INTRODUCTION

This report is divided into two parts. Part I consists of an analytical survey of the Vital Statistics of the province in the form of narrative summaries, summary tables and charts. Its objectives are (1) to indicate (in so far as can be portrayed by vital statistics) the general trend over the past several years, in the general state of the health of the people of Ontario; (2) to assess the vital statistics of 1943 in the light of these general trends; and (3) to bring to light certain specific problems in the field of public health, such as infant and maternal mortality and deaths from specific diseases such as cancer and tuberculosis and those resulting from accidental causes. Part II consists of detailed tables covering vital statistics for the year 1943. In the interests of economy several tables are not printed in this report. These are listed in the Table of Contents and the information is available upon request providing that such requests, in the opinion of the Registrar-General, are sufficiently warranted and urgent in the public interest.

PART I.—COMPARATIVE AND ANALYTICAL SUMMARY

Population

For reference purposes the estimated population of the province over a period of about two decades is shown by sex in Table A, while a distribution by sex and age-groups of the estimated population of 1943 is provided in Table B.

TABLE A—POPULATION, CENSUSES 1921, 1931 AND 1941 AND ESTIMATED FOR INTERCENSAL YEARS, BY SEX, ONTARIO

Year	Total	Male	Female	Year	Total	Male	Female

Figures supplied by Social Analysis Branch, Dominion Bureau of Statistics.

*These estimates do not take into account interprovincial migration, figures for which are not available for intercensal years.

The rural and urban distribution of the 1943 estimated population was as follows:—

Population Group	Estimated Population	Per cent
Incorporated centres *10,000 population and over	1,805,906	46.1
Incorporated centres *5,000 to 10,000 population	226,141	5.8
Incorporated centres *1,000 to 5,000 population	301,955	7.7
Rural Population (including incorporated centres under 1,000*)	1,582,998	40.4

*As at Census of 1941.

Natural Increase

The natural increase in the population and the computed rates for the period 1922 to 1943 are shown in Table C.

TABLE C—NATURAL INCREASE AND NATURAL INCREASE RATES, ONTARIO, 1922-1943

Year	Live Births	Deaths	Excess of Births over Deaths	Natural Increase Rate per 1,000 Population
1922	71,430	34,034	37,396	12.5
1923	70,056	35,636	34,420	11.4
1924	71,510	33,078	38,432	12.6

1938	65,564	36,890	28,674	7.9
1939	64,123	37,530	26,593	7.2
1940	68,524	38,503	30,021	8.0
1941	72,262	39,226	33,036	8.7
1942	78,192	39,119	39,073	10.0
1943	81,173	41,063	40,110	10.2

The natural increase rate has shown a general downward trend during the past two decades with a considerable recovery taking place since 1939. This is attributable, to a large extent, to a sudden rise in the birth rate associated with the war. The lowest rates were reached in the immediate post-depression period of 1933 to 1939, as is clearly shown in Chart 1. The main factors throughout were naturally a general falling birth rate and a relatively stable death rate for the total population despite an increase in the deaths among the higher ages which is directly associated with an ageing population.

Births

Table D presents an historical summary of births, stillbirths and illegitimate births, together with computed rates for each, while Chart 1 portrays the general trends over the same period.

The number of live births has shown a more or less general decrease from 1922 to approximately 1937 when 61,645 births were registered. There was some recovery up to the war period followed by a decided increase accompanying the war. The crude birth rate of 20.7 in 1943 was 21 per cent higher than in 1939, and was as high as that attained in 1929, a prosperity period.

The stillbirth rate, on the other hand, has been on an extremely encouraging downward trend with a reduction of almost 41 per cent since 1922. In 1922 for every 1,000 babies born alive, 44 were stillborn, while in 1943 there were 25 stillborn—a fact which may be taken as a partial reflection of the improved health of mothers in the province and the improvement in obstetrical services.

Illegitimacy, however, has been increasing at an alarming rate—3,741 illegitimate births being registered in 1943 as compared with 1,519 such births in 1922. The rate has risen $1\frac{1}{4}$ times since 1922 with over 46 of every 1,000 births in 1943 being illegitimate as compared with 21 in 1922 and 40 in 1931. It will be noted, however, that in the period 1922-1931 the rate rose 88 per cent as compared with a rise of only 21 per cent since that period and that there was a slight decrease in 1943.

Tables E, F and G provide a breakdown of births by age of mothers for the same three groups, and indicate to some degree the extent to which age has contributed to the trends outlined above, while Chart 2 provides an interesting picture of the age distribution over the same period on the basis of five-year averages.

Chart 2

PERCENTAGE OF
LIVE BIRTHS, STILLBIRTHS AND ILLEGITIMATE BIRTHS
IN EACH AGE-GROUP OF MOTHERS
ONTARIO

There has been a general tendency during the past two decades towards younger motherhood. For example, of every 100 babies born alive in 1922, 6 were to mothers under 20 years of age, over 24 to mothers 20-24, and 28 to mothers 25-29 or a total of 59 children to mothers under 30 years of age. In 1943 of every 100 live births, 7 were born to mothers under 20, 30 to mothers 20-24, and 30 to mothers 25-29 or a total of 67 children to mothers under 30 years of age. The picture, however, is not complete without mentioning the fact that fewer children are now being born to each mother than was the case two decades ago, and these are being borne in the early years of married life.

As a partial effect of the trend towards younger motherhood, a greater percentage of stillbirths is now occurring at the younger ages than was the case in 1922. In 1943, 5.9 per cent of the stillbirths were to mothers below 20 years of age as compared with 4.7 per cent in 1922, and 21.6 per cent as compared with 21.0 per cent to mothers 20-24, while proportionate declines are evident among older mothers, particularly those in the late thirties. In 1943 of every 100 stillbirths, 44 were to mothers over 30 years of age as compared with 50 in 1922 and 49 in 1931.

There are indications that the number of stillbirths per 1,000 deliveries has been decreasing at an encouraging rate over the past two decades, and that this has been evident for each age-group of mothers, although the fact remains that the risk of stillbirth delivery increases with age. The following summary sufficiently indicates the general trend in this respect over the 20-year period. For example, of every 1,000 deliveries among mothers 15-19 in 1943, 20 were stillborn as compared with 29 in the period 1922-27; among mothers 20-24 years of age, 18 as compared with 30; among mothers 25-29 years of age, 24 as compared with 33, with similar encouraging figures for older mothers, although the risk of stillbirth delivery increases rapidly for mothers over 35 years of age.

With respect to illegitimacy, Table G and Chart 2 indicate that the great majority of the illegitimate live births occur to mothers under 25 years of age.

Of every 100 such births in 1922, 74 were to this group of mothers, as compared with 67 in 1943.

In recent years a greater proportion of illegitimate births have been born to mothers in the older age-groups. Chart 2 illustrates this fact showing higher percentages for mothers in their 30's with proportionate reductions for mothers in the 'teen ages.

Infant Mortality

Table H and Chart 3 both show very clearly the declining trend in the number of deaths of children under one year of age. This decline in trend indicates, to a large extent, the success of a long range programme directed, during the last two decades, at the reduction of infant mortality.

Chart 3

INFANT MORTALITY
ONTARIO
DEATHS AT EACH AGE PERIOD
 Five-year Averages 1926-1940
 and for the year 1943

A reduction in the number of infant deaths is apparent for each of the successive periods indicated and this for every monthly age-group, with 1942 figures significantly lower than the average for the last 10 years. The figures for 1943 show a definite increase in the first month of life due to an increase in the number of deaths from prematurity. Any increases which are noted for 1941 and 1942 must be considered in comparison with the extensive increase in the number of births during the same two years. In support of this statement, the following summary, indicating the number of infant deaths per 1,000 live births, presents possibly a more accurate picture of the rapid reduction in infant mortality than that obtained by a consideration of the total number of deaths occurring in the first year of life.

Years	Infant Deaths per 1,000 Live Births

1926-30.....	74
1931-35.....	61
1936-40.....	50
1941.....	46
1942.....	40
1943.....	42

The 1943 rate shows an increase due for the most part to the increase in the number of deaths in the first month of life.

Table I which presents the deaths and rates for certain causes brings out the fact that there has been a notable reduction in deaths attributable to some of these causes namely in those due to diseases of the digestive tract, of the respiratory organs and whooping cough. The group of diseases of early infancy showed a marked decrease in the period from 1934 to 1942 but due to the increase in deaths from prematurity the rate for this group increased in 1943. Influenza has fluctuated over the period showing the effect of minor epidemics and there was no improvement apparent in the death rate from malformations.

Maternal Mortality

From Table K, it will be noted that a considerable reduction in the number of deaths of mothers during childbirth has taken place during the past 20 years, and particularly during the past 5 years, with the 1943 rate being considerably below the average of the last decade. In general, the reduction in the rate seems to be more apparent in younger than in older mothers, although in 1942, and 1943, the latter group showed a marked decrease in the rate per 1,000 live births.

The tables which follow present the distribution of maternal deaths during 1943 by locality, as well as deaths of women not directly classified as due to pregnancy or child-birth, but which were associated therewith.

The rates shown in Table L are of special interest in that they indicate clearly not only the general downward trend in maternal mortality as between cities, towns and rural areas of the province but that the maternal mortality rates during the past three years have been somewhat higher in towns than in cities and lowest in rural communities, the rates for 1943 being 2.4 per 1,000 live births in cities, 2.6 in towns and only 2.1 in the rural areas. The rural rates have been consistently lower than those for the urbanized communities.

General Mortality

Table N presents a historical summary of deaths by sex in the province and the computed crude death rates over a 22-year period while Chart 1 presents a graphic picture of the general trend in the rate.

Over the past two decades two main trends are apparent. From 1922 to the early 1930's the rate averaged close to 11 deaths per 1,000 population. Dropping rapidly in 1931 and 1932, it has since stabilized at about 10 deaths per year per 1,000 population.

The death rate among males has been consistently higher than that among females and there are indications that this divergence between the two rates has been widening during the past decade or more. During the past four years the male rate has been influenced, of course, by deaths among the Armed Forces.

Table O presents both male and female crude death rates for each 5-year age-group, based on the population as enumerated at the censuses of 1921, 1931 and 1941 and as estimated for the years 1942 and 1943. There are several features with respect to changing death rates which are worthy of comment, notable among which is the remarkable decrease in the death rate of children under 5 years of age from 31.8 in 1921 to 13.5 in 1943 for males and from 24.8 to 10.5 for females. Similar declines are apparent in the other age-groups up to middle life. After middle life an increase will be noted in the rate for males.

This latter fact is clearly portrayed in Chart 4 which depicts the percentage of deaths occurring in each age-group of the population.

The Ten Leading Causes of Death

In Table P it will be seen that during the past 10-year period diseases of the heart, cancer, diseases of the arteries, and accidental causes have been the 4 leading causes of death in Ontario. In 1941 nephritis moved to 5th place from 6th, and intracranial lesions of vascular origin to 6th from 9th place. The change in place of the latter group and also the shifting of the diseases of the arteries to 4th from 2nd place is due to changes in classification in the "Fifth Revision of the International List of Causes of Death". In 1941 and 1942 pneumonia dropped from 5th to 7th place but returned to 5th place in 1943. The group of diseases peculiar to the first year of life has dropped from 7th to 8th place and tuberculosis from 8th to 9th place. In 1940 diabetes displaced influenza and diarrhoea and enteritis as the 10th main cause of death.

In 1943 diseases of the heart accounted for almost 31 of every 100 deaths, with a rate of 324.2 per 100,000 population. Cancer and diabetes rates have also

shown considerable upward trends over the past 10 years. In 1943 diseases of the heart and arteries and cancer together accounted for over half of the deaths in the province.

NOTE: It should be noted that the effects of certain changes in classification and rearrangement of titles provided in the Fifth Revision of the International List of Causes of Death are apparent in the following: Tuberculosis, Diseases of the heart, Diseases peculiar to the first year of life, Diseases of the arteries and intracranial lesions of vascular origin.

The Four Chief Causes of Death in each Age-Group

Table Q shows the four primary causes of death in each age-group for 1943. In brief, it will be seen that accidents, or other violent causes, is the main cause of death of persons from 1 to 39 years of age. From 10 to 29 years of age tuberculosis was the second chief cause of death. In 1942 it was second in the 5 to 9 group, but in 1943 pneumonia and bronchitis displaced it. Diseases of the heart becomes one of the four chief causes in the 10 to 19 year age-group and after 40 years of age becomes the chief cause of death in every age-group, causing approximately 70 per cent of the deaths in the older age-groups. Cancer does not appear as a main cause of death until the late 30's, increasing with age and particularly affecting persons in their 60's. In general, diseases of the heart and arteries, cancer and intracranial lesions of vascular origin are the primary causes of death of persons over 50 years of age.

Mortality from Notifiable Diseases

A summary of deaths and death rates from notifiable diseases is shown in Tables R (1) and R (2) for the last 10-year period. The 1943 figures were consistently lower than those for the previous year for all diseases except chickenpox, influenza and measles. In general, from 1934 to 1943 deaths from diphtheria, erysipelas, scarlet fever and typhoid fever have been on a general downward trend. Deaths from influenza have shown a decided decline except for minor epidemics in 1937, 1939. Deaths from poliomyelitis have shown the same trend except for the year 1937, as well as those from whooping cough except for the year 1941. Deaths from tuberculosis are discussed in detail in the section to follow.

Mortality from Tuberculosis

Table S(1) shows the deaths from all forms of tuberculosis in the province from 1934 to 1943. Table S(2) shows the death rates per 100,000 population classified by the age of the decedents for 1931, 1941, 1942 and 1943. There have been two main trends in the total numbers of those dying from tuberculosis; namely, a gradual decline from 1,337 deaths in 1934 to 1,085 in 1939, followed by a levelling off during the past four years, with an average of 1,076 deaths per year. On the other hand, the death rate shows a steady decline from 36.8 per 100,000 in 1934 to 27.0 in 1940, followed by slightly increased rates of 29.0 in 1941 and 28.1 in 1942 and 1943. Chart 5 illustrates the decided reduction in mortality from tuberculosis which has taken place since the beginning of the century.

The largest number of deaths occurred in 1943 in the age-groups 20 to 29 and 30 to 39 years, followed by the 50 to 59 year group. Since 1934 there has been a decline in the number of deaths in the younger age-groups, whereas, in the older age-groups there has not been much change in this period. The rates, however, in all instances, have been either more than halved or greatly reduced. Although the number of deaths of children under four years of age has always been relatively small, since 1931 there has been a remarkable reduction in the death rate among this group of the population.

Table 48, in Part II of this report, gives details of deaths and death rates for counties according to place of occurrence and place of residence for the year 1943.

Mortality from Cancer

Chart 5 illustrates the steady upward trend in the mortality rate from cancer since the beginning of the century. The increase in the total number of deaths since 1934 is shown in Table T (1) and is apparent in most of the age-groups particularly among older persons. In addition the general cancer death rate has increased over the past decade, standing at 132.6 deaths per 100,000 population in 1943, as compared with 130.2 in 1941 and 113.8 in 1934. Table T (2) shows the rates from 1934 to 1943 by sex and indicates that the female rate is higher than the male rate, but the death rate for males has increased more rapidly than that for females.

The number of deaths from cancer classified by sites affected is given in Table U for the period 1934 to 1943. Cancer of the digestive organs and peritoneum accounts for almost half of the deaths from this disease, with an increase of 15.8 per cent in the number of deaths occurring in this group since 1934. The number of deaths from cancer of the male and female genital and urinary organs has increased over 25 per cent since 1934, cancer of the breast 38 per cent, while cancer of the respiratory organs has more than doubled during the same period.

Mortality from Pneumonia

In Chart 5 it is readily seen that the death toll from one disease, namely tuberculosis, has been very rapidly reduced over the past 40 years. On the other hand, the death toll from cancer has shown almost a steady incline. Also included in the chart is a curve portraying the trend in the death rate from pneumonia, a disease which may be affected by epidemics as illustrated by the peaks of 1907, 1916 and 1918. During the twenty years from 1924 to 1943 the death toll from this disease showed a general downward trend indicating the effect of the public health programme. The decrease was more noticeable after the introduction of the sulpha drugs for the treatment of respiratory diseases. The rate was 76.2 per 100,000 in 1924; 44.2 in 1941 and 51.9 in 1943.

Special Classes of Accidental Deaths

Table V shows that of 2,266 accidental deaths in 1943, cross-classified according to nature of injury, 908 were attributable to crushing, 760 to falls, 306 to drowning, 135 to burns and 157 to poisonous gas, suffocation, electrocution, etc. Of those injured by crushing, 471 deaths were attributable to automobile accidents (excluding trains or street-cars), 71 to railway accidents (excluding motor vehicles) and 129 to air transport accidents.

Marriages

From Table W it will be noted that there have been significant fluctuations in the number of marriages in the province since 1922, each of which have reflected general economic trends. For example, there was a general increase in marriages and in the marriage rate leading up to 1929, a prosperity period, followed by a decline coincident with the depression period which continued till approximately

1933. This was followed by a return to a more stable economic condition which is reflected by an increase in both the total number of marriages and the marriage rates. The effect of the war is clearly apparent in the relatively high rates of 11.0, 11.4 and 11.7 per 1,000 population during the three years, 1940, 1941 and 1942. In 1943 the rate is 9.2, slightly lower than in 1939.

Divorces

In Ontario, divorced persons form a very small proportion of the population as compared with some of the other countries of the world. The following summary indicates the number and percentages of such persons in the population of the province as enumerated in the past three censuses.

	1921*	1931	1941

Female.....	0.09	0.06	0.15

*Including legal separations.

An historical summary of the number of marriages dissolved in Ontario since 1919 is presented in Table X. Previous to 1920 very few divorces were granted in the province. There was no appreciable increase in the number till the late 1920's, but since the transfer in 1930 of jurisdiction from the Dominion Parliament to provincial courts there has been a steady annual increase (except in 1937) in the number of divorces. Previous to 1930 a record number of 213 (1928) divorces were granted. From an annual average of somewhat over 300 in the early 1930's the number has increased rapidly to 949 in 1941, 1,185 in 1942 and 1,243 in 1943, representing an increase in the rate per 100,000 population of from 9 or 10 to 32 in 1943.

In the early 1920's the majority of the successful applicants were husbands, but since that period dissolutions granted on the application of wives have been in the great majority. Since 1935 for every 1,000 divorces granted to wives, an average of 550 have been granted to husbands as applicants, the ratio in 1943 being 631 per 1,000 divorces granted to wives.
