FRUIT SITUATION

S-167

JULY 1968

Fruit prices have recently varied widely, compared with the relative stability of the wholesale price index for all commodities. In late 1966 and early 1967, fresh fruit prices fell sharply, reflecting ample acidulous supplies and a record citrus crop. Since mid-1967, however, prices have recovered strongly, following supply reductions of both citrus and non-citrus fruits.

Prices for canned fruits and juices have followed a similar, but less variable pattern. By early 1968, supplies of many canned fruits were tight and prices were generally high.

SUMMARY*

Supplies of both fresh and processed deciduous fruits in 1968/69 are likely to be substantially above the short levels of the past season. Prices are expected to average lower than in 1967/68.

Production prospects for the new citrus crop are also favorable. But until new-crop harvest begins in the fall, both fresh and processed citrus supplies will be considerably below the heavy levels of 1966/67, and prices are expected to continue firm.

Noncitrus Fruit: Production of noncitrus fruit in 1968 is expected to be substantially larger than 1967's reduced output. Largely responsible are much brighter crop prospects in California. Last season, harsh spring weather severely limited California crops. So far this year, conditions have generally been good.

No quantitative estimates are yet available for the 1968 apple and grape crops. Early indications point to apple production about equal to last year's. Current prospects for grapes are generally good. In the aggregate, production of other deciduous fruits probably will be considerably larger than in 1967.

The U.S. peach crop is expected to be record large. Particularly sharp gains over last year's output are anticipated in California and the Southeast. These areas will furnish heavy fresh market supplies in early summer, probably at prices under those of last year. California's cling-stone peach crop, more than a third larger than in 1967, is expected to result in a big canned pack.

Pears are also expected to be much more plentiful than in 1967/68. The bulk of the supply increase is expected in California, where tonnage is likely to triple last season's meager output. In the Northwest, however, production of pears and most other tree fruits is expected to be short because of freeze damage.

California's plum and nectarine crops probably will substantially exceed those of a year ago as well. Tart cherry output is expected to recover somewhat from the low levels of output recorded in 1966 and 1967. The 1968 strawberry crop may total slightly larger than in 1967. But reduced tonnages of apricots and

*The summary of this report was released on July 25, 1968.

prunes are likely. And sweet cherry production appears substantially smaller than in 1967, principally because of heavy freeze damage in the Northwest.

Packers' stocks of most processed fruits were relatively low as 1967/68 marketing drew to a close. However, anticipated sizable increases in the packs of several major items this season will likely bring total 1968/69 supplies above the preceding year's levels, and result in moderately lower prices.

Citrus: As of mid-June, prospects for the 1968/69 citrus crop were good. Heavy rains in late May and early June in Florida relieved drought conditions which existed in early spring. Abundant water supplies were available for irrigation in Texas, where a good set was reported. Trees in California and Arizona had a good set, and weather there has been favorable for crop development.

By June 1, more than four-fifths of the 1967/68 U.S. orange crop and more than 90 percent of the grapefruit output had been marketed. Remaining quantities of both fruits for marketing this summer were sharply below those of a year earlier. Slightly more lemons remained for harvest than on June 1 last season.

Reflecting the reduced 1967/68 crop, both fresh and processing uses of citrus to June 1 were considerably below the heavy utilization of a year earlier. Fresh usage was down sharply in the West. In Florida, the reduction was most pronounced in processing utilization.

Output of frozen and canned products has been down sharply. Although below the heavy rates of last season, movement of these items has been active. Inventories at the end of the season are likely to be sharply below last fall's carryover.

Unlike other items, production and utilization of chilled citrus juices through June 1 were above a year earlier.

Prices for fresh and processed citrus--at all levels of marketing--have

been considerably above the low levels of last season. They are expected to continue higher until new-crop citrus becomes available in the fall.

PEACHES

Sharp Production Increase Expected in 1968

Total U.S. peach production is expected to be 1.9 million tons (77.6 million bushels) in 1968. This would be 41 percent more than last year's small crop and 8 percent above the 1962-66 average.

Southern Supplies Large

In the 9 southern states, the crop is forecast at nearly 450,000 tons, up 70 percent from a year ago and 29 percent above average. In the Gulf Coast States, smaller crops than a year ago are anticipated. But the Carolinas and Georgia together are expected to harvest more than twice as many peaches as in 1967. Harvest in most southern states was underway in late May.

California's freestone crop, estimated at 235,000 tons, is 14 percent larger than a year ago. By the end of May, most of California's white-fleshed varieties had been harvested and picking turned to the yellow freestone crop.

The 9 southern states and California freestones will furnish most fresh market supplies during June and July. Combined production from the 2 sources is more than double that of 1967 and more than a fourth above average. By mid-June, prices had fallen considerably from the high levels returned by early offerings, and were well below a year earlier. If current production prospects materialize and harvest overlap occurs, prices through July are likely to continue below those of a year earlier.

Some Late Areas Hurt By Cold Weather

Output of other areas is also expected to be sharply above last season's reduced crop, although substantially below the 1962-66 average.

The Northeast expects a much larger output than last year; New Jersey and Pennsylvania crops are forecast at levels substantially above average. But winter injury and freeze damage are expected to be reflected in short midwestern crops. And in Washington, Oregon, and Idaho, severe freeze damage is expected to hold production considerably below last year's and average.

California Canning Crop Up Sharply

The 1968 California clingstone peach crop, used mostly for canning, is forecast at 920,000 tons. This is 34 percent above last year and 18 percent above average. In contrast to last year's cold, wet spring, growing conditions have been good this season.

Growers are again basing their negotiations with canners on a sliding scale relationship between canning tonnage and prices.

NECTARINES

California's 1968 nectarine production was estimated at 70,000 tons as of June 1, more than a fourth above a year ago, and a tenth larger than the 1962-66 average. Fresh market shipments of California nectarines normally begin in late May and extend into September. Harvest began on schedule this season, as the San Joaquin Valley provided first supplies. This area, plus the Sacramento Valley and Central Coast are expected to furnish volume shipments in July and August. Prices were high as harvest began, but declined somewhat by mid-June.

APRICOTSCrop Down Again in 1968

Total 1968 production of apricots in California, Utah, and Washington was estimated, as of June 1, at 145,200 tons. This quantity would be 2 percent smaller than last season's light crop and 28 percent below the 1962-66 average.

Because of a spotty set, a slightly smaller crop than last season's is anticipated in California--which normally provides about 90 percent of the 3-state output. Washington's crop is expected to be a fourth below last year's and only a third as large as average. The decrease is due to April frosts combined with a reduction in bearing acreage. Utah's crop will likely be larger than Washington's this year. An 80 percent increase is expected for Utah, usually the smallest producer of the 3 states.

As usual, most of the crop is expected to be processed. In 1967, nearly 73 percent of apricot sales were made to canning outlets; 15 percent were dried; and 5 percent were frozen. Only a little more than 7 percent of sales were made to fresh markets.

California provides the bulk of apricots used for processing. In Washington and Utah, most apricots usually are shipped fresh. With stocks of canned and frozen apricots relatively small and the crop down, prices may average above those of last season despite the greater availability of other stone fruits.

CHERRIESNorthwest Freezes Cut
Sweet Cherry Output

U.S. sweet cherry production in 1968 is estimated at 83,420 tons, a fourth below last year and 17 percent less than average. Recurring spring frosts sharply

cut Northwestern crop prospects. At 14,000 tons, Oregon's output is expected to total only a third as large as in 1967; the Washington and Idaho crops both appear to be down more than 50 percent.

California is expected to regain from Oregon its position as largest sweet cherry producer in 1968. The California crop is estimated at 28,000 tons, 65 percent larger than the light 1967 production. The 3 Great Lakes States are expected to produce 23,000 tons of sweet cherries this year, slightly more than last season but a little below average. Production increases in New York and Pennsylvania are expected to offset a crop reduction in Michigan, where the southwest cherry crop was practically wiped out by freezes in early May.

In California, harvest started much earlier than last year, when unfavorable weather both delayed and reduced the state's crop. By late May 1968, interstate shipments had hit the 150 car per week level; harvest had barely started by late May last season.

Prices for California Bing and Royal Anne cherries for brining were reported in late May at 13 and 15 cents per pound respectively--about 5 cents below last season. With fresh market prices relatively higher, more small fruit was reported being shipped fresh than in most recent seasons.

Tart Cherry Crop up Sharply,
But Still Much Below Average

The 1968 U.S. tart cherry crop is expected to total 113,050 tons--nearly a third more than last year's short crop, but less than half the size of the record 1964 output (Table 22).

Production in the Great Lakes States--based on crop condition as of June 15--is forecast at 105,800 tons, 42 percent more than the light 1967 crop, but 29 percent below the 1962-66 average. Weather was generally unfavorable during the pollination period, and below-average crops are expected in all 5 states.

As of June 1, production in the Western States was forecast at 7,250 tons, 37 percent below the 1967 crop and 35 percent less than average. In the West, only Colorado expects a larger crop than in 1967. Spring freezes limited this year's prospects in all other western areas.

Although this season's crop is sharply above last year's, no unusual marketing problems are anticipated. Carryover stocks of both canned and frozen tart cherries are light and substantial pack increases are needed to restore inventories to normal levels.

Processing accounts for the bulk of tart cherry utilization; in 1967, 95 percent of the crop was processed. More than 60 percent of sales went to freezers last season. Canning--including small quantities used for juice, jam, jelly, and brining--accounted for a little more than a third of sales. Only about 4 percent of the crop was sold fresh.

PEARS

Crop Prospects Much
Brighter Than in 1967

As of June 1, the 1968 U.S. pear crop was estimated at 625,520 tons. This would be 35 percent larger than last season's short crop but 1 percent below the 1962-66 average.

In the Pacific Coast States, which normally account for about 90 percent of the commercial pear crop, output is projected to be 42 percent higher than in 1967. Washington and Oregon, hit by spring freezes, have smaller crops. Washington's estimated 118,000 tons would be 18 percent below a year ago; at 100,000 tons, the Oregon crop would be down more than a third. However, California's anticipated 368,000 ton output is more than 3 times that of 1967, sufficient to more than offset the Northwest's reduction.

Pacific Coast Bartlett production is estimated at 450,000 tons, more than two-thirds above last season. Output of other varieties in these 3 states is moderately smaller than both last season's and average. In other than the Pacific Coast States, pear production is expected to be more than a fifth smaller than in 1967 and little more than half of average. Sharp reductions are expected in New York and Michigan as a result of unfavorable weather during the pollination period.

Considered alone, the sharp increase in output from that of a year ago would suggest low prices this season. But production is slightly below the 1962-66 average. And as a result of last season's light pack, processor supplies of canned pears are tight, requiring much heavier inventory replenishments than a year ago.

Highlights from 1967

Total sales of the 1967 pear crop were 447,289 tons. Of this total, nearly 42 percent were used fresh and about 58 percent were canned. Drying accounted for less than half of 1 percent of sales. The canned pack, at 5.7 million cases (Basis 24 No. 2½ cans) was down 48 percent from a year earlier and the smallest pack since 1963.

Short supplies of both fresh and canned pears substantially reduced our foreign trade balance in this commodity last season. From July 1967 through April 1968, we exported about 25,000 tons of fresh pears, down nearly a fourth from

a year earlier. During the same period, we imported about 10,000 tons, more than 2½ times the quantity imported during July-April of 1966/67. Perhaps more significant was our change from a net exporter to a net importer of canned pears in 1967/68. Our exports of canned pears, at 64,000 cases (Basis 24 No. 2½ cans) from July-April 1967/68, were down more than 50 percent from a year earlier. During the same period we imported 312,000 cases, up from only 300 cases during the same months in 1966/67.

APPLES

1968 Crop May About Equal Last Season's

Although no specific quantitative estimates are yet available, crop conditions on June 1 suggested a 1968 apple crop about equal to that in 1967. The 1967 crop was moderately below average.

In the East, prospects are for a crop about equal to a year ago. Cold and wet weather during the pollination period interfered with early development in widespread areas. Reports of a light set of Delicious were received from several states.

Despite instances of frost damage, production in the central states is indicated to be slightly larger than in 1967. But in the Northwest, prospects are for a smaller crop. Low spring temperatures affected all of Washington's major apple producing areas as well as the Medford and Willamette Valley areas of Oregon.

In contrast, California has had conditions favorable for crop development, following a good bloom. Picking of White Astrachans began in early June, but general harvest activity will be light until Gravensteins begin to mature in July.

The first official quantitative estimate of the 1968 apple crop will be released on July 10.

1967 Crop Supplies Nearly Depleted

Cold storage stocks of apples on May 31, 1967 were reported at 47 million pounds--61 percent below a year earlier but about equal to the 1962-66 average for the date. About 57 percent of the May 31 stocks this year were in controlled atmosphere storage.

Prices received by growers for fresh apples (national average basis) during early 1968 were at the highest level of the decade. In May, they averaged 10.5 cents per pound, compared to less than 8 cents per pound a year ago. In Washington State, where most late-season apples are stored, shipping point prices for all varieties in mid-June continued sharply above those of a year earlier.

Foreign Trade in 1967/68

U.S. exports of fresh apples during July 1967-April 1968 were approximately 130 million pounds, about a fourth less than a year earlier and smallest for the period since 1962. Imports during the same 10 months totaled 92 million pounds, nearly 80 percent more than during the comparable months in 1966/67. The reduced domestic crop and accompanying high prices, plus large supplies in the hands of several of our foreign trade competitors, combined to bring about this reduction of our net exports in 1967/68.

PLUMS AND PRUNESCalifornia Plum Crop Above Average

As of June 1, the 1968 California plum crop was forecast at 110,000 tons, 12 percent above last season and 8 percent larger than the 1962-66 average. Active shipping was underway in the second half of May, nearly 2 weeks earlier than in 1967 and a little earlier than normal. Harvest is usually heaviest in June and July, but picking of some late varieties extends into September. Prices opened at high levels but moderated by June 1 as volume increased.

California Prune Crop Down Slightly

Prospective production of California prunes is 160,000 tons (dry basis), 2 percent below 1967 but moderately above average. Trees bloomed early under generally favorable conditions, but a lighter set than last season's is forecast in the Sacramento Valley. First harvest is expected in mid-July.

Plums and Prunes in Other States

No official quantitative estimates of 1968 plum and prune crops outside of California will be available until July 10. Freezing April temperatures reduced northwestern prospects. Michigan has also had cold temperatures this spring, but it is too early to evaluate production prospects there.

STRAWBERRIES

This season's strawberry crop is now estimated at 479 million pounds, slightly larger than last year's output, but 5 percent less than the 1962-66 average. Smaller acreage is expected to be offset by a moderate increase in average yields per acre.

California's Crop Bigger,
Earlier Than Last Year's

California, which is expected to account for half of this year's U.S. output, is estimated to have a 14 percent larger crop than a year ago.

California harvest became active earlier than last season. Shipments reached the 100 carlot per week level by mid-March and increased sharply thereafter, averaging more than 1,000 cars per week in April. Prices declined sharply in early April, as heavy California shipments were supplemented by berries from early spring areas in Louisiana and Texas. By mid-May, however, prices had recovered strongly, as cool weather slowed picking in California and cold, wet conditions delayed harvest of eastern crops.

By mid-June, California had shipped more than 10,000 cars of 1968-crop strawberries to interstate fresh market outlets, about double the quantity moved during the same period in 1967. Of the total shipped, 80 percent had moved by truck, 16 percent by air and 4 percent by rail. The more than 1,600 carlot equivalents shipped by air through mid-June evidenced the continued uptrend in this form of transportation for strawberries. In 1967, air lines reported handling nearly 2,000 carlot equivalents of California strawberries.

Other States Have Smaller Crops

In contrast to California's gains this season, shipments from most other states through mid-June have been substantially below those of a year ago. Acreage reductions have been partly responsible. A late March freeze cut Louisiana volume. And a cool, wet May reduced crop prospects and delayed harvest in most other states. In the mid-spring states, which extend from Oklahoma to Maryland and include much of the South, production is expected to fall 6 percent below last year's output.

In the northern late spring states, aggregate production is estimated to be 10 percent smaller than a year ago. Much of this region's performance can be attributed to reduced acreages in Michigan and in the Northwest. But average yields per acre are also expected to be down slightly.

U.S. average grower prices for fresh market strawberries in May were 24.6 cents per pound, moderately higher than in May 1967. In mid-June, shipping point prices for fresh berries were generally a little below those of a year earlier.

Processing Prospects Mixed

Most strawberries for processing are grown in the Pacific Coast States. They accounted for more than 90 percent of the 1968 U.S. frozen strawberry pack. California's deliveries of strawberries to freezers through mid-June were

reported at 28.8 million pounds, 53 percent more than during the same period a year ago. California's production is expected to exceed that of 1967. But the increase suggested by deliveries to date is influenced by earlier maturity this season and will likely be reduced substantially. The combined Oregon-Washington production--mostly utilized for freezing--is expected to be 12 percent smaller than in 1967. This reduction is likely to offset California's anticipated pack increase. Through June 15, only about 17 million pounds of strawberries had been delivered to Oregon and Washington processors. Through mid-June a year earlier, they had received 25 million pounds.

Fresh Strawberry Imports Continue Uptrend

During the first 4 months of 1968, U.S. imports of fresh strawberries totaled nearly 19 million pounds, about a third more than during the same period a year ago. Virtually all originated in Mexico. The import period for fresh Mexican strawberries begins in fall and extends into spring. This season, imports peaked in January and February; more than 6 million pounds were imported in each of these 2 months. By April, fresh imports had fallen to 2.4 million pounds, as domestic supplies became available in increasing volume. In 1967, a total of 21.7 million pounds of fresh strawberries were imported; 94 percent came from Mexico.

BANANAS

Although few bananas are grown in the United States, it is our leading fruit in terms of fresh usage. In the past several years, civilian consumption of fresh bananas has averaged about 18 pounds per person annually, more than either fresh oranges or apples.

U.S. commercial production is limited to Hawaii. During the early 1900's substantial quantities were shipped to the mainland, but this practice ceased with the outbreak of World

War II and has not been resumed. In the last several years, Hawaiian production had averaged 6 to 7 million pounds annually (destemmed fruit basis).

Our net imports of bananas (imports minus re-exports) have long been substantial and have made slight annual increases for the past several years. The net 3.6 billion pounds (destemmed fruit basis) imported in 1967 was about 1 percent more than the quantity imported a year earlier.

In the first 4 months of 1968, net imports were again running slightly above a year earlier; during this period, retail prices averaged slightly below those of January-April 1967. In this decade, retail prices for bananas have averaged a little below those of the 1950's. Banana supplies and average prices in the U.S. are usually much more stable than are those of other fresh fruits.

NEW CROP CITRUS CONDITION

In early June, prospects for the new citrus crops (for harvest in 1968/69) were generally favorable. Despite drought conditions in early spring, Florida's trees were reported to be in very good condition in June. General rains during the last half of May broke the drought, and additional moisture associated with the tropical storm "Abby" helped considerably to replenish irrigation supplies. In California and Arizona, conditions have been good for new crop development. Water supplies are reported to be abundant in Texas where trees are holding a good set.

ORANGES

Fresh Supplies for Summer Down Sharply

Supplies of oranges available for fresh market this summer are much smaller than a year ago (Table 23). As of June 1, total 1967/68 U.S. orange production was estimated at 129.3 million boxes, nearly

a third less than last season's huge output. The Valencia crop--which accounts for most summer supplies--is 32 percent below a year ago. Furthermore, a larger share of the crop has been marketed than at this time a year ago.

Despite a 28 percent crop reduction in Florida, the state's sales to fresh market outlets to date have been only moderately below those of last season. Through early June, nearly a fourth of Florida's orange sales had been made to fresh market outlets. In 1966/67, less than 15 percent of the much larger crop was sold fresh. However, with harvest nearing completion, Florida is now declining sharply as a fresh market supplier.

The small Texas crop, sharply reduced by hurricane damage last fall, has virtually all been marketed.

Most fresh market supplies during the rest of the season will be California-Arizona Valencias; and Valencia production in these 2 states is estimated to be 46 percent below a year ago. Limited by unfavorable weather during the bloom period, California output was additionally reduced by freezes last December and January. Much of the freeze-damaged fruit has had to be diverted to processing outlets, further depleting potential fresh market supplies.

Prices Much Higher

Fresh market f.o.b. prices for oranges this season have been much higher than the low returns generated by last season's burdensome production. In May, the U.S. average f.o.b. price was 55 percent above that in May 1967. Fresh market prices in Florida increased in late May, remained strong through early June, and are likely to continue so until new-crop supplies become available in the fall. F.o.b. prices for California Valencias declined moderately in May and early June, but were sharply above those of a year earlier.

Similarly, prices for oranges used for processing have been sharply higher

than those of last season. As 1967/68 Florida packing activity hit its late-season peak in May, U.S. on-tree prices for processing oranges averaged \$2.21 per box. In 1966/67, on-tree prices for processing oranges averaged only \$.55 per box for the entire season.

Foreign Trade Influenced by Smaller Crop

U.S. exports of fresh oranges during the first 6 months of the 1967/68 season (November through April) totaled slightly more than 2 million boxes. This was 43 percent less than during the same months of 1966/67, when the U.S. crop was much larger.

While retarding exports, the contrast between this season's domestic supply conditions and those of last season prompted a jump in orange imports. During the 6 months ending in April, 1968, we imported 118 million pounds of fresh oranges. This constituted our heaviest imports for the period since the 1963/64 season, and was nearly 5 times the quantity imported during November-April in 1966/67.

GRAPEFRUIT

Remaining Supplies Light

Harvest of this season's Florida grapefruit crop is nearing completion. From now until fall, most fresh grapefruit shipments will originate in California and Arizona. As of June 1, approximately 3.3 million boxes of grapefruit, or 8 percent of the 1967/68 crop, remained for marketing. All but about a half million boxes of this quantity was California-Arizona fruit.

The 1967/68 grapefruit crop was estimated at 42.7 million boxes, about a fourth smaller than the preceding season's heavy output. Florida accounted for about 80 percent of the crop; California, Texas, and Arizona each accounted for 5 to 8 percent of U. S. output.

Through early June, about half of the crop was marketed fresh and half processed. With supplies heavier in 1966/67, about 55 percent of sales moved to processing outlets.

Prices Strong

Prices of grapefruit for both fresh market and processing uses have been sharply above those of a year earlier throughout the season. Reduced output more than offset the influence of the heavy inventories of processed products on hand at the start of the season. In May, f.o.b. prices for fresh grapefruit averaged \$5.05 per box, compared to last year's season average of \$4.15. On-tree prices for grapefruit for processing reflected an even sharper contrast. From January through April, when packing was most active, on-tree prices for Florida processing grapefruit ranged from \$1.37 to \$1.42 per box. Last season, Florida's processing grapefruit price averaged \$.24 per box on tree.

Grapefruit processing is virtually finished for this season; most remaining supplies will be marketed fresh. Prices are likely to remain firm for the limited volume.

Exports Fall

During the 8 months ending April 1968, fresh grapefruit exports totaled 1.8 million boxes, nearly a fourth less than during the like period in the 1966/67 season. Despite the reduction, exports continued to far outstrip imports.

LEMONS AND LIMES

Lemon Output Down

The 1967/68 California-Arizona lemon crop was estimated as of June 1 at 16.8 million boxes--6 percent smaller than the 1966/67 output, but 6 percent larger than the 1961-65 average production. California's crop, expected to account for nearly four-fifths of the

U.S. total, is 11 percent smaller than last season's. Arizona, however, managed to continue its upward production trend with a 16 percent larger crop than in 1966/67.

Through May, a little more than 60 percent of the 1967/68 crop had been marketed. An estimated 6.4 million boxes remained for distribution after June 1. To date, fresh sales have kept pace with those of a year ago. Processing utilization has been moderately smaller.

Exports Continue Gain

Despite the smaller production, the industry has managed to increase its lemon export market. In the first 6 months of the season (November through April), fresh lemon exports totaled 1.5 million boxes, considerably more than during the like period of 1966/67. In recent years, Japan has become the leading country of destination for U.S. lemon exports. Considerable quantities are also moved to Europe and Canada.

Our trade balance for this fruit is clearly favorable; less than 1,000 boxes were imported last season, and little gain is likely in 1967/68.

Prices Hold Higher

In every month of the 1967/68 season through May, on-tree prices for lemons averaged above those for the same months of the preceding year. In May, prices averaged \$2.97 per box on tree in California for all uses, compared to \$1.92 in May 1967. In mid-June, California shipping point prices for fresh lemons were averaging about a fifth higher than a year earlier.

Larger Lime Crop Seen in 1968/69

The 1968/69 Florida lime crop was forecast as of June 1 at 750,000 boxes--4 percent larger than in 1967/68 and nearly 80 percent more than the 1966/67 crop. The marketing season for Florida limes is substantially different than for other citrus fruits, beginning in April and ending in March. Some harvest

occurs in every month of the year, but it is most active during the summer.

Fresh sales are the leading outlet, but in recent years, more than a third of the crop has been moving to processors. Lime prices have a record of unusual volatility. In May, packinghouse door prices averaged \$12 per box, compared to \$21.60 in April and \$8.92 per box in May, 1967.

In 1967/68 (April through March) sizable exports of fresh limes were recorded. At 62,000 boxes, they were then twice as large as in the preceding year. Imports during the same period totaled 29,000 boxes.

TREE NUTS

Almond Crop Down from 1967

Unlike most California orchard crops this season, a smaller production than last year appears likely for almonds. If the current forecast of 70,000 tons (in shell) materializes, the crop would be 8 percent below average. Although trees bloomed under generally favorable conditions, there is an uneven set in all areas except the Kern County district. Although the general set per tree is expected to be light, the average nut size appears to be quite large.

U.S. exports of shelled almonds during the first 9 months of the 1967/68 season (August through April) were 8,772 tons, up 11 percent from the same period a year earlier. A record quantity--nearly 11,000 tons--was exported 2 years ago; in 1966/67, the total was a little over 9,000 tons.

Exports of in-shell almonds, a comparatively minor item, totaled 632 tons from August 1967 to April 1968, little more than half the quantity shipped a year earlier.

Walnut Crop Prospects Below Average

The 1968 California walnut crop is forecast at 75,000 tons--1 percent larger than last year's output and

9 percent below average. Windy weather during catkin formation and light amounts of frost damage contributed to the limited crop prospects. Production estimates for the 1968 filbert crop will be released on July 10 and those for pecans on August 9.

PROCESSED NONCITRUS FRUIT

Output Down Sharply in 1967

The aggregate reduction in output of 1967 fruit crops was reflected in reduced utilization for processing. Mainland usage for processing totaled about 5.9 million tons--13 percent below 1966 and a fifth less than the record 1965 utilization (Table 1). Data on production and use of 9 leading deciduous fruits are shown in Tables 2 and 3.

Total disposition of the 1967 non-citrus fruit crop was approximately as follows: 65 percent processed; 33 percent sold fresh; and 2 percent used on farms or not marketed because of economic conditions.

Canned Fruit Stocks Down

Canners' packs, shipments, and stocks of 13 major canned fruits are shown in Table 4. Increased packs of canned pineapple and apple products failed to offset reduced processing of most other canned items in 1967/68. Three items--peaches, pears, and fruit cocktail--accounted for a 17.5 million case (basis 24 No. 2 $\frac{1}{2}$ cans) pack reduction last season.

The overall pack reduction and consequent tightness of supplies prompted substantial increases in wholesale canned fruit prices last fall. The Bureau of Labor Statistics' wholesale price index for canned fruits stood at 118.7 in April, 1968 (1957-59 = 100), up nearly 20 points from April 1967. Reduced supplies and higher prices reduced 1967/68 movement of canned fruits considerably. Shipments to April 1 were 15 below a year earlier. And on April 1, packers' stocks of these items totaled 32.4 million cases, the

smallest since April 1964. Although no current aggregate stock data are available, it is clear that stocks of many items will be relatively low at the outset of the 1968/69 packing season. Inventories of pears and sour cherries are particularly tight.

The 1967/68 canned packs of 14 leading noncitrus fruits are shown on Table 5, in terms of proportions packed in retail and institutional sizes. As usual, retail-size packs exceeded institutional output for all items except apple slices, tart cherries, and mixed fruits.

Canned Pineapple Bought By USDA

On June 17, USDA announced the purchase of 401,400 cases of canned pineapple tidbits and 59,400 cases of crushed pineapple (basis 6 No. 10 cans) for distribution to schools participating in the National School Lunch Program. In June 1967, USDA bought 272,000 cases of tidbits in a similar purchase.

Purchase of Canned Apricots Planned

On June 21, USDA announced an offer to buy unpeeled halves or peeled whole styles of 1968-pack canned apricots. Purchases will be made on an offer and acceptance basis. The amount to be bought will depend on quantities and prices offered. Distribution through the National School Lunch Program is planned.

Canned Exports Off in 1967/68

Table 11 provides recent export history of canned fruits important in our export trade. Canned peaches, fruit cocktail, and pineapple are regularly our leading items. In the current season, our exports of these and most other canned items have fallen sharply from year-earlier levels. From June 1967 through April 1968, we exported only 1.9 million cases of canned peaches (basis 24 No. 2 $\frac{1}{2}$ cans), compared with 4.9 million cases during the same months in the 1966/67 season. Comparing the same time periods, exports of fruit cocktail fell from 3.2 to 1.9 million cases and those

of canned pineapple, from 1.9 to 1.3 million cases. Sharp reductions were also reported for canned apricots and pears.

Canned Noncitrus Fruit Juices

The principal canned noncitrus fruit juices are apple, grape, pineapple, prune, and fruit nectars. To date, 1967/68 pack data are available only for apple juice and Hawaiian pineapple juice. The pack of apple juice in 1967/68 totaled 8.7 million cases (basis 24 No. 2 cans), slightly below the preceding season's output.

The pack of canned single-strength Hawaiian pineapple juice during June 1967-March 1968 was approximately 12.7 million cases, 1 percent more than a year earlier. Movement from canners' hands during the same period was 12.7 million cases, moderately below the June-March period of 1966/67. Canners' stocks on April 1 were about 3.9 million cases, moderately more than a year earlier.

The pack of concentrated pineapple juice during June 1967-March 1968 totaled about 8 million cases (basis 6 No. 10 cans), down 40 percent from the same period in 1966/67. But carryover into the 1967/68 season had been large, and inventories on April 1, 1968 were only 12 percent smaller than a year earlier.

U.S. exports of canned single-strength pineapple juice during the first 11 months of the 1967/68 season (June-April) were 4.5 million gallons, 12 percent above a year earlier and the largest for the period since the 1962/63 season. Exports of concentrated pineapple juice, a comparatively small trade item, totaled .2 million gallons in the 11-month period.

USDA Purchases Canned Juices for Needy

On May 21, 1968, the U.S. Department of Agriculture announced the purchase of 347,625 cases (basis 12 No. 3 cylinder cans) of canned grape juice

for distribution to needy families. Deliveries were scheduled during the period June 5 through July 1.

Purchases of 404,244 cases of prune juice (basis 12 32-oz. bottles) and 202,275 cases of apricot nectar (basis 12 No. 3 cylinder cans) were announced on June 6. Also acquired for distribution to the needy, deliveries are scheduled during July and August.

Dried Fruit Production and Exports

California dried prunes are the only dried fruits for which 1968 estimates are now available. At 160,000 tons (dry basis), the crop is forecast 2 percent below a year ago.

The 1967/68 U.S. dried fruit pack was approximately 348,000 tons (processed weight)--nearly a fifth below that of 1966/67. A sharp decrease in raisin production was chiefly responsible for the decline. But output of most other dried fruits was also smaller than a year earlier. Prunes provided a notable exception. The 1967 pack, at 130,000 tons, was nearly a third larger than in 1966.

Raisins and prunes accounted for about 86 percent of the 1967 dried fruit pack. Other fruits included in the total pack are apples, apricots, dates, figs, peaches, and pears. The above figures are based on processed weight and exclude prunes for juice and substandard figs. They also allow for stem removal and moisture standardization.

U.S. raisin exports in the 9 months ending April 1968 totaled about 49,000 tons, up 7 percent from a year earlier. A large inventory of raisins at the start of the 1967/68 season partly offset the reduced pack and contributed to the increased exports. During the September-to-April period, U.S. exports of dried prunes totaled nearly 34,000 tons, moderately more than during the same months of the 1966/67 season.

1967 Frozen Deciduous Fruit
and Berry Pack Down Slightly

The 1967 U.S. pack of frozen deciduous fruits and berries (excluding juices) totaled approximately 642 million pounds in 1967, down 3 percent from a year earlier. Data on carryin, pack, supply, disappearance, and stocks of 11 major frozen items are shown on Table 8. These items accounted for about 93 percent of total frozen fruit output in 1967.

Supplies Reflect Smaller Frozen
Pack and Carryin

The reduced pack, combined with a smaller carryin, resulted in 1967/68 total frozen fruit supplies moderately below those of the preceding season. With supplies the smallest since 1963/64, prices increased for most items. Nevertheless, aggregate disappearance to May 31 was only a little below that of the preceding season.

Frozen Strawberry Supplies
Off Slightly

The 1967 pack of frozen strawberries, by far the leading frozen fruit, was off about 10 percent from a year earlier. But due to a larger carryin, the total 1967/68 (May 1967-April 1968) supply was down only 2 percent from a year earlier. Apparent disappearance of domestic supplies--at about 239 million pounds--was about 8 percent higher than in the preceding season. In addition, about 75.6 million pounds of frozen strawberries were imported during the 12 months ending in April 1968. This moderately exceeded the previous record 72.2 million pounds imported during the preceding 12-month period. Most imports of this item come from Mexico.

Frozen Cherry Supplies Tight

Last season's pack of frozen tart cherries, another leading item, was up from the preceding year but still sharply below average. And with carryin light at the start of the season, total

supplies in 1967/68 were the smallest for this commodity since the mid-1950's. Tight supplies have curtailed use of this item in the past 2 seasons.

Supplies of Other Frozen Fruits
Equal to Those of Last Year

In 1967/68, aggregate supplies of frozen fruits other than strawberries and cherries were about equal to a year earlier. Supplies of frozen blueberries were record high. Those of frozen peaches, grapes, and boysenberries were larger than in 1966/67. However, supplies of frozen apples, apricots, blackberries and raspberries were smaller.

PROCESSED CITRUS FRUIT

Output Down in 1967/68

The estimated 28 percent reduction in citrus production this season is being reflected in reduced output of many processed citrus products.

Florida accounts for the bulk of the U.S. pack of processed citrus items (other than lemon products). Florida's 1967/68 packs of frozen citrus juices and canned citrus products through the end of May were sharply below the heavy levels of a year earlier. Chilled juices, however, appear to be continuing their gain in popularity. On June 1, Florida's pack and movement of both chilled orange and grapefruit juices were ahead of those of a year earlier.

No data on 1967/68 processed citrus packs are available for California, Arizona, and Texas. However, information on movement of California-Arizona oranges to processors indicates substantially larger processing utilization this season. The increase largely reflects freeze damage, which made considerable quantities of California oranges unsuitable for fresh shipment. Total movement of California-Arizona grapefruit to processors is reported to be little different than a year ago. In Texas, processor utilization of both oranges and grapefruit was down substantially. Through early June,

with a major part of the lemon processing season remaining, disposition of California-Arizona lemons to processors was substantially below that of a year ago.

Frozen Orange Concentrate Pack
Off Sharply

The 1967/68 Florida pack of frozen orange juice concentrate (including concentrated orange juice for manufacturing) through June 1 was 67.4 million gallons--38 percent below a year earlier (Table 9). By early June in 1966/67, Florida had packed about 83 percent of its final output of this product. And with a smaller portion of the crop remaining for harvest than a year ago, it is unlikely that the gap between the 2 seasons' packs will be narrowed.

However, carryover stocks last fall were very large. At 27.2 million gallons, they were more than double those on hand at the start of the 1966/67 season. Therefore, the disparity between supplies available for marketing this season and last is not as great as the pack reduction might imply. Through June 1, packers had moved 52 million gallons of orange concentrate. This was below the 60 million gallons moved by early June last season, but about a tenth more than was shipped during the first 6 months of the 1965/66 season.

As the result of the smaller pack and relatively good movement, packers had only 43 million gallons of orange concentrate on hand on June 1. This was 30 percent less than year-earlier stocks and moderately less than the quantity on hand in early June, 1966.

F.o.b. prices for concentrated orange juice advanced several times during the early part of the packing season, but held steady from mid-March through early June. This season's prices have averaged sharply above the low levels which prevailed during most of the 1966/67 season. But current prices are moderate in comparison to those of the early 1960's.

Grower's prices for Florida oranges used for frozen concentrate increased gradually through the packing season and have averaged sharply above those of a year ago. In late May, spot prices for fruit for freezing were reported at over \$3.00 per box, nearly double those of a year earlier.

Supplies of Frozen Concentrated
Grapefruit Juice Also Down

On June 1, there were 2.7 million gallons of frozen concentrated grapefruit juice in inventory, 30 percent below a year earlier. Although the fall carryover--at 2.9 million gallons--had been nearly 3 times that of a year earlier, this season's pack through June 1 totaled only 1.7 million gallons, compared to the 4.9 million gallons packed during the same period last season. Despite substantially higher prices, movement of frozen concentrated grapefruit juice through the first 6 months of 1967/68 was about 1.9 million gallons, only 7 percent less than a year earlier.

Chilled Juices Maintain Upward Trend

The sharply smaller crop, which reduced packs of most processed citrus products this season, has so far failed to halt the upward trend in chilled juice production and utilization.

Through June 1, a total of 72.6 million gallons of chilled orange juice had been processed from fresh oranges, slightly less than the 74.3 million gallons packed from fresh fruit a year earlier. But additionally, 4.1 million gallons had been processed from frozen concentrated orange juice, compared to only 1.9 million gallons reprocessed from this product in the same period last season. So in total, pack from the 2 sources to June 1, 1968, was slightly larger than a year earlier. As fresh fruit supplies dwindle, packers will turn increasingly to frozen concentrate for reprocessing into chilled juice.

Total movement of chilled orange juice through June 1 this season was

66.7 million gallons, up from 65.9 during the same period a year ago. This gain occurred despite higher retail prices for chilled orange juice this spring than a year earlier.

The movement of chilled grapefruit juice has increased even more sharply. Through June 1, Florida packers had moved 4.2 million gallons, compared with only 2.9 million gallons to early June a year ago. Both carryin and pack to June 1 were substantially above a year earlier, but stocks on hand were moderately smaller.

In the aggregate, both pack and movement of chilled citrus sections and salad were a little below last season through June 1. On that date, about 4.2 million gallons of these chilled products (grapefruit sections, orange sections and citrus salad) were on hand, about 8 percent less than a year earlier.

Canned Citrus Supplies Down

At the start of the 1967/68 packing season, the aggregate carryover of canned Florida citrus juices was 6.6 million cases (basis 24 No. 2 cans), compared to 2.4 million a year earlier.

But it soon became evident that the heavy inventory would be more than offset by a smaller pack.

By June 1, Florida canners had packed only about 25 million cases of canned citrus juices--26 percent less than a year earlier. Packs of grapefruit, orange, tangerine, and blended juice were all down.

Aggregate Florida citrus juice movement during the first 8 months of the 1967/68 season (October through May) totaled only about 19 million cases, compared to 22 million cases a year earlier. But the smaller pack more than offset the influences of larger carryover and reduced movement. On June 1, canners' inventories of the 4 juices stood at 12.3 million cases, 12 percent below a year earlier.

Similarly, pack reductions of canned citrus sections and salad had offset a large carryin and a decline in movement by early June 1968. Combined stocks of grapefruit sections, orange sections, and citrus salad were about 2 million cases on June 1, compared with 2.3 million cases on hand a year earlier.

Table 2.--Production and utilization of specified fruits, United States, crops of 1963-67
