# Remarks to Purchasers

READ CAREFULLY BEFORE ORDERING

**Name and Address.** Write your Name, Post Office, County and State as distinctly as possible. Some orders reach us which give neither name nor location. In such cases it is impossible for us to fill orders until we again hear from the senders.

**Use the Order Sheet.** Make out your list of requirements consecutively in the order as given in the Catalogue, placing the quantity wanted before the article, and the price of the same in the column to the right; and always keep a copy of your orders.

**Correspondence** should not be intermingled with the body of the order, but either written at the bottom of the Order Sheet, or on a separate sheet of paper.

**Remittances.** The safest method of sending money is by **Post Office Orders**; where they are not obtainable, it can be sent by Express Money Order, Registered Letter, or Draft on New York. For small amounts, postage stamps will be acceptable.

**When the Remittance** is not sufficient to pay for the quantity of seeds ordered, we will reduce the quantity to correspond with the remittance.

**Errors.** All possible precautions are taken to avoid their occurrence. Notify us at once if your order is not properly filled, and we will promptly make the necessary corrections.

**Substitution.** As the season advances some stocks of seeds are exhausted, so it is advisable when late orders are sent to name a few substitutes. We make substitution only when requested to do so, sending varieties that will as fully cover the indicated wants as our stock will permit. If not so instructed, the remittance will be refunded.

**Send Us Your Order as Early as Possible.** It will facilitate the prompt execution of same, and you will have your seed when you are ready to plant.

**We Pay Postage** on seeds only in packets, ounces and quarter pounds. For larger quantities postage must be added by the customer. See notes, page 1, on postage on seeds.

**Seeds by Express.** Seeds can now be forwarded at 20 per cent less than merchandise rates; a saving to the buyer of one-fifth over previous rates.

**Shipments by Freight.** Seeds in bulk, implements, and other heavy goods are shipped by freight, and unless there is a freight agent at point of destination, the freight must be prepaid, the purchaser advancing the same, unless otherwise arranged. Our facilities for shipping to points south of Pittsburgh on the Ohio River and connecting streams are excellent, steamers plying daily between this and southern points.

**Catalogues** are sent free to all our customers of the past year. Should any change their place of residence, we desire to be informed, that we may correct the address in our Catalogue list. Our local customers, who purchase over our counters, will please give their correct address when making their first annual purchase; this will insure their receiving Catalogues the following year by mail. Many of our patrons who desire our Catalogues fail to receive them because their post-office address is unknown to us.

**NON-WARRANTY.** I use all possible care and precaution to send out only seeds that are pure and reliable; but I give no warranty, express or implied, as to description, quality, productiveness, or any other matter of any seeds, bulbs or plants that I send out, and I will not be in any way responsible for the crop. If the purchaser does not accept the goods on these terms, they are to be returned at once.

# Beckert's Superior Vegetable Seeds for Home and Market-Gardens

## SEEDS OF SUPERIOR QUALITY AND STRONG VITALITY

Our Vegetable Seed Department embraces nearly all varieties that are desirable or of known value, together with the more important of recent introductions. The list has been carefully selected, and the descriptions given are chiefly derived from our own experience and observation. We have endeavored to make them as accurate and helpful as possible, to aid the purchaser in making selections.

### SEEDS BY MAIL

We pay postage on seeds in packets, ounces and quarter-pounds. For larger quantities, add to your remittance postage at the rate of 8 cts. per pound. For Peas and Beans, 8 cts. per pint and 15 cts. per quart. For Sugar Corn, 5 cts. per pint and 10 cts. per quart.

PARCEL POST does not affect postage on seeds and bulbs, the rate remaining as heretofore, excepting that we can mail packages up to 20 pounds in the first and second zones, and up to 11 pounds in all other zones. Letter stamps can be used on parcel-post packages.

## BEANS *Bohnen*

Beans should not be planted before the ground becomes light and warm, in favorable seasons usually about the first of May. Successive sowings, made at intervals of about two weeks until the middle of July, will give a plentiful supply of Beans throughout the season. One quart of seed will sow 100 feet of drill. If Beans are wanted by mail, add for postage 8 cts. per pint or 15 cts. per quart to prices; 10-cent packets sent postpaid

## POLE or RUNNING BEANS

(Stangen Bohnen)

Less hardy than the Bush Beans, and should be planted several weeks later, when the ground is warmer. Plant the seeds in slightly raised hills, 5 or 6 feet apart, four or five seeds to a hill. The Limas are especially tender, and the rule for late outside planting with them is rigid. Painstaking cultivators who are usually the most successful plant them eye downward, after setting stout poles for every hill. All sorts of late-ripening Pole Beans are benefited by pinching the tips of the vines back when they are about 5 feet high. Lima Beans are considered by many the very finest of all Beans, and there is nothing in the vegetable line that can take their place. A quart of Limas will plant about 100 hills; a quart of smaller sorts about 200.

Goldenrod Corn

## CORN, Sweet or Sugar (Maiz)

This delicious vegetable may be enjoyed from early summer until frost, if the proper varieties are selected and planted for succession at intervals of every two weeks until the middle of July. If the seed is planted too early, before the ground becomes warm, it is liable to decay. Plant in hills 3 to 4 feet apart each way, five or six kernels to a hill; or in rows 4 to 5 feet apart, scattering the seeds thinly in the rows. The taller growing the variety, the richer should be the soil and the wider the space allowed for development. One quart will plant 200 hills.

If Corn is wanted by mail, add 5 cts. per pint or 10 cts. per quart for postage; 10-cent packets of all kinds sent postpaid

## PEAS (Erbsen)

All smooth-seeded Peas may be planted as early in the spring as the soil can be prepared for them, being very hardy. Sow for the first crop as early as practicable, and for successions at intervals of about two weeks until June. Late sowings, however, do not yield so well as early ones. Sow in drills about 2 to 3 inches deep, and from 2 to 4 feet apart, according to variety, taller sorts requiring more room than dwarf ones. Dwarf Peas require a very rich soil, while taller ones thrive best in rather thin ground. The latter are frequently sown in double rows, with the brush, or support of some kind, between them. Wrinkled Peas are not so hardy as the smooth sorts, and should not be sown quite so early, but are superior to them in quality, more delicate in flavor, and remain longer in season. One quart of seed will plant about 100 feet of drill.

If Peas are wanted by mail, add postage at the rate of 8 cts. per pint or 15 cts. per quart, to prices given; 10-cent packets sent postpaid. Wrinkled varieties marked with a star.

## THE BEST GARDEN BEETS (Salatrüben)

The soil best suited for the Beet is a deep, light and rich loam. For very early crops, the seed is sown in hotbeds, and the seedlings are transplanted to the open ground. For winter crops, sow seed in June, in drills, as for early Beets. An ounce will sow 50 feet of drill; five or six pounds to an acre.

# CABBAGE (Kopfschl)

Seed sown in hotbed or greenhouse about February 15 will give plants large enough to transplant into hotbeds about March 10. Set them 2 to 3 inches apart each way, and as soon as they become well established, remove the glass for part of the day, to harden them for final transplanting into the open ground, increasing the exposure daily until April 10 to 20, when the final transplanting may be made. Plants for this early crop need not stand farther apart than  $1\frac{1}{2} \times 2$  feet. For late crops, sow the seed in April or May and transplant to the open ground when large enough, setting the plants up to the first leaf, and  $2 \times 3$  feet apart. It is important that the plants should not stand thick in the seed-beds, as this would induce weak, slender plants. To insure large, solid heads of Cabbage, the soil must be plowed deep and made very rich. The insects which molest them should be kept in check with remedies which seem most efficacious in the locality. Crops of Cabbage should not be grown on the same ground for a number of years on account of the tendency to club-root.

## CELERIAC, or TURNIP-ROOTED CELERY

(Knollen Sellerie)

Sow in early spring; transplant the seedlings in May. They will be ready for cooking in October, and may be preserved in dry sand for use during winter. Celeriac is said to be as fine a nerve-tonic as celery, and can be grown in many sections where celery-culture is practically impossible. The roots have almost the same flavor as white celery stalks, while they keep much longer than celery. An ounce of seed will produce about 2,000 plants.

**PRAGUE GIANT.** Roots are very large. When young, they are quite tender and marrow-like, having a very fine flavor and cooking quickly. Pkts. 5 cts. and 10 cts., oz. 30 cts.

Prague Giant Celeriac

**Lawn Grass Seed.** If you desire a perfect lawn, use our Evergreen Lawn Seed. For SHADY PLACES sow our Shady Nook Lawn Seed. Both kinds, if sown early in the spring, will produce a good lawn by midsummer.

# CAULIFLOWER (Blumentohl)

**How to Grow Fine Cauliflower.** Culture for Cauliflower and cabbage is essentially the same, but to the former extra care given in applying fertilizers and moisture well repays the gardener. Sow the seeds for early and late crops as directed for cabbage, but do not set the early plants in the open field too soon, for if too much stunted by severe frosts, they begin to form heads before they are strong enough to develop them well. Plants which have not headed before winter sets in may be stored in a cool cellar or coldframe, and will form heads without further attention. An ounce of seed will produce about 1,500 plants.

**BECKERT'S EARLY SNOWBALL.** Produces large, handsome heads, measuring 8 to 10 inches across; pure snowy white; close, compact and of the finest quality. The stalks are short, of compact growth, and can be planted closely. It is extra early, a very certain header, and equally good for a late crop. Unsurpassed by any strain offered. Pkt. 25 cts.,  $\frac{1}{4}$  oz. \$1, oz. \$3.50.

**BECKERT'S SMALL-LEAVED SNOWBALL.** About two weeks earlier than the preceding; a sure header and fine for forcing, or outdoor culture. Pkt. 25 cts.,  $\frac{1}{4}$  oz. \$1, oz. \$3.50.

**EXTRA-EARLY ERFURT.** The plants may be depended upon to form large, firm, white heads; very early. Pkt. 20 cts.,  $\frac{1}{4}$  oz. 95 cts., oz. \$3.25.

**DANISH GIANT, or DRY WEATHER.** Similar to Snowball in size, quality, etc., but matures about one week later and is a better drought- and heat-resister. Pkt. 25c.,  $\frac{1}{4}$  oz. \$1, oz. \$3.50.

**PERFECTION.** A new and distinct variety that is as early as Snowball and producing equally as perfect a head. Has long leaves that grow straight up, with the inner leaves twisted and whorled, which naturally protects the head from the sun to a great extent. Pkt. 25 cts.,  $\frac{1}{4}$  oz. \$1.50, oz. \$5.50.

**EXTRA-EARLY PARIS.** Large leaves and large, firm, white heads. Pkt. 10 cts.,  $\frac{1}{4}$  oz. 20 cts., oz. 60 cts.

**LENORMAND'S SHORT-STEM.** A late Cauliflower; good heads, with close, uniform curds. Pkt. 10 cts.,  $\frac{1}{4}$  oz. 20 cts., oz. 60 cts.

**VEITCH'S AUTUMN GIANT.** White, large, firm heads. Pkt. 5 cts.,  $\frac{1}{4}$  oz. 15 cts., oz. 50 cts.

# CELERY (Cellerie)

Celery can be grown in any garden soil, but the finest is produced in deep, mellow, bottom land. Seed for early crops should be sown in hotbeds about March 15. The plants may be either thinned to give them room to grow, or transplanted to another bed to grow until it is time to plant them in the open ground. For main crop, seed should be sown in the open air as soon as the soil and air are warm enough. They should be covered lightly, or merely pressed into the earth with a board, if the soil is fine and mellow. The seed-bed must be kept free from weeds, and well watered in dry weather. When the plants are large enough, transplant them to shallow trenches or furrows, from 4 to 6 feet apart, according to the variety grown, setting the plants 6 inches apart in the rows and pressing the soil firmly around them. Blanching consists of drawing earth up to the stalks at intervals of about two weeks, until all but the tops of the plants are covered. Celery may be kept for winter use in pots or cellars, or in deep, narrow trenches, in a dry situation; the latter must be covered with boards, with sufficient soil and manure on top to keep out the frost, leaving openings at short distances for ventilation in mild weather. An ounce of seed will produce about 2,000 plants.

**GIANT PASCAL.** Stalks broad, thick and about 2 feet high; blanch quickly; rich, nutty flavor; tender, crisp and stringless. A fine market Celery. Pkts. 5 cts. and 10 cts., oz. 25 cts.,  $\frac{1}{4}$  lb. 75 cts., lb. \$2.50, postpaid \$2.58.

**BECKERT'S PERFECTION WINTER.** Grows to good size; very brittle, and white in color. ## CUCUMBERS (Gurte)

The seed cannot be planted in the open ground before the weather has become warm and settled, and the ground mellow and light. Plant the seeds in well-enriched hills about 4 feet apart each way, and, as soon as all danger from insects is over, thin the plants to leave four of the strongest in each hill. For succession, sow at intervals of every two weeks until midsummer. Extra-early crops are grown by planting the seed in hotbeds in April, upon pieces of sod turned upside down, and removing them to hills in open ground as soon as the weather is warm enough. For pickles, sow seed from the middle of June until the middle of July. The vines bear longer if the fruits are gathered as soon as they are large enough; their strength is soon exhausted by ripening fruits. An ounce of seed will plant 100 hills; two pounds will plant an acre.

If wanted by mail, add 8 cts. per pound for postage on quantities of one-half pound and up

## LETTUCE (Garten Salat)

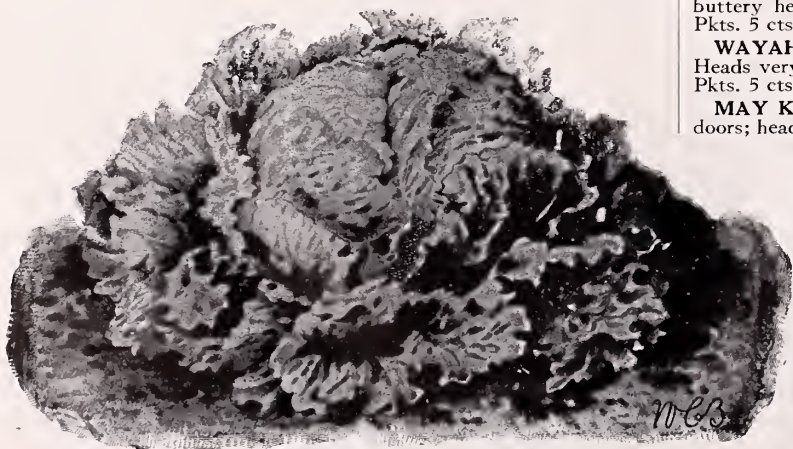

Seed for the first outdoor crop is usually sown in hotbeds in February, and the seedlings transplanted to the garden in April, 8 to 12 inches apart in rows 12 inches apart. For a succession until frost, sow in drills in the open ground at intervals of every two or three weeks, and thin the plants to stand 6 to 8 inches apart. For plants to force in hotbeds from November until spring, sow seed in hotbeds in the fall, and cover up as winter approaches, until the plants are required for use. Or the seed may be sown in hotbeds early in winter and the seedlings transplanted into fine and well-prepared garden soil. Half an ounce of seed will sow 100 feet of drill and produce about 1,500 plants.

## MUSKMELONS (Muscat Melonen)

Muskmelon seed should not be planted outdoors until the ground has become warm and dry. The hills should be about 6 feet apart, and carefully prepared. Rich earth is far better for the young plants than manure; but, if the latter must be used, see that it is well rotted. Plant from six to twelve seeds in a hill, and when the young seedlings are strong enough to resist the attacks of insects, thin them, leaving three of the strongest in each hill. An ounce of seed will plant about 100 hills.

## ONION SEED AND ONION SETS (Zwiebel)

Good Onion Seed is of the greatest importance

Onions thrive best on a rich, deep, loamy soil. For sets, the seed should be sown very thickly in drills as early as possible in spring. In summer, as soon as the tops die down, harvest the bulbs and store them in a dry, cool place, spreading them in thin layers. Early in the following spring, replant them 4 inches apart, in small drills 12 inches apart, and they will form into fine, large bulbs early in the season. Large Onions may also be grown from seed the first season if the land is strong and well manured, the seed sown thinly in drills a foot apart, and the seedlings thinned to stand 3 or 4 inches apart in the drills; they must be well cultivated and kept free from weeds. Five pounds to the acre will be required for large Onions; for sets, 60 lbs.

If wanted by mail, add 8 cts. per pound for postage on quantities of one-half pound and up

# List of Select Flower Seeds

In the following pages is offered a **carefully chosen** list of **Flower Seeds**, in which no want of the flower-garden has been neglected, the numerous varieties insuring a wide range of color, form, height, habit and season, thus permitting selection for any and every ornamental purpose.

**PLEASE USE THE ORDER SHEET** that is enclosed in catalogue; by so doing, the filling of orders is speeded, and the chance of errors lessened.

The complete index will contribute to an easy and rapid selection of seeds wanted.

**HARDY ANNUALS.** Of these, some varieties may be sown outdoors during July and August, or in boxes and coldframes during September; either of these methods rendering possible earlier effects than from spring-sown seed. The latter may be sown outdoors in April and May, according to season and condition of soil, or may be sown in a hotbed; the combining of any two methods being advisable, thereby avoiding a possible failure of one sowing, and providing plants for succession if both sowings prosper. Ground under all conditions should be rather light, well manured and thoroughly dug up. When nicely raked and leveled, the coarser seeds sown are to be covered to once or twice their thickness, whilst very fine seeds are to be merely **pressed into** the soil. All sowings should be firmed with a board or the hand, as this hastens the sprouting of the seeds as well as promoting its regularity. With any method, careful attention is required, as soon as seeds are sprouted, that seedlings receive sufficient water, air, etc., according to conditions under which they are grown.

**Half-hardy Annuals, Half-hardy Biennials, Half-hardy Perennials**, for early results, may be sown in hotbeds or boxes in March to May, and outdoors after the middle of May, as directed for Hardy Annuals. The Biennials and Perennials must be sown early, to secure bloom the first year.

Their value for cut-flowers is one of their chief merits, the spiciness of the odor being agreeable to all. The new variegated forms are the result of great care in selection.

Trimardeau Pansies

## PANSIES (Heartsease) HP<sup>o</sup>

Pansies, while preferring a light, rich soil and a partially shady, cool and moist situation, producing, under such ideal conditions, large, magnificently colored flowers, will nevertheless thrive under less favorable surroundings. In fact, almost any soil and situation will give good returns. If planted in full sun exposure, mulch beds during the hot term and water freely; the delicate tints may be partially neutralized, and flowers will not attain full size, yet a very rich and continuous display may be had, which in fall will almost equal the early spring show. Faded flowers must be removed every few days to prevent seeding. Seed may be sown from July to September, and these plants, protected over winter, will flower early in spring and continue throughout the season. Spring-sown seed will flower from summer to fall. We offer a very complete collection of varieties and strains embracing "All That's Good in Pansies."

## PETUNIA HHA

Hybridizing has accomplished wonders in this as in other genera of plants. But a few years back it was deemed imperative to secure in fall stock plants of all desirable varieties. At the present day this would be a waste of time and space, as the excellent strains of seed now offered fulfill all wants. Single- and double-flowering, plain or fringed petals, tall or dwarf growth, may all be had remarkably true from seed, and with these go a degree of vigor that is lacking in plants propagated by cuttings. Petunias are valuable as pot-plants, particularly adapted for vases, baskets, window-boxes, etc., and the dwarf varieties are leaders for bedding. For the latter purpose February and March sowings will be timely. We offer in the following list only the best strains.

## SWEET PEAS

Improved varieties are coming thick and fast, and many old favorites must of necessity be dropped from the list. Many of the Spencers are very grand Sweet Peas, but not fully fixed in character and not so productive as the older varieties. Their size and form, however, render them very attractive and effective. Our stock is grown for us under most favorable conditions, and will be found true to name and of excellent quality. The seeds should be sown early in spring; or, when the ground is not readily prepared in spring, fall sowing may be made, excepting the white-seeded varieties, which should not be sown until soil becomes quite warm and dry; or they may be started early in pots in greenhouse or frame and planted out as early as the weather permits.

Simplicity Combined Hatcher and Brooder

### SIMPLICITY COMBINED HATCHER and BROODER

The best thing on the market in the way of a Hatcher. Easiest and simplest of all to operate. No extra expense for a brooder after the chicks are hatched. These Hatchers are made of galvanized iron and copper. Copper is really the only material to use in an incubator, costs only \$1 more than the iron, lasts indefinitely. The heat-conducting property of copper is several times greater than that of iron or steel, and the saving in fuel alone will in a short time more than cover the difference in cost. Send for complete descriptive circular.

- 50-egg Simplicity, with 14-oz. copper heater and tank. \$8 50
- 100-egg Simplicity, with 14-oz. copper heater and tank. 12 00

# HOW TO ENRICH YOUR LAND AND KEEP IT RICH

WITHOUT THE CONTINUOUS EXPENSE OF HIGH PRICED FERTILIZER

COMMERCIAL fertilizers are to be recommended for certain conditions, but for general soil improvement they are too expensive and the results are only temporary. The growing of inoculated legumes for both hay and green manure will bring back your worn out soil to a fertile and permanently productive condition. They will add nitrogen to the soil by means of the nitrogen sacks or nodules produced upon their roots by the nitrogen fixing bacteria. Fertilizer value equivalent to 1000 lbs. of Nitrate of Soda per Acre may be deposited by the legumes during their growth. In addition to this the yield and quality of the legume is increased. Practical experiments have shown that it is **always profitable** and **very often necessary** to inoculate clovers, peas, vetch and all other legumes in order to have them yield profitable returns and give their fertilizing value. This can be best accomplished by inoculating the seed, just before planting, with a bottle of Farmogerm. It comes prepared ready for use and can be applied by anyone in a few minutes. We recommend it to all our customers as being absolutely reliable. It has been on the market for many years and is used by the largest practical farmers in the country. We will be glad to send you further particulars.

# HOW TO GROW ALFALFA

---

**A**LFAFA can be grown in practically all parts of this country, giving good yields of the very finest forage and improving the soil where it grows. There are certain conditions which are necessary for the successful growth of Alfalfa and careful attention must be given to them. Well drained loose surface and sub-soil is best, but any well drained soil will do. The land should be reasonably rich and supplied with organic matter. The food value of Alfalfa has been so fully demonstrated in all parts of the country that further mention is unnecessary. The fact of interest to the practical farmers is that—

**It is Possible and Practical to Grow Alfalfa on Your Farm!**

**First Cutting of 400 Acres of Alfalfa—All seed inoculated with Farmogerm.  
Farm of H. G. Leavitt, Scottsbluff, Neb.**

#### SEED BED

The seed bed must be well and deeply cultivated and compacted by harrowing. It must be entirely free from weeds. The growing of a cultivated crop previous to preparing for Alfalfa frequently assists in freeing the soil of weeds. Lime is frequently necessary. A ton to the acre is generally sufficient.

#### SEED

Great care should be exercised in selecting the proper variety of seed to suit the climatic condition. Seed which is adapted to hot climates will not survive the rigorous winters of the North nor will the seed suited to Northern conditions withstand the long hot summers of the South. Of course, the seed must be fresh and free from any of the many injurious seed which are found in cheaper grades of alfalfa seed. The best seed only should be used.

#### INOCULATION

Alfalfa must be inoculated just before it is planted. This has been proven to be absolutely necessary. The use of Farmogerm pure cultures is recommended because it is easily and quickly applied gives thorough inoculation and there is absolutely no danger of introducing weeds and root and soil diseases which the use of soil transfer is almost sure to do. The cost of Farmogerm is less than the cost of using soil.

#### PLANTING

Planting can be made in the Spring or Summer. August planting is most generally practiced. Even as late as September and October will give you good results in the warmer sections of the country. Fifteen to twenty pounds of seed of the proper variety and well inoculated should be drilled or sowed broadcast. It should be covered very lightly. No nurse crop should be used except in very exceptional cases.

TRADE **FARMOGERM** MARK

#### THE STANDARD INOCULATION

Comes in bottles ready for use. By adding a little water, shaking well, sprinkling the mixture on the seed and then thoroughly mixing the seed together, the inoculation is complete. The seed for 50 acres can be inoculated in half as many minutes. For many years this preparation alone has demonstrated that Alfalfa can be grown in sections where it was considered impossible to grow Alfalfa.

(A Food - Not a Medicine)

Chick Salts were first originated and formulated by Our Laboratory Department Chief Chemist. They are still being compounded by him. # ESSEX-MODEL NUTRINE CHICK SALTS

(A Concentrated Food - Not a Medicine)

The particles of earth picked up by chicks; the green leaves and stalks, bugs and insects they get contain juices and certain chemical salts, Phosphates, Chlorides, Sulphates, etc., which are not found in ordinary grain foods, or found only in small amounts. These chemical salts are necessary to enable the chick to properly digest and absorb the carbohydrates, fats and proteins of which the grain foods are so largely composed, and to furnish a properly balanced food.

These Chemical Salts are the great nerve, bone and tissue builders and without them the chick cannot develop properly.

In order then to successfully raise chicks we must give them these elements which are sometimes lacking in artificial foods, and they must be given in a form in which they will be as easily digested as they are in their natural state. Such a composition is found in **Essex-Model Chick Salts** of which we are the sole originators and manufacturers. These salts are a very carefully prepared and evenly balanced mixture of the various inorganic Earth Salts necessary for the proper growth and development of the baby chick.

During the past few years the greatest trouble encountered in raising chicks has been loss from bowel trouble and indigestion which causes diarrhoea. The chicks are bright and strong when hatched, but after a few days they commence to droop and mope about, and do not grow as they should.

Whenever your chicks seem to mope, or do not grow fast enough, a package of Nutrine Chick Salts will in most cases work a wonderful improvement.

**Essex-Model Nutrine Chick Salts** reduces the loss by disease to the smallest possible number. It helps weak chicks to live and grow strong, and it helps strong chicks make rapid growth. If you use **Essex-Model Nutrine Chick Salts** you will have

no poor half-feathered birds. They will be bright and strong and out for business. They will grow faster on less food. Build up the feathers, bone and tissue of your chicks with these chemical salts. They will make better show birds and better layers.

To get the best results from **Essex-Model Nutrine Chick Salts** we suggest the following as the method of handling and caring for the chicks:

- (1) Put the chicks in a warm and comfortable well-heated brooder.
- (2) Do not overfeed them. Give lots of green food.
- (3) See that they have fine grit before they always.
- (4) Let them out in the fresh air as much as possible.
- (5) Keep the water and food vessels clean.

Add half pound of **Essex-Model Nutrine Chick Salts** to every ten pounds of mash or quarter pound to five pounds of mash. Mix thoroughly. Feed all they will eat up twice a day. Scatter chick food in litter to induce exercise. After the second week add one pound instead of half pound of **Chick Salts** to every ten pounds of mash, and feed the mash dry if kept before them all the time. The mash must be mixed fresh if fed moist.

Feed and handled in this way, and given **Nutrine Chick Salts** regularly, the chicks will properly digest the food they eat, will be bright, strong and active, and you will be able to raise to maturity practically every well hatched chick, barring accidents.

and Tree Spraying  
PARAGON SPRAYERS WON'T CLOG

## Its Advantages Over Other Machines

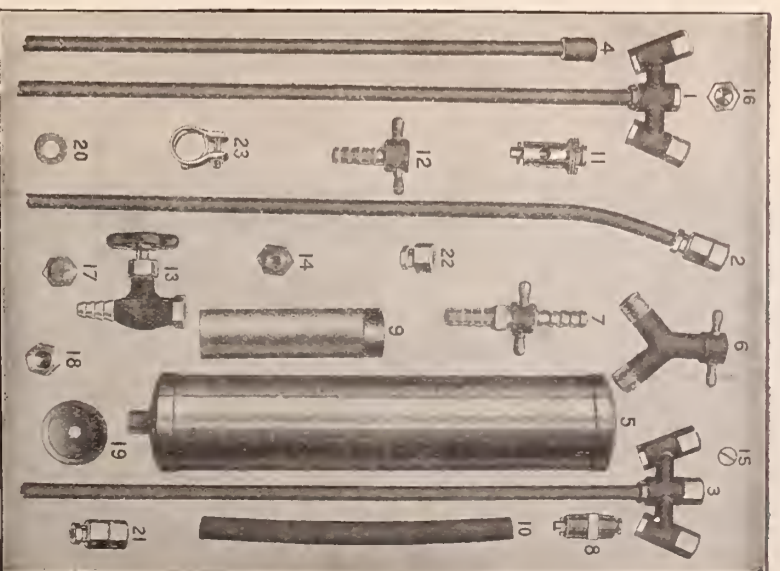

This is the only machine in the market that works satisfactorily for several purposes. It is positively a first-class whitewashing as well as tree spraying machine. One of the very important features is that the spray-nozzle can not clog, no matter how gritty or dirty the liquid is that is being sprayed. All liquid passes through the automatic self-cleaning strainer before entering pump, and therefore cannot clog the nozzle when spraying. The strainer won't clog or choke as the agitator passes over it with each stroke of the pump, dislodging any articles the suction may draw on its surface. This feature is very good and should not be overlooked, as straining liquid, whitewash in particular, is a slow and disagreeable task, and is eliminated by using this sprayer. This feature also permits the use of a nozzle with a very small opening, thereby covering the greatest surface with the least possible amount of spraying solution, making this the most economical sprayer. This feature is original and only used on the PARAGON.

This machine is easily operated by one man, and can be brought in close proximity with the work, eliminating the use of a long expensive hose.

The nozzle makes a most beautiful mist-like spray and does not drip.

A heavy, steady pressure is easily attained, the air chamber being of sufficient size and strength and is made of seamless brass tubing. The reservoir is made of heavy sheet iron well galvanized. All essential fittings and valves are made of brass and are giving thorough satisfaction. The hose is 6-ply of best quality. The strainer is made of heavy perforated brass and is strong and durable. The pump frame is well ribbed to prevent breakage and is easily removed from tank for cleaning.

By pumping water through machine after using, the entire mechanism is easily cleaned. Simplicity, durability and satisfaction are guaranteed, and thousands are now in use.

# “OCULUM”

(From *Reliable Poultry Journal*,  
*February, 1912.*)

tober 21, 1910. We saw them and thought they could not possibly live until the following morning. They lay in a comatose condition until Sunday evening (over forty hours), before either one opened its eyes. These two chickens are now perfectly well and in fine condition. Restoring these two fowls to health by the use of Oculum alone was truly a wonder to us."

The above mentioned "black hen and white rooster" were exhibited at the Garden Show in the Hancock Incubator exhibit. They did not have the "fuss and feathers" of some of the prize winners, for they were just ordinary "chickens," but their appetite and health were on a par with the appetite and health of the birds of "quality."

Inoculation is a new departure in the treatment of sick birds, at least in the common practice of poultry. However, after waiting the progress in popularity of "Oculum" and observing the good work that it is doing, even the lay mind could fairly conclude that inoculation is a success.

The condition of the intestinal tract bears directly on the health of chickens, mature as well as young. And OCULUM injected proceeds to clean the system destroying the organisms that are too numerous and too strong for nature to control effectively.

It is claimed for Oculum that it is a poultry panacea for the reason that a great number of poultry troubles are due to organisms which it can reach and destroy. White diarrhoea, for instance, is purely an intestinal

disease, the bacteria being inherited from the infected ovary of the hen, and it is only in the last stages that the white diarrhoea organism is found in the liver, kidney, spleen, etc. On the other hand, for gapes an injection of the medicine can be made in the bird's mouth.

At the Madison Square Garden show this year the Hancock Inoculatum Co., of Salem, Va., had a display booth and demonstrated the worth of "Oeulum." Mr. G. McClung, president of the company took the writer up on one of the balconies and showed him a game hen in coop No. 2340 which had won second. At the Palace show two weeks before, this hen was nearly dead. Three doses of Oeulum were administered to her. At the Garden, Mr. McClung also cured a fine Dorking cockerel that had been imported from England and that "went off" in the show.

Already, in fact over a year ago, such good men as Messrs. Hawkins, Latham, Smith, Bradley, Fishel, etc., had unqualifiedly endorsed Oeulum and this year the Hancock Inoculatum Co. came into the biggest show in

America and began at once actually to cure the birds.

Mr. McClung told an interesting story of D. B. Mentzer, of Greenburg, Pa., who had lost 7900 ducks last year. One morning a representative of the Hancock Inoculatum Company arrived at Mr. Mentzer's farm and found 179 ducks on a cart, the birds having been picked up that morning as dead. Mr. McClung stated that they saved "163 of those young ducks."

The Hancock Inoculatum Company has issued a circular which contains what they call the "Golden Testimonial." It is signed by the presidents of the four banks of Salem, Va., and many other prominent business men and citizens who were eye witnesses to the incident. It reads:

"On October 21, 1910, The Hancock Inoculatum Company, Salem, Va., manufacturers of Oeulum, bought two chickens from O. D. Oakey, Salem, Va. A black hen and a white rooster. They were so near dead with cholera that they could not move or open their eyes. The company inoculated them with Oeulum at 3:30 p. m., Friday, Oc-

Gentlemen—Would say in reply, we used Tree Tanglefoot as recommended; it worked like a charm; and we had apples when other people did not. We received the Tree Tanglefoot March 4th, on March 11th and 12th we used about half the preparation, but there was not a worm to be seen. As we were busy did not get the balance on until March 16th, then we saw one or two worms. On March 23rd and 24th they were like a bee swarm and were mating until March 29th, then they were gone. It is a mystery to me where they went; not one to be seen only those struggling in the Tree Tanglefoot and disappointed as they were, had to lay their eggs in Tree Tanglefoot.

Also I was disappointed that I did not have enough Tree Tanglefoot. Some of the worms succeeded in reaching the foliage by crawling over the bodies of those that had already been caught. It was too late to try to get more Tree Tanglefoot, so we finished with spraying.

We will commence earlier this year. Please send 4 - 10 lb. cans of Tree Tanglefoot. Enclosed please find money order for ten dollars.

Gents—I have a prune orchard of about 1600 trees, a part of which was badly infected with Canker Worms in 1903 and 4. I applied a band of Tree Tanglefoot to about one thousand trees early in November, 1904. I applied the compound directly on the bark, making a thin band about 3½ to 4 inches wide. During the latter part of November and all December I caught untold millions of the female and male moths—a few of the females evidently got over the bands which could have been avoided by applying the Tree Tanglefoot a little wider and thicker. However it has proved a great success, as my orchard was nearly free of Canker Worms last spring. I shall apply Tree Tanglefoot to every tree in my orchard next November and feel certain that in one more application will completely eradicate the pest.

Gentlemen—I have used your Tree Tanglefoot for the past three years upon the trees of my estate at Weston, Mass., trees that were badly infested by the gypsy and brown-tail moths. The results were entirely satisfactory. I have saved my trees. In midsummer when my neighbors' trees showed plainly that they were suffering from the ravages of gypsy and brown-tail moths my trees looked splendid, I do not hesitate to recommend Tree Tanglefoot as a reliable, effective and economical defense against the gypsy and brown-tail moths, and have no doubt but that it could be used with equal success against any climbing or creeping insect pest. It is very interesting to see the various kinds of worms, etc. that are unable to cross this Tree Tanglefoot. It saves the trees when properly put on and cared for.

## For a Fine Lawn Use Our Evergreen Lawn Seed

GOOD soil and proper drainage are absolutely necessary to produce a good lawn. There should be no less than one foot of good surface or sandy soil, heavy loam where possible. In light or sandy soil the grass has a tendency to burn out in hot, dry weather. Where it is necessary to grade the surface, the subsoil should be removed and replaced with good earth.

Unless the soil is sufficiently rich, apply a liberal quantity of well-rotted manure; dig or plow this in and incorporate with the soil. Rake or harrow the surface even, and after sowing the seed rake again lightly and firm the soil with a lawnmower. Never attempt to dig, rake or roll a lawn when the ground is wet.

The best time to make a lawn is early in spring as soon as the ground is in good tillable condition, although very satisfactory results are obtained from lawns made during the summer and autumn.

When the young grass is from 3 to 4 inches high, it should be mown, but not too short, as close cropping is injurious to a new lawn. Repeat the mowing at intervals of about ten days. After the lawn is once well established, frequent rollings are beneficial, especially early in spring, after the soil and with it the roots of the grass have been drawn up by the winter's frost.

On banks and terraces, where the seed is liable to be washed off by rains before it has sprouted, a quick catch can be secured by mixing the seed with moist earth about one week before sowing; at the expiration of that time much of the seed is ready to sprout.

### BECKERT'S EVERGREEN LAWN

Good seed is as necessary to make a lawn as the proper preparation of the ground. We have made many experiments to determine the grasses best adapted for lawn purposes, and the above mixture is composed of a combination in proper proportions, of the best natural lawn grasses, so as to produce a continuous good lawn from early spring throughout the summer until late in fall.

The ingredients of this mixture are the highest grade of re-cleaned seeds only. The value of Lawn Grass Seed can be best determined by its weight per measured bushel; the better the quality the heavier the weight. This Lawn Seed is sold by the standard bushel of 32 quarts (dry measure) and weighs 24 pounds per bushel.

Lawn Seeds are generally sold on a basis of 14 pounds to the bushel, which will invariably fall one-third or more short of actual measure if composed of choice clean seeds, and where a bushel of 14 pounds holds out in measure, it must of necessity be largely composed of light, chaffy matter of no value.

Use 1 qt. to 300 sq. ft., 4 to 5 bus. per acre. Qt. 20 cts., postpaid 27 cts.; 2 qts. 35 cts., postpaid 49 cts.; 3 qts. 50 cts., postpaid 71 cts.; 4 qts. 60 cts., postpaid 86 cts.; pk. \$1.15, ½ bus. \$2.25, measured bushel of 24 pounds, \$4.50, or \$2.65 for a bushel of 14 pounds.

### PUTTING-GREEN MIXTURE

### LAWN FERTILIZERS

Stable manure should never be used as a top-dressing on a lawn, as it always contains large quantities of noxious weed seeds, and is objectionable on account of unsightliness and disagreeable odor.

**BECKERT'S ODORLESS LAWN AND GARDEN FERTILIZER.** A clean, high-grade fertilizer, free from disagreeable odor, especially prepared for us. When applied to the lawn, it produces a rapid and rich green growth of grass and can be applied in the fall or spring. When used in the garden, it can be applied before or after planting, and during the growing season several additional applications at intervals will intensify its beneficial action. Apply about 10 lbs. to 300 square feet, or 1,500 lbs. per acre, more or less according to the condition of the soil. 10 lbs. 45c., 25 lbs. 90c., 50 lbs. \$1.50, 100 lbs. \$2.50, 200 lbs. \$4.80, 500 lbs. \$11.75, 1,000 lbs. \$22.50, \$1,500 lbs. \$33, ton \$43.

**CANADIAN UNLEACHED HARDWOOD ASHES.** Unequaled as a fertilizer for lawns. Acts as a stimulant and supplies natural plant-food, permanently enriching the soil. Apply in the fall or early in spring, so that the rain may carry the elements down to the roots of the grasses, producing a rapid and rich green growth. Apply 1,500 to 2,000 lbs. per acre. Per sack of 100 lbs. \$1.50, per 500 lbs. \$6.50, per 1,000 lbs. \$11.50, per ton \$22. Nothing smaller than sack lots.
