# Robert Louis Stevenson

From Wikipedia, the free encyclopedia

**Robert Louis Balfour Stevenson** (13 November 1850 – 3 December 1894) was a Scottish novelist, poet, essayist, and travel writer. His most famous works are *Treasure Island*, *Kidnapped*, *Strange Case of Dr Jekyll and Mr Hyde* and *A Child's Garden of Verses*.

A literary celebrity during his lifetime, Stevenson now ranks among the 26 most translated authors in the world.<sup>[1]</sup> His works have been admired by many other writers, including Jorge Luis Borges, Bertolt Brecht, Marcel Proust, Arthur Conan Doyle, Henry James, Cesare Pavese, Ernest Hemingway, Rudyard Kipling, Jack London, Vladimir Nabokov,<sup>[2]</sup> J. M. Barrie,<sup>[3]</sup> and G. K. Chesterton, who said of him that he "seemed to pick the right word up on the point of his pen, like a man playing spillekins."<sup>[4]</sup>

## Works [ edit | edit source ]

### Novels [ edit | edit source ]

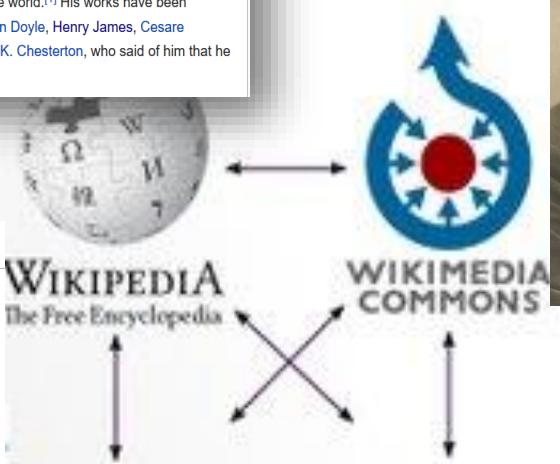

- *Treasure Island* (1883)
- *Prince Otto* (1885)
- *Strange Case of Dr Jekyll and Mr Hyde* (1886)
  - *The Annotated Strange Case of Dr Jekyll and Mr Hyde*
- *Kidnapped* (*Adventures of David Balfour*, 1886)
- *The Black Arrow* (1888)
- *The Master of Ballantrae* (1889) (External scan)
- *Catrina* (*Adventures of David Balfour*, 1893)
- *Weir of Hermiston* (1896, unfinished)
- *St. Ives* (1898, unfinished)

### with Lloyd Osbourne [ edit | edit source ]

- *The Wrong Box* (1889) (External scan)
- *The Wrecker* (1892)
- *The Ebb-Tide* (1894) (External scan)

### Short stories [ edit | edit source ]

- *A Lodging for the Night* (1877)
- *The Sire de Maletroit's Door* (1878)
- *Will o' the Mill* (1879)

[wikidata.org/wiki/Q42](https://wikidata.org/wiki/Q42)

# Adding data to Wikidata

Firstly consult Wikidata's [Data Import Hub](#).

1. **Manual editing** by user. ([Video tutorial 1](#)) ([Video tutorial 2](#)).
2. **Mass editing** using tools e.g.
  - a) The [Mix n Match tool](#) allows you to match an external data set to Wikidata items.
  - b) Importing data from Google Spreadsheets into the [Quickstatements](#) tool. ([Video tutorial 1](#)) ([Video tutorial 2](#)). ([Exemplar sheet](#)). The syntax you need is explained in [QuickStatements v.1](#) and you can use the [Wikidata plug-in](#) for Google Sheets to make formating the data in Google Sheets easier.
3. **Bot editing** (making edits over the API) e.g. [ProteinBoxBot](#)

See the [Bots request](#) section of the Data Import Guide.

# Enabling Open Science e.g. The Gene Wiki project circa 2008

Summarized knowledge via crowdsourcing

The screenshot shows the ITK (gene) page on Wikipedia. On the left, a green arrow points from the "Summarized knowledge via crowdsourcing" text to the main content area. On the right, a red box highlights a sidebar titled "Data imported from structured databases".

**ITK (gene)**  
From Wikipedia, the free encyclopedia

**Function**  
This gene encodes an intracellular tyrosine kinase expressed in T-cells. The protein is thought to play a role in T-cell proliferation and differentiation.<sup>[2][3]</sup>

**Structure**  
This protein contains the following domains, which are often found in intracellular kinases:<sup>[4]</sup>

- N-terminus – PH (pleckstrin homology domain)
- BTK – Bruton's tyrosine kinase Cys-rich motif
- SH3 – Src homology 3
- SH2 – Src homology 2
- C-terminus – tyrosine kinase, catalytic domain

**Interactions**  
ITK (gene) has been shown to interact with FYN,<sup>[5][6]</sup> Wiskott-Aldrich syndrome protein,<sup>[7][8]</sup> KHDRBS1,<sup>[9][10]</sup> PLCG1,<sup>[10][11]</sup> Lymphocyte cytosolic protein 2,<sup>[11][12]</sup> Linker of activated T cells,<sup>[12][13]</sup> Karyopherin alpha 2,<sup>[14]</sup> Grb2<sup>[15]</sup> and Peptidyl/prolyl isomerase A.<sup>[15]</sup>

# Reelin

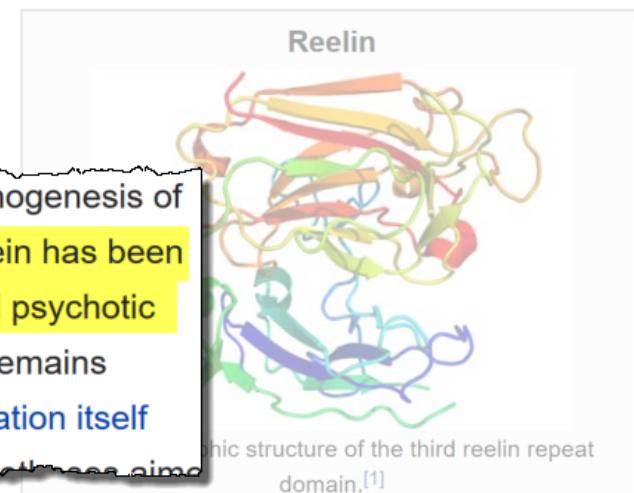

From Wikipedia, the free encyclopedia

Reelin is a large secreted extracellular matrix glycoprotein that helps regulate processes of neuronal migration and positioning in the developing brain by controlling cell–cell interactions. Besides this important role in early development, reelin continues to work in the adult brain. It modulates synaptic plasticity by [2][3] It also stimulates dendrite[4] migration of neuroblasts general zones. It is found not only in the tissues.

Reelin has been suggested to be expression of the protein has been bipolar disorder, but the cause of this observation remains uncertain as studies show that psychotropic medication itself affects reelin expression. Moreover, epigenetic hypotheses aimed at explaining the changed levels of reelin expression<sup>[6]</sup> are controversial.<sup>[7][8]</sup> Total lack of reelin causes a form of lissencephaly. Reelin may also play a role in Alzheimer's disease, temporal lobe epilepsy and autism.

Reelin's name comes from the abnormal reeling gait of *reeler* mice,<sup>[9]</sup> which were later found to have a deficiency of this brain protein and were homozygous for mutation of the RELN gene. The

Reelin has been suggested to be implicated in pathogenesis of several brain diseases. The expression of the protein has been found to be significantly lower in schizophrenia and psychotic bipolar disorder, but the cause of this observation remains uncertain as studies show that psychotropic medication itself

# Federated queries

Run queries that combine data from Wikidata and other selected data sources on the web.

[List of 3rd party services supported for federated queries inc. Europeana, Bibliothèque nationale de France, Biblioteca Virtual Miguel de Cervantes and UK Office for National Statistics](#) among others.

**Simple example federated query:**

[Works by Lope de Vega, retrieved from the BVMC digital library](#)

1. Lope de Vega's unique [BVMC](#) id is determined from Wikidata
2. This id is then used to retrieve works by Lope de Vega on the BVMC digital library

Activity – Creating ‘worklists’ using the Listeria tool to search Wikidata.

[Listeria](#) subpages – Creating Wikidata ‘worklists’ on Wikipedia.

# Basic Listeria code

====List of Scottish female writers on Wikidata=====

\_\_TOC\_\_

```
 {{Wikidata list
|sparql =SELECT distinct ?item WHERE { ?item wdt:P106 wd:Q36180 .
?item wdt:P27 wd:Q22 . ?item wdt:P21 wd:Q6581072 .}
|section=P69
|sort=label
|columns=label:article,P18,description,P19,P569,P800,P19,P21:gender,P373
|thumb=128
|min_section=1
}}
{{Wikidata list end}}
```

**NB: Please remember to add the {{Wikidata list end}} to the code at the bottom of your listeria query.**

Check the code in the Wikidata Query Service  
<https://query.wikidata.org/>

## **How Do We Get People to Participate?**

- This has proven difficult in past efforts
- We are getting specific research communities involved in the development
  - Chlamydiverse.org is under development

## **Summary/Next Steps**

- Application development pattern for using a public, open and shared database
- Technical layer that allows users to integrate data into the underlying schema
- Data that comes from WikiGenomes becomes available to any application that uses Wikidata as its backend. (e.g. chlamyditive.org, Repurpose.us)
- Modularize the framework to be repurposed for any list of taxids
- And standby for WikiGenomes 2.0!!! Coming soon

# Creating new properties on Wikidata

- To create a new predicate ("property" in Wikidata), you have to add a request here - [https://www.wikidata.org/wiki/Wikidata:Property\\_proposal](https://www.wikidata.org/wiki/Wikidata:Property_proposal) - select the type of property from the list of options (e.g "Authority control" for adding an ID property). Once on one of the category pages, there's a box with button just after the contents).

- Once proposed, other community members will either support or oppose, and some questions may be asked/discussed. After around 2 weeks to a month, if there's been no unresolved objections then the property will be created by an admin.

- The notability of the data is still best discussed initially by posting a message into [Project Chat](#) - notability of a *proposed property* is also discussed on the property proposal page

# The schema of Wikidata

- The hierarchy of Wikidata is being created by the community (using "instance of" and "subclass of" properties to create a tree of "what things are"). It's generally not very consistent at the moment, and is not fixed to any existing method of classifying things.

There are tools for examining the class tree though - e.g.

<https://tools.wmflabs.org/sqid/#/> and

<https://angryloki.github.io/wikidata-graph-builder/?property=P279&item=Q35120&limit=2&mode=reverse>
