SUMMARY OF PHILIPPINE MARINE AND FRESH WATER MOLLUSKS

By LEOPOLDO A. FAUSTINO

INTRODUCTION

It has often been remarked that the Philippine Islands has furnished the greatest variety of sea shells of all the marine provinces comprising the Indo-Pacific region. In all parts of the world, wherever collections are found, Philippine shells are numerous. The Islands have long been famous for their molluscan fauna, and the fact that many generic and specific forms culminate there supports the conclusion reached by several writers that the Philippine Archipelago is the nucleus of the whole region. The province is rich, not only in marine forms, but also in land shells. Gorgeously colored shells are not uncommon, and some of the finest and handsomest forms in European collections came from the Philippine Islands.

The number of species has been variously estimated at between 5,000 and 7,000. Dr. Paul Bartsch's* catalogue file of Philippine shells shows that there are 7,161 named forms. These are distributed as follows:

Cephalopods	12
Gastropods	3,082
Scaphopods	28
Pelecypods	1,030
<hr/>	
Total marine forms	4,152
Land forms	2,782
Fresh-water forms	227
<hr/>	
Grand total	7,161

It is not beyond the range of probability that the number of species will reach 14,000 when a complete survey is made. It is admitted that many of the names now present in the literature are synonyms or represent merely variations of one species;

* Curator of marine invertebrates, United States National Museum, Washington, D. C.

nevertheless, the number of unnamed forms, notably in the collection of the United States National Museum at Washington, is very great, indeed.

The extraordinary richness of the molluscan fauna of the Philippines had led numerous expeditions to explore and collect in the Archipelago, and various workers have from time to time made reports on the shells of this interesting zoologic province. Most of the Philippine species were described by European conchologists, and both the British and the Paris Museums are very rich in Philippine material. Of late years the United States National Museum has acquired a large collection, and today it probably has the best collection of Philippine shells. The Philippine Bureau of Science has purchased the Quadras collection, the Dominican Fathers have built up a good collection in the Museum of the University of Santo Tomas at Manila, and the Jesuit Fathers have a large collection at the Ateneo de Manila.

The present paper was prepared with the advice and under the direction of Prof. James Perrin Smith, of Leland Stanford Junior University, as a preliminary report on the present state of our knowledge of Philippine shells. It is intended to serve as an introduction to the study of fossil shells by presenting a bibliographic enumeration of all the shells known or reported to occur in the Philippine Archipelago. Students of stratigraphy, palaeontology, and geologic history of the Philippine Islands will want to know the present fauna, as these shells are the descendants of those we now find as fossils in the formations. Like other investigations, it is necessary to start from the known and work to the unknown; hence, thorough familiarity with the Recent fauna becomes absolutely essential in the study of the fossil species. It is only to repeat what has been said by practically all students of historical geology in the East Indies and the tropical western Pacific Ocean to say that these regions have had only slight changes in temperature and other conditions during Tertiary and Recent times and, hence, the changes and variations in the faunas have also been slight.

The territory covered in this bibliographic enumeration is limited by the political boundaries of the Philippine Islands; namely, the islands and the waters surrounding them lying between $21^{\circ} 10'$ and $4^{\circ} 40'$ north latitude and between $116^{\circ} 40'$ and $126^{\circ} 34'$ east longitude. No attempt has been made to record shells from the China Sea, Singapore, or the islands of the Dutch East Indies.

The writer wishes to acknowledge with thanks the many kindly suggestions and valuable help given him by Professor Smith and Mrs. Ida S. Oldroyd, of the Stanford Museum. He also wishes to mention the many courtesies extended him by the libraries of Stanford University, the California Academy of Sciences, the University of California, and the United States National Museum. Lastly, he wishes to express his very deep appreciation of the encouragement given him by Dr. Paul Bartsch, of the United States National Museum. Doctor Bartsch not only consented to look over the present manuscript but, during the writer's nine months' stay in the National Museum, always turned an attentive ear to all his troubles. With unfailing courtesy Doctor Bartsch gave his time, his knowledge, and his valuable advice; the value of his counsel and suggestions cannot be overestimated. Doctor Bartsch has been engaged in the study of Philippine shells since 1901 and has in preparation a series of monographs on Philippine shells.

EARLY LITERATURE

The Philippine Islands were discovered in 1521 by Magellan in his attempt to reach the Moluccas by a western route, and between 1565 and 1571 several settlements were established by the Spaniards in the different parts of the Archipelago. During the first half of the seventeenth century communication between Manila and Europe was well established, and it was probably not later than the beginning of the eighteenth century that shells from the Philippine Islands began to find their way into European capitals. In early conchological literature, however, the Philippine Islands has not been mentioned as the place of origin of some of the specimens, and even in Martini's *Neues Systematisches Conchylien-Cabinet*, twelve volumes of text and twelve volumes of colored plates in quarto, Nuremberg, 1769-1795, where *Strombus Samar* Chemnitz is described and figured (p. 221, pl. 157, fig. 1503), no Philippine locality is given.

THE PERIOD OF GREATEST ACTIVITY

1. The first half of the nineteenth century may be said to have been the period of greatest activity. Not only were there several expeditions to the Philippine Archipelago, but also some of the most important contributions to Philippine conchology appeared during this period. The first important work to make its appearance was a descriptive catalogue of Recent shells

arranged according to the Linnean method with particular attention to the synonymy, by Lewis Weston Dillwyn, in two volumes, published in London in 1817.

2. Several years later a number of scientific expeditions touched the Philippines. Dr. Johann Friedrich Eschscholtz, professor and director of the Zoological Museum in the University of Dorpat, accompanied an expedition on the Russian ship *Predpriaetië*, commanded by Captain Kotzebue, during the years 1823-1826, and about 1825 reached Manila. About the same time Captain Beechey was making a voyage to the Pacific and Bering Strait in H. M. S. *Blossom*, 1825-1828. In the zoölogy of Captain Beechy's voyage John Edward Gray described not only the shells of the expedition, but also shells from other parts of the world.

3. The most important of these expeditions, however, was that of Hugh Cuming. Cuming left England on February 26, 1836, and proceeded directly to the Philippine Islands. Aided by powerful recommendations and with permission granted by the Queen Regent of Spain he was able to penetrate into the interior of the Islands and make very extensive collections. He visited the whole group. He collected in fifteen provinces of Luzon and in the following islands: Mindoro, Mindanao, Panay, Siquijor, Cebu, Bohol, Camiguin, Negros, Leyte, Samar, Capul, Ticao, Masbate, Burias, Temple, Marinduque, Maricaban, and Romblon. His collection of shells numbered more than 3,000 species, many of which were new to science, and several new genera were represented. According to Cuming the smaller islands were particularly rich in the pulmoniferous mollusca, which he found principally in the deep forests. Cuming left the Philippines in November, 1839, proceeding thence to Singapore and Malacca, and returned to England in June, 1840. The shells that he carried to England were to a great extent described in the Proceedings of the Zoological Society of London and figured in the monographs of Sowerby and Reeve. Broderip,* in commencing the description of the shells collected by Cuming, wrote as follows regarding the material:

Mr. Cuming by his accurate notes, and the open publication of the places where every one of the multitudinous species and varieties collected by him was found, has mainly assisted in making a complete revolution in this department of science, and has done more towards giving us data for the geographical distribution of the testaceous Mollusca than any person who has yet lived.

* Proc. Zool. Soc. London (1840) 84.

4. Philippine shells were described in the Proceedings of the Zoological Society of London. The first paper was presented by Broderip on August 11, 1840, and was entitled Description of shells collected and brought to this country by Hugh Cuming, Esq.

Other descriptions of shells from the Philippine Islands by Sowerby, Reeve, Deshayes, Hinds, Hanley, and others appeared in the proceedings of the society for the following years:

1840	1847	1854	1862
1841	1848	1855	1864
1842	1849	1856	1865
1843	1850	1858	1867
1844	1851	1859	1880
1845	1852	1860	1888
1846	1853	1861	

5. The shells taken to England by Hugh Cuming were also described and figured in the Monographs of Genera of Shells by G. B. Sowerby, Jr.; the five volumes constituted his Thesaurus Conchyliorum. The first of these appeared in London in 1847, the second volume in 1855, the third in 1866, the fourth in 1880, and the fifth and last in 1887.

6. Probably the most important work on shells to appear during this period was Lovell Reeve's *Conchologia Iconica*. This classic work contains descriptions and figures of the shells in the British Museum, including the Hugh Cuming collection which was purchased in 1865. The first volume appeared in 1843, but after the fifteenth volume, in 1865, Reeve died and the work was continued by G. B. Sowerby, who up to this time had made the drawings. The twentieth and last volume appeared in 1878. The volume numbers and dates of publication follow:

Vol. 1 1843.	Vol. 8 1855.	Vol. 15 1866.
Vol. 2 1843.	Vol. 9 1856.	Vol. 16 1868.
Vol. 3 1845.	Vol. 10 1858.	Vol. 17 1870.
Vol. 4 1847.	Vol. 11 1859.	Vol. 18 1873.
Vol. 5 1849.	Vol. 12 1860.	Vol. 19 1874.
Vol. 6 1851.	Vol. 13 1862.	Vol. 20 1878.
Vol. 7 1854.	Vol. 14 1864.	

7. Another expedition to touch the Philippines was that of H. M. S. *Sulphur*, under the command of Capt. Sir Edward Belcher, during the years 1836–1842. After leaving Singapore the ship proceeded by way of Palawan to Manila, arriving there on the morning of December 1, 1840. In the Zoölogy of the voyage, published in London in 1844, several Philippine shells were described.

8. In the Transactions of the American Philosophical Society, Philadelphia, volume 10, 1852, there is a paper, entitled Description of nineteen new species of Colimacea, by Isaac Lea, which was read before the meeting of the society on February 21, 1840. Sixteen of the new species came from the Philippine Islands.

9. Captain Sir Edward Belcher again visited the Philippines, this time commanding H. M. S. *Samarang*, during the years 1843–1846. Stops were made at Zamboanga, Tawitawi, the Sulu Archipelago, and Manila. Numerous specimens were obtained, and the account of the zoölogy of the voyage was edited by Arthur Adams and published in London in 1850. In the Introduction to the Mollusca, attention is called to the separation of the "Eastern" archipelago by the seas of Sulu and Celebes, which gave rise to a peculiar geographic distribution of the genera encountered. According to the account the "Zamboanga Roads" yielded very few shells, as the tide set through with great rapidity and no soundings were obtained farther offshore than half a mile, where the floor was composed of dead coral, black sandy mud, and loose pebbles. The coral reefs bordering the shore all along this part of Mindanao provided shallow pools filled with marine vegetation supporting numerous *Fissurellæ* and *Emarginulæ*. The Batan Islands, the northernmost group of the Philippine Archipelago, were also not very productive. It seems that the most favorable localities were found among the bays and reefs of the Archipelago where the coasts were low and shelving and where the water remained shallow for some distance from shore.

10. During the years 1838–1842 the United States Exploring Expedition under the command of Captain Wilkes, U.S.N., was engaged in the circumnavigation of the globe. The expedition reached Manila at daylight on January 13, 1842. It stayed there until the 21st when it left for Singapore touching, however, Mindoro, Panay, Mindanao, and Sulu on the way. The expedition had a conchologist on board, J. P. Couthouy, who with the aid of his companions collected about 2,000 species of shells, 250 of which were considered new. The description of these shells was intrusted to Dr. A. A. Gould, of Boston, and in volume 12 of the account of the voyage, entitled *Mollusca and Shells of the U. S. Exploring Expedition*, published in Philadelphia in 1852, the results of his labors are recorded.

11. Some years later Gould published the result of his studies in conchology from 1839 to 1862 and called the volume *Otia*

Conchologica. This was published in Boston in 1862 and contains all the descriptions of shells that he had published from time to time. Ten species have Philippine localities.

12. Dr. Ludovici Pfeiffer was one of the early workers who described shells from the Philippine Islands. In his *Monographia Heliceorum Viventium*, in eight volumes, many shells are referred to the Philippine Islands. These volumes were published from 1848 to 1877. Besides this important work, he also published in 1846 his *Symbolae ad Historiam Helicorum*, Third Section, V. Diagnosis of Species, in 1852 the first of the three volumes of his *Monographia Pneumonopomorum Viventium*, and in 1856 his *Monographia Auriculaceorum Viventium*. All these works contain numerous shells referred to Philippine localities.

13. In L. C. Kiener's Coquilles Vivantes comprising the collection of the Museum of Natural History of Paris, the Lamarckian collection, the collection of Prince Masséna, later of Baron Benjamin Delessert and the discoveries of several voyages, several Philippine shells are recorded. This important work was begun by Kiener and continued by P. Fischer. The first volume bears no date, but the last volume was published in 1880.

14. In 1852 the fourth edition of John C. Jay's Catalogue of Shells appeared. The list is an enumeration of the shells contained in his collection at Rye, Westchester County, New York. The species are arranged in alphabetical order, and the list includes their varieties, authors, and synonyms, as well as references to works where figured or described, and localities. Some of the shells came from the collection of Hugh Cuming; hence the list contains a good number referred to the Philippine Islands.

15. The Annals and Magazine of Natural History, London, contains valuable contributions to Philippine conchology. These appeared in the following volumes:

Vol. 12, Second Series, 1853.	Vol. 10, Fifth Series, 1882.
Vol. 7, Third Series, 1861.	Vol. 2, Sixth Series, 1888.
Vol. 8, Third Series, 1861.	Vol. 11, Sixth Series, 1893.
Vol. 10, Third Series, 1862.	Vol. 13, Sixth Series, 1894.
Vol. 16, Third Series, 1865.	Vol. 17, Sixth Series, 1896.
Vol. 20, Third Series, 1867.	Vol. 19, Seventh Series, 1907.
Vol. 9, Fourth Series, 1872.	Vol. 15, Eighth Series, 1915.
Vol. 19, Fourth Series, 1877.	Vol. 16, Eighth Series, 1915.

16. In 1854 Jacques Bernard Hombron and Honore Jacquinot published the molluscan part of the *Voyage au Pôle Sud et dans L'Océanie* of the *Astrolabe* and *Zélee*. In this work some Philippine shells are mentioned.

17. In 1867 the volume on Mollusca of Die Preussische Expedition nach Ost-Asien, by Edward von Martens, appeared. This work records several Philippine shells.

18. In a letter published in Siebold and Kölliker's Zeitschrift, Dr. Willemoes Suhn, of the Challenger Expedition, mentions finding on the beach at Zamboanga, Mindanao, *Lingula anatina* in hundreds and of paying one dollar for a hundred specimens.

19. Dr. C. E. Lischke's Japanische Meeres-Conchylien gives the distribution of Japanese sea shells, and Philippine localities are mentioned.

20. Carl Semper's Reisen im Archipel der Philippinen, published from 1870 to 1914, contains descriptions and figures of Philippine land shells. W. Kobelt's Die Landdeckelschnecken forms a part of this classic work. Several papers on marine shells were included, but those that came to my attention dealt mostly with the soft parts.

21. In his Index Molluscorum Maris Japonici, 1882, Guglielmo Dunker listed several shells as occurring also in the Philippine Islands.

22. Thomas Davidson's Monograph of Recent Brachiopoda, published in the Transactions of the Linnean Society of London, Second Series, Volume 14, 1886-1888, enumerates a number of Philippine shells.

23. In Journal de Conchyliologie, Paris, several papers by Semper on Philippine shells were published. These are as follows:

Description d'une Hélicéen nouvelle des Philippines 10 (1862) 146.

Description d'une Hélicéen nouveau des Philippines 10 (1862) 152.

Description d'Hélicéens nouveaux des Philippines 10 (1862) 261.

In the same journal Hidalgo published several of his papers. These are as follows:

Description d'une espece nouvelle de Circe des Philippines 33 (1885) 195.

Description d'especes nouvelles provenant des Philippines 34 (1886) 154.

Description d'un Amphidromus et d'un Cyclophorus, provenant des îles Philippines 35 (1887) 36.

Espèces nouvelles ou peu connues de coquilles terrestres des îles Philippines 37 (1889) 296.

24. In Nachrichtenblatt der Deutschen Malakozoologischen Gesellschaft, Frankfurt am Main, several papers on Philippine shells were published. These are as follows:

Mittheilungen aus dem Gebiete der Malakozoologie; von den Philippinen (V).* In Manila Provinz Bulacan auf Luzon, Gegend von Norzagaray und Angat. May and June, 1888: 65. Von Dr. O. F. von Mollendorff.

25. Dr. Otto Franz von Mollendorff was for some time German consul-general for the Philippine Islands. While serving as representative of the German Imperial Government he took advantage of every opportunity to study natural history and, besides the papers published in *Nachrichtsblatt der Deutschen Malakozoologischen Gesellschaft*, Frankfurt am Main, he made several important contributions to the conchology of the Archipelago. In 1890 his *Die Landschnecken-Fauna der Insel Cebu* * appeared. This was followed in 1893 by *Materialien zur Fauna der Philippinen*, XI, *Die Insel Leyte*, † and in 1898 he published his *Verzeichniss der auf Philippinen Lebenden Landmollusken*.‡

26. In 1888 the first volume of Fr. Paetel's *Catalog der Conchylien-Sammlung*, devoted to marine univalves, appeared in Berlin. The second volume, devoted to marine bivalves, appeared in 1889; while the third volume, devoted to land and fresh-water univalves, made its appearance in 1890. This is an important work and contains a catalogue list of species including localities and important references. It enumerates many shells referred to the Philippine Islands.

27. In his *Obras Malacológicas, Memorias, Real Academia de Ciencias*, Madrid, volume 14, Joaquin Gonzales Hidalgo attempted to put together in one volume all that has been written and published on Philippine shells. He had access to all the collections containing shells from the Archipelago, including that of Quadras whose sixteen years' collecting in the Islands almost duplicated Cuming's in the number and variety of species. He published the first part in 1890, and the second, which was devoted to marine Mollusca, appeared in 1893. This is an important work, for it contains descriptions and synonymy and not a few figures. In 1904-1905 Hidalgo published in Madrid his

* Bericht über die Senckenbergische Naturforschenden Gesellschaft zu Frankfurt am Main.

† Ibid.

‡ Abhandlungen der Naturforschenden Gesellschaft, Gorlitz 22 (1898).

Catálogo de los Moluscos Testáceos de las Islas Filipinas, Joló y Marianas. This contains no figures or descriptions, but under each genus are mentioned the different species in alphabetical order with citations of figures, references, and localities.

28. The Establecimiento Tipográfico del Colegio de Santo Tomás, Manila, printed in 1893 a pamphlet entitled Catálogo de la Colección de Moluscos de Filipinas, Existente en la Inspección General de Montes, Recolectados y Clasificados por el Ayudante 2.^o, D. José Florencio Quadras. This catalogue simply lists the species, with localities.

29. In 1896 R. P. Fr. Casto de Elera published the third volume of his Catálogo Sistemático de toda la Fauna de Filipinas, which was devoted to Mollusca and Radiata. This work is an enumeration of the shells contained in the collection of the Dominican Fathers in the Museum of the University of Santo Tomas, Manila, with synonymy, references, and geographical distribution.

30. A. H. Cooke published an article in the Proceedings of the Zoological Society of London, May 17, 1892, On the Geographical Distribution of the Land-Mollusca of the Philippine Islands, and their Relations to the Mollusca of the neighboring Groups. This is a very interesting paper and gives the writer's conclusions regarding the ancient relationship of the different islands to one another.

31. In the Annales de la Société royale Zoologique et Malacologique de Belgique, volume 41 (1906) pages 72 and 73, is the article by H. B. Preston, Descriptions of New Species of Marine Pelecypoda from the Philippine Islands.

32. The most important work in our present-day conchological literature is the Manual of Conchology, which was begun by George W. Tryon, Jr., and is being continued by Henry A. Pilsbry, of Philadelphia. This work is a series of monographs of shell genera, and contains numerous references and descriptions of Philippine shells. The following paragraphs from the advertisement of the first volume, published in Philadelphia in 1879, will be of interest:

* * * It will include, in systematic order, the diagnoses of all the genera and higher divisions of the Mollusca, both recent and fossil, and the descriptions and figures of all the recent species; together with the main features of their anatomy and physiology, their embryology and development, their relations to man and other animals, and their geological and geographical distribution . . .

* * * It is intended to arrange and describe the valid species in accordance with their inter-relationships, and it is hoped that by so doing their number may be greatly reduced. Every genus and every recent species will be fully illustrated, so far as specimens or hitherto published figures will enable me to do so.

The first series of the Manual of Conchology was completed in 1897-1898, twenty years after the appearance of the first volume. George W. Tryon, Jr. conducted the work until 1888, as far as the middle of the tenth volume.

32. During the years 1907-1910 the United States Bureau of Fisheries steamer *Albatross* made an expedition to the Philippine Islands, and every opportunity was utilized to make an extensive collection of marine as well as land and fresh-water shells. In 1909 the Philippine Bureau of Science, through the late Dean C. Worcester, then Secretary of the Interior, transmitted a large consignment of mollusks to the United States National Museum for report. Since then numerous collections have been sent to the National Museum from the Archipelago, and Dr. Paul Bartsch, curator of the Division of Marine Invertebrates, has been engaged in naming, describing, and classifying the material. On account of the size of the collection and the pressure of other work it will be many years before the work is completed. Doctor Bartsch, however, has already published many reports in the Proceedings of the United States National Museum, Biological Society of Washington, and the Washington Academy of Sciences. These papers are as follows:

- The Philippine mollusks of the genus *Planorbis*, No. 1512, Proc. U. S. Nat. Mus. 32 (1907) 83-85.
- The Philippine pond snails of the genus *Vivipara*, No. 1518, Proc. U. S. Nat. Mus. 32 (1907) 135-150, pls. 10, 11.
- Four new land shells from the Philippine Islands, No. 1705, Proc. U. S. Nat. Mus. 37 (1909) 295-300, pl. 29.
- Notes on the Philippine pond snails of the genus *Vivipara*, with descriptions of new species, No. 1709, Proc. U. S. Nat. Mus. 37 (1909) 365-367, with pl. 34.
- The giant species of the mollusean genus *Lima* obtained in Philippine and adjacent waters, No. 1978, Proc. U. S. Nat. Mus. 45 (1918) 235-240, pls. 12-20.
- The Philippine mollusks of the genus *Dimya*, No. 1893, Proc. U. S. Nat. Mus. 45 (1913) 305-307, pls. 27-28.
- New land shells from the Philippine Islands, No. 1993, Proc. U. S. Nat. Mus. 45 (1913) 549-553, pl. 43.
- The Philippine land shells of the genus *Schistoloma*, No. 2104, Proc. U. S. Nat. Mus. 49 (1915) 195-204, pl. 51.

NOTE.—In a personal communication Dr. Paul Bartsch suggests that in the following enumeration of species only original descriptions be cited. I have tried to follow the suggestion but where a specimen has been referred to the Philippine Islands the reference is given rather than the original citation for the species. Doctor Bartsch also suggests that the type locality be given in every instance. It is regretted that this suggestion cannot be carried out at this time.—L. A. F.

SUMMARY OF SPECIES *

PHYLUM MOLLUSCOIDEA

Class BRACHIOPODA Duméril

Order ATREMATA Beecher

Superfamily LINGULACEA Waagen

Family LINGULIDEA Gray

Genus LINGULA Bruguière

LINGULA ANATINA Lamarck.
