

AGRICULTURAL BOTANY:

AN

ENUMERATION AND DESCRIPTION

OF

USEFUL PLANTS AND WEEDS,

WHICH MERIT THE NOTICE, OR REQUIRE THE ATTENTION,

OF

AMERICAN AGRICULTURISTS.

BY WILLIAM DARLINGTON, M. D.

Hic Segetes, illic veniunt felicius Uvae: Arborei fetus alibi, atque injussa virescunt Gramina. Virgil, Georg. 1.

Here golden harvests wave, there Vineyards glow, Fruit bends the bough, or Herbs unbidden grow.

Sathely.

NEW YORK:
MARK H. NEWMAN & CO., 199 BROADWAY.

1847.

63 Ja

ENTERED according to Act of Congress, in the year one thousand eight hundred and forty seven (1847), in the Clerk's office of the District Court of the Eastern District of Pennsylvania.

TO THE YOUNG FARMERS

OF THE UNITED STATES,

THIS HUMBLE ATTEMPT

TO AID AND PERSUADE THEM

TO CULTIVATE A DEPARTMENT OF SCIENCE,

ESSENTIAL TO AN ENLIGHTENED AGRICULTURE,

AND

INDISPENSABLE TO AN ACCOMPLISHED YEOMANRY,

IS RESPECTFULLY DEDICATED BY

THE AUTHOR.

PREFATORY.

AGRICULTURE, in a broad and legitimate sense, being a comprehensive system of Natural Science-involving more especially a practical acquaintance with the useful portion of the Vegetable Creation,—I have long thought it due to the Profession, and desirable in every point of view, that the young Farmers of the United States should acquire an exact knowledge of the Plants which it immediately concerns them to know; and that they should be enabled to designate, and treat of them, with the precision and methodical perspicuity which belong to scientific language and arrangement. Under this impression, and in the hope of promoting an object deemed so important, the present work has been compiled. In submitting it to those for whom it is more particularly intended, I am not unaware that its technical features are ill-suited to the notions of many plodding disciples of the old school of Agriculture, who despise every form of knowledge derivable from Books, - and whose ideas never stray beyond the manual operations of the field and the barn-yard. It is scarcely probable, indeed, that any written treatise-though couched in the most familiar dialect-would obviate the objections, or conciliate the prejudices, of such antiquated tillers of the soil. My views, therefore, have not been directed to that unpromising quarter. I address myself to the youthful and aspiring Agriculturists of our country, who seek to elevate their noble Profession to its just rank among human pursuits,—and who feel that the exercise of intellect, as well as of muscle, is indispensable to the accomplishment of their purpose.

I have preferred to treat of the Plants, which it more immediately behoves the farmer to be acquainted with, according to the most approved method of our day, and in the language of Systematic Botany. By exhibiting as much of the classification, or frame-work of the Science, as is requisite to present the Genera and Species, here described, in their natural and relative positions, the Student will be enabled to comprehend their connection with the other portions of the System, and to examine them, as the Geologists say, in situ. In that process, he will necessarily have to learn something of their structure, and essential character; and that I should consider as an important advantage,—even if his researches should there terminate. His knowledge, however limited, will be established on a correct basis,—and will be always available in his intercourse with men of science: But, to those who may subsequently resolve upon a more extended acquaintance with the vegetable kingdom, such knowledge will be a clear gain, and a valuable preliminary step; - that step which, according to the proverb, is the

only one which costs.

In adopting the machinery of Science—preferring the botanical to the popular names of plants, as well as arranging them in kindred groups—I have supposed that such a plan would be most conducive to accuracy of conception,—and would, in fact, facilitate the investigation of their true character. By employing names, and phrases, which have an exclusive application, and a definite meaning, the study of plants is really simplified; and the knowledge acquired—being thereby communicable with more readiness and precision—is greatly enhanced in practical value. By using, every where, the same terms in the same sense, men of different regions, or districts, can be sure that they comprehend each other's meaning,—and may then discuss questions understandingly. When disputes arise, touching the merits or demerits of particular plants, both parties will have clear conceptions of the objects referred to,—and will consequently have the advantage of knowing exactly what they are talking about:—which is far from being always the case when they make use of a variable popular nomenclature.

It is a great mistake, in my opinion, to suppose that the significant language of our Science must necessarily be merged in the vernacular idiom, or degraded into a local patois, in order to adapt it to the capacities of intelligent practical men. An active intellect, I think, more readily acquires new terms, appropriate to a Science, than new meanings of old familiar words: and hence it is that most persons, as they advance in any department of knowledge, are apt to discard all equivocal terms, and to substitute those which are definite, technical and peculiar. Instead, therefore, of writing down to the level of boorish apprehension, I would rather see Agricultural works gradually written up to the scientific standard. I would have our young Farmers taught to appreciate the importance of scientific precision, and incited to take their appropriate position in the intellectual com-

In the present work, it is hoped and believed that with the aid of the copious Glossary, the Index of Common Names and Synonyms, and the other facilities annexed, there can be no difficulty in becoming familiar with the terms employed, nor in the investigation of the plants enumerated: And the farmer who shall have accomplished that much, will find that he has obtained many new and interesting views of objects intimately connected with his Profession,—that he has acquired a capacity for observing and profiting by numerous processes and phenomena, in the vegetable economy, which had theretofore been unheeded, or imperfectly understood. A spirit of research will often be awakened, which, in itself, is an unfailing source of gratification to ingenuous minds,—and not unfrequently leads to important practical results.

The study of BOTANY, in its widest sense—comprising, as it does, the entire vegetable creation,—will ever have its select votaries in those who can appreciate its manifold charms, and find their reward in the pleasures incident to the pursuit: But when regarded in a

^{*}As a convenient and satisfactory mode of acquiring the requisite Botanical knowledge—and of keeping that knowledge always within reach, in case of forgetfulness.—I would recommend to the young Farmer, the formation of a select Herbarium, containing authentic specimens—neatly prepared, and appropriately labelled—of those plants which it is his interest to be acquainted with.—Such a Collection could readily be obtained by every one who has the taste, or even the curiosity, to extend his information in that direction. It would afford instructive subjects for investigation, and comparison, in seasons of leisure; and the contents, being duly arranged, could be examined, or referred to, with the like facilities, and advantages, as attend the consultation of a Dictionary.

more limited and practical point of view, it may fairly challenge the attention even of the most inveterate Utilitarians. There are three aspects, or relations of the Science, in which its importance will scarcely be denied by the most penurious calculator of economical values: namely, 1. Agricultural Botany,-2. Medical Botany,and 3. Artistical Botany, or the history of those plants which are employed, or afford materials, in the processes of the Arts and Manufactures. The Medical branch of the science has been often treated of, with something like system, by the Professional writers of Europe and America. The other two divisions less frequently, and with less method, in various Agricultural Journals, Cyclopaedias, and Mercantile Dictionaries. The attempt here made, is an Essay on the Agricultural branch,—or a systematic description of those Plants (both useful and pernicious) which more immediately interest American Farmers—especially those in the middle States of this Confederacy. The Botany of the Arts, whenever undertaken, will afford a highly interesting theme for some future laborer in this elegant departinent of Natural History.

In compiling this Farmer's Flora, I found it somewhat difficult to determine, satisfactorily, the line of demarcation between the Plants intitled to a place in it, and those which might properly be omitted. It may, perhaps, be thought by some, that the list is unnecessarily large,—while others may be of opinion that there are species left out, which ought to have been inserted. My aim has been—not, certainly, to describe all the plants which an accomplished Agriculturist might very properly desire to know; but—to include those only (whether in the woodlands, the fields, or the kitchengarden,) of which no intelligent Farmer would willingly be ignorant. When he shall have made himself familiar with these, he can extend his acquaintance with the Vegetable Tribes, at pleasure, by having recourse to more general and comprehensive works: such, for example, as the Flora of North America by Torrey and Gray,—or Prof. De Candolle's Prodromus of a Natural System, comprising all the known forms of vegetation upon this terraqueous globe.

In my humble opinion, no Education can be deemed sufficient, without some acquaintance with the rudiments, or first principles, of Botanical Science - some rational knowledge of the vast and multiform creation around us, known as the Vegetable Kingdom. consider such knowledge just as indispensable to a rightly instructed people, as any of the usual elementary branches of school learning. By this, however, I do not mean the smattering of a few obsolete terms, unconnected with any available ideas-which, in too many instances, passes under the imposing name of "Botany": but I do mean, that thorough conception of the general nature and relations of Plants, which may be acquired by the aid of such works as the Botanical Text-Book of Prof. A. GRAY. In all other employments, it is very properly expected that a workman shall not only be expert in the manipulations of his art, but shall also be well acquainted with the nature of his materials: and I can perceive no good reason why it is not equally incumbent on a practical farmer to understand the true character of those plants, which it is his especial interest either to cultivate or to extirpate.

If our American Youtlis, who are being educated with a view to

Agricultural pursuits, were thoroughly instructed in the admirable Text-Book, above referred to,—and were then required to make themselves botanically acquainted with that portion of the vegetable kingdom which annually demands their attention, on the farm,—the Profession would speedily assume a new and engaging aspect. The labors of the field would be blended with the contemplation of facts and phenomena of the deepest interest to inquiring minds,—and Agriculture—instead of being shunned as an irksome drudgery—would be justly esteemed as one of the noblest employments of a free and intellectual people.

If the present Essay may in any degree tend to promote that auspicious result, the Author will derive a sincere gratification from the belief, that the time and attention devoted to its preparation have

not been wholly misapplied.

WEST-CHESTER, PENNA.

June, 1817.

GLOSSARY

OF THE

PRINCIPAL BOTANICAL TERMS USED IN THIS WORK.

The reader will bear in mind, that where compound descriptive terms are employed in this work, the last member of the compound word is intended to give the predominant character, - and that the word or syllable prefixed, merely indicates a modification of that character:—as, for example,—"ovate-lanceolate" signifies lanceolate, but inclining somewhat to ovate; while "lance-ovate" means ovate with something of the lanceolate form, &c. So of colors: "yellowish-green," "bluish-green," & a. signify that green is the prevailing hue,—but that it is tinged with a shade of yellow, blue, &c. Terms indicative of the size of any organ, or portion of a plant—as "large," "small," or "middle-sized"—are, of course, relative,—and have reference to the usual or average size of such parts, or organs, in other species of the same genus, or family.

ABIETINEAE. The Abies Sub-order, or Pine and Fir section, of the Order The Abies Sub-order, or Adherent, attached to, or united with,

any organ.

Abortive, not arriving at perfection; Adventitious, happening irregularly; not producing no fruit.

Abrupt, not gradual; sudden.

Abruptly acuminate, suddenly narrowed to an acumination.

Abruptly pinnate. See Even-pinnate.

Acaulescent, apparently stemless.
Accessory, additional, or supernumerary.
Accumbent cotyledons, having the radicle applied to the cleft, or recurved along the edges of the cotyledons (represented by this sign, o=).—as in some Tetradynamous or Cruciferous plants.

The Acrost Model for the Cotyledons agreeated, crowded, or standing together on the same receptacle.

AGROSTIDEAE. The Agrostis or Herdgrass tribe of the Order Grammeae.

ACERACEAE. The Acer or Maple family. Acerose, linear and needle-like, -as Juniper leaves, &c.

Achenium. See Akene.

ACHYRANTHEAE. A Tribe of the Order AMARANTHACEAE, represented by the Alae.

genus Achyranthes.

Accordance of Ac or develop from the apex or summit. only, of the stem.

Acrogens. Apex-growers, or acrogenous

plants; -which see. Aculeate, prickly; armed with prickles.
Aculeolate, armed with little prickles.

Acuminaté, ending in a produced tapering point. An extended tapering Acumination.

point. Acute, sharp; ending in an angle, or

point; not rounded.

ADENOSTYLEAE. A division of the Subtribe Eupatorieae,—characterized by glandular styles.

Pine and Fir section, of the Order Conference another different organ, as the calyxtube to the ovary, &c. See coherent.

Abortion, an imperfect development of Adnate, adhering laterally; fixed or

growing to.

produced naturally, or usually.

Aestivation. The mode in which sepals

and petals are arranged in the flowerbud, before they expand.

Aftermath. The second growth of the grasses in the same season, after being cut off.

AGARICINAE. A Sub-tribe of the FUNGI,of which Agaricus is the type.

The Ajuga tribe of the AJUGOIDEAE. Order LABIATAE.

Akene (or Achenium). A 1-seeded fruit with a dry indehiscent pericarp,— often bony or nutlike. lae. Wings, or membranous expan-

sions.

Alate, winged; having a membranous border.

blumen. A deposit of nutritive inorganic matter, distinct from the Embryo, found in many seeds,—and sometimes (as in the grasses) constitutional in the constitution of the constitution o Albumen. tuting their chief bulk.

Albuminous seeds, furnished with, or

containing albumen. LGAE. The great aquatic Order, or family, of Sea-weeds.

ALISMACEAE. The Alisma, or Water-

Plantain, family of plants.
ALISMEAE. A Sub-order of ALISMACEAE, specially typified by the genus Alisma. Alternate, not opposite; placed alternately on the axis, or receptacle.

honeycomb.
ALYSSINEAE. The Alyssum tribe of the

Order Cruciferae.

Amaranthaceae. The Amaranthus, or Princes'-Feather, family of plants.

AMARANTHEAE. A Sub-tribe of ACHY-RANTHEAE,-typified by the genus Amaranthus.

AMBROSIEAE. tribe of Compositae,—of which divi- Antirrhineae. sion Ambrosia is the type.

usually diclinous flowers, with imbricated scales or bracts.

Lichens.

*Appendiculate, having some appendage**

AMMINEAE. UMBELLIFERAE.

stem.

AMYGDALEAE. The Amygdalus or Al-Approximate, growing or situated near mond Sub-order of the family of Rocach other. SACEAE.

ANACARDIACEAE. The Anacardium or

Cashew-nut family.

Analogue. A body or organ resembling, substituted for, or equivalent to, another body or organ.

Anastomosing, applied to branching Arachnoid, resembling a spider's web. vessels which inosculate, or unite Araliaceae. The Aralia or Spikenard

again, like net-work.

Anatropous ovule, or seed. Turned: inverted on the funiculus, so that the orifice, or apex, points towards the placenta.

Ancipial, two-edged; somewhat flatted.

with opposite edges.

Androgynous, having staminate and pistillate flowers distinct, but on the same spike, or plant.

NDROPOGONEAE. The Andropogon or

ANDROPOGONEAE. Indian-grass tribe, of the Order GRA-

Angiogasteres. Fungi,-with the sporules in a ven-

tained in a distinct pericarp or seedvessel.

Angulate, having angles, or corners, mostly of a determinate number.

Anisate, resembling anise-seed, in taste or odor.

Annotinous, applied to leaves, &c. which are annual, or renewed every year. Annual, living or enduring but one year.

Annular, in the form of a ring.

Annulate, having a ring, or belt.
Anomalous, not according to rule or system; forming an exception to usu-Ascending, rising from the ground al appearances, or structure.

Anophytes. Superior plants,-i. e. cellular plants (as Mosses) which emulate or resemble the forms of vascular plants; a class of flowerless plants. Anterior, in front,—as that part of a

flower next to the bract, or farthest from the axis of inflorescence.

like plants, represented by Anthemis.

Alveolate, having pits, or cells like a Anther. The knob, or capsule, containing the pollen,-usually supported on a filament.

Antheridia. The analogues, equivalents,

or representatives of Anthers.

Antheriferous, bearing Anthers.

Apetalous, destitute of petals; not having a corolla.

Apex. The summit, upper or outer end.

A division of the Senecio Aphyllous, destitute of leaves. of the Order SCROPHULARIACEAE.

Ament. A slender spike of naked and Apothecia. The cups, or shield-like receptacles of the fructification of the

annexed.

Amplexicaul, embracing or clasping the Appressed, pressed to, or lying close against.

each other.

Aquatic, growing naturally in water, or in wet places.
ARABIDEAE. The Arabis tribe of the Or-

der CRUCIFERAE.

ARACEAE. The Arum or Indian Turnep family of plants.

family of plants.

Arborescent, approaching the size or height of a tree.

Arcuate, curved, or bent like a bow. A small cavity,-as in the base Areola. of some akenes.

Arid, dry, as if destitute of sap.

Arillate, having an arillus. Arillus. An expansion of the funiculus or seed-stalk, forming a loose (and often fleshy) coating of the seed.

Aristate, awned; having awns, or bristlel.ke processes.

A Sub-t. ibe of the Aristolochiacene. The Aristolochia or Snake-root family. Armed. having thorns or prickles.

Angiospermous, having the seeds con- Aromatic, having a spicy flavor or fragrance.

RTEMISIEAE. A division of the Sub-tribe Anthemideae.—of which the genus Artemisia is the type. ARTEMISIEAE.

Articulated, jointed; connected by joints, or places of separation.

Joints; the places at Articulations. which articulated members are separable.

ARUNDINACEAE. The Arundo or Reidtribe of the Order GRAMINEAE.

obliquely.

ASCLEPIADACEAE. The Asclepias family. ASCLEPIADEAE. The genuine or proper tribe of the Asclepias family.

Asphodeleae. A Suborder of Liliaceae, represented by the genus Asphodelus. Assurgent, rising in a curve from a declined base.

ANTHEMIDEAE. A Sub-tribe of Senecio- (ASTEREAE. The division of the Subtribe ASTERINEAE most allied to Aster. ASTERINEAE. The Sub-tribe of Aster- Bi-gibbous, having 2 hunches, or gibbous like plants, of which Aster is the special type.

ASTEROIDEAE. The Aster-like tribe of the

Order Compositae.

ATRIPLICEAE. The Atriplex tribe of the Chenopodium family.

Attenuated, tapering gradually until it

AURANTIACEAE.

becomes slender.

The Aurantium or Auriculate, having rounded appendages at base, like ears.

AVENACEAE. The Avena or Oat Tribe

of the Order GRAMINEAE.

Awn. A slender bristle-like process,common on the chaff of Grasses: sometimes on anthers, &c.

Awned, furnished with awns, or bristle-

like appendages.

Awnless, destitute of awns.

Avil. The angle between a leaf and stem, or branch, on the upper side.

Axillary, growing in, or proceeding from, the axil.

Axis. A central stem, or peduncle; or, a real or imaginary central line extending from the base to the summit. g from the base to the summit Bivalved, having 2 valves. berried,—becoming fleshy or Biventricose, having 2 bellied or distend-

succulent, like a berry.

Bald akenes, naked at summit; desti- Bloom.

tute of pappus or crown. BALSAMIFLUAE. The Balsam flowing or

Sweet-Gum family.

BAMBUSEAE. A Sub-tribe of FESTUCA-CEAE, typified by the genus Bambusa. Barb. A straight process, armed with one or more teeth pointing backwards. Basilar, originating at, or affixed to, the

base of another organ. Beak. A terminal process, like a bird's

bill. Beaked, having, or terminating in, a

beak. Bea.d.d. crested or furnished with parallel hairs: the term is applied, also. to awned wheat, &c.

Berry. A pulpy valveless fruit, in which

the seeds are imbedded.

The Eetula or Birch BRASSICEAE. BETULACEAE. family of plants.
Bibracteate. having 2 bracts.

Bibractcolate, having 2 small bracts. bractlets, or bracteoles.

Bicuspidate, ending in 2 sharp points or cusps.

Bidentate, furnished with 2 teeth.

BIDENTIDEAE. A division of the Helianthus Sub-tribe, represented by the Bud. A growing point, or undeveloped genus Bidens.

Biennial, living 2 years-in the second of which the flowers and fruit are Bulb. produced-and then dying.

Bifarious, in two series, or opposite rows; pointing in two directions.

Bifid, two-cleft, or split into two segments.

foliate, having or producing 2 leaves. Bifurcate, forked; ending in two equal branches.

productions.
Bi-glandular, having or producing two

glands.

BIGNONIACEAE. The Bignonia or Trumpet-flower family.
BIGNONIEAE. The Tribe of BIGNONIACEAE

specially represented by the genus Bignonia.

Bi-labiate, having 2 lips.

Bilamellate, having 2 lamellae, or thin plates.

Bilocular, having 2 cells.

Bipartible, separable into 2 parts.

Bipartite, two-parted. common petiole having opposite branches, and those branches bearing opposite articulated leaflets.

Bipinnatifid leaf. The common petiole bearing opposite pinnatifid segments. Ei-rostrate, having 2 beaks. Bi-setose, having 2 bristles.

Bisulcate, having 2 grooves or furrows. Biternate leaf, twice ternate; the common petiole 3-parted, and each division, or branch, bearing 3 leaflets.

ed portions. loom. A fine powdery coating on certain fruits, &c. as the plum.

BORAGEAE. The Tribe of BORAGINACEAE specially typified by the genus Borago. Boraginaceae. The Borago family.

Bowl-shaped, hemispherical and concave. or hollow, like a bowl.

Brachiate, having the branches spread-

ing, opposite and decussate.

ract. A floral leaf; a modified leaf, from the axil of which arises the Bract.

flower-branch, or peduncle.

Bracteate, furnished with bracts, or modified leaves among or near the flowers.

Bracteoles, or Bractlets. Small bracts.

Bractless, destitute of bracts.
Branchlets. Small branches, or subdi-

visions of branches. The Brassica or Cabbage

tribe of the Order CRUCIFERAE. Bristles. Stiffish elastic hairs, straight or hooked.

A Sub-tribe of FESTUCACEAE, EROMEAE. typified by the genus Bromus.

The Bromelia or Pine-BROMELIACEAE.

apple family of plants.

leaves.

A kind of bud, formed of fleshy scales. or coats, and usually seated on the neck of the root,—sometimes in the axils of the leaves.

Bulbiferous, bearing or producing bulbs. Bulbous, formed of, or like, a bulb.

Bullate leaf, having bubble-like convexities on the upper surface, with corresponding cavities beneath.

Caducous, falling off immediately, or Caryopsis. A fruit where the pericarp earlier than usual for such organs.

Calcarate, spurred; having a process like a horn, or spur,—usually hollow.

Callous, firm and gristle-like. Callus. A compact gristle-like tubercle, Cassieae. or substance.

Calyciform, shaped like a calyx.

Calyculate, having an additional (usually

small) outer calyx, or calyculus.

Calyptra. The cap, or hood (resembling
the extinguisher of a candle,) on the fructification of the mosses.

Calyx. The flower-cup, or outer (and sometimes the only) covering of a flower, usually green. CAMELINEAE. The Camelina tribe of the

Order CRUCIFERAE

Campanulate, in the form of a bell.

CAMPYLOSPERMAE. A Sub-order of UM-BELLIFERAE, with the face or commissure of the carpels incurved on the CELTIDEAE. The Celtis Sub-order of the margins, or apparently grooved lengthwise.

Campylotropous ovule, or seed. Where the ovule curves upon itself, and thus brings the orifice, or apex, near to

the funiculus.

Canaliculate, channelled or furrowed. Canescent, hoary; clothed with a whitish or gray pubescence.

CANNABINEAE. The Cannabis Sub-order, or Hemp section, of the Urtica family. Capillaceous, or capillary, long and fine. or slender, like a hair.

Capitate, head-form; growing in a head.

or globular mass.

Capituliform, in the form of a little head. CAPRIFOLIACEAE. The Caprifolium or Honeysuckle family.

Capsular, resembling, or being, a cap-

sule.

A dry hollow seed vessel,usually opening by regular valves, and definite seams.

CARDUINEAE. A Sub-tribe of the Cynaratike Compositate, of which the genus Cespitose, having many stems growing Carduus is the type. Carduus is the type.

CARICEAE. The Carex or Scage tribe of

the Order CYPERACEAE.

Carinal, belonging to the keel, or midrib. Carinate, keeled; having a ridge on the back, like the keel of a boat.

Carnose, fleshy; more firm than pulp.

Carpel. A little fruit; usually a partial pistil, or constituent portion of a com
chaff y, bearing chaff; also resembling chaff. pound fruit.

Carpophore. A slender central axis. bearing the carpels,—as in Umbellife-RAE.

Carpophylls. The modified leaves which form the pericarp,—as in the capsule of the Gentian family.

Cartilaginous, hard yet somewhat flex-

ible, like gristle.

Caruncle. A fleshy excrescence, sometimes found at the hilum of seeds.

CARYOPHYLLACEAE. The Caryophillus CHENOPODIACEAE. The Chenopodium or

or Clove-Pink family.

is very thin, indehiscent, and closely adherent to the surface of the seed, in the Grasses, Cyperaceae, &c.

The Cassia tribe of the Order LEGUMINOSAE.

CATALPEAE. A Sub-tribe of BIGNONIEAE, typified by the genus Catalpa. Cauda. A tail. Caudate, having a tail,

or tail-like appendage.

Caulescent, having an evident or true

stem. Cauline, belonging to, or growing on,

the main stem.

Cellular, made up of little cells, or cavities, formed of membranaceous sacs. Cellular plants. The lower orders of

plants (including the Mosses, and those below them), composed exclusively of cellular tissue.

ULMACEAE or Elm family.

CENTAURIEAE. A Sub-tribe of the Cynara tribe of COMPOSITAE, of which Centaurea is the type.
Centrifugal inflorescence,—where the

central flower of a cyme precedes the others,-i.e. the flowering commences at the centre and extends successively to the circumference.

Centripetal inflorescence, where the outer flowers of a corymb or umbel precede the inner ones,-i. e. the flowers expand, in succession, from the circumference to the centre.

Cephalodia. The knobs, or head-shaped fructifications, of some of the LICHE-

NES.

Cereal, pertaining to Ceres; belonging to those farinaceous grains, or seeds, of which bread is made, - and over which the Goddess Ceres was supposed, by the ancients, to preside.

Cernuous, nodding; the apex or summit drooping, or turned downwards.

tussock.

Chaff. A dry membrane,—usually the small husks, or seed-covers, of the grasses; also the bracts on the receptacle of many compound and other ag-

Longitudinal grooves; the Channels. interstices between the ribs on the fruit of umbelliferous plants.

Channelled, grooved or furrowed. Character (in Natural History). The features of objects, or classes of objects, by which they are known, and distinguished from each other.

Chartaceous, of a texture resembling

Goose-foot family.

CHENOPODIEAE. The Tribe of propert Chenopodiums, of the Order Chenopo-DIACEAE.

A Sub-tribe of GENTIANEAE, CHLOREAE. represented by the genus Chlora. CHLORIDEAE. A Tribe of Grasses, typified by the genus Chloris.

HRYSANTHEMEAE. A division of the Anthemis Sub-tribe, of which Chyan-CHRYSANTHEMEAE.

themum is the type.

Chrysocomeae. A division of Aster-like Comose, having a tuft or topknot of hairs, bracts, or leaves, at summit, or

is the type.

of a leaf, &c.

CICHORACEAE. The Tribe of COMPOSITAE COMPOSITAE. of which Cichorium is the type. Cilia. Hairs arranged like eye-lashes,

along the margin of a surface.

Ciliate-serrate, having serratures resembling cilia, or short eye-lashes. CIMICIFUGEAE. The Cimicifuga tribe of the Order RANUNCULACEAE.

Cinereous, of the color of wood-ashes. Circinate, with the apex rolled back on itself, like the young fronds of a fern.

Circumscissed, cut round transversely, or opening horizontally, like a snuff-box. Cirrhose, bearing tendrils, or terminating

in a tendril.

Cirrhus. A tendril,-which see.

Class. One of the higher or primary divisions of plants, or other natural objects, in a systematic arrangement.

i. e. larger at summit.

Claw of a petal. The slender tapering portion at base, or below the middle. Cleft, split, or divided, less than half way to the base: sometimes the division itself is called a cleft.

Coastaneous flowers, appearing at the same time with the leaves.

Coarctate, contracted, or crowded into a narrow compass.

Coccus (plural cocci). A kind of semi-baccate indehiscent carpel.

Cochleate, coiled like a snail-shell. CCELOSPERMAE. A Suborder of UMEELLI-FERAE, with the face or commissure of the carpels concave by the incurving of base and apex.

Coherent, united with an organ of the Coniferate. The family of conebearing same kind,-as stamens coherent with each other, &c. See adherent.

Collateral, placed side by side; or on the same side of another organ.

Colored, of any other color than green.

Columella. A little column.
Column. The axis or central pillar of a capsule: or the combined filaments!

and style of a Gynandrous or Orchidaceous plant.

Coma. A terminal tuft of hair, bracts,

&c. Commissure. The line of junction of two bodies,—as the face of the carpels (or mericarps), in UMBELLIFERAE.

Common (petiole, peduncle, &c.), belonging to, or sustaining, several simi-

at one end.

Cicatrice. A scar,—such as that left at Compact, condensed, or pressed together. the place of articulation, after the fall Complete flower, having both calyx and corolla.

The family of Compound, or Syngenesious aggregated flowers. Compound, not simple,—but made up of

similar simple parts.

Ciliate, fringed, or edged with parallel Compound flower. An aggregated clushairs, like eye-lashes. seated on a common receptacle, and embraced by an involucre, or manyleaved common calyx.

Compound leaf. Consisting of several leaflets, or laminae, each articulated with the common petiole, and ultimately falling from it.

Compound Ovary. Consisting of 2 or more carpels, or simple ovaries, cohering together. Compound Umbel. An Umbel in which

each primary peduncle, or ray, bears a small umbel at summit.

Compressed, flatted, as if squeezed or

pressed. Clavate, club-shaped; thicker towards the summit, or outer end.

Clavellate, in the form of a little club,—

Clavellate, in the form of a little club,—

Clavellate, in the form of a little club,—

Clavellate, club-shaped; thicker towards compressed Akene (in compound flowers), flatted, with one edge to the front, or periphery. See obcompressed.

Concave, presenting a hollow or depressed surface.

Concentric layers, or circles. Circles of different sizes, or diameters, with a common centre.

Concrete, grown together, or united. Clypeate, in the form of an ancient Conduplicate, doubled lengthwise, or shield or buckler.

Conduplicate, doubled lengthwise, or folded together like a sheet of paper, or the leaves of a book.

Cone. The woody ament of the Pines; also the fruit of the Hop, &c.

Conic, Conical, or Conoid, having the figure of a cone. Confluent, blended, or running together;

forming a junction.

Congener. A plant belonging to the same genus: nearly related Conglomerate, clustered or heaped to-

gether.

plants,—as the Pines, &c.
CONIOMYCETES. A Tribe of the Order

Fungi, or Mushroom family: minute powder-like fungi.

Conjugate, in pairs; coupled.

Connate, growing together, or cohering. Connective, or Connectivum. The organ which connects the two cells of an anther,-conspicuous in some of the Crenulate, very finely crenate. LABIATAE.

Connivent, the summits meeting, or bending towards each other.

Constant, invariable; also never failing,

or wanting. Contiguous, so near as to seem to touch.

Continuous, without interruption, or articulation. Contorted, twisted; or obliquely over-

lapping.

Contracted, narrowed, or reduced into a smaller compass.

Contrary dissepiment. Not parallel, but at right angles, or nearly so, with the

Convolute, rolled into a cylindrical form. CONVOLVULACEAE. The Convolvulus or Bind-weed family.

CONVOLVULEAB. The proper Convolvulus Tribe of the Order Convolvulaceae. Coraloid, resembling coral, in appearance.

Cordate, heart-shaped, with the sinus or notch at the base.

Cordate-oblong, oblong, with a cordate Crustaceous, having a dry brittle shell.

Coriaceous, tough and leather-like.

Coriandreae. The Coriandrum Tribe Cucullate, in the form of a cowl; the of the Order UMBELLIFERAE.

Cormophytes. Plants having a stem, or

axis of growth.

Cormus. A fleshy subterraneous stem, of CUCUREITACEAE. The Cucurbita or Gourd a round or oval figure, and an uniform family.

compact texture, as in the Arum, or Cucurentere. The special Gourd tribe,

family.

Corneous, having the consistence or ap-

pearance of horn.
Corniculate, having little horns or spurs. Cornute, having appendages like horns. Corolla. The delicate inner covering of the flower, between the calyx and stamens, mostly colored.

Coroniform, in the shape of a crown. Corrugated, contracted into wrinkles. Cortical, belonging to the bark.

Corymb. A mode of flowering: a kind of raceme, with the lower peduncles elongated so as to form a level top.

Corymbose, in the manner of a corymb. Corymbulose, having the flowers in little

CORYPHINAE. A Tribe of the Order Pal-MAE, of which the genus Corypha is the type.

Costate, ribbed.

Cotyledons. The seed-lobes, or first crude leaves of a plant,—formed in the seed; and sometimes becoming green leaves in vegetation.

Creeping, running along the ground, and

putting forth small roots.

Crenate, notched on the edge, with the gular. segments rounded, and not inclining Cymose, with the flowers in cymes, or towards either extremity.

Crested, having an appendage resembling a cock's comb.

Crisp, curled, or wavy at the edges.

Cristate, crested; having a crest. Cross, or cross-breed. A hybrid, or mule, produced by the mixing of two nearly allied species.

Crowded, thickly set; standing in close

order.

Crown. A circular series of petaloid appendages at the throat of a corolla; valves of the pericarp.

Convex, presenting an elevated rounded surface.

also of chaffy scales at the summit of an akene.

Crowned, having appendages resembling a crown. also of chaffy scales at the summit of

Crown-shaped, resembling the figure of

a crown.

Cruciate, or cruciform, having 4 petals arranged in form of a cross,—as in Tetradynamous flowers.

CRUCIFERAE. The cross-bearing family of plants: Tetradynamous plants with 4 petals arranged in the form of a cross.

Cryptogamous plants. Plants which are destitute of visible genuine flowers.

edges rolled in so as to meet at base, and spreading above,-like a hood thrown back.

Indian Turnep.

Of the Order CUCURBITACEAE.

CORNACEAE. The Cornus or Dog-wood

Culm. The stem of the Grasses, and

Cyperaceous plants.

Cuneate, or cuneiform, wedge-shaped; tapering with straight edges to the

CUPRESSINEAE. The Cupressus or Cypress Sub Order of the CONIFERAE. Cupule. The cuplike involucre of the

acorn, &c. The family of cupule-CUPULIFERAE.

bearing trees and shrubs,—as the Oaks, &c. CUSCUTEAE. The Cuscuta or Dodder

tribe of the Convolvulaceae. Cusp. A stiffish tapering sharp point.

Cuspidate, tapering to a straight stiffish sharp point.
Cuticle. The outer skin,—usually thin

and membranaceous. CYCLCLOBEAE. A Sub Order of CHENO-

PODIACEAE, in which the embryo is coiled in a circle round the albumen.

Cylindric, long, round, and of uniform diameter.

A kind of panicle, depressed nearly to the form of an umbel .- with the principal peduncles rising from the same centre, but the subdivisions irre-

approaching that form.

Cymules. The reduced cymes, or cy-Didynamous, having 2 long and 2 shorter mose clusters, of the LABIATAE; sometimes called Verticillasters.

A Tribe of COMPOSITAE, of CYNAREAE. which the genus Cynara is the type. CYNOGLOSSEAE. A Subtribe of BORAGEAE

represented by Cynoglossum.

WPERACEAE. The Cyperus or Sedge CYPERACEAE. family of plants.

CYPEREAE. A Tribe of the Sedge family, specially typified by the genus Cyperus. DALIBARDEAE. A Sub tribe of the Order Rosaceae, typified by the genus Dali-

barda.

DATUREAE. The Datura or Thorn-apple tribe of the Order SOLANACEAE.

DAUCINEAE. The Daucus or Carrot tribe

of the UMBELLIFERAE.

Decan Irous, having ten distinct stamens. Deciduous, falling off at the usual time, or at the end of the season; more durable than Caducous,—which see.

Declinate, or declined, bent off horizon
Dioicously polygamous, having perfect Dioicously polygamous, having perfect Dioicously polygamous, having perfect Dioicously polygamous and different different distance of the usual time, brown color.

Dioicous, having staminate and pistillate flowers on distinct plants.

tally; or curved downwards.

Decompound, twice compound; composed of compound parts.

Decumbent, leaning upon the ground, DIFSACEAE. with the base only erect. family.

with the base only erect.

Decurrence. A running or extending Discoid flower, or head. A disk of com-

down, or backwards. Decurrent leaf. When the two edges are Disepalous, having 2 sepals.

continued down the stem, like wings. Decussate, growing in opposite pairs and alternately crossing each other

Definite, clearly defined, or limited; also Dissected, cut into segments, or lobes. large) number.

Deflected, bent off, or downwards.

Dehiscent, gaping, or opening naturally by seams, at maturity.

Deltoid, triangular in the outline,-like the Greek letter Delta.

Demersed, growing or being under water. Dense, closely arranged; compact. organ.

Dentate, toothed; edged with tooth-like Divaricate branches. Spreading so as to

projections.

Denticulate, having very small teeth. Depauperated, with a starved or stunted

inflorescence; few-flowered. right angle, or nearly so, with the stem. Depressed, flatted vertically, or pressed Divided, separated or cleft to the base,—

down at summit. Depressed-globose, globular, with the base Dorsal, belonging to, or growing on, the

and apex flatted.

Diaphanous, transparent;

of a dichotomous stem or branch.

Dichotomous, forked; regularly divided and subdivided, in two equal branches. Diclinous, having the stamens and pistils same or different plants

Dicotyledonous plants. Where the embryo has 2 lobes, or cotyledons.

Didymous, twin; growing in pairs, and more or less united.

stamens, mostly in a bilabiate, ringent, or personate corolla.

Diffuse, spreading widely in a loose irre-

gular manner.
Seitate leaf. Where a simple petiole Digitate leaf. connects several distinct leaflets, finger-like, at its summit,—as in the Horse Chesnut.

Digynous, having 2 pistils, or 2 distinct

stigmas.

Dilated, made wider; stretched or ex-

panded.

Dimerous, composed of two parts,—as a dimerous calyx or corolla, when there are 2 sepals or petals.

Dimidiate, halved,—as if one side, or half had been cut off.

Dingy, of a dull, soiled, smoky, or leaden-

and imperfect flowers on different plants.

Dipetalous, having 2 petals.
DIPSACEAE. The Dipsacus or Teasel

pound flowers, without ray-florets.

Disk. The surface of the leaf; also the face, or central part, of a head of compound flowers.

of a constant or determinate (and not Dissepiment. The partition between the cells of seed-vessels.

Distant, having a larger intervening space than usual.

Distichous, two-rowed; bearing leaves, flowers, &c. in 2 opposite rows

Distinct, separate; not connected with each other, nor with any contiguous

form more than a right angle with the stem above.

Divergent, spreading widely; making a right angle, or nearly so, with the stem.

or to the midrib, if a leaf.

back.

Diadelphous, having the filaments united in 2 parcels,—usually 9 and 1, with a papilionaceous corolla.

Diandrous, having 2 stamens.

Diandrous, having 2 stamens.

Diandrous, having 2 stamens.

permitting Dorsally compressed, flatted on the back.

light to pass through.

Dichotomal flower. Situated in the fork Dotted, covered with dots, specks, or minute and slightly elevated points.

Downy, clothed with soft fine hairs.

Drooping, inclining downwards, more than nodding.

in distinct flowers,-whether on the Drupaceous, drupe-like,-of a structure resembling a drupe, or what is usually

called stone-fruit. Drupe. A fleshy, succulent, or spongy pericarp, without valves, containing a 1 or 2-seeded nut, or stone.

Drupel. A little drupe; a constituent por- Equitant leaves. When alternate distion of a compound berry,—such as that of Rubus.

DRYADEAE. A tribe of ROSACEAE, typified

EBENACEAE. family.

Ebracteate, destitute of bracts.

Ebracteolate, destitute of bractlets. Ecaudate, destitute of a cauda, or tail.

ECHIEAE. A Subtribe of BORAGEAE, represented by the genus Echium.

Echinate, hedge hog-like; covered with

prickles.

Elaters. Minute clubshaped filaments, which are coiled round the spores of certain cryptogamous plants,-and by unrolling, assist in dispersing those spores.

Elliptic, or elliptical, oval; longer than wide, with the two ends narrowing

equally.

Elongated, exceeding the usual or aver-

age length.

Elongating, becoming gradually and finally elongated.

Emarginate, having a notch or sinus at

the end.

Embryo. The young plant in the rudimentary state, as it exists in the seed.

Emersed, raised out of water.

That membranous or bony EU-ASTEREAE, Endocarp. portion of the pericarp which lines the cavity, or forms the cells for the seeds (ex. gr. the stone, or hard shell, in a Drupe).

Endogenous plants. Those which have a single cotyledon,—and grow by central deposites of new matter, distending or pushing the older deposites outwards.

Sented by that genus.

EUPATORIACEAE. The Eupatorium Tribe of the Order CompositaE.

EUPATORIEAE. The Sub-tribe of EUPATORIEAE. a single cotyledon, -and grow by cen-

Endogens. Inside-growers; plants which increase by central or internal deposites of new matter. See Endogenous EU-PHASEOLEAE. A Sub-tribe of PHASEOplants.

Enneandrous, having 9 stamens.

Ensiform, sword-shaped; two and tapering from base to apex. Entire, having a continuous even margin;

without incision, notch, or tooth.

NTOPHYTI. A Subtribe of parasitic Fungi which develope themselves ENTOPHYTI. within the tissue of other, and usually Eu-senecioneae. A division of the Seliving, plants,-as mildew, &c.

Envelope. An integument, or covering. Ephemeral, diurnal; enduring one day Evanescent, disappearing; speedily van-

only.

carp, or fruit.

Epigynous, adnate to the ovary so that the upper portion is apparently inserted on its summit,—as sepals, petals, and more especially stamens: exem-

Epipetalous, inserted on the petals. Equal, similar parts equal among them-selves,—as calyx-segments, sepals,

petals, stamens, &c.
DUISETACEAE. The Equisetum family. EQUISETACEAE.

tichous leaves are infolded lengthwise and towards each other, the outer ones inclosing or embracing the inby the genus Dryas.

BENACEAE. The Ebenum or Ebony ERECHTITEAE. A division of the Senecio

subtribe of COMPOSITAE, represented

by the genus Erechtites

Erect ovules, or seeds. When they arise from the bottom of the ovary, or base of the cell, and point upwards. ERICACEAE. The Erica or Heath fami-

ly of plants.

ERICINEAE. The Sub-order of ERICACEAE, of which the genus Erica is the spe-

cial type.

Eroded, or erose, irregularly notched, as

if gnawed by insects.

Esculent, eatable; fit or safe to be eaten. Etiolation, the blanching of plants,—or rendering them white by the exclusion of light; as practised with Celery, Endive, &c.

Eu, a greek adverb, meaning clearly, or certainly,-often prefixed to the names of Sub-tribes, or Divisions, indicating their genuineness, or close affinity to

the typical genus.

EU-ANTHEMIDEAE. A division of the Chamomile Sub-tribe of CompositEAE, embracing plants of the true Anthemis

Structure or type.
U-ASTEREAE, The Sub-division of Aster-like plants, which includes Aster itself, and the most nearly allied genera.

Eu-heliantheae. A division of the $H\epsilon$ lianthus Sub-tribe, specially repre-

RIACEAE, specially typified by the genus Eupatorium.

LEAE, eminently and clearly allied to Phaseolus.

two-edged EUPHOREIACEAE. The Euphorbia family of plants.

EUPHORBIEAE. A tribe of EUPHORBIACEAE, specially typified by the genus Euphorbia.

necio tribe, specially represented by that genus.

ishing.

Epicarp. The outer coating of the peri- Even-pinnate leaf. With the leaflets all in pairs, or without a terminal odd one; often termed abruptly pinnate. Evergreen, continuing green, and per-

sisting all the year. Exalbuminous, destitute of albumen.

plified in Umbelliferae and Araliaceae. Excentric, deviating from the axis, or centre.

Exfoliate, to throw off layers or plates,as bark, &c.

Exogenous plants. Those which have 2 (or sometimes more) cotyledons,- (or new matter) on the outside, between the old wood and bark.

Exogens. Outside-growers; plants which increase by annual additions to the outside. See Exogenous plants.

Exsert, or exserted, projecting, or pro-truding out,—as stamens from the tube of the corolla.

Exstipulate, destitute of stipules.

atrorse anthers. Having the cells turned outwards, or from the pistils,— Extrorse anthers. and the filament, or connective, extending up the inner side.

Falcate, sickle-shaped; curved like a sickle, or scythe.

Family of plants. A definite group of kindred plants, called also an Order.—sometimes of numerous genera and species—sometimes comprising but a single genus.

Fan-shaped, cuneate below, and spread-

ing above,—like a lady's fan.

Farinaceous, mealy; reducible to a meal-like powder

A little bundle, or bunch, of flowers, leaves, &c. originating from Foramen (plural, foramina), a roundish nearly the same point.

Fasciculate, growing in bundles, or bunches, from the same point.
Fastigiate, level-topped; the summits

of the branches all rising to the same height.

Favose, deeply pitted; somewhat like a Free, not adhering to each other, nor to

honeycomb.

Feather-veined leaf. Where the lateral veins (or nerves) diverge regularly from each side of the midrib,—like the Frondose, leafy or with leaf-like appenplumage of a quill.

Ferruginous, of the color of rust of iron; Fructification.

ducing fruit. FESTUCACEAE. The Festuca or Fesoue

tribe of the Order GRAMINEAE. Fibrous, composed of fibres, or threadlike processes.

Fide, on the faith, or authority, of.

Filament. That part of the stamen (usually thread-like) which supports

Fungous, of rapid growth and soft texthe anther.

FILICES. The family of Ferns.

fern-like; belonging to or resembling ferns.

Filiform, very slender and terete, like a thread.

Fimbriae. Fringes, or fringe-like processes.

Fimbriate, finely divided at the edge.

like a fringe.

Fimbrillate, clothed with fimbrillae (i. e membranaceous, linear or subulate. Galeate, helmeted; resembling a casque, filaments)-as the receptacle of thistles, &c.

Fissure. A slit, crack, or narrow open-

Fistular, hollow and terete, like a pipe. tubular.

Flabelliform, fan-shaped,—which see.

and grow by annual layers of wood, Flaccid, so limber as to bend by its own weight.

Flagelliform, long, slender, and pliable,like a whip lash.

FLAVIFLORAE. The yellow-flowered tribe of the Order LAURACEAE.

Flexuose, serpentine, or with a succession of short alternating curves.

Floccose, or flocculent, covered with flocks, or flakes, or little matted bunches of partly detached tomentum. Floral, belonging to, or situated near, a flower.

Floral envelopes. The verticils, or coverings of flowers,—usually known as calyx and corolla; sometimes as chaff.

Floret. A little flower; usually one of the number in compound or aggregated flowers.

Floriferous, bearing flowers.

Foliaceous, of a leaf-like form and texture; resembling a leaf,

Follicle. A capsular fruit opening longitudinally by a suture on one side. Follicular, resembling, constructed like,

or being, a follicle.

hole, or opening.
FRAGARIEAE. A Sub-tribe of the Order ROSACEAE, typified by the genus Fragaria, or Strawberry.

FRAXINEAE. The Fraxinus or Ash tribe

of the Order Oleaceae.

any adjacent organ.

Frond. The leaf, or leaf-like expansion,

of Cryptogamous plants.

The flower and fruit,

reddish-brown.

Fertile, having perfect pistils, and pro-

and its contents. Frutescent, becoming shrubby, or hard

and woody. Fruticose, shrub-like, or shrubby.

Fugacious, fleeting; of short duration. Fulvous, tawny, fox or tan-colored. Fungi. The Order of Mushrooms.

ture, like the fungi.

Funiculus. The little cord by which seeds are attached to the placenta. Funnel-form, tubular below, and ex-

panding above,—like a funnel. Fuscous, greyish-brown, or deep brown

with a tinge of green. Fusiform, spindle-shaped; terete and

tapering to a point.

Galea. A helmet; the arched upper lip

of a ringent corolla.

or helmet.
The Galega tribs of the

GALEGEAE. Order LEGUMINOSAE.

Gamopetalous, having the petals all more or less united,—forming what is called (rather incorrectly) a monopetalous corolla.

Gamosepalous, having the sepals all more or less united,—forming a mon-

genus.

Geniculate, forming an angle at the Halved, one-sided,—as if one half had joints, like a bent knee.

tian family. GENTIANEAE. The proper Gentian tribe

of the Order GENTIANACEAE.

Genus (plural, genera). A group of sile flowers. species which agree with each other HELIATHEAE. A Sub-tribe of Senecioin the structure or essential characters of the flower and fruit: sometimes a genus comprizes but a single species. HELLEEOREAE. Germ. The growing part of a bud.

Germen. The old name for the ovary.

growth, of a seed.

Gibbous, hunched, or swelled out, on one or both sides.

Gills. The fruit-bearing membranes of

the Agarics, or Mushrooms.

Glabrous, very smooth; without any roughness or pubescence.

roughness or pubescence.

Gland. A small roundish organ, or appendage, which often secretars of the secretary of the secretar appendage, which often secretes a fluid.

Glandular, furnished with glands.

Glandular-hispid, or glandular-pubes- in Ambrosia, &c. cent, hairy or pubescent, and the hairs Heterogamous heads. Heads of Syngetipped with glands.

Glaucous, silvery; pale b pale bluishwith greenish-white mealiness. Globose. or globular, spherical; round on

all sides.

heaps, or irregular heads. Glomerules. Small dense roundish Hilum.

clusters.

Glumaceous, chaff-like; resembling chaff HIPPOCASTANACEAE. The Horse-chesnut or glumes

Glumes. The bracts, or outer chaff, embracing the spikelets of the grasses (cally x, of Linn.). See Palea. Glumose, having glumes (or, sometimes.

having conspicuous glumes).

Glutinous, viscid; covered with an adhesive fluid.

GNAPHALIEAE. A Sub-tribe of Seneciolike plants, represented by the genus Gnaphalium.

GRAMINEAE. The family of true Grasses. Gramineous, grass-like; grasses

Graniferous, bearing a grain, or grains. Granular, formed of grains, or small particles.

GROSSULACEAE. The family of Gooseberries and Currants.

Gymnospermous, having the seeds na-ked—i. e. not inclosed in a pericarp. Horny, of a texture or consistence like horn. See corneous. ked—i. e. not inclosed in a pericarp. horn. See corneous.

Gynandrous, having the stamens growHumus. The mould, or soil, formed by

ing on, or adhering to, the pistil.

tube, formed by the connate filaments

more or less united,—forming a monosepalous caly x.

GASTEROMYCETES. A tribe of FUNGI with the spores in a ventral sac.

Generic, pertaining or relating to a distribution of the Asclepias family.

Habit of plants. Their general external appearance and mode of growth, by which they are recognized at sight.

Habitat, or habitatio. The natural or

native place of growth.

been cut off.

GENTIANACEAE. The Gentiana or Gen-Hastate, shaped like a halbert; lanceolate, with a divariente lobe on each side of the base.

Head. A dense roundish cluster of ses-

like plants, typisfed by the genus Helianthus.

The Helleborus tribe of the Order RANUNCULACEAE.

Heptandrous, having 7 stamens.

Germination, the sprouting, or incipient Herbaceous, not woody; of a tender consistence, and usually destructible by frost.

A collection of dried speci-Herbarium.

mens of plants.

Herbs. Plants which are not woody-of a more tender structure than trees and

genesious florets of different sexual character (i.e. staminate and pistillate heads distinct) on the same plant,-as

nesious flowers, containing florets of different structure and sexual character.

Heterophyllous, having leaves of different forms.

all sides.

Hexamerous, consisting of 6 parts.

Hexandrous, having 6 stamens of equal

length.

The scar left on a seed, at the point of attachment to the funiculus.

family. rough-haired; clothed with

Hirsute, rough

Hispid, bristly; beset with rigid, spreading, bristle-like hairs.

Hoary, covered with a white or whitish

pubescence. Homogamous heads. Heads of Synge-nesious flowers, in which all the flo-rets are of similar structure and the same sexual character.

Hooded. See cucullate.

resembling HORDEACEAE. The Hordeum or Barley tribe of the GRAMINEAE.

Horizontal ovules. When they project from the side of the cell, pointing neither to base nor apex.

Horn. A process or elongation resembling a horn. See Spur.

the decomposition of vegetable matter. Gynostegium. The pistil-covering, or HYACINTHEAE. A tribe of the Sub-order Asphodeleae, represented by the ge-[Indehiscent, not opening at maturity. nus Hyacinthus.

Hyaline, transparent, like glass.

Hyaline, transparent, like glass.

Hybrid. A mule; a cross-breed between Induplicate, folded inwards. two varieties, or nearly allied species. Indurated, hardened; become hard.

partaking of each but different from Indusium. The membrane, or veil, which covers the young Sorus (or

HYMENINI. A section of the tribe HYME-NOMYCETES,—i. e. Fungi with the sporules contained in a superficial mem-

brane, or in gills.

Hymenium. The membrane containing the sporules of certain Fungi; the plates, or gills, on the under side of the pileus of the Agarics. the pileus of the Agarics.

HYMENOMYCETES. A tribe of the Order Inflated, distended or swelled like a

Fungi, containing the sporules in a

membrane, or hymenium.

HYOSERIDEAE. A Sub-tribe of CICHORA-CEAE, represented by the genus Hyo-Inflorescence.

HYPERICACEAE: The Hypericum or St.

John's Wort family.

HYPERICEAE. The tribe of HYPERICACEAE. Inserted, fixed upon, or growing out of. of which Hypericum is the special Internode.. That portion of a culm, or type.

HYPODERMIA. A division of the Sub-tribe of Entophytes; minute Fungi. seated under the skin or epidermis of living plants.

Hypogaean, situated, growing, or re-

maining, under ground.

Hypogynous, inserted beneath the ovary. -i. e. on the receptacle, and free from the surrounding organs.

Icon. An image, figure, or representa-

tion.

Icosandrous, having about 20 stamens. which are perigynous,—i. e. growing to, or apparently inserted on the rim of, the calyx.

Imbricate, or imbricated, the edges lying closely and regularly over the next series,-like shingles on a roof, or

scales on a fish.

Imperfect flower. When either stamens

or pistils are deficient.

Incised, cut, or gashed; separated by Involucrate having an involucre. incisions.

Inclinate, or inclined, bent over towards the ground, or some other object.

Included, wholly contained within tube, or cavity; the opposite of exserted.

Incomplete flower. When either Calyx Involute, rolled inwards.

or Corolla is wanting.

Incrassate, thickened upwards, or towards the summit.

Incumbent, lying upon against, or across. Incumbent anther. Attached at or near its middle, and lying horizontally across the summit of the filament.

Incumbent cotyledons. Having the ra-dicle bent over and applied to the back of one of the cotyledons (represented by this sign, oil).

Incurved, hent or curved inwards.

Indefinite, not distinctly limited, or defined; numerous, and of no constant Kernel. The nucleus, or seed contained or determinate number.

Indigenous, native; growing naturally,

cluster of fruit) on the Ferns.

Inferior caly x. Having the ovary above, and free from the caly x.

Inferior ovary. Situated apparently below the calyx, or rather its segments; -i. e. adnate to the tube of the caly x, and consequently bearing the segments

blown bladder.

Inflected, or inflexed, bent suddenly in-

wards.

The disposition or arrangement of flowers and their foot-stalks on a plant,—such as Umbel, Panicle, Raceme, &c.

stem, between the nodes or joints.

Interpetiolar stipules. Situated or originating between the petioles of opposite leaves.

Interrupted, having intervals; or the

continuity broken.

Interruptedly pinnate, having smaller pinnae, or leaflets, between each pair of larger ones.

Intra-petiolar stipules. Situated within and above the petioles,-usually sheathing the branch above the axil of the leaf; as in Platanus.

Introrse anthers. Having the cells turned inwards, or towards the pistils, -and the filament, or connective, extending up the outer side.

Inversely, in a contrary position; end for

end, or upside down.

evolucel. The verticil of leaflets at the Involucel.base of an umbellet

Involucellate, having involucels.

Involucre. An assemblage of modified leaves accompanying certain forms of inflorescence,—usually verticillate at the base of an Umbel,—or in imbricated series beneath or around the heads of aggregated flowers.

Irregular, the component parts differing in size and shape.

JUGLANDACEAE. The Juglans or Walnut family.

JUNCACEAE. The Juncus or Rush family of plants.

A longitudinal central ridge on Keel. the back of a leaf, sepal, &c. resembling the keel of a boat: Also, the lower pair of united petals in a papilionaceous flower.

in a nut.

KOCHIEAE. A Sub-tribe of CHENOPODI-EAE typified by the genus Kochia. LABIATAE. The family of labiate or

two-lipped flowers.

Lacerate, divided into irregular segments as if torn.

Laciniate, jagged; the margin irregularly cut into unequal segments. Lactescent, milky; containing a milky

or whitish juice. A Sub-tribe of CICHONA-

LACTUCEAE.

CEAE, typified by the genus Lactuca, or Lettuce. Lamellae. The plates or gills (Hyme-

nium) of the Agaric, or common Mush-

Lamellate, divided or dilated into thin

plates.

A thin layer or plate; the Lamina. expanded or flat portion of a leaf, or petal, as distinguished from the petiole, or claw.

Lanate, woolly; clothed with wool. Lanceolate, tapering gradually from near the base to the apex,-like the head

of an ancient Lance, or Spear. Lance-dinear, Lance-ovate, &c., linear, ovate, &c., with something of the lanceolate form.

Lance-ovoid, egg-shaped, or terete, with a swelling base and tapering apex. Lanuginous, clothed with a loose wool.

Lateral, at the side.

Laterally compressed, flatted on the sides; the lateral edges pressed towards each other.

Latticed, obliquely cross-barred, with open spaces like net-work. LAURACEAE. The Laurus or Bay-tree

family of plants.

Lax. loose, or limber; not compact.
Leaflets. Partial leaves; the constituent leaves of a compound leaf. Leaf-like (foliaceus), having a texture

and expansion resembling a leaf. Leafy (foliosus), furnished or abounding

with leaves.

Legume. A Bean.—or fruit formed of a single carpel of 2 valves, with the seeds affixed along the upper suture,

The family of Legume-LEGUMINOSAE.

bearing plants.

Leguminous, having the structure of a lew moo Legume; bearing or producing the LYCCPODIACEAE.

orbicular and compressed, but convex on both faces.

LEPIDINEAE. Order CRUCIFERAE.

vegetable expansions.

Ligneous, woody; of a firm woody tex-MALVACEAE.

ture.

Knot. A node; a solid, inseparable, and Lignescent, becoming somewhat woody. often swelling joint,—as in the stem LIGULAEFLORAE. The third Sub-order of of the grasses, &c.

Compositae, in which all the florets are ligulate.

Ligulate, strap shaped, or ribband-shaped; flat and linear.

Ligule. The usually membranous appendage at the base of the leaf, or summit of the sheath, in the grasses. LILIACEAE. The Lilium family, or Or-

der of Lily-like plants.

Limb. The summit of a monosepalous calyx; or the upper spreading part

of a monopetalous corolla.

LINACEAE. The Linum or Flax family.

Line. The twelfth part of an inch. Linear, of an uniform width; long and

narrow with parallel sides.

Linear-lanceolate, &c., partaking of both forms, but more of the latter.

Lip. The upper or under division of a labiate flower; or the lower perianthsegment of many Orchidaceous flowers.

LITHOSPERMEAE. A subtribe of BORA-GEAE. represented by the genus LITH-

OSPERMUM.

Lobe. The division, or segment, of a petal, or leaf: the free portion of a gamopetalous corolla.

Lobate, or lobed, cut or divided into lobes.

The Lobelia family. LOBELIACEAE.

LOBELIEAE. The tribe of LOBELIACEAE, specially represented by the genus Lobelia.

Loculicidal dehiscence. When the peri-carp opens naturally on the back of a cell (i. e. at the dorsal suture) directly into the cavity.

oment. An indehiscent 2 or several-seeded legume, contracted between each seed and finally separating at Loment.

the joint-like contractions.

LOMENTACEAE. A division of the Order CRUCIFERAE, containing plants with lomentaceous pods.

Lomentaceous legume, or pod. A pod of 2 or more seeds, with a joint-like contraction, or transverse partition, between the seeds.

Longitudinal, length wise; parallel with the axis,—or in a direction from the base towards the summit or apex.

Lunate, or lunulate, having the figure of a new moon.

The Lycopodium or

fruit called a Legume. or Bean. club-moss family.

Lenticular, having the form of a lens; Lyrate, lyre-shaped; pinnatifid, with orbicular and compressed, but contact the terminal segment largest and mostly rounded.

The Lepidium tribe of the MAGNOLIACEAE. The Magnolia family or Order.

Order of flowerless Thallophytes, or CEAE, of which the genus Magnolia is the special type.

ALVACEAE. The Maka or Mallow,

family.

the stem, instead of falling off.

Margin. The edge or circumference of Nettle fami a leaf, or other expansion; also, the Mucorodel. thin wing-like border of certain seeds,

Marginate, or margined, having a border or edging of a texture or color different from that of the disk; surrounded by a wing-like expansion, Mult fid, many-cleft; cut into numeror narrow membrane.

cellular tissue, which pass from the

pith to the bark, in woody stems.

MELAMPODINEAE. A Sub-tribe of Senecio-

MELIACEAE. The Melia or Pride of India family.

of the Order LABIATAE.

Melliferous, producing or containing

Membranaceous, or membranous, thin, Mutic or muticous, awnless or point-flexible, and often slightly transluless: the opposite of mucronate. cent.

ENTHOIDEAE. The Mentha or Mint tribe, of the Order LABIATAE. MENTHOIDEAE.

Iericarp. A name given to the inde-hiscent carpel of the UMBELLIFERAE. Mericarp. Micropyle. The small foramen, or opening in the proper coats of a seed, to

which the radicle always points.

idrib. The main central nerve of a leaf,-apparently a continuation of

the petiole.

Monadelphous, having the filaments all united in one set,-usually forming a tube.

Monandrous, having a single stamen.
Monardeae. The Monarda or Horsemint tribe of the Order LABIATAE.

Moniliform, arranged like, or resembling the beads of a necklace.

Monoclinous, having the stamens and pistils in the same flower.

Monocotyledonous plants. Where the Monocotyledonous plants. embryo has but a single lobe, or co-

tyledon. Monograph. A description (usually ample and elaborate) of a single thing. or class of things,—as of a Genus, Tribe, or Family, &c.

Monogynous, having but one pistil. Monoicous, having staminate and pistillate flowers distinct, but on the same

plant. Monoicously polygamous, having perfect

plant. Monopetalous, having but one petal; or, more correctly, the petals united into

Monosepalous, consisting of one sepal, kernel of a nut.

or rather, several sepals united Nucules. Little nuts, or nut-like fruit.

more or less completely. See gamo Nut. A hard 1-celled indehiscent fruit, sepalous.

Marcescent, withering and shrivelling on Moreae The Morus Sub-order, or Mulberry section of the URTICACEAE, or Nettle family.

UCOROIDEI. A Sub-tribe of the GAS-TEROMYCETES, or closed FUNGI, typified by the genus Mucor, or Mould.

Marginal, belonging to, or situated at, the margin.

Mucronate, terminated by a mucro, or small projecting point,—usually the marginate, or margined, having a border or edging of a texture or color derivative mucro, or mucronulate, having a small mucro, or

ous segments.

Medullary rays. Bands or thin plates of Multiple. A number containing another number several times without a fraction, or remainder;—as 9 is a multiple of 3

like plants, of which the genus Me-lampodium is the type.

Multiple fruits. Where there is a combination of several flowers into one aggregate mass,-as in the Pine-apple,

Mulberry, &c.

MELISSINEAE. The Melissa or Balm tribe, Muricate, armed or covered with short spreading points, or acute excrescenccs,-like a Murex.

Musci. The family of Mosses.

Naked, destitute of the usual covering, or appendage,-as a stem without leaves, or scales-leaves without pubescence-corolla without a calyx, or crown-seeds without a pericarp-a receptacle without chaff, or hairs-an Umbel without an involucre, &c.

Napiform, turnep-shaped.

Natural Order, family, or tribe. An association or group of kindred genera, or of plants which are nearly related in their structure, and most important characters.

Nectury. That organ, or portion of a flower, which secretes honey; a term formerly applied to all disguised or modified forms of petals and stamens.

NEPETEAE. The Nepeta or Catnep tribe, of the Order LABIATAE.

Nerved, having nerves, or coarse rib-

like fibres. Nerves. Rib-like fibres (in leaves, &c.) which usually extend from the base to, or towards, the apex.

Having nei-Neuter, or neutral flower.

ther stamen nor pistil.

NICOTIANEAE. The Nicotiana or Tobacco tribe, of the Order SOLANACEAE.

Nodding, turning downwards; somewhat drooping.
ode. The knot, or solid and often tu-

Node.mid joint, of a stem or branch.

and imperfect flowers on the same Nodose, having numerous nodes, or tumid joints.

Normal, according to rule; agreeing with the pattern or type.

one. See gamopetalous.

Monophyllous, consisting of a single leaf. Nucleus. A central body; the seed, or

usually containing a single seed.

Ob, a preposition which inverts the usual meaning of the word to which

ıt is prefixed.

Obcompressed akenes (in the Composi-TAE). Flattish, with the greatest diameter from right to left,—or with the Ordinal, belonging to the Orders, or to flatted side to the front. or periphery of the head.

Obconic, inversely Conical,—i. e. with the point or apex downwards.

Obcordate, heart-form, with the sinus at summit, and the narrowed point at place of insertion.

Oblanceolate, inversely lanceolate,—or with the widest part above the middle, and tapering gradually to the

base.

Oblique, a position between horizontal ORYZEAE. and erect; also descriptive of the base of a leaf, &c., when it is unequal, or produced on one side.

Oblong. longer than wide, with the sides

parallel, or nearly so.

Obovate, inversely ovate, -or with the broadest end above.

Obovoid, inversely ovoid.
Obsolete, indistinct, as if worn out.
Obtuse, blunt, or rounded.

Obversely, turned contrary to the usual

position.

gins of each folded leaf is exterior, the other interior; also termed half-ovate-oblong, oblong, with an ovate diequitant. See Equitant.

Ochrea. A membranous stipular sheath, embracing the stem like a boot-leg;

as in Polygonum, &c.

Ochroleucous, yellowish-white, or cream colored.

OCIMOIDEAE. The Ocimum or Sweet Ocules. The rudiments of future seeds, Basil tribe, of the Order LABIATAE.

Octandrous, having 8 stamens. Odd-pinnate leaf. Having the leaflets in opposite pairs, with a terminal odd

one; often termed impari-pinnate. OENOTHEREAE. The Oenothera section or Sub-tribe of the ONAGRACEAE.

Officinal, used in, or belonging to, a shop, or medical office.

OLEACEAE. The Olea or Olive family.
OLEINEAE. The tribe of OLEACEAE specially typified by the genus Olea.
Oleraceous, of the nature or quality of

pot-herbs.

ONAGRACEAE. The Onagra or Evening Primrose family.

ONAGREAE. The proper Onagra tribe of the Order ONAGRACEAE.

Opaque, not transparent.

Opercular, opening like a lid that is fixed by a hinge at one side.

Opposite, situated directly against each other, or at the same height, on contrary sides of the stein.

Orbicular, circular and flat, like a coin: the length and breadth equal and the circumference an even circular line: a term applied to leaves, or flatted bodies. See Terete. bodies.

Orchidaceous, or Orchideous, belonging

to, or resembling, plants of the Orchis family.

A family or group of allied natural objects; a subdivision of a Class, embracing kindred Genera.

an Order.

Ordinal names. The names of the Natural Orders, or families of plants.

ORTHOSPERMAE. A Sub-order of UMBEL-LIFERAE, in which the face, or com-missure of the carpels, is straight and flat.

Orthotropous ovule, or seed. Straight; not curved, nor turned from its origi-

nal or natural direction.

The Oryza or Rice tribe, of the Order GRAMINEAE.

Oval, longer than broad, with the two ends of equal breadth and curvature,

and the sides curving from end to end.

Ovary. The young seedvessel, or fruit; the hollow portion at the base of the pistil, containing the ovules, or bodies destined to become seeds.

Ovate, flat, with the outline of a longitudinal section of an Egg; a somewhat oval figure, but broader near the

base.

Obvolute leaves. When one of the mar- Ovate-lanceolate, lanceolate, inclining to ovate at base.

Ovoid, egg-shaped; terete, and swelling near the base-i. e. having the outline of an entire egg.

Ovoid-oblong, the ovoid form lengthened

contained in the Ovary, or young fruit.

Palate. The prominence in the lower lip of a personate corolla.

Palea (plural, paleae). Chaff; a term applied to the inner, or immediate, floring ral covering of the Grasses. (Corolla, of Linn). See Glumes.

Paleacous, chaffy; of a chaffy texture,
—or furnished with chaff-like scales.
PALMAE. The Palm family.
Palmate, hand-shaped; deeply divided,

with the segments nearly equal and spreading like fingers on the open hand.

Palmately veined, or cleft,-having the veins or segments divergent, like the spreading fingers of an open hand. Panduraeform, fiddle-shaped; oblong

with the sides contracted, like a violin.

PANICEAE. The Panicum tribe of the Or-

der Gramineae.

Panicle. A loose irregular compound raceme,—in which the peduncles are unequally elongated, and variously and irregularly subdivided; as in Oats, &c.

Paniculate, disposed in the form of a

panicle.

PAPAVERACEAE. The Papaver or Poppy | Pellucid, transparent; pervious to light.

PAPILIONACEAE.

ceous corollas.

Papilionaceous corolla. Butterfly-sha-Peltate, like a shield; having the footped; when complete, consisting of 5 petals,-the upper one (mostly largest) called the vexillum or banner,—the 2 lateral ones termed the alae or wings,-the 2 lower ones more or less Pendulous, hanging down; attached at cohering by their lower margins, and. from their form denominated the keel. Pendulous ovules, or seeds. When their

Papillate, or papillose, having the surface covered with fleshy dots, or Penicillate, tipped or tufted with hairs,

points, like minute teats.

Pappus. The crown of the fruit,—being the segments, or free portion of an adherent calyx, in the CompositAE. and some other plants,-usually hairlike, or plumose,—sometimes in the form of minute chaff, or scales.

site.

Parenchyma. The soft spongy cellular tissue (often green), which forms the pith of stems, the pulp of leaves and young fruit, and fills the interstices of woody or vascular fibres.

Woody or vascular fibres.

The outside

Paries (plural, parietes). The outside wall, or inclosing shell, which circumscribes the cavity of a pericarp.

Parietal, affixed to, or belonging to, the paries or outer wall of the seed-cell of Perfoliate, having the stem apparently a pericarp.

Parietal placentae. When the placentae are borne upon the walls, instead of the axis, of the ovary, or pericarp.

of the axis, of the ovary, or pericarp.

Partied, divided deeply, almost to the base.

Partial a term applied to constituents.

Partial, a term applied to constituent portions of a compound whole.

Partition. See Dissepiment. Small orbicular receptacles Patellulae. of the Lichenes. resembling little dish-

es; sometimes termed spangles. Pectinate, finely, regularly and deeply cleft, so as to resemble the teeth of a comb.

PEDALIACEAE. The Pedalium family of

The tribe of PEDALIA-PEDALINEAE. CEAE, of which the genus Pedalium is

the special type. Pedate leaf. Like a bird's foot; divided nearly to the petiole in narrow segments, with the laterolones diverging.

Pedicel. A partial peduncle; the ulti- Perigynous petals and stamens. Insertmate branch, or division (next to the flower, or fruit), in a compound inflorescence.

on, a pedicel

Peduncle. A simple flower-stem; also, the common footstalk of a compound inflorescence.

Pedunculate, having a peduncle; not

sessile.

APILIONACEAE. A Sub-order of Legu-MINOSAE, containing the papiliona-ceous corollas.

Pellucid-punctate, having punctures which permit light to pass through. Peltae. Little flat receptacles on the Lich-

stalk affixed to the under surface, and not to the margin.

Pencil-ferm, resembling a painter's pencil, or little brush.

one end. and swinging loosely.

like a painter's pencil. Penninerved leaf.

enninerved leaf. Having the lateral nerves pinnately arranged, or feather-like. See Feather-veined. Pentagonal, having 5 angles, or corners.

Pentagynous, having 5 pistils. form of minute chaff, or scales.

Parasite. A plant growing on, or deriving sustenance from, another plant;

Ving sustenance from, another plant;

Pentapetalous, having 5 petals.

Penultimate, next to the last; the one plant in the terminal one.

An indehiseent, fleshy or internally pulpy fruit, usually composed of 3 carpels invested by the ealyx-tube, and with a firm rind; as the Melon, &c.

Perennial, living more than two years,

and for an indefinite period.

Perfect flower. Having both stamen and pistil (1 or more of each), and producing fruit.

pierced through the leaf.

Perianth. A term for the envelopes of a flower, where the calyx and corol-

Perichaeth, or perichaetium. The verticil, or cluster of bract-like leaves, round the base of the seta, or footstalk of the urn, in Mosses, -often called perichaetial leaves.

Peridium. A term applied to the outer sac. or envelope of the sporanges, in

some of the Fungi.

Perigonium. A name for the envelope of the flower,-said to be double when there is both calyx and corolla: but often used synonymously with Perianth-which see.

erigynium. The sac (formed by the union of 2 bractlets) which encloses the ovary of the Carices.

ed on the calyx,-or rather adhering to the inner surface of the calyx-tube -and thus surrounding the pistils.

Pedicellate, having, or being supported Peripherical, fixed or coiled round the circumference, or periphery.

> Perisperm. A deposit in many seeds, affixed to, or surrounding, the embryo -synonymous with albumen-which

> Peristome. The circle of teeth, or bris-

tle-like processes, which surround the Pistillate flowers. Those which have orifice of the Theca or capsule of the Mosses

Persistent, not falling off; remaining beyond the time when similar organs usually fall off.

Personate corolla. Masked; having the Placenta (plural, placentae). That part of

throat closed by a prominent palate.

-as in Linaria.

etal. The (usually) delicate colored flower leaf. In a flower of one petal Petal. (or united petals), the corolla and petal *Placental*, pertaining to the placenta are the same: in a flower of more *Placentiferous*, bearing the placenta. than one petal, the corolla is the whole *Plane*, flat, and with an even surface. and the petals are the parts.

Petaloid, petal-like; delicate and colored, or expanded, like a petal.

Petiolar, seated on, or belonging to, the

Petiolate, having, or being supported on, a petiole; not sessile.

Petiole. The stem or footstalk of a leaf. Petiolulate, having a partial or subdivid-

ed petiole. Petiolule. A little or partial petiole; the

the Order UMBELLIFERAE.

Fhaenogamous, or phanerogamous, having visible genuine stamens or pistils;

bearing true flowers.

PHALARIDEAE. The Phalaris or Canary-Grass tribe of the Order GRAMINEAE.

PHASEOLEAE. The Phaseolus or Garden

Bean tribe of the Order LEGUMINOSAE. Phyllodium. The imitation, analogue, or substitute of a leaf.—usually the dilated foliaceous petiole of an abortive compound leaf.

PINTOLACCAUSAND.

Poke family of plants
Poke family of plants
Poke family of plants
Polyandrous, naving pogynous stamens.

Polygala family.

in the Agarics.

Pilose, hairy; composed of, or clothed with, distinct straightish hairs. tillate, or neur Pinnae. The paired or opposite leaflets Polygonaceae.

leaflets in pairs, on opposite sides of a simple petiole.

Pinnatifid leaf, or frond. Cleft in a pinnate manner, but the segments united or confluent at base.

Pinnatifidly, in a pinnatifid manner.

Pinnatisect, pinnately dissected or divided,—but the segments not articulated

with the petiole.

Pinnules. The leaflets or subdivisions of a bi-tri- or multi-pinnate leaf, or frond.

Pistil. The central organ of a fertile flower,—consisting usually of overry. the tube of the adherent calyx.

The central organ of a fertile flower,—consisting usually of orary. style, and stigma: sometimes the style is wanting,—or, in other words, the control of holes, cells. or tubular stigma is sessile.

pistils, but not stamens.

Pistillidia. Small bottle-shaped bodies, -the analogues or substitutes of pis-

a pericarp to which the seeds are attached; the line, or ridge projecting in the cavity of the ovary, which bears

the ovules.

Plano-convex, flat on one side and convex on the other.

PLANTAGINACEAE. The Plantage or Plantain family. PLATANACEAE. The Platanus or Button-wood family.

Plicate, plaited; folded or crimped, like a

fan, or ruffle.

Plumose, feather-like. A pappus is plumose, when each hair has other hairs arranged on opposite sides of it,-as in

footstalk of a leaflet.

Peucedanear tribe of Pod. A dry seed-vessel, narrow and more or less elongated, and usually of 2 valves. The term is often applied indiscriminately to both Legumes and Siliques.

odetia. The pedicels or footstalks which support the knobs (Cephalodia) Podetia.

of the Lichenes.
ollen. The fertilizing powder contain-Pollen. ed in the anthers.

Pollen-masses, or Pollinia. The waxy masses of pollen, in the Asclepias and Orchis families. PHYTOLACCACEAE. The Phytolacca or Polyadelphous, having the filaments uni-

Polygamous, having some flowers per-fect, and others either staminate, pistillate, or neuter.

The Polygonum

of a pinnate leaf.

Not-weed family.

Pinnate leaf. Having distinct articulated Polygoneae. The tribe of Polygonace E specially typified by the genus Polygonum.

Polymorphous, variable; assuming, or apt to assume, many different forms.

Polypetalous, having many distinct pe-tals,—or, at least more than one. Polysepalous, having many distinct se-

pals,—or more than one.

Pome. An apple; a fleshy fruit formed of several cartilaginous or bony carpels, imbedded in pulp and invested by

openings.

PORTULACACEAE. The Portulaca or Quaternate, 4 together; arranged in Purslane family.

Praemorse, end-bitten; ending blunt, as Quinate, 5 together; arranged in fives. if bitten off.

the bark, only,—and not originating in the wood.

Primary, first in a series, in order of time, or in importance,—opposed to secondary.

Primordial, first in Order; usually ap-Raceine. A mode of flowering, in which plied to the first genuine leaves,-or those which are next above the cotyledons or seminal leaves.

Process. A protuberance, eminence, or

projecting part.

Procumbent, lying on the ground, with-

out putting forth roots.

rodromus. A herald, or harbinger,—usually the fore-runner of another Prodromus. more complete and extensive work Radiate-veined, where the veins of a leaf

on the same subject.

Produced, extended, or lengthened out. Proliferous, producing its like in an unusual way,-as lateral bulbs; or putting forth a young and unusual accessory growth, from the centre of an umbel, flower, &c.

Prostrate, lying flat, or close on the

ground.

Protophytes. First plants; a term applied to the ALGAE, which are supposed to have been the earliest created tenants of our earth.

Pruinose, covered with a glaucous mealiness, like a plum.

Pseudo-pinnate, falsely or imperfectly pinnate,—the leaflets (or rather segments) not articulated at base: See Pinnatisect.

Puberulent, covered with a minute, short

Pubescent, clothed with hairs,-especially with short weak hairs.

Pulp. A soft, fleshy or juicy mass. Pulverulent, dusty; composed of, covered with, a fine powder.

Punctate, appearing as if pricked full of small holes, or covered with indented points.

Puncticulate, having very minute punctures, or indented points.

Pyramidal, tapering upwards; usually applied to 4-sided solids which diminish to the apex.

Pyriform, shaped like a pear; largest

at the upper end.

Pyroleae. A Sub-order of Ericaceae, of which the genus Pyrola is the type. Quadrangular, four-angled.

Quadrifarious, in 4 rows, or directions; facing or pointing 4 ways.

Qualcifid, 4-cleft.

fours.

if bitten off.

Prickle. A sharp process arising from Race of plants. A fixed and peculiar form or modification,—produced by the crossing or blending of distinct varieties: or sometimes, perhaps, accidental forms rendered permanent by culture, or other influences.

the common peduncle is elongated, with the flowers on short lateral

simple pedicels.

Prismatic, like a prism; having several Racemose, having the flowers in racemes. angles and intermediate flat faces. Rachis. The common peduncle, or elongated receptacle, on which florets are collected in a spike; also the mi-

drib of a pinnatisect frond.

Radiate, having rays (i. e. spreading ligulate florets) at the circumference; as the heads of many Compositae.

diverge from a common centre, or point, at the summit of the petiole.

Radiati form, a term applied to heads of compound flowers in which all the

florets are ligulate, and directed towards the circumference.

Radical, belonging to, or growing immediately from, the root.

Radicating, sending out roots, or striking root at the nodes.

Radicle. A little root; the slender fibrous branch of a root.

Rameal, pertaining or belonging to the branches.

Ramentaceous, covered with ramentai. e. the scales, or persistent remains (vestiges, or debris,) of leaves, or other previously existing organs.

Ramification. The branching or division

of an organ into several parts.

Puberulent, covered with a minute, snorth and fine pubescence.

Ramose, branching.

Ramose, branching.

Rank. A row, or arrangement in a line.

RANUNCULACEAE. The Ranunculus or Butter-cup family. RANUNCULEAE. A tribe of RANUNCULA-

CEAE, specially represented by the genus Ranunculus.

RAPHANEAE. The Raphanus or Radish tribe of the order CRUCIFERAE.

Raphe. The line, or little ridge, on one side of anatropous (i. e. inverted) ovules and seeds,—formed by the ad-

hesion of a portion of the funiculus. Pungent, sharp-pointed, or prickly at Ratoon (Span. Retono). A sprout from the root of a plant which has been cut Pyramidal, tapering upwards; usually off (chiefly used in reference to the

Sugar-cane).

ays. The spreading ligulate florets Rays. round the disk of a compound flower: also, the footstalks, and enlarged mar-

ginal flowers, of an umbel.
eceptacle. The apex of the peduncle Receptacle. (much dilated in the CompositAE), on which the parts of a flower (or entire florets) are inserted; the seat of the fruit, or of seeds and their equivalents. Recurved, curved backwards.

Reduplicate, with the edges folded or turned outwards.

Reflexed, bent or doubled backwards. Regular, having the parts uniform and

Remote, seated or growing at an unusual

distance.

Reniform, kidney-shaped.

Repand, having the margin slightly indented with shallow sinuses.

Replicate, folded back on itself.

Replum. A name given to parietal plate plant. centae when separated from the SABALINEAE. A Sub-tribe of the Palmae, valves; also, the persistent border of a fallen legume.

Resupinate, turned upside down.

Reticulate, netted; having veins or nerves crossing each other, or branching and reuniting, like network. Retrorse, or retrorsely, pointing backwards

or downwards.

Retuse, having a shallow sinus at the SALICACEAE.

Revolute, rolled backwards, or outwards.

parallel ridges.

Ribs. Parallel ridges, or nerves, extending from the base to, or towards, the

Rigid, stiff, inflexible, or not pliable. Ringent, gaping, with an open throat.
Root-stock. See Rhizema.
ROSACEAE. The Rose family.
ROSACEAE PROPER. The Sub-order of

ROSACEAE, of which the genus Rosa is the special type.

OSEAE. The tribe of ROSACEAE I ROPER

ROSEAE. immediately represented by the Rose.

Rostrate, beaked; having a process resembling the beak of a bird.

Rosulate, in a rosette; arranged in circular series, like the petals of a double

Saxifragaceae. The Saxifraga family.

Saxifrageae. The Sub-order of Saxifrageae.

rose.

Wheel-shaped; mono-Rotate corolla. petalous (or gamopetalous) and spread-Scabrous, rough with little points, or ing almost flat, with a very short tube.

ROTTBOELLIACEAE. A tribe of the order GRAMINEAE, represented by the genus Rottboellia.

Rough, covered with dots, points, or short hairs, which are harsh to the touch.

Round, circular, or globular; not angu-See globose, orbicular, and terite. RUBIACEAE. family.

Rudiment.

rust-colored

Rufous, reddish-brown, or rust-colored wrinkled. wrinkled.

[Ruminated, a term applied to a variegated albumen-i. e. when its substance is wrinkled or plicate, and the investing membrane prolonged within the folds.

equal among themselves,—as the lobes Runcinate, resembling the teeth of a or petals of a corolla.

Runcinate, resembling the teeth of a mill-saw; somewhat pinnatifid, with the segments acute and pointing back-

wards.

Runner. A slender shoot, producing roots and leaves at the end, only, and at that point giving rise to another plant: exemplified in the Strawberry-

represented by the genus Sabal.
Sac. A membranous bag, or boundary

of a cavity. Saccate, having, or being in the form of,

a sac, or pouch.
Sagittate, arrow-shaped; notched

base, with the lobes (and frequently the sinus) acute.
ALICACEAE. The Salix or Willow

family.

Salver-form, or salver-shaped, tubular, with the limb abruptly and flatly or

Rhomboid, rhomb-shaped; having four sides, with unequal angles.

Ribbed, having ribs, or longitudinal parallel ridges. apex, or margin,—as the Maple, Ash, Elm, &c.

Samaroid, winged or margined like a Samara.

Sambuceae. The Sambucus or Elder tribe of the order Caprifoliaceae. Santalaceae. The Santalum or San-

dal-wood tamily.

Sarcocarp. The fleshy portion of a pericarp (ex. gr. of a Drupe), between the Epicarp and the Endocarp.

Sarmentose, having, or sending forth, or being in the form of, runners.

FRAGACEAE, specially typified by the genus Saxifraga.

hairs.

Scales. Small thin plates, or leaf-like processes; also the leaflets of the involucre, in the COMPOSITAE.

Scandent, climbing,—usually by means of tendrils.

A peduncle proceeding directly from the root, and mostly naked. Scarious, dry and skinny,-generally

transparent. Scattered, disposed or distributed thinly,

without any regular order.

An imperfectly developed Scirreae. The Scirrus or Club-Rush

organ.

**Tribe of the Order CYPERACEAE.

**Rufescent*, becoming reddish-brown, or Scorzonereae. A Sub-tribe of Cicliorust-colored. RACEAE, typified by the genus Scorzenera.

Rugulose, finely Scrobiculate, having the surface excavated into little pits, or hollows.

CHENES.

SCUTELLARINEAE. The Scutellaria tribe

of the Order LABIATAE.
Scutellate, shaped like, or resembling, a target or shield.

Seam. See Suture.

Secund, one-ranked; all seated on, or SILICULOSAE.

turned to, the same side.

egment. The division, or separated portion, of a cleft calyx, leaf, &c. Semi, half; as semi-bivalved, half-2-

valved, -semi-terete, half-round, &c. Sempervirent, always green; living through the winter, and retaining its SILIQUOSAE. verdure.

SENECIONEAE. A Sub-tribe of the Sene-

that genus.

SENECIONIDEAE. The Senecio or Ground-sel tribe of the Order COMPOSITAE.

Sepal. The leaflet, or distinct portion, of Simple Umbel. a calyx.

Sepaloid, resembling sepals; green and

not petal-like.

Septicidal dehiscence. When a compound pericarp opens by splitting the dissepiments—i.e. the carpels separate Sinuate-dentate,—Sinuate-serrate, having from each other, and open to the seeds by the ventral suture.

Septiferous, bearing a septum. Septife agal dehiscence. Whe When the diswhile the valves break away from them.

Septum. The partition which divides the SMYRNIEAE.

cells of fruit.

Sericeaus, silky; covered with soft smooth Soboliferous, producing young plants

glossy appressed hairs.

Series. A division, or comprehensive Solanaceae. The Solanum, Potato, or group, of objects in Natural History; Nightshade family. also, a continued succession of things Solaneae. of the same Order.

Serrate, sawed; having sharp teeth on the margin, pointing towards the Solidagineae. A Sub-division of Aster-

apex.

Serratures. The teeth, or sharp segments. of a serrate margin.

Serrulate, finely serrate; having small

teeth or serratures. Seselineae. The Seseli tribe of the Order Umbelliferae.

Sessile, sitting closely; without any

footstalk or pedicel.

elastic hair. Setaceous, bristle-like; resembling bristle in size and figure.

ered with bristles.

Sheath. A membranous expansion Spathe. which is tubular, or convolute, and inclosing or embracing a stem.

Sheathed, inclosed or embraced by a

Sheathing, embracing the stem with a

Scrophularia Shining, glossy smooth and bright. Shrub. A small woody plant, branching Scutellae. The little shield-like orbicular sessile receptacles of some of the Liprincipal stem.

Shrubby, hard and woody; of the texture

and size of a shrub.
SILENEAE. The Silene tribe of the Order

CARYOPHYLLACEAE.

Silicle. A little or short silique, nearly as wide as long.

A division of the Order CRUCIFERAE, comprising the plants bearing Silicles, or short pods.

Silique. A long slender pod, or membranous seedvessel of 2 valves, having the seeds fixed alternately along both sutures.

A division of the Order CRUCIFERAE, comprising the plants with Siliques, or long pods.

cio-like plants, specially typified by Siliquose, having siliques,-or resem-

bling a silique.

When each ray terminates in a single flower,-instead of a secondary or partial umbel.

Sinuate, having sinuses, scallops, or gashes which are open and rounded

teeth, or serratures, with the clefts or openings rounded at bottom.

Sinus. An open notch; a rounded incision, or scallop.

sepiments remain attached to the axis, SISTMBRIEAE. The Sisymbrium tribe of the Order CRUCIFERAE.

SMILACEAE. The Smuax landay.

SMURNIEAE. The Smyrnium tribe of the Order Umbelliferae.

Nightshade family.

CLANEAE. The tribe of SCLANACEAE

specially typified by the genus Solanum.

like Compositae, of which Solidago, or Golden Rod, is the type.

Solitary, standing alone; one only in a place.

SOPHOREAE. The Sophora tribe of the Order LEGUMINOSAE.

Sori (plural of Sorus). Small clusters of granules, or sporanges, on the back of the fronds of Ferns.

Seta (plural, Setae). A bristle; a stiffish Spadix. A sort of dense-flowered, fleshy or club-like Spike,-usually enveloped by, or proceeding from, a sheathing involucre called a Spathe.

Setose, bristly; having the surface cov- Spathaceous, having a spathe, or resem-

bling a spathe. A sheathing kind of bract, common calyx, or involucre, open on one side,-often containing the spadix.

Spathulate, or spatulate, like a spatula; obovate-oblong, or larger and rounded at the end, and tapering to the base. Species. The lowest permanent division arrangement; a group comprising all similar individuals.

Specific, belonging to, or distinguishing,

the species.

Spermoderm. seed. Sphacelate. dark-colored, as if gangre-

nous, or dead.

Sphagnous, full of bog-moss, or Sphag-Spicate, in the form, or after the manner,

of a spike.

Spike. A kind of inflorescence in which the flowers are sessile on the sides of a long common peduncle, or rachis. Spikelet. A little spike,—or sub-division

of a compound spike.

Spine. A thorn; a sharp process originating in the wood—i. e. a pointed abortive branch.

Spinellose, armed with minute spines. Spinescent, becoming thorny,—or inclining to he thorny.

Spinose, thorny; armed with thorns. Spinulose, covered with small spines. Spongioles. The delicate sponge-like tissue, forming the growing-points of Stipelles.

roots. Sporange. The pericarp of the crypto-

envelope of the sporules.

Spores, or sporules. The seminal equivalents, or analogues of seeds, in Stipular, belonging or relating to sticryptogamous plants.

Sporidia. Spore-like bodies; or some-

Sporocarp, a synonym of Sporange. Sporules. Dimin. of Spores; which see. Spur. A tapering hollow production of the base of a petal, or sepal,-usually called a nectary.

Spurred, having a spur, or spur-like elongátions.

Squamose, scaly; covered more or less

with soales.

Squarrose, jagged; having spreading tips, or divaricate points, all round,—as the scales of some involucres.

Stachydeae. The Stachys or Hedge-

nettle tribe of the Order LABIATAE.

Stamen. The organ of a flower which prepares the pollen,-usually consisting of a filament and anther, and situated between the corolla and the Striate-sulcate, scored with minute lonpistil.

Staminate flower. Having stamens, but Strict, straight and rigidly upright.

not pistils.

Staminiferous, bearing or supporting the

Imperfect organs occupy-Staminodia. ing the position of, and resembling Stamens, -being in the transition stage between petals and stamens.

STELLATAE. A Sub-order of RUBIACEAE distinguished by whorled or stellate

leaves.

Stellate, like a star; arranged like the rays of a star.

of natural objects, in a systematic Stellular, radiating after the manner of little stars.

Stellular pubescence. Compound or fasciculate hairs, with the branches spreading like rays.

The proper coating of a Stem. Themain axis or body of a plant; the common supporter of branches,

leaves, flowers and fruit.

Stemless, having no visible or aenal stem: applied to plants where the stem is suppressed, or so short as to be apparently wanting.

Sterile, barren, or unproductive; applied

to flowers which produce no fruit. Stigma. The summit of the style, that portion of the pistil through which the pollen acts.

Stigmatic, belonging or relating to the

stigma.

Stigmatiferous, or stigmatose, bearing, or belonging to, the stigma.

Stipe. A little pedicel, or footstalk, of

seeds, &c. also, the petiole of the frond, in ferns.

Stipellate, furnished with stipelles,-i. e. the stipules of leaflets, in compound

leaves.
inelles. The stipular appendages, or little stipules, of leaflets, in compound leaves.

gamous plants; the membranaceous Stipitate, having a stipe; supported on a little pedicel.

Stipitiform, resembling a stipe.

pules.

cryptogamous plants.

by providia. Spore-like bodies; or sometimes the cells, or sacs, which contains the sporules of the Fungi.

by provides. Dimin. of Spores; which see.

considering the spore of th from the root: usually applied to young wheat, in autumn and spring. Stole-bearing, producing stoles. See sto-

loniferous.

Stoles (i. e. stolones—corruptly, stools). The shoots, suckers, or off-sets, from the base of the stem, or roots, of plants: usually applied to young winter grain,—as wheat, &c. See Tiller. Stoloniferous, having suckers, off-setts, or running shoots (stolones), from the base of the story or running the story of the story or story of the story.

base of the stem, or crown of the root. Fine parallel ridges, or lines. Striae.

Striate, marked with longitudinal lines, or stripes.

gitudinal grooves and ridges.

Strigose, armed with spreading bristly hairs, which taper from base to apex. Strobile. The cone, or collective fruit, of the Pines, Firs, &c.

A little crown. or fungous Strophiole.

appendage to the hilum of a seed.

Style. The columnar (usually slender) portion of the pistil, between the ovary and the stigma,-sometimes wanting. Styliferous, bearing or producing a style, or styles.

Stylopodium. The foot or thickened base

of the style (or united styles), at the junction with the epigynous disk,—as

in Umbelliferae.
Stylostegium. The hood or covering of

Sub—a preposition signifying under, or a division,—as a Sub-class, Sub-order, &c.: also employed as a diminutive.

Tetragonous, 4-cornered, or having angles.

Tetramerous, consisting of 4 parts, or qualifying term, equivalent to alconstituent portions.

most, somewhat, or about,—as sub-sesTetrandrous, having 4 stamens of equal sile, nealy sessile, &c.

Suberose, of a texture resembling cork. Subulate, shaped like an awl-blade; linear or cylindric below, angular and

tapering to a sharp point at summit. Succulent, juicy; full of juice.
Sucker. A shoot, or offsett, from the

root, or base of the stem. Suffrutescent, almost shrubby.

Suffruticose, somewhat shrubby; shrubby at base.

Sulcate, furrowed, or grooved.

Super, or supra, a preposition signifying Theca (plural, Thecae). A name for the above or upon, beyond or more than, as super-axillary, situated above the axil.

Super-or Supra-decompound, more than decompound; many times subdivided,

or compounded.

Superior. above; a term applied to the ovary, when it is above the calyx, or free in the flower; also to the calyz. when the tube is adherent to the ovary. and the segments borne on its summit.

Suppression, the non-production, or failure in the developement, of an organ.

Surculose, bearing suckers, or offsets.
Suspended ovules, or seeds. When they are attached to the summit of the ovalarly in the cavity.

equal number of parts in each series, or vertical.

Eyngenesious, having the anthers united, —as in the Compositae.

Synonym. Another name for the same

Tenacious, sticky or adhesive; also. holding on by means of little hooked Toothed. See dentate. points.

Tendiil. A filiform twining branch, or appendage, by which some plants Tortuous, bentin different directions. climb, or sustain themselves: in the grape vine, it is an abortive raceme.

Tortuous, bentin different directions. Tortuous, bentin different directions. Tortuous, bentin different directions.

Telete, round, like a column,—and either cylindric or tapering; applied to stems, or stem-like bodies. See orbicular. Terminal, situated at, or proceeding

from, the end or summit!

of three parts, or elements.

Ternate, three-fold; three together,-as the leaflets of clover, &c.

Tessellated, resembling mosaic work; in

little squares, or checquers, like a chess-board.

Testa. The outer integument, or proper coat, of a seed.

the style,—as in the Asclepias family. Tetradynamous, having 4 long and short stamens, in a cruciate flower. having 4 long and 2

Tetramerous, consisting of 4 parts, or

length: Thallogenous plants. Plants destitute of

stem, or axis; consisting of Thalli, or mere expansions of cellular vegetable growth.

Thallophytes. A Class of flowerless plants,-consisting wholly of Thallus, or vegetable leaflike expansion.

Thallus. A name for the stemless, frondlike expansion, of which many Cryptogamous plants are entirely compo-

little case, sac, or capsule, (sporocarp), containing the spores of certain Cryptogamous plants (ex. gr. the Mosses).

Tho.n. A sharp process from the woody part of a plant,—being a stunted, or

abortive branch.

Throat. The orifice or passage into the tube of a corolla.

Thyrsoid, resembling, or being in the form of, a Thyrsus.

Thyrsus. A kind of contracted, or dense, ovoid panicle, -as in the Lilac, Horse-Chesnut, &c.

TILIACEAE. The Tilia or Linden family Tiller. A sucker, or young shoot, of Wheat, Rye, &c.

ry, or pericarp, and hang perpendicu-Tiller, or tillow, to put forth suckers, or new shoots, from the root, or base of

Suture. The line, or seam, formed by the junction of two margins.

Symmetrical flower. When there is an Tissue. Web, or fabric; the intimate organic structure, or composition, of bo-dies,—especially those which are, or have been, alive.

Tomentose, covered with a curled, or mat-

ted, cottony pubescence.

Tomentum. A matted downy or cottony pubescence.

Torose, or torulose, swelled out in obtuse ridges.

apex of a flowerstalk, on which are inserted all the parts of the flower.

Translucent, clear, or transmitting light faintly.

Transverse, transversely, across; cross-wise; at right angles with lengthwise. Ternary, arranged in threes; consisting Triadelphous. having the filaments united in 3 parcels.

Triandrous, having 3 stamens. Triangular, having 3 angles, corners, or points.

Tribes. Groups of kindred plants, inter-Turf. The green sward, or grassy sod.

Tribracteate, having 3 bracts.

Trichotomous, three-forked; dividing by 3 equal branches. Tricoccous, composed of three separable

indehiscent carpels (or cocci).

3 sharp points. Trifarious, facing, or pointing, in 3 di-

rections. Trifid, three-cleft; partially cut or di-

vided into 3 segments. Trifoliate, having 3 leaves; or the leaves

arranged in threes.

TRIFOLIEAE. The Trifolium or Clover tribe, of the Order LEGUMINOSAE.

Trigonous, three-cornered. Trigynous, having 3 pistils.

Trilobate, three-lobed. Trimerous, consisting of 3 parts.

Tripartite, three parted.

Tripetalous, having 3 petals:

Tripinnate, thrice-pinnate; the common petiole 3 times divided, or with bipin nate divisions on each side.

Tripinnaifid, pinnately dissected, with the primary divisions twice pinnatifid Triplinerved, having 3 principal nerves UMBelliferae. The Order or family of

sides,-as the culms of many CYPERA-CEAE.

Trise palous, having 3 sepals.

Triternate leaf. When the petiole is twice divided ternately, and each final branch bears 3 leaves.

The T.opaeolum or TROPAEOLACEAE Nasturtium family.

transversely cut off. Tube, a pipe, or hollow cylinder.

Tuber. A solid fleshy knob, attached to

roots. TUBERACEAE. A division of the Subtribe

Angiogasteres, typified by the genus Tuber, or Truffle.

Tubercle. A small excrescence, knob, or point, on a surface-making it rough, or uneven

Tubercula. The partial receptacles of some of the Lichens.

Tuberculate, covered with tubercles.
Tuberiferous, bearing or producing tubers.

Tuberous, consisting of, or fleshy and URTICACEAE. The Urtica or Nettle famisolid like tubers.

Tubular, having a tube, or constructed like a tube.

TUBULIFLORAE. The first Sub-order of Compositae, with the perfect or disk florets all tubular.

Tuft. A bunch, or fascicle, growing from the same root, or originating nearly at the same point.

Tum'd, swelled, or enlarged like a swelling.

having concentric Tunicate. coated; coats, or thin layers.

Turbinate. top-shaped; inverted cone,

mediate between Orders and Genera. | Turgid, swelled, but not inflated.

Turion. A thick, tender, young shoot of a plant,—as of Asparagus, Hop, &c.

Tussock. A dense tuft or bunch formed at the root,—as in some species of Carex, Grasses, &c.

Tricuspidate, having, or terminating in, Twin, two of the same kind connected, or growing together.

Twining, winding round and ascending spirally.

Two-ranked (or rowed), See distichous.
TYPHACEAE. The Typha or Cat-tail fam-

ily of plants. ULMACEAE. The Ulmus or Elm family. ULMEAE. The Sub-order of ULMACEAE, of which the genus Ulmus is the special

type. Umbel. A kind of inflorescence, in which the flower-stalks proceed from a common centre, like rays, or the braces of Umbels are simple, or an umbrella. compound: which see.

Umbellate, in the form or manner of an

umbel.

A partial umbel; one of the Umbellet.

Triquetrous, having 3 angles and 3 flat Umbellificous, bearing the flowers in umbels.

Umbilicate, navel-like; having a central pit, or depression.

Unarmed, without thorns or prickles. Uncinate, hook-shaped; hooked at the end.

Undulate, wavy; curved, or rising and depressed, like waves.

Truncate, having the end blunt, as if Unequal, the parts not corresponding in length, size, form or duration.

Unguicu'ate, having a slender or narrow base, like an unguis, or claw.

Uniform, or unifo.mly, in one form, or manner; equally and alike.
Unilateral, on one side; growing, or inscreed, all on one side of a stem, or common pedancle.

Unisexual, of one sex-i. e. staminate, or pistillate, only.

Urceolate, pitcher-shaped, or urn shaped; swelling below, and contracted to a neck, above.

ly of plants.
URTICEAE. The Sub-order of URTICA-

CEAE, specially typified by the genus Urtica.

Utricle. A little sac, or thin membranaceous pericarp, which incloses, but does not adhere to, the seed. See Caryopsis.

VACCINIEAE. A Sub-order of ERICACEAE,

represented by the genus Vaccinium.

Valvate aestivation. When the sepals or retals are folded together, and fit by their edges, without overlapping.

resembling ar Valves. The several parts of a regularly dehiscent pericarp,-especially of a capsule: also, the scales which closes the tube, in some corollas; and the chaffy pieces which cover the flowers Verticil. A whorl; flowers, leaves, or other organs, arranged in a horizontal

Var (Varietas), a variety, or modifica-

tion of a species.

Variety. A new or unusual form, or mo-dification of a plant, produced by acci-dental causes,—such as crossing, soil. climate, culture, &c. but not permanently, or at least, not specifically, dis tinct.

Vascular plants. The higher Orders of plants (including all above the Mosses), -composed more or less of woody fibres, and elongated cells, or vessels,

in the form of slender tubes.

Vau ted, arched over, like the roof of the VICIEAE.

mouth.

Veil (of the Fung). A delicate membrane or fringe, in certain Agarics, which in an early stage connects the margin of the pileus with the stipe.

Veined, having the vessels variously

branching, over the surface.
Venation of a leaf. The distribution of the veins, or frame work, in the lamina or blade.

carpel, or folded leaf, formed by the union of its margins: the opposite of dorsal.

VERBASCEAE. The Verbascum or Mullein tribe, of the Order Scrophulariaceae

VERBENACEAE. The Vertena or Vervain family.

The mode in which young Vernation. leaves are folded and packed in a bud.

VERNON'ACEAE. The Vernonia or Ironweed tribe of the Order Compos. TAE.

VERNONIEAE. The Sub-t. ibe of VERNON-IACEAE, of which the genus Vernonia is the special type.

Vertucose, warty; covered with wart-

like excresences.

Versatile anther. When it is fixed by the middle on the point of the filament, and moves round lightly and readily,-

as in the Grasses, &c.
Vertical, or vertically, in a perpendicular direction; from the zenith, or highest

point directly downwards.
Vertical leaves. When they stand edge their faces-to the earth and sky : indicative rather of Phyllodia, than of true leaves.

ring, round a stem, or at its summit.

Verticillaster. A spurious verticil; condensed cyme, or cluster resembling a verticil,—as in many LABIATAE.

Verticillate, growing or arranged in a verticil, whorl or horizontal ring.
Vesicles. Little bladder-like vessels.

Vesicular, or vesiculose, made of, or resembling, little bladders.

Vespertine flowers. Those which expand in the evening.

Vexillum. The banner, or broad upper.

petal of a papilionaceous corolla.

ICIEAE. The Vicia or Vetch tribe, of

the Order LEGUMINOSAE.

Villose, or villous, velvety; clothed with numerous, and rather long, soft hairs. Villus (plural, vill). The velvet-like pubescence on a villous plant.

Virescent, inclining to, or becoming, green.
Virgate, wand-like; long, slender, and

straight. Viridescent, greenish.

Ventral, contained in, or belonging to, the belly.

Ventral suture. The line or seam of a Viraceae. The Vitis or Grape family.

Vittae. Fillets; linear receptacles of oily matter on the carpels of Umbelli-

ferons plants.

Ventricose, bellied; swelling out in the viviparous, producing a collate al off-middle, or below it.

Viviparous, producing a collate al off-spring by means of bulbs; or having the seeds to germinate before they are detached from the parent plant.

Volubile, ascending spi ally, or climbing by embracing another object. See

Twining.

Volva. The wrapper, or outer covering of a young Mushroom (Agaric),—which bursts by the rapid development of the plant, leaving its remains adherent to the base of the stipe.

Vu'go, commonly called (in the vernacu-

lar); in common parlance.

Wavy,—See undulate. Whorl,—See verticil.

Winged, having a thin extended margin. Wings. The side-petals of a papilionaceous corolla: also, the membranous expansion at the summit or margin of certain pericarps, and on the sides of some petioles.

Woolly, clothed with a long, curled or ettical leaves. When they stand edge matted pulescence, resembling wool, up, or present their margins—and not XANTHOXYLACEAE. The Xanthoxylon or

Prickly Ash family of plants.

LINNAEAN ARRANGEMENT

OF THE GENERA TREATED OF IN THIS WORK.

For the convenience of those who are accustomed to investigate Genera by the *Linnaean Method*, the following Synopsis is here inserted.

DIANDRIA MONOGYNIA.

A. FLOWERS COMPLETE, regular. Fruit a Berry.

LIGUSTRUM. Calyx minutely 4-toothed. Corolla 4-lobed; lobes ovate, spreading. Berry 2-celled; cells 2-seeded. ORD. CV. OLEACEAE. page 136.

B. FLOWERS MOSTLY INCOMPLETE. Fruit a Samara.

Fraxinus. Dioicously polygamous: Calyx 0, or 3-4-parted. Corolla 0, or 4-petaled. Capsule (or Samara) 2-celled, compressed, with a thin wing-like extension at apex. Ord. CV. Oleaceae. p. 134.

[Catalpa. Ord. LXXXVIII. BIGNONIACEAE. p. 107.] [Hedeoma, and Salvia. Ord. XCIII. Labiatae. p. 111.]

DIGYNIA.

[Anthoxanthum. ORD. CLX. GRAMINEAE. p. 210.]

TRIANDRIA MONOGYNIA.

[For the Genera belonging here, See Ord. CLIX. CYPERACEAE. p. 199.]

[Juncus communis. Ord. CLV. Juncaceae. p. 199.]

DIGYNIA.

[The Genera belonging here, are the true Grasses,—and will be found in ORD. CLX. GRAMINEAE. p. 204.]

[Amaranthus albus. Ord. CIX. AMARANTHACEAE. p. 141.]

TETRANDRIA MONOGYNIA.

A. OVARY INFERIOR. a. Corolla monopetalous.

DIFFACUS. Flowers in ovoid heads: Calyx minute, cup-shaped, entire. Corolla tubular; limb 4-cleft, erect. Fruit akene-like, 1-seeded, crowned with the calyx. Receptacle conical, chaffy. ORD. LXXXIV. DIFFACEAE. p. 73.

Rubia. Calyx 4-toothed. Corolla 4 or 5-parted, rotate. Style bifid. Fruit didymous, subglobose, baccate or succulent. Ord. LXXII. Rubiaceae. p. 72.

b. Corolla tetrapetalous.

CORNUS. Calyx 4-toothed. Petals 4, oblong. Drupe with a 2 or 3-celled nut. ORD. LXIX. CORNACEAE. p. 70.

B. OVARY SUPERIOR. a. Flowers complete.

PLANTAGO. Calyx mostly 4-parted. Corolla monopetalous, marcescent; limb 4-cleft, reflexed. Stamens much exserted. Capsule 2-celled, circumscissed (or opening horizontally). ORD. LXXXIV. PLANTAGINACEAE. p. 105.

b. Flowers incomplete.

Symplocarpus. Spathe conch-shaped, acuminate. Spadix roundishoval. Calyx deeply 4-parted, persistent; segments cuneate, truncate and somewhat cucullate, becoming thick and spongy. Style 4-sided, tapering; stigma minute. Seeds solitary, imbedded in the spadix. Ord. CXXXV. Araceae. p. 189.

DIGYNIA.

[Cuscuta epilinum. ORD. XCIX. CONVOLVULACEAE. p. 127.]

PENTANDRIA MONOGYNIA,

A. FLOWERS COMPLETE. § 1. Ovary superior.

a. Corolla monopetalous. † Seeds or Nuts 4, apparently naked.

*Nuts fixed to the bottom of the calyx.

LITHOSPERMUM. Calyx 5-parted. Corolla small, funnel-form; limb 5-lobed; throat open. Stamens included. Nuts imperforate at base, bony, rugose or sometimes smooth. ORD. XCIV. BORAGINACEAE. p. 123.

Echium. Calyx 5-parted. Corolla irregular, subcampanulate; limb unequally and obliquely 5-lobed; tube short; throat open. Nuts imperforate at base, tuberculate. Ord. XCIV. Boragina-ceae. p. 122.

* * Nuts affixed to the Style or central column.

CYNOGLOSSUM. Calyx 5-parted. Corolla funnel-form; throat closed by 5 obtuse connivent scales. Nuts (or Akenes) echinate, somewhat depressed, ovate, convex externally and angular on the inner side. ORD. XCIV. BORAGINACEAE. p. 124.

† † Seeds in an evident Pericarp. * Fruit a Capsule.

SAEBATIA. Calyx 5 to 12-parted. Corolla sub-rotate, 5 to 12-parted. Stamens sometimes 6; anthers finally revolute. Stigmas 2, spirally twisted. Capsule 1-celled, 2-valved. Ord. CI. Gentianaceae. p. 132.

Convolvulus. Calyx 5-sepaled, naked or with 2 bracts at or near the base. Corolla campanulate-funnel-form; limb obsoletely 5-lobed, plicate. Filaments dilated at base. Stigmas 2, linear-terete, often revolute. Capsule 2-celled, 2-valved. Ord. XCIX. Convolvulaceae. p. 125.

BATATAS. Calyx 5-sepaled. Corolla campanulate; limb quinqueplicate. Filaments scarcely dilated at base. Stigma capitate, 2lobed. Capsule 3-4-celled, 3-4 valved. ORD. XCIX. CONVOL-VULACEAE, p. 124.

DATURA. Calyx tubular, 5-angled, 5-cleft at summit, deciduous. Corolla funnel-form; limb 5-angled, plicate. Capsule ovoid, mostly muricate, 2 to 4-celled, 4-valved. ORD. C. SOLANACEAE. p. 128.

NICOTIANA. Calyx somewhat urceolate, 5-cleft, persistent. Corolla

funnel-form; limb spreading, plicately 5-lobed. Capsule ovoid, smooth, bisulcate, 2-celled, 2 to 4-valved. ORD. C. SOLANACEAE. p. 127.

VERBASCUM. Calyx 5-parted. Corolla rotate; limb unequally 5-lobed. Stamens declined; filaments (or some of them) hairy. Capsule ovoid or globose, 2-celled, 2-valved. ORD. XCI. SCROPHULA-RIACEAE. p. 109.

* * Fruit a Berry.

Solanum. Calyx 5 to 10-cleft. Corolla rotate or sub-campanulate: limb plicate, mostly 5-lobed. Anthers erect, connivent, opening by 2 pores at summit. Berry globose, 2 to 4-celled. ORD. C. Solana-CEAE. p. 129.

Lycopersicum. Calyx 5 to 10-parted. Corolla rotate; limb plicate, 5 to 10-lobed. Anthers cohering by an elongated membrane at summit, opening longitudinally. Berry mostly depressed-globose and often torose, 2 to 3-celled. Ord. C. Solanaceae. p. 131.

CAPSICUM. Calyx mostly 5-cleft. Corolla sub-rotate; limb plicate, mostly 5-lobed. Anthers connivent, opening longitudinally. Berry without pulp, polymorphous, imperfectly 2—3-celled. Ord. C. Solanaceae, p. 129.

b. Corolla mostly pentapetalous: Fruit a Berry.

VITIS. OFTEN DIOICOUSLY POLYGAMOUS: Callyx minute, 5-toothed. Petals cohering at apex, caducous. Stigma subsessile, obtuse. Berry 2-celled, 4-seeded; cells and seeds often abortive. ORD. XLVI. VITACEAE. p. 28.

§ 2. Ovary inferior. à. Corolla monopetalous.

LOBELIA. Calyx 5-parted. Corolla tubular, irregular, cleft on the upper side nearly to the base. Stamens more or less united; anthers coalesced into a tube. Stigma 2-lobed. Capsule sometimes half superior, 2 or 3-celled, opening at summit. ORD. LXXVI. LOBELIACEAE. p. 101.

b. Corolla pentapetalous.

RIBES. Calyx campanulate or tubular, 5-cleft; segments more or less colored. Petals small, inserted alternately with the stamens in the throat of the calyx. Style 2 to 4-cleft. Berry crowned with the shrivelled remains of the flower, 1-celled, pulpy, many-seeded. Ord. LIX. Grossulaceae. p. 56.

B. FLOWERS INCOMPLETE.

NYSSA. DIOICOUSLY POLYGAMOUS: STAMINATE FL. Calyx 5-parted. Corolla 0. Stamens 5 to 10 or 12, inserted round a peltate disk. PISTILLATE FL. Calyx 5-cleft. Corolla 0. Stamens 5, or wanting. Drupe oval; nut striate. ORD. CXIV. SANTALACEAE. p. 149.

[Acer rubrum. Ord. XLI. Aceraceae. p. 27.]
DIGYNIA.

A. OVARY SUPERIOR. † Flowers complete.

Cuscuta. Calyx 4 or 5-cleft. Corolla globose-urceolate, 4 or 5-lobed. Stamens adnate to the tube of the corolla, alternating with the lobes, supported by fringed scales at base. Capsule 2-celled, circumscissed. Ord. XCIX. Convolvulaceae. p. 126.

Asclepias. Calyx 5-parted. Corolla 5-parted; lobes reflexed. Stamineal crown 5-lobed; lobes erect, cucullate, each with a subulate process projecting from within. Antheridia 5-angled, truncate, opening at the winged angles by 5 vertical fissures. Pollinia 5 distinct pairs, compressed, pyriform, pendulous. Ovaries 2, one mostly abortive. Follicles ventricose. Okd. CIII. Asclepiada-Cear. p. 133.

† † Flowers incomplete.

CHENOPODIUM. Calyx 5-parted, persistent. Corolla 0. Styles very short. Utricle thin, membranaceous. Seed 1, vertically depressed, lenticular. Ohd. CVII. CHENOPODIACEAE. p. 139.

BETA. Calyx 5-parted, persistent, adhering to the base of the fruit. Corolla 0. Seed 1, subreniform-cochleate, imbedded in the base of the calyx. Ord. CVII. CHENOPODIACEAE. p. 138.

ULMUS. Calyx small, campanulate, 5 to 8-cleft. Corolla 0. Stamens 5 to 8. Samara 1-celled, 1-seeded, flat, with a broad membranous margin. ORD. CXVII. ULMACEAE. p. 150.

Celtis. Monoicously folygamous: Staminate Fl. Calyx 6-parted. Corolla 0. Stamens 6 (fide Nutt.). Perfect Fl. Calyx deeply 5-parted. Corolla 0. Stigmas subulate, elongated. Drupe globose, 1-seeded. Ord. CXVII. Ulmacfae. p. 151.

B. OVARY INFERIOR. † Flowers in simple Umbels.

Panax. Dioicously polygamous: Staminate Fl. Calyx small, turbinate; limb nearly entire. Parfect Fl. Calyx obsoletely 5-toothed. Petals 5. Stamens inserted under the margin of the epigynous disk. Styles 2 or 3 (rarely 1). Fruit a fleshy or subcoriaceous berry, 2 or 3-celled; cells 1 seeded. Ord. LXVIII. Araliaceae. p. 69.

† † Flowers in compound Umbels.

[The Genera of this division all belong to Ord. LXVII. UMBELLIFERAE. p. 62.]

TRIGYNIA.

a. Ovary inferior: corolla monopetalous.

Sambucus. Calyx mostly 5-cleft; limb small. Corolla sub-rotate, mostly 5-lobed. Stamens sometimes 6 or 7. Berry subglobose, 1-celled, 3 to 5-seeded. ORD. LXXI. CAPRIFOLIACEAE. p. 71.

b. Ovary superior: Corolla pentapetalous.

RHUS. DIOICOUSLY POLYGAMOUS: STERILE FL. Stamens 5, mostly shorter than the petals. Stigmas mostly 3. Ovary abortive. Fertile Fl. Stamens 5, or often wanting. Stigmas mostly 3, subsessile. Drupe small, nearly or sometimes quite dry; nut bony. Ord. XXXIX. Anacardiaceae. p. 23.

PENTAGYNIA.

a. Ovary inferior.

ARALIA. Calyx 5-toothed or entire. Petals 5. Styles sprending, persistent. Berry 5-celled, 5-seeded. ORD. LXVIII. ARALIACEAE. p. 69.

b. Ovary superior.

LINUM. Calyx deeply 5-parted, persistent. Petals 5, unguiculate.

Stamens united at base in a hypogynous ring, with intermediate teeth. Capsule globose, 10-celled, 10-valved. Seeds solitary, compressed, ovate. Oad. XXXI. LINACEAE. p. 21.

HEXANDRIA MONOGYNIA.

a. Perianth mostly Corolla-like. † Flowers with a Spathe.

ALL'UM. Spathe membranaceous: Flowers in a dense terminal umbel, or head. Perianth 6-parted. Filaments sometimes tricuspidate (i. e. in threes, the anthers on the lateral ones abortive).—Capsule 3-celled, 3-valved. Ord. CLII. LILIACEAE. p. 195.

† † Flowers destitute of a Spathe.

Asparagus. Perianth 6-parted; segments linear-oblong, erect. Stigmas 3, subsessile. Berry 3-celled; cells 2-seeded. Ord. CLII. LILIACEAE. p. 198.

Ornithogalum. *Perianth* deeply 6-parted; segments spreading above the middle. *Filaments* dilated at base. *Capsule* roundish, somewhat trigonous, 3-celled. Ord. CLII. LILIACEAE, p. 195.

TILLANDSIA. Perianth deeply 6-parted,—the outer verticil nearly distinct and calyx-like; segments of both lanceolate and of equal length. Capsule 1 to 3-celled. Seeds crowned with a tuft of hair. ORD. CXLVI. BROMELIACEAE. p. 192.

b. Perianth calyx-like. † Flowers on a Spadix.

Acorus. Spadix terete, sessile on the side of an ensiform leaf-like scape. Perianth of 6 glumaceous oblong subcucullate sepals, thickened at apex. Capsule angular, 3-celled, indehiscent. Ord. CXXXVIII. Araceae. p. 190.

† † Flowers more or less Paniculate.

Juncus. Perianth of 6 glumaceous persistent sepals, bibracteate at base. Stamens sometimes 3. Stigmas 3, subsessile. Capsule mostly 3-celled, 3-valved, loculicidal. ORD. CLV. Juncaceae. p. 198.

[Sabbatia angularis. ORD. CI. GENTIANACEAE. p. 132.]

DIGYNIA.

[Polygonum Persicaria, Pennsylvanicum, and arifolium. ORD. CXI. POLYGO NACEAE. p. 144.]

[Oryza sativa, and Zizania aquatica. ORD. CLX. GRAMINEAE. p. 206.]

TRIGYNIA,

Sabal. Flowers on a branched Spadiz, with numerous incomplete Spathes. Calyx 3-parted. Corolla of 3 petals. Ovaries 3, at first distinct, finally united. Drupe simple and subglobose or 2 or 3-lobed. ORD. CXXXIV. Palmae. p. 188.

RUMEX. Flowers sometimes dioicous. Perianth calyx-like, persistent, deeply 6-parted, the outer segments smaller. Stigmas many-cleft. Seed (Akene, Nut, or Caryopsis) triquetrous. ORD, CXI. POLYGONACEAE. p. 142.

[Sambucus Canadensis. ORD. LXXI. CAPRIFOLIACEAE. p. 71.]

HEPTANDRIA MONOGYNIA.

Aesculus. Calyx tubular, somewhat ventricose. Corolla of 4 or

5 unequal petals. Stamens sometimes 6 or 8. Capsule 3-celled, mostly 1-seeded by abortion. Seed large. ORD. XLII. HIPPOCASTANACEAE. p. 27.

OCTANDRIA MONOGYNIA.

OENOTHERA. Calyx tubular, 4-cleft; limb reflected, and with part of the tube caducous. Petals 4, obcordate or obovate. Stigma 4-lobed, or spherical. Capsule 4-celled, 4-valved. Seeds not comose. ORD. LIV. ONAGRACEAE. p. 55.

† † Fruit a Berry.

Oxycoccus. Calyx 4-toothed. Corolla deeply 4-parted; lobes linear-lanceolate, revolute. Stamens connivent; anthers bifid, tubular. Berry globose, 4-celled, many-seeded. ORD. LXXVIII. ERICACEAE. p. 103.

b. Ovary superior. † Flowers perfect.

TROPAEOLUM. Calyx colored, 5-parted,—the upper segment spurred at base. Petals 5, unequal,—the 2 upper ones sessile—the 3 lower ones unguiculate. Fruit composed of 3 connate carpels, fleshy or subcoriaceous; carpels, 1-seeded, indehiscent. Ord. XXXV. Tropaeolaceae. p. 22.

† † Flowers mostly polygamous.

DIOSPYROS. DIOICOUSLY POLYGAMOUS: Calyx 4-parted. Corolla urceolate, 4-cleft. Staminate Fl. Stamens often 16. Ovary abortive. Fertile Fl. Stamens 8 to 12, mostly abortive or imperfect. Ovary 4-angled. Berry subglobose. Ord. LXXX. EBENACEAE. p. 105.

Acer. Flowers polygamous, or sometimes dioicous: Calyx 5-cleft or 5-parted—sometimes truncate with the limb entire. Petals 5, or none. Stamens about 8,—but ranging from 3 to 12. Samarae in pairs, winged at apex, diverging. Ord. XLI. Aceraceae. p. 26.

DIGYNIA.

[Ulmus Americana. ORD. CXVII. ULMACEAE. p. 150.] TRIGYNIA.

POLYGONUM. Perianth mostly 5-parted, persistent, often colored. Stamens 5 to 9, mostly 8. Styles 2, or 3. Akene solitary, compressed or triquetrous according as the styles are 2, or 3. ORD. CXI. POLYGONACEAE. p. 144.

FAGOPYRUM. FLOWERS SOMETIMES POLYGAMOUS: Perianth deeply 5-parted, persistent, colored. Stamens alternating with 8 hypogynous glands. Akene triquetrous. ORD. CXI. POLYGONACEAE. p. 146.

ENNEANDRIA MONOGYNIA.

Sassafras. Didicously polygamous: Perianth 6-parted, colored. Sterile Fl. Stamens 9, in three series, all perfect,—the 3 inner ones with a gland on each side at base. Ovary wholly abortive. Fertile Fl. Stamens 6, imperfect. Ovary ovoid, acuminate; stigma discoid. Drupe ovoid-oblong. Ord. CXIII. Lauraceae. p. 147.

BENZOIN. MOSTLY DIOICOUS: Perianth 6-parted, colored. STERILE FL. Stamens 9 perfect, and 6 to 9 imperfect in an inner series. Ovary a mere rudiment. Fertile Fl. Stamens 15 to 18, imperfect, filiform, acute. Ovary subglobose; stigma 2-lobed. Drupe oval. Ord. CXIII. LAURACEAE. p. 148.

TRIGYNIA.

RHEUM. Perianth colored, narrowed at base, 6-parted, persistent. Ovary triquetrous; stigmas multifid, reflexed. Akene triquetrous,—the angles membranaceously margined. ORD. CXI. POLYGONACEAE. p. 142.

DECANDRIA MONOGYNIA.

a. Ovary inferior: Corolla monopetalous.

VACCINIUM. Calyx mostly 5-toothed. Corolla campanulate or urceolate, mostly 5-cleft. Berry globose, 4 or 5-celled, many-seeded, crowned with the persistent calyx-teeth. ORD. LXXVIII. ERICACEAE. p. 102.

b. Ovary superior. † Corolla monopetalous.

Andromeda. Calyx 5-parted, persistent. Corolla tubular, subcylindric or ovoid; limb 5-cleft, reflexed. Anthers awnless or awned at summit. Capsule 5-celled, 5-valved, loculicidal. Ohd. LXXVIII. ERICACEAE. p. 103.

†. † Corolla pentapetalous.

CHIMAPHILA. Calyx 5-cleft. Petals 5, roundish-obovate. Ovary depressed-globose, umbilicate; style very short, immersed in the umbilicus of the ovary; stigma peltate, orbicular. Capsule depressed-globose, 5-celled, 5-valved, loculicidal at apex. Ord. LXXVIII. ERICACEAE. p. 104.

MELIA. Calyx 5-parted. Petals linear-spatulate. Stamineal tube subcylindric, 10-cleft at summit, bearing the anthers in the throat. Stigma 5-rayed. Drupe globose; nut 5-celled. Ord. XXIX. MELIACEAE. p. 20.

[Cereis. Ord. XLVIII. LEGUM NOSAE, p. 40.]

DIGYNIA.

Saxifraga. Calyx 5-parted, persistent, often adnate to the base of the ovary. Petals 5, entire, with short claws. Capsule 2-celled, 2-beaked (or rather 2 acuminate connate carpels), opening between the beaks. Oad. LXV. Saxifragaceae. p. 61.

PENTAGYNIA.

Lycinns. Calyx tubular, 5-cleft, naked at base. Petals 5, with slender claws, often crowned. Capsule 1-celled, or 5-celled at base, opening with 5 teeth at summit. Off. XXI. CARYOPHYLLACEAE p. 15.

DECAGYNIA.

Phytolacca. Perianth corolla-like, deeply 5-parted. Ovary superior, vertically depressed, orbicular. Berry 10-celled, 10-seeded. ORD. CXII. Phytolaccaceae. p. 146.

ICOSANDRIA (CLASS).

[For the Genera of this Class, See ORD. XLIX. ROSACEAE. p. 41.]

POLYANDRIA MONOGYNIA.

IF Ovary mostly superior.

CITRUS. Calyx urceolate, 3 to 5-cleft. Petals 5 to 8. Filaments dilated, united in parcels. Stigma hemispherical. Fruit a pulpy berry, with a subcoriaceous coat. ORD. XXVIII. AURANTIACE E. p. 19.

Tilia. Calyx 5-parted, deciduous. Petals 5, naked within, or each with an internal scale or accessory petal (staminodium). Filaments distinct, or somewhat united in parcels. Ovary globose, villous. Nut coriaceous or bony, by abortion 1-celled. Off. XXVI. Tiliaceae. p. 18.

PORTULACA. Ca'yx adnate to the base of the ovary, 2-parted, finally circumscissed near the base and deciduous. Petals mostly 5, inserted on the calyx. Stamens 8 to 15. Stigmas 3 to 8. Capsule subglobose, circumscissed, 1-celled, many-seeded. ORD. XXIII. PORTULACACEAE. p. 15.

PAPAVER. Calyx of 2 concave caducous sepals. Petals 4. Stigmas sessile, radiated. Capsule obovoid, opening by small valves under the crown formed by the stigmas. Seeds numerous, affixed to placentae which form incomplete dissepiments. Ord. XI. Papaveraceae. p. 5.

CIMICIFUGA. Calyx of 4 or 5 caducous sepals. Petals (or staminodia) 3 to 5 or 8, caducous,—sometimes 0. Carpels 1 to 8, follicular, many-seeded. Ord. I. RANUNCULACEAE. p. 3.

[Diospyros. Crd. LXXX. Feenaceae. p. 105.] DI-PENTAGYNIA.

HYPERICUM. Calyx deeply 5-parted. Petals 5. Filaments united in parcels. Styles 3 to 5. Capsule membranaceous, 3 to 5-celled, many-seeded. Ord. XIX. HYPERICACTAE. p. 14.

Deliphinium. Calyx of 5 irregular petaloid deciduous sepals,—the upper one spurred at base. Petals 4, irregular,—the two upper ones spurred and introduced into the spur of the calyx. Carpels 1 to 5, follicular, many-seeded. Oad. I. Ranunculatere. p. 2.

POLYGYNIA.

† Carpels dehiscent.

MAGNOTIA. Calyx of 3 deciduous sepals. Petals 6 to 9 or 12, in concentric series. Carpels crowded in a strobile-like spike, persistent, opening on the back, 1-seeded. Seeds in a fleshy coat, suspended by a long funiculus. Ord. II. MAGNOLIACEAE. p. 3.

† † Carpels indehiscent.

Liriodendron. Calyx of 3 somewhat petaloid caducous schals.— Petals mostly 6. Carpels samaroid, densely imbricated in a cone, decidnous, 1 or 2-seeded. Ord. II. Magnoliaceae. p. 4.

RANUNCULUS. Calyx of 5 deciduous sepals. Petals 5 (sometimes 10), each with a nectariferous scale, or pore, at base on the inside. Carpels compressed, mucronate, striate, smooth or tuberculate, arranged in a head. Ohd. I. RANUNCULACE E. p. 1.

DIDYNAMIA GYMNOSPERMIA.

[For the Genera belonging here, See ORD, XCIII. LABIATAE. p. 111.]

ANGIOSPERMIA.

CATAIPA. Calyx 2-parted. Corolla campanulate, with a ventricose tube; limb 5-lobed. Stamens 2 perfect, and 2 to 3 abortive (sometimes perfectly Didynamous). Capsule very long, terete, 2-celled, 2-valved. Seeds flat, margined and fringed at each end. Ord. LXXXVIII. BIGNONIACEAE. p. 107.

MARTYNIA. Calyx 5-cleft. Corolla subcampanulate,—the limb 5-lobed. Capsule oblong, much acuminate, finally woody with a coriaceous coating, 4-celled, 2-valved,—the acumination splitting into two long incurved claw-like beaks. ORD. LXXXIX. PEDALIACEAE. p. 108.

LINARIA. Calyx 5-parted. Corolla personate; upper lip bifid, reflexed; lower lip trifid,—the throat closed by the prominent palate; tube inflated, spurred at base. Capsule ovoid, 2-celled, opening with several valves at apex. Seeds numerous, margined. O.D. XCI. SCROPHULARIACEAE. p. 110.

VERBENA. Calyx tubular, 5-toothed. Corolla tubular, somewhat funnel-form,—the limb 5-lobed. Capsule thin and evanescent, 2 or 4 celled; cells 1-seeded. ORD. XCII. VERBENACEAE. p. 111.

TETRADYNAMIA (CLASS).

[The Genera of this Class all belong to Ord. XIII. CRUCIFERAE. p. 5.]

MONADELPHIA PENTANDRIA.

[Lobelia. Crd. LXXXVI. LOEELIACEAE. p. 101.]
FOLYANDRIA.

[For the Genera belonging here, See ORD. XXV. MALVACEAE p. 16.] DIADELPHIA OCTANDRIA.

POLYGALA. Sepals 5, irregular,—the 3 outer ones smaller, bract-like—the 2 inner ones wing-like, petaloid. Petals 3 to 5, somewhat cohering, united with the stamens,—the lower one keel-shaped. Capsule compressed. Seeds pubescent. Ohd. XLVII. Polygalacere. p. 30.

DECANDRIA.

[For the Genera belonging here, See CRD. XLVIII. LEGUMINOSAE. p. 31.]

SYNGENESIA (CLASS).

[The Genera of this Class belong to Ord. LXXV. Compositae. p. 74.]

GYNANDRIA HEXANDRIA.

ARIST LOCHIA. Perianth tubular, ventricose near the ovary,—the limb dilated, somewhat 3-lobed. Ovary inferior; stigmas 6, subsessile. Capsule 6-angled, 6-celled, many-seeded. O.D. CVI. ARISTOLICH ACEAE. p. 137.

MONOECIA MONANDRIA.

Eufholb:A. Flowers naked, in involuerate clusters. Involuere monophyllous, subcampanulate, with 5 petaloid segments, which have externally 5 gland-like teeth, alternating with them. Staminate Fl. numerous,—each consisting of an anther with its filament articulated in the middle. Pistillate Fl. solitary, central; ovary pedicellate; styles 3, bifid. Capsule 3-lobed, 3-celled: cells 1-seeded, bursting elastically on the back. Ord. CXXII. Euphorbia-ceae p. 152.

DIANDRIA.

[Fraxinus. Ord. CV. OLEACEAE. p. 134.] TRIANDRIA.

TYPHA. Florets in a long dense cylindric Spike,—the staminate ones above. Staminate Fl. Perianth 0. Stamens united by threes on 1 filament, which is inserted on the hairy receptacle. PISTILLATE Fl. Perianth 0. Ovary pedicellate, surrounded at base with a tuft of pappus-like hairs. Ord. CXXXVIII. TYPHACEAE. p. 190.

[Carex. Orb. CL1X. CYPERACEAE. p. 200.] [Zea. Tripsacum. Orb. CLX. Gramineae. p. 207.]

TETRANDRIA.

URTICA. Flowers sometimes Dioicous: Staminate Fl. Perianth of 4 roundish sepals, with the cup shaped rudiment of a pistil in the centre. Pistillate Fl. Perianth mostly of 2 persistent sepals. Stigma villous. Nut (or Akene) compressed, orbicular-ovate, shining. O.D. CXXXI. URTICACEAE. p. 179.

MORUS. Flowers in ament-like spikes,—sometimes Dioicous. STA-MINATE FL. in rather loose spikes. Perianth 4-parted. PISTILLATE FL. in dense spikes, which are sometimes androgynous. Perianth 4-parted,—the segments becoming baccate. Nut small, compressed, ovate, covered by the succulent perianth. ORD. CXXXI. URTICACEAE. p. 176.

ALNUS. STAMINATE FL. Ament long, cylindric,—the scales cuneate, truncate, 3-lobed, 3-flowered. Perianth 4-parted. Pistillate FL. Ament ovoid-oblong; scales subtrifid, 2-flowered. Perianth 0. Nut compressed, not margined. ORD. CXXVII. Betulaceae. p. 170.

PENTANDRIA.

Amaranthus. Stam:nate Fl. Perianth deeply 3 or 5-parted, mostly colored, persistent. Stamens sometimes 3. Pistillate Fl. Perianth as in the staminate flowers. Capsule 1-celled, circumseissed. Seed 1. Oad. CIX. Amaranthaceae. p. 140.

[Xanthium. Ambrosia, Ord. LXXV. Compositae, p. 74.]

[Celtis. ORD. CXVII. ULM.: CEAE. p. 151.]

[Quercus. Ond. CXXV. Cupuliferae. p. 160.]

HEXANDRIA.

[Zizania. ORD. CLX. GRAMINEAE. p. 206.] POLYANDRIA.

SAGITTARIA. Perianth deeply 6-parted,—the 3 outer segments sepaloid, persistent—the 3 inner ones petaloid, decidnous. Pistillate howers below the staminate ones. Ovaries numerous, in a globose head. Carpels compressed, margined, 1-seeded, not opening. Ond. CXXXIX. ALISMACEAE. p. 191.

ARUM. Often DIOICOUS: Spathe cucullate, convolute at base.—Spadix naked at summit, staminate in the middle, and pistillate at base. Perianth 0. Berry 1-celled, many-seeded. ORD. CXXXV. ARACEAE. p. 188.

QUERCUS. STAMINATE FL. in loose Aments. Perianth mostly 5-cleft. Stamens 4 or 5 to 10. PISTILLATE FL. Involucre of numerous

scales, united to form a cup. Perianth closely investing the ovary, 6-toothed. Ovary inferior, 3-celled; styles united into 1; stigmas 3. Nut (or Acorn) by abortion 1-celled, 1-seeded, coated by the enlarged persistent, coriaceously woody perianth, and seated in the cup-shaped involucre. Ord. CXXV. Cupuliferal. p. 160.

CASTANEA. STAMINATE FL. numerous, interruptedly clustered in long ament-like Spikes. Perianth 5 or 6-parted. Pistillate Fl. usually 3, within an ovoid squarrose or muricate involucre. Perianth urceolate, 5 or 6 cleft, containing the rudiments of 10 or 12 abortive stamens. Ovary inferior, connate with the perianth; stigmas pencil-form, exserted, cartilaginous. Nuts 1 to 3, included in the enlarged echinate 4-valved involucre. Ord. CXXV. Cepuliferae. p. 167.

FAGUS. STAMINATE FL. in pendulous globose Aments. Perianth campanulate, 6-cleft. PISTILLATE FL. mostly 2, in an ovoid squarrose involucre. Perianth urceolate, with 4 or 5 minute segments at apex. Ovary inferior, connate with the perianth; stigmas 3. Nuts usually 2, triquetrous, included in the coriaceous, muricate, 4-cleft involucre. Ord. CXXV. Cupuliferae. p. 166.

Corylus. Staminate Fl. imbricated in cylindric Aments; scales 3-cleft,—the middle segment covering the 2 lateral ones. Perianth 0. Stamens about 8. Pistillate Fl. numerous, in a terminal squamose cluster. Perianth obsolete. Stigmas 2. Nut bony, roundish-ovoid, sub-compressed, embraced by the foliaceous lacerate-dentate involucre. Ord. CXXV. Cupuliferae. p. 159.

OSTRYA. STAMINATE FL. Ament cylindric; scales orbicular-ovate, acuminate, ciliate. Anthers bearded at summit. P.STILLATE FL. Ament loosely imbricated, bracteate, with the flowers in pairs; scales in pairs, dilated and cohering by the margins, forming a membranous sac, or involucre, inclosing each flower. Perianth slightly urceolate, closely adherent to the ovary. Nut somewhat compressed, lance-oblong, included in the bladder-like sac. Orr. CXXV. Cupuliferae. p. 158.

BETULA. STAMINATE FL. Aments cylindric; scales ternate—the middle one bearing the stamens. PISTILLATE FL. Aments ovoid-oblong; scales trifid, 3-flowered. Nuts compressed, margined or samaroid, 1-seeded. ORD. CXXVII. BETULACEAE. p. 169.

PLATANUS. Aments all globose, on long peduncles. STAM: NATE FL. very minute. Perianth 0. Stamens numerous, mixed with subclavate scales. P.STILLATE FL. Perianth 0. Ovaries numerous, inversely pyramidal, mixed with spatulate scales; style subulate; stigma recurved. Nuts coriaceous, clavate, mucronate with the persistent style, invested at base with pappus-like hairs. ORD. CXXX. PLATANACEAE. p. 175.

LIQUIDAMBAR. Flowers in conical and globose Aments,—each ament embraced by a 4-leaved caducous involucre. Staminate Fl. in compound conical or ovoid-oblong aments. Perianth 0. Anthers numerous, subsessile in capitate clusters. Pistillate Fl. in globose aments. Ovaries surrounded by numerous scales, all cohering together and enlarging. Styles 2, subulate. Capsule 2-lobed, 2-celled, opening between the diverging styles. Ord. CXXIX. Balsamifluae. p. 174.

JUGLANS. STAMINATE FL. Aments simple, cylindric, loosely imbricated; Scales 5 or 6-parted, sometimes bracteate at base. Stamens numerous, subsessile, on a glandular disk. PISTILLATE FL. Perianth double,—the outer one 4-toothed—the inner one longer, 4-parted. Ovary inferior, ovoid; style short; stigmas 2, subclavate, spreading,—the upper surface lacerate or fringed. Drupe globose or oval, the epicarp spongy or coriaceous, and indehiscent; nut rugose and irregularly sulcate, imperfectly 4-celled, 2-valved, 1-seeded. Ord. CXXIV. Juglandaceae. p. 154.

CARYA. STAMINATE FI.. Aments mostly ternate, slender, imbricated; scales 3-parted. Stamens 3 to 6 or 8. PISTILLATE FL. Perianth single, 4-cleft. Ovary inferior; stigma 4-lobed, sessile. Drupe with a coriaceous epicarp, which finally opens by 4 valves; nut oval, somewhat quadrangular,—the surface even and smooth. ORD. CXXIV. JUGLANDACEAE. p. 156.

MONADELPHIA.

PINUS. STAM:NATE FL. Aments mostly in clustered terminal spikes; scales peltate. PISTILLATE FL. in terminal ovoid or oblong aments (cones, or strobiles), clustered or solitary; scales closely imbricated, enlarging and becoming woody, often thickened at apex and mucronate. Seeds naked, in pairs at the base of the scales, margined,—the margin deciduous, or sometimes persistent. Ord. CXXXII. Conferme. p. 181.

TAXODIUM. STAMINATE FL. Aments numerous, crowded in pyramidal terminal spikes; scales excentrically peltate. Pistillate Fl. Aments ovoid, in pairs at the base of the staminate spikes: scales imbricated, acute, recurved—spreading at apex,—finally somewhat peltate, and woody, forming a subglobose strobile. Seeds naked, irregularly angular, not margined. Ord. CXXXII. Conferre. p. 184.

Thuja. Staminate Fl. Aments ovoid, terminal, very small; scales excentrically peltate, loosely imbricated. Pistillate Fl. Aments terminal, small, somewhat depressed; scales quadrifariously imbricated, slightly recurved at apex,—forming an ovoid or subglobose tuberculaie strobile, at first closed, finally opening. Seeds naked, with a narrow margin. Ord. CXXXII. Conferred. p. 185.

RICINUS. STAMINATE FL. Perianth 5-parted. Stamens numerous. PISTILLATE FL. Perianth 3-parted. Style short; stigmas 3, bifid. Capsule muricate, 3-celled; cells 1-seeded. ORD. CXXII. EUPHOR-BIACEAE. p. 153.

LAGENARIA. Calyx campanulate or turbinate. Petals 5, obovate, adnate to the calyx below its border. Staminate Fl. Stamens 5, triadelphous: anthers very long and tortuous. PISTILLATE Fl. Ovary inferior; stigmas 3, 2-lobed, subsessile. Fruit a ligneous pepo, 1-celled, with 3 parietal placentae. Seeds arillate, with tumid margin. Ord. LXIII. Cucureitaceae. p. 57.

Cucumis. Calyx tubular-campanulate. * Petals 5, nearly distinct and free from the calyx. Staminate Fl. Stamens 5, triadelphous; anthers very long and tortuous. Pistillate Fl. (sometimes perfect): Ovary inferior, oblong; stigmas 3, 2-lobed, subsessile. Fruit an oblong fleshy 3 to 6-celled pepo. Seeds not arillate, acute at base and on the margin. Ord. LXIII. Cucurbitaceae. p. 58.

CITRULLUS. Calyx tubular-campanulate, 5-parted. Petals 5, adnate to the calyx. Staminate Fl. Stamens 5, triadelphous; anthers long and tortuous. Pistillate Fl. Ovary inferior, subglobose; stigmas 3, convex, reniform-cordate. Fruit a globose or elliptic pepo, 3 to 6-celled, succulent or fleshy. Seeds obovate-oblong, truncate at base, obtuse on the margin. Ord. LXIII. Cucurbitaceae. p. 59.

CUCURBITA. Corolla campanulate,—the petals cohering with each other and with the calyx. Staminate Fig. Calyx campanulate, with a short tube. Stamens 5, triadelphous and syngenesious; anthers straight and parallel, with the base and apex abruptly curved. Pistillate Fig. Ovary inferior; calyx with an obovoid tube, circumscissed below the limb after flowering; stigmas 3, thick, 2-lobed. Fruit a fleshy or subligneous 3 to 5-celled pepo, of various form—cither subglobose, oval, obovoid, clavate, or depressed and clypeate. Seeds ovate, with the margin scarcely tumid. Ord. LXIII. Cucurbitaceae. p. 59.

DIOECIA DIANDRIA.

Salix. Aments cylindrie; sea'es imbricated, 1-flowered. Perianth 0. Staminate Fl. Stamens 2 to 5, with a nectariferous gland at base. Pistillate Fl. Ovary acuminate, with a nectariferous gland at base; stigmas 2, bifid. Capsule 1-celled, 2-valved. Seeds minute, comose. Ord. CXXVIII. Salicaceae. p. 171.

[Fraxinus. ORD. CV. OLEACEAE. p. 134.]

TRIANDRIA.

Ficus. Flowers numerous and very minute, on the inner surface of the hollow turbinate carnose receptacle; orifice of the receptacle closed by small scales. Staminate Fl. Perianth 3-parted. Pistillate Fl. Perianth 5-parted. Ovary 1-celled; style lateral; stigma bifid. Utricles minute, membranaceous, dry, 1-seeded, lining and filling the cavity of the succulent pyriform receptacle. Ord. CXXXI. Urticaele. p. 178.

TETRANDRIA.

Maclura. Staminate Fl. racemosc. Perianth 4-parted; segments ovate. Ovary abortive. Pistillate Fl. coalesced in a dense globose head. Perianth 4-sepaled,—the sepals cucullate-concave. Ovary sessile, compressed, 1-celled; styles 2,—one usually abortive, the other elongated and very villous. Akenes 1-seeded, included in the baccate coalesced perianths. Ord. CXXXI. Urticaceae. p. 177. Broussonetia. Staminate Fl. Spikes amont-like. Perianth 4-parted. Pistillate Fl. crowded in a dense capitate compound cluster, mixed with hairy scales. Perianth urceolate, 3 or 4-toothed. Ovary ovate, 1-celled; style filiform, excentric. Akene subcarnose, elevated on the baccate receptacle, and partially embraced by the perianth. Ord. CXXXI. Urticaceae. p. 178.

[Morus. Urtica. CRD. CXXXI. URTICACEAE. p. 176-9.] PENTANDRIA.

HUMULUS. STAMINATE FL. Perianth of 5 equal sepals. Ovary wholly abortive. PISTILLALE FL. Aments ovoid-oblong; scales or bracts membranaceous, entire, imbricated, enlarging, 2-flowered. Perianth urceolate, thin and transparent, closely embracing the

ovary. Ovary ovate, 1-celled; stigmas 2, subulate. Akenes resinous-glandular. Ord. CXXXI. URTICACEAE. p. 180.

CANNABIS. STAMINATE FL. racemose. *Perianth* deeply 5-parted. PISTILLATE FL. glomerate. *Perianth* ventricose at base, acuminate, including the ovary, slit on one side. *Ovary* subglobose, 1-celled; stigmas 2, subsessile, elongated, pubescent. *Nut* ovoid, 1-seeded, indehiscent. ORD. CXXXI. URTICACEAE. p. 180.

Spinacia. Staminate Fl. Perianth 5-parted. Pistillate Fl. Perianth ventricose-tubular, 2 or 3-toothed. Ovary ovoid, 1-celled; stigmas 4, subsessile, long and filiform. Akene roundish-ovoid, inclosed in the persistent indurated (and sometimes muricate) perianth. Ord. CVII. Chenopodiaceae. p. 138.

[Rhus. Ord. XXXIX. ANACARDIACEAE. p. 23.]
[Acer. Ord. XLI. ACERACEAE. p. 26.]
[Vitis. Ord. XLVI. VITACEAE. p. 28.]
[Nyssa. Ord. CXIV. SANTALACEAE. p. 149.]
HEXANDRIA.

SMILAX. Perianth colored, campanulate, deeply 6-parted. PISTILLATE FL. Ovary superior; stigmas 3, subsessile. Berry globose, 1 to 3-celled, 1 to 3-seeded. ORD. CLI. SMILACEAE. p. 193.

[Gleditschia, Ord. XLVIII. LEGUMINOSAE. p. 41.] [Rumex Acetosella. Ord. CXI. Polygonaceae. p. 143.] [Sabal. Ord. CXXXIV. Palmae. p. 188.]

OCTANDRIA.

Populus. Aments cylindric; scales lacerately fringed. Perianth sub-turbinate, oblique, entire. Ovary superior, 1-celled; stigmas 2, elongated, bifid, subsessile. Capsule 2-valved. Seeds minute, comose. Ord. CXXVIII. Salicaceae. p. 172.

ENNEANDRIA.

[Sassafras. Benzoin. Ord. CXIII. LAURACEAE. p. 147-8.] DECANDRIA.

AILANTHUS. DIOICOUSLY POLYGAMOUS: Calyx 5-cleft. Corolla 5-petaled. Staminate Fl. Stamens as long as the corolla,—the alternate ones opposite the petals, and a little shorter. Ovaries 5, or fewer, abortive rudiments. PISTILLATE Fl. Ovaries 3 to 5, free, compressed, 1-celled; style lateral; stigma subcapitate. Samarae 3 to 5, or fewer by abortion, oblong, tumid in the centre. Perfect Fl. with 2 or 3 stamens. Ord. XL. Xanthoxylaceae. p. 25.

MONADELPHIA.

JUNIPERUS. STAMINATE FL. Aments ovoid-oblong; scales excentrically peltate, imbricated. PISTILLATE FL. Aments ovoid, axillary, bracteate at base. Involucre of 3 to 6 scales, which coalesce and become a subglobose drupaceous tuberculate fruit, inclosing 2 or 3 naked angular nut-like seeds. ORD. CXXXII. CONFERAE. p. 186.

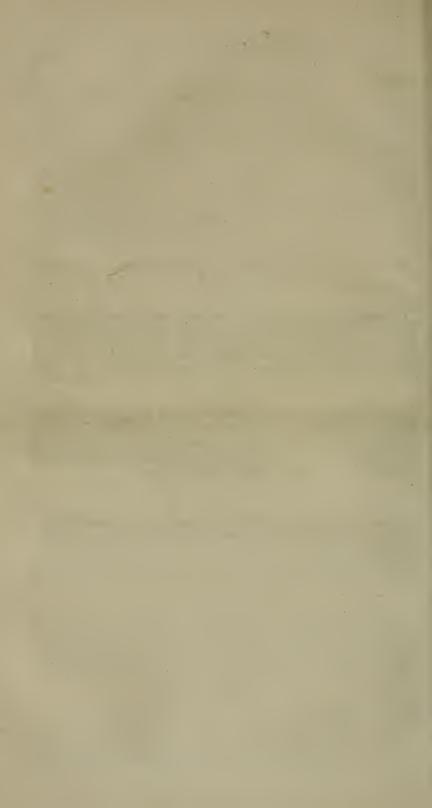

CRYPTOGAMIA (CLASS).

The few Genera, in the present work, which belong to this Class, will be found in the Series of Flowerless Plants,—where they can be as readily determined by their natural characters, as by any artificial arrangement. In fact, the *Cryptogamous* plants are necessarily disposed in conformity with the *Natural Method*.

Le Naturaliste place à côté les uns des autres tous les êtres qui ont le plus grand nombre d'organes communs ou semblables, et sépare ceux qui n'en possèdent en commun qu'un petit nombre ; d'où resulte que, tandis que la perfection d'un système artificie est de ne compliquer le caractère des classes que du plus petit nombre d'idées possible, une methode naturelle, au contraire, est d'autant plus parfaite, que les caractères des classes peuvent exprimer un plus grand nombre d'idées.

DE CANDOLLE.

The true Naturalist arranges or groups together all those beings which have the greatest number of organs in common, or of similar structure,—and separates those which possess but a small number of them in common: whence it results that, while the perfection of an Artificial System consists in connecting with the character of the Classes the smallest possible number of ideas.—a Natural Method, on the contrary, is so much the more perfect, as the characters of the Classes are expressive of a greater number of ideas.

GROUPS AND ORDERS

NOTICED IN THIS WORK.

The Vegetable Kingdom is arranged, by Prof. A. Gray in his Botanical Text-Book (which arrangement is here adopted,) in two Series, or grand Divisions,—known as Phaenogamous or Flowering Plants, and Cryptogamous or Flowerless Plants. These, again, are subdivided; and the plants belonging to them are disposed, according to their structure and affinities, in Classes, Sub-Classes, Divisions, Groups, Orders, Sub-Orders, Tribes, Sub-Tribes, Genera, Sub-Genera, Species and Varieties.

The following is a Synoptical View of the general arrangement and grouping of the *Natural Orders*, or Families, to which the plants described in the present work are referable: for which, as the intelligent reader will perceive, I am indebted to the valuable

Text-book, above mentioned.

PHAENOGAMOUS OR FLOWERING PLANTS.

Plants furnished with *Flowers* (essentially consisting of stamens and pistils), and producing proper Seeds.

CLASS I. EXOGENOUS OR DICOTYLEDONOUS PLANTS.

Stem consisting of a distinct bark and pith, which are separated by an interposed layer of woody fibres and vessels, forming genuine wood in all perennial stems: increase in diameter effected by the annual deposition of new layers between the old wood and the bark,—which layers are arranged in concentric zones or rings, and traversed by medullary rays. Leaves commonly articulated with the stem,—their veins branching and reticulated. Sepals and Petals, when present, most commonly in fives—sometimes in fours—and very rarely in threes.* Embryo with two (in the Coniferae with a verticil of several) Cotyledons.

^{*}A complete symmetrical Flower consists of 4 distinct successive orders of verticils or whorls of modified leaves, crowded together at the summit of a stem, branch, or peduncle,—the members or constituent parts of the successive verticils being known as Sepals, Petals, Stamens, and Pistils. The normal or regular number of these modified leaves, in each floral verticil of Exogenous plants, is five; but they are subject to much variation,—and one or more of them is often suppressed, or abortive—especially in the superior, central, or pistillate verticil. Sometimes the members of these verticils are more than five; in which cases they are frequently ten, or some multiple of five—clearly indicating a doubling or multiplication of one or more of the normal orders of verticils. This is remarkably the case with the staminate verticil; and such multiplied stamens are, moreover, apt to be imperfectly metamorphosed, or left in the form and condition of Staminodia,—and even of complete Petals: in which latter state they constitute what are called double flowers. In Endogenous plants, the floral verticils are usually less complete; and each consists, normally, of three members,—or, when increased in number, of six, or some multiple of three. The Sepals (or lower verticil), in this class, often appear to be wanting; or are so blended with the petals as scarcely to be distinguished.

SUB-CLASS I. ANGIOSPERMOUS EXOGENS.

Ovules produced within a closed ovary, and fertilized by the action of pollen through the medium of a stigma. Embryo with a pair of opposite Cotyledons.

DIVISION I. POLYPETALOUS EXOGENS. *

Floral envelopes consisting generally of both Calyx and Corolla,—the petals distinct, or but slightly connected (united in Ord. LXIII. Cucurbitaceae. p. 57. wanting in some species of Fraxinus, Ord. CV. Oleaceae. p. 134.).

GROUP 1. Ovaries several or numerous (solitary in Berberidaceae), distinct; when in several rows sometimes coherent with each other, but not united into a compound pistil. Petals and Stamens inserted on the receptacle (hypogynous). Seeds albuminous.

Stamens or Pistits (one or both) numerous or indefinite.

ORD. I. RANUNCULACEAE. p. 1.

ORD. II. MAGNOLIACEAE. p. 3.

GROUP 3.† Ovary compound (composed of 2 or more united carpels), with parietal placentae! Calyx entirely free from the ovary! Stamens and Petals inserted on the receptacle,—the former mostly distinct. Leaves not dotted.

a. Sepals 2, or rarely 3, caducous.
ORD. XI. PAPAVERACEAE. p. 4.
b. Sepals and Petals 4, or rarely 6.
ORD. XIII. CRUCIFERAE. p. 5.

Group 4. Ovary compound, with the placentae parietal,—or 2 to 5-celled by the meeting of the placentae in the axis; styles distinct, or partly united. Calyx entirely free from the ovary. Stamens and Petals inserted on the receptacle,—the former often united in 3 or more parcels (polyadelphous). Seeds with a straight embryo, and little or no albumen. Leaves punctate with transparent or black dots.

ORD. XIX. HYPERICACEAE. p. 13.

GROUP 5. Ovary compound, 1-celled, with a free central placenta,—or 2 to several-celled, with the placentae in the axis,—free from the calyx, or nearly so. *Embryo* coiled around the outside of mealy albumen!

Petals 3 to 5 or 6, rarely wanting.

ORD. XXI. CARYOPHYLLACEAE. p. 14. ORD. XXIII. PORTULACACEAE. p. 15.

GROUP 6. Ovary compound and several-celled, with the placentae in the axis,—sometimes several carpels more or less coherent with each other, or with a central axis. Calyx free, valvate in aestivation. Stamens indefinite, monadelphous, or sometimes polyadelphous, inserted with the petals (with which they frequently cohere)

*A few instances of polypetalous flowers occur in Order LXXVIII] ERICACEAE, (VIZ. in Sub-Order III. Pyroleae)—which is, nevertheless, placed in the monopetalous division of the Series.

† For the sake of conformity and convenient reference, I have not numbered the Groups and Orders, here given, consecutively; but have retained the numbers as they are applied in the second edition of Dr. Gray's Text-book.

into the receptacle, or on the base of the calyx. Embryo usually curved,—the foliaceous cotyledons twisted and plicately folded.

ORD. XXV. MALVACEAE. p. 16. ORD. XXVI. TILIACEAE. p. 18.

Group 7. Ovary compound, with 2 or more cells, and the placentae in the axis, free from the calyx, which is imbricated in aestivation. Stamens indefinite, or twice as many as the petals, often monadelphous or polyadelphous, inserted with the petals into the receptacle. Seeds nearly or quite destitute of albumen. Embryo mostly straight, with large or thickened cotyledons.

ORD. XXVIII. AURANTIACEAE. p. 19. ORD. XXIX. MELIACEAE. p. 20.

GROUP 8. Ovary compound, or of several earpels adhering to a central axis, with 1 or more ovules in each cell or carpel, free from the calyx, which is mostly imbricated in aestivation. Petals as many as the sepals, or sometimes fewer. Stamens usually as many, or twice as many, as the petals, inserted on the receptacle, commonly monadelphous. Seeds usually with little or no albumentiowers perfect.

a. Flowers regular, or nearly so: Calyx imbricate.
ORD. XXXI. LINACEAE. p. 21.
b. Flowers irregular and unsymmetrical.
ORD. XXXV. TROPAEOLACEAE. p. 22.

GROUP 9. Ovary compound, with 2 or several cells,—or, Carpels several, and more or less united by their styles. Calyx free. Petals as many as the sepals, or rarely wanting. Stamens once or twice as many as the petals, distinct, inserted on the receptacle, or base of the calyx. Flowers often dioicous or polygamous, regular.

ORD. XXXIX. ANACARDIACEAE. p. 23. ORD. XL. XANTHOXYLACEAE. p. 24.

Group 10. Ovary compound, mostly 2 or 3-lobed, 2 or 3-celled, with 1 or 2 ovules in each cell, free from the calyx, which is imbricated in aestivation. Petals mostly irregular, or one fewer than the sepals, sometimes wanting. Stamens distinct, definite, inserted on or around a hypogynous disk. Seeds destitute of albumen. Embryo curved, with large cotyledons. Flowers often polygamous.

ORD. XLI. ACERACEAE. p. 25. ORD. XLII. HIPPOCASTANACEAE. p. 27.

Group 11. Ovary compound, 2 to 5-celled, free or sometimes adherent to the calyx. Petals and Stamens as many as the lobes of the calyx and inserted into its base or throat, or into the disk which covers its base. Seeds albuminous, with a large and straight embryo. Flowers perfect, or sometimes polygamous or dioicous.

ORD. XLVI. VITACEAE. p. 28.

Group 12. Ovary compound, 2-celled, free from the calyx. Sepals and Petals very irregular. Stamens monadelphous,—tube of filaments split on one side, and more or less united with the claws of the hypogynous petals; anthers 1-celled, opening by a pore at the apex! Seeds albuminous.

ORD. XLVII. POLYGALACEAE. p. 30.

GROUP 13. Ovary simple and solitary, free from the calyx,-the

fruit a Legume. Corolla papilionaceous, or sometimes regular. Stamens monadelphous, diadelphous, or distinct. Seeds destitute of albumen.

ORD. XLVIII. LEGUMINOSAE. p. 31.

GROUP 14. Ovaries simple and distinct, or compound and 2 to several-celled, with the placentae in the axis. Calyx free, or often adherent to the ovary. Petals regular, inserted on the throat of the calyx. Stamens distinct, inserted with the petals. Seeds destitute of albumen. Embryo straight.

a. Stamens mostly indefinite.
ORD. XLIX. ROSACEAE. p. 41.
b. Stamens definite.
ORD. LIV. ONAGRACEAE. p. 54.

GROUP 15. Ovary compound, 1-celled, with parietal placentae. Calyx adherent to the ovary, or sometimes free,—when adherent, bearing the petals and stamens on its throat, and the flowers perfect.

ORD. LIX. GROSSULACEAE. p. 55.

GROUP 16. Ovary compound, 2 to several-celled (or 1-celled by obliteration),—the placentae arising from the axis, but carried outward to the walls of the pericarp. Calyx adherent to the ovary. Corolla frequently monopetalous! Stamens united either by the filaments or anthers. Flowers monoicous or dioicous.

ORD. LXIII. CUCURBITACEAE. p. 57.

Group 17. Ovaries two or more, distinct or partly united,—or combined into a compound pistil, which has 2 or more cells with the placentae in the axis,—or sometimes 1-celled with parietal placentae. Calyx free from the ovary, or sometimes more or less adherent. Stamens mostly definite, and, with the petals, inserted on the calyx. Seeds numerous, with a straight embryo in the midst of albumen.

ORD. LXV. SAXIFRAGACEAE. p. 61.

Group 18. Ovary compound, 2- (rarely 1-3- or 5-) celled, with a single ovule suspended from the summit of each cell. Calyx usually closely adherent to the ovary. Stamens as many as the petals, and inserted with them upon the throat of the calyx, or on an epigynous disk. Seeds with a small embryo in the midst of hard albumen. Petals mostly valvate in aestivation.

Calyx-tube entirely adherent to the ovary: Stamens and petals epigynous.

ORD. LXVII. UMLELLIFERAE. p. 62. ORD. LXVIII. ARALIACEAE. p. 69.

ORD. LXIX. CORNACEAE. p. 70.

DIVISION II. MONOPETALOUS EXOGENS.*

Floral envelopes consisting of both calyx and corolla,—the petals more or less united (forming what is more correctly termed a gamopetalous corolla.)

^{*}The plants belonging to ORD. LXIII. CUCURBITACEAE, although commonly monopetalous (i.e. gamopetalous), will be found in the polypetalous division: And some species of Fraxinus, belonging to ORD. CV. OLEACEAE, p. 134, at the end of this Division, are destitute of petals.

GROUP 1. Ovary adherent to the calyx (inferior), 2 to several-celled, with 1 or many ovules in each cell. Seeds albuminous. Stamens inserted on the corolla.

ORD. LXXI. CAPRIFOLIACEAE. p. 71. ORD. LXXII. RUBIACEAE. p. 72.

- Group 2. Ovary adherent to the calyx (the limb or free portion of which assumes the form of a crown, or pappus,—or else is obsolete), 1-celled and 1-ovuled,—rarely 3-celled, with 2 of the cells empty. Seeds with little or no albumen. Stamens inserted on the corolla. Fruit a kind of Akene (or Achenium). Flowers usually crowded into heads.
 - a, Stamens distinct. Seed suspended.
 ORD. LXXIV. DIPSACEAE. p. 73.
 b. Stamens syngenesious. Seed erect.
 ORD. LXXV. COMPOSITAE. p. 74.
- GROUP 3. Ovary adherent to the calyx, 2 to 7- (rarely 1-) celled, with numerous ovules. Seeds albuminous. Stamens inserted with the corolla upon an epigynous disk; anthers not opening by pores.

 ORD. LXXVI. LOBELIACEAE, p. 100.
- GROUP 4. Ovary sometimes adherent to the calyx, but generally free (superior), with 2 or more cells, and usually with numerous ovules. Seeds albuminous. Stamens inserted with the corolla (either hypogynous or epigynous), or rarely adherent to its base,—as many, or twice as many as its lobes; anthers commonly opening by pores or chinks. Petals sometimes distinct!

ORD. LXXVIII. ERICACEAE. p. 101.

GROUP 5. Ovary free, or rarely adherent to the calyx, several-celled, with a single ovule (or at least a single seed) in each cell.—Stamens definite; anthers not opening by pores.

ORD. LXXX. EBENACEAE. p. 104.

GROUP 7. Ovary free (superior), 1-celled with a single ovule,—or 2-celled with several ovules attached to a thick central placenta.—Stamens as many as the lobes of the regular corolla, or the nearly distinct petals,—either alternate with or opposite to them. Seeds albuminous.

ORD. LXXXIV. PLANTAGINACEAE. p. 105.

GROUP 8. Ovary free, 1 or 2-(or spuriously 4-) celled, with numerous ovules. Corolla bilabiate, or more or less irregular; the Stamens inserted upon its tube, and mostly fewer than its lobes.

ORD. LXXXVIII. BIGNONIACEAE. p. 107. ORD. LXXXIX. PEDALIACEAE. p. 108. ORD. XCI. SCROPHULARIACEAE. p. 109.

GROUP 9. Ovary free, 2 to 4-lobed, in fruit separating into as many Nuts or Akenes. Corolla regular, or irregular (bilabiate),—the Stamens inserted on its tube, equal in number or fewer than its lobes. Seeds with little or no albumen.

a. Corolla irregular or bilabiate.

ORD. XCII. VERBENACEAE. p. 110. ORD. XCIII. LABIATAE. p. 111. b. Corolla regular.

ORD. XCIV. BORAGINACEAE. p. 122.

GROUP 10. Ovary free, compound,—or the carpels 2 or more and

distinct; ovules usually numerous in each cell. Corolla regular,—the Stamens inserted on its tube, as many as the lobes and alternate with them. Fruit capsular, follicular, or baccate.

a. Ovary compound (of 2 or more united Carpels.)

ORD. XCIX. CONVOLVULACEAE p. 124. ORD. C. SOLANACEAE. p. 127.

ORD. CI. GENTIANACEAE. p. 132.

b. Ovaries mostly 2 and distinct—at least in fault.
ORD. CHI. ASCLEPIADACEAE. p. 133.

GROUP 11. Owary free, 2-celled; cells 1 to 3-ovuled, in fruit 1 or 2-seeded. Corolla regular (the Petuls sometimes nearly distinct, and occasionally wanting). Stamens fewer than the lobes of the corolla (usually 2), inserted on its tube, or upon the receptacle.

ORD. CV. OLEAGEAE. p. 134.

DIVISION III. APETALOUS EXOGENS.

Corolla mostly none;* the floral envelopes consisting of a single series or verticil (Calyx),—or sometimes entirely wanting.

Group 1. Flowers perfect, with a colored or petaloid calyx. Ovary, of several cells, with numerous ovules in each.

ORD. CVI. ARISTOLOCHIACEAE. p. 137.

GROUP 2. Flowers perfect, or rarely polygamous, with a regular and sometimes a petaloid calyx. Ovules solitary in each ovary, or cell. Embryo curved or coiled around the outside of mealy albumen, or spiral,—rarely in the axis.

a. Ovary 1-celled or simple.

ORD. CVII. CHENOPODIACEAE. p. 137. ORD. CIX. AMARANTHACEAE. p. 140.

ORD. CXI. POLYGONACEAE. p. 142.

b. Ovary compound—a verticil of united carpels.
 ORD. CXII. PHYTOLACGACEAE. p. 146.

GROUP 3. Flowers perfect, or sometimes polygamo-dioicous, not disposed in aments, having a regular and often petaloid calyx. Ovary 1-(rarely 2-) celled, with a solitary ovule—or at least a single seed, in each cell. Embryo not coiled around albumen.

a. Style or Stigma 1.

ORD. CXIII. LAURACEAE. p. 147. ORD. CXIV. SANTALACEAE. p. 149. b. Styles or stigmas 2, divergent. ORD. CXVII. ULMACEAE. p. 150.

GROUP 6. Flowers monoicous or dioicous, not in aments. Fruit capsular, tricoccous, or drupaceous with 2 or more cells,—cach cell 1-(rarely 2-) seeded.

ORD. CXXII. EUPHORBIACEAE, p. 152.

GROUP 7. Flowers monoicous or dioicous,—the sterile ones (and sometime the fertile ones also) in aments, or in heads, or spikes. Calyx sometimes wanting. Ovary 1-to several-celled,—but the fruit always 1-celled, except in Liquidambar. Trees, or shrubs, with the exception of some of the URTICACEAE, which are herbaceous.

*The flowers of some of the plants belonging to Euphorbiaceae (Ord. CXXII.)—and also to Juglandaceae (Ord. CXXIV.);—are furnished with a Corolla.

- a. Fruit drupaceous,—the Epicarp fibrous or coriaceous: Calyx adherent.
 ORD. CXXIV. JUGLANDACEAE. p. 154.
 - b. Fruit a nut, involucrate: Calyx adherent. ORD. CXXV. CUPULIFERAE. p. 158.
- c. Fruit indehiscent, 1-seeded: Flowers all in aments, and destitute of a calyx.

 ORD. CXXVII. BETULACEAE. p. 169.
- d. Fruit dehiscent, many-seeded,—the seeds comose: Flowers all in aments, and destitute of a calyx.

ORD. CXXVIII. SALICACEAE. p. 171.

e. Fruit a nut, or a 2-celled few-seeded capsule: Flowers in globose amentaceous heads, destitute of a calyx.

ORD. CXXIX. BALSAMIFLUAE. p. 174. ORD. CXXX. PLATANACEAE. p. 174.

f. Fruit an Akene, often included in a baccate calyx: Flowers variously disposed. Juice milky, when in trees or shrubs.

ORD. CXXXI. URTICACEAE. p. 175.

SUB-CLASS II. GYMNOSPERMOUS EXOGENS.

Ovules, and consequently the seeds naked—i. e. not inclosed in an ovary,—the carpel being represented either by an open scale, as in the Pines; or by a more evident leaf, as in Cycas; or else altogether wanting, as in the Yew. Of course, there is neither Style nor Stigma.

ORD. CXXXII. CONIFERAE. p. 181.

CLASS II.

ENDOGENOUS OR MONOCOTYLEDONOUS PLANTS.

Stem not distinguishable into bark, pith and wood; no concentric zones or layers, and no medullary rays; increase in diameter effected by a central deposit of new fibres. Leaves not articulated with the stem, but often sheathing at base,—the veins simple and nearly parallel. Floral envelopes, when present, mostly in threes (or some multiple of three,)—the calyx and corolla often undistinguishable. Embryo with a single cotyledon.

GROUP 1. Flowers on a spadix, furnished with a double perianth (calyx and corolla). Ovary 1 to 3-celled, with a single ovule in each cell. Trees with unbranched columnar trunks.

ORD. CXXXIV. PALMAE. p. 187.

GROUP 2. Flowers mostly on a spadix, with the perianth wanting, or scale-like,—rarely regular and single (calyx). Chiefly aquatic herbs.

ORD. CXXXV. ARACEAE. p. 188. ORD. CXXXVII. TYPHACEAE. p. 190.

GROUP. 3. Flowers not on a spadix, furnished with a double perianth (calyx and corolla). Ovaries 3 to 6, or numerous, free, distinct, or more or less united. Aquatic or swamp herbs.

ORD. CXXXIX. ALISMACEAE. p. 191.

GROUP 4. Flowers with a single or double perianth, which adheres either to the lower part, or to the whole surface, of the ovary. Herbs.

ORD. CXLVI. BROMELIACEAE. p. 192.

GROUP 5. Flowers with a regular perianth, often in 2 series which are similar and more or less petaloid, or rarely (viz. in Ord. CLV. Juncaceae. p. 198.) glumaceous, free from the ovary. Embryo inclosed in albumen. Herbs; rarely shrubby and climbing plants.

ORD. CLI. SMILACEAE. p. 193. ORD. CLII. LILIACEAE. p. 194. ORD. CLV. JUNCACEAE. p. 198.

GROUP 7. Flowers imbricated with chaffy bracts (glumes and paleae), and disposed in spikelets,—but with no proper floral envelopes or perianth, except in the form of bristles, or small rudimentary scales. Ovary 1-celled, with a solitary ovule; fruit an Akene, or Caryopsis. Embryo at the extremity of the albumen next the hilum. Sedges and Grasses.

ORD. CLIX. CYPERACEAE. p. 199. ORD. CLX. GRAMINEAE. p. 201.

CRYPTOGAMOUS OR FLOWERLESS PLANTS.

Plants destitute of flowers (or with mere analogues, or resemblances of stamens and pistils), and producing no proper seeds,—but propagated by minute cellular particles, or seminal equivalents, called Spores or sporules,—which are often contained in vessels, coverings, or cavities, called Thecae, Sporanges, Sporocarps, or Sporidia—and aggregated on certain parts of the plants: sometimes the spores are naked—scattered over the surface, or immersed in the substance, of the parent plants.

CLASS III. ACROGENOUS OR APEX-GROWING PLANTS.

Stem extending or growing only at the summit,—having no provision for continued increase in diameter, either by external layers or internal deposit of new fibres.

ORD. CLXII. EQUISETACEAE. p. 237. ORD. CLXII. LYCOPODIACEAE. p. 237. ORD. CLXIII. FILICES, p. 238.

CLASS IV.

ANOPHYTES, OR SUPERIOR CELLULAR PLANTS.

Plants wholly cellular—i. e. destitute of vascular and woody fibres,—but still resembling the superior Orders of vegetation, in having distinct stems and foliage, and the analogues or equivalents of flowers.

ORD. CLXV. Musci. p. 239.

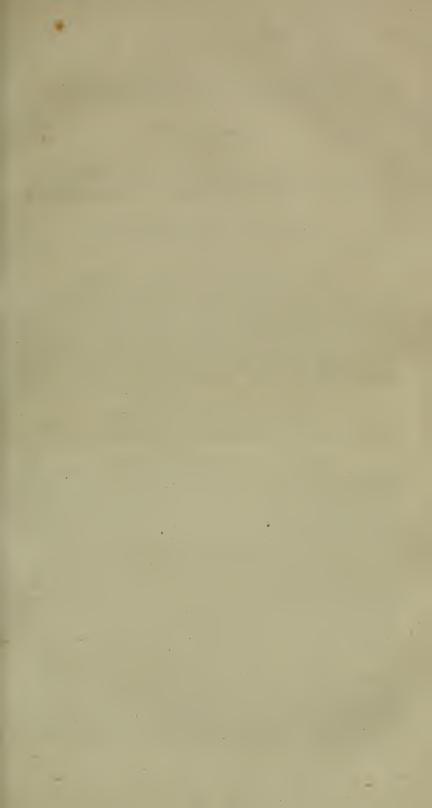

CLASS V.

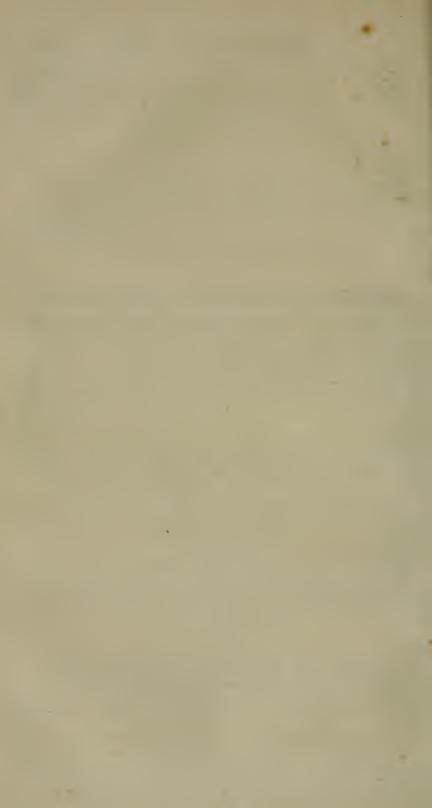

THALLOPHYTES, OR VEGETABLE EXPANSIONS.

Plants wholly cellular in their structure,—developing themselves

(often indefinitely) in flat leaf-like expansions (Thalli), or in roundish masses—but with no clear indication of a distinct root, stem, or foliage.

ORD. CLXVII. LICHENES. p. 240. ORD. CLXVIII. FUNGI. p. 242.
ORD. CLXX. ALGAE. p. 246.

AGRICULTURAL BOTANY.

SERIES I. PHAENOGAMOUS OR FLOWERING PLANTS.

POLYPETALOUS EXOGENS.

ORDER I. RANUNCULACEAE. Juss.

Herbaceous (rarely frutescent, and occasionally climbing) plants, with an acrid watery juice. Leaves mostly alternate, variously lobed or divided—the petioles more or less dilated and stem-clasping at base. Calyx of 3 to 6—usually 5—distinct sepals, mostly deciduous. Petals 5 to 15, sometimes deformed or irregular—occasionally absent. Stamens indefinite, distinct. Ovaries numerous (rarely few, or solitary), distinct. Embryo minute, at the base of firm albumen.

This Family comprises a number of plants of considerable beauty; but few of Agricultural importance. Some species of Ranunculus are highly acrid; the Aconites are even poisonous; and the warmly aromatic seeds of Nigella sativa, L. have been used as a substitute for the Nutmeg. These, however, scarcely come within the scope of the present work.

TRIBE II. RANUNCULEAE. DC.

Petals with a small nectariferous scale, gland or pore, at base inside. Anthers extrorse. Carpels dry, indehiscent, 1-seeded. Seed erect, or sometimes suspended.

1. RANUNCULUS. L. Endl. Gen. 4783.

[Latin, Rana, a frog; the plant often growing where that animal is found.] Sepals 5. Petals 5 (sometimes 10 or more), with a nectariferous scale, pore or glandular spot, on the inside of the claw. Stamens mostly numerous. Carpels numerous, compressed, ovate, pointed, disposed in roundish or cylindrical heads. Seed erect, (rarely suspended).-Annual or perennial Herbs. Leaves mostly radical, the cauline ones at the base of the branches and peduncles.

To Carpels smooth and even. Leaves dissected.

1. R. BULBOSUS, L. Hairy; radical leaves petiolate, trifoliolate and somewhat pinnately divided; leaflets usually 3-cleft, incisely toothed, the middle or terminal one petiolulate; stem erect, bulbous at base; peduncles furrowed; calyx reflexed, shorter than the petals; carpels subovate, with a short acute recurved beak. Torr. & Gr. Fl. N. A. 1. p. 24. DC. Prodr. 1. p. 41. Fl. Cestr. p. 331. Icon, Fl. Lond. 2.

Bulbous Ranunculus. Vulgò-Butter-cups. Crow-foot.

Germ. Knolliger Ranunkel. Span. Boton de Oro.

Root perennial. Stern about a foot high, often several from the same root, more or less branched, clothed with appressed hairs. Leaves variously cut, the segments cuneate. Peduncles 2 to 6 inches long, sulcate-angular. Petals sometimes more than 5 (flowers double), deep yellow and shining. Carpels in a globose head.—Pastures and Meadows: introduced. Native of Europe. Ft. May. Fr. July.

Obs. This foreigner is becoming extensively naturalized, and is considered quite a nuisance, by many farmers in Chester County, Penn.—particularly in the meadows along the Brandywine. The fleshy bulb is highly acrid,—affording a powerful rubefacient, and even causing ulcers, when externally applied. Beggars in Europe, it is said, use it for this purpose, in order to excite sympathy. I do not know that cattle have been injured by it; but as it is a troublesome weed, when fully introduced, it may be well for farmers to know the plant, and eradicate it upon its first appearance in their grounds. There are several native species, frequent in our woodlands, and moist low grounds; but they have not been found troublesome.*

TRIBE III. HELLEBOREAE. DC.

Calyx mostly petaloid. Petals irregular, often bilabiate or tubular, nectariferous—sometimes wanting. Carpels few (rarely solitary), follicular, dehiscent, several-seeded.

2. DELPHINIUM. L. Endl. Gen. 4796.

[Greek, Delphin, a dolphin; from a fancied resemblance in the nectaries.] Calyx petaloid, irregular, the upper sepal produced into a spur at base. Petals 4, irregular, the two upper ones with a spur-shaped appendage at base inclosed in the spur of the calyx. Ovaries 1 to 5, mostly 3. Follicles many-seeded. Annual or perennial Herbs.—Leaves petiolate, palmately divided. Flowers in terminal racemes.

1. D. Consolida, L. Stein erect, with spreading branches; leaves many-parted, the segments linear; flowers few, in loose racemes; pedicels longer than the bracts; carpels solitary, smooth. *Torr. & Gr. Fl. N. A.* 1. 2. 30. *DC. Prodr.* 1. p. 51.

Solder Delphinium. Vulgò—Lark-spur. [Caballero. Fr. Pied d' Alouette. Germ. Der Rittersporn. Span. Espuela de

Root annual. Stem about two feet high, and with the foliage and flowers somewhat pubescent. Flowers blue or violet-purple, sometimes the petals are multiplied into double flowers. Grain fields, and waste places: introduced. Native of Europe. Fl. July. Fr. August.

Obs. This plant (which gets its specific name from a supposed virtue in soldering or uniting wounded flesh,) has strayed from the gardens, in some places, and is an unwelcome intruder in grain fields and other cultivated grounds. This, and a kindred species (D. Ajacis, L. with few erect branches, longer and more crowded racemes,) are so common in gardens, that it requires some attention to prevent them from trespassing on the farm. Plants which have matured their seed in the garden, should never be carried to the Barn-yard, nor permitted to mingle with farm manure,—otherwise the fields will soon be infested with pernicious and worthless weeds.

TRIBE IV. CIMICIFUGEAE. Torr. & Gr.

Sepals petaloid, caducous. Petals (or rather Staminodia—dilated sterile filaments,) 3 to 6 or 8. Anthers introrse. Carpels few—sometimes solitary, rarely numerous—follicular or baccate, with several seeds,—sometimes indehiscent and 1-seeded. Flowers occasionally unisexual, by abortion.

* My friend, Prof. A. Gray, of Cambridge, informs me that R. aeris, L. also called Butter-cups, and Upright Meadow Crow-foot—a kindred species, (with palmately divided leaves,—the stem not bulbous at base,—and the peduncles not furrowed), is quite common around Boston,—in Western New York, &c., and deserves to be enumerated among the pernicious Weeds of the country.

- 3. CIMICIFUGA. L. [Botrophis. Raf. Endl. Gen. 4890.] [Latin, Cimex, a bug, and fugare, to drive away; in allusion to supposed virtues.] Sepals 4 or 5. Petals (or Staminodia) 3 to 5 or 8, concave or unguiculate,—sometimes, by abortion, fewer or none. Stamens numerous; style short; stigma simple. Carpels 1 to 8, follicular, many-seeded. Perennial Herbs. Leaves bi- or tri-ternately divided. Flowers in virgate racemes.
- 1. C. RACEMOSA, Ell. Leaves triternate; leaflets ovate-oblong; petals slender, forked at apex; carpels solitary. Torr. & Gr. Fl. N. A. 1. p. 36.

Actæa racemosa. L. DC. Prodr. 1. p. 64. Fl. Cestr. p. 319.

RACEMOSE CIMICIFUGA. Vulgò-Tall Snake-root. Black Snake-root.

Root perennial, large, branching. Stem 4 to 6 feet high, slender, smooth, leafy near the middle, naked above and below, with one or two radical leaves on long erect petioles. Leaves ternately decompannd, petiolate; leaflets 2 to 4 inches long, acute or acuminate, unequally incised-dentate, the terminal one larger and often 3-lobed. Racemes terminal, branching, 6 to 12 inches long. Sepals 4, orbicular, concave, greenish white. Petals (or staminodia) 4 to 8, slender, sublinear, bifurcate or emarginate at apex. Carpel ovoid, subcompressed, smooth, obliquely beaked with the persistent style. Seeds compressed and angular.—Rich woodlands. Fl. June. Fr. Sept.

Obs. The white terminal racemes of this plant, when in flower, are quite conspicuous in the woodlands of Pennsylvania. The stem and leaves, when bruised, emit a disagreeable odor. The root is somewhat mucilaginous and astringent. Although a plant of no Agricultural value—and probably over-rated as a medicine,—the infusion of the bruised root is so generally regarded as a sort of Panacea for stock (especially for sick cows), that every farmer ought to know it, and be able with certainty to designate it.

ORDER II. MAGNOLIACEAE. Juss. DC.

Trees or shrubs. Leaves alternate, subcoriaceous, entire or lobed (never serrate), often large, stipulate; stipules convolute or nearly flat, membranaceous, caducous. Flowers solitary, usually large and often fragrant. Calyx of 3 to 6 colored deciduous sepals. Corolla of 3. 6. or many petals in concentric series. Stamens numerous mostly with short filaments, and long adnate anthers.—the cells either introrse, lateral, or sometimes extrorse. Carpels several in a single stellate verticil,—or more commonly numerous and spicate, or imbricated, forming a kind of strobile on the prolonged receptacle. Seeds one or two in each carpel; sometimes with a pulpy covering, and suspended (when the carpels open) by a slender elastic cord. Embryo minute, at the base of fleshy albumen.

A small but splendid Family; more ornamental, however, than important in

Agriculture.

TRIBE II. MAGNOLIEAE. DC.

Carpels spicate on the elongated torus or receptacle. Anthers long.

4. MAGNOLIA. L. Endl. Gen. 4737. [Named in honor of Prof. Pierre Magnol, a French Botanist.]

Sepals 3, deciduous. Petals 6 to 12. Anthers introrse or lateral. Carpels forming a strobile-like fruit, persistent, dehiscent by the dorsal suture. Seeds baccate,—when mature, pendulous from the open carpel by a long slender funiculus. Fine trees, in the U. States (except the fragrant-flowered M. glauca, L. which is usually a shrub,—though I have seen it 30 feet high). Stipules convolute. Leaves sometimes perennial.

1. M. ACUMINATA, L. Leaves oval, acuminate, pubescent beneath, deciduous; petals 6 to 9, oblong-obovate. Torr. & Gr. Fl. N. A. 1. p. 43. DC. Prodr. 1. p. 80. Icon, Mx. Sylva, 2. tab. 53.

ACUMINATE MAGNOLIA. Vulgò—Cucumber tree.

Fr. Le Magnolier. Germ. Der Gurkenbaum. Span. Arbol de Castor.

Tree 50 to 80 feet high, and 2 to 3 or 4 feet in diameter at base. Leaves 6 to 10 or 12 inches long (on vigorous young saplings much larger—as is usually the case with all trees). Flowers large, bluish white, often with a tinge of yellow; petals scarcely expanding. Fruit sub-cylindric, 3 to 5 or 6 inches long. Mountain forests, New York to Georgia. Fl. June—July. Fr. Sept.—October.

Obs. Several species of Magnolia are worthy of culture, as ornamental Shade-trees; but as they are not otherwise important in Agriculture, I have mentioned this one merely as a sample (and perhaps one of the finest) of that noble genus. The green fruit has some resemblance to a Cucumber (whence the common name of the tree); and being intensely bitter and somewhat aromatic, a tincture of it, prepared with whiskey, is a popular preventive of autumnal fevers, with those who are fond of an excuse for taking alcoholic medicine.

5. LIRIODENDRON. L. Endl. Gen. 4740.
[Greek, Leirion, a lily, and Dendron, a tree; from its lily-like flowers.]
Sepals 3, caducous. Corolla campanulate; petals mostly 6. Anthers extrorse. Carpels samaroid, indehiscent, densely imbricated in a cone, 1 or 2-seeded. A large tree. Stipules nearly flat, and applied face to face.

1. L. TULIPIFERA, L. Leaves dilated, subcordate at base, 3-lobed, the middle lobe broad and emarginately truncate. Torr. & Gr. Fl. N. A. 1. p. 44. D.C. Prodr. 1. p. 82. Fl. Cestr. p. 326. Icon, Mx. Sylva, 2. tab. 61. [Tulip tree. Tulip-Bearing Liriodendron. Vulgò—Poplar. Tulip Poplar.—Fr. Le Tulipier. Germ. Der Tulpenbaum.

Tree 80 to 120 feet high, and 2 or 3 to 5 or 6 feet in diameter. Leaves 4 to 6 inches long on old trees, and about as wide as long,—the side-lobes often with a sinus making two points. Petals greenish-yellow, with tinges of reddish-orange. Carpels 2-celled (one cell mostly obliterated, and both seeds often abortive), produced at apex into a lanceolate-oblong wing, and closely imbricated in a cone on the fusiform receptacle. Rich woodlands: Canada to Louisiana. Fl. May. Fr. October.

Obs. The timber of this magnificent tree is highly valued in many branches of the mechanic arts,—especially the variety called yellow Poplar, which is generally to be known by its thicker and more deeply-furrowed bark. The hygrometric properties of the wood—particularly of the white variety—render it rather objectionable in cabinet furniture (causing it to swell in damp weather): but the yellow Poplar is much esteemed for its mellowness, lightness and durability. The bark of the root, and young tree, is a valuable aromatic bitter. The prevalence of the Tulip-tree, in woodlands, is a pretty sure indication of a good soil.

ORDER XI. PAPAVERACEAE. Juss.

Herbs, with a milky or colored juice. Leaves alternate, without stipules. Calyx of 2 (rarely 3) caducous sepals. Corolla of 4 to 6 regular petals. Stamens 6 to 24—or numerous, but some multiple of the petals. Fruit 1-celled; either pod-

shaped with 2 to 5, or capsular with many, parietal placentae, from which the valves often separate. Seeds numerous. Embryo minute, at the base of fleshy

and oily albumen.

The Poppy, which is the type of this Family, is the only plant belonging to it, of much importance. The Red-root, or Indian Paint (Sanguinaria Canadensis, L.), a common plant in the rich woodlands of the U. States, has been commended for the medicinal properties of its rhizoma, or subterraneous stem.

PAPAVER. L. Endl. Gen. 4823.

[Celtic, Papa, pap; from its being added to children's food, to induce sleep.] Sepals 2. Petals 4 (sometimes multiplied). Stamens numerous. Stigmas 4 to 20, sessile, radiating on the summit of the ovary.— Capsule obovoid, opening by chinks or pores under the edge of the crown formed by the stigmas: placentae opposite the stigmas! and extending into the cavity so as to form incomplete partitions. Annual or perennial Herbs. Flowers nodding before opening.

1. P. Dubium, L. Stem clothed with slender spreading hairs,—the peduncles with bristly appressed hairs; leaves pinnately dissected, the segments often incised, decurrent; sepals hairy; capsules obovoid-oblong, smooth. Torr. & Gr. Fl. N. A. 1. p. 60. DC. Prodr. 1. p. 118. Fl. Cestr. p. 317. Icon, Fl. Lond. 2.

Dubious Papaver. Vulgo-Poppy. Field Poppy.

Fr. Pavot bâtard. Germ. Der Saat-Mohn. Span. Amapóla.

Root annual. Stem 1 to 2 feet high. somewhat branched below. Leaves 2 to 5 inches long. hairy. Peduncles terminal. 6 to 12 inches long, flexuose, leafless. Petals pale red or brick-dust colored. Stigmas about 7-rayed, on a convex disk: Cultivated grounds: introduced. Native of Europe. Fl. May. Fr. July, August.

Obs. This foreigner has found its way into some districts; and, if unattended to, may become a troublesome weed,—as it and the "Corn Poppy" (P. Rhoeas, L.) are said to be, in Europe. The common or Opium Poppy, (P. somniferum, L.—a smooth species with stem-clasping leaves),-which yields the most efficacious and soothing of all anodynes,-is often seen in the flowerbeds of our gardens. I believe there was an attempt made, near New York, some 30 or 40 years ago, to cultivate that species for the purpose of obtaining Opium: But it did not succeed,—and perhaps its culture, even if practicable here, is better suited to the Orientals, than to the people of our country. The common Celandine (Chelidonium majus, L.), an introduced weed, of this natural Order, occurs frequently in waste places on our farms; but it is scarcely of sufficient importance, in any respect, to require a more particular notice in this work. A similar remark may be made of the Prickly Poppy (Argemone Mexicana, L.), another kindred weed which is occasionally met with.

ORDER XIII. CRUCIFERAE. Juss.

Herbs with a pungent or acrid watery juice. Leaves alternate, without stipules. Flowers in racemes or corymbs; the pedicels without bracts. Calyx of 4 sepals, deciduous. Corolla of 4 regular unguiculate petals,—their spreading limbs forming a cross. Stamens 6. 2 of them shorter (tetradynamous). Fruit a pod (called a Silique when much longer than broad, and a Silicle when short), which is 2-celled by a membranaceous septum or partition that connects the two marginal placentae.—from which the two valves usually fall away. Seeds without albumen. Embryo curved; cotyledons flat or plicate.—either with their edges to the radicle (when they are said to be accumbent,—represented by this sign. o=), or with the back of one of them to the radicle (and then termed incumbent.—of which this is the sign. o||).

This Order, which comprises upwards of one hundred Genera, is a remarkably natural or homogeneous one,—as well in the sensible properties, as in the botanical characters, of the plants belonging to it. There are but few important ones, however, beside those here noticed. The Woad, or Dyer's weed (Isatis tinctoria, L.), is cultivated, in Europe, for its blue coloring matter; but I believe it is little known or attended to, in the U. States.

DIVISION 1. SILIQUOSAE (the pod a Silique).

TRIBE I. ARABIDEAE. DC.

Silique dehiscent, usually elongated; valves flattish; septum linear. Seeds compressed, oval, sometimes margined. Cotyledons flat, accumbent (o=), parallel with the septum (i. e. with their edges towards the placentae).

7. NASTURTIUM. R. Br. Endl. Gen. 4850.

[Latin, Nasus tortus, a tortured nose; from the pungent effect of the plant.] Sepals spreading, equal at base. Stigma somewhat 2-lobed. Silique nearly terete, sometimes almost as short as a silicle, usually curved upwards. Seeds small, irregularly disposed in a double series, not margined. Aquatic or subaquatic Herbs. Leaves often pinnately dissected.

1. N. officinale, R. Br. Leaves pinnately divided; segments ovate, subcordate, sinuate-dentate; seeds reticulately rugose. Torr. & Gr. Fl. N. A. 1. p. 72. DC. Prodr. 1. p. 137. Icon, Fl. Lond. 3. Officinal Nasturtium. Vulgò—Water Cress.

Fr. Cresson de Fontaine. Germ. Die Brunnenkresse. Span. Bérro.

Perennial. Stem 6 to 12 and 18 inches long, branching. Leaves odd-pinnately dissected; segments in 3 or 4 pairs, the terminal one largest. Petals white.—Brooks and rivulets: probably introduced from Europe. Fl. June. Fr. July.

Obs. This plant (well known as the "Water Cress," in England,) was detected in Chester County, Penn. by my friend Mr. Joshua Hoopes, since the publication of the Flora Cestrica. Although abundant in some rivulets, there is reason to believe it is not a native. It affords an excellent wholesome Salad—antiscorbutic in its properties, as all the Cruciferae are; and being easily propagated, is worthy of being introduced into all suitable localities.

8. BARBAREA. R. Br. Endl. Gen. 4851. [So named, from having been formerly dedicated to St. Barbara.]

Silique ancipital or somewhat 4-sided, the valves concave-carinate. Seeds in a single series. Leaves lyrately pinnatifid.

1. B. PRAECOX, R. Br. Lower leaves lyrate, the terminal lobe obovate or rounded, coarsely sinuate-dentate,—upper leaves pinnatifid, with entire linear-oblong segments; siliques linear, elongated, compressed-ancipital; style thick and very short. Torr. & Gr. Fl. N. A. 1. p. 75. DC. Prodr. 1. p. 140.

EARLY BARBAREA. Vulgò—Scurvy-grass. Early Winter Cress. Fr. Roquette des Jardins. Germ. Die Winter-kresse. Span. Yerba de Santa Barbara.

Root biennial? Stem 9 to 15 inches high, somewhat branching. Leaves smooth; lower ones 3 or 4 inches long. Petals yellow. Siliques 2 or 3 inches long, slender. Gardens: cultivated. Fl. May—June. Fr. July—Aug.

Obs. This plant,—which is said to be a native of Canada, and the country further north,—is cultivated in the gardens, near Phila-

delphia, under the name of "Scurvy-Grass." The leaves afford a tolerable Salad; but not equal to the common Cress (Lepidium sativum, L.), nor to the Water Cress (Nasturtium officinale, R. Br.). There is another and stouter species (B. vulgaris, R. Br. probably naturalized,) growing along our streams, which is sometimes used as a Salad; but it is bitterish, and inferior in quality to this.

TRIBE II. SISYMBRIEAE. DC.

Silique longitudinally dehiscent; valves nearly flat, or somewhat concave and carinate; septum linear. Seeds compressed, ovate or oblong, not margined.—Cotyledons flat, incumbent (o||), contrary to (i. e. with their edges towards) the septum.

9. SISYMBRIUM. All. Endl. Gen. 4906. [An ancient Greek name; applied to this genus.]

Silique somewhat terete, sessile. Stigmas 2, somewhat distinct, or connate and capitate. Cotyledons sometimes obliquely incumbent. Annual or perennial Herbs. Leaves various.

1. S. OFFICINALE, Scop. Lower leaves runcinate, upper ones subhastate; racemes spike-form, slender and virgate; siliques erect, subulate, appressed to the rachis. Torr. & Gr. Fl. N. A. 1. p. 91. DC. Prodr. 1. p. 191. Fl. Cestr. p. 386. Icon, Fl. Lond. 3.

Officinal Sisymprium. Vulgo-Hedge Mustard.

Fr. Herbe au Chantre. Germ. Der Hederich. Span. Jaramago.

Root annual. Stem 1 to 3 or 4 feet high, with spreading branches, pilose.—Leaves pilose; lower ones 3 to 6 or 8 inches long. Petals small, greenish yellow. Siliques terete-subulate or somewhat nerved and angular, tapering at apex.—Cultivated grounds, lanes and road sides: introduced. Native of Europe. Fl. May—Aug. Fr. Aug.—Octo.

Obs. This foreigner is completely naturalized, and somewhat troublesome as a weed. It was formerly held in some repute, in Europe, as a remedy for coughs, the hoarseness of Singers, &c. (whence its French name): but its virtues were doubtless over-rated,—and it is now regarded, by tidy farmers in this country, merely as a plant to be expelled from their premises.

TRIBE III. BRASSICEAE. DC.

Silique longitudinally dehiscent. Style often enlarged, and with a seed-bearing cell at its base. Seeds mostly globose. Cotyledons incumbent, longitudinally plicate or doubled, embracing the radicle in the fold or sinus.

10. BRASSICA, L. Endl. Gen. 4949. [Supposed to be from Bresic; the Celtic name for the Cabbage.]

Calyx closed or erect. Silique sub-terete; valves concave, or slightly keeled by a central nerve; style short, obtuse. Seeds in a single series, globose. Foreign plants: mostly biennial Herbs, with a short stem and long flowering-branches.

1. B. OLERACEA, L. Leaves somewhat fleshy, repand or lobed, glabrous and glaucous. DC. Prodr. 1. p. 213. Fl. Cestr. p. 388.

OLERACEOUS OR POT-HERE BRASSICA. Vulgò-Cabbage.

Fr. Chou potager. Germ. Der Kohl. Span. Berza.

The following Sub-species, or Varieties, are more or less cultivated, in the Kitchen Garden, or "Truck-patch."

* † Racemes paniculate.

Sub-species B. ACEPHALA, DC. Stem elongated; leaves expanded. DC. l. c.

Vulgò-Tree Cabbage. Bore-Cole. Headless Cabbage.

Fr. Chou sans tête. Germ. Blatt-Kohl.

Sub-species C. Bullata, DC. Stem somewhat elongated; young leaves subcapitate, finally expanding, bullate or crisped. DC. l. c. $Vulg\hat{o}$ —Savoy Cabbage. Curled Cabbage.

Fr. Chou de Savoie. Germ. Savoyer Kohl. Span. Berza crespa.

Sub-species D. CAPITATA, DC. Stem short; leaves concave, not bullate, densely imbricated in a head before flowering. DC. l. c. Vulgò—Head Cabbage. York Cabbage.

Fr. Chou en tête. Germ. Kopf-Kohl. Span. Berza repolluda.

Sub-species E. Caulo Rapa, DC. Stem with an oval or subglobose fleshy enlargement at the origin of the leaves. DC. l. c.

Vulgò—Bulb-stalked Cabbage.

Fr. Chou Rave. Germ. Kohl Rabi.

†† Racemes corymbose.

Sub-species F. Botrytis, DC. Leaves oblong, connivent, bluish glaucous; peduncles of the racemes corymbose, short fleshy and coalesced in a head before flowering; flowers often abortive. DC. l.c.

Var. a. Cauliflora, DC. Stem short; heads thick, compact. DC.l.c. $Vulg\grave{o}$ —Cauliflower.

Fr. Chou fleur. Germ. Blumenkohl. Span. Berza florida.

Var. b. Asparagoides, DC. Stem taller; leaves elongated; heads sub-ramose; branches fleshy at apex, bearing clusters of abortive flower-buds. DC. l. c. $Vulg\grave{o}$ —Broccoli.

Biennial. Stem 6 inches to 1 or 2 feet high, branching the second year from the summit, or head of imbricated leaves. Leaves large (6 to 12 or 18 inches in length), suborbicular or oblong. Racemes long, loose. Petals greenish or citron yellow. Gardens, and Lots: cultivated. Fl. May—June. Fr. July.

Obs. Few plants have undergone greater modifications, by culture, than this esculent herb; and those varieties furthest removed from the original form, are the most esteemed. All the foregoing are occasionally to be met with, under culture; but the sub-species B and E are rare. The latter (Caulo Rapa, DC.) is a curious monstrosity—with a turnep-like enlargement or tumor in the stem, near the base,—and was never cultivated in West-Chester, Penna. until introduced by my friend Dr. E. F. Rivinus—who is a skilful Horticulturist, and a worthy descendant of one of the fathers of Botany. Sub-species F is more common; and D is found in abundance in every well-managed Kitchen Garden.

2. B. CAMPESTRIS, L. Leaves slightly fleshy, glaucous,—the young lower leaves lyrate, dentate, somewhat hispid or ciliate,—those above amplexical and acuminate. DC. Prodr. 1. p. 214. Fl. Cestr. p. 389.

FIELD BRASSICA.

Sub-species C. Napo-Brassica, DC. Root tumid, turnep-shaped.—DC. l. c.

Var. a. communis, DC. Root white or purplish, with the summit and petioles greenish or purplish. DC. l. c.

Vulgò-Turnep-rooted Cabbage.

Fr. Chou Navet. Germ. Die Kohl-ruebe. Span. Nabiza.

Var. b. Ruta baga, DC. Root yellowish, subglobose. DC. l. c.

Vulgo-Rutabaga. Swedish Turnep.

Fr. Chou de Suède. Navet jaune.

Biennial or annual. Root thick, turnep-shaped, fleshy. Stem 1 to 2 feet high, smooth, glaucous, branched above. Racemes loose. Petals citron-yellow. Gardens, and Lots: cultivated. Fl. June. Fr. July—August.

Obs. These varieties were cultivated, some years since, to a considerable extent,—chiefly as food for Stock; but I have not seen much of them latterly, in Chester County. The farmers of the U. States, having the advantage of the *Indian Corn* crop, do not much incline to the *Root culture*: perhaps not so much as might be beneficial to Stock, during our long winters.

3. B. RAPA, L. Radical leaves lyrate, hirsutely scabrous, not glaucous,—middle cauline ones incised,—the upper ones entire, smooth. DC. Prodr. 1. p. 214. Fl. Cestr. p. 390.

Sub-species A. Depressa, DC. Root turned below the neck, depressed-globose, abruptly contracted to a slender tapering radicle beneath. DC. l. c.

Vulgò-Turnep. Common Turnep.

Fr. Navet. Grosse Rave. Germ. Die Ruebe. Span. Naba.

Biennial. Root fleshy, depressed, orbicular, 3 to 6 or 8 inches in diameter—Stem 2 to 4 feet high, branched. Radical leaves 6 to 12 inches long. Racemes loose, corymbose-paniculate. Petals pale greenish yellow. Seeds small, reddish brown. Fields, and Gardens: cultivated. Fl. May. Fr. June—July.

Obs. The root is a favorite table vegetable, and is generally cultivated for that purpose. In Pennsylvania, the seeds are usually sown about the last of July, and the roots collected in November.

11. SINAPIS. Tournef. Endl. Gen. 4950. [A name of uncertain meaning; derived from the Greek.]

Calyx spreading. Silique sub-terete; valves nerved, smooth or hispid; style short and subulate, or ensiform. Seeds in a single series, subglobose. Foreign plants: mostly annual or biennial Herbs—nearly allied to Brassica. Lower leaves usually lyrate, incised or pinnatifid. Flowers in elongated racemes.

1. S. NIGRA, L. Lower leaves lyrate and scabrous,—upper ones lanceolate and smooth, pendulous; siliques somewhat 4-angled, smooth, appressed to the rachis; style short, subulate. Torr. & Gr. Fl. N. A. 1. p. 99. DC. Prodr. 1. p. 218. Fl. Cestr. p. 390.

BLACK SINAPIS. Vulgo-Mustard. Black Mustard.

Fr. Moutarde noire. Germ. Schwarzer Senf. Span. Mostazo.

Root annual. Stem 3 to 6 feet high, much branched, smooth. Leaves petiolate, variously lobed and toothed. Racemes slender. Petals greenish yellow. Seeds numerous, small, dark brown. Gardens, and waste places: introduced from Europe. Cultivated in some districts. Fl. June—July. Fr. August.

- Obs. This plant is nearly naturalized in many places; and in some parts of our country (especially in Ohio), is extensively cultivated. The value of its highly acrid seeds, in the hands of the Cook, and Physician—as a condiment and rubefacient—is well known.
- 2. S. ALBA, L. Leaves lyrate, smoothish; siliques hispid, spreading. scarcely as long as the ensiform beak. DC. Prodr. 1. p. 220. Fl. Cestr. p. 390. Icon, Fl. Lond: 3: WHITE SINAPIS. Vulgo-White Mustard.

Fr. Moutarde blanche. Germ. Weisser Senf. Span. Mostazo blanco.

Root annual. Stem 2 to 5 feet high, rather stout, branched. Leaves petiolate, lyrately pseudo-pinnate, the terminal segment large and 3-lobed. Petals rather large, yellow Seeds few, larger than in the preceding species, pale brown—Gardens: cultivated. Native of Europe. Fl. June. Fr. August.

Obs. This species is often cultivated, on a small scale, for its seeds,-which are employed in preparing condiments. They have also been somewhat celebrated as a remedy for nervous complaints, dyspepsia, &c. in which cases they are administered whole—a teaspoonful or more at a dose. The seeds of both species are used in preparing Flour of Mustard.

DIVISION 2. SILICULOSAE (the pod a Silicle).

TRIBE V. ALYSSINEAE. DC.

Stirle dehiscent; valves flat or convex; septum broadly oval and membranaceous. Seeds compressed, often margined. Cotyledon's flat, accumbent (0=), parallel with the septum.

12. COCHLEARIA. Tournef. Endl. Gen. 4882. [Latin, Cochleare, a spoon; from the form of the leaves of some species.] Silicle ovoid-globose or oblong, sessile; valves ventricose; style very short. Seeds numerous, not margined. Leaves often somewhat fleshy.

1. C. Armoracia, L. Radical leaves oblong, crenate, petiolate, stem leaves lanceolate, dentate or incised, sessile; silicle elliptic. DC: Prodr. 1. p. 173. Fl. Cestr. p. 379.

Armorican Cochlearia. Vulgò—Horse-Radish. [picante. Fr. Moutarde des Capucins. Germ. Der Meer-Rettig. Span. Rábano

Root perennial, long, terete, fleshy, white, very acrid. Stem 2 to 3 feet high, angular-striate, smooth, with erect axillary branches. Radical leaves large (3 to 15 inches long—somewhat resembling those of a Dock, or Rumex); petioles 4 to 12 inches long. Racemes corymbose, elongating. Petals white. Silicles oval, usually abortive. Gardens: margins of ditches, &c. introduced. Native of Europe. Fl. May—June. Fr. June—July.

Obs. The pungent root of this plant is a favorite condiment, and one of the most valuable antiscorbutics. It requires little or no culture; but thrives best in a moist rich deep soil. The true or common Scurvy-Grass, of Europe, is a species of this genus (C. officinalis, L.—with leaves whose form suggested the generic name); but I think it is rarely cultivated, in this country.

TRIBE VI. CAMELINEAE. DC.

Silicle dehiscent, obovoid oval or oblong; valves convex or flat, parallel with the septum; septum elliptic or ovate, sometimes incomplete. Cotyledons flat, incumbent (o||), contrary to (i. e. their margins towards) the septum.

13. CAMELINA. Crantz. Endl. Gen. 4919.

[Greek, Chamai, dwarf, and Linon, flax; from a fancied resemblance.] Silicle obovoid or subglobose; valves ventricose, dehiscing with a part of the style; cells many-seeded. Style filiform. Seeds oblong, not margined.

1. C. SATIVA, Crantz. Leaves sessile, oblong-lanceolate, nearly entire, sagittate at base; silicles inflated, obovoid-pyriform, margined, mucronate with the longish subconical style. Torr. & Gr. Fl. N. A. 1. p. 110. DC. Prodr. 1. p. 201. Fl. Cestr. p. 379.

Cultivated Camelina. Vulgò—Wild Flax. Gold of Pleasure. Fr. Cameline cultivée. Germ. Der Leindötter. Span. Miagro.

Root annual, fusiform, rather slender. Stem 18 inches to 2 or 3 feet high, simple, paniculately branching at summit, roughish-pubescent below, smoothish above. Leaves 1 to 3 or 4 inches long,—the lower ones longest and often somewhat spatulate or oblanceolate,—those above gradually smaller and smoother, sagittate with acute subamplexicaul lobes at base; pubescence of the lower leaves and stem often branched or bifurcate. Racemes coryinbose-paniculate, elongating; pedicels half an inch to an inch long, without bracts. Petals pale yellow, rather small, cuneate or obovate-oblong, obtuse. Silicles about one-fourth of an inch long, with a keel-like margin on each side; style about half as long as the silicle, persistent finally splitting with the dehiscent valves. Seeds reddish yellow. Cultivated fields; among Wheat, Flax, &c.: introduced. Native of Europe. Fl. May—June. Fr. July.

Obs. This foreigner was formerly frequent among Flax, when that plant was generally cultivated; and it was one of the vulgar errors of the day, that it was a kind of transmuted or degenerate flax,—caused by burning the soil, in clearings. Since the culture of flax declined, the Camelina has become rare, within my observation: but I am informed by H. Jones Brooke, Esq. an intelligent farmer of Delaware county, Penn. that the plant has become a serious nuisance, in his Wheat fields, within a few years. Being an annual, the obvious remedy is to prevent it from maturing its seeds; but it must be confessed, that where it appears in great numbers among grain crops, the remedy is more easily prescribed than administered,—and therefore it may be well for farmers to watch the progress of the plant, and arrest it on its first appearance.

TRIBE VIII. LEPIDINEAE. DC.

Silicle usually dehiscent, compressed contrary to the narrow septum (sometimes 1-celled); valves boat-shaped or rarely ventricose. Seeds few, not margined—Cotyledons, flat, mostly incumbent (o||), parallel to the septum.

14. LEPIDIUM. R. Br. Endl. Gen. 4932. [Greek, Lepis, a scale; from the form and size of the silicles.]

Silicle subcordate-ovate or oval; valves keeled or rarely ventricose, often winged at apex and emarginate; cells 1-seeded. Seeds compressed or somewhat 3-sided. Cotyledons sometimes accumbent (o=).

1. L. SATIVUM, L. Leaves oblong, variously incised and pinnatifid; silicles elliptic-ovate, winged and notched at apex. DC. Prodr. 1.

p. 204. Fl. Cestr. p. 380.

CULTIVATED LEPIDIUM. Vulgo-Pepper-Grass. Tongue-Grass.

Fr. Cresson Alénois. Germ. Die Garten-Kresse. Span. Lepidio.

Root annual. Stem 9 to 18 inches high, smooth, glaucous, corymbosely branched above. Leaves 1 to 3 inches long, deeply divided into linear or cuneate segments. Petals white. Seeds compressed; cotyledons incumbent (o||). Gardens: cultivated. Native of Persia. Fl. June—July. Fr. August.

Obs. A pleasant antiscorbutic Cress, frequent in Gardens. There is a native species (L. Virginicum, L.—with cotyledons accumbent—separated from this genus by some authors, and called Cynocardamum: See Endl. Gen. 4888.) frequent in lanes and fields, in Pennsylvania. The reddish-brown seeds of this are sometimes found among clover seed, and excite apprehensions of some pernicious intruder; but, although a worthless little weed, if there be nothing worse, among the clover seed, the farmer need not be alarmed.

15. CAPSELLA. Vent. Endl. Gen. 4927.

[Diminutive of the Latin, Capsa, a coffer, or case; in allusion to the fruit.]

Silique somewhat triangular or obcordate-cuneate; valves boatshaped, coriaceous, not winged; cells many-seeded. Seeds oblong;
cotyledons incumbent (o||). Radical leaves rosulate. Flowers
small, in elongating racemes.

1. C. Bursa-pastoris, Moench. Radical leaves mostly pinnatifid; stem-leaves lanceolate, sagittate. Torr. & Gr. Fl. N. A. 1. p. 117. DC. Prodr. 1. p. 177. Fl. Cestr. p. 380.

Thlaspi Bursa-pastoris. L. Icon, Fl. Lond. 3.

Shepherd's Purse Capsella. Vulgò—Shepherd's Purse. [Pastor. Fr. Bourse de Pasteur. Germ. Die Hirten-tasche. Span. Bolsa de

Root annual. Stem 3 or 4 to 18 inches high, more or less hirsute, and often branched. Radical leaves 2 or 3 to 6 or 8 inches long. Racemes at first corymbose, finally elongated. Petals white. Fields. and road-sides: introduced. Native of Europe. Fl. April to September. Fr. June to October.

Obs. This worthless little intruder is found in almost every field; and is sometimes so abundant as to be rather a nuisance. Such small weeds, however, can generally be suppressed by careful culture, and inducing a vigorous growth of more useful plants. That learned and sagacious observer of Nature—the late Professor Dr Candolle—remarks, that "all the plants of a country—all those of any given place—are in a state of war, in relation to each other.—All are endowed with means, more or less efficacious, of reproduction and nutrition. Those which first establish themselves accidentally, in a given locality, have a tendency, from the mere fact that they already occupy the space, to exclude other species from it: the largest ones smother the smallest ones; the longest-lived ones supersede those of shorter duration; the most fruitful gradually take possession of the space which would otherwise have been occupied by those which multiply more slowly." The farmer,

*Toutes les plantes d'un pays, toutes celles d'un lieu donne, sont dans un etat de guerre les unes relativement aux autres. Toutes sont douces de moyens de reproduction et de nutrition plus ou moins efficaces. Les premieres qui s' ctablissent par hasard dans une localite donne, tendent, par cela meme qu' elles occupent l'espace, a en exclure les autres especes: les plus grandes etouffent les plus petites; les plus vivaces remplacent celles dont la duree est plus courte; les plus fecondes s'emparent graduellement de l'espace que pourroient occuper celles qui se multiplient plus difficilement Essai Elementaire de Geographie Botanique. Par A. P. DE CANDOLLE.

therefore, should avail himself of this principle,—and aid the more valuable plants in their struggle to choke down or expel the worthless ones.

DIVISION 4. LOMENTACEAE (the pod transversely partitioned).

TRIBE XI. RAPHANEAE. DC.
Silique or silicle indehiscent, transversely separating in 1- (or few-) seeded cells or joints. Seeds globose. Cotyledons incumbent and conduplicate.

16. RAPHANUS. Tournef. Endl. Gen. 4972.

[Greek, Ra, easily, and phainomai, to appear; from its prompt germination.] Seeds in a single Silique many-celled, by transverse partitions. series. Leaves lyrate. Flowers in elongating racemes.

1. R. sativus, L. Lower leaves lyrate, petiolate; upper ones ovateoblong, serrate, subhastate-lobed at base, subsessile; siliques terete, torulose, acuminate, scarcely longer than the pedicels. DC. Prodr. 1. p. 228. Fl. Cestr. p. 391.

CULTIVATED RAPHANUS. Vulgò-Radish. Garden Radish.

Fr. Radis. Raifort. Germ. Der Rettig. Span. Rábano.

Sub-species A. Radicula. DC. Root more or less fleshy, tender, white or red. DC. l. c.

Var. a. rotunda. Root subglobose. Vulgò-Turnep-Radish.

Var. b. oblonga. Root oblong or fusiform. Vulgò—Common Radish. Sub-species B. NIGER. DC. Root fleshy, solid and firm, more or less acrid. DC. l. c.

Var. a. vulgaris (also b. rotundus). Root black externally, white within, oblong or subglobose.

Vulgò-Black Turnep-Radish. Spanish Radish.

Annual. Stem 1 to 3 feet high, sparsely hispid, branched. Leaves 8 to 12 or 15 inches long, hispid. Petals purple and greenish white. Siliques with fungous or subcrose partitions. Seeds few. large. Gardens, &c.: cultivated. Native of China.Fl. June—Sept. Fr. July—October.

Obs. The tender fleshy root of this plant is an universal favorite at table, in early spring,—and is found in every garden; where, by successive planting, it may be produced all summer. To produce the root in perfection, a rich mellow soil and a wet season are requisite.*

ORDER XIX. HYPERICACEAE. Juss. Lindl.

Herbs or shrubs, with a resinous or limpid juice. Leaves opposite, entire, without stipules, punctate with black or pellucid dots. Flowers regular. Calyx of 4 or 5 persistent sepals, the 2 outer ones often smaller. Petals 4 or 5, twisted in aestivation, often sprinkled with black dots. Stamens usually numerous and polyadelphous. Capsule (the fruit rarely baccate) with septicidal dehiscence, many-seeded. Seeds destitute of albumen.

An Order containing hum few general and those of little interest to the Agriculture.

An Order containing but few genera; and those of little interest to the Agriculturist,—with the exception of the obnoxious species here noticed.

TRIBE I. HYPERICEAE. Chois. Fruit capsular. Seeds terete. Leaves mostly sessile.

*I learn from my friend, Prof. A. Gray, that the R. Raphanistrum, L. or Wild Radish (a species with simply lyrate leaves, and yellowish flowers), is so far naturalized, in Eastern New England, as to be quite a troublesome Weed. It has not yet found its way, I think, into Pennsylvania.

17. HYPERICUM. L. Endl. Gen. 5464. [A name used by the ancient Greek writers on plants.]

Sepals 5, more or less connected at base, foliaceous. Stamens mostly numerous,—the filaments united at base in 3 or 5 parcels. Styles 3 to 5, persistent, sometimes united. Capsule membranaceous, 1-celled with 3 to 5 parietal placentae, or 3 to 5-celled by the placentae meeting at the axis. Herbaceous or shrubby. Flowers solitary or cymose at the summit of the stem and branches.

1. H. Perforatum, L. Herbaceous; stem somewhat ancipital; leaves linear-elliptic, rather obtuse, sessile, pellucid-punctate; flowers in leafy paniculate corymbs; petals and anthers with dark purple dots; styles 3, long, diverging. Torr. & Gr. Fl. N. A. 1. p. 160. DC. Prodr. 1. p. 549. Fl. Cestr. p. 323. Icon, Fl. Lond. 3. PERFORATED HYPERICUM. Vulgo-St. John's Wort.

Fr. Millepertuis. Germ. Das Johannes kraut. Span. Corazoncillo.

Root perennial. Stem herbaceous but finally hard, 1 to 2 feet high, often several from the same root, brachiately and corymbosely branched. Leaves half an inch to an inch and half long. Petals yellow or orange-colored. Fields, and pastures: introduced. Native of Europe. Fl. June—Sept. Fr. July—October.

Obs. This foreigner is a worthless and rather troublesome weed, on our farms; and ought to be diligently excluded. Some 40 or 50 years ago, it was very common for cattle—especially white cows, and horses with white feet and noses—to be affected with cutaneous ulcers, during the pasture season; and those sores were universally and confidently attributed to the St. John's Wort. In those days, I never doubted the fact, myself: but I must in candor add, that, although the plant continues to be abundant in our pastures, I have not noticed any such sores for a number of years past. Was the affection ascribed to a wrong source? and has the real cause ceased to exist?—The flowers and leaves are evidently somewhat resinous; and a tincture of them has held a place among popular remedies for disorders of the stomach and bowels. It is worthy of remark, that in the year 1842, the St. John's Wort totally failed to make its appearance (in Chester County—and I believe throughout Pennsylvania,) even in fields where it had previously abounded. The succeeding year, it was quite rare; but is now (1846) becoming as common as ever, in neglected fields. The cause of that total, though temporary, disappearance of a perennial-rooted plant, is as obscure as the fact is curious.

ORDER XXI. CARYOPHYLLACEAE. Juss. Torr. & Gr.

Herbs. Stems tunid at the nodes or joints. Leaves constantly opposite, often connate, entire, without stipules. Flowers regular, terminal. Calyx of 4 or 5 sepals, distinct or more or less cohering—often united into a tube. Corolla of 4 or 5 unguiculate petals—or sometimes wanting. Stamens as many—or commonly twice as many—as the petals. Styles, or stigmas, 2 to 5, distinct. Capsule 2 to 5-valved—or opening only at apex by twice as many teeth or valvening as stigmas. Steds curved (community property), mostly numerous: embrate. points as stigmas. Seeds curved (campylotropous), mostly numerous: embryo coiled around the outside of mealy albumen.

An Order comprising about 30 genera, and a great number of species,—some of them (such as the *Pinks*) are very pretty and fragrant: but none of Agricul-

TRIBE I. SILENEAE. DC.

Sepals united into a tube, which is 4 or 5-toothed at summit. Petals with a long slender claw, inserted with the stamens on the stipe of the ovary.

18. LYCHNIS. DC. Endl. Gen. 5250.

[Greek, Lychnos, a lamp; the cottony leaves of some species being used for wicks.] Calyx 5-toothed or with 5 long segments, without scales at base. Petals 5, mostly crowned at throat. Stamens 10. Styles 5. Capsuls 1-celled, or 5-celled at base, the stipe sometimes wanting.

1. L. GITHAGO, Lam. Hairy; stem dichotomously paniculate above; leaves lance-linear; calyx coriaceous, tube subcampanulate, teeth very long and foliaceous; petals not crowned; stipe of the ovary none. Torr. & Gr. Fl. N. A. 1. p. 194. DC. Prodr. 1. p. 387.

Agrostemma Glthago. L. Fl. Cestr. p. 281. Ioon, Fl. Lond. 2. Vulgò-Cockle. Corn Cockle.

Fr. La Nielle des Blés. Germ. Gemeine Rade. Span. Neguillon.

Plant clothed with long appressed hairs. Root annual. Stem 2 to 4 feet high, branched above. Leaves 3 to 5 inches long. Peduncles terminal. 4 to 8 or 10 inches long. Petals reddish or pale violet-purple. Capsule ovoid. Seeds numerous, muricately ribbed, purplish black. Cultivated grounds.—chiefly among Wheat and Rye: introduced. Native of Europe. Ft. June. Fr. July.

Obs. This well-known foreign weed,—although diligently expelled by all neat farmers,-may be seen in almost every wheat field, at the season of flowering; which is, consequently, the best time for detecting and eradicating it. The seeds are of a size to render it difficult to separate them from wheat,—and when abundant, are injurious to the quality and appearance of the flour. Every farmer, therefore, is interested in causing the plant to be carefully extirpated.

ORDER XXIII. PORTULACACEAE. Juss. Lindl.

Succulent or fleshy Herbs. Leaves alternate or opposite, entire, without stipulcs. Flowers axillary or terminal, usually ephemeral. Calyx mostly of 2 (rarely 3) sepals, often united below and adhering to the base of the ovary. Petals 5, or rarely more numerous. Stamens variable in number, opposite the petals when of the same number. Styles 2 to 8, united below. Capsule 1-celled; placenta central. Seeds mostly numerous, curved (campylotropous): embryo coiled around mealy albumen. mealy albumen.

There are some 30 genera in this Order,—of which the plant here noticed is the type. They are, however, of little or no interest to the farmer.

19. PORTULACA. Tournef. Endl. Gen. 5174. [A name of obscure and uncertain derivation.]

Sepals 2, partly united, and adherent to the base of the ovary,—the upper portion finally circumscissed and deciduous. Petals mostly 5, inserted on the calyx. Stamens 8 to 15 or 20. Stigmas 3 to 8. Capsule subglobose, circumscissed. Seeds on filiform footstalks (or funiculi). Leaves scattered, often whorled near the flowers,frequently with a tuft of hair in the axils.

1. P. OLERACEA, L. Leaves oblong-cuneate, obtuse, fleshy, smooth; axils and nodes naked; flowers sessile. Torr. & Gr. Fl. N. A. 1. p. 196. DC. Prodr. 3. p. 353. Fl. Cestr. p. 314.

Pot-Herb Portulaca. Vulgò-Purslane.

Fr. Pourpier potager. Germ. Gemeiner Portulak. Span. Verdolaga.

Root annual. Stem 6 to 12 or 15 inches long, fleshy, smooth, prostrate, branching and radicating. Leaves half an inch to an inch long, alternate and opposite. Petals pale yellow. Gardens, and cultivated grounds. Fl. July—Aug. Fr. Sept.

Obs. This plant—though said to be indigenous in the far west—

has every appearance of being a naturalized stranger, in Pennsylvania. It was often used, formerly, as a pot-herb; but is now generally superseded by better ones,—and is, indeed, only entitled to notice, here, as a troublesome weed in gardens.

ORDER XXV. MALVACEAE. Juss.

Herbs, shrubs, or rarely trees. Leaves alternate. palmately veined, furnished with stipules. Flowers regular, mostly large, often with an involucel forming a double calyx. Calyx mostly of 5 sepals, more or less united at base. Petals as many as the sepals, spirally twisted in aestivation. Stamens monadelphous, of-

many as the sepais, spirally twisted in aestivation. Stamens monadelphous, often indefinite; anthers reniform, 1-celled. Styles as many as the carpels, distinct or united below. Fruit capsular, or the carpels separate or separable. Seeds with little or no albumen; cotyledons foliaceous, plicate and twisted.

An Order comprising about 30 genera, and numerous species,—some of them showy and handsome. They are generally remarkable for their mucilaginous and demulcent properties: But the Cotton plant is pre-eminently interesting to the American people.—both as yielding the great staple of the exports from the Southern States, and of the manufactures of the Northern States. There are, however, but few other plants of Agricultural importance belonging to the Order.

20. MALVA. L. Endl. Gen. 5271.

[Latinized from the Greek, Malache, soft; in allusion to its emollient nature.] Calyx 5-cleft, mostly with an involuced of 3 oblong or setaceous bracts. Carpels several, dry, indehiscent, arranged in a circle round the axis.

1. M. ROTUNDIFOLIA, L. Stem herbaceous, prostrate; leaves cordateorbicular, doubly crenate; pedicels axillary, 1-flowered, declined in fruit; carpels wrinkled, 1-seeded. Torr. & Gr. Fl. N. A. 1. p. 225. DC. Prodr. 1. p. 432. Fl. Cestr. p. 395. Icon, Fl. Lond. 3.

Round-Leaved Malva. Vulgò—Running Mallows. Low Mallows. Fr. Petite Mauve. Germ. Rundblaettrige Malve. Span. Malva de hoja redonda.

Root perennial. Stem 1 to 2 or 3 feet long, branching only at base or from the root. Leaves 1 to 2 or 3 inches in diameter, obscurely 5 or 7-lobed; petioles 2 to 6 or 8 inches long. Flowers small; bracts linear. Petals twice as long as the calyx, reddish-white with purple veins. Yards. Gardens, and Lots: introduced. Native of Europe. Fl. May—Sept. Fr. July—Octo.

Obs. This foreigner is extensively naturalized; and although somewhat popular as an ingredient in cataplasms and demulcent drinks, is generally regarded as an unwelcome intruder in yards and gardens. The Marsh Mallow (Althaea officinalis, L.), a nearly allied plant, has been introduced in many places, on account of its mucilaginous character; but is scarcely to be considered among our cultivated plants.

21. HIBISCUS. L. (Abelmoschus. Medik. Endl. Gen. 5281.) [An ancient Greek name for a plant of the Mallow tribe.]

Calyx 5-toothed or 5-cleft, surrounded by a many- (or sometimes a few-) leaved involucel, the leaflets of which are usually linear and distinct—sometimes more or less united. Stigmas 5 to 10. Carpels united in a 5 or 10-celled loculicidal capsule; cells mostly many-(rarely 1-) seeded.

1. H. ESCULENTUS, L. Herbaceous; leaves somewhat obtusely and palmately 5-lobed, cordate at base, the lobes dentate; involucels 10-leaved, deciduous; calyx bursting lengthwise on one side; fruit 10-angled, pyramidal. DC. Prodr. 1. p. 450. Fl. Cestr. p. 396. ESCULENT HIBISCUS. Vulgò—Okra.

Root annual. Stem 18 inches to 3 feet high, somewhat branched, pilose but not aculeate. Leaves 3 to 6 inches long, and wider than long, lobed about half way to the base; petioles about as long as the leaves. Petals pale greenish yellow, with a dark purple spot at base. Capsule 2 or 3 inches long, erect. Gardens: cultivated. Native of India. Fl. August. Fr. Sept.—October.

Obs. This plant is cultivated for its green pods or capsules,—which are remarkably mucilaginous, and much esteemed, by many persons, as an ingredient in soups.

22. GOSSYPIUM. L. Endl. Gen. 5286.

[A name supposed to be of Egyptian origin; etymology obscure.]

Calyx cup-shaped, obtusely 5-toothed, surrounded by a 3-leaved involucel,—the leaflets united and cordate at base, deeply incised-dentate. Styles united; stigmas 3 or sometimes 5. Capsule 3 to 5-celled, loculicidal. Seeds numerous, enveloped in a long fine wool. Young branches and leaves more or less covered with black dots; the nerves beneath usually with one or more glands.

1. G. HERBACEUM, L. Stem smooth; leaves 3 to 5-lobed, with a single gland beneath; lobes rounded, mucronate; involucel serrate; wool white. Torr. & Gr. Fl. N. A. 1. p. 250. DC. Prodr. 1. p. 456. Icon, Farmer's Libr. vol: 1.

HERBACEOUS GOSSYPIUM. Vulgò—Cotton. Cotton-plant. Fr. Le Cottonnier. Germ. Die Baumwolle. Span. Algodon.

Root annual. Stem 2 to 4 feet high, branched. Leaves 3 to 5 or 6 inches long; petioles 2 to 3 inches long. Petals greenish yellow, tinged with purple at base. Seeds large, thickly beset with long wool-like cellular or tubular fibres, which, at maturity, are shrunk and contorted so as to render them in some degree adhesive, when pressed together,—and thereby susceptible of being spun or drawn and twisted into delicate threads. Cultivated very largely in the Southern and South-western States. Native of Asia. Fl. Fr.

Obs. This plant,—as yielding the material for light clothing—and especially in reference to its commercial value,—may be regarded as one of the most important objects of American Agriculture. Although not so essential as the cereal tribe, the fibrous envelope of the seeds is scarcely less interesting, as an article of trade,—and as the subject of useful and ingenious industry.* A full and satisfactory history of the Cotton-plant may be found in the first volume of that admirable work, the Farmer's Library, edited by John S. Skinner, Esq.

23. ABUTILON. Gaertn. Endl. Gen. 5292. [An ancient name of a plant, allied to Althaea.]

Calyx 5-cleft, without an involucel. Ovary 5 or many-celled, with

^{*}Since the above was written a wonderful discovery has been announced, in reference to Cotton wool. It appears that by subjecting Cotton to some Chemical processes, the fibres (without apparent alteration.) may be rendered as explosive as Gun powder! To what extent it may be made available, as a substitute for gun-powder, of course, remains to be ascertained. It is also alleged, that Tow, or the cortical fibres of flax. and some other minutely divided vegetable substances, can be rendered in like manner explosive, by the same or similar processes.

3 (or rarely more) ovules in each cell. Capsule composed of 5, to 15 or more, 2-valved 3 to 6-seeded carpels.

1. A. AVICENNAE, Gaertn. Leaves orbicular-cordate, acuminate, crenate-dentate, velvety-tomentose; peduncles axillary, shorter than the petiole; carpels about 15, truncate, obliquely birostrate, hairy, 3-seeded. Torr. & Gr. Fl. N. A. 1. p. 230.

Sida Abutilon, L. DC. Prodr. 1. p. 470. Fl. Cestr. p. 397.

AVICENNA'S ABUTILON. Vulgò-Indian Mallow. Velvet-leaf.

Root annual. Stem 2 to 4 or 5 feet high, branched. Leaves 4 to 6 or 8 inches long; petioles 3 to 5 inches long. Petals yellow. Carpels 12 to 15, verticillately arranged in a truncate subcampanulate head. Cultivated Lots, and waste places: introduced. Native of Europe and Asia. Fl. July—Sept. Fr. Aug.—October.

Obs. This foreigner is a worthless and troublesome intruder,frequent in Indian-corn fields, Potato patches, and other cultivated lots,—and is of a size sufficient to be a nuisance. It should be always carefully eradicated before it matures its seeds.

ORDER XXVI. TILIACEAE. Juss.

Trees or shrubby plants. Leaves alternate, furnished with deciduous stipules. Flowers axillary, small. Calyx of 3 to 5 deciduous sepals. Petals 3 to 5. Disk glandular. Stamens often in 3 to 5 clusters, distinct or somewhat united—one of each parcel sometimes transformed into a petaloid scale; anthers 2-celled. Styles united into one. Fruit, either a 2 to 5-celled capsule with several scale of the styles united into one.

z-cened. Signs united into one. Fruit, either a 2 to 5-celled capsule with several seeds in each cell—or coriaceous, and sometimes drupaceous, 1-celled by abortion, and 1 or 2-seeded. Seeds albuminous, with a large embryo; the foliaceous cotyledons usually plicate.

This, like the preceding, is a mucilaginous Family of plants, and comprises about 30 genera. In the U. States, the Lindens (which are the representatives of the Order) are the only interesting species: But in the tropical regions, the Gunny-bags, of commerce, are manufactured from the fibrous bark of two species of Corchorus. The acid drupes of Grewia sapida, Raxb, are employed in the preparation of the oriental beverage called Sherbet: and some other plants of the Order contribute to economical nurnoses.

the Order contribute to economical purposes.

24. TILIA. L. Endl. Gen. 5373. [A name of obscure and uncertain derivation.]

Sepals 5, connected at base. Petals 5. Stamens numerous, more or less cohering in 5 parcels,—the central one of each parcel (in the N. American species) a petaloid scale (nectary, or staminodium). Ovary globose, villous, 5-celled; cells with 2 ovules. Fruit coriaceous or woody, globose, by abortion 1-celled, 1 or 2-seeded. Trees, with subcordate serrate leaves, and a tough fibrous bark. Flowers in pendulous cymes, with the lower half of the common peduncle adnate to a long membrano-foliaceous bract.

1. T. PLATYPHYLLA, Scop. Leaves orbicular-cordate, acuminate, puberulent beneath; flowers without staminodia or petaloid scales. DC. Prodr. 1. p. 513.

T. Europaea, L. Fl. Lond. Icon, vol. 2. [Linden. Broad-Leaved Tilia. Vulgo-Linden, or Lime tree. European Fr. Le Tilleul. Germ. Die Linde. Span. Tilo.

Stem 20 to 40 or 50 feet high, and 1 to 2 feet in diameter,—the numerous branches forming a handsome symmetrical top. Leaves 3 to 5 inches long; petioles 1 to 2 inches long. Flowers yellowish-white, destitute of the accessory petals (or staminodia) which are found in the American species. Cultivated. Native of Europe. Fl. Beginning of June. Fr. September—October.

- Obs. This foreign species has been extensively introduced, as an ornamental shade tree, in our cities and villages. In the beginning of summer it is handsome; but the leaves begin to die, or become diseased (assuming a scorched appearance), soon after midsummer,and the tree is, moreover, infested by so many loathsome and destructive insects, that it is now being superseded by others less subject to such accidents. The flowers are said to afford to bees a superior quality of honey.
- 2. T. AMERICANA, L. Leaves obliquely cordate or truncate at base, abruptly acuminate, subcoriaceous, glabrous; flowers with staminodia, or petaloid scales, connected with the filaments. Fl. N. A. 1. p. 239. Icon, Mx. Sylva, 3. tab. 131.

T. glabra. Vent. DC. Prodr. 1. p. 513. Fl. Cestr. p. 312. [wood. AMERICAN TILIA. Vulgò-Linden, or Linn. Basswood.

Stem 40 to 60 or 80 feet high, and 2 to 3 feet in diameter, with spreading branches. Leaves 3 to 6 inches long, unequal at base; petioles 1 to 2 inches long. Flowers yellowish-white or cream-colored,—furnished with an accessory petal (or staminodium—scarcely changed from the petal form—) attached to each parcel of stamens. Rich woodlands, and banks of streams; along the mountains, from Canada to Georgia. Fl. Latter end of June. Fr. Sept.—October.

Obs. The wood of this fine tree is light, soft and white,—and is much used in the manufacture of domestic utensils. The inner bark. by maceration, separates into broad thin fibres,—from which a rude cordage, and matting, are sometimes made. It also affords a mucilaginous liniment, which has been highly commended in burns and scalds;—though I suppose it is about as efficacious as most other mild mucilages. This species is sometimes planted as a shade tree; but its branches are more straggling, and less symmetrical, than those of the European Linden. Neither of them, however, is as valuable, for that purpose, as the Sugar Maple or the Horse Chesnut. There are two or three other species of Tilia in the U. States: but they are more local in their habitat, and of less general interest, than this one.

ORDER XXVIII. AURANTIACEAE. Correa.

Shrubs, or small trees. Leaves alternate, with articulated petioles, destitute of stipules, dotted with pellucid glands which are replete with a volatile oil.— Flowers fragrant. Calyx short, urceolate or campanulate. Petals 3 to 5 or 8.— Stamens inserted in a single series upon a hypogynous disk, as many as the petals or some multiple of their number, often somewhat monadelphous or polyadelphous. Style cylindrical; stigma thickish. Fruit a many-celled berry, with a leathery rind filled with pulp. Seeds without albumen.

This small but truly Hesperidian Order (which is chiefly tropical.) affords a few fruits beside those here noticed; but they are little known in the U. States.

25. CITRUS. L. Endl. Gen. 5514. [The etymology of this name has not been ascertained.]

Calyx urceolate, 3 to 5-toothed. Petals 5 to 8. Stamens numerous, polyadelphous. Stigma hemispherical. Fruit baccate, 7 to 12celled; cells pulpy, many-seeded. Seed-cover (testa or spermoderm) membranaceous.—Small trees or shrubs, often with axillary spines. Leaves perennial, compound (i. e. odd-pinnate, with all the leaflets but the terminal one suppressed!); petiole sometimes winged.

1. C. Medica, Risso. Petioles not winged; leaves oblong-oval, acute; fruit elliptic-oblong, with a thick rugose coat, and acid pulp. DC. Prodr. 1. p. 539.

MEDIAN CITRUS. Vulgò-Lemon. Lemon tree.

Fr. Cedrat. Germ. Der Citronenbaum. Span. Limonero.

A branching Shrub, 6 to 12 feet or more in height. Leaves 3 to 6 inches long, obsoletely serrate, coriaceous; petioles half an inch to three quarters in length. Petals white, often tinged with purple externally. Stigma peltate, broad and thick—when not fully developed, the fruit inwariably abortive. Fruit elliptic, 2 to 3 inches long,—the rind greenish-yellow, adhering to the pulp. Cultivated.—Native of Media. Fl. March, and after. Fr. Successively.

Obs. This tender evergreen shrub is often to be seen (under shelter in winter,) even in the middle and northern States; and doubtless succeeds well in those at the southern extreme of the Union. It is usually inserted, by inoculation, upon an Orange stock. It appears to flower at different seasons,—and the fruit is a year or more in arriving at maturity; so that the shrub is often charged with both flowers and fruit (the latter in all stages of growth) at the same time. The uses of the fine acid fruit are universally known, and its value appreciated.

2. C. Aurantium, Risso. Petioles more or less winged; leaves ovate-oblong, acute; fruit globose, with a thinnish rugose coat, and sweet pulp. DC. Prodr. 1. p. 539:

[Sweet Orange. Orange. China Orange.—
Fr. L'Oranger. Germ. Der Oranienbaum. Span. Naranjo.

A branching shrub, 5 to 10 feet high. Leaves 3 to 5 inches long, coriaceous; petioles half an inch to an inch long. Petals white. Fruit spherical or an oblate spheroid, about 2 inches in diameter, the rind reddish-yellow, and separable from the pulp. Cultivated. Native of Eastern Asia. Fl. and Fr. as in the preceding.

Obs. The Orange tree was introduced into Florida many years ago,—and seems, from accounts, to be pretty well naturalized, there. It may probably be cultivated to advantage, in the more southern districts of our country: but it can only be known as a Green-house plant, in the middle and northern States,—and it is to Green-house specimens that the size here mentioned, of this and the preceding species, has reference. In a congenial climate, they no doubt become much larger. The delicious fruit of this species is too well known to require comment.

ORDER XXIX. MELIACEAE. Juss. DC.

Trees or shrubs. Leaves alternate, usually compound, destitute of stipules. Calyx of 3 to 5 sepals, more or less connected. Petals 3 to 5. Stamens twice as many as the petals, monadelphous, inserted outside of a hypogynous disk; anthers sessile in the orifice of the tube of filaments. Ovary several-celled, with 1 or 2 ovules in each cell; styles and stigmas mostly united into one. Fruit a drupe, berry, or capsule,—often 1-celled by abortion, and the cell 1-seeded. Seeds with little or no albumen, and wingless.

The genus which represents this Order, is the only one belonging to it which is much known in our country,—and that is pretty much confined to the States

south of the Potomac.

26. MELIA. L. Endl. Gen. 5520.
[The Greek name of a species of Ash,—which this tree resembles.]

Calyx small, 5-cleft. Petals 5, linear-oblong, spreading. Stamen-

tube 10-cleft at summit, with 10 anthers in the orifice; segments of the tube 2 or 3-parted. Ovary seated on a slightly elevated disk; style filiform; stigma capitate, 5-angled, Drupe ovoid, with a 5-celled bony nut; cells 1-seeded. Embryo inclosed in thin fleshy albumen; cotyledons flat, foliaceous. Trees, with odd-pinnate or bipinnate leaves. Flowers in axillary panicles.

1. M. AZEDARACH, L. Leaves bipinnate; leaflets somewhat in fives, obliquely ovate-lanceolate, acuminate, incised-dentate, smooth. Torr. & Gr. Fl. N. A. 1. p. 241. DC. Prodr. 1. p. 621. Icon, Mx. Sylva, 3. tab. 102.

Vulgò-Pride of India. Bead-tree.

Fr. Arbre aux Patenôtres. Germ. Der Zederach.

Stem 20 to 40 feet high, and 1 to 2 or 3 feet in diameter, with branches clustered at irregular intervals. Leaves deciduous; leaflets 1 to 2 or 3 inches long, forming secondary pinnae of 2 or 3 pairs, with a terminal odd one. Flowers pale violet-purple or lilac-colored. Drupe with a soft yellowish pulp, and an obtusely angular nut. Cultivated. Native of Syria, Persia, and the far East. Fl. April.—Fr. September—October.

Obs. This tree has been introduced into the Southern States, as an ornamental shade tree,—and is now, Mr. Elliott says, perfectly naturalized. It will not endure the winters of Pennsylvania. The most northern point at which I have seen trees of any considerable size, was Norfolk, Virginia; and even there, they are sometimes killed by frost. The bark of the root is reputed to be a good vermifuge. In the south of Europe, the nuts are often used for beads; whence one of its English and French names.

ORDER XXXI. LINACEAE. DC. Lindl.

Herbs. Leaves alternate opposite or verticillate, entire, sessile, without stipules. Flowers regular and symmetrical. Calyx of 3 to 5 imbricated persistent sepals. Petals as many as the sepals, unguiculate, twisted in aestivation, ephemeral—Stamens as many as the petals (often with intermediate teeth, representing an abortive series), all united at base into a ring. Ovary mostly with as many styles and cells as there are sepals,—each cell with 2 suspended ovules. Capsule globose, acuminate with the peristent base of the united styles, mostly 5-celled; each cell or earpel more or less perfectly divided by a false dissepiment proceeding from the dorsal suture,—the spurious cells 1-seeded. Embryo flat, fleshy and oily, with little or no albumen.

and oily, with little or no albumen.

This Order is pretty much limited to the genus which is its type; and consequently, the character of the genus is nearly the same as that of the Order.

27. LINUM. L. Endl. Gen. 6056.

[Greek, Linon, or Celtic, Llin; the name for flax, or thread; in those languages.] Sepals, Petals and Stamens 5. Styles 5 or rarely 3. Capsule with a septicidal dehiseence,—the carpels 2-valved at apex.

1. L. USITATISSIMUM, L. Leaves alternate, lance-linear, very acute; panicle corymbose; sepals ovate, acute, with a membranaceous margin; petals somewhat orenate. Torr. & Gr. Fl. N. A. 1. p. 204. DC. Pradr. 1. p. 426. Fl. Cestr. p. 210. Icon, Fl. Land. vol. 1.

Most useful (or common) Linum. Vulgo-Flax.

Fr. Lin. Germ. Gemeiner Flachs, Span, Lino.

Root annual. Stem 2 to 3 feet high, slender, terete, smooth, corymbosely branched at summit. Leaves an inch to an inch and half long. Petals rather

large, blue, often with a tinge of purple, very caducous. Seeds lance-ovate, smooth and shining. Cultivated. Native of Europe. Fl. June. Fr. July.

Obs. This valuable plant—once considered so indispensable among the crops of our farmers-is now but little cultivated. I have not seen a flax-patch for a number of years: whereas, in the "good old times"—before Spinning-wheels were superseded by Pianos every rural family cultivated and manufactured as much flax as was required for domestic purposes. But now, the Cotton-plant of the South has nearly banished the Flax-plant from the Middle and Northern States. Nor is the revolution thus effected a subject of regret, with the farmer. The flax crop is one which involves a good deal of troublesome, disagreeable labor, - and, without being profitable, is generally believed to be injurious to the soil: an opinion as old as the time of Virgil-who says

"Urit enim Lini campum seges, urit avenae."-GEORG. 1. 71. or, as rendered by Sotheby,

"Oats and the Flaxen harvest burn the ground."

The seeds of this plant, beside yielding a most valuable oil, afford one of the best mucilaginous drinks, for coughs, and dysenteric affections.

ORDER XXXV. TROPAEOLACEAE. Juss. A. Grav.

Herbs, with a pungent watery Juce, a straggling or twining stem, alternate petiolate petiate or palmate leaves with radiating nerves, and without stipules.—
Flowers irregular, large, on long axillary peduncles. Calyx of 5 colored united sepals, somewhat bilabiate,—the upper lip produced at base into a hollow spur. Petals 5, unequal, inserted on the calyx,—the 2 upper ones sessile, arising from the throat of the spur,—the 3 lower ones unguiculate, smaller and sometimes abortive. Stamens 8, unequal, distinct. Ovary 3-lobed,—composed of 3 united carpels, which are 1-seeded, indehiscent, and separate from the common axis when mature. Seeds without albumen, large; cotyledons thick, distinct when young, finally consolidated or soldered together.

A very small Order, and of little interest beyond the genus which represents it.

A very small Order, and of little interest beyond the genus which represents it.

28. TROPAEOLUM. L. Endl. Gen. 6063. [Latin, a little banner, or Trophy: from a fancied similitude in the plant.]

For the character of the Genus, see that of the Order.

1. T. MAJUS, L. Leaves peltate, sub-orbicular, obscurely repandlobed, the nerves not exserted; petals obtuse. DC. Prodr. 1. p. 683. Fl. Cestr. p. 243.

Greater Tropaeolum. Vulgò Nasturtium. Indian Cress. [china. Fr. Grande Capucine. Germ. Dic Kapuziner kresse. Span. Capu-

Root annual. Stem 3 to 6 or 8 feet long, fleshy, smooth. Leaves 2 to 3 inches in diameter, the nerves which radiate from the centre not projecting beyond the nargin (as they do in another species): petioles 3 to 6 inches long; Peduncles 1-flowered, mostly longer than the petioles. Petals yellowish or reddish orange, with dark purple stripes and spots,—the 3 lower ones fringed at base. Carpels sulcate. fleshy, finally suberose or coriaceous. Gardens. Cultivated. Native of South America. Fl. June—September. Fr. August—October.

Obs. This ornamental stranger is sometimes cultivated for show; but chiefly for the young fruit—which is prepared as a condiment, and affords a tolerable substitute for capers. The plant is said to be perennial in its native country (Peru),-whence it was brought to Europe in the year 1684.

ORDER XXXIX. ANACARDIACEAE. R. Br. Lindl.

Trees or shrubs, with a resinous or milky, often acrid, juice, which turns black in Trees or shrubs, with a resinous or milky, often acrid, juice, which turns black in drying. Leaves alternate (often compound), without stipules, and not dotted.— Flowers small, mostly paniculate, often polygamous or dioicous. Calyx of 3 to 5 sepals, more or less connected at base. Petals, and usually the stamens, as many as the sepals, inserted into the base of the calyx. Ovary 1-celled (by abortion), but with 3 styles or stigmas, and a single ovule. Fruit indehiscent, usually drupaceous. Seed without albumen; embryo curved.

In the tropical regions, this Family presents plants of much interest: such as that which yields the celebrated Mango fruit (Mangifera Indica, L.)—the Cashew nut (Anacardium occidentale, L.)—and the Pistacia nut (Pistacia vera, L.): with others which afford various kinds of Lacquer and Vannish. A species of Rhus (R. Cotinus, L.) affords the "young Fustic," of commerce,—the "old Fustic" being the wood of Morus tinctoria, L.

The Chian or Cyprus Turpentine is obtained from the Pistacia Terebinthus, L.

29. RHUS. L. Endl. Gen. 5905.

[Greek, Rhous,-or Celtic, Rhudd,-red; the prevailing color of the fruit.] Sepals 5, connected at base, small, persistent. Petals 5, ovate, spreading, inserted under the margin of an orbicular disk. Stamens 5 (rarely 10—and sometimes wanting), inserted into the disk. Styles mostly 3, distinct or united; stigmas subcapitate. Drupe small, nearly or quite dry; nut bony, 1-celled. Cotyledons foliaceous, with their commissure to the radicle (accumbent).

Shrubs or small trees, sometimes very lactescent. Leaves sometimes simple, often compound (odd-pinnate or trifoliolate). Flowers

(of all the species here given) dioicous by abortion.

† Leaves odd-pinnate. * Branches villous.

1. R. TYPHINA, L. Young branches and petioles densely villous; leaflets in many pairs, acutely serrate, glaucous and somewhat pilose beneath; drupes densely pubescent. Torr. & Gr. Fl. N. A. 1 p. 217. DC. Prodr. 2. p. 67. Fl. Cestr. p. 205.

Турна-Like Rhus. Vulgò—Staghorn Sumach.

Lactescent. Stèm 10 to 15 or 20 feet high, and sometimes 4 to 6 inches in diameter, branched. Leaves composed of 8 to 15 or 20 pairs of lance-oblong leaflets (2 to 4 inches in length); common petioles 1 to 2 feet long. Flowers yellowish-green, in thyrsoid panieles,—the fertile panieles smaller and more compact. Ovaries clothed with a long greyish velvety pubescence—which on the fruit becomes a bright purple, and sharply acid. Woodlands, and banks of streams: Canada to Louisiana. Fl. June. Fr. September—October.

Obs. This is the largest and handsomest species of the genus, as seen in the Middle States. The fine purple clusters of fruit, on the fertile plant, render it quite ornamental; and, if introduced into the yards and public squares of our cities, would present an almost literal exemplification of the much-admired R (h) us in urbe!

* * Branches smooth.

2. R. GLABRA, L. Branches and petioles glabrous; leaflets in many pairs, serrate, smooth on both sides, glaucous beneath. Torr. & Gr. Fl. N. A. 1. p. 217. DC. Prodr. 2. p. 67. Fl. Cestr. p. 206.

GLABROUS RHUS. Vulgò-Common, or Smooth Sumach.

Very lactescent. Stem 3 to 8 or 10 feet high, irregularly branching; young branches stout and thick, with a large pith, somewhat angular or compressed. Leaves composed of 8 to 12 or 15 pairs of leaflets (2 to 3 or 4 inches in length); common petiole 9 to 18 inches long, often dark purple. Flowers yellowish-green;

the fertile panicles smaller and more compact than the sterile ones. Ovaries clothed with a short greyish silky pubescence, which on the fruit becomes bright purple, and contains a sprightly acid. Old fields, fence-rows and thickets: Canada to Louisiana. Fl. June. Fr. September—October.

Obs. This shrub is apt to be abundant in neglected sterile old fields; and its prevalence, in arable lands, is strong evidence of the occupant being a poor thriftless farmer. The branches and leaves are aid to be useful in the process of tanning morocco leather.

3. R. VENENATA, DC. Branches and petioles smooth; leaflets in few pairs, very entire; common petioles not winged; fruit glabrous. Torr. & Gr. Fl. N. A. 1. p. 218. DC. Prodr. 2. p. 68. Fl. Cestr. p. 207.

R. vernix. L. and the older authors.

Poisonous Rhus. Vulgò-Poison Sumach. Poison Elder.

Not lactescent. Stem 8 to 12 or 15 feet high, branching above, young branches rather slender, terete, smoothish, sightly verrucose or dotted. Leaves composed of 3 to 5 or 6 pairs of leaflets (2 to 3 or 4 inches long); common petioles 4 to 10 or 12 inches long. Flowers greenish. Panicles slender, racemose, on long axillary peduncles. Drupes dry, smooth and shining, nearly twice as large as in either of the preceding. Low grounds, along swampy rivulets: Canada to Georgia. Fl. June. Fr. September.

Obs. This was formerly supposed to be identical with the oriental species which yields the Japan Varnish,—and hence the old specific name. It is a shrub to be carefully extirpated from the farm; as it is not only worthless, but exceedingly poisonous to many persons, if they come in contact with it—or even get unawares in its immediate vicinity.

† † Leaves trifoliolate.

4. R. TOXICODENDRON, L. (vars. a, and b, Torr. & Gr.) Stem erect, decumbent, or climbing by radicles; leaflets in threes, obliquely ovate or rhomboid, acuminate; fruit glabrous. Torr. & Gr. Fl. N. A. 1. p. 218.

R. radicans, and Toxicodendron. DC. Prodr. 2. p. 69.

R. radicans, L. Fl. Cestr. p. 207.

Poison-tree Rhus. Vulgò-Poison-vine. Poison-oak. Poison-ivy.

Not lactescent. In the erect variety, stem 2 to 5 or 6 feet high; leaflets larger (4 to 6 or,8 inches long), variously and coarsely toothed or lobed: in the more common climbing variety, stem 8 or 10 to 30 or 40 feet long, branching, climbing and closely adhering to trees and other objects by means of numerous radicating processes; leaflets smaller, and more commonly entire, than in the other variety: thin or somewhat membranaceous in both. Flowers yellowish-green. Panicles slender, racemose, on short axillary peduncles. Drupes about the size of those in the preceding species, dry, smooth and shining, pale brown. Woodlands, and old fence-rows: Canada to Georgia, and the Rocky Mountains. Fl. May—June. Fr. September.

Obs. This species (and especially the climbing variety—which is by far the most common, in Pennsylvania) is also poisonous,—and should not only be known to the farmer, but diligently expelled from his premises. There are several other species of Rhus in the U. States,—interesting to the Botanist—as all plants are,—but not immediately so to the practical Agriculturist.

ORDER XL. XANTHOXYLACEAE. Nees & Mart. Lindl.

Trees or shrubs. Leaves mostly alternate (often compound). without stipules; leaflets mostly pellucid-punctate. Flowers polygamous or dioicous. Calyx of 3

to 9 sepals, more or less connected at base. *Petals* as many as the sepals (or rarely wanting), convolute in aestivation. *Stamens* as many, or twice as many, as the petals. *Ovaries* 2 or more, borne on the convex or elevated receptacle, united or separate. Fruit various,—baccate, drupaceous, or capsular, and sometimes samaroid. Seeds 1 or 2 in each cell or carpel, mostly albuminous.

This Order contains several plants possessed of medicinal properties; but few, if any, of Agricultural interest.*

30. AILANTHUS. Desf. Endl. Gen. 5980. [Formed from Ailanto,—the name it bears in its native country.]

Calyx 5-toothed. Petals 5, convolute at base, inserted under a hypogynous disk. Stamens 10, inserted under the disk. Ovaries 2 to 5, distinct, compressed. Carpels 3 to 5, or fewer by abortion, membranaceous and samaroid, tumid and reticulately veined in the centre, 1-celled, 1-seeded, indehiscent. Seed compressed, obliquely ovate, without albumen. Tall trees. Leaves pinnate, but not punctate. Flowers dioicously polygamous. Fruit samara-like, somewhat resembling that of the Ash.

1. A. GLANDULOSA, Desf. Leaves odd-pinnate; leaflets oblonglanceolate, acuminate, coarsely dentate at base, with a gland on the under side of each tooth. DC. Prodr. 2. p. 89. GLANDULAR AILANTHUS. Vulgo-Chinese Sumach. Tree of Heaven.

Stem 30 to 60 feet, or more, in height, much branched; young branches never multiplying during growth, but developed only from the buds of the preceding year. Leaves (on young trees, especially) much elongated, and consisting of many pairs (15 to 20) of smooth leaflets, which are 3 to 5 inches in length, and entire, except a pair or two of coarse teeth at base. Flowers pale greenish yellow, in terminal open thyrsoid panicles. Cultivated as a shade tree. Native of China. Fl. June. Fr. Sept.—October.

Obs. This oriental stranger has not been long enough in the country to demonstrate the size to which it may grow, -but quite long enough (25 to 30 years) to convince some who have tried it, that it is one of the most objectionable trees, in and about yards and gardens, which has yet been introduced. It is a real nuisance,—and was appropriately named Cacodendron (evil or pernicious tree,) by an eminent Botanist. The roots extend far and wide, and send up myriads of suckers which it is almost impossible to keep in subjection,—or to get rid of, even after the tree has been cut down. The sterile flowers are very numerous, and emit a disagreeable odor,—as does also the young plant, when bruised or handled. The tree is of very rapid growth, and might perhaps be worth cultivating, in suitable situations, for the sake of the timber: but I would advise that it be kept away from the vicinity of houses and gardens.-Another recently introduced tree (Paulownia imperialis, Sieb.) is said to be objectionable for the same troublesome tendency to multiply suckers from the roots.

ORDER. XLI. ACERACEAE. Juss. Lindl.

Trees or shrubs. Leaves opposite and mostly palmate-lobed, without stipules.—Flowers small, regular, disposed in racemes, corymbs or fascicles, often polyga-

*Prof. A. Gray suggests, that the Prickly Ash (Xanthoxylum Americanum, Mill.—a small tree, or shrub, to be found in many places in the Northern and Western States—) may be worthy the attention of Farmers, for the purpose of hedging. I doubt, however, whether it can ever be as eligible, and effective, as the Cock-spur Thorn.

mous or dioicous by abortion,—sometimes preceding the leaves. Calyx mostly of 5 sepals, more or less united and colored. Petals as many as the sepals, or often wanting. Stamens varying from 3 to 5, 8, or 12. Ovary 2-lobed. Fruit composed of 2 indehiscent samaroid carpels, finally separable,—the wing of each thickened on the outer or lower margin. Seeds erect, with little or no albumen; embryo curved or sometimes nearly straight; cotyledons foliaceous, irregularly plicate and convolute. gularly plicate and convolute.

The importance of this small Order is limited to the genus which is its type.

The Sycamore, of Europe, is a species of Acer (A. Pseudo-Platanus, L.).

31. ACER. Moench. Endl. Gen. 5558. [Latin, Acer, sharp; the wood having been used for pikes or lances.]

The character of the Order will serve for that of the Genus.

1. A. SACCHARINUM, L. Leaves broad, subcordate at base, 3 to 5lobed with the sinuses obtuse,—the lobes acuminate, coarsely and sparingly sinuate-dentate; flowers apetalous, pendulous on long filiform corymbose pedicels; fruit turgid, smooth. Torr. & Gr. Fl. N. A. 1. p. 248. DC. Prodr. 1. p. 595. Fl. Cestr. p. 245. Icon, Mx. Sylva, 1. tab. 42.

SACCHARINE ACER. Vulgò—Sugar Maple.

Stem 50 to 80 feet or more in height, and 2 to 3 feet in diameter. Leaves 3 to 5 inches long, and generally rather wider than long, dark green above, paler beneath; petioles 2 to 4 inches long. Calyx pale greenish yellow, truncate and cup-like, the limb fringed with long hairs. Petals none. Fruit ovoid at base, about an inch long (including the wing), slightly diverging. Rich woodlands: Canada to Georgia. Fl. April—May. Fr. Sept.

- Obs. This is one of the most valuable and interesting of our native trees,-particularly in the forests of the North and West-where its sap, in early spring, yields an immense quantity of Sugar and Syrup. The beautiful wood, known as Bird's-eye Maple—so much admired in cabinet work—is obtained, I believe, from this species; and it is, moreover, rarely surpassed, in any respect, as an ornamental shade tree.
- 2. A. DASYCARPUM, Ehrh. Leaves palmately and deeply 5-lobed with the sinuses rather obtuse,—the lobes acute, unequally inciseddentate; flowers apetalous, aggregated on short pedicels; ovary densely tomentose. Torr. & Gr. Fl. N. A. 1. p. 248.

A. eriocarpum. Mx. DC. Prodr. 1. p. 595. Fl. Cestr. p. 245. Icon, Mx. Sylva, 1. tab. 40 (the flowers inaccurately represented).

HAIRY-FRUITED ACER. Vulgò-Silver-leaved Maple. White Maple.

Stem 30 to 60 feet high, and 2 feet or more ("in the western states sometimes 8 or 9"—Torr. & Gr.) in diameter. much branched,—the young branches virgate and straggling or drooping. Leaves 3 to 6 inches long, bluish white or glaucous beneath; petioles 2 to 5 inches long. Flowers in fascicles mostly of fives and sevens. Calyx pale green, truncate and cup-like. Petals mostly of fives and ing the wing) 2 to 3 inches long, one of the carpels usually abortive; pedicels of the fruit an inch long. Seed large; embryo nearly straight. Banks of Rivers: Maine to Georgia. Fl. April. Fr. May—June.

Obs. This has been extensively introduced into our cities and villages, as an ornamental tree,—and is often mistaken for the true Sugar Maple. It appears, indeed, from the researches of Prof. A. GRAY, that LINNAEUS established the A. saccharinum upon a specimen of this plant: but, as it was done under a misapprehension of its character, the name has been very properly transferred, by all succeeding Botanists, to the real sugar-producing species. The Silver Maple, however—though fashionable at present—is by no means to be compared with the Sugar Maple, even as a shade tree,and much less for its economical value.

3. A. RUBRUM, L. Leaves generally 3-lobed with the sinuses acute, subcordate at base, -the lobes acute, spreading, unequally inciseddentate; flowers pentapetalous, aggregated on rather long pedicels; ovary glabrous. Torr. & Gr. Fl. N. A. 1. p. 249. DC. Prodr. 1. p. 595. Fl. Cestr. p. 244. Icon, Mx. Sylva, 1. tab. 41. RED ACER. Vulgo-Red Maple. Swamp Maple.

Stem 40 to 60 or 80 feet high, and 1 to 2 feet or more in diameter, branched,—the young branches purplish. Leaves 2 to 4 inches long; petioles 1 or 2 to 5 inches long. Flowers appearing before the leaves, in fascicles of fives. Calyx petaloid, and with the petals, bright purple (or often yellowish tawny). Fruit (including the wing) near an inch long. Moist low grounds; swampy woodlands: Canada to Florida. Fl. March—April. Fr. Sept.

Obs. The variety with yellowish or tawny flowers, is quite common in Pennsylvania,—and in a pretty extensive examination, I find those flowers generally staminate and sterile (rarely perfect); while the bright purple flowers are constantly perfect. The wood of the Red Maple-especially that variety or form of it, known as Curled Maple—is much used in the manufacture of various articles of furniture, &c. and the refuse timber makes excellent fuel. The bark affords a dark purplish-blue dye, and makes a pretty good bluishblack ink. The sap of all the species is more or less saccharine.

ORDER XLII. HIPPOCASTANACEAE. DC. Torr. & Gr.

Trees or shrubs,—the annual growth of the branches rapid and definite. Leaves mostly opposite, compound (digitate by sevens and fives), without stipules; leaflets penninerved. Flowers perfect, unsymmetrical, in large showy terminal thyrsoid panicles or racemes. Calyx of 5 connected sepals. Petals 5 (or sometimes 4, by the suppression of the lower one), unequal. Stamens 6 to 8—usually 7—distinct, inserted upon a hypogynous disk. Ovary 3-celled (or 3 united carpels, with each 2 ovules); styles united into one. Fruit a subglobose coriaceous capsule, echinate or unarmed, mostly 1-celled by abortion, 2 or 3-valved with a learlieful delice over Scale with subglobose with a loculicidal dehiscence. Seed mostly solitary by abortion, large, subglobose, with a smooth shining reddish-brown testa and broad paler hilum, destitute of albumen: cotyledons very thick and fleshy, gibbous, cohering or soldered together, remaining under ground in germination.

A very small Order, and little known in Agriculture.

32. AESCULUS. L. Endl. Gen. 5641. [An ancient Latin name of a tree which bore esculent fruit.] The generic character is nearly that of the Order.

1. Æ. HIPPOCASTANUM, L. Leaflets in sevens, obovate-cuneate, acute, dentate; flowers 5-petaled and heptandrous; fruit echinate. DC. Prodr. 1: p. 597.

Horse-chesnut Aesculus. Vulgò-Horse Chesnut. [de Indias. Fr. Marronnier d' Inde. Germ. Die Rosskastanie. Span. Castaño

Stem 30 to 50 or 60 feet high, and 1 to 2 feet in diameter, with numerous symmetrical rather erect branches. Leaflets 4 to 6 or 8 inches long; common petioles 4 to 6 inches long. Flowers white or ochroleucous, with red spots and tinges of yellow. Cultivated. Native of Asia. Fl. May. Fr. October.

Obs. This ornamental tree (which is often called English Horse Chesnut, because it came to us by way of England—but which originally came from Northern India—) has not been as generally introduced as it deserves to be. It is not only symmetrical and handsome, but also remarkably exempt from the depredations of noisome insects: and although of slower growth than some others, it is, in my opinion, well worth waiting for—on account of its rare beauty, and the perfect shade it affords. The young shoots, or branches of each year, complete their development, and come to a full stop, early in the summer,—the residue of the season being requisite to harden and prepare them to endure the succeeding winter; and no secondary branches are ever put forth during growth. There are several native species of Aesculus in our mountain forests, from Virginia to Georgia—and along the river banks of the West,—where they bear the name of Buck-eye, from a fancied resemblance of the seeds to the eye of that animal. The trees, from their abundance, have become the popular emblem of Ohio—which is known throughout the Union as the Buck-eye State.

ORDER XLVI. VITACEAE. Juss. Lindl.

Shrubby plants, with nodose stems, and generally with a loose stringy bark. Stems climbing by tendrils (which are abortive racemes or peduncles). Leaves simple or compound,—the lower ones opposite,—upper ones alternate, opposite the racemes which are sometimes partly or wholly changed into tendrils.—Flowers mostly in compound racemes, often polygamous or dioicous, small, greenish. Calyx very small, entire or 4 or 5-toothed, lined with a perigynous disk. Petals 4 or 5, inserted on the outside of the disk, valvate in aestivation, sometimes cohering by the tips, caducous. Stamens as many as the petals. and opposite them! Ovary 2-celled, with 2 erect collateral ovules in each cell. Fruit a berry. Seeds with a bony testa; embryo much shorter than the horny or fleshy albumen.

The interesting genus here given is the only important one of the Order.

33. VITIS. L. Endl. Gen. 4567. [An ancient Latin name; of obscure derivation.]

Calyx obsoletely 5-toothed. Petals 5, cohering at apex and speedily falling off (pushed off by the stamens). Stigma subsessile, obtuse. Berry 2 or 3-celled, 4-seeded,—some of the cells and seeds often abortive. Perennial climbing shrubs.

† Flowers perfect (Foreign species).

1. V. VINIFERA, L. Leaves lobed, sinuate-dentate, glabrous or to-mentose. DC. Prodr. 1. p. 633. Fl. Cestr. p. 152.

WINE-PRODUCING VITIS. Vulgò—Wine Grape. English Grape, &c. Fr. La Vigne. Germ. Der Weinstock. Span. La Vid.

Stem 10 to 20 feet or more in length (but usually kept shorter by lopping). Leaves more or less lobed and dentate, generally smaller than in our native species, sometimes very glabrous and shining. Berries often large, of various forms and colors. Cultivated. Native of southern Asia. Fl. June. Fr. Aug. September.

Obs. Many varieties (with names as numerous) of this plant have been produced by long culture in different soils,—and a number of them are cultivated in the U. States, for their delightful fruit; but the product is rather uncertain, in this climate, without great care and attention. The manufacture of wine, also, seems not yet to have succeeded well, in our country. The excellence of the fruit of the Vine—whether fresh, or dried and preserved in the state of

Raisins—is universally known and appreciated; while the fermented juice of the Grape has been the theme of eulogy and song (and the excessive use of it, the cause of infinite mischief), from the earliest ages down to the establishment of Temperance Societies, in the present day. The Currants, of commerce (Corinths, or Grapes of Corinth)—often called Zante Currants—are believed to be a small-fruited variety of this,—or perhaps a distinct yet nearly allied species.

† † Flowers often dioicous (Native species).

2. V. LAERUSCA, L. Leaves roundish-cordate, somewhat 3-lobed, acutely dentate, densely whitish-tomentose beneath; fertile racemes mostly simple, short, and few-flowered; berries large. Torr. & Gr. Fl. N. A. 1. p. 244. DC. Prodr. 1. p. 634. Fl. Cestr. p. 150. Vulgò—Fox-Grape, of the Northern States.

Stem 15 to 20 or 30 feet long, straggling over bushes and small trees. Leaves 4 to 6 inches in length,—the tomentum beneath hoary, or sometimes a little tawny; petioles 2 to 3 inches long. Berries globose, large (about half an inch in diameter),—when mature varying in color from nearly black to dark amber and greenish-white,—with a thickish coat, a tough central pulp, and a musky or rancid flavor. Moist thickets, along streams: Canada to Georgia. Fl. June. Fr. September.

Obs. According to Mr. Elliott, this is one of the largest species of Vine, in the South—"climbing over the loftiest trees" of the forest: But in Pennsylvania, it is usually rather slender, and of moderate extent. The wild fruit is not very palatable,—having a disagreeable musky flavor. There are, however, some varieties (or perhaps hybrids)—improved by long culture—which are much esteemed: such as the "Isabella"—the "Schuylkill" (called also "Alexander's," and "Tasker's,")—the "Catawba"—and especially the "Bland's" Grape. These varieties succeed best, in the Middle States; and, indeed, have nearly superseded all the foreign ones—except among the more curious pains-taking amateurs.

3. V. AESTIVALIS, Mx. Leaves broadly cordate, often 3 to 5-lobed or sinuately palmate, coarsely and unequally dentate, loosely ferruginous-tomentose beneath; fertile racemes mostly compound, long, many-flowered; berries small. Torr. & Gr. Fl. N. A. 1. p. 244. DC. Prodr. 1. p. 634. Fl. Cestr. p. 151.

SUMMER VITIS. Vulgà-Little Grape. Common Wild Grape.

Stem 20 to 40 and sometimes 60 feet or more in length. Leaves 4 to 8 inches long, often palmately lobed with rounded sinuses,—the younger ones with a loose cobweb-like russet pubescence beneath, which becomes coarser and more hirsute with age, and sometimes nearly disappears. Berries globose, small (generally about one fourth of an inch in diameter), deep blue or bluish black when mature, and covered with a fine glaucous powder,—the skin thinnish, and the flavor (especially after a little frost) a sprightly agreeable acid. Rich woodlands, and thickets: Connecticut to Florida. Fl. June. Fr. October.

Obs. This is the tallest climber of all our Grape-vines, in Pennsylvania; and I have seen an old vine, of this species, 8 to 10 inches in diameter, at base. The fruit varies in size and quality,—the best specimens being well worthy of culture. I have cultivated a native of this vicinity, in which the fruit often equals that of the "English Grape" (or Miller's Burgundy) in size; and although somewhat harshly acid, it abounds in a rich purple juice, at maturity,—and makes a fine preserve, for pastry.

4. V. VULPINA, L. Stem and branches with a close greyish-brown bark; leaves orbicular, coarsely and unequally dentate, cordate at base, glabrous and shining on both sides; fertile racemes compound, umbellulate; berries large. Torr. & Gr. Fl. N. A. 1. p. 245.

V. rotundifolia. Mx. DC. Prodr. 1. p. 635.

VULPINE OR FOXY VITIS. Vulgo - Fox-Grape, of the Southern States; also called "Muscadine," and "Bullet- or Bull-Grape."

Stem 20 to 50 feet or more in length, with an adhesive greyish minutely verrucose bark. Leaves 2 to 3 inches in diameter. Berries globose, large (half an inch to three quarters in diameter), bluish black when mature, with a coriaceous coat and not unpleasant flavor (fide Elliott). Woodlands, and banks of streams: Virginia to Florida. Fl. May—June. Fr. July—August.

Obs. The most striking feature of this vine, is the close even texture of its grey bark, -somewhat resembling that of the Beechtree, or Hornbeam; while all the other species, so far as I know, have a loose, lamellated, stringy, dark-brown bark, after the first year's growth.* It is quite probable, as suggested by Mr. Elliott, that this is the *original* "Fox-Grape," or V. vulpina, of Linnaeus. I have observed it growing in abundance in the vicinity of the village of Suffolk, Virginia; but have not seen the fruit. The inhabitants assured me, however, that the large black berries were quite palatable, -and were uniformly, in that region, known by the name of Fox-Grapes. Mr. Elliott thought the species might be, some day, advantageously cultivated.

ORDER XLVII. POLYGALACEAE. Juss. Lindl.

Herbaceous (all the N. American species.) or shrubby plants. Leaves generally alternate, simple, entire, destitute of stipules. Roots bitter, and sometimes with a milky juice. Pedicels with 3 bracts. Flowers perfect, unsymmetrical, usually racemose or spicate. Calyx of 5 irregular sepals,—the 2 lateral or inner ones (wings) larger, and usually petaloid. Petals usually 3, more or less united,—the anterior or lower one (keel) larger than the others. Stanens 6 to 8, combined in a tube, which is split on the upper side, and united below with the claws of the petals; anthers mostly 1-celled, opening by a pore at apex. Ovary compound, 2-celled, with a single suspended ovule in each cell; style curved and often cucullate. Capsule flattened. Seeds often pubescent, with an arillus-like caruncle at base; embryo straight, in fleshy albumen.

A small Order,—and. notwithstanding the promise implied by the name of its type (Polygala—much milk), of little or no value in Agriculture.

34. POLYGALA. Tournef. Endl. Gen. 5647. [Greek, Poly, much, & Gala, milk; from its supposed influence on lacteal secretion.]

The character of the Genus is essentially that of the Order.

1. P. Senega, L. Stems simple, terete; leaves alternate, ellipticlanceolate, the upper ones acuminate; raceme terminal, spike-form; wings of the calyx orbicular-obovate, concave, rather longer than the petals. Torr. & Gr. Fl. N. A. 1. p. 131. DC. Prodr. 1. p. 330. Fl. Cestr. p. 403.

Vulgò-Seneka Snake-root. Milk-wort. Mountain Flax.

^{*}Adrien de Jussieu accounts for the usual phenomenon, by the circumstance that, in the Vine, the Liber (or inner fibrous bark) is annually detached or thrown off along with the outer cortical layer. "On n'y trouve pas de liber, qui, dans la Vigne, est chaque année détaché avec la couche corticale tout entiere."—Cours Elementaire. p. 531, But this species would seem to be an exception.

Root perennial, thick and somewhat woody, with coarse branches. Stems usually several from the same root, 9 to 15 inches high, herbaceous and rather flaceid. Leaves 1 or 2 to 4 inches long—those near the root small, ovate and scale-like. Flowers greenish white. Capsule orbicular. Seeds large, pyriform, hairy, the arillus-like caruncles nearly as long as the seeds. Hilly woodlands: Canada to N. Carolina. Fl. May. Fr. July.

Obs. The root of this species is so valuable for its medicinal properties—as a stimulating expectorant, in croup, &c.—that although not strictly a plant of Agricultural interest, every farmer ought to know its character, and be able to recognize it when he sees it.

ORDER XLVIII. LEGUMINOSAE. Juss.

Herbs, shrubs, or trees. Leaves alternate, stipulate, usually compound (sometimes reduced to a solitary leaflet—and even to a phyllodium, or dilated common petiole); leaflets mostly entire. Calyx usually of 5 sepals, more or less united. Corolla of 5 petals,—either papilionaceous or regular. Ovary single and simple; style proceeding from the upper or ventral suture. Fruit a legume. Seeds attached to the upper suture, mostly destitute of albumen; embryo straight or often with the radicle bent back along the edge of the cotyledons; cotyledons either thin and foliaceous or thick and fleshy.

This vast Family—comprising upwards of 400 genera—is as important as it is comprehensive. Among the remarkable plants (or products) belonging to the Order, and not here described, may be mentioned—on account of their value, beauty, or other characteristic—the Logwood (Haematoxylon Campechianum, L.)—the Braziletto or Brazil Wood (Caesalrinia Brasiciensis, L.)—the Rose Wood (a species of Mimosa)—the Sissoo Wood of India (Dalbergia Sissoo, Roxb.)—the Red Sandal Wood (Pterocarpus santalinus, L.)—the Liquorice plant (Glycyrrhiza glabra, L.)—the Tomarind tree (Tamarindus Indica, L.)—the Toma Genen (Dipterir odorata, Willd.)—the Senna of the Shops (Cassia Senna, L.)—the plants yielding Gum Arabic (species of Acacia) and various other gums and balsams,—the pretty Laburnum (Citysus Laburnum, L.)—and the wonderful Sensitive plant (Mimosa pudica, L.), &c. &c. The famous Chinese condiment, called Soy, is also obtained from the seeds of a plant (Dolichos Soja, L. or Soja hispida, L.C.) belonging to this Order; and the bean called "Gram" in Bengal,—so extensively used, there, as food for horses, &c.—is, I believe, the seed of the Cytisus Cajan, L. or Cajanus flavus, L.C. This vast Family-comprising upwards of 400 genera-is as important as it is flavus, DC.

SUB-ORDER I. PAPILIONACEAE. L.

Leaves simple or compound (mostly pinnate or pinnately trifoliolate). Flowers usually perfect. Corolla butterfly-shaped (papilionaceous) or rarely almost regular, with an imbricated aestivation. Stamon mostly 10, diadelphous—sometimes monadelphous, or distinct-inserted with the petals upon the base of the calyx.

TRIBE I. VICIEAE. Bronn.

Herbs. Leaves mostly even-pinnate (odd in Cicer),—the common petiole not articulated with the stem, generally produced at apex into a bristle or tendril. Stamens diadelphous (9 and 1). Legume continuous (not jointed), usually dehiscent. Radicle mostly inflexed. Co.yledons thick, farinaceous, remaining underground unchanged in germination.

35. CICER. Tournef. Endl. Gen. 6578. [The Latin name for a species of Vetch; applied to this genus.]

Calyx somewhat gibbous at base, 5-parted; segments acuminate, the upper ones incumbent on the vexillum. Legume turgid, 2-seeded. Seeds gibbous.

1. C. ARIETINUM, L. Leaves odd-pinnate; leaflets cuneate-obovate, serrate; stipules lanceolate, subdenticulate; calyx slightly gibbous, the segments as long as the wings of the corolla. DC. Prodr. 2. p. 354. Fl. Cestr. p. 423.

RAM CICER. Vulgo-Coffee Pea. Chick Pea. Garavances. Fr. Le Pois Chiche. Germ. Gemeine Kicher. Span. Garbanzo. Whole plant canescent and glandular-pilose, the hairs secreting oxalic acid. Root annual. Stem 9 to 18 inches high, branching. Leaflets about half an inch long, in 4 to 6 pairs (often alternate), with a terminal odd one instead of a tendril. Flowers axillary, solitary, white. Seed gibbous, pointed,—in form resembling the head of a sheep—and hence the specific name. Gardens: cultivated. Native of Europe, and the East. Fl. July—September. Fr. August—October.

Obs. This Vetch is occasionally cultivated for the seeds,—which are said to afford a tolerable substitute for coffee. Coffee-drinkers, however, are not apt to admire substitutes for their favorite berry; and it is hardly likely that this plant will ever be of much account, in our country.

36. ARACHIS. L. Endl. Gen. 6601. [An ancient name, of obscure meaning.]

Monoicously polygamous: Sterile Fl. Calyx with a slender pedicel-like tube; limb bilabiate,—the upper lip 4-toothed, lowerone entire. Corolla resupinate. Stamens monadelphous (9 united, and 1 abortive). Ovary minute, abortive. Fertile Fl. Calyx, Corolla, and Stamens none. Ovary on a stipitate elongating receptacle, or peduncle, by which it is thrust under ground. Legume subterraneous, oblong, terete, obtuse at each end, somewhat torulose, coriaceous, reticulately veined, 2 or 3-seeded, indehiscent. Seeds irregularly ovoid; cotyledons thick; radicle straight!—Herbaceous. Leaves even-pinnate; stipules elongated, adnate to the petiole; leastets in 2 pairs, not stipulate. Flowers axillary, pedunculate,the lower ones subterraneous, solitary and fertile—the upper ones aërial, often several in an axil and all sterile. [This somewhat anomalous plant does not exactly accord with any of the established Tribes; but I have acted on a suggestion of Prof. De Candolle, and placed it among the Vetches.]

1. A. HYPOGAEA, L. Stem procumbent; leaflets obovate,—the common petiole not produced into a tendril. DC. Prodr. 2. p, 474. SUBTERRANEAN ARACHIS. Vulgò—Ground-nut. Pea-nut. Fr. L' Arachide. Germ. Die Erd-nuss. Span. Mani.

Root annual. Stem 9 to 18 inches long, prostrate, branching, pilose Leaflets an inch to an inch and half long, subsessile, minutely mucronate at apex, entire and bordered by a pilose nerve; common petioles 1 to 2 inches long, channelled above, pilose. Sterile flowers 1 or 2 to 5 or 7, in the upper axils, on long slender pedicels,—the corolla orange-yellow. Cultivated. Native of South America. Fl. July—September. Fr. September—October.

Obs. The summers are rather short for this plant, in Pennsylvania,—where it is sometimes seen in gardens, as a curiosity: But, in the Southern States, it is cultivated to a great extent,—and from thence our Nut-Merchants derive their supply. The seeds—either raw, or roasted in the legumes—are quite a favorite with children, and others; and large quantities of them are consumed at all public gatherings. The seeds are said, also, to yield a valuable oil.

37. FABA. Tournef. [Vicia. L. Endl. Gen. 6581.] [The Latin name for a Bean; appropriated to this genus.]

Calyx tubular, 5-cleft,—the 2 upper segments shorter. Style bent nearly at a right angle with the ovary; stigma villous. Legume large, coriaceous, somewhat tumid. Seeds oblong, subcompressed, with the hilum at one end. Stem erect. Tendrils simple and nearly obsolete.

1. F. vulgaris, Moench. Leaflets 2 to 4, oval, mucronate; stipules semi-sagittate, obliquely ovate. DC. Prodr. 2. p. 354. Fl. Cestr. p. 424.

COMMON FABA. Vulgò-Horse Bean. Windsor Bean.

Fr. Fêve de Marais. Germ. Die Sau-Bohne. Span. Hába.

Root annual. Stem 1 to 2 feet high, simple, smooth. Leaflets 2 to 3 inches long, entire, smooth; tendrils obsolete; stipules large. Flowers in simple erect axillary racemes. Corolla white, with a large black spot on each wing. Legume 2 to 3 inches long, torulose. Gardens: cultivated. Fl. June—July. Fr. August.

Obs. This Bean—originally from the shores of the Caspian Sea—is sometimes cultivated for the table,—but is not generally admired. The seeds have a strong and rather unpleasant flavor.

38. ERVUM. Tournef. Endl. Gen. 6580. [The Latin name for a species of Vetch or Tare.]

Caylx 5-parted; segments lance-linear, acute, about as long as the corolla. Style ascending; stigma glabrous. Legume 2 to 4-seeded.

1. E. Lens, L. Stem erect, branching; leaflets elliptic-oblong, somewhat pilose; stipules obliquely ovate-lanceolate, ciliate; peduncles axillary, 2 or 3-flowered; legumes broad, short, finely reticulated, smooth, 2-seeded; seeds lenticular. DC. Prodr. 2. p. 366. Fl. Cestr. p. 426.

Vulgà-Lentil.

Fr. La Lentille. Germ. Gemeine Linse. Span. Lenteja.

Root annual. Stem 6 to 12 inches high. Leaflets 3 to 6 or 8 pairs. half an inch long; tendrils nearly simple. Corolla white or pale purple. Legume about half an inch long. Seeds 2. orbicular, compressed, white or tawny yellow. Gardens: cultivated. Native of Europe. Fl. June—July. Fr. August.

Obs. This Vetch is cultivated in the old world, chiefly, I believe, as food for Stock,—both herbage and seeds serving that purpose. The plant is sometimes seen in Gardens, here; but it will scarcely command the attention of American Agriculturists.

39. PISUM. Tournef. Endl. Gen. 6579. [The Latin name for the common Pea.]

Calyx-segments foliaceous, the 2 upper ones shorter. Vexillum large, reflexed. Style compressed, keeled, villous on the upper margin. Legume oblong. Seeds numerous, globose, with an orbicular hilum.

1. P. SATIVUM, L. Leaflets rhomboid-ovate, rather obtuse, mucronate, entire; stipules very large, ovate, semi-sagittate, crenatedentate at base; peduncles 2 or many-flowered; legumes subcarnose. DC. Prodr. 2. p. 368. Fl. Cestr. p. 426.

CULTIVATED PISUM. Vulgò-Pea. Garden Pea.

Fr. Pois cultivé. Germ. Gemeine Erbse. Span. Guisante.

Plant smooth and glaucous. Root annual. Stem 1 to 3 or 4 feet long; flaccid, climbing by tendrils. Leaflets usually 2 pairs, 1 to 2 or 3 inches long; tendrils long and branching; stipules larger than the leaflets. Pedunc'es axillarry, 1 or 2 to 6 inches long, often with two flowers at summit. Corolla white. Style reflexed. Legume about 2 inches long, subterete. Gardens and Lots: cultivated. Native country unknown. Fl. June—July. Fr. July—August.

Obs. Several varieties of this are cultivated (one or more of them in almost every garden), chiefly for the young seeds,—which afford a favorite dish at table. In the Northern States, the field culture of Peas (for the mature seeds,) is much attended to; but is rarely seen in Pennsylvania—or, I believe, south of that.

TRIBE II. PHASEOLEAE. Bronn.

Herbaceous or shrubby plants. Stem often twining. Leaves compound (usually plunately trifoliolate—rarely reduced to a single leaflet), stipellate. Stamens diadelphous (9 and 1)—or rarely somewhat monadelphous. Disk a membranous sheath surrounding the base of the ovary. Legume continuous, but often torose and with cellular partitions between the seeds, dehiseent. Seeds usually reniform, convex or compressed.

SUB-TRIBE I. EU-PHASEOLEAE. Benth.

Inflorescence racemose, the pedicels aggregated on alternate knobs. Vexillum with 2 appendages at base. Ovary with several ovules; style often indurated above the middle. Cotyledons thick, nearly unchanged in germination, and often rising out of the ground.

40. PHASEOLUS. L. Endl: Gen. 6674. [Latin, Phaselus, a boat; from the keel-like form of the legumes.]

Calyx bibracteate at base, campanulate, somewhat bilabiate,—the upper lip bifid or emarginate, the lower one trifid. Keel (of the corolla), together with the stamens and style, spirally twisted or circinate. Ovary stipitate, the stipe sheathed. Legume linear or falcate, compressed or subtercte, many-seeded. Seeds reniform, with an oval-oblong hilum. Leaves trifoliolate.

Herbaceous: Peduncles shorter than the leaves.

1. P. VULGARIS, Savi. Stem mostly volubile; leaflets ovate, acuminate; racemes solitary, pedunculate; bracts as long as the calyx; legumes nearly linear and straight, long-mucronate; seeds reniform. DC. Prodr. 2. p. 392. Fl. Cestr. p. 429.

Common Phaseolus. Vulgè—Kidney Bean. String Bean. Pole Bean. Fr. Haricot. Germ. Gemeine Bohne. Span. Fasoles.

Root annual. Stem 4 to 6 or 8 feet long, slender, volubile and climbing (always twining against the Sun—or W. S. E.)—or short and erect (in the "bunch" variety). Leaflets 2 to 4 or 5 inches long; common petio'es 1 to 5 or 6 inches long. Racemes on stont peduncles 1 to 3 or 4 inches long. Corolla mostly white. Legume 3 to 6 inches long. Seeds more or less reniform, whitish, or of various colors. Gardens, and Lots: cultivated. Native of India. Fl. June—August. Fr. Sept.

Obs. Very generally cultivated for the table,—both seeds and legumes being eaten while young; when mature, the seeds only. The baked Beans, of New England, constitute a sort of national dish, among the descendants of the Pilgrims.

The P. nanus, L. Dwarf or Bunch Bean (with short erect stem, more acuminate leaflets, and larger bracts), is supposed to be only

one of the many varieties produced by long culture.

2. P. LUNATUS, L. Stem volubile, smoothish; leaflets obliquely- or deltoid-ovate, acute; racemes subpedunoulate; bracts shorter than the calyx; legumes broad, compressed, seymitar-form or somewhat lunate; seeds much compressed, broad. DC. Prodr. 2. p. 393. Fl. Cestr. p. 430.

LUNATE PHASEOLUS. Vulgè-Lima Bean. Carolina Bean.

Root annual. Stem 6 to 8 or 10 feet long, branching, slender, volubile and climbing. Leaflets 2 to 4 inches long; common petroles 2 to 6 inches long. Racemes loose flowered, on peduncles about two thirds of an inch long. Coolla greenish white, rather small. Legumes 2 to 3 inches long, and about an inch wide. Seeds few, large, flattish and mostly white. Gardens and Lots: cultivated. Fl. July, August. Fr. September—October.

Obs. This species (supposed to be a native of Bengal—though generally named as if of South America,) affords a favorite dish, in the latter part of summer,—the large seeds, only, being used. Both species are tender plants,—impatient of cold, and killed by the slightest frost.

TRIBE III. GALEGEAE. Bronn. Torr. & Gr.

Erect herbs, shrubs, or trees. Leaves usually odd-pinnate, seldom stipellate. Inflorescence racemose or spicate. Corolla papilionaceous, or otherwise irregular. Stamens diadelphous (9 and 1), or sometimes monadelphous. Legume continuous, dehiscent, 1-celled, several-seeded (rarely with transverse cellular partitions); or 1 or 2-seeded and indehiscent.

Leaves mostly odd-pinnate: Flowers in racemes: Corolla truly papilionaceous.

41. ROBINIA. L. Endl. Gen. 6546. [Name in honor of John and Vespasian Robin; French Botanists.]

Calyx subcampanulate, 5-cleft,—the 2 upper segments approximate or cohering. Vexillum large; keel obtuse. Stamens diadelphous. Style bearded on the side next the free stamen. Legume compressed, many-seeded, the upper or seed-bearing suture margined. Trees, or shrubs. Leaflets petiolulate, stipellate.

1. R. Pseud-Acacia, L. Branches virgate, armed with stipular prickles; leaflets oblong-ovate; racemes loose, drooping; legumes smooth. Torr. & Gr. Fl. N. A. 1. p. 294. DC. Prodr. 2. p. 261. Fl. Cestr. p. 410. Icon, Mx. Sylva, 2. tab. 76.

False-Acacia Robinia. Vulgo-Locust tree.

Stem 30 to 60 or 80 feet high, and 1 to 2 feet in diameter. Leaflets 3 or 4 to 8 or 9 pairs, 1 to 2 inches long, each with a small subulate stipelle at base; common petiole pinnate nearly to the base, with 2 stout prickles in place of stipules. Racemes 3 to 6 inches long. Corolla white. Legume 2 to 3 inches long. Mountain forests: Pennsylvania to Arkansas. Fl. May—June. Fr. September.

Obs. The timber of this tree is celebrated for its durability,—and is consequently much prized for posts, rail-road ties or sleepers, &c. It is a rather handsome tree,—and is often planted about houses, as a shade tree; but the branches are somewhat liable to be broken by gusts of wind, and the roots are troublesome in sending up suckers. This latter characteristic, however, renders it easy to propagate Locust groves (and the tree is worth cultivating, for the timber,) in a suitable soil. The flowers are fragrant, but of a rather oppressive odor.—There is another species (R. viscosa, Vent.)—inferior to this, both in size and value,—and also a small species (R. hispida, L.), which bears a profusion of rich roseate clusters of flowers,—and is one of our most ornamental shrubs, when in bloom.

42. INDIGOFERA. L. Endl. Gen. 6530.

[A Latinized name; meaning a plant that produces or brings Indigo.]

Calyx 5-cleft; segments acute. Vexillum orbicular, emarginate; keel with a subulate spur on each side—at length often bent back

elastically. Stamens diadelphous. Style filiform, glabrous. Legume continuous, 1- few- or many-seeded. Seeds truncate at both ends, often separated by cellular partitions. Herbaceous or suffruticose plants. Leaves various, usually odd-pinnate; stipules small, distinct from the petiole. Flowers in axillary racemes.

1. I. TINCTORIA, L. Stem suffruticose, erect; young branches and common petioles clothed with a cinereous pubescence; leaflets in 4 or 5 pairs, with a terminal odd one, oval or obovate-oblong, mucronate, petiolulate, somewhat pubescent beneath with whitish appressed hairs; racemes shorter than the leaves; legumes subterete, torulose, arcuate and deflected. DC. Prodr. 2. p. 224.

DYER'S INDIGOFERA. Vulgò-Indigo. Indigo-plant.

Fr. L' Indigotier. Germ. Die Indigopflanze. Span. Indigo.

Annual or biennial. Stem 2 to 3 feet high, branching. Leaflets half an inch to an inch in length; common petiole 2 to 3 inches long. Racemes 1 to 2 inches long. Corolla purplish blue? Legumes numerous, half an inch to three quarters in length, deflected on the pedicel, curved upwards. Southern States: cultivated. Native of Asia and Africa. Fl. Fr.

Obs. This plant—so important in yielding a blue coloring matter—was formerly cultivated to a considerable extent, in Georgia, and some other portions of the South: But the supply from India, and other places abroad, seems to have curtailed that branch of Southern Agriculture,—and has probably turned the attention of the Planters to a more healthful and agreeable, if not a more profitable, employment. The Indigo-plant is said to be annual, when subject to inundations,—as on the delta of the Ganges; but is sometimes fruticose—yielding one or two ration crops (i. e. successive growths of suckers, or sprouts), after having been cut off. There is another species (I. Anil, L.—nearly allied to this), which is extensively cultivated, in India, for the same object.

TRIBE IV. TRIFOLIEAE. Bronn.

Herbaceous or rarely suffruticose plants. Leaves mostly palmately or pinnately trifoliolate, not stipellate: leaflets often dentate or serrulate! Inflorescence axillary or terminal, racemose, spicate, capitate or umbellate. Corolla papilionaceous. Stamens diadelphous (9 and 1). L gume continuous, 1-celled, several-seeded and dehiscent,—or 1- or few-seeded and nearly indehiscent.

43. TRIFOLIUM. Tournef. Endl. Gen. 6511. [Latinized from the Greek, Triphyllön; a three-leaved plant.]

Calyx tubular, persistent, 5-cleft; segments subulate. Corolla usually marcescent; petals more or less united, and mostly free from the stamen-tube; keel shorter than the wings and vexillum. Legume small, membranaceous, scarcely dehiscent, 1 or 2- (rarely 3 or 4-) seeded, mostly included in the calyx-tube. Flowers mostly capitate. Stipules adnate to the base of the petiole.

1. T. ARVENSE, L. Stem erect, pilose; leaflets linear-obovate or spatulate, minutely 3-toothed at apex; stipules narrow, subulate-acuminate; heads oblong-cylindric, softly villous; calyx-segments longer than the corolla; petals scarcely united. Torr. & Gr. Fl. N. A. 1. p. 313. DC. Prodr. 2. p. 190. Fl. Cestr. p. 406. Icon, Fl. Lond. 3.

FIELD TRIFOLIUM. Vulgò-Stone Clover. Welsh Clover. Rabbit-foot. Fr. Pied de Lievre. Germ. Der Hasen Klee. Span. Piè de Liebre.

Whole plant softly pilose. Root annual. Stem 6 to 12 inches high, slender, generally much branched. Leaflets half an inch to an inch long; common petiols one fourth of an inch to an inch long. Corolla inconspicuous, whitish or pale pink, with a purple spot on the wings. Legume 1-seeded. Sterile old fields: Canada to Florida: introduced? Native of Europe. Fl. June—Aug. Fr. Aug.—Octo.

Obs. This species—which I believe to be a naturalized foreigner —is only intitled to the notice of the farmer on account of its prevalence and its worthlessness. Its presence is a pretty sure indication of a thin soil, and neglected Agriculture; and the appropriate remedy is to improve both. It is then easily superseded by more valuable plants.

2. T. PRATENSE, L. Stems ascending; leaflets oval or ovate-oblong, often retuse or emarginate; stipules broadly lanceolate, membranaceous, nerved, terminating in a subulate point; heads ovoid, obtuse, dense-flowered, subsessile, bracteate at base; calyx-segments scarcely half as long as the corolla, the lower one longer than the others. Torr. & Gr. Fl. N. A. 1. p. 313. DC. Prodr. 2. p. 195. Fl. Cestr. p. 406.

MEADOW TRIFOLIUM. Vulgò-Red Clover. Common Clover. Fr. Trêfle des Prés. Germ. Der Wiesen-Klee. Span. Trebol.

Root biennial, or perennial? large, fusiform. Stems several from the same root, 1 to 2 or 3 feet long, rather weak at base and often decumbent, somewhat branched, striate and pilose. Leaflets half an inch to an inch and half long, sessile, hairy beneath; common petiole half an inch to 4 or 5 inches long. Heads of flowers ovoid or subglobose, an inch or more in diameter. Corolla purplished (rarely white),—the petals all united into a slender tube about half an inch in length. Legume 1-seeded, included in the calyx. Seed reniform, greenishyellow with a shade of reddish-brown. Cultivated fields, meadows, &c. Canada to Florida: introduced. Native of Europe. Fl. May—September. Fr. July,—October. -October.

Obs. This valuable plant is extensively naturalized; but it is also diligently cultivated by all good farmers. In conjunction with the Grasses-especially with Timothy (Phleum pratense, L.)-it makes the best of hay,-though, by itself, it is rather indifferent pasture. In the latter part of the season, "feeding-cattle" will actually fall away, upon clover, alone. Its culture, however, exerts a most kindly influence on the soil. The seed is usually sown (in Pennsylvania) in the month of March, among Wheat and Rye,—and the crop is ready for the scythe the second year. The flowers contain much nectar,—but the tube of the corolla is so long that the Honey Bee cannot reach the treasure with its proboscis; and consequently that insect rarely alights on the heads, but leaves them to the more amply provided Humble Bee. It seems to be an undetermined question, whether this plant is biennial or perennial. Certain it is, that a very large portion of that under culture dies at the end of the second year: But my friend, Mr. Joshua Hoopes-who is a very acute observer-assures me, he has satisfactorily ascertained that the plant will live more than two years. The perennial Grasses undoubtedly have a strong tendency to expel or choke out other plants; and it is possible that the disappearance of the Red Clover

from our meadows may be partly owing to that exclusive or monopolizing tendency, in the Grasses. The Red Clover was introduced into general cultivation, in Chester County, Penna., between the years 1790 and 1800. I recollect well, the first large field of it that I ever saw. It was on the farm of the late Mr. John Sharpless, of Delaware County—who was one of the pioneers of improved Agriculture, in this State; and the time was about the year 1792. The price of the seed, at that day, was 16 dollars per bushel; whereas now it is usually less than half that sum. Watson's Annals of Philadelphia mention, that John Bartram had fields of this Clover, prior to the American Revolution.*

3. T. REPENS, L. Stems creeping, diffuse; leaflets roundish-obovate and emarginate, or almost obcordate, denticulate; stipules lanceolate, mucronate, scarious; heads depressed-globose, on very long axillary peduncles; flowers pedicellate, finally reflexed; legumes about 4-seeded. Torr. & Gr. Fl. N. A. 1. p. 316. DC. Prodr. 2. p. 198. Fl. Cestr. p. 407. Icon, Fl. Lond. 3.

GREEPING TRIFOLIUM. Vulgò-White Clover. Dutch Clover.

Fr. Triolet. Trêfle blanche. Germ. Weisser Klee. Span. Trebol blanco.

Root perennial. Stem 4 to 12 or 15 inches long, smooth, procumbent, radicating, diffusely branching from the base. Leaflets half an inch to an inch long; common petiole 1 or 2 to 6 or 8 inches long. Heads of flowers on erect sulcate naked peduncles which are from 2 to 8 and 12 inches in length. Corolla white, withering and becoming a pale dirty brown. Legume \(\frac{1}{4}\to\frac{1}{5}\to\frac{1}{6}\to\tan \text{inch}\text{long}\), inches in length. Corolla white, torulose, 2 or 3 to 5-seeded. Seeds irregularly ovoid, reddish brown. Pastures, woodlands, &c. throughout the U. States: introduced? Native of Europe. Fl. May—Sept. Fr. July—Octo.

Obs. The pedicellate florets are somewhat corymbose—forming depressed-globose or vertically flatted heads. The outer or lower florets open first, and are successively reflexed,—so that, during the process of flowering, the heads appear horizontally divided between the withered and the young or opening florets. This species is every where common—and in some years very abundant,—though rarely cultivated. Its flowers are a favorite resort of the Honey Bee; and the plant is esteemed, as affording an excellent pasture, in Pennsylvania,—though Mr. Elliott speaks unfavorably of it, in the South.

* On the 19th September, 1843, I found in my pasture field, two specimens of Trifolium pratense, L. which finely illustrate Goethe's theory of the retrograde metamorphosis of vegetable organs. The florets, in the heads, were on elongated pedicels, varying from one third to three fourths of an inch in length; the usually gamopetalous corolla was, in each floret, substituted by 5 distinct, green, oborate leafets, on scariously margined petioles; the stamens, within this verticil, were all apparently free, or distinct,—some of them abortive and dilated into scarious narrow petals, or staminodia; the ovary elongated, forming a thin membranaceous tube, dilated above,—the stigma incurved, with a mucronate point on each side terminating the dilated margins of the tube, at summit. [In some instances, since observed—viz: in Sept. 1846—there were 1, 2, or 3 obovate-oblong, green leaflets, proceeding from within the corolla,—giving the florets the appearance of being proliferous. These leaflets, from their position, seemed to be metamorphased stamens—completely and at once retrograded into foliage!] In consequence of the elongated pedicels of the florets, the head, in each case, was quite open, or loose,—presenting a cluster of small, green, hairy leaves. The whole head was necessarily sterile; but there were other heads on the same stem (on inferior branches,) which were in the usual form and condition. These metamorphosed heads were the terminal ones, in every instance; and I have observed the Peloria (in Linaria,) to be constantly at the summit of the stem, or raceme.

Notwithstanding its present general distribution over our country, it is possible that this species, also, may have been introduced. Jonathan Dickinson, in 1719 (fide Watson's Annals), writing from Pennsylvania, says, "the white clover already tinges the roads as a natural production." Kalm, in 1748, spoke of it as being abundant, here.—There are more than 100 other species of this genus, known to the Botanists,—some of which are cultivated, and appear to be esteemed, by the Agriculturists of Europe; but they have not yet commanded the attention of our farmers, and probably are inferior in value to the common Red Clover.

44. MELILOTUS. Tournef. Endl. Gen. 6510. [Greek, Mel, honey, and Lotus: a Lotus-like plant, attractive of Bees.]

Calyx tubular or campanulate, persistent, 5-toothed. Corolla deciduous; vexillum free, longer than the wings; keel-petals completely united, cohering with the wings, free from the stamen-tube. Legume longer than the calyx, coriaceous, globose or ovoid, 1- or few-seeded, scarcely dehiscent. Herbs. Flowers mostly in long spicate racemes.

1. M. LEUCANTHA, Koch. Stem rather erect, striate; leaflets ovate-oblong, somewhat emarginately truncate at apex, mucronate, remotely dentate-serrate; stipules setaceous; racemes loose, elongated; calyxteeth about as long as the tube; corolla more than twice as long as the calyx; legume ovoid-oblong, wrinkled, 1 or 2-seeded. Torr. & Gr. Fl. N. A. 1. p. 321. DC. Prodr. 2. p. 187. [Clover.

WHITE-FLOWERED MELILOTUS. Vulgò—Tree Clover. Bokhara Fr. Le Melilot blanc. Germ. Weisser Steinklee. Span. Meliloto.

Root biennial? Stem at first ascending or oblique, finally erect, 3 to 5 or 6 feet high, stout, striate-ribbed, smooth, paniculately branched. Leaflets an inch to an inch and a half long; common petiole 1 to 2 inches long. Racemes 2 to 4 inches long, on axillary peduncles 1 to 2 inches in length. Flowers retrorsely imbricated before opening. Corolla white. Introduced, and partially cultivated. Native of Europe. Fl. June—Aug. Fr. Aug.—September.

Obs. This plant has been introduced by some amateur farmers, and much commended as being specially suited for soiling (or cutting, as wanted, for Stock that are kept up): But, without any practical knowledge on my part, I cannot help doubting whether so coarse a plant can be as valuable as the common Red Clover. A former species of this genus (M. coerulea, Lam.),—but which has been separated, and is now the Trigonella coerulea, DC. a plant of strong and enduring odor,—is employed, in Switzerland, to give the peculiar flavor to the famous Schabzieger, or (as it is usually called in the vernacular) "Sap-sago," Cheese.

45. MEDICAGO. Tournef. Endl. Gen. 6507.
[So named by the Greeks, from having been introduced by the Medes.]

Calyx somewhat cylindric, 5-cleft. Keel of the corolla remote from the vexillum. Legume usually many-seeded, of various forms—always more or less falcate, or spirally coiled. Mostly herbaceous plants. Peduncles axillary, 1, 2, or many-flowered.

1. M. SATIVA, L. Stem erect; leaflets obovate-oblong or sub-cuneate, dentate, mucronate; stipules lanceolate, subdentate; pedunoles racemose; legumes spirally twisted, finely reticulated, several-seeded.

Torr. & Gr. Fl. N. A. 1. p. 321. DC. Prodr. 2. p. 173. Fl. Cestr. p. 405. [Clover.

Cultivated Medicago. Vulgò—Lucerne. Spanish Trefoil. French Fr. La Luzerne. Germ. Der Schneckenklee. Span. Alfalfa. Mielga.

Root perennial. Stem 1 to 2 feet high, branched, smoothish. Leaflets half an inch to an inch long,—the lateral ones subsessile, the terminal one petiolulate; common petiole one-fourth to three-fourths of an inch long. Racemes erect, on peduncles half an inch to an inch long. Corolla violet-purple, nearly twice as long as the calyx. Introduced: cultivated. Native of Spain. Fl. June—July. Fr. August.

Obs. This was formerly cultivated on a small scale, as a fodder,—but it did not find favor with our farmers, and is now rarely seen, in Pennsylvania. It might answer, for soiling, in suitable situations,—though I think the stem is too ligneous and wiry to become a favorite fodder, where the red clover can be had. The Saint-foin (Hedysarum Onobrychis, L. or Onobrychis sativa, Lam. a plant of the Hedysarum tribe, DC. the sixth of Torr. & Gr.), is much cultivated for fodder, on the calcareous soils of Europe,—and the late Mr. Crawford, of Georgia, interested himself in endeavoring to introduce it into the Southern States: but I do not learn that its culture was adopted to any extent. I have never met with it on any farm; and presume it scarcely belongs to the Agriculture of this country.

TRIBE VIII. SOPHOREAE. Spreng. DC.

Leaves either simple, palmately foliolate, or odd-pinnate,—the leaflets not stipellate. Corolla mostly papilionaceous. Stamens 10, distinct; anthers uniform. Legume continuous, or sometimes moniliform, but not jointed. Cotyledons flat, toliaceous: radicle inflexed, or often straight.

46. CERCIS. L. Endl. Gen. 6750.

[Greek, Kerkis, a weaver's shuttle; from the form of the legnme.]

Calyx campanulate, 5-toothed, gibbous at base. Corolla scarcely papilionaceous; perals all distinct, unguiculate,—the vexillum smaller than the wings, and the keel-petals larger. Stamens unequal. Legume oblong, acute at each end, much compressed, 1-celled, many-seeded,—the upper suture margined. Seeds obovate; radicle straight. Small trees, with simple entire leaves, and membranaceous caducous stipules. Flowers fasciculate along the branches, appearing before the leaves.

1. C. CANADENSIS, L. Leaves orbicular-cordate, acuminate, villous in the axils of the nerves beneath. Torr. & Gr. Fl. N. A. 1. p. 392. DC. Prodr. 2. p. 518. Fl. Cestr. p. 433.

CANADIAN CERCIS. Vulgò-Red-bud. Judas-tree.

Stem 15 to 20 or 30 feet hight and 6 to 12 inches in diameter, with somewhat geniculate branches. Leaves 3 or 4 inches long; petioles 1 to 2 inches long. Flowers bright purple, acid, on filiform pedicels which are clustered (4 to 6 or 8 from a bud) on the naked branches. Legumes about 3 inches long, subcoriaceous, smooth. Banks of streams: Canada to Louisiana. Fl. April. Fr. June.

Obs. This little tree is admired, in early spring, for its clusters of small flowers, which clothe the branches in purple before the leaves appear. Although not of agricultural importance, it deserves to be known, and to have a place among ornamental shrubbery and trees, around the mansion of the tasteful farmer.

TRIBE IX. CASSIEAE. Bronn.

Trees. shrubs, or herbs. Leaves usually even-pinnate, or bipinnate; leastets not stipellate. Corolla regular,—or more commonly irregular, but not papilionaceous. Stances 10, or sometimes fewer, distinct; anthers sometimes of two forms. Legume continuous, 1-celled, often intercepted between the seeds, dehiscent. Seeds sometimes with a small quantity of albumen; cotyledons foliaceous or rarely fleshy; radicle straight.

47. GLEDITSCHIA. L. Endl. Gen. 6756. [Named in honor of John Gottlieb Gleditsch; a German Botanist.]

FLOWERS POLYGAMOUS: Sepals 3 to 5, equal, united at base. Petals as many as the sepals, -or fewer by abortion-or by the union of the two lower ones. Stamens as many as the sepals and opposite them, or by abortion fewer. Legume stipitate, often intercepted internally between the seeds, dry or with sweet pulp around the seeds. Seeds oval: embryo with a small quantity of albumen. Trees: the superaxillary branchlets often converted into simple or branched spines. Leaves even-pinnate or bipinnate (often both forms on the same tree); leaflets somewhat serrate. Flowers small, somewhat spicate.

1. G. TRIACANTHOS, L. Spines stout, mostly triple; leaflets linear or lance-oblong; legumes oblong, much compressed, somewhat falcate and undulate, many-seeded,-the intervals filled with sweet pulp. Torr. & Gr. Fl. N. A. 1 p. 398. DC. Prodr. 2. p. 479. Icon, Mx. Sylva, 2. tab. 79. Ted Acacia. THREE-THORNED GLEDITSCHIA. Vulgò-Honey-Locust. Three-thorn-

Fr. Le Fevier à trois Epines. Germ. Der Honigdorn.

Stem 30 to 50 or 60 feet high, and 2 to 3 or 4 feet in diameter. Leaflets about an inch or inch and half long. Flowers yellowish green. Legumes 6 to 12 or 15 inches long, and an inch or more in width, thin and wavy, or somewhat twisted. Pennsylvania to Louisiana: often cultivated. Fl. July. Fr. September-Octo.

Obs. This is occasionally seen about houses, in Pennsylvania, as a shade or ornamental tree,—and further South it has been used, while young, for hedging: But, although the thorns are very formidable, I believe it does not make a close, effective hedge. Dr. Gray informs me, however, since the foregoing was written, that it is used considerably, and successfully, near Cambridge, Mass.

ORDER XLIX. ROSACEAE. Juss.

Trees, shrubs, or herbs. Leaves alternate, usually furnished with conspicuous stipules. Flowers regular, sometimes polygamous or dioicous. Sepals 5 (rarely 3 or 4), more or less united, and often with as many bracts. Petals as many as the sepals (rarely none), inserted on the edge of a thin disk which lines the tube of the ealyx (perigynous). Stamens indefinite or sometimes few, distinct, inserted on the disk just within the petals. Ovaries with solitary or few ovules; styles often lateral. Seeds mostly destitute of albumen; cotyledons flat or planoconvex: radiale straight.

styles often lateral. Seeds mostly destitute of albumen; cotyledons flat or planoconvex; radicle straight.

This Order—comprising about sixty Genera—is remarkable for the amount and variety of its esculent products. Many of the fruits are valuable, and some of them eminently delicious,—while the type of the Order (Rosa) is by universal consent regarded as the queen of beauty, among flowers. A few of the drupaceous species of the Order contain a dangerous quantity of Prussic acid, in the nuts and leaves; but the fleshy or succulent fruits are, almost without exception, innocent and wholesome.

SUB-ORDER II. AMYGDALEAE. Juss.

Ovary solitary, free from the deciduous calyx, with 2 suspended collateral ovules,

and a terminal style. Fruit a drupe, mostly 1-seeded by abortion. Trees or shrubs, with simple leaves: stipules free.

48. PERSICA. Tournef. [Amygdalus. L. Endl. Gen. 6405.] [A name derived from Persia,-its native country.]

Calyx tubular, with 5 spreading segments. Drupe oval, tomentose or smooth, very fleshy and succulent; nut with the surface rugosely furrowed, and perforated. Small trees. Leaves lanceolate, serrate, conduplicate in vernation. Flowers subsessile, solitary or in pairs, preceding the leaves.

1. P. VULGARIS, Mill. Fruit densely tomentose. DC. Prodr. 2. p. 531. Fl. Cestr. p. 284.

Common Persica. Vulgò—Peach. Peach tree.

Fr. Le Pêcher. Germ. Der Pfirschenbaum. Span. El Melocotón.

Stem 8 to 12 or 15 feet high, branching. Leaves 3 to 5 inches long; petioles half an inch long, channeled above and glandular near the leaf. Petals pale red or purplish. Drupe with the flesh white, yellow, or reddish,—either adhering to the nut (and then called Clingstone)—or separable from it (when it is termed Freestone). Cultivated. Native of Persia. Fl. April. Fr. August—September.

Obs. The varieties of delicious fruit, afforded by this tree, are very numerous; and although the tree is short-lived, the culture is managed with great spirit and success, in the Middle States,—particularly in Maryland, Delaware, and New Jersey. A succession of trees is kept up, by raising young stocks from the seeds, and inserting on them buds, or scions, from the most approved varieties.*

2. P. LAEVIS, DC. Fruit smooth. DC. Prodr. 2. p. 531. Fl. Cestr. p. 285.

SMOOTH PERSICA. Vulgò-Nectarine.

Fr. Le Brugnon. Germ. Der Nektar-pfirschenbaum. Span. Abridor.

Obs. This small tree is scarcely to be distinguished from the preceding, except by its smooth-fruit, -which presents the same varieties, of Clingstone and Freestone. It is more rare than the Peach,

and generally smaller.

The Almond (Amygdalus communis, L.—which is nearly related to the Peach,—except that the Drupe is dry and fibrous, instead of succulent—and the seed is the eatable portion,) has not yet, I believe, been much cultivated within the U. States: but it may probably be successfully introduced into Florida,—and perhaps some other Southern States. The hard-shelled or bitter Almond has succeeded, even in Pennsylvania.

49. ARMENIACA. Tournef. [Prunus. L. Endl. Gen. 6406.] [A name derived from Armenia,—its native country.]

Calyx campanulate, with 5 reflexed segments. Drupe roundish-oval,

*This process, for changing the character of the tree, is alluded to by the great English Bard with his usual felicity:

"You see, We marry
"A gentler scion to the wildest stock;
"And make conceive a bark of baser kind
"By bud of nobler race: This is an art
"Which does mend nature,—change it rather: but
"The art itself is nature." [Winter's Tai

[Winter's Tale. Act 4.

fleshy, clothed with a soft velvety pubescence; nut compressed, the surface even and not rugosely sulcate,—one margin obtuse, the other acute, both grooved. Small trees. Leaves subcordate or ovate, convolute in vernation. Flowers subsessile, solitary or few, preceding the leaves.

1. A. VULGARIS, Lam. Leaves orbicular-ovate, acuminate, dentate, subcordate at base; flowers sessile. DC. Prodr. 2. p. 532. Fl. Cestr. p. 285.

Common Armeniaca. Vulgò—Common Apricot. Moor-park Apricot. Fr. L'Abricotier. Germ. Der Aprikosenbaum. Span. Albaricoque.

Stem 10 to 15 or 20 feet high, with rather stout spreading branches. Leaves 2 to 3 inches long; perioles an inch to an inch and half long, mostly with cup-like glands near the base of the leaf. Petals white. Drupe oval, yellowish when mature. Cultivated: Native of Armenia. Fl. April. Fr. July.

Obs. This tree yields a luscious and favorite fruit; and, in propitious seasons, the branches are so loaded as to remind one of the admonitory passage in Shakspeare:

"Go bind thou up yon' dangling Apricocks,
"Which, like unruly children, make their sire
"Stoop with oppression of their prodigal weight:
"Give some supportance to the bending kwigs."
King Richard

It is melancholy to reflect how thoughtless and negligent mankind generally are, with respect to providing fruit for themselves. There are few persons who do not own or occupy sufficient ground to admit of 3 or 4 choice fruit-trees and a grape-vine;—such, for example, as an Apricot, a Peach, a May-duke Cherry, a Catharine Pear, and a Catawba grape: yet the great majority seem never to think of planting such trees,—while they are ready enough to run after the rare fruit which some provident neighbor may have taken the pains to cultivate. It is high time that such disreputable negligence should cease; and that people should be more attentive to duties which are enjoined by every consideration of comfort and good taste,—nay, even of sheer justice to those around them, who are now annually plundered of the fruits of their own care and labors.

2. A. DASYCARPA, *Pers.* Leaves ovate or oval, somewhat acuminate, doubly serrate; flowers pedicellate. *DC. Prodr. 2. p. 532. Fl. Cestr. p.* 286.

HAIRY-FRUITED ARMENIACA. Vulgò-Black Apricot.

Stem 10 to 15 feet high; branches rather slender and virgate. Leaves $1\frac{1}{2}$ to near 3 inches long; petioles about an inch long. Paals white. Drupe subglobose, hairy, dark purplish color when mature. Cultivated: Native country unknown. Fl. April. Fr. July.

Obs. This species has more of the habit of a Prunus or Plum tree, than the preceding,—and is reputed to be a more certain fruit-bearer; but I have not found it so. It flowers freely; but the young fruit is soon stung by an insect, and nearly all falls off before it is half grown.

50. PRUNUS. Tournef. Endl. Gen. 6406. [The Latin name for the Plum.]

Drupe ovoid or oblong, fleshy, very smooth and mostly covered with a fine glaucous powder or bloom; nut compressed, the surface even,

with both margins acute and slightly grooved. Small trees. Leaves convolute in vernation. Padicels 1-flowered, often in umbellate fascicles; flowers preceding—or sometimes succeeding—the leaves.

1. P. DOMESTICA, L. Branches unarmed; leaves lance-ovate or oval, mostly acute, serrate; pedicels sub-solitary. DC. Prodr. 2. p. 532. Fl. Cestr. p. 286.

Domestic Prunus. Vulgò-Common Plum. Damascene, Gage, &c. Fr. Prunier. Germ. Der Pflaumenbaum. Span. Ciruélo.

Stem 8 to 12 or 15 feet high, branching. Leaves 1 to 3 inches long; petioles half an inch to an inch or more in length. Flowers rather preceding the leaves, solitary or in pairs; pedicels about half an inch long. Petals white. Drupe oval, ovoid or obovoid, of various colors from black to pale greenish-yellow, covered with bloom, the flesh rather firm. Cultivated: Native of Southern Europe. Fl. April. Fr. August.

- Obs. Several varieties of this are cultivated,—some of them of a large size; but the depredations of insects render the fruit an uncertain crop—at least in the country. In cities, the insects seem to be less destructive.
- 2. P. AMERICANA, Marsh. Branches subspinose; leaves oval and obovate, conspicuously acuminate, sharply and often doubly serrate; umbels subsessile, 2 to 5-flowered. Torr. & Gr. Fl. N. A. 1. p. 407. Fl. Cestr. p. 287. Icon, Annals N. Y. Lyceum, vol. 3.

Cerasus nigra, & hyemalis. DC. Prodr. 2. p. 538.

AMERICAN PRUNUS. Vulgo-Red Plum. Yellow Plum.

Stem 8 to 12 or 15 feet high, much branched.—the young branches virgate, the old ones rugged and somewhat thorny. Leaves 2 to 3 inches long; petioles one fourth to half an inch long. Flowers preceding the leaves, in numerous fascicles of threes or fours; pedicels one third to half an inch long. Petals white. Drupe oval or subglobose, mostly reddish-orange-colored, nearly destitute of bloom, with a rich succulent yellow pulp, and a thick tough skin. Thickets, fence-rows, and banks of streams: Canada to Texas. Fl. April. Fr. August.

- Obs. This Plum—about which foreign Botanists have been so bewildered—is extensively diffused through our country. In its wild state, the flowers are apt to be abortive,—and the fruit is small and rather acerb; but by long culture, the drupe sometimes becomes as large as a common Apricot. Although of a pleasant flavor, when fully mature, it is not adapted to culinary purposes; and is scarcely to be enumerated among our cultivated plants.
- 3. P. Chicasa, Mx. Branches subspinose; leaves narrow, oblong-lanceolate or oblanceolate, acute, finely serrulate with glandular-pointed teeth; umbels sessile, 2 to 3-flowered. Torr. & Gr. Fl. N. A. 1. p. 407. Fl. Cestr. p. 287.

Cerasus Chicasa. DC. Prodr. 2. p. 538.

CHICASA PRUNUS. Vulgo-Chickasaw Plum. Mountain Cherry.

Stem 6 to 10 or 12 feet high, much branched,—the young branches virgate, dark purple, smooth and shining,—the old ones crooked or geniculate, and somewhat thorny. Leaves 1 to 2 inches long, smooth; petioles slender, one fourth to three fourths of an inch long. Fiowers appearing with the leaves (coexaneous), in sessite fascicles of threes; pedicels about half an inch long, slender and smooth. Drupe globose, red or yellowish-red, nearly or quite destitute of bloom, with a tender pulp, and a thin skin. Cultivated. Fl. April. Fr. July.

Obs. This little tree (which is believed to be a native of our South-

western territory,—where it is a small shrub, in its wild state,—) by long culture produces a very pleasant fruit,—worthy of more attention than it has yet received. It approaches the *Cherry*, in character and appearance, and may be considered as a connecting link between the Plum & Cherry; but is unquestionably, I think, a true Plum.

51. CERASUS. Juss. [Prunus. L. Endl. Gen. 6406.] [The name of an Asiatic town,—whence the tree was obtained.]

Drupe globose or roundish-ovoid, often umbilicate at base, fleshy and succulent, very smooth, destitute of bloom; nut subglobose, the surface even. Trees or shrubs. Leaves from terminal buds, conduplicate in vernation. Pedicels either in umbellate fascicles from lateral leafless buds, and then rather preceding the leaves,—or in racemes terminating leafy branches, and coming after the leaves.

† Flowers in umbellate fascicles.

1. C. AVIUM, Moench. Branches erect or ascending, rather stout; leaves oval or obovate-oblong, acuminate, coarsely serrate, pilose and somewhat glaucous beneath; umbels sessile; flowers scarcely preceding the leaves; pedicels rather long; drupe roundish-ovoid or subcordate at base. DC. Prodr. 2. p. 535. Fl. Cestr. p. 289.

Birds' Cerasus. Vulgò—English Cherry. Bleeding-heart, &c. Fr. Le Cerisier. Germ. Der Kirschbaum. Span. Cerézo.

Stem 30 to 60 feet or more in height, and often 2 to 3 feet in diameter, at base,—branching regularly, and somewhat verticillately, so as to form an oblong conical top. Leaves 3 to 5 or 6 inches long; petioles an inch to an inch and half long. Pedicels slender, an inch to an inch and half long, usually 3 (often 2) in a fascicle. Petals white. Drupes of various size and color, tender and often very succulent, sweet or bitterish-sweet. Cultivated. Fl. April. Fr. June—July.

- Obs. Cherries are said to have been originally brought to Rome from Cerasus, a city of Pontus, by the Roman Consul and General, Lucullus, some 60 or 70 years before the Christian era; and from Rome they have been distributed over the rest of the civilized world. Our cultivated Cherry trees seem obviously to consist of at least two original species,—viz. the sweet "English Cherry," so called,—and the common Sour Cherry. The numerous varieties—produced by culture (and possibly some hybrids)—may perhaps be all referred to one or the other of those two; though Prof. De Candolle admits of no less than five species. I am not sure that I perfectly comprehend the Professor's views—nor that I am acquainted with the trees on which he has founded those species. There are, undoubtedly, several very distinct sorts of fruit; but I incline to think the general habit and aspect of the trees commonly seen in this country, warrant the reduction of them all to the two above referred to: and I shall so consider them in this work.
- 2. C. VULGARIS, Mill. Branches spreading, slender and flexible; leaves obovate and ovate-lanceolate, mostly narrowed at base, acuminate or acute, serrate, smoothish; umbels subsessile; flowers rather preceding the leaves; pedicels rather short; drupe globose. Fl. Cestr. p. 288.
- C. Caproniana? DC. Prodr. 2. p. 536.

COMMON CERASUS. Vulgo-Red or Sour Cherry. Morello Cherry, &c.

Stem 10 to 20 feet high, irregularly branched; branches rather slender and flaceid, spreading nearly horizontally and forming a roundish bushy top. Leaves 1½ to 3 inches long; petioles half an inch to an inch long. Pedicels half an inch to an inch in length, 2, or more frequently 3, in a fascicle. Petals white. Drupes fleshy, more or less acid, red or dark purple when mature. Cultivated. Fl. April. Fr. July.

Obs. The "Sour Cherry" is the most common and, for culinary purposes, the most valuable of the genus. The Morello Cherry (var. Griotta? DC.) is a remarkably fine fruit, with a rich purple juice,—and in the days of "Cherry Bounce," was a great favorite: But, for the last 30 years it has almost entirely disappeared from Pennsylvania, in consequence of the ravages of an insect, causing large warty excrescences on the branches of the tree. The fruit first failed,—and now (1846) the tree itself has become very scarce.

† † Flowers in racemes.

3. C. SEROTINA, DC. Leaves oval, oblong, or lance-oblong, acuminate, smooth, shining above, finely serrate with appressed or incurved callous teeth; racemes elongated; drupes globose, small. Torr. & Gr. Fl. N. A. 1. p. 410. DC. Prodr. 2. p. 540.
C. Virginiana. Fl. Cestr. p. 289. Icon, Mx. Sylva, 2. tab. 88. LATE CERASUS. Vulgò—Wild Cherry.

Stem 40 to 60 or 80 feet high, and 2 to 3 feet in diameter at base, with large irregular spreading branches. Leaves 2 to 4 or 5 inches long, subcoriaceous; peticles half an inch to three quarters in length. Racemes simple, rather erect, 2 to 4 or 5 inches long. Petals white. Drupes dark purple or purplish black when mature, succulent, bitter and mawkish to the taste. Banks of streams; fencerows, &c.: Canada to Florida. Fl. May. Fr. August.

Obs. It seems that this is not the true C: Virginiana (Prunus Virginiana, L.),—although it has passed for it, among the Botanists, for many years. The specific name, Virginiana (as we learn from Torrey & Gray), was given, by Linnaeus, to the small species called Prunus obovata, by Bigelow,—the Cerasus obovata of Beck, and the Flora Cestrica; and must therefore be continued to that species. The wood of the Wild Cherry is a pale reddish brown, close-grained and hard,—taking a good polish (a sort of indigenous Mahogany),—and was formerly much used by cabinet makers. The bark—though a rather unpalatable bitter—is a valuable tonic. The leaves are a favorite food of caterpillars,—the young trees being often completely stript by those voracious animals; and the ripe fruit is greedily sought by birds.

SUB-ORDER III. ROSACEAE PROPER. Torr. & Gr.

Ovaries numerous or several, rarely solitary, free from the calyx (which is often bracteolate, as if double), but sometimes inclosed in its persistent tube,—in fruit becoming either follicles, akenes, or little drupes. Styles terminal or lateral. Herbs, shrubs, or very rarely trees. Leaves simple or compound.

TRIBE II. DRYADEAE. Vent. Torr. & Gr. Ovaries in fruit becoming akenes, or sometimes little drupes.—and when numerous, collected on a conical or hemispherical torus or receptacle.

SUB-TRIBE 5. FRAGARIEAE. Torr. & Gr. Ovaries numerous, becoming akenes in fruit: style mostly lateral.

52. POTENTILLA. L. Endl. Gen. 6363. [Latin, potens, powerful; in reference to supposed medical properties.]

Calyx concave at bottom; limb mostly 5-cleft, with an external

bract at each cleft. Petals mostly 5. Stamens numerous. Style sometimes nearly terminal. Akenes numerous, often rugose, capitate on a dry persistent villous receptacle. Seed suspended: radicle always superior. Herbaceous or suffruticose. Leaves pinnately or palmately compound.

1. P. Norvegica, L. Hirsute; stem erect, dichotomous above; leaves palmately 3-foliolate, the cauline ones on short petioles; leaflets obovate-oblong, the uppermost lanceolate, coarsely and incisely serrate; peduncles axillary, cymose at summit and leafy; petals shorter than the calyx; akenes rugosely ribbed or striate. Torr. & Gr. Fl. N. A. 1. p. 436. DC. Prodr. 2. p. 573. Fl. Cestr. p. 303. Norwegian Potentilla.

Root annual. Stem 1 to 2 feet high, rather stout. Leaflets 1 to 3 inches long; common petioles 1 to 4 inches long; stipules large (often an inch or more in length). Flowers often numerous, in leafy cymes at summit, and on long solitary peduncles below,—the lower peduncles often opposite the leaves. Petals yellow. Pastures, and road sides: Northern States. Native of Lapland, Norway, and Northern America. Fl. July—Aug. Fr. September.

Obs. This is said to be native in the Northern States, and British America,—but it has very much the appearance of an introduced plant, in *Pennsylvania*,—and has not yet, so far as I know, acquired a common name.

It is only intitled to the notice of the farmer, as being a coarse, homely, worthless intruder in his pasture fields.

2. P. Canadensis, L. Villous; stems sarmentose, procumbent and ascending; leaves palmately 5-foliolate; leaflets cuneate-obovate, incisely serrate-dentate near the apex; peduncles axillary, solitary, elongated; petals longer than the calyx; akenes somewhat rugose. Torr. & Gr. Fl. N. A. 1. p. 443. DC. Prodr. 2. p. 575. Fl. Cestr. p. 303.

Also, P. simplex. Mx. DC. l. c. Fl. Cestr. p. 304.

CANADIAN POTENTILLA. Vulgò—Cinquefoil. Five-finger.

Root perennial. Stem 2 or 3 to 12 and 18 inches long, slender, somewhat branched, often several from the same root. Radical leaves on petioles 2 to 6 or 8 inches long; stem leaves nearly sessile: leaflets half an inch to 1 or 2 inches long. Peduncles about as long as the leaves. Petals yellow. Old neglected fields; borders of woodlands, &c. Canada to Georgia. Fl. April—June. Fr. June—August.

Obs. The P. simplex, of authors, is no doubt properly regarded as only a variety of this. Both varieties are rather harmless, though worthless; and are merely indicative of a poor soil, or a thriftless farmer. Some lands, when kept as pasture fields, seem to have an almost incurable tendency to lose the valuable Grasses, and to become speedily overrun with Cinquefoil. Lime and manure, however, will work wonders in the worst of soils.

53. FRAGARIA. Tournef. Endl. Gen. 6361. [Latin, fragrans, odorous; in reference to its fragrant fruit.]

Calyx, Corolla, and Stamens, the same as in Potentilla. Style deeply lateral. Akenes numerous, smooth, scattered on the enlarged succulent or pulpy receptacle—which often finally separates from the conical central portion of the torus. Perennial stoloniferous Herbs.

Leaves 3-foliolate; leaflets coarsely dentate. Flowers several, cymose on a scape-like peduncle; sometimes dioicous by abortion.

1. F. VESCA, L. Peduncles usually longer than the leaves; calyx of the fruit reflexed; fruit conical or hemispherical,—the akenes superficial. Torr. & Gr. Fl. N. A. 1. p. 448. DC. Prodr. 2. p. 569. EATABLE FRAGARIA. Vulgò-English Strawberry. Garden Strawberry.

Fr. Le Fraisier. Germ. Die Erdbeerpflanze. Span. Fresera.

Whole plant hairy. Root perennial, and the leaves often green through the winter. Stem very short,—but several slender prostrate radicating runners, 1 to 2 feet long, are thrown out from the crown of the root. Leaves mostly radical; common petioles 3 to 8 or 9 inches long; leaflets ovate or cuneate-obovate, plicate, 1 to 3 or 4 inches long. Cymes 5 to 12 or 15-flowered, with 2 or 3 foliaceous bracts at base, on peduncles 4 or 5 to 10 or 12 inches in length. Flowers sometimes abortive.* Petals white. Receptacle (commonly regarded as the fruit) red or yellowish white, bearing the akenes superficially and rather prominently on the even surface. Gardens: cultivated. Native of Europe. Fl. April. Fr. May—June. May-June.

Obs. Several varieties are cultivated in the Gardens,—and probably some which are specifically distinct; -as the Hauthoy (F. elatior, Ehrh.), and the Chili Strawberry (F. Chilensis, Ehrh.). A variety of extraordinary size, called "Hovey's Seedling," has been recently obtained, -which, although not equal in flavor to some of the smaller ones, is a magnificent product, and well worthy of universal culture.—The Gardeners announce, also, some other fine seedling varieties.—Although the true fruit of this plant consists of mere dry specks, or bony particles (i. e. the minute akenes), scattered over the surface of the enlarged receptacle, -yet the receptacle itself furnishes a pulpy substitute of the most delicious character. Shakspeare has the following allusion to the habitat, or associates of the plant, to illustrate a moral sentiment:

"The Strawberry grows underneath the Nettle; "And wholesome berries thrive and ripen best, "Neighbor'd by fruit of baser quality."

King Henry V.

2. F. VIRGINIANA, Ehrh. Peduncles commonly shorter than the leaves; calyx of the fruit spreading; fruit ovoid, nodding,—the akenes imbedded in the pitted surface of the receptacle. Torr. & Gr. Fl. N. A. 1. p. 447. DC. Prodr. 2. p. 570. Fl. Cestr. p. 304. VIRGINIAN FRAGARIA. Vulgò-Wild Strawberry.

Obs. This native species is usually a smaller plant (perhaps for want of culture), but has a close general resemblance to the preced-

*Individual plants are frequently to be found, in Strawberry beds, in which the flowers are all abortive,—the stamens having the appearance of coarse blighted monstrosities—the pistils abortive—and the receptacle failing to enlarge. The Gardeners call these male plants,—and insist that their presence is absolutely indispensable, to insure a crop of fruit: But the flowers in question, so far as I have observed, are palpably neutral, and nothing more than blights. The Gardeners, indeed, are very positive in their opinions (as merely practical operatives—and all others, who take things for granted—are somewhat apt to be); but I confess I cannot comprehend how the vicinity of such abortions can be essential to the perfection of the fruit in other plants. The organs of plants are undoubtedly subject to great modifications, by long culture; but the precise mode in which their productiveness is affected, is probably not yet thoroughly understood. understood.

ing,—and is frequent in old fields, and meadows, throughout the U. States. Drs. Torrey & Gray remark, that "the deeply pitted fruit affords the only character for this species that can be wholly relied upon;" and even that, I fear, is not unexceptionable. It is a deep purple, when mature,—and in its wild state, of a more sprightly (sub-acid) flavor than the cultivated sorts.

SUB-TRIBE VI. DALIBARDEAE. Torr. & Gr.

Ovaries numerous or rarely few, becoming succulent little drupes in fruit: style terminal or nearly so.

54. RUBUS. Tournef. Endl. Gen. 6360. [Latin, Ruber,—or Celtic, Rub,—red; from the color of the fruit, or branches.] Calyx flattish at base, 5-parted, without bracts at the clefts. Petals 5. Stamens numerous, inserted on the border of the disk which lines the calyx. Carpels mostly numerous, capitate on a protuberant spongy receptacle, becoming succulent and drupaceous, cohering and forming a compound berry, either deciduous or persistent. Perennial and mostly suffruticose plants. Stems erect or procumbent, usually biennial and armed with prickles. Leaves pinnately or pedately compound, sometimes simple.

§1. Carpels forming a hemispherical fruit, concave beneath, and deciduous or falling away from the dry receptacle when ripe (RASPBERRY).

† Leaves simple.

1. R. odoratus, L. Stem fruticose, erect, unarmed, hispid with glandular hairs; leaves palmately 3 or 5-lobed, unequally serrate; stipules nearly free, deciduous; corymbs terminal, spreading, glandular-pilose and viscid; flowers large; sepals with a long acumination. Torr. & Gr. Fl. N. A. 1. p. 449. DC. Prodr. 2. p. 566. Fl. Cestr. p. 309.

ODOROUS RUBUS. Vulgò-Rose-flowering Raspberry.

Root creeping. Stem perennial, 3 to 5 feet high, branching. Leaves 4 to 8 inches long, and nearly as wide as long, cordate at base; petioles 2 to 4 or 6 inches long. Flowers corymbose: peduncles and sepals clothed with a purplish claumy glandular pubescence. Petids mostly purplish rose-color. Fruit broad, on a large receptacle, of a palish bright red or scarlet when mature,—often abortive. Rocky woodlands, and mountains: Canada to Georgia. Fl. June—July. Fr. July—August.

Obs. The fruit of this is pleasantly flavored,—but is rarely perfected under cultivation; and indeed is often abortive in its native localities. I have seen it, on the mountains, in August, bearing flowers and ripe fruit at the same time. It is rather a troublesome plant, when introduced into yards and gardens,-sending up numerous suckers.

† † Leaves (pinnately or pedately) 3-5-foliolate.

2. R. Idaeus, L. Stem suffruticose, erect, terete, not glaucous, hispid at base and somewhat prickly above; leaves pinnately 3- or 5-foliolate; leaflets rhomboid-ovate; flowers in paniculate corymbs; petals entire; carpels slightly rugose, finely pubescent, not pitted in drying. DC. Prodr. 2. p. 558. Fl. Cestr. p. 305.

IDA RUBUS. Vulgò—Antwerp Raspberry. Garden Raspberry.

Fr. Framboisier. Germ. Die Himbeerstaude. Span. Frambuéso.

Root creeping. Stem 3 to 5 feet high, branching, mostly hispid when young, especially towards the base—smoothish (or sometimes pubescent) and armed with slender recurved prickles above,—the hispid bark, below, exfoliating the second year. Lower leaves odd-pinnate by fives, the upper ones by threes; common petioles 1 to 3 or 4 inches long; leaflets 2 to 4 inches long, acuminate, unequally incised-serrate, smoothish and green above, clothed with a dense white cottony tomentum beneath. Petals white. Carpels incurved at apex, clothed with a very fine short dense pubescence, whitish, amber-colored, or purple, when mature. Gardens: cultivated. Native of Europe. Fl. May. Fr. July.

Obs. This species is much cultivated for its favorite fruit. The plant presents some varieties—particularly in the size and complexion of the fruit; and I am not sure that a nearly allied native species with red fruit (R. strigosus, Mx. Torr. & Gr.), which is found on our mountains, is not sometimes seen, and mistaken for it, in the gardens. It requires some attention to keep the plant from spreading unduly, in a mellow soil, by means of its rambling roots.

3. R. occidentalis, L. Stem suffruitoese, rather flaccid and leaning or probability and planeaus armed with required

3. R. OCCIDENTALIS, L. Stem suffruticose, rather flaccid and leaning or arched, terete, smooth, and glaucous, armed with recurved prickles; leaves pinnately 3- (rarely 5-) foliolate; leaflets lance-ovate; flowers in subumbellate corymbs; petals often emarginate; carpels smoothish, pitted in drying. Torr. & Gr. Fl. N. A. 1. p. 453. DC. Prodr. 2. p. 558. Fl. Cestr. p. 306.

Western Rubus. Vulgò—Wild or Black Raspberry. Thimble-berry.

Stem 5 to 8 or 10 feet long, sparingly branched, limber and often arching over so that the summit comes to the ground and takes root, mostly purplish and pruinose or covered with a fine bluish-white powder. Leaflets mostly in threes, 2 to 4 or 5 inches long, often with a long acumination and subcordate at base, smoothish above, clothed with a dense glaucous tomentum beneath. Petals white. Fruit dark purple, or nearly black (rarely whitish—alboque simillima Graculo!) when mature. Canada to Georgia and Missouri: Borders of woodlands, fence-rows, &c. Fl. May. Fr. July.

- Obs. The fruit of this is smaller and less esteemed than that of the preceding,—but is nevertheless sweet and agreeable. The plant, however, is generally treated as a weed, on all neat farms.
- § 2. Carpels forming an ovoid or oblong fruit, persistent on the somewhat juicy receptacle (Blackberry).
- 4. R. Canadensis, L. Stem fruticose, procumbent, armed with numerous short recurved prickles; branches assurgent, sparingly aculeate; leaves mostly 3-foliolate; stipules linear-lanceolate; leaflets rhomboid-oval; pedicels subsolitary, axillary or in terminal corymbs on the short leafy flowering-branches. Torr. & Gr. Fl. N. A. 1. p. 455.

R. trivialis. Pursh. Fl. Cestr. p. 308. not of Mx. (fide Torr. & Gr.) Canadian Rubus. Vulgò—Dewberry. Running Brier.

Stem 4 to 8 or 10 feet long, slender, trailing, smoothish,—often several from the same root running in different directions, and giving out numerous leafy pubcscent flowering-branches, which are nearly erect, and 2 to 4 or 6 inches long. Leaflets mostly in threes (sometimes pedately in fives), three fourths of an inch to an inch and half long. Flowers terminal and subterminal on the short branches, few and rather large, somewhat corymbose by the elongation of the lower axillary pedicels. Corolla white. Fruit oblong obtuse or often roundish, large (half an inch to near an inch in diameter), black when mature, very succulent and sweet. Rocky sterile soils, old fields, &c. Canada to Virginia. Fl. May. Fr. July.

Obs. Our Dewberry is a fine fruit, and is generally preferred before all the other Blackberries proper; but it is not the "Dewberry" of England,—which is the R. caesius, L. There has been some confusion respecting our plant, among the Botanists,—and Prof. DE CANDOLLE seems not to have had a clear conception of the species: But there is scarcely a farmer's boy, in Pennsylvania, who is not well acquainted with it,-from having often encountered its prickly trailing stems with his naked ankles, while heedlessly traversing the old fields where it abounds. On well-managed farms, however, the plant is becoming somewhat rare.

5. R. VILLOSUS, Ait. Stem fruticose, erect, angular, branching, armed with stout curved prickles; young branches and peduncles glandular-villous; leaves 3-foliolate or pedately 5-foliolate; stipules subulate; leaflets ovate or lance-oblong, villous beneath, the petioles and midribs aculeate; racemes elongated, many-flowered. Torr. & Gr. Fl. N. A. 1. p. 454. DC. Prodr. 2. p. 563. Fl. Cestr. p. 307. VILLOUS RUBUS. Vulge-Blackberry. Common Brier, Bramble.

Fr. La Ronce. Germ. Der Brombeerstrauch. Span. Zarza.

Root creeping. Stem 3 to 6 or 8 feet high, stout, ridged or angular and somewhat furrowed. Leaflets 2 to 3 or 4 inches long, mostly acute. Racemes rather large, sometimes leafy. Petals white. Fruit ovoid-oblong or cylindric—sometimes near an inch long.—changing from green to red or purplish, and finally black when mature. Old fields, thickets, and borders of woods: throughout the U. States. Fl. May. Fr. July—August.

Obs. Every one knows the common Brier. The root, both of this and the preceding, being moderately astringent, is a popular remedy for diarrhoea and mild dysentery. The ripe fruit affords a pleasant jam, which is also considered salutary in such cases. Even the knots which are formed on the branches, from the puncture of insects, were formerly carried by credulous simpletons, as a sort of amulet, or charm against the tooth-ache! The plant, nevertheless, is often something of a nuisance on our farms, from its tendency to spread, and take possession of neglected fields. There are several other species of Rubus in the U. States; but the foregoing are the chief of those which in any degree interest, or interfere much with the operations of the farmer,

TRIBE III. ROSEAE. Juss.

Calyx urceolate,—the tube contracted at the orifice, including the numerous distinct ovaries, at length becoming fleshy or baccate; the segments somewhat spirally imbricated in aestivation, often foliaceous at apex. Akenes numerous, crustaceous, hispid, included in and attached to the mner surface of the calyx-tube. Styles terminal or subterminal, somewhat exserted. Shrubby and prickly plants. Leaves alternate, mostly odd-pinnate (rarely reduced to a single leaflet); ettingle, expelly adapte to the petiole. stipules usually adnate to the petiole.

55. ROSA. Tournef. Endl. Gen. 6357. [Supposed from the Celtic, Rhos, red; the prevailing color of the flowers.] The Generic character is the same as that of the Tribe.

1. R. CAROLINA, L. Stem smooth, armed with stout recurved stipular prickles; leaflets mostly 5 or 7, oblong-oval or ellipticlanceolate, finely serrate, somewhat glaucous beneath; flowers corymbose. Torr. & Gr. Fl. N. A. 1. p. 458. DC. Prodr. 2. p. 605. Fl. Cestr. p. 311.

CAROLINA ROSA. Vulgò—Swamp Rose.

Stem 4 to 6 feet high, with numerous purple branches. Leaflets 1 to 2 inches long. Flowers mostly in terminal corymbs of 3 to 6 or 7 in a cluster. Petals red or purplish. Fruit (i. e. the fleshy calyx-tube) depressed-globose, a little glandular-hispid, dark red and shining when mature. Low swampy grounds, and thickets: Northern and Middle States. Fl. June—July. Fr. September.

Obs. This is often a troublesome plant, in wet meadows and low grounds,—forming unsightly thickets with other weeds, if neglected.

The native Roses of Pennsylvania are few in number, and not particularly handsome: but many beautiful species and varieties are every where cultivated, by persons of taste, for ornament. The R. setigera, Mx. sometimes called "Prairie Rose"—introduced from the West—is a fine showy species, and well adapted to train along walls, palisades, &c.—In the Southern States—especially in South Carolina—an introduced species—probably a native of China, though known by the name of the "Cherokee Rose" (R. laevigata, Mx. Torr. & Gr. with long flexible branches, and bearing large white flowers), is highly commended by Mr. Elliott. "In our rural economy," he says, "this plant will one day become very important. For the purpose of forming hedges, there is perhaps no plant which unites so many advantages." This Rose, however, will not stand our northern winters.

SUB-ORDER IV. POMEAE. Juss.

Ovaries 2 to 5 (rarely solitary), cohering with each other and with the thickened fleshy or pulpy calyx-tube,—each with one or few ascending seeds. Trees or shrubs. Leaves mostly simple, rarely pinnate.

56. CRATAEGUS. L. Endl. Gen. 6353.

[Greek, Kratos, strength; in allusion to the strength or firmness of the wood.]

Calyx-tube urceolate; limb 5-cleft. Petals 5. Stamens numerous.

Styles 1 or 2 to 5. Pome fleshy or somewhat farinaceous, containing 1 to 5 bony 1-seeded carpels. Thorny shrubs or small trees.

Leaves alternate, simple, often incised or lobed. Flowers mostly in terminal corymbs.

1. C. CRUS-GALLI, L. Leaves obovate-cuneate or lance-oblong, serrate, coriaceous, smooth and shining, subsessile; styles 2 or often solitary; fruit somewhat pyriform. Torr. & Gr. Fl. N. A. 1. p. 463. DC. Prodr. 2. p. 626. Fl. Cestr. p. 290. [Thorn.

COCK-SPUR CRATAEGUS. Vulgò-Cockspur Thorn. New Castle

Stem 10 to 15 or 20 feet high, much branched, and armed with sharp tapering thorns 2 to near 3 inches in length. Leaves 1 to $2\frac{1}{2}$ inches long, on short petioles. Corymbs terminal on short rigid spurs. Petals white. Fruit middling sized, reddish brown when mature. Thickets, fence-rows, hedges, &c. Canada to Florida. Fl. June. Fr. October.

- Obs. This shrub—of which there are two or three pretty distinct varieties—is, in my opinion, the best adapted for hedging, of any of the genus. It has been long used for that purpose, in the vicinity of New Castle, Del.—but I do not think they have heretofore managed it in the best mode. It should be well laid, or plashed, at the proper age, and kept neatly trimmed to a convenient size,—instead of permitting it to grow at random, and occupy so much space, as the old ones around New Castle have done.
- 2. C. CORDATA, Ait. Leaves deltoid-ovate and sub-cordate, acu-

minate, incised-serrate and somewhat 3-lobed, smooth, on slender and rather long petioles; styles 5; fruit depressed-globose. Torr. & Gr. Fl. N. A. 1. p. 467. DC. Prodr. 2. p. 628. Fl. Cestr. p. 293. Cordate Crataegus. Vulgò—Washington Thorn. Virginia Thorn.

Stem 15 to 20 feet high, much branched, and armed with slender tapering sharp thorns 1 to near 3 inches in length. Leaves 2 to 3 inches long, often 3-lobed like a leaf of the Red Maple. Corymbs terminating the young slender short branches. Petals white. Styles more or less united. Fruit small, bright reddish purple when mature. Banks of streams: Virginia to Georgia. Fl. June. Fr. October.

Obs. This species is the one which has been chiefly cultivated for hedging, in Pennsylvania,—where it was introduced, from the vicinity of Washington City, about the commencement of the present century. It makes a handsome hedge, but not a very substantial one; and, in my opinion, is decidedly inferior to the Cockspur Thorn, for that purpose. I have used it extensively; but have found it so subject to be broken into gaps, by thoughtless or reckless trespassers, that my hedges have been rather a source of vexation, than of satisfaction.

57. PYRUS. L. Endl. Gen. 6342. [The Latin name for the Pear.]

Calyx-tube urceolate; limb 5-lobed. Styles mostly 5, often united at base. Pome fleshy,—containing 2 to 5 cartilaginous or nearly membranaceous carpels. Seeds 2 in each carpel or cell; testa chartaceous or cartilaginous. Trees or shrubs. Leaves alternate, simple or pinnate. Flowers in terminal spreading cymes or corymbs.

1. P. COMMUNIS, L. Leaves simple, lance-ovate, slightly serrate, the upper surface smooth; peduncles corymbose; styles distinct; fruit turbinate, not umbilicate at base. DC. Prodr. 2. p. 633. Fl. Cestr. p. 297.

Common Pyrus. Vulgò—Pear. Pear-tree. Fr. Le Poirier. Germ. Der Birnbaum. Span. El Peral.

Stem 15 to 30 feet high, branching; branches virgate, rather erect, forming an oblong or conical top. Leaves 2 to 3 inches long; petioles 1 to 2 inches in length. Petals white. Fruit of various size (1 to 2 or 3 inches in diameter), fleshy or succulent, umbilicate at apex, obovoid, tapering to the peduncle, often somewhat curved or oblique: cultivated. Native of Europe. Fl. May. Fr. August—November.

Obs. Many varieties of this luscious fruit have been obtained, by long culture,—in which the French seem particularly to excel.

2. P. Malus, L. Leaves simple, ovate-oblong, serrate, the upper surface pubescent; peduncles subumbellate; styles subconnate; fruit depressed-globose or oblong, umbilicate at base. DC. Prodr. 2. p. 635. Fl. Cestr. p. 297.

APPLE PYRUS. Vulgò—Common Apple. Apple-tree. Fr. Le Pommier. Germ. Der Apfelbaum. Span. Manzáno.

Stem 15 to 25 or 30 feet high, branching; branches mostly spreading and often geniculate, forming a broad bushy top. Leaves 2 to 3 inches long; petioles an inch or more in length. Petals mostly pale red. Fruit of various size (1 to 3 or 4 inches in diameter). fleshy, umbilicate at both ends. Cultivated. Native of Europe. Fl. May. Fr. July—November.

Obs. The varieties of this valuable fruit are almost innumerable,—and every farmer provides more or less of an Orchard: but there is

far too little attention paid to the selection of the best. It is really wonderful to observe, how many worthless trees are permitted to cumber the ground, which might just as readily, and far better, be occupied by those which bear the choicest fruit.

3. P. CORONARIA, L. Leaves simple, broad-ovate, rounded or subcordate at base, incised-serrate and somewhat angulate-lobed, smoothish; peduncles corymbose; styles subconnate; fruit depressed-globose, umbilicate at base. Torr. & Gr. Fl. N. A. 1. p. 470. DC. Prodr. 2. p. 635. Fl. Cestr. p. 296.

Malus coronaria. Mill. Mx. Sylva, 2. p. 67. Icon, tab. 65.

CROWN PYRUS. Vulgò-Crab Apple. Sweet-scented Crab-tree.

Stem 10 to 15 feet high, branching; branches spreading, rugged with short spurs, forming a rather bushy top. Leaves 2 to 3 inches long; petioles half an inch to an inch and half in length. Flowers large and fragrant; petals pale rose red. Fruit rather small (about an inch in diameter), umbilicate at both ends, fleshy but firm and hard, smooth, pale greenish yellow and very fragrant when mature—yet extremely acid. Borders of woodlands, road-sides, &c. New York to Louisiana. Fl. May. Fr. September.

Obs. This native Apple is now becoming scarce, in the older settlements of Pennsylvania. In former times, the ripe fruit was sought after, by notable Housewives, for the purpose of making Preserves.

58. CYDONIA. Tournef. Endl. Gen. 6341. [The name of a city of Crete,—whence it was obtained.]

Calyx-tube subturbinate; limb 5-lobed,—the lobes sometimes foliaceous. Styles 5. Pome fleshy, containing 5 cartilaginous carpels. Seeds several in each carpel or cell, covered with mucilaginous pulp. Small trees or shrubs. Leaves alternate, simple, entire or serrate. Flowers large, solitary or subumbellate.

1. C. VULGARIS, *Pers.* Leaves oblong-ovate, obtuse at base, very entire, tomentose beneath; fruit sub-turbinate, tomentose. *DC. Prodr.* 2. *p.* 638. *Fl. Cestr. p.* 298.

COMMON CYDONIA. Vulgò-Quince. Quince-tree.

Fr. Le Cognassier. Germ. Der Quittenbaum. Span. Membrilléro.

Stem 8 to 12 or 15 feet high, with spreading branches. Leaves 2 to 3 inches long; petioles about half an inch long. Flowers terminal, solitary. Petals reddish white. Stamens in a single series. Fruit 2 inches or more in diameter, somewhat obovoid, umbilicate at apex, abruptly tapering or produced at base, yellow when mature. Cultivated. Native of Southern Europe. Fl. May. Fr. September—October.

Obs. The fruit of this is chiefly used for making preserves,—for which it is excellent. It is supposed to be the golden apple of the Hesperides, so celebrated in ancient fable; but if the Orange had then been known, it would doubtless have been esteemed a more precious fruit, by "the Western Maidens." The C. Japonica, Pers. (Pyrus Japonica, Willd.) is well known for its beauty as a flowering shrub, in the gardens; but the fruit—though remarkably fragrant—is very hard and acerb, and of little value.

ORDER LIV. ONAGRACEAE. Juss. Lindl.

Herbs, or rarely shrubby plants. Leaves alternate or opposite, not dotted nor stipulate. Flowers usually tetramerous (i. e. composed of 4 pieces or parts), showy. Calyx tubular,—the tube adherent to the ovary, and usually produced beyond it. Petals 4 (rarely 3 or 6—occasionally wanting), and the Stamens as many or twice as many, inserted into the throat of the calyx. Ovary commonly 4-celled; styles united; stigmas 4, or united in one. Fruit mostly capsular, with a loculicidal dehiscence,—sometimes baccate. Seeds destitute of albumen.

An Order containing some plants (such as the *Fuchsias*) which are interesting for their beauty,—but none of Agricultural value.

TRIBE I. ONAGREAE. DC.

Petals as many (sometimes wanting), and Stamens mostly twice as many, as the lobes of the calyx (which are usually 4), regular. Pollen connected by cobweb-like threads. Ovules mostly indefinite. Fruit capsular, or rarely dry and indehiscent. Herbs or suffruticose plants.

SUB-TRIBE 2. OENOTHEREAE. Torr. & Gr.

Calyx deciduous from the summit of the ovary after flowering. The Stamens opposite the petals, sometimes imperfect. Seeds naked (i. e. not comose). Leaves alternate.

59. OENOTHERA. L. Endl. Gen. 6115. [Greek, Oinos, wine, and thereus, to hunt; the roots being incentives to wine-drinking.]

Calyx of 4 membranaceous sepals, partially cohering above, and united below into a long 4-sided or 8-ribbed tube; limb reflexed, and, with a portion of the tube, deciduous. Petals 4. Stamens 8, erect or declined. Ovary 4-celled; stigma 4-lobed (rarely sphaerical). Capsule more or less oblong and quadrangular, 4-valved, many-seeded,—the placenta either persistent in the axis or cohering with the dissepiments. Flowers axillary, solitary or in terminal spikes—often vespertine.

1. OE. BIENNIS, L. Stem erect, somewhat branched, pilose and roughish; leaves ovate-lanceolate, repand-dentate; capsule obtusely 4-angled, subsessile. Torr. & Gr. Fl. N. A. 1. p. 492. DC. Prodr. 3. p. 46. Fl. Cestr. p. 240.

BIENNIAL OENOTHERA. Vulgò-Evening Primrose. Night Willow-

Root biennial. Stem 2 to 5 or 6 feet high, rather stout, hairy and usually greenish. Leaves 2 to 6 inches long, sessile or subsessile. Flowers large, in a terminal leafy spike. Calyx colored,—the tube much longer than the ovary. Petals yellow. Ovary oblong; style rather longer than the corolla; stigmas 4, cruciate, elongated, linear. Capsule obscurely 4-sided, an inch to an inch and half long, smoothish splitting into 4 sub-linear valves, with the dissepiments in the middle (loculicidal), and the placenta persistent in the axis. Fields, fencerows, &c. throughout the U. States. Fl. June—Sept. Fr. Aug.—Octo.

Obs. This coarse plant is intitled to the notice of the farmer, merely in consequence of being a common, rather conspicuous, and worthless weed, in pastures, and on the borders of cultivated fields. A variety, of yet stouter growth, and very large flowers (Oe. grandistora, of some authors), is often tolerated in Gardens. There is another species (Oe. fruticosa, L. of smaller size, with more slender yet more rigid stems), which is quite common in old fields; but is scarcely of sufficient importance—even as a weed—to claim a place in this work.

ORDER LIX. GROSSULACEAE. DC. Mirb.

Small shrubs, often spinose or prickly. Leaves alternate, somewhat in fascicles, palmately lobed and veined, often sprinkled with resinous dots. Flowers in racemes or small clusters. Calyx-tube adherent to the ovary, and more or less produced beyond it,—the limb 5-lobed, sometimes colored. Petals 5, small. Stamens 5. Ovary with 2 parietal placentae; styles more or less united. Fruit

a berry, crowned with the shrivelled remains of the flower. Seeds mostly numerous; embryo minute, in hard albumen.

A small Order,—and of little or no interest beyond the genus here noticed.

60. RIBES. L. Endl. Gen. 4682. [An ancient Arabic name, -of obscure meaning.]

The Generic character the same as that of the Order.

† Stems more or less aculeate.

1. R. Uva-crista, L. Leaves obtusely 3 to 5-lobed, somewhat villous beneath and on the petiole; peduncles mostly 1-flowered, bracteate; sepals reflexed; ovary and style villous; berry hairy or smooth. DC. Prodr. 3. p. 478. Fl. Cestr. p. 161.

Var. sativum, DC. l. c. Vulgi-Goose-berry.

Fr. Vrai Groseillier. Germ. Die Stachelbeere. Span. Uva espina.

Stem 2 to 3 feet high, diffusely branching. Leaves 3 of an inch to an inch and half in length, and as wide as long, incisely lobed and dentate; petioles generally much shorter than the leaves, often margined. Pedunctes solitary or in pairs, often bracteate near the middle. Petals pale greenish-yellow. Berries solitary, pendulous, large, oval, of a greenish amber color when mature. Gardens: cultivated. Native of Europe. Fl. April. Fr. July.

Obs. This species is much cultivated, for its fine fruit: but (in Pennsylvania, at least) it often fails to perfect the fruit, from some eause not well understood. Judging from specimens which I have seen, it appears to succeed much better, in England,—and the fruit attains to a much larger size, in that country.

† † Stems not aculeate.

2. R. Rubrum, L. Leaves obtusely 3 to 5-lobed, smooth above, pubescent beneath; racemes pendulous, nearly smooth; ealyx rotate, the segments rounded. Torr. & Gr. Fl. N. A. 1. p. 550. DC. Prodr. 3. p. 481. Fl. Cestr. p. 161.

RED RIBES. Vulgò-Red Currant.

[roja.

Fr. Groseillier rouge. Germ. Gemeine Johannisbeere. Span. Ribes

Stems numerous, slender. sparingly branched, 2 to 4 feet high. Leaves 1 to 2 or 3 inches long, and rather wider than long, unequally incised-dentate; petioles about as long as the leaves. Racemes produced from lateral buds distinct from the leaves: bracts ovate. Petals greenish yellow, minute. Berries globose, red (rarely whitish or pearl-color) when mature. Gardens: cultivated. Native of Europe and the northern regions of America. Fl. April. Fr. June—July.

Obs. This is so easily cultivated, and is so constantly productive, that it is to be found in almost every garden. The fine acid fruit yields a favorite jelly, for the table; and even the green berries are much used by the pastry cook.

3. R. NIGRUM, L. Leaves 3 to 5-lobed, sprinkled with yellow resinous dots beneath; racemes loose, pilose; calyx tubular-campanulate. DC. Prodr. 3. p. 481. Fl. Cestr. p. 161.

BLACK RIBES. Vulgo-Black Current.

Fr. Cassis. Germ. Schwarze Johannisbeere. Span. Ribes negra.

Stems numerous, slender, 3 to 5 feet high. Leaves 2 to 3 inches long, and nearly as wide as long, dentate-serrate, pubescent beneath; petioles shorter than the leaves. Racemes somewhat pendulous, generally with a distinct single-flowered peduncle at base; bracts subulate. Petals pale yellowish green (sometimes changed into stamens or staminodia). Berries roundish-ovoid, purplish black when mature. Gardens: cultivated. Native of Northern Europe. Fl. April. Fr. June—July.

Obs. This is sometimes found in gardens; but the fruit being of a rather insipid or flat sweetish taste, it is not much esteemed. It however affords a jelly, which is a popular and useful remedy for sore throat, colds, &c. There are numerous other species of this genus; but, so far as I know, the foregoing are all that are cultivated (and perhaps all that are worth cultivating) for the sake of the fruit. The R. aureum, Pursh, or "Missouri Currant"—a species of modern discovery, with a long tubular calyx-is much admired for the clove-like fragrance of its early flowers, - and is now very common among the ornamental shrubbery of yards and gardens.

ORDER LXIII. CUCURBITACEAE. Juss.

ORDER LXIII. CUCURBITACEAE. Juss.

Herbs, with succulent stems, and climbing by means of tendrils. Leaves alternate, palmately veined or lobed. Flowers monoicous or dioicous (rarely perfect). Calyx of 4 or 5 (rarely 6) sepals, united into a tube, and in the fertile flowers adherent to the ovary. Petals as many as the sepals, more or less united, and cohering with the calyx. Stamens 5 or 3, inserted into the base of the corolla or calyx, distinct or variously united by their filaments and long, mostly tortuous, anthers. Ovary usually 2 to 5-celled,—the thick fleshy placentae often filling the cells, or carried back so as to reach the walls of the pericarp; the dissepiments often disappearing during its growth: stigmas thick, dilated or fringed. Fruit usually fleshy, with a firm (sometimes a ligneous and occasionally a membranous) rind. Seeds flat, often arillate, destitute of albumen; cotyledons foliaceous. This Order—so well known for its culinary products—contains some which are possessed of active medicinal properties (such as the Colocynth, of the shops—Cucumis Colocynthis, L.); but few, if any, of Agricultural interest, beyond those here mentioned.

those here mentioned.

TRIBE II. CUCURBITEAE. DC.

Tendrils lateral, stipular (supposed to be transformed stipules.) Flowers monoicous (rarely dioicous or perfect).

61. LAGENARIA. Ser. Endl. Gen. 5136. [Greek, Lagenos, a flagon or bottle; from the shape of the fruit.]

Calyx campanulate or subturbinate, 5-toothed,—the segments subulate-lanceolate, shorter than the tube. Petals 5, obovate, inserted within and beneath the margin of the calyx. Stamens 5, triadelphous, the fifth one free. Stigmas 3, subsessile, thick, 2-lobed, granular. Fruit at first fleshy and pubescent, finally with a smooth ligneous rind. Seeds compressed, obovate, somewhat 2-lobed at apex, the margin tumid.

1. L. VULGARIS, Ser. Softly pubescent; stem climbing; leaves roundish-cordate, acuminate, denticulate, with 2 glands at base; fruit clavate-ventricose. Torr. & Gr. Fl. N. A. 1. p. 543. DC. Prodr. 3. p. 299. Fl. Cestr. p. 551.

Common Lagenaria. Vulgo-Calabash. Bottle Gourd. Fr. Calebasse. Germ. Der Kuerbiss. Span. Calabaza.

Whole plant somewhat viscid, and emitting a fetid musky odor. Stem 10 to 15 or 20 feet long, slender, branching, climbing by tendrils which are 2 to 4-cleft. Leaves 4 to 6 or 8 inches long; petioles 2 to 6 inches long. Flowers axillary, on long peduncles; corolla white, with green nerves and veins. Fruit 12 to 18 inches long, and 4 to 6 or 8 inches in diameter, unequally bi-ventricose, finally nearly hollow or partially filled with the loose dry suberose placentae,—the rind yellowish or pale brown, thin and hard. Seeds in a dry membranous arillus. Gardens, and Lots: cultivated. Native of the tropical regions. Fl. July—August. Fr. September—October.

Obs. The thin firm woody shell, of the fruit, affords a very convenient kitchen utensil,—and the plant is sometimes cultivated for the sake of that fruit, by cottagers and farmers who cannot afford, or do not choose, to purchase more costly utensils.*

62. CUCUMIS. L. Endl. Gen. 5137. [Derived from the Celtic, Cucc, a hollow vessel,—according to De Theis.]

Calyx tubular-campanulate, 5-toothed,—the teeth subulate, scarcely as long as the tube. Petals 5, nearly distinct and but slightly adnate to the calyx. Stamens 5, triadelphous. Stigmas 3, subsessile, thick, 2-lobed. Fruit fleshy, indehiscent. Seeds white, lance-oblong, compressed, acute at base and on the margin.

1. C. Melo, L. Stem prostrate; leaves subcordate, obtuse, somewhat angled, the angles rounded; fertile flowers perfect; fruit oval or subglobose, torulose. DC. Prodr. 3. p. 300. Fl. Cestr. p. 552.

Melon Cucumis. Vulgò-Musk Melon. Cantaleupe.

Fr. Melon. Germ. Die Melone. Span. Melon almizcleño.

Hirsute and roughish. Root annual. Stem 5 to 8 or 10 feet long, sparingly branched; tendrils simple. Leaves 3 or 4 inches long, and rather wider than long; petioles 2 to 3 inches in length. Flowers axillary, on short peduncles. Corolla yellow. Fruit 4 to 6 or 8 inches in diameter, often longitudinally ridged (torulose),—the flesh, when mature, yellowish, succulent, and of a saccharine spicy flavor. Gardens, and Lots: cultivated. Native of Asia. Fl. June—July. Fr. August.

- Obs. The fruit of this—of which there are several varieties—is a great favorite with many persons,—and it is often cultivated, in Pennsylvania; but the best specimens are grown in the warm sandy soil of New Jersey, and the Southern States.
- 2. C. Sativus, L. Stem procumbent; leaves subcordate and angulate-lobed, the terminal lobe prominent; fruit oblong, obscurely and obtusely trigonous, scabrous when young, finally smoothish. DC. Prodr. 3. p. 300. Fl. Cestr. p. 552.

Cultivated Cucumis. Vulgà-Cucumber.

Fr. Le Concombre. Germ. Die Gurke. Span. Pepino.

Rough and hispid. Root annual. Stem 6 to 12 or 15 feet long, somewhat branching; tendrits simple. Leaves 3 to 5 or 6 inches long, and nearly as wide as long, somewhat 5-angled and lobed; petioles 2 to 4 inches in length. Flowers axillary, on short peduncles; corolla yellow. Fruit 6 to 12 inches long and 2 to 3 inches in diameter, rough with bristle-pointed tubercles when young, smoothish and tawny yellow when mature. Gardens, and Lois: cultivated. Native of Tartary and the East. Fl. June—September. Fr. August—October.

- Obs. Known to every one,—and universally cultivated for the young or green fruit. The young fruit (sometimes called Gherkins) is much used for Pickles. In the Middle States, the popular time for planting the seeds, is "the first day of May, before sunrise."
- 3. C. Anguria, L. Stem prostrate, slender; leaves palmate-lobed and sinuate, cordate at base; fruit sub-globose or oval, echinate. DC. Prodr. 3. p. 301. Fl. Cestr. p. 553.

Vulgo-Prickly Cucumber. Jerusalem Cucumber.

^{*}WILLDENOW seems to have had a high opinion of its value, in domestic economy. Under the head of "Usus." he mentions "Lagenae, cochlearia, infundibula, pilei. innumeraque alia utensilia.' It might serve all these purposes, in a primitive state of society; but our people have generally got rather past that.

Hirsute. Root annual. Stem 3 to 6 feet long, branching; tendrils simple. Leaves 3 or 4 inches in length, deeply sinuate-lobed; petioles 1 or 2 inches long. Flowers greenish yellow, on short axillary peduncles. Fruit usually about an inch and half long, oval, muricate, green. Gardens: cultivated. Native of Jamaica. Fl. July—August. Fr. September.

Obs. Occasionally cultivated for the young fruit,—which is used for Pickles.

63. CITRULLUS. Neck. Endl. Gen. 5131. [From Citrus, an Orange; the pulp being of an Orange red.]

Calyx deeply 5-cleft,—the segments linear-lanceolate. Petals 5, connected at base, adnate to the bottom of the calyx. Stamens 5, inserted on the base of the corolla, triadelphous. Style cylindric, trifid; stigmas convex, reniform-cordate. Fruit sub-globose, fleshy, the placentae mostly very succulent. Seeds numerous, colored, obovate-oblong, compressed, truncate at base and obtuse on the margin.

1. C. VULGARIS, Schrad. Stem prostrate, rather slender; leaves somewhat 5-lobed, the lobes obtusely sinuate-pinnatifid, bluish glaucous beneath; flowers solitary, pedunculate, with a single bract; fruit globose or oval, very smooth, stellate-maculate. Walp. Repert. 2. p. 199.

Cucumis Citrullus, Ser. DC. Prodr. 3. p. 301. Fl. Cestr. p. 553. Common Citrullus. Vulgò—Water Melon.

Fr. Melon d'eau. Germ. Die Wasser Melone. Span. Sandia.

Plant hairy. Root annual. Stem 8 to 12 or 15 feet long, angular, somewhat branching; tendrils branched. Leaves 3 to 5 or 6 inches long, ovate in their outline: petioles 2 to 3 inches long, generally erect. Flowers axillary, on hairy peduncles an inch or more in length. Corolla pale greenish yellow. Fruit 10 to 20 inches long, globose or oval, with a firm fleshy rind, and, when mature, with a tender sweet watery pulp within which is usually purple or reddish orange-colored (sometimes nearly white). Seeds black or purplish brown. Gardens, and fields: cultivated. Native of India, and Africa. Fl. June—Aug. Fr. August—September.

Obs. This plant—so well known for its delicious fruit—is extensively cultivated,—but succeeds best in the sandy soils along the Atlantic coast, or on the alluvial banks of our Western waters.—There is a nearly allied plant, often seen in gardens, which bears a considerably different fruit—known by the name of "Citron," the firm rind of which is used in making "Sweet meats" or Preserves. The flesh is very firm, and the centre does not become red, tender nor watery, like the common Water Melon: yet the whole aspect of the plant, and external appearance of the fruit, so closely resemble this species, that I suppose it may be nothing more than a variety: perhaps the var. Pasteca, Ser. DC.

64. CUCURBITA. L. Endl. Gen. 5138.

[The Latinized Celtic name for a Gourd or hollow vessel; applied to this genus.] Corolla campanulate,—the petals coalesced with each other and with the calyx. Staminate Fl. Calyx hemispherical-campanulate. Stamens 5, triadelphous and syngenesious; anthers straight and parallel, with the base and apex abruptly curved. Pistillate Fl. Calyx obovoid-clavate, contracted to a neck above the ovary, always circumseissed below the limb after flowering. Stigmas 3, thick,

2-lobed. Fruit fleshy, or sometimes becoming subligneous. Seeds white, convexly compressed, obovate, the margin scarcely tumid. Stems procumbent. Leaves cordate.

1. C. Pepo, L. Leaves obtusely cordate, somewhat 5-lobed; fruit subglobose oblong or clavate, smooth, always fleshy. DC. Prodr. 3. p. 317. Fl. Cestr. p. 555.

Vulgò-Pumpkin. Fr. La grosse Citrouille. Potiron.

Rough and hispid. Root annual. Stem 10 to 20 or 30 feet long, sparingly branched; tendrils branched. Leaves 9 to 15 or 18 inches in length; petioles 3 to 6 or 8 inches long. Flowers yellow, large, axillary,—the staminate ones often solitary on a long peduncle. Fruit of various forms, sizes and colors,—the flesh of the rind usually yellow, the cavity loosely filled with a yellow stringy pulp.—Fields, and Lots: culturated (usually with Indian Corn, in Pennsylvania). Native of the East. Fl. July. Fr. October.

- Obs. Extensively cultivated for its fruit,—of which there are many varieties; some of them attaining to an enormous size (2 feet or more in diameter),—but these are not so valuable. The better sorts are often used at table,—affording the celebrated Pumpkin Pie of New England; and the coarser varieties are esteemed for feeding Stock. When growing in the immediate vicinity of Squashes, the fruit of this species is liable to be converted into a Hybrid, of little or no value. I have had a crop of Pumpkins totally spoiled, by inadvertently planting Squashes among them,—the fruit becoming very hard and warty—unfit for the table, and unsafe to give to cattle.
- 2. C. Melopepo, L. Leaves subcordate, somewhat 5-angled; fruit mostly orbicular and much depressed, or clypeate, with the margin often tunid and torulose, at first fleshy, finally subligneous. DC. Prodr. 3. p. 317. Fl. Cestr. p. 555.

Vulgò-Round Squash. Cymling. Fr. Bonnet de Prêtre. Pastisson.

Hirsute. Root annual. Stem 8 to 12 or 15 feet long, somewhat branching; tendrils branched,—sometimes transformed or developed into imperfect leaves. Leaves 6 or 8 inches long; petioles as long as the leaves. Flowers yellow, rather large, pedunculate. Fruit of various colors (mostly yellow, pale green, or mottled), smooth or sometimes warty,—the rind finally hard and woody, containing a loose stringy pulp. Fields, and Gardens: cultivated. Native country uncertain. Fl. July. Fr. October.

Obs. Cultivated for the young fruit,—which is generally esteemed, as a vegetable sauce. There are numerous varieties of the fruit—and of various qualities. There is also a kind of stunted variety of the plant, with a short bushy stem, which is often a prolific bearer.

3. C. VERRUCOSA, L. Leaves deeply 5-lobed, the middle lobe narrowed at base; fruit elliptic-oblong, or clavate and often arcuate, verrucose. DC. Prodr. 3. p. 317. Fl. Cestr. p. 556. Also? C. subverrucosa. Willd. DC. l. c.

WARTY CUCURBITA. Vulgò-Warted Squash. Long-necked Squash.

Hirsute. Root annual. Stem 10 to 15 feet long, somewhat branching; tendrils branched. Leaves 8 to 10 inches long; petioles nearly as long as the leaves. Flowers yellow, rather large. Fruit varying from oblong to obovoid and clavate, often much elongated and curved, rough with warts or obtuse tubercles, and of various colors, or shades, from yellow to green and white, finally hard and subligneous or bony. Lots, and Gardens: cultivated. Native country unknown. Fl. July. Fr. October.

Obs. Cultivated as the preceding (to which it is nearly allied), and for the same purposes. Both species are apt to produce worthless Hybrids among Pumpkins, when growing near them; and therefore should never be planted in their immediate vicinity.

ORDER LXV. SAXIFRAGACEAE. Juss. DC.

Herbs or shrubs. Leaves alternate or opposite, sometimes stipulate. Inflorescence various, often cymose. Sepals 4 or 5, persistent, more or less connected with each other, and often more or less adherent to the ovary. Petals as many as the sepals—rarely wanting. Stamens as many—or more commonly twice as many (rarely fewer, or 3 or 4 times as many)—as the petals, and inserted with them into the throat of the calyx. Ovaries mostly 2 (sometimes 3 or 4), usually cohering at base and distinct at summit. Fruit capsular, mostly with septicidal dehiscence. Seeds numerous; embryo straight, in the axis of fleshy albumen.

An unimportant Order, to the Agriculturist,—though some species of Hydrangea and Philadelphus are admired, and cultivated, as Ornamental Shrubs.

SUB-ORDER I. SAXIFRAGEAE. DC. Torr. & Gr.

Herbs. Petals imbricated in aestivation. Capsule (when the carpels are united) either 2-celled with the placentae in the axis, or 1-celled with parietal placentae.

65. SAXIFRAGA. L. Endl. Gen. 4634.

[Latin, Saxum, a rock, and frangere, to break; the plant often growing in clefts of rocks.]

Calyx 5-parted, often adnate to the base of the ovary. Petals 5, entire. Stamens mostly 10 (rarely 5). Capsule usually 2-beaked,or rather consisting of 2 acuminate connate carpels, opening between the diverging beaks. Radical leaves usually rosulate; cauline ones mostly alternate.

1. S. Pennsylvanica, L. Leaves all radical, oblanceolate or oval, rather acute, obsoletely denticulate, tapering at base to a broad margined petiole; scape leafless, striate, pubescent; cymes in an oblong panicle; flowers pedicellate; petals linear-lanceolate, scarcely twice as long as the calyx; ovary nearly free. Torr. & Gr. Fl. N. A. 1. p. 571. DC. Prodr. 4. p. 39. Fl. Cestr. p. 270.

Pennsylvanian Saxifrage. Vulgò—Tall Saxifrage.

Root perennial, with coarse fibres. Leaves 4 to 6 or 8 inches long, thin and smoothish, somewhat ciliate. Scape 2 to 3 (occasionally 4 or 5) feet high, rather stout, sulcate-striate. Cymes at first in conglomerate heads—finally rather loose, in an oblong open panicle 12 to 18 inches in length,—the branches glandular-pubescent and somewhat viscid. Petals greenish yellow, small. Stamens persistent; anthers orange-colored with a tinge of purple. Seeds angular, dark brown. Swampy meadows, and low grounds: Canada to Virginia and Ohio. Ft. May. Fr. July.

Obs. There are numerous species of Saxifrage on this continent (a white-flowered one,—viz. S. Virginiensis, Mx. is very common on rocky banks, in the wood-lands of the middle States): But this is the only one which, by its size, and frequent occurrence in wet meadows, is likely to attract the notice of the farmer. It is a mere eveed; but not difficult to get rid of, by draining and proper attention.

The Heuchera Americana, L. or Alum-root—a plant belonging to this order-is frequent along fence-rows and borders of rich woodlands,—and its astringent root has been of some notoriety as an Indian remedy for cancerous sores: But it is scarcely of sufficient prominence, on the farm, to command the attention of the Agriculturist.

ORDER LXVII. UMBELLIFERAE. Juss.

Herbs. Stems often fistular and furrowed. Leaves alternate, simple but generally much dissected,—the petioles more or less sheathing or dilated at base. Fiowers in umbels; umbels mostly compound and involucrate. Calax intirely adherent to the surface of the 2-carpelled ovary; the limb reduced to a mere border or to 5 small teeth. Petals 5, distinct, with inflected points, inserted together with the 5 stamens on a disk which crowns the ovary. Ovary 2-celled, with a solitary suspended ovule in each cell or carpel: Styles 2,—their bases often united and thickened (forming a Stylopodium). Fruit dry, consisting of 2 single-seeded indehiscent akene-like carpels (called Mericarps, by DC.), which adhere by their faces (or commissure) to a slender common axis (Carpophore),—at length separating from each other, and suspended from the summit of the adhere by their faces (or commissure) to a slender common axis (Carpophore),—at length separating from each other, and suspended from the summit of the axis or Carpophore: the Carpels are usually marked with a definite number of longitudinal ribs (juga), which are sometimes dilated into wings; the intervals or channels between the ribs—as also the commissure—often contain, within the pericarp and parallel with the ribs, one or more linear receptacles of aromatic oil,—which receptacles are called Vittae or fillets. Seed usually coherent with the carpel; embryo minute, at the base of horny albumen.*

This large and important Order comprises about 200 genera,—and is remarkable for the aromatic and generally harmless character of the fruit—while the herbage (including root, stem and leaves,) is often highly deleterious. The species best known on the farm, and in the kitchen-garden, are here noticed. Some medicinal gums are furnished by this Order,—such as Asafoetida, Galbanum, and perhaps Ammoniae.

num, and perhaps Ammoniac.

SUB-ORDER I. ORTHOSPERMAE. DC.

Inner face of the seed and albumen straight and flat or plane (i. e. neither involute at the sides, nor incurved from base to apex).

A. Carpels few-ribbed: i. e. with primary ribs only.

TRIBE IV. AMMINEAE. Koch.

Fruit laterally compressed or didymous. Carpels with 5 equal filiform or sometimes slightly winged ribs,—the lateral ones marginal. Vittae various.

† Calyx with the limb dentate.

66. CICUTA. L. Endl. Gen. 4391.

[A Latin name for the hollow stem, or internodes, of plants; applied to this genus.] Calyx with 5 acuminate segments. Petals roundish-obcordate by the inflection of the apex. Fruit roundish. Stylopodium depressed. Carpels with 5 flattish equal ribs. Channels filled with single vittae. Commissure with 2 vittae. Carpophore 2-parted. Involucre 0 or few-leaved. Involucels many-leaved. Sub-aquatic herbs. Stem terete, smooth, fistular. Leaves tripinnately or triternately dissected.

1. C. MACULATA, L. Stem spotted or streaked; leaves bi- or triternately divided,—the segments lanceolate, mucronately serrate; nmbels terminal and axillary. Torr. & Gr. Fl. N. A. 1. p. 610. DC. Prodr. 4. p. 99. Fl. Cestr. p. 185.

SPOTTED CICUTA. Vulgo-Spotted Cow-bane. Water Hemlock.

*The longitudinal ribs, on the carpels, are distinguished into primary and secondary. The primary ones (10 in number on the 2 carpels—or 5 on each.) are pretty constant and more or less conspicuous,—representing the midribs and sutures (or lines of junction) of the 5 sepals, which, by their union, form the tube of the calyx and coat of the fruit. The 5 ribs which correspond with the midribs of the 5 sepals, are termed carinal ribs, and their extension at apex forms the 5 calyx-teeth: the 5 which represent the sutures of the sepals, are called sutural ribs,—and they, of course, terminate at the sinuses between the calyx-teeth. Alternating with these primary ribs, there is sometimes a development of secondary ones,—which Prof. De Candolle regards as representing lateral nerves (i. e. one on each side of the midrib) of the united sepals. These ribs and vittae, together with the form or manner of compression of the fruit. ribs and vittae, together with the form or manner of compression of the fruit, afford important aid in determining the generic character of the plants of this remarkably natural family.

Root perennial with thick oblong fleshy fibres. Stem 4 to 6 feet high, branching, dark purple, or striate with green and purple or brown. Leaves smooth,—the lower ones on rather long petioles, triternately dissected with the terminal division mostly in fives; segments or leaflets 2 to 3 inches long, petiolulate, penninerved,—the nerves (as remarked by Dr. Bigelow,) running to the notches of the serratures instead of the points. Umbels spreading; rays slender. Involucte 0 or 1 or 2 linear leaflets. Involucels of 5 or 6 small lance-linear leaflets. Petals white. Fruit nearly round; ribs rather broad; channels reddish brown or dark purple, filled with aromatic oily matter. Swampy grounds, and margins of rivulets: throughout the U. States. Fl. July. Fr. September.

Obs. The mature fruit of this plant has a strong anisate odor. The root is an active poison; and the lives of children, and others, are often endangered and sometimes destroyed by eating it, in mistake for that of the Sweet Cicely (Osmorhiza longistylis, DC.)—an aromatic plant of the same natural family. The herbage is also said to be destructive to Cattle, when eaten by them: all which goes to show the propriety of possessing sufficient Botanical knowledge to be able to identify the plant—and likewise the necessity of extirpating it from all meadows and pastures.

† † Calyx with the limb obsolete.

67. APIUM. Hoffm. Endl. Gen. 4393. [From the Celtic, Apon, water; near which it naturally grows.]

Petals roundish, with a small inflexed apex. Fruit roundish. Stylopodium depressed. Carpels with 5 filiform equal ribs. Channels with single vittae, the outer ones often with 2 or 3 vittae. Carpophore undivided. Involuce 0. Involucels 0. Stems sulcate. Leaves pinnately dissected.

1. A. GRAVEOLENS, L. var. dulce, DC. Lower leaves on very long petioles; segments cuneate, lobed and incised-dentate at apex. DC. Prodr. 4. p. 101. Fl. Cestr. p. 187.

STRONG-SCENTED APIUM. Vulgà-Celery.

Fr. Céléri. Germ. Der Celeri. Span. Apio hortense.

Whole plant glabrous. Root biennial, fusiform. Stem 2 to 3 feet high, branching. Radical leaves on stout succulent channelled petioles 6 to 12 inches or more in length: and which are green. or often purplish, when not artificially blanched; stem leaves on short petioles. Umbels terminal and axillary,—the axillary ones often subsessile; rays unequal, spreading. Petals greenish white. Fruit nearly orbicular. Gardens: cultivated. Native of Europe. Fl. July. Fr. September.

Obs. This is much cultivated for the sake of the succulent spicy petioles of the radical leaves,—which are used as a salad: But in order to be rendered palatable—or even eatable—they require to be blanched or etiolated by the exclusion of light,—which is usually effected by planting in trenches and covering them with earth. The var. rapaceum, DC. or Turnep-rooted Celery, is also cultivated,—though not so commonly.

68. PETROSELINUM. Hoffm: Endl. Gen. 4394.
[Greek, Petra, rock, and Selinum; Rock Selinum,—from its native habitat.]
Petals roundish, incurved, scarcely emarginate by the inflection of the narrow apex. Fruit ovate. Stylopodium conical, short. Carpels with 5 equal ribs. Channels with single vittae. Commissure with 2 vittae. Carpophore 2-parted. Involuce few-leaved. Involucels many-leaved. Stems somewhat angular. Leaves decompound.

1. P. SATIVUM, Hoffm. Segments of the lower leaves cuneate-ovate, trifid and incised-dentate,—of the upper ones linear-lanceolate and nearly entire; involucels subulate. DC. Prodr. 4. p. 102. Fl. Cestr. p. 188.

Cultivated Petroselinum. Vulgò-Parsley.

Fr. Persil. Germ. Die Petersilie. Span. Perexil.

Plant smooth. Root biennial. Stem 2 to 4 feet high, striate with green and yellowish stripes, branched. Leaves shining green, the lower ones much dissected. Umbels terminal and axillary, pedunculate. Involuce of a single leaflet (or sometimes 2 or 3), linear. Involucels of 5 or 6 short subulate leaflets. Petals greenish white. Fruit ovate. Gardens: cultivated. Native of Eastern Europe. Fl. June. Fr. August.

Obs. Cultivated for the pleasant-flavored leaves which are used in culinary processes. The root has long been a popular diuretic. The var. crispum, or Curled Parsley—with the segments of the lower leaves broader, and curled on the margin—is also frequent in kitchen gardens.

69. CARUM. Koch. Endl. Gen. 4406. [Said to be derived from Caria,—the native country of the plant.]

Petals regular, obovate, emarginate by the inflection of the apex. Stylopodium depressed; styles deflected. Fruit ovate or oblong. Carpels with 5 filiform equal ribs. Channels with single vittae. Commissure with 2 vittae. Carpophore free, bifid at apex. Involucre and Involucels various—sometimes 0. Stems striate, smooth. Leaves pinnately dissected; segments multifid.

1. C. CARUI, L. Leaves somewhat bipinnatifid, the segments linear; involuce 1-leaved or 0; involucels 0. DC. Prodr. 4. p. 115. Fl. Cestr. p. 188.

CARIAN CARUM. Vulgò-Common Caraway.

Fr. Carvi. Germ. Gemeiner Kuemmel. Span. Alcaravéa.

Root biennial? (perennial, DC.), fusiform. Stem about 2 feet high, branched. Radical leaves rather large; stem leaves multifid, the segments filiform. Petals white. Fruit oblong or elliptic, often oblique at apex. Gardens: cultivated. Native of Europe. Fl. June. Fr. August.

Obs. This is sometimes cultivated for its highly aromatic fruit,—which is used to impart a flavor to cakes, and other articles of cookery.

TRIBE V. SESELINEAE. Koch.

Fruit terete—1. e. a transverse section of it nearly orbicular. Carpels with 5 filiform or winged ribs,—of which the lateral ones are marginal, and equal with, or a little broader than, the others.

70. FOENICULUM. Adans. Endl. Gen. 4425. [Latin, diminutive of Foenum, hay; from a resemblance in its odor.]

Calyx with the limb a little tumid, the teeth obsolete. Petals oval, entire, involute, with a broadish retuse apex. Fruit elliptic-oblong, subterete. Stylopodium conical. Carpels with 5 obtuse keeled ribs,—of which the lateral ones are marginal, and often a little broader. Channels with single vittae. Commissure with 2 vittae. Involuce and Involucels 0. Biennial or perennial. Stems terete, striate. Leaves decompound, pinnately dissected, the segments linear.

1. F. VULGARE, Gaertn. Segments of the leaves subulate-linear, elongated; umbels many-rayed. DC. Prodr. 4. p. 142. Fl. Cestr. p. 191.

COMMON FOENICULUM. Vulgo-Fennel. Garden Fennel.

Fr. Fenouil. Germ. Der Fenchel. Span. Hinojo.

Plant smooth. Root perennial? (biennial, DC.). Stem 4 to 5 or 6 feet high, branching, striate-grooved, purplish-green and somewhat glaucous. Leaves large, finely and somewhat biternately dissected; segments an inch to an inch and half long, almost filiform,—the subdivisions often dichotomous: common petioles much dilated, sheathing, produced into 2 marginal lobes at summit. Umbels of 15 to 20 or 30 unequal rays. Petals yellow. Carpels semi-terete, striately ribbed and grooved. Gardens: cultivated. Native of Europe. Fl. July. Fr. September.

Obs. The whole plant is highly aromatic. Those who kept Bees, in former years, were much in the practice, when those insects swarmed, of rubbing the inside of the Bee-hive with this fragrant herb,—under the impression that the odor would attach them to their new domicil. It is chiefly cultivated for its aromatic fruit,—which is occasionally used in domestic economy; and is sometimes smoked, like tobacco, as a popular remedy for cholic.

TRIBE VII. PEUCEDANEAE. DC.

Fruit dorsally and more or less flatly compressed, surrounded with a single di-lated entire smooth margin,—which is flattened or slightly convex, but not thickened at the edge. Carpels with 5 filiform (or rarely winged) ribs,—of which the lateral ones are contiguous to the dilated margin or united with it.

71. ARCHEMORA. DC. Endl. Gen. 4472. [Named from Archemorus,—who died from eating Parsley. DC.]

Calyx 5-toothed. Petals obcordate by the inflection of the acuminate apex. Fruit elliptic-ovate, convex or lenticularly compressed. Stylopodium conical, broad at base. Carpels with 5 equidistant obtuse ribs,—the lateral ones dilated into a flattish thin-edged mar-Channels filled by single vittae. Commissure with 2 or more vittae. Carpophore 2-parted. Involucre 0 or few-leaved. Involucels many-leaved. Stem terete, striate. Leaves pinnately or ternately dissected,—the segments or leaflets entire or sparingly toothed near the apex.

1. A. RIGIDA, DC. Leaves pinnately dissected,—the segments in 3 to 5 pairs with a terminal odd one, sessile, oblong-lanceolate, very entire or remotely incised-dentate near the apex; umbels terminal and subterminal, on long peduncles. Torr. & Gr. Fl. N. A. 1. p. 631. DC. Prodr. 4. p. 188. Fl. Cestr. p. 195.

RIGID OR STIFF ARCHEMORA. Vulgò-Cow-bane. Wild Parsnep.

Whole plant smooth. Root perennial. Stem 2 to 4 or 5 feet high, rather slender, sparingly branched above. Leaves all simply pseudo-pinnate; common petioles 1 to 5 or 6 inches long, channelled and somewhat margined: leaflets or segments 2 to 3 or 4 inches long,—varying from linear to ovate-lanceolate and cuneate-oblong, often a little falcate. Umbcls about 3, on rather long sulcatestriate peduncles. Involuce 0, or sometimes of 2 or 3 lance-linear leaflets. Involucels of 6 or 8 subulate-linear leaflets. Petals white. Channels filled to convexity by the dark purple vittae. Commissure a little concave, lined with a white suberose coat. Swampy meadows, and low grounds: New York to Louisiana. Fl. August. Fr. October.

Obs. This is reputed to be an active poison,—particularly to horned Cattle, when eaten by them; and therefore every farmer is interested in knowing the plant, and causing it to be eradicated from his meadows and pastures. It varies somewhat in its features; but the above is a description of its usual form, in Pennsylvania.

72. PASTINACA. Tournef. Endl. Gen. 4473. [Latin, Pastus, a repast or nourishment; from the use made of the root.] Calyx-teeth minute or obsolete. Petals orbicular, involute, retuse by the inflection of the broadish apex. Fruit oval, flatly compressed, with a dilated flat margin. Stylopodium depressed, peltate. Carpels with 5 very slender ribs,—3 of them dorsal and equidistant—the other 2 remote, contiguous to the margins. Channels with single conspicuous vittae. Commissure with 2 or more vittae. Carpophore 2-parted. Involucre mostly 0. Involucels 0, or fewleaved. Stem sulcate, smooth. Leaves pinnately dissected,—the

1. P. SATIVA, L. Leaves minutely pubescent; leaflets in 3 or 4 pairs with a terminal odd one, ovate-oblong, rather obtuse, incised-dentate, sessile,—the terminal one 3-lobed and petiolulate; umbels large, spreading, fastigiate; fruit emarginate. Torr. & Gr. Fl. N. A. 1. p. 632. DC. Prodr. 4. p. 188. Fl. Cestr. p. 196.

Cultivated Pastinaca. Vulgò—Parsnep. Garden parsnep. Fr. Panais potager. Germ. Die Pastinake. Span. Chirivia.

leaflets incised-dentate or lobed.

Plant yellowish green. Root biennial, fusiform, large and fleshy. Stem 3 to 5 feet high, rather stout, furrowed and fistular, somewhat branching. Leaflets 2 to 4 inches long (the primary leaves, of the young plant, orbicular-cordate and incisely crenate). Umbels nearly level on the top. Calyx-teeth obsolete. Petals yellow, small, with the apex incurved or rolled in. Fruit thin or very flatly compressed on the back. Ribs fliform; channels greenish yellow; vittae dark purple, generally linear, sometimes a little clavate. Gardens: cultivated. Native of Europe. Fl. June—August. Fr. August—October.

Obs. Generally cultivated for its fine esculent root,—which, in the best varieties (such as that called the "Guernsey Parsnep"), is remarkably rich and marrow-like. The plant produces many seeds, and is apt to stray from the garden into the fields,—where it speedily degenerates, and, if neglected, becomes a troublesome unsightly weed.

B. Carpels many-ribbed: i.e. with the secondary ribs prominently developed.

TRIBE XII. DAUCINEAE. Koch.

Fruit lenticularly compressed on the back, or sometimes nearly orbicular on a transverse section. Carpels with the 5 primary ribs filiform and bristly—the lateral ones on the commissure,—the 4 intervening secondary ribs more prominent, extended into prickles, which are either distinct or united at base into a wing.

73. DAUCUS. Tournef. Endl. Gen. 4497. [Daukos, the ancient Greek name of the Carrot.]

Calyx 5-toothed. Petals obovate, emarginate by the inflection of the acuminate apex,—those on the margin of the umbel often larger than the others, and obcordate or bifid. Fruit ovoid-oblong, somewhat dorsally compressed. Stylopodium depressed, thickish. Carpels with the 5 primary ribs filiform and minutely bristly,—of which

ribs 3 are on the back of the carpel, and 2 on the commissure: the 4 secondary ribs equal, prominently winged, and each pectinately cleft into a single row of prickles. Channels with single vittae under the secondary ribs. Carpophore free, entire. Involuce many-leaved; leaflets pinnatifid. Involucels many-leaved; leaflets trifid or entire. Leaves bi- or tri-pinnately dissected.

1. D. CAROTA, L. Stem hispid; leaves 2-3-pinnatifid; segments pinnatifid, the lobes lanceolate and cuspidate; leaflets of the involucre nearly as long as the umbel; prickles about equal to the diameter of the oblong-oval fruit. Torr. & Gr. Fl. N. A. 1. p. 635. DC. Prodr. 4. p. 211. Fl. Cestr. p. 197.

CAROT DAUCUS. Vulgò-Carrot. Wild Carrot.

Fr. Carotte. Germ. Die Moehre. Span. Zanahoria.

Plant greyish green, hispidly pilose. Root biennial, fusiform, yellowish or orange-colored. Stem 2 to 3 or 4 feet high, rather slender, terete, sulcate-striate, branching. Leaves twice or thrice pinnatifid; segments half an inch to an inch long, much incised. Umbels on long peduncles or naked branches, nearly level on the top when in flower—concave when in fruit. Petals white or ochroleucous—occasionally with a purplish tinge,—the central floret of the umbel often abortive, with fleshy dark purple petals. Fruit very hispid,—the prickles on the secondary ribs somewhat barbed. Gardens, fields and road sides: introduced. Native of Europe, and the East. Fl. July—September. Fr. September—October.

Obs. The var. sativa, DC. or common Garden Carrot,—with a large fleshy yellow or reddish orange-colored root,—is much cultivated as a culinary vegetable, for soups, &c. In Europe, it is highly esteemed as a food for Milk Cows, and other stock, during winter; but in this country, the root culture, for such objects, is but little attended to,—probably less than it ought to be. The wild variety is extensively naturalized,—and threatens to become a troublesome pest, on our farms. When it gets on the premises of a careless slovenly farmer, it soon multiplies so as to become a source of annoyance to the whole neighborhood. It should be diligently eradicated before it matures its seeds.

SUB-ORDER II. CAMPYLOSPERMAE. DC.

Inner face of the seed and albumen involute at the sides—forming a longitudinal groove.

Fruit with primary ribs only.

TRIBE XVI. SMYRNIEAE. Koch.

Fruit turgid, often laterally compressed or contracted. Carpels with 5 ribs,—the lateral ones marginal, or placed in front of or opposite the margin—sometimes nearly obliterated.

74. CONIUM. L. Endl. Gen. 4532. [An ancient name, of obscure etymology.]

Calyx with the limb obsolete. Petals obcordate by the inflection of the short acuminate apex. Fruit ovate, compressed or contracted at the sides. Stylopodium dilated at base. Carpels with 5 prominent equal ribs which are undulate-crenulate when immature,—the lateral ones marginal. Channels striate, without vittae. Carpophore bifid at apex. Seed with a deep narrow longitudinal groove on its face. Involucre few-leaved. Involucels dimidiate or one-sided, about 3-leaved.

1. C. MACULATUM, L. Stem terete, spotted; leaves tripinnately dissected,—segments lanceolate, pinnatifid, the lobes acute and often incised; leaflets of the involucels lanceolate, shorter than the umbellets. Torr. & Gr. Fl. N. A. 1. p. 640. DC. Prodr. 4. p. 242. Fl. Cestr. p. 201. Icon. Fl. Lond. 1.

SPOTTED CONIUM. Vulgò—Common Hemlock.

Fr. Ciguë ordinaire. Germ. Der Schierling. Span. Ceguda.

Plant smooth, deep bluish green, and sometimes glaucous. Root biennial, fusiform, whitish and fleshy. Stem 2 to 4 (sometimes 6 or 8) feet high, fistular, branched, somewhat sulcate, streaked with green and yellow and often spotted with dark purple. Common petioles dilated, nerved, with scarious margins. Petals white. Fruit somewhat gibbous. Carpels with the ribs wavy, especially while young,—the faces inclining to separate between the base and apex (i. e. somewhat coelospermous), when mature. Waste places: introduced. Native of Europe. Fl. June—July. Fr. September.

Obs. This foreigner is partially naturalized in many places,—and being a powerful narcotic poison, it ought to be known by every person on whose premises it may occur. The plant when bruised emits a disagreeable odor. The extract was formerly celebrated as a remedy in scrophulous disease; and, like the generality of poisons, it may no doubt prove medicinal, when judiciously and skilfully employed.

SUB-ORDER III. COELOSPERMAE. DC.

Inner face of the seed and albumen transversely concave—or with the base and apex curved towards each other.

TRIBE XVII. CORIANDREAE. Koch.

Fruit globose,—or the carpels subglobose and didymous: primary ribs depressed and flexuous or nearly obsolete; the secondary ones more prominent; all wingless.

75. CORIANDRUM. Hoffm. Endl. Gen. 4549.
[Greek, Koris, a bug; the bruised leaves having the odor of a bed-bug.]

Calyx 5-toothed,—the teeth conspicuous, unequal, persistent. Petals obcordate by the inflection of the acuminate apex,—those on the margin of the umbel larger and bifid. Stylopodium conical. Carpels cohering, scarcely separating,—each with 5 undulate depressed primary ribs, of which the lateral ones are placed in front of an accessory margin; the 4 secondary ribs more prominent and keeled. Channels without vittae. Commissure with 2 vittae. Carpophore free in the middle, semibifid, adnate at base and apex. Involucre

1. C. SATIVUM, L. Leaves bipinnately dissected,—segments of the lower ones broad-cuneate, incised-dentate,—of the upper ones narrow and linear; carpels hemispherical. DC. Prodr. 4. p. 250. Fl. Cestr. p. 202.

Involucels dimidiate, about 3-leaved.

Cultivated Coriandrum. Vulgò-Coriander.

1-leaved or 0.

Fr. Coriandre. Germ. Der Koriander. Span. Cilantro.

Plant smooth. Root annual (sometimes biennial, DC.). Stem 1 to 2 feet high, slender, striate, somewhat branched at summit. Umbels 3 to 5-rayed. Umbellets of numerous short unequal rays. Petals white—tinged with red before expanding. Carpels very concave on the face, cohering by their margins so as to form apparently a simple globose fruit. Commissure with 2 linear-lanceolate vitue in a loose membrane which covers the face of the seed. Gardens: cultivated. Native of Tartary and the East. Fl. June—July. Fr. August—September.

Obs. Occasionally cultivated for its aromatic fruit,—which is used by the pastry Cook and the Confectioner; and also to impart a flavor to Tinctures, &c. It is said that the Tartars prepare a favorite potage, from the fresh herb.*

ORDER LXVIII. ARALIACEAE. Juss. Richard.

Perennial herbs, shrubs or trees. Leaves alternate, mostly compound, destitute of stipules; petioles long, thickened and dilated at base. Flowers mostly umbellate,—the umbels often paniculate. Calyx adherent to the ovary,—the limb usually very small, toothed or entire Petals 5 to 10, valvate in aestivation. Stamens as many as the petals and alternate with them, inserted under the margin of an epigynous disk. Ovary 2 to 15-celled (i. e. composed of so many united carpels), with a solitary suspended ovule in each cell; styles as many as the cells—sometimes united; stigmas simple. Fruit baccate or drupaceous,—sometimes nearly dry, but the carpels not separating. Embryo short, at the base of the copious fleshy albumen.

A small Order, and of little interest to the farmer. The Irn (Hedera Helix, L.)

A small Order, and of little interest to the farmer. The Ivy (Hedera Helix, L.) is perhaps the only plant belonging to it, worth mentioning-in addition to those

here noticed.

76. ARALIA. L. Endl. Gen. 4558.

[A name of unknown derivation: supposed to be of Canadian origin.] Flowers mostly perfect. Calyx 5-toothed, or with the limb entire. Petals 5, spreading. Stamens 5, on short filaments. Styles 5, divaricately spreading, persistent. Berry 5-celled, often torose or somewhat 5-lobed. Herbs or shrubs,—sometimes prickly. mostly decompound.

1. A. RACEMOSA, L. Stem herbaceous, smooth, divaricately branched; leaves ternately and quinately decompound; leaflets cordate-ovate, acuminate, doubly serrate; racemes axillary, compound, paniculately umbellulate; involucels small. Torr. & Gr. Fl. N. A. 1. p. 646. DC. Prodr. 4. p. 258. Fl. Cestr. p. 209. RACEMOSE ARALIA. Vulgo-Spikenard.

Root perennial, thick, aromatic. Stem 3 to 5 feet high, with spreading and somewhat dichotomous branches. Leaflets 3 to 6 or 8 inches long, slightly hairy, mostly petiolulate. Flowers in large umbellulate panicles; pedancles pubescent. Involucels of several short subulate leaflets. Calyx with 5 small acute teeth. Petals greenish white. Styles united below; stigmas diverging or recurved.—Berries small, not torose, dark purple when mature. Rich woodlands: Canada to Georgia; and in Gardens, cultivated. Fl. July. Fr. September.

Obs. This plant is native in our rich woodlands; but has been long introduced into Gardens, as a popular medicine. The root, and berries, infused in alcohol, made a favorite Tincture, in times past, for those who indulged in the perilous habit of taking such stomachics. There is another species in our woodlands-known by the name of Sarsaparilla (A. nudicaulis, L.)—which is also a popular medicine,-and often substituted for the Sarsaparilla of the shops. Neither of them has much connection with Agriculture: but the intelligent farmer would doubtless like to know them,—or at least the usually cultivated species.

77. PANAX. L. Endl. Gen. 4551.

[Greek, Pan, all, and akos, a remedy: an imaginary Panacea, or universal medicine.] FLOWERS POLYGAMOUS: Calyx turbinate, 5-toothed or the limb

* "Herba recens in deliciis habetur et ex eâ jusculum conficitur, undè ubiquè in hortis Tataricis culta." DC. l. c. It would probably require a Tartar palate to relish soup, prepared with herbage which has the "odor of a bed-bug"!

nearly entire. Petals 5. Stamens alternate with and as many as the petals, inserted with them under the margin of the disk. Styles 2 or 3 (rarely 1). Fruit fleshy, drupaceous or subcoriaceous, didyinous and reniform or trigonous-ovoid, 2 or 3-celled. Flowers mostly in a simple pedunculate terminal umbel.

1. P. QUINQUEFOLIUM, L. Root fusiform, often branched; leaves in threes, compound; leaslets mostly in fives, obovate, acuminate, unequally serrate, petiolulate; peduncle of the umbel rather shorter than the common petioles; styles 2; fruit succulent, 2-celled, 2-seeded. Torr. & Gr. Fl. N. A. 1. p. 647. DC. Prodr. 4. p. 252. Fl. Cestr. p. 181.

FIVE-LEAVED PANAX. Vulgò-Ginseng.

Root perennial, 3 to 6 inches long, and about half an inch in diameter, often forked downwards, whitish, transversely rugose. Stem 9 to 18 inches high, herbaceous, angular, smooth, with a verticil of 3 (rarely 4) petiolate compound leaves at summit, and a simple erect pedunculate umbel in the centre. Common petioles 3 or 4 inches long. Leaflets unequal,—the 3 principal ones 3 to 5 inches long, the lateral ones much smaller. Umbel many-flowered,—the central flowers often abortive. Petals yellowish green. Ovary compressed, cordate-ovate or gibbous at base on each side Fruit a fleshy drupaceous reniform berry, crowned with the persistent calyx-teeth and styles, smooth, bright crimson when mature. Rich woodlands: Northern and Western States. Fl. July. Fr. September.

Obs. The root of this plant is slightly stimulant, and rather pleasantly aromatic. It has long been, and continues to be, an article of some importance in our commerce with China: and although it has but little to do with Agriculture, it is presumed that a brief description of a native plant, so abundantly produced in our Western forests-and so highly prized in the "Celestial Empire"-will not be unacceptable.

ORDER. LXIX. CORNACEAE. DC. Lindl.

Chiefly small trees or shrubs. Leaves mostly opposite, entire, and destitute of stipules. Flowers in cymes, sometimes clustered into heads and surrounded by a large petaloid involucre. Calyx adherent to the 2-celled ovary,—the limb 4-toothed. Petals 4, valvate in aestivation. Stamens as many as the petals, and alternate with them. Styles united into 1. Fruit a 2-celled drupe, crowned with the persistent calyx-teeth. Seeds solitary, pendulous: embryo nearly the length of the fleshy albumen.

The genus which gives the name to this small Order, is the only one intitled to notice, here.

78. CORNUS. Tournef. Endl. Gen. 4574. [Latin, Cornu, a horn; from the horny toughness of the wood.]

Calyx 4-toothed,—the teeth minute. Petals oblong, spreading. Stamens longer than the corolla. Style sub-clavate; stigma obtuse or capitate. Drupe oval or subglobose, with a 2 or 3-celled nut.

Flowers capitate, with a 4-leaved Involucre.

1. C. FLORIDA, L. Arborescent; leaves ovate-oblong, acuminate; involucre large,-the petaloid leaves obcordate or with a callous notch at apex; drupes oval. Torr. & Gr. Fl. N. A. 1. p. 652. DC. Prodr. 4. p. 273. Fl. Cestr. p. 106. Icon, Mx. Sylva, 1. tab. 48.

FLOWERING CORNUS. Vulgò—Dogwood. Common Dogwood.

Stem 15 to 20 (sometimes 30 or 40) feet high, and 3 or 4 to 6 or 8 inches in diameter, much branched,—the young branches opposite or often verticillate in fours. Leaves 3 to 5 inches long, pilose with short appressed hairs, glaucous beneath. Flowers in terminal capitate clusters; involucre about 3 inches in diameter,—the leaves in opposite pairs, white or sometimes tinged with purple. Corolla greenish yellow. Drupe bright red when mature. Woodlands: Canada to Louisiana. Fl. May. Fr. October.

Obs. The wood of this small tree is very close-grained and firm, and valuable for many purposes in Mechanics. The woodman selects it as the best material for wooden wedges. The young straight stems make good hoops, for the cooper; and the slender verticillate branches once furnished distaffs for Spinsters,-when that description of females had a practical existence in the community. The bark is an excellent tonic-almost equaling the Peruvian, in efficacy. Altogether, it is a valuable, as well as ornamental, little tree. Observing farmers have remarked, that the proper time to plant Indian Corn (Zea Mays, L.) is when the Involucres of the Dogwood are first developed.

MONOPETALOUS EXOGENS.

ORDER LXXI. CAPRIFOLIACEAE, Juss. Richard.

Mostly shrubs, often twining. Leaves opposite, mostly without stipules. Calyx adherent to the ovary,—the limb 5- (rarely 4-) toothed. Corolla tubular or rotate, regular or irregular. Stamens as many as the lobes of the corolla, and alternate with them—or rarely 1 fewer—inserted into the tube. Ovary mostly 3-celled; style long and filiform with a capitate stigma—or 3 to 5 sessile stigmas. Fruit baccate, or sometimes dry, often 1-celled by abortion. Embryo in the axis of fleshy albumen.

An Order of small importance in Agriculture; but it contains the favorite tribe of *Honeysuckles* (Lonicera,) so much admired by the cultivators of flowers.

TRIBE II. SAMBUCEAE. Kunth.

Corolla regular, sub-rotate or rarely somewhat tubular. Stigmas 3 to 5, sessile. Testa of the seed membranaceous.

79. SAMBUCUS. Tournef. Endl. Gen. 3341. [Greek, Sambuke, a musical instrument; said to have been made of this shrub.] Calyx with the limb small, mostly 5-cleft. Corolla sub-rotate, mostly 5-lobed; lobes obtuse. Stamens 5, shorter than the corolla. Stigmas 3, sessile. Fruit subglobose, baccate, scarcely crowned; nucules 3 (rarely 5), crustaceous, rugulose, each containing a suspended seed. Shrubs or perennial herbs. Leaves odd-pinnately dissected. Inflorescence cymose or thyrsoid.

1. S. Canadensis, L. Stem suffruticose; leaflets oblong-oval, acuminate, serrate; flowers in 5-parted spreading cymes. Torr. & Gr. Fl. N. A. 2. p. 13. DC. Prodr. 4. p. 322. Fl. Cestr. p. 205.

CANADIAN SAMBUCUS. Vulgò—Elder bush. Common Elder.

Stem 5 to 8 or 10 feet high, finally shrubby, filled with a large pith, branching, nodose—the young branches tumid at the nodes. Leaflets usually in 3 pairs with young branches think at the holes. Leafless totally in 3 pairs with a terminal odd one, 2 to 4 inches long, petiolulate. Cymes broad, terminating young branches, on peduncles 4 to 6 inches long. Corolla white. Berries numerous, small, juicy, dark purple or nearly black when mature. Thickets, and Fence-rows: throughout the U. States. Fl. June. Fr. August.

Obs. This is a rather troublesome plant, on our farms,—the long roots being very tenaceous of life, and inclined to spread extensively along fence-rows and hedges. If neglected, it soon gives the farm a very slovenly appearance. The Viburnums (Black Haw, Snow-Ball, Tall Cranberry, &c.) belong here; but they are scarcely of sufficient importance, in any respect, to intitle them to a place in this work.

ORDER LXXII. RUBIACEAE. Juss.

Herbs, shrubs or trees. Leaves opposite or verticillate, entire, and furnished with stipules—which sometimes resemble true leaves. Flowers regular. Calyx-tube adherent to the ovary, or sometimes almost free,—the limb 4 or 5-cleft or toothed—occasionally obsolete. Corolla inserted on the summit of the calyx-tube,—the lobes as many as those of the calyx. Stamens as many as the lobes of the corolla, and alternate with them. Ovary mostly 2-celled: styles mostly 2, more or less united; stigmas mostly 2, distinct or concrete. Fruit various,—baccate, drupaceous, capsular, or separable into indehiscent carpels. Seeds solitary, few, or numerous, in each cell: embryo in the axis, or at the extremity, of copious fleshy or horny albumen.

This Order—comprising various Tribes, and nearly 250 Genera—contains many plants of great value,—though but few of them immediately concern the North American farmer. Among the most important, may be mentioned the Coffee plant (Coffea Arabica, L. which may yet, possibly, be advantageously cultivated in Florida, and some other places on our Southern borders)—the Peruvian Bark (Cinchona officinalis, L.)—and the Ipecacuanha (Cephaelis Ipecacuanha, Rich.). The popular vermifuge called Carolina Pink (Spigelia Marilandica, L.), and the well-known beautiful and fragrant Cape Jessamine (Gardenia florida, L.), are also referred to this large Natural Family.

SUB-ORDER I. STELLATAE. R. Br.

Herbs. Leaves apparently verticillate—but probably really opposite,—all except a single pair being regarded as stipules, because they never have axillary buds. Fruit of 2 united indehiscent 1-seeded carpels, baccate or dry.

80. RUBIA. Tournef. Endl. Gen. 3101. [Latin, Ruber, red,—the color produced by its roots.]

Calyx-tube ovoid-globose,—the limb 4-toothed or obsolete. Corolla subrotate, 4 or 5-parted. Stamens short. Styles 2, united at base. Fruit didymous, subglobose, baccate, smooth. Herbaceous or suf-fruiticose. Stems 4-angled, diffusely branching. Leaves opposite with 2 or 3 intermediate stipules resembling leaves,—constituting a 4 to 6 or 8-leaved verticil.

1. R. TINCTORUM, L. Stem herbaceous, flaccid, aculeate on the angles; leaves mostly in apparent verticils of six, lanceolate, subpetiolate; peduncles axillary, trichotomous; lobes of the corolla with a callous acumination, but not cuspidate. DC. Prodr. 4. p. 589. Fl. Cestr. p. 103.

DYERS' RUBIA. Vulgò-Madder. Dyers' Madder.

Fr. La Garance. Germ. Die Faerber-Roethe. Span. Rubia.

Root perennial, large, reddish brown. Stems procumbent, 3 or 4 feet long, much branched, pubescent at the joints; angles prominent, sometimes more than 4, aculeate with short retrorsely curved prickles. Leaves and stipules similar, 1 to 2 inches long,—the midrib and margins retrorsely aculeate—Flowerbearing branches axillary, opposite. Corolla brownish yellow, often 5-lobed. Gardens, and Lots: cultivated. Native of the East. Fl. July. Fr. September.

Obs. This is sometimes cultivated, on a small scale, in Pennsylvania, for the sake of the roots,—which are well known to yield a valuable red coloring matter: and I understand that a more extended culture has been tried, and found profitable, in Ohio-and perhaps in some other States.

There is a Genus (Galium) very nearly allied to this,—of which one of the numerous species (G. Aparine, L. perhaps a foreigner,) known by the name of Cleavers or Goose-grass-occurs frequently about gardens, and along fences, &c. on the farm: But it is scarcely of sufficient importance—even as a weed—to require notice, here.

ORDER LXXIV. DIPSACEAE. Vaill. Juss.

Herbs. Leaves opposite or rarely verticillate, sessile, destitute of stipules. Flowers aggregated—mostly in dense involucrate heads. Calyx-tube wholly (or sometimes at summit only) adherent to the ovary,—the limb cup-shaped and entire, 4 or 5-lobed—sometimes ringent or irregular. Stamens mostly 4, distinct or rarely united in pairs—often unequal. Ovary 1-celled, with a single suspended ovule; style filiform. Fruit membranaceous or akene-like, indehiscent, crowned with the limb of the calyx, 1-celled, 1-seeded. Embryo nearly the length of the fleshy albumen.

The Genus which is the type of this small Order, is the only one entitled to notice, in this work.

TRIBE II. SCABIOSEAE. DC.

Corolla 4 or 5-lobed, not ringent. Stamens 4 or 5, free and nearly equal. Flowers aggregated on a conic receptacle, with a general Involucre at base, -each floret embraced by a calyx-like Involucel, and with a chaffy bract on the lower side.

81. DIPSACUS. Tournef. Endl. Gen. 2191. [Greek, Dipsao, to thirst; the stem-leaves holding water at their junction.] Involucre many-leaved, longer than the acuminate subfoliaceous chaff of the receptacle. Involuced 4-sided, 8-furrowed, closely investing the ovary and fruit. Calyx-tube adherent to the ovary,the limb minute, cup-shaped or discoid, entire. Corolla with 4 erect lobes. Stamens 4. Stigma longitudinal. Stout biennials. Stems angular and prickly. Leaves opposite and often connate at base. Heads large, oblong,—the florets commencing to expand in a ring about the middle of the head, and gradually extending the process towards base and apex!

1. D. SYLVESTRIS, Mill. Leaves lanceolate-oblong, crenate-dentate and serrate, prickly on the midrib; involucre curved upwards, longer than the head; chaff of the receptacle straight and flexible. Torr. & Gr. Fl. N. A. 2. p. 54. DC. Prodr. 4. p. 645. Fl. Cestr. p. 98. Icon, Fl. Lond. vol. 1.

WILD DIPSACUS. Vulgò—Teasel. Wild Teasel.

Root biennial. Stem 3 to 5 or 6 feet high, branched. Radical leaves 8 to 12 inches long; stem-leaves sessile, subconnate.—those of the branches lanceolate and often nearly entire. Leaflets of the Involucre lance-linear, pungent at apex, unequal in length. Heads of flowers ovoid-oblong: corolla pale purple. Bracts or Chaff of the receptacle oblong-cuneate, keeled, abruptly tapering into a straight flexible awn-like acumination, longer than the flowers,—those at the top of the head longest. Borders of fields, roadsides, &c. Northern and Middle States: introduced. Native of Europe. Fl. July. Fr. September.

- Obs. This coarse plant is completely naturalized, in some localities,—and is not only worthless, but threatens to become something of a nuisance to the farms, if not attended to. A little timely care, however, would soon subdue it.
- 2. D. Fullonum, Mill. Leaves obovate and oblong-lanceolate, smoothish, serrate, the upper ones entire; involucre spreading or

reflexed, shorter than the head; chaff of the receptacle recurved, rigid. DC. Prodr. 4. p. 645. Fl. Cestr. p. 99.

Fullers' Dipsacus. Vulgò-Fuller's Teasel. [dencha.

Fr. Chardon à Foulon. Germ. Aechte Kartendistel. Span. Car-

Root biennial. Stem 4 or 5 feet high, branched. Radical leaves obovate, narrowed to a petiole at base; stem-leaves connate-perfoliate. Leaflets of the Involucre lanceolate, mucronate, rigid. Heads of flowers cylindric or elliptical; corolla pale purple. Bracts or Chaff of the receptacle cuneate-oblong, keeled, bristly-ciliate on the margin, terminating in a rigid subulate recurved acumination. Lots: cultivated. Native of Europe. Fl. July. Fr. September.

Obs. This species is cultivated by some Cloth Manufacturers, for the sake of the Heads,—the rigid recurved points of the chaffy bracts, on the mature heads, serving as a kind of card, to raise the nap on woollen cloth.

ORDER LXXV. COMPOSITAE. Vaill.

Herbs, or sometimes shrubs. Leaves alternate and opposite, often lobed or dissected, but never compound, and not stipulate. Flowers in heads, crowded on a common receptacle, and surrounded by one or more series of small leaves (bracts or scales) which form an Involucre,—the several florets often furnished with each an accompanying bract (chaff or palea). Calyx-tube closely adherent to the ovary,—the limb (called pappus) consisting of scales, bristles, hairs, &c. or sometimes obsolete. Corolla of 5 united petals, tubular or ligulate. Stamens as many as the petals or lobes of the corolla,—the anthers united into a tube around the style (syngenesious). Ovary 1-celled, with a single erect ovule; style 2-cleft,—the branches mostly flattish on the inner or upper side and furnished with pollen-collecting hairs,—the proper stigmas (stigmatic glands) occupying the inner surface, near the margins, in the form of glandular slightly prominent lines. Fruit an akene, either crowned with the pappus, or naked at summit. Seed destitute of albumen; cotyledons flat or plano-convex. titute of albumen; cotyledons flat or plano-convex.

This immense Order—containing between 800 and 900 Genera, or about one

tenth of all the flowering plants—presents but few of much interest to the American farmer, beside what are here noticed. Some possess medicinal properties—and others are remarkable for their beauty: but the general character of the Order is that of mere Weeds,—of which many species are found in all our fields, meadows, and woodlands; though the greater portion may be readily kept in tolcrable subjection by care and attention.

SUB-ORDER I. TUBULIFLORAE. DC.

Corolla of the perfect or disk florets tubular, and mostly 5-lobed.

TRIBE I. VERNONIACEAE. Lessing.

Heads discoid, with the florets all tubular and perfect (homogamous), or rarely radiate. Style cylindric above: the branches mostly subulate and elongated, equally hispid,—the stigmatic lines terminating below or near their middle, not confluent.

SUB-TRIBE I. VERNONIEAE. Cassini.

Heads discoid, homogamous. Branches of the style elongated, acuminate.

82. VERNONIA. Schreb. Endl. Gen. 2204. [Named in honor of William Vernon; an English Botanist.]

Heads many-flowered; florets all equal and tubular. Involucre imbricate, shorter than the flowers,—the inner scales longest. Receptacle mostly naked. Corolla regular—the lobes about the length of the tube. Filaments smooth. Akenes mostly striate or ribbed, with a cartilaginous callus at base, and the epigynous disk large. Pappus usually double,—the inner series of numerous bristles—the

outer mostly short, minute, often dilated and scale-like. Mostly perennial *Herbs*, with alternate leaves.

1. V. Noveboracensis, Willd. Stem striate-sulcate, roughish pubescent, leafy; leaves lanceolate, serrulate, roughish; heads numerous, in a terminal corymb; scales of the involucre ovate, acute or often with a long filiform flexuous point. Torr. & Gr. Fl. N. A. 2. p. 57. DC. Prodr. 5. p. 63.

V. praealta. Willd. Fl. Cestr. p. 448. not of DC.

NEW-YORK VERNONIA. Vulgò-Iron-weed.

Stem 2 or 3 to 6 or 7 feet high, somewhat branching at summit, finally firm and subligneous. Leaves 3 to 6 or 8 inches long, subsessile, thickish or subcoriaceous. Florets bright deep purple. Akenes turbinate-oblong, sulcate, scabrous with short hairs; pappus a dirty white, or often purplish, scabrous,—the outer series consisting of short chaffy or scale-like bristles. Moist meadows, and low grounds: throughout the U. States. Fl. August. Fr. September.

Obs. This plant is quite common in moist low grounds, and along fence-rows. Its worthless character and coarse hard stem cause it to be regarded as a rather obnoxious weed, in our meadows; and of course it is carefully eradicated, by all neat farmers.

TRIBE II. EUPATORIACEAE. Less.

Heads mostly discoid, with the flowers all tubular and perfect (homogamous). Style cylindric above; the branches usually much elongated, subterete and obtuse or clavate, puberulent or papillose externally towards the summit,—the stigmatic lines inconspicuous, terminating near the middle of the branches (rarely reaching the apex), not confluent at their termination. Anthers never caudate.

SUB-TRIBE I. EUPATORIEAE. DC.

Heads discoid,—the flowers all perfect and similar (hemogamous), usually white, rose-color or purple—never yellow.

DIVISION 2. ADENOSTYLEAE. DC.

Pappus composed of slender hair-like bristles in one or more series, scabrous or plumose. Branches of the style more or less papillose or glandular above.

IF Akenes 5-angled, not striate. Pappus scabrous.

[Named from Eupator, King of Pontus; who, it is said, first used the plant.] Heads 3 to many-flowered. Involucre oblong, cylindric or campanulate,—the scales imbricated in 2, 3, or more series—or sometimes nearly equal in a single scries. Receptacle flat, naked. Corolla funnel-form, or often with a campanulate limb. Anthers included. Branches of the style much exserted, terete or slightly flattened, obtuse. Pappus a single series of very slender bristles, rough or minutely serrulate. Perennial Herbs, with leaves mostly opposite or verticillate.

1. E. PERFOLIATUM, L. Stem rigid, hirsutely villous, corymbosely branched above; leaves opposite and decussate, connate-perfoliate, oblong-lanceolate, crenate-serrate, reticulately veined and rugose, very pubcscent beneath; heads about 10-flowered. Torr. & Gr. Fl. N. A. 2. p. 88. DC. Prodr. 5. p. 151. Fl. Cestr. p. 451.

Perfoliate Eupatorium. Vulgò—Thorough-stem. Bone-set.—Indian Sage.

Stem 2 to 4 feet high, the branches whitish and very pubescent. Leaves 4 to 6 or 8 inches long, opposite and completely united at base—or sometimes contracted at base and scarcely connate (rarely verticillate in threes, and connate), tapering gradually to a slender point, sprinkled with resinous particles beneath. Heads of flowers crowded, in large corymbs. Scales of the involucre lance-linear, rather acute. Florets white. Akenes smoothish. Low swampy grounds: throughout the U. States. Fl. July—August. Fr. September.

Obs. This species is so common in wet meadows, and low grounds, as to be regarded rather as an objectionable weed: But it is chiefly intitled to notice for its medicinal properties,—being either emetic, cathartic, or tonic—according to the dose, or mode of exhibition.

There are several other species of this genus, which meet the cyc of the farmer, in his meadows and along the borders of woods and thickets—particularly a tall stout one, with verticillate leaves and purple flowers (E. purpureum, L.); but they are scarcely of sufficient importance to claim a place in this work.

TRIBE III. ASTEROIDEAE. Less.

Heads mostly heterogamous, and often radiate. Style (in the perfect florets) cylindric above; the branches flattish, linear or lanceolate, externally pubescent above—the conspicuous stigmatic lines terminating opposite to where the external pubescence commences, not confluent. Perennial Herbs. Leaves mostly alternate.

SUB-TRIBE I. ASTERINEAE. DC.

Heads mostly heterogamous and radiate—never dioicous. Receptacle seldom chaffy. Anthers not caudate.

DIV. 1. ASTEREAE. DC.

Heads heterogamous and radiate,—the rays varying in color from blue to purple and white, but never yellow,—the disk-florets yellowish, but finally becoming purplish.

SUB-DIV. 1. EU-ASTEREAE. DC.

Pappus composed of capillary—or rarely subulate—bristles. Akenes more or less compressed.

** Rays fertile. Pappus of the Ray and Disk mostly similar,—the inner series capillary.

84. ASTER. Tournef. Endl. Gen. 2301.

[Greek, Aster, a star; the radiated heads of flowers resembling stars]

Heads many-flowered—the ray-florets in a single series, pistillate,—those of the disk tubular and perfect. Scales of the involucre more or less imbricated, usually whitish below and green or foliaceous at apex. Receptacle flat, mostly alveolate (or pitted). Akenes usually compressed. Leaves alternate, entire or serrate. Heads corymbose, paniculate, or racemose.

1. A. ERICOIDES, L. Smoothish, much branched,—the simple leafy branchlets or peduncles racemose and mostly unilateral on the virgate spreading branches; leaves rather rigid,—the radical and lower cauline ones oblanceolate or oblong-spatulate, tapering to a margined petiole, often serrate,—the others linear-lanceolate and linear-subulate, entire, acute at each end; heads small, numerous, solitary on the branchlets; involucre hemispherical or subturbinate,—the scales loosely imbricated, linear-oblong, acute, spreading at apex. Torr. & Gr. Fl. N. A. 2. p. 123. DC. Prodr. 5. p. 241.

A. tenuifolius. Fl. Cestr. p. 467. not of L.

ERICA-OR HEATH-LIKE ASTER.

Stem 1 to 2 or 3 feet high, often branched from the base. Radical leaves 1 to 3 or 4 inches long, sparingly serrate, ciliate, tapering to a petiole nearly as long as the leaf; stem-leaves 1 to 3 inches long,—those on the branchlets smaller, subulate-linear. Rays white, or often tinged with pale purple,—the disk often becoming reddish-purple. Sterile soils; old fields, pastures, &c. throughout the U. States. Fl. August—September. Fr. October.

Obs. Many species of this genus meet the eye of the farmer, in the latter part of summer, in his woodlands, low grounds, borders of thickets, &c. some of which species are quite ornamental: but the little bushy one here described (which, I believe, has not acquired a common name,) is almost the only one which invades our pastures to any material extent. In thinnish old fields, it sometimes becomes an abundant—as it is always a very worthless—weed. Good culture, and enriching the soil, soon cause it to disappear.

85, ERIGERON. L. Endl. Gen. 2333.

[Greek, Er spring, and Geron, an old man; the plant being hoary in spring.] Heads many-flowered, somewhat hemispherical; ray florets very numerous and usually in more than one series, pistillate,-those of the disk tubular, perfect—or some of the outer ones (perhaps transformed ray-florets) filiform-tubular, truncate, and pistillate only. Scales of the involucre mostly equal, narrow, in a nearly single Receptacle flat, naked, punctate. Branches of the style series. very short, obtuse. Akenes compressed, usually pubescent. Pappus a single series of capillary scabrous bristles, often with minute ones intermixed,—or sometimes with an exterior coroniform pappus of subulate scales. Heads solitary, corymbose or paniculate.

1. E. Canadense, L. Stem hirsute, paniculately branched; leaves lance-linear, mostly entire, hispidly ciliate; heads of flowers small, numerous, racemose on the branches; rays minute. Torr. Fl. N. A. 2. p. 167. DC. Prodr. 5. p. 289. Fl. Cestr. p. 471.

CANADIAN ERIGERON. Vulgà—Horse-weed. Butter-weed.

Root annual. Stem 6 inches to 5 or 6 feet high. Leaves 1 to 3 or 4 inches long, sessile,—the lower ones sparingly dentate. Rays white, very narrow, scarcely longer than the straw-colored pappus. Akcues oblong, sparsely hispid. Fields, road sides, and waste places: throughout the U. States. Fl. August—September. Fr. September—October.

Obs. This plant varies very much in size, according to the soil in which it grows. On dry sterile banks, it is a very dwarf. It has disseminated itself, more or less abundantly, all over our country, and, it is said, all over Europe; and is a worthless weed, wherever found. Good farming is the mode for smothering out such intruders.

2. E. Annuum, Pers. Stem sparsely hirsute, corymbosely branched. above; leaves coarsely and sharply dentate-serrate,-the radical and lower ones ovate, obtuse, tapering into a margined petiole,the others sessile, lanceolate, acute, entire near each end; rays very narrow, about as long as the sparsely setose involucre. Torr. & Gr... Fl. N. A. 2. p. 175.

E. heterophyllus. Muhl. Fl. Cestr. p. 472.

Stenactis annua, and S. strigosa. (excl. syn.). DC. Prodr. 5. p. 298. (fide Torr. & Gr.).

ANNUAL ERIGERON. Vulgo - Flea-bane. Daisy.

Root biennial? (annual, DC.). Stem 2 to 3 or 4 feet high, rather stout, striate and often angular. Radical leaves 2 to 4 inches long, roughish and hairy, with narrow-margined petioles nearly twice as long as the leaves; stem-leaves gradually smaller as they ascend. Heads of florets rather small; rays white, or sometimes tinged with purple. Akenes oblong, somewhat compressed, hirsute; pappus whitish,—the ray-florets destitute of pappus, except a few short coroniform teeth at or near the summit of the akene. Pastures, and waste places: Northern, Middle and Western States. Fl. June—July. Fr. August.

- Obs. A frequent worthless weed, in our pastures: not particularly injurious,—but conspicuous enough to attract the notice of the observing farmer; and therefore worthy to be known by him.
- 3. E. STRIGOSUM, Muhl. Stem more or less strigosely hairy, corymbosely paniculate above; leaves lanceolate, narrowed at base, dentate or entire,—the radical ones spatulate-lanceolate, tapering into a margined petiole; rays narrow, nearly twice as long as the minutely hispid involucre. Torr. & Gr. Fl. N. A. 2. p. 176. Fl. Cestr. p. 471.

Phalacroloma obtusifolium. Cass. DC. Prodr. 5. p. 298. (excl. syn.) fide Torr. & Gr. Also, Stenactis ambigua, DC. Prodr. 5. p. 299.

Strigose Erigeron. Vulgò—Flea-bane. Daisy.

Root biennial? Stem 2 to 4 feet high, sulcate-striate and angular, rather slender, and often sparingly branched. Leaves 1 to 3 inches long. Heads of florets rather larger than in the preceding; rays white. Akenes oblong, angular or ribbed, sparsely pilose; "inner pappus in the disk, of about 15 slender fragile and deciduous bristles; in the ray none, or sometimes of one or two caducous bristles: the exterior a small setaceous-squamellate crown, similar in the ray and disk." Torr. & Gr Pastures, and upland meadows: Canada to Florida, Fl. June—Aug. Fr. July—September.

Obs. This plant has a strong general resemblance to the preceding, but is more common,—though they are usually both confounded under the same popular names. This one is apt to be very abundant in the first crop of our upland meadows, in Pennsylvania, after a course of Grain crops. After that—especially in good land—it becomes more rare,—being probably choked down by the Grasses. All three of the species are equally worthless unwelcome weeds.

DIV. 2. CHRYSOCOMEAE. DC.

Heads either heterogamous and radiate, or homogamous and discoid (both forms sometimes occurring in the same genus); the rays and disk-florets yellow (the latter unchanging). Receptacle never chaffy.

SUB-DIV. 3. SOLIDAGINEAE. DC.

Rays in a single series—sometimes wanting. Pappus of the disk and ray-florets similar, simple, capillary or bristle-like,—rarely chaffy or scale-like.—Akenes sub-terete, ribbed.

86. SOLIDAGO. L. Endl. Gen. 2376.

[Latin, Solidare, to unite, or make firm; from its supposed healing virtues.]

Heads few- or sometimes many-flowered; ray-florets few, pistillate—sometimes wanting; disk-florets tubular, perfect. Scales of the oblong involucre imbricated, appressed, not green or foliaceous at apex. Receptacle narrow, mostly alveolate. Branches of the style lanceolate. Akenes many-ribbed, somewhat terete. Pappus simple, consisting of numerous scabrous capillary bristles, mostly equal. Heads in terminal or axillary racemes, with the pedicels often unilateral,—sometimes corymbose.

1. S. NEMORALIS, Ait. Stem simple or corymbosely branched above, clothed with a very short velvety cinereous pubescence; radical leaves obovate-cuneate or spatulate, tapering into a petiole, sparingly crenate-serrate,—cauline ones oblanceolate, nearly entire, roughish-pubescent; racemes numerous, short, dense, unilateral, at length recurved-spreading, often corymbose-paniculate; scales of the involucre lance-oblong, obtuse, appressed; akenes pubescent with white appressed hairs. Torr. & Gr. Fl. N. A. 2. p. 220. DC. Prodr. 5. p. 333. Fl. Cestr. p. 456.

Wood or Grove Solidago. Vulgà-Golden Rod.

Whole plant of an ash-colored or greyish aspect, by reason of its short cinereous pubescence. Stem 1 to 2 or 3 feet high, sometimes branched from near the root. Radical leaves 1 to 4 or 5 inches long, with petioles 1 to 3 inches long. Heats with 3 to 6 disk-florets, and 6 to 9 ray-florets, in secund racemes—or (in stanted branched specimens) often in small axillary clusters; rays rather short, spatulate-oblong. Sterile, neglected old fields; borders of woods, &c.: throughout the U. States. Fl. August—September. Fr. October.

Obs. Several species of Solidago (or Golden Rod, as they are all named, in the vernacular tongue)—some of them much larger than this—occur along fence-rows, borders of woods and thickets, &c. They are all no better than weeds, on a farm: But this is the one which mostly intrudes upon neglected pasture grounds,—and has therefore been selected for description, as a sample of the genus. It is speedily banished by good farming,—as most of our native weeds are, or may be.

TRIBE IV. SENECIONIDEAE. Less.

Heads homogamous, heterogamous, or heterocephalous (monoicous or dioicous). Style (in the perfect florets) cylindric above,—the branches linear, somewhat convex externally, penicillate or hairy at the apex, either truncate or produced into a cone, or a more or less elongated and hispid appendage; the stigmatic lines terminating at the base of the cone or appendage, not confluent.

SUB-TRIBE 1. MELAMPODINEAE. DC.

Flowers all unisexual,—the pistillate and staminate florets either on different plants (dioicous), or in different heads on the same plants (heterocephalous), or distinct in the same heads (monoicous). Anthers not caudate at base. Pappus none, or coroniform, or consisting of awns—never of hairs or bristles. Receptacle almost always chaffy.

DIV. 6. AMBROSIEAE. DC.

Heads heterocephalous—i. e. staminate and pistillate florets in distinct heads on the same plant,—the pistillate ones often apetalous—the staminate ones tubular. Scales of the involucre, in the fertile heads, united into an ovoid or oblong persistent covering, including or closely investing the florets and fruit often prickly or spinose. Pappus none. Anthers distinct or cohering but slightly.

87. AMBROSIA. Tournef. Endl. Gen. 2482. [Poetically, Food of the Gods: in this case something like Lucus, a non lucendo.] Staminate heads in terminal racemes or spikes,—the pistillate ones at their base or in the axils of the upper leaves. Staminate Fl. Involucre flattish, hemispherical, or subturbinate, composed of several united scales, 5 to 20-flowered. Corolla funnel-form, 5-toothed. Anthers tipped with a bristle-like inflexed appendage. Ovary none,—the abortive style included, minutely fringed at summit. Receptacle flattish, usually with filiform chaff among the

florets. PISTILLATE FL. Involucee globose-ovoid or turbinate, closed, acuminate, usually with 4 to 8 pointed tubercles near the summit, 1-flowered. Corolla none. Stamens none. Branches of the style filiform, elongated. Akene subglobose or obovoid. Annual Herbs. Leaves lobed, or pinnatifiely dissected.

1. A. TRIFIDA, L. Stem tall and stout, hairy and rough; leaves mostly opposite, palmately 3 or 5-lobed, hairy, scabrous,—the lobes oval lanceolate, acuminate; petioles narrowly winged, ciliate; racemes elongated, paniculate. Torr. & Gr. Fl. N. A. 2. p. 290. DC. Prodr. 5. p. 527. Fl. Cestr. p. 478.

TRIFID AMBROSIA.

Stem 3 to 6 or 8 feet high, branched. Leaves 4 to 6 or 8 inches long; petioles 1 to 2 inches long. Stam nate heads small, numerous, in long terminal paniculate racemes; florets whitish. Pistillate heals at the base of the racemes; the involucre turbinate-obovoid, with a conical apex, 6-ribbed, the ribs terminating in so many pointed tubercles, round, the base of the conical acumination. Low grounds, and waste places: Canada to Georgia. Fl. August. Fr. October.

- Obs. This coarse ugly weed has not acquired any popular name, that I know of; and yet it is sufficiently common, and worthless, to intitle it to the notice of every farmer who desires to keep his premises clear of such nuisances.
- 2. A. ARTEMISIAEFOLIA, L. Stem paniculately branched, villous; leaves bipinnatifid, smoothish above, somewhat canescent beneath,—the uppermost simply pinnatifid; petioles ciliate with long hairs; racemes somewhat spicate, paniculate. Torr. & Gr. Fl. N. A. 2. p. 291. DC. Prodr. 5. p. 526.

A. elatior. L. Fl. Cestr. p. 479. Also, DC. l. c.

Artemisia-leaved Ambrosia. Vulgò-Bitter-weed. Rag-weed.

Stem 1 to 3 or 4 feet high, usually much branched or bushy. Leaves 2 to 4 or 5 inches long; petioles half an inch to an inch and half long. Siam inate heads small, numerous, in terminal slender spicate racemes. Pistiliate heads solitary or clustered along the lower part of the staminate racemes and bracteate, or in the axils of the upper leaves: sometimes the heads are dioicous—specimens occurring in which the terminal racemes (or rather spikes), as well as the clusters beneath, are all pistillate, and the flowers in small sessile bracteate clusters. Cultivated fields, and pastures: Canada to Florida. Fl. Aug.—Sept. Fr. Octo.

Obs. This worthless weed occurs in most cultivated grounds,—and is usually very abundant among the stubble, after a crop of wheat: but, if the land be good, the plant seems to be smothered or choked out, the next season, by the crop of clover and timothy. It is always ready, however—like several other coarse weeds—to make its appearance whenever the grassy turf is broken up. The curious anomaly above mentioned,—of the flowers on the terminal spikes being all pistillate,—has been also observed by my friend, Mr. Daniel B. Smith, of Haverford School, near Philadelphia.

88. XANTHIUM. Tournef. Endl. Gen. 2480. [Greck, Xanthos, yellow; a color said to be produced by the plant.]

Heads glomerate-spicate,—the sterile spikes at the summit. Staminate Fl. numerous, in subglobose heads; scales of the involucre distinct, in a single series. Corolla tubular, clavate, somewhat hairy. Anthers connivent but distinct. Style abortive, undivided. Receptacle oblong, terete, chaffy. PISTILLATE Fl. 2, inclosed in a

2-celled oblong coriaceous closed *involucre*, which is armed with hooked prickles and terminated by 1 or 2 stout beaks. *Corolla* filiform. *Stamens* 0. *Branches of the style* linear-filiform. *Akenes* solitary in each cell of the involucre, oblong, flat. Annual *Herbs*. *Leaves* alternate, lobed or dentate.

1. X. STRUMARIUM, L. Leaves broad-ovate, mostly somewhat 3-lobed, dentate, unarmed at base; involucre of the fruit oval, with 2 straight beaks. Torr. & Gr. Fl. N. A. 2. p. 294. DC. Prodr. 5. p. 523. Fl. Cestr. p. 478.

Scrophulous Xanthium. Vulgò-Clot Bur. Cockle Bur.

Fr. Lampourde. Germ. Die Spitzklette. Span. Lampazo pequeño.

Stem 1 to 3 feet high, roughish-pubescent, branching. Leaves 3 to 6 inches in length, and nearly as wide as long, subcordate at base, but cuneately produced at the union of the 3 principal nerves. Heads of flowers in axillary clusters. Involucre of the fruit persistent, becoming an oblong bur, with rigid uncinate prickles. Road-sides, and waste places: Northern and Middle States: Introduced? Fl. August-September. Fr. October.

- Obs. This has the appearance of a naturalized stranger, in Pennsylvania, and is an obnoxious weed,—though not much inclined to spread; and with a little attention, is easily kept in subjection. The burs are a great annoyance in the fleeces of sheep. There is another species (X. echinatum, Murr.),—described by Torrey & Gray as being naturalized along the atlantic coast,—which has considerable general resemblance to this.
- 2. X. SPINOSUM, L. Leaves ovate-lanceolate, entire or somewhat 3-lobed, armed at base with slender 3-parted spines; involucre of the fruit cylindric-oblong, with an inconspicuous beak. Torr. & Gr. Fl. N. A. 2. p. 295. DC. Prodr. 5. p. 523. Fl. Cestr. p. 478.

Spinose Xanthium. Vulgò-Thorny Clot-Bur.

Stem 2 to 3 or 4 feet high, branched. Leaves 1 to 3 inches long, and one fourth to three fourths of an inch wide, entire or with a lobe-like tooth on each side,—the upper surface pale green, pubescent on the midrib—the under surface clothed with a short cinereous tomentum,—the base narrowed to a short petiole—on each side of which is a triple or 3-forked spine, the branches about an inch long, very sharp, yellowish or pale straw color. Heads of flowers axillary, solitary,—Farm yards; road sides, &c.: Massachusetts to Georgia: introduced. Native of Europe. Fl. September. Fr. October.

Obs. This execrable foreign weed is becoming naturalized in many portions of our country,—particularly in the Southern States. It may be frequently seen along the side-walks, and waste places, in the suburbs of our northern sea-port towns,—and is a vile nuisance wherever found. I have understood that the authorities of one of our cities, a few years since, enacted an Ordinance against the plant,—in which enactment it was denounced by the name of the Canada Thistle! The misnomer probably did not impair the efficacy of the Ordinance: Yet I cannot help thinking it would be decidedly preferable that both Lawgivers and Farmers should avoid confounding objects which are essentially distinct,—and learn to designate even weeds by their proper names.

SUB-TRIBE 2. HELIANTHEAE. Less.

Heads heterogamous and radiate—rarely homogamous and discoid; disk-florets perfect. Receptacle chaffy. Corolla of the perfect florets with the lobes often thickened and papillose. Anthers blackish, not caudate at base. Pappus either

wanting or coroniform, or consisting of awns which are sometimes chafty or with chaffy scales intermixed,—never of capillary bristles nor of uniform and distinct chaffy scales.

DIV. 2. EU-HELIANTHEAE. Torr. & Gr.

Rays sterile (neutral or imperfectly styliferous). ligulate. Akenes often compressed, but never obcompressed. Pappus coroniform, toothed, or of 1 to 4 awns or chaffy scales, or wanting.

89. HELIANTHUS. L. Endl. Gen. 2538.

[Greek, Helios, the sun, and Anthos, a flower; from the resemblance of the flowers.] Heads many-flowered; ray-florets numerous, neutral. Involucre imbricated in 3 or more series,—the scales often foliaceous and spreading at apex. Receptacle usually flat and large,—the persistent chaff embracing the akenes. Corolla of the disk commonly 10-nerved, with a short proper tube. Branches of the style hispid, subulate-conical at apex. Akenes laterally compressed or sometimes rather 4-sided, not winged or margined. Pappus of 2 chaffy or awn-like scales arising from the principal angles of the akenes, and often with 2 or more intermediate smaller scales, very deciduous. Herbs, annual or perennial, mostly stout and rough. Leaves sometimes scattered, but usually opposite or with only the upper ones alternate. Heads somewhat corymbose, sometimes few or solitary and very broad: rays bright yellow; disk-florets yellowish or sometimes purplish at summit.

1. H. Tuberosus, L. Root bearing oblong tubers; stem erect, branching, scabrous; leaves ovate, acuminate, serrate, 3-nerved, scabrous, petiolate,—the lower ones subcordate at base; petioles ciliate; scales of the involucre lanceolate, hispid and ciliate. Torr. & Gr. Fl. N. A. 2. p. 332. DC. Prodr. 5. p. 590. Fl. Cestr. p. 484. Tuberous Helianthus. Vulgò—Jerusalem Artichoke.

Fr. Topinambour. Germ. Die Erdartischoke. Span. Cotúfa.

Root perennial? (or rather appearing perennial, by the annual production of tuberous rhizomas?) Stem 4 to 6 or 8 feet high, stout, branching, terete, hirsute. Leaves 4 to 6 or 8 inches long, very scabrous on the upper surface, abruptly contracted at base to a narrow cuneately-tapering margined petiole, which is 1 to 2 or 3 inches long,—the lower leaves opposite (or rarely ternate), the upper ones alternate. Heads rather large. Akenes somewhat compressed and 4 sided, cuneate-oblong, smooth; pappus 1 to 4 (usually 2) subulate chaffy scales. Gardens, and Lots: cultivated. Native of Brazil. Fl. August—September. Fr. October.

Obs. This Sunflower is often cultivated for the firm fleshy tubers, or rhizomas, found at its roots. These tubers are pickled, and used as a condiment. They have been commended, also, for feeding Stock. It may be remarked, here, that in a rich mellow soil, they multiply so rapidly as to make the plant rather troublesome, and difficult to keep within bounds. The large Garden Sunflower (H. annus, L. with a fibrous root, and alternate broad-cordate or ovate leaves) is said to be worth cultivating, for the oil afforded by the seeds. There are several native species of Helianthus,—but none of Agricultural interest.

DIV. 4. BIDENTIDEAE. Less.

Rays neutral, ligulate—sometimes wanting. Akenes obcompressed, or often 4-sided, and sometimes terete, beaked at apex. Pappus consisting of 2 to 4 (rarely 5 or 6) barbed or retrorsely hispid awns.

90. BIDENS. L. Endl. Gen. 2541.

[Latin, Bi-dens, having 2 teeth; in allusion to the awns of the akenes.]

Heads many-flowered; ray-florets neutral, often inconspicuous and sometimes wanting,—those of the disk tubular and perfect. Involucre double,—the outer scales larger and often foliaceous. Receptacle flattish,—the chaff deciduous with the fruit. Corolla of the disk-florets funnel-form, with a slender tube. Branches of the style hairy at summit, terminated by a subulate cone. Akenes obcompressed, or sometimes slender and more or less 4-sided, often attenuate or beaked at summit, crowned with 2 or 4 (rarely 5 or 6) retrorsely hispid awns. Annual or sometimes perennial Herbs. Leaves opposite, incised-serrate or pinnatifiely dissected. Flowers mostly yellow.

- † Akenes flat and broadish, not beaked at summit, ciliate on the margins.
- 1. B. frondosa, L. Leaves odd-pinnately divided,—the lower ones with 5 divisions, the upper with 3; divisions distinct and mostly petiolulate, lanceolate, serrate; heads discoid, on slender axillary peduncles; outer scales of the involucre foliaceous, narrowed and ciliate at base, much longer than the head; akenes obovate-cuneate, 2-awned, pubescent and ciliate with erect hairs. Torr. & Gr. Fl. N. A. 2. p. 351. DC. Prodr. 5. p. 594. Fl. Cestr. p. 486.

Frondose Bidens. Vulgò-Bur-Marigold.

Root annual. Stem 2 to 4 or 5 feet hight, somewhat hairy, often dark purple, branched. Leaflets or segments 2 to 4 or 5 inches long, pilose beneath, abruptly narrowed at base to a short margined ciliate petiolule,—the common petiole 1 to 3 inches long. Heads rather small, on long slender naked peduncles. Involucre double,—the 8 or 10 outer scales lanceolate, leaf-like, unequal, 2 or 3 to 5 or 6 times as long as the head, ovate-lanceolate, with a scarious margin. Florets yellowish. Chaff of the receptacle linear-lanceolate, about as long as the akenes. Gardens, fence-rows, Indian-Corn fields, &c.: throughout the U. States. Fl. Aug.—September. Fr. Obtober.

- Obs. All the species, here enumerated, are very worthless, and particularly disagreeable weeds,—on account of the barbed awns of the fruit, which cause it to adhere in great numbers to clothing. This one is apt to be quite abundant in gardens, Indian-corn fields, &c. and if permitted to mature its fruit, becomes very annoying, in the latter part of summer.
- 2. B. CHRYSANTHEMOIDES, Mx. Leaves oblong-lanceolate, tapering at each end, serrate, sessile, and connate at base; heads conspicuously radiate, often somewhat nodding; outer scales of the involucre foliaceous, mostly shorter than the rays; akenes oblong-cuneate, 2 to 4-awned, retrorsely aculeate-ciliate on the margins. Torr. & Gr. Fl. N. A. 2. p. 352. DC. Prodr. 5. p. 595. Fl. Cestr. p. 485.

Also? B. quadriaristata. DC. l. c.

CHRYSANTHEMUM-LIKE BIDENS. Vulgò-Beggar-ticks.

Plant glabrous. Root annual. Stem 6 inches to 2 feet high, erect or often declined at base, branching, the branches opposite and axillary. Leaves 3 to 6 inches long. Heads rather large, solitary, terminating the branches. Outer scales of the involucre about 8, linear-lanceolate, ciliate-serrulate, spreading, the largest sometimes nearly as long as the rays; the inner scales membranaceous, elliptic or ovate-oblong, nearly equal, about as long as the disk-florets. Rays bright yellow, numerous, near an inch long. Akenes striate-ribbed and somewhat keeled on the flatted sides; awns usually 4. Chaff of the receptacle spatulate-linear,

scarious, 3-nerved, yellow, or sometimes purplish at summit. Low grounds; along swampy rivulets: generally throughout the U. States. Fl. Aug.—Sept. Fr. Octo.

Obs. This species is rather showy, when in flower,—and is less inclined than either the preceding or the following to invade cultivated grounds. It is, however, quite an objectionable weed, on account of the vast quantity of its adhesive fruit, in autumn. There appear to be several varieties of the plant,—noticed in Torrey & Gray's N. A. Flora.

† † Akenes slender, linear, 4-sided, beaked at summit, mostly smooth.

3. B. BIFINNATA, L. Leaves bipinnately dissected, petiolate,—the segments lanceolate or oblong-ovate, mucronate, usually narrowed at base; heads few-rayed, small, on slender angular-sulcate terminal and axillary peduncles; outer scales of the involuere scarcely as long as the inner ones; akenes long and slender, 4-angled and grooved, 3 or 4-awned. Torr. & Gr. Fl. N. A. 2. p. 354. DC. Prodr. 5. p. 603. Fl. Cestr. p. 487.

BIPINNATE BIDENS. Vulgè-Spanish Needles.

Plant glabrous Root annual. Stem 2 to 4 feet high, quadrangular, branched. Leaves 2 to 4 or 5 inches long, deltoid-ovate in the outline; petioles 1 to 3 or 4 inches long. Heads oblong, slender; rays 3 or 4, obovate, small, yellow with dark veins; disk-florets about 20, yellow. Akenes about three fourths of an inch long, somewhat scabrous with short erect hairs. Chaff of the receptacle lance-linear, shorter than the akenes. Gardens, and cultivated Lots: New England to Florida. Fl. August—September. Fr. October.

Obs. This, like the B. frondosa—if not carefully watched and eradicated—is a great pest incultivated Lots,—especially in Kitchen Gardens and Indian-corn fields. One or two other species, equally worthless as the preceding, are frequently to be met with, in low grounds: but those here given are the most common, and the most annoying,—and therefore most intitled to the notice of the farmer.

SUB-TRIBE 6. ANTHEMIDEAE. Cass.

Heads mostly heterogamous, never dioicous; ray-florets in one or more series, pistillate or rarely neutral, lighlate or tubular; disk-florets perfect or sometimes staminate. Receptacle naked or chaffy. Anthers not candate. Branches of the style truncate and mostly beated at apex—rarely produced into a short cone. Pappus none, or small and coroniform. Leaves mostly alternate, often much dissected.

DIV. 1. EU-ANTHEMIDEAE. DC.

Receptacle chaffy. Heads mostly radiate,—the rays ligulate, in a single series; disk-florets perfect.

91. MARUTA. Cass. Endl. Gen. 2640.

Heads many-flowered; rays mostly neutral, continuous or obscurely articulated with the abortive ovary. Involucre hemispherical,—the scales imbricated in few series, shorter than the disk. Receptacle prominently convex or oblong-conical, chaffy all over or only at summit. Akenes obovoid or obconic, ribbed, destitute of pappus. Annual Herbs. Leaves bi- or tri-pinnately dissected.

1. M. Cotula, DC. Scales of the involucre with whitish scarious margins; receptacle conical, chaffy at summit only; chaff subulate. Torr. & Gr. Fl. N. A. 2. p. 408. DC. Prodr. 6. p. 13.

Anthemis Cotula. L. Fl. Cestr. p. 489. Icon, Fl. Lond. vol. 3.

Vulgò—Stinking Chamomile. Dog's Fennel. May-Weed. [fetida. Fr. Maroute. Germ. Stinkende Kamille. Span. Manzanilla

Plant strongly fetid. Stem 6 to 12 inches high, mostly erect, somewhat pilose, leafy and much branched. Leaves 1 to 2 or 3 inches long, bi- and tri-pinnately dissected,—the segments short, flat, linear, acute. Heads terminal on elongated pubescent peduncles; rays white, sometimes imperfectly pistillate; disk yellow, prominently convex or subcylindric. Akenes oblong or obconic, striate-ribbed, mostly tuberculate in lines, with a minute disk at summit, but no sort of pappus. Farm yards, and waste places; throughout the U. States: introduced. Native of Europe. Fl. June—Sept. Fr. August—October.

Obs. This disagreeable little weed has become extensively naturalized; and although not apt to spread to an injurious extent over cultivated grounds, it is often quite abundant in lanes and farmyards, and not easily expelled.

92. ANTHEMIS. L. Endl. Gen. 2639.

[Greek, Anthemon, a flower; in allusion to the great number it bears.] Heads many-flowered; rays pistillate. Scales of the involucre imbricated in few series. Receptacle conical, with membranaceous chaff among the florets. Akenes terete or obtusely quadrangular; pappus minute, coroniform, or sometimes wanting. Annual or perennial Herbs. Leaves bipinnately dissected.

1. A. NOBILIS, L. Stems simple, numerous, spreading and decumbent, villous; leaves pinnately dissected, subvillous,—the segments multifid with the sub-divisions linear-subulate; chaff of the receptacle scarious, lanceolate, not awned at apex, a little shorter than the florets. DC. Prodr. 6. p. 6. Fl. Cestr. p. 488.

Noble Anthemis. Vulgò—Chamomile. Garden Chamomile.

Fr. Camomille Romaine. Germ. Die Kamille. Span. Manzanilla.

Root perennial, woody. Stems simple, but numerous from the root, 4 to 8 or 10 inches long. Leaves 1 to 2 inches long, sessile. Heads terminal on elongated leafless pubescent peduncles; rays white, finally reflexed; disk yellow, convex and at length conical. Akenes with a nearly obsolete crown-form pappus. Gardens: cultivated. Native of Europe. Fl. July. Fr. September.

Obs. The whole plant (and particularly the heads of flowers) is a fine aromatic bitter, and deservedly popular as a tonic medicine,—for which purpose it is generally cultivated. It is an old and still prevalent opinion, that this plant thrives better for being trampled upon or kept prostrate,—which is thus incidentally noticed by Shakspeare, in the first part of his King Henry IV.—"For though the Camomile, the more it is trodden on the faster it grows—yet youth, the more it is wasted the sooner it wears." There is another species (A. arvensis, L.) which is partially naturalized,—and appears as a weed in the cultivated grounds of some of the middle and northern States: but it is not of sufficient importance to call for a more extended notice, here. There are no native species.

93. ACHILLEA. L. Endl. Gen. 2649. [Named after Achilles, a disciple of Chiron,—who first used the plant.]

Heads many- or several-flowered; rays few and short, pistillate; tube of the disk-florets obcompressed. Involucre ovoid-oblong,—the scales imbricated, unequal. Receptacle flat or sometimes elon-

gated, chaffy. Akenes oblong, obcompressed, somewhat margined, destitute of pappus. Perennial Herbs. Leaves alternate, mostly pinnatifid. Heads small, corymbose.

1. A. MILLEFOLIUM, L. Stem sulcate-striate, somewhat villous; leaves bipinnately dissected,—the segments linear, incised-serrate, acute; corymb compound, fastigiate; rays about 5, roundish-obovate. Torr. & Gr. Fl. N. A. 2. p. 409. DC. Prodr. 6. p. 24. Fl. Cestr. p. 489. Icon, Fl. Lond. vol. 3.

THOUSAND-LEAF ACHILLEA. Vulgò-Yarrow. Milfoil.

Fr. La Millefeuille. Germ. Die Schafgarbe. Span. Milenrama.

Stem 2 to 3 feet high, hairy and somewhat lanuginous, mostly simple, corymbose at summit. Leaves 2 or 3 to 6 inches long (the radical ones still longer), nearly sessile, much and finely dissected. Heads small, numerous, in a dense terminal fastigiate corymb; rays white or often tinged with purple, crenate-dentate at apex; disk-florets whitish,—the tube sprinkled with resinous particles. Akenes obcompressed, slightly margined near the summit, smooth. Receptacle small, flat; chaff lance-oblong, acute. Pastures; fence-rows, &c.: throughout the U. States: introduced. Native of Europe. Fl. June—Sept. Fr. Aug.—Octo.

Obs. This foreigner has become completely naturalized. It is an aromatic bitter, and somewhat astringent,—quite popular as a tonic. The English agricultural writers speak of it as a plant of some value, in their pastures; but I believe it is universally regarded, here, as a mere weed. Certainly it is far inferior to our usual pasture plants,—and I think our cattle rarely eat it.

DIV. 2. CHRYSANTHEMEAE. DC.

Receptacle not chaffy. Heads mostly radiate,—the rays ligulate, pistillate or rarely neutral, in a single series; disk-florets perfect.

94. LEUCANTHEMUM. Tournef. Endl. Gen. 2667. [Greek, Leukos, white, and Anthemon, a flower; in reference to its white rays.] Heads many-flowered; rays pistillate, numerous. Involucre spreading or broad-campanulate,—the scales imbricated, with scarious margins. Receptacle flat or somewhat convex, naked. Tube of the disk-florets fleshy, obcompressed and slightly 2-winged. Akenes of the disk and ray similar, subterete, striate, mostly destitute of pappus. Perennial Herbs. Leaves alternate, mostly pinnatifid or incised-dentate. Heads rather large, solitary and terminal.

1. L. VULGARE, Lam. Stemerect, somewhat branched; leaves laciniately incised or pinnatifid-dentate,—the cauline ones sessile and somewhat clasping—the radical ones obovate-spatulate, petiolate; scales of the involucre with narrow russet-brown margins. Torr. & Gr. Fl. N. A. 2. p. 412. DC. Prodr. 6. p. 46.

Chrysanthemum leucanthemum. L. Fl. Cestr. p. 490. Icon, Fl. Lond. vol. 3. [weed.

Common Leucanthemum. Vulgò—Daisy. Ox-eye Daisy. White Fr. L'oeil de Beuf. Germ. Die Wucherblume. Span. Margarita mayor.

Stem 1 to near 2 feet high, erect or subdecumbent, angular and striate, somewhat hairy, simple or sparingly branched, but often several from the same root. Leaves 1 or 2 inches long,—the upper stem-leaves oblong—the lower ones cuneate-spatulate—and the radical ones obovate or orbicular-spatulate. Heads broad; rays very white—in length about equal to the diameter of the disk; disk-

florets yellow. Akenes subterete, ribbed, smooth, dark purple between the ribs, destitute of pappus. Receptacle slightly convex, dotted. Fields and meadows, more or less throughout the U. States: introduced. Native of Europe. Ft. June—Aug. Fr. July—Sept.

Obs. This vile intruder is becoming a great nuisance in our country. In some districts, the careless slovenly farmers have permitted it to get almost exclusive possession of their pasture fields,rendering them quite white, when the plant is in bloom. Cows will occasionally crop a portion of the weed, in our pastures, -and I have heard it alleged, that it contributes to the making of good Butter: but my own observations induce me to regard it as utterly worthless. It is propagated rapidly,—and is, moreover, exceedingly difficult to get rid of, when once fully established: so that one negligent sloven may be the source of a grievous annoyance to a whole community. I have understood that annual ploughing and cropping, for a few years, is the most effectual remedy for the evil: but then the fencerows and neighboring fields must be well watched, to prevent the formation and introduction of fresh seed. The Corn Marygold (Chrysanthemum segetum, L. a kindred plant)—which is said to be such a pest to the agriculture of Europe-does not appear to have found its way, as yet, to the U. States.

DIV. 3. ARTEMISIEAE. DC.

Receptacle naked (i. e. not chaffy). Heads discoid, homogamous or heterogamous; florets all tubular,—the central ones perfect—one or more series of the marginal ones sometimes pistillate.

95. TANACETUM. L. Endl. Gen. 2696.

[Corrupted from Athanasia, Gr. a, not, and Thanatos, death: from its durable flowers.]

Heads homogamous with the florets all perfect, or heterogamous with the marginal ones pistillate in a single series. Scales of the involucre imbricated, dry. Receptacle more or less convex. Akenes angled or ribbed, with a large epigynous disk. Pappus none or minute, coroniform, entire or toothed, often unequal. Perennial Herbs, or suffruticose plants. Leaves alternate, variously dissected. Heads solitary or corymbose.

1. T. VULGARE, L. Stem herbaceous, smoothish; leaves bipinnately parted,—the rachis and lobes incised-serrate; heads heterogamous, numerous, in a dense fastigiate corymb; pappus coroniform, of 5 equal lobes. Torr. & Gr. Fl. N. A. 2. p. 414. DC. Prodr. 6. p. 128. Fl. Cestr. p. 492.

Common Tanacetum. Vulgò—Tansey.

Fr. Tanaisie. Germ. Der Rainfarn. Span. Tanaceto.

Stems 2 to 4 feet high, somewhat branched above, often growing in clusters. Leaves 2 or 3 to 6 or 8 inches long, interruptedly pseudo-pinnate,—the segments pinnatifid, unequally incised-serrate. Heads depressed-hemispherical; involucre smoothish,—the outer scales lanceolate, acuminate—the inner ones oblong, obsuse; florets deep yellow, numerous and densely crowded,—the marginal ones trifid, obsoletely radiate. Receptacle nearly flat. Gardens, fence-rows, waysides, &c.: introduced. Native of Europe. Fl. July—Aug. Fr. September.

Obs. This was originally introduced as a garden plant, and generally cultivated for its aromatic bitter properties,—which have rendered it a prominent article in the popular Materia Medica. It has

now escaped from the gardens, and is becoming naturalized—and something of a weed—in many places.

96. ARTEMISIA. L. Endl. Gen. 2694. [Said to be so called from Artemis,—one of the names of Diana.]

Heads discoid, few- or many-flowered, heterogamous,—the central florets perfect (yet sometimes abortive), 5-lobed—the marginal ones pistillate in a single series, and 3-lobed,—or sometimes the heads are homogamous, with the florets all perfect. Scales of the involucre imbricated, mostly dry and with scarious margins. Receptacle flattish or convex, naked or villous. Akenes obovoid, with a small epigynous disk, destitute of pappus. Herbaceous or fruticose—mostly perennial plants. Leaves alternate, usually pinnatifid.—Heads small, racemose or paniculately spicate.

- §.1. Receptacle naked: Heads heterogamous,—the central or diskflorets apparently perfect, but sterile by the abortion of the ovary.
- 1. A. Dracunculus, L. var. sativa, Bess. Herbaceous, green and glabrous; stem erect, branching; radical leaves trifid at apex,—stem-leaves linear-lanceolate, sub-dentate or entire; heads subglobose, racemose-paniculate; scales of the involucre with scarious margins,—the outer ones oblong—the inner ones broadly elliptic. DC. Prodr. 6. p. 97.

LITTLE-DRAGON ARTEMISIA. Vulgò-Tarragon.

Fr. Estragon. Germ. Esdragon. Span. Estragon.

Root perennial. Stem 2 to 3 feet high. Leaves 1 to 2 or 3 inches long, mostly entire sessile, narrowed at each end, those on the branches smaller. Heads small. Florets yellowish. Gardens: cultivated. Native of Russia and Siberia. Fl. August. Fr. September.

- Obs. This species is sometimes cultivated, in the kitchen gardens of the curious, for the sake of its aromatic herbage. It is said to impart a fine flavor to vinegar, by steeping a bunch of the green Herb in that liquid.
- §. 6. Receptacle villous or hairy: Heads heterogamous,—the florets all fertile.
- 2. A. Absinthium, L. Silky-canescent; stem suffruticose, angular-sulcate, paniculately branched above; leaves bipinnatifid,—the segments lanceolate, often incised; heads hemispherical, racemose-paniculate, nodding; outer scales of the involucre linear—the inner ones rounded, scarious. Torr. & Gr. Fl. N. A. 2. p. 424. DC. Prodr. 6. p. 125. Fl Cestr. p. 491.

Vulgo-Worm-wood.

Fr. L'Absinthe. Germ. Der Wermuth. Span. Axenjo.

Plant hoary with a short and rather dense silky pubescence. Root perennial. Stems 2 to 4 feet high, clustered or numerous from the root. Leaves 1 to 2 or 3 inches long, petiolate, multifid or irregularly bipinnatifid,—the principal segments often trifid, and cuneate at base—the subdivisions elliptic-oblong, obtuse, entire. Heads numerous, in leafy paniculate racemes; florets yellowish. Akenes obconic-oblong, smooth. Gardens: cultivated. Native of Europe. Fl. August. Fr. September—October.

Obs. This plant—proverbial for its bitterness—is generally kept in gardens; and is valuable for its medicinal properties, as a tonic, vermifuge, &c.

There is another species (A. Abrotanum, L.), commonly known by the name of "Southern-wood," or "Old Man," frequent in gardens; and a fourth (A. vulgaris, L.), called "Mug-wort," is occasionally met with: But these are of less importance,—and scarcely intitled to a place, here.

SUB-TRIBE 7. GNAPHALIEAE. Less.

Heads discoid, homogamous or heterogamous, sometimes dioicous; florets all tubular,—the pistillate ones filiform, or very rarely ligulate. Anthers caudate at base! Style, in the perfect florets, with the branches not appendiculate,—in the staminate ones mostly undivided. Pappus capillary or setaceous—rarely wanting. Leaves mostly alternate.

Receptacle not chaffy.

97. GNAPHALIUM. L. Endl. Gen. 2746.

[Greek, Gnaphalon, soft down or wool,—with which the plants are clothed.] Heads many-flowered, heterogamous; florets all tubular,—the outer ones pistillate, very slender, mostly in several series—the central ones perfect. Involucre ovoid; scales imbricated, appressed, scarious or hyaline. Receptacle flat. Akenes subterete, or sometimes obcompressed. Pappus in a single series, capillary and scabrous. Herbaceous or rarely suffruticose plants, mostly woolly or tomentose. Leaves sessile or decurrent. Heads corymbose, glomerate, or spicate; scales of the involucre variously colored.

1. G. POLYCEPHALUM, Mx. Stem herbaceous, erect, paniculately branched; leaves linear-oblanceolate, acute, sessile and not decurrent, smoothish above, tomentose beneath; heads numerous, in terminal corymbose clusters. Torr. & Gr. Fl. N. A. 2. p. 427. DC. Prodr. 6. p. 227. Fl. Cestr. p. 494.

Many-headed Gnaphalium. Vulgò—Life-everlasting.

Root annual. Stem 1 to 2 feet high, hoary-tomentose and generally much branched. Leaves 1 to 3 inches long, somewhat undulate on the margins, green and nearly smooth on the upper surface—whitish and densely tomentose beneath. Heads rather small, oblong-ovoid, ochroleucous, aggregated in dense terminal clusters, very fragrant. Florets slender, yellowish. Akenes oblong, subterete, smooth. Pappus somewhat tawny. Old fields, and Pastures: Canada to Texas. Fl. Aug.—Sept. Fr. October.

Obs. This is often quite abundant in old pasture fields; and although not a pernicious plant, it is altogether valueless to the farmer, and must be regarded as a mere weed.

SUB-TRIBE 8. SENECIONEAE. Cass.

Heads homogamous or heterogamous (never dioicous), discoid or radiate; rays (when present) ligulate, in a single series. Receptacle very rarely chaffy. Anthers not caudate. Pappus capillary—sometimes wanting on the outer akenes. Leaves alternate.

DIV. 1. ERECHTITEAE. DC.

Hads discoid, heterogamous; florets all tubular,—the marginal ones pistillate.

98. ERECHTITES. Rafin. Endl. Gen. 2790. [One of the names given, by Dioscorides, to the Senecio.]

Heads many-flowered, discoid; marginal florets pistillate, very slender, 2 or 3-toothed,—the others perfect, 4 or 5-toothed. Involucre cylindrical,—the scales in a single series, linear, acute, bracte-

olate. Receptacle naked, somewhat papillose. Branches of the style tipped with a pubescent cone. Akenes oblong, striate, somewhat attenuated at apex. Pappus copious and smoothish, of very fine capillary bristles in several series. Annual Herbs. Heads corymbose.

1. E. HIERACIFOLIA. Raf. Stem simple, or paniculate at summit; leaves lance-oblong, narrowed at base, acute, unequally incised-dentate, sessile,—the upper ones often sagittate-auriculate and somewhat amplexicaul; involucre sub-cylindric, smooth, with subulate-linear bracteoles at base. Torr. & Gr. Fl. N. A. 2. p. 434. DC. Prodr. 6. p. 294.

Senecio hieracifolius. L. Fl. Cestr. p. 498.

HIERACIUM-LEAVED ERECHTITES. Vulgò-Fire-weed.

Stem 2 to 4 or 5 feet high, rather large, succulent and tender when young, striate-sulcate, more or less hairy, sometimes nearly smooth. Leaves 3 to 6 or 8 inches long. Heads middle-sized, often numerous, in small cymose corymbs terminating the paniculate branches; involucre terete-oblong, slightly ventricose; florets whitish or ochroleucous, very slender and numerous. Pappus very white, of numerous fine and almost silky hairs. Receptacle flat, roughish-dotted. Moist grounds; recent clearings, &c.: throughout the U. States. Fl. July—August. Fr. September.

Obs. This plant (which has much the aspect of a Sonchus, or Sow-thistle) is remarkable for its prevalence in newly-cleared grounds,—especially in and around the spots where brush-wood has been burnt; whence its common name, "Fire-weed." It is a coarse worthless weed, and often very abundant in new grounds; but it is not apt to be troublesome in cultivated fields.

DIV. 2. EU-SENECIONEAE. DC.

Heads either homogamous and discoid, or heterogamous and radiate,—the ray-florets pistillate.

99. SENECIO. L. Endl. Gen. 2811. [Latin, Senex, an old man; the pappus resembling a white beard.]

Heads many-flowered,—either discoid with the florets all tubular and perfect—or radiate with the ray-florets pistillate. Scales of the involucre in a single series, or calveulate with a few accessory scales. Receptacle naked or alveolate, not chaffy. Branches of the style, in the perfect florets, truncate,—the apex only minutely penicillate. Akenes not beaked nor winged—often grooved or ribbed. Pappus

Akenes not beaked nor winged—often grooved or ribbed. Pappus of numerous very slender caducous hairs. Herbs, or sometimes shrubby plants. Leaves alternate. Heads solitary, paniculate or corymbose.

*** Perennial: Heads mostly radiate, corymbose. Radical leaves undivided.

1. S. Aureus, L. Smooth, or often somewhat arachnoid-woolly when young; radical leaves roundish-ovate and subcordate, or varying to obovate and oblong-lanceolate, crenate-serrate, petiolate; lower stem-leaves lyrate,—the upper ones lanceolate, pinnatifid, sessile or partly clasping; corymb subumbellate. Torr. & Gr. Fl. N. A. 2. p. 442. DC. Prodr. 6. p. 432. Fl. Cestr. p. 496.

Also, S. obovatus, and Balsamitae. Muhl. DC. l. c. Fl. Cestr. p. Golden Senecio. Vulgò—Groundsel. Squaw-weed. [497.

Stem 1 to 2 feet high, corymbosely branched,—the lower branches elongated, axillary and distant—the upper ones crowded or subumbellate at the summit of the stem. Leaves 1 to 3 inches long, varying in form on the different varieties; petioles of the radical leaves 1 or 2 to 6 or 8 inches long. Heads terminal on the fastigiate branches; rays and disk yellow. Akenes linear-oblong. striate-ribbed; pappus white. Banks of streams; moist sterile fields, and meadows: throughout the U. States. Fl. April—June. Fr June—July.

Obs. Torrey and Gray have reduced Muhlenberg's two species (viz. obovatus, and Balsamitae,) to varieties of the S. aureus, L. The var. Balsamitae-with a nearly simple stem, and elliptic or lance-oblong radical leaves-is a frequent weed in poor moist meadows and pastures,-where the farmer may often see patches, in the spring, made conspicuous by its yellow rays. The var. obovatus (called "Squaw-weed") has been denounced, by an Agricultural writer in New York, as being poisonous to sheep; but I know not how correctly, - and am rather inclined to doubt the accuracy of the statement. The Senecios are a multitudinous family. Prof. DE CANDOLLE describes nearly 600 species,—of which about 40 are enumerated by Torrey & Gray as inhabitants of North America. Although the species are so numerous—and, I believe, altogether worthless,-I do not know that they have been found very troublesome, on the farm. Our native ones, certainly, have not. The common Groundsel, of Europe (S. vulgaris, L .- a homely little weed, with discoid heads and pinnatifid leaves) - which DE CANDOLLE says migrates almost every where with European men-has been introduced about the sea-ports of the northern States; but it does not appear to extend itself very rapidly.*

TRIBE V. CYNAREAE. Less.

Heads homogamous or heterogamous, sometimes dioicous. Style, in the perfect florets, often nodose-thickened near the summit (sometimes penicillate at the node); the branches either distinct or concrete, puberulent externally,—the stigmatic lines extending to their apex, and there confluent.

SUB-TRIBE 2. CENTAURIEAE. DC.

Heads discoid, many-flowered,—the marginal florets usually neutral, irregular and much larger than the central ones. Scales of the involucre imbricated, variously appendiculate. Akenes with an arcola (or small cavity) at base which is more or less lateral. Pappus capillary, bristly, or chaffy—never plumose,—sometimes wanting.

100. CENTAUREA. L. Endl. Gen. 2871.

[From the Centaur, Chiron,—who, it is said, cured his wound with the plant.] Heads many-flowered; florets unequal,—the marginal ones larger and neutral, or sometimes wanting,—the central ones perfect. Involucre imbricated, the scales various. Receptacle bristly-paleaceous. Akenes compressed. Pappus usually composed of scabrous filiform bristles in one or more series,—the inner series often smaller and somewhat connivent. Polymorphous Herbs. Leaves alternate. Heads solitary, large.

^{*}Since the above was written, the S. rulgaris has been detected in the streets of West Chester, Pa. by Mr. Pennock Passmore—a gentleman who is at once a practical farmer and an acute observer, with the eye of a Botanist. It is possible the plant may yet become generally disseminated,—though I had only noticed it in the vicinity of Philadelphia, before Mr. Passmore pointed it out to me in my own village.

1. C. Cyanus, L. Floccose-tomentose; stem erect, much branched; leaves lance-linear, sessile, entire,—the lower ones broader, tapering into a kind of petiole, toothed or pinnatifid at base; pappus shorter than the akene. Torr. & Gr. Fl. N. A. 2. p. 454. DG. Prodr. 6. p. 578. Fl. Cestr. p. 435. Icon, Fl. Lond. vol. 3.

BLUE CENTAUREA. Vulgà-Blue-bottle. Ragged Robin. Blue Bonnets, of the Scotch.

Fr. Bluet. Germ. Die Korn-blume. Span. Ciano.

Root annual. Stem 1 to 2 or 3 feet high. Leaves 2 to 6 inches long, hoary-villous or lanuginous—especially on the under side. Heads roundish-ovoid pedunculate, not bracteate; outer scales of the involucre ovate serrate.—the inner ones longer, lanceolate, scarious and entire below, serrate near the apex. Florets of obsoletely pistillate, larger, spreading or recurved, funnel-form with a long tube, blue, or sometimes purplish or white. Akenes oblong, compressed, striate, pilose, with a cavity (areo.a) on one side of the base: pappus composed of numerous russets cabrons hairs of unequal length. Gardens and cultivated fields: Northern and Middle States: introduced. Native of Europe. Fl. July. Fr. August.

Obs. This plant is often seen in Gardens,—and in some places is gradually straggling into the cultivated fields. As it is considered a troublesome weed, among the grain crops of Europe, it may be well to watch and arrest its progress, here. Every worthless intruder should be regarded with a jealous eye, by the farmer.

SUB-TRIBE 3. CARDUINEAE. Less.

Heads discoid, homogamous, many-flowered; florets all similar, perfect or dioicous. Scales of the involucre imbricated in several series, often spinose at apex. Corolla usually curved outwards,—the exterior lobe often more deeply separated than the others. Anthers slightly or not at all caudate. Alenes not beaked, glabrous, with a terminal areola. Pappus composed of slender scabrous or plumose bristles, which are often united into a ring at the base.

101. CYNARA. Vaill. Endl. Gen. 2882.

[Greck, Kyon, kynos, a dog; the spines of the involucre resembling dog's teeth.] Heads homogamous, many-flowered; florets all equal. Involucre ovoid,—the scales imbricated, coriaceous, produced into a lanceolate appendage which is spinescent at apex. Receptacle flat, fimbrillate or bristly-paleaceous. Corolla 5-cleft,—the limb thick at base, half as long as the tube, the lobes very unequal. Anthers with a very obtuse appendage; filaments papillose, somewhat barbed.— Branches of the style concrete. Akenes obovate compressed or 4sided, smooth; areola broad, somewhat oblique. Pappus in several scries, long, plumose, -the bristles free at base, but attached to a decideous ring. Perennial spinose Herbs. Leaves alternate, pinnatifidly lobed, not decurrent. Heads large, with a thick fleshy receptacle.

1. C. Scolymus, L. Stem branching; leaves subspinose, bipinnatifid and sometimes undivided, tomentose beneath; scales of the involucre ovate, thick and fleshy at base, obtuse at apex and somewhat emarginate,-rarely subspinescent, straight or slightly diver-

gent. DC. Prodr. 6. p. 620. Vulgò—Artichoke.

Fr. Artichaud. Germ. Die Artischoke. Span. Alcachofa.

Root perennial. Stem 3 to 5 feet high, stout, striate and tomentose. Leaves large, entire or lobed and spinose. Heads ovoid, 2 to 3 inches in diameter; florets blue or violet-purple. Gardens: cultivated. Native country uncertain. Fl. Aug. Fr. September.

Obs. The thick receptacle—together with the fleshy bases of the scales of the involucre—affords a favorite vegetable dish,—for which this plant is cultivated, by those who are curious in such matters. I have seen magnificent specimens from the Garden of Mrs. Latimer (near Wilmington, Del.),—a Lady who excels in the culture of

rare plants, choice fruits, and beautiful flowers.

Another species, called Cardoon (C. Cardunculus, L.),—with the leaves all bipinnately lobed, and more spinose,—to which the foregoing is nearly allied (if, indeed, it be not, as Prof. De Candolle suggests, a mere variety produced by long culture)—is also cultivated for the thick fleshy petioles and ribs of the leaves,—which are rendered delicate and white by etiolation, or blanching, after the manner practiced with Celery.

102. CIRSIUM. Tournef. Endl. Gen. 2887.
[Greek, Kirsos, a varix, or enlarged vein; for which the plant was a supposed remedy.]

Heads many-flowered; florets all similar and perfect, or rarely dioicous. Involucre subglobose; scales imbricated in numerous series, mostly cuspidate or tipped with a spine. Receptacle fimbrillate. Corolla with the limb regularly, or sometimes unequally, 5-cleft,—the tube rather short. Anthers more or less produced and lacerate at base; flaments often hairy. Branches of the style concrete nearly or quite to the apex. Akenes oblong, compressed, not ribbed, glabrous; areola terminal. Pappus of many series,—the hairs united into a deciduous ring at base, plumose, merely denticulate (the stouter ones slightly clavellate) at apex. Biennial or perennial Herbs. Leaves alternate, sessile or decurrent, often pinnatifid with the margins and segments spinose,—the radical ones much larger than the cauline—as is usual with biennials.

1. C. LANCEOLATUM, Scop. Leaves decurrent on the stem and forming a spinose lobed wing, pinnatifid, prickly hispid on the upper surface, arachnoid-lanuginous beneath,—the segments lanceolate, bifid, divaricate, spinose; involucre ovoid, nearly bractless; scales linear-lanceolate, tipped with a spine, the outer ones spreading. Torr. & Gr. Fl. N. A. 2. p. 456. DC. Prodr. 6. p. 636.

Carduus lanceolatus, L. Fl. Cestr. p. 436.

LANCEOLATE CIRSIUM. Vulgò-Common Thistle.

Fr. Chardon lanceolé. Germ. Die Kratzdistel. Span. Cardo.

Root biennial. Stem 2 to 4 feet high, branched, striate-sulcate, hairy, winged by the decurrent leaves. Leaves 4 to 8 or 12 inches long. Heads terminal, erect, about an inch in diameter; scales of the involucre connected by a cobweb-like villus. Florets purple, with yellowish anthers. Akenes small, obovate-oblong; pappus about an inch long, silky. Pastures, fence-rows, way-sides. &c. Northern and Middle States: introduced. Native of Europe. Fl. June—July. Fr. July—August.

Obs. This foreigner—which delights in a rich soil—is abundantly naturalized in Pennsylvania, and the Northern States, generally.—Though not so repulsive and ugly as some of the spinose Compositae of Europe (such as Onopordon, Carlina, Kentrophyllum, &c.), it is nevertheless a very objectionable weed, on our farm,—and requires constant vigilance and attention to exclude it, or keep it in subjection. If permitted to mature its fruit, the spreading pappus may be

seen, by hundreds, floating the akenes through the air, and disseminating the noxious intruder far and wide.

2. C. discolor, Spreng. Leaves sessile, more or less deeply pinnatifid, sparsely hairy and green above, densely hoary-tomentose beneath,—the segments linear-lanceolate, cuspidate and spinulose-ciliate; involucre ovoid-oblong; scales appressed, tipped with a slender prickle,—the outer or lower scales lance-ovate, the inner or upper ones linear-lanceolate. Torr. & Gr. Fl. N. A. 2. p. 457. DC. Prodr. 6. p. 640.

Carduus discolor. Nutt. Fl. Cestr. p. 437.

TWO-COLORED CIRSIUM.

Root biennial. Stem 2 to 5 feet high, with rather slender spreading leafy branches, striate, pubescent with crisped membranous hairs. Leaves 3 or 4 to 12 or 15 inches long (those on the branches small), the under surface bluish-white with a soft dense tomentum. Heads 1 to 2 inches long, and an inch or more in diameter; scales somewhat arachnoid-villous, all appressed, terminating in a slender spreading spine. Florets reddish-purple, with whitish anthers. Fields, and borders of thickets: Northern and Western States. Fl. Aug.—Sept. Fr. Sept.—October.

Obs. Like all others of the genus, this is a worthless, obnoxious weed,—but is much easier kept in subjection, than the preceding.

3. C. Pumilum, Spreng. Leaves semi-amplexicaul, pinnatifid, green on both sides,—the segments short, irregularly lobed, spinulose-ciliate and pointed with strong sharp spines; heads few and large, roundish-ovoid, bracteate; scales of the involucre appressed,—the outer ones ovate-lanceolate, acuminate, tipped with a short spine, the inner ones lance-linear with acuminate scarious serrulate tips. Torr. & Gr. Fl. N. A. 2. p. 459. DC. Prodr. 6. p. 651.

Carduus pumilus. Nutt. Fl. Cestr. p. 437.

Low or DWARF CIRSIUM.

Plant pale greyish green. Root biennial. Stem 1 to 2 feet high, stout, sparingly branched, striate, retrorsely pilose. Leaves 4 to 12 inches long very prickly, more or less hairy, densely pilose on the midrib beneath. Heads few (1 to 3), often near 2 inches in diameter, mostly with large pinnatifid spinose bracts at base. Florets often 2 inches in length, usually of a pale reddish-purple, with whitish anthers Neglected old fields, and low grounds: Middle and Northern States. Fl. July. Fr. August.

Obs. The flowers of this species are quite fragrant, and the heads somewhat showy or conspicuous,—being larger than those of any other native thistle. It does not disseminate rapidly; and is therefore easily kept in subjection, by proper attention.

4. C. HORRIDULUM, Mx. Leaves semi-amplexicaul, pinnatifid, lanuginous beneath,—the short segments toothed or incised, strongly spinose; involucre ovoid, large, with a verticil of pectinately spinose bracts at base; scales loosely imbricated, linear-lanceolate, tapering to a subulate point, but scarcely spinose. Torr. & Gr. Fl. N. A. 2. p. 460. DC. Prodr. 6. p. 651.

Carduus spinosissimus. Walt. Fl. Cestr. p. 438.

Somewhat Rugged Cirsium. Vulgò-Yellow Thistle.

Root biennial? (perennial, DC.). Stem 18 inches to 2 or 3 feet high, rather stout, simple or sparingly branched, arachnoid-lanuginous when young, finally

smoothish. Leaves 4 to 12 inches long, hairy on the upper surface, lanuginous beneath,—the segments pointed with short rigid spines. Heads terminal, few, (often but one), nearly as large as in the preceding species, surrounded at base by a whorl of numerous (10 to 20 or 30) linear-lanceolate bracts, about as long as the involucre,—the bracts subpinnatifid or sinuate-dentate, pectinately spinose, with the spines somewhat in pairs, or fascicled. Florets an inch to an inch and half long, pale yellow (sometimes purple? or becoming purple in drying?). Pastures, and waste places: Sea coast, from Massachusetts to Louisiana: introduced? Fl. July. Fr. August.

- Obs. This rugged repulsive plant has, to me, the appearance of a foreigner, in our soil. I have only met with it on the sandy coast of New Jersey,—and in a single locality in Chester County, Penna., where it was evidently a stranger. It is very desirable that it should continue to be a stranger, to our farms.
- 5. C. ARVENSE, Scop. Rhizoma creeping; stem rather slender, striate-angled, paniculately branched at summit; leaves sessile, lance-oblong, sinuate-pinnatifid and dentate, undulate, ciliate-spinose; heads numerous, small, sometimes dioicous; involucre oblongovoid; scales appressed, lance-ovate, mucronate,—a few of the outer ones cuspidate-spinose. Torr. & Gr. Fl. N. A. 2. p. 460. DC. Prodr. 6. p. 643.

Carduus arvensis. Sm. Fl. Cestr. p. 439.

Cnicus arvensis, Hoffm. Fl. Lond. Icon, vol. 3.

FIELD CIRSIUM. Vulgò-Canada Thistle. Cursed Thistle.

Fr. Chardon aux Anes. Germ. Die Acker Kratzdistel.

Rhizoma perennial,—creeping horizontally 6 or 8 inches below the surface of the ground, and giving off numerous erect biennial branches. Stem 18 inches to 3 feet high, slender and smoothish—the branches slender and lanuginous. Leaves 4 to 8 or 10 inches long, sessile and slightly decurrent, smoothish on the upper surface, sometimes arachnoid-lanuginous beneath,—the radical ones curled or wavy. Heads half an inch to two thirds of an inch in diameter, terminal, sub-pedunculate; scales smoothish, minutely chiate. Florets palish lilacpurple, with whitish anthers, perfect or the heads dioicous by abortion. Akenes linear-oblong, slightly 4-cornered; pappus finally longer than the florets. Fields, and way-sides: Northern and Middle States: introduced. Native of Europe. Fl. July. Fr. August.

Obs. This foreigner is, perhaps, the most execrable weed that has yet invaded the farms of our Country. The rhizoma, or subterranean stem (which is perennial and very tenacious of life,) lies rather below the usual depth of furrows,—and hence the plant is not des-This rhizoma ramifies and extends troyed by common ploughing. itself horizontally in all directions, -sending up branches to the surface, where radical leaves are developed the first year-and aerial stems the second year. The plant appears to die, at the end of the second summer; but it only dies down to the horizontal subterranean stem. The numerous branches, sent up from the rhizoma, soon cover the ground with the prickly radical leaves of the plant,and thus prevent cattle from feeding where they are. Nothing short of destroying the perennial portion of the plant will rid the ground of this pest; and this, I believe, has been accomplished by a few years of continued culture (or annual cropping of other plants, that require frequent ploughing, or dressing with the hoe,) -so as to prevent the development of radical leaves, and deprive the rhizoma of all connection or communication with the atmosphere.

The following notice of this annoying weed, from Curtis' Flora Londinensis, may not be uninteresting to the American farmer:

"Vitium agrorum apud nos primarium est [it is the greatest pest of our fields], Linnaeus observes in his Flora Lapponica. The same may be said with us: and we have bestowed on this plant the harsh name of cursed, with a view to awaken the attention of the Agriculturists of our country to its nature and pernicious effects.

"Repeated observation has convinced us that many husbandmen are ignorant of its economy,—and while they remain so, they will not be likely to get rid of one of the greatest pests which can affect their corn fields and pastures. Of the Thistle tribe the greatest part are annual or biennial, and hence easily destroyed. Some few are not only perennial, but have powerfully creeping roots,—and none so much as the present. In pulling this plant out of the ground, we draw up a long slender root which many are apt to consider as the whole of it; but if those employed in such business examine the roots so drawn up, they will find every one of them broken off at the end: for the root passes perpendicularly to a great depth, and then branches out horizontally under ground.

"To give an idea of its astonishing increase, we shall subjoin from the memoirs of the Bath Agricultural Society an experiment made for the very purpose of ascertaining it. When this paper was delivered to the Society, from experiments then made, I was of opinion that repeated mowing or spudding would not destroy this Thistle. I have since had cause, from further observation and experiments, to think differently: so deep, however, does it penetrate, that these operations are the only ones which can well be applied to its destruction,—and if they do not effectually overcome, they will

greatly enfeeble it."

Two or three other species of *Cirsium* are frequently to be met with (viz: C. muticum, Mx. with the heads not spinose,—and C. altissimum, Spreng. with the stem-leaves not pinnatifid): But, as they do not incline much to infest the open grounds or farm land, I have not judged it necessary to notice them more particularly, here.

103. LAPPA. Tournef. Endl. Gen. 2892.

[Celtic, Llap, a hand—or Greek, labein, to seize; from its adhesive involucres.] Heads many-flowered; florets all perfect and similar. Involucre subglobose; scales imbricated, coriaceous, appressed at base, spreading and subulate above, with the rigid apex uncinately incurved. Receptacle somewhat fleshy, bristly-paleaceous. Corolla regularly 5-cleft, 10-nerved. Anthers tipped with filiform appendages, and caudate at base; flaments papillose. Branches of the

*"April 1st, 1778, I planted in a garden a piece of the root of this Thistle, about the size of a goose quill, and 2 inches long, with a small head of leaves, cut off from the main root just as it was springing out of the ground. By the 2nd of the November following, this small root had thrown out shoots, several of which had extended themselves to the distance of 8 feet,—some had even thrown up leaves 5 feet from the original root: most of the shoots, which had thus far extended themselves, were about 6 inches under ground,—others had penetrated to the depth of 2 feet and a half: the whole together, when dug up and washed from the earth, weighed 4 pounds. In the spring of 1779, contrary to my expectation, this Thistle again made its appearance on and about the spot where the small piece was originally planted. There were between 50 and 60 young heads, which must have sprung from the roots which had eluded the gardener's search,—though he was particularly careful in extracting them."

style free and divergent at apex. Akenes oblong, compressed, transversely rugose. Pappus in several series, short, filiform, scabrous, not united into a ring at base, caducous. Biennial Herbs, coarse and branching. Leaves alternate, subcordate, petiolate, large. Heads rather small, solitary or somewhat corymbose.

1. L. MAJOR, Gaertn. Lower leaves cordate-oblong, upper ones ovate; scales of the involucre all subulate with uncinate tips, smooth or loosely arachnoid. Torr. & Gr. Fl. N. A. 2 p. 463. DC. Prodr. 6. p. 661.

Arctium Lappa. L. Fl. Cestr. p. 436. Icon, Fl. Lond. 3.

GREATER LAPPA. Vulgò-Bur-dock.

Fr. Glouteron. Germ. Die Klette. Span. Bardana Lampazo.

Root biennial. Stem 2 to 4 or 6 feet high, paniculately branching, striate-sulcate, roughish-pubescent. Leaves green and roughish-pubescent above, paler and arachnoid-tomentose beneath,—the radical ones 1 to 2 feet long, erosely dentate and undulate on the margin (sometimes pinnatifid, or coarsely and deeply dentate); petioles 9 to 18 inches long; stem-leaves smaller, and more or less ovate. Heads roundish-ovoid, on short peduncles, terminal and axillary; scales of the involucre subulate-lanceolate, keeled, minutely serrulate, smoothish, spreading, with the point incurved and hooked. Florets purple, with bluish anthers. Akenes compressed, angular, rugose. Receptacle fimbrillate,—the bristly chaff smooth, longer than the akenes. Fence-rows, and waste places: introduced. Native of Europe. Fl. July—Sept. Fr. Sept.—October.

Obs. Every body knows this coarse homely weed, wherever it has gained admittance,—but every body does not take care to keep it in due subjection. One of the earliest and surest evidences of slovenly negligence, about a farm-yard, is the prevalence of huge Bur-docks. The plant is considerably bitter; and the leaves are a favorite external application in fevers, head-ache, &c.

SUB-ORDER III.* LIGULAEFLORAE. DC.

Florets all ligulate and perfect, disposed in a homogamous radiatiform head.

TRIBE VIII. CICHORACEAE. Vaill.

Style cylindric above,—the summit, as well as the rather obtuse branches, equally or uniformly pubescent; stigmatic lines terminating below or near the middle of the branches. Plants with a milky juice! Leaves alternate.

SUB-TRIBE 2. HYOSERIDEAE. Less.

Pappus coroniform or of numerous small chaffy scales, in one or two series. Receptacle not chaffy.

104. CICHORIUM. Tournef. Endl. Gen. 2978. [Etymology obscure: perhaps from Chicouryeh, the Arabic name of the plant.] Heads usually many-flowered. Involuce double,—the outer one of about 5 short spreading scales—the inner one of 8 or 10 scales. Akenes turbinate, somewhat compressed and angular, striate, glabrous. Pappus of numerous very small chaffy scales. Branching Herbs.

1. C. INTYBUS, L. Radical leaves runcinate, hispidly scabrous on the midrib,—the cauline ones small, oblong or lanceolate, partly

^{*}SUB-ORDER II. LABIATIFLORAE, contains no plant of Agricultural interest.

clasping, sinuate-dentate or entire—those of the branches inconspicuous; heads axillary, subsessile, mostly in pairs. Torr. & Gr. Fl. N. A. 2. p. 472. DC. Prodr. 7. p. 84. Fl. Cestr. p. 440. Icon, Fl. Lond. 3.

Vulgò-Wild Succory. Chiccory.

Fr. La Chicoree sauvage. Germ. Der Wegewart. Span. Achicoria.

Root perennial, somewhat fusiform. Stem 2 to 4 feet high, angular-striate, roughish-pubescent, with numerous and somewhat virgate scabrous branches. Radical leaves 4 to 8 or 10 inches long, numerous. Heads axillary on the side of the stem and branches, in pairs or often solitary. Florets blue, or sometimes purplish—and not unfrequently white,—all ligulate and radiating towards the circumference. Pappus of minute chaffy scales, oblong, obtuse or emarginate, in a double series. Fields, and meadows: Northern and Middle States: introduced. Native of Europe. Fl. August. Fr. Sept.—October.

- Obs. This foreigner is becoming extensively naturalized. Some European Agriculturists recommend it as a valuable forage plant,—though they admit that it gives a bad taste to the milk of Cows which feed upon it. In this country, it is generally—and I believe justly—regarded as an objectionable weed, which ought to be expelled from our pastures. The roasted root has been used, on the continent of Europe, as a substitute for the Coffee-berry; but those who delight in the aromatic beverage, are not likely to take much interest in this or any other substitute for the genuine article.
- 2. C. Endivia, Willd. var. sativa, DC. Radical leaves somewhat erect, obovate-oblong, sinuate-dentate, and often pinnatifid, smoothish,—the cauline ones auriculately dilated at base; heads sessile and aggregated in twos and fours in the axils of the upper leaves, or solitary on elongated branches. DC. Prodr. 7. p. 84.

Vulgò-Endive. Garden Succory.

Fr. La Scarole. Germ. Die Endivie. Span. Endibia.

Root biennial—or sometimes annual. Stem 2 to 3 feet high, terete, fistular, somewhat branched, smoothish, or often sparsely hirsute. Radical leaves 6 to 12 inches long, sinuate-dentate with the teeth varying from large to very small and numerous, sometimes pinnatifid with the margin curled and lacerate, slender and tapering to the base. Outer scales of the involuce hispid-ciliate. Florets violet-purple, or sometimes white,—the ligules at first involute. Akenes turbinate or obconic, somewhat compressed, angular and ribbed; pappus of minute chaffy scales in a double series. Gardens: cultivated. Native of India. Fl. July—August. Fr. September.

Obs. Cultivated for the young radical leaves,—which are etiolated or blanched by the exclusion of light, and used as a salad.

SUB-TRIBE 3. SCORZONEREAE. Less.

Pappus of narrow semi-lanceolate chaffy scales or bristles,—the inner ones, and those on the interior akenes, mostly plumose. Receptacle not chaffy.

105. TRAGOPOGON. Tournef. Endl. Gen. 2995. [Greek, Tragos, a goat, and Pogon, a beard; in allusion to the pappus.]

Heads many-flowered. Involuce in a nearly single series; scales 8 to 16, somewhat united at base, finally reflexed. Akenes sessile, with a lateral areola at base, scabrous, terminating in a long continuous beak. Pappus in several series,—all plumose except the 5 outer ones, which are longer than the rest. Biennial or perennial Herbs. Leaves sublinear, with parallel nerves.

1. T. PORRIFOLIUM, L. Glabrous; leaves lance-linear, acuminate, very entire; peduncles somewhat obconical, fistular; scales of the involucre about 8, lanceolate, acute, longer than the florets. DC. Prodr. 7. p. 113. Fl. Cestr. p. 442.

LEEK-LEAVED TRAGOPOGON. Vulgè—Oyster-Plant. Salsify. Fr. Salsifis. Germ. Der Bock-bart. Span. Barba cabruna.

Plant glabrous and somewhat glaucous. Rost biennial? (annual, DC.), fleshy and fusiform. Stem 3 to 4 or 5 feet high, sparingly and somewhat dichotomously branched. Leaves 6 to 12 or 15 inches long, ovately dilated at base, and tapering to a long narrow acumination, keeled, sessile and semi-amplexicaul, somewhat distictions. Heads terminal, on enlarged clavate hollow peduncles.—Flores violet-purple with a fuscous tinge. Akenes lance-oblong, strate-sulcate, scabrous, tapering to a smooth slender beak, about an inch in length, and supporting the pappus at summit. Gardens: cultivated. Native of Europe. Fl. June. Fr. July.

Obs. This is frequently cultivated for its fleshy root,—which, when properly cooked, has something of the flavor of fried Oysters; whence one of its common names.

SUB-TRIBE 4. LATUCEAE. Cass.

Pappus capillary,—the bristles mostly soft or fragile—not dilated nor thickened at base, nor plumose. Receptacle not chaffy.

** Pappus bright white. † Akenes terete, ribbed or angled.

Greck, Tarasso, to stir or disturb; in allusion to its supposed active properties.] Heads many-flowered. Involucre double,—the outer scales small, appressed, spreading, or reflexed—the inner ones erect, in a single series,—all of them sometimes callous-corniculate at apex. Akenes oblong, striate-ribbed or angled, minutely muricate on the ribs, often spinellose at summit,—the apex abruptly produced into a long slender beak. Pappus in many series, capillary, very white. Perennial stemless Herbs: Leaves, consequently, all radical. Heads of flowers mostly solitary, on simple fistular naked scapes.

1. T. Dens-leonis, Desf. Leaves lance-oblong, unequally and acutely runcinate,—the lobes triangular, dentate anteriorly; scales of the involucre not corniculate at apex, the outer ones reflexed; akenes spinellose at summit. Torr. & Gr. Fl. N. A. 2. p. 494. DC. Prodr. 7. p. 145.

Leontodon Taraxacum. L. Fl. Cestr. p. 443. Icon, Fl. Lond. 3. Lion-tooth Taraxacum. Vulgò—Dandelion.

Fr. Dent de Lion. Germ. Der Loewenzahn. Span. Amargon.

Plant at first somewhat pubescent, at length smooth. Root perennial. Leaves 4 to 10 or 12 inches long. Scapes several from the same root, 4 to 12 or 15 inches long (clongating), terete, each bearing a single head. Involucre oblong,—the inner scales lance-linear, appressed, with scarious margins—the outer ones reflexed, slightly ciliate,—finally the entire involucre reflexed. Florets yellow. Akenes terminating in a beak, which is short at first, then suddenly clongating to about three fourths of an inch in length, filiform, bearing the pappus at summit, diverging so as to form a globose head. Pastures, &c.: nearly throughout the U. States: introduced. Native of Europe. Fl. April—Aug. Fr. May—Sept.

Obs. This foreigner—although not a very obnoxious plant—has become so thoroughly naturalized as to be more abundant than wel-

come, in our pasture-grounds and meadows: and yet, if it cannot be repressed or smothered out by better plants, it will be a difficult task to extirpate it,—as myriads of seeds are annually wafted over the country by means of the pappus. The plant is reputed to be medicinal; and the young radical leaves, when blanched, are said to make a good substitute for Endive.

† † Akenes flattened, compressed or obcompressed.

107. LACTUCA. Tournef. Endl. Gen. 3008. [Latin, Lac, milk; in reference to its milky juice.]

Heads few- or several-flowered. Involucre cylindrical, calyculateimbricate; scales in 2 to 4 series,—the outer ones shorter and broader. Akenes flatly obcompressed, wingless, abruptly produced into a filiform beak. Pappus in several series of soft white hairs. Caules-Heads of flowers paniculate or corymbose. cent Herbs.

1. L. SATIVA, L. Stem corymbosely branching, leafy; radical leaves erect, oval, narrowed at base, wavy,—the cauline ones cordate, amplexicaul. DC. Prodr. 7. p. 138. Fl. Cestr. p. 442.

CULTIVATED LACTUCA. Vulgo-Garden Lettuce. Salad. Fr. La Laitue. Germ. Der Salat. Span. Lechuga.

Plant smooth, mostly yellowish green and glaucous,—sometimes fuscous and tinged with dark purple. Root annual. Stem 2 to 4 feet high; branches clothed with numerous small leaves. Heads numerous, terminal, small. Inner scales of the involucre lanceolate,—the outer or lower ones evate. Florets yellow. Akenes lance-obovate, striate-ribbed, about half as long as the filiform beak. Gardens: cultivated. Native country uncertain,—probably India. Fl. July. Fr. August.

Obs. This plant—called Salad, par excellence—is almost universally known, and cultivated. Those forms known as Curled, and Head Salad (L. crispa, and L. capitata), are considered as distinct species, by Prof. De Candolle, l. c. There is a native species (L. elongata, Muhl.) frequently to be met with, on the farm; but it is scarcely of sufficient importance to be intitled to notice, here.

Some species of Sonehus, and Mulgedium, - plants belonging to Lactuceae, but with akenes not beaked,—are often to be found on farms (the Sonchus or Sow-thistle, in Gardens,—and 2 or 3 species of Mulgedium-coarse, brittle plants-along fence-rows, and borders of thickets): But, although they are worthless weeds, they are neither very troublesome, nor difficult to manage, -and are therefore omitted.

ORDER LXXVI. LOBELIACEAE. Juss.

Herbs, or somewhat shrubby plants, often lactescent. Leaves alternate, without stipules. Flowers mostly solitary, axillary, and racemose. Calyx 5-parted, more or less adherent to the ovary. Corolla irregularly 5-lobed, usually somewhat bilabiate, cleft on one side nearly or quite to the base. Stamens 5, coherent into a tube. Style 1; stigma mostly 2-lobed, fringed with a pilose ring. Fruit capsular, 2 or 3- (rarely 1-) celled, many-seeded. Seeds with a fleshy albumen.

The genus which represents this Order, is the most important one, on account of its acrid and narcotic properties. Some of the species are remarkable for the showy brilliance of the flowers.

TRIBE IV. LOBELIEAE. Presl.

Capsule 2-celled, opening at apex by 2 valves which are septiferous in the mid-dle (loculicidal), or rarely by 2 pores.

108. LOBELIA. L. Endl. Gen. 3058. [Named in honor of Matthias de Lobel,—a Flemish Botanist.]

Calyx 5-lobed; tube obconic, ovoid, or hemispherical. tubular, - the tube cylindric or funnel-form, cleft on the upper side nearly to the base; limb somewhat bilabiate,—the upper lip mostly smaller and erect—the lower one broader, spreading, 3-cleft or 3toothed. Anthers coherent in a tube,—the 2 lower ones (rarely all) bearded at apex. Ovary more or less adherent to the calyx, sometimes nearly free. Mostly Herbs. Flowers racemose-spicate, of various colors—usually blue or red.

1. L. INFLATA, L. Stem erect, hirsute, paniculately branched; leaves subsessile, lance-ovate, crenate-dentate, pilose; racemes leafy; flowers small, axillary; calyx-tube ovoid, smoothish, the segments as long as the corolla; capsule ovoid or oval, inflated.

DC. Prodr. 7. p. 380. Fl. Cestr. p. 155.

INFLATED LOBELIA. Vulgè—Eye-bright. Indian Tobacco.

Root annual. Stem 9 to 18 inches high, sometimes angled or slightly winged by the decurrence of the leaves, often very hairy; branches axillary. Leaves 1 to 3 inches long, more or less ovate, unequally sinuate-dentate or crenate. Peduncles one fourth to half an inch long. Corolla pale blue, rather inconspicuous. Capsule thin and membranaceous, smoothish. Seeds minute, elliptic-oblong, rough with ferruginous reticulated ridges. Pastures, roadsides, &c.: Canada to S. Carolina. Fl. July—Sept. Fr. Aug.—October.

Obs. This is an acrid plant,—possessing emetic, cathartic and narcotic properties; and is somewhat notorious for the use made of it by a tribe of reckless modern Empiries. It is frequent in our pastures, in the latter part of summer, - and has been suspected of causing the ptyalism or slabbering of Horses, so often observable at that season. I cannot, however, help doubting the correctness of the opinion; for the Horse is a dainty animal in the selection of his food. I have often remarked the care and dexterity with which he separates the palatable herbage from that which is not so; and have never seen him eat, nor even crop, so acrid and offensive a weed as this Lobelia. We have two species, in Pennsylvania, which are admired for the beauty of their blue and red flowers,-particularly the crimson Cardinal-flower (L. cardinalis, L.): but they are not intrusive on the farm.

ORDER LXXVIII. ERICACEAE. Juss. Endl.

Shrubs, or sometimes Herbs. Leaves mostly alternate and entire, without stipules. Flowers regular, or nearly so. Calyx either adherent to the ovary, with a 4 to 6 (usually 5-) parted epigynous limb,—or entirely free, 4 or 5-parted and persistent. Corolla 4 to 6 (usually 5-) lobed, epigynous or hypogynous,—rarely with the petals almost or quite distinct. Stamens definite, as many, or twice as many, as the petals or lobes of the corolla, mostly distinct; authers 2-celled, often with awn-like appendages. Styles and stigmas united into 1. Fruit baccate or capsular. Seeds with fleshy albumen.

An interesting Order, mostly of charles, some of them medicinal and others.

An interesting Order, mostly of shrubs.—some of them medicinal, and others very beautiful—especially the Azaleas, Rhododendrons, Kalmias, and many species of the genus (Erica) which is the type of the Order. The medicinal plant called Uva Ursi (Arctostaphylos Uva-Ursi, Spreng. indigenous in the Pine forests of New Jersey), also belongs here.

SUB-ORDER I. VACCINIEAE. Endl. A. Gray.

Ovary adnate to the tube of the calyx, becoming a berry or a drupe-like fruit. Stamens epigynous,—twice as many as the lobes of the corolla; anthers 2-parted, mostly awned on the back.

109. VACCINIUM. L. Endl. Gen. 4332. [An ancient classical name; etymology obscure.]

Calyx adherent to the ovary, but mostly with a free 5-toothed limb. Corolla either campanulate, urceolate, or cylindrical,—the limb 4 or 5-cleft, and often reflexed. Stamens twice as many as the lobes of the corolla, inserted on the limb of the calyx, often included; anthers with 2 tubular horns at summit, and sometimes with 2 bristle-like awns on the back, near the base. Berry globose, umbilicate at apex by reason of the persistent calyx-teeth, 4 or 5-celled,—the cells several-seeded. Seeds angular,—the testa membranaceous and reticulately rugose. Shrubs and undershrubs. Leaves scattered, mostly entire, often sempervirent, and never sprinkled with resinous atoms.

IF Anthers not awned on the back.

1. V. CORYMBOSUM, L. Flower-bearing branches nearly leafless; leaves oblong-oval, acute at each end, pubescent when young, deciduous; racemes short, subcorymbose, bracteate,—the bracts scale-like; corolla tubular, ovoid-cylindric. DC. Prodr. 7. p. 571. Fl. Cestr. p. 256. [Blue-berry.

CORYMBOSE VACCINIUM. Vulgò-Swamp, or Tall Huckleberry.

Stem 5 to 8 or 10 feet high, often stout, with irregular straggling branches,—the young leafing branches pubescent—the flower-bearing ones somewhat angular, naked, and inclining to a greenish bronze color. Leaves 1 to 2 inches long, generally elliptic, entire, and always with a short obtuse callous mucro, or point, at apex, pubescent when young—especially on the nerves and under surface,—finally smoothish; petioles very short. Racemes half an inch to an inch long, 6 to 10 or 12-flowered, proceeding from lateral buds, and unaccompanied with leaves; pedicels 1 fourth to 1 third of an inch long, with purplish bracts, at base, which resemble bud-scales. Corolla white, mostly tinged with purple, nearly cylindrical, somewhat contracted at the orifice,—the lobes short and tooth-like. Stamens included; filaments pubescent; anthers not awned on the back,—the terminal parallel tubes opening laterally, and becoming flat, linear, acute membranes. Style longer than the stamens, but scarcely as long as the corolla (rarely exserted). Berries rather large, black with a bluish bloom when mature, very agreeable to the taste. Swamps, and moist woods: Canada to Georgia. Fl. May. Fr. July—August.

Obs. Not being personally familiar with the localities, in New Jersey, which supply the Philadelphia market so abundantly with the favorite blue Huckleberries, I have heretofore been under the impression (received from others), that those delightful Berries were the product of the V. frondosum, L.: But, my friend Prof. A. Gray—who has recently examined the whole matter—assures me that we are indebted, for them, to the plant above described. It seems, moreover, that several Shrubs, hitherto considered as species of Vaccinium, do not, in fact, accord with the essential character of that genus,—but must be separated from it, "on account of their remarkable ten-celled avaries, and drupaceous ten-seeded fruit." Of these, may be mentioned, the aforesaid V. frondosum, L. the V. resinosum, Ait. and the V. dumosum, Andr. (all with "resinous-dotted leaves"),—which are now to be transferred to the genus Gay-Lussacia, of H. B. K. [so named in honor of the distinguished French Chemist and Philosopher, Gay-Lussac]—as will more fully appear in the forthcoming North American Flora, by Torrey

GRAY.* Several species, however, of this new Genus—as well as a number of the *true Vacciniums*—afford esculent fruit; but none so much admired as the *Blue-berry*, of the Jersey swamps.

110. OXYCOCCUS. Tournef. Endl. Gen. 4331. [Greek, Oxys, sharp or acid, and kokkos, a berry; in allusion to the acid fruit.] Calyx adherent to the ovary, with the limb 4-toothed. Corolla deeply 4-parted,—the lobes lance-linear, revolute. Filaments 8, connivent; anthers 2-parted, tubular, opening by oblique pores. Berry 4-celled; cells many-seeded. Suffruticose, slender and mostly trailing plants. Peduncles solitary, axillary, bibracteate near the flower. Fruit rather large.

1. O. MACROCARPUS, Pers. Creeping; branches ascending, filiform; leaves oblong, obtuse, entire, nearly flat, glaucous beneath; peduncles lateral, elongated. DC. Prodr. 7. p. 577. Fl. Cestr. p. 241.

Large-fruited Oxycoccus. Vulgò-Cranberry, or Crane-berry.

Stem 1 to 2 or 3 feet long, very slender, prostrate, creeping, throwing up short branches. Leaves about half an inch long, entire or with distant obsolete serratures, slightly revolute on the margin. glabrous,—the young ones pubescent-ciliate at apex; petioles very short. Flowers nodding: corolla pale purple. Berry subglobose, about half an inch in diameter, bright red or crimson when mature. Sandy swamps, and wet grounds: Northern and Middle States. Fl. May—June. Fr. October.

Obs. The acid fruit of this slender vine-like shrub is highly prized, when prepared for the table. It is said to be successfully and advantageously cultivated, in the Northern States; and it certainly merits that attention, wherever a suitable situation for it can be obtained.

SUB-ORDER II. ERICINEAE. Desv. A. Gray.

Ovary free from the calyx. Fruit capsular, or sometimes baccate or drupaceous. Stamens as many, or twice as many, as the lobes of the corolla; anthers 2-celled, opening by terminal pores. Testa conformed to the nucleus of the seed. Shrubs, or small trees. Leaves often accrose and evergreen. Petals sometimes distinct.

TRIBE II. ANDROMEDEAE. DC.

Fruit capsular, loculicidal. Cordia deciduous.

111. ANDROMEDA. L. Endl. Gen. 4318.

[Named in allusion to the exposure of Andromeda; from its place of growth.] Calyx 5-parted, persistent. Corolla hypogynous, tubular, campanulate, or globose,—the limb 5-cleft, reflexed. Stamens 10; anthers often 2-horned at summit, and sometimes awned on the back. Capsule ovoid or subglobose, 5-celled, 5-valved,—the valves septiferous in the middle (loculicidal), entire or finally bifid.

- 1. A. Mariana, L. Glabrous; leaves oval, mostly acute at each end, very entire, sub-coriaceous, paler and puncticulate beneath,
- *Dr. Gray designates the fruit of the Gaylussacias by the popular name of Huckleberries,—and distinguishes that of the true Vacciniums by the name of Blue-berries. The "Huckleberry" of the Boston market, he informs me, is the product of Gaylussacia resinosa,—while the fruit of G. frondosa is little known, there. He further states, that the "Blue-berries," of the same market are chiefly afforded by the Vaccinium corymbosum, V. virgatum, and V. Pennsylvanicum.

deciduous; flowering branches nearly leafless; pedicels fasiculate, bracteate; calyx naked at base; corolla ovoid-cylindric; anthers awnless at summit. *Fl. Cestr. p.* 260.

Leucothoë Mariana. DC. Prodr. 7. p. 602.

MARYLAND ANDROMEDA. Vulgà-Stagger-bush.

Stem 1 or 2 to 3 or 4 feet high, with erect branches. Leaves 2 to 3 inches long; petroles about one fourth of an inch long. Flowers in racemose fascicles on the old branches. Corolla white, or reddish-white. Capsule pentangular-ovoid, truncate at apex. Seeds numerous, small, clavate. Woodlands, and sandy plains: New England to Florida. Fl. June. Fr. Aug.—Sept.

Obs. This shrub is very abundant in the sandy districts of New Jersey; and the farmers, there, allege that it is injurious to sheep, when the leaves are eaten by them,—producing a disease called the staggers. I believe the evidence is not conclusive, on this point: but it may be well to know the plant, against which such a charge is made.

SUB-ORDER III. PYROLEAE. DC. A. Gray.

Ovary free from the calyx. Petals distinct! or nearly so. Fruit a capsule. Testa of the seed loose and cellular, not conformed to the nucleus.

112. CHIMAPHILA. Pursh. Endl. Gen. 4348.

[Greek, Cheima, winter, and Philos, a lover; from its green appearance in winter.] Calyx 5-cleft. Petals 5, orbicular, spreading, deciduous. Stamens 10,—2 in front of each petal; filaments dilated in the middle; anthers 2-celled, opening by 2 pores. Ovary obtusely conic, or depressed-globose, umbilicate at apex; style very short, immersed in the ovary; stigma orbicular, peltate. Capsule depressed, obtusely pentagonal, 5-celled, 5-valved, loculicidal at base and apex. Seeds very minute, reticulate-striate. Humble suffruticose evergreens. Peduncles terminal, somewhat corymbose.

1. C. UMBELLATA, Nutt. Leaves cuneate-oblong, acute at base, serrate, uniform-green; flowers in a terminal subumbellate corymb; filaments glabrous. DC. Prodr. 7. p. 775.

Pyrola umbellata. L. Fl. Cestr. p. 266.

Umbellate Chimaphila. Vulgò-Pipsissawa. Winter-green.

Root creeping. Stem ascending, 3 to 6 inches long, leafy at summit. Leaves 1 to 2 inches long, subverticillate (often in 2 or 3 distinct verticils), coriaceous, glabrous. Corymb 4 to 6-flowered. Petals reddish-white. Hilly woodlands—particularly of Northern exposure: Northern and Middle States. Fl. June. Fr. September.

Obs. This half-shrubby little Evergreen possesses some astringency and bitterness, so as to be moderately tonic,—though doubtless much over-rated in popular estimation. It has been so long and so generally noted, as an *Indian* medicine, under the name of *Pipsis-sawa*, that every one who resides in the country ought to be able to identify it.

ORDER LXXX. EBENACEAE. Vent.

Trees or shrubs, destitute of milky juice,—the wood often black. Leaves mostly alternate and entire, without stipules. Flowers often polygamous. Calyx 3- to 6-cleft, free from the ovary. Corolla 3 to 6-cleft, subcoriaceous, often pubescent

externally. Stamens twice to four times as many as the lobes of the corolla. Ovary 3- to several-celled,—the style with as many divisions. Fruit baccate. Seeds pendulous, bony, with cartilaginous albumen.

A small Order; and the genus here given is the only one of any considerable importance,—some of the species of which furnish the well-known hard black wood, called Ebony.

113. DIOSPYROS. L. Endl. Gen. 4249.

[Greek, Dis, Dios, Jupiter, and Pyros, fruit; a rather fanciful name for such fruit.] DIGICOUSLY POLYGAMOUS: Calyx 4 to 6-parted. Corolla tubular, somewhat urceolate, 4 to 6-cleft. Sterile Fl. Stamens twice or many times (usually 4 times) as numerous as the lobes of the corolla; anthers linear-lanceolate. Ovary abortive. Fertile Fl. Stamens 8 to 12, mostly abortive. Ovary 4 to 8- (rarely 10 or 12-) celled; styles 2, 4, or several, more or less connate at base. Berry ovoid or subglobose, with the persistent calyx often adhering to the base, 8 to 12-seeded. Seeds oblong, compressed. Trees, or rarely shrubs. Leaves alternate—rarely sub-opposite—entire, on short petioles. Flowers axillary, subsessile, -the fertile ones solitarythe sterile ones mostly in threes.

1. D. VIRGINIANA, L. Leaves elliptical or ovate-oblong, obtusely acuminate, reticulately veined, pubescent on the petiole, nerves and margin; calyx 4-parted, silky-pubescent within at base; corolla 4lobed, obtusely 4-angled, contracted above, glabrous. DC. Prodr. 8. p. 228. Fl. Cestr. p. 244. Icon, Mx. Sylva, 2. tab. 93.

VIRGINIAN DIOSPYROS. Vulgò-Persimmon. Date Plum. Fr. Le Plaqueminier. Germ. Der Pseudo-Lotus.

Stem 20 to 50 or 60 feet high, and 10 to 15 or 20 inches in diameter, irregularly branched. Leaves 2 or 3 to 5 inches long, subcoriaceous, green above, paler or somewhat glaucous beneath; petioles half an inch to near an inch long. Calyx of the fertile flower spreading and persistent at the base of the fruit. Corolla ochroleucous or pale greenish yellow, of a thick leathery texture. Berry about an inch in diameter, reddish-orange color when mature,—soft and pulpy after frost. Seeds large, flattish. Rich bottom-lands, along streams: Middle and Southern States. Fl. June. Fr. Octo.—November.

Obs. The ripe fruit of this tree is sweet and luscious, after being subjected to the action of frost,—but is remarkably harsh and astringent, in a green state. The bark is astringent and tonic.

ORDER LXXXIV. PLANTAGINACEAE. Juss. Lindl.

Chiefly low, apparently stemless, perennial Herbs. Leaves radical, rosulate, strongly ribbed. Flowers small, spicate, on axillary or interfoliaceous scapes. Calyx mostly 4-cleft, persistent. Corolla tubular or urceolate, membranaceous and persistent,—the limb 4-cleft. Stamens 4, inserted on the tube of the corolla alternately with the lobes; filaments very long, flaccid, persistent. Ovary 2-celled; style single. Capsule membranaceous. circumscissed; cells 1 to several-seeded. Seeds sessile, peltate or erect; embryo in the axis of fleshy albumen.

An Order consisting chiefly of the genus whose name it bears; and the species here described are those of chief interest, to the Agriculturist.

114. PLANTAGO. L. Endl. Gen. 2170. [A name of obscure and uncertain derivation.]

Calyx 4- (rarely 3-) parted,—the segments nearly equal. Corolla tubular, scarious, marcescent; limb 4-cleft, reflexed. Stamens 4, much exserted. Ovary free, 2-celled; ovules peltately affixed to the dissepiment. Style simple,—the summit or stigma pubescent, exserted before the florets open. Capsule ovoid, 2-celled, transversely dehiscent; dissepiment finally free, bearing the seeds on its faces. Flowers spicate or capitate, bracteolate.

1. P. MAJOR, L. Leaves ovate or oval, smoothish, obscurely dentate, on long petioles; scape terete, smooth; spike nearly cylindrical, rather slender and very long; flowers somewhat imbricated; capsule about 6-seeded. Willd. Sp. Pl. 1. p. 641. Fl. Cestr. p. 110. ICON, Fl. Lond. 1.

GREATER PLANTAGO. Vulgò-Common Plantain. Way-bread. Fr. Plantain ordinaire. Germ. Der grosse Wegetritt. Span. Llanten.

Root perennial. Leaves 3 to 6 or 8 inches long, strongly 5 to 7-nerved with an elastic filament in each nerve, generally smoothish (sometimes quite pilose), abruptly contracted at base to a channelled petiole about as long as the leaf. Scapes several, 6 to 18 inches high (including the spike of flowers, which varies from 2 to 12 or 15 inches in length). Bracteoles lanceolate, keeled, appressed, shorter than the calyx. Corolla whitish, inconspicuous, ventricose below, contracted into a neck above, shrivelling and persistent. Stamens about twice as long as the corolla. Moist rich grounds; along foot paths. &c.: throughout the U. States: introduced. Native of Europe and Japan. Fl. June—September. Fr. Angust—October. Fr. August-October.

Obs. This foreigner is very generally naturalized; and is remarkable for accompanying civilized man,—growing along his footpaths, and flourishing around his settlements. It is said our Aborigines call it "the white man's foot," from this circumstance. Perhaps the generic name (Plantago) may be expressive of a similar idea, viz. Planta, the sole of the foot, and ago, to act, or exercise. It is rather a worthless weed,—but is not much inclined to spread, or be troublesome, on farm lands. The leaves are a convenient and popular dressing for blisters, and other sores; a fact which seems to have been known in the time of Shakspeare,—as we may learn from his Romeo & Juliet, Act 1. Sc. 2.

"Rom. Your Plantain leaf is excellent for that. "Ben. For what. I pray thee? "Rom. For your briken shin."

The Plantain leaf continued in vogue, for that purpose, until a substitute was furnished by modern Experimenters, in their empirical attempts to regulate the national currency!

2. P. LANCEOLATA, L. Leaves lanceolate, acute at each end; scape sulcate-angled, long and slender; spike ovoid-cylindric, short; calyx deeply 3-parted; capsule 2-seeded. Willd. Sp. Pl. 1. p. 643. Fl. Cestr. p. 110. Icon, Fl. Lond. 1. [Plantain. LANCEOLATE PLANTAGO. Vulgò-English Plantain. Buckhorn

Root perennial. Leaves 4 to 8 or 10 inches long, hairy, narrowed gradually at base to a petiole 2 to 5 or 6 inches in length. Scapes several, 1 to 2 feet high, somewhat pilose with appressed hairs. Spike 1 to 2 inches long,—at first ovoid-oblong, finally nearly cylindric, dense-flowered. Bracteoles ovate, acuminate, scarious on the margins and at apex,—the slender point at length reflexed. Ca'yr deeply 3-parted (or rather of 3 sepals).—the outer or lower segment or sepal oval, truncate, emarginate, with 2 green keel-like lines—the lateral segments or sepals rather longer, boat-shaped, acute, keel green, fringed with hairs near the apex. Corolla dirty white. Stamens several times longer than the corolla; anthers greenish-white. Seeds oblong, convex on one side, concave on the other, shining, brown or amber-colored. Pastures, and upland meadows: introduced. Native of Europe. Fl. May—August. Fr. July—September.

Obs. This species, also, is extensively naturalized, and is becoming particularly abundant in the upland meadows, or clover grounds, of Pennsylvania. The seeds being nearly the same size and weight as those of the red clover, they cannot readily be separated, - and thus the two plants are disseminated together, in the culture of clover. Nearly all kinds of Stock eat this Plantain freely,-and it has even been cultivated expressly for a Sheep-pasture: but it is generally much disliked, in Pennsylvania. I do not, however, perceive any mode of getting rid of it-or even of arresting its progress, -unless it can be choked down by heavy crops of Clover and the valuable Grasses.

ORDER LXXXVIII. BIGNONIACEAE, Juss. R. Br.

Mostly trees, or climbing shrubby plants. Leaves usually opposite, sometimes simple but generally pinnately compound. Flowers large and showy. Calyx 5-parted, 2-parted or bilabiate, often spathaceous. Corolla with a large open throat,—the limb irregular, 5-lobed or somewhat bilabiate. Stamens 5.—of which 1, and often 3, are reduced to sterile filaments or rudiments; when 4 are fertile they are didynamous. Ovary 2-celled, with the placentae in the axis,—the base surrounded by a fleshy ring or disk. Capsule woody or coriaceous, pod-shaped, 2-valved, many-seeded. Seeds commonly winged, destitute of albumen.

An Order of which there are but few species known in the U. States. They are chiefly remarkable for their large showy flowers; though some of the South American Bignonias are said to furnish valuable ship-timber.

TRIBE I. BIGNONIEAE. Bojer.

Fruit capsular, dehiscent. Seeds with a membranaceous margin.

SUB-TRIBE 2. CATALPEAE. DC.

Septum of the mature capsule opposite to the flat or convex valves; i. e. the valves septiferous, and therefore the dehiscence loculicidal.

115. CATALPA. Scop. Endl. Gen. 4113. [A name said to be derived from our Southern Indians.]

Calyx bilabiately 2-lobed. Corolla campanulate,—the tube ventricose—the limb unequally 5-lobed, sub-bilabiate. Stamens 2 fertile and 3 sterile or abortive (rarely didynamous). Style filiform; stigma bilamellate. Capsule silique-form, cylindric, long, 2-valved; septum thickish, opposite the valves. Seeds numerous, transverse, compressed, produced at each end into a membranous wing, which is fringed or comose at apex. Trees. Leaves simple, opposite or ternately verticillate, petiolate, without stipules. Flowers in terminal panicles.

1. C. BIGNONIOIDES, Walt. Leaves cordate, acuminate, entire, pubescent beneath; panicles pyramidal, trichotomously branched; calyx-segments with a single mucronation. DC. Prodr. 9. p. 226. C. cordifolia. Duham. Fl. Cestr. p. 363.

Bignonia Catalpa. L. Mx. Sylva, 2. p. 63. Icon, tab. 64. BIGNONIA-LIKE CATALPA. Vulgò—Catawba. Bean-tree.

Stem 15 to 25 feet high, with irregular spreading branches. Leaves 4 to 8 or 10 inches in length; petioles 2 to 6 inches long, terete, smoothish. Corolla whitish, tinged with violet-purple, the throat spotted with purple and yellow,—the lobes unequal, crenate and wavy. Capsule 6 to 12 or 15 inches long, and about half an inch in diameter, pendulous, persistent. Seeds lance-oblong, about half an inch in length,—apparently of 2 flat oval divaricate lobes, connate at base, with

a membranous covering which is extended at the margin, and especially at the apex,—each apex terminating in a slender filamentous tuft or coma. About farm-houses, and along streams: Southern, Western and Middle States. Fl. June—July. Fr. October.

Obs. This small tree is said to be indigenous in the South and West,—though it has the appearance of an introduced plant, in Eastern Pennsylvania. It is not of much value,—and has been cultivated chiefly as an ornamental shade tree: but it is rather objectionable, on account of the numerous suckers from its roots.

ORDER LXXXIX. PEDALIACEAE. R. Br. Lindl.

Herbs, often viscid. Leaves opposite, or nearly so. Flowers axillary, bibracteate. Calyx with 5 nearly equal segments. Corolla irregular,—the throat ventricose—the limb somewhat bilabiate. Stamens 4, didynamous, with the rudiment of a fifth. Ovary seated in a glandular disk; style 1; stigma divided. Fruit capsular or drupaceous, valvular or indehiscent, with 2 to 8 cells. Seeds rarely winged, destitute of albumen.

A small Order, and of little interest to the Agriculturist.

TRIBE II. PEDALINEAE. R. Br.

Fruit indehiscent or imperfectly dehiscent at apex, drupaceous or a hard woody capsule. Seeds few, never winged.

116. MARTYNIA. L. Endl. Gen. 4175.

[Named in honor of John Martyn, Prof. of Botany at Cambridge, England.] Calyx nearly equally 5-cleft, with 2 or 3 small bracts at base. Corolla irregular, campanulate, gibbous at base,—the limb unequally Stamens mostly 4, didynamous, with a fifth rudimentary one, - sometimes all, sometimes 2 only, bearing anthers. Capsule somewhat 4-celled, 2-valved, woody with a coriaceous and finally deciduous coat, ovoid-oblong, terminating in a curved beak at apex, -the beak parting into 2 horns, but the capsule scarcely dehiscent. Seeds few in each cell, arranged in a single series along the septum, somewhat baccate, finally tuberculate-rugose.

1. M. PROBOSCIDEA, Glox. Stem branching; leaves orbicular-cordate, entire, petiolate,-the upper ones alternate; beaks longer than the pericarp. DC. Prodr. 9. p. 253.

LONG-BEAKED MARTYNIA. Vulgò-Unicorn Plant.

Plant pale green, viscid-pubescent and fetid. Root annual. Stem leaning or procumbent, 1 to 2 feet long, branching, fistular. Leaves 2 to 5 inches long; petioles 2 to 6 inches long. Flowers axillary; peduncles 1 to 3 inches long. Calyx slit on one side to its base. Corolla large, pale greenish-yellow or ochroleucous, with orange-colored or brownish spots within. Capsule 2 to 3 inches long, somewhat sulcate in front, with a bipartible crest-like fringe along the suture in the broad shallow groove, tapering to a beak which is 2 to 3 or 4 inches long, and finally split into two rigid horns, which are incurved like claws. South Western States: Gardens: cultivated. Fl. July—August. Fr. Sept.—Octo.

Obs. This plant—a native of the valley of the Mississipi, and the plains of Mexico-is much cultivated, of late, for its singular fruit,which, in its young state-before it becomes hard and woody-is used for making that kind of condiment called pickles.

The Benni plant (Sesamum Indicum, L.)—which belongs to this natural Order-is cultivated, in the Southern States, for the sake of its oily seeds,—and also for the bland mucilage afforded by the fresh

leaves, when macerated in water.

ORDER XCI. SCROPHULARIACEAE. Juss. Lindl.

Herbs, or sometimes shrubby plants. Leaves alternate, opposite or verticillate, without stipules. Calyx of 4 or 5 more or less united sepals, persistent. Corolla more or less irregular, bilabiate or personate,—the lobes imbricated in aestivation. Stamens either 4 and didynamous—the fifth stamen sometimes appearing in the form of a sterile filament, or very rarely antheriferous,—or often only 2—one pair being either suppressed or reduced to sterile filaments. Ovary 2-celled, with the placentae united in the axis. Capsule 2-valved. Seeds indefinite, albuminous.

An Order of nearly 150 genera,—affording many curious and rather handsome flowers,—some troublesome weeds,—and a few plants of considerable medicinal powers—especially the purple Fox-glove (Digitalis purpurea, L.).

TRIBE I. VERBASCEAE. Benth.

Corolla with the tube short or subglobose,—the limb flat or spreading, 4 or 5-cleft, or bilabiate, not ringent. Stamens 2 to 5 fertile, often declinate. Capsule 2-valved, septicidal,—the valves often bifid.

117. VERBASCUM. L. Endl. Gen. 3878.

[Quasi Barbascum: Latin, Barba, beard; from its bearded or woolly habit.] *Calyx 5-parted, the segments nearly equal. Corolla with a very short tube; limb sub-rotate, 5-lobed,—the lobes nearly equal or the front one larger. Stamens 5, unequal, inserted on the tube of the corolla, declinate, exserted,—the filaments (or some of them) bearded. Capsule ovoid or globose, 2-celled, 2-valved, septicidal,—the valves inflected, bifid at apex. Placentae adnate to the septum. Seeds numerous, rugose-pitted. Herbaceous or suffruticose plants. Flowers in dense spikes, or paniculate racemes.

1. V. Thapsus, L. Stem simple, erect, tomentose; leaves ovallanceolate or oblong, very woolly on both sides,—the cauline ones decurrent; flowers in a dense terminal spike. DC. Prodr. 10. p. 225. Fl. Cestr. p. 134.

THAPSUS VERBASCUM. Vulgò—Mullein. Common Mullein. Fr. Bouillon blanc. Germ. Das Wollkraut. Span. Gordolóbo.

Whole plant pale greyish-green or hoary-tomentose,—the pubescence much branched. Root biennial. Stem 3 to 6 feet high, rather stout, leafy, rarely branching unless injured. Radical leaves 6 to 12 inches long,—the cauline ones smaller. Spike cylindric, 6 to 12 or 15 inches long; flowers bracteate. Corolla bright yellow. Stamens unequal,—the two lower ones longer, with smooth filaments. Neglected fields; road-sides, &c.: introduced. Nauve of Europe. Fl. June—July. Fr. Aug.—September.

Obs. This plant, although abundant in all the older settlements, is undoubtedly, in my opinion, a naturalized foreigner. It is a worthless unseemly intruder, in our pastures and cultivated grounds. There is no surer evidence of a slovenly, negligent farmer, than to see his fields over-run with Mulleins. As the plant produces a vast number of seeds, it can only be kept in subjection by a careful eradication while young—or at least before the fruit is mature. When neglected, the soil soon becomes so full of seeds, that the young plants will be found springing up, in great numbers, for a long succession of years. There is a slender smoothish species, called Moth Mullein (V. Blattaria, L.), which is frequent in pasture fields, and altogether worthless; but it is not so much of a nuisance as the one here described.

TRIBE III. ANTIRRHINEAE. Chav.

Corolla tubular,—the limb personate or ringent, bilabiate or rarely equally lobed. Stamens 4, didynamous; anthers approximated in pairs. Capsule 2-celled, opening with teeth or lids, rarely of several valves—sometimes irregularly ruptured.

118. LINARIA. Tournef. Endl. Gen. 3891. [Latin, Linum, flax; from the resemblance of the leaves.]

Calyx 5-parted. Corolla with the limb personate,—the upper lip bifid with the lobes folded back—the lower lip trifid, closing the throat by its prominent palate; tube inflated, spurred at base. Stamens 4, didynamous,—usually with a minute abortive rudiment of a fifth. Capsule ovoid or globose, chartaceous or membranaceous, 2-celled, opening with several valves at apex, or sometimes with a lid. Seeds numerous, margined. Mostly Herbs, annual or perennial. Leaves alternate, rarely opposite or verticillate. Flowers usually racemose.

1. L. VULGARIS, Mill. Stem erect, simple; leaves lance-linear, acute, alternate, numerous; flowers imbricated, in a terminal raceme; spur of the corolla acute, about as long as the tube. DC. Prodr. 10. p. 273. Fl. Cestr. p. 368. Icon, Fl. Lond. 3. [Eggs. Common Linaria. Vulgò—Toad-flax. Ranstead-weed. Butter and Fr. Muflier linaire. Germ. Das Flachskraut. Span. Linaria.

Plant smooth and somewhat glaucous. Root perennial, creeping, subligneous. Stem 1 to 2 or 3 feet high, slender, terete, leafy, sometimes branched at summit and bearing several racemes, generally growing in bunches or small patches. Leaves 1 to 2 inches long, narrow, irregularly scattered on the stem, but very numerous. Flowers pedunculate, in a dense bracteate raceme—the peduncles shorter than the bracts. Corolla pale greenish-yellow, smooth,—the palate of the lower lip bright orange-color, villous in the throat; spur subulate, about half an inch long. Style shorter than the longest stamens; stigma obliquely truncate. Capsule ovoid-oblong, thin, smooth, longer than the calyx. Seeds with a dilated orbicular margin, roughish-dotted in the centre. Pastures; fence-rows, &c.: introduced. Native of Europe. Fl. June—Sept. Fr. Aug.—October.

Obs. This foreigner is extensively naturalized,—and has become a vile nuisance in our pastures and upland meadows. Mr. Watson, in his annals of Philadelphia, says it was introduced from Wales, as a garden flower, by a Mr. Ranstead, a Welsh resident of that city; and hence one of its common names. It inclines to form large patches, by means of its creeping roots,—and as far as it extends, takes almost exclusive possession of the soil. Although the flowers are somewhat showy, it is a fetid, worthless and very objectionable weed,—the roots very tenacious of life—and requiring much persevering effort to extirpate them. The remarkable variety called Peloria—with a regular 5-lobed ventricose corolla, 5 spurs, and 5 perfect stamens—is occasionally to be observed. Sometimes these Pelorias are tetramerous; i.e. the corolla 4-lobed, with 4 spurs, &c. They are frequently, if not always, late flowers,—situated at the summit of the raceme of full grown capsules, and apparently the latest floral developments of the plant.

ORDER XCII. VERBENACEAE. Juss.

Herbs, shrubs, and even trees within the tropics. Leaves mostly opposite, without stipules. Flowers variously arranged. Catyx tubular, 4 or 5-toothed, persistent. Corolla tubular,—the limb 4 or 5-lobed, mostly irregular, sometimes bilabiate. Stamens mostly 4 and didynamous, occasionally only 2. Ovary free, entire, 2 to

4-celled. Fruit drupaceous, baccate, or dry and splitting into 2 or 4 indehiscent 1-seeded nucules (or little nuts). Seeds with little or no albumen.

An Order of but little importance to the farmer,—though containing a number of plants interesting to the florist. The tree which furnishes the "ever-during Teak," of India (Tectona grandis, L.)—so celebrated in ship-building—belongs to this Order.

119. VERBENA. L. Endl. Gen. 3685.

[Celtic, Farfaen, to remove stone; from its supposed medical virtues.]

Calyx tubular, 5-toothed,—one of the teeth often shorter. Corolla tubular, somewhat funnel-form, with the limb rather unequally 5lobed. Stamens mostly 4, didynamous, inserted on the tube of the corolla and included. Ovary 2 to 4-celled, with 1 ovule in each cell. Fruit dry, with a thin evanescent pericarp, separable into 2 or 4 nucules. Herbaceous or suffruticose plants. Leaves opposite. Flowers mostly in terminal spikes, bracteate.

1. V. urticaefolia, L. Leaves ovate and lance-ovate, acute, serrate, petiolate; spikes filiform, terminal and axillary, somewhat paniculate; flowers distinct. Willd. Sp. Pl. 1. p. 119. Fl. Cestr. p. 373.

NETTLE-LEAVED VERBENA. Vulgè-Common Vervain.

Root perennial. Stem erect, 2 to 3 or 4 feet high, obtusely quadrangular, hirsutely pubescent, with slender axillary spreading branches above. Leaves 2 to 4 inches long, abruptly narrowed at base to a short petiole. Spikes 1 or 2 to 5 or 6 inches long, green, very slender. Flowers distinct and finally a little distant, small, sessile, with a minute bract at base. Corolla white,—the throat closed by a delicate white villus. Fruit separating into 4 nucules, which are oblong and triquetrous, with the outer side convex. Pastures; road-sides, &c.: throughout the U. States. Fl. July—Aug. Fr September.

Obs. This is not a very pernicious nor troublesome weed: but as it is altogether worthless, and often so abundant in pasture fields as necessarily to attract the notice of the observing farmer, I thought it might be admitted into the present work.

ORDER XCIII. LABIATAE. Juss.

Herbs, or suffruticose plants, with quadrangular stems and opposite branches. Leaves opposite or sometimes verticillate, simple, without stipules, replete with receptacles of volatile oil. Flowers in axillary opposite Cymules (each pair forming what Bentham calls a verticillaster or imperfect verticil), rarely solitary. Calyx tubular. 5-toothed or 5-cleft, or often bilabiate, persistent. Corolla bilabiate. Stamens 4, didynamous (the lower pair usually longer), inserted on the corolla,—or sometimes diandrous—the 2 upper ones being wanting: anthers 2-celled; the cells either parallel, or diverging, or completely divariente,—sometimes distinct and remote from each other by means of the thickened or elongated filiform connective. Ovary deeply 4-lobed,—the style proceeding from the base of the lobes. Fruit consisting of 4 (or by abortion fewer) little nuts (nucules or akenes), at the bottom of the persistent calyx. Seeds with little or no albumen.

A highly interesting and valuable Order, containing upwards of 100 genera,—and particularly remarkable for the aromatic fragrance, and stomachic proper-Herbs, or suffruticose plants, with quadrangular stems and opposite branches.

and particularly remarkable for the aromatic fragrance, and stomachic properties, of many of the species. The most important, however,—being generally cultivated,—are here inserted.

TRIBE I. OCIMOIDEAE. Benth.

Stamens declinate. Corolla sub-bilabiate,—the 4 upper lobes flat and nearly equal,—the lower one declinate and mostly of a different form—flat or often concave, boat-shaped or saccate.

120. OCIMUM. L. Endl. Gen. 3569. [Supposed from the Greek, Ozo, to smell; in reference to its fragrance.]

Calyx 5-cleft,—the upper segment dilated, orbicular-ovate. Corolla

with the upper lip 4-cleft,—the lower lip scarcely longer, declinate, entire, flattish. Stamens 4, declinate, the lower pair longer,—the upper filaments often toothed at base. Akenes compressed, ellipticovate, smoothish.

1. O. BASILICUM, L. Stem herbaceous; leaves ovate-oblong, subdentate, smooth, petiolate; racemes simple. Benth. Lab. p. 4. Fl. Cestr. p. 338.

ROYAL OCIMUM. Vulgò-Sweet Basil.

Fr. Basilic. Germ. Gemeines Basilienkraut. Span. Albaháca.

Root annual. Stem 6 to 12 inches high, often much branched, smoothish as base, pubescent above with short reflexed hairs. Leaves half an inch to an inch long; petioles one third to two thirds of an inch long, somewhat ciliate. Flowers in simple terminal interrupted racemes. Bracts ovate, acuminate, petiolate, ciliate. Calyx inflated-campanulate, reflexed after flowering. Corolla whitish or bluish-white. Akenes minutely punctate. Gardens: cultivated. Native of India. Fl. July. Fr. September.

Obs. This fragrant little plant is one of the numerous kitchengarden Herbs, usually cultivated for culinary purposes.

121. LAVANDULA. L. Endl. Gen. 3585.

[Latin, lavare, to wash,—the distilled water being used for that purpose.]

Calyx tubular, ovoid-cylindric, ribbed, with 5 short teeth, the upper one sometimes dilated and produced at apex. Corolla with the upper lip 2-lobed, the lower one 3-lobed; lobes all nearly equal, spreading; tube exserted. Stamens 4, included, declinate; filaments smooth, not toothed; anthers ovoid-reniform, confluent, 1-celled. Style bifid at summit,—the branches flatted, subconnate, stigmatiferous on the margin. Disk coneave, with 4 fleshy scales on the margin opposite the akenes. Akenes smooth and even, adnate to the scales of the disk. Perennial Herbs, or suffruticose plants,—the stems leafy near the base, but often naked below the spike. Flowers in terminal spikes.

1. L. VERA, DC. Leaves oblong-linear or lanceolate, entire, revolute on the margin, the younger ones hoary; spikes interrupted; cymules 3 to 5-flowered; floral leaves (or bracts) rhomboid-ovate, acuminate, membranaceous, the upper ones shorter than the calyx; bracteoles obsolete. Benth. Lab. p. 148.

L. Spica. DC. Fl. Cestr. p., 338.

TRUE LAVANDULA. Vulgò-Lavender. Garden Lavender.

Fr. La Lavande. Germ. Der Lavandel. Span. Espliégo.

Plant clothed with a short hoary tomentum. Root perennial Stem suffruticose, branching from the base; branches erect, 12 to 18 inches high. Leaves 1 to 2 inches long, crowded near the base of the branches,—often with fascicles of young leaves in the axils. Flowers in a terminal imbricated spike about an inch in length, with 1 or 2 distant cymules below. Corolla blue, pubescent, nearly twice as long as the calyx. Gardens: cultivated. Native of Southern Europe and shores of the Mediterranean. Fl. July. Fr. September.

Obs. The compound tincture of this herb (or, as the good ladies term it, "Lavander Compound"—) is deservedly popular, for its cordial and stomachic properties. The distilled water is also highly esteemed for its pungent and grateful fragrance.

TRIBE II. MENTHOIDEAE. Benth.

Corolla campanulate or funnel-form; tube scarcely longer than the calyx; limb 4 or 5-cleft,—the lobes nearly equal. Stamens mostly 4, not approximated in pairs, but distant, upright or diverging.

122. MENTHA. L. Endl. Gen. 3594.

[From Minthe, a daughter of Cocytus,—fabled to have been changed into this plant.]

Calyx campanulate or tubular, 5-toothed, equal or subbilabiate,—the orifice naked or rarely villous. Corolla 4-cleft, nearly regular,—the upper lobe broader and usually emarginate. Stamens 4, nearly equal, erect, distant; filaments glabrous, naked; anthers with 2 parallel cells. Style bifid,—the branches stigmatiferous at apex. Herbs. Cymules often many-flowered, axillary or terminal.

Cymules interruptedly spicate,—the spikes terminal.

1. M. VIRIDIS, L. Stem erect; leaves oblong-lanceolate, acutely incised-serrate, subsessile; spikes terete, slender, elongated, tapering at summit,—the cymules mostly distant. Benth. Lab. p. 173. Fl. Cestr. p. 339.

GREEN MENTHA. Vulgò-Spear-mint. Common Mint.

Fr. Baume verte. Germ. Die Spitzmuenze. Span. Menta puntiaguda.

Plant smoothish and rather pale green. Root perennial, creeping. Stem 1 to 2 feet high, branching, mostly green. Leaves 1 to 2 or 3 inches long, very acute, palish green. Spikes of cymules terminal, often numerous and somewhat paniculate, 2 to 4 inches long. Corolla pale purple. Moist grounds; waste places, &c.: introduced. Native of Europe. Fl. July—August. Fr. September.

- Obs. This pleasantly aromatic herb has been so generally introduced into all the older settlements of this country, that it is now very extensively naturalized. It is deservedly popular as a domestic medicine, in relieving nausea, &c. and it is the species employed in preparing that most seductive beverage, known as the "Mint Julep" of old Virginia.
- 2. M. PIPERITA, L. Stem procumbent at base, ascending; leaves ovate-lanceolate, serrate, petiolate; spikes cylindric, rather short, obtuse,—the cymules loosely approximated. Benth. Lab. p. 175. Fl. Cestr. p. 339.

Pepper Mentha. Vulgò-Pepper-mint.

Fr. La Menthe. Germ. Pfeffer-muenze. Span. Menta piperita.

Plant smoothish and purplish. Root perennia creeping. Stem 1 to 2 feet long, branching, mostly dark purple, sometimes pubescent. Leaves 1 to 2 inches long, more or less ovate and rounded a base, dark green, on petioles one fourth to half an inch in length. Spikes of cymules half an inch to an inch or more in length, terminal, solitary,—the cymules crowded—except the lower pair which are often a little distant. Corolla purple, larger than in the preceding species. Moist low grounds; Gardens, &c.: introduced. Native of Europe. Fl. Aug. Fr. Sept.—October.

Obs. This most grateful aromatic is generally allowed a place in gardens, or about houses,—and is apparently naturalized, in many localities. The essential oil, and distilled water, are well known for their stomachic properties, and deservedly held in high esteem.

TRIBE III. MONARDEAE. Benth.

Corolla bilabiate. Stamens 2 fertile, ascending,—the upper pair abortive; anthers 2-celled, the cells either contiguous or separated by a long linear connective, one of the cells often empty.

123. SALVIA. L. Endl. Gen. 3597.

[Latin, salvare, to save; on account of supposed medicinal virtues.]

Calyx subcampanulate, bilabiate,—the upper lip mostly 3-toothed—the lower one bifid; throat naked. Corolla ringent,—the upper lip erect, straight or falcate. Stamens 2; anthers halved,-the cells separated by the long linear connective, which is transversely articulated with the filament.

1. S. officinalis L. Stem shrubby at base, leafy, hoary-tomentose; leaves lance-oblong, crenulate, rugose; upper lip of the corolla as long as the lower one, somewhat vaulted. Benth. Lab. p. 208. Fl. Cestr. p. 342.

Officinal Salvia. Vulgò-Sage. Garden Sage.

Fr. La Sauge. Germ. Die Salbei. Span. Salvia.

Root perennial. Stems 1 to 2 feet high, growing in bunches, branching from the base. Leaves 1 to 2 or 3 inches long, rather obtuse, sometimes lobed near the base, clothed with a short pubescence. greyish-green.—the upper or floral leaves sessile—the others on petioles about an inch long. Cymules 5 to 10-flowered, in interrupted terminal racemes. Corolla mostly violet-purple. Stamens ascending,—the 2 lower ones fertile—the 2 upper ones minute abortive rudiments. Gardens: cultivated. Native of Southern Europe. Fl. May—June. Fr. July-August.

Obs. Generally cultivated in kitchen gardens, for culinary purses. The infusion makes a good gargle,—and is otherwise moderately medicinal.

The plant would seem to have been once considered as a kind of

panacea,—if we may judge from the following monkish lines:

"Cur moriatur homo cui Salvia crescit in horto?

"Contra vim mortis non est medicamen in hortis.

"Salvia salvatrix, Naturae conciliatrix.
"Salvia cum Ruta faciunt tibi pocula tuta."

There is now, however, but little confidence placed in the virtues thus imputed or implied: and in these temperance times, the doctrine of the concluding line would be denounced as rank heresy, -even though the charm be fortified "with Rue"—that "herb of grace o'Sundays," as Shakspeare terms it—which is here appropriately enough associated with an indulgence in cups! We often find, on dry sterile meadow banks, a native species of this genus (S. lyrata, L.), which is a mere weed; but scarcely of sufficient importance to require a description, here.

TRIBE IV. SATUREINEAE. Benth.

Calyx 5-toothed and equal, or bilabiate with the upper lip 3-toothed and the lower one bifid. Corolla sub-bilabiate,—the upper lip erect, flat, entire or bifidly emarginate—the lower lip spreading, trifid, with the lobes nearly equal; tube about as long as the calyx. Stamens 4, (or the 2 upper ones sometimes abortive), distant, straight, diverging.

124. MAJORANA. Moench. Endl. Gen. 3609. [A name derived from the Arabic.]

Calyx sub-bilabiate, deeply divided—the upper lip flat, dilated and

rounded at apex, entire or 3-toothed, contracted and involute at base—the lower lip very small. Corolla sub-bilabiate,—the upper lip rather erect, emarginate—the lower lip spreading, 3-lobed, lobes nearly equal; tube about as long as the calyx. Stamens 4, exserted, distant; anthers 2-celled; cells parallel, diverging, or finally divaricate. Flowers in short dense 4-sided spikelets, imbricated with orbicular bracts.

1. M. HORTENSIS, Moench. Branches smoothish, racemose-paniculate; leaves elliptic-obovate or spatulate, obtuse, entire, petiolate, downy and canescent on both sides; spikelets oblong, compact, clustered at the ends of the branches. Benth. Lab. p. 338. Fl. Cestr. p. 347.

GARDEN MAJORANA. Vulgò-Sweet Marjoram.

Fr. La Marjolaine. Germ. Der Majoran. Span. Majorana.

Reat annual. Stem 9 to 12 or 18 inches high, subterete, somewhat branched. Leaves one third of an inch to an inch long, varying from ovate to obovate and spatulate. Spikelets one fourth to half an inch long, obtusely 4-cornered, hoary-pubescent, in sessile terminal clusters of threes, or on short axillary branches; bracts very obtuse or rounded, ciliate-pubescent, quadrifariously and densely imbricated,—the margins at base involute. Calyx with the upper lip free, like a distinct sepal, dilated, obtuse, ciliate-pilose and mostly 3-toothed at apex, narrowed below with the margins folded in,—the lower lip or division ovate, smooth, very small. Corolla white, or tinged with purple. Gardens: cultivated. Native of Africa and Asia. Fl. July—Aug. Fr. September.

Obs. One of the fragrant culinary Herbs, generally cultivated.

125. THYMUS. L. Endl. Gen. 3610. [Greek, Thymos, courage; in allusion to its cordial qualities.]

Calyx tubular-campanulate, 10-ribbed, bilabiate,—the upper lip tri-fid—the lower one bifid; throat villous. Corolla with the upper lip erect, nearly flat, emarginate,—the lower lip spreading, 3-lobed, middle lobe longer. Anthers 2-celled; cells parallel or finally diverging. Humble shrubby or suffruticose plants. Leaves small, entire. Cymules few-flowered,—sometimes all remote,—sometimes in loose terminal heads, or interrupted spikes.

1. T. VULGARIS, L. Stems erect or procumbent at base; leaves oblong-ovate or lance-ovate, revolute on the margin, fasciculate in the axils; cymules in terminal interrupted leafy spikes. Benth. Lab. p. 342. Fl. Cestr. p. 347.

Common Thymus. Vulgò—Garden Thyme. Standing Thyme. Fr. Serpolet. Germ. Der Thymian. Span. Tomillo.

Root perennial, woody. Stems 4 to 6 inches high, numerous, slender, rather erect, much branched and matted together at base, suffruticose, clothed with a short cinereous pubescence. Leaves one fourth to halt an inch long, abruptly narrowed to a petiole, punctate, slightly pubescent beneath, fasciculate in the axils by reason of abortive branches. Calyx hirsute, strongly ribbed, punctate; segments of the lower lip subulate, pectinately ciliate. Corolla pale purple. Gardens: cultivated. Native of Southern Europe. Ft. June—Aug. Fr. Aug.—September.

Obs. A favorite condiment in culinary processes,—and generally cultivated, in kitchen gardens. The creeping Thyme (T. Serpyllum, L.)—a species nearly allied in properties and appearance—is naturalized in many places.

126. SATUREJA. L. Endl. Gen. 3611. [A name supposed to be derived from the Arabic.]

Calyx tubular-campanulate, 10-nerved, deeply and nearly equally 5-toothed, or obscurely bilabiate; throat naked, or nearly so. Corolla bilabiate,—the upper lip erect, flat—the lower one spreading, 3-lobed, lobes nearly equal. Stamens 4, diverging; anthers 2-celled,—the cells parallel or diverging. Herbs or suffruticose plants. Leaves small, entire, often fasciculate in the axils. Cymules sometimes few-flowered and scarcely bracteate—sometimes many-flowered or aggregated in heads, and supported by bracts.

1. S. HORTENSIS, L. Stem erect, much branched, pubescent; leaves oblong-linear, acute; cymules axillary, pedunculate, few-flowered, somewhat secund, remote or the upper ones somewhat spiked. Benth. Lab. p. 352. Fl. Cestr. p. 348.

Garden Satureja. Vulgò.—Summer Savory. Fr. La Sarriette. Germ. Die Saturey. Span. Ajedrêa.

Rost annual. Stem 6 to 12 inches high, obscurely 4-angled, branched so as to appear bushy, suffruticose at base, roughish-pubescent, mostly dark purple. Leaves half an inch to an inch long, narrowed at base to a very short petiole. Cymules about 3-flowered,—the upper ones crowded into a leafy spike. Corolla pale violet-purple, somewhat pubescent, scarcely longer than the hispid-ciliate calyx-teeth. Gardens: cultivated. Native of Southern Furope. Fl. July—Aug. Fr. September.

Obs. Cultivated as a culinary Herb.

127. HYSSOPUS. L. Endl. Gen. 3612. [Latinized from Ezob,—an ancient Hebrew name.]

Calyx tubular, 15-nerved, equally 5-toothed; throat naked. Corolla bilabiate,—the upper lip erect, flat, emarginate—the lower lip spreading, 3-lobed, middle lobe larger. Stamens 4, exserted, diverging; anthers 2-celled,—the cells linear, divaricate. Style bifid,—the branches equal, subulate, stigmatiferous at apex.

1. H. OFFICINALIS, L. Leaves linear-lanceolate, rather acute, very entire, sessile; cymules secund, racemose,—the upper ones approximate. Benth. Lab. p. 356. Fl. Cestr. p. 348.

Officinal Hyssopus. Vulgo.—Hyssop. Garden Hyssop. Fr. Hysope. Germ. Der Isop. Span. Hisòpo.

Root perennial. Stem 18 inches to 2 or 3 feet high, subterete, shrubby at base and much branched. Leaves three fourths of an inch to an inch and half long. Cymules rather crowded in a one-sided terminal raceme or spike, with a few distant ones below. Corolla bright blue, or sometimes purplish. Gardens: cultivated. Native of Southern Europe, and Asia. Fl. July—Aug. Fr. Sept.

Obs. Cultivated as a medicinal Herb. The infusion has long been a popular febrifuge. The Dittany (Cunila Mariana, L.)—which belongs to this Tribe—is also a well known article in the popular Materia Medica: but as it grows wild—and is usually confined to dry hilly woodlands—it is scarcely intitled to a place among Agricultural plants.

TRIBE V. MELISSINEAE. Benth.

Calyx 13- or rarely 10-nerved, bilabiate,—the upper lip 3-toothed—the lower one bifid. Corolla bilabiate,—the upper lip straight, entire or emarginately bifid, mostly flatush—lower lip spreading, 3-lobed; lobes flat, the middle one often broader. Stamens ascending, 4 and didynamous, or sometimes the 2 upper ones abortive.

128. HEDEOMA. Pers. Endl. Gen. 3615. [Greek, Hedeia Osme, a pleasant odor; from its fragrance.]

Calyx ovoid-tubular, gibbous on the under side near the base, 13-nerved, bilabiate,—the upper lip 3-toothed—lower one bifid; throat villous. Corolla bilabiate,—the upper lip erect, flat—lower lip spreading, 3-lobed, lobes nearly equal. Stamens 2 fertile, ascending, about as long as the corolla; anthers 2-celled; cells divering or divaricate: the two upper stamens entirely wanting,—or rudimentary and sterile, short, subulate and capitate. Herbs, or suffruticose plants. Cymules few-flowered, loose, axillary.

1. H. PULEGIOIDES, *Pers*. Stem herbaceous, erect, branching, pubescent; leaves lance-ovate, rather obtuse, subserrate, narrowed at base, petiolate; cymules about 3-flowered; corolla about as long as the calyx. *Benth. Lab. p.* 366. *Fl. Cestr. p.* 350.

Pulegium-like Hedeoma. Vulgò.—Pennyroyal.

Root annual. Stem 6 to 12 inches high, hoary-pubescent, branched above. Leaves half an inch to an inch long, sparingly serrate or sometimes entire, slightly pubescent, narrowed at base to a pubescent petiole one eighth to half an inch in length,—the floral leaves resembling the cauline ones. Cymules usually 3-flowered; bracteoles linear-lanceolate, scarcely as long as the pedicels. Corolla pale blue, with purple spots. Stamens scarcely exserted, ascending, the anthers approximated under the upper lip,—the upper pair of stamens reduced to mere abortive rudiments. Slaty soils; old fields, &c.: throughout the U. States. Fl. July—Aug. Fr. September.

Obs. A warmly aromatic little herb,—in general use as a popular diaphoretic, carminative, &c. and therefore entitled to a description by which it may be certainly recognized. This is not the "Penny-royal" of Europe; but has been so called because of its resemblance to that plant,—which is a species of Mint—viz. the Mentha Pulegium, L.

129. MELISSA. Benth. Endl. Gen. 3617. [Greek, Melissa, the honey-bee; the flowers being a favorite of that insect.] Calyx tubular, 13-nerved, bilabiate,—the upper lip mostly spreading, 3-toothed—the lower one bifid. Corolla bilabiate,—the upper lip erect, flattish, emarginately bifid;—the lower lip spreading, 3-lobed, middle lobe mostly broader. Stamens 4, ascending, mostly approximated in pairs at summit; anthers 2-celled; cells distinct, parallel, finally diverging,—the connective often thickened. Herbaceous or suffruticose.

1. M. OFFICINALIS, L. Stem herbaceous, erect, branching; leaves ovate, coarsely crenate-serrate, obtuse or truncate and sometimes cordate at base, rugose; cymules loose, few-flowered, turned to one side; bracteoles few, ovate, petiolate; corolla twice as long as the calyx. Benth. Lab. p. 393. Fl. Cestr. p. 351.

Officinal Melissa. Vulgò—Balm. Common Balm. Fr. La Melisse. Germ. Die Melisse. Span. Melisa.

Root perennial. Stem 1 to 2 or 3 feet high, more or less pubescent. Leaves 2 to 3 or 4 inches long; petioles half an inch to an inch and half in length,—the floral leaves resembling the cauline, but usually somewhat cuneate at base. Cynules 3 to 6-flowered, on a short common peduncle. Calyx arid, pilose,—the upper lip truncate, with 3 short acute teeth—the teeth of the lower lip longer, subulate and ciliate; throat gaping, pilose. Corolla white or ochroleucous—sometimes slightly tinged with purple. Gardens: cultivated. Native of Southern Europe, and Asia. Fl. July—Aug. Fr. September.

Obs. This is generally cultivated or kept in gardens, as a popular medicinal Herb,—the infusion being a pleasant diaphoretic drink. It is partially naturalized, in many places.

TRIBE VI. SCUTELLARINEAE. Benth.

Calyr bilabiate,—the upper lip truncate, entire or somewhat 3-toothed. Corolla bilabiate,—the upper lip vaulted; tube exserted, ascending, annulate within or naked. Stamens 4, ascending under the upper lip of the corolla.

130. PRUNELLA. L. Endl. Gen. 3624.

[German, Brunelle,—from Die Braeune, the Quinsy; said to be cured by it.] Calyx tubular-campanulate, about 10-nerved, reticulately veined, bilabiate,—the upper lip flat, dilated, truncate, with 3 short teeth—the lower lip bifid, segments lanceolate. Corolla ringent,—the upper lip erect, vaulted, entire—the lower lip depending, 3-lobed, middle lobe rounded, concave, crenulate; tube a little contracted at throat, inflated below it on the under side, with an annulus, or little ring of short hairs or scales, near the base within.

1. P. VULGARIS, L. Leaves ovate-oblong or ovate-lanceolate, crenate dentate or obsoletely servate, sometimes pinnatifiely incised, petiolate. Benth. Lab. p. 417. Fl. Cestr. p. 352. Icon, Fl. Lond. 3. Common Prunella. Vulgò—Heal-all. Self-heal.

Fr. Brunelle ordinaire. Germ. Gemeine Brunelle. Span. Brunéla.

Root perennial. Stem 8 to 12 or 15 inches high, erect or ascending, somewhat branched, especially at base. Leaves 1 to 3 inches long; petioles half an inch to 2 inches long (those of the radical or lower leaves often 3 or 4 inches long); the floral leaves bract-like, orbicular-cordate, sessile, with a short abrupt acumination,—the lower ones conspicuously acuminate. Cymules 3-flowered, crowded into compact imbricated oblong terminal spikes. Bracteoles none. Corolla violet-purple (rarely pale purple or nearly white), smoothish. Fields; roadsides; open woodlands, &c.: introduced. Native of the old world. Fl. July—September. Fr. August—November.

Obs. This plant appears to be distributed over the four quarters of the globe; but I should judgde it not to be a native, here. Although not a pernicious weed, it is so common, on our farms, that it seemed proper to notice it in this work. Its ancient reputation for healing wounds—like that of many other such medicaments of the olden times—is now quite obsolete. The famous mad-dog scull-cap (Scutellaria lateriflora, L.)—which once figured in the Gazettes as a specific for Hydrophobia—belongs to this Tribe,—and is frequent in wet meadows.

TRIBE VIII. NEPETEAE. Benth.

Ca'yx with the limb oblique, or sub-bilabiate,—the upper segments larger. Corolla bilibiate,—the upper lip somewhat vaulted—lower one spreading; throat mostly inflated. Stamens 4, ascending or diverging,—the upper pair longer!

131. NEPETA. Benth. Endl. Gen. 3636. [Supposed to be named from Nepete,—a town in Italy.]

Calyx tubular, sometimes ovoid, about 15-nerved, arid; limb obliquely 5-toothed. Corolla bilabiate,—the upper lip erect, somewhat concave, emarginate or bifid—the lower lip spreading, 3-lobed, middle lobe largest; throat dilated, with the margin often reflexed; tube slender below, naked within.—Stamens ascending,—the lower pair shorter; anthers mostly approximated in pairs, 2-celled; cells diverging, finally divaricate.

1. N. CATARIA, L. Hoary-pubescent; stem erect, tall; leaves oblong-cordate, acute, coarsely crenate-serrate, rugose; cymules densely many-flowered, the upper ones crowded in a spike—the lower ones distant; calyx ovoid-tubular; corolla one half longer than the calyx. Benth. Lab. p. 477. Fl. Cestr. p. 356.

CAT NEPETA. Vulgò.—Cat-mint. Cat-nep.

Fr. Herbe aux Chats. Germ. Die Katzen muenze. Span. Gatera.

Plant softly pubescent. Root perennial. Stem 2 to 3 feet high, mostly several from the same root, somewhat branched. Leaves 2 to 3 or 4 inches long, green above; canescent beneath; petioles half an inch to an inch and half in length, grooved on the upper side. Cymules on short common pedancles, in interrupted terminal spikes; bracteoles lance-linear, a little longer than the pedicels. Corolla ochroleucons, with a reddish tinge and purple dots, pubescent,—the upper lip emarginately bifid, the lower one crenate dentate, villous at base. Fence-rows; fields, and waste places: introduced. Native of Europe. Fl. June—August. Fr. July—September.

- Obs. This foreigner is so extensively naturalized as to be a rather troublesome weed. The dried herb, in infusion, is a highly popular medicine among the good ladies who deal in simples,—and is probably often useful: But, as a weed on the farm, it is objectionable,—and, when permitted to multiply, gives to the premises a very slovenly appearance.
- 2. N. GLECHOMA, Benth. Stem procumbent, radicating at base; leaves cordate-reniform, rounded, crenate; cymules few-flowered,—all distant, axillary; calyx tubular; corolla nearly three times as long as the calyx. Benth. Lab. p. 485. Fl. Cestr. p. 356.

Glechoma hederacea. L. Icon, Fl. Lond. 3.

Vulgò.-Ground Ivy. Ale-hoof. Gill.

Fr. Lierre terrestre. Germ. Die Gundelrebe. Span. Yedra terrestre.

Root perennial. Stem 6 to 18 inches long, slender and prostrate,—the flowering branches erect or ascending, 4 to 8 or 10 inches high, retrorsely pubescent. Leaves three fourths of an inch to an inch and half long, and rather wider than long; petioles 1 to 3 inches long: floral leaves conformable, or similar to the cauline ones. Cy mules all distant; bracticles minute, subulate and cilate. Corolla blue or purplish-blue (rarely white), pilose,—the upper lip bifid. Anthers approximated in pairs,—the cells diverging and presenting the figure of a cross. Fence-rows, and moist shaded places: introduced. Native of Europe, and Northern Asia. Fl. May—June. Fr. July.

Obs. Naturalized about many settlements,—and being a mere weed, is often inconveniently abundant. The herb was employed, in England, to clarify and give a flavor to Ale (whence one of its common names), until the reign of Henry Sth,—at which period Hops were substituted. The infusion of the herb is a popular medicine,—like that of the preceding species.

TRIBE IX. STACHYDEAE. Benth.

Calyx irregularly veined, or 5 to 10-nerved,—the limb equal, oblique, or somewhat bilablate, 3 to 10-toothed. Corolla bilablate,—the upper lip galeate or flat, entire or emarginate—the lower lip variously 3-lobed. Stamens 4, ascending,—the upper pair shorter.

132. LAMIUM. L. Endl. Gen. 3645. [Greek, Laimos, the throat, from its gaping flowers.]

Calyx tubular-campanulate, about 5-nerved; limb mostly oblique; teeth 5, nearly equal, subulate at apex. Corolla ringent,—the

upper lip ovate or oblong, galeate, mostly narrowed at base; throat dilated; lateral lobes at the margin of the throat truncate or oblong—sometimes with a tooth-like process; middle or lower lobe (lower lip) broad, emarginate, contracted at base and substipitate. Anthers approximated in pairs, 2-celled; cells finally divaricate, oblong, often hirsute externally. Akenes triquetrous with the angles acute, truncate at summit, smooth or minutely rugose-tuberculate.

1. L. AMPLEXICAULE, L. Leaves orbicular, crenately incised,—the lower ones petiolate—the floral ones sessile, amplexicaul; tube of the corolla naked within, the lateral lobes not toothed; anthers hirsute. Benth. Lab. p. 511. Fl. Cestr. p. 357. Icon, Fl. Lond. 3. Stem-clasping Lamium. Vulgò—Dead-Nattle. Hen-bit.

Fr. Le Lamier. Germ. Die Taube-nessel. Span. Ortiga muerta.

Root annual. Stems several, or much branched from the base, decumbent or ascending, 6 to 12 inches high, mostly purplish. Leaves half an inch to three quarters in length, and mostly wider than long,—the lower or cauline ones on petioles half an inch to an inch long. Cymules densely many-flowered, axillary,—the lower ones distant—the upper ones rather approximated. Calyx sessile, hirsutc. Corolla bright purple, pubesceut,—the galeate upper lip nearly entire, clothed with a purple villus,—lower lip obcordate; throat dilated, laterally compressed; tube slender, much exserted. The Corolla, in the lower cymules, is often minute, or wanting. Gardens, and cultivated Lots: introduced. Native of Europe and Northern Africa. Fl. April—May. Fr. June.

Obs. This worthless little weed is abundantly naturalized in and about our gardens, in Pennsylvania,—and requires some attention to keep it in due subjection. Another species (L. purpureum, L.) has also been introduced, in some localities; but it does not appear to multiply so rapidly.

133. LEONURUS. L. Endl. Gen. 3647.

[Greek, Leon, a lion, and Oura, a tail; from some fancied resemblance.]

Calyx turbinate, 5 or 10-nerved,—the limb truncate. 5-toothed; teeth subulate, subspinescent, finally spreading. Corolla bilabiate,—the upper lip oblong, entire, flattish or somewhat vaulted—lower lip spreading, 3-lobed,—the lateral lobes oblong—the middle one entire or sometimes obcordate. Anthers approximated in pairs, incumbent, 2-celled; cells mostly parallel, the valves naked. Akenes triquetrous, truncate at summit, smooth.

1. L. Cardiaca, L. Pubescent; lower stem-leaves palmate-lobed, the upper ones ovate and lobed; floral leaves cuneate-oblong, mostly trifid, with a lengthened narrow base,—the lobes of all the leaves ovate or lanceolate; corolla longer than the calyx-teeth,—the tube with a villous ring within at base; upper lip flattish, hirsutely villous; lower lip spreading, the middle lobe entire. Benth. Lab. p. 518. Fl. Cestr. p. 358.

CARDIAC LEONURUS. Vulgò-Motherwort.

Fr. L'Agripaume. Germ. Das Herzgespann. Span. Agripalma.

Root perennial. Stem 2 to 4 feet high, branched at base and above, retrorsely pubescent, with a harry ring at the joints or nodes. Leaves 2 to 4 inches long, rugose,—the lower ones nearly orbicular in the outline; petioles 1 to 2 inches long. Cymules 3 to 6 or 8-flowered, sessile, distant, forming an interrupted leafy spike 6 to 12 or 15 inches in length; bracteoles subulate, smooth. Calyx strongly 5-ribbed, smoothish; teeth acuminate, pungent,—the lower ones rather longer. Corolla pale purple, externally very villous, especially on the upper lip. Akenes

hirsute at summit. Fence-rows; and waste places: introduced. Native of Europe and Asia. Fl. June-July. Fr. August.

Obs. This foreigner is completely naturalized, and is apt to occupy all neglected nooks, and waste places, about farm yards, and along field sides. It is an utterly worthless weed—unsightly and disagreeable,—and speedily gives a forlorn appearance to the premises of the slothful and slovenly farmer. There is another species (L. marrubiastrum, L.) which has become partially naturalized in some districts; but it does not threaten to become so prevalent and troublesome.

134. MARRUBIUM. L. Endl. Gen. 3657. [Etymology obscure; supposed to be from a town in Italy.]

Calyx tubular, 5 to 10-nerved, nearly equally 5 or 10-toothed,—the teeth erect or finally spreading. Corolla bilabiate,—the upper lip erect, flattish or concave, entire or bifid—lower lip spreading, 3-lobed, middle lobe broader, mostly emarginate; tube included in the calyx. Stamens included; anthers 2-celled,—the cells divaricate, subconfluent. Akenes obtuse at summit, but not truncate.

1. M. VULGARE, L. Stems ascending, hoary-tomentose; leaves roundish-ovate or oval, crenate-dentate, softly villous and canescent beneath; cymules many-flowered, woolly and canescent; calyx with 10 subulate recurved teeth; upper lip of the corolla oblong, bifid at apex. Benth. Lab. p. 591. Fl. Cestr. p. 360.

Common Marrubium. Vulgò—Hoar-hound.

Fr. Marrub blanc. Germ. Der weisse Andorn. Span. Marrubio.

Root perennial. Stems 9 to 18 inches high, cespitose or branching from the base. Leaves about 2 inches long, abruptly narrowed at base to a flat nerved woolly petiole half an inch to an inch long. Cymules dense, sessile in the rather distant axils; bracteoles subulate. Corolla white, small. Stony banks, and waste places: introduced. Native of Europe and middle Asia. Fl. July-August. Fr. Sept.

Obs. This has been introduced as a medicinal Herb.—and is partially naturalized in many places. It has a weed-like appearance, but does not incline to spread much,—and may well be tolerated to some extent, for its valuable tonic properties. The Syrups and Candies, prepared from or with it, are excellent pectoral medicines.

TRIBE XI. AJUGOIDEAE. Benth.

Corolla with the upper lip sometimes very short—sometimes split, with the segments depending,—rarely erect and vaulted; lower lip elongated. Stamens 2 or 4, ascending, generally much exserted. Akenes more or less reticulately rugose.

[Named from Teucer, a Trojan Prince,—who, it is said, first used the plant.]

Calyx tubular-campanulate, nearly equally 5-toothed. Corolla

with the tube short,—the 4 upper lobes of the limb nearly equal,
oblong and declined, or very short and rather erect,—the lowest lobe

oblong and declined, or very short and rather erect,—the lowest lobe largest, oblong or rounded, mostly concave. Stamens 4, exserted from the cleft between the upper lobes of the corolla; anthers with the cells confluent. Akenes rugose.

1. T. Canadense, L. Herbaceous, erect, hoary-pubescent; leaves ovate-lanceolate, acute, serrate, rounded at base, on short petioles;

cymules few-flowered, crowded in a simple terminal spike; calvx declinate, campanulate, finally somewhat gibbous,—the upper teeth broader. Benth. Lab. p. 672. Fl. Cestr. p. 362.

CANADIAN TEUCRIUM. Vulgò-Wood Sage. Germander.

Root perennial. Stem 1 to 2 or 3 feet high, simple or sparingly branched, square Root perennial. Stem 1 to 2 or 3 feet high, simple or sparingly branched, square with the sides concave and the angles obtuse, clothed with a retrorse cinereous pubescence. Leaves 3 to 5 inches long, on petioles one fourth to three fourths of an inch in length. Cymules 2 or 3-flowered, mostly crowded, sometimes a little distant, in a greenish-grey spike 2 to 5 or 6 inches in length (often an opposite pair from the axils of the first leaves beneath). Corolla pale purple, minutely pubescent; limb declinate, with a central fissure on the upper side,—the upper or lateral lobes erect, acute,—the middle or lowest lobe oblong or obovate, concave. Style longer than the stamens, curved, equally bifid at summit. Fence-rows, and low shaded grounds: throughout the U. States. Fl. July. Fr. Aug.—Sept.

Obs. This plant is frequently to be seen in low grounds, along streams, - and sometimes along fence-rows, and borders of fields; but it has not become generally known as an intrusive weed. An observing farmer, however, has recently brought to me some specimens of it, collected in his fields, -where, he assured me, he found it a very troublesome weed-and, moreover, exceedingly difficult to extirpate. I have, therefore, deemed it proper to describe the plant, and commend it to further notice,—so that its true character may be certainly determined, before its inroads become extensive.

ORDER XCIV. BORAGINACEAE. Juss. Lindl.

Herbs, or sometimes shrubby plants, with round stems. Leaves alternate, simple, mostly rough and hispid, without stipules. Flowers often in one-sided clusters or racemes, which are spiral before expansion (circinnate, or scorpioid). Calyx of 5 foliaceous persistent sepals, more or less united at base, regular. Corolla mostly regular,—the limb 5-lobed, often with a row of scales in the throat. Stamens as many as the lobes of the corolla and alternate with them. Ovary deeply 4-lobed,—the style proceeding from the base of the lobes, which in fruit become little nuts or hard akenes. Seeds with little or no albumen.

An Order, for the most part, of rough homely plants,—some of them very obnoxious weeds. A few are slightly medicinal. The Alkanet of Commerce (a red coloring matter.) is afforded by a plant of this Order, viz: Anchusa tinctoria, L.) Several species have showy flowers,—and some of the Heliotropiums are admired for their fragrance. mostly rough and hispid, without stipules. Flowers often in one-sided clusters

admired for their fragrance.

TRIBE IV. BORAGEAE. DC.

Ovary consisting of 2 carpels, each 2-celled or 2-parted. Style central, proceeding from the base of the lobes. Fruit 2 or 4-parted,—the carpels each 2-celled or separable into 2 akenes.

SUB-TRIBE 2. ECHIEAE. DC.

Corolla more or less irregular, naked at throat. Akenes affixed to the receptacle.

136. ECHIUM. Tournef. Endl. Gen. 3757.

[Greek, Echis, a viper; from the resemblance of the seeds to a viper's head.] Calyx 5-parted. Corolla hypogynous, subcampanulate, limb obliquely 5-lobed, unequal. Stamens 5, inserted on the tube of the corolla. Ovary 4-lobed; style simple; stigma bifid. Akenes 4, distinct, turbinate, with a triangular areola at base.

1. E. VULGARE, L. Stem tuberculate-hispid; leaves linear-lanceolate, hispid; flowers in lateral secund spikes; stamens longer than the corolla. DC. Prodr. 10. p. 18. Fl. Cestr. p. 119.

Common Echium. Vulgò—Blue-weed. Viper's Bugloss. Blue Devils. Fr. Herbe aux Vipères. Germ. Der Natterkopf. Span. Yerba de la Vibora.

Roct biennial. Stem 2 to 3 feet high, branched above. Radical leaves 5 to 8 inches long, lanceolate, petiolate; stem leaves smaller, linear-lanceolate, acute, sessile. Spikes numerous, axillary, secund and at first recurved, finally erect. Calyx-segments linear, pectinate-ciliate. Corolla at first purplish, finally bright blue, pubescent externally. Akenes subovoid, angular on the inner side, keeled on the back, a little incurved and acuminate, rough with tubercles of a greyish-brown color. Fields, and road sides: introduced. Native of Europe. Fl. June. Fr. August.

Obs. This showy but vile weed has become extensively naturalized, in some portions of our country,—and is a sad pest, wherever it establishes itself. I have seen it in considerable quantities in the State of Maryland,—though I think it is yet rare in Pennsylvania. Prof. A. Gray informs us (Silliman's Journal, Vol. 42. p. 13,), that in the valley of the Shenandoah, Virginia, "for the distance of more than a hundred miles, it has taken complete possession, even of many cultivated fields." A veteran Editor of a Newspaper, in the "old Dominion," has long been noted for harping on the Ovidian phrase—"Principiis obsta,"—i. e. meet and resist beginnings—or nip the first buddings of evil. If he had taught his Agricultural felloweitizens to apply his favorite maxim, practically, to this plant, he would "have done the State some service": and every farmer would do well to bear that maxim in mind, not only in reference to this, but to all pernicious weeds. It would save a vast deal of vexatious labor, at a future day.

SUB-TRIBE 4. LITHOSPERMEAE. DC.

Corolla regular, naked at throat. Akenes 4, affixed to the receptacle, imperforate at base.

137. LITHOSPERMUM. Tournef. Endl. Gen. 3761. [Greek, Lithos, a stone, and Sperma, seed; from the stony hardness of its seeds.] Calyx 5-parted. Corolla hypogynous, funnel-form; limb 5-lobed; throat naked. Stamens 5, inserted on the tube of the corolla, included. Ovary 4-lobed; style simple; stigma 2 or 4-cleft. Akenes 4, distinct, bony, smooth or rugose.

1. L. ARVENSE, L. Hispidly pilose; leaves lance-linear, rather acute, entire, nerveless, sessile; akenes rugose-pitted. DC. Prodr. 10. p. 74. Fl. Cestr. p. 118.

FIELD LITHOSPERMUM. Vulgà—Stone-weed. Gromwell. Fr. Grémil des champs. Germ. Acker Steinsame.

Root annual. Stem 12 to 18 inches high, generally much branched from the root, and often branched near the summit. Leaves 1 to 2 inches long,—the lower ones often oblanceolate and obtuse. Flowers axillary, solitary, subsessile. Corolla ochroleucous, small. Akenes ovoid, acuminate, rugose, brown when mature. Grain fields, and pastures: introduced. Native of Europe. Fl. May. Fr. June.

Obs. A worthless little foreigner,—more noticeable for its frequency in our fields, than for any intrinsic importance—even as a weed.

SUB-TRIBE 5. CYNOGLOSSEAE. DC.

Throat of the corolla mostly furnished with arching scales. Akenes 4, mostly echinate, or winged, adnate to the base of the style, imperforate at base.

138. CYNOGLOSSUM. Tournef. Endl? Gen. 3784. [Greek, Kyon, kynos, a dog, and Glossa, a tongue; from the form of the leaves.] Calvx 5-parted. Corolla funnel-form,—the tube nearly as long as the calyx; throat closed by 5-obtuse connivent scales; limb 5-lobed; the lobes very obtuse. Stamens 5, included. Ovary 4-lobed; style simple; stigma subcapitate, entire or emarginate. Akenes 4, roundish, convex, or depressed, echinate all over, or sometimes only at the edges, imperforate at base, affixed to the base of the style, at maturity separating from base to apex and cohering by the summit of the style.

1. C. Morisoni, DC. Stem erect, somewhat hispid, divaricately branched at summit; leaves ovate-lanceolate, acuminate, narrowed at base; racemes somewhat in pairs, bracteate, with the rachis villous; pedicels extra-axillary, finally reflexed; calyx-segments nearly as long as the corolla; fruit densely covered with uncinate prickles. DC. Prodr. 10. p. 155.

Echinospermum Virginicum. Lehm. Fl. Cestr. p. 121. Morison's Cynoglossum. Vulgò-Beggar's Lice.

Root annual. Stem 2 to 4 feet high. Leaves 3 or 4 inches long, acute at each end, scabrous,—the lower ones petiolate—the upper ones subsessile. Racernes terminating the slender divaricate branches, mostly dichotomous; pedicels about as long as the fruit. Corolla bluish-white. small. Fence-rows, and borders of thickets: Northern and Middle States. Fl. July. Fr. October.

Obs. The slovenly farmer is apt to get a practical acquaintance with this obnoxious weed, -in consequence of its racemes of bur-like fruit entangling the manes of his horses, and the fleeces of his sheep. The Hound's-tongue, of Europe—another species (C. officinale, L.) —has been introduced, and is partially naturalized, in many places; and there is also a native species (C. Virginicum, L.), known by the name of "Wild Comfrey," frequent in our woodlands: but they scarcely come within the purview of this work. The same remark applies to the common Garden Confrey (Symphytum officinale, L.),—which belongs to this Tribe—and is occasionally seen in Gardens.

ORDER XCIX. CONVOLVULACEAE. Juss. R. Br.

Twining or trailing herbs or shrubs,—often with a milky juice. Leaves alternate, simple, without stipules. Flowers axillary, often large and showy. Calyx of 5 smalls, without stiputes. Flowers axiliary, often large and show, Caigle of Sepals, imbricated, or usually more or less united, persistent Corolla plicate, and twisted in aestivation,—the limb 5-lobed—or often nearly entire. Stamens mostly 5, inserted on the tube of the corolla near the base. Ovary 2 to 4-celled, with 1 or 2 erect ovules in each cell; styles more or less united; stigma often 2-lobed, capitate or linear. Capsule 2 to 4- (or by obliteration 1-) celled.—the valves falling away from the persistent dissepiments (septifiagal). Seeds large, with a little mucilaginous albumen: cotyledons foliaceous, corrugated—wanting in Carecta.

An interesting Order—containing many beautiful species. The Jalap, and Scammony, of the shops, are furnished by plants of this Order.

TRIBE II. CONVOLVULEAE. Chois.

Carpels coalesced into a single ovary. Fruit capsular, dehiscent.

139. BATATAS. Rumph. Endl. Gen. 3807. [Apparently an aboriginal or barbarous name,—adopted for the genus.] Sepals 5. Corolla campanulate,—the limb spreading. Stamens 5, included. Style simple; stigma capitate; 2-lobed. Capsule 3 or 4-celled, 3 or 4-valved. Seeds 3 or 4, erect.

1. B. Edulis, Chois. Stem creeping, rarely volubile; leaves sub-hastate—cordate with the sinus broad and shallow, often angular and partially lobed, petiolate; peduncles as long or longer than the petioles, 3 or 4-flowered. DC. Prodr. 9. p. 338.

Convolvulus Batatas. L. Fl. Cestr. p. 132.

EATABLE BATATAS. Vulgò—Sweet Potato. Carolina Potato.

Fr. Patate jaune. Germ. Bataten Winde. Span. Batata de Malaga.

Root perennial, tuberous; tubers oblong, terete, acute at each end, purple or yellowish-white externally, yellowish within. Stem 4 to 8 feet long, slender, prostrate, radicating, pilose. Leaves 2 to 3 or 4 inches long; petioles about 2 inches in length. Corolla purple (fide DC.). Gardens, and Lots: cultivated.

Obs. This plant is much cultivated for its fine esculent tubers,—particularly in the sandy soil of New Jersey and the Carolinas,—where it succeeds best. It is propagated by cuttings of the tubers; and, so far as I know, it has never produced flowers, in the middle States. This is said to be the Potato, spoken of by Shakspeare, and contemporary writers; the Solanum tuberosum, or "Irish Potato" (now so common), being then scarcely known in the old world. According to De Candolle, the Sweet Potato is a native of the East Indies; but M'Culloch, in his Commercial Dictionary, says it is supposed to have been carried to Europe from New Grenada, by Sir John Hawkins, in 1545.

140. CONVOLVULUS. L. Endl. Gen. 3803, [Latin, Convolvo, to entwine, or wind about; descriptive of the plant.]

Sepals 5. Corolla campanulate. Style simple; stigmas 2, teretelinear, often revolute. Ovary 2-celled, 4-ovuled. Capsule 2-celled. Seeds 4, erect.

1. C. ARVENSIS, L. Stem volubile or often prostrate, angled and striate; leaves ovate-oblong, mostly obtuse, sagittate at base and somewhat auriculate; peduneles mostly 1-flowered, bibracteate—the bracts small, remote from the flower; sepals very obtuse, roundish-ovate. DC. Prodr. 9. p. 406. Fl. Cestr. p. 131. Icon, Fl. Lond. 1.

FIELD CONVOLVULUS. Vulgà-Bind-weed.

Fr. Liseron des champs. Germ. Die Ackerwinde. Span. Corregüela.

Root perennial, creeping, long. Stem about 2 feet long, slender, branching, procumbent or twining round other plants, twisted, a little hairy. Leaves an inch to an inch and half long.—the smaller ones rather acute—the larger ones obtuse and somewhat enarginate—all of them with a minute cusp at the end of the midrib; petioles half an inch to an inch long. Peduncles axillary, 1 to $2\frac{1}{2}$ inches long, with 2 minute bracts half an inch to an inch below the flower. Corolla pale red or reddish-white. Cultivated Lots: introduced. Native of Europe and Asia. Fl. June—July. Fr. August.

Obs. This foreigner has been introduced into some portions of our country,—and may give the farmers some trouble, if they do not guard against it. We are told that incessant vigilance is the condition on which alone the rights of freemen can be maintained; and I believe the farmer will find a similar condition annexed to the preservation of his premises from the inroads of pernicious weeds.

The following remarks, from the *Flora Londinensis*, will afford some idea of the character of this *Convolvulus*, as observed in England,—and may serve as a salutary caution, here.

"Beautiful as this plant appears to the eye, experience proves it to have a most pernicious tendency in Agriculture. The field of the slovenly farmer bears evident testimony of this; nor is the garden wholly exempt from its inroads. The following experiment may serve to show what precaution is necessary in the introduction of plants into a garden, especially when we want them to grow in some particular situation.

"Tempted by the lively appearance which I had often observed some banks to assume, from being covered with the blossoms of this Convolvulus, I planted twelve feet of a bank in my garden, which was about four feet in height, with some roots of it: it was early in the spring, and the season was remarkably dry, so that I scarcely expected to see them grow; but a wet season coming on, soon convinced me that my apprehensions were unnecessary, for they quickly covered the whole surface of the bank, to the almost total extirpation of every other plant. It being a generally received opinion, that if a plant was cut down close to the ground, it would thereby be destroyed, or at least very much weakened, I was determined to try the validity of this opinion by an experiment, and accordingly, the whole of the Convolvulus was cut down somewhat below the surface of the earth. In about a month the bank was covered with it thicker than before. I then had recourse to a second cutting, and afterwards to a third: but all these were insufficient; for now at this present writing (August) the bank is wholly covered with it; nor do I expect to destroy it, but by levelling the bank and destroying the roots.

"This experiment seems to determine a matter of no small consequence in Agriculture, viz: that the cutting down those plants, which have creeping roots, rather tends to make them spread further than destroy them; and that nothing short of actual eradication will effect the latter.

"It is seldom that this plant is highly prejudicial to meadows, or pastures; but many fields of corn are every year destroyed by it, or rendered of little value."

TRIBE IV. CUSCUTEAE. Chois. Embryo filiform, destitute of cotyledons! Parasitic Herbs.

141. CUSCUTA. Tournef. Endl. Gen. 3816. [A name of uncertain derivation, and obscure meaning.]

Calyx 4 or 5-cleft. Corolla globose-urceolate or tubular,—the limb 5 or rarely 4-cleft. Stamens 5, or rarely 4, adnate to the tube of the corolla, alternate with the lobes, and mostly supported at base by epipetalous scales. Ovary free, 2-celled and 4-ovuled; styles 2, rarely united into 1; stigmas acute, clavate, or capitate. Fruit mostly capsular,—the pericarp membranaceous, circumscissed at base or bursting irregularly. Embryo spiral, filiform, more or less convolute in and around fleshy albumen. Parasitic Herbs, with siender twining leafless orange-colored stems; germinating in the earth, but speedily attaching themselves to other plants by radicating

processes, through which they derive nourishment,—and, dying at the root, soon loose all direct connection with the soil. Flowers clustered.

1. C. EPILINUM, Weih. Stem filiform; flowers in dense capitate sessile rather distant clusters; calyx 4 or 5-cleft; corolla scarcely exceeding the calyx, withering on the capsule; scales minute; styles finally divaricate; stigmas acute. DC. Prodr. 9. p. 452.

C. Europaea? L. Fl. Cestr. p. 167.

FLAX CUSCUTA. Vulgò-Flax-vine. Dodder.

Fr. Fil de terre. Germ. Die Flachs-seide. Span. Cuscuta.

Annual. Stem 2 to 3 or 4 feet long, very slender, smooth, pale orange-color. Flowers in small dense heads or clusters. Ca'yx-segments 4 or 5. ovate, rather acute. Corolla yellowish-white or pale orange-color, subglobose-urceolate. 4 or 5-lobed; lobes ovate, acute, somewhat spreading. Stamens inserted at the clefts of the corolla. Scales adnate to the corolla below the stamens, short, truncate, crenate-laciniate. Capsule depressed-globose. Seeds reddish-brown, scabrous or almost muricate under a lens. Parasitic on Flax: introduced. Native of Europe. Fl. June. Fr. July.

Obs. This singular plant—formerly a great pest among the flax-crops—has become quite rare, since the culture of flax has declined. Dr. Engelmann, of St. Louis, has given an interesting Monography of our American Cuscutas, in the 43rd volume of Silliman's Journal,—in which a number of native species are described; one of which, at least, (C. Gronovii, Willd. in DC.—C. Americana, of Fl. Cestr.) is quite frequent in Pennsylvania: But as they do not interfere with the crops of the farmer, they need not be more particularly noticed, in this work.

ORDER C. SOLANACEAE. Juss. Lindl.

Herbs, or shrubby plants, with watery juice. Leaves mostly alternate, without stipules. Inflorescence often supra-axillary; pedicels without bracts. Calyc usually of 4 or 5 sepals, more or less united, and mostly persistent. Corolla hypogynous, regular or sometimes a little irregular plicate, in aestivation. Stamens 5 (rarely 4 or 6), inserted on the tube of the corolla. Orary free, 2-celled, with the placentae in the axis; style simple; stigma undivided or obsoletely 2-lobed. Fruit a many-seeded Capsule or Berry. Embryo mostly curved, in fleshy albumen; cotyledons semi-cylindric.

in fleshy albumen; cotyledons seini-cylindric.

An Order affording many powerful narcotics, and stimulants, as well as some valuable esculents. In addition to those here given, may be mentioned the poisonous Hendane (Hyosciamus niger, L.), and the deadly Nightshade (Atropa

Belladonna, L.).

TRIBE I. NICOTIANEAE. Endl.

Capsule 2-celled, 2-valved—the valves septicidal at apex—often finally loculicidal.

142. NICOTIANA. L. Endl. Gen. 3841.

[Named in compliment to John Nicot,—who introduced it into France.]

Calyx tubular-campanulate, 5-cleft, persistent. Corolla funnelform,—the limb spreading, plicately 5-lobed. Stamens 5, inserted
on the tube of the corolla, included, equal in length. Style simple;
stigma capitate. Capsule covered by the calyx, septicidally 2-valved
at apex,—the valves finally bifid, retaining separate placentae.
Seeds very numerous, minute.

1. N. TABACUM, L. Leaves large, lance-ovate, sessile, decurrent;

lobes of the corolla acuminate,—the throat inflated. Willd. Sp. Pl. 1. p. 1014. Fl. Cestr. p. 133.

Това поттама. Vulg?—Товассо.

Fr. Le Tabac. Germ. Der Taback. Span. Tabaco.

Whole plant viscid-pubescent. Rost annual. Stem 4 to 6 feet high, stout, finally almost woody at base, paniculately branched above. Leaves 1 to 2 feet long, smaller as they ascend. Calyc about one third the length of the corolla, ventricosc,—the segments lanceolate, erect. Corolla about 2 inches long; limb rose-colored, spreading; tube pale yellowish-green. Capsule ovoid, sulcate on each side. Seeds reniform, rugose. Fields: cultivated extensively in the Southern and Western States. Native of the warmer regions of America. Known to Europeans about the year 1560. Fl. July—August. Fn September.

Obs. The extent to which this nauseous and powerfully narcotic plant is cultivated—its commercial importance—and the modes in which it is employed to gratify the senses—constitute, altogether, one of the most remarkable traits in the history of civilized man. Were we not so practically familiar with the business, we should, doubtless, be disposed to regard the whole story of the Tobacco trade—and the uses made of the herb—as an absurd and extravagant fable. In view of the facts and circumstances, it does seem like sheer affectation, on our part, to pretend to be astonished at the indulgence of the Chinese, and other Asiatics, in the use of Opium. The habitual use of Tobacco is always more or less injurious to the system—especially the nervous system; and in many instances it is highly deleterious. I speak from long observation, and a personal experience of many years,—having smoked and chewed the herb, until its pernicious effects compelled me to es-chew it altogether.

TRIBE II. DATUREAE. Endl.

Capsule or Berry incompletely 4-celled,—the primary dissepiment bearing the placentae on both sides, in the middle or near the parietal angle.

143. DATURA. L. Endl. Gen. 3845.
[Supposed to be from Tatorah,—the Arabic name of the plant.]

Calyx tubular, often angular, 5-cleft at summit or slit on one side, circumscissed above the peltate persistent base, deciduous. Corolla funnel-form,—the limb spreading, plicate, 5 to 10-toothed. Stamens 5, inserted on the tube of the corolla, mostly included. Ovary incompletely 4-celled,—one of the partitions imperfect above the middle—the other complete, placentiferous in the middle on both sides; placentae projecting, many-ovuled; style simple; stigma bilamellate. Capsule ovoid or subglobose, muricate or aculeate (rarely smooth), half 4-celled at summit, 4-valved. Seeds numerous, laterally compressed, sub-reniform, roughish-dotted. Mostly herbaceous, fetid and narcotic plants. Leaves somewhat in opposite pairs. Flowers large, solitary, axillary or dichotomal, on short peduncles.

1. D. Stramonium, L. Stem dichotomously branching; leaves ovate, sinuate-dentate, petiolate, smooth; capsule aculeate, erect. Willd. Sp. Pl. 1. p. 1008. Fl. Cestr. p. 133. Icon, Fl. Lond. 1.

 $Vulg\hat{o}$ —Jamestown (corruptly Jimson) weed. Thorn-apple.

Fr. Pomme epineuse. Germ. Der Stech-apfel. Span. Estramónio.

Root annual. Stem 2 to 5 feet high, rather stout, terete, pale yellowish-green (dark purple in var. Tatula), smooth. Leaves 4 to 6 or 8 inches long, sinuate or

somewhat angular-dentate; petioles 1 to 3 or 4 inches in length. Calyx prominently 5-angled, nearly half as long as the corolla Corolla ochroleucous (pale violet purple in var. Tatula), about 3 inches long. Capsule about an inch in diameter. Waste places; farm-yards; road-sides, &c. Fl. July—Aug. Fr. Sept.

Obs. This plant is supposed to be a native; but to my view, its habits and aspect are very much those of a naturalized exotic. In Pennsylvania, the variety with dark purple stems and bluish flowers (D. Tatula, Willd.) is much the most common,—and is usually of larger growth than the other. Both varieties are powerfully narcotic and poisonous,—and equally obnoxious as coarse unsightly fetid weeds—which every neat farmer will be careful to extirpate from his premises.

TRIBE IV. SOLANEAE. Endl.

Fruit a 2 or several-celled Berry, with central placentae,—rarely a valveless capsule.

144. CAPSICUM. Tournef. Endl. Gen. 3854. [Greek, kapto, to bite; from its hot or biting quality.]

Capsule 5 or 6-cleft, persistent. Corolla sub-rotate with a very short tube,—the limb plicate, 5 or 6-lobed. Stamens 5 or 6, inserted on the throat of the corolla, exserted; anthers connivent, longitudinally dehiscent. Ovary 2, 3 or 4-celled; placentae adnate to the base of the dissepiment or central angular receptacle, many-ovuled; style simple, sub-clavate; stigma obtuse, obsoletely 2 or 3-lobed. Berry nearly dry, inflated, polymorphous, incompletely 2 or 3-celled,—the upper portion of the placentae and partitions dissolving or disappearing. Seeds numerous, compressed, reniform, hot or acrid: embryo semicircular, sub-peripherical, within fleshy albumen.

C. ANNUUM, L. Stem herbaceous; leaves ovate, acuminate, entire, glabrous; peduncles solitary, axillary. Willd. Sp. Pl. 1. p. 1050. Fl. Cestr. p. 139.

Annual Capsicum. Vulgò—Red Pepper. Cayenne Pepper. Fr. Poivre d'Inde. Germ. Spanischer Pfeffer. Span. El Pimentero.

Root annual. Stem 1 to 2 feet high, angular, branching above, somewhat pilose. Leaves 2 to 4 inches long, deep green; petioles 1 to 3 inches long, semiterete, slightly channelled above. Calyx angular, with short segments. Corolla white, with ovate-oblong spreading lobes. Anthers white, with a tinge of blue. Berry hollow, terete and slender, ovoid-oblong, or depressed-globose, angular or torose, red when mature. Gardens, and Lots: cultivated. Native of S. America. Fl. July—August. Fr. October.

Obs. Cultivated for its fruit,—which is powerfully stimulant, and much used as a condiment. Several varieties (perhaps distinct species)—with the fruit of various forms—are to be met with in the gardens. That one with slender terete elongated fruit, is sometimes cultivated on a large scale,—for the manufacture of Cayenne Pepper, from the mature fruit: the other forms with thicker rinds, are used in the green state, for pickles.

145. SOLANUM. L. Endl. Gen. 3855. [A name of obscure and uncertain meaning.]

Calyx 5 to 10-parted, persistent. Corolla rotate or subcampanulate; tube short; limb plicate, mostly 5-lobed. Stamens mostly 5, inserted on the throat of the corolla, exserted; anthers connivent,

opening at apex by 2 pores. Ovary 2- (rarely 3 or 4-) celled; placentae adnate to the dissepiments, many-ovuled; style simple; stigma obtuse. Berry 2- (rarely 3 or 4-) celled. Seeds numerous, subreniform; embryo peripherical, spiral, including the fleshy albumen.

† Stem and leaves unarmed.

1. S. NIGRUM, L. Stem herbaceous, angular, branched, scabrous on the angles; leaves ovate, obscurely repand-dentate; flowers subumbellate. Willd. Sp. Pl. 1. p. 1035. Fl. Cestr. p. 136.

BLACK SOLANUM. Vulgò-Night-shade.

[Yerba mora.

Fr. Morelle noire. Germ. Der schwarze Nachtschatten. Span.

Root annual. Stem 1 to 2 feet high, much branched, angular or slightly winged. Leaves 2 to 3 inches long; petioles about an inch long. Umbels lateral, above the axils, few-flowered, nodding. Corolla white. Berries globose, rather small, black when mature. Waste places; about gardens, and dwellings. Fl. July. Fr. September.

- Obs. Several varieties of this are noticed in the books; and the common one, in this country, is the var. Virginicum, of Willdenow: whether really a native, seems undetermined. It is a homely, worthless, and even deleterious weed,—which ought to be carefully expelled from the vicinity of all dwellings.
- 2. S. TUBEROSUM, L. Root producing tubers; stem herbaceous, simple, angular; leaves interruptedly pseudo-pinnate,—the lobes ovate, entire; peduncles corymbosely subdivided. Willd. Sp. Pl. 1. p. 1033. Fl. Cestr. p. 136.

Tuberous Solanum. Vulgà—Common Potato. Irish Potato.

Fr. Pomme de terre. Germ. Die Kartoffel. Span. Batatin.

Annual; the base of the stem producing tuberous oblong or roundish pedicellate rhizomas. Stem 2 to 3 feet high, thickish and succulent or fleshy, often decumbent, somewhat pubescent. Leaves odd-pinnately dissected,—the segments somewhat petiolate, sometimes opposite, the alternate pairs very small. Flowers in terminal nodding corymbs, on a common peduncle 3 to 5 inches long; pedicels articulated. Corolla bluish-white. Anthers orange yellow, often slightly cohering. Berries globose, about half an inch in diameter, greenish-yellow when mature. Kitchen gardens, and fields: cultivated. Native of S. America. Fl. June—July. Fr. September.

Obs. This most important plant is more or less cultivated, for its esculent tubers, by every owner or occupant of land. It is one of the indispensable crops, for a family.* Numerous varieties of tubers—purple, white and yellow—have been obtained, by long culture, or from seedling plants. According to M'Culloch, Potatoes were introduced to England, from Virginia, by Sir Walter Raleigh, in 1586: into Ireland, in 1610,—where they have "long furnished from three-fifths to four-fifths of the entire food of the people": and into Scotland, in 1728.

† † Stem and leaves aculeate.

*Within a few years past, a most alarming disease, or rot (sometimes called "Potato Murrain"), has attacked the tubers, about the time they were full grown—and in many instances entire crops have been destroyed. This disease has appeared in various and distant parts of our own country,—and in some seasons, has spread dismay throughout Great Britain and Ireland. Although the cause of this affection has been anxiously investigated, it does not seem, as yet, to be well understood.

3. S. ESCULENTUM, Dunal. Stem herbaceous, nearly simple; leaves ovate, somewhat sinuate-lobed, tomentose; peduncles solitary, thickened, nodding; calyx aculeate; fruit very large.

S. insanum, L. Willd. Sp. Pl. 1. p. 1037. Fl. Cestr. p. 137.

ESCULENT SOLANUM. Vulgò-Purple Egg-plant.

Fr. Aubergine rouge. Germ. Eifrüchtiger Nachtschatten.

Whole plant clothed with a stellated tomentum. Root annual. Stem about 2 feet high, hollow, aculeate, finally subligneons. Leaves 6 to 9 inches long,—the nerves and petioles aculeate; petioles 1 to 3 inches long. Peduncles lateral, supra-axillary, thick (sometimes slender and dichotomous, or bearing 2 flowers), aculeate. Calyx 5 to 7 or 10-parted, aculeate. Corolla purplish, pubescent; lobes 5 to 7 or 10, ovate, spreading. Berries ovoid or obovoid-obloug, 3 to 5 or 6 inches in diameter, smooth, mostly dark purple when mature—sometimes pale green. Gardens; cultivated. Native of India. Fl. July—Aug. Fr. Sept.—Octo

- Obs. This is cultivated for its fruit,—which is quite a favorite culinary vegetable. The S. Melongena, L.—a nearly allied species or perhaps variety—which is not prickly, and produces a whitish fruit,—is also cultivated, though not so commonly as this.
- 4. S. Carolinense, L. Stem suffruticose, branching, annual; leaves ovate-oblong, acute, sinuate-angled and often subhastate, prickly on both sides; racemes simple, loose; fruit small. Willd. Sp. Pl. 1. p. 1043. Fl. Cestr. p. 138.

CAROLINIAN SOLANUM. Vulgò-Horse Nettle.

Root perennial. Stem 1 to near 2 feet high, annual but firm and almost shrubby, hollow, branching, armed with sharp spreading prickles. Leaves 4 to 6 inches long, aculeate on the midrib and larger nerves on both sides, clothed with a hirsute stellate pubescence; petioles half an inch to an inch and half long. Racemes lateral, opposite to and often longer than the leaves. Calyx 5-parted, aculeate. Coro a bluish-white. Berries globose, one fourth to one third of an inch in diameter, orange-yellow when mature. Pastures, and cultivated grounds,—especially in the Southern States. Fl. July. Fr. October.

- Obs. This is an exceedingly pernicious weed,—and so tenacious of life that it is almost impossible to get rid of it, when once fully introduced. It grows in patches, so thickly as to deter Stock from feeding among it, and even to monopolize the soil,—while its roots gradually extend around, and to a great depth. It is a native of the Southern States,—but has found its way to several localities in Pennsylvania. The farmers will do well, therefore, to enable themselves to know it, when they meet it,—and moreover to eradicate it, promptly and effectually, wherever they find it on their premises.
- 146. LYCOPERSICUM. Tournef. Endl. Gen. 3856. [Literally, Wolf-Peach; a metaphorical name, having reference to the fruit.] Calyx 5 to 10-parted, persistent. Corolla rotate; tube very short; limb plicate, 5 to 10-lobed. Stamens 5 or 6, inserted on the throat of the corolla, exserted; filaments very short; anthers oblong-conical, cohering by an elongated membrane at summit, longitudinally dehiscent on the inner side. Ovary 2 or 3-celled, with the placentae adnate to the dissepiment, many-ovuled. Berry 2 or 3-celled.—Seeds numerous, reniform, pulpy-villous; embryo sub-peripherical, within the fleshy albumen.
- 1. L. ESCULENTUM, Mill. Stem herbaceous; leaves interruptedly pseudo-pinnate,—the segments petiolate, lance-ovate, acuminate,

deeply incised-serrate; racemes 2-parted, leafless; fruit depressed-globose, mostly torose.

Solanum Lycopersicum, L. Willd. Sp. Pl. 1. p. 1033. Fl. Cestr. p. 137. [apple.

ESCULENT LYCOPERSICUM. Vulgò. Tomato, or Tomatoes. Love-Fr. Pomme d'amour. Germ. Der Liebes-Apfel. Span. Tomate.

Plant of a greyish aspect, viscid-pubescent and somewhat fetid. Root annual. Stem 2 to 4 feet long, branching, often straggling or procumbent unless supported. Leaves odd-pinnately dissected,—the alternate pairs of segments smaller. Flowers in naked lateral racemose clusters; common peduncle 1 to 2 inches long, dichotomously divided,—the subdivisions articulated to the pedicels of the flowers. Calyx-segments 5 to 10, linear-lanceolate.long. Corolla yellow, pubescent,—the lobes 5 to 10, lanceolate, spreading. Anthers cohering, acuminate, with the points recurved. Berries large (1 to 3 or 4 inches or more in diameter), globose, or flatly depressed and orbicular, often remarkably torose or distorted by large swelling ridges, red or reddish-orange color when mature. Gardens, and Lots: cultivated. Native of Spanish America. Fl. Junc—August. Fr. Aug.—Sept.

Obs. This is cultivated for its succulent acid fruit—which, as a sauce, is considered very healthful,—and has, of late years, become a favorite and almost universal dish, in its season. Even the venders of medical nostrums have seized upon it, as a means of levying an additional tax upon the credulous.

ORDER CI. GENTIANACEAE. Juss. Lindl.

Herbs, with a watery juice. Leaves mostly opposite, simple and entire, without stipules. Inflorescence usually centrifugal,—the flowers showy. Calyx mostly of 4 or 5 (rarely 6 to 12) persistent. more or less united, sepals. Corolla regular, mostly twisted in aestivation. Stamens as many as the lobes of the corolla, and alternate with them, inserted on its tube. Ovary single, formed of 2 united carpophylls, 1-celled, or sometimes half 2-celled by the introflexion of the valves or parietal placentae, many-ovuled; stigmas 2 or single, sometimes sessile. Capsule 1- (or half 2- or 4-) celled, septicidal, many-seeded. Seeds with fleshy albumen and a minute embryo.

An Order containing many beautiful species,—a number of them valuable for their bitter, tonic properties: among which may be mentioned the Gentian of the shops (Gentiana lutea, L.). Few or none, however, are of any Agricultural

importance.

TRIBE I. GENTIANEAE. DC.

Corolla twisted to the right (or left, if you look into the centre of the flower,) in aestivation. Testa membranaceous. Leaves mostly opposite, very entire.

SUB-TRIBE 2. CHLOREAE. DC.

Anthers furnished with a connective. Style distinct, deciduous.

147. SABBATIA. Adans. Endl. Gen. 3546. [Named after Liberatus Sabbati; an Italian Botanist.]

Calyx 5 to 12-parted. Corolla sub-rotate,—the limb 5 to 12-lobed Stamens as many as the corolla-lobes; anthers erect, opening by a longitudinal fissure, finally recurved. Ovary with the valves slightly introflexed, 1-celled,—the ovules inserted along the sutures; style 2-parted,—the branches stigmatiferous, at length spirally twisted. Capsule 2-valved, septicidal, 1-celled, with spongy placentae along the sutures. Seeds numerous, minute, destitute of a distinct funiculus:

1. S. ANGULARIS, *Pursh*. Stem acutely 4-angled, somewhat winged,—the internodes the length of the leaves; branches opposite, erect,

corymbose; leaves ovate, sessile and amplexicaul; calyx-segments mostly 5, linear-lanceolate, acute, much shorter than the corolla; corolla mostly 5-parted,—the lobes obovate, rather obtuse. DC. Prodr. 9. p. 50. Fl. Cestr.p. 125.

Angular Sabbatia. Vulgò—Centaury.

Root annual? (biennial, DC.). Stem 12 to 18 inches high, often bushy with numerous branches. Leaves about an inch long. Flowers sometimes composed of 6 parts. Corolla rose red, with a pale green star in the centre. Capsule oblong-ovoid, mucronate, with a keeled suture on each side. Seeds rugosely pitted, under a lens. Sterile old fields: Canada to Carolina. Fl. July—August. Fr. September.

Obs. This plant has but little connection with Agriculture: yet it is so generally and deservedly popular, as a Bitter, and tonic medicine, that it would seem desirable for every farmer to be able to identify it,—and therefore I have inserted it. There is another plant in the South and West, belonging to this Tribe, which is highly commended for similar properties,—namely, the Wild Colombo (Frasera Carolinensis, Walt.). I do not deem it necessary, however, to do more than mention it, here.

ORDER CIII. ASCLEPIADACEAE. R. Br. Lindl.

Herbs, or shrubs, mostly with a milky juice. Leaves generally opposite, simple, entire; stipules none or reduced to mere bristles. Inflorescence interpetiolar, somewhat umbellate, fasciculate, or racemose, rarely solitary. Calyx 5-parted, persistent. Corolla hypogynous, 5-lobed, deciduous. Stamens 5, inserted into the base of the corolla, alternately with the lobes; filaments sometimes free, but usually dilated and connate in a tube including the pistil (hence called the Gynostegium, or pistil-covering),—the tube often augmented by 5-cucullate appendages (stamnneal crown); anthers erect, united, truncate at summit—or the connective sometimes thickened and acuminate, or produced into a thin whitish membrane—mostly 2-celled, the cells with projecting cartilaginous appendages: pollen cohering in waxy masses (Pollinia), which are attached in pairs (from the contiguous cells of different anthers) to 5 small gland-like processes at the angles of the stigma. Ovaries 2; styles 2; stigma common to both styles, fleshy, dilated, 5-cornered, bearing a little shining blackish corpusele, or gland, at each corner. Follicles 2 (one often abortive); placenta attached to the suture, finally separating. Seeds numerous, compressed, imbricated, pendulous; testa membranaceous, usually margined,—the margin, near the hilum, splitting into a silky coma; albumen thin.

An Order remarkable for the peculiar structure of the flowers (well illustra-

An Order remarkable for the peculiar structure of the flowers (well illustrated in Gray's Botanical Text Book),—and containing many plants interesting

to the curious; but few that concern the mere practical farmer.

TRIBE III. ASCLEPIADEAE. R. Br.

Filaments connate. Anthers 2-celled. Pollinia 10, affixed in pairs to the processes of the stigma, pendulous.

DIV. 7. ASCLEPIADAE. Dene. DC.

Throat of the corolla naked. Stamineal crown 5-leaved,—the leaflets concave or cucullate, inserted at the base (rarely on the summit) of the tube of connate filaments (gynostegium), and mostly with a subulate or horn-like averted process arising from the cavity of each leaflet.

148. ASCLEPIAS. L. Endl. Gen. 3490. [The Greek name of Aesculapius,—to whom this genus is dedicated.]

Calyx deeply 5-parted,—the segments (or sepals) ovate-lanceolate, small, spreading. Corolla deeply 5-parted,—the lobes valvate in aestivation, lance-oblong, at first spreading, finally reflexed. Sta-

12

mineal crown seated on the summit of the gynostegium, 5-leaved; leaflets cucullate,—the hoods ovate or dilated above, always emitting from the bottom of the cavity an averted horn-like process which is curved towards the stigma. Anthers terminated by a membrane. Pollinia compressed, pyriform, affixed by the attenuated apex, pendulous. Stigma depressed. Follicles smooth or sometimes softly muricate. Seeds compressed, margined, comose. Perennial Herbs; mostly lactescent. Leaves opposite, sometimes verticillate—rarely alternate. Umbels interpetiolar, or sometimes

1. A. TUBEROSA, L. Hirsute; not lactescent; stem ascending, divaricately branched at summit, leafy; leaves oblong-lanceolate or linear-oblong, mostly alternate, subsessile; umbels numerous, lateral and terminal, often forming a spreading corymb. DC. Prodr. 8. p. 567. Fl. Cestr. p. 173.

Tuberous Asclepias. Vulgo-Butterfly-weed. Pleurisy-root.

Whole plant mostly very hairy. Root perennial; large, tuberous. Stem about 2 feet high, generally more or less oblique or leaning; branches spreading and often recurved. Leaves 2 to 4 inches long, and half an inch to an inch wide, scattered or rarely opposite, varying from lance-linear to oblong and oblanceolate, acute or obtuse, mostly obtuse at base, on very short petioles. Stamineal crown bright orange color,—the leaflets crect, lance-oblong, distinct, abruptly narrowed below, the infolded margins with each an obtuse tooth near the base; horns subterete, tapering to a point, incurved, nearly as long as the leaflets. Follieles about 4 inches long, somewhat ventricose, acuminate, tomentose-pubescent. Old fields; Pastures, and fence-rows: throughout the U. States. Fl. July—Aug. Fr. Sept.—October.

Obs. This is the only species of the genus, which is inclined to make its appearance in our cultivated grounds, or pasture fields,and even this, though a rough, coarse weed, is not a troublesome one. I have inserted it, merely as a specimen of a remarkable and somewhat numerous family, which may be readily recognized by the peculiar structure of the flowers. When in bloom, the bright orange-colored umbels of this species are quite showy. The root once had a reputation for being medicinal; but it is now generally neglected.

ORDER CV. OLEACEAE. Hffmsg. & Link. Lindl.

Trees or shrubs. Leaves opposite, simple or odd-pinnate. Flowers racemose or paniculate, terminal and axillary, perfect and complete, or sometimes dioicous and apetalous. Calyx 4-lobed or 4-toothed, mostly persistent, rarely obsolete. Corolla 4-cleft, or of 4 distinct petals—sometimes wanting; aestivation mostly valvate. Stamens usually 2. Fruit various—baccate, drupaceous, capsular or samaroid,—2-celled, or by abortion often 1-celled and 1 or 2-seeded. Seeds pendulous mostly albuminous. dulous, mostly albuminous.

A small but interesting Order. Olives, and Olive oil. are afforded by the genus (Olea) which is the type of the family,—the pericarp, instead of the seed, yielding the oil. The Manna of the shops is derived from a species of Ash (Fraxinus rotundifolia, L.).

TRIBE I. FRAXINEAE. Bartl.

Fruit dry, samaroid, 2-celled, indehiscent. Flowers sometimes polygamous or dioicous and apetalous-sometimes 4-petalled, rarely 2-petalled-and sometimes destitute of calyx. Seeds albuminous.

> 149. FRAXINUS. Tournef. Endl. Gen. 3353. [The Latin name of the Ash tree; etymology obscure.]

Dioicously polygamous: Calyx 4-cleft or none. Petals sometimes

none, sometimes 4, often cohering in pairs at base, oblong or linear. Stamens 2. Stigma bifid. Samara 2-celled, compressed, winged at apex; cells 2-ovuled, by abortion 1-seeded. Seeds pendulous, compressed; albumen fleshy, thin; embryo as long as the albumen. Trees. Leaves opposite, mostly odd-pinnate. Flowers racemose or paniculate.

Flowers dioicous and apetalous.

1. F. AMERICANA, L. Leaflets in 3 or 4 pairs, petiolulate, ellipticovate, acuminate, entire or obsoletely dentate, glaucous beneath; petioles and young branches terete, smooth; buds with a rufous velvety pubescence; panieles compound, loose, axillary; flowers calyculate; samaras linear-oblong, obtuse, narrowed at base. DC. Prodr. 8. p. 277. Icon, Mx. Sylva. 3. tab. 118.

F. acuminata. Lam. Fl. Cestr. p. 8.

AMERICAN FRAXINUS. Vulgò-White Ash.

Stem 40 to 60 and 80 feet high, and 2 to 3 feet in diameter,—the young branches smooth and dotted with white specks. Leaflets 2 to 4 inches long,—at first downy, finally smooth and green above, pubescent and glaucous beneath. Flowers with a minute 3 or 4-toothed calyx. Samara terete at base, with a narrowish lance-oblong wing. Woodlands: throughout the U. States,—but particularly in the Northern States. Fl. May. Fr.

- Obs. The timber of this tree is highly valuable, and much used by wheelwrights, coachmakers, &c. It also makes excellent fuel.
- 2. F. Pubescens, Walt. Leaflets in 3 or 4 pairs, petiolulate, elliptic-lanceolate, acuminate, subserrate; petioles and young branches velvety-pubescent; flowers calyculate; samaras linear-lanceolate. DC. Prodr. 8. p. 278. Fl. Cestr. p. 8.

F. tomentosa. Mx. Sylva, 3. p. 63. Icon, tab. 119.

PUBESCENT FRAXINUS. Vulgo-Red Ash.

Stem 30 to 50 or 60 feet high, and 12 to 18 inches in diameter. Leaflets 2 to 3 inches long.—more lanceolate and narrower than in the preceding—more pubescent beneath—and the petiolules shorter. Samaras terete and tapering below, almost acute at base, with a long narrow linear-lanceolate wing. Low grounds; along streams: throughout the U. States. Fl. May. Fr.

- Obs. This has considerable resemblance to the preceding species; but, beside the pubescence of the young branches, it is a smaller and less valuable tree.
- 3. F. SAMBUCIFOLIA, Lam. Leaflets in 4 or 5 pairs, sessile or subsessile, ovate-lanceolate, acuminate, serrate, somewhat rounded and unequal at base, hirsutely bearded beneath on the midrib and in the angles of the nerves; flowers naked; samaras oblong, obtuse at each end. DC. Prodr. 8. p. 278. Fl. Cestr. p. 8. Icon, Mx. Sylva, 3. tab. 122.

Sambucus-Leaved Fraxinus. Vulgo-Black Ash. Water Ash.

Stem 30 to 40 or 50 feet high, and 12 to 18 inches in diameter; young branches glabrous, green, sprinkled with black elliptic dots or warts. Leaflets 3 to 4 inches long, rugose and shining above, with tufts of tawny pubescence in the angles of the nerves beneath. Samaras broadish, of nearly uniform width. Low grounds; along rivulets, &c. Northern and Middle States. Fl. April. Fr.

Obs. This species is less common, and of less value, than either of the preceding. There are several other species in the Southern

and Western States; but I have not judged it expedient to swell this work by a more particular notice of them.

TRIBE III. OLEINEAE. DC.

Fruit fleshy, drupaceous or baccate. Flowers perfect, and complete. Seeds albuminous.

150. LIGUSTRUM. Tournef. Endl. Gen. 3352. [Latin, ligare, to tie; from the use made of its phable branches.]

Calyx with a short tube, 4-toothed, deciduous. Corolla funnel-form, the tube longer than the calyx; limb 4-parted. Stamens 2, inserted on the tube of the corolla, included. Ovary 2-celled; ovules 2 in each cell, pendulous from the apex of the septum; style very short; stigma bifid, obtuse. Berry globose, 2-celled; cells 2- (or by abortion 1-) seeded. Shrubs. Leaves opposite, simple, entire. Flowers in terminal thyrsoid panicles.

1. L. VULGARE, L. Branches slightly pubescent at apex; leaves elliptic-lanceolate, acute or obtuse, mucronulate, glabrous; panicle compound, contracted. DC. Prodr. 8. p. 293. Fl. Cestr. p. 2. Icon, Fl. Lond. 1.

Common Ligustrum. Vulgò-Privet. Prim.

Fr. Le Troêne. Germ. Die Gemeine Rheinweide. Span. Alheña.

Stem 6 to 8 or 10 feet high, much branched; branches opposite. Leaves 1 to 3 inches long, varying from lanceolate and acute, to elliptic or oblanceolate and obtuse, on short petioles. Corolla white. Berries black (rarely greenish-white) when mature. Way-sides; fence-rows, &c.: introduced. Native of Europe. Fl. June. Fr. October.

Obs. This shrub is perhaps intitled to notice, in the present work, from the circumstance of its having been introduced, by the early settlers of Pennsylvania, for the purpose of hedging. It did not answer the purpose, however,—and was soon neglected. Yet it has become partially naturalized.

The Olive (Olea Europaea, L.)—which is so noted and important a plant, in the South of Europe—belongs to this tribe. It has not yet, I believe, been successfully cultivated in our country; but, with

a fair trial, it may possibly succeed, in our Southern States.

APETALOUS EXOGENS.

ORDER CVI. ARISTOLOCHIACEAE. Juss. Lindl.

Herbaceous, or shrubby and climbing,—the wood without concentric zones. Leaves alternate, simple, petiolate—often with foliaceous stipules. Flowers mostly perfect, axillary, solitary. Calyx-tube more or less adherent to the ovary; limb 3-lobed,—the lobes valvate in aestivation. Stamens 6 to 12, epigynous or adherent to the base of the short thick style. Stigmas radiating, as many as the cells of the ovary Fruit dry or somewhat fleshy and succulent, 3 to 6-celled, many-seeded. Embryo minute, in the base of fleshy albumen.

A small Order, of little or no interest in Agriculture.

151. ARISTOLOCHIA. Tournef. Endl. Gen. 2162. [A Greek name,-having reference to the medical virtues of the plant.]

Calyx colored, tubular,—the lower portion adherent to the ovary, ventricose above the ovary, straight or curved; limb oblique, 2 or 3-lobed,—the lower lobe sometimes ligulate or extended to a lip.— Stamens 6, inserted on an epigynous disk; anthers extrorse, 2-celled. subsessile, adnate to the style. Stigmas 6, radiated. Capsule coriaceous, 6-celled, septicidally 6-valved. Seeds numerous.

1. A. Serpentaria, L. Stem erect or ascending, flexuose; leaves lance-oblong, acuminate, entire, cordate (and sometimes auriculate) at base; peduncle sub-radical; lip of the calyx lanceolate. Willd. Sp. Pl. 4. p. 159. Fl. Cestr. p. 515.

SNAKE-ROOT ARISTOLOCHIA. Vulgo-Virginia Snake-Root.

Root perennial, of numerous rather coarse fibres. Stem herbaceous, 9 to 15 inches high, simple or branched from the base, slender, angular, pubescent, leafy above, nearly naked or with small abortive leaves below. Leaves 2 to 4 or 5 inches long; petioles one fourth of an inch to near an inch long. Flowers rather leaves they are solution, near the base of the stems and the long. large, few or solutary, near the base of the stem and often concealed beneath dead leaves, on a flexuose bracteate peduncle 1 to 2 inches in length. Calyx a dull purplish brown, subcoriaceous, angularly bent, gibbous at the angle,—the limb dilated and somewhat 3-lobed. Capsule turbinate or roundish-obovoid, somewhat flexy, pubescent. Rich woodlands; throughout the U. States. Fl. June. Fr. July-August.

Obs. This little plant is to be found in almost every woodland, where the soil is good; and its medicinal value, as an aromatic stimulant, renders it desirable that every person should know or be enabled to recognize it. For this reason I have been induced to give it a place, here.

ORDER CVII. CHENOPODIACEAE. Vent. Lindl.

Chiefly weed-like Herbs. Leaves mostly alternate. more or less fleshy, without stipules. Flowers inconspicuous. sometimes dioicous or polygamous Calyx deeply divided, or sometimes tubular at base, persistent. Stamens inserted into the base of the calyx opposite its segments, and equal to them in number, or fewer. Ovary single, free or occasionally adherent to the tube of the calyx, with a single ovule arising from its base. Fruit an utricle or akene—sometimes baccate. Seed single, with copious farinaceous albumen,—the embryo peripherical, more or less completely surrounding the albumen.

may be mentioned the Quinoa (Chenopodium Quinoa, Willd.)—an article of food, in South America; and the maritime genera, Salsola and Salicornia, which yield vast quantities of Soda.

SUB-ORDER I. CYCLOLOBEAE. C. A. Meyer.

Embryo either completely annular or curved into the form of a horse-shoe,—the albumen being central and more or less copious.

TRIBE II. ATRIPLICEAE. C. A. Meyer.

Flowers polygamous or dioicous, not bracteate. Calyx of the staminate flower different from that of the pistillate one. Stem continuous (i. e. not articulated).

152. SPINACIA. Tournef. Endl. Gen. 1915. [Latin, Spina, a thorn; the covering of the fruit being often prickly.]

FLOWERS DIOICOUS: STAM. FL. Calyx 4 or 5-parted,—the segments equal. Stamens 4 or 5, inserted on the receptacle opposite the segments of the calyx. PISTILLATE FL. Calyx ventricose-tubular, 2 or 3-toothed. Ovary ovoid, 1-celled, 1-ovuled; stigmas 4, elongated, filiform, subsessile. Akene included in the turgid indurated calyx, which is often 2 or 3-horned on the back. Seed vertical, compressed; embryo annular, peripherical, surrounding the farinaceous albumen. Herbaceous: flowers axillary, glomerate,—the staminate ones in racemose-paniculate clusters.

1. S. OLERACEA, L. Leaves hastate-lanceolate, often incised at base, petiolate; fruit sessile, prickly or unarmed. Willd. Sp. Pl. 4. p. 766. Fl. Cestr. p. 565.

Pot-HERB SPINACIA, Vulgò-Spinach, or Spinage.

Fr. Epinard des potagers. Germ. Der Spinat. Span. Espinaca.

Root annual. Stem 18 inches to 2 feet high, somewhat branched, or often simple. Leaves 2 to 4 inches long, cuneately tapering to a petiole 1 to 3 or 4 inches in length. Flowers greenish. Fruit inclosed in the subglobose persistent calyx, which is scarcely cleft at maturity, and often not prickly in the variety usually cultivated. Gardens: cultivated. Native of the East. Fl. June—July. Fr. Aug.—September.

Obs. This well-known pot-herb—said to have been first brought into Spain, by the Arabs—is frequently found in gardens,—especially in the vicinity of our cities and market towns. The Atriplex hortensis, L. or Garden Orach, is another pot-herb, belonging to this Tribe; but I believe it is not much cultivated in the U. States.

TRIBE III. CHENOPODIEAE. C. A. Meyer.

Flowers perfect or polygamous, ebracteolate or rarely bibracteolate, all similar. Seed vertical or horizontal; testa crustaceous or membranaceous. Stem continuous.

SUB-TRIBE 3. KOCHIEAE. Endl.

Flowers ebracteolate. Seed horizontal; testa crustaceous or membranaceous.

153. BETA. Tournef. Endl. Gen. 1924.

[Celtic, Bett, red: or from its fruit resembling the Greek letter B (Beta).]

FLOWERS PERFECT: Calyx urceolate, 5-cleft, finally indurated at base,—the segments remaining unchanged. Stamens 5, inserted on a fleshy ring at the throat of the short calyx-tube, opposite the segments of the limb. Ovary depressed, 1-celled, 1-ovuled; stigmas 2, short, connate at base. Utricle subglobose, inclosed in the dru-

paceous tube of the calyx, and covered by the fleshy limb. Seed horizontal, depressed; testa membranaceous; embryo annular, peripherical, surrounding the farinaceous albumen. Herbaceous, with a large fleshy root formed of concentric zones. Flowers glomerate in spikes or paniculate racemes,—the fruit often concrete or cohering.

1. B. VULGARIS, L. Lower leaves ovate; flowers in dense sessile axillary clusters, interruptedly spicate. Willd. Sp. Pl. 1. p. 1308. Fl. Cestr. p. 178.

COMMON BETA. Vulgò—Beet. Garden Beet. Sugar Beet. Fr. Bette-rave. Germ. Gemeiner Mangold. Span. Acélga.

Root biennial, fleshy, large (often 3 or 4 inches in diameter and more than a foot long.) terete, tapering downwards, deep purple or yellowish.—exhibiting, on a transverse section, concentric layers which seem to have some relation to the number and size or vigor of the radical leaves—perhaps severally formed and nourished by them. Stem 2 to 4 feet high, sulcate-angled, smooth, somewhat paniculately branching. Radical leaves 6 to 12 inches long. undulate, greenish-purple; petioles 4 to 8 inches long. succulent, purple, channelled above; stem-leaves lance-ovate, acute, petiolate, smaller as they ascend. Calyx purplish-brown, fleshy at base, finally indurated or externally suberose,—the segments keeled, incurved and subsaccate at apex. Seed depressed, cochleate-orbicular, loosely farinaceous, enveloped in a purple membrane and lodged in a bony cell at the base of the calyx. Gardens, and Lots: cultivated. Native of Southern Europe. Fl. July. Fr. September.

Obs. Very generally cultivated for its fine esculent root—of which there are several varieties. That one, called "Sugar Beet"—with a pale yellowish root—is extensively cultivated, on the continent of Europe, for the purpose of making Sugar,—and has been partially tried, in this country: But, while we have the Sugar Maple and the Sugar Cane to supply us, it is not probable the Beet will be much relied upon, for that object. A large-rooted variety of B. Ciola, L. (a nearly allied species), called Mangel Wurtzel, or Scarcity Root, is sometimes cultivated for Stock,—and is probably intitled to more attention than it has yet received from our farmers—who are not generally partial to the culture of root crops.

154. CHENOPODIUM. L. Endl. Gen. 1930.

[Greek, Chen, a goose, and Pous, podos, a foot; from the form of the leaves.]
FLOWERS PERFECT: Calyx 5-parted,—the segments finally keeled.
Stamens 5, inserted at the bottom of the calyx, opposite the segments. Ovary depressed, 1-celled, 1-ovuled; stigmas 2 or 3, filiform, very short. Utricle membranaceous, depressed, included in the connivent 5-angled calyx. Seed horizontal, lenticular; testa crustaceous; embryo annular, peripherical, surrounding the copious farinaceous albumen.

1. C. ALBUM, L. Leaves rhomboid-ovate, erose-dentate, entire and tapering towards the base,—the upper ones oblong-lanceolate, entire; racemes erect, branched, somewhat leafy. Willd. Sp. Pl. 1. p. 1302. Fl. Cestr. p. 176. Icon, Fl. Lond. 1.

WHITE CHENOPODIUM. Vulgò—Lamb's Quarters. Goose-foot. Fr. Anserine blanche. Germ. Der Gaensefuss.

Root annual. Stem 3 to 5 or 6 feet high, rather stout, angular, often striped with yellow and green, sometimes purplish, branched. Leaves 1 to 3 inches long, covered with very minute flat or cup-like scales (especially on the under sur-

face), which give them a glaucous or mealy appearance; petioles 1 to 2 or 3 inches long. Flowers in pulverulent clusters. Calyx depressed, 5-angled by the prominent keels of the incurved segments, greenish and glaucous. Seed dark purple or nearly black, lenticular and slightly cochleate, smooth and shining. Gardens, Yards, and waste places: introduced. Native of Europe. Fl. July—Aug. Fr. October.

- Obs. This coarse and rather homely weed has become very extensively naturalized throughout the U. States,—and is quite troublesome in gardens. The young plant is sometimes used as a pot-herb; but would be gladly dispensed with by all neat gardeners and farmers.
- 2. C. ANTHELMINTICUM, L. Leaves oblong-lanceolate, acute, dentate; racemes axillary and terminal, long, slender, leafless. Willd. Sp. Pl. 1. p. 1304. Fl. Cestr. p. 177.

WORM-DESTROYING CHENOPODIUM. Vulgò-Worm-seed.

Plant pale yellowish-green Root perennial Stem 2 to 3 or 4 feet high. sulcate-angled, branched. Leaves 1 to 2 or 3 inches long, repand-dentate or sometimes rather incised-dentate, cuneate at base, sprinkled with resinous atoms beneath; petioles one fourth to three fourths of an inch long. Flowers in long slender interrupted naked racemes or spikes,—the clusters small. Calya smoothish, green. Stigmas 3. Gardens, road-sides, and waste places. Fl. July. Fr. Sept.—Octo.

Obs. This species is noticed here, chiefly because of its repute as a remedy for worms, in children. The plant has a strong disagreeable odor,—and the essential oil—though a very nauseous dose—often proves an effective vermifuge. Mr. Elliott considered it a native of the Southern States; but it has not that appearance, in Pennsylvania.

There are several other weed-like species of *Chenopodium* to be met with, occasionally; but they have not become as troublesome

as the C. album.

ORDER CIX. AMARANTHACEAE. Juss. R. Br.

Herbs. or suffruticose plants. Leaves simple, opposite or alternate, mostly without stipules. Flowers perfect or monoicous, rarely dioicous, aggregated in heads, or spikes, or dense clusters, imbricated with dry scarious bracts which are usually colored. Calyx of 3 to 5 sepals, persistent, dry and scarious. Stamens hypogynous, as many as the sepals and opposite to them,—sometimes multiplied, distinct or monadelphous, with the alternate ones abortive (staminodia); anthers often 1-celled. Ovary single, 1 or several-ovuled; stigma simple or compound. Utricle membranaceous, 1 or several-seeded, valveless, bursting irregularly. Seeds lenticular-remiform; testa crustaceous: embrgo curved or forming a ring round the circumference of the farinaceous albumen.

An Order of plants mainly of a weed like character,—though some of the Prince's feather tribe are admired for their showy unfading clustered inflorescence.

TRIBE II. ACHYRANTHEAE. Endl. Ovary 1-oyuled. Anthers 2-celled.

SUB-TRIBE 4. AMARANTHEAE. Endl.

Flowers monoicously polygamous or perfect, tribracteate. Utricle circumscissed or indehiscent.

155. AMARANTHUS. L. Endl. Gen. 1972.

[Greek, a, not, maraino, to fade, and anthos, a flower; the flowers not changing or fading.]

FLOWERS MONOICOUSLY POLYGAMOUS: Calyx of 3 or 5 sepals, mostly colored, slightly connected at base. Stamens 3 or 5 (rarely 2 or 4), free; staminodia none. Ovary 1-celled, 1-ovuled; stigmas 2 or 3,

filiform, subsessile. Utricle circumscissed. Seed lenticular-reniform; embryo curved into a half circle, peripherical, surrounding the albumen.

1. A. Albus, L. Stem obtusely angular, smooth, much branched; leaves obovate and spatulate-oblong, emarginate, setaceously mucronate; flowers triandrous, in small axillary clusters. Willd. Sp. Pl. 4. p. 382. Fl. Cestr. p. 526.

Also? A. graecizans. Willd. l. c.

WHITE AMARANTHUS.

Root annual. Stem 1 to 2 or 3 feet high, rather stout, pale green or whitish, generally much branched,—the principal branches near the base, spreading. Leaves half an inch to an inch and half long, entire, narrowed at base to a slender petiole one fourth of an inch to an inch and half long. Flowers pale green, inconspicuous, in small axillary bracteate clusters; bracts subulate-lanceolate, spinescently acuminate, longer than the flowers. Barn yards; Indian-corn fields, &c. Fl. Aug. Fr. Sept.

- Obs. This coarse weed is quite common, in Chester County, Pa. in Gardens, and cultivated Lots; and yet I do not learn that it (nor, indeed, either of the following species) has been sufficiently noticed to acquire a common name. It is certainly a plant so entirely worthless that it ought to be extirpated. Although stated, in the books, to be a native of Pennsylvania, it has, to me, much the habit and appearance of a naturalized weed.
- 2. A. HYBRIDUS, L. Stem sulcate-angled, roughish-pubescent, sparingly branched; leaves ovate or ovate-lanceolate; flowers pentandrous, in dense compound axillary and terminal spikes. Willd. Sp. Pl. 4. p. 389. Fl. Cestr. p. 526.

HYBRID AMARANTHUS.

Root annual, fusiform, purple. Stem 2 to 4 or 5 feet high, often nearly simple. Leaves 2 or 3 to 5 inches long, wholly green, roughish, entire, tapering to the apex but the point mostly obtuse, emarginate and setaceously mucronate, abruptly narrowed at base to a petiole 1 to 3 inches in length. Flowers small, dull green or sometimes becoming purplish, the staminate and pistillate ones intermingled, and densely clustered in ovoid-oblong compound spikes,—the terminal spike elongated and sub-cylindric; bracts subulate, with a slender sharp acumination, longer than the flowers. Gardens, and cultivated Lots: New York to Carolina. Fl. August. Fr. October.

- Obs. This is another coarse homely weed,—and quite troublesome in gardens, in the latter part of summer. If permitted to mature its seeds, it soon becomes very abundant.
- 3. A. Spinosus, L. Stem striate, smoothish, much branched; leaves ovate-lanceolate; axils spinose; flowers pentandrous, in compound terminal and axillary spikes. Willd. Sp. Pl. 4. p. 393. Fl. Cestr. p. 527.

THORNY AMARANTHUS.

Root annual. Stem 18 inches to 2 or 3 feet high, often purple. Leaves 1 to 2 inches long, rather obtuse, mucronate, entire, roughish-dotted, with glaucous blotches beneath; petioles about as long as the leaves, with 2 subulate spines (stipules?) at base, one fourth to half an inch in length. Flowers small, clustered in oblong terete erect terminal and subterminal spikes. Cultivated Lots—way-sides, and waste places: introduced. Native of India. Fl. August. Fr. Octo.

Obs. This foreigner is naturalized in many places—especially in the unfrequented streets and outskirts of our sea-port towns,—and

is a vile nuisance wherever it prevails. It cannot be too sedulously guarded against.

ORDER CXI. POLYGONACEAE. Juss. Lindl.

Herbs, or rarely shrubs. Leaves alternate, stipulate,—the stipules mostly sheathing or cohering round the stem, above the leaves, in the form of an ochrea of boot. Flowers sometimes unisexual—often racemose, or spicate—occasionally cymose, or capitate,—and in some instances, with a tubular or cup-shaped involucre. Calyx of 3 to 6 sepals, more or less united at base, imbricated in aestivation, sometimes colored. Stamens definite, inserted on the bottom of the calyx. Ovary single, mostly free, with a single erect orthotropous (i. e. straight) ovule; styles as many as the angles of the ovary, distinct or connate at base; stigmas simple. Fruit akene-like, usually compressed or triquetrous; embryo inverted, curved or nearly straight, applied to the outside (sometimes in the centre) of farinaceous albumen.

An Order of little interest beyond what belongs to the plants here given,—with the exception of that species of *Rheum* which furnishes the *Rhubarb* of the shops.

TRIBE II. POLYGONEAE. Endl.

Involucre none. Ovule basilar, sessile; radicle superior.

156. RHEUM. L. Endl. Gen. 1984.

[From Rha, the ancient name of the river Volga,—its native region.]

Flowers perfect: Calyx of 6 sepals, in a double series, persistent and shrivelling. Stamens 9, arranged in pairs opposite the outer sepals, and singly opposite the inner ones; anthers ovoid, versatile. Ovary trigonous, 1-celled; stigmas 3, subsessile, spreading. Akene triquetrous, winged at the angles, surrounded at base by the withered calyx. Herbaceous: Leaves chiefly radical, large; flowers fasciculate, racemose-paniculate.

1. R. Rhaponticum, Ait. Leaves cordate-ovate, rather obtuse,—the sinus at base dilated; petioles with a shallow channel above, rounded at the edges. Willd. Sp. Pl. 2. p. 488. Fl. Cestr. p. 254. Rhapontic Rheum. Vulgò—Rhubarb. Pie Rhubarb.

Root perennial, tuberous, large, reddish-brown, yellow within. Stem 3 to 5 feet high, stout, nodose, striate-sulcate, smoothish, fistular, paniculately branched at summit. Radical leaves becoming very large (18 inches to 2 feet long), smoothish above, pubescent on the veins beneath; petioles thick and succulent, 4 to 8 or 10 inches long,—the stem-leaves smaller, and petioles shorter, as they ascend; stipules large, membranaceous, sheathing. Flowers in large terminal racemose panicles,—the pedicels fasciculate, slender, one third to half an inch long, articulated near the middle. Sepals greenish, with white margins,—the outer ones rather narrower. Stigmas large, multifid. reflexed. Gardens: cultivated. Native of Scythia. Fl. May. Fr. July—August.

Obs. Frequently cultivated for the sake of its fleshy acid petioles—which are used by the pastry cook, in early spring, as a substitute for fruit, in making pies.

157. RUMEX. L. Endl. Gen. 1993.

[Latin, Rumex, a pike, or spear; from the shape of the leaves of some species.] Flowers sometimes dioicous: Calyx of 6 persistent sepals, in a double series,—the 3 outer ones green, connected at base—the 3 inner ones larger, sometimes a little colored, connivent, naked or graniferous on the back. Stamens 6, in pairs opposite the outer sepals; anthers oblong, attached by the base. Ovary triquetrous; styles 3, filiform, free or adnate to the angles of the ovary; stigmas penicillate-multifid. Akene triquetrous, free within the valvately connivent inner sepals.

- † Flowers perfect. * Inner sepals entire, and all graniferous.
- 1. R. CRISPUS, L. Radical leaves oblong-lanceolate, mostly acute, curled or wavy on the margin; inner sepals large, cordate, nearly entire, reticulately and prominently veined, all dorsally graniferous. Willd. Sp. Pl. 2. p. 251. Fl. Cestr. p. 236. Icon, Fl. Lond. 2.

CURLED RUMEX. Vulgo-Sour Dock. Curled Dock.

Fr. Patience frisée. Germ. Krauser Ampfer.

Root perennial, rather large, fusiform, yellow. Stem 2 to 3 or 4 feet high, angular-sulcate, smoothish, paniculately branched above. Radical leaves 8 to 12 or 15 inches long, and 1 to 2 or 3 inches wide; petioles 2 to 4 inches long; the stem-leaves smaller, linear-lanceolate. Flowers in crowded verticillate fascicles, with scarious involucres at base. Calyx green; inner sepals much larger than the outer ones, entire or obsoletely denticulate near the base,—each with an ovoid acuminate excrescence, or grain on the back. Moist grounds; meadows, &c.: introduced. Native of Europe. Fl. May—July. Fr. July—September.

Obs. The radical leaves of this are often used as a pot-herb, or early "Greens"; but the plant is an unsightly and troublesome weed,—and has become so extensively naturalized as to require a vigilant attention to keep it in due subjection.

- * * Inner sepals dentate, one or more mostly graniferous.
- 2. R. OBTUSIFOLIUS, L. Radical leaves subcordate-oblong, obtuse, crenulate; inner sepals lance-ovate, acutely dentate near the base,—one of them conspicuously graniferous. Willd. Sp. Pl. 2. p. 254. Fl. Cestr. p. 236. Icon, Fl. Lond. 2.

OBTUSE-LEAVED RUMEX. Vulgò-Bitter Dock. Broad-leaved Dock.

Root perennial, thickish, branching, brown externally, yellow within. Stem 2 to 4 feet high, angular-sulcate, roughish, paniculately branched. Radical leaves 8 to 12 inches long, and 4 to 6 inches wide, roughish-pubescent on the nerves; petioles 3 to 6 inches long. Flowers in interrupted verticillate fascicles. Calyx green,—the inner sepals with long acute teeth near the base, and one of them bearing a large grain on the back. Grass-lots; gardens, meadows, &c.: introduced. Native of Europe. Fl. June—July. Fr. August—September.

Obs. This species is even more worthless than the preceding; but—although completely naturalized—it is not quite so prevalent. The presence of either imparts a very slovenly appearance to a meadow or pasture lot.

† † Flowers dioicous: Sepals not graniferous.

3. R. Acetosella, L. Leaves lanceolate-hastate,—the lobes acute, spreading; flowers dioicous; inner sepals entire. Willd. Sp. Pl. 2. p. 260. Fl. Cestr. p. 236. Icon, Fl. Lond. 2. Vulgò—Sheep Sorrel. Field Serrel.

Fr. Petite Oseille. Germ. Der Sauer Ampfer. Span. Acederilla.

Root perennial. somewhat fusiform. Stem 6 to 12 or 15 inches high, slender, branching, somewhat angular and furrowed, Leaves 1 to 2 inches long.—the lower ones mostly all hastate and on petioles as long or longer than the leaves—the upper ones on short petioles, and sometimes not hastate. Flowers in paniculate racemes, finally becoming purple,—the verticils dimidiate, 6 to 8-flowered. Pistillate plants mostly taller than the staminate. Sandy fields and pastures; about old stumps, &c.: introduced. Native of Europe. Fl. May. Fr. August.

Obs. This little species (well known for its acidity,) is often so abundant as to be a nuisance on the farm. Improving the land—especially by adequate dressings of Lime—is believed to be the best mode of expelling this, as well as many other obnoxious plants.

158. POLYGONUM. L. Endl. Gen. 1986.

[Greek, Polys, many, and Gonu, a knee, or joint,—the stem being much jointed.] Flowers perfect or polygamous: Calyx often colored, mostly of 5 sepals, in a double series,—the sepals more or less united, sometimes unequal, often finally enlarged. Stamens 5 to 9, mostly 8,—arranged singly opposite the sepals, or sometimes in pairs opposite the inner sepals—often alternating with perigynous or hypogynous glands; anthers ovoid, didymous, versatile. Ovary 1-celled, compressed or triquetrous; styles 2 or 3, more or less united below; stigmas capitate. Akenes lenticular or triquetrous according as the styles are 2 or 3, inclosed by the persistent calyx. Herbaceous. Flowers often with sheathing ochrea-like bracts.

† Flowers mostly fasciculate, in terminal or axillary Spikes.

1. P. Hydrofiper, L. Leaves lanceolate, not spotted; spikes filiform, flaccid, nodding; fascicles few-flowered, rather remote; flowers mostly octandrous; calyx glandular-dotted; styles 2 or 3; seeds lenticular or triquetrous. Mx. Fl. Bor. Am. 1. p. 238. P. punctatum. Fl. Cestr. p. 248. not? of Ell.

WATER-PEPPER POLYGONUM. Vulgò-Water-Pepper.

Root annual. Stem 12 to 18 inches high, slender, more or less branched, sometimes decumbent, smooth, often purple. Leaves 2 to 4 inches long, tapering to a slender apex, acute at each end, subsessile, often hairy on the midrib and upper surface, scabrous-ciliate on the margin, marked with numerous pellucid punctures. Stipules sheathing, truncate and fringed at summit with bristles one third to two thirds their length. Spikes 2 to 4 inches long, very slender and flaccid; fasicles rather distant, 2 to 4-flowered, embraced by tubular truncate bristly-ciliate bracts. Sepals green, with the margins white, or often tinged with purple. Stamens 8, or frequently 7. Ovary either lenticular with 2 styles, or triquetrous with 3 styles. Akene purplish brown or nearly black, ovate or triquetrous, and in either case acuminate. Moist waste grounds; road-sides, &c. throughout the U. States. Fl. August. Fr. Sept.

Obs. Whether the P. punctatum, of Elliott, is really distinct from our plant, I have not the means of determining; but Dr. Engelmann, of St. Louis, pronounces the P. punctatum, of the Flora Cestrica, to be nothing else than the true P. Hydropiper of Linnalus. The elder Michaux so considered it; and Dr. Torrey long since suggested that it might be only a variety. I now concur in these views; and have, therefore, restored the Linnaean name to the species. It is a worthless weed—as most of the numerous species are; and it is, moreover, a highly acrid plant,—sometimes causing obstinate ulcerative inflammation, when incautiously applied to the skin.

2. P. Persicaria, L. Leaves lancedate, spotted; stipules somewhat pilose, ciliate at summit; spikes terminal and axillary, ovoid-oblong, dense-flowered, erect, on smooth peduncles; flowers hexandrous, and mostly digynous. Willd. Sp. Pl. 2. p. 446. Fl. Cestr. p. 249. Icon, Fl. Lond 2. [weed.

Peach-leaved Polygonum. Vulgò-Lady's thumb. Spotted Knot-Fr. Persicaire. Germ. Flöhkraut. Span. Persicaria.

Root annual. Stem 1 to 2 feet high, branching, smooth, often purplish. Leaves 2 to 4 inches long, tapering at base to a short petiole,—the upper surface usually marked with a dark-colored lunate or sub-cordate spot near the middle. Stipules truncate, fringed with bristles one fourth to one third their length. Spikes about an inch long, on glabrous peduncles,—the fascicles crowded. Sepals purple or bright crimson. Akenes mostly compressed. Waste places; road-sides, &c. introduced. Native of Europe. Fl. Aug. Fr. September—October.

- Obs. This has become a common weed,—about farm-houses; and a good taste requires it to be kept down.
- 3. P. Pennsylvanicum, L. Leaves lanceolate and often spotted; stipules smooth, not ciliate; spikes oblong, somewhat nodding, on glandular-hispid peduncles; flowers mostly octandrous and digynous. Willd. Sp. Pl. 2. p. 448. Fl. Cestr. p. 250.

PENNSYLVANIAN POLYGONUM.

Root annual. Stem 2 to 3 or 4 feet high, smooth below, geniculate, with tumid nodes, paniculately branched above,—the branches glandular-hispid. Leaves 3 to 6 inches long, often with a dark spot in the middle; petioles about half an inch long, and usually purple. Stipules scarious, not fringed at summit. Spikes numerous, rather large (1 to 2 inches long). Sepals bright palish-purple or rose-colored, larger than in the preceding. Akenes compressed. Moist grounds; waste places, &c.: throughout the U. States. Fl. July—Aug. Fr. September—October.

Obs. This has much general resemblance to the preceding—usually growing in company with it—and equally worthless. It is, however, a stouter plant, and readily distinguished by the characters above noted.

† † Flowers in paniculate clusters. Stem aculeate.

4. P. SAGITTATUM, L. Stem flaccid, procumbent, 4-angled, retrorsely aculeate; leaves sagittate, acute, on short petioles; flowers octandrous and trigynous, crowded, subcapitate,—the heads on smoothish peduncles. Willd. Sp. Pl. 2. p. 453. Fl. Cestr. p. 251.

SAGITTATE POLYGONUM. Vulgà-Arrow-leaved Tear-thumb.

Root annual. Stem 2 to 4 feet long, slender, branching, acutely quadrangular,—the angles armed with sharp recurved prickles. Leaves 1 to 3 inches long, and half an inch to an inch wide, sagittate at base.—the midrib and petiole retrorsely aculeate. Stipules lanceolate, amplexicaul or sheathing, smooth. Flowers in pedunculate heads or clusters. Sepals pale red, with the margins nearly white Akenes ovoid-triquetrous. Swampy meadows, and thickets: New York to Florida. Fl. August. Fr. September.

- Obs. The mowers and haymakers are familiar with this weed, in the second crop of wet meadows. Ditching and draining are the remedies for the evil.
- 5. P. ARIFOLIUM, L. Stem flaccid, sulcate-angled, retrorsely aculeate; leaves hastate, acuminate, on long petioles; flowers hexandrous and digynous, distinct, sub-racemose; racemes few-flowered, on glandular-hispid peduncles. Willd. Sp. Pl. 2. p. 453. Fl. Cestr. p. 251.

Arum-leaved Polygonum. Vulgò—Halbert-leaved Tear-thumb.

Root annual. Stem 3 to 6 feet long, slender but coarser than the preceding, branching, often purple. Leaves 2 to 5 inches long, and 1 to 3 inches wide, hastate-lobed at base,—the lobes acuminate—the midrib and nerves hirsute; petioles half an inch to 3 inches long, subcate-angled, retrorsely aculeate. Stipules ovate, amplexicaul, ciliate. Flowers in slender loose racemose clusters. Calyx often of 4 connected sepals, purple, with the margins pale red. Akenes compressed, ovate. Swampy low grounds; along rivulets, &c.: throughout the U. States. Fl. August. Fr. September.

Obs. This is generally found in company with the preceding,—and is of much the same obnoxious character, as a weed. There are

several other species of Polygonum to be met with about our farms (descriptions of which may be found in the Floras), -but, as they are not particularly troublesome, they are omitted, here.

159. FAGOPYRUM. Tournef. Endl. Gen. 1987. [So named, from its fruit resembling that of the Fagus, or Beech.]

Flowers perfect, or sometimes diclinous by abortion. Calyx of 5 persistent colored nearly equal sepals, in a double series. Stamens 8, arranged in pairs opposite the 3 external sepals, singly opposite the 2 inner ones, and alternating with 8 hypogynous glands; anthers ovoid, versatile. Ovary trigonous, 1-celled; styles 3, longish; stig-mas capitate. Akene triquetrous, embraced at base by the marcescent calyx.

1. F. ESCULENTUM, Moench. Stem erect, paniculately branched, sulcate-angled, smoothish; leaves cordate-sagittate or subhastate, acute; racemes terminal and axillary.

Polygonum Fagopyrum. L. Willd. Sp. Pl. 2. p. 455. Fl. Cestr. p.

ESCULENT FAGOPYRUM. Vulgò-Buck-wheat.

Fr. Bled Sarrasin. Germ. Der Buchweitzen. Span. Trigo Sarraceno.

Root annual. Stem 2 to 4 feet high, much branched, pubescent near the nodes, becoming dark purple. Leaves 2 to 3 or 4 inches long, and 1 to 2 inches wide, often a little hastate at base, on petioles 1 to 2 or 3 inches long (sessile, Endl.); stipules short, smooth. Flowers in somewhat paniculate racemes,—the fascicles rather crowded; pedicels slender. longish, obscurely articulated above the middle. Sepals mostly white, with tinges of green and pale purple. Akenes equally and acutely triquetrous, somewhat acuminate, much longer than the withered sepals, smooth, dark brown when mature, often striately clouded. Fields: cultivated. Native of Middle Asia. Fl. Aug. Fr. Sept.—October.

Obs. This is extensively cultivated for its seeds,—the farinaceous albumen of which affords a delicious article of food, when properly managed—and a very sorry one, if unskilfully treated. of the plant is pretty much confined (in this region, at least,) to rough hilly districts; as it is considered a severe and unprofitable crop, on highly improved lands. It is, however, admirably adapted to subdue wild lands—or those newly cleared of timber. The glandular flowers are a favorite resort—and afford a rich reward to the labors-of the Honey-Bee.

ORDER CXII. PHYTOLACCACEAE. R. Br. Lindl.

Herbs, or suffruticose plants. Leaves alternate, entire, without stipules. Flowers racemose. Calyx of 4 or 5 petaloid slightly connected sepals. Stamens as many, or twice as many, as the sepals—or sometimes indefinite. Ovary compound (rarely simple), consisting of 10 confluent 1-ovuled carpels; styles or stigmas distinct—one for each cell or carpel. Fruit baccate or dry, entire or lobed, 1 or many-celled. Seeds ascending, solitary; embryo mostly peripherical, and curved round mealy albumen.

A small Order, and of little interest in Agriculture.

160. PHYTOLACCA. Tournef. Endl. Gen. 5262. [Gr. Phyton, a plant, and Lachanon, a pot-herb; the young shoots being so used.] Flowers perfect, or rarely dioicous. Calyx of 5 roundish-ovate colored persistent sepals. Stamens as many as, or usually some multiple of, the sepals, -often 10, inserted on a sub-hypogynous disk; anthers incumbent. Ovary free, composed of 5 to 10 confluent carpels; styles as many as the carpels, recurved at apex. Fruit a depressed-globose 5 to 10-celled berry: cells 1-seeded.

1. P. DECANDRA, L. Leaves ovate-oblong, acute at each end; flowers decandrous and decagynous. Willd. Sp. Pl. 2. p. 822. Fl. Cestr. p. 283. [berry.

DECANDROUS PHYTOLACCA. Vulgò-Poke. Poke-weed. Pigeon-Fr. Morelle à Grappes. Germ. Kermesbeere. Span. Yerba carmin.

Whole plant glabrous. Root perennial, large, fusiform and branching. Stem herbaceous, 4 to 6 feet high, stout, branching, terete or obtusely ribbed below the petioles and branches, finally purple. Leaves 5 to 10 inches long, acute or acuminate, thin; petioles half an inch to 2 inches or more in length. Racemes 3 to 6 inches long, simple, mostly opposite the leaves, on angular peduncles 2 to 4 inches long. Sepals white, membranaceous at the margin. Berries vertically depressed, umbilicate, orbicular, obscurely ribbed, 10-celled, 10-seeded, dark purple and juicy when mature. Seeds compressed, roundish-reniform. Rich soils; on banks, borders of fields, in clearings, &c.: throughout the U. States. Fl. June—September. Fr. August—October.

Obs. The young shoots of this plant afford a good substitute for Asparagus: the root is said to be actively emetic; and the tincture of the ripe berries is, or was, a popular remedy for chronic rheumatism. The mature berries, moreover, have been used by the pastry cook, in making pies of equivocal merit. Notwithstanding all this, the plant is regarded and treated as a weed, by all neat farmers.

ORDER CXIII. LAURACEAE. Juss. Lindl.

Trees or shrubs. Leaves mostly alternate, simple, sometimes lobed but with entire margins, destitute of stipules. Flowers often polygamo-dioicous. Calyx of 4 to 6 somewhat united sepals which are imbricated in two series, free from the ovary. Stamens definite, but usually more numerous than the sepals, inserted on the base of the calyx; authers 2 to 4-celled, opening by reflected peristent valves! Fruit a berry or drupe,—the pedicel often thickened. Seed solitary, destitute of albumen: cotyledons large, plano-convex or almond-like.

The tropical plants of this Order are highly interesting,—affording Cinnamon, Cassia, and Camphor; and also that species of Laurus (L. nobilis, L.) of which the Ancients formed their Laurel wreaths, or crowns. The species in the U. States are of less importance.

States are of less importance.

TRIBE X. FLAVIFLORAE. Nees.

Flowers dioicous or polygamous. Calyx rotate, thin, yellow. Stamens 9 fertile—sterile none; anthers 2 or 4-celled, all introrse. Berry on a nearly naked pedicel, which is sometimes thickened.

161. SASSAFRAS. Nees. Endl. Gen. 2056. [Altered from Salsafras, the Spanish name of Saxifrage,—given to this plant.] Flowers dioicous, naked. Sepals 6, membranaceous, united at base, persistent. STAM. FL. Stamens 9, in three series, all fertile,—the 3 innermost supported by a pair of stipitate glands; anthers introrse, linear, 4-celled,—the lower cells lateral—the upper ones covered by the ascending or reflected valves of the lower ones. Ovary entirely abortive. PISTILLATE FL. Stamens 9 or fewer, all sterile,—the inner ones often coalesced with glands. Ovary 1-celled, 1-ovuled; style subulate; stigma discoid. Berry 1-seeded, on a thickened clavate fleshy pedicel, and supported by the unchanged spreading sepals.

1. S. OFFICINALE, Nees. Leaves 3-lobed, or ovate and entire;

flowers in terminal clustered corymbose racemes, with lance-linear villous bracts; buds and pedicels silky-pubescent.

Laurus Sassafras. L. Willd. Sp. Pl. 2. p. 485. Fl. Cestr. p. 254. Icon, Mx. Sylva, 2. tab. 81.

Officinal Sassafras. Vulgò-Sassafras.

Stem 15 to 40 or 50 feet high, and 6 to 12 inches (in some rare instances, near 2 feet) in diameter, branching,—the young branches yellowish and pubescent. Leaves 3 to 5 inches long, and 2 to 4 inches wide,—often ovate and undivided, but more commonly dilated and 3-lobed at apex and cuneate at base (sometimes oval, with a lateral lobe),—silky-pubescent when young, finally smooth; petioles half an inch to an inch long. Flowers from the same buds, and contemporaneous, with the leaves. Sepals oblong, rather obtuse, pale greenish-yellow. Extension ovoid-oblong, dark blue when mature; pedicels purple. Woodlands; fencerows, and old fields: Canada to Florida. Fl. April. Fr. September.

Obs. The bark of this well-known small tree is a powerful, yet pleasant, aromatic stimulant, and possesses valuable medicinal properties; which acquired for it, at an early day, in Europe, an exaggerated reputation. An infusion of the roots, or bark of the roots, makes an excellent diet drink. The pith of the young branches contains much mucilage,—and is said to be used, in the South, along with the young leaves, to thicken potage, and make the celebrated "Gumbo Soup." We learn, also, from Michaux's Sylva, that bed-steads made of the wood, "are never infested with insects"; which circumstance—to adopt the language of the Gazettes—is certainly "important, if true,"—and well worthy of notice.

162. BENZOIN. Nees. Endl. Gen. 2057.
[A name said to be derived from the Arabic,—expressive of perfume.]

Flowers dioicous, in small lateral fascicles or clusters, surrounded by a deciduous 4-leaved involucre. Sepals 6, membranaceous, connected at base, persistent. Stam. Fl. Stamens 9 fertile, in three series; anthers introrse, ovoid, 2-celled, opening by as many ascending valves: also 6 to 9 sterile stamens, in 2 or 3 series, with compressed reniform-emarginate heads, alternating with the fertile ones of series 2 and 3—or sometimes with all the fertile ones. Ovary an abortive rudiment. Pistillate Fl. Sterile stamens 15 to 18, filiform, acute, alternating with smaller spatulate ones. Ovary 1-celled, 1-ovuled; style short; stigma 2-lobed. Berry 1-seeded, sitting on the persistent calyx.

1. B. Odoriferum, Nees. Leaves obovate-lanceolate, entire; flowers in lateral umbellate clusters, preceding the leaves; buds and pedicels smooth.

Laurus Benzoin. L. Willd. Sp. Pl. 2. p. 485. Fl. Cestr. p. 253.

Odoriferous Benzoin. Vulgò—Spice-wood. Wild Allspice. Feverbush.

Stem 6 to 8 or 10 feet high, much branched; branches virgate, brittle. Leaves 2 to 4 inches long, mostly acute or with a short acummation (sometimes obtuse and rounded at apex), often cuneate at base; petioles about half an inch long. Flowers in involucrate clusters of 3 to 5 from a bud, on pedicels 1 or 2 lines long; flower-buds distinct from the leaf-buds,—usually a flower-bud on each side of a leaf-bud. Sepals greenish-yellow, obovate-oblong, obtuse. Stamens rather shorter than the sepals,—the filaments of the sterile ones (staminodia) bearing 2-lobed (or sometimes peltate) glands instead of anthers: perfect authers 2-celled,—each cell opening by a longitudinal elastic valve, which is detached

at the lower end and reflected upwards. Berries oval, red or finally dark purple when mature. Moist rich low grounds; borders of thickets, &c. Canada to Florida. Fl. April. Fr. September.

Obs. This is a strongly aromatic shrub. In early times—before Physicians were so numerous—an infusion of the brittle spicy twigs was much used as a popular remedy, and even as a preventive, of the fevers which attacked the first settlers: but it is now chiefly prescribed as a diet-drink for sickly cows, in the spring of the year.

ORDER CXIV. SANTALACEAE. R. Br.

Trees, shrubs, or sometimes herbs. Leaves alternate, simple, entire, without stipules. Flowers perfect, or sometimes dioicously polygamous, small. Calyx-tube adherent to the ovary; limb 4 or 5-cleft, valvate in aestivation, its base lined with a fleshy disk, the edge of which is often lobed. Stamens usually as many as the lobes of the calyx and opposite them, inserted on the edge of the disk. Ovary loose of the early and opposite them, inserted on the edge of the disk. Overly 1-celled: ovules 2 to 4, pendulous; style short; stigma capitate, 2 or 3-lobed, or rarely radiate—sometimes simple. Fruit drupaceous or dry indehiscent, mostly crowned with the limb of the calyx. Seed with a densely fleshy albumen.

The fragrant Sandal wood—afforded by species of Santalum (the type of the Order)—is the only product of much interest, beside the genus here given.

163. NYSSA. L. Endl. Gen. 2086. [A name of obscure derivation.]

Flowers polygamo-dioicous. Calyx with the tube short; limb 5parted, deciduous. Stamens 5 to 10, inserted round a flattish disk which fills the bottom of the calyx, in the sterile flowers; anthers 2-celled, didymous. Ovary inferior, 1-celled; ovule single, pendulous; style subulate, incurved; stigma simple. Drupe baccate, 1seeded; nut oval, striate-angular. Seed inverted; embryo straight, in the axis of scanty albumen.

1. N. MULTIFLORA, Walt. Leaves oval and obovate, acute at each end, often acuminate, very entire,-the petiole midrib and margin villous; fertile peduncles mostly 3-flowered. Ell. Sk. 2. p. 684. Fl. Cestr. p. 164.

N. villosa. Willd. Sp. Pl. 4. p. 1112.

N. sylvatica. Mx. Sylva, 3. p. 33. Icon, tab. 110. MANY-FLOWERED NYSSA. Vulgò—Sour Gum. Black Gum. Pepe-

Stem 30 to 60 or 70 feet high, and 1 to 2 feet in diameter; branches numerous, horizontally spreading and often a little drooping. Leaves 2 to 4 inches long, dark green and shining above, paler and pubescent beneath, the margin villous-ciliate: peticles half an inch to an inch long, often margined, conspicuously villous-ciliate. Staminate flowers pedicellate. 2 to 5 or 6 in a loose cluster, on a slender common peduncle about an inch long. Fertile flowers sessile, mostly 3 in a dense involucrate cluster (sometimes 2, or only 1), on a clavate common peduncle, which at first is about half an inch—finally an inch to an inch and half—in length. Drupe elliptic, near half an inch long, bluish-black when mature. Moist woodlands, and low grounds: throughout the U. States. Fl. May—June. Fr. September.

Obs. The woody fibres of this tree are remarkably interlocked, so as to render it very difficult to split; on which account it is much used for making naves, or hubs, for carriage wheels,-and also hatter's blocks. The younger trees, when growing solitary, have much symmetry-affording a fine shade; and in autumn the leaves add greatly to the picturesque appearance of the country, by changing to a bright crimson color. There are three other species of Nyssa, in the Southern States, - with which I have but little acquaintance: viz. N. biftora, Walt. N. uniftora, Walt. and N. capitata, Walt. The first two are described as trees of large size,—often reaching the height of 60 or 80 feet, in the Southern swamps and ponds. The N. capitata is a shrub, rarely reaching the height of 20 feet,—and bearing a large red sub-acid drupe, called "Ogeechee Lime",—which is said to make a good preserve. See Elliott's Sketch, Vol. 2. pp. 684-6. and Dr. Baldwin's Correspondence, p. 328.

ORDER CXVII. ULMACEAE. Mirbel.

Trees, or shrubs, with a watery juice. Leaves alternate, simple, roughish, with deciduous stipules: Flowers in lateral fascicles, or axillary and solitary, perfect or sometimes polygamous. Calyx campanulate, 4 or 5- (sometimes 6 or 8-) cleft, free from the ovary; lobes imbricated in aestivation. Stamens inserted on the base of the calyx, as many as its lobes and opposite to them—sometimes more numerous. Ovary 1 or 2-celled, with a single suspended ovule in each cell; styles or stigmas 2, divergent. Fruit 1-celled and 1-seeded, indehiscent,—either sumaroid or drupaceous. Seed pendulous; albumen none, or very little.

A small Order,—and of little interest, beyond what is here given.

SUB-ORDER I. ULMEAE. A. Gray. Flowers perfect, fasciculate. Fruit samaroid: albumen none.

164. ULMUS. L. Endl. Gen. 1850. [An ancient Latin name,—of obscure etymology.]

Calyx membranaceous, turbinate-campanulate, 4, 5, or 8-cleft. Stamens as many as the lobes of the calyx. Ovary compressed, ovate, 2-celled; ovules solitary, appended to the apex of the dissepiment; styles 2, diverging, stigmatose on the inner side. Samara membranaceous, compressed, winged all round, by abortion 1-celled and 1-seeded. Seed inverted.

1. U. AMERICANA, L. Leaves ovate, smooth above, very unequal at base, rather simply serrate,—the serratures uncinately acuminate; flowers conspicuously pedicellate, in loose fascicles; samara oval, densely villous-ciliate on the margin. Willd. Sp. Pl. 1. p. 1325. Fl. Cestr. p. 178. Icon, Mx. Sylva, 3. tab. 126.

AMERICAN ULMUS. Vulgò-White Elm. Weeping Elm.

Stem 60 to 80 feet, or more, in height, and 2 to 3 or 4 feet in diameter; branches long and spreading, or often rather drooping. Leaves 3 to 5 inches in length, acummate; petioles one fourth to half an inch long, smoothish Stipules smooth. Calyx somewhat obliquely truncate, about 8-cleft, smoothish; tube green; lobes purphish-brown, short, rounded. Stemans mostly 8, exserted. Styles pubescent, nearly white. Samara reticulately veined, tapering to a pedicel at base, emarginate or bifid at apex between the 2 styles,—the segments incurved so as to leave an apparent foramen through the wing; margin densely fringed with soft white hairs. Banks of streams; borders of swamps, &c.: throughout the U. States. Fl. April Fr. June.

Obs. This is a fine large tree; and, if I mistake not, is the species so much cultivated as a Shade tree, in New England. The noble avenues of Elms, at New Haven, Conn. are the admiration of all visitors; and nothing is required but a little attention, at the proper season, to have every village in the land similarly adorned. Why will not the people of all our American towns and villages learn to do that much, for the sake of taste, and their own future comfort?*

^{*}It may be hoped that the persuasive arguments, and clegant illustrations, of A. J. Downing, Esqr. in reference to Shade trees, Landscape Gardening, &c. will induce our countrymen, generally, to pay more attention to such improvements, than they have hitherto done.

2. U. Fulva, Mx. Leaves oval or obovate-oblong, conspicuously acuminate, very scabrous above, rather unequal and somewhat cordate at base, doubly serrate; buds clothed with a fulvous tomentum; flowers in dense subsessile fascicles; samara orbicular, naked on the margin. Fl. Cestr. p. 179.

U. rubra. Mx. Sylva, 3. p. 89. Icon, tab. 128. TAWNY ULMUS. Vulgò—Slippery Elm. Red Elm.

Siem 30 to 50 feet high, and 12 to 18 inches in diameter; branches virgate. Leaves 4 to 6 or 8 inches long,—the upper surface remarkably rough—the under surface tomentose-pubescent, especially along the midrib and nerves; petioles about one third of an inch long, pubescent. Stipules pilose. Calyx about 7-cleft; lobes obtuse, clothed and ciliate with a reddish-tawny pubescence. Stamens often 7, much exserted. Styles glandular-pubescent, purple. Samara radiately veined, on a slender pedicel the length of the calyx, cleft at apex between the styles,—the segments acuminate and so incurved and overlapped as to give the margin the appearance of being entire at apex. Rich low grounds; fence-rows, &c.: throughout the U. States. Fl. April. Fr. June.

Obs. The inner bark of this species contains a large quantity of mucilage,—which has caused it to be added to the materia medica, in our Shops. The military, on the Canada frontier, during the last war, fed their horses with it, when destitute of the usual forage,—and found it a tolerable substitute for hay. The tree being smaller, and the branches straggling, it does not answer for a shade tree, so well as the preceding. There is another species (U. alata, Mx.) occasionally to be met with,—having the branches remarkably ridged, or winged, with a cork-like bark; but it is a small tree, and not of much interest to the farmer.

SUB-ORDER II. CELTIDEAE. Rich. A. Gray.

Flowers polygamous, subsolitary. Fruit drupaceous. Albumen scanty.

165. CELTIS. Tournef. Endl. Gen. 1851. [An ancient name of the Lotus,—applied to this genus.]

Calyx of 5 or 6 sepals, slightly connected at base, persistent, concave, imbricated in aestivation. Stamens as many as the sepals and opposite to them; anthers introrse, 2-celled, cordate, acuminate.—
Ovary ovoid, 1-celled; ovule single, appended to the parietes near the apex; stigmas 2, terminal, elongated and acuminate, spreading or recurved, glandular-pubescent. Drupe globose, fleshy, smooth, 1-seeded. Seed pendulous, curved; cotyledons conduplicate, emarginate at apex, inclosing the somewhat gelatinous central albumen.

1. C. OCCIDENTALIS, L. Leaves obliquely ovate, acuminate, serrate, entire at base; flowers solitary or in pairs; fruit brownish-orange color. Willd. Sp. Pl. 4. p. 994. Fl. Cestr. p. 180. Icon, Mx. Sylva, 3. tab. 114.

Western Celtis. Vulgò-Nettle-tree. Sugar-berry.

Stem 20 to 60 or 80 feet high, and 6 inches to 2 or 3 feet in diameter. Leaves 2 to 4 or 5 inches long, more or less scabrous on the upper surface, and somewhat hairy beneath, finally coriaceous; petioles one third or half an inch in length. Flowers axillary, solitary or sometimes in pairs; pedicels slender, half an inch or three quarters in length. Sepals dull greenish-yellow, oblong-lanceolate. Stigmas densely pubescent, long, divaricate, with the points often incurved. Drupe yellowish-brown when mature (purple, Ell.),—the pulpy coat thin, sweetish. Rich light soils; throughout the U. S. but I think not abundant any where. Fl. May. Fr. September.

Obs. This is by no means a common tree, in Eastern Pennsylvania,—and is but little known to the farmers. There appears to be another species (probably C. crassifolia, Lam.),—with larger coarser leaves, and, if Michaux is correct, with dark blue fruit; but I have not seen the fruit, and cannot speak confidently of the character of the tree. It is, however, rather a matter of Botanical curiosity, than of Agricultural importance.

ORDER CXXII. EUPHORBIACEAE. Juss. R. Br.

Herbs, shrubs, and even trees,—often with an acrid milky juice. Leaves opposite or alternate, mostly simple; stipules small and deciduous, or often wanting. Flowers monoicous or dioicous, usually bracteate or involucrate. Calyr free, lobed,—with various glandular or scaly internal appendages (in a few cases with genuine petals!),—sometimes obsolete or wanting. Stamens definite or indefinite, distinct or monadelphous; anthers 2-celled. Ovary sessile or stipitate, 2-3- or several-celled (or rather of so many united carpels); ovules solitary or twin and collateral, suspended from the inner angle of the cell near the apex; styles and stigmas as many as the cells, distinct or united. Fruit capsular,—often separating into its elementary carpels, which usually open elastically by one or both sutures. Seeds with a large embryo inclosed in fleshy albumen.

This large and varied—yet essentially natural Family—comprises upwards of 100 genera,—many of them possessing very active properties, or otherwise curi-

This large and varied—yet essentially natural Family—comprises upwards of 100 genera,—many of them possessing very active properties, or otherwise curious and interesting. Of these may be mentioned, the Croton Tiglium, L. which yields the powerful Croton Oil of Oil of Tiglium,—the Jatropha Manihot, L. which affords the Cassava and Tapioca,—the Crozophora tinetoria. Juss. yielding Turnsol,—the Siphonia elastica, Pers. affording the true Caoutchouc or Gum elastic,—the Buxus semperviens, L. affording the beautiful Box-wood,—the Hura creptans, L. or curious Sand-box tree, &c. &c.

TRIBE I. EUPHORBIEAE. Bartl.

Flowers monoicous, apetalous,—the staminate with the pistillate, within a common involucre. Cells of the ovary (carpels) 1-ovuled.

> 166. EUPHORBIA. L. Endl. Gen. 5766. [Named after Euphorbus, -an ancient Greek Physician.]

Flowers monoicous,—several naked monandrous staminate ones surrounding a single pistillate one, within a common involucre. Common involucre campanulate-turbinate; limb 4 or 5-cleft,—the lobes membranaceous and often petaloid, with 5 external gland-like teeth alternating with them. STAMINATE FL. each consisting of a single stamen with a lacerate-ciliate bract. Calyx and CorollaPISTILLATE FL. on a long pedicel. Calyx minute, dentate or lobed, often obsolete. Ovary composed of 3 united 1-ovuled carpels; styles 3, bifid or rarely united in one; stigmas 6. Capsule 3-lobed (tricoccous), smooth or verrucose, sometimes pilose,—the cells or carpels elastically 2-valved, opening on the back, deciduous. Herbaceous, or fruticose; very lactescent: Leaves opposite and stipulate, or alternate and naked; flowers axillary or sub-umbellate.

1. E. HYPERICIFOLIA, L. Stem nearly erect, with spreading branches, smoothish; leaves opposite, unequal at base, oval-oblong, sub-falcate, serrate; corymbs terminal; capsules smooth; seeds blackish. Willd. Sp. Pl. 2. p. 895. Fl. Cestr. p. 516.

HYPERICUM-LEAVED EUPHORBIA. Vulgò-Eye-bright. Spurge.

Plant replete with an acrid milky juice. Root annual. Stem 9 to 13 inches high, rather slender and leaning as if topheavy, with somewhat dichotomous spreading branches above, smoothish, often purple. Leaves half an inch to near an inch and half long, obliquely ovate-oblong or sub-falcate, rather obtuse, sharply

serrate, nearly entire towards the base on the rounded or convex side, more or less pilose with longish fine hairs, 3-nerved, linear-dotted, often stained with purple blotches along the midrib; petioles scarcely a line in length. Clusters of flowers axillary and dichotomal, pedicellate, forming small corymbs at the ends of the branches; petaloid segments of the involucre minute, white, or purple edged with white, minute. Capsules small, smooth, often tinged with dark purple. Seeds dark brown or nearly black, rugose-pitted, mostly 4-sided, with prominent rib-like or keeled angles. Sandy fields; pastures, road-sides, &c.: throughout the U. States. Fl. July—September. Fr. Sept.—October.

Obs. This species is very common in dry pasture fields—especially in thinnish sandy soils, - and has been suspected of being the cause of the salivation, or slabbering, with which Horses are often affected, in the latter part of summer. I cannot say how much foundation there may be for the suspicion; but I have often observed that horses are not apt to eat much of any acrid or unpalatable plant,-and are, moreover, very expert in scleeting esculent herbs from among those which are not so. This plant is a worthless obnoxious little weed,-and I believe is best kept down by improving the soil, and choking it out by more valuable substitutes. There is another species (E. depressa, Torr. Ell.—E. maculata L? Fl. Cestr.) frequent in cultivated grounds—especially in Indian-Corn fields,-which lies prostrate and very close to the ground-branching off from the root in every direction: but it is scarcely of sufficient importance, even as a weed, to claim a further notice, here. I avail myself of this occasion, however, to say, that I am now strongly inclined to believe the E. maculata, of most authors, is only a variety of E. hypericifolia, L,—and that the E. depressa, of Torrey & Elliott ("E. maculata, L?" of Fl. Cestr.), is most probably the E. thymifolia, of Michaux and Pursh. I have been fortified in this opinion, by the remarks of that able and sagacious Botanist, Dr. Engelmann, of St. Louis, -to whom I sent specimens of both the species here referred to.

TRIBE IV. CROTONEAE. Blume.

Flowers often furnished with petals, fasciculate, spicate, racemose, or paniculate. Ovary with the cells 1-oyuled.

167. RICINUS. Tournef. Endl. Gen. 5809. [Latin, Ricinus, a tick, or bug; from the resemblance of the seeds]

Flowers monoicous. Calyx 3 to 5-parted,—the lobes valvate in aestivation. Corolla none. Stam. Fl. Stamens numerous; filaments variously united, and much branched; anthers with the cells distinct and pendulous from the apex of the filament. Ovary globose, 3-celled; cells 1-ovuled; style short; stigmas 3, deeply 2-parted, oblong, colored, plunrose. Capsule mostly echinate, 3 lobed (tricoccous); cells or carpels 1-seeded.

1. R. COMMUNIS, L. Stem herbaceous, pruinose; leaves alternate, petiolate, peltate, palmately 5 to 7-lobed,—the lobes lanceolate, glandular-serrate; capsule echinate. Willid. Sp. Pl. 4. p. 564.

COMMON RICINUS. Vulgò—Castor-oil Bean. Palma Christi. Fr. Le Ricin ordinaire. Germ. Der Wunderbaum. Span. Ricino.

Reat annual. Stem 4 to 6 feet high, stout, branched, terete, nodose, smooth, mostly purplish and covered with a glaucous powder. Leaves 6 to 12 inches across, palmate-lobed,—the undivided portion nearly orbicular; petioles 3 to 6 inches long,

with a gland at apex, and sometimes 1, 2, or 3, near the base; stipule opposite to each leaf, embracing the stem, caducous. Flowers terminal, paniculate,—the staminate below, the pistillate above—all on articulated pedicels. Calyx yellow-ish-green. Pistils purple and glaucous. Capsule covered with subulate points. Seeds subovoid, smooth, mottled. Gardens and fields; cultivated. Native of India. Fl. July—September. Fr. Sept.—October.

Obs. This plant is extensively cultivated, in the South western States, for the valuable medicinal oil afforded by its seeds; and I have seen considerable fields of it, in the warm sandy districts of New Jersey. It is rarely seen in Pennsylvania,—except as a curiosity, in gardens. In tropical regions, it is said to be perennial, and shrubby.

ORDER CXXIV. JUGLANDACEAE. DC. Lindl.

Trees. Leaves alternate, odd-pinnate, without stipules. Flowers monoicous. STAM. FL. in aments, with a membranous irregular calyx. Stamens indefinite. PISTILLATE FL. mostly in small terminal clusters: Calyx-tube adherent to the ovary; limb small, 3 to 5-parted,—sometimes with the addition of as many small petals! Ovary incompletely 2 to 4-celled, with a single ovule. Fruit drupaceous,—the epicarp (coating of the nut) fibrous-fleshy and indehiscent, or coriaceous and opening by valves,—the endocarp (shell or nut) woody and rugosely sulcate, or bony, ribbed and smooth, 2 to 4-celled at base. Seed erect, 2 to 4-lobed at base,—the lobes occupying the cells of the nut: embryo shaped like the seed: albumen none. Cotyledons thick, fleshy and oily, 2-lobed, sinuate-torulose.

A small but interesting Order,—of which the more important genera and species are here noticed.

species are here noticed.

168. JUGLANS. L. Endl. Gen. 5890. [Latin, Jovis Glans, the nut of Jupiter; by way of eminence.]

Monoicous: Staminate Fl. lateral, amentaceous. Aments simple, cylindric, proceeding from buds distinct from the leaves, on branches of the preceding year. Calyx adnate to an entire 1-flowered bract, 5 or 6-parted,—the segments membranaceous, unequal, concave, imbricated in aestivation. Stamens numerous, sub-sessile. PISTIL-LATE FL. terminal, solitary, or few and clustered. Calyx-tube ovoid, adherent to the ovary,—the limb 4 or 5-cleft, Petals 4, minute, inserted at the summit of the calvx alternately with the segments, slightly connected by their dilated bases, spreading at apex. Ovary 1-celled above, 4-celled at base,—the dissepiments doubled, united at the centre and forming a thick receptacle of the ovule; ovule single, erect, sessile at the apex of the receptacle; styles 2, very short; stigmas 2, elongated, recurved, papillose-fimbriate. Fruit drupaceous, containing a single nut,—the epicarp somewhat fleshy, fibrous within, indehiscent or opening irregularly,—the nut woody, rugose and irregularly sulcate, 4-celled below, 1-celled above, 2valved, 1-seeded. Seed affixed to the thick receptacle, erect, 4lobed below,—the lobes thrust into the cells of the nut; testa membranaceous, thin; cotyledons fleshy, sinuate-lobed; plumule 2-leaved, pinnate. Trees, with simple aments. Fruit indehiscent.

1. J. NIGRA, L. Leaflets ovate-lanceolate, subcordate at base, the under surface and petioles slightly pubescent; drupe globose, roughish-dotted, spongy; nut subglobose, rugose-sulcate. Willd. Sp. Pl. 4. p. 456. Fl. Cestr. p. 543. Icon, Mx. Sylva, 1. tab. 30.

BLACK JUGLANS. Vulgò-Black Walnut.

Stem 40 to 60 or 80 feet high, and 2 to 3 feet in diameter, with spreading crooked branches,-often forming a broad roundish and rather open top. Leaflets 2 to 4 inches long, serrate, subsessile, in 7 to 10 pairs, with a terminal odd one which is often starved, or abortive. Aments about 2 inches long. Pistillate flowers in small terminal clusters of 2 to 4, on a short common peduncle. Drupe an inch and half to $2\frac{1}{2}$ inches in diameter, mostly globose, sometimes oval or oblong-ovoid, greenish-yellow when mature,—the epicarp (or "huli") more or less succulent and spongy. Rich woodlands; fence-rows, &c.: throughout the U. States. Fl. May. Fr. October.

Obs. The dense dark-brown wood of this species is valuable,—and is much used by Cabinet-makers, as a substitute for Mahogany. The spongy epicarp is often employed as a domestic dye-stuff,—and the nucleus, or kernel, although somewhat oily, is generally esteemed. The young fruit and leaves, when rubbed or bruised, emit a strong and not unpleasant resinous odor. This tree, when prevalent, is a pretty sure indication of a fertile soil; but it exerts an unfriendly influence on many cultivated plants (especially, it is said, upon the young hedges of Virginia Thorn), if placed in its immediate vicinity.

2. J. CINEREA, L. Leaflets oblong-lanceolate, rounded at base, softly pubescent beneath, with the petioles villous; drupe ovoid-oblong, coriaceous, viscid-pubescent; nut elliptic-oblong, acuminate, conspicuously sculptured. Willd. Sp. Pl. 4. p. 456. Fl. Cestr. p. 543.

J. cathartica. Mx. Sylva, 1. p. 160. Icon, tab. 31.

CINEREOUS JUGLANS. Vulgo-White Walnut. Butter-nut.

Stem 15 to 20 or 30 feet high, and 6 to 12 or 18 inches in diameter, with numerous branches and a smoothish cinereous bark. Leaves 2 to 4 or 5 inches long, serrate, sessile, softly pubescent and paler beneath, in 7 or 8 pairs with a terminal odd one. Aments 3 to 5 inches long. Pistillate flowers 3 to 5 or 7, in a terminal spike, rather distant, sessile on a long common peduncle. Drupe 2 to 3 inches long, and 1 to near 2 inches in diameter, elliptuc-ovoid with a short tapering protuberance at apex, often slightly compressed and obscurely angular, softly hairy and clammy,—the epicarp somewhat cortaceous: nut oval, acuminate, somewhat compressed, deeply sulcate, with the ridges sharp and irregular. Rich bott m lands; along streams, &c.: throughout the U. States. Fl. May. Fr. Sept.—Octo.

Obs. This is a smaller tree than the preceding—often rather a large branching shrub,—and the wood is much less valuable. The bark affords an extract, which is a convenient and popular cathartic. The young drupes, collected about the last of June, make excellent pickles. The kernel of the mature fruit is oily, and soon becomes rancid,—so that it cannot be eaten.

3. J. REGIA, L. Leaflets oval, rather acute, smooth, nearly entire; fruit roundish-oval. Willd. Sp. Pl. 4. p. 455. Icon, Mx. Sylva, 1. tab. 29.

ROYAL JUGLANS. Vulgò—English Walnut. Madeira Nut. Fr. Noyer commun. Germ. Die Wallnuss. Span. Noguera.

Stem 20 to 30 or 40 feet high, and 9 to 15 inches or more in diameter, branched. Leaflets 2 to 5 inches long, acute, or sometimes rounded and emarginate at apex, subserrate or entire, villous in the angles of the nerves beneath, in 3 to 5 pairs with a terminal odd one,—the lower pairs smaller. Aments ovoid-oblong, 2 to 3 inches in length. Pistillate flowers in small terminal clusters of 2 or 3, on a rather short common peduncle. Drupe oval or subglobose, mucronate, about 2 inches long and 1 or 2 inches in diameter, with a smoothish subcoriaceous epicarp; nut oval, subcompressed, smoothish or somewhat corrugated. About houses: cultivated. Native of Persia. Fl. May. Fr. October.

Obs. This oriental species is called English Walnut, in consequence, as I suppose, of its having come to us by way of the mother country. Such misnomers are not unfrequent, among cultivated

plants. This one is occasionally cultivated for the young fruit,—which makes a favorite pickle. The tree is rather impatient of the climate, in the rural districts of Pennsylvania; but does very well in the shelter afforded by our cities and large towns. The nuts are rarely perfected, here; but those imported, are more highly esteemed than our native walnut.

169. CARYA. Nutt. Endl. Gen. 5889. [Greek, Karya,—the ancient name of the Walnut tree.]

Flowers monoicous, proceeding from the same buds with the leaves. Stam. Fl. lateral, amentaceous. Aments ternately branched, slender, situated below the leaves. Calyx adnate to an entire 1-flowered bract, 2 or 3-parted,—the segments membranaceous, ovate. Stamens 3 to 6; anthers hairy. Pistillate Fl. terminal, in small clusters. Calyx-tube ovoid, adherent to the ovary,—the limb 4-cleft. Corolla none. Ovary as in Juglans; stigma sessile, large, discoid, 4-lobed, papillose. Fruit drupaceous,—the epicarp coriaceous, opening more or less completely by 4-valves; nut bony, smooth, often somewhat 4-angled. Trees, with compound aments. Fruit opening by 4 valves. Pubescence stellate.

1. C. Alea, Nutt. Leaflets mostly 5, obovate-lanceolate, acuminate, sharply serrate, villous beneath,—the terminal one petiolulate; aments smoothish; fruit depressed-globose; epicarp thick; nut 4-angled, compressed, with the shell thin. Fl. Cestr. p. 544.

Juglans compressa. Mx. Willd. Sp. Pl. 4. p. 458.

J. squamosa. Mx. Sylva, 1. p. 181. Icon, tab. 36.

WHITE CARYA. Vulgò-Shell-bark, or Shag-bark Hickory.

Stem 60 to 80 feet high, and 1 to 2 feet or more in diameter, with the outer bark exfoliating in long scales or plates, which generally adhere in the middle, while one or both ends are detached and elevated, making the surface very rough and shaggy. Leaftts mostly in 2 pairs with a terminal odd one, 3 or 4 to 6, 8 or 10 inches long, the terminal one usually largest, and the lower pair much smaller. Aments at the base of the young growth, 2 or 3 to 4 or 5 inches long, triple or 3-parted on a common peduncle, smoothish, pendulous, with a linear-lanceolate bract at the base of each branch or lateral ament. Stamens mostly 4,—the anthers somewhat hairy. Pistillate flowers terminal, mostly 2 or 3 together, sessile on a common peduncle. Fruit somewhat umbilicate at the ends, and depressed or sulcate along the sutures of the valves; epicarp (or hull) thick and subcarnosely coriaceous, opening at maturity into 4 distinct valves or pieces; nut about an inch long, suborbicular or oval, compressed and somewhat 4-angled, white,—the shell thin and frangible,—the seed or kernel rather large, oily sweet and esculent. Low lands; along streams, &c. New England to Carolina. Fl. May. Fr. October.

Obs. The nuts of this tree are well known, and highly esteemed. I think there are some varieties,—with the bark less shaggy, the fruit with a thinner epicarp, a thicker shell, and the kernel of inferior quality. The whole genus is believed to be peculiar to this continent,—and is celebrated for affording a superior quality of firewood.*

2. C. TOMENTOSA, Nutt. Leaflets mostly 7, oblong-lanceolate, acu-

*Mr. Emerson, in speaking of the Hickories of Massachusetts, seems to give this species the precedence, for the fuel it yields,—as well as for its excellent nuts. I think I am not mistaken, however, in saying that, in Pennsylvania, the following species (viz. C. tomentosa, Nutt. or White-heart Hickory,) is considered superior to all others, as fire-wood. In selecting Hickory wood, for fuel, experienced house-keepers, in this region, always give the preference to that which has the least red in it.

minate, slightly serrate, roughish-pubescent and resinous-dotted beneath,—the terminal one subsessile; aments tomentose; fruit ovoid or elliptic-oblong; epicarp very thick; nut somewhat 6-angled, with the shell thick and strong. Fl. Cestr. p. 546. [Pursh. Juglans alba. L. Willd. Sp. Pl. 4. p. 457. Not of Michaux & J. tomentosa. Mx. Sylva, 1. p. 176. Icon, tab. 35.

Tomentose Carya. Vulgò—White-heart Hickory.

Stem 60 to 80 feet or more in height, and 18 inches to 2 feet in diameter,—the bark with the fibres interlocked and not exfoliating. Leaflets generally in 3 pairs with a terminal odd one, 3 or 4 to 8 inches long (the two lower pairs considerably smaller than the others), smoothish above, clothed with a roughish stellate pubescence beneath, and sprinkled with minute dark-purple particles among the pubescence. Aments 4 to 6 or 7 inches long, filiform, pubescent. Pistillate flowers mostly in pairs, sessile on a short thick bracteate common peduncle. Fruit ovoid or oblong-oval, large (often 2 inches or more in length, and 1½ in diameter): epicarp thick and coriaceous, opening by 4 valves more than half way to the base; nut somewhat 6-angled near the apex,—the shell very thick and bony,—the kernel rather small, and, though esculent, much inferior to the preceding. Upland forests: New England to Virginia. Fl. May. Fr. October.

Obs. This species, also, appears to present several varieties,—some of them producing remarkably large fruit. All the Hickories are noted for affording good fuel; but the wood of this one (which is white to the heart—while the others are more or less red, within,) is considered the best of all, for that purpose. It is replete, in early summer, with a sweet syrup-like sap,—and when cut, at that season, is much preyed upon by worms. The proper time for cutting it, is the month of August.

3. C. PORCINA, Nutt. Leaflets 5 to 9—usually 7—lanceolate and obovate-lanceolate, acuminate, serrate, smooth, resinous-dotted beneath,—the terminal one subsessile; fruit pyriform or subglobose; epicarp thin, partially opening; nut with an even surface. Fl. Cestr. p. 546.

Juglans porcina. Mx. Sylva, 1. p. 194. Icon, tab. 38. J. glabra, Willd. and obcordata. Lam. Willd. Sp. Pl. 4. p. 458. Hog Carya.—Vulgò—Pig-nut Hickory. Broom Hickory.

Stem 40 to 60 or 70 feet high, and 1 to 2 feet in diameter, with a close bark, and numerous tough branches. Leaflets usually in 3 pairs (not unfrequently in 2 or 4 pairs,) with a terminal odd one, 2 or 3 to 5 or 6 inches long, generally smooth on both sides—sometimes a little pubescent beneath—sprinkled with minute purple particles. Aments ternately branched or in pairs, 2 to 4 or 5 inches long, filiform smoothish. Pistillate flowers terminal, solitary or 2 or 3 sessile and rather distant on a common pedancle. Fruit rather small, subglobose, oblong, or obovoid,—the obovoid variety often a little compressed and retuse, or obcordate: epicarp thin and coriaceous, opening partially (at summit) by 4 valves; nu smooth and even,—the shell often hard, but sometimes thin and frangible; kerne often astringent and bitter,—sometimes esculent, but of inferior quality. Moist woodlands, and low grounds: New England to Carolina Fl. May. Fr. Octo.

Obs. The young saplings of this species were much used, formerly, for making splint brooms; and the tough sprouts, or seedling plants, are often employed as ligatures, in rural economy, under the name of hickory withes. The wood, of the older trees, is used by wheelwrights for making axles of carts and wagons: and, like that of all the species, is much esteemed for fuel. The species most likely to be confounded with this one, is the Bitter-nut Hickory (C. amara,

Nutt.), but the latter is much less common,—at least in this region. 4. C. OLIVAEFORMIS, Nutt. Leaflets 11 to 15, lanceolate and somewhat falcate, serrate, subsessile,—the terminal one petiolulate; fruit obovoid-oblong; epicarp rather thin; nut olive-shaped, obscurely 4-angled, with an even surface. [Sylva, 1. tab. 32. Juglans olivaeformis. Mx. Willd. Sp. Pl. 4. p. 457. Icon, Mx. OLIVE-SHAPED CARYA. Vulgo-Pecan Hickory. Pecan nut.

Stem 50 to 70 feet high. Leastess in 5 to 7 or 8 pairs, with a terminal odd one, 3 to 6 inches in length, smooth, with a short roughish pubescence on the midnb and nerves beneath. Fruit 1 to near 2 inches long; nut with a thin frangible shell,—the kernel large. Wet, low grounds: Western and South-western States. Ft. April—May. Fr. Sept.—October.

Obs. This tree is little known, in the North, except by its very fine nuts,—which are even superior to those of the admired Shellbark. There are a few other species of Hickory, in the U. States; but the foregoing are those of chief interest to the farmer.

ORDER CXXV. CUPULIFERAE. Richard.

Trees, or shrubs. Leaves mostly alternate, simple, penninerved, with deciduous stipules. Flowers usually monoicous. Staminate Fl. in Aments, with either a scale-like or a regular calyx, and the stamens 1 to 3 times the number of its lobes. PISTILLATE FL. either solitary, 2 or 3 together, or in clusters,—furnished with an Involuce which incloses the fruit, or forms a Cupyle at its base. Calyx adherent to the ovary,—the limb minute, denticulate, often finally disappearing. Ovary 2 to 6-celled, with 1 or 2 pendulous ovules in each cell,—the dissepiments projection forms the projects to the course, forther force the rest part residence. projecting from the parietes to the centre, finally for the most part vanishing; style columnar; stigmas as many as the cells of the ovary, rigid, cartilaginous. Fruit (by abortion) a 1-celled 1-seeded indehiscent nut, coriaceous or bony, more or less embraced or inclosed by the involucre. Seed without albumen; embryo with thick fleshy cotyledons.

A highly important and valuable Order,-of which the principal Genera, and most interesting species (with the exception of Quercus Suber, L. from which Cork is obtained), are here noticed.

170. OSTRYA. Michel. Endl. Gen. 1842.

[Greek, Ostreon, a shell, or scale,—in allusion to the structure of the fruit.] Flowers monoicous. STAMINATE FL. Aments cylindric, elongated,

lateral and terminal. Calyx a simple scale without bract; scales imbricated. Stamens numerous, inserted at the base of the scale; anthers 1-celled, pilose at apex. PISTILLATE FL. Aments terminal, loosely imbricated; bracts small, deciduous. Scales of the involucre in pairs, hairy at base, membranaceous, uniting by their margins and inclosing 1 or 2 flowers. Calux adherent to the ovary, somewhat urceolate, -the limb undivided, forming a very short tube, ciliate. Ovary 2-celled; ovules solitary, suspended from the apex of the dissepiment; stigmas 2, subsessile, elongated, filiform. Fruit in a strobile (or cone), formed of the scales of the involucre, which are membranaceous, nerved, and coalesced into utricles or little sacs. Nuts solitary within the utricles, compressed, ovate-lanceolate, smooth, 1-seeded.

1. O. Virginica, Willd. Leaves ovate-oblong, acuminate, sharply serrate; cones ovoid-oblong; buds acute. Willd. Sp. Pl. 4. p. 469. Fl. Cestr. p. 541.

Carpinus Ostrya. L. Mx. Sylva, 3. p. 30. Icon, tab. 109. Virginian Ostrya. Vulgò—Hop Hornbeam. Iron-wood.

Siem 20 to 40 or 50 feet high, and 5 to 8 or 10 inches in diameter. Leaves 2 to 4 inches long, on short petioles. Staminate aments an inch to an inch and half long. Pistillate aments mostly terminal and solitary, 1 to near 2 inches long, slender and, while young, linear; flowers in pairs,—each pair subtended by an ovate-lanceolate tawny caducous bract; each flower contained in a membranaceous sac formed by the united scales of the involucre.—the sac enlarging and becoming a bladder-like envelope of the nut, slightly inflated, ovate, imbricated, and forming altogether, at maturity, a pedunculate pendulous cone—about the size of, and much resembling, the Common Hop. Woodlands: New England to Carolina. Ft. April—May. Fr. September.

Obs. The wood of this small tree is remarkably firm and tough: and although neither very common, nor very important,—it may be well, perhaps, for the intelligent farmer to know what it is when he meets with it. According to Mr. Emerson, it is known by the name of Lever wood, in New England. The Common Horn-beam, or Water Beech (Carpinus Americana, Mx.)—a large shrub, allied to this—is quite frequent along the banks of swampy rivulets.

171. CORYLUS. Tournef. Endl. Gen. 1844. [Greek, Korys, a helmet, or cap; in allusion to the involucrate fruit.]

Flowers monoicous. Staminate Fl. Aments cylindric, with imbricated bracteal scales. Calyx of 2 collateral scales beneath the bract, and all three united at base. Stamens about S; anthers 1-celled, subsessile, ovoid, bristly at apex. Pistillate Fl. from subterminal buds, in small clusters at the ends of the branches, with entire bracts; involucre of 2 or 3 (at first minute, but subsequently enlarging) villous leaflets, which are lacerate on the margin and coherent at base, embracing 1 or 2 flowers. Calyx adherent to the ovary,—the limb very minute, denticulate, villous. Ovary 2-celled; ovules solitary, suspended from the apex of the dissepiment; stigmas 2, elongated, filiform. Nut (by abortion) 1-seeded, roundish-ovoid, obtuse, subcompressed, bony, smooth, solitary in the enlarged foliaceous lacerate-dentate involucre. Seed pendulous; testa very thin and membranaceous; cotyledons elliptic, plano-convex.

1. C. AMERICANA, Marshall. Leaves orbicular-cordate, acuminate; stipules ovate-lanceolate; involucre ventricose-campanulate, much larger than the nut, with the limb compressed, dilated, lacerately many-cleft. Willd. Sp. Pl. 4. p. 471. Fl. Cestr. p. 539.

AMERICAN CORYLUS. Vulgò-Hazel-nut. Wild Filbert.

Shrub. Stem 4 to 6 feet high, slender, branching,—the young branches virgate, pubescent and glandular-hispid. Leaves 3 to 6 inches long, varying from roundish-cordate to ovate and obovate, dentate-serrate, pubescent; petioles one fourth of an inch to an inch long. Stipules ovate-lanceolate, caducous. Aments preceding the leaves, 1 to 2 inches long. Pistillate flowers in pedunculate squamose clusters.—the scales finally enlarging, uniting and forming the involucres of the nuts. Nut subglobose, somewhat compressed at apex, rather wider than long, finely pubescent, embraced by the subcoriaceous involucre, which is twice as long as the nut, glandular-hirsute externally, ventricose at base, with the limb bilabiate and irregularly lacerate-dentate. Borders of thickets; fence-rows, &c.: throughout the U. States. Fl. March—April. Fr. September.

Obs. This shrub is generally well known, for its esculent seeds,—though I believe it has never been thought worth while to cultivate it. The Filbert, of Europe (Corylus Avellana, L.),—an allied species, bearing larger nuts,—is occasionally to be seen in gardens, and is probably worthy of culture; but it is scarcely, as yet, intitled

to be reckoned among our cultivated plants.* Judging from the habit of Hazel bushes, and their tendency to form thickets, they are probably the identical genus referred to, by VIRGIL, in the passage—"Hic inter densas CORYLOS &c."

172. QUERCUS. L. Endl. Gen. 1845.

[Celtic, Quer, handsome, or excellent, and Cuez, a tree; on account of its value.] Flowers monoicous. STAMINATE FL. Aments slender, pendulous, without bracts. Calyx 6 to 8- (mostly 5-) parted,—the segments unequal, ciliate, some of them occasionally bifid. Stamens 4 or 5 to 10, inserted round a glandular disk at the base of the calyx; anthers 2-celled. PISTILLATE FL. from buds which are axillary, or sessile on a common peduncle. Involucre 1-flowered, - formed of minute bracts, and scales, imbricated in many series, and coalesced into a cupule embracing the base of the flower. Calyx adherent to the ovary,—the limb 6-cleft or obsoletely denticulate. Ovary 3 or 4-celled; ovules in pairs in the cells, collateral, suspended from the apex of the inner angle; stigmas as many as the cells of the ovary, subsessile, erect or spreading. Nut (or Acorn) by abortion 1-seeded, ovoid or oblong, mucronate, coriaceously woody, embraced and more or less included by the indurated cup-like involucre. Seed pendulous; testa membranaceous, thin; cotyledons plano-convex, thick and fleshy.

The numerous species of Oak may, for convenience, be arranged in two principal Sections,—namely, those with biennial, and those with annual, fruit: and these, again, may be thrown into subordinate groups—distinguishable by the outline or margin of the leaves, The most important, only, of each group, will be here described.

§. 1. FRUCTIFICATION BIENNIAL: FRUIT SUBSESSILE.

† WILLOW-LEAVED AND LIVE-OAK GROUP.

Leaves mostly entire, narrow and small, often perennial.

1. Q. Phellos, L. Leaves deciduous, linear-lanceolate, tapering at each end, mucronate at apex, glabrous; cupule saucer-shaped; acorn roundish. Willd. Sp. Pl. 4. p. 423. Icon, Mx. Sylva, 1. tab. 14.

Vulgò-Willow-leaved Oak. Willow-Oak.

Stem 40 to 60 or 70 feet high, and 1 to 2 feet or more in diameter, with a smoothish bark. Leaves 2 to 4 inches long, subsessile, entire or the young ones sometimes dentate. Acorn small, subglobose, seated in a shallow saucer-like subsessile cup. Moist low grounds: New Jersey, and South. Fl. May. Fr. October.

Ohs. There are apparently some varieties of this,—or, if they are specifically distinct, nearly allied species. The tree sometimes acquires considerable size,—but the timber is not particularly valuable; and as it is rather local in its habitat, is not much known beyond those limits. The Oaks of this Section are remarkable for their biennial fructification,—the axillary pistillate flowers, which

*The young forked twigs of the European Filhert, constitute the celebrated divining rod (virgula divinitoria) with which certain impostors, in the old world, practice upon the credulity of the ignorant. In our own Country, a kindred set of knaves, called "Water smellers," employ the twigs of Hamamelis Virginica, L. or Witch Hazel, for similar purposes,—and it is found to answer equally well—when they have fit subjects to practice upon!

appear in the spring, remaining almost stationary the first season—the ovaries not enlarging, nor becoming mature fruit, until the succeeding year! In consequence of this peculiarity, the fruit, in the second year, ceases to be axillary (except in the evergreen species)—the leaves of the first summer having fallen, and left the fruit naked on the sides of the branches.

2. Q. IMBRICARIA, Mx. Leaves deciduous, lance-oblong or elliptic-lanceolate, acute at each end, mucronate, smooth and shining above, pubescent beneath; cupule saucer-shaped; acorn somewhat hemispherical. Willd. Sp. Pl. 4. p. 428. Icon, Mx. Sylva, 1. tab. 15. Shingle Quercus. $Vulg\hat{c}$ —Laurel-leaved Oak.

Stem 40 to 60 feet high, and 1 to 2 feet in diameter, with a smoothish bark; branches numerous and irregular. Leaves 3 to 5 inches long, entire, somewhat crowded, on short petioles. Acom rather small, roundish above, with a broad flattish base, so as to be nearly hemispherical, seated in a shallow subsessile cup. Banks of streams: Western States. Fl. May. Fr. October.

- Obs. This species—being chiefly confined to the country west of the Alleghany Mountains—is but little known in the east: and although deriving its specific name from the roofing material which it affords, its timber is said to be of an inferior quality—even for that purpose.
- 3. Q. VIRENS, Ait. Leaves perennial, coriaceous, elliptic-oblong, somewhat toothed or angled on young trees, entire on old ones, with a revolute margin, rather acute at apex but not mucronate, stellately pubescent beneath; cupule turbinate, pedunculate; acorn oblong. Willd. Sp. Pl. 4. p. 425. Icon, Mx. Sylva, 1. tab. 12.

Green Quercus. Vulgò—Live Oak.

Stem 20 to 40 or 50 feet high, and 1 or 2 to 5 or 6 feet in diameter, with numerous large wide-spreading crooked branches,—the wood remarkably dense and heavy, with twisted gnarled fibres. Leaves an inch and half to 3 inches long, perennial, but a portion of them falling from the old trees every spring, dark green above, whitish beneath, on short petioles. Acorn ovoid-oblong or oval, of a dark brown color, seated in a bowl-shaped pedunculate cup,—the peduncle about an inch long, axillary. Sea-coast: Virginia to Florida. Fl. April. Fr.

Obs. This noted tree—so valuable in ship-building—is pretty much confined to the sandy sea-coast of the Southern States. Its most northern locality appears to be at Old Point Comfort, near Norfolk, Virginia,—where it is reduced to quite a small tree. Four or five other species, belonging to this group, are found in the U. States—chiefly in the South; but they are mostly small, and of little value.

† † BLACK AND RED-OAK GROUP.

Leaves repand or sinuate-lobed, rather large: lobes acute,—the points or nerves setaceously mucronate.

4. Q. NIGRA, Willd. Leaves somewhat coriaceous, cuneate, dilated at apex, retuse or obscurely 3-lobed, smooth above, covered with a russet pulverulent pubescence beneath, when young the nerves setaceously mucronate; cupule subturbinate; acorn ovoid. Willd. Sp. Pl. 4. p. 442.

Q. ferruginea. Mx. Sylva, 1. p. 95. Icon, tab. 20.

Stem 15 to 30 or 40 feet high, and 6 to 12 or 15 inches in diameter, with a thickish furrowed dark-colored bark; branches numerous. Leaves 5 to 8 inches long, much dilated at apex (4 to 6 inches wide), narrowed towards the base, on short petioles. Acom ovoid, seated in a rather deep or bowl-shaped subsessile cup. Sterile soils: New Jersey to Florida. Fl. May. Fr. October.

Obs. This small tree—abundant in Maryland, and well known by the name of "Black Jack"—is chiefly valuable for fuel.

5. Q. TINCTORIA, Bartr. Leaves obovate-oblong, sinuate-lobed, pulverulent beneath; cupule subturbinate; acorn ovoid. Willd. Sp. Pl. 4. p. 444. Fl. Cestr. p. 531. Icon, Mx. Sylva, 1. tab. 24. (fruit, tab. 25.)

DYER'S QUERCUS. Vulgò-Black Oak. Quercitron.

Stem 60 to 80 or 90 feet high, and 2 to 3 or 4 feet in diameter, with a thickish deeply-furrowed dark-colored epidermis, and a spongy yellow inner bark. Leaves 6 or 8 inches long, obovate in their outline, more or less deeply sinuate-lobed (usually 3 principal lobes on each—side),—the base obtuse or sometimes cuneately tapering, smoothish above, the under surface clothed with short stellate or fasciculate hairs which present a pulverslent appearance; petioles 1 to 2 inches long. Acorn rather small, ovoid, scated in a subsessile cup, which is tapering at base. Rich upland forests: New England to Georgia. Fl. May. Fr. October.

- Obs. The wood of this species is not very durable,—neither is it much esteemed for fuel: Yet, in consequence of its abundance, it is, or has been, very extensively used for fencing, firewood and shingles. The straight fibres, and facility of splitting the wood, no doubt recommended it for shingles. The inner bark is an article of commerce, under the name of Quercitron; and is exported in large quantities to Europe, where it is employed in dying yellow. It has nearly superseded the use of Weld (Reseda luteola, L.) in Calico printing. The prevalence of this fine tree, in Woodlands, is an indication of a good soil for Agriculture.
- 6. Q. COCCINEA, Wangenh. Leaves oblong, deeply sinuate-lobed, smooth, the lobes divaricate, acutely dentate, petioles rather long; cupule subturbinate, conspicuously scaly; acorn roundish-ovoid, a little depressed at apex. Willd. Sp. Pl. 4. p. 445. Fl. Cestr. p. 532. Icon, Mx. Sylva, 1. tab. 25. (fruit, tab. 24.).

Crimson Quercus. Vulgò-Red Oak. Scarlet Oak.

Stem 60 to 90 feet high, and 2 to 3 or 4 feet in diameter. Leaves 5 to 8 inches long, deeply lobed (usually 4 principal lobes on each side), the sinuses rounded and wider at bottom, the base obtuse or sometimes rather cuneate, both surfaces smooth and shining green, with a dense pubescence in the axils of the nerves beneath,—finally becoming red, and spotted with deeper crimson; petioles 2 to 4 inches long. Acorn roundish, depressed or slightly umbilicate at apex,—the lower half immersed in a rough scaly cup. Rich moist woodlands: New England to Georgia. Fl. May. Fr. October.

- Obs. This is a fine large tree,—and is remarkable for its crimson leaves, in autumn. The wood is much used for Coopers' stuff, &c. and the bark of this, and the two next following species, is esteemed the best, of all the Oaks, for the process of tanning.
- 7. Q. RUBRA, L. Leaves oblong, smooth, sinuate-lobed, sinuses rather acute; lobes incised-dentate with the teeth very acute; cupule shallow, saucer-shaped, flat at base, nearly even on the outer surface; acorn rather large and turgidly oblong-ovoid. Willd. Sp. Pl. 4. p. 445. Fl. Cestr. p. 532. Icon, Mx. Sylva, 1. tab. 28.

RED QUERCUS. Vulgò-Red Oak. Spanish Oak (erroneously).

Stem 60 to 90 feet high, and 2 to 4 feet in diameter. Leaves 5 to 8 or 9 inches long, often somewhat obovate, rather obtuse at base, sinuate-lobed (usually 3 principal lobes on each side), the sinuses shallower and more acute than in the-preceding species; petioles 1 to 2 inches long. Acorn oblong-ovoid, plump and rather large, seated in a broad flat-bottomed saucer-like sessile cup, of which the scales are so compact as to present a smooth or nearly even surface. Hilly woodlands: Northern and Middle States. Fl. May. Fr. October.

Obs. The wood of this species is also used for Coopers' stuff, &c. and the bark is in high repute with the Tanners.* This (and I think the preceding, also,) is often called "Spanish Oak," in districts where the true Spanish Oak is not found: but that name properly belongs to the following.

8. Q. FALCATA, Mx. Leaves elongated and rather narrow, sinuate-lobed, or sometimes almost palmately 3-lobed, obtuse at base, densely tomentose beneath; lateral lobes falcate, the terminal one longer and trifid; cupule shallow, subturbinate; acorn roundish-ovoid. Mx. Sylva, 1. p. 106. Icon, tab. 23.

Q. elongata. Willd. Sp. Pl. 4. p. 444.

FALCATE QUERCUS. Vulgò-Spanish Oak. Red Oak.

Stem 40 or 50 to 80 feet high, and 1 or 2 to 4 feet in diameter. Leaves 3 to 6 and 9 inches long, with 2 to 4 or 5 (usually 3) distant more or less falcate entire lobes on each side,—those on small trees, or young branches, often dilated and 3-lobed at apex, with the side-lobes diverging; petioles about an inch long. Acom small, seated in a shallow saucer-like cup, which is tapering at base and supported on a short peduncle. Sandy, or sterile clay soils: New Jersey to Georgia. Ft. May. Fr. Octo.

Obs. This tree (which is the genuine "Spanish Oak,")—so far as I have observed—seems to be pretty much confined to that district, along the Atlantic coast, which is marked as alluvial, on Geological maps. It is said to grow very large, in the South; but is rather below an average size, near its northern limits. The timber is reddish, coarse-grained and not very durable,—but is much used for the inferior kinds of Coopers' stuff. The bark, however, is reputed as preferable to that of every other species of Oak, for tanning.

9. Q. PALUSTRIS, Mx. Leaves oblong, deeply sinuate-lobed, smooth—lobes divaricate, acutely dentate, the sinuses broad; cupule saucershaped; acorn subglobose, small. Willd. Sp. Pl. 4. p. 446. Fl. Cestr. p. 532. Icon, Mx. Sylva, 1. tab. 27.

Marsh Quercus. Vulgò-Pin Oak. Swamp Spanish Oak.

Stem 40 to 60 or 70 feet high, and 1 to 2 feet in diameter, with numerous rather slender horizontal or drooping branches, which are frequently very knotty. Leaves 4 to 6 inches long, deeply lobed (usually 3 lobes on each side).—the lobes rather narrow, diverging, the base of the leaves obtuse or often somewhat cuneate, both surfaces smooth, except a tuft of pubescence in the axils of the nerves beneath; petioles 1 to 2 inches long. Acorn small (mostly numerous),

*I observe that Mr. Emerson, in his truly valuable and interesting "Report on the Trees and Shrubs growing naturally in the Forests of Massachusetts," speaks of the bark of Quercus rubra as being "almost worthless for the use of the tanner." I am, of course, unable to speak from personal or experimental knowledge; but I have uniformly understood, from the Tanners of Pennsylvania, that the Red Oak bark ranked next in value to that of the true Spanish Oak; and that impression is even now sustained by the testimony of my friend, Mr. Joshua Hoopes, of this Borough,—who is well acquainted, botanically, with our Forest trees; and, moreover, served a regular apprenticeship to the tanning business.

seated in a smoothish shallow nearly flat-bottomed subsessile cup, which is often abruptly tapering from the centre of the base. Wet low grounds: along rivulets, &c.: New England to Pennsylvania, and West to Illinois. Fl. May. Le October.

Obs. The wood of this Oak is very firm,—and is much employed by wheelwrights, &c. It is quite common in Pennsylvania,—but does not appear to extend to the South. It would seem as if the Q. falcata, and this species, were distinctly located in the two great divisions of the U. States. Four or five additional species, belonging to this group, are found in the U. States; but they are not very important,—and some of them are quite small and scrubby.

§. 2. FRUCTIFICATION ANNUAL: FRUIT MOSTLY PEDUNCULATE.

† WHITE-OAK GROUP.

Leaves sinuate-lobed; lobes obtuse and not mucronate.

10. Q. OBTUSILOBA, Mx. Leaves obovate-oblong, cuneate at base, pubescent beneath, irregularly sinuate-lobed,—the upper lobes dilated, retuse; cupule hemispherical or bowl-shaped; acorn ellipticovoid. $Fl.\ Cestr.\ p.\ 533.\ Icon,\ Mx.\ Sylva,\ 1.\ tab.\ 5.$

Q. stellata. Wangenh. Willd. Sp. Pl. 4. p. 452.

OBTUSE-LOBED QUERCUS. Vulgo-Barrens White-Oak. Post Oak.

Stem 20 to 40 or 50 feet high, and 1 to 2 feet in diameter; branches irregular, spreading, densely pubescent when young. Leaves 4 to 6 inches long, thick and coriaceous, mostly with 3 unequal lobes on each side and unequal angular sinnses,—the upper surface smoothish and shining (often roughish with short fasciculate hairs, when young), the under surface pale ferruginous, or tawny, and clothed with a stellate pubescence; petioles about half an inch long. Acom rather small, oval or roundish-ovoid, with the apex often depressed or umbilicate,—the lower half embraced by the scaly hemispherical cup, which is sessile, or the fruit often in small clusters on a common peduncle. Dry sterile hills; among serpentine rocks, &c.: New York to Florida. Fl. May. Fr. October.

Obs. This tree, in Chester county, Penn'a., seems to be confined to slaty barren hills, and exposed ridges of serpentine rock. The wood is very durable, and much valued for posts, &c. It also makes excellent fuel.

11. Q. ALBA, L. Leaves oblong, pinnatifidly sinuate,—lobes nearly equal, oblong, obtuse, mostly entire, the sinuses narrow; cupule somewhat bowl-shaped, tuberculate; acorn ovoid-oblong. Willd. Sp. Pl. 4. p. 448. Fl. Cestr. p. 534. Icon, Mx. Sylva, 1. tab. 1. White Quercus. Vulgò—Common White Oak.

Stem 60 to 80 and 100 feet high, and 2 to 4 or 5 feet in diameter, with a whitish or light grey bark. Leaves 4 to 6 inches long, subcoriaceous, smooth, nearly equally pinnatifid, usually with 3 or 4 lobes on each side (sometimes cuneate and 3-lobed); petioles half an inch to an inch long. Acorn rather large, seated in a shallowish bowl-shaped cup, which is pubescent and rough externally with roundish tubercles,—the fruit generally in pairs, sessile on a common peduncle about half an inch long. Woodlands; throughout the U. States: often abundant in moist low clayey grounds. Fl. May. Fr. October.

Obs. This is one of our finest and most valuable forest trees,—and frequently attains to an enormous size. Its prevalence, however, is not so indicative of a good soil, as that of the Q. tinctoria, or Black Oak. The timber is firm and durable, though somewhat liable, when in the form of boards and scantling, to warp or spring.

It is extensively used in the mechanic arts,—especially by the Wheel-wright, the Mill-wright, and the Ship-wright. The keels of some of our finest National vessels have been obtained from this Oak. It also affords the best quality of Coopers' stuff, for making Liquor-casks. The bark is astringent and tonic, and is frequently employed in medical practice. The acorns are sweet, affording a nutritions and favorite food of swine. On young trees, the leaves are remarkably persistent, after they are killed by the frost, in autumn. Three other species, in the U. States, belong to this group,—remarkable for their large acorns, or large cupules; but they are rather too rare, and too local in their habitat, to require a place in a practical farmer's Flora.

† † CHESNUT-OAK GROUP.

Leaves coarsely sinuate-dentate, -not lobed.

12. Q. EICOLOR, Willd. Leaves oblong-obovate, rather acute, softly tomentose beneath, coarsely and unequally sinuate-dentate, entire at base; fruit mostly in pairs, sessile on long common peduncles; cupule hemispherical; acorn ovoid-oblong. Willd. Sp. Pl. 4. p. 440. Fl. Cestr. p. 534.

Q. Prinus discolor. Mx. Sylva, 1. p. 47. Icon, tab. 7.

Two-colored Quercus. Vulgò-Swamp White-Oak.

Stem 40 to 60 or 70 feet high, and 2 to 3 feet in diameter. Leaves 4 to 6 or 8 inches long, varying from broad-ovate to oblong and obovate, with coarse unequal teeth which are dilated at base, rather acute and callous at apex, smooth above, clothed beneath with a soft velvety pubescence, which is either whitish, pale olive-colored, or greenish-ferruginous; petioles about half an inch long. Fruit in pairs (or often single), on an axillary common peduncle 1 or 2 to 4 inches long. Acorn rather large, seated in a roughish-pubescent bowl-shaped cup,—the margin of which is dentate with the points of the scales. Low grounds; along streams, &c.: Pennsylvania to Carolina. Fl. May. Fr. October.

- Obs. The timber of this is every way inferior in value to that of Q. alba. This, and all the following species of this subdivision, have considerable general resemblance; so much, indeed, that the elder Michaux regarded them all as varieties of Q. Prinus.
- 13. Q. Prinus, L. Leaves obovate and elliptic-oblong, acute or acuminate, finely pubescent beneath, coarsely and nearly equally sinuate-dentate,—the teeth obtuse; fruit on short common peduncles; cupule nearly hemispherical; acorn oval. Willd. Sp. Pl. 4. p. 439. Fl. Cestr. p. 534.
- Q. Prinus palustris. Mx. Sylva, 1. p. 52. Icon, tab. 8. Vulgo—Swamp Chesnut-Oak. Chesnut White-Oak.

Stem 60 to 80 or 90 feet high, and 2 to 3 or 4 feet in diameter. Leaves 5 to 8 inches long, penninerved with a coarse obtuse tooth for each nerve, and a small callus at the apex of each: petioles 1 to near 2 inches long. Fruit in pairs (1 often abortive), on a common peduncle about half an inch long. Acorn large, oval, or ovoid-oblong, seated in a scaly bowl-shaped cup which embraces nearly one third of the nut. Moist low woodlands: Penna, to Florida. Fl. May. Fr. October.

- Obs. This is often a fine tree, and the timber valuable.
- 14. Q. MONTANA, Willd. Leaves broad-obovate, acute, pubescent and subglaucous beneath, coarsely and nearly equally sinuate-den-

tate,—the teeth short, broad and obtuse, submucronate; fruit on short common peduncles; cupule turbinate; acorn elliptic-oblong. Willd. Sp. Pl. 4. p. 440. Fl. Cestr. p. 535.

Q. Prinus monticola. Mx. Sylva, 1. p. 56. Icon, tab. 9. Mountain Quercus. Vulgò—Rock Chesnut-Oak.

Stem 40 to 60 or 70 feet high, and 1 to 2 or 3 feet in diameter,—when old, the bark thick and deeply furrowed. Leaves 4 or 5 to 8 or 9 inches long, broadly (and sometimes roundish-) obovate, rather unequal at base,—the teeth often shortly mucronate with a small callous point; petioles half an inch to an inch long. Acorn large, rather longer but not so thick as in the preceding (about 1½ inch long, and \(\frac{2}{3} \) of an inch in diameter), seated in a rather deep bowl-shaped or sub-turbinate cup. Hilly, rocky woodlands: New England to Carolina. Fl. May. Fr. October.

Obs. The wood of this species is valuable,—and the bark is esteemed by the Tanners. The acorns, also, are sweet and nutritious,—much sought after by swine.

15. Q. Castanea, Muhl. Leaves oblong-lanceolate, acuminate, pubescent and cinereous beneath, nearly equally dentate or sinuateserrate,—the teeth rather acute, and callous at apex; fruit subsessile; cupule nearly hemispherical; acorn elliptic-ovoid. Willd. Sp. Pl. 4. p. 441. Fl. Cestr. p. 535.

Q. Prinus acuminata. Mx. Sylva, 1. p. 61. Icon, tcb. 10. Chesnut Quercus. Vulgò—Chesnut-Oak. Yellow Oak.

Stem 40 to 60 or 70 feet high, and 1 to 2 feet in diameter. Leaves 3 to 6 inches long, the points of the teeth (and along the whole margin) callous, the uppersurface smooth and yellowish-green, the under surface finely pubescent and whitish or cinereous; petioles half an inch to an inch long. Acorn rather small, seated in a pubescent bowl-shaped cup, which embraces one third of the nut, and is either sessile on the branch or on a short common peduncle. Mountains; slaty hills, and banks of streams: Middle and Western States. Fl. May. Fr. October.

Obs. This is often a fine tree,—though not so common, in Eastern Pennsylvania, as the others of this subdivision. It presents some varieties—at least in the leaves; but they generally have a striking resemblance to those of the Chesnut tree. The acorns are said to be more sweet and nutritious than those of any other species. There is a dwarf species (Q. Chinquapin, Mx.), belonging to this subdivision—common on our slaty hills; but it is too small and unimportant to require a more particular notice, here.

The fifteen Oaks, here described, are all noble trees,—and some of them of great value. They are emphatically (as Endlicher says of the Order,) "sylvarum decora"—the pride and ornament of our American forests; and every young American Farmer should be able to distinguish them all, and to understand their intrinsic and

relative importance.

173. FAGUS. Tournef. Endl. Gen. 1847. [Latin—from the Greek, phago, to eat; the fruit being esculent.]

Flowers monoicous. Staminate Fl. Aments globose, pendulous on long peduncles, with minute deciduous bracteal scales. Calyx campanulate, 5 or 6-cleft. Stamens 8 to 12. PISTILLATE Fl. from terminal buds, with numerous linear unequal bracts surrounding, and connate with, the 2-flowered urceolate somewhat 4-lobed involucre. Calyx adherent to the ovary,—the limb elongated, laciniate.

Ovary triquetrous, 3-celled; ovules solitary, pendulous; styles 3, filiform; stigmas lateral, fissure-like. Fruit capsule-form,—a coriaceous or subligneous muricate involucre, finally 4-valved, usually containing 2 nuts. Nuts acutely triquetrous, crowned with the pilose limb of the calyx, by abortion 1-celled and 1-seeded; epicarp coriaceous; endocarp villous. Seed pendulous; testa membranaceous, thin; cotyledons thick, fleshy, irregularly plicate.

1. F. SYLVATICA, L. Leaves elliptic-ovate, acuminate, slightly dentate, ciliate on the margin; nut ovoid-triquetrous, obtuse, mucronate. Willd. Sp. Pl. 4. p. 459. Fl. Cestr. p. 538.

F. sylvestris. Mx. Sylva, 3. p. 18. Icon, tab. 107.

Wood Fagus. Vulgà-Beech-tree. White Beech.

Fr. Le Hêtre. Germ. Die Buche. Span. Haya.

Stem 40 to 80 feet or more in height, and 1 to 2 feet or more in diameter, with a thin even-surfaced whitish bark, and giving out numerous slender horizontal or depending branches, which subdivide and terminate in slender terete acuminate buds, near an inch in length. Leaves 2 or 3 to 5 inches long, more or less dentate, penninerved, and plicate along the nerves while young, silky-pilose, finally smoothish on the upper surface; petioles one eighth to half an inch long; stipules long, linear, membranaceous, tawny, caducous. Aments of staminate flowers very numerous, loosely subglobose, silky-pubescent, pale greenish-yellow, on slender silky-pilose peduncles an inch or inch and half long. Involucres of the pistillate flowers fewer, roundish-ovoid, enlarging, coriaceous, muricate with flexible subulate squarrose or recurved points, ferruginous-pubescent, on rigid axillary peduncles about half an inch long. Nuts 1 or 2 in each involucre, pubescent, pale reddish brown. Low moist woodlands; throughout the U. States. Fl. May. Fr. September—October.

Obs. The density and uniform texture of the wood, renders it valuable for many purposes,—such as plane-stocks, and other implements of the mechanic arts. The leaves, especially of young trees, are remarkably persistent, after they are killed by frost,—often remaining on the branches until late in the ensuing spring. The oily seeds afford a nutritious food for swine.

The Beech—although a symmetrical and pretty tree—is seldom cultivated, in this country, either for shade or ornament: And yet it would seem, from Virgil's Pastorals, that in the land of sweet do nothing ("dolce far niente"), the Italian Peasant, of ancient times, found an enviable enjoyment under its spreading branches—

--- " patulae recubans sub tegmine FAGI."

174. CASTANEA. Tournef. Endl. Gen. 1848. [Named from a City of Thessaly (Castanea),—famed for Chesnuts.]

Flowers monoicous, or very rarely perfect. Staminate Fl. indefinitely glomerate around axillary amentaceous spikes, rarely solitary, bracteolate. Calyx deeply 5 or 6-parted. Stamens 8 to 15; anthers incumbent. Pistillate and Perfect Fl. from axillary subsolitary buds, with numerous linear unequal bracts which are connate with the campanulate 1- to 3-flowered involucre. Calyx adherent to the ovary,—the limb 5 to 8-cleft. Stamens 5 to 12, mostly abortive, minute. Gvary 3 to 6-celled; ovules solitary, pendulous; style very short, thick; stigmas as many as the cells, setiform, spreading. Fruit capsule-form,—a coriaceous echinate involucre, containing 1 to 3 nuts, and opening by 4 valves. Nuts ovoid when single, planoconvex or compressed when two or three,—1-seeded by abortion.

Seed pendulous; epicarp coriaceous; endocarp fibrous; testa membranaceous, sinuately folded,—the folds lining the chinks or fissures of the kernel; cotyledons thick, farinaceous, often unequal, plicate, closely cohering.

1. C. VESCA, Gaertn. Leaves oblong-lanceolate, acuminate, mucronately sinuate-serrate, smooth on both sides. Willd. Sp. Pl. 4. p. 460. Fl. Cestr. p. 536. Icon, Mx. Sylva, 3. tab. 104.

EATABLE CASTANEA. Vulgò-Chesnut. Chesnut tree.

Fr. Le Chataignier. Germ. Der Kastanienbaum. Span. Castaño.

Stem 60 to 80 or 90 feet high, and 2 to 4 or 5 feet in diameter. Leaves 6 to 9 inches long; petioles about half an inch long; stipules linear-lanceolate, entire, smoothish, caducous. Staminate flowers small, whitish or ochroleucous, in slender pubescent interrupted spikes or aments, 4 to 8 inches in length,—the florets crowded in dense bracteate clusters: stamens long. Pistillate flowers mostly 3 together, in a scaly squarrose ovoid involucre. Involucre usually solitary—sometimes 3 or 4 in a cluster—subsessile, enlarging, finally globose, about 2 inches in diameter, thickly covered with acute compound or coalesced prickles, opening at maturity by 4 valves or lobes, densely villons within. Nuts 3 (by abortion often 2, or 1), roundish-ovate, acuminate, reddish-brown, smooth below, the upper half covered with a grayish-tawny pubescence; the middle nut flatted on both sides, the lateral ones convex or gibbous externally,—and when the lateral ones are both abortive, the central one becomes roundish-ovoid. Upland forests,—abundant on sterile slaty hills: throughout the U. States. Fl. June. Fr. October.

- Obs. The American Chesnut-tree is scarcely more than a variety of the European,—the chief difference being in the size of the fruit. The nuts of our native Chesnut-tree are smaller, and the kernels much sweeter, than those of the European variety—or "Spanish Chesnut," as it is commonly called. The wood of the Chesnut-tree is light, easily split, and rather brittle,—yet very durable: not esteemed for fuel, but highly valued for making fences. The tree seems naturally to abound on our sterile slaty hills, and is of rapid growth,—being speedily reproduced, by suckers from the stump, when cut off—and therefore well calculated to keep up a supply of fencing timber.
- 2. C. Pumila, Mill. Leaves obovate-oblong, acute, serrate or denticulate, whitish-tomentose beneath. Willd. Sp. Pl. 4. p. 461. Fl. Cestr. p. 537. Icon, Mx. Sylva, 3 tab. 105.

DWARF CASTANEA. Vulgò-Chinquapin.

Stem 6 to 10 or 12 feet high, and 1 to 2 or 3 inches in diameter. Leaves 2 to 6 inches long, mucronately serrate or sometimes denticulate, green and smoothish above, clothed with a soft dense cinereous tomentum beneath; petioles about half an inch in length Staminate flowers in aments, 1 or 2 to 4 inches long, slender and numerous. Involucies of the pistillate flowers in spikes, or clustered on short tomentose axillary branches or common peduncles, enlarging, finally globose, an inch or inch and half in diameter, pubescent and prickly, opening at summit with 4 lobes or valves. Nut (by abortion?) constantly solitary, small, ovoid, acute. dark brown, pubescent at summit. Sterile soils: Maryland to Florida. Fl. June. Fr. October.

Obs. This shrub is rarely seen, north of Maryland. The kernels are remarkably sweet and pleasant to the taste,—but are scarcely half the size even of our native Chesnut. The seeds of both Chesnut and Chinquapin—and especially of the latter—are very subject to be preyed upon, by worms.

ORDER CXXVII. BETULACEAE. Richard. Bartl.

Trees, or shrubs. Leaves alternate, simple, straight-veined; stipules free, deciduous. Flowers monoicous; both kinds in axillary aments, and usually naked,—placed 2 or 3 together in the axil of each 3-lobed bract. Stamens definite. Ovary 2-celled; cells 1-ovuled; stigmas 2, sessile, filiform. Fruit membranaceous or samaroid, by abortion 1-celled and 1-seeded, forming with the 3-lobed bracts a kind of strobile. Seed destitute of albumen.

"An Order consisting of the two genera here noticed. The peculiar odor of Russia leather, is said to be owing to a pyroligneous oil obtained from the Betula alba, L. a European species; and, according to Sir W. J. Hooker, a wine is made of the sap of the same tree, in Scotland.

175. BETULA. Tournef. Endl. Gen. 1840. [Supposed from Betu,-the Celtic name for the Birch.]

STAMINATE AMENTS with the scales peltate, bibracteolate, 3-flowered. Calyx a scale. Stamens 4; anthers subsessile, oblong, 1-celled. PISTILLATE AMENTS with the scales 3-lobed, imbricated. Calyx none. Ovaries 3 under each scale, sessile, 2-celled; ovules solitary, pendulous from the apex of the dissepiments; stigmas 2, filiform. Fruit an ament-like strobile, with membranaceously margined scales. Nuts lenticular, samaroid or winged.

1. B. NIGRA, L. Leaves rhomboid-ovate, acute, doubly serrate, entire at base, pubescent beneath; pistillate aments subsessile, somewhat erect, elliptic-oblong; scales villous, - the lobes sub-linear, obtuse. Willd. Sp. Pl. 4. p. 464. Fl. Cestr. p. 539.

B. rubra. Mx. Sylva, 2. p. 99. Icon, tab. 72.

BLACK BETULA. Vulgo-Black Birch. Red Birch.

Stem 40 to 60 or 70 feet high, and 1 to 2 feet in diameter,—the young trees and branches with a smoothish cinnamon-colored bark,—the outer layers of old bark exfoliating in broad thin revolute laminae or sheets. Leaves 1 to 4 inches long; petioles 1 fourth to 3 fourths of an inch in length; stipules small, oblong-lanceolate. Staminate aments 2 to 3 inches long, flexible and pendulous. Pistillate aments about an inch long, oblong, obtuse, on short peduncles; scales 3-cleft two thirds of their length,—the segments equal, linear or spatulate-linear, obtuse. Nut compressed, ovate, with a membranaceous margin which is widest towards the base. Lew grounds; banks of streams: New Jersey to Carolina. Fl. April. Fr. Aprenst. Fl. April. Fr. August.

Obs. The timber of the Birches is not particularly valuable, though some of them afford tolerable specimens of lumber, as well as good fuel. The virgate branches were famous instruments in the hands of Pedagogues, of the olden time, in promoting good order, and a close attention to study, among the rising generation:* But "the march of mind," in the present day, has rendered such auxiliaries nearly obsolete! The flexible twigs of this species,—instead of being used to stimulate idle boys to learn their lessons—are chiefly employed for making coarse brooms, to sweep streets and courtyards, in our Cities.

2. B. Lenta, L. Leaves cordate-oblong, acuminate, sharply serrate; pistillate aments subsessile, somewhat erect, elliptic-ovoid; scales roughish-pubescent,—the lobes ovate-lanceolate, rather acute, prominently veined. Willd. Sp. Pl. 4. p. 464. Fl. Cestr. p. 540. Icon, Mx. Sylva, 2. tab. 74.

SOFT OR PLIANT BETULA. Vulgo-Sweet Birch. Cherry Birch.

^{-&}quot; afflictive Birch, "Curs'd by unletter'd, idle youth." J. PHILIPS.

Stem 30 to 60 feet high, and 1 to 2 feet in diameter; branches numerous, slender, phable, smooth and dotted with small white scars. Leaves 3 or 4 inches long, thinnish, varying from ovate-oblong to obovate, mostly somewhat cordate and often a little unequal at base,—the upper surface sprinkled with long hairs—the margin and nerves beneath hairy; petioles about half an inch long, pilose. Staminate aments 2 to 3 inches long, larger than in the preceding species. Pistillate aments about an inch long, and two thirds of an inch in diameter; scales 3-cleft nearly half their length,—the lobes prominently keeled and nerved, hirsuely ciliate. Nut compressed, elliptic-obovate, acute at each end, with a membranaceous margin which is broader towards the summit, and somewhat ciliate,—but every where narrower than in the preceding. Mountain forests: throughout the U. States. Fl. April. Fr. August.

Obs. The wood of this species is colored reddish,—something like that of the Wild Cherry (Cerasus serotina, DC.); and it is used, like that, in making Cabinet-ware, bedsteads, &c. The bark and young twigs are pleasantly aromatic,—and were formerly employed in domestic brewings, diet-drinks, &c.

3. B. PAPYRACEA, Ait. Leaves ovate, acuminate, doubly serrate,—the veins beneath hirsute, petioles glabrous; pistillate aments pedunculate, nodding, nearly cylindric; scales with the lateral lobes short, sub-orbicular. Willd. Sp. Pl. 4. p. 464. Icon, Mx. Sylva, 2. tab. 69.

PAPER BETULA. Vulgò-Paper Birch. Canoe Birch.

Stem 40 to 60 or 70 feet high, and 1 to 2 or 3 feet in diameter; branches slender and flexible,—the shining brown bark dotted with white. Leaves 2 to 3 inches long; petioles about half an inch long. Pistillate aments about an inch long, pendulous on a peduncle three-fourths of an inch in length. New England, and Canada. Fl. April—May. Fr. July—August.

Obs. The wood of this, is considered less valuable than that of the preceding species; but the tree is remarkable, as furnishing, in its thin firm and durable bark, the material of which the Aborigines of our country made their portable Canoes. Various other articles—as boxes, baskets, &c. are manufactured from the bark. There are several other species of Betula, in the U. States,—as the B. excelsa, Ait. a tree of considerable size, in British America and the northern parts of New England,—and the B. populifolia, Ait. a small tree, very abundant in some portions of New Jersey—beside some shrubby ones: But I have supposed the preceding to be those of chief interest to the farmer, and have therefore omitted the others.

176. ALNUS. Tournef. Endl. Gen. 1841. [The Latin name for the Alder.]

STAMINATE AMENTS with the scales peltate, 5-bracteolate beneath, 3-flowered. Calyx 4-parted. Stamens 4, inserted at the base of the calyx-lobes, and opposite them; anthers ovoid, 2-celled. PISTILLATE AMENTS with the scales imbricated, fleshy. Calyx of 4 scale-like sepals. Ovaries 2 under each scale, sessile, 2-celled; ovules solitary, pendulous; stigmas 2, filiform. Strobile formed of coalescing scales and bracteoles, which become woody. Nuts woody, compressed, angular, not winged, by abortion 1-celled and 1-seeded.

1. A. SERRULATA, Willd. Leaves obovate, sub-acuminate, doubly serrulate; stipules oval, obtuse. Willd. Sp. Pl. 4. p. 336. Fl. Cestr. p. 525. Icon, Mx. Sylva, 2. tab. 75. fig. 1.

SERRULATE ALNUS. Vulgò—Common Alder. Candle Alder.

Stem 3 to 10 or 12 feet high, and half an inch to 1 or 2 inches in diameter, with crooked and rather rigid branches. Leaves 2 to 4 inches long, strongly nerved, sub-plicate, thick and subcornaceous, smoothish; petioles about half an inch long. Staminate aments one and a half to near 3 inches long, cylindrical, slender, flaccid, pendulous and sub-fasciculate near the ends of the branches; scales reddish-brown; anthers yellow. Pistillate aments half an inch to near an inch long, oblong, rigid, dark purplish-brown, persistent, on short lateral branches below the staminate ones,—when in flower, bristled with the dark-purple exserted stigmas. Swamps, and margins of rivulets; throughout the U. States, Fl. March—April. Fr. October.

Obs. This shrub is of little or no value;—and is only noticeable as a frequent intruder in swampy meadows, and along rivulets,where, if neglected, the bushy growth soon gives the premises a slovenly appearance. It is true, the Alders often make a comfortable shade for the Trout, in the little pools of our meadow rivulets: but the tidy farmer likes to keep even the margins of those streams clear of weeds and bushes.

ORDER CXXVIII. SALICACEAE. Richard. Lindl.

Trees, or shrubs. Leaves alternate, simple; stipules scale-like and deciduous, or foliaceons and persistent. Flowers dioicons; both kinds in Aments, destitute of floral envelopes, one under each bract. Stamens 2 to several, sometimes monadelphous; anthers 2-celled. Ovary 1-celled or imperfectly 2-celled, many-ovuled! styles 2, very short; stigmas 2 to 3-lobed. Fruit a follicular kind of capsule, opening at apex by 2 valves. Seeds numerous. ascending; funiculus short, thick, solitting into a silky-langinous coma! Albumen none.

An Order comprising the Willows and true Poplars.

177. SALIX. Tournef. Endl. Gen. 1903. [Celtic, Sal, near. and Lis, water; alluding to its place of growth.]

STAMINATE AMENTS with entire bracts. Calyx none. Receptacle gland-like. Stamens 2 to 5; filaments free, or more or less connate. PISTILLATE AMENTS with entire bracts. Ovary 1-celled; ovules numerous, on parietal placentae near the base; stigmas 2, subsessile, 2-lobed. Capsule follicular, 1-celled, 2-valved,—the valves bearing the erect comose seeds in the middle, near the base.

1. S. VITELLINA, L. Branches rather erect, yellow; leaves lanceolate, glandular-serrulate or nearly entire, smoothish and yellowishgreen above, silky-pilose and glaucous beneath; aments coëtaneous. Willd. Sp. Pl. 4. p. 668. Fl. Cestr. p. 562.

EGG-YOLK SALIX. Vulgò—Yellow Willow. Golden Osier. Fr. Osier jaune. Germ. Die Dotter-weide. Span. Sauce.

Stem 30 to 40 or 50 feet high, and 2 to 3 feet in diameter at base; branches numerous, with a smooth shining orange-yellow bark. Leaves 2 to 3 or 4 inches long, generally lanceolate and acute, with indistinct cartilaginous glandular serratures,—not unfrequently obovate-oblong, obtuse and entire (especially when young, or the early ones at the base of young branches): petioles 1 or 2 lines long; stipules minute, ovate-lanceolate, caducous. Pistillate aments about 2 lines a large server alaprecepter of the proposers. inches long; scales ovate-lanceolate, ciliate, externally pubescent. houses; meadows, &c.: introduced. Fl. April. Fr.

Obs. This was introduced from Europe, at an early period, as a shade-tree about houses, and spring-heads or fountains, - and has become almost naturalized in some spots: but is gradually giving place to the more graceful Babylonian Willow. It is propagated by cuttings,—and spreads also by the roots. I have never observed any but pistillate trees. A variety with paler branches (perhaps S. alba, of authors), is also frequently to be seen, in old settlements; and, I think, has been cultivated, by the manufacturers of Gunpowder, in order to obtain charcoal from the wood. Sir W. J. Hooker says, the twigs of the S. vitellina are used, in Europe, "as an Osier," for making baskets.

2. S. Babylonica, L. Young branches very slender, flaccid and pendulous; leaves linear-lanceolate, acuminate, sharply serrulate or nearly entire; stipules minute, ovate, glandular-dentate; aments coëtaneous. Willd. Sp. Pl. 4. p. 671.

Babylonian Salix. *Vulgò*—Weeping Willow. Drooping Willow. *Fr.* Saule pleureur. *Germ.* Babylonische Weide. *Span.* Sauce de Babilonia.

Stem 30 to 50 feet high, and 2 to 3 or 4 feet in diameter at base, widely branching above,—the young branches greenish, very numerous, slender, long and perpendicularly pendent. Leaves 2 to 4 or 5 inches long, narrow-lanceolate, the larger ones with a long acumination, smooth; petioles 1 or 2 lines long. Pistillate aments about an inch long, mostly ascending, or turned up, on the pendulous branches; scales lanceolate, smooth. About houses: introduced. Fl. April. Fr.

Obs. This elegant and interesting species—a native of the East—is deservedly admired, and much cultivated, as a shade-tree. The pistillate plant, only, has been introduced to this country. Its specific name was given, by Linnaeus, under the idea that it might be the tree so touchingly referred to, in the 137th Psalm:—"By the rivers of Babylon, there we sat down, yea, we wept, when we remembered Zion. We hanged our harps upon the Willows in the midst thereof."

In addition to these, there has been introduced to some extent, the S. viminalis, L. or common Osier, of Europe,—the pliable branches of which are wrought into baskets; and also a species which I have supposed to be the S. Russelliana, of Smith: But, as they scarcely come within the scope of the present work, I do not insert them. Most of our native Willows are mere shrubs,—of little or no Agricultural interest.

178. POPULUS. Tournef. Endl. Gen. 1904.
[Latin, Populus, the people: the tree of the people; being used to shade public walks.]

STAMINATE AMENTS with laciniate or fringed bracts. Calyx subturbinate,—the limb oblique, entire. Stamens 8 to 12, or more;—the filaments free. PISTILLATE AMENTS with bracts and calyx as in the staminate: Ovary 1-celled; stigmas 2, subsessile, elongated, 2-parted. Capsule 1-celled, 2-valved. Seeds numerous, comose.

1. P. TREMULOIDES, Mx. Leaves small, cordate-orbicular, abruptly acuminate, unequally dentate-serrulate, pubescent on the margin. Mx. Sylva, 2. p. 241. Icon, tab. 99. fig. 1. Fl. Cestr. p. 568.

P. laevigata? or P. trepida? Willd. Sp. Pl. 4. p. 803.

TREMULA-LIKE POPULUS. Vulgo-Quaking Asp. American Aspen.

Stem 30 to 50 or 60 feet high, and 12 to 18 inches in diameter, with a smoothish cinereous bark. Leares about 2 inches in length, and rather wider than long; peti es 2 to 3 inches long, slender, smooth, subterete towards the base, laterally compressed or vertically dilated near the leaf, which disposes the leaf to be agitated by the slightest motion of the air. Pistillate aments 3 to 4 or 5 inches long. Low swampy grounds: Northern and Middle States. Fl. April. Fr. May.

Obs. This is a rather pretty tree,—and is occasionally planted about houses and lawns, for shade and ornament. It is admired for

the extreme mobility of its *leaves*; and is, moreover, in considerable repute for the tonic properties of its *bark*.

2. P. ANGULATA, Ait. Branches alate-angular; leaves deltoid-ovate, acuminate, obtusely uncinate-dentate, glabrous,—the younger ones broadly cordate. Willd. Sp. Pl. 4. p. 805. Icon, Mx. Sylva, 2. tab. Angulate Populus. Vulgò—Cotton-wood. Carolina Poplar. [94.

Stem 60 to 80 feet high, and 2 to 3 or 4 feet in diameter,—the bark on the branches elevated into acute longitudinal ridges, as if by the decurrence of the petioles. Leaves 3 to 6 or 8 inches long; petioles 2 to 4 inches long, laterally compressed near the leaf. Staminate aments large. Along rivers; South Western States. Fl. March. Fr.

- Obs. This tree is well known along the rivers in the valley of the Mississippi. The wood, however, of all the poplars, is light, brittle, and of little value. There are several other native species,—but, being of small importance to the farmer, they are omitted here. The two following were introduced, as shade trees.
- 3. P. Graeca, Ait. Branches terete; leaves cordate-ovate, acuminate, obsoletely serrate, somewhat ciliate. Willd. Sp. Pl. 4. p. 804. Grecian Populus. Vulgò—Athenian Poplar.

Stem 30 to 50 feet high, and 1 to 2 feet in diameter, with irregular and rather spreading branches. Leaves 4 to 6 or 8 inches in length, and as wide as long; petioles $1\frac{1}{2}$ to 3 inches long, laterally compressed near the leaf. Pistillate aments 3 to 6 inches long. About houses: cultivated. Native of Greece. Fl. April. Fr.

- Obs. This species was introduced, as a shade tree, about 40 years ago; but it was not generally adopted,—and is now nearly superseded by more eligible ones. We have only the pistillate plant in this country; and the cotton which is shed from the capsules is so abundant as to render the tree objectionable, in the immediate vicinity of dwellings.
- 4. P. DILATATA, Ait. Leaves much dilated, nearly deltoid, acuminate, serrate, glabrous on both sides. Willd. Sp. Pl. 4. p. 804.

DILATED POPULUS. Vulgè—Lombardy Poplar. Italian Poplar.

Fr. Peuplier Italien. Germ. Lombardische Pappel. Span. Alamo de Lombardia.

Stem 60 to 80 feet high, and 1 to 2 or 3 feet in diameter; branches numerous, nearly erect, forming a close conical symmetrical top. Leaves 2 to 3 inches long, and wider than long; petioles about 2 inches long, laterally compressed near the leaf. Staminate aments 2 to 3 inches long. About houses, and along avenues: cultivated. Native of Italy. Ft. April. Fr.

Obs. This was a favorite ornamental tree, for a number of years; but is now (1846) going out of fashion. Mr. Watson, in his Annals of Philadelphia, says it was introduced to that city, from England, in the year 1784, by William Hamilton Esq. of the "Woodlands," west side of the river Schuylkill. The Botanical Editor of Rees's Cyclopaedia, however, thinks they have only the pistillate plant in England,—whereas it was the staminate plant that was introduced by Mr. Hamilton; and he may have procured it from Italy. All the Lombardy Poplars that are, or have been, in the U. States, may be considered as elongations, branches, or offsets, of the tree from which Mr. Hamilton obtained his specimen.

The pretty Silver Poplar, or Abele tree (P. alba, L.)—so remarkable for the snow-white tomentum on the under surface of the leaves—is occasionally to be seen about houses,—and is annually becoming more frequent; but is scarcely, as yet, intitled to a place in our list of cultivated shade trees.

ORDER CXXIX. BALSAMIFLUAE. Blume.

Trees. Leaves alternate, petiolate, palmately lobed; stipules caducous. Flowers monoicous, in conical or globose Aments, with a caducous 4-leaved involucre. Staminate aments conical or elongated, loosely racemose at base; stamens numerous, in capitate clusters,—the lower clusters pedicellate; anthers rather large, oblong-didymous, 2-celled, subsessile. Pistillate aments pedunculate, globose,—the ovaries surrounded or mixed with numerous small fleshy scales—all finally coalescing and enlarging together. Ovary 2-celled—or rather formed of 2 carpels—connate at base; ovules numerous on the dissepiment; styles 2, thickish, continuous with the carpels stigmatose on the inner face, somewhat recurved. Capsules obcordately 2-lobed or 2-beaked, 2-celled, coalescing with the indurated scales in a kind of globose strobile, dehiscent between the styles or beaks. Seeds few, compressed, margined, peltately affixed to the dissepiment, with but little albumen.

An Order limited to the single genus here given; and consequently, the Ordi-

nal and Generic characters are the same.

179. LIQUIDAMBAR. L. Endl. Gen. 1902.

[A name given on account of the aromatic gum yielded by the tree.]

1. L. STYRACIFLUA, L. Leaves palmately 5-lobed; lobes ovate-lanceolate, glandular-serrate; axils of the nerves villous. Willd. Sp. Pl. 4. p. 475. Icon, Mx. Sylva, 2. tab. 62.

STORAX-FLOWING LIQUIDAMBAR. Vulgò-Sweet Gum. Bilsted.

Stem 40 to 60 or 70 feet high, and 2 to 3 feet in diameter, with a deeply furrowed bark when old,—the branches somewhat winged with high ridges of suberose bark. Leaves 3 to 5 inches long, deeply 5-lobed,—the lobes spreading; petioles about 3 inches in length. Staminate aments an inch or inch and half long, couical, branched near the base,—the lowest branches half an inch to nearly an inch long, all bearing small sub-globose heads or clusters of stamens—the upper clusters sessile; rachis hirsute with tawny hairs. Pistillate aments globose, about an inch in diameter when full grown, muricate with the beaks of the capsules; pedancles 2 to 3 inches long. Moist low grounds: New England to Florida. Fl. May. Fr. October.

Obs. The products of this tree do not meet the expectation naturally raised by its high-sounding name. The leaves, however, when slightly bruised, are remarkably fragrant. The timber is not particularly valuable,—but makes tolerably good fuel. As far as I have observed, the tree seems to be confined to the alluvial district, along the Atlantic coast. It is quite abundant in the lower part of New Jersey,—yet rare in Pennsylvania.

ORDER CXXX. PLATANACEAE. Lestib. Lindl.

Trees. with a watery juice. Leaves alternate, petiolate, palmately nerved and lobed; stipules intra-petiolar or super axillary, sheathing, deciduous (none, Endl.*); petioles turnid and hollow at base, concealing the young buds. Flowers monoicous, minute and inconspicuous, densely crowded on globose receptacles,—

^{*}Endlicher, in saying "Stipulae nullae," seems to have followed Jussieu, without giving the whole of that Author's remark. Jussieu says, "Stipulae nullae, sed vagina intra petiolum ramulo circumposita, limbo inaequalis et patens, in ramis decidua"; and this sheath, which embraces the branch within the petiole, or above the axil of the leaf, seems to be as much intitled to the name or character of stipule, as is the somewhat analogous Ochrea of the Polygonaceae.

both kinds destitute of floral envelopes; heads pendulous on long slender peduncles. Staminate Fl. Stamens numerous, irregularly mixed with subclavate scales (staminodia), densely crowded. PISTILLATE FL. Ovaries numerous, obconic or filiform-clavate, densely crowded, mixed with spatulate scales (abortive ovaries); style elongated, subulate, stigmatose on one side, near the apex. Fruit a 1-celled 1-seeded clavate coriaceous little nut,—the base surrounded with pappus-like articulated hairs. Seed cylindric-oblong, pendulous; embryo in the axis of fleshy albumen.

An Order consisting of the single genus here given,—and the generic character, of course, the same as that of the Order.

180. PLATANUS. L. Endl. Gen. 1901.

[Greek, Platys, broad; in allusion to its wide-spreading branches and foliage.] 1. P. occidentalis, L. Branches cinereous; leaves roundishpentagonal, acuminate, obscurely palmate-lobed, sinuate-dentate, pubescent beneath. Willd. Sp. Pl. 4 p. 471. Fl. Cestr. p. 542. Icon, Mx. Sylva, 2. tab. 63.

WESTERN PLATANUS. Vulgò-Button-wood. Sycamore. Plane-tree.

Stem 60 to 100 feet high, and 2 to 4 or 5 feet or more, in diameter, with large spreading branches, and a smoothish cinereous bark, which exfoliates in broad thinnish plates. Leaves 3 to 6 or 8 inches long, and wider than long,—the base at first truncate, finally subcordate, obscurely palmate or angulate-lobed, unequally sinuate-dentate with the teeth acuminate, loosely clothed with lobed, unequally sinuate-dentate with the teeth acuminate, loosely clothed with a hoary branching deciduous pubescence; petioles 1 to 3 inches in length, tumid and hollow at base, covering the young bud which is formed within and occupies the cavity; stipules somewhat salverform, sheathing the young branches immediately above the petioles.—the limb spreading, foliaceous, coarsely and unequally toothed. Staminate heads or globes small, on peduncles 1 to 2 inches long, deciduous. Pistillate heads about an inch in diameter, pendulous on slender terete peduncles 3 to 5 inches long, persistent. Nuts about one third of an inch long, slender, subterete, clavate, mucronate,—the base acute and invested with tawny pappus-like hairs. Banks of streams; roadsides, &c.: throughout the U. States. Fl. April—May. Fr. October.

Obs. This stately tree—originating from a very small seed—often attains to a larger size than any other in our country. It is sometimes planted for shade,—but becomes rather large for streets, or to stand near houses. The timber is not much esteemed,—though occasionally sawed into joists, and other lumber. For several years past, the trees (or, at least, the branches), in the spring, appeared every where to be diseased and dying; but they have still recovered again, more or less completely, in the course of the summer. The cause of this phenomenon, - (whether insects, as some suppose - or late unseasonable frosts, as I incline to think,) has not been satisfactorily determined.

ORDER CXXXI. URTICACEAE. Juss. Endl.

Trees or shrubs with a milky juice, or herbs with a watery juice. Leaves alternate or opposite, often stipulate. Flowers monoicous, dioicous, or polygamous, furnished with a regular calyx,—sometimes collected in aments, or fleshy heads. Stamens definite, distinct, inserted into the base of the calyx, opposite its lobes. Ovary free from the calyx, simple, with a solitary ovule. Fruit an Akene, or Utricle,—often inclosed in a fleshy or baccate calyx or involucre. Embryo straight, curved, or spiral,—with or without albumen.

straight, curved, or spiral,—with or without albumen.

A comprehensive and very important Order,—containing plants of various, and, in some instances, of remarkably dissimilar aspect and properties;—such as the Nettle and the Mulberry—the bitter Hop and the luscious Fig—the nutritious Breadfruit (Artocarpus incisa, L. f.) and the deadly Upas (Antiaris toxicaria, Leschen.). The celebrated Cow-tree or Palo de Vaca (Brosimum Galactodendron, Don.), of South America,—"which yields a copious supply of rich and wholesome milk,"—belongs to this Order; as also does the yellow-dye wood, called Fustic (Mactura tinctoria, Don.), and the wide-spreading Banyan-tree (Ficus religiosa, L.), of India. A species of Ficus (F. elastica, Roxb.) also yields Caoutchouc or Gum elastic.

SUB-ORDER II. MOREAE. Gaudich. A. Gray.

Trees, or shrubs—very rarely herbs—with a milky juice. Staminate and pistillate flowers either in separate aments or spikes, or often intermixed—and sometimes included in the same hollow receptacle (as in the Fig),—the calyx becoming succulent and forming a compound fruit. Seeds albuminous.

181. MORUS. Tournef. Endl. Gen. 1856.

[Greek, Morea, the Mulberry: or Celtic, Mor, black,-in allusion to the fruit.]

Flowers mostly monoicous, in cylindric spikes. Staminate Flowing loss ament-like spikes. Calyx 4-parted,—the segments ovate. Stamens 4, opposite the calyx-segments; anthers introrse. Ovary an abortive rudiment. Pistillate Flowing dense spikes. Calyx 4-parted,—the segments ovate, concave, opposite—the outer pair larger. Ovary sessile, ovoid, 2-celled; ovules solitary; stigmas 2, terminal, filiform, villous on the inner side. Akene membranaceous or somewhat fleshy, by abortion 1-celled, 1-seeded, inclosed in the persistent calyx, which finally becomes succulent and berry-like. Seed pendulous.

1. M. RUBRA, L. Leaves cordate-ovate and acuminate, or sometimes 2 or 3-lobed, serrate, scabrous above, pubescent beneath; spikes often androgynous; fruit dark purple. Willd. Sp. Pl. 4. p. 369. Fl. Cestr. p. 524. Icon, Mx. Sylva, 3. tab. 116.

RED MORUS. Vulgò-Red Mulberry.

Stem usually 15 to 25 feet high, and 9 to 18 inches in diameter (in some instances considerably taller and larger), with numerous spreading branches at summit. Leaves 4 to 6 or 8 inches long, more or less cordate (on young plants often 2 or 3-lobed, and very scabrous above), dentate-servate, with an entire acumination, deep green and roughish on the upper surface—softly and, while young, somewhat hoary-pubescent beneath, especially along the nerves; petioles 1 to 2 or 3 inches long, with linear membranaceous caducous stipules at base. Flowers greenish, small, numerous, in axillary peduneulate ament-like spikes,—sometimes dioicous—and not unfrequently the spikes are androgynous. Staminate spikes 1 to near 2 inches long. Pistillate spikes more densely flowered, cylindric, about an inch long,—the calyx of the florets becoming thick and fleshy, forming an oblong terete compound berry, which is juicy, dark purple, and pleasantly esculent when mature. Pedancle of the berry about half an inch long. Rich woodlands; fencerows, &c: throughout the U. States. Fl. May. Fr. June--July,

- Obs. The wood of this small tree is exceedingly durable, and highly valued for making posts, &c. The leaves have been successfully used for feeding silk-worms; but the product is said to be not so fine as that afforded by the White Mulberry. The fruit is more admired than that of any other species.
- 2. M. ALBA, L. Leaves obliquely cordate-ovate, and somewhat lobed, acute or sub-acuminate, serrate, smoothish and shining; fruit mostly yellowish-white. Willd. Sp. Pl. 4. p. 368. Fl. Cestr. p. 524.

WHITE Morus. Vulgò-White Mulberry.

Fr. Murier blanc. Germ. Weisse Maulbeere. Span. Morera.

Stem 10 to 20 or 25 feet high, and 8 to 12 or 15 inches in diameter, much branched at summit. Leaves 2 to 4 inches long (sometimes—especially in young plants—2 or 3 times that size), unequally crenate-serrate, often partially lobed, smoothish, shining and yellowish-green; petioles half an unch to an inch long, with lance-linear stipules at base. Pistillate spikes shorter and smaller than in the preceding. Fruit pale yellow or straw-color, when mature—rarely dark purple, or nearly black. About houses; fence-rows, &c.: introduced. Native of China, Persia, &c. Fl. May. Fr. June—July.

Obs. This species was introduced into Pennsylvania, nearly a century since, with a view to the feeding of Silk-worms, and the production of Silk. The silk-culture, however, was soon abandoned, -for, in that early stage of the Colony, the sparsely settled Agriculturists found it more important to multiply mammiferous animals, rather than Insects: But the tree became partially naturalized,and is still frequently to be met with, in Chester County. About ten years ago, a variety of the White Mulberry—of smaller stature, and much larger leaves, (well known by the name of Morus multicaulis)—was introduced, as being still better adapted to the feeding of Silk-worms; and soon afterwards, a scene of speculation and infatuation was exhibited, throughout the U. States, which bade defiance to all the suggestions of reason and common sense. There was a sort Multicaulis monomania (or Moro-mania!)—so universal, and engrossing, that it became absolutely ludicrous; and was scarcely exceeded in absurdity, by the nearly contemporaneous epidemic, which afflicted the nation, in reference to its financial concerns. Almost every body was eagerly engaged in cultivating myriads of trees, to sell,—without stopping to enquire where they could be sold, or who would be likely to buy! At some future day-and under different circumstances,—it is quite probable that a portion of our population will find the Silk-culture an eligible business, and the Morus multicaulis a valuable little tree.

182. MACLURA. Nutt. Endl. Gen. 1857. [Named in honor of William Maclure, -- a munificent Patron of Natural Science.] FLOWERS dioicous. STAMINATE FL. racemose. Calyx 4-parted, the segments ovate. Stamens 4, opposite the calyx-segments. Pistil-LATE FL. capitate, densely crowded, and coalesced, on a globose fleshy receptacle. Sepals 4, in opposite pairs, oblong, cucullateconcave, fleshy,—the exterior ones larger. Ovary sessile, lenticular-compressed, 1-celled; ovule single, affixed to the middle of the parietes; style terminal, bifid,—one branch elongated and much exserted, stigmatose on the inner side—the other branch small or abortive. Akenes severally embraced by the fleshy sepals, which are all coalesced into a large compound globose lactescent Berry, with a glabrous, but uneven, verrucose or irregularly tessellated surface.

1. M. AURANTIACA, Nutt. Branches spinose; leaves alternate, lance-ovate, acuminate, entire, sub-cordate at base, glabrous and shining above, roughish-puberulent beneath; berry subsessile, axillary, solitary. Nutt. Am. Genera, 2. p. 234.

Orange-Like Maclura. Vulgo-Osage Orange.

Stem 15 to 25 or 30 feet high, and 10 to 15 inches, or more, in diameter, with a much-branched bushy top,—the branches virgate, but often inclined to droop or curve d wnwards, armed with small and very sharp spines. Leaves 4 to 6 or 8 inches long, subcoriaceous, mucronate by the extended midrib; petioles 1 to 2 inches long; stipules oblong, somewhat cucullate, caducous. Pistillate flowers coalesced in a solid globose head, which is 2 to near 3 inches in diameter, when fully grown; styles near an inch long, villous and finally purplish,—the abortive branch, so called, probably an abortive style, and indicative of an abortive second cell in the ovary. South Western States. Fl May—June. Fr. Sept.—October.

Obs. The roots of this are of a bright orange color. has some resemblance to that of the Mulberry tree, and is probably durable. It is said to be used for Bows, by the aboriginal hunters and warriors. The young plants, properly managed, promise to make a very effective *hedge*,—of which I have seen a good sample, at the seat of the late Reuben Haines, Esq. at Germantown, near Philadelphia.

183. BROUSSONETIA. Vent. Endl. Gen. 1858. [Dedicated to P. N. V. Broussonet, a French Naturalist.]

Flowers dioicous. Staminate Fl. in an ament-like spike, bracteate. Calyx 4-parted,—the segments ovate, acuminate. Stamens 4, opposite the calyx-segments. Pistillate, Fl. capitate, densely crowded on a globose receptacle, and mixed with hairy scales (abortive florets). Calyx urceolate, 3 or 4-toothed. Ovary ovoid, 1-celled, obliquely seated on a clavate finally elongated pedicel or stipe (gynophore); ovule single, parietal; style filiform, excentric, stigmatose on one side. Akene softly fleshy, elevated on the baccate pedicel (gynophore), which is surrounded at base by the calyx. Seed pendulous.

1. B. PAPYRIFERA, Vent. Leaves scabrous above, pubescent beneath,—those on the young branches lobed, on the older ones mostly undivided, roundish-ovate or subcordate, acuminate, serrate. Willd. Sp. Pl. 4. p. 743.

PAPER-PRODUCING BROUSSONETIA. Vulgò-Paper Mulberry.

Stem 15 to 20 or 25 feet high, and 8 to 12 or 15 inches in diameter, with spreading branches,—the branches coated with a remarkably tough bark. Leaves 3 to 6 or 8 inches long; petioles 1 to 3 inches long. Staminate spikes about 2 inches long, resembling loose aments. Pistillate flowers in a dense carriate cluster. About houses: introduced. Native of Japan, and the South Sea Islands. Fl. May. Fr.

Obs. This tree was introduced into Pennsylvania, some 50 or 60 years since, as a shade tree; but it is inferior to many others in beauty,—and is now rarely planted for that purpose. The roots are soprolific in suckers, as to be quite a nuisance, about yards and gardens,—almost as bad as Ailanthus. I have seen only the staminate plant, growing in this country.

184. FICUS. Tournef. Endl. Gen. 1859. [An ancient name,—of obscure derivation.]

Receptacle pyriform or subglobose, fleshy, concealing the florets in a central cavity,—the orifice, at apex, closed by small scales. Florets numerous, very minute, pedicellate, crowded on the internal surface of the receptacle, dioicous, or the upper ones staminate and the others pistillate. Staminate Fl. Calyx 3-parted. Stamens 3, opposite the calyx-segments; anthers incumbent, 2-celled. Pistillate Fl. Calyx 5-cleft,—the tube decurrent on the pedicel. Ovary seated somewhat laterally on a short stipe (gynophore), 1-celled; style lateral, continuous with the gynophore, filiform; stigma bifid. Fruit-bearing receptacle succulent,—the cavity lined with minute dry membranaceous utricles, which are severally surrounded by the vestiges of the calyx. Seed parietal, uncinate; testa hard, fragile.

1. F. Carica, L. Leaves cordate at base, 3 to 5-lobed, repanddentate, lohes obtuse, scabrons above, pubescent beneath; receptacles pyriform, glabrous. Willd. Sp. Pl. 4. p. 1131. Carian Ficus. Vulgò—Fig-tree.

Fr. Le Figuier. Germ. Der Feigenbaum. Span. Higuèra.

Stem 6 to 10 or 12 feet high,—a stout branching shrub, with an aerid milky juice. Leaves 6 to 9 inches long, deeply 3-lobed with 2 shorter side-lobes; petioles 3 to 5

or 6 inches long, with large convolute stipules at base. Receptacles axillary, turbinate or pear-shaped, about an inch in diameter. Cultivated. Native of Caria, in Asia. Fl. July. Fr.

Obs. This shrub requires the shelter of a green-house, in the middle and northern States,—where it produces freely: And although I do not learn that it has yet been much attended to, in our southern States, I think it would probably succeed well, in the open air, in that region. The inflorescence, or position of the flowers, of the Fig—(concealed within the body of what is commonly regarded as the fruit,) is very remarkable;—being just the reverse of that of the Strawberry,—in which the minute pistils are scattered over the exterior of the enlarging succulent receptacle.

SUB-ORDER III. URTICEAE. Juss. A. Gray.

Herbs (shrubs, or trees, within the tropics,) with a waterv juice, often armed with stinging hairs. Flowers mostly loose, spicate or paniculate. Akene usually surrounded by the dry membranaceous calyx. Embryo straight, in fleshy albumen.

185. URTICA. Tournef. Endl. Gen. 1879.

[Latin, uro, to burn, and tactus, touch; from the sensation produced by touching it.]

Flowers monoicous or dioicous. Staminate Fl. Calyx regular, 4 or 5-parted,—the segments valvate in aestivation. Stamens as many as the calyx-segments, and opposite them; anthers elliptical, incumbent. Pistillate Fl. Sepals 4, in opposite pairs,—the outer pair smaller, sometimes abortive—the inner pair persistent, sometimes baceate. Ovary free, 1-celled; ovule single, erect from the base of the cell; stigma sessile, subcapitate, villous, penicillate, or filiform and elongated. Akene oblong, somewhat compressed, smooth or tuberculate, naked or inclosed by the baceate sepals. Seed erect; testa connate with the epicarp.

1. U. DIOICA, L. Hispid and stinging; leaves opposite, ovatelanceolate, conspicuously acuminate, cordate at base, coarsely and acutely serrate; flowers mostly dioicous, in clustered paniculate spikes longer than the petioles. Willd. Sp. Pl. 4. p. 352. Fl. Cestr.

p. 523. Icon, Fl. Lond. 4.

Didicous Urtica. $Vulg\dot{o}$ —Nettle. Stinging Nettle. F_r . Grande Ortie. Germ. Die Brennessel. Span. Ortiga.

Root perennial. Stem 2 to 3 feet high, obtusely 4-angled, branching, very hispid. Leaves 2 or 3 to 5 inches in length; petioles half an inch to 2 inches long, hirsute; stipules linear-lanceolate. Flowers small, in interrupted clusters, on slender axillary branching hispid spikes. About houses; waste places, &c.: introduced. Native of Europe and Asia. Fl. June—Aug Fr. Aug.—September.

Obs. A naturalized weed,—well known to all who have ever come in contact with it. When permitted to flourish about dwellings (which, of course, can only happen where slovens or sluggards reside), it becomes a vile nuisance. There is a native species (U. Canadensis, L.), which is a homely and somewhat stinging weed; but it does not incline to intrude much upon farm lands. There is also a smooth little annual species (U. pumila, L.)—with a succulent and almost translucent stem—which is very common in rich shaded spots, about houses; yet, though entirely worthless, it scarcely rises to the importance of a pernicious weed.

SUB-ORDER IV. CANNABINEAE. Blume. A. Gray. Herbs, erect and annual—or twining and perennial—with a watery juice. Flowers dioicous,—the staminate ones racemose or paniculate—the pistillate ones glomerate, or imbricated with bracts and forming a strobile-like ament. Embryo curved; albumen none.

186. CANNABIS. Tournef. Endl. Gen. 1890. [An ancient Greek name,—of obscure etymology.]

STAMINATE FL. racemose. Sepals 5, nearly equal, imbricated in aestivation. Stamens 5, opposite the sepals; anthers terminal, large, oblong, pendulous. PISTILLATE FL. spicate-glomerate, with single bracts. Calyx urceolate, membranaceous. Ovary subglobose, 1-celled; ovule single, pendulous; style terminal, short; stigmas 2, elongated, filiform, pubescent. Nut (or caryopsis) 1-celled, 2-valved, indehiscent. Seed pendulous; cotyledons incumbent, convex on the back.

1. C. Sativa, L. Leaves digitate, petiolate; leaflets 5 to 7, lanceolate, serrate. Willd. Sp. Pl. 4. p. 768. Fl. Cestr. p. 564.

CULTIVATED CANNABIS. Vulgò—Hemp. Fr. Le Chanvre. Germ. Der Hanf. Span. Cañamo.

Root annual. Stem 5 to 8 or 10 feet high, obtusely angular and sulcate, scabrous-Root annual. Stem 5 to 8 or 10 feet high, obtusely angular and sulcate, scabrous-pubescent, often branched. Leaves mostly opposite (the upper ones often alternate); lea flets usually 5—sometimes 7—3 to 5 inches long (the outside or lateral ones much smaller than the others, and often entire—especially on the staminate plant); common petioles 1 to 2 or 3 inches long; stipules lanceolate. Staminate flowers greenish, in loose pedunculate axillary clusters, rather crowded in a kind of dense panicle at summit. Pistillate flowers axillary, sessile, mostly in pairs. Calyx subglobose, acuminate, pubescent, green, slit on one side. Stigmas long, slender, densely pubescent, somewhat tawny. Nut ovoid, slightly compressed, smooth, greenish, reticulated with whitish veins, inclosed in the persistent calyx. Cultivated Native of Persia. Fl. June. Fr. August.

Obs. This plant—so important in Commerce and the Arts—is cultivated on a large scale, in Kentucky, and some others of the fertile western States; but only to a limited extent, in the middle and northern States.

187. HUMULUS. L. Endl. Gen. 1891.

[Latin, Humus, moist earth, or mould; in allusion to its place of growth.] STAMINATE FL. racemose or paniculate. Sepals 5, equal, imbricated in aestivation. Stamens 5, opposite the sepals; anthers terminal, large, oblong, erect. PISTILLATE FL. amentaceous or strobile-like, bracteate; bracts foliaceous, imbricated in several rows, 2-flowered,—each floret sessile at the base of a scale-like membranaceous enlarging involucre, and embraced by its involute or folded Calyx urceolate, obliquely truncate, obsoletely denticulate. Ovary ovoid, slightly compressed, 1-celled; ovule single, pendulous; stigmas 2, terminal, elongated, subulate, pubescent. Strobile membranaceous, formed of the enlarged imbricated bracts and scales. Nuts roundish-ovoid, inclosed in the persistent truncate calyx. Seed pendulous; cotyledons linear, spirally involute. 1. H. Lupulus, L. Leaves mostly 3-lobed, cordate at base, petio-

late, scabrous. Willd. Sp. Pl. 4. p. 769. Fl. Cestr. p. 563.

Vulgò-Hop. Hop-vine.

Fr. Houblon. Germ. Der Hopfen. Span. Hoblon.

Root perennial, branching. Stem 10 to 15 or 20 feet long, several from the same root (or thizoma), slender, volubile (twining constantly with the sun, or East-South-West), somewhat angular and mostly twisted, retrorsely aculeate, with slender branches above. Leaves 3 to 5 inches long, generally opposite—the upper slender branches above. Leaves 3 to 5 inches long, generally opposite—the upper ones often alternate and not lobed,—all very scabrous on the upper surface; petioles 1 to 2 or 3 inches long; stipules ovate-lanceolate, connate below, free at summit. Staminate flowers in oblong panicles. Pistillate flowers in pendulous ovoid-oblong bracteate strobiles, or aments, which are proverbially numerous and crowded ("as thick as hops"), 1 to 2 inches long at maturity; bracts orbicular or broadly-ovate, with a short abrupt acumination,—the intervening scales (or involucres of the florets) membranaceous, ovate-oblong, rather obtuse, nearly as long as the bracts, and thickly sprinkled, at base, with orange-colored resinous atoms, which are highly bitter and aromatic—containing, in fact, the Lupulin or essence of the hop. Cultivated,—but indigenous in most parts of the U. States. Fl. July. Fr. September.

Obs. The value of the Cones, or Aments, of the pistillate plant, is well known to every house-keeper; and it is cultivated for culinary purposes, in almost every garden. The medicinal virtues of the cones are also very considerable. The hops, for the Breweries, are cultivated on a large scale, in some districts of the northern and middle States-particularly in Western New York,-where, it is said, they are a profitable crop. The staminate plant is of so little account, that it is scarcely known—except to the Botanists.

GYMNOSPERMOUS EXOGENS.

ORDER CXXXII. CONIFERAE. Juss.

Trees, or shrubs, abounding in resinous juice. Leaves mostly evergreen, scattered or fascicled, usually rigid and needle-shaped or linear, entire. Flowers monoicous or dioicous, commonly amentaceous. Staminate flowers consisting of one or more (often monadelphous) stamens, destitute of calyx and corolla, and arranged on a common rachis so as to form a kind of loose Ament. Pistillate flowers in Cones of various structure and character. Seeds albuminous.

A valuable and very interesting Order, of peculiar Botanical character,—comprising some of the most magnificent trees known, * and yielding various balsams, resins, and resinous fluids, of great importance. The celebrated "Cedar of Lebanon" is Pinus Cedrus, L. belonging to the Sub-genus Lariz, or Larch extinus of the Pines

Larch section of the Pines.

SUB-ORDER I. ABIETINEAE. Richard. A. Gray.

Fertile aments formed of imbricated scales,—which are the flat and open carpels, and bear a pair of ovules adherent to their base, with the foramen (or micropyle) turned downwards. Scales subtended by bracts. Fruit a strobile or cone. Integument of the seed (testa) coriaceous or woody, more or less firmly adherent to the scale. Embryo in the axis of fleshy and oily albumen, with 2 to 15 cotyledons!

188. PINUS. L. Endl. Gen. 1795.

[Supposed from the Celtic, Pin, or Pen, a rocky mountain,—often its place of growth.]

Flowers monoicous. Staminate Aments solitary or spicate. Stamens numerous, inserted on the axis; anthers subsessile, 2-celled, covered at apex by the dilated scale-like connective. Fertile AMENTS solitary or clustered. Scales (or open flat carpels) imbricated, each mostly subtended by an adnate bract. Ovules in pairs, at the base of the scales, collateral, inverted. Strobile formed of woody scales, with a cavity at the base of each scale, containing the seeds. Seeds nut-like; testa woody or coriaceous, with the base, on one side, produced into a membranaceous wing.

^{*}Some of the Pines, on or near the West Coast of America, are represented as being from 200 to 300 feet in height,—and upwards of 50 feet in circumference, near the base.

SUB-GENUS OR §. 1. PINUS. Link. THE PINES PROPER.

LEAVES sempervirent. fasciculate (from the suppression or non-development of the branches).—the fascicles bound with a scarious sheath, at base. Bracts of the fertile aments evanescent. Strobile conical, with the scales thickened and angular at summit, often mucronate near the apex, excavated at base. Wing of the seed deciduous.

1. P. VARIABILIS, Lambert. Leaves fasciculate in twos or threes, elongated, slender, channelled; strobiles ovoid-conic, rather small, subsolitary,—the scales armed with small incurved spines. Willd. Sp. Pl. 4. p. 498.

P. mitis. Mx. Sylva, 3. p. 120. Icon, tab. 3.

VARIABLE PINUS. Vulgà—Yellow Pine (of the North).

Stem 40 to 60 or 80 feet high, and 1 to 2 feet, or more, in diameter, with the bark in rather broad flat scales. Leaves 3 to 5 inches long, slender, linear, dark green, mostly in pairs (sometimes in threes, on young branches). Strobiles (or cones) 2 to 3 inches long. New England to Georgia; abundant in New Jersey. Fl. May. Fl.

Obs. This tree affords valuable lumber,—and is much employed in the construction of houses, and merchant vessels: but it is much inferior in quality to the P. palustris, L. or Yellow Pine of the South.

2. P. PALUSTRIS, L. Leaves fasciculate in threes, very long; stipules pinnatifid, portions of them persistent; strobiles elongated, conoid,—the scales armed with small recurved spines. Willd. Sp. Pl. 4. p. P. australis. Mx. Sylva, 3. p. 133. Icon, tab. 6. [499.

MARSH PINUS. Vulgò—Yellow Pine (of the South). Long-leaved Pine.

Stem 80 to 100 feet high, and 2 to 3 or 4 feet in diameter, with a smoothish bark.—the branches rough with the persistent remains of the stipules (stipules ramentaceous). Leaves 9 to 15 inches long. Strobiles 6 to 9 inches long. Sandy soils: Virginia to Florida. Fl. April. Fr. Ang.—Sept.

Obs. This is a most important and valuable species. It yields the firmest and most durable lumber, for house and ship building, of any of the genus. The superior "heart pine" boards, for flooring, &c. and the string pieces for rail-roads (where a wooden superstructure is used), are furnished by this tree. "From the sap of the living tree," says Mr. Elliott, "most of the Turpentine of commerce is obtained." Tar is procured by charring the wood and roots of this, and other species, by a smothered fire, which melts the turpentine and mixes it with the sap and juices of the wood. Pitch is the inspissated residuum, left by boiling Tar until the watery portion is driven off. The ground, where this tree prevails, becomes thickly covered by the long leaves—which the Southern people call straw.

3. P. Strobus, L. Leaves fasciculate in fives, scarcely sheathed at base, long and slender; strobiles oblong, subcylindric, pendulous,—the scales unarmed, and loosely imbricated. Willd. Sp. Pl. 4. p. 501. Fl. Cestr. p. 549. Icon, Mx. Sylva, 3. tab. 10.

Vulgò-White Pine. Weymouth Pine. New England Pine.

Stem 60 or 80 to 120 feet or more in height, and 2 to 4 or 5 feet in diameter straight and with a smooth bark—especially while young; branches verticillate, slender, rather few and those near the summit when the trees are crowded. Leaves 3 to 5 or 6 inches long, linear, bluish or glaucous-green. Strobile 3 to 5 inches long, somewhat curved; scales cuneate-obovate, slightly thickened at apex. Rich soils: bottom lands, along streams, &c.: Canada to Virginia. Fl. May. Fr. Aug.—Sept.

Obs. This is also a most valuable tree,—furnishing an immense amount of lumber, in the form of boards and scantling, - and, of late years -since the Cypress has become somewhat scarce and dear-it is extensively wrought into shingles. Being fine-grained, and comparatively free from turpentine, the White Pine is much used for the interior wood-work of houses—except floors,—for which purpose it is rather soft. There are several other species, belonging to this section, - such as P. inops, Ait. or Jersey Pine-with the leaves short and in pairs, and the scales armed with straight subulate spines: P. rigida, Marsh. or Pitch Pine—with the leaves in threes, and the scales with stout reflexed spines: &c. But, as the three here described are decidedly the most important, the others are omitted.

SUB-GENUS OR §. 3. ABIES. Tournef. THE FIRS.

Leaves sempervirent, solitary, scattered or distichous.* Bracts of the fertile aments persistent. Strobble oblong, with the scales somewhat woody, thin and rounded at apex, not excavated at base. Wing of the seed persistent.

4. P. Canadensis, L. Leaves somewhat distichous, flat, minutely denticulate; strobiles elliptic-ovoid, terminal, small. Willd. Sp. Pl. 4. p. 505. Fl. Cestr. p. 548.

Abies Canadensis. Mx. Sylva, 3. p. 185. Icon, tab. 13.

CANADIAN PINUS. Vulgò—Hemlock. Hemlock-Spruce.

Stem 40 to 60 or 70 feet high, and 1 to 2 or 3 feet in diameter, but tapering rapstem 40 to 60 or 70 feet high, and 1 to 2 or 3 feet in diameter, but tapering rapidly near the top,—with long horizontal, or often rather depending branches, which are slender and flaccid, while young. Leaves half an inch to three quarters in length, shining green above, bluish-glaucous heneath. Staminate flowers in small roundish-ovoid pedunculate aments, which are racemosely arranged around, and near the ends, of the slender branches. Strobiles terminal, somewhat pendulous, about an inch long, bluish-glaucous when young, finally pale brown or ferruginous; scales obovate, concave, with the apex rounded, thin and entire. Mountains; and rocky banks, along streams: throughout the U. States. Fl. May. Fr. Aug—Sept.

Obs. This tree is so generally diffused throughout Northern America, that it has been adopted, as emblematic, in Vignettes on Maps, and other devices, having reference to the country. It does not, however, afford a very valuable timber,-though frequently sawed into scantling, and other lumber. The bark is much used, in the

*The Buds of the Firs contain the undeveloped branches of the succeeding year, with all their tiny leaves completely formed, and closely packed together. The process of growth elongates the branches, and consequently increases the distance between the leaves. Something like this, seems to be the fact in all trees, in which the branches have a defin te annual growth; such as the Horse-Chesnut, &c. where the buds contain the future leaves and flowers—perfect, though in miniature. The phenomenon is happily noticed by the Poet, Cowper:

- "The beauties of the wilderness are His,
 "That makes so gay the solitary place.
 "Where no eye sees them. And the fairer forms,
- "That cultivation glories in, are His.

- "He sets the bright procession on its way,
 "And marshals all the order of the year;
 "He marks the bounds which Winter may not pass,
 "And blunts his pointed fury; in its case,
 "Russet and rude, folds up the tender germ,
 "Uninjured, with inimitable art;
 "And ere one flowery season fades and dies.
- "And ere one flowery season fades and dies," Designs the blooming wonders of the next."

TASK, Book VI.

Northern States, in the process of tanning; and Marshall informs us, that the Aborigines used it to dye their splints, for baskets, of a red color.

In this section of Firs, there are some very ornamental evergreen trees,—with the branches beautifully symmetrical, and forming a conical top;—such as P. balsamea, L. the Balsam or Silver Fir, which yields the "Canadian Balsam;" P. nigra, Ait. the black or double Spruce, which gives the flavor to Spruce beer; and several others,—well worthy of culture, to adorn country residences; but scarcely of sufficient Agricultural importance to require a description, in this work.

SUB-GENUS OR §. 4. LARIX. Tournef: THE LARCHES.

LEAVES numerously fasciculate, needle-shaped, mostly annual, proceeding from subglobose buds which open only at apex.—the buds finally extending into branches laden with other buds. Bracts of the fertile aments colored, persistent. Strobile with the scales woody, thin at apex, excavated at base. Wing of the seed persistent.

5. P. MICROCARPA, Lambert. Leaves fasciculate, rather short, deciduous; strobiles roundish-ovoid, small, few-flowered; bracts elliptic, obtusely acuminate. Willd. Sp. Pl. 4. p. 502.

Larix Americana. Mx. Sylva, 3. p. 213. Icon, tab. 153.

SMALL-FRUITED PINUS. Vulgo-Red Larch. Tamarack.

Stem 80 to 100 feet high, and 2 or 3 feet in diameter (fide Michaux. f.), with a smooth bark. Leaves half an inch to an inch long, crowded into pencil-like fascicles by the abreviation of the axis or branchlet. Strobiles about three quarters of an inch long,—the scales orbicular, loosely imbricated. Mountains: Canada to Pennsylvania. Fl. May. Fr.

Obs. According to Michaux, this is often a large tree,—and the timber superior to that of "any species of Pine or Spruce." I have only met with the smaller specimens, to be seen on the mountains of Pennsylvania,—and cannot speak of it from my own observation. I have introduced it, here, chiefly as a sample of the Pines of this section. The "Cedar of Libanus" (P. Cedrus, L.) belongs here; but has perennial leaves.

SUB-ORDER II. CUPRESSINEAE. Richard. A. Gray.

Fertile aments of few scales crowded on a short axis. or sometimes more numerous and peltate, not bracteate; onless 1. 2, or numcrous, borne on the base of the scale, erect (the foramen towards its apex). Fruit either an indurated strobile,—or fleshy and with the scales coalesced, forming a kind of drupe. Integument of the seed (testa) membranaceous, woody, or bony. Cotyledons 2, or more. Anthers of several parallel cells, under the dilated peltate connective.

189. TAXODIUM. Richard. Endl. Gen. 1794.

[Taxus, the yew, and eidos, form,—the foliage having the habit of that plant.] Flowers monoicous, on the same branches. Staminate aments numerous, arranged in a terminal pyramidal spike or raceme. Stamens few, inserted towards the apex of the axis, which is naked at base; filaments short, thick, produced into a scale-like excentrically peltate connective; anthers with 2 to 5 cells, which are longitudinally 2-valved and seated beneath the lower margin of the connective. Fertile aments roundish-obovoid, sessile in pairs at the base of the staminate spike; scales numerous, inserted on the axis, imbricated, acute, recurved-spreading at apex. Ovules 2 at

the base of each scale, sessile, erect, perforate at summit. Strobile subglobose,—formed of angular subpeltate lignescent scales. Seeds erect from the base; testa woody, irregularly angular; embryo in the axis of scanty albumen; cotyledons 6 to 9, linear.

1. T. DISTICHUM, Rich. Leaves flat, pinnately distichous on short slender deciduous branches; staminate aments in terminal leafless paniculate racemes; strobiles globose,—the surface uneven.

Cupressus disticha. L. Willd. Sp. Pl. 4. p. 512. Mx. Sylva, 3. p. 197. Icon, tab. 151.

DISTICHOUS TAXODIUM. Vulgà-Cypress. Bald Cypress.

Stem 80 to 100 feet high, fastigiately branched at summit,—the trunk 2 to 4 feet, or more, in diameter—often abruptly and much enlarged at base; the creeping or spreading roots protruding a number of large conical hollow knobs above the surface of the ground. Leaves one third to halt an inch long, sublinear, acute, pinnately or distributely arranged on alternate slender herbaceous branches (which rather resemble common petioles), 1 to 2 or 3 inches in length; a number of leaves are also solitary, and scattered on the woody branches. Swamps, along large streams: Delaware to Louisiana. Fl. February—April. Fr. Sept.—October.

Obs. The wood of this noble and remarkable tree is soft, fine-grained, and exceedingly durable. For many years, it supplied the market with those valuable roofing materials, called "Cedar shingles;" but since these have become rather scarce and dear, they have been extensively superseded by shingles made of the White Pine (Pinus Strobus, L.),—which make a reasonably good substitute, at a much less price.

190. THUJA. Tournef. Endl. Gen. 1790.

[Greek, Thuo, to sacrifice; the wood having been used in that ceremony.]

Flowers monoicous, on different branches. Staminate aments terminal, ovoid, minute. Stamens numerous, naked, inserted on the axis; filaments excentrically peltate, loosely imbricated; anthers with 4 cells, longitudinally dehiscent and seated beneath the lower margin of the peltate connective. Fertile aments terminal, small, angularglobose, somewhat depressed; scales quadrifatiously imbricated, spreading. Ovules in pairs, at the base of the scales, sessile, erect, bottle-shaped, perforate at summit. Strobile formed of imbricated lignescent scales, which are recurved-mucronate near the apex,—at first closed, afterwards spreading. Seeds 2 under each scale, erect from the base; testa bony or membranaceous, produced on each side into a narrow wing; embryo in the axis of fleshy albumen; cotyledons 2, oblong.

- 1. T. SPHAEROIDALIS, * Rich. Young branches compressed; leaves minute, scale-like, ovate, quadrifariously imbricated, tuberculate at base; strobile depressed-globose, angular. *
- *My friend, Prof. A. Gray—who did me the favor to glance at some portions of the MS. of this work—suggests a doubt whether this is really a *Thuja*. Not having the means at hand to determine the question, I must content myself with noting the doubt.—and leave its solution for future inquirers. The tree seems, in fact (as remarked by Mr. EMERSON) to be intermediate—a sort of connecting link—between *Thuja* and *Cupressus*;—having "the scale-like imbricated leaves and fan-shaped branches of the former, and the lofty port and globular or many-sided fruit of the latter."

Cupressus thyoides. Willd. Sp. Pl. 4. p. 512. Mx. Sylva, 3. p. 207. Icon, tab. 152.

SPHAEROID THUJA. Vulgò-White Cedar.

Stem 60 to 80 feet high, and 1 to 2 feet in diameter, sparingly branched. Leaves evergreen, very small and crowded, appressed to the branches. Strobiles one third to half an inch in diameter. Swamps, in Pine forests: New England to Georgia. Fl. April—May. Fr. September.

Obs. This valuable tree is very abundant in certain spots in the Pine forests of New Jersey; and is apparently restricted to swamps or broad shallow pools, near the sources of streams, in that sandy region,—where the straight stems are exceedingly numerous and crowded—forming almost impenetrable dark groves, or clamps, of several acres. The wood is light, soft, and very durable. Shingles were formerly made, to a considerable extent, from the larger trees: but these are now chiefly wrought into domestic wares, by the Cedar Cooper. The smaller trees are used for fence rails,—for which purpose they are highly valued. There is, perhaps, no other woodland that will yield so much valuable timber per acre,—and no description of territory, in New Jersey, that will command half the price that can be obtained for good Cedar Swamp.

The other species of the genus, as now constituted, are the small trees, or shrubs, known by the name of Arbor Vitae,—which, though sometimes cultivated for ornament, scarcely come within the pur-

view of the present work. *

191. JUNIPERUS. L. Endl. Gen. 1789.

[Supposed from the Celtic, Interius, rough, or harsh; descriptive of the plant.] Flowers dioicous,—or rarely monoicous on distinct branches. Staminate aments axillary or subterminal, ovoid, very small. Stamens numerous, naked, inserted on all sides of the axis; filaments excentrically peltate, imbricated; anthers with cells in threes or sixes, longitudinally dehiscent, attached beneath the lower margin of the peltate connective. Fertile aments axillary, ovoid, imbricately bracteate at base. Involucre of 3 to 6 scales, coalesced at base, 1 to 3-ovuled. Ovules erect from the base of the involucre, bottle-shaped, perforate at summit. Fruit drupaceous, umbilicate at apex, squamose at base,—the involucre baccate. Seeds 1 to 3, erect, subtriquetrous; testa bony; embryo in the axis of fleshy albumen; cotyledons 2, oblong.

1. J. VIRGINIANA, L. Leaves on the young branches ovate, imbricated in 4 rows, shorter than the fruit,—on the older branches subulate, cuspidate and somewhat spreading. Willd. Sp. Pl. 4. p. 853. Fl. Cestr. p. 572. Icon, Mx. Sylva, 3. tab. 155.

VIRGINIAN JUNIPERUS. Vulgo-Cedar. Red Cedar.

Stem 30 to 50 feet high, and 9 to 18 inches in diameter at base, tapering, often with longitudinal obtuse ridges and intervening channels, sending off numerous horizontal or spreading branches. Leaves minute,—those on the young branches scarcely a line in length, ovate, acute, opposite and decussate, crowded, appressed and imbricated, covering the branches and making them 4-angled,—

^{*}Since the above was written. I learn from Prof. A. GRAY, that the Thuja oecidentalis, L. or Americ an Arbor vitae (which is the "White Cedar" of the Northern States), is regarded as a valuable tree—the most important of the genus—north of New Jersey.

those on the older branches 3 to 5 or 6 lines long, and cuspidate. Staminate aments ovoid-oblong, tawny-ferruginous, 2 or 3 lines in length. Fruit roundishovoid, about 2 lines in diameter, tuberculate with the points of the fleshy connate scales of the involucre, dark blue when mature, and covered with a bright bluish-glaucous bloom. Fence-rows; old fields, &c.: throughout the U. States. Fl. April. Fr. October.

Obs. The wood of this tree is fine-grained, very durable, and valuable for many purposes. The heart-wood (which is reddish,) of this, and a Bermudian species, or variety, is much used in the manufacture of black-lead pencils. The tree is said to be injurious to Thorn hedges, when permitted to grow in the immediate vicinity. The J. communis, L. or Juniper bush, was formerly kept in many gardens, for the sake of the drupaceous "berries,"—which are somewhat medicinal, and were also employed in the preparation of the liquor called Gin, or Geneva. The J. Sabina, L, or Savin, is another cultivated species-reputed medicinal, and sometimes to be met with; -but neither of them possesses much interest for the Farmer.

There is a third Sue-order of this family (Taxineae, Rich;), which contains (among others) the Taxus, or Yew tree—so intimately associated in our minds with Churches, and Church-yards: but it scarcely belongs to Agricultural Botany.

ENDOGENOUS OR MONOCOTYLEDONOUS PLANTS.

ORDER CXXXIV. PALMAE. L. Juss.

Chiefly trees, with unbranched cylindrical trunks. growing by a terminal bud.

Chiefly trees, with unbranched cylindrical trunks, growing by a terminal bud. Leares (or fronds) alternate, large, clustered, fan-shaped or pinnated, plicate in vernation. Flowers small, perfect or polygamous,—the stamens usually as many as the petals and sepals together. Fruit a drupe or berry. Seeds with cartilaginous albumen, often hollow,—the embryo placed in a small separate cavity. The plants of this noble Order (chiefly tropical) have been compared to Princes, by European Botanists; and it is certain they could not flourish among the sturdy Plebeians of our republican forests! Though but little known in the U. States, they are of incalculable value to the inhabitants of their native regions,—affording food drink condiments medicine cluthing and shelter—with the menaffording food, drink, condiments, medicine, clothing, and shelter-with the ntensils, and materials, for almost every economical purpose. Of the more important of these remarkable vegetables, may be mentioned, the Cocoa-nut tree (Cocos nucifera, L.)—which, of itself, supplies nearly all the wants of the people who repose under its shade; * the Date tree (Phoenix dactylifera, L.); and the Sago Palms (species of Sagus or Metroxylon). The plant which turnishes Rattans (the rations, retonos, or slender flexible branches of the Calamus Rotang, L.), also belongs to this Order.

TRIBE IV. CORYPHINAE. Martius.

Spathes numerous, incomplete. Ovary of 3 carpels, cohering inwardly; ovules solitary. Fruit baccate, 3- or 2-lobed, or (by abortion) simple.

SUB-TRIBE 1. SABALINAE. Martius.

Flabellifrond; i. c. the leaves (or fronds) plicate and expanding in the form and manner of a lady's fan.

*" Utilissima generi humano, omniaque ferè quae ad vitam sunt necessaria praebens," Kunth.

192. SABAL. Adans. Endl. Gen. 1758.

[A name employed by Adanson; of unknown, if of any, meaning.]

Flowers perfect, sessile on a branching spadix which is sheathed by numerous incomplete spathes, bracteate and bracteolate. Calyx cup-shaped, 3-parted. Corolla 3-petaled. Stamens 6, hypogynous; filaments nearly distinct, subulate; anthers cordate-ovoid. Ovaries 3,-at first distinct, soon coalescing; style trigonous; stigma capitate. Berry drupaceous, simple and globose, or deeply 2 or 3-lobed. Albumen uniform (not ruminated), horny.

1. S. Palmetto, Loddig. Stem arborescent; leaves plicate-palmate, the petiole unarmed; spathes doubled. Kunth, Enum. 3. p.

Chamaerops Palmetto. Mx. Sylva, 3. p. 1. Icon, tab. 101.

Vulg∂-Cabbage-tree. Tall Palmetto.

Stem 20 to 40 or 50 feet high, and 10 to 15 inches in diameter, cylindrical, unbranched, naked, with a tuit of large leaves at summit. Leaves (or fronds) 3 or 4 feet in length, broad, palmate and plicate like a fan; petioles (or stipes) 1 to 2 feet long, not aculeate. Flowers small, greenish, on branching spadices, or panicles, at the base of the leaves. Drupes, or berries, about the size of a pea, bluish-black when mature. Sea coast: Carolinas to Florida. Fl. June—July. Fr.

Obs. The wood of this elegant tree—though extremely porous is highly valued in the South, for sub-marine structures, such as wharves, &c. on account of its durability in salt water, and its exemption from the attacks of the ship-worm. The leaves are used, also, in the manufacture of hats, baskets, &c. The terminal bud, or cluster of undeveloped leaves-called "the cabbage"-affords a favorite vegetable dish, in the South: But Mr. Elliott remarks, "it is a wasteful luxury, -as the tree always perishes when deprived of this part of its foliage."—South Carolina has chosen this graceful plant as the emblem of the Commonwealth,—and hence she is often called "the Palmetto State."

ORDER CXXXV. ARACEAE. Juss. Schott.

Herbs, with a fleshy Cormus or rhizoma-occasionally shrubby or climbing plants within the tropics. Leaves sometimes divided or apparently compound, frequently with the veins more or less reticulated. Spadix (often naked at the extremity) usually surrounded by a spathe. Flowers commonly monoicous (occasionally perfect,) and sometimes destitute of envelopes. Ovary 1 to several-celled, with 1 or more ovules. Fruit a berry. Seeds mostly with fleshy albumen.

An Order containing a number of acrid plants; but those here given are the principal ones intitled to the notice of the American Agriculturist.

193. ARUM. L. [Arisaema. Mart. Endl. Gen. 1674.] [An ancient name,-of obscure etymology.]

Spathe convolute at base,—the limb cucullate or flattish. Spadix unisexual at base, with stamens or rudiments of stamens or pistils above (sometimes these entirely wanting),-the summit of the spadix exserted or included in the spathe, naked. Floral envelopes none. Anthers on distinct filaments, verticillate,—the cells opening by a pore or transverse fissure. Ovaries numerous, free; ovules 2 to 6, or rarely more numerous. Berry 1 or few-seeded. Seeds subglobose, albuminous.

1. A. TRIPHYLLUM, L. Leaves mostly in pairs, ternately divided, the segments elliptic-ovate or lanceolate, acuminate, entire, sessile; spadix clavate, obtuse, shorter than the spathe. Willd. Sp. Pl. 4. p. 480. (in part.) Fl. Cestr. p. 530.

Arisaema atrorubens. Blume. Kunth. Enum. 3. p. 17.

THREE-LEAVED ARUM. Vulgò-Indian Turnep.

Root perennial, consisting of numerous fibres proceeding from the base of an orbicular depressed rugose cornus, or subterranean stem. Aerial stem none. Leaves mostly 2 (sometimes solitary), ternate,—the leaflets or segments 2 or 3 to 6 or 8 inches long, smooth, green or often purplish, thin and membranaecous, or almost scarious, when dried; common petioles 9 to 18 inches long, inserted on the cornus, and embracing the central scape, at base. Scape 6 to 15 inches high, situate between the leaves—the base inclosed by the sheathing petioles. Spathe 3 to 5 inches long,—the lower half convolute—the upper half (or limb) a little dilated, flat, ovate-lanceolate, acuminate, and cucullately incurved, often variegated with dark-purple and yellowish stripes and spots. Spadia mostly unisexual, with the summit clavate, naked and smooth, much shorter than the spathe, but a little exserted from the convolute portion. Berries numerous, in a dense oblong cluster around the base of the spadix orange-red or scarlet when mature. Rich shaded grounds; throughout the U. States. Fl. May. Fr. Aug.—Sept.

Obs. I have retained the Linnaean name, of this plant, in accordance with the suggestion of my friend, Prof. A. Gray. The turneplike subterranean stem (designated by the name of Cormus), is highly acrid in its fresh or green state; but that quality is dissipated, in great measure, by boiling or drying. A kind of Sago has been obtained from it; and the recent tuber, grated and boiled in milk, is a popular medicine in coughs and pulmonary consumption.

A plant nearly allied to this, called "Tunyer"—(the Tallo or Tarro, of the New Zealanders, fide Kunth—Arum esculentum, L. or Colocasia esculenta, Schott.) is said to be cultivated, occasionally, in the gardens of the Southern States, for the sake of the cormus, or tuberous rhizoma,—which is used at the table as a substitute for the

potato, or yam.

194. SYMPLOCARPUS. Salisb. Endl. Gen. 1705. [Greek, Symploke. connexion. and Karpos, fruit,—descriptive of the plant.]

Spathe cucultately conch-shaped, acuminate. Spadix pedunculate, oval or subglobose, densely covered with perfect flowers. Sepals 4, persistent, becoming fleshy or baccate. Stamens 4, opposite the sepals; filaments linear, flattened, included; anthers 2-celled; cells parallel. Ovary 1-celled; ovule single; style 4-sided, tapering to a minute terminal stigma. Berries coalescing, 1-celled, 1-seeded. Seed destitute of albumen.

1. S. FOETIDUS, Salisb. Stemless; leaves cordate-oval, enlarging; spadix oval. Kunth, Enum. 3. p. 84. Fl. Cestr. p. 112.

FETID SYMPLOCARPUS. Vulgò—Swamp Cabbage. Skunk-weed.

Root perennial, in verticals of fleshy fibres from a thick truncate rhizoma. Aerial stem none. Leaves appearing after the spadix has flowered, at first orbicular-cordate, at length cordate-oval. becoming very large (often near 2 feet long, and a foot or more in width). entire, smooth; stipules expanding, ovate-oblong, acuminate, or often spatulate. Spathe subsessile, spotted with purplish-brown, green, and yellow, Spadix about an inch in diameter, on a short thick peduncle. Flowers compact, appearing tessellated. Sepals dark-brown, fleshy, cuneate, truncate, the apcx and margins inflected. Anthers slightly exserted. Style projecting a little above the sepals. Fruit fleshy, coalesced with the base of the persistent sepals, and imbedded in the surface of the receptacle. Seeds globose, about the size of a common garden pea. Wet, low grounds: Canada to Virginia. Fl. Feb.—March. Fr. Sept.

Obs. This plant—so readily known by its skunk-like odor, when wounded-is quite common in wet meadows, and other swampy low grounds, in the middle and northern States. It is a worthless weed, - and its bunches of large leaves are sufficiently unsightly to command the attention of the neat farmer.

195. ACORUS. L. Endl. Gen. 1708.

[Gr. a, privative, and kore, the pupil of the eye; a supposed remedy for sore eyes.] Spathe a kind of phyllodium, elongated, compressed,—being a continuation of the scape, and resembling the leaves. Spadix lateral, sessile, subcylindric, covered with sessile perfect flowers. Sepals 6, obovate-oblong, subcucullate, thickened at apex, persistent. Stamens 6, inserted on the base of the sepals; filaments linear, flattened; anthers reniform (1-celled, Kunth, 2-celled, Endl.) transversely dehiscent. Ovary trigonous, 3-celled; ovules numerous, pendulous; stigma sessile, minute. Fruit somewhat baccate, indehiscent. Seeds few, inverted, albuminous, nestling in a gelatinous matter; testa thin, closely adherent to the somewhat horny albumen.

1. A. Calamus, L. Scape ancipital, terminated by a long ensiform leaf-like spathe extending much above the lateral spadix. Kunth, Enum. 3. p. 87. Fl. Cestr. p. 226.

Reed Acorus. Vulgo-Calamus. Sweet Flag. Fr. Acore odorant. Germ. Der Kalamus. Span. Acoro Calamo.

Root perennial, in coarse verticillate fibres from a horizontal creeping pungently aromatic rhizoma. Aerial stem none. Leaves radical, ensiform-linear, 2 to 3 feet long, and half an inch to near an inch wide, smooth. Scape as long as the leaves and much resembling them, somewhat triangular below the spadix. Spadix 2 to 3 inches long, terete, tapering to an obtuse point. Sepal's greenish, cuneate-oblong, keeled, with scarious margins. Swainpy meadows; about springs, &c. introduced: Native of India. Fl. May—June. Fr. September.

Obs. This stranger has become naturalized in many places. The whole plant is warmly aromatic—especially the creeping rhizoma; and that subterraneous portion is deservedly popular for its medicinal virtues. I have seen some wet meadows, however, in which the plant had got possession to such an extent as to become something of a nuisance, - and a difficult one to get rid of. It would be well, therefore, in introducing it, to plant it only in circumscribed swamps.

ORDER CXXXVII. TYPHACEAE. Juss. DC.

Perennial marshy or aquatic Herbs. Stems without nodes. Leaves alternate, linear, entire. Spadix with a caducous spathe, or naked. Flowers monoicous,—sometimes arranged in contiguous cylindric spikes at the summit of a simple culm—sometimes in globose spadices at the ends of branches,—the staminate flowers above. Staminate Fl. Calyr none,—but, in its stead, simple hairs, or small membranaceous scales. Stamins numerous, proceeding immediately from the rachis,—often connate below in twos threes, or fours, and mixed with sterile branching filaments. Pistillate Fl. Calyr none,—but, in its place, subclavate bristles (abortive ovaries), or scales. Ovaries sessile or stipitate; ovule single, pendulous; style simple, continuous with the ovary; stigma unilateral, oblong. Fruit a sort of dry drupe, indehiscent, 1-seeded. Seed inverted; embryo in the axis of fleshy albumen. axis of fleshy albumen.

An order comprising but two genera (Typha and Sparganium),—and those of

little interest to the farmer.

196. TYPHA. Tournef. Endl. Gen. 1709. [Greek, Tiphos, a bog, or marsh; from its place of growth.]

Flowers monoicous, in two long dense cylindric spadices, or spikes,

cne above the other on the same culm. Staminate spike terminating the culm, contiguous to the pistillate one, and merely separated by a membranceous caducous spathe—or else somewhat remote, with a naked space between them. Stamens numerous,—the filaments mostly united in threes, and beset with hairs. Pistillate spike below the staminate one. Ovaries numerous, 1-celled, 1-ovuled,—at first sessile, finally stipitate, surrounded at base with numerous subclavate bristles (abortive ovaries); style simple; stigma unilateral, tongue-shaped. Fruit sub-drupaceous, very small.

1. T. LATIFOLIA, L. Leaves somewhat ensiform-linear, flat; staminate and pistillate spikes mostly contiguous. Kunth, Enum. 3. p. 90. Fl. Cestr. p. 519. Icon, Fl. Lond. 4. [Mace. Broad-Leaved Typha. Vulgò—Cat-tail. Coopers' Reed. Reed-

Fr. Masse d'eau. Germ. Die Rohrkolbe. Span. Espadaña.

Root (or rather rhizema) perennial, thick and creeping. Culm 4 or 5 feet high, simple, terete, smooth, solid with pith, leafy at base. Leaves about as long as the culm, and 1 third to 2 thirds of an inch wide, tapering at apex but obtuse, sheathing the culm at base. Staminate spike, or spadix, 6 or 8 inches long, and near an inch in diameter, yellowish-brown, with a sheathing membranaceous caducous spathe as long as the spike. Pistillate spike immediately below (and about as thick as) the staminate one, 4 to 6 inches long, greenish-brown,—sometimes in contact or continuous with the staminate spike—sometimes with a naked space of near half an inch between them. Pools, and swampy springs: throughout the U. States. Fl. June—July. Fr. September.

Obs. The leaves of this plant are (or formerly were) much used, by the Coopers, to secure the joints of casks, &c. from leaking. Poor people sometimes collect the fruit with its hairy involucels, from the mature spikes, for the purpose of filling beds; but it becomes exceedingly dusty and unpleasant, and is even unhealthy,—in every respect a miserable substitute for clean Oats chaff, or cut straw.

ORDER CXXXIX. ALISMACEAE. DC. R. Br.

Swampy herbs; mostly perennial,—the leaves and scapes usually arising from a creeping rhizoma. Leaves either linear, or with a dilated lamina which is ribbed or nerved, but the veinlets commonly reticulated. Flowers regular and often complete, perfect or monoicous, mostly in racemes or panicles. Sepals and Petals mostly 3. Stamens as many as both the sepals and petals,—Ovaries 3, 6, or many (rarely solitary), verticillate or crowded in a head, distinct or in some degree coalescing. Seeds solitary in each carpel or cell, straight or curved, destitute of albumen; testa coriaceous or membranaceous.

A small and unimportant order.

SUB-ORDER II. ALISMEAE. Richard.

Leaves with a dilated nerved lamina. Flowers complete—i. e. with genuine pesals. Embryo curved.

197. SAGITTARIA. L. Endl. Gen. 1042. [Latin, Sagitta, an arrow; from the prevailing form of the leaves.]

Flowers monoicous. Sepals 3, persistent. Petals 3, deciduous. Staminate Fl. above; stamens numerous. Pistillate Fl. Ovaries numerous, capitately crowded on a hemispherical receptacle, distinct, 1-celled, 1-ovuled; ovules erect. Carpels numerous, crowded in a head, distinct, laterally compressed, margined, indehiscent, 1-seeded. Seed curved; testa membranaceous.

1. S. SAGITTAEFOLIA, L. Leaves broad-ovate, mostly acute, deeply

sagittate at base; scape simple; bracts ovate-lanceolate, acuminate. Kunth, Enum. 3. p. 156. Fl. Cestr. p. 528.

Arrow-Leaved Sagittaria. Vulgò-Arrow-head.

Fr. Flechière commune. Germ. Das Pfeilkraut. Span. Saeta.

Root perennial producing oval fleshy tubers (or rhizomas) 1 to 2 or 3 inches in diameter. Leaves all radical, 3 or 4 to 8 or 10 inches long (including the lobes), and 1 or 2 to 6 inches wide, sagittate-lobed at base,—the lobes ovate-lanceolate, about as long as the lamina of the leaf; petioles 4 to 12 or 15 inches long. Scape 9 to 18 inches high, smooth. Flowers pedicellate, in numerous verticils of threes, the staminate ones above; pedicels one quarter to half an inch long, with membranaceous bracts at base. Petals white, orbicular. Pistillate flowers with ovaries forming depressed globose heads, which, in fruit, are one half to two thirds of an inch in diameter. Ditches, and swampy springs; throughout the U. States. Fl. July—August. Fr. Sept. October.

Obs. This plant frequently occurs in ditches and swampy places, and is of a size to attract the notice of the observing farmer. Hogs are fond of the tubers, - and when these animals have access to their place of growth, are apt to disfigure the ground very much, by rooting. Draining is the remedy for this, and for most other aquatic weeds.

The Alisma Plantago, L. or Water Plantain (belonging to a genus which represents the Order- and is the special type of this Sub-order), is frequent in wet places, - and at one time, made some noise among gossiping dealers in marvellous specifics, as a certain remedy for Hydrophobia: But it was soon forgotten,—and is now scarcely noticeable, even as a weed.

ORDER CXLVI. BROMELIACEAE. Juss. Lindl.

Herbs, or suffruticose plants (chiefly tropical), often stemless, with perennial roots, or rhizomas. Leaves mostly rigid, dry, and channelled, with a squamose or scurfy surface, sheathing at base. Flowers perfect, spicate, racemose, or paniculate, bracteate. Sepals 3. Petals 3. Stamens 6, or more. Ovary free, or admate to the calyx, 3-celled; style trigonous, simple or sometimes separable into 3; stigmas 3. Fruit 3-celled, baccate and indehiscent, or more frequently capsular and septicidally (or sometimes loculicidally) 3-valved. Seeds mostly numerous; testa coriaceous; embryo small, straight or curved, in the base of mealy albumen albumen.

The plant of chief interest, in this Order, is that which affords the delicious Pine-apple (Bromelia Ananas, L. or Ananassa sativa, Lindl.),—the fruit of which is formed by the consolidation or blending of the imperfect flowers, bracts, and receptacle, into one fleshy succulent mass, which is usually crowned with a terminal tuft of leaves.

198. TILLANDSIA. L. Endl. Gen. 1306. [Named in honor of Elias Tillands,—a Swedish Botanist.]

Calyx free from the ovary, unequally 3-parted, persistent,—the segments somewhat convolute. Corolla 3-cleft, tubular below, spreading above. Stamens 6, hypogynous,—the alternate ones mostly adhering to the petals; anthers incumbent. Ovary 3-celled; ovules several, at the central angle of the cells near the base, in a double series, ascending; style filiform or dilated at apex, straight or twisted. Capsule cartilaginous, cylindrical or ovoid, 3-celled, septicidally (?) 3-valved (loculicido-trivalvis, Endl.). Seeds several, erect from the base of the dissepiments, linear-clavate, stipitate,—the stipe invested with pappus-like hairs; embryo straight.

1. T. USNEOIDES, L. Stem filiform, flexuose, branching, pendulous;

leaves subulate-filiform; peduncles 1-flowered, short. Willd. Sp. Pl. 2. p. 14.

USNEA-LIKE TILLANDSIA. Vulgò-Long Moss.

Perennial, parasitic, taking root in the fissures of the bark of trees. Stem3 to 6 feet or more, in length, branched, pendulous in long tangled bunches from the limbs of old trees, very slender, terete, covered and somewhat roughened (as well as the leaves) with minute whitish membranaceous scales which are dotted in the centre,—the centre of the stem and leaves consisting of a black horny elastic thread. Leaves subterete, slender, acute. Flowers yellowish-green, Pursh (purple, Loudon. Eney), solitary, axillary, sessile, with 3 or 4 small leaves (or bracts) at base. Calyx and Corolla deeply parted,—the segments equal in length, lanceolate, membranaceous. Ovary oblong. Capsule nearly cylindrical, 2 or 3-celled. Seeds several in each cell, oblong, acute at each end, comose. Grows on the forest trees, in the low-land districts of the South. Fl. June—September. Fr.

Obs. This singular parasite extends as far north as the Dismal Swamp, in Virginia; but I have not had the pleasure of seeing it in its native forests. Mr. Elliott (from whose Sketch I have chiefly derived the above details,) says, "black cattle eat this plant in winter with avidity, and sometimes trees are felled, during a series of severe frosts, to place the moss within their reach. The moss, when dried, is beaten until the bark falls off, and the cartilaginous hair-like flexible stem used for stuffing mattresses, chairs, &c." The uses, here mentioned, seem to intitle the plant to a place in the present work.

ORDER CLI. SMILACEAE. R. Br.

Herbs or shrubby plants, often climbing, mostly perennial by a creeping rhizoma. Leaves alternate or verticillate, simple, entire, with the veins or veinlets reticulated. Flowers perfect or dioicous. Calyx free, mostly 6-parted, often corollalike. Stamens as many as the calyx-segments and opposite them, mostly adhering to them at base. Ovary mostly 3-celled,—the styles, or stigmas, as many as the cells. Fruit baccate, few- or many-secded. Seeds subglobose, affixed to the central angle of the cells; testa membranaceous, thin; embryo small, in dense or hard albumen.

A small Order, and of little importance—except as affording the Sarsaparilla of the shops,—a medicine of some repute, but of rather uncertain efficacy.

TRIBE II. CONVALLARIEAE. Endl. Styles connate.

199. SMILAX. Tournef. Endl. Gen. 1184. [Greek, Smile, a grater,—in reference to its harsh prickles.]

Flowers dioicous, in axillary pedunculate simple umbels. Calyx somewhat corolla-like, campanulate, deeply 6-parted,—or rather of 6 petaloid sepals in two series, the outer ones broader. Staminate Fl. Stamens 6; anthers linear, adnate to the filaments. Pistillate Fl. Ovary 3-celled; ovules solitary; stigmas 3, subsessile. Berry 1 to 3-celled, 1 to 3-seeded.

IF Stem suffruticose, perennial, prickly.

1. S. ROTUNDIFOLIA, L. Stem sub-terete; leaves orbicular-ovate, acuminate, subcordate at base; common peduncles scarcely longer than the petioles. Willd. Sp. Pl. 4. p. 779. Fl. Cestr. p. 566.

ROUND-LEAVED SMILAX. Vulgò-Green-brier. Rough Bind-weed.

Plant glabrous, yellowish-green. Stem 10 to 20 or 30 (sometimes 50) feet long, slender, flexuose, somewhat branched, armed with straight rigid prickles, and climbing by tendrils. Leaves 2 to 3 inches long, and often as wide as long;

petioles one third to three fourths of an inch long, striate, margined at base, giving out a simple filiform, but strong tendril, on each side, at the summit of the margin. Flowers greenish-yellow, in small globose axillary umbels. Berries dark blue, or bluish-black with a glaucous bloom, when mature. Moist thickets, and woodlands,—climbing bushes and trees: Canada to Carolina. Fl. June.

- Obs. This rugged shrubby vine is often abundant in moist low grounds,-forming almost impenetrable thickets; and is a great annoyance to the woodman, when employed in clearing out such places. It is not so difficult, however, to extirpate, as the following species.
- 2. S. CADUCA, L. Stem somewhat angular; leaves ovate, mucronate or subacuminate; common peduncles longer than the petioles. Willd. Sp. Pl. 4. p. 780. Fl. Cestr. p. 566.

CADUCOUS SMILAX. Vulgo-Green-brier.

Plant glabrous, yellowish-green, or often tinged with purple. Stem 3 or 4 to 8 or 10 feet long, slender, flexuose, simple or somewhat branched, prickly, subprocumbent or leaning, supporting itself by tendrils. Leaves about 2 inches in length, and nearly as wide as long, subglaucous beneath and often purplish; petioles about half an inch long, and furnished as in the preceding species. Flowers greenish-yellow, in small axillary umbels,—the common peduncle generally about twice as long as the petioles. Berries bluish-black when mature. Thickets, and neglected old fields: Canada to Virginia. Fl. May—June. Fr. October. October.

Obs. This is nearly allied to the preceding; but it is a smaller and less rugged plant, in this region,-yet more difficult to subdue. It is quite frequent in sterile old fields, on our slaty hills,—and always indicates a low state of agriculture. There are several other prickly species in the U. States-especially in the South; and some of them may be as annoying to the planter or farmer as these,-but I cannot speak of them from my own knowledge. We have an unarmed herbaceous species (S. herbacea, L.)-frequent along fencerows, and borders of thickets-which is chiefly remarkable for the carrion-like foetor of its flowers.

ORDER CLII, LILIACEAE. Juss. DC. Lindl.

Herbs, with the flower-stems springing from bulbs or tubers, or with fibrous or Herbs, with the flower-stems springing from bulbs or tubers, or with fibrous or fascicled roots. Leaves simple, entire, sub-linear, sheathing or clasping at base,—the radical ones crowded. Flowers regular, perfect. Calyx colored, mostly corolla-like, 6-parted, or of 6 distinct or slightly connected sepals,—often melliferous at base. Stamens usually 6; anthers introrse. Ovary free, 3-celled; styles united; stigma often 3-lobed. Fruit capsular, 3-celled, mostly loculicidally 3-valved,—sometimes baccate and indehiscent. Seeds several or numerous in each cell; testa either membranaceous, pale, and sometimes margined—or often crustaceous, brittle and black; embryo in the axis of fleshy albumen.

A large and very interesting Order—comprising nearly one hundred genera,—and many of them rivalling the Rosaceae, in beauty. The most important plants of this Order, not here described, are those which produce the Squill and Aloes, so well known for their medicinal properties—and the New Zealand Flax

so well known for their medicinal properties,—and the New Zealand Flax (Phormium tenax, Forst.), so valuable for the strength of its fibres.

SUB-ORDER IV. ASPHODELEAE. Endl.

Herbs. Root bulbous, fasciculate-fibrous, or tuberous. Calyx tubular, or of slightly connected sepals, regular and mostly corolla-like. Stamens 6, hypogynous or inserted on the calyx. Fruit capsular or baccate. Seeds globose or angular,—the testa crustaceous and black.

TRIBE I. HYACINTHEAE. Link. Endl.

Root bulbous. Calyx tubular, or 6-sepaled. Stamens inserted on the base of the sepals, rarely hypogynous. Fruit capsular.

200. ORNITHOGALUM. Link. Endl. Gen. 1132. [Greek, Ornis, ornithos, a bird, and gala, milk; an ancient whimsical name.] Calyx corolla-like, of 6 sepals slightly connected at base, spreading above the middle. Stamens 6, the filaments dilated at base, narrowed and subulate at apex. Ovary 3-celled; ovules several, in a double series. Capsule roundish, obtusely trigonous, 3-celled, loculicidally dehiscent at apex. Seeds often few in a cell, subglobose or angular; testa black, rugose.

1. O. UMEELLATUM, L. Bulb proliferous; leaves linear, channelled; peduncles corymbose, longer than the lanceolate bracts; sepals elliptic-lanceolate; filaments lance-subulate. Kunth, Enum. 4. p. 362. Fl. Cestr. p. 219. Icon, Fl. Lond. 2.

UMBELLATE ORNITHOGALUM. Vulgo-Ten o'clock.

Fr. Dame d'onze heures. Germ. Die Vogelmilch. Span. Ornitogalo.

Bulbs biennial? small, white. Leaves radical, numerous, 6 to 12 inches long, very smooth, green with a whitish longitudinal line. Scape 6 to 9 inches high, terete, smooth, corymbosely branched at summit,—the branches or peduncles alternate, 1 to 2 inches long, each with a membranaceous linear-lanceolate acuminate bract at base. Sepals white within, externally green with a white margin. Ovary somewhat trigonous-turbinate, often abortive. Pastures, and cultivated fields: introduced. Native of the old world. Fl. May—June. Fr. July.

Obs. This foreigner has escaped from the gardens, in many places,—and multiplies its bulbs so rapidly as to become a great nuisance, if neglected. The bulbs are exceedingly tenacious of life; and when once completely in possession of the soil, it is an almost hopeless task to attempt to extirpate them. The leaves generally die, however, in the early part of summer,—and, in good land, are replaced by the valuable grasses: so that this obnoxious little intruder is not quite so serious a pest as some others;—such, for example, as the Canada Thistle, or Ox-eye Daisy.

201. ALLIUM. L. Endl. Gen. 1137. [Supposed to be from the Celtic, All;—signifying hot or aerid.]

Calyx of 6 petaloid sepals, slightly connected at base, spreading or campanulate-connivent. Stamens 6, inserted on the base of the sepals, exserted or included; filaments subulate-filiform, more or less dilated below,—the inner or alternate ones often membranaceously dilated, trifid, or with a slender cusp or tooth at summit, on each side of the antheriferous one; anthers introrse. Ovary 3-celled or sometimes 1-celled by reason of imperfect dissepiments; style filiform; stigma simple or sometimes trifid. Capsule membranaceous, trigonous, or somewhat 3-lobed. Seeds few, roundish and angular; testa black, rugose or minutely granular-dotted. Herbs of a strong odor, with tunicated (biennial?) bulbs. Scapes naked, or with sheathing leaves below, solid or fistular. Leaves mostly narrow, channelled, semi-cylindric, or terete, often hollow, sometimes flat. Umbel terminal, embraced by a membranaceous 1 or 2-valved marcescent spathelike involucre,—sometimes bearing little bulbs. Flowers not articulated with the pedicels.

§. 1. PORRUM. Don. Leek Section.

Scape leafy below. Sepals campanulate-connivent,—the outer ones boat-shaped and keeled. The 3 inner stamens tricuspidate,—the lateral cusps longer than the middle antheriferous one.

1. A. SATIVUM, L. Scape terete, leafy to the middle; leaves lance-linear, somewhat channelled; spathe 1-valved, with a long acumination, caducous. Kunth, Enum. 4. p. 380. Fl. Cestr. p. 216.

CULTIVATED ALLIUM. Vulgò-English Garlic.

Fr. L'Ail. Germ. Der Lauch. Knoblauch. Span. Ajo.

Growing in bunches. Radical bulbs compound, consisting of small bulbous offsets, called cloves. Scape 1 to 2 feet high, smooth,—the lower half apparently leafy, by the extension of the sheaths. Leaves 9 to 15 inches long, distinhously arranged. Heads, or umbels, bearing numerous small ovoid-oblong bulbs,—each bulb with a membranous covering. Calyx pale purple. Gardens: cultivated. Native of Europe. Fl. July. Fr. September.

Obs. This species is so generally cultivated, as a domestic medicine, that it seemed to claim a place, here. I suppose it to be the plant so much esteemed by the "Garlic-eating Peasantry," of Spain.

* * Leaves terete, fistular.

2. A. VINEALE, L. Scape terete, slender, sparingly leafy to the middle; leaves terete, with a narrow channel on the upper side; spathe abruptly acuminate, caducous; stamens exserted. Kunth, Enum. 4. p. 382. Fl. Cestr. p. 215. [Garlic.

VINE (or VINEYARD) ALLIUM. Vulgò—Garlic. Field Garlic. Crow Fr. Ail des Vignes. Germ. Acker-Lauch. Wein-bergs-Lauch.

Bulbs small. Scape 2 to 3 feet high, very slender, with a few leaves below the middle. Leaves 8 to 12 or 15 inches long. Umbel globose, about an inch in diameter (smaller and densely capitate, when bearing bulbs,—the bulbs often vegetating while in the heads); pedicels of the flowers filiform, clavate. Calyx deep purple tinged with green. Pastures, and cultivated grounds: introduced. Native of Europe. Fl. June. Fr. August.

Obs. Tradition says, this species was introduced by the first Welsh immigrants to Pennsylvania, for the purpose of supplying an early pasture. It is now completely naturalized,—and was formerly so abundant, in some districts, as to be quite a nuisance. It not only imparted a disgusting flavor to milk, butter, &c. but, by its abundance among the wheat, seriously injured the flour,—and rendered the manufacture of it difficult. Our best farmers, however, have now nearly subdued it, by the improvement of their land, and a judicious rotation of crops.

† | Umbel mostly capsule-bearing. Leaves flat-rarely keeled or folded.

3. A. Porrum, L. Scape rising from the centre of a simple bulb, terete, leafy to the middle; leaves broad, somewhat channelled or folded, and keeled, acute; umbel globose; sepals with a rough keel; stamens a little exserted. Kunth, Enum. 4. p. 384.

Leek Allium. Vulgò—Leek. Garden Leek.

Fr. Porreau. Germ. Gemeiner Lauch. Span. Puèrro.

Bulb middle-sized. Scape 2 to 3 feet high, stout and solid. Leaves distichously arranged on the lower half of the scape, 6 to 12 inches long, and about an inch wide at base, with the margin sometimes ciliate. Spathe with a long acumination. Umbel globose, dense, rather large (2 inches or more in diameter); pedicels of the flowers clavate. Calyx pale violet-purple. Filaments white. Gardens: cultivated. Native of Europe. Fl. July. Fr. September.

Obs. This species—which is regarded as a sort of national Em-

blem, by the Welsh*—is occasionally cultivated as an ingredient in soups, &c. but I have rarely observed it in Pennsylvania.

§. 2. SCHOENOPRASUM. Don. Chives or Onion Section. Sepals stellately spreading,—the outer ones keeled. Filaments mostly simple, the inner ones sometimes dilated at base, or furnished with a tooth on each side. Spathe 2-valved, not acuminate. Bulbs cespitose.

IF Leaves terete, fistular.

4. A. Schoenoprasum, L. Scape naked or few-leaved at base, about as long as the subulate-filiform leaves; spathe 2-valved, about equal to the umbel; umbel subglobose, eapsule-bearing; stamens shorter than the calyx,—the filaments not toothed. Kunth, Enum. 4. p. 391. Fl. Cestr. p. 216.

RUSH-LEEK ALLIUM. Vulgo-Chives, or Cives.

Fr. Ciboulette. Germ. Der Schnittlauch. Span. Cebollino.

Growing in bunches. Bulbs small. Scape 6 to 9 inches high, smooth. Leaves erect, about as long as the scape. Umbel about an inch in diameter. Spathe of 2 ovate membranaceous nerved purplish valves. Calyx purple with a tinge of violet. Gardens: cultivated. Native of Europe. Fl. July. Fr. September.

- Obs. Cultivated as a culinary herb; and often used as a kind of medicinal food for young poultry.
- 5. A. Cepa, L. Scape naked, or leafy at base only, fistular, and ventricose below the middle, much longer than the leaves; leaves subterete, fistular, somewhat ventricose; umbel globose, usually capsule-bearing; stamens longer than the ealyx,—the alternate filaments obtusely toothed on each side, at base. Kunth, Enum. 4. p. Fl. Cestr. p. 216.

Vulgi-Onion. Garden Onion.

Fr. Oignon. Germ. Die Zwiebel. Span. Cebolla.

Bulb biennial? depressed or turnep-shaped, large (2 to 3 inches in horizontal Bulb biennial? depressed or turnep-shaped, large (2 to 3 mehes in horizontal diameter). Scape 2 to 3 feet high, terete, often an inch or more in diameter in in the most ventricose portion, smooth, glaucous. Leaves 6 inches to a foot or more in length. Umbel 2 to 3 inches in diameter,—the pedicels filtform. Spathe greenish-white. Sepals lance-oblong, white with a green keel. Outer stamenas about as long as the calyx, spreading,—the inner ones nearly twice as long, erect; filaments white,—the 3 inner ones much dilated at base, obscurely toothed. Gardens, and fields: cultivated. Native country unknown. Fl. July. Fr. September.

Obs. This species—universally known and cultivated, as a culinary vegetable—is by far the most valuable of the genus. The culture is carried to a great extent in some favorable localities,—as at Wethersfield, Connecticut. There is a variety with bulb-bearing umbels, or heads, sometimes to be seen in gardens. The expressed juice of the Onion is a popular remedy for the croup, in children. Its stimulating quality is thus playfully alluded to, by SHAKSPEARE, in the Taming of the Shrew:

* "Leek to the Welsh, to Dutchmen butter's dear,

[&]quot;And if the boy have not a woman's gift,
"To rain a shower of commanded tears,
"An Onion will do well for such a shift;
"Which in a napkin being close conveyed,
"Shall in despite an force a watery even,"

[&]quot;Shall in despite enforce a watery eye."

[&]quot;Of Irish swains potato is the cheer; "Oats for their feasts the Scottish shepherds grind." GAY.

Two or three other species of this genus are cultivated, in Europe; namely, A. Scorodoprasum, L. or Rocambole—A. Ascalonicum, L. or Schallott, &c. But I believe they are not much attended to, in this country. We have, also, a few native species; but they are scarcely of sufficient importance to require the notice of the Agriculturist.

TRIBE III. ASPARAGEAE. Juss. DC. & Dub. Herbs, shrubs, or trees. Root tuberous, fleshy and fascicled, or fibrous. Calyz spreading, or rarely tubular. Fruit baccate.

202. ASPARAGUS. L. Endl. Gen. 1164.

[Greek, Asparagos, a young shoot, or turion; notable in this plant.] Calyx of 6 nearly equal linear-oblong petaloid sepals, slightly connected at base, spreading at apex. Stamens 6,—the lower half of the filaments adnate to the base of the sepals; anthers peltate. Ovary trigonous-turbinate, 3-celled; ovules 2 in each cell; style short; stigmas 3. Berry globose, 3-celled; cells 2-seeded. Seeds angular-

subglobose; testa coriaceous, black; embryo excentric, somewhat

1. A. officinalis, L. Unarmed; stem herbaceous, erect, paniculately branched; leaves fasciculate, setaceous and flexible; peduncles articulated in the middle. Willd. Sp. Pl. 2. p. 150. Fl. Cestr. p. 218. [row Grass." Officinal Asparagus. Vulgò—Asparagus, or (corruptly) "Spar-Fr. Asperge. Germ. Der Spargel. Span. Espárrago.

Root perennial, consisting of numerous coarse fleshy fasciculate fibres. Plant smooth, 3 to 6 feet high,—the turions, or young stems, at first simple, stout and fleshy, with leaves in the form of appressed scales—finally the stem is ramified into a large paniele. Leaves neequal, I third of an inch to an inch or more in length, very narrow, linear, flat, abruptly acute, in fascicles of 3 to 10 or 12 (often 6), with a minute ovate acuminate scarious stipule at the base of each fascicle. Peduncles in pairs (sometimes solitary), lateral (not axillary) at the base of the alternate branches, about half an inch long, slender, the upper half (above the thickened ring, or articulation) slightly clavate. Calyx pale greenish-yellow. Berries globose, slightly umbilicate, red when mature. Gardens: cultivated. Native of Europe. Fl. May—July. Fr. September.

Obs. Almost every garden has a bed of Asparagus roots, for the sake of the young Turions,—which afford a favorite vegetable dish, in early spring.

ORDER CLV. JUNCACEAE. Juss. Agardh.

Herbaceous, mostly perennial grass-like or sedge-like plants. Stem (or culm) nodose, often simple and leafless, or leafy at base with nearly naked scapes. Leaves alternate, sheathing at base, narrow, and either flat, channelled or terete. Flowers small, glumaceous, in paniculate clusters, cymes, or heads. Calyx of 6 dry greenish or brownish sepals, in two series. Stamens 6, or rarely 3. Ovary free, 3-celled,—or 1-celled by reason of the placentae not reaching the axis; ovules either 3 at the base of the ovary, or numerous and affixed to the placentae; styles united; stigmas 3. Capsule localicidally 3-valved, few or many-seeded. Seeds erect; testa membranaeeous; embryo included in the base of dense fleshy albumen.

A small Order of homely and worthless plants.

203. JUNCUS. L. Endl. Gen. 1049.

[Latin, Jungere. to join.—being used to tie or bind objects together.]

Calyx bibracteate at base. Sepals 6, glumaceous, in a double series,—the 3 outer ones keeled. Stamens mostly 6, inserted on the base of the sepals,—sometimes those on the 3 inner sepals abortive.

Ovary free, 3-celled; ovules numerous, at the inner angle of the cells, erect; stigmas 3, subsessile, filiform, villous. Capsule 3-celled, or somewhat 1-celled by the incompleteness of the dissepiments, 3-valved,—the valves bearing the dissepiments in the middle (loculicidal). Seeds numerous.

1. J. COMMUNIS, var. a? E. Meyer. Culms cespitose, naked, erect. smooth, filled with a continuous pith; sheaths radical, without leaves; inflorescence lateral, much branched, cymose, conglomerate or diffused; flowers triandrous; sepals lanceolate, acuminate, as long as the obtuse capsule. Kuuth, Enum. 3. p. 320.

J. effusus. L. Willd. Sp. Pl. 2. p. 205. Fl. Cestr. p. 227.

Common Juneus. Vulgò-Rush. Soft Rush.

Fr. Jone à Mêche. Germ. Gemeine Simse. Span. Junco.

Root perennial, forming tussocks. Culms 2 to 3 feet high, simple, soft and pliable, sheathed at base, and terminating at summit in a long tapering point. Inflorescence cymose-paniculate, bursting from a fissure in the side of the culm near the summit, often proliferous, bracteate; bracts oblong-lanceolate, scarious. Stamms 3. shorter than the sepals, opposite the 3 outer ones; anthers white. Capsule trigonous-obovoid, obtuse. Seeds minute, oblong, acute at each end, yellowish. Moist meadows, and low grounds: throughout the U. States. Fl. June. Fr. July-August.

Obs. There appear to be varieties, or nearly allied species, which have created some confusion respecting J. effusus. Kunth (after E. Meyer) has reduced the J. conglomeratus and J. effusus, of Lin-NAEUS, and others, into varieties of J. communis.

The genus is a numerous one,—comprising about 100 known species-of which some 18 or 20 are natives of the U. States. They are all homely plants, and entirely worthless to the farmer; but the one here given is the most troublesome, -continually forming numerous unsightly bunches or tussocks, in wet low grounds-and requiring some attention to keep it in proper subjection. Mr. ELLIOTT says that in S. Carolina, this Rush "occupies and almost covers rice-fields as soon as they are thrown out of cultivation."

ORDER CLIX. CYPERACEAE. Juss. DC.

Herbs, perennial or annual,—the stems (or culms) often angular, or compressed, somewhat nodose, usually solid and cespitose, never shrubby. Leaves distinhously alternate, originating at the nodes,—the petioles dilated, embracing the culm, with the margins mostly united so as to form entire sheaths—the lamina (of the lower once especially) often wanting. Flowers perfect or unisexual, monoicous or polygamous, rarely dioicous, spicate; spikes either solitary and terminal or axillary, or variously clustered, and involucrate, at the summit of the culm: florets 1 in the axil of each chaffy scale or bract. Calyx none,—or the sepals reduced to a few mere bristles. Stamens usually 3, hypogynous. Ovary free, by abortion single, 1-celled, 1-ovaled; styles 2 or 3, more or less united,—the branches stigmatose on the inner side. Fruit an Akene (or caryopsis), either compressed, or more or less trigonous, according to the namer and perfection of pressed, or more or less trigonous, according to the number and perfection of the styles,—the pericarp not adnate to the seed, chartaceous, crustaceous or bony. Seed conforming to the shape of the pericarp, creet; testa delicate: embryo minute. included in farinaceous or somewhat fleshy albumen.

An Order of some 50 genera,—remarkable for their worthlessness; and also for their presence, or prevalence, at least, being an indication of swampy, neglected, or valueless land. The herbage of this Order—unlike that of a large number of the Gramineae, or true Grasses—contains but little saccharine matter;

and therefore is neither nutritious, nor palatable to stock.

TRIBE I. CARICEAE. Nees.

Flowers diclinous. Scales or glumes of the spikes imbricated on all sides. Akene

(caryopsis, or nut) inclosed in a (usually acuminate) sac or utricle, formed of 2 membranaceous bracts or glumes with their margins united, but often leaving the apex bidentate.

204. CAREX. L. Endl. Gen. 957.

[Latin, carere, to lack, or want; the staminate spikes bearing no fruit.]

Spikes one or several, unisexual or androgynous, rarely dioicous.

STAMINATE FL. Stamens 3. PISTILLATE FL. Ovary included in a utricle formed of 2 glumes united by their margins; utricle beaked, and either bidentate, emarginate, or truncate at apex. Styles 2 or 3, united at base,—the stigmatose branches elongated, exserted. Akene with a chartaceous pericarp (usually lenticular, or plano-convex, when there are but 2 stigmas,—triquetrous when the stigmas are 3), inclosed in the persistent utricle. Perennial herbs. Culms triangular, leafy throughout or only at base. Leaves grass-like, mostly scabrous on the margins and keel. Spikes terminal or axillary, distant or approximated, or variously clustered.

§. 1. SPIKES ALL ANDROGYNOUS.

F Spikes clustered, staminate at their summit. Stigmas 2.

1. C. MULTIFLORA, Muhl. Spike oblong, decompound, interrupted, bracteate,—the spikelets numerous, ovoid-oblong, obtuse; fruit crowded, compressed, ovate, acuminate, 3-nerved, scabrous on the margin, finally diverging, rather shorter than the ovate cuspidate glume. Kunth, Enum. 2. p. 387. Fl. Cestr. p. 29.

Many-flowered Carex. Vulgò—Sedge. Scdge-grass.

Culm about 2 feet high, obtusely triangular and leafy at base, acutely triquetrous above. Leaves lance-linear, channelled above, scabrous on the margin,—the upper ones over-topping the culm; sheathes transversely rugose on the side opposite the leaves. Spike 2 to 3 inches long, formed of numerous spikelets which are crowded into clusters a little separated from each other, and either appressed to the rachis or diverging. Bracts at the base of the compound spike, and also of the principal clusters, often long and foliaceous,—those at the base of the spikelets, short, setaceous and scabrous. Staminate glumes lanceolate, with a short point. Pistiliate glumes ovate, with a long serrulate point. Fruit 3-nerved, bifid at apex, rather small, densely crowded, finally much diverging, and yellowish. Swamps, and low grounds: northern and middle States. Fl. May. Fr. July.

Obs. This—like all the other species of this very numerous genus (amounting to some 300, or more) is a very worthless plant; and is often quite abundant, in wet meadows. The form of the akenes, in Carex—like those of Polygonum, already noticed—has a constant relation to the number of styles, or stigmas. When the stigmas (or stigmatose branches) are 2, the akene is compressed, and ancipital or 2-edged; but when there are 3 stigmas, the akene is uniformly triquetrous. A similar relation, between the form of the akene or nut, and the number of the styles or stigmas, appears to exist in numerous other instances,—as in Rumex, Rheum, Scirpus, Cyperus, Fagus, Morus, Alnus, Betula, &c. &c. and the law may, perhaps, be general.

- §. 2. Spikes, Staminate and Pistillate distinct. Stigmas 3.
 - † Staminate spike solitary : pistillate subsessile.
- 2. C. TENTACULATA, Muhl. Staminate spike bracteate, on a short peduncle; pistillate spikes about 3, cylindric-oblong, approximate,

horizontal; bracts long, foliaceous; fruit densely crowded, ovoid, ventricose, nerved, long-beaked, about twice as long as the lance-linear awned glume. Willd. Sp. Pl. 4. p. 266. Fl. Cestr. p. 35.

C. rostrata, Muhl. in Schkuhr. fide Kunth, Enum. 2. p. 496.

Tentaculate or many-beaked Carex. [(doubtful).

Whole plant yellowish-green. Culm 12 to 18 inches high, triquetrous, scabrous on the angles above, leafy. Leaves linear-lanceolate, nerved, scabrous on the margin, longer than the culm. Staminate spike about an inch long, with a narrow lance-linear bract at base longer than the spike; glumes lance-linear, terminated by a long scabrous awn. Pistillate spikes commonly 2 or 3 (often but 1—rarely 4), about an inch or inch and half long,—the upper ones approximate, sessile—the lowest one a little distant on a short scarcely exserted pedancle; glumes terminated by a long setaceous scabrous awn. Bracts resembling the leaves, very long. Fruit ovoid, inflated, spreading, smooth and shining, attenuated into a long straight, slender beak. Akene triquetrous, roughish-puncticulate. Swampy low grounds. Fl. May—June. Fr. August.

Obs. This is a very common species, in the swampy meadows of Pennsylvania,—and probably throughout the greater portion of the United States.

†† Staminate spikes mostly 2 or more. Stigmas 2.

3. C. ACUTA, Gooden. Staminate spikes 1 to 3, erect; pistillate spikes usually 2 or 3, rather distant, cylindric, subsessile, often staminate at summit; fruit compressed, ovate, with a very short beak and the orifice entire, about as long as the oblong-lanceolate awnless glume. Kunth, Enum. 2. p. 412. Fl. Cestr. p. 41. Icon, Fl. Lond. 4.

Acute (or sharp-angled) Carex. Vulgo-Tussock-sedge.

Culms 1 to 2 feet high, very slender and acutely triquetrous, striate, minutely serrulate on the angles, leafy at base,—usually growing in large dense tufts, or tussocks. Leaves narrow, linear, keeled, scabrous on the margin, often longer than the culm,—the radical ones very numerous and loosely spreading, forming a large tuft of a lively bluish-green. Staminate spikes 2 or 3 (often solitary), erect, sessile except the uppermost one; glumes oblong, mostly obtuse. Pistillate spikes 3 (or often but 2), 1 to 2 inches long, rather slender,—the lowest one on a very short peduncle—the upper ones sessile, and often staminate at summit (andregynous); glumes brown, with a green keel. Fruit ovate, elliptic, or obovate, smooth. Akene obovate, uncronate, puncticulate. Swamps: throughout the U. States. Fl. April. Fr. June.

Obs. The description of C. caespitosa, L. as given in the books, so nearly fits this plant, that a young Botanist might be puzzled to make anything else of it; and Kunth pronounces it to be only a marsh form of that species (Nil nisi forma paludosa Caricis caespitosae."). It is the most common, and most troublesome, of all the species. It is true, that a pedestrian, in crossing neglected boggy meadows, finds its dense tufts quite a convenience, to step on,—yet it is decidedly more farmer-like to provide good walking, in such places, by ditching and draining. The tussocks, formed by the matted fibrous roots, of this species of Carex, are often very large, and very durable. I once hauled a quantity of them into the barn-yard, with a hope that they might decompose, and make manure: but they effectually resisted decomposition, and were tossed about the yard, for years,—as large, and almost as indestructible, as so many hatter's blocks. The best way to dispose of them, is to collect them—when cut out and dried—into a heap, and burn them,—taking care

afterwards, by appropriate draining, to prevent the growth of others. The three species here described, are inserted merely as samples of a very extensive genus of unprofitable plants,—of which every intelligent farmer would like to know something. Those who may desire to become better acquainted with the family, will find the species well described, in various Monographs and Floras.

TRIBE IX. SCIRPEAE. Nees.

Flowers perfect. Scales of the spikelets imbricated on all sides (rarely bi-trifarious), uniform,—the lowest ones usually empty or sterile. Calyx none, or substituted by several bristles, hairs, or linear scales. Style often bulbous at base.

205. SCIRPUS. L. Endl. Gen. 1000.

[An ancient Latin name for the Bull-rush,—which belongs to the genus.] Spikelets many-flowered. Scales imbricated on all sides (or rarely sub-distichously),—the lower ones empty. Calyx none,—substituted by capillary bristles, which are hispid or puberulent. Styles 2 or 3, distinct at summit, united at base, often bulbous and articulated with the ovary. Akene crustaceous, either somewhat compressed, or trigonous—according to the condition or number of the styles or stigmas. Perennial sub-aquatic herbs. Culms mostly simple, triangular or terete, often with leafless sheaths. Spikelets either solitary, conglomerate or corymbose, terminal or lateral.

1. S. TRIQUETER, L. Culm triquetrous, nearly leafless; spikelets ovoid-oblong (1 to 5), in a dense lateral cluster near the summit of the culm; scales orbicular-ovate, emarginate, mucronate; bristles 3 to 5 or 6, slender, shorter than the akene; styles 2, united below, free at summit; akene subcompressed, obscurely trigonous, abruptly acuminate. Kunth, Enum. 2. p. 163. Fl. Cestr. p. 593. Icon, Fl. Lond. 1.

Also, S. pungens, Vahl. Kunth, l. c. S. Americanus Pers. & others. Three-cornered Scirpus. Vulgò—Chair-maker's Rush.

Root (or rhizoma) creeping. Culm 2 to 4 or 5 feet high, cuspidate at summit, acutely triquetrous (2 of the sides concave, the other flat), naked and smooth, sheathed at base,—the sheaths often bearing a few short triangular-carinate leaves. Spikelets nearly sessile, in a dense lateral cluster,—i.e. at the base of an erect tapering 1-leaved involucre, which is apparently a continuation of the culm. Scales often emarginate, and mucronate with the projecting midrib, ferruginous on the sides,—the margins scarious and pubescent-ciliate. Bristles retrorsely scabrous, brittle. Akene smooth, dark-brown. Swampy meadows, and middy margins of rivers—salt and fresh: throughout the U. States. Fl. July. Fr. Sept.

Obs. This is the plant used in making the seats of "Rush-bottomed Chairs," in the U. States. Some of the English Botanists say, the terete culms of the S. lacustris, L. or common Bull-rush, are used for that purpose,—which I think must be a mistake; as they are certainly much inferior, in tenacity and pliability, to those of S. triqueter,—and the chairmakers would be apt to discover the fact. Numerous species of this genus occur in our wet low grounds: but, although of no value in Agriculture, they scarcely require notice, here,—inasmuch as they are neither very troublesome, nor difficult to get rid of, by draining, and other appropriate management of the grounds.

TRIBE X. CYPEREAE. Nees.

Flowers perfect. Spikelets usually many-flowered, with the scales distichously

imbricated, uniform,—the margins often decurrent on the angles of the rachis. Calyv none, or rarely cup-shaped,—sometimes substituted by retrorsely hispid bristles. Style rarely bulbous at base.

206. CYPERUS. L. Endl. Gen. 1003. [An ancient Greek name,—of uncertain etymology.]

Spikelets many-flowered, or rarely 1 to 3-flowered. Scales distichously imbricated,—the lowest ones empty and sometimes smaller. Calyx none of any kind. Stamens 2 or 3. Styles 3 (rarely 2,) united below into one, deciduous. Akene crustaceous, triquetrous or rarely compressed,—sometimes mucronate with the persistent base of the united styles. Perennial herbs. Culms simple, often triquetrous, leafy and sheathed at base. Leaves grass-like. Spikelets in loose spikes, involucrate fascicles, or umbels.

1. C. STRIGOSUS, L. Umbel mostly simple, with several elongated unequal rays bearing oblong loose spikes; spikelets numerous, each 6 to 8 or 10-flowered, lance-linear, acute, much compressed, divaricate, spreading on all sides; involucre of about 6 leaves,—the exterior or lower ones very long. Torr. N. Am. Cyp. p. 261. Kunth? Enum. 2. p. 87. Fl. Cestr. p. 15.

STRIGOSE CYPERUS. Vulgò—Bristle-spiked Galingale.

Culm 1 to 2 or 3 feet high, triquetrous, smooth, leafy below and tuberous at base. Leaves rather broad, acute, keeled, nearly as long as the culm, somewhat scabrous on the margin. Umbel 3 to 6 or 9-rayed, rather spreading; rays unequal, 1 or 2 to 4 or 5 inches long, triquetrous, sheathed at base,—the central ones suppressed—(i. e. the central spikes sessile). Spikes yellowish, 1 to near 2 inches long (often compound—or with 1, 2 or 3 smaller spikes, branching from the base), formed by numerous spikelets (20 to 60 or 80) which spread on all sides, and are finally a little reflexed. Spikelets about three fourths of an inch long,—the scales somewhat loosely imbricated, striate, with a green keel and yellowish sides. Styles long, 3 united in one, distinct at summit. Akene triquetrous, oblong, acute, roughish-dotted. Wet meadows, and low grounds: throughout the U. States. Fl. Aug. Fr. Sept.

- Obs. This species is inserted—not as being a particularly trouble-some weed, but—as one of the most conspicuous of the genus, in the swampy meadows of the middle and northern States. The two which follow, belong rather to the Southern States,—and are there regarded as real scourges, by the Planters.
- 2. C. REPENS, Ell. Root creeping, tuberiferous at the extremities; umbel mostly simple, 4 to 6-rayed; involucre about 3-leaved, much longer than the rays; spikes distichous; spikelets 10 to 14, linear, obtuse, sub-compressed, approximated, somewhat spreading, each 12 to 20-flowered. Torr. N. Am. Cyp. p. 264. Fl. Cestr. p. 592. C. phymatodes. Muhl. Kunth, Enum. 2. p. 62. [in Torr. Creeping Cyperus. Vulgò—"Nut Grass," of Florida; Baldw.

Root (or rhizoma) creeping extensively, and sending up numerous suckers,—the fibrous branches often terminating in tubers the size of a pea. Culm 1 to near 2 feet high, triquetrous, very smooth. Leaves 9 to 18 inches long, and 2 to 3 lines wide, keeled, smooth or slightly scabrous on the margin, yellowish green. Umbel rather erect,—the rays 1 to 2 or 3 inches long. Involucre usually 3 or 4-leaved. Spikelets half an inch to three quarters in length, a little compressed, obtuse when mature, somewhat distichously arranged on the common rachis,—the lowest ones often in pairs or fasciculate; scales oblong, rather acute, nerved, pale tawny. Styles 3, united in one, distinct at summit. Akene triquetrous, oblong, minutely punctate. Banks of streams; pastures, and cultivated grounds: New York to Florida, and Louisiana.

Obs. This species is, fortunately, rather rare, in the northern and middle States; but it is said to be a troublesome plant, in the South.

3. C. Hydra, Mx. Rhizoma creeping, tuberiferous; umbel mostly simple, 3 or 4-rayed; involucre 2 or 3 leaved, about as long as the rays; spikes distichous; spikelets 4 or 5 on each ray, or spike, lance-linear, acute, much compressed, 14 to 20-flowered. Torr. N. Am. Cyp. p. 265. Icon, Ell. Sketch, 1. tab. 2. fig. 2.

C. rotundus, L? Muhl. Kunth, Enum. 2. p. 58.

[grass "?

HYDRA CYPERUS. Vulgò-"Nut Grass," of S. Carolina. "Coco-

Rhizoma creeping,—its branches ending in tubers nearly half an inch in diameter. Culm 3 to 8 and 12 inches high, triangular, smooth, naked. Leaves all radical, shorter than the culm, about 2 lines wide, acute, slightly channelled, often recurved, somewhat glaucous. Involucre sometimes shorter than the umbel. Rays of the umbel 2 to 3 inches long, erect or slightly spreading. Spikelts nearly an inch long, alternate and distichous along the upper part of the rays,—the scales closely imbricated, bright chesnut-color with a green keel, not nerved, slightly mucronate. Styles 3, united below, distinct at summit. Akine triquetrous. Sandy fields; sand drifts, along the sea coast: Virginia to Florida, and Arkansas. Fl. All summer.

Obs. This is stated to be one of the greatest pests of the Southern Planters. It seems to be an inhabitant of all the 4 quarters of the globe. Mr. Elliott gives the following account of it:—"This grass (?) is becoming a great scourge to our planters. It shoots from the base of its stem a thread-like fibre, which descends perpendicularly 6 to 18 inches, and then produces a small tuber. From this, horizontal fibres extend in every direction, producing new tubers at intervals of 6 or 8 inches, and these immediately shoot up stems to the surface of the earth, and throw out lateral fibres to form a new progeny. This process is interminable,—and it is curious to see what a chain or net-work of plants and tubers can, with some care, be dug up in a loose soil. The only process, yet discovered, by which this grass can be extirpated, is to plough or hoe the spots in which it grows every day through the whole season. In their perpetual efforts to throw their leaves to the light, the roots become exhausted and perish,—or if a few appear the next spring, they can easily be dug up." J. S. SKINNER, Esq. in a letter written during an excursion to the South, in the spring of 1846, sent to me an imperfect specimen of a Cyperaceous plant, which I suspect to be this species; and says of it-"I send you inclosed a spear or shoot of the vilest of all pests, the Coco-grass,—which has taken possession of, and caused to be abandoned, some of the best Sugar estates in Louisiana. Of all things it is said to be the most tenacious of life; and nothing serves so well to propagate it, as to plough and replough, with a view to destroy it."

There are numerous other species of Cyperus, in the U. States; but the foregoing are the most important for the Agriculturist to be acquainted with. The Papyrus—which the ancients used, for writing upon, prior to the manufacture of paper from rags—was obtained from a species of this genus, viz: C. Papyrus, L.

ORDER CLX. GRAMINEAE. Juss.

Mostly Herbs of humble growth, perennial or annual, often cespitose—rarely woody and fruticose or arborescent. Stems (or culms) terete, nodose, mostly hollow,

and closed at the nodes.* Leaves distichously alternate, originating at the nodes,—the petioles dilated, sheathing the culm, but mostly sht on one side (i. e. nodes,—the periods dialed, shealing the culm, but mostly sit on one side (i. e. the margins not united, as in the Cyperaceae); stipules axillary, adnate to the petiole, with the summit often free and known as the ligule,—sometimes obsolete or wanting; lamina, or blade of the leaf, usually narrow, sub-linear, with parallel nerves, the margins entire and frequently scabrous. Flowers perfect or unisexual—monoicous or polygamous, rarely dioicous,—in little spikelets at the ends of branches; and these spikelets disposed in loose panicles—or, by the contraction of the branches, condensed into racemes or spikes. Snikelets consisting ends of branches; and these spikelets disposed in loose panicles—or, by the contraction of the branches, condensed into racemes or spikes. Spikelets consisting of distichously imbricated chaffy bracts (stunted or modified sheaths of abortive leaves),—of which the outer or lower ones are called glums—and the two that immediately inclose each flower are termed paleae. Calyx or Corolla none,—or in the form of minute membranous or fleshy hypogynous scales (1 to 3 in number), distinct or united. Stamens 1 to 6, or more—commonly 3—hypogynous; anthers versattle. Ovary free, by abortion single, 1-celled, 1-ovuled; styles or stigmas mostly 2, the latter plumose. Fruit a caryopsis, free or sometimes adherent to the paleae,—the pericary closly adnate to the seed, thin and chartaceous, or rarely crustaceous. Embryo situated on the front side, and near the base, of copious farinaceous albumen.

This vast Order—comprising some 230 genera, and perhaps not less than 3000 species—is probably the most generally diffused, and the most important to man, of all the families of plants. The seeds, and herbage, furnish a principal portion of the food of the human race, and of the more valuable domestic animals. A great number of the Grasses, however, are little better than weeds, on a farm,—and some of them exceedingly annoying. Those which the American Agriculturist is more immediately interested to know, are here inserted.

TRIBE I. ORYZEAE. Kunth.

Spikelets sometimes 1-flowered, with the glumes often abortive; sometimes 2 or 3flowered: the lower florets with a single palea, and neutral; the terminal one, on y, fertile. Paleae chartaceous, rigid. Flowers often diclinous, and mostly hexandrius.

> 207. LEERSIA. Soland. Endl. Gen. 728. [Named in honor of John Daniel Leers,-a German Botanist.]

Flowers perfect. Spikelets 1-flowered. Glumes 0. Paleae 2, compressed-carinate, nearly equal in length, awnless,—the lower one broader. Stamens 3 to 6-rarely 1. Ovary smooth; stigmas plumose; the hairs branched. Caryopsis free, compressed, covered by the paleae.

1. L. ORYZOIDES, Swartz. Panicle diffusely branched; florets triandrous; paleae conspicuously ciliate on the keel. Kunth, Enum. 1 p. 5. Specim. Gray, Gram. No. 104. Fl. Cestr. p. 92.

ORYZA—OR RICE-LIKE LEERSIA. Vulgò—Cut-Grass. Wild Rice.

*The roots of the Grasses may be regarded as rhizomas, or subterranean stems,producing buds, and throwing up branches, of rapid growth, which are the culms, or aerial stems. "The stem of a Grass," says Prof LINDLEY, "exists in two different states,—that of the rhizoma, and of the culm; the rhizoma, which is the true trunk; and the culm, which may be considered a ramification of it. The true trunk; and the culm, which may be considered a ramification of it. The rhizoma grows slowly, and differs in no respect from the stem of other Monocotyledons, as is evident in that of the Bamboo. The culm, on the contrary, which grows with great rapidity, is fistular, with a compact impervious diaphragm at each articulation; a fact which must be familliar to every one who has examined a straw, or the joint of a Bamboo. In the beginning when this culm was first developed, it was a solid body like the rhizoma, only infinitely smaller; but in consequence of the great rapidity of its development, the cellular tissue forms more slowly than the woody vascular bundles which it connects, and in consequence a separation takes place between the latter and the former, except at the articulations, where, by the action of the leaves and their axillary buds, is formed a plexus of vessels, which grows as rapidly as the culm distends, and therefore never separates in the centre. Something analagous to this occurs in the flowering stem of the common Onion among Monocotyledons, and in Umbelliferae among Dicotyledons." belliferae among Dicotyledons." 18

Root perennial, creeping. Culm 3 to 5 feet high, striate, scabrous with minute retrorse prickles,—the nodes pubescent. Leaves 6 to 12 mches long, lance-linear, acuminate, keeled, retrorsely and sharply scabrous, ciliate on the margin; sheaths sulcate-striate, very rough with retrorse prickles in the grooves; ligule short, retuse. Panicle usually sheathed at base, much branched; branches flexuose, the lower ones in threes and fours. Spikelets elliptic-oblong, pedicellate, greenish-white. Paleae compressed, pectinate-ciliate on the keel,—the lower one boat-shaped, 3-nerved—the upper one a little longer, linear, 1-nerved. Swamps, and along sluggish rivulets: throughout the U. States. Fl. Aug. Fr. Sentember September.

Obs. This rough grass seems to be common to both hemispheres, and is often quite abundant in our swampy meadows, and along the margins of muddy streams. It is not only worthless, but rather a nuisance. The farmer should therefore know it, and take measures (by drainage, &c.) to expel it, or keep it in subjection.

208. ORYZA. L. Endl. Gen. 729.

[The Greek name of Rice,-coined from Eruz, its Arabic name.]

Flowers perfect. Spikelets 1-flowered. Glumes 2, small, awnless but cuspidate, slightly concave. Paleae 2, compressed-carinate, nearly equal in length,-the lower one broader, and often with a straight awn at apex. Stamens 6. Ovary smooth; stigmas plumose,-the hairs branched. Caryopsis oblong, free, closely embraced by the persistent paleae.

1. O. SATIVA, L. Leaves lance-linear, elongated, rough; panicle racemose, contracted; branches slender, rough; paleae oblong, scabrous, awnless or often with a terminal awn. Kunth, Enum. 1. [p. 7.

CULTIVATED ORYZA. Vulgò—Rice. Common Rice.

Fr. Le Riz. Germ. Der Reiss. Span. Arroz.

Root annual. Culm 2 to 4 or 5 feet high, smooth, striate. Leaves 9 to 18 inches long, broadish, rough on the upper surface, smooth beneath; sheaths striatenerved, smooth; ligule elongated (half an inch to three quarters in length), erect, tapering to a point. Panicle oblong, 4 to 8 or 9 inches in length, with the branches erect. Outer palea nerved or ribbed, hispidly scabrous, often awned,—the inner one awnless. Cultivated in the Southern States. Native of Asia? Fl. Fr.

Obs. There are several varieties of cultivated Rice; some, called Upland or Mountain Rice, usually awnless, -others, with the paleae commonly awned, or mucronate, cultivated in low grounds which can be irrigated, or overflowed with water. The aquatic variety is one of the staple crops of South Carolina. The importance of this plant, to the inhabitants of the tropical regions, generally-but especially in Asia-can scarcely be estimated by the residents of higher latitudes. It is believed that its seeds enter more largely into the nourishment of the human family, than those of any other plant-not excepting even Wheat.

209. ZIZANIA. L. (HYDROCHLOA. Endl. Gen. 731.) [A Greek name,*-supposed to have been originally applied to Lolium.] Flowers monoicous. Spikelets 1-flowered,—the staminate and pistillate ones in the same panicle—the former below, the latter above. STAMINATE SPIKELETS: Glumes 0. Paleae 2, concave, nearly equal

^{*} In the original language of the New Testament (St. Matthew. chap. 13). Zizania is the term which is rendered, or represented in English, by the word "Tares": yet Tares have usually been considered to be species of Vetch (either Vicia sativa, L. or Ervum hirsutum, L.).

in length, the lower one mucronate, 5-nerved, embracing the 3-nerved upper one. Scales 2, glabrous. Stamens 6. Ovary an abortive rudiment. Pistillate spikelets: Glume a minute orbicular cupshaped rudiment. Paleae 2, linear,—the lower one 3-nerved, terminating in a long straight awn, and embracing the narrower 1-nerved upper one. Scales 2, glabrous. Stamens abortive rudiments. Ovary sessile, oblong; stigmas pencil-form,—the hairs simple, subulate. Caryopsis cylindric, sulcate on one side, beaked, enveloped in the paleae.

1. Z. AQUATICA, L. Panicle pyramidal,—the lower branches spreading, bearing staminate flowers—the upper branches erect, bearing pistillate flowers; spikelets on clavate pedicels; awns long; caryopsis slender, elongated. Fl. Cestr. p. 93.

Z. clavulosa. Mx. Willd. Sp. Pl. 4. p. 394.

Hydropyrum esculentum. Link. Kunth, Enum. 1. p. 9.

AQUATIC ZIZANIA. Vulgè-Water-Oats. Reed. Indian Rice.

Root perennial. Culm 4 to 8 or 10 feet high, stout, fistular, terete, glabrous. Leaves 1 to 2 or 3 feet long, and an inch to an inch and half wide, linear-lanceolate, keeled, smooth, serrulate on the margin; sheaths striate, smooth,—the base, at the nodes, surrounded with a ring of short silky appressed pubescence; ligule rather large, elongated, erect, lanceolate, finally lacerate-dentate, often purplish. Panicle 1 to 2 feet long,—the branches verticilate. Pistillate spikelets about an inch long, needle-like, somewhat racemose on the branches. Paleae scabrous, dark greenish-purple,—the lower one closely embracing the upper one, and terminating in a slender straight hispid awn as long as the spikelet. Muddy margins of tide waters; swampy rivulets, &c.: throughout the U. States. Fl. August. Fr. Sept.—October.

Obs. At the suggestion of my friend, Prof. A. GRAY, I have retained the name of this plant, originally proposed by CLAYTON, or GRONOVIUS,—and adopted by LINNAEUS. KUNTH has excluded the only original species from the genus,—in violation of the canons in such case made and provided. This fine stout Grass is well known, along the muddy shores of our tide waters, as the favorite resort of the Reed-bird (Emberiza Oryzivora, L.), in autumn. Mr. Elliott supposed it might be a valuable grass, in overflowed or marshy meadows,—as its leaves, he says, are eaten with avidity by Stock of all descriptions. I do not know that it has been found of much importance, in that respect, in the northern or middle States.

TRIBE II. PHALARIDEAE. Kunth.

Spikelets with the flowers either perfect, polygamous, or rarely monoicous,—sometimes 1-flowered with or without a stipitiform rudiment of another flower above—sometimes 2-flowered, both being perfect or stammate—and sometimes 2 or 3-flowered with the terminal one fertile, the others imperfect. Glumes mostly equal. Paleae often shining and indurated in fruit. Styles or stigmas frequently much elongated.

210. ZEA. L. Endl. Gen. 742.

[Greek, Zao, to live; from the sustenance it affords to animal life.]

Flowers monoicous: Staminate ones terminal, racemose; pistillate ones axillary, densely spicate,—the spike enveloped in the sheaths of abortive leaves. Staminate spikelets 2-flowered. Glumes 2, concave,—the lower one 3-nerved—the upper one 2-nerved. Paleae membranaceous, awnless. Scales 2, collateral, fleshy, glabrous. Stamens 3; anthers linear, 4-sided, erect. Pistillate spikelets 2-

flowered, the lower one neutral. Glumes 2, fleshy-membranaceous, very broad, ciliate,—the lower one emarginately 2-lobed. Neutral floret with 2 paleae,—the lower one rounded, concave, embracing the fertile floret. Fertile floret with 2 or 3 concave paleae. Scales and stamens none. Ovary sessile, roundish-ovoid, oblique; style terminal, capillary, very long, pubescent at apex and mostly bifid,—the lobes subulate. Caryopsis compressed, roundish-reniform or cuneate, with a groove on the upper side, surrounded at base by the persistent glumes and paleae; pericarp thin, chartaceous and diaphanous.

1. Z. Mays, L. Leaves flat, linear-lanceolate, acuminate, entire,

1. Z. Mays, L. Leaves flat, linear-lanceolate, acuminate, entire, with a broad thickish midrib channelled above. Kunth, Enum. 1. p. 19. Fl. Cestr. p. 94.

Vulgò-Corn. Indian-Corn. Maize.

Root annual, coarsely fibrous. Culm 4 to 8 or 10 feet high, and an inch to an inch and half in diameter, simple (often producing suckers or branches at base), nodose, semi-terete or with a broad shallow channel on alternate sides between the nodes, smooth, solid with pith. Leaves 2 to 3 feet long, and 2 to 4 or 5 inches wide, obtusely keeled, smooth beneath, pubescent above, finely ciliate; sheaths striate, smooth, conspicuously pubescent along the margin; ligule short, obtuse. Staminate flowers in terminal pedunculate fascicled racemes; spikelets somewhat unilateral on the branches, mostly in pairs—one subsessile the other pedicellate,—each 2-flowered; anthers greenish yellow; scales collateral, cuneate, truncate, fleshy and smooth. Pistillate flowers in stout deuse solitary spikes on short axillary branches (1 to 3 or 4—usually 2—of these spikes, or Ears, on each plant). Spikes 6 to 12 or 15 inches long, enveloped in numerous involute spathelike "husks" (i. e. the sheaths of abortive leaves,—of which one originates at each node of the spike-bearing branches); spikelets crowded, sessile on the thick fleshy subcylindric rachis (receptacle or "Cob"), arranged in numerous (8 to 12) longitudinal series,—the series, or "rows," always in approximated pairs. Ovary smooth, at first rounded, gradually becoming compressed, in full ears; style very long and slender, projecting (with others in a glossy bundle, called "the silk") beyond the sheaths of the spike,—the exserted portion pendulous, and often purple. Caryopsis (or grain) compressed by crowding,—rounded when not crowded), with a slight groove on the upper side, in which the embryo is lodged, varying from orbicular-reniform to elongated and cuncate (often indented at apex in the cuncate forms), sitting transversely on the cylindric or tapering receptacle, and partially imbedded in a socket formed by the persistent glumes and paleae. Cultivated. Beheved to be a native of the warmer regions of America. Fl. July—August. Fr. September—October.

Obs. Culture has produced several varieties of this plant,—with the grains yellow, white, or sometimes dark purple. In the north, it is much smaller than in the middle and South western States. There is, also, a remarkable variety—frequent, I believe, in the South west—in which a kind of husk, or involucre, is developed around every grain, or spikelet, on the receptable. The Indian-Corn is one of the most interesting of the Gramineae, or Grass family, rivalling the Sugar Cane and the Rice, in intrinsic value, and, in the more favorable districts, ranking next in importance to Wheat itself. The fresh Bread, made of Indian-Corn meal (the "Pone," of Maryland and Viginia), when rightly prepared for the Breakfast table, may challenge a comparison with that made from any other grain. Sugar has also been obtained from this plant, of an excellent quality, and in considerable quantity; but whether the saccharine product will warrant the culture of the plant for that object, remains to be determined. In Chester County, Pa. the Indian-Corn is usually the first in the routine of crops, on breaking up the Lay, or sod. Oats or Barley next succeed,—and then Wheat; with Clover and Timothy to constitute the meadow, or Hay-crop, for two or three years after the wheat comes off.

211. PHLEUM. L. Endl. Gen. 750.

[A name derived from the ancient Greeks; meaning obscure.]

Flowers perfect: Spikelets 1-flowered, Kunth, (2-flowered, Endl.), crowded into a dense cylindrical terminal spike. Glumes 2, keeled, awnless, acuminate or produced at apex into an awnlike bristle. Paleae 2, thin and membranaceous, shorter than the glumes,—the lower one truncate at apex, awnless mucronate or awned on the back—the upper one 2-keeled, and often with the stipitiform rudinent of another floret at base. Scales 2, unequally 2-lobed, glabrous. Stamens 3. Ovary sessile; styles 2; stigmas plumose, with simple hairs. Caryopsis free, obliquely ovoid or elliptical, subterete, closely covered with the palea.

1. P. PRATENSE, L. Culm erect; spike cylindric, elongated; spikelets destitute of the stipitiform rudiment; glumes truncate, mucronately awned,—the awns shorter than the glumes; keel ciliate. Kunth, Enum. 1. p. 29. Fl. Cestr. p. 59.

Meadow Phleum. Vulgò—Timothy. Cats-tail Grass. Fr. Fléole des Prês, Germ. Das Wiesen-Lieschgras.

Root perennial, fibrous. Culm 2 to 4 feet high, simple, terete, smooth,—when old rather firm and wiry, and often somewhat bulbous at base. Leaves 6 to 12 or 15 inches long. lance-linear, acute, flat, glaucous. somewhat scabrous; sheaths striate, smooth; ligule membranaceous, obtuse, finally lacerate. Spike 3 to 6 or 8 inches long, green. Glumes equal. compressed abruptly mucronate, pubescent. Paleae concealed in the glumes,—the lower one larger. Anthers purple. Stigmas white. Fields and Meadows: cultivated. Native of Europe. Fl. June. Fr. July.

Obs. This foreign Grass is extensively naturalized in the U. States. In New York, and throughout New England, it is known by the name of Herd Grass,—a name which, in Pennsylvania—and I believe in all the States South—is applied exclusively to Agrostis vulgaris, L. The Meadow Phleum, or Timothy, is very generally cultivated in Eastern Pennsylvania; and is undoubtedly one of the most valuable of the "artificial grasses," so called. Mixed in about equal proportions with red clover (Trifolium pratense, L.), it makes the best quality of Hay. It requires a good soil,—and is considered a rather severe and exhausting crop;—inasmuch as the oftermath, or second growth of radical leaves, is somewhat scant and tardy, during the dry weather which usually succeeds harvest; and thus the ground is left exposed to the injurious influence of the scorching sun. The clover, however, when present in sufficient quantity, soon springs up and affords a shelter to the soil; and, when the land is good, the green grass (Poa pratensis, L,) comes in, spontaneously, as the clover disappears. The seed, of Timothy, is usually sown in autumn, - among, and immediately after, Wheat and Rye; though it answers very well, when sown early the ensuing spring.

212. HOLCUS. L. Endl. Gen. 754. [An ancient Greek name,—of obscure etymology.]

Spikelets 2-flowered, the florets a little distant, pedicellate,—the lower one perfect, awnless—the upper one staminate, awned on the back. Glumes 2, nearly equal, boat-shaped. Perfect Fl. Paleae 2,—the lower one boat-shaped, awnless—the upper one 2-

keeled. Scales 2, 2-lobed, glabrous. Stamens 3. Ovary sessile, pyriform; styles 2, terminal; stigmas plumose,—the hairs simple, or rarely bifid at apex. Caryopsis free, smooth. Staminate Fl. Lower palea awned near the summit. Ovary mostly abortive.

1. H. LANATUS, L. Panicle oblong, rather contracted; awn of the staminate floret recurved, included in the glume. Kunth, Enum. 1. p. 34. Fl. Cestr. p. 91. Icon, Fl. Lond. 1.

Woolly Holds. Vulgò-Feather-grass. White Timothy.

Fr. Houque laineuse. Foin de mouton. Germ. Wolliges Honig-gras.

Root perennial, fibrons. Culm simple, 18 inches to 2 feet high, and, with the leaves and sheaths, clothed with a soft hoary pubescence. Leaves lance-linear, acute, 2 to 5 or 6 inches long; ligule white, truncate, dentate. Panicle oblong, somewhat dense,—the branches hairy. Gluemes roughish-pubescent, whitish, often tinged with purple. Florets both pedicellate, smooth and shining. Paleae of the perfect floret nearly equal in length, the lower one broader, keeled,—of the staminate floret unequal, the lower one larger, keeled, with a recurved or hooked awn on the back near the apex. Moist meadows: introduced. Native of Europe. Fl. June. Fr. July.

Obs. This grass is naturalized in many places, in Pennsylvania. Some of the farmers in Virginia speak favorably of it; but I think it must be from want of familiarity with more valuable kinds. It is true, that Muhlenberg praises it—calling it "excellens pabulum;" but it is certainly very little esteemed by the farmers of Chester County: and in this they concur in the opinion expressed by Mr. G. Sinclair, in his valuable Hortus Gramineus.

213. ANTHOXANTHUM. L. Endl. Gen. 756. [Greek, Anthos, flower, and Xanthos, yellow; from the color of its spikes.] Spikelets 3-flowered,—the 2 lower ones neutral—the uppermost one perfect. Glumes 2, keeled,—the lower one shorter, 1-nerved—the upper one 3-nerved. Neutral Fl. Palea 1, channelled, emarginate at apex, awned on the back. Perfect Fl. Paleae 2, boatshaped, awnless,—the lower one embracing the 1-nerved upper one. Scales 0. Stamens 2. Ovary sessile; styles 2; stigmas distichously plumose, with simple hairs. Caryopsis subterete, free, closely embraced by the paleae.

1. A. ODORATUM, L. Panicle contracted into an oblong spike; spikelets sub-pedunculate, spreading, pubescent; paleae of the neutral florets ciliate. Kunth, Enum. 1. p. 38. Fl. Cestr. p. 64. Icon, Fl. Lond. 1.

FRAGRANT ANTHOXANTHUM. Vulgò—Sweet-scented Vernal-Grass. Fl. Flouve odorante, Germ. Das Ruch-gras.

Root perennial. Culm erect, 12 to 18 inches high, rather slender. Leaves lance-linear, shortish (1 or 2 to 5 or 6 inches long), pubescent; sheaths nerved, sulcate: ligule elongated, membranaceous. Panicle a sort of loose spike 1 to 2 or 3 inches long, becoming yellow when mature; spikelets somewhat fascicled, on short pedancles. Paleae of the perfect floret very short obtuse, nearly equal, smooth and shining, the lower one much broader. Paleae of the neutral florets single, linear-oblong, ciliate on the margins,—one of them with a geniculate awn from near the base, more than twice as long as the palea—the other with a straight awn, about as long as the palea, inserted on the back near the summit. Anthers linear, large. Stigmas white. Cargopsis oblong, blackish, shining. Meadows; and moist open woodlands: introduced. Native of Europe. Fl. May—June. Fr. July.

Obs. This has been much noticed, in Europe, as a fragrant mea-

dow-grass; but it seems rather to belong to a moist, cold, thin soil, and is by no means regarded, in the U. States, as a grass of superior value. When cut, and partly dry, it emits a remarkably fragrant odor. The culms have been used in the manufacture of imitation Leghorn hats and bonnets.

This grass is the plant referred to by Dr. DARWIN, in the following lines of his imaginative poem, the "Botanic Garden:"-

"Two gentle shepherds, and their sister-wives,
"With thee, Anthoxa! lead ambrosial lives;
"Where the wide heath in purple pride extends,
"And scatter'd furze its golden lustre blends,
"Clearly in green recover unpayied lot! "Closed in a green recess, unenvi'd lot!
"The blue smoke rises from their turf-built cot;
"Bosom'd in fragrance blush their infant train, "Eye the warm sun, or drink the silver rain."

Bot. Garden, Part II. Canto I. l. 85-92.

Belonging to this tribe (Phalarideae), is the Meadow Foxtail, of Europe (Alopecurus pratensis, L.); which the farmers, there, seem to regard as a grass of merit: but, although it has been partially introduced into some districts of the U. States, it can scarcely be said to belong to the agriculture of the country,—and it may, perhaps, be doubted whether it can ever advantageously take the place of our best grasses. The Phalaris arundinacea, L. (a variety of which, with striped leaves, is known by the name of Ribbon-grass), also belongs to this tribe—as the generic name indicates. It is a deep-green luxuriant-looking grass, frequent along swampy ditches; but it is not valuable,—neither is it very troublesome; and therefore I do not describe it at length. The P. Canariensis, L. furnishes the well known Canary-seeds, used for feeding birds; but does not possess much interest for our farmers.

TRIBE III. PANICEAE. Kunth.

Spikelets 2-flowcred,—the lower floret imperfect. Glumes more tender or herbaceous than the paleae,—the lower one often (rarely both) abortive. Paleae more or less coriaceous or chartaceous, mostly awnless,—the lower one concave. Caryopsis compressed on the back.

214. PANICUM. L. Endl. Gcn. 770.

[Latin, Panicula, a mode of flowering: or Panis, bread,-afforded by some species.]

Spikelets 2-flowered,—the lower floret staminate or neutral—the upper one perfect. Glumes 2, unequal, concave, awnless. Stami-NATE FL. Paleae 2. Stamens 3: sometimes the floret is NEUTRAL, the upper palea and the stamens being abortive. PERFECT FL. Paleae 2, nearly equal, coriaceous, concave,-the lower one embracing the 2-nerved upper one. Scales 2, collateral, hatchet-shaped, or truncate and 2 or 3-lobed; glabrous. Stamens 3. Ovary sessile; styles 2, terminal, elongated; stigmas penicillate, generally purple, —the hairs simple, denticulate. Caryopsis free, glabrous, closely embraced by the paleae.

† Inflorescence spicate. Spikes somewhat digitate-fasciculate: neutral floret with a single palea.

1. P. SANGUINALE, L. Spikes several, digitate, somewhat spreadng; leaves and sheaths hairy; florets lance-oblong, slightly ciliatepubescent on the margin. Kunth, Enum. 1. p. 82.

Digitaria sanguinalis. Scop. Fl. Cestr. p. 44. Icon, Fl. Lond. 3. Bloody (or Purple) Panicum. Vulgò—Crab-Grass. Finger-grass.

Root annual. Culm decumbent, 1 to 2 feet long, somewhat branching from the sheaths, geniculate, glabrous, radicating at the lower nodes. Leaves 1 or 2 to 6 or 8 inches long, softly pilose; sheaths strigosely hairy; ligule short, truncate, or ovate and acute, white or often tinged with purple. Spikes usually 4 to 6 (sometimes 8 or 10) in number, and 2 or 3 to 6 inches in length, often in 2 fascicles or verticils a little distant from each other, becoming purple; rachis flat, flexuose, scabrous on the margin. Spikelets in pairs, appressed, in two rows on the outer or under side of the rachis, on short pedicels,—the lower one subsessile. Inferior glume nearly obsolete. Gardens, and cultivated grounds; throughout the U. States. Fl. July—Sept. Fr. Aug.—October.

Obs. In the middle States, this is a troublesome Grass in Gardens, in the latter part of summer; and is frequent, also, in Indian-Corn fields,—but not difficult to be kept in reasonable subjection, by the early and free use of the "cultivator." Cattle will eat it,—but do not appear to be particularly fond of it: and indeed it is generally choked out of good pastures, by the prevalence of more acceptable grasses. It is said to be a serious pest, in the cultivated grounds of the Southern planters. Mr. Elliott—than whom there can be no better authority—has the following remarks on this plant:—"Grows every where on lands not inundated. Well known to planters under the name of Crab or Crop grass. It is the most troublesome grass our planters have to encounter in high ground culture, and though an annual, it is the best grass for hay at present known in our low country."

A very slender, smooth species (P. filiforme, L.), belonging to this sub-division, is often abundant in sandy pastures,—but is not very

important in any respect.

†† Inflorescence paniculate: branches of the panicle more or less divided; spikelets solitary, scattered.

2. P. CAPILLARE, L. Culm nearly simple; sheaths very hirsute; panicle large, capillary, loose, finally expanding; spikelets lanceolate, acuminate, smooth, on long scabrous peduncles. Kunth, Enum. 1. p. 114. Fl. Cestr. p. 45.

CAPILLARY OR HAIR-LIKE PANICUM.

Root annual. Culm assurgent or erect, usually 1 to 2 feet (occasionally only a few inches) high, sometimes branching. Leaves 3 to 8 or 10 inches long, lancelinear, rather broad, acuminate, nerved, hairy: sheaths sulcate-striate, very hirsute with spreading whitish bristly hairs; ligule short, fringed or beard-like. Panicle large and pyramidal; branches numerous, subdivided, very slender, straight,—at first erect, then spreading, finally divaricate. Spikelets small, often purple. Abertive floret without a superior palea. Perfect floret much shorter than the upper glume, lance-oblong, plano-convex, smooth and shining. Sandy pastures; cultivated grounds: throughout the U. States. Fl. Aug. Fr. September.

Obs. This worthless species flourishes most in a light sandy soil; but it is usually more or less abundant in all Indian-Corn fields, in the latter part of summer. In autumn, the dry culms break off, and the light divaricate panicles are rolled over the fields, by the winds, until they accumulate in great quantities, along the fences and hedges. Common, and remarkable as this grass is, I do not recollect to have ever heard a common name for it. This vast genus (containing upwards of 400 species,—a considerable number of which are indigenous, or found in our country) is remarkable for the

little value, or interest, which it possesses, in an agricultural point of view. With the exception of *P. miliaceum*, *L.*— and perhaps one or two other oriental species, which produce a kind of *Millet*—the whole multitudinous group are regarded as little better than mere *weeds*:—though none of them, so far as I know, are particularly obnoxious, or difficult to expel by judicious culture. The two here described, are inserted merely as samples of a numerous and somewhat variant family.

215. SETARIA. Beauv. [Pennisetum. Rich. Endl. Gen. 781.]
[Latin. Seta, a bristle; from the bristly involucres of the spikelets.]

Spikelets 2-flowered, invested with an involucre of persistent bristles,—the upper floret perfect—the lower one staminate or neutral, with 1 or 2 awnless paleae. Glumes 2, unequal, concave, awnless.

Staminate Fl. Paleae 2, membranaceous, with 3 stamens: sometimes the floret is neutral,—the upper palea and stamens being abortive. Perfect Fl. Paleae 2, coriaceous, concave, awnless,—the lower one embracing the 2-nerved upper one. Stamens 3. Scales 2, collateral, truncate, fleshy, smooth. Ovary smooth; styles 2, terminal, elongated; stigmas plumose, with simple hairs. Caryopsis free, compressed, included in the paleae. Inflorescence with the panicle often much condensed or spike-form.

1. S. GLAUCA, Beauv. Spike cylindric, tawny yellow; involucre of numerous fasciculate bristles much longer than the spikelets; paleae of the perfect floret transversely rugose. Kunth, Enum. 1. p. 149. Fl. Cestr. p. 51.

GLAUCOUS SETARIA. Vulgô-Fox-tail Grass.

Root annual. Culm 2 to 3 feet high, sometimes branching, often several from the same root, smooth. Leaves 6 to 12 or 15 inches long, somewhat glaucous, lance-linear, keeled, slightly scabrous, with a few long slender hairs at the base; sheaths striate, smooth; ligule short, fringed or beard-like. Spike 2 to 4 inches long, rather slender and quite cylindrical; rachis pubescent. Bristles of the involucre scabrous upwards, becoming tawny or orange-yellow. Staminate floret sometimes wholly abortive or neutral. Perfect floret plano-convex,—the paleae very firm and traversed by horizontal undulate wrinkles. Cultivated grounds; stubble fields, &c.: introduced. Native of India, and Continental Europe. Fl. Aug. Fr. September.

Obs. All the species of this genus (formerly referred to Panicum) are believed to be strangers, here. This one usually makes its appearance, in abundance, among the stubble after a wheat crop,—and is often seen in pastures, orchards, &c. when not kept down by the promotion of a more valuable growth. Cattle refuse the herbage, if better can be had; and the plant is altogether worthless,—except that poultry (especially turkies) are fond of stripping the spikes of their seeds, in the latter part of summer.

2. S. VIRIDIS, Beauv. Spike elliptic-oblong, green; involucre of 4 to 10 fasciculate bristles much longer than the spikelets; paleae of the perfect floret longitudinally striate, punctate. Kunth, Enum. 1.

p. 151. Fl. Cestr. p. 50.

Panicum viride, L. Fl. Lond. Icon, Vol. 1.

GREEN SETARIA. Vulgò-Green Foxtail. Bottle grass.

Root annual. Culm 1 to 2 or 3 feet high, branching near the base, rather slender. Leaves 3 to 6 or 8 inches long, lance-linear, flat, somewhat scabrous, minutely serrulate on the margin; sheaths striate, smooth, pilose on the margin;

ligule fringed or beard-like. Spike 1 to 3 inches long, somewhat compound or a little enlarged in the middle, often nearly cylindric; rachis hirsute with short hairs. Bristles of the involucre scabrous upwards, green. Sterile floret usually wholly abortive or neutral,—the upper palea very small. Paleae of the perfect floret smooth, puncticulate, striate longitudinally, with a slight transverse rugosity perceptible under a lens. Cultivated grounds; pastures, &c.: introduced. Native of Southern Europe. Fl. July—Aug. Fr. Aug.—September.

- Obs. This species is also naturalized to a considerable extent, and is about as worthless as the preceding,—but is not regarded as a serious nuisance.
- 3. S. Italica, Beauv. var. Germanica, Kunth. Spike compound, ovoid-oblong, yellowish-green; involucre of 4 to 8 bristles, unilateral, about as long as the spikelets; paleae of the perfect floret striately punctate, obscurely 3-nerved. Kunth, Enum. 1. p. 153.
- S. Germanica. Beauv. Fl. Cestr. p. 51.

ITALIAN SETARIA. Vulgò-Millet. Bengal-Grass.

Root annual. Culm 2 to 4 or 5 feet high. Leaves 6 to 12 and 18 inches long, lance-linear, rather broad, flat, serrulate on the margin; sheaths striate, pubescent on the margin; ligule beard-like. Spike compound (or rather a densely contracted panicle), 3 to 6 inches long,* ovoid-oblong or subcylindric; rachis densely hirsute with long hairs. Eristles of the involucre sometimes longer than the spikelets, yellowish. Sterile floret wholly abortive, or neutral,—the upper palea very minute. Paleae of the perfect floret smooth, minutely striate-punctate. Fields; cultivated as a fallow crop. Native of Europe and India. Fl. July. Fr. August.

Obs. Some years ago, the culture of this plant was introduced into Pennsylvania, and excited considerable interest, for a time, among the farmers,—as affording valuable fodder, when the usual hay-crop was likely to be deficient. It was soon found, however, not to be as valuable as the usual fallow crop (of Oats, or Barley), of which it occupied the place; and was, moreover, remarkably liable to damage from rain. The cultivation, therefore, soon declined,—and is now generally abandoned. There is another species (S. verticillata, Beauv.—with the spike composed of interrupted verticils of spikelets, and the involucre of retrorsely scabrous bristles, in pairs), which is becoming something of a nuisance, about gardens, in many places; but it seems scarcely, as yet, intitled to a more particular notice, here.

216. OPLISMENUS. Beauv. Endl. Gen. 778, [Greek, Oplismenos, armed; in reference to its echinate spikelets.]

Spikelets 2-flowered,—the lower floret staminate or neutral—the upper one perfect. Glumes 2, unequal, concave or somewhat keeled, mostly awned. Staminate Fl. Paleae 2, the lower one awned; sometimes the floret is NEUTRAL—the upper palea and stamens being abortive. Perfect Fl. Paleae 2, nearly equal,—the lower one acuminate, mucronate, embracing the 2-nerved upper one. Scales 2, collateral, truncate. Stamens 3. Ovary sessile; styles 2, terminal, elongated; stigmas plumose, with simple hairs. Caryopsis free, glabrous, inclosed by the paleae. Spikelets arranged in spikes,—the spikes racemose or paniculate.

1. O. CRUS GALLI, Kunth. Spikes alternate, secund, divided or

^{*}The paniculate spike, or contracted panicle, of a gigantic variety which grows wild along the marshy shores of the river Delaware, is often from 12 to 18 inches in length.

simple; florets imbricated; glumes and outer palea of the neutral floret hispid, awned or mucronate; outer palea of the perfect floret terminating in a scabrous awn; rachis hirsute. *Kunth*, *Enum*. 1. p. 143.

Panicum Crus Galli. L. Fl. Cestr. p. 49. Icon, Fl. Lond. 1.

COCKSPUR OPLISMENUS.

Root annual. Culm 2 to 5 feet high, rather coarse, smooth. Leaves 9 to 15 inches long, lance-linear, broadish, flat, nerved, serrulate on the margin; sheaths rather loose, compressed, striate, smooth; ligule none. Spikes sub-paniculate,—the spikelets crowded in dense spike-form compound racemes on the branches. Spikelets ovoid, plano-convex, echinate, awned or sometimes awnless; lower glume short, ovate, acute, 3-nerved,—the upper one as long as the perfect floret, ovate, acuminate, 5-nerved, with bristles on the nerves. Neutral floret with 2 paleae,—the lower one ovate, flat, with a scabrous awn or long acumination, 5-nerved—one of the nerves central, scabrous, the others marginal, in approximated pairs, presenting a double row of cartilaginous bristles,—the upper palea ovate, acute, thin and membranaceous, nearly as long as the perfect floret. Perfect floret plano-convex, acuminate,—the paleae firm, smooth and shining. Caryopsis compressed, orbicular, white or ash-colored. Moist grounds; meadows, drains of Barnyards, &c.: introduced? Fl. August. Fr. September.

Obs. Kunth gives this as an inhabitant of the four quarters of the globe; but I suspect it is a naturalized foreigner, here. There is a variety, in which the sheaths are hispid and another in which the floral coverings are awnless. In every form, it is a coarse worthless grass—in fact a mere weed,—apt to abound along the drains of crude liquid, flowing from barn-yards,—and in spots which are usually designated as "wet and sour." It is readily expelled, however, by a proper management. Frequent and conspicuous as this grass is, I do not know that it has acquired any common name, in Pennsylvania.

217. CENCHRUS. L. Endl. Gen. 783.

[Greek, Kenchros, Millet; probably applied, originally, to some other plant.) Spikelets involucrate, 2-flowered,—the lower floret staminate or neutral—upper one perfect: sometimes the spikelet is solitary—sometimes 2 or more are crowded within a multifid involucre, which is externally muricate with spinose bristles—finally indurated, and falling off with the spikelets. Glumes 2, unequal, membranaceous. Staminate Fl. somewhat resembling the perfect one,—sometimes Neutral, by the abortion of the stamens and upper palea. Perfect Fl. Paleae 2, subcoriaceous, concave,—the lower one embracing the upper one. Stamens 3. Scales 0. Ovary sessile, glabrous; styles 2, terminal, elongated, sub-connate at base; stigmas plumose, with simple denticulate hairs. Caryopsis free, somewhat compressed, included in the paleae.

1. C. TRIBULOIDES, L. Involucre subglobose, pubescent, spinosely muricate, split on one side. *Kunth? Enum.* 1. p. 166. Fl. Cestr. p. 52. Tribulus-like Cenchrus. *Vulgò*—Bur-grass. Hedge-hog Grass.

Root annual. Culm 1 to 2 feet long, usually oblique or procumbent, geniculate, branching, smooth. Leaves 3 to 6 or 8 inches long, lance-linear, acuminate, slightly scabrous on the margin; sheaths loose, smooth; ligule beard-like. Raceme terminal, of 6 to 12 or 14 alternate involuerate heads or clusters; rachis angular, flexuose, slightly scabrous. Involuere urceolate or subglobose, laciniate, usually split to the base on one side, hairy, armed externally with rigid subulate scabrous spines, villous within, embracing 1, 2, or 3 spikelets. Sterile floret mostly staminate. Sandy fields. Fl. Aug. Fr. Sept.

Obs. Our plant appears to agree more nearly with the description of C. echinatus, in Kunth's Enumeration: but Dr. Torrey expressed the opinion to me, that "it is doubtful whether the true C. echinatus inhabits N. America; our two species (as some call them)

being merely forms of C. tribuloides."

The plant is very abundant, in the sandy districts of New Jersey,—and has found its way to some of the slaty hills of Pennsylvania. It is altogether a worthless grass; and the prickly involucres are a grievous nuisance, wherever it prevails in cultivated grounds, or about houses. It ought to be most carefully and thoroughly extirpated, on its first appearance in any agricultural region.

TRIBE V.* AGROSTIDEAE. Kunth.

Spikelets 1-flowered,—very rarely with the subulate rudiment of a second superior one. Glumes and Paleae 2, membranaceously herbaceous,—the lower palea often awned. Stigmas mostly sessile.

218. MUHLENBERGIA. Schreb. Endl. Gen. 803. [In honor of Rev. Henry Muhlenberg,—an early and eminent American Botanist.] Spikelets 1-flowered,—the flower sessile, bearded at base. Glumes 2, unequal, usually much shorter than the paleae, awnless or with a short awn. Paleae 2, herbaceous, finally slightly indurated,—the lower one awned at apex—the upper one 2-keeled. Scales 2, membranaceous, entire. Stamens 3,—the filaments connate at base with the stipe of the ovary. Ovary stipitate, glabrous; styles 2, terminal; stigmas plumose, with simple hairs. Caryopsis free, subterete, glabrous, covered by the paleae.

1. M. DIFFUSA, Willd. Culms filiform, decumbent, branching, diffuse; leaves short, spreading; panicles terminal and lateral, contracted and slender; glumes unequal, very minute; awn about as long as the palea. Kunth, Enum. 1. p. 200. Fl. Cestr. p. 58. Specim. Gray, Gram. 2. No. 106.

Spreading Muhlenbergia. Vulgò—Dropseed Grass. Nimble Will.

Root perennial. Culm 6 to 12 and 18 inches long, decumbent, geniculate, compressed, very slender and rather wiry, glabrous, much branched,—the branches assurgent. Leaves 1 to 2 or 3 inches in length, divaricate, lance-linear, acute, roughish; sheaths rather open, striate, pubescent at throat; ligule very short, finally lacerate or ciliate. Panicles 3 to 6 or 8 inches long, very slender, often purplish,—the branches alternate, rather distant, appressed, scabrous; spikelets all pedicellate, racemose. Glumes persistent, very minute,—the lower one a mere rudiment—the upper one truncate, laciniate-dentate. Paleae unequal,—the lower one longer, almost triangular, with 3 prominent scabrous nerves, and terminating in a slender scabrous awn, which is generally a little longer than the palea itself. Caryopsis linear-oblong, acute, brown. Pastures; yards; and borders of dry open woodlands. Fl. Aug.—Sept. Fr. Sept.—October.

Obs. This slender grass often appears in considerable quantity, in the latter part of summer, in fields which have been kept up some years for pasture. Cattle feed on it; but it is not so valuable as

*The 4th Tribe (STIPACEAE, Kunth.) contains no plant of importance in American Agriculture. The genus Stipa—the representative of the Tribe—contains a species (S. tenacissima, L. macrochloa, Kunth—the Esparto, of the Spaniards,) which is much used in the Southern provinces of Spain, in the manufacture of cordage, matting, sacks, &c. There is also, in Europe, another species of Stipa (S. pennata, L.), which is a curiosity, on account of its very long and beautifully feathered awars.

several of the other grasses, herein mentioned. It is said to be known, in Kentucky, by the name of "Nimble Will." In Pennsylvania, it has scarcely been noticed, by the farmers, sufficiently to acquire a common name.

2. M. Mexicana, Trin. Culms slender, ascending, nodose, much branched; panicles terminal and lateral, contracted; glumes acuminate, nearly as long as the paleae; paleae nearly equal, pilose at SPECIM. Gray, Gram. 1. no. 14.

Cinna Mexicana. Kunth, Enum. 1. p. 206.

Agrostis lateriflora. Mx. Fl. Cestr. p. 56.

MEXICAN MUHLENBERGIA.

Root perennial, creeping. Culms erect or ascending, 1 to 2 or 3 feet high, slender and wiry, with numerous swelling nodes, much branched and leafy above, often becoming nearly naked below. Leaves 2 to 4 or 5 inches long, lance-linear, acute, nerved, scabrons—especially on the upper surface; sheaths smooth, compressed and but partially embracing the culm; ligute short, obtuse and lacerate. Panicles numerous, 2 or 3 inches in length, contracted and rather dense-flowered,—the lateral ones partly sheathed at base. Glumes narrow-lanceolate, with scarious margins and a subulate point. Paleae usually longer than the glumes (sometimes twice as long),—the lower one occasionally terminating in an awn. Moist grounds; borders of fields, and woodlands. Fl. Aug. Fr. September.

Obs. This species affords an indifferent pasture, in the latter part of summer; but it is not of much worth. It is better to supersede these—and all grasses of inferior quality—by the introduction of more valuable ones,—and it can be done, by the aid of lime and manure. When the soil is enriched, and properly managed, the better kinds of natural Grasses (especially Poa & Festuca) soon come in, spontaneously, and expel the others.

219. AGROSTIS. L. Endl. Gen. 810.

[Greek, Agros, a field; being eminently an occupant of fields and meadows.] Spikelets 1-flowered,—sometimes with the pedicel, or rudiment, of a second superior floret. Glumes 2, keeled, awnless, nearly equal, usually much longer than the floret. Paleae 2,-the lower one awned on the back, or rarely awnless-the upper one 2-keeled, sometimes very small or obsolete. Scales 2, nearly entire. Stamens usually 3. Ovary glabrous; stigmas 2, terminal, subsessile, plumose. Caryopsis free.

1. A. VULGARIS, With. Culms slender, mostly erect; leaves lancelinear; panicle loose, ovoid-oblong in its outline,—the branches spreading, finally divaricate; paleae awnless,—the lower one twice the size of the upper one. Kunth, Enum. 1. p. 220. Fl. Cestr. p. 55.

A. polymorpha. Huds. Gray, Gram. 2. Specim. No. 108.

Common Agrostis. Vulgo-Herd-grass (of Penna.). Red-top.

Root perennial, crceping. Culms cespitose, very slender, erect or ascending, 1 to 2 feet high. Leaves 3 to 6 or 8 inches long, nerved, scabrous; sheaths striate, smooth; ligule short, truncate. Panicle mostly purple,—the branches capillary, alternatingly semiverticillate, smoothish or often scabrous. Glumes smooth, except on the keel, lanceolate, acute, finally expanding. Paleae membranaceous, smooth at base,—the lower one nearly as long as the glumes—the upper one very small, retuse. Pastures, and moist meadows: introduced. Native of Europe. Fl. July. Fr. August.

obs. This grass is somewhat variable in its botanical characters—as may be inferred from one of the specific names it has received: viz. A. polymorpha. It is often cultivated in some districts of the country,—and answers a tolerably good purpose in wet or swampy meadows, which its roots tend to consolidate: but it is not among the most esteemed grasses—either for pasture or hay. It should be borne in mind, by dealers in Seeds, that this is not the "Herd-grass" of New York, and New England,—which is Phleum pratense, or Timothy. The whole Genus (Agrostis,) is known, in England, by the name of "Bent Grass,"—and one of the species (A. stolonifera, Willd.), was quite celebrated, some years ago, under the name of "Fiorin Grass"—as being superior to all others for yielding great crops of hay; but, like many other plants whose value has been exaggerated, it has nearly ceased to attract notice.

TRIBE. VI. ARUNDINACEAE. Kunth.

Spikelets sometimes 1-flowered, with or without the pedicel or rudiment of a second superior floret—sometimes many-flowered. Flowers mostly clothed, or invested at base, with long soft hairs. Glumes and Paleae 2, membranaceously herbaceous,—the glumes equalling or exceeding the florets—the lower palea awned or awnless. Mostly tall grasses.

220. PHRAGMITES. Trin. Endl. Gen. 824.

[Greek, Phragmos, a partition, or hedge; from the use said to be made of it.] Spikelets 3 to 6-flowered: florets distichous, rather distant, not hairy at base,—the lowest one staminate, the others perfect; rachis clothed with long silky hairs. Glumes keeled, acute,—the upper one larger. Paleae membranaceous,—the lower one elongated, narrow-subulate—the upper one 2-keeled. Scales 2, entire. Stamens 3. Ovary sessile, glabrous; styles 2, terminal, elongated; stigmas plumose,—the hairs thickish, simple or sometimes branched, papillose-dentate. Caryopsis free.

1. P. communis, Trin. Panicle large, loosely expanded; spikelets 3 to 5-flowered. Kunth, Enum. 1. p. 251. Specim. Gray, Gram. 2. no. 127.

Arundo Phragmites. L. Fl. Cestr. p. 61.

Common Phragmites. Vulgò—Reed-Grass.

Fr. Roseau à balais. Germ. Gemeines Rohr. Span. Caña.

Root perennial. Culm 8 to 12 feet high, and often an inch or more in diameter at base, nodose, terete, glabrous. Leaves 1 to 2 feet long, and about 2 inches wide at base, linear-lanceolate, attenuated at apex, glancous scabrous on the margin; sheaths closely embracing the culm, smooth; ligule very short, pilose or fimbriate. Panicle terminal, large,—the branches smoothish, long, slender, semi-verticillate, with a tuft of soft hairs at base. Spikelets lance-linear, erect, pedunculate, 3 to 5- (mostly 3?) flowered. Lowest floret stammate, sessile, naked at base; upper florets pedicellate,—the pedicels finally clothed with long white silky hairs which are nearly as long as the florets (these hairs scarcely perceptible on the young panicle). Paleae very unequal,—the lower one with a long slender acumination, which is involute, resembling an awn. Margins of swamps, and swampy streams. Fl. August. Fr. September.

Obs. This grass appears to be indigenous in both hemispheres. It possesses but little agricultural interest: yet, being so remarkably large (rivalling Indian Corn, in size), I have concluded to give it a place, here.

TRIBE VIII.* CHLORIDEAE. Kunth.

Spikelets arranged in unilateral spikes, 1 or many-flowered, with the upper florets abortive. Glumes and Paleae 2, membranaceously herbaceous,—the glumes persistent on the rachis, the outer one superior—the paleae awnless or awned. Spikes digitate or paniculate, rarely solitary; rachis not articulated.

221. CYNODON. Rich. Endl. Gen. 836. [Greek; literally Dog's tooth; but the reason is not obvious.]

Spikes digitate, in pairs, or racemose. Spikelets with 1 perfect floret,—and sometimes with the subulate pedicel or abortive rudiment of a second superior floret. Glumes keeled, awnless, nearly equal, the upper one exterior. Paleae membranaceous,—the lower one keeled, acute, awnless, or sometimes mucronulate—the upper one 2-keeled. Scales 2, fleshy, mostly connate. Stamens 3. Ovary sessile, glabrous; styles 2, terminal; stigmas plumose, with simple hairs. Caryopsis free, inclosed in the paleae.

1. C. Dactylon, *Pers.* Spikes 3 to 5, digitate, spreading; paleae longer than the glumes, glabrous, somewhat ciliate, with a beardless bristle at the base of the inner one. *Kunth*, *Enum.* 1. p. 259.

FINGER CYNODON. Vulgò—Bermuda Grass. Dog's-tooth Grass.

Root perennial, fibrous, creeping (numerous slender rhizomas). Culm procumbent, radicating, 6 to 12 or 15 inches long, terete, smooth. Leaves 1 or 2 to 4 inches long, acute, somewhat distichous and rigid, slightly hairy and scabrous; sheaths longer than the internodes, hairy; ligule beard-like. Spikes 3 to 5 (usually 4), 1 to 2 inches long; rachis flexuose and angular, not winged. Scales obovate, half as long as the ovary. Stigmas dark purple. Loose sandy soils; Southern States: introduced? Fl. All summer (Ell.). Fr.

Obs. This grass (which, I am inclined to think, is a foreigner) has never come under my notice, in Pennsylvania; but I have received specimens from Virginia. I should judge it to be a grass of doubtful value, and equivocal character, in agriculture-compared with our better species. Mr. Elliott gives the following account of it [under the name of Digitaria Dactylon], as observed in S. Carolina:— "We have two varieties of this plant, one coarser (perhaps a species) growing in damp soils, native; the other described above, said to be imported, a tender, delicate grass, growing over and binding the most arid and loose lands in our country, and apparently preferred by stock of all descriptions to every other grass. The cultivation of this grass on the poor and extensive sand hills of our middle country would probably convert them into sheep walks of great value; but it grows in every soil, and no grass in close rich land is more formidable to the cultivator; it must therefore be introduced with caution." Sir James Edward Smith, the Botanical Editor of Rees! Cyclopaedia, has the following remarks [Art. PANICUM dactylon], in reference to the plant:-"This grass was perceived by Mr. LAM-BERT, to be no other than the Agrostis linearis, of Koenig, Retzius, and WILLDENOW, - the Durva of the Hindoos, - which the late Sir WILLIAM JONES, in the 4th volume of the Asiatic Researches, has celebrated for the extraordinary beauty of its flowers, and its sweetness and nutritious quality as pasture for cattle. We cannot but remark what extraordinary celebrity is attached, every now and

^{*}The 7th Tribe (PAPPOPHOREAE, Kunth,) contains no plant of Agricultural importance.

then, to one grass or other, and how their fame passes away 'like the morning cloud,' while the best graziers scarcely know, perhaps, better than their fat cattle, any thing of the nature of the common never-failing herbage, to which they are both so much indebted."

222. ELEUSINE. Gaertn. Endl. Gen. 841.

[Named from Eleusis; where Ceres the Goddess of harvests, was worshipped.] Spikes digitate-fasciculate, rarely 1 or 2. Spikelets unilateral, sessile, 2 or many-flowered,—the florets distichous, all perfect. Glumes shorter than the florets, keeled, awnless. Paleae membranaceous, awnless,—the lower one keeled—the upper one with 2 keels. Scales 2, emarginately 2-lobed. Stamens 3. Ovary sessile, glabrous; styles 2, terminal; stigmas plumose, with simple hairs. Caryopsis free,—the epicarp membranaceous, opening spontaneously; seed transversely rugose.

1. E. Indica, Gaertn. Culm compressed, decumbent; spikes 2 to 4 or 6, linear, straight, digitate; spikelets lance-ovate, about 5-flowered. Kunth, Enum. 1. p. 272. Fl. Cestr. p. 81.

Indian Eleusine. Vulgò-Dog'stail Grass. Crow-foot Grass.

Root annual. Culm 6 to 12 and 18 inches long, oblique or often nearly procumbent, smooth, branching at base. Leaves 2 to 12 inches long, rather crowded and distichous at the base of the culm, linear, often inclined to be conduplicate, smooth or sparingly pilose; sheaths loose, striate, glabrous, pilose at throat; ligule very short, truncate, minutely dentate. Spikes 2 to 4, sometimes 6 (rarely 1), 1 or 2 to 4 inches long; rachis compressed. Spikelets imbricated, smooth. Lower paleae ovate-lanceolate, with a green keel,—the upper one a third shorter, somewhat conduplicate, with 2 keels. Caryopsis triangular-ovoid, dark brown, transversely rugose,—the epicarp a thin arillus-like membrane. Farm-yards, lanes, and along foot-paths: introduced? Fl. Aug.—Sept. Fr. Sept.—October.

Obs. This grass has, to me, the appearance of being a naturalized foreigner,—though no American Botanist speaks of it as such. It is usually to be seen in abundance, in lanes and woodyards, about farm-houses, in *Pennsylvania*, during the latter part of summer,—where it grows very thick, and forms a fine carpeting in spots which had been previously naked and muddy. Cattle and hogs are fond of it,—and Mr. Elliott commends it for hay; but in this region, it rarely grows in mowing grounds, to any considerable extent.

There is another species (E. coracana, Gaertn.), which is "cultivated, as corn, under the name of Natchenny, upon the Coromandel coast." I believe it is unknown in this country,—and probably

would not be worth introducing.

TRIBE IX. AVENACEAE. Kunth.

Spikelets 2- or many-flowered,—the terminal floret mostly blighted or abortive. Glumes and Paleae 2, membranaceously herbaceous; lower palea mostly awned,—the awn often dorsal, and twisted.

223. AVENA. L. Endl. Gen. 864. [A classical Latin name; applied to this genus.]

Spikelets 2 to 5-flowered; florets rather distant,—the uppermost one blighted. Glumes nearly equal, awnless, loose and membranaceous. Paleae herbaceous,—the lower one mostly bicuspidate at apex, with a twisted awn on the back—the upper one two-keeled, awnless. Scales 2, bifid, rather large. Stamens 3. Ovary sessile, hirsute at

summit; stigmas 2, sessile, distant, villously plumose, with simple hairs. Caryopsis subterete, sulcate on the inner or upper side, hairy at summit, usually closely embraced by the paleae, and adherent to the upper one.

1. A. SATIVA, L. Panicle regular; spikelets 2-flowered, pendulous; florets shorter than the glumes, naked at base,—the lower one mostly awned. Kunth, Enum. 1. p. 301. Fl. Cestr. p. 67.

Cultivated Avena. Vulgò-Oats. Common Oats. Fr. Avoine cultivée. Germ. Gemeiner Hafer. Span. Avena.

Root annual. Cu'm 2 to 4 feet high, smooth. Leaves 6 to 12 or 15 inches long, lance-linear, nerved, scabrous; sheaths striate, smooth, rather loose; ligule lacerate. Panicle loose, somewhat nodding,—the spikelets all pedunculate, pendulous. Lower floret mostly awned on the back; upper floret awnless,—with a pedicel at the base of the upper palea, bearing, at its summit, membranaeous rudiments of a third floret. Caryopsis closely invested by the smoothish shining subcartilaginous paleae. Fields; cultivated as a fallow crop. Fl. July. Fr. August.

Obs. The native country of this plant—as of most of our cultivated grains—seems to be somewhat uncertain,—though this one is said to have been found native in the island of Juan Fernandez. Oats are extensively cultivated, in this country,—chiefly as food for horses. Dr. Johnson took occasion, in compiling his Dictionary, to fling a sarcasm at the Scotch, by defining oats to be the food of Horses in England, and of Men in Scotland,—as if the effects of climate were a fit subject on which to taunt a people! Yet this was but one of many instances, of his national prejudice and illiberality.

This grain succeeds better than Barley, in a thin soil; and is therefore frequently employed, in the rotation of crops, when Barley would have been preferred, had the land been good. The A. nuda, L. called "skinless oats,"—a species nearly allied to this, but with 3 to 5-flowered spikelets, and the caryopsis loosely covered by the paleae,—has been partially cultivated, by the curious, on account of its superior fitness for making Oat-meal, as an article of diet for

the sick.

224. ARRHENATHERUM. Beauv. Endl. Gen. 865. [Greek. Arrhen, male, and ather, an awn; the stammate floret being awned.] Spikelets somewhat 3-flowered,—the lowest floret being stammate, the second one perfect, and the third an abortive filiform rudiment. Glumes concave, awnless,—the upper one longer, equalling the florets. Stammate Fl. Paleae 2,—the lower one concave, awned on the back—the avn elongated, twisted at base; upper paleae 2-keeled, awnless. Stamens 3. Ovary obsolete. Perfect Fl. Paleae 2,—the lower one concave, slightly bifid at apex, awned on the back—the awn short, straight; upper palea 2-keeled. Scales 2, elongated, lance-linear, entire. Stamens 3. Ovary sessile, hairy at summit; stigmas 2, terminal, villously plumose,—the hairs simple, sharply serrulate. Caryopsis sub-terete, sulcate on the upper side, adherent to the upper palea.

1. A. AVENACEUM, Beanv. Leaves flat; panicle oblong, contracted, finally spreading. Kunth, Enum. 1. p. 307.

Avena elatior. L. Fl. Cestr. p. 66.

Holcus avenaceus. Scop. Fl. Lond. Icon, Vol. 1.

OAT-LIKE ARRHENATHERUM. Vulgà—Oat-grass. Grass of the Andes. Fr. Avoine elevée. Germ. Wiesen Hafer.

Root perennial, creeping, nodose. Culm about 3 feet high, glabrous. Leaves 4 to 8 or 10 inches long, lance-linear, scabrous on the margin and upper surface; sheaths striate, smooth; ligule short, retuse. Panicle linear-oblong, finally spreading and somewhat nodding,—the branches short, semi-verticillate. Glumes unequal,—the lower one shorter than the florets. Upper palea of the perfect floret with the filiform rudiment of a third floret at its base. Cultivated lots: introduced. Native of Europe. Fl. May. Fr. July.

Obs. This grass has been partially introduced, and cultivated, by a few curious farmers; but it does not appear to be much of a favorite, either for pasture or hay, in Pennsylvania. It is sometimes called "Grass of the Andes,"—but I know not for what reason, as it seems to be of undoubted European origin.

TRIBE X. FESTUCACEAE. Kunth.

Spikelets usually many-flowered. Glumes and Paleae 2. membranaceously herbaceous, rarely coriaceous,—the lower palea often awned—the awns not twisted. Inflorescence generally paniculate.

SUB-TRIBE 1. BROMEAE. Endl. Herbeceous grasses. Stamens 3.

225. POA. L. Endl. Gen. 876. [Greek, Poa, herbage, or pasture; applied by way of emmence to this genus.] Spikelets 2 to many flowered,—the florets distichous, perfect. Glumes awnless, unequal or sometimes nearly equal. Paleae awnless,—the lower one keeled or concave—the upper one 2-keeled.* Scales 2, entire or bifid. Stamens mostly 3. Ovary sessile, glabrous; styles 2, terminal; stigmas plumose,—the hairs simple, sharply serrate-denticulate. Caryopsis free, or rarely adherent to the upper palea.

IF Spikelets paniculate, compressed; florets generally 3 to 5, rather distant, often connected by a villous web at base; lower palea herbaceous, with a diaphanous margin, commonly 5-nerved. LEGITIMATE OR GENUINE POAS, Kunth.

1. P. Annua, L. Culms oblique, subcompressed, sometimes radicating at base; leaves rather short; ligules oblong; panicle subsecund, divaricate,—the branches smooth, solitary or in pairs, finally deflected; spikelets oblong-ovate, about 5-flowered,—the florets not villous at base. Kunth, Enum. 1. p. 349. Fl. Cestr. p. 76. Icon, Fl. Lond. 1.

Annual Poa. Vulgà-Dwarf, or Early Meadow-Grass. Fr. Paturin annuel. Germ. Jachriges Rispengras.

Root annual. Culms cespitose, 3 to 6 or 8 inches long, smooth, geniculate, oblique at base, or often nearly procumbent. Leaves 1 to 3 inches in length, sublinear, acute, keeled, smooth, minutely serrulate on the margin; sheaths loose, smooth; ligule oblong, dentate. Panicle sometimes rather secund.—the branches often solitary, subdivided. Spikelets rather crowded on the divisions of the branches, 3 or 4 to 6- (very often 3-) flowered. Gluenes unequal, acuminate, with scarnous margins. Paleae minutely pubescent, but destitute of the villous web,—the lower one ovate, obtuse, 5-nerved—the upper one a little shorter, scarious, with 2 green keels. Cultivated grounds; pastures; along foot-paths, &c. introduced? Native of Europe. Fl. April—Sept. Fr. June—Octo.

*It is probable that the "2-keeled" upper palea—so frequent in the Grasses, and so obvious in this, and the following tribe—in reality consists of two collateral keeled paleae, united by their contiguous margins, while the outer margins are inflexed, or folded in,—leaving the two keels apparently at the two edges of the upper palea.

- Obs. This little species—which was probably introduced from Europe—comes forward early in the spring,—and what little pasture it affords is tolerably acceptable to Stock: but it is far inferior in value and importance to either of the following.
- 2. P. TRIVIALIS, L. Culm and sheaths somewhat scabrous; leaves lance-linear, flat, acuminate; ligule elongated, acute; panicle diffuse, regular,—the branches scabrous; spikelets ovate, 2 to 3-flowered,—the florets slightly villous at base. Kunth, Enum. 1. p. 352. Fl. Cestr. p. 75. Icon, Fl. Lond. 1.

TRIVIAL POA. Vulgò-Rough-stalked Meadow-Grass.

Root perennial. Culm 1 to 2 or 3 fect high, subterete or slightly ancipital, often declined at base, generalate, and stoloniferous, somewhat scabrous retrorsely. Leaves 2 or 3 to 6 or 8 inches long, lance-linear (those of the root or suckers long and narrow), acute or acuminate, slightly scabrous on the margin; sheaths striate-nerved, scabrous when rubbed upwards; ligule much elongated, scarious and whitish. Panicle loose, expanding,—the branches semi-verticillate in about fives, sharply scabrous. Spikelets usually 2- (sometimes 3-) flowered. Glumes scabrous on the keel,—the lower one rather shorter, very acute—the upper one 3-nerved, with a scarious margin. Paheae unequal, nearly smooth or very slightly villous at base,—the lower one longer, 5-nerved, scarious at apex. Moist low grounds; meadows, and woodlands: introduced? Fl June. Fr. July.

- Obs. This species (also, perhaps, a foreigner) is frequent in moist pastures and meadows,—and affords a good forage, both pasture and hay. It has much general resemblance to the following species (P. pratensis), when growing in open grounds; but is decidedly inferior in value,—and may be readily distinguished from it, by the elongated ligule and retrorsely scabrous sheaths and culms. In woodlands, it is often a weak straggling plant.
- 3. P. PRATENSIS, L. Culm and sheaths smooth; leaves linear, keeled, abruptly acute; ligule short, truncate; panicle somewhat crowded, regular, finally spreading; spikelets ovate, acute, 3 to 5-flowered; florets connected by a villous web. Kunth, Enum. 1. p. 352. Fl. Cestr. p. 74. Icon, Fl. Lond. 1.

Also, P. viridis. Muhl. Kunth. l. c. [Meadow Grass. Meadow Poa. Vulgò—Spear Grass. Green Grass. Smooth-stalked Fr. Paturin des Prés. Germ. Vieh-gras. Wiesen Rispen-grass.

Reot perennial, creeping. Plant smooth. Culm erect, 1 to 2 or 3 feet high, siender, terete. Radical leaves often very numerous, and long (1 to 2 feet or more in length, in good soils), scarcely a line wide and exactly linear, terminating abrupily in a boatshaped or keeled point, deep green, slightly scabrous on the margin,—the culm leaves shorter than the structenerved glabrous sheaths; ligule scarious, short, obtuse, often crenate-dentate. Panicle at first rather crowded, at length expanding and pyramidal.—the branches semi-verticillate, 3 to 5 from a node, flexuose and nearly smooth. Spikelets pedicellate, a little crowded on the branches; 2 or 3 to 5-flowered: florets acute, connected at base by cobweb-like hairs. Glumes a little unequal, compressed, keeled, sharply acuminate. Lower palea somewhat compressed, acute, 5-nerved,—the upper one acuminate. slightly scabrous on the two keels. Fields, meadows, and woodlands: introduced? Fl. May—June. Fr. July.

Obs. This species (supposed to be a naturalized foreigner,) varies considerably, in size and appearance, when growing in different soils and situations. In our best soils, the radical leaves are very long and luxuriant,—when it is known by the name of "Green Grass." In Kentucky, it is commonly called "Blue Grass,"—a name which properly belongs to the following species (P. compressa,

- L.). It is the profusion of the nutritious radical leaves, which constitutes the chief excellence of this grass. It is, indeed, as Muhlenberg terms it, "optimum pabulum,"—being decidedly the most valuable of all the grasses known in our pastures. It has not been found necessary, in Pennsylvania (of latter years, at least), to cultivate it, by sowing the seed; for when the land is duly prepared by lime and manure, it soon takes possession of the soil—or comes in, as the farmers term it,—and supersedes the artificial grasses. The prevalence, therefore, and luxuriant growth of this grass, is one of the best evidences of the land being in good condition, and well managed. In very poor land, it deteriorates so much that it would scarcely be recognised as the same plant. The slender culms, of this species, afford an excellent material for the manufacture of the finer kinds of Leghorn hats.
- 4. P. COMPRESSA, L. Culm oblique or declined at base, much compressed; panicle contracted, somewhat secund; spikelets oblong-ovate, 3 to 6-flowered; florets connected by a villous web. Kunth, Enum. 1. p. 355. Fl. Cestr. p. 76. [Meadow Grass.]

Compressed Poa. $Vulg\hat{j}$ —Blue Grass. Wire Grass. Flat-stalked Fr. Paturin applati. Germ. Rehwasen.

Root perennial creeping (numerous branching rhizomas). Plant smooth with rather few and short radical leaves. Culm9 to 18 inches long, often procumbent and radicating at base. Leaves 2 or 3 to 5 or 6 inches long, linear, keeled, roughish near the end, and, with the culm, of a bluish-green or glaucous hue; sheaths rather loose, striate; ligule short, obtuse. Panicle contracted,—at first almost spicate and rather secund—finally a little expanding; the branches by twos and threes, short, somewhat flexuose and scabrous. Spikelets generally 5 or 6-flowered, subsessile. Glumes nearly equal, acute, serrulate on the keel. Lower palea minutely pubescent, often dark purple near the apex, with a narrow white scarious margin: upper palea scabrous on the two keels. Caryopsis oblong, reddish-brown. Upland fields, and pastures: introduced? Fl. June. Fr. July.

Obs. This species—which, though rarely if ever cultivated, yet finds its way into most pastures—is not held in so high estimation, by our farmers, as the one-next preceding,—and certainly falls far short of it, in the quantity of herbage afforded; but that which is afforded, is, in my opinion, even more nutritious. Cows which feed on it, yield the richest milk, and finest butter. The creeping roots (or rhizomas) are remarkably tenacious of life,—and in consequence, are sometimes rather troublesome, in cultivated grounds, among other crops: but, on the whole, it is an excellent grass—especially in Dairy and sheep pastures. It seems rather probable, that this—as well as all the preceding species—has been introduced from Europe.

226. GLYCERIA. R. Br. Endl. Gen. 878.
[Greek, Glykys, sweet; on account of the sweet taste of the seeds.]

Spikelets many-flowered,—the florets perfect, imbricately distichous. Glumes concave, obtuse,—the lower one shorter. Paleae nearly equal,—the lower one elliptic-ovate, rounded at apex or obsoletely 3-lobed, 7-nerved,—the upper one 2-keeled. Scales 2, truncate, more or less connate. Stamens mostly 3. Ovary sessile, glabrous; styles 2, terminal, elongated, divaricate; stigmas plumose,—the hairs dichotomous, denticulate, hyaline. Caryopsis free, oblong.

1. G. FLUITANS, R. Br. Panicle long, slender, secund; spikelets linear, about 10-flowered; florets distinct, obtuse; lower palea conspicuously 7-nerved, eroded or many-toothed at apex. Kunth, Enum. 1. p. 367. Fl. Cestr. p. 72. Icon, Fl. Lond. 1.

FLOATING GLYCERIA. Vulgò-Manna Grass.

Fr. Manne de Prusse. Germ. Essbarer Schwingel.

Root perennial, creeping. Culm 4 to 6 feet high, erect or ascending, compressed, glabrous. Leaves 5 to 8 or 10 inches long, lance-linear, striate, scabrous on the margin and upper surface; sheaths nerved, smooth; ligule very large, oblong, membranaceous, acute or sometimes obtuse. Paniele slender, 12 to 15 inches long, usually partly concealed in the sheath of the upper leaf,—the branches mostly simple. Spikelets about an inch long, nearly sessile, racemose on the branches and appressed. Glumes membranaceous, nerveless. Upper palea emarginate or bidentate at apex,—the margins folded in, and a green keel at each apparent border. Caryopsis oblong, sulcate on the upper side. Wet low grounds; margins of shallow pools, &c. Fl. June. Fr. July.

Obs. This stout semi-aquatic grass is common to both hemispheres. The seeds have a sweetish taste,—and in some parts of the old world—where they are known by the name of Manna seeds—they are used by the poorer peasantry in making soups and gruels. In the U. States, the country people, as yet, are happily ignorant of all such expedients,—and will long continue so, if they have industry enough to cultivate more valuable grains. The herbage of this plant is eaten by Stock; but it is so much confined to wet localities, that it is scarcely intitled to be enumerated among the grasses interesting to American farmers.

227. DACTYLIS. L. Endl. Gen. 892.

[Greek, Daktylos, a finger; in reference to the spiked inflorescence.]

Spikelets 2 to 7-flowered, compressed, densely clustered,—the florets perfect. Glumes unequal in length, with somewhat unequal sides, keeled, mucronately awned or acuminate, somewhat unilateral at apex,—the upper one often smaller, thinner, nerveless and concave. Paleae herbaceous,—the lower one 5-nerved, keeled, mucronately awned, the keel ciliate—the upper one 2-keeled. Scales 2, bifid. Stamens 3. Ovary sessile, glabrous; styles 2, terminal, short; stigmas plumose,—the hairs simple or bifid, sharply denticulate. Caryopsis free.

1. D. GLOMERATA, L. Panicle distantly branched, rather secund; spikelets 3 or 4-flowered, in dense unilateral clusters at the ends of the branches. *Kunth*, *Enum.* 1. p. 386. *Fl. Cestr.* p. 80.

Clustered Dactylis. Vulgò—Orchard Grass. Cock's-foot Grass. Fr. Dactyle pelotonnè. Germ. Gemeines Knauel-gras.

Whole plant scabrous. Root perennial. Culm 2 to 3 or 4 feet high. Leaves 6 to 18 inches long, lance-linear, keeled, glaucous; sheaths striate; ligule elongated, lacerate. Panicle glaucous, contracted, racemose at summit, rather one-sided; branches 3 to 5, solitary, erect, distant, subdivided towards the extremity. Spikelets about 4-flowered, compressed, crowded in dense unilateral ovate or lance-oblong clusters at the ends of the branches. Glumes unequal,—the lower one narrower, membranaceous—the upper one 3-nerved, scabrous on the keel. Lower palea scabrous, 5-nerved, emarginate, ciliate on the keel, which is extended into a cusp or short scabrous awn; upper palea acuminate, bifid at apex, ciliate on the two green keels,—the margins folded in so as to meet, embracing the stamens. Caryopsis lance-oblong, subtriquetrous, acute at each end. Fields, and Orchards: cultivated. Native of Europe. Fl. May. Fr. June.

Obs. This grass has been introduced, and cultivated to a considerable extent. Our farmers, however, are not agreed upon its merits. Some condemn it as unworthy of culture, either for pasture or hay; while others set a high value on it, for both. The fact seems to be, that it is inferior to Timothy (Phleum pratense, L.) for hay; yet it has the advantage of the latter, in being mature at the same time with clover,-with which both are usually cultivated. It is also less exhausting to the soil. But its great value is as a pasture, when sown sufficiently thick; which, however, it rarely is,and hence is apt to form bunches or tussocks. It is of quick growth, and is speedily reproduced after being cut, or eaten down; so much so, that we may almost literally apply to it the lines of VIRGIL:-

"Et quantum longis carpent armenta diebus

"Exigua tantum gelidus ros nocte reponet." Georg. 2. 201.

"Cool dews restore beneath night's transient hours, "All that the herd each live-long day devours."

This grass also possesses the additional advantage of thriving well in the shade of trees,-and answers a very good purpose in Orchards, &c. The seed is usually sown in autumn, immediately after Wheat or Rye.

228. FESTUCA. L. Endl. Gen. 899.

[A Latin name for the shoot, or stalk, of a plant; applied to this genus.] Spikelets 2 or many-flowered,—the florets perfect, distichous. Glumes unequal, awnless, mostly keeled. Paleae herbaceous,—the lower one acute at apex, mucronate or often terminating in an awn, rounded (i. e. not keeled) on the back—the upper one 2-keeled. Scales 2, acute, bifid at apex. Stamens mostly 3. Ovary sessile, generally smooth; styles 2, terminal, a little distant, very short; stigmas plumose,—the hairs simple or rarely bifid, dentate. Caryopsis linearoblong, plano-convex, free or sometimes adherent to the upper palea.

1. F. PRATENSIS, Huds. Panicle loose, rather erect and secund; branches single or in pairs, racemose; spikelets linear-lanceolate, 5 to 9-flowered; lower palea scarious at apex and rather acute, never mucronate. Kunth, Enum. 1. p. 404. Fl. Cestr. p. 71. Icon, Fl. Lond. 1.

Meadow Festuca. Vulgè-Fescue-Grass. Meadow Fescue. Fr. Festuque des Prés. Germ. Wiesen Schwingel.

Plant glabrous. Root perennial. Culm 2 to 3 feet high. Leaves 4 to 6 or 8 inches long (the radical leaves numerous and longer). lance-linear, acuminate, nerved, shining beneath scabrous on the margin; sheaths nerved; ligule very short or obsolete. Panicle 4 to 6 or 8 inches long, somewhat secund, mostly erect,—the branches generally single, but often subdivided. Spikelets about 7-flowered, racemose on the branches, often purplish. Glumes unequal,—the lower one keeled—the upper one larger, 3-nerved, scarious on the margin. Lower palea scarious on the margin, obscurely 5-nerved, somewhat acute but not acuminate nor mucronate; upper palea white, with 2 green keels, and the margins doubled or folded in. Fertile pasture fields, and meadows; roadsides, &c. introduced. Native of Europe. Fl. June. Fr July.

Obs. This is a valuable grass - commonly mingled with Poa pratensis, L. in good soils; but easily distinguished from that plant, by its tapering slender-pointed shining leaves. It is extensively naturalized in the middle and northern States; and although I have never known it to be cultivated, it soon finds its way into all rich

pasture lands. We have a few native species of Festuca,—but they are of little or no value in Agriculture—and some of them are indicative of a poor soil.

229. BROMUS. L. Endl. Gen. 900.

[Greek, Broma, food; Bromos was an ancient name of a species of wild oats.] Spikelets 3 to many-flowered,—the florets perfect, distichous. Glumes unequal, mostly keeled, awnless. Paleae herbaceous,—the lower one convex on the back, mostly awned below the apex, and the apex often cleft to the origin of the awn; upper palea 2-keeled,—the keels pectinate-ciliate. Scales 2, entire. Stamens 3. Ovary sessile, hirsute at summit; stigmas inserted on the outer side near the summit, subsessile, plumose,—the hairs simple, elongated, acutely denticulate. Caryopsis linear-oblong, plano-convex, villous at summit, adnate to the upper palea.

1. B. SECALINUS, L. Panicle spreading, nodding in fruit; spikelets ovate-oblong, 8 or 10-flowered,—the florets elliptic with contracted margins, distinct, longer than the flexuose awns. Kunth, Enum. 1. p. 413. Fl. Cestr. p. 69.

Rye Bromus. Vulgò-Cheat. Chess. Brome-grass.

Fr. Brome Seigle. Germ. Roggen-Trespe. Span. Bromo.

Root annual. Culm 3 to 4 feet high, smooth,—the nodes pubescent. Leaves 6 to 12 inches long, lance-linear, nerved, scabrous and pilose on the upper surface; sheaths nerved, smooth; ligule oblong, retuse, laciniate-dentate. Panicle 4 to 6 or 8 inches long.—the branches semi-verticillate, nearly simple, scabrous and pubescent. Spikelets finally nodding,—the florets a little remote at base, so as to appear distinct on the flexuose rachis. Lower glume shorter, 5-nerved, sometimes mucronate,—the upper one 7-nerved, obtuse or emarginate. Lower palea obscurely 7-nerved, slightly pubescent near the apex,—the awn mostly shorter than the floret, flexuose (sometimes wanting, or a mere rudiment); upper palea linear, awnless, pectimate-ciliate on the keel at each border, the scarious nargins being folded in. Cargopsis closely embraced by the lower palea, grooved on the side with the upper palea doubled in the groove, and adherent. Cultivated grounds,—chiefly among Wheat and Rye: introduced. Native of Europe. Fl. June. Fr. July.

Obs. This foreigner is a well-known pest among our crops of Wheat and Rye,—and occasionally appears in the same fields, for a year or two, after the grain crop; but being an annual, it is soon choked out by the perennial grasses,—and the fallen seeds remain, like myriads of others, until the ground is again broken up, or put in a favorable state for their development. The best preventive of this and all similar evils, in the grain-field, is to sow none but good clean seed.

Among the curious vulgar errors, which yet infest the minds of credulous and careless observers of natural phenomena, may be mentioned the firm belief of many of our farmers (some of them, too, good practical farmers), that this troublesome grass is nothing more than an accidental variety, or casual form, of degenerate Wheat,—produced by some untoward condition of the soil, or unpropitious season, or some organic injury:—though it must be admitted, I think, by the most inveterate defender of that faith, that in undergoing the metamorphosis, the plant is surprisingly uniform in its vagaries, in always assuming the exact structure and character of Bromus!

A similar hallucination has long prevailed among the peasantry of Europe, in relation to this supposed change of character in the

Grasses: But, in the old world, they were even more extravagant than with us;—for they believed that Wheat underwent sundry transmutations,—first changing to Rye—then to Barley—then to Bromus,—and finally from Bromus to Oats! I believe the most credulous of our countrymen have not been able, as yet, to come up with their transatlantic brethren, in this matter. There are one or two other foreign species, partially naturalized in our pastures,—and two or three native ones occur in and about our open woodlands; but none of them are of much importance, in any agricultural point of view.

SUB-TRIBE 2. BAMBUSEAE. Nees. Shrubby or arborescent Grasses. Stamens 3 to 6.

230. ARUNDINARIA. Rich. Endl. Gen. 904.

[A name signifying analogous to, or like, Arundo,—a large kind of Reed.] Spikelets many-flowered, somewhat compressed,—the florets imbricately distichous, distant, perfect or staminate. Glumes concave, awnless, small,—the lower one much less than the upper. Paleae herbaceous,—the lower one ovate, concave, sharply mucronate, many-nerved—the upper one 2-keeled. Scales 3, entire, acute, membranaceous, subciliate, longer than the ovary. Stamens 3. Ovary sessile, glabrous; styles 3, terminal, very short; stigmas plumose,—the hairs long, simple or sparingly branched. Caryopsis free, ovoid-oblong, somewhat curved, terete.

1. A. MACROSPERMA, Mx. Leaves linear-lanceolate, green on both sides, smoothish; panicle terminal, subracemose, simple; spikelets few, distichous, 7 to 10-flowered. Kunth, Enum. 1. p. 426.

Long-or large-seeded Arundinaria. Vulgò-Cane.

Root perennial, cespitose (creeping rhizomas). Culm 3 to 15 feet high (30 feet, or more, in the gigantic variety), terete, glabrous, fistular, rigid, branching towards the summit,—the branches distichous. Leaves distichous, lanceolate, large, flat, slightly acuminate, pubescent on the under surface; sheaths much longer than the internodes, marcescent,—the throat contracted; ligule bristly. Paniele simple,—the peduncles about an inch long, pubescent. Spikelets 1 to 2 inches in length. Rich, occasionally inundated soils: South-western States. Fl. March—April. Fr.

Obs. Having only seen the small variety of this species, as it grows in the vicinity of the Dismal Swamp, Virginia,—I cannot speak, from personal observation, of the arborescent variety which forms the celebrated Cane brakes of the Mississippi region. Although this remarkable grass has but little connection with Agriculture, I have supposed it might be intitled to a brief notice,*—for which I am indebted to Mr. Elliott's valuable Sketch of the Botany of South Carolina and Georgia.

TRIBE XI. HORDEACEAE. Kunth.

Spikelets usually 3 or many-flowered (sometimes 1-flowered), often awned,—the terminal floret blighted. Glumes and paleae 2, herbaceous.—the former rarely wanting. Stigmas sessile. Ovary mostly pilose. Inflorescence spicate; spike simple, solitary; rachis rarely articulated, sometimes winged.

231. LOLIUM. L. Endl. Gen. 912. [A classical Latin name,—applied to this genus.]

Spikelets many-flowered, distichous with the edge to the common

^{*} The slender, straight, elastic culms, make very light convenient angling-rods, for the disciples of the Izaak Walton school.

rachis, sessile,—the florets imbricated, naked at base. Glumes (in the terminal spikelet) 2, nearly equal, awnless, channelled,—in the lateral spikelets, the lower or inner one (next the rachis) wanting. Paleae herbaceous,—the lower one concave, awnless or awned near the apex—the upper one 2-keeled. Scales 2, acute, entire or 2-lobed. Stamens 3. Ovary sessile, glabrous; styles 2, very short; stigmas plumose,—the hairs elongated, simple, sharply denticulate, hyaline. Caryopsis adherent to the upper palea. Spikelets in a simple terminal spike.

1. L. PERENNE, L. Spikelets compressed, linear-lanceolate, longer than the glumes, about 7-flowered,—the florets mostly awnless. Kunth, Enum. 1. p. 436. Fl. Cestr. p. 87. Icon, Fl. Lond. 1.

Perennial Lolium. Vulgò—Ray-grass, or Rye-grass. Darnel. Fr. Ivraie vivace. Germ. Ausdauernder Lolch. Span. Joyo.

Root perennial, creeping. Culm 1 to 2 feet high, smooth. Leaves 4 to 8 or 10 inches long, lance-linear, shining green, smooth, somewhat scabrous near the end; sheaths striate, glabrous; ligule truncate. Spike about 6 inches long,—the rachis flexuose, channelled or concave opposite the spikelets. Spikelets 12 to 18 or 20, a little distant, alternately on opposite sides of, and with their edges to, the rachis. Glumes 1 to each spikelet (except the terminal one), lance-linear, acute, nerved, resembling a short rigid leaf. Lower palea rather obtuse, obscurely 5-nerved; upper palea a little longer, ciliate-serrulate on the two prominent keels. Meadow banks, and Grass lots: introduced. Native of Europe. Fl. June. Fr. July.

Obs. This grass—which seems to be much esteemed in Europe—has been partially introduced into this country, and has become naturalized in many places,—though I believe it has been but little cultivated, by our farmers. It affords a tolerably good pasture, and makes a handsome sward for yards and lawns; but as a meadow grass, for hay, it is doubtless inferior in value to both *Timothy* and *Orchard-grass*.

There is another species, in Europe (L. temulentum, L. supposed to be the "infelix Lolium," of Virgil—the "Darnel," of the English),—of which the seeds are said to be somewhat poisonous. If so, it is the only instance known, in all the Gramineae, in which

the sound seeds are of that character.

232. TRITICUM. L. Endl. Gen. 913.

[Latin, tritum, rubbed, or ground; the seeds being so prepared, for food.] Spikelets 3- or many-flowered,—the florets distichous; rachis mostly articulated. Glumes sub-opposite, nearly equal, awnless or awned. Paleae herbaceous,—the lower one concave, either awnless, mucronate, or awned—the upper one with 2 more or less aculeate-ciliate keels. Scales 2, mostly entire and ciliate. Stamens 3. Ovary sessile, pilose at summit; stigmas 2, terminal, subsessile, plumose,—the hairs elongated, simple, sharply denticulate. Caryopsis free, or sometimes adherent to the paleae, convex externally, concave or sulcate on the inner or upper side, pubescent at summit.

† Spike mostly 4-sided. Glumes ventricose-concave, ovate-oblong, obtuse or truncate. (Genuine or legitimate Triticum).

1. T. vulgare, Vill. Spike somewhat 4-sided, imbricated, with a tough rachis; spikelets 4 or 5-flowered, rather crowded, broad-ovate,

obtuse; glumes ventricose, mucronate, compressed at apex: lower palea awned, mucronate, or awnless; caryopsis free. *Kunth*, *Enum*. 1. p. 438.

T. sativum. Lam. Fl. Cestr. p. S6.

Common Triticum. Vulgò—Wheat. Winter Wheat. Spring Wheat. Fr. Le Froment. Bled. Germ. Gemeiner Waizen. Span. Trigo.

Root annual. Culm 2 or 3 to 5 feet high, terete, smooth,—the nodes striate, pubescent. Leaves 6 to 15 inches long, lance-linear, nerved, smooth or slightly scabrous on the upper surface; sheaths nerved, smooth; ligule truncate, dentate. Spike 3 to 5 inches long, dense, 4-sided, mostly simple, finally nodding; rachis compressed, broad, hirsute on the margin. Spikelets sessile, broad, compressed at apex. Glumes ventricose, boat-shaped at apex. Florets usually 3 fertile and 2 abortive,—the penultimate one pistillate—the terminal one neutral and pedicellate. Paleae nearly equal,—the lower one ventricose, awned or mucronate—the upper one folded, ciliate on the two keels. Caryopsis ovoid-oblong, sulcate on the upper side, yellowish, or brown. Fields: cultivated. Native country uncertain,—perhaps Persia. Fl. June Fr. July.

Obs. Although it has been estimated that more human beings are nourished by Rice, than by any other grain,—yet it is probable that Wheat is the most intrinsically valuable of all the Cerealia, or grainbearing grasses. It is to this plant that civilized man-especially in the temperate latitudes—is emphatically indebted for his bread; and it is consequently a prominent object of attention with the practical agriculturist. The variety, called "Spring Wheat," is occasionally, but rarely, cultivated in this country,—while the "Winter Wheat" is cultivated every where, throughout the northern, middle, and western States. A plant that has been so long under culture, in almost every kind of soil and climate, of course presents specimens of various character, and aspect; -such as bearded, beardless, redchaff, white-chaff, &c. and the color of the grain also, varies from whitish, or yellowish, to brown. These fixed characters, or permanent varieties of the plant (called races by the Botanists), have all, in their turn, been favorites with the farmers,-according as they were best adapted to the market, or the place of growth—or best resisted the ravages of the "Hessian fly." A bearded variety, with a brown grain, called "Mediterranean Wheat," is the present favorite, in Chester County, Penn. In remarking on the character of the grain, M'Culloch says, "the finest samples of Wheat are small in the berry (caryopsis), thin skinned, fresh, plump, and bright, slipping readily through the fingers." *

One species of *Triticum* (*T. turgidum*, *L.*) is said to be cultivated, in *Italy*, solely for the manufacture of Leghorn or straw hats.

†† Spike mostly distichous. Glumes lanceolate or linear-oblong, often acuminate. [AGROPYRUMS, OR COUCH GRASSES.]

2. T. REPENS, L. Spike distichous; spikelets about 5-flowered, dis-

*In the north of Europe, they have one or two other species of Wheat, of inferior quality;—namely, T. Polonicum, L. or Polish Wheat,—and T. Spelta, L. commonly called "Spelta." This latter species, the German immigrants brought with them, when they first came to Pennsylvania.—and many of them continued the cultivation of it for some time; but they finally learnt—by observation, and the experience of their Anglo-American neighbors—that, however the Speltz might be adapted to the bleak regions from whence they migrated, it was not worthy of culture in a soil and climate where the best species of Wheat could be raised with equal facility, and to much greater advantage.

tant, alternate, lance-oblong, acute; glumes acuminate; paleae mostly awnless. Kunth, Enum. 1. p. 440. Fl. Cestr. p. 86. CREEPING TRITICUM. Vulgò—Couch-grass, Quitch-grass. Fr. Chien dent. Germ. Gemeine Quecke.

Root perennial—a white, jointed, creeping rhizoma. Culm about 2 feet high, smooth. Leaves 4 to 8 or 12 inches long, lance-linear, nerved, scabrous and somewhat pilose on the upper surface; sheaths nerved, smooth; ligule short, truncate. Spike 3 to 5 inches long; rachis flexuose, compressed; scabrous on the margin. Glumes keeled, strongly nerved, roughish,—the outer margin broader. Florets alternate, a little distant. Lower palea 5-nerved, mucronate, smooth; upper palea obtuse, ciliate-serrate on the two keels. Meadows; pasture lots, &c.: introduced. Native of Europe. Fl. July. Fr. August.

Obs. This species—which is quite distinct in habit from the genuine Wheat—has found its way into some districts of our country; and is a troublesome pest in cultivated grounds, when fully introduced,—by reason of the great tenacity of life in its rhizomas, or creeping subterranean stems. It is therefore desirable to keep our farms as clear of it as possible. The Triticums of this section—though numerous—are of little agricultural value.

233. SECALE. L. Endl. Gen. 914. [Latin, secare, to cut: or perhaps from the Celtic, Sega, a sickle.]

Spikelets 2-flowered,—the florets sessile, distichous, perfect, with the linear rudiment of a third terminal floret. Glumes sub-opposite, nearly equal, keeled, awnless or awned. Paleae herbaceous,—the lower one awned at apex, keeled, with unequal sides—the outer side broader and thicker; upper palea shorter, 2-keeled. Scales 2, entire, ciliate. Stamens 3. Ovary sessile, hairy; stigmas 2, subsessile, terminal, plumose,—the hairs elongated, simple, sharply denticulate. Caryopsis free, hairy at summit. Spike simple, compressed, linear.

1. S. CEREALE, L. Glumes subulate-linear and, with the awns, scabrous; paleae smooth,—the lower one bristly-ciliate on the keel and exterior margin. Kunth, Enum. 1. p. 449. Fl. Cestr. p. 82. HARVEST SECALE. Vulgò—Rye. Common Rye. Fr. Le Seigle. Germ. Gemeiner Roggen. Span. Centeno.

Root annual. Culm 4 to 6 feet high, glabrous, hairy near the spike. Leaves 6 to 18 inches long, lance-linear, smooth beneath, roughish above and on the margin, glaucous; sheaths membranaceous, nerved, smooth; ligule short, dentate. Spike 4 to 6 inches long, 2-sided and flattish, linear. Spikelets mostly 2-flowered, with an awn-like rudiment of a third. Glumes a little distant from the florets, opposite, scabrous, bristly-pilose at base. Lower palea ventricose, acuminate, compressed at apex, 5-nerved, terminating in a long scabrous awn; keel and exterior margin bristly-ciliate,—the inner margin not ciliate, and the nerves on that side less conspicuous: upper palea lanceolate, acuminate, often bifid at apex, sparingly ciliate on the 2 keels. Caryopsis oblong, subcylindrical, grooved on the upper side, hairy at summit, dusky brown. Fields: cultivated. Native of the East. Fl. June. Fr. July.

Obs. This cereal grass seems to do best in light sandy soils; and is consequently much cultivated in the lower districts of New Jersey, and on the slaty hills of Pennsylvania. The grain, in such soils, is of a better quality, and affords a whiter flour. Rye comes nearer to Wheat, in bread-making qualities, than any other grain,—but is, nevertheless, decidedly inferior to it. It is the principal bread-corn of the northern parts of Europe—especially of Russia and Germany.

The seed is subject—particularly in wet seasons—to become diseased, and enlarged,—producing what is called Ergot, or spurred

Rye. This diseased grain is injurious to health, when made into bread; but has been found to possess important medical properties, in certain cases, when judiciously administered.

234. HORDEUM. L. Endl. Gen. 917. [An ancient Latin name; of obscure derivation.]

Spikelets 1-flowered, with a subulate rudiment of a second floret—arranged in threes at the joints of the rachis, the lateral ones mostly blighted. Glumes lance-linear, flat, rigid, subulate-awned, collateral in front of the spikelets. Paleae herbaceous,—the lower one concave, produced into a long awn at apex—the upper one 2-keeled. Scales 2, entire or unequally 2-lobed, ciliate or pilose, rarely glabrous. Stamens 3. Ovary sessile, pilose at summit; stigmas 2, subterminal, sessile, plumose. Caryopsis hairy at summit, oblong, sulcate on the upper or inner side, adherent to the paleae, or rarely free.

1. H. VULGARE, L. Spikelets all fertile, awned,—the florets arranged so as to form a nearly four-sided spike. Kunth, Enum. 1. p. 455. Fl. Cestr. p. 85.

Common Hordeum. Vulgò—Barley. Four-rowed Barley. Fr. Orge commune. Germ. Gemeine Gerste. Span. Cebada.

Root annual. Culm 2 to 3 feet high, smooth. Leaves 6 to 15 inches long, lance-linear, keeled, striate, smoothish; sheaths nerved, smooth, auriculate at throat; ligule very short. Spike about 3 inches long, rather thick and somewhat 4-sided; rachis compressed, smooth, pubescent on the margin. Spikelets with each one fertile floret, and a pubescent awn-like rudiment of a second at the base of the upper palea. Glumes collateral, in front, shorter than the florets, terminating in a slender awn. Lower palea 5-nerved, terminating in a very long awn, which is keeled, somewhat 3-nerved, and serrulate on the margin: upper palea acuminate, obtuse or emarginate. Caryopsis lance-oblong, somewhat angular, adhering closely to the paleae. Fields: cultivated. Native of Sicily, and Tartary. Fl. May. Fr. June.

Obs. The ternate spikelets of this species being all fertile, the spike often assumes somewhat of a six-sided appearance; and I understand that in Western New York—the great Barley region of this country—it is usually called Six-rowed Barley,—though that name would seem more properly to belong to another nearly allied species (H. hexastichum, L.)—if, indeed, it be really distinct. This and the following species are cultivated extensively in the middle and northern States—and almost exclusively for the Breweries. The grain is rarely given to cattle,—and Barley bread is unknown in the U. States. The plant requires a good soil,—and hence serves as a kind of index to the quality of the farms, in Pennsylvania: the fallow crop on good land being generally Barley,—while the occupants of a poor soil have to be content with a crop of Oats.

2. H. DISTICHUM, L. Lateral spikelets sterile, awnless,—the fertile ones awned, distichous or forming a two-sided spike. *Kunth. Enum.* 1. p. 455. *Fl. Cestr.* p. 85.

Distictions Hordeum. Vulgo-Two-rowed Barley.

Root annual. Culm 2 to 3 feet high, smooth. Leaves 6 to 15 inches long, lancelinear, nerved, scabrous on the upper surface; sheaths nerved, smooth, with 2 lanceolate auriculate appendages at throat; ligule short, truncate. Spike 3 to 4 inches long, compressed or ancipital, linear; rachis flatted, smooth, hirsute on the margin. Perfect floret sessile; lower palea subcoriaceous, smooth, keeled or angular, partially 5-nerved, embracing the upper palea, and terminating in a very long, keeled, serrulate awn: upper palea with a pilose awn-like rudiment

at base. Sterile florets (or spikelets) pedicellate, staminate (sometimes neuter?),the lower palea awnless—the upper one with a naked awn-like rudiment at base. Fields: cultivated. Native of Tartary. Fl. June. Fr. July.

Obs. This species is something later than the preceding, in coming to maturity; and on that account is preferred by many farmers, in Pennsylvania, -as it interferes less with their Hay crops. It also stands better than the preceding, after it is ripe,—and yields a heavier grain—though not a greater quantity. The seed, of both species, is usually sown (in Pennsylvania,) about the last of March.

TRIBE XII. ROTTBOELLIACEAE. Kunth.

Inflorescence spicate,—the rachis often articulated. Spikelets 1 or 2- rarely 3-flowered—seated in an excavation of the rachis,—sometimes solitary—sometimes in pairs, with one of them pedicellate and often blighted: one floret of each 2-flowered spikelet (sometimes the lower—sometimes the upper one) often imperfect. Glumes 1 or 2—sometimes none—mostly coriaceous. Paleae membranaceous, rarely awned. Styles 1 or 2, sometimes very short or wholly suppressed.

235. TRIPSACUM. L. Endl. Gen. 930. [Greek, tribo, to grind; the applicability of which is not obvious.]

FLOWERS MONOICOUS: Spikes solitary, or often digitate in twos or threes, articulated,—the staminate spikelets above. Spikelets sessile, imbedded in the rachis: Staminate spikelets in pairs on each joint, and longer than the joint, collateral, 2-flowered,—the florets each with 2 paleae, and triandrous. PISTILLATE SPIKELETS solitary, as long as the joint, acuminate 2-flowered, - the florets each with 2 paleae-the outer or lower floret neuter-the inner or upper one pistillate. Glumes coriaceous, awnless,—the outer one concave, thick—the inner one thinner and boat-shaped. Paleae very thin and membranaceous, hyaline, awnless, -the lower one of the pistillate floret boat-shaped, acute—the upper one shorter, narrowed at apex, 2-nerved. Scales 2, somewhat fleshy, truncate and unequally 2-lobed. Ovary sessile, glabrous; style terminal, elongated; stigmas 2, long, densely villous,—the hairs simple. Caryopsis ovoid,

acute, free. 1. T. DACTYLOIDES, L. Spikes usually 2 or 3, aggregated or digitate, sometimes solitary,—the upper-half staminate, the lower pistil-

late. Kunth, Enum. 1. p. 469. Fl. Cestr. p. 95. FINGER-LIKE TRIPSACUM. Vulgò—Gama Grass. Sesame Grass.

Root perennial. Culms somewhat cespitose, 3 or 4 to 6 feet high, hard and glabrous, solid with pith,—the internodes broadly channelled on alternate sides; nodes smooth, with a dark-brown contracted ring at the base of the sheaths. Leaves 1 or 2 to 4 feet long, and half an inch to an inch or more in width, lance-Leaves 1 or 2 to 4 feet long, and half an inch to an inch or more in width, lance-linear, keeled, smooth beneath, roughish on the upper surface, serrulate on the margin, contracted and sparingly pilose at base; sheaths nerved, glabrons; ligule very short, ciliate. Spikes 4 to 6 or 8 inches long, terminal, usually digitate in twos or threes—rarely in fours—but not unfrequently single; when solitary, the pistillate portion of the spike is terete,—when in pairs, semi-terete as if split down,—and when ternate, the spikes are somewhat triquetrous; rachis articulated, separating at the joints in drying. Staminate spikelets in pairs, which alternate on two sides of the triquetrous rachis, each 2-flowered,—the inner floret sometimes neuter, usually both staminate. Glumes nearly equal,—the outer ones of each pair of spikelets collateral, one inserted a little above the other, oblong, coriaceous, nerved, the margins thin and inflexed,—the inner ones subcoriaceous, boat-shaped. Paleae very thin and diaphanous, nearly as long as the glumes. Stamens-3; anthers orange-colored, becoming reddish-brown, opening by 2 pores at summit. Ovary abortive,—often with a long slender style and rudiments of stigmas. Pistillate spikelets imbedded in recesses of the rachis, obliquely ovoid, acuminate, gibbous on the inner side, each 2? flowered (3-flowered, Nutt.),—the inner? floret fertile. Glumes nearly equal,—the outer one ovate, acute, indurated and polished, embracing the florets, closing the ob-

lique boat-shaped cavity in the rachis, except a ciliate foramen, or sinus, on each side of its base—the *inner* one thin and subcoriaceous, somewhat boat-shaped, acuminate. Paleae very thin and membranaceous, 2 to each floret,—but, by the abortion of one of the florets from pressure, they appear like several paleae enveloping one ovary. Ovary roundish-ovoid, acute; styles 2 united into 1, long and slender; stigmas 2, large, plumose, dark-purple. Caryopsis ovoid, smooth,—the pericarp thin and tender. Moist meadows; banks of streams, &c.: Middle and Western States. Fl. July. Fr. September.

Obs. This stout and remarkable Grass is not very common on the Atlantic slope of our continent; but it is said to be abundant in the valley of the Mississippi. Some years ago, it was highly extolled, by a few western correspondents of our Agricultural Journals, as an article of fodder for Stock; but I have not heard much of it, latterly. The leaves and young culms may probably answer a good purpose—where better materials are scarce: but any one who will examine the coarse hard stems of the full-grown or mature plant, may soon satisfy himself that it can never supersede the valuable grasses, or the good hay, now in use,—nor compete, in any respect, with common Indian-corn fodder.

TRIBE XIII. ANDROPOGONEAE. Kunth.

Spikelets 2-flowered,—the lower floret always imperfect. Paleae of more delicate texture than the glumes, mostly hyaline.

236. SACCHARUM. L. Endl. Gen. 939.

[Latinized from the Greek, Sacchar: originally from the Arabic, Soukar, sugar.] Spikelets in pairs—one of them pedicellate, the other sessile—each 2-flowered, with a tuft of long silky hairs at base; the lower floret neuter, with a single palea,—the upper one perfect. Glumes 2, nearly equal, awnless. Paleae 3 (counting that of the neutral floret), minute, unequal, awnless, hyaline. Scales 2, obsoletely 2 or 3-lobed at apex, sometimes connate in a tube. Stamens 1 to 3. Ovary sessile, glabrous; styles 2, terminal, elongated; stigmas plumose,—the hairs simple, denticulate. Caryopsis free?—Gigantic tropical grasses, with large silky panicles.

1. S. OFFICINARUM, L. Leaves flat; panicle large and expanding; spikelets racemose on the slender branches; florets triandrous; glumes obsoletely 1-nerved, or keeled, invested with long silky hairs at base. Kunth, Enum. 1 p. 474.

Officinal Saccharum. Vulgò-Sugar-cane.

[Azucar.

Fr. Canne à Sucre. Germ. Aechtes Zucker-rohr. Span. Caña de

Root perennial (a nodose rhizoma). Cu'm 8 to 15 or 20 feet high, and 1 to 2 inches in diameter, with numerous nodes, and solid with pith. Leaves linear-lanceolate, large (something resembling those of Indian Corn). Panicle a foot or more in length, loosely branched,—the branches numerous, flilform, 4 to 6 inches long, remarkably plumose, or pubescent with verticils or tufts of long white silky hairs at the base of the racemose spikelets. Cultivated, in Louisiana; and other States in the extreme South of the Union. Native of Asia. Fl. Fr.

Obs. The Sugar Cane is rarely permitted to flower, under cultivation,—being propagated by sections of the culm. The value and importance of this noble Grass, in the domestic economy and commerce of the civilized world, are too well known to require comment. Not having the advantage of an acquaintance with the living plant, and its culture, my descriptive details and remarks are necessarily very imperfect. Some interesting notices may be found in Rees' Cyclopaedia (Art. Sugar); and in the Farmer's Encyclopaedia.

237. ANDROPOGON. L. Endl. Gen. 950. [Greek; literally Man's beard,—in allusion to the hairy spikelets.]

Spikelets in pairs (or the terminal ones in threes,—the middle one fertile and sessile, the others sterile and pedicellate), 2-flowered,—the lower floret neuter with a single palea—the upper one perfect or unisexual. Glumes 2, finally somewhat indurated or coriaceous, awnless. Paleae mostly 2, shorter than the glumes, hyaline,—the lower one of the perfect floret usually awned—the upper one smaller, awnless, sometimes wanting. Scales 2, truncate, mostly glabrous. Stamens 1 to 3. Ovary sessile, glabrous; styles 2, terminal; stigmas plumose,—the hairs simple, denticulate. Caryopsis free, enveloped by the glumes and paleae.

§1. RACHIS SPICATE.

† Spikes solitary at the apex of the culm and branches.

1. A SCOPARIUS, Mx. Culm paniculately branched above,—the branches somewhat fasciculate, erect, elongated, slender and purplish; sheaths villous; spikes simple, on long peduncles; florets distinctly alternate, triandrous,—the sterile ones neuter, awned. Kunth, Enum. 1. p. 490. Fl. Cestr. p. 89. Specim. Gray, Gram. 1. no. 64.

Broom Andropogon. Vulgà—Indian Grass. Purple Wood-grass.

Root perennial. Culm 3 or 4 feet high, rather slender, smooth, somewhat compressed, sulcate on alternate sides of the internodes; nodes smooth; branches long, slender, in lateral fascicles, or sometimes in pairs, often subdivided. Leaves 4 to 8 or 12 inches long, lance-linear, acute, scabrons, a little hairy and somewhat glaucous; sheaths striate, roughish; ligule truncate. Spikes about 2 inches long; rachis compressed or plano-convex, pilose at the edges. Spikelets distichously arranged: abortive spikelet minute, subulate, on a linear plumose pedicel which is nearly as long as the perfect spikelet,—the floret neuter; perfect spikelet sessile; glumes lance-linear, much acuminated,—the lower one bifid at apex; paleae nearly equal, ciliate.—the lower? one deeply bifid, with a twisted awn between the segments. Old fields; sterile banks, and road-sides: throughout the U. States. Fl. August. Fr. September.

Obs. This, and the other native species, are remarkably worthless grasses,—and are apt to abound in poor old neglected fields. Where they prevail, no further evidence is required to demonstrate the unprofitable condition of the land, or the miserable management of the occupant.

†† Spikes conjugate or digitate, at the apex of the culm or branches.
2. A. Furcatus, Muhl. Spikes digitate, generally in threes or fours; rachis hairy; florets in pairs,—the perfect one sessile, awned—the staminate one awnless, pedicellate. Kunth, Enum. 1. p. 492. Fl. Cestr. p. 89. Specim. Gray, Gram. 1. no. 63. Forked Andropogon. Vulgò—Finger-spiked Wood-grass.

Root perennial. Culm about 4 feet high, smooth, terete below, semi-terete above, often branching; nodes smooth. Leaves 4 to 8 or 12 inches long, lancelinear, nerved, smoothish, scabrous on the margin, pilose at base; sheaths striate, smooth; ligule obtuse, sometimes ovate, fringed. Spikes 2 to 3 inches long, usually in threes or fours (sometimes 5 or 6), frequently purple; rachis semi-terete, pilose on the angles: abortive spikelet on a clavate, plumose pedicel: perfect spikelet sessile. Slaty hills, and sterile low grounds. Fl. Aug. Fr. Sept.

Obs. This is one of the native species which is very worthless,—and very frequent on poor, neglected, badly managed farms.

3. A. SACCHARATUS, Roxb. Culm stout, terete, solid with pith; panicle large, loosely expanding,—the branches verticillate, elongated, finally nodding; glumes of the fertile spikelets subcoriaceous, clothed with glossy appressed hairs. Kunth, Enum. 1. p. 502. Sorghum saccharatum. Pers. Fl. Cestr. p. 90.

SUGAR ANDROPOGON. Vulgo—Broom-Corn.

Root annual. Culm 6 to 8 or 9 feet high, and half an inch to an inch in diameter, smooth; noles tumid, with a ring of short appressed hairs at the base of the sheaths. Leaves about 2 feet long, and 2 to 3 inches wide, linear-lanceolate, acuminate, keeled, smooth, densely-pubescent at base adjoining the ligule; sheaths smooth; ligule short, ciliate. Panicle 1 to 2 feet long,—the branches nearly simple, long, flexuose, scabrous with short hairs. Spikelets mostly in pairs, one of which is abortive (the terminal ones in threes, two being abortive), and these pairs in racemose clusters of threes or fours, near the extremities of the branches. Upper? or inner palea of the fertile spikelets with a purplish flexuose arm, about twice as long as the spikelet. Gardens, and fields: cultivated. Native of India, and Arabia. Fl. August. Fr. October.

Obs. This oriental grass is cultivated, on a small scale, by farmers generally,—for the domestic purpose of making brooms of its panicles: and in some districts of the country, the culture of the plant, and the manufacture of brooms and brushes, are very extensively carried on. It is said that Sugar has been obtained from it, in the South of Europe; but it must be much inferior to Indian Corn (Zea Mays, L.), in its saccharine products: and neither of them, probably, will ever come in competition, to any material extent, with the true Sugar Cane. There are 2 or 3 Asiatic species, allied to this one, which are cultivated in the East; namely, A. Sorghum, Brot. or "Indian Millet"—A. eernuus, Roxb. known here as "Guinea Corn," or "Egyptian Millet"—and A. bicolor, Roxb. called "Chocolate Corn." All these are occasionally seen, as curiosities, in our Gardens; but they do not—and probably never will—belong to the Agriculture of the country.

4. A NUTANS, L. Panicle oblong, or loose and spreading, finally somewhat nodding; glumes of the perfect spikelets rufescent, shining,—the lower one hairy; awns contorted. Kunth, Enum. 1. p.

504. Fl. Cestr. p. 88. Specim. Gray, Gram. 1. no. 67.

Also, A. avenaceus, Mx. Kunth, l. c. p. 503.

Nodding Andropogon. Vulgò-Wood-grass. Oat-like Indian grass.

Root perennial. Culm 3 to 5 feet high, simple, terete, glabrous; nodes bearded with white appressed hairs. Leaves 6 to 18 inches long, lance-linear, rough, serrulate on the margin; sheaths nerved, smooth; ligule elongated, truncate, bordered by a lanceolate extension of the margins of the sheath. Panicle 6 to 9 inches in length,—the ultimate branches, or pedicels of the upper spikelets, plumosely hairy. Abortive spikelet pedicellate, often a mere awn-like plumose rudiment. Glumes of the perfect spikelet lanceolate, indurated, of a light russetbrown color,—the lower or outer one hairy, embracing the upper one, which is smooth and rather longer. Paleae thin and membranaceous,—the lower? one bifid, awned below the division; awn contorted, bent obliquely. Sterile old fields: throughout the U. States. Fl. Aug. Fr. September.

Obs. The three native species of Andropogon, here given, are the most common and obtrusive ones, in our poor lands,—at least in Pennsylvania. There are a few others,—particularly one with the spikes conjugate, in fastigiate bushy panicles (A. macrourus, Mx.)—which is not unfrequent in wet, swampy meadows; but, though they are all equally worthless, these are scarcely of sufficient importance to require further notice, in this work.

CRYPTOGAMOUS OR FLOWERLESS PLANTS. ACROGENS, OR APEX-GROWING PLANTS.

ORDER CLXI. EQUISETACEAE. DC.

Leafless plants. Rhizoma creeping. Stem simple or verticillately branched, terete, sulcate, articulated—the articulations embraced by monophyllous sheaths. Fructification terminal. Receptacles of numerous angular peltate stipitate scales, collected in the form of a strobile or cone. Sporanges in sixes and sevens, membranaceous, adnate to the under surface of the receptacles, 1-celled, filled with numerous spores, introrsely dehiscent. Spores embraced by 4 hygrometric clavate filaments (elaters).

An unimportant Order, of a single genus.

238. EQUISETUM. L. Endl. Gen. 601.

[Latin, Equus, a horse, and Seta, a bristle; resembling a horse's tail.]

There being but a single genus, its character is consequently the same as that of the Order.

1. E. HYEMALE, L. Stems all fertile, simple, naked, striate-sulcate, very rough, bearing a terminal ovoid spike; sheaths short, cylindric, whitish, with a black ring at base and summit, dentate,—the teeth lance-subulate, awned, deciduous. Willd. Sp. Pl. 5. p. 8. Fl. Cestr. p. 574. Icon, Fl. Lond. 4.

WINTER EQUISETUM. Vulgò—Scouring Rush. Fr. La Prêle. Germ. Das Kannenkraut. Span. Equiseto.

Root perennial. Stems 1 to 2 feet high, fistular, pale cinereous-green, or glaucous (purplish black at base), terminating at summit in an ovoid blackish spike, or cone, about half an inch in length; sheaths 2 to 4 lines long, nearly cylindric, striate, whitish-cinereous, with a purplish-black band at base,—and at summit a ring of small blackish teeth, which soon fall off, leaving the sheath truncate and entire. Margins of swamps; knolls, &c. Fr. June.

Obs. This plant is common to Europe and America. The cuticle abounds in silicious earth,—and its rough file-like surface is well adapted to the scouring and polishing of hard wood, metals, &c. to which uses it is often applied. There are several other species of this genus,—but they are of no interest to the farmer.

ORDER CLXII. LYCOPODIACEAE. Swartz. DC.

Herbaceous or fruticose, mostly perennial, plants. Stem erect or prostrate, terete, angular, or compressed, alternately or dichotomously branched, leafy. Leaves spirally arranged, often crowded, imbricated, simple, sessile or decurrent, never articulated. Sporanges (or sporocarps) sometimes in the axils of the leaves, along the whole stem—sometimes in the axils of crowded bracts, forming ament-like spikes at the ends of the branches.

A small Order, of little interest to the farmer.

239. LYCOPODIUM. L. Endl. Gen. 696.

Sporanges 1-celled, uniform, or of 2 forms,—those containing a fine powder, subreniform and 2-valved—those containing globular grains, subglobose, 3 or 4-lobed, and 3 or 4-valved.

1. L. DENDROIDEUM, Swartz. Stem erect, branched,—the branches alternate, crowded near the summit, dichotomously subdivided; leaves scattered, somewhat 6-rowed, linear-lanceolate, equal, spread-

ing; spikes terminal, solitary, sessile. Willd. Sp. Pl. 5. p. 21. Fl. Cestr. p. 589.

TREE-LIKE LYCOPODIUM. Vulgò-Ground Pine.

Plant smooth, deep green. Root perennial. Stems (or rather branches of the creeping rhizoma) 6 to 9 inches high, erect or ascending, terete, flexuose, clothed with lance-linear acute leaves, branched and bushy near the summit,—the branches dichotomously subdivided, slender. Leaves (on the branches) somewhat 4-rowed, about 2 lines long, obliquely subdiate-linear, or slightly falcate, acute, spreading, shining green,—those on the stem (or main branch) rather appressed. Spikes mostly several (1 or 2 to 5 or 6), about 2 inches long, terete, a little tapering upwards, yellowish,—the scales or bracts ovate, acuminate, with a scarious margin. Woodlands, and shady thickets: throughout the U. States. Fr. July. Fr. July.

Obs. This pretty little plant—of unfading verdure (together with L. complanatum, L.-a trailing species, with pedately divided, flatted branches)—is much employed in making garlands, and festoons, to decorate country parlours; and is moreover regularly sought after, by those who venerate pleasing ancient usages, for the purpose of trimming churches, at Christmas. Every intelligent person, therefore, would like to know the plant; and for that reason I have inserted it.

ORDER CLXIII. FILICES. L. Juss.

Herbaceous plants, with a perennial rhizoma (rarely with an erect arborescent trunk). Leaves (or frnds) scattered on the rhizoma, or rosulate-fasciculate at its apex, circinnate in vernation, annual or perennial, simple or compound, entire or pinnatifilly dissected. Sporanges placed along the veins on the back or margin of the leaves,—collected in little clusters (termed Sori), which are sometimes naked, but often covered by a membranaceous scale, or folded and modified margin of the leaf (called an Indusium),—pedicellate or sessile, 1-celled, indefinitely dehiscent. Spores numerous, free, globose or angular.

An Order of some 70 genera—very interesting to the curious student of Nature, but unimportant to the practical American farmer. In tropical regions, however, the Ferns occasionally assume the stature and appearance of trees,—and the roots, or rhizomas, of some species, are esculent.

240. PTERIS. L. Endl. Gen. 622.

[The Greek name for a Fern; from Pteryx, or Pteron, a plume or feather.] Sporanges placed on the apices of the veins, which are united into a nerve-like receptacle, bordering the frond, and forming a continuous linear marginal sorus. Indusium formed of the inflexed modified margin of the frond, scarious, opening along the inner side.

1. Pr. AQUILINA, L. Frond 3-parted; divisions bipinnate; pinnae oblong-lanceolate,—the upper ones entire—the lower ones pinnatifid, with oblong obtuse segments. Willd. Sp. Pl. 5. p. 402. Fl. Cestr. p. 583.

AQUILINE OR EAGLE PTERIS. Vulgo-Brake. Bracken, of the Scotch. Fr. Fougere femelle. Germ. Adler-Saumfarrn. Span. Helecho feminino.

Root perennial. Frond very large (1 to 2 or 3 feet long), supradecompound, spreading, the branches bipinnate, the divisions or pinnae oblong-lanceolate, subsessile, pubescent, pale dingy green,—the upper ones entire—the lower ones pinnatifid; segments half an inch to an inch and half long, and 2 to 4 or 5 lines wide, lance-oblong, obtuse, entire or somewhat repand, with the margin reflexed, confluent at base, or sometimes the lower ones nearly distinct; stipe (or footstalk of the frond) 1 to 2 feet long, angular, smooth, tawny, or brown. Sori linear and marginal, resembling a narrow russet hem, or border-trimming, along the edge of the segments, on the under side. Moist woodlands, and thickets; throughout the U. States. Fr. July—Aug.

239 FILICES

Obs. The Ferns have but little connection with our Agriculture: but, as this is a common one nearly all the world over,—and, in our country, one of the most conspicuous of that numerous and curious family of plants,-I have given it a place in this work, merely as a sample of the Order. It sometimes forms quite a thicket, of itself, and affords a good shelter or hiding-place for Game, along the borders of woodlands.

ANOPHYTES, OR SUPERIOR CELLULAR PLANTS.

ORDER CLXV. MUSCI. Dillen. Juss.

ORDER CLXV. MUSCI. Dillen. Juss.

Mostly perennial herbs, small in size and wholly cellular in structure. Stems terete, slender, erect or procumbent. Leaves scattered or distichous, simple, sessile and obsoletely decurrent. Reproductive organs of two kinds: 1. Axillary bodies (antheridia, or supposed analogues of stamens),—small cylindrical or fusiform pedicellate sacs, in the axils of the leaves, containing numerous spherical or oval particles, mingled with minute jointed threads (called Paraphyses). 2. Theeae (capsules, sporanges, or pistillidia—analogues of pistils),—hollow urn-like cases, each elevated on a seta, or bristle-like peduncle—covered, in an early stage, by a membranaccous caducous Calyptra (resembling a candle extinguisher), and closed by an Operculum (or lid), which opens at maturity. The orifice at the summit of the theca, or capsule, is sometimes naked, but more commonly protected by one or two rows of rigid little processes, called teeth—or collectively, the Peristome. These teeth are either distinct (free), or more or less combined—ranging, numerically, from 4 to 64,—but always, when more than 4, some multiple of that number. The centre of the theca is occupied by an axis, or little column,—and the space between it and the sides of the theca is filled with minute spores. The leaves which are aggregated round the base of the seta, or footstalk of the theca (forming what is called the Perichaetium), may be regarded as the analogues of bracts,—being generally different from the rest of the foliage, and are known by the name of perichaetial leaves.

A numerous Order of small and insignificant plants—in the eye of the mere farmer; but by no means unimportant, in the economy of Nature.

241. SPHAGNUM. Dillen. Endl. Gen. 476. [A Latin name,-anciently applied to some kind of Moss.]

Fructification terminal. Antheridia clavate. Pistillidia disk-form. Calyptra irregularly torn in the middle,—the ragged base persistent. Theca with a flat deciduous lid,—the orifice destitute of teeth; central column obsolete at maturity. Soft, fllaccid, spongy, pale-green or whitish Mosses, -in dry situations erect-in pools floating and branched, the branches in lateral fascicles. Leaves imbricated, concave, nerveless, diaphanous. Thecae, or sporanges, sessile on pedunculate receptacles.

1. S. PALUSTRE, L. Branches tumid, tapering, spreading or recurved; leaves ovate or lanceolate, obtuse or acute, reticulated. S. obtusifolium. Hook. Brit. Fl. 2. p. 5.

Marsh Sphagnum. Vulgo-Bog-Moss.

Stems 3 to 6 or 8 inches long (sometimes much longer, when floating), loosely tufted by numerous branches near the summit. Leaves often closely imbricated, glaucous, or whitish. Theca oval or subglobose, embraced at base by the persistent remains of the calyptra or hood, sessile on a receptacle at the summit of a transparent terminal peduncle. Swamps, and pools; throughout the U. States. Fr. in early Spring.

Obs. Several species of Sphagnum are enumerated in the books,

—but they have been supposed, by good judges, to be little more than varieties of the original S. palustre, of Linnaeus. This soft spongy Moss—which is common to both hemispheres—affords an excellent material for enveloping and protecting the roots of plants which are to be removed to a distance. It is believed to have contributed largely of the material of which Turf or Peat is formed. The Mosses are a very numerous family (comprising about 800 species); and although scarcely claiming the attention of mere practical Agriculturists, they are highly interesting to intelligent observers of Nature and natural phenomena. "In the economy of man," says Prof. Lindley, "they perform but an insignificant part; but in the economy of Nature, how vast an end!" I have therefore deemed it expedient to insert a sample of the Order.

THALLOPHYTES, OR VEGETABLE EXPANSIONS.

ORDER CLXVII. LICHENES. Ach.

Perennial plants, varying exceedingly in form, appearance and texture—always constituting a thallus, crust, or frond, (universal receptacle, Ach.) which frequently spreads horizontally upon soil, rocks, bark of trees and dead wood,—and is pulverulent, membranaceous, coriaceous, gelatinous, filamentous, and variously lobed and divided: sometimes it is erect, shrub-like and much branched,—at others, pendent; variously colored, rarely green: often the substance is simply composed of cellules—at other times the cellules are mixed with fibres. Imperfect roots are sometimes found,—but more for the purpose of fixing the plant to its place of growth, than of deriving nourishment—which appears to be afforded solely by the air. Fructification is of two kinds,—1. A powdery substance, forming indeterminate masses, or collected into more or less evident receptacles; and 2. (what is considered a higher state of fructification.) apothecia, or partial receptacles,—which have received different names, according to their forms:—as scutellae (shields)—patellulae (spangles)—peltae (targets)—tubercula (tubercles)—cephalodia (knobs, or heads—when the stalk which bears them is called the podetium)—&c. These receptacles, for the most part, are sessile, perennial, and contain a waxy plate or layer, in which are imbedded sporules inclosed in little membranous tubes or thecae. Hooker.

A numerous Order of apparently very insignificant plants: but some of them are nutritious, and slightly medicinal,—while others (as the *Roccella*,) afford beautiful and valuable dyes. Lichens, says Sir W. J. HOOKER, "are among the first plants which clothe the bare rocks and form a humus (soil, or mould) for others of a higher organization to live and flourish in."

† Thallus usually compressed and laciniated. Apothecia scutellaform [Scutellae, or shields].

242. CETRARIA. Ach. Endl. Gen. 175.

[Latin, Cetra, a buckler,—which the Apothecia are supposed to resemble.]

Thallus foliaceous, somewhat coriaceously membranaceous, ascending or spreading, lobed and laciniated, naked and smooth on both sides. Apothecia orbicular, obliquely adnate to the margin of the thallus—the lower portion being free; disk colored, plano-concave, with a border formed of the thallus and inflexed.

1. C. Islandica, Ach. Thallus erect, tufted, olive-brown, paler on one side, laciniated, channelled, and dentate-ciliate,—the fertile laciniae very broad; apothecia brown, appressed, flat with an elevated border. Hook. Brit. Fl. 2. p. 221.

ICELAND CETRARIA. Vulgò-Iceland Moss.

Obs. Dr. A. Gray informs me that he has collected this plant on "Grandfather Mountain," North Carolina. He says it grows, also, on the White Mountains of New Hampshire. It is a mountain plant, and usually grows in exposed situations, on the ground. That which is found in our Shops, and employed as a remedy for coughs, pulmonary consumption, &c. is procured from Norway, or from Iceland. Sir W. J. Hooker informs us, that "immense quantities are gathered in the latter country, not only for sale, but for their own use as an article of common food. The bitter and purgative quality being extracted by steeping in water, the Lichen is dried, reduced to powder, and made into a cake, or boiled and eaten with milk,—and eaten with thankfulness, too, by the poor natives, who confess 'that a bountiful Providence sends them bread out of the very stones'."

To this section of the Lichens, belongs the Roccella tinctoria, DC. the Rock Moss, or Archill,—so valuable in the arts, for its purple coloring matter.

†† Thallus shrub-like, rounded, usually much branched and erect, —the branches (or Podetia) fistular. Apothecia hemispherical, fleshy (Cephalodia, or knobs).

243. CLADONIA. Hoffm. Endl. Gen. 168. [Greek, Klados, a branch,—the ramifications being often numerous.]

Thallus somewhat shrubby, branched or rarely simple, leafy with scales which are finally often evanescent; branches (or podetia) cartilaginous, rigid, fistular, all attenuated and subulate, divided, fertile, generally perforated in the axils. Apothecia (being Cephalodia) sessile, orbicular, convex, capituliform, not bordered, fixed by the circumference, free beneath in the centre, the sides reflexed, uniform within.

1. C. RANGIFERINA, Hoffm. Podetia creet, elongated, roughish, cylindrical, greenish-white, very much branched; axils perforated; branches scattered, often intricate, divaricate,—the ultimate ones drooping; apothecia subglobose, brown, on small erect branchlets. Hook. Brit. Fl. 2. p. 235.

Rein-deer Cladonia. Vulgò-Rein-deer Moss.

Obs. This is very common in the colder woodlands, throughout the middle and northern States. "A very variable Moss," says Sir W. J. Hooker, "especially in the length of the ramifications, and also in color,—and an inhabitant of almost every part of the world—even of the tropics; but in the colder and arctic regions it is most abundant. The barren specimens are the most branched and tufted, with the branches very intricate. It is this, which, for the greater part of the year and especially in winter, is the support of the vast herds of Rein-deer, wherein consists all the wealth of the Laplanders. No vegetable, Linnaeus tells us, grows throughout Lapland in such abundance as this,—especially in woods of scattered pines, where, for very many miles together, the surface of the sterile soil is covered with it as with snow. On the destruction of forests by fire, when no other plant will find nutriment, this Lichen springs up and flourishes,—and, after a few years, acquires its full size. Here the Rein-deer are pastured; and, whatever may be the depth

21

of snow during the long winters of that climate, these creatures have the power of penetrating it and obtaining their necessary food." This, and the preceding Lichen, are here noticed—not as belonging to American Agriculture, but—as interesting specimens of a vast Order of plants, which even a farmer may with propriety become so far acquainted with, as to have at least a general idea of their character.

ORDER CLXVIII. FUNGI. Juss.

Plants consisting of a congeries of cellules, among which filaments are occasionally intermixed,—increasing in size by addition to their inside—their outside undergoing no change after its first formation; chiefly growing upon dead or decaying substances,—frequently ephemeral, and variously colored. Sporules arranged in tubular cells,—the cells situated in some part of the external surface. The part in which the reproductive organs are placed, is called the Hymenium.

A very numerous Order—comprising nearly 300 genera, and uncounted species; some of them large, and often either esculent or poisonous,—others minute, and frequently destructive of the *textures* (whether living or dead) on which they grow.

TRIBE 1. HYMENOMYCETES. Fries. Hymenium naked. Sporidia in little sacs (asci).

SUB-TRIBE 1. HYMENINI, OR AGARICINAE. Fries. Hymenium distinct. Receptacle long or expanded, superior.

DIV. 1. PILEATI. Fries.

Receptacle dilated, occasionally branched, tending to an orbicular form. Hymenium inferior.

244. AGARICUS. L. Endl. Gen. 453.

[From Agaria, a town of Sarmana,—where the plant was much used for food.] Fungus inclosed in a wrapper (volva) when young,—with a pileus, or cap, supported on a thick terete stipe. Pileus horizontal, dilated, orbicular, gradually becoming flatted,—the lower surface occupied by distinct radiating parallel lamellae, or gills (hymenium), on which the sporules are situated.

1. A. CAMPESTRIS, L. Pileus white, fleshy, dry, somewhat scaly or sericeous; lamellae free, pink changing to dark fuscous; stipe solid, white, with an annular veil. *Lindl. Ency. p.* 1002.

FIELD AGARICUS. Vulgò—Common eatable Mushroom. Fr. Champignon. Germ. Der Erd-schwamm.

Obs. This plant is a noted delicacy among Epicures,—and is much cultivated for the table, in Europe. There seems, however, to be some uncertainty in determining the characters, by which the esculent specimens are distinguished from poisonous ones; and therefore caution is always to be observed. Prof. Lindley (in Loudon's Encyclopaedia of Plants) says, "the gills of this species are loose, pinky red, changing to a liver-color,—in contact with the stem, but not united to it; very thick set, irregularly disposed—some forked next the stem, some next the edge of the pileus—some at both ends, and in that case generally excluding the intermediate smaller gills. The pileus is white, changing to brown when old, and becoming scurfy; regularly convex, fleshy, flatter with age, from 2 to 4 inches, and sometimes 9 inches in diameter, liquefying in decay,—the flesh white. The stem (or stipe) is solid, white, cylindrical, from 2 to 3 inches high, half an inch in diameter,—the cur-

FUNGI 243

tain white and delicate. When this mushroom first makes its appearance, it is smooth and almost globular,—and in this state it is called a button. This species is esteemed the best and most savory of the genus,—and is much in request for the table, in England. It is eaten fresh, either stewed or boiled,—and preserved either as a pickle, or in powder; and it furnishes the sauce called ketchup. The field plants are better for eating than those raised on artificial beds,—their flesh being more tender; and those who are accustomed to them can distinguish them by their smell. But the cultivated ones are more sightly, may be more easily collected in the proper state for eating, and are firmer and better for pickling. The wild mushrooms are found in parks and other pastures, where the turf has not been ploughed up for many years; and the best time for gathering them [in England] is August and September."

Weil like a cob-web. Gills becoming discolored, cloudy, dissolving. Sporidia brownish-purple.

245. MERULIUS. Hall. Endl. Gen. 445. [A name applied, by the ancients, to a species of Fungus.]

Pileus fleshy or membranaceous, without a stipe. Hymenium veined,—the veins or folds a little tumid, anastomosing with each other. Fungous parasites, sessile, effused or spread about.

1. M. LACHRYMANS, Schum. Effused, large, yellow-ferruginous or deep orange-color; margin white and cottony; veins large, forming irregular pores by their sinuosity. Lindl. Ency. p. 1007. Weeping Merulius. Vulgò—Dry Rot.

Obs. This Fungus (and some others—such as Polyporus, Sporotrichum, &c. which infest timber in places where a damp air is confined) is known by the name of "Dry Rot." It is, says Prof. LINDLEY, "a pest to the wood of dwelling houses [and ships], which it speedily destroys. It is said to be destroyed by a wash of diluted sulphuric acid. The whole plant is generally resupinate, soft, tender, at first very light, cottony and white. When the veins appear, they are of a fine yellow, orange, or reddish-brown, forming irregular plicae, most frequently so arranged as to have the appearance of pores,-but never any thing like tubes. Sometimes the pileus or substance of the plant, from its situation, produces pendent processes like inverted cones. The whole fructification often forms a circle of 1 to 8 inches in diameter. Except in favorable situations, it does not produce fructification, and resembles a dry pithy cottony substance,—whence it has been called dry rot. When in a perfect state, its sinuses contain drops of clear water,—which have given rise to the specific name." Various chemical processes have been resorted to, to prevent the appearance, or growth, of this destructive fungus-some of which, I believe, have been thought worthy of Letters patent; but of their value I am unable to speak. There is a Fungus, which, from its resemblance to fibrous roots, is called Rhizomorpha. It is often troublesome, by choking up trunks, and bored logs, that are used for the conveyance of water. It has so much the appearance of real roots, that it is generally mistaken for them,—especially when the trunks are laid in woodlands: though the question might very naturally occur, to observing minds, how such coarse fibres could penetrate, or pass through the logs, or planks, without being visible in their substance.

There is also a remarkable Fungus, called Oak-leather (Xylostroma Corium, Pers. or Byssus gigantea, DC.), -often found in the fissures or wind-shakes of old trees; which bears a striking resemblance to a dressed sheepskin,—and is sometimes almost as large.

TRIBE II. GASTEROMYCETES. Fries.

Fungus entirely closed, bearing sporidia in an interior or ventral sac.

SUB-TRIBE I. ANGIOGASTERES. Fries.

Ventral sac finally bursting forth, separate from the receptacle. Sporidia lodged in the receptacle.

DIV. 2. TUBERACEAE. Fries.

Sporanges membranous, scattered in an hymenium which is often latticed with small veins, and inclosed in a ventral sac. Sporidia at first pulpy.

246. TUBER. Michel. Endl. Gen. 350. [An ancient Roman name.]

Ventral sac subglobose, externally smooth or papillose-verrucose, indehiscent, somewhat coriaceously fleshy within, reticulately veined. Sporidia sub-pedicellate, scattered among the veins. Subterraneous Fungi, often destitute of roots, roundish, fleshy, -the flesh variegated with sporule-bearing veins.

1. T. CIBARIUM, Sibth. Very rough with sub-prismatic warts, blackish; roots entirely wanting; flesh firm or toughish. Ency. v. 1022.

EATABLE TUBER. Vulgò-Truffle. Fr. Truffe. Germ. Trueffel. Span. Criadilla de tierra.

Obs. This is the Fungus so celebrated in the annals of cookery, under the name of Trufte. It often attains to the size of a man's fist (pugni saepe mole, Endl.),—and is found in light dry sandy soils, in various parts of Europe and Asia. Dogs, it is said, are taught to find it by the smell,—and to scratch it up out of the earth. The Truffle, I believe, is but seldom met with, in the U. States. The late Rev. Mr. Schweinitz mentions, that it was not unfrequently found near Nazareth, in Pennsylvania, some 60 years since, by an old German hunter, and his dog, which had been trained to seek for it.* A subterrancous esculent Fungus, called "Tuckahoe" (probably nearly allied to the Truffle), has been found in the Southern States. See Farmer's Encyclopaedia.

Some other Fungi are esculent, and much esteemed by Gastronomers; -such as the Morchella esculenta, Pers. or Morel, -and the Helvella esculenta, Pers. They are, however, less known, in our

country, than the common eatable Mushroom.

SUB-TRIBE IV. MUCOROIDEI. Fries.

Peridium formed of flocci loosely woven together, vanishing in the middle. Sporidia in heaps.

247. ASCOPHORA. Tode. Endl. Gen. 255.

[Greek, Askos, a sac, and phero, to bear; in allusion to the receptacle of sporules] Peridium membranaceous, stipitate, finally bursting, turned inside out, convex and somewhat persistent; stipe simple or branched, tubular, pellucid, articulated.

*In reference to the Tuber cibarium, Mr. Schweinitz says—"Nunquam ipse inveni—sed certior factus sum ante sexaginta annos in vicinitate Nazarethorum ab antiquo venatore germano, caneque suo ad hoe olim educato, non rariter inventum esse."—Am. Philos. Transactions, 4. new Series. p. 252.

FUNGI 245

1. A. Mucepo, Link. Stipe simple; heads inflated, spherical, at first white, finally dark grey, bursting close to the long filiform stipe. Lindl. Ency. p. 1036.

Mucor Mucedo. L. Vulgò—Mould. Bread-mould. Fr. Moisissure. Germ. Der Schimmel. Span. Moho.

Obs. This minute Fungus usually abounds on moist decaying substances,—and is well known to most persons—especially to house-wives—as growing plentifully on bread and pastry which has begun to "spoil;"—yet it is probable that many of them have never suspected it of being as genuine a plant, as any weed that grows on the farm.

TRIBE IV. CONIOMYCETES, Fries. Sporidia naked, without any heterogeneous receptacle.

SUB-TRIBE II. ENTOPHYTI. Fries. Sporidia naked, separate, without a receptacle.

DIV. 2. HYPODERMIA. Fries.

Parasites upon living plants,—originating in a diseased parenchyma, under the spidermis, which being ruptured, the sporidia burst forth.

248. UREDO. Pers. Endl. Gen. 181.

[Latin, uro, to burn, or scorch,—from the apparent effect of the plant.]

Peridium none,—or the epidermis of the leaves and stems forming a pseudo-peridium. Sporidia 1-celled, free, sessile, mostly globose.

1. U. SEGETUM, Pers. Clusters large, irregular, brown or black, usually occupying the organs of fructification; sporidia globose, minute. Lindl. Ency. p. 1044.

Corn Uredo. Vulgò—Smut. Blight. Smut-Brand.

Obs. This Fungus is usually found within the glumes and fruit of Wheat, Barley, and other Grasses,—spreading, and in a short time filling the whole with a profuse black dust, which, under the microscope, is found to consist of minute spherical sporidia. Where the grain is but partially, or slightly affected, it may be freed from the offensive fungus, by the operations of mechanical contrivances, called "Smut Machines," which have been invented for that purpose.

The fructification (both ears and tassels) of *Indian Corn*, is often invaded by this destructive parasite,—and sometimes the spikes, or ears, are enlarged to an enormous size. Prof. DE CANDOLLE, and others, have considered this as a distinct species, under the name of *U. Maydis*, or *U. Zeae*. It is curious to observe the manner in which the ears of Indian Corn—grains and all—retain something of their original form, while undergoing the destructive process. Various species of this blighting Fungus grow on, and are perhaps peculiar to, different genera and species of plants.

249. PUCCINIA. Pers. Endl. Gen. 185.

[Perhaps from the Greek, puka, densely crowded,—from its manuer of growth.] Peridium none,—or the epidermis of the leaves and stems forming a pseudo-peridium. Sporidia 1 or many-celled, dehiscent at apex, often pedicellate, emerging from under the irregularly ruptured epidermis. Minute fuscous or blackish Fungi, aggregated in little clusters.

1. P. Graminis, Pers. Clusters dense, often confluent and forming long parallel lines, changing from yellowish-brown to black; sporidia

21*

elongated, clavate, stipitate, 2-celled,—the upper cell larger. Lindl. Grass Puccinia. Vulgò—Mildew. Rust? __ [Ency. p. 1048. [Ency. p. 1048. Fr. La Nielle. Germ. Der Mehlthau. Span. El Tizon.

Obs. This is the Fungus which, under the name of Mildew (and perhaps Rust—though this may be another species,) often appears so abundantly and operates so injuriously, on our Wheat crops, in warm, close, foggy, and cloudy or wet weather, near harvest time,especially where the crop is a little backward, and mingled with an undue proportion of other grasses, or herbage. The species of this genus are numerous, - and appear to be confined to certain plants, from which they derive their specific names; -as P. Rosae-P. Rubi -P. Pruni-P. Trifolii, &c.

There may, perhaps, be different kinds of these minute Fungi (species of Aecidium, and other genera), infesting the various Grasses, and cultivated crops. A little orange-colored one is very prevalent, some seasons, on the leaves of the Washington Thorn (Crataegus cordata, Ait.). Until they shall be better understood, and a preventive remedy discovered, they deserve to be carefully studied,

both by Naturalists and Farmers.

ORDER CLXX. ALGAE. Juss.

Leafless flowerless plants, with no distinct axis of vegetation, growing in wa-Leafless flowerless plants, with no distinct axis of vegetation, growing in water, and consisting either of simple vesicles lying in macus, or of articulated filaments, or of lobed fronds formed of uniform cellular tissue,—absorbing the ambient liquid only by the immersed portion and not conveying it to the other parts; sometimes reddish, sometimes green,—emitting oxygen gas when exposed under water to the sun. Reproductive matter either altogether wanting, or contained in the joints of the filaments, or deposited in thecae (of various form, size and position) caused by dilatations of the substance of the frond. Sporules with no proper integument,—in germination elongating in two opposite directions.

An Order comprising more than 100 genera, some of which afford food—others medicine, and materials used in the arts;—but few of them of any importance in Agriculture.—and those chiefly as a manure, in the vicinity of the Sea shore.

in Agriculture.—and those chiefly as a manure, in the vicinity of the Sea shore. The edible Swallow's nests, which are esteemed such a delicacy by the Chinese, are believed to be mainly constructed of a species of Seaweed.

250. FUCUS. Agardh. Endl. Gen. 119. [Latinized from the Greek, Phulos, a Sea-weed.]

Frond flat or compressed (rarely filiform), dichotomous, coriaceous. Air vessels, when present, innate in the frond, simple, large. Receptacles mostly terminal, turgid, containing tubercles imbedded in

mucus and filled with sporules and filaments.

1. F. VESICULOSUS, L. Frond flat, with a middle nerve or rib, linear, dichotomous, entire; vesicles spherical, innate upon the frond in pairs; receptacles terminal, compressed, turgid, mostly elliptical. Hook. Brit. Fl. 2. p. 267.

Bladdery Fucus. Vulgà—Sea-weed. Sea-wrack. Fr. Varec. Germ. Der Meer-tang. Span. Fuco.

Obs. This and some other Sea-weeds are attached to submarine rocks. by leathery shield-like expansions; but are often torn loose, and thrown on shore in great quantities, by the agitation of the Sea. Being collected and burned, they leave an alkaline residuum, called Kelp, which is said to be valuable as a manure—as well as an article of considerable commercial importance. The poor half-starved cattle, on the coast of Scotland, feed upon this Sea-weed, in times of scarcity; but in our country, such fodder is but little known. For an interesting notice of Kelp, see the Farmer's Encyclopaedia,—a highly valuable Repository of information in every department of Agriculture.

THE Plants enumerated in this work may be classified according to their character and properties, as follows:

[N. B. Those which are cultivated, in Italics.]

I. Plants yielding esculent Roots, Herbage, or Fruits, for Man.

GENUS. GENUS. 10. Brassica oleracea, L. 73. Daucus Carota, L. — B—— campestris, L. — B—— Rapa, L. 101. Cynara Sco'ymus, L. 104. Cichorium Endivia, Willd.105. Tragopogon porrifolium, L. 16. Raphanus sativus, L. 21. Hibiscus esculentus, L. 107. Lactuca sativa, L. 109. Vaccinium corymbosum, L. 25. Citrus Aurantium, Risso. 110. Oxycoccus macrocarpus, P. Vitis vinifera, L. V Labrusca, L.
V aestivalis, Mx.
V vulpina, L. 113. Diospyros Virginiana, L. 139. Batatas edulis, Chois. 145. Solanum tuberosum, L. 35. Cicer arietinum, L. - S- esculentum, Dunal. Arachis hypogaea, L. 146. Lycopersicum esculentum, 37. Faba vulgaris, Moench. Mill. 38. Ervum Lens, L. 152. Spinacia oleracea, L. 39. Pisum sativum, L. 153. Beta vulgaris, L. 156. Rheum Rhaponticum, Ait. 40. Phaseolus vulgaris, Savi. 157. Rumex crispus, L. - P-- lunatus, L. 48. Persica vulgaris, Mill. 159. Fagopyrum esculentum, Mh 160. Phytolacca decandra, L. - P--- laevis, DC. 49. Armeniaca vulgaris, Lam. 168. Juglans nigra, L. - J--- regia, L. - A- dasycarpa, Pers. 169. Carya alba, Nutt. 50. Prunus domestica, L. - P—— Americana, Marsh. - P—— Chicasa, Mx. - C- olivaeformis, Nutt. 171. Corylus Americana, Marsh. 174. Castanea vesca, Gaertn. 51. Cerasus avium, Moench. - C- pumila, Mill. - C- vulgaris, Mill. 181. Morus rubra, L. 53. Fragaria vesca, L. 184. Ficus Carica, L.192. Sabal Palmetto, Loddig. - F- Virginiana, Ehrh. 54. Rubus Idaeus, L. Rubus occidentalis, L. 201. Allium Porrum, L. - R—— Canadensis, L.
- R—— villosus, Ait. A--- Cepa, L. 202. Asparagus officinalis, L. 208. Oryza sativa, L. 57. Pyrus communis, L. - P -- Malus, L. 210. Zea Mays, L. 60. Ribes Uva-crispa, L. 232. Triticum vulgare, Vill. 233. Secale cereale, L. - R --- rubrum, L. - R---nigrum, L. 244. Agaricus campestris, L. 246. Tuber cibarium, Sibth. 62. Cucumis Melo, L.

63. Citrullus vulgaris, Schrad.

64. Cucurbita Pepo, L.

- C Melopepo, L. - C verrucosa, L.

72. Pastinaca sativa, L.

Fifty-seven are cultivated. Note.-Many of the preceding, afford food for Domestic animals, also.

Eighty in number; of which

II. Plants yielding Food exclusively, or chiefly, for Domestic Animals.

43. Trifolium pratense, L. T—— repens, L.

44. Melilotus leucantha, Koch.

45. Medicago sativa, L. 114. Plantago lanceolata, L.

172. Quercus alba, L. 173. Fagus sylvatica, L. 209. Zizania aquatica, L.

211. Phleum pratense, L.

212. Holcus lanatus, L. 213. Anthoxanthum odoratum L.

214. Panicum sanguinale, L.

215. Setaria Italica, Kunth. 218. Muhlenbergia diffusa, W'ld.

 M—— Mexicana, Trin. 219. Agrostis vulgaris, With.

221. Cynodon Dactylon, Pers.

222. Eleusine Indica, Gaertn.

223. Avena sativa, L.

224. Arrhenatherum avenaccum, Beauv.

225. Poa annua, L.

- P-- trivialis, L.
- P-- pratensis, L.
- P-- compressa, L.
226. Glyceria fluitans, R. Br.

227. Dactylis glomerata, L.

228. Festuca pratensis, Huds. 231. Lolium perenne, L.

235. Tripsacum dactyloides, L. 243. Cladonia rangiferina Hoffm.

Thirty in number; of which

Ten are cultivated.

III. Plants yielding Condiments and Drinks.

7. Nasturtium officinale, R. Br.

8. Barbarea praecox, R. Br. 11. Sinapis nigra, L.

- S---alba, L.

12. Cochlearia Armoracia, L. 14. Lepidium sativum, L.

28. Tropaeolum majus, L.

31. Acer saccharinum, L. 33. Vitis vinifera, L.

57. Pyrus Malus, L. - P- Coronaria, L.

58. Cydonia vulgaris, Pers.

60. Ribes rubrum, L. 62. Cucumis sativa, L.

- C--- Anguria, L. 67. Apium graveolens, L.

68. Petroselinum, sativum, Hoff.

69. Carum Carui, L.

70. Foeniculum vulgare, Gaert. 75. Coriandrum sitivum, L.

89. Helianthus tuberosus, L.

96. Artemisis Dracunculus, L.

116. Martynia proboscidea, Glox. 120. Ocimum basilicum, L.

121. Lavandula vera, DC. 122. Mentha viridis, L.

123. Salvia officinalis, L. 124. Mujarana hortensis, Moench

125. Thymus vulgaris, L. 426. Satureja hortensis, L.

144. Capsicum annuum, L. 168. Juglans cinerea, L.

J—— regia, L.

201. Allium Schoenoprasum, L.

234. Hordeum vulgare, L. - H- distichum, L.

236. Saccharum officinarum, L. Thirty-seven in number; of

which thirty-three are cultivated.

IV. Medicinal Plants.

3. Cimicifuga racemosa, Ell. 25. Citrus Medica, Risso.

34. Polygala Senega, L.

74. Conium maculatum, L. 76. Aralia racemosa, L.

78. Cornus florida, L. 83. Eupatorium perfoliatum, L.

92. Anthemis nobilis, L.

95. Tanacetum vulgare, L.

96. Artemisia Absinthium, L.

108. Lobelia inflata, L.

112. Chimaphila umbellata, Nutt

122. Mentha viridis, L. - M--- piperita, L.

123. Salvia officinalis, L. 127. Hyssopus officinalis, L.

128. Hedeoma pulegioides, Pers.

129. Melissa officinalis, L.

131. Nepeta Cataria, L.

134. Marrubium vulgare, L.

142. Nicotiana Tabacum, L. 143. Datura Stramonium, L.

147. Sabbatia angularis, Pursh.

151. Aristolochia Serpentaria, L. 154. Chenopodium anthelminti-

cum, L. 161. Sassafras officinale, Nees.

162. Benzoin odoriferum, Nees.

164. Ulmus fulva, Mx.

167. Ricinus communis, L.

168. Juglans cinerea, L.

187. Humulus Lupulus, L. 193. Arum triphyllum, L.

195. Acorus Calamus, L. 201. Allium sativum, L.

242. Cetraria Islandica, Ach.

Thirty-five in number; of which fifteen are cultivated.

V. Plants employed in the Arts, in Commerce, in Domestic or Rural Economy.

4. Magnolia acuminata, L.

5. Liriodendron tulipifera, L.

22. Gossypium herbaceum, L. 24. Tilia plutyphylla, Scop.

- T- Americana, L.

26. Melia Azedarach, L.

27. Linum usitatissimum, L.

29. Rhus glabra, L.

- R-- typhina, L. 31. Acer saccharinum, L.

- A dasycarpum, Ehrh.
- A rubrum, L.

32. Aesculus Hippocastanum, $oldsymbol{L}_{oldsymbol{\circ}}$ 41. Robinia Pseud-acacia, L.

42. Indigofera tinctoria, L. 46. Cercis Canadensis, L.

47. Gleditschia triacanthos, L.

51. Cerasus serotina, DC. 56. Crataegus Crus-galli, L.

- C--- cordata, Ait.

61. Lagenaria vulgaris, Ser. 77. Panax quinquefolium, L.

78. Cornus florida, L.

80. Rubia Tinctorum, L. 81. Dipsacus Fullonum, L.

115. Catalfa bignonioides, Walt. 149. Fraxinus Americana, L.

F pubescens, Walt.F sambucifolia, Lam.

150. Ligustrum vulgare, L.

163. Nyssa multiflora, Walt. 164. Ulmus Americana, L.

165. Celtis occidentalis, L.

168. Juglans nigra, L.

169. Carya alba, Nutt.

- C— tomentosa, Nutt.

170. Ostrya Virginica, Willd.

172. Quercus Phellos, L.

172. Quercus imbricaria, Mx.

Q— virens, Ait.
Q— nigra, Willd.
Q— tinctoria, Bartr.
Q— coccinea, Wangenh.
Q— rubra, L.
Q— falcata, Mx.

Q— palustris, Mx.
Q— obtusiloba, Mx.
Q— alba, L.
Q— bicolor, Willd.
Q— Prinus, L. _

Q — montana, Willd.
Q — Castanea, Muhl.

173. Fagus sylvatica, L.

174. Castanea vesca, Gaertn.

175. Betula nigra, L.

- B-lenta, L. - B-papyracea, Ait.

177. Salix vitellina, L. - S- Babylonica, L.

178. Populus tremuloides, Mx.

- P-angulata, Ait. - P. Graeca, Ait.

P. dilatata, Ait.

179. Liquidambar styraciflua, L.

180. Platanus occidentalis, L. 181. Morus rubra, L.

- M-- alba, L.

182. Maclura aurantiaca, Nutt.

183. Broussonetia papyrifera, Vent.

186. Cannabis sativa, L.

187. Humulus lupulus, L.

188. Pinus variabilis, Lambert.

P—— palustris, L. P—— Strobus, L.

P—— Canadensis, L. P—— microcarpa, Lamb't.

- 189. Taxodium distichum, Rich.
- 190. Thuja sphaeroidalis, Rich.
- 191. Juniperus Virginiana, L.
- 192. Sabal Palmetto, Loddig.
- 196. Typha latifolia, L. 198. Tillandsia usneoides, L.
- 205. Scirpus triqueter, L.
- 230. Arundinaria macrosperma,
- 236. Saccharum officinarum, L.

- 237. Andropogon saccharatus, Roxb.
- 238. Equisetum hyemale, L.
- 239. Lycopodium dendroideum,
- 241. Sphagnum palustre, L.
- 250. Fucus vesiculosus, L. Ninety-one in number; of which Twenty-four are cultivated.
- VI. Pernicious and troublesome Plants—to be expelled: eminently pernicious ones in SMALL CAPITALS.
 - 1. Ranunculus bulbosus, L.
 - 2. Delphinium Consolida, L.
 - 6. Papaver dubium, L.
 - 13. Camelina sativa, Crantz.
- , 17. Hypericum perforatum, L. 18. LYCHNIS GITHAGO, Lam.
- 23. Abutilon Avicennae, Gaert.
 - 29. Rhus venenata, DC.
- R- Toxicodendron, L. - 30. Ailanthus glandulosa, Desf
 - 54. Rubus Canadensis, L.
 - R--- villosus, Ait.
- 55. Rosa Carolina, L. / 66. Cicuta maculata, L.
- 71. Archemora rigida,, DC.73. Daucus Carota, L.
 - 79. Sambucus Canadensis, L.
 - 81. Dipsacus sylvestris, L.82. Vernonia Noveboracensis,
 - Willd.
 - 87. Ambrosia artemisiaefolia, L.
 - 88. Xanthium strumarium, L.
 - X- SPINOSUM, L.
 - 90. Bidens frondosa, L.
 - B --- chrysanthemoides, Mx.
 - B-- bipinnata, L.
 - 91. Maruta Cotula, DC.
 - Lam.
 - 100. Centaurea Cyanus, L.
 - 102. Cirsium lanceolatum, Scop. 232. TRITICUM REPENS, L. C discolor, Spreng. 245. MERULIUS LACHRYMANS,

 - C discolor, Spreng.
 C pumilum, Spreng.
 C horridulum, Mx.
 C ARVENSE, Scop.
 - 103. Lappa major, Gaertn.
 - 104. Cichorium Intybus, L.
 - 114. Plantago lanceolata, L.
 - 117. Verbascum Thapsus, L.
 - 118. LINARIA VULGARIS, Mill.

- 131. Nepeta Cataria, L.
- 133. Leonurus Cardiaca, L. 136. ECHIUM VULGARE, L.
 - 138. Cynoglossum Morisoni, DC.
- 140. Convolvulus arvensis, L.
- 141. Cuscuta epilinum, Wich.
- , 143. Datura Stramonium, L.
 - 145. Solanum nigrum, L. - S- CAROLINENSE, L.
- 154. Chenopodium album, L.
- , 155. Amaranthus albus, L.
 - A hybridus, L.
 A spinosus, L.
- 157. Rumex crispus, L.
- R— obtusifolius, L. R— Acetosella.
- 158. Polygonum sagittatum, L.
- P-- arifolium, L.
- 185. Urtica dioica, L. ×199. Smilax rotundifolia, L.
 - S-- caduca, L.
- 200. ORNITHOGALUM UMBELLA-TUM, L.
- 201. Allium vineale, L.
 - 203. Juncus communis, E. Mey'
 - 204. Carex acuta, Gooden. 206. CYPERUS REPENS, Ell.
 - C- HYDRA, Mx.
- 94. Leucanthemum vulgare, / 214. Panicum sanguinale, L.
 - 217. CENCHRUS TRIBULOIDES, L. 229. Bromus secalinus, L.

 - Schum.
 - 247. Ascophora Mucedo, Link. 248. Uredo segetum, Pers.
 - 249. Puccinia Graminis, Pers.
 - Seventy-three in number; of which some 16 or 18 are eminent-
 - ly pernicious.

VII. Plants which are chiefly mere Weeds, upon Farms,—and ought to be expelled, or superseded by more useful ones.

9. Sisymbrium officinale, Scop. 130. Prunella vulgaris, L.

15. Capsella Bursa-pastoris, Moench.

19. Portulaca oleracea, L. 20. Malva rotundifolia, L.

29. Rhus glabra, L.

43. Trifolium arvense, L.

52. Potentilla Norvegica, L. - P-- Canadensis, L.

54. Rubus (all the wild species).

59. Oenothera biennis, L. (and all others).

65. Saxifraga Pennsylvanica, L.

83. Eupatorium (all the species)

84. Aster ericoides, L. (and all others).

85. Erigeron (all the species).

86. Solidago nemoralis, Ait. (and all others).

87. Ambrosia trifida, L.

93. Achillea Millefolium, L.

97. Gnaphalium polycephalum, Mx.

98. Erechtites hieracifolia, Raf.

99. Senecio aureus, L.

103. Cirsium (all the species).

106. Taraxacum Dens-leonis, Desf.

108. Lobelia (all the species). 111. Andromeda Mariana, L.

114. Plantago major, L.

119. Verbena urticaefolia, L.

131. Nepeta Glechoma, Benth. 132. Lamium amplexicaule, L. 135. Teucrium Canadense, L.

137. Lithospermum arvense, L. 148. Asclepias tuberosa, L.

158. Polygonum (all the species).

160. Phytolacca decandra, L. 166. Euphorbia (all the species).

176. Alnus serrulata, Willd.

194. Symplocarpus foetidus,

Salisb.

197. Sagittaria sagittaefolia, L.

203. Juncus (all the species).

204. Carex (all the species). 205. Scirpus (all the species).

206. Cyperus (all the species).

207. Leersia oryzoides, Swartz.

215. Panicum (all the species).

215. Setaria glauca, Beauv. - S- viridis, Beauv.

216. Oplismenus Crus-galli, K'th

220. Phragmites communis, Trin

237. Andropogon scoparius, Mx.

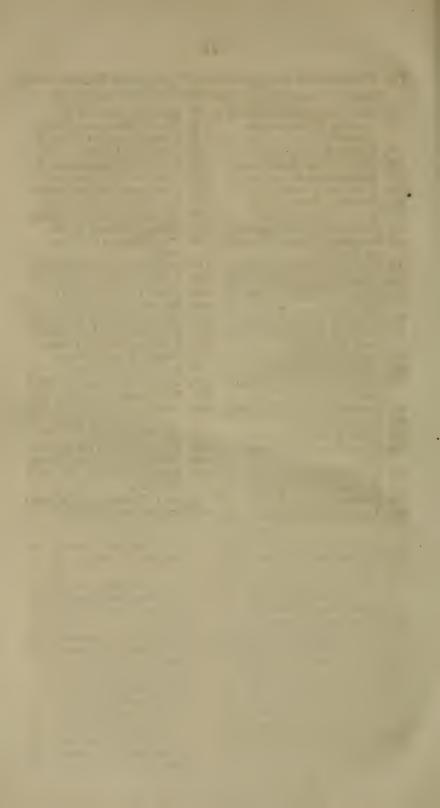

- A—furcatus, Muhl. - A—nutans, L.

238. Equisetum (all the species).

240. Pteris (and all other Ferns).

241. Sphagnum (and all other Mosses).

About 120 species, which infest the farm, as mere Weeds.
