## ADVERTISEMENT.

I WISH it had been in my power to have given a perfect conclusion to the Zoology of our country: but my small acquaintance with Insects, and the fourth division of the VIth class, Lithophyta and Zoophyta, forbad me to meddle with them. The Public has little reason to regret this omission, since the universal genius John Reinhold Forster, has hinted * a design + of undertaking the first; and my late worthy friend Mr. Ellis, (whom Linneus so justly stiles Lynceus) has in a great measure executed the last.

[^0]In my arrangement of the present work, I have taken the liberty of making a distinct class of the Crustaceous Animals; and separated them from Insects, among which they are usually placed.

I have paid implicit respect to the Swedish Naturalist, in my classing of the Vermes and Shells. I have, on another occasion, ${ }^{*}$ given my sentiments of that wonderful man, (after $R_{A y}$ ) the greatest illuminator of the study of Nature. I have borrowed from him the Latin trivial names; sometimes given translations of them; sometimes given other English names, when I thought them more apt.

Gratitude prompts me to mention a most irreparable loss in my amiable friend
logia Britannica; Mr. Kirby a Monographia Apum Anglic; Mr. Haworth is proceeding with the Lepidoptera Britannica; and several valuable papers on this portion of Natural History are to be found in the Transactions of the Entomological and Linncan Societies. Doctor Solander gave to the world an account of Zoophytes, by the late John Ellis, Esq., which contains most of the British species. Doctor Turton has included the Zoophytes and the Vermes Infusoria into his British Fauna. Ed.

* Synopsis of Quadrupeds, Preface vii.

Bentamin Stillingfleet, Esq. in whom were joined the best heart and the ablest head. Benevolence and innocence were his inseparable companions; retirement his choice, from the most affectionate of motives.* How great, yet how unnecessary, was his diffidence in public! How ample his instruction in private! How clear his information! How delicate the conveyance! The pupil received advantage, edified by the humility of the master. Thoroughly imbued in Divine Philosophy, he had an uncommon insight into the uses of every object of Natural History ; and gave sanction to those studies, which, by trivial observers, were held most contemptible. The end of his labors was the good of manirind. He attempted to destroy the false shame that attended the devotee to Ornithology, the chace of the Insect, the search after the Cockle, or the poring over the Grass. He proved every subject to be of the greatest service

[^1]to the world, by the proper remarks that might be made on them. The traveller, the sailor, the husbandman might, if they pleased, draw the most useful conclusions from them. The reader may receive the proof from his translations of various essays, the productions of the Linnetan school; his own Calendar of Flora, and Observations on Grasses. How much to be lamented is this short catalogue of the works of so great, so good a man! I speak not of his Essay on Music, as foreign to the subject. Some of his remarks appear in. my British Zoology. He thought me so far deserving of his encouragement, as to dedicate part of his time to farther acts of friendship. I received the unfinished tokens of his regard by virtue of his promise ; the only papers that were rescued from the flames, to which his modesty had devoted all the rest.

Defended by so great an example (howsoever unequally I may follow it), there is hardly any need for an apology for the
subject of the following sheets. But if any should require one, I take the liberty of delivering it in the words of my ever regretted friend :

- From a partial consideration of things, ' we are very apt to criticise what we ' ought to admire ; to look upon as useless ' what perhaps we should own to be of ' infinite advantage to us, did we see a ${ }^{6}$ little farther; to be peevish where we ' ought to give thanks; and at the same ' time to ridicule those, who employ their ' time and thoughts in examining what ' we were, i. e. some of us most assuredly ${ }^{6}$ were, created and appointed to study. ' In short, we are too apt to treat the ' Almighty worse than a rational man ' would treat a good mechanic; whose ' works he would either thoroughly exa' mine, or be ashamed to find any fault ${ }^{6}$ with them. This is the effect of a par' tial consideration of Nature ; but he who
' has candor of mind, and leisure to look
' farther, will be inclined to cry out :

6 How wond'rous is this scene! where all is form'd

- With number', weight, and measure! all design'd
' For some great end! where not alone the plant
${ }^{6}$ Of stately growth ; the herb of glorious hue,
- Or food-full substance; not the laboring steed,
- The herd, and flock that feed us; not the mine
- That yields us stores for elegance; and use;
- The sea that loads our table, and conveys
- The wanderer man from clime to clime, with all
- Those rolling spheres, that from on high shed down
' Their kindly influence; not these alone,
' Which strike ev'n eyes incurious, but each moss,
- Each shell, each crawling insect holds a rank
' Important in the plan of Him, who fram'd
' This scale of beings ; holds a rank, which lost
- Would break the chain, and leave behind a gap
- Which Nature's self w्ould rue. Almighty Being,
' Cause and support of all things, can I view
- These objects of my wonder ; can I feel
- These fine sensations, and not think of thee?
' Thou who dost thro' th' eternal round of time ;
' Dost thro' th' immensity of space exist
- Alone, shalt thou alone excluded be
' From this thy universe ? Shall feeble man
' Think it beneath his proud philosophy
- To call for thy assistance, and pretend
- To frame a world, who cannot frame a clod ? $\qquad$
- Not to know thee, is not to know ourselves? -
- Is to know nothing-nothing worth the care
' Of man's exalted spirit-all becomes
' Without thy ray divine, one dreary gloom;
- Where lurk the monsters of phantastic brains,
' Order bereft of thought, uncaus'd effects,

[^2]** The Editor takes this opportunity of repeating his obligations to the reverend Hugh Davies for the vast additions made to this volume; his valuable communications are distinguished by an asterisk: the Editor, in this, as in the preceding volumes, is answerable for those parts included in a crotchet. Ed.

On examining the complete copy of this new Edition, which has been sent to him previous to its publication, the Editor is extremely sorry to find, that owing to his not having seen impressions of the Plates to the fourth Volume, (and a few of the third,) after the inscriptions and references had been engraved upon them, a number of mistakes have been committed. The correction of these, by reference to the description, in the text, or the List of Plates prefixed to the Volume, is a matter of great ease; but to save trouble to the reader, a list of them will be found at the end of this Volume.

October, 1812.

## LIST OF PLATES.

VOL. IV.

## Class V. CRUSTACEOUS.

## Genus I. CRAB.

Frontispiece.
Plate I. Fig. 1 Pea Crab.
2 Minute Cr.
3 Long-horned Cr.
4. Broad-footed Cr.
II. 1 Common Cr.

2 (leanser Cr.
III. Black-clawed Cr.
IV. 1 Velvet Cr.

2 Cleanser Cr. Var.
V. 1 Wrinkled $\mathrm{C}_{\mathrm{r}}$.

2 Angular Cr.
VI. 1 Bristly Cr.

2 Great-clawed Cr .
VII. Long-clawed Cr. M. and F.
VIII. 1 Spinous (r.

2 Four-forked Cr.
IX. 1 Spider Cr.

2 Var.
3 Slender-legged Cr .
X. 1 Weymouth Cr.

2 Uneven Cr.
3 Rough Cr.

\section*{CLASS V.}

\section*{CRUSTACEOUS ANIMALS.}

\section*{GENUS I. CANCER. CRAB.}

Feet eight or ten, rarely six, two of them clawed.
Eyes two, remote, for the most part fixed on a stalk, moveable.
TAIL foliated, and short, lodged in a groove in the body.
C. Lin. Syst. 1039. Gm. Lin. Herlst. Canc. 95. t. 2. f. 2964. 21.
1. Pisum. Pea.

CR . With rounded and smooth thorax, entire and blunt. With a tail of the size of the body, which commonly is of the bulk of a pea.
Inhabits the mussel, and unjustly has acquired the repute of being poisonous. The swelling after eating of mussels is wholly constitutional ; for one that is affected by it, hundreds remain uninjured. Tab. i. fig. 1.

Crabs, either of this kind, or allied to them, the antients believed to have been the consentancous inmates of the pinne, and other bivalves; which being too stupid to perceive the approach of their prey, were warned of it by their vigilant friend. Oppian tells the fable prettily.*

In clouded deeps below the Pinna hides, And thro' the silent paths obscurely glides; Astupid wretch, and void of thoughtful care, He forms no bait, nor lays the tempting snare. But the dull sluggard boasts a \(C r a b\) his friend, Whose busy eyes the coming prey attend.
One room contains them, and the partners dwell
Beneath the convex of one sloping shell;
Deep in the wat'ry vast the comrades rove,
And mutual int'rest binds their constant love;
That wiser friend the lucky juncture tells,
When in the circuit of his gaping shells
Fish wand'ring enter; then the bearded guide
Warns the dull mate, and pricks his tender side;
He knows the hint, nor at the treatment grieves,
But hugs th' advantage, and the pain forgives:
His closing shells the Pinna sudden joins,
And 'twixt the pressing sides his prey confines;
Thus fed by mutual aid, the friendly pair
Divide their gains, and all the plunder share.
* Halieut. lib. ii. He calls the crab Mivvo甲uдaそ, custos Pinna.

\section*{GENUS II. ASTACUS. LOBSTER.}

Body cylindric.
Antenne long.
Tail long.
1. Gamma - Cancer. Lin. Syst. 1050. Gm. Herbst. Canc. ii. 42. t. 25. RUS. Lin. \(2985 . \quad f .1\).
Common. Astacus. Rondel. 538.
L. With a smooth thorax; short serrated snout; very long antenne; and between them two shorter, bifid; claws and fangs, large, the greater tuberculated, the lesser serrated on the inner edge; four pair of legs; six joints in the tail; caudal fins rounded.

Inhabits all the rocky shores of our island; but chiefly where there is a depth of water. In Llyn, in Caernarvonshire, a certain small lobster, nothing different except in size, burrows in the sand.

Brought in vast quantities from the Orkney isles, and many parts of the eastern coast of Scotland, to the London markets. Sixty or seventy thousand are annually brought, in

Class V. ASTACUS. LOBSTER.
well-boats, from the neighborhood of Montrose alone.*

Lobsters fear thunder; and are apt to cast their claws on a loud clap. I am told they will do the same on firing a great gun; and that when men of war meet a lobster-boat, a jocular threat is used, That, if the master does not sell them good lobsters, they will salute him.

The habitation of this species is in the clearest. water; at the foot of rocks that impend over the sea. This has given opportunity of examining more closely into the natural history of the animal, than of many others who live in an element that prohibits most of the human researches, and limits the inquiries of the most inquisitive. Lobsters are found on most of the rocky coasts of Great Britain. Some are taken by the hand; but the greater quantity in pots, a sort of trap formed of twigs, and baited with garbage; they are formed like a wire mouse-trap, so that when the lobster gets in, there is no return. These are fastened to a cord sunk into the sea, and their place marked by a buoy.

They begin to breed in the spring, and continue breeding most part of the summer. They propagate more humano; and are extremely

\footnotetext{
* Tour in Scotland, 1772. part ii. p. 146.
}
prolific. Doctor Baster says he counted 12,444 eggs under the tail, besides those that remained in the body, unprotruded. They deposit these eggs in the sand, where they are soon hatched.

Lobsters change their crust annually. Previous to their putting off their old one, they appear sick, languid, and restless. They totally acquire a new coat in a few days; but during the time that they remain defenceless they seek some very lonely place, for fear of being attacked and devoured by such of their brethren that are not in the same weak situation.

It is also remarkable, that Lobsters and Crabs will renew their claws, if by accident they are torn off; and it is certain they will grow again in a few weeks.

They are very voracious animals, and feed on sea-weeds, on garbage, and on all sorts of dead bodies.

In addition to this, I beg leave to give an accurate account of the natural history of this animal, communicated to me by the ingenious Mr. Travis, surgeon, at Scarborough.

\section*{- Scarborough, 25th Oct. 1768.} - SIR,
' We have vast numbers of fine Lobsters on ' the rocks, near our coast. The large ones are e in general in their best season from the middle
' of October till the beginning of May. Many ' of the small ones, and some few of the larger ' sort, are good all the summer. If they be four ' inches and a half long or upwards, from the ' tip of the head to the end of the back shell, ' they are called sizeable Lobsters. If only - four inches, they are esteemed half size ; and
' when sold, two of them are reckoned for one - of size. If they be under four inches, they ' are called paroks, and are not saleable to the ' carriers, though, in reality, they are in the
- summer months superior to the large ones in
' goodness. The pincers of one of the lobster's
- large claws are furnished with knobs, and those
' of the other claw are always serrated. With
' the former it keeps firm hold of the stalks of ' submarine plants, and with the latter it cuts ' and minces its food very dextrously. The - knobbed or numb claw, as the fishermen call ' it, is sometimes on the right and sometimes ' on the left, indifferently. It is more danger' ous to be seized by them with the cutting ' claw than the other; but in either case, the - quickest way to get disengaged from the crea' ture is to pluck off its claw. It seems pecu' liar to the Lobster and Crab, when their claws ' are pulled off, that they will grow again, but ' never so large as at first.
- The female or hen Lobster does not cast
' her shell the same year that she deposits her
' ova, or, in the common phrase, is in berry.
- When the ova first appear under her tail, they
' are very small and extremely black; but they
' become in succession almost as large as ripe
' elder-berries before they be deposited, and
' turn of a dark brown color, especially towards
' the end of the time of her depositing them.
' They continue full and depositing the ova in ; constant succession, as long as any of that
' black substance can be found in their body,
' which, when boiled, turns of a beautiful red
' color, and is called their coral. Hen Lobsters
6 are found in berry at all times of the year, but
' chiefly in winter. It is a common mistake,
' that a berried hen is always in perfection for
' the table. When her berries appear large
' and brownish, she will always be found ex-
' hausted, watery, and poor. Though the ova
' be cast at all times of the year, they seem
' only to come to life during the warm summer ' months of July and August. Great numbers ' of them may then be found, under the appear' ance of tadpoles, swimming about the little ' pools left by the tides among the rocks, and - many also under their proper form, from half ' an inch to four inches in length.
' In casting their shells, it is hard to conceive ' how the Lobster is able to draw the fish of
' their large claws out, leaving the shells entire
' and attached to the shell of their body; in
' which state they are constantly found. The
' fishermen say the Lobster pines before cast-
6 ing, till the fish in its large claw is, no thicker
' than the quill of a goose, which enables it to
' draw its parts through the joints and narrow
' passage near the trunk. The new shell is quite membraneous at first, but hardens by
- degrees. Lobsters only grow in size while ' their shells are in their soft state. They are
' chosen for the table, by their being heavy in
' proportion to their size; and by the hardness ' of their shells on their sides, which, when in perfection, will not yield to moderate pres-
' sure. Barnacles and other small shell-fish ' adhering to them are esteemed certain marks ' of superior goodness. Cock Lobsters are in '. general better than the hens in winter; they
' are distinguished by the narrowness of their
' tails, and by their having a strong spine upon
' the center of each of the transverse processes
' beneath the tail, which support the four mid' dle plates of their tails. The fish of a Lob-
' ster's claw is more tender, delicate, and easy
' of digestion than that of the tail. Lobsters
' are not taken here in pots, as is usual where
' the water is deeper and more still than it is
' upon our coast. Our fishermen use a bag-
' net fixed to an iron hoop, about two feet in
' diameter, and suspended by three lines like
' a scale. The bait is commonly fish-guts tied
' to the bottom and middle of the net. They
- can take none in the day-time, except when
' the water is thick and opake; they are com
- monly caught in the night, but even then it is
' not possible to take any when the sea has that
' luminous appearance which is supposed to
' proceed from the nereis noctiluca. In sum
s mer, the Lobsters are found near the shore,
' and thence to about six fathoms depth of
' water; in winter, they are seldom taken in
" less than twelve or fifteen fathoms.' Like
' other insects, they are much more active and
' alert in warm weather than in cold. In the
6 water they can run nimbly upon their legs or
' small claws, and if alarmed can spring tail-
' foremost, to a surprising distance, as swift as
' a bird can fly. The fishermen can see them
' pass about thirty feet, and by the swiftness of
' their motion, suppose they may go much far-
' ther. 'Athencus remarks this circumstance, ' and says, that the incurvated Lobsters zoill 'spring zoith the activity of dolphins. Their
\({ }^{6}\) eyes are raised upon moveable bases, which ' enables them to see readily every way. When 6 frightened, they will spring from a consider' able distance to their hold, in the rock; and \({ }^{6}\) what is not less surprising than true, will ' throw themselves into their hold in that man' ner, through an entrance barely sufficient for ' their bodies to pass; as is frequently seen by ' the people who endeavour to take them at ' Filey Bridge. In frosty weather, if any hap6 pen to be found near the shore, they are quite ' torpid and benumbed. A sizeable Lobster is ' commonly from one pound to two in weight. ' There was one taken here this summer which ' weighed above four, and the fishermen say ' they have seen some which were of six pounds, ' but these are very rare.

> ' I am, Sir, \&c.'

I conclude with saying, that the Lobster was well known to the antients, and that it is well described by Aristotle, under the name of Aбтaros; * that it is found as far as the Hellespont, and is called, at Constantinople, \(\uparrow\) Liczuda, and Lichuda. Tab. xi.

*L. with four rather short antennce, one pair about one third part longer than the other; body of fourteen joints, very smooth; on each of the three last joints of the body is a small fasciculus of spines; claws four, imperfect; legs ten, the four anterior, smaller; caudal fins five, subulate; color sandy; length about an inch.

Common on most of our shores.
15. Pulex. C. Lin. Syst. 1055. No. 81. Herlst. Canc. ii. 130. t. 36. Flea.
\[
\text { Gm. Lin. } 2992 . \quad \text { f. } 4.5
\]

Linn. Tr. ix. 93. t. 4.f. 2.
L. with five pair of legs, and two pair of claws imperfect; with twelve joints in the body.

Very common in fountains and rivulets; swims swiftly in an incurvated posture on its back; embraces and protects its young between the legs; does not leap.
* Resembles much the C. Locusta; is about half its length; wants the fasciculi of spines; the color paler, and sometimes tinged with green.

\end{tabular}
*L. with two large antenne of about equal length with the body, the foremost half ciliated at the joint, and two others minute; body oblong, compressed, very smooth, of twelve joints; eyes reticulated; legs twelve, the foremost pair very small; length about three quarters of an inch; color sandy.

The most common on all our sandy shores.

Cancer. Lin. Syst. 1056. Gm. Herlst. Canc. ii. 145. Lin. 2993.
17. Salinus. Salt.
L. with jointed body; hands without claws; antenne shorter than the body; ten pair of legs; tail filiform, subulated; very minute.

Discovered by Doctor Maty in the salt pans at Lymington.

Cancer. Lin. Syst.1056. Gm. Herlst. Canc. ii. 121. t. 35. 18. StagnaLin. 2993. f. 8-10.

L1s. Pond.
L. with jointed body ; legs eleven on each side ; tail bifid; head of the male armed with two singular fangs.

Inhabits the crannies of rocks, in fresh waters; suspected by Linnexus to be the larva of an Ephemera.
[Accurately described by Dr. Shaze. Ed.
19. Mantis. C. Lin. Syst. 1054. No. 76. Gm. Lin. 2990.

Mantis.
L. with short antenne; short thorar, and two pinnated substances on each side; three pair of claws with hairy ends; the body long, divided by eight segments; two fins on each side of the tail; tail conoid, with spines on the margin.

Weymouth. From the Portland cabinet.
20. Bernar- Cancer. Lin. Syst. 1049. Gm. Herlst. Canc. ii. 14. t. 22.

DUS. Hermit.

Lin. 2982.
C. with rough claws; the right claw is the longer ; the legs subulated, and serrated along the upper ridge; the tail naked and tender, and furnished with a hook, by which it secures itself in its lodging.

This species is parasitic, and inhabits the empty cavities of turbinated shells, changing its habitation according to its increase of growth, from the small nerite, to the large whelk. Nature denies it the strong covering behind, which it has bestowed on others of this class, and
therefore directs it to take refuge in the deserted cases of other animals.

Aristotle describes it very exactly under the name of Kagxsvov. * By the moderns it is called the hermit, from retiring into a cell. Tau. xviii.
21. SubterRANEUS. Subterraneous.
*L. with one pair of antenne, of the length of the body, and a second pair between them, short and bifid; body long, smooth, of six segments; one claw very large, sometimes exceeding the body in size, compressed; legs eight; caudal fins seven, the middle one pointed, the others broad and rounded.

Length about two inches. Color different shades of yellow.
22. STELLATus.
*L. with a trifid serrated snout, and one pair Star-spotted. of antennce of the length of the body, and a second pair short and bifid; the body is linear, of six smooth joints, anterior part of the thorax spinous; claws rather broad, imperfect, legs eight; caudal fins five, the middle one bifid. Length about two inches. Color sandy.

MIHE CONTUENTI SESE PERSUASIT RERUM NATURA, NIHIL INCREDIBILE EXISTIMARE DE EA.
\[
\text { Plinii lib. xi. c. } 3 .
\]

SLOW, soft, expanding, tenacious of life, sometimes capable of being new formed from a part; the enliveners of wet places; without head or feet; hermaphroditical; to be distinguished by their feelers.

Not improperly called by the antients, imperfect animals; being destitute of head, ears, nose, and feet, and for the most part of eyes; most different from insects ; from which Linveus has long since removed these works of Nature.

They may be divided into Intestinal,

Soft or Mollusca,* Testaceous, Lithophytes, and Zoophytes.

The Intestinal (heretofore styled the earthly) perforate all things by help of the great simplicity of their form. The Gordius pierces the clay, that the water may percolate; the Lumbricus, the common soil, least it should want moisture ; the Teredo, wood, to promote its decay. In like manner, Рноlades, and some sorts of mussels, penetrate even rocks, to effect their dissolution.

The Mollusca are naked, furnished with arms ; for the most part wander through the vast tract of ocean; by their phosphoreous quality illuminate the dark abyss, reflecting lights to the heavens; thus what is below corresponds with the lights above.

These Mollusca often become the inhabitants of testaceous calcareous covers, which they carry about with them, and often they themselves penetrate calcareous bodies; like insects, are multiplied into infinite variety; and exhibit, both in form and colors, splendid

\footnotetext{
* Mollusca signifies a tribe of animals which are so called as being soft or fleshy, and are destitute of any bones, those internal fulcra or props to the muscles of other animals,-Quadrupeds, Birds, Fishes, or Reptiles. H. D.
}
examples of the excelling powers of the allmighty Artificer. Nor are they without their uses; several species afford a delicious and nourishing nutriment. The healing art calls in the snail in consumptive cases; and the shells calcined are of known efficacy in stubborn acidities. Shells are the great manure of lands in many parts of these kingdoms. The pearls of Great Britain have been celebrated from the time of Ceesar.

\section*{GENUS I. ASCARIS.}

Body slender, filiform, attenuated at each end.
1. Vermicu-
laris.
Vermicular.
Asc. with faint annular rugre; thicker at one end than the other; mouth transverse.

Inhabits, according to Limnaus, boggy places, and under the roots of decayed plants; found in the rectum of children and horses; often observed in the dung of the last; emaciates children greatly; is sometimes vomited up.
2. Marina. Marine. Gm. Lin. 3035. Gordius marinus. Lin. Syst. 1075.

Asc. filiform, twisted spirally and lying flat.

Common in the intestines of the herring and other sea-fish. Aristotle* remarks that the Ballerus and Tillo are infested in the dog-days with a worm that torments them so much, that they rise to the top of the water, where the heat destroys them. Bleaks are observed to rise at certain seasons to the surface, and tumble about for a considerable space, in seeming agonies. I suspect them to be affected in the same manner with those Aristotelian fish. Tab. xxi. fig. 1.

Ascaris. Lin. Syst. 1076. Gm. Lin. 3029.
Asc. with a slender body, subulated at each end; but the tail triangular; grows to the length of nine inches; viviparous; and produces vast numbers.

Inhạbits the human intestines.

Turton Br. Faun. 125. Redi opusc. iii. \(t\). 17. f.3. \&. Canrs,

[Asc. with a whitish cylindrical taper body, sometimes a foot and an half in length, and as thick as a man's little finger; often marked with brown patches.

In the horse.
8. Carbonis. Turton Br. Faun. 125. Lin. Tr. v. 24.
[Asc. with a yellowish-brown body, coiled up into a ball or mass.

In the crop of the common Corvorant and of the Shag.

\section*{Turton Br. Faun. 126.}
9. Lacustris.
[Asc. body lying flat, spirally twisted, tapering at both extremities.

Found in the intestines of the Stickleback and liver of the Pike. Ed.

\section*{GENUS II. TRICOCEPHALUS.}

Body round, variously twisted, thickest in front, furnished with a slender proboscis. Tail long, capillary, tapering to a point.
1. Hominis. Turton Br. Fuun. 126. Lond. Med. Soc. v. t. 3.
[Tr. body of a pale color, crenate above, smooth underneath, two inches long; head obtuse, furnished with a proboscis, which it can protrude and draw in at pleasure; tail or thinner part twice the length of the body.

In the human intestines.
2. Equi.
\[
\text { Turton Br. Faun. } 126 .
\]
[TR. resembles the last, but rather longer. In the intestines of the horse. Ed.

\section*{GENUS III. FILARIA.}

BoDY round, filiform, smooth, of equal thickness.
Mouth dilated, with a roundish concave lip.
Gm. Lin. 3040.
Turton Br. Faun. 126.

Ph. Tr. Alr. ii. 774.
1. Scaraв㞓.
[Found in the Scarabreus fimetarius.
Martin Lister says that he took three, out of the belly of one beetle, of a dark hair color, with whitish bellies, somewhat thicker than hog's bristles; and one out of another beetle which was of a lighter color and measured five inches and an half.
Gin. Lin. 3040. Turton Br. Falun. \(126 . \quad\) 2. Carabe.

Found in one of the species of Carabus. Ed.

\section*{GENUS IV. LIGULA.}

Body long, slender, flattened, with a visible groove on each side.
Mouth or vent: none apparent.
1. Abdomi- Ligula. Gm. Lin. 3042. 1078. Faun. Suec. No. nalis. Fasciola intestinalis. Br. Zool. Aldominal. iv. 35. 2076.

Lin. Syst. ed. vi. 70. tal. vi.
Fasciola intestinalis. Lin. Syst. f. 1 .
L. with a long slender body, if extended; when contracted, of a sub-oval form.

Inhabits the intestines of fresh-water fish discovered in breams and sticklebacks.

\section*{GENUS V. ECHINORINCHUS.}

Body long, cylindrical.
Mouth with a cylindrical retractile proboscis, crowned with hooked prickles.

Turton Br. Faun. 126. Mull. Zool. Dan. i. 139. t. 1. Candidus. 37. f. 7. 10.
[Есн. body about three inches long, pale opake, varying in color, slightly wrinkled. Ed.*
* Animals of this genus are found in the intestines of quadrupeds, birds, and fishes, but never in those of men. Forty-eight species are enumerated by Muller and some northern naturalists. Ed.

\section*{GENUS VI. FASCIOLA. FLUKE.}

Body oblong; a pore or sucker at the extremity, and another on the belly.
1. Hepa- Fasciola. Lin. Syst. 1077. Rasel. app. tat. xxxii. f. 5. тica. Gm.Lin.3053. Faun. Suec. Borlase Nat. Hist. CornLiver.

No. 2075. Amæn. Acad. wall, tal. xx. fig. 10.
F. with an ovated body, a little sharper on the fore part; in the centre is a white spot, with a line of the same color passing towards each extremity.

Infests the livers of sheep and hares.
2. Trachef. Poultry.
[F. with a round body, acuminated at the posterior end; a large arm or stalk extends from the side, and terminates in an aperture, used as a sucker, by which it adheres to the trachea; color red; length about an inch; breadth not half a line.

Found in the trachea of poultry, and probably of partridges and pheasants, occasioning the complaint called in Devonshire, the Gapes,
and which prevails in other parts of the kingdom ; cured in America, where it is also known, by introducing a feather into the mouth and throat of the bird, and twisting it round, by which means the animal is entangled and withdrawn. Ed.

\section*{GENUS VII. TENIA. TAPEWORM.}

Body flat, composed of numerous joints. Head, with four orifices for suction below the mouth.
Mouth terminal, generally crowned with a double series of retractile hooks.
* Mouth armed ; body with a vesicle behind.
1. Viscera \(=\quad\) Turton Br. Faun. 126. \(\quad P h\). Tr. xiiii. 305. f. \(1-8\). Lis.
[T. Pea shaped, inclosed in a vesicle, broad on the fore part, jointed behind.

In the liver, placenta, \&c. of mankind.
2. Cellu- Turton Br. Faun. 126. Werner verm. int. 2. t. 1.f. 1 -8. LOSA.
[T无. solitary inclosed in cartilaginous vesicle and two tailed tunic.

In the cellular covering of the human muscles.
** Mouth armed ; body without the terminal vesicle.
3. Solivm. Turton Br. Faun. 127. Carlisle in Lin. Tr. ii. 250. tal. 25. [Te. with long, narrow articulations, and marginal mouths, one on each joint, generally alter-
nate, by which it attaches itself to the intestines. Grows from the length of three to sixty feet.
Found in the human intestines.
Mr. Carlisle states, that the natives of England have this species and rarely any other, while those of Sreitzerland have the Tania lata, \&cc.

Turton Br. Faun. 127. Shaw Nat. Misc.t.241. 4. Vulgaris.
[T在. with short and broader articulations, and a mouth in the centre of each ; the body tapering to each end; tail ending in a rounded joint; length from three to fifteen feet.

In the human intestines.

Turton Br. Faun. 127. Lin. Tr. ii. \(t .25 . f\).9.11. 5. Cateniformis.
[Te. with oblong-elliptic articulations and single marginal mouths.

Fesembles the Ta. solium, but the mouths are mostly opposite.

In the intestines of the dog and cat.

\section*{Turton Br. Faun. 127. Goeze Eingev. t. 20.a.f.1-5. 6. CerebraLis.}
[Te. with a body not larger than a grain of sand, armed on the head with from thirty to
forty hooks; several, united at the base to a large common vesicle, affix themselves to the brain or its coats, and occasion the disease in sheep known by the name of Dunt or rickets.
** Mouth unarmed.
7. Lata. Turton Br. Faun. 127. Carlisle in Lin. Tr. ii. t. 25. f. 12-14.
[T Æ. with very short broad joints, knotty in the middle; a single central mouth in each; color white; length from eighteen to one hundred and twenty feet.

In the human intestines.
8. Ovina. Turton Br. Faun. 127. Carlisle in Lin.Tr. ii. p. 25.
\[
f .15,16
\]
[ T 不. with very short and narrow joints rounded at the ends; the lateral vesicle pellucid, distinct, with double marginal lateral mouths. Ed.

GENUS VIII. LUMBRICUS. DEW-WORM.

Body slender annulated, furnished with lateral pores.
Mouth simple, nearly terminal.

Lumbricus. Lin. Syst. 1076. Faun. Suec. No. 2073. Gm. Lin. 3083. \\ Raii insect. 1. \\ 1. TerresTRIS. Earth.
}
L. with a hundred and forty rings; head taper; mouth, at the end, round; fore part of the worm cylindric, the rest depressed; at about one third of its length is a prominent annulated belt; on each side of the belly a row of minute spines, distinguishable only by the touch, assistant in motion. Tab. xx. fig. 1.

A variety only of the former; excepting in (A.) Minor. size, resembling it. Raii insect. 2. Lesser.

Inhabits the common soil, and by perforating, renders it apt to receive the rain; devours the cotyledons of plants, or part of the seed that vegetates; comes out at night to copulate; is the food of moles, hedge-hogs, birds, \&c. In English, the Dew or Lobworm. Tab. xx. fig. 2.
(B.) Intestr- Inhabits the lesser intestines of the human Intestinal. species, chiefly of children; does not differ in the lest from the former kinds.
2. Marinus登 L. marinus. Lin. Syst. 1077. Armicole. Bosc. Hist. nat. Lug Gm. Lin. 3084. Faun. des Vers. i. 161. Suec. No. 2074. Belon aq. Nereide lumbricride. Pallas 444. in nov. act. Petrop. ii. tab. 1. fig. 19 .
L. with round mouth, and circular body annulated with greater and lesser rings; the first prominent; on each of them are two tufts of short bristles placed opposite; the tail-part is smooth; elegant ramifications are observed to issue from among the tufts in the living worm; is soft and full of blood.

Inhabits sandy shores, burying itself deep; but its place distinguishable by a little rising, with an aperture on the surface; of great use as a bait for fish. Tab. xx. fig. 3.

\end{tabular}
L. with a brown body, marked with six yellow lines.

Inhabits standing waters. The best of phlebotomists, especially in hemorrhoids. The practice is as old as the time of Pliny, who gives it the apt name of hirudo sanguisuga. Leeches were used instead of cupping-glasses for persons of plethoric habits, and those who were troubled with the gout in the feet. He asserts, that if they left their head in the wound, as sometimes happened, it was incurable; and informs us, that Messalimus, a person of consular dignity, lost his life by such an accident.*

}

SL. of an amber color, marked with white.
[Either this animal or a species nearly allied to it, distinguished by Mr. Hoy in the first vo-
lume of the Linnaan Transactions, under the name of Limax filans, has the faculty of forming a thread like the spiders or caterpillars. That gentleman observed* one hanging from a Scotch fir four feet from the branch of the tree, and four feet and an half from the ground, to which it was approaching by the elongation of the thread, at the rate of about an inch in three minutes. Ed.
* On the 11th of Octoler 1811, I observed the same phænomenon. This was suspended from a projecting part of a building. H. D.

\section*{GENUS XIV. APLYSIA.}

Body covered with reflexible membranes.
Shield, a horny, on the back, guarding the lungs.
Aperture on the right side.
Vent on the extremity of the back.
Feelers four resembling ears.
1. Depilans. Depilatory.
A. Tentaculorum membrana- Lepus marinus. Plin. lib. ix. rumque margine cum disco concolore ; pulmonibus flabelliformibus, fusco albido- Lernæa. Bohadsch.* tab.1.5. que variis.
c. 48.

Rondel. pisc. 520. Gm. Lin. 3103.
* Apl. Its color is different shades of brown tinged with blue or purple; lungs fan-shaped, variegated with stripes of dusky brown and white.

As the lungs are visible without dissection, we have risked a specific distinction, by means of this part, with regard to this and the following species. There are already instances of specific characters taken from the interanea of this tribe of animals. See Ascidia. Gm. Lin.
* De quibusdam animalibus marinis, \&c. Dresde, 1761.

Bohadsch has given us the colors as above, and in tab. iv. \(f .21\), 22. figures of the lungs, which resemble in some measure a lady's fan.
\begin{tabular}{ccc} 
A. unicolor, mustelina; mibus phœniceis. H. Da- 2. Muste- \\
pulmonibus spicifor- & vies. Mss. \\
LrNa. \\
Tawny.
\end{tabular}
* This species is of a deep tawny, or yellowish brown color, except the shield, which is a dull brown, and the part, which by its situation corresponds with what Bohadsch deems the lungs in his subject, which is crimson. Notwithstanding these parts differ so much in color and form, as represented in the figures given by Bohadsch and Mr. Knapp, they are surely designed for the same use.

Mr. Knapp observes, " this part apparently " performs the office of spiracles, being in a " constant state of contraction and expansion; " this fabrication, when the animal is at rest, " is concealed by one of the lobes \(\mathbf{E}^{*}\) and the " shield."

The figure is the production of the accurate pencil of J. L. Knapp, Esq. who found the subject in deep water near Tenby, Pembrokeshire. Tab. xxii.
3. Viridis. Laplysia. Mont. in Lin. Tr. vii. p.76. tal. 7. f. 1. Green.
* Apl. with the fore part of the body like a common limax or slug; tentacula two, all (except the under part which is paler) of a bright grass-green color, marked on different parts with azure spots; the shield is not discernible. This beautiful animal, not having what is deemed in this genus the second, or foremost pair of tentacula, tends to confirm Bohadsch's assertion that the genus has really but one pair of feelers, as the two other appendages, in the front of the head, are altered in their form and appearance according to the will of the animal, and sometimes to that degree, that they have not at all the resemblance of horns or tentacula. This observation consequently seems to justify his definition of the genus, corpus subovatum, dorsum labiosum, tentacula in fronte duo auriformia.*

\footnotetext{
* Mr. Montagu, in his description of this species, takes an opportunity of controverting the generally received opinion, that the Apl. depilans has an offensive smell, or is poisonous to the touch. Mr. Sowerly makes the same remark, and seems to attribute to it the merit of producing the Tyrian dye. Ed.
}

\section*{GENUS XV. TRITONIA.}

BODY oblong, creeping, pointed behind, convex above, flat or grooved underneath.
Mouth at one of the extremities, surrounded with tentacula.

cidea.
\end{tabular}
N. with a linear jointed body, with a filiform foot issuing from each; the whole animal of the size of a short bristle of a hog; an object of the microscope.

Inhabits wet places.
3. DigiTATA.

Gm. Lin. 3121. 452.

Shaw's Nat. Misc. tab. Turton Br. Faun. 137.
[N. with single lateral bristles, but chiefly distinguished by six retractile processes at the end of the tail; length four lines.

In stagnant waters towards the decline of summer; rare. Ed.

\section*{GENUS XXII. ASCIDIA.}

Body fixed to a shell, rock, \&c. forming a sheath.
Apertures two, one on the summit, the other lower.
1. Ebora CENSIS. Scarborough.

Ast. with scabrous extremities ; one end bending upwards; middle part smooth; lower flat; of a brown color.

Taken off Scarborough. Tab. xxv. fig. 3.

Asc. subovalis, depressa, lævis, virescens, interaneis purpureofuscis, orificiis lutescentibus. M.S. H. Davies.
* Asc. gelatinous, diaphanous, closely adhering to the inside of dead oyster-shells.

The length from one to two inches; breadth from one half to one inch. The upper aperture is surrounded by eight crimson spots, the lower by six only.

Taken by dredging in the Merai, on the coast of Anglesey, in the year 1800.

\section*{2. ViresCENs. Green.}
* Asc. subconic in the younger state; in a more advanced state cylindrical; rough; color ferruginous, apertures red ; length two inches ; eatable.

On roots of Fucus digitatus near Leith.
4. Prunum, Gm. Lin. \(3124 . \quad\) Mem. Wern. Soc. 557.
* Asc. oval, smooth, somewhat transparent; sheath white; one aperture on the side. Leith shore, on Fuci.
5. ConchiGm. Lin. 3124. Mem. Wern. Soc. 557.
* Asc. compressed, covered with fragments of shells; sheath white, changing into blue, oval or cylindric.

Leith shore, on Fuci.
Animals of this genus have the faculty of squirting out the water they take in.

\section*{GENUS XXIII. DERRIS.}

Body detached, cylindrical, composed of articulations.
Mouth terminal.
Head with two simple cirri at the top.

> Adams in Lin. Tr. iii. 67. Turton Br. Faun. \(132 . \quad\) 1. SANGUlt. 13. f. 1,2.
[D. body covered with a membranaceous transparent coat, through which the internal parts are visible; head extended beyond the outer skin, connected to the anterior part of the body by a membranaceous covering forming a neck; mouth with two lips, one straight and fixed, the other hooked and moveable; length rather more than an inch.

A new genus, formed by Mr. Adams, of which this is the only species now known. ED,

\section*{GENUS XXIV. ACTINIA.}

Body wrinkled, affixing itself to some other substance.
Aperture, one at the extremity, from which issue numberless tentacula.
1. Sulcata, Hydra cereus. Gm. Lin. 3867. Sulcated.

Hydra tentaculis denudatis,

Body smooth.
Mouth above, without cirri.
Aperture one.
Gm. Lin. 3135. - Mem. Wern. Soc. 557.
1. MammilLA.
* M. Conically ventricose; white.

Found on the shore near Leith, adhering to fuci.

\section*{GENUS XXVI. HOLOTHURIA.}

Body not affixed, naked, gibbous.
Tentacula, many at one extremity, surrounding the mouth.
1. Pentac- Hol. Lin. Syst. 1091. Gm. ner. Ph. Tr. 1761. p. 75.

TEs.
Five-rowed.

Lin. 3139.
Hydra corolliflora tentaculiṣ retractilibus frondusis. Gert-
H. with an incurvated cylindric body, marked with five longitudinal rows of papilla; ; out of the centre of each issue, at will, slender feelers like the horms of snails; the upper extremity retractile; when exerted, assumes a cordated form, surrounded at the apex with ten tentacula, elegantly ramified, of a yellow and silver color.

Found on the shore between Penzance and Newland. Supposed to inhabit the deep.

The figure engraven to illustrate this genus was dredged up near Weymouth. Tab. xxviii. fig. 1.

Aristotle and Pliny make use of the words
oxaoovigix and Holothuria ; * but I should imagine, from the context, that they intend those marine bodies, which modern naturalists style Zoophyta, perhaps Alcyonia: for both of the former make them analogous with plants. Yet Aristotle hints that they have life; a discovery assumed in later times.
* Aristot. Hist. An. lib. i. c. 1. de Part. An. lib. iv. c. 5. Plinii Hist. Nat. lib. ix. c. 47.

\section*{GENUS XXVII. LUCERNARIA.}

Body gelatinous, wrinkled, branched. Mouth beneath.
1. Auricu- Gm. Lin. 3151. Mont. in Lin. Tr. ix. 113. t.7. f. 5. la.
* Lu. In make this animal resembles a bottle, with a round short neck; the extremity expanded, and surrounded with eight fasciculi of feelers, which are repeatedly subdivided; color extremely variable; length an inch or more; breadth as much.

Taken in Salcomb Bay, Devonshire, adhering to algre.

\section*{GENUS XXVIII. TEREBELLA.}
* Body oblong, creeping, naked, furnished with branchice at the sides, often inclosed in a tube.
Mouth at the end, with lips, and a clubshaped proboscis.
Teeth none.
Tentacula numerous, capillary, ciliated, surrounding the mouth.

Mont. in Lin. Tr. ix. 110. tal. 4. fig. 2.
* Te. with a long slender body, composed of above two hundred annulations, each furnished with two fasciculi of very minute bristles; no eyes; from the sides issue very long red capillary appendages, like so many worms, writhing in all directions; mouth beneath; color, olive green above, dull orange beneath; length eight or nine inches.

Found in wood in the deserted habitation of a Pholas.
1. Tenta CULATA.

2.
S. with an ovated body; fins along the whole of the sides, and almost meeting at the bottom; two long tentacula; the body contains the bone, the cuttle-bone of the shops, which was formerly used as an absorbent.

The bones are frequently flung on all our shores; the animal very rarely.

\footnotetext{
- Lib. ix. c. 29.
}

This (in common with the other species) emits, when frightened or pursued, the black liquor which the antients supposed darkened the circumambient wave, and concealed it from the enemy.

Th' endanger'd Cuttle thus evades his fears, And native hoards of fluid safety bears. A pitchy ink peculiar glands supply, Whose shades the sharpest beam of light defy. Pursu'd he bids the sable fountains flow, And wrapt in clouds eludes th' impending foe. The fish retreats unseen, while self-born night, With pious shade befriends her parent's flight.*

The antients sometimes made use of it instead of ink. Persius mentions the species in his description of the noble student.

> Jam liber, ct bicolor positis membrana capillis, Inque manus chartæ, nodosaque venit arundo. Tum querimur, crassus calamo quòd pendeat humor ; Nigra quòd infusa vanescat Sepra Lympha. \(\dagger\) At length, his book hé spreads; his pen he takes: His papers here, in learned order lays; And there, his parchment's smoother side displays. But oh! what crosses wait on studious men, The Curtee's juice hangs cloted at our pen. In all my life such stuff I never knew, So gummy thick-Dilute it, it will do. Nay, now'tis water! DRYDEN.
* Jones's Translation of Oppian's Halieut. lib. iii. † Sat. iii.

This animal was esteemed a delicacy by the antients; and is eaten even at present by the Italians. Rondeletius gives us two receipts for the dressing,", which may be continued to this day. Athencus \(\dagger\) also leaves us the method of making an antique Cuttle-fish sausage ; and we learn from Aristotle, 京 that those animals are in highest season, when pregnant.

12. Capil. lata.
}
M. body whitish, semipellucid, convex, fragile; margin with sixteen indentures.

On the Kentish coast. Ed.
These animals inhabit all our seas; are gregarious ; often seen floating with the tide in vast numbers ; feed on insects, small fish, \&c. which they catch with their claspers or arms. Many species, on being handled, affect with a nettlelike burning, and excite a redness. The antients, and some of the moderns, add something more.* They were known to the Greeks and
 and Pulmo marinus, Sea-Lungs. They attributed medicinal virtues to them. Dioscorides \(\ddagger\) informs us, that if rubbed fresh on the diseased part, they cured the gout in the feet, and kibed heels. Elian§ says, that they were depilatory, and if macerated in vinegar, would take away the beard. Their phosphoric quality is well

\footnotetext{
* Pruritum in pudendis, et uredinem in manibus et oculis movent, atque acrimonia sua, venerem sopitam, vel extinctam excitant. Rondel. 532. In several languages they are called by an obscene name.
\(\uparrow\) Arist. Hist. An. lib. v. c. 15. Dioscorides notis Matthiol. 341. Plinii, liv. ix. c. 47.
\(\ddagger P\).341. § De Animal. lil. xiii. c. 27.
}
known; nor was it overlooked by the antients. Pliny notes, that if rubbed with a stick it will appear to burn, and the wood to shine all over.* The same elegant naturalist remarks, that when they sink to the bottom of the sea, they portend a continuance of bad weather. I must not omit, that Aristotle, and Athencus after him, give tō some species the apt name of \(K \nu i \delta \eta\), or the nettle, from their stinging quality. \(\dagger\)

The antients divided their Kvion into two classes, those that adhered to rocks, the Actinia of Linnceus; and those that wandered through the whole element. The last are called by later writers Urtica Soluta; by Linn®us, Meduse; by the common people Sea Gellies and Sea Blubbers.

I do not find that the moderns make any use of them. They are left, the prey of basking sharks, perhaps of other marine animals.

\end{tabular}

Ast. with five rays issuing from an angular body; the rays dividing into innumerable branches, growing slenderer as they recede from the base ; the most curious of the genus.

Found in the north of Scotland. The late worthy Doctor IVilliam Borlase informed me that it had been taken off Cornzeall.

Aristotle and Pliny* called this genus A \(\sigma\) rns,
* Aristot. Hist. An. lib. v. c. 15. Plinii Hist. Nat. lil. x. c. 60 . and stella marina, says the first, from their resemblance to the pictured form of the stars of heaven. They asserted that they were so exceedingly hot, as instantly to consume whatsoever they touched.

\section*{GENUS XXXIII. ECHINUS.}

Body covered with a sutured crust, often furnished with moveable spines. Mouth quinquevalve, placed beneath.

Echinus. Lin. Syst. 1102. E \(\chi\) ıvos wíd. Aristot. Hist. An. 1. EscuGm. Lin. 3168. List. Angl. Lib. iv. c. v. 169. tab. iii.

Есн. of a hemispherical form, covered with sharp strong spines, above half an inch long; commonly of a violet color, moveable; adherent to small tubercles elegantly disposed in rows. These are their instruments of motion, by which they change their place.

This species is often taken in dredging, and often lodges in cavities of rocks just within lowwater mark. Tab. xxxvi. fig. 1.

Are eaten by the poor in many parts of \(E n\) gland, and by the better sort abroad. In old times a favorite dish. They were dressed with vinegar, honied wine, or mead, parsley and mint ; and esteemed to agree with the stomach.*

\footnotetext{
* Athenceus, lib. iii. p. 91.
}

They are the first dish in the famous supper of Lucullus,* when he was made Flamen Martialis, priest of Mars. By some of the concomitant dishes, they seemed designed as a whet for the second course, to the holy personages, priests, and vestals, invited on the occasion. Many species of shell fish made part of the feast. The reader will perhaps find some amusement in learning the taste of the Roman people of fashion in these articles.

Echini, the species here described.
Ostrea cruda, raw oysters.
Peloride, \(\dagger\) a sort of Mya, still used as a food in some places.

Sphondyli, a sort of Bivalve, with strong hinges, found in the Mediterranean sea. Not the gristly part of oysters, as Doctor Arbuthnot conjectures.

Patina Ostrearum. Perhaps stewed oysters. Pelorides. Balani nigri et albi; two kinds of Lepades.

Sphondyli, again.
Glycymerides. + A shell. I suspect to be the same with the Mactra lutraria of this work.

\footnotetext{

L. consisting of five shells, compressed, affixed to a pedicle, and in clusters. Tab. xli. fig. 2. Adheres to ships bottoms by its pedicles.
The tentacula from its animal are feathered; and have given our old English historians and naturalists the idea of a bird. They ascribed the origin of the Bernacle Goose to these shells. The account given by the sage Gerard, is so curious, that I beg leave to transcribe it.
' But what our eyes have seene, and hands ' have touched, we shall declare. There is a ' small island in Lancashire called the Pile ' of Foulders, wherein are found the broken ' pieces of old and bruised ships, some whereof ' have been cast thither by shipwracke, and ' also the trunks and bodies with the branches ' of old and rotten trees, cast up there likewise; ' whereon is found a certaine spume or froth ' that in time breedeth unto certaine shels, in ' shape like those of the Muskle, but sharper ' pointed, and of a whitish colour; wherein is ' contained a thing in form like a lace of silke ' finely woven as it were together, of a whitish
' colour; one end whereof is fastened unto the ' inside of the shell, even as the fish of Oisters ' and Muskles are: the other end is made fast ' unto the belly of a rude masse or lumpe, ' which in time commeth to the shape and form ' of a bird: when it is perfectly formed, the ' shell gapeth open, and the first thing that - appeareth is the foresaid lace or string; next ' come the legs of the bird hanging out, and as ' it groweth greater it openeth the shell by de' grees, till at length it is all come forth, and ' hangeth onely by the bill: in short space after ' it commeth to full maturitie, and falleth into ' the sea, where it gathereth feathers, and grow' eth to fowle bigger than a Mallard and lesser ' than a Goose, having blacke legs and bill or - beake, and feathers blacke and white, spotted ' in such manner as is our Mag-Pie, called in ' some places a Pie-Annet, which the people ' of Lancashire call by no other name than a ' tree Goose: which place aforesaid, and all ' those parts adjoining, do so much abound ' therewith, that one of the best is bought for ' three-pence. For the truth hereof, if any - doubt, may it please them to repaire unto me, ' and I shall satisfie them by the testimonie ' of good witnesses.' Vide Herbal, p. 1587, 1588.

This genus is called by Linnceus, Lepas, a name that is given by the antients to the \(P a\) tella. Shells of this class are called by Avistotle, Baxavoi, \(\dagger\) from the resemblance some of them bear to acorns. We have seen before, in the account of the supper of Leniulus, that they were admitted to the greatest tables.

Mont. Test. Br. 23.
4. CRISPATA. curled.

Ph. with a strong oval shell ; the half next to the hinge waved and striated; tooth large and strong; breadth three inches and a half; length one inch and three quarters. Tab. xliii. fig. 1.
Lin. Tr. viii. 33. Mont. Test. Br. 22.t.1.f.7.8. 5. parva.

Ph. with a shell thinner than the former; and the tooth very slender and oblique; in externals resembling the preceding, only never found larger than a hazel nut. Tab. xliii. fig. 2.

This genus takes its name from \(\phi \omega \lambda \varepsilon \omega\), to lurk in cavities. A shell of the name of pholis Athenaus; but I suspect it to be the dactylus of Pliny. A species now called datyl, abounding within the rocks of the Mediterranean, is much admired as a food.*
I have often taken them out of the cells they had formed in hard clay, below high-water mark, on many of our shores. They also perforate the hardest oak plank that accidentally is lodged in the water. I have a piece filled with them, which was found near Pensacola in West Florida, and presented to me by that ingenious naturalist the late John Ellis, Esq.

I have also found them in masses of fossil wood, in the shores of Abergelex in Denbighshire. The bottoms of the cells are round, and appear as if nicely turned with some instrument.
* Pliny, lib. ix. c. 61. Armstrong's Hist. Minorca, 173.

\section*{Sect. II. BIVALVE SHELLS.}

GENUS IV. MYA. GAPER.

Animal, an Ascidia.
Shell gaping at one end.
Hinge, for the most part, furnished with a thick, strong, and broad tooth, not inserted into the opposite valve.
\begin{tabular}{cl} 
M. Truncata. Lin. Syst. 1112. & List. Angl. tal. v. fig. 36. \\

List. Angl. App. tab. 1. fig. 4.
M. with an oval brittle shell. The primary hinge tooth on one valve is crenulated, and received into a corresponding double tooth on the other valve. Breadth from three to four inches ; length two. Inhabits rivers. Tab. xlvi. fig. 1.

Used to put water colors in; whence the name. Otters feed on this and the other freshwater shells.
9. ovata. Lin. Tr. viii. 39. M. ovalis. Mont. Test. Br. 34 .
* M. with an ovate shell, narrower at one end; hinge tooth the same as in the last, but near the posterior end ; length one inch and three quarters, breadth three inches and a quarter.

Found with the \(M\). pictorum in the rivers Ouze, in Yorkshire; Avon, Somersetshire; and the New River, near Londion.

Lin. Syst. 1112. Gm. Lin. Scheffer Lapland, 145.
10. MARGARITIFERA. pearl.
M. with a very thick coarse opake shell; often much decorticated; oblong, bending inward on one side, or arcuated; black on the outside; usual breadth from five to six inches; length two and a quarter. Tab. xlvi. fig. 2.

Inhabits great rivers, especially those which water the mountanous parts of Great Britain.

This shell is noted for producing quantities of pearl. There have been regular fisheries for the sake of this pretious article in several of our rivers. Sixteen have been found within one shell. They are the disease of the fish, analogous to the stone in the human body. On being squeezed, they will eject the pearl, and often cast it spontaneously in the sand of the stream.

The Conrey was noted for them in the days of Camden. A notion also prevales, that Sir Richard Wymn, of Gwoydir, chamberlain to Catherine queen to Charles II. presénted her majesty with a pearl (taken in this river) which is to this day honored with a place in the regal
crown. They are called by the Welsh, Cregin Dilurw, or Deluge Shells, as if left there by the flood.

The Irt in Cumberland was also productive of them. The famous circumnavigator, Sir John IIcrokins,** had a patent for fishing that river. He had observed pearls plentiful in the Straits of Magellan, and flattered himself with being inriched by procuring them within his own island.

In the last century; several of great size were gotten in the rivers of the county of Tyrone and Donegal, in Ireland. One that weighed 36 carats was valued at \(40 l\). but being foul, lost
- much of its worth. Other single pearls were sold for \(4 l .10 s\). and even for 10 l . The last was sold a second time to Lady Glenlealy, who put it into a necklace, and refused 80l. for it from the Duchess of Ormond. \(\dagger\)

Suietonius reports, that Cosar was induced to undertake his British expedition for the sake of our pearls; at comparing the sizes of which he was so expert, as sometimes to have ascertained the weight by his hand only. + I imagine that Ccesar only heard this by report; and

\footnotetext{
* Camden. ii. \(1003 . \quad\) + Ph. Tr. Alridg. ii. 831.
\(\ddagger\) Sueton. Vit. Jul. Cces. c. xliv.
}
that the crystalline balls in old leases, called mineral pearl, were mistaken for them.*

We believe that Cesar was disappointed of his hope: yet we are told that he brought home a buckler made with British pearl, \(\uparrow\) which he dedicated to, and hung up in the temple of Tenus Genetrix. A proper offering to the Goddess of Beauty, who sprung from the sea. I cannot omit mentioning, that notwithstanding the classics honor our pearl with their notice, yet they report them to have been small and ill colored; an imputation that in general they are still liable to. Pliny \(\ddagger\) says, that a red small kind was found about the Thracian Bosphorus, in a shell called Mya, but does not give it any mark to ascertain the species.

Lin. Tr. viii. 33. Mya Pholadia. Mont. Test. 11. pubia.
M. with a rudiment of a tooth within one shell; with an oval and large hiatus opposite to the hinge. Shells brown and brittle.

Shape of a pistachia nut. Length of a horsebean. Tab. xlvii.
* Woodward's Method of Fossils, 29. part ii.
+ Plinii, lib. ix. c. 35. Tacitus Vit. Agricolce.
\(\ddagger\) Plinii, lijl. ix. c.35,

Found near Weymouth. From the PortLAND cabinet.
12. INEQUYvalvis. Lin. Tr. viii. 40. t. 1.f.6. Mont. Test. Br. 38.
* M. with a shell somewhat triangular ; strong, opake white; one valve nearly double the size of the other; back swelling out and bending inwards; in size rather smaller than a horsebean.

Coasts of Kent, Cornwall, and Devonshire.
13. BIDENtata. Lin. Tr. viii. 41. Mont. Test. Br. 44.
* M. with a shell somewhat oval, flattened; at the hinge one valve has two broad diverging teeth; the other valve has none; color dull white. Minute.

Found by Mr. Montagu in old oyster-shells in Salcombe Bay.
14. SUBORLin. Tr. viii. 41. Mont. Test. Br. 39.
* M. with a shell in some degree spherical; a single hinge tooth in one valve received into a double tocth on the other, with lamellated side teeth; length thrce-eighths of an inch, breadth half an inch; resembles Tellina cornea.

\section*{Class VI. MYA. GAPER.}

Discovered by Mr. Montagu in hard limestone at Plymouth.
* M. with a white ovate shell, with irregular concentric ridges decussated by regular longitudinal stria, which form tubercles at the anterior end ; margin waved; length half an inch, breadth rather more.

Frith of Forth; rare.

Mont. Test. Br. Sup. 21.
* M. shell slightly wrinkled transversely, whitish, with a purple tinge near the beak; minute.

Taken amongst coralline in deep water; Deyonshire coast.

Mont. Test. Br. Sup. 22. iv. 166.
* M. with a white subovate shell, moderately convex with obsolete wrinkles; beak obtuse, near one end front margin nearly strait; breadth half an inch, length a quarter of an inch.

Found on Belton sand near Dunbar in Scotland.

\footnotetext{
17. FERRU GINOSA.
}
18. NITENS. Mont. Test. Br. Sup. App. 165.
* M. with an ovate shell regularly striated concentrically; color pink and white; a single tooth in one valve enters a cleft in the other ; about a quarter of an inch long, and threeeighths of an inch broad.

Near Dunbar ; extremely rare.

\section*{GENUS V. LIGULA. SPOON-IIINGE SHELL.}

Animal, an Ascidia.
Shell equivalve.
Hinge, with a broad tooth on each valve projecting inwards, furnished with a cavity for the reception of the connecting cartilage.
\[
\text { Mont. Test. Br. Sup. 23. tal. 26.f. } 3 .
\]
1. PRISMA TICA.
* Li. shell oblong, flat, thin, glossy, white, considerably attenuated at one end, and obsoletely striated concentrically; beak nearer the smaller end ; length three-eighths of an inch, breadth six-eighths.

Coast of Devonshire.

Mont. Test. Br. Sup. 25.
* Li. with a white, sub-ovate, sub-pellucid shell, wrought with distant, obsolete, elevated, longitudinal strice; inside plain; margin smooth; diameter one-tenth of an inch.

Taken by deep dredging on the Devonshire coast; very rare; discovered by Mr. Montagu.*
* Mr. Montagu, in the Supplement to his Testacea Britannic̈a, expresses a wish that the Mya proetenuis, M. pubescens, M. distorta, and the Mactra tenuis, M. compressa, M. Boysii, should be comprehended in this new genus. We lament, in common with others, that it should have received a name which had been previously appropriated to one of the Vermes Intestince. Ed.

\section*{GENUS VI. SOLEN. RAZOR-SHELL.}

Animal, an Ascidia.
Shell oblong, open at both ends.
Тоотн, a subulated, at the hinge, turned back, often double; not inserted in the opposite shell.

Lin. Syst. 1113. Gm. Lin. List. Conch. tab. 409. 3223. Faun. Suec. No. 2131. List. Angl. tab. v. fig. 37.

Lin. Tr. viii. 43. Mont. Test. Br. 46.
S. with a strait shell, equally broad, compressed, with a double tooth at the hinge, receiving another opposite; and on one side another tooth sharp pointed, and directed downwards. Color olive, with a conoid mark of an ash color, dividing the shells diagonally; one part striated lengthways, the other transversely. Breadth usually five or six inches, sometimes nine. 3223. List. Conch. tab. Mont. Test. Br. 48.
in each shell placed opposite. Shell yellow, marked much like the former; usually about five or six inches broad. T'ab. xlix. fig. 1.

Inhabits Red IVharf, Anglesey.*
3. NOVA-

CULA. Lin. Tr. viii. 44.

Mont. Test. Br. 47.
* S. with a strait shell somewhat compressed; single bent hinged-tooth in each valve; has much the appearance of the \(S\). Siliqua, but the teeth turn contrary ways, and when closed, clasp into each other.

Found near Llaugharne, Caermarthenshire, by Mr. Montagu.
4. ENSIS. scymeter.

Lin. Syst. 1114. Gm. Lin. 3224. List. Angl. App. tab. ii. fig. 9. List. Conch. tab. 411.
S. with a shell bending like a scymeter, with hinges like those of the Siliqua; and colored and marked like it. The shell thin, and rounded at each end. Usual breadth four or five inches. Tab. xlviii. fig. .2.
* First noticed by the reverend Hugh Davies. Ed.

Lin. Tr. viii. 44. Mont. Test. Br. 49 .
5. pelluciDUS. pellucid.
S. sub-arcuated and sub-oval; with the hinge consisting of a sharp double tooth on one side, receiving a single one from the opposite, with a process in each shell, pointing towards the cartilage of the hinge. Shell fragile, pellucid; about an inch broad.

Inhabits Red TVharf, Anglesey.* Tab. xlix. fig. 2.
Lin. Syst. 1114. Gm.
Lin. Tr. viii. 45.
Lin. 3224. List. Conch. Mont. Test. Br. 50.
6. Legumen.
sub-oval.
S. with a strait sub-oval shell; with teeth exactly resembling those of the last, furnished likewise with similar processes; one end is somewhat broader than the other. Usual breadth about two inches and an half. Shell sub-pellucid, radiated from the hinge to the margin.

Inhabits the same place. Tab. xlix. fig. 3.

\footnotetext{
* Discovered about the year 1770, by the Rev. Hugh Davies, on the coast of Efionydd, Caernarvonshive, and afterwards at Red Wharf. Ed.
}
7. antr- Solen coarctatus. Gm. Lin. S. antiquatus. Lin. Tr. viii.

QUATUS. 3227?
List. Conch. 421.
46.

Mont. Test. Br. 52.
S. with a kidney-shaped shell; with a single tooth in one valve locking in between two teeth in the opposite. The shell covered with a rough epidermis. . Breadth nearly two inches; length seven-eighths of an inch.

Inhabits the sea near Weymouth.
This species borders on the mya, and connects the genera. Tab. xlix. fig. 4.
* S. with an oblong pellucid shell, rounded at the ends ; hinge near the middle; a single subulate tooth in one valve, and a double dissimilar recurved in the other; breadth an inch and an half, length half an inch.

Found on the Dorsetshire coast.
\(\begin{array}{llc}\text { 9. vesper- Lin. Tr. viii. } 47 . & \text { Tellina depressa. Br. Zool. } 4 \text { to. } \\ \text { tinus. } & \text { Mont. Test. Br. } 54 . & \text { iv. 73. t. 47.f. } 27 .\end{array}\) Gm. Lin. 3228.
* S. with an oblong-ovate shell, compressed, a single hinge tooth of one valve received into a
forked one in the other ; length one inch and a quarter, breadth two inches and an half. Tab. 1. fig. 2.

Lin. Tr. viii. 47.
Gm. Lin. 3226.
Mont. Test. Br. 53.
10. MINU= tus.
* S. with an oval shell, abrupt at one end close to the hinge, the other end of the valves toothed; length a quarter of an inch, breadth half an inch.

Found by Mr. Montagu burrowed in limestone at Plymouth.

Lin. Tr. viii. 48. Mont. Test. Br. 565.
* S. with a shell somewhat circular, with two forked hinge-teeth diverging from the beak; length three-eighths, breadth half an inch.

Discovered by Mr. Montagu in Salcombe Bay.

Lin. Tr. viii. 48.
Mont. Test. Br. 560. id.
12. Pinds, Sup. 27.
* S. with an ovate compressed shell, the valves from the hinge forming a strait line; delicate, white, transparent, with frequent concentric wrinkles; one tooth in each valve.

First observed by Mr. Pennant at Weymouth. Tab. lxvii, fig. 3.

I am not acquainted with the natural history of the sixth and seventh. The four first lurk in the sand near low-water mark, in a perpendicular direction : and when in want of food, elevate one end a little above the surface, and protrude their bodies far out of the shell. At approach of danger, they dart deep into the sand, sometimes at lest two feet. Their place is known by a small dimple on the surface. Sometimes they are dug out of the sand with a shovel; at other times are taken by a bearded dart suddenly struck into them. They were used as a food by the antients. Athenceus* (from Sophron) speaks of them as great delicacies, and particularly grateful to widows:
Oblongæ conchæ solenes, et carne jucundâ
Conchylium, viduarum mulierum cupediæ.

These are often used as a food at present; and brought up to table fried in eggs.

\footnotetext{
* Lib. iii. p. 86.
}

GENUS VII. TELLINA. BENT-WEDGE.

Animal, a Tethys.
Shell generally sloping on one side.
Teeth, three at the hinge; side teeth in one of the valves flat or wanting.
* Ovate, thickish.

\section*{Lin. Tr. viii. 48. id. iii. 252.}

P. with fourteen rays, very prominent and broad; striated lengthways above and below; ears equal. Grows to a large size. Tab. lxii.

Found in beds by themselves; are dredged up, and pickled and barrelled for sale.

The antients say, that they have the power of removing themselves from place to place by vast springs or leaps.* This shell was called by the Greeks Krধıs, by the Latins Pecten, and was used by both as a food; and when dressed

\footnotetext{
*Arist. Hist. An. lib, ir. c. 4.
}
with pepper and cummins, was taken medicinally.*

The elegant figure of the crouching Venus, in the Maffei collection, is placed sitting in a shell of this kind. The sculptor probably was taught by the mythology of his time, that the goddess arose from the sea in a scallop. This perhaps may have been the concha venerea of Pliny, so styled from this circumstance.

Another shell (Cypraa) has the same name, for a different reason.

The scallop is commonly worn by pilgrims on their hat, or the cape of their coat, as a mark that they had crossed the sea in their way to the Holy Land, or to some distant object of devotion.

\end{tabular}
O. commonly of an orbicular form, and very rugged. A description of so well known a shell is needless. Varies in size in different places. Figured with an Anomia (A.) on it. Tab. lxv. fig. 2.

Britain has been noted for oysters from the time of Juvenal,* who satyrizing an epicure \({ }_{3}\) says,

Circceis nata forent, an
Lucrinum ad Saxum, Rutupinove edita fundo, Ostrea, callebat primo deprendere morsu.

He, whether Circe's rock his oysters bore, Or Lucrine lake, or distant Richlorough's shore, Knew at first taste.

The luxurious Romans were very fond of this fish, and had their layers or stews for oysters,

\footnotetext{
* Sá̆yr. iv. V. 140.
}

VOL. IV.
Q
as we have at present; of which Sergius Ora\(t a^{*}\) was the inventor, as early as the time of \(L\). Crassus the orator. He did not do this for the sake of indulging his appetite, but through avarice, and made great profits from them. Orata got great credit for his Lucrine oysters; for, says Pliny, the British were not then known.

The antients eat them raw, and sometimes roasted. They had also a custom of stewing them with mallows and docks, or with fish, and esteemed them very nourishing. \(\dagger\)

Britain still keeps its superiority in oysters over other countries. Most of our coasts produce them naturally, and in such places they are taken by dredging, and are become an article of commerce, both raw and pickled. The very shells, calcined, become an useful medicine as an absorbent; and in common with those of other species, prove an excellent manure.

Stews or layers of oysters are formed in places, which nature never allotted as habitations for them. Those near Colchester have been long famous; at present there are others, which at lest rival the former, near the mouth of the Thames. The oysters, or their spats, are

\footnotetext{
* Plin. Nat. Hist. lib. ix. c. 54, † Athenceus, lit. iii. p. 92.
}
brought to convenient places, where they improve in taste and size. It is an error to suppose, that the fine green observed in oysters taken from artificial beds, is owing to copperas; it being notorious how destructive the substance or the solution of it is to all fish. I cannot give a better account of the cause, or of the whole treatment of oysters, than what is preserved in the learned Bishop Sprat's History of the Royal Society, from p. 307 to 309.
' In the month of May the oysters cast their ' spaun, (which the dredgers call their spats;) ' it is like to a drop of candle, and about the ' bigness of a halfpenny.
' The spat cleaves to stones, old oyster' shells, pieces of wood, and such-like things, ' at the bottom of the sea, which they call ' cultch.
' 'Tis probably conjectured, that the spat in ' twenty-four hours begins to have a shell.
' In the month of May, the dredgers (by the ' law of the Admiralty court) have liberty to ' catch all manner of oysters, of what size ' soever.
' When they have taken them, with a knife ' they gently raise the small brood from the ' cultch, and then they throw the cultch in : again, to preserve the ground for the future,

Q 2
\({ }^{6}\) unless they be so newly spat, that they cannot \({ }^{6}\) be safely severed from the cultch; in that \({ }^{6}\) case they are permitted to take the stone or ' shell, \&x. that the spat is upon, one shell \({ }^{6}\) having many times twenty spats.
' After the month of May, it is felony to
- carry away the cultch, and punishable to take ' any other oysters, unless it be those of size, " (that is to say) about the bigness of an half' crown piece, or when the two shells being \({ }^{6}\) shut, a fair shilling will rattle between them.
' The places where these oysters are chiefly
' catcht, are called the Pont-Burnham, Mal' den, and Colne waters; the latter taking its ' name from the river of Colne, which passeth ' by Colne-Chester, gives the name to that \({ }^{6}\) town, and runs into a creek of the' sea, at a
' place called the Hythe, being the suburbs of \({ }^{6}\) the town.
' This brood and other oysters they carry to
\({ }^{\circ}\) creeks of the sea, at Brickel-Sea, Mersey,
- Langno, Fingrego, Wivenho, Tolesbury, and
'Saltcoase, and there throw them into the
" channel, which they call their beds or layers,
" where they grow and fatten, and in two or
' three years the smallest brood will be oysters
* of the size aforesaid.
- Those oysters which they would have green,
' they put into pits about three feet deep in the ' salt-marshes, which are overflowed only at ' spring-tides, to which they have sluces, and ' let out the sault-water until it is about a foot ‘ and half deep.
' These pits, from some quality in the soil ' co-operating with the heat of the sun, will ' become green, and communicate their colour ' to the oysters that are put into them in four ' or five days, though they commonly let them ' continue there six weeks or two months, in 's which time they will be of a dark green.
' To prove that the sun operates in the ‘ greening, Tolesbury pits will green only in (summer; but that the earth hath the greater ' power, Brickel-Sea pits green both winter ? and summer: and for a further proof, a pit ' within a foot of a greening-pit will not green; ' and those that did green very well, will in - time lose their quality.
- The oysters, when the tide comes in, lie ' with their hollow shell downwards, and when ' it goes out, they turn on the other side ; they ' remove not from their place, unless in cold ' weather, to cover themselves in the ouse.
- The reason of the scarcity of oysters, and consequently of their dearness, is, because - they are of late years bought up by the Dutch.
' There are great penalties, by the Admiralty ' court, laid upon those that fish out of those grounds which the court appoints, or that
' destroy the cultch, or that take any oysters
' that are not of size, or that do not tread
' under their feet, or throw upon the shore,
' a fish which they call a Five-finger,* resem-
' bling a spur-rowel, because that fish gets into
' the oysters when they gape, and sucks them ' out.
' The reason why such a penalty is set upon
\({ }^{6}\) any that shall destroy the cultch, is, because
' they find that if that be taken away, the ouse
' will increase, and the muscles and cockles will
' breed there, and destroy the oysters, they
' having not whereon to stick their spat.
' The oysters are sick after they have spat;
' but in June and July they begin to mend, and
' in August they are perfectly well: the male
' oyster is black-sick, having a black substance
' in the fin; the female white-sick, (as they ' term it) having a milky substance in the fin.
'They are salt in the pits, salter in the layers, ' but salter at sea.'

To this I beg leave to join a sort of present state of this article, borrowed from the 84th

\footnotetext{
* Asterias glacialis, the common Sea Star.
}
page of the History of Rochester, in 12mo. published in 1776.
- Great part of the inhabitants of Stroud are ' supported by the fisheries, of which the oyster ' is most considerable. This is conducted by ' a company of free dredgers, established by ' prescription, but subject to the authority and ' government of the mayor and citizens of \(R 0\) -- chester. In 1729 an act of parliament was ' obtained, for the better management of this ' fishery, and for confirming the jurisdiction of ' the said mayor and citizens, and free dredgers.
- The mayor holds a court of admiralty every ' year, to make such regulations as shall be ' necessary for the well conducting this valu' able branch of fishery. Seven years appren' ticeship entitles a person to the freedom of ' this company. All persons catching oysters, ' not members of the fishery, are liable to a ' penalty. The company frequently buy brood ' or spat from other parts, which they lay in ' this river, where they soon grow to maturity. ' Great quantities of these oysters are sent to ' London; to Holland, Westphalia, and the ad' jacent countries.'

\end{tabular}
B. with about five spires, often obsolete ; inside of the mouth slightly toothed. A very strong thick shell, of a whitish color.

Varieties, yellow ; or fasciated with yellow on a white ground; or sulcated spirally, and sometimes reticulated.

See figures 1. I. I. tab. Ixxv.
In many, which I suspect to be shells not arrived at full growth, the lip is thin and cultrated. Length near an inch and a half.

Inhabits (in vast abundance) rocks near lowwater mark.

This is one of the English shells that produces the purple dye, analogous to the purpura as an object of curiosity.

The antient has been long since superseded by the introduction of the insect Coccus Cacti, or the Cochineal beetle. The shells were of the genus of Murex, mentioned by Linncus, pp. 1214, 1215. But one was a sort of Buccimum. Pliny describes both.* The finest was the Tyrian.

\section*{- Tyrioque ardebat Murice lana;'}

A strong expression of Virgil, who describes the cloth,

> ' Glowing with the Tyrian Murex.'

The species of shells are found in various parts of the Mediterranean. Immense heaps of them are to be seen about Tarentum \(\dagger\) to this day, evincing one place where this pretious liquor was extracted.

The process of obtaining the English Purpura is well described by Mr. William Cole, of Bristol, in 1684, in the following words : \(\ddagger\)
' The shells being harder than most of other ' kinds, are to be broken with a smart stroke ' with a hammer, on a plate of iron, or firm

\footnotetext{
* Liv. ix. c. \(36 . \quad+\) Baron Riedesel's Travels, p. 174.
\(\ddagger\) Ph. Tr. Alr. ii. 826.
}
' piece of timber, (with their mouths down' wards) so as not to crush the body of the ' fish within; the broken pieces being picked ' off, there will appear a white vein, lying ' transversely in a little furrow or cleft, next to ' the head of the fish, which must be digged 6 out with the stiff point of a horse-hair pencil, ' being made short and tapering. The letters, - figures, or what else shall be made on the - linen, (and perhaps silk too) will presently 6 appear of a pleasant light-green color, and if ' placed in the sun, will change into the follow' ing colors, i. e. if in winter, about noon ; if in ' the summer, an hour or two after sun-rising, ' and so much before setting; for in the beat ' of the day, in summer, the colors will come ' on so fast, that the succession of each color ' will scarcely be distinguished. Next to the ' first light-green, it will appear of a deep' green, and in a few minutes change into a ' sea-green, after which, in a few minutes more, ' it will alter into a watchet-blue; from that, in ' a little time more, it will be of a purplish-red; ' after which, lying an hour or two, (supposing ' the sun still shining) it will be of a very deep ' purple-red, beyond which the sun can do no - more.
- But then the last and most beautiful color;
- after washing in scalding water and soap, will
' (the matter being again put into the sun or
' wind to dry) be of a fair bright crimson, or
' near to the prince's colour, which afterwards,
' notwithstanding there is no use of any stip-
' tick to bind the colour, will continue the
' same, if well ordered; as I have found in
' handkerchiefs, that have been washed more
' than forty times; only it will be somewhat
' allayed, from what it was, after the first
' washing. While the cloth so writ upon lies
' in the sun, it will yield a very strong and
- foetid smell, as if garlick and assa-fcetida
' were mixed together.'

He. with five spires most remarkably ventricose; slightly umbilicated; fasciated with a lighter and deeper brown.

Inhabits the woods of the southern counties of England.

A naturalized species, introduced, as is said, by Sir Kenelm Digby; whether for medical purposes, or as a food, is uncertain. Tradition says, that to cure his beloved wife of a decay was the object.

They are quite confined to our southern counties. An attempt was made to bring them into Northamptonshire,* but they would not live there.

These are used as a food in several parts of Europe during Lent; and are preserved in an escargatoire, or a large place boarded in, with the floor covered half a foot deep with herbs, in which the snails nestle and fatten. \(\dagger\) They were also a favorite dish with the Romans, who had their cochlearia, a nursery similar to

\footnotetext{
*Morton, 415. + Addison's Travels, 272.
}
the above. Fulvius Hirpinus* was the first inventor of this luxury, a little before the civil wars between Cesar and Pompey. The snails were fed with bran, and sodden wine. If we could credit Varro, \(\dagger\)-they grew so large that the shells of some would hold ten quarts! People need not admire the temperance of the supper of the younger Pliny, \(\ddagger\) which consisted of only a lettuce apiece, three snails, two eggs, a barley cake, sweet wine, and snow, in case his snails bore any proportion in size to those of Hirpinus.

Its name is derived not from any thing relating to an orchard, but from \(\Pi \tilde{\omega} \mu \alpha\), an operculum, it having a very strong one. This seems to be the species described by Pliny, lib. viii. c. 39, which he says was scarce ; that it covered itself with the opercle, and lodged under ground ; and that it was at first found only about the maritime \(A l p s\), and more lately near \(V e\) litra. Tab. lxxxvii. fig. 1.

Inhabits the west of England. Tab. xcii. fig. 3.
14. APERTURA.

Lin. Tr. viii. 236.
Mont. Test. Br. 491. t. 13. f. 10. id. Sup. 155.
* P. with a somewhat conic shell, ribbed lengthways; top perforated, bent; minute.

Found in the sand near Falmouth, and at Salcombe bay, Devonshire.
This genus was called by the Greeks \(\lambda \varepsilon \pi \alpha\), , and is mentioned by Aristotle and Athencus;* who acquaint us, that it was used for the table; and also inform us of its nature of adhering to rocks. Aristophanes, with much humour, speaks of an old woman who stuck as close to a young fellow, as a Lepas to a rock. Linneus has adopted the Latin name of Patella, a sort of dish; and has applied it (as some other modern writers have before) to this genus.

\section*{GENUS XXXII. DENTALIUM.}

> Animai, a Terebella.
> Shell slender, tubiform, mostly pervious.

Lin. Syst. 1263. No. 786. Faun. Suec. No. 2201. Gm. Lin. 3736. Lin. Tr. viii. 237.
list. Conch. tal. 547. fig. 2. Mont. Test. Br. 494.
1. ENTALIS. common.
D. with a slender shell, a little bending; pervious; length near an inch and a half.

Inhabits most of our seas. Tab. xciii. fig. 5.
\begin{tabular}{ll} 
Gm. Lin. 3736. & D. striatum. Mont. Test. Br. 2. dentalis. \\
Lin. Tr. viii. 237. & 495. id. Sup. 156.
\end{tabular}
* D. with a white tubular shell, having a few faint annulets at the larger end, and twenty strice, rather bent, interrupted; length half an inch; inhabits the sea on the western coast.
3. STRIATU LUM.

Gm. Lin. 3738.
Lin. Tr. viii. 238.

Mont. Test. Br. Sup. 155.
* D. with an acuminated shell, of eight angles, and eight strice of a green color with a white point.

Found on the coast of Cornteall.
4. GADUE.

Lin. Tr. viii. 238.
Mont. Test. Br. 496. t. 14 . f. 7.
* D. with a very smooth shell, somewhat bent, and contracted towards the aperture ; length scarcely three eighths of an inch, greatest breadth one tenth of an inch. Inhabits the ocean, and is called by mariners Hake's Tooth.
5. IMPERFORATUM.

Lin. Tr. viii. 238. Mont. Test. Br. 496.
* D. with a cylindric shell, somewhat bent, transversely striated, abrupt, and imperforate at the apex; minute. Inhabits the sea.
Lin. Tr. viii. 239. Mont. Test. Br.497. t. 14. f. 10.
* D. with a bent round shell; stria very numerous, annular, closely set; apex abrupt, imperforate; minute. Inhabits the sea.

Lin. Tr. viii. 239. Mont. Test. Br. 497. 7. Glabrum.
* D. with white, smooth, bent, cylindric shell, and imperforate; very minute.

Found on the northern coast of Devonshire.

\section*{GENUS XXXIII. SERPULA. WORMSHELL.}

Animal, (generally) a Terebella. Shell tubular, adhering to other bodies.
* Spiral.
1. SPIRORBIS. spiral.

Lin. Syst. 1264. No. 794. Gm. Lin. 3740.
Faun. Suec. No. 2204.

Lin. Tr. viii. 241.
Mont. Test. Br. 498.
S. with a shell spiral or wreathed, like the cornu ammonis; very small; adhering to shells, crustacea, and alge. Tab. xciv. fig. 1.

\begin{aligned}
& \text { 2. SPIRIL- } \\
& \text { LUM. }
\end{aligned}
\]

Gm. Lin. 3740. Mont. Test. Br. 499.
* S. with a pellucid, uniform, spiral, orbiculate shell; volutions round, gradually decreasing in size.
\[
\text { S. sinistrosa. Mont. Test. Br. } 504 . \quad \text { VAR. B. }
\]

In this variety the volutions are reversed; minute.

Found in the sea on Zoophytes.

Lin. Tr. viii. 241. Mont. Test. Br. \(505 . \quad\) 3. minuta.
* S. with an uniform, spiral, orbiculate shell ; volutions round, reversed; very minute. Found on the sea adhering to Zoophytes.
Gm. Lin. 3741.
Mont. Test. Br. 500.
4. granu: lata.
* S. with a round spiral shell, glomerated, and having three raised ridges on the upper side; minute. Adheres to stones and sea shells.

Lin. Tr. viii. 242. Mont. Test. Br. 503. \(\begin{gathered}\text { 5. hetero- } \\ \text { Strophal }\end{gathered}\)
* S. with a round spiral shell, and having two or three sulcated reversed volutions.

Found on shells and slaty rocks in the sea.
6. carinata. Lin. Tr. viii. 242. Mont. Test. Br. 502.
* S. with an uniform spiral shell; the exterior volution ridged above; minute.

Found adhering to shells in the sea.
7. CORRUGATA.

Lin. Tr. viii. 242.
Mont. Test. Br. 502.
* S. with an uniform spiral shell, transversely wrinkled, umbilicated; diameter one eighth of an inch. Inhabits rocks in the sea.
8. cornea.

Lin. Tr. viii. 243. Mont. Test. Br. 503.
* S. with an uniform, round, pellucid shell, of three volutions, shell horn-colored; is it a distinct species? Inhabits the sea.
9. lucida. S. vitrea. Gm. Lin. \(3746 . \quad\) Mont. Test. Br. 506. Lin. Tr. viii. 243.
S. with a round spiral very smooth and glossy shell, volutions reversed; very minute. Inhabits the sea; on Zoophytes.

* S. with a smooth white shell, of six equidistant longitudinal ribs; neck long; subcylindric; minute. Inhabits the sea.

* S. with a white pellucid shell, of many longitudinal stria, neck long; minute. Inhabits the sea.

Lin. Tr. viii. 248. Vermiculum retortum. Mont. 26. retorta.
* S. with a white, opaque, round, marginated shell; neck placed obliquely; minute. Inhabits the sea.

* S. with an urn-shaped, white, smooth, semipellucid shell; apex conic; minute. Inhabits the sea.
* S. with a white, depressed, sub-pellucid, suborbicular shell; of three irregular volutions, and numerous dissimilar concamerations; minate; rare.

Taken up by the Amphitrite ventilabrum in the formation of its tube.
Class VI. TEREDO. PIERCER. ..... 367

\section*{GENUS XXXIV. TEREDO. PIERCER.}
-Animal, unknown.
Shell slender, bending.
Valves, two, testaceous, hemispherical, covering the head; two lanceolate, near the tail.

Lin. Syst. 1267. No. 807. Lin. Tr. viii. 249. , 1, Navalis. Gm. Lin. 3747. Mont. Test. Br. 527. ship.
Faun. Suec. No. 2087.
Justly called by Linncus, calamitas navium. Was imported from the Indies. Penetrates into the stoutest oak plank, and effects their destruction.

\section*{GENUS XXXV. SABELLA. CONCRETESHELL.}

Animal various, Nereis, Amphitrite, \&c. Covering tubular, fabricated with sand and broken shells, coherent by a glutinous cement.
1. RU̇DIs.
coarse.

Baster sulses. i. p. 80. tal. 9. fig. 4.
S. conchilega. Mont. Test. Br. 547.
S. with a single case formed of larger fragments of shells, with little or no sand.

Found near Weymouth, lodged in the shell of a bivalve. The animal is represented magnified in Tab. xxviii. marked A. A.
2. AlveoLATA. honey-comb.

Lin. Syst. 1268. No. 812. Ellis Conch. tab. xxxvi. p. Gm, Lin. 3749. 90.
S. with numerous tubes placed parallel, with the orifices open, forming in the mass the appearance of the surface of honey-combs : composed chiefly of sand, with very minute frag- three inches long.

Found on the western coasts of Anglesey; near Criccaeth, Caernarvonshire; and near Yarmouth. It covers the rocks for a considerable space, near low-water mark. Tab. xcv. fig. 1.

5. chryso- Gm. Lin. 3749.

DON.

Pallas Misc. Zool. t. 9. Mont. Test. Br. 546.
* S. with a cylindrical membranaceous tube, about the size of a goose quill, covered with sand and particles of broken shells; the mouth furnished with long fibres, composed of the same materials ; length about six inches.

Found on the sea shore, sunk in the sand above low-water mark. . Animal, a Terebella.
6. Lumbricalis.

Gm. Lin. 3752. ?
Mont. Test. Br. 549.
* S. a strong tube, composed chiefly of coarse sand, firmly cemented together and attached to stones, shells, \&c. in a creeping manner; the strongest of the genus; length two or three inches ; diameter one quarter of an inch. Animal, a Terebella.

Common on all our shores.
7. cirrata. Gm. Lin. 3119. Mont. Test. Br. 350.
* S. with a thick fragile tube, a little tapering, composed of sand and clay, readily falling to pieces when dry; length six or seven inches; diameter half an inch.

Found in muddy bottoms above low-water mark. Animal, a Terebella.

\author{
Mont. Test. Br. 552.
}
* S. with a cylindric tube, extremely brittle, composed of fine sand; length from one to two inches, and about the size of a raven's quill. Animal unknown.
9. subcy-

LINDRICA.
* S. with a slender, fragile, subcylindric tube, composed of fine sand, and minute particles of shells, cemented together on a fine membrane ; length from one to three inches; diameter not above one tenth of an inch. Animal unknown.

Mont. Test. Br. 553.
* S. with a slender tube, tapering at the smaller end to one half of the larger end, composed of particles of shells and stones, placed in an imbricated manner; length three or four inches; size double that of an hog's bristle. Animal unknown.
* S. with a tube composed of particles of sand and stone, sometimes of the finest sand alone, on a tough membrane, somewhat tapering; length scarcely one inch; size that of a crow quil. Animal, a Terebella.

Covers the whole surface of the shore in the inlet near Kingsbridge, Devonshire.
12. TUBIFORMIS tule.

S. granulata. Lin. Syst. 1268. Mont. Test. Br. 544.
S. with a case of a taper strait form; made ùp of minute particles of sand, most elegantly put together.

Its animal described at p. 91.
Common on all our sandy shores. Tab. xcr. fig. 2.
* S. with a broad and extremely flat tube, composed of large fragments of bivalve shells, chiefly of the Pecten; length about an inch and a half,
breadth three eighths of an inch. Animal unknown.

\section*{Inhabits deep waters.*}
* The editor perfectly coincides in the opinion entertained by the authors of the Testacea Britannica, and recently adopted by Mr. Montagu, " of the impropriety of classing these heterogeneous tribes with the testacea;" but as no other place has been assigned them in the system, he has left the genus Sabella where it was placed by Linnapus and Mr. Pennant. Ed.

```

[^0]:    * Catalogue of British Insects. 2.
    $\dagger$ [This design has never been executed. Mr. Donovars has published fourteen volumes of the Natural History of British Insects; Mr. Marsham one vo'ume of an EntomoVOL. IV.

[^1]:    * Mr. Gray's Letters, $23 S$.

[^2]:    - Fate freely acting, and unerring Chance.
    - Where meanless matter to a chaos sinks
    - Or something lower still, for without thee
    - It crumbles into atoms void of force,
    - Void of resistance-it eludes our thought.
    - Where laws eternal to the varying code
    - Of self-love dwindle. Interest, passion, whim
    - Take place of right and wrong, the golden chain
    - Of beings melts away, and the mind's eye
    'Sees nothing but the present. All beyond
    ' Is visionary guess-is dream-is death.'
