大根 Rabanosy Rabanitos RADISH (ラデシユ) 大根

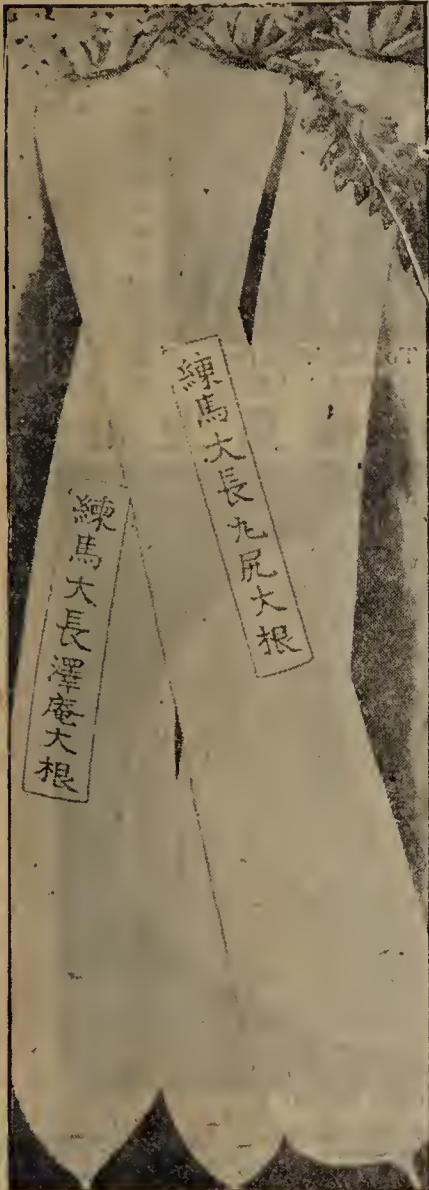

No garden is complete without radishes in succession at all times. They are no trouble, have no pests, and mature in a month and a half. Crimson Giant Forcing, Icicle and Half Long are all very solid varieties. Use two-thirds ounce for 100 feet of row, and thin the very young plants somewhat to prevent crowding. Summer varieties can be sown all Spring and well into Summer. Winter varieties, however, require some time to mature, and the seed should be planted in August and September for good radishes in November and December.

JAPANESE RADISH or "DAIKON" (大根)

DAIKON—Is surely one of the Oriental wonderful vegetables. They grow to immense sizes Picture to yourself a pure white radish 1 to 3 feet in length, about 10 inches in circumference, and 2 to 10 pounds in weight, and some grow round, like a baseball, to about 20 to 30 pounds in weight. It has the flesh of Baldwin apple and is as fine as a grain, and you will find it flavored a head of the best spring radish that ever passed your lips. It is excellent boiled with meat or used in vegetable soup, it is also good in oyster stews. By all means try this strains and you will be surprised at the real value of these wonderful radishes. It will thrive at any season during the growing year, however some variety do better at certain season as one will see by reading the following descriptions of the variety which we introduce as being the best for local conditions. Sow in drill 20 to 24 inches apart and when 3 to 6 inches high thin out 10 inches in row. Japanese radish should be grown in light, rich loam soil well worked. Water once a fortnight during cool weather and once a week during the warmer months. They mature in between 60 to 120 days. Six pounds will sow an acre.

NERIMA-LONG or MIKADO (ネリマ大長丸尻大根)—This is the leader of Japanese radish and the taste will immediately convince anyone of the fact that it is not merely a curiosity but a radish of extraordinary quality, large and long (as long as 3 feet) and 2 to 3 inches in diameter, and the end of the root is round in form, snowy white and bright color and very fine taste with sweet flavor. **NERIMA** can be used in many ways of cooking and pickles, hardy and good keeper. We have had long experience production of **NERIMA-LONG** successfully and we are earnestly presenting this to all good farmers and garden lovers. Try it this year and you will find a big, interesting crop in a few weeks. For main crop sow according to the following schedule. San Francisco and vicinity, early August; Southern States, late August; Northern States in early July. (Pkt. 10c.; oz. 20c.; 4 ozs. 60c.; lb. \$1.75; 2 lb. \$2.80) postpaid. Imported seed.

MIYASHIGE (宮重太長大根)—Grows more than two feet long and over 3 inches in diameter. And are very richly formed; solid and fine sweet flavor. Skin is a beautiful white and green in top. Keeps well, firm and crisp for a long time. We recommend our selection of this as being an extra good cooking radish. In Japan it is generally cut into small pieces and dried in the sun and keep for a long time. Grows easily everywhere, for the main crop saw to schedule of **NERIMA-LONG**. Col repollo CABBAGE (キャベチ) 甘 藍 カンラン

It is difficult to give definite cultural directions for cabbage, since it is possible to have good cabbage at all seasons of the year in some part of the country. Seed may be planted almost any time of the year. However, there are the seasons preferable for sowing—in September for early spring cabbages, from January to April for summer and fall cabbages, and July to August for winter cabbages. Sow the seed 1/2 inch deep and transplant the early varieties to rows 24 inches apart and 18 inches apart in the rows. They will mature in about 105 days. The late varieties mature in about 150 days and should be planted in rows 30 inches apart and 24 inches apart in the row. To prevent the heads from splitting open before they are ready to be harvested, in the plants should be bloomed a little at the root. Cabbages require plenty of moisture, but too much water causes them to rot very readily.

SWEET CORN (コーン)

One of the garden's sweetest vegetables. Plant from February 15th to August 1st, in rows 3 feet apart, drop 6 or 7 kernels in hills every 18 inches in the row and thin out to two of the healthiest plants in each hill when about 5 inches high. Break off all side shoots except the two top ones as they will produce the largest and best ears. Corn is at its very best when picked and eaten within an hour, but it is extremely important that it be picked just at the right time especially when not too old. Frequent plantings of several varieties in succession will keep a good supply available all summer.

Klondyke

WATERMELONS *Zandia* ウオタメロン (西瓜)

A light, sandy soil, with good exposure to the sun, is the best for watermelons. It should be prepared deep, but receive shallow cultivation. Hoe often and thoroughly. To get good, strong vines early in the season, from large, well-drained hills of earth, made very rich, about 8 feet apart. In these plant the seed as soon as the ground is warm and dry, dropping 6 to 10 seeds in the hill. Protect the young plant from insects. One oz. to 30 hills, 3 lbs. to the acre. When the plants are about 4 inches high thin out, leaving only four of the strongest plants to each hill.

KLONDYKE (クロンダイク)—A great favorite of recent introduction. Oblong, dark rich green, flesh bright red, very crisp and sweet. We first offered the Klondyke watermelon in 1914. It gained in popularity each year, first in one market then another. On account of the thin rind and extreme crispness the shipper was slow to accept it. But its extreme popularity impelled the shipper to grow it. Each year a larger acreage was planted, bringing greater profit to the grower. Although having a very thin rind it is a better shipper because it does not wilt. We now feel that the Klondyke has fairly won the title. "The Prince of all Watermelons." The seed is small. One pound of Klondyke will number as many seeds as two pounds of other varieties. The color of the seed is brown, mottled black. (Pkt., 10c.) (oz. 25c.) (¼ lb. 75c.) (lb. \$2.50) (2 lbs., \$4.00).

We highly recommend this variety to all market growers on account of its many excellent qualities. (Pkt. 10c.) (oz. 20c.) (4 ozs. 50c.) (lb. \$1.50) (2 lbs., \$2.40) postpaid.

Mushroom Spawn

Cultural Directions

マツシ ルーム スポーン

(茸の種子)

Ten pounds will spawn about 10 feet square. Mushrooms can be grown in any dark room or cellar where the temperature can be kept at from 50 to 70 degree. From some old pasture procure good, rich soil, and to every bushel of this soil add 2 bushels of fresh horse manure. Of this well-mixed compound prepare a bed, say, 4 feet wide. Put down a thin layer and pound it down hard, and go on until you have a bed 12 or 18 inches thick. As soon as the temperature of the

bed falls from 75 to 50 degrees, the spawn may be inserted in pieces about the size of a walnut, about 2 inches deep and 6 inches apart. Cover with loamy soil about 2 inches deep and beat it down evenly and firmly. Finish off with a covering of clean hay, about a foot thick, and the work is done. If the temperature is right, in 6 or 8 weeks you may expect mushrooms. The beds will continue bearing from 20 to 30 days. After the first crop is gathered spread over the bed an inch of flesh soil, moisten with warm water, and cover with hay as before. The main conditions in mushroom growing are proper and uniform temperature and very rich soil.

A light, dry soil, not over rich, suits the Pea. If they grow too vigorously and show no signs of bloom, run a spade along about eight inches from the row straight down, and thereby root prune them. Do this each side the row, and they will bloom in a few days. Plant as early as the ground can be worked, and again every two weeks for succession throughout the season. Plant single or double rows from four to six feet apart, according to the different heights, about an inch apart in the row and three inches deep; hoe often. In dry weather, Peas should be soaked in soft water five or six hours before planting, and if the grounds very dry they should be watered in rows.

EARLY FLOWERING SPENCER (早咲)

This splendid group has justly earned signal recognition from a great body of American planters, particularly from the commercial growers for forcing under glass. It deserves more attention from the home gardener who has possibly been disappointed in his results with the later sorts, as it comes into bloom from three to four weeks earlier and therefore should be well in flower before our summer heat arrives. Besides they enjoy a very long blooming season and where cool nights are the rule they will continue to bear for months. The vines are less branching than those of the late Spencers but the blossoms are equally large, beautifully waved and carried on splendid long stems. They are ideal for late fall planting and where the winters are mild, as in our Gulf States, those bordering on the Rio Grande or in California they are used in large quantities at that season of the year.

THE ROSE ローズ

December, January, February and March are the best months for planting but should the season be favorable you can still plant during the early part of April. The plants sent out during these months are what we call dormant two-year old budded plants. Roses give best results when planted in a fairly sunny location and in good heavy sediment soil to which may be added some old manure or bone meal, but never use fresh manure. When planting straighten out all roots and as the dirt is filled in see that it is well packed around them; this keeps out the air and encourages a new growth of rootlets. Be sure that the Rose is planted so that the point where it is budded shall be just below the surface.

Tree and Shrub Seeds 庭木の種子

Most tree seeds are better sown in the latter part of winter or spring, though there are many that can be sown at any time, and some which must be sown while the seeds are quite fresh. Most kinds are best sown in boxes, of light, well-drained soil, covering the seed about its own depth or some of the larger ones a little deeper, press the soil down slightly with the hands. Keep in a lath house, frame, or some sheltered place and water carefully. As soon as large enough to handle, pot and grow on until large enough to plant in the open ground, where they are to remain. Pines and other Conifer seeds are best sown in March and April, use a soil containing plenty of decomposed granite and always water in the morning and not at night, as the young seedling "damp off" very easily. Acacia seeds should be soaked in hot water for twelve hours or more before sowing.

KONO

INSECTICIDE MIXTUR

"KONO" Insecticide, A-3—This new invention has the power of killing certain insects where other remedies have failed. It is very effective for use in garden, truck farms, and flower nurseries, especially for the control of red spider, aphid, caterpillar, white and green fly, thrip, also against snails and slugs.

This form of liquid spray will be found to be very much more effective than the dry, or powder sprays, because the liquid made more "CARRYING" by the soap bubbles, will cover, and cling to the under as well as the upper surfaces of the leaves, also, it will not blow off as will the powder form of insecticide spray.

DIRECTIONS FOR USE

Use 1/2 pound A-3 "KONO" Insecticide in fifty gallons of water. If necessary, stronger solutions may be used down to twenty-five gallons of water without injury to plants, vegetables, or trees (five teaspoonsful for one gallon of water).

Japanese Giant Chrysanthemums 日本秋菊

The Chrysanthemum is the queen of autumn flowers. Nothing is more beautiful as house plants, in the late fall and early winter, than these large, fluffy, Japanese varieties. For massive blooms, grandeur of colors, ease of culture and certainty to flower there is no plant that will surpass them. The endeavor of nearly all growers has been, in late years, to introduce varieties which will produce the largest and finest blossoms for exhibition purposes. It is from these varieties that this seed is saved. These plants are easily raised from seed. Almost all the new and striking varieties are the result of plants grown from seed, and the amateur, is as liable to originate new and splendid varieties as is the professional florist.

They are of the easiest culture and always give satisfaction as house plants. The blossoms you get will surprise you with the odd and beautiful forms of the flowers and abundance of bloom. If you want a magnificent collection of these gorgeous Chrysanthemums—red, white, yellow and pink—you will make no mistake in getting a packet of our select seed.

We sell the seed in packets only, and guarantee it to be from the genuine large flowered Japanese varieties, imported seed. (Pkt. 25c.; 3 pkts. 60c.; postpaid).

Choice Chrysanthemum Plants

Set out the plants about 2 feet apart in well fertilized ground. After the young plants have grown 2 inches pinch them back 4 inches, then each plant will send out from 3 to 4 stems. In order to give strength to the blossoms, cover the ground with a layer of an inch or two of decayed manure. As soon as the buds appear on the stems, let the largest remain and pinch off all others.

- Ready about May 1st. (20c. each; 6 for \$1.00) postpaid.
- MAJOR BONNAFFON—Deep yellow, incurved.
 - MEUDON—Immense pink, broad, long, drooping petals, full in the center.
 - MRS. G. G. MASON—Clear-blood-red.
 - PINK TURNER—Clear lavender-pink, incurved.

IMPORTED JAPANESE LILY BULBS

Hardy Lilies 日本百合

Japanese Lily, Auratum (山百合)

LILIES are stately and most beautiful bulbous plants producing large flowers of exquisite outline and varied coloring. They are hardy even in cold locations with protection, and usually surviving for many years. Ideal locations are in the shrubbery or herbaceous border where the roots are sheltered from the hot sun. Groups of 6 or more lilies of a kind, here and there, in such situations are most effective. Large isolated clumps or beds of the varieties Auratum, Henryi, Speciosum, Tigrinum, etc., are also very beautiful. They should be planted just as soon as the ground can be worked 6 to 8 inches below the surface in light soils, or 4 to 5 inches below in heavy soils; in the latter case the bulbs should be surrounded by sand to facilitate drainage.

LILIUM LONGIFLORUM "Giganteum"—This type produces the most beautiful white flowers of large size, perfect form and of superior substance; the stems marked kind of black. The flowers will be opened little later than "Formosum" but it is the high sort for EASTER forcing. First size bulbs, 40c. each; \$4.00 per doz. postpaid.

AURATUM (The Golden Rayed Lily of Japan)—The flowers are pure white, thickly studded with crimson spots, while through the center of each petal runs a clear golded band. Fully expanded, the flowers measure nearly a foot across and possess a most delicious fragrance. Season of bloom from July to October. 3 to 5 feet. See illustration. Extra size bulbs, 50c. each; \$5.00 doz.

HENRY HENRYI (The Yellow Speciosum)—A new rare and very beautiful Lily from China. It is very hardy, and without doubt one of the best Lilies for garden culture. The flower stalks, 3 to 5 feet high, carry to 8 large flowers each, rich apricot-yellow, lightly spotted with brown. The shape and size of the flowers has suggested the name "Yellow Speciosum." 75c. each; \$7.50 doz.

REGALE ("A Royal Beauty")—The flowers are white, slightly suffused with pink, with a beautiful shade of canary yellow at the center; blending out part way up the trumpet. The fragrance is fascinating. A splendid hardy Lily for the garden, flowering about July 1st. Well-grown bulbs often produce five to eight blooms. 50c. each; \$5.00 per doz.

SPECIOSUM RUBRUM (Roseum)—White, shaded and spotted with rose and red. Largest bulbs. 40c. each; \$4.00 doz.

TIGRINUM SPLENDENS (Improved Tiger Lily)—The grandest of the Tigers, black polished stem, sometimes 6 feet high. Very large pyramids of flowers, orange red, spotted with black, 3 to 5 feet high. Bloom in August. 35c. each; \$3.50 doz.
