elaborate attempts to analyze character. Ancient biography was possessed of a stately dignity, colored but sparingly with eulogy or censure. Modern biography, on the other hand, like modern history, is often full of criticism and disquisition. Of strictly biographical works, the most valuable that have come to us from the ancient Greeks are the *Memorabilia* of Xenophon and the *Lives* of Plutarch. Roman literature also possesses an admirable *Life of Agricola*, by his son-in-law, Tacitus. Besides these may be mentioned the *Lives* ascribed to Cornelius Nepos; the writings of Suetonius; the *Life of Alexander the Great* by Curtius; *Lives of the Sophists* by Philostratus; and a *Life of Plato* by Olympiodorus. Later, we encounter the *Lives of the Fathers* by St. Jerome and others, while biographies of saints, martyrs, etc., are scattered profusely through ecclesiastical literature. The monks of the Middle Ages worked at the manufacture of biographies in which the hunger for the marvelous was gratified. For modern compilations, see the article on BIOGRAPHICAL DICTIONARIES.

Biology [from Gr. βίος, life + λόγος, discourse, -λογία, doctrine, science]: that branch of the study of nature which

treats of organized beings under their diverse relations, in contradistinction to mineralogy, which relates to the inorganic or mineral substances; its subjects are therefore animals (zoölogy) and plants (botany or phytology), living and extinct. These agree with each other, and differ from minerals in (1) the physical and chemical characteristics of their primitive constituents or cells, and the concomitant phenomena of life exhibited under certain conditions; in (2) the perpetual change during life in the organism by loss of substance proportioned to the demands on the system of exertion or existence, and the renewal of substance by derivation and assimilation of nutriment from without; in (3) the segregation and specialization, when the demand for rapid growth has been fulfilled, of certain portions of the organism as reproductive organs, differentiated as receptive and procreative (female), and impregnating and vivifying (male); from the former of which (after the conjunction of the two under certain conditions) an organism originates essentially like that from which it proceeds; in (4) the existence, for a vaguely determinate period, of the organism, and finally a disturbance of the equilibrium or conditions of existence, death and dissolution; and in that (5) originating as above indicated, the offspring repeats the same cycle of phenomena as the parent, and in turn contributes to the perpetuation of the race. Our limits will only allow us to briefly consider, in the order indicated, these characteristic features of the great empire of organic nature.

(1) The animal or vegetable organism is in the main constituted of four elements, three of which are separately known in a gaseous state—*oxygen*, *hydrogen*, and *nitrogen*—and one—*carbon*—in a simple condition is only known in a solid form. From this predominance of gaseous elements results the degree of molecular mobility of the constituents of the organism, and, according to Herbert Spencer, "that comparative readiness displayed by organic matters to undergo those changes in the arrangement of parts which we call development, and those transformations of motion which we call function." The same author has also insisted on facts that (1) the elements in question (except oxygen) have affinities which are narrow in their range, but low in their intensity; (2) that in all allotropism (or the ability to assume different states) is inherent; and (3) that they all present certain extreme antitheses (as, for example, between oxygen and nitrogen as to chemical affinity, and between carbon and the gases as to molecular mobility); and that these extreme contrasts "fulfill, in the highest degree, a certain further condition to facility of differentiation and integration." The primary form into which these elements enter is a fluid substance called protoplasm, which may or may not be nucleated, but in most organisms assumes the nucleated condition (that is, of cells); of such elements, more or less modified and disguised according to circumstances (i. e. specialization and complexity of parts), the entire organism is built up.

(2) By the absorption or ingestion of extraneous substances the organism derives a nutriment which is assimilated and converted into its own substance, and supplies the material (1) for the power for work, (2) the repair of the system, and (3) for direct growth. Every action and exertion is attended with a loss of substance, and hence exists the necessity for a corresponding supply of nutriment. For a certain length of time (according to the species or race), in addition to the preservation of an unstable equilibrium, there is also a demand for supply for increase of bulk, or growth, of the organism. The period and extent to which this is carried is, within certain limits, constant for each species.

(3) When the full stature or phase of development has been more or less nearly attained, the organs of reproduction become functionally developed, and provision for the perpetuation of the race is made. In plants, the female element is termed a seed; in animals, an ovum or egg. The male and female elements may be united in the same individual, as in most plants and many animals, but in the highest animals the sexes are always differentiated in distinct individuals. In mollusks, hermaphroditism is almost of ordinal value, but not more, and in at least one case (*Talvatida*) hermaphroditism occurs in an order of which the other members are dioecious. Among vertebrates, true hermaphroditism is only known (as an exceptional development) in certain fishes (*Serranida*); it is entirely unknown in the higher forms (mammals, etc.), all the reported cases to the contrary being referable to males with the genitalia in an embryonic condition, or females with the clitoris hy-

peretrophied. The homologies of the male and female organs render it impossible that there shall be a union of the sexes in the same individual in the mammals. Actual fecundation of individual germs (seeds or eggs) by the male element is necessary, in most cases, for their development, but in exceptional cases (e. g. certain insects, crustaceous mollusks), females produce broods of young without having had direct previous intercourse with the male. This peculiar capability has been designated *parthenogenesis*; the unimpregnated eggs (in some forms) produce only females. The question of the determination of sex is still involved in obscurity.

(4) After a certain period, if the individual has escaped all the liabilities to death that occur from enemies, accidents, and disease, there is a decline in the activity of the functions, the system becomes disordered, and death ensues. This period, like those of growth and development of the reproductive power, is also, within certain limits, a constant term, and all reports of extreme longevity—such as the reputed ages of H. Jenkins (169 years), T. Parr (150 years), and the Countess Desmond (140 years), and others—are either based on very unsatisfactory evidence or demonstrably false.

(5) The offspring, although as a rule very similar to the parent, is never exactly like it, being always distinguishable by some more or less obvious difference or *individuality* of character. Occasionally, however, the offspring differs very markedly in some one character, which may or may not be co-ordinated with other correspondingly important differences. The newly developed peculiarity is apt to be transmitted either to the immediate offspring or to a succeeding generation, and sometimes in an exaggerated degree. But such peculiarities, if the individuals so distinguished pair with those not exhibiting them, generally disappear in their descendants after a longer or shorter course. If, however, the individuals thus characterized are set aside, and their immediate and remote descendants selected in ratio to their possession of some peculiarity, that peculiarity will be indefinitely perpetuated, and a new race distinguished thereby will be thus originated. By means of such *artificial selection*, unintentional or studied, the various races of domesticated animals have been produced. And as, in most cases, there is an obvious fitness of organized beings to the conditions under which they are found, it has been assumed that such relations are the result of the survival of beings possessing characteristics which may have spontaneously arisen, and which have gradually become (relatively) perpetuated in the "struggle for existence"; and hence the hypothesis of *natural selection* has originated. Inasmuch, also, as no offspring is exactly like the parents, it follows that no generation is exactly like the preceding; and although there must be a certain unstable equilibrium, resulting from constant interbreeding, in the incessant surge of variations, the descendants must necessarily depart more and more from their progenitors. While in an historical epoch no very obvious changes may be perceptible, eventually (unless by the interposition of miraculous agency) there must be a contrast between the extremes of a lineage, and the exhibition of such must be merely a question of time, determined to a greater or less degree by the changes of condition. The assumption of this hypothesis, and the inductive evidence furnished by various departments of science, have culminated in the theory of *evolution*, and for an explanation of the *modus operandi* of evolution, natural selection (or Darwinism) has been evoked. The evidence relied upon is chiefly derived from morphology (and the contrast between it and teleology), embryology, the geological succession, and the geographical distribution of organisms.

While animals and plants differ from minerals, and agree with each other in all the characters thus specified, there are no such salient differences between themselves. It is, indeed, easy to distinguish the higher animals and plants, and they are, to a certain extent, antitypes and complementary to each other. On the one hand, plants derive their nourishment by absorption from the inorganic world through the external surfaces of their roots and leaves, and (under most conditions) decompose carbonic acid gas, assimilate carbon (and nitrogen), and eliminate oxygen. On the other hand, animals derive their nutriment, immediately or mediately, from plants, and ingest it either through a provisional or specialized alimentary cavity, imbibe oxygen, and exhale carbonic acid gas. The mode of taking nutriment is the most characteristic feature, and specialization especially tends to that end, but supplemented, in the animal,

by a specialization of other systems to guide it in the selection and pursuit of its food. Some rather high animals (e.g. certain Entozoa) take their nutriment through their external surfaces, but this is rather a teleological modification co-ordinated with atrophy of the intestinal tube, superinduced by peculiar conditions of life. In view of the slight differences between animals and plants, and their contrast with minerals, it is evident that the ternary division of natural objects into animals, plants, and minerals does not express the degree of the relations between them; and hence the animal and plant kingdoms have been combined in an *organic empire* or realm on the one hand, and on the other the minerals have been denominated an *inorganic empire*. The impossibility or great difficulty of discriminating the lowest plants and animals has also led some naturalists to separate them from the animal and vegetable kingdoms, and combine them in a peculiar one, which has received, with some varying limits, numerous names—e.g. Infusory world (Infusorienwelt), règne de Zoöphytes, règnes Psycholaire, règne chaotique, règne Plantanimal, regnum Amphorganicum, règne organique Primitive, kingdom of Protozoa, regnum Primitivum, kingdom of Primalia, and Protistenreichs. Such propositions, however, do not remove the difficulty, but only shift and complicate the questions, and obscure the recognition of the tendencies of the two antitypically functional divisions of nature. It need only be added that there is also, to some extent, a contrast in respect to individuality in the respective kingdoms, numerous individuals (flowers) being developed from the outgrowth of the contents of a single seed, while in all except some of the lower animals a single individual only originates from one egg. The subject of individuality, however, is a somewhat obscure one, and has provoked much discussion; and the question has been involved by the confusion of potential and actual individuality. For more detailed information respecting the various subjects of biology consult EVOLUTION, HERMAPHRODITISM, LONGEVITY, MORPHOLOGY, PALEONTOLOGY, PARTHENOGENESIS, TELEOLOGY, ZOÖLOGICAL GEOGRAPHY, and ZOÖLOGY and BOTANY, and their respective subdivisions. THEODORE GILL.

Bí'ón (of Smyrna): Greek heroic poet of the third century B. C.; contemporary and imitator of Theocritus. The longest and most admired of his poems is the *Lament for Adonis* (Ἐπιτάφιος Ἀδωνίδος). The language is beautiful, the tone tender. Reflexes of it are to be seen in the *Adonais* of Shelley. Ed. with Theocritus and Moschus by Gaisford (1821); Alrens (1855); Meineke (1856); translated with the same by Andrew Lang (1889).

Biando, bè-ò'n'dò, FLAVIO (1388-1463); the greatest archaeologist of the Italian Renaissance; author of *Roma instaurata*, *Roma triumphantis*, and *Italia illustrata*, three bulky encyclopedias of archaeological information which have constituted the basis of all subsequent dictionaries of Roman antiquities. Contemporary critics severely censured his careless style ("probitas laudatur et alget"). See Alfred Masius, *Flavio Biando und seine Werke* (Leipzig, 1879); J. A. Symonds, *Renaissance in Italy*. A. GÜDMAN.

Biot, bè-ò, EDOUARD CONSTANT; Chinese scholar; son of Jean Baptiste Biot; b. in Paris, July 2, 1803; was first interested in the introduction of railroads in France, but retired from public service on account of poor health, and devoted himself to study of the Chinese; member of the Academy 1847; author of articles on Chinese subjects in the *Journal Asiatique*; *De l'Abolition de l'Esclavage Ancienne en Occident* (1840); and *Dictionnaire des Villes, etc., de l'Empire Chinois* (1842). D. Mar. 12, 1850.

Biot, JEAN BAPTISTE; natural philosopher and astronomer; b. in Paris, Apr. 21, 1774. He became in 1800 Professor of Physics in the College of France. In 1803 he was admitted into the Institute, and in 1805 published *An Elementary Treatise on Physical Astronomy* (2 vols.). An enlarged edition of this appeared in 5 vols., 1841-57. Having been appointed a member of the bureau of longitudes, he was sent to Spain with Arago to measure the arc of the meridian. He contributed many able articles to the *Biographie Universelle* and the *Annales de Chimie et de Physique*; published, besides other works, a *Treatise on Experimental Physics and Mathematics* (4 vols., 1816), which is highly esteemed; and *Researches in Ancient Astronomy* (1829). In 1840 he received the Rumford medal of the Royal Society of London for his researches on the circular polarization of light. He was admitted into the French Academy in 1856. D. in Paris, Feb. 3, 1862.

Bí'otite, called also **Uniax'ial**, or **Magne'sian Mí'ea** [named for *Biot*, a French physicist, 1774-1862]: a mineral occurring in six-sided tubular prisms, having a perfect basal cleavage; generally dark green, brown, or nearly black in color. It has a vitreous luster, varies from transparent to opaque, is sectile, flexible, and elastic when reduced to thin laminae. It consists chiefly of silica, alumina, magnesia, and oxide of iron, with some potassa.

Bí'pont Editions: certain editions of the Greek and Latin classics, the publication of which was begun in 1779 at the German town of Zweibrücken (Deux-Ponts), called in Latin *Bipontium*.

Bir, beer (anc. *Bir'tha*; Turk. *Bireh-jik*): a town of Asiatic Turkey; on the left (east) bank of the Euphrates; 74 miles N. E. of Aleppo (see map of Turkey, ref. 6-11). It has about 2,000 houses, a citadel or castle on a steep rock, and several mosques. Caravans from Aleppo to Diarbekir and Bagdad cross the Euphrates at this point. Pop. about 6,000.

Bí'rch: a tree or shrub of the genus *Betula* and family *Cupulifera*; native of temperate and cold regions in Asia, Europe, and America (several species are found among the Himalayas). The genus *Betula* is distinguished by ten to twelve stamens and winged seeds (achenia); has alternate, simple leaves, and flowers in scaly catkins. The common birch of Europe and Asia (*Betula alba*) is a handsome tree with triangular or deltoid leaves, which are doubly serrate. The bark is smooth and chalky white, and separable in thin sheets or layers. This bark is very durable, and is used for tanning, dyeing yellow, and other purposes. In some countries hats, shoes, and boots are made of it. The wood is firm, tough, and valuable, and is much used by coopers, turners, and wheelwrights. The sap is esteemed as a beverage in Scotland, both in a fresh state and fermented. Europe produces a graceful variety called weeping-birch (*B. pendula* of some botanists), which attains a height of 60 feet, and has very slender and pendulous branches. The American white birch (*B. populifolia*) is a small, graceful tree with tremulous, deltoid, and shining leaves, but is not valuable for timber. Among the other species indigenous in the U. S. are the *B. lenta* (sweet or black birch), and *B. lutea* (yellow birch) and *B. papyracea* (canoe or paper birch). The *B. lenta* is a rather large tree, the bark of which is aromatic, yielding an essential oil identical with that of *Gaultheria*, and the timber is fine-grained and valuable for cabinet-work. The *B. papyracea* grows in the Northern States to the height of about 70 feet, has a fine-grained wood, and a very tough, durable white bark, splitting freely into thin layers, which have been used as paper. The Indians make canoes of this bark. The *B. lutea* sometimes attains a height of 80 feet, and is remarkable for the brilliant yellow tint of its bark or epidermis. The leaves are from 3 to 5 inches long. Besides the above and several less important species, the U. S. have the *B. nigra*, or river birch, which grows on the banks of streams and has remarkably tough wood. Russia leather is tanned with birch bark. "Russian oil" is a tar-like, empyreumatic substance obtained from birch-wood in Russia, and is useful in certain skin diseases.

Bí'rch, CHARLES BELL, A. R. A.; sculptor; b. at Brixton, England, Sept. 28, 1832; educated at Somerset House School of Design and Berlin Royal Academy; won prize of £600 for his group *A Wood Nymph* (1864); exhibited *The Last Call* (1879); and executed many busts and statues. He contributed drawings on wood and stone to various publications, especially the *Illustrated London News*. D. in London, Oct. 16, 1893.

Bí'rch, SAMUEL, LL. D.; b. in London, Nov. 3, 1813; was educated at Greenwich and Blackheath; afterward at Merchant Taylors' School, which he left in 1834, and was first employed under the commissioners of public records. In 1836 he was appointed assistant in the department of antiquities of the British Museum, from which he rose to be assistant keeper in 1841, and in 1861 keeper of the Oriental and Egyptian antiquities and ethnographical collections. He was considered one of the best modern Egyptologists; was the author of nearly all the last volume of Bunsen's work on Egypt, which contains the only English translation of the *Book of the Dead*; published a treatise on *Hieroglyphics* (1857); the *Rhind Papyrus* (1866), etc. In 1878 he edited Wilkinson's *Manners and Customs of the Ancient Egyptians*, and was editor of *The Records of the Past* from 1873 to 1880. D. in London, Dec. 27, 1885.

Birch, THOMAS, D. D., F. R. S.: biographer and historian; b. in London, England, Nov. 23, 1705. He took orders in the Anglican Church (1730), and became rector of parishes in London (1744) and in Depden, Essex (1761); was fellow of the Royal Society from 1735 and its secretary 1752-65. Among his numerous works, besides editions of Cudworth, Robert Boyle, Spenser, Sir Walter Raleigh, the prose works of Milton, and Bacon's *Letters and Speeches*, are *The General Dictionary, Historical and Critical* (10 vols., 1734-41); a *Life of Archbishop Tillotson* (1752); *Memoirs of the Reign of Queen Elizabeth* (2 vols., 1754); and a *History of the Royal Society* (4 vols., 1757). D. in London, Jan. 9, 1766.

Birch, THOMAS: portrait and marine painter; b. in London, England, in 1779; d. in Philadelphia, Jan. 3, 1851. He removed to the U. S. in 1793 and painted portraits in Philadelphia until about 1807, when he took up marine-painting. A number of his works represent naval battles of the war of 1812. W. A. C.

Birch-Pfeiffer, CHARLOTTE: actress and dramatic writer; b. at Stuttgart, June 2, 1800; married Dr. Birch, of Copenhagen, in 1825. She attained success as a performer and a writer. Among her dramas are *Die Günstlinge*; *Hinko*; *Dorf und Stadt* (1848); and *Anna of Austria* (Anna von Oestreich, 1850). D. in Berlin, Aug. 25, 1868.

Bird, EDWARD: genre-painter; b. in Wolverhampton, England, in 1772; apprenticed to a maker of japanware; became a drawing-teacher in Bristol; in 1809 he exhibited *Good News* in the Royal Academy, and soon after *The Choristers Rehearsing*; in 1814 was appointed painter to Princess Charlotte; the next year became a Royal Academician. D. in Bristol in 1819. His most famous canvas was *The Day after the Battle of Chery Chase*. He painted some historical and scriptural pictures, among which was *The Death of Eli*; but his reputation rests on his genre work, as *The Village Politicians* and *The Blacksmith's Shop*.

Bird, FREDERIC MAYER: hymnologist; b. in Philadelphia, June 28, 1838; graduated at University of Pennsylvania 1857, and Union Theological Seminary, New York, 1860; Lutheran minister 1860-67; chaplain in the U. S. army 1862-63; ordained deacon Oct. 25, 1868; some time a rector in Iowa City and in Waterloo, Ia. In Feb., 1881, was appointed chaplain and Professor of Psychology, Christian Evidences, and Rhetoric in Lehigh University, South Bethlehem, Pa., which post he resigned in 1886. He edited *Charles Wesley seen in his Finer and Less Familiar Poems* (1867); with Rev. Dr. B. M. Smucker, *The Lutheran Ministerium Hymnus* (1865; revised 1868 as General Council's *Church Book*); revised, with Bishop Odenheimer, *Songs of the Spirit* (1871). He contributed a monograph on the *Hymnody of the Church* to Bishop Perry's *History of the American Episcopal Church*. Editor of *Lippincott's Magazine* (1891-). He is a contributor to encyclopedias and magazines, and engaged in literary pursuits.

Bird, ROBERT MONTGOMERY: father of F. M. Bird; novelist and journalist; b. in Newcastle, Del., in 1805; studied medicine in University of Pennsylvania; wrote dramas *Oraboosa*; *The Bruker of Bogota*; and *The Gladiator*, in which Edwin Forrest won distinction. His first novels were concerned with the Spanish conquest of Mexico, and W. H. Prescott commended them for their antiquarian accuracy. They were *Calvar* (1834) and *The Infidel* (1835). All his books were published in Philadelphia. His most popular novel was *Nick of the Woods* (1837), a tale of frontier Kentucky. *Peter Pilgrim* is a collection of tales. In 1847 he became an editor and joint proprietor with Morton McMichael of the *Philadelphia North American and United States Gazette*. D. in Philadelphia, Jan. 22, 1854.

Bird, ISABELLA L. (Mrs. Bishop, of Edinburgh): traveler; b. in England; has undertaken many long and adventurous journeys in various parts of the world, of which her graphic published accounts have been very popular; author of *The Englishwoman in America* (1858); *Six Months among the Palm Groves of the Sandwich Islands* (1875); *A Lady's Life in the Rocky Mountains* (1879); *Unbeaten Tracks in Japan* (1880); *The Golden Chersonese* (1883).

Bird-catching Spider (*Mygale avicularia*): a large spider; native of Surinam. Its body is nearly 2 inches long, and its legs when stretched out occupy a space almost a foot in diameter. Its mandibles work vertically instead of laterally, and are very strong. It does not construct a net or web for the capture of its prey, but it obtains it by the chase, and

hunts only in the night. This spider and other species of *Mygale* are said to attack and kill small birds. It is asserted

Bird-catching spider.

that in some tropical countries there are spiders which feed upon birds caught in their webs.

Bird Cherry: in England the *Prunus padus*; a small tree growing wild in Europe, and called *hagberry* in Scotland. It bears racemes of small drupes of a sweetish and bitterish taste, which are used in the north of Europe to make spirituous liquors. In the U. S. the wild *Prunus pennsylvanica* also is called bird cherry.

Birde, or Byrd, WILLIAM: English composer of church music; b. probably at Lincoln, about 1538; and was appointed organist of Lincoln about 1563, and of the Chapel Royal, London, 1569, in conjunction with Thomas Tallis, to whom with him Queen Elizabeth in 1575 granted a monopoly to print and sell music. He produced, among other works, *Cantiones Sacre* (Sacred Songs) and a magnificent canon entitled *Non Nobis, Domine*. D. probably at London, July 4, 1623.

Birdlime (in Lat. *viscus*): a viscous adhesive substance placed on the branches of trees to catch birds which may perch there. It is prepared by boiling the middle bark of the holly (*Ilex*), the mistletoe (*Viscum album*), or other glutinous plants, and concentrating the decoction by evaporation. The gluten of wheat flour is sometimes used as a substitute for birdlime. A tame bird in a cage is sometimes employed to decoy the birds to the tree on which the birdlime is smeared.

Bird of Paradise: any one of several species of birds of the genus *Paradisæa* and kindred genera, of the order *Passerres*; natives of Papua and the neighboring islands, remarkable for the beautiful form and splendor of their plumage. The name was originally applied to the *Paradisæa apoda*, which was supposed to be destitute of feet, because the skins, which are exported to Europe, are usually deprived of wings and feet. The older naturalists imagined that they passed all their lives floating in the air and feeding on ethereal food or nectar. For these fabulous and fanciful ideas science substitutes the prosaic truth that they are nearly allied to the *Corvidæ* (crow family), and are omnivorous. The value of these birds arises chiefly from the extraordinary development and light and beautiful structure of the plumes which grow from the scapular and lateral portions of the body. The plumage of the males is remarkable not only for brightness of tints, but also for a velvety texture and brilliant

metallic reflections. Tufts of feathers growing from the shoulders are so prolonged that they extend even beyond the

Bird of paradise.

tail, and they constitute the most beautiful part of the plumes of the bird of paradise, which are a highly prized article of commerce. The principal species of this genus are the com-

Red bird of paradise.

mon bird of paradise (*Paradisaea apoda*), the royal bird of paradise (*Cicinnurus regius*), the red bird of paradise (*Paradisaea rubra*), the magnificent bird of paradise (*Diphyllodes magnifica* or *speciosa*), and the six-threaded (or golden) bird of paradise (*Parotia sexfilata*), from the head of which grow six long and thread-like feathers, each ornamented with an ovate black racket, three on each side. The common bird of paradise is about as large as a jay, and is mostly of a cinnamon color, with a throat of emerald green, whence it is sometimes called the emerald bird of paradise. The royal bird of paradise has two long feathers or filaments, which extend behind the tail and terminate in disks, like the tail-feathers of a peacock. The red bird of paradise has two very long filaments, extending far beyond its rich and beautiful tail-feathers. Birds of paradise are generally gregarious, and they sometimes fly in flocks from one island to another. It is stated that they can fly more easily against than with the wind. In confinement they are lively and bold, and bestow great care on their plumage. About twenty-five specimens are now known.

A writer, referring to what he calls "the supremely glorious members of the feathered tribe which have by common consent been termed birds of paradise," observes that "the plumage of these birds is wonderfully rich and varied, and not even the humming-birds themselves present such an inexhaustible treasury of form and color as is found among the comparatively few species of the birds of paradise." See Wallace, *Malay Archipelago*. Revised by CHARLES H. GILBERT.

Birds (*Aves*): a class of oviparous vertebrate animals; definable as air-breathing vertebrates with a coating of feathers, with the two anterior limbs or wings adapted for flying or swimming, the two posterior limbs or legs adapted for walking or swimming; respiration never effected by gills or branchia, but after leaving the egg by lungs which are connected with air-cavities in various parts of the body. Reproduction by eggs fertilized within the body, and hatched externally either by incubation or by exposure to the heat of the sun; the shell calcareous, hard, and brittle. The sole really diagnostic character is this: all birds have feathers, and no other animal has feathers. No other character can be found by which the birds as a whole, living and extinct, can be separated from the reptiles. The plumage serves as clothing, and assists in motion through the air. The feathers entangle among their fibers a considerable quantity of air, and are well adapted to protect the bird from extremes of cold and heat. The internal temperature of birds is from 105° to 112° F., much higher than that of man or mammals generally. Their buoyancy and muscular energy are increased by numerous air-cells which are connected with the lungs. (See AIR-CELLS.) The general form of birds is adapted to aerial navigation, and the body is somewhat boat-shaped. The number of vertebrae in the neck varies from ten to twenty-six, and is always greater than is found in any mammal. Among their peculiar organs are the toothless jaws, covered with a hard, horny sheath, forming the beak or bill. (See BILL.) The head is articulated to the neck by a single condyle. The number of toes of each foot is generally four, of which three extend forward and one backward; but the climbing birds have two before and two behind. The sternum or breast-bone is very large and strong, with a prominent keel, except in the ostrich and its relatives, serving for the attachment of the powerful muscles which move the expanded wings. The wing of a bird is the homologue of the arm of a man, and is composed of bones which correspond to those of a human arm or the fore leg of a quadruped. The wing is furnished with numerous feathers, called quills, which display an admirable combination of strength and lightness. The names of the several varieties of wing-feathers are *primaries*, *secondaries*, *tertiaries*, and *coverts*. The primaries are quill-feathers arising from the first or terminal joint—i. e. the part of the wing which corresponds to the hand and fingers of a man. The form of these indicates the bird's capacity of flight, and birds of powerful flight have long and firm primaries. Next to these are the secondaries, which are attached to the middle bone, the homologue of man's forearm. The tertiary feathers grow from the part of the wing between the elbow and the shoulder. The leg of a bird is formed of bones which are homologous to those of mammalia, but are subject to modifications. The thigh-bone is very short, and is so concealed within the skin that it is not apparent as a part of the leg on a superficial view. The next division, often mistaken for the thigh, is the *tibia* or proper leg-bone, which is always the largest bone of the limb, the *fibula* being rudi-

mentary. This joint is followed by one usually called the "tarsus," composed of tarsal and metatarsal bones fused together. The "tarsus" is covered with scale-like plates, the arrangement of which furnishes important characters in classification. The feet vary according to the habits of the birds, some of which have strong, hooked claws, fitted for seizing prey; others are adapted for swimming by a membrane which unites their toes; still others for climbing. The perching of birds is facilitated by an interesting adaptation in the structure of the legs, the tendons connected with the toes passing over the leg-joint, so that the bird's weight, by bending the latter, mechanically closes the toes.

The digestive apparatus is modified in accordance with the nature of the food. Birds do not masticate their food, which passes from the mouth into the crop or eraw, which is merely an enlargement of the gullet. The *crop*, or first stomach, is present in birds of prey, and also in the larger birds which feed on grain and seeds. It serves to soften the food, and in the pigeons secretes a cheesy substance with which the young are fed. The second stomach, or *proventriculus*, is largest in those birds in which the crop is small or wanting. The third and principal stomach is the *gizzard*, which is a powerful grinding apparatus, especially in those birds which feed on grain and swallow gravel and pebbles, as the common domestic fowl. The sense of sight in this class is exceedingly keen, and is remarkable for its perfect adaptation to near or distant objects. The swallow, when darting through the air with a swiftness which has become proverbial, is capable of accommodating its sight to the insect which it pursues, even in the short time which is occupied by its swoop at its victim. Some birds of prey have an acute sense of smell, and nocturnal birds, such as owls, have sensitive organs of hearing. Birds are distinguished among all dumb animals for their musical powers, and song-birds are doubtless sensitive to sound and differences of pitch. All the best singing-birds belong to the *Passeres*.

Among the most interesting subjects connected with birds are their migrations and the instincts and ingenuity which they exhibit in building nests. (See NESTS OF BIRDS.) The number of eggs in a state of nature varies from one to twenty, and birds generally breed only once a year, which is in spring. Many species of birds are gregarious, but large rapacious birds are quite solitary in their mode of life. They all moult—i. e. change their feathers once a year—and the summer plumage of many birds is very different from the winter dress. The plumage of the males is generally richer and more brilliant than that of the females. Their flesh and eggs are valuable as food for man, and many species render him great service by checking the increase of insects.

The earliest traces of the existence of birds on the globe have been supposed to be the so-called birds' tracks in the Triassic sandstones of the Connecticut valley; but it is now generally conceded that most if not all these tracks were made by reptiles and amphibians. It is especially noteworthy that the earlier birds (Jurassic and Cretaceous) had true teeth in their jaws. In the lithographic slates of Solenhofen (Jurassic) have been found a feather and two nearly complete bodies of birds exhibiting some remarkable features, and representing a peculiar order (*Saururus*) that is supposed to form a kind of connecting link between birds and reptiles. (See ARCHLEOPTERYX.) The remains of birds have been found in the greensand of England, the Eocene of the island of Sheppy, and the Paris basin, as well as in the more recent Tertiaries at various European localities. In America fossil birds were unknown until quite recently; they have now been found, however, in the greensand of New Jersey, the cretaceous beds of Kansas, and the Tertiary deposits of Wyoming and Idaho. The Cretaceous birds, according to Prof. O. C. Marsh, belong to two distinct orders named *Odontornis* and *Odontolepis*. The most important of his discoveries in this branch of paleontology is that of birds with teeth in the Cretaceous beds. In the superficial deposits of New Zealand and Madagascar the remains of several kinds of extinct birds have been met with, some of which far exceed in dimensions the largest now living. The great bird of Madagascar is called *Epiornis maximus*. It is supposed to have been at least 12 feet in height, and very massive. The egg of this bird was over a foot in length. The contents of one of these eggs were equal to those of six ostrich's eggs or 148 hens' eggs. The largest extinct birds of New Zealand have been described under the name of *Dinornis* by Prof. Owen. They were from 6 to 10 feet in height. See ORNITHOLOGY.

Revised by CHARLES H. GILBERT.

Birdsall, WILLIAM RANDALL, M. D.: b. at Greene, Chenango co., N. Y., Jan. 1, 1852; pursued special scientific studies at the University of Michigan; entered the medical department of that institution, and in 1876 graduated M. D.; removed to New York city the same year; began practice with Dr. Seguin; prosecuted neurological studies in Europe; engaged as a clinical teacher on diseases of the nervous system at different medical colleges and hospitals in New York; for two years lecturer on helminthology at the American Veterinary College, New York. He is the author of a work on *Electro-therapeutics and Electro-diagnosis*, and is a contributor to several medical journals, principally on neurological subjects. D. in New York, June 7, 1892.

Birdsboro: borough, Berks co., Pa. (for location of county, see map of Pennsylvania, ref. 5-1); on Schuylkill river and Phila. and Reading, Wilmington and Northern, and Pennsylvania Railroads; 9 miles S. E. of Reading. Principal industry, iron manufactures. Pop. (1880) 1,705; (1890) 2,261.

Bird's-eye Limestone: a compact, dove-colored stone, with whitish crystalline points, belonging to the lower division of the Trenton group of the lower Silurian strata of North America, apparently corresponding to the Llandeilo flags of Wales. It contains many orthoceratites of enormous size, and fossil brachiopods.

Bird's-eye View: a term used in the fine arts to denote a picture or view arranged according to the laws of perspective, in which the point of sight or situation of the eye is placed at a considerable height above the object. If the eye is considered as looking perpendicularly down while it sweeps over each point of the scene in succession, we have an exact ground-plan, no object covering another, and horizontal angles being exactly delineated. This is a convenient method of representing battles, or of depicting a large city or a small tract of country. In sketching a locality for military purposes this kind of perspective is used. The common kind of bird's-eye view differs from ordinary perspective only in that the horizontal line is placed considerably above the picture.

Bird's-foot: a plant of the genus *Ornithopus* and family *Leguminosae*; which derives its name from the resemblance of the curved pods to birds' claws. One species, the *Ornithopus sativus*, an annual plant, a native of Portugal, is cultivated in that country, and affords a nutritious green fodder for cattle.

Bird's-foot Trefoil: a plant of the genus *Lotus* and family *Leguminosae*; native of the temperate and cold regions of the Old World; so called because a cluster of its pods resembles a bird's foot. The *Lotus corniculatus*, common in the pastures of Great Britain and introduced into the U. S., is eaten with avidity by cattle. It bears yellow flowers, which have a honey-like smell, and leaves which are trifoliate, like those of clover. A larger species or variety, called *Lotus major*, is also a native of England.

Revised by CHARLES E. BESSEY.

Birds' Nests: See NESTS OF BIRDS.

Birds' Nests, EMBLE: the nest of the sea-swift (*Collocalia esculenta*), of the Malay Archipelago, a bird of the size of a common martin. It builds its nest of a glutinous substance which it is said to derive from a seaweed. This weed is swallowed and partly digested, and then disgorged and fashioned into a nest as large as a common coffee-cup. When fresh these nests are of a waxy white color, and are said to be worth twice their weight in silver in the markets of China, where alone they are sold. The poorer sorts bring \$5 or more a pound, according to the age of the nests. The taste of dishes prepared from these nests is said to be insipid, but the Chinese prize them, not perhaps so much for their taste as for their supposed tonic and aphrodisiac powers.

Birds of passage: birds which are migratory, passing instinctively and habitually from one country or latitude to another, following the change of the seasons. The migration of birds is in general along north and south lines. Spending the summer in the temperate or polar regions, they leave on the approach of cold weather for the south, where they pass the winter. Migratory birds which breed in the U. S. are called summer birds of passage with reference to those States. They return in autumn to warmer regions, and are winter birds of passage in the countries where they pass the winter. Wild geese and other waterfowl that breed in the Arctic regions in summer annually visit the U. S. and

Great Britain in autumn, and return northward in the spring. Several other species that are not aquatic, as the woodcock, fieldfare, and snowbird, pass the winter in the temperate parts of Europe or the U. S., and spend the summer in a more northern latitude.

Bird-tick: a small insect, regarded as a degraded fly; parasitic on numerous species of birds. *Olfersia americana* is a common species.

Birdwood, SIR GEORGE CHRISTOPHER MOLESWORTH, M. D., LL. D.: b. in Belgium, Bombay, Dec. 8, 1832; M. D., University of Edinburgh, 1854; appointed to the medical staff of the East India Company the same year; appointed acting Professor of Anatomy and Physiology in Grant Medical College, Bombay, 1857, and retained his connection with the college in various chairs until he left India in 1869; appointed to the companionship of the Star of India Jan. 1, 1877; knighted in 1881; was mainly instrumental in establishing the Victoria and Albert Museum and the Victoria Gardens in Bombay. Author of very many articles on India. C. H. TURBER.

Biren, bee ren, **Biron**, bee'ron, or **Buren**, boo ren, ERNEST JOHN: Duke of Courland; b. in Kalnezeen, Nov. 12 (22), 1690. He gained the favor of Anna (a niece of Peter the Great), who became Empress of Russia in 1730, and gave him the title of dnke. He abused his power during her reign by the execution of many innocent persons. On the death of Anna in 1740 he became regent, but he was exiled to Siberia in 1741. When Elizabeth ascended the throne in 1741 she permitted him to return to Russia, and in 1763 the dnchy of Courland was restored to him. D. Dec. 28, 1772. See Ruchl, *Geschichte E. J. von Biron* (1764).

Biretta, or **Birretta**: a cap worn by some Western ecclesiastics. The ordinary Roman biretta is a square stiff-sided cap, with curved ridges, and a tassel at the top, commonly made of the same material as the cassock. It is usually of black for priests, violet for bishops, and scarlet for cardinals. There are also academic forms of it to be seen in use in some parts of Europe. W. S. PERRY.

Birgitta, **Brigitta**, or **Bridget**, SAINT: a Swedish mystic and religious reformer; b. at Finstad, 1302 or 1303. Her father, Birger Persson, was "lawman" of Upland, and her mother, Ingeborg, was related to the royal family. At the age of fourteen Birgitta married a young nobleman, Ulf Gudmarsson, by whom she had eight children. On the death of her husband in 1344 she retired to the convent of Alvastra and gave herself up to a life of devotion, though she appears never to have joined any religious order. From this time till her death she regulated her conduct entirely according to revelations which (as she believed) were at frequent intervals vouchsafed her from on high. In one of her trances she received from Christ directions for the establishment of a new monastic order. Securing large gifts from the king and queen, as well as from the Swedish nobility, she made arrangements for the erection of a monastery at Vadstena, and in 1349 set out for Rome with her confessor, her eldest son, and a few other companions. Arriving in the jubilee year, 1350, she opened a hospice for Swedish pilgrims and students. Henceforth she devoted all her energies to attacking the corruption of the Church, to urging the restoration of the papal residence from Avignon to Rome, and to securing the pope's authorization for the new order. The influence that she exerted by means of her revelations, which were published from time to time, and in which she did not hesitate to attack the highest ecclesiastical dignitaries, was very great, and no doubt had its part in inducing Urban V. (pope 1362-70) to take up his residence in Rome in 1367. Aug. 5, 1370, just a month before Urban was forced to return to Avignon, she obtained a bull authorizing her order and the foundation at Vadstena. This foundation consisted of sixty sisters and twenty-five brothers, living in different buildings but under the same rule (a modification of the Augustinian). In 1372-73 Birgitta performed a pilgrimage to Jerusalem. Soon after her return to Rome she died (July 23, 1373) in the convent of the nuns of St. Clare at Panisperna. Her bones were carried to Vadstena in 1374. In 1391 she was canonized by Boniface IX.

The *Revelations of St. Birgitta* occupy an important place in the mysticism of the later Middle Ages. They were written down by her from time to time in Swedish, but only two leaves of the original version have been preserved. Her confessor, Peter Alvastra, turned them into

Latin, and they were edited by Alfonso the hermit (previously Bishop of Jaen), and in part also by Mathias, Canon of Linköping. Before 1400 they were translated back into Swedish (*Heliga Birgittas Uppenbarelser, efter gamla Handskrifter utgifna af G. E. Klemming*, 5 vols., Stockholm, 1857-84), and from this version into Danish. The Latin text was first printed at Lübeck in 1492, and has been often reissued. From the Latin entire or partial translations were made into Low German (printed between 1484 and 1494), Dutch (printed 1491), High German (printed 1502), French (printed 1624), Italian (printed 1518), Spanish (printed 1676), and English (printed about 1530; another selection London, 1873). A Polish and a Bohemian version exist in MSS. of the fourteenth century. Though vehemently attacked from many quarters, the genuineness and orthodoxy of the *Revelations* were confirmed by the Councils of Constance and Basel.

The monastic order founded by St. Birgitta, known officially as the *Order of the Holy Saviour*, but popularly as the *Birgittine Order*, had great success in the North, especially in Sweden and Denmark, and, from its principle of circulating works of devotion in the vernacular, exercised a powerful influence on mediaeval Swedish and Danish literature (*q. v.*). The rule spread to other European countries till there were at one time in all no less than seventy-four establishments professing it (among them several in Spain, and one, Sion House, in England), but it is now almost extinct. The first abbess of the Vadstena convent was the daughter of St. Birgitta, St. Catherine (Katarina) of Sweden, b. about 1355; d. 1381; canonized 1489.

G. L. KITTRIDGE.

Birgittine Order: See BIRGITTA, SAINT.

Birk'beck, GEORGE, M. D.: English educational reformer; b. in Settle, Yorkshire, Jan. 10, 1776; educated at Edinburgh; Professor of Natural Philosophy in the Andersonian Institution at Glasgow 1779; gave free courses of lectures on the mechanics of Glasgow 1801-04; prominent in founding the London Mechanics' Institute, of which he was made president for life, 1823; d. in London, Dec. 1, 1841. The Birkbeck Institution was rebuilt 1883-84. See his *Life* by J. G. Goddard (London, 1884).

Birk'head: a seaport-town of Cheshire, England; on the left bank and near the mouth of the Mersey; opposite Liverpool, and 15 miles N. N. W. of Chester, with which it is connected by railway (see map of England, ref. 7-P). It is about 1½ miles S. W. of Liverpool, and is the residence of many merchants who do business in that city. Steamers cross the river between these places every few minutes, and a railway tunnel to connect them, 1,250 yards long, was opened in 1886. Birkenhead was only a small fishing-village as recently as 1824; it has since increased rapidly in consequence of the construction of extensive docks and important public works. It has wide streets, a fine public park, a college called St. Aidan's (designed for the education of young men for the Anglican ministry), and many handsome villas. One of the docks occupies 120 acres. Ship-building is extensively carried on, and here the Confederate cruiser Alabama was built. There are vast works here for turning out iron bridges and other heavy constructions for engineers. Pop. (1881) 83,324; (1891) 99,184.

Birmingham: one of the great manufacturing cities of England; in the county of Warwick; on the river Rea; 79 miles by rail S. E. of Liverpool, and 130 miles by rail N. W. of London (see map of England, ref. 7-G). It is built on the eastern slope of three undulating hills, and has a gravelly foundation. Its suburbs extend into Staffordshire and Worcestershire. It returns seven members to Parliament. Birmingham is the chief town of Great Britain for the manufacture of hardware and metallic products made of gold, silver, brass, iron, steel, and mixed metal, including fire-

arms, swords, jewelry, buttons, tools, steel pens, locks, steam-engines, and all sorts of machinery. From a very early period Birmingham has been a seat of manufactures in metal, and from the close of the seventeenth century it became one of the principal centers of that industry, partly on account of its easy access to cheap coal and iron, and partly on account of its freedom, there being no guilds or companies, or restrictions of any kind. The chief variety is the brass-working trade, in which more than 10,000 people are engaged, and which annually consumes more than 50,000 tons of metal. Next comes jewelry, gold, silver, and gilt. Then follow small-arms of all kinds, some of the larger factories being able to turn out 2,000 stand per week. Further specialties are buttons, hooks and eyes, pins, and other articles of dress; screws and nails, of which trade Birmingham has a kind of monopoly; steel pens, of which there are produced about 20,000,000 a week; electro-plating, which was first established there in 1848; bell-founding, the making of steel toys, etc. Here are also extensive manufactures of glass and papier-maché. The city of Birmingham contains about 100 churches; Queen's College, connected with the London University; a free public library; the schools of Edward VI.; a botanic garden; a Roman Catholic cathedral; and a town-hall, which is a handsome edifice of the classic style, with a very fine organ. A musical festival is held in this hall once in three years. In the vicinity of Birmingham are the famous Soho and Smethwick works, founded by Watt and Boulton, who there manufactured their first steam-engines. Among the charitable institutions are an asylum for the deaf and dumb and an asylum for the blind. Pop. (1881) 400,757; (1891) 429,171.

Birmingham: city; capital of Jefferson co., Ala. (for location of county, see map of Alabama, ref. 3-C); one of the most important manufacturing cities of the "New South." It is situated at the foot of "Red Mountain," a formation holding, besides vast limestone deposits, an iron hematite ore vein of remarkable extent and easily accessible to miners, and almost touching the great Warrior coal-field of 7,800 sq. miles, the Cahawba coal-field, 400 sq. miles, and the Coosa coal-field, also about 400 sq. miles. Iron and steel are manufactured here under the most favorable conditions. Six trunk railway lines (Louisville and Nashville; Queen and Crescent; Richmond and Danville; Georgia Central; Kansas City, Memphis and Birmingham; and East Tennessee, Virginia and Georgia) cross each other in this city, giving it as good railway facilities as any interior Southern city.

Birmingham has 22 churches (18 for white and 4 for colored people); 11 public schools (7 for white, 4 for colored children), with school property valued at \$275,000; an extensive water-work system, the reservoir on Shade's Mountain, 225 feet above the city, having a capacity of 28,500,000 gal. Birmingham has adopted the Waring system of sewerage, and has about 12 miles of storm-water and 28 miles of sanitary sewers. Suburbs are made accessible by 92 miles of street railroads, 2 miles of which are operated by horses, 75 miles by steam-power, and 15 miles by electricity. Coal, iron, cotton, and lumber industries are the foundation of Birmingham's prosperity. In 1890 there were 223 establishments, employing 2,869 hands and \$3,401,835 capital, and producing goods valued at \$5,236,609. Of this output, the iron and steel manufactures employed 1,020 hands and turned out goods valued at \$1,618,201, to which the foundries and machine-shops added \$385,229. Area of city proper, 349 sq. miles. Pop. (1871) 800; (1880) 3,086; (1890) 26,178, including suburbs about 44,700. EDITOR OF "NEWS."

Birmingham: manufacturing borough of New Haven co., Conn. (for location of county, see map of Connecticut, ref. 11-F); on railroad and the Housatonic river; at the mouth of the Naugatuck; 9 miles W. of New Haven. A bridge across the Naugatuck connects it with the village of Old Derby, on railroad. It has several rolling-mills, and manufactures of augers, chains, pins, and carriage-axles and springs, pianos and organs. Here is the first pin-factory established in the U. S. Pop. (1880) 3,026; (1890) 4,413. See DERBY. EDITOR OF "TRANSCRIPT."

Birmingham: a former borough of Alleghany co., Pa.; on the left (west) bank of the Monongahela river; 1 mile S. of Pittsburg, with which it is connected by a bridge 1,500 feet long. It derives its prosperity chiefly from manufactures of glass and iron. In 1872 it was united to Pitts-

Bir'nam: a hill of Scotland; in Perthshire; 12 miles N. W. of Perth; 1,580 feet high, and commanding a fine view of the valley of the Tay. It was formerly covered by part of a royal forest, to which Shakspeare has given celebrity in his tragedy of *Macbeth*.

Bir'ney, DAVID BELL; general; b. in Huntsville, Ala., May 29, 1825; son of James G., the Free-soiler; practiced law in Philadelphia. He became a brigadier-general of Union volunteers in 1861; served at Fredericksburg, Dec., 1862. He was raised to the rank of major-general, and commanded a division at Gettysburg in July, 1863, and Gen. Sickles's corps after that officer was wounded, and was at the head of the Tenth Army Corps in several battles in Virginia in 1864. D. in Philadelphia, from disease contracted in the service, Oct. 18, 1864.

Birney, JAMES GILLESPIE; an anti-slavery leader; b. in Danville, Ky., Feb. 4, 1792; graduated at Princeton in 1812, and became a lawyer in Danville, and then a planter in Huntsville, Ala. In the Kentucky and Alabama Legislatures he endeavored to obtain constitutional enactments restricting the slave-trade and providing for emancipation. He served the Colonization Society until the Texas policy of Andrew Jackson convinced him that the methods of that society were inadequate. Then he resolved to attempt to array Kentucky on the anti-slavery side. He had emancipated twenty-one inherited slaves, when he returned to Danville to publish a paper, which he was compelled to print in Cincinnati. Violence led him to remove to the latter city, where he continued his anti-slavery paper, called *The Philanthropist*. His office was several times attacked by a mob, which threw his press into the river, but he maintained his ground and secured toleration for free speech there. Having become secretary of the American Anti-Slavery Society, he removed to New York city about the year 1836. He was nominated in 1840 for the presidency of the U. S. by the Liberty party, which also supported him in the election of 1844. D. in Perth Amboy, N. J., Nov. 24, 1857.

Biron, bō' rōn', CHARLES DE GONTAUT, Duke de; French general; b. in 1561; a son of Armand (d. 1592). He served with distinction at Ivry 1590; became a favorite of Henry IV.; marshal of France in 1595; appointed governor of Burgundy. He was ambitious, and was convicted of forming a treasonable plot with the Duke of Savoy, for which he was beheaded in the Bastille, July 31, 1602. See De Thou, *Historia sui Temporis*; Martir-Rizo, *Historia de la Vida del Duque de Biron* (1629).

Birthmarks: See NEVUS.

Birthworts (*Aristolochiaceae*): a small family of 200 species of herbaceous (rarely shrubby), mostly climbing dicotyledonous flowering plants. They have inferior ovaries, and a single, often gamophyllous, perianth. Their affinities are difficult to make out, and it is at present impossible to assign them definitely to their proper position among dicotyledons. Many species of *Aristolochia* are cultivated for their odd flowers. Several species of *Aristolochia* and *Asarum* are natives of the U. S. CHARLES E. BESSEY.

Bis'cay, or **Biscaya,** bis-kī'a (Sp. *Vizca'ya*): one of the four Basque provinces of Spain; bounded N. by the Bay of Biscay, E. by Guipúzcoa, S. by Alava, and W. by Santander. Area, 849 sq. miles. It consists partly of mountains and partly of level plains. The chief products are wine, fruits, walnuts, chestnuts, figs, and grain. Pop. (1887) 235,659. Capital, Bilbao.

Biscay, Bay of (in Fr. *Golfe de Gascogne*; anc. *Gallicus Oecanus*, or *Aquitanus Sinus*): a portion of the Atlantic Ocean bordering on France and Spain; extends from the French island of Ushant to Cape Ortegal. The depth, which is greatest near the coast of Spain, varies from 20 to 200 fathoms. The southern or Spanish coast is bold and rocky, but the east coast, from the Adour to the mouth of the Gironde, is low and sandy. The largest rivers that flow into this bay are the Loire and the Gironde. The principal ports on it are Nantes, Bordeaux, Bayonne, La Rochelle, the new port La Pallice, and Rochefort in France, and Bilbao and Santander in Spain. Violent currents and winds render the navigation of this bay difficult.

Bisceglia, bō-shāl yā (Lat. *Vigilia*): a fortified seaport-town of Italy; province of Terra di Bari; on the Adriatic; 25 miles W. N. W. of Bari (see map of Italy, ref. 6-G). It has a cathedral, a college, and several churches and convents. Excellent currants and olives are raised in

the vicinity. It is connected by rail with Foggia and all the points along the coast S. of Barletta to Brindisi. Pop. 25,127.

Bischof, KARL GUSTAV; German chemist and geologist; b. in Würd, near Nuremberg, Jan. 18, 1792; educated at Erlangen; Professor of Chemistry in Bonn in 1819; d. there Nov. 30, 1870. In 1840 he published a prize-essay on the means of avoiding explosions in mines, experimented on inflammable gases, and improved safety-lamps. He wrote treatises on mineralogy, dynamic geology, and chemistry, his principal work being *Elements of Chemical and Physical Geology* (Bonn, 1847-54; 3d ed. in 1866, and supplement in 1871).

Bischoff, THEODOR LUDWIG WILHELM; a German physiologist and anatomist; b. in Hanover, Oct. 28, 1807. He became Professor of Anatomy at Heidelberg in 1836, at Gießen in 1843, and obtained a chair at Munich in 1851. He gained distinction by his researches in embryology, on which he wrote several treatises. D. in Munich, Dec. 5, 1882.

Bischweiler, bish-wiler; a town of Alsace; on the river Moder; 14 miles by rail E. N. E. of Strassburg. It has manufactures of linens, coarse woollen cloths, gloves, and earthenware. It is the center of the hop-trade in Lower Alsace. Near it is a rich mine of iron. It was formerly fortified. Pop. (1890) 7,005.

Biscuit [French spelling of older *bisket* (seventeenth century), O. Fr. *biscoit*; Ital. *biscotto*, as if from Lat. **biscoctum* (sc. *panem*); bis, twice + *coquere*, cook]; a hard kind of unfermented bread formed into small cakes or flat pieces, and sometimes called ship-bread or sea-biscuit. It is composed of wheat flour, water, and salt, and is rendered hard and dry by baking, in order that it may be preserved for a long time. Biscuits are exposed to the heat of an oven for about twelve minutes, and afterward dried in a warm room for two or three days. "Captain's biscuit" is prepared with butter, in addition to the ingredients mentioned above, and sometimes contains milk. Water or hard biscuits are made of flour, water, with variable quantities of butter, eggs, and sugar. Soft biscuits contain increased proportions of butter and sugar. Several varieties of fermented biscuits are manufactured. Meat biscuit consists of wheat flour, combined with the essential or soluble part of beef, so that the nutritive qualities of the meat may be preserved for a long time. To prepare this biscuit large pieces of beef, with water sufficient to cover them, are subjected to slow ebullition. The fat is skimmed off, the liquor is reduced by evaporation to the consistency of sirup, and is then mixed with wheat flour, rolled out to the thickness of ordinary ship-biscuit, and cut, baked, and dried in the same manner as common biscuits. One pound of meat biscuit contains about one-half pound of flour and the soluble part of 5 lb. of meat. It is used in the form of soup, which is made by boiling the biscuit in twenty times its weight of water for half an hour. See **PEMMECAN**.

BISCUIT, in pottery, is applied to porcelain and earthenware after it has been hardened in the fire, and before it has received the glaze. In this state it is porous and permeable to water. Biscuit in sculpture is a species of porcelain, of which groups and figures in miniature are formed, which are twice passed through the furnace or oven.

Bishop [O. Eng. *biscop* = O. H. G. *bischof*, an early loan-word from vulg. Lat. form of Lat. *episcopus* = Gr. ἐπίσκοπος, overseer. Adopted in Rom. langs. as Ital. *vescovo*, O. Fr. *vesque*, Mod. Fr. *évêque*, etc.]; an ecclesiastic of the highest rank in the Christian Church—all patriarchs, archbishops, metropolitans, and the pope himself belonging to the order of bishops. In many Protestant denominations the order of bishop is held to be identical with that of presbyters or elders; and in such sects these names are used in preference to that of bishop. The Eastern, Roman, and Anglican Churches, with some minor sects, claim for their bishops, by direct succession, an authority derived from the twelve apostles. Lutherans, Presbyterians, and other denominations also claim a tactual succession for their orders, but do not draw the same dogmatic inferences from it. The principal churches recognizing the superior rank of bishops are the Greek, the Roman Catholic, the Armenian, Coptic, Abyssinian, Nestorian, and Jacobite, the churches of the Anglican communion, the Moravian, the Catholic Apostolic (Irvingite), the Old Catholics, and a part of the Lutheran churches. The Methodist Episcopal churches and some others give their bishops a superiority of office, but not of order.

In the Roman Catholic and Anglican Churches bishops have the title of "right reverend," while archbishops and metropolitans are addressed as "most reverend." In Great Britain bishops of the Church of England are called lord bishops. In England and Wales the two archbishops and twenty-four diocesan bishops have seats and a vote in the House of Lords; but the Bishop of Sodor and Man, the bishops of Scotland, Ireland, and of newly created dioceses and suffragan bishops, do not have seats with the peers or court precedence, but are called lords by courtesy. See **VICAR APOSTOLIC**.

The bishop is required by the ancient canons to be consecrated by three bishops. Consecrations by a single bishop, though valid, are deemed irregular. It pertains to the office of a bishop to administer, ordain, confirm, consecrate churches, etc., and to share in legislating for the church in conjunction with convocations, councils, and conventions, as the canons of the respective churches may direct. His vestments are properly cassock, alb, girdle, rochet, amice, tunic, dalmatic, chasuble, cope, mozzetta, chimere, gremial, and buskins. Anglican bishops use only a portion of these vestments. The bishop's distinctive *ornamenta* are the miter, ring, and pastoral staff. The black or purple chimere (red for convocation) and the white rochet, which with the square cap form the usual episcopal robes of Anglican prelates, were, it is probable, the walking-attire of the bishops during the reign of the Tudors. See **VESTMENTS**, **ECCLESIASTICAL**, also **APOSTOLIC**, **ARCHBISHOP**, **INVESTITURE**, **ORDINATION**, etc. W. S. PERRY.

Bishop, ANNA; singer; b. in London in 1814; daughter of Mr. Rivière, an artist. In 1831 she married Sir Henry Rowley Bishop (see below), who was a widower, but eloped from him in 1839 with Robert Nicholas Charles Bochsá, an Italian harpist (b. in Montmédy, France, 1789; d. in Australia, 1855). Her *debut* was made in 1837. She won the highest distinction in Europe, the Americas, and Australasia, as a singer in classical music and modern opera. She married Martin Schultz, of New York, in 1858. In 1868 she lost her voice. D. in New York, Mar. 19, 1884.

Bishop, Sir HENRY ROWLEY, MUS. D.; English composer; b. in London, Nov. 18, 1786. He produced numerous popular operas, which are commended for their long flowing melodies and animated style. Among them are *Guy Rannering*; *Maid Marian*; *Naxos Land*; and *The Virgin of the Sun*. His glees are very fine. He was knighted in 1842, and was appointed Professor of Music in the University of Oxford in 1848. D. in London, Apr. 30, 1855.

Bishop, WILLIAM HENRY; novelist; b. at Hartford, Conn., Jan. 7, 1847; graduated at Yale College in 1867; studied architecture in New York and Washington; edited a newspaper at Milwaukee. Resided in New York from 1877 to 1888, since which time he has been in Europe. Among his novels are *The House of a Merchant Prince* (1883) and *The Golden Justice* (1886). A book of travel, *Old Mexico and her Lost Provinces*, was published in 1884.

HENRY A. BEERS.

Bishops Suffragan (as distinguished from suffragan bishops, every diocesan bishop being a "suffragan" of his metropolitan where "provinces" are established); bishops consecrated in England under the Act 26 Hen. VIII., enacted to supply the place of the earlier bishops *in parlibus* who formerly assisted the incumbents of English sees. Under this act twenty-six places are named as "the sees of bishops suffragan." To these the Act 50 and 52 Vict. permits additions to be made under orders in council. The diocesan presents two spiritual persons to the crown. The crown selects one of the two to be bishop of a suffragan see, and presents him by letters patent under the great seal to the archbishop of the province for consecration. Until the present generation eighteen consecrations appear to have taken place under the act of Henry VIII. The present Bishop of Dover, consecrated in 1890, is the fifth of that title, his predecessor of the Reformation period being Richard Rogers, Dean of Canterbury, and suffragan to Archbishop Parker. A suffragan holds his commission at the will of the diocesan, at whose death it lapses. But the lapse or voluntary resignation of such commission does not affect the "style, title, or dignity" of the suffragan see. James Kemp, D. D., was consecrated suffragan to Bishop Claggett, of Maryland, with jurisdiction of "the Eastern Shore," Sept. 11, 1814. On Bishop Claggett's death he succeeded him as Bishop of Maryland. Suffragans are not allowed in the Protestant Episcopal Churches in the U. S. Dr. Brett's

treatise on *Suffragan Bishops and Rural Deans* (1711) has been republished with notes by James Fendall (1858).

WILLIAM STEVENS PERRY.

Bismarck: city; capital of N. Dakota and Burleigh co. (for location of county, see map of North Dakota, ref. 3-D); very advantageously situated on Northern Pac. R. R. and on east bank of Missouri river. The Missouri is navigable for boats of 250 to 700 tons for 1,200 miles above Bismarck, which contains an immense river-warehouse; 15,000,000 to

State Capitol, Bismarck, North Dakota.

25,000,000 lb. of freight shipped via river annually. Bismarck contains the Capitol, which cost over \$500,000; the penitentiary, fine court-house, high-school building, water-works, electric light, a large flouring-mill, extensive brewery, etc. The bridge across the Missouri river cost \$1,500,000. Pop. (1880) 1,758; (1890) 2,186. EDITOR OF "TRIBUNE."

Bismarck Archipelago: a group of islands off the north coast of the eastern end of New Guinea, including islands formerly called New Britain, New Ireland, New Hanover, and Duke of York group. It was appropriated by Germany in 1884 and 1885 and assigned to the New Guinea Company. Area, 18,200 sq. miles. Pop. estimated at 188,000, of whom only 61 were Europeans, in 1891. New Britain was in 1885 rebaptized as New Pomerania; New Ireland as New Mecklenburg, and the Duke of York group as New Lanenburg.

Bismarck-Schönhausen. bis maärk-shön-how zen. Count HERBERT, von; German diplomat; son of Prince Bismarck; b. at Berlin, Dec. 28, 1849. Count Bismarck is a major in the German army; has served as secretary to the embassy in London and as minister at The Hague. He sits in the Reichstag for Schleswig-Holstein, and was (1886-90) at the head of the German Foreign Office, but retired upon the resignation of his father. His marriage, June 21, 1892, to Countess Margaret Hoyoos, in Vienna, was the occasion of a great popular demonstration in favor of his father, who attended the wedding.

Bismarck-Schönhausen. OTTO EDUARD LEOPOLD, Prince von; Prussian statesman and the unifier of Germany; b. on the knight's estate of Schönhausen, near Stendal, in Prussian Saxony, Apr. 1, 1815. His father's family belonged to the lower order of Prussian nobility, and several of his paternal ancestors distinguished themselves in war and diplomacy. His mother was the daughter of Ludwig Menken, a liberal-minded privy counselor of Frederick the Great. A year after Bismarck's birth his father moved to one of his estates near Stettin in Pomerania, and it was there that the future statesman received his first impressions of life. At the early age of six he was sent to the boarding-school of Herr Plamann at Berlin, where, as he afterward said, he had "elastic meat with parsnips as the invariable dish," and where in matters of discipline "a spurious Spartanism was the rule." At twelve he went to a gymnasium, where he fell under the influence of Dr. Prevost and Dr. Bonheil, both of whom seem to have had much influence on his methods of thought and life. History was his favorite study, though he acquired at this time such thorough knowledge of the elements of English and French that he ever afterward used these languages with ease, and surprised both Napoleon III. and Beaconsfield with his mastery over them. During this period, and especially in his vaca-

tions, he devoted himself to all kinds of manly sports, and thus developed those remarkable physical powers for which he was afterward so famous. In 1832, at the age of seventeen, he was entered as a student of law at the University of Göttingen. That he did not devote himself very assiduously to study may be inferred from the fact that in the course of three semesters he fought twenty-eight duels, in all of which he drew blood from his opponent, while in one only did he receive a scar, the one observable on his left cheek. In 1833 he went to the University of Berlin, where a little later he passed the requisite examinations for professional life. But instead of entering upon the practice of law he returned to Pomerania, and devoted himself to the care of his estates and the life of an energetic country squire. It was not until 1847 that he was elected to the Prussian House of Burgesses. He remained a member until 1851, when he was chosen a representative of the Germanic Diet. It was here that his remarkable public career began, for immediately after he appeared in the Diet he outlined the characteristics of all the most important of his political doctrines.

At the beginning of the nineteenth century there was about as little representative government in Germany as in Asia. The Napoleonic campaign which shattered Prussia at Jena, however, led to many reforms under the inspiring leadership of Von Stein. Frederick William III. not only issued an edict of emancipation, but a little later he also promulgated at the Congress of Vienna an ordinance promising his people a written Constitution and a representative Assembly. It was largely from the inspiration of these edicts that Germany aroused herself to throw off the Napoleonic yoke. But a reaction soon came on under the baleful influence of Metternich. In all the German states the prospect of constitutional government grew less and less as the years went on. In Prussia the reign of Frederick William IV. seemed to give no hope whatever. It was owing to the general feeling resulting from the faithless promises of royalty that the Revolution of 1848 took so strong a hold in Germany. Though Bismarck entered the Prussian Parliament in 1847, it was not till he entered the Germanic Diet in 1851 that he exerted strong influence. From the first, however, he not only opposed all revolutionary measures, but demanded that in the Diet Prussia should have the same rights as Austria. He remained at Frankfort till 1859, when he was sent as minister to St. Petersburg. His diplomatic experience, begun in Russia, was continued in France, whither he was sent in 1862 in order that he might obtain an insight into the politics of the Tuileries. In the autumn of the same year he was recalled to take the portfolio of foreign affairs, and became president of the cabinet. A period of turbulent parliamentary disagreements ensued. The Government was unable to induce parliament to make the needed appropriations for a reorganization of the army, whereupon parliament was repeatedly dissolved, after being told that the king would be obliged to act without its sanction. In this way the reorganization of the army went on in spite of parliament. The death of the King of Denmark soon afforded the opportunity for showing Prussian strength. The Schleswig-Holstein duchies were claimed for the Duke of Augustenburg by Prussia, with a view to detach them from Denmark and incorporate them with Germany, and Bismarck was adroit enough to enlist in behalf of the claim the general sympathy of the empire. Austria and Prussia soon came to dissension over the occupation of these duchies, with the result that the conflict was brought to a crisis at the battle of Königgrätz in 1866, where Austria was so disastrously defeated that Prussia was able to place herself at the head of the North German Confederation, from which Austria was excluded. The war had carried Prussia to the very front of military nations, and Bismarck was universally recognized as the leading spirit in the movement. The result of the war was disastrous, however, to the friendly relations of France and Prussia. The French people saw the aggrandizement of their old foe with great alarm, and seized upon the first pretext for declaring war. The events of 1870-71 afforded Bismarck the opportunity he desired. The military prestige of France was humbled, if not broken; but, what to him was doubtless of far more consequence, the result intensified the national feeling among the Germans to such an extent that the new German empire was established, with the King of Prussia at its head. Bismarck himself was given the rank of prince, and made chancellor of the empire. At his dictation France was obliged, at the Treaty of Frankfort, May 10, 1871, to cede to Germany the greater

part of Alsace-Lorraine, and pay an indemnity of \$1,000,000,000.

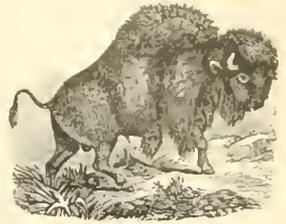

At the close of the war Bismarck entered upon what was in many respects the most remarkable part of his career. Having accomplished the consolidation of the German states into a federal union, he saw that the welfare of the country demanded that development of German resources which could only come from a long term of peace. He held that the sentiment of France was such that there could be no security against another outbreak of war except the general belief that an attack by France could have no chance of success. In order to secure this end he sought, on the one hand, by all the means at the command of diplomacy to isolate France, and on the other to form strong alliances between Germany and other European powers. In both of these efforts he was signally successful. While he made it impossible for France to form any advantageous union, he succeeded in uniting Germany with Austria and Italy in the firm bond of a triple alliance. He also strengthened the German army so far as to make it obvious that even a hostile alliance between France and Russia would not be able to cope with the combined forces of Germany, Austria, and Italy. Meanwhile, for the purpose of developing home industries, he secured the adoption of a law establishing a high protective tariff on foreign goods. In this and in many other ways he fostered the German spirit of solidarity and independence. This was done, however, at the expense of much opposition. He desired to make every party and power in the state subordinate to the general interest, and therefore incurred the violent opposition of the Liberal party on the one hand and of the Ultramontanes on the other. But his parliamentary skill was equal to the task of playing one party against another, and thus defeating all his enemies. When it became apparent that the reign of William I. was near its end, the hopes of the Liberals were very much encouraged by the political attitude and sympathies of the Crown Prince Frederick. But the prince, when he ascended to the throne, was too ill to urge his policy with success, and his death, which soon occurred, left the power of Bismarck apparently unshaken. The turmoils of Frederick's short reign, however, made a deep impression on the vigorous mind of the crown prince unfavorable to the chancellor, and when William II. succeeded his father it became apparent that the emperor and the chancellor were not in harmony, so the latter resigned Mar. 18, 1890. On his retirement he received many honors at the hands of the emperor, among them the dukedom of Lauenburg. See *Prince Bismarck*, by Charles Lowe (2 vols., London, 1885); *Our Chancellor*, by Moritz Busch (2 vols., New York, 1884); *Bismarck and the Franco-Prussian War*, by Moritz Busch (New York, 1878); *The Two Chancellors* (Götschakoff and Bismarck), by Julian Klaczko (London, 1876). C. K. ADAMS.

Bismuth [loan-word from Germ., which has also the form *Wismuth*]; a brittle metal (symbol Bi; specific gravity about 9.8; atomic weight 208) of a crystalline texture and of a grayish-white color, with a red tinge; occurs native in Australia, Germany, France, Cornwall, California, Texas, and Sweden. It is also found in combination with oxygen, sulphur, and arsenic. It fuses at about 500° F. When strongly heated it burns with a bluish-white flame, and is rapidly oxidized. This metal is not often used in the arts in a pure state, but its alloys are of considerable importance. Some of them are extremely fusible. A compound of 8 parts of bismuth, 5 of lead, and 3 of tin melts in boiling water, and is called *fusible metal*. Other alloys are even more fusible. Bismuth is an ingredient of some kinds of stereotype metal. The most important of several compounds it forms with oxygen is the trioxide (Bi₂O₃), which is employed in the manufacture of porcelain as an agent for fixing the gilding and for increasing the fusibility of fluxes. The sub-nitrate is a tasteless, heavy powder of pure white color, called pearl white, pearl powder, blanc de farl, etc. This is used as a cosmetic. As a medicine it acts as a tonic and antispasmodic. Revised by IRA REM-EX.

Bismuthine: a trisulphide of bismuth, composed of 81.6 per cent. of bismuth and 18.4 of sulphur. It occurs in lodes and beds in the older rocks with ores of arsenic, copper, iron, and lead, either crystallized in acicular prisms or massive with a foliated structure. It is a rare mineral.

Bison: a genus of animals of the order *Ruminantia* and family *Bovidae*; nearly allied to the ox; natives of Europe and North America. The bisons have short horns, which are curved inward at the point. They are distinguished

from the ox by an additional pair of ribs (having fourteen pairs), and by long woolly or shaggy hair, which covers the neck and shoulders of the males. They differ from the true buffaloes in having a hump upon the back, and in the absence of the dewlap. The buffaloes have cavities in their horns communicating with the nasal passages—bisons have not; the horns turn outward in the true buffaloes and inward in the bisons. (See BUFFALO.) At least three species of fossil bison have been discovered. (For the European bison, see AUROCHS.) The American bison (*Bison americanus*) is known in the U. S. by the incorrect name of buffalo. This is the only species of the ox family indigenous to America, except the musk ox. It is similar to the European bison, but the fore parts are more shaggy, and it is a powerful and ferocious-looking animal. The color of its hair is mostly brown. Vast herds of bisons formerly roamed over the plains and prairies between the Mississippi river and the Rocky Mountains, feeding on grass and brushwood. They were generally inoffensive and would not attack men, but preferred to run rather than to fight. During their migration they moved in herds, which were innumerable and irresistible. Great numbers of them were killed by Indians, who pursued them on horseback and subsisted on their flesh. Their hides were also valuable, and under the name of buffalo robes were an important article of commerce. The flesh of the cows was highly esteemed and similar to beef, being very juicy and savory. The bisons are swift in running, and have so keen a sense of smell that the hunter found difficulty in approaching them. The Indians sometimes circumvented them by setting fire to the prairie grass on several sides, and thus drove them in confusion toward a central position. They also drove them over precipices in large herds, the momentum of which was such that the leaders could not stop or retreat, being forced forward by the mass behind them. The chase of bisons was attended with some danger, as they sometimes turned upon an assailant, who was liable to be trampled under the feet of the herd. Numerous tribes of aborigines were mainly dependent on bisons for their food and clothing. The skins, which are covered with soft hair or fur, were much used for blankets, and their flesh and fat were converted into pemmican, the favorite food of the fur-hunters and *voyageurs* of North America. Bisons are nearly extinct, and only a few small herds now exist in North America. The largest of these occurs within the limits of the Yellowstone National Park. Experiments are now being made in crossing the bison with the domesticated cattle.

Bison.

Revised by DAVID S. JORDAN.

Bissagos, bis-saa gōs, Islands: a group of small volcanic islands in the Atlantic; near the west coast of Africa, between lat. 10° and 12° N., and between lon. 15° and 17° W. (see map of Africa, ref. 4-A). They have several good ports. Some of them are densely peopled with a savage Negro race, who cultivate maize, bananas, etc., and raise cattle. Bissao, an island of the above group, is a settlement of Portuguese who formerly traded in slaves, and who export hides, wax, and rice. It has about 8,000 inhabitants.

Bissell, EDWIN COXE, D. D.; Congregationalist; b. at Schoharie, N. Y., Mar. 2, 1832; graduated at Amherst College 1855, and at Union Theological Seminary 1859; pastor successively at Westhampton, Mass. (1859-61), San Francisco, Cal. (1864-66), Winchester, Mass. (1870-73); missionary in Austria, sent by the A. B. C. F. M. (1873-78); professor in Hartford (Congregational) Theological Seminary from 1881 until 1892, when he became professor in the McCormick (Presbyterian) Theological Seminary, Chicago, Ill. He commanded company K, Fifty-second Massachusetts, in the civil war, 1862-63. He was the author of *The Historic Origin of the Bible* (New York, 1873), a critical work; revised translation and commentary, in the Lange Series, on *The Apocrypha of the Old Testament* (1880); *The Pentateuch, its Origin and Structure* (1885); *Biblical Antiquities* (Philadelphia, 1888; 2d ed. 1892); *A Practical Introductory Hebrew Grammar* (1891); *Genesis printed in colors, showing the original sources from which it is supposed to have been compiled, with an introduction* (Hartford, 1892). D. in Chicago, Ill., Apr. 9, 1894. GEORGE P. FISHER.

Bissell, William Henry Augustus, D. D.: second Bishop of Vermont; b. at Randolph, Vt., Nov. 10, 1814; graduated at the university of his native state in 1836. He was ordained deacon 1839, priest 1840, and held charges at West Troy, Lyons, and for nearly twenty years at Geneva, N. Y. He was consecrated bishop of the diocese of Vermont June 3, 1868. D. at Burlington, Vt., May 14, 1893.

Bissell, Wilson Shannon; lawyer; b. in New London, Oneida co., N. Y., in 1847; at five years of age accompanied his parents to Buffalo, N. Y., where he has since resided. Graduating at Yale in 1869, he took up the study of law in the office of Laning, Cleveland & Folsom, in Buffalo; was admitted to the bar in 1871, and in the following year entered into partnership with Lyman K. Bass. Mr. Grover Cleveland joined the firm in 1874, and remained senior partner until his election as Governor of New York State in 1882. Mr. Bass retiring in 1876. After Mr. Cleveland's withdrawal Mr. Bissell headed the firm. He was chiefly interested in railroad litigation, and became president of some of the smaller branches of the Lehigh Valley system. In 1893 he was appointed Postmaster-General in Mr. Cleveland's second administration, but resigned in Feb., 1895, and resumed his law practice.

Bis'sen, Herman Vilhelm; a Danish sculptor; b. in Schleswig, Oct. 13, 1798. He went to Copenhagen in 1816, where he made such wonderful progress in his studies that he took the great gold medal in 1823, and was sent to Thorwaldsen in Rome. His works are numerous, and he ranks second only to Thorwaldsen in Denmark, and, inasmuch as he devoted all his time and talents to his native country, his influence upon Danish art has been even greater than that of Thorwaldsen. In 1850 he became director of the Academy in Copenhagen, and there died Mar. 10, 1868.

R. B. ANDERSON.

Bissextile [from Lat. *bis(s)extilis*, deriv. of *bis(s)ertus*; *bis*, twice + *sextus*, sixth]; the year which contains 366 days; usually called in English LEAP-YEAR (*q. v.*). In the Julian calendar the length of the year was fixed at 365½ days, about 11 minutes more than the actual length. In order that the year should always begin with the beginning of a day, it was directed that every fourth year should contain 366 days, and the other years 365. The additional day was given to February, and was inserted next after the 24th, which the Romans called *Sexto Kalendas Martii*. This was reckoned twice, and the repeated day was *Bis Sexto Kalendas*; hence the name *bissextile*. See CALENDAR.

Bistineau, bis-te-nō': a lake in the northwest part of Louisiana; forms the boundary between Bienville and Bossier parishes. It is about 25 miles long, and has a mean width of nearly 2 miles. Its water is discharged through a short outlet into Red river. It is navigable by steamboats.

Bistort (*Polygonum bistorta*): a perennial herbaceous plant of the family *Polygonaceæ*; a native of Europe and Asia. It bears flowers in a dense terminal spike. The whole plant is astringent, containing much tannin. The tortuous root is one of the most powerful vegetable astringents, and is used both internally and externally.

Bister, or Bistre: a pigment of a warm brown color, or reddish brown; used by painters in water-colors. It is prepared from the soot of wood, especially the beech.

Bistritz, bis'trits: a town of Transylvania; situated in a beautiful valley on the Bistritz river; 52 miles N. E. of Klausenburg (see map of Austria-Hungary, ref. 6-L). It has two monasteries, a gymnasium, and several large cattle-fairs every year. Near it are the ruins of an ancient castle, the former residence of the family of Huniades. It was of great commercial importance in the fifteenth and sixteenth centuries. Pop. 9,150.

Bit, or Bitts: two short but strong vertical timbers fixed upon the deck of a ship. They are used for fastening the cable when the ship rides at anchor, and for "leading" the principal ropes of the rigging. To "bit the cable" is to fasten it round the bit. "Topsail-sheet-bits" are for belaying or fastening the topsail-sheets. To resist strains, the bits are strongly bolted to the beams that support the deck.

Bitur, bē'-thoor': a town of India; in the Northwestern Provinces; on the right bank of the Ganges, about 12 miles N. W. of Cawnpore (see map of N. India, ref. 6-F). It has numerous pagodas, and is visited by multitudes of pilgrims. During the mutiny of 1857 it was a stronghold of Nana Sahib, and was taken by Gen. Havelock in Aug., 1857. Pop. about 8,000.

Bithyn'ia: an ancient country of Asia Minor; bounded N. by the Pontus Euxinus (Black Sea), E. by Paphlagonia, S. by Galatia and Phrygia, and W. by the Propontis (Sea of Marmora), which separated it from Europe. The chief towns were Nicomedia, Chaleedon, Nicæa, Prusa, and Heraclea. Bithynia was annexed to the Persian empire in 543 B. C., but afterward became an independent kingdom. Nicomedes I. began to reign over it in 278 B. C., and d. in 246. Prusias II. was King of Bithynia in the time of Hannibal, who sought refuge at his court. In 74 B. C. Bithynia became a province of the Roman empire. Nicomedia was for a long time the capital of the kingdom. In 1298 the Turks conquered the country, and in 1328 made Prusa the capital of their whole empire.

Bitlis', or Betlis': a town of Turkish Armenia; on the Bitlis river; a sub-tributary of the Tigris; on the northern slope of the Armenian Taurus, a few miles southwest of Lake Van. It is on very rough ground, and the houses are scattered and surrounded by gardens and orchards. In the center is a very steep eminence, on which stands an ancient fortress, now in ruins. The dancing dervishes have twelve monasteries in the place. Gold and silver ware, cotton cloth, carpets, and tobacco are manufactured here. The town is said to have been founded by Alexander the Great; it came into the possession of Turkey in 1514, and for about three centuries has been held as a fief of a powerful Kurdish family. Pop. about 25,000, one-fourth Armenian.

M. W. H.

Bitonto, bē-tōn'tō (anc. *Bituntum*, or *Bituntum*): a town of Italy; in the province of Bari, 11 miles W. of Bari (see map of Italy, ref. 6-G). It is well built, and has a fine cathedral and several monasteries. Good wine is made in the vicinity. The Spaniards gained a decisive victory over the Austrians here May 25, 1734. Pop. 27,000.

Bitsch, beech (in Fr. *Bîteche*; Lat. *Biēna*): a small fortified town of Lorraine; in a pass of the Vosges, about 36 miles N. N. W. of Strassburg, and 64 miles E. of Metz (see map of German Empire, ref. 6-C). Here is a citadel that is nearly impregnable, on a steep isolated rock. The town was originally a countship held by the Counts of Alsace and Flanders, but was given to the Duke of Lorraine by Frederick III., and finally passed to France with the duchy of Lorraine in 1738. It was in the French department of Moselle until 1870, when possession was taken of it by the Germans at the general cession of the country; for, in spite of a long siege and bombardment, it was not surrendered. Pop. (1890) 2,764, one-quarter military.

Bittenfeld, Herwarth von: See HERWARTH VON BITTENFELD.

Bitterfeld, bit'ter-felt: a town of Prussia; province of Saxony; on the Mulde river; 20 miles by rail N. of Leipzig. It is on the railway from Berlin to Leipzig, with branches to Halle and other places. It has important manufactures of cloth, iron, machines, etc. Pop. (1890) 9,047.

Bitter-king (*Soulaurea amara*): a shrub or small tree of the family *Polygalacæ*; derives its name from its intense bitterness. It is a native of the East Indian islands, has large oval leaves and axillary racemes of regular flowers. It is used as a remedy for fevers and other diseases.

Bittern [from same source as *bitter*, adj.]: the mother-liquid remaining after the removal of common salt from brines which have been partially evaporated. The bitter taste is due to the magnesium salts present. Sea-water and many salt-wells yield a bittern which is valuable in the production of Epsom salts (sulphate of magnesia), and especially of bromine.

Bittern [from O. Fr. *butor*; of uncertain origin]: a wading-bird allied to the heron; belonging to the genus *Botaurus* and family *Ardeida*. It has a long, straight, and sharp bill, long legs, and a long neck; frequents marshy fens and reedy shores of rivers and lakes, where it lies hid during the day, and feeds by night on frogs, fish, etc. The common bittern of England is widely diffused in Europe, Asia, and Africa. It utters a peculiar hollow and booming sound, which is noticed in Goldsmith's line, "The hollow-sounding bittern guards its nest." When assailed it

Bittern.

defends itself bravely with its sharp bill, which is about 4 inches long. In the U. S. are found two bitterns similar in habits to *Botaurus stellaris*—viz., *Botaurus lentiginosus* (bittern or bog bull) and *Ardetta exilis* (least bittern).

Revised by D. S. JORDAN.

Bitter Root River: in the State of Montana; rises in the Rocky Mountains; flows northward, and enters Clark's river in Missoula County. Length, estimated at 110 miles. Gold is found near it.

Bitter-root: See ROT.

Bitters: certain medicines, simple or compound; chiefly of vegetable origin, characterized by a bitter taste, and for the most part having tonic virtues. There are two classes: *aromatic bitters*, having a fragrant odor, due to volatile oils, and *simple bitters*, which possess no peculiar properties beyond their bitterness. "Bitters," as popularly used, are generally compounds of dilute alcohol with various drugs, as aloe if a cathartic effect be desired; if a tonic effect is sought, the bitters used are calisaya bark, gonian, quassia, colombo, and others. An aromatic is often added.

Bitter Spar: a variety of DOLOMITE (*q. v.*) of easy cleavage. It usually occurs in obtuse rhombohedrons, and consists of about 55 per cent. of carbonate of lime and 45 of carbonate of magnesia. Fine transparent crystals of it are found at Gap in France and Traversella in Piedmont.

Bitter-sweet, or Woody Nightshade (*Solanum dulcamara*): a perennial plant with a shrubby stem, nearly allied to the potato; is a native of Europe and Asia, and is naturalized in the U. S. It has ovate, heart-shaped leaves, the upper ones halberd-shaped or with two ear-like lobes at the base, and purple flowers. The fruit is a poisonous red berry. The stems or twigs gathered in autumn are sometimes used in medicine in chorea and some cutaneous disorders.

The name bitter-sweet is frequently given in this country to a climbing woody vine, the *Celastrus scandens* of the family *Celastraceae*, which grows wild in the Northern and Atlantic States. This vine is also called wax-work and staff tree. It has been used in medicine, and is popularly believed to have great virtues as an alterative.

Bitter-sweet Family: See SPINDLE-TREE FAMILY.

Bitterwood: a name given to several trees and shrubs of the genus *Xylopi*a and the family *Anonaceae*; natives of Brazil and the West Indies. They are remarkable for the bitterness of their wood. The fruit of *Xylopi*a *sericea* is aromatic and pungent like pepper. The term is also applied to the *Pteronia excolsa* and *Quassia excolsa*, the wood of which is used in medicine as a tonic. See QUASSIA.

BITTLE, DAVID FREDERICK, D. D.: founder of Roanoke College; b. in Frederick co., Md., Nov. 19, 1811; graduated at Pennsylvania College 1835; studied theology at the seminary of the Lutheran Church at Gettysburg, Pa.; pastor in the valley of Virginia, and afterward in Middleton, Md.; president of Roanoke College, Salem, Va., from 1853 until his death, Sept. 25, 1876.

Bitumen (Lat. *bitumen*): generically, a term applied to a variety of substances, from natural gas through naphtha, petroleum, and mineral tar, to solid asphaltum, containing for the most part carbon and hydrogen, with more rarely oxygen, nitrogen, and sulphur. No general chemical formula can be assigned to it.

Bitumen has been known to man in all its varied forms from the dawn of history. The Hebrew word translated "slime" in Gen. xi. 3 is rendered *אֶפְרַיִם* in the Septuagint and *bitumen* in the Vulgate.

Geographical Distribution.—Nearly all forms of bitumen are very widely distributed over the surface of the earth. On the Western continent a basin in the central and northern portion of the Mississippi valley, said to embrace 200,000 sq. miles, yields natural gas and petroleum in enormous quantities. In the central valleys of the eastern slope of the Rocky Mountains, from the mouth of Mackenzie river to Mexico, outcrops of maltha and asphalt occur at intervals. They occur in the valley of the Mackenzie for a distance of 1,500 miles. Along the Athabasca river a mass of asphaltic sand outcrops in bluffs 150 feet high for 60 miles. In Western Louisiana and Northeastern and other parts of Texas maltha and asphalt are frequently met. In Southern Central Texas an extensive deposit of calcareous asphalt has lately been reported similar to that of Val de Travers. In Eastern Mexico asphalt and maltha are of frequent occurrence. In Utah extensive deposits of ozokerite and gilsonite

occur. On the Pacific coast of California, from San Luis Obispo to San Diego, but chiefly in the valley of the Santa Clara river, springs of asphaltum, maltha, and petroleum are very numerous.

In the islands of Cuba, Barbadoes, and Trinidad asphaltum and petroleum in commercial quantities have long been known as Cuban asphalt, Barbadoes tar, and Trinidad asphalt, from the celebrated pitch lake. On the mainland in Venezuela another and larger "pitch lake" is known, and in Peru and Bolivia petroleum occurs in large quantities.

On the Eastern continent a line of bituminous outcrops occur from Hanover on the North Sea through the Carpathians, the peninsula of Taman, the Caucasus, the peninsula of Apsheron at Baku, the table-lands of Armenia and Persia, the environs of the Dead Sea, the valleys of the Tigris and Euphrates, the mountains of Baluchistan and Hindustan, Burma, and the islands of Java and Sumatra. Petroleum occurs in China and Japan, Egypt, Italy, the Ionian islands, Sicily, and the Pyrenees. Asphalt and maltha occur in Dalmatia, on the eastern shores of the Adriatic, and in many localities in France. In the Val de Travers, in Switzerland, and in the Tyrol and Sicily a peculiar limestone occurs impregnated with asphalt, which is widely used for pavement under the name of asphalt. The magnificent avenues of the city of Washington are covered with this material and asphaltum from the island of Trinidad. In England petroleum springs have been observed yielding small quantities of oil, but not in commercial quantity.

Geological Occurrence.—There are two well-marked geological eras noted for the occurrence of bitumen, although it may be said to occur from the Silurian up to the Tertiary. On the North American continent, east of the Mississippi river, the Devonian in Pennsylvania, the sub-carboniferous in Eastern Ohio and West Virginia, the upper Silurian in Tennessee and Kentucky, and the Trenton limestone in Western Ohio, Indiana, Michigan, and Canada, form an ellipse around the Cincinnati anticlinal, from which these newer formations slope upon all sides. In this ellipse occur the great petroleum and natural-gas regions of Canada and the U. S. At Great Manitoulin island, in the northern part of Lake Huron, and in the peninsula of Ontario, lying between Lakes Huron and Erie, petroleum has been observed. In Western New York, from Lake Erie as far east as Canandaigua Lake, natural gas is abundant, especially at Fredonia, where it has been used to light the town since La Fayette's visit in 1824. Near the boundary line between New York and Pennsylvania the oil regions of Pennsylvania commence, and extend through the western counties of that State, reaching into the eastern counties of Ohio, and extending southward into West Virginia and Kentucky. At one place in Wood co., West Va., a sort of asphalt called grahamite, that has been described as hardened petroleum, was mined until the deposit was exhausted. A similar mineral called gilsonite has lately been found in Utah. The formations throughout this region, inclosing the oil and gas, range from the Devonian in the northern portion to the sub-carboniferous in the southern portion, everywhere lying beneath the coal or coal-measures, if they are present. Through all the eastern counties of Kentucky into Tennessee petroleum and gas are frequent, as also along a line extending through Central and Western Kentucky into Indiana. Although both oil and gas occur at many points throughout these last-named regions, the developments are as yet unimportant, the oil and gas issuing for the most part from the upper Silurian. Asphalt also occurs in Tennessee in small quantity. In Northwestern Ohio and Northeastern Indiana, around Lima, a very prolific oil and gas field has been developed within the last ten years from the Trenton limestone. Limestone impregnated with petroleum occurs near Chicago, Ill., and throughout the southern peninsula of Michigan oil in small quantities is of frequent occurrence. Natural gas everywhere accompanies the petroleum, and many localities, both within and along the borders of this area, yield gas without oil, usually under an enormous pressure, at which no doubt the gas exists in a liquid state in the containing rocks. So far as is known, the deposits of the central valleys are cretaceous, the asphalt deposit of Texas lying in the Permian. The deposits of California, the West India islands, and South America are, so far as is known, in the Tertiary.

On the Pacific coast of California all forms of bitumen, from petroleum to half-decayed asphalt, occur, issuing from Miocene rocks, and gradually passing from the liquid to solid forms under the influence of the sun and rain. On the coast near Santa Barbara veins of asphalt mixed with very

fine sand occur in the Quaternary, apparently injected from below into crevices formed by some upheaval.

In Cuba asphalt is mined from veins in rocks supposed to be cretaceous. The great pitch lakes of Trinidad and Venezuela lie in the Tertiary, and the petroleum of South America issues from rocks of that age.

The small amount of petroleum observed in England has sprung from the coal-measures. In France the extensive deposits of asphalt occur in relation to what has been called by the French geologists an *époque asphaltique*, which has been assigned to the cretaceous. The vast region embracing the Carpathians, the Caucasus, and the table-lands of Persia yields every known form of bitumen from Tertiary formations. The petroleum of Italy and asphalt of Dalmatia and Albania also proceed from the Tertiary. But little is known of the geology of the occurrence of bitumen in other and less important localities.

Chemistry.—Bitumens consist of various mixtures of hydrocarbons, usually of very complex nature. A few are simple substances, having a definite chemical composition, and for the most part contain oxygen. Natural gas consists largely of marsh gas. With this are mixed in various proportion free hydrogen, and the members of the series next below marsh gas with traces of carbonic acid and carbonic oxide. The petroleum of the New York, Pennsylvania, Ohio, and West Virginia regions consist of the marsh gas or paraffine series, ranging from marsh gas in the dissolved gas to the solid paraffines. The lightest of these oils are yellow or red in color (amber oils), through brown and dark green to black. The more dense and dark oils hold in solution in small quantity solid substances, containing but little hydrogen, of high boiling-point and coloring power, only a few drops of which added to a colorless oil suffice to give the oil a high fluorescence. The Bunnese oils contain in addition notable portions of the benzole series. The Russian oils contain the additive compounds of the benzole series. All of these varieties contain also more or less of the olefine series. The initial members of these several series are as follows:

Marsh gas.....	$\text{CH}_4 - \text{C}_n\text{H}_{2n+2}$.
Olefiant gas.....	$\text{C}_2\text{H}_2 - \text{C}_n\text{H}_n$.
Benzole.....	$\text{C}_6\text{H}_6 - \text{C}_n\text{H}_{2n-6}$.
Hexa benzole.....	$\text{C}_6\text{H}_{12} - \text{C}_n\text{H}_{2n-6} + \text{H}_6$.

Many varieties of petroleum have been studied very little, if at all. It is observed, however, that some are very permanent in the air, undergoing no change when exposed in masses or flowing upon the ground or water, while others soon become dark-colored and viscid, passing into maltha, and finally into asphaltum. The petroleum from Tertiary formations are mainly of this character. Those from the cretaceous are of uncertain composition, and, while very widely distributed, are of minor importance. The Tertiary petroleum that form asphaltum rarely contain paraffine, except in the Carpathians, where immense quantities of native paraffine, called ozokerite, occur in masses in the rocks. In Utah ozokerites occur, not associated with other forms of bitumen. Asphaltum usually occurs in beds, where petroleum or maltha has flowed over the surface, and gradually gives up hydrogen to the oxygen of the air until the asphaltum, with a large excess of carbon, becomes solid and firm, in many instances resembling splint coal. Other forms of asphalt occur in veins, where they have apparently been intruded in a pasty or semi-fluid form at a high temperature and have become solid upon cooling. The material contained in these veins is identical only in a general manner. The albertite of New Brunswick, the grahamite of West Virginia, and gilsonite of Utah yield on distillation the paraffine series; but veins occurring in the region of Tertiary bitumens yield products, and partake of the characteristics of those substances. As a rule, asphalts of all kinds are soluble in benzole, but there are a few exceptions. The asphaltic sands of the Athabasca river are really petroleum sands, as the mass is not solid, but may be cut like marmalade. These natural mixtures of bitumen and sand are more complete than can be made by any artificial means, and for that reason are preferred to artificial mixtures for some purposes. When subjected to the action of chlorine, California petroleum may be converted into asphalt with liberation of hydrochloric acid. California petroleum contains a notable quantity of nitrogen, which appears to be a constituent element. Other petroleum contain sulphur, but it appears to be an accidental impurity rather than a constituent. Such petroleum are often very

difficult to refine, as the sulphur forms substitution compounds at high temperatures.

The word naphtha is of Arabic origin, and in Persia the native name is used to designate the most fluid variety of petroleum, often nearly colorless. In the U. S. the word has no similar meaning, but is always applied to some artificial product, usually the most volatile products of the distillation of petroleum.

The Origin of Bitumen.—This is a subject of pure speculation, but a careful study of the occurrence of bitumen in various parts of the world leads to conclusions well-nigh final.

Some of the most distinguished chemists of recent years have succeeded by very elaborate and ingenious experiments in producing from materials entirely inorganic oily fluids resembling petroleum. Reasoning from these results, they have assumed that nature's laboratories furnish the alkali metals, metallic iron, spiegel eisen, fluorobates, etc., and that the reaction of steam and carbonic acid at a white heat upon these produces the forms of bitumen as they appear at the earth's surface. Too much is required of nature's laboratories not sustained by observed phenomena to warrant the acceptance of such theories.

The occurrence of geodes filled with petroleum or other forms of bitumen, including anthracitic residues, in strata filled with fossil remains of animals, leads to the conclusion that in some instances the bitumen is the product of the decomposition of animal remains *in situ*, probably under great pressure and at a comparatively high temperature, perhaps beneath a deep sea. Large orthoceratites (an animal that may be compared to an uncoiled nautilus) have been observed with the cavities filled with fetid petroleum. Many facts observed in the vicinity of the pitch lake of Trinidad lead to the conclusion that the bitumen there is the product of the decomposition of wood or other vegetable matter under conditions that render the product wholly different from that of ordinary decay.

An examination of those regions that furnish bitumen in its various forms in greatest abundance, and particularly petroleum, leads irresistibly to the conclusion that by far the larger portion of the petroleum of the world is a distillate produced by natural causes. The Pennsylvania oil regions furnish oil from deposits of coarse sandstone and quartz conglomerate often consisting of water-worn pebbles of white quartz, of a lenticular or nearly spherical form, connected only at their points of contact, leaving the interstitial spaces open. The surrounding rock does not contain petroleum, and the rocks overlying these deposits are very hard silicious shells that hermetically seal the petroleum beneath them. It is impossible that the oil should have passed downward or laterally against such pressure, nor could it have penetrated the shells. The pebble sand is entirely destitute of organic remains, or of anything that would suggest them. The coarse sandstone of the Bradford field contains a few fossil shells. In seeking a source for the petroleum, it is found below in the immense deposits of shale that underlie that entire region, from 1,000 to 1,500 feet in thickness. At Erie, Pa., the shales come to the surface, and are there found to contain enormous quantities of fossil seaweeds. They have been made to yield 50 gal. to the ton of an oil resembling crude petroleum, and also hold petroleum in small quantities in their deeper layers. The cubic miles of this formation that underlie the oil region in Northern Pennsylvania and Southern New York and the black shales of Kentucky furnish a perfectly adequate source from which the vast supply of this material might be drawn. This theory is further strengthened by all of the facts observed in the destructive distillation of organic material in the arts. The hydrocarbons found in the more liquid forms of bitumen have also been found in artificial distillates from wood, bituminous coal, a lime soap made with menhaden oil, peat, shale, and other substances of organic origin. The lower the temperature at which such distillation is made, especially when steam is injected into the still, the closer is the resemblance between the distillate and the forms of bitumen. It is impossible that distillation could proceed from any natural cause, except it be at the lowest possible temperature and accompanied by all the possible effects of the presence of steam. As is the case when artificial distillates are produced from various organic materials and at different temperatures, we find that the various bitumens found in different formations and at different geological epochs partake in many respects of the peculiar composition of the organic remains from which the distillation proceeded. In

illustration it may be mentioned that the simple vegetable remains (*fucoids*) found in the shale on the western slope of the Alleghenies have furnished a distillate made up of the pure hydrocarbons of the paraffine series, rich in hydrogen and almost entirely free from nitrogen and sulphur. On the other hand, the Miocene formations of Southern California, inclosing remains of animals, furnish a bitumen consisting of compounds rich in carbon and containing nitrogen and sulphur. Again, the petroleum of Galicia, which issues from formations lying upon the slopes of the Carpathians, where the rocks contain both animal and vegetable remains, possesses the characteristics of both the Palaeozoic and Tertiary petroleum of the American continent.

Bitumen is one of the most permanent substances in nature. It resists decay in nearly all its forms, and has remained unchanged in its natural deposits often through countless cycles of geological time. In the constructions of mankind in various parts of the world it forms a part of the oldest existing monuments. It was used to cement in their places the magnificent sculptured slabs of alabaster that adorned the temples and palaces of Babylon and Nineveh. The cisterns in the rock-hewn city of Petraea of unknown antiquity (perhaps three thousand years) are still intact. Cisterns and silos in Egypt, perhaps older than Petraea, might still be used. It was employed in the vineyards of the Levant, in building boats on the Tigris and Euphrates, in the perpetual fires of the Guebres and Parsis, and for other purposes; and the "fire wells" (natural gas) of China are mentioned in the oldest records of that ancient country. In the Middle Ages it was of considerable importance in Persia, Italy, and Sicily, and nearly all travelers overland to India from Europe mention the fire-worshippers of Baku. Peruvian mummies prepared before the conquest also attest the universality and antiquity of its use.

In modern times all forms of bitumen have become of great importance in ministering to the wants of man, and have assumed an influence scarcely to be estimated upon the civilization of the last half century.

The amount of natural gas produced in 1890 in the U. S. could not be measured; its value is estimated at \$20,000,000. The production of petroleum reached 45,000,000 bbl., valued at \$30,000,000; of asphaltum, 40,841 short tons, valued at \$190,416; of ozokerite, 350,000 lb., valued at \$26,250. Total value of bituminous minerals for 1890, \$50,216,666.

See ALBERTITE, ASPHALT, NATURAL GAS, GILSONITE, GRAHAMITE, HYDROCARBONS, MALTHA, NAPHTHA, OZOKERITE, PARAFFINE, and PETROLEUM. S. F. PECKHAM.

Bituminous Coal: See COAL, COKE, and GAS.

Bitzius, bil-si-oo8, ALBERT (*Jeremias Gotthelf*): Swiss author; b. in Murten, canton of Freiburg, Oct. 4, 1797; educated for the church at Bern, and from 1832 till his death, Oct. 22, 1851, pastor of Lützellüh in Emmenthal. He is very popular among the Swiss for his masterly tales of Swiss life, among which are *Käthi die Grossmutter* (1847); *Uli der Knecht* (1841); *Uli der Pächter* (1849); and *Erzählungen und Bilder aus dem Volksleben der Schweiz* (1852-55). Translated is his *Jays and Sorrows of a Schoolmaster* (London, 1864; 2d ed. 1867). See his *Life* by C. Manuel (Berlin, 1857).

Bivalve [formed from Lat. *bi-*, double + *valva*, double or folding doors]; a shell which consists of two concave calcareous plates or valves joined together by a hinge and an elastic ligament, as the oyster.

BIVALVE SHELLS, or **BIVALVES**, are those coverings of mollusks which consist of two concave plates or valves, united by a hinge. (See CONCHOLGY.) A majority of recent bivalve shells belong to the acephalans or lamelli-branchiate Mollusca. There are also worm-like animals of the class Brachiopoda which possess bivalve shells. The structure and chemical composition of the shell, however, is different in the two classes. A very large proportion of the bivalve shells of the older fossiliferous rocks belong to the class Brachiopoda. In the Brachiopoda one valve is ventral and the other dorsal; in the Lamelli-branchiata both are lateral.

Bivouac, biv wäk [Fr. *bivouac*, prob. originally loan-word from Swiss Germ. *Biwachl*, supplementary night-watch]; a French word signifying an encampment of soldiers by night in the open air, without tents, or the system by which soldiers on a march, or in expectation of a battle, remain all night in the open air, resting with their arms by their side and ready for action. This practice is said to have been common among the crusaders. The generals of the French

Republic or the First Empire introduced the plan of dispensing with the use of tents and passing the night *en bivouac*. The same system was adopted by the other great powers on the Continent of Europe. In recent times it has been common for soldiers on the march to use the *tente d'abri*, or shelter-tent.

Bixby, JAMES THOMPSON, Ph. D.: Unitarian minister; b. at Barre, Mass., July 30, 1843; educated at Harvard College and Harvard Divinity School; held various charges in the Unitarian Church in Massachusetts and Maine 1870-79; Professor of Religious Philosophy in Mendville Theological School 1879-83; traveled in Europe 1883-85; became pastor of the Unitarian church at Yonkers, N. Y., 1885; received degree of Ph. D. at Leipzig, 1885; author of *Similarities of Physical and Religious Knowledge* (1876); second edition under the title *Religion and Science as Allies* (Chicago, 1889); and *The Crisis in Morals* (Boston, 1891).

Bixin: the coloring principle of annatto, the paste obtained by bruising the seeds of *Bixa orellana*.

Bizerta, bö-zär'ta, or **Benzert**, ben-zärt' (anc. *Hippo Zarytus*): a fortified seaport of Tunis, and the most northern town of Africa; about 38 miles N. W. of Tunis (see map of Africa, ref. I-D). The port, which was formerly good, has been filled up, so that it will now admit only small vessels. It is surrounded by walls and defended by two castles, but is commanded by the adjacent heights. This place was fortified by Agathocles about 308 B. C. Pop. 8,000.

Bizet, bö-zay', ALEXANDRE CÉSAR LÉOPOLD; commonly called *Georges Bizet*; b. Paris, Oct. 25, 1838; best known as the composer of the popular opera *Carmen*; studied under Halévy, whose daughter he married in 1869. He gained the Prix de Rome for composition, and was a brilliant pupil of the Paris Conservatory from 1848 to 1857. His operas include *Vasco da Gama* (1863); *Les Pécheurs des Perles* (1863); *La Jolie Fille de Perth* (1867); *Djamileh* (1872); *Carmen* (1875), his last work. He also completed Halévy's opera *Noé*. He died quite suddenly near Paris, June 3, 1875.

D. E. HERVEY.

Bjerregaard, byär-re-gård, HENRIK ANKER; a Norwegian poet; b. Jan. 1, 1792. His national songs represent the enthusiasm of the new-born nation in the early part of the century. His drama *Fjeld-eventyret* is still very popular. D. Apr. 7, 1842.

Björneborg, byörn-ne-börg, or **Biörnburg**, byörn börg; a seaport of Finland; at the mouth of the Kumo; 115 miles S. of Vasa; lat. 61° 29' N., lon. 39° 23' E. (see map of Russia, ref. I-B). It has various manufactures and a considerable trade. Pop. (1888) 9,632.

Björnson, byörn son, BJÖRNSTJERNE; dramatist and novelist; b. Dec. 8, 1832, in a lonesome and dreary parsonage in Kvikne, North-western Norway, where his father was a minister. He was educated in the Latin School at Molde, from which he went to the University of Christiania in 1851. But in the next year he broke off his scientific education and turned his attention to literature. His first book, published in 1857, was a little novel, *Synnøse Sollukken*, descriptive of peasant life in Norway. It made a very deep impression. The plot was simple, but at every movement it touched the deepest laws of life. The characters were pure psychological developments, never marred by explanations or comments from a merely individual moral point of view. The style was the short, pithy sentence of the saga, with all its power of signification, all its strength of passion, and all its sweetness of feeling. The effect of this book was wonderful, and the impression it made was both deepened and widened by the novels which followed, *Arne* (1858); *En glad gut* (Å Happy Boy, 1859); *Fiskerjenten* (The Fisher Lass, 1868), etc. In spite of the great variety of characters and situations which they depict, they are all so singularly alike that in the reader's mind they melt into one book, into one charming picture of life in Norway. Alternating with the novels he wrote dramas, and in this field he experienced some opposition. When his first tragedy, *Halte-Halda*, was published in 1858, there were people who felt that a dramatic genius had arisen, but the Scandinavian theaters were at first singularly unwilling to try the new author. Moreover, the young poet had not yet learnt to say unimportant things in an unassuming manner. His next drama, *Kong Scener* (1861), was better in this respect, but it was not until he published his great trilogy, *Sigurd Slemb* (1862), that the public thoroughly felt the greatness of his dramatic powers. *Sigurd Slemb* is a grand conception, executed in

a masterly way; and when in 1865 the Royal theater in Copenhagen presented his lovely little comedy, *De Nygifte* (The Newly Married), and in 1867 his tragedy, *Maria Stuart* (published 1864, translated in *Scandinavia*, Chicago, 1883-84), the impression was irresistible. With 1870 the first period of his literary activity may be said to have closed. Between this year and 1875 he underwent a great mental and spiritual change, due in the main to the influence of foreign literature and thought, to the study of which he devoted himself with ardor. He was particularly affected by the works of Darwin, John Stuart Mill, and Taine, as well as by the "modern" movement in Danish letters. In his second period, which begins with 1874, he appears as the foremost Norwegian advocate of republicanism in politics, and of free thought in religion. His principles have found expression not only in a succession of pamphlets, newspaper articles, and public addresses, but in a series of remarkable dramas dealing with social, religious, and political problems. These are *Redaktøren* (The Editor, 1874); *En Faldit* (Bankruptcy, 1875); *Det ny System* (The New System, 1879); *Kongen* (The King, 1879); *Leonarda* (1879); *En Hanske* (A Glove, 1883); *Over Erne* (Overstrained, 1883). Björnson's activity as editor and political leader has been of much importance. He has always been an earnest advocate of Norwegian independence, and his influence as the greatest popular orator of Norway has been especially marked since his American tour in 1880-81. Of the non-dramatic works of his second period the following deserve mention: *Magnhild* (1877); *Kaptein Mansana* (1879); *Det flager i Byen og paa Havnen* (1884); *Paa Guds Føje* (1889). See Georg Brandes, *Moderne Geister* (1882, pp. 389-436).

Björnstjerna, björn-stjärna, MAGNUS FREDRIK FERDINAND, Count; Swedish general and author; b. in Dresden, Oct. 10, 1779. He fought against the French in 1809-13, and negotiated the treaty by which Sweden and Norway were united. He was ambassador at London for many years (1828-46). Among his works is *The Theogony, Philosophy, and Cosmogony of the Hindoos* (1843). D. in Stockholm, Oct. 6, 1847.

Blaeas, blåå'kaa', PIERRE LOUIS JEAN CASIMIR, Duke of; a French statesman; b. at Anps, in the department of Var, Jan. 12, 1771; a faithful adherent of the Bourbons. He negotiated the concordat of 1817, and was employed on various important embassies. He founded the Egyptian Museum in Paris, and became a member of the Institute. D. in the castle of Kirchberg, Lower Austria, Nov. 17, 1839.

Black: color. See DYE-STUFFS and PAINTS.

Black, ADAM; publisher; b. in Edinburgh, Feb. 20, 1784; with his nephew, Charles Black, established the publishing-house in Edinburgh which gained control of the *Encyclopædia Britannica* in 1829, and of Scott's novels in 1851. Mr. Black was provost of Edinburgh 1843-48, declining the honor of knighthood; Liberal M. P. for his city 1856-65. D. in Edinburgh, Jan. 24, 1874.

Black, JEREMIAH SULLIVAN; jurist and Democratic politician; b. in Somerset co., Pa., Jan. 10, 1810; became a judge of the Supreme Court of Pennsylvania in 1851; Attorney-General in the cabinet of Buchanan in 1857; and Secretary of State in 1860, where he exerted himself to keep the Government from disruption by the secessionists. He was retained in many celebrated cases. D. in York, Pa., Aug. 19, 1883.

Black, JOSEPH; chemist; of Scottish extraction; b. at Bordeaux in 1728. He graduated as doctor of medicine at Edinburgh in 1754, and became Professor of Anatomy at Glasgow in 1756. His reputation is founded chiefly on the theory of latent heat, which he propounded between 1759 and 1763. He obtained in 1766 the chair of Chemistry in the University of Edinburgh, where he lectured for thirty years, and acquired great popularity. D. in Edinburgh, Dec. 6, 1799. His *Lectures on Chemistry* were published in 1803 (2 vols. 4to).

Black, WARREN COLUMBUS, D. D.; minister of M. E. Church South; b. in Copiah co., Miss., May 24, 1843; educated at Centenary College, Jackson, La.; joined the Mississippi Conference in 1871; has filled pastorates at Raymond, Madison, Camden, Natchez, Meridian, and Jackson; author of *Temperance and Totalitarianism* (1886); *Christian Womanhood* (1888).

Black, WILLIAM; Wesleyan divine; b. in England in 1760; removed to Nova Scotia in 1775; founded there the Wesleyan Church. He was subsequently general superin-

tendent of the Wesleyan missions in British America. His purity of life and eminent services to his denomination made him one of its most memorable characters. D. Sept. 8, 1834.

Black, WILLIAM; novelist; b. in Glasgow, Scotland, in 1841; educated at private schools; studied for a short time in the Government school of art, Glasgow, but soon engaged in journalism for the *Glasgow Weekly Citizen*; in 1864 went to London and wrote for magazines; in 1865 was attached to the staff of the *Morning Star*, and was its special correspondent in Prusso-Austrian war of 1866; afterward wrote numerous novels, among which are *In Silk Attire* (1869), descriptive of peasant life in the Black Forest; *March of Mincing Lane; A Daughter of Hell* (1871); *The Strange Adventures of a Phaeton* (1872); *A Princess of Thule* (1873); *MacLeod of Dare* (1878); *White Wings* (1881); *In Far Lochaber* (1888); *New Prince Fortunatus* (1890). His books range from Bohemian art life in London to outdoor sporting life, Scotch scenes and characters, and descriptions of scenery strung on a mere thread of incident. He was for several years assistant editor of the *Daily News*.

Black, WILLIAM HENRY, D. D.; minister in the Cumberland Presbyterian Church; president of Missouri Valley College, Marshall, Mo.; b. in Centreville, Ind., Mar. 19, 1854; educated at Waynesburg, Pa., and the Western Theological Seminary, Pittsburg; pastor in Pittsburg and in St. Louis. He was moderator of General Assembly at the age of thirty-four. He has published *God our Father* (Nashville, Tenn., 1889); *Womanhood* (1890); *Sermons for the Sabbath School* (1892). W. J. BECHER.

Black Acts: the acts of the Scottish Parliaments passed between 1425 and 1586—so called because they were printed in the characters known as *black letter*. In English law books the term "black act" is applied to the 9 Geo. I. c. 22 (1722), because it was occasioned by the outrages committed by persons whose faces were blackened. They destroyed the deer in Epping Forest, and committed other offenses. The act was repealed in 1827.

Black Art: See MAGIC.

Black Band: a variety of clay ironstone or compact carbonate of iron, containing 25 or 30 per cent. of carbonaceous matter. It occurs abundantly in the coal-fields of Scotland, and is the one almost exclusively used for the production of certain grades of iron in that country. It is not very rich, but it is easily reduced. Black band also occurs in the coal-measures of Ohio, and is used to a moderate extent for the production of iron.

Black-bass: a common name for two American fishes of the genus *Micropterus*; highly esteemed as game-fishes. The small-mouthed species is now known as *M. dolomieu*, and the large-mouthed one as *M. salmoides*. The two species are well known to anglers, and are found in almost all streams of the U. S. east of the Rocky Mountains. The small-mouthed species abounds in clear or swift streams; the other in sluggish waters or lakes. See BASS.

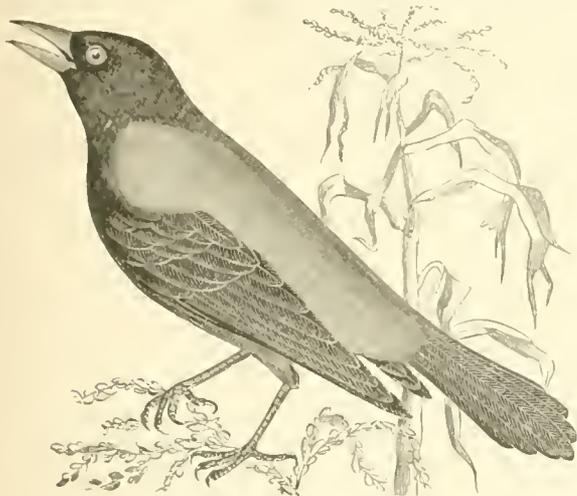

Black'berry: one of several brambles belonging to the family *Rosaceæ*; the drupelets adhere to the receptacle or "core." The common blackberry of America, which is the most important commercial species, is *Rubus villosus*, a native over a large part of the country. In a wild state it is exceedingly variable, and many of the cultivated varieties are simply selected wild variations. The greater part of the garden sorts belong to the variety *Sativus sativus*; certain early and lower growing small-leaved varieties, as the Early Harvest, belong to the var. *frondosus*; while the "white" blackberry is the var. *albus*. The blackberry first began to attract attention as a market fruit about fifty years ago. The New Rochelle (or Lawton) and Dorchester were the first prominent sorts introduced. The latter was brought to notice in 1841. For the trailing blackberry, see DEWBERRY.

Blackberries bear their fruit upon the canes or stems of the preceding year's growth, and these canes bear but one crop. It is therefore necessary to cut them out after they have borne, either immediately after the fruit is picked or sometime before growth begins the following spring. In the meantime new canes for the next crop are growing from the crown or root of the plant, and their tops are cut off when they reach a height of 3 or 4 feet, in order to increase their strength and productiveness. This heading-in induces the formation of lateral branches, which are usually cut off to a length of a foot or 18 inches the following fall or spring. Blackberries grow readily from root-cuttings (see CUTTINGS),

or the sprouts which spring naturally from old plants may be used. The plants are set in rows 8 or 9 by 4 to 5 feet apart. A good blackberry plantation will last from eight to twelve years. The greatest drawbacks to blackberry culture are borer insects which attack the canes, drouth at fruiting-time, and the orange-rust. The latter is a fungus (*Crona luminatum* or *C. atrens*). This appears as an orange-red coating upon the leaves. There is no remedy but to destroy the plants. Leading varieties of blackberry are Wilson, Snyder, Taylor, Kittatinny, Agawam, Ancient Briton.

L. H. BAILEY.

Blackbird, or Merle: a popular name in the British islands of the *Merula merula*; a species of thrush which abounds in Europe. In size it is intermediate between the song-thrush, or mavis, and the missel-thrush. The plumage of the male is all deep black, but that of the female is brown. It has a powerful voice, and its song is more mellow than that of the song-thrush, but inferior in compass and variety. The blackbird is often kept in cages, and is

The rusty crow-blackbird.

very easily trained. It feeds on worms, insects, and fruits, and frequents hedges, woods, and thickets. Its nearest American relative is the common robin, from which it differs little except in color. Quite distinct from this bird is the blackbird of the U. S. (*Quiscalus quisenta*), sometimes called "crow-blackbird," or purple grackle. The "rusty crow-blackbird" (*Scolecophagus ferrugineus*) is a rather less common bird of the U. S. It is a great predator of corn-fields. The swamps and meadows of the U. S. are frequented by the *Agelaius phoeniceus*, or red-winged blackbird. It is gregarious, and feeds on insects and grain. Several other related species are also called blackbird in America.

Revised by D. S. JORDAN.

Blackburn: a manufacturing town of Lancashire, England; situated in a barren district on a small stream called "The Brook"; 24 miles by rail N. N. W. of Manchester (see map of England, ref. 7-F). It has a beautiful Gothic parish church, a fine new exchange, also in the Gothic style, and numerous chapels of the Dissenters, a grammar school founded by Queen Elizabeth, a hospital, a theological academy, and a theater. The principal business of the town is the manufacture of cotton stuffs, chiefly coarse calicoes and muslins, in which 10,000 or more persons are employed. Coal and lime are abundant in the vicinity. James Hargreaves, who invented the spinning-jenny in 1767, was born here. Railways extend from this point in various directions. Blackburn sends two members to Parliament. It has a public park which is 700 feet above the level of the sea. Pop. (1881) 104,012; (1891) 120,064.

Blackburn, JOSEPH CLAY STYLES: U. S. Senator; b. in Woodford co., Ky., Oct. 1, 1838; graduated at Center College, Danville; admitted to the bar in 1858; served through the war in the Confederate army; entered Congress as a Democrat in 1875; four times re-elected; elected Senator from Kentucky Feb. 3, 1884.

Blackburn, WILLIAM MAXWELL, D. D.: b. at Carlisle, Ind., Dec. 31, 1828; graduated at Hanover College, Ind., in 1850, and at Princeton Theological Seminary 1854. He was

Professor of Biblical and Ecclesiastical History in the Presbyterian Theological Seminary at Chicago 1868-81, when he became a pastor in Cincinnati, O. President of University of North Dakota 1884-85; from 1885 president of Pierre University, North Dakota. He has published *William Farel, or The Swiss Reformation* (Philadelphia, 1865); *Aonio Paleario* (1866); *Ulrich Zwingli* (1868); *Admiral Coligny and the Rise of the Huguenots* (2 vols., 1869); *St. Patrick and the Early Irish Church* (1869); *History of the Christian Church from its Origin to the Present Time* (New York, 1879).

Blackburn's Pendulum: a device for tracing the curves resulting from the composition at right angles of two simple harmonic motions. (See WAVE-MOTION.) It is a pendulum the rates of vibration of which in two planes at right angles to each other are independent and variable within certain limits at the will of the experimenter. When these rates are adjusted to any exact ratio, the Lissajous figure for that ratio is traced by the bob, which carries a pencil or point.

Blackcap, Blackcap Warbler, or Fauvette (*Currucula atricapilla*): a European bird of the family *Sylviidae*; nearly allied to the nightingale, which it rivals in sweetness of song. Its note is rich in tone, and has a great variety of sweet and gentle modulations. It is a summer bird of passage in Great Britain, which it enters in early spring, and from which it migrates in September. It is highly prized as a cage-bird, not only for its song, but for its pleasant manners and temper.

Blackcap is also the name applied to a species of raspberry (the *Rubus occidentalis*), of which several varieties have recently been introduced for cultivation into gardens in the U. S.

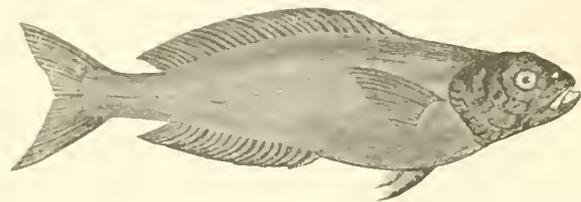

Blackcock, Heath-fowl, or Black Grouse (*Lyrurus tetrix*): a bird of the family *Tetraonidae*; abundant in Scotland and the north of England. It also occurs in the mountains and marshy parts of the continent of Europe, and abounds in Scandinavia and Russia. Its favorite haunts are moors, bogs, and morasses covered with rank herbage. The male, which weighs nearly 4 lb., is of a shining bluish-black color, with a conspicuous white bar on the wings below the ends of the great wing-coverts. The female is of a rust color, and is called the "gray hen." This species of grouse is gregarious, but in winter the males and females form separate flocks. They build nests of very simple construction on the ground, and lay in each six or eight eggs, which are about 2 inches long. Their food consists of seeds, berries, insects, and the young shoots of the pine, fir, and birch. Their flesh is highly esteemed for food.

Black Death: See PLAGUE.

Black Duck (*Anas obscura*): one of the best known and most highly prized of American wild ducks; breeds abundantly throughout the Eastern U. S. from Texas to Labrador. Its range is known to extend westward to Kansas and Iowa. It is of a generally blackish-brown color, with white lining to the wings, the speculum or wing-patch violet bordered with velvety black.

Blackfeet Indians: See ALGONQUIAN INDIANS, SIOUAN INDIANS.

Blackfish: (1) the blackfish or tautog of the Northern U. S. (*Tautoga onitis*); a species of the family *Labridae*, of an oblong form, with smooth scaly skin. It is one of the chief market-fishes of New York. (2) In Great Britain the

European blackfish.

Centrolophus pompilus, a species of the family *Stromatidae*; found most abundantly in the Mediterranean and contiguous waters. The name blackfish is also applied to cetaceans of the genus *Globicephalus*—e. g. *G. melas* of the Atlantic coast, and *G. scammoni* of the Pacific coast, of the U. S.

Black Flags: a name given to the more desperate survivors of the Taiping rebel army who, on its defeat, took refuge in Tonquin. In 1868 they were in possession of the valley of the Red river as far as Hanoi, but soon after were

repressed to the upper part of the valley, where they have settlements and chiefs of their own. They have usually promoted Chinese interests in Tonquin. The Black Flags were called upon by the Tonquines in 1873 to aid in expelling the French from Hanoi, and under their leader, Liu Yung-Fu, they defeated a sortie under Garnier, and killed that commander. In 1882 they inflicted a like disaster upon Rivière in the same locality and under similar circumstances. In 1885, China having become engaged in the war for the expulsion of the French from Tonquin, the Black Flags, with Chinese troops from Yunnan, held the passes above Tuyen-Kivan for nearly a month against repeated assaults, and until negotiations put an end to the war. The previous year the Black Flags became notorious everywhere because of their destruction of French mission stations and the appalling massacre of priests and native Christians, of whom it was estimated that nearly 10,000 fell victims. The Black Flags number about 5,000, and the Yellow Flags are regarded as twice as numerous. The latter are peacefully disposed; the former comprise many desperadoes, and are given to pillage.

Black Flux: a mixture of potassium carbonate and finely divided carbon or powdered charcoal. It is prepared by mixing in a crucible one part of niter with two or three parts of crude cream of tartar, and deflagrating the mixture by ignited charcoal; or by heating in a covered crucible cream of tartar or potassium bitartrate, when the tartaric acid is decomposed and charred, forming carbonic acid, which remains in combination with the potash. It is a valuable flux in reducing ores. The metal potassium can be obtained by heating this flux in iron vessels.

Black Forest (Germ. *Schwarzwald*; anc. *Hyrcinia Sylva*): a mountainous and wooded region in Baden and Württemberg, with a chain of mountains which extends about 85 miles, and separates the basin of the Rhine from that of the Neckar. It was a part of the ancient Hercynian Forest. This region is remarkable for its extensive forests and its mines of silver, copper, zinc, lead, and iron. The highest point of this chain is the Feldberg, which rises 4,903 feet above the level of the sea. The Danube, Neckar, Kinzig, Murg, and Elz rise in the Black Forest. A number of small lakes are found here at elevations of 2,500 to 3,500 feet. Granite and gneiss form the foundations of these mountains, and porphyry occurs on their sides, which are also covered with abundance of fir-trees. The descent is precipitous on the western side, but the eastern slope is very gentle. A valley called Murgthal, situated in this forest, is famous for its beautiful scenery. In the vicinity of Neustadt is the mountain-pass of Hölle, which was celebrated in connection with Moreau's retreat in 1796. The soil of these highlands is not adapted to tillage. The inhabitants are extensively employed in the manufacture of wooden clocks and toys.

Blackfriars: a term applied, on account of the color of their garments, to the Dominican order of monks, who first went to England about A. D. 1220, and settled at Oxford. Their second house was the Blackfriars in London, and from it the district still bears the name of the order, which had nearly sixty houses in England and Wales at the time of the abolition of monasteries. See DOMINICAN.

Black Fungi (*Pyrenomycetæ*): an order of degraded plants of the class *Ascomycetes* (*q. v.*), often of a black color (whence the name) and usually of a hard texture. They are essentially parasitic plants, although many are saprophytic. They number fully 7,000 species, which are distributed among a number of families, viz.: (1) *Sphaeriaceæ*, of which *Valsa* and *Hypoxylon* are common genera; (2) *Hypocreaceæ*, represented by *Claviceps purpurea*, the ergot of rye; (3) *Dothidiaceæ*, of which the best-known representative is *Ploerightia morbosa*, the black knot of plum-trees; (4) *Microthyriaceæ*, minute parasitic fungi, scarcely represented in U. S.; (5) *Lophiostomaceæ*, minute parasitic fungi, with few representatives in U. S.; (6) *Hysteriaceæ*, represented in U. S. by many species of *Hysterium* and *Hysteroglyphium*; (7) *Laboulbemiaceæ*, microscopic, greatly degraded black fungi, which are parasitic upon insects. CHARLES E. BESSEY.

Black Grouse: See BLACKCOCK.

Blackguard: It is said that when the Kings of England made a progress with the court from one royal residence to another, it was customary for the scullions and other menials to follow with loads of kitchen utensils, and even coals; and from their dirty appearance they received the derisive name of *blackguard*, which has come to be applied to any

person of a vile character, or one who uses vulgar or ruffianly language. See Trench, *English, Past and Present*.

Black-gum: a popular name of the *Nyssa multiflora*; an American tree, sometimes called pepperidge, hornpipe, tupelo, and sour gum. It has oval or obovate leaves, commonly acuminate, which turn bright crimson in autumn. The fruit is a bluish-black drupe, the wood close-grained, tough, and very difficult to split. It is used for cog-wheels, hatter's blocks, and wheel-naves. It belongs to the family *Cornaceæ*.

Black Hawk: city, on Union Pacific R. R.; Gilpin co., Col.; 36 miles W. of Denver (for location of county, see map of Colorado, ref. 2-D). It contains, and is adjacent to, rich mines of gold and silver. It has numerous quartz-mills and also smelting-works. Pop. (1880) 1,540; (1890) 4,067.

Black Hawk: an American Indian; chief of the Sac tribe; b. in Kaskaskia, Ill., 1767. He waged war against the U. S. in 1832 for the recovery of lands which certain chiefs of the Sacs and Foxes had ceded to the whites. D. on the Des Moines river, Oct. 3, 1838. See J. B. Patterson, *Life of Black Hawk* (1834); also one by W. J. Snelling.

Black'heath: an elevated open common in the county of Kent, England; 5 miles S. E. of London, adjoining Greenwich Park; a favorite holiday resort for Londoners. It commands an extensive view, and is bordered by numerous handsome villas. The Roman Watling Street crosses this heath, which is the site of Morden College. This heath was the scene of the insurrections of Wat Tyler and Jack Cade, and was formerly infested by highway robbers.

Black Hills: an oval group of low mountains lying chiefly in South Dakota, but partly in Wyoming. The summits rise from 2,000 to 3,000 feet above the surrounding plains, and the culminating point, Mt. Harney, has an altitude of 7,400 feet. The hills are due to a local uplift in the form of a flat dome, from which erosion has removed the cretaceous strata of the plains and laid bare in successive rings carboniferous and Cambrian rocks, with a nucleus of crystalline schists. In 1875 the hills were ceded to the U. S. by the Dakota Indians, and an important mining industry immediately sprang up. Since that time the district has produced (1891) gold to the value of \$45,000,000, and silver to the value of over \$2,000,000. Deposits of tin have been discovered. G. K. G.

Black Hole: the name of a small dungeon or cell in Calcutta, which was the scene of a nefarious crime committed by the nabob Surajja Dowlah in June, 1756. Having captured the English garrison of a fort at Calcutta, he confined the prisoners, 146 in number, in a cell 20 feet square, with only two windows. They suffered great agonies from thirst, heat, and foul air, and 123 died from suffocation in the first night. The twenty-three survivors were taken out the next morning. One of them, John Z. Holwell, published a narrative of their sufferings.

Black'ie, GEORGE STODART, A. M., M. D., Ph. D.: b. at Aberdeen, Scotland, Apr. 10, 1834; educated at the universities of Bonn, Paris, and Edinburgh, graduating A. M. and M. D. at the last in 1855; obtained the gold medals for botany and his thesis; removed to the U. S., and became Professor of Natural History at the University of Nashville 1856-61; served in the civil war as surgeon, medical inspector, etc.; has been Professor of Botany in Tennessee College of Pharmacy, and of Chemistry in Nashville Medical College since 1875; held prominent positions in Masonry, among them that of grand commander of the State; has published *Cretins and Cretinism* (Edinburgh, 1855); *Bolany the Ally of Medicine* (Nashville, 1859); *Medical Flora of Tennessee* (Nashville, 1859); *History of the Knights Templar* (Nashville, 1871); besides numerous other works; and edited the *Nashville Medical Journal* 1858-70, and the *Masonic Record* 1870-71.

Blackie, JOHN STUART: Scottish classical scholar; b. in Glasgow, July, 1809; studied at Edinburgh and Göttingen; Professor of Greek in the University of Edinburgh 1852-82. He translated Goethe's *Faust* into English verse (1834), and produced in 1850 an able translation of the works of Æschylus. He contributed to the *Encyclopedia Britannica* and the *Imperial Dictionary of Biography*. Among his other works are *Lays and Legends of Ancient Greece* (1856; 2d ed. 1880); *Lyrical Poems* (1860); *Homer and the Iliad*, with a translation in ballad meter (4 vols., 1866); *War Songs of the Germans* (1870); *Lays of the High-*

lands and Islands (1872); *The Wise Men of Greece* (1877); *Natural History of Atheism* (1877), a plea against Agnosticism; *Lay Sermons* (1881); *Allarona* (1882); *The Wisdom of Goethe* (1883); *Life of Robert Burns* (1887); and *Essays on Subjects of Moral and Social Interest* (1890). Through his efforts a chair of Celtic was established in the University of Edinburgh, and endowed. D. in Edinburgh, Mar. 2, 1895.

Black-jack: the name given by miners to blende (sulphide of zinc). It is also a popular name of a small species of American oak (*Quercus nigra*), sometimes called barren oak and iron oak. Its wood is very hard and makes a good firewood, but is rather perishable.

Black Lead: See GRAPHITE.

Black Leg: See BLACK QUARTER.

Black Letter: a term applied to the Gothic or Old English types or letters, which were used in the typography of the first books ever printed in England. Books printed before 1500 are generally in this character, which was commonly used in manuscripts by Europeans long before the invention of the art of printing. A form of type similar to this is still used by the Germans.

Black-letter Days: (1) Holy days recorded in the calendars of the service-books in "black-letter" type, rather than in the same type printed in red, consequently holy days of an inferior dignity. (2) In the English Prayer-book the black-letter days are days of observance for which no special collects or services are provided.

Black List: the name familiarly applied in Great Britain to printed lists of bankruptcies, assignments, dissolution of partnership, decrees in absence, judgments for debt, protested bills, and other matters affecting the credit of firms and individuals, issued weekly and circulated for the guidance of the mercantile community. These lists, which serve an important purpose, are well known by commercial men in the United Kingdom. Similar information is furnished in the U. S. and Canada by commercial agencies in the "Reports" and "Weekly Correction Sheets." See MERCANTILE AGENCIES.

Blackmail: an impost formerly submitted to in parts of Scotland and the north of England as a compromise with robbers. A class of men, often belonging to families in good standing, levied a tax upon their neighbors (generally about 4 per cent. of the rental of their property), on the pretext of protecting them from cattle-thieves. The celebrated Rob Roy was one of these blackmailers. The practice ceased in Scotland after the rebellion of 1745. It had already been long extinct in England. In modern usage, blackmail signifies money extorted from a person by threats of accusation or exposure in the public prints. Those who practice this extortion are said to "levy blackmail."

Blackmore, Sir RICHARD: a court-physician of William III. and of Queen Anne; a voluminous writer of prose and verse; b. in Corsham, Wiltshire, about 1630. He was the object of the satire of Pope and of the ridicule of the wits of his time. His chief works are *Prince Arthur* (1696) and *The Creation* (1712). D. in Boxted, Essex, Oct. 8, 1729.

Blackmore, RICHARD DOBDRIDGE: novelist and poet; b. at Longworth, Berkshire, England, in 1825. He graduated at Exeter College, Oxford, in 1847, and practiced law in London. *Lorna Doone* (1869), a romance of Exmoor in the seventeenth century, is the most successful of his novels, among which are *The Maid of Sker* (1872); *Cripples the Carrier* (1876); *Ereuna* (1877); *Springhaven* (1877), and others. Besides several volumes of original verse, he has published a translation of Vergil's *Georgics* (1871). HENRY A. BEERS.

Black Mountains: a group of mountains in Yancey co., N. C., a few miles W. of the Blue Ridge. It derives its name from the forests of dark balsam firs which crown its summits. It has the shape of a horse-shoe. The highest of its peaks rises to 6,688 feet, and is called the Black Dome, Mt. Mitchell, or Mitchell's High Peak, in honor of Dr. Mitchell of the University of North Carolina, who perished while exploring this inhospitable region, and was buried on its top. This is the highest point of the U. S. east of the Rocky Mountains.

Black Oak: a large tree of the U. S.; common E. of the Mississippi; now considered a variety (*tinctoria*) of the scarlet oak (*Quercus coccinea*). It is a handsome tree, affording useful timber, but is best known for its thick yellow bark, which is prized for tanning purposes, and yields

quercitron, a valuable yellow dye. It is also called yellow oak and dyer's oak.

Blackpool: a municipal borough of Lancashire, England; incorporated in 1875 and extended in 1879 (see map of England, ref. 6-F). It is situated on the Irish Sea; 20 miles by railroad W. of Preston; has an electric railway, and is much frequented for sea-bathing. Pop. (1891) 23,846.

Black Quarter, **Quarter Evil**, or **Black Leg**: a disease which attacks animals, especially thrifty young neat cattle, which are kept on fertile but undrained land. It is characterized by swelling of a joint, leg, or quarter, diarrhoea, extravasation of blood, and formation of abscesses. It is usually fatal. It is probably the same disease which is known in man as malignant pustule. Its causes are not well understood. It is a disease hard to cure, but stimulants, free incision in the affected part, with the application of weak solutions of chloride of zinc and carbolic acid, may prove useful. The best preventive is thorough underdrainage of pastures.

Black River of Louisiana: that part of Washita river below the mouth of the Tensas river, and between it and Red river, is sometimes called Black river.

Black River, or **Big Black River**: in Missouri and Arkansas; rises in Iron co., Mo.; flows nearly southward to the north line of Arkansas. It afterward runs southwestward, and enters the White river at Jacksonport, Ark. Length about 350 miles. It is navigable by steamboats 100 miles, except when the water is low.

Black River of New York; rises in Herkimer County; flows in a general N. W. direction, and enters Lake Ontario about 6 miles below Watertown. The whole length is about 125 miles. It falls 63 feet near Turin, in Lewis County.

Black River of Wisconsin; rises in Marathon County; flows southward and southwestward through Clarke and Jackson Counties, and enters the Mississippi about 15 miles above La Crosse. Its length is about 225 miles.

Black River of Vermont (Indian name *Kaskatuac*): rises in ponds in the town of Plymouth, Windsor co.; flows S. by E., and empties into the Connecticut river. It furnishes abundant water-power, which is employed in numerous manufactories.

Black River Falls: city; capital of Jackson co., Wis. (for location of county, see map of Wisconsin, ref. 5-C); on railroad and on Black river, 50 miles N. of La Crosse. It has a large flouring-mill, wagon-factory, sash and door factory, water-works, and electric lights; has one of the best water-powers in the U. S. Iron-ore deposits have been found in the vicinity, but with the veins badly faulted. There are many sawmills in the vicinity. Pop. (1880) 1,427; (1890) 2,261; (1895) 2,068. EDITOR OF "BADGER STATE BANNER."

Black Rock (Conn.): See BRIDGEPORT (Conn.).

Black Rod (of Scotland): a cross of gold which was alleged to contain a piece of the true cross; brought into Scotland in 1067 by Margaret, sister of Edgar Atheling, queen of Malcolm III. It was regarded as a national palladium. It was taken twice, at least, by the English, who after 1346 kept it in Durham Cathedral. It disappeared at the Reformation.

Blacksburg: town (founded in 1879); York co., S. C. (for location of county, see map of South Carolina, ref. 4-D); situated at junction of Rich. and Dan. and Chas. Cin. and Ch. R. Rs.; 1,500 feet above the sea-level, 221 miles N. of Atlanta. It has a healthful, invigorating climate, and is sheltered from severe north winds by the mountains. There are here deposits of magnetic and hematite iron ores, baryta, plumbago, and silver; and sulphur, lithia, and magnesia mineral springs. The industrial establishments of the town are mostly connected with the development of its natural resources, and include iron-works, furnace, foundry, machine-shops, railroad repair-shops, cotton-mill, wood-working factory, brick-yard, etc. There are here 4 churches, 2 graded schools, and 4 hotels. The surrounding country is one of the best developed agricultural regions of the State. Pop. (1880) 145; (1890) 1,245; (1893) estimated, 2,700.

EDITOR OF "NEWS."

Black Sea, or **Eux'ine** (anc. *Pontus Euxinus*; Turk. *Kara Diegis*): a large inland sea between Europe and Asia. It extends from lat. 40° 45' to 46° 45' N., and from lon. 27° 30' to 41° 50' E. The extreme length is about 700 miles, and its greatest breadth about 380 miles. Area, estimated at 185,000 sq. miles. It communicates with the Sea of Mar-

mora by the Bosphorus, and with the Sea of Azof by the Strait of Kertch. The shores of this sea are high and bold on all sides except the N. W., between the Crimea and the mouth of the Danube. In the middle of it no soundings were obtained at 160 fathoms. It incloses no islands except a few small ones at the mouth of the Danube, and the Symplegades, near the Bosphorus. The largest rivers that flow into it are the Danube, Dniester, Bug, Don, Dnieper, Kuban, and Kizil İrmak. This sea has no tide, but strong currents are produced by the influx of the large rivers, in consequence of which the water is fresher than that of the Mediterranean. The navigation of the Euxine is not dangerous, except during violent storms. It is supposed that this sea once extended much farther E. than it does now. In ancient times it was an important highway of commerce. The Turks excluded the ships of all foreign powers from it until 1774, when the Russians obtained the right to navigate its waters. By the treaty of Paris, 1856, this sea was neutralized—that is, the Russians and Turks were not permitted to keep ships of war in it. In 1871 the Russians again were permitted to have men-of-war on this sea.

Black-snake, or Blue-razer: a species of snake (*Bascanion constrictor*) common in nearly all parts of the U. S. Its length varies from 4 to 6 or 7 feet. It is remarkable for agility, climbs trees with ease, and moves along the ground very swiftly. It feeds on frogs, mice, lizards, eggs, birds, etc. Although it is harmless and has no poison-fangs, it will sometimes attack or resist its human enemies.

Blackstone, Sir WILLIAM: jurist and eminent commentator on law; b. in London, July 10, 1723. He was admitted to the bar in 1746, but obtained little practice. In 1758 he became Vinerian professor of law at Oxford, of which he was a graduate: in 1761 was elected to Parliament. He was appointed solicitor-general in 1763, and a justice of the court of common pleas in 1770. His principal work is *Commentaries on the Laws of England* (4 vols., 1765-69), which acquired a high reputation and is extensively used by students of law. His style is clear, ornate, and graceful, but his method is not scientific, and he was not well qualified to judge of the law from a legislator's point of view. D. Feb. 14, 1780. His *Commentaries* were severely criticised by Bentham. According to Horne Tooke, his work is "a good gentleman's law-book—clear, but not deep." See Clitheroe, *Life of Sir W. Blackstone* (1780); Foss, *The Judges of England*.

Blackstone, or Blaxton, WILLIAM: clergyman of the Church of England; the first white inhabitant of Boston, Mass.; settled at Shawmut, now Boston, in 1623, but left the place in 1634, not liking his Puritan neighbors. An account of Blackstone's sale of the land on which the city of Boston now stands will be found in the *Mass. Hist. Soc. Coll.*, 2d series, iv, 202. See also *The Memorial History of Boston*, vol. i., and Perry's *History of the American Episcopal Church*. D. in Rehoboth, Mass., May 26, 1675.

Blackstone River of Massachusetts: rises in Worcester County; flows southeastward into Rhode Island, and enters through Providence river into Narragansett Bay. The name Pawtucket river is given to that part of it which is below the town of Pawtucket. It affords abundant water-power, and flows through several manufacturing villages.

Blackthorn: See SLOE.

Black Tin: tin ore ready for the process of smelting.

Black Vomit: the hemorrhagic discharge from the stomach peculiar to YELLOW FEVER (*q. v.*)

Black Wad: a name sometimes given to the native black oxide of manganese. See MANGANESE.

Black Walnut (the *Juglans nigra*): a valuable timber tree of the U. S.; belonging to the family *Juglandaceae*; growing from Florida northward, and especially westward, being rare at present in New England. It is a handsome tree; produces a nut which, though edible, is less so than that of the European walnut, while its timber is even more valuable. The wood is employed for gunstocks, furniture, the finishing and flooring of rooms, and a great variety of purposes.

Black Warrior: a river of Alabama; formed by the junction of the Locust Fork and Mulberry Fork, which unite near the S. extremity of Walker County. It flows southwestward, and enters the Tombigbee about 2 miles above Demopolis. Its length is estimated at 175 miles.

Steamboats ascend this river from its mouth to Tuscaloosa. Bituminous coal is found on this river.

Black Water: See RED WATER.

Blackwell, ANTOINETTE LOUISA (Brown): preacher and reformer; b. in Henrietta, Monroe co., N. Y., May 20, 1825; graduated at Oberlin 1847; preached on her own orders; in 1853 became pastor of orthodox Congregational churches in Wayne co., N. Y.; became a Unitarian; champion of women's rights; married Samuel C., a brother of Dr. Elizabeth Blackwell, in 1856. Among her published books are *Shadows of our Social System* (New York, 1855); *Studies in General Science* (New York, 1869); *The Market-woman* (1871); *The Island Neighbors* (1871); *Sexes Throughout Nature* (1875); *Physical Basis of Immortality* (1876).

Blackwell, ELIZABETH, M. D.: b. in Bristol, England, 1821; the first woman who ever obtained the degree of M. D. in the U. S. She came to the U. S. with her parents in 1831, and taught school at Cincinnati from 1838 to 1847. Having studied medicine in private, she applied for admission to the medical colleges of Philadelphia, New York, and Boston, without success. She was at last admitted by a unanimous vote into the College of Geneva, N. Y., in 1847, and graduated as M. D. with honor in 1849. She afterward studied midwifery in Paris, and began to practice in New York city in 1851. In 1854, with her sister Emily, she opened the New York Infirmary for Women and Children. In 1859 she delivered a course of medical lectures in London, and in 1868 settled there in connection with the Women's Medical College. She wrote *Laws of Life* (1852); *Counsel to Parents on the Moral Education of their Children* (1879).

Blackwell's Island: in the East river; a part of New York city; has a lunatic asylum, workhouse, almshouse, penitentiary, smallpox, charity, and fever hospitals, one for incurables, one for epileptics and paralytics, and an asylum for the blind, all city institutions. The island has an area of 120 acres, and was named from a family which long owned it. At its north end is a stone lighthouse, with a fixed red light, which is 54 feet above the sea; lat. 40° 46' 15" N., lon. 73° 56' 08" W.

Blackwood, WILLIAM: Scottish publisher; b. in Edinburgh, Nov. 20, 1776; was the founder of *Blackwood's Magazine*. He began business as a bookseller in 1804, and issued the first number of his magazine in 1817. It obtained speedy success and a high reputation, to which the writings of Scott, John Wilson, and J. G. Lockhart greatly contributed. Its editors advocated the political creed of the Tories with powerful sarcasm and considerable virulence. Mr. Blackwood was chief manager of the magazine until his death, Sept. 16, 1834, and was succeeded by his sons, under whom it maintained its reputation, and received contributions from many eminent authors, including Bulwer, W. S. Landor, and De Quincey.—His son Joux, b. in 1818, d. Oct. 29, 1879, succeeded him in the business.

Bladder: a musculo-membranous sac contained in the anterior part of the pelvis, containing the urine or secretions from the kidneys. It is absent in all invertebrate animals. A few cartilaginous fishes possess it; so do *Batrachia* (frogs, etc.) and *Chelonina* (turtles). No birds have it, although the ostrich and cassowary have a dilatation of the cloaca somewhat resembling it. It is present in all mammalia. In man the bladder is nearly triangular when empty, oval when full. The ureters (one on each side) convey the urine to it from the kidneys; and this is voided, by the contraction of the bladder, through the urethra. The entrance to the latter is guarded by a valve, partly muscular, called by some anatomists the *sphincter vesicæ*. Distension of the bladder (retention of urine) from any obstruction of the urethra is a very painful and sometimes dangerous affection. It may be spasmodic, but it is more often the effect of a stricture or contraction of the passage from local disease. In low fevers it is not uncommon for a kind of paralytic distension of the bladder to occur. In either of these cases the removal of the urine by means of a catheter is of great importance. The bladder is also liable to inflammation (*cystitis*) and to chronic irritability, either of which may cause great distress. For stone in the bladder, see CALCULUS.

Bladder-nut: a popular name of several plants of the genus *Staphylea* and family *Sapindaceæ*. They are so called because the fruit is a bladderly, membranous, and inflated capsule, inclosing hard, bony seeds. They are shrubs or small trees with pinnate leaves, five stamens, and five

petals. The *Staphylea pinnata* is a native of Europe, and is planted as an ornamental tree in British shrubberies. Another species, the *Staphylea trifolia*, or American bladder-nut, is a native of the U. S. It is a shrub about 10 feet high, having three ovate leaflets. The seed of these species is aperiënt, and the wood is suitable for turning.

Bladderwort: an aquatic plant of the genus *Utricularia* and family *Lentibulariaceæ*, which comprises numerous species abounding in tropical and temperate parts of both hemispheres. Their flowers adorn the surface of lakes, ponds, and stagnant or shallow waters. Seventeen species are found in the U. S. They are remarkable for a provision by which the plant, which is ordinarily submerged in water, is raised to the surface, in order that the flowers may expand in the air. The leaves and stems are furnished with little bladders or vesicles, which become filled with air at the time of flowering. The air is afterward removed, so that the plant sinks again, and ripens its seeds at the bottom. A few species which do not grow in the water have no bladders. It has been discovered recently that these bladders act as traps for minute water animals, and it appears probable that the plants are benefited by absorbing the juices of the decaying organic matter. See INSECTIVOROUS PLANTS.

Revised by CHARLES E. BESSEY.

Blagoweshshensk, blâ-gô-ves-chensk' (i. e., good news): the capital of the province of Amoor, in Siberia (see map of Asia, ref. 3-11). It was founded in 1858, and consists mostly of government buildings. Some trade is carried on here between the Chinese and the Russians. Pop. (1888) 20,212.

Blair, WILLIAM GARDEN, D. D., LL. D., F. R. S. E.; a minister of the Free Church of Scotland; b. at Aberdeen, Feb. 5, 1820; graduated at Aberdeen; ordained in the Scotch Kirk, but came out at the Disruption in 1843 and became pastor of the Free Church at Pilrig, Edinburgh, 1844; Professor of Apologetics and Pastoral Theology, New College, in 1868; president of the meeting of the Alliance of Churches of the Presbyterian order, Toronto, 1892. Between 1819 and 1883 he was editor successively of the *Free Church Magazine*, the *North British Review*, the *Sunday Magazine*, and the *Catholic Presbyterian*. Among his best-known works are *Bible History in Connection with General History* (London, 1859; rev. ed. 1882); *Better Days for Working People* (1863, 1882); *Heads and Hands in the World of Labor* (1865); *Counsel and Cheer for the Battle of Life* (1867); *For the Work of the Ministry* (1873; 4th ed. 1885); *Personal Life of David Livingstone* (1880; 4th ed. 1884); *Public Ministry and Pastoral Methods of Our Lord* (1883); *Leaders in Modern Philanthropy* (1884); *The First Book of Samuel; The Second Book of Samuel; The Preachers of Scotland, from the Sixth to the Nineteenth Century* (1888), etc.

Blaine; city; Whateom co., Wash. (for location of county, see map of Washington, ref. 1-C); on Gt. Nor. R. R. and on Gulf of Georgia; 24 miles S. E. of New Westminster, British Columbia; has fishing industry, sawmills, and a canning-factory. Pop. (1890) 1,563.

Blaine, JAMES GILLESPIE, LL. D.; statesman; b. in Washington, Pa., Jan. 31, 1830; graduated at Washington College in 1847; and soon after removed to Maine, where he became editor of the *Portland Advertiser*. Chosen to Congress in 1862, he immediately achieved distinction as a debater, and was five times re-elected. His position and influence in the House are indicated by the fact that he was chosen Speaker in 1869, 1871, and 1873. During all this period he exerted a powerful influence in shaping the legislation of Congress. The encouragement of railroads in the West by governmental appropriations was one of the means by which he believed the country was to be most successfully developed; and his interest in this method of internal improvement brought him into intimate relations with many of the great railroad enterprises of the time. His vigorous methods aroused many animosities. In 1876 he was charged with having received \$64,000 from the Union Pacific Railway Company for legislative services rendered; but he produced letters from officers of the company declaring that he had never received a dollar from the company for any purpose whatever. He was accused of having received bonds from the Little Rock and Fort Smith R. R. as a gratuity, and that lands had been sold through the Union Pacific Railway Company for his benefit. To this he replied that all the bonds of that company he ever possessed he had bought at the market price, and had held at a pecuni-

ary loss. He was charged with having received a certain gift of bonds of the Kansas Pacific R. R., and that he had been party to a suit concerning them in one of the courts of Kansas. To this charge he replied that his name had been confounded with that of a brother who had held stock in that railroad for many years. A resolution was adopted in the House of Representatives to authorize a committee to investigate the alleged sale of certain bonds of the Little Rock and Fort Smith R. R. to the Union Pacific. Evidently the investigation was aimed at Mr. Blaine. The committee ascertained that an extended business correspondence had for many years been carried on between Mr. Blaine and Mr. Warren Fisher, of Boston, and that a number of important letters, constituting a part of this correspondence, had fallen into the hands of a clerk by the name of Mulligan. This clerk was summoned to Washington; but on his arrival Mr. Blaine obtained possession of the letters, and on June 5, 1876, produced them in the House of Representatives. A memorable scene followed. Asserting that the letters were private, and that the House had no right to them, he held them up and exclaimed: "Thank God, I am not ashamed to show them. There is the very original package; and with some sense of humiliation, with a mortification I do not attempt to conceal, with a sense of outrage which I think any man in my position would feel, I invite the confidence of forty-four millions of my countrymen, while I read these letters from this desk." After reading the letters Mr. Blaine asked the Speaker if he had received a dispatch from Josiah Caldwell, one of the originators of the Fort Smith R. R., who was familiar with the whole transaction. The Speaker gave an answer which was considered evasive. Mr. Blaine then exclaimed: "Within my positive knowledge you received such a dispatch, completely and absolutely exonerating me from this charge, and you have suppressed it." The effect of this charge was electric. Seldom in the history of the House has so tumultuous a scene been witnessed. This event occurred on June 5, 1876. On the following Sunday, just as Mr. Blaine was entering church, he was prostrated with extreme heat, and his condition for a time created serious alarm. At the National Republican Convention, held during the same week, he was earnestly supported by his friends as candidate for the presidency, and up to the eighth ballot led all other candidates. On the seventh ballot he lacked only twenty-eight votes of a majority. But at that point his opponents united, and gave the nomination to Gov. Hayes, of Ohio.

Soon after the convention, Senator Morrill, of Maine, resigned his place in the Senate to accept the secretaryship of the Treasury, and Mr. Blaine received the appointment as his successor. In the Senate his power as a debater gave him great prominence. He was an ardent supporter of the Republican policy in the South; and there, as in the House of Representatives, he advocated with great power the policy of generous appropriations for the assistance of railroads and other means of internal improvements. As the presidential convention of 1880 approached, he was once more a prominent candidate for the Republican nomination. His most formidable opponent seemed to be Gen. Grant, who was now put forward for a third term. On the first ballot Grant received 304 votes, Blaine 284. The convention continued through six days. On the thirty-sixth ballot the friends of Blaine and the other opponents of Grant united on Gen. Garfield, and gave him a majority.

On the election of Garfield, Blaine took the position of Secretary of State. It immediately became evident that his administration of this department of the Government would be characterized by two important lines of policy. He endeavored in the first place to secure and preserve peace throughout this continent. His second purpose was to extend commercial relations, and cultivate close habits of trade and intercourse between all the nations and peoples of the New World. For the accomplishment of these ends he proposed the assembling of a Universal Peace Congress at Washington. The project met with great favor. The letter of invitation, issued Nov. 29, 1881, called for a meeting on Nov. 24, 1882. But the assassination of President Garfield interrupted all plans for the meeting, and on Dec. 19 Mr. Blaine resigned his position. His successor reversed his policy after nearly all the powers had accepted the invitation, and the congress had to be abandoned.

The leisure afforded Mr. Blaine by his retirement from the cabinet gave him opportunity for literary work. He now entered upon an elaborate historical composition, which

was published in two volumes in 1884 and 1886, under the title *Twenty Years of Congress*. The work was brilliantly written and had a wide sale. As the time of the National Republican Convention of 1884 approached it became evident that he would once more be a popular and powerful candidate. On the first ballot he received 334 votes, only about 70 less than a majority. On the fourth vote he received 541 out of 813. But the canvass that followed was one of peculiar bitterness. The "Mulligan letters" played a conspicuous part in the campaign. Mr. Blaine entered personally into the canvass, speaking in Ohio, Indiana, and New York. The result depended upon the vote in New York, and New York voted for Mr. Cleveland by a majority of 1,047. In 1888 Mr. Blaine declined to be a candidate for the presidency and took no active part in the campaign, but on the election of President Harrison he once more became Secretary of State. He now had the opportunity of developing the policy he had advocated in the first months of the presidency of Garfield. He pursued a vigorous policy in regard to the "Fisheries Question," and also to the protection of the sealing industry off the coast of Alaska. (See *BERING SEA (CONTROVERSY)*.) In accordance with his former purpose, he brought about a congress at Washington of all the American powers, for the purpose of encouraging a more friendly commercial intercourse. But the most important of his measures was his advocacy of the doctrine of commercial reciprocity. When the McKinley Tariff Bill was before Congress, Mr. Blaine took the ground that, although he was earnestly in favor of fostering the industries of the U. S. by means of a protective tariff, yet he believed the interests of those industries would be best subserved by a policy of reciprocity, by which it should be in the power of the Government to admit free of duty staple goods of those nations which made equivalent concessions in imposts upon the products of the U. S. In consequence of Mr. Blaine's advocacy a provision was adopted in the McKinley Tariff Bill authorizing the President, under certain restricted conditions, to waive the operations of the protective measures of the statute. (See *RECIPROcity*.) Mr. Blaine's administration of the affairs of state increased his popularity to such an extent that in 1890 and 1891 it seemed certain that he would be nominated by the Republican party in 1892. In the autumn of 1891, however, he published a letter positively withdrawing his name from consideration. Whether this withdrawal was due to a sense of loyalty to President Harrison, or whether it was owing to the precarious state of Mr. Blaine's health, was the subject of much speculation during the winter and spring before the convention of June, 1892. On June 3 he unexpectedly resigned, in order, it was alleged, that he might be free to accept the presidential nomination if offered to him, as his friends confidently expected it would be. Unquestionably he could have received the nomination if he had not positively declined to be a candidate. His subsequent resignation subjected him to the charge of finess and insincerity. The nomination, after a short contest, was given to President Harrison. During the summer Mr. Blaine's health was precarious, and he abstained from active participation in the political canvass. It was popularly supposed that his relations with President Harrison were not friendly; but this supposition seems to have had very little foundation. At the end of the summer he returned from his summer home in Maine to Washington, where, after many weeks of severe illness, he died on Jan. 27, 1893.

Mr. Blaine throughout his political career was remarkable for the personal charm of his manners, the breadth and readiness of his knowledge, and the magnetic fascination which he exercised over those with whom he was associated.

C. K. ADAMS.

Blainville, blān'veel, HENRI MARIE DUCROTAY, de, M. D., F. R. S.: French zoölogist and anatomist; b. at Arques, near Dieppe, Sept. 12, 1777. He studied comparative anatomy under Cuvier, who employed him as his assistant; in 1808 received the degree of doctor of medicine; was appointed Professor of Anatomy and Zoölogy in the Faculty of Sciences of Paris in 1812; admitted into the Institute in 1825. In 1832 he succeeded Cuvier as Professor of Comparative Anatomy in the Museum of Natural History. He acquired a high reputation as a teacher and writer. Among his works are *Lectures on General and Comparative Physiology* and *Osteology, or a Comparative Iconographic Description of the Skeleton and Dentary System of the Five Classes of Vertebrated Animals* (unfinished). D. May 1, 1850.

Blair: city and railroad junction; capital of Washington co., Neb. (for location of county, see map of Nebraska, ref. 10-II); 2 miles from the Missouri river and about 25 miles N. of Omaha; in a beef, pork, and grain raising district. Pop. (1880) 1,317; (1890) 2,069.

Blair, FRANCIS PRESTON, JR.: lawyer; b. at Lexington, Ky., Feb. 19, 1821. He graduated at Princeton in 1841; was elected a member of Congress by the Free-soil Party of St. Louis, Mo., in 1856, after which he acted and voted with the Republicans for several years. He joined the Union army in 1861, and obtained the rank of major-general. In 1864 he commanded a corps of Sherman's army in the campaign which resulted in the capture of Atlanta. Having joined the Democratic party, he was selected as a candidate for the vice-presidency by the convention which nominated Horatio Seymour for the presidency in 1868. He was chosen a U. S. Senator for Missouri in Jan., 1871. D. at St. Louis, Mo., July 8, 1875.

Blair, HUGH, D. D.: Scottish divine; b. in Edinburgh, Apr. 7, 1718; licensed as a minister of the Church of Scotland in 1741. In 1743 he became one of the ministers of the Canongate church, Edinburgh, and in 1758 was transferred to the High church of Edinburgh. His sermons were admired for their polished style, but were not remarkable for originality or profoundness. In 1760 he was appointed Professor of Rhetoric and Belles-Lettres in the University of Edinburgh (regius professor 1762). He published five volumes of sermons (1777-1800), which were once very popular, but their reputation has declined. His *Lectures on Rhetoric* were published in London 1783 (2 vols.), on his retirement from his professorship, and were used in many schools. D. in Edinburgh, Dec. 27, 1800. See his *Life* by James Finlayson (1801).

Blair, JAMES, D. D.: b. in Scotland, probably in Edinburgh, 1656; entered the Anglican ministry; removed to America in 1685; in 1689 became commissary of the Bishop of London for Virginia and Maryland; was founder and first president of William and Mary College (charter granted Feb. 14, 1692, but he did not enter formally on his duties as president till 1729), and rector of Williamsburg, holding all these and other important offices till his death, in Williamsburg, Va., Aug. 1, 1743. Another account gives the date of the commissary's death as Apr. 18. Besides other works, he published a commentary on the *Sermon on the Mount* (4 vols., 1722), highly commended by Waterland, Doddridge, and Bickersteth. A second edition was issued in 1732.

Blair, JOHN: jurist; b. at Williamsburg, Va., in 1732. He graduated at William and Mary College, and studied law in London. Having previously filled several high offices, he was appointed by Washington judge of the Supreme Court of the U. S. (1789); resigned in 1796. D. in Williamsburg, Va., Aug. 31, 1800.

Blair, MONTGOMERY: lawyer and politician; b. in Franklin co., Ky., May 10, 1813; graduated at West Point in 1835, serving in artillery in Florida war till he resigned, May 20, 1836; counselor-at-law in St. Louis, and U. S. attorney for the district of Missouri 1839-43; judge of the St. Louis court of common pleas 1843-49; solicitor of the U. S. in the court of claims 1855-58; counselor-at-law in Montgomery co., Md., 1853-61, and since 1863, being counsel for plaintiff in the famous Dred Scott case; president of the Republican committee of Maryland 1860; and Postmaster-General of the U. S. 1861-64. D. in Silver Spring, Md., near Washington, D. C., July 26, 1883.

Blair, ROBERT: Scottish poet; b. in Edinburgh, 1699; a relative of Hugh Blair. He was ordained minister of Athelstaneford in 1731. He wrote a poem of undoubted merit, entitled *The Grave*, which was not printed until after his death. D. in Athelstaneford, Feb. 4, 1746.

Blairsville: borough and railroad junction; Indiana co., Pa. (for location of county, see map of Pennsylvania, ref. 5-C); on the Conemaugh river, 56 miles E. of Pittsburg. Grain, pork, lumber, and coal in great quantities are shipped here. Pop. (1880) 1,162; (1890) 3,126.

Blake, EDWARD, M. A.: Canadian statesman; b. in township of Adelaide, Middlesex, Ont., Oct. 13, 1833. He was educated at Upper Canada College and University of Toronto, where he took first-class honors in classics, and received the degree of M. A. in 1858. He was admitted to the bar in 1856; appointed queen's counsel in 1864; was for a short time an examiner and lecturer on equity law for the Upper Canada Law Society. He was elected for South Bruce, in the Liberal

interest, for the Ontario Legislative Assembly in 1868; was leader of the opposition in that body from 1867 till 1871, when he became Premier of Ontario; resigned that office and his seat in the Assembly in 1872. He was a member of the Mackenzie cabinet 1873-74; Minister of Justice 1875-77; and president of the Council 1877-78, all of which portfolios he resigned before the expiry of his term of office. He was elected leader of the Liberal party in 1880; represented South Bruce and West Durham in the Dominion Parliament; and in July, 1892, was elected to represent South Longford, Ireland, in the British Parliament. He was elected chancellor of Toronto University in 1876. His father, the late Hon. William Hume Blake, jurist, was solicitor-general of Upper Canada, and subsequently chancellor of that province.

NEIL MACDONALD.

Blake, ELI WHITNEY, LL. D.: manufacturer and inventor; b. in Westboro, Mass., Jan. 27, 1795; graduated at Yale in 1816; became associated with his uncle, Eli Whitney, in the manufacture of arms on the plan of machine-made and interchangeable parts, which revolutionized the art of manufacturing complex constructions. (See ELI WHITNEY.) Established a pioneer factory of domestic hardware near New Haven, Conn., 1834, and introduced many of those improvements in metallic house-furnishings which have given to American hardware its acknowledged superiority; invented (1857) the "Blake crusher," his most important invention, now in general use throughout the world. In this machine for reducing stone and ores to small fragments, he devised a new mechanical principle, that of crushing between upright convergent jaws, having a short and quick vibration. The machine may be said to have introduced a new era in road-making and mining industries. Mr. Blake was the author of numerous scientific papers. Received the degree of LL. D. from Yale in 1879. D. at New Haven, Conn., Aug. 17, 1886. C. H. THURBER.

Blake, GEORGE SMITH: commodore, U. S. navy; b. in Worcester, Mass., in 1803. He served in the Mexican war. Was superintendent of the U. S. Naval Academy at Annapolis and at Newport, R. I., from 1857 to 1865. D. in Longwood, near Boston, June 24, 1877.

Blake, ROBERT: b. in Bridgewater, Somersetshire, England, in 1599; elected to Parliament in 1640; when the civil war began in 1642 raised a troop with which he fought against the royalists. He gained distinction by his defense of Taunton in 1645. In 1649 he was appointed "general of the sea." He destroyed or captured nearly all of Prince Rupert's fleet in the Tagus in 1651. In 1652 he became chief admiral, and in May of that year gained a victory over Van Tromp, who attacked Blake in the ensuing November near Goodwin Sands. Blake was defeated, but in Feb., 1653, he attacked Van Tromp and gained a victory in a running fight of three days. In 1654 he chastised the Dey of Tunis. He destroyed the Spanish plate-fleet at Santa Cruz in 1657. D. at Plymouth, Aug. 17, 1657.

Blake, WILLIAM: poet and artist; b. in London, England, Nov. 28, 1757. In 1783 appeared *Poetical Sketches* by W. B. This was printed and published in the ordinary way, and was without illustrations. In 1789 came *Songs of Innocence*; in 1793 *The Gates of Paradise*; in 1794 *Songs of Experience*; and later several volumes of poetic rhapsody. All these were published by the author, and all were illustrated. Both text and illustrations were engraved, and when printed off Blake tinted both text and border in a style of his own, making each page a picture. Much of his loveliest and sublimest work is in these illustrations. But he produced so much that a mere list of his engravings, water-colors, and drawings in distemper would fill a page of this work. He is best known to the public by his *Canterbury Pilgrims*, his *Inventions to the Book of Job*, and his designs to Blair's *Grave*. D. in London, Aug. 12, 1827. *Life* by Alexander Gilchrist; Cuninghame's *Lives*; *William Blake*, by A. C. Swinburne. *The Poetical Sketches* and *The Songs of Innocence and Experience* were reprinted in 1874. *The Inventions to the Book of Job* have been reproduced by heliotype by James Osgood (Boston, Mass.).

Blake, WILLIAM PHIPPS, A. M., Ph. B.: b. in New York city, June 1, 1826; graduated at the Sheffield Scientific School, New Haven, Conn., in 1852. In 1853 he was mineralogist and geologist for the U. S. Pacific R. R., exploring expedition in California, in connection with which he wrote several reports; was editor of the *Mining Magazine* 1859-60; he was, 1861-63, mining engineer for the Japanese Government, and with his

associate, Mr. Raphael Pumpelly, organized the first school of science in Japan under the auspices of the Japanese Government. Returning to America by the way of China, the Aleutian islands, and Sitka, he accompanied a Russian expedition up the Stickeen river, and described a series of glaciers not before known. In 1863 he engaged in explorations in California and Nevada; became Professor of Mineralogy, Geology, etc., in the College of California, and geologist to the State board of agriculture; in 1867 was commissioner of California to the Paris Exposition; removed in 1867 to New Haven, Conn.; was chosen executive commissioner of the Centennial Commission, and in 1873 went as special agent to the Vienna Exhibition; made a series of reports to the U. S. commission for the Centennial Exhibition; was the chairman of the committee on classification and member of the special committee for the selection of judges. He was also appointed by the Smithsonian Institution director of the U. S. mineral collection in 1876. In 1878 he attended the Paris Universal Exposition as commissioner of the U. S., as secretary of the additional commissioners, and as one of the jurors, receiving from the French Government the cross of the Legion of Honor. He also co-operated in the exhibition of 1889 by securing an official and representative series of minerals and ores from the U. S. He was called to Chicago to advise in regard to the system of classification for the Columbian Exposition, and drafted the grouping which was adopted by the commission. He has been actively engaged in the exploration of the chief mining regions of the U. S., and is the author of numerous professional reports and opinions, and of papers of general scientific and practical interest, which may be found in the pages of the *American Journal of Science* and in the *Transactions of the American Institute of Mining Engineers*. He is the inventor of an automatic roasting furnace, which has been successfully applied in metallurgical operations. Among his published works are *Silver Ores and Silver Mines* (1861); *California Minerals* (1863); *Production of the Precious Metals* (1867); *Iron and Steel* (1873); *Ceramic Art and Glass* (1878); *History of the Town of Hamden, Conn.: Life of Captain Jonathan Mix*, etc. C. K. ADAMS.

Blake, WILLIAM RUFUS: b. at Halifax, Nova Scotia, in 1805; studied medicine, but in 1825 (after playing some time in the theater at Halifax) he appeared at the old Chatham Street theater, New York. He soon attained the first rank as a comedian, excelling particularly in eccentric characters. D. in Boston, Apr. 22, 1863.

Blakeley, JOHNSTON: naval officer; b. near Seaford, County Down, Ireland, Oct., 1781. He removed with his parents to the U. S.; graduated at the University of North Carolina in 1800; entered the U. S. navy Feb. 5, 1800, and obtained command of the sloop Wasp in 1813. In June, 1814, he captured the British sloop-of-war *Reindeer*, and in the ensuing September defeated and sunk the sloop *Avon*. The *Wasp* never returned to port, and the fate of Capt. Blakeley and his crew was never ascertained.

Blakelock, RALPH ALBERT: landscape-painter; b. in New York, Oct. 15, 1847. His father was a physician and he was destined for the same profession, but his strong taste for music and the arts induced him to take up painting, and he began without instruction from a master. His work is notable for its general aspect, which is striking on account of strong color-schemes which he sometimes succeeds in harmonizing with considerable truth to nature's forms. Studio in New York. WILLIAM A. COFFIN.

Blakesley, JOSEPH WILLIAMS, D. D.: Dean of Lincoln; b. in London, Mar. 6, 1808; graduated at Trinity College, Cambridge, 1831; fellow of Trinity College 1831-45; select preacher 1840-43; Canon of Canterbury 1863; member of the New Testament Company of the Bible Revision Committee 1870; Dean of Lincoln 1872. Author of *Thoughts on the Recommendations of the Ecclesiastical Commission* (1837); *Life of Aristotle* (1839); *Conciones academice* (1843); *Four Months in Algeria* (1859); and edited *Herodotus* in 2 vols. (1852-54). D. at Lincoln, Apr. 18, 1885.

Blanc, blańk, AUGUSTE ALEXANDRE PHILIPPE CHARLES: critic of the fine arts; b. at Castres, France, Nov. 15, 1813. He was a brother of Louis Blanc. Besides many valuable contributions on subjects connected with the fine arts to various French journals, and the text of several important books of art illustration, he was the most important contributor to the *History of the Painters of all the Schools*, a very complete and extensive work begun in 1849 by Armen-

gaud, and continued till its completion in 1859, under the editorship of Blanc, with the assistance of able writers, such as Delaborde, Mantz, Silvestre, and P. Charles. Blanc was twice director of fine arts in France—once in 1848, when he replaced M. Garraud, and again in 1871. D. in Paris, Jan. 18, 1882. Revised by RUSSELL STURGIS.

Blanc, JEAN JOSEPH LOUIS: a French historian and radical; b. in Madrid, Oct. 28, 1813; educated in France. He founded in Paris in 1839 the *Revue du Progrès*, which advocated social and political reform. In 1840 he published an able work on the *Organization of Labor*. His next important work was a *History of Ten Years—1830-40*, which had a very damaging influence on the popularity of Louis Philippe. He was a member of the provisional government formed in Feb., 1848, and was very popular with the socialists and workmen of Paris, who revolted and were defeated in June, 1848. He then went into exile, and resided in England for many years. Early in 1871 he was elected to the National Assembly by the voters of Paris. Among his works is a *History of the French Revolution* (12 vols. 8vo, 1847-62), the style of which is eloquent and dignified. D. at Cannes, Dec. 6, 1882.

Blanc, PAUL JOSEPH: genre-painter; b. in Paris, Jan. 25, 1846; pupil of Bin and Cabanel; Grand Prix de Rome 1867; first-class medal, Paris Salon, 1872; Legion of Honor 1878; first-class medal, Paris Exposition, 1889. One of his most celebrated works is a decorative composition depicting the consecration, baptism, and triumph of Clovis. Style academic. Studio in Paris. W. A. C.

Blanchard, blaän'shaar', FRANÇOIS: French aéronaut; b. in Andeleys in 1753; noted for his mechanical ingenuity. He constructed a balloon with wings and a rudder, with which he ascended in Mar., 1784. In 1785 he crossed the Channel in this balloon and landed in England, for which exploit the King of France gave him a pension. He made many other ascents. D. Mar. 7, 1809. His wife, who had been his companion in several aerial voyages, was killed in consequence of the burning of her balloon in 1819.

Blanche of Castile: Queen of France; daughter of Alphonso IX. of Castile; b. in 1187. She was married in 1200 to the dauphin of France, who became King Louis VIII., and she acquired much influence in affairs of state. When Louis died in 1226, she became regent of the kingdom, which she governed with ability during the minority of her son, St. Louis. She was eminent for virtue and wisdom. D. Dec. 1, 1252. See Macheco, *Vie de Blanche de Castile* (1820); T. Nisard, *Histoire de la Reine Blanche* (1842).

Blanching [from Fr. *blanche*, white]; a process by which gardeners arrest the progress of secretions in the leaves of plants, in order to render them more wholesome and palatable as food. Celery, sea-kale, and other plants are usually blanched by the exclusion of light from them, which deprives them of their natural green color and of certain bitter properties. The blanching is effected in various modes, as heaping up the earth against the growing plants, or covering them with boxes or blanching-pots made of earthenware and perforated with many holes.

Bland, RICHARD PARKS: Congressman; b. near Hartford, Ky., Aug. 19, 1835. By working during the summer and attending school in winters he finished his academic education; studied law; moved West, and in 1860 became treasurer of Carson co., Nev.; returned to Missouri in 1865 and settled at Rolla; elected to Congress as a Democrat in 1873; has been regularly re-elected. In 1875 he became chairman of the committee on mines and mining. Silver coinage having been discontinued in 1873, he introduced into Congress in 1878 the famous "Bland Bill," which provided that the Secretary of the Treasury shall purchase sufficient bullion to coin the minimum amount of \$2,000,000 a month in silver dollars of 412½ grains each, and that these dollars shall be legal tender. He has since been a champion of the free coinage of silver. C. H. THURBER.

Bland, Col. THEODORIC, M. D.: b. in Prince George co., Va., in 1742; was an uncle of John Randolph, of Roanoke; studied medicine in Edinburgh, Scotland; opposed Gov. Dunmore under the pen-name of *Cassius*. He entered the army in 1777, and gained the confidence of Washington, who employed him in several important affairs. In 1780 he was elected a member of Congress, in which he remained till 1783, and was again chosen a member of that body in 1789. D. in New York, June 1, 1790. The *Bland*

Papers were collected and published by Charles Campbell (Petersburg, 1840).

Bland, THEODORIC: b. in 1777; was for twenty-two years chancellor of Maryland. He commenced his judicial life as judge of the county court of Baltimore, and afterward became judge of the U. S. district court of Maryland; published *Reports of Cases Decided in the High Court of Chancery, Maryland*. D. in Annapolis, Md., Nov. 16, 1846.

Blane, Sir GILBERT, F. R. S.: physician; b. in Blanford, Ayrshire, Aug. 24, 1749. He became private physician to Lord Rodney, who took command of the fleet in the West Indies in 1780. Dr. Blane served as chief physician to that fleet during the war, and published in 1783 *Observations on the Diseases of Seamen*. He was physician to St. Thomas's Hospital, London, from 1785 to 1795, and became first physician to William IV. in 1830. Among his works is *Elements of Medical Logic* (1819). D. in London, June 26, 1834.

Blank Verse: the heroic verse of five iambic feet without rhymes. Blank verse is peculiar to the Italian, English, and German languages, having been imported into the two latter from the first. In Italian the line is of eleven syllables, and is used invariably in the drama, and frequently in serious poetry, epic or didactic. In England it was first adopted by the Earl of Surrey in his translation of the fourth book of the *Æneid* (1547); first applied to dramatic uses by Lord Buckhurst in his tragedy of *Gorboduc* (1561); popularized by Christopher Marlowe in his tragedy of *Tamburlaine* (1585). It has since been the accepted meter of English dramatic and heroic verse. The Miltonic verse is constructed with closer attention to the melody of the cadence and caesura than the dramatic; it admits also less frequently of the eleventh syllable, which in English poetry must be regarded as a sort of license; while Shakspeare and other dramatists occasionally double the short syllable at the end, and thus extend the number to twelve. Blank verse fell into comparative disuse in England after the Restoration (1660), and was revived by John Philips in his *Splendid Shilling* (1703) and *Cider* (1706), and by James Thomson in his *Seasons* (1726-30). Among the most successful of modern writers of blank verse are Bryant in *Thanatopsis*; Tennyson in his *Idyls of the King, Ulysses*, and *Tithonus*; and Aldrich in *Wyndham Towers*.

HENRY A. BEERS.

Blanqui, blaän'kee', JÉRÔME ADOLPHE: French political economist; b. at Nice, Nov. 20, 1798. He became in 1823 Professor of Economy in the Conservatory of Arts and Trades in Paris. He advocated free trade. Among his works are a *Summary of the History of Commerce and Industry* (1826) and a *History of Political Economy in Europe from the Ancients to the Present Time* (2 vols., 1837-38), which is highly esteemed. D. in Paris, Jan. 28, 1854.

Blanqui, LOUIS AUGUSTE: communist; a younger brother of the preceding; b. in Paris, Feb. 7, 1805. He was a member of the Society of Political and Moral Sciences. He studied for the law; affiliated with the rabid members of French revolutionary societies; underwent his first imprisonment at the age of twenty-one. A year later he took part in the insurrection of Rue St. Denis, receiving his first wound. In the revolution of 1830 he took up arms against Charles X.; was again wounded; received the decoration of July; became an active member of the Society of Friends of the People; tried for participating in the "conspiracy of the Nineteen," and incarcerated for a year; accused in 1835 of a conspiracy to manufacture gunpowder for revolutionary uses; sentenced to imprisonment for two years and to pay a fine of 3,000 francs, but was amnestied in 1837. The insurrection of the Montagnards, with Blanqui and Barbes at their head, followed, and upon its prompt suppression Blanqui was condemned to death. The sentence was, however, commuted to perpetual imprisonment. The revolution of 1848 set him free, and he immediately organized the Central Republican Society, productive of the great popular agitation resulting in the three days' insurrection and an attempt to dissolve the National Assembly, May 15, 1848. Blanqui was sentenced to ten years' imprisonment at Belle Isle. At the age of fifty-three he returned to France, but in less than a month he was in exile again. He ventured back to Paris, and his incarceration followed; upon his release was conveyed to the frontier. Again he was an exile for a period of eight years. In 1870 Blanqui was once more in Paris, the editor of a journal whose influence

culminated in the Commune. He was captured by the Versaillesists; the communists offered in exchange for him the Archbishop of Paris, but he was considered too dangerous a man to be released. He was sentenced to transportation for life to New Caledonia, but in consideration of his old age and his feeble health he was imprisoned at Clairvaux instead. In 1880, while still a prisoner, Blanqui was returned to the Chamber of Deputies by the radical Republicans of Bordeaux, but the chamber refused to ratify this election. He was soon afterward released, and lived in seclusion till his death, which occurred in Paris, Jan. 1, 1881.

Blantyre, blañ'Cr: a mission station in East Africa; in the valley of the Shire river, S. of Lake Nyassa, and about 10 miles S. W. of Lake Shirwa; lat. 16° S., lon. 35° E. (approximate). It was founded in 1876 under the auspices of the Established Church of Scotland, and has become a center for British colonization and trade, though it is close to the boundary of Portuguese East Africa. It is named after Blantyre, in Lanarkshire, Scotland, the birthplace of David Livingstone.

Blarney: a village and castle of Ireland; in Munster; on a rivulet of its own name; 4 miles N. W. of Cork, and surrounded by beautiful scenery. The castle and groves of Blarney are celebrated in song. The castle, which once belonged to the Earls of Clancarty, stands on a steep rock, at the base of which is a deep valley. Among the relics of this ruined castle is the famous "Blarney stone," which, according to the popular opinion, imparts to those who kiss it a peculiar style of eloquence, or great skill in the use of complimentary speech.

Blash'field, Edwin Howland: genre, historical, and portrait painter; b. in New York, Dec. 15, 1848; pupil of Léon Bonnat, Paris; National Academician; member of the Society of American Artists (1882); of the American Watercolor Society and the Architectural League, New York; third-class medal, Paris Exposition, 1889. He has done excellent work in decorative painting, and is well known as an illustrator and writer of descriptive articles for *Scribner's* and other magazines. His works, such as *The Emperor Commodus Leaving the Amphitheater at the Head of the Gladiators* (1878) and *Roman Ladies—a Lesson in the Gladiators' School* (1879), are scholarly and well painted. His color-schemes are harmonious, and his work in general is remarkable for good drawing and pleasing arrangement. He spent eleven years in Paris, from 1867 to 1878, and passed three years in Paris and Italy (1889-92), when he painted, among other works, a large composition called *Christmas Bells*. Studio in New York. WILLIAM A. COFFIN.

Blasphemy [via Fr. and Lat. from Gr. *βλασφημία*, slander. *Blaspheme* and *blame* are doublets, the former representing the learned, the latter the popular, adoption into French of Lat. *blasphemia re*]; an indignity offered to the Deity or to religion. According to Blackstone, it is denying the being and providence of God, contumelious reproaches of our Saviour Christ, and profane scolding at the Holy Scriptures, or exposing it to contempt and ridicule. It has been otherwise defined to be the act of wantonly uttering or publishing words casting contumelious reproach or profane ridicule upon God, Jesus Christ, the Holy Ghost, the Holy Scriptures, or the Christian religion. If the words were written or printed, there might be a case of blasphemous libel. If oral, the case would be one simply of blasphemy. The law does not brand as a crime serious discussion or the promulgation in a temperate manner of opinions opposed to Christianity. Blasphemy is an offense punishable as a misdemeanor at common law. In many of the States the crime is punishable by statute.

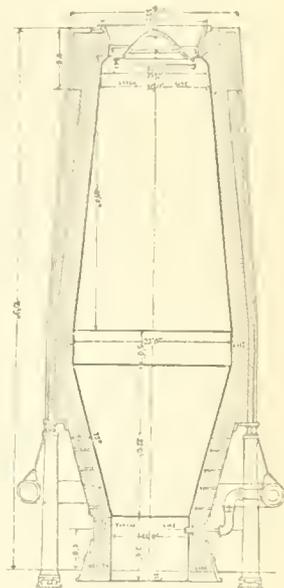

Christianity is declared by the courts to be a part of the common law, which recognizes that the good morals and orderly conduct of the community are closely connected with a respect for religion, and that insults to the Author of Christianity and malicious attacks on his religion tend to the dissolution of civil government.

Blass, blas, FRIEDRICH WILHELM: Greek scholar; b. in Osnabrück, Jan. 22, 1843; professor at the University of Kiel; called to Halle in 1892; author of *Die Geschichte der attischen Beredsamkeit* (3 vols.); *Die Aussprache des Griechischen* (Eng. trans. by W. J. Purton, 1890); *Criticism, Hermeneutics, and Palæography* (in J. Müller's *Handbuch d. class. Alterth.*, vol. i. 2); editor of *Antiphon*, *Andocides*, *Hyperides*, *Demosthenes*, Aristotle's *Πολιτεία Ἀθηναίων*, and some of the *Lives* of Plutarch. ALFRED GUDEMAN.

Blast Furnace (Germ. *Hochofen*; Fr. *haut fourneau*): In its primary signification the term blast furnace implies an elevated shaft lined with a refractory material, designed for the reduction of metals from their ores. The shaft is open at the top, where the ore, fuel, and fluxes are charged, and supplied with a blast of air near the bottom, where openings are provided for removing the metal and cinder. In its essential details a blast furnace consists of a stack in whole or in part of masonry, surrounding a vertical chamber or shaft of circular section. The diameter of the shaft usually increases from the top downward and from the bottom upward. The lower part of the furnace is called the *hearth*, and has the smallest diameter. At its upper part are one or more openings through which the blast of air is introduced, and in the lower part, or *crucible*, the molten iron and cinder collect. The hearth is prolonged toward the front of the furnace, and is closed by the *dam*, and covered in on top by the *tympan*. The dam is formed of firebrick or other refractory material. It slopes inward toward the interior of the furnace, and has its outer vertical face covered with a cast-iron plate, called the *dam-plate*. At the bottom of the dam is a channel communicating with the interior of the furnace, through which the molten iron is tapped off, and on its upper edge is a notch, called the *cinder-notch*, over which the cinder flows. The tympan is covered by the *tympan*, a long, hollow casting, through which water constantly circulates. The blast is supplied through *tuyeres*, from one to eight in number, which are set into the masonry of the furnace. They are hollow truncated cones, supplied with a constant current of water to prevent the bronze or iron of which they are composed from melting. Into these *water-tuyeres* are fitted the *nozzles* of blast-pipes, which are connected with the *blast main* which encircles the furnace. The sloping walls connecting the hearth with the widest part of the furnace are called the *boshes*. This term is very generally, though incorrectly, used to express the greatest diameter of the furnace. In many cases there is no sharp line of demarcation between the hearth and the boshes, the former being simply a continuation of the curved walls of the boshes.

In constructing a blast furnace, the upper portion is built on iron pillars, and is entirely independent of the boshes and hearth, which can be removed and reconstructed without interfering with the body of the stack. The top or *mouth* of the furnace, where the materials are charged, is provided with an arrangement which closes the furnace except during charging, when it is opened by some simple mechanism. The gases of the furnace, which were formerly allowed to escape and burn at the mouth, are now almost universally utilized. This is effected by making openings in the walls near the top of the furnace, and conducting the gases by suitable channels to the boilers and hot-blast stoves, where they are burned.

The essential accessories of a blast furnace are the blowing-engine, hot-blast stoves, and hoist. There are three varieties of blast-engines in use; the vertical-beam engine, the horizontal, and the upright. The latter have the steam cylinder either directly above or below the blast cylinder. They are rapidly gaining in favor, owing to their compactness and efficiency. The blast, on leaving the blowing cylinder, passes to the hot-blast stoves. These consist of a series of cast-iron pipes, through which the blast passes, heated on the outside by the combustion of the gases of the furnace. The gases are usually burnt in a combustion chamber under the chamber containing the pipes. In this way the heat is more uniformly distributed, and there is less danger of the pipes being injured by the heat. Re-

Edgar Thomson furnace "F," 1886.

cently Siemens's system of regenerative heating in many different forms is generally superseding the cast-iron pipe stoves. In this system the gases are burned in a chamber, and the products of combustion pass through a network of firebrick, which becomes intensely heated. The gases are then caused, by means of valves, to pass into a second stove like the first, and burned as before, while the blast is conducted through the first stove. The blast and gases are made to alternate in this way at regular intervals. The temperature of the blast as it enters the furnace varies within wide limits. There are very few furnaces at the present day driven with cold blast, the temperature employed varying from 800 to 1,500° F. With the firebrick stove above mentioned a temperature of from 1,500° to 1,600° F. has been attained. The blast on leaving the stoves passes through the main to the furnace, and is there distributed to the tuyeres. The pressure employed varies with the kind of fuel used. Charcoal furnaces usually are blown with $\frac{1}{2}$ to $1\frac{1}{2}$ lb., though sometimes as high as 4 lb. are used. Coke furnaces are blown with 6 to 10 lb., while anthracite furnaces require 7 to 10 lb.

Hoists or lifts serve to raise the ore, fuel, etc., from the ground to the level of the mouth of the furnace, where they are charged. There are many varieties, as the pneumatic, hydraulic, and steam hoist.

The illustration shows a section of a modern furnace at Pittsburg. Its height is 79' 9"; greatest diameter, 23 feet; yield, 3,000 tons iron per week. The gases are taken off at the top of the furnace, and descend by a vertical flue, then by an underground channel to the boilers and hot-blast stoves. The contrivance for closing the mouth of the furnace is known as the cup and cone, or bell and hopper. This arrangement is one of the simplest, and the one most generally adopted.

The blast furnace of the present day is an outgrowth of the small primitive furnaces still to be met with in Eastern countries for reducing iron ores. It differs from them, however, in three essential particulars. The low furnaces produce an unmelted mass of soft iron, and a cinder rich in oxide of iron, and the process is intermittent. A blast furnace produces a compound of iron and other substances, principally carbon, which is fluid at the temperature of the furnace; the cinder is composed of earthy ingredients, and is almost entirely free from iron, and the process is continuous.

The history of the development of blast-furnace construction for the last half century is almost entirely a record of increasing dimensions, both in height and diameter, having for a consequence greater yield, and, within certain limits, greater economy of fuel. During the past decade progress in blast-furnace practice has developed in the direction of faster work, closer watchfulness of details, and more careful study, chemically, of stock and of product. The flat boshes of the older furnaces and the rapid narrowing upward toward the mouth have been generally replaced by steeper boshes and wider mouths. There have been, however, no universally accepted principles of blast-furnace construction developed, as far as regards the interior outline. The Cleveland district of England affords a striking instance of the growth of furnaces in height and capacity. Furnaces were built

In 1851,	42 feet high,	15 feet diameter,	capacity 4,566 cubic feet.
" 1861,	62 " "	20 " "	" 12,778 " "
" 1870,	90 " "	30 " "	" 41,149 " "

Since then a reaction has taken place against an increase in the dimensions, and furnaces 75 to 85 feet high are now the standard.

The Blast-furnace Process.—The charge introduced into the mouth of a blast furnace consists of iron ore, which varies greatly in richness and purity in different regions; fuel, either anthracite, raw bituminous coal, coke, or charcoal, and, ordinarily, limestone, the latter serving to unite with the earthy matters of the ore and form a fluid slag or cinder. The action of the furnace, expressed in its simplest form, is as follows: Air is blown through the tuyeres, and comes in contact with incandescent fuel. The oxygen of the air is speedily converted into carbonic oxide gas, which, together with the nitrogen of the air, rises through the descending charge. The reaction of the carbonic oxide and oxide of iron of the ore results in the formation of metallic iron and carbonic acid gas; the latter, ascending, escapes at the mouth of the furnace, while the former descends to the hottest part of the furnace, where it melts and drops into the hearth. The earthy matters of the charge fuse

likewise, and collect in the hearth, floating on top of the molten iron. At regular intervals the slag and iron are tapped off; the former is thrown away, and the latter is cast in molds of sand or iron, and forms "pigs," or is conveyed in large ladle cars, in a fluid state, to adjoining steel-works. Although this simple statement of the blast-furnace process is correct as far as the end result is concerned, yet the reactions which occur in the furnace are, in reality, very complex and dependent on many conditions. The reducibility of different varieties of ore is very dissimilar: while some varieties require a high temperature and long exposure to an atmosphere rich in carbonic oxide gas, other varieties yield up their oxygen at a comparatively low temperature and short exposure to an atmosphere relatively poor in carbonic oxide. According to Sir Lowthian Bell, a gaseous mixture of 40 to 45 volumes of carbonic acid to 100 of carbonic oxide fails to exert any appreciable effect on Cleveland ironstone at a temperature of melting zinc (782° F.), but the same mixture possesses decided reducing power at a red heat. Again, some ores are rapidly reduced with the above gaseous mixture at a temperature at which Cleveland ironstone is unaffected.

The reduction of iron ores, or the removal of the oxygen of the oxide of iron, does not simply consist in the abstraction of oxygen by carbonic oxide. The investigations of Bell prove that reaction of carbonic oxide and oxide of iron is a very complex one. The first effect is the formation of some carbonic acid and some metallic iron. The further action of carbonic oxide on the metallic iron thus formed causes the carbonic oxide to break up into carbonic acid and carbon, the latter being deposited in the form of a black powder on the reduced metal. This combined process of reduction and carbon deposition continues until the iron is nearly all in the metallic state; but absolute reduction is never attained by the action of the carbonic oxide alone. As this product, composed of iron and carbon and some oxide of iron, descends into the hotter regions of the furnace, the carbon thus deposited is partially removed by the carbonic acid, but it is not until the point of fusion is reached that the last traces of oxygen are removed. It is probable that the carbon found in the pig iron is a part of the carbon deposited in the ore. The amount and rate of carbon deposition depend on the temperature and the relative amount of carbonic acid present in the gases. It may begin as low as 392° F., but decreases rapidly as soon as a red heat is reached. The most favorable temperature is between 752° F. and 842° F. The temperature of incipient reduction of sesquioxide of iron by carbonic oxide is variously given by different observers. Bell's determination is the lowest by far—viz., 384° F.—while the oxidation of metallic iron, according to the same observer, does not begin below 752° F.

It is evident that the economical production of iron in the blast furnace is mainly a matter of the amount of fuel used. A saving of the fuel in the process can be effected in two ways: first, by increasing the heat of the descending charge; and, second, by increasing the heat of the ascending blast. The first of these conditions is realized by adding to the height or diameter of the furnace; in other words, increasing its capacity, so as more effectually to intercept the heat of the escaping gases; and the second condition is accomplished by direct heating of the air forced into the furnace. It was long considered that there was no limit to the saving that could be effected by increasing the capacity of the furnace and temperature of the blast, but Bell has shown that the profitable limit has probably been attained in both instances, at least in so far as the smelting of Cleveland ore is concerned. The practical limit of capacity in a blast furnace is reached when the gases which are given off at the mouth no longer have the power to abstract oxygen from the ore—a condition dependent on the temperature of the gases and the relative amount of carbonic oxide they contain. But gases which are inactive on one ore at a given temperature may still have power to reduce another ore at the same temperature; consequently the height and capacity of a blast furnace are dependent on the kind of ore smelted in it.

The cause of the great economy of fuel effected by the hot blast—say, on an average, 10 to 11 cwt. per ton of iron—has long puzzled metallurgists, and the subject can not be said to be yet entirely removed from the sphere of speculation. The researches of Bell in England and Åkerman in Sweden have, however, thrown great light on the subject. The following considerations show where the principal

sources of economy lie; in other words, why the combustion of a given amount of fuel, outside of the furnace and conveyed through the blast, is more than equivalent to the same amount of fuel burnt in the furnace itself. The fuel burnt before the tuyeres is oxidized merely to carbonic oxide, and gives per unit of carbon only 2,400 heat-units; while the fuel in the hot-blast stoves is burnt to carbonic acid, and gives, per unit of carbon, 8,000 heat-units, or more than three times the amount in the first instance. Although not more than one-half of this heat is available, owing to loss by the chimney and by radiation, yet there is still a gain from this source. The principal source of saving, however, is to be found in the fact that the heat brought into the furnace by the blast is unaccompanied by any increase in the bulk of the gases in the furnace; whereas the same amount of heat produced by the combustion of the fuel before the tuyeres would have been accompanied by the amount of air necessary for its combustion. This decrease in the bulk of the gases, consequent upon the use of hot blast, acts, first, by diminishing the rapidity of the upward current, thus allowing longer contact of the gases with the ore; and, second, as there is less gas escaping from the furnace, less heat will be carried off in this way.

As the reduction of the ore is dependent upon the temperature and composition of the gases, it is evident that the amount of heat which we may supply by the blast has a limit, for this heat is unaccompanied by the production of carbonic oxide. When, therefore, the fuel used in the furnace has been so far reduced in amount as only to supply the minimum amount of carbonic oxide needed for the reduction of any given ore, further increase of the temperature of the blast can be of no advantage, as the heat thus conveyed to the furnace will either escape at the mouth, or it will, by increasing the heat of the furnace, cause a loss of fuel by enabling the escaping carbonic acid to take off another equivalent of carbon.

The product of the blast furnace is *pig* or *cast iron*. Its composition is dependent on the ores and fuel used, the principal constituents being carbon, silicon, manganese, sulphur, phosphorus, copper, and titanium. It always contains 3 to 4 per cent. of carbon, and in some varieties as high as 5 per cent. The carbon exists in two forms in pig iron—chemically combined, and in the form of graphite. The darker and more highly graphitic varieties are formed at the highest temperatures. The higher the temperature the more silicon will be reduced and unite with the iron, and its presence induces the segregation of carbon in its graphitic form.

Sulphur is more readily removed in the cinder at an elevated temperature, while the total phosphorus of the charge goes almost entirely into the pig iron, whatever the temperature may be. The presence of manganese, copper, and titanium depends upon their occurrence in the ore.

The production of a blast furnace depends on its capacity, the richness and reducibility of its ores, the nature of the fuel, and the volume and temperature of blast. While some small furnaces yield but 3 tons daily, the production of some of the modern furnaces of the U. S. is 400 tons daily, American practice having in this respect far outstripped the records of iron-makers in other countries. The composition and character of the cinder or slag from a blast furnace depends on the nature of the ore and the temperature of the furnace. It consists mainly of a double silicate of lime and alumina.

T. M. DROWN.

Revised by C. KIRCHHOFF.

Blasting: The use of gunpowder in quarrying stone probably dates back almost to the invention of that explosive. In ordinary practice the blocks of stone are separated from the mass in the quarry by means of one or more *blasts*, each blast being made by first drilling a hole into the rock by the use of a *drill*, operated either by hand or—as is now the general practice in large works—by machinery driven by steam or compressed air.

In removing very large masses of rock quickly, to make way for a railroad, to furnish stone in sufficient quantities for the rapid construction of an important breakwater, or to prepare the site for a fort, it has become the custom to run galleries into the rock, and to place in chambers prepared for the purpose very large charges of powder of sufficient power to bring down the whole face of a cliff or side of a mountain, as was the case at Dover and Holyhead in England, at Lime Point, entrance to San Francisco Bay, Cal., and at Hell Gate, New York harbor.

In hand-drilling the operation is performed by means of a *drill* or *juniper*, which is formed from a bar of steel, or of iron tipped with steel at one end, which is flattened out into a fan shape, with a sharp cutting edge extending on each side a little beyond the body of the drill, so that the drill may have free play in working. The drills are of lengths suited to the depths of the holes to be drilled, it being customary to use a short drill in commencing a hole, and longer ones in succession as the hole is deepened. Their diameters also vary, generally with the depths of the hole, but are also much modified by the kind of explosive used, blasting powder requiring much more space for the charge than nitro-glycerine and its compounds. To prevent the cutting edge of the drill becoming heated, and thereby softened, water is frequently poured into the hole. From time to time the fragments and powdered stone have to be taken out of the drill-hole by means of a *spoon* or *scraper*.

The next step, after finishing the drilling and removing the chips, powdered stone, etc., from the bottom of the drill-hole, is to determine the *strength of the charge*. In former times an inferior kind of gunpowder, called blasting powder, was generally used, and is still employed in many quarries in preference to the quicker and stronger explosives.

The necessity for a more active agent for use in mining, and in excavating railroad tunnels and large cuttings in solid rock, has brought into use more powerful explosives. Nitro-glycerine, first invented and used in Europe, was introduced at the Hoosac tunnel by Prof. Mowbray, in 1868.

Nitro-glycerine, chemically known as tri-nitro-cellulose, is glycerin oil, $C_3H_5N_3O_9$, made by treating glycerine with nitric and sulphuric acids at a low temperature. It is very rarely used in the pure state, the general practice being to mix it with an inert or with a chemical absorbent material, which renders it perfectly harmless so long as exudation of the oil does not take place. The generic term for these mixtures is *dynamite*, although originally that term was applied to the nitro-glycerine powder in which infusorial earth was employed as the absorbent. When increased strength is required, explosive bases, notably gun-cotton, are added. Atlas, Dualine, Forcite, Tonite, Rendrock, Hercules, Raekarock, and Vulcanite are different dynamites largely in use.

After the strength of the charge has been determined, and all moisture removed from the bottom of the drill-hole by means of wisps of straw, hay, or bits of rags, the powder is either poured in from a can, or inserted as a cartridge. A wooden rod is used to press down the powder and to dislodge any grains that may have attached themselves to the sides of the hole.

The method now generally practiced is to use the cartridge, from which projects the copper *priming-needle*. Above the powder, around the needle, and filling up the hole, a very soft, clayey material, called tamping, is rammed gas-tight by a copper-tipped "*tamping-bar*." After the needle has been withdrawn a "*fuse*" is inserted, which, when ignited, fires down into the powder. The "*fuse*" or "*squib*" is a thread of powder wrapped in tarred hemp or in cotton, and waterproofed outside. Though not essential, it is the practice in many localities to have the end of the fuse in the cartridge fitted with a fulminating cap, which fires the powder by detonation. Dynamite is charged in cartridges with a safety fuse or electric wire and cap slightly tamped. All high explosives are now fired with the use of strong detonators, and it is the general practice to arrange several holes for simultaneous firing. This synchronous firing can only be well attained by electricity. The holes are charged, the fulminating cap is inserted, two wires take the place of the fuse, and slight tamping is done. The different holes are connected in series, and a current of electricity is sent through the wire by means of a small, portable hand-power dynamo or frictional machine.

Steam Drilling-machines.—The length of time required, as well as the great labor and expense of drilling by hand, has led to the introduction, in large private and public works, of drilling-machines driven by steam or compressed air. Sommeiller invented a machine which was used with success at the Mont Cenis tunnel. This was driven by compressed air conveyed into the headings in pipes, the compressors being situated near the east and west entrances to the tunnel. Subsequently the Burleigh drill, similar to the above, was patented in the U. S., followed by the Rand, Ingersoll, and Sergeant, which are the types that have survived the active competition in this country. Broadly, the mechanism consists of a power cylinder, sliding in a guide bed-

plate, mounted on a tripod or column, and a cutting tool clamped as an extension of the piston rod. The apparatus must possess the mechanical provisions for carrying out these movements: the blow of the cutting tool, the rotation of the cutting tool through a small arc to produce a round hole, so as to prevent rilling and jamming, and the advancement of the cylinder and boring tool to follow the growing depth of the drill-hole, and to admit of withdrawing it. The principal distinguishing feature between the different drills in use is the method of moving the valve of the power cylinder. The older system is that of causing the valve to oscillate by means of tappets, which being a positive movement is considered safer in the hands of unskilled labor. The other system is that of a steam-moved valve, which admits of a higher rate of speed. The rotation of the drilling tool, which usually has an X-shaped bit, is in nearly all modern American machines accomplished by a fluted bar and nut, constituting a ratchet. The feed is by hand, the power cylinder and the drilling tool sliding in a guide-way, the movement being controlled by a screw. Usually steam is employed above ground, while compressed air, which possesses incidental advantages as concerns ventilation, is adopted for underground work, the pressure ranging between 50 and 80 lb. per sq. inch, while the average speed is 200 blows per minute. The conditions under which drilling is done vary so widely that it is impossible to make any specific statement concerning the work performed. It is a fact acknowledged by all authorities that high explosives and power-drilling have led to a marked lowering in the cost of mining and tunneling, and have greatly increased the rapidity of working.

The diamond drill has been used very little in mining and tunneling for drilling blasting holes, being employed chiefly in prospecting. See MINING.

Efforts have been made recently, chiefly by the late C. Van Depoele and by H. N. Marvin, of Syracuse, N. Y., to introduce electric percussion drills, the reciprocating motion being produced by the solenoid. There is still a good deal of uncertainty concerning their successful introduction, from an economical point of view.

Revised by CHARLES KIRCHHOFF.

Blastoderm: See EMBRYOLOGY.

Blastoi'dea [from Gr. *βλαστός*, sprout + *εἶδος*, form]: an order of extinct Crinoids, in which the head is armless, on a short stalk, its general form like that of a closed lily-bud. The chief genus is *Pentremites*, which occurs in the Upper Silurian. The blastoids are most abundant in the Carboniferous measures.

Blatchford, SAMUEL, LL. D.: son of Richard M.; b. in New York city, Mar. 9, 1820; graduated at Columbia College, New York city, in 1837; in 1839 became private secretary of Gov. William H. Seward, of New York; in 1845 practiced law in Auburn, N. Y.; in 1854 removed to New York city; practiced law and continued the publication of reports of cases in the circuit courts of the U. S. in the second circuit, which he had commenced publishing in 1852; in May, 1867, became judge of the district court of the U. S. for the southern district of New York; in Apr., 1878, became circuit judge of the second judicial circuit; and on Mar. 27, 1882, was appointed by President Arthur an associate justice of the Supreme Court of the U. S. D. July 7, 1893.

Blathwayt, or **Blathwayte**, WILLIAM: politician; b. at St. Martin-in-the-Fields, London, about 1649. He was in the English diplomatic service as early as 1668, was clerk of the privy council, and an important witness in the libel trial of the seven bishops in the reign of James II. in 1688. Under William III. he was a member of the board of commissioners of trade and plantations, created by the king in May, 1696, for the purpose of making the colonies "most useful and beneficial to England," and to aid in "diverting them (the colonies) from trades which may prove prejudicial to England." Blathwayt drafted a new charter for Massachusetts. Many of his manuscripts have been preserved in the British Museum and elsewhere. D. in August, 1717.

Blau'veit, CHARLES F.: genre-painter; b. in New York in 1824; pupil of the National Academy and of Charles L. Elliot; National Academician 1859; made Professor of Drawing at U. S. Naval Academy at Annapolis in 1878. W. A. C.

Blauw-boc, blow bok [Dutch, blue buek; so named from its blue-black color]; the *Antelope leucophaea*; an exceedingly swift antelope whose habitat extends from Cape Colony to Senegambia. It is 6 feet long and 3½ feet high. It

fights when at bay, and is then dangerous. Its flesh is poor. The name is also given to the pygmy antelope (*Cephalophus*

The blauw-boc.

pygmaea), which is only a foot high. It is found in South Africa, and is of a bluish slate color.

Blavatsky, Madame HELENA PETROVNA: founder of the Theosophical Society; b. in Ekaterinoslav, Russia, in 1831; daughter of Col. Peter Hahn, and of noble descent on both her father's and her mother's side; married when seventeen Nicephore Blavatsky, forty-three years her senior, a councillor of state; separated from him after three months by mutual agreement. An ardent love of travel and a thirst for curious knowledge then led her to travel to all parts of the world. In the course of her travels she succeeded in 1855 in entering Thibet. In 1858 she met with an accident in which she sustained a fracture of the spine by being thrown from her horse, which caused a strange psychological experience, and for eighteen months she led a complete dual existence. In 1873 she visited New York, where she remained for six years, and founded in 1875 the Theosophical Society, with which her name has since been closely associated. Author of *The Secret Doctrine*, *The Synthesis of Science, Religion, and Philosophy*; *The Key to Theosophy*; *The Voice of Silence*; *Isis Unveiled, a Master Key to the Mysteries of Ancient and Modern Science*. D. in London, May 8, 1891. C. H. THURBER.

Blazonry: See HERALDRY.

Bleaching [deriv. of vb. *bleach*: O. Eng. *blæcan*; Germ. *bleichen*]: the process by which the natural colors of various substances are discharged, so as to whiten them. Bleaching is extensively applied to the textile fibers; linen, cotton, wool, and silk; and to straw, paper-stock, ivory, wax, animal and vegetable oils, etc. Until the close of the eighteenth century the agents employed were air, light, and moisture, aided by weak alkalies and acids. More recently the process has been wonderfully hastened by the use of such powerful agents as chlorine and sulphurous acid. Numerous other agents possessing bleaching properties have been from time to time recommended, but they have not as yet been used to any extent. Such are bromine, ozone, permanganates, chromates, etc. The selection of the bleaching agent depends as much upon the properties of the article to be bleached as upon the coloring-matters to be removed. Cotton, flax, and many other vegetable fibers, being composed of cellulose, one of the most permanent of all organic bodies, are capable of withstanding the action of acids, alkalies, and chlorine, while the animal fibers, silk and wool, being of very different composition, are destroyed by these agents, and must be bleached by the milder sulphurous acid.

Modern bleaching includes much more than the mere application of chlorine or sulphurous acid. The goods are subjected to certain preliminary cleansing processes, such as washing in cold or hot water, boiling with alkaline lyes or soaps, and treatment with acids. By these operations many resinous, fatty, and other impurities, either natural or in-

roduced during the preparation of the yarn, cloth, etc., are removed from the fiber. The more powerful agents are then used for removing the last traces of coloring-matter.

SPECIAL METHODS.

Bleaching Linen.—This is a very ancient art. We read in the Scriptures of "fine linen, white and clean." The old method, still practiced in some localities, consisted in the alternate treatment of the cloth with alkaline and acid liquids, and exposure on the grass to air, light, and moisture. Holland long enjoyed the reputation of possessing the best bleacheries. The brown linen of Scotland was sent over early every spring to be bleached, and on its return in the late autumn was sold under the name of "Hollands," a name still retained in the trade for certain kinds of bleached linen. The word "lawn" is another name of similar origin, having been applied to a finer quality of linen cloth bleached on better grass-plots, or lawns. The Dutch process lasted from March till September, and consisted of the following distinct operations, often repeated: (1) Steeping in water four or five days, or in an alkaline lye forty-eight hours. (2) Bucking or bawking, boiling in an alkaline lye. (3) Crofting, or exposing on the grass for several weeks, and sprinkling from time to time with water. (4) Souring with buttermilk. After every dipping the cloth was washed with soap, then with water. The process was necessarily very expensive and laborious. In 1749 the Dutch method was introduced into Scotland, where it was considerably shortened by the employment of dilute solutions of sulphuric acid in place of buttermilk. In 1784 Berthollet investigated chlorine, publishing his results in 1787, and announcing the bleaching properties of this element. Prof. Copeland introduced this agent at Aberdeen. Chlorine was first used in aqueous solution, then in alkaline solution, and finally, in 1798, Charles Tennant, of Glasgow, introduced chloride of lime, which has been almost exclusively used ever since. Bleaching linen is still a tedious operation, as the fibers are heavily incrustated with impurities; the actual loss during the operations of bleaching being one-third the original weight, while cotton loses only one-twentieth. Steeping, washing, bawking and crofting are still found necessary, and are several times repeated. Souring is effected with hydrochloric or sulphuric acid. The goods are then chlorinated with hypochlorite of potash, made by mixing chloride of lime with carbonate of potash. Washing, souring, soaping, scalding in soap-suds and weak lye, and crofting complete the operation. A fortnight is the shortest time in which the bleaching can be effected, and often a much longer time is necessary.

Bleaching Cotton.—Cotton is either bleached in the yarn or in the cloth. The following description of the process employed in American print-works will sufficiently illustrate the methods in common use: The cloth is (1) "singled" by a shearing-machine or by passing over a red-hot roll or over a series of gas-flames; (2) it is "limed," boiled for a night with milk of lime; (3) washed; (4) soured with dilute sulphuric acid; (5) washed; (6) bawked, boiled for a night with soda-ash and rosin; (7) washed; (8) bawked with a weak soda-ash lye for seven or eight hours; (9) washed; (10) chemicked with a weak solution of chloride of lime; (11) washed; (12) soured with dilute sulphuric acid; (13) washed—the entire series of operations being completed in three or four days.

Bleaching Wool.—Wool is (1) washed on the sheep, to remove sweat and much of the dirt, including a peculiar substance called suint, which is a neutral salt of potash with a peculiar organic acid. Owing to the high price of potash, this suint has recently attracted considerable attention, and a special industry has been established in the French wool districts for its preservation and utilization. The wool contains from 15 to 33 per cent. of suint, a 9 lb. fleece containing 20 oz. of suint, or 6 to 7 oz. of potash. This can be recovered from the water in which the sheep are washed. It is estimated that 3,000,000 lb. of potash can be manufactured annually in the French districts alone. (2) The wool is steeped in soap and water, weak alkaline lye, or putrid urine to remove a peculiar lime-soap which it contains, and other impurities. It is then oiled for spinning, and finally cleansed and bleached, either in the yarn or in the cloth. The operations consist in passing it (3) through a weak warm solution of carbonate of soda and soap; (4) washing with lukewarm water; (5) exposing to sulphurous acid gas. Operations 3, 4, and 5 are sometimes repeated once or twice. The goods may then be blued with carmine of indigo in a weak solution of soap containing a little hydrate of alumina.

Silk Bleaching.—Raw silk contains about 40 per cent. of gummy matter, consisting of albumen, gelatinous substances, wax, fat, resin, and yellow coloring-matter. This is removed by boiling the silk in a solution of soap, and washing with pure water. Bran is sometimes added to the soap to neutralize by the lactic acid it yields any free alkali present. When the silk is to be left white, or dyed or printed with very light colors, it is exposed for a few hours to sulphurous acid gas.

Bleaching Paper-stock.—Cotton and linen rags are bleached in the same manner as cotton yarn and cloth. Old paper is treated with caustic soda to loosen the ink, then with soapsuds, and finally with chloride of lime. Tow and straw are treated with caustic soda and lime, and finally bleached with chloride of lime.

Bleaching Straw.—For the manufacture of hats, bonnets, etc., straw is bleached by (1) exposing it on a meadow to air, sunlight, and dew, with occasional turning; (2) steaming; (3) fumigating with sulphurous acid gas.

Wool is bleached by caustic soda and a chlorine bath made by mixing chloride of lime and sulphate of magnesia in equivalent proportions, and dissolving them in cold water. **Human hair** is said to be bleached on the head to a blonde by the action of hydrogen dioxide, or peroxide. **Feathers** are bleached by immersion (1) in a dilute solution of potassium bichromate containing a little nitric acid, and (2) in a weak solution of sulphurous acid. **Sponges** are bleached by immersion in a warm solution of caustic soda, followed by washing in water and treatment with a hyposulphite of soda solution, to which a little hydrochloric acid has been added. **Ivory** is bleached by rubbing it with pumice-stone and water, and placing it under a glass shade in the sun. It may also be bleached by immersion (1) in a solution of sodium carbonate, (2) in pure water, (3) in a solution of sodium sulphite; (4) to the sulphite is added dilute hydrochloric acid (5) in pure water. **Beeswax** is bleached by exposure to air, sunlight, and moisture in thin ribbons. **Animal and vegetable oils** are often bleached by heating them with a little caustic alkali, by which a small quantity of soap is formed, which settles to the bottom, carrying with it some of the coloring-matter. They are also bleached by exposure in shallow vessels to the sun under glass. **Old engravings** which have turned yellow may be cleansed or bleached by exposure to ozone, generated in a capacious vessel, by a stick of phosphorus partly immersed in water. Immersion for a minute in Javelle water, hypochlorite of soda, is said to answer equally well, though, to prevent injury to the paper, it must be subsequently dipped in water containing hyposulphite of soda.

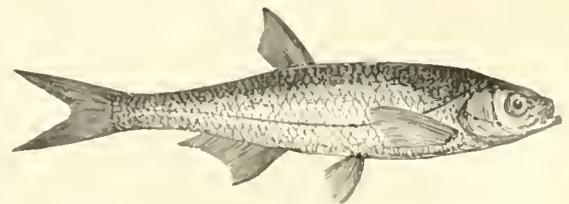

The Chemistry of Bleaching.—The exact chemical character of the changes which occur in bleaching is not fully established. When the coloring-matter is absolutely destroyed, it is probable that it is generally due to the action of active oxygen, ozone, formed by the agents employed. In some cases, however, sulphurous acid unites with the coloring-matter, forming a colorless compound, the color of which can be restored again. A red rose bleached by this agent returns to its original color when placed in dilute sulphuric acid.

Antichlore.—If free chlorine is allowed to remain in the articles bleached, it is liable to injure their strength and damage the metallic parts of machinery. To prevent this, substances such as hyposulphite or sulphite of soda, stannous chloride, coal-gas, etc., are employed, but the first mentioned is generally used. These are called ANTICHLORÉ (*q. v.*).

Revised by IRA REMSEN.

Bleaching-powder: See HYPOCHLORITES.

Bleak (*Alburnus alburnus*): a small and beautiful freshwater fish of the family *Cyprinida*; allied to the minnow and

The bleak.

dace. It is about 6 inches long, is found in many European rivers, and is esteemed as a delicate article of food.

Bled'soe, ALBERT TAYLOR, LL. D.: metaphysician and teacher; b. in Frankfort, Ky., Nov. 9, 1809; graduated at West Point in 1830; served as lieutenant of infantry at Fort Gibson till he resigned Aug. 31, 1832. He was Adjunct Professor of Mathematics and teacher of French in Kenyon College, O., 1833-34; Professor of Mathematics in Miami University, O., 1835-36; counselor-at-law in Springfield, Ill., 1840-48; Professor of Mathematics and Astronomy in University of Mississippi 1848-53; Professor of Mathematics in the University of Virginia 1853-61; and during the civil war Assistant Secretary of War of the Southern Confederacy. He was author of an *Examination of Edwards on the Will* (1845); *A Theodicy, or Vindication of the Divine Glory* (1856); *Philosophy of Mathematics* (Philadelphia, 1862), and other works; contributor to the principal literary, scientific, and theological reviews of the U. S.; principal of a female academy at Baltimore, Md., and editor of the *Southern Review* (Methodist). D. in Alexandria, Va., Dec. 1, 1877.—His daughter, SOPHIA McILVAINE, b. in Gambier, O., Mar. 26, 1837, married James Burton Herrick, of New York, in 1860, and became distinguished as a writer for magazines on microscopical botany.

Bleeder: See HÆMOPHILIA.

Bleeding, or **Hæmorrhage** [*hæmorrhage* is from Gr. *αἷμα*, blood + *ρεῖν*, flow]; in surgery, the escape of blood from the vessels which normally contain it. When the escape takes place into the tissues it is called "extravasation." Hæmorrhage into an internal cavity is said to be "concealed." A slight cut through the integument is usually followed by loss of blood, chiefly from the capillaries. Capillary bleeding will in many cases cease spontaneously, or it may require compression or the application of medicines, such as persulphate of iron or tannic acid. These medicines are called hæmostatics or styptics. Arterial bleeding is recognized by the fact that the blood escapes in jets, and is of a bright-red color. Arterial bleeding tends spontaneously to grow less, both from the feebleness of the heart's action which naturally follows, and from the retraction and contraction of the arterial walls, and the consequent formation of a clot of blood, which plugs the wound; but it may be necessary to resort to ligation or tying, to acupressure or compression of the artery by needles, or to pressure, mechanical or by hand, upon the course of the artery between the heart and the wound. A handkerchief may be tied around and then twisted with a stick. The wounded part should be elevated if possible. Venous bleeding is not generally very formidable. It may be recognized by the steady flow of dark blood. A great source of danger when large veins are cut is that air may enter the circulation; in which case death may immediately follow.

Hæmorrhage from an internal and inaccessible surface may be treated by astringents, as gallic acid, or by ergot, which is especially important in hæmorrhage after childbirth. Some individuals have what is known as the hæmorrhagic diathesis—a disposition to bleed excessively even after a slight injury. (See HÆMOPHILIA.) A tendency to hæmorrhage from the mucous surfaces is characteristic of some diseases, such as typhoid fever.

Bleeding, or **Blood-letting**: the abstraction of blood from the circulation as a means of curing or preventing disease. This operation is performed either by opening a vein (venesection or phlebotomy), by abstraction from the capillaries by means of leeches or cups, or more rarely by opening an artery (arteriotomy). Bleeding was formerly in extensive use in the treatment of many diseases, and no doubt was greatly overused. The striking results obtained in certain cases and ignorance concerning many physiological and pathological processes led to this abuse of an agent which in cases, now much better discriminated, is capable of the greatest good. Thus in the early stage of a pneumonia, when the lungs are surcharged with blood, the right heart distended, the general venous system overfilled, judicious letting of blood may alter materially the progress of the case. The reaction which set in when attention was first directed to the evils of bleeding has, however, overshoot the proper mark, and physicians are still loath to practice a procedure which they feel is called for but which popular opinion condemns. New procedures, as also popular opinion concerning them, always thus overshoot the level on the side of the sanguine, only to swing back, pendulum-like, to the opposite extreme when doubt is raised; but always at the end judicious afterthought establishes the place of rest.

WILLIAM PEPPER.

Bleek, blayk, WILHELM HEINRICH IMMANUEL: philologist; son of FRIEDRICH (1793-1859), the New Testament commentator; b. in Berlin, Mar. 8, 1827; settled in Cape Town in 1856, where he became librarian of Sir George Grey's valuable library. He wrote, among other works, a vocabulary of the Mozambique languages (1856); a *Handbook of African, Australian, and Polynesian Philology* (London, 1858); *Comparative Grammar of the South African Languages* (vol. i., 1862); *Reynard the Fox in South Africa, or Hot-tentot Fables and Tales* (1864); and *Ursprung der Sprache* (1868). Bleek was probably the first to suggest a rational explanation of grammatical gender. D. in Cape Town, Aug. 17, 1875.

Blende [loan-word from a deriv. of Germ. *blenden*, deceive]; the native sulphide of zinc, which British miners call black-jack. It abounds in primary and in secondary rocks, and occurs both massive and crystallized in octahedrons and rhomboïdal dodecahedrons. Pure blende is composed of 67 per cent. of zinc and 33 of sulphur. It is a valuable ore, but is more difficult to reduce than calamine. This is the chief ore employed in the important zinc industry of Illinois, Missouri, and Kansas. The term is sometimes applied to sulphides of antimony and of manganese, the former of which is a rare mineral called red antimony. Revised by C. KIRCHHOFF.

Bléneau: a village in the department of Yonne, France; about 29 miles W. S. W. of Auxerre; famous as the place where Turenne defeated the Prince of Condé in 1652. Pop. (1891) 2,084.

Blenheim, blen'im, Germ. pron. blen'him, or **Blindheim**, blin'him: the name of a small village of Bavaria, near the Danube; 23 miles N. N. W. of Augsburg. From it the English have named the famous battle which occurred at the neighboring village of Höchstädt, Aug. 13, 1704. Here the allied armies, commanded by the Duke of Marlborough and Prince Eugène (who had about 52,000 men), attacked the French and Bavarians (about 56,000 men), who were commanded by Tallard and the Elector of Bavaria. The Duke of Marlborough and Prince Eugène gained a decisive victory, and took about 13,000 prisoners, including Tallard. The French and Bavarians also lost nearly 10,000 killed and wounded, besides many that were drowned in the Danube. The French and Germans call this the battle of Höchstädt. The name Blenheim is also given to the estate at Woodstock, Oxfordshire, and the palace, conferred by Parliament on John Churchill, first Duke of Marlborough.

Blenheim, blen'im: village of Harwich township, Kent co., Ontario, Canada (for location, see map of Ontario, ref. 6-13); 12 miles from Chatham and 75 from London. Has churches of seven denominations, large public school, a mechanics' institute, large flour-mills, bending and planing mills, fire department, good streets, electric lights, and water-works. There is a large supply of natural gas 3 miles away, which is now (1893) being piped to the village. The surrounding country is settled by wealthy farmers, and Blenheim is the chief bean-market in Canada. Pop. (1881) 1,212; (1891) 1,708. EDITOR OF "NEWS."

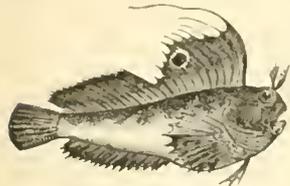

Blenheim-dog, or **Marlborough-dog**: a small and beautiful variety of spaniel. It closely resembles the cocker in form and appearance, but is generally white, with spots and markings of a red color. The muzzle is also fuller. It derives its English name from Blenheim Palace, in Oxfordshire, where the breed has been preserved since the beginning of the eighteenth century.

Blennerhassett, HARMAN: a victim of Aaron Burr; b. in Hampshire, England, Oct. 8, 1764 or 1765; educated in London and Dublin; settled on an island in the Ohio river, below Parkersburg; gave his time to scientific recreation and luxury; supplied Burr with a rendezvous and equipment for his Southern schemes; involved in litigation and confiscations; tried in vain to recover his fortunes in Canada and England; d. in Guernsey, Feb. 1, 1831. His wife wrote some books, and died in the U. S. while endeavoring to recover losses from the Government. See *Blennerhassett Papers* (New York, 1864).

Blenorrhœa [from Gr. *βλέννος*, mucous + *ῥοια*, -ρροια, flux]; an abnormally copious discharge from any mucous membrane. In discharges termed blenorrhœal there is a mixture of epithelial scales in large quantities from the mucous membrane, with numerous pus-cells. After inflammation of the urinary mucous membrane a gleet discharge frequently continues for a long period. The treatment consists in establishing health by tonics, fresh air, and careful

regimen, with astringent lotions to lessen the secretion, and occasional local stimulants to alter the depraved condition of the mucous membrane.

Blenny [from Lat. *blennius*, name of a fish; Gr. βλενωσ, slime]: a fish of the genus *Blennius*, order *Acanthopteri*, and family *Blenniidae*. The true blennies are small, naked fishes, often gayly colored, abounding in seaweeds, tide pools, and among rocks near the shore, especially in warm regions. They are seldom used as an article of food, but are in request for the aquarium, on account of their tenacity of life and their activity. They feed chiefly on small crustaceans. The eyed-blenny (*Blennius ocellaris*), called also the butterfly-fish, has a large

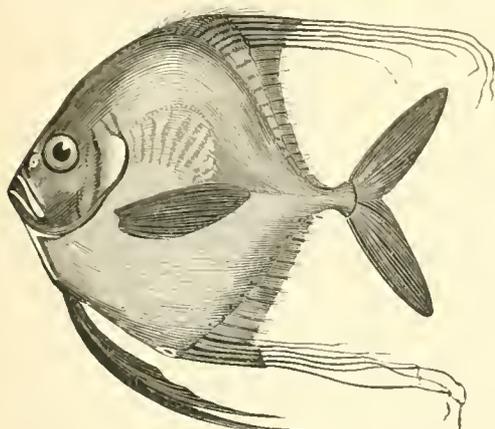

Eyed-blenny.

and prominent dorsal fin, in which is a spot resembling an eye. This fish is common in the Mediterranean.

Some of the blenny family retain their eggs within the oviduct until they are hatched, so that the young are produced alive, and capable of seeking food for themselves. Several blennies are found on the American coasts.

Bleph'aris [Gr. βλεφαρίς, eyelash]: a genus of fishes of the family *Carangidae*; with a short, deep body, and long

Blepharis crinitus.

streamers on the fins. The American species (*B. crinitus*) reaches the length of a foot or more, and is found in warmer parts of the Atlantic.

Bléré, blay'ray' (Lat. *Bleriacum*): a town of France; department of Indre-et-Loire; on the river Cher; 16 miles E. S. E. of Tours. It has a church built about 1150. Pop. (1891) 3,272. Near it is the château of Chenoueaux, which Henry II. of France gave in 1535 to Diana of Poitiers, who, having sumptuously embellished it, was compelled to transfer it to Catherine de Médicis. In 1733 it was purchased by M. Dupin, the wit and beauty of whose widow caused it to be frequented by Fontenelle, Voltaire, Buffon, Rousseau, and others. The castle is in good preservation.

Bles-bok (*Damalis albifrons*): an antelope of South Africa. Its name is derived from the *blaze* (Dutch, *bles*) of white in its face.

Blessed Thistle (*Cnicus benedictus*): a plant of the family *Composita*; a native of Europe, sparingly naturalized in the U. S. It was formerly regarded with great veneration on account of its supposed medicinal virtues, which are celebrated by Burton in his *Anatomy of Melancholy*, and by Shakspeare, under the name of *Carduus benedictus*. It is tonic and diaphoretic.

Bles'ington, MARGARET GARDINER, Countess of: an accomplished and beautiful Irish lady; b. near Clonmel, in Tipperary County, Sept. 1, 1789. Her maiden name was *Power*. She was married in 1818 to the Earl of Blessington, who was her second husband. She traveled with him extensively on the Continent, and after he died in 1829 she lived in Gore House, London, where her soirées were attended by many literati and other eminent persons. She published *Conversations with Lord Byron* (1834); *The Idler*

in France; and other works. D. in Paris, June 4, 1849. See R. R. Madden's *The Literary Life and Correspondence of Lady Blessington* (3 vols., 1855).

Blicher, blee'cher, STEEN STEENSEN: Danish poet and writer of tales; b. Oct. 11, 1782. His tales, the first of which appeared in 1824, deal chiefly with life in Jutland, where he was pastor for many years. They are remarkably true to life, and have had no small influence on Danish literature. A collected edition was published in 1882 (*Samlede Noveller og Skizzer, ordnede efter Tidsfølgen af P. Hansen*, 4 vols.). He translated Macpherson's *Ossian* into Danish. He wrote also in the Jutland dialect. D. Mar. 26, 1848.

G. L. KITTRIDGE.

Blida, bleé'diã: a town of Algeria; province of Algeria; about 30 miles S. W. of Algiers. It is pleasantly situated on the border of the Metidjah, is a station on a railway, and is said to be very flourishing. It has been occupied by the French since 1838. Pop. (1891) 23,686.

Bligh, bli, WILLIAM: an English naval officer; b. of a Cornish family in 1753. He commanded the ship *Bounty*, with which he was sent to Tahiti in Dec., 1787, to procure plants of the breadfruit tree, in order to plant them in the West Indies. During his voyage for Jamaica with a cargo of these plants a part of his crew mutinied, Apr. 28, 1789, on account of his harsh treatment. The captain and eighteen of his men were sent adrift in the launch, and after much suffering arrived at the island of Timor in June, having traversed 3,600 nautical miles in an open boat. The mutineers settled on Pitcairn's island. Bligh was appointed governor of New South Wales in 1806, but his conduct was so tyrannical that he was expelled in 1808. D. in London, Dec. 7, 1817.

Blight: a name given to many parasitic fungi and to the diseases which they produce. It has been particularly applied to the *Erysipheæ*, a family of *Ascomycetes*, which are in some publications called "the blights," but latterly these have borne the much better name of powdery mildews. (1) *Apple blight* is a disease of apple-trees affecting the twigs, leaves, branches, and even the trunk. When the twigs are affected the leaves suddenly turn brown and die, and a gummy exudation appears here and there upon the bark. On the larger branches and the trunk the blight appears in the form of dead and sunken patches of bark. It has been demonstrated within the past few years that this blight is due to the presence of bacteria, *Bacillus amylovorus*, or, according to some, *Micrococcus amylovorus*. Inoculations, made by inserting these bacteria into the living tissues of apple twigs, are followed by the development of blight. The bacteria live upon the cell-substances, and, by robbing the cells, finally cause their death. (2) *Pear blight* is identical with apple blight. (3) *Pear-leaf blight* appears upon the leaves, producing yellowish or reddish spots, marked in the center by minute black pimples. It attacks the fruit also, causing it to crack open and become stunted. This disease is due to *Entomosporium maculatum*, one of the so-called "imperfect fungi," of the order *Sphaeropsidæ*. The fungus appears to pass the winter upon the fallen leaves. (4) *Quince-leaf blight* is identical with pear-leaf blight. (5) *Strawberry-leaf blight* produces upon the leaves red spots, which develop later into larger diseased, whitish areas, bordered with red. This is caused by *Sphaerella fragariae*, one of the black fungi (*Pyrenomyces*) of the family *Sphaeriaceæ*. Here again the fungus appears to pass the winter in the dead leaves. (6) *Potato blight* forms rusty brown patches on the under side of the leaves, followed by wilting and death. It is caused by *Cladosporium fulvum*, one of the "imperfect fungi" of the order *Hyphomycetes*. Most of these fungus diseases are prevented by spraying with solutions of copper sulphates or carbonates. (7) *Grape blight*, see MILDEW. (8) *Potato blight*, see ROT. CHARLES E. BESSEY.

Blim'bing, or **Bilimbi** (variously written also *blimbi* and *bilimby*): the native name for the berries of an East Indian tree (*Averrhoa bilimbi*) belonging to the *Oxalidææ* or *Sorrel* family. They are extremely acid, but are esteemed and much used as a preserve and a pickle. The juice is used as a remedy for certain diseases of the skin. *Averrhoa bilimbi* and its congener *Averrhoa carambola* have been introduced into cultivation in the West Indies. They exhibit to a moderate degree the phenomena of "sleeping" and "waking," exhibited by other members of the same order.

Blind, Education of the: Previous to the eighteenth century no systematic effort was made to educate the blind

as a class. In 1646 an Italian published a book drawing attention to their condition, and in 1670 Lana Terzi, a Jesuit of Brescia, dissented the possibility of their education. In the latter part of the seventeenth and early part of the eighteenth centuries two causes tended especially to awaken thought on this subject—viz., the philosophical discussions of Locke, Leibnitz, and Reid concerning blindness and the appearance of a few blind persons of remarkable talent, whose achievements were greatly admired, of whom Saunderson, Blacklock, and Theresa von Paradis are illustrations. The first school for the blind was organized and taught by Valentine Haüy in 1784 at Paris; similar schools were soon instituted in Great Britain, Russia, and other European countries. The first in the U. S. was established by legislative enactment of Massachusetts at Boston in 1829, and schools of this character are now in operation in most of the principal States in the Union. They are essentially a part of the school system of the respective States in which they are situated. Dr. Samuel G. Howe was the pioneer in the work in this country. Others who have labored in this field are Messrs. Chapin, Williams, Wait, Lord, Little, Morrison, Huntton, and Anagnos, the son-in-law of Dr. Howe.

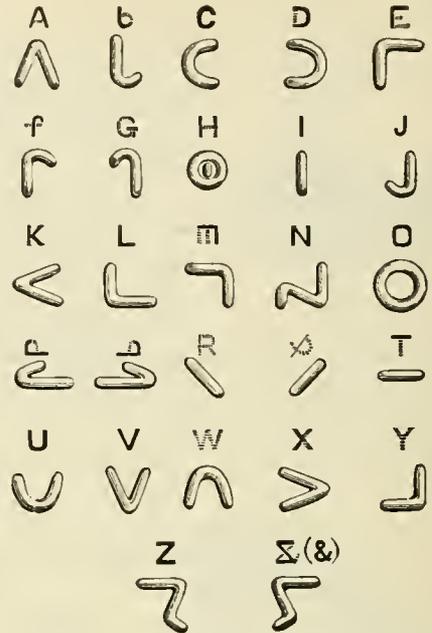

The U. S. Government has shown interest in this work; and Congress in March, 1879, passed an act to promote the education of the blind, by virtue of which \$250,000 was set apart as a perpetual fund, the interest of which should be appropriated to the purchase of suitable books and apparatus to be distributed annually among the various institutions for the blind in the U. S. The American Printing-house for the Blind, situated at Louisville, Ky., has charge of this fund, and is constantly sending forth excellent books and maps adapted to the use of the blind. Prescott's *Conquest of Peru*, Motley's *Peter the Great*, Steele's *Chemistry*, Perry's *Political Economy*, and other similar works, are among the books made available by this admirable institution. Music adapted to the use of the blind is also published by this house. The Perkins Institution publishes books from the Howe Memorial Press, and a few books are printed by various other institutions in the country.

An organization known as the American Association of Instructors for the Blind holds a meeting biennially in some part of the U. S. to discuss methods of teaching, and to consider other questions connected with their work. The most noted schools for this class in foreign countries are at Paris, Amsterdam, Vienna, Berlin, Copenhagen, and London. At London is the Royal Normal College for the Blind, the principal of which is a blind man who was born and educated in the U. S.

In Great Britain there are many societies organized for the purpose of alleviating the condition of those devoid of sight. The Association for Promoting the General Welfare of the Blind, founded in London by Miss Gilbert in 1856, has for one of its objects the teaching and training of blind persons who on account of age or other cause are not eligible for admission to the schools. Outside of schools more is done for the sightless in Great Britain through the medium of this and similar societies than in other countries.

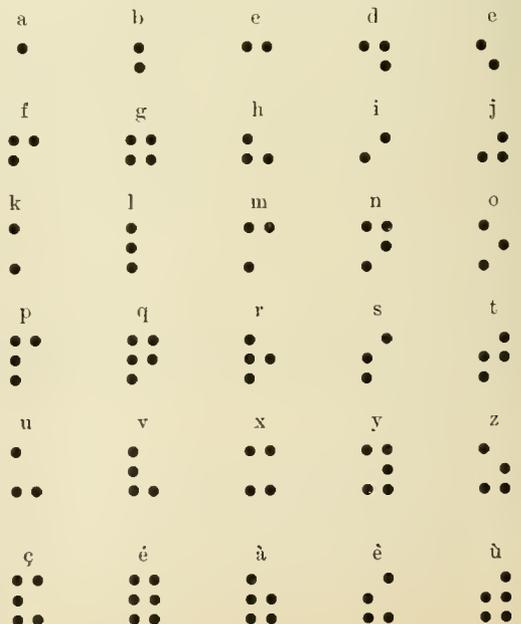

Beginning with the little school of Italy at Paris, the idea of educating the blind has become cosmopolitan. In most of the schools there are three departments—viz., literary, musical, and industrial. The education in the literary department is about equal to the English course in academies. In teaching reading various alphabets have been used. In Edinburgh two blind men invented and used a string alphabet, by which the different letters were designated by the form and distance of knots on a cord, on which events could be recorded or letters written and the manuscript rolled into a ball and preserved or sent to a friend, as the occasion might demand. The alphabets commonly used, however, consist of letters, or characters representing letters, raised about one-thirty-second of an inch above the level of the page and read with the tips of the fingers. Stenographic systems have been invented, but not extensively used. The Moon type—so called from the name of the inventor, Dr. Moon, of Brighton, England—is extensively used, especially in Great Britain. The alphabet consists of six Roman letters unaltered and twelve with parts left out; the others are designated by new but simple forms. The Scriptures and many volumes of history, science, poetry, and biography have been issued in this type. The following large shaded characters are the MOON ALPHABET for the blind. The dotted marks of the letters printed over this alphabet show what portions of the common letter are taken away in order to lay the characters open and clear to the

touch. The large shaded characters when printed for the use of the blind are in relief (embossed), without ink:

The Roman letter and the point or dot system are the most popular. There are two methods of distinguishing letters by points, the Braille and the New York, in use both for literary and musical composition. In Boston only the Roman letter is employed in printing. At the American Printing-house for the Blind the Roman letter and the New York point are used. In foreign countries both books and music are embossed in the Braille point. The Braille system has also been successfully adapted to the needs of the blind of China by the Rev. William H. Murray, of the National Bible Society of Scotland, Peking, China. In Japan the katakana form of the forty-eight letters of the Japanese syllabary has been modified somewhat in the Moon fashion, but in a less degree, and introduced successfully by Dr. Henry Faulds and another, and portions of the Scriptures and other books have been produced.

The following is the BRAILLE ALPHABET as employed in France, Switzerland, Germany, and other foreign countries:

from deficient development of the nervous apparatus. The most important idiopathic diseases of the eye which may produce permanent blindness are ophthalmia of the newly born, granular lids, inflammations of the cornea, iris, choroïd, and retina, atrophy of the optic nerve, glaucoma, and tumors of the eye and its vicinity. Blindness the result of injuries may be due to a wound of the eye, to unsuccessful operations, to injuries of the head, and to sympathetic inflammation. Blindness may be produced by general diseases—for example, scrofula, syphilis, inflammation of the brain and its membranes (including insanity and epilepsy), disease of the spinal cord, the various eruptive fevers, intermittent fever, heart disease, Bright's disease, and toxic influences (lead, tobacco, alcohol).

AMBLYOPIA AND AMAUROSIS.—Both of these terms signify dimness of vision, the former being used to describe obscurity of sight, and the latter the more advanced condition of loss of vision. Modern methods of examination have greatly lessened the number of instances to which older writers applied the words amblyopia and amaurosis. Amblyopia is a symptom, and describes the defective vision from which the patient suffers. This may be due to functional disturbance, or to disease of the visual apparatus (retina, optic nerve, or visual centers), and may be unassociated with changes in the eye; or there may be atrophy of the optic nerve. Amblyopia and amaurosis may be congenital or acquired, temporary or permanent, and symmetrical or non-symmetrical. Congenital amblyopia is a term generally applied to instances of defective vision uncomplicated by evident disease of the coats of the eyes. The faulty vision has always existed, and often there are high grades of farsightedness and astigmatism, and clear images have never been focused on the retina. Squint is usually present in eyes of this character. Sometimes the amblyopia is present only for colors, and is then known as *color-blindness*. Other causes for amblyopia are injuries, the toxic action of certain drugs (alcohol, tobacco, quinine, sulphide of carbon), and various diseases—for example, Bright's disease, diabetes, and malaria. A curious form of amaurosis occurs in connection with hysteria. Blindness is sometimes simulated by those who desire to escape distasteful duties (malingerer).

NIGHT-BLINDNESS (*Nyctalopia*, often incorrectly termed hemeralopia).—This is a functional complaint consisting in an imperfect adaptive power of the retina, due to exposure of the eye to strong light, together with a debilitated and often scorbutic state of the system. It affects residents in tropical countries, often soldiers and sailors, and has been occasionally observed in large schools, usually in the early spring or summer. It prevails as an endemic in certain countries, especially in Russia during the Lenten fasts. The patients are unable to see well in the dusk, or even on dull days, although their vision is good enough in a bright light. Night-blindness is also a symptom of a very serious disease of the retina which is called pigmentary degeneration, quite distinct from the functional disorder which has just been described.

DAY-BLINDNESS (*Hemeralopia*, often incorrectly termed nyctalopia).—This is an affection characterized by the fact that its subjects see better on dull days and in the dark than in a bright light. Sometimes it is a symptom of diseases of the retina and of the optic nerve; sometimes it is found in certain congenital faults of the eye, particularly albinism, and sometimes it is an idiopathic affection, and may develop in those who have long been excluded from the light. Among nocturnal animals, as owls, bats, etc., it is the normal condition. GEORGE E. DE SCHWEINITZ.

Blindstory: See TRIFORIUM.

Blindworm: a popular name of the lizard *Anguis fragilis*, which, however, is not blind, nor is it a worm. It is a lizard, closely related to typical forms, differing, however, in the snake-like body, and in the absence of external limbs, but the bones of the shoulder and pelvis exist in a rudimentary state. It is found in nearly all parts of Europe, is inoffensive and timid, and moves very slowly; hence it is sometimes called slowworm. Its length varies from 10 to 15 inches. Its eyes are small but well developed, and with movable lids. As in most lizards, its tail is very brittle, hence the popular name of glass-snake for the American species of *Anguilla*. See GLASS-SNAKE.

DAVID S. JORDAN.

Bliss, PHILEMON: jurist; b. in Canton, Conn., July 28, 1814; educated at Hamilton College, Clinton, N. Y. In 1861 he became chief justice of Dakota, and afterward a

judge of the Supreme Court of Missouri. For a number of years he was dean of the Law School of the State University of Missouri. He was the author of a work on code pleading. D. in St. Paul, Minn., Aug. 25, 1889.

HENRY WADE ROGERS.

Bliss, PHILIP PAUL: b. at Clearfield, Pa., July 9, 1838; received instruction in music from George W. Root; became the chorister of the First Congregational church of Chicago, and superintendent of the Sunday-school; joined afterward in the lay evangelistic labors of Maj. Whittle, and perished at the Ashtabula, O., railway accident, Dec. 29, 1876. His hymns *Hold the Fort, Hallelujah, 'tis done!*, *More to Follow*, etc.—of which he generally composed both text and melody—became very widely used.

Bliss, PORTER CORNELIUS: journalist and diplomat; b. on the Cattaraugus reservation of Seneca Indians, Erie co., N. Y., Dec. 28, 1838; studied at Hamilton and Yale Colleges; traveled in Maine, New Brunswick, and Nova Scotia 1860-61, investigating the condition of the Indian tribes in behalf of societies at Boston; was employed for some months as clerk in the Indian bureau, and subsequently in the post-office department at Washington 1861; took part in volunteer organizations for the defense of the capital; visited England the same year; accompanied Gen. J. W. Webb as private secretary on his mission to Brazil 1861-62; was commissioner of the Government of the Argentine Republic for the exploration of the Indian country called the Gran Chaco 1863; edited at Buenos Ayres a monthly periodical, *The River Plate Magazine* (1864); was appointed by President Lopez historiographer of Paraguay; became secretary to Hon. C. A. Washburne, U. S. minister to Paraguay, 1866; aided him in collecting materials for his *History of Paraguay* (2 vols., 1871); was imprisoned by command of Lopez on a charge of treason and conspiracy for his assassination Sept. 10, 1868; rescued by a U. S. squadron Dec. 10, 1868; appointed translator to the State department at Washington, Mar., 1869; editor of the *Washington Chronicle* 1869-70; secretary of legation in Mexico 1870-74, and acting minister several months 1872-73. He afterward resided in New York, and was vice-president of the American Philological Society and an editor of the *New York Herald*. D. in New York, Feb. 1, 1885.

Bliss, WILLIAM WALLACE SMITH, A. M.: soldier; b. in Whitehall, N. Y., Aug., 1815; graduated at West Point in 1833; assistant adjutant-general (rank of major) July 7, 1846. He served in the Cherokee nation, 1833-34; assistant professor at the Military Academy 1834-40; in the Florida war 1840-41, being chief of staff to commanding general; assistant adjutant-general at headquarters of Western military departments 1842-45; chief of staff of Maj.-Gen. Taylor in the military occupation of Texas 1845-46; in the war with Mexico 1846-48; in command of the Western division 1848-49; engineer at Palo Alto, Resaca de la Palma (brevet major), Monterey, and Buena Vista (brevet lieutenant-colonel); private secretary of President Taylor, Mar. 4 to July 9, 1850; assistant adjutant-general of the Western division, headquarters at New Orleans, La., 1850-53. D. in East Pascagoula, Miss., Aug. 5, 1853.

Bliss'field: village (founded in 1825); Lenawee co., Mich. (for location of county, see map of Michigan, ref. 8-3); on L. S. and M. S. R. R. (old line); 23 miles W. of Toledo; has 2 graded schools, 6 churches. Its only industry is farming. Pop. (1880) 1,222; (1890) 1,132; (1894) 1,236. EDITOR OF "ADVANCE."

Blistered Steel: See STEEL.

Blisters [in Early Modern English also *blyster* and *bluster*; from Middle English *blisler*; perhaps from Old French *blestre*, *blostre*, a swelling]; a term applied in *medicine* either (1) to thin vesicles filled with serum produced upon the skin by certain applications, or (2) to the applications themselves. The material most frequently employed is cantharides or Spanish-fly (*Cantharis vesicatoria*), which may be mixed with oily substances, or incorporated in collodion, painted upon the surface. Ordinarily from four to six hours are required for a satisfactory blister, but in persons with delicate skin a shorter time may suffice, and it is well in such cases to have a thin sheet of gauze between the skin and the application. Poultices over the blister hastens its action. Ammonia is also useful in some cases, but the resulting blisters are more severe.

Blizzard [of doubtful etymology]: a storm characterized by a high wind, extreme cold, and an air filled with fine,

hard, sharp crystals of snow. Blizzards generally follow an unusually deep "low" or storm-area of winter when the pressure rises rapidly. They appear first in the plains of Canada E. of the Rocky Mountains and pass into the U. S. through Eastern Wyoming, North Dakota, and Minnesota, and rarely pass E. of the region of the Great Lakes, unless the ground has a continuous covering of snow. They are very destructive to unprotected stock, and are dangerous to human beings exposed to them. The fine snow fills the air and prevents the traveler from seeing his way and stings the skin, the mind becomes confused, and the sufferer may perish even within the hearing of a call from his own door. Fortunately, severe blizzards are rare, and when they occur they seldom continue more than a day or two. M. W. H.

Block: a heavy piece of timber; a massy body, solid and heavy; the piece of wood on which criminals are beheaded; the wooden mold on which a hat is formed; any obstacle or obstruction; also a continuous row of buildings. The term is applied in New York and other cities to the space and buildings between two consecutive streets.

Block: in the rigging of a ship, is the part of the apparatus for raising sails and yards, tightening ropes, etc. The uses of blocks are very numerous on shipboard, and to subserve these uses they are distributed about the masts and yards. The block comprises a *shell* or exterior, a *sheave* or wheel on which the rope runs, a *pin* on which the sheave turns, and a *strap* to fasten the block in its place. A single block contains only one sheave; a double block, two; and so on. Besides the designation of blocks according to the number of sheaves they contain (as single, double), they receive other names—such as cheek block, clew-garnet block, clew-line block, etc. Elm is used for blocks, and lignum vitæ for sheaves.

Until 1781 ship's blocks were made by hand. But it required unusual skill and practice to fashion the pieces and put them together so as to possess the requisite strength and facility in working. More than 1,400 blocks were required for one of the old seventy-fours, and a proportionate number for other vessels. In 1781 a Mr. Taylor began to make the sheaves and shells of blocks by machinery for the British navy. Sir M. J. Brunel in 1801 invented machinery for making blocks, which was put into successful operation in 1808. Thomas Blanchard, an American mechanic, invented most ingenious machines for block-making. For his invention and superintending the work, Brunel received from the British Government £20,000.

Block. MORITZ: a French writer on statistics and political economy; b. in Berlin, Feb. 18, 1816. Among his works are *Statistics of France* (2 vols., 1860); *Europe, Political and Social* (1869, both in French); *Die Bevölkerung des Französischen Kaiserreichs* (1861); and *Die Bevölkerung Spaniens und Portugals* (1861). Since 1856 he has published the *Annuaire de l'économie politique et de la statistique*.

Blockade: the act of shutting out all trade by sea with certain specified ports or coasts of one belligerent by another. It is a war right only, arising not from the theory that one state by occupation of certain waters of another has acquired sovereignty over them, but from the right which either party in a war has of weakening his enemy's power of resistance by cutting off his neutral trade. Being a recognized belligerent right, there exists a corresponding duty on the part of the neutral to observe it. This duty, however, the neutral government is not bound to enforce through its municipal law, for this burden is held to lie upon the shoulders of the blockading power, the neutral merely warning its subjects of the fact of blockade and its penalty. Blockade, unlike siege, implies no attempt to gain possession of a port or town; it is rather an act of prevention, restricting trade from within as well as from without the blockaded waters. By comity, at the commencement of a blockade a certain delay is usually granted to enable ships inside either already loaded or in ballast to leave the country. In the U. S. Civil War this delay was fifteen days. Neutral men-of-war on a diplomatic errand and ships driven in by stress of weather may also be granted the privilege of entrance in spite of blockade. When a navigable river like the Rio Grande is a boundary between two states, the enemy of one of them can only apply his blockade to the trade of that one; vessels bound for a neutral port up river must be allowed passage. Declaration of blockade is an act of sovereignty which is rarely delegated to the subordinate officers of a state. Being a serious limitation of the neutral's right to trade freely with his friends, that neu-

tral has insisted that due notice of it shall be given him, and that the declaration of blockade shall be substantiated by the stationing of a suitable force at the blockaded point. There are then three essentials to a valid capture for breach of blockade. (1) Due notification must have been given. (2) The blockade must be effective. (3) There must be an attempt to break it.

1. *Notification of Blockade.*—This may be given in two ways; by diplomatic announcement to all neutral powers, or by a warning at the blockaded port inscribed upon the register of the ship trying to enter. The diplomatic notice after a reasonable length of time implies presumptive knowledge of the blockade on the part of all ship-owners, particularly now when the telegraph is so freely used in commerce. The notice at the blockaded port may precede the other or supplement it, as when the blockade of Southern ports was instituted by the Northern fleet during the war of rebellion in the U. S. By proclamation all ports of the Confederacy from South Carolina to Texas were put under blockade Apr. 19, 1861, and a week later the ports of Virginia. But since there was not at first force enough to make this effective, the special notice at the harbor's entrance was allowed for a while also. This was loose practice, savoring of paper blockades, and an injustice to the neutral shipper, who was warned away from all Southern ports, while some only were actually closed. He did not lose his ship, it is true, since she was granted the special notice, but he was likely to lose his voyage, because he could not know for a while which ports were still open.

The French rule is to give both these notifications—the diplomatic one and that communicated to the vessel at the mouth of the harbor—and at no stage of the operation to neglect the latter. M. Molé, Minister of Foreign Affairs, wrote in 1838 to another French minister of state: "I will not recall here the reasons why, independently of the official and diplomatic notice of a blockade, every ship showing itself before the blockaded port ought to receive the warning from the commanding squadron." The French, however, hold, if we are not mistaken, that at the outset of a war, before notice has had time to travel over the commercial world, a simple warning to a ship is sufficient, and that an attempt to break through into the port after this would expose the vessel to seizure and trial. The English and our own rule does not require the double notice. It is enough to send the diplomatic notice to all neutrals, and only at the very commencement of a war, especially before notice has had time to fly abroad, to warn off any approaching vessel. If, meanwhile, a vessel should seek to enter the blockaded harbor under the plea of ignorance, the length of its voyage and other circumstances must decide whether the plea is just. The diplomatic notice must be sent everywhere, and if only common fame has carried it to a particular country, that is not sufficient to involve in guilt a vessel of that country when seeking the blockaded port. If we compare the two rules, we shall give the preference to the English. The diplomatic notice is intended to prevent voyages, which may be useless or losing, to places in an actual condition of siege. Should a vessel now appear at the harbor's mouth with the claim of not knowing the state of facts, the presumption is against the story, and she must prove her words as she can. But why give a new warning here, any more than to a burglar at your door? It is highly criminal to break blockade; the purpose to do it is a hostile purpose, and no indulgence is called for by such traffic.

If a blockade is raised even temporarily by the approach of the enemy's fleet, for instance, or by any cause except stress of weather, and then resumed, a new diplomatic notice is necessary, and no captures are valid at that point until such notice can have been received and spread. Here again we notice loose practice in the blockade of 1861, for on certain occasions several days elapsed between the departure of the blockading ship from its post and the arrival of the relieving one, but no new notice was given. In case a blockade is abandoned, notification of the fact should be given as widely and publicly as of its commencement.

II. *Effective Blockade.*—The amount of force necessary to make blockade legal and effective is somewhat indefinite. The fourth rule of the Declaration of Paris of 1856 is that "blockades, in order to be binding, must be effective; that is to say, maintained by a force sufficient really to prevent access to the coast of the enemy."

This definition of "effective blockade" is a little misleading. It does not mean that occasional evasions of a block-

ade will vitiate it. It is enough if there is so great risk of capture as to make blockade-running very dangerous. The rule of the Declaration of Paris was aimed at those abuses of the right which are called cabinet or paper blockades, of which the best known examples occurred at the beginning of the present century. Prussia had treacherously seized Hanover, and closed her ports against Great Britain. Great Britain soon after declared the coast from the Elbe to Brest under blockade. This was not, and could not be, made effective by force. Napoleon in reply, by a decree dated Nov. 21, 1806, at Berlin, laid the whole British coast under blockade. Then by a British order in council the European coast from the Elbe to Italy was put under blockade, and France in turn renewed the Berlin decree with fresh penalties. Such a blockade on Napoleon's part was ridiculous, except for the fact that occasionally the penalty could be exacted for its breach from a neutral ship touching at some British port and then trading with the continent; and the blockade of all the European seaports was far beyond the power of the English fleet. Both sets of orders bore very hard upon the neutral, who saw his legitimate trade ruined, not by the exercise of a belligerent right, but by the mere threat of it, a threat impossible of execution. The growth of the neutral interest secured the abrogation of such a species of blockade in 1856, and as the U. S. has consistently professed the same doctrine, it may be considered maritime law to-day.

III. *Breach of Blockade.*—Lastly, there must appear an attempt to break the blockade after it has been announced and made effective. This may be inferred by the court from the lading-papers, course of the ship, the owner's instructions, any attendant circumstances, even at the outset of the voyage. By the doctrine of continuous voyages, even if a ship is bound for a neutral port, in case her real eventual destination is clearly proven to be a blockaded port, it may be considered one continuous voyage and the penalty attach. But on account of the extreme difficulty of inferring this eventual destination, great fault has been found with courts applying this principle.

The penalty for breach of blockade is confiscation of the ship first and then of the cargo, unless it can be removed from complicity in the act of the ship.

The presumption is against the innocence of the cargo, for it will probably be for the sake of the cargo that the ship makes the venture. If both belong to the same owner, the guilt of the cargo is conclusive. This penalty rests on the vessel until the end of the return voyage. No punishment can be visited upon the crews of blockade-runners. The restrictions of a blockade are paramount to the rights acquired under a license to trade granted by the same government.

On the proclamation of peace, or from any political or belligerent cause, the continuance of the investment may cease to be necessary, and the blockade is then said to be *raised*. The blockading force then retires, and the port is open as before to all other nations.

Revised by T. S. WOOLSEY.

Blockade: in military art, an operation and an effort to reduce and capture a fort or town without a bombardment or regular siege, relying solely upon the stoppage of supplies. The attacking party throws up redoubts or other works on the neighboring heights and roads. A part of the investing army sometimes remains in a temporary camp, ready to repel a sortie of the garrison. Forts built on steep and rocky eminences may be reduced more easily by blockade, because the roads or paths by which supplies can be received are few, and can be guarded by a small force.

Block Books: books printed from blocks of wood on which the letters have been cut in relief. Previous to the invention of printing, besides the calligraphists and illuminators who prepared and adorned the books of scholars and clerics, there existed a separate guild for the fabrication of school-books and books of devotion, as well as calendars and popular medical books for the lay public. These were ornamented with rude paintings. The card-painters were identical with this craft until the beginning of the fifteenth century. As the demand for the products of their art increased, they invented the process of block-printing, cutting into blocks of wood, and sometimes plates of metal, so as to leave the letters and pictures standing out, and applying colors to these and taking impressions. In these xylographic books sometimes one, sometimes both sides of the sheet were printed.

Block-house: a wooden redoubt or temporary fort; it is always covered. It is usually rectangular, is built of logs, and has two stories, one of which is sunk several feet below the surface of the ground. The upper story projects a few feet beyond the lower on all sides. It is loopholed for the use of muskets. Block-houses have been much employed in the U. S. as a defense against Indians. If exposed to the fire of artillery they should be formed of double rows of logs, 3 feet apart, with well-rammed earth between them.

Block Island: an island belonging to the State of Rhode Island; situated between Montauk Point, the east extremity of Long Island, and Point Judith (see map of Rhode Island, ref. 12-M). It constitutes the township of New Shoreham in Newport County. It is 8 miles long and from 2 to 5 miles wide. Block island light, at the north extremity, is in lat. 41° 13' 46" N., lon. 71° 34' 17" W. Pop. (1880) 1,203; (1890) 1,320.

Blockley: a former township of Philadelphia co., Pa.; on the west side of the Schuylkill river; is now included in the city of Philadelphia. It is the site of the Blockley Insane Asylum, and of a large almshouse occupied by the paupers of the city.

Block-printing: See BLOCK BOOKS and PRINTING.

Block System: a method of controlling railway trains which are moving in the same direction on the same track, so as to prevent rear collisions. The name originated either from the blocking of the track by stopping the trains, or from the fastening or blocking of the handle of the signal which was used when the system was first introduced. The system, however, does not depend upon any particular kind of signals, or upon any especial mode of transmitting messages. It can indeed be operated by men using flags and lanterns alone, although this would require numerous block stations and hence be very expensive. Usually the block stations are several miles apart, and communication between them is made by the electric telegraph.

To operate the block system a railroad is divided into sections *AB, BC, CD*, etc., of equal or unequal length, as may be most convenient, and a signalman is stationed at

A	B	C	D	E
---	---	---	---	---

each of the signal stations *A, B, C*, etc., who is able to communicate with the signalmen at the two adjacent stations. If a train is on the section *BC* a danger signal remains displayed at *B* until the train has passed *C*. The signalman at *C* then informs the signalmen at *B* and *D*, the danger signal is lowered at *B*, and one is displayed at *C*, and so on in succession; thus only one train can be upon one section at the same time. If a train should be derailed between *C* and *D* the train next following would be stopped at *C*, and this would cause the danger signal to be put out at *B*, so that the third train would stop there. The system, therefore, keeps a certain space interval between all trains on the track, and thus prevents rear collisions if its rules and regulations are observed by the signalmen and engineers.

The block system as just described is often confounded with the automatic block system. The latter may be defined as an attempt to perfect the former by the use of signals electrically controlled and working automatically, so as to remove as far as possible the danger due to the fallibility of human agencies. For instance, in the simple block system a train might be derailed between *C* and *D*, and the signalman at *C* might turn his danger signal to safety, dreaming perhaps that *D* had given this order; then the following train would go on and collide with the derailed one. In the automatic system, however, the signals are so connected or interlocked that it is impossible for the danger signal at *C* to move until the track is clear between *C* and *D*. This system, moreover, by passing the electric current through the rails, can be made to display a danger signal at *C* if a rail should be broken or a switch be opened between *C* and *D*.

The principles of the block system were enunciated by Sir W. F. Cooke in 1842, in a pamphlet entitled *Telegraphic Railway*, but it was first practically applied in 1851 on the South Eastern Railway of England, and it is now extensively used on European railways. In the U. S. the block system is still in its infancy, and is used only on a few leading railroads, but every rear collision emphasizes its importance, so that its introduction is now rapidly going on. The "absolute block system" is that where the rules absolutely forbid more trains than one on the same section at the same time,

as described above. The "permissive block system" is that where a second train is permitted to enter upon the section, with a warning that it is already occupied and with instructions to go cautiously. The permissive system is manifestly far less secure than the absolute, but is still often used, particularly under the pressure of extra traffic.

According to the statistics kept by the *Railroad Gazette*, the only ones obtainable for the U. S., there occurred during the year 1892 a total of 2,327 train accidents, of which 1,062 were collisions. The latter are classified as 485 rear collisions, 25 butting collisions, and 326 crossing and miscellaneous. In these train accidents 672 persons were killed, of which number 362 perished in the collisions. As the railway mileage is constantly increasing, the total number of train accidents per annum also increases (the number of collisions alone having doubled since 1885), so that the attention of the traveling public is every year more forcibly directed to the necessity of insisting upon an efficient system of protection by means of the block system. See *American Practice in Block Signaling* (New York, 1892) and *Railway Equipment under Railways*. MANSFIELD MERRIMAN.

Block-tin: a name of a variety of tin which is inferior in quality to grain-tin. During the process of melting or reduction in a reverberatory furnace the purest tin first fuses, and is withdrawn. The residue, being melted at a higher temperature, is poured into molds, and is called block-tin.

Blodgett, LORIN: scientist and writer; b. in Chautauque co., N. Y., May 23, 1823. In 1851 he became assistant professor at the Smithsonian Institution at Washington. He may be said to have laid the foundation of American climatology. In 1855 he published a quarto volume of climatological observations, and in 1857 *Climatology in the United States*, a work extensively circulated and very favorably received in Europe. He was editor of the *North American*, published in Philadelphia, and secretary of the Philadelphia Board of Trade from 1858 to 1864. He contributed articles on finance to the *North American Review* in 1866 and 1867, besides making contributions to various other publications.

Blodgett, HENRY WILLIAMS, LL. D.: jurist; b. in Amherst, Mass., July 21, 1821. His parents removed with him to the State of Illinois in 1838. He studied for a time in the Amherst Academy. In 1842 he began the study of law in Chicago, and was admitted to the bar in 1845. In 1853 he was a member of the House of Representatives of the Illinois Legislature, and in 1858 he was a member of the State Senate. In 1870 he was appointed judge of the U. S. district court for the northern district of Illinois. In June, 1892, he was appointed one of the counsel to represent the U. S. before the board of arbitrators between the U. S. and Great Britain in regard to the fur-seal interests in the Bering Sea. He is Professor of Admiralty and Patent Law in Northwestern University Law School, and dean of its law faculty.

Bloemfontein, bloom-fon'tin: the capital of the Orange Free State, in South Africa; on a tributary of the Modder, in about lat. 29° 10' S., lon. 26° 40' E. (see map of Africa, ref. 9-F). It is the see of a large diocese of the Church of England. Pop. (1890) 3,459 white, about 1,000 blacks.

Blois, blwā (anc. *Bléva*): a town of France; capital of the department of Loir-et-Cher; finely situated on high ground on both sides of the Loire, and on the railway from Orleans to Tours; 36 miles by rail S. W. of Orleans, and 112 miles by rail S. W. of Paris (see map of France, ref. 4-E). It has a fine cathedral, a college, a public library, a botanic garden, an episcopal palace, and a town-hall. Here is the celebrated castle of Blois, the scene of many interesting historical events, and once the favorite residence of the Kings of France. Francis I., Henry II., and Charles IX. held their courts in this castle, which has been inhabited by many princes. Blois is a place of great antiquity, and was once more important than it is now. It has manufactures of gloves and porcelain, and a trade in brandy, wine, and timber. Here is an aqueduct cut in the rock by the ancient Romans. Pop. (1891) 23,457.

Blomfield, blūm'fōld, ALFRED, D. D.: Bishop Suffragan of Colchester, England; youngest son of Dr. Charles James Blomfield, Bishop of London; b. at Fulham, Aug. 31, 1833; educated at Balliol College, Oxford; ordained 1858; fellow of All Souls College, Oxford, 1856-69; Archdeacon of Essex 1878-82; Archdeacon of Colchester, and consecrated bishop

suffragan June 24, 1882. Author of *Memoirs of Bishop Blomfield* (2 vols., 1863); *Sermons in Town and Country* (1871). D. Nov. 5, 1894.

Blomfield, CHARLES JAMES, D. D.: a learned English prelate; b. at Bury St. Edmunds, in Suffolk, May 29, 1786; graduated at Trinity College, Cambridge, B. A. 1808, and was elected a fellow. He edited several dramas of Æschylus and the works of Callimachus (1815), and of Euripides (1821). He became Bishop of Chester in 1824, and Bishop of London in 1828. He was an efficient promoter of the erection of new churches in London. D. at Fulham, Aug. 5, 1857. See G. E. Biber, *Bishop Blomfield and his Times* (London, 1857); A. Blomfield, *Life of C. J. Blomfield* (1863).

Blom'maert, PHILIPPUS: Belgian author and philologist; b. in Ghent, Aug. 27, 1808; an eager advocate of the revival of the Flemish language and of a Flemish national life. He published editions of old Flemish poems (*Theophilus*, 1836; *Oude vlaamische gedichten*, 3 vols., 1838-51), and translated parts of the *Nibelungen* into Flemish iambs. His most important work is a history of the Belgians, *Aloude geschiedenis der Belgen of Nederduitschers* (1849). D. in Ghent, Aug. 14, 1871. Revised by A. R. MARSH.

Blood: the principal nutritive fluid of the body. It consists of a clear liquid, the *plasma* or *liquor sanguinis*, and numerous small bodies, the *corpuscles*, also nearly transparent, but of different refractive power from the plasma, and therefore the two commingled make an opaque mixture. In most of the invertebrates and in the amphioxus, a fish of low type, the blood is clear and transparent. In many invertebrates it is colored, red, green, or yellowish. The red fluid seen when the head of a fly is torn off or crushed is not blood, but comes from the eyes. In vertebrates only are corpuscles found. There is usually a faint odor characteristic of the animal.

In man the blood is light red in the arteries, and is designated as *arterial*; in the veins it becomes dark bluish or even blue-black, and is called *venous*. The color is due to an organic substance, *hemoglobin*, which is contained in the red corpuscles. The oxygen of the air entering at the lungs combines with this substance, and gives rise to the bright red color of arterial blood. In the tissues the oxygen is consumed, the hemoglobin becoming "reduced"—that is, deprived of oxygen—and the bluish color of the venous blood results. The temperature of the blood is about 100° F. in the deep-seated vessels, but becomes rapidly cooled in those of the exterior. Its specific gravity is about 1.055, but varies in different conditions of health and disease.

The plasma is an albuminous fluid containing various substances, including carbonates, phosphates, sulphates, and chlorides of sodium and potassium, sulphates and phosphates of lime and magnesium, certain organic salts, and undetermined "extractives." Sugar occurs in small proportion in the venous blood, especially that leaving the liver. Urea, urates, carbonic acid gas, and various other substances meant for excretion are also found in the blood in small quantities.

The corpuscles are the red, the white and the blood plaques or plates. The *red corpuscles* are small bi-concave disks about $\frac{3}{8000}$ of an inch in diameter, of amber color when seen separately, but when in mass of the red color characteristic of the blood. In the lower vertebrates they are of oval or elliptical outline, and often nucleated; in man and the mammals, excepting the camel tribe, the outline is circular. The *white corpuscles* or *leucocytes* vary in size, but are generally somewhat larger than the red. The leucocyte consists of a protoplasmic mass, possessed of amoeboid motion, and containing one or more nuclei. They are much less numerous than the red, the proportion being variously stated at from 1 : 250 to 1 : 700. Besides these two well-defined corpuscles there is a third form, the *blood plaques* or *plates*, small circular disks, pale amber in color, and about half the size of the red corpuscles. They are by some considered young red corpuscles, but their true nature is much in doubt.

The blood is a peculiar tissue in that its cells are not reproduced from the pre-existing ones, but supplied by certain blood-making organs, among which the bone marrow, the spleen, and the lymphatic glands are important. At the same time destruction of corpuscles also occurs in various places, but principally in the spleen and liver.

The functions of the blood are distributed among its different elements. The plasma, aside from the mechanical purpose of furnishing a circulating medium, serves to con-

vey to the tissues the various nutritive substances derived from digestion, and from them the excrementitious products of tissue waste and oxidation. The red corpuscles consist largely of the substance called *hemoglobin*, the coloring-matter of the blood. This substance, chemically albuminous and containing iron, has the property of readily uniting with oxygen and setting this free again. It thus accomplishes the chief purpose of the red corpuscle, that of carrying oxygen from the lungs to the tissues. The functions of the white corpuscles are more obscure, but they doubtless bear a close relation to the processes of growth and tissue repair.

When blood is let it rapidly undergoes clotting or coagulation, certain chemical substances uniting to produce fibrin which catches red and white corpuscles in its meshes to produce a clot or *crassamentum*.

The so-called diseases of the blood are not such, strictly speaking, but rather diseases of the blood-making organs or other structures, whereby the blood becomes deteriorated secondarily. The general term *anæmia* includes a number of such conditions. (See *ANÆMIA*, *CHLOROSIS*, and *LEUCÆMIA*.) Excessive amount of blood or *plethora* was formerly regarded as of great importance and very common in those of full habit; but we are at present inclined to attach much less significance to the amount of blood in these cases. See *HISTOLOGY*.

WILLIAM PEPPER.

Bloodbird (*Myzomela sanguinolenta*): a beautiful little species of honey-sucker which receives its name from the rich scarlet color of the head, breast, and back of the male. It inhabits the thickets of New South Wales.

Bloodflower: a bulbous plant of the genus *Iteanthus* and family *Amaryllidaceæ*; native of South Africa; so called from the red color of the flowers. Bloodflowers are cultivated in greenhouses for the beauty of their flowers, which grow in heads or clusters. The leaves of some species are linear, and those of others nearly round. The inspissated juice of *Iteanthus toxicarius* is used by the natives of South America to poison their arrows.

Bloodhound [so called because formerly employed to track wounded game by their blood]: one of several varieties of dog, distinguished for the keenness of their scent and the persistency with which they will follow the track of game. They have been employed in many petty wars to track small forces of partisans, also to follow escaped prisoners, etc., as in time of peace they have been trained to hunt felons, poachers, and fugitive slaves. When kept for these purposes they acquire a peculiarly ferocious and blood-thirsty character, but when employed for the chase they are sagacious and trusty. The Cuban and Russian hounds are celebrated for their ferocity. They differ much from the English hounds, but like them have pendulous ears and lips and a compact and muscular build.

Blood-letting: See *BLEEDING*.

Blood-money: the reward for betraying a criminal to justice. More commonly, however, the compensation by a slayer to the slain person's next of kin. With primitive peoples, who can not understand how taking a life is compensation for life, the practice prevails of paying a fine to surviving relatives in cases of homicide. The amount is fixed by custom or law. The laws of the ancient Germanic races which settled in the various countries of Europe elaborately fix the fines for homicide of different degrees.

Blood-poisoning: the condition produced by the absorption of injurious substances from a wound, from a local disease, or from an intact mucous membrane. Using the word in its broadest sense the condition occurs in almost every disease, certainly in all infectious diseases. In every disease and in every wound there are substances produced which are absorbed into the blood, and which, when present in sufficient amount, or when sufficiently virulent, manifest their action by the production of fever and other disturbances of the general constitution. The substances which are absorbed may be of the most varied character. They may be living micro-organisms which are capable of multiplying in the blood, or they may be chemical substances which are produced by the bacteria or by the local inflammatory or degenerative processes. Ordinarily the word is not used in such a general sense, but only to denote the constitutional disturbances which result from the absorption of injurious substances from wounds. A number of terms have been used to designate the various diseases so produced, which have reference chiefly to the nature of the substances

absorbed. They have been divided into two groups, with the distinction that in one, *septicæmia*, no abscesses are produced in distant localities, in the other, *pyæmia*, abscesses are produced.

Under *septicæmia* three conditions have been distinguished. (a) *Fermentative fever*. This is the simplest of the wound complications. It is due to the absorption of fibrin or other ferments from effused blood or from the products of dead tissue. It is seen in perfectly aseptic, non-suppurating wounds, as after a simple fracture of a bone. It is present in every wound if it is sufficiently large and if the conditions favor absorption. Open wounds, where the products can easily escape, are naturally not so liable to be followed by fever as wounds in which the products are retained. The fever is of greater or less intensity and the constitutional disturbance is slight. (b) *Sapræmia*, or *putrid intoxication*. This is the condition produced by the absorption of the chemical products of bacteria. They may be the chemical substances known as ptomaines, which are produced by the vital activity of the bacteria in the same way as alcohol is produced by the yeast fungus, or they may be albuminous substances (toxic albumen) resulting from the action or degeneration of the bacteria themselves. There are numerous examples of poisoning by the absorption of such substances when taken in with the food: ice-cream poisoning, meat poisoning, etc. The products of the different bacteria vary greatly in virulence. The violence of the symptoms is in direct ratio to the amount of the material absorbed and its virulence. There are usually severe chills at the onset, followed by fever reaching 103° or more. (c) *Progressive septicæmia*. The condition produced by the entry of bacteria into the blood and their multiplication there. The bacteria may enter the blood either through the walls of the blood-vessels or by the lymphatics. They multiply in the blood, and after death are found in the various organs. The symptoms resemble those of *sapræmia*. (d) *Pyæmia*. In this abscesses are produced in various parts of the body. The manner of their production is as follows: In a suppurating wound the blood-vessels become filled with clots which contain bacteria. When portions of these clots break off they get into the general circulation, and if they are too large to pass through the capillaries they become lodged in various organs, and produce suppuration. These abscesses are called metastatic, or secondary. The difference between progressive *septicæmia* and *pyæmia* is probably due to the association of the bacteria with the blood clot. There is marked constitutional disturbance, and the onset is noted by severe rigors.

W. T. COUNCILMAN.

Blood-root (*Sanguinaria canadensis*): a plant of the family *Papaveraceæ*; growing wild in many parts of North America. It is one of our most beautiful early spring flowers. It takes its name from the orange-colored sap of the root, which contains the alkaloid *sanguinaria*, remarkable for the fine red color of its salts. The root of this plant is a valuable stimulant expectorant, but its use requires caution, for its administration has been followed by the symptoms of *aero-narcotic poisoning*.

Blood-stone: See *JASPER*.

Blood-sucker: See *LEECH*.

Bloom: waxy or resinous matter frequently developed on the surfaces of leaves and other parts of higher plants. It may consist of (1) a continuous layer, or (2) of multitudes of vertical rods, or (3) of minute rounded grains, or (4) of needles scattered irregularly over the surface. Bloom is common upon many fruits, as grapes and plums; it is abundant upon the leaves of the cabbage, and is well developed upon the young stems of blackcap raspberries (*Rubus occidentalis*). Its use is not certainly known. In some cases it appears to preserve the surface from wetting, and possibly may prevent too great a rise in the temperature of the underlying tissues.

CHARLES E. BESSEY.

Bloomary, bloom-a-ri, **Bloomery**, or **Bloomary** [deriv. of *bloom*, mass of iron < O. Eng. *blōma*; prob. same as word for flower; but history of the signification unknown]: a furnace for converting pig or cast iron into malleable or "wrought" iron, or for producing malleable iron from iron ore directly. In the latter case it differs from the *BLAST FURNACE* (*q. v.*), in reducing the ore and producing the iron in a mass or "bloom" without melting it, while the blast furnace produces an impure molten iron, which is tapped off and cast into pigs; the blast furnace working continuously, the bloomary (in many cases) interruptedly. The

change of cast into malleable iron by the bloomery process is generally superseded by puddling, but the former is used to a very limited extent in the U. S. and Sweden in the production of the better kinds of metal. Bloomeries for the direct production of iron are of various forms. The process is one of the oldest known in metallurgy, and rude forms of it are at present used in many barbarous countries. The two best known modern forms of the bloomery (the Catalan furnace and the German bloomery) are at present used in Spain, Sweden, Russia, and parts of the U. S. for the reduction of ores, chiefly by means of charcoal. Only the richest ores can be profitably used, and the loss of iron is much greater than by the blast furnace. In the true Catalan forge the charcoal, with a great part of the charge of iron ore, is heaped on the small square hearth opposite to the tuyere, fine ore and charcoal being thrown in from time to time. A moderate blast is maintained, and the whole is stirred at proper times; and in about six hours the iron is removed, and forged at once into a bloom. In the ordinary or German bloomery the ore is first made fine, and then thrown in small quantities upon a charcoal fire with a blast. See IRON (*Manufacture*).

Revised by C. KIRCHHOFF.

Bloom'er, AMELIA: a dress reformer whose maiden name was *Jenks*; b. in Homer, N. Y., May 27, 1818; married Dexter C. Bloomer in 1840, and settled at Seneca Falls, N. Y.; Jan. 1, 1849, established *The Lily*, a semi-monthly publication, which attained a circulation of over 4,000. From 1855 until her death, Dec. 30, 1894, she resided in Council Bluffs, Ia., where she took part in the woman's suffrage work of that State. Mrs. Bloomer did not originate the costume which bears her name, but after seeing it worn by Elizabeth Smith Miller, daughter of Hon. Gerrit Smith, she, with Elizabeth Cady Stanton, Lucy Stone, and others, adopted it.

SUSAN B. ANTHONY.

Bloom'feld: town (founded in 1834); capital of Greene co., Ind. (for location of county, see map of Indiana, ref. 9-C); on branch of L., N., A. and C. R. R. and E. and L. R. R., 80 miles S. W. of Indianapolis. Bloomfield has a high school, four churches, steam flouring-mill, and a saw-mill. It is situated in an agricultural district, 10 miles W. of the mining district of Greene County, and has an active trade. There are hereabouts abundant unworked deposits of iron and coal. Pop. (1880) 988; (1890) 1,229; (1892) estimated, 1,400.

EDITOR OF "NEWS."

Bloomfield: city; railroad junction, and capital of Davis co., Ia. (for location of county, see map of Iowa, ref. 7-I); has manufactures of plows, wagons, and furniture. It has a high-school building costing \$30,000, and is the center of a rich farming district; has a public library and a large trade. Pop. (1880) 1,531; (1890) 1,913; (1895) 2,047.

Bloomfield: township; Essex co., N. J. (for location of county, see map of New Jersey, ref. 2-D); 4 miles N. N. W. of Newark; on branch of D., L. and W. R. R. and N. Y. and Greenwood Lake Ry.; has superior high school, nine churches, a German Presbyterian Theological Seminary, extensive manufactures of woolen cloth, tissue and photographic paper, hats, shoes, safety-pins, saddlery hardware, rubber goods, church pipe-organs, cabinet-organs, mantels, and perfumery; here are also brass rolling-mills. Bloomfield was founded as early as 1685, under the name of Wat-
terson; named Bloomfield in 1796 from Gen. Joseph Bloomfield. Pop. (1880) 5,748; (1890) 7,708; (1895) 8,093.

EDITOR OF "RECORD."

Bloomfield, JOSEPH; b. at Woodbridge, N. J.; studied law; entered the Revolutionary army in the Third Regiment of New Jersey troops as captain, serving bravely throughout the war; became attorney-general of New Jersey; Governor of New Jersey (1801-12); brigadier-general in the war with Great Britain (1812-15); and an influential Jeffersonian member of Congress (1817-21). D. in Burlington, N. J., Oct. 3, 1823.

Bloomfield, MAURICE, Ph. D.; philologist; b. at Bielitz, Austrian Silesia, Feb. 23, 1855; removed to the U. S. with his parents 1867; studied at the University of Chicago; A. M., Furman University, Greenville, S. C., 1877; studied Sanskrit and comparative philology at Yale 1877-78; fellow of Johns Hopkins University 1878-79; Ph. D. 1879; studied in Berlin and Leipzig 1879-81; associate in Johns Hopkins University 1881, where he now is professor of Sanskrit and comparative philology. He has edited from the MSS. the ritual book of the *Atharva-Veda*, the *Kāṅṅika-Sūtra*, and

published some forty *Contributions to the Interpretation of the Veda*, besides numerous grammatical and philological papers.

C. H. THURBER.

Bloomfield, ROBERT: English pastoral poet; b. at Honington, in Suffolk, Dec. 3, 1796; was apprenticed to a shoemaker. He worked at that trade in London, and wrote in a garret *The Farmer's Boy* (1798), a rural poem which obtained great popularity, and was translated into French, Latin, and Italian. Among his other works are *Wild Flowers* and *Ballads and Songs*. D. in Sheffield, Bedfordshire, Aug. 19, 1823. See *Pursuit of Knowledge under Difficulties*, vol. ii.; *Blackwood's Magazine* for June, 1822; W. H. Hart, *Selections from Correspondence* (1871).

Bloom'ington: a city and railroad center; capital of McLean co., Ill. (for location of county, see map of Illinois, ref. 5-E); 60 miles N. N. E. of Springfield. It has manufactures of stoves, furnaces, grain-separators, ice, flour, and plows; car-works and repair-shops (employing some 1,200 hands), a coal mine, elevators, tile-factories, brick-yards, and several furnaces. Ten nurseries and twenty-five firms of horse importers are located in Bloomington and Normal. Ten miles of electric street railway are in operation, and 15 miles of the streets are paved with brick. It is connected by a street railroad with Normal, 2 miles distant, which is the seat of the State Normal University and the Soldiers' Orphans' Home. Bloomington is the seat of the Illinois Wesleyan University and a Roman Catholic college. Pop. (1880) 17,180; (1890) 20,484.

EDITOR OF "BULLETIN."

Bloomington: city; railroad junction, and capital of Monroe co., Ind. (for location of county, see map of Indiana, ref. 8-D); 51 miles S. W. of Indianapolis. It is the seat of the State University; has important limestone quarries and manufactures of hard wood, and contains large tanneries. Pop. (1880) 2,756; (1890) 4,018.

Blooms'burg: town (incorporated as such in 1870); capital of Columbia co., Pa. (for location of county, see map of Pennsylvania, ref. 4-II); on Del., Lack. and W. and Phil. and Reading R. Rs., and on north branch of Susquehanna river, 56 miles S. W. of Scranton. Iron and limestone abound in the vicinity. The town has a State normal school, 3 public schools, 8 churches, iron furnaces and foundries, silk-mill, carpet-factory, brass and copper tube-works, furniture and desk factories. Pop. (1880) 3,702; (1890) 4,635; (1893) estimated, 5,500.

EDITOR OF "COLUMBIA COUNTY REPUBLICAN."

Blossburgh: borough; Tioga co., Pa. (for location of county, see map of Pennsylvania, ref. 2-F); on railroad and Tioga river, 41 miles S. of Corning, N. Y.; has mines of semibituminous coal and of iron. Pop. (1880) 2,140; (1890) 2,568.

Blouet, bloo'ay', PAUL (*Mar O'Rell*); author; b. in Brittany, France, Mar. 2, 1848; educated in Paris (A. B. 1864; B. Sc. 1865); commissioned in French army 1869; taken prisoner at Sedan in Franco-Prussian war 1870; was badly wounded in fighting against the Commune; newspaper correspondent in England 1873; head French master in St. Paul's School 1876-84; lectured much in Great Britain and the U. S. 1887-90. Author of *John Bull and his Island* (1883); *John Bull's Daughters* (1884); *Deal the Boys* (1886); *Jonathan and his Continent* (1889).

C. H. THURBER.

Blount, blünt, WILLIAM: Senator; b. in North Carolina in 1744; member of the Continental Congress; in 1790 became governor of territory south of the Ohio. In 1796 he was elected a U. S. Senator for Tennessee, and in 1797 was expelled from the Senate on a charge that he was implicated in a plot to surrender a part of Louisiana to the British. D. in Knoxville, Tenn., Mar. 21, 1800.

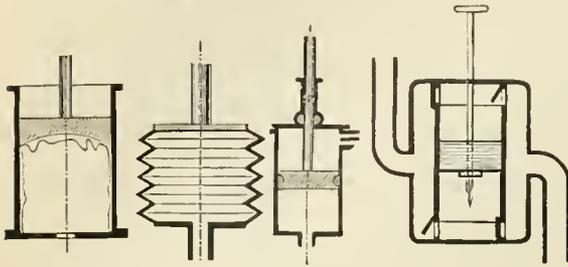

Blow, HENRY T.; legislator; b. in Southampton co., Va., July 15, 1817; graduated at the University of St. Louis, Mo.; prominent Unionist and anti-slavery man before the civil war; U. S. minister to Venezuela (1861-62); member of Congress (1863-67); minister to Brazil (1869-71). D. in Saratoga, N. Y., Sept. 11, 1875.

Blow-fly: a large fly; black and steel-blue in color; attracts attention by its loud buzzing; is readily attracted by the smell of meat, on which it lays its eggs or "fly-blows." *Calliphora vomitoria* is the common species. See FLESH-FLY.

Blowing-machines: machines for producing blasts of air, as for a fire or furnace, or for exhausting air or other gases, as for ventilation.

Probably the earliest form was a bag of skin or leather. From this was developed the common blacksmith's bellows.

(See BELLOWS.) A form of bag-blower, in which the bag is inclosed in a cylinder and operated by a piston, is shown in Fig. 1, a form of bellows in Fig. 2, and a double-acting piston-blower in Fig. 3. These are shown in an elementary form without valves.

FIGS. 1 to 4.

It is stated by Renleaux in his *Konstrukteur* that, contrary to Wilkinson and Ewbank, the bellows shown in the Egyptian wall-paintings have not flap-valves, but the inlet is closed by the heel of the workman, and in the bellows used in India to-day the heel or thumb of the operator serves for an inlet valve.

Piston-blowers.—The modern piston blowing-machine is essentially a pump, with inlet and outlet valves, as in Fig. 4. Such machines are commonly called blowing-engines, and they may, like pumps, be driven by a crank and pitman from a rotating shaft or wheel, such as an overshot water-wheel, or by a steam-cylinder, either directly or through the medium of gearing. When designed to furnish air at high pressures, as for pneumatic transmission to drive rock drills or other machinery, the blowing-machine becomes an "air-compressor." The construction of a blowing-engine and of a compressor is practically identical, except that the latter is provided with a water-jacket or with a spraying apparatus in the air-cylinder for cooling the air heated by the compression.

Prior to about 1870 the cylinders of blowing-engines for blast furnaces were made of great size, and run at a low speed, say ten to fifteen double strokes per minute. When driven by a steam-engine they were either horizontal, in which case they were driven through cog-wheel gearing, the steam-cylinder having a higher speed than the blowing-cylinder, or vertical, in which case the engine was a beam-engine, with the steam-cylinder at one end and the blowing-engine at the other end of a huge walking-beam. The valves were usually large flap-valves of leather, backed with wood or metal. Since 1876, however, the direct-acting vertical blowing-engine has come into almost universal use, with smaller valves, allowing the use of much higher speeds, fifty double strokes per minute for an engine of 4-foot stroke being not uncommon. It is customary to place the blowing-cylinder above the steam-cylinder.

Fig. 5 shows a modern blowing-engine of this type, built by the Weimer machine works, Lebanon, Pa. The valves are of sheet rubber, perforated with slots, and rest upon iron seats having alternating slots. They lift against iron guards having slots corresponding to those in the valves. As these valves work equally well on any plane, they may be placed horizontally, vertically, or obliquely, and may therefore be so disposed as to secure the maximum area of opening. The blowing-cylinder-heads are devoted to the inlet valves placed in the sides and bottoms of recessed segmental boxes. The outlet valves are placed in the periphery of the cylinder, and work against vertical slots in its shell of such length as to give the desired area of opening into the air-jacket surrounding the cylinder.

Engines of the type shown in Fig. 5 are built as large as 48 inches stroke, with steam-cylinder 42 inches and air-cylinder 84 inches in diameter, discharging 307 cubic feet per revolution, or 15,350 feet per minute, at a speed of 50 revolutions per minute, and an air-pressure as high as 14 lb. per square inch.

In the ordinary form of vertical blowing-engine the air and the steam piston are on the same rod. In the steam-cylinder, when the steam is cut off before the end of the stroke, in order to realize the economy due to expansion, the pressure on the steam-piston is highest during the earlier portion of the stroke, and lowest at the end of the stroke; while in the air-cylinder the pressure increases from the pressure of the atmosphere at the beginning up to a maxi-

mum at that portion of the stroke at which the air-discharge valves open, that is at the pressure in the air-receiver or main, and continues constant during the remainder of the stroke. The fluctuations of energy during a stroke, due to the differences in pressure upon the air and steam pistons,

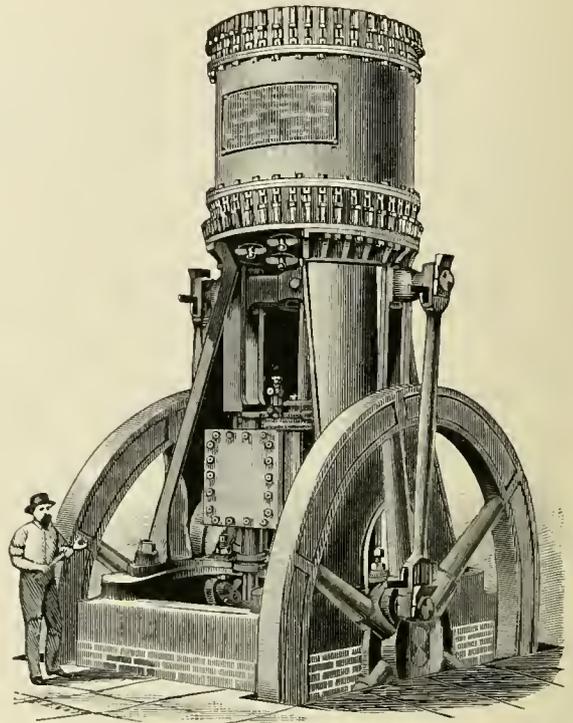

FIG. 5.—Direct-acting piston-blower.

are absorbed and then given out by two large and heavy fly-wheels, which alternately receive force from and give it back to the reciprocating piston-rod through two pitmans connected with a heavy cross-head, which is rigidly attached to the piston-rod. The massive fly-wheels and their connections make this form of blowing-engine a very heavy and costly piece of apparatus relatively to the horse-power developed by it, although not so heavy or costly as the earlier forms of engines which it has displaced. It is likely ere long to be displaced by a compound engine, with cranks at 90 or 120 degrees, carrying the initial steam-pressure to a greater distance in each cylinder, thus more nearly equalizing the strains, balancing the fluctuations in energy through the crank-shaft instead of storing and restoring it by means of heavy fly-wheels, and at the same time realizing the economy of steam due to compounding.
