our art has degenerated in an extraordinary manner. At the same time I think we have begun to emerge from the age of darkness, and let us hope that the greater our application, the stronger will be the new light, which is already dawning upon architecture and architectural science. And for this new light I must give the antiquary his due share of credit, he having collected a most valuable set of ancient examples, which must have had a great influence upon our art, and which ought to serve us as an extensive field for imagination to work upon; and by recombinations we may to work upon; and by recombinations we may yet produce a style peculiar to the nineteenth century, not forgetting that our predecessors, from the scientific knowledge which they possessed, were enabled to give art certain dependence on rules (at least there is the appearance of such hairs, the case) which is will be ance of such heing the case), which it will be impossible for us to do if we try a royal road nowledge.

Although the present, when compared with the past, is encouraging, yet taste in architec-ture is not sufficiently cultivated to bring with it its corresponding influence upon art. Reflecting upon by gone ages, when architecture was at its zenith, we find that the church con-sidered it as a most important branch of education, and the art was encouraged in every possible way. Taxes were levied amongst their people for the purpose of increasing the magnificence of their cathedrals and churches: this means their cdifices bore the impress of their power,—a power which was not used from feelings of ostentations pride, but for the purpose of showing the devotion and reverence with which they looked up to the Almighty. This lavish outlay was far preferable to the close-fisted parsimony of the present times, when committees seem to be trying a series of experiments as to how cheap they can build churches or chapels, which, when done, are sometimes unsafe to sit in.

The present state of public competition is The present state of public competition is ruinous to the architect, to public taste, and to the progress of pure art. It appears to me to arise from the following causes, viz.:—
Want of architectural taste in those who

have to decide the merits of the various de-

Want of union amongst the profession, and want of good architectural criticism,

Want of taste and knowledge in those who have to decide upon the several merits or de-merits of a design is a deficiency so often merits of a design is a deficiency so often experienced by men of talent in our profession, that it will be quite unnecessary for me to prove that it does exist: I think it is greatly owing to the neglect with which architecture is treated by the public press; the mass of the people, therefore, have no popular means of improving their minds on this subject.

Want of unon amount the profession is

Want of union amongst the profession is another cause for the indignities which are continually borne by its members. I think continually borne by its members. I think that architects as a body ought to be quite strong enough either to pass laws themselves or get them passed by the legislature, which shall protect them from these fearful competition jobs. From the want of good criticism in the public journals, these jobs are often allowed to pass unnoticed, thus leaving the evil to increase in consequence of the jobbone. evil to increase in consequence of the jobbers evit to increase in consequence of the powers escaping free. One would suppose that with such power as the daily papers possess, it would not be difficult by degrees to promote a knowledge of true architecture amongst the

classes who most require it.

Architecture seems to have heen entirely neglected; it has not been sufficiently studied as a fine art, an art which should have the same interest for the architect that poetry has for the poet, painting for the artist, and form for the sculptors. The public are hardly acquainted with its unusual advantages as a material art. What I mean is, that I look upon painting, poetry, and sculpture, as imaginative, but our pursuits are realities. For a proof of this we have only to review the buildings of Ancient Greece, where usefulness was combined with a great simplicity of form, and consimulate with a great simplicity of form, and consuminate art in the arrangement of the ornamental parts. These works show a refined taste, which has only been equalled by our own countrymen in the wonderful examples of Gothic architecture.

I am inclined to believe that good architectural criticism, or even appreciation of the art, will not increase until more importance is

attached to the profession; and also that no profession will have much importance attached to it unless studied in a systematic form. Upon comparing the present method of education adopted by our profession, I cannot but see that it is entirely inferior to all others. The medical profession is one which it would be impossible for a member to practise unless he had arrived at a certain standard of perfection: unless he attends regularly courses of lectures and examinations on anatomy, be would be incapable of performing the commonest surgical operation. The church and the law are equally strict: a man to become a member of either must go through a certain course of study. To come nearer to our procourse of study. To come nearer to our profession I will add the engineer, who must have a thorough knowledge of mathematics and mechanics before he can construct a steam-engine or a railway bridge.

Now let us compare the state of architectural education with these facts. How are its students treated? Where are their colleges i llow much are they required to know? I sorry to say their schools are various and systematic, as various, in fact, as are the abili-ties which are shewn by the practising mem-bers of the profession. The schools I allude to are architects' offices, where youths are sent they happen to show any taste for drawing, their parents unwisely saying, "that boy must be an architect," without reference to other capabilities which are indispensable to a thorough architect. The premium is paid, and the victim perhaps enters a bustling office, is set to lay down paper and to perform a variety of such jobs, which, according to the present practice, it is the duty of the fresh-

perform. It is the system in some offices to confine pupils or assistants to one particular branch of the duties; such as drawing and writing to of the duties; such as traving and wring to plans—drawing and colouring perspectives and elevations—or measuring and taking out quar-tities. If a young student happen to over-come all these impediments, and show evidence of talent and knowledge superior to his fellow pupils, it is seldom that he is assisted or encouraged by his master. This superiority is principally owing to his own observation and

comer to

These are some of the causes which tend to These are some of the causes which tend to check the progress of taste and of pure art: while such practices last, the engineer will assume the scientific department of architecture, the builder the practical,—and, as for art, that will be forgotten altogether.

Until the public are certain that architects are educated and scientific men, there will always be a distrust of them, which will act in a detrimental manner to their interests, and to

a detrimental manner to their interests, and to the spread of architectural taste. wonder at this distrust, when such instances are common as that of an architect giving an estimate to a committee for the erection building, which, when properly calculated, amounts to double the money. It is a common excuse among architects that it is impossible to tell what a building will cost until the quantities are taken out, and the huilder's estimates given. This is allowing the huilder to usurp the office of the architect; and it is certain that its effects upon the pockets of the professional man are very serious. I have heard of numerous cases where a builder has been consulted in preference to an architect, merely because the employer thought the practical man could give him a better idea of the sum to be expended; and this, I am afraid, is the case with

many landed proprietors, who, if they were not afrait!, would employ professional men. Another evil, which acts in a prejudicial manner to the interest of the architect, is the uncertainty of the rates of professional remu-netation. ARTHUR ALLOM.

THE HEALTH QUESTION.

In reply to Mr. Bernal's indignant re-monstrance, my Lord Ebrington informs us that we have had cesspools emptied and sewers flushed, and that the commissioners' plan is about completing. Of the former we are unabout completing. Of the former we are un-happily aware—since for eighten months we have had his lordship's foul gift following, morning, noon, and night, the lunar influences between Barnes and Erith;—we accept with joy the probable correctness of his lordship's second assurance. We have a faith in second assurance. We have also faith in the public will, that the best plan which modern science and sound sense can devise for the constant cleansing of the metropolitan atmosphere shall be that which the Commissioners of Sewers adopt.

We have been long enough, and in more than one, like the lampooned of senses

Tongilianus habet nasum, scio, non nego, sed jam, Nil præter nasum Tongilianus habet

But eighteen months have given us cause and leisure to inquire both what we are to be ridden of, and what we are to acquire, What is it to be? Are we to be freed for ever of the nauseous emanations of graveyards, of 5 feet thicknesses (vide St Bride's) of putrefaction, scantily covered with a little earth—just burial scantily covered with a little earth—just burial sufficient to frank the departed shade across dismal Styx? Are we to be freed from the foul reek of contractors' yards, slaughter-houses, bone-heaps, manufactories of scientific filth?—from the miasmata of gully-holes and untrapped inlets?—from the abominations of cesspools and uncovered ditches? Are we to be cleansed by the pustular system of Mr. Austin, or the downdraught of Mr. Phillips, hy the constant suppuration of sumphs, or the diarrhœa of tunnels? Are we to have sewer within sewer, one carrying off to Plumstead the foul contributions of manufactories and man, the other voiding into the Thames the whole surface water of the London Basin, rendering gully-traps useless, and 3 inches water under our kitchen-floors at Stockwell impossible? Are we to have all dwellings in-spected, and found properly convenienced, ventilated, and trapped? Are we to have intra-parietal herding confined within mortal

In fine, are we, who work ten or fifteen hours a-day, to be left to look after ourselves, or are a-day, to be left to look after ourselves, or are those appointed to the work of supervision to see whether it be done or no? "He that is fifthy, let him be filthy still," that has been the cry long enough. If, as Sir J. Jervis says, we are to he left to the common law, it may be the cry for ever. Common sense as a prompter, let alone common law as a remedy, is not to be trusted, and unless we are looked after by these mcn, we must devise some other means of deliverance. I have imagined in such a case that a sanitary league, with moderate funds, employing a public prosecutor to follow up all complaints made by members, might be productive of some effect. Meanwhile, we have THE BUILDER at all events,—whose, with much respect, is

JUVENIS EFFLUVIATUS INFELIX.

MOVING PANORAMA OF THE NILE.

THE moving panoramic picture of the Nile, the preparation of which we first announced, was exhibited to friends on Saturday last, and was opened to the public on Monday. Messrs. Warren, Bonomi, and Fahey, assisted by Messrs. Martin, Corbould, Weigall, and Howse, have Martin, Corbound, Weigan, and Those, have conspired to produce an exceedingly interesting and very heautiful work of art. The spectator, starting from Cairo, is made to see, first one hank of the Nile, as far as the second caturact, in Nuhia, and then, returning, the other is burnet before him. other is brought before him.

The subject is full of interest. "Egypt," as the preface to the catalogue states, "was the land visited by Abraham in search of food, when they was the land visited by a braham in search of food, when there was a famine in his own country; the land to which Joseph was carried as a slave, and which he governed as prime minister. From Egypt Moses led the Israelites through the waters of the Red Sea. Here Jeremiah wrote his 'Lamentations.' Here Solon, Pythagoras, Plato, and other Greek philosophers, came to study. Here Alexander the Great came as a concavery, and here the the Great came as a conqueror; and here the

infant Saviour was hrought by his parents to avoid the persecution of Herod. Egyptian heroglyphics, in which the characters are taken from visible objects, are the earliest form of writing; and the Hebrew and Greek alphabets were both borrowed from them. Egypt taught the world the use of paper—sode from its rush the nature. begypt taught the world the use of paper—
made from its rush, the papyrus. In Egypt
was made the first public library, and first
college of learned men, namely, the Alexandrian Museum. There Euclid wrote his 'Elements of Geometry,' and Theocritus his Poems,
and Lucian his 'Dialogues.' The heauty of Cleopatra, the last Egyptian queen, held Julius Cæsar, and then Marc Antony, captive. In Egypt were built the first monasteries; the Christian fathers Origen and Athanasius lived there; the Arian and Athanasian controversy began there."

The huildings which remain are the oldest in the world—some of them the largest; the country was the first civilised: it was the parent of Greek science and art. With such samples of Greek science and art. With such a subject, the artists we have named could scarcely fail to produce a fine work, and they have fully justified the anticipation. If we have anything to regret, it is that greater advantage was not taken of some of the buildings,—that is, we would have had them leave the actual banks of the river for brief intervals, so as to take the spectator more closely to the colossal and mysterious ruins, now sometimes represented at a distance. We found this represented at a distance. We found this regret on the beauty and efficiency of those parts of the panorama where the monuments parts of the panorama where the monuments are represented in the foreground; as, for example, "the Sitting Statues," the rock-cut temples of "Ahou Simhel," the "Second Pyramid," and the "Sphinx;" but we do not intend it to modify our praise of the very charming and instructive painting (accompanied as it is, too, by a running commentator,) which Messrs. Warren, Bonomi, and Fahey, have praduced. have produced.

PROPOSED CHURCH, SANDFORD DISTRICT, CHELTENHAM.

SIR,—My attention has heen drawn to an article in THE BUILDER of the 14th instant, headed "Architectural Competition: Proposed Church, Sandford District, Cheltenham," and signed "Raphael Brandon," to which, as it conveys a direct insult to the committee, of which I am honorary secretary, I must trouble you with a few remarks in reply.

Mr. Brandon first refers to the amount for which the church is to be huilt, viz., 4,000l. "This," says he, "is simply an impossibility. To build a church, as a church should be built, in the severest manner, would cost at least 6,000l." Mr. B. gives no data for coming to this conclusion; it is simply his isse dixit. Has Sir.-My attention has been drawn to an

this conclusion; it is simply his ipse dixit. Has Mr. B. inquired the price of materials, &c., in our neighbourhood, or does he fix 6,000l. as his minimum for a church, without reference to

attendant circumstances?

Mr. Brandon then proceeds to question the bona fides of the committee, by suggesting that have some favourite architect in view, they &c. &c. What ground has he for the assor-tion, and whence does he draw his conclu-sions? I can only imagine that he takes him self as the standard by which to judge others. For the sake of brevity I pass over many irregular statements of Mr. Brandon, and proto where he quotes the instructions of the Cheltenhan committee, at this point:—
"In case the building shall not be commenced within twelve months after notice to the architect that his plans are approved, he shall be entitled to receive for his plans, designs, and drawings, the sum of 50%, and no more, in full discharge of all claims for such plans, &c., which are then to become the property of the committee;" which he interprets thus: "They have only to delay a twelvemonth to hecome entitled to a full set of working drawings and entitled to a full set of working drawings and specifications, together with the design itself, for the sum of 50%." Now it is possible that such an inference may be drawn upon a prejudiced perusal of the instructions, but is it likely that a respectable body of men would act in the manner implied above?

conduct of the Cheltenhain committee. have honestly stated their requirements, and thus given an opportunity to those who disapproved of the instructions to abstain from the competition. Supposing the committee had left several points open,—the architect would have omitted them in his calculations, and his design would have been cast out as not coming within the compass of the means in the hands of the committee, and all for the want of the very instructions which Mr. Brandon calls so extraordinary. It heing at the option of Mr. B. to enter into the competition, his proper course would have heen to apply to the committee, or myself, for an explanation, instead of imputing base motives and misconstruing their instructions. The several interviews I have had with architects, under these instructions, convince me that to build a good substantial church, such as required, for 4,000l. is not the impossibility stated by Mr. Brandon; and also that others have not understood the passage referring to the architect's compensation in the unfair manner in which he interprets it.—I am, &c., Cheltenham. J. REES PHILIPPS.

CAST ZINC IN DECORATION.

M. Geiss, of Berlin, has been exhibiting specimens of zinc used for architectural and decorative purposes in a mode not hitherto employed amongst us,—namely, cast. It appears that for seventeen years, zinc has thus been used in Berlin for architectural purposes, namely, for all exterior as well as interior ornamental parts of huildings, which, by casting, can he produced in the sharpest forms, and are said to be at the same time capable of resisting all influence of the weather. Columns, capitals, consoles, acroteria, cornices, dressings for doors, balconies, vases, statues, &c., can be formed of zinc.

I'he late distinguished architect, Schinkel,

thus writes on the subject:—
"The cast metal offers particular advantages from its greater strength in comparison with rolled zinc, from its being less subject to the influence of temperature, and from its capalities. hility of receiving the finest impressions casting, for which reasons it seems most adapted for all plastic works of art.

or all plastic works of art.
"We see, therefore, already, large statues, copies of antiques, in the atelier of M. Geiss, at Berlin, executed in the most elaborate style: to which statues, by a precipitate of copper, an excellent imitation of copper can be given. All ornaments of carved work and projecting members forming perforations, and crowning members, are capable of being executed of this metal in the easiest way. At the same time the more important parts of building can be made very cheap and durable. We have recently finished a large restoration of our university, in which about 1,600 feet of cornice, with modillions, have heen cast in zinc, which was fastened to an iron framework, and which, instead of 16 dollars per foot if in stone, cost in zinc only 9 dollars, including the iron framework.

"The many advantages which zinc offers for the construction of furniture, as vases, can-delabra, basins, &c. &c., which in the open air are less exposed to damage than stone, and for the clothing of rough iron supports, with the elegant forms of columns and consoles, dressings for doors, and richly ornamented architectural members, show clearly the extent of its extreme usefulness, and will render it in future indispensable for architecture, contributing at the same time more and more to the extension of architecture itself."

With reference to a remark recently made in our pages as to the effect of sea air and coal smoke on the ordinary rolled zinc, the agent of the Vieille Montagne Zinc Company has addressed a communication to us, wherein he says:—" I would refute the erroneous and generally received idea in this country, that zinc (pure zinc at least), corrodes when exposed to the sea air or spray on coasts, or in countries where coal is the predominant fuel. Wood yields such gases no less ahundantly than coal, and yet zinc is admitted to stand well in the

happen that the zinc roofs of the large sheds at Amsterdam and Rotterdam, for building men of war, have stood the test of such ex-

men of war, have stood the test of the posure for at least twenty years? Witness, too, the large shed of the great arsenal at Flushing, the large prison at Cherhourg, the barracks and railway stations at Boulogne-sur-Mer and at Havre, and other huildings in various other sea ports

It is asserted, and our manufacturers should look to this, that British zinc is less pure than

that used ahroad.

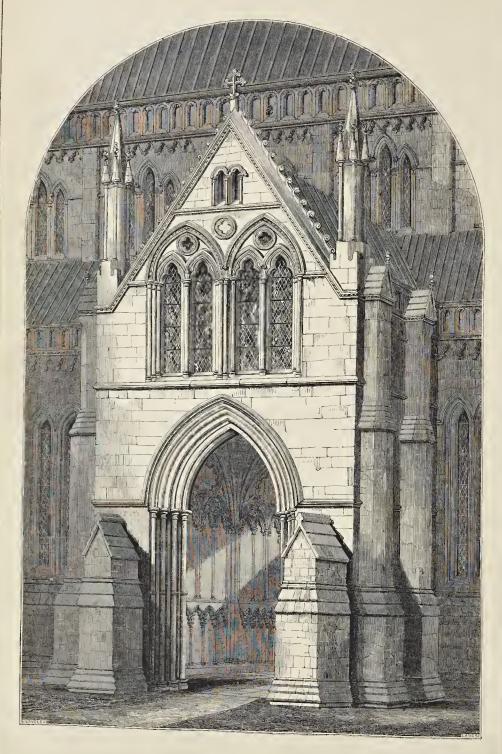

THE WORD OF THE LAW versus THE

THE WORD OF THE LAW versus THE SPIRIT.

LIVERPOOL BUILDING ACT.

A FEW days ago Mr. Robinson, building surveyor, appeared at the Police-court, in Liverpool, to substantiate an information against Mr. Wells, builder, for placing the purlins in the roof of a church now in course of erection in Sackville-street, of less dimensions than are required by the Act of Parliament. Mr. Robinson said the bearings of the purlins to the roof of the church were fourteen feet. With a slight variation they were 6 feet. purlins to the roof of the church were fourteen feet. With a slight variation they were 6 feet 6 inches apart. The Act prescribed that these purlins, if more than 6 feet apart, should he 7 inches by 9 inches. Mr. Bell, solicitor, who appeared for the defendant, wished to show that by the timber used there was a greater amount of strength than if they had strictly adhered to the provisions of the Act; and, in addition to this, that strength had been gained by the great nitch of the roof. This was not determined the provisions of the Act; and, in addition to this, that strength had been gained by the great pitch of the roof. This was not de-nied. After some conversation, Mr. Rushton, the magistrate, said it was clear to him, from the explanations given, by the aid of several models which had been brought into court, that the roof was much stronger than if made with a less pitch, and a different descrip-tion of wood, as the Act made no mention of the kind of wood to be used, but merely the dimensions, but he regretted to say the Act allowed him no discretion in the matter. The question was, how it could be altered with the least possible cost? Surveyor—By nailing a piece upon the purlin. This was considered a bad precedent by the magistrate; hut, after some demur, Mr. Rushton said that the case was one of an unusual nature, and that as his province was more particularly to see to the safety of the public, the suggestion might be taken into consideration. However, he would adjourn the case, in order that the surveyor might have time to communicate with Mr. Hay, the architect, and see what would he the hest course to adopt. The architect, who was virtually the defendant in the case, in the course of his examination, showed that a piece of timher, according to the size used, namely, 10 inches by 6 inches, by Tredgold's formula, proved, hy actual experiment, was stronger than a piece of timber cut to scantling of 9 inches by 7 inches, which contained a greater quantity of timber, but complied with the Act. The same piece of timher cut out of Baltic (of which the whole of the roof is constructed), would have required a weight of 23,357 lbs. to break it, and a purlin 9 inches by 7 inches, as required by the Act, 9 inches by 7 mones, as required by the Act, and which would have been permitted of yellow pine, would only have required 13,365 lbs. to break it. Mr. Hay further contended that the hasis of the triangles were the real bearings of the respective roofs—the roof in question being at a pitch of 55°, the other, as allowed by the Act, of 27°. That for a square of roofing of the first, it would have required 348 tone I cyt. 5 lhs. to break the timber, whereas the latter would yield to a pressure of only 20 tons

STREET CROSSINGS .- When detained with other foot passengers at the crossings of some other foot passengers at the crossings of some of our principal streets, by a long string of carriages or carts, it has often struck me as very desirable that the inconvenience, and I may add danger, of many of these crossings, might, and indeed ought to, be obviated (in situations where the width of the way would allow of its being done), by the erection across the streets, of light bridges for foot passengers, to whom much valuable time would then be I do not agree with his view respecting the advantages of a competition; but, without entering into this point, I see no ground for the opinion formed by Mr. Brandon as to the THE NORTH PORCH, SALISBURY CATHEDRAL.

THE ARCHÆOLOGICAL INSTITUTE AT SALISBURY.

THE members of the Archæological Institute THE members of the Archæological Institute have gathered together in good array around the cathedral of Salisbury, and are proceeding with the business of the congress. On the 24th, the introductory meeting was held, and various objects in or near the town were visited, of which we hope to say something in our next number. At the dinner-meeting, on Tuesday, in the council room, at least 300 ladies and centlemen sat room, at least 300 ladies and gentlemen sat down to a plenteous display of the good things of life, which the mayor and corporation had liberally provided. On the following morning several hundreds of the poorer inhabitants of the city were presented with the remains of the feast in food and liquors, and thus were com-forted and made harms.

feast in 1000 and iquors, and thus were com-forted and made happy.

At the morning meeting, the Marquis of Northampton, on taking the chair, had ad-dressed an assembly of at least two hundred, in his accustomed kind and affable manner, by saying how much he rejoiced in seeing so many congregated from various parts of the country to compliment archæology and the singular locality in which they met. His lordship intro-duced the Right Honourable Sidney Herbert as the president for the ensuing year. This accomplished and learned gentleman manifested much taste and tact in addressing the company, by pointing out and characterising the prominent objects of archæological and historic interest which belong to Old and New Sarum, to the castrametations and barrows of the plains, Stonehenge, Wilton House, &c., and dwelt particularly on the merits of some of the Wiltshire worthies, who had been born or dwelt at Salisbury or in the county. The hishops of Salisbury and Oxford followed in the same strain, in proposing certain resolutions. Two papers were next read by Mr. Matcham and the Rev. Joseph Hunter, the latter on the topographical gatherings at Stourhead and the archæological lore and re-searches of the late Sir Richard Colt Hoare. The President announced that Sir Hugh Hoare would be happy to show the antiquities of Stourhead to a select party of the institute, on Monday next. The meeting then broke up, and proceeded in parties to visit the museum opened at the King's House, in the Close. the cathedral, and other objects of archæological interest in the city.

In the evening, Professor Willis in the chair, a paper was read by Mr. Tucker, written by the Rev. E. Duke, on Stonehenge, endeavouring to show that it indicated.

ing to show that it indicated a part or member of a vast planetary orrery of the universe.

The Dean of Hereford gave some explanations and details of the operations now going on at Silbury-hill, and the contents of certain of the barrows near Amesbury. The dean found the cutting at Silbury-hill advanced found the cutting at Silbury-hill advanced about 32 yards on Wednesday week. He ad-vised the workmen to stop at about two yards vised the workmen to stop at about two yards from the centre of the hill, in order that the members might be present at its exploration. The speaker next alluded to the contents of some barrows he had opened while in the neighbourhood. An animated conversation neighbourhood. An animated conversation followed, in which Mr. Britton, Mr. Yates, and

other gentlemen, took part. On Wednesday morning, large parties visited Amesbury, Old Sarum, Stonehenge, &c.; and in the evening Mr. Markland and Mr. Britton read two papers to a large assembly at the council-house. Of these and future proceedings more anon.

Annexed we give an engraving, from a drawing made for the purpose, of the north porch of the cathedral, a very interesting expension. purpose, or the ..., a very interesting example of the Early English period. The cathedral, with the exception of the tower and spire, was commenced and finished between 1220 and 1258. Professor Willis is to illustrate it, and our readers may look to have the advantage of some of his remarks.

STRENGTH OF BEAMS.-Permit me to ask STRENGTH OF DIAMS,—FERRING HE WESTS for a demonstration of the following statement, hoping some of your readers will furnish a solution. I am not aware of any simple demonstration, and it is with the object of obtaining such that it is proposed. The question is "Clints in beauty of acual length and obtaining such that it is proposed. The question is—"That in beams of equal length and breadth the transverse strength is as the square of the depth ?"-A., Belfast.

BURIAL IN TOWNS-THE CHOLERA.

"When thy judgments are in the world the people of the earth will learn rightcourness."-PSAIM.

You are aware that the following proceeds from one who, with little public éclât and less of interested motives, has had long and ample opportunities of judging on the above subject. Within the last two months, bowever, I have first percently beautiful. first personally known illness, severe and painful, not merely of grave-diggers but also of an excellent clergyman, himself very willing for exceient ciergyman, nimsen very wining for any equitable change, contracted whilst reading the funeral service by the grave. This was in an important ground, and not one of the most generally obnoxious. If space between graves were enforced, and coffins not allowed to graze each other, nor piles of them of different dates to be exposed at fresh dig-gings, a child could see that danger would be materially lessened.

But for the moment, let me presume to suggest that chloride of lime should be placed in churches and chapels, when bodies are taken into them, -and wby not also by the side of graves?

The fact of certain burying grounds ahly assisting the cholera is now fully brought home, and perfectly useless to be denied. We are publicly told that St. Margaret's, minster, now poisons the neighbouring sewers. The ground has been obstinately kept up in defiance of representations for a long time. Would it not be a most righteous rebuke in any such aggravated case for a congregation to leave any church for a time, and go to others where there was room? I believe that most persons, except the clergy themselves, know that equitable compensation has not been in the least objected to in this case-the objection not being to the fees, but to the dreadful commodation" afforded in return; they know however, that the system cannot be endured much longer. The cholera scourge may be protracted for some time. Is it their pleasure that it should outlast that? I have tried to defend the clergy many times, from individual good opinion and some predilections, and have urged that they have not the power of remedy. But I have received one answer which cannot be answered again, but greatly imports all whom it properly concerns—"They are represented in the House of Lords!"

As to the difficulty of removing bodies far out of town, I had rather see several coffins deposited in one hearse, and horses gallopping with them, if I knew they would be decently deposited at the end, than see bearers creeping with coffins to a filthy churchyard. And in this wonderfully contriving age, cheap means might be arranged for persons to visit the graves of their relations and friends. The new regulation of 5 feet depth above coffins would be excellent if it were virgin earth, or undisturbed for fifteen or twenty years; but how different the case is in town burying places, of which many in large provincial towns seem, if possible, worse than in London, any one can

Shakspeare has been quoted (grave-digging scene in "Hamlet"), in proof of bad state of churchyards in his day. But it should be carefully observed, that he alludes to nothing but or worse than bones, not to previous premature disturbance. "Here, now, is a skull which has lain i' the earth three and twenty years," a much hetter lease than the usual ones of London churchyards.

"Lay her i' the earth,
And from her fair and unpolluted flesh
May violets spring."

A beautiful poetical idea, but requiring a different character of burial place.

One concluding observation on a different but not incongrnous subject. It was predicted four years ago, when the triumphant clearings out of the poor took place in St. Giles's, for the erection of new and smart streets, that their case would be rendered doubly bad. sent Earl of Carlisle took up the subject, to his honour, and something has been done in the erection of lodging houses, &c. Still, what the whole effect of such "clearings" has been, let any one read for himself in the report of "Church and Currier street," St. Giles's, in the Times of a few days back. And, perhaps, until the very poorest can get a decent weekly

bed for a shilling, and even a safe nocturnal cover for a penny—the ends of salubrity and humanity will not be fully answered.

EUBULUS.

NOTES IN THE PROVINCES.

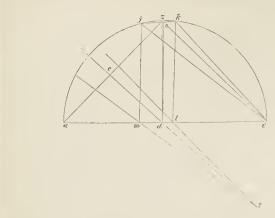

THE foundation-stone of Portland Breakwater was to be laid on 25th inst. by Prince Albert.—On Monday week the chief stone of Affort.—On Monday week the chief stone of the church of St. John, at Gailey, Wolverhampton, was laid by the Countess of Cavan. The edifice is to be built in the early English style, and of stone from the Penkridge quarries. The site and a donation were presented by Load Hatstaten. The architecture sented by Lord Hatherton. The architect is Mr. Robinson, junr.—The town council of Bridgnorth have resolved that part of the Highstreet be taken up and repaved, by Charles Green, of Shrewsbury, who agreed to do it for 33d. Der yard; having repayed that portion of the north of the Town Hall for 3d. per yard, but at that price could not get wages. While driving the holdfasts for fixing an improved lightning conductor to Sheffield parish church, according to the local Times, the apex which finishes the octagon of the spire found to have three fissures, which rendered the upper part of the spire very precarious.

The spindle of the vane was much corroded, and about 9 feet of the spire required to be taken down. The work was commenced inside the spire, and a stone being taken out. a rope was suspended, to which a cage for the workmen to be placed in was attached. An octagon iron frame with sockets to admit of supporters for the outside scaffolding was fitted to the spire, and rendered firm by screws. When the old vane was taken down scription was quite legible: on one side were the words "Mr. W. Burton, Capital Burgess, 1789," and on the other, "Mr. Saml. Younge, Capital Burgess, 1823."

The foundation-stone of the new church to be executed at Pitterseur words. erected at Pitsmoor, says the same paper, was laid on Monday week. The church is to be laid on Monday week. The church is to be built from the designs of Messrs. Flockton and Son. It is to be cruciform in plan, with nave, aisles, porch, transepts, chancel, and tower. The style is Early Decorated, the windows being filled with geometrical tracery. It will seat 266 persons in low pews, and 352 in open free seats on the ground-floor. Small galleries in the transepts and tower will accommodate 224 children, making the total number of sittings 842. The roofs are to be open and stained. The builders are—J. and A. Ridal, masons; W. Turner, carpenter; J. Copley, slater; T. S. Harrison, plasterer; Drury and Smith, numbers, &c.—The old church at Smith, plumbers, &c.—The old church at Charlecote has been pulled down, and is about to be re-erected on nearly the same site, but enlarged, at the cost of Mrs. Lucy, relict of enlarged, at the cost of Mrs. Lucy, relict of Mr. George Lucy.—Active measures are in progress for the collection of a sufficient sun, by subscription, for the proposed monument to Cromwell at St. Ives.—The St. Neot's Gas Company will again, it is said, pay a dividend of 8½ per cent. on its 'capital.' The price of gas at St. Neot's has been 8s. per 1,000 feet during the three years of the Company's existence. They must reduce their price, and thereby increase their dividend, already a good one. There are plenty of poor people at St. Neot's whose means, such as they are, will thus be made use of by the company to its own increasing profit.—The rector of Moulton, Suffolk, has commenced, at his own cost, ton, Suffolk, has commenced, at his own cost, a school, for 100 children, with master's house attached. It is in the Tudor style, with three light transomed gable windows and side lights, roof open, coping gablets, and finial of stone, ridging trefoliated crest tiles. Mr. J. F. Clark is the architect.—At Brigg, says a contemporary, the corn-exchange, new gas-works, and many new freehold private residences, and various establishments, about to make their appearance, will cause the town for some time to become a seeen of bustle and activity in the building department.— Christ Church, King-Sterndale, near Buxton, was consecrated on Thursday in last week.

THE BRITISH ARCHÆOLOGICAL ASSOCIA-Monday.

MULTIPLICATION OF THE CUBE.

In your number of the 16th June, a method and its "demonstration" are given by J. P. W., for the multiplication of a given cube on geo-metrical principles; and although you have guarded the reader, in observing that the guaracta the reader, in observing that the method is but an approximation to the truth, yet I suppose you may not consider it altogether useless in noticing the following explanation of the imperfection in the "demonstration."

The accompanying diagram is lettered pricisely as that of your correspondent J. P. W.

It will readily be seen that the mode of demonstration adopted by J. P. W. requires, to be perfect, that the line joining the points u and z should be parallel to mj, or at right angles to the base ae; but it can be shown that it is Draw the line jk, cutting the line ze in o, then, if jk be parallel to ml, will $\frac{jo}{ok} = \frac{mu}{ul}$

because hy construction the angles oej, keo, are respectively equal to the angles msu, lsu, hence the line ou is parallel to jm, and it therefore follows that u is not parallel to jm; again, if jk be not parallel to ml, then will neither zu nor on the parallel to jm, nor ever can be whilst that the points j and k do not coincide, which, indeed, will be the case when the angle fbg is equal to the angle fyb (see J. P. W's diagram), because in this case the line gb coincides with the bisecting line gi, and therefore the points jzck would also coincide. I will only add on this subject a general formula for the duplication of the only which Label 1. of the cube, which I should be glad to see put into a pure geometrical shape by any of your numerous readers. If a represent the side

of a cube then will $a + \frac{a}{\sqrt[3]{61}}$ represent the side of a cube double the size of the given one.

Another geometrical problem occurs to me, which, perhaps, is of more practical use than the former: it is the following:—

Having a drawing to make of a three-light window in the pointed-arch style, the tracery of which consists of simple curves, the leading lines being as shown in the accompanying diagram, the radius of the large arch a b, and the width of the lights being given, to find the

radius o b of the inscribed circle c b d e.

Make g r on the vertical line equal to h g, the distance from centre to centre of the mullions; join ra, cutting the vertical line np in m, then is n m equal to the radius o b as required.

Demonstration.—Put
$$o \ b = x$$

 $a \ b = a = f \ d$
 $n \ q = e$

n g = eThen, because

$$a + x)^{2} \propto a - x)^{2} = a + e)^{2} \propto a - 3 e)^{2}$$
Or $\frac{2e}{x} = \frac{a}{a - e}$. Hence $gr: mn :: ga: na$.

JOHN BURLISON.

PERMANENT DECORATION FOR ROOMS.

I would suggest an improved style of decorating the walls of sitting rooms. At present we use paper; or plain painting, occasionally, for dining rooms. Paper is liable to this serious objection, viz., that stains from any cause cannot be removed; thus after a very short occupation of a house, it must be repapered at great expense, because the paper

repapered as great experience, because whe paper is soiled in one or two places.

What we require is something more durable, which, unless ill-used, will last as long as the house itself; can he constantly cleaned, easily touched up again if necessary, and be renovated in part without an entire change being necessary

My idea is taken chiefly from the French panel papers, and partly, also, from the practice of painting the walls of rooms.

tice of painting the walls of rooms.

I would let into the walls of rooms porcelain slabs richly painted, which would give the same effect as the French panel papers; then the intervals should be filled up with plain painting, which should harmonise with the panels. Thus you have all the style of the French panel paper with a much more durable material. If more expensive in the beginning it would be far cheaper in the end.

If porcelain be too dear, glass or some kinds of wood, possibly encaustic tiles, would answer the same purpose. The great advantage of such a material would be, that it might be washed without injury, and would not imbibe grease as the papers do.

grease as the papers do.

A House Proprietor.

THE REVIVAL OF A NATIONAL ARCHITECTURE

THE adoption in architecture of one manner instead of employing various styles, as under our present system, has been proposed to re-medy the unsatisfactory state that all who think earnestly on the subject agree in considering the art to be in. It is a suggestion for which fair apology exists. Whenever architecture has possessed genuine vitality, as formerly in this country a style prograbled. has possessed genuthe vitality, as formerly in this country, a style prevailed,—one language was accepted and spoken by all. Like other speech, it refined with time,—gained strength and copiousness from use. Development was and copiousness from use. Development was induced, progression manifested,—not apparently dependent upon the extraordinary chances of individual genius, only deriving, perhaps, some sudden occasional splendour from the latter source. With us, it is needless repeating, a host of styles prevail: we have a confusion of tongues,—a corrupt jargon of nearly every dialect ever lisped or spoken upon the earth. The history of the art does not encourage us to expect again a noble, living speech, unless one of these many modes of expression were extricated, and cultivated of expression were extricated, and cultivated apart from the rest.

Nature bas imparted to every soil its own

peculiar character, and all the valuable and interesting architecture in the world resembles nature in this particular. The architecture of a country, setting aside its nationality, should be a homogeneous architecture. Such did Britain once contain and architecture was and tain once contain—an architecture vast and beautiful, congruous with the scenery of the land. Our modern structures, in most inland. Our modern structures, in most instances, equally outrage both, and appear (what, indeed, they are) debased and garbled copies, in the presence of glorious originals. A new architecture would be folly, unless it were in harmony with the old, whose monuments are our actual wealth, and stand quick amid the lifeless fossil spoil by which they are encumbered. encumbered.

encumbered.

To imagine, however, that our architects would, or could, unanimously agree immediately to appropriate and practice exclusively one general form, is absurd. Still it may not be vain to invite a section of them to combine for such a purpose, or to invite all approving minds to unite such a purpose, as far as possible, with the system at present encouraged. A society might he formed, perhaps of a local kind, in a particular district or county. It is not meant for designing churches alone, with a public edifice or mansion now and then, but to design any and every building whatsoever; for, well considered, every creation of this art has a great destination. a great destination.

The choice of a style need not embarrass us. If styles are manifold, there are but two sorts of architecture—organic and scenic, the real and the feigned. But the style becomes of less importance when it is selected as a vehicle for thought and invention,—when assumed by a hody of men, who, in the study of it, contemplate not to be pupils always, but poets presently. presently.

METROPOLITAN COMMISSION OF SEWERS

A GENERAL court was held on Thursday, the 19th. The Earl of Carlisle in the chair. The necessary deeds were ordered for the purpose of accepting a loan of 3,000L from the Royal Exchange Assurance Company, for the Fulham and Hammersmith dis-

ricts.

New rates were ordered to be prepared on the following districts, the funds being entirely exhausted:—Lower Wapping Level, at 8d. in the pound; Limehouse Level, at 18.; Tower-hill Level, at 6d.; and Hermitage Level, at 6d. The Chancery Proceedings against the Commissioners.—A letter was received from Messrs. Smith and Son, the solicitors to the commissioners, announcing the result of the proceedings before Vice-Chancellor Knight Bruce, the injunction heing granted; but an opinion was expressed that the works of the commission would be little impeded thereby.

works of the comments.

Mr. Leslie dissented altogether from the interpretation put upon the Vice-Chancellor's decision by the solicitors of the commission. The Vice-Chancellor had, in his decision, distinctly declared resistances had acted wrong, had ex-Chancellor had, in his decision, distinctly declared that the commissioners had acted wrong, had exceeded their authority, and that the case was not one that came within the 61st section. He believed the matter had been correctly stated in the daily journals; and he (Mr. L.) had the opinion of the registrar of the court that the decided view of the Vice-Chancellor was that the question did not come

within the 61st section.

The Earl of Carlisle remarked that the position The Earl of Carlisle remarked that the position of the commissioners was most perplexing. If, in cases of emergency, they ordered works, they did so at the risk of getting into the Court of Chancery, if they neglected to do so, Mr. Payne, the coroner, had recently, in a charge to a jury, told them that the commissioners could be indicated for manslaughter. In this unenviable position, if the question could be settled on terms of arbitration, be thought they should adopt that course as soon as possible.

he thought they should adopt that course as soon as possible.

Mr. Bullar said the only illegality was in removing the soil. The officers, for the purpose of filling in the ditches, had dug the soil from the hanks instead of taking dry ruhhish to the spot.

Mr. Leslie said that at first the court justified their acts under the 61st section, but being driven from that they tried the 37th and 38th sections; but on these they found the Vice-Chancellor just as much opposed to them as he was on the 61st, although they contended that it was artificial ground formed by the casting-up of the sewer, and that they might take possession of it. This was a matter of great importance, having got the decision upon it, and having got into the 'mess' entirely through not hringing the question hefore the court in the first instance. Before the court knew anything about it, the officers were sent to the land to commit what had hrought them into the Court of Chancery.

The views be entertained on this subject were embodied in a protest signed by him some time since, that complaints were not brought before the court in the first instance, and then referred to a committee for investigation. He wished to know who was to pay the expense of this Chancery suit? Certainly not the rate-payers, as the parties who had ordered these works, it turned out, had no right nau ordered these works, it turned out, had no right to give any such order. The costs, be understood, were upwards of 250*l*., which was an amount of great importance, and therefore he thought that a special court should be held to consider that question. By that time they would have the Vice-Cbancellor's order. The question now was how far the officers were safe in carrying on their works. Every order, he doubted not, would now get into the solic tor's office, and the solicitor, on the other side, was delighted at the prospect of abundant employment.

R. L. Jones believed it was now time to take a common-sense mode of conducting the business of the court, instead of its heing done by the Works Committee, who had taken upon them-selves the authority of giving answers in the name of the court. To go through the minutes of their selves the authority of giving answers in the office court. To go through the minutes of their proceedings, he must say their acts were really astonishing. Were the court to meet week by week the business might be got rid of, the officers would be more at liberty to attend to their daties, seeking out what was proper to be done, instead of, as at present, their time being engrossed in their attendance upon committees. Another important principle required to be settled—as to some general plan in their works; but now, in one case, they would order a 9-in. drain, in another one of 2 ft. 6 in., without any systematic plan whatever. They had also put any systematic plan whatever. They had also put it forth that a 6-inch pipe would carry off the entire drainage of 12,000 houses. Now, such a statement was truly ridiculous. They were wasting their time in experiments, while the wants of many districts were neglected. He instanced the present defective were neglected. He instanced the present defective sewerage of Holloway, and, although they found 20,000% in hand belonging to that district when they took office, yet that money had been appro-priated to other objects, and the inhabitants of Hol-loway remained without any relief.

The Earl of Carlisle thought it useless to enter into these general topics, as the court had confirmed the order of the committee. It had been represented to them that persons were dying on the banks of this sewer, and however sorry he might be to see that their proceedings had brought them into the Court of Chancery, yet the inhabitants of Bermondsey had publicly thanked them for the measures that had been taken in their behalf. He Court of thought directions should be given to their solicitors thought directions should be given to their solicitors to devise measures for the purpose of coming to a solution of the difficulty with Mr. Rains, and he accordingly moved—"That the Vice-Chancellor's judgment be communicated to the surveyors, and that the solicitors be ordered to communicate with Mr. Rains with a view to an equivable adjustment." Mr. Rains with a view to an equitable adjustment.

This was unanimously agreed to.

—This was unanimously agreed to.

—State of the Sewerage of Blackfriars-road.—A deputation from the Board of Guardians of St. Saviour's Union, Southwark, attended the court to represent the offensive state of Blackfriars-road, in sequence of the stench arising from the gullyholes of the sewers.

Mr. Charles Brady addressed the court, and said Mr. Charles Brady addressed the court, and said that, as a medical man, he could positively state that most severe injuries were attributable to the acts of the present commissioners. He had for twenty-five years resided in this neighbourhood, but until about eighteen months he found no odour to offend the nose in any part of tais locality; I but now the neighbourhood was so completely infected that persons in the habit of coming from Brixton, Clapham, and other places, to their places of husiness in the City, avoided the Blackfriars-road altogether, in consequence of the offensive smells in every part of it. quence of the offensive smells in every part of it. He believed the cause of this smell to arise from the fact of their having covered in an old open ditch nearly seven feet wide, for which they had substituted a pipe of twelve inches bore, and this pipe heing insufficient to discharge the contents of the heing insufficient to discharge the contents of the old ditch, the stench was forced into the adjoining

Mr. Chadwick defended the system of flushing, Mr. Chudwick defended the system of ilushing, but it should be borne in mind that there were 300,000 cesspools in the metropolis, and according to the evidence contained in the third report of the the Sanitary Commissioners, it appeared that if the contents of them were hrought together it would form one enormous cesspool of 50 feet in width, 6 feet 6 inches in depth, and would reach from the Recorders at Hammesrith to Roy, bridge a dis-Broadway, at Hammersmith, to Bow-bridge, a distance of upwards of 10 miles. They had been charged with wasting 400*l*. per week in flushing, but it appeared that the whole amount spent for this purpose was 150t. per week, every sixpence of which represented a load of filth removed.

After observations from other commissioners, it

was ordered that Mr. Grant, assistant surveyor, do accompany the deputation, survey the locality, and

specially report upon it to the court.

The Retirement of Mr. Hertslet, the Clerk.-Mr. Leslie said, however painful it might be to bim, if Mr. Hertslet persisted in his determination, he would move that his resignation be accepted. He wished to know if he had any communication to

make on the subject.

Mr. Hertslet was willing to do so, if it was the wish of the court, and accordingly read a letter, of which the following is the pith:—

"I have never hesitated to express my opinion of the impracticable character of the Metropolitan Sewers Act, especially with reference to the improvement rates, which are by no means what I contemplated in my evidence before the Sanitary Commission, and which, I venture to predict, can never be carried out as a system, even though they succeed in a few isolated cases; nay, more, I am convinced that if attempted in their present shape they will greatly retard the practical good which may and ought to be effected by improvement rates.

Lad bood that as the comprision were to less that the control of the control of

I had hoped that, as the commission was to last In an object that, as the commission was to last but for two years, the court would have addressed itself at once, after modifying the more pressing evils, to the laying down of a definite and intelligible course of action for works, with a code of bye-laws embracing the general principles which should guide the public and the officers of the court; but, without going into details which would give offence, I will briefly say this has not been done; an entirely dif-ferent course has been pursued, and I must, there-fore, respectfully decline to continue in the service of the commissioners.

Our objects are, I am convinced, the same, but the mode of obtaining our objects is as opposite as it is possible to be. It is not the amount of work that has borne me down, but the anxiety caused by the conviction that the manner in which the work is about is not the way to gain the point in view.

It has been suggested to me that biame may tach to me as order-clerk because I have not attach to me as order-certs occasion. I have brought forward rules and regulations for adoption; but allow me to ask what rules could I propose for working out a system of which the online even bas

never been communicated to me, if, indeed, it exist?
In proof that I am not alarmed by the vastness of the subject, I will add a few observations as to of the subject, I will add a few observations as to future plans; but before doing so, I must ask leave to explain a part of my letter of resignation which appears to bave heem misunderstood. It has been inferred in the public papers that I have applied for a pension, but all I have asked for is that I may not be considered to have waived my claim, should not be considered to have waived my claim, should through age or infirmity, ever require sistance. At present, and so long as I 1, through age or has assistance. At present, and so long as I nave health and strength to gain a competence, I must confess I am too proud to take, in such a way, the money of the rate-payers.

With regard to future drainage works, I believe that he a well considered plan, most valuable and that he a well considered plan, most valuable and

With regard to inture graninge works, a cens-that by a well considered plan, most valuable and at the same time most economical arrangements are easy of attainment; but the question of drainage cannot possibly much longer be allowed to stand alone, nor can the inhabitants of the metropolis be permitted to remain under the imputation of being the only people in the kingdom incompetent to manage their own affairs, or to have a voice in the details of measures for which they supply the

A Health Act must be introduced into the metropolis, but I respectfully submit that it must not be the present Public Health Act. The subjects of the following Acts are so blended that it is impossible to separate them; and the working of so arbitrary and oppressive as to demand their immediate alteration or repeal, viz .-

- I. The Metropolitan Buildings Act,
- The Metropolitan Paving Act. The Metropolitan Sewers Act.
- 4. The various and numerous Acts for paving, water, &c., &c., within a radius of 10 miles of St. Paul's.

These Acts (taken in connection with such clauses as apply, of the Public Health Act and of the Nuisances Prevention Act), if not very valuable in the way of suggestion, will at least point out many things to be avoided in the future Act.

The working of an Act to be framed so as to embrace all these objects (and until all these objects are embraced no real good will be effected) should be intrusted to men standing high in the several professions of physic, engineering, and law. By adopting the commercial principle of payment for attendances, as Directors of Companies are paid, the services of six commissioners might be obtained for those of six commissioners might be obtained for those of one on the present system. To work out the de-tails of the system to be laid down under such guidance, I would recommend that the metropolis be divided into sections, keeping in view the two elements of property and population. Each of these sections, say eight or ten, should annually elect a commissioner or commissioners; and, again adopting the principle above alluded to, the com-missioners so elected should be paid for each attend-ance, the number of attendances being limited so missioners of create account to pain for each account and an account and the number of attendances being limited so that no one commissioner should receive more than 2000, per annum. The public would thus have no one to blame but themselves if they did not obtain the services of a board in which they could most thoroughly confide, at a cost equal only to the

salary of one or two commissioners paid as at pre-

The saving that would thus be effected would be one of the least advantages, it would, however, be immense; I helieve that the fees and expenses under the Buildings Act alone (between 30,000%, and 40,000%, a-year) would meet the whole deand 40,000. a-year) would meet the whole de-mands, except, perhaps, the charges for extra su-pervision of important works, and the present charges and expenses under all similar acts for the metropolis would be entirely saved."

A special court was held on Monday last, for the Mr. Phillips, the surveyor, for the drainage of the whole metropolitan district, by means of a tunnel sewer, extending from Twickenham to Plumstead marsbes, a distance of 19½ miles.

As the scheme proposed to embrace within its operation the drainage of the city of London, the Lord Mayor and the City Commissioners of Sewers were summoned, for the first time, under the pro visions of the Act.

On the motion of the Earl of Carlisle, the Lord

On the motion of the Earl of Carlisse, the Lord Mayor was called to the chair. The first letter of Mr. Phillips, presented on the 21st of June, was read, as was Mr. Austin's obser-vations in reply to the statements therein contained, some portions of which were of a very personal nature, and the general purport of it was, that Mr. Phillips's plan was so extremely faulty that it would be difficult to believe that any one holding the office be difficult to believe that any one nothing the one of chief surveyor to the Metropolitan Commission of Sewers could have been serious in laying it of Sewers could have been serious in laying it before the court.—A letter was read from Mr. Phillips, which stated that, of the fourteen days allowed him for arranging his plan, estimates, &c., five of them had been taken up by the proceedings in the Court of Chancery.

Another letter was read from Sir II. De la Beche, pointing out that the strata through which the proposed tunnel would pass, were not entirely London clay, that faults would be found in them, and stating the difficulties that must arise if ever the tunwel be-

the difficulties that must arise if ever the tunnel h came choked.

Mr. Phillips then produced a voluminous document, in exposition of his views, with the leading features of which our readers are acquainted.*

The Lord Mayor said, he observed in the reading of this downsest that the control of th

of this document that no provision was made for the accumulation of the refuse at those seasons when sewage was not required in the country districts; and he wished to know how that was to be tricts; and he wished to know now that was to up provided for ?—Mr. Pbillips said, as the sewage was received it would undergo a process of filtra-tion, and the filtered water might then be di-charged into the Thames. The extent of the dep-t at Plumstead would be between seven and eight

The Earl of Carlisle then rose and said, that he The Earl of Carisle then rose and said, that he believed that this was a measure of immense importance, not only in respect to Mr. Austin and Mr. Phillips, but with regard to the commission itself, which, it might be considered, was put upon its trial, and that it should receive a scrupulous attaction, our to leave no doubt upon the mind of attention, so as to leave no doubt upon the mind of the public as to their impartiality. At that ment it was difficult to state the proper course, he had no doubt that any suggestions would be properly received by the intelligent body of gentlemen that he then had the honour to address. He felt, nevertheless, from the largeness of the details that they had but heard for the first time, they could come to no sudden decision upon the question at the present moment. They had, happily, some engineers of high character in the comtherefore he suggested that this plan should be referred to them for their consideration

Mr. Walter, M.P., hoped that if it was referred to civil engineers it would not be to those who were members of the commission, as one of them at least had expressed an opinion strongly against Mr. Phillips, who might not receive an impartial sideration.

Mr. Leslie thought the same opportunities should given to Mr. Austin as had been afforded to Mr Phillips for bringing forward his plan, and that both plans should be submitted to the metropolitan parishes, who would have to raise the money to pay for them, as it was quite impossible to undertake works of such magnitude unless they had the har-monious concurrence of those parties who were to find the funds.

Lord Ebrington objected to the theory that this court was tied to any one plan, as a particular plan might be good for one part of London and not for another. Whatever the views of the court might be as to the desirableness of coming to a just decision he trusted that one plan would not be pitted against another, and if they were sent out, that they would be sent out simultaneously. He thought, too, that their former surveyor, Mr. Roe, whose loss to the commission as an active reformer be much deplored, should be communicated with and consulted on this

^{*} Our notices have already extended to so great a length that we must postpone the extracts we had made from the report.

subject. At present no result could be arrived at, and they should also take care that the final tribunal to which it might be referred, should, like Casar's

suspicion.

wife, be above suspicion.

Mr. Chadwick concurred in the importance of the subject, and vindicated the independent course pursued by the Survey Committee. He was opposed to sending out their discussions to the parishes, and also to the exclusion of the engineers of the commission from the consideration of this subject. He then took a review of the plans that had been proposed by Mesars. Austin and Phillips for a portion of the metropolis. He would not go into the subject of the attacks that had been made on the commission, as he felt assured that those who made them were unaware of what had really been done. The sewer drainage consisted but of one-fourth, mission, as he felt assured that those who made them were unaware of what had really been done. The sewer drainage consisted but of one-fourth, while the cesspool and house drainage comprised three-fourths of the evaporating refuse, and the attention of the Survey Committee had been for some time devoted to this subject, and even Mr. Phillips had availed himself of their researches in the production of his present plan, when he proposed hollow brickwork instead of solid. He hoped the city commissioners would pursue their inquiry independent of this commission, for the more investigation there was, the greater would be the ultimate benefit to the public.

The Hon. F. Byng, Mr. R. L. Jones, and Mr. Bullar having spoken,
Dr. Buckland, in a long address, pointed out the great variation of the geological strata through which the tunnel would pass. It was proposed on the assumption that it would entirely go through London clay. Now he could positively affirm that the tunnel was even below it. Several parts of the line abounded with blastic class alternated with beds.

there was no London clay at Rotherhithe, but that the tunnel was even below it. Several parts of the line abounded with plastic clays, alternated with beds of permeating weeping sand and gravel, and in many districts loaded with water. He also alluded to the expensive cutting near Reading, on the Great Western Railway, from the inability, in its con-struction, to bore the plastic clay; and also at Bosley, on the South-Western Railway, where the engineer stranged to through it but was convolved. engineer attempted to tunuel it, but was compelled to give up the effort. They frequently found beds of porous sand and water below the London clay, as the case in the Kilsby tunnel on the North-stern Railway, in which work nearly half a liou of money had been wasted. Below the million of money had been wasted. Below the Thames it might be said that the strata were fre-quently but a sack of sand so loose in its nature, that n the ground being opened for a sewer on the outh side of St. Paul's, there was an immense rush of sand, and so rapidly did it run, that great fears were entertained that the fabric of St. Paul's would be undermined; and there was no security that, by tapping those beds of water on the south-east part tapping these outs of water on the south east part of London, every bouse in that district might not be undermined. The London clay glanced off at the north-east corner of St. Paul's, and he could vouch that there was not an atom of London clay between Rotherhithe and the base of Shooter's Hill.

Mr. Leslie made a few observations on the geological strata near Greenwich; and said the great mistake of the Thames Tunnel was in not taking a lower level, the top of the present tunnel being, he was informed, only 6 feet from the bed of the was informed, only b feet from the bed of the river.—Mr. Alderman Lawrence thought a portion of the drainage might be passed to Twickenham, notwibstanding the joking that had taken place on the former commissioners attempting to pass drainage up hill.

Mr. Norman appears that the life of the property of the property

the former commissioners attempting to pass drainage up hill.

Mr. Norris suggested that the subject should be thrown open to the scientific world, by which they would invite more complete and more efficient plans, which might turn out to be superior to those at present under consideration; and therefore he thought that all persons should be invited to send in plans. After some further observations, the Earl of Carlisle proposed a series of resolutions, to the effect that Mr. Phillips and Mr. Austin present stat ments of their plans, with the probable expense, in a month from this date; that at the same time any other plans that may be offered will be received, and referees appointed to report on the whole; that each plan comprehend the whole area of Mr. Phillip's scheme, and the probable amount of compensation for land; and that the Ordanace be applied to fora rough plan of the area now under survey, to be given as quickly as possible.

COLLEGE OF CIVIL ENGINEERS, PUT-COLLEGE OF CIVIL ENGINEERS, PUTNEY.—At the annual meeting of this establishment, held on the 20th inst, the Duke of Cambridge presided. It appeared from the report read by the principal, the Rev. Morgan Cowie, that the council have founded three exhibitions of 30L per annum each.

ALL SAINTS' CHURCH, KNIGHTSBRIDGE, was consecrated on Saturday morning in last week. It is situated in the new estate known

It is situated in the new estate known as Ennismore-gardens, and was built from the designs of Mr. Lewis Vulliarry, in the Italian style. We must take an opportunity to look

Miscellanea.

RAILWAY JOTTINGS .- The southern portion of the Great Northern Railway is protion or gressing rapidly;—
Tottenham, Whetstone, Ennew,
Tottenham, whetstone, Ennew,
Wims, are in active preparation.

Wims, are in active preparation.

Interpretable to the control of t rapidly;—the several tunnels at m, Whetstone, Enfield, and South e in active preparation. The whole of the brickwork is being laid in mortar made of Lias lime. A wooden bridge on this line, between Lincoln and Littleworth, named Pcakirk-bridge, took fire on Sunday week, and was entirely destroyed in an incredibly brief period of time. The loss is estimated at 2,000*l*. to. 3,000*l*.—The Sheffield and Lincolnshire Junction Railway was opened on Tuesday week from Sheffield to Gainsborough, completing the communication between Liverpool on the west and Grimsby and Hull on the east. Captain Winn has inspected the whole, bestowing particular care, it is said, on the Rother viaduct (of which 21 arches fell in November), and the iron bridges, especially the wrought-iron tubular bridge over the Trent at Gainsborough.—A great many men are at work on the large tunnel between Aber-dare and Merthyr,—Messrs. Ritson and Ed-wards, contractors. Messrs. Ritson and Co. are also actively engaged on the same line between Hirwain and Pontwalby. — Some alleged improvements on Messrs. Clarke and Varley's resilient atmospheric tube are being patented by Mr. C. H. Greenhow, patentee of the geometrical railway. The piston is to be guided internally by wheels and a rod, and a vacuum is to be obtained, on the barometrical system, by causing water to fall to its barometrical level from an air-tight vessel connected with the atmospheric tubes. The final departure of the Provisional Government by railway from Carlsruhe, says a German correspondent of the Times, was attended by a curious incident. They ordered the officers to give up the caisse of the company, and seized a large quantity of furniture and matériel belonging to the Government, which they directed to be packed into waggons and sent on, along with themselves, towards Rastadt. Just before starting, the loaded carriages were dexterously backed into a covered shed, and others exactly similar, but empty, were attached to the train. With these the Provisionals departed in all security. When the 'mistake' was discovered it was too late to rectify it, for the Prussians were in possession. sion. The coup was worthy of a Figaro

JOKING OVER THE GRAVE. - Some of our readers are curious in epitaphs, and may like to see the following vagary, which is in Mon-mouth churchyard we are told:—

WHO DIED MAY 31st, 1832. AGED 33 YEARS.

We give it not alone for the ingenuity it displays, but that we may reiterate our condemnation of such misplaced jokes.

FLOWER-PATTERN PAPER-HANGINGS. -FLOWER-PATTERN PAPER-HANGINGS.—
I would speak of the importance of a knowledge of botany to the inventors of flower
patterns; whether for muslin, for damask, or
for wall papers. It is most certain that true
taste will prefer the pattern which most nearly
taste will prefer the pattern which most nearly represents the natural flowers, with all their peculiarities of form, and in their true colours. The stems in nature may be stiff and angular; if they be so, it is vain to attempt in the pattern to give them graceful bends, and to hope, by so doing, to please the eye. To represent branches of hawthorn flowers on the twining branches of hawthorn flowers on the twining stems of a convolvulus would be monstrously absurd. And yet faults as glaring are frequently committed by ignorant draughtsmen, when they attempt the composition of floral patterns. Of course, I am not now speaking of the combinations of "fancy flowers"—blossoms that exist only in the brain of the

calico-printer or the paper-stainer-these may be as fantastical as you please. But I speak of the unnatural distortion of real flowers, resulting from ignorance of the proper proportion and number of their parts, proportion and number of their partes, Why is it that floral patterns on wall papers are out of fashion? or are driven up to the bed-rooms on the third landing, or to the back parlour of the country inn? It is not, surely, that flowers are out of fashion; or that the taste for them is less general than it was formerly. But it is that the taste of the public is not properly ministered to: it has outrun that of the manufacturer. In a rude state of education, bright colours and gracefully bended branches on the walls will please the eye that does not stop to question their propriety. But as refinement increases, truth in form will be preferred to brilliancy in colour, and the twining of branches that is not natural will be no longer thought graceful. It will be no longer regarded as a twining but a twisting—perverting nature for a false effect. This is the true reason why floral patterns in wall papers are now so much out of favour, and why, when selecting the paper for a room, one is forced (I speak from experience), after turning over books of patterns till you are weary, to take refuge in some arabesque design—some combination of graceful curves of no meaning as an escape from the frightful compositions that are called flower patterns. It is surely high time that our manufacturers should seek to correct this evil. These are not days in which any one can afford to be left a step behind the rest of the world. He that once loses his place in the foremost rank, is pushed aside and lost in the crowd that is eagerly pressing forward, and almost treading on his heels. Already French wall-papers are rapidly coming into use. They have brought down the prices of the home-manufacture consider-ably, and they will undoubtedly drive home-made papers out of the market altogether if the manufacturers do not exert themselves to produce more artistic patterns than they commonly originate at present.*

RAILWAY COMPENSATION. — At Wolver-hampton, a case was lately tried by special jury between a mine-owning company at dale, Rowley Regis, and the Stour Valley Railway Company, as to an acre of land, on which the claimants wanted 400%, for surface value, and 2,400l. for injury from severance. In course of the evidence it appeared that the owners had been previously compensated for severance of this area by a canal company, and that the cost of new shafts, &c., which the owners said they meant to have formed, had not the severance taken place, would be of itself between 4,0001. and 5,0001., a sum exceeding the value of the mine altogether, the more especially as all the thick coal had been already worked out of it by the old shafts. The defendants' counsel, therefore, appealed to the practical common sense of the jury, and "trusted that the result of their vertical would." owners said they meant to have formed, had trusted that the result of their verdict would be to read a wholesome lesson to persons who came forward with such exorbitant and fictitious claims." The jury found a verdict of 350l., as value of the land, but nothing for severance. The amount recovered was 250l. less than the

sum offered by the company. PROJECTED WORKS .- Advertisements have PROJECTED WORKS.—Advertisements have heen issued for tenders, by 18th August, for the whole or any portion of the several works required in the erection of the north wing, &c., of the Manchester Royal Infirmary; by 10th, for masons', plasterers', and other works in the restoration of St. Andrew's Church, Halstead; by a date not specified, for the erection of twelve eight-grouped houses in the erection of twelve eight-roomed houses in the vicinity of St. Giles's, Camberwell; by 21st August, for pewing, repewing, repairing, and warming the interior of Northfleet Church, Kent; hy 3rd, for the restoration and repewing of Kirk Deighton Church, near Wetherby; by a date not specified, for alterations and additions to the Court-house in Wakefield; by 2nd August, for the erection of a turnpike-honse at Orwell; by 31st July, for the erec-tion and completion of a cotton-shed at Wigan, by 7th August, for alterations and additions to premises at Leeds; by 21st, for copper nails, rivets, tacks, &c., for the navy; and by 28th, for pine timber and Dantzic oak thick stuff,

also for the navy.

^{*} From "Botany considered in Reference to the Arts of Design," by Dr. Harvey.

BEEDLE AND ROGERS'S VENTILATING BRICKS.—Under this title has been registered a brick so shaped that when two are placed end to end a circular space is left at the junction. This circular space connecting from course to course, a wall formed with them is, to a certain extent, hollow, and admits of currents of air through it, either heated or otherwise. Each brick is 9 inches square and 3 inches thick, the size of two common bricks, so that only half the usual number is required so that only had the usual minutes is equited to do a rod of brickwork, and as they pay but one duty, and are laid with very little more labour than a common brick, work may be executed at a considerable saving. A common brick is used at the angle of each course.

HER MAJESTY'S THEATRE.—The second scene in the new and successful ballet divertisement at her Majesty's Theatre, Les Plaisirs de l'Hiver, is a very charming representation of a town on the banks of a frozen river, and a bright day in the midst of winter. The houses and buildings are covered with snow, the sun rises, and the sports begin. Well done, Mr. Marshall!

No. CCCXXXIX.

SATURDAY, AUGUST 4, 1849.

EOMAGUS, Caerleon, Cestria, or Chester, as we now call it, is known by every one to be full of interest. The Roman and the "Goth" have both left

their impress in every quarter, and have concurred to render it a place of delight for the modern antiquary, and the city of all others for "The British Archæological Association" to spend a week in. The Roman altars, hypocausts, and other recovered vestigia,—the peculiar arrangement of the streets (the "Rows," as they are termed), the walls, the castle, the numerous stone crypts to be found in various parts of the city, two or three churches, and last in order, but not in importance, the Cathedral,—all claim the attention of the visiter, and gratify the inquirer.

The cathedral externally is in a miserable state of decay, the result of the use of the red sandstone,* and has little of beauty remaining : when the canopied niches, open parapets, and crocketted pinnacles, however, formerly there, were perfect, its appearance must have been exceedingly handsome. It is greatly to be desired that some arrangement for its restoration, its maintenance even, should be speedily made. Internally a considerable sum of money has been spent in repairs, and considerable improvements have been made, especially in the choir, through the exertions of the dean (Dr. Anson), and others. The bishop's throne has been restored, new seating put up, a new stone pulpit and screen erected (mentioned some time since in our pages), some windows filled with stained glass, and other works done. The pulpit has an elaborately carved stone canopy, which is not so satisfactory as the lower part. The details seem to us clumsy, and being supported wholly at the back, corbelling over therefore, the notion of wood rather than of stone is given. It was designed by Mr. Hussey, and was the gift of the present excellent mayor, Sir Edward S. Walker, who, we may here say, has entered most warmly into the views of the Archæologocal Association, and greatly aided in the singular success which has attended the meeting.

A few years ago the choir of the cathedral was vaulted with wood and plaster, made to look like stone, and something is said about pursuing the same course in the nave. We mention this simply that we may advise the authorities to do no such thing. If wood is to be used, let it be as wood, and not in the place, and in imitation of another material. The feeling of the chapter appears to be so good, that we feel certain they will receive the remark in the spirit in which it is made.

Mr. Ashpitel, assisted by Mr. C. Bailey, ably illustrated the cathedral on the second evening meeting, and we shall probably give the heads of their paper, so that we will not now make any further remarks on the building beyond mentioning the Chapter House and vestibule, of which we have engraved a view. This, unlike that of Lincoln, illustrated by us some time since, and Salisbury (of

* The earliest portions, belonging to the twelfth century, are in a comparatively sound state.

which we intend to speak on another occasion) is a parallelogram, and a very interesting specimen of Early Englisb. It is called 50 feet in length, 26 feet wide, and 55 feet high, so that it is nearly a double cube. The heads of the lights, it will be observed, take a peculiar shape, in following the line of the groining. The sides of the apartment at this moment are encumbered by ugly bookcases, but those we have omitted in the view, and hope soon to hear that they bave been removed from the building.

The streets of Chester have been much modernized within a few years; they are still, however, full of quaint old fronts, mostly overhanging and belonging in date to the end of the sixteenth and commencement of the seventeenth century. One in Watergate-street is inscribed 1539; another, dated 1652, has this motto, "God's providence is my inheritance;" put up, it is said, by the occupier after escaping the plague. Some of the houses are very elaborately carved. We give a hasty memorandum of one of simpler character.

Of the churches and some of the works at present being executed we shall have another opportunity to speak. We must now relate succinctly some of the proceedings of the meeting, intending, however, as our custom has been, to refer chiefly to those matters which more immediately interest our readers.

It has been the most successful congress yet held by the association, nearly 400 tickets having been disposed of. From the Bishop, whose courtesy and ability have made friends of all, down to the humblest shopkeeper, all have appeared anxious to aid in rendering the visit an agreeable one. What the Bishop said at the opening meeting, when introducing the president, Lord Albert Conyngham, was made true-" As I am sure there will be nothing wanting on the part of the members of the Association to make their visit instructive to themselves, so I am sure there will be nothing wanting on our part to mark our sense of the privilege that has been conferred on us, and to make your visit, my Lord, so far as we can, agreeable to yourselves, and not altogether unworthy of the distinguished honour which it implies."

The President said in the course of his address,—"Though the science of Archæology may be followed as a relaxation to the mind, it is highly important in the graver pursuits of life. No person taking part in public life can do so without some antiquarian knowledge. The explanation of the technical forms of government, the principles of public policy, the tenures of land, our British union of Teutonic custom with the Roman law, cannot be understood without some antiquarian research. That eminent and often quoted writer, Mons. de Tocqueville, thus lends his authority to the importance of antiquarian re-

search :- If we were able to go back to the elements of states, and to examine the oldest monuments of their history, I doubt not that we should discover the primary cause of the prejudices, the habits, the ruling passions, and in short of all that constitutes what is called the national character. We should then find the explanation of certain customs which now seem at variance with prevailing manners-of such laws as conflict with established principles, and of such incoherent opinions as are here and there to be met with in society; like those fragments of broken chains which we sometimes see hanging from the vaults of an edifice, and supporting nothing. This might explain the destinies of certain nations which seem borne along by unknown force, to ends of which they themselves are ignorant. We cannot investigate and illustrate the monuments and arts of our own country without studying those of the more classic regions. That the artist requires their study we have the authority of Sir Joshua Reynolds, who says- But we must not rest contented even in this general study of the moderns; we must trace back the art to its fountain head-to that source from whence they drew their principal excellences, the monuments of pure antiquity. As the inventions and thoughts of the ancients, whether conveyed to us in statues, bas-reliefs, intaglios, cameos, or coins, are to be sought after and carefully studied, the genius that hovers over these relics may be called the father of modern art.' But if the study of antiquity is requisite for the politician and the artist, how much more is it required by those who turn their minds towards that higher study which reflects upon the Almighty and his ways !"

Mr. Dillon Croker read a short paper in

answer to the question,—"What is the good of Archæology?" wherein he compared it to the telescope as the medium through which far distant things are revealed to our knowledge.

"It is the observation of Madame de Stael, that 'the erudition derived from archæology is far more animated than that we acquire from books: we seem to revive what we unveil, and the past appears to rise from the dust which concealed it. This passion for antiquity is no idle prejudice. We live in an age when self-interest seems the ruling principle of all men. What sympathy—what enthusiasm can ever be its results.' Madame de Stael, in the same its results. work, also truly says, 'Antiquity inspires in-satiable curiosity. To penetrate the past, in-terrogate the human heart through many ages, to seize on a fact, on a word, and on the man-ners or customs of a nation; in fact, to reenter the most distant time in order to conceive how the earth looked in its youth, and in what way men supported the life which civilization has since rendered so complicated—this were a continual effort of imagination, whose guesses discover secrets that study and reflec-tion cannot reveal. Thus does Madame de Stael popularlyshow how archeology affects his-tory. Without its aid history is but fable, or what is worse than fable, theory, as regards the past. Archæology establishes or contradicts the existence of nations, and whether they flourished or fell. History may record their rise and progress, but archæology must be the evidence whether history be true or false. Archæology cannot take its proper position as a science until its value is acknowledged, its treasures arranged, and its principles understood. In the process of procuring the most precious ore, much worthless matter has often to be carefully sifted and cast away hefore its sterling worth can he ascertained; so must the rubbish which encumbers the golden treasures of archaeology be gradually cleared away by scientific lahourers. In this process, however, the great difficulty is to say what is, or what is not, deserving the name of rubbish. A single character or mark upon the merest fragment of a stona or rises of all the state of a stone, or piece of clay, may be of infinite importance in forming a link wanting decidedly to connect a chain of convincing argument that link will be supplied by the study of archæology."

Mr. J. R. Planché read a paper that must have cost him much labour and research, on the "Seals of the Earls of Chester," which afford some curious illustrations of the practice of bearing arms, "No tale," said Mr. Planché truly, " has been too idle, no fable too preposterous, for the majority of the writers on this important, but mis-used subject. Had half the ingenuity and industry been exerted to discover the real origin of armorial insignia which has been wasted upon inventing stories to account for them, what service might have been rendered to history-what light thrown upon genealogy and biography! How many a document has now disappeared or utterly perished, which was accessible to Upton, Legh, Morgan, Fern, Randal Holmes, and others, who have used them but to mystify and perplex their readers! Is it too late to unravel the skein they have so wantonly tangled, to extract the valuable grains which it is but justice to admit they have preserved to us from the bushel of chaff in which they are so provokingly smothered?"

Mr. W. Beamont, in the course of an account of the remains at Edisbury, a place only seven miles from Chester, yet little known, inquired how it happens that within the precincts of Edisbury we seek in vain for any remains of the castle of the Saxon foundress, Elfleda, or for any decisive traces of the former existence of buildings?

"Walls and structures raised by the Romans in Britain, said he, many centuries before the birth of Edisbury, still remain to attest the grandeur of the builders. The Norman fortress of Halton, and the still greater remains

of Beeston, arrest the eve of the traveller at a distance, and astonish him by their grandeur on a near approach. How is it then that within this royal city, raised by the illustrious daughter of our greatest monarch, not one stone remains upon another to show what a Saxon palace might be? Is it that here the hand of the spoiler has been more unrelenting in his devastation, or that the successive waves of ruin have wrecked the last vestiges of Saxon architecture within it? 'The demolition of Edisbury cannot, I think, be ascribed to any such causes. It is more probably owing to the habits of our Saxon ancestors, and the general character of their architecture, that we are without any remains of buildings either ecclesiastical or civil within the enclosure of Edisbury. The Saxons were mean builders; neither the structure nor the materials of a Saxon house were calculated for long duration, else would our Saxon ancestors, during their long sway in England, have left us more nuas well as more perfect remains buildings they erected for civil ions purposes. The ecclesiastical merous as well of the or religions purposes. The ecclesiastical structures of undoubted Saxon origin are but few, and a writer in the Encyclopædia Metropolitana informs us there were but few castles in England at the time of the Norman conquest, and that a part of the conqueror's success is to be attributed to that circumstance. Mr. Fishbrooke has given a description and a plate of an ancient Saxon house, and of its prototype, a house of their predecessors the Britons, neither of which structures, either by their form or their materials, gave promise of a long life. It appears, says Mr. Henry, from many incidental hints in our ancient historians, that stone buildings were still very rare in the that some outlings were sin very rare in the sth and 9th centuries, and that when such buildings were erected they were objects of much admiration. Some of the buildings of Alfred were magnificent for that age, and of a new and singular construction; but they were generally more remarkable for their number and utility than their grandeur; for there is sufficient evidence that long after his time almost all the houses in England, and by far the greatest part of the monasteries and churches, were very mean buildings, constructed of wood and covered with thatch."

Of Mr. Halliwell's paper on the "Cottage Literature of the Palatine Counties," read by Mr. Pettigrew, we can only give two jokes from the curious tract of "Tom of Chester," supposed to have been printed in the latter part of the 17th century.

Thus,-an old painter, at the repairing of a church in Chester, was writing sentences of Scripture upon the walls. By chance Tom came into the church, and reading them, perceived much of false English. "Old man," said Tom, "why don't you write true English?" "Alas! Sir," quoth he, "they are poore simple people in this parish, and they will not goe to the cost of it." And again,-"A gentleman in Chester had a goodly fair house, new built, but the hroken bricks, tiles, sand, limestones, and such rubbish as is commonly the remains of such buildings, lay confusedly in heaps, and scattered here and there. The gentleman demanded of his surveyor wherefore the rubbish was not carried away. The surveyor said that he purposed to hire a hundred carts for the purpose. The gentleman replied that the charge of carts might be saved, for 'a pit might be digged in the ground and bury it.' 'Sir,' said the surveyor, 'I pray you, what shall we do with the earth which we dig out of the said pit?' 'Why, you silly fellow,' said the gentleman, 'canst thou not dig the pit deep enough, and bury altogether?'

On the second day, Mr. W. H. Black, of the Record Office, gave a very elaborate review of the public records, which lasted two hours and a half, and yet fatigued none.

On Wednesday the association, after an examination of the cathedral, went to Conway Castle, to hear a paper on it by Mr. Hicklin,

and on Thursday they were to visit Liverpool, to examine some buildings in the neighbourhood and read papers.

A very interesting temporary museum has been formed, in what was formerly the refectory adjoining Chester Cathedral, and is now known as the "King's School." There is a well-known Early English pulpit here, of which we shall give a view.

THE PERSONAL QUESTION AS TO THE TUBULAR BRIDGES.*

The tubular bridges constitute an idea now not only realised on British ground, but described and accounted for in the folios of a goodly volume, of great interest and importance. To Mr. Fairbairn the engineering and architectural profession are as certainly indebted for the latter benefit, as he conceives they are for the former, all due justice to the originater of the idea notwithstanding.

In the outset of this elahorate volume, which, besides a large mass of correspondence, and a minute detail of numerous experiments, contains upwards of twenty large plates and a multitude of minor woodcuts, the author, after alluding to the peculiar difficulties to be overcome at Conway and Menai, and the necessity for some new expedient in engineering, says—

"It was under these circumstances—having to encounter extraordinary difficulties of execution, and being compelled, by the opposition of so powerful a branch of the Government as the Admiralty Board, to abandon the ordinary resources of the engineer—that Mr. Stephenson conceived the original idea of a huge tubular bridge, to be constructed of riveted plates and supported by chains, and of such dimensions as to allow of the passage of locomotive engines and railway trains through the interior of it.

It was with reference to this expedient, after all others had been found inapplicable, that I was consulted by him, and that my opinion was requested, first as to the practicability of the scheme, and secondly as to the means necessary for carrying it out. This consultation took place early in April, 1845, and as far as could be gathered from Mr. Stephenson at the time, his idea then was, that the tube should be either of a circular or an egg-shaped sectional form. He was strongly impressed with the primary importance of the use of chains, placing his reliance in them as the principal support of the hridge; and be never for a moment entertained the idea of making the tube self-supporting. The wrought-iron tube, according to his idea, indeed, was entirely subservient to the chains, and intended to operate from its rigidity and weight as a stiffener, and to prevent, or at least to some extent counteract, the undulations due to the catenary principle of construction. In fact, for many months afterwards, and even up to the time of the experiments on the model tube in December, 1846, he insisted, as will be seen from the annexed correspondence, on the application of such chains. A perusal of this correspondence will, moreover, show that I was throughout strongly opposed to their application, even as an auxiliary. I always felt that in a combination of two bodies, the one of a perfectly rigid, and the other of a flexible nature, there was a principle of wakness; for the vibrations to which the one would he subjected, would call into operation forces whose constant action upon the rivets and fastenings of the other could not hut tend to loosen them, and thus, by a slow but sure agency, to break up the bridge.

slow but sure agency, to break up the bridge.

At the period of the consultation in April, 1845, there were no drawings illustrative of the original idea of the bridge, nor had any calculations been made as to the strength form, or proportions of the tube. I was asked whether such a design was practicable, and whether I could accomplish it; and it was ultimately arranged that the subject should be investigated experimental, 1, to determine, not only the value of Mr. Stephenson's original conception, but that of any other tubular form of hridge which might present itself in the prosecution of my researches. The matter was placed unreservedly in my hands; the entire conduct of the investigation was entrusted to me; and, as an experimenter, I was to be left free to exercise my own discretion, in the investigation of whatever forms or conditions of the structure might appear to me best calculated to secure a safe passage across the Straits. This freedom of action was obviously necessary to the success of my experiments."

^{*} An Account of the Construction of the Britannia and Conway Tabular Bridges: with a complete history of their progress, from the conception of the original lides to the conclusion of the elaborate experiments which determined the exact form and mode of construction ultimately adopted. By William Fairbairm, C.E. London: Weale; and Longman and Co., 1819.

At an entertainment, however, given when the first of the Conway tubes was completed, as our readers may be aware, Mr. Rohert Stephenson, to whom Mr. Fairbairn attributed the original idea, had himself claimed everything, in short, but 'aid.' This occurred on 17th May,

" It is now upwards of six, or ahout seven years, said he on that occasion, "since I entertained the idea of constructing bridges with wrought iron plates riveted together. I was called upon,—in a smaller case I admit, but not a very simple one,—to construct a bridge authorised by Act of Parliament, but with such limitations that it became a ment, but with such limitations that it became a matter of extreme difficulty. All the ordinary kind of bridges were discussed, and I eventually hit upon the notion, and the designs were completed, for a thin tubular bridge, although not precisely the same as the present, yet in principle precisely the same. That was effectually completed, and answers its purpose, and may he now seen on the Northern and Eastern Railway. From that time, become a to the partial of companying the Cleater. however, to the period of commencing the Chester and Holyhead Railway, the idea fell, or dropped however, to the period of commencing the Chester and Holyhead Railway, the idea fell, or dropped rather, for the time, in consequence of the expense of wrought-iron rather exceeding that of cast.

* * * * Parliamentary powers were granted for the construction of a hridge over the Britannia rock, with such conditions attached to it as rendered it all hut, if not absolutely, impracticable. It was then, to use a common expression, that I felt myself fairly 'driven into a corner.' No existing species of hridge was at all applicable under the operation of the Act of Parliament as granted; and it was after an anxious investigation of every possible description of hridge, that it occurred to me, that hy revieing the old notion of seven years ago, that by extending it, it might enable me to get over the difficulty. Approximate calculations were immediately made, and the result of those calculations were such as to satisfy me of the perfect feasibility of the work. I had satisfied myself that the thing was practicable, and I stood by it. I obtained the consent of the directors to institute a very laborious, and elaborate, and expensive series of experiments, in order, most thoroughly, to test experimentally the theory I had formed, and also to add suggestions for its full development. It was then that I called in the aid of two gentlemen, eminent, both of them, in their profession, Mr. Fairbairn and Mr. Hodgkinson. [Here formed, and also to add suggestions for us nut use-velopment. It was then that I called in the aid of two gentlemen, eminent, both of them, in their pro-fession, Mr. Fairbairn and Mr. Hodgkinson. [Here follow a few compliments, of no importance to the point at issue.] But having mentioned these two names, there is another gentleman that I wish to call to your notice—I allude to my assistant, Mr. Edmund Clarke. He has heen my closit compa-nion from the commencement of the preliminary Edmud Clarke. He has been my clos't companion from the commencement of the preliminary investigation; no variation or inconsistency in the experiments eluded his keen perception; he was always on the look out for contingences that might affect the success—though not the principle, still the success—of the undertaking; and he and the other gentlemen whom I have just named, are the three to whom I feel deeply indebted for having hrought the theory I first broached to such perfection, and I thus publicly tender them my acknowledgments."

Mr. Reinhaire programment and the property of the latest the programment of the

Mr. Fairbairn more particularly alludes to this speech in his concluding remarks. Our quotation of these, however, like that of the preceding, must be a condensed and hrief one.

"The inaccuracies, both as to facts and dates, in this statement of Mr. Stephenson," he observes, "are very numerous. It simply requires a reference to the short description of the Ware-bridge, 113, and to the drawings, to disprove the assertion, 'that it is a thin tubular bridge, although not precisely the same as the present, yet in principle precisely the same,' and it can be easily shown too, that considering the Ware-bridge as a simple girder bridge, it is exceedingly defective in design. Is there any thing new in this application of wrought-iron plate girders? As well might it he synthesis are not supported for deckes, is 'a counterpart of the proposed cellular top for the Britannia tubes.' I really cannot but regret that Mr. Stephenson, whose name will he always associated with the grandest bridge that has ever heen constructed, should have committed binself in making such an erroneous assortion, as that it was hy reviving and extending his original conception of this imperfect structure at Ware, that he was led to originate the bridges consign the Conway and Menai Straits. **

should have committed binself in making such an extending his original conception of this imperfect structure at Ware, that he was led to originate the hridges crossing the Conway and Menal Straits. * *

Let the reader turn again to the earlier letters of the correspondence, and he will find of what a crude and dangerous scheme that iden consisted; how totally dissimilar, in form and principle, it was to the present tuhular structures, and how slowly Mr. Stephenson was persuaded to give up his earliest conceptions. Again, it was I, and not Mr. Stephenson, that solicited Mr. Hodgkinson's co-operation, and this was not done until I had been actively engaged for several months in my experimental researches, and after I had discovered the principle of

strength which was offered in the cellular top, and not only proved the impracticability of Mr. Stephenson's original conception, but had given the outline of that form of tube which was ultimately carried into execution.

into execution.

Mr. Bateman, C.E., showed the unjustifiable position which had been taken by Mr. Stephenson, and asserted, that in an engineering work of such novelty and magnitude, Mr. Stephenson would not have injured his own reputation, by acknowledging, in suitable and truthful terms, the merits due to those who had rendered him the most valuable service. Mr. Stephenson replied to his letter, and the tenor of his remarks showed his determination to stand by his public assertion. He quoted, from my telier of the 27th of October, 1846, my testimony to his claim of originality in having the application of a wrought-iron tube for the purposes of railway traffic; a great merit which neither Mr. Bateman or myself had ever denied to him, and which I have uniformly asserted that he is undouhtedly entitled to. But he left entirely untouched the point at issue, viz., that it was almost exclusively my exertions which gave to his conception a useful and practicable form—that the experiments which I had conducted and originated, showed the weakness of the circular tube, which he had originally recommended—that I alone showed him the danger of the principle which he was anxious, for so great a length of time, to carry out, hy attaching a flexible cateuary to a perfectly rigid platform or roadway,—that from the results of these experiments, I designed and submitted for his approval an entirely novel kind of tubular bridge, different in form, different in principle, vastly superior in economy of material and strength, and which as finally approved and carried out, and which as finally approved and carried out, and which is now in existence, spanning the rapid estuary at Comway, and admirably fulfilling the varied requirements of rail-way traffic with perfect security."

In support of his allegations, Mr. Fairbairn adduces an abundant mass of correspondence and experiments, showing the gradual progression through which the series of trials naturally advanced from the first crude idea towards maturity. From this evidence it first of all appears that the idea-the original idea which he was called upon to test by experiment, or which at least was so tested, at Mr. Stephenson's instance,-was nothing cellular at all,nay, not even modified as yet into any sort of scheme for strengthening either top or bottom, hut simply a cylindrical tube made of riveted iron plates; and tubes such as these altogether failed to support anything like a safe or sufficient weight, uniformly yielding, primarily above to compression in wrinkles, cross corrugations, or puckers, but also readily to tension below, in disjointings and rents. These results were next followed by obvious appliances for the strengthening, and even the local patching, of those parts, above at least, which so readily gave way. In the midst of these we find Mr. Fairhairn's first suggestion of a form of tube not cylindrical and self-supporting, but in-tended, as he says, to meet Mr. Stephenson's views, though, as he thought, superior to one supported by chains, the necessity for which latter appears to have urged even after he had been convinced by Mr. Fairbairn that the tuhe would be entirely self-supporting, as he still did not think it could be put up without the aid of that costly adjunct.*

The suggestion just referred to was made in a letter to Mr. Stephenson, dated 31st May, 1845, and enclosing a sketch of such a tuhe, strengthened above, but without the most distant idea or semblance of cells, as yet, even on Mr. Fairbairu's part. On the 3rd June following, a very ingenious suggestion is made by the latter for the erection of such a tube without even the temporary aid of the objectionable chains, by working simultaneously from each pier in opposite directions, so as to maintain a sort of equilibrium till the centres met. These and subsequent communications are followed up by a note from Mr. Stephenson, of date 21st July (1845), in which he says, with reference to the tubes, "I hope some of them, of an elliptical form, and with thick plates at the top and bottom, will be tried." Still nothing of the principle—the cellular—on the part of either. It is fair, indeed, to conclude, from Mr. Stephenson's own words, that as yet that principle had never even been dreamed of either by one or other of them.

"The difficulties," here remarks Mr. Fairbairn, "experienced in retaining the cylindrical tubes in shape, when submitted to severe

strains, naturally suggested the rectangular form. Many new models of this kind were prepared and experimented on before the end of July, and others, with different thicknesses of top and hottom plates, or flanches, before 6th August." Of that date a letter, containing the following passage, was written by Mr. Fairbairn to Mr. Stephenson:—

"In almost every instance we have found the resistance opposed to compression the weakest; the upper side generally giving way from the severity of the strain in that direction. These facts are important so far as they have given rise to a new series of experiments, calculated to stiffen or render more rigid the upper part of the tuhe, as well as to equalise the strain, which in our present construction is evidently too great for the resisting forces of compression."

And now comes the germ of the cellular principle. "It occurred to me," says Mr. Fairbairn, "that the top might be strengthened by other means than by thickening it, and I addressed the following letter to my son, four days after the date of the last." In this he directs him to have prepared a rectangular tube with a hollow triangular 'fin' or corrugation (or cell, in fact) of sheet-iron, running along the top, to which it was to be riveted. The idea of a single long corrugation, to counteract the cross corrugation of the puckerings of compression, forthwith led him to that of two such corrugations doubled and reversed, so as to appear in section like a pair of spectacles; the superior strength of which, Mr. Fairbairn remarks, induced him "to adopt that cellular structure of the top of the tube which ultimately merged in a single row of rectangular cells—that structure which gives to the bridges now standing across the Conway straits their principal element of strength."

principal element of strength."

The next letter is one from Mr. Eaton Hodgkinson to Mr. Fairbairn, of date 18th of same month, written from the "British Iron Works, Ahersychan, near Ponty-pool," intimating that he was now at liberty to offer his services as desired by Mr. Fairbairn, who now found that "the experiments had assumed a shape which seemed to require the assistance of a mathematician, who should deduce, if that were possible, a formula which, from the obscrved strength of a tube of a lesser, might enable me to calculate the strength of one of a greater size." Mr. Hodgkinson accordingly first appears on the field of operations at Millwall on 19th September, the day when "the tubes which had been constructed with single hollow or cellular tops were experimented on."

hollow or cellular tops were experimented on."
While intimating the result to Mr. Stephenson, in a letter dated 20th September, Mr. Fairbairm says,—"You will be aware, on referring to my last letter, that the great difficulty we had to encounter was a due proportion of the parts, so as to neutralize or render the two resisting forces of compression and extension equal;" and, after reviewing the whole series of previous experiments, and pointing out the defects in cylindrical and elliptical tubes, even though protected by single 'fins' or corrugations, he goes on to say—

"It is more than probable that the bridge, in its full size, may take something of the following sectional shape. The parts, a, a, being two longitudinal plates, divided by vertical plates so as to form squares, calculated to resist the crushing strain in the first instance, and the lower parts, b, b, also longitudinal plates, well-connected with rivetted joints, and of considerable thickness to resist the tensible strain in the second."

In short, by a natural process somewhat the reverse of that whereby, according to the French anatomists, a 'cell' becomes a 'fin' as well as any other organ, Mr. Fairbaim's 'fin' had now, and only now it appears, assumed that very 'cellular' and rectangular form which he afterwards realized at the Conway Strait.

"It is from this period," he remarks, in allusion to these and other experiments immediately following on these, "that I date the disappearance of almost every difficulty respecting the construction and ultimate formation of the Britannia and Conway tubes."

When these experiments—but a faint glimpse of the numerous series of which only we have here had space to offer—were sufficiently matured, the importance of Mr. Fairbairn's position appears to have been such as to induce the directors of the Chester and

^{*} Mr. Fairbairn estimated the expense of such a chain at about 200,000t. !

Holyhead line, on 13th May, 1846, formally to appoint him joint engineer with Mr. Stephenson for the bridges, and, as to these, on principles of perfect equality with him. The working plans even went forth with Mr. Fairbairn's many alone attached to the characteristics. name alone attached to them; he was authorised to engage the workmen, and he was fully recognised as the acting engineer: indeed, Mr. Stephenson bimself, on one occasion, says, "I consider you as acting with me in every department of the proceedings."

acpuriment of the proceedings.

So much, then, for the assistance which Mr.

Fairbairn afforded in the realization of Mr.

Stephenson's theory and principle. The original idea, as already said, Mr. Fairbairn freely accords to him.*

SALISBURY CATHEDRAL AND ITS SCULPTURES.

THE ARCH. EOLOGICAL INSTITUTE.

In our last number we gave a brief notice of the Archæological Institute's proceedings at Salisbury, wherein we purposely omitted mention of the gloom that was unfortunately thrown over them by the prevalence of cholera in the town, which led the Bishop to decline receiving the Institute, and made the entertainment given by the corporation a silent

Of some of the places visited we may speak hereafter. On the present occasion we must confine ourselves chiefly to the papers on the

cathedral and its sculptures,†

At the opening meeting the Hon. Sidney
Herbert, the president, made an excellent
address. In the course of it, when speaking
of Wiltshire, he said,—In this county, at
Malmesbury, lived Hobbes, the philosopher;

4. Salisbury, lived Harris, the author of at Salishury lived Harris, the author of "Hermes;" in this county resided the late Lord Arundel of Wardour, and near him his acquaintance the late Sir Richard Colt Hoare, who has done so much for the topography of the county. Lord Clarendon took his title from a town in this county; and not far from Old Sarum stands or stood an old manorhouse in which Chatham lived when a youth.

Old Sarum stands or stood an old manor-house in which Chatham lived when a youth. From that house went forth a young man as a * It appears, however, that Mr. Stephenson, even as the originater of the idea of a weught item rat way tunnel, is not to be left in quiet possession of his hort always tunnel, is not to the first of the idea of a weught item rat way tunnel, is not to the left in quiet possession of his hort can be controlled in the control of the idea of a weight here in the controlled From that house went forth a young man as a

† Reported at greater length in the Sulisbury and Willshire
Herald, and also in the Journal

cornet of dragoons, whose voice afterwards thundered through Europe—that man was Lord Chatham. It was impossible to look at that humble village without feeling some emotions in contemplating the spot whence that great man had gone forth, and whose gigantic intellectual proportions are shrouded only by the figure of his still more illustrious son. But Wiltshire had given birth also to poets. He had already spoken of Massinger as having seen the light at Wilton. At Bemerton lived the good George Herbert. And here he would remark what an interesting scene must be that have been between his way Level when that have been between him and Laud, when he tried to remove his scruples respecting the cure of souls. No man (said the speaker) was prepared to grapple with the future who had not studied and investigated the past. They had a right to claim in this district examples of wisdom, learning, ability, and poetry: and there was no walk of life in which inspiration could not be drawn from the contemplation of the worth and merits of departed genius.

The Bishop of Oxford who followed, said, was true that there was an aspect in which antiquarian pursuits may be viewed, as a collection only of the dust as it were of the past, as if virtue and goodness had had no existence. With such a spirit he felt sure that the memhers had no sympathy. This was the abuse, and not the use of antiquarian pursuits. He knew that there were pursuits connected with anti-quarian investigation which may not be abused, and which lifted up the mind and heart to the reverence of the only living and true God. The past may be studied, as if it was better than the present; and we may do nothing but lament the past; but the wise man will learn lessons from it to guide him in the future, and will thank God for the rich inheritance which has been handed down to him from his forefathers; while at the same time he will not overvalue the present, hut will find in more senses than one, when he looks back into the history of past ages, that there were indeed "giants in those days." One of the chief merits of a cultivated mind and taste was that of of a cultivated mind and taste was that or drawing the materials of present enjoyment out of the past and future. This is not mere fancy; not mere imagination. It was taking a practical view of the question; for it was wholly impossible for a man to understand even things around him without investi-cating those times that had gone before him gating those times that had gone before him without viewing the past in the present. And in the course of such investigations he will stay the hand of sweeping innovation, masmuch as he will see a use and a meaning which he could not otherwise have discovered, and he will observe how necessary many things that he could not before understand are to the constitution and fabric of society.

The illustration of

THE CATHEDRAL

THE CATHEDRAL

was, as usual, entrusted to Professor Willis. He said, that in the other cathedrals which he had explained he had been enabled to trace how each building had grown up by degrees—as at York, Lincoln, Winchester, and Ely—but at Salisbury no cathedral existed previously to the present. This cathedral was erected during the early English period in its best character, containing all traces of the purest style of that era. It was on this account that it was valuable to the student, as affording an independent and unfettered example of the it was valuable to the student, as affording an independent and unfettered example of the style without mixture. He had never seen such perfect unity of design, even to the mouldings, as was exhibited in this cathedral. The original design was so well preserved that it was almost next to impossible to find out what part was erected first. The tower and suite, and all above the roofs contain the what part was crected first. The tower and spire, and all above the roofs, contain the style in a higher state of development, being creeted at a later period than the body of the church, while the cloisters also are later. He would refer to the history of the building. The first Bishop of Sarum—the see being removed from Wilton to Old Sarum—was Herman, who was succeeded by Osmond, who built his cathedral in 1093, in the midst of the fortress. This situation was a great incorre fortress. This situation was a great inconvenience to the bishop; and there was also a great want of water for the inhabitants of the city, so that in fact as much money was paid for water as for wine. All these circumstances are set forth in the Bull of Pope Honorius the Third, which was granted March 20, 1218,

by which permission was given to remove the see. In 1219 it was agreed to remove from Old Sarum, and a wooden chapel was erected for the performance of the service, instead of remaining in the old church. In 1220 the foundations of the cathedral were laid, and in 1225 the services of the church were performed within it. And there was one curious peculiarity in this ceremony, not seen elsewhere, viz., the great number of stones which were laid, one for the Pope, one for the Archbishop, one for the Bishop himself, one for Longespee, and nother for his wife, and are things of the second services of the second services. and another for his wife; and some time after-wards others laid stones also. He never re-collected a parallel case in the history of the contected a parameter case in the instory of one foundation of any church. From 1233 to 1246 Bishop Bingham earried on the works with great activity, and completed them—including the body of the structure and the west front, without the tower and spire, which were afterwards added. In 1258 the cathedral was dedicated—during the episcopate of Bishop Bridport. The cloister and chapter-house were erected during the latter part of the thirteenth century; and by examining the monument of Bishop Bridport, who was buried in 1262; it will have exact the state of the control of the state of the control of the state of the control of the state of th in 1262, it will be seen that it is of the same date in point of architectural characteristics as the style of the cloisters and chapter house. It appears that the tower and spire were not contemplated by the original architect, and no provisions had been made for their erection; neither is there any distinct historical record of the time of their construction. But in the chapter re-cords exists a contract by that body with an architect named Richard Farleigh, that he should carry on the work. Thus the name of the architect who erected the tower and spire been as an architect, his skill was but small as an engineer, as he ran the risk of crushing an engineer, as he ran the risk of crushing down the structure, by the erection of so mighty a tower,—the piers and arches of which never were intended to carry a stone spire. No sooner was the erection of the tower and spire completed than the chapter were in great dismay, and endeavoured to get funds for strengthening the building. In the year 1415 arrangements were made for continuing the repairs of the fabric; for an indenture was made in that year between the chapter and Nicholas Wayte, mason, who constructed the Nicholas Wayte, mason, who constructed the braces, buttresses, and arches, which prevented the tower and spire from falling. This was the last great event of any kind, until the building of the Hungerford and Beauchamp Chapels, which have been removed. In consequence of the havoc which had occurred to the church, we find that after the Restoration Sir Christo-pher Wren was called on to examine the building, and to fit up the choir and chancel, and to this examination we owe one of the most curious reports ever penned. He mingles in his reports mistakes respecting the style of architecture, while he comments freely on the structure in a mechanical point of view. He admires it exceedingly; but is, however, full of prejudice against what he considers to be the corrupted style of the edifice. The next event was the alteration of the church, under Bishops Hume and Barrington, when the building suffered from an experiment of Wyatt,—it being left to his own judgment as to the manner in which the repairs should be carried out. He did not look at this building with reference to the system upon which it was erected; for it must be borne in mind that this and similar ones must be viewed not so much as mere works of art, but as monumental remains of a peculiar state of architectural science. (Hear, hear.) Neither Wyatt nor his employers acted upon this view of the sub-ject. The changes which Wyatt made in the eathedral were totally irrespective of the uses to which the various portions of the church had been applied. Thus the church was full of screens, arranged and adapted according to the ceremonies of the ancient ritual. It also contained monuments of the pious founders of the church and other eminent persons, and the site on which they stood was in every way connected with the life and purpose of the persons who were buried beneath them. These memorials of primitive times Wyatt removed—no feeling of historical association having entered his head—and he placed them in a row under the pillars of the navel. He also pulled down the Hyacorford-up. pulled down the Hungerford and Beauchamp Chapels, which were erected in the Perpendicular styles, because they offended his notions. The professor then proceeded to observe that he had discovered some curious and very pecuhe had discovered some curious and very peculiar features in this cathedral. He had walked round the foundations two or three times before he noticed the peculiarity to which he would refer. The Chilmark stone, which is exceedrefer. The Chilmark stone, which is exceed-ingly beautiful, is laid on concrete; the masonry is of exquisite symmetry, and in fact, this church was the only mediæval structure with which he was acquainted, where the masonry was employed as a mode of decoration, by the uniform manner in which the courses of stone are laid. In our ecclesiastical structures the stones are laid as they come to hand; but in Salisbury Cathedral there is a regularity of design running round the ma-sonry of the edifice. The courses of stone are sonry of the edifice. The courses of stone are not the same in thickness, but they follow a certain law. First, there is a band of large stones—then, a course somewhat narrower; and so followed on the courses, in strict symmetry and arrangement. The professor then stated that he considered that that portion of the church eastward of the nave was the first part which was completed. It must be recollected that the church was nearly forty years in erection, and that during that time the appeared to have lagged; there was evidently a pause between the nave and the east end a pause between the nave and the east offul and transepts. He considered that the nave was crected at the latter end of the thirtcenth century. It must be recollected, that five years after the foundations of the church were laid, several altars were creeted. The whole of the Lady Chapel had been completed, and was first consecrated in the time of Longespee. another point of view the church is favourable to the study of Early English architecture in this country. In France there are several eathedrals, the foundations of which were laid about the same time. Professor Willis then exhibited drawings of Amiens and Salisbury Cathedral, the foundations of both of which were laid in the same year; and commented upon the peculiarities of each edifice, and upon the growth of the pointed arch. He then proceeded to state that ecclesiastical architecture in this country was derived from the French-Canterbury Cathedral being erected from the designs of William of Sens, a Norman; this cathedral being the type of edifices in the Norman and transition period. All the great steps in ecclesiastical architecture, from Norman to the Decorated style, were made by French architects, until we come to the Perpendicular, which was the growth of this country. This was not a mere theory; it was matter of history. Why should it be supposed that a change which took place in the style. of architecture all over Europe was invented in England?

Professor Cockerell read a paper on

THE SCULPTURES OF THE CATHEDRAL.

The professor commenced his remarks by observing that sculpture was the right hand of architecture during the middle ages; and might be regarded as an epitome of the manners, habits, and customs of the period in which it was executed. There were amongst the sculptures of this church some "sleeping beauties" which had been too much neglected; and this neglect was to be deplored, inasmuch as these works were of great historical value. It would be found that they were anterior to the period of Italian art, and were not inferior to the great works of the masters of that school. The cathedral of Salisbury was commenced in 1220, and completed about 1258; its builders were desirous of illustrating the glories of the Old and New Testament, of the apostles and martyrs; and the west front was the page on which this object was inscribed, there being upwards of 160 statues ornamenting the exterior of the cathedral, 123 of which adorned the four remaining. The two minor buttresses to the north and south contained monuments of the Count of Salisbury and Bishop Poore. On the south end of the west front was a statue of Peter holding a scroll—the drapery of this figure was very fine. On the other side was Paul, holding the pommel of a sword. Under-neath was a figure of John the Baptist, and opposite a figure of John the Evangelist, it being a common practice to represent them in juxta-position. These were the only figures on the buttresses. The west front formerly con-

tained the twelve apostles and other members of the holy family. On the north side was an elegant statue, evidently representing Stephen holding a stone in one hand, and in the other a palm branch, the symbol of martyrdom. There was an altar in this church dedicated to this saint. In a niche on the northern side is a statue of Archbishop Langton, who was one of the coadjutors of Magna Charta, and who was present at the dedication of this church. This statue is an elegant figure, and held in the right hand an episcopal staff. The lecturer then proceeded to point out the historical sculptures of the extreme north and south ends of the west front. At the south was a figure in a secular dress, which was remarkably well executed—and there could be but little doubt that this was intended to represent Longespee (Count of Sarum, and the natural son of King Henry II. by Fair Rosamond Clifford), who had laid one of the stones of the cathedral. If they compared the execution of these works with those of contemporary art, they would find them greatly superior. There was more suavity and grace in these figures than in those of the west front of Wells. Here there was a masterly display of drapery execution of which was superb. He had last year visited the cathedral of Amiens, a coutemporary structure, which contained many es-but those of Salisbury were supe He was quite sure that many persons in looking at these figures would be reminded of the works of Greek art; and if they were compared with the sculptures of the great Italian masters-Giotto, Cimabue, and whose works these sculptures were anterior they would not suffer by the comparison. But it has been asked, were these works executed in England? He would give a few reasons for their being of English workmanship. 600 statues in the west front of Wells cathedral, the works of which were going on at the same time, as also were those of Lincoln, k, Durham, and at many other English cathedrals. It was therefore perfectly ridiculous to say these sculptures were executed by foreigners, and not by English hands.

Mr. Richard Westmacott read a paper on THE MONUMENTAL SCULPTURES IN THE CATHEDRAL.

The lecturer, after pointing out the origin of monumental sculpture in this and other countries, proceeded to sketch the peculiarities of the monuments in the cathedral,—where specimens existed from the earliest period of monumental sculpture in this country, down to the time when a corrupt taste prevailed-viz. from the twelfth to the seventeenth century The first object of a monument was to denote the fact that a body was buried; the second to denote the quality; then regard was had to the individual figure, and sometimes an inscription was added, containing the name and rank of the person. Of this kind of monument there were several very interesting examples in the nave. From the 5th to the 12th centuries the church exercised a very dominant influence over monumental sculpture, and compelled a similitude of style, and consequently most of the specimens are of a devotional character. One of the most interesting monuments in this cathedral is that of William Longespee, Earl of Salisbury, the under part of which is of wood; and no one who beholds that ancient relic can fail to be struck with the simplicity and repose of the figure. The details are well carried out, and the turn of the head is well executed. Mr. Westmacott then referred to the monument of Bishop Bridport in one of the transepts, to the Audley monument, and then proceeded to refute an observation which had sometimes been made, viz., that the art of monumental sculpture had declined in this country in consequence of the Reformation. He also proceeded to show that the best works of monumental sculpture were erected in an age when religion and morals were at a low in an age not deeply imbued feeling. These works were, in standard, and with religious feeling. These works were, in fact, erected in an age inferior to our own in He believed that the piety of the people of this country was as pure and unaffected in the seventeenth century—when monumental sculpture was not so pure and chaste—as in the days when the monument of Longespee was erected. The fact was, that the piety of the age had nothing to do with the matter. He

then proceeded to point out the causes of the change which came over Christian art, ascribing it to the revival of classical literature, which changed the taste. Hence classical subjects were introduced in religious art; and imitations of the sculptures of ancient Greece, and subjects from the heathen mythology, were employed to illustrate modern art in Christian churches. This was called taste; it was, however, the absence of all taste. He then proceeded to condemn the affectation for mediaval subjects in Christian churches, and protested against copying rude efforts of art, which were very interesting, as illustrating their own age, but served only to degrade art, when imitated in our own times.

HOW A CHURCH SHOULD BE BUILT.

PROPOSED CHURCH, SANDFORD DISTRICT,
CHELTENHAM.

In the course of a replication from Mr. Brandon, for the whole of which we have not room, he says—Mr. Philipps writes that I give no data for coming to the conclusion that a church cannot be properly built to accommodate 1,000 persons for 4,000. The only possible data which I can furnish in a letter, is the assertion of my experience on the subject, and having devoted considerable attention to church building, I believe I can form a pretty just

opinion thereon.

The question, however, turns not upon how little a building can be erected for to be called a church, but upon, how a church ought to be built? My answer to that is, in the very hest and most suitable manner that the science of the architect and the nature of the materials will admit,—I do not say, as an essential, in the most ornamental, though that would be a desideratur; but surely the only buildings that we can feel assured will be required by all future generations should be, of all others, erected in the most enduring manner possible, and the sacred purpose to which they are dedicated, should be sufficient to claim for them the very best of materials and workmanship. Unless these conditions can be complied with when church accommodation is required, I should recommend the erection of a temporary building, not to save the present generation from the expense of building a proper church, but merely as a substitute for such a building till the funds could be collected for it, and as a means of obtaining such funds.

I must here also allude to an expression contained in a private letter to me on the subject, from one of the members of the Committee, which I should not make mention of hut that it probably expresses the general opinion of the committee. The writer, after referring to a church that was in the course of erection to accommodate 1,000 for 5,000l., goes on to state, that "a much smaller building than this would, with the usual number of galleries, contain 1,000." I must confess I am ignorant of what is the usual number of galleries for a church, but know that one is

one too many.

As regards the amendment which is required in the present system of competitions, it must be left, as I before observed, to the profession at large to make it, and I should be delighted to find the matter taken up by them, and to assist it in any way in my power.

Baths and Washhouses.—At Chelmsford a committee has been appointed to consider the propriety and means of establishing baths and washhouses there. A design has been provided by Mr. Chancellor, who estimates the cost at between 3,000l. and 4,000l. The following details of the proposed design are from the Chelmsford Chronicle:—The façade consists of a centre building two stories high, and two wings one story high. The ground-floor is rusticated with a Roman dorie portico, and an arcade with pilasters of a similar character continued along the wall, with circular-headed windows. An Italian tower for ventilation, with an exterior gallery, rises from the centre of the buildings, and is a prominent feature of the design.

rises from the centre of the obligances, and is a prominent feature of the design.

GUTTA PERCHA.—Ricent advices from Singapore announce that the supply of this article is still on the increase. Some imports of it had been latterly received from a new source, at a place called Coti.

CHAPTER HOUSE, CHESTER CATHEDRAL.

[See page 361, in present number.]

PORTLAND BREAKWATER.

The foundation-stone of this national work was laid by Prince Albert on Wednesday week. The stone was a block weighing 14 tons; it was suspended by an iron chain, and being let slip after a bottle containing a plan of the breakwater, specimens of the coinage, &c., had been deposited, fell to the bottom of the sea, in the midst of a drenching shower of spray and a noise like thunder.

The construction of this breakwater, as many The construction of this preakwater, as many of our readers are aware, is not a new idea. It was first proposed by Mr. John Harvey, mechanic to George III., and afterwards postmaster at Weymouth; and after whose death the subject continued in agitation partly by the efforts of Mr. Harvey's son. The attending of Companies houses a way not steadily tion of Government, however, was not steadily fixed upon the matter until 1846, when the Refuge Harbour Commission reported very strongly in its favour. But the work was not decided on, even then, until a second commission had confirmed the recommendation of the first, and pointed out the advantages which the breakwater would secure. necessary surveys were then made, and powers for the compulsory purchase of land obtained by Act of Parliament, after which Mr. Rendell, civil engineer, was authorised to prepare a design of the work. As to prepare a design of the work. As planned by Mr. Rendell, it will shelter an area of 1,822 acres from the only wind to which it is exposed. From the eastern point of the island, it will run out 1,500 feet in an easterly direction, and then going off at an angle will be earried 6,000 feet to the north-east. At the angle there will be an opening of from 400 to 500 feet for the use of steamers and small craft, but the whole work will be 7,900 feet, or one mile four furlongs in length. Of this more than 7,000 feet will be built in from 5 to $8\frac{1}{2}$ fathoms' depth at low water. Of the whole area there will be 1,544 acres having not less than 5 fathoms' average depth, and 1,072 acres with 6½ fathoms' average depth, thus acres with 6½ fathoms' average depth, thus making accommodation for the largest channel fleets and convoys known during the last continental war. From the facilities which the stone quarries on the island afford for the work, and the intended employment of conversions the stone and loadvict labour for quarrying the stone and loading the waggons, the estimated cost is only 560,000l. A railway, with three inclines, drums, wire ropes, &c., will raise or lower the waggons, and carry stones from the top of the island to the spot where they are dropped into the sea. By means of self-registering weigh-bridges, the weight of stone put into the breakwater can be exactly ascertained.

There are upwards of 500 convicts or workmen now on the spot, and it is said there will be shortly in all 800 employed, some in quarrying, others in squaring stone, others in making new roads and levelling the quarries for laying down the rails preparatory to the removal the stone to the breakwater. The establish-ment, which can only be seen by an order from the Secretary of State, is constructed chiefly of wood and iron, so that it may be taken down and removed on the completion of the hreakwater. Each man has a second separate sleeping cell, about 7 feet long by 4 feet wide and 7 feet high. These small cells are ranged four stories high, and open into four spacious halls which are so placed as to be under inspection from a central corridor, where the officers are stationed. All the necessary offices are placed in an adjoining building, where there is a large cookhouse, washhouse, and drying-slied, baths, &c. The large chapel and other buildings are still in progress. The building is now inclosed by a lofty wall at the edge of is now inclosed by a lofty wall at the edge of the quarry. On the outside are houses for the governor, chaplain, and superior officers; and extensive ranges of cottages for warders and others. There is also a large infirmary, protected from the prevailing winds by having been built in a large quarry. Instead of going to the expense of breaking up the large stones, and levelling the vard where the sick will take and levelling the yard where the sick will take exercise, the rocks have been left, and a party of convicts, under the direction of a governor, have made walks among them. There is a have made walks among them. There is a gasometer from which all the buildings are lighted, and the supply of water is pumped up from a reservoir about 350 feet below the top of the rock.

CONSTRUCTION OF GREENHOUSES, &c. WITH METROPOLITAN BUILDINGS' ACT.

As 'doubts exist in the minds of not only builders and proprietors, but the district surveyors themselves, as to the requirements of the act in respect of greenhouses and such erections, it will be useful to give the decision of the referees (Messrs, Hosking and Poynter) in a recent case.

A conservatory was in course of erection for Mr. John Meek, against the back wall of a dwelling-house in the Peckham-road, district of Camberwell, and a requisition was forwarded to the referees, setting forth that the frames and sashes of the said conservatory had been prepared in wood, and that it was proposed to fix the same on dwarf brick walls on two sides, and to inclose the conservatory on the other side by a party wall; to which materials the district surveyor objected, being of opinion "that the hearers of the roof, and the angle and door posts ought to be made of fire-proof materials." At the hearing, it was stated "that the wall which will enclose one side of materials. the said conservatory is a party fence wall, and that the bearers of the roof thereof for carrying the running sashes, will not be let into the external wall of Mr. Meek's house, which will enclose the said conservatory on another side; and the district surveyor stated that the said conservatory is intended to be 14 feet high in the highest part and is to be built as an addition to the dwelling-house with which it will communicate internally, and that it is to be heated by pipes from a boiler within the dwelling-house; and he contended that the sills and the bearers of the roof of the said conscrvatory ought to be of fire-proof materials, and that the outer quoin and the piers against the back wall of the house, and against the party fence wall, ought to be of brickwork, in order that the frames of the sashes might be set in reveals." The official referees awarded that it would not be contrary to the Act to build the conservatory in the manner and of the materials proposed, "provided that the party fence wall by which it is intended to enclose the said conservatory on one side thereof, and which by the erection of the said conservatory will be converted into a party wall, be carried up to the height required for party walls by Schedule D, Part 3. of the said Act, and be otherwise made conformable to the rules of the said Act with reference to party walls."

THE CANYNGE SOCIETY AND ST. MARY REDCLIFFE CHURCH, BRISTOL.

We have already spoken of the Canynge Society as having been established to assist in the restoration of that fine structure St. Mary Redcliffe, Bristol. On Thursday in last week the second anniversary meeting was held, when the active and able Mayor, Mr. J. Kerle Haberfield, presided, and 60 or 70 of the leading citizens assembled. From the report it appeared that nearly 500l. were raised by the society last year, and had been applied in the clerestory of the chancel, and that the amount of subscriptions for the eurrent year has increased as much as could be expected.

The chairman performed his task well. The

The charman performed ins task well. The Rev. Mr. Whish, Mr. R. P. King, Alderman Pountney, Mr. W. P. King, Mr. Garrard, the City Chambrelain, Alderman Wyld, Mr. G. F. Powell, and others addressed the meeting, but we must confine ourselves to a few memoranda which may assist the cause.

Mr. Proctor, the chairman of the Restoration Committee, made a strong and able appeal in favour of the cluurch. He said it was now some years since they first endeavoured to impress upon their fellow-citizens the necessity of attending to the noble fabric for whose restoration they were associated. The dilapidations then going on could no longer be triffed with; but now, by the kind contributions of their fellow-citizens, the committee had been enabled to grapple with the evil, and to render the fabric secure at all events, and he did feel that with the assistance of the society they would be enabled very much to hasten the complete and perfect restoration of the church. He said "complete and perfect," heeause he felt assured that it would be impossible, now that general attention was drawn to the work, but

it must be so, and it ought in common credit to themselves to be speedy: it was the finest monument they possessed of the past, it was the most magnificent specimen of architectural beauty in the city, and what was it used for? to offer up thanksgivings and ask for future blessings. For what, too, did they ask? was blessings. For what, too, did they ask? was it not for the prosperity of themselves and their land? And if they so prayed, was it creditable for them to allow the building in which they did so to fall in ruin before their faces? were necessary to say more, he would venture to add, though they were doing much toward the prosperity of their city, there was more than at first view appeared to be the case in the restoration of St. Mary Redcliffe, as re-garded its conducement to that effect. If only as a matter of example, it was of great importance. The proper restoration of St. Mary Redcliffe would offer them an example which would stimulate them in the erection and maintenance of other public huildings, for no one could see the perfect beauties of that structure without being better educated in the beautiful, without feeling the power of beauty so strongly that they would not be able to tolerate the erection of such public buildings as would be a discredit to the city. Redcliffe Church was now seen black and bedizened with dirt, and yet they asked the poor to elean their houses: ought they not to restore this building, and give a tone and example to the poor? He wished he could impress upon the poor? He wished he could impress upon them lines written in the days of yore, and make them feel their truth. The work then would be soon done :-

"If thou wouldst see famed Bristowe in full prosperitie, Take heed thou keep'st faire Redeliffe in true sinceritie,"

The architect, when his health was drunk, said he was sure they would exonerate him from any suspicion that self-interest alone led him to advocate the restoration of the church. did not look upon the restoration as matter of pounds, shillings, and pence. He believed that any architect who sat down to design or restore a church with no higher motive than 5 per cent, would not be likely to produce any effective results; and, induct to be likely to produce any effective results; and, indeed, he believed he would not be competent for the task at all. The church was most heautiful even in its ruins, although he hoped before a very long time to be able to show it as it had been. He had examined most of the noble structures in the low countries, in France and Germany, and he did not recollect one which surpassed in parts St. Mary Red-cliffe. He had a full recollection of the beautiful feathery spires of Antwerp and Strasburg Cathedrals, of the sublimity of Notre Dame, and the richness of Chartres, but still he maintained that the tower of St. Mary Redcliffe was second to none. For piquancy of fancy he knew nothing throughout Germany or France which could compete with its north porch; if they looked at it foot by foot, it dis-played the most extraordinary evidence of the cy and genius of the old architects; every corbel was different, and manifested a degree of care and attention, an imagination and a fire that could not be surpassed; it was designed by men who knew what they were about, and carried out by others with heart and soul. It gave him great pleasure to see the way in which the workmen were pursuing the work, and if they continued to go on in the way they had began, they would soon see the north porch as beautiful as ever. The necessity for the re-storation had not taken that hold of the citizens of Bristol that it should have done. of country, love of the bcautiful, love of God, too, should tend to make it an object of desire. Lord Palmerston the other night electrified the House of Commons by stating that public opinion was stronger than arms and cannons; that if publicopinion was founded on justice and truth, arms and cannon would disappear before it. Let them, then, bring public opinion to bear on the present question, let it be shown that such a building was a means of education, -and this point had been too much neglected,-let it be shown that the contemplation of a fine building has an exalting effect upon the mind, and he was sure that enough of public spirit telligence of the city of Bristol to enable them

An excellent sermon was preached by the Rev. Canon Harvey previous to the dinner; and it was announced that the Duke of Beau-fort had accepted the office of president for the ensuing year.

ARCHITECTURAL CRITICISM.

DOUBTFUL as I am whether you will allow the remarks I am about to make to appear in The Builder, I nevertheless send them. I The Bullder, I nevertheless send them. I cannot agree with you in thinking—as you appear to do—that "such men" as Sir R. Smirke, Mr. Barry, and Mr. Blore, are not to be spoken of unreservedly as regards their professional doings. On the contrary, I am of opinion that "such men" can best of all of opinion that "such men" can best of all hear to hear the voice of honest criticism. If those who have been signally favoured by opportunities, and who have been employed on works of especial mark, cannot bear to have their works fairly submitted to critical examination, who can? They are, or ought to be, fully prepared for criticism, as what they must expect; and those alone have reason to desprecaye the experies of it who are conscious must expect; and those alone have reason to deprecate the exercise of it who are conscious that their works will not endure its scrutiny.* For Sir Robert Smirke, indeed, there is this excuse—that in his time—namely, a quarter of a century ago, when he commenced operations at the British Museum—the could not have the wholesome fear of criticism before his cyes, because actions described description description description. because nothing deserving the name of archi-tectural criticism then existed. There was because nothing description then existed. There was then no vehicle for it—not a single architectural journal—hut all was then a dead calm, as far as criticism is concerned, because nearly as far as criticism is concerned, hecause nearly all were then in a dead sleep. For rousing us out of such a state of torpid indifference, we have to thank the late Mr. London, who did much to popularise architectural criticism, not merely by his Magazine—the first periodical of its kind—but also by other publications. His policy—and most excellent and liheral it is—was to promote discussion,—to allow hoth sides to be heard, and even his own particular opinions to he freely called in question by any one who thought proper to do so; he being aware that it is only by the collision of opinions that prejudices can he removed, imperfect notions corrected, and erroneous imperfect notions corrected, and erroneous ones exploded.

ones exploded.

In the paper on "Architectural Criticism," in your last number, it is very justly said,—"Good criticism is a means by which the taste of masses may be greatly improved;" and not that of the "masses" only, but of the profession also. It could be wished, however, that the writer had expressly defined what "good criticism" is, and what is to be understood by it, instead of contenting himself with doing so only negatively, hy giving us an instance of what he calls "negative criticism," which does not deserve to be called criticism at all, hut should he left to Punch, and to those who, for lack of criticism, indulge in such small-witted lack of criticism, indulge in such small-witted facetiousness as is that of comparing spires to extingnishers, tozza fountains to dumh-waiters, and window pediments to cocked-hats.† What I myself understand by "negative criticism" I myself understand by "negative criticism" is that which, whether it be unfavourable, or, as frequently happens, quite the reverse, amounts to nething more than the hare expression of opinion, without any attempt at fair and rational argument in support of it. It is not enough that, either way, the opinion itself be perfectly valid and just,—it does not become critism, where it was one its index

itself be perfectly valid and just,—it does not become criticism unless it pronounce its judgment after an impartial estimate.

The absence of thoughtful, intelligent criticism operates disadvantageously in more ways than one. One great source of the interest attending architecture is cut off; getting no more than summary verdiets as to the merits or defects of the buildings that happen to be spoken of, the public may, indeed, admire or condemn just as they are so directed, yet remain just as uninstructed as before. Another evil is, that unless criticism be freely exercised professional men feel themselves, on the one professional men feel themselves, on the one hand, secure from open reproach for their faults; and on the other, little encouraged to exert themselves to the best of their ability. He who can set at nought idle and ignorant

censure is also most likely to reject with scorn censure is also most likely to reject what sectin that sort of hackneyed praise which betrays itself to be either mere complimentary notice or indiscriminating adulation—hyperbolic in its language, perhaps, even to fulsomeness, but cold in feeling, and totally devoid of all beartiness. heartiness.

It is, moreover, owing to the lack of a sufficiency of sound architectural criticism, and the consequent ignorance that prevails generally as to architecture itself, that many who are more or less unqualified to do so, venture to put forth off-hand opinions and crude remarks as criticism, they knowing that they may do so without the slightest fear of being contradicted or gainsaid. We certainly do frequently find the most one-sided—if not actually absurd—observations made, yet sufactually absurd—observations made, yet suf-fered to pass unrehuked, consequently, to all appearance acquiesced in, which would not he the case were criticism to he properly exercised. Exempli gratia: When Mr. Fergusson calls the new building at Buckingham Palace "hideously ugly," he quite overshoots the mark, and does not bring against it those real and valid objections which he easily might have done. Had the same design been exe-cuted as a façade for a range of houses any where in Belgravia, it might then have been called handsome—certainly would have been of superior quality to any of the architectural doings in that quarter; whereas, as the principal or public façade of a royal palace, it is so totally destitute of all those qualities which should stamp one, as to be, when its purpose is considered, most unsatisfactory, undignified, commonplace, and dowdy; and surely a considerable difference there is between being dowdy and "hideously ugly."

Arti Fidelis.

THE DRAINAGE PLAN.

ALLOW me to correct Dr. Buckland's statement that "the London clay glanced off at the north-east corner of Saint Paul's," by ascer-

Section at Black Swan-alley in Saint Paul's churchyard :-

Made ground	11	
Yellow clay or loam	4	6
Sand and gravel	18	6
Blue clay cut into	-0	6

The gravel and sand was completely full of water. It had no tendency to run, for sharp sand, when water-laid, does not run. The whole of this water was pumped out by a steam-engine, and wells drained on the north side of Saint Paul's churchyard, in Saint Martin's-le-Grand, and in Newgate market, yet no building was in the least injured, simply from Duilding was in the least injured, simply from this circumstance, that sand containing water is as compact as it can possibly be, the water only fills the interstices, and its removal does not affect the solidity of the stratum. Section at 24 feet from the south end of

Princes-street, Bank :-

 0

The blue clay underlies Moorgate-street, and has been cut into 5 feet 6 inches in depth, and in King William street it has been cut into to a depth of 10 feet.

In Fenchurch street the gravel has been cut into; in Aldgate High-street the loam has been cut into, and sand reached, and it is all but an established certainty, that heneath the London loam or gravel there is blue clay.

These I know to be facts, therefore I assume that the doctor has not spoken of his own knowledge, and venture to impugn so great an

authority, merely from a desire that any project for getting rid of the foul pollution of the Taames should not be injured by unsupported assertion.

It is very doubtful if Philips's proposition can be carried out, but out of it something practicable may grow.

Mr. Bardwell has forwarded a communica-Mr. Bardwell has forwarded a communica-tion on the subject of a plan laid by him before the commissioners at their first sittings. The writer says,—It was simply three intercepting sewers, at a depth of one or more feet below the lowest existing sewer. The first embraced nearly all the sewers in the old Westminster commission, and commenced at Charing Cross, running down Whitehall, Parliament-street, Millbank, Lupas-street, Chelsea Hospital Gar-dens. Chevne-row, and emptying itself into dens, Cheyne-row, and emptying itself into reservoirs near the Kensington Canal. The second commenced at Northumberland-street, running heneath Hungerford-market, the Adelphi and Somerset House, through the Temple Gardens to Earl-street, along Thames-street and the Lower Ditch to East Smithfield, High-street, Shadwell, and along the banks of Inglastreet, Snaweri, and along the banks of the Bromley Canal to Bromley Common. The third, the Surrey division. Its sewer commenced at the Effra, ran along Vauxhall-row Princes-street, Palace New-road, York road, Stamford street, Bankside, Tooley-street, Jamaica-row, to the reservoirs near the King's-

road, Bermondsey.

From the depôts the sewage would be sent in pipes for irrigation at the proper seasons, and at other times the solids would be separated from the fluid by electric or chymical agents.

NOTES IN THE PROVINCES.

THE chief stone of Romford New Church The enter stone of Komford New Churen was laid on 26th ult. The old foundations have been used in front, but the walls are carried out at the back 10 feet further than the limits of the old site. The church is to be in the Decorated style, the walls faced with Kentish ragstone, with dressings of Bath stone, and will contain 1,110 persons. The length of the interior is 113 feet; the width length of the interior is 113 feet; the width 54 feet; the height to the roof, which is an open one, 54 feet; the tower will he 66 feet high, and the spire from the ground 140 feet. The total cost will he 5,850. Mr. Johnson is the architect, Mr. Kelk the builder, and Mr. Gibbons the clerk of the works. A view of the church has been published.—From recent reports it appears that that great hore the Northam Artesiau well, near Southampton, has now been bored to 353 feet in depth. The progress has been impeded by a stone 22 inches thick, and the supply of water had decreased through the decay of the rods.—In a recent lodgement of tenders for repair of In a recent lodgement of tenders for repair of In a recent lodgement of tenders for repair of conduits belonging to the Soutlampton Water Works Company, it was found that "Mr. Howell's tender was 821. 10s., while that of Mr. Metcher was only 39l.; the others varying from 61l. 16s. to 79l. 17s." Mr. Metcher's tender was accepted. It appeared, says a Hampshire cotemporary, that the miscellaneous repairs had amounted to about 75l. a-year.——A Bristol lady has hequeathed 4,000l. to found a school of arts in that city.—Kemerton Church, says the Bristol Journal, is again in course of restoration. The north aiste has now Church, says the Bristol Journal, is again in course of restoration. The north aisle has now heen taken down, and the whole interior of the building, with its Norman columns, exposed to view. The Norman arcade is, it is said, to be removed.—All Hallows-on-the-Walls, Exeter, has recently had stained glass inserted in the south window of the chance.

Albertage Church is to he reliable and inserted in the south window of the charter,
—Abberley Church is to be rebuilt and

^{*} Our correspondent misunderstands the remark, ppears to do so. Our objection was not to criticism,

[†] It is due to the author of the paper in question to say, that only part of it was printed in THE BUILDER.

Ulverston to the memory of Sir John Barrow.—The new church of Seghill, says a Newcastle paper, was consecrated on Saturday week. It is in the Early English style, and will accommodate 530 persons, mostly free. The cost of erection and site is about 1,700l. Mr. John Green supplied the design.— Another small church was conscerated on Tuesday week at Newton Arlosh, parish of Holme Cultram; one at Skinburness on the day following; and on Thursday one at Mow-bray, near Allonby.——A model lodging-house has been formally opened at Aberdeen, under the auspiees of the Lord Provost. Charges per night 3d. a-head.

RAILWAY JOTTINGS.

ABOUT 3,000 tons of a cutting near Warms worth church, on the South Yorkshire line, gave way on Monday week, leaving a void about 30 yards in length and 10 in breadth, extending from the top to the bottom of the cutting. The sides of the gullet are said to have been too perpendicular, but the late rains are chiefly blamed for the result. Another large portion was left in a very critical position, with a large fissure nearly 50 yards further off.—The pressing necessity for the free transit to guards along a train was instanced lately, as it so often is in one way or other, in a case where the tire of a wheel was gone and the carriage off the line. Although the luggage-van with the guard was at hand, and the guard was at length made aware of the danger to those within the carriage, he stood in the absurd position of a 'guard' without power to afford the least assistanee, while the train was running at the rate of 25 to 30 miles an hour. 'Bawling till hoarse' to the driver was of no use; and the carriage was dragged on for a number of miles, with the passengers in continued and unenviable consciousness of their imminent peril, till the train eventually stopped. Since the opening of railways, the useful article, milk, has flowed into Liverpool in such abundance that the 'genuine article' now costs only half what its anomalous representative used to be what its anomalous representative used to be sold at in stinted quantities. —On the list of applicants for situations on the Manchester, Sheffield, and Lincolnshire line, there are upwards of 800 names! —A Liverpool merchant, complaining in the Times of the 'extraordinary delay' of the Electric Telegraph Company on a recent occasion of commercial importance, says,—"It was a matter of great importance to numerous parties both in Liverpool and America that this intelligence in Liverpool and America that this intelligence should have been posted in that establishment in time for the parties interested to have included the fact in their communications by the American mail steamer sailing on that day. It is remarkable, however, that on the Satur-day, when the steamer sails at an earlier hour -the very day on which it is necessary that news should be posted early-the telegraphic intelligence is not posted till the steamer is

METROPOLITAN COMMISSION OF SEWERS.

A SPECIAL court was held on Thursday 26th. The Earl of Carlisle in the chair.

The appointment of a new Order Clerk.—The report of the general committee on the appointment of a successor to Mr. Hertslet, as order clerk, was brought up and read. It stated, that it having heen considered desirable that a person having a knowledge of the law should be selected, the committee were unanimous in only in that Mr. Weslewshee were unanimous in opinion that Mr. Woolrych, of the Inner Temple, should be recommended to the court as a fit and proper person to fill that office. I JAfter some conversation Mr. Woolrych was ap-pointed.

The Earl of Carlisle said he could not, on this

district, and stating that the fatal effects of the offensive drainage and open ditches had struck ter-ror into the minds of the people, and calling upon the commissioners to cover over the open ditches. The Earl of Carlisle remarked that they had been

told hy a deputation, a few days since, that in convering over an open ditch they had only aggravated the evil.

ome remarks having been made on the subject

Some remarks having been made on the subject of the process of flushing,

Mr. Lesile said, there appeared to be great diversity of opinion on this subject, for last year their surveyor, Mr. Roo, had ordered flushing to be suspended, and he believed that it was so suspended for upwards of three months. Even their own officers were divided in opinion on the propriety of it. Mr. Lovick was in favour of it, while Mr. Gotto was opposed to it, and in a report had set forth that this practice only aggravated the evil it was intended to cure. Mr. Leslie then deprecated the practice of coroners holding inquests on persons dying of bowel complaints, which statements were got hold of by the reporters, and great and unnecessary alarm was created amongst weak-minded persons.

unnecessary alarm was created amongst weak-minded persons.

Mr. Chadwick supported the system, but contended that the operation ought to be superintended by a competent person, as had been recommended in the second notification of the Board of Health.

Mr. Lovick and Mr. Gotto having expressed their opinions for and against flushing in particular

cases.

Dr. Southwood Smith said it appeared to be overlooked the difference that had taken place in the mode of cleansing by means of a discharge of the cesspools into the sewers, and the old mode of cleansing the matter, whether there had really heen an injury or not; but without medical testimony, to go into such investigation would be quite absurd.

The Tunnel Sewer for the Metropolis.—A question was referred by the Finance Committee as to the payments to be allowed to surveyors and others for the cost of surveys, levels, borings, &c., undertaken with reference to plans for the drainage of London.

Mr. Hawes said the reason for bringing this be.

Mr. Hawes said the reason for bringing this before the court was an impression on the mind of the Finance Committee, that at the last court when the Finance Committee, that at the last court when the subject of the tunnel sewer was under consideration, it appeared to be the opinion of the court that no expense should he incurred in the production of plans, &c., for the same. Now, certain charges on this score had been sent in to the committee, and they wished the opinion of the court as to how far they were justified in allowing the same, and paying the expenses incurred. expenses incurred.

Mr. Chadwick thought they should give a liberal interpretation of the orders of the court in the pay-ment of small incidental expenses, relying on the discretion of the officers as to the amount of them.

A member remarked, that as the Ordnance Survey Committee had already ordered borings to he made for the purposes of Mr. Austin's plan in Orchard-street, Westminster, it would be only fair to allow Mr. Phillips the same advantages. He wished to ask Mr. Austin what sum had been ex-pended in these borings?

Mr. Austin said that they amounted to ahout 701 Mr. Bullar read an extract from a letter received Aff. Bullar read an extract from a letter received from Mr. Hutton, who, he stated, was an eminent geologist, and who gave it as his opinion that the plan was impracticable; in fact, the difficulties were so great as to discourage any one but a graduan of an impraguage, and as to horing with a madman or an ignoramus, and as to horing with a view to information, it would be only so much money thrown away.

The Earl of Carlisle thought all parties should have fair play, although he was unwilling to incur

have fair play, although he was unwilling to incur any preliminary expense.

Mr. Leslie said the parties who commenced the first tunnel under the Thames in 1804, got within 150 feet of the opposite shore without laying a single brick. They proposed to brick as they went on, and if 940 feet could be done without hricks at all, he did not think the difficulties insurmountable. Geologists were fond of riding their hobby, and such being the case he would only be satisfied from borings, especially as he knew that in digging a well for Greenwich Hospital, they got into chalk at 109 feet. If they got into the chalk he apprehended there would be no difficulty in forming a tunnel through it with the assistance of their engines in pumping out the water that might make its way

The Earl of Carliele said he could not, on this occasion, forbear to convey the general sentiments of the court to their late officer, Mr. Hertslet, and their deep regret at the circumstance that had led to their separation from him.

The Cholera.—A letter was read from the Home Office, calling the attention of the commissioners to upwards of 600 complaints of nuisances and drainage made during the previous week by the inspectors of police of the various metropolitan and suburban divisions.

These reports were referred to the surveyor. A memorial was presented from the inhabitants of Dulwich, in public meeting assembled at the Haff Moon Tavern, complaining of the condition of that the subject had been hurriedly forced upon them, and that a "row" had been guipout of the doors. That paper, the Times, he said, had taken the lead in this; but now, in consequence of their engines in thoughing a tunnel tunning at the progress of the work.

Mr. Phillips stated, unless he was allowed the tunning tunnel tu

that had taken place at the last court, they began to think that there were difficulties in the way, and were anxious to back out of it. However, he trusted that in executing a work that was to last for ages, they would not be hurried on in its considera-tion, but would take their own course, independently of any newspaper whatever.

After some further discussion the following resolutions were agreed to:

"That the expense already incurred for surveys, levels, borings, &c., referred by the Finance Committee to the court, be allowed."
"That, as Mr. Phillips states that 2007, will be

necessary for all the horings, &c. requisite for his plan, the court sanctions his expending on them a sum not exceeding that amount."

Miscellanea.

MURAL PAINTINGS, PLASTERED AND WHITEWASHED.—At Winehfield Church, Hants, recently, some workmen found, beneath a thick coat of plaster, the remains of painting which at one time appeared to have entirely covered the walls. The rector pro-cured a respite, and Mr. Baigent, of Winchester, made tracings and drawings, produced at a recent meeting of the Archæological Asso-eiation. Mr. Waller described the chief subject to be that of "the rich man and Lazarus, and stated that it possessed some artistic and religious interest. This, we are told, makes the fifth instance of the preservation, by the association, of church mural paintings found in Hampshire; but the spirit of destruction at Northwood Church, Isle of Wight, was too rapid for the conservative pencil of members who resided almost within call. Some frescoes, described as of a superior kind, were laid open a week or two ago, and a churchwarden, or some person invested with a brief authority, had them effectually destroyed. A representa-tion of "the last judgment" in Shorewell Church was re-whitewashed about three years ontice was re-winewasted about three years since, while a gentleman was engaged in making a copy for the association; but the churchwardens have preserved the legend of St. Christopher, which the association has engraved.

engraved.

Bethnal Green.—A correspondent from
the Mile-end-road, who signs himself "F.
Creasy," draws attention to the state of premises in Cambridge-road, and complains of want of attention on the part of the local board and the Metropolitan Sewers Commission after repeated application. He says: "The houses have a ditch running behind them, of which recently one of the tenants has stopped the the course: the result is, that a quantity of stagnant matter from the adjoining privies, accumulates frequently to the depth of 2 feet, which cannot be carried off except by the influence of the atmosphere. I think that from what I have extent there exercises what I have stated there can be no doubt of the unhealthy and dangerous condition of the locality alluded to; if there be any such doubt, I would mention the fact of several visits from the superior board, who have always stated that it was so bad that were cholera to ensue, they should not be surprised; and since the they should not be surprised, and the house No. 15 has died, which death the medical gentleman who attended him considers to have een accelerated by the unwholesome state of

the locality.' Door-KNOB COMPOSITION. - Mr. John Harrison, Stillwater, Saratoga county, New York, has patented an improvement consisting in the compounding of the following materials, calcined, pulverized, and ground, viz.:—bone, 10 parts; black flint, 4 parts; crystal felspar, 10 parts; granite, 10 parts; Vermont white sand, 10 parts; China clay, 11 parts; chromate of potash, 1 part; litharge, 1 part; antimony, 1 part; chrome green, 1 part; oxide of iron, 3 parts; oxide of tin, 1 part; oxide of rion, 5 parts; oxide of manganesc, 4 parts. The articles are ground in water, and constitute the body and everything necessary

for the manufacture.
OMNIBUS STATISTICS.—From returns just made by the Commissioners of Inland Revenue, it appears that the total number of omnibuses nd appears that the total number of omnibuses now plying for hire in the metropolis is 3,000, paying duty, including mileage, averaging 9*l*, per month each, or 324,000*l*, per annum. The number of conductors and drivers is about 7,000, who pay annually 1,750*l*. for their licenses.

AN IRISH CALIFORNIA IN THE BOSS.— Mr. Jasper Rogers and his bog charcoal for deodorizing the metropolis, and thus effecting its sanitary reform, has been completely out-shone by a light exhibited in the House of Commons-a veritable extract of bog, if not of minutes—a vertiable extract of bog, it not a solid concentration of will-o'-wisp. The O'Gorman Mahon, in calling attention to a development of the resources of Ireland,—one, he said, of the most important discoveries that had ever heavy world. had ever been made, produced what he called a spermaceti candle made from Irish bog, though how the cetaceous sperm got into th bog it would be hard to say, but at least it appears to have been very like a whale sperm candle, and was examined with some curiosity by Lord John Russell and other hon mem-bers. This the O'Gorman said, however, was but one of a number of valuable extracts which he enumerated, from the same fertile mine,
—and he then appealed to Lord Ashley as to
the truth of what he had stated. His lordship promptly responded by assuring the House that these substances, he had every reason to believe, had been extracted from Irish bog by Mr. Owen, the chemist,—a most trustworthy gentleman and a personal friend of his own. Mr. Owen had already invested a large capital in the Irish bogs, and had been carrying on his operations for twelve months. Out of every hundred tons of peat, the cost of which was 5l., and 8l. more in labour, but take the cost at 20l., the results, on which Mr. Owen cost at 20l., the results, on which Mr. Owen staked his character, were these:—Carbonate of ammonia, 2,602 lb., value 32l. 10s.; soda, 2,118 lb., value 8l. 16s. 6d.; vinegar, 600 lb., value 7l. 10s.; candles, 600 lb., value 17l. 10s.; camphine oil, 600 lb., value 5l.; common oil, 800 lb., value 3l. 6s. 8d.; gas, 8l. in value; and ashes, 1l. 13s. 4d.; making a total of 91l. 16s. 1d. Moreover, the soil below is so saturated with ammonia as to be invaluable for agriculture. Englishmen. no less than for agriculture. Englishmen, no less than Irishmen, may well rejoice if all this be no ignis fatus. It unfortunately happens, however, that 20,000*l* were long since sunk in Dartmoor bogs, in just such extractive efforts, but they certainly have not yet sprung up and

Tructified to perennial profit.

Steam-Husbandry.—The Mark-lane Express notices an interesting machine or combi-Shaftesbury. This machine (for it seems like one perfect whole) receives the sheaves, disenes the corn, clears it of all small seeds, thrashes any ears that may escape the first operation, winnows it from the chaff, separates the liest from the imperfect corn, conveys the hest into the market sacks, deposits the tailing in another part of the barn, and passes the straw into the yard. It also accurately weighs the sacks of corn; and as the scale turns shuts off the supply; rings the call-bell, so that the man in attendance ties and removes the sack, replacing it by an empty one, to be filled and removed in the same manner. At the same moment a pair of mill-stones is engaged grinding corn, and producing meal for the consumption of the cattle; the dressing apparatus is not yet added. The corn-bruiser is also performing its part in the preparation of food for the stock. The chaff-cutting machine of food for the stock. The chaft-cutting machine is in full operation, and the bone-mill at work. The whole of this machinery is said to be of the most simple construction, and not easily thrown out of repair. It is worked by a small steam-engine, not consuming more than 1 cwt. of coal per hour, and attended by one man.

THE CULLODEN MONUMENT.—Mr. Machine is a fixed by the construction of the constructi

kenzie, of Elgin, architect, has constructed a design for this monument, for the erection of which a considerable sum has already been subscribed. The model represents a large, irregular, broken, conical mass, in imitation of natural rock, round which is a rough road, now winding through clefts, and now ascending by steps, seemingly water-worn, until it reaches a small flat on the top of the mass. In front, crowning a precipice, is a fine female figure, leaning on the rock, and mourning; with two boys, holding by her band and skirts,—the young one looking anxiously up in her sorrowful face. In front of the precipice is rudely carved the word "Culloden, 1746." At various prominent points the model presents small tablets of various forms, the greated by along a in mercury of itali. to be erected by clans, or in memory of individuals.—Edinburgh Weekly Register.

Builders' Benevolent Institution. The second annual general meeting was held at the London Tavern, on the 30th ult., Mr. Biers, the president, in the chair. The meeting was numerously attended, and was addressed by various gentlemen, who united in ex-pressing their acknowledgments to the president for his perseverance and attention to the interests of the institution. The usual to the interests of the institution. The usual annual report was read, and adopted with all the more cordiality, inasmuch as it announced that, with the aid afforded at the anniversary dinner, which we lately reported at large, and when no less than 110 new subscribers, it seems, had added to the previous prosperous progress of the institution the goodly sum of 500%, the Directors now felt themselves in the appropriate position of heing already able to unexpected position of being already able to announce that they would give the subscribers an opportunity of exercising their privilege in October next, would each be granted the maximum rate of pension fixed by the rules, namely 24l. for males and 20l. for females. Such an announcement was regarded by the meeting as an unprecedented circumstance, considering the short time since the institution was founded. Some incidental relief to workmen disabled by accident is now also to be afforded. It was stated in the report that the institution now possesses 1,000l. stock in the 3 per cent, consols, in the name of trustees for behoof of the charity. All donations re-quiring, by the rules, to be funded, the direc-tors wish to urge the increase of annual subscriptions as the main dependence of the poor objects of the charity and the chief hope of increasing their number. Earl Manvers was elected a patron, and a number of gentlemen vice-presidents. The usual votes of thanks were then accorded, and the meeting

ESTIMATING-CHELMSFORD UNION.-The careless manner in which persons connected with the building profession appear to make their estimates being so often exposed and commented on in your valuable publication without effect, it would appear that either inexperience or recklessness must be the cause of such glaring inconsistencies. The following of such garding inconsistences. The following tenders for painting the above union-house were received by the Board:—No. 1, from Islington, 60*l*.; No. 2, 50*l*.; No. 3, 35*l*.; No. 4, 35*l*.; No. 5, 32*l*. 10s.; No. 6, 32*l*.; No. 7, 24*l*. 12s.—these six were from Chelmsford. ford and its vicinity. At the previous board two architects sent tenders for superintending the above work, the one 1/. 1s.; the other 51. 53. In the early part of the year tenders were sent in for a wall containing three rods of brickwork, including a 1½ inch door and frame, also two privies with half a square of roofing and slating to the same, 112 feet superficial inch deal partition in the dormitory, painted both sides in three oils, with other minor works specified. The tenders were, No. 1, 48l.; No. 2, 46l. 10s.; No. 3, 41l. 10s.; No. 4, 41l.; No. 5, 40l.; No. 6, 35l. The last had it,—pray who was the winner?—A. B.

THE BUILDINGS ACT AMENDMENT BILL The Bill introduced into the House of Lords by the Earl of Carlisle, for the amendment of the present Buildings Act, has just been printed. It consists of 150 clauses and 12 schedules. It is brought forward (though too late as to legislation) so that any useful in-formation may be elicited upon it during the recess, with a view of resuming the Bill at a very early period in the next session. We had prepared a summary of its provisions, but some of the clauses seem on a hasty inspection so singularly different from what we looked for, that we think it better to withhold the summary until such time as we can give the Bill consideration and express our opinions upon it. What the Committee, who at the request of Lord Carlisle reported on the amendments required, will say to it, we

INDEPENDENT COLLEGE, ST. JOHN'S-WOOD-COMPETITION,-Ten architects were havies, Barry and Brown, &c. The Comparison, Davies, Barry and Brown, &c. above conege, including Messrs. Domaison, Davies, Barry and Brown, &c. The Com-mittee, assisted by John Shaw, Esq., of Christ's Hospital, have selected the design of Mr. Emmett for execution, and awarded the pre-miums to Messrs. Kendall, jun., and Pope.

PROJECTEN WORKS. - Advertisements have been issued for tenders for works at a new pauper lunatic asylum at Powick, nave been issued for tenders for works at a new pauper lunatic asylum at Powiek, Worcester; by 21st inst., for pewing, repewing, repairing and altering, warming, &c., the interior of Northfleet Church; by 14th, for new walling to enclose addition to Jewish burying-ground at Mile-end; by 6th, for reglazing the nave windows of St. Mary's Church, Brampton Ash, Northamptonshire, in quarries, with old glass and new lead; by 8th, for additions and alterations at St. George the Martyr's workhouse, Southwark; by 7th, for working and maintaining nermanent. the Martyr's workhouse, Southwark; by 7th, for working and maintaining permanent way and works of Blackwall Railway; by 1st September, for a considerable number of street cocks, fire cocks, or hydrants, and air valves, for Manchester water-works; by 6th, for paving and keeping in repair the streets, lanes, courts, &c., of St. Mary's, Rotherhithe; by 9th, for the reconstruction of the drainage and water supply, and for alterations and works, at Cuckfield Union Workhouse; and by 13th inst., for lighting with gas a portion of the district of St. John's, Notting-hill, Kensington. Notting-hill, Kensington.

[August 4, 1849.

Suspension Builde at Chester—A Novelty.—Messrs. M'Kean, Perkes, and Co., of Liverpool, have designed and constructed a light Chinese-looking bridge for Earl Howe, near the Grosvenor-bridge, across Earl Howe, near the Grosvenor-bridge, across the Dee, and spanning a ravine on a slight slope by 12 iron chain rods in links of 15 feet each, with a light-looking X shaped railing. The means by which this bridge is suspended are hid from view. The span is 150 feet between the bearings of the points of suspension. The platform is 7 feet wide. The chain rods are secured together by flat bars about 6 feet apart, on which the timber platform rests and is secured by Theaded bolts and nuts. The chains secured by T-headed bolts and nuts. The chains are made fast at one end to a stone pier built in the embankment. The centre of the pier at the other end of the bridge is formed into a large pit, on the top of which is secured a turnbarrel, round which the chains take one wind and descend into the pit, and are secured to a cast-iron plate suspended near the bottom, at a depth of 30 feet, on which is built a mass of a depth of 30 rete, on which is built a mass on masonry, forming a weight which counter-balances the whole. It is further secured hy backstays at each end of the bridge, running inland under ground, and belted to blocks of lard oak. The cost is said to be very mode-

ROYAL ITALIAN OPERA, COVENT GARDEN. The scenery and costumes in Meyerbeer's new opera, Le Prophète, are worthy of the magnificent work they are intended to illustrate. Messrs. Grieve and Telbin have here done their best, and we the more gladly award them our hearty commendation, because, on a late occasion, we found it necessary to object, on the score of chronology. The first scene—a landscape with windmills—is a nice work. In the scene for the winter sports there is a wooden bridge across the stage, and a large tree in the middle distance, cleverly managed. The great scene, however, is that of the third act, the interior of the cathedral of Munster, for which a novel point of view is taken,—across the transept, looking obliquely into the choir. When the stage is filled with a crowd of splendid costumes the appearance presented by this scene has seldom been equalled.

FALL OF A STAIRCASE IN CHARLES-STREET, DRURY-LANE.—A cry of fire was raised in a large building in Charles-street, Drury-lane,—formerly a coach factory, and now a Roman Catholic chapel,—on Sunday evening last; and a crowd rushing to the staircase, this fell in with a tremendous crash, and seriously injured a number of persons. The alarm was caused, in the first instance, by the weight of the audience causing a partial

the weight of the audience causing a partial subsidence of the floor.

St. Mary's, West Brompton.—The first stone of this church, of which we gave an engraving a short time since, was laid on the 2nd inst., by the Venerable Archdeacon Sinclair, assisted by a large body of the local clergy and the inhabitants of the neighbourhood. Robert Gunter, Esq., the donor of the land, afterwards entertained a number of the principal visiters at his residence. principal visiters at his residence.

BRIGHTON PAVILION .- The inhabitants of Brighton have determined on purchasing the Pavilion at the price named by the Woods and Forests, 53,000%.

LAMINATED TIMBER ARCHES. - Messrs. Green's handsome wooden bridges, on the line of the Newcastle and North Shields Railway, have familiarized the public eye with the lami-nated timber arch. The principle, as we learn from The Bullder, is now applied to the construction of roofs; and a controversy has arisen as to authorship or discovery. If our worthy contemporary, who gives names, dates, and extracts, in relation to laminated arch ribs, will turn to Coxe's "Travels in Switzerland," volume first, second edition, 1791, he will find mentioned, at page 132, the wooden bridge of Wettingen, which spans the Limmat, near Baden, and was erected by Ulric Grubenman, of Appenzel, a self-taught architect; and the letterpress is accompanied by an engraving from a sketch by Sir John Soane. Coxe's description is vague, but the arch is evidently formed of laminated timber.—Gateshead Ob-

STREET ORDERLIES.—The united parishes f St. Giles-in-the-Fields and St. George, Bloomsbury, have come to the resolution of employing "street orderlies" for the purpose of cleansing the public streets. We commend them for the step, and hope to see the example followed.

VERY BLIND.—Tenders for slight repairs and the painting of a house in Great Marl-borough-street:

No. CCCXL.

SATURDAY, AUGUST 11, 1849.

OLLOWING out the course we have taken from the first in respect of the two archæological societies, which, by the way, ought unquestionably to be but

one, we attended both the recent meetings in the country, although, thanks to the bad feeling or the bad management somewhere, which fixed them at the same time, only for a part of the week, and that at no trifling inconvenience. Salisbury is 96 miles in one direction, and Chester 180 miles in another, but a will brings a way, and the rail makes all easy. We have already given our readers the beads of some of the papers read on architectural subjects, and in our present number will be found one on Chester Cathedral. Without attempting a continuous account of the proceedings, which would interest only a portion of our readers, and absorb all the space we can afford to the matter, we will throw together some of the jottings in our note-book, made during the trip, with reference rather to places than proceedings.

Willis rightly abused Wyatt, as our readers have seen, for his abominable deeds in Salisbury Cathedral,-screens destroyed, monuments mixed, and chapels pulled down. The interior of this cathedral is greatly inferior in interest and beauty to the exterior. Mitford, in his letters on the "Principles of Design," wherein he examines Salisbury Cathedral at some length, comes to the conclusion that pointed architecture is unsuited to the production of fine exteriors, and that the attention of those who designed the vast buildings of the Middle Ages was less given to the outside than to the in. How he could have arrived at this with reference especially to Salisbury is singular, since this building looked at alone would justify exactly the reverse conclusion. The outline of the mass is beautiful, pyramidizing upwards, and terminating in that wonderful tower and spire, piercing the sky.

Some repairs to the top of the spire are now going on, and a slight scaffolding surrounds the apex. This spire affords a striking proof of the goodness of Chilmark stone, properly selected.

The west front of the cathedral is less good in detail than other portions, and it affords a curious example of sham architecture, of which the mediæval architects were not often guilty. A considerable portion of this front is hut a mask, and windows are introduced in what is merely a blank wall.

The Chapter-house is a gem; the miserable state of it is much to he deplored. It is an octagon, on plan, with a central shaft, and this shaft is about 9 inches out of an upright. The stone-work generally is in a dreadful state of dilapidation, the carvings are fast disappearing, and the singular tile pavement is scarcely distinguishable. With an industry and skill highly honourable, Lord Alwyne Compton has made a drawing on a large scale of this pavement, as it would appear restored.*

* The drawing was exhibited in the temporary museum formed in the "'King's House," an interesting building of the Tudor period, which is about to be restored, for the pur-poses of a training school.

A plan for the restoration of the Chapter-house was prepared some time ago, but seems to be in abeyance. The central column was to have been taken out and rebuilt, the stone-work generally repaired, flying buttresses added outside, so as to admit of the removal of a network of iron-rods at the springing of the vaulting, and a stained glass window put up in the side opposite the entrance. The estimated cost was 5,000l.

We sincerely hope that no time will be suffered to elapse before the works are commenced.

In the cathedral there are several very well executed modern monuments, by Mr. Osmond, an inhabitant of the place, whose works we have before this bad occasion to mention.* One of the most recent is a mural tablet of novel form, from a sketch by Mr. Pugin, in memory of Lieut. William Fisber, who fell at Moodkee.

The end of the north transept of the cathedral appears much rent, and the same may be said of the cast end. A survey is desirable.

A small Roman Catbolic church has been recently built in Salisbury by the architect last named. It is in the decorated style, and consists of nave, south aisle, with a small tower at the west end of it, chancel, and chapel of the Virgin, at the east end of aisle. At the back of this chapel is the sacristy, and over the latter is placed the organ. The ceiling of the chancel is richly painted, red, white, and gold, on a blue ground. The pulpit is very small and low, simply a stone desk, slightly elevated : it stands in the north-east angle of the nave. The whole is designed with skill. The tower here has settled down, and has caused some

The determination which has been come to, to raise the fallen stones at Stonehenge, that mysterious monument of the misty past, is a good one. There is of course to be no imaginary restoration, but those stones which have fallen within the memory of man are to be raised into their original position. It is desirable, too, that others which show a tendency to fall, should be looked to and set upright. The Dean of Westminster, when the Institute visited this curious temple, offered some general observations upon it, and in the course of his remarks made a work upon this monument by Mr. Browne, the subject of jest and merriment. The son of the writer, who now holds a lower station, and maintains a family by selling copies of a model of the monument executed by his fatber, was present, and went his way with a weary step and a heavy heart. The memory of his father, held by him in the deepest respect and reverence, had been outraged. This has caused a correspondence in the Salisbury and Winchester Journal, and we doubt not will lead the dean to heal the wound he, perhaps unwittingly, gave. †

Silbury Hill has again baffled the investigators,-it has evidently no sympathy with bores. A tunnel has been cut to the centre, but nothing has been discovered. It ought not, however, yet to be inferred that further examination is useless.

Every one has heard of Wilton House, and the relics of ancient art garnered within its walls. The Hon. Sidney Herbert, considering, as he said, that those who are by accident the occupiers of such residences are only trustees of a great national establishment, threw it open to the members, and with his beautiful wife,-the Queen of Wilton, as the neighbourhood in their admiration call her, -entertained them hospitably.

The collection of sculptures here was commenced by Thomas, Earl of Pembroke, at the close of the last century; the Arundel marbles forming the nucleus. The principal of the Giustiniani marbles and of the Mazzarine collection, when broken up, were purchased to increase it, and others were brought from Naples. Mr. Charles Newton, of the British Museum, made a critical review of the sculptures, and demolished the reputation of many of them with an unsparing hand. The host, however, took it all in good part, -seeking the

Inigo Jones designed Wilton House, and Mr. Gwilt, in his Encyclopædia, says those who have seen it "can appreciate Inigo's merit for having introduced into England, in the seats of our aristocracy, a style vieing with that of the villas of Italy." We were not there long enough to find this out for ourselves. Some disagreement appears to have arisen hetween Jones and the Earl of Pembroke, and in the Harleian Library, it seems, there is an edition of Jones's "Stonehenge," on which the Earl in question, to whom it formerly belonged, has written much abuse of the author, calling him "Iniquity Jones," and anything but an honest man.

In the reign of George the Second, the well-known amateur architect, Henry Herbert, Earl of Pembroke, did much to improve Wilton, and built the Palladian bridge, in the beautiful gardens there. A right pleasant stroll we had over it, with some pretty specimens of " Early English," who could discuss "style" in more applications of the word than one.

The new Byzantine church at Wilton, with its detached campanile, mosaic pavements, and pulpit; stained glass, of varied worth; polychromatized apses, and reredos of marble columns, was of course visited; and the architect, Mr. Wyatt, who was there, had to reply to all sorts of questions, and, as a matter of course, all sorts of objections. This sumptuous evidence of Mr. Herbert's piety and

"The collection of gravestones and crosses by his son,
"Christian Memorial," by W. Osmond, Jun., is now
finished, and will be found useful. It is published by
Masters, of Aldersgate-street, in six parts.

† A writer in the Journal gives the following interesting
notice of the author of the work in question:—"He was a
nan of limited means, but of respectable mental attainments, who had been early struck with the magnificence of
the remains on Salisbury plain, and had imbibed a passion
for the temple at stoneheape as absorbing and as powerful
as that felt hy the young Parishenne for the Belyidere Apollo,
or as any one of the Pygmallon-like instances of which
so many are recorded. To this, and to its illustrative remains
in the neighbourhood, all is thought were devoted. Fit
in the neighbourhood, all is thought were devoted. Fit
the court the hidden mystery of its existence; he lectured
upon its many wonders,—unfortunately he published a book
about it! When engaged on his lectures to the members of
the Literary Institution that existed some years since in
Salisbury, he used to bring his drawings and make his
arrangements in the morning, return to Amesbury to dinner,
come back with more materials in the afternoon, read his
the cutter in the evening, and then again wall on his solitary
opp, after having already walked five and twenty miles. But
this persevering energy of his character was more yearticularly exempified during the construction of his model of
Stonebenge. Every stone was modelled on the spot, and

the most minute variations in the original carefully noted in his capy. Day after day, and week after week, was he to be found among these memorials of old time, planning, measuring, modelling, painting in the prosecution of his self-prescribed task, and interrupted only hy the necessity of sometimes visiting Salishury for materials, which he bore home himself and on foot. The difficulty of making such a copy would not perhaps he great with proper assistance, but this man worked wholly by himself, and we can imagine his self-gratualtation on the completion of his labours, when he could exclaim, like the victor of Corioli, 'Alonel didit! Il' But Mr. Browner, though he had completed his work, hadework to the British Museum. It was accepted by the trustees with thanks, and its author chose to have the pleasure of placing; it with his own hands in this great repository of the antiquities of the world. Unavilling to trust he model from his sight, and equally unwilling to runshle to bear the expenses of the usual modes of travelling, he resolved to walk with it to London, and mounting his model on a wheel-harrow or hand-track, he set off across the Plain with his charge. After a tollsome and almost continuous march of two days and nights (for he only leght to a short time in the day) be amaginated to the plate of the standard of the standard

liberality cost about 36,000l.,* and is in the style of the early churches of Northern Italy. It is not the style we should choose for an English church; but as this was not left at the discretion of the architect, no blame attaches to him in this respect. The chancel is very fully decorated with colour, but the colour is not to our eyes good: it is too red,and the patterns, in a principal part, are too large and coarse. The nave, at present quite bare, requires colour; and this the architect feels,for he had caused to be put up some temporary scroll-work in the spandrills of the main arches and around the arches themselves, in order to induce a decision to that effect. Unfortunately, however, these temporary colourings were scarcely the right thing, and so, perhaps, the object was rather injured than advanced. There is an appearance of thinness and weakness about the main arches, which colour would probably improve. This thinness would have been avoided if the arches, instead of springing, as they do, from the line of the upper diameter of the columns, so that they are far set in on the top of the capital, had been stilted, and had sprung from the outer line of the abacus, or nearly so, -the arrangement usually exhibited in the Byzantine churches.

But though there may be something to question in this building, there is much more to praise; and we have no desire to depreciate a work of great thought and labour, which stands alone in this country.

On the day after the visit to Wilton, the sad state of the town, and other causes, having hroken up the set excursions of the day, we went with a pleasant half-dozen, fit though few, to Romsey ; + but of what we saw there we must take another opportunity to speak, Chester, too, must stand over.

ON THE ARRANGEMENT OF COLOURS IN ANCIENT DECORATIVE ART.

I VENTURE to intrude on your notice a few brief remarks upon certain coincidences in the arrangement of colours, which I have obscrved to obtain extensively in nature, and in ancient, mediæval, and semi-barbarous ornamentation.

It is not necessary that I should occupy your attention, by any lengthened attempt, to prove that ancient and medieval artisans had, by some means or other, a happy mode of combining and contrasting, with exquisite skill, the most brilliant shades of positive cocombining and skill, the most primant snaues of postawe co-lours. This facility, upon whatever principle it may depend, is not generally within the scope of the artisan of the present day; he rather trusts for his effects to the use of neutral, undecided, and delicate tints, avoiding for the most part any considerable amount of intense colour. I do not enter into the question of the propriety of this arrangement, but merely assert, what I believe you will readily admit, that brilliant colours are less harmomiously arranged by the modern than they were by the mediæval artisan. This is par-ticularly the case when colour is used in the internal decoration of churches and of church windows.

It is a generally received opinion also, that British manufacturers are less tasteful in the combination of colours than their continental opponents. I call your attention to this assertion that I may afterwards point out a possible reason for this presumed inferiority.

The length of the church, from the western porch to the chancel apse, is 120 feet; the width, 53 feet; height of nave, 57 feet,—of tower, 100 feet.

It might be more difficult to induce you to believe that many barbarous or half-civilised nations are remarkable for the harmonious intermixture of their coloured ornaments, were we not able to call as evidence to the fact one of the very best authorities in the kingdom.

If, then, I be correct in my assertion, corroborated as it is in part by high authority, it assuredly becomes a matter of no slight intcrest to discover any of the means employed by the ancient artisan, to produce this very satisfactory result.

It is, to what I presume to be one of these means, that I venture to direct your attention.

Some years since I had an opportunity of closely examining a number of illuminated MSS., of what I believe is allowed to be the best period of English mediæval art,—that of the three first Edwards. I was particularly struck with the uniform arrangement of certain colours, and remarked that the practice of the illuminators was-

1. To separate the prominent colours, red, blue, green, purple, ruby, violet, &c., from each other, by spaces or lines of yellow, white, or black.

2. To paint with brilliant colours, on grounds of yellow (frequently gold), white, or black; or, if the ground was of any other colour, to use yellow, white, or black, only for the ornamentation.

To combine two or more shades of red, or of blue, green, purple, &c. &c., without the intervention of yellow, white, or black.

4. To place yellow, white, or black together, or upon each other, without reference to the law which appears to have regulated the arrangement of all other colours.

Having carefully noted these laws-as for induced to inquire whether they were peculiar to illuminated books, and to the particular cra

to illuminated books, and to the particular cra of mediæval art, known as the English Deco-rated; to my surprise I found them of very general application.

I briefly notice a very few of the more pro-minent instances, mentioning only such as admit of being easily verified or contradicted by reference to books, or the contents of ordi-nary measures. nary museums

* See the coloured engravings to "Belzoni's Researches in Hight and Nubia." I find from the notes of a gentleman, into whose hand I was permitted the notes of a gentleman, into whose hands I was permitted use the more and when he was about to visit the east, and place memoranda when he was about to visit the east, and place memoranda when he was about to visit the east, and place to memorand when he was about to visit the east, and place the more considerable to the place of the pl

vices.

' See Dr. Layard's ' Monuments of Nineveh,' and in rticular, the coloured engraving representing a restored

See "The Alhambra," by Owen Jones.

§ It must be remarked that towards the end of the fit-teenth century, and the decadence of Gothle architecture, frequent violations of the rules occur, both in mural paint-ings and in glass.

The black lines in painted glass are merely the leads used to hold together the different pieces forming the mosia. They are frequently arranged with much artistic skill in the folds of the drapery, e.e.

less subjected to capricious changes of fashior than any other branch of ornamented art. But heraldry is also governed by a peculiar law of its own, which excludes it from the last of the its own, which excludes it from the last of the rules regulating ancient colour, thus, metal on metal, being bad heraldry, precludes the use of yellow on white, or white on yellow. In all other particulars, heraldry strictly follows the rules, even to the admission of two shades of the same colour in diapering the fields of shields, a beautiful enrichment of the ancient heraldic painter, entirely neglected in the pre-

sent day.

This list might be greatly extended, but I have done enough if I succeed in rousing curiosity, and inducing inquiry and examina-

In every case, however, exceptions may be met with, but the extent to which these laws were acted upon, and the relative proportion of the exceptions, may be well understood by an examination of three books, to which I solicit your attention, not only because they are most valuable authorities, for, or against, my argument, but also because they may easily be referred to, and thus serve to confirm or refute it, at least to the extent of the mediæval

art.

1. "Specimens of the Geometrical Mosaic of the Middle Ages, by Matthew Digby Wyatt," containing 90 coloured subjects, and representing, with undoubted accuracy, beautiful and the subjects of the subject of tiful examples of this exquisite art. Of these, eighty-five are strictly in accordance with the laws I have endeavoured to explain, while five only, and that in a slight degree, vary from

"Glossary of Ecclesiastical Ornament and Costume, compiled and illustrated ancient authorities and examples, by A. Welby Pugin, architect." This splendid volume exhibits upwards of two hundred and thirty distinct examples, subject to the arrangement, and only eight opposed to it, five of these eight in a very trifling degree.

3. "Details and Ornaments from the Alhambra, by Owen Jones, architect." Out of sixty-five coloured subjects in this magnificent sixty-five coloured subjects in this magnificant and well-known publication, I find two only directly opposed to the rules; a few others differ from them very slightly. † *

The coincidence of these laws for the ar-

rangement of colour, thus influencing the art of various and widely-spread nations, unconnected as most of them were hy local or by religious ties, -- and extending from the earliest era of art, to the present time, -- is at least curious and interesting. I believe that a knowledge of the facts may be useful also to the modern decorator and manufacturer. I will now endeavour to point out their probable origin.

One of the most original modern writers on art, states, in reference to architectural form, "I would insist especially on the fact, of which I doubt not that further illustrations will occur to the mind of every reader, that all most lovely forms and thoughts are directly taken from natural objects; because I would fain be allowed to assume also the converse of this, namely, that forms which are not taken from the natural objects must be ugly;" and again, "that forms are not beautiful because they are copied from nature; only it is out of the power of man to conceive beauty without her aid."

What is here demanded with so much boldness and truth for elegance of form, I claim with equal confidence for harmony of colour; it is impossible to imagine any beautiful or harmonious colouring at variance with nature, or at least with nature when expressing her lovelier attributes of harmony and peace

If then the ancient and mediæval artisans, If then the ancient and mediaval artsans, and semi-barbarians of every age, alike excelled in the beauty of their coloured ornamentation, it is probable they all took nature for their copy, which, as Sir Joshua Reynolds has remarked, "is always at hand, in comparison of whose rules the best coloured pictures are but faint and feeble. Now, all the great nictures of nature when exhibited mode. great pictures of nature, when exhibited under ordinary circumstances, are painted strictly in

sy feet,—of tower, not feet.

† Truth to say, the meeting, as a whole, was \$\lambda_{eve}\$ one; and, according to some, this was not wholly owing to the epidemic. One correspondent, who sign the epidemic of cone correspondent, who sign was dearly estimated and the power, and of any desire, on the part of those who had the power, which are also also were also also with the power of the whole and also were to obtain a were all title less off that the property of the property

The Seven Lamps of Architecture," by John Ruskin, London: Smith, Elder, and Co. 1849.

accordance with the rules practised by the mediæval artist. The azure firmament of day has its golden sun, its clouds of white, shaded with black, and tinted with yellow, or if tinged with red, as at sunset, usually seen in an atmosphere of pale yellow. The indigo sky of night has its silver moon, and is studded with red with the property of the state while the black leaded are the state. night has its silver moon, and is studied with golden stars, while the black clouds are ever fringed with silvery white. When exceptions occur they are looked upon as portentous and awful, and even the greatest exceptions are but modifications of the rules, which nature rarely

The green meadows of spring and early summer are embroidered with flowers, among summer are embroidered with flowers, among which white or yellow immensely preponderate. It is not until the strong sun of June has tinged the herbage with gold colour that flowers of blue, red, or purple prevail. In the emerald grass we find the daisy and the buttercup, among the yellow grain the scarlet poppy and the bright blue cornflower.

When nature paints in miniature she adheres to the same rules. Cull the flowers in your garden, and examine them one by one, you will find that when more than one distinct colour occurs in any specimen, one of these

contradicts entirely.

your garden, and examine them one by one, you will find that when more than one distinct colour occurs in any specimen, one of these colours is certain to be white, yellow, or (though more rarely) hlack.* Or, you may find many flowers beautifully damasked with two or more tints of one colour like the diapering in ancient heraldry.†

I do not seek to impugn any existing theory of colour, much less to establish a new one, but I desire to engage your attention to a subject of much importance to British commerce and to British art. Your most extensive means of observation may enable you to test the comprehensiveness and utility of this practice of the ancient decorators, and of the manufacturers of other countries, both civilised and barharous, and to judge how far an adoption of these rules might benefit those of England. I may be mistaken in my idea of their importance, yet I sometimes imagine, that simple as they are, they really embrace many of the requirements of art. Comhinations of yellow, white, and black produce an innumerable variety of tints in undecided greenst and neutral greys,—the most universally diffused of all colours, and these really diffused of all colours, and these really diffused of all colours, and these really diffused of all colours. and these really diffused of all colours, and these really diffused and all colours, and these really diffused of all colours, and these really diffused and all colours, and these really diffused and all colours, and these really diffused of all colours, and these really diffused and all colours, and these really diffused and all colours, and these really diffused of all colours. And these really diffused as all colours and these really diffused and all colours and these really diffused and the colours and the colours and the colours and the colours and greens' and neutral greys,—the most universally diffused of all colours, and these are warmed or cooled to any degree by the addition of the primitives, red or hlue.

I take leave to reiterate the remark, that I do not claim the beauty of ancient and mediæval polychromic effects, or of the best specimens of modern manufacturers, to be produced only by the peculiar arrangement of colours which I have endeavoured to explain, but I venture to believe that it is one of the means successfully employed for the purpose, and therefore I do not hesitate to advocate its use by the English artisan.

GILBERT J. FRENCH.

IMPORTATION OF FOREIGN GLASS,—A return, moved for by Mr. Richard Spooner, M.P., shows that the total imports of foreign glass in the year 1848 were as follow, viz.:—31,037 cwt. of white or stoned window glass, of one colour only; 90,442 square feet of silver and polished glass; 1,195 feet of painted or otherwise ornamented glass; 35,086 lb. of white flint glass bottles, not cut or engraved other white flint glasses, tumblers, and all other white flint glass goods, not cut or otherwise ornamented; 639,967 lb. of all flint cut glass, flint coloured glass, and fancy ornamental glass; and 370 cwt. of glass manufactures not otherwise described. The quantities tures not otherwise described. The quantities of British glass exported from this country in the year 1848 were as follow, viz.:—15,296 cwt. of finit glass, 19,708 cwt. of window glass, 49,227 fect of plate glass, 194,755 cwt. of common glass bottles, and 6,965% worth of looking-glasses and mirrors.

* It is 'impossible to change the colours of flowers ad thittun, by artificial means, yet the rose, naturally red, may be changed to any shade between red and yellow, red and white, or red and black, but it admits no shade of blue, so it is the shade of the staragement may be easily and pleasantly ascertained by examining natural flowers by the light of a lanthern on a dark night. The exquisite beauty of nature's floral gems, when thus exhibited, can scarcely be understood without trial of the experiment.

‡ The value of the neutral greens (if I may so term the tints of black and yellow, without the intermixture of red or blue), was well understood by the old artists in glass, and is agreeably exemplified in many an ancient church window.

IRON GRILL, STA. MARIA NOVELLA, FLORENCE.

IRON GRILL, STA. MARIA NOVELLA, FLORENCE.

Although the name and contents of the celebrated Spanish chapel are probably famicereorated Spanish chapet are probably faint-liar to most of our readers, we question whether the accompanying elaborate iron-work is as well known as it deserves to be. We believe it hitherto unpublished. The pictorial treasures absorb so much of the traveller's treasures absorb so much of the traveller's attention, that the grills in the windows and iron gates are hardly likely to attract much notice. It is of wrought iron, apparently rather late in style. The variety and richness of these grills in some of the cities of Italy are quite extraordinary: a very interesting collection might be formed of them. We would particularly instance Venice and Florence in this respect. The grill here engraved is drawn to the scale of half an inch to the foot.

ON CHESTER CATHEDRAL, ITS HISTORY AND ARCHITECTURE

WE proceed to give the substance of Mr. Ashpitel's interesting discourse on the history and architecture of Chester cathedral.

The speaker said, without entering into minute details of what every one knew, it was sufficient for him to state for the information strangers, that the present cathedral was originally a monastery, and although Chester had been the seat of a bishopric previous to the conquest, it had only been restored to these privileges by the reformation. The chronicle of Henry Bradshaw (Leland's Collectanea, vol. ii., p. 62) stated that Chester was the seat of a cathedral church in the time of King Lucius, the first Christian king of Britain. It is true Bishop Tanner had given a contradiction to this statement, but without authority. The light of Christianity had penetrated where Roman civilization had spread, and he thought it bold to contradict without authority a tradition that bore every trace of probability. However, this girls the it was not extended the ever this might be, it was not pretended that ever this might be, it was not pretenued that the present erection was any part of such cathedral. We learn from the same authority, Bradshaw, the Cestrian monk, before cited, and from the chronicle of John Brompton, Decem Scriptores, p. \$10, that St. Werburgh was the Augustus sigter and wife of kings, what disdaughter, sister, and wife of kings, that disgusted with the world, she founded a monas-

tery at Ely, which she governed many years, died at Trent, and was buried at the place then called Heanburga, now Hanbury. Her relics, according to both authorities above cited, were removed, for fear of an incursion of the Danes, to Chester, and there re-buried with pomp, a ceremony called usually "the translation of the

body."

In 924, according to the MS, chronicle preserved among Bishop Gastrell's Notitia, it is stated that King Athelstane erected a monastery here for secular canons; although William of Malmsbury (fo. 164, n. 30) states there was a monastery for nuns, (as the word "sanctimonialis" is usually translated) "ex antiquo," from a very early period. Whether the word may not mean any monastic person it is not worth while to inquire. Suffice it to say, there was a monastery for regular canons in 1057, when Leofric, Earl of Chester, celebrated in his day, but now better known as the husband when Leofric, Earl of Chester, celebrated in his day, but now better known as the hushand of Lady Godiva, the heroine of a very uncertain legend relating to Coventry, came to Chester and repaired the buildings at his own expense. Shortly after this, the greatest political convulsion that ever agitated this land took place—the Norman conquest. Every thing was changed. Arts, commerce, arms, customs, were administered by new hands. Among other changes, the secular, or as we should other changes, the secular, or as we should were administered by new hands. Among other changes, the secular, or as we should call them, the parochial clergy, were removed from their possessions, and monks placed there in their standard and monks placed there in their stead—a change attempted often hefore the conquest, but against which the common voice of the English nation strongly revolted. Under their new Norman lords, however, this was done everywhere.

The Conqueror now created his friend and fellow-soldier, the celebrated Hugo D'Avranches, better known as Hugh Lupus, Earl of Chester. He followed the example of most of his predecessors—lived a life of the wildest harmonic and control of the predecessors—lived a life of the wildest harmonic and control. his predecessors—lived a life of the wildest luxury and rapine. At length, falling sick from the consequence of his excesses, he was visited by the celebrated Anselm, the Abbot of Bec, in Normandy, afterwards the Archibishop of Canterbury, who persuaded him, as William of Malmsbury says, to eject the old canons, who he says were very few in number, and who lived in an irregular or improper and beggarly way,—" ejectus inde pauculis clericis qui ibidem fædo et pauperi victu vitam transigebant." According, however, to the anony-

mous Chronicle of Evesham, MS. Bib. Bodl. fo. 96, and the Golden History of John of Tynemouth, in the same library, he converted the canons into regular monks,—in the terse words of the latter author, "tonsoravit eos," he shaved them, alluding to the tonsure the regular monks have on the head. The three chronicles respectively give us, as the dates of the foundation, the years 1093, 1094, and 1095, a slight variation, into which there is little use to inquire. In the meanwhile the monastery was built, and age and disease coming on, the old hardened soldier was struck with remorse, and—an expiation common enough in those days, and alluded to with such force by our greatest teat as the second with such force hy our greatest poet-as those who

" Dying, put on the weeds of Dominic, Or as Franciscan think to pass disguised,"-

the great Hugh Lupus took the cowl, retired in the last state of disease into the monastery, and in three days was no more.

It now must be endeavoured to point out what parts of the church are the work of this what parts of the church are the proud earl. Mr. Ashpitel stated that he could not, from the most minute research, discover any portions of the Saxon church. He conany portions of the Saxon church. He considered it probable that there might be some portions in the foundations, but there were none visible. It was not one of those cases where the period of the Saxon erection is within a few short years of the Conquest, and where we are told one building just built was pulled down, to be immediately replaced by another. The Saxon building must have heen very old; it was much dilapidated a few years previously, when Leofric repaired it. We have the testimony of William of Malmsbury to the squalid poverty of the monks, and probably of their buildings; besides this, we have the in-direct evidence of the earl's charter, where he alludes to the church in the words " quæ constructa est," which lead us to suppose it had just heen built; and the direct evidence of Ordericus Vitalis above cited, who speaks of it as the church which Lupus himself had built

-"quod idem Cestriæ construxerat."

The Norman work remaining consists of the lower part of the north-west tower, standing lower part of the north-west tower, standing on the opposite side of the nave to the present Consistory Court, containing some beautiful shafts and capitals, and five lofty arches, the general character of which would lead every one to suppose the original church to have been of very fine architecture. The north wall of the nave, to the height of the windows, is likewise Norman and contains on the side is likewise Norman, and contains on the side of the cloister six tombs, where, as we find from a MS. written on the back of an old charter now in the British Museum, the early Norman abbots are interred. The north transept is also of Norman work to a considerable sept is also of Norman work to a considerable height, and contains a very curious Norman arcade, so placed that he at first thought the original design to have been like that of Exeter,—a nave and choir, flanked by two towers, the lower parts of which were open and formed transepts. This idea, however, was disproved by authorities which afterwards were obtained. were obtained.

He then explained the way in which the Gothic cathedral had, as it were, grown out of the Roman basilica, and that the circular tribunal, which terminated the Norman building, had been first elongated a little, still keeping its rounded form at the eastern end, and thus became the choir. On inquiry, he found that two bases of columns still existed in the choir, near the hishop's throne, and he showed on the plan their situation, and the probable line the old circular part then assumed * He also the old circular part then assumed.* He also pointed out on the plans the buildings which had just been opened, by the kindness of the bishop and clergy. These are vaulted apartments of early Norman work, and are described in the charter of Henry VIII. by which he divides the properties between the bishop and dean, as promptuaria et pannaria, the former derived from a word denoting a butler or steward, probably a buttery; and the latter from pannus, a cloth, probably the place for clothing. clothing.

The next point in the history of the monas-tery was the removal or translation of Earl Hugh's remains by Randal, the third Norman During the late restoration the arrangement of the Nor-an building was made evident, and Mr. Hussey submitted plan of it at a meeting of the Archeological Institute one time ago.—Ep.

earl. This, he states-in the charter whereby earl. This, he states—in the charter whereby he gives the monks the land north of the abbey as far as the Northgate—he does for the good of his soul and for those of his relations. The speaker suggested, from the fact of the land to the north of the abbey having been given about this time, that it probably was the occasion of building the canon's vestry, and subsequently the chapter-house. It was necessary to inquire again among the charters and other documents for more historical information. This was to be found in the Red Book of St. Werburgh, now in the British Museum. 1205 there is a "significavit," or pastoral l 1205 there is a "significavit," or pastoral letter from Peter de la Rochc, Bishop of Winchester, stating that the church threatened "intolerable ruin"—that it was necessary to rebuild the choir and tower, which latter word, Mr. Ashpitel observed, was in the singular number, and therefore disproved his first idea that there were two flanking towers as at Exeter; that some very small attempt ("incipiculos") had some very sman attempt ("Interpetuos") had been made to carry out this purpose, which had failed; and finally they endeavoured to raise money for the purpose. How little success this met with is clear from a pastoral letter from William, Bishop of Coventry, for the same purpose, which describes the state of the same purpose, which describes the state of the same purpose, which describes the state of the same purpose. church as deplorable,-the choir open to the weather, and without doors. This, on the margin, is dated 12th of John

Now, it is clear from the style of architecture, that the vestry, the chapter-house, and lady chapel are of date from 1220 to 1250—and accordingly we may suppose some new and unexpected source of wealth must have fallen in. In Abhot Marmion's time the convent could afford to elect a hereditary cook, and could attord to elect a hereditary cook, and to give him large fees and privileges, and in Abbot Pinchbeck's time, from 1221 to 1240, the number of monks was increased from twenty-eight to forty. Mr. Ashpitel then described the architecture of these respective parts at some length. He dwelt particularly on the beauties of the chapter house, which he considered, with its singularly tasteful vestibule, to be the fluest in the kingdom of its bule, to be the finest in the kingdom of its form; and then took occasion to animadvert severely upon the tastelessness of a professed architectural critic, who could pass over the huilding with the cold criticism "poor enough." He (Mr. Ashpitel) had been told the same story, and had come down to Chester with a heavy heart, and the fear he should have an ungracious task, but he found beauties which grew on him more and more at every visit.

The Norman remains, he said, are extremely fine; here is work of all kinds of great beauty, and the most curious and instructive transitions from style to style, that perhaps were ever contained in one huilding.†

The next historical fact was, a quotation from the mutilated chronicle among Bishop Gastrell's MSS. In 1259, as far as the passage can he deciphered, the convent met to consider the rehulding of the church, and, after some opposition, probably on the part of the abbot, as appears from the MS., the opinion of the convent was ordered to be carried out. Ahout twenty years after this, a law suit, which bad been long pending between the abbot and a powerful family in the neighbourhood, terminated in favour of the abbot: by allowing his adversary an annual sum, he came into possession of four immense manors. There can be but little doubt that this accession of can be but little doubt that this accession of property gave a great impetus to the works of Simon Whiteburch and his successors. At this period it is probable the building of the choir commenced. An architect would suppose that the bays to the north end of the choir were erected first—there are some corhels of decidedly earlier date—and the hases of the piers are of such decidedly early English character, compared to the other work of the same description, that there can be but little doubt this was the first attempt at rebuilding. It would be evident to the eyes of the architect

It would be evident to the eyes of the architect that the greater portion of the choir, the tower arches, nay, even the nave itself, is of the Decorated period, that is, including transition, from 12s0 to 1360.

Now, what are the recorded facts? In 1259 the monks met to consider a rebuilding; in 1281 they came into possession of large

property; and in 1284 we have a curious document. It appears that the first Edward visited the town on his way to repel the incursions of the Welsh; and in the 17th year of his reign we find in the Red Book of St. Werburgh a grant of venison, directed to Reginald Corre. who same to have hed control or of the second to have bed control or of the second to have hed control or of the Grey, who seems to have had control over the forests of Wirral and Delamere; and in a contemporary hand it states in the margin, that it "was for the monks engaged in the great work of rebuilding the church." Similar grants follow in the same way. At last we get a grant of six bucks, six does, and one stag, probably a red deer, as distinguished from the fallow deer.

There is no reason, in fact, to suppose that the works proceeded other than in regular order, following the even tenor of their way, till an unfortunate, and in fact disgraceful event occurred to the monastery. We find that Richard Seynesbury, in 1362, had misconducted himself in such a way that the Prior St. Alban, the lead of the Ponelium. St. Alban, the head of the Benedictine Order in England, and the Prior of Coventry, formed a visitation "to inquire into his offences and extensive dilapidation." The painful result was, that the abhot fled from the inquiry. The abhey was under Papal protection, being what was technically called an "exempt:" the abbot appealed to the pope, went to Italy, and died in Lombardy.

It has been shown that there is a style that an architect would designate at once as that which prevailed from 1300 to 1360; and we then find work about the abbey that bears the character of at least a hundred years later; and yet these styles have been confounded toge-ther. It is deeply to be regretted that when Mr. Ormerod published his great work, which may he designated as the prince of county histories, the knowledge of the style and period of Gothic architecture was as yet in its infancy. He would not otherwise have attri-buted to Simon Ripley work which seems to have been at least from 80 to 100 years earlier; nor would others have attributed much of the work to the reign of King John that clearly is at least 100 years later. But before entering at least 100 years later. But before entering into this argument, as concerns the nave of the church, it will perhaps be well to turn our attention to the north transept, or the Church of St. Oswald.

It has already been stated that the church was dedicated jointly to St. Werburgh and St. Oswald. It is doubtful at what period; but it must have been early it became a parish church. The architecture was, he thought, certainly about the year 1340 to 1360, and historical facts, which he quoted, bore out the

Mr. Ormerod has attributed the erection of the tower, nave, and transept of St. Oswald's Church to this abbot, but the slightest glance at the older part of St. Oswald's will show the contrary. It appears that this notion has arisen from the fact that the two letters S and R are found twined together in the carving of the caps; but it might have been that the carving as is often the case would be left. carving, as is often the case, would be left till the completion of the work—or, what is still more probable, the letters R and S would re-present Richard Seynesbury quite as well as Simon Ripley. In fact, it is in accordance with the notion of a had and unscrupulous man, like Seyncsbury, that he should have the vanity to attach his name to works in which he had no share. If we suppose much of the work attributed to Simon Ripley to be of the earlier period, we then have a consistent account of the church of St. Oswald. Every part of this is clearly of the Decorated period, except the roof of its nave and the windows of the west, or, as it may have been called, the north-west side. These and the windows of the south aisle of the nave of the cathedral have positively Perpendicular tracery, while the jambs, shafts, gabled canopies, the hollow, the ball flowers, and the clear indication of a Decorated parapet show that the work could never be of the date 1488. But if we suppose this work to have heen nearly completed in 1360, and then abandoned till the energy of Simon Ripley took up the matter, the whole is clear.

matter, the whole is clear.

Mr. Ashpitel acknowledged with thanks the assistance of Mr. Baily, especially in the preparation of a number of diagrams by which the discourse was illustrated. Both are well entitled to the thanks of the association for the

^{*} See our view of Chapter House, p. 366, ante. † It was very good of Mr. Ashpitel to say all he could to make the inhabitants of Chester proud of their cathedral. We cannot, however, endorse all his praise.

time and care bestowed on the subject. Mr. Ashpitel is one of the few architects to whom a Latin charter is no stumbling-block in an inquiry, and he speaks fluently and well.

THE NEW SEWERS AMENDMENT ACT.

This act has just been printed; it appears to have undergone considerable mutilation in its passage through Parliament,—the original bill (as introduced by Lord Ebrington) cononly eighteen: those clauses by which almost unlimited powers were sought have been completely rejected. Whether what are left will be conducive to the public interest remains to be seen.

Clause 3 empowers the commissioners to agree with any paving board or authorities in matters of paving, on such terms as may be agreed on, where the commissioners and such board may deem that sewerage works and the convenience and health of the public would be

promoted thereby.

4. In cases of failure of works or of accident, the commissioners may make reasonable compensation for such damage or loss sustained

thereby.

5. This clause has been introduced to meet the objection successfully taken by the paro-chial authorities of St. Margaret's, Westmins-ter, against cleansing cesspools during the day It empowers the commissioners to order and authorise their officers to carry on all operations of cleansing, and to remove all filth, soil, or matter, in the day time, notwithstanding the provisions of the Police Act, the commissioners taking care, as far as possible, to prevent nuisance, annoyance, or delay; and any contractor employed by the commissioners who neglects all reasonable precautions, to be liable to a penalty of 51.

9. The commissioners may accept and order payments by instalments, and where a sewer has been constructed within thirty five years from the passing of the act, the commissioners may order the owner or occupier required to drain into a sewer to pay such sum as they may think just towards the expense of the same, which sum may be recovered as a deht due to the commissioners, by distress and sale of the goods and chattels of the person liable

to pay the same.

10. The amount of any improvement rate may be recovered, with interest at the rate of 5 per cent., and such a sum as will meet the expenses incurred in recovering the same.

11. That where expenses have been incurred in the improvement rate, and the premises in which it was made are partly derespect of stroyed, pulled down, or suffered to go into decay, or are untenanted for twelve successive mouths, then the commissioners by their decree may order such charges to be paid as default, and may charge the unpaid amount, with interest, upon the site of such premises, and order such expenses to be paid by the owner for the time being, to be recovered in the manner set forth in other parts of this Act. 15 and 16. Change the title of "Clerk" to that of "Secretary," and the "Surveyors" to "Regimers".

Engineers."

17. Commissioners may borrow money, and for the purpose of raising money may, instead of making mortgages under this Act, grant annuities for lives or years, to be paid out of the rates, as they shall think fit, notwithstanding any Act may not pass for the renewal of this Act (!), and any mortgage or annuity so con-tracted by the commissioners after the expira-tion of the Act shall be valid and in full force.

The bill originally introduced contained clauses for the appointment of medical officers of health—to give almost unlimited powers to committees—to appoint a barrister to hear appeals against rates—to remove nuisances, and to inflict penalties for neglecting orders for so doing—to compel the Water Companies to supply water for the use of the commissioners, and also for water-closet apparatus, and if deemed expedient, the commissioners to purchase streams of water for their own use, to dispose of any surplus water to the rate-payers for domestic or other purposes, and to continue drain pipes beyond the limits of the commission, for the purpose of disposing of sewage refuse, making compensation to the owners of the land for the same.

ARCHITECTS AND ARCHITECTURE IN JAMAICA.

Some short time ago a letter appeared in your columns, signed "A Tradesman," charging architects with, among other things, compelling builders to perform their own private work without any remuneration. Although I would not attempt to assert that there are no "black amongst us, as well as in every other sneep annongst us, as were as in cry other profession, still I am of opinion that, had the matter been inquired into, it would have been found, in many instances, that the parties who carried on this dishonourable practice, were men who had assumed a title to which they could lay no claim.

The consideration that it is the duty of every architect, "in so far as in him lies," to uphold and maintain the dignity of the profession, as well as to expose anything that might cast a slur on its honour, impels me to make known through the medium of your paper, the following circumstances, which bear out the assertion contained in my first paragraph:—A person who came to this island some time ago, as an organist, music master, &c., not finding his success so great as he had anticipated, looked around him for some other occupation, and what, think you, was the character he put on? No less, Mr. Editor, than (to use his own words, or rather copy his signature), that of "Architect, Civil Engineer, &c. &c." Having succeeded in imposing on some persons, he was engaged to erect a chanthe cathedral church of the island. With the aid of one who should have acted differently, and the assistance of your BUILDER, and some other works, he gave a design, the side windows of which were copied from Northfleet Church, Kent (vide The Builder, March 27th, 1847), and the one at the eastern end from Merton Chapel, Oxford. Tenders were obtained, and contracts for certain portions of the works entered into. The cost of crection was estimated at 3,000l., although it will take more than that sum now to com-

Three thousand pounds for the building of a chancel, free from all architectural decoration, and not larger than is usually attached to

ordinary parish churches!

It has now leaked out that our "Architect, Civil Engineer, &c. &c.," has been, and still si, extracting from the pockets of the builder, either 5 or 7½ per cent., besides the commission he receives from the parish. And I have been given to understand that every one (for the contracts have been divided), who is connected with the building has to pay a like per cen-

I shall abstain from all comment, but I really think it is time for architects to be "up and doing." Something should be done to protect the legalised members of the profession, and put at once a stop to a system that casts dishonour on its members. I enclose my card, together with the names of the other parties.

ONE WHO HOPES TO SEE A STOP PUT TO SUCH DOINGS.

We learn from another correspondent, that at present architecture is at a very low ebb in Jamaica. The only works going on in Kingston of any pretensions are a store and dwelling for Mr. Pinnock, a merchant, and the United Presbyterian Church, both of which are under the direction of Mr. B. W. Walsh, architect.

The church consists of a nave, south porch, and small chancel. It is of Perpendicular date The side windows of two lights with transom. The western and eastern windows are large, of five and four lights, and filled in with tracery of rather an elaborate character. The roof is open, and of pitch pine, wrong htwithout tracery, and is to be covered with slates. The sittings will be all low and open, with stall-ends, with carved finials. The woodwork of the sittings will be of cedar; the pulpit, &c., will also be of cedar. There is to be no paint used to any portion of the woodwork. The church is built of brick, with stone dressings. The windows will be wrought out of the stone of the country, from the parish of Portland. They will be the first windows ever made out of the stone of the country, as well as the first ever worked in the island. There are to be no galleries. The church will seat 512 persons. The passages, chancel, and porch, will be paved with red and blue tiles from Minton's manufactory. The tion is the great thing needed.—ED.

cost of the church will be 1,700l. The height of the building from floor to ridge will be 51

Two iron bridges for the parish of Trelawney are projected. The span of one is to be 162

ONE-SIDED TEMPLES .- LEASEHOLD.

FEW, indeed, are the examples in our day of structures which, standing on an isolated site, are complete, so as to present four sides, or an entire exterior of uniform design.

or an entire exterior of uniform design.

The value of space in a crowded city already pre-occupied, and the impossibility of obtaining a freehold plot, will account for this; for if the locality be leasehold for ninety-nine years (and this is the longest lease now granted), it is not worth the cost to build for the inheritance of a cunning proprietor, who already for the agrandizement of his succalculates for the aggrandizement of his suc-

calculates for the aggrandizement of his successor in the fourth generation.

It is a matter of wonder that so many richly-embellished and solid structures are to be found in our streets, rather than that we see none built completely detached and exhibiting writing of deliver are all sides. In biting a unity of design on all sides. In such thoroughfares as Pall-mall, which is one continued chain of palaces, it cannot be expected that each one should stand apart,—for there, with the back to the Park and front to a noble causeway, the land is too valuable, and the variety of elevation conduces much to the beauty of the strada; but it is curious to conceauty of the strada; but it is curious to con-template (and this might give a subject to Punch) the tumult in the clubs about the year 1920, when the original leases will have lapsed.

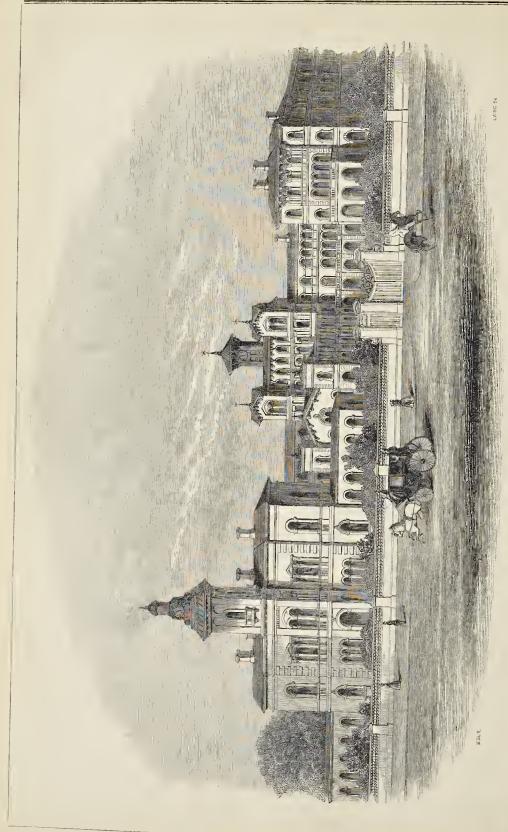

The managing committee of the Reform, Athenæum, Conservative, &c., will then have rare commotions and treaties with the successors of the Woods and Forests! The law and usages are on the side of the officials, and if the system of leasehold tenure for short terms, should go on (which I very much doubt) till that year of grace, those anarchists must either break up and get freehold plots, somewhere out of Middlesex, or compound at rack rents of 2,000l. a-year, for by that period the terms of lease will be added to the period the terms of leases will be reduced to 31 years; and this, according to the present ratio of diminution, would he a long lease, since the extent of leases was in A.D. 1800, often 500 years; in 1820, 99 years; and at the present period of our chronicles it is (vide the Portland estate) 60 years! whilst in other districts of the town building leases vary from 80 to 60 years. In private residences of moderate pretensions, possibly the extent of the term makes no greater subjy the extent of the term makes no greater difference as to the outward appearance of the structure; but contrast the solidity of a house in Paris, built on freehold, with one of the same order in London, and the result will be manifestly in favour of the perpetuity.

Such a condition of clubs and public communities may hereafter, when the evils of short leases become palpable, lead the greater community, the nublic, to reflect unon the tendence.

munity, the public, to reflect upon the tendency of this custom to centralize property (the fixed capital in houses) in the possession of a very rew landlords; but by that time the whole body of lessees in the metropolis will be also extraded and hunted out. No man can then have an interest in his tenement hut as a his ancestors will be lost to the last tenant, and "thousands yet unborn may rue the hunting of that day."

WATER FROM ROOF OF NEW CHURCHES. A correspondent from Milton Rectory,
Abingdon, says,—"I shall be glad of an opinion
as to the best remedy against the evil of the
constant dropping of water from the new wooden roofs of churches on to the floor of the church, occasioned, as I suppose, by the con-densation of the moisture of the internal heated atmosphere. Will an application of felt prevent the evil? and if so, how is it to be applied? or is a plastered roof more secure from this evil than a boarded roof?"—Some of our this evil than a boarded root: —some of our readers will perhaps give us the result of their experience in a similar case. A layer of asphalted felt between the boarding and the slates or lead with which it is covered, would

THE CITY OF LONDON UNION WORKHOUSE.

A DESIGN for the City of London Union Workhouse was sought by a public competition, the circumstances attending which will be remembered by many of our readers. A plan by Mr. R. Tress was ultimately selected, and this has been carried out under the architect's direction by Messrs. Curtis, huilders, of Stratford, and the house is nearly ready for occupation. The amount of the contract was

The annexed engraving represents the building as seen from the Bow-road, wherein it In our ensuing number we shall give a plan of the ground floor, and some particulars of the arrangement. Suffice it now to say, that the huildings externally are of brick, with Portland cement and, to a certain extent, Caen stone dressing. The low building seen in the centre is the chapel, and serves to divide the fore court into two quadrangles, having around three sides of each an open

THE ADORNMENT OF THE CITY OF EDINBURGH.

WE are surprised to learn that it is not only intended to alter, in effect, the front of the Register House, by the erection of Mr. Stecle's colossal equestrian statue of Wellington there, but that, in order to make way for the statue, a complete alteration of the central portion of the screen or step-flight is meditated. We the screen or step-flight is meditated,† We must really protest against any such tampering with one of the chief architectural ornaments of this fine city. With our correspondent "Vitruvius," however well and carefully or tastefully accomplished, we would just as soon see "The Lady of the Lake," or "Marmion," with additions and improvements by John Wilson, or the professor's own beautiful poems altered by some poet of a future age. Not that we would object to see an appropriate piece of by some poet of a future age. For that we would object to see an appropriate piece of sculpture added to Adams's masterpiece. As it is, it is admirably designed for some such ornament, and we know that the citizens of Edinburgh have ever longed to crown this clarent approach with some appropriate piece. elegant approach with some appropriate piece of sculpture, and indeed have looked on it as an uncompleted design without such an ornaan uncompleted design witbout such an ornament; but that such a desire should now be attempted to be gratified by altering, and that it appears most vitally, those very proportions and that very design which induced the desire, is quite preposterous. A colossal equestrian statue too, however excellent as a separate work, is certainly not an appropriate piece of sculpture for such a site, whether altered or not. A double wrong would thus be done, a wrong both to architect and sculptor, as in the case at Hyde park Corner. The conjunction, without the slightest doubt, would be found to be incongruous and absurd. A correspondent of the Edinburgh Courant, adverse, as a man of taste, to the threatened infliction, shows that the effect of the statue, as seen from the only the effect of the status, as seen from the only available points of view, would remind every one closely of the sentinel on duty at the Horse Guards,—but it would be even still stiffer and more ludicrous to view a colossal horse-guard thus stuck up literally on a staircase, when the work it has not still one and not very even though it be an outside one and not very high. As well to mount him on the house-top at once. A correspondent of the Scotsman. at once. A correspondent of the Scotsman, also adverse to the meditated arrangement, points to St. Andrew's-square as a better site for such a statue. But the Melville monument already occupies the centre of that square, as a grand terminal to the series of lesser monuments all along designed to occupy the several crossings in the line of George-street, and the toute ensemble of such a design might be injured or confused by such arrangement. The favourite suggestion that it be placed in the Princessuggestion that it be placed in the Princes-street Gardens appears to merit its favour and preference, even though the statue were placed in a central position near the Scott monument, inasmuch as these gardens constitute that one

sunny central spot in the city where, graced in the back ground by the picturesque antique ontline and shadow of the High-street houses, boldly ascending along the hilly ridge to the castle, and flanked and freshened by the rich foliage of the gardens in the valley beneath, a foliage of the gardens in the valley beneath; a perfect galaxy of sculptural and architectural ornaments might be and ought to be crowded and concentered. And already the idea has been seized and appropriated by the city architect, Mr. Cousin, in whose design for the advanced of the agatern and most seen and adornment of the eastern and most seen and frequented division, we find a series of pedestals laid out along a grand terraced mall, and fitted for just such bold and open air groups as a colossal equestrian statue.

The adornment of the Calton-hill, we may

here add, was lately, in some of its details, under notice in the council, when it was re-

" That as there is little likelihood of the National Monument being soon completed, and seeing that the site thereof is in an unseemly state, and out of keeping with the natural beauty of the hill, it be remitted to the Plans and Works Committee, to endeavour to effect some arrangement with the Trustees, whereby the mason sheds and unsightly Prusees, whereby the mason-sheds and unsightly wooden paling be removed, the site inclosed with a low parapet wall and rail, and the ground laid out in shrubbery or flowers, with a fountain in the centre; always securing to the Trustees the rights conferred by Act of Parliament to resume possession of the ground whenever there is a likely chance of the monument being completed."

Mr. Treasurer Dick said that surely it was possible to raise some 400l. or 500l. per annum possible to raise some 4001. or 5001. per annum to keep the work itself still in progression. By the arrangement proposed, the Council and Trustees would be virtually declaring that the public had given up all hope. Another Councillor, Mr. Wright, did not think either Council or Trustees would be justified in again proceeding with the work till they had the whole funds collected.

NOTES IN THE PROVINCES.

THE first stone of the Fulham Union Workhouse was laid on Monday week, by the Bishop of London, and the event was celebrated in the evening at Hammersmith, where the guardians and principal inhabitants and others connected with the union met at dinner; Mr. John Gunter, of Fulham, in the chair.—Plans for the rebuilding of St. Thomas's Church, Newport, Isle of Wight, are to be shortly called for by advertisement.—The Worcester Gas Company lately announced a dividend of 8 per cent. for the previous half-year.—St. Peter's Church, Cookley, is to be consecrated by the Bishop of Worcester on 21st September. A parsonage and school are in course of erection on either side of the church. The style is Early English, from a design supplied by Mr. E. Smith, of Oldswinford, the architect and builder.—Nearly 300l. have been subscribed for erecting the piece of sculpture representing for erecting the piece of sculpture representing the Good Samaritan, in the entrance-hall of the general hospital at Bristol.—Under head of "Great Improvements at Small Cost," a correspondent of Felix Farley's Bristol Journal, "A Lover of Gothic Architecture," suggests that the "following improvements might be effected by a few trifling subscriptions from the lovers of the Gothic standard of beauty in ecclesiastical architecture.—One the well-alecclesiastical architecture:—Open the walled-up cloisters of the cathedral, let the stranger once more wander over that holy ground; re-move the modern sashes from the old Saxon once more wander over that holy ground; remove the modern sashes from the old Saxon gateway in College-green; and replace them hy windows of the proper period; remove the Grecian flower-pots from the old tower of St. James; remove the tawdry porch of St. Peter's church, with its puffing cherubims, and replace it by a modest Gothic arched doorway; let the interesting crypt of St. John's church, with its monument of Rowley, &c., he cleansed, the bosses picked out, that the place may no longer be used as a coal cellar; let the mahogany arched box that encloses the entrance to the cathedral be swept away, and the old Gothic porch be opened."—The plant of the late contractor has been taken at a valuation by the Plymouth Great Western Dock Company, and the works have been again commenced; but we are informed that it is only the intention of the Directors to spend from 6001, to 8001, to secure the works commenced by the late contractor, and also to repair the Millbay Pier.

The company have no contractor; the securing of the works is let to six workmen who were employed by the late contractor.—
The new parish church of St. Agnes, Cornwall, was opened on Tuesday in week before last. The nave and chancel are 85 feet long, exclusive of tower at east-end; south aisle, 73 ft. 6 in.; north aisle, 61 ft. 6 in. The style is perpendicular, with flat headed side windows. The roof is lined with wood, stained dark. The aisles are laid with red and black tiles, and the chancel with encaustic tiles. The seats are The company have no contractor; the securing the chancel with encaustic tiles. The seats are all low, open, and uniform. The old tower and spire remain for the present, but there is a surplus for a building-fund for a new tower. The edifice was begun in August, 1848, on the site of the old one, which had become ruinous in rather an odd way. A worthy church-warden, about half a century ago, finding one of the pillars in his way, forthwith removed it, and a brother Sampson feeling that his power to do the like was unquestionable, forthwith removed its fellow. The roof accordingly began to fall in, and the walls to fall out, so that, notwithstanding "props of timber," and and spire remain for the present, but there is that, notwithstanding "props of timber," and other unavailing support, the whole hecame ruinous and unsafe, and was at length pulled down to make way for the present structure.— The contract for building St. Peter's Church, Macclesfield, was completed in the week before last, and on Saturday week the edifice was consecrated. It is in the Early English style, with three aisles, and is built of stone, for 600 to 700 persons. The chancel windows are filled with estimate glass. The chancel windows for 600 to 700 persons. Ane chancet windows are filled with stained glass. The architect was Mr. T. Turbshaw, of Newcastle; and the builder, Mr. Evans, to whom it was transferred from Mr. Frith. The new school of St. Peter's change gating. from Mr. 17th. The new school of St. Peter's adjoins the building.—A Congregational Church for 1,000 sitters has been erected at Wolverbampton, at a cost of 6,500l., including site, from designs by Mr. Edward Banks, of Wolverhampton, architect, who superintended the creefice and the statement of the control of the contr Wolverhampton, architect, who superintended the erection, and also designed the schools connected with the church.—A new national school and master's-house is ahout to be erected at Beverley, Mr. W. Richardson, builder.—The Edinburgh Plan and Works Committee have accepted an estimate by Messrs. Hume and Melville for fitting up wells on the Calton-bill, at a cost of 781.—The City Dean of Guild has ordered the immediate removal of the tenement in which John Knox removal of the tenement in which John Knox

LONDON GRAVEYARDS .- THE CHOLERA.

MR. WALKER has addressed another note of warning to the public on this subject, accomor warming to the punic on this sunject, accompanied by some startling statements from Sir James Murray, which ought to receive attention. He says in it,—"Searcely an effort has been made to remove the most evident and most prolific cause of visitations, of which we are now gathering the justly-merited fruits.

The saturation of the earth's surface and sub-surface by the excretions of man and animals,—the sanitary mischiefs resulting from imperfect sewerage and overflowing cess-pools, wherever large congregations of the human species are gathered together in cities or towns, are not immediately remediable,—the mistakes and errors of centuries cannot be rectified in a day.

But we can and ought instantly to remove a chief cause of disease and premature death deposited in our very midst.

Between forty-five and fifty thousand hodies are annually placed in the receptacles for the dead in London; and these bodies are deposited amidst millions of others who have presided amidst millions of others who have predeceased them. Twelve-thirteenths of dead body must dissipate and mix with the air we hreathe, which is thus made the vehicle of invisible and subtle poisons. The transmission of gases and the percolation of animal compounds, through the walls of houses and drains, and their consequent diffusion therein, and transmission through the gully-holes, I have years since proved."

Sir James Murray, first referring to what has Sir James Murray, first reterring to what nas been said elsewhere, as to the connection between epidemic diseases and the electrical condition of the atmosphere, remarks,—" Let any of the advocates of intra-mural graveyards employ accurate electricians, with delicate instruments, to measure the terrible galvanic

^{*} Thirty-one tenders were sent in, ranging from 33,100t. to 73,957:11
† In virtue of a warrant obtained from the Dean of Guild Court, operations have been commenced, although it is said that there is little probability of the statuc being ready for at least a twelvemonth.

[†] The arch there, by the way, appears to be confounded by some of the Edinburgh critics with the marble arch at Buckingham Palace,

derangements of fermenting churchyards, then they must be convinced of their fatal practices. Every decomposing human body deposited there is hourly altering and disordering the electric fluid of that locality, which otherwise ought to be, in its normal integrity, fit to maintain the natural proportion of the same fluid in living beings. When the organic elements of dead animals are resolving into kindred dust, that decomposing mass acts as a feeder for a vast display of galvanic actions in the moist grave, as certainly as an acid liquor sets loose a flood of electric fluid in a galvanic trough. As an untoward generation of disturbed electric agency is constantly at work in the continuous caudron of dissolving graves, its action must be felt by the living in proportion to the vicinity and intensity of the galvanic disturbances. I had long since communicated to Dr. Simpson the result of my observations on the direful consequences resulting from an effervescing Golgotha, long kept in active fermentation in Belfast, near the quary, and on a level with low-water mark. my observations on the interfil consequences resulting from an effervescing Golgotha, long kept in active fermentation in Belfast, near the quays, and on a level with low-water mark. This graveyard was bounded on three sides by streets and lanes, and the houses adjoining opened into it. I was for many years the medical attendant chiefly employed by the residents of that district, and can safely affirm that they were generally unhealthy, and liable to howel complaints, influenza, fevers, English cholora, scrofula, and other diseases of dehility, whilst the people on the opposite sides of the same lanes or streets were comparatively healthy, and exempt from the continual scale of epidemic disorders, which merged into each other according to the lethal activity of the galvanie passes in continual operation by the accession of new bodies, and by being in actual contact with the communicating tenements adjoining the churchyard. During all these years I had many proofs demonstrating that persons in these tenements could not be efficiently electrified, because the best machines could seldom produce sparks of any intensity. During these years I often noticed that anagine capable of sustaining fifty pounds with ease in other situations, could not for a moment suspend an iron of ten pounds in the habitations built on the decastating place of internent. From these, and many other observations, it was plain that negative electricity pervaded this vast swamp, and drew away the positive electricity from the living creatures in immediate contact with the damp earth and air of that fatal and extended trough, or galvanic pile."

ARCHITECTS' CHARGES.

DERICK v. STANTON, CLERK.

This was an action (tried on the Oxford circuit for the amount of an architect's bill, for his expenses, and for furnishing plans for building a new district church at Ocker-hill, near Dudley. The defendant had paid 571.8s. into court, in satisfaction of the plaintiff's demand,

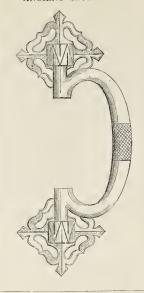

demand.

The plaintiff was said to be an architect of good practice in building churches, and the defendant was curate of the new district of Ocker-hill. By the direction of the defendant, the plaintiff had prepared several plans for the intended new church, and, at the suggestion of the defendant, several alterations and additions were afterwards made to some of the plans, and some new ones substituted for others. It did not appear that any specification for working the plans had ever been made or delivered. Though they had not been exactly followed in building the church, there was such a general resemblance of design that two architects swore that they had been substantially followed. It was proved that the ordinary remuneration for an architect, when he did not superintend the works, was 3½ per cent, on the estimate,* which was in this case 3,0001, together with an allowance for travelling extogether with an allowance for travelling ex-

Without hearing witnesses for the defence, the jury said they were already satisfied that the sum paid into court was a sufficient remu-neration under the circumstances, and accordingly found a verdict for the defendant.

* So says our informant.

LANDLORDS AND TENANTS.

GUMMER v. POWELL .- This was an action to recover compensation in damages for an illegal seizure. The case was heard in the City Sheriffs' Court on Monday. Damages were laid at 10t.

were laid at 10t.

The facts are these:—In July, 1848, the plaintiff, a poor woman, was induced to lend 28t. to a person named Offord, a tobacconist, at that time carrying on business in Little Bell-alley, where he rented a shop, parlour, and kitchen belonging to the defendant, who is the owner of several houses in that neighhourhood. Offord being mahle to pay the loan, gave plaintiff a hill of sale of his stock in trade and furniture, dated 20th October, 1848. On the 4th of July in the present year, Offord being in arrears for rent, the defendant and a present of the present year, of the stock in the stock in the stock in the story of the stock in the stock i being in arrears for rent, the defendant and a man named Shetlock broke open the shop door and distrained upon the goods in question, notwithstanding he had received notice to withdraw, and the instrument under which the plaintiff put in her claim having been shown

to him.

The defendant admitted that he had received such notice, and that he gave Shellock directions to break open the door, but considered that he was justified in so doing, the door heing in the passage, and also on the ground that he had previously obtained an entry into the kitchen occupied by Offord, the door of which was wide open. which was wide open.

His Honour inquired if there was any door immunicating from the kitchen to the shop? The defendant replied in the negative.

Shetlock, in the course of a rigid examina-

tion, admitted that he produced a false war-

rant.

Mr. Buchanan, who argued the case for the plaintiff, contended that the defendant had clearly heen guilty of a trespass. The shopdoor, notwithstanding it was in the passage, and was an inner door, was the outer door of the tenant. If it were not so, as well might it he contended that the landing door of a suite of chambers was not an outer door. The defendant, therefore, having made a foreible entry, had unlawfully possessed himself of the plaintiff's property. Had the goods belonged to the tenant, the defendant would have had an undoubted right to distrain; although, as in the case of the Duke of Brunswick v. Slo-

man, he would have been guilty of a trespass, and liable to an action. He (Mr. Buchanan) would say nothing about the bad warrant— (further than it went to show that the defend-ant was aware that he was acting illegally)—a landlord having a right to distrain in person, without the intervention of a broker.

The defendant's solicitor urged that his

Client, having got possession, had a right to distrain; and submitted that if his Honour should he of opinion that a trespass had been committed, the only person to whom the de-fendant was liable was the tenant. His Honour concurred with Mr. Buchanan,

that the door in the passage was the tenant's outer door. If there had been a door in the outer door. If there had been a door in the kitchen, which led to the premises broken into, then the defendant would have heen justified. The defendant was clearly liable for trespass; the defendant was cleanly habit out capasas, but such an action could not be maintained by the plaintiff in the present action, who was only entitled to recover the value of the goods distrained by the defendant, and which, in his Honour's opinion, had been unlawfully existed.

The goods having been valued at 4l., a verdict was given for that amount.

METROPOLITAN COMMISSION OF SEWERS.

A GENERAL court was held on Thursday, the 2nd instant, at the Court-house, Greek-street; Sir John

instant, at the Court-house, Greek-street; Si John Burgoyne in the chair.

The first subject was to receive the recommendations of the Financial Committee for payment of certain items for wages, flushing, and contracts, &c., amounting altogether to 6477. For the past week. A tabular statement was handed in, containing the different heads of expenditure.

The Head Sor expenditure.

amounting altogether to 6472. For the past week. A tabular statement was handed in, containing the different heads of expenditure.

The Hon. Fred. Byng rose, and said, in reference to the item for flushing, that charge appeared to have been made for merely stirring the offensive odours of the sewers, to the annoyance of the public at large, and the sum of 6472. for the week's expenditure was an extraordinary amount. The vestry of the parish of St. James's had pressed upon him the necessity of not discontinuing his attendance at the court, so that he might use his endeavours in checking wasteful expenditure upon experiments; but he was of opinion that his visits there were quite useless. He had no desire to "obstruct" the public business, or to sanction illegal proceedings. However, he must allude to the expenses of these experiments, which fell heavily upon the ratepayers, and he had no douth would speedily rouse the parishes to take measures for the dissolution of a commission which spent the public money in useless objects, and did not remedy existing abuses. He wished to allude to another subject, and that was, that if anything more eminently than another could show the propriety of the protest that he had presented, it was, that an Act of Parliament had been—

Mr. Chadwick rose to order.—This was not the proper time to make these observations, when they had a routine husiness before them. Mr. Byng had been long enough a member of that board to know that order should be followed out. If he had anything to bring forward against the commission, let him prove his case in a proper and regular manner.

Mr. Byng said he would submit to the decision of the Chairman; but he wished to know when would be the proper time to speak on an Act of Parliament which had not been heard of in the court, and had been passed without the slightest knowledge of it by the members of the court.

Mr. Leslie said, Mr. Byng had been requested by his vestry to attend, and he, finding a large item for wages, whished to know how those wage

bad no power to judge whether they had been properly employed.

A long personal altercation ensued, and after some delay Mr. Chadwick proceeded to address the court at some length. He said it had been held np to parishes that they were spending enormous sums of money for flushing the sewers, whereas the fact was, that sum did not exceed 240l. per week. This was for emptying sewers, which at the period to which the old commissioners helonged would have cost 6s. 6d. per load in carting away, to be discharged into the Thames or any other place found convenient, and no doubt in many cases into another sewer, only to be again raised at a fresh cost. By their mode they had now reduced that charge to 6d. per load. Such was the absolute state of things, that even this economy had been held up to be a waste of the ratepayers' money. For his part, he wished there had been more of this extravagance, and they had expended to a much

This was a sample of the comlarger amount. This was a sample of the complaints made by the old commissioners, and one of the points on which had been effected a large economy. He was of opinion that if they could go on free from the "obstruction" of the old commissioners, they might still further succeed in reducing the expenditure, and he now moved that the sum of 6471, he agreed to.

Mr. Leslie said, of all the ignorance he had ever Mr. Leslie said, of all the ignorance he had ever heard in that court, nothing equalled what had just fallen from Mr. Chadwick. And what had called forth this philippie? They had signed a cheque for a certain amount, and they merely asked what it was for. They found items in the sheet for contracts for flushing, and other charges that they believed did not properly come under the head of "wages," and they required explanation.

Mr. Byng said he thought that it was quite useless for any commissioner to attend who was not on the

for any commissioner to attend who was not on the Works Committee. The Works Committee go-verned the commission, and the rest of the Com-missioners were perfect ciphers, who were treated

with contempt.

Dr. Southwood Smith pointed out that wherever the cholera had been received in groups, were found indications of neglect of that which it was the object of this commission to remove, while localities had altogether escaped that had been properly cleansed. He greatly regretted that more had not been done; but to say that nothing had been done was a great misrepresentation, as there was a considerable improvement in the removal of filth over the former method.

inethod.

After further discussion, the following resolution was earried:—"That the weekly sheet be printed, with the items of the work done, and of the former charges of the like work, and an account of the charges which any of the items may be intended to reduce, so far as such information can be obtained in the course of a week from this day."

The New Sewers Amendment Act.—On the re-commendations of the Works Committee being brought forward,

commendations of the Works Committee being brought forward,

Alr. Leslie said, before they went into the recommendations of the Works Committee, it would be as well first to ascertain whether that committee had any legal existence. He held in his hand a Bill that he was told was a Government measure, brought forward on their own responsibility hy his friend Lord Ebrington. It contained a clause to give the Works Committee, however, went on the principle that amajority of the commissioners could decide all questions; but some of them feeling an uneasiness of conscience, went to Parliament to ask for the extraordinary powers contained in the fourth clause of the new Bill. (Mr. Leslie then read the clause giving the committees power to transact any business falling within a certain class without heing first brought hefore the court, and, in fact, nearly to usurp the entire functions of the court.) This power had been sought behind the backs of the commissioners, who had never here informed of it, and he clause had very grouperly heen strike out hy the

had been sought behind the backs of the commissioners, who had never heen informed of it, and the clause had very properly been struck out by the House of Commons.

Alr. Byng remarked that this Bill had heen brought into the House of Commons without the commissioners, or even the clerk, heing consulted upon it. The Bill had been smuggled into the house under the care of its godfathers, Lord Ashley and Lord Ebrington, and yet fourteen of its clauses had heen struck out.*

On the next recommendation of the same committee, that two additional assistant-surveyors be

On the next recommendation of the same committee, that two additional assistant-surveyors be appointed,

Mr. Leslie protested against adding to the array of officers that he then saw before him, who were in attendance on Committee A on Monday, Committee B on Tuesday, and some "fid fad" for every day in the week, instead of attending to their duties. In fact, they had now arrived at such a point that he was determined the Chadwick system should no longer go no, but that it should be ex-

duties. In lact, they had not achieve system should no longer go on, but that it should be exposed and put a stop to. Ee had had eighteen months' trial, which had proved his utter incompetency for the management of that commission. Mr. Chadwick denied that he controlled the business of the commission, but he objected that in the interval of the intermittent courts the business of the commission should be brought to a stand. He then read a passage from the report of the Sanitary Commissioners in support of his opinion. Every step on the part of the old commissioners and old officers was one of retractation of principles and opinions of years. opinions of years.

The motion was then put and agreed to.

The motion was then put and agreed to.

A report was presented by Mr. Grant, on the
subject of offensive drainage in the neighbourhood
of the Blackfriars-road, complained of recently by a
deputation that attended the court. The report
stated that in the immediate neighbourhood horses
were skinned and boiled for dogs' meat, and that in
one yard were seven dead horses that would be
hoiled in one night, and the refuse from them cast

into the sewer in Friar-street, which was I ft. 10 in into the sewer in Friar-street, which was I ft. 10 in. lower than the sewer in the Blackfriars-road, which was a sort of cut de sac, and filled with gases of the most deadly character,—so much so, that a brick-layer going into it was ill for eighteen hours, and that it was impossible to get a lighted candle 15 inches helow the pavement. The sewer was 5 feet 3 inches by 2 feet 3 inches, and the deposit in it was from 2 to 3 feet in depth. As a temporary measure, the report recommended trapping the house drains. measure, the house drains.

house drains.

The report led to a long conversation, in which an opinion was expressed that these sewers would form a favourable means for a trial of Mr. Goldsworthy Gurney's plan for draining off the foul air by means of a steam-jet, and decomposing the same by fire and chemical appliances. The surveyor was directed to communicate with Mr. Gurney on the subject, and the report was received.

A letter was received from the solicitor to Mr. Rains, on the subject of the Bermandsey mill.

A letter was received from the solicitor to Mr. Rains, on the subject of the Bernandsey mill-streams, to inquire whether the commissioners would be disposed to take the remainder of the streams, making his elient a proper compensation for the same,—that Mr. Rains would offer every facility for the same,—and suggested as the basis of an arrangement, the value of the land taken, and what it would cost to make the mill as efficient by steam as water power, including the cost of another steam-engine. (Cool enough!)

The subject was referred to the surveyors, and it was mentioned incidentally, that the son of Mr.

was mentioned incidentally, that the son of Mr. Rains had, within a few days, been fatally attacked, and had fallen a vietim to the cholera.

The next business was to make rates on the following districts, viz.—Western division of Westminster Sewers, Counters Creek district, and Poplar district,

Westminster division ...£17,730 7 0 £17,508 13 0 £19,000 8 9 district ... 3,755 5 4 3,687 2 10

The collection averaged 97½ per cent.

A long acrimonious conversation ensued on the proposition that Mr. Joseph Smith should report on the horings for the purpose of the proposed tunnel scheme, which was agreed to.

scheme, which was agreed to.

A communication was received from the visiting justices of Tothill-fields prison, on the drainage of that locality, and a report upon it was presented by Mr. Gotto, the surveyor, recommending a rearrangement of the internal drainage, and a removal of a portion of the prisoners, as it was originally intended only to receive 500, but recently no less that 809 persons had heen crammed within it. Eleven fatal cases of cholera had taken place there—9 males and 2 females. Report agreed to

Delven fatal cases of choiera had taken place there—9 males and 2 females. Report agreed to.

A vast mass of other business was brought forward, and, after a sitting of nearly six hours, and the exhibition of much unpleasant feeling, the court adjourned.

The conrt met again on Thursday last, the Rev. W. Stone in the chair. It was resolved, on the recommendation of the Finance Committee, that Mr. Hatton be permanently appointed clerk of accounts, at a salary of 350%, per annum, to commence from Midsummer last.

Mr. Hatton be permanently appointed cierk of accounts, at a salary of 330£, per annum, to commence from Midsummer last.

A lengthy document was received from the inhabitants of South Lambeth, setting forth that cholera had broken out in that district, caused, as they helicved, by open drainage and the nuisance arising from the Effra river, from which exhaled the most noxious effluvia. Referred to the surveyors.

A letter was received from Sir George Grey, Secretary of State for the Home Department, enclosing a document from Mr. Baker, one of the coroners for Middlesex, on the subject of a complaint made by the guardians of the poor of St. Mary's, Whitechapel, that he was in the habit of holding unnecessary inquests on persons who had died of cholera, and justifying their necessity at the present moment more than ever. Several commissioners expressed their opinion upon the document, and Dr. Southwood Smith declared that no inquests had been held without good effects and valuable information elicited; that the greatest neglect had been shown by the guardians of the Whitechapel Union, on the outhreak of the cholera; and that had it not been for the influence of Mr. Baker, used for two hours, the jury in a particular case would have returned a verdict of manishaughter against them.

The letter was referred to the Works Committee. The following resolution of the Works Committee. The following resolution of the Works Committee. The following resolution of the works Committee consideration and report, the plans by Mr. Austin and Mr. Phillips, and all other plans suggested; and also to order that, till further order, this committee, after August 20, 1849, open to all the commissioners."

A warm discussion ensued upon this subject, in

A warm discussion ensued upon this subject, in which the Hon. Frederick Byng, Mr. Leslie, Mr. Chadwick, Mr. Lawes, Mr. Bullar, and Captain Dawson took part; and, after a good deal of opposition on some points, it was finally agreed to.

A report was presented by Mr. Grant on the drainage of Richmond, with various suggestions for its sanitary improvement, and that it should be declared two divisions, under the titles of the Sheen and Richmond divisions, and a special sweets rate. and Riehmond divisions, and a special sewers rate raised for the improvement of the same. Agreed to.

raised for the improvement of the same. Agreed to.

A long report was presented on the prevalence of
cholera in various parts of Southwark, particularly
in the neighbourhood of Tooley-street and St.
George's-road, attributing those eases that had occurred in the latter to the improper emptying of cesspools by hand, which opinion was coincided in by
the coroner's jury, who gave it as their opinion
that this course had only aggravated the evils it was
intended to check. intended to eheck.

Intended to check.

The matter was ordered to be immediately attended to by the surveyors.

A weekly balance-sheet, ordered to be printed at the last court, was presented, and upon this Mr. Leslie took the opportunity of repudiating the assertions of waste on the part of the old commissioners, and denying the large economy stated to have accrued from the system of flushing by Mr. Chadwick, and that the returns presented as the charge for flushing were false, and did not include several large items that were incurred for carting away the refuse left by the flushes, and he intimated that three commissioners would call for a special court to investigate the whole question. The question was adjourned. question was adjourned.

Just as the court was about to rise, a Mr. Hawkins rose and addressed the commissioners, and having made some inquiries as to peronission to present a plan for the drainage of London, addressed Mr. Chadwick, threw his card on the table, and expressed his determination of meeting him on the 20th instant, when he would prove that he (Mr. C.) had obstructed measures of improvement, and that he would expose the schemes and intrinues and that he would expose the schemes and intrigues that had been going on. The court expressed their determination not to be made the vehicle of such communications. Mr. Hawkins then abruptly re-

Miscellanea,

HOISTING APPARATUS AT BRITANNIA-BRIDGE.—The lifting of the tube lately laid down at the piers has probably by this time begun. The Bramah's hydraulic presses, by the power of which this work is to be done, are noble instruments. The largest has a cylinder 11 inches thick, with a piston or ram 20 inches in diameter, and the lift a span of 6 feet. The weight of the cylinder is sixteen tons,—of the whole machine forty tons. This one alone has power enough to lift the whole, a weight, it is estimated, equivalent to that of 30,000 men. It would spout the water pressed into its eylinder to a height of nearly 20,000 feet, according to Mr. Clark, or more than five times the height of Snowdon, or 5,000 feet billow that Most Message 10,000 feet higher than Mont Blanc. And yet any one man can "put a hook into the nose of (this) Leviathan," and, alone with him, with the utmost facility and precision, guide and con-trol his stupendous action. There are two of smaller power, with rams 18 inches in diameter. These are placed side by side on the top of the Britannia Tower, and act in conjunction with the larger, which stands at the same level on a tower adjoining. The chains descending to the tube below, are like those of an ordinary suspension bridge, in eight and nine links alternately. The weight of one of these alone is about 100 tons, or more than that great 'life,' the duke's statue, at Hyde-park-corner. They are attached to the rams by iron yokes, or cross heads, of great thickness. The two chains pass through square holes at each end, and are gripped at the top by clams or cheeks, of wrought-iren, screwed like a vice. At the lower end the chains are attached to the tube, or rather to lifting frames within its extremities, by three sets of massive cast-iron beams, crossing, one above another, and secured by wrought-iron straps, passing over the upper pair, and descending into the bottom cells, where they are keyed. The ends of the chains fit under deep shoulders or notches in the lifting frames, where they are secured by screw bolts. These lifting frames and beams add other 200 tons to the weight to be lifted. As the tube rises, it is to be wedged till the masonry is filled in every lift of six feet, so that the process will be slow.

^{*} The principal heads of the new Act will be found in another part of our present number .-- ED.

PROJECTED WORKS. - Advertisements PROJECTED WORKS. — Advertisements have been issued for tenders, by 16th inst., for a new water wheel and pumps, &c. (separate tenders), for the corporation of the city of Oxford; by 1st September, for the erection of a dwelling-house at Kippax, near Leeds; by 4th September (postponed from 6th August), for works to be executed in a new paper lunatic asylum at Powick, near Worcester; by 21st inst., for additional building and alterations at Penrith workhouse: by 14th, for the 21st inst, for administ and antera-tions at Penrith workhouse; by 14th, for the reconstruction of the laundry and erection of steam apparatus for washing, cooking, and heating certain wards in the Thame union workhouse, and other alterations and works at same (building and engineers' work to be separately tendered for); by a date not speci-fied, for the construction of sewers and pipefield, for the construction of sewers and pipedrains at Southampton, also of private drains to 150 properties there; by 16th, for the construction of a small iron bridge at Wyming brook, Upper Hallam,—also for roadmaking and walling there; by 21st, for 5,000 yards of broken Guernsey granite, for Whiteliall and Regent's-park; and by 28th, for fire-bricks and clay, loam, and glars-grinders' sand for the naval dock-yards.

RAILWAY JOTINGS.—West-bridge station, on the NORTH Midland, has been burnt to the

on the North Midland, has been burnt to the ground by spontaneous combustion of 'waste'—grease, oil, &c.—The Huddersfield and Manchester tunnel is said to be more than three miles in length, and to pass at a depth of 652 feet below the ridge of the hill, which it because the stricks the said to be more than three miles in length, and to pass at a depth of 652 feet below the ridge of the hill, which it pierces so straight that on a clear day one can see through from either end.—The receipts on the Croydon and Epsom line are said to have increased 13 per cent, by reducing the scale of charge for periodical tickets, increasing the number of third-class trains, and issuing excursion tickets from London at reduced rates.—A correspondent of the Sheffield Times, who calls himself "One of the Jury," denies the truth of an assertion in a Sheffield paper, that "the disastrous fall of twenty-one of the arches of the Rother viaduct in Septemof the arches of the Rother viaduct in September last was occasioned by the premature removal of one of the centres," and states that the fact was fully established that the fall was occasioned by the sinking of one or more of the piers, caused by the insufficiency of the foundations. "From the evidence of other parties," he adds, "and from personal observation on the spot, I can show you that the original foundations of many of the piers were built on an alluvial deposit, and not on the natural formation—that the centres were not removed from those arches which first fell—that twenty-six out of the thirty-five piers have been taken down, although many of them been taken down, although many of them stood erect, and almost uninjured by the fall stood erect, and almost uninjured by the fall of the aches—that twenty-five of these piers have been rebuilt upon piles, and one on a much deeper stone foundation, and that the whole of the piers are this time built up solid, instead of hollow, as was the case in the first instance. Why has all this been done if the fall was occasioned simply 'by the premature removal of a centre?''

THE IRISH BOG DIGGINGS .- The great discovery noticed in our last is likely to resolve discovery noticed in our last is likely to resolve itself, even sooner than we anticipated, into a mere ignus fatuus. First comes a cry of despondency from Dartmoor hogs, into which "brother tradesmen" were beguiled by a wicked imp of bog-extraction "equal to the Ashley statement." Then comes Mr. Owen himself, to deny that he had ever made experiments on thousands of tons of bog, had ever expended a fortune in such experiments, or ever carried on for a year such a large establishment as was represented. And Lord ever carried on for a year such a large establishment as was represented. And Lord Ashley, too, himself, complains of misrepresentation. In short, the bog-spermacet 'on the table' of the House of Commons seems to have been a true exhalation of bog, that "cast the glamour o'cr the een" of even sharp-sighted members the moment it was lighted. A manufacturer of carbonate of ammonia, astonished, or rather amused with the splendid vision, asks in the Times, how it happens that 600 lbs. weight of that article can be worth 30l., while he can only obtain 9l. 10s. for the very same quantity. "If Lord Ashley's informant," he adds, "has been as over-sanguine in the quantity obtained "It Lord Ashley's informant," he adds, "has been as over-sanguine in the quantity obtained as in the value, this amount should be again divided by three to give a proper result." As to peatine and other articles mentioned, if they

were produced in sufficient quantity to regenerate a dozen Irish parishes, they would, he nerate a dozen trish parishes, they would, he is assured, become so depreciated as not to be worth collecting; and then, as for calling vegetable tar tailow, it must be only meant for a joke. Even the O'Gorman's assurance that the 'spermaceti' was of 'home manufacture' and 'contained no foreign ingredient,' was but an equivocal one, although, we believe, there is no doubt that candles may be extracted from bor.

extracted from bog.
CHRIST CHURCH, BATTERSEA. - This new church was consecrated, on the 27th ult., by the Bishop of Winchester, attended by a large number of the clergy of the surrounding parishes. The church is of the Decorated or Middle Pointed style, with a tower and spire; the plan is cruciform, with nave, aisles, and chancel, also a children's chapel on the north side of the chancel, opening thereto and to the orth transept by pointed archways, which are to be filled with oak open carved screens. The principal entrance is by a doorway, surmounted by a crocketed gablet, in the tower, which is attached to the west end of the nave on the north side. The organ-loft is in the tower. At the east and west ends are large five light windows with traceried heads. The east window is filled with painted glass, by Mr. Ballantine, of Edinburgh, who has introduced prisms tine, of Edinburgh, who has introduced prisms of coloured glass (an invention of his own) at the intersections of the pattern, to throw the prismatic rays. In the children's chapel there is a painted glass window, presented by the architect, Mr. Charles Lee. The reading-desk, pulpit, seats in the chancel, and communion railing, are of oak, enriched with carving, by Mr. Ollett, of Norwich. The centre of the pavement of the chancel, as also the risers of the steps, are inlaid with Minthe risers of the steps, are inlaid with Min-ton's encanstic tiles. The church will accom-modate 950 persons, half being in free-seats, and the entire cost is stated to be a little more

STAINED WINDOW, Sr. Peter's CHURCH,
DERBY.—The east window of St. Peter's DERRY.—The east window of St. Peter's Church, Derby, was completed on Thursday last. Five lights compose the lower part, and eighteen (in the tracery) the upper; the former has been described in The BULDER at page 273. The subjects of the latter are the resurrence of the latter are the resurrence. 213. The subjects of the fatter are the resur-rection, the ascension, the annunciation, the four evangelists, with their respective emblems, and the apostles St. Paul, St. Mathias, St. Thomas, St. James, St. Barnabas, and St. Philip; the remaining four contain the figures of St. George, St. Patrick, St. David, and St. Andrew, the patron saints of the United King-dom. Besides these are four small squares which are filled with the arms of the donor, Mr. Simpson, and with angels bearing scrolls. Each of the five large figures in the lower compartment is surrounded with a gorgeous canopy, exact copies from those in the window of the choir of York Minster. Messrs. Barker and Son, of York, are the artists. The execution of the window is good. As for the design, it does not show well for our artists that they duces them at once to the level of services.

X. Y. Z. are found to fly to ancient beauties, which re

duces them at once to the level of servile copyists.

ROYAL ACADEMY REFORM.—Sir: Is it not a great pity that the institution which takes the arts peculiarly under its wing in this country, viz., the Royal Academy, should be so unwilling to relax any of its laws for the sake of exciting the public mind to love of art. I have on former occasions suggested that it would be a good thing to let the lover orbition. would be a good thing to let the lower public enjoy the exhibition of painting and sculpture, say for a fortnight, at half price, 6d., and for two or three days at quarter price. The Royal Academy are very unwilling to make the least alteration in their ways; what a paltry thing it is that we past students. thing it is that we past students should, after ten years, have to drop our hands for a shilling every visit we make to the exhibition; one would not mind the catalogue, but it seems unworthy a great public institution, after once permitting a boon, to withdraw it, but still one would not begraudge the money if there was good reason to believe that the funds of the academy were really well applied. I say it without hesitation, the funds of the academy are not fruitfully spent for the cause of art. I have no hostility against the academy, but I do happen to know a good many of the ins and outs, and feel with many others that improvement is necessary.—A PAST STUDENT. unworthy a great public institution, after once

IMPROVED IRON PIPES FOR WATER, GAS, AND DRAINAGE. — Sheet-iron pipes, of a peculiar description, were patented in 1838, by M. Chameroy, a French engineer, and have in France been extensively employed for gas, water, and drainage,—being considered more economical than cast-inopossessing freedom from all leakage, are uninjured by salts or acids, bear great deflections of the salts of the s tion without injury, and for water are far more conducive to health. Messrs. Fox, Henderson, and Co. have purchased the exclusive licence for their manufacture in England, and erected their manufacture in England, and erected machinery for executing large contracts. They are made of sheet-iron, bent to the requisite form, strongly rivetted together, and coated with an alloy of tin; the longitudinal joints are also soldered, rendering them air-tight and water-proof. For additional stiffness and protection, they are then coated on the outside with asphalte cement; and, when intended for water, the inside is also coated with bitumen, which resists. like glass, the action of acids which resists, like glass, the action of acids and alkalies. They become so elastic by these and analists. They become so class by these processes that an 8-inch pipe will bear, it is said, a deflection of 1 foot in 50, without leaking at the joints, or injury to the pipe itself. The vertical joints serew together similar to

a cast-iron gas pipe.

Corrugated Iron Houses.—A house constructed of corrugated iron, by Mr. John Walker, of Old-street-road, has been sent to San Francisco. The structure measures 75 feet long, 40 feet wide, and 20 feet high, and is composed of plates of iron, each 8 feet long; its cost was 6004. Mr. Walker has likewise in course of construction eight other corrugated iron houses for California, each having three dwelling-rooms and one store-room. Corru-gated iron has considerable strength, with little weight, and seems to have advantages for portable dwellings and store-houses.

Independent College—Competition.

-With reference to a paragraph in our last number, we are requested to mention that, although several architects were invited by the committee of the proposed college about to be erected on the Finchley-road, to send in de-signs, yet several did not do so, on account of the very short period, of only one month, allowed for preparing the design, and the limited sum to which the competitors were restricted.

to which the competitors were restricted.

A DEFINITION OF ARCHITECTURE.—What do your readers think of the following definition of architecture by Mr. Macaulay, in the 410th page of the first volume of his "History of England?"—"An art which is half a science—an art in which none but a geometrician can excel—an art which has no standard of grace, hut what is directly or indirectly dependent on utility—an art of which the creations derive a part, at least, of their majesty from mere bulk."

The Marble Arch.—Three years ago the

THE MARBLE ARCH.—Three years ago the suggestion was made in THE BUILDER of placing this arch to form a public entrance to St. James's park, at Spring-gardens, and it was referred to again a short time since. I was reterrent to again a sinor time since. It wish to make a similar suggestion, with some modifications. To Buckingham Palace there are but the three chief approaches mentioned below,—one down Constitution-hill, the other through Buckingham-gate, the third under the arch at the Horse Guards. Of these, the two former are little better than backways, and a coachman must almost stoop on entering the tatter. There is, indeed, no main approach; but one glance at the map shows that the Mall in St. James's-park, by the removal of a few houses in Spring-gardens, could be at once converted into a truly main one, conducting direct from Charing-cross to the Palace gates. direct from Charing-cross to the raince gates. By removing these houses, and by lopping and trimming the trees, besides supplying the deficiency, a view of the stone building at the end of an avenue of trees would be added to the architectural embellishments of Charingthe architectural embelisments of Charing-cross—a new feature, almost, to the capital itself. The marble arch should be placed, to complete this main Palace entrance, within the entrance, and completely detached, after the manner of the Roman triumphal arches, and those is Barie Benefities, then but this and those in Paris. Providing, then, by this scheme, a main approach to Buckingham Palace, a view of the Palace and the Mall to Charing-cross, and an effective site for the marhle arch, I think it must be allowed that the suggestion is worthy of consideration.
H. Field, B.A.

SOUTH MYTON WESLEYAN SCHOOLS are to be erected in the Grecian style, near Great Thornton-street Chapel. They are to be faced with white stock bricks and stone dressings Thornton-street Chapel. They are to be faced with white stock bricks and stone dressings and cornice. The ground floor, an infants' school, is 41 feet by 24 feet, with two class rooms, each 11 feet square. There are also two covered play-grounds, one 27 feet by 15 feet, and the other 42 feet by 27 feet, and upwards of 700 square yards of open play-ground in addition. On the first floor the junior school is 55 feet by 27 feet; a class-room adjoining, 20 feet by 13 feet; and an industrial-room, 27 feet by 14 feet. The master's-house is to be at the end of the school buildings, commanding the play-grounds and out-buildings. The entire cost will be about 2,000l., about one-third Government grant. The land, value 500l., was presented by Mr. Thomas Holmes, who laid the foundation-stone on Monday week. Mr. William Foale is the architect; and the contractors are Messrs. B. Musgrave, bricklayers; Steele and Darneley, joiners; R. Wilson, mason; P. Stringer, plumber; Dauber and Son, slaters; Wilson and Woodlin, ironfounders; W. Wardale, painter.

painter.

Supply of Water to Windsor Castle.

—The expense of the "increased supply of water" to the castle is estimated at 10,000l., which the Lord Chamberlain considers to be "urgently required" for the frequent cleansing of the drains, and more especially for the safety of the Castle in case of fire, the present supply being very uncertain and deficient in quantity. This "special service" will require the superintendence of an engineer, and Mr. James Simpson has been selected for the purpose. Mr. Simpson will charge a commission of 5 per cent. on the outlay, not exceeding the of 5 per cent. on the outlay, not exceeding the amount of his estimate—10,000l,

MESSRS. W. and J. FREEMAN consider it to be a duty they owe to their respected connections and themselves, to request a perusal of the following documents.

Translated from the French Language by Mr. A. DE PINNA, of Bartholomew-lane, Royal Exchange, London, Notary Public and Conveyancer, Foreign and English: Official Translator to Her Majesty's High Conver of Admiralty of England, Sec. 8cc. 8cc.

"We, the Maire of the Commune of Allemagne, Canton of Caco, Department of the Calvados,—
"We, the Maire of the Commune of Allemagne, Canton of Caco, Department of the Calvados,—
"Bid, on the 28th May last, deliver to Messer, Lovand, Beednan, and Co. a certificate attesting that the idea had never heat entertained, on the part of the French Government, to commit any infringement on the right of ownership in the quarries opened in my said commune.

"It would appear that, from the said certificate, inserted from time to time in the London journal, "The Builder," erronous inferences have been drawn, tending to establish the belief that M. JOBERT, Senior, is only a secondary proprietor of quarries, while Messrs. LUARD, BEEDRAM, and Co. are the principal proprietors of the quarries of Allemagne, and the only parties capable of executing the large orders for Cace Stone.

"I hat howes me, therefore, to rectify whatever there is contrary to truth in such like assertions; whereofer, I declare unto all whom it may concern, that M. JOBERT, Senior, was the originator of the business of quarring Allemagne Stone, the quarries whereof he has worked, without any interruption, ever suce the year 1820.

"That he is the principal ower of the Allemagne Quarries, and that he is in a situation to meet the largest demands for supplies that can be addressed to him.

"I do further certify, that it comes within my knowledge that the finest stones raised by M. JOBERT, Senior, are consigned, in England, to his correspondents, Messrs. W. and J. FREEMAN, of London.

"Done and delivered at Allemagne, to serve as of right, the 2nd July, 1819."

No. CCCXLI.

SATURDAY, AUGUST 18, 1849.

HE point which most impressed us during a perusal of the new Bill to amend the Buildings Act, brought in by Lord Carlisle,or, as it is to be called, when

passed, "The Metropolitan Buildings Act, 1849,"-is the great alteration made in the relative positions of the Official Referecs and the Registrar.

To all who have been much in communication with these authorities it must have become painfully evident that there was great want of unanimity between the referees and the registrar-that an antagonistic feeling prevailed which could not fail to militate against the speedy and satisfactory discharge of the business of the office. A return of the number of awards made by the referees, since the date of the Supplemental Act that changed the referees from two to three, to which the registrar has refused to affix the seal, and which have consequently been sent to the Commissioners of Woods for adjudication, would show this in a singularly striking manner. Before the passing of the Supplemental Act, when there were but two referees, the registrar acted as a third referee, and the two opinions, where there was a difference, carried it against the one. The seal, so far as we can learn, was then seldom if ever withheld. Since that event, however, the position of the registrar, acting no longer as referee, has necessarily changed, and he has found it his duty to be much more particular in respect of forms, and is less often able to give effect to the award of the referees by affixing the seal. How far the registrar may have been right or wrong we have not now to inquire; we are simply stating the actual position of affairs at the office.

Under the existing Act the referees are appointed as the parties to superintend its execution, and to arbitrate on differences, "as well as to exercise, in certain cases, a discretion in the relaxation of the fixed rules and directions of the Act." The registrar is appointed that relaxations and proceedings may be duly recorded, and with power to withhold the seal from any award, or other document, until directed by the Commissioners of Woods, "if it shall appear to the said registrar that any such documents are contrary to law, or not complete in any of the requisite forms, or beyond the competence of the said official

By the provisions of the new Bill, it will be seen that the registrar is made supreme and dominant, and the referees removed to the position of his clerks or assistants, with the duty of supervising all public buildings. Clause 70 says,-" for the purpose of providing for the determination of questions, and the adjudication of matters arising under this Act, be it enacted-

"That if any doubt, difference, or dissatisfaction arise between any persons whomsoever as to whether any matter or thing is subject to as to whether any matter or thing is subject to any of the provisions, rules, and directions of this Act, or as to which of such provisions, rules, and directions any matter or thing is subject to, or as to the true intent and meaning or effect of this Act in any case, or whether

trary to any of the provisions, rules, and directions of this Act, or as to any matter whatever, whether involving questions of law or questions of fact, arising under or within the operation of this Act, or if any building owner or other person claim to execute any work or operation authorised or required by this Act, and the adjoining owner or other person whose consent thereto may be required shall not have signified in writing his consent to such work or operation if any such adjoin. to such work or operation, if any such adjoining owner or other person cannot be found, or cannot by reason of legal disability or other cause give such consent, or if it be not known who is the person having a right to give such consent, or if any person claim any special certificate which is required or authorised by any of the provisions, rules, or directions of this Act, then it shall be lawful for both or either of the parties concerned in any such case of doubt, difference, or dissatisfaction as aforesaid, or for any such building owner or other person, or for any person claiming any such special certificate as aforesaid, to refer any such matter of doubt, difference, or dissatisfaction, or any such claim, to the registrar of metropolitan buildings, by requisition in writing."

True, it goes on to say,-

"And if any such requisition relate to the structural sufficiency or stability of any building or part thereof, or of any work done or proposed to be done, or to the quality of materials, or work or workmanship, or to the nature of any business alleged to be dangerous. noxious, or offensive, or to the general ous, noxious, or offensive, or to the general line of buildings, or to the obstruction of light nne of buildings, or to the obstruction of light and air, or other injury alleged to be occasioned by any projection, or to the works necessary to be done to any party-structure, or the proper manner of executing works by this Act authorised to be done, or to the quantity of soil or ground or other parts of the premises of one owner which ought to be laid to the premises of another owner or to the execution. premises of another owner, or to the amount of the expenses of works, or to the amount of damage, loss, or injury done in any case, or to the alteration in the value of any premises in consequence of any works, or to any other matter whatever requiring the exercise of the professional knowledge, skill, or judgment of an architect or surveyor, then in any such case, where the question does not relate to any public building, it shall be the duty of the registrar to refer, either generally or specially, any such matters so requiring the exercise of the professional knowledge, skill, or judgment of an architect or surveyor as aforesaid, to one of the official referees, or if the matter of such question be a claim on the part of a building owner or other person to execute any work or operation authorised or required by this Act as aforesaid, and the district surveyor be not a party concerned, then to the district surveyor, to ascertain the facts and circumstances of the to ascertain the facts and circumstances of the case in respect of such matter, and to certify upon such matter; and where the question relates to any public building it shall be the duty of the registrar to refer as aforesaid any such matter to the official referees, or two of them, to ascertain the facts and circumstances of the

case, and to certify upon such matter."

But what then? The referee or the district surveyor having examined into the matter and reported his opinion to the registrar, the registrar, after seven days' notice to the parties of such report (if from the district surveyor), "shall dispose of the matters in reference, together with such matters incidental thereto or involved therein, either by one award or by several awards, as he may think proper, and in such award or awards shall make such determination, appointment, order, or direction, or give such consent or authority, as the case shall require."

More than that,-

"If it appear to the registrar that the matter of any requisition is such as not to require the exercise of the professional knowledge, skill, or judgment of an architect or surveyor as aforesaid, then it shall be lawful for him to dispose of the matters in reference for him to dispose of the matters in reference to him, together with such matters incidental thereto or involved therein, either by one award any matter or thing is or has been done con- or by several awards, as he shall think proper,

and in such award or awards to make such determination, appointment, order, or direction, or give such consent or authority, as the case shall require, without the certificate of any district surveyor, official referee or referees as aforesaid."

So that, as we have said, the registrar for the time being will be supreme; he may call in anybody or nobody to advise him; take the advice or not, just as he pleases; and the referees are reduced to the position of his clerks or assistants.

The committee appointed by Lord Carlisle in 1847, to inquire into the desirability of amending the Act, were unanimous on two points,-the necessity of lessening law-forms and technical proceedings, and of giving the officers under the Act greater discretionary powers,-that is, empowering them to do what, according to the 80th section of the present Act, already quoted, they were appointed to do, but for which it seems no power was given them, -viz., "to exercise, in certain cases,* a discretion in the relaxation of the fixed rules and directions of this Act, where the strict observance thereof is impracticable, or would defeat the object of this Act, or would needlessly affect with injury the course and operation of this branch of business."

How the first of these recommendations would he carried out by the transformation of the board to which we have drawn attention, it is unnecessary to say: forms and technical proceedings would be multiplied without end: it would be a law-court, and all the advantages which were looked for on the establishment of the office, in the shape of prompt decisions and the legislation of practical men, would disappear.

As to the discretionary powers, clause 10 of the new Bill says,-

"That if any of the rules or directions of this Act be found to defeat the purposes of this Act, or needlessly to affect with injury the course or operation of any trade or business, or to obstruct the advantageous use or conversion of buildings, or to hinder the adopto minute successful or binders are accomplishing the purposes of this Act; or if in rebuilding any building already built, or in accomplishing the purposes of this Act; or if in rebuilding any built may already built, or in executing any work upon any such building, a full compliance with the rules and directions of this Act will be attended with injury, or inconvenience; or if in any case any rules or directions of this Act be at variance with or prevent the due observance of the covenants, agreements, or conditions contained in any lease, or agreement for a lease, being of the nature of a building lease, made before the passing of this Act,"—

Then the person affected may ask a modification from the registrar, and the registrar is to obtain the opinion of the referees on the statement, and report it, with his own opinion, to the Commissioners of Woods, who may make the modification required; but this, it will be seen, goes little farther than clause 11 of the present Act.

The Bill proposes a novelty, in the shape of an attorney to be appointed to serve as agent on behalf of the district surveyors and of the official referees when acting in the supervision of public buildings. It is to be "the duty of the said agent to act on behalf of the district surveyors and on behalf of the official referees acting as aforesaid, in the conduct and management of all prosecutions and other proceedings before any justices, magistrates, or courts of law or equity, which any district surveyor or official referee is by this Act directed or authorised to conduct or take, and also to act on the part of the said surveyors or of the said

^{*} These words, "certain cases," made the hitch which prevented the exercise of discretionary powers.

official referees acting as aforesaid in the conduct and management of all references under this Act in which any such surveyor or official referee acting as aforesaid shall be a party, or shall be officially concerned or interested, and generally to advise the said surveyors or official referees acting as aforesaid on all matters of law connected with the execution of their duties."

By way of remuneration, this agent is to receive a per centage on the aggregate amount of fees "which shall have become payable" to each district surveyor, and to the referees for public buildings. This arrangement would probably be advantageous to three or four litigious district surveyors, but whether it would be palatable to those who find law not only undesirable hut unnecessary, remains to he seen. As it now stands, it would necessarily tend to increase litigation and its consequence, bad feeling. Moreover, he could not satisfactorily act for referees and district surveyors too.

The schedules seem an improvement on those attached to the Act now in force. All buildings (except public buildings) are declared to be of one class, and party and external walls of each rate are to be of one thickness, preventing any 9-inch party wall in a tbird-rate building, and allowing it in a fourthrate for the uppermost two stories only. An additional half-square in area is allowed to fourth-rates; and the public have an advantage in the removal of public buildings altogether from the supervision of the district surveyors. This would not only save the public from the payment of two sets of fees for the same building, which the present Act enforces, but would avoid the annoyance to architects of having their buildings first surveyed and passed by the district surveyor, and then pulled to pieces by the official referees, who may take a different view of the provisions of the Act.

ON THE NATURE AND PROPERTIES OF THE METALS USED IN THE BUILDING TRADES.

We have but opened the ball.

CAST-1RON-MALLEABLE-1RON-STEEL

Having already* noted the chief sources whence the almost universally-diffused, and all-important, metal, iron, is derived, we shall now proceed to treat more particularly of its nature and properties, and especially of its three chief varieties, or states, of cast-iron, wrought-iron, and steel.

The appearance, tint, or glance of iron, in whichever of its states we take it,—whether in all the glitter and glory of 'cold steel,' in the homely shine of the kitchen poker, or in the still more dusky hue of the common cast-iron articles of daily use, is so familiar to one and all, that it is only, of course, pro formā that we need here note, that it is of a greyish white with a shade of blue, and capable of assuming, in its form of steel, so high a polish as to excel in splendour every one of even the 'nobler' metals, such as silver, gold, or platinum. In tenacity and strength, too, though not in malleability, or even in ductility, it can be made to excel all other metals. Yet it is capable of being rendered both extremely ductile and remarkably malleable. It can be drawn out into wires finer than human hair, and can be beaten into tolerably thin plates and ribbons. In short, as remarked by one of our standard authorities, in treating of those manifold uses of this most precious metal which are, or ought to be, known to every one,—"It is capable of being cast into moulds of any form; of being drawn out into wires of any desired strength or fineness; of being bent in every direction; of being sbarpened, hardened, and softened at pleasure. It accommodates itself, in fact, to all our wants,

desires, and even caprices; it is equally serviceable to the arts and sciences, to war and peace; the same ore furnishes the sword, the ploughsbare, and the scythe, the pruninghook, the needle, and the graver, the spring of the Geneva watch, or of the ponderous locomotive, the chisel, the chain, the anchor, the compass, the cannon, or the bomb."

But in speaking of its tenacity and its other a little more simpler properties, we must be a little more explicit in detail. Its matchless tenacity in its explicit in detail. other states than that of mere cast-iron is such, that a wire of wrought-iron, drawn out, by its extreme ductility, through orifices gradually diminishing in calibre down to the 0.787 part of a line in diameter, has been found capable of supporting a weight of about 550 lbs.; and a wire of tempered steel, according to Parkes, has been found to carry double the weight of an ordinary wire. One of weight of an ordinary wire. British iron, an inch in diameter, and estimated, in relation to Swedish, only as 348'88 to 549'25, is stated by Murray to have sustained weights without hreaking till raised to 25 tons 6 cwt. The tremendous strength of wire ropes may thence be all the more readily conceived. Invaluable as such properties are, however, there is another perhaps still more peculiar and practically important, namely-welding, which it, and it almost alone amongst metals, possesses, and that in high perfection. Were it not for this peculiarity, indeed, in which it not for this peculiarity, indeed, in which platinum amongst metals, and sodium amongst metalloids, alone at all resemble it, the great infusibility of wrought-iron would sadly diminish its vast utility. The metal when pure and malleable requires the highest temperature The metal when pure of a wind furnace to make any impression on its extreme infusibility. The fusing point of cast-iron even, which will fuse, ranges to 3480° Fahrenheit; and it is very doubtful whether at any temperature it can be made to boil, as many metals readily do. But wrought, or malleable, or fibrous iron, at a bright red heat, is soft and pliable, and, by hammering, will so interweave its fibres, those of one piece with those of another, as to become spliced, as it were, completely, into one continuous whole. Such is a feasible enough idea of the nature of welding. But it is, in fact, hy a species of welding that the very particles of wrought-iron are first of all worked into mass as such. In that curious process, 'puddling,' cast-iron while fused in a proper reverberatory furnace, is stirred or puddled, and thus exposed to the air and flame till the whole mass heaves, burns blue, grows tough, less fusible, and actually falls at length into a dry powder. Then the fire is urged so that the pulverulent mass again agglutinates at the welding heat, and thus, as it were molecularly rewelled, is worked up into masses, and squeezed through rollers into 'malleable iron,' as afterwards and elsewhere more particularly pointed out. The elsewhere more particularly pointed out. The oxides of iron, too, thus yield, with combustible or carhonaceous matter, in the furnace, a metallic spongy mass for subsequent compaction into malleable metal. Such, probably, was every where the earliest mode of treating iron ores, as, indeed, is still the case with ruder nations. But along with this agglutinative property, iron is equally singular in forming, at a high heat, that correlative compound with carbon—cast-iron, whence, again, the purer and more malleable metal is prepared by pud-dling, and by means of which the separation from the ore of every thing extraneous is faci-

* The effect of puddling being apparently so important, one would think there could be but one opinion of its advantage and necessity. Yet we find the son of a very entinent practical authority on this particular subject, namely the late Mr. Mushet, not only broaching another opinion on the versally held ever since the trace of that which has been universally held ever since there are the trace of the whole the son the property of the most preposeberous dogma in the present science of iron-making?—1. The use of the refinery?—2. The use of the blackband iroustones? I am aware that, in attackband every the state of the property of

In connection with these peculiarities of iron, we may here note that it is well known that hammering long continued destroys that very malleability which it at first contributed so sesentially to mature. Dr. Black suggested from this that the hammering, which we all know will evolve even red heat from cold iron, expelled too much of the heat latent in (or, as we may very properly term it, constitutional to) the malleable state of the iron, or to that state essentially necessary, and he accordingly conceived metals to possess malleability in pro-portion to their latent (or constitutional) heat. rom some facts too related by Sir James Hall, it appeared that at certain temperatures, above the welding heats, all iron falls to pieces under the hammer, even as at first applie independently of long continuance, and that this happened at different heats in the different varieties of the iron of commerce,—in cast iron at about 15° Wedgwood,—in steel at 36°,—Swedish iron at 50° to 66°,—and Siberian at 100°. In estimating the respective degrees of tenacity in iron, and investigating other kindred peculiarities of a most interesting and practically important order, such facts might be of great use. It is very generally might be of great use. It is very generally helieved for instance, that mere long continued or reiterated vibration, or other continuous or recurrent motion, will, in like manner heat or hammering as above, at length of itself destroy the tenacity or toughness of wrought-iron—a question, this, that cannot wrought-iron—a question, this, that cannot too soon be investigated and decided, in connection with a scries of just such and experiments as those to which attention has now been drawn. The very fact itself, indeed, that so singular a change in iron as that from the ordinary to the magnetic state, can be induced by merely stroking, tapping, or other gentle percussion or friction, or even by the mere continued pressure of gravitation or magnetic posture in the sphere, prove the proposed subject of investigation to be no idle or groundless one; for if hammering or percussion, heat, or even mere friction or pressure can produce changes so remarkable, so may vibration,—all of these, in fact, being merely different modes of subtle force, operative on, and undermining, or otherwise altering, the connections of the more or less minute particles, crystlets, polarcles, molecules, or atoms of the mass.

The texture of iron, like most of its other properties, varies much with its varieties of state, or with the methods of working it. Though, in bars, or wire, it seems to be longitudinally fibrous, yet when kept long red hot, it acquires a crystaline texture, and has a tendency to cuboidal fracture. This, too, doubtless, involves the nature of that very change which takes place in the undermining of its tenacity by high heat, even though not of long duration. The specific heat of wrought-iron is 0.11379 (Regnault); that of cast-steel, 0.11848; and that of cast-iron 0.12728.

The affinity of iron for oxveen is so wreat

The affinity of iron for oxygen is so great that it will unite with it to form rust at all temperatures, withdrawing it even from water, liberating the hydrogen. Yet it is very singular that the oxide of iron thus produced is reducible again to the metallic state by the very hydrogen which it had liberated. Nevertheless, the spongy mass thus obtained, when exposed to air, has its affinity for oxygen still so strong and undiminished that it takes fire even spontaneously and burns into oxide again. More than that, the black, or rather deep blue protoxide itself, when carefully produced and dried out of access to air and then suddenly exposed to it, will still burn further, and that too spontaneously, glowing like tinder, into brown peroxide, or common rust. In an atmosphere of oxygen, iron burns with vivid brilliant scintillations, produced by merely tying a little cotton to the end of a piece of wire and plunging it in while the cotton is in flames; and D'Arcet showed that combustion

former processes employed, that up to this moment iron manufacturers have apparently never considered whether it is possible to supersede the puddilug process by a direct method of operation. It is not for me to attempt to enlighten the mighty men of fron, whose greatness, like that of King Og, seems to be measured by the extent of their make in iron —Og being celebrated for his iron bedstead, and the eminent iron-masters for the extent of their beds of iron; but I would ask, what is the mighty obstacle which really exists to the production of iron fit for rolling out at once into bars." If there be anything in this rather startling heterodaxy, our quotation of it may assist in ripening the fruits of reflection on it.

^{*} Vide p. 197.

might even be obtained by merely whirling a piece of heated iron rapidly through the ordinary atmosphere with a wire and string. Smithy ashes are scales of partially oxidized or burnt iron, formed by the more subdued burning of highly-heated iron in the open air even without any such artificial excitement. At a red heat, iron rapidly decomposes water and steam, and hence explosions are believed to arise from this powerful affinity of iron for oxygen as from the steam or water. The same affinity enables it, with the aid of high heat, even to decompose potash, or deprive the metalloid potassium of its oxygen, although the affinity of potassium for oxygen is so great that a piece of that substance, to outward appearance just like a piece of soft lead, will, when thrown into water, run along the surface of it burning and blazing, while it consumes the water or unites with its oxygen. It is almost needless to say, that if from manifested its peculiar affinity for oxygen in so peculiar and inconvenient a way, we should have had little use of iron as a metal. Iron, however, as said, will corrode in water for all

deed, as arsenic is but a metallic sulphur after all, there is not the least doubt that arsenical pyrites, or arseniuret of iron, will also rot just as readily as ordinary pyrites, or sulphuret of iron. It is thus that we would attempt to explain some contradictory testimony on the subject of galvanised iron. The perfect purity of the zinc is a point of great importance.

We find it impossible to exhaust the subject of iron and its properties, even in a very elementary and humble way, in a single article, and must therefore recur to this important subject at another fitting opportunity.

descent of several steps in the archway beyond the fireplace,—these, with a few shields of arms, are all that is left to interest the antiquarian visiter. It is not known by whom the fireplace was built; there are the letters W. H. L. upon it; the style is late, and the workmanship is rather rude; it stands in an angle of the room, which is a very small one—too small for such a large fireplace.—C. J. R.

IRISH ARCII-ERY

THE recent visit of Her Majesty and Prince Albert to Ireland, which has proved so gra-tifying in every aspect, and is calculated to lead to much advantage, has given ample occupation to the designers and constructors occupation to the designers and constructors of triumphal arches, and, if we could believe the newspaper accounts, we should be led to state that some "really splendid pieces of architecture," "magnificent designs," and "fine works of art" (sie in leading journals), were put up for the occasion. We are not going to object to the epithets, but merely to remark what struck us forcibly in reading all the accounts that, as Planché writes and Matthews sings, thews sings,-

" Every thing was any thing but what it seemed." This was imitation of one thing, and that of another; the arch was to look like a pedestal and the boards like Sicilian marble. Nothing was real but the loyalty,-every thing sham

but the good feeling.

Amongst the schemes for the improvement of Ireland now rife is the establishment of a ishing settlement and industrial farm on the coast of Mayo, to be called "The Barony of Erris Settlement." A plan bas been prepared by Mr. T. C. Tinkler, architect, comprising school-room, dormitories, kitchen, dining-hall, and master's and paid superintendent's house, with out-houses, &c. Funds for the support of a scholarser have been granted by the Irish Society of London, and the erection will be commenced forthwith. One great object of the promoters is, to lead the people to take advantage of the abundance of fish to be found upon the coast, and for which a ready market has been found. For centuries this incal-culable benefit has been lost to Ireland; from the indifference of the people to the advan-tage, and the want of knowledge and enterprise amongst them, the markets of the neigh-bourhood have been chiefly supplied by fish from Scotland

We cordially wish success to the enterprise.

BUILDING SOCIETIES EXEMPTION FROM STAMP DUTY

As there are many of your readers interested in, or connected with, building societies, I am desirous of directing their attention to a recent case in the Court of Common Pleas, which is the most important, in relation to the law regulating these societies, that has occurred for some time. It was, doubtless, the consideration of this importance, and the general discussion which the decision has given rise to in the profession, that induced Mr. Scott, the authorized reporter of the court, to publish the case separately in a complete form,* and thus that gentleman has been enabled to present to those whom it may concern, a very full and accurate report of the same, with annotations, some months before it would have otherwise some months before it would have otherwise appeared. I will not, therefore, trouble your readers by touching on all the technicalities and subdivisions into which the case resolves itself; the point decided with which we have more immediately to do is,—"that mortgages and other securities given to the trustees of building societies established under the 6 & 7 Wm. 4, c. 32, are exempt from stamp duty." There was a floating onlying among many many transfer. There was a floating opinion among many mem-There was a floating opinion among many members of the profession, that the joint provisions of the Friendly Societies Act (10 Geo. 4, c. 55), and the Building Societies Act (6 & 7 Wm. 4, c. 32), warranted this conclusion. The 37th section of the 10 Geo. 4, c. 56, enacts, "that no copy of rules, power, warrant, or letter of autorney granted or to be granted by any bersons as trustees of any receive stability. persons as trustees of any society established under this Act, for the transfer of any share in the public funds standing in the name of such

"The case of Walker r. Girs and Another, decided in the Court of Common Pleas in Trinity Vacation, 1849. By "Aft. Joys' Scott, of the Inner Temple, Barrister at law. Deny and London: Spettigue and Farrance.

trustee, nor any receipt given for any dividend in any public stock or fund, or interest of Exchequer bills, nor any receipt, nor any entry book or receipt for money deposited in the funds of any such society, nor for any money received by any member, his or ber executor, administrator, assigns, or attorneys, from the funds of such society, nor any bond or other security to be given to or on account of any such society, or by the treasurer, or trustee, or any officer thereof, nor any draft or order, nor any form of assurance, nor any appointment of any agent, nor any certificate other instrument for the revocation of any such appointment, nor any other instrument or document whatever required or authorized to or document whatever required or authorized to be given, issued, singled, made, or produced in pursuance of this Act, shall be subject or liable to, or charged with, any stamp duty or duties whatsoever." The fourth section of the 6 & 7 Vim. 4, c. 32, enacts, "that all the provisions of a certain Act made and passed in the tenth year of the reign of his late Majesty King George the Fourth, withheld? And to amend an Act of the Fourth, initialed 'An Act to amend an Act of the tenth year of his late Majesty King George the Fourth, to consolidate and amend the laws rerouth, to consolidate and amond the laws leading to friendly societies, so far as the same, or any part thereof, may he applicable to the purposes of any benefit building society, and to the framing, certifying, enrolling, and altering the rules thereof, shall extend and apply to such benefit building society, and the rules thereof, in such and the same manner as if the provisions of the said Acts had been therein expressly re-enacted." That portion of the 37th section of the Friendly Societies Act which enacts that no "bond nor other security to be given to or on account of any such society" shall be subject to stamp duty is exsociety sharp be sunject to stamp duty is extended and applied to building societies by a part of the 4th section of the 6 & 7 Wm. 4, c. 32, "so far as the same, or any part thereof, may he applicable to the purposes of any henefit building society." As, therefore, securities must be given for carrying out the purposes of huilding societies it follows as a precessory in building societies, it follows as a necessary in-ference that such securities shall not be "subject, or liable to, or charged with any stamp

duty or duties whatsoever."
Wilde, C.J., in delivering the judgment of the court in this case, said—"By the 37th section of the former Act, bonds and other securities or assurances given to or on account of any friendly society are expressly exempted from stamp duty. And the 4th section of the latter Act—its preamble having already sbown that its object was to afford encouragement and protection to societies to be established thereunder, and to the property obtained therewith—enacts that all the provisions of the 10 Geo. 4, c. 56, so far as the same, or any part thereof, may be applicable to the purposes of any benefit building society, &c., shall extend and apply to such benefit building society, and the rules thereof, in such and the same manner as if the provisions of the had been therein expressly re-enacted. Reading, therefore, the 37th section of the 10 Geo. 56, as incorporated into the 6 & 7 Wm. 4, c. 32, so far as applicable, it seems to us to exempt from stamp duty all securities given

for the purpose of carrying the last-mentioned Act into effect."

One of your contemporaries has sought to call in question (without, we conceive, any great effect) the soundness of this decision; and it is removed that a statute is in the case. and it is runoured that a statute is in the con-templation of the legislature, by which the present exemption from stamp duties, extended to friendly and building societies, will be limited. We can only hope that no such short-sighted notice will be carried into execution limited. We can only hope that no such short-sighted policy will be carried into execution, and for the present we must consider that the Court of Common Pleas held that mortgages and other securities given to the trustees of huilding societies established under the 6 & 7 Wm. 4, c. 32, are exempt from stamp duty, and that, therefore, this is the law. We would also remind your rerders that if such exemp-tions were limited by statutory enactment, it would have a prospective rather than a retrospective operation. Three other questions much importance were determined in the judgment, and the whole case, replete as it is with the pleadings, arguments, rules, certificates, &c., is deserving a perusal by the officers of these associations, and a careful examination from their professional advisers.

A MEMBER OF THE INNER TEMPLE.

THE MANUFACTURE OF GLASS

THE removal of the excise restriction from glass appears likely to give a great impulse to the manufacture, and to raise the material to a still more important position in the arts than

still more important positions it has yet occupied.

The composition of glass is very various; but a feature of general resemblance consists in the presence of silica or flint, combined with one or more alkaline bodies, with the addition frequently of other oxide. The sub-

addition frequently of other oxide. The substances usually present in glass, besides silica, are potash, soda, lime, oxide of iron, alumina, and oxide of lead. Any of these may be used with silica, it being only indispensable that one alkaline base should be present. In these companies, borreis and may be substituted compounds, boracic acid may be substituted for silica without material disadvantage. Much obscurity hangs over the invention of glass, but it is invariably attributed to the

Phenicians, on the authority of Pliny, who relates that some mariners of that nation, when driven by a tempest for shelter to the mouth of the river Belus, which runs from the foot of Mount Carmel, were surprised on finding that the aslies of the plant "kali," with which they were cooking their provisions on the shore, by mingling with the sand, formed a vitreous and rather transparent sub-

The Phenicians for a length of time were famed for the manufacture of glass; and, in the days of Pliny and Strabo, the glass manufacturers of Tyre and Sidon produced articles of great beauty and very elaborate workman-ship, which they had acquired the art of staining and cutting in imitation of precious stones. The Egyptians, it is probable, received their knowledge of the glass manufacture from the Phenicians,—no mention being made in the Mosaic or other ancient writings of their acquaintance with its processes, the only evidence resting upon some pieces of blue glass which have been found at Thebes; but these might have been formed in the course making the glass of their earthenware beads, with which it is identical in composition.

The Egyptians, consequently, rivalled their teachers; and about the time of the Emperor Adrian, Rome obtained its supply of glass from Alexandria, although the import must have been very insignificant in point of quanglass-ware from the time of Nero, who gave nearly 50,000l of our money for two glass cups with handles; but by the time of the Emperor Titus, the Romans must have obtained considerable proficiency, since various glass utensils have been found in Herculaneum, which was destroyed in his reign.*

In the reign of Alexander Severus, the glass manufacturers of Rome were so numerous that they had a distinct quarter of the city assigned them, and were in such a flourishing condition that a tax was afterwards imposed on them. It was in the tomb of Severus that the famous vase was found, which received the name of the Barberini Vase, from the palace in which it was preserved for more than two centuries, when it was purchased by the Duchess of Portland, and afterwards became known to the British public as the Portland Vase.

At a very remote period glass formed one of the articles of commerce which the Phenicians exchanged for tin with the inhabitants of the southern parts of Britain; and it is supposed that the Druids had some slight acquaintance with glass-making, which they turned to good account by persualing their ignorant votaries that their clumsily-formed beads of coloured

glass were amulets of rare virtue. So early as the middle of the first century,

the windows of some churches and monasteries in Britain were glazed by foreign artists, though it was not for some centuries after that glass became common even in such buildings. In the beginning of the sixteenth century glass windows were so rare, that they were carried off as valuable hooty during some riots that took place in Oxford. Even half a century later off as valuatie noosy using some cuts later took place in Oxford. Even half a century later glass windows were by no means in extensive use, for we find that the glazed window sashes of Alnwick Castle, in Northumberland, were taken out and laid carefully aside for fear of

* Among the ruins of Pompeii there was found a large bow window, glazed with a greenish-tinged glass; and a window of the baths, with a kind of plate-glass, ground on one side, to prevent persons from seeing through it.

-A new butter cross, to accommodate

accidents during the absence of the earl. accidents during the absence of the earl. Scotland seems, as well as England, to bave made slow progress in its use: in the year 1661 only the upper part of the windows of the palace itself were glazed, the lower part being closed by wooden shutters. Although it was not much used in England, it made considerable progress in France; hut it was not until the middle of the seventeenth century that the manufacture was firmly established there, Colbert giving encouragement to some French artists, who had learned the art at Venice. The chief articles produced by these manufacturers were mirrors of hlown glass,—the introduction of cast glass mirrors being effected by a manufacturer named Thevart some twenty by a manuacturer named I nevart some twenty years later, who, after experiencing great opposition from the old company, was obliged to unite with it; and it was not till the formation of a new company on the ruins of the old united one, that the manufacture became prosperous.

The manufacture of flint glass was commenced in England in the year 1557 at Crutched Friars and Savoy House in the Strand; and in 1635 considerable improvement was effected by Sir Robert Mansell substituting coal for wood fuel. The first plates of blown glass for mirrors and coach windows produced in this country were made in Lambeth in 1673, by some Venetian artisans, under the auspices of the Duke of Buckingham. There was no English establishment of importance for the manufacture of cast plate glass till the year 1773, nearly a century after its introduction into France into France, when a company was incorporated by royal charter, and established works at Ravenhead, in Lancashire. It appears strange that the Chinese, who have anticipated the Europeans in many matters, should have been ignorant of glass-making, especially when we consider the operations of their porcelain manufacture, and the glazes which are used in it are such as might he supposed likely to lead to the discovery of glass. Even now the only glass-house in the Chinese empire, so far as is known, is one at Canton, in which only old and broken glass of foreign manufacture is remelted and worked again.

G. J. RHODES.

NOTES IN THE PROVINCES.

THE enclosure at Portland breakwater; understand, is to be named the Victoria Har-bour of Refuge.—The projected improve-ment of the entrance into Winchester Cathedral precincts from the Square, by removal of an ancient house, and enlargement of the Mechanics' Institution, has commenced.— The Gloucestershire Chronicle informs us that the restoration of Upleadon Church, in that dishas been completed. The old church had fallen into a sad state of decay. The floor was so damp that it grew weeds in some places, and the pews were in a wretched state. The ancient Norman windows had been filled with common casements, or partially blocked up, and on the outside earth had accumulated to and on the outside earth had accumulated to the depth of 3 feet. All the pews have been replaced by open sittings with carved bench-ends. A simple lectern has been substituted for a cumbrous reading-desk. The old wooden roofs have been stripped, cleaned, and var-nished. The windows have been restored, and the east window filled with stained glass by Mr. Rogers, of Worcester. The chancel has been raised two steps above the aisle, and laid with Painswick stone, in lozenges. munion rails, after an Early English example, enclose the communion-table, which stands on a floor of encaustic tiles in eight compartments. This restoration has cost 370L, and has been carried out chiefly by the incumbent, warmly seconded by the farmers in the parish. After the re-opening on Thursday week, the foundation stone of a new school-room was laid by the Hon. Mrs. Sayers, near the parsonage: Mr. Cullis, builder.— The foundation-stone of Landscove new district church, near Totness, was laid on Tuesday week, in the presence of a large concourse of people, by the Rev. W. Martin. This church will be dedicated to St. Mary, and is, we understand, the gift of Miss Champernowne, the dean and chapter of Exeter providing the ground and the endowment. The architect is Mr. J. L. Pearson, of London; and the builder Mr. John Mason, of

200 to 300 people, is to be erected at Knighton, according to a correspondent of the Hereford -At a late meeting of the Birming ham Street-Act Commissioners, Mr. J. Arnold read a letter from Mr. Pigott Smith, who suggested the propriety of an architect being employed to examine the state of the spire of St s Church, as, in case of its falling, life might be sacrificed .- Mr. J. H. Beilby said, that as much alarm had been created relative to the statements with respect to St. Martin's spire, apprehension might perhaps be allayed by his stating that two eminent architects had lately inspected it, and were of opinion that not the slightest danger exists.—The new buildings of the west wing of Queen's College, Birmingham, from the plans of Messrs. Drury and Bateman, which comprise a suite of rooms of 154 feet in length, for model rooms, library, two additional lecture halls, engineering workshops, and twenty-six additional sets of chambers for resident students, are in rapid progress towards completion, under the contract with Mr. James Mountford, builder.—— The laying of the foundation-stone of the New Wesleyan Chapel, Hill Top, West Bromwich, took place on Monday in last week. The chapel is intended to accommodate 1,000 persons, at an estimated cost of 2,000l, the greater part of which has been subscribed. The architect is Mr. James Simpson, of Leeds, the builder, Mr. John Lees, Hill Top.
-The new Town Hall or Corn Exchange at Stourhridge was opened on Tuesday week. The hall is 70 feet long by about 40 feet wide, and is capable of dining 300 persons. There are two entrances—one from the main entrance to the Market Place, opening into High-street and the other from the Rye Market. Mr. E Smith, of Oldswinford, was the architect and builder, and the cost of building was 550l.

The Altrincham Town Hall and Market Hall is rapidly approaching completion. The brick-work is raised to the full height, the roof timhers are being laid, and the centre of the front has been surmounted by the timber frame-work of the clock and bell-turret. The Market Hall will be 29 feet by 25 feet, and 12 feet 6 inches in height, besides an additional space at the hack of 20 feet by 10 feet 6 inches. The Town Hall or Assembly Room will be 39 feet 6 inches by 26 feet, with an ante-room behind of 16 feet 6 inches by 10 feet 6 inches. ——Thirty new houses only have been huilt in Lancaster during the last year; all of them occupied at good rents. They were all engaged, we believe, before the second story was reared. It has been stated that good small houses pay 13 per cent, upon the outlay.entrance to Rotherham from the bridge, a line of crazy buildings is to be demolished, and the street thereby widened. A new street at right angles with Bridge-gate, opposite the end of College-street, and to extend to the river, has also been projected by the feoffees -From a report of the committee for conducting the subscription for the restoration of Hexham Abbey Church, it appears that the total amount 1,559l. 3s., and the sum expended in purchasing and pulling down houses encumbering the east front of the Abbey Church was 1,431% 19l. 6d., leaving a balance in the treasurer's hands of 127l. 4s. 6d. It was resolved, that an effort be made to raise the an effort be made to raise the sum (3501) necessary to purchase and pull down the remaining bouses, and to put the Lady Chapel in such a state of repair as to prevent it from falling to decay; and that the subscription be then closed, trusting that at some future time the complete restoration of the building may be accomplished.—The church of Amcotts, parish of Atthorpe, Lincolnshire, suddenly fell down on Tuesday week before last. The rec-tor, the Rev. James Aspinall, had observed a yielding of one of the walls two or three weeks yielding of one of the walls two or three weeks before, and had, consequently, performed the service in the school-room. It was a very old building, and the immediate cause of its fall was the increased weight of the thatched roof occasioned by a shower of rain.—A correspondent of the Chelmsford Chronicle states that in addition to the church now A correspondent of the Chetmsford Chronicle states that, in addition to the church now erecting at Romford, several improvements are about to be carried into effect. The large loam pond at the top of market place is to be converted into a fountain, and, with an artesian well, will provide the whole town with pure

A new county court, with a literary institution combined, will form another fea-ture, together with a dispensary. The removal of several dilapidated buildings and the turnpike from the town is projected, with other local improvements.

COLOUR IN DECORATION.

I was much interested with the observa-tions, in the last number of "The Bullder," by Mr. Gilbert J. French, "on the arrangement of colours in ancient decorative art Mr. French having evidently made a careful research into the rules which guided the ancient decorator, it was satisfactory to me to find how closely they corresponded with what I had myself observed.

In the examples that I have examined, which consist of some of the coloured decora-tions to be found among our old churches, the first, second, and fourth laws, with certain trifling exceptions, are invariably followed. The third rule is not much used, except in The third rule is not intent need except in stained glass. I would also notice, how fond the ancient decorators appear to have been of alternating red with green; blue being used more sparingly, and confined very much to soffits, the ground of small groining, panels of ceilings, or, any part where it may be supposed to represent the sky. Red appears, however, to have been the colour most used, especially in the earlier decorations, where frequently red, relieved by the stone colour of the walls, was almost the only colour employed. Red and white was at all times a favourite

Gold was not much used in the decoration of buildings until the 14th century, at least I have not met with any example. At this date it became almost an invariable rule to gild all carved parts which were foliated. ture may be said, generally, to be coloured

your account of the doings Archæological Institute at Salisbury, I see no mention made of the coloured decorations of the cathedral. Although all covered up wi white or yellow wash, except a little in the chapter house and the passage leading thereto, they were at one time very considerable. Traces of magnificent scrolls and other forms may be still seen through the whitewash upon the groining and walls of the choir, which, judging by the little which is uncovered, must be of a very superior description.

It is a pity that the proper authorities do not take the means of bringing them once more to light, by carefully brushing off the whitewash, as they are doing in the Lady Chapel at Ely.

JAMES K. COLLING.

ON THE USE OF THE PEAT BOGS OF IRELAND.

AT a meeting of the Botanical Society London, held on the 3rd inst., Mr. J. W. Rogers brought under the consideration of the meeting the purport of his paper read at the previous meeting of the society held on the 8th July last, "On the uses and properties of the peat moss, and the value of peat charcoal as a disinfecter and fertilizer." It may be necessary to mention that by the aid of peat charcoal, Mr. Rogers purposes to consolidate and deodorize the solid matter of the London sewers, and, whilst by that means benefiting to consolidate the inhabitants of the metropolis, there would be placed within the reach of the agriculturist a manure of the most powerful kind, pul verized, free from odour, and fit for transit by any conveyance. In 1845 he brought the subject under the consideration of the public, and it was then alleged that charcoal could not give that quantity of carbon to the leaf of the plant which it was necessary it should receive, and that the leaf, and not the root, being the portion of it which required such sustenance, his discovery was of no use. Often, however, since then he had tried the experiment, and the result had invariably heen that it was the root, and not the leaf of the plant, which attracted the carbon, and therefore he was more convinced of the propriety of the system he was endeavouring to promulgate. From the experiments he had made, he had found that peat charcoal possessed far superior advantages to what wood chargoal did.

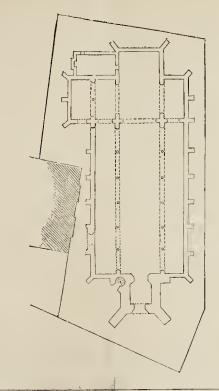

ROMAN CATHOLIC CHURCH, "OUR LADY STAR OF THE SEA," GREENWICH. MR. W. W. WARDELL, ARCHITECT.

NEW ROMAN CATHOLIC CHURCH, "OUR LADY STAR OF THE SEA," CROOM'S-HILL, GREENWICH.

We occasionally hear of the munificence of individuals of different persuations in contributing largely towards the erection of places of worship: amongst the results of such acts, the church of which we present a view in the present number is worthy of especial

PLAN OF ROMAN CATHOLIC CHURCH, GREENWICH.

men have fought in all our great sea-fights, and helped to make England what she is,—mistress, in a great measure, of the destinies of the world. They never flinched when fighting by the side of their Protestant brethren. The good Protestant, with a heart to feel, will acknowledge that they deserve even from him consideration in their conscientions scruples.

The present party (the Rev. Fighterst North)

consideration in their conscientious scruples. The present pastor (the Rev. Richard North undertook their cause. His first effort was unfortunate. He collected 900l. with difficulty, and lost it in the failure of Wright's bank. This misfortune made him but the more ardent to set to work again. In his distress he applied to the Lords of the Admiralty, and received from them 200l. At the present time, after an outlay of nearly 8,000l., he has almost succeeded in huilding his church: much help, however, is still needed to enable him to finish it as it should be. Space forbids us here to give particulars; suffice it to state that nearly 1,000l. have been contributed in copper and silver.

The church is built of Kentish rag stone, The church is built of Kentish rag stone, with Caen stone dressings to the windows and doorways, and is in the style of the fourteenth century, or Decorated English. It consists of a nave, aisles, chancel, three chapels, sacristy, and tower. The columns of the nave are octagonal, of solid polished Purbeck marble. The roofs of the nave and aisles are open, and those of the chancel and chapels are lined with cedar panelling on richly moulded oak ribs; the whole of this will be emblazoned with sacred devices. The cornices from whence this panelling springs are to be filled in with carved foliage, lilies, roses, &c., and the hymn, Ave Maris Stella. In the chapels the inscriptions will relate to their dedications. The outer chapel, on the gospel side of the chancel, is for the organ, and an oratory of a religious community, who will form the choir. The fittings will all be carried out in the same style. The architect is Mr. W. Wardell.

The annexed plan shows the distribution of with Caen stone dressings to the windows and

The annexed plan shows the distribution of the building, and the confined site on which it stands. The tower is next the road.

PARLIAMENTARY COMMITTEE ON SCHOOL OF DESIGN.

The Parliamentary Committee appointed to inquire into the management of the Government School of Design say in their report, which is just now published,—

"From a general review of the evidence, your committee conclude that the schools, though far from having attained the degree of perfection of which they appear capable, are producing beneficial effects, and may in due time be expected, with energetic support and under judicious management, to realize the anticipations with which they have been founded. In an undertaking of so novel and experimental a character, difficulties have naturally arisen, and no doubt errors have been committed. Prejudices have been encountered; it has been found difficult to get men duly qualified in all respects for the duties which they have had to discharge; and finally, there have been many differences of opinion there have been many differences of opinion among those who have been charged with carrying out the undertaking, which have ne-cessarily impeded the uniformity of its opera-tion. Your committee cannot flatter them-

that some confusion exists in the proceedings of the present managing body, which they attribute to the circumstance of the relations between the Board of Trade and the committee of management being imperfectly defined; they would recommend that the management be placed on a more distinct footing, by rendering the Board of Trade directly responsible for the management; and vour committee trust that the Board of Trade.

pooting, by rendering the Board of Trade directly responsible for the management; and your committee trust that the Board of Trade, being made distinctly and primarily responsible for the working of the system, will from time to time make such improvements as experience may show to be desirable."

"Your committee are then, generally, of opinion that the principles of management of the head and branch schools should be these that the supreme executive authority should be vested in the Board of Trade, and that all persons employed should be immediately responsible to that department. That the Board should appoint all masters and other persons. That one or more paid inspectors, acquainted with ornamental designing, should be appointed, who should frequently visit and report upon the provincial schools, but that the inspectors should not be authorized to interfere with the details of the teaching in any school, for which the head-master or masters of every school ought to be solely responsible." of every school ought to be solely responsible."

The committee recommend an increased supply of examples and works of art for the provincial schools, and better accommodation for the central school at Somerset House.

The report seems to us a very "yea-nay" sort of document, and so far as we can discover, might as well have remained unwritten.

THE COVERED BRIDGES OF SWITZER-LAND AND THE TUBULAR BRIDGE OVER THE MENAI STRAITS.

As a visitant of Chester during the recent congress of the British Archæological Asso-ciation in that city, it was impossible, when so near the most important modern triumph of the art of engineering, not to visit the new tubular Victoria Bridge over the Menai Straits, and I believe it may now, during its formation and erection, be more duly appreciated in all its colossal proportions and the felicities of its

its colossal proportions and the felicities of its construction than it will be when poised in mid air as a thoroughfare for immense trains. But it struck me that the idea of a "hanging and covered bridge," though in a different material, viz., wood, had been realised in Switzerland and Germany, nearly a century back. I need not recall to your recollection those uncommonly curions structures that were erected over the rapid torrents of the Swiss republic, where, from the force of the current, pillars supporting arches were impracticable; but to your readers the following particulars of some of them, and of others copied from them, may be new and interesting:—

The first in date and merit is that of Schaffhausen, built over the Rhine, where the influence of that river's cataract, a couple of miles lower down, at Laufen, is felt in great force.

lower down, at Laufen, is felt in great force. From its firm construction, it was accounted the best wooden bridge in the world, though the flatness of the banks on each side offered no facilities, and the merit of its projection and construction is due to a common carpenter of the place, called John Ulrick Grubenmann, in 1757. Its entire width was 353 feet 7 inches, cessarily impeded the uniformity of its operation. Your committee cannot flatter themselves that these difficulties are yet at an end; but they see reason to hope that they are gradually disappearing, and confidently recommend to the house to continue the support which has hitherto been afforded to an object of such great national importance."

"Evidence has been taken upon the systems of management which have prevailed since the opening of the schools, and upon the principles on which the several managing bodies have acted. The inconveniences of the plan of placing a council, or committee of management, variously composed, and consisting of unpaid members, between the Board of Trade and the masters of the school, have been for some time recognised; and unless your committee were prepared wholly to disregard the evidence taken on this point, they cannot avoid expressing the opinion that the present committee of management ought not to be retained. * * Your committee observe

A fine geometrical elevation of the hridge at A nne geometrical elevation of the intoge at Schaffhausen is also given in Gauthey's "Traité de la Construction des Ponts," &c., edited by M. Navier, Paris (tom. i. 1809, tom. ii. 1819), on plate iii. fig. 5. Perhaps, in imitation of that at Schaff-hausen, Joseph Ritter, a Lucerne carpenter, built in 1824 bis first hanging woden bridge

hausen, Joseph Ritter, a Lucerne carpenter, built in 1764 his first hanging wooden bridge over the River Candel, in the canton of Berne, with a span of only 156 feet, and on account of the precipitate banks of the river, with a nunch steadier hold, and therefore much simpler than its prototype; and in 1786 he followed it up by building another over the Reuss, in the same canton, with a span of 148 feet, which seems to have had many of its parts in common with a hanging bridge re-cently built over the Calder. In 1786, an architect of the name of Etzel

built a bridge on these principles at Plochingen, in the then dukedom, now kingdom of Würtemherg, over the Neckar; it has two spans over the river, resting upon a pier in the centre, each of 176 feet, and has this peculiarity, that the centre is narrower across than the ends, to prevent its slipping out of

In more modern times the art of woodenbridge building has been carried to great perfection in Hungary, by the Austrian road architect, John Gross, who in 1807-8 built a covered bridge over the Waag, in the county of Thurotz, on the principle of the former at Sci affhausen, which seems to have served as a general model. It has, however, the advantage of heing huilt upon the two banks, hold and precipitate, which permit the staunchions support it to be directed to a common centre above the roadway, which gives the whole great strength and firmness. It is described in Jos. Jeckel's "Galizien's Strassen und Brückenbau," Wien and Trieste, 1806, and copied from this into Langsdorff's "Brückenbau," plate xvii. But the most "Brückenbau," plate xvii. But the most curious feature in these Magyaric structures is But the most their small cost; the above was built for only 35,000 gülden, or about 3,000l. So also one over the Saat, in the county Przemisl, with a total span of 497 feet over three stone piers, cost only 48,600 gulden, or 4,050l. At Tarnow, one over the Bial river, in 1782, with 177½ feet span, only 10,080 gulden, or 840l.; and as recently as 1802 one in the county of Arvanser, width 236 feet, at the expense to the imperial treasury of 15,600 gulden, or exactly 1,300?.

—so cheap is labour and indigenous material in that country, which may almost account for the obstinacy of resistance offered by it to the Austrian arms, where men are so readily to be procured and such immense woods exist cover a retreat or to check the operations of an WILLIAM BELL.

A GERMAN ARCHITECT ON ARCHITECTURAL COMPETITION.

AT a time when architectural competition is so much discussed, both as to its principle and practice, the following remarks by a German architect (M. Van der Nüll), on the occasion of a competition for the Parliament Houses at Pesth, may not be useless :-

"The course of calling upon architects to submit designs in competition is one which ought, if properly carried out, to lead to a satisfactory result, by reason of its publicity; but as long as the instructions issued are not accompanied by a distinct assurance that the prize or prizes will be awarded to one of the designs submitted, and as long as the capabithe judges to decide on the artistic well as the general merits of the designs is little considered, and their proceedings deserve so little confidence from architects, competi-

tion will continue to be a mere form to screen

It would seem reasonable that, as in other professions the merits of men and measures are only decided on by persons properly qualified, architects smould at least be treated with same consideration: but not so; to criticise architecture seems easy to every one, and laymen (if the term may be allowed) are even beginning to furnish designs!

It too frequently happens that designs sub-mitted in competition are returned with the answer that they do not fulfil the required conditions; and it is certain that the result of

often great mental toil is thus exposed to piracy, without any safeguard. But these great evils are not inherent in the

principle of public competition, but are the results of its improper use, and might be remedied if the attempt were but made in earnest

When the building for which designs are required is of considerable extent, as in the present instance, the premium offered must necessarily be of small account in comparison with the whole of the outlay, and should, therefore, be awarded to the best design, according to the terms of the instructions, even in the almost inconceivable case of none of the submitted designs being suitable; for surely it is worth some small sacrifice to obtain the result of so much mature deliberation on the requirements of the case as will be found in the different designs.

The remaining evil, that of the decision, might

perhaps be removed by calling on the com-peting architects themselves to decide on the merits of the designs,—each, of course, omit-ting his own; or should this method prove impracticable, the Institute of German Architects might, at its annual meeting, be called upon to determine the artistic merits of the respective designs, when it would remain for body instituting the competition to adopt one of them,—grounding their choice on the opinion of the institute.

In conclusion, it may be observed that it is very desirable to obtain the opinion of the public by exhibiting the designs,—as the majority of an enlightened and educated people generally tolerably unanimous in their

THE VENTILATION OF STABLES

AT a late meeting of the Highland Society, Mr. Neil Ballingal, of Kinross-shire, farmer, read a paper on this subject, containing the following remarks:—The experience of modern times, both as respects man and cattle, proves that nothing has greater influence upon health and longevity than the nature of the air which is ordinarily breathed. The air expired from the lungs is naturally and necessarily impure, and to breathe the same air continuously is to inhale what acts on the system as a poison. More especially as regards my immediate subject, there can be given no more convincing proof of the imperfection of the system at present generally pursued than the effect produced by the various agents in operation, even on the timber and roofing of stables and byres. Every one acquainted with the subject knows that from imperfect ventilation, the plastering and lathing of roofs fall away in flakes, and are reduced to rottenness by the constant action of So much is this the the condensed steam. case, that it is no unusual thing, in the course of a nineteen years' lease, for it to be necessary lease, for it to be necessary to re-roof a byre, if home timber has been employed. Now, this action indicates a want of power to carry off the impure air yielding the condensed steam, that must prove deleterious. in the highest degree, to the cattle; and we need not wonder, in these circumstances, that pulmonary complaints among cattle are alarm-ingly on the increase. It is with a view to lead others to contribute their experience on a subject so important to the agriculturist, that enture to submit what has occurred to myself regarding ventilation.

The subject of my experiment was a hyre, about 40 feet long by 16 broad, the height of the side walls heing 8 feet, and the roof being tiled, with lath and plaster under the tiles. I found it in a state of complete disrepair in the roof, the wood falling, which had been rendered rotten by the condensed breath of the cattle in continual operation on it. I first raised the side walls 2 feet. At the head of each animal I placed an air slit 2 inches deep, with 1 foot of horizontal length externally, and widening till internally it had a horizontal length of 18 inches. Externally, this slit was about 8 feet from the ground, and it rose gradually till, in the inside, it was 10 Under the ridge rows of tiles on both sides of the roof the tile lath along was put on, leaving these rows uncovered with lath and plaster from end to end of the byre. The well known property of heated air to dilate and ascend, and that of cold air to descend, sufficiently accounts for both my reasoning and adopting this process, and for its effects. The gradual risc of the cool air through the slit provided for its subsequent ascent for a brief space, so as to cool the beated air passing from the animals' lungs before it should strike the roof, and prevent it from depositing the moiswhich it contained. By the slit gradually widened, I aimed at spreading the air over as large a surface as possible, and without introducing too much cold air, giving the most extensive effect to what was intro-duced. The removal of the plaster has pro-vided for the egress of that portion of the heated air which ascended to the ridge of the

The result has been most successful. cattle have, since that time, been uniformly strong and healthy. The air of the byre is cool and refreshing in all weathers; and, what affords a palpable proof of the excellent effect of the system, the wood of the roof which, as has been mentioned, gives way soon in all ordinary cases, is, at this moment, as clean, white, and sound as it was on the day in which

it was put up two years ago.

The simplicity of the plan consists of:—1st. In the case of a slate roof, 1 propose as the most economical plan, to raise the lower edge of the slating by means of a board laid on blocks on the outer edge of the wall, leaving apertures of about an inch high between the board and the wall, which will admit a free current of air. The air will pass under the outer board and lower edge of the sarking, in which a horizontal slit is to be cut of about which a nortzontal still is to be call of about one inch wide, so as to admit its free ingress. To the whole scheme double apertures are necessary. The second or upper aperture, in necessary. The second or upper aperture, in the case of slate roofs, is thus provided under-neath the second row of slates. On both sides let the sarking be removed for the space of about four inches from end to end. This leaves board enough to which to nail the slates; and the aperture allows the heated air to escape gently through the seams of the slates. In cases where cattle are tied with their heads to the gable ends, slit openings up the gable, leaving sufficient strength of sarking to stiffen the roof, will answer the same end. 2nd. In the case of a tile roof. In the lowest row of tiles take off the under slip of plaster latb. This will admit a sufficiency of the external and wholesome air through the curved vacan-cies of the tiles. Then for the second aperture -under the ridge or topmost row of tiles on each side, leave that row, as in my experiment, free from lath and plaster, from end to end of the byre; there is thus provided a sufficient the byre; there is thus provided a sufficient aperture for the escape of the heated air.

An article on this subject, giving the result of other personal experience, will be found in an early volume of our journal.

A TRULY "GOTHIC" EDIFICE.

A CHAPEL, described in the local papers as A CHAPEL, described in the local papers as "the beautiful design of — — Esq., architect," has lately been erected in St. Paul's parish, Bristol. The style is initiation Tudor, and the plan almost a square. Its interior "beauty" consists of an enormously projecting gallery attached to the four sides of the "sacred edifice;" and while some of the principal timbers in the roof are shown, the spaces between them are plastered and ornamented with centres formed of the acanthus leaf. The street, or front, elevation is chiefly remarkable for a peculiar pediment rising from the parapet (supported at the back by an iron bar springing from the roof), and exhibiting the name of the chapel in large Roman characters.

The other features of the front are three extravagant four-light windows, with a transom formed of quaterfoil to hide the floor of the gallery. At either extremity of this front is a very depressed door-way. The mouldings, mullions, jamhs, &c., are of freestone, without dressings. The walls are of rubble, plastered and stucceed. Cost of chapel and vestry from 2,0001, to 3,0001 2,000l. to 3,000l.

How long, Mr. Editor, will the public submit to such caricatures of Christian architecture? How long is our glorious art to be degraded by its so-called professors?

Bristol. No Gотн.

COUNTRY CHURCHYARDS.

THE formation of cemeteries in the neighbourhood of cities, and the abandonment alto-gether of intramural burial, by which, let us hope, it is speedily to be attended, leaves still desirable some improvement of country church-yards, to perfect properly the reform in pro-gress with regard to our means of sepulture. gress with regard to our means of sepulture. The evil which has bred so much reproach in towns—the disturbance and destruction of graves-exists likewise, after a less expeditious fashion certainly, in the village burial-ground, and from the same cause—want of space. Nor has the facility at hand for remedying this evil has the facility at name for remeaying this evin in the country, annexing a portion of the con-tiguous field, heen, seemingly, often taken advantage of. The end, besides this constantly proceeding erasure, as it were, of old graves, has been frequently an elevation of earth to a level above that of the floor of the church, producing damp and decay, and not ministering, one would think, to the health of the congregation; or, if the gutter about the building, commonly seen, may counteract the ill effects alleged, the appearance of the church-a choice example, perhaps—remains impaired. The measure demanded appears plainly to be the enlargement of churchyards, where requisite, throughout the kingdom. The sacredness of the grave being this way ensured, an opportuthe grave being this way ensured, an opportunity presents itself for emobling the view of the church, as well as imparting to the ground a shaded, solemn aspect, by the planting of trees (shrubberies, or anything resembling gardens, to be avoided); nor should a recommendation in favour of improved forms of head stones, &c., be omitted. There are few spots, in short, so capable of being converted, generally, as some instances already betoken, into scenes of more grateful seclusion, of more impressive beauty, than the village burial-yard.

GRAVEYARDS IN CLERKENWELL.

Among the crying evils of the present day may be classed the system of intra-mural burials. In no place is a reform in this particular more necessary than in the district of Clerkenwell, where they are completely hemmed in and closely abutted on, on all sides, by dwelling-houses and workshops, in many cases deriving light and veruilation solely from these pestilential graveyards. The overcrowded state of one of them has been made the subject of a Government commission (I allude to Spafields); the others (four) are scarcely in a better condition; an examination scarcely in a better condition; an examination of them is imperatively necessary. My attention, as district surveyor, has lately been called to the state of the vaults in St. James's Church, where, through quite open gratings, piled in rows, are to be seen coffins seven or eight deep; the graveyard is literally crammed. Strange to say, interments still go on. Extensive workshops are being erected on the adjoining properties.

The attention of Government is now being directed to this subject, and the nuisance must be summarily dealt with. Any further inter-

ments should be interdicted, the vaults sealed, and 2 feet of concrete placed over the grave-yards. R. LACON SIBLEY.

THE FACE OF SHAKSPEARE.

LATE inhabitant of Stratford-on-Avon, Mr. William Warner, has forwarded to us a cast of the front half of Shakspeare's head, from the monumental hust in the parish church, nicely mounted on a black slab. of the poet, whom-

" Neither man nor muse can praise too much,"

may be glad to hear that copies of this are to be had. The mask appears to be a careful transcript of the original, but the hair and beard seem more detailed.

Mr. Britton, in an interesting little volume, which he has just now printed for the subscribers to his testimonial,* "by way of instalscribers to his testimonial, "by way of instal-ment," gives some particulars of the original monument and of the cast taken by Mr. Bullock in 1814, at bis suggestion, with evidence in favour of this being a correct resemblance of the poet, worked it may be from a cast taken from life, or rather, perhaps,

METROPOLITAN COMMISSION OF SEWERS.

A GENERAL court was held on Thursday last, at the Court House; the Rev. W. Stone in the chair. A letter was received from Mr. Pattison, clerk to the Chelsea Improvement Commissioners, asking for facilities to be afforded to that body for carrying into effect certain cleaning operations, if no legal objection existed to such a course. There being several legal objections, the clerk was ordered to communicate with the commissioners to devise means to meet the difficulties upon the question. On the question being submitted to the court as

On the question being submitted to the court as to the appointment of two additional surveyors, Mr. Leslie took an objection to their appointment, and called for the report of the committee showing the necessity for them. It appeared there was merely a simple recommendation from the Works Committee. This subject led to a long and rather permittee. This subject led to a long and rather per-sonal conversation, in which Mr. Leslie, Mr. Bullar, Mr. Chadwick, and the Rev. W. Murray took part; but it was finally resolved that Mr. Bazalgette and Mr. Creasy should be appointed, as assistant-sur-veyors, at a probationary salary each of 2501. per

annum.

Mr. Graham, of Battersea, attended the court to complain that several cases of cholera had occurred in his family, arising, as he believed, from a most offensive main sewer receiving the drainage of Clapham and discharging into the Thames, and which sewer was on the boundary of his property. The deposit in this sewer was 16 feet wide and 4 feet deep. Mr. Grant, the surveyor, was ordered to report on the subject.

A deputation from the parish of St. James, Westminster, headed by Mr. Charles Cochrane, attended the court, on the subject of cleansing the streets of that parish by "orderlies."

After some discussion it was finally agreed, on the motion of Sir John Burgoyne, that no further proceedings be taken in the matter.

*Appendix to Britton's Auto-biography, containing biographical, archeological, and critical essays on Shakspeare and Stratford, &c.

A report was presented by Mr. Grant on the state of Albion-place, Wandsworth-road—the place in which cholera has raged to so fearful an extent, and so specially referred to in the last report of the Registrar-General. From it it appeared that hetween the 27th of July and the 13th of August there were in this place, consisting of 17 houses, 38 cases of cholera, and 25 deaths, and that six of these deaths had occurred in one house; and it also appeared that the cisterns for water were below the level of the cesspools. On the 26th of July there was a very heavy fall of rain, which caused the drains to overflow into the water-cisterns. The day after this storm the first person was attacked; and it was mentioned as a remarkable fact, that no persons were attacked east or west of this place where the cisterns were not liable to this overflow. the cisterns were not liable to this overflow

Miscellanea.

MONEY FOR PUBLIC WORKS .- It appears the great hindrance to any public and national work is the want of funds, and the aversion the Chancellor of the Exchequer has to borrowing for such purposes—but surely there cannot be a more legitimate purpose for borrowing. National works, now in abeyance, or in a very slow course of progress, as the Houses of Parliament, Westminster-bridge, deposit for records, National Gallery, are surely not meant for this generation only, but for ages yet to come; then why should the pre-sent generation be taxed for the carrying on of such works, and our posterity have the full enjoyment at our expense? Would it not be far more just that the country should be simply taxed for the interest of a sinking fund for the ultimate redemption of the debt, than be charged with the principal money required for such purposes? The immense advantage to the working classes engaged in building operations should have some consideration. If the Chancellor of the Exchequer had the most ample funds, still the objection would remain; to employ money raised by taxation for the completion of national works I consider both unjust and impolitic upon those now so heavily burthened.—M. P.

IPSWICH MECHANICS' INSTITUTION.—For

some time past the committee of this institution have been striving to obtain a proper building for their purposes, but have heretofore not succeeded. Some of our readers will perhaps remember a competition on the subject, to the terms of which we were obliged to object without the property of the subject to the terms of which we were obliged to object without the subject to the sub terms of which we were obliged to object rather strongly. Plans, it seems, have now been matured, by which, at a contemplated expense of 1,900l., will be obtained a lecture-room 63 feet 6 inches long, 40 feet wide, and 25 feet high, and a reading-room 48 feet long, and 28 feet wide. The committee seek assistance, and we shall be glad to find it afforded to them. Mr. Shave Gowing, of Ipswich, receives subscriptions.

VALUE OF LAND.—At the sale, on Monday, of the building land at Woodhill, Portspeat, the property was hought in at 400 feer.

day, of the building land at woodmil, Forts-head, the property was bought in at 400. per acre, about four acres of the least valuable part (two acres and a half of which must not be built upon) having been disposed of pre-viously to the sale at that price.—Hereford

JOTTINGS. - The position of the Chester and Holyhead line is anything, it is said, but cheering. More than double the present traffic, it seems, will not pay the interest to the preference holders, leaving out of question the holders of the original capital of 2,100,000l. RAILWAY holders of the original capital of 2,100,000.

The contract for constructing the hridge at Chepstow, for the South Wales line, has been taken by Messrs. Smith and Willey, of Liverpool, engineers. The whole is to be of wrought-iron, the largest span being about wrought-fron, the largest span being about 300 feet, resting on cast-iron piers or pillars, sunk down to the rock.—The Rhymney Iron Works have contracted, it is said, with the Royston and Hitchin Railway Company to deliver in London 5,000 tons of rails at 4t. 18s. 6d. per ton.—The works on the Ipswich and Norwich line are progressing. The via-duct over the Norfolk line is commenced; the bridge near the Victoria-gardens is nearly com-pleted; and the earthworks are proceeding with.—The Edinburgh and Glasgow Com-pany, according to the Reformer's Gazette, have opened up the tunnel at their Glasgow have opened up the tunnel at their Giasgow station through a space of 90 feet between Cathedral and Holmhead-streets, thus admitting light and air into that portion lying near the station. — The London and North-Western Company has permitted the issue of assurance tickets at the principal stations on its line. In the event that the feet of life or present in the reference of the contraction in the contraction of the contraction of the contraction in the contraction of the contraction in the contraction of the contraction of the contraction in the contraction of the contraction the principal stations on its line. In the event either of loss of life, or personal injury, a first-class passenger, by a payment of threepenee, will insure 1,000l.; a second-class, by a payment of twopenee, 500l.; and a third-class, by a payment of one penny, 200l. The insurance is irrespective of distance.——In consequence of the increase of business in transmitting intelligence by electric telegraph, says the Liverpool Albion, and the great complaints, by the eity merchants and the press, on the enormous charges made by the company in comparison with the United States, it is intended to make a great alteration in the scale, so as to render a great alteration in the scale, so as to render this means of communication more available to all parties. We are glad to hear of it, for the sake of the Company itself as well as the pub-lic.——The Moniteur announces that the Pre-sident of the French Republic has authorised Mr. Jacob Brett to establish on the coast of France, between Calais and Boulogne, a sub-main telegraph to cross the Changle and marine telegraph, to cross the Channel, and eommunicate with the English coast at Dover. The treaty guarantees certain advantages to the French Government, and leaves all the expense to the contractor, to whom it secures a privilege of ten years, should the experiment succeed. The works are to be terminated on 1st September, 1850, at latest.

Sussex Archeological Society.—The fourth annual meeting of the Sussex Archeological Society was held last week, at Arundel. In the absence of the Duke of Norfolk, the chair was taken by the Earl of Arundel and Surrey. At twelve o'clock the members assembled at the Town Hall, where a great number of interesting objects in archeology were exhibited. Some pleasant papers were read, and the members viewed the patchy, degraded castle, and ruinous monuments in the church. The disfigurements in the castle, by Dallaway, afford subjects for reprobation.

Bristol-bridge Competition.—The

Bristol-bridge Competition.— The Improvement Committee of the Town Council has awarded a premium of 251. for a design for widening Bristol-bridge, by the corporation architects, Messrs. Pope and Co. It consists, we bear, of two Tuscan columns built upon each of the cutwaters and abutments of the bridge, bearing on their capitals strong iron girders, upon which will be placed iron cantilevers to carry the flagstones of the footway, intended to be 8 feet wide, and surmounted with a balustrade. Eighteen drawings and one model were sent in.

BLIND BUILDERS.—A list of tenders for schools, at Harlow, in Essex; Mr. G. E. Pritchett, architect, The quantities supplied!

RAILWAY COMPENSATION CASES.—Several claims on the London and North-Western Company were recently brought before special juries at Birmingham. In the first, 9,0001, to 10,0001, it was understood, were claimed by Messrs. Waddell and Izod, for the Hen and Chickens Hotel, through part of the stables only of which the Company had made their way. Informality of notices on the Company's part were urged, and the case was cast aside. The powers of the Company to take compulsory possession of property was to expire on the following day.—The next case was Captain Inge's claim of 1,5811. 15s. for a property leased by his ancestors in 1773, for 99 years. Part of the elaim consisted of 5271. 5s., or 50 per cent. for compulsory sale, on 1,0251, the product of 4 per cent. on 103 years' purchase of the rents, amounting to 1001. The calculation was made according to Imman's tables, which the Company's counsel ridiculed as "a system of thimble-riggery to prove anything required." The valuations on the defendants' part ranged between 5501. and 5601. The jury returned a verdict for 1,1471. 10s. The company had offered 7151., and the claimant had offered to accept 1,3401.—The next was a demand of 5,3001. by Mr. Bird, a druggist, for compulsory removal, fixtures, and loss of lease and local business. His rent was 701., but elsewhere, it was alleged, would be 2001. For loss of fixtures 4001, were claimed; loss of income 1 8001. a-year for three years, 2,4001,—forced sale 50 per cent.,—or 3,6001. on whole for loss of trade; loss on 7001. worth of stock 80 per cent., or 5501. The profit on drugs was represented to be 5761., his income-tax amounted only to 131, 6s. 3d., in place of 211. 17s. 3d., but that the return was fixed by the Government assessor, and not hy the claimant. An agreement for lease, duly stamped, was put in. The company's counsel, however, explained that Mr. Bird did not possess a lease, that the company had themselves purchased the free-hold without any such lease, and that the free-holder had merely agreed to give Mr

CAMBRIAN ARCHEOLOGICAL ASSOCIATION.—This society will hold its third annual meeting in Cardiff, on Monday, the 27th inst., and four following days. The president-elect for the year is the Viscount Adare. Cardiff is within reach of many antiquities of interest; the great eromlechau, near St. Nicholas; tumuli, beacons, and camps; the Roman stations of Cardiff and Caerleon, and museum of Roman antiquities at the latter place; a large number of mediawal castles of the first class—Caerphilly, Cardiff, St. Donat's, &c.; Llandaff Cathedral, Ewenny Priory, Margam Abbey, and many interesting smaller churches; there are also very early inscriptions at Lantwit, Margam, &c.

Margam, &c.

INCREASE OF TRADE.—From a summary of exports during the month ending 5th July, in the Birmingham Journal, it appears that there was an increase on glass manufactures of 1,5331. on 20,1691,—the value exported during the like period of last year; that on hardwares and cutlery there was an increase of 15,0021. on 165,8731.; on painters' colours an increase of 2,9831. on 12,9621.; on ron and steel, an increase of 40,2931. on 464,2941.; on copper and brass, an increase of 51,5331. on 101,9861.; and on lead an increase of 13,4321. On 11,4521. On machinery, however, there was a decrease of 3,9531. on 93,8711. The following table shows a progressive demand for articles peculiar to the Birmingham district. Even machinery here appears to be progressing, month by month:

Projected Works.—Advertisements have been issued for tenders, by 25th inst., for the creetion of a party-wall between the ground of the l'addington Workhouse and that of the Lock Hospital; by 23rd, for the crection and completion of certain buildings at the back of and adjacent to, the workhouse of St. Leonard's, Shoreditch; by 27th, for building 1,050 feet of brick sewer, and other works connected therewith, along the Willow Walk, Bermondsey; by 30th, for the reconstruction of the drainage and water supply, with various other works, at the Union Workhouse, Cuckfield; by 27th, for works required in the formation of roads at West Croydon station, and the extension of the Bricklayers' Arms goods depôt, of the London and Brighton Railway; by 8th Sept., for extensive repairs, &c., to the parish church of Aylesbury; by 28th inst., for the erection of Bracknell District Church; by 27th for the whole, or any portion of the works required to be done in the erection of a church in All Saints' district, Leeds; hy a date not specified, for any portion of the works to be done in the erection of St Matthew's National School and schoolmaster's house, Little London, Leeds (drawings to be seen till 21st inst.); by 21st, for the erection of a national school for 225 children, with mistress's house attached, and other buildings by 10th September, for the construction of three reservoirs, and the masonry of a bridge for the Manchester Corporation Waterworks; by 24th September, for works to be executed in new pauper lunatic asylum, to be erected a Powick, Worcester (plans, &c. to be seen on and after 4th Sept., in place of from 6th inst.), and by 28th inst., for making a road, and for pavement and curb-stone, at Southampton Marsh.

Marsh.

New Gas Generater.—A patent self-acting gas apparatus has been exhibited at Hull, according to the Packet, by English's Patent Camphine Company. The gas which it generates (from camphine or mineral oil) is said to produce a light far purer and more brilliant than that of coal-gas, and without the least noxious vapour. The apparatus consists of a furnace of cast-iron, divided into two compartments, in one of which the retort is set, the other being filled with fuel, descending into the furnace, exactly as the combustion proceeds. In the lower compartment is fixed a double retort, having at one end, outside the furnace, a short vertical pipe. At a little distance is the gasometer, and above, a vessel containing the fluid, and connected with the retort by a small tube. The fluid flows through the upper along the lower compartment of the retort, being decomposed in its passage; it then passes through a syphon-box for the receipt of any undecomposed fluid; thence through a washer to the gas holder. Should the gas be generated too rapidly for the burners which are lit, the rising of the gas holder immediately raises a lever and cuts off a portion of the supply of fluid. The apparatus can be adapted to any number of lights for public buildings, churches, lighthouses, gentlemen's houses, road-side railway stations, hotels, and other places where coal gas cannot be obtained. It is also said to cook with cleanliness and nicety.

ART-UNION OF LONDON EXHIBITION.—
The works of art purchased by the prizeholders are now being exhibited in the Suffolk-street Gallery, and will remain on view for three weeks longer. Subscribers and their friends will find it wise to pay their visits at once, while there is plenty of room, and not wait till nearly the close, by which course the rooms become most inconveniently crowded.
UNIVERSITY OF LONDON AND ARCHITEC-

UNIVERSITY OF LONDON AND ARCHITECTURE.—By the new charter granted to the University of London, the council may institute examinations for certificates of proficiency on any subject they may think fit, connected with the arts or sciences, such as architecture and civil engineering. This was spoken of at the closing meeting of the Institute as matter for congratulation. Cela dépend, as the French say.

MANCHESTER CATHEDRAL.—The days of the old tower of the cathedral church are said to be numhered. It has long been in a miserable condition, and the present churchwardens having called in professional advisers, their report fully confirms the reports of former architects as to its dangerous state.

No. CCCXLII.

SATURDAY, AUGUST 25, 1849.

UR ecclesiastical structures of the twelfth century, massive, solid, dignified, and imposing, with their careful proportions and quaint carvings, are interesting

objects for examination, and ever give pleasure to those who know how to observe. Even in ruin we do not merely see

"A pile decayed, Bricks in cunning fashion laid Ruined buttress, moss-clad stone, Arch with ivy overgrown, Stairs round which the lichens creep— The whole a desolated heap!"

But as a memorial of the olden time, telling of the feudal prime—

" More than history can give With these ruined towers doth live !"

And the reflection arises-

Thus it is that vacant air, MIND informs with visions fair."

We are not about to speak, however, of what they suggest, but what they are. The number and grandeur of the edifices raised in the 12th century are matters for wonderment. As Mr. Freeman remarks, when speaking of the works of this extraordinary period, in his recent "History of Architecture" (a work to which we owe a notice), "If art had not reached the same zenith of perfection as in the palmy days of Gothic skill, yet the number, vastness, and magnificence of its works attest alike the bounty of founders and the genius of archi-Within one hundred years, or little tects. more, all the cathedral, and prohably most of the existing conventual, churches in England were reconstructed, sometimes more than once, while many ahheys were newly founded, and parochial schools innumerable built or rebuilt. And, notwithstanding the transmutations which our churches have since undergone, the remains of this period are yet scattered profusely throughout our country, and in many of our most superb buildings it is the prevalent style. Majestic and awful rather than beautiful, no style is more religious, more imbued with the spirit and position of the church in its own day, the day when St. Anselm braved spoliation and hanishment, and St. Thomas sealed his witness with his blood."

Every small village was furnished with a sound substantial church of stone, which in numerous cases has kept its promise of long endurance, and still serves to give stability and importance to the localities which, but for this, had lost their identity long ago. Even in a constructive point of view, they contrast unfavourably for our time with some of the churches of the day, which, cheap, flimsy, and unsubstantial, will not outlast the present generation. We have seen several specimens lately which are a positive disgrace to the parish, the architect, and the huilder.

Winchester Cathedral, Gloucester Cathedral, Southwell, Tewkesbury, Rochester, + and others, described at different times in our pages, afford

good examples of twelfth century buildings In our present number we give a view of ROMSEY Abhey Church, taken from the north-east; * a structure which presents, as completely as any remaining, the outline and general appearance of a purely Norman Conventual Church. In its details, however, it is transitional. The pointed arch makes its appearance in various parts amongst the round arches, and at the western end of the nave the Early English style wholly prevails. A descriptive account of the church, by the Rev. J. L. Petit, will be found in our third volume (p. 446). We will here, therefore, only briefly say it was commenced, on the site of an earlier church, about the middle of the twelfth century; built (as Scott says of Lindisfarne),-

- " Ere the art was known, By pointed aisle, and shafted stalk, The arcades of an alleyed walk To emulate in stone.

It is cruciform; there is a semi-circular absis on the east side of each arm of the transept, as was not unusual in Norman and Byzantine churches. Each aisle of the choir likewise terminates with a similar absis formed in the thickness of the wall, so as not to show externally. The west end contains a singularly lofty triple lancet window. In the south wall of the nave next the transept, one of the original Norman doorways remains, and is now used as a window. It presents a series of concentric arches adorned with various sculptured enrichments, and supported by two columns on either side, with enriched capitals. In the external wall of the south transept, next the door, is a curious sculptured figure of Christ on the cross, about 51 feet high, and close down on the ground, with a band from the clouds above pointing to it. Near it is a small recess in the wall, probably to receive a lamp or taper. Some of the capitals in the aisles, at the east end, are sculptured with figures of singular appearance, and have led to three communications to the Society of Antiquaries, printed in the "Archæologia."+

The tower, at the crux, is low and massive, and is surmounted by a monstrous modern ahomination in the sbape of a wooden enclosure for the bells, which suggests the idea of a brewbouse or a tanner's drying shed in Bermondsey. It seems exceedingly well adapted for-lighting the fires, to which luminous fate, and speedily, we, with our heartiest wishes, commend it.

A short time ago the interior of the church was restored under the able direction of Mr. B. Ferrey, at a cost, as we were told, of ahout 3,000l. At the present moment works are going on outside under the guidance of the churchwarden only, against which course we very earnestly protest. Structures of this kind are nationally important, and should not be touched except under proper advice. Mr. Jenvey may be a very good churchwarden, but he cannot be competent to meddle with the architecture of Romsey Abbey Church. Something is said about taking off the lead and putting slate in its stead; hut we hope our expostulation may be in time to prevent the exhibition of so had a principle, and induce application to a proper director.

Internally it is much to be regretted that the main arches of the chancel and its aisles bave been blocked up,-possibly there were reasons for it, not apparent to the observer. With the new font (a melancholy imitation of Early English) the architect could not have had any thing to do. The old one, if we remember rightly, was much superior.

The transept internally is very interesting, but is marred by galleries. These ought to he removed.

The central tower was originally open as a lantern, and must have had a good effect; but, to form a chamber for the ringers in the upper part of it, at the time of erecting the wooden monstrosity already mentioned, a false ceiling was put in. At the recent restoration this ceiling was raised up somewhat, but still shuts off about 20 feet of the lantern. And here we find a little bone to pick with friend Ferrey. Not because the ceiling is there,-he would of course have wished to get rid of it altogether, if the authorities had been prepared to carry out another arrangement for the bells,-but for a little falsification which may tend to perpetuate the interpolated ceiling. Against the four sides of the lantern are attached-columns which run up to the top, and are therefore of course intersected by the modern ceiling, and what we object to is, that at this intersection, to form a finish inside, helow the ceiling, Norman capitals have been introduced to terminate the columns, which may serve as an argument in years to come, when their modern date is forgotten, against those who may wish to restore to the church its crowning glory: an excusable crime after all, some will say; and we are quite willing to admit it.

Such of our readers as are led to devote one of these pleasant summer days to Romsey Abbey* should notice a touching little monument to the memory of the infant daughter of a surgeon of the town, modelled by bimself. It is inscribed-

"Is it well with the child?

Near to it is a mural tablet, by Flaxman, to Henry, Visconnt Palmerston, and his second

The church has the advantage of a sexton, James Major, who seems to prize every stone of it, and whose intelligence and right feeling deserve a passing notice.

CONSIDERATIONS AFFECTING THE RE-MOVAL OF SMITHFIELD MARKET.

In matters connected with public health, it must be confessed by everybody at all com-petent to form an opinion, that there prevails in England a carelessness upon the part of the public in general, and a total absence of system upon that of the persons especially charged with its care. In no case has the truth of this ohservation been more painfully verified than in the recent attempt to obtain the removal of Smithfield Market. With the exception of the parties interested in the maintenance of this nuisance, everyhody appears disposed to admit that it is desirable that it should be removed, A committee of the House of Commons has examined patiently a great number of witnesses, both for and against the removal; and finally, it bas presented a report to the House to recommend the latter course. A witty member of the House utters some jokes, of very equivocal taste, — and the affair is shelved.

shelved.

We Englishmen talk loudly, and praise ourselves much upon the high state of civilization of our country. The beauty of our capital; the infinite pains we take to maintain

^{*} See p. 402.
† From Dr. Latham, Vol. XIV. p. 136: from Sir H. C. Englefield, following the former; and from W. Latham, Esq., Vol. XV. p. 304. "The length of this church, according to the curious description given in the addenda to Brown Willis's Mittred Abbies, is 240 feet; and its width, that is to say, the length of the transept, 120 feet. His words are:—Ecclesia de Rumesseye, de fundatione regis Edgari, continct in longitudine circa 90 steppys, et parum ultra; item in latitudine condinct circa 46 steppys mess.* The height of the tower is about 120 feet, and that of the body of the church is said to be 86 exactly."—Spence's Descriptive Essay, p. 37.

[&]quot; Winchester Cathedral and the church of St. Cross are but a short distance from Romsey, and may be included in the jaunt.

ruousneu by Masters, Aldersgate-street, London.
† Parts of the interior of Rochester Cathedral are exceedingly interesting and instructive. The exterior has been miserably mangled and marred. The state of the great western door,—one of the finest specimens of an erriched Norman doorway in England,—is to be regretted; but if it would have no better treatment in restoration than some other parts have received, it is much better it should remain as it is. * Published by Masters, Aldersgate-street, London.

its salubrity; the attention we pay to the comforts of the humbler classes of our fellow citizens; the care we take of the education of the rising generation,—are sentences constantly in our mouths. Gladly would the nation sacrifice in any manner, to effect, really, an amclioration in any of these objects, we may safely and proudly assert. Yet either from ignorance or from carelessness we allow the existence of a state of things, in the very heart of London, which is a shame and a disgrace to any Christian land,—which spreads around in every direction the seeds of physical pestilence,—and gives rise to a motal degradation more awful still.

Have any of the readers of this article ever visited the streets and lanes in the neighbourhood of Smitbfield? It is to be feared that there are not many bold enough to expose themselves to the sight of the accumulation of borrors there congregated. If there had been many so bold, our Government would certainly never have dared to allow the money, lately spent upon the rublic improvements, to have been employed merely to make clean the out-side of the cup and the platter, whilst the inside still remains so full of ravening wicked-ness. For we have within a musket-shot of the great thoroughfares of Holborn and King-street,—within the district, in fact, bounded by those streets to the south and east, by the market itself and Goswell street to the north and cast, by Clerkenwell and Field lane on the north and west, -a collection of abominations, the mere recorderation of which is enough to make the gorge rise. Narrow streets,— badly paved, worse drained; houses ill-built, rotten, damp, and falling to pieces; the entries below the level of the street, so that the drainage takes place inwards instead of outwards; no privies worthy even of that name; and in the midst of all this misery and filth, every now and then we find a private slaughter every now and then we find a private slaughter house, a knacker's yard, a tripe-boiler's, a fat-nelter's, or a sort of stall to receive the animals for the next market. Children swarm in the midst of these sights and scenes; for it appears to be a law of nature that our race should develop itself with the greatest proli-ficness under circumstances of the greatest misery. And because we have the state of misery. And here we,—we who talk and boast of the care we take of the children of the poor,—allow them to wallow in the blood and filth of these most foul and disgusting operations. tions; we allow them to accustom themselves tions; we anow them to accussom themserves to sights and scenes which make blood, suffering, and death objects of daily and hourly occurrence. What are we entitled to expect from a population thus contaminated? Should any great political convulsion upset the elahorately artificial system of our society, and drag us through the horarce of a reactivity. us through the horrors of a revolution, it is amongst them that the future Dantons will the instruments willing and able to commit the crimes and butcheries they may order. In the interest of society then, if not from a higher motive, it hehoves us to examine whether some remedy cannot be found for the present awful state of this neighbourhood; and, when once found, the pressure from with-out must be employed to make the Govern-ment fulfil its duty to a class of society so long neglected, and remove a nuisance which can but become greater as the City of London in-creases in wealth and importance.

Presented thus, the questions to be solved are,—Firstly, whether the state of the neighbourhood might not be much improved without displacing the market? Secondly, whether, the market removed, the nuisances would case? Thirdly, what new organization would be necessary to insure the supply of butchers' meat for the London market, and the most favourable conditions for the maintenance of the public health?

The first two questions, by implication, involve the examination of the advisability of retaining the market in its present position,—because, if it be shown that a market in the middle of a town is necessarily accompanied by a series of grievous nuisances, its removal is the first object to be aimed at.

Is the first object to be aimed at.

Now, it is an undoubted fact that the neighbourhood of Smithfield might be immeasurably improved, even though the market were retained. What takes place therein is shocking enough but a mere cattle-market does not necessarily imply a dangerous state of public health. To get the cattle to and from Smith-

field exposes them doubtlessly to much torture; the narrow space they are forced into, and the means adopted to make them crowd together, doubtlessly cause much pain and suffering to doubtlessly cause much pain and suffering to the animals; the absence of water in summer, the filtby mud they stand in in winter, doubt-lessly aggravate their sufferings. But we in England only punish cruelty in detail. Mr. Martin's Act can reach a costermonger who ill-treats his donkey; it is powerless to force the City to find the room necessary to prevent the cruelty to thousands of bullocks, ex-posed every week. And so the grazier has to suffer by the loss of weight of his animals— the public is forced to consume a description the public is forced to consume a description of meat which cannot be in its normal condition of healthiness. This is a sad tale, but it might exist without the accompaniment of the sadder tales told by the neighbourhood; for, at the market of Sceaux, near Paris, which also is too small for the number of cattle exposed, much cruelty prevails. Moreover, it is to be observed that there are parts of London removed from Smithfield, which are as foul as that sink of all that is disgusting; for instance, Whitechapel, Rotherhithe, and the Follies of Southwark. There is, then, no ab-solute connection between the market and the nuisances around it; they may both enjoy their sad celebrity in perfect independence of one another. But there is an important mark to be made - namely, that a market always is accompanied by a peculiar set of aunoyances, which depress the value of the property in its neighbourhood, and which, by so much, encourage the establishment of certain industries, which would not be tolerated in other localitics. Now, as our police only acts expost facto, and upon the complaint of injured parties, it is almost impossible to pre-vent the concentration of nuisances in such localities. In France, where it is necessary have a license to open a building or establishment devoted to a trade of a nature to annoy the neighbourhood, it is easy to control not only their location, but the conditions of salubrity in which they are erected. We have no such control, and it may admit of question whether, after all, the results obtained by our defective police in these matters are not as satisfactory as those obtained by the elaborate one in force in France. Be that as it may, it is certain that unich might be done (and it is a foul shame upon the corporation that it still remains to be done) to improve the neighhour-hood of Smithfield. The drainage and the paving of the streets are surely things easily improved: some means might be devised to open new lines of communication, to widen regulations should be adopted to enforce the observance of the laws of common decency in the different slaughter houses and bone shops of these now-unnoticed localities. It is not too much to assert that hardly one of these establishments is constructed upon the principles of drainage, ventilation, or supply of water now universally received as being necessary to ensure the healthy state of the neighbourhood in which they are situated.

Secondly. As to the question whether the market being removed the nuisances would cease, what has heen said above may be applied here. There is no inevitable connection between the two, their separate and independent existences may therefore well continue. But it is more than probable that many of these unwholesome industries would disappear if the market were removed. For instance, the cattlelayers would of course accompany the new market; the low lodging and public-houses would cease to receive their present tenants; the class of people who would succeed them, in all probability, would be hetter—they cannot be worse; and, by degrees, the foul industries of the quarter would be forced to observe better regulations. We are not justified in saying that the removal of the market will inevitably cause the nuisances, now agglomerated round it, to cease; but every reason exists to induce us to believe that insensibly they would do so. At any rate, their degree of concentration would be less.

Subsidiarily, we may observe, that the connection between the market and the ahominations which surround it is so great, that the latter may almost be regarded as the consequences of holding the former in its present position. The market diminishes the value

of the property in the neighbourhood; it facilitates the establishment of industries which are carried on under conditions unfavourable to public health; it agglomerates a poor, corrupt population in quarters fit only to aggravate their poverty and their corruption. No respectable man, with any degree of refinement of taste, could live near Smithfield. The ground is, therefore, left open to those whose trades require contiguity thereto. Slaughter-houses, cattle layers, tripe boilers, knacker's yards, flourish in the precincts of the great market for the sale of the articles on which their owners work. We may, therefore, hold the market responsible for the abominations of its neighbourhood; and even were it not itself a cause of unnecessary cruelty to the animals, and of loss to the graziers, we should be justified in calling loudly for the removal of a nuisance which is a shame and a blot upon any civilized country.

civilized country.

Thirdly, we have to consider what new organization would be necessary to secure the supply of butcher's meat for London, and the regulations connected with this matter it would be advisable to adopt in the interest of the public health. This involves an examination of the regulations to be enforced in the cattle market, the slaughtering and converting of the

carcases.

There are numerous schemes abroad for choosing a substitute for Smithfield, which have as many opponents as admirers. Some are for transferring it (the market) to Islington, are for transferring review and to the session of King's-cross. But both these schemes are based upon what is in no way proved—the necessity for concentration. They are, moreare based upon what is in no way proved—the necessity for concentration. They are, moreover, only means of shifting the question. Both Islington and King's-cross are already surrounded with houses. London is "going out of town" in both directions. We shall surrounded with houses. London is "going out of town" in both directions. We shall soon find that the same evils will spring up there that we complain of in the present locality. Besides, if the market be still kept in London, why move it? The dwellers of that part of the town appear to have grown to the filthy state in which they live; why force others to undergo such a seasoning? Islington and King's-cross will soon be as densely inhabited as Chelcowell, or count the City. Between as Clerkenwell, or even the City. Between two crowded localities there can be little reason to choose, beyond the fact of the one baving for years enjoyed the monopoly of the nuisance. If any change be made, it must be by removing the market altogether out of London,—Romford, to Finchley, to Hanwell, or Romford, to Finchley, to Hanwell, or to Croydon; perhaps by establishing markets at all these points on different days of the week. The cattle bought at these markets might then be brought to the different slaughter-houses, or to the different butchers' shops, should they prefer to kill upon their own premises. Rules for the sanitary condition of the slaughter-houses should be drawn up, and no operations of this nature should be allowed to be carried in places licensed to that effect, the license to be granted by a board of magistrates upon a report of a district surveyor. If the slaughter-houses be well built, there need be no restriction as to the neighbourhood in which they are to be established; of course, care being taken to remove them from the immediate contact of the public. But the tallow melting shops, the tripe dealers, and the bone burners, as they give rise to foul miasmas, so they should not be allowed to work in the midst of the usual population of a large city.

After some years the forced use of public slaughter-houses might become law; transition, the butchers might retain the right to slaughter at home, the more especially as their own interest would soon make them prefer the large establishments, where the necessary sanitary conditions are so much more easily attained.

The substitute for Smithfield is, after all, the most difficult part of the question. As to the slaughter-houses, the results obtained upon the continent from their adoption have been so remarkable, their success so perfect, both as commercial speculations and as guarantees for the public health, that nothing hut the desperate obstinacy our organised bodies invariably oppose to the adoption of anything foreign, can account for their not being applied in England. But the question of the new market is far from being as simple. In fact, a central market, inasmuch as it brings in contact a vast number of buyers and sellers, rentered.

ders monopoly impossible. Again, a butcher from Camberwell can easily attend at Smithfield, whereas a market on the northern or eastern side of London would force him to absent himself from home all night. The travelling expenses of the butcher must, in the end, be paid by the public; any injudicious choice of the new market which might augment them, would, therefore, have for effect to increase the price of meat. Careful investigation must, then, be made into the sources of supply, the mode of arrival, and the centres of consumption, before any definite course be adopted. But we must bear in mind that after all the difficulties of this question are not so great as they appear. The number of butchers who buy live cattle is small comparatively; in Paris only about one-half attend the markets, the rest buy the dead meat. Doubtlessly in London the proportion is about the same, for our dead meat market increases in importance every day, owing to the railways and steamboats. A change in the market might perhaps only augment the number of retail butchers; and as the wholesale buyers would divide their expenses over a greater amount of capital in movement, the increased expense would not be sensible. But gain, even supposing that the whole augmentation be borne by each separate hutcher, it is more than questionable whether the weight he would gain by purchasing animals in a more healthy state would not amply compensate the money he would spend. A bellock in a London stable, whatever be the mode upon which lee has been fattened, cannot lose less than 8 lbs. weight per day; what must be the loss upon the poor animals worried, driven, and to the result of the ready and the public health! Who can estimate the difference in the nutritive qualities of meat supplied by animals in a normal condition from that furnished by the wearied, feverish victims of our present most absurd and barbarous system?

resent most absurd and barbarous system?

The difficulty of a change in the locality of the market is, nevertheless, very great. Not so, however, the change in the system of slaughtering. For a number of years the proprietors of the present establishments might be allowed to enjoy all their existing liberties or rights, on the simple condition of executing the works necessary to isolate their establishments from the public gaze, to insure proper drainage and removal of offal, and to furnish the means of effectually cleansing their establishments. Facilities should be given for the erection of public slaughter-houses, either by companies or by municipalities. In all cases where they have been built in France, the revenues have been such as to make such constructions good speculations. At Paris, in 1847, the revenues (gross) were 1,200,000f., nearly; the expenses, including employés, repairs, water, lighting, &c., were not 140,000f., leaving net 1,060,000f. to pay the interest on a capital of 18,000,000f. In the town of Havre the abattoirs are built upon an 18½ years' lease; and yet the proprietor makes money by his speculation. At Caen the abattoirs produce a net revenue of 24,000f., to pay the interest of a capital of 300,000f. Everywhere the results are about the same; nor can there be any reason to doubt but that in England the results would be equally favourable. The butchers of Paris, at first, violently opposed the establishment of the abattoirs; but now they are so convinced of their utility and commodity that they would almost as vigorously oppose any return to the former system. Indeed, it must evidently be to the interest of the butcher that his meat be killed in the most perfect conditions to insure its preservation, and to satisfy the public that every precaution is taken to insure a supply of wholesome meat.

In the matter of public inspection of the quality of the food exposed to sale, we, a nation who read our Bible much, would do well to take example by the laws of Moses. They were, it is true, given for a nation inhabiting warm climates; but whether in England or in Syria, it cannot be a matter of indifference to eat of animals healthy or unhealthy. As it is, not the slightest control is exercised; and it is a fact well known in the trade, that lately a noble duke sent to Smithfield a large number of sheep tainted with the small-pox. Such things could not occur in any civilized country

but our own. We push the horror of the intervention of the Government authorities to such an extent, that it appears we prefer to be poisoned rather than let them interfere. It is true, however, that the absurdities of the Sewers Commission fully warrant our objections

to governmental action. As for the other trades connected with the conversion of the carcases of animals, slaughtered either for our food or for the dogs and cats of London, they should, under no possible circumstances, be retained in the centre of the town. Science has not been able hitherto to obviate the foul odours they give rise to; they should, therefore, be, without hesitation, consigned to such positions as would guarantee the public health against their deleterious effects. And yet in the present day, whilst the press is crying forth, and with reason, against the imperfect system of the London sewerage, we allow the air of the very centre of the town to be contaminated by the various trades which have been for so many years carried on near Field-lane.

ried on near Field-lane. In face of the public apathy, what is to be done in these most important matters? To whom are we to turn,—where are we to address ourselves, to secure a calm disinterested exa-mination? In the Honse of Commons we are met by flat jokes from Mr. B. Osborne, about his father being offended by the smells of the Westmipster sewers,—an argument, as was hefore observed, as absurd as deficient in taste. The llome Office is to examine the question; but as, in all probability, a set of lawyers and crotchety doctors will be named upon the commission, the results will, in all probacommission, the festins with in a probation with the about as successful as those attained by the Sewers Commission. The corporation of the City of London have already given us the means of indeping of the temper with which they would be likely to take up the question. Their interest in the maintenance of the existing state of things is, moreover, so great, that they cannot reasonably be expected to be impartial. It is to the press only we can turn, with any confidence, to aid in the re-moval, or at least in the amelioration, of this gigantic nuisance. The fourth power of the gigantic nuisance. The fourth power of the realm must again teach the others that their duties cannot he neglected with impunity. Could the evil effects arising from the present state of the neighbourhood of Smithfield, and its congeners in filth, be confined to the places themselves, we would say, in God's name, let those who like such scenes enjoy themselves to their heart's content. But the moral and physical pestilences spread far and wide. "The wind bloweth where it listeth," and carries the germs of sickness in every direction. The restless mind, contaminated in the same scenes. restless mind, contaminated in the same scenes, leaves them to spread its direful action elsewhere. It is the duty of every one to strive to eradicate both these sources of evil,—more especially is it the duty of the noblest and most powerful instrument we possess to spread the happiness and comfort of our race. It is the duty of every one to protest loudly against the existence of a state of things which, it cannot be too often repeated, is a blot upon the civilization of our country,—a shame and a disgrace to any Christian land, and which must, if allowed still to revel in all the rich luxuriance of its mental and physical pollution, be a curse to the people who tolerate G. R. B.

NORTHAMPTON CORN EXCHANGE COMPETITION.—The directors have selected two designs, but the names of the authors are not the circular which they have received; one says:—"The pompous curtness without courtesy of the notification is only another nail driven, it is to be hoped, in the coffin of competition. Thanks—brief thanks—it would seem, are matters that enter not into the consideration of these gentlemen directors as being in any way necessary in the light of a slight return for the attention bestowed in their behalf by competing architects. Who are the chosen two? Perhaps, indeed, the rejected competitors may consider themselves honoured by having their designs returned duly carriage-paid.—9."

WILTON CHURCH.—'The architects wish us to say that the cost of Wilton Church was 25,000l., not 36,000l., as stated. The cost was given us on the spot as printed.

PLANS FOR THE DRAINAGE OF LONDON,

On Monday, the 20th, the day appointed for the consideration, by the Sewers Commission, of the plans of Mr. Phillips and Mr. Austin, for the entire drainage of London, and such others as might be sent in up to that date, the court was well attended by commissioners, and the space allotted to visiters was crowded to excess. Mr. C. Johnson presented a letter from Mr. Bailey Denton, civil engineer, which set forth that he was most anxious to present a plan, but that the time that had been specified was insufficient to prepare the same, and asking for the period to be extended.—It appeared that fifty-eight plans had been sent in, and that amongst the competitors were some of the first civil engineers of the day.* Mr. Chadwick was for sending all the plans to the Works Committee,—Mr. Leslie, that the court should consider them. The latter gentleman also suggested the necessity of eare to prevent piracy of ideas. Mr. Alderman Lawrence thought they should not be tied, as a whole, to any one plan, as they might find it expedient to take portions of several, each portion being good in itself, but yet not good as a distinct plan, which principle had been adopted in several public buildings,—the Royal Exchange and London-bridge as instances. They might borrow ideas, not with the view of stealing them, but to reward those by whom they were given.

After a long and irregular conversation the

After a long and irregular conversation the following provisional resolutions were put seriatim, and agreed to:—

"That all proposals and plans sent to the court before and during its sitting be received.

That the time for amending the present plans, and for sending in other plans, be extended to October 1, 1849.

That each of the competitors who have sent in plans be required to send in, in the course of this week, a concise statement of the main features, whether in principle or in details, of his own plan, and that such statements be printed for the commissioners.

That outline maps, with such information as to altitudes as exist in the office, be forthwith prepared and lithographed, and that each of the competitors who have already sent in plans be, on his application for the same, supplied with a copy thereof gratis, and that future competitors be supplied with copies thereof, at a charge sufficient to cover the cost of paper and printing."

In pursuance of the order of a former court, Mr. Joseph Sainth had attended the process of the various borings along the proposed line of tunnel sewer, and it was resolved, "That the sections of the borings be lithographed when finished, and circulated among the commissioners, and given to competitors."

In reference to these borings, it will be recollected that at the first court held, on the proposed tunnel of Mr. Phillips, Dr. Buckland asserted unequivocally "that there was not an atom of London clay between Rotherhithe tunnel and the base of Shooter's Hill," and that "it glanced off at the northeast corner of St. Paul's." Since that time evidence of the most satisfactory nature, and from unquestionable authority, has been obtained, that it does exist, and in large quantities, in places altogether denied in the speech of Dr. Buckland, as will be found in the following statement—

At Greenwich Marshes, opposite Blackwall, 55 feet of London clay.

Near the London Dock and St. Katharine's Dock, 55 feet.

At Bermondsey, 55 feet.

Near London-bridge, 130 feet.

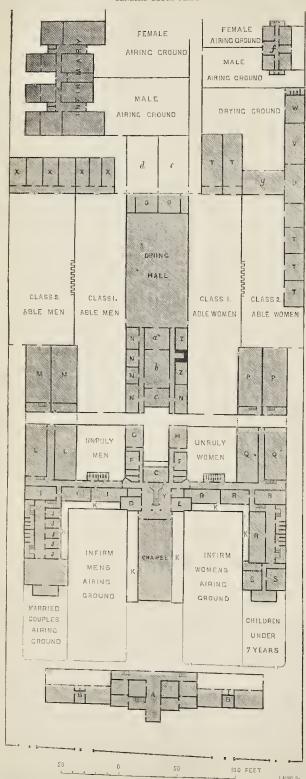

And, extending upwards, it was found at Lamheth, 160 feet; at Westminster, 170 feet; at Kensington, 170 feet; and at Brompton, 237 feet; and for a considerable distance above London-bridge the bed of the river is cut in the blue clay.

Thus it may be considered that, at all events, one of the difficulties anticipated has really no existence.

^{*} The statements of some of the competitors have been forwarded to us, and we shall of course be happy to receive others. To print them, however, as requested, is out of the question.

CITY OF LONDON WORKHOUSE.

GENERAL BLOCK PLAN.

THE CITY OF LONDON UNION WORKHOUSE.

In accordance with the promise made when we gave a view of the new City of London workhouse, recently erected in the Bow-road,* we annex a general block plan of the establishment, with descriptive references. It is intended to accommodate 1,200 persons. The diping hall an anaturent of large size (about dining hall, an apartment of large size (about though any an apartment of large size (about 100 ft. long and more than 50 ft. wide), has an open timber roof, of queen-post construction. The chapel roof, the general effect of which the architect should endeavour to improve before the building is thrown open, has cast-iron translate active the state of the state o principals resting on small iron columns

MODEL TOWNS.+

THAT the establishment of model dwellings, baths, and washhouses,—the opening of mechanics' and other instructive and national institutions, museums, libraries, lecture-rooms, and schools,—the promotion of sanitary reform in towns, and the laying out of public parks, walks, and pleasure-grounds around them, the agitation of the short-time or early-closing movement,—&c., &c., are all preparing the movement,—&c., &c., are all preparing the way, however slowly or feebly, for a mighty organization and expansion into model streets, organization and expansion into model streets, districts, and towns, there cannot, we think, be a doubt. The principles of such improvements, if commendable in detail, cannot but be good in the aggregate; that which is beneficial here and there, cannot be much otherwise when everywhere extended. But it is not in the form of such model elements and exemplars alone as those we have just instanced that the first beginnings of a vast and promising, and as it were a natural and inevitable process or growth of accumulative system, or enlightened associative organization of process or growth of accumulative system, or enlightened associative organization of families and individuals into great and exemplary commonwealths, can be traced. We observe the rudiments of the same interesting and growing process also in those wide-spreading and increasing agglomerations of men into organized and powerful unions such as those of joint-stock and other common-good associations, which would seem to be rapidly associations, which would seem to be rapidly crystallizing, as it were, the loose and heterogeneous units of self-interest in the community, and requiring only, one would almost think, to spread forth a network of connecting tentacles or radii from their separate centres, till the whole be interlaced and combined into just such a wider and more comprehensive joint-stock union or association for the com-mon weal, as ought of itself, together with combinations for health and enjoyment, as well as for industry and wealth, to constitute a sort of model town.

of model town.

It would be well, however, at once to bring a system of enlightened and connected purposes to bear upon these striking features of the nineteenth century, and to guide its pregnant developments into proper, permanent, and concurrent channels of direction, for the simultaneous common good of every class of the community. With joint-stock and other great associations and establishments, commercial or manufacturing, and much more so with more limited companies and individual

† National Evils and Practical Remedies: with the Plan
of a Model Town. Illustrated by Two Engravings. Accompanied by an Examination of some Important Moral and
Political Problems. By James S. Buckingham. P. Jackson,
St. Martin's-le-Grand.

capitalists, worldly prosperity and riches are accumulated only by the comparatively few, while the many reap little or no personal profit or permanent prosperity from them. And, moreover, the rich are ever becoming richer, and the poor poorer, in a rapidly increasing ratio, the final result of which, if not timely checked, it is fearful to contemplate. That result, in fact, is a certain and complete separation or split of the community into two great elements of mortal strife, in which it is but too easy to see that the pent-up stream of misery and want will overflow its restricted limits, and overwhelm everything great, and rich, and noble.

It would be well, indeed, to take time by the forelock, and hastily to retrace our steps, could we but see our practicable way to the site, materials, and outlined scheme and specification of some more just and wide-spead diffusion of riches, or, at least, of competencies, as the basis of a system that would ultimately comprehend even the poorest outcast of the present period of unsatisfactory and dangerous extremes within the sunshine of an assured, contented, and screne prosperity. As for the elements, the materials, of so great and practical a good,—as said, we certainly cannot but see our way to these in the successful practical endeavours of really noble and manly natures to establish model institutions, not only for the physical, but for the educational and industrial improvement of the mass. Let us only extend the limits and purposes of this good work, as far as possible, with discretion and good sense, as well as system. Let us cautiously consider how these already crystallizing, organizing, elements of a practical and beneficial system, can best be extended and agglomerated into more or less complete, consistent, and self-supporting organizms of industry and happiness,—into model towns, in short, or joint-stock companies on the great scale, each comprehending, as far as possible, within and around its own respective precincts, everything requisite to the life and the enjoyment of the limited thousands or tens of thousands destined to share in its benefits, and to reside within its walls,—with not only a strict municipal army or organization of manufacturing industry, but also an agricultural, as indeed a main and essential branch of the mafacturing industry, but also an agricultural, as indeed a main and essential branch of the mafacturing industry, but also an agricultural as indeed a main and essential branch of the mafacturing industry itself, inclusive.

The idea is by no means a merely theoretical, far less a new one. Nay, from facts anthemicated in history, as in the case of the Cretans, according to Roblin,—the ancient Germans, according to Roblin,—the ancient Germans, according to Robertson,—the would almost appear as if cooperative commonwealths, with great prosperity and enjoyment, were amongst the most anciently established facts in the history of the human race in its more civilized forms of anciently established facts in the history of the human race in its more civilized forms of ancient times. And even in modern experience it is well known that flourishing communities exist in America on the principle of co-operative association for the common weal. Anthorities, ancient and modern, too, entitled to more or less respect, have recorded their favourable opinion of such a systematization of human efforts,—as witness, Minos, Lycurgus, Theseus, Plato, Moses, the Essenes (or pre-Christians), and the Apostles themselves; also in less ancient times, Sir Thomas More, Bishop Berkeley—to whom Pope attributed "every virtue under heaven," Condorcet, W. Godwin, Babbage, Mill—the historian of India and moral philosopher, with many others. And, indeed, what was it but this element of good in the fallacious and abominable doctrines of Owen and his Socialists that redeemed even them from contempt while they excited the horror of every well constituted mind, with bastard doctrines of communism and irreligion which Owen was but too anxious to veil and withdraw, when he found he had only succeeded in damning both his own previously ligh philanthropic character and the cause in which he was engaged?

But to our more immediate purpose, which is to give our readers some little idea of Mr. Buckingham's opinions on the subject of model-towns. We confess we opened his very interesting volume with some misgivings, that we might find in it much that would appear to be either impracticable or otherwise objectionable—not by any means from personal considerations as to the author—quite the contrary.

—but from knowing how the subject had been so almost inextricably entangled and interlarded by others with impracticabilities quite inconsistent with the nature of man as he at present exists; and more particularly as regards the evils of unmitigated communism contrasted with and apart from the benefits of individual association; but our mind was speedily re-assured on these points, and although we do not mean to bind ourselves down to the author's hopes or opinions, we do think his subject well handled, and worthy of wide-spread perusal and careful consideration.

Previous to the development of his plan, the author prohes pretty deeply the evils to he remedied. These evils—the existing evils of society—he ranks under the heads of ignorance, intemperance, national prejudice, monopoly, war, competition, the helpless and hopeless condition of the unfortunate in every country in Europe, and the clashing of the interests of various classes and professions, such as those of law and medicine, with their clients, patients, &c., in particular. These cvils, all of them, he proposes by specific, and, as he conceives, practical measures, to remedy; and, with pardonable allusion to previous suggestions, he points attention to the fact thany of his own most cherished ideas, stigmatized while he was urging them as "visionary," as "very good in theory but not in practice," or even as altogether "absurd," have since been favourably received or finally realized."

On his particular views as to the several specific remedies for prevalent evils we cannot at present enter, except so far as they may incidentally appear in what is to follow. In treating of the productive power of associated labour, he says—

"Surely what large landowners and large manufacturers effect for themselves by the labour of others, can be quite as easily effected by the labourers, under a proper organization, for their own benefit; and this is what a great number desire to see attempted at least, stimulated as they are by the sight of so many large establishments giving such enormous fortunes to their masters, out of the profits of their labour.

profits of their labout.

They perceive, for instance, the immense power to effect the greatest undertakings, conferred by co-operation or association, as in the case of rill-roads, insurance companies, mining associations. &c. The wealthiest man in England could not, of limself, and out of his own means, have constructed the Great Western Railway; but, by a union of capital, skill, and labour, in such proportions as to be readily recognized for dividends and payments, the work was easy; and now the heaviest goods can be transported the longest distances in a sbort space of time, and at very trifling expense, compared with the enormous cost of conveying a bale of heavy goods on horse-back from London to Edinburgh, by several weeks' journey, which it required for a single horse, a few centuries ago.

In short, it is like the difference between carry-in a carge, of 10,000 bales of cotton from India to

In short, it is like the difference between carrying a cargo of 10,000 bales of cotton from India to England in one large ship of 2,000 tons burden, compared with the conveyance of the same bales, each in a single canoe, requiring 10,000 separate boats, and 200,000 men at least to navigate them the latter showing the costliness of individual, and the other the economy of associated labour."

Government, he conceives, might do an immense deal to forward the right "organization of labour," and resolve the great problem of the age. Indeed, he points attention to the fact that Government is already well and practically initiated into all the essential principles of the art—if we may call it so.

"In nothing, perhaps, is the superiority of organization and association more powerfully seen than in the arrangements of the Post-office, where the greatest degree of dispatch, punctuality, economy, and productiveness are exhibited. By

the power of organization and association of labour, 252 letters, at a penny each, can he carried for a guinea (the estimated average price of one, if sent by individual me:sengers), within the kingdom; and the proportion of difference is still greater in foreign letters, supposing them at present to average a sbilling each; while such is the punctuality and precision with which all the operations of this great example of the 'Organization of Labour' in the General Post-office arc carried on, that, no matter bow obscure the individual to whom a letter is addressed, if its superscription be legible, and the person addressed be in existence, the letter is ultimately almost sure to find him out.

example of the 'Organization of Labour' in the General Post-office are carried on, that, no matter bow obscure the individual to whom a letter is addressed, if its superscription be legible, and the person addressed be in existence, the letter is ultimately almost sure to find him out.

Notwithstanding the remarkable proofs of the power of both governments and individuals to establish the most perfect 'organization of labour' for certain purposes in which they perceive they have a clear benefit, yet, whenever this is proposed to be done for the purpose of forming an associated community, by which, under a proper union of agriculture and manufactures, and by a well-adjusted proportion between labour, skill, and capital, the unemployed labourers of the country are to be put in a position to maintain themselves, and even accumulate wealth by their labours,—the answer commonly is, 'that it is an impractucable scheme,' or 'a visionary or a utopian dream of an entlu-

Yet the Government find he difficulty in organizing a fleet and an army, with such case and in such perfection, that every movement of each is regulated at the Admiralty and the Horse Guards; and if you desire to obtain any information about any one individual in either of these wastodies, you have only to apply to the Admiralty or the War-office, and they will give you his name, age, height, complexion, the color of bis eyes, the peculiarities of his countenance, and tell you in what slip or what regiment he is, where stationed, in what company, what amount of pay is due to him, and every other particular. The Government can organize a large army of Custom-bouse and Excise officers, coast-guard, tax-gatherers, and police, with a discipline so perfect, that they will find out every man, and ascertain his income, and even bis political opinions, if desired. They can organize labour to build useless ships of war and extravagant royal yachts, to kill oxen and bogs, prepare sait-beef and pork, and even bake biscuits in their own ovens, for the fleets at Plymouth and Portsmouth, besides making ropes, sulls, and blocks by machinery, and every other thing needed for their naval arsenals. They can cast camon and canon-balls, bombs, and shells, make guopowder and Congreve rockets, and store up at the Tower 100,000 stand of arms, muskets, bayonets, pistols, spears, and tomahawks, to shed the blood and take the lives of our enemies when needed. They can swear in nearly the whole male population of London as special constables, to resist an appreheaded insurrection, and marshal every division in its most appropriate place, eurolling old men of seventy, and young boys of fifteen, for this nurrose.

ling old men of seventy, and young boys of fifteen, for this purpose.

They can do all these things in the way of 'organization and association of labour,' but, alas, they canaot (as they say), or they will not, (which is perhaps nearer the truth), undertake any organization and association of labour, to employ the unemployed portion of the population, and place in their own hands the means of not merely earning their own livelibood, but adding largely to the health, wealth, morality, and happiness of the whole nation. The old proverb says truty, 'Where there's a will, there's a way;' and the absence of the will, seems, in this instance, the only solution of the problem, wby the way has never yet been found, and why it is deemed, by the Government at least,

a will, there's a way;' and the absence of the tette, seems, in this instance, the only solution of the problem, wby the way has never yet been found, and why it is deemed, by the Government at least, to be beyond the power of discovery.

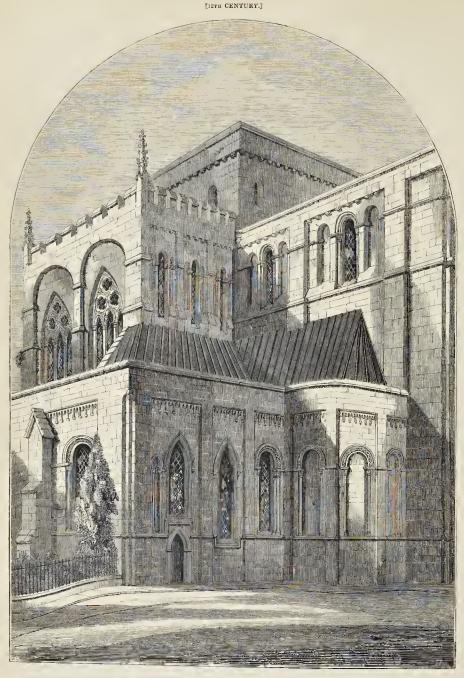

To remedy this defect, it is proposed, that the public at large, the source of most of our social and moral improvements, shall take the matter into their own bands, and see wbether, by proper care and due guarantees for security, a company can be formed, to be called 'The Model-Town Association,' for the purpose of building an entirely new town, to combine within itself every advantage of beauty, security, healthfulness, and convenience, that the latest discoveries in architecture and science can confer upon it; and which should, at the same time, be peopled by an adequate number of inhabitants, with such due proportions between the agricultural and manufacturing classes, and between the possessors of capital, skill, and labour, as to produce, by the new combinations and discipline under which its code of rules and regulation s might place the whole body, the highest degree of abundance in every necessary of life, and many luxurles, united with the lightest amount of labour and care, and the highest degree of health, contentment, morality, and enjoyment yet seen in any existing community established on the principles by which society is now generally regulated."

The first model town Mr. Buckingham pro-

The first model town Mr. Buckingham proposes to call "Victoria," and he suggests that it might be built on the sbores of the Solent and Southampton water, and within the New

Forest, where there are 60,000 acres wholly useless to the Government and the country, out of which the Woods and Forests, authorized by Parliament, might grant a lease of the requisite ground, without rent the first year, and afterwards at a rent rising from 5s. an acre, by an annual increase of 2s. 6d., up to 20s., so that for the site of a town or farm, one mile square, with 10,000 acres of land surrounding it, the state would receive 10,000l. a-year of rental, in place of, as now, virtually because of the state would receive 10,000l.

· See p. 397, in present number.

where the experiment might be tried, and we might here ask whether some such joint-stock association might not come within the sphere of operations lately proposed in Parliament for the regeneration of Ireland?

The plan of a town laid down in the engravings appended to the volume is a concentric series of squares within squares, with spacious avenues radiating from the central range, both at right angles across the square, and diagonally towards the corners for convenience. In the central

shops of same width. The houses in the shops of same within. The houses in the several squares have all garden ground, the outer, of 1,000 houses, 100 feet deep and 20 feet frontage. There are school-houses on feet frontage. There are school-houses on each side of the second square, and baths, reading-rooms, dining-halls, &c., in the spaces between some of the inner squares. At each outer corner of the whole is a fountain, and at each entrance are a couple of towers. All large manufactories using steam-engines would be removed at least half-a-mile beyond the town, as well as abbatoirs or slaughtering-houses, cattle-markets, reservoirs of sewerage for maoure, cemeteries, hospitals, &c., and there would be in convenient proximity a park promenade, gymnasium, botanic garden, &c., and eithe for substantial programs and either for substantial programs. and sites for suburban villas, reserved for such as might desire them. The town, it is proposed, would contain every improvement in position, plan, drainage, ventilation, architecture, supply of water, light, and every other elegance and convenience which are not expressed in admit of The number of the property of th art and science will admit of. The number of its inhabitaots not to exceed 10,000, and each resident householder to be a shareholder to the extent of 201. at least, and a subscriber to the rules for its government. The company to be incorporated by Royal Charter, or Act of Parliament, under the title of "The Model-Town Association," so as to limit the respon-sibility of each individual to the shares held by him in its stock. Rentals to be regulated by a moderate interest on the actual cost, and the dwellings to be of every gradation of size and scale, so as to have apartments, suites of rooms, and entire houses or tenements, from a rental of 101. per annum up to 3001. The capital required to build such a town is computed at 3,000,000%, besides 1,000,000% to stock the farms, factories, and workshops with provisions and materials,—a sum, in all, the author observes, not half that expended on some single railways, nor more than the cost of Westminster Palace and the last new bridge across the Thames-two single structures only. capital it is proposed to raise in 200,000 shares 201. each, to be paid up by instalments of 11. a-month into the Bank of England in the name of trustees to be appointed by the share-holders. No member to hold more than 500 shares.

The rules relate, among other matters, to provisions for temperance and peace, the limitation of hours of labour, gratuitous education, law and medicine without individual expense, freedom of religion, &c. The inhabitants are proposed to comprise 1,000 members of the building trades, 600 cabinet-makers, upholsterers, and other furniture makers, 500 producers of food, 800 producers of materials for clothing, 800 miscellaneous manufacturers, 700 preparers of clothing, 300 preparers of food, a limited number of keepers of shops or stores of different kinds, 200 officers of education, health, religioo, justice, and government, &c. &c.

As to the division of profits, rules as to currency, &c., we cannot enter into these, having already, indeed, overstepped our limits. We must, therefore, refer all who feel an interest in these and numerous other details connected with Mr. Buckingham's scheme to the work itself, which is got up in a clear and readable style both by author and publisher, and eontains essays, also, on financial reform, on emigration and colonization, on a new reform bill, and on the regeneration of Ireland.

To CLEANSE OLD COINS.—In reply to a correspondent, who asks for a recipe for cleaning old coins, copper, brass, and silver,—and snys he has a quantity found at Richborough Castle, Kent, we may state,—that the red rust may be removed from silver coins by vinegar or by lemon juice; the green by a solution of ammonia; the rust on copper or brass coins should not be disturbed, as a coin which eannot be read wheo oxidized is seldom improved by being cleaned, but often rendered quite useless; a graver may occasionally be employed, but its safe use presumes a knowledge of the coin to be operated on, both portrait and legend. The Rieliborough coins, which the writer refers to, would no doubt be thankfully examined by Mr. Roach Smith, who is, we believe, at this moment preparing an extensive catalogue of Roman coins, found at that place, for publication.

AN ACCOUNT OF CONWAY CASTLE.

ONE of the recent excursions made by the British Archæological Association included a visit to Conway Castle, an interesting remnant of rude times known probably to many of our readers.* Mr. Hicklin, the editor of the Chester Courant, gave an account of the castle. He said, in the course of it, that Edward the First having resolved to complete the subjugation of Wales to the English Crown, was naturally anxious to strengthen his power in those places of security where he could best support his authority, by curbing the pride of the barons, who might attempt to thwart his schemes, and by suppressing the revolts of his discontented subjects. Independently of the romantic and picturesque seenery by which the rock of Conway is surrounded, its situation afforded a most advantageous post from which its de-fenders might observe the slightest indication of any hostile movement: the passes might easily be rendered perfectly inaccessible; and unless treachery was in the garrison, the fortress might be considered impregnable before the use of artillery. The Castle of Conway was completed in 1284, under the personal impreciation of the contract of personal inspection and direction of King Edward; and Henry de Elreton, the builder of Carnaryon Castle, was the architect employed.

"After size and weight," says an able writer, "the power of architecture may be said to depend upon the quantity of its shadow; and it seems to me that the reality of its works and the use and influence than have its works, and the use and influence they have in the daily life of men, as opposed to those works of art with which we have nothing to do but in times of rest or pleasure, require that it should express a kind of human sympathy by a measure of darkness as great as there is in human life; and that as the great poem and great fiction generally affect the most by the majesty of their masses of shade, and cannot take hold upon us if they affect a continuance of lyric sprightliness, but must be serious often, and sometimes melancholy, else they do not express the truth of this wide world of ours, so there must be in this magnificently human art of architecture, some equivalent expressions for the trouble and wrath of life; for its sorrow and its mystery; and this it can only give by depth or diffusion of gloom, by the frown upon its front, and the shadow of its recess. So that Rembrandtism is a noble its recess. So that Rembrandtism is a noble manner in architecture, though a false one in painting. But since the thirteenth century, we have built like frogs and mice, except only in our eastles (and perhaps Mr. Stephenson would add, in our railroads). Until our street architecture is bettered, until we give it some size and boldness, until we give our windows recess and our walls thickness, I know not how we can blame our architects for their feebleness in more important work; their eyes are inured to narrowness and slightness; can we expect them, at a word, to conceive and

*On the same day they visited Plint and Flint Castle, and the inhubitants drew attention to the present neglected attent of the latter, and requested the Association to aid them by their influence in procuring from the patites to whom the state of the latter, and requested the Association to aid them by their influence in procuring from the patites to whom the venerable rule in the latter of the procuring from the patites to whom the venerable rule in the latter of the latter of the latter of the latter in the latter of the latt

deal with breadth and solidity? They ought not to live in our cities; there is that in their miserable walls which bricks up to death men's imaginations, as surely as ever perished forsworn Nun. An architect should live in cities as little as a painter. Send him to our hills, and let him study there what nature understands by a buttress and what by a dome. There was something to the old power of architecture, which it had from the recluse more than from the citizen. We have sources power in the imagery of iron coasts and azure hills; of power more pure, nor less serene, than that of the hermit spirit which once lighted with white lines of cloisters the once ighted with white lines of cloisters the glades of the Alpine pine, and raised into ordered spires the wild rocks of the Norman Sea; which gave to the temple gate the depth and darkness of Elijah's Horeb Cave; and lifted out of the populous city, grey cliffs of lonely stone into the midst of sailing hirds and silent air." Mr. Hicklin resumed. The form of the castle is oblong, and it is greated on a high rock at one long, and it is erected on a high rock at one corner of the triangle which encloses the town. One side is bounded by the river, another by a creek which is full of water at every tide, and into which the river Gyffin flows; the other two sides are within the town walls. On the outside, eight massive and enormous towers, forty feet in diameter, project,—four on each side; and there was a winding staircase to the summit in a smaller tower contained in each, which in the four nearest the river issue out to the height of several feet, and form an exceed-ingly beautiful addition. The summit of these ingly beautiful addition. The summit of these commands an extensive view of the adjacent The walls and towers are embattled. country. and vary from 12 to 15 feet in thickness. principal entrance was from the town at the west end by a drawbridge over a very deep moat; this leads by the ascent of a few steps to a spacious terrace, protected by five small towers, and intervening walls; thence through a gateway, defended by a portcullis, to the larger court. This contains on the south side the noble hall, which is 130 feet long, 32 wide, and of a proportionate height, about 30 feet: out of this was partitioned off, at the east end, a chapel with a large window. The roof was supported by eight fine Gothic arches, four of which still remain; one fell about 44 years ago; it was warmed by a great fire place at one end, and two others, one on each side there are six wiodows to the country, and three larger ones to the court: underneath three larger ones to the court: underneath were the spacious vaults which contained the ammunition for the use of the garrison, and also the cellars for provisions. At the east end of this court is the reservoir, 15 feet in diameter, and 20 deep; the water which supplied it is traditionally reported to have been conveyed in pipes from a well above Tygwyn. The entrance into the inner court is by a nassage through a strong wall. 10 feet is by a passage through a strong wall, 10 feet and a half in thickness, which on the outside has a lodge for a sentinel, who could see through a loop-hole every one coming from the chief entrance. On the right io this court is one of the state rooms, 29 feet by 22 feet: a beau-tiful arch which supported the roof remains perfect, a second has long ago been destroyed: the windows look into the court. Between this room and twr y brenin, or the king's tower, was the king's chamber, which communicated with that of the queen's on the opposite side. The north tower is called twr y vrenines, or the queen's tower; and the room of the first story contains a recess taken out of the wall, which is the only place with any appearance of ornament in the castle. It is formed by seven pointed and groined arches uniting with each other at the roof, and under them are more arches, with a basement all round. This recess, which, with the adjoining room, was the queen's private chapel, contained the altar-table; and on both sides are small apertures communicating with two apartments. That such was the use of this place is corroborated by the circumstance, that this is the ground-floor which does not contain a fireplace. The diameter of the inside of the towers above the ground-floor which does not contain a fireplace. The diameter of the inside of the towers is short 15 foot; these consists carried to the contains a fireplace to the contains a fireplace. is about 18 feet: these consist generally of two stories, with the ground-floor, which was chiefly used for keeping stores. The king's tower has a strong-room below, which was accessible only by a trap-door; but the keep, or twry carcharorion is the second on the

south side, adjoining the hall, from which there is a passage through it to the top of the walls. On the east side there is another terrace, protected by three towers and walls, where there was a second entrance to the eastle; this was from the river, by ascending a steep rock, where once had been a narrow flight of winding stairs, protected by a wall, with a small covered hanging tower, which went a considerable way into the river, and had another round tower at its extremity to went a considerable way into the river, and had another round tower at its extremity to prevent the approach of an enemy at ebb tide. The portion in the river had been for a long period destroyed; but the narrow wall with the hanging-tower, as far as the terrace, was taken down, when making the approach to the bridge. The next tower to the king's, twr darn, or the bridge tower, research a new windstream, or the broken tower, presents a very picturesque ruin. The avarice, it is said, of some of the inhabitants led them to excavate the rock at its base, which occasioned a vast fragment of the base, which occasioned a vast tragment of the tower to fall: the upper half remains perfect, suspended at a great height, and projecting nearly thirty feet over the walls below. The walls which surround the town were built at the same time as the castle, and are nearly triangular,—a form evidently prescribed by the situation; the walls which remain almost entire are very lofty and embattled: in the cir-cuit of a mile and a quarter there are twenty-one strong towers, rising considerably above the walls, besides three entrances to the town, the walls, besides three entrances to the town, with two stronger towers to each. The base of the triangle runs along the river, and in it are seven towers with a gateway called Porth isav, or the lower gate; between this and the castle, there is also a portal in the wall, cailed Porth bach, but without towers. From the northern extremity of the base, a curtain with battlements on each side runs nearly seventy yards into the river, which had at its extremity yarus into the river, which had at its externity a large tower, long since destroyed, but the ruins are visible. This corresponded with a similar tower under the castle: the gateway through the curtain is called Porth yr aden. A second entrance to the town was from the country site nearly marks to parth icer. it is called Porth uchav, or the upper gate, and its called Porth uchav, or the upper gate, and it was furnished with a drawbridge: the third is on the south side, and led to the velin heli, or salt-water mill,—it is called Porth y velin, or the gate of the mill. Event on the rigge side the gate of the mill. Except on the river side, the whole town was surrounded by a deep and wide moat. One of the towers on the south bas a wall built on the town side, and contained some spacious apartments, -it is called Twr Llywelyn.

Edward made Conway a strong military sta-

tion, and granted the town a charter as tion, and granted the town a charter as a free borough, securing to it considerable privileges, a condition being annexed with which the good citizens of London, in their present humour, would, he thought, be especially angry, "That the Jews dwell not at any time in the same borough."

At the restoration of Charles the Second, the conditions would be a supported by the "next reported".

castle was granted by the "merry monarch" to the Earl of Conway, who was altogether unworthy of such a possession; for in the spirit of a pedlar, rather than a patrician, he ordered his agent to dismantle this glorious structure, his agent to distinguish the first provided the shipped to Ireland, ostensibly for his majesty's, but in reality for his own use. With a most commendable determination, Colonel Wynn, Mr. Thomas Bulkeley, and several of the leading gentry of the country, attempted to oppose this destructive design, but in vain. The spoiler did his work; but a suitable fate atspoiler did his work; but a suitable fate attended this desecration of one of the noblest works of antiquity. Lord Conway was not merely prejudiced, as he complains, by the loss of an opportune season for shipping, but by the loss of the property itself, for the vessels which contained the materials for Ireland were wrecked on the voyage. The castle is at present held from the Crown by the Dowager Lady Erskine, who takes commendable care for its preservation. for its preservation.

NATIONAL ART-UNION OF IRELAND.—
On the 31st ult. the annual meeting of this society was held, when it appeared that the amount received in subscriptions, 5111. 5s., had only sufficed to obtain a print for the members and pay the expenses, and that there could be no drawing for prizes. The pressure of the times was the cause assigned.

THE BOSTON ATHENÆUM, UNITED STATES.

A NEW building, to be called "The Atheneum," has been erected in Boston, for the collection and preservation of a large library, and the exhibition of works of art in sculpand the exhibition of works of art in sculpture and painting. A correspondent has favoured us with the following particulars. The design of the structure is Palladian, the material free-stone, from New Jersey. The basement is rusticated, the windows are in arched recesses, with intervening pilasters supporting the entablature. A central division of the elevation projects, slightly. The antice of the elevation projects slightly. The entire height is 62 feet, and the length 114 feet. The basement is constructed, within, of bricks, the oeiling being formed by continuous groined arches, which support the Iower floor, and give security against fire from below. Here are furnaces, with flues going into all parts of the building; ample store-rooms for packing, &c., with an apparatus for hoisting, through a fireproof passage, quite to the upper story. The front doorway is 14 feet high by 10 feet broad, and is arched with a semi-circular light. to open on a vestibule, or main entry, 32 feet by 28, which contains double staircases, ascending to the upper story, and lighted from the roof and by a large window in front. The first-floor is partitioned for a hall 80 feet

The first-floor is partitioned for a hall 80 feet in length, intended for a sculpture gallery, two spacious apartments for reading rooms, and one for a cabinet of medals, coins, and other articles of value and curiosity. The second floor is appropriated entirely to books. The main library is 109 feet in length and 42 feet in its extreme breadth. It contains about 40,000 volumes, and is divided by a wide archway: one division displaying the books in alcoves, and the other, cases lining the walls. It is finished in the Italian style, with a decorated ceiling. The third-floor is appropriated as a gallery for pictures. That portion of it which is over the great hall of the library is finished in four divisions, lighted from the top. The edifice has cost about 100,000 dollars, in its present state, and may be completed for 25,000 more.

NEW ROOF AT THE BANK OF ENGLAND.

THE drawing-office in the Bank of Eng-Intel drawing-once in the bank of Edg-land,—an apartment of great length (138 feet), and about 44 feet wide,—is being remodelled by Mr. Cockerell: the columns are removed, and a roof to span the whole has been formed. A paragraph which has gone the round of the daily papers would really lead to the impression, in the minds of those who knew no better, that before this event no roof of 44 feet span had been formed.

Divested of the singular halo thrown around the matter by the notice in question, it is simply this,—that wrought-iron box-girders are used, patented by Mr. G. Nasmyth, containing an iron arched rib. They are 2 feet 3 inches ing an iron archea rio. They are 2 test 3 inches deep for the span in question, and, as we understand, cost about 105l. more than cast-iron girders would have done. Apart from the puff in question they seem to be very good things, well worth examination.

IMPROVEMENT OF THE SOUTH SIDE OF THE THAMES.

On the south of the Thames nothing but neglect seems the rule. It is believed there are ample funds to proceed with proposed improvements, and in one instance the coal duties are available. The south of the Thames is entitled to a sbare positively provided for by Act of Parliament. It is pub-licly stated that several new churches are to be built, that sites are selected, and that ample funds can be found. For drainage!—that is put off!—for ever! and the truth is that it would he a great favour to leave all to the old management, for, bad as it was called, it was infinitely hatter that the present. It must shoully some better than the present. It must shortly come to this, -- that those who have been born and bred in the southern localities must surrender bred in the southern localities must surrender their present comfortable homes, though hum-ble, and go into lodgings,—that most of the government payers will be lost, the parochial rates greatly diminished, and taxes will only be obtained by the authority of Somerset House, —a state of things that must arise if some energies are not immediately put out to stem

the impending ruin. No district around the metropolis has been so cruelly treated as the southern boroughs—the "elder sister of London," as they used to be called-deserted, and

don," as they used to be characteristication, and become a runed heap. Westminster-bridge, a nuisance, and tolerated by authority, is stilted up, and, if a severe winter come, will be found prostrated, jammed, and huddled together in the fall, and the whole the characteristic processes upon the severy tide. and nuddled ogener in the lan, and the whole district, perhaps, under water at every tide. Speculated upon by railways, controlled, for termini, by government, Woods and Forests, for new roads, and by the so-called Metropolitan Improvement Commissioners, the Commission of Sewers, &c. &c., we ask your advocace.

AN OLD SUBSCRIBER.

METROPOLITAN COMMISSION OF SEWERS

EXTRAORDINARY PROCEEDINGS.

A special meeting was called for Tuesday last on the following requisition to Mr. Woolrych:—

A SPECIAL meeting was cancel for Lucsaly last on the following requisition to Mr. Woolrych:—

"We, the undersigned, request you, as secretary to the Metropolitan Commission of Sewers, to summon a special court of sewers, to be beld at the principal office, No. 1, Greek-street, Soho-square on Tuesday, the 21st day of August instant, at teo 'clock in the forencon, for the purpose of acertaining from documentary and other evidence whe there there be any truth in the statements made by Mr. Chadwick, at the public court of sewers on the 2nd instant, against the undersigned commissioner for obstructing and misrepresenting 'the very larg economy' resulting from the present system of contract for removing by flushing the soil from the sewers at a cost of 'sixpence per cubic yard;' for the removal of soil under the old Westminster commission, the cost was 7s. per cubic yard; and the undersigned were approving members of such expenditure in that commission, thus exhibiting a alleged 'large economy' in favour of the present system, of 6s. 6d. per cubic yard, being a difference of 1,300 per cent.

To a severation the exact amount in thousands.

system, of 6s. 6d. per cubic yard, being a dinerent of 1,300 per cent.

To ascertain the exact amount in thousands pounds of the money of the ratepayers already epended in the flushing department entirely omitte by Mr. Chadwick, in his statement of 'the vei large econemy' of the present system of flushing it sewers by 'contract,' and to ascertain what in reali

such 'contract' is.

To ascertain from the account book of Assistan Surveyor Lovick (to wbom on the recommendation 'The Committee of Works,' the flushing department has been for many months exclusively entrasted), whether, during the 31 weeks of the prentyear to the 31st July, the 'yards lineal' sewers flushed out in the Surrey and Kent district do not make a total of 214½ miles, at a cost to tratepayers of 104. 6s. 4d. per mile, independent of the district portions of the very large omissio of expenditure by Mr. Chadwick in his stateme on the 2nd instant. To ascertain from the account book of Assistan on the 2nd instant

on the 2nd instant.

To ascertain if beyond these omissions by M Chadwick, and beyond the Iol. 6s. 4d. per m shown in the account-book of Assistant-Survey Lovick, the rate-payers of the Surrey and Ke districts have not been charged in the account the contractor with the court for those district Mr. Dethick, other large items of expense connected with flushing, among which are 2,400 log of soil carted away at 2s. 6d. per load for carts

only.

To ascertain the number of times the same length the all marks are

To ascertain the number of times the same leng of sewer has been flushed out in the 31 weeks, es-time of such flushing costing the rate-payers on a general average at the rate of 101. 6s. 4d. per mit To ascertain if any of the sewers in any distr are flushed out three times a-week. To investigate the 'special contracts' at per 'yi lineal' entered into by Assistant-Surveyor Lov and the labourers, and to ascertain if any of sewers under such urrangements, have bad the s-washed into the addining sewers at an expense washed into the adjoining sewers at an expense the rate-payers equal to 3s. per cubic yard.

And to take such immediate steps as the res
of the evidence to be submitted at such spe
court may render necessary for the honour, c
racter, and usefulness of the Metropolitan Come
sion of Sewers, and the best interests of the met
politan ratepayers confided to the guardianshi
the commission. Dated this 16th day of Aug
1849.

(Signed)

JOHN LESLIE,

JOHN LESLIE FREDERICK BYNG JOHN BIDWELL.

Great excitement appeared to prevail in the off and the proceedings were looked forward to veonsiderable interest. The commissioners pres in the court at the usual bour of commencing be ness were Mr. Joseph Hume, M.P., Sir J. Burgoyne, Mr. Leslie, and Mr. Bidwell. Byng was prevented from attending through disposition. Several other commissioners s

after arrived; hut instead of entering the court they took their seats in an adjoining room. Half an honr passed over, and still the court was not opened, and the course intended to be pursued was then whispered about.

The regulations of the Act of Parliament require that a court shall consist of not less than six com-missioners; and as the solitary four remained in the court for an hour without a quorum being formed, the Act declares that such intended court shall stand

adjourned. The Secretary (Mr. Woolrych) then addressed the numerous parties who were waiting for admission, and informed them that the court was adjourned until Wednesday next. The commissioners who remained in the room were Mr. Chadwick, Mr. Hawes, Mr. Bain, Dr. Southwood Smith, Mr. Banfield, Mr. Hodgson, Sir H. de la Beche, and Mr. Johnson.

proceeding elicited comments not of the most favourable description against the parties who had thus evaded the making of a court, and thereby "shirked" a question involving considerations of

"shirked" a question involving considerations of importance to the ratepayers at large. We would recommend commissioners, whatever their opinions may be, not to venture a second time on such a lett-handed move, or the public may he led to give a verdict without a trial!

A Court was held on Thursday; Sir John Burgoyne in the chair. A letter was read from Mr. Goldsworthy Gurney in reference to his plan of puri-Goldsworthy Gurney in reference to his plan of puri-fying sewers by means of a steam jet, in which he stated generally that his plan is to withdraw all offensive effluvin from the sewers to a given point, and replace it by fresh air, so that the men might be enabled to go into them and flush them or clean them, and if necessary then to decompose and destroy the objectionable gases, as they escape, by a particular method of combustion. This led to a long conversation, and it was ultimately agreed "that the Works Committee be authorized to take the proposition by Mr. Golds-worthy Gurney into consideration, and to incur an expense not exceeding 20.1 for an experiment in the

expense not exceeding 25l. for an experiment in the Friar-street sewer."

Friar-street sewer."

A letter was received from Mr. Brushfield, Chairman of the Whitechapel Union, stating that cholera had broken out in Dorset-street, in which there were a great number of overflowing cesspools, and as the ownership of the houses was disputed, calling upon this Court to relieve and cleanse them, as the parochial authorities were mable to levy the amount in consequence of the difficulties as to whom the extenses should be charged.

in consequence of the difficulties as to whom the expenses should he charged.

Mr. Leslie and Dr. S. Smith were opposed to this Court relieving the parochial officers of what was clearly their daty to perform, they having ample funds in hand to pay for the same.

Mr. Chadwick and others were of opinion, that in cases of emergency some assistance ought to he rendered, and it signified little, as the money was to come out of the pockets of the ratepayers, by which body the work was performed.

It was at length agreed, "That the surveyors the dictire the district be directed to communicate with the

It was at length agreed, "That the surveyors or the district be directed to communicate with the Board of Guardians, and be authorized to lend them the aid of any machinery or workmen belonging to the commission for the purpose of cleansing the places in question, on the payment of the usual charges."

charges,"

A letter was received from Mr. Hogg, Clerk of
the Works at Buckingham Palace, setting forth that
pposite the palace the main King's Scholars'-pond
sewer was charged with deposit 18 inches in depth,
and offensive odours were exhaled therefrom. Referred to the surveyor to report immediately

A report was presented by Mr. G. Donaldson, on the operation of sewage manure on certain lands that had been irrigated by it during the latter part of last and the first part of the present year. It stated that the lands so irrigated had produced a louble crop of grass, and on the corn lands there and been an improvement in value of not less than 30 per cent., and taking its operation generally on the land, he estimated the increased value from 40s. so 50s. per acre. The report was accompanied by a oug list of charges incurred for these experiments, mounting altogether to 757t.

Mr. Leslie moved that the report be printed, and aken into consideration on a future day. A report was presented by Mr. G. Donaldson, on

aken into consideration on a future day.

aken into consideration on a future day.

Mr. Chadwick, as an amendment, moved that he amount be paid at once, and felicitated the rate-payers and agriculturists on the results that had seen arrived at, which had settled the value of ewage manure. The general results had proved hat 100 tons of liquid manure could be distributed at a cost of 1s. 6d. or 1s. 8d. per acre, and its lotted that be one highly satisfactory on every description of land. ion of land.

ion of land.

Mr. C. Johnson was of opinion that, ultinately, not less than half a million sterling profit
vould be derived from the sale of manure, to say
tothing of the advantage of the purification of the
Thames.—Mr. Leslie said they had never heard of the
aport before, and therefore its consideration ought
o be postponed. He then went into a variety of

statements as to the value of the manure, and mentioned that a friend of his had paid 21. 10s. per week for sewage manure, but upon investigation it turned out that he had only been supplied with Thames

water.

Mr. Lovick explained that this arose from a party inserting a house-drain into the Sewage Company's pipe, and who had temporarily stopped it with clay that had not been removed.—Report deferred. Some other business was disposed of, but the court was finally "counted out."

Books.

The Principles of Gothic Ecclesiastical Architecture, with an explanation of Technical Terms. By Matthew Holbeche Bloxam. Ninth edition. London: Bogue, Fleet-street.

This admirable manual does not now need recommendation from us, but we may mention that in this, the ninth edition, the text has been enlarged and many woodcuts added. Mr. Bloxam mentions in the preface that a German translation of his book has been pub-

lished at Leipzig.

We cordially recommend it to all desiring introductory information on the subject of which it treats. The engraved illustrations

are nicely executed.

Miscellanea.

ROSHERVILLE GARDENS.—When nature provides cliffs, water, trees, varied surface, and a magnificent prospect, very little art, well applied, will suffice to produce a fine result. We had associated with "Rosherville Gardens," near Gravesend, no other idea than dens," near Gravesend, no other usea than that of shrimps and eigars, and were not prepared for such a charming scene as we found them present when accidentally led to visit them last week. We will not say much about the imitation Tudor Hall there (a very large apartment), but even from this a valuable hint may be gained, and that is, as to the use of looking-glass. To take the end as to the use of looking-glass. To take the end of the hammer beam of the roof on each side slight upright supports are introduced, thus dividing the apartment into three aisles. This, of course, if apparent, would contradict the apparent construction of the roof, and to avoid this the upper part of each upright is cased with looking-glass, which considerably lessens the defect. The lower part of the upright is made to serve for hat pegs, &c. Of course we do not allude to this to lead to the imitation of such an arrangement of roof, but as an ingenious expedient applicable in more legitiingenious expedient applicable in more legiti-mate positions. What we are speaking of, however, are the gardens, and these really are very pretty.

COMPENSATION CASE.—The site, at Shef-field, chosen by the Duke of Norfolk as promoter of the projected new markets, includes the extensive area of the Tontine Hotel, and as a wide difference arose as to compensation, the point was referred to arbitration. contains 3,502 square yards, and is held under a lease from the duke for 99 years, to expire in 1883,—rent 201. per annum. The proprietors, seventeen survivors, claimed 15,5001. Mr. W. Flockton, architect, valued it at that amount, The proprietors, Flockton, architect, valued it at that amount, with a reference to improvements to cost 2,200*L*. and increase the value to 612*L* 16s. a-year in all, worth, by the usual annuity tables, 16½ years' purchase. Mr. *J.* Harrison, architect, concurred in this valuation, as nearly did Mr. F. R. Jones, of Huddersfield, land valuer. For the duke, Mr. W. Fowler, land agent, was called, and valued the property at 6.133*L* is called, and valued the property at 6,138/., called, and valued the property at 0,1381, in-cluding 5581, for compulsory sale, and esti-mating the net income at 300l. 17s. Mr. H. Holt, of Wakefield, land valuer, and Mr. H. M. Wood, of Nottingham, architect, concurred. The unpire, Mr. Foster, awarded 7,720l., and s. costs.

M. Gerente, the French glass painter, who has executed some windows in Ely Cathedral, and seemed to be warmly taken up by some leading men in this country, has been carried off by the cholera in Paris. Two other French artists in glass have been with us lately with strong letters, and have been canvassing for commissions. Their works, so far as we saw, afforded no substantial reason

for employing them to the prejudice of our

RAILWAY JOTTINGS .- The Great Western RAILWAY JOTTINGS.—The treat western appear to have offered a dividend of 2 per cent. only for the last half-year, leaving a balance of 18,0001. odds under head of receipts. The solicitor to the Company is said to have 'misappropriated' a sum of 45,0001. belonging to his constituents.—The opening of Wilder extraction of the South Western of Windsor extension of the South-Western is likely to be obstructed for some time by the snapping of the cast iron girders of one of the arches of the bridge which crosses the Thames near Eton College. The masonry and brick-work of the piers are built on caissons of cast iron, driven into the bed of the river hy means of Dr. Potts's patent process, and the super-structure above the masonry is of cast iron. One of the piers, in consequence of the great weight, appears to have sunk several inches, thus causing the snapping of the girder in question. Fears are entertained that the caissons will sink still further, it being sup-posed that they are now chiefly resting on a soft bed of clay.—The contract for con-structing the Chepstow-bridge, for the South Wales line, has been taken by Messrs. Smith

and Willey, of Liverpool, engineers.

ELECTRO-TELECRAPHIC PROGRESS.—The
London company have purchased Mr. Bain's
patent for Great Britain, which is said to increase the rapidity of communication from 65 to 1,000 letters per minute.—Herapath complains of the personal interest of the railway management in certain patents as a main cause hitherto operative to the injury of the public hitherto operative to the injury of the painterest in this useful invention, as well as to interest in this useful invention, as well as to that of the shareholders themselves. "If it happens," he observes, "as we need not say it does-that the first patents in which all these managers and officials are interested are not the best, that they are far inferior in utility and the best, that they are far interior in using and economy to others subsequently brought out, we are enabled to perceive great evil in directors, &c., participating in the profit of such patents. The shareholders are injured and the patents. The snarenouers are injured and the public are injured. The shareholders' interests are sacrificed by the extension and the continuance of plans much more expensive than others. It is the interest of the directors not others. It is the interest of the directors not to adopt anything cheaper. The public interests suffer, in higher charges than need be being maintained, and in convenience. The public are charged, perhaps, 12s. 6d. where 3s. 6d. or 2s. 6d. would be ample remuneration by the improved apparatus, and beyond that the facility of communication is not so great."

BATHS AND WASHHOUSES .- The foundation-stone of new baths and washhouses, for the working classes resident at Miles Platting, Manchester, was laid, according to the local Spectator, on Thursday week. The population of the suburb are indebted, it seems, to Sir of the suburb are indebted, it seems, to Sir Benjamin Heywood for their present prospect of a cheap luxury. The estimated cost will be 2,000l. The building is being erected by Mr. Marmaduke Burnell, and will be 160 feet in length and 49 feet in breadth. It will contain fifteen baths for males, and eight for females; also a diple house. There will be a plung-hath 27 feet 8 inches love and be a plunge-bath 27 feet 8 inches long and 16 feet wide, with dressing-stalls, &c. The washhouses will be five in number, one (in the spirit of a recent advice in The Builder) for the cleansing of infected clothes exclusively. The drying-room will be 19 feet by 16 feet 9 inches in dimensions, and will be heated by steam-pipes. The whole is to be conducted under the eye of Sir Benjamin's agent, and will be ready for use, it is thought, in four or

Oxford Town Council.—Blind Ten-Ders.—At the town council held a few days ago, the following fourteen tenders were opened for new water-wheels, pumping machinery, &c. at the City Water Works. Messrs. Easton

and Amos, engineers:—

Provincial.—A new museum is about to be erected by subscription at Oxford, at a cost of 50,0001. The site chosen is in the parks, near the Wadham College gardens, Merton College.—St. Micbael's Church, Gloucester, has been gutted preparatory to demolition, to make way for the work of 'restoration.'(?) The tower alone will remain.—The building fund of the Normal College for Wales now exceeds 3,0001.—The numerous repairs and alterations in progress for the last two years at Lanercost Church have been completed and the edifice reopened. The whole has been reroofed, and indeed it was the falling in of a portion of the old roof that led the Woods and Forests to grant the means of repair and alteration, the design for which was supplied by Mr. Salvin, and superintended by Mr. Stone.—Mr. Robins, we observe, announces the forthcoming sale by auction of a "free-hold Episcopal Chapel, of the Gothic order of architecture, newly built in the township of Moss Side, near Chorlton-upon-Medlock, presenting (of course) a capital investment." It is said to have, as it is, accommodation for above 1,000 persons, and to have cost 6,0001, but whether built on spec or otherwise, is not declared.—The porch of Hunstanton Church, near Lynn, which is a specimen of decorated work, has lately been restored, under the superintendence of Mr. Frederick Preedy principally at the expense of some liberal but unknown subscriber. — Messrs. Lee and Sons have contracted with Government to protect the cliff, at Harwich, from its commencement to Mr. Bagshawe's property, by a wall of Kentish rag-stone, with a promenade 8 feet in breadth, to the new breakwater.

BIRMINGHAM WORKHOUSE — SECOND COMPETITION.—Forty-three designs were received, and were referred to Messrs. Edge, H. Stevens, and Gihson (vice Shaw). have reported upon them, and state their first object was to reject such designs as they considered to be inadmissible; and as many of them were imperfect and ill-considered, and as them were imperfect and in-considered, and as others had been evidently prepared for other places, they had not much difficulty in reducing the number to ten sets, all of which appeared to have been studied with reference to the locality, and to demand a close scrutiny.

After making a further careful comparative archemical processing and the set of analysis of the ten designs, they again reduced the number to six. To these they had devoted a large portion of time; for though they had not experienced much difficulty in arriving at not experienced much directly in arriving at a judgment, they felt that it would be un-just to decide which they would recom-mend, without giving to these reserved designs the full benefit of the closest in-vestigation. The result had been an unanimous and decided opinion in favour of two plans, the numbers of which were specified in the schedule. Both these sets of designs appeared to have emanated from the same architects, from the similarity of principle observed in the arrangements, and in the descriptive parti-culars. A third set of designs were therefore selected for recommendation as deserving of the second premium—a distinction to which they were fairly entitled by the great care be-stowed upon their preparation. The three architects stated various grounds on which they preferred one of the two designs before referred to to the other, and their opinion that it could be erceted for the stipulated sum. The guardians resolved that the six plans therein referred to should lic for the examination of the guardians for one week, when the meeting to be then held should be made special for adopting such resolutions with reference to them as might be deemed desirable. The letters accompanying them were sealed up in an envelope, and will not be opened till after the final decision both by guardians and Poorlaw Board.

LAYING IT ON.—We are told that a Trowbridge minister has had gutta percha piping carried round his chapel, and connected with a large oval funnel in the book-board of the pulpit; and wherever a deaf hearer sits, he bas an ear trumpet attached to the tube, by which he can hear all that passes.—Loving music, and anxious to extend the enjoyment of it, we have often contemplated the possibility of laying it on to various quarters by means of pipes from a central producing orchestra. The possibility seems to be becoming a probability,

PROJECTED WORKS.—Advertisements have been issued for tenders, by 10th September; for various works, for her Majesty's Ordnance, Pembroke district; by 4th September, for reslating four gun sheds, at the Grand Depôt, Woolwich; by 1st, for painting the iron railings and curbs of Tavistock, Gordon, and Harrington squares, and for the interior and exterior painting required at the Commissioners'-office (Bedford estate); by 20th October, for the whole or any part (four divisions), of the works in the erection of the new Grammar Schools and Master's house, at Loughborough, Leicester; by 27th inst., for the erection of a British school at Thaxted, Essex; by 27th, for the erection and completion of a garden market at Worcester; by 7th September, for the several works required in the execution of a railway of three miles in length, crossing the river Blyth (Newcastle); by 31st inst., for the carpenter's work of sheds to be creeted on the quays of the Nelson Dock, Liverpool; and by 6th September, for 50 iron gas columns, and 50 street posts, at Bethnal-green.

The Tubular Bridges.—In a recent report, Mr. Stephenson states that the masonry of the Britannia-bridge contract is completed as far as practicable, prior to the floating and lifting of the tubes; that some delay had arisen from an unsoundness in one of the large castings of the new hydraulic press in the Anglesea Tower, which occasioned so much leakage, as threatened to render a new casting necessary; that the leakage, however, had been stopped, and the lifting might have been completed, but he had deemed it prudent to lift by short stages only, and to build up step by step underneath with brickwork, in order effectually to gnard against the serious consequences which might arise from any failure or derangement of the hydraulic presses, whilst the tube was suspended from them. Such an accident he believed to be very improbable; but, after the fracture that took place in one of the crossheads during the lifting of the Conway tubes (fortunately discovered in time to prevent a very serious disaster), the utmost caution was deemed expedient. The issue has since proved the great necessity of such prudence and caution. The lower part of the defective cylinder burst, on 17th inst., with a tremendous explosion. Only one man was injured, but he was dreadfully smashed by the falling mass of nearly three tons weight. The precautionary packing and bricking, with cement, under the tube, alone prevented the most terrible consequences. The tube is now raised about 21 feet from the base. In the 26th report of the Parliamentary Commissioners on this route of railway it is stated that, on careful examination of the Menai-bridge, the whole structure appears to be in as perfect a state as when first opened. The Conway-bridge has also been found perfect.

BREAKAGE OF GLASS.—Messrs. Hartley, glass manufacturers, Sunderland, lately brought an action against the Great Northern Railway Company for 1651. 10s., loss on rough plateglass, a residue not required by Messrs. Peto in roofing the railway station at Lincoln, and ordered to be returned viā Peterborough to save repacking, but sent by the Company viā Grimsby, and thereby destroyed. Glass being excepted under the Carriers' Act, the judge on the northern circuit, before whom the case was tried, directed the jury to return a verdict for the defendants, as no additional charge was paid by way of insurance. Leave, however, was reserved to the plaintiffs to enter the verdict for them if the Court above should decide that the direction was wrong.

decide that the direction was wrong.

RAMSGATE SEAMEN'S INFIRMARY.—The foundation-stone of the Ramsgate Seamen's Infirmary was laid on Friday, the 17th day of August, hy Mr. John Ashley Warre, the president of the institution, in the presence of a large number of spectators. The building is to be erected from designs in the Grecian style, prepared by Mr. Wm. E. Smith, Architect, of Ramsgate. The site selected for its erection is on the West Cliff, in the district recently assigned to Christ Church. The incumbent of this (the Rev. E. Hoare) will have the moral and religious superintendence, and to whom praise is due for the promotion of this institution, which must be found of service to the afflicted mariners occasionally visiting the harbour of Ramsgate.

CONDITION OF EDINBURGH .-- In your last week's paper you have an article on the adorn-ment of the city of Edinburgh: I will venture to give you the impression made on me at a recent visit to this city, as to the vanity of our Scottish neighbours in attempting to adorn their city while they are so utterly regardless of the common decencies of life. Prince'sstreet and Canongate form a sad contrast to each other: in the former the luxurious Scott monument,-the handsome screens, with columns, &c., on the bridge overlooking the lower town, near the Post-office,—the affected imitation of the Parthenon, on the Calton-hill, imitation of the Parthenon, on the Calton-hill, may be cited as examples of so much money spent in adornment. An apostle has said, "Cleanliness is next to goddiness;" our pious Scotch neighbours overlook this passage strangely; the filthy exhibitions in Canongate are hardly credible in this reformed age. A worthy citizen of Edinburgh told me he really believed that there was not a single privy or accommodation of any character throughout Canongate. For the information of those who Canongate, For the information of those who have not visited Edinburgh, it should be mentioned that Canongate, for the most part, is a wide street, more than a mile in length, and a street, more than a mine in length, and a steep hill the whole length; lofty, irregular, barrack-like houses; the shops, for the most part, stores of different kinds; the upper floors, or flats as they are called, screa and eight in number, frequently inhabited by labouring classes; the exhibitions at the windows aften of not very delicate character. dows often of not very delicate character,— more than half the glazing of the sashes deficient, the vacant panes stuffed with straw or a piece of a garment; the narrow staircases frequently jutting out into the street, give a peculiar character. The affected imitation of the Parthenon on the Calton-hill is, I think, a disgrace to the age. Think of the poverty of idea to servilely copy that which the men of Athens set up more than 2,000 years ago! No adaptation of principle of design, but a uncre servile copy! Ye men of Edinburgh, consider if this is not plain truth.—R. ficient, the vacant panes stuffed with straw or

ANOTHER ROMAN PAVEMENT AT CIRENCESTER.—We understand that, in digging a sewer down Dyer-street, Cirencester, a Roman tesselated pavement has been discovered in good preservation. The principal object is a dragon within a chequered border. It was found about 2 feet below the surface; and from the fact of a former one having been discovered many years ago in the cellar of the house parallel with it, the supposition is that it must originally have extended a great distance. It seems that its preservation is not contemplated: it is to be hoped, however, that a drawing will be made of it, and the spot where it was found carefully mapped.

The Stature of Angels.—Bishop Purcell, of Cincinnati, has received the first of a pair of kneeling angels to adorn his cathedral, sculptured under the direction of Hiram Powers, in Italy. Some one asked the bishop if the stature was not of uncommon size, it being the kneeling figure of a person six feet in height. In answer, he gave the history of his commission to Powers. If he had directed it to be made "of the natural size." Powers, in reply, requested something more definite, alleging that "he had never seen an angel." The bishop referred to Revelations xxi. 17 for his measurements. This was conclusive, and was the gauge as to size and proportions of the object sent.—Boston Chronolype.

BUILDINGS AND MONUMENTS, MODERN AND MEDIEVAL.

Edited by Geo. Godwin, F.R.S., Fellow of the Institute of Architects; Corresponding Member of several Societies.

Part III. of this work, price 2s. 6d., to be published on the 1st of September, will contain Views or Roslin Chapel, near Edinburgh; New Church at Homerton, Middlesex; the Royal Botanical Gardens, Kew; Bridgewater House, London; Sir Benjamin Heywood's New Bank, Manchester; El Cathedral, East End; the Théâtre Historique Paris; Sir Robert Peel's Picture Gallery; will descriptive letter-press.

Parts I. and II. may now be had. Order of an bookseller,

No. CCCXLIII.

SATURDAY, SEPTEMBER 1, 1849.

NE of the most recent of Weale's little red rudimentary works, is a History of the Styles of Architecture, by Mr. Bury,* wherein the writer endeavours

to show, as we also have again and again asserted, "that there is, perbaps, no art or science which possesses more extensive or prolific means of instruction and entertainment, or which has greater claims on the consideration of the world at large, than that of architecture." The architecture of a country is inseparable from its history; -" it is the external and enduring form of a people's habits-an index of their state of knowledge and social progress." In architecture, as in other things, we may say with Göethe, "There is neither rest nor pause, but ever movement and evolution, a curse still clinging to standing still." How greatly our ideas of the past are elcvated in imagination by its architectural relics seems to have escaped consideration Mr. D'Israeli saw this, when he said at a recent dinner, speaking of the works of the architect,-" Depend upon it there is magic in form, to which human nature must ever be obcdient. When we contemplate the past, even in ruins, we admire it, not merely from the associations of the past, but because the past is embodied in the beautiful. If all that remained of the past was a ruined cotton mill, you would not contemplate it as you do Tintern Abbey."

Mr. Bury re-treads the ancient paths, and has produced a pleasant book. Some of his historical statements are made with too little reservation, as if there were no such thing as doubt. For example, one among many, he writes that the temple of Belus "was founded by Semiramis, 1650 years before Christ,"-as if the bills were in our Record office (such as it is), and could be appealed to; whereas the fact is altogether doubtful, and the date more so. There are so many contradictory opinions as to the time at which this queen lived, even to the extent of centuries, that it is impossible to arrive at a satisfactory conclusion upon it; and one distinguished living writer asserts that Semiramis never existed at all, and that her history is simply an allegory, showing the power of maritime commerce!

There is a little want of chronological arrangement, too, in the first portion of the book; these objections, however, shall not prevent us from awarding praise to Mr. Bury for his work as a whole, and recommending it to such of our readers as require an introductory history of architecture.

A part of his concluding chapter will serve as a specimen of the writer's style, and give his opinion on three subjects,-Nash; competitions; and precedent-rule.

Nash, he says, "undouhtedly may be considered as the originator of a new class of arrangement in street architecture, and to whom, on account of his bold and masterly conceptions and improvements, London owes more than to any architect since the time of

* '' History and Description of the Styles of Architecture of Various Countries, from the Earliest to the Present Period." By T. Talbot Bury, Architect. Weale, Holborn. 1849.

Wren: criticism has been too often unduly exercised on his works, which in some instances, in mouldings and details, are faulty; but when we consider the low state of architectural taste at the period of his career, and the immensity of the works on which he was engaged, his imperfections ought to be forgotten in our admiration of his mental energy and unceasing industry and exertion. *"

Of competition he says :-

"The present system of selecting a design from a large number submitted in a general competition (all purporting, of course, to be in conformity with the instructions) is mostly favourable to the unprincipled and incompetent artist, whose professional dishonesty is too frequently successful, and he is chosen to increase the list of monuments of bad taste or parsimony, for which this country, more than any other, is so celebrated. The selection any other, is so celebrated. The selection thus made is more generally influenced by the greater amount of ornamental features, and not hy the superior composition of the design; it matters little if the ornaments are inappropriate, meretricious, or unequally distributed, or to what extent three sides of the building are impoverished or starved, so that the principal façade looks rich: in short, the quantity of enrichment seems to be the main object, without consideration as to its consistency for the purpose or situation of the building. The details of cathedrals, royal chapels, palaces, and princely mansions, are borrowed to disguise hospitals, schools, asylums, training colleges, and even workhouses. This dishonesty in the expression of a building, and the ignorant in-troduction or bad execution of useless ornament, seems to be sanctioned by custom, and is daily perpetrated; --success stimulates the empiric to proceed in his career, and the public taste becomes infected by his productions. May we not partly consider it as a sign of the times, when the unrealities, inconsistencies, and shadows of the art of architecture, are chosen in preference to works of sound judg-ment and sterling merit? or must we blame the fatality which too frequently permits some influential member of a committee to propagate his own mistaken views of architecture?"

And then of precedent :-

" From the errors of this system another has arisen, which, in ecclesiastical buildings, seems to hinder all advance in art: precedent is now the only rule, and from which it is heresy to depart;—'that which has been shall be.' without consideration as to whether it may without consideration as to whether it may or may not be perfect. The criterion of an artist's merit, or the groundwork of his fame, consists in servile copies of ancient ex-amples, and too frequently in the introduction of features for which, by the change of our religious ccremonials and forms, there is not the least use.† The only requirement of an architect of the present day (so far as the erection or restoring of churches is conceroed), seems or restoring of churches is conceroed), seems to be a knowledge of the varieties of details of the Gothie buildings, which he is allowed to put together in any way he likes; for, according to the views of certain societies, they must of themselves produce a good building. Now if the letters of the alphabet of architecture, thus jumbled together without system or principle, are not generally insuccessful in their combination, what noble results might we not expect to follow a proper study of the works of our ancestors, and a discovery of the essential elements of their art! Then would build-tial elements of their art! tial elements of their art! Then would buildings be designed on the principles which brought to such perfection the works of the fourteenth century, and we should have har-monions compositions, instead of bad copies of the patched and mutilated erections of all dates."

As ao example of the engravings with which Mr. Bury's work is illustrated, we give, on the following page, a view of Southwell Minster,-a well-known Norman structure.

* "The fate of the dead lion was Nash's: the difficulties attendant on the building of the new streets were of such a magnitude as few men could have contended against;— these and his good works have been forgotten, whilst small imperfections are noted."

† "To describe more minutely these peculiarities, would only be to direct censure to some buildings where the archi-tects are not altogether responsible for the inconsistencies."

Part II. of the "Rudiments of Civil Engineering," by Mr. H. Law, a portion of the same series, treats too cursorily (to justify the sub-heading "special construction") of roads, railroads, canals, docks, and bridges.

The same publisher has recently issued a second edition of Mr. Gibbons' excellent treatise "On the Law of Dilapidations;" a work which will be found of great service by all architects and surveyors, and indeed by others beside these.*

" I have been more spacious concerning this learning of waste," says Coke, "because it is most necessary to be known of all men;" and Mr. Gibbons, acting on the same motive, has been "more spacious" in this new edition, and has added the cases decided since the first edition was published, also the statutes passed.

Amongst books of this description, scarcely so well known as it deserves to be, is a volume on "The Law of Fixtures," by Mr. Standish Grady. † This is a subject on which many of our correspondents are seeking information, and, in reply to some of them, we may usefully extract, on another occasion, a portion of our author's chapter "Of the Right to Remove Fixtures set up for Ornament or Conveoience and Domestic Use."

From the twisted course of law we pass to the production of the Grecian volute. Our readers will remember a letter from Mr. Jopling, a short time since, announcing his discovery of a simple adjustment for describing the volute and other scroll-work. Mr. Jopling bas now published his method, in the shape of a small pamphlet,‡ with a request prefixed that reviewers will not publish any explaoation of the adjustments. What the author sets forth is, "that while one end of a definite distance (a rod of any length), is carried round a circle once, the other end may be taken twice round another circle;" and his mode of doing this is shown in the pamphlet. Mr. Jopling has long laboured to impress the public with the importance of a knowledge of curved lines, and to induce a more general study of them. He now asserts that "the mystery which has so loog hung over the simple cause of the great superiority in ancient Greek architecture and works of art, as to the beauty, proportion, and harmony of the forms which they introduced-' those refinements which marked the smallest production of the Grecian chisel,' as well as the largest features in their works of art-is now discovered beyond a doubt to be in a great degree owing to the scientific knowledge of particular and practical geometrical curved lines possessed by their architects, artists, and artizans, which instructed their mind and eye in truth, beauty, and variety of form, and enabled them to design and execute works which no other people have equalled."

It appears that others have been working in the same path. A correspondent, who signs himself "Edward Burstow," addressed a letter to us on the appearance of Mr. Jopling's communication just now referred to, stating that he had himself, ten years ago, invented a simple apparatus by which "every description of parallel and converging lines, and every continuous spiral line that may be required can be drawn, with as much ease as adjusting a pair of compasses, and making different circles from the same

^{*} A Treaise on the Law of Dilapidations and Nuisances, By David Gibbons, Special Pleader, Weale, 1849.
† The Law of Fixtures with reference to Real Property, and Chattels of a Personal Nature. By Standish Grote Grady, Barrister-at-Law, London: Owen Richards. 1845.
† "An Impulse to Art; or Ancient Greek Practice! Principles for Volutes and Lines of Beauty innumerable." By Joseph Johing, Architect. The Author: Felton Villa, Finchley-road.

centre, so that an artist, however deficient in attainment, can, by the aid of this simple instrument, produce the scroll or volute to any proportion. In any prescribed space a volute to any proportion. In any prescribed space a volute the obstructions which faint-heartedness, as proportion. In any prescribed space a volute can be described in one revolution, and all the lines converge to the same point, or in the same space can make many revolutions with the same number of continuous spiral lines tending to the same centre." He afterwards sent us a number of volutes described by the instrument. These investigations have more extensive hearings than are apparent at first sight.

As we are speaking of books, we will take the opportunity to mention the scheme of The Architectural Lending Library, which has been opened by a respectable member of the profession, and will probably be found advantageous by some of our readers. The catalogue, now before us, includes 742 works, and this number it is proposed to increase. Each subscriber is to pay three guineas at the time of entering his name, as an entrance fee, and three guineas as his subscription for the year: for the second year the subscription alone is to be paid. Any two gentlemen under the age of twenty-one may club together to pay the subscription. Each subscriber is entitled to have out of the library at one time any number of volumes to the full amount of the annual or half-yearly subscription he has paid, for a period specified. But it is proposed, if the project meet with support, to appoint a committee of subscribers to advise as to these and other laws, and as to the best mode of increasing the efficiency of the arrangements. We sincerely hope that the scheme will find favour in the eyes of the public, as we see in it the germ of an important establishment.

"The number of books," writes a student-

"Energy of spirit is requisite to overcome the obstructions which faint-heartedness, as well as the indolence of nature, opposes to cdu-cation. Not without a significance did the Goddess of Wisdom, in the old fable, step in full armour from the head of Jupiter; since her first occupation is warlike. At her very birth she has to maintain a hard contest with the senses, who will not be torn from their sweet repose."

Fight the good fight, and fear not.

THE VALUE OF THE ROMANESQUE STYLE.

Through circumstances, the new Byzantine Church at Wilton has lately met with consi-derable attention; and several opinions have heen expressed as to the fitness of that style of architecture for modern English ecclesiastical

At the risk of differing from many whose opinions are entitled to the highest respect, I cannot help thinking that the Romanesque (and I include under that name all its protean varie-ties in England, France, Germany, Sicily, and Constantinople) has not met with a fair share of attention from modern architects. To those whose ideas of church architecture are limited to a reproduction of the forms of mediaval antiquity to the minutest detail, it is not to he wondered at that Romanesque should prove a

antiquity to the infinites are well and prove a dead letter; they soon get lost in a perfect maze of beak-heads, cat-heads, griffins, and other monstrosities, which they soon see would never do to copy: they have not the smallest notion of improving a style: unless a style will furnish them with door, window, and buttress ready made, it is in their opinion worthless. The history of Romanesque architecture is in one respect quite unique; its resources were never, as in Greek, Roman, or Gothic architecture, fully developed. Its infancy may be seen in the ancient basilicas, its youth at Constantinople or Ravenna, but a prime it never had. It was nipped in the bud by the invention of the pointed arch. There are some "The number of books," writes a student-friend to us, "which it is necessary to master, the much greater number of which it is necessary to know something, oppress and overwhelm me." We have not space to offer him consolation and to urge him onward, hut we have an apposite sentence of Schiller on the tip of our tongue, which he shall have instead,

than reproduction), it would go a great way towards attaining that great desideratum-a new style of church architecture in the spirit of the Protestant ritual.

of the Protestant ritual.

It cannot fail to strike the attentive observer
of the architecture of the metropolis, that
there is a singular want of harmony between the ecclesiastical and domestic structures
erected of late years. The tapering spire, the pointed arch, the gracefully-diminishing but-tress,—features which combine so well with those picturesque conventual buildings and straggling gables which the mediæval archistragging gauses which the mediaval archi-tect knew so well how to group around them, but ill accord with Pimlico palaces and west-end squares. The horizontal and perpendi-cular line, when brought into violent juxta-position, produce, perhaps, the most juring and unpleasant contrasts of which architecture is capable. Now just inagine, Mr. Editor, a church in a Romanesque spirit creeted in such a situation. 'The admirable manner in which the Lombard churches of Italy combine with street architecture, is worthy of remark, and they nevertheless present a strictly ecclesiastical character.

astical character.

Mr. Sharpe has noticed the great number of churches existing on the continent where the round arch is used in windows, &c., and the pointed arch in what he terms the arches of construction. The round of the Temple Church, and Kirkstall and Fountains Abbeys, are English instances of this arrangement, the effect of which is, to my mind, very pleasing. In a case such as I have supposed, where the pointed arch would be too vertical in its outline for the exterior, it ought still to be used, to give greater solemnity to the interior. It strikes me that this mode of treatment would have been a great improvement to the church at strikes me that this mode of treatment would have been a great improvement to the church at Wilton. Another reason which induces me to recommend the Romanesque for metropolitan churches is its great suitabliness for decorations in ornamental brickwork. Any one who will look attentively at the new church at Streatham will, I think, soon convince himself of this fact. I know that many will point to the brick mouldings and ornaments of the the brick mouldings and ornaments of the Tudor period, and ask, triumphantly, what can be more suitable than these? But, with all due deference to their opinion, I must affirm that these were imitations of the stone features of their predecessors,—and to imitate stone in moulded clay seems to me just as

reprehensible as to imitate masonry in cast plaster. Any style which requires mullions or tracery must necessarily be unsuitable to brick construction. Let a mullion appear what it is,—a bar: construct it of stone, wood, or metal, if you will, but not of a number of bittle pieces of baked clay, piled one on the top of the other. The high-pitched roof, "excluding sun and air," which Professor Cockerell has lashed so vigorously, and which is such a source of expense to modern which is such a source of expense to inducting Gothic architects, would not be necessary to give due expression to this style,—and a glance at the interior of St. Mark's, at Venice, would serve to show that in a style which admits of such a picturesque display of large and subordinate arches even galleries would and subordinate arches, even galleries would

not be altogether hopcless.

Whatever may be the faults of the Romanesque -and they are legion-they were faults pro-duced rather from a want of refinement of duced rather from a want of refinement of execution than from any inherent defect in the style itself. It breathes throughout the purest spirit of Christianity, somewhat gloomy and ascetic perhaps, but still untainted hy the subsequent pollution. It has been well remarked by Lord Lindsay, that these artists "Christianized everything they touched;" and when we reflect that their sole precedent was the very dregs of the splendid luxury and licentiousness of the Roman empire, it must be admitted of the Roman empire, it must be admitted that they displayed an amount of taste and mat they displayed an amount of tasks and originality quite marvellous. It was these barbarians, be it noted, who were the first to spring the arch from the column, instead of buttressing the arch with the column,—who first laid aside the clumsy bent architrave of the Burnards adout that heaviting layers are the Romans to adopt that beautiful system of orders of mouldings afterwards carried to such perfection by the Gotbic architects,—who first conceived the magnificent idea, and carried into effect the magnificent reality, of an ærial cupola. But take the least artistic part of the Romanesque—its truly barbarous sculpture—and compare it with the Gothic sculpture of the fifteenth and sixteenth centuries, and this will show the minds of the artists in their true light. Both were grotesque in the extreme; the one the production of an impotent hand, the other of a vindictive mind; the one did his best to produce that holy imagery and peculiar symbolism which had its origin in the catacombs of Rome, the other to pourtray his rival monks in ludicrous positions and un-seemly attitudes; the one carved his devout freemasonry rudely enough, the other cut elegant devices into riddles and rebuses of the names of ecclesiastics. I must own I prefer the crudeness of the former to the refinements of the latter.

I sincerely hope, in conclusion, that a style which our continental neighbours are studying with great avidity may meet with some little more attention in England.

PHILO ROMANESQUE.

NORTHAMPTON CORN EXCHANGE.

SIR,-May I beg, through the medium of your columns, and as an architect and com-petitor for designs for this building, to say a few words respecting this competition; and in so doing, I beg to say that I should not have trouhled you, nor have occupied your valuable space, but from a sense of the gross injustice done to those architects who, I may say, were so unfortunate as to join in this competition,a competition, I believe, that has seldom been surpassed for the taste which most of these designs exhibited; and from a careful estimation of them I should say they could not have been valued at less than 2,000%. The cost of the building, as stated in the

instructions to architects, was not to exceed 7,300l., but after some time had elapsed, and we (that is myself and partner) had begun preparing our designs, a circular was sent to the effect that the directors had come to a resolution that plans would be entertained although the cost of the building might in their estimate exceed that sum, and that the intention of the directors was to select such plan as would best carry out their require-

ments at the least expense.

Trusting, of course, to what was here stated, we sent in a design accordingly; and in about three weeks afterwards, having to transact

and was allowed the liberty of inspecting the designs, of which there were upwards of fifty, and a better collection, as I have said before, I have never seen.

Upon making inquiries, I found that the committee had selected three designs, which they were to submit to the directors, who were to make a selection of one of them. I also found, to my astonishment, that they had re-solved not to consider any design estimated above the sum of 8,000*l.*, and also all those with pillars in the large hall,—and which virtually threw out of the competition three-

fourths of the designs sent in.

Now, what can be thought of such a com-petition:—the directors of a public company petition:—the infectors of a public company inviting architects to compete, sending them instructions which they did not abide by, and only led us astray in our designs? I am in-clined to think that it was merely for their own fancy; for what should they know about pillars, when out of about a dozen designs they chose three, and, after referring them to three eminent architects, refused to have any of them. But to return; it can be proved that a room with pillars would have suited their purpose as well, if not better, than without; and I will leave it to any other architects who have seen these designs to attest the truth, and to bear me out in saying that the majority of the designs sent in with pillars were infinitely the designs sent in with pillars were infinitely better than those without. I do not say that they have not a right to throw out such designs as they might think proper, provided they were not according to their instructions,—but that is not the case. Is it at all likely, I would ask, that we, or any of those architects who were thus thrown out of the competition without having their designs even looked at, would have been at the trouble and expense which is necesat the trouble and expense which is neces-sarily incurred in designs for such a build-ing, if we had thought the instructions were not binding? If we had not com-plied it would have been a different thing; but here it is just the opposite; we trusted to their instructions, and why did they not abide by them? There were no restrictions before the plans were made, then why should they have made any after they had been sent in? All this would bave been avoided if they had employed a professional man at the first, instead of three at the end, as they have done, and which would no doubt have led to far different results, as it appears, from a resolu-tion they have come to, that from the reports of the architects they employed to report on the three designs they had selected, who considered that neither of them were at all suitable or even capable of construction without an enormous outlay much beyond their means, they therefore resolved that none of them should be accepted; but that two of the architects whose plans had been thus con-demned should design another between them, so that they are about as near getting a plan to their mind as they were at first. A. AND C.

** Since writing the above I have received a letter in answer to an inquiry I had made, stating that Mr. S. Alexander, and Mr. Hull of Northampton, are the architects chosen.

THE BIRMINGHAM WORKHOUSE COM-PETITION.

THE guardians have resolved on adopting the plan, No. 24, selected by the architects, whom they had called in to advise them, as the best. It would seem, however, that the matter is even now not straightforward. Our readers will remember that the selecting architects recommended also a second plan, said by them to be obviously by the same architect as the first. Now this plan, it appears, bears the name of the architects Messrs. Drury and Bateman, partially erased; and as the instruc-tions peremptorily required that the designs should be anonymous, a guardian, Mr. Brookes, moved that these two designs should be rejected, inasmuch as they were not prepared in accordance with the instructions. The motion was rejected, on the ground that the onus of the selection rested on the three architects who had been appointed to examine the plans, and that these gentlemen could not have been in-fluenced in their decision by the names being three weeks afterwards, having to transact on the plan. This is not the question. If the some business in that town, I proceeded there,

tion not prepared strictly in accordance with the instructions, they have not done their

"A WORD TO THE WISE."

DWELLING-HOUSES. THE fears of us poor Londoners have been much worked upon lately with the fearful results of a visit from the cholera. At the very mention of that fearful scourge whole parishes are found ready to unite in petitioning for an Act to render increased ventilation and perfect drainage an imperative provision in all houses hereafter built; but more than this is required,-they imagine that this want is not with them, or with their class, but that the real necessity exists in but small tenements situate in the narrow confined courts and pest forming the back sluins of London, and homes of our mobility. It is not, however, only those houses that are deficient in the mere requisites that are necessary to ensure health for the occupants, but it is houses of the respectable reptals of 40l. or more. To tenants of such houses we would urge the imperative duty of seeing that in the house there is nothing injurious to the health of their family. But a short such that is the health of their family. rious to the health of their family. But a short time since a fatal case was reported of the death of a widow lady of cholera, in Gibsonsquare, Islington, and this was followed within the week by another death in the same house, and the fatal result was attributed to "sleeping over a closet that smelt of the drains." Is it to be told to a reasonable man, that to ensure perfect ventila-tion and good drainage, an extra expense must be first incurred to effect the same, and if, knowing this, a man grinds a builder down in the purchase money to such a low figure as will pay none but those who know how to scamp and hnrry through work to suit the market price,—is it likely that the builder would incur expense when it is doubtful whether he would in return get one farthing more from the enlightened and liberal purchaser? This cheap purchase of house property will tell, and has with many already told, a fearful tale, verifying most impressively the old adage—"Penny wise but pound foolish."

That man who purchases a newly-erected house cheaper than he can have it built, is either them. taken in and done for, or strictly speaking he is encouraging a rogue; for if the builder does not receive a fair price, how is it possible for him to act with lonesty and justness by his fellow tradesmen engaged under him? If the builder receive but 15s. for every 20s. he expends, it is manifest that to keep up such a losing game some must suffer. Every one must have a home; a home is the first and last essential to human life; it is the place in which all our associations are to is the place in which all our associations are to he found; it is there we enjoy the pleasures and endure the sorrows of life. To securthat essential and necessity we are come pelled to make every other thought subservient. These thoughts should occupy every man's attention—should arouse in him a continual anxiety and thirst to know in what manner the "home" may be increased in comfort; not a modern invention connected with lealth should be passed without examination; many, perhaps, will be found to examination; many, perhaps, will be found to be whimsical and useless, but all will be found to be instructive and suggestive. All matters connected with building have long been considered as unworthy of general interest; scarcely a man but who in his own mind considers himself a judge of "bricks and mortar," chuckling to himself that he can see as far as any one through a brick wall, but if the ar as any one through a brick wait, but it the question was more deeply considered, a great change would speedily be effected; they would find, when they gained a knowledge of the principles that govern all connected with building, what a very little they really understand of the science. Thousands of houses are built and sold in the manner the public would purchase an article of clothing but would purchase an article of clothing, but unfortunately, the one being for permanent use while the other is but temporary, the result, when unfortunate, is continually felt by the unflucky owner, and unless a great portion of the community will arouse to view the right side of this question, there seems but little doubt that every square yard near London will be covered with houses ill-arranged, badly ventilated, filled with faults, and containing all the elements that old King Death can wish for.

Francis Cross.

In recording the effects and halillities of Colours, it should not be foresten that the Painter's Vehicle or Differed much have considerable effect in preventing Chemical Action moves much as are that the painter's fine of the painter's fine

FREE EXHIBITIONS OF ART FOR THE PEOPLE.

RECENTLY in our metropolis works of art have been offered to the gaze of the public free of charge, in a few edifices, that thus may be said to illustrate the pictorial genius of the age. That such free exhibitions exercise very powerful influences upon the taste of the community, and are, on this account, very desirable and necessary, we do not think will be questioned. We may express a hope, however, that they may become, by every possible means that can be adopted for their success, a great attraction. If the proprietors and managers of them persevere in popularizing art in its varied departments, which doubtless RECENTLY in our metropolis works of art managers of them persevere in popularizing art in its varied departments, which doubtless they will do, provided they only receive sufficient encouragement,—if they secure, as assuredly they deserve, patronage from quarters whence it is expected to flow,—if they render them worthy of frequent observation,—their tendency to refine the masses and educate them in art, will indubitably, before long, be every where and by every body acknowledged: the nitimate effect will be a universal understanding of its powers and its principles. It is more especially the large halls, containing the productions of different artists, open free of expense to all who seek to derive pleasure and profit from their contemplation, which we and profit from their contemplation, which we consider to be such a great boon to society. Facility to an examination of these works is racing to an examination of these works is every thing, for thus inducement is held out to the multitude; inclination to visit them as often as opportunity offers, increases with the gratification; and a familiarity with, and pleasure in looking upon, the most beautiful things, are safeguards against many vices.

The proprietors of these halls themselves may be reminded that the beneficial results which spring from them will be in proportion to the merit and moral impression of the works to the merit and moral impression of the works exhibited. The more excellent they are, the more they display those qualities which the great masters inculcated,—the more will they be calculated to convey a perfect knowledge of art. We advocate, therefore, or recommend, the adoption of these free exhibitions for the people. Let them be multiplied. Let one or more be established in every city and provincial town throughout the kingdom. We would suggest the value, the immeasurable good, of giving grathitous lectures on the pure and simple elements of art, so as to form and assist the judgment of those ignorant of, or who are not yet conversant with, matters to which their attention is directed.

F. Lush. their attention is directed.

CLERKENWELL GRAVEYARDS AND THE FLEET DITCH.

WITH reference to a recent letter in your journal, on "Graveyards in Clerkenwell," from the surveyor of the district, recommending that 2 feet of concrete should be placed over them, permit me to say that the churchyards of Clerkenwell being several feet above the public ways, this would, if covered with concrete, force all this would, if covered with concrete, force all pernicious exudations through the walls of the churchyards, and thereby occasion more danger to the public than by permitting them to pass off unrestrained. Can it be necessary still to say, that the best way of remedying the abomination is to cease burying in the churchyards of all towns and crowded neighbourhoods? Prevention will be found better than care.

while addressing you upon the all-absorbing subject of the present time, may I urge upon the Commissioners of Sewers a little more caution, at this unhealthy season, in causing drains to be opened and cesspools emptied. I know of several instances where the inhabitants were quite well until the drains were disturbed; why not wait for a cooler temperature? It is also to be regretted that the Commissioners of also to be regretted that the Commissioners of Sewers do not practise their experiments, or gain their experience in some out-of-the-way-place, such as the Isle of Dogs, instead of poisoning the metropolis; any of your readers who have been obliged to move about the streets recently will no doubt bear witness to

When the weather becomes cooler some careful steps must be taken to render the Fleet ditch (if it cannot be covered) more bearable, what I ask anybody to go down Bowling-street, and publicenter the houses on the west side, and it will out.

be observed that the flow of water does not be observed that the flow of water does not touch the sides, upon which the excrements are left, with fish, vegetables, &c., to decompose and fill the atmosphere with poisonous vapours. I was asked a few days ago if there were any odours from a dust-yard just opened in Castle-street, Clerkenwell? The question, however, cannot be readily answered; it is exactly similar to striking all the notes of a piano at once, and then inquiring as to the tone of any one note. You are no doubt tone of any one note. You are no doubt aware of the various smells in this locality from the different occupations on the borders

of the Fleet ditch.

In conclusion, I request your attention to the reservoirs belonging to the New River Company in Claremont-square and St. John's street-road, which are above the public ways, and you will observe that the water is exuding through the walls, and that in one instance the walls are bulged,

W. P. GRIFFITH.

A WORD FOR THE ROYAL ACADEMY.

Not being a constant reader of THE BUILDER, the letter of a "Passed Student," BUILDER, the letter of a "Passed Student," dated August 11, only accidentally came to my knowledge. It does not require much phrenological science to perceive how differently minds are constructed. I am, like your correspondent, a "passed student," but my feelings towards the Royal Academy are feelings of unmixed gratitude. For ten years I enjoyed all the advantages of that institution, without one sixpence cost. The great and glorious statues of the Greek sculptors were always exposed for my study; living models were prostatues of the Greek sculptors were always exposed for my study; living models were provided and prepared to my hand; paintings by the first masters, from which the principles and practice of the art are to be learnt, were annually placed before me. In addition, the library, where are to be found prints from every school, as well as treatises on art in every language, was always at my milimited command. During these ten years I was free to the annual exhibition. In all this time, though a careful and thoughful student, I was not successful in obtaining one of the many mot successful in obtaining one of the many medals proposed to the school as tests of progress. Leaving the Academy, I spent some time on the continent of Europe, and at my return I applied to the council to be readmitted to the advantages of the schools: my former course being beautiful beautiful to the course being the schools of the school of the s former course being known, this favour was readily granted, with the notice that the application must be made annually, as the council could only renew the permission for one year. To me, an annual letter seemed no great tax. I now became an exhibitor, and so obtained free admission to the exhibition; and, Sir, if in any season. I saw to provide the control of the property of the control of th

I now became an exhibitor, and so obtained free admission to the exhibition; and, Sir, if in any season I sent no picture, so far from considering the payment of a shilling, a hardship, I contributed it with a feeling of pride, in the iden that I could add my mite to that treasury from whose accumulated mites I had derived such incalculable advantage.

Your correspondent says, "he has no hostifity against the eachemy." It would be strange indeed if he had; but he seems to think the funds not properly appropriated. All other exhibiting societies divide the profits amongst the members, but the members of the Royal Academy share nothing. All the funds are produced by shillings received at the door (certainly the public have a shilling's worth for their shilling), and these funds are expended on the schools. The fabled pelican of the wilderness plucks its own breast for the support of its young. The Royal Academy spends the funds procured by its own exertions in raising up students, who are to become the rivals of its members, and who are to take the bread from their mouths. A reserved fund is, therefore, necessary to save the institution from the contingency of diminution in the annual receipts, to preserve members in fund is, therefore, necessary to save the insti-tution from the contingency of diminution in the annual receipts, to preserve members in their old age from penury, and to extend the hand of charity to all who have ever exhibited on the walls of the academy. Your corres-pondent well knows that nothing is contributed to the support of the Royal schools, by the Government, or by the Sovereign. The shil-ling received at the door is its all in all. The mirety hence its to be gained by admitting

The mighty henefit to be gained by admitting what your correspondent calls "the lower public" to the exhibition, is not well made out. Those who most loudly insist on this

measure, are the men who deny to modern artists any knowledge or power (?). If then their works are so contemptible, what good are "the lower public" to derive from the exhibition. The National Gallery at next door is open to every shirtless amateur. He may there study the works of the masters in art; and on Sunday he can walk to Hampton Court and see the cartoons of Raffaelle. Surely all this is much more wholesome food for his mind than what Mr. Conyngham calls "the chalky absurdities" of Eastlake, Mulready, Etty, Landseer, &c.

As you have admitted one passed student to state his feelings, you will not, I am sure, refuse the privilege to

A GRATEFUL STUDENT.

A LONDON FEVER STILL.

THE CRYPT OF BOW CHURCH.

"HE CRYPT OF BOW CHURCH.
"I have often reflected upon the unprovided condition that
the body of the people were in at the first coming of this
calamity upon them, and how it was for want of timely
entering into measures and management, as well public
as private, that all the confusions that followed were
brought upon us, and that such a productions number of
people sank in that disaster, which, if proper steps had
avoided, and which, if posterity think fit, they may take
a caution and warning from."—Account of the Great
Plague in London in 1655, by Daniel De Foe.

Ly has Bonn our lot for many warrs past to

It has been our lot for many years past to be more or less engaged in investigating the antiquities of London, and during these re-searches to explore various neighbourhoods which few persons without a particular object would think of examining. When searching for the relics of a bygone time, we bave never failed to observe the condition of things of the present, and to endeavour, when occasion served, to lay such matter as seemed useful before the public. We have engraved the annexed sketch of the ancient crypt of Bow church, thinking that in the present state of the public health it would be beneficial to lay before our readers not only verbal denuncia-tions, but a correct representation of one of the abuses which, even at the present en-lightened day, is allowed to remain in this densely populated metropolis, premising that our objections are to the system, and are not intended to apply invidingly.

our objections are to the system, and are not intended to apply invidiously.

If it were not that powerful interests are in this matter opposed to improvement, it would be scarcely necessary to do more than place this drawing before the public, and to observe that below a large number of the London churches are similar receptacles for the dead. The fearful consequences of such a practice must surely be evident to every unprecipilized and The rearru consequences of such a practice must surely be evident to every unprejudiced and well informed mind; but there are two classes of persons—one having a pecuniary and the other a personal interest in the continuance of intramural hurials—who are difficult to continuance. vince. As to the first of these classes we will say nothing more than that their interests should be duly considered; but the feeling which dictates the wish to have our last rest-ing place near the remains of dear relatives is a circumstance worthy of the greatest respect. Still, even this feeling ought to be quite se-condary to the consideration of preserving the public health. It has been fallaciously argued that no ill effects arise from burials in vaults, and no ill effects arise from burials in vaults, in consequence of the bodies being encased in lead, and some say that they would think it a great hardship to be prevented from being placed after death among their family. Although the crypt of Bow Church is by no means the worst in London, still its atmosphere is a proof against the above assertion, and Mr. Walker and others have given evidence on the point beyond contravers. dence on the point beyond controversy. Wishing to obtain another opinion in addition to those already recorded and our own, we wrote an able surgeon and chemist to the following effect:

"It having been stated that the practice of encasing bodies in lead previous to interment will prevent poisonous gases from being dispersed throughout the vaults in which such bodies are laid, will you inform us if you think it is possible by any such process to confine the gases which are generated by de-composition."

In reply, he said—"They would be com-pletely confined by such cases made of lead until by their accumulation the case would no longer resist the pressure; the result would be either the sudden rupture of the case or the

A LONDON FEVER STILL-THE CRYPT OF BOW CHURCH.

We have also put the following question to a person who is extensively employed as an undertaker:—Do you think that the lead coffins at present in use are capable of containing the gases which are generated by decomposition?—He said: I do not think they can answer any such purpose, and it is a common practice among the trade to make certain holes, which are partly concealed by the

production of a small fissure allowing a gradual escape. As to the production of such gases there can be no doubt that they are always produced by the gradual decomposition of animal bodies, and a case must be far stronger than is ever used to resist their pressure. The simple fact of exclusion from the air could not prevent their formation."

We have also put the following question to a person who is extensively employed as an a person who is extensively employed as an and that to continue to recording the production of such gases, and also of their poisonous character, and that the continue to recording the production of such gases. puncture such coffins as he thinks suspicious.
There can be no doubt of the escape of these gases, and also of their poisonous character, and that to continue to manufacture them in the vault of a church is not only fearfully dangerous to the congregation, but the whole neighbourhood.

City of London National School.

Inquiring of an intelligent man who resides opposite to the church-wall as to the state of his neighhours' health, it appeared, that in a court adjoining, fever was seldom absent, and that at the present time persons were ill. Mr. J. W. Archer, who has had a good opportunity of examining the London crypts, writes to us on this subject as follows:—"Deep and gloomy must be the path of him who would gloomy must be the path of bim who would

behold the mysteries of London's earliest vestiges and most august remains. The mourner, who follows the remains of a friend to that final abode of mortality may start at the jarring recoil of the heavy iron doors which separate the living from the dead, and as he descends the dark steps and enters the region of vaulted darkness beyond, he will shudder belike, as though he were at once close wrapped in a damp cerement, and his whole circulation will change under the influence of that lifeless and loaded atmosphere; but his sojournthere is brief and hurried, and he ascends to the sunshine and vital air with a thanks-giving for its blessing, and a renewed con-

giving for its blessing, and a renewed consciousness of the cheerfulness and elasticity of the external world.

But though he may have noted the creeping blackness of the floor of this house of death and corruption, whose contact struck a numband corruption, whose contact struck a numb-ness into his limbs and very marrow, and the rings of grey mould that vegetate on that ghastly pavement may have suggested to his imagination an idea of the moribund revel in which ghosts and vampires might be supposed to indulge there, in emulation of healthier spirits in their fairy rings on their own green sward, when the moon shines and sparkles on the fresh dews of early right, west there are

spirits in eneri any rings on their own greensward, when the moon shines and sparkles on the fresh dews of early night,—yet there are other details peculiar to such places now used as sepulchral vaults which we may not expect his observation would extend to, under such saddening and brief circumstances.

It is for the zealous and unflinching sanitary reformer to make himself familiar with these dreary and perilous cells. Here with his lantern and a little camphor to burn, as well for the sake of throwing a white and penetrating illumination over their obscure recesses as likewise to move and somewhat purify the stagnant and oppressive medium,—here, surrounded by piles of dusty coffins, the lower tiers of which are bulged by the pressure of the leaden accumulation above, so that portions of

TERRA-COTTA WORKS IN ITALY——DETAILS FROM BOLOGNA AND FERRARA.

the shroud and melancholy tokens of decayed mortality are revealed, must the earnest searcher pursue his calm investigations, when even the hardened sexton, accustomed to the horrors of the charnel, hesitates to hold the light, and finds rather some excuse to linger at the entrance of the vault, where the air and light faintly enter, and scare whole hosts of huge black and scorpion-like spiders, and many other weird and revolting things, which troop over the dank wall and decaying floor towards the inner penetralia of their gloomy temple."

Common sense demands the immediate reform of a deadly evil.

PAINTINGS AT THE ROYAL INSTITUTION, MANCHESTER.—We understand that the sales have been numerous, and to a larger amount than at the corresponding period of last year's exhibition. Since the opening on the 2nd ult., paintings have been sold to the extent of 747*l*, being in amount 200*l*. more that the total sales at the same period last that the total sales at the same period has year. Amongst the pictures sold are No. 117, the Refreshing Stream (Poole, A.R.A.); 166, Orthelius, the Belgian Geographer (P. Van Schendal), which was sold for 100 guineas;*
178, St. Cecilia (Henry O'Neil); and 348, View of Scarborough (J. W. Carmichael).

* To this picture the Heywood gold medal has been awarded—the subject a Belgian Geographer of the sixteenth century in his study, with strong effects of artificial light upon his face.

THE TERRA-COTTA WORKS OF ITALY. ORNAMENT FROM BOLOGNA AND FERRARA,

THOSE who have made themselves ac quainted with the extraordinary and heautiful examples of terra-cotta in Italy, certainly would wish to see this material used, as far as practicable, in the countries like our own, where so much brick building is in vogue.

The want of notices upon this head, made when in Italy in the worse 1816.

us, when in Italy, in the years 1846-7, take sketches of many of the best examples in this style, and through the medium of your valu-ble paper, we may bring a subject into notice which we hope may prove of interest to many of its readers

Bramante, one of the greatest architects, shows, in his "Ospedale Grande," the church S. Maria delle Grazie, and other churches, as well as private buildings in Milan, that much can be done in that material: the cloisters of can be done in that material: the cloisters of the Certosa, near Pavia, the Foro dei Mer-canti, and many palaces in Bologna, have been treated with equal success. Many inter-esting examples are to be found in Ferrara, Forli, Pisa, Sienna,—and even Venice and Rome, with their marble palaces and rich basilicas, did not disdain works in terra cotta. Annexed are drawings of some ornamental works in this material from Bologna and Ferrara.

Ferrara.

The various combinations of the proportionately small members in the cornices, string courses, &c., are remarkable; also, the little pro-jection in proportion to height, the richness of the

flat ornaments, and the pleasing variety obtained by the intermixture of coloured or glazed bricks. The ease with which ornament is produced in low relief, with great finish and elegance, compared with the same works in stone, at comparatively small cost, is in our day of economical reform a great acquisition.

Colour should be used with great care, and not too lavishly introduced, as it would overburden the light and delicate mouldings and destroy the general effect,—the forms given to the bricks being elegant and diversified enough of themselves, and capable of producing in one colour a rich and solid effect.

In the façades of houses in other countries, particularly in the north of Germany, it is very common to introduce at intervals a course of

particularly in the north of Germany, it is very common to introduce at intervals a course of green, or violet-coloured, or glazed brick, which often tells well. The coloured course must not be carried through the architraves of the openings, as is sometimes seen; it divides and destroys the effect of the best-composed profiles. A dark-coloured course does not look well unless the change be at every other or every third course.

look well unless the change be at every other or every third course.

When no varied courses are introduced, the choice of the colour of the bricks to be used should not be overlooked. In Italy, particularly in Bologna, they are, generally speaking, much darker than those in the north of Europe: a yellowish red seems to be the best for our colder climes,—the rough weather serving in time to darken the tints.

H. W. and H. M. B.

insight to it.

THE POLYTECHNIC INSTITUTION REGENT-STREET.

THE new series of dissolving views now exhibiting at this institution, plethoric of attraction, are particularly interesting of attraction, are particularly at this moment as showing sor at this moment as showing some of the localities prominently brought before the public by the recent operations of the French in Italy,—operations which the historian will hereafter find difficult of explanation in connection with French consistency. If our volatile, disorganized, but nevertheless wonderful neighbours wish to learn the opinion entertained by the ordinary English public of their proceedings before Rome, they should send a deputation to the Polytechnic, and the shout with which the demonstrator's reference to the bombardment of remains which belong to the whole world is received, would give them an

We should like to see a series of good lectures on architecture and architectural history illustrated here. It is not possible to visit this institution without picking up something. You go into the theatre, and the lecture is speaking of water—that it is companyed of the gauge covern and believer. lecturer is speaking of water—that it is compounded of two gases, oxygen and hydrogen—he decomposes some, shows how hydrogen will burn singly—how oxygen will re-illume a blown-out taper—and how the two together will explode, to the alarm of a whole row of Mrs. Smith's ringletted charges and the evident delight of the school-boys. Well, all this you know; you have passed it long since; so you have the theory of dew, evaporation, and the principles of the steam-engine; but, nevertheless, it review previous studies, and theless, it revives previous studies, and keeps the mind awake to what is passing around us every hour in nature's great laboratory. In the midst of it, too, you get an idea or two: he leaves the elementary, and for a minute or two shows how abstract discoveries by the mathematician and the patient investigator in the closet are brought to bear on the every-day life, and to increase the comforts and lengthen the lives of the multitude; he gives you the last bit of knowledge in connection with springs, and you probably go out saying, I had either forgotten that, or had never heard it. Old and young, wise and nnlearned, may spend an hour or two usefully as well as pleasantly at the Polytechnic Institu-

NOTES IN THE PROVINCES.

THE west end of the Early English chapel at Stourbridge is said to have given way considerably, owing to the cutting of the railway and the continual shaking by the trains passing it.—Remains of interest, it seems, have been already found at Bury St. Edmunds, where the trains of the state of the s tracing of the extensive foundations of the monastery has been commenced, under direction of the Bury Archæological Institute.

Contracts for rebuilding Halstead Church having been entered into, the demolition of the old edifice is in progress. The subscription is rapidly increasing: 1,500l have been already realized.—The restoration of Holy Rhood realized.—The restoration of Holy Rhood Church, Southampton, is now finished, excepting the tower, and the church was to be opened on the 28th.—It has been resolved to erect a new district church, with free sittings, and a parsonage, in St. Maurice and St. Mary Kalender, united parishes, at Winchester. A site has been chosen by the committee, and an endowment offered by the curate of and an endowment offered by the enrate of St. Maurice's. A subscription is also in progress, headed by 100.f. from the bishop.—The price of gas at Poole is to be reduced from 10s. to 8s. 4d. per 1,000 cubic feet, in the hope, apparently, of increasing the dividend, even now 6 per cent., by a less impracticable price than heretofore.—The foundation stone of a new church in commemoration stone of a new church in commemoration. tion stone of a new church in commemoration of the majority of Viscountess Fielding, has just been laid at Downing, near Holywell,—a better way of laying out money on such an occasion than practice generally inculcates.—Attempts are being made, hy sale of sites by auction, to 'project' a new town on the sea coast of North Wales, at Llandudno, near Conway, on an estate belonging to Mr. E. M. Lloyd Mostyn, M.P. Two new maps of Liverpool have just been published by the borough engineer. Conteur lines are given for sewerage purposes, &c., from actual measurement of levels, at

every 4 feet of altitude on the large scale map, and at every 8 feet on the smaller.—The United Gas Company at Liverpool, while admitting that the consumption of their gas has been ehecked by depression of trade, have just declared a dividend of 9 per cent., or 41 per cent. on last half-year's proceeds. also announce that there is now a progressive increase in the company's rental.—The chief stone of St. Paul's Church, Portwood, Stock-port, was laid on Wednesday week.—An organ has been built for Hatfield Church, by Messrs. Forster and Andrews, of Hull. It is encased in the Gothic style of the building. The gallery and pews, in this church, which block up the northern limb of the transept are to be removed, it is said, and the wooden partitions in the gallery, it is hoped, will follow.——The chapel at Brougham Hall, has been recently "splendidly fitted up in the antique style," (?) hy Mr. William Brougham, brother to Lord Brougham.—On Wednesday week, the Ancient Fraternity of Wallers, Bricklayers, and Plasterers, at Newcastle, laid the foundation stone of their new hall, now being erected in the Castle Garth, hy the York, Newcastle, and Berwick Railway Com--The aid of the Admiralty is now expected at Queenstown, late Cove of Cork, in the formation of a long talked of pier, in place of the present miserable landing place.— Nearly 2,000 poor starving Irishinen were lately set to work on the Newry Ship Canal, at 9s. a-week, but they had no sooner recruited their exhausted energies a little, than they struck work for 12s. a-week, and are now idle

RAILWAY JOTTINGS.

THE calls for August, so far as lately advertised, amount to 1,124,346l. For August last year they were 3,122,773l. For the eight months of the present year they have now reached 15,758,980l., against 25,750,019l. in the corresponding period of 1848.—It is stated that a proposition has been made by one of the contractors on the Oxford, Worces. and Wolverhampton to complete the most productive part of that line on his own responsibility, taking as security the tolls to sponsinity, taking as security the thirs become due on the opening.—A local paper says, that a contractor of some considerable standing has offered to make the line of railstanding has offered to make the fine or run-way from Portishead to Bristol (following the course of the river), for 50,000/., exclusive of termini.—On a report that the works on the Basingstoke and Salisbury line are to be shortly resumed after a lengthened stoppage, the Salisbury correspondent of a Hampshire paper says this has rather surprised him, as he had long looked as despairingly at the embankments and tunnel near the city as at the excavaments and tunner near the cry as at the carting tions, &c. of the Salisbury and Southampton Canal which was to have done such wonders for Salisbury years ago. — The tube, it seems, has been itself considerable injured, in the recent accident at the Britannia-bridge. The four upright beams of the off entrance are cracked at about 2 feet from the bottom of the tube, and three of the top cross heams, and three of the bottom ones in connection with them, are broken in like manner about 12 inches from the centre of the tuhe, in addition to which, one of the lifting beams gave way close to the hearing.— A new bridge, on the principle of the Besons-bridge, over the Seine, near Paris, has been erected, we hear, on the Read-Guildford, and Reigate Railway, to carry a ling, double line over a gully at Albury. The span is 50 feet. Five light girders support a wooden platform. The weight of the girders, composed of wrought and cast-iron, does not amount to 10 tons. When tested, this light structure did not deflect in the middle, it is said, more than 5ths of an inch with one of the heaviest of the South-Eastern locomotives on it, and at a speed of 45 miles an hour the deflection was very little more than atbs of an inch.—The high level bridge at Newcastle was opened for the passage of trains on Wednesday week. Only one line of rails, however, is complete enough for traffic.—The tailors of Gateshead appear, from the Observer, to be disputing ahout the trowsers that saved the life of one of the passage of trains on Wednesday week. the workmen employed at this bridge, by hooking him in descent on a good stout nail driven in where a nail had no other special business to beatthat moment. Why don't the nailers

take example by the tailors, and uphold the admirable adaptation of their stout rial for the hooking of passing workmen? A labourer has been remanded at the Clerkenwell Police-court, for urging a driver of two loaded trucks to take them, in defiance of orders to the contrary, along a temporary bridge on the East and West India Docks line crossing the Great Northern at Islington while the bridge was insecure and under repair, and whereby the bridge gave way and killed a man and two horses on the spot. A New York correspondent of the Times states that railways on a new plan are to be introduced into the streets of that city, whereby omnibuses will be done away with. There will omnibuses will be done away with. There will he but one rail placed on upright stanchions. The carriages will be suspended from their axles, will hang near the ground, and will be drawn by horses. The railway will not interfere with the passing of other carriages.

THE BRICK TAX IN 1711.

THE following appears to be a printed statement drawn up to hear out a petition to the House of Commons in the reign of Queen Anne, against a forthcoming tax on bricks. As it is a genuine statistical account of building matters in the metropolis a century and a half ago, you perhaps will think it worth perpetuating in the pages of your journal.

"A Just and Exact Account taken out of the Books of the several Brickmakers, Lime-burners, Tilemakers, Slaters, Masons, and Paviers, of the Goods made, or brought in by them, within the Weekly Bills of Mortality, or within Ten Miles of the same, in the Year 1711, in relation to the intended Duties on Bricks, Lime, Tiles, &c., humbly offer'd to the Consideration of the Honourable House.

The total of bricks made anno 1711, within the bills of mortality, and ten miles' distance, as appears by the makers' books 29688000 makers' booksaste and loss to be deducted, not less 03711000

Remaines to be taxed 25977000 Which at 3s. per thousand comes to £3896 11 00 Plain tiles made in the aforesaid year and distance, appears to be 2250000 at 4s. per thousand, comes to . . . Ridge tiles made in the said year and 0450 00 00 distance, and sold therein is 12000, 0903 12 00

0135 00 00 0058 10 00

distance, of twelve inches square is 39000, at 3s. per hundred ... Paving tiles of the lesser sort, of ten inches square, is 59000, at 1s. per hundred Slates used for covering, the year and

or 2s. per quarter, comes to Note.-That 3d. per bushel on lime

is as much as the whole value of the commodity (water and land-car-riage excepted).

Pebbles, raggstones, &c., for paving streets and stables, &c., is 11000 ton, at 2s. per ton.

Portland, Purbeck, Rygate, Oxford, Newcastle, and marble stone, brought and used in the said year distance, is 3355 tons, at 2s per ton

THE OBSTRUCTIVE QUESTION AT THE METROPOLITAN COURT OF SEWERS.

METROPOLITAN COURT OF SEWERS.

On Wednesday last a meeting of the commissioners was held, in pursuance of a special summons, for the purpose of ascertaining, from documentary and other evidence, the truth of certain statements made by Mr. Chadwick and others with regard to flushing sewers, as noticed in The Bullder of last week. The Rev. Wm. Stone, M.A., presided.

The requisition having been read by Mr. Wool. rych, the clerk, Mr. Bullar said he had received a communication from Sir John Burgoyne, which set forth, that as a matter of order, Sir John "considered it to be inexpedient to enter into any discussion on the requisition, on account of its personal character," as he believed it to be "calculated to diminish the feeling of cordicility and action which every one would admit ought to be encouraged amongst the commissioners." Sir John proposed that a resolutionshould be adopted, suggesting another requisition for the purpose of considering the question of flushing, and omitting any reference to the opinions or statements of other members of the commission. He, Mr. Bullar, fully coincided with Sir John Burgoyne as to the necessity of such a step being taken at that stage of the proceedings, so that time might not be wasted, nor angry and unprofituble discussions indulged in.

The Rev. E. Murray moved that a resolution, in the form of Sir John Burgoyne's suggestion, be

profitable discussions indulged in.

The Rev. E. Murray moved that a resolution, in the form of Sir John Burgoyne's suggestion, be adopted; and Mr. Bullar seconded the motion.

Mr. Leslie objected. Certain statements had gone forth to the world impeaching the "morality" of himself, Mr. Byng, and Mr. Bidwell, as to this movement, and he (Mr. Leslie) did not think it was just to take any steps which might lead to stifling an important inquiry. If it was found that any plan was pursued by which the money of the public was wasted, surely they were not justified in pursaing such a course, even for another hour. Why need there be additional delay? The requisitionists were prepared with their proofs, but they were prevented from submitting them. First, they had been counted out;" now they were told that their requisition was not properly worded; all they wanted was to go at once into the question, and they had no doubt of convincing even Mr. Chadwick himself that they were right, and be was wrong.

Mr. Johnson contended that "the dignity of the

Mr. Johnson contended that "the dignity of the count "required to be maintained by their not permitting personal accusations to mix with notices of motion, or in matters of debate. The policy of flushing was the question, into which he thought they could not fully enter, unless the notice on the paper was altered. paper was altered.

After much irregular conversation, the resolution

was carried.

Mr. Hume, M.P., then moved—"That with the view of enabling this board to decide as to the accuracy of the charges made as to the expenditure, at hifferent times, for the works performed under the former and the present Commissioners of Sewers, Mr. Leslie, Mr. Byng, and Mr. Bidwell be requested to call for papers and returns of the expenditure in such case, and that a court be summoned a consider the whole question as soon as the facts ball have been selected." He (Mr. Hume) contended, that unless they "condescended to particulars,"—to use a Scotch but most expressive phrase, they would make no progress in the investigation.—Carried.

Mr. Bullar, that proposed, and Mr. Leslie see

Mr. Bullar their proposed, and Mr. Leslic se-conded a resolution, which was carried, requiring the secretary to prepare an account, in detail, of all the expenditure and particulars of, and incident to, the flushing works done since the opening of the commissions in 1847. commissions in 1847.

Miscellanea.

COMPETITION FOR THE RESTORATION OF NORTHFLEET CHURCH.—Sir: A competition was called for as far back as May 10th, and the drawings were to be sent in on June 5th. on common with many others I sent in designs on that day. On the 26th of July, not hearing enything as to their fate, I wrote to the vestry phything as to their fate, I wrote to the vestry oberks, Messrs. Southgate and Son, requesting o know whether the committee had come to make the committee had come to make that the committee had decided upon the committee had decided upon the committee had decided upon the committee had not receive this answer until after the concessful architect had advertised for tenders. accessful architect had advertised for tenders from builders. I naturally expected after this ele committee would return my drawings, but seems this committee have no notion of aroubling themselves with the rejected plans, or although I have written, I can neither obain them nor any reply .- J.

More Iron Houses .- The Messrs. Belt-MORE IRON HOUSES.—THE constructing four iron dwellings to be sent to California. One of them, now finished, is 20 feet long by One of them, now finished, is 20 feet long by 10 fect wide; the roof is elliptically arched, having a spring of about 18 inches in the width of 10 feet. One cottage was made with a pitched roof, but the arch is preferred. The inside height of the house is 7 feet 6 inches from the floor to the spring, and 9 feet to the centre, of the arch. Internally, the house comprises two rooms; the "house part," or day room, 12 feet 6 inches by 10 feet, and the bed-room, 7 feet 6 inches by 10 feet. The cottage has one outer door into the day room, an inner door between the rooms, and a window an inner door between the rooms, and a window in each room. In each gable wall, within the arched portion, are four circular holes for ventilation, so that when open at both ends, and the inner door is also open, a current of air can pass through the house. The windows have also an opening by swivel and rack, like those in our factories. The whole fabric is of iron; the walls and roof of wrought-iron plates, 1-8th of an inch thick, and averaging about 5 feet by 2 feet 6 inches. These are frauned on angle iron and T iron uprights, each plate numbered so as to fit into its own place, and all are fastened together, without rivets, by bolts and nuts only. Externally there are three uprights on each; these are of hollow roll iron, which, heing filled with wood, can have screwed to them inside a wooden lining, which in each room. In each gable wall, within the screwed to them inside a wooden lining, which is being applied to two of the cottages about to be sent out. The roof caves project about eight inches, so as to keep the rain off, and the whole structure is so compactly fitted, as to be perfectly water-tight. The external walls rest on a foundation of balks of timber, upon rest on a foundation of balks of timber, upon which are laid iron bases, forming a moulding on the outside, which prevents the water from settling there, and at the same time gives a finished appearance to the house. There is no flooring provided, it being intended that the floor shall be levelled on the spot, and either made of puddled clay or of boards, at the choice of the settler. The doors are simple frames of woundstrain covered with sheets of frames of wrought-iron, covered with sheet iron, and having lock and latch. Each window is 3ft. deep by 2ft. 4in. wide; the frame-work wholly of cast-iron, containing 16 panes, of wholly of cast-iron, containing 16 panes, of which the four centre ones open on a swivel, with a segmental rack, for setting it open at three different angles, very similar to those in cotton factories. The weight of iron in one of these houses is about 2½ tons; and one such cottage costs (unlined) about 60L; if lined with wood, about 101. more.

REPORT ON SCHOOL OF DESIGN.—The wishy-washy character of the recent Parliamentary report on the London school is apparent to others besides ourselves. The Atheneum says:—"It certainly does seem a curious problem why, when every circumstance has seemed to favour the institution of schools of design in this country—when we know that they were established by the highest power in the state to supply a publicly recognized want on the part of the community—when there has never been a period at which in their public declarations being at which in their public declarations their managers have not seemed animated by the greatest sincerity and devotion towards conducting their operations to a successful end—when the state and the manufacturers have given their money, the masters their energies, and the students their attention—when among the lists of managers and masters we meet constantly with names of individuals occupying high nositions in govern viduals occupying high positions in govern-ment, art, and letters,—it does, we say, seem a strange problem why all inquiries into the pro-gress of the school have resulted in an uniform admission that it was not in a position to furnish the world of manufacture with what it was exthe world of manufacture with what it was expressly created to supply—good, efficient, and properly-educated designers. It certainly is not to be sure, in the present milk-and-water report that we shall find any resolution of this 'crux.' We must mount bigher up the stream, above the point where Parliamentary etiquette and the unwillingness to give personal offence to 'powers that be' have thrown the veil of polite ambiguity over the ugly yet honest faces of Truth and Candour.'

TINTED GLASS FOR GREENHOUSES—The

TINTED GLASS FOR GREENHOUSES .-- The Literary Gazette says, that the tinted glass used in the great Palm Stove, Kew, is a failure; and that this enormous structure will have to be reglazed with common glass.

AMERICAN METHOD OF TEMPERING EDGE Tools.—For heating axes or other similar articles, a heating furnace is constructed, in the form of a vertical cylinder, the exterior made of sheet-iron, lined with firebrick, 4 feet 8 inches diameter, or of such outside diameter as to give it an inside one of 4 feet, and 3 feet high. In the interior of this cylinder several fire-chambers are formed—usually four. The inner wall of each fire-chamber is 18 inches long, 4 inches from front to back, and about 4 inches in depth—forming, in the whole, a circle of 3 feet 4 inches diameter. Under each there are grate bars, and air is supplied through there are grate bars, and air is supplied through a pipe connected with a blowing apparatus. A circular table of cast-iron, 3 feet 4 inches diameter, is made to revolve slowly on the level with the upper part of the said chamber. This chamber is sustained on a central shaft, which passes down through the furnace, and has its bearing in a step below it: a pulley keyed on to it serves to communicate rotatory motion to the table. When the axes or other articles are to be heated, they are a pulley keyed on to it serves to communicate rotatory motion to the table. When the axes or other articles are to be heated, they are placed upon the table, with their bits or steeled parts projecting so far over its edge as to bring them directly over the centre of the fire, and the table is kept slowly revolving during the whole time of heating. When duly heated, they are ready for the process of hardening. The hardening bath consists of a circular vat of salt water: within the tub or vat, a little above the surface of the liquid, is a wheel, mounted horizontally with a number of hooks around the periphery, upon which the axes or mounted horizontally with a number of hooks around the periphery, upon which the axes or other articles are suspended. The height of the hooks from the surface of the liquid is such as to allow the steeled part only to be immersed. As soon as the hardening is effected, the articles are removed from the hooks, and cooled by dipping in cold water. With the best cast-steel, a temperature of 510 deg. Fahr, has been found to produce a good result in hardening in about 45 minutes.—Scientife American. in about 45 minutes.—Scientific American.

UNWISE EXPENDITURE FOR BRITANNIA Unwise Expenditure for Britannia Bridge.—Can you inform an ignoramis what reason can possibly he given for forming the approaches, as well as the bridge itself, of the enormously expensive tubes? To me, I must own, it appears that this is a stupendous instance of the reckless manner in which Directors often waste the funds intrusted to them. tors often waste the funds intrusted to them. The bridge consists (as you know), of eight tubes, laid in pairs, side by side, four of which will span the whole water way; and the four others, two at each end, will form the approaches over the steep banks of the Strait. Now, it appears quite obvious, that the tubes over the dry land, or bank, possess no advantage whatever over apprecables, rade in the tage whatever over approaches made in the usual manner by a viaduct; consequently the excess of the cost of these tubes at each end above the cost of common arches must be just so much money thrown away .- Fnugr.

IRON SEWER FOR THE THAMES .- Is not the recently constructed tube at the Menai Straits suggestive of a plan of sewerage? Let us suppose a series of tubes laid down on each side of the river, made of wrought iron strongly riveted, and in lengths of 20 ft. by 12 in height, and 8 in breadth—the top of the tunes either level with or only one or two feet below the bed of the river. There can be no difficulty in sinking these tubes: any derangement might be quickly remedied, and the saving in expense, as compared with Mr. Phillips's tunnel, enormous. The junctions could be easily made, and at any time closed or altered, pro renata. These tubes could be carried from Hammersmith to Woolwich Reach, at a distance from each shore of about 40 feet, or say about half-way between high and low or say about natiway between high and low water marks. Corregated iron towers of about 6 ft, square might rise at intervals of a furlong, for the escape of the gases generated, and provided with a sluice or flood-gate on one side for the admission of water at ebb tide, when a greater impetus is required, as is often the case in a long drought. The natural often the case in a long drought. The natural and proper incline of the bed of the river to seaward might be kept; and at the terminus at Woolwich Marshes might be a spacious dock, in which the accumulated sewage could be drained and solidified, taking advantage of the ebb to get rid of the superfluous moisture. Let us once more be able to say of our river—" Infirmo capiti fluit utilis, utilis alvo."

QUIDNUNC.

PROJECTED WORKS.—Advertisements have been issued for tenders, by 20th instant, for the erection of a new church at Birmingham; by 24th, for works to be executed in New Pauper Lunatic Asylum, at Powick, Worcester; by 6th, for the several works required in finishing 12 six-roomed and 5 eight-roomed houses now in carcase, at Islington; by 13th, for various works in erection of St. Lukc's Church, Morton, near Bingley; by 20th October, for the erection of new grammar schools and master's house, &c. at Loughborough; by 4th inst., for additional building and alterations of Penrith Workhouse; by 11th, for the erection of a station and platform at Cosham, near Portsmouth; by 8th, for the erection of a weaving shed, mill, and warehouse, at Shipley; by 5th, for the building of two brick bridges at Beverley; by 18th, for the supply and fixing of iron roofs at Tithebarn-street station, Liverpool; by 25th, for founders', coppersmiths', and braziers' works for the navy; by 5th, for lighting part of Hampstead with naphtha, or essential oil of tar, &e., and for lamp burners, and paving of foot- and carriage-ways at West-minster

Competition.—Advertisements have been issued for plans, by 1st proximo, of subscription baths to be erected at Wolverhampton.

REPORT OF THE COMMISSION ON THE BRITTSH MUSRUM.— It appears that the buildings in which the vast collection is deposited have cost, since the year 1823, nearly 700,000l. The sums which have been expended in purchases upon the collection since that period the commissioners could not learn; but the whole since 1755, independently of the amount expended on the huilding since 1823, considerably exceeded 1,100,000l. The commissioners recommend, in lieu of the present board of 48 trustees,—1. The establishment or revival of an executive government, vested in one person solely responsible for the due execution of his duty, but assisted by a council, to whom he might readily and on all occasions resort for advice and assistance. 2. The establishment of a committee of trustees—a standing committee—elected and undertaking personally to perform all those duties of superintendence, investigation, and control which seem to be the proper and peculiar duties of the trustees, as distinguished from the duties of practical management and executive government, which seem to be the proper and peculiar duties of a governor director. 3. The providing better for the patronage or power of appointing all officers and servants.

Lancepield Forge, the property of Messrs. Fulton and Neilson, at Anderston, Glasgow, when in full operation employs about 100 persons, with several steam-engines constantly at work. A cutting machine slices iron plates, an inch thick, into small pieces, as a housewife cuts a piece of cheese with a table knife. The scraps are built into heaps, put into a furnace, and drawn out in masses blazing red, and subjected to the "tilt hammer," by which they are beaten into bars, the material for immense shafts, columns, and heavy engine gearing, sometimes requiring 10 or 12 horses to convey them away. The bars by Nasmyth's patented hammers are beaten into larger pieces, and made by them to assume their ultimate form and design. These machines can he made to come down at one moment so softly as scarcely to bruise a blade of grass, and at another with a force that would sink a ship of war. By the help of lever power, two or three men can raise, and turn, and manage the formation of a mass of iron weighing 12 or 14 tons as readily as a black-smith forges a horse's shoe, and form it so accurately as not to be the sixteenth part of an inch from pattern. The slotting machine is a huge iron structure, about 65 tons weight, by which blocks of cold iron are cut, and grooved, and pared, as easily as pieces of wood in the hands of a carpenter. The workmen here have the use of hot, cold, and shower baths.

A MONUMENT TO THE LATE MR. C. BUL-LER, M.P., is proposed to be erected in Westminster Abbey. It is to be hoped due regard to the architecture of the building will be paid in determining the character of any future monuments here.

RESTORATION OF ELY CATHEDRAL.—The dean and chapter of Ely have published a statement of the contributions which they have received towards the restoration of their eathedral and the formation of a new choir. Contracts have been entered into for a new open screen, for the throne of the bishop and the stall of the dean, and for new sub-stalls, upon a scale and character suited to the magnificence of the church. They are to be finished before the 1st March, 1851, and their cost will exceed 4,200l. The superior stalls, the work of the great architect, Allan de Walsingham, in 1830, are to be restored as nearly as possible to their original condition. Plans are in progress for the removal of the organ to the north side of the choir, with a case and fitting in full accordance with the stallwork. The other works are advancing: the beautiful canopy-work next the altar of the chapel of Bishops Alcock and West, which was nearly destroyed, has been restored. The dean and chapter have been compelled, from a sense of imminent danger, to undertake a very extensive repair of the southern transept, the principal timbers of the roof of which were found to be rotten, and the upper walls and arcades, mon which they rested, seriously dislocated. It is intended to replace the mutilated sculpture of the timber cornice, the painting of the roof, the ancient decorations of the walls, and to open partially the arch of the western aisle.

AMERICAN WHITEWASH.—The following recipe is used for preparing the celebrated strace whitewash, used on the east end of the President's house, at Washington. Take half a bushel of good unslacked lime; slack it with boiling water, covering it during the process to keep in the steam. Strain the liquor through a fine sieve or strainer, and add to it a peck of clean salt previously dissolved in warm water, three pounds of good rice ground to a thin paste and stirred while boiling hot, half-a-pound of powdered Spanish whiting, and a pound of clean glue which has been previously dissolved by first soaking it well and then hanging it over a slow fire in a small kettle within a large one filled with water. Add five gallons of hot water to the whole mixture; stir it well, and let it stand a few days, covered from dirt. It should be put on quite hot; for this purpose it can be kept in a kettle on a portable furnace. It is said that abont one pint of this mixture will cover a square yard upon the outside of a house, if properly applied.—Mining Journal.

Fell's System of Propulsion.—In this system, the motive power is that of compressed air. A stationary engine communicates with a cast-iron pipe placed between the rails along the whole length of the line, and by this means air vessels of requisite size, placed at certain distances along the pipe, are filled with air of the wished for density. These air vessels (to speak popularly) supply the momentum to the engine truck, a lever bar attached to the truck opening, as it passes along, a valve or cock, which causes the compressed air to escape into a "chamber" running along the under part of the truck, and thus to become available for propulsion. As regards cost, the calculation is, that it will be 50 per cent. less than that of steam.—Morning Post.

MONUMENTAL WINDOW IN WORCESTER CATHEDRAL.—There has been erected a memorial window in this cathedral, by the Rev. Canon Wood, to the memory of his late lady. It is placed in the Baptistry, or Jesus Chapel, in the north aisle of the nave. The stone-work of the window, which is in the Decorated style, has been restored, and the tracery altered so as best to admit of the subjects represented in the various compartments of the head. There are six subjects represented in the body of the window (which consists of three lights), all directly or indirectly connected with the rite of baptism, and the legends underneath each are in Latin. The window was executed by Wailes.

CIRENCESTER.—THE TESSELATED PAVE-MENT.—We understand that Earl Bathurst has undertaken, as lord of the manor, the removal and preservation of this relie of antiquity. It is understood that a house will be taken as a museum, and that the pavement will be laid down so as to form the floor of two of the rooms,

OPENING OF TUMULI ON ACHLAM WOLD The Yorkshire Antiquarian Club have been recently engaged in opening some of the ancient British tumuli near Achlam and Leavening. In one of a numerous lot at Achlam, on the 14th, was found the skeleton of an ancient, and, we suppose, a true Briton, sitting in an attitude of majestic repose, with head to the north, in that precise magnetic position which has been recommended as a novelty by some profound magnetician of the nineteenth century, as the true or right position into which all the bedsteads of the modern Britons ought at once to be wheeled. The ancient hero lay not only in the right meridional posi-tion, however, but also latitudinally right, or, in less scientific terms, on the right side, with a small British urn, the contents of which he seems to have appeared as if contemplating. The urn was much crushed, but the skull has been preserved entire, and is to figure in the Yorkshire Museum, where its owner doubtless never expected it to be. Another tumulus yielded a very large urn crushed and collapsed, but full of calcined bones, and surrounded by various coloured clays. In a third, a curious various coloured clays. In a third, a curious arrangement of chalk and flint rubble occurred, with some loose bones and marks of fire. A netting-needle appears to have been found in one of the tumuli. The urns were only half baked. The club proposed opening an Anglo-Saxon burial mound, near Driffield, on

Excavations at Mountsorrel.—For several weeks past an attempt has been in progress to explore certain supposed remains of the ancient castle which stood on a rock overhanging this town. The task has been planned and carried on by a party of quarrymen, and there is now, it is thought, some prospect of the question being settled as to the existence of a secret mode of access to the castle. The men work, in the evenings only, in a shaft about 12 feet hy 11 feet wide, which has been lowered about 50 feet, or hetween 60 and 70 feet below the surface of the hill. It has been cut out of the solid granite. Nearly 200 tons of old worked material, &c. have been thrown out of it, including cut stones, and oak beams—some 17 feet long and perfectly sound. Nails, bricks of the quarry form, and other curiosities have also been found. An opening of ancient construction, running towards the shaft, has been discovered in a back yard. The blocks of stone thrown out of the shaft, it is thought, may have formed part of a winding staircase for ascent into the castle. Other secret passages are also traditionally believed to exist.

New Power.—A hydraulic gravitation engine, to supersede steam as a motive power, has been projected by a Southampton mechanician, a Mr. Jackson. Once started, it is said, it will go for six months without any sensible wearing of the material. A model is to be submitted to the Admiralty.—A metropolitan inventor proposes to assist the action of small locomotive or other steam engines by a large wheel, with sliding weights and leverage so arranged as of themselves to produce a power of progression only requiring the aid of a very small engine to overcome the dead points, where the weights have to be raised in their most disadvantageous position while generating an auxiliary power in redescent.

COMPENSATION CASE.—On 10th and 11th unit an inquiry took place at Ruabon, for assessing compensation to Mr. G. H. Whalley, and others, for the purchase of 1 acre 2 roods 16 perches of land, part of the Plas Madoc estate, by the Shrewsbury and Chester Railway Company. The amount offered was only 140t.; but, after a lengthened investigation, the jury brought in a verdict for the purchase of lands, 564t. 15s. 4d., and for residental and other damages, 1,800t.— making together 2,364t. 15s. 4d.; being more than sixteen times as much as the company had offered!

BRISTOL ART-UNION.—The drawing of the Art-Union connected with the Bristol Fine Arts' Academy took place in the exhibition-room on Wednesday in last week. The number of subscribers was small. A new feature in this year's Art-Union was the presenting to each subscriber an original sketch in lieu of an engraving as heretofore. There were six prizes.

NEW CEMETERIES.—The graveyards in Bury being, in dread reality, chock full, the ratepayers have determined on the substitution of a suburban cemetery, for carrying out which object they have appointed a committee,—At Bradford there also appears to be a prospect of the like substitution.—At Tredegar the inhabi-tants have been taking steps to establish forthwith a cemetery on a large scale, about half-amile from the town,

A NEW COLLIERY GAS JET .- One of these singular and interesting perpetual burners, has recently been lit at a pit hetween Harrington and Workington, in order to consume a 'large blower' in the pit, which would have otherwise put a stop to the working of it. Ventilation and other efforts had failed to obviate the inconvenience, and the jet was therefore conducted from below, through a train of boxes and pipes, to the surface, where it now blazes on without ceasing, thus effectually curing the dreaded evil.

CANDIFF DNAINAGE COMPETITION PLANS.—A correspondent informs us that the commissioners placed the eleven plans sent in commissioners placed the eleven plans sent in into the hands of Mr. Cubitt, who examined them, and made a report, having called in to his assistance Messrs. Scott and Smith, engineers. Mr. C. recommended No. 8, to be most worthy of the premium, by Messrs. Waren and Dimmock, contractors of the South Wales Railway through Cardiff. The Commissioners paid them the 50t. premium, and Mr. Cubitt 40t. for his trouble. Mr. Cubitt 401. for his trouble.

Monument to the late Sir John Bannow.—A proposition is on foot to crect a monument in memory of the late Sir John Barrow, in the neighbourhood of his birth-place, near Ulverston. It is proposed that the monument shall take the form of a pillar or tower, 70 feet high, to serve as a sea-mark. The sum to be expended is put down at 1,200l.

BRICK-MAKING.—On Wednesday last, Jos. Rush, at Peter Syke, Cumberland, per-formed the feat of making one thousand bricks in one hour—one hundred in five minutes, and twenty-six in one minute.- Carlisle Journal.

THORWALDSEN.—The Cologne Gazette an-Museum, at Copenhagen, will sell, on the 1st of October, a portion of the works left by the sculptor, consisting in part of duplicates in their possession, and partly of objects of value appointed to be so disposed of by Thorwald-

ANTIQUARIAN SMASHERS.—We are told that a person of gentlemanly appearance has lately contrived to swindleseveral antiquaries in Kent, hy selling them false Anglo-Saxon and early English coins. Is such a thing never done in London shops of "gentlemanly appearance?"

PESTH SUSPENSION-BRIDGE.—It is stated that, notwithstanding rumours to the con-trary, and the fact that much damage was done to this work during the war between the Hungarians and the Austrians, it is now in a state little the worse for what has happened.

THE ROYAL VISIT TO IRELAND .- It is proposed to erect a statue of the Queen, by subscription, in Dublin, to commemorate Her Majesty's visit.

BUILDINGS AND MONUMENTS, MODERN AND MEDIÆVAL.

Edited by GEO. GODWIN, F.R.S., Fellow of the Institute of Architects: Corresponding Member of several Societies.

Part III. of this work, price 2s. 6d., is now ready, and contains Views of Roslin Chapel, near Edinburgh; New Church at Homerton, Middlesex; the Entrance to Royal Botanical Gardens, Kew; The New Palm Stove ; Bridgewater House, London, with altered plan; Sir Benjamin Hey-wood's New Bank, Manchester; Ely Cathedral, East End; the Théâtre Historique, Paris; Sir Robert Peel's Picture Gallery; with descriptive letter-press, and numerous details.

Parts I. and II, may now be had. Order of any bookseller.

No. CCCXLIV.

SATURDAY, SEPTEMBER 8, 1849.

EARLY eighty plans for the drainage of this vast metropolis have been submitted for the consideration of the Sewers' Commission, and the exten-

sion of the time for receiving plans, will doubtless lead to an increase in the number. Many of these plans are quite worthless, and more of them are crude and ill-digested, the necessary consequence of the short time allowed for the preparation of them, - a circumstance which, as Mr. Bailey Denton urged in a letter to the commissioners, seeking the extension of the time afterwards given, amounted to " a positive exclusion of every person having a regard for his own reputation; for although the proposal which may ultimately be preferred, may involve but one main principle of design, such principle can only be mentally tested and matured by bringing to bear upon it every fact and contingency which locality and science may suggest to the originator of it. And will five weeks suffice for this?'

Well might Mr. Denton ask the question. If there were no other proof on record of the unfitness of the majority of the members of this commission for the position they occupy, this limitation would suffice. The subsequent extension of time, too, although sought by some who had found it impossible to submit a wellconsidered plan by the date named, was an injustice to those who had contrived to send in something. Further to illustrate the action of the Board of Sewers, we find that they are desirous of receiving proposals for a general system of sewerage, but that they refuse to have soundings executed. Now, such preliminary steps are to the full as necessary to ensure any thing like an approximation to an estimate of the cost of the works, as a correct map is to ascertain the best direction to he given to them. The very great uncertainty which the geologists of the board confessed that they felt as to the nature of the soil to be worked upon. would alone be a convincing proof of the necessity of such researches. As the commissioners would have the benefit of them, they surely ought to pay for them, and to furnish copies of the results to the different engineers they might invite to furnish competition plans for the works. To make definite plans in ignorance of the ground to be worked upon, would be merely a waste of time.

And here we would, on the other hand, briefly (and in a parenthesis) caution some who are connected with the commission not to affect to despise theoretical knowledge because they themselves only possess experience.

Theory and practice should go together. He who trusts to the one without the other, is very likely to meet with a combination of circumstances which will leave him sadly at a loss.

The discussions which have recently taken place at the meetings of the commission illustrate the necessity which exists for organizing, in a more scientific manner, the execution of public utility in our country. We have, in this case, a board appointed by Go-

vernment under a special Act of Parliament, with full powers to act, and almost to legislate, yet it appears that, after eighteen months' existence, the real solution of the question of the effectual sewerage of London is as remote as ever. Small experiments have been tried; much talking has gone on amongst the amateur engineers; but as for the real good effected, it is indeed but small. Such a state of things could scarcely have arisen had the commission included some professional men. At any rate, the common sense of the public would not have been shocked by the publication of some of the absurdities contained in the reports of the meetings of the present board.

A correspondent writing to us from Paris on this subject observes :- "To a person accustomed to the contrary abuse of scientific discussion which prevails in France, there is something painfully ludicrous in the reports of this commission's proceedings, which show amateurs enunciating statistical and engineering facts in the very teeth of common sense. The statements are repeated by the daily press; they set the ignorant agape; but foreigners ask themselves, with wonder, how so eminently practical a nation as ours can allow such nonsense to be published by official authorities. Why does not the profession endeayour to exonerate itself from the restraints and difficulties imposed upon it by the composition of the different public boards? In almost every country but our own these questions are left to the decision of men having the very highest education in the branches of service they are called upon to direct. How is it that we in England so long admit that a man can become competent to decide engineering questions by the study of law, or of physic? Yet such is the system we adopt throughout our public administration. When we name a Lord of the Admiralty, we take a man who is fit to be a political economist; we make noblemen or lawyers secretaries at war, who never carried a sword; and we take barristers, gentlemen, and doctors to make our commissioners of sewers. 'Ils avaient besoin d'un mathématicien, et ils ont pris un maître de danse,' said Beaumarchais : truly in England the same rule appears to prevail."

To the composition of the commission we objected when it was first made known, and still more so to the principle laid down by those who nominated the members of it that because a man was an architect or engineer (and therefore might be supposed to know something, at all events, of the matters requiring consideration), he was not fit to be a Commissioner of Sewers. Tell us that such an architect or engineer is unscientific, is not intelligent, has prejudices and narrow views, and therefore will not make a good Commissioner of Sewers, and we can understand and admit the force of the olijec-But when it is said that an enlightened, liberal-minded, scientific man, with business-habits, acquainted with construction, accustomed to the direction of such works as are likely to be required, is not a proper person, simply because he is an architect or engineer, -- common sense revolts, and we unequivocally pronounce it one of the most preposterous assertions ever hazarded.

It was set forth in respect to drainage works in the report of the Metropolitan Sanitary Commissioners, and it is repeated in the "Report by the General Board of Health," i just

* "Report of the General Board of Health, on the Measures adopted for the Execution of the Nuisances Removal and Diseases Prevention Act, and the Public Health Act, up to July, 1849." Clowes and Son, London.

now issued, that "the more the investigation advances, the more it is apparent that the progressive improvement and proper execution of this class of public works, together with the appliances of hydraulic engineering, cannot be reasonably expected to be dealt with incidentally or collaterally to ordinary occupations, or even to connected professional pursuits, but require a degree of special study, which not only places them beyond the sphere of the discussion of popular administrative bodies, but beyond that of ordinary professional engineering and architectural practice. In justification of this conclusion, and to show the evil of the perverted application of names of high general professional authority, we might adduce examples of the most defective works which have received their sanction. All the improvements which the public have yet obtained in this branch of public works have been the result of the special and undivided practical attention of well qualified paid officers, and it appears to us that further improvement must be sought by the same means, and that one of the chief objects of future administrative arrangements must be to secure, protect, and encourage the zealous undivided attention and efficient labour of such officers."

Suppose we admit all this, surely the men of "connected professional pursuits" will be better able to judge of and discriminate the schemes of the "well-qualified paid officers" than those who know nothing of the matter. And what is the position of the present board? As a body (of course there are exceptions), they are ignorant of the matter in hand, and evidently-avowedly, indeed, by acts-have no reliance on the "qualified paid officers,"-one of whom, the chief surveyor, warns them against attempting to execute works proposed by the consulting engineer, as "they are wholly impracticable, and unworthy the object which should he kept in view for the perfect drainage of this great metropolis;" and says, as to the commission itself, that it is time for him "to speak out," in order that it may not bring itself "into ridicule, and destroy public confidence;" while another, the consulting engineer, says of a plan proposed by the surveyor, that it "would serve only to retard rather than to advance the general improvement," and that "it would be difficult to believe that any one holding the appointment of chief surveyor to the Metropolitan Commission of Sewers had really been serious in laying it before the court!"

The expenditure under some heads has been enormous, and demands immediate and rigid scrutiny. The "flushing" inquiry will probably lead to this; and if, as Sir John Burgoyne said in his letter to Mr. Bullar on the subject, "the startling results stated by the requisitionists prove, on inquiry, to be correct," an immediate remedy must be found.

The cost of flushing the Holborn and Finsbury sewers, under Mr. Roe, according to Mr. Leslie, was 3s. 3d. per mile per week; the money expended, according to the same authority, in flushing the Surrey and Kent sewers, amounts to 10l. 6s. 4d. per mile per week, and, in the gross, to a sum which is positively astounding! If this be correct, and it is seen that actually thousands of pounds have thus been got rid of, under the exclusive control, too, of one of the assistant-surveyors, and in a manner which seems to admit of little check, the necessity of the inquiry will be pretty evident. The useful result of the flushing is a further question.

To get perfect drainage (to lessen pain and

lengthen life) money should ungrudgingly be spent; but there must be no waste, no "cooking," no blinding the eyes of the public. The money is wrung from many who are ill able to pay it. What will our readers say when we tell them, in proof of this, that the Commissioners of Sewers have signed during the year no less than 9,500 warrants of distress, and that there are 4,000 more waiting for signature! If our contemporaries aid us in bringing this fact to the knowledge of the rate-payers,-Nine thousand five hundred distress warrants signed within the year, and four thousand more ready to be issued,-attention will be recalled to the magnitude of the affairs confided to the Metropolitan Commission of Sewers; and the urgent necessity for an intelligent, wise, and businesslike administration of them will be made

PROGRESS OF PUBLIC WORKS IN FRANCE.

More has been done during the eighteen years of Louis Philippe's reign, in the way of works of public utility and embellishment, than during the thirty years preceding, under the Consulate, the Empire, and the Restoration. Great as was the encouragement given by Napoleon, and tru'y magnificent hoth in project and utility the plans he formed, particularly for the improvement of Paris, nothing that he actually did can be compared to the results of the numerous operations undertaken since September, 1830, when a grant was obtained, to the amount of five millions of francs, for carrying them on. The sum thus voted was no doubt as much in consideration of the distress of the working class immediately after that revolution, as for a mere love of improvement. But the Government of Louis Philippe, in thus wisely employing them, has been accomplishing a double good, while it satisfied, at the same a double good, while it satisfied, at the same time, the enlightened views of the industrious middle classes, who see in such improvements immense advantages to commerce and manu-

The republic is not less sensible of the importance of continuing these works, and find therefore rather an increase than a diminution of the amount and value of them.

On referring to a public document, we shall be able to extract some curious and interesting information connected with all the great works which the Government has had executed, and which will show a progress in art as great as

Which will show a progress in areas great as in that of works of mere utility.

We have, in the first place, twelve monuments or public buildings in the capital, which have been constructed, finished or restored.

The Arc de Triomphe de l'Etoile, intended perpetuate the glory of the French army, the largest monument of the kind ever erected by man.

The Church of the Madeleine, commenced under the old dynasty, and proposed by the Imperial Government as a Temple of Glory. The Pantheon, whose fortune has changed

with every revolution.

The Museum of Natural History, at the Garden of Plants, containing a splendid and precious collection.

The Ecole des Beaux Arts. The Cathedral of St. Denis, whose beautiful spire, menacing ruin, has we regret to say,

been removed. The magnificent Hôtel of the Quai d'Orçay,

now occupied as the "Cour des Comptes' the republic. The bronze column of July, at the Bastile.

The Chamber of Deputies - again insufficient for its purpose.

The Institute of the Deaf and Dumb. The Pont de la Concorde.

The College of France. To these we may add, the additions to the Hotel de Ville, now one of the finest buildings, and one of the greatest ornaments of the town; the new hotel of the Minister of Foreign with its superb offices; the additions optel of the President of the Chamber; the new stamp office in the Rue de la Banque the estpration of the Cathedral of Notre Dame, and completion of the improvements

around it; and many other works. Indeed, we are not far from the truth in saying that scarcely a public building has remained unembellished or unimproved since 1830. But we will confine ourselves for the moment

to public works, that is, to such as are directly under the administration of Government, and are carried on by means of grants regularly

voted by the Chamber.
Great attention has been paid of late to the improvement and extension of roads. The Government has shown in that respect a very laudable solicitude, and has shown a readiness at all times to second the recommendations made to it. In 1824, the total length of what were called "routes royales," was 33,538 kilometres, or about 20,637 miles. In 1836 they increased to 34,511 kilometres, or about 600 miles more; and in 1845 to 35,250 kilometres, or 460 miles more.

Between 1830 and 1847 we find that there

were grants to the amount of 266 millions of francs, or 10,640,000/. for repairs and improveof various kinds connected with roads. And that other special and exceptional grants were made, in order, among other things, to give employment to the working class, or to

remedy disasters occasioned by inundations.

Great benefit has been derived from these outlays, however, and a great impulse given to the progress of art in construction of various kinds connected with these works, and particularly in respect to suspension bridges; and more of these and bridges of the common character have been constructed in France since racter have been constructed in France since 1831, than during several centuries under the old monarchy. All these improvements are worthy of note, as they distinctly indicate a vast industrial progress in the country, and prove that a new class of men interested in and connected with it have of late years directed the action of the Government.

The number of bridges constructed by the State or by companies on the "routes royales, and on the departmental, strategic, and conntry roads, amounts to 481. In few countries so many noble structures of this kind, combining greatness of span with boldness and economy of construction be found. The Rhône, the Durance, the Dordogne, the Ga-ronne, the Loire, the Saône, and the Seine, are crossed by some of the finest among them. We would mention those of La Roche-Bernard, of Cuhzac, of Tournay-Charente and of Saint Claude, as heing chefs d'œuvre in point of construction. The money appropriated for this purpose alone amounts to about 24,000,000

francs, or nearly a million sterling.

In the course of sixteen years, previous to 1830, 57 bridges were constructed by companies; and from 1830 to 1847 as many as 162.

There are 1,540 ferries in France, connected with the public service, -established wherever the circulation is insufficient to repay the expense of a more costly means of passage; and these produce to the revenue the sum of 400,000 francs-16,000l.

The number of light-houses in France, in the latter part of the reign of Charles X., was only 16,—10 on the British Channel, 5 on the Atlantic coast, and 1 on the Mediterranean. They have since been increased to 57; but, independently of these, there are 104 lights of an inferior kind, destined to mark the enan interior kind, desumed to mark the en-trance of such roads and ports as are most frequented. The 57 light-houses are thus distributed,—17 on the British Channel, 25 on the Atlantic Ocean, and 15 on the Medi-terranean and the coasts of Corsica.

The French think their system of lighting their coasts now quite complete, and helieve it to be the finest in the world. Of this we will not affect the complete the complete to the finest in the world. to be the finest in the world. Of this we will not offer an opinion; but we may as well remark, en passant, that their establishments for the manufacture of the apparatus connected with light-houses are of a decidedly connected with light-noises are of a decueury superior character. There are considerable works in progress for the completion of the system of navigation by means of canals, intended to connect important points,—one between the Marne and the Rhine, another along the Garonne, and a third to unite the Aisne with the Marne. The extent of canal navigation in actual completion amounts at the present day to 4,623 kilometres, or about 2,680 miles English. In connection with these, great improvements have been made in deepening and ameliorating the condition of the navigable streams and rivers: these, when

finished, will present an extent of about 5,380 kilometres, or about 3,311 miles, and cannot fail to be bighly beneficial to the country.

At the same time that these immense works were carrying on by the State by means of grants, the departments and communes of France were endeavouring on their side to improve and increase what are called "les voies départementales et vicinales." The first entered to about 44,977 kilometres, or 27,684 English miles, and the second to 60,184 kilometres, or 36,918 miles, while, what we should characterize as cross-roads and byeared affectives de second to some second of the sec roads (chemins de petite vicinalité) extend to no less than 600,000 kilometres, or 369,318

The tenth of the price of places in public whicles, according to financial statements, amounted in 1832 to 4,887,000 francs; in 1840 to 8,450,000 francs; and now produces about 11,000,000, or 440,000l.

THE GREEK CHURCH, LONDON WALL.

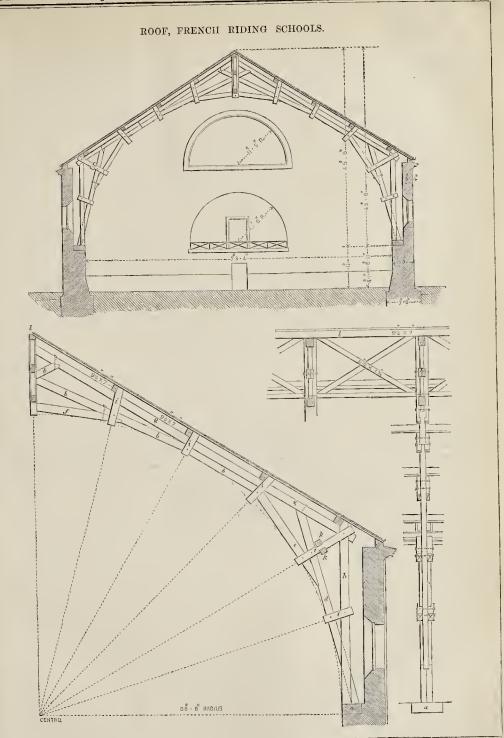

In London-wall, at the corner of Little Winchester-street, a building has been erected for the celebration of the rites of the Greek Church, under the direction of Mr. Owen. is lofty and substantial, and must have cost a considerable sum of money. The opportunity was a good one for introducing a characteristic type, and this would seem to have been aimed at, but is missed. 'The architecture of Byzantium, the capital of the Lower Greek Empire (not "the Corinthian Order," as some of our contemporaries have stated), is adopted for parts of the building, but is not thoroughly carried out. The plan is a Greek cross, marked by a shallow recess in each side, and is crowned by a flat cupola in the centre. In two of the recesses are tribunes or galleries carried on horse-shoe arches and columns, the arches having a fringe of orna-ment. The ornamentation of the fronts of the galleries is Italian, and so is the cciling generally. In front of the iconostasis, or screen enclosing the sanctuary, which is ornamented to a considerable extent, and is being coloured and gilt, are marble steps. The pulpit is peculiar in outline, half a water butt on a post.

Externally there is the same curious mixture styles. There is a recessed porch formed of styles. by Byzantine columns, coupled dos-a-dos, with fringed horse-shoe arches (three intercolumniations): above are three other arches of similar character, having windows beneath them, while the front of the huilding is crowned by a pediment, with a heavy console cornice. The whole of the front is of hrickwork cemented, with the exception of the porch, which is of stone.

THE FEVER-STILLS OF LONDON

THE prevention of intramural burials approaches: the public appear to be at last aroused to the enormity of the evil, and are crying out so loudly that the fatal abuse can-not longer be persisted in. Our engraving last week did its part well, and gave fresh impetus to the movement. The Times calls upon Sir George Grey to prepare a Bill to prohibit burials in crowded districts, ready for the meeting of the House in February: but this is driving it off too long. IMMEDIATE steps are demanded, to prevent the further destruc-IMMEDIATE steps tion of life. The necessity is so urgent as to justify an "Order in Council," and we earnestly suggest that petitions to that effect should be forthwith sent from all parts of the country to the Secretary of State. The Board of Health are beginning to move in it, but must not he waited for.

BALMORAL CASTLE. - Extensive alterations, it seems, have been made at Balmoral, the huildings being now fully doubled in extent. As its numerous round towers, gables, and turets are now seen rising above the birch wood which surrounds them," says a more northern correspondent of the Edinburgh Register, "Balmoral Castle seems really worthy Register, "Balmoral Castle seems really worthy of the Majesty of England. It is a palace in miniature." The new erections, however, are solely servants' apartments. The kitchen is said to be an exact model of that at Windsor

WOOD ROOFS OF LARGE SPAN.

Allusion having been made to the work of Colonel Ardant upon wood roofs of great spans, it appeared to me that it might interest your readers were I to furnish them the means of judging of the practical skill of that distinguished officer. Annexed, therefore, is a sketch of a roof, executed under his orders, for the riding schools of some of the cavalry barracks in France.

The object Colonel Ardant has proposed to himself in this case, is to arrive at the suppression of the tie-beam without throwing the lateral effort of the principal rafters on the external walls. Colonel Emy attained this result by means of the bent timber beams; but, in some parts of France, it is next to impossible to obtain plank-stuff at reasonable prices, and squared oak timber exists in profision. Wherever fir can be had the engineer officers employ the bent timber roofs for the

g, 114 inches by 8 inches. Posts (double), each 1 foot by 8 inches, h. Hanging ties, double, i, 84 inches by 44 inches. Longitudinal ties, k, 6 inches by 44 inches. Ridge, l, 9½ inches by 7 inches. Cross pieces under ditto, 64 inches by 48 inches. Purlins, 9½ inches by 7 inches. Common rafters, 4½ inches by 4 inches. Common rafters, 4½ inches hy 4 inches. The whole covered with battens and tiles.

SCHINKEL ON ART-EDUCATION.

THE Germans are perhaps more accustomed to generalize their views of the fine arts than is the case with us; and as a result of this course, I think we may take the fact of there existing in Germany two distinct schools * of architecture, the classical and the mediaval, which may be said to have their respective head quarters at Berlin and Munich; and that the followers of these two directions base their practice on some fixed principles, may be guthered from the active and able manner in which they respectively defend their own, in the different polemical essays which have issued from the pens of the foremost champions of each party.†

The classical school must certainly be considered to have been founded by C. F. Schinkel, whose principal works are known to most of whose principal works are certainly open to criticism, it is in fact because they are something more than mere lifeless imitations and adaptations of the antique forms, such as constitute the chief part of our modern classical architecture. Schinkel was educated as an artist and scene-painter, and, as might be expected from this circumstance, the picturesque element is seldom wanting in his designs, hut that he also worked upon principles arrived at by a careful study of his art is shown, I think, by the following translation of notes found among his papers, and published by Dr. G. F. Waagen, on one of the anniversaries of his birthday which is kept at Berlin. They form evidently only a fragment, but seem to afford subject for much reflection to the architect who aims at that amount of individual originality which alone can effect the general advance-

ment of his art :-"I discovered," he says, "as soon as I had commenced my architectural studies, that a vast treasure of forms had been originated and worked out by nations essentially different, in the course of many centuries of development. But I also saw that the use we made of this store of sometimes heterogeneous matter was very indiscriminate; and what, in its original use in old buildings, produced a very pleasing effect, when introduced into modern works seemed entirely inappropriate. It struck me particularly that we may find the cause of the great want of character and style, from which so many of our modern buildings suffer, in this want of discrimination. I forthwith made it the aim of my life to obtain a clearer view of It the aim of my life to obtain a clearer view of this subject; but the further I proceeded the greater seemed to be the difficulties which opposed my progress. I soon fell into the error of designing a building solely with re-ference to its intended use and construction, from which resulted a work day and lifeless. from which resulted a work dry and lifeless, devoid of two essential elements, the historical devoid of two essential elements, the historical and the poetical. I examined further how far the practical consideration of the subject ought to prevail, to render the appearance of a building accordant with its purpose, and how far, on the other hand, the influence of ancient monuments ought to cooperate with artistic feeling to give the building the character of a work of art. From these considerations, it americal to me that I had considerations it appeared to me that I had discovered that position in the art of architecture which must be occupied by the purely artistical element, and beyond which it is and artistical element, and beyond which it is and must always remain a scientific handicraft; further, that in this position, as throughout the theory of the fine arts, the assertion of any distinct doctrine must be difficult, and will be reduced at last to the cultivation of taste, which in architecture embraces a very wide field, and must be formed in the most diversified manner to produce any successful result. sified manner to produce any successful result. I think it necessary to state precisely the

We can scarcely claim such a degree of organization for

different spheres in which the taste of the architect must necessarily be developed, in order that I may at the same time give a general view of the art.

In the first place he must consider what the age demands as essential in its architectural undertakings.

Secondly, he must take a review of the past in order to see what has been already worked out for similar purposes, and how far any completely developed work may he appropriate and useful to us.

Thirdly, he must determine what modifications are necessary in that which appears suit-

And, lastly, in what manner the imagination must be employed to create new matter for these modifications, and how it is to be treated as to its forms, so as to harmonize with the traditional ancient part, and without losing sight of the original style of the design, to produce the impression of an entirely new one, in which, at the same time, the assimilation to the old style may still be recognised, and afford an additional cbarm."

In speaking of the utilitarianism of the present public taste, he says :- "In judging of works of art, and more particularly of architecture, few people can raise their minds sufficiently to take general views: usually that only is beautiful and praiseworthy which they desire according to their station of life, and think according to their station of suitable to the same. A certain completeness and finish in the ordinary articles of domestic and missi in the ordinary articles of nonlessing use constitutes their ideal of heauty. Any thing new or grand is rarely appreciated by the great mass of the people, and, if it does agree with their ideas of comfort, will always meet with great censure and opposition. Artists that are only influenced by this utilitarian opinion must soon sink from the regions of art to be the slaves of fashion. C, F,

ON THE BASILICAS OF CHRISTIAN ROME.*

THERE is no feeling so intimately connected with architecture as religion, for amidst all forms of faith, however mistaken, there ever has been shown a desire to render the place of worship worthy of the divinity worshipped. Before the reign of Constantine, as is well known, the Christians—the followers of a known, the Christians—the followers of a prohibited creed—assembled in the rooms of private houses and in obscure retreats, or, if occasionally permitted to construct buildings occasionary permitted to construct outcomes for the performance of their rites, they were not allowed either to make them of large di-mensions or to consult their external appear. ance. It will be recollected, too, that there existed at Rome places of Christian worship, of a remarkable character, which had a direct influence upon the structure of the churches which were subsequently built. I allude to the catacombs.

Constantine, who first extended to Christianity the protection of the law, built his first church at Rome. Rome, therefore, may be said to have been the birthplace of ecclesiastical problems. architecture.

Whilst conscientious feelings deterred and repelled the early Christians from adopting the heathen temples for the purposes of Christian heather temples for the purposes of Christian worsbip, the same feelings attracted them to holy ground. From the custom which had originated in the catacombs,—from the habit which the primitive Christians had acquired of visiting the graves of the martyrs,—it became a natter of necessity to associate the church necessity to associate the church

with the tomb.

The first and earliest Christian churches of The first and earliest christian conrectes of which we can form any clear idea, either from actual plans, or existing remains, are the sepulchral churches of the Constantine age. The most remarkable monument of the Christian and tian world—the Church of the Holy Sepulthan world—the Church of the Holy Sepul-chre raised hy Constantine—from its sanctify and celebrity, became the primitive type of all the other churches of a circular form. This circular form, however, was in no wise calculated to receive a Christian congregation during the celebration of the entire liturgy, nor was it appropriate for the service of the altar.

The heathen temple, then, being found unfit, and the form of the sepulchral church being

inconvenient or inappropriate, for the purpose inconvenient or inappropriate, for the purpose of liturgical worship, the adoption of som other type became necessary. Could the professors of Christianity find any edifices raised by the heathen, but unpolluted by idol-worship which might be adapted to their form of wor ship? Such did exist.

Amongst the structures with which ancien a change advanced was the heatilica. This

Amongst the structures with which ancien Rome was adorned, was the basilica. This heing unpolluted by beathen rites, was fount to be well adapted for Christian worship. The name of the basilica was adopted from the control of the c Greeks of Athens, whose second archon was styled ἄρχων βασιλεύς, and the tribunal where he adjudicated στοά βασίλειος, situate in the Athenian Ceramicus, immediately beneath the Pnyx. According to Livy, the basilica did not appear at Rome until the year 182 s.c. It was situate in the forum. The destination of the secular basilica was two-fold: it was at the secular basinea was two-toid: it was at once a court of justice and an exchange. The building was an oblong, terminated by the tribunal. In the centre of the semi-circular apsis was placed the curule chair of the prætor, and seats for judices. This is the portion to which in Scripture (St. John, xix. 13) the name of substantial properties of substantial properties. of gabbatha, or lithostroton (pavement) was assigned. Round the sides of the hemicycle, assigned. Round the sides of the nemerycle, called the wings (cornua), were seats for persons of distinction, as well as the parties engaged in the proceedings. These seats were guarded from intrusion by the carcelli. Three-fourths of the oblong composed a hall, the remainder was a transverse aisle which intervened between the hall and the semi-circular recess. In all the basilicas the great hall was divided by columns into a portion similar to the centre aisle of a church, and two side aisles, separated from the centre one each by a single row of columns. Behind one each by a single row or commiss. Demind each of these columns was placed a square pier or pilaster, which supported the flooring of an upper portico, similar to the gallery of a modern church. The upper gallery was in like manner decorated with columns of lower dimensions than those below, and these served to support the roof, and were connected with one another by a parapet wall or balustrade: this gallery reached entirely round the inside of the building; one side of it was occupied by women, and the other by men. The staircase which led to the upper portico was on the outside. Sometimes the whole building was covered by a roof, sometimes only portions. At the sides, the more ancient of these edifices were entirely open to the external air, being surrounded and protected solely by an open peristyle of columns. At a later date a wall was substituted for the external peristyle.

From the description which has been given. it will be evident how much these edifices were adapted to the uses of a Christian church. The general shape of the church, as prescribed by the apostolical constitutions, was to be an ob-long, like unto a ship, that is, to the vessel of long, like unto a ship, that is, to the vessel of the ark. The term nave shows how enduringly the idea prevailed in subsequent ages. The basilica, therefore, were accordingly given up, for the purpose of Christian worship. Ausonius, addressing the Emperor Gratianus, tells him:—"Basilica olim negotiis plena, name voits pro tud sulute susceptis." This occupation of the Roman basilings was nevertheless. votis pro tud salute susceptis." This occupation of the Roman basilice was, nevertheless, only temporary; they did not become the abiding places of faith. Only one existing example can be found of a secular basilica actually converted into a Christian church; and that example, memorable as it is, does not exist in Rome. It is to be found in Treves. Abandoned for more hallowed ground—the graves of the martyrs—the civil hasilicas were destroyed, and the columns which supported them transported to the new sites.

them transported to the new sites. A Christian basilies may be thus briefly described. It consisted of four principal parts:—

1. Hobvace, the vestibule of entrance. 2. Nave, navis, and sometimes greatium, the nave or centre aisle, which was divided from the two side aisless by a row of which the control of th or centre aisle, which was divided from the two side aisles by a row of columns on each of its sides. Here the people assembled for the purposes of worship. 3. 'Δυβων (ἀναβαίνειν, to ascend), chorus (the choir), and suggestum, a part of the lower extremity of the nave, raised above the general level of the floor by a flight of steps. 4. 'Ιερανίου, ἰερὸν βῦμα, sanctuarium, which answered to the tribune of the aucient basilica. In the centre of this sancancient basilica. In the centre of this sanctuary was placed the high altar, under a tabernacle or canopy, such as still remains in the

[†] I may perhaps follow out this subject further on a future occasion, if an opportunity occur.

The following paper was read by Mr. Talbot Barnard, at a meeting of the Bedfordshire Archaeological and Architectural Society. Reported in the Bedford Times.

basilica of St. John of Lateran, at Rome. Around the altar, and in the wings of the sanctuarium, were seats for the assistant clergy, with an elevated chair for the bishop at the bottom of the aisle in the centre. In some of the large basilice the sanctuary was divided from the nave by the "Triumphal Arch,"—an imitation of the triumphal arches of ancient Rome,—but, in its new situation, intended to proclaim the triumph of the

Of the existing Christian basilicas at Rome, the remarkable church of San' Clemente is the first which the architectural pilgrim should

The church of St. Agnese is one of those which were built immediately above a martyr's grave,—above a part of the catacombs in which the body of St. Agnese was found. It

is hullt on the usual plan of the basilica.

The church of St. Prassede is also on the usual plan of the basilica, with the addition, however, of a series of immense round arches, which are thrown over the nave at wide intervals. Pope Paschal 1. added to this church a small chapel, which opens out of one side of the church, and which is ornamented with mosaics. The mosaic which adorns the ceilmosaics. The mosaic with adoling the con-ing represents a picture of our Saviour, sup-ported by four angels. There is great heauty and no inconsiderable degree of classical feel-ing in this composition. This chapel is one of the earliest instances of a side chapel, which

the earliest instances of a site chapt, which formed no part of the primitive churches.

The campanile, or bell tower, is a marked departure from the primitive age. It was almost invariably erected in front of the church at Rome, hut it never thoroughly became an assimilated integral portion of the basilica.

The rule of Orientation, though prescribed by the apostolical constitutions, never obtained in Italy, where the churches are turned in-discriminately towards every quarter of the heavens. It is not quite clear when this rule was adopted, which afterwards hecame general: St. Angustine says, "Let us turn to the rising sun of truth."

I have mentioned that, in the gallery of the civil basilica, the women were placed on one side and the men on the other. Such appears to have been the arrangement carried out in the early Christian churches. There are, doubtless, many here who have been struck at first sight, that while the south side of the choir of the magnificent cathedral at Cologne seems to blossom with exuberance, the north seems to plosson with externate, the north side—as with those at Frieburg and Amiens—is comparatively plain. The fact, perhaps, may be thus explained. The north side has had, since the first period of Christianity, its particular meaning; the south the same. The north side was that of the evangelists, who gave the truth in plainness and simplicity; the south was that of the prophets, who repre-sented it in oriental figure and imagery. Also the women, who were especially commanded to cover themselves, and abstain from ornament, stood on the north side, hence called the muliebris; while the men, to whom no such prohibition extended, stood on the south. Hance it is that the south side is consistently Hence it is that the south side is occasionally found to he richly decorated—that towards the north markedly simplified.

More than 1,500 years have elapsed (says his Excellency the Chevalier Bunsen, in his admirable work which he has devoted to the admirance work which has devoted to the basilica), since the hasilicas of Rome, in their various changes, have been the admiration of the Christian world; and he considers that the unity of idea which prevails in its form gives these buildings an indescribable charm.

There is still one Christian Basilica, which, although not situate a Rome against he week,

although not situate at Rome, cannot be passed over without some allusion. I refer to the Basilica of St. Boniface, at Munich, which has peculiar claims upon our attention. This most peculiar claims upon our attention. This most beautiful church was commenced in the year 1836, and resembles the church of St. Paul (fuori delle mura), at Rome, which was the most complete of the Roman Basilicas, but was most complete of the Roman Basilicas, but was unfortunately destroyed by fire in the year 1822. The Basilica of St. Boniface is supported in the interior by sixty-four columns of marble, dividing the aisles from the nave. The pavement is of marble, the roof of wood painted blue, with gold-stars, the beams being carved and gilt; the sides of the church are ornamented with paintings in fresco, by Hess, one of the most distinguished of the German

artists. The subjects of these frescoes are the principal events in the life of St. Boniface. One of the earliest of them is of surpassing heauty. St. Boniface — then Winfred the Monk—is bidding farewell to those who had been his companions in the Benedictine Abbey of Nutsall, near Winchester, as he embarks on his holy mission. Among those uninspired men who have been distinguished by active piety, we have few greater to revere than the Monk of Nutsall, nor can we find a greater benefactor of the human race.

We have seen that the Basilica of St. Boniface is adorned with paintings in fresco, the subjects of which bring prominently before the minds of the worshippers the zeal with which that great man was inspired, in promoting the cause of that holy religion which they profess, for which he ultimately laid down his life. and for which he ultimately laid down his life. And here perhaps it may not be irrelevant to say a few words on the destruction of ancient works of art. During the latter part of the reign of Constantine, many statutes of the gods were destroyed and melted down, and not long after his time a systematic destruction began, which under Theodosius spread over began, which under Theodosius spirit of de-struction, however, was not directed against works of art in general, and as such, but only against the Pagan idols. The opinion therefore, which is entertained by some, that the losses we have sustained in works of

ancient art are mainly attributable to the in-troduction of Christianity, is too sweeping and general. Of the same character is another opinion, according to which the final decay of ancient art was a consequence of the spiritual nature of the new religion. The coincidence of the general introduction of Christianity with the decay of the arts is merely accidenta. That the early Christians did not despise the arts as such, is clear from several facts. We know that they erected status to their marters. such, is clear from several facts. We know that they erected statues to their martyrs, in which we bave a specimen in that of St. Hippolitus, in the Vatican library; and it is expressly stated by Baronius that Christians devoted themselves to the exercise of the arts. The numerous works, lastly, which have been found in the Christian catacombs at Rome, it is the context of the state of the st

might alone be a sufficient proof that the early Christians were not hostile towards the repre-sentation of the heroes of their religion in works of art. It has been reserved for the fanatic fury of the Iconoclasts in a great measure to destroy the traces of the former splendour of the imitative arts. It must, likewise, ever be admitted that statuary and painting are a kind of silent poetry, which arouses the attention, interests the heart, strikes the eye, and elevates the imagination. The almost total exclusion, the imagination. therefore, of picturesque representations from the reformed churches, is greatly to he re-gretted. Whether mankind in any state of

society were ever so ignorant as to make these visible representations the actual objects of their adoration may well be doubted, but, at all events, there can now be no danger of such an error in the most uninformed part of Europe; and it may yet be hoped that as the spirit of bigotry declines, religion may be allowed to avail herself of every aid which may engage her admirers, illustrate her precepts, or

enforce her laws.

THE LIVERPOOL GOODS STATION OF THE NORTH-WESTERN RAILWAY in Waterlooroad contains 5 acres of land, entirely occupied by warehouses and zinc covered sheding. To form the whole upwards of 120 separate To form the whole dipwards of 120 separate properties, including 150 dwelling-houses, and various warehouses, sheds, &c., were purchased and pulled down. The sheding covers seven lines of rail, and extends over a span of 183 feet, including a cotton-quay, whence 20,000 bales of cotton can be loaded daily. 20,000 bales of cotton can be loaded daily. The warehouses are far larger than any other even in Liverpool. The rooms are each 102 feet by 90, containing an area close upon 1,000 square yards. The principal entrances to this station, which is said to be the largest goods station in England, are from Waterlooroad and Great Howard-street. It is reached from Edge-hill by the new Victoria tunnel. An engine of 50 horse-power is to do all the warehouse work. The whole premises have been whitewashed. The general offices of the Company are to be built on an adjoining plot

BIRMINGHAM WORKHOUSE COMPETITION.

We have received the following from one of the selecting architects:

You have given circulation to the assump-tion of Mr. Brookes, that the inspecting architects were in error, in recommending the designs Nos. 21 and 24, to the guardians, on the ground of the discovery which he had made, of the imperfect erasure on the former giving a clue to the authorship* of the de-signs, and therefore disqualifying them ac-cording to the instructions given to com-

I think it right to forward the enclosed extract from the Birmingham Journal of last tract from the Birmingham Journal of ast week, which appears to take a candid view of the circumstances upon which this opposition to the report was founded, but which proved so weak, as to end in a minority of four, on the amendment to the original motion being put from the chair at a full Board.

In correction, however, of that paragraph, I have to state that the inspecting architects were not cognizant of any other signature upon the plan No.21, than the assumed motto "Persenerando," and that the designs recommended for adoption were in strict ac-cordance with the instructions. They cannot cordance with the instructions. They cannot but feel satisfied that no stronger ground of opposition could he found to the adoption of the report, and that whatever uninformed writers may assume or insinuate, they are conscious of having discharged a very onerous duty to the best of their judgment, and in a fair and honourable manner.

It will probably be asking too much to request that you will give insertion to the journal extract, but I must beg the favour of your publishing this letter in your next paper, in order that the erroneous impression may be counteracted which your article is calculated to create in the minds of those who are interested in the competition.

HENRY J. STEVENS, Architect.

The following portion of the article in ques-The following portion of the article in question is all that bears in the slightest degree on the point in dispute:—" It has been found that on the plan No. 21, which it was considered was the production of the same architect as No. 24—recommended as the best—the names of Messrs. Drury and Bateman appear partially erased. Under any other circumstances, this would have been a most unfortunate disclosure; were as its the contractoms is sukward. No. even as it is, the contretemps is awkward. without entering into the question whether the fact of this distinctive mark being upon these lact of this distinctive mark being upon these plans, is a breach of the rules of competition sufficient to justify disqualification, and while being perfectly sensible of the impropriety of names being affixed to them, we cannot imagine that the decision of the inspecting architects would be influenced either one way or the other by the knowledge so inoppor-tunely afforded."

Mr. Stevens has called a very had witness. Mr. Stevens has called a very law Miness. The respectable local paper quoted, not being a professional journal, will not enter "into the question whether the fact of this distinctive mark being upon these plans, is a breach of the rules of competition sufficient to justify disqualification;" but we do, and state unequivocally (the affixing of the names not heing denied) that the plans were disqualified, and that, too, by a departure from the instructions in the gravest particular : whether or not it "influenced" the "inspecting architects, either one way or the other, by the knowledge so inopportunely afforded," has nothing whatever to do with the question—as

we said last week.

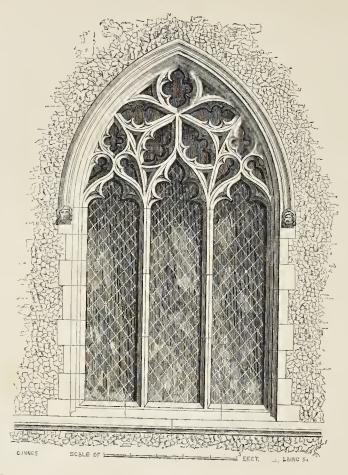

Mr. Stevens had done better if he had rested solely on his assertion that they "were not cognizant of any other signature upon the plans than the assumed motto,"—although this might perhaps lead some of the guardia

this might perhaps lead some of the guardians to imagine that the examination of the plans had not been very minute.

Striving as we do in all cases to induce committees to take professional assistance in the determination of competitions, we much deplore this occurrence, and fear that the reformation of architectural competitions will be little advanced by the judicial proceedings of Messrs, Stevens, Edge, and Gibson.

DECORATED WINDOW, WARE CHURCH, HERTS.

INTERNAL RESTORATION OF ST. MARY'S, WARE.

For a reason which will be obvious to some of our readers, we prefer taking the following notice of the works in St. Mary's, at Ware, from a contemporary, The Ecclesiologist, to attempting any description of them ourselves:—

tempting any description of them ourselves:—
"Had we a few years back been asked to name the churches which were most likely to be, during the next quinquenniad, restored, we should certainly not have named this one." It is, therefore, with no little pleasure that we now proceed to describe its actual condition. The church, a large cruciform structure, is composed of a western tower, clerestoried paye with aisles, south porch, transents, clerecomposed of a western tower, cierestoried nave with aisles, south porch, transepts, clerestoried chancel, Lndy Chapel forming the south chancel-aisle, and another chapel to the north, with a sanctuary beyond. The north transept-window is a good reticulated one, and the most, easterly window in the south navetransept-window is a good reticulated one, and the most easterly window in the south naveaisle is late-flowing,—the remainder of the church perpendicular,—the rest of nave being probably very little later than its one middle-pointed window, as it contains the badge of Richard II., to whose mother the manor of Ware belonged, and who may therefore not unreasonably be assumed to be its rebuilder.* Till lately, the church presented a hinge collection of lofty pews and galleries,—that at the west end of portentous size, the latter have entirely disappeared, and had the subscriptions sufficed, it was intended to have replaced the Oa stripping the walls of the chancel the fabric was seen

e On stripping the walls of the chancel the fabric was seen be of the Early English period.—En.

pews by open sittings. This unhappily has been but partially carried out; but the pows have been cut down to an uniform height. The architect was Mr. Godwin. The western portion of the chancel is occupied with longitudinal sittings, leaving, we are sorry to say, too narrow a central passage. We understand that a difficulty was felt, from a grant having been given by the "Incorporated Society" towards fresh sittings eleven years ago. It was, of course, not found easy to retain the stipulated number after sweeping away the galleries. The eastern portion of the chancel proper, which is free, is, as well as the sanctuary, paved with encaustic tiles. The prayers are said at a side desk to the west of the chancel on the north side, with a western face for the lessons. Over it stands the old Jacobean pulpit of the church. The organ is placed in the north chancel aisle.

The most striking feature in the restoration is the quantity of polychrome which has been applied. The spandrills of the navearches, ten in number, are filled with flowerpots, from which grows lilies, each bearing a scroll, with one of the beatitudes inscribed upon it. The commandments are painted, where they are ordered, on two tablets on each side of the chancel-arch. The Creed and the Lord's Prayer are on the eastern wall, flanking the east window. The bosses of the nave and chancel-roofs are coloured and gilt, and the architectural portions of the roof of the Lady Chapel are emblazoned; and copies of the figures which were found there in a muti-The most striking feature in the restorathe figures which were found there in a muti-

lated condition are on record, with a view to their future restoration. They are those of the Apostles with the sentences of the creed, and of the minor prophets with typal verses. The windows of the Lady Chapel have been filled with Powell's quarries; the eastern with the monogram alternating with the lity; the two side ones with the cross and the lity, and the legends respectively—"A Virgin, &c.," and "The Word was made flesh, &c." We may here notice a curious feature in the Lady Chapel; it was originally connected with the chancel by one sprawling segmental arch; its ugliness or its unsafeness being canvassed, it ugliness or its unsafeness being canvassed, it was divided into two by a slender Purbeck shaft (restored), bearing a spandril of open panel-work. The great south transept window was, during the late incumbent's time, filled, was, during the late incumbent's time, filled, at an enormous cost, with Flamboyant tracery.* This has of course been left, and the windows glazed with Powell's quarries—so is the south nave clerestory. A local benefactor is about to fill the east and the west window with glass, by Mr. Wailes, taking the Crucifixion as the subject of the one, and the Baptism, and the Blessing Little Children, of the other. The font is a remarkably fine one, and was given to the church in the time of Henry IV., by William De Montacute, Earl of Salisbury. It re-

[•] In this window the mullions had simply a very wide chamfer, and the little of the glass was at the termination of this, which produced a coarse and bud effect, especially in the tracery. By merely hollowing the front half of the chamfer on each side, so as to get another perpendicular the on each side of the mullion, the effect was greatly improved. —ED.

presents, in the cight panels, S. Gabriel, the Blessed Virgin, S. John Baptist, S. Thomas, S. Catherine, S. George, S. Christopher, and S. Margaret, with beneath eight angels, alter-S. Margaret, with beneath eight angels, alternately bearing the instruments of the Passion, and playing musical instruments. The angel who bears the spear has the countenance of having been a fallen one. What is the reason of this peculiarity? This font has been restored, provided with lead lining and drain, placed in the tower, and surmounted with a very lofty oaken canopy. The west door has been shielded by a solid screen, We suppose that the fear of drafts made this necessary, but we should then have made the screen as simple as possible, and not covered it with we should then have made the screen as simple as possible, and not covered it with shallow tracery. We wish Mr. Godwin had not given nosings to his chancel steps. The nave-alleys are paved with red and black tiles. The corbels supporting the nave-roof are new, and represent the Apostles: they struck us as being too large. The exterior of the church (huilt of flint, with stone dressings) has been tirlly restored, which involved a partial rebuilding. With few exceptions, all the funds necessary for the restoration were raised in the parish, and contributed with most perfect necessary for the restoration were raised in the parish, and contributed with most perfect good will. We most heartily congratulate the people of Ware on so good a work."

We will only add that the church originally was painted and gilt from floor to ridge. The walls were covered with figures the size of life.

walls were covered with figures the size of the The new polychronic decorations were executed under the direction of the architect, by Mr. W. H. Rogers. The font cover, to which reference is made, was carved by Philip, Wynne, and Lunsden: as was also the altar rail. The and Lumsden; as was also the altar rail. The corbels and other stone carving were by Barrett; the tile paving by Minton: the general contractors were Messrs. Carter and Ellis.

Annexed we give an illustration of the easternmost window of the south aisle,—a nice specimen of the Decorated period.

TOWER OF "LA MARTORANA," PALERMO.

TOWER OF "LA MARTORANA,"
PALERMO.

THE annexed representation offers a sketch of a portion of the tower which is attached to the principal entrance of the church of "La Martorana," at Palermo.

This tower is supposed to have formed originally an entrance to some Saracenic edifice, as, before the extensions of the present church, it stood quite detached, and was separated from the immediate precincts of the church. When viewed from the atrium below, it presents a very rich and picturesque appearance. The second story of the tower (i. e. the lowest in the engraving) is exceedingly clegant, and has a decidedly Oriental character. This portion is doubtless of an earlier date than the two upper stories, which were added about the year 1143-5, and which partake more of that style of architecture used by the Normans in France than in Sicily. Owing to this latter circumstance, the composition, viewed entire, offers less unity of design than might be wished, and is perhaps open to criticism; its individual features, however, possess considerable merit, and show no lack of imagination on the part of the designers.

The use of the broad Oriental billet, or rustic, which we here see surrounding the

on the part of the designers.

The use of the broad Oriental billet, or rustic, which we here see surrounding the windows, was greatly in fashion both amongst the Oriental and Norman architects of Palermo, and is a characteristic which, if successfully treated, would give great decision to a design. Incrustations of black lava are freely and tastefully applied in each story.

The church was founded in A.D. 1113, by George Antiochenus, a follower of the faith as

The church was founded in A.D. 1113, by George Antiochenus, a follower of the faith as observed in the Greek Church. In A.D. 1139 he became an admiral of King Roger II. An inscription, probably placed in the church at a period subsequent to the latter date, informs us that the Admiral Antiochenus was the foundar. founder.

founder.

Originally the church was dedicated to "Santa Maria l'Annunziata;" but Aloisia, the wife of "Godfrey de Martorana," who founded the adjoining convent in A.D. 1193, and repaired and extended the church to its present dimensions, obtained from King Alphonso the privilege of changing the name it usually bore to that of her own, "La Martorana."

The interior of the church contains some

TOWER OF "LA MARTORANA," PALERMO.

excellent specimens of Mosaic pictures and ornaments, and is full of interest, presenting a very fair example of a church planned according to the Greek ritual. W. L. B. G.

MANAGEMENT OF ARCHITECTURAL COMPETITIONS.

MANAGEMENT OF ARCHITECTURAL COMPETITIONS.

It has been suggested more than once in your journal that architects should meet together and lay down a set of regulations as to on what terms they would furnish designs in competition. This is precisely what they ought to do; and though I am not a member of the Royal Institute of British Architects, I should certainly, out of respect for it, prefer seeing such a movement emanate from that Royally chartered body. As yet it has done nothing further than to issue ten years ago a certainly very excellent report on competitions; but as ten years' experience has proved that "reports" will not remedy the evil, I hope the institute will take up the matter and convene a meeting of architects, to agree to "a set of regulations as to on what terms" they will henceforth submit designs in public competition. I am quite sure any half a dozen architects might easily do this; and, with a little energy, and a sensible set of regulations, secure the combined signatures of nine-tenths of their brethren, great and small, throughout the kingdom, neldžed to compete only on such of their brethren, great and small, throughout the kingdom, pledged to compete only on such and such "regulations." To such a body committees would be the first to pay respect, as the institute themselves thus declare in their report on competitions, to which I have just alluded.

usually bore to that of her own, "La artorana."

"Your committee," ** * have the greatest reason to believe, from the information they have obtained, that, in a very great majority

of cases of competition, the committees, or parties to whom judgment is confided, are quite ready to acknowledge themselves deficient in the means of fulfilling their duty, when once the nature of that duty is candidly and temperately explained to them; and that any suggestions will be favourably received, when offered in proper terms, and at a proper season."

The proper season, Sir. is invariably before

The proper season, Sir, is invariably before designs shall have been obtained: the proper parties to suggest and explain are the council of the Royal Institute of British Architects; but, failing them, it is quite proper for the Architectural Association, or for any half dozen resistance to express the explainment. architects, to suggest, to explain, nay, to com-mand in this matter.

As to the "proper terms" (or regulations call them), I would submit for the consideration of the profession a few hints, preparatory, I hope, to "a monster meeting."

Instructions to Architects should be as simple as possible, and where really no nenchant for any particular style exists, should say nothing about such matters. Thus committees should not say "the style of architecture to be Grecian, and the order Ionic," and straightway award their first premium to a Gothic design, and their second premium to a ditto—(a fact).

Drawings should be, so far as is consistent with the intelligible delineation of the design, as few, as small, and as free from cost as possible. The exact kind and number of them, and, wherever practicable, the exact length and breadth of each, should be stated, with a view to uniformity, portability, and compact-Instructions to Architects should be as sim-

view to uniformity, portability, and compactness, and consequent facility of comparison one with another. The size of perspective views, the point whence taken, their mode of execu-

tion, should be invariably defined; and as you yourself, Sir, have frequently urged, the extra-vagant custom of bedizening them in gold

frames, &c., should be forbidden.

Other Papers.—Many architects accompany their designs with printed circulars, engraved views, &c., and some even with builders' tenders. I don't blame them under the present roly-poly system, but under an amended system, I would forbid all this at once, strictly limiting the number and kind of documents to be supplied by each competitor, so as to place all on an equality, and leave the design to what after all it must come to, if executed, its naked merit.

Prizes .- Five per cent. ought, in all competition cases, to be paid, and in order to put an end to all canvassing and cheapening ought to be openly guaranteed by the committee, who should offer in small competitions a secon I and third, and in large competitions a fourth and fifth premium, as the case may require. A first premium is an absurdity, never contended for, and in fair competitions seldom paid; is amount will supply funds for two secondary

Estimates .- As to the estimated cost of each design, I would, after stating what really were the resources of the committee, leave every competitor at liberty to state what sum he thought fit; but as to committees selecting a design by such a criterion as a competitor's estimate, there can be, I conceive, no greater folly; and yet as committees almost invariably constitute this their test of merit or eligibility, who can wonder at competitors, in a wicked world like ours, yielding to the temptation to put down the very lowest figure which an acquaintance with your weekly list of "Blind Builders" may suggest to him?

uilders " may suggest to him?

Decisions.—In judging of the accuracy of the estimate of any design the committee may take to, or of its efficient construction or arrangement, they should be guided by the opinion of some non-competing professional man, to be recommended by the general voice of the competitors. Each competitor should, therefore, submit with his design the name of some one or more non-competing architects, to whose judgment and experience he himself would be willing to refer the committee for guidance. This method, I may state, was actually adopted (by the Committee's especial request), in the case of the competition for the Blackburn Exchange; and, beaten competitor as I was in that case, I have always considered it the fairest competition I have ever engaged Y.

METROPOLITAN COMMISSION OF SEWERS.

APPEAL AGAINST RATE IN POPLAR.

A GENERAL court was held on Monday last, which was originally intended to have been held on Saturday, but was postponed in consequence of sufficient members not heing present to form a quorum. In the interim, notices had been sent to every member of the commission, impressing upon them the necessity of their attendance. Some time for commencing business, however, only five members were present. As only one hour is allowed from the time named for the court to an only five members were present.

is allowed from the time named for the court to an
adjournment to a future day, it was agreed by the
parties who had appeals to prosecute that the
husiness should proceed with hut five members.

hatties with that appears the history and the husiness should proceed with hit five memhers. Sir John Burgoyne took the chair.

The Ratling of Paplar,—The secretary (Mr. Woolrych) read a notice of appeal from Mr. John Carter, of High-street, Poplar, against the rates made upon him for that division.

Mr. Needham, the barrister, on hehalf of appellant, proceeded to state his case. It appeared that the appellant, with several other persons, occupied premises situate on the north side of Poplar ditch. From time immemorial the inhabitants of this district had never heen rated to the sewers rate, as it was a condition of their tenure that they should cleanse out and keep in reprir a ditch which bounded cleanse out and keep in reprir a ditch which bounded cleanse out and keep in reprir a ditch which bounded cleanse out and keep in reprir a ditch which bounded their property. In the year 1826 an attempt was made by the Commissioners of Sewers for Poplar Marsb district to rate property in this neighbourhood, which was resisted, and an action at law was the result of this demand. The case was tried by a special jury in London, hefore Lord Chief-Justice Abbot (afterwards Lord Tenterden), Mr. (now Lord) Brougham appearing for the Sewers Commissioners. The case occuring a considerable time missioners. The case occupied a considerable time, and the evidence was very voluminous. As it was most material, and might guide their decision in the present question, he would recite the three points prominently placed hefore the jury hy the learned judge on that occasion.

"First. Whether the owners and occupiers of the land and ground lying contiguous to and on the north side of the ditch have, from time immemorial, by reason of their tenure of these g compellable to scour the Poplar ditch. grounds, been

compensation to scour the Popiar ditch.

Second. Whether the occupiers of the land on
the north side of the ditch have, hy reason of the
obligation that the law casts upon them to scour
this ditch, heen exempt from all other expenses of
the level, whether they have heen exempted by
reason of that charge.

reason of that charge.

The third question is quite distinct,—Wbether, in your judgment, the plaintiff's house derives any hencit from the works done by the commissioners

or under their superintendence.

In the two first cases, the jury answered in the affirmative, and in the latter in the negative. He contended that this question was precisely identical, mutatis mutandis, with the present case. He thought, therefore, that, as it was the practice in Westminster-hall, when once a case had been solemnly argued, to consider it as conclusively desome error was apparent,—that court would hesitate before they reversed the judgment that had been given by Lord Chief Justice Abbott, and with the caution with which he approached such a question. The learned counsel reiterated his arguments, and in pport of them quoted the following words of th section of the present Sewers Act:—" yided also that where, in any separate sewerage district, any property is hy law or by the practice of the existing Commissioners of Sewers entitled to exemption wholly or partially from, or to any reductions roll. tion or allowance in respect of, the sewer-rates, the commissioners shall, in making the district sewer-rate, observe and allow such exemption, reduction, or allowance.

Mr. Leslie said the question was, whether the appellant derived any benefit from the works of the communisioners, and whether the circumstances of 1826 were similar with those of 1849? Whether the circumstances brought before Lord Chief Jus-tice Abbott were not changed by the operation of the circumstances prought better Lora View by the operation of the 37th section of the present Act, which declares "that all sewers, shices, &c., within the limits of the commission, shall be subject to the survey, order, and control of the commissioners, according to the provisious and subject to the regulations and restric-

tions of this Act.

Mr. Needham then called as witnesses, Mr. Car-Mr. Needham then called as witnesses, Mr. Catter and Mr. Morris, the former proving that no sewer-rates had ever been charged upon this property, and the latter, that until last year no sewer commission had any jurisdiction over the Poplar

It was also given in evidence, that as the guardians It was also given in evidence, that as the guardians of the poor of Poplar had turned the drainage of the workhouse into this ditch, they passed from 8,000 to 10,000 gallons of clean water into it: the Commissioners of Sewers had brought into it the drainage of 300 houses, with only the filthy refuse. On the part of the commissioners Mr. Phillips.

On the part of the commissioners, Mr. Phillips, the surveyor, was examined by the chairman, who stated that Mr. Carter and every other inhabitant of Poplar derived benefit from the works of the of Poplar derived benefit from the works of the commission. The Poplar ditch was periodically attended to hy the officers of the commission. If the outlet were not looked to. Mr. Carter's premises would be flooded. The whole of the cesspools in would be flooded. The whole of the cesspools in the workhouse had been aholished, and the incon-venience and expense of cleansing them had of course been avoided. The ditch was flushed by every tide, and washed into the Thames at the ex-

every tide, and washed into the Toames at the expense of the sewer-rates.

Mr. Woolrych then addressed the court, and said there were two questions to consider; first, whether the appellant derived any benefit; and, secondly, if he bad derived any henefit, whether he had made out to the satisfaction of the commissioners that he was exempt from liability from some prescriptive was exempt and the benefit to he proved, there was exempted to support the latter proposition.

usage? Assuming the cenent to me provent con-was no evidence to support the latter proposition. Mr. Leslie ultimately moved—"That the rate made on the Poplar district he confirmed;" which was put and agreed to; and after a sitting of nearly six hours the court adjourned.

A general court was held on Thursday, the 6th; Sir John Burgoyne in the cbair.—A recommendation was received from the Finance Committee to grant Mr. Samuel Page, late surveyor, a retiring allowance of 1901. a-year, out of the Holborn and Finsbury division, to commence from March 25, 1848. It appearing that he had been in the service of the late commission for upwards of forty years, the recommendation was unanimously agreed to.

The Question of Flushing.—Mr. Bullar said, as great doubts existed as to the propriety of flushing, and as it was evident that if it was not good they must discontinue it, but, if good, that it should be more extensively adopted, he hegged to move—in that a circular letter be forthwith sent to the various medical practitioners bolding union or parogeneral court was held on Thursday, the 6th; Sir

various medical practitioners bolding union or chial appointments throughout the rated districts, requesting them to favour the commissioners on or before the 11th inst. with their opinion (resulting from their own observation) of the effect which the flushing of any sewers has had on the health of these who reside in the neighbourhood of those sewers."

The following resolution was also agreed to:—
"That having regard to the present condition of
the health of the metropolis, the Trial Work's Com-

the health of the metropolis, the Trial Works Committee he authorized to expend a sum not exceeding 250l, for the ventilation and trapping of sewers in those places they would think heneficial."

A deputation attended the Court from the parishes of Camherwell and Newington, representing the offensive state of these neighbourhoods, caused, as the memorialists helieved, by the disharce of essengols into the public sewers and caused, as the memorialists helieved, by the dis-charge of cesspools into the public sewers, and calling upon the Commissioners to suspend the operations of flushing until a colder season. The surveyor of the district was ordered to fully report on the subject, Mr. Leslie contending that the works of the district were a disgrace to the com-mission, particularly in the case of the Friar-street sewer, upon which they had a report from their own officers upwards of twelve months since. Improvement of the Drainage of Westminster.— A long report was presented to the Court by Mr.

long report was presented to the Court by Mr. otto, on the state of the drainage of Westminster, Gotto, on the state of the drainage of Westminster, embracing plans for its improvement, to be carried on concurrently with the works of the Westminster Improvement Commissioners. The report recommended that a new surface and subsoil sewer, 5 feet in diameter, be constructed from Richmond-terrace, Whitehall, along Parliament-street, and across the Broad Sanctuary, at Westminster, to the commencement of the new Victoria-street, a distance of 2,200 feet, and to be continued along New Victoria-street, 4 feet in diameter, for a distance of 3,000 feet, at an expense of 8,1421, on condition 3,000 feet, at an expense of 8,1421., on condition that the Westminster Improvement Commissioners pay the sum of 3,375*l*.; that the work he executed public tender, and that the works be executed thwith, to save the inconvenience of interruption of the traffic during the session of Parliamer

of the traine during the session of Parliament. Sir Edward Pearson attended on behalf of the Westminster Commissioners, and impressed upon the Court the necessity of some immediate action in this neighbourhood, and that unless something was proceeded with, the whole works of the Improve-ment Commissioners, so peculiarly constituted were tbey under their Act of Parliament, must fall to the

Mr. Gotto gave it as his decided opinion that his Mr. Gotto gave it as his decided opinion that his plan would not at all affect the ultimate propositions for the entire drainage of London, and that this work might safely he executed without present reference to them. It was ultimately resolved—"That Mr. Gotto's report on the Westmin.ter Improvement Sewerage be approved, and that on the payment by the Westminster Improvement Commissioners of 3,3751, as recommended by that report, the works specified be executed, and that tenders for these works he immediately advertised, and when received he opened by the Works Committee."

A resolution was then agreed to calling for a

return of attendances by commissioners A very voluminous report was presented by Mr. Grant, on the state of Albion-terrace, Wandsworthroad, being a detailed statement explanatory of a roat, oeing a detailed statement captured short report presented at former court. It stated, that up to the closing of his report, the deaths in that terrace had heen increased to fifty, and that the whole of seventeen houses were now unoccupied. whole of seventeen houses were now unoccupied. The subject of the water-supply was treated upon at great length, the water had been submitted to a che-mist for analyzation. (Samples of the water were produced in the court, and that taken from two of the cisterns closely resembled ink in colour, with a most fœtid odour.) It generally attributed the disease to the overflowing of the cesspools into the water cisterns, and recommended that the cesspools should be abolished, and a supply of water obtained from the water company in lien of the present mode

of supply from an adjoining well.

A discussion ensued as to how far the commission were responsible for the fatality that had occurred,

were responsible for the fatality that had occurred, Mr. Leslie concending that it was a question that rested entirely with the landlords and their teuants. This opinion appeared to be generally received by the court, and Mr. Grant was ordered to put himself in communication with the owners of the property, to afford them any information, but the court declined to proceed in the matter.

A letter was received from Mr. Smith, vestry-clerk of Richmond, stating that the parish approved of the plan of Mr. G. Donaldson for an improved drainage, and wished to see it carried into effect as

drainage, and wished to see it carried into effect as

unaimage, and wised to see it carried into effect as speedily as possible.

In the case of Mr. Dennis, of Bath-place, Chalk-road, who had been ordered to do certain works, and positively refused to do the same, it was ordered the positively refused to do the same, it was ordered the positively refused to do the same, it was ordered the positively refused to do the same, it was ordered the positively refused to do the same, it was ordered the positively refused to do the same, it was ordered the positive of the positive o that the commission do execute the works, and charge Mr. Dennis with the expenses; the amount to be recovered by distress or otherwise, if such a course should be found necessary.

WARMINGTON CHURCH.-Mr. Caveler has nearly completed a work illustrative of this building. The specimens we have seen are capitally drawn.

Books.

An Historical and Statistical Account of Life Assurance; with Observations on Friendly Societies and Savings Banks. By Mr. Alfred Burt, Secretary to a Life Office. Effingham Wilson, Royal Exchange.

The proposition with which Mr. Burt desires to familiarize the popular mind is, that the data and deductions on which the system of life assurance is founded, are as satisfactory and conclusive as those of any other branch of commerce; and he only wishes it were as easy to induce the middle classes to avail themselves of the benefits as to make them understand the terms and conditions of life assurance.

The mutual system he recommends, as we do, above all others. On this point he says,

"Mutual societies are based on the only plan of life assurance which the public are interested in supporting. The experience of nearly a century derived from upwards of a hundred life companies confirms the conclusion at which scientific and mathematical investigation has arrived, that mutual assurance is the most advantageous to the assured. The annual reports of established offices show, that while in all mutual offices the assured's policies have increased in value, in proprietary companies the shares of the proprietors."

In mutual offices there are no shareholders,—the policy-holders themselves constituting the company amongst whom the profits are thus divided, and a policy in such offices has been known to increase in value no less than 600 per cent., while with proprietary companies, of course, the 500 per cent. would have been divided among the shareholders,—the value of the policy remaining as at first, without the slightest increase. There is not only room, but an urgent demand, according to Mr. Burt, for a great increase of mutual assurance societies: nevertheless, the increase of all classes of insurance offices in the United Kingdom of late years has been remarkable. In 1820, there were only twenty in all; but the number was exactly doubled in 1830; that number again was just doubled in 1840, when there were eighty. Singular as it may seem, adds the author, the increase has ever since proceeded in the same ratio—doubling every ten years,—so that, in 1845, one hundred and twenty had been established.*

Replete, however, as Mr. Burt's book is with matter of general interest, put in a popular form, devoid of much of that formidable statistical science which has heretofore repelled those classes for whose benefit it is so desirable that such books should be not only cheap and accessible as this, but also as readable and as generally interesting,—we can, nevertheless, perceive where and how the author might have here and there increased the information and the interest of his little work, as, for instance, from the historical matter to be found in Mr. Lewis Pocock's "Familiar Explanation of the Nature, Advantages, and Importance of Life Assurance,"—a work of information which we are surprised to find all special mention of by Mr. Burt either intentionally or unintentionally avoided. We hy no means desire to disparage Mr. Burt's efforts, however; and hope that the exposition will be extensively perused by the class for whom it is specially intended,—not so much for Mr. Burt's interest, indeed, as for their own.

The Principles of the Differential and Integral Calculus Simplified, and applied to the Solution of various useful Problems in Practical Mathematics and Mechanics. By Thomas Tate, Mathematical Master of the National Society's Training College, Battersea: author of "Exercises on Mechanics," &c. Longman and Co., Paternoster-row.

The object of this new work of Mr. Tate is to bring the fundamental principles of the calculus within the comprehension of students with merely a knowledge of ordinary algebra and trigonometry, and to enable them to peruse such practical works as "Moseley's Principles of Engineering," "Whewell's Mechanics," &c. This object the author appears

* It is estimated that capital to the amount of fifty millions has been already invested in these offices, yielding a revenue of more than one million per annun to Govern-Their engagements are computed at upwards of one hundred and twenty millions.

to have prepared the way of students for, with his usual tact and ability.

On Copyright in Design in Art and Manufactures. By T. Turner, of the Middle Temple. F. Elsworth, Chancery-lane.

At the present moment, when the law of patents is in a sort of transition state, and genius and invention are, it is to be hoped, coming to something like an easy and profitable inheritance of their own "property in form" and substance, Mr. Turner's able little treatise is extremely well timed. It contains a complete anatomy of form in design, interwoven with more than a spice of quaint anecdote and curious "cases," and though not on a subject necessitating anything like a knowledge or treatise of high art, is all about art, in its rubs and conflicts with £. s. d.,—amongst big wigs and little, Chancery and police,—set in motion by fleeced and fleecer, rogue and original; and though mainly, therefore, a compilation, is full of curious interest. The disquisition on property in form, however, with which so much lawyer learning is interwoven, may well boast of higher pretensions. Advices, too, are offered on practical points, such as a lawyer alone can safely give, and the principles of legal right as now administered, have been fully entered into. In an appendix are copies of such statutes in force as those of the four Engraving Acts, two Designs Acts, and International Act, and of the rules of the registrar of designs, and tables of fees, with lists of cases reported—in reference to which, by the way, the pages of THE BUILDER itself might have been searched to some purpose.

Miscellanea.

Centrifugal Pump.—A model is said to have recently been made of a pump for draining marshes, &c., in which the principle of the turbine appears to have been adopted — or modified—so as to have led to a hope of its doing wonders. A small box water-wheel, nade of tin, a little thicker, but no larger, than a halfpenny, is fitted at the bottom of a square tube dipping into a small cistern of water, and the wheel being made to rotate with great velocity, throws up water rapidly into the tube above itself, until it overflows in a continuous stream at the top, so as to deliver eight gallons stream at the top, so as to deliver eight gallons per minute, and to drive it even through a nozzle to a distance of 20 feet. A wheel, about 15 inches in diameter, will, it is said, deliver 1,800 gallons per minute, worked hy an engine of 4-horse power. The inventor is said to be a Mr. Appold, who proposes to aid the drainage of Haarlem Lake with one 40 feet in diameter, and delivering 1,500,000 gallons a minute. Great talk, this!

Exposition of Arts and Manufactures at Birningham.—The exhibition of the manufactures of Birmingham and the midland counties was opened on the 3rd. The exposition is made in a temporary building of immense dimensions, in the grounds of Bingley House, Broad-street, and is described as being very satisfactory.

CLERKENVELL GRAVEYARDS.—Sir: Mr. Griffiths is not correct in stating the graveyards of Clerkenwell to be several feet above the public ways,—one only of the four being 1 foot above the way,—two of the others being level with it, and the one on Pentonville-hill being considerably beneath the public way. What depth does this gentleman assume to be the average of burials, when he takes an objection to the ezudations through the walls? Were the ground much raised, a remedy might doubtless have suggested itself to bim,—that of lining them. Of the evils of the system we have had usque ad nauseam—any remedy short of the one proposed, i.e. interdicting any more interments, sealing the vaults, and covering the graveyards with two feet of concrete, would be merely a shifting expedient, which the cupidity of parties interested might soon evade, and the remains of mortality be dealt with in as unscrupulous a manner as has been demonstrated to be the case in London—fatally injurious to those whose avocations bind them to these plague spots.

R. L. SIBLEY, District Surveyor.

OWEN AND HIS SOCIALISM.—A correspondent, dating from Adelphi, regrets the force of a remark by us, made while treating of model towns. The remark in question bore reference more particularly to doctrines at one time openly inculcated and afterwards with-drawn, or at least veiled and cast out of view. Now, the question here is not the moral cha-racter of the man or his sect, but the objecracter of the man of his sect, but the objectionable nature of doctrines, at one time at least, if not now, openly preached by the one and accredited by the other. We cannot accord even to one who "knows him and his principles thoroughly" a closer or more intimate observance and consideration than our own of doctrines which have been publicly taught by Mr. Owen and his disciples, whatever they may now do. For some years ever they may now do. For some years we closely considered everything published by them that we could possibly lay hands on. We began in admiration of the man -then universally esteemed-and ended in disgust with some of those doctrines which he at length, and by degrees, ventured to publish, in entire miscalculation of the strength and permanence of that public esteem which previous caution on his part had allowed to spread into world-wide renown, but which his subsequent imprudence converted into abhorso that he and his sect became a byeword of reproach, that ultimately compelled them, as we said, to veil and withdraw what was rather too strong for the public taste to relish or their stomach to retain. At first Mr. Owen defied the tide of adverse public opinion that he himself had caused to set in against him, maintaining that the ob-noxious doctrines were absolutely essential to the full carrying out of bis social principles, the full carrying out of bis social principles, and that the sooner the public reconciled themselves to them the better. Then it was that Mr. Owen utterly lost that repute and esteem which he never has regained, and never will, we fear, whatever be his own more recent line of policy. Then it was that he could no longer boast of such friends to his views as the Duke of Kent, and many more of even equal influence, had been. More we need not say as our purpose certainly. More we need not say, as our purpose certainly is not to republish and revive what its mistaken author may have repented of; but our only fear on reconsidering the remark objected to was, that we might thereby, by inference, be erroneously supposed to be countenancing Mr. Owen's present doctrines, as entirely devoid of that old leaven of offence. This, we trust, may not be the case, for we know less of his present published opinions than we do of his past. And neither would we desire to prejudice or prejudge the more matured fruits of his past experience and reflection, of the merits of which we thus, without being in the least ashamed of it, acknowledge our comparative ignorance. More we need not say, as our purpose certainly

ledge our comparative ignorance.

Northampton Corn Exchange.—Sir; I scarcely know which is most to blame,—the parties who, through ignorance, state a sum for which it is utterly imposs be to erect the building, or the architect who would lend himself to such a deception. Let any professional person, with the slightest knowledge of his business, sit down and make a rough calculation of the cost of such a building as is required by the Northampton Committee, and he will find it could not be executed for a less sum than from 12,000% to 14,000%, instead of 8,000%, as stated; and if any person watches the case closely, he will find the truth of this assertion. It will prove a case of the deceived

assertion. It will prove a case of the deceived and the deceiver.—A Subscriber.

The Invended New Town of Llandudho was the contemplated new town of Llandudho was held on Tuesday, at the large room in Plas Mawr, in the town of Conway. The room was quite full, but the result did but amount to the bond fide sale of about six or seven lots only. Next day (Wednesday) closed with the bond fide sale of thirty-seven lots. Three or four more were disposed of in the course of Thursday. Twenty-six thousand yards have been already sold, varying from 1s. to 1s. 6d. per square yard. The several lots sold will form a part of the eastern end of the crescent, also a full street near the Conway Bay, and a full street near the Conway Bay, and a full street near the Conway Bay, and a full street under the present village. The lots disposed of on Thursday were 2d. per yard higher than those of Wednesday, although on the same spot.—Carnarvon Herald.

PROJECTED WORKS.—Advertisements have been issued for tenders, by 20th instant, for the erection and conversion of certain buildings, in providing school-rooms and schoolmaster's quarters, at Dover; by 15th, for the erection of two school-rooms and master's house at Wilmington; by 20th, for the erection of St. Juke's Church, Birmingham; by 10th, for the restoration of the exterior of Hilton Church, near St. Ives; by 13th, for various works in crection of St. Luke's Church, Morton, near Bingley; by 22nd, for the construction of the exterior of St. Luke's Church, Morton, near Bingley; by 22nd, for the construction of St. Luke's Church, Morton, near Bingley; by 22nd, for the construction of whitehaven water-works, under one or more contracts, comprising about 15 miles of pipelaying, with tanks, aqueducts, &c., &c.; by 11th, for the various works in erection of a school and master's bouse at Woodhouse Grove, near Leeds; by 11th, for the erection of Moor-Allerton Church and School; by a date after 14th not specified, for works in repairing and re-slating roof, and constructing new ceiling, to Horsforth Church; by 11th, for the erection of a villa at Winchester; by 17th, for 2,000 cast-iron chairs, a number of malleable iron spikes, and 10,000 native larch, Norway, or best Baltic or other sleepers; and by 18th, for the supply and fixing of iron roofs for passenger station at Tithebarn - street, Livernood

Bartholomew Fair, Smithfield.—As a gradually fading vestige of old London, we have, for many years past, invariably visited Bartholomew Fair, that we might watch its decline and see it expire. The light flickers in the socket. On Tuesday night last, when we naid our accustomed visit, we found that one or two stalls for gingerbread, two or three gambling-tables for nuts, and one "puppet-show," constituted the fair. A few people were scattered about, but the majority of them were policemen. The moon was shining brilliantly on the "Smooth-field," the scene of knightly jousts and religious burnings in time gone by (and of an abominable nuisance in the present day), and illumined the church built by Rahers even hundred and forty years ago, and the hospital he founded. If it were our part to moralize and evolve "Reflections," we might fill a page with such a subject.

THE ELECTRIC LIGHT.—In Mr. Pearce's specification of patent, the main point claimed as his invention consists in so employing bar electrodes that the light shall be developed at the sides or edges in place of at points at the ends. He also claims a mode of employing bar electrodes, whereby a constant supply of non-conducting matter is kept up to retard the approach of the bar electrodes: also a mode of reobtaining contact in the event of the light going out, by the introduction of a conducting substance, to be removed by means of an electro-magnet bar or coil. There is also a claim for clockwork for regulating the time of giving light, and various other claims for alleged improvements.

SUSPENSION BRIDGE OVER THE DNEIPER.

—Mr. James, of Stamford-street, has recently constructed a model of the suspension bridge which is about to be constructed for the Emperor of Russia over the Dneiper, at Kieff; and which will be half a mile long. It will have six bays, four of them 444 feet long, and two 222 feet. The roadway will be 34 feet wide, and the footpath 6 feet. A swivel bridge, on the Russian side, will communicate with the rest of the structure by an island formed of masonry, and be constructed so that any injury to the chains fastened within it can be easily rectified. The whole work will occupy about five years in completion. The model, prepared in this country for the Emperor, and about to be dispatched to Russia, is constructed on the scale of one-eighth of an inch to the foot.

scale of one-eighth of an inch to the foot.
CONCRETE PIERS.—An iron bridge is to be built at Chepstow, for the South Wales Railway. It is stated, that for the construction of the piers sheet-iron tubes, 12 feet in diameter, will be lowered into the river, and are expected to cut their way down to the rock. "Then, the water being pumped out, each tube will be filled with eement (query: concrete?), and this will remain in the form of a pillar of stone when the iron tube has wasted away."

TEMPORARY CHOLERA HOSPITAL IN THE CITY.—The site of the late Fleet Prison is selected, on the recommendation of the City architect, for the erection of a temporary hospital for cholera patients.

ENGLISH AND AMERICAN RAILWAYS. There were about eighty passengers in the train, forty of whom were in the same carriage as ourselves. "The car," in shape like a long omnibus, has a passage down the middle, sometimes called "the aisle," on the back part of which, the seats are ranged transversely to the length of the apartment, which is high enough to allow a tall man to walk in it with his hat on. Each seat holds two persons, and is well cushioned, and furnished with a wooden back, ingeniously contrived, so as to turn and permit the traveller to face either way, as he may choose to converse with any acquaintance who may be sitting before or behind him. The long row of windows on each side affords a good view of the country, of which more is thus seen than on our English railroads. The trains, moreover, pass frequently through the streets of villages and towns, many of which have sprung up since the construction of the railway. The conductor passes freely through the passage in the centre, and from one car to another, examining tickets and receiving payment, so as to prevent any delay at the stations. If we desire to form an estimate the relative accommodation, advantages, comforts, and cost of the journey in one of these railways, as compared with those of England, we must begin by supposing all our first, second, and third-class passengers thrown into one set of carriages, and we shall then be astonished at the ease and style with which the millions travel in the United States. The charge for the distance of 54 miles, from Boston to Portsmouth, was 1½ dollar each, or 6s. 4d. Englisb, which was just half what we had paid three weeks before for first-class places on our journey from London to Liver-pool (2l. 10s. for 210 miles). Here there is the want of privacy enjoyed in an English first-class carriage, and the seats, though excellent, are less luxurious. On the other hand, the power of standing upright when tired of the sitting posture is not to be despised, especially on a long journey, and the open view right and left from a whole line of windows is no small gain. But when we come to the British second and third-class vehicles, cushionless, dark, and if it happen to rain, sometimes closed up with wooden shutters, and contrast them with the cars of Massachusetts, and still more the average appearance, dress, and manners of the inmates, the wide difference is indeed remarkable; at the same time, the price which the humblest class here can afford to pay proves how much higher must be the standard of wages than with us .- Lyell's Second Visit to the United States.

PREVENTION OF RAILWAY ACCIDENTS. Mr. Preecy, of Lyndhurst, New Forest, pro-poses two plans for counteracting the effect of collisions by railway. The first he calls the hermaphroditic engine, which, when one sec-tion is built to the tender and the other to the luggage van, will, it is said, repel 300 tons, and in collision with another train similarly constructed 600 tons, besides the resistance of one ton for every buffer in the train. Sections placed as pilots before the engines will run into each other, causing a further repulsion estimated at 500 tons. One section placed as a rear-guard will resist to the same extent, if run into. The second plan is by placing four elliptic springs betwixt every pair of gravitation buffers horizontally, whereby a repellant power of 32 tons will be provided, it is said, to each carriage. But it seems to be essential to this plan that "every description of carriage that is to run on the same rail must be built greatest precision as to length on and width across the rail, with corrected carriage springs, all standing the same height, with the same weight, the fittings as to gravitation buffers, as to width across the rail, and height from the bearings of the wheels, the height of the sway buffers from the gravitation buffer, and the width of the sway buffers from each other. Every carriage must be built so exactly by the same gauge, that, turn the carriages either way, when empty, convex buffers may point centrally into the concave buffers." Now, the danger inevitably resultant from any cause, whether temporary or in permanent construction, capable of altering the preconcerted height of one buffer thus locking into another, is so obvious that the usefulness of any plan requiring such nice "precision" of detail must be doubtful.

Orbitand Armani's Patent Metallic Lava.—We are glad to observe that this material for paying is getting steadily into use. We have seen more of its since we first spoke of it, and find no reason to alter our opinion then expressed, especially that for keeping down damp it was well adapted. The vestibule of the great hall of the Euston-square station is paved with it. It admits of the exercise of taste on the part of designers.

Zinc Paint.—We are glad to find that our hint to practical chemists has not been fruitless. Mr. C. A. F. Rochaz, St. Swithin's-lane, has recently lodged a specification of patent for improvements in the manufacture of oxide of zinc, and in the making of paints and cements where oxide of zinc is used. The first regards the sublimation of the zinc into oxide, the pure particles of which are collected by adhesion to ranges of bands suspended in canvas-covered chambers for the purpose. The coarser particles are thus collected separately and used, under the second section of the specification, as cement, when mixed with mortar. The patentee states that he makes a durable, rapidly drying, white pigment with 20 parts white zinc, 4 resin, 2 turpentine, and 1 drying oil.

EARTHENWARE TUBES.—An improvement in the formation of sockets has been patented by Mr. Charles Jacob, of Nine Elms, engineer. A socket mould fits on the orifice in the dieplate, through which the pipe is moulded: when the socket mould is filled with clay, it yields and goes along with the pipe in being formed; and it is held up to its place against the die-plate, or against the end of the pipe, by means of a counterpoise weight.

CREMORNE GARDENS, BATTERSEA - BRODGE.—We lately noticed the beauty of Rosherville, and are reminded that we might justly say a word in favour of Cremorne Gardens, on the banks of the Thames,—another resort for the jaded million. This we are quite willing to do. Divested of the crowd which usually fills them (but against whom, by the way, we have nothing to say, for they enjoy themselves with great propriety, and the management seems very good), they form an enjoyable retreat and deserve a visit.

NORTHFLEET CHURCH COMPETITION.— The first premium of 15th for the restoration of this church was awarded to Messrs. Brandon and Ritchie, and the second, of 10th, to Messrs. R. Potter and G. Low.

The Timber Preserving Company was held on the 31st ult, at their offices, Whitehall-wharf, Westminster, when a dividend at the rate of 6 per cent per annum was declared, the chairman, Mr. George Burge, stating that their future prospects were most encouraging.

New Schools, St. Pancras.—The vestry of St. Pancras is about to erect a school-house for 250 boys, on the workhouse premises. The plans prepared by Mr. J. Lockyer have been approved, and will be ready carly next week for the inspection of contractors. Particulars will doubtless be advertized.

BLINO BUILDERS v. IMPERFECT SPECIFI-CATIONS.—Sir: Separate tenders were required to be sent in for works to be done under the parish surveyor, at St. Luke's church, Old-street. The following is a list:—

	General Work.	Clean Cornice of Church.	Drain.	
	£. s. d.	£. s. d.	£. s. d.	
London	83 0 0	22 0 0	6 10 0	
Wilson	89 15 0	70 0 0	6 0 0	
Mason	93 15 0	73 10 0	28 10 0	
James Ward	98 0 0	24 0 0	6 10 0	
William Lamprell	98 10 0	26 0 0	22 0 0	
Grist	99 0 0	69 10 0	5 10 0	
Loffitt	99 15 0	70 0 0	6 0 0	

The tender of Mr. London was accepted as regards the general work, but he was required by the committee to meet them at the church to tell them what he intends to do for the other amounts, as they are sure something is wrong. Whether this error is with the hlind builders, or is with the professional gentleman who made the specification, your readers will judge from the practice they have in reading different specifications. To my knowledge, it frequently lies with the profession, and I believe this to be the case here.—JUSTICE.

SATURDAY, SEPTEMBER 15,1849.

E anxiously invite the serious attention of our readers of all classes to the following communication from Professor Cockerell, R.A., dated from the

Architect's Office, Bank of England.

Every one concerned in building operations has witnessed with grief, from time to time, the breaking up of those benefit societies which building operatives have established for their mutual protection against casualties, sickness, old age, &c. Generally humble and local, these have failed from ill-constructed tables, these have raised from in-Constitucted tables, from corruption in the officers, and not un-frequently from the perversion of the funds in cases of strike or political agitation, for pur-poses of conviviality, &c. : the great suffering of families in consequence, and the demoralization of the operatives themselves, need no comment.

The consideration of these deplorable liabilities engaged some architects and builders seven years ago (1842), by an invitation from this office, to consult, in the hope that exemption from such like dangers might possibly be obtained from better constructed rules and so that a society, directed under their responsible guidance, might effectually secure the interest of their fellow labourers, the buildthe interest of their fellow labourers, the build-ing artificers of London, in respect of provision against age and sickness; but, after much care-ful deliberation, especially by the "Builders' Society," no plan sufficiently promising could be devised for this desirable purpose. The project has, however, been recently re-vived by the encouraging example of the "Servants' Provident and Benevolent Society, founded on the Act for the nurchase of Annu-

founded on the Act for the purchase of Annuities through the medium of Savings Banks." ties through the medium of Savings Banks." Existing scarcely seventeen months, this society has already grown into importance through the earnest exertions of some able and zealous individuals, and the patronage of the highest authorities of the realm, and especially of his Royal Highness Prince Albert; and, in proof of it, we have the remarkable fact, that while, during sixteen years since the passing of proof of it, we have the remarkants fact, total while, during sixteen years since the passing of the Deferred Annuity Act, nine hundred and forty-one persons only have availed themselves, throughout the kingdom, of the benefits of the Act, this society, during the short period of fourteen months, has added one hundred and three, or one-tenth of the whole, and since the 22nd of May has increased that number.

A meeting for the purpose of more effectually calling public attention to the Government Annuity system, and of advancing the society, was invited on the 16th May last, when his Royal Highness Prince Albert presided, and thereby generously pledged his high responsibility for its value and authenticity. His Royal Highness explained to the effect, "that this was not an institution of charity but of friendly assistance and advice to those who were willing assistance and advice to those who were willing to belp themselves,—who, exercising present self-denial, providence, and perseverance in the days of their strength and prosperity, might, by the kindly co-operation of masters, secure themselves against the adversities of sickness, old age, and want of employment; and above all, against delusive clubs offering extravagant advantages (for ever falsified), in which so much hard-earned capital is continually sunk,—and leading, besides, to convivial meetings, and leading, besides, to convivial meetings, equally dangerous to the prosperity of families and habits of thrift.

That the provident objects of the society were chiefly to recommend the purchase of annuities, deferred for at least ten years, from the amount of 4l, to 30l, per annum (according to the table), as the most profitable investment of the savings of the servant which could be

offered. That the financial scheme upon which the Act was founded was the most advantageous that could be devised or afforded; and indeed was limited on that account to incomes not exceeding 150l, per annum. That it was based

on the credit of the country at large, and the faith of Government, by the Acts of Parliament, 3 Wm. 4, cap. 14, and 7 and 8 Vict., cap. 83.

That the deposits are attended, under these Acts, with this peculiar advantage, unpre-cedented in trading assurance companies, cedented in trading assurance companies, namely, that they may be withdrawn at any time, previous to the payment of the annuity, by the depositor; so that he can command the money deposited for the purchase of his annuity at any period, as in a bank, though of course without interest upon those deposits.

That the benevolent objects of the society (sustained as it was by the subscription of its

(sustained as it was by the subscription of its patrons), were to form a medium or gratuitous agency, by which the great benefits of this Act might he obtained without trouble, risk, or loss by its provident members, cleared of all technical wording and complicated provisions, usual and necessary in Acts of Parliament, and to establish an office for the conduct of the business, attended by persons ready to offer explanations, receive deposits, and regulate correspondence.

That other obvious advantages might be expected to flow (should the public patronage

pected to flow (should the public patronage continue prosperously) from the benevolent objects of the society in favour of the depositors, such as the loan or advance of premiums in case of sickness or affliction." Finally, his Royal Highness urged upon the notice of the public the fact that the system adopted by the Servants' Provident and Benevolent Society was applicable to every other class of her Majesty's subjects whose income and social position were 'limited to similar conditions. conditions.

Such an example and such a model, with some modifications suited to the building arti-ficers' class, would enable the architects, engineers, and builders, uniting with the operatives, to establish and uphold a Building Artificers' Provident and Benevolent Society, of the utmost benefit and comfort to all parties. And, most benefit and comfort to all parties. And, when the number and respectability of the building artificers on the one hand are considered, and the distinction and influence of architects, engineers, and builders, on the other, amongst all classes, from the prince to the humblest labourer throughout the country, the means of such a society may be easily appreciated.

reciated.

The consideration of such a project is earnestly recommended to all those who are connected with the building classes, and who naturally feel the greatest concern for the welfare of the worthy artificer, and the permanent security of the hard-earned savings of his labours during health and prosperity.*

C. R. COCKERELL, Architect.

* The subjoined table will show the amount of the yearly instalments to secure a Government annuity of 20t. for life, contracted for between the ages of twenty-five and thirty-five, and due at the ages of forty-five, lifty, fifty-five, and skirty. We have not space to make it more full. The instalment for an annuity of 10t, will cost exactly half as much again; and so in proportion for an annuity of any intermediate amount.

The proposal we here publish is aimed at one of the most momentous objects of the present times, namely, the promotion of the greater sympathy of ranks-of master and workmen, employer and employed-and the re-establishment of that link of kindliness which ought to exist in bodies having one common occupation, no less in permanent than in immediate interest.

The Labourers' Friend Society, the Servants' Provident, and many similar institutions that have recently come into notice, are so many proofs of this growing sense of duty and benevolence on the part of the upper ranks towards their humble fellow-labourers, and of the enlightened policy which, beginning with George Rose and the Savings Banks, and the beneficent Acts of William and Victoria, quoted in this paper, has continually laboured for the permanent benefit of the humbler ranks.

We hail every attempt to carry out these views, especially in the meritorious and formidable class we advocate—the building class—in which this sympathy, protection, and fellowship are lamentably deficient (from discreditable causes), and the establishment of wbich would effect a great moral and social good amongst us, mitigating that fearful antagonism between capital and labour which breaks out continually in so alarming a form, and threatens the framework of society.

The Paternal Institution of the Freemasons (now extinct 132 years), and the several guilds of old, grew out of similar motives, namely, the confession of mutual obligation, the association for mutual benefit and protection of the high and low (the grand masters, wardens, and brothers), for the security of permanent as well as immediate support.

Individual ranks in the present day do not fail to make such provision as they can for their separate interests; but this comprehensive, paternal, and corporate union of ranks, upon the broad basis of mutual and general good to the class, ceased with the Freemasons.

Thus the architects, engineers, and builders have established an insurance office for themselves; the builders have also their Builders' Society, or union, for the protection of their own individual interests; they have also a Society for decayed builders, to which they invite public subscription.* The building artificer, on his side, is not behind-hand; he has the Club for his security (as he sometimes vainly imagines) in sickness and old age, + and his Union for that of his rank, and the support of that intestine war against capital, which is ever raging more or less, and ever consuming his hard-earned savings. Thus the separate selfish and individual interests have all been consulted, but the union of all for mutual good and a full and active admission of fellowship has been neglected. The obligations of the architect, the engineer, and the builder, to the simple artificer are as clear as that of the general to the simple soldier. The mere commercial exchange of wage and labour can never discharge the debt of the former to the latter: a grateful country acknowledges this truth at Chelsea and Greenwich and the Invalides. The slave-driver is com pelled by law to provide for those hands, in sickness and old age, which have ministered to his comfort and prosperity in youth and vigour; but the freeman artificer and operative of England has no such advantage, nor even

^{*} It is right to say, that "The Builders' Benevolent Institution" also propose giving assistance to workmen when accidentally injured in their master's employ.

+ We will not omit honourable mention of "The Provident Institution for Builders' Foremen,"

sympathy from his master, unless it be at the this kind has long been in the contemplation parish expense. Between him and his cmployer there is no absolute obligation beyond that which the labour markets and the laws of commerce impose-the work performed and the wage paid terminate their connection,- the merchant builder, whose fortune has been achieved by the combined labour of the artificer, has thus (as he considers) fulfilled his part;-the honey once hived the drones are expelled, and must provide for their own future as best they can.

Amongst the many reasons for this isolation of interests, and the deficiency of more generous, paternal, and comprehensive views for the benefit of the various subordinate ranks composing a class, is the system of union and combination, so constantly the subject of legal discussion and enactment, and that antagonism in which capital, on the one hand, and labour on the other, are continually placed. To what an alarming pitch the warfare of this antagonism rises, the annals of the last forty years familiarize to the recollection of all of us. It is one of the great evils inherent in a wealthy commercial and manufacturing country, and has been the ruin of flourishing states, as it may be of this.

But this evil is greatly aggravated, and indeed in a measure justified, where a line of separation is drawn between the ranks, and no sympathy for permanent good and happiness of the humbler is shown by the higher,no hand of friendship, advice, and fellowship is offered for the ulterior security of the operative and his family, beyond the commercial interchange of wages and labour, with all the contentions and bitterness which always will accompany this barter,-a sympathy and fellowship which the superior instruction, wealth, and influence of the higher ranks would so easily and profitably bestow upon the lower, provided they will help themselves, by thrift and providence, with those means which have been provided for them.

In a wealthy, commercial, and manufacturing country the Merchant Builder is of natural growth, and has been exhibited during the last half century, in this country, in very remarkable development, unknown to former ages: his capital absorbs the little tradesman, with all his individuality of skill and character, and either grinds him under his colossal weight into the sub-contractor, or melts him down into his establishment as a hired article of trade. He offers advantageous terms to the public, inasmuch as he is satisfied with one profit instead of the several which the various trades would require, and entails but one trouble and responsibility instead of the many which the ancient system was liable to. The public, therefore, patronize and confirm this practice.

But this, as a kind of monopoly, leads to many well-known evils, and excites an antagonism on the part of labour, which is consuming and ruinous alike to the prosperity, as also the morality, of the operative, -an antagonism which he uses in self-defence, and which brings with it pretensions of wage and rights often indefensible, and which he justifies when he perceives no friendliness or sympathy in his superior towards his personal permanent interests.

Thus, to the tyranny of capital we have opposed the tyranny of labour, equally violent and unreasonable, and which nothing but a conviction of established mutual regard, apart NEWS If ath the question of barter, would mitigate.

We know that some beneficial measure of

of the Builders' Society; but neither they, nor the other two ranks concerned, could alone effect a really beneficial society of the kind proposed; for any measure exclusively from them would be suspected by the operative, as a device to draw the teeth of their unions, and to rivet the chains already complained of.

The operatives also, alone, are helpless, having neither the leisure nor influence to place their claims before the public in their due proportion; but these two, united to their natural leaders, the architects and engineers, who could have no other interests than those of honour and fairness, would possess all the elements of a great and beneficial institution, and a balm of consummate efficacy in the present malady of our operative system.

An office should be established for the gratuitous agency of contracts for deferred annuities, for all comers, unionists or not, and thus institute the provident part of the institution. For the support of this office, and for general benevolence in case of sickness, inability to pay premiums, and other similar purposes, a Benevolent Fund would be raised; and when we consider the means and the motives which the capitalist builder would have for the support of this fund, and also the public, through the influence of the heads of the profession (who have access to the highest authorities of the country without suspicion of interested motives, other than such as honour and benevolence dictate), and who could thus put forward the claims of the meritorious class which they would benefit, the success of such a society by annual public meetings, and a weekly board, could never be doubted by those who see how many societies of the same general object do flourish in this great country.

The operative thus hefriended, and associated with his natural protectors in the face of the public, would be raised and dignified as a class; his morality must be improved by well-directed providence and friendly countenance; and his attachment to Government and public order would be secured by his reliance on their stability; unions would lose their virulence and their justification; a false communism would be displaced for a real one; and a grand step towards a more wholesome order of society in this meritorious class, of most beneficial influence upon others, would be effected, to the great honour and satisfaction of every true Mason and well-wisher to the ingenious and useful class to which he belongs.

We invite suggestions and co-operation: Government Annuities are suggested; hut it has been shown that on the principle of Mutual Assurance greater advantages can be obtained than are given in Government Annuities; and if, as we understand, a Bill is about to be brought into Parliament to carry out this principle with Government security, a different view may be taken.

BIRMINGHAM WORKHOUSE DIRMINGHAM WORKHOUSE COMPETI-TION.—Sir: You have appended to my letter of last week comments reflecting upon the decision of the selecting architects, caused by a charge made by Mr. Brookes—"that he had COMPETI. discovered the name of an architect partially erased on one of the plans."—I trust you will permit me simply to re-assert that no such name was visible to us at the time of our inspection, and allow me to add, in fairness to the competitors, that the whole of their plans were minutely examined, and those reported upon were then in strict accordance with the instructions issued by the Board of Guardians. -HENRY J. STEVENS.

What does Mr. Brookes say to this?

REMOVAL OF ILLICIT FEVER-STILLS.

St. Botolph's, Bishopsgate-street. - The vestry of this parish, after a long discussion, unani-mously passed the following resolution:— "That in the opinion of this vestry the public That if the opinion of this vessity the purple health is alarmingly endangered by the continued practice of interring the dead in the parochial burial-ground, and in the vaults under the churchy and that all interments in the churchyard of the parish, and in the vaults when the church heave furth discontinued. under the church, be henceforth discontinued. That a committee he appointed to carry out the foregoing resolution, with full power to take any measure necessary for its enforce-ment." The vicar anxiously concurred, and

ment. The vicin analysis, the Lord Mayor took part in the discussion.

St. Clement's, Eastcheap, City.—The inhabitants have directed the churchwardens to discontinue for the future the burials in the church and churchyard of this parish; the rector cheerfully acquiescing.

Tottenham-court-road Chapel.—The Board

of Health have ordered the burial-ground of

this chapel to be closed.

St. Clement Danes', Strand.—The Board of Health have peremptorily closed the horrible fever-still in Portugal-street, belonging to this parish.

John's, Westminster. -- Forty householders and residents have called on the Board of Health to look to the burial-ground of St.
John the Evangelist. The two first cases of
cholera in that district occurred in houses

abutting on the worst part of the ground, Lambeth.—At a meeting of the inhabitants of Lambeth on the 10th, it was resolved that "the churchyard in High-street, wherein from 200 to 300 persons are buried weekly, to the imminent risk of the lives of all the parishioners, be immediately closed against all future interments.

So long ago as 1552, Bishop Latimer said,-So long ago as 1552, Bisnop Latiner sau,—
"I doe marvel that London, being soe great a
citie, hath not a burial-place without; for no
doubt it is an unwholesome thinge to bury within the citie, especiallie at such a time, when there be great sicknesses, and manie die together. I think verilie that many a man taketh his death in Paul's Churchyard, and his I speake of experience; for I myself, when I have been there on some mornings to heare the sermons, have felt such an ill-savoured and unwholesome savour that I was the worse for it a great while after; and I think noe lesse but it is the occasion of great sicknesse and

Sir Christopher Wren, when named one of the commissioners for building new churches, wrote a letter for the consideration of his col-leagues from which a correspondent, Mr. leagues, from which a correspondent, Mr. Barlow, has forwarded us an extract. He says:
—"I could wish that all burials in churches might be disallowed, which is not only unwholesome, hut the pavements can never be kept even nor pews upright; and churchyard be close about the church, this also is inconvenient, because the ground being continually raised by the graves, occasions in time a descent by steps into the church, which renders it damp and the walls green, as appears evidently in all the old churches. It will be inquired where then shall be the burials? I answer in cemeteries, seated in the outskirts of the town; and since it is become the fashion of the age to solemnize funerals by a train of coaches, though the cemeteries should be half a mile or more distant from the church, the charge need be little or no more than usual; the service may be first performed in the church. But for the poor, and such as must be interred at the parish charge, a public hearse of two wheels, and one horse, may be kept at small expense, the usual bearers to lead the horse, and take out the corpse at the grave. A piece of ground of two acres in the fields will be purchased for much less than two roods among the buildings. This being enclosed with a strong brick wall, and having a walk round, and two cross walks, decently planted with yew trees, the four quarters may serve four parishes, where the dead need not be disturbed at the pleasure of the sexton, or piled four or five upon one another, or the bones thrown out to gain room. In these places beautiful monu-ments may be erected; but yet the dimensions should be regulated by an architect, and not left to the fancy of every mason; for thus the rich, with large marble tombs, would shoulder

out the poor. * * * It may be considered farther, that if the cemeteries be thus thrown into the fields, they will bound the excessive growth of the city with a graceful border, which is now encircled with scavengers' dungstalls."

Since then we have been piling up corruption to a fearful extent, in spite of warnings. Not a moment must be lost in stopping the evil. Again we say, petition for an Order in council.

AN APPEAL FROM THE ROYAL INSTI-TUTE OF BRITISH ARCHITECTS.

The council of the institute, impressed with the importance and responsibility attached to their duties, are anxious to take such steps as may still more fully realize those results which are expected from the proceedings of the institute. They feel it to he necessary for all to bear in mind, that one of the great objects of the meetings is to elicit facts relating to the several departments of knowledge which are subservient to architecture. Many may imagine that investigation has already exhausted discovery. But if for a moment we consider how much each year developes that is new and useful to our art, it must be confessed that there is a vast field yet unexplored. And if we may hope to see embodied the intense aspiration of the present race of architects to discover some new source of inspiration of the state of science, and of the requirements of the present day. It was by the investigation of such principles that, under like circumstaces, the men of genius of former periods brought to bear new appliances, in order to satisfy the wants of their times, and to work out the full capabilities of the new stream of thought which then presented itself. It is only thus that we also can hope to create and mature ideas which shall distinctly mark this epoch of our art, this period of the existence of the institute

stitute.

Never until now bad English architects so fully mastered, by laborious study and deep research among the monuments of ancient time, all the phases that architecture has assumed in successive periods. The portfolios of our professional brethren are so many treasures, rich in stores of material, and evidences of how deeply their possessors have felt and thought on the subject. This is further proved by the monuments of our art and the various valuable works produced within the last quarter of a century. The concentration of these riches of reflection and experience is the great desideratum. Can this be better effected than by unreserved communications and interchange of ideas through the medium of the institute?

of ideas through the medium of the institute? Under these feelings, and conscious that our body are capable of working out great things for the art, the council confidently appeal to the members, and call upon them to assist their earnest efforts to give that efficiency of action, and to produce those fruits, which the profession, the public,—shall we say? Europe—are entitled to expect from our combined exertions. They are most desirous to give additional stimulus and energy of purpose to the members, and to induce them to exert themselves, and to combine, in a movement onwards, in an united effort for some new and striking results, which shall redound to the credit of our honoured institution. There is many a floating idea, many an immature notion of a something unrealised, which, if expressed, may lead to striking results; and if they could be brought before the institute, stated, discussed, and so diffused among many thoughtful minds, good must arise, and still greater variety and originality ultimately mark the productions of our artists.

But justice would not be done to the ample scope of our theme, if you were led to consider, that allusion was only intended to architecture as a fine art, to the exclusion of its scientific division. The æsthetics of each distinct period of architecture have grown out of the principles of construction then in practice, and hence have arisen new combinations of form and proportion. We are now undergoing a marked transition in the canons of construction; new materials, new wants have been introduced, and new elements for combination. The con-

structive architect of this day has larger views and almost boundless requirements to satisfy, which existed not half a century ago. All these circumstances suggest new subjects for consideration. The more precise form now given to the investigations and results of architectural experience in the several classes of building, each lawing its own laws, shows, that he who wishes to keep pace with the wondrous progress of the present time must work and think not alone but in combination. Such combination is peculiarly offered in the institute.

institute.

The council trust, then, to render the next session remarkable by a more distinct aim and activity of purpose. They would venture to anticipate, that the members will consider it a duty and a delight to contribute somewhat to the intellectual advancement which they lope to set in action. This can only be done by each one's turning his attention to the consideration of some idea. The illustration of an existing fabric,—the statement of a doubt,—the suggestion of a principle,—the development of a train of thought,—will contribute to this. There is not one who has not some, perclance indistinct, leading notion in his mind. Let this then assume a tangible shape, and such a contribution may produce important consequences.

T. L. Donaldson, Honorary J. J. Scoles, Secretaries.

MANAGEMENT OF ARCHITECTURAL COMPETITIONS.

What your correspondent "Y." says respecting the management of architectural competitions is excellent; yet there is one desideratum which he has overlooked, namely, that competitors should have a reasonable time allowed them for fairly studying the subject proposed. At present, that is so far from being the case, that very frequently scarcely time enough is allowed for merely making drawings,—or, perhaps, not even that, unless an architect either happen to be entirely disengaged, or can put all other business aside in order to work for the sake of a mere chance.

The off-hand expedition required on such

The off-hand expedition required on such occasions is an equally serious and gratuitous tax upon the profession; and, so far from at all benefiting those inflicting it, is plainly contrary to their interests, although they them selves seem to be far too dull to perceive it.

What better than hastily put together ideas

What better than hastily put together ideas can committees expect to get from architects, if they will not allow the time for producing thoroughly well considered and matured designs? And by "matured designs" I do not mean carefully finished drawings, for the latter may be and frequently are exceedingly common place in point of design. In fact, the drawings sent in to competitions should not be allowed even to aim at any of the allurements of mere pictorial effect, but both be and be looked upon by those to whom they are submitted as no more than preparatory drafts, which, should there be occasion to do so, can afterwards be transcribed quite fair. Beauty of mere drawing is apt to be so exceedingly seductive, especially to non-professional persons, that committees ought to be particularly on their guard against it, and carefully scrutinize a design that seeks so to recommend itself; they having to consider not what the drawing before them is, but what the structure erected after it will be, and how the latter will show itself:

As to the first matter I have touched upon—the hurry with which competitions are usually managed in the first instance becomes the more preposterous, when, as often turns out to be the case, a twelvementh or more elapses before the work competed for is actually set about.

It is to be boped the valuable suggestions of your correspondent "Y," in last week's Builder, will not fail to create the desired effect, but will he the means of stirring up the profession to a proper sense of the present disgraceful system upon which architectural competitions are carried on. Ever since your valuable journal was first started, scarcely a week has passed without complaints being made through your columns of some competition job. Yet, after all that has been said and written, nothing has been done practically to

remedy the evil. From experience it may be confidently asserted neither "institute reports," nor long letters to "THE BUILDER," will of themselves produce the desired reform. very well to blame committees, composed (as very went to battle committees, composer (as they generally are) of men totally incapable of forming a correct judgment of the relative merits of designs submitted to them, for all the evils attendant upon architectural competitions. For my own part I am inclined to think architects have only themselves to blame for the expenses they are subjected to in preparing drawings, when they, regardless of the risk they are incurring, submit their designs to the adjudication of men, who, from deficiency of education in the fine arts, are totally in-capable of arriving at a correct decision. The difficulty then that presents itself, is bow, the most effectually, to remedy the growing evil. The one suggested hy your correspondent of a "monster meeting," of all parties interested, appears to be the only likely means of bringing about the desired reform, the object of which meeting would be to draw up a certain code of regulations sufficiently comprehensive to meet the requirements of almost every case, to which it should be the object of the meeting, or a committee appointed by it, to obtain the assent of the whole profession, binding them, at the risk of forfeiture of caste, to strictly adhere to them. A thorough reform of the pre-sent pernicious system would, doubtless, be the work of time, and difficulties would present themselves, in the refusal of competition committees to accept the code of regulations submitted to them. In such cases it would be the duty of the profession to make a manly stand, and at every risk to refuse to compete. If such a course were pursued in one or two instances, by the profession, united committees would soon begin to see they must either give way, or put up with inferior designs, while it would also be the duty of the profession, however painful the adoption of such a course might be, to excommunicate from its honourable fellowship, any architect who might be found to engage in a competition against which the profession had authoritatively pronunced. It is very probable the subject will be energetically agitated before long, by means of public meetings; in the meanwhile I would be presented by the reserver to the reserver. suggest to the profession to give the subject mature thought, and reduce to writing any suggestions that might occur to them, so that when the agitation is once commenced, it may not be allowed to subside, without thoroughly removing the evils under which the present system labours.

C. G. system labours.

THE HONOUR OF THE LONDON AND NORTH - WESTERN RAILWAY COMPANY.

In 1845 the London and North-Western Railway Company took the West London Railway, which had cost the proprietors 280,000½, on lease for one thousand years, paying down 60,000½, to clear off liabilities, and binding themselves to work the line efficiently, and give the West London Company half the receipts. And this was at a time when other companies would have purchased. They obtained an Act to extend the line to the Thames, and year after year have pledged themselves to the West London to carry out their arrangement. They now point-blank refuse to work the line, under any circumstances, for passenger traffic, or to pay any compensation to the West London. The poor deluded shareholders in the latter Company, who have never received a single sixpence for their 280,000Å. long since advanced, are told that they would have no chance at law against so powerful a Company as the North-Western. They have called a special meeting, however, for the 18th of next month, to consider what course shall be pursued; and we hope, if they find that their deeds are all right, that they will try the extent of the boasted power of the North-Western. Company over law, justice, and honour. Further, a very large population are interested in obtaining a station at Kenistrate.

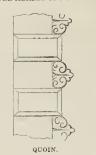

BIRMINGHAM EXHIBITION OF INDUSTRIAL ART.—We have received some particulars of this exhibition of English industry, but must endeavour to see it for ourselves next week

ARCHITECTURE OF CATANIA

LOWER MEMBER OF A CORNICE.

UNIVERSITY, CATANIA

This sketch will serve to give some slight idea of the general architecture of Catania, the style whereof is peculiar and very striking. The peculiarity consists chiefly in the extraor-The peculiarity consists enterly in the extraordinary richness of the details. The doors, windows, and cornices are all lavishly adorned: and even the poorest houses partake of the ornament. It is, however, seldom carried so high as the main cornice, which is a smally too wask in effect for the richness of usually too weak in effect for the richness of the lower parts of the façades. The annexed sketch is from the entrance court of the University, a building which is said to have suffered greatly during the late warfare. A few memoranda, showing other specimens of the style, are subjoined. T. H. L.

HEALTHY HOMES

UNDER this title we are glad to see a cheap issue of Professor Hosking's "Guide to the proper Regulation of Buildings, Streets, Drains, and Sewers."* The original title sounded too technical, and did not convey the fact to the public that the book treated of matters in which all were vitally interested, and that they were set forth in a manner which all could understand. We gave our hearty commendation to the book in its original shape, and we hope the new issue will be extensively read, as we are satisfied it is calextensively read, as we are satisfied it is cal-culated to do much good.

In a postscript to the work, Mr. Hosking had warned the Commissioners of Sewers in strong language against attempting to remove the deposits in the sewers "with a plague marching upon us with steady pace in the midst of a mild and damp winter," and in the advertisement to the sewin removes. advertisement to the new issue he points to the course of events since its first publication as

totals of events since its instrumentation as justifying the warning he gave.

A large portion of the book is devoted to the subject of drainage and ventilation, and it contains many valuable suggestions with a view to render our dwelling-houses more section with a contains the them. cure against fire than they now are.

We give an extract from the appendix touching bell-traps, which are usually so ill-regulated in houses as to prove a source of constant annoyance and danger :-

"Bell-traps are commonly left loose, because many substances which pass through the grating or strainer of the trap refuse to pass the trap, either floating so that they cannot go under the lip of the bell, or sinking in the well as that they do not so that the strainer of the strainer of the strainer of the strainer. so that they do not get over the standing end of the drain pipe; and as tea leaves, rice, and other matters arising from the washing of plates and dishes, the ravelled threads of house cloths, hair from brooms, and many other such like matters, find their way to the grating in the sink, or at the drain head, and enough of

* Published by John Murray: London, 1849.

them pass through and lodge in the well into which the bell is dipped, the escape becomes choked, and the trap requires to be lifted to clear the way. To solder down bell-traps is, therefore to render the sink useless, unless they are protected from access of such obstructions, or means be devised of clearing them away. They may be protected by a wire strainer over the sink to stop everything that strainer over the sink to stop everything that can tend to choke a bell-trap before it can reach the grating;—or any ordinary obstruction may be cleared by forcing all such matters as will pass the grating of a bell-trap to go under the lip of the bell, and to rise over the end of the stand-pipe, and so pass away into the drain, and the requisite force may be obtained from a chight head of water by means. tained from a slight head of water by means of a very simple apparatus that may be always at hand in every house:—A tin or other cheap metal tube of three or four feet in length, fun-nel-shaped at each end, and the edges formed or bound with caoutchouc, so that when stood on end and pressed firmly down there may be a water-tight joint. This instrument placed over the grating of any bell trap so as to em-brace it fully, and filled with water, the pres-sure will be sufficient to clear away any ordinary obstruction from the trap, and render it unnecessary to leave the trap loose. apparatus may be applied by any maid-servant, and to any sink in or about a house, wherever, it must be added, there is clear height enough for it to be placed upright, though it is capable of being articulated to bend in some slight degree; and it may be made telescope fashion to give the means of increasing the pressure if need be."

AWARDS OF OFFICIAL REFEREES.

DUTIES OF DISTRICT SURVEYORS.

The district surveyor of Wandsworth and
Tooting (Mr. Hiscocks), gave notice at the end
of last year to Mr. W. Josiah Smith, addressed "To the owners or occupiers of the house and premises, situate at Garratt," to "repair the brickwork of the chimney shafts, refix the pots, make good and secure the tiling or slates of the rocky remains the state of the rocky remains of the roofs, repair the gutters and shoots, and do such other repairs to the front and side walls of the said buildings and premises, as may be required pursuant to the said Act," and then in January last sent in a decreased for then in January last seut in a demand for for surveying the repairs of bouses at Garratt, under section 43, and causing the rules of the Act to be observed."

rules of the Act to be observed."

Mr. Smith refused to pay: the surveyor threatened to summon him: and Mr. S. therefore sent the papers to the referees to inquire into the matter, and he set forth that the only repair necessary was the pointing of the roofs, which was always done once a-year. The referees accordingly surveyed the buildings, which it appeared were ten in number, and determined (July last) that none of the things stated in the notice were, at the date of the notice, in danger of falling within the meaning of the

43rd section, and being of opinion thereupon that there was no sufficient ground for the proceeding taken in the matter by the district surveyor, awarded "that the said district surveyor is not entitled to be paid by, or to re-ceive from, the said William Josiah Smith, any fee in respect of the proceeding hereinbefore referred to

"And further, we do hereby declare our opinion as to such proceeding, if it had been a necessary one in the case, that inasmuch as the ct surveyor does not in the said notice specifically set forth for, and as to each of the said several buildings, the particular matters or things which in each of the said several buildings he deemed and alleged to be in dan-ger of falling, the said notice is not a sufficient requirement or notice, under the 43rd section of the said Act first herein mentioned, to the several occupiers or owners of the said buildings," and further that the account, as it did not state "the number of such houses, or the amount claimed in respect of each of the said houses, or which of the several fees specified in schedule L is claimed," was not such an account as the district surveyor is required to give. Cost to be paid by the district surveyor. BACK-YARDS.

With regard to four fourth-rate dwellinghouses in Hatfield-street, Goswell-street, in the district of St. Luke's, Old-street, and the liberty of Glasshouse-yard, the surveyor of the district (Mr. Carpenter) laid an information before the official referees. Messrs. Davey, builders, had "formed the back-yards so as to contain less than one square each, exclusive of any building thereon." The yards measured any building thereon." The yards measured respectively 12 feet 1 inch by 8 feet 2 inches = 98 feet 8 inches; 12 feet 2 inches by 7 feet 9 inches = 94 feet 3 inches; 11 feet 11 inches by 7 feet 4 inches; = 87 feet 4 inches; and 11 feet 10½ inches by 7 feet 0 inches = 83 feet

At the hearing it was stated, "that there had formerly been buildings on the site occupied by the present buildings; that such buildings had been pulled down from thirteen to fifteen years ago; and that the present buildings contain three stories only, and that the lowest story is not an underground or basement story; the said district-surveyor stated that, as regarded the line of street, he had recognized the erection of the said huildings as the rebuilding of previously existing buildings."

The referees determined, "That inasmuch

as the buildings which formerly stood upon the site of the said four buildings were pulled down and removed before the time when the said Act first herein mentioned came into operation, the erection of the said four build-ings does not constitute a rebuilding of buildings already built within the meaning of Schedule K of the said Act; and that the said buildings are buildings hereafter built within the meaning of the said schedule; and that in-asmuch as each of the said buildings has been built without having an enclosed back-yard or

open space of at least one square without any building thereon, and inasmuch as all the said rooms of each of the said buildings cannot be lighted and ventilated from the street, the said buildings have been severally built and are contrary to the rules and directions of the said Act first herein mentioned."

STAIRS IN PUBLIC BUILDINGS.

With regard to the chapel of the Foundling Hospital, Guildford-street, in the district of St. Pancras, it was desirable to provide additional stair accommodation for the public, and "there being no means of making such stairs fireproof" (as was stated), the same were confreproof "(as was stated), the same were constructed of woodwork. Doubts arising in the mind of the district-surveyor (Mr. Baker) as to whether the rules of Schedule C, part 6, applied to the said works, a joint requisition was sent to the official referees to request their opinion thereon.

The referees determined, "that inasmuch as the said gallery has not heen altered or enlarged since the passing of the Metropolitan Buildings Act, it is not required by that Act to form any fire-proof stairs or accesses to such gallery; and that the erection of the said whosen stairs, in addition to the wooden stairs which had been in use before the passing of the Metropolitan Buildings Act, is not contary to the rules of the said Schedule C, part 6."

THE ART-UNION OF LONDON. "THE SMILE," AND "THE FROWN.

THESE engravings, which are now being given to subscribers of the current year on payment of the subscription, an arrangement made by the council to prevent a complaint on the part of members, which, looked at properly, is seen to be most unreasonable, that they have to wait some time before they ohtain their prints,—are exceedingly well executed by C. W. Sharp and W. D. Taylor, after two most characteristic works of the artist, Mr. Webster, R.A.

Originally these were to bave been issued by a print publisher, and the pair would have been priced at two guineas. As members are, in addition to these, to receive for each guinea subscribed a beautiful series of etchings from subscribed a beautiful series of etchings from drawings by Mr. Maclise, R.A., illustrative of Shakspeare's "Seven Ages," and a chance in the distribution of prizes,—to say nothing of a copy of the report, tickets for their friends for the exhibition and the general meeting, coupled with the satisfaction of knowing that they are also aiding the rising artists of the country, the number of subscribers can scarcely fail to be very large.

During the past week two or three cor-

During the past week two or three cor-respondents of the Times have been permitted abuse the works issued by the society, and to make some very erroneous statements, we hope unknowingly. The anonymous writer of nope unknowingly. The anonymous where of the first letter which appeared called Maclise's outlines "a complete failure—at all events, a very weak production;" and says, as to "The Smile" and "The Frown," he "can only designate them as twaddle," and an "inane production." It would be more than sufficient, in answer to this, to give simply the opinion of the Times itself, which had previously said—"The choice of pictures for the engravings with which the subscribers are presented has been most judicious, for no works could be more most judicious, for no works count of more generally acceptable, or more characteristic of the excellent artist who produced them, than 'The Smile' and 'The Frown.' Further, "they are admirably engraved."

It happens, however, that the whole of the

press, so far as we have seen, are unanimous in their praise. Confining ourselves to such London papers as happen to be before us, the Athenaum, unfortunately never willing to speak well of the Art-Union, talks of Mr. Webster's "two admirable little pictures" and Mr. Maclise's highly poetical outlines illustrative of the "Seven Ages." The Atlas says the pictures are "admirably engraved." The Spectator, after expressions of admiration, says, "the companion prints form a work of says, "the companion prints form a work of which English art may be proud;" and the Examiner remarks, "the choice of pictures for the engraving is most judicious, for no work could be more generally acceptable, or more charac-teristic of the excellent artist who produced them." The Observer says of "The Smile"

and "The Frown," that they are "inimitable pictures," engraved in a manner creditable in the highest degree to the talents of the artists;" and ends with, "it is not saying too much to state that these are decidedly the best prints ever issued by the Art-Union of London."
The Morning Herald says, the prints "are among the best yet issued by the society. They are accurate copies of the original paintings, which are as distinguished for their natural character as for their genuine humour." The Morning Post remarks, that these prints "are certainly the best the Art-Union has hitherto presented to the public. * * * Worth the price of the subscription." The Morning Advertiser calls them "two works of conspicuous attraction." The Art-Journal of conspicuous attraction." The Art-Journal believes "that they will constitute the most popular presentation that has ever heen made to the subscribers," and as to the "Seven Ages," that "they are surpassingly sweet in sentiment," full of "simple and severe elegance." The Journal of Design is of opinion, that the Websters are "excellent in subject and in treatment, and capital engravings," and that the series of the "Seven Ages," by Maclise, are "among the best of his designs," and elsewhere that they are "by far the richest return which has yet been offered to the subreturn which has yet been offered to the subscribers, and onght to attract many additional thousands." Two of the writers in the Times, with counterfeited sorrow (one a reverend gen-tleman, who, it is to be hoped, for the sake of the souls committed to his charge, knows more about divinity than he does about art), lament about divinity than he does about art, lament that the council allows its functions to be exer-cised by one or two gentlemen." They will of course be delighted to be informed, that every Tuesday throughout the whole year the council meet, without intermission, in the season and out of the season, usually from twelve to sixteen in number, and never by any accident less than seven, and patiently and most anxiously determine on every step that is taken. It is not our intention to reply to the ungracious

letters in question, but feeling great interest in the progress of the Art-Union of London, and anxious that an institution which has done so much towards forming an art-loving and art-appreciating people, and which moreover benefits so largely an important class, should not be injured either by ignorance or malevo-lence, we have ventured to put together the foregoing opinions on the prints offered for the current year.

NOTES IN THE PROVINCES.

Some considerable alterations are being arried out at the Shire-hall, Chelmsford, and the petty session room is being converted into prisoners' cells.—The contract for a new mansion in Tortworth park has been taken by contracts from Linday. Earl Ducie means a contractor from Lincoln. to spend at least 30,000l. on this new residence —Some improvements have been recently made at the fish shambles, Louth, by Mr. P. Bellamy, of Lincoln, architect. —Tenders For sewers at Southampton have been lodged— Mr. Richard Docwra to construct the Kingshard, Richard Doewa to construct re Kings-land-place sewers, according to specifications, for 787l. 10s. 3d., and Spa-road sewers for 100l. 7s. 4d.,—Mr. Stevens for Kingsland-place 786l., Spa-road 100l.,—Mr. Emmett for Kingsland-place 765l., Spa-road 130l.,—Mr. C. E. Lansdell, Kingsland-place 750l., Spa-road 130l. The pursually representations road 1301. The unusually near agreement in the amount of the tenders excited some surin the amount of the tenders excited some surprise. Each party also tendered for private drains: referred to committee. The tenders for Kingsland-place sewers were about 3504. above the surveyor's estimate, accounted for by necessary connections with the main sewers. Mr. Stevens's tender, at 1004, for the Spa-road sewer, accepted.—The building of the new Government school at Wimborne has been begun.—The inhabitants of Stoke have resolved to purchase a piece of land for pleasure grounds and healthful recreation, particularly for the working classes.—The foundation for the working classes.—The foundation stone of the Temperance-hall and Mechanics' Institute, at Grosvenor-street, Chorlton-on-Medlock, was to be laid on 1st inst.—The Stockport Temperance Society's hall will be 72 feet long by 42 feet wide, divided into three compartments by two ranges of columns lengthwise, making the central division 21 feet in width. In the basement will be class-

rooms and other apartments. The whole will be of brick and stone, with a lofty central doorway with rusticated Tuscan pilasters and entablature.
The foundation-stone was laid on Wednesday The foundation-stone was laid on Wednesday week. — Ten shillings per thousand feet for gas at Otley, being "considered a most exorbitant charge by the consumers," says the Bradford Observer, means for enforcing a reduction of price have been resolved on. — On Saturday in week before last the foundationstone of a new county hospital was laid at York. — Elaborate plans of the sewers of Newcastle and Gateshead, it is said, are being formed, at great expense, by the Town Improvement Committees. All the properties which have been connected by branch drains with the main sewers and all those which might have been connected will be delineated might have been connected will be delineated on these plans in distinctive colours. Such a guide to house purchasers and tenants ought been' without further loss of time.—At Roseneath, a favourite resort of the citizens of Glasgow, reached by steam on the Clyde, sea-ward, the Duke of Argyle has resolved to fence out lots for villas to form a watering-place, and the plots or areas, of half an acre and upwards only, are being rapidly taken, and a steamer quay is to be shortly erected. —Mr. Raeburn, late architect (at Edinburgh?) to the Woods and Forests, has furnished a design for a pyraand Forests, has furnished a design for a pyramid or obelisk, in commemoration of the battle of Culloden. He proposes to use bronzed castiron, in place of stone, and to form the whole at a cost of 250t. to 300t. The design consists of an obelisk-shaped pyramid, fluted, 60 feet high, with a base of 30 feet square, resting upon four gigantic balls, and affording space for figures and inscriptions in basso relievo. The vacant space heneath the base to be laid with whinstone, "so as to represent the shades of the slain." The foundations have been laid.—Her Majestri is said to have expressed a —Her Majesty is said to have expressed a desire to have a Royal marine resolution. at Killiney, within eight miles of Dublin, on a promontory commanding a view of the bay.

NEW NORTHERN SCHOOLS, ST. MAR-TIN'S-IN-THE-FIELDS, LONDON.

On Tuesday last the Rev. Henry Mackenzie, vicar of St. Martin's-in-the-Fields, laid the first stone of the new Northern Schools for that parish—the Royal parish as it is termed—in Castle-street, Long Acre.

Some time since the committee invited the

Some times since the committee invest interactive architects resident in the parish to send in designs. Fifteen plans were in consequence submitted, and from these the committee selected one by Mr. James Wild, architect. As we shall engrave the elevation for our ensuing number, we shall not go into any particulars

of the design now.

Messrs. Haward and Nixon, old residents in the parish, and deservedly respected there, are

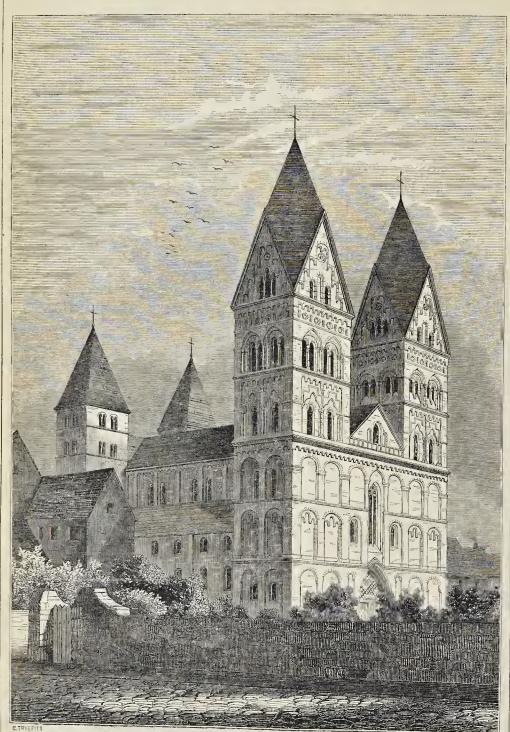

the builders.

The parish authorities and the friends of the undertaking afterwards took luncheon in the vestry-room, the Rev. Vicar pleasantly presiding. In the course of the few speeches which followed, it was stated that the Queen and the Prince had made a joint donation of 100l. towards the schools. The site was presented by the Mercers' Company, for 999 years, at 2l. per annum, and some idea of the value of it was given, when it was stated, that for about one-third of the ground, which was at present held for an unexpired term of 3½ years, the tenant asked 1,250l. for his interest. The schools are to accommodate 800

The schools are to accommodate 800 children, and have the peculiarity of a covered play-ground on the top of them.
The health of the architect was very properly included in the list of toasts.

MONUMENTS FOR MADRAS CATHEDRAL. MONUMENTS FOR MADRAS CATHEDRAL.

—Mr. E. Richardson, sculptor, is engaged on the Dick and Broadfoot testimonials for Madras Cathedral. The artist baving chosen for the former a veteran highlander of Sir Robert Dick's regiment, the 42nd, has just completed his models from picked men at the depot of the regiment at Parkhurst. These contents wised two general subscription works, raised by a general subscription throughout the presidency of Madras, will be executed in marble. CATHEDRAL OF ANDERNACH, ON THE RHINE.

taing 5

THE CATHEDRAL OF ANDERNACH, ON THE RHINE.

As we write "the Rhine," a flood of recol-As we write the fallie, a nood of recon-lections of most pleasant and not uninstructive rambles over the ruin-crested bills which form the hanks of this picturesque and bistoric river, pass through the mind. Seve-ral years bave passed away since we last saw the glories of Cologne, Mayence, and Strasburg; sight-seeing English have sophisti-cated the people on its borders, and disorder and anarchy bave since ruffled the surface of the country through which it flows. Its associations, in our minds, however, are all pleasant and vivid, as those of youthful enjoyment and adventure usually are.

In connection with the subject of Romanesque Architecture, recently treated of in our pages, we give in our present number a north-west view, taken for the purpose, of one of the many interesting specimens of that style of architecture, with which the Rhine abounds —Andernach Cathedral. This exhibits in many respects the influence of Byzantine art, and is the more interesting to the investigator on that account.

Andernach Cathedral bas four towers-one at each corner; and has a semicircular absis, with small galleries and arches, resting against a gable end. The towers are square, and those at the west end have over each face a gablet from the centre of which springs one angle of

the spire.

The tower of the interesting little church at Sompting, in Sussex, which is very early, is the only example of this arrangement in England which occurs to us.

It will be noticed that pointed arches are inter-It will be noticed that pointed arches are intermixed with the semicircular at Andernach, and that some consist of two lateral curves, with a higher central curve, forming pointless trefoil arches.* The porches of the Rhine churches exceed in beauty those of the buildings in Normandy of the same era;—the south porch of Andernach may be mentioned as an instance.

COOKERY BOOK-ERY.+

ARCHITECTS, builders, antiquaries, and artists, like common men, must of necessity dine.
"To that complexion they must come at last:"
there is nothing to be done without eating, and much of our time and much of our substance are consumed in the delicate operation. It is of much consequence, then, that this, which occurs so constantly and regularly, should be provided for as well and cheaply as possible. "A man," says Bacon (an à propos author in matters of the kitchen), "ought warily to begin charges which once begun will continue; but in matters that return not he may be more magnifi-cent;" which, put into other words, means that when you give a state dinner or an enter-tainment to your friends, which occurs but seldom, you need not think much about a little extra expense, but in the every day breakfast extra expense, our in the every day preaktast and the every day dinner, which comes (at least it is to be hoped so) 365 times every year of your life, see that you have the most and the best for your money, and that nothing be wasted.

wasted.

With management and knowledge, a good dinner may be had for less money than a bad one costs without them, without reckoning the evil of grumpy looks and cross words, too often the concomitants of the latter. Now to those who want this knowledge without reference to who want this knowledge, without reference to a high style of cooking, we introduce Mons. Soyer's "Modern Housewife," with a full conviction that she will prove a useful adviser. In a note, the author says, "I forward to you my 'Modern Housewife." She is very fond of employing The Builder to correct the evils which exist in our domestic establishments; perhaps she may interest you." She has interested us; and to the fair daughters and wives of our readers, to whom, if such and wives of our readers, to whom, it such ever dip into our pages, we would softly whisper,—Don't let the keys of the piano-forte make you forget the keys of the store-room, or the enlightenment of your understanding

prevent you from inquiring the price of candles,—we especially commend her.
Soyer is a bit of a dandy, and thinks uncom-

monly well of himself,—puts his portrait in the front of all his books and on the top of all his bottles; but there's a genius in him that leads one to overlook this; and, moreover, he made us his friend when, on being asked a question relative to some endeavours which were making in a large builder's establishment, to obtain at the smallest cost the greatest amount of nutritious food for the workmen, he voluntarily came down and spent several bours in advancing the object.

CHURCH BUILDING NEWS.

A STAINED glass east window, in the Perpendicular style, with shields, &c., has been put up in the cburch of St. Andrew the Great, Cambridge, at a cost of 160l. been put up in the cburch of St. Andrew the Great, Cambridge, at a cost of 160l. Mr. Bolton, now of Cambridge, was the artist. The incumbent, the Rev. Mr. Cooper, intends to decorate the whole of the east end in accordance with the window.—
The sum of 1,000l. has been bequeathed by the late Dr. Dowdeswell, canon of the catbedral of Christ Church College, Oxford, for the restoration of the cathedral, or of some public edifice belonging to the society. public edifice belonging to the society.—
In St. Michael's church, Aston Clinton, near Aylesbury, some curious and interesting paintings have been recently brought to light on the north wall of the nave, which is undergoing extensive restoration. The two principal subjects are a figure of St. Christopher with subjects are a figure of St. Christopher with his staff and the Holy Infant, and a figure of the Virgin between two dragons—one appears to be swallowing up and the other disgorging human souls. There is the following legend at the side, "Anima, ave Maria ira."—The at the side, "Anima, ave Maria ira."—The a late thunder-storm. The lightning seems to have entered the south window of the chancel, injuring the apex of the arch, tearing the mullions of the tracery, and wrenching out a por-tion of the flint-work at the base. Curiously enough, three other windows are injured in precisely the same manner. The tower sus-tained the greatest injury. On the western tained the greatest injury. On the western side, there is a breach four feet square superficially, and ten inches deep; and inside the injured part is eight feet in length and eighteen inches in width. The fint-work is shaken and "looks as if torn out by a pick-axe." The porch was also struck, and the parsonage-house sustained great damage. — A plan for the tower of Holy Rhood Church, Southampton, has been formed,—the cost to be about 300l. only, for which a subscription is to be opened. — The church of Morewinstow, Cornwall, has lately been restored. Lord Clinton and his lady have contributed a decorated eastern window in accordance with the strike of the oddies and the strike of the oddies. style of the edifice, and designed by the Rev. W. Haslam, author of "Perranza-bulce."—The nave of Elford Church, near buloe."—The nave of Elford Church, near Lichfield, has now been entirely rebuilt, the fittings of the old building replaced in carved oak, windows filled with stained glass, and passage paved with encaustic tiles. A corona for the lights has also been provided, the old alabaster monuments restored, and a new font added. Mr. Paget, the incumbent, has been engaged for several years, but more particularly of late, in these restorations.—The new church of St. Jude, Birmingham, to be erected at Tonk-street, will contain 1,447 The new church of St. Jude, Birmingham, to be erected at Tonk-street, will contain 1,447 sittings, 1,000 free. Messrs. Orford and Nash, architects, have furnished the design, which is Early English, with nave, aisles, chancel, south transept, and tower 100 feet high: materials, blue brick with stone dressings. Estimated cost, 4,000...—The Wesleyans of Willenhall have resolved to relieve the overflowing state of the parish churchyard by laying out a piece of ground already provided for a cemetery, one of ground already provided for a cemetery, one of ground already provided for a cemetry, on a declivity near the town.—The new cemetery for the establishment, now in course of formation beside the original cemetery at Sheffield, approaches towards completion. The improvements comprise a new carriage road, 45 feet wide, pass-ing the cemetery, and in connection with which a bridge bas been erected over the river Porter. The church, with its tall spire, is nearly finished. The whole of the works, we understand, have been designed, and carried out by Messrs. Flockton and Son, — Oxenbope

Church, near Keighley, will be ready for consecration early in October. It is a Norman building, having a nave, one side aisle, and chancel.

The tower is the whole width of the building, having a nave, one side aisie, and chancel. The tower is the whole width of the nave. The chancel arch is inlaid with encaustic tiles.—The new church at Rockcliffe, says the Carlisle Journal, was consecrated on Tuesday week. It is a small building of white stone, and in the English style of the four-teenth century, with a nave, chancel, transept, and a tower and spire. The roof is open, and and a tower and spire. The roof is open, and the seats are all free; sittings, 150. The win-dows are all of stained glass, by Messrs. Scott, of Carlisle. The design was furnished by Mr. J. Stewart, of Carlisle, architect. Mr. T. John-son was the mason, and Mr. Black supplied son was the mason, and Mr. Black supplied the woodwork. The cost is expected to be about 1,500*l*., mostly paid by Mr. G. G. Mounsey.——The Earl of Durham, on the attainment of his majority, has given 100*l*. towards a school and master's house at Lumley towards a school and master's house at Lumley (in addition to a former donation), and 100*l*. towards a chapel at Newbottle,—besides 300*l*. to the poor at his collieries.—The roof of Bishopwearmouth Church has been found to be much dilapidated, and a new one is to be put on by public contribution.—The Stella (Roman Catbolic) Chapel, says the Gateshead Observer, has been considerably altered and improved, and was re-opened on Wednesday week. An organ has been built Wednesday week. An organ has been built for it by Mr. J. T. Davis, of Newcastle.— The works for making a portion of a new The works for making a portion of a new street adjoining the new congregational church now in progress, at Berwick, were let on the 3rd inst. The proposed range of houses and shops is upwards of 150 feet in length, to be built of stone, and of an Italian character. Mr. T. Oliver, jun., is the architect.—
The foundation of a great cathedral (Roman Catholie) Church, according to the Tablet, is to be laid at Edinburgh, in November; Mr. Pugin, architect.—A "free church" with a lofty tower, is to be erected in bonour of the late Rev. Dr. Chalmers, at Anstruther, his native Rev. Dr. Chalmers, at Anstruther, his native town.—An episcopal church is to be erected by subscription, and dedicated to St. John, at Anderston, Glasgow, at a cost of 1,100*l*, for chancel and nave for 500 persons, to be, if possible, enlarged at a further cost of 500*l*. for aisle, &c. The first stone is to be laid on 21st inst.—The new Methodist chapel in Donegal-square, Belfast, was totally destroyed by fire on Sunday week. The building cost 5,500*l*., and the organ 400*l*. The premises are insured for 4,000*l*.—The erection of new churches is proceeding in the diocese of Cork with considerable energy. A large church near Bandon was lately consecrated, and in a month seven more are to be consecrated.

SUPPLY OF WATER TO LONDON.

Ir will be remembered that at the end of last year a plan was propounded for bringing water to London from the river Thames at Henley, promising to ensure to every inhabitant of the metropolis an unremitting supply of this all-important desideratum within his own house. The opposition was manifold, and the Bill was lost on the second reading. The promoters of that Bill have, it seems, resolved promoters of that bill have, it seems, resolved on a fresh attempt, modifying their scheme so as to get rid of some of the opponents, and they propose to place the management of the undertaking in the hands of a representative

Commission.

Water is to be brought from Henley by intended), and to be delivered into a reservoir at Hampstead, high enough to supply the loftiest buildings, and extinguish fires without

engines.
We are not at this moment in a position to assert that their plan for supplying London with pure water is the best suggested, but we do say that the importance of the object is such, the necessity for water is so great and paramount, that the proposal ought to receive the most candid and careful consideration. When it is known that at the present moment there are 70,000 houses in London, containing not less than 560,000 inhabitants, which have no water supplied to them from any one of the eight great water-companies which exist, further argument must be unnecessary. All London ought to cry as loudly as if next door were on fire,—Water! water!!!

^{*} Hope, when mentioning the occurrence of arches thus formed, in the Lombard or Romanesque churches of German, manny, mentions that in "Pope Gregory's Gospels," of Gopels, "Opid by a monk of Salisbury as early as the 10th century, those in the pointless trefoil arches are seen, alternating with those in the form of a pediment.

§ "The Modern Housewife, or Ménagère." By Alexis § "The Modern Housewife, or Ménagère," Lyndon. 18199. Simpliti and Marchall.

SHEFFIELD SCHOOL OF DESIGN.

THE annual meeting took place on Wednesday in last week, the Earl of Arundel and Surrey in the chair. The council's report was first read, in which the increase of Government grant from 250l. to 600l. per annum was annumed, and the number of pupils from 1843 to 1849 stated to have been 509, most of them now engaged in the staple trades of Sheffield. The head master, Mr. Young Mitchell, read a report, chiefly on the exhibition at Paris.

The chairman then addressed the meeting. His lordship disclaimed all intention or ahility to treat of art-questions, but felt assured that such schools as this are absolutely essential to the future prosperity of England as a com-mercial country. When we find other na-tions combating us with our own weapons, and almost equalling us in these, while ex-celling us in others, it is absolutely necessary for us to seize on every means of keeping ahead of them as heretofore; for if we fail in anead or them as neretotore; for it we tail in that, as a great. European power we are gone. And no better way of assisting to do so probably exists than supporting and maturing such schools as this. If that be not zeabously done, we may rely on it that other nations will over-stole our read est with a still beautiful. stock our markets with articles more pleasing at least to the eye, and cheaper, although per-haps hardly so good, and thus we shall be shut out of the great markets of the world. His lordship then complained that less than 150%. a-year should as yet have been subscribed by

Mr. Northcote, of the Board of Trade, said that it was the zeal of the teachers and the pupils that had actuated Mr. Poynter and himself in recommending the Government grant. On these accounts he had himself, in grant. On these accorded the palm to the Sheffield amongst all the provincial schools. This year, however, an increase to other schools had also been recommended. But the Government looked to the active co-operation of the residents, as, without local energy, they would dents, as, without local energy, they would continue to give no such aid. Referring to the idea that the French are superior to ourselves idea that the prenent are superior of eart, he re-garded such an idea as a mere fallacy. It was education alone that was requisite. And was education alone that was requisite. And then we must create a demand, we must educate the people, so as to enable them to appreciate the beautiful and excellent in art, and the artist will soon come forward then to produce what is admirable and good. To accomplish all this we must surround the people with objects of beauty in their houses, and familiarize them with it even in their most ordinary household objects and utensils. When a taste for ornamental art in the commonest articles of utility is thus produced amongst the mass, you will proportionately elevate the taste and skill and energy of those who devote themselves to the fine arts. When they are appreciated and admired they will surpass their former selves, and rise rapidly the multitude pushing up the leaders, and the leaders drawing up the multitude after them. Various other gentlemen addressed the meet-ing; the usual resolutions were passed, and the prizes were then distributed.

EXHIBITION OF ARTS AND MANUFAC-TURES OF ALL NATIONS.

THE arrangements for the monster exposi-The arrangements for the monster exposi-tion in Loudon of arts and manufactures of all nations, projected by Prince Albert, appear to be going on vigorously. A deputation from the prince, consisting of Mr. Cole and Mr. Fuller, have been to Scotland and to Ireland, in order to meet the leading manufacturers of the country on the subject. It is proposed to be held in the year 1851, and that premiums to the extent of 20,000/. should he iven for inventions or improvements. It is hought that the Queen will present the given for inventions or improvements. It is thought that the Queen will present the prizes. An erection in Hyde-park is talked of, a mile and a-half long, for which designs will be required in competition,—unless, indeed, the Woods and Forests take the vector in land. matter in hand.

Local committees are to be organized as soon as the result of the interviews with manufacturers has been reported to the prince. The matter will require careful management.

SIR ROBERT PEEL'S PORTRAIT GALLERY, DRAYTON MANOR.*

It is about twenty years since Sir Robert Peel took down the old house at Drayton Manor occupied by his father, and built the present mansion, from the designs of Sir Robert Smirke, on a site closely adjoining the previous building. It is a quadrangular stone mansion, in the Elizabethan style, of very considerable extent, but without any ostentatious display of architecture, either internally or externally.

The taste and fondness for the fine arts which form so marked and agreeable a feature in Sir Robert's character, exhibit themselves plainly at this residence. A large corridor or gallery, in the centre of the building, has its walls entirely covered with fine works of art, as well as almost every available space on the staircase and elsewhere; and to his high credit

Staticase and coewhele, and to ins a days the it said, that almost every picture at Drayton Manor is by some artist of the present day.

Sir Robert's collection of pictures having far outgrown the means at his disposal for suitably hanging them, a gallery was erected in 1846, from the designs and under the able direction of Mr. Sydney Smirke, A.R.A. It forms a wing appended to the north-west angle of the mansion, and extends westward about 100 feet. It is built of a fine-grained magne-sian limestone, and is designed in the style of English Renaissance, so as to harmonize the rest of the building. The exterior is with the rest of the building. The exterior is embellished with colossal statues of Rubens, Vandyke, Sir Joshua Reynolds, and Sir Thomas Lawrence. The gallery within is 90 feet long by 22 feet wide, and 21 feet high, being subdivided into three compartments by columns and pilasters of Italian and German marbles. The parqué flooring, and all the wood fittings, are of wainscot and walnut-tree.
The walls are painted of a strong neutral

green colour. The ceiling is coved, and elaborately ornamented with corbels and pendants,

The pictures are lighted by skylights in the

flat central part of the ceiling.

It does not come within the scope of these pages to enter into any description of the pictures which enrich the walls of this unique gallery; suffice it to say that they almost en-tirely consist of portraits of Sir Robert's con-temporaries, eminent either as statesmen or as men of science or literature, and comprise some of the *chefs-d'œuvre* of Reynolds and Lawrence. When we take into consideration the high merit of these pictures as works of art, the distinguished eminence of the persons they represent, and the brilliant character of the individual who has taken delight in paying this homage to contemporary genius, we can-not but regard the Gallery at Drayton Manor with the deepest interest.

METROPOLITAN COMMISSION OF SEWERS.

A GENERAL court was held on Thursday, at the A GENERAL COURT WAS BERG ON INUISORY, AS USE COURT-house, Greek-street: Sir John Burgoyne in the chair. A long discussion ensued on the ques-tion that Mr. Lavers he appointed clerk of sur-veyors' and contractors' accounts, at a salary of 3001, per annum, in pursuance of the recommenda-tions of the Finance Committee, which was finally

300t. per annum, in pursuance of the recommenda-tions of the Finance Committee, which was finally referred hack for the committee to define the duties. A deputation of the Bermondsey Improvement Commissioners attended the Court, with Mr. Drew, Commissioners attended the Court, with Mr. Drew the vestry clork, complaining generally of the sower the vestry cicrs, complaining generally of the sewert age of the district, and in particular of the system of discharging the contents of the cesspools into the public sewers, without any means accompanying the operation of passing the same to the Thames, and also of the large number of untrapped gullics.

In answer to questions to Mr. Pbillips, the chief surveyor, he said there was undoubtedly a much larger amount of fith in the sewers, caused by the increased number of drains laid to them and from increased number of drains laid in the said them.

increased number of drains laid into them, and from the pumping of the cesspools into the sewers. The members of the deputation added, that in the neighbourhood of their residences, and particularly in Bermondsey-street, during the process of flusbing, the stench was almost unhearable, continuing for days together, and that such offensive odours were never observed until the adoption of that sys-

tem hy the present commission.
Dr. Southwood Smith an Dr. Southwood Smith and Mr. Chadwick contended that the cvils arose from the un-

scientific manner in which the operations were conducted, and not from the system of flushing itself. They had endeavoured to obtain the supervision of proper officers, but that proposition was opposed, and it was now too bad for those gentlemen who had opposed it to hlame them for the clumsy manner in which these works had been performed.

which these works had been performed.

The secretary, in answer to a question from Mr.
Leslie, said the opinions of the medical officers of
the various parishes, on the subject of flushing, had
heen received, amounting to 79, and were thus
divided:—Approving flushing, 13; dissentients,
32; neuter, 34. It appeared, also, that from Bermondsey they were,—Approving, 1; dissentients,
1; neuter, 1. 1: neuter. 1.

Leslie insisted that the time had arrived the system of flushing should he suspended, AIT. Lestic insisted that the time had arrived when the system of flushing should be suspended, and an early day appointed to take the whole subject into consideration. He was also of opinion that they had had enough of experiments,—which view was concurred in hy the Hon. F. Byng

Several other commissioners expressed views pro. and con. on the system of flushing, and the deputation were finally assured by the chairman that the court would take the subject into their serious consideration.

Other deputations were heard. One from Islington pointed out the very defective state of the ton pointed out the very defective state of the sewerage of their district, and said, if that district sewerage of their district, and said, it that district were compelled to wait for the adoption of some general system of drainage, that in the interim disease would sweep away one-half of the inhabit-ants, and referred to the last report of the Registrar-General in justification of this assertion. Allusion was also made to the discharge of the refuse drainage of the new Small-pox Hospital into the open ditches, which it was possible might he attended with the most fatal consequences.

Mr. Lambert Jones, at considerable length, cen-

Mr. Lambert Jones, at considerable length, censured the waste of public money on districts where no rates had ever heen collected, and said that this no rates had ever been collected, and said that this district, at the termination of the old commission, possessed funds to the amount of 20,000L, which money had heen spent on the Kent and Surrey division, and those parties who paid the money were left without any relief whatever.

It was proposed that the subject should he referred to the Works Committee, as a report on the drainage of the whole district would he presented by the surveyors ou Monday next, and at the next court the question might he again brought forward. Upon this Mr. Leslie advised the deputation again to attend and see what was done.

Mr. Barfield rose to order, and Mr. Chadwick

again to attend and see what was done.

Mr. Banfeld rose to order, and Mr. Chadwick protested against the intrusion of other hodies into their proceedings.—This was replied to with some warmth hy Mr. Leslie, who said that, as a public hody, they were but trustees for the public, and that they were ahout spending the money of the deputation, who were perfectly justified in seeing that it was not spent improperly.

The matter was at length referred to the surveyors.

The Drainage of Westminster.—The secretary announced to the court that the Westminster Imannounced to the court that the Westminster An-provement Commissioners had paid into the court the sum of 3,792l., in pursuance of the resolutions passed for the improved drainage of that district. Upon the above announcement being made, Mr. Chadwick moved that a report presented by Mr.

Chadwick moved that a report presented by Mr. Austin, consulting engineer, he read.

Mr. Woolrych then read the report referred to. It stated that he appeared in opposition to a work, which, hy means of erroneous and unwarrantable statements, had obtained the sanction of the court. statements, had ordanist the sanction of the court. The first objection was, that the sanction given to this work prejudged the question of general drainage, and was an injustice to the competition to which the public had been invited. That it is an unnecessary work, founded on erroneous principles, and would soon be as great a nuisance to the neighbourhood as the existing faulty constructions, neighnournoon as the existing rathy constructions, and that the amount expended upon it will be an utter waste of the rates and funds of the Westminster Improvement Commission, and further, that an efficient and economical subsoil drainage, affordan efficient and economical subsoil drainage, affording the required relief, may he put in, as well as a
temporary provision for surface drainage in far less
time, and without the necessity of any such construction as that recommended. It characterized
the proposed work as an utterly useless construction,
alike unnecessary either for surface or for subsoil
drainage, and said a proper subsoil drainage might be
laid down at an expense of 1,000%. The report concluded hy "stating, that as the court, hy erroneous statements, had heen led into the adoption of a work statements, nad neen teal mot one adoption of a work which prejudges the question of the general drainage, confirming one principle, and condemning another,—a work useless in itself, and leading to a large waste of the rates, and of the funds of the Westminster Improvement Commission, I would heg respectfully to urge that their resolution of the 6th instant with reference to this subject he rescinded."

Mr. Chadwick, in a speech of great length, moved that the resolution of the last court he rescinded.— Mr. Leslie reiterated the statements he made on the subject at the last court, when he wished the subject

^{*} From the third part of Godwin's "Buildings and Monuments." A view of the gallery will be found in The Builder, vol. III. p. 222.

to he postponed for a week, to give time for consideration. They were now brought into a "mess" from having ordered the work to he done, issued their advertisements, and received the money of the Westminster Improvement Commissioners. He also contended that the resolution passed could not be rescinded without notice of motion.

There appeared to be very conflicting opinions as to the legal hearings of the case, Sir Edward Pearson, on the part of the Westminster Commissioners, stating that they looked upon the plan as a "contract," and so anxions were then the stating that they looked upon the plan as a "contract," and so anxious were they to commence their works, that they would even sacrifice 3,000\(ldot\). rather than the question should be again re-opened. The subject was brought to a close by the adoption of the following resolutions, proposed by Mr. Chadwick:—"That as the work proposed is extraordinary husiness, and as such required notice, the order for it is invalid.

"That the reports of Messrs. Phillips and Gotto and Mr. Austin, he printed, and referred to the Works Committee."

Miscellanea.

SYRO - EGYPTIAN SOCIETY AND THE PANORAMA OF THE NILE.—On Thursday evening, in last week, the exhibition of the Panorama of the Nile was closed to the public Panorama of the Nile was closed to the public to enable the Syro-Egyptian Society and their friends to hold a meeting "in the presence." Dr. Lee was in the chair, Mr. Bonomi described the panorama, and Mr. Sharp, Mr. Gliddon, the American Egyptologist, whose tone savours a leetle too much of Sir Oracle, the Chairman, and others, differed very pleasantly, and gave the unlearned part of the audience a notion of the want of positive knowledge under some heads, which still exists. The last discussion was on the Pyramids, which all who spoke on the subject agreed were royal tombs, and the nucleus of circumjacent cemeteries. The pyramid of Ghizeh was once encased with stone, 20 feet thick, as some of cemeteries. The pyramid of Ghizeh was once one encased with stone, 20 feet thick, as some of the pyramids of Sakkara are at present. The work of destruction as regards this surface commenced in the twelfth or thirteenth century, and continued almost down to our own At present, and for several years past, it has presented a front of rugged mason work, easy to ascend, hut unseemly to look at. easy to ascend, but unseemly to look at. Finally, the Sphinx was pronounced to he a portrait statue, as far as the head is concerned, of Amenoph II., supposed to he identical with Cheops, who is stated by the Greek historial Herodotus to be the huilder of the great pyramid of Ghizeh. At the close, men qualified to judge hore testimour to the accuracy to judge bore testimony to the accuracy and beauty of the panorama. It is still with us a matter of regret that it was not painted to be

lighted from the front.

THE VALUE OF AN ARCHITECT AND SURVEYOR IN HASTINGS. — The Commisstoners of Hastings have addressed an adver-tisement "to architects and surveyors," intimating that they are about to elect such a person to do the business of the town. His duty will be, they say, "to prepare plans, specifications, and estimates of all public works directed by the commissioners within the limits of their Act, and to superintend their execution, as well as to inspect the execution of all private works permitted by the commissioners; to superintend the draining, paving, scavengering, repairing, and watering of the streets and public places; to pay the labourers' wages, examine the tradesmen's account learner. counts, keep all accounts connected with the office, and to attend at all general and comornee, and to attend at all general and committee meetings of the commissioners, and generally do all the duties of the office of surveyor." He must have a practical knowledge of levelling, and of the several branches of huilding and other works connected with the office of surveyor; and he prepared to undergo an examination as to the extent of his knowledge. For all which he is when as thuergo an examination as to the extent of ins knowledge. For all which he is, when ap-pointed, to receive the enormous salary of 751. per annum. The Hastings Commis-sioners seem to have a liberal idea of the value of knowledge. A journeyman bricklayer, earning 30s. a-week, would lose by being pro-

moted to the appointment. TERRA COTTA. — The proprietors of the Cliffe Terra Cotta Works, Wakefield, York-shire, have determined on executing any of

the chimney tops, ornaments, tracery, &c., given in the publications of the Architectural Publication Society, on receiving an order for not less than twenty-five of a sort.

PROJECTED WORKS .- Advertisements have been issued for tenders, by 26th September, for the erection of schools, dormitories, workshops, and other buildings for 600 children at Penge; by 26th, for building a boys' school-house at St. Pancras workhouse; by 26th, for the erec-tion of new workhouse at Kirhymoorside, Yorkshire (several tenders); by 23rd, for draining at Kennington-cross; by 22rd, for crection of national school at Spofforth; by 25th, for erection of farm-house and offices at 25th, for erection of farm-house and offices at Burnham, Essex; by 18th, for supply and fixing of iron roofs over various stations on Lancashire and Yorkshire Railway; by 19th, for essential oil lamps, three-jet gas-burners and supply of gas, &c., at All Saints, Poplar; and by 15th, for building 5,200 feet of brick sewer and other works at Parliament-street, &c., Westminster.

Westminster.

ExameLs for Iron.—Mr. Charles Stumer, of New York, has recently secured a patent, which he describes to consist "in providing an enamel for iron and other metals, which will retain its adhesion to the metal, and particularly is not capable of being crumbled or broken off by blows or by heat, this possessing the quality of comparatively commingling with the surface of the metal. Thus it is far superior to any known enamelling for mingling with the surface of the metal. Thus it is far superior to any known enamelling for metals, and may be modified so as to render it in all the shades of colours, in full variety. 1—16 ounces of gravel sand, 10 ounces of silver gilass (silver gilt or silver gilding), 2 ounces of white clay, $\frac{3}{7}$ of an ounce of saltpetre. 2.—7 ounces of glass (common white glass), 4 ounces of gravel sand, 8 ounces of zean reanocks (or oxide of tin), 6 ounces of borax, $1\frac{1}{2}$ ounce of soda, 3 ounces of saltpetre, $1\frac{1}{2}$ ounce of white clay, 1 ounce of magnesia, $\frac{1}{4}$ of an ounce of white chalk, $\frac{1}{4}$ of an ounce of voyster shells; this should be pulverized like first composition, and then mixed with the oyster sneals; this should be pulverized like first composition, and then mixed with the gum water. Claim—What I claim as new, and desire to secure by letters patent, is the peculiar composition, composed of the parts and compounded as described. —Franklin Journal.

EDUCATION AT PUTNEY COLLEGE.-The Rev. Morgan Cowie, the principal here, has published a letter to the Duke of Buccleuch, pointing out the requirements of the day in pointing out the requirements of the day in education, and that they endeavour to meet these requirements at Putney. "A useful, intelligent, improving race," says Mr. Cowie, well imhued with sound principles of science, would be the real strength of the country; and this must be secured by beginning at the commencement, by educating our youth before they are called upon to act, by furnishing them with sound views of science, and with an accurate knowledge of the great prowith an accurate knowledge of the great progress that has heen made in all the arts, and of the means of that progress." Increased funds are evidently required; the college has not had fair play yet, and we think so well of its capabilities that we shall be glad to see the public taking it up in earnest. We suggest the new the progress of the progress of the progress of the progress of the public taking it up in earnest. taking it up in earnest. We suggest to our readers who are fathers, to look into the constitution of the establishment for themselves, see if they cannot make it useful.

Porchester Castle.—This time-honoured relic of antiquity, midway between Fareham and Portsea, Hants, is now to become another Cremorne or Rosherville. The railway will lend its aid to carry holidaymakers to the spot, and "enterprising proprietors" expect to render it the most attractive place of resort on the southern coast of England,

CLERKENWELL GRAVEYARDS. person who may think proper to walk through Clerkenwell-close or Clerkenwell-green will he Clerkenwell-close or Clerkenwell-green will be convinced of the truth of my remark, viz.—
that the churchyards are several feet above the public ways. There are two points to which your attention is directed; 1st, instead of four graveyards in Clerkenwell, as mentioned by the surveyor of the district, there are seven; and, 2ndly, when that gentleman asks, "what depth do I assume to be the average of burials?" he loses eight of the parlours, kitchens, cellars, pantries, &c., being entirely below the graveyards. I had to underpin a wall adjoining one of these horrors only a few weeks ago, on which of these horrors only a few weeks ago, on which occasion skulls and bones fell into the cellar, and ends of coffins were presented to view like squares of black masonry, and close to the wall. The only cure is to cease hurying in all towns The only cure is to coast and crowded neighbourhoods.

W. P. Griffith.

REORGANIZING SEWERS' COMMISSION. The task undertaken by the present commis-The task undertaken by the present commissioners was a gigantic one, and they would probably have failed, even had they brought extraordinary knowledge and ability to hear upon it. It is a subject that has long occupied my attention, and I feel sure that one general commission cannot fulfil properly the duties devolving upon several local commissioners. It appears to me unreasonable and unconstituappears to me unreasonable and unconstituappears to me unreasonance and unconstruc-tional that those whose lives and properties are chiefly affected, and who find the funds for all that is done, should be excluded from all management of themselves and their properties. I would suggest that all or some portion of the commissioners should be elected. I think it would answer well to have half appointed by the crown, and half elected. There should be twelve or twenty commissioners to each district, according to the size. Each district commission should elect one of its body, to be one of a general committee, who should have power to determine all questions affecting the general interest, and decide upon plans for general drainage, &c.—Charles Tooke.

New Mode of Ventilation.—The Lite-

rary Gazette states that Dr. Chowne has en-rolled a patent for improvements in ventilating rooms and apartments, hased upon an action in the syphon which has not previously at-tracted the notice of any experimenter, viz., that if fixed with legs of unequal length, the air rushes into the shorter leg, and circulates up, and discharges itself from the longer leg, "It is easy to see how readily this can he applied to any chamber, in order to purify its atmosphere. Let the orifice of the shorter leg he disposed where it can receive the current, and lead it into the chimney (in mines, into the shaft), so as to convert that chimney or the shaft), so as to convert that chimney or shaft into the longer leg, and you have at once the circulation complete. The curiosity of this discovery is that air in a syphon reverses the action of water, or other liquid, which enters and descends or moves down in the longer leg, and rises up in the shorter leg!" We ought to remark that fires or heating apparatus are not at all necessary; and that, as the specification expresses it, "this action is not prevented by making the shorter leg hot whilst the longer leg remains cold, and no artificial heat is necessary to the longer leg of the air-

heat is necessary to the longer leg of the air-syphon to cause this action to take place."

ARCHITECTURAL COPYRIGHTS.—Sir: I have hy me a view of a congregational chapel, proposed to be erected at Cockermouth, bearproposed to he erected at Cockermouth, bearing the name of C. Eaglesfield as the architect. I have been credibly informed that the originals drawings of Myrtle-street Baptist Chapel, Liverpool, have been put into the possession of this self-styled architect, copies sent to Day and Son, from which they have made a perspective view, and the design is not only passed off as the work of a local builder, assuming a professional title, but the original designer is robbed of his fairly earned honour and remuneration. Let him look to the Myrtle-street Chapel descons, who quelt to he instruct of the property of the control of the street of the designer is robbed of the fairly earned honour and remuneration. street Chapel deacons, who ought to be instreet Chapel deacons, who ought to be informed that (perhaps unintentionally) they have unfairly made a double use of that for which they only paid a single price, and are the principals in perpetuating a serious form of immorality, by depriving the designer (to whom a design must always belong), of his recognized honour and remuneration, and at the same time sanctioning the present system of quackery so prevalent in every profession. I quackery so prevalent in every profession. Another Mode of Raising the Britannia Tubes.—A correspondent of the

TANNIA TUBES.—A correspondent of the Times (Mr. J. Faulding) suggests that the tube might be raised without waiting for the casting and testing, and, after all, the still remaining risk, of a new hydraulic machine, in place of the one that lately hurst. The power of the tide-rise of 15 feet, with pontoons and proper scaffolding, heightened, at low tide, 15 feet for every lift, constitutes the main elements of the suggestion; and of course during each lift the process of wedging, building in under the tube, &c., would be gone on with as heretofore. exc., would be gone on with as nerectore. The writer further proposes that, to save further expense, both the parallel tubes might be thus raised simultaneously. Tidal power, he observes, might also have been used to work thus raised simultaneously. 11021 power, he observes, might also have heen used to work the presses in place of steam, even had the great expense of forming and elevating such huge hydraulic presses, chains, frames, &c., been unavoidable.

CONSECRATION OF ST. THOMAS'S CHUNCH, COVENTRY.—The first stone of this edifice was laid by the Rev. T. Sheepshanks, rector of St. John Baptist's parish, on the 2nd of March, 1848. There are kneelings for 576 persons, of which 456 are free and unappropriated. The which 456 are free and unappropriated. The total cost bas been 3,350. It was consecrated a few days ago. It was designed by Messrs. Sharpe and Paley, and built by Mr. Taylor, of Coventry. It is in the Early Decorated style, and consists of nave, north and south aisles, north porch, chancel, and vestry. The exterior of the church is incomplete, from the absence of a tower and spire, an addition which is intended to be given to it as soon as funds can be raised for the purpose. Its outline, however, is broken at the west end by a bell-turret, which goes far to supply the deficiency. The clerestory windows of the nave are spherical triangles filled with tracery. The church is built of red sandstone, from a quarry of Lord Leigh's, on the Kenilworth road. The aisles are separated from the nave by piers and assies are separated from the have oppers and the pointed arches. The roofs are open, and the seats are all low and open. The corbels sup-porting the wall-pieces of the nave roof are angels bearing shields, on which are depicted in colour the apostolic emblems. Above the western door is a sculptured group of three angels, of whom the centre one bears a legend inscribed in illuminated letters—" Go, and sin no more," The pulpit, on the south side of the chancel arch, is approached from the vestry, and is a simple platform of stone, with a brass railing. The reading-pew faces south and

MR. SHEEPSHANKS' COLLECTION OF PICTURES.—One would suppose, if anything could call the Government to a sense of the duty they owe to the late Mr. Vernon for his munificent gift to the nation,—it is the on dit that "Mr. Sheepshanks has expressed his intention of presenting to the University of Oxford his valuable collection of pictures, by artists of the British school, from an impression that his gift will meet with greater care and attention from the University than if consigned, like Mr. Vernon's, to the cellars of the National Gallery." It is to be hoped, if the above be the fact, that Oxford will set a good example, by erecting an appropriate gallery for the reception of such a collection. That they need a gallery of pictures is very evident, for nothing can be more wretched than those exhibited at the Randolph and Taylor Building. S.

Sinks, Drains, and Cesspools should be deodorized as far as possible with chloride of lime, which, it is recommended, should be used simultaneously throughout a district, say between 9 and 10 A.M. on Saturdays, especially during the prevalence of cholera. Two ounces are sufficient to stir into a paifful of water, and ought to cost no more than 1d.

water, and ought to cost no more than Id.

THE SCULPTURE ON BUCKINGHAM PALACE.—Sir: In the centre of the new façade of her Majesty's Palace at Pimlieo there must be, I presume, a gateway. Over this, then, and at the summit of the building, is an arch, flanked on one side by the figure of Britannia, reposing gracefully on a lion couchant; on the other by our patron saint, who has, unfortunately, failed in his attempt to transfix the dragon, which, in return, is about to make a vigorous snap at him. The piers of the arch are faced by two female figures,—one, prohably a beggar-woman cuddling a baby. So far is tolerably clear; but what is the central superincumbent mass intended to represent? I can trace at its base some leaves, at the top a wreath hung upon a peg, and on the face the initials of our gracious Sovereign, and the date; but can guess no further. Pray, Mr. Editor, be kind enough to enlighten the ignorance of—Mg.

** There is little further explanation to be given. "Story? I have none, Sir." The composition is certainly an odd one. It consists of a shield, in shape very much like a pair of fashionable stays, with the addition of a peak at the top, resting on two coarsely-executed palm branches, and bedizened with flowers. The face of it displays the initials V. R., and the whole is surmounted by a large wreath, stuck most ungracefully on the aforesaid peak. This wreath projects so far forward that to the spectator who is ignorant as to how it may be held up behind, it seems about to fall. It is to be boped that it will.

Extras on Specification Work.—A case was lately tried before Mr. Baron Rolfe and a common jury, in which a builder, being indebted a sum of 1161. to a party who proposed to take repayment in repairs to his house, entered into a written specification with the party to do the work for 1752, but on the ground of extra work demanded in all 230 Only 701. beyond the debt of 1161. having been paid, however, the builder brought his action for the balance, but was nonsuited on exhibiting a specification sworn by his own witness not to be the one entered into and signed. Thereupon the successful party raised an action for repayment of the sum paid beyond the original amount specified, with costs, and a verdict was granted accordingly; so that, in place of his extras, the builder will have to refund the overplus, and pay all costs, of themselves not less than 4001.

THE ROMAN TESSELATED PAVEMENT AT CIRENCESTER .- We learn from the Gloucestershire Chronicle that workmen, under the instruction of a member of the Archæological Institute, have been all the week busily em-ployed in removing this interesting relic into a place of safety. The pavement is now placed on the lawn in front of Earl Bathurst's mansion, where it is protected by a marquee, until an appropriate place can be fixed upon for its final destination. On its removal it was found to be supported by a hard concrete resting on pillars, also of concrete, surmounted by layers either of brick or tile, which rested on a floor about a foot and a half beneath. At the western corner were found the remains of what appeared to have been a stove, which supplied fund an to the apartment above by means of funnel-shaped pipes made of clay, parts of which still remained. There was also a low wall, the same height as the pillar, acting as an additional support to the floor, running along each side of the room, which, on being removed the same transfer of the same hot air to the apartment above by means of removed, showed marks of painting, in various devices, on the plastered sides of the apart-As these devices were continued to the lower floor, which was of very common materials, it is imagined that the original building having fallen to decay, another had been erected upon the site, of superior character, at a higher elevation.

THE CARVATIDES OF ST. PANCRAS CHURCH, LONDON.—Two countrymen, observing the female figures with pitchers in their hands, which support the porticoes of St. Pancras Church, wondered what they represented, "They must be the foolisk virgins," said one. "They can't be, neither," replied the other, "there's only four of 'em." "Oh, it's all right," replied the friend; "the other is gone for the ail" you may desired on."

"They can't be, fletiner, repried the carry, "there's only four of 'em," "Oh, it's all right," replied the friend; "the other is gone for the oil," you may depend on't.
GREAT YARMOUTH CHURCH.—By restoration of Yarmouth Church, already accomplished, additional accommodation has been provided for 1,100 persons, the whole area of the church seating 2,900 persons. Previous to the alteration, the poor were virtually excluded. Ever since the opening there has been attentive congregation, evidently or the increased accommodation. a full and thankful for the increased But even now, urgent applications for as many 300 sittings have been received by the churchwardens, from persons who request to be seated in their parish church, and efforts are therefore being made to raise money for completing the restoration. The cost at which the new arrangements have been accomplished is 4,467; the committee with difficulty have raised 4,1961, by which a debt of 2501 now remains to be discharged; and to complete the restoration, 2,0001 more is required: in Schools are also much needed. all 2,250%. is proposed to erect two, to contain 500 children each. An excellent site for one has been given by the corporation at the south end of given by the corporation at the south end of the town; and the Dean and Chapter of Norwich have offered the ancient priory, part of which is now a stable, adjacent to the parisb church, which it is now proposed to restore for the other school at the north end of the town. The cost of these two schools will not be less than 2,500l., towards which 1,000l. may be expected from public sources, leaving 1,500l. to raise. Mr. C. J. Palmer, of Yarmouth, is acting as honorary secretary.

• This sum does not include the cost of a memorial window, which has been placed at the west end of the north aisle in memory of the late Sarah Martin, so well known for her successful exertions in promoting the spiritual improvement of prisoners in Yarmouth Gaol.

RATING PUBLIC BUILDINGS IN IRELAND UNDER THE POOR-LAW.—The Cork Constitution has the following announcement:—"The different public buildings in the Cork Union, such as the Custom-house, military and police barracks, &c., which have been heretofore exempt from poor-rate, are now being included in the rate about to be struck, and half poor-rate will be charged the lessee on the amount of the rent. The amount of property thus made liable by a late Act of Parliament will exceed a total of 4,0001,—a sum which will assist considerably in lightening the pressure of taxation on the ratepayers of the union."

[SEPT. 15, 1849.

New Rotary Engine.—A working mechanic of the name of Scotthorn bas invented some alleged improvements in rotary engines. His machine mainly consists, according to Aris's Gazette, of a metallic case containing a cylindrical chamber, with a segment at each side, as if cut off, to open into lesser cylindrical abutment chamhers, all on one axial plane. On the main shaft is set centrically a hollow cylinder or drum in the main chamber, which heing of larger diameter, has a vacancy between the cylinder and the case called the steam compartment. From the drum projects a sort of piston, with steamtight joint. The working, however, cannot well be described within our limits, more especially without diagrams. The efficient working force is said to be quadruple that of crank engines.

THE CAMBRIAN ANCHÆOLOGICAL ASSO-CIATION met at Cardiff last week: the attendance of members was not so numerous as had been hoped. The Marquis of Northampton, Professor Petrie, of Dublin, and several other Irish antiquaries, were present. Amongst the chief papers read was one, by the Dean of Llandaff, on Llandaff Cathedral, which structure was visited. Excursions were also made to Caerphilly Castle, Caerleon, &c. A collection of local antiquities forming a nucleus for a museum, excited much interest. Mr. Wardy's Portrait Engravings.—

Mr. WARD's PORTRAIT ENGRAVINGS.—Mr. George Raphael Ward has lately produced a very effective and truthful engraving in mezzotinto, after Mr. F. Grant's painting of the Rajab of Sarawak, Sir James Brooke. A short time previously the same engraver produced an excellent likeness of Mr. Henry Dover, of Norfolk, the chairman of the sessions. Both these engravings are carefully and ably executed, and must tend to advance Mr. Ward in public opinion as a mezzotint engraver.

FOLKESTONE.—A Tontine Building Company has been provisionally registered, for the erection of eighty houses in Folkestone. In consequence of the increasing communication between this country and the continent, the town of Folkestone is rapidly advancing in size and importance, and will soon become a considerable scaport, and from its acknowledged salubrity, a fashionable resort for visitors. There is said to he a great demand for houses, with shops of the better class; and it is the object of this Company to meet the wants of the inhabitants and visitors, by building a street of shops of a superior description.

In the New Assessment of Bethnal-

IN THE New ASSESSMENT OF BETHAL-GREEN the Eastern Counties Railway Company's assessment has been increased from 4,300l. to between 7,000l. and 8,000l.; the East London Waterworks Company's from Gool. to 1,700l., while the Regent's Canal Company's has been reduced, their private act not permitting rates for tolls or improvements, Numerous appeals have been made against the increased rates.

CHUNCH DECORATION. — The nave of Wigmore Church, Hereford, displays two instances of taste worth mentioning. The oak pews are whitewashed, and to the north wall is affixed the strangest mural monument we ever saw. It is no less than the ornamental (I) plate of a coffin-lid, inscribed to the memory of a certain "Martha Millichap."

MODEL OF SUSPENSION-BRIDGE OVER

MODEL OF SUSPENSION-BRIDGE OVER THE DNEIPER.—We ought to have said that this bridge was designed, and is in the course of erection by Mr. C. Vignoles, C.E.

SUSPENDING SASHES, &c.—A patent for improved apparatus is advertised in our columns to be sold by auction on the 19th inst. If it can effect all that the patentees assert, it is worth attention.

WORKS ON GREAT NORTHERN RAILWAY SOUTH OF DONCASTER.—At the intersection, near Doncaster, of the Sbeffield and Rotherham road, there is a large hrick tunnel bridge—length of arch 200 feet, width 197 feet—built by Mr. Morton, contractor, under Messrs. Peto by Mr. Morton, contractor, inner Messrs. reto and Betts. After crossing the Carr drainage, the contract of Mr. Morrel commences, and extends to 3 miles of Bawtry. The Rossing-ton bridge is built on the skew, at an angle of 38 degrees—span 26 feet, width 25 feet. Fur-ther care too Grang as the contract of the contraction. 38 degrees—span 26 feet, width 25 feet. Further on are two flying arches springing from layers of brickwork, on the banks of a cutting 16 feet deep. The contract of Mr. Morton, 16 feet deep. The contract of Mr. Morton, under Messrs. Peto and Betts, succeeds the one just named. The great north road is crossed by a skew bridge, angle 33 degrees, and built on square abutments: span of arch 52 feet 8 inches, width of bridge 35 feet 3 inches, height 24 feet. It contains between 400,000 and 500,000 bricks. The stations and lodges were designed by Mr. H. Goddard, of Lincoln, architect. Near the junction with the Manchester, Sheffield, and Lincoln line, the Chesterfield Canal is crossed by a bridge constructed of tubular girders, like one over the structed of tubular girders, like one over the Don at Doncaster. The width of this bridge between the buttresses is 25 feet, and it crosses at an angle of 32 degrees.

CHURCHYARD MONUMENTS.—It must have pained many of your readers, more especially those who have been visitants to our ceme-teries, to have witnessed that many monuments, these with the bear restants to the control of the to boast of so many beautiful specimens of art, which the scythe of Time has spared to us .-- H.

INCREASE OF HOUSES, &c., IN THE METROPOLIS.—Returns just published by order of the House of Commons show that the total number of new houses built within the metropoitan police districts, since January I, 1839, up to the present time, amounts to 64,058; and the number of new streets formed to 1,652,—200 miles in length. The increase of population, from 1839 to 1849, within the said district, is estimated at 325,904; the total population of the metron of the tation of the metropolitan districts being now about 2,336,960.

ARCH AT GLASGOW .- In commemoration ARCH AT GLASGOW.—In continenoration of the Queen's visit, the town council talk of perpetuating in stone the temporary archaised at the bridge. If a sketch of it which was forwarded to us be correct, we advise the cown council to think twice before they do so.

No. CCCXLVI.

SATURDAY, SEPTEMBER 22, 1849.

IRMINGHAM has been in a bit of a bustle for several days past: science and savans, music, manufactures, and paintings, concurred to attract a large

number of visitors to what the Bishop of Oxford called the "great practical metropolis of the kingdom,"—he might have said, of the world. We allude, of course, to the "Festival," the British Association for the Advancement of Science, the Exposition of Manufactures and Art, and the Exhibition of the Birmingham Society of Artists,—or rather, the exhibition of modern works of art in the rooms of the Birmingham Society of Artists.

Birmingham is a wonderful place, when thoroughly comprehended; but this is not to be done by a glance. As the Rev. Professor Robinson, the new president of the Association, observed at the dinner :- "Where in the whole world could be, and men like him, whose delight it was to have their theoretical knowledge enlightened by the intelligence and skill of practical men,-where on earth could they learn such new and extraordinary things, and see a development beyond any thing they could have conceived of the application of the principles to which they had devoted their lives;" and never let the merely practical men forget that it is to science they are indebted for the discovery of principles out of which processes grow,-that science has increased their powers and directed their labours?

We would say, with the president, of the works of Birmingham, though we could not go wholly with him in applying the remarks, as he did, to the present exposition there-"Days and months would be consumed in viewing those extraordinary creations and treasures of industrial art, and on the last day there would be still much to wonder at and to learn. What a development of power-what an amount of knowledge! What patient perseverance and industry exist and reign where such things are! What a noble school to open men's minds to a full conviction of the powers before them of the boundless mind that only wanted to be explored, but which, to be explored in its widest range and its fullest extent, must be explored under the guidance of the lamp of knowledge! It was not by mere blind and tentative experience that they bad been able to realize the marvellous conceptions they had arrived at. They told as clearly as a book did the mind of its author, -they told in unmistakeable distinctness that these men must bave been among the giants of their race,-that however they among their books might think highly of their own attainments, there was a far wider field, a far greater number of labourers teaching them what they knew of the past.

At the opening meeting, on the 12th, the professor spoke eloquently of the value of association, and maintained that science can be advanced only by its means.

"The power of association," said he, "of combining united labour, is confessed in all ordinary undertakings, in arts, in manufactures, and in politics. What then is there new in applying it to science? There is nothing new

the novelty is in recognizing its efficacy. Observe, in the first place, that although science—at least physical science—is of comparatively recent origin, physical knowledge is of very ancient date. Even from the origin of our race it seems to have been the object of our desire. Some sought it for the influence and power it gave them over mankind; some from the high instinct which leads the noble mind to see its beauty, and appreciate its worth. Even in the first glimmer of history, the astronomy of the Assyrian magi looms through the dark. Geometry, which might be the champion and guide of astronomy, stands forth in feeble development amidst the antiquities of India. The sepulchres of Etruria, of Egypt, and of Nineveh, give up their treatment. sures to prove that even in that remote date was developed in no low degree that practical chemistry which has been transmitted to us hy the Arabians, their successors. The architecture of the middle ages displays a knowledge of the principles of equilibrium and power, with admiration and wonder beyond that in-spired by marvels of modern art. The writings of Roger Bacon and Kirch show that much of the rudiments and ulterior aims of experimental physics was known in the cloister. But although the elements were there, there was no vivifying principle to combine them into a living body. Association was wanting, not intellectual power and sagacity. The Greeks possessed that in a measure equalled perbaps hy no other variety of mankind. But the unhappy element of discord, which seemed inherent in their nature, and which split their philosophers into aggressive sects and their nations into hostile fragments, prevented the union necessary to a development of science. But at last that great principle was revealed in one of those mighty movements which stirs up the world of mind from time to time, as those of malowy disturbed the carried to the control of molecular disturbed the carried to the carrie of geology disturbed the earth at the com-mencement of some great formation. We find that now, united in the brotherhood of knowledge, they have become as anxious for publication as they were before for secresy. Communication and intercourse bave belped investigation: each seeks the other for aid, and only jealousy that is now shown is lest they should be anticipated in important discoveries or successful results.

The reverend speaker erred in his statement, and lost an illustration, when he so spoke of mediæval architecture. The principle of association was therein carried out in an extraordinary degree, and the result was extraordinary progress.

In answering those who asked, "of what use is science?" the president said,—

"There is not a single element of our commercial prosperity in which the vivifying power of science might not be felt, in which the loss arising from want of that certainty of action which mere unenlightened practice can never attain, does not reach an amount which, if stated in figures, would astound the most thoughtless. For instance, the causes which in our great cities hasten the death and dehase and embitter the life of so many, bave at last been forced by chemists and physiologists on the notice of the public. Look at Dr. Smith's report on the 'Air and Water of Towns,' in our volume; and when we think that the victims of the deadly influences which are there revealed are chiefly found among the people whose industry is the foundation of our greatness,—that every year cut off from the life of each of these is so much subtracted from national wealth,—even were all moral sense or religious feeling dead in us, we must confess that the knowledge which is capable of averting them 'is of use.' The ships that hear the treasures produced by this industry through the world are lost to a fearful amount,—nearly three daily. What are they worth—ship, cargo, men?—and most of them perish from want of nautical science or from unscientific construction. How many men have been ruined by searching for minerals, when the merest smattering of geology would have dispelled their delusion? On the other hand, the agricultural produce of our islands might be doubled by a more perfect application of the principles of botany and chemistry. The ma-

nufacture of iron has been augmented six-fold by the use of the puddling furnace and the hot-blast,—both gifts of theory. How gigantic a result is this, without reference to the increase in the thousand arts of which this immense supply of that most precious of metals is the exponent."

At the soirée, on the following day, Mr. Gassiot exhibited the electric light; but what was said by Mr. Faraday and others on the occasion, would not serve to encourage the ingenious men who are at this time striving to bring it into practical operation.

The papers read in the various sections were numerous-many of them valuable, but they present no particularly salient points. In the mechanical section, Mr. Robert Stephenson, who ably presided, gave an interesting account of the accident to the hydraulic press at the tubular bridge across the Menai Straits. In allusion to a peculiar state of pulsation or vibration observed throughout the tube during the lifting, Professor Willis and Mr. Webster made some remarks. The latter considered that this pulsation might have had some influence in causing the fracture. There might be a conspiration of vibration in the tube and the press, which would destroy the cohesion in the particles of the metal, and cause the fracture. An interesting question this, which may show the importance of some recent remarks in THE BUILDER on this very subject of vibration and its effects on iron. Mr. Roberts suggested that in casting the new hydraulic cylinder, the fluid metal should be poured into the mould spirally, to obviate the unequal contraction, to which the accident was attributed. The casting, however, bas taken place, it is said, on the most approved principle, and after a week's annealing the cylinder will be ready for transmittal to the Menai.*

Mr. Heaton exhibited a clever invention for preventing the oscillation of locomotives on railways. +—Mr. Whishaw stated, as to bis

cause the fracture."

Mr. Heaton proposes to attach a weight with connecting rod, and an auxiliary crank, to the head of the crank pin, cqual to the weight of the piston and its gearing, so as to make the weight run to the left hand at the same instant the piston goes to the right. The blow to stop the piston and make it return will be received in the auxiliary crank, instead of in the wheel, producing a neutral point in the centre and steadiness of motion; for when the blow is recommunicated through the axie, and gives a twisting motion to the whole framing of the congue.

railways. —Mr. Whishaw stated, as to bis

* The Birmingham Journal thus reports the conversation:

- "Mr. Stephenson proceeded to captain the precautions that had been taken to avail to the process of the conversation of the state of the s

gutta percha tubing for telegraphs, that he had invented a method of preserving the tube from damage when laid under water. The pipe into which the wire covered with gutta percha was placed, consisted of a tube of metal, jointed at every 2 or 3 fect, as the sinuosities of the river or the various levels of its bed required. Twelve hundred feet had been laid down in the Rhine near to Cologne, and it had answered its purpose well. The tube was payed out from a vessel, and pinned down to the bed of the river, accommodating itself to any sinuosity or change of level. Mr. Roberts described a machine for forming mouldings in sheet metal, which seems worth attention. Mr. Robert Davison explained the desiccating process, the principle of which is, that in drying any body, it is not simply heat that is required, but a current of air also; not mercly a moving but a rapid current of air. It is the impulsion of atmospheric air at the velocity of the hurricane, or upwards of 100 miles per hour, combined with the elementary heat, under perfect control, which constitutes the desiccating process. Our readers have much on this subject before them from the advocates of different systems, and may weigh the evidence on both sides.

Last Monday evening was set apart for a discourse from Professor Willis, "On the Application of Mechanical Science to Railways according to the programme, but which, as the professor himself remarked, ought to have been on an application of science to that subject. It will be remembered that soon after the fracture of the Dee-bridge girder, a commission was appointed to inquire into the use of iron for railway bridges, &c. The commission, which included Mr. Willis, have tried a number of experiments on a very large scale at Portsmouth, and have sent in their report, and the object of the lecturer was to put before the members of the association, in a popular form, one of the principal results of the inquiry. Their experiments were made to show the difference of effect on railway girders when a locomotive is at rest upon it and when traveling over, and this important fact was established, namely, that the deflection caused by the weight of the locomotive was increased in proportion to the velocity, even as much as three times. The inference, the professor said, seemed painful, namely, that bridges which had been calculated to bear safely the weight of a train which would have to pass over them might not be able to resist the strain caused by it in motion. But he afterwards gave reasons why, in practice, there was not really cause for alarm; but this part of the subject was not made very clear. The curve produced by the deflection through different velocities was shown by simple apparatus, and it was seen that the increased deflection took place, not when the weight was in the middle of the bar, but when in the second half of its

The discourse was delivered in the Townhall, and had a large audience. The ceiling and walls of this fine apartment, by-the-way,* have been chromatized, with good effect, and we may mention that the scaffolding is up for the completion of the back of the building externally, under Mr. Edge, and that masons are preparing the stone-work.

Considerable additions are being made to Queen's College, and, in another part of the town, some industrial schools of Tudor character are nearly completed.

For the Exposition of Industrial Art, a large

structure of timber bas been erected, under the direction of Mr. Hussey, architect, at a cost of 750l. A subscription was raised to defray this and other expenses, but the money taken at the doors, if so applied, will render the subscription unnecessary. Some, however, are anxious that the money received should not be appropriated in this manner, but be applied in the formation of a permanent museum, much to be desired in Birmingham, and we trust they will succeed in effecting this arrangement. So long ago as 1839, when the association met first in Birmingham, the conductor of this journal suggested, through the Midland Counties Herald, that a temporary museum of manufacturing processes which had been formed, should be kept together permanently as the nucleus of a perfect collection illustrative of our manufactures, but the time had not then come, and the collection was dispersed. Let us hope for a better result on the present occasion.*

The present exposition is exceedingly interesting, and bears honourable testimony to the advance made in Birmingham in the union of art with manufactures during the last few years. At first sight of the collection our anticipations were scarcely realized, but this was rather owing to our knowledge, bit by hit, of all that had been done, and in consequence of which, therefore, there was little to surprise us,-than to any short-comings on the part of the Birmingham manufacturers. When we remember that the very name of the town as applied to works formerly conveyed a positive condemnation, and then examine the specimens of artistical manufacture now collected, the enormous improvement which has been effected and is going on, becomes strikingly evident. In glass, in porcelain, in silver and plated ware, in iron, forms of great beauty are exhibited, and deserve to be inspected by all who can contrive to pay Birmingham a We should have been glad to have found the names of some of the designers of these noticed. One of the tables contains a large collection of French bronzes, the works of various foreign manufacturers, and serves to show how much we have yet to do in this branch of industrial art. The committee acte ! wisely in admitting these. The proprietors of the table scarcely expected they would have been permitted to exhibit their wares (they are all priced for sale), and said to us candidly, that far more liberality had been shown towards them than Englishmen under similar circumstances would receive in France. We are quite contented that England is, in such feelings, in advance.

* As the suggestion applies now as it did then, we venture or reprint a part of the letter:—

The most important contribution by any single firm is the collection of ecclesiastical furniture (for Roman Catholic uses), and decorations, exhibited by Messrs. Hardman and Co. Such an amount of fine work in metal has never before been seen together in modern England. Pastoral staves, candlesticks, brackets, chandeliers, monumental brasses, stained glass, oak cabinets, tapestry, and paperhangings (the latter executed by Messrs. Crace), assisted by a foreground of tiles by Minton, form a whole of extraordinary excellence. Mr. Hardman, the exception to the rule, has given the name of the designer,-Mr.

Many of the series of specimens illustrative of manufacturing processes are very curions, and no less instructive. Some of our readers would stare to see, for example, in the manufacture of a simple brass rack-pulley, that the piece of metal of which it is formed passed tbrough thirty-seven stages.

We must run away, however, just to ask permission at the Workhouse to see the selected plans for the intended Union, a course which we thought necessary, to prevent the possible reproach hereafter that we had promulgated untrue statements, when, being in the town, we might have seen and judged for ourselves. With some little difficulty we found out the retreat of pauperism, and stated our wish and motive. The Clerk of the Guardians, Mr. Corder, a polite, common-sense man, could see no reason why this should be refused, the selected design having been approved by the Poor-law Board and returned, but he had no power to comply. He would, however, obtain authority from some of the guardians, who were then assembling. One was asked, and another was appealed to; but each shook his head, like a true descendant of Lord Burleigh, and it was ultimately decided that a reply could be obtained only by formal application to the Board. Not being disposed to spend in the workhouse of Birmingham the short time we had to stay in the workshop of the world," waiting the doubtful result of a discussion on this knotty point, we left them in the quiet possession of their plans, and sighed for the hour we had wasted in the ineffectual attempt to fit ourselves to do instice.*

We afterwards looked in at the Exhibition of Modern Works of Art, but found little there beyond pictures already exhibited in London, including some by W. Linton, Inskipp, Stanfield, Collins, Anthony, Etty, Uwins, Leslie, O'Ncil, Redgrave, Turner, and others; a pleasant collection, nevertheless, which restored our equanimity, and enabled us to leave Birmingham in better humour than we left the workhouse.

GREENWICH NAVAL GALLERY. - Eight pictures, illustrative of the life of Lord Viscount Nelson, have been purchased by sub-scription, and deposited in the Naval Gallery of Greenwich Hospital, at a cost of 300l., of which the sum of 136l. was contributed by Mr. Jasper de Sainte Croix.

^{*} It is 145 feet long, 65 feet wide, and 65 feet high.

And you may now again respond, "the rest nowhere." You they have made one sad mistake, and appearances are against them." The writer afterwards asked, "What has become of the second promium?"

THE SHRINE OF ST. THOMAS, AT CANTERBURY.

GATE HOUSE, WALSINGHAM PRIORY

PILGRIMAGES TO WALSINGHAM AND CANTERBURY.

Amongst the many pleasant excursions which the members of the two Archæological Associations have enjoyed, that to Walsingstam, when the Institute visited Norwich, stands prominent. The weather was fine, the place itself full of interest, and the host, Mr. Lee Warner, received all with such genuine and warm kindness as greatly to increase their enjoyment.

Amidst the pleasant results of that visit (and every one of these excursions produces more good results than are at once apparent) must he placed a new translation, by Mr. John Gough Nichols, of "The Pilgrimages to St. Mary of Walsingham and St. Thomas of Can-

terhury," by Erasmus.* Mr. Nichols, the worthy hcarer of a worthy name, was peculiarly well fitted for the task, and has brought to hear upon it a large amount of antiquarian knowledge, throwing light on our early religious history and our architectural anti-

quities.

Our readers will scareely require to be told that these celebrated colloquies were directed against "such as run mad upon pilgrimages undertaken under pretext of religion." The translator, however, does not put it forth in a polemical spirit, but as illustrating early history; and he shows that the degree of dis-

* "With the Colloquy on Rash Yows, by the same Author, and his Characters of Archbishop Warham and Dean Colet, and illustrated with Notes, by John Gough Nichols, F.S.A."
Westminster: Nichols and Son. 1849.

credit which has been thrown on the descriptive portions of these works was unjust. He found the account of the churches of Walsingham quite correct: "There were two,—the Priory Church, and the wooden Chapel of the Virgin, around which 'the new work' of stone had been erected, but was never finished, just as Erasmus describes it. The two wells, which he mentions, still exist."

We give, as specimens of the engravings with which the book is further illustrated, a view of the Gate-house of Walsingham Priory, and of the Shrine of St. Thomas, at Canterbury, from a pen-and-ink sketch on one of the Cottonian MSS. (Tib. E. viii., fo. 209.) credit which has been thrown on the descrip-

Canterously, nom a pen-an-line search of none of the Cottonian MSS. (Tib. E. viii., fo. 269.)

"The head in the quatrefoil in the front of the gateway, and two smaller ones in the side walls, are portions of the original design, and are intended to represent the porter and warders on the look out."

The shrine at Canterbury is described by Stowe as "builded about a man's height, all of stone; then upward of timber, plaine. * * * The timber-work of this shrine on the outside was covered with plates of gold," &c. "The finials on the crest of the shrine," says Mr. Nichols, "were of silver gilt, the central one weighing 80 onnes, and the two others each 60 ounces." The shrine had in front of it a curious mosaic pavement (which still remains in the cathedral), such as is found at Westminster Abbey, about the sbrine of Edward the Confessor.

Mr. Nichols is entitled to praise for this very interesting and scholarly contribution to the library, not alone of the English reader, but of those who, knowing the author in the original, would more fully understand his references and allusions.

IS TIME MONEY?

HE should possess no ordinary stock of courage who withholds assent to the dogma so pertinaciously upheld and acted upon by a large portion of the world. Yet so far from being received as a canon, it deserves our most serious inquiry, whether the too universal adhesion to it by the commercial community is not one of the causes of that depression which periodically sweeps over the face of which periodically sweeps over the face of mercantile affairs, as surely and naturally as debility and forced inactivity follow a fever in our mortal frame.

dehility and forced inactivity follow a fever in our mortal frame.

It has been truly remarked that men live quicker now than they did—that the work of fifty years is compressed into twenty. Yet the fuel that supplies heat to the great commercial hot-house is human bone and blood. And it is inevitable that the lower the rank in life the more fatal is the operation of this forcing system. A statesman or philosopher wears out prematurely the scalbard of life by the activity of his trenchant spirit; a poet swims the adverse stream till heart-strings crack in the contest; another throws down the disgustful cup of life scarce tasted; and their premature exit is chronicled in the memories of all who sympathize with men struggling against the chilly tide of the world's selfishness. But who notes the heatombs offered on the altar of the Moloch of haste? Every additional hurden thrown on the edifice of human society, however much it may he felt by the capital and the shaft, presses with a more crushing weight upon the hase.

It must, I think, be evident to the most superficial observer, that much of the depression in trade arises from the rapidity with which work is now executed. A tradesman solicits, or tenders for work, and after lowering his prices till a scarcely living profit is attainable (and after figuring in the list of "Blind Builders"), promises to do the work of six days in two. By hard task-masters, long hours of business, and hody-destroying and soul-wearying exertions on the part of employés, he succeeds—the work is done: how done is of no consequence, if he barely fulfil bis contract, or satisfy the requirements of the man to whom

success—the work is one: how one is of no consequence, if he barely fulfil bis contract, or satisfy the requirements of the man to whom "time is money," and who, as he begrudges the "money" for the execution, hegrudges the "time" for examination into the stability and propriety of the work done for him. By this system the master-workman suffers much, but how fare the working hands? Work cannot he made for them; and after doing the six days' work in two (for which they hardly get

three days' pay - perhaps much less), they stand still. If they work at piecework, they lose directly in not receiving wages; if monthly or yearly servants, they are menaced with a prospective and indirect loss in the reduction of establishments and a lowering of salaries.

But in a moral point of view, is time, indeed to he looked upon only as money? Is no part to be looked upon only as money? Is no part of it to receive more consideration than if it were mere dross? Was it only given us that we might go on heaping bag upon hag of gold, adding house to house, and acre to acre? If, in fact, every minute were weighed as a broad piece of gold, and every day as an ingot, should we he justified in running the hea long, jostling race we every day pursue? Ask the "Integer vitæ scelerisque purus," to sel you his good opinion or his vote for money, and the honest blood rushes to his face; hut his in-dignation is nullified, his reproach blunted, ge and point, hy his rigid adherence to "Time is money." If commercial integrity is "more precious than fine gold," how ought we to estimate the moral culture of the inward man, whose purity and right education is the alone basis of all fair dealing?

Much as we imagine ourselves superior in philosophy and attainments to our continental neighbours, we might learn from them a useful lesson—that of heing contented with less money, and devoting more time to æsthetic pursuits, and to the cultivation of all that makes life worth living for. And here suffer me to throw out a hint for thinkers. May not a comparison he drawn, much to our disad-vantage, hetween the mediæval times and our own? I speak architecturally. Look at the works of the men who worked slowly and thought much, and turn to the productions of our day, when men "run up" a church in a few months, a standing monument of their want of thought.

It was hoped that when railroads were made, so much time would be saved in travel, as to give greater leisure to the ordinary affairs of life, hat the anticipation has not heen realized. The fever has grown with what it feeds on. Truly, the demon of nnrest has entered into and we rush down the steep places to drown ourselves in a sea of troubles

FESTINA LENTE.

RESTORATION OF ST. PETER'S CHURCH, FROCESTER, COUNTY OF GLOUCESTER.

This pretty and retired village, through which the line of railway from Gloucester to Bristol runs, and in which village Ralph Bigland, the well-known author of the "History of the County of Gloucester," formerly resided, possesses an old parish church, now about a mile from the village, which has for a period of more than a century lain in a state of desolation and decay, and in the interior of of desolation and decay, and in the interior of which, and among the tombs of the departed, till very lately, the owl and the hat had found an ahode. The restoration of this old parish church (said to he dedicated to St. Peter) has heen commenced under the direction of the writer; and a short description of the church, as of the restorations about to be effected, may he interesting.

The original fabric appears to have been huilt about the commencement of the Early English period of ecclesiastical architecture. The plan of this courch consisted of a long and narrow nave, 64 feet hy 15 feet, a chancel in a continuous line with the nave, and latterly without any separation, internally 20 feet hy 15 feet; a north aisle, 20 feet hy 13 feet, with a north chapel, separated from this aisle at the eastern end formerly hy an oak screen, and at the western end of which was placed the tower, 9 feet by 9 feet internally; and ahout the middle of the nave, on the south side, was a porch, the side walls of which are forated, and altogether of a peculiar design. The tower was surmounted with a broach spire, very stumpy in proportion, constructed of oak timher, covered with oak shingles. In the tower were placed six bells. The nave was separated from the north aisle by piers and arches; the piers at the eastern end being circular, and at the western end square. In the chancel existed a piscina of the Early English period; and several flat coffin lids, with various devices of monumental crosses

incised on them of the Early English period, is well as stone coffins, have been discovered The fahric, viz., the nave, aisle, and porch, according to the existing specimens of the windows and doorways, &c., appears to be about the period of Henry the Seventh, 1485, Perpendicular. At the western end of the nave. I should mention, there existed a recess ahout 3 feet in width by 22 feet in length: this recess was covered over with a lean-to roof,—for what purpose it was used I am desirous of ascertaining.

As to the intended restorations, the walls all round are to be taken down, as well as the piers and arches, and rehult on the site of the old foundations, with the exception of the tower, which is to he extended northwards, and the north aisle westwards, thereby in-creasing the internal area of the huilding. All the old roofs were constructed of either oak or chesnut timber, consisting of all common rafters, with semi-circular tie pieces un-derneath, and covered with stone tile. The same construction of roofs is ahout to placed on the new walls, the old timhers being reused, as far as they are sound. The present porch, and all the old windows, of four different patterns, are to he repaired and reinserted in the new walls, and some new windows made to correspond. Between the chancel and nave I conclude a rood screen existed, and which formed the only separation between the two. The way leading to the rood loft the two. The way leading to the rood lort remained, and underneath the semi-circular carved pieces of the roof, about 7 feet in length, there existed panelling and rib mouldings painted, which was formerly over this rood loft no doubt. The walls of the chancel were in a very had state of repair, and considerably out of the perpendicular, and the roof had partly fallen in.

This portion of the church is heing repaired, under the care of the lay rector (a converted Romanist), and the incumbent (a very low Churchman, and formerly an officer in the army), and I am sorry to say it is about to be restored in the cheapest, plainest, and not altogether with the most substantial materials, the roof timhers heing, I understand, ahout to be worked out of heech timber, and underneath these roof timbers to he plastered. The whole of the other portion of this church-nave, aisle, tower, and porch-is now heing restored, at the expense of the parishioners, who bave come forward in a praiseworthy and liheral manner, with the assistance of the squire of the parish, Mr. J. A. G. Clarke. The seats, as well as the roof, are being worked out of oak. The few remains left of the old benchends had the linen-fold, or scroll pattern, in the panels. The new seats, which are to be without doors, are to be worked according to this pattern; and this church, when completed, will accommodate nearly 300 persons. There is to he a new stone font and pulpit, and an oak reading-desk; and the north oak reading-desk; and the north chapel (a proposed site for an organ), is to be separated from the aisle hy an oak screen, as well as the chancel from the nave. Buttresses are now placed against the side walls, which formerly did not exist. The tower is to he of the same size on plan as the old one, but is to he now carried up 10 feet higher, and the spire is to be of stone, and made more tanging is its ore of stone, and made more tapering in its pro-portions than the old one.

The contract for carrying out the restorations of this church amounts to between 1,800l. and 1,900l. The amount of the subcriptions is at present far short of this, but it is to he boped this work, now so well begun. will be nevertheless completed in the manner in which it is proposed it should be carried FRANCIS NIBLETT.

PLATE-GLASS MANUFACTURE.—A patent has heen granted to Mr. Obed Blake, Blackwall, for smoothing plates, sheets, or panes of glass, hy means of suction or vacuum blocks, arranged in combination with runners and other machinery as set forth and described, illustrated by drawings. hlocks are made to adhere to such glass-plates as are already used with the finest emeries in as are already used with the linest emeries in smoothing by hand, and the object of the in-vention is to imitate this finer work, hitherto done by hand, the coarser heing already done by machine, with plaster of Paris for adhesion.

OF THE RIGHT TO REMOVE FIXTURES SET UP FOR ORNAMENT OR CONVE-NIENCE AND DOMESTIC USE.*

THE author premises that it must not be forgotten each case must depend, in a great measure, upon its own peculiar facts,—" 'That the right (to remove) is an exception only, and though to be fairly considered, is not to be extended; and that it will be requisite to ascertain whether there be any custom or prevailing usage; what is the nature and construction of the article, its mode of annexation, and the effect of its removal;† these will all prove useful and safe criteria in practice, where there is any doubt, or where any new case arises

Hangings .- In Poole's case, 1 Salk., Lord Holt denies the right of a tenant to re-move any other description of fixtures, save trade; nevertheless Lord Keeper Squier v. Mayer, 2 Freem. 249, held that hangings nailed to the walls should be accounted as personalty, and go to the executor as against the heir.

Looking Glasses .- So hangings and looking glasses are only matters of ornament and fur-niture, and not to he taken as part of the house and freehold, hut removable by the lessee of the house. Beck v. Rehow, 1 P. Wims. 94. See Elwes v. Maw, 3 East, 33, per Lord Ellenborough.

Tapestry, &c.—So hangings, tapestry, and iron backs to chimneys. Harvey v. Harvey, 2 Stra. 1141. Id. Wainscot.—So wainscot fixed by screws,

Manscot.—So wanscot fixed by screws, and marble chimney-pieces. Lawton v. Lawton, 3 Atk. 15. Ex parte Quincey, per Lord Hardwick, Lawton v. Salmon, 1 II. Bl. 260. And, it would seem, a cornice fixed with screws. Owen v. Cheslyn, 3 Ad. & E. 75.

Chimney-pieces .- An outgoing tenant may remove an ornamental chimney-piece put up by himself during his tenantcy, but not a chimney-piece which is not ornamental. Leach v. Thomas, 7 Car. & P. 385, per Patteson.

Window-sashes .- So window-sashes which are neither hung nor headed into the frames, but merely fastened by laths nailed across the frames to prevent their falling in, for they are not fixed to the freehold. Rex v. Hedges, 1 Leach, C. C. 201; 2 East, P. C. 590. n. Beds fastened to the Ceiling.—So heds fastened to the ceiling with ropes, or even nails.

tened to the ceiling with ropes, or even nails. Ex parte Quincey, 478.

Stoves, Cupboards, &c. — So stoves and grates fixed into the chimney with brickwork, and cupboards supported with holdrasts. Rex v. St. Dunstan's, 4 Bl. C. 686, per Bayley, J. See Lee v. Risdon, 7 Taunt. 191; Colgraves v. Dias, 2 B. & C. 76; Lyde v. Russell, 1 B. & Al. 194. But see Winn v. Ingilby & Hauxwell, 5 B. & Al. 625.

In Birch v. Dawson, 6 Carr & P. 658, it is made a quare whether carpet tacked to the floor is fixed furniture.

floor is fixed furniture.

Pumps.—So a pump which was attached to a perpendicular plank resting on the ground at one end, and at the other fastened to the wall hy an iron pin, having a head at one end and a screw at the other, which went through the wall. *Tindal*, C. J., observing, 'that the article was one of domestic convenience, was slightly fixed, erected by the tenant, and might be removed entire.' Grimes v. Boweren, 6 Bingh. 437.

These articles, heing generally affixed hy the tenant for his personal comfort and convenience, and being equally useful in another house, and capable of heing easily disunited, hy which the premises will neither he injured nor left in a worse state than they were before,

the tenant may remove.

Doors, Hearths.—But things affixed to the house for the purpose of completing it he can-

not take away; thus doors, hearths, windows. Poole's case, 1 Salk. 368. Veranda.—Nor a veranda placed in front of the house, supported by posts fixed in the ground. Penry v. Brown, 2 Stark. N. P. 403.

ground. Penry v. Brown, 2 Stark. N. P. 403.

* 'Prom' "The Law of Fixtures, &c.' By S. G. Grady,
Barrister-at-Law. Richards, Fleet-street.

† 'Whether a fixture can be removed by a tenant without substantial injury to the premises is a question proper
for the jury, upon an issue whether the fixture is removable
or not by law. Avery v. Cheslyn, 3 Ad. & E. 75; 5 Nev. &
M. 372."

This was an action of covenant by which the defenation of the start of the s

Pillars of Brick and Mortar.—An outgoing tenant has no right to remove pillars of brick and mortar built on a dairy floor to hold pans, although such pillars are not let into the ground. Leach v. Thomas, 7 Car. & P. 328, per Pateson, J.

Shrubs. & P. Nore

Shrubs, \$c.—Nor can a tenant (not a gardener) remove shrubs, flowers, &c. planted by him in a garden. Empson v. Sodden, 4 B. & Ad. 655.

Bookcase, &c. — A. bequeathed his lease-hold messnage, with the grates, stoves, coppers, locks, boths, keys, belts, and and other fixtures and fixed furniture, to G. for life; and the household goods, furniture, plate, linen, china, books, wine, and liquors, and other properties in the messuage not being comprehended under the preceding terms, fixtures and fixed furniture, to G. absolutely. There were in the messuage looking-glasses standing on chimney-pieces and nailed to the wall, and a bookcase standing on (but not fastened to) brackets, screwed to the wall. It was held that G. took only a life interest in them. Birch v. Dawson, 4 N. & M. 22; 2 Ad. & E. 37; 6 Car. and P. 658.

Conservatories.—In Buckland v. Butterfield, 4 Moore, 440, it was held that pineries and conservatories were not removable by a tenant. The judgment of Chief Justice Dallas being a very important one, and the case itself being considered a leading authority on this class of fixtures, it is better to set it out at length.

'It was an action on the case, tried before Mr. Baron Graham at the last assizes at Aylesbury. The question in the cause, as far as related to the motion before the Court, was, whether a conservatory affixed to the house, in the manner specified in the report,* was so affixed as to be an annexation to the freehold, affixed as to be an annexation to the freehold, and to make the removal of it waste? In the argument and judgment of the Court of King's Bench, in Elwes v. Maw, will be found at length all that can relate to this and other cases of a similar description. It is not necessary to go into the distinctions there pointed out, as they relate to different classes of persons, or to the subject-matter itself of the inquiry. Nothing will here depend on the relation in which the parties stood to each other, or to the distinction between trade and agriculture; for this is merely the case of an ornaculture; for this is merely the case of an ornamental building, constructed by the party for his pleasure, and the question of annexation arises on the facts reported to us; and I say arises on the facts reported to us; and I say the facts reported, because every case of this sort must depend on its own special and peculiar circumstances. On the one hand, it is clear that many things of an ornamental nature may be in a degree fixed, and yet during the term may be removed; and, on the other hand, it is equally clear that there may be that sort of fixing or annexation which, though the building or thing annexed may have been merely for ornament, will yet make the removal of it waste. The general rule is, that where a lessee, having annexed a personal chattel to lessee, having annexed a personal chattel to the freehold during his term, afterwards takes it away, it is waste. In the progress of time this rule has been relaxed, and many excep-tions have been grated upon it. One has been in favour of matters of ornament,—as ornamental chimney-pieces, pier-glasses, hangings, wainscot fixed only by screws, and the like. Of all these, it is to be observed that they are exceptions only, and therefore, though to be fairly considered, not to be extended. tended; and with respect to one subject in particular, namely, wainscot, Lord *Hardwicke* treated it as a very strong case. Passing over all that relates to trade and agriculture, as not being connected with the present subject, it will be only necessary to advert, as bearing upon it, to the doctrine of Lord Kenyon, in Pentan v. Robart, referred to at the bar. The case itself was that of a building for the purpose of trade, and consequently standing upon a different ground from the present; but it has been cited for the dictum of Lord Kenyon, which seems to treat of greenhouses and hot-houses erected by great gardeners and nurserymen as not to be considered as annexed to the

freehold. Even if the law were so, which it is not necessary to examine, still, for obvious reasons, such a case would not be similar to the present; but in Elwes v. Maw, speaking of this dictum, Lord Ellenborough said, "There exists no decided case, and, I believe, no recognized opinion or practice, on citber side of Westminster-hall, to warrant such an extension." Allowing, then, that matters of ornament may or may not be removable, and that whether so or not must depend on the particular case, we are of opinion that no case has ever extended the right to remove, nearly so far as it would be extended, if such right were to be established in the present instance, under the facts of the report, to which it will be sufficient to refer; and therefore we agree with the learned judge in thinking that the building in question must be considered as annexed to the freehold, and that, consequently, the removal of it would be waste.'

Any injury, however, which would occur in removing fixtures must be made good by the party severing, and he must leave the premises in all respects as he found them, whether the fixtures be set up for trade or domestic purpose. See Foley & Addenbrooke, 13 M. & W. 100 "

BAD EFFECTS OF THE BRICK DUTIES.

The following statement in respect of the brick duties has been made by "The Financial Reform Association:"—The duty on bricks was 2s. 6d. per thousand when first imposed, in 1784, but was increased at different periods, from 1794 and 1806, in aid of the war expenditure, to 5s. 10d. per thousand. Additions have been made, higher rates levied on the finer kinds of brick, and drawbacks allowed for damages, which make the present duty to stand at, or near to, 7s. per thousand. Though this be a considerable addition to the price of a cottage containing 15,000, or to an ordinary street house, containing 50,000 bricks, the evil operation of the tax is not seen in the enhancement of cost price, the house is, in many essential parts, weakened, by the absence of bricks which sbould be used to give it solidity. But the evil influence of the tax is more apparent when examined at the brickfield, where the article is in process of manufacture. There, a certain mould of legal size must be invariably used. A builder might come and say be was desirous of bricks of different sizes, that he might build a house better apportioned, as to strength and solidity, in its different parts; but the exciseman says, "Not so; the law has settled the size of bricks, and the quality too." The builder may rejoin, "Is my experience in the construction of dwellings, and churches, and railway arches, to go for nothing? Has the world learned nothing since 1784?" The exciseman says, "Railway arches might not be known in 1784; but the law of that time has ruled what kind of bricks you are to build them of."

Next, there are the makers of the bricks. In the neighbourhood of large towns the excisemen visit the brickfields pretty regularly, to take account of the work done, perhaps once a-day; but in remoter places they cannot do so, unless there were an exciseman appointed to each place of work. For this reason, villagers or farmers, who would make their own bricks to huild their own houses, must not do so, because they have not an exciseman living beside them. They must send to great distances, where it is convenient to make the article under the supervision of the excise. Even where the officers visit the works once a-day, the inconvenience and loss to the operative at work are ever recurring. They are bound to lay their moulded clay down on certain spaces, and on those only, from which they must not remove the pieces until account has been taken of them for duty. Nor must they lay more on those given spaces than the officer allows: if full, they must stop work. If rain falls, and reduces the moulded clay to mud, or otherwise disfigures it, so as to be unfit to be sent to the kiln for burning, the duty must be paid, though the clay be returned to the pit, to be again worked up for the moulder. The lost labour falls to the operative brickmakers, while their employers lose the duty. Those accidents from weather

would seldom occur if the makers were allowed to remove their bricks at any time, or lay them in any place.

In every respect the hrick duty is an unqualified evil. It obstructs the operations of an important branch of industry, and ends by endangering human life in habitations to which is denied the application of a sound constructive science.

CHURCHES AND SCHOOLS.

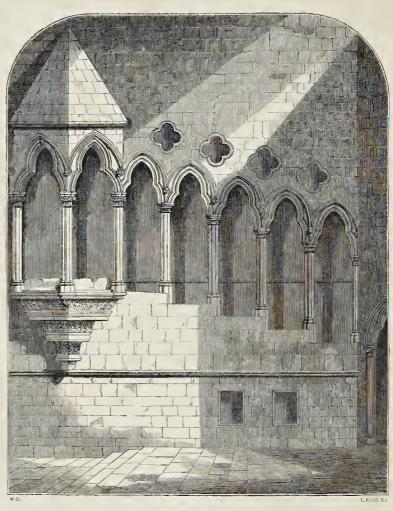

Wavendon Church was consecrated on Tuesday week. The whole body of the edifice has been rebuilt, except the tower. The restoration, as it is called, was made from plans by Mr. Butterfield, architect. The walls are of limestone, with dressings of Caen stone. The roofs of the nave and aisles are covered with lead. The whole is in the decorated style, and consists of nave, aisless, and chancel, with vestry. &c. of nave, aisles, and chancel, with vestry, &c.
The old tower remains. The west window, a
gift of Mr. H. C. Hoare, is filled with stained glass, and is seen through the open tower arch in the interior, from the opposite end of the in the interior, from the opposite end of the church. The east window is a decorated one, with four lights, and according to the Bedford Times, is a gift by Miss Prince, as another, on the north is, by Miss Hoare. The chancel ceiling is painted blue, with gold stars, and the windows are all of stained glass. The gates of the chancel screen, a low one of stone, are of metal, with commental workmanship, in are of metal, with ornamental workmanship in burnished brass and colours. There are no pews in the church. The open benches have carved oak ends. The whole floor is paved carved oak ends. The whole floor is paved with black and red tiles, encaustic with patterns in the chancel.—A committee has been appointed to obtain estimates and subscriptions for the repewing of St. Edward's Church, Cambridge.—Some workmen employed in repairing the interior of Chelsworth Church, Campringe.

Tepairing the interior of Chelsworth Church, near Biddlestone, have discovered a painting, in good preservation, over the chancel arch. It represents the Day of Judgment. The church formerly belonged to the abbey of Bury St. Edmund's.—The chancel of Little Wilbraham Church has been restored by the rector. A new east window, decorated, has been added. The parishioners are restoring the south aisle windows, and nave roof, &c Opposite this church new schools and teacher's dwellings, are in course of erection.—Balsham Church is under repair and restoration,
——All Saints, Maidstone, has been reopened,
after having undergone some long-talked-of alterations and restorations. Cumhrous galleries have been removed, and pews of all sorts replaced by open benches, with carved oak poppy heads. The works have been done under the architectural superintendence of Mr. Carpenter, and by contract with Mr. Cobb, builder. The removal of the galleries has, it is said, improved the transmission of sound said, improved the transmission of sound and the hearing throughout the church.—
A new school and teachers' dwellings have been founded at Nettleton, Wilts, on a plan furnished by Mr. Salway, of Chippenham, architect: mason, Mr. T. Brookman.——Some further repairs or improvements have been made at Astley Church, under the superintendence of Mr. Dodson, of Worcester.—Llan-Gasty-Tal-Y-Llyn Church, Brecon, has been restored by Mr. Pravson, of London, architect. The tower has been raised 12 feet, and 'the great banner of the cross now floats architect. The tower has been raised 12 feet, and 'the great banner of the cross now floats from its summit.' The interior space under the tower has been laid open with its lofty arch to the nave, and provided with open seats. The roofs are open, showing woodwork in the Early English style of the building. The whole area of the church is paved with encaustic tiles. The chancel windows are filled with stained glass, by Wades. The font, a large one, is of Bath stone, carved. The south large one, is of Bath stone, carved. The south porch door is of oak, massive, with floriated ironwork.—To complete the erection of St. Thomas's, Wigan, Mr. H. Gaskell bss given the munificent sum of a thousand guineas.—The foundation stone of St. Luke's Free Church was laid in Great Hamilton-street, Glasgow, on Monday week. It is to accommodate 800. Mr. Wylson is the architect. The ediffice is to be in the Pointed stell, with toward edifice is to be in the Pointed style, with tower at the south-east corner.—St. Ninian's Cathe-dral (Episcopal), at Perth, was to be formally founded on the 15th inst., by the laying of the

^{* &}quot;The conservatory was erected on a brick foundation 15 inches deep, attached to the wall of the dwelling house by cantilevers let 9 inches into the wall, connected with the parlour chimney by a flue, and having two windows in common with the dwelling-house, and to a pinery creeted in the garden, on a brick wall 4 feet deep.

STONE PULPIT, EARLY ENGLISH PERIOD.

[CIRCA 1270.]

EARLY ENGLISH STONE PULPITS.

In the course of a recent notice of proceedings in Chester we promised a view of the Early English pulpit in the Refectory there ;-one of the very few remaining examples of pulpits of that era. By a rare accident, however, the drawing of it when put on the wood was not reversed, and the engraving was therefore made to show it on the north side of the refectory instead of the south. We had in consequence abandoned the idea of publishing it, but being pressed by some of our correspondents to keep the promise, we now give it, not as a view of the Chester pulpit, although it really is so with the exception mentioned, but simply as an example of a stone pulpit in the Early English style.

The steps, it will be seen, are formed in the thickness of the wall, and the pulpit is corbelled out. The width of the stairs is 2 feet 8 inches. The height of each opening to apex 7 feet 6 inches, and the floor of the pulpit is 4 feet 3 inches from the ground.*

* The details of this interesting specimen are given in Mr. Dollman's " Examples of Antient Pulpits," published by G. Bell.

MATERIALS FOR BUILDING WORKS.

THE durability of materials employed in building works is a question too little attended to, the present cost, alas, deludes the majority of those whose province is to decide in these matters. Quantity for money is the popular mania, in the stead of quality, which our fore-fathers loved. The builders of the 19th century was comply to the control of the 19th century was comply to the control of the 19th century was comply to the second of the 19th century was the first beautiful to the control of the 19th century was the first beautiful to the control of the 19th century was the first beautiful to the control of the 19th century was the first beautiful to the 19th century was the first beautiful to the 19th century was try may carry the palm far above all preceding time for gigantic and rapidly-conceived and executed works, but those who follow us will find out many secrets arising out of this rapid and cheap style of building. But the topic I wish now to fix attention to more particularly is the very great paging to feature the statement of the process of the statement of th wish now to fix attention to more particularly is the very great neglect of attention in selecting the best materials for the character of any proposed work: when I use the term best, I mean best for its use consistent with durability,

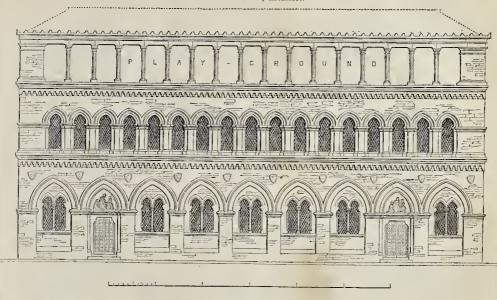

brick walls were resorted to is not so obvious,the iron rods and standards forming the ori-ginal fence are built in the contriver of this work surely forgot the important principle of the expansion and contraction of iron-work under different conditions of the thermometer. Again, the constant expense of keeping the joints of a 9-inch wall pointed up on both sides would have seemed a strong reason why an-other method of enclosure should have been

sought out. Most of our railway companies will find out by bitter experience the ultimate cost of wooden erections: miles of upright matched boarding have been fixed during the last five years on the sides of the platforms at the various stations. Travelling the other day on the North Kent line, I observed (at Woolwich, mean best for its use consistent with durability, economy, and good taste: these conditions, in my opinion, should be sought to be combined as much as possible. The architect has a noble field in aiming to design an effective, economical, and durable building. I will now advert to two or three illustrations of my argument as to the selection of materials.

In the recently-published Blackwall Railway report, the parapet walls enclosing the sides of the railway are said to have cost above 2,600*L*. The purpose of these walls is sufficiently obvious now that locomotives are employed, but why

NORTHERN SCHOOLS, ST. MARTIN'S-IN-THE-FIELDS, LONDON.

MR. JAMES WILD, ARCHITECT.

pended on lodges, lakes, gates, &c., to this park, surely it would have been better policy to have saved a name control lish oak posts to their fencing.

More Anon to have saved a little elsewhere, and fixed Eng-

NEW NORTHERN SCHOOLS, SAINT MARTIN'S-IN-THE-FIELDS, LONDON.

Annexed we give the elevation of the Northern Schools for St. Martin's-in-the-Fields, intended to be built in Castle-street, under the superintendence of Mr. Wild, as stated in our last number.

The frontage of the huilding is 100 feet: on the first floor this length, by 24 ft. 6in., is divided into two school-rooms, one for 200 boys and the other for 200 girls; on the ground floor there is a school-room for 320 infants—thus making 720 children in all.

The building will be faced with red brick; the arches and moulding to be rubhed and gauged; the columns and architrave of the gallery or playground, which extends over the top of the whole, are of Caen stone. The style approximates to the Gothic of the north of Italy.

approximates to the Gothle of the lady.

The amount of the contract entered into by Messrs. Haward and Nixon is 2,4331.*

The doors are to be of oak, panelled (as shown in the design), and are further to be ornamented with bronze studs. The sculpture over the doors is only proposed, and is not included in the estimate: probably there will be cluded in the estimate: probably there will be inscriptions instead.

From the height of the building and the width of the street, the roof cannot be seen, and, therefore, forms no part of the design.

CHEAPENING DWELLINGS FOR THE POOR.—It is supposed that one-fourth of the cost of a dwelling which lets for half-a-crown or three shillings a-week, is caused by the expense of the title-deeds and the tax on wood and bricks used in its construction. Of course the owner of such property must be remunerated, and he therefore charges sevenpence halfpenny or ninepence a-week to cover these hurdens. Government affect to regret that the working classes are crowded together, which looks very CHEAPENING DWELLINGS ROT classes are crowded together, which looks very like hypocrisy, as it is in their power to prevent it by reducing the price of buildings, and, consequently, lessening rents.

* The highest of seventeen tenders received was 2,774/.

NEW PRESBYTERIAN CHURCH, MANCHESTER

The foundation stone of a new church was laid in Grosvenor-square, on Wednesday week. It will be arranged to contain 1,090 sittings, including those of 150 children. The body of the edifice will be approached by a flight of steps from the square, 6 feet above the street. The length of it will be 72 feet, and breadth 51 feet. A further mass of building for sessions-house, vestry, and schools will extend to the extreme depth of the land, bounded by Chatham-street, 60 feet in length hy 36 feet. A large lecture-room is to extend under the body of the church, and be of the same dimension. The design appears to be somewhat curious. It is thus described in a Manchester paper:—"The style of architecture is Roman Corinthian. The front to Grosvenor-square has a portice in antis, with Corinthian columns and pilasters at each angle. was laid in Grosvenor-square, on Wednesday Corinthian columns and pilasters at each angle, surmounted by two cupolas, which are to be executed in stone. The novelty of this part of the design is much more remarkable than either the design is much more remarkable than euner its appropriateness or its success. Not only are turrets or enpolas at the base angles of the pediment of a Grecian building wholly unauthorized in architecture, but they are totally opposed to the principles upon which its beauty depends. And, in the present case, there is the further objection that the turrets are themselves averagingly make piles and are themselves exceedingly ugly piles, and, with their heavy and clumsy pillars, and massive buttresses, are about as little suited to the light and graceful elegance of a Corinthian building as anything that can well be imagined. Besides, the architects have not merely introduced turrets into the design, they actually seem intending to bind them together by a blank curtain wall, thus giving together by a blank curtain wall, thus giving to the edifice a square instead of an angular termination; and producing, as it seems to us, a most clumps and awkward effect. We would fain hope that it is not yet too late to re-consider these parts of the design; for we are sure that the edifice would be much improved by their omission." The architects are Messrs. Starkey and Cuffley, of Manchester. chester.

Another Pavement at Cirencester. —We learn that on Wednesday in last week another pavement was discovered at Circun-cester,—making the sixth that has been found upon the spot that has recently excited so much interest.

CUTTING BUILDERS AND ARCHITECTS.

-In your columns I frequently find the architects individually descanting upon the subject of competitions. I much wish that the profession would feel it to be their duty whole profession would ree! It to be their duty as well as their advantage to promote the interests of the respectable portion of the building trade in every branch, by stremuously refusing in all competitions to superintend the execution of works under the lowest estimate, where it is their advantage as the superintend the superintend that the superintend the superintend that their superintend that the superintend that the superintend that the superintend that the superintend unless it is in their opinion adequate to afford a remunerating profit to an expert tradesman. In the present state of things, the profession must be fully aware, from their experience and knowledge of the cost of material and labour, that "blind or reguish builders" are running away with a great portion of the business, and I regret to add of my own knowledge, that it is in a great measure attributable to the readiness with which the profession fall into the plan (or advise employers) of obtaining com-petition for everything, thus inducing even the most respectable established tradesman to unmost respectable established tradesman to un-necessarily curtail his profit, in the hope of keeping his customer. As to a combination of the building trade, it is completely out of the question while so many are to be found who look to the bankruptcy and insolvent courts as the only mode of settling with their creditors, and also when gentlemen taking houses allow themselves to be duped into the mode of employing the merely office-keeping house-arents with which the town abounds, to house-agents with which the town abounds, to get the repairs and decorations done for them,—
men who, totally ignorant of the nature of the
business, or the quality of a single article used,
let out 'the work to poor competing taskmsters, at an enormous profit to themselves,
and very generally at a loss, or near a kin to
it, to the poor fellow employed, while the gentleman gets his work but half, or very superficially executed, but which he does not discover until some time after he has paid for it.

A BULLDER house-agents with which the town abounds, to

A BUILDER.

Mr. John Woolley.—Some of our readers will hear with regret of the premature death of Mr. John Woolley. Mr. Woolley was a highly accomplished member of the profession, and an excellent man; had he been led to practice (his circumstances rendered it unnecessary). he would have distinguished himself in bis art. He was a member of the Council of the Insti-We lose in him an amiable friend,

MANAGEMENT OF COMPETITIONS

SIR,-That not only some few, but nearly the whole, of the profession should be slumbering whole, of the profession should be suffineering, still putting upwith the direful losses and insults hourly offered them by committees, through the medium of "competitions," is astonishing. But the truth is, they are as sheep without a shepherd; wandering about, as if there were need to their incurrent became to their towns. no end to their journey; keeping up a harassing warfare with the enemy; constantly suffering by travelling in mere foraging parties, instead of uniting together as brothers under one banner, and fighting in one rank against their common oppressor. They have forgotten that "Union is strength;" or, if borne in mind, their practice is essentially different from the precept. Let it be so no longer: let the shrill blast of the trumpet, blown through the organs of The BUILDER, be heard through the organs of THE BUILDER, be heard through the length and breadth of the land; and, above all, let it be responded to. If one "monster meeting" is too inconvenient, let each county assemble at each county town, and there, with united voice, for ever put an end to competitions, if found unable to after them. But this arterna extense accuraable to alter them. But this extreme course will hardly be found necessary. Resolutions can be come to, placing the matter on its proper footing. Then, and not till then, will competition be valuable. When that happy period shall arrive, we may look for a new and glorious era in architecture. It is to be hoped that the "Institute" will show that it is really what it professes; otherwise the Architectural Association will reap the laurels, and wear them with honour. Each of these meetings should be put in communication with the London meeting, and the whole body organized. As one suggestion, I would recommend a resolution to the effect that a plan and elevation of the selected design in every connection be engraved by the committee, and distributed to every competitor. W. W. to every competitor.

DRAINAGE OF LONDON PLANS.

The following note gives the substance of five others received by us:—Will you kindly inquire how it is that parties who are desirous to compete for the drainage of London are not furnished with the necessary preliminary information, as it was stated would be afforded them by the metropolitan commissioners? It appears to me now, that although this step (taken two years too late) has the semblance of an open question, there is still an under current at work that will render it almost a mere waste of time entering into such a competition. I think the question of the entire drainage, &c., of London is one of so much importance that the plans submitted should be referred to a competent hoard of civil engineers -say the council of the Institute, notwith-standing it does not exactly coincide with a theory widely promulgated. If any proof were wanting of the correctness of this opinion, it is the fact that the quasi-scientific mountain (alias the Metropolitan Commission) has been in labour nearly two years, and has produced something less than a mouse.

NEW SCHOOLS AT WALSALL.

THE Free Grammar Schools at Walsall were founded by Queen Mary, and are divided into grammar and commercial schools, under the control of ten governors. New buildings for this foundation are now in progress, under the superintendence of Mr. E. Adams, archi-tect. They comprise a school-room for 150 boys with an open loggia underneath of equal area, a board-room (20 by 16), class-room (30 by 16), and two assembling-rooms (each 20 by 16); also three houses for the masters: the first m aster's house contains twelve rooms. the second master's nine rooms, and the third master's six rooms; this is exclusive of cellarage to each house.

The principal frontage is 148 feet long. The dimensions of the school-room are 70 feet by 30 feet, by 30 feet in height.

The buildings are Tudor in character, faced

with picked red bricks, and the quoins, mouldings, &c., are of stone.

The whole of the works, including 880 feet in length of fence walling and several thousand swaders. sand yards of earthwork, are contracted for by

Mr. Highway, of Walsall, for the sum of 4,530l., exclusive, however, of the stoves, chimney-pieces, and desks in school-rooms.

COST OF WORKHOUSES.

A CORRESPONDENT has handed us the following statement :-

The cost of the whole of the workhouses erected by order of the Poor-law Commissioners in the years 1836-7-8-9 (when materials were much more expensive than at the present time) was as follows:-

	Number of Workhouses built.	No. of inmates.	Cost.	Average per head.
1836 1837 1838 1839	127 86 92 18	36,056 21,132 20,862 4,425	£659,154 403,342 404,179 87,917	£18 5 19 1 19 7 19 17 £76 10

being an average of 19l. 2s. 6d. per inmate.

METROPOLITAN COMMISSION OF SEWERS.

A GENERAL court was held on Thursday last, A GENERAL court was held on Thursday last, at the Court-bouse, Greek-street, Sobo-square. The Earl of Carlisle in the chair.—A report was presented by Messrs. Lovick and Cresy, on the present state and proposed drainage of the Potteries, Kensington.—Mr. Leslie urged that the improvement of this locality should be carried out by the owners of the property, which view was concurred in by Mr. Lambert Jones.

Mr. Chadwick vindicated the principle which had been agreed upon in the case of the drainage of Gulston-street, Jennings's buildings, and also with regard to Sydenham. Besides, insurmountable difof the drainage of ficulties presented themselves in the way of owner-ship, as the holdings were so various that in many cases improvements charged upon the owners would amount to a confiscation of the rents for the whole

amount to a connection of the rents for the whole term of their ownership.

Mr. Leslie replied, and contended that before moving in these matters, they ought to determine the questions of the outfalls, water supply, and house drainage. He also ridiculed the idea of this court going into the money-market to borrow every 400. or 500, required for this purpose.

Mr. Chadwick justified the use of tubular drainages being down in the abstract. Westington.

Mr. Chadwick justified the use of tubular drainage, as laid down in the cloisters, Westminster, Galston-street, and other neighbourhoods, by means of which the localities were kept quite clear, which previously required (the cloisters, for instance) 400 loads of refuse to be removed to the Printed.—In answer to a question, Mr. Gotto stated that no steps wbatever had been taken with regard to the proposed works for Jennings's-buildings, Kensington, or with those for Carnerstreet, St. Giles's.

Mr. Lambert Jones complained that no relief was afforded to the inhabitants of Holloway, who

was afforded to the inhabitants of Holloway, who had for years been rated to the sewers-rates, while attention was given to districts that had never paid one farthing towards them.

The Sheen District.—In reference to a recom-

mendation of the Works Committee, that Messrs.
Donaldson and Bazalgette's application as to the employment of levellers, and making trial-pits in the Sheen district, be acceded to,

the Sheen district, be acceded to,

Mr. Leslie wished to know how it was that these
levels could not be obtained from the Ordnance?—

Mr. Austin said the levels had certainly been taken
by the Ordnance, but points of connection would
be required, and be thought tracings of them might be obtained.

Mr. Jones said the officers of the commission were engaged in the out districts, such as Syden-ham, Richmond, and other healthy places, while those who were suffering from want of drainage were neglected.

The Earl of Carlisle believed that it would be The Earl of Carlisle believed that it would be desirable to proceed with all speed in those places that had long contributed to the rates, but, at the same time, they could not shut their eyes to the claims of some of the outer districts, such as Brentford, Richmond, and other places, which were the seats of cholera and disease.

seats of cholera and disease.

The recommendation was then agreed to.

Mile-end New Town.—A report was presented by Mr. J. Roe, on the drainage of Mile-end New Town, which stated that cholera and other diseases existed there to a great extent. There were 71 cesspools, which were filled to overflowing with the most offensive exhalations. It recommended that certain improvements be effected, to be defrayed by means of an improvement rate.—Dr. S. Smith bore testimony to the necessity of immediate measures for the improvement of this district, and the recommendation was put and unanimously agreed to.

mendation was put and unanimously agreed to.

Drainage of Richmond.—A letter was received from the authorities of Richmond, who concurred

in the recommendation of Mr. G. Donaldson for the drainage of the neighbourhood.— Mr. Cbadwick moved a series of resolutions, to the effect that a system of tubular pipes be constructed, that the amount of money necessary be borrowed on the credit of the rates, and that tubular permeable drains

be laid down.—Agreed to.

Mr. Bullar, in reference to certain resolutions be Mr. Bullar, in reference to certain resolutions of intended to move on the subject of house drainage, said he would rather that they should stand on the paper as notice of motion.—Mr. Chadwick believed the subject was of great importance, and that a determination upon it would be gladly received by the builders of the country, and he had the opinion of the chairman of the Carpenter's Society in favour of that course.-Postponed.-The next motion on of that course.—Postponed.—The field motion of the paper was a notice given by Mr. Leslie,— "That the Trial Works Committee, on account of the expenditure and small results, be abolished." Lord Carlisle trusted that Mr. Leslie would see

the propriety of postponing bis motion until that committee had made their report.—Mr. L. said be was quite willing to do so if there was a prospect of

was quie wining to do so that epoch prospectors that report being presented within a week.

The Rev. Edward Murray said their report would be presented with the least possible delay, but he was unable to speak in helialf of the other members was unable to speak in heinar of the other memoers of the Committee: he could not promise that the report would be presented within that time. He was not, however, aware of what information was sought, or what explanations were required.—Mr. L. said then in that case he thought he bad better

L. said then in that case he thought he bad better proceed with his motion.

Mr. Bullar theu rose, and said that if that motion was proceeded with, he should feel it to be his duty to move an amendment upon it, the terms of which he would read, viz.—"That the existing Metropolitan Sewers Commission be superseded with the least practicable delay."

The Earl of Carlisle believed the Committee very properly objected to presenting their report, until they obtained all the information they required, and thought the motion should be postponed until that period arrived.—After conversation, the motion was postponed till the next court.

period arrived.—After conversation, the motion was postponed till the next court.

The Experiments of the Trial Committee.—Mr. Leslie complained of the acts of two members of the Committee, in expending a sum of money in erecting a ventilating shaft at Bermondsey, although at the last Court it had been determined that no expense should be incurred for that purpose.

Mr. Murray institude the acts of the committee.

pense snould be incurred for that purpose.

Mr. Murray justified the acts of the committee, and said it was in consequence of the very pressing solicitation of the deputation from Bermondsey as to immediate measures, and the success that had followed the adoption of a ventilating shaft in Harley-street, that the experiment bad been tried in this neighbourhoad. in this neighbourhood.

A statement of the cost of the experiments was ordered to be laid before the next Court.

Several works were ordered, and the Court ad-

journed.

Books.

The First Principles of Artificial Manuring.
A lecture hy John Ryan, L.L.D., M.D.
Simpkin and Marshall. London: 1849.

THE object of this lecture is first to inquire into the principal causes of the conditions which are denominated sterility and fertility; and secondly, to discuss the means of preventions the conditions of the conditions the condit ing the one and of rendering permanent the other. Dr. Ryan has carried out this intention in a perspicuous and simple manner, and the pamphlet is calculated to remove many erroneous notions in respect of artificial manures; and, by showing how entirely the physical and chemical condition of the soil may be changed, lead our agriculturists to take science to their aid and effect most profitable improvements.

Miscellanea.

GALLOWAY'S ROTARY ENGINE. -Elijah Galloway, C.E., in claiming the invention of a rotary engine, of the patent for which the Hon. Captain Fitzmaurice bolds a share, and under whose name the invention had been noticed in the Times, -in the same paper remarks that he is induced, on public paper remarks that he is induced, on public grounds, to make the claim, as he perceives a growing practice among the assignees of patents to give the invention their own names, which appears to him just as reasonable as if you pully have believe in the design. able as if we nnly knew Bolton in the steam-engine, or the publishers, Murray and Constain the works of Byron and of Scott. Galloway declares, that in this way he had already lost all nominal honour in 'Morgan's wheel' or feathering paddle, though himself the inventor.

PROJECTED WORKS.—Advertisements have been issued for tenders, by a date not specified, for the erection of industrial schools, &c., in St. Pancras parish; by 1st October, for rebuilding Great Shelford Vicarage; by 22nd inst., for the erection of a new school-house, with boundary wall, at Godmanchester; by 6th October, for the works connected with the building of a bank and dwelling-house, at Carlisle; by 26th inst., for the erection of schools, dormitories, workshops, &c., for 600 children, at Penge, Surrey; by 27th, for 1,800 tons of rails, 700 tons of chairs, and 60,000 sleepers, &c., for the Birkenhead, Lancashire, and Cheshire Railway; by 1st October, for the supply of flints, whinstone, granite, &c., for St. George the Martyr, Southwark; by 26th inst., for making the tumpike road from Tinsley to Sheffield, and repairs; by 9th October, for pig lead and white lead, for Navy dockyards; by 25th, for the erection of two thirdrate houses at Whitechapel; and by 10th October, for building an infirency, with laundry wash-house, &c., for the St. Olave Union Workney of the supplementary.

RAILWAY JOTTINGS.—The contract for the various works in making the Blyth and Tyne Railway, including the large viaduct over the river Blyth, near to Blyth, has been taken by Mr. Richard Cail, of Newcastle.—Third-class carriages are to be attached to the trains leaving London and Edinburgh every Saturday, so that the working classes can go through either way for 30s.—A correspondent of the Aberdeen Herald reports the fall of two or more arches of a railway bridge across the Bervie, on the north of Scotland route. The same work, it is stated, had been already "altered from its foundations from Mr. Gibb's plan, by the new engineers." It would appear, however, that the bridge is not of stone.—The engine drivers on the Eastern Counties line have intimated that they will leave the line unless a stop be put to a system of discharging the experienced hands so soon as they reach, in the company's own scale of wages, 7s. 6d. a-day, and substituting young firemen then at 4s. 6d. to 5s. 6d. a-day. The drivers dread that a clean sweep of the whole corps is thus contemplated, in their dismissal so soon as they have successively reached that settled point of increase in their wages treacherously set before them, like the good things before the eyes of the poor donkey, stuck on the point of its own rider's stick, as an inducement to get on.—The net work of railways in France covers an extent of 5,525 kilometres, of which 2,888 are, or soon will be, ready for traffic. The total sum to be expended is 53,535,000 f., of which 59 per cent.

pended is 53,535,000 f., of which 59 per centhas already been expended.

Drainage of Towns.—The expense of putting Worcester into good sanitary condition has been estimated by Mr. Austin at 47,000 l., including 23,000 l. for machinery and works for collecting and distributing the city sewage for agricultural purposes, and also 10,000 l. for the erection of baths and washhouses.—A survey of sewers and drains at Sheffield is in progress, with the view of ascertaining the best mode of securing an uninterrupted efflux of their contents into a capacious general outlet proposed to be opened to the Don at Attercliffe. — The complete sewerage of Winchester, according to a semi-official announcement, will cost 4,500 l.—A company has been established at Leeds for the purpose of converting the contents of the sewers, cesspools, &c., into manure.

Window Sashes for Lunatic Asylum Sashes for Lunatic As

WINDOW SASHES FOR LUNATIC ASYLUMS, &c.—Mr. Thomas Melling, of the Rainhill Iron-works, near Liverpool, has taken out a patent for a new arrangement of apparatus for window sashes, in lieu of sash weights and pulleys, by which space is open for ventilation, while the possibility of escape through such opening, or persons entering from without, is precluded. A rack is fastened on the inside of each outer rail of the upper sash, and also on the outside of the lower one. A slaft crosses the centre of the window frame between the two sashes, at each end of which is fixed a pinion, which takes into the two pairs of racks, by which arrangement, on raising the lower sash by the action of the racks and pinions, the upper one is lowered to the same extent, and, according to the length of the rack, the spaces for the admission of air may be regulated to any width required.

The Metropolitan Fever-stills.—The Board of Health seem to be now fully awake to the necessity of suppressing these loatbsome cancers in the midst of human vitality. They have issued a notification to churchwardens, overseers, and other persons, on the subject, intimating that they are prepared to adopt measures for the prevention of intramural interments, wherever, on the report of an inspector, based on the Nuisances Removal and Diseases Prevention Act, it shall appear that danger to health results, hut recommending their voluntary abandonment forthwith. The hoard is also otherwise vigorously at work in the promotion of sanitary reform. They have just instituted a prosecution against the City Guardians, one and all, for neglecting their orders on various points. The people them selves are astir for the immediate suppression of intramural burial. A meeting of the "Metropolitan Society" for this abolition was held in Blackfriars on the 18th inst., when our suggestion to memorialize the Home Secretary for an Order in Council for their suppression was adopted. The press and its correspondents are also beginning to insist on the same course.

Provincial.—The value of house property in Lincoln has of late, it is said, been seriously on the decline. Some premises worth near 3,000l. last year have recently sold for 1,900l. This state of things has been attributed to the alleged artificial value of such property formerly; a way of putting it which seems to make little difference as regards the fact of the decline.—We hear that in the Thetford Abbey grounds articles of archaeological interest are daily turning up. An explanation of them will be given at the joint meeting of the Suffolk and Norfolk Archæological Societies on 27th inst. The base of two columns on the sides of the principal arch, a Roman pavement with tiles coloured and glazed, and a tomb, at present unopened, have been already it seems discovered.—The works for erecting St. George's schools, Sunderland, were let on the 18th inst. The design includes a classical school, girls' school, and three class-rooms, on the ground-floor, and one large general school with simultaneous gallery in the transept, formed over the class-rooms, on the upper floor. The upper school is to have an open timber roof. The style selected is the palazzo Lalian, and the whole of the building is to be of stone. Mr. Oliver is the architect.—The operations for the projected improvement of Princes-street Gardens, Edinburgh, are now in progress. Estimates for the terrace, parapets, and stairs are being obtained, and meanwhile the terrace ground is being laid out on the north side and a retaining wall built on the south.

THE SOMERSETSHIRE ARCHÆOLOGICAL SOCIETY will hold their first general meeting at the Assembly-rooms, Taunton, on the 26th inst

MANCHESTER CATHEDRAL.—Mr. Gregan and Mr. Bellhouse have issued a report on the cathedral, showing the miserable and dilapidated state of the stone-work in general. It is to be hoped this will lead to restoration.

BLIND BUILDERS.—On the 10th, at the office of Mr. G. Allin, architect, St. Ives, were opened the following tenders for the restoration of the exterior of the parish church of Hilton, Hunts:—

, —	
Parker, Thrapston	£311
David	288
Cade, Alconbury	270
Beldom, Fenstanton	266
Smallbones, St. Ives	256
Smith and Co., Fenstanton	255
Bunting and Harrison, ditto	231
Harrat and Bland Huntingdon	150

The following is a list of tenders opened for repewing, &c., the Independent Chapel, St. Ives:—

Parker, Thrapston £472
Mills, Whittlesea 399
Harrat and Bland, Huntingdon 295

Tenders for labour of masonry and bricklaying for four houses, for Mr. Clark, Sunderland: Mr. Oliver, architect:—

Heron and Keall	£245
Simby	219
Forster	208
Walker (accepted)	126
Parkin	119

ARISTRONG'S HYDRO-ELECTRIC ENGINE.

—We lately witnessed the wonderful power of this machine at the Polytechnic Institution, Regent-street. As there remarked by the lecturer, the old machine used at that institution in exemplification of the great power of electricity, large and astonishing as its results once appeared, is a mere toy in comparison with this potent rival. And yet it is but a small locomotive boiler. It is mounted on six glass pillars, and contains its fire in the interior. Along the upper part of one side is a numerous series of jet pipes, through which the steam rushes, and in which, condensing into water it evolves the electricity. These jets are worked by handles on the opposite side, so as to allow of either the whole power, or a part only, being set on. The long streaks of light which shoot from all parts of the surface when a sparking rod is directed towards the boiler, can no longer, with the least propriety, go under the name of mere sparks—they are no mean semblance of the forked lightning of nature itself, and our respect for the dartings, which were displayed in darkness, was by no means diminished by the dread shriek of "hell in harness," which ever accompanies them here, as the storm-shriek often does in nature's lightning-play. A powerful observer, in giving us a recent account of an Armstrong, states that it was constructed at Louis Philippe's order for the Academy of Sciences at Paris, and that the republic having adopted it, Mr. H. Watson, of Highbridge, Newcastle, the manufacturer, is about to send to off to Paris. It will be the most powerful one yet made. We may here record our belief that the ultimate purpose and utility of such machines have not been yet realized, any more than have the limits of their nower.

that the ultimate purpose and utility of such machines have not been yet realized, any more than have the limits of their power.

The Encavations at Bury St. Edwinds, "The whole plan of the prior's house is now laid open. The workmen, amongst other relies, bave dug out a small cesspool with an oblique shoot from it, thought to have belonged to a piscina drain. Part of a passage paved with encaustic tiles has also been exposed, and several curious specimens of painted glass, one with a layer of shining substance between two flakes of glass, have been found, as also skeletons, coins, &c. The Archæological Committee speak of opening the entire ruins of the abbey, if possible.

Archæological Committee speak of opening the entire ruins of the abbey, if possible.

Manchester Art-Union.—Following the example set by the London Art-Union, the committee of this association have this year determined to distribute, in addition to pictures, a quantity of statuettes in Parian and Carrara porcelain, including some impressions of a statuette of Sabrina, from the marble statue by Marshall

statue by Marshall.

Posttion of New Cemeteries.—As there is now a prohability that some step will be taken to provide against future intramural burials by the establishment of cemeteries in the country surrounding this great metropolis, and other large cities and towns, I would suggest, that no Company should be allowed by the Legislature to establish a cemetery without purchasing sufficient land around it, to be for ever kept free from any babitable building, save and except the tenement necessary for the person who might be required to superintend the cultivation of such land, or to look after the plantation if it be so laid out. I am the more led to this opinion and suggestion from an advertisement which I saw in the Tines, offering to the notice of such companies a desirable plot of ground at Lower Norwood, near Crown-hill, and stating as a desideratum that such plot was pleasantly bounded by some gentleman's pleasure-grounds,—a very great inducement, I should think, for the said gentleman to purchase the said plot by way of keeping his pleasure-grounds from contiguity with a burial-ground.

J. Y.

P.S. A medical friend of mine, to whom I mentioned this withent grounds that Carefully is a support to make the said and the Careful and the

P.S. A medical friend of mine, to whom I mentioned this subject, remarked, that Government might convert the Isle of Dogs into a public cemetery, and I have to observe, that there is an excellent and silent highway to it,—the Thames,—and wharves on both its banks, from which a steamer appropriated for that purpose might convey the corpse and mourners at a very moderate expense.

IMPORTS AND EXPORTS OF IRON IN 1848. -From a Parliamentary return, it appears that the quantity of foreign iron, chiefly Swedish and Russian, imported in 1848, was 23,869 tons har-iron, 464 tons blooms, 257 tons old iron, and 28,891*l*, odds in value of wrought-iron and steel. The quantity of foreign bar-iron exported was 3,432 tons, of steel unwrought 340 tons, of wrought-iron and steel, value 11,560/. The value of foreign iron retained for home consumption was 17,3311. Of British iron exported, chiefly to the United States, Holland, Iceland, Denmark, &c. &c., there were 175,650 tons pig, 32,135 tons har, 17,554 tons bolt and rod, 19,371 tons cast, 76,365 tons wrought, and 61,913 tons steel unwrought, besides 1,913 tons wire and 7,241 tons old iron. The exports of British hardware and cutlery amounted to 13,105 tons, value 1,850,150L, chiefly to America and Canada, East Indies, &c. Of British machinery and mill-work, the value of exports was \$17,656L, chiefly to Russia, Spain, Italy, Hans Town, France, Brazil, &c.

EMPLOYMENT OF ARCHITECTS: EXETER ARCHITECTURAL SOCIETY.—The council of this society, in their last report, say; -"Your committee have again, as on several former occasions, received applications for gratuitous plans for the whole or for a portion of churches. They have been obliged, in all these cases, to return a negative answer to the application, on the principle of not interfering with the exertions of professional men, especially as the constant and careful supervision of an experienced ar-chitect is as necessary to the satisfactory completion of a work as the promising of a suitable design. There will he always something occurring to call forth the genius of a living mind, and it is in the wise meeting of difficulties that skill is mainly shown; the difference hetween working hy architect and by published plans is similar in kind to that hetween ornaments carved by hand and those stamped by machinery,—the latter must be a faithful copy of the stamp, but it is a mere lifeless reproof the stamp, but it is a mere lifeless reproduction of one type,—the other has more light and shadow, greater variety of design, and greater freedom in execution, while a due appreciation of the principles of Christian art will effectually check the danger of variety changing into what is opposite in kind, or of freedom degenerating into licentiousness. It needs a living architect to give life to a design; it also needs the recognition of yould defead it also needs the recognition of well-defined principles of Christian architecture to inspire and to direct, to spur and to rein, the architect in his conception of a successful work."

Mosaic Glass.—We have lately been

favoured with a sight of a work of art quite novel. It is called mosaic glass, and is adapted to many different purposes—church windows and church decorations, shop windows, and fan lights, window blinds, staircase windows, &c. It is equal in beauty and transparency to the most brilliant stained glass, and the designs the most hrilliant stained glass, and the designs for window blinds and other purposes are very rich. It has been brought out and patented at considerable expense and with much labour; but we have no doubt the company will be amply rewarded, for it requires only to be seen to he appreciated. It is produced at one-sixth the cost of stained glass; but it is not unlikely that its price will be enhanced when it has become well known, as the demand will be great. For church windows it is admirable, great. For church windows it is admirable, great. For church windows it is admirable, from the variety and heauty of the designs; and of its durability, the mode of combining the colour with the glass is a sufficient guarantee. It is also hrought out in labels to a large extent, and, indeed, the variety of purposes to which it is applicable is very great.—Leeds Intelligencer. Leeds Intelligencer.

IMMENSE BLOCK OF GRANITE.—Last week a "muckle hole" (a term used by the quarriers of stone) was put down 15 feet the quarriers or stone) was put down in teacher through solid granite, in one of the quarries of Stithians, near Penryn, helonging to Mr. Elliot, of the latter place. Only 25 lbs. of powder were deposited, which being hlasted was found to have thrown off from its hed and side injurts, a black containing 20 300 autics. side joints a block containing 20,300 cubic feet, or 1,400 tons, of excellent quality and blue colour, thus enabling the workmen to cut blocks of any dimensions required,-West

Briton.
THE BRIGG CORN-EXCHANGE COMPE-TITION has been decided in favour of Messrs, Lockwood and Mawson, architects, of Hull; and the works are to progress immediately.

SPANISH CHURCHES .- A foreign correspondent of the Athenaeum, writing from Saragossa, says:—"A leading feature in Spanish churches is always the 'retahlo,' a huge erection of carving, gilding, and painting in wood or stone, rising immediately behind the high altar, generally to the height of the roof. This 'retablo'' is often very handsome in its way; hut to those acquainted with the fine churches of the north of Europe, it must ever appear a miserable substitute for the beautiful east window or windows which it supersedes. The Lady-chapel, together with the range of chapels circling behind the high altar, which form so exquisitely beautiful a feature in many of our cathedrals, is almost always wanting in the north of Spain; possibly because the entire church is but a *Lady-chapel* in this land of ultra-Marialatry. Thus the 'retablo' generally forms the eastern extremity of the building. The inclosed choir is often an eye-sore in our churches—it is yet more so in those of Spain. Placed generally from the altar, it is often near the west end of the nave; and consists of a solidly walled inclosure, which blocks up and embarrasses the perspective of blocks up and empartasses the perspective of the church sadly. It is shut in at the eastern end by an iron railway—'reja'—often magnifi-cently worked, with a gate in the middle opposite to the altar." NORTH SURREY INDUSTRIAL SCHOOLS.— In consequence of the calamitous occurrence

at the late Mr. Drouet's school at Tooting, the guardians of the poor law unions forming the North Surrey district resolved to form a school district and to erect suitable buildings. For this purpose fifty acres of land have been purchased, adjoining the Anerley station of the Croydon Railway, at Penge, Surrey, and tenders have been advertised for, to carry out designs prepared for the building by Mr. Charles Lee. The establishment is to be industrial, to have accommodation for 250 boys, 210 girls, and 140 infants, with three schoolrooms and class-rooms, with apartments for steward, matron, three school-masters, and three school-mistresses, with dining-room, chapel, chaplain's-room, board-room, kitchens, bakery, offices, lavatories, baths, and work shops; also separate laundry-building, with all the necessary rooms attached thereto for drying, ironing, &e.; likewise a detached infirmary building, having all the requisite wards, nurses' rooms, kitchen, washhouse, surgery, &c.; there are to he also farm-buildings, so that the boys may be instructed not only in trades, but in farming operations, and the girls in dairy-work as well as in cooking,

household-work, and needle work.
New Church of St. Peter, At Croy-New Church of St. Peter, at Crovpon.—A few days ago the foundation-stone of
this church was laid by Mr. George Robert
Smith, the banker, whose seat is at Selsdon,
within the parish, the Rev. John George
Hodgson, the vicar of Croydon, officiating.
The site is very picturesque, on the side of a
hill, ornamented with some good elms, and well
seen from the Brighton Railway on the
right, as it emerges from the cutting south
of the Croydon station. The church is in the
Early Decorated style, with aisles, south porch,
and tower at the west end of nave, and is to and tower at the west end of nave, and is to accommodate 800 persons. The spire will be of shingle, the walls of flint, with facings of Maidstone stone. The site has been liberally presented by Mr. John Russell, the owner of the surrounding property. The architect is Mr. Scott. The church is to be huilt by contract, for which tenders have been made in consequence of advertisement, and we underconsequence of advertisement, and we understand that eleven tenders were received, varying in amount from 6,893t to 12,913t, and with variations also according to specified difference of materials. The two lowest tenders were by Mr. Myers and Mr. Wm. Harris; the former heing lower in some respects and the latter in others. Mr. Harris being a townsman, the contract was given to him.

BATHS AND WASHHOUSES.—At a meeting of the Works Committee of the Goulstonsquare model establishment, on 6th instant, returns were read, from which it appears that from 26th July, 1847, to 31st December, 1848, the number of hathers was 81,694, and the receipts 914l. 19s. 1d.; and that thence to 1st instant, the number of bathers was and the receipts 1,058l. 1s. 7d. During the latter period the number of baths to men was 77,831,-to women, 3,187,-to children (sometimes four together) 1,201; and the weekly average was—to men, 2,223; women, 91; children, 35: weekly receipts, 30l. 5s. 4d. That even these encouraging returns were limited by the accommodation, appears from another return, showing, that since all the haths have been brought into use, there was an increase of 36,679 hathers during the three last months, over those during the same months of last year. In the washing department, since 30th April last, the number of washers, to 1st instant, was 3,013; and the number of driers the same; the number of hours' washing and drying being 10,005-average 3 hrs. 20 min, to each washer and drier. No ironing appears to have been done.

BATHS AND WASHHOUSES, LIVERPOOL, -A third suite of baths and washhouses have been ordered to be erected by the health committee, from plans proposed by the borough engineer. The site selected is at the junction of Cornwallis-street and Leveson-street, which forms the east corner of the spacious square inclosing St. Michael's Church and cemetery. The building, we are told, is designed in the simplest Italian style, two stories in height, and with projecting roof, and includes first, second, and third-class baths, and two classes of making stalls, each of which will be discipled. washing stalls, each of which will be distinct and separate from the rest, "with improved and original contrivances for wringing and

drying the clothes."
Welbeck.—The Duke of Portland has long contemplated a great work, which is now the course of being vigorously prosecuted. This is the erection of a bridge over the Welbeck lake head, near what is called Mosshall and lake head, near what is called Mosshall and the Dogkennels. Masons are daily expected from London, and a good deal of stone has been already got and hewn ready in blocks of various dimensions. The high hill, at Whitwell, has supplied some much more preferable to the Anston stone, it is said, which has been so much called for for the new Parliament

Houses.—Derby Courier.
MANCHESTER BOROUGH GAOL.—The new prison at Manchester, alluded to by us some time since, is now nearly completed. It is stated that the cost of it will be about 120,000l. and it is calculated to accommodate soners. The cost, per individual, will therefore be 240l. About two years have been occupied in raising it. The houndary wall of the incloses almost ten acres of ground, of which 5,641 square yards are occupied by the prison building, the remainder being exercising

grounds, yards, &c.

A Wire Suspension Bridge has heen thrown across the Ohio. It is 1,010 feet in

length.

THE IRON-ROOF, LIME-STREET STATION, LIVERPOOL.—At a meeting of the Liverpool Polytechnic Society, held last week, Mr. Tur-ner, of Dublin, who is constructing the new galvanised iron roofing and other iron works of the Lime street railway station, furnished the meeting with the following particulars :- The roof covers an area of 6,140 square yards, heing about 360 feet in length, and 153 feet 6 inches in width. There are no intermediate columns; hut this great space is spanned over hy one stupendous arch, rising in a segment of a circle, to a central height of 30 feet from the spring or chord. The roof consists of 17 curved girders of wrought-iron, resting at one side upon the walls of the offices, and at the other npon cast iron columns of the Doric order, connected by ornamental arches, in perforated iron. These girders are trussed vertically by a series of radiating struts, acted upon by the bars con-nected with the extremities of the girders; and they are trussed horizontally by a series of purlins and diagonal rods, thus forming one igid piece of framing from end to end. this framing will be laid plates of galvanized corrugated iron, and three ranges of plate-glass (in sheets about 12 feet 6 inches in length, and of great thickness), extending the whole length of the roof. In consequence of the great extent of surface exposed to the variations of temperature, provision has been made for expansion and contraction of the iron without injury to its bearings. The roof, when finished, will weigh about 700 tons. The whole of the work, with the exception of the cast-iron columns and ornamental arches, is of wroughtiron. The iron columns upon which the roof rests on the south side of the yard are 2 feet 3 inches in diameter at their bases. Six of the girders are fixed, and the centres struck.

SATURDAY, SEPTEMBER 29, 1849.

OME of our correspondents express surprise that we have not given a decided opinion on the question pending between the Architect of the new Houses of

Parliament and the Government, as to the amount of remuneration which he should receive for his past services, "as the general question of payment to architects so materially affects the whole profession." We need not tell our old readers, that on the general question of architects' remuneration we have repeatedly spoken, and that in our volumes will be found a considerable amount of information on the subject. We have, again and again, called the attention of the profession to the present unsettled state in which the question rests, and have shown the evils of the 5 per cent. system, as well as its advantages, and the position of architects who so make their charge, when they are obliged to go into a court of law to recover payment for their services. It seems clear that the amount of the commission, as a commission, cannot be recovered,-that simply proving to a jury that 5 per cent, is the customary charge will not suffice to insure a verdict. Evidence must be given that the sum claimed is a fair compensation for the skill and labour employed in the particular case.

In the case of Mair against Ward, it will be remembered, the plaintiff charged 5 per cent. commission on the amount expended, his travelling expenses, and two guineas a-day for the time occupied in travelling. The witnesses proved that the principle on which he claimed payment was universally acted on by the profession, and that the work done was worth the money. The jury gave the plaintiff all he went for. A new trial was demanded, on the ground that, as the " particular" claimed the money entirely in the character of a per-centage, and as, according to the opinion of Lord Denman, the claim could not be allowed upon that ground, the jury, not having the power to go beyond the particular, ought to have found a verdict for the defendant. The new trial, however, was refused; the court, after deliberation, decided, that although the jury rejected the claim as grounded upon the commission, they were justified in awarding the money as a compensation for labour.*

Returning to Mr. Barry's dispute with the Government, however, and which, we may mention, still remains unsettled, the general question,—the propriety or otherwise of charging 5 per cent. on the amount expended, is not at issue. A statement of the architect's case will be found at p. 341 of our present volume, and it will be there seen that he claims

5 per cent. commission on 841,6307.
17s. 11d.
And for special or extraneous services
during a period of ten years.
5,256

Making in the whole...... £47,337

To this the commissioners reply, not that a commission is an improper mode of charging, or that the sum named is more than the skill and labour employed are worth,—but that

* See vol. iii., p. 605, and vol. iv., p. 61. Also vol. vi., p. 301. And for a paper on "The Rights and Responsibilities of Architects," p. 350 of our present volume.

the architect had, by special agreement, abandoned the accustomed remuneration, and had accepted the fixed sum of 25,000l. for "the superintendence, direction, and completion of the proposed edifice," for the express purpose of avoiding what was pointed out to him as being considered hy Parliament an objectionable mode of paying architects.

If an architect make an agreement, he is, of course, bound to abide by it. It might even occur that an architect would agree to do certain work for a certain sum, for the purpose of obtaining an employment for himself at the expense of another architect, who might refuse to enter into such an agreement, and it would, of course, be manifestly unjust if he were able afterwards to get rid of the agreement, and claim the usual amount of remuneration.

The question with Mr. Barry turns wholly on the agreement, but even in this light the profession generally are much interested in it,-both as to the effect which such an agreement would have in lessening professional charges generally, and as to the justice of the course pursued by the commissioners to obtain When the architects of the United Kingdom submitted their designs for the intended Palace of Parliament in competition, it was, of course, with the expectation that the successful competitor would be employed, and paid as other Government architects always have been paid. Mr. Barry asserts that he was appointed unconditionally to carry his design into effect, at the commencement of 1837, and expected his "remuneration would be of the customary amount," and that he was not informed that the Commissioners of Woods considered 25,000l. a fair and reasonable remuneration for what he was about to do, till the 1st of March, 1849, when he had made such costly arrangements to carry on the work, that he could not have relinquished the employment without a considerable sacrifice. He therefore acceded, under a protest "as to the inadequacy of the amount proposed, and with an intimation that he should offer proof of its inadequacy when the building was in such an advanced state as to allow of a competent judgment being formed on the subject." Still, he did accede, and on this the Government rest their objection. It may be said that he did wrong to accede, and there is force in the remark; but the circumstances and the temptation must be duly considered against it.

Apart from this, that Mr. Barry is fully entitled to the usual commission of 5 per cent. none will deny who know the nature of the work, and are competent to judge. Sir Jeffrey Wyatville received 5 per cent. on the amount expended at Windsor Castle, and was also paid for measuring the works; Mr. Nash received 5 per cent. for Buckingham Palace; and the superintendence of piles of warehouses and doeks are paid for after the same rate.

It must be borne in mind by those who are to legislate on this matter, that the building which Mr. Barry was to see carried out for 25,000l. was estimated at 707,000l., and that of the 842,000l., using round numbers, on which the commission is now claimed, Mr. Barry says 370,000l. are for works which form no part of the original design and estimates. If circumstances led to, or justified a larger outlay than was at first intended,—an outlay ordered or assented to by the Government, and increased by popular approval,—it would be unreasonable to expect that the architect's payment is to remain the same. Some, it is true, plead this increased expenditure as the

fault of the architect, and far from allowing him any commission upon it, would make it a reason for lessening the sum agreed to be paid. That this is the fact has yet to be proved, Mr. Barry denying it vigorously.

The charge against architects for exceeding their estimates is as old as Augustus, and has been repeated in every succeeding century. Thus, John Evelyn, in a dedication to Wren, says :- "I have known some excellent persons abused, who, trusting to the computations of either dishonest or unskilful artists, have been forced to desist, sit down by the loss, and submit to the reproach,-This man began to build and was not able to finish. But so, it seems, would not the Greeks suffer themselves to be overreached, when those great builders, the Ephesians (who knew sufficiently what mischief it was to the public, as well as private men) ordained it for a law, that if a elerk undertook a work, and spent more than by his calculation it would amount to, he should be obliged to make it good out of his own estate; whilst they most liberally and honourably rewarded bim, if either he came within what was first designed or did not much exceed it. This was esteemed so reasonable (upon consideration how many noble persons had been undone, and magnificent structures left imperfect) that Vitruvius, writing to the great Augustus concerning this subject, wishes the same law were in force at Rome also."

An architect who gives a false estimate to his employer will find no defender in us, but before condemning we must know that it really is false, and, moreover, that he was paid for making a correct one. Our views on this head we have already stated, but we shall take an early opportunity to recur to them, as we shall to the general question of architects' remuneration. The present position of the matter is most unsatisfactory and hurtful both to architecture and its professors. We are not wedded to the per centage system, we have shown many objections against it, one not the least of which is that it gives apparent ground for the calumny, that architects bring upon their employers ruinous expenses, adding useless ornaments and preposterous decorations, for the sake of increasing their own charges,-that they take a hundred pounds out of their employer's pockets that they may put five pounds into their own!

A committee of the Institute, it will be remembered, inquired into the custom of payment, and drew up a report upon it for the use of the members on special application. This, however, was an incomplete and crude document, and an unsatisfactory arrangement, and we urged that they should go more fully into the inquiry, and publish a clear and comprehensive report on it for the information of the public, and the guidance of the profession.

We are glad to be informed that they are now about to resume the question, and we shall look anxiously for the result.

The Paris Architectural Exhibition.

—The show made by the architects in the present exhibition of works of modern art in Paris is rather better than it was in 1848. "Workmen's Towns;" Hospitals for "Civil Invalids," a subject referred to four architects by General Cavaignac, when at the head of the Government; the everlasting completion of the Louvre, for which more than fitty architects bave made designs since 1799; and new markets—are the principal subjects treated. The gem of the exhibition, according to Mons. Jules Bouchet, entitled Essais de Restaurations, showing, by eight drawings, Pompeil restored.

TIDAL OBSERVATIONS IN THE RIVER THAMES

DRAINAGE OF THE METROPOLIS.

A SERIES of tidal observations were made in the River Tham's between the 19th June and the 19th July of the present year, in connection with the metropolitan survey. Tidal observations of the kind, taken simultaneously at different stations, and referable to the same datum, are at any time interesting, but at the present time, when the general drainage of the metropolis occupies so large a share of public attention, and when the question of continuing or discontinuing the river as the main sewer in that drainage, must necessarily be dis-cussed in its various bearings, they become of more than ordinary professional interest.

The stations or gauges at which the observations were taken were three in number; one in Deptford-reach, another at London-bridge, and the third at Battersea-pier, near the Red house. The observations were registered every 10 minutes from 6 a.m. to 6 p.m., and correct time of each observation was determined by means of a marine chronometer at each station, set to Greenwich mean time.

The zeros of the gauges were connected by careful levelling; hence their relative level as well as that of the surface of the water in the river at all states of the tide was easily ascer-

tainable.

tainable.

It was found that there was a considerable difference in the time of the high and low water at the three stations. The greatest interval of time between the high water being—Deptford, before London-bridge, 20 minutes, and before Battersea, 45 minutes. The least interval of time of the high water was, Deptford, before London-bridge, 5 minutes, and here Battersea, 30 minutes; and the and before Battersea, 30 minutes; and the mean interval of time during the month's ob-servations was, Deptford before Londonbridge, 12 minutes, and before Battersea, 36 minutes.

The greatest interval of time between the low water at the three stations was, Deptford, before London-bridge, 55 minutes, and before Battersea, 90 minutes; the least interval of time was, Deptford, before London-bridge, 13 minutes, and before Battersea, 63 minutes; and the statement of the statement o and the mean interval of time during the month's observations, was Deptford before London-bridge, 24 minutes, and before Battersea, 73 minutes. The interesting fact is deduced from this variation of time of high and low water, that the tide is, when near the time fow water, that the fuce is, when near the time of high water, flowing for a period of 30 to 45 minutes in opposite directions, that is to say, at Battersea it is flowing down the river at Deptford, the intermediate points being affected the accreanding a visual according to their to a corresponding extent, according to their relative position. The counter currents about the time of low water, continue for a longer period, the current of the ebb stream at Battersea flowing down the river for an hour or an hour and a half after the flood stream has set up the river at Deptford. Hence it appears that about the time of high water, there is a counter tidal current within the limits of dense population, of half an hour or three quarters of an hour in duration; but inasmuch as these opposite currents are separating, or receding from each other, that is, the part highest up the river flowing still higher, while at the places situated lower down the river, the water is flowing towards the sea, it may be supposed that the agitation in the mass of water produced thereby is inconsiderable. to a corresponding extent, according to their relative position. The counter currents about may be supposed that the agitation in the mass of water produced thereby is inconsiderable. In the case of the low water period, however, the matter is very different. Here it will be observed, while the water is at or near its lowest diurnal level, and consequently when all the sewers of the metropolis discharge their contents were the divinished. contents upon the diminished stream, or upon the half-dried mud which the recession of the tide has left bare, while at the same time a hundred river steamers, and vessels of all kinds nundred river steamers, and vessels of all kinds
stirring up the mud from the very bottom of
its bed, two opposing currents of the tide are
rushing towards each other from Battersea to
Deptford, which meet about midway, or somewhere between London and Waterloo-bridges.

The relating least of the high and desired.

The relative level of the high and low water at the different parts of the river, as well as the relative level of the several parts at the same instant of time, during the entire ebb and flow of the tide throughout its whole age, must obviously enter largely into the discussion of any general scheme of sewerage which contemplates using the Thames as the main artery of its system. The following results bear on this point :-

The mean difference of level of the highwater at the three stations was, Deptford lower than London-bridge, 0.25 (eet; and higher than Battersea, 1.03 feet. The main difference of the level of the low-water at the three stations was, Deptford lower than London-bridge, 0.59 feet; and lower than Battersea, 1.98 feet.

The greatest range of tide Deptford . . 21.35 feet. London-br. 20.65 , Battersea . . 16.70 ,, The least range of tide Deptford .. 14.76 London-br. 14.50 during ditto..... Giving a mean range of tide for the river between Deptford and Battersea of .. 16.78 ,,

This affords fair data for ascertaining the approximate volume of water which ebbs and flows twice a-day, and, consequently, of the quantity to be contaminated by each individual or family of the entire population. The area of the river from Deptford Dockyard to Battersa Pier is about 1,360 acres; and we have in each acre, according to the average range of tide here stated, 730,937 cubic feet, or 4,554,000 gallons, giving a total quantity in the whole area of 6,193,440,000 gallons for a single average tide, or 12,386,880,000 gallons during each twenty-four hours. Now, allowing that the population contaminating this mass of water is 2,000,000, there will be for each individual an average quantity of 6,193 gallons, or upwards of 30,000 gallons for each average family of five persons.

Different minds will draw very different in-ferences from these matters of fact. Some will say that, with this quantity of water for each individual, or family, it would be utterly impossible to render the whole mass so dangerously polluted as it is stated to be; whilst another class, from their assumed knowledge of numerous collateral and constantly recurring sources of contamination, will probably arrive at a totally opposite conclusion. One thing, however, may be stated as certain—namely, that the whole question cannot be fairly discussed by taking an isolated view of the facts, or with an imperfect knowledge of them.

Great diversity of opinion has been expressed with respect to the quantity of contaminating matter which passes into the Thames from the matter which passes into the Thames room whe sewers of the metropolis, and the proportion which it bears to the quantity of water in the river. Mr. Chadwick, at a recent meeting of the Commissioners of Sewers, stated this proportion to be as 1 to 10,000; this, however, can only be taken as a conjecture. The following considerations will aid in forming as correct an opinion upon the subject as the imperfectly known facts will warrant.

The area of the metropolitan district drained The area of the metropolitan district graines by the part of the river Thames here under consideration, is about 24,000 acres, or nearly 40 square miles. The annual quantity of rain falling in the metropolis is about 21 inches, which gives for this area of drainage about 11 area of 2000 relies. Of this instantian 11,397,300,000 gallons. Of this quantity, onehalf probably passes away by evaporation, and the other half, or a daily average of about 15,600,000 gallons, passes through the sewers into the Thames.

Another source of supply is from the water pipes. The quantity of water supplied daily by the several water companies to the metropolis in 1833 was stated, before a Parliamentary polis in 1833 was stated, before a Parlamentary Committee to be 35,000,000 gallons (a quantity scarcely credible). To this may probably be added, on account of increase of population, &c., 20 per cent., or 7,000,000 gallons, giving a total of 42,000,000 gallons, or 21 gallons daily for each individual, at the cresent time. Assuming that one-fourth of or 21 gallons daily for each individual, at the present time. Assuming that one-fourth of this quantity passes into the waste pipes, and thence into the sewers, we have 10,500,000 gallons per diem passing into the river from this source, which, added to the average daily quantity of 15,600,000 derived from rain, gives a total daily average of 26,100,000 gallons. Or, adding to this that which is supplied through the natural channels of streams

derived from sources exterior to the area of derived from rain is fluctuating in its supply, stheads the daily approximate the portion derived from rain is fluctuating in its supply, although the daily approximate the portion derived from rain is fluctuating in its supply, although the daily approximate the protection of the rived from rain is fluctuating in its supply, although the daily average throughout the year may be 30,000,000 gallons, the actual daily supply for sewer-cleansing purposes in dry weather may be as low as half that quantity, while in rainy seasons the daily supply may rise to 45,000,000. In the former case there would be about a proportion of one gallon of polluted sewer water to 800 gallons of tidal water, and in the latter case it would be as one gallon to 267 gallons. The purity of the water in the river would, however, be as much deteriorated in the one case as in the other, as teriorated in the one case as in the other, as an equal quantity of soil must necessarily be cleansed from the sewers in both cases; the only difference would be, that with the more copious supply of water the soil would be in a more diluted shape, but not on that account in greater quantity.

It may be fairly expected that in some of the

numerous plans of sewerage to be shortly laid before the Commissioners of Sewers, this im-portant subject will be fully discussed. To do so, however, the fact must not be lost sight of, that as the tidal wave is to a certain extent oscillating in estuaries, or rivers like the Thames, it cannot be supposed that the whole of the semi-diurnal additions of drainage impurities can pass completely away with each tide; we know, indeed, that they do not; and it becomes a matter of vital importance to ascertain the progressive amount of these accumulating impurities. It is as absurd to pretend that the water of the Thames is uncontaminated, while it is used as the main sewer, as to expect the purity of a mountain stream in a river on whose banks 2,000,000 of the most restlessly active people in the world

exist.

IMPROVEMENT OF WROUGHT-IRON WATER-PIPES

In your number of the 11th of August a paragraph was inserted stating that Messrs. Fox and Henderson had purchased the license for the manufacture in England of the wroughtiron pipes, upon the patent of M. Chameroy. Iron pipes, upon the patent of M. Chameroy. This paragraph escaped my notice until very recently, but as it is always better late than never, perhaps you will allow me through your columns, to call the attention of these gentlemen, and of the profession, to some defects in the use of these pipes. I do this, because the defects are susceptible of being remedied; and the parties would render a real service to all interested in drainage and waterservice to all interested in drainage and waterworks, were they to succeed in the attempt.

Firstly. The tubes, or pipes (as I have seen them employed in Paris, and in other French towns), are not made sufficiently strong to resist the pressure from without. The weight resist the pressure from without. The weight of the earth above them, combined as its action often is with a settlement below (for most water pipes are laid in made ground), forms indents which diminish the volume of water delivered. But as the indent is not always accompanied by a leakage, it is very difficult and expensive to ascertain where the obstruction occurs. I have known nearly a mile of pipe laid bare to find the cause of the diminished delivery. In fact, elasticity is not to be desired in a water pipe.

to be desired in a water pipe.

Again. The screw couplings being soldered on, are very likely to be, and often are in practice, detached. It is easily conceivable that an artificial joint of this kind is exposed to minute defects, hardly perceptible by the workmen, but which the continual action of the water, with a "head" such as is required for the high service, cannot fail to discover, and also to accurate. and also to aggravate.

In France the screw socket pipes were used for lengths of about 80 feet, and then flange pipes were introduced to admit of repairs in case of accident. Great inconvenience arose from this great length between the flange joints; for it is invariably found that the oxidation of the iron in the worm of the screw joints, made these last adhere together so firmly, that it was next to impossible to sepa-rate them; or at least the solder between the

screw flange and the tube was so much detached, that the water, when reintroduced,

almost invariably forced it way through the

The objects to be attained are, to assure the pipes against compression by increasing their resistance to a lateral, or transverse strain; next to introduce some means of making the joints, which should not be liable to the objections stated above. There is a collateral objection to these pipes, which in some cases assumes a very great importance, but which might also be obviated; namely, that the settlement of the earth round them, when in place, gives rise to a species of friction which destroys the asphalte coating, and leaves the salts, and of the moisture of the ground. I have seen some of these pipes at Havre nearly eaten through from the outside, the inside remaining perfect. Should the manufacturers in question remove these objections, they would confer a benefit upon the profession, inasmuch as the pipes in question do not affect the quality of the water like those generally used.

G. R. Burnell.

ART-EDUCATION FOR THE PEOPLE.

The people of this country have been long allowed to remain ignorant of the fine arts, and debarred, in consequence, of much that highly concerns their knowing. Their treasures, however, should be now open to them, and they should be trained for them by means of artistic discipline heing made, henceforward, an important part in the system of our national instruction. In all the public schools and establishments for upraising the popular mind it has been strangely omitted, and is now only beginning to be very feebly and inadequately enforced. It seems hitherto to have been considered as one of those divisions of human attainments too mysterious and sacred to be entered upon by the generality. The beautiful was created for all, although it is true it has been enjoyed only by the few! Untivivitation must make the knowledge of it universal. It cannot be the exclusive privilege of a class; all the world will one day be its worshippers. But, until this be the case, we shall find the majority of the community will remain sadly deficient in the necessary amount of discrimination of what is true, natural, or beautiful; their sympathy and admiration in presence of monuments of national glory will be dead, and their patriotism will grow wold. With these reasons, we think the subject of art-education is one that ought to have great weight with the political thinker and legislator. Communicate this to the operatives, mechanics, and artizans of the country, for their sakes and for its honour,—for the cause of art and artists; you will improve the condition of the one, and exalt the character of the other; they will commence a mutual existence for each other; artists will be compelled, as they value fame, to produce excellent works, for then no medicority will be tolerated by the multitude, nor will they any longer be imposed upon by the accustomed arrogance and flippancy of critics. This set of unen, wise in their own generation, will have to be on their guard; and those who have been indifferent about the reputation of othe

A STARTLER FOR THE DRAIN-PIPE MAKERS.

THE following are tenders for draining an estate at Kennington-cross, the property of Mr. Henry Bowden; Mr. Rogers, architect. The work consists of nearly 3,000 feet run of tabular socket glazed earthenware pipes, of different sizes, from 4 inch to 15 inch.

THE BIRMINGHAM UNION COM-PETITION.

A PRETTY STATEMENT.

I AM led by the manly and independent manner in which you always advocate fair play, and expose all ahuses connected with architectural competitions, but more especially by what you have already published respecting the doings of the Birmingham guardians, to send you some particulars I have received relative to the said board; in order that you may further expose the gross injustice that has been done those architects, who, like myself, were induced by the specious promises and great professions of honesty and fair dealing made by the guardians at the time they issued their conditions and instructions to architects.

From inquiries I have lately made, I now find that the whole affair from beginning to end has been, to say the least of it, a delusion and a snare, and I think you will acknowledge a more disgraceful or dishonest affair never came under your notice, when I tell you I am in possession of information, which not only proves the truth of the statement made by Mr. Brookes as regards Messrs, Drury and Bateman's names being on their drawings, but also confirms the suspicion that two at least out of the three judges were influenced and guided thereby, in the opinion they gave of the designs submitted for them to examine and report upon: in proof of which I would mention the fact that one of them (Mr. Edge) canvassed some of the guardians in favour of Messrs. Drury and Bateman, during the first competition; and that it is currently reported in Birmingham, that another of the judges (Mr. Gibson) is about forming an alliance with the family of one of the successful competitors. I therefore think under these circumstances, that you and every other unprejudiced person will agree, that I, with every other competitor, have good reasons for impugning the disinterestedness of a tribunal so constituted.

In addition to what I have already stated, I have been informed that a large sum of money was spent during the late election of guardians which took place between the first and second competition, to ensure the return of the present members, and although it would be very difficult, if not impossible, to prove that a large portion of it was subscribed by the present successful competitors, yet such I am informed was reported at the time of election, and what serves to confirm this statement, is the fact that nearly, if not quite all their supporters in the first competition, the present chairman of the hoard amongst the number, were re-elected and the opposing party thrown out; and besides which, it was well known that but few, if any, of the party who took an active part in the election, had sufficient interest for spending money upon such an occasion.

occasion. In order to satisfy the competitors and the public at large that the design recommended by the judges, and finally adopted by the judges, and finally adopted by the guardians and Poor-law Commissioners, does display such superior talent as to require so distill difficulty in arriving at a judgment independent of the names of the architects, I would recommend that a public exhibition be made for all the designs sent in; which course, I think, neither the guardians nor the judges they appointed could possibly object to, if their decision has been an honest one. But in case they neglect this means of vindicating their characters, I would then recommend that a meeting of the competitors be called, for the purpose of arranging such exhibition, and forming a committee to make a report thereon, and taking such steps as they may deem advisable. As regards the expenses attending such exhibition, I have no doubt they would be more than covered by making a trifling clarge to the public for viewing the same, as I understand the matter excites considerable interest in Birmingham; and should any surphus remain, after paying the expenses, it would serve to make up a fund for the purpose of trying a question at law, whether each competitor is entitled to be paid for his design, provided it can be clearly proved the guardians have broken their contract by not fulfilling the conditions of the competition; or it might be given to some needy and useful charity in the eneighbourhood.

I do not wish my name to appear, but I enclose my eard as a guarantee of my good faith.

LOVER OF FAIR PLAY.

PARKS FOR THE METROPOLIS.

Something has been said recently in The BUILDER on the parks. Now, in my opinion, gross negligence has been manifested for the welfare of the inhabitants of this overgrown metropolis, excepting as regards the western portion, and perhaps I should admit the extreme eastern part. In the year 1833 a select committee was appointed in the House of Commons, to consider the propriety of establishing additional public parks and places for exercise. The committee having considered the matter, reported that the number of such places were insufficient then for the requirements of the public, and recommended that five additional sites should be appropriated for the establishment of public parks and walks.

Now, Sir, since that period, sixteen years ago, what has been done? Victoria Park, such

Now, Sir, since that period, sixteen years ago, what has heen done? Victoria Park, such as it is, has been partly formed; and the very best site for a public park in the neighbourhood of London, viz., Copenhagen Fields, has been suffered to be entirely destroyed, and almost every footpath in that neighbourhood closed against the public, which, at the time above mentioned, they had full enjoyment of.

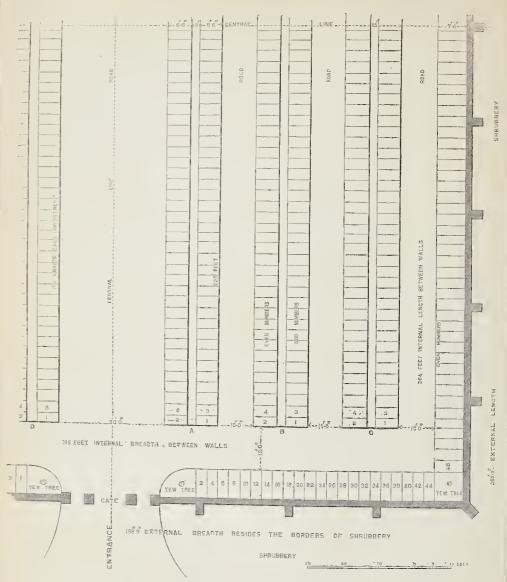

Hackney Downs, too,—these would form a noble park. But there are boards up to say that the ground is to be let for building purposes; although I believe it is or was common, or lammas land. But no measures have ever been taken, at least that I am aware of, to secure this beautiful spot for the use of the public.

I do not mean to blame the present Government for all this. Of course they cannot be answerable for the misdeeds of their predecessors. But I must say that I think it very hard, that when the sum of 150,000. should be lavished upon additions (the propriety of which is very questionable) to a single palace, which has already cost no one knows how much, and such immense sums should be expended upon the new Houses of Parliament, so little should have been done for the suffering million. By the suffering million, I mean those poor creatures who are compelled to drag on a miserable existence in the crowded courts and alleys of this bloated city, and who scarcely ever, now, are able to see a green field. I do not mean those who can afford to spend two or three weeks or months at a watering-place every year, nor those who, besides having the enjoyment of the parks at all times at their command, spend a considerable portion of their time at their country seats, but the poor artizan and clerk, who are compelled to toil from year's end in the close workshop and counting-house for the means of subsistence.

The builders are not blameless in this matter, for the reckless way in which they have covered every available spot of ground without reservation; and this they will find out the error of before long, or I am very much mistaken. The better class of houses, that is, houses of from 50% a-year and upwards, do not let now so well as they used to do. Those parties who can afford it are beginning to move off a little way into the country, along the different lines of railway. I know three or four instances of this within these last twelve months. One party has gone to reside at Sydenham, from the neighbourhood of Cloudesley-square, Islington, and the other two to Penge, on the Croydon line, from Myddelton-square. Now, as new lines of railway are opened, and the facilities for residing a short distance from town increase, so will the houses in the suburbs be deserted by the most respectable tenants, and the depreciation of house property in these neighbourhoods be beyond alteralulation; and, in the end, the consequences will fall upon the heads of those by whose means and connivance it was brought about.

ENFORCEMENT OF CLEANLINESS IN DWELLINGS.—The corporation of Brussels, and several other large Belgian cities, have determined, it is said, forcibly to close all houses left uncleansed, and to stick on the door a bill bearing the words "interdicted house."

A PLAN FOR A PARISH BURIAL GROUND. DATA FOR CHURCHWARDENS.

The public appear now to be alive to the impropriety of continuing the practice of intramineal burials. In most towns with which I am acquainted the churchyards are completely full of coffine, and thus, independently of the fail of coffins; and thus, independently of the question of health, there exists a sufficient reason why other burial-grounds should be provided.

provided.

It has struck me with some surprise that no parties have as yet given any ideas on the subject; I therefore take it up, with the view of assisting churchwardens, or other authorities entrusted with such matters, to judge of the quantity of ground required, and the number of graves necessary in proportion to the population. It is of some importance that the ground should be properly laid out in the first instance, because the arrangement (if there be any) cannot well he altered after interments have taken place. have taken place.

Annexed is a plan of a burial-ground, capable of containing 1,174 graves, each 6 feet 6 inches by 3 feet, and numbered, having a communication by road, without trespassing on any other grave. I propose that the burial-ground should be enclosed by a wall, having its footings carried down to the depth of the deepest graves—say 7 feet helow the surface,—and that there should be a shrubhery or plantation, of from 30 to 33 feet broad, on the outside, to keept in neat order, with a view to prevent houses or sheds from heing built in contact with the walls, overlooking the ground, and otherwise hecoming a nuisance.

should he gravel, and not clay, if it can be avoided.

The plan shows one quarter of a hurial-ground calculated to contain 1,174 graves. One-fortieth of the population are supposed to disturbed for at least seven years after intermed. Thus, the population + 40 and × 7 gives the least number of graves required for the parish or district. The space here occupied is 110 yards × 88 yards, = 9,680 yards superficial, or two acres.

R. T. (Colonel.) otherwise hecoming a nuisance.

I have not shown any buildings to contain tools, &c., because, if required, they can afterwards be erected on the shrubbery ground,

It is evident that the number of graves can either be increased or diminished, by increasing or diminishing the number of the compartments A B C D E f by an equal number on each side of the central line. The soil chosen

MACADAMIZED ROADS FOR STREETS OF LARGE TOWNS.*

THERE is a prevalent feeling against the employment of hroken stone roads for streets, hecause, as they are usually managed, they are the cause of great inconvenience to householders and others by the dirt and dust they occasion, and also because their maintenance and repairs are very expensive, while the draught of vehicles upon them is very heavy. The object of this paper is to prove, from long continued experience on a large scale, that these objections do not necessarily accompany the use of such roads. In discussing this question the interests of two parties must be considered: those who principally use the road,—the owners and employers of horses and vehicles,—and those who pay for it,—the rate-payers, who are they who would be injured and annoyed if it were unduly expensive or unnecessarily dirty, dusty, and noisy. It is a common error to dusty, and noisy. It is a common error to consider that road the cheapest which costs the least in direct expenditure. If, however, this so-called cheapest road cause waste of horsepower, undue wear and tear of horses and vehicles, loss of time by being unfit for rapid transit, and occasion loss to the inhabitants by filling their dwellings with dust, and coverby filing their dwellings with dist, it is evident that such a road is really very dear. There is an apparent diversity of interest between those who use and those who pay for our public streets; as the principal loss from bad roads of the diversity was those who keep or graphy. falls directly upon those who keep or employ horses and vehicles, while the expense of road repairs falls upon the inhahitants generally. A little consideration, however, will show that this diversity of interest is more apparent than real. It is the interest of all that there should be easy, safe, and cheap means of transit through the public streets; and any increase in the cost of transit is a source of indirect expense even to those who have no horses of their own, as it must add to the cost of everything carried through the streets, and of all hired vehicles, and of all the numberless conveniences which accompany residence in a large town. It must also he remembered that very wasteful to allow a road to go out of repair, since it is less costly to keep a road up than to restore it. That roadway is best for than to restore it. That roadway is best for the owner or user of a horse or vehicle which can be travelled over most easily, safely, quickly, and chaply; and that ease, safety, speed, and economy are to be obtained by having the road firm, even, and smooth, and perfectly free from mud or dust, or any form of unattached materials. It is evident that the same qualities will render the roadway most free from poise dirt and dust the three great. free from noise, dirt, and dust, the three great causes of annoyance and injury to the inhabit-ants of all ordinary streets. The question causes of annoyance and injury to the limition ants of all ordinary streets. The question which remains to be considered is, whether the advantages of good roads to the inhabitants generally are worth their cost? If the question had to be decided in accordance with the interest of the users and owners of horses merely, and the limition of the contract of the second of the contract of the second of the contract whatever nature the surface of a road is to be, it is essential that its foundation should be of firm material, well consolidated, and perfectly drained; if not, the crust becomes loosened and destroyed, the road is rough and uneven, and wears into holes and ruts. Having obtained a good foundation, the next point is to cover it with a hard, compact crust, impervious to water, and laid to a proper cross section. The stones must be broken to one regular The stones must be broken to one regular size, well raked in, and fixed there by a binding composed of the grit collected in wet weather by the sweeping machines, and preserved for this purpose. This binding must be laid on regularly, and watered until the new material be firmly set, which it will do very quickly and with the regularity of a well-laid pavement. The sharp angles of the stones are preserved, and there is both great saving of material and a firmer crust formed than by of material and a firmer crust formed than by the common method of leaving the material to work into its place without the use of hinding, —in which case the angles of the stones are worn off and reduced to powder, and at least one-third of the material is wasted in forming a binding in which the stones may set. By the improved method the binding is formed of material that would otherwise be useless. Many

the ground that the road is rendered rotten by it, and that when the road is set it has to be carted away again. This is apt to be the case under bad management, and when ordinary soil is used, the fine particles of which work into mud, and keep the road from setting firmly. But the coarse grit obtained by the sweeping ma-chine off the roads is the very same material as is produced by wearing away the angles of the stones, and when judiciously applied to a new coating it will speedily become as well consolidated and firm as an old road. In the common method not only is there great waste of material, but the loose stones occasion delay or material, but the loose stones occasion delay hy their resistance, great fatigue to the horses, and danger to their feet, while the noise pro-duced hy their grinding together is annoying to the inhabitants. Upon the improved method the inconveniences of road repair are incomparably less than those of pavement. Both recogning and repairs may be made without stopping the traffic. Under no circumstances must any imperfection of surface be allowed. If a hollow he not immediately stopped it very quickly extends over the sur-face. All loose stones should be carefully picked, as every loose stone passed over by heavily laden carriages, if not ground to pow-der, breaks the crust of the road, and if water he permitted to lodge on the surface it will cause great mischief. It is the neglect of these essential precautions that has led many consider macadamized roads expensive, They are expensive if neglected. On a well made road heavy showers do good, by cleansing them:—so, also, does artificial watering if the road be clean or swept quickly after it is watered. A road which is perfectly dry loses its tenacity, and the surface grinds into dust; whence the economy of judicious watering in whence the economy of judicious watering in hot weather, which preserves the road as well as prevents the annoyance of dust. The practice so common in London and elsewhere of heavily watering a dirty road without cleansing it, and thereby converting the dust into mud, is very injurious to the road, and merely changes one nuisance into another—dust into mud. A great source of waste, both to those who use and to those who repair a road, is to allow it to be dirty. The draught on a dirty road is twice as heavy as on a clean one,—that is, a horse must evert double force to draw that is, a horse must exert double force to draw his load with the same speed. The cost, how-ever, of employing double force is so great, that the expedient of diminishing the speed is generally adopted, as a horse can exert greater pulling force at a slower pace,—less power being required to carry his own body. It often happens that the extra resistance occasioned hy dirt diminishes the speed one-fifth or onefourth. The effect of the dirt, therefore, is to increase the work by 20 or 25 per cent. It will easily he believed that such a waste far exceeds the cost of the most perfect cleansing. This is the case when cleansing is done by Into is the case when cleansing is done by scrapers (the greatest enemy a macadamized road has to contend against). By their use the stones are dragged from their places, and the adhesive dirt is not effectually taken away. Sweeping is the only mode of cleansing that should be allowed, either on streets or turn-site and a Sweeping by the wide heaven. pike roads. Sweeping by the wide brooms of Mr. Whitworth's machine is preferable to all other modes of cleansing yet tried. It must be evident, that the fact of these wide brooms sweeping longitudinally, with a pressure that can be adjusted according to circumstances, can be adjusted according to circinistances, tends powerfully to preserve the road and to consolidate its surface. They press most upon the ridges, and least upon the hollows, thus tending to reduce the former, and fill up the latter. When the dirt is stiff, and adheres firnly to the stones, it should first be well watered, when it may be completely removed by the machine, without disturbing the crust, leaving the surface firm and connect. The leaving the surface firm and compact. The use of water for this purpose has been objected to by high authorities, on the ground that it does remove the useful grit; but the contrary has been proved by ample experience. I have found the use of the sweeping machines, with the proper employment of water, has reduced the amount of material required for the repair of roads in Birmingham one-third,--namely, from about 20,000 to 13,000 cubic yards. The first-named amount is the average for seven years preceding the introduction of machines,
—the latter, the three years subsequent.

The great objection urged against macadamized roads for streets is the annoyance by dust and ditt which they occasion, and many persons prefer submitting to the deafening noise of pavement in order to avoid these; but this would not be the case if water and machine cleansing were adopted, the cost of which would be saved in diminished wear and tear. The entire cost of cleansing and watering Birmingham is ahout 5,000L per annum,—or less than one penny per week for each of its inhahitants.

J. P. Smith.

MANAGEMENT OF COMPETITIONS.

START not, nor throw this aside, on seeing the heading again. You closed your leader a few weeks ago with "Fight the good fight, and fear not." I trust you will apply this to architectural competition, and "fight it out." The subject, it is quite cheering to see, is being so well discussed by your correspondents, and this time with such a fore-shadowing of a successful, enduring, movement on the part of the profession, that I trust you will not close your columns to weekly communications on this topic (such as you have inserted for the last three weeks), till the right management of architectural competitions be, as it very soon must be, decided on by a "monster" meeting, which a public meeting of architects, cordially uniting to look after their common rights, will surely be—

"A stranger animal, cries one, Sure never lived beneath the sun."

"W. W.'s" letter last week is useful, though I lite not the scramble for "laurels" he hints at. The words of the institute's report on competitions, are "to effect this object rests with the profession at large," and the institute will, doubtless, not be wanting, should the profession, as the sailors have it, "turn out."

A meeting, to be of use, as ably shown by your correspondent "C.G." (page 435), should he put in communication with every known architect practising in Great Britain; and to effect this, would be attended with more expense than any one society might wish to incur; whereas the most trifling, instgnificant subscription on the part of the profession as a hody, would amply supply the requisite funds. Perhaps some of your correspondents can point out a mode of dealing with this difficulty.

One word more in allusion to your other last week's correspondent, "A Builder." He takes a most correct view of this question, and sees, like a clear-sighted "builder" as he is, that builders are vitally concerned in it, for what on earth can more conduce to the propagation of "blind huilders" than the present mode of conducting architectural competitions, which sets architects one against another to produce—not the best structure, oh, no! but the most attractive, gaudy designs, which their authors undertake to realize for a mere song, succeed in the struggle thereby, and straightway (such is competition), institute a scramble of very "blind builders," to endorse their own promises? To The Builders again I say, "fight the good fight, and fight it out."—Y.

DISTRICT OF CHRIST CHURCH, ST GEORGE'S-IN-THE-EAST, LONDON.

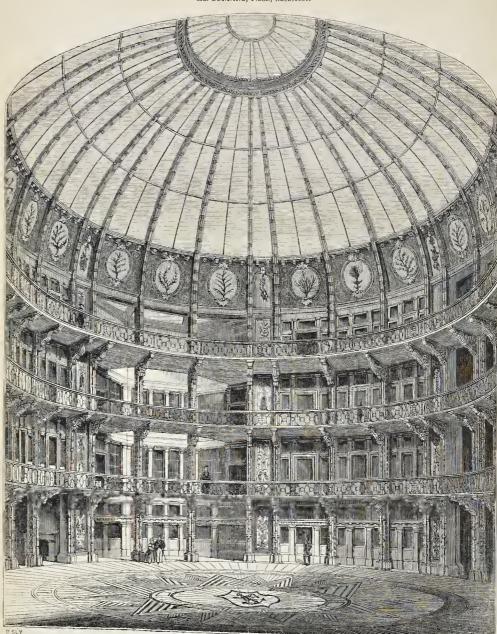

In the year 1847 an appeal was made for public support in order to obtain:—1. A parsonage for the innister of the present church, the Rev. W. Quekett. 2. Three new schools for 790 children, with three residences. 3. A new church of stone, plain but substantial, for 1,000 persons. And 4. A parsonage for the minister of the new church.

The minister exerted himself greatly; Government and the London Diocesan Board of Education assisted; and the parsonage, the schools, and the residences (Mr. Geo. Smith, of the Mercers's Company, architect), have been completed, and a church is now being erected at the cost of a munificent nobleman. Ahout 8,000l. have been spent, irrespective of the church. The schools and residences cost 3,558l.; the site, 700l.; the parsonage, 1,048l. There is a deficiency of 211l.: 1,500l. are wanted for a parsonage for the minister of the new church; and a further appeal is being made. The church is geometrical pointed in style, and is to have a tower and spire at the east end of the south aisle of nave.

^{*} The following is a portion of a paper read before the British Association for the Advancement of Science.

THE LONDON COAL EXCHANGE, THAMES-STREET.

MR. BUNNING, F.S.A., ABCHITECT.

INTERIOR OF THE LONDON COAL EXCHANGE, THAMES-STREET.

The interior of the new London Coal Exchange, now nearly completed, at the corner of Lower Thames-street and St. Mary-at-Hill, under the direction of Mr. Bunning, architect to the corporation, presents considerable novelty both in design and decoration. It includes a circular area for the meeting of the merchants, 60 feet in diameter, with three galleries running round it, which communicate with snitable offices; and the area is covered by a glazed dome, the eye of which is 74 feet rom the floor.

The galleries are peculiarly constructed, and entirely composed of iron, embellished with symbols of the coal trade. The stannehoons, brackets, ribs and eye of the dome are also of iron, and the panels (twenty-four in number) are ornamented with paintings of the plants and fossil remains found in the coal series, from drawings made by Mr. Melhado, a pupil of the architect, from specimens in the British Museum, and painted by Mr. Sang in encaustic. The eight smaller compartments are filled in with implements used in the coal district. The panels in the galleries contain figures of the miners, which are less satisfactory in execution.

Each rib, of which there are thirty-two, is 42 feet 6 inches long, and is cast in one length, averaging in weight 2 tons: there are in all about 300 tons of iron, including the gully plates, stauncheons, brackets, &c. The galleries are about 12 feet from floor to floor. The cupola is glazed with ground plate glass, and the eye with amber-coloured glass. The ornamented portions of the stauncheons, gallery railing, soffits, &c., display in almost too great profusion the rope form. The floor of the area represents the mariner's compass, in the centre of which are the City arms, composed of different woods. A portion of the decorative part of this floor is formed with part of an oak tree

which had been found imbedded in the river

A staircase leads to the hyporcaust which was discovered in excavating for the foundation, and described in our pages at the time.

A visit to this will amply repay the lovers of antiquity; and its minute agreement with the details given by Vitruvius should be noticed. The artificers' works generally have been performed by Mr. Trego; the iron-work by Messrs. Dewer; and the wood-work has been researed by Mr. Trego; the iron-work by Messrs. Dewer; and the wood-work has been

Messrs. Dewer; and the wood-work has been seasoned by Messrs. Davison and Symington's patent desiccating process. The floor of the merchants' area was laid down by the first-named of these gentlemen, Mr. Davison.

The cost of this Exchange will be about 40,000%. A view of the exterior of the building, which has a circular tower 100 feet high at the angle of the two fronts, forming the principal entrance and containing a staircase leading to the several stories, will be found in our fifth volume, page 566. our fifth volume, page 566.

SUPPLY OF WATER.

IT has been stated in THE BUILDER that 70,000 houses in the metropolis are without a supply of water; and the public are recommended to raise an outery until a supply be raised,—but how the outery is to accomplish the chief does not expressed.

raised,—but how the outery is to accomplish the object does not appear.

These houses are mostly of the smallest class, situated in courts and alleys, and occupied by tenants paying weekly rents to landlords, whose great object is to make the properties as profitable as possible. The tenants get their water how they can—from pumps or common cocks in the neighbourhood, or perhaps buy or beg of some publican or shop-keeper. Two difficulties must be dealt with, in order to remove the evil. An outlay must be made, to convey the water into the houses; and an annual payment must be secured to the be made, to convey the water into the houses; and an annual payment must be secured to the parties who convey the water: it would be idle to expect that the Henley, or any other waterworks company (new or old) would spend money to improve other persons' property, or afford a supply of water, except upon remunerative principles. It is the owners of the property only that must be looked to: and there rative principles. It is the owners of the property only that must be looked to; and there can he no more reason why a man should be allowed to let a house for the manufacture of fever and postilence, than that he should be allowed to poison the atmosphere in any other

. E. does not see how an outcry for water is to aid in obtaining a good supply of it. He may depend on it that without an ontery it will never be procured. The outcry must be for sufficient water, pure water, and cheap water; and when this is to be had, and the vital importance of it is brought to the minds of all, landlords will feel made, or be made to afford it, to those not sufficiently strong to claim it for themselves. Can the existing water companies comply with the requirement? That they do not is certain. If they cannot, or will not, those who will undertake to do so should be supported on all hands. A continuous and abundant supply of pure water is imperatively demanded. We direct attention to the following communication on same subject.

I beg, through your valuable journal, to call the attention of the public to the source from whence all the water for the southern districts of London is supplied. Whilst a great portion of the north side of the Thames,—say the City of London, and parts around, are supplied from the New River—a stream comparatively pure,*—and this district has suffered very slightly with respect to the cholera,—the south side, such as Lambeth, Newington, &c. &c., has suffered a dreadful mortality. May not this be greatly attributed to the water, impreshas suffered a dreadful mortality. May not this be greatly attributed to the water, impregnated as it is with everything that is bad and prejudicial to health? And, though the water company professes to filter it before it is sent in to our houses, which they may do, as regards anything like substances, they cannot filter the filthy mixture of liquids from it any more than they could, by filtering, turn here into surjuny water. Consequently we can be a suffered to the surjuny water. beer into spring water. Consequently we, on the south side of London, are compelled to drink it, such as it is. I think, after this, we eannot wonder at the amount of illness and

death. The only wonder is, that we are not all poisoned together, for it only requires one moment's consideration, or a glance at the points in the river from whence the supply is taken, to fully explain the greater extent of mortality on the south side of London over the north. The Thames water was bad enough before, but since the flushing of the sewers, of course it is ten times worse than ever;—so they, in their wisdom, flush the sewers on the north side of London, and we, on the south side, are compelled to drink it,—a very pretty state of things truly. Common sense would immediately condemn such a plan, but that is an article in very little use amongst committees. One sensible man would do more practical good than balf the committees combined. The state of the river has been so ahominable of state of the river has been so anominable of late that the steam-boat passengers could scarcely hear the smell; and yet this filth is served up for domestic purposes. Such a course ought, in justice to the inhabitants, to be stopped as soon as possible; and this might he done by laying down a pain of teams. be stopped as soon as possible; and this might be done by laying down a main, at any cost, by the side of the Kingston Railway, from about Kingston to their tanks in Battersea fields, so as to have a supply of water above the influence of the tide. Until some remedy be obtained, we must drink the pollutions of London, and die in consequence. R. M.

NOTES IN THE PROVINCES.

A CHAPEL of case is being erected on Letty-green, near Hertford, under the direction of Mr. G. Fowler Jones, to accommodate 125 in open seats, 100 of which are free. The style Early English; the plan a parallelogram, 50 feet by 21 feet; the walls of brick, faced with the plan and parallelogram of the plan to the style of the plan to the pla flint, with stone dressings; a bell turret on west gable; high pitched roof, open to the boarding, and stained and varnished; cost 6301., which has been raised by subscription. through the exertions of the rector of Hertingfordbury and some of the neighbouring gentlemen, the site being given by Lord Cowper. The building is to be ready for consecration towards the end of October.—Considerable alterations are now in progress, under the same architect, at the recently erected church at Tolmers, in the same county, to make it more eccles astical: it has, along with the school and master's house, been built and endowed by Mr. Thomas Mills, of Tolmers. by Mr. Thomas Mills, of Tolmers.—
In consequence of the recent destruction of eight houses in the market-place of Cambridge by fire, it is now proposed to remove the whole of the west side of the market-hill, together with Warwick-street or Pump-lane, throwing open the market to St. Mary's Church, and the University buildings and grounds beyond.—The Sanitary and Drainage Committee of this town met the other day to receive tenders for drains in several improvements. to receive tenders for drains in several important districts:—For Newmarket-road, 528 yards, tender of Samnel Peacock accepted, yaids, tender of Samnel Peacock accepted, price 12s. 3d. per yard,—average depth 13 feet; other tenders were sent in, one at 18s., and another at 14s. a-yard:—For Gas-lane, offer of James Stevens taken, at 7s. 6d. per yard,—depth 7 feet 6 inches:—For Albertstrect, John Ilall's tender accepted, at 7s. 6d.,—depth 9 feet:—For Thompson's-lane the work is deferred:—For St. Peter's-street, work is deferred:—For Inlimpson's-lane the work is deferred:—For St. Peter's-street, 165 yards,—average depth 9 feet 6 inches, James Stevens, contractor, at 8s. 3d. per yard.

The contractors are carrying out the new The contractors are carrying out the new sewerage of Colchester, with vigour.—The new church at Kemp-town, Brighton, crected principally at the expense of the Marquis of Bristol, with accommodation for the pupils of St. Mary's Hall for education of daughters of deceased clergymen, has been consecrated.—The Southampton Sanitary Committee have resolved to recommend the Board of Waterworks forthwith to form an additional works forthwith to form an additional reservoir on the common for the better supply of water to the town. The cost of a five acre reservoir was estimated at 2,3001.—It is seriously proposed to build an extensive university at Birkenbead, to constitute the Oxford or Cambridge of the north of England. The Archbishop of Canterbury, the Marquis of Westminster, and Lord Robert Grosvenor, have it is said already contributed 1,000/L each, and the highest sanction in the state, it is added, has been secured. A piece of ground, 10 acres in extent, belonging to Mr. Brassey,

has been thought of as the locus in quo. The Liverpool Health Committee recommend that five of the most crowded burial grounds be closed; namely, St. Nicholas's, St. Peter's, St. Paul's, St. John's, and St. James's; and St. Paul's, St. John's, and St. James's; and they have decided to apply to Parliament for power to close these fever-stills for ever.—
The foundation stone of Wycliffe Chapel, Heaton Norris, was laid on Saturday week. It is to he in the Pointed style, from plans prepared by Mr. E. Walters, the architect of Cavendish Chapel and schools, Manchester, The chapel is to cost 2,000l., and will accommodate 600 adults and 100 children.—At Rochdale, on Monday week, a stone building. Rochdale, on Monday week, a stone building, three stories high, 52 feet by 54 feet, built ten years ago, for handloom weaving flannels, and also six cottages, were "knocked down" for 2251. The handloom building alone cost more than 1,400l.

LAYING FIRST STONE OF THE NEW CITY OF LONDON PRISON.

THE first stone of the new City Prison to be erected at Holloway, said by the Lord Mayor, who officiated, to be "the largest and most expensive building ever undertaken by the corporation," was laid on Wednesday last. According to the newspapers, for we received no intimation of the occurrence, the prison is intended for the separate confinement of four hundred convicted prisoners, and has large work-rooms attached. It is to be in the castellated style of architecture, and the main parts are to be faced with Kentish rag-stone.

parts are to be faced with Kentish rag-stone. A tower of considerable height will form a prominent feature, and by it the whole of the prison is to be ventilated. On each side of the main approach to the prison, and fronting the Camden-road, a dwelling-house, faced with red brick and Caen stone, will be erected, as residences for the governor and the chaplain. The entrance gateway and the poster's lodge will also be in the castellated style of architecture, faced with Kentish ragstone. The front portion of the unin huilding, which will stand at a considerable distance from the road. stand at a considerable distance from the road, will consist of a centre building, containing, on the basement, reception-cells, bath-rooms, examining-rooms, fumigating-rooms, furnacerooms, and the principal staircase to the ground floor, which will contain offices for the governor, the magistrates'-room, and rooms for the medical officer and chaplain, and also separate visiting-places. On this floor will be

separate visiting-places. On this floor will be a corridor, leading to the portion of the prison to be appropriated to adult prisoners; and above will he the chapel, arranged to contain separate inclosed seats for the prisoners.

Connected with the centre building, and diverging therefrom, will be four main wings, which are to be appropriated to the confinement of adult male prisoners. Each wing throughout the prison will contain a corridor the entire length and height of the building, with a weigeting, gallery on each stowy above. with a projecting gallery on each story above the ground floor for access to the cells, and iron staircases leading thereto. The whole of the building appropriated to the confinement is to be fire-proof, and the floors will be formed with asphalte, with which also the roofs of the cells and corridors will be covered. The whole area contains about twelve acres of ground, and will be enclosed with a high wall.

INDURATED STONE.

In your publication of Sept. 15, I find an article on "Churchyard Monuments," wherein the decay and early ruin presented in their appearance is justly regretted. I would mention how this may be obviated.

In 1843, the hospital at Bayenx, also the cathedral and palace, were repaired and beautified with what is called indurated stone, and pathing in art can give more suits faction, then

nothing in art can give more satisfaction than the result. The weather and all other influences usually detrimental to masonry, both as to durability and colour, have not the slightest effect thereon; and up to this moment no discolouration or decay is visible. This I can vouch for under the authority of the highest officers of the place, and amongst

them, Judge Bertauldt.

I was much gratified lately when at Tonbridge Wells, to find a corroboration of the above, and much pleased to find the autho-

rities are sanctioning its use generally; in ict, resident architects and others are fically ordering the hard wearing portions of various buildings to be executed therein. I find the invention now rests in Mr. Hutchison, who is carrying out the process in that town.

On subsequent inquiries I find the invention On subsequent inquiries into the invention renders the stone non-absorbent, throwing off all discolouring matter, with freedom from vegetation. In my humble judgment, an article more suitable to the requirements inferred from your remarks cannot be found, and from its low price it is well deserving encouragement.

POLYGONAL CHAPEL, CHURCH OF ST. MARY, WOOTON-UNDER-EDGE.

THERE is a chapel in the church of St. Mary, Wooton-under-Edge, Gloucestershire, the arrangement of which is rare for English architecture, namely, that of a polygonal apse (five sides of an octagon), set on the north wall of the nave, ahout half way down, and looking The sides by which this chapel is are remarkable for their extreme formed irregularity, as seen in the following dimensions:—the west wall, 10 feet 3 inches; northwest wall, 8 feet 4 inches; north wall, 5 feet 7 inches; north-east wall, 8 feet 10 inches; east wall, 10 feet 2 inches: each wall being 2 feet 4 inches in thickness. The N.W., N., and N. E. walls have windows of similar form and character, which are filled with singular though not very elegant tracery: they, nevertheless, are effective, and lend character to the There is a piscina in the wall which divides this chapel from the nave, close to the east wall; there is also a plain doorway in the

The roof is conical, reminding the observer of the form of roof prevalent among small buildings of the Early English style, though the general details of this chapel fix the period as the Decorated.

This chapel was formerly used as a vestry, but is now approached through an ancient arch, which has recently been opened by the ascent of a flight of steps, and is now used a baptistery. There are other points in this interesting church well worthy of note, namely, two fine hrasses in a very perfect state; some good incised grave crosses; two ambries; also some good Early English work in the arches and piers; a tower of fine detail and propor-tions of the Decorated period, the window and door of which (both very good specimens) are surmounted by labels studded with ball flower. The windows and other details of the flower. The windows and other church generally are perpendicular.

W. H. I

PROPOSED PROVIDENT AND VOLENT SOCIETY FOR BU BENE. BUILDING ARTIFICERS.

IN an article which appeared in The Builder of the 15th inst. on the subject of the proposed Provident and Benevolent Society for Building Artificers, it was stated of the Servants' Provident Society, that while "during sixteen years since the passing of the Deferred Annuity Act, 941 persons only have availed Annuty Act, 941 persons only have availed themselves throughout the kingdom of the benefits of the Act, this society, during the short period of fourteen months, has added 103, or one-tenth of the whole, and since then has in-

Thope you will allow me, as secretary to the Servants' Provident and Benevolent Society, to inform you, and your readers who may be interested in the subject proposed by Professor Cockerell, and advocated in your journal, that the success of the Servants' Society, which is held out as an encouragement to those who may be disposed to join the Builders' Society, may be disposed to join the Builders' Society, has not only continued, but been largely increased, since the period referred to, viz., May 16th, 1849, when his Royal Highness Prince Albert condescended, as chairman of the public meeting in the Hanover-square Rooms, to explain the benefits which the Government annuity system offers to express and the annuity system offers to servants and the working-classes in general.

working-classes in general. Up to May, 1849, 103 servants had contracted, through this society, for Government annuities, amounting to 1,658*l*.; and had paid towards the same 1,192*l*.12s.10d.; whereas,

from May to the present time, 199 servants have contracted, through this society, for Government annuities, amounting to 3,429l. 10s.; and have paid for the same, 4,283l. 4s. 1d. making in the whole, for eighteen months, 302 servants who have contracted for Government annuities, amounting to 5,087l. 10s.; and have this society, no less a sum than 5,4751. 16s, 11d.

I trust that this statement may afford some encouragement to Professor Cockerell, and others, whether architects, builders, or artificers, who may feel disposed to co-operate with that gentleman and yourself to ensure the success of his laudable design.

PROCEEDINGS OF THE METROPOLITAN COMMISSION OF SEWERS.

WE wasted one hour and a half this (Thurs-We wasted one nour and a hait his chaurs day) morning in listening to objections and explanations and angry recriminations, all wholly unnecessary under proper arrangement, in the Court of the Commissioners of Seyers; and considering that there were fifteen officers of the commission whose hours are paid for hy the rate-payers, sitting all this time at the back of the room in case they might be the back of the room in case they might be wanted (to say nothing of eight reporters for the press), the public are somewhat interested in a knowledge of the fact, and an alteration in the state of things. Mr. Leslie was unyielding; objected to everything; obstructed everything, and yet we cannot condemn his proceedings, however disagreeable and ill natured they appeared, for the course scened really to a great extent forced course seemed really to a great extent forced upon him, and the blame must rest with those who make the objections necessary. We give our usual report below. Our object in this preface is again to express our regret at the undignified position in which the commission and its officers stand before the public, and to call for immediate alteration. A very to call for immediate alteration. A very short time ago we showed the state of antagonism between the chief surveyor and the consulting region. sulting engineer, and the smart things they said of each other. Now we have the latter and the assistant surveyor abusing one another, and endeavouring to show that each is quite unfit for his office. Let them take care lest they all prove their case in the eyes of the public. Mr. Gotto advises a plan of drainage for the luckless Westminster Imdrainage for the luckless Westminster Improvements Commission. Mr. Austin feels it his duty, unasked, to report upon it as a work entirely "at variance with what is correct," "on erroneous principles;" "absurd and impracticable;" it is a "faulty work," "a useless work;" and he then gives his own vigues.

his own views.

Mr. Gotto replies, in a report printed, but not yet before the court, that—"Either I (Gotto) am incompetent for the office of your assistant-surveyor, or Mr. Austin is incompetent to the duties of the consulting engineer to the commission," and asserts point blank that Mr. Austin's own propositions "form one mass of engineering blunders." We cautioned some of engineering blunders." We cautioned some of the officers of the court, when they were attacking people out of dors, against this slashing style of writing, but advice has heen thrown away. They all write with too much facility; and then, as everything is printed (and a pretty hill there must be for this), the temptation to be smart is too much for their randoms. prudence

Scriously, we invite Lord Carlisle to look Seriously, we invite Lord Carnise to flow into the matter, and put affairs on a better footing, or, as a matter of course, the first step taken when Parliament meets will be a Committee of Inquiry; and more printing, more delay, more waste of money.

A general court was held on Thursday, in Greek-street; Sir J. Burgoyne, in the chair.

The Cholera in Bethnal Green.—A letter was received from Mr. Baker, one of the coroners for Middlesex, setting forth that at the request of a jury of an inquest on John Papel, of Alfred-street,

Bethnal-green, he wished to call the attention of the commissioners to the entire want of drainage in that locality, and that no less than 400 fatal cases of cholera had occurred in that parish. Referred to

On the motion of Mr. L. Jones, the following reso-On the motion of Mr. L. Jones, the following reso-lation was agreed to:—"That a separate account be kept of the whole of the expenses incurred in any district where there has not heen any rate made for such district, including the salaries of the officers employed in such respective districts, in order that any expenses may be charged to such district."

such expenses may be charged to such district."

New Plan for the Drainage of Westminster.—

On the following recommendation of the Works Committee being read — "That the plan proposed by the consulting engineer (Mr. Austin), for the hy the consulting engineer (Mr. Austin), for the sub-soil drainage of Westminster be sanctioned, and that permission be given to the Westminster Improvement Commissioners to carry out the works suggested at their own expense,"

Mr. Leslie having called for the minutes of the last court of the carriers work to a change that

Mr. Lesile naving cancer for the minutes of the last court on this question, went on to observe that, at that court it was ordered that the plan of Mr. Gotto, with Mr. Austin's counter plan, should be printed, and sent round for the consideration of the Commissioners. But what were they now called the control of the con upon to discuss? Why, a new project that had never been referred to the Works Committee at all, or that had been ordered to be printed. They were, in fact, called upon to adopt some new project, which was admitted to be incomplete, and was really achieved all the the court beautiful.

no plan at all, and the court knew nothing about it.
Mr. Banfield believed the committee was th proper place to discuss the question. All that rested with the court was, to consider whether they ought to adopt the recommendations or not.—Mr.
Leslie replied that this was one of the most extraordinary proceedings he had ever seen in the conduct of public business, two papers having been
sent to the Works Committee, to consider which should be determined upon. Instead of which they proposed a third, of which the court bad never heard, still less referred to them.

heard, still less referred to them.

Mr. Jones concurred in this view, and thought
that the plan of Mr. Austin, if plan there were,
should he printed and sent round to the commissioners for consideration. He, however, had no
wisb to throw cold water on what had been done by the committee, or to consider bow far Mr. Austin had trod closely on the heels of Mr. Gotto, as he heard was now the case, but still he was of opinion that the question should he postponed for further

that the question should be postponed for further consideration.

Mr. Austin said his new work was partly of an experimental character, and he believed it would be calculated to benefit the whole district, rather than the line of the proposed street.—Mr. Leslie wished to ask Mr. Austin whether he had not thrown over the whole of his original plan, and had adopted almost in entire the plan of Mr. Gotto.—This Mr. Austin altogether denied.—Mr. Leslie said further, he was quite ready to prove that Mr. Austin could not carry into effect either of his plans.

It was urged by several commissioners that the question should be adjourned; and the matter was finally terminated by the adoption of the following resolution, on the motion of Mr. R. L. Jones:—

"That the recommendation of the Works Committee upon the report of Mr. Austin, and the original report with reference to that report and the original report with reference to that report and the original report.

with reference to that report and the original report of Mr. Gotto, be printed, and copies sent to each commissioner, and that further consideration be adjourned."

adjourned."

After the above motion was carried, a very sharp, recriminatory conversation was carried on, Mr. Leslie contending that Mr. Austin had placed the court in a position of the greatest difficulty. Mr. Austin called upon the Chairman, while be was their consulting acrosses to vertext him free wheth he consulting engineer, to protect him from what he considered unfair attacks; and Mr. Banfield, designating the manner in which business was carried on as disgraceful to the court, and unworthy even of a hear-garden, was anxious to move an adjournment.

The Drainage of the Potteries, Kensington.—The ext matter was to consider Messrs. Austin, Lovick, and Cresy's report on the drainage of the Potteries, of Kensington, presented to the court at its last

meeting. After some questions as to the power of the court to call upon the owners of the property to do the works required, the report was agreed to.

The Sewage Manure Committee. — Mr. Leslie then said that the objections urged to his proceeding with the subject of the Trial Works Committee could not apply to the Sewage Manure Committee, as a report from it had been issued upwards of six months. He then went on to state that the expenses incurred by the Sewage Manure Committee did not warrant its continuance. For instance, the sum spent on seven acres amounted to more than the fee-simple of the land. They had spent an enormous amount, and all they were likely to receive in return was 15s. from Colonel Citheroe, of Boston House, Hanwell. They needed no new experiments on the subject of sewage manure, which had been fully treated upon in the able report of Mr. Chadwick, known as the Poor Law Commissioners', as far back as 1842, at Edinburgh and other places. The recent experiments were the worst he had ever seen, and had been carried on in a most appropriate place—round the lunatic asylum at Hanwell. Had the question stopped here it would have been bad enough, but they had gone further, and placed themselves in communication with Mr. Tower, of Weald Hall, Essex, to supply bim with sewage for irrigation of land at an altitude of 540 feet above high-water mark. They proposed to carry this sewage 16 miles through a 7-inch pipe, at the expense of the ratepayers. Believing it to be the only means to stop this visionary expenditure, be should move that the Sewage Manure Committee be aboilshed.

be abolished.

Mr. Banfield seconded the motion, for unless (he said) the court supported the committee it would be impossible to go on; and to bring the question fairly before the court he had seconded the motion that the Sewage Manure Committee be abolished. The question led to a most protracted discussion, and Mr. Stone moved, as an amendment,—" That, considering the application of sewage manure to be a subject of invaluable importance to the ratepayers in towns and the agriculture of the country at large, they would be guilty of a neglect of duty in objecting to prosecute inquiries upon it, the court is of opinion that it would be premature to abolish the committee, and therefore requests it to continue its important labours." Carried by a large majority.

Books.

The Churches of the Middle Ages; or, Select Specimens of Early and Middle Pointed Structures, with a few of the purest late Pointed Examples, illustrated by Geometric and Perspective Drawings. By Henry Bowman and J. S. Crowther, Architects. Manchester, 1848.

UNDER the above title Messrs. Bowman and Crowther bave published three parts of what, if completed in a similar manner, will be a beautiful and valuable work. In their preliminary prospectus the authors said,—" This work is intended to he one of simple and practical utility. It is not the purpose of the authors to enunciate any new principles, or theorize in any way, but simply to give illustrations of entire churches of the purer styles, which, either as wholes, or from the great beauty of their details, will be of service in modern practice. At the same time, plates will be occasionally given of miscellaneous details, selected from other churches, which may not be considered of sufficient value to be given entire. The subjects will be selected principally from the midland and eastern counties, which are known to abound with the finest ecclesiastical structures. The illustrations will consist of geometrical drawings, details, and perspective view. It is unnecessary to add, that every detail and dimension given in the work will be from the most careful measurement."

In carrying out their intention, however, they have gone farther, and have added per-

spective views.

The churches illustrated in the parts now before us are St. Andrew's, Ewerby, and St. Andrew's, Heckington, both in Lincolnshire; and St. Mary's Chapel, Temple Balsall, in Warwickshire. To the first of these, fifteen plates are appropriated, including an extraplate of the mouldings, full size. The perspective of St. Andrew's, Heckington, is a charming specimen of lithography, by Hawkins.

We unhesitatingly recommend Messrs. Bowman and Crowther's work to our readers, as likely to be useful to them. It will consist of twenty parts of plates, and two parts of letter-press, and will form two handsome volumes. We suggest to the authors to confine themselves, as far as possible, to subjects which have not been given.*

holland's Wages, Miscellaneous, and Haulage Tables; arranged upon a novel and comprehensive Principle. By J. T. Holland, Accountant. London, Bradshaw's Office, 59, Fleet-street.

Tables, adapted to the Use of Builders, Carpenters, Timber Merchants, and others, to facilitate the Casting and Checking of Accounts. By James Morris. London, 1849. Miller and Field, Bridge-road.

Mn. Holland's tables will be found of great practical utility by contractors, surveyors, builders, and others in extensive business; for checking day-accounts, too, they are very valuable. They include a series of more than 36,000 calculations under the heads wages, miscellaneous, and haulage. The "miscellaneous" table applies from ½ to 50,000 of any thing at from ½d. to 40s. per yard, lb., or foot. The brick haulage from 25 to 100,000; ½ to 15 miles, at from 1s. 6d. to 2s. 6d. per mile, and so on.

mile, and so on.

Mr. Morris's tables form a book of less size and cost than the preceding, and mainly refer to planing and sawing. Table t, for example, shews at one view the cost of sawing any number of planks or deals by dozens and single cuts; Table 2, the cost of planing any number of boards at from 2d. to 1s. 4d. each; Table 3, the number of boards of any length and width required for one square of flooring, roofing, &c., and so on. They seem to be very carefully computed.

The New Testament in Lewisian Short-hand. By Thos. Coggin. London: Nisbet and Co., Berners-street. 1849.

This little book is, perhaps, more curious than useful, although it may serve the purpose of the stenographic student. It is executed in lithography from the neat MS. of Mr. Coggin, who is in the office of the Commissioners of Sewers, and it is dedicated, by permission, to the Earl of Carlisle. We are glad to find the practice of short-hand writing increasing—it is a very useful art.

Miscellanea,

RAILWAY JOTTINGS .- The revenue of British railways, observes a contemporary, cannot now be put down at less than twelve millions a-year—a greater sum than many important political states possess. dred millions of money were expended on them up to the close of last year, and even in the midst of the deep depression of 1848, when commerce was, as it were, in a state of complete collapse, not less than 33,234,818l. were expended in railway works. The number of passengers on these "new highways" during the last six months of 1848 was no less than the fast six months of 1848 was no less than 31,630,292, expending a sum of 3,283,301*l.*; or at the rate of 63,260,584, expending 6,566,602*l*. for the year. In the same half-year, goods, cattle, and parcels were conveyed at the charge of 2,461,662*l.*, or 4,923,324*l*. in the year. The amount of traffic for the week hefore last on 4,941 miles of railway was 245,550*l.*, being an increase of 19,815*l.* over the corresponding weak of lest were when the the corresponding week of last year, when the mileage was 4,091. The average earnings per vere 501., whilst last year they were 551. The works on the Great Northern line, in the neighbourhood of Huntingdon, are progressing with rapidity. At the crossing of the Onse, preparations are making for the iron bridge which is to span the river. Messrs. and Henderson, who built the Earithbridge, have, we understand, the contract for this structure. The plans for the viaduct north of the town have been completed.

The Cardiff station on the South Wales line will be an extensive one. It will have all the offices and accommodation now found only at stations such as Swindon, Bristol, or Gloucester. Its entire cost will be about 11,000%. The framework of the roof and its supporters The framework of the roof and its supporters is to be of iron, while much of the roof itself will be of glass. The station at Neath will also be an important one, on account of the junction with the Vale of Neath Railway. The bridge over the new channel through which the Taff is to be conducted in its passage to the sea (near the town), is in a forward state,——The Berwick Railway-bridge across the Tweed, which has been in course of erection for about two years, it is probable will not be the Tweed, which has been in course of erection for about two years, it is probable will not be finished for upwards of twelve months. On the south side fourteen arches have been completed, and several others nearly so; but on the north the arches are not nearly so far advanced. The length of the whole will he about a quarter of a mile, and height above the river 190 feet. the river 120 feet.

PROJECTED WORKS.—Advertisements have been issued for tenders, by 6th October, for the freestone work in restoring Cowbridge Church, Glamorganshire; by 9th, for the construction and erection of boilers, pipes, and fittings for baths and washhouses at Bristol; by 8th, for 30,000 sleepers for the Brighton and South Coast line of railway; by 15th, for the rebuilding of Merrington Church; by 10th, for building an infirmary, with laundry and washhouse, &c., for the St. Olave's union workhouse; by 9th, for rebuilding a house at Southampton; by 3rd, for fifty iron lampposts for Mile-end Olid-town; by 1st, for three cranes, one to lift 10 tons and the others five cach, at Adelphi and Plymouth; by 24th inst, for repairing the Surrey Canal wharf and fences; by 3rd, for best plate iron, and for pitch and tar for the East-India Company; and hy 2nd, for Rock-hill, Castle-hill, and Yorkshire paving, gravel, granite, &c., and also for carpenters', smiths', ironmongers', and bricklayers' works, for Camberwell district authorities.

Architectural Lectures,—The Whittington Club, in the Strand, announce in their new programme two lectures on the "Romance of Architecture and Architectural Practice," by Mr. Wightwick, to be given in November. The syllabus of the second is suggestive:—
"Anticipations of the architectural student—His first job—Duties of an architect—What he should know before he begins to practise—What he learns after he has begun—Dramatic illustration of the process of business between the architect and his patron, and his patroness?—End of the beginning—Perplexities of progress—Want of faith in two-feet rules—Disappointments in the new house, because of fond recollection of things in the old—House-maid's closet versus portico—Sir J. Soane and 'guess estimates'—Summary of an architect's labours—'Rough sketches'—'Fair drawings'—Present condition of architectural practice."

INDIA-RUNREN BUFFENS AND SPRINGS have now been introduced, it is said, on upwards of fifty lines of railway, and stood the test of heat and cold, and wear and tear, so as to form a cheap and useful substitute for the old apparatus. Needing no cumbrous extension beneath the waggon or carriage framing, they can be fitted to newly-built waggons, it is alleged, for about 41, 10s. a-set, and the wear and tear of the old buffers, estimated on luggage trains at 50 to 60 per cent. on their own much greater cost, thus reduced to 10 per cent. The new material has also been tried for hearing-springs, but has not hitherto come into use as such.

The Queen's Pictonial Commissioner.— The Limerick Chronicle states that Mr. Bickham Escott, late M.P. for Winchester (of all men in the world), has been deputed her Majesty's "pictorial commissioner," to sketch the most beautiful natural scenery and modern cultivation in Ireland, in order that the Queen may make a selection for her visit next year; and that he has been in Limerick on that mission, taking sketches of the picturesque wood and water scenery of Castle Connell.—Another Irish paper says, that the Queen has commissioned Mr. Deane Butler to prepare plans for a royal residence in Ireland, and that they are now ready. Quick work this, if true.

BLIND BUILDERS.—The following is a list of tenders opened on Wednesday for the erection of the Industrial Training Schools for 250 boys. They are to be built for the vestry of the parish of St. Pancras, on the site of the present stone-yard in the workhouse premises. Mr. James Lockyer, architect:—

^{*} The same authors announce, we observe, another work, sas a companion to this,—" Details of Pointed Architecture, upractically Delineated; or, Working Drawings of Doorways, Windows, Buttresses, and other features of Ancient Ecolosiatical Architecture, with full-sized Sections of the (Mouldings.)"

Assessment in Bethal-Green.—At a recent petty sessions to decide on objections to rates assessed by the surveyor, Mr. Paine, the case of Messrs. Truman and Hanbury, the brewers, was first tried. They objected to an increase from 1;150l. to 1,750l. on their brewery and stabling in the parish. The bulk of their premises are in the parish of Spitalfields, and stabling forms the most part of those in Bethnal-green, but that, the company's solicitor argued, could scarcely be rated in the same way as houses, inasmuch as the inhabitants were not likely to become chargeable to the parish. The frontage in the parish was 300 feet by 250 deep, and contained a cooperage and storchouse besides. Mr. Paine argued in defence, that the Act compelled him to regard this property not merely as stabling, but as a valuable adjunct to the brewery. There was stabling for 127 horses, which would pine and die in ordinary stables. The premises also contained a dwelling-house, and various other buildings, besides twelve vats, each said to be capable of bolding a party of 100 seated at dinner. The area of the cooperage was 42,000 feet, and paved with granite. Mr. Parnell said that he never heard of paving heing rated; and as for the vats, they were not fixtures, and were actually moved on some occasions. Details were then gone into, after which the court decided that 15s. per foot for frontage in Brick-lane, and 7s. for the others was too high, 7s. and 5s. being sufficient. The vats also being moveable, must be exempted. As for the other parts of the case, "seeing that we are bound," said the magistrate, "to rate machinery and plant, which was never done in this parish before, and that we must book at the value of these stables in connection with the important purposes to which they are applied, we consider it all proved." 150l, were then deducted on vats and land, and the assessment confirmed at 1,600l. Mr. Parnell intimuted that his elients would doubtless errry the case before another tribunal.—Mr. C. Eagle, of Hackney-road, ohjected th

ELECTRO-TELEGRAPHIC PROGRESS.—The telegraph at the Post-office is now in full operation, and despatches can be transmitted to Alnwick, Amhergate, Broxhourne, Birmingham, Burton-on-Trent, Barnsley, Beverley, Bridlington, Bradford, Berwick-on-Tweed, Bishopstoke, Chelmsford, Colehester, Cambridge, Chesterfield, Darlington, Derby, Dunbar, Darham, Ely, Edinburgh, Gloucester, Gosport, Glasgow, Hertford, Hull, Halifax, Ipswich, Lincoin, Loughborough, Leicester, Lowestoffe, Leeds, Liverpool, Leith, March, Milton, Manchester, Malton, Morpeth, Newmarket, Newark, Nottingham, Norwich, Northallerton, Newcastle, Normanton, Peterborough, Romford, Rugby, Rotherham, Rochdale, Slough, Stortford, St. Ives, Stamford, Sheffield, Selby, Skipton, Scarborough, Sunderland, South Shields, Southampton, Thetford, Tamworth, Todmorden, Thirsk, Witham, Wisbeach, Worcester, Wakefield, Ware, York, and Yarmouth. The rate of charge for twenty words is 1d. per mile for first 50 miles, ½d. per mile for second 50 miles, and ½d. per mile for any distance beyond 100 miles.——A proposal tis said, is under consideration by the East-

India Company.

THE TRAFALGAR-SQUARE WELLS.—
Workmen have been engaged in making canals in the ground straight along from the Springgarden entrance to the park to the Storey's gate entrance, for the purpose of laying down water-pipes, which are to convey the Trafalgar spring-water to Buckingham Palace. There is also a proposition for carrying the pipes up Constitution-hill across Knightsbridge into Hyde-park, to throw some thousands of gallons of pure water into the Serpentine. Along the line of pipes several water-pumps are to be erected for watering the streets.

METAL CYLINDERS CAST WITHOUT CORES.

—A patent has been granted to Mr. A Shanks, of Robert-street, Adelphi, engineer, for casting pipes, cylinders, and spherical vessels in moulds, by means of centrifugal force,—the mould being made to revolve on its axis by machinery, while the molten metal within adheres to its sides.

STATE OF THE STREETS OF BRISTOL.—With such intelligent and active authorities as we know Bristol has, it seems surprising that the surface of the streets should be allowed to remain in the miserably dirty state in which it is. The wind was blowing freshly as we walked through the "aneient city" on Saturday last, and the air at every fresh gust was filled with dust and triturated dung, to the great injury of the eyes, the temper, and the health of the busy crowd which filled both paths and roads. Good seavenging would, of course, cost money, but if some of the clear heads in the eommon council will quietly calculate the amount of injury done to the goods of the shopkeepers by this unnecessary dirt, the extra "washing and ironing" entailed on all the inhabitants, to say nothing of the effect on the general health (and illness and death are very costly matters), they will find that some thousands a-year would not pay the loss caused by the want of proper attention to the surface of the streets. This remark applies to many other places besides Bristol.

caused by the want of proper attention to the surface of the stricts. This remark applies to many other places besides Bristol.

A SANTARY COMMISSION FOR EVERY HOUSEKEEPER.*—Some evening soon, provide yourself with a roll of brown paper, and visit every cellar sough in your dwelling. Light the roll of hrown paper, and then extinguish the light, so as to leave only the smoking embers; apply the paper to the holes of the grid, and the direction of the smoke will tell you if you have a return draught from the drain. If the smoke is blown aside, get a sinktrap at once. This will be safer and cheaper than pouring any disinfecting fluid down your soughs. Look to the slop-stone pipe, and if it terminates in a sough, have a hell-trap put in the stone. Fever often enters by this waste pipe. The seeds of howel complaints, dysentery, head-aches, enter many a house by a cellar sough, or a slop-stone pipe; the more readily if the house fires are connected with good drawing chimneys. The next visit of inspection may be to the bed-rooms; and when you enter, call to mind that though eye and limb may slumber, the heart and lungs know no rest. If eight hours be spent in the bedroom, the lungs lawe opened and closed 10,000 times during that repose, and the air which passes out is not only unfit to be breathed again, but contaminates the general air of the room; then remember a reckoning is due for the perspiration. Now inquire in what way you have aided the efforts of the lungs and the skin to purify the blood, and build up the waste of the day, and see whether you have not made a "famine of pure air." Remove the fire-board, take away the listing which has been tacked over the crevices of the window, and see that the joiner makes a way for the air to come in over the door (if you will seep with it fully closed), and there is a corner in every room where the warmed and vitiated air may be led out. Bathing and sponging are excellent, but pure air in a bedroom is a sine qua non in this cholera time.

LEVELS OF LONDON.—Mr. Wyld, of the Strand, has published a map of London, on which are marked in red figures the levels taken by order of the Commissioners of Sewers for the information of those who contemplate submitting plans for the drainage of the metropolis. The altitudes are given in feet "allove the approximate mean water at Liverpool, being 12½ feet below Trinity high-water mark."

MASONS' PROVIDENT INSTITUTION.—Mr. Tite, F.R.S., has kindly consented to become president of the above institution, in the room of the late Alderman John Johnson. The objects of the institution are the erection of almshouses, and provision of a pension fund for decayed members of the trade, their widows and orphans, or for those who may become disabled by accident or infirmity.

FIRE-PROOF FLOORS.—Messrs. Clarke and Motley, among other inventions, have patented what they think an improvement in the construction of floors of buildings fire-proof, on an economical plan, "which is not only applicable to new erections, but may be applied to existing huildings, such as warehouses, manufactories, mills, &c., very economically—viz., at not exceeding from 6d. to 9d. per superficial foot—so that a floor of 50 feet long and 20 feet wide may be rendered fire-proof for about 30%."

CIRENCESTER ROMAN PAVEMENT.—The newly-discovered pavement in the old town of Cirencester, the site of ancient Corinium, already mentioned by us, measures 25 feet square, and exhibits nine circles of nearly 5 feet diameter cael. They contain (according to our correspondent) bold and well-executed heads of Ceres and Flora, and exceedingly spirited representations of Actæon and his dogs, and of Silenus riding on his ass.

PUNCTUALITY TO TIME BY RAIL ENFORCED.—An Exeter solicitor, detained for an hour at the Starross station on the South Devon line, was lately awarded 10s. damages by a jury, on the ground that an hour's cleay in the arrival of a train, without good excuse, was actionable under the contract to carry passengers at a certain time, implied in the company's time-table.

ON THE DURATION OF WOOD, AND MEANS or Prolonging it.—The following are the results of experiments made with great care and patience by Mr. G. S. Hartig:—Pieces of wood of various kinds 2 5-8th inches square, were buried about an inch below the surface of the ground, and they decayed in the following order:—The lime, American birch, alder, and the trembling-leaved poplar, in three years; the trembling-leaved poplar, in three years; the common willow, borse-chesnut, and plane, in four years: the maple, red beech, and common birch, in five years; the elm, ash, horn-beam, and Lombardy poplar, in six years; the robinia, oak, Scotch fir, Weymouth pine, and silver fir, were only decayed to the depth of half an inch in seven years; the larch, common juniper, red cedar (juniperus virginiana), and arbor-vitæ, at the end of the last-mentioned period, remained uninjured. The duration of period, remained uninjured. The duration of the respective woods depends greatly on their age and quality; specimens from young trees decaying much quicker than those from sound old trees; and, when well seasoned, they last much longer than when buried in an unseasoned state. In experiments with the woods cut into thin boards, decay proceeded in the following order, commencing with the most perishable order: -The plane, horse-chesnut, poplar, American birch, red becch, hornbeam, alder, ash, maple, silver fir, Scotch fir, elm, Weymouth pine, larch, robinia, or locust oak, It has been proved, by recent experiments, that the best mode of prolonging the duration of wood is to char it, and then paint it over with three or four coats of pitch. But simply charring the wood was of very little utility, as were also saturations with various salts, acids, &c.—Revue Horticole.

NOVEL BUILDING MATERIALS.—The erection of a tenement in the Low Calton, Edinburgh, in which fire-brick alone is employed as the building material, instead of stone, has excited some interest among the inhabitants in that locality. The building, of which one story is already completed, is to consist of three flats, and the fire-brick is used in blocks of the size and appearance of hewn stone. The basement story is designed for a warehouse, the exterior being in the form of shops, and the front exhibits the elegance and finish of polished ashlar. The blocks are of large size, being upon an average 2 feet in length by 14 inches deep; but those employed in the construction of the other parts of the building are smaller, ranging from 18 to 20 inches long by 6½ to 9 inches square. The principal advantage in the use of fire-brick is its resistance to fire and damp, but the expense, we believe, is greater than stone, from the heavy duty upon bricks. The huilding, however, will have a light and clean appearance, and the experiment is viewed with some interest.—
Edinburgh Weekly Register.

SATURDAY, OCTOBER 6, 1849.

REAT and urgent has become the necessity of supplying the intellectual wants of the population, and many thanks are due to Mr. William Ewart, M.P.

(to whom the public are already greatly indebted for originating previous important inquiries connected with the cognate subjects of literature and art), for the recent Parliamentary inquiry as to the best means of extending the establishment of libraries freely open to the public.

The rudimental education of the people, in the fulfilment of its great purpose, has of late years been exciting intellectual wants,opening wide, book-eating, hungry mental mouths throughout the country; and a necessity has arisen to provide the wherewithal to satisfy these healthy appetites. "For the last many years in England everybody has been educating the people, but they have forgotten to find them any books."* In byegone times, to be sure, the little musty old parochial libraries, which still lie scattered in dusty holes and corners throughout the country, did constitute a supply that even exceeded the demand. But then the essential preliminary process of exciting a demand by the general education of the people had scarcely been dreamt of, except indeed in Scotland, where "a respect for education and reading, long fostered by the ancient and excellent system of instruction by means of parochial schools, is hereditary." Of late years, however, both England and Scotland have made rapid progress in the initiative that now demands a further step in sequence, to be taken towards the fulfilment of that end towards which the spread of school-education was but a means.

The whole of the evidence recently adduced proves one thing clearly,-that "the qualifications of the people to appreciate and enjoy such institutions" as those demanded, namely, free public libraries in every city, town, village, and hamlet in the empire, " are unquestionable." And, with the still growing increase of these very qualifications, there is also " abundant testimony to the fact of a vast and progressive improvement in the national habits and manners." Of the fitness of the people for the rational enjoyment and the moral and general benefit to be derived from public libraries, as observed, there can be no greater proof than their own independent efforts to create them; and wherever any favourable opportunity presents itself, there it very soon appears that the working classes are not to be satisfied with the mere manufacture of the cheap abridgment and extracted substance of knowledge-the milk, merely, as it were, of the secular "Word" in their souls. With mental appetites hale and hearty, they revolt at all such pap, and yearn for the " strong meat" of men, as their only nutritive intellectual viaticum. Nothing short of the whole range of science and literature, in short, will satisfy their inquiring minds, once fairly

awake, with opportunity, to the treasures of wisdom and knowledge.

Although nothing new to us,—there is something that we are assured will astonish many, in the curious evidence adduced on this particular subject.

We are told, for instance, that some of the best-read men in Birmingham are working men, who are perfectly versant not only in history, politics, and literature generally, but in the sciences at large, and also in languages-such as the German and the French, -in all of which accomplishments, of course, they are self-taught ;-that in Manchester there is a large class of operatives who are naturalists and members, curators, &c., of natural history societies, while there is also in the same place a curious set of 'working' botanists and entomologists, who make formal botanizing and entomological excursions; -that not only is Shakspeare in many instances known almost by heart, by working men, who can stand a cross-examination on any of his plays,-that not only do working men sustain a constant and fluent correspondence through the newspaper press on all sorts of subjects, and write poetry'-such as it may be-by the mile, on all sorts of subjects too,-but that there are many such men who constitute regular debating societies, or who dive even into and fully relish all the profundities of 'philosophy,' and are sworn disciples of Kant or Fichté, Schelling, or Hegel, or are warm admirers of Carlyle. And should it be asked, of what earthly use can some of such pursuits be to most of these wielders of the hammer or the shuttle, the chisel or the file, let us (leaving out higher arguments) whisper gently in response, that they all tend to calm political agitation and disturbance, ever fiercest in ferment where the only profundity of mind to fathom is that of its ignorancethat it has been proved in formal evidence, in short, that where there is a studious or reading temperament and habit, there, too, is the least possible liability to be played upon by the mere appeals of demagogues to the feelings: and certainly such a result, in these times of revolutionary warfare, is worth "a king's ransom" in itself, or at the very least it is worth a free public library in every centre of political agitation and disturbance. Nevertheless, we cannot but admit that, it may be, some may thus be only filled with self-sufficient empty notions ill befitting the contented steady exercise of their respective handierafts or callings; but the self-sufficiency of ignorance is an evil ten thousand-fold more inveterate. curious fact, for instance, that in mining districts the uninstructed miners may be got to attend at any series of lectures rather than those on mineralogy or geology. So is it in many other trades-there is an ignorant conceit in the way of knowledge hard to remove. The reading workman, on the other hand, in his eagerness to improve his mind, needs no stimulus from without. And even where without the advantage of a library, many are known to work extra hours for "book-money." This desire for reading is even heginning to display itself in the very "ragged schools," where books, especially on emigration, are perpetually thumbed and eagerly devoured with the deepest and most affecting interest.

It would be well, however, if the reading of the masses were at least all as little capable of producing positive mischief. But from the want of a national diffusion of good books in public libraries, instruction itself (we will not call it education) has in many in-

stances done much evil by enabling the readers to peruse that never-ending flow of garbage, in the form of which, writers of even positive talent, and from whom better things might have been expected, are ever pandering, in some novelty of shape or other, to the basest feelings and passions of the million. In proportion as education increases, the facility of obtaining books corrective or preventive to such abomination, as well as to political dispeace and disturbance, ought to be increased and must be increased. And here is a field for the philanthropist, wide as that of ignorance itself, and even worse, in results; for ignorance may be consistent so far with rectitude of thought, feeling, and conduct, but that such false enlightenment can never be. Let every right-minded person then assist in this good cause as far as he can. The foundation of public libraries in every city, town, village, and hamlet throughout the empire would be a mighty good in many aspects, and it only remains for us to show how this, it is conceived, can best be done

But first of a few statistical and other details of interest in connection with the purpose more immediately in view. And the report on which our present remarks are based is full of such details, presented both viva voce and in elaborate statements, tables, plans, &c., to the Committee, amongst which details we cannot resist a desire specially to allude to those by Mr. E. Edwards, of the British Museum, of whose ability and laborious industry we needed not these numerous and convincing proofs to be well assured.

Amongst the details is a curious map exhibiting the relative amount or provision of books in libraries publicly accessible in the principal states of Europe, as compared with their respective populations. The proportions are, to every 100 of the population in the British Isles and Holland, 63 to 53 books; in Russia and Portugal 80 to 76; in Belgium, Spain, and Sardinia, about 100; in France, 129; in the Italian States, 150; in the Austrian empire and Hungary, 167; in Prussia 200; in Sweden and Norway, 309; in Bavaria, 339; in Switzerland, 350; in Denmark, 412; and in the smaller German states, nearly 450!! Is it not sad to think that the British isles, which rank so high above all other states in other points of pre-eminence, are here the lowest of the low? These figures are black enough certainly, but the map, which is scored with black lines-close and numerous in proportion to the comparative paucity of books cr-literary darkness, shall we say?-gives a still more glaring relief to our bad pre-eminence in this respect. The British isles are black as ink can make them - blacker than semibarbarous Russia, while the one little bright spot, par excellence, is limited to the narrow outlines of the smaller German states.*

A heavy load of this disgrace, as might be anticipated, rests on poor Ireland. Amongst the details it is incidentally noted that there are 73 towns in Ireland without even a single bookseller, although the population of each look with an evil eye on the diffusion of books of any class in Ireland. As for ourselves inclusive, there are 8,000,000 of us who cannot form even pothooks in writing. In a Norfolk parish of 400 people it was some few years since found absolutely necessary to elect a

^{*} From a table presented by Mr. Edwards, it appears that the average number of volumes published within Great Britain and Ireland during the last ten years was 3,1394 vols. per annum, and the average value 1,3322. Is. In Germany, about 11,000 separate works, including pamphless, appear to have been issued during each of the last three years; and in France, 5,500 in 1647.

^{*} See Mr. George Dawson's evide.ce, p. 85, in Appendix to "Report from Select Committee on Public Libraries." &c., on which Report and Appendix the following remarks are based,

female as parish clerk, no male parishioner having so much learning or skill as to be able to write! This female probably still holds her post by virtue of her exclusive elerkship.

As to the more immediate subject of interest in the committee's report, that of public libraries, France contains 107 public libraries. all free, and unrestricted to poor and rich, to foreigner and native, while Britain has scarcely one of which the same can be said, although almost all foreign libraries together are free like those in France. Belgium has 14, Prussia 44, Austria 48, and the little State of Bavaria, In Paris alone there are 7; in Florence 6; in Dresden 4, and in Vienna 3. A large proportion of these, too, are lending libraries, of which Britain is about as devoid as of libraries with perfectly free access. Indeed, the Chetham library, at Manchester, is the only one of the latter order in existence in this country, although a certain degree of freedom of access is enjoyed by the public, or certain classes of the public, in a few others. Even in such places as Birmingham, Sheffield, Leeds, and Hull, there is no public library of any kind. The United States appear to have numerous public libraries, and a multitude of readers, besides an immense general sale of books, so that authors do not appear to be injured by the public library system, but the contrary.

The first thing to be done towards the establishment of a liberal distribution of free public libraries in this country, advised in the evidence, is the erection of buildings by the respective town councils, or otherwise. Donations, it is believed, would thereupon rapidly flow in, and almost alone constitute large libraries. Half the books in the British Museum were donations. It is recommended, however, that Government assist hy grants in aid of subscriptions, as to schools of design, &c., if not also by small rates, authorized by an extension of the Muscums Act, or otherwise. The reformation of such public libraries as already exist, is urged, and district branch libraries recommended. The Scottish system of itinerating libraries for small towns or villages is said to have worked well; and it appears that village libraries, farm libraries, mill, and even kitchen libraries, are spreading into minuter and more special ramifications, as it were, or rootlets of a great system. In the establishment of town libraries, it is conceived that, to be useful to the industrious classes, they must above all be open in the evenings. The want of such an arrangement in the British Museum library (which would of course require to be made compatible with freedom from all risk of loss by fire) renders it quite useless to such classes, and indeed to many literary professional men themselves. For the working classes, the system of public libraries actually, therefore, does not exist in this country at all. An evening sederunt is their only hope, and it is not in the least doubted that these classes would at once, and largely, avail themselves of such a privilege. The lending out of all ordinary works is regarded as an essential to the convenience and adequate study of the literary man bimself. The utility of provincial town libraries to the provincial press, as well as to students and general authors, is inferred from various circumstances, such as occasional pilgrimages to the metropolis to consult works in the national library here. We bave ourselves known instances of students quitting other employments in the provinces and coming to reside altogether in town, mainly with such views and purposes. In aid of the whole

system, as regards the people at large, the diffusion of lectures is strongly recommended, as eliciting discussion, and inducing many to seek out and peruse works bearing on the subjects of lecture. At present, some lecturers are said to reap a good harvest in the provinces, 500l. to 800l. per annum being estimated as the income of some of the more popular. The libraries of Mcchanies' Institutes are said to belong to a somewhat higher class than the ordinary run of mechanics. A new order of public libraries, therefore, for the people at large is only the more pressingly called for and necessary. In some of the 2,000 coffee houses in the metropolis there are rather extensive libraries accessible, it may be said, without cost, inasmuch as no charge is made, and coffee, &c., may be had from one penny

For special localities, special libraries, or collections of books, are advised, for the use of practical men. There should, it is thought, be a centralization of catalogues, if not a mutual and general exchange of them, and in the metropolis, in fact, a library of catalogues. Foreign nations, too, might exchange both catalogues and books, such as duplicates, as some already do. Authors and publishers abroad are called on as here to present copies of their books to certain libraries, but the Governments often subscribe to the publications, and purchase copies for further distribution. The benefit being public or national, it is justly conceived that the expense should not be borne by the authors. In fine, the appointment of a Ministry of Public Instruction is recommended.

We earnestly hope to see the intellectual wants of the population speedily supplied.

ON CIVIL ENGINEERING AND ARCHITECTURE.

AN INAUGURAL LECTURE.*

CIVIL engineering and architecture, the subjects upon which I am called to lecture, are both essentially practical sciences, and are in some measure so connected as to be synonymous; both the engineer and the architect must be well versed in the strength of the various materials with which they have to deal, and be so acquainted with their properties, as to be enabled to make a choice of them, for any peculiar circumstances attending their work.

Both must be mathematicians, draughtsmen, carpenters, masons, and be acquainted with the details of all, or nearly all, the mechanical trades; at least they must be learned judges of them if rectailed.

them, if not skilful operators.

They must both be men of business, and should not be ignorant of law. Both architecture and engineering, therefore, in their most comprehensive meanings, are studies of many and singularly opposite qualitics, and are allowed by all whose opinions are worth regarding, to be sciences of the highest importance to the well-being of society; thus far the two professions go side by side. But architecture, as well as being a science, is also essentially a fine art, and here the two professions separate. The path of the architect will, after he has gained his practical knowledge of construction and building, be parallel with that of the painter and the poet in the regions of cultivated taste. The path of the civil engineer is widely different, and if his lahours be less in the captivating regions of beauty than the architect's, they are perhaps more among the grand,—certainly more among the stern developement of massive strength, to resist shocks, inundations, and storms which, from the simplicity of the requisite forms, and their associations, constitute grandeur. I come amongst you fully sensible of the responsibilities of my office, and with an equally full determination, to perform

* Read by Mr. Clegg before the College of Civil Engineers, Putney, on Wednesday, Sept. 20th.

its duties to the utmost of my power; and I shall expect you to go with me, cheerfully, to the tasks which lie before us, and assist me with your diligence. Nothing is more necessary to the due understanding and proper study of engineering and architecture, and to the formation of a proficient in either, than habits of application and industry. Without them even the lowest departments of the pro-fessions are not to be mastered. It is not a rapid growth that produces a sound and skilful rapid growth that produces a sound and skillful practitioner, any more than precedity is an emblem of a great statesman. It is not by occasional fits of application, by short starts of preparation, by numerous little works, performed in a little time, and with less study, sometimes discontinued, and again renewed, that eminence is to be obtained in either of these arts; on the contrary, it is only by regular application—by a constant study of good examples—by able instruction,—by deep and intense study of the elementary principles, with an uninterrupted practice, solely directed to the object, grown up almost into a habit, and ready to be called into use at the shortest principles, it is only hexartically accurate and the shortest it is only hexartically accurate and the shortest and the state of the same state. notice,—it is only by sacrificing every comfort that aims at prevention,—by having resolution to suffer nothing to impede your progress, and by avoiding the dead sea of idleness and plea-sure, that you can be enabled to shine either as an architect or as an engineer. Michelangelo, full of the great and sublime ideas of his art, lived very much alone, and never suffered a day to pass without handling his chisel or his pencil. When some person reproached him for leading so melancholy and solitary a life, he said, "Art is a jealous thing, and requires the whole and entire man." He was also both frugal and temperate, and so persevering in his labour, that be used occasionally at night to throw himself upon his bed without disen-cumbering himself of the clothes he had worked in. Inigo Jones, by bis indefatigable raised himself from the position working mechanic to that of the first architect of the day. He was bound apprentice to a joiner; but the Earl of Arundel, seeing his statent and industry, sent him to Rome to study landscape painting. When at Rome, finding that he possessed more talent for designing palaces than adorning cabinets, he turned his study to architecture. By denying himself the common necessaries of life,—by rising early, and retiring late, sometimes not going to his bed at all, he conquered all the difficulties in his path; and after remaining some time in Italy, shackled by poverty, Christian the Fourth of Sweden invited him to Denmark, and appointed him his architect. and appointed him his architect. He after-wards returned to England, and was made surveyor-general of the king's works to James the First, but refused to accept any James the First out refused to accept any salary until the heavy debts contracted under his predecessor had been liquidated. Upon the accession of Charles he was continued in his office, when his salary as surveyor was 8s. 4d. per day, with an allowance of 46l. per year for house rent. Sir Christopher Wren an example of an architect excelling in mathematics, and producing works bearing the evident impress of their author's learning. From the number and diversity of his occupations, may be gathered the fact of his close study and application; and although unlike Inigo Jones he had not poverty to fight against, infinite credit is due to him. He was He was one of the original members of the club which was formed at Oxford in 1648, for philosophical discussion and experiments, and which eventually gave rise to the Royal Society. In 1657 he was chosen professor of astronomy at Gresham College, and on the restoration was appointed to the Savilian professorship of astronomy at Oxford. It was very soon after this that he was first called very soon after this that he was hist called upon to exercise his genius in architecture (a study, however, which had previously engaged a good deal of his attention), by being appointed assistant to the surveyor-general. This led to Wren's employment on the work on which his nonline fame, principally restricted. on which his popular fame principally rests— the rebuilding of the cathedral of St. Paul's after the great fire. The erection of this noble edifice occupied him for thirty-five years, but did not prevent him during the same period from designing and superintending the completion of many other buildings, nor even interrupted his pursuit of the most abstract branches of seience. Wren was created a doctor of law

and logic by the university of Oxford in 1661, and was knighted in 1674. In 1680 he was elected to the presidency of the Royal Society, and in 1685 he entered Parliament as the representative of the borough of Plympton. While superintending the crection of St. Faul's all the salary Wren received was 200l. He was also used by the commissioners in other respects with extreme illiberality and meanrespects with extreme illiberality and mean-ness, and was obliged to yield so far to their ignorant clamour as to alter the design of his building, and to decrease the size of his dome, which he had intended should spring from the outside large gallery which surrounds it. If he had had the moral courage of Michelangelo, we should have had yet a nobler monument of his fame. Michelangelo, like Wren, had obstacles thrown in his way, and we are told the following anecdote:—Under the papacy of Julius III. the faction of Michelangelo's rival, San Gallo, gave him some trouble respecting the building of St. Peter's, and went so the building of St. Peter's, and went so Iar as to prevail upon that pope to appoint a committee to examine the fabric. Julius told him that a particular part of the church was dark. "Who told you that, holy father?" replied the artist. "I did," said Cardinal Marcello. "Your eminence should consider, then," said Michelangelo, "that besides the window there is at present, I intend to have one in the ceiling of the church" "You did not tell me so," of the church" "You did not tell me so," of the church." "You did not tell me so," replied the cardinal. "No, indeed, I did not, Sir; I am not obliged to do it, and I would never consent to be obliged to tell your eminence or any other person whomsoever anything concerning it. Your business is to take care that moncy is plenty in Rome, that there are that money is plenty in Rome, that there are no thieves there,—to let me alone, and to permit me to proceed with my plan as I please." Wren's ungrateful employers, in 1718, dismissed him from his place of surveyor of public works: he was at this time in the 86th year of his age. This great and good man died at Hampton Court on the 25th February, 1702 in the 20th result for some of the second file some in the 18th result was a file some file some in the 18th result for some file some file some in the 18th result for some file some file some files some file 1723, in the 91st year of his age. His remains were accompanied by a splendid attendance to their appropriate resting-place under the noble edifice which his genius had reared, and over the grave was fixed a tablet, with the following inscription:—" Beneath, is laid the builder of inscription:—" Beneath, is laid the builder of this church and city, Christopher Wren, who lived about 90 years, not for himself but for the public good. Reader, if thou seekest for his monument, look around."

Great architects, if uniting with their works any other pursuit or study, have generally fixed upon some branch of science or art con-nected with architecture: thus, Michelangelo

any other pursuit or study, have generally fixed upon some branch of science or art connected with architecture: thus, Michelangelo was a sculptor; Inigo Jones was a painter, and then an astronomer. But Sir John Vanbrugh was a dramatist as well as an architect; he wrote "The Provoked Wife," "Esop," and other comedies, and built Blenheim and Castle Largest

Were I to give the character of each and all the eminent architects of this or any other country, they would serve to show how great was the amount of their labour, and with what cheerfulness and perseverance they pursued their tasks at the commencement of their career, and with what determined energy they maintained their name and fame after they had risen to excellence: nor will the characters of civil engineers lose by comparison with the

already-named artists.

When the state of civilization and trade in England required more convenient and cheaper modes of transit for its goods than the common roads and waggons of the day afforded, a system of inland navigation was proposed, and Mr. Smeaton was employed in making rivers available for this purpose: afterwards, more direct routes became desirable, and canals were projected, in imitation of those made before by the Dutch and Frencb. The Duke of Bridgewater was the great patron of these schemes, and brought forward James Brindley, who constructed for him the canal called the Bridgewater Canal, between Liverpool and Manchester. This immense work, the idea of which was ridiculed by most of the scientific men of the period as impracticable, Brindley undertook, and completed so as to form a junction with the Mersey. This success caused him to be employed, in 1766, to unite the Trent and Mersey, upon which he commenced the Grand Trunk Navigation Canal. From this main branch Mr. Brindley cut another canal near Haywood, in Staffordshire, unit-

ing it with the Severn in the vicinity of Bewdly, and finished it in 1772. From this period scarcely any work of the kind in the kingdom was entered upon without his superintendence or advice. Among other designs, he prepared one for draining the fens of Lincolnshire, and the Isle of Ely, and another for clearing the Liverpool Docks of mud, which was especially successful. The variety of his inventions, and the fertility of his resources, were only equalled by the simplicity of the means by which he carried his expedients into effect. He seldom used any model or drawing, but when any material difficulty presented itself, he used to seclude himself for days, or until an idea presented itself to him for overcoming it; and so partial was he to inland navigation, that upon the question being put to him by the opposition to one of his schemes, "For what purpose he imagined rivers to have been created," he at once replied, "Undoubtedly to feed navigable canalis." The intensity of his application to business brought on a fever, of which he died in 1772, in the fifty-sixth year of his age.

fifty-sixth year of his age.

John Smeaton, another engineer, who did much to advance his profession in this country, may almost be said to have been born an engineer, his grains appeared at so early an age. His playthings were not those of children, but the tools which men employ. Before lew as six years of age, he was discovered on the top of his father's barn, fixing up what he called a windmill, of his own construction; and at another time, while he was about the same age, he attended some men fixing a pump, and observing that they cut off a piece of the bored pipe, he procured it, and actually made a pump with it, which raised water. When he was under 15 years of age, he made an engine for turning, and worked several things in ivory and wood, which he presented to his friends. A part of every day was occupied in forming some ingenious piece of mechanism. In 1751 he began a course of experiments to try a machine of his own invention, to measure a ship's way at sea, and made two voyages to try the effect of it, and also to make experiments upon a compass of bis construction. In 1753, he was elected a fellow of the Royal Society, and the number of papers he published in their transactions, will show how highly he deserved the honour of being enrolled a member of that useful and important

body: in 1759 he received the gold medal. In 1775, the Eddystone Lighthouse, was burned down, and Mr. Smeaton being recommended to the proprietors of that building as an engineer in every way calculated to rebuild it, he undertook the work, which was completed in 1759. To this work I shall allude more particularly when instructing you in the building of lighthouses, as the practice of building then adopted has been continued to this day. But the part of Mr. Smeaton's life I would more particularly draw your attention to is this. During many years he was a frequent attendant upon Parliament, his opinion upon various works begun or projected being continually called for; and in these cases his strength of judgment and perspicuity of expression had full scope.

ression had this scope.

It was his constant custom, when applied to, to plan or to support any measure, to make himself fully master of the subject, to understand its merits and probable defects, before he would engage in it. By this caution, added to the clearness of his expression, and the integrity of his heart, he seldom failed to obtain for the Bill which he supported the sanction of Parliament. No one was ever heard with more attention, nor had any one ever more confidence placed in his testimocy. In the Courts of Law he had several compliments paid him from the bench, by Lord Mansfield and other judges, for the new light he always threw on difficult subjects. Mr. Smeaton died in 1792, in the 68th year of his age.

in the 68th year of his age.

John Rennie, to whom England is indebted for some of her noblest engineering works, was born on the 7th of June, 1761, at Phantassie, in the parish of Prestonkitk, in the county of East Lothian. His father, a highly respectable farmer, died in 1766, Ieaving a widow and nine children, of whom John was the youngest. The first rudiments of his education were acquired at the village school. It so happened that he had to cross a brook on the way, which, when flooded, obliged him to

make use of a boat kept in the workshop of Mr. Andrew Meikle, an ingenious mechanic, well known in Scotland as the inventor of the thrashing machine. In passing so frequently through this worksbop, young Rennic's atten-tion was directed to the various operations in which the men were engaged; and they, no-ticing the interest he took in their labours, were in the habit of lending him tools and showing him their use. In the evenings he amused himself with endeavouring to imitate the models he had seen at the shop; and it is related that, at little more than ten years of age, he had completed the models of a windmill, a pile-engine, and a steam-engine. Rennie continued at the Preston school till twelve years of age, when, having had a quarrel with his master, he entreated to be allowed to leave, and, at his own request, was placed for two years with Mr. Meikle. At the end of that time, feeling that a constant application to manual labour was likely to retard his mental improvement, he determined to become a pupil of Mr. Gibson, an able mathematical teacher at Dunbar. Here he soon attained great proficiency, and in less than two years returned to Mr. Meikle with a mind well stored with mathematical and physical science. His first essay in practical mechanics was the repairing of a corn-mill in his native village; and before he was eighteen years of age he had erected several others. During this time he occasionseveral others. During this time he occasion-ally visited Edinburgh, to pursue his studies in physical science, under Professors Robinson and Black. The former of these gentlemen may perhaps have laid the foundation of his future fortune, by introducing him to Messra. Boulton and Watt, of Soho. Deeming the capital the proper theatre to try the strength of his own powers, Rennie settled in London, after having been a few months only with Boulton and Watt, who had confided to him the superintendence of the mill-work of the Albion Mills then erecting. Mr. Rennie was thus led to study hydraulic engineering, in which he became so celebrated as, after the death of Smeaton, to have no rival. Amongst the most celebrated works of this great engineer must be mentioned—besides numerous with hydrogen canals. Leader Wyterlee and gineer must be mentioned—besides numerous mills, bridges, canals—London, Waterloo, and Southwark bridges, the Laneaster Canal, with the aqueduct over the Lune, the breakwater in Plymouth Sound, and the improvements in the dockyards at Portsmouth, Plymouth, Chatham, and Sheerness. The industry of Mr. Rennie was so great, that he never suffered amusement of any kind to interfere with his business which frequently occupied him twelve. business, which frequently occupied him twelve, and sometimes fifteen hours in the day. was clear in his mode of communicating information to others, and pleased when he found that information was desired. He was never actuated by professional jealousy, or selfish feelings, but was always kind and con-descending to the more humble members of his profession. Mr. Rennie died on the 16th of October, 1821, in the sixtieth year of his age, and was buried in St. Paul's, where his mains repose near to those of Sir Christopher

Thomas Telford was born in 1757, and commenced his life as a shepherd boy in Eskdale; but his early and eager love of knowledge led him to seek abroad an occupation more suited to his inclinations. He first repaired to Edinburgh, where he studied architecture with unremitting application, although he must have earned his daily bread by the labour of his hands. In 1782 he was emboldened to try his fortune in London, and was (as he states in his life, written by himself), fortunate enough to be employed at the quadrangle at Somerset-place, where he acquired much practical information, both in the useful and ornamental branches of architecture. After a residence of two years in London, he was engaged in superintending the building of a house in the Portsmouth Dockyard. During the three years, he remarks, that I was employed in building the commissioner's house, and of a new chapel in the Dockyard, I had an opportunity of observing the various operations necessary in the foundation and construction of graving docks, wharf walls, and similar works, which afterwards became my chief employment." When he left Portsmouth, he was appointed surveyor to the county of Salop, and to this, and the connections formed at this time, he was indebted for a very favour-

able opening of his career as a civil engineer. the clerk, who assured him that a 12-inch pipe His chief attention was devoted to huilding and repairing hridges, but he also built several

repairing influges, but he also but several churches and other architectural edifices. Telford's progress in his professional career, though not rapid, was steady and certain, and every new opportunity of exerting his talents contributed to extend a reputation which at length became unrivalled - not to his talents alone though, he it said, but by his talents atone though, he it said, but by downright hard work united with them. To enumerate all his works would take a long time, but his principal ones are the Holyhead-road (upon which he himself sets higher value than any other), and the Menai-bridge, unquestionably the most imperishable monument of Telforil's fame.

The defects of his early education he had endeavoured to remedy by his own unaided exertions in his maturer years. He taught himself Latin, French, German, and mathematics, in which he was a proficient, but relied more for the dimensions of his works upon practical experiment than upon calculation; hut his reason for the preference may have been, and most likely was, his distrust of the data furnished him by mathematical experi-menters in those days; hut now that we have had Barlow and Hodgkinson, calculations from the results of their labours may be safely relied on.

relied on.

Telford was the first President of the Institution of Civil Engineers, and died still holding that office in 1834, aged 77 years.

From these few instances in the lives of men
devoted to science and to art, the student will
learn the necessity of study, exertion, and selfdependence. An architect or an engineer
taking up his work as a task, or merely with
the business-like given of earning a livelihood the business-like view of earning a livelihood, will never excel. In the days when men of science were comparatively scarce, great perseverance were comparatively scarce, great per-severance was necessary to get into notice and rise to fame; but double exertions are now necessary; an aspirant to professional honour will find himself jostled and hard set hy com-petitors at every step of his progress, and this must raise up within him a determined spirit of emulation as a print not to help the help to the of emulation, a spirit not to he daunted or cast down by failures, hut one that will become more buoyant by pressure, one that with steady stride and upright head will still walk up the steep and difficult path which leads to fortune.

MASTER CARPENTERS' SOCIETY.

SMALL DRAINS.

A MEETING of the master carpenters' society was held at the Freemasons' Tavern, Sept. 20, and was attended by Mr. Nesham, president; Mr. Stephens, Mr. Stephen Bird, Mr. George Bird, Mr. Norris, Mr. Eales, Mr. Burstall, Mr. Outhwaite, Mr. Unwin, and others.

Mr. Outhwaite, Mr. Unwin, and others.

Mr. Stephens called the attention of the society to the recent regulations of the Commissioners of Sewers respecting house drainage, and the restrictions as to the unusually small sizes of the pipes permitted to he used from dwelling-houses, and said, if, as he anticipated, the present sizes proved insufficient in general use, the public would have reason to general use, the public would have reason to complain of having heen forced to lay down pipes which most practical men considered

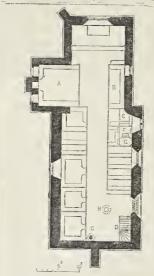

inefficient.

Mr. Geo. Bird said it was necessary that Mr. Geo. Bird said it was necessary that the members should meet numerously and consider the proposed new Buildings Bill. It appeared to him that few of the recommendations of this society had been well considered, and he proposed that the committee meet and study the various clauses of the Bill. With regard to the inconvenience mentioned With regard to the inconvenience mentioned by Mr. Stephens arising from the instructions of the Commissioners of Sewers, he thought that previously to such extensive alterations that previously to such extensive aiterations and new regulations heing made and forced upon the public, some eminent engineers, architects, and practical men, should be consulted. Mr. Bird referred to one instance in sulted. Mr. Bird referred to one instance in particular as coming under his own observation. In October last, a 12-inch pipe was laid down in the centre of the existing 3 feet sewer in George-street, which takes the drainage from Bryanstone and Montague-squares, and all the collateral sewers in the neighbourhood. As soon as he perceived it he called at Greak-street, and pointed it out to

drain was large enough. Mr. Bird differed and left, stating that it was not the proper season to try such an experiment, as most of the inhabitants of the district were out of town, and therefore not above half the usual quantity of water was sent into the sewers. In April or May last, he saw the pipes broken to pieces and taken out, after putting the public to the useless expense. Several of the other members expressed

similar opinions, and hoped the commissioners would seek the opinions of the leading architects and engineers, combined with practical men, hefore they adopted or committed the public to so important a matter as a plan for the complete drainage of the London

OSMASTON CHAPEL, DERBYSHIRE.

A Sir H. Wilmot's pew. B Clergyman's ditto. C Font.
D Staircase to turret.

Osmaston is situated about three miles from the railway station at Derby, near the road to Ashhy-de-la-Zouch. It is written "Osmundestune," in the Domesday survey; no doubt taking its name from Osmund, the Saxon possessor, in the reign of Edward the Confessor.

The manor was granted to Rohert Holland, Esq., in 1307, as an appendage of Melbourne, with which manor it has passed ever since, being in 1817 the property of the Marquis of Hastings. The principal estate here belongs to Sir H. Wilmot, haron, descended from a younger branch of the Wilmots of Chadderden. Sir Nicholas Wilmot, of Osmaston, serjeantat-law, in the reign of Charles the Second, was fourth son of Robert Wilmot, Esq., of Chadderden, by the heiress of Shrigley. The late Sir Robt. Wilmot was created a baron in 1772.* Osmaston Hall is the seat of this family. The manor was granted to Rohert Holland,

The chapel is built within a short distance of the hall. In it are the monuments of Sir Nicholas Wilmot, knight, who died in 1682, aged 72; that of Sir Robert Wilmot, the first baronet, who died in 1772, aged 65 years; and that of Sir Robert Wilmot, the second haronet, who died in Like Like the second haronet. that of Sir Robert Wilmot, the second haronet, who died in July, 1834, at the advanced age of \$2 years. Robert-de-Dun, Lord of Breadsull, in the reign of Henry the Second, gave up all his rights in the patronage of the chapel to the abbot of Derby. Sir H. Wilmot is the present patron. Robert Foncher, or Folger, founded a chantry in the chapel in 1357, the endowment of which was, in 1547, valued at 60s. \$3. The chapel consists of a nave measuring 29 ft. 9 in. by 15 ft. 9 in.; and a chancel 20 ft. 9 in. by 13 ft. 3 in.: the length of chancel includes the east wall of nave which is 2 ft. in thickness. The entrance doorway is placed

called at Greek-street, and pointed it out to in thickness. The entrance doorway is placed

in the south wall of nave, the door of which follows the sweep of the arch; the panel above the springing heing pierced and filled in with glass—rather an unusual occurrence. There is no porch. The hell turret is at the west end, in centre of roof, a portion of the nave being used as a "hell-chamber," without even the used as a "hell-chamber," without even the slightest applogy of a screen to separate the ringer from the congregation. The way of approach to the turret is by an open staircase, constructed of stone, and huilt up in the south-west corner of nave. Some of the treads are not more than 4½ in, wide, but the rise is very steen. The turnet is framed of winds averaged. steep. The turret is framed of wood, covered with plain tiles, and crowned by a vane, which has hecome rather bent by age. The north and south sides are open, and louvre boarded, the others lath and plaster. The roof of nave apparent to the steep of th pears to be very strongly framed, and well-tied. None of the timbers are visible from below—joists being thrown in hetween the ties and the whole ceiled flat. Two corbels, rest-ing on stone corbel head, are however left naked; they are in the centre of nave, and naked; they are in the centre of nave, and support one of the tieheams; but their accompaniments being cut off, they look sadly out of place. They are of navel formation, and would doubtless have a good effect in an open timbered roof. The fout is pushed up in a corner, being in an angle formed by a pew and the west wall. The pedestal is square, the shaft round, and the hasin polygonal; although not more than 2 ft. 9 in. high, it is strapped to the wall, having an iron roller round shaft, and a holdfast. Although it does not appear very old, it is decidedly infirm. The stove is placed close by, and near the entrance, for the purpose of heating the air ere it reach the pulpit. The pipe is thrust through the west wall, and carried up above the roof, a complete eyesore both externally through the west wall, and carried up above the roof, a complete eyesore both externally and internally. The nave, chancel, and "sanctum sanctorum," are paved with common red bricks: within the altar-rail the hricks are covered with brown paper, over this, a carpet. The communion-table is very plain, covered with scarlet cloth. The east wall is pierced with a three-light window, arched and cusped under a low four-centred arch. It is a very common, late, and debased design of cusped under a low four-centred arch. It is a very common, late, and dehased design of the second pointed style. The lights are filled in with quarry glass, having four quarries in the centre of the centre light in one, with the letters I H S painted on in yellow, the colour of which has flown much. The window is rather deeply splayed inside, but without any moulding. There is a small window in south of chancel with an organ arch but devoid of moulding. There is a small window in south of chancel, with an ogee arch, hut devoid of of chances, with an oger atts, but devote or tracery; the jambs of this are square, as are the two on the opposite side, lighting the squire's pew, and which are exactly similar: these three are filled in with stained and plain glass, set alternately in an octagonal pattern. The pew has a stove in it, and betokens much attention to the comfort of the occupants. The stove communicates with a flue pans. The stove commences with a more outside, in the shape of a massive luttress, finished square at the top. The use of it is unmistakeable, and shows in a remarkable manner the subserviency design had to construction with the mediaval architects, and making good the motto of "The Bullder," "Structural propriets in the architects are included." "Structural propriety is the main element in the production of heauty." The altar-rail is very poor, and the supports—call them what you will—very curious. The vicar's pew in the you will-very curious. The vicar's pew in the chancel is likewise inclosed in the same manchancel is likewise inclosed in the same manner, contrasting strongly with the comfortable pew on the opposite side. The remaining pews are large, square, social apartments, just those lumbering things that are now properly getting out of date with our modern contrivers, who seem afraid to lose an inch of area. Verily they are justified in the "economy" when expected to find accommodation at "four pounds a head," and this including all extras. No such parsimony governed our forefathers; what they applied to the purposes of religion was of the best procurable, given with an open hand, and upon the principle with an open hand, and upon the principle that "a labourer is worthy of his hire." Nothat a labourer is worthy of his line. Another thing was with them too good for the house of their Lord: if that was all the parish possessed, still that was a piece of decency; strong, though not heavy, fine, yet not tawdry. In their age of poverty, their children were rich; in ours of wealth, the generality are poor.

This ought not to be. What is to be done, should be done well, and for posterity. We plant our estates to enrich our sons; let us not, plant our estates to enrich our sons; let us not, at the same time, hurden them with the constant repairs of that which should be delivered to them free and unencumbered. You have done much, Mr. BUILDER, towards the cleansing of the "Augean stable;" you have dealt giant-blows, and progressed with giant strides, yet much remains for you to do. In your efforts to effect so great and good a change we wish you God sneed,—remember your motto.

efforts to effect so great and good a change we wish you God speed,—remember your motto, and "nil desperandum."

The free seats are very commodious, and fitted up with book and kneeling-boards. The brick floors would be uncomfortable, were not our "bold peasantry, their country's pride," accustomed to that in their own homes, a boarded room being with them a rarity. Bricks and plaster constitute their floors generally. and plaster constitute their floors generally. The plaster is very clean and good; it is like-wise (an all-important consideration) very

cheap.

The reading-desk and pulpit are placed rather curiously, the means of access being through the clerk's desk to the reading-desk, and through both to the pulpit. The pulpit is octagonal, of oak, and is provided with a sounding-board. The windows being behind the desk, the light is thrown directly on the books, without inconveniencing the clergy-man.

By referring to the plan it will be seen that By referring to the plan it will be seen that this chapel possesses a marked peculiarity, namely, a buttress in the centre of the west end, as Howel Church; this thickness above the base moulding is 1 ft. 9 in.; it is projection 3 ft. 9 in.; it is of three stages, and dies into the wall at about the commencement or base line of gable. With exception of the flue buttress there is only one other, and that is set diagon-ally at the north-east corner of the chancel; it is finished ere reaching the eaves, but the ivy is too thick to ascertain the number of its

I had forgotten to mention an oil painting, (by whom I could not learn) which is hung on (by whom I could not learn) which is hung on the north side of the chancel, but in a light that does not allow it to show to advantage. It is a representation of the birth of our Sa-viour: astonishment, not unmixed with fear, is depicted in the countenances of the by-standers, who seem to be making all sorts of conjectures, and pointing to the infant Jesus.

W. WIGGINTON.

REMARKS ON THE RESISTANCE OF POSTS TO FLEXURE.†

THE ordinary formula for the stiffness of beams, supported at the ends and loaded in the middle, is

 $w = \frac{b \ d^3}{c \ l^2},$

in which (w) represents the weight which produces a given deflection; b = breadth in inches; d = depth in inches; and l = length in feet: c is a constant, to be determined by substituting the values of the other quantities in the countien. equation.

equation.

In making experiments to determine the constant from this formula, it is necessary to observe very accurately both the weights and the deflections produced by them, and then, hy means of a proportion, find the value of (w), which will produce the deflection required to be substituted in the formula.

In reflecting upon the circumstances connected with the flexure of beams, the writer conceived the idea of deducing an expression

nected with the flexure of beams, the writer conceived the idea of deducing an expression for the weight which a post would support from the ordinary formula for the stiffness of a horizontal heam, by the following considerations:—If a beam is bent by an applied weight there will be a tendency, from the elasticity of the material, to recover its form when the weight is removed; but if the ends are fastened by being placed between resisting points, so that the piece cannot recover its shape, there must be a horizontal force caused by the reaction of the material, and this force is such, that if the beam were placed in a vertical position and loaded with a weight equal to it, the deflection should be the same as that of the horizontal beam, and consequently the extreme

limit of the resistance of the post to flexure would be determined.

To ascertain the force which is exerted by the reaction of a bent beam in the direction of the chord of the arc.

Let ΛB represent a beam, supported at the ends and loaded with a weight (w) applied at the middle point. d = deflection caused by the applied weight. BC = tangent of curve at B.

If the weight be removed, the reaction of the beam will cause it to regain its original figure, if not resisted by a pressure at the ends. The force of this reaction will he proportional to the degree to which the fibres are portional to the degree to which the fibres are portional to the degree which the objects is nothing at the ends A and B, and increases uniformly to the middle point, the force of reaction will be in the same proportion, and the point of application of the resultant of the whole of the reacting forces will correspond to the centre of gravity of a triangle whose base is Bf; it will, consequently, be at a distance from $B = \frac{2}{3}Bf$.

The effect of this resultant acting at a distance $\frac{2}{3}$ Bf, must be the same as the weight $\left(\frac{w}{2}\right)$ acting at a distance B f, and must consequently be in proportion to $\frac{w}{2}$ as 3:2. The value of the resultant is therefore $\frac{3 w}{}$

The line of direction of the pressure at B being the tangent B C, the force of reaction at h may be considered as applied at the point k of its line of direction; and as k h B and CfB are similar triangles, Cf: $fB:: \frac{3}{4}w:$ horizontal pressure at $B = \frac{3}{4} w \times \frac{f B}{f C} =$ $\frac{3}{4}w^{\frac{1}{2}}\frac{l}{2}\frac{l}{d} = \frac{3}{16}\frac{w}{d}.$ Representing this force by P, we have

 $P = \frac{3 \ wl}{16 \ d}$

As the deflection of a beam within the elastic limits is always in proportion to the weight, if (w') = the weight that will produce a deflection equal to unity, the deflection (d) will require a weight = $(d \ w')$, and by substituting this value in the equation, we find

 $P = \frac{3}{16}, \frac{d w' l}{d} = \frac{3}{16} w' l.$

In this expression (d), which represents the deflection, has disappeared, and as (w') is a constant quantity for the same beam, representing the weight that produces a deflection equal to the unit of measure, it follows that P is the same with every weight and every degree of deflection within the elastic limits. This result seems at first view to be contrary to fact; it would appear that if the weight be increased, the horizontal strain should be increased in the same proportion; but when it is remembered that the deflection increases with the weight, and that the former diminishes the value of P in precisely the same proportion that the latter increases it, the difficulty vanishes, and the reason why P should be constant for the same beam becomes obvious. stant for the same beam becomes obvious.

The practical importance of this result is very great, as it furnishes the means of obtain-ing a formula which will give at once the extreme limit of the resistance to flexure, or the weight which, applied to a post, will cause it to yield hy bending.

As the formulæ used hy Tredgold are calulated for a deflection of $\frac{1}{40}$ th of an inch to one foot, or $\frac{1}{480}$ of the length, the weight which would cause a deflection of 1 would be $w = \frac{l}{480} = \frac{480 \text{ w}}{l}$ and by substituting this value for w' in the equation

 $P = \frac{3}{16} w' l,$ we find P = 90 w = A.

But from the ordinary formula for the stiff-

ness of a beam supported at the ends we have $w = \frac{b \ d^3}{c \ l^2} \quad \text{Therefore P} = \frac{90 \ b \ d^3}{c \ l^2} = B$

The expression P = 90 w shows that the extreme limit of the strength of any post whatever, of any length, breadth, or depth, or of any kind of material, is ninety times the weight which causes a deflection of $\frac{1}{16\pi}$ of the

The second expression, $P = \frac{90 \ b \ d^3}{c \ l^2}$, will give the value of P directly, without first knowing the weight required to cause a given deflection in a horizontally supported heam. In this expression, b = breadth in inches, l = length in or at least dimension in inches, l = length in feet, and c = a constant to be determined by experiment for each species of material. The value of c for white pine is 01. By substituting this value, we find $P = \frac{90000 \ b \ d^3}{l^8}$, a remarkable simple formula

a remarkably simple formula, which gives the extreme limit of the resistance to flexure of a white pine post.

The same expression may be used to determine the constants used in the ordinary formula for the stiffness of beams. For this purpose let the equation $P = \frac{90 \ b \ d^3}{c \ l^2}$ be trans-

c 12

posed, which will give $c = \frac{90 \ h \ d^3}{P \ l^2}$ hy applying a string to a flexible strip of the material to be experimented upon, in the manner of a chord to an arc, and ascertain the tension on the chord with an accurate spring tension on the chord with an accurace spring balance. It will be found that, whether the strip he bent much or little, the tension on the chord, as shown by the spring balance, will be constant, and this tension, in pounds substi-tuted for P, will give the value of c without re-quiring, as is necessary with other formulæ, an observation of the deflection,

Experiments made upon these principles with strips of white pine, yellow pine, and white oak, 5 feet long, 1½ inch wide, and ¼ inch deep, give the following results:—

The observed tensions were—
White pine, 7½ by, wellowed.

White pine, $7\frac{1}{4}$ lbs. value of c=0097 Yellow pine, $6\frac{1}{4}$,, , , = 0108 White oak, $6\frac{1}{4}$,, , , = 0104 As the stiffness is inversely as their constants, it follows that white pine is stiffer than yellow pine or oak. The experiments of Tredevold give similar results. gold give similar results. H. HOUPT, C.E.

THE WESTMINSTER IMPROVEMENT COMMISSION.

THE great importance of forming athorough. The great importance of forming athorough-fare through the populous district of West-minster, not only for the object of the sanitary condition of a large and densely inhabited district, lying contiguous to the New Palace of Westminster and the Queen's Palace at Pim-lico, but also for forming a suitable and con-venient communication between the seat of the Legislature and the large and wealthy dis-trict of Belgrave-square, has long been recog-nized. Acts of Parliament were obtained in 1845 and 1847 to promote these objects, and the Legislature, feeling the great importance of the project, granted very considerable of the project, granted very considerable powers and pecuniary assistance to the com-missioners, to whom the carrying out of the

powers and pecuniary assistance to the commissioners, to whom the carrying out of the
act was intrusted.

Without entering into the details of the
various proceedings which are always required
to conduct such undertakings to a successful
conclusion, or assenting to all the acts of the
commissioners, it may be sufficient to say that
many improvements have been made in the
line of street as originally laid down; and
powers to form new collateral streets and
other additional advantages have been ohained. The commissioners have silently and
gradually purchased a large amount of property through this dense and ill-tenanted
locality: nearly the whole line of street is
now opened of the width of 80 feet, and it is a
circumstance unusually favourable in the
formation of streets of this description, that
a depth of building-land has been secured on
each side of the street from 60 to 70 feet deep;
and with powers which will be gradually put in and with powers which will be gradually put in force to clear large tracts of the adjoining pro-perty. We may have something to say to the perty. We may have some commissioners before long.

^{*} See page 169, present vol. of "The Builder."

THE HALL AT BOWOOD.

THE HALL AT BOWOOD.

Bowood is the seat of the Marquis of Lansdowne; it is situate about 4½ miles from Chippenham, in the middle of a noble park. The mansion is a large and fine pile of building, the work of the Adams. It has lately had some considerable additions, of conservatories, terrace gardens, &c., by Mr. Barry. Our view represents the end of the great hall, and illustrates how a seeming difficulty in the hands of a skilful architect may become a beauty. Without giving the plan of the upper rooms of the building, we can hardly illustrate the inconvenience sometimes occasioned by carrying up a large room, such as this entrance hall, two stories in height, by its interference with the communication between the rooms on each side of it on the upper floor. Bowood is the seat of the Marquis of

the communication between the rooms on each side of it on the upper floor.

The ingenious way in which a passage in this instance is obtained, will be evident upon an inspection of the view. An easy communication is obtained between the rooms on either cation is obtained between the rooms on either side, on the upper floor, and a picturesque termination formed for the hall itself.

FRENCH IMPORTS OF METALS.—The chief imports in August last, in met. quin., as com-pared with those of August, 1847, were—

THE BIRMINGHAM WORKHOUSE COMPETITION

REMUNERATION OF ARCHITECTS

THE guardians of the Birmingham union seem to have made up their minds to keep in our books. At their last meeting the committee reported that they had made an offer to Messrs. Drury and Bateman of a sum of 800L. Messrs. Drury and Bateman of a sum of 8001. to prepare the necessary working drawings, and superintend the erection of the new work-house according to their plans; that amount not being intended to include the remuneration of the clerk of the works. (The building, we should mention, is estimated at 25,0001.) The chairman read the reply of Messrs. Drury and Bateman, which stated, that as the expenses out of pocket already incurred, and those which must necessarily be incurred hereafter, in carrying out the designs for the new workwhich must necessarily be incurred hereafter, in carrying out the designs for the new workbouse, would amount to nearly the sum proposed to be paid them, and leave scarcely anything to compensate services that would extend over a period of two years, they were under the necessity of declining the offer. They were willing, bowever, to make some concessions, and hoped to be met in the same spirit. A motion that 900f. should be offered was put, but ultimately, after considerable discussion, it was resolved, by a majority of 26 to 12, that an offer of 4 per cent, upon the outlay should be made to the architects as a remuneration for their services.

in which architects place themselves who go into competition without properly-arranged conditions. After risking the entire loss of the time and expense incurred in the preparation of designs, and succeeding against rivals, they are offered less than the ordinary remu-neration paid in cases where there is no risk at all. If the guardians did not intend paying

at all. If the guardians did not intend paying the ordinary commission, they were bound to say so in the first instance.

We have given publicity to the improper circumstances attending the selection of Messrs. Drury and Bateman's plan (which may be not merely the best of those submitted, but the best ever made, for aught we know to the contrary); but the guardians having appointed them, we are bound to protest against pointed them, we are bound to protest against the endeavour which is being made to induce them to accept less than the usual commission.

BACKS OF HOUSES.—I think a word might be said with advantage on the mode of constructing the backs of some of our finished bouses, which are made as unsightly and unlike the fronts as possible. Look, for in-stance, at Kernm-town, and other of the great unlike the fronts as possible. Look, for instance, at Kemp-town, and other of the great terraces at Brighton, which, seen from the back, look more like piles of workhouses or factories than the residences of the gentry of England. A little attention to "keeping" in building the backs of houses, would add This affords a fresh example of the position greatly to their beauty and very little to their cost.—P.

TOWER OF ST. MARY'S CHURCH, TAUNTON.

Two or three weeks ago, called in to examine professionally thevery interesting churchat Wrington, in Somersetshire (and concerning which we shall have a few words to say herewhich we shall have a few works to say here-after, not unimportant to church-builders), we took to the "down" rail again, instead of the "up," and steamed on to Taunton, to re-vive our recollection of the church of St. Mary Magdalene. Five-and-thirty miles on the iron borse take less time than a short spire-hunt on foot "across country." It is too late now to talk to our readers of the

very extensive works at St. Mary's, which, comwere the vicar, Dr. Cottle, and carried on during several years with a large expenditure, baye comvicar, Dr. Cottle, and carried on during several years with a large expenditure, bave completely restored the body of the church, elaborately (though perhaps, in some cases, questionably) decorated it, and made it an object of attraction to visiters from all parts of the country,—works which we are sorry to hear, by the way, have so crippled the resources of the vicar, as to force him to quit the scene of his labours and seek some more lucrative appointment. pointment.

We were, however, so struck by the miser-able condition of the tower of the church that

able condition of the tower of the church that we cannot avoid calling attention to it, to aid in leading to its restoration.

Annexed we give a view of this structure, to enable such of our readers as have not seen it to appreciate its beauties. It is one of the best towers of the Perpendicular period,—standing pre-eminent in a county distinguished by the elegance of its towers. There is no record of the date of its erection, but it may be safely ascribed to the latter half of the fifteenth century. fifteenth century.

In an essay on the "Gothic Towers of Somerset," forming part of an elegant and interesting book descriptive of St. Mary's, Taunton, published by Mr. May, of that place, it is said on this point,—"There are, unfortunately, no coats of arms, or cognizances,

upon the tower, to settle the exact date when it was built; but on the transoms of the two upper series of believy windows are sculptured angels supporting shields, on which are carved the initials \$\mathbb{X}\$. These letters may refer to Richard Beere, Abbot of Glastonbury, who presided over that establishment in the fifteenth century,—a dignitary eminently skilled in architecture, and who built the church at Glastonbury, on which are sculptured the same initials, \$\mathbb{X}\$. \$\mathbb{B}\$. it is therefore not unlikely that he may have designed the beautiful tower of \$\mathbb{S}\$. Mary's Church."* Beere was installed abbot January 20th, 1493, and died January, 1524.

The engraving gives a south-east view of the tower, and shows also the body of the church as restored. The stonework of the former is in a dreadful state of decay and disruption. On each of the four stories the walls are tied together with iron bars, which go right through to the outside, and the genuing a series of the contents of the contents are the greatly through to the outside a set the greatly and the contents of the contents are stored a sinual the greatly and the contents of the contents are the greatly at the contents of the contents of the greatly and the greatly are the greatly at the greatly and the greatly are the greatly at the greatly and the greatly are the greatly as the greatly are the greatly are the greatly and the greatly are th

iron bars, which go right through to the outside; and the crowning perforated pinnacles and traceried parapets are scarcely safe.

It is to be hoped that measures will speedily be taken to restore this very interesting specimen of fifteenth century art.

SOMERSETSHIRE ARCHÆOLOGICAL SO-SOMERSETSHIRE ARCHEOLOGICAL SO-CIETY.—This society beld their general meeting on Wednesday, in last week, when Sir Walter Trevelyan presided, and the Hon. Mr. Bon-veric, Mr. Daubeny, Dr. Buckland, Mr. Brit-ton, the Rev. Mr. Dymock (the hon. secre-tary), Mr. Giles, Mr. Crosse, and others, took part. Dr. Buckland characterized the use of Bath-stone in London as a gross mis-take, and said none should come into West-minster Abbey so long as he was there. minster Abbey so long as he was there.

" "Some Account of the Church of St. Mary Magda-lene, Taunton; with several Notices on Ecclesiastical Mat-ters. Beautifully printed in Imperial 8vo., with 10 Engra-ings and Ground Plan." Containing, also, besides the easy already mentioned, a paper on "The Ecclesiastical Architecture of England;" and another on the "Orna-ments of Churches." Sold by Hamilton, Adams, and Co. London: and F. May, Taunton,

TASK-WORK.

Knowing your willingness to give publicity to any existing grievances or abuses of trade, I beg, through the aid of your journal, to call the attention of the building public generally to the system much in practice among builders, de-nominated task-work,—not that I wish to im-pute blame to builders, but to offer a caution against a system that is alike injurious to themselves and to the interests of the working-

A builder, being anxious to let a portion of work, allows certain parties to send in tenders for the same—labour only, and in many cases his foreman is included. This person wishing to keep his situation, and the other parties also his foreman is included. This person wishing to wishing to obtain employment, send in, as is generally the case, ridiculously low prices: the consequence is, that the accepted party, whom we shall call the task-master, after making an agreement to draw wages every week, is well aware, at least this is generally the case from the low price given, that there will be no balance when the work is completed, even if it can be done for the money, excepting by management. He, therefore, employs a quantity of inferior workmen, or what are termed "improvers," at trifling wages, and they are mixed with superior workmen. He is then able to draw the full wages for all parties, enriching himself at the expense of the builder, and to the injury of the mechanic. Should he find the sum agreed not likely to bear out, he, having nothing to lose, can leave the job whenever he thinks proper, leaving the builder and men in the lurch.

But I am convinced throughout all the men in the lurch.

men in the lurch.

But I am convinced, throughout all the building line, there is no branch so abused as the one to which I belong, viz., plastering, owing to the ready access the task-master has to hawk-boys. Those boys, after serving a plasterer a few months, are put to casting ornament, lathing, colouring, and other minor things. In a short time one of these is placed with a mechanic (this branch menerally with a mechanic (this branch generally

work in pairs), and the man is obliged to put up with it, or be at the risk of being discharged; he is also required to get over the same quan-tity of work as if another good mechanic was with him.

I now ask, is it possible for architects and builders to have good work executed under such a system? The mechanic has not time to do it, and these boys or improvers cannot do it I am not saying that boys must not be taught, but let them be apprenticed or brought up to the trade in a straightforward manner, when we should still be able to have superior opera-These, I am sorry to say, are fast diminishing.

And what benefit does the builder derive from

And what been those the builder usine receive from the end for having his work done; his materials are wasted, owing to the inexperience of the parties employed; the work cracks, and in many cases falls before the building is completed, and he is at the expense of replacing it, the materials, generally, getting the blame. It is earnestly to be desired that huilders will consider these facts, and abandon a system which (as I have said before) is injurious to themselves, and highly prejudicial to the in-terests of the working classes.

A PLASTERER.

NOTES IN THE PROVINCES.

THE intramural churchyard of All Saints. Stamford, being totally insufficient to bury the dead in any longer, a space on the north-east side has been appropriated for that purpose, and the tender of Mr. Robert Woolston, for 501., to do the work in three or four weeks accepted. The new catacomb will contain 100 to 120 or 100 or 1 coffins, and may last, they say, two years.—At Romford, the more sensible proceeding of at once opening a piece of ground outside the town has been adopted. It is to be enclosed and planted, and a chapel erected from plans already prepared.—The alterations of Hun-tingdon County Gaol are progressing towards completion. Besides a detached infirmary, there is an additional building with kitchens, hath rooms, laundry, and other offices, on the basement. The interior is open to the roof, basement. The interior is open to the roof, with a ventilating shaft, communicating with sixty-two cells ranged round the interior, and approached by a gallery. Hot-air pipes also communicate with all the cells, which are lighted with gas, and have water-closets, water, &c. The dinners are served up by railway from the kitchen, and altogether the arrangements, "but for the solitary confinement gather hold out a varietiem," arrangements. "but for the solitary connement, rather hold out a premium for the commission of crime than the shunning it." The whole has been executed by Mr. Parker, of Thrapston, from a plan provided by Mr. Smith, and at a cost of 6,000. to 7,000.—The newly-erected church of St. Peter, at Cookley Wasserser was consecrated on Friday. The newly-erected church of St. Peter, at Cookley, Worcester, was consecrated on Friday week. The proportions are as follows:
Leugth of nave, 52 feet by 10 feet; side aisles, Length of have, 92 feet by 19 feet; since asses, each 9 feet wide; chancel, 15 feet by 13 feet; interior of tower, open to the church, 10 feet by 12 feet; exterior height of tower to the top of the battlements, 57 fect. The builder was Mr of the battlements, 57 feet. The builder was Mr. E. Smith, and the architect was the builder. The Committee of Privy Council on Education have awarded a grant of 2,200l. towards the construction of the proposed Training School at Saltley, for the diocese of Worcester. The execution of the work is postponed till the spring of next year. A deficiency in the funds of nearly 3,000l. still exists.—A new church is to be erected at North Malvern.—At Net-tleton, Wilts, last week, the foundation-stone of a new school-room and house of residence for the teachers was laid. The ground was given by Mr. G. P. Scrope.—Frankleigh House, near Bradford, Wiltshire, in conrse of reconstruction in the Elizabethan style, is now nearly completed. The architect is Mr. Henry Clutton; and the builders are Messrs. D. and C. Jones, of Bradford.—On Thursday week, at Leamington, the first stone was laid of a "Poor Man's Church," in High-street, in connection with the national schools at present E. Smith, and the architect was the builder .connection with the national schools at present in Court-street.—St. Asaph Cathedral has been beautified by the Bishop of the diocese with two painted windows, in memory of Mrs. Short.——St. Mark's Church, Pensnett, was consecrated on Tuesday week. It is cruciform, with nave and aisles, north and south tran-

septs, chancel, and chancel aisles, or chapels. The style is First Pointed. The breadth from north to south across the transept is about 70 feet, and the length from west to east about 133, of which 38 are given to the chancel. The tower, which is to be enlarged and completed hereafter, stands in the position of a south porch, and is to be carried to the height of 180 feet. The interior of the church presents a dark brown colour of roof and seats, sents a dark brown colour of roof and seaso, with walls relieved by red sandstone in the arches and pillars, and black, red, and buff tiles in floor. The organ, by Bishop and Sons, cost from 4901, to 5001. The aisle, transept, and chapel windows have be n filled with glass, on which tint and diaper patterns have been painted and hurnt in, rendering them permanent. The sittings for at least 1,000 persons are to be chiefly free. A stone-arched gateway, in a houndary wall, leads to the church through a graveyard enclosure.—On the corporation gas-works at Manchester, this year, there has gas-works at Manchester, this year, there has been an increased profit of at lenst 4,000L, over and above provious splendid returns. Almost 25,000,000 feet of gas more than in 1848 have been made since the previous reduction in price. Amongst the disbursements during the past year we perceive a sum of 27,663L odds put to the credit of the Improvement Committee, over and above 1,625L odds to the Chorlton on Medlock Committee.—
The Springfield-lane bridge improvement at Salford will cost 1,500L. Its progress has been delayed. A contract for the erection of the bridge here over the Irwell, according to the plans and specifications, has been autho-

the plans and specifications, has been authorized by the Inprovement Committee, the council to pay 1,600. of the whole, and the landowners the balance.—A dispute has landowners the balance. — A dispute has been in progress at Sunderland hetween the engineer and directors of the dock and Mr. contractor. Barricades Craven, the Craven, the contractor. Barricades were erected and alternately occupied by the belligerent parties, who shot shovelfuls of water at each other, till the police interfered. The right of the directors to enter on the premises having at length been recognized by the Craven the director. Mr. Craven, the dispute terminated, and the contractor proceeded with his work.—The alteration of the screen-wall of the Edinburgh Register House is to be proceeded with, on a plan by Messrs. Burn and Bryce, approved of by the trustees of the Register House. It proposes to throw back the wall about 9 feet, and the pavement 5½ feet. But 15 to 16 feet of additional carriage-way are demanded at the head of Leith-street, where a corner house juts head of Leith-street, where a corner notes, and on the street, opposite the Register House, and on the street, opposite the negister from really constitutes the obstacle in the way. The alteration is to cost 162l.—St. Andrew's ew parish school at Glasgow has been opened, Mr. Kirkland was the architect. The building fronts the green, and consists of two schoolrooms for 400 scholars in all.

THE DRAINAGE OF LONDON.

WE have already expressed our opinion as to the error of the course adopted by the commissioners in the attempt to obtain plans for missioners in the attempt to obtain plans for the drainage of London. A satisfactory result is impossible: the time of the competitors has been thrown away. We have only space in our present number for a report of the meeting of commissioners to receive the plans, and must defer the consideration of several letters on the subjust till next weak. on the subject till next week.

A special court of the Metropolitan Commissioners of Sewers was held on Wednesday last, at the Court house, Greek street, pursuant to adjourn the Court-house, Greek-street, pursuant to adjournment, for the purpose of receiving the plans proposed for a permanent and efficient drainage of the metropolis. Present—Sir John Burgoyne (in the chair), Mr. Alderman Lawrence, Capt. Veitch, Capt. Dawson, the Rev. E. Murray, Rev. M. Cowie, Mr. Chadwick, Mr. Bain, Dr. Southwood Smith, Sir II. de la Beche, Mr. Lawes, Mr. R. L. Jones, Mr. Hawes, the Rev. W. Stone, Mr. Norris, &c.

Mr. Woolrych, the clerk, read the resolutions Mr. Woolrych, the clerk, read the resolutions passed at the former overt on this subject, and stated that, of the sixty-two plans sent in up to that time, fifty-one descriptive statements had been received, in compliance with a resolution passed to that effect; fifty-four new plans had heen sent in, thereby increasing the number of plans to one hundred and sixteen. In addition to these, those who had originally sent in their plans bad subsequently sent in thirty-two sundementary statements; so sent in thirty-two supplementary statements; so

that there were, in fact, no less than one hundred and forty-eight schemes for the consideration of the court. Mr. Woolrych then read the names of the competitors whose projects bad been sent in since the 20th of August last.

Mr. Alderman Lawrence objected to the names being read, as such a course might influence the selection of a particular plan. It was a well-known fact that the work of any individual whose name was familiar was received with favour.

Mr. Chadwick believed that the mention of names ad in some measure been brought about by the resolution of the court.

resolution of the court.

The Rev. Mr. Cowie said, before any further steps were taken on the question, he must, on his own part, protest against the course they were pursuing altogether. He might be alone in his views, as he had spoken to no commissioner upon the subject, but he felt it to he his duty to embody his opinions in a protest, which he would read. (Mr. Cowie then read the protest, which set forth that before receiving any plans for the proposed object, the court should have laid down certain rules for the guidance of the competing engineers, embracing the guidance of the competing engineers, embracing the main features, and also with reference to the disposal of the sewage manure. Another essential point to be determined was the water supply, without which subject being settled no practical henefit could be derived. In conclusion, it stated that what could be derived. In concussion, it stated that what had been done was a most ill-judged proceeding, urged on prematurely by the chief surveyor and a portion of the public press.) Mr. C. then spoke at great length in support of his views in general con-

great length in support of his views in general condemnation of proceeding at all.

Mr. Chadwick said, as they bad only within a few days received the plans, he thought a short time should be given for their consideration and classification, either as a part or as the whole of a plan when brought together. He thought the best course to pursue would be, that the author of each new plan should send a concise statement of his plan, whether in principle or detail, which should be printed for the consideration of the commissioners as soon as possible, and that a special court sioners as soon as possible, and that a special court should be called to receive the same. He regretted that the proceedings of the Works Committee, the Sewage Manure Committee, and the Trial Works that the proceedings of the Works Committee, the Sewage Manure Committee, and the Trial Works Committee, with their approximate works under consideration, had not been made known, as thereby a great deal of lahour might have been saved or more efficiently directed. He agreed with Mr. Cowie that they bad heen unduly hurried into the matter, as it was his opinion that no plan could be adopted until the completion of the survey. They were now on the eve of completing the surface and subterranean survey, with a variety of important trial works, which would be found highly essential and govern the preparation of plans. He, therefore, thought the statements should be printed, and that they should adjourn the whole question.

Mr. R. L. Jones protested against the court coming then to any decision on the subject.

Mr. Alderman Lawrence was opposed to leaving the question to the members of the court, and, as one of those representing the City of London, he could state that no plan would give satisfaction to that body, nor would there be any security for persons submitting the designs, unless they were referred to the first engineers of the day, to gentlemen who were conversant with the subject, and competent to judge of the respective merits, and not submitted to those who had come to foregone conclusions.

Sir H. de la Beche believed that the court could

Sir H. de la Beche believed that the court could Sir H. de la Beche believed that the court could not do better than adopt the course proposed by Mr. Chadwick, and that by so doing they would do their best to place the question in such a light that the jublic should eventually be satisfied with the decision that they might come to. Whether it were prudent to print the names of the candidates he would offer no onlying—nethous its mittaken.

prudent to print the names of the candidates be would offer no opinion—perhaps it might have admitted of a question—but as the statements of the plans formerly received had been printed, he thought it would be only fair that those who had subsequently sent in should be placed on a precisely similar footing.

The Rev. E. Murray agreed in the view taken by Mr. Chadwick, although at first sight it might appear as a postponement of the question. Still he thought they night enter upon the first stage of a subject that must be carried on with the most deliherate consideration. Mr. Chadwick had spoken of the necessity of a classification, and in looking over them he helieved those clusses might be reduced to a very small number developing general plans. to a very small number developing general plans. For the larger class, he found nineteen advocating the principle of two tunnels. The second class comprised twenty one plans of a miscellaneous chacomprised twenty one plans of a miscellaneous character, different in their principles and mode of action, amongst which would be found that of Mr. Austin, their consulting engineer. Three others involved the question of fiftration,—a question that had never received the consideration that was necessary, while conting was presented. sary; while another was contingent on a certain supply of water, so large that it might almost be considered unlimited, and to an extent never hitherto considered necessary. There were fifty other plans, unaccompanied by any statement, but something like a general agreement appeared upon the question of a double tunnel, while the chief surveyor and four others took up the same idea of a single tunnel. Therefore, he thought that not more than four or five classes need be formed, to which they should refer the leading principles to be kept in view. He denied that any foregone conclusion had been come to upon this subject, as be believed that one of the most eminent engineers in the country would not adopt the plan of either the consulting surveyor or of the chief engineer. As to the delay that they appeared to have fallen into, in fifty-six statements sent in, and particularly those advocating two tunnels, they appeared to have wholly neglected one of the greatest difficulties, and that was, let the tunnel be where it night, with an intermittent supply of water, what would be the proportion of the deposit; for if they constructed tunnels, there could be no doubt that in the lapse of years they would be filled up. In the extense of each travel the exercise.

deposit; for if they constructed tunnels, there could be no doubt that in the lapse of years they would be filled up. In the scheme of one tunnel the same difficulty would exist, though in a greater proportion. Such being the state of the matter, where they had so much to learn, he thought they might be pardoned if they asked for more time, as there were other considerations than the mere relief of London by a certain canal.

Mr. Alderman Lawrence thought no classification should be made by the Court, but that they should leave that question unincumbered to persons who were practically acquainted with the subject, who would themselves classify them if such a course was considered necessary. He trusted that all parties would receive fair play, especially as he found great disunion in the board, and their decisions were guided by the influence of majority against minority. Let the plans be good, bad, or indifferent, he was for referring them to gentlemen of known skill and experience.

experience.

The Chairman said their position reminded him The Chairman said their position reminded nim-of the story of the man that prayed to Jupiter for wealth, bis request was granted, and he was over-whelmed in the shower of it. They were not exactly overwhelmed, but they would have some difficulty in extricating themselves from the mass, and select-tics and profitors as they might deep valuable. He ing such portions as they might deem valuable. He thought the most judicious course would be the one

ing such portions as they might deem valuable. He thought the most judicions course would be the one that had been suggested.

After a few words from Mr. Norris,
Mr. Chadwick said his opinions on this subject had been fully set forth in olicial documents, to which he had set bis name. Long since he had pressed two plans on the consideration of the court, to bring these principles in issue; and so fur from dictating, or taking any undue position, bis object had hen to place facts before the commissioners, without any pre-conceived opinions on his part. He had wished them to delay their decisions until their trial-works were in a fit stage for them to decide; and he was strongly of opinion that they should decide no general plans until the two surveys were completed. If he bad any pre-conceived opinions, they were directed—first, to the purfication of the house, which formed at least two-thirds of their work; the next, to purfifying the street; and lastly, the river. Great misrepresentations had been made out of doors as to the state of feeling in the court, and what had been done. He admitted that there had been great delays, but at the same time he felt assured that a most important progress had been made over those acts of any previous commission.

Mr. R. L. Jones said, certainly the greatest divi-

Mr. R. L. Jones said, certainly the greatest divi-Mr. R. L. Jones said, certainly the greatest divi-sions existed in the court,—for what was agreed to by one court was rescinded by another; they had no principle haid down as to house drainage, or the difference that should be made between a large house and a small one; in fact, nothing was done hut on the bit-by-bit system. These evils had been brought upon them, he helieved, by splitting up the court into sections by the formation of com-

Several commissioners addressed the court, and the following resolutions were put and agreed to unanimously:-"That the author of each plan received since the

20th Angust be required to send in, by the 17th of October, a concise statement of what he considers the main features, whether in principle or detail.

"That the statements of what he considers the main features, whether in principle or detail.

"That the statements of the consideration of the consideration of the commissioners as early as practicable.

practicable.

"That within fourteen days after the completion of the printing and circulation of the concise statements, a special court be summoned to consider of the proceedings which it may be proper to take for deciding upon them, in conformity with the previous realistics of the context.

receiting upon teem, in conformity with the previous resolutions of the court.

"That such persons who send in plans shall, on receipt of such plans, be entitled to receive back the amount paid for sections and particulars." The court, on this question, was then adjourned

THE ARCHITECTURAL ASSOCIATION begin their season with a conversazione this (Friday) ecvening, the 5th inst., at their rooms, Lyon's METROPOLITAN COMMISSION OF SEWERS.

A GENERAL Court was held on Thursday, at the

Court-house, Greek-street; Sir Julius Burgoyne.
R.E., in the chair.

A letter was received from Mr. Bell, chemist, complaining of the state of the drainage of Great Portland-street, one death having recently occurred there from cholora, and at the present time the smells there from cholera, and at the present time the smells were so offensive, that the worst results were anti-cipated, unless a remedy was immediately applied by trapping the gullies, such work to be done at the expense of the commission. The application, on the recommendation of the Works' Committee, was agreed to.

was agreed to.

Sewage Manure for Hyde-park. It was agreed that permission be given to Mr. Mann, superintendent of Hyde-park, to sink, at his own expense, a well to receive a portion of the sewage from the sewer running through Hyde-park, for the purpose of pumping and using it for manuring the park.

Use of Sewage Manure in Agriculture.—The following letter was read by Mr. Woolrych, the clerk:—

following letter was read by Mr. Woolrych, the clerk: —

"Weald Hall, Brentwood, Sept. 29, 1849.

"Gentlemen,—In consequence of the invitation of landholders within 50 miles of London, in reference to the application of sewage manure, I obtained the inspection of a portion of my estate by Mr. Donaldson. Never having received any information of the result of that inspection from your board, I conceived it had been given np. As, however, I perceive from a report in the Times of Friday last that I am in error, I lose no time in declining further treaty for it. The late ravages of cholera in the lowlands and banks of rivers have led me more to appreciate the healthiness of these hills, where bappily no cases of that pestilence have yet shown themselves. I fear the importation of such whole-sale floods of London sewage, charged with noxious pily no cases of that pesuience methods themselves. I fear the importation of such whole-state floods of London sewage, charged with noxious gases, especially if deposited in an open reservoir sufficiently extensive to admit of a supply to reach Crouch river, and which, according to Mr. Baker's calculations per acre, must be enformous, would be beyond the power of every deodorizing fluid yet discovered. Of the value of sewage manure to meadow land there can be no doubt, but the opinion of so experienced an agriculturist as Mr. Robert of so experienced an agriculturist as Mr. Robert Baker leads me to question its applicability to the wet arable lands of Essex in the direction proposed. et arable lands of Essex in the oncome. From I am, gentlemen, yours, obediently,
W. Tower.

E. R. Woolrych, Esq."

The letter was laid upon the table, but no conver-

The letter was laid upon the table, but no conversation took place upon the subject.

The Explosion of the Sewer in Friar-street.—A letter was received from Messrs. Catlin and Co., soap-makers, on the subject of the recent explosion of a sewer in Friar-street.—Mr. Leslie said he had intended to move the abolition of the Trial Works. Committee but was induced at the recent of these committees. intended to move the abolition of the Trial Works Committee, but was induced, at the request of Lord Carlisle, to postpone that motion until the Com-mittee had made their report. That report lad not appeared, but they had one notwithstanding on Saturday last, in the sbape of an explosion in the sewer in Friar-street. On hearing of it, he (Mr. Leslie) sent for Mr. Medworth, to ascertain if he land and the state of the company of the com-Lessley sent for Mr. Medworth, to ascertain it me knew anything of the works done there, but he denied that there was any truth in it; and Mr. Grant, the district surveyor, denied the story in toto, in the presence of Mr. Hatton and two other officers, Mr. Grant adding that at this period of the officers, Mr. Grant adding that at this period of the year the newspapers were glad to get anything they could. Not satisfied, however, from the circumstantial account which appeared of the transaction, he made further inquiries, and it turned out that one of the officers had gone on Saturday night, on his own responsibility, and had blown up the sewer. He thought, therefore, that if there was then any objection to stop the Trial Works Committee, there could be none now. It appeared that they had made a communication from the ash-pit of the steam-engine of Thorne's brewery with this foul sewer. Such a process he considered hazardous. If damage occurred, and the factory were blown up, who was to pay the expenses of the policies of insurance—certainly not the fire offices. He therefore hoped they would now and at once stop the further proceedings of the Trial Works Committee. Notwithstanding the commission was stated to be on its last legs, he hoped they should, at any rate, die with something like decency. — Mr. Murray justified the Trial Works Committee.

Mr. Grant, anticipating some observations might he made upon this stipiets.

Mr. Grant, anticipating some observatious might be made upon this subject, had drawn up a report, which be would now read. It stated that the reports that had appeared of this circumstance were of a that had appeared of this circumstance very exaggerated and incorrect character. F the state of this sewer, he suggested that Gurney's mode of ventilation should be tried. Cooper and other parties were consulted on the subject, and a pipe was attached from the sewer to the ash pit of a furnace. The draught was very great, and for some time the experiment went on great, and the stone time experiment went on satisfactorily, but the stone-ware pipe nearest the furnace became very hot, and showed symptoms of cracking. To ascertain the effect of the air of the

sewer at the side entrance, a lantern was let down and the air inflamed, which operation was repeated, after which, when the men were closing the flap, it was suddenly carried with a jerk like the blasting of a quarry, the inflamed gas escaping suddenly, and slightly injuring one of the men who was standing at the entrance. Simultaneously the inflamed gas being drawn in to the furnace, the stone-ware pipe, which had been getting hotter, suddenly burst, and the door of the ash-pit, which bad heen hanging loose, was thrown off. This was the whole extent of the exiption. It further stated that no one but himself was responsible, as he did not consult either of the chief officers, nor did he do it by order of any commissioner. He also mentioned various places where similar experiments bad been tried with success; and in support of his view, quoted the opinion where similar experiments bad been tried with success; and in support of his view, quoted the opinion of Mr. Faraday contained in the first report of the Metropoltan Sautary Commission, in which he stated that "I have often thought that the many furnace and engine flues that rise up so abundantly in London might be made to compensate in part for the miasona which their smoke occasions by heing turned to account in ventilating the severes and burning the putrid vapours generated therein."—A long and rather disorderly debate ensued on this question, which was terminated by the adoption of the following resolutions:—

" That the court approves of the course taken by "That the court approves of the course taken by Mr. Grant, in reference to the sewer in Friar-street, having consulted the best available authorities, and that the expenses be paid."—"That the Trial Works Committee be instructed to report on the subject of such ventilation, and that an early day after its receipt be appointed for the consideration of the said report."

the said report.

A long conversation took place on the improper use of candles in the sewers,—Mr. Leslie contending that the Davy lamp should invariably be used as various accidents had arisen from the neglect; which view was supported by Dr. Southwood Smith.

—It was ordered that the use of the Davy lamp should be strictly insisted upon for the future. Some works were then ordered, and the court

adjourned.

Miscellanea.

CARPENTERS' HALL, LONDON-WALL .-Alderman Lawrence, one of the new sheriffs, being on the Court of the Carpenters' Company, the sheriffs' inauguration dinner was given in the old hall, which has not been used for such a purpose for many years. We have before now spoken of this building; it appears to have been acquired by the company in the year 1428, and in the following year a "Great Hall" was built by them. Whether any part of the original hall be still standing, cannot be ascertained; but the records of the Carpenters' Company, which (with the exception of a few years during a portion of the reign of Henry VIII.) present an unbroken series of the accounts of the company since the year 143, contain no notice of the subsequent erection of any hall, though they include constant entries of disbursements for extensive repairs and additions. The present hall, therefore, if not built in the reign of Henry VI. (1429), must, at least, be as ancient as that of Henry VIII. Little of the original work, however, is to be seen. The interesting mural paintings here, discovered in 1845, will be remembered by our readers.

BURIAL IN TOWNS .- The Board of Health have, unfortunately, been beaten in their righte-ousendeavours to save the lives of the community by the suppression of this nuisance. Under the 9th clause of the Nuisances Act they sum-moned the proprietors of the Whitfield Chapel graveyard, in Tottenham-court-road, before Mr. Jardine, for resisting their order to dis-continue the nuisance; but the insufficiency of the clause induced the judge to dismiss the summons, while, at the same time, he confessed the propriety of the Board's intention. We that even in the mean time, however, this will prove no check to the vigorous procedure of all in power with those other general measures requisite to the health and life of the community. Pity it were not the modern practice, as it was the more sensible practice of the ancients, to burn or embalm all the putri-fiable matter of the dead. As for measures of general cleansing, the time for that now approaches. The danger of opening cesspools, &c., has crippled all endeavours, hitherto, while plague raged, and the canals of filth below the level of the Thames on the south side have done their dreadful work without the least qualification or mercy. Something now, however, must be done.

BATHS AND WASHHOUSES IN ST. LUKE'S. OLD-STREET.—At the monthly meeting of the Board of Guardians, held on Wednesday evening last, Mr. Churchwarden King in the chair; on a motion by Mr. Atkins, for a committee to be appointed to carry into effect the laudable object of establishinto effect the laudable object of establishing baths and washhouses in the parish of St. Luke's, Mr. Shillibeer observed, in supporting the motion, that he did so with more than ordinary pleasure, because he felt that the densely populated district of St. Luke's parish required such an establishment, to afford the poorer portion of his fellow parishioners those advantages of personal compett and alexaliness which in other parishes parismoners those advantages of personal com-fort and cleanliness which in other parishes had been found of such vast benefit to the working classes. He boped no further time would be lost in putting in force the Act authorizing the creation of such an establishment, and felt sure that although, at first, it might increase the parish rates, yet it would soon become a self-supporting institution, and ultimately a source of profit to the parish, and meet with the cordial approval of every rate-payer. Other guardians having expressed their entire concurrence in the object of the motion, a committee was appointed to consider of, and report to the board, the best means of establishing baths and washhouses in the parish.

THE MECHANICAL SECTION OF THE BRITISH ASSOCIATION is very fully reported in The Civil Engineers' Journal for the current month; and diagrams are given to illustrate Robert's moulding machine; Appold's centrifugal pump (an ancient machine revived); Heaton's means for preventing the oscillation of locomotives; Brunton's coal mine venti-lator; Hosmer's self-acting cistern; and Ro-

bert's patent tide winding apparatus.
The Art-Journal of the current month contains what must be considered a very remarkable notice of the Birmingham Exhibition of Industrial Art, presenting no less than one hundred and fifty admirably-drawn and engraved illustrations of articles exhibited. When it is known that the whole has been produced in somewhat less than a month,collected, drawn, engraved, and printed,—the feat appears marvellous. The editor, with justice, puts in his claim to early advocacy of the advantages of a national exposition of works of industry and art.
FROCESTER CHURCH RESTORATION.—An

architect, dating his letter from Bristol, says, Passing the railway station the other day, I observed that the wooden spire had been taken down, and I must say that I was exceedingly disappointed to learn, from the architect's account in a late number of The Builder, that it was to be replaced by a stone one of more taper proportions. This wooden spire was a perfect curiosity in the neighbourhood. a perfect curiosity in the neighbourhood. Except at Almondsbury, I believe there is not another in the county. It presented a con-siderable similarity to those simple wooden erections in the county of Surrey, and harmo-nized admirably with the genius loci, and at the same time contrasted very well with the neighbouring well-known and excessively taper spire of Slymbridge. Defend us from such restorations as these !

PAROCHIAL BURYING GROUNDS-JOINT OR SEPARATE. — Your correspondent, the "Colonel," who has with so much ability and public spirit given his opinions and calculations to the public, but who states that "no ideas" had been previously offered, is, I am sure, not aware of the plan and calculation for sure, not aware or the pian and carcunation to joint parochial cemeteries which your humble correspondent gave in your excellent pages, vol. iv., pp. 261 and 310; which also I am emboldened to say has been adopted, not only in one or two country districts, but in the recent "Report on the Subdivision of Parishes," &c. I will not presume to say—certainly with the immediate recollection of the tainly with the immediate recollection of the distinguished authors, two of whom, to my own knowledge, had seen the pamphlet in which it was afterwards incorporated,—but practically, because the suggestions had originated no where else; which I am sure they will accept as an Euclidic argument of authorship. Although the above suggestions applied principally to joint grounds, which should have a common chapel in the centre, with a proposed radiating divergence of lines, the calculation was nearly as well saited for individual grounds. was nearly as well saited for individual grounds,

J. D. PARRY,

Nelson Column, Trafalgar-square.

With regard to the Nelson column, there is reason for apprehending that, however satisfactory they may be in themselves as works of art, the bronze bas-reliefs with which the panels on the pedestal are to be filled in will in a short time after being put up be scarcely dis-tinguishable—and thus blankness will be ex-changed only for blackness. The latter, howwill be in keeping with the capital of the ever, will be in keeping with the capital of the column; which, as might have been foreseen from the first, shows only as a dark mass whose details are entirely lost. We doubt if bronze be fit for other than small ornamental articles which are intended for close inspection, or large single figures and statues, which, however viewed, show their outlines distinctly. We question if it should he applied to rilievos on a large scale, unless some method could be found of keeping the surface of a uniformly clear and clean hue, so as to exhibit light and shade both forcibly and distinctly. As to the snaue both forcibly and distinctly. As to the "monument" itself, since a column it was to be, it is to be regretted that Mr. Railton did not venture to deviate from precedent and routine by greatly expanding the base, by means of a boldly sweeping apophyge, similar to that given to the columns within the temple at Bases. Had this bean deviate the venture. at Bassæ. Had this been done, the pedestal would have been increased in proportion,—and the column would have stood far more firmly and majestically than it does now. however, is the respect paid to precedent, that art is ruined by the very course intended to preserve it.—Althenæum.—[One of the basslefs her her basslefs her bassleft her basslefs her bassleft her b reliefs has been hoisted into its place, on the south side of the pedestal; but, at this present, its merits cannot be canvassed, because its

THE NORWICH AND WEST SUFFOLK ARCHEOLOGICAL SOCIETIES met on Thursday in last week at Thetford, and the proceedings were opened in the town hall by the mayor. A visit was paid to the ancient British mound and camp, where the Rev. Mr. Bulmer addressed the meeting upon its history. A visit to "The Place" or nunnery, was the next point, containing many architectural beauties, but which are now converted to ignoble purposes, and Mr. Timms, the secretary to the West Suffolk Society, read a paper upon its antiquity. Taking in their way the old Grammar School, on the site of which are many antiquarian beauties, the company arrived at the abbey, to the pretty grounds of which, by the liberal dispersion of tickets, were admitted many besides its members. Excavations to a considerable extent had been carried on for the purposes of this meeting; the oriwith its encaustic tiles, ginal floor, with its encaustic tiles, was laid open, and the base and shaft of the columns of the noble church, built in 1170, gave an idea of its magnificence and extent.

DWELLINGS FOR THE POOR .- It has been suggested that parochial bodies should be empowered to erect dwellings for the working classes in localities where such are required, and as they have the power to erect baths and washhouses I do not see why they should not have this power also conferred on them by Act of Parliament. It is the only remedy that can see for the present state of things. LONDONER.

EXPLOSION OF A SEWER IN SOUTHWARK -On Saturday evening last, an explosion of sewer-damp happened in Friar-street, in the Borough. The cast-iron plates, covering the man-holes in the flag pavement in Friar-street, are said to have been blown into the air, and flames came through the gully-gratings into the strects. A statement on the subject by an officer of the commissioners is given in a previous column: but it should be further investigated. At the present moment, when the best mode of ventilating sewers is occupying attention, it is of consequence that the cause of the accident, and the circumstances attending it, should be thoroughly understood.

WATER FOR THE TOWER OF LONDON.—

The pernicious properties of the water hereto-fore supplied to the soldiers have induced the forwarding of arrangements whereby a limited supply of pure spring water has been intro-duced for the present. It is to be used for drinking and cooking alone, as it does not exceed 2,000 gallons a-day. It is said the Duke of Wellington has induced the Woods and Forests to agree to bore an Artesian well in the Tower for supply of the garrison.

RAILWAY JOTTINGS .- It is understood that the Government are to lend money, on sufficient or I per cent. In reduction of taxation.—
During last half-year 96 persons have been killed, and 75 injured by railway in Great Britain and Ireland.——The dangerous curves on the Lancashire and Yorkshire line at Charlestown have recently been reduced from a radius of 660 to one of 2,000 feet.—The result of the Crown investigation into the fall of the bridge at Royburgh, on the North of the bridge at Roxburgh, on the North British line, is the indictment of the contractor and resident engineer for trial at next assizes.

—The works on the tunnel of the Great Southern and Western Irish line have been suspended, and a large body of labourers disemployed. The reason assigned is, that the Directors are desirous of ascertaining what the amount of traffic will be when the line has been opened from Cork to Blackpool on the 14th inst.

ENGLISH SHIP BUILDERS .- A correspondent writes: —Latterly work has been very dull with steam ship-builders; and knowing that the following order is now in the market to be given away, I send you a note of it. Six first-class steam-vessels and four small ditto have been ordered by the Messrs. Eider and Co., the French shipping agents, for the Mediterranean and French trade. The engineer appointed by them intends dividing the contracts between Glasgow, London, and Newcastle, thus showing that England still maintains the superiority of its character for ships and marine engines; although, in a French paper (National) a long article was recently given, setting forth the superiority of French work and Frenchmen in these depart-ments of trade. The contracts can be completed in this country for an average of 4,000l. sterling each vessel less than in France; proving, that in price a great advantage is had in this country, where skill and the division of labour reduce the expense, although wages are higher than in other countries .- J. S.

NEW REGULATIONS AT SALISBURY CA-THEDRAL.—The nave and transepts of the cathedral are to be thrown open to the public daily, between the hours of the morning and daily, between the hours of the morning and afternoon services. The choir and other parts of the interior can only be inspected by applying to the verger, as before. The spire has been nearly completed by the workmen engaged in pointing and restoring it.

PROFITS OF ROYAL FORESTS.—According to the helis morner of the

to the daily papers, the total income of the year from all the royal forests and woodlands belonging to the crown was 29,860l.; the total expenditure 34,682l.! Public deficiency, 4,822l. The Sewerage and Refuse of Liver-

POOL .- It is the intention of the Health Committee to purchase or rent several thousand acres of waste land near the shore, in the vicinity of Ince or Formby, and apply to these the manure conveyed thither from Liverpool in boats. The farm operations are to be carried on by able-bodied paupers from the parish, and it is supposed that the profits will not only pay It is supposed that the profits will not only pay for the cost and the value of the manure, but leave a surplus in favour of the corporation.— Liverpool Courier.

Hereford.—The chapter-house of the cathedral is to be restored, in order to render the library accessible to the clergy. In 1645,

lead was taken off its conical roof to repair

the breaches in the castle.

NEW ROMAN CATHOLIC CHURCHAT KENTISH TOWN.—The first stone of the Church of St. Alexis, Fitzroy-place, Kentish Town, was laid on the 1st inst., by Prince John of Spain. Mr. Wardell is the architect, Mr. T. Jackson the builder. The church is to be cruciform, according to our informant, 105

feet long and 55 feet wide, will have a central tower and spire 200 feet high, and will accommodate 1,000 worshippers.

THE "COLLECTANEA ANTIQUA"*—The first part of Mr. Roach Smith's "Etchings and Notices of Ancient Remains," illustrative of the contract the customs and history of past ages, contains a full and interesting account of the Roman villa at Hartlip, in Kent, with numerous engravings. The walls of the rooms and passages here had been well stuccoed and painted, in some cases red, in others white.

^{*} Published by J. R. Smith, Old Compton-street, London.

PROJECTED WORKS.—Advertisements have been issued for tenders, by a date not specified, for restorations in clerestory of chancel of St. Mary Redcliffe Church, Bristol; by 24th November, for the restoration of St. Peter's Church, Northampton; by 15th inst., for the rebuilding of Merrington Church; by 9th, for alterations in Presteign Church; by 9th, for alterations in Presteign Church; by 9th, for alterations in Sewers and drains at Southampton; by a date not specified, for the fittings-up of the Corporation Baths at Bristlei and by 8th, for constructing sewer wise tol; and by 8th, for constructing sewer with branches, and for tubular house drainage, &c., at Southwark,

TO CORRESPONDENTS.

"Drying-Clasets for Oats."—A correspondent says.—
"Reading an article in The Bullder or 'Drying-Closet,'
and being about to build a mill for grinding oats, it stude we that some such arrangement would answer much better than the common kins for drying oats before grinding, as, in the common kins, perhaps mne-tentlis of the heat is lost. Probably some of your correspondents would give an opinion on this matter."

is, in the common kills, perhaps ame-tentlis of the beat is lost. Probably some of your correspondents would give an opinion on this matter."

"Constant Subscriber," Chatham.—A Fellow of the Institute must be an architect who has been engaged as principal for at least even successive years in the practice of eivil architecture. To become an Associate, it is necessary to have attained the age of 21, and to be engaged in the study of civil architecture or in practice less than seven years. There is nothing to prevent any man dubbing finnes f architect, and starting a brass-plate to that effect.

W. R.—The variation is itself inconstant. Its amount in winter is scarcely half that in summer, and there is even a considerable daily variation, morning, noon, and night. Attention to this is scarcely necessary in fixing a vance.

Received.—The xention is itself inconstant, onen, and eight. Attention to this is scarcely necessary in fixing a vance.

Received.—E. E. C. ('scained-glass borders may be used in a conservatory without fear of injuring the plants.—Y.—Y.—Y. H., L. ("W. K.," E. H. M.," "Y. W. H.," "Y. W. H.," "Y. W. H.," "Y. W. H.," "Y. W. W. H.," "Y. W. W. H.," "Y. W. W. H.," "Y. W. W. H.," "Y. W. W. H.," "Y. W. W. H.," "Y. W.

No. CCCXLIX.

SATURDAY, OCTOBER 13, 1849.

Lord Chancellor's supersedeas for some time past, and it has now come; whether for the purpose, simply, of ridding the board of one or two of its members found troublesome hy those with most influence, or that it may be wholly reconstructed, remains to be seen. To the constitution of the board we objected in the first instance, protesting strongly and repeatedly against the systematic exclusion of professional and practical men. Its unsatisfactory proceedings, its position in the estimation of the country, and its premature extinction, fully justify our views. And yet while we have found it our duty to object in plain and strong language to the course pursued on too many occasions, we will not go so far as those who say that the late commission has done nothing; and we have withheld quires of complaints against it, and so offended a portion of the public, because we believed that those complaints were founded on misapprehension of its province and powers. But that it has failed miserably,-that it has shown itself incompetent for the Herculean task committed to its charge, is certain and undeniable.

We will not at this moment speculate on the probable constitution of the new hoard: a very short time will elapse before the question will be set at rest, for we cannot suppose that the Government will allow matters connected with the drainage of the metropolis to stand still a single week. It has been suggested in our pages, on more than one occasion, that the board should be representative, or partly so. One of our correspondents suggested that half the commissioners should he appointed by the Crown, and half elected; that there should be twelve or twenty commissioners to each district, according to the size, and that " each district commission should elect one of its body to be one of a general committee, who should have power to determine all questions affecting the general interest, and decide upon plans for general drainage." * Speculation, however, is useless, as by this time the matter is

And now as to the plans for general drainage, which were submitted to the late commission in reply to their appeal to the public. We are anxious to say a few words in behalf of the parties who responded to this invitation, although we fear there is little chance of their obtaining any advantageous return for their lahour, unless, indeed, the new commission may be led to vote some compensation to those competitors who have furnished the more useful designs.

In our article of September 8th (p. 421, ante) we were compelled to remark, when speaking of the appeal to the public for plans, that if there were no other proof on record of the unfitness of the majority of the commissioners for their position, the thoughtlessness, must we add ignorance, which characterized the course

taken would suffice, and afterwards this same view was adopted by one of the late commission, the Rev. Morgan Cowie, who suhmitted a written protest against the proceedings, fearing probably, and with justice, that if he did not do so, his fitness for the office of principal at the College of Engineers might he questioned.

That others of the commissioners had felt the necessity of affording to the competitors further data to proceed upon is evidenced by the fact that one of them, Mr. Hume, addressed a letter to the surveyor, who, on the day first fixed for receiving the plans, memorialized the court for an extension of the time, -asking him what information he thought desirable to enable surveyors to prepare "the best and most comprehensive plan for so great and important an undertaking." "I see the difficulties," continued Mr. Hume, "hut not the means of removing them at present, and therefore wait for information." The reply of the party addressed showed how he thought the difficulties might be met; he said,-

I write, in the earnest hope that, by your influence and advocacy, such information will be directly afforded as will induce professional men of reputation and husiness to come forward with designs on the 1st of October next. At present it may be justly assumed that none but those who, being connected with the commission, possessed the desired data hy virtue of their office, and those who, having little practically to engage their attention, have managed to acquire these data by tion, have managed to acquire these data by indirect means, are qualified to compete for an object as well worthy the talents and attention of the most exalted professional minds as any object that has ever presented itself for public competition. No palace, no church, no cartoon painting, was more worthy 'a prize for the best design' than the origination of the hest principle upon which to drain the of the best principle upon which to drain the metropolis, and I therefore submit to you that it is desirable not only to give the required data, but to offer distinctly a prize or prizes for such designs as may he considered by competent judges worthy of some mark of distinction.

The information which ought to he supplied to each competitor is-

An outline (reduced) plan of the whole district, for which an improved outfall is now sought.

On this map should be shown, simply-

The main streets.
 Rivers and open watercourses.

Open and covered main sewers from their source (as sewers) to their outlets: along the course of each river, watercourse, and main sewer, simple figures should express the various falls or gradients, and the depth of the bottom of each helow the surface of the ground; thus, 1 in 480 would represent a fall 20

of 4 inch in 10 feet and 20 feet below surface. This information should he as perfect as it can possibly be afforded by the court within the limited time. At the beginning and end of each main sewer the height, with respect to Trinity datum and low-water line at their several outlets, should be particularly given; thus,

The heights of surface of ground (independent of the sewers) at various and frequent spots throughout the whole district to he operated upon having reference to one datum (Trinity high-water) should be given; thus,

(45) meaning 45 feet above datum at the spot on which it is figured. Whatever borings have been taken should be appended by index to the map.

About sixty plans had been sent in at this time, it must be remembered. The court, when they extended the time after receiving these sixty, ordered some additional information to he supplied to competitors, which by Messrs. Bardwell, C. Ellerman, R. Netherway, &c.

reached them hut a very few days hefore the expiration of the time fixed, and was wholly insufficient.*

The result, as a matter of course, is, that the plans are all incomplete; -the competitors have laboured in vain ;-the "hest plan" has yet to be prepared.

The "concise statements" of the plans sent in before the 20th August last, form a pamphIet, small folio in size, of ninety pages, and are from fifty-three competitors. The names of these are, following the printed order, Messrs. H. Austin, J. T. Barkley, G. Burge, J. H. Clive, F. Coxworthy, J. W. Couchman, M. Dunn, R. Dover, A. Doull, Dredge and Stephenson, J. Dean, R. Dixon, J. Elliott, Chas. Fowler, F. Finlay, J. Faulkner, J. Gibbs, C. Hutton Gregory, J. T. Harrison, M. Kerridge, T. Lunt, John Martin, Martin, Sowerby, and Hodgson Jones, T. Morris, J. B. M'Clean, J. Murray, John Phillips, T. W. Plum, Joseph Prestwich, Jas. Pilhrow, G. Remington, Jasper Rogers, J. B. Redman, Ross and Low, F. Roe, Rumball and Shepberd, R. Rettie, W. Radley, W. Stewart, J. Pigot Smith, J, Sutton, F. Swinburns, Herbert L. Smith. C. Sanderson, B. G. Sloper, Harcourt Thompson, Tate and Gilmore, E. Wharmby, F. Wood, and Professor Wallace. The other plans are anonymous.†

According to the statement of the late secretary, Mr. Woolrych, on the 3rd inst., fifty-four plans bave been submitted since the 20th of August, making in the whole 116 plans, witbout reference to thirty supplementary papers. "Concise statements" of the former are required to be sent in hy the 17th inst., that these also may he printed, hut hy whom the whole will be judged is yet to he learnt. Be they who they may, we ask at their hands, on the part of the competitors, fair play and liberal consideration.

We append here as part of the same subject, rather than under a fresh heading, the following note dated Greek-street, October 8th, and signed J. L. Hale, assistant-surveyor to the Metropolitan Commission of Sewers :-

"I observe in THE BUILDER of last week, a reference made hy Mr. Bird to certain experi-ments made by the Metropolitan Commissioners of Sewers, in Upper George-street, Edgware-road. The experiments consisted of laying down a line of 12 inch pipes in the main sewer of Upper George-street, with 9 inch junctions, to eive the drainage of the collateral sewers. The object of the experiments was to ascertain how far, in respect of quantity of sewage, the sewers in that locality were unnecessarily large, and to ascertain what were the relative merits of stoneware pipes and hrick barrel drains, for the general conveyance of sewage. I enclose a printed copy of the report made to the commissioners on the result of the experiments, from which it appears the result was satisfac-tory. Mr. Bird, on the assumption that the experiments were a failure, stated that he "in April or May last saw the pipes hroken to pieces and taken out, after putting the public to the useless expense.' Now, the fact is, that

to the useless expense. Now, the fact is, that

* The correctness, too, of some of the information furnished has been impreched by a writer in the Time. It have of the sections of the strata in various existing wells. The says of the sections of the strata in various existing wells. The sections of the strata in various existing wells to the sections of the sections of the London benchmarked to the 160 sections of the London benchmarked to the 160 sections of the London the clay at Goding's brewery, Southwark, it is stated to be 160 sections of the sections of the sections of the chalk also is indicated at a depth of 190 feet, when it is 245 feet. Another of these sections indicates the thickness of the blue clay at Messrs. Thome's brewery, Westminster, to be 162 feet, when it is only 100 feet, and the chalk is stated to be 202 feet from the surface, when it is 230 feet. The section blue clay 35 feet, is correct. and, and the thickness of the blue clay is 5 feet, and the chalk is stated to be 202 feet from the surface, when it is 230 feet, is correct. and also the thickness of the blue clay is 5 feet, is correct. and also the section of the metropolis. I could have further comments, particularly on the anomaly of showing the blue clay at particularly on the anomaly of showing the blue clay at such section of the metropolis. I could have such incorrect data issued from the Commissioners' or a such that the correct data issued from the Commissioners' accounts of the control of the control of the section of the comments of the control of the c

the experiments having been completed, and the commissioners having other works in the neighbourhood, where 12 inch pipes were re-quired, the pipes in Upper George-street were used instead of purchasing new ones, to save the nublic expense." the public expense

We will also add, respecting the ventilation of sewers, part of a note from the surveyor to the Hull corporation, Mr. D. Thorp, forwarded to us sometime ago, and accidentally mislaid. Mr. Thorp says,-

"In the first place I may mention that I have trapped 360 gully holes in the old town of Hull, which is that part of the town within the docks and harbour, and within that area, which comprises 87 acres very closely built upon, we have about 180 more to complete.

upon, we have about 180 more to complete.

"Now, it required much consideration in doing this to get rid of the effluvia which would naturally he pent up in the sewers as we proceeded trapping, and which was fully proved by my men not being able to proceed in the first outset with more than one street at a time, and then not without being ill. This induced, me to apply the provision made in induced me to apply the provision made in one of our bye-laws, viz., to compel all parties to connect the rain pipes in the fronts of their houses with the main sewer, by means of either brick or tubular glazed drains (the latter of which are much to be preferred). are much to be preferred), thereby making so many flues for the escape of foul air to the tops of the houses, and I may say that this plan has acted admirably."

After the foregoing article was in type, we received a list of the parties, thirteen in number, to whom the new commission has been directed, and here it is :- Viscount Ebrington; Major-General Sir John Burgoyne, K.C.B.; Sir Henry de la Beche, F.R.S.; Mr. Robert Stephenson, M.P.; Mr. S. M. Peto, M.P.; Lieutenant-Colonel Alderson, R.E.; Mr. Philip Hardwick, R.A.; Captain Vetch, R.E.; Mr. J. M. Rendel; Captain Harness, R.E.; Mr. Thomas Hawes; Captain R. K. Dawson, R.E.; and Mr. Edward Lawes, Barrister-at-law.

It will be seen that all the more prominent opponents on each side have been omitted in the new arrangement, the number of commissioners has been reduced, and the correctness of our views has been unconditionally recognised by the infusion of professional and practical men,-the abandonment of the absurd principle that architects and engineers were not fit for Sewers' Commissioners, simply because they were architects and engineers. The builders, too, are represented. Of the credit of obtaining this result we claim no small share: we fought the fight alone, -- so far as we know, no word upon it has been elsewhere uttered, and we venture to think, with all modesty, that the profession owe

Beyond what we have said we offer no opinion at present on the goodness, or otherwise, of the sclection, or as to the omissions, but wait to see the working of the board.

BIRMINGHAM WORKHOUSE COMPETITION. -Were your correspondent, as he styles him-self, "A Lover of Fair Play," he would have sell, "A Lover of Fair Play," he would have hesitated before making such statements as those contained in his letter, appearing in The BULDER of the 29th ult.; but as his assertions may gain credit with some parties, if suffered to pass uncontradicted, I beg to say:

—1st. That I most emphatically deny ever baving canvassed the Birmingham Guardians in favour of Messrs. Drupy and Rateman in favour of Messrs. in favour of Messrs. Drury and Bateman, either during the first competition, or at any other period, and challenge him to produce or other period, and challenge him to produce to other period, and challenge him to produce or name any one guardian so solicited by me. 2ndly, That I saw no signature or name upon the plans, except the motto appended. 3rdly. That the selection was made, in every respect, in strict topordance with the instructions of the guardians.—CLARLES EDGE, Birmingham, October 3, 1849.

ON CIVIL ENGINEERING AND ARCHITECTURE

AN INAUGURAL LECTURE.

I HAVE said that both architects and engi-I HAVE said that both architects and engineers must possess a knowledge of the strength and nature of the materials with which they have to work. This I think is self-evident, for the money to be expended is always one great element in their calculations; and the quantity of materials that can be usefully employed can only be ascertained by ealculations based upon an intimate knowledge of the strains and forces they will have to of the strains and forces they will have to resist, and the capabilities of the timber, the stone, the iron, or other substance that may be employed to resist them. Both Tredgold and Barlow have furnished us with admirable works from which the theoretical knowledge of the properties of all the materials used in building can be learned. There is no excuse, therefore, for failures of work arising from actual want of strength; but failures do sometimes occur, notwithstanding every preeaution may have been taken to give to the materials, both theoretically and practically, their proper size and form, and proper distribution in the work. In engineering especially, circumstances are oc-curring every day, features constantly present themselves, of which even the oldest practitioner may have had no example previously; and other means taken to obviate evils that may and do thus arise may be the best that both science and art could point out, and yet fail in their object. art could point out, and yet fail in their object. I say that these are misfortunes only, not faults; but when they occur with a man unqualified with scientific knowledge to deal with them, they are very scrious faults indeed, and should be visited with the utmost censure. Engineering is of all professions (says Mr. Hyde Clarke), the military excepted, that in which a new adaption of expedients to unforeseen occurrences is ever most imperatively seen occurrences is ever most imperatively required, and in which a mere knowledge of past efforts will be insufficient, unless the mind be competent to invent new processes, as well as to avail itself of the best manner of old ones. No man can go upon a spot and say, I will do such and such things at such expense; some unexpected variation of nature beneath the surface will often thwart the best-calculated plans, and render all attempts at economy abortive. It is practice, aided by scientific knowledge of the highest kind, that only can properly preside over the just application of materials to the ever-occurring variations which spring up in the course of an engineering undertaking. And if science and practice sometimes fail in effecting their object at once, what must be the result when ignorance attempts the work? Failure, certain and disastronic failure. astrous failure, heaping disgrace upon the head of the quack practitioner, and often ruin upon his employers. I use the word advisedly, for although neither architects nor engineers nor amough neither architects nor engineers unfortunately need diplomas of practice to give them a right to the use of C. A. or C. E. after their names, they yet have morally, and in common honesty, an obligation, which should bind them to certain spheres of work which have feel themselves and fight to undertake. they feel themselves qualified to undertake; and every man knows his own capabilities,

and every man knows and depend upon it.

If, then, men calling themselves engineers or architects, undertake a work they know they are incapable of performing without the assistance of a dry nurse, in the shape of a good "clerk of the works," they are quacks in every sense of the word, quacks as much as the undertaken in the undertaken medicine without the charlatan who practices medicine without the consent of the colleges.

The demand for engineers, caused by the

The demand for engineers, caused by the late wild railway speculations, has filled the profession with unqualified persons, and has tended to lower it below its proper level, and although the present times arc, I am rejoiced to say, weeding them out pretty fast, it will, and must, be some time before it reaches its healthy state again. its healthy state again.

It is true, the Institution of Civil Engineers and the Institute of Architects exist, and men to become members of either must present proper qualifications; but there are numerous practitioners, who are not prophers and who proper quantications; but there are numerous practitioners who are not members, and who seek and gain employment. But I hope to see, ere long, by legislative enactment, both architect and engineer obliged to take out a diploma before being allowed to take upon

themselves the responsibility of any work, when lives, or a sum of money beyond a certain amount, are at stake, -- a diploma granted only after a severe examination as to scientific acquirements, and a practice under others of least seven years.

I here beg permission to quote some passages from a paper written hy Sir John Soane, which appeared in the Artist of June 13th, 1807,-as quotations from this high authority will give strength to what I have ventured to

suggest myself:-

suggest myself:—
"An artist (architect), strictly so considered, is not sufficiently employed; his profession is too open to the assumption of persons who have no claim by education or ability; and these are admitted to that patronage without which the architect has no chance either of emolument or fame. There are therefore year far ways and are the suffice years of the force years of the part of the suffice years of the suffice ways for the proposed selection. are, therefore, very few persons engaged solely in the practice of architecture. The great mass of those whom we here call architects, though many of them respectable in talents as artists, are under the necessity of combining with their study of the science pursuits not strictly analogous, and arc, in consequence, and to their great discouragement and mortification, assimilated with another description of professional men called surveyors,* and that name is again assumed by sorts and

classes of building workmen and others, until it becomes utterly contemptible."

After enlarging somewhat (and in language by no means mild) upon the difficulties which beset an architect when carrying out a design, through the interference of public boards, and completing intelly that meanly find the complete of the complaining, justly, that unqualified persons are allowed to enter into competition with him, by the aid of pilfered plans, Sir John concludes thus:—

" Before the state of architecture can improved, and the professors excited to that species of emulation which only can make them eminent, strong and marked distinctions must take place. Those who have patronage must consider it a sacred trust and deposit. the meed only of science and genius. The claims of the untaught, ignorant, and presumptuous, must not only be disallowed, but repelled with indignation and contempt, till at length they are consigned to that obscurity whence they ought never to have been suffered to emerge." †

Both engineer and architect must also be men of business; and to the knowledge of the uses and relative advantages of materials must be added the knowledge of their commercial value. The sum to be expended in any undertaking is always a marked feature; and the reputation of an engineer, especially, will be respectation of an engineer, especially, will be raised by the commercial success of his work. Harbours, roads, canals, and railways, before they are commenced, must show that the traffic or dues from them will amount to such a sum as will insure to their projectors a proper return for their money. The first estimate of the engineer is the document from which the probable amount of returns is calculated. The statistical calculations, or the quantity of trade that will arise, is not, strictly speaking, in the department of the engineer, and he is not answerble if the scheme, is not a new in the scheme is not a new in the scheme. not answerable if the scheme is not a paying one, from a deficiency in the traffic returns or dues: but if it fail through any excessive ex-penditure over and above his estimate, he is answerable.

His estimate and schedule of prices, fixed through knowledge of local charges and custom of labour—through his close observation and acquaintance with the geological nature of the spot, and through his knowledge of the best districts from whence to draw his foreign materials-must be so worked out in detail and capable of being referred to precedent, if precedent exist, or borne out by the opinion of others, that it will bear the investigation of a Parliamentary Committee; for, be it remem-bered, that estimates are the most vulnerable points in which opponents can strike you in the "House;" and if the said estimates do not carry on the face of them the handiwork of a man of business, they will be the first and last work of the scheme, for the session in which they are brought forward at all events.

Perfect knowledge of the business habits of contractors, and of the working babits of arti-

BUILDER

^{*} By Mr. Clegg, at the Putney College. See p. 472, anic.

^{*} A comment seems called for here, but we have not time to make it.— FB.

† This is the right test; not a mere name.—ED.

zans, can alone enable him to draw out his specification properly. It is true the lawyer will be called upon to give to it its legal phrases and finely-drawn pains and penalties of any breach in the performance thereof; but the lawyer will have to work upon a base of the engineer's planning, and, be sure, the blame will rest on him, if any oversight has been

committed on his part. In the specification must be described the exact method by which the various works enumerated therein are to be performed. All the drawings must be enumerated, and more particularly referred to and explained: in short, the specification must be a book of reference, as it were, for the contractor, by which he can settle dimensions, quantities, and appeal to, in case of any dispute with his emapplears, as to the proper performance of his duty. There can therefore, I think, be no doubt but that the engineer must be a thorough

man of business.

Because I have not alluded in these examples to the architect, it must not be supposed that such documents as estimates and specifications are foreign to his practice, for, equally with the engineer, must he he capable of directing the modus operandi of his undertaking,—nay, even probably with still greater minuteness of detail, seeing that his work is generally more minute, and depending more particularly on exact dimensions for its success.

Both architects and engineers must also understand those branches of law which relate to their profession, and study the science of jurisprudence, so far as to enable them to judge of the legality of their proceedings, to prevent their employers from being involved in lawsuits through their means, and to extricate them by the shortest way when so involved, by a cessation or alteration of the offensive operations, if the cause be connected with their pursnits. I mean not their duties should in any way trench on those of the attorney, or that they should advise in any matter involving legal or technical question, for "a little law dangerons thing;" but they should always understand the particular sections of the law relating to their operations, that they may be able to steer clear of the dangerons rock of litigation.

All the laws of England contain enactments and regulations concerning building, and they consist both of written laws or statutes, and unwritten laws, or laws of common customs. It would he out of place here to describe all the laws which affect the operations of an en-gineer or architect, but I may be pardoned for making mention of one or two points that have come within my experience, to serve as illustrations of my statement, that they should

know "their own law."

For instance, when the inhabitants of a county are liable for the repairs of a public bridge, they are liable also to repair, to the extent of 100 yards, the highway at each end of the bridge. One instance came under my observation, in which a surveyor neglected not only to take into account the existence of that law in his estimate of the work to be done, but even through his ignorance suffered an action to be brought against himself, as the representative of the county. He lost the action, and the magistrates refused to bear him harmless, 'law," "because he ought to have known the

I may mention another instance in the case of a bridge. An engineer was employed by a private gentleman to build a bridge for a public road upon his estate: two years after its completion it was washed away by a flood. It had becomesouseful to the public that it was necessary to have it rebuilt, and the owner then thought that it might be erected at the expense of county. But the county refused, because his congineer had not submitted his plans to, and obtained the approval of, the county surveyor.

An architect designed and erected for a

gentleman a very expensive conservatory, and it was made portable, for as this gentleman was only a yearly tenant, he intended to remove it should he change his residence. But his architect erected the conservatory on brick foundation : it thus became a fixture, and the property of the landlord.

Examples of such cases might be repeated until the relation of them might fill a consider-able volume, but those mentioned will serve to sishow that the artist employed to execute any

works should inquire concerning the laws relating to them.

I have now said as much as the limits of a lecture will allow, upon the duties required of architects and engineers, and I will say a few words upon the duties of the general community with regard to architecture more espe-

cially.

If we refer to history we shall find that exactly in proportion as civilization advanced architecture flourished—had its rise, its architecture nonrished—nau to took its styles, its progress, and decay. It took its styles, its varieties, and its tones, from the nations who invented or introduced it, and what may be called, with great propriety, a national style, always existed.

always existed.

Greece, during her independence, invented that architecture which, even at the present day, is our model. Her princes und rulers esteemed it the highest honour to be ranked with artists, and her buildings were looked

upon by all as types of her glory.

Republican Rome, although she borrowed her designs from Greece, and built by the hands of Grecian artists, cherished architecture, because, through it, the eternal city might be embellished, and the dignity of its citizens be enlarged, and although this did not, perhaps, arise from pure love and veneration of the art, it had its effects, and buildings were produced that have been handed down to us as forms worthy to be imitated to the present

day.

The architecture of England also had its The architecture of England also had its rise, progress, and decay. Its rise during the Anglo-Normans, its progress during the reigns of the Plantagenets and Tudors, when it arrived at the greatest excellence, and its decline may date from James I. (if we may inclinde the Elizabethan, which, although not indigenous, has become, and perhaps de-servedly, a favourite style in England), almost up to our own times; I say almost, for latterly under the fostering patronage of royalty, and men of taste and genius, it has struggled into a new existence: let us hope that it is the dawn of a new era for architecture and the fine arts in England. That this germ may bud and grow into healthy beauty, it will require the steady co-operation of all Englishmen connected in any way with architecture. Genuine professors of the art will gladly give their best energies to the task of regeneration, and we have already examples which tell in glorious language (language engraven in stone) what e result of those energies. is wanted but men of influence and taste to add weight to the balance already inclining so decidedly in favour of purity and fitness of

I am an advocate for fitness in the style of architecture of every building, civil, military, or ecclesiastic; and would those through whose patronage the fine arts flourisb study, with its professors, the true meaning and intent of fitness, there would speedily be an end to incongruity, and English buildings would stand prominently out as types of Eng-

lish architecture.

Both Grecian and Palladian architecture bave taken so firm a root in the soil of England, that any attempt to dismiss the styles at once would be useless, and perhaps fatal to the re-generation of a national one. But will not a little consideration show that these styles are unfitted for the English climate throughout the year? The windows, few and far between, obstruct the light. The low pitched roofs retain the snow and rain, and the projecting porticos throw shadows, where there is already too much shade. An Italian villa, appropriately situate, may fitly serve as a summer residence, but we must seek in another style that comfort and homeness so loved by all Englishmen: for this style we need not become imitators or pilferers from a foreign nation.

The high pitched roof, the ornamented gable, the oriel window, the irregular plan, suitable as well for internal convenience as for external beauty, are all characteristics of our English style, and each feature has, besides, fitness to our climate to further recommend it. I wish particularly to be understood that I now speak of domestic architecture,—for that of public edifices we may still be indebted to

Greece or Rome.

Our palaces, institutions, and prisons may still be in the decorated Corinthian, the chaste Palladian, or the stern and sombre Doric. But let our residences, our country residences, serve to keep us in mind of our former genius, while they add to our comfort and enjoyment.

One word more before we leave this subject, upon a point which every man has power to forward. I allude to internal deco-ration. In this hranch of art the house-painter, the paper-hanger, and the joiner, are too often allowed to usurp the place of artists, and suffered to bedaub the walls with incongruous colours, or tasteless wood-work. Joiners, in particular, have a kind of systematized patent to work evil things; custom to one set of forms and method of work, has so fixed itself upon us, that the same set of moulding planes, the same kind of paneling, serves for styles of houses. The architect himself probably somewhat to blame in this, but I believe only to a small extent, for builders, not architects, are generally employed to run up the brick and stucco boxes called houses, and these, building either per contract, or for themselves, to save money and trouble, are little inclined to study propriety in internal finish. It is not that the architect considers it finish. It is not that the architect considers it to be beneath him to be the decorator; for Raffaelle painted the walls of the Vatican, Rubens' hand embellished the ceiling of Whitehall, Sir James Thornhill decorated the walls of the chapel and hall of Greenwich, and we have Owen Jones in our day.

It cannot, therefore, be through any false notion of the architect that these internal finishings are left to artizans, but whether it be or not, every gentleman, every man of cultivated mind is to blame who suffers his house to be coloured up to suit the taste of the sign painter, who without any feeling of art in his composition daubs away in any shade of

any pigment he may fancy to be in fashion.

Many patrons of the arts would fire up and say indignantly, "I do not suffer this outrage upon taste to be committed in my house." And I am only happy to admit that there are some glorious exceptions to my rule, but that they are exceptions I will uphold, and say confidently that eight out of ten have houses painted, fitted, and furnished, with designs that have issued from the shop, and not from the studio.

Poor men in the present state of things cannot, perhaps, help this; and the poor man with refined feelings for art must submit,

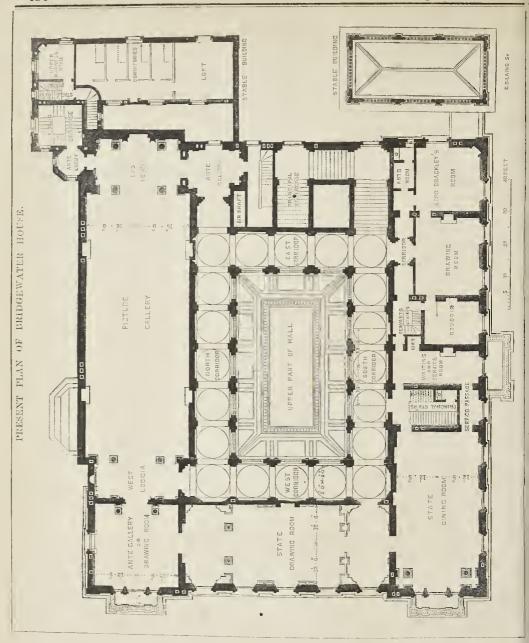

for he cannot alter.

But rich men are those to whom I point, and say, study art, and be judges yourselves where art is employed, or consult those whose whole life has been devoted to the cultivation of it, and who will work for you, not for money alone, but for the love of art: architects should be such men.

After an outline of the system of instruction

he intended to follow, the lecturer continued,]
It is likewise my wish to make all the students familiar with the use of tools, and that they should become practical as well as scientific workmen; that this is essential, I have the high authority of the late Mr. Telford, who has said,—"Youths of respectability and competent education, who contemplate civil engineering as a profession, are seldom aware how far they ought to descend in order to found the basis of future elevation. It has happened to me more than once, when taking oppor-tunities of being useful to a young man of merit, that I have experienced opposition in taking him from his books and drawings, placing a mallet and chisel or a trowel in his hands, till, rendered confident by the solid knowledge which only experience can bestow, he was qualified to insist on the due performworkmanship, and to judge of merit as well in the lower as in the higher departments of a profession in which no kind or degree of practical knowledge is superfluous.'

A NEW SORT OF CHURCH ORGAN has been constructed, in two parts, one for each side of a window. The exterior, says the Daily News, is architectural, and of the colour of dark oak. Each of the two compartments is all the same of the colour of the colour of the two compartments is all the same of the colour of the two compartments is all the same of the colour of the two compartments is all the same of the colour of the two compartments is all the same of the colour of the two compartments is all the colour of th lach of the two compartments is 26 feet in height, and the bellows are so arranged as to admit of their being placed under the window, which is to appear in the centre. The object The object of the designer, a Mr. Walker, has been construct an instrument combining the advantages of a German organ with the principles of the extended compass on the Manuals.

THE ALTERED PLAN OF BRIDGEWATER HOUSE, LONDON.

WE have been asked to give some informa-

We have been asked to give some information concerning the alterations which have been made in the internal arrangement of Bridgewater House, Cleveland-row, and cannot better comply with the request than by annexing a plan of the house as it is now proposed to be completed, which may be compared with the original plan given in our last volume (VI.), page 474.

It will be seen that a central hall has been formed, and the principal staircase moved to the side. The chief motive of the alteration is understood to be a desire to render the gallery and its approaches independent of the rest of the building, it being Lord Ellesmere's intention to afford the greatest possible facilities to the public for visiting his fine collection. A separate staircase has been constructed, with this end in view, at the north-east corner, and is surmounted by a campanile.

apartment marked "service-room" on the plan.

We have received an ill-natured account, signed an "Employé of Mr. Barry," of what the hall is to be when finished; but being satisfied that, notwithstanding his signature, be writes in ignorance, as well as ill-feeling, we make no use of it.

The following, from a second correspondent, is fair criticism, to which we have no right to refuse a place :-

" With respect to the alteration in Bridgeformed, and the principal staircase moved to the side. The chief motive of the alteration is understood to be a desire to render the gallery and its approaches independent of the rest of the building, it being Lord Ellesmere's intention to afford the greatest possible facilities to the public for visiting his fine collection. A separate staircase has been constructed, with this end in view, at the north-east corner, and is surmounted by a campanile.

The entrance to the central hall is under the

objection is, that, on its being first entered below, just as much will be seen as after ascending the staircase. Perhaps it would be better were the corridors to be partly enclosed, so as to leave only eight of the sixteen arcades open to the upper part of the hall, viz. three on each side and one at each end, which might on each side and one at each end, which might be done not by stopping up those at the angles, but by merely glazing them with ornamental diapered or mosaic glass, in patterns of various colours; in which case the corresponding arcades below, if the corridors on the ground-floor be also quite open to the hall, ought to be closed up solid. That would confine the space sufficiently, and instead of the whole being disclosed at the first glance, parts would come into view successively,—would, after first appearing, disappear, and then appear again. It is not every architect that has a forte for plan—for so 'laying out' a mansion as to secure various effects by means a mansion as to secure various effects by means of piquant contrasts, transitions, and combinations.

THE ARCHITECTURAL ASSOCIATION. OPENING CONVERSAZIONE

On Friday evening, the 5th instant, the Architectural Association met in Lyon's-Inn Hall, Strand, to open the session.* The walls presented a fair show of drawings, including several series of the sketches made by members of the Class of Design; and the room was well filled. The advantages resulting from this sketching class will be great: it should be sedulously attended by the younger members. Letters were announced from Mr. Donald-

son, Mr. Scoles, Mr. Tite, &c.

Mr. G. J. Wigley, secretary, read the report of the council, from which it appeared that the number of members had increased from 97 to 140. The committee urged the value of unrestricted interchange of opinions amongst the members, and showed the advantage that was resulting from all becoming well acquainted with each other. An attempt to form a bookelub, it appeared, had not succeeded. The endeavour to establish a free architectural exhibition was very successful, and the collection of th exhibition was very successful, and the concertion had heen visited by a daily average of shout 500 persons. They had taken upon themselves the responsibility and risk of its permanent establishment, and they anxiously sought the concurrence and co-operation of the whole

profession.

Mr. Christopher Creeke read a very able paper on various matters affecting professional practice, to which we shall devote space next week. In the course of the address it was stated that steps had heen taken towards calling a meeting of the profession on the subject of Competition, and that every architect in England would be communicated with.

Mr. Godwin being represented to make

Mr. Godwin, being requested to make some observations, said the course he had pursued in respect of the Association from its foundation would, he thought, lead them to give him credit for sincerity when he stated that he was much gratified at hearing of its successful progress, and more than this, seeing the result of its operations. Many of the papers read on the alternate Fridays were most creditable to their authors, and in several instances had gained for them, as he was able to say positively, the good opinion of a large number of persons. But it was not merely at these meetings that good was done through the Asso-The sketches on the walls produced on the intermediate Fridays, from given sub-jects, were exceedingly satisfactory evidence of the efforts of the members in another direction. Apart, however, from these proceedings, advantages resulted from association in the abstract. It seemed to him important that in our doings we should consider how they would operate on others,—that we should regard not simply their effect on ourselves, but on the well-being of our order, and this we were led to by such associations. We should find that in upholding the dignity and high character of the profession, we were best advancing our own individual interests. Never was there a moment when it was more important that architects should unite to set themselves and their profession right with the public than now; for pressed as they were on either side by circumstances of the time, their position was seriously threatened. The works of the architect, the value of design, were not recognised rightly by the public. A little matter which came under his observation a few weeks ago (and a straw might show the current) would in some degree illustrate this. An individual asked a young architect to make him"a little de-" for a summer-house, and having obtained his charge for it, called upon him (the speaker) to know if the snm of two guineas, which the architect had named, was not too much for merely "a few lines and a bit of colonr." He need not say what his answer was. But what he wanted to remark was this—that the same individual sent the drawing to a lithographer, wishing to distribute copies of it, and being

charged three guineas for putting it on the stone, perfect satisfaction act of mechanically copying he could appreciate, but the value of the productive power, and the propriety of paying for what seemed such pleasant amusement for the artist, he did not understand. Architects had done much to induce this feeling and lower the character of the profession, hy their indiscriminate com-pliance with invitations to compete, without those regulations which would ensure them justice. It gave him much pleasure to hear of the steps which had been taken by the Association towards following out the suggestions eation towards following out the suggestions published in The BUILDER, with the view of obtaining a proper management of competitions. The late Birmingham Union competition was a case in point, where the successful architects, after having risked the chance of getting nothing for their time and skill, had been coolly offered about 3 per cent. on the amount of their estimate. He sincerely trusted that the architects would under the circumstant. that the architects would, under the circumstances, resist any departure from the custo-mary remuneration.* The customary remuneration! This was another point imperatively needed settlement; and and if the imperatively needed settlement; and it the elder members of the profession were too nuch occupied, or disinclined to take steps in the matter, he loped, when the Association had succeeded in putting competitions on a proper footing, that they would turn their attention to the question of remuneration. The speaker then alluded to the excellence of the paper which had heen read by the president, and moved a vote of thanks to him.— Carried.

Mr. Papworth afterwards briefly addressed the meeting, taking up the question of a "new style," mooted by the president, and urging with ability, that all that could be expected of architects was the re-combination and thoughtful application of the modes hefore us, with the adaptation of modern improvements and appliances, to the wants and purposes of the

GAS AND HEALTH IN WARE, HERTS.

THE Gas Company in Ware charged 8s. per 1,000 feet. A new company came into the town, and offered, if a certain number of persons would agree to deal with them, to construct works agree to deal with them, to construct works and supply gas at 6s. per 1,000. A meeting was called, and the old company were applied to, to know if they would supply it at that price, as in that case no encourage ment would be given to the new company. They refused. given to the new company. They refused.
The new company have constructed their works, and the old company are now offering gas at four shillings per 1,000 feet,—too late, however, the new company having, of course, obtained a written agreement from many of the inhabitants to take their gas, before the works were commenced. The relation of this occurrence may not be without its value to other Companies if they will consider it wisely.—A local board of health has been appointed here under the Health Act, and are getting to work, though, perhaps, not very vigorously at present. There was a considerable struggle at the election,—the turning point being, as it has heen in some other places, "who should be clerk to the board." How this has operated in Ware we are not in a position to say,—the best, were for the state of the st best men for the purpose may have been elected for anything we know to the contrary, but it must be obvious that if the qualification for members of local boards is to be simply determination to support Mr. A. as clerk against Mr. B., or vice-versa, the reverse at times must be the case.

THE IRON TRADE.—Several of the usual quarterly meetings have been held, but the masters have deemed it advisable not to advance the nominal price previously fixed, namely, 6*l*. per ton for rods and bars. The small makers are reported to be in pretty full work for home consumption, but on the whole the trade is represented to be not in the most satisfactory condition for the manufacturers.

RAILWAY JOTTINGS.

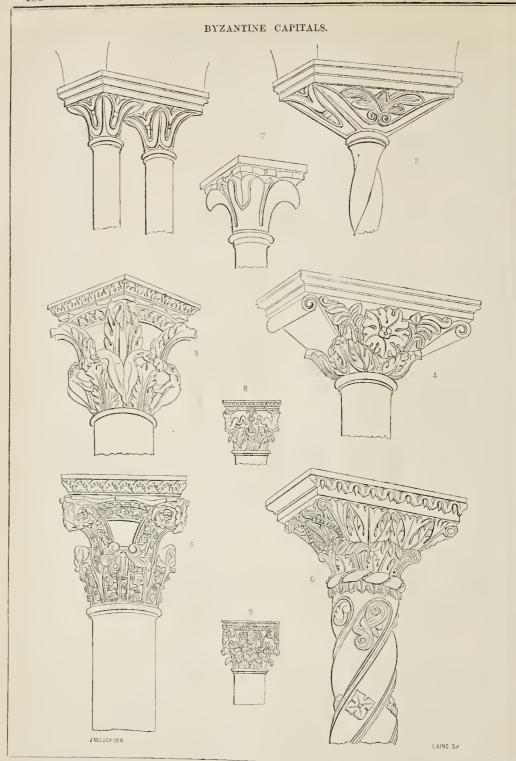

THE raising of the tube at the Britanniabridge, Menai Straits, has been resumed, and there is now a clear height of 55 feet between the tube and high-water, so that small vessels sail beneath.—The contract for the formation of that portion of the Whitehaven and Furness Junction line which runs from Broughton to Bootle has been taken by Messrs. Fell and Joplin, of Greenodd, who intend to commence operations immediately, to be completed by April.—The total loss on the atmospheric experiment on the South Devon, after deducting the estimated value of materials on hand, is said to be 351,000%.—The foundations of the iron bridge over the Ouze, at Huntingdon, were commenced on Thursday week. The piles, or cylinders rather, are being driven, it seems, under a modification of being driven, it seems, under a mouncation or Dr. Pott's process. Those forming the piers or supporters of the arches are about 9 feet long, and 4 in diameter. One of these having been sunk in the river, another is placed on the top of it, with a cap on the head of that, and all are made air-tight. Two large cylinders on the shore are then exhausted of air, and on turning a tap in a tube connecting them with those in the river, the air is suddenly trans-ferred from one to the other, when the pressure of the atmosphere causes it to descend with considerable rapidity. In each case on Thursday, the tube was driven in 6 to 7 feet; and this process will be repeated till they are at the proper depth, when the water and soil will be taken from them and concrete intro-duced.—The engine-drivers on the Great Western have heen receiving for the last five or six weeks, in addition to their wages, ahout a-week each as premium on the amount of coke saved hy them below that fixed by regulation. — The wages paid to enginemen are:— Great Western, 5s. 6d. to 7s. 6d. a-day; Mid-land, 5s. to 7s.; York and North Midland, 4s. to 7s.; London and North-Western (Manchester and Birmingham division), 5s. to 7s.; Eastern Counties, 5s. to 7s. 6d.; North British, 5s. to 6s. 10d.; Edinburgh and Glasgow, 3s. 6d. to 7s.; Perth and Dundee 4s. to 8s. The enginemen of the York, New-castle, and Berwick have entered into a union to obtain—For merchandise and passenger traffic, 6s. for first year, 6s. 6d. for second, and traine, os. for first year, os. on for second, and 7s. afterwards. Those proposed by the company are—5s., 5s. 6d., 6s. 6d., and 7s. respectively.

—The Great Western to Windsor was to be opened from Slough to Windsor on Monday -The works on the South Wales belast.—The works on the sound mass between Newport and Gloucester are going on rapidly: permanent way is being laid.—Two arches of the viaduct of more than fifty arches over the river Calder, near Whalley, on a branch of the Bolton, Clitheroe, and West Vallating line grow way, on Saturday Yorkshire line, gave way on Saturday last. The centres of several of the arches had been withdrawn on the previous day. Three lives were lost by the accident.—The survey of the intended line for Madras has been completed 13 miles, and the results, it is reported, are favourable, so far as regards engineering details. The road is almost level. The calls advertised for October amount to 1,046,749*l*; 11,106*l*. are on account of foreign companies. For the corresponding for ign companies. For the corresponding month of last year they were 1,693,655/. The total calls for the first ten months of 1849 now amount to 17,700,964l. against 30,072,610l. in

WORKING CLASS CLUB-HOUSES. - The bakers are likely to have the honour of setting the first class example in carrying out the principles so long advocated by The Bullder, and successfully set agoing by the society for improving the dwellings of the industrious classes. A meeting of master and journey-men bakers was held on Monday week, at King's-cross, when it was resolved to have a building, with fifty or sixty bed-rooms, to be let at 2s. a-week each, with warm and cold baths, the former at one penny, and the latter one halfpenny each. All the daily newspapers and a select library to be provided, with a reading and coffee-room. The expenses were estimated at ahout 300l., and the income at about 365l. per annum, leaving a balance in favour of the speculators of 65l. The assistance of the parent association was fully anti-

^{* &}quot;The objects of the Architectural Association are, the advancement of the study of design in Architecture, the development of true principles of criticism, and the affording means whereby the student may acquire an aptitude for the application, recombination, and extension of the present materials of the art. For the attainment of these objects, the business of the Association is to consist of the production of designs for previously determined subjects; the reading of papers on the several hranches of science and art, comparison, and the contribution to the Society's portfolio of construction and decoration, or modes of representation."

^{*} The architects have accepted the second proposition of the guardians, namely, I per cent, upon the cost of the building—that sum to cover the premium of 2004, the super-intendence of the erection, &c., but exclusive of the renunc-ration to the clerk of the works. In reply to some archites who express their anxiety to call a meeting of the profession in that town, on the subject of competitions, we would sug-gest a postponement for a short time.—Es.

BYZANTINE CAPITALS.

Amples of this style in Italy. It is similar in arrangement to the more recent cloister at St. John Lateran, at Rome, save that single shafts cupport the small arrences of the columns supporting the large pulpit in the columns supporting the large pulpit in the columns supporting the large pulpit in the cathedral of San Pantaleone, at Ravello, now only a small town near Amalfi, but once a flourishing city of 36,000 inhabitants. The printing-press in Italy was established, in the printing-press in Italy was established, in the pulpit itself is a magnificent pile, of white more recent cloister at St. John Lateran, at Rome, save that single shafts cupport the suml arrangement to the more recent cloister at St. John Lateran, at Rome, save that single shafts cupporting the large pulpit in the columns supporting the

sculptured. It is supported on six columns, the shafts twisted and inlaid with mosaic bands. These columns are carried by six marble lions These columns are carried by six marble lions in marching order, three and three; the carving throughout is delicate and varied. The capitals now engraved are about 1 foot 3 inches in height. The date of erection is 1260. No. 7 is from the ruins of an old palace of about the same date, closely adjoining the cathedral. It is usually called the palace of Charles of Anion Charles of Anjou.

Nos. 8 and 9 are from a pulpit in the cathedral at Salcrno, erected about the year 1170 by the Archbishop Romoald. The execution of these caps is superior to that of the Ravello examples of nearly a century later, and is a good specimen of the use of the peculiar drilling that characterizes so much the works of the Greek artists of the period. The cathedral at Salerno was built by Robert Guiscard, with materials brought chiefly from the ruins of Pæstum. No. 8 is an elegant specimen, and partakes rather of the fancy of the cinquecentisti than of the workmen of the twelfth century.

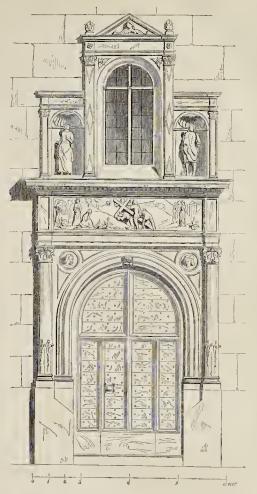

THE AIR SYPHON VENTILATOR.

WE mentioned a short time since Dr. Chowne's patent mode of ventilation founded on his asserted discovery that, "if a bent tube or hollow passage be fixed with the legs upwards, the legs being of unequal lengths, whether it be in the open air, or with the shorter large communicating with a cover at the shorter leg communicating with a room or other place, the air circulates up the longer leg, and that it enters and moves down the shorter leg; and that this action is not prevented by making the shorter leg hot, whilst the larger leg re-mains cold; and no artificial heat is necessary to the longer leg of the Air Syphon, to cause this action to take place." Thus, by using the chimney of an ordinary room, for example the chimney of an ordinary room, for example (into which air has free access), as the longer leg, and by conducting a tube or channel constituting the short leg of the Air Syphon, from any part (as near the ceiling, for instance), into the lower part of the chimney, at the suitable place, a stream of air will proceed from the apartment down the shorter leg, and away up the longer one. the longer one.

The longer one.

The llustrated News of last week gives two diagrams, farther elucidating the patentee's views. These show that a portable ventilator may be set up on a chimney piece, in the shape of a vase, or column perforated, and having a tube carried from the bottom, and continued into the chimney.* "In assembly-rooms, even where fire is not used, which become over-heated and close, to whatever part of the room rout-forms extend, the means of ventilation can also be conducted, either by channels (as light zinc tube) suspended under the forms, or by making the forms themselves hollow channels. In either case this channel being made continuous, and finally passing through an opening in a chimney-board, or by some an opening in a chimney-board, or by some similar arrangement, into the fireplace, and similar arrangement, into the super parts of the room, the warm air would constantly de-scend through them to the continuous channel, and then into the larger leg of the Syphon."
To convey away the heat from gas or other lamps, in drawing-rooms or large working ampartments, if is proposed to perforate an orna-mental pillar, and carry a piece of tubing under the floor to the nearest chimney. According to the diagrams it is unnecessary that the two legs of the Syphon should be of the same diameter. We have yet to see the plan in operation.

IRON HOUSES ADROAD .- The Journal de Liege states that at the establishment of Seraing, and others near Verviers, a great number of cast-iron (corrugated) cottages and warehouses have been constructed, and shipped at Antwerp for the gold regions of California. A chapel and church in iron have been made A chapet and church in iron have been made for the Missionary Society of Brussels, which has attracted curiosity. Now that affairs are more tranquil in France, a great many English-men are employed in the iron foundries, stee factories, and the engine and machinery works. RENAISSANCE DOORWAY, ST. ANDREW'S, JOIGNY, FRANCE.

RENAISSANCE DOORWAY,

ST. ANDREW'S, JOIGNY, FRANCE.
THE church of St. Andrew, at Joigny, con-

The church of St. Andrew, at Joigny, contains several matters of interest to artists, especially some paintings of the fourteenth century, and some good sculpture.

The side door represented above is a graceful composition of the Renaissance period. The arrangement of the pedestal of the columns, the large frieze with its sculptured decoration, and the management of the upper storey, are all worthy of note.

BOOKS FOR THE WORKING CLASSES.

As a working man, allow me to thank you for the fresh proof of your goodwill to our class, contained in your last number. There is a tendency to move forward to supply the defects therein laid open, and I am, as one of the starved in book knowledge, deeply grateful for your attack on the castle of ignorance. Might I beg of you to bring hefore the public a suggestion made some years ago, and unheeded? That a building apart from the British Museum, and thereby obviating the danger of fire to that institution, should be appropriated to the reception of duplicate copies which, from various causes, are found in that library, that so the nucleus of a library for working men, to be opened from six to eleven o'clock at night, might be provided. Tickets might be given under restrictions, as at present, and works under restrictions, as at present, and works lent out upon a deposit equal to the value of them. I lay much stress upon this last item. Although the quiet of a reading-room is favour-

able for study, yet the possession of a book, unattainable from the ordinary libraries and very far beyond the means of a working man urchase, gives a charm to the deal table and clean-swept hearth of home, which would not exist in the gas-lit and French-polished public reading-room. Besides, a working man, after finishing his day's work, must go home for some refreshment; and if not able to leave, a book at home, for some refreshment. to keep a book at home a few days, must lose some time in "cleaning himself." This would involve perhaps a wearing of the better coat and hat in the evening, as most men would not like to go in the stains of their labour,—albeit not ashamed of them.

I have had, through the kindness of a friend, the privilege conferred on me of a reading order for the British Museum library, but although I have had it now fourteen months, have been able but three times to avail myself have been able but three times to avail myself of it. I am in the position of a starving man with a good 50th note in his possession, for which no one will give change. I believe there is no want of sympathy on the part of our influential men with the growing desire for knowledge evinced by the working classes, but they want to be led to consider the subject; and I further believe it to be the mission of The Builder to keep the matter before the public. What organ so proper as the mblies. public. What organ so proper as the publica-tion which is thumbed, and dirtied, and greased by working men, smiths, bricklayers, masons, and carpenters; consulted by architects, and land-owners, and clergy; and which lies (so report says) on the table of the "first gentleman" in the land?

OGER.

^{*} The patentee says,—'When this ventilator is used without a fire, as for example in the summer, it will be better (although not necessary), that the space left in the opening of the valve of the register, between the tube and the margins of the opening, should be closed by a piece of sheet tin, cut so as to fit and cover the space.'

USE OF BRONZE FOR MONUMENTS.

WITH regard to the remarks on the Nelson column, adopted in your last number, from a clever contemporary, I venture to send you a varied impression. I admit the unexampled varied impression. which that proceeding has been sloth by characterized, and say with the Observer, "It is hoped, it is entreated, of the Government that they will, without any longer delay, give orders for the completion of this monument, which, as it now stands, is a satire upon the sea service, and a memento of national ingratitude to departed heroism, rather than a symbol of naval glory."

The point, however, to which I am desirous of drawing attention is the ready violation of the canons of art for the mere purpose of spicing a critique. Thus bronze,—the vehicle spicing a critique. Thus bronze,—the vehicle celebrated throughout all history, the fore-runner of marble in the hands of the sculptor, and ever a favourite material,—is to be abandoned, except for cabinet morceaux or large single objects; but for compositions such as those on the pedestal of the Nelson column, some 14 fect square, having the chief figures of natural or beroic size, with the limbs and accessories frequently detached, and in some instances almost the entire figure, bronze is to be no longer admissible.

But what is to be the succedaneum? I fear it would be difficult to point to a material that would afford equal facilities. The inferior applicability of stone to minute parts is exemplified in the bronze sword of Bailey's figure at the top; and unless in some such ductile nonabsorbent and imperishable substance as the one employed for the *relievi*, much of their finish and detail must have been omitted.

The local or pervading colour of material, wholly unrecognized in architecture, is of very

wholly unrecognized in architecture, is of very little consequence to the sculptor; a monochrome in lampblack is as powerful as one in gamboge, and so thought the authors of the black marble centaurs of the capital.

Bronze, for the ornamental part of the Nelson capital, was probably adopted from necessity,—it would never have been so well done in granite; but while it now holds in some aspects an intense death of shale, it becomes aspects an intense depth of shade, it becomes, under the ordinary play of light, so perfectly distinct that the markings of the leaves are as perceptible as those of the wreath on the granite torus immediately helow the shaft.

As to the recommendation for distorting the base, surely some better and more analogous authority should be adduced than the puny, not to say hypothetical, interior order at Bassæ, whose chief characteristic is its unparalleled eccentricity. MODERATOR.

THE "OLD HALL" AT GAINSBOROUGH

Passing through Gainshorough a few days since, I went to see how the "restorations" were progressing at the "old halt" (a distinctive name this fine old building took when the llickman family removed to the new hall at Thonack). The "old hall" is one of the at Thonack). The "old hall" is one of the few remaining wood and plaster buildings erected towards the close of the fifteenth century, and though it has been much neglected, it is in a pretty good state of preservation. The general plan of the building is three sides of a quadrangle, one of which is wholly occupied by the great hall, till lately encumbered with all the paraphernalia of a theatre,—the minstrel gallery serving for a dressing, and the fine oriel for a green-room. The hall is open to the roof, which has a lantern, and principals supported by arched ribs; the latter once sprung from carved corbels, not one of which are now remaining, having been rewhich are now remaining, having which are now remaining, having been removed one by one as they were found to stand in the way of the theatrical arrangements; and I helieve there are those in the town who could tell where some, at least, of these corbels are yet to be found, and they might (if too much decayed to be reinstated) serve as models for new ones. All the windows towards the inner area are of ask, some presenting the standard of the standard of the standard of the server as models for new ones. new ones. An use without area are of oak, some projecting 7 or 8 inches from the face of the building, with cills, cornices, mullions, &c., nicely moulded, as also more and the project of the project o nices, mullions, &c., nicely moduleo, as also tracery in the upper part probably 1½ inch or 2 inches thick, giving them a screen-like ap-pearance. These and several other windows have only of late been freed from the lath and

plaster with which for generations they have been blocked up. The warder's tower (a fine piece of brickwork), and the brick front towards the east, as well as the offices towards the west, appear to have been additions made about the beginning or middle of the sixteenth century.

It is a pity so rich a relic of bygone days should be restored so superficially as this appears to be: for instance, the oak mouldings,

carvings, &c., where decayed, are being patched with deal, and plaster ornament has been used for "beautifying" the stone fire-places. You will prohably not wonder at this when told, as I was, that "the whole of the works" were under the superintendence of a resident lawyer; and still it is surprising, when we know that men of acknowledged taste in these matters (and one, at least, a distinguished archæologist) reside in the immediate neighbourhood.

ANCIENT BELL-RINGERS' RHYMES. HATHERSAGE CHURCH.

THE following is a literal copy of an in-scription in the black letter, in the belfry of Hathersage Church, Derlyshire. It was written about the year 1650, by one Anthony Frith, clerk of the parish, and whose family have held the office ever since. Perhaps you may think it worthy of insertion among the curiosities of your journal.

"You gentlement that here intend to ring,

You gentlemen that here intend to ring, See that these laws you keep in every thing, Or els be sure you must without delay The penalty thereof to th' ringers pay. First when you do into the belhouse come, Look that the ringers have convenient room, For if you be an hindrance unto them, Four pence you forfeit to these gentlemen; Next if you do intend here for to ring, With lant or spurs on, do not touch a string, For if you do, your forfeit is for that, First 4 pence down to pay, and loose your hat. If you a bell turn o're, without delay Four pence unto the ringers you must pay: Or if you strike, miscall, or do abuse, You must pay 4 pence for the ringers' use. For every oath here sworn, ere you go hence Unito the poor then, you must pay twelve pence. And if that you desire to be enrould. A ringer here, these orders keep and hold, But steeped the property of the part of the pence of the ringer here, these orders keep and hold, But steeped the part of the pence of the ringer here, these orders keep and hold, A ringer here, these orders keep and hold, But whose doth these orders disobey Unto the stocks wee will him take straight way, There to remain untill that hee be willing To pay his forfeit, and the clark a shilling."

The church is about undergoing a thorough restoration under the care of Mr. Butterfield. There are several good brasses in the church, but these the present representative of the Frith family will not allow of being copied by any one but himself, and for which he charges a very respectable price. C. H. B.

WHAT MUST WE DO?*

WILL the pestilence, which is now rapidly Will the pestilence, which is now rapidly abating in the metropolis, disappear for good in a few weeks? or will it smoulder in the population during the winter, and burst forth again with renewed virulence on the recurrence of the summer heats? The answer to this questions are the summer heats? of the summer heats? The answer to this question depends on the use which we may make of the respite afforded by the coming frosts. If we employ the next five or six months in resolute exertions, well directed, and well sustained, to cleanse and purify the squalid low-lying districts of London;—if we get rid of the two millions and a quarter cubic feet of ordere (just about one cubic foot per man) in the midst of which we live;—if we divert to rural cemeteries the thousands of corpses that knock weekly at our metropolitan church-doors—pale applicants for lodging in corpses that knock weekly at our metropolitan church-doors—pale applicants for lodging in the vaults below;—if we purge with ventilating air-holes, and wash with preparations of lime, all such horrible "pest-houses" as that of 48, Half Moon-street (mentioned in a recent report of the city medical officer)—"the filtly, stinking, airless residence of fourteen families, never free from fever;" or that at 4, Harts-horn-court, where nine unhappy outcasts lie rotting "in the midst of cholera and diarrheea" in one small and stinking room; "if we stop rotting in the milist of cholera and diarrhear in one small and stinking room;—if we stop at their source the subterranean rivers of filth and blood that take their rise from Smithfield-market and Whitechapel shambles;—if we ex-

* From the Times.

plore and evacuate the hideous caves of Ald gate and Tyler's-market, where underground slaughterers, red-armed, and ankle-deep in putrid garbage, ply their loathsome trade;—if the black tidal ditches of Bermondsey, Ro therhithe, and Lambeth, those chosen haunt of pestilence, be cleansed at length and covered;—if, instead of the scanty and intermittent supplies of water now doled out to u at extravagant charges by corporate mono polists, we agitate for free continuous streams at constant pressure and at reasonable price; if, profiting at length by the terrible teaching II, pronting at length by the terrible teaching of experience, we thus set to work in good earnest to improve the sanitary condition of London, instead of leaving it, as i actually is, worse off for air, light, water drainage, &c., than in 1832, taking intraccount the increase of building and population;—then, but not otherwise, we may hope that the pestilence, now only remitting, will be finally subdued,—then, but not otherwise, we may reasonably expect that just as a wise, we may reasonably expect that just as at Dulwich, fever was recently arrested by flush ing out the drains—just as in the Long-alley district, where 500 cases of typhus occurred within six months, one passage, lately cleaned has since remained exempt from the epidemic has since remained exempt from the epidemic raging around it—and just as in a street of Hammersmith, epidemic diarrhea, previously severe, entirely disappeared after the emptying of an overflowing cesspool—so in all London, similarly purified, a similar exemption from preventible diseases may ensue.

Miscellanea.

THE ADVANCE OF IRON-WORKING IN ENGLAND is a subject for congratulation, and should he aided by architects to the extent of their power. The current number of iron:—This most valuable metal may be called almost the direct agent of man in whatever he undertakes. In agriculture, manufacture, the building of ships, &c., this was early seen, and therefore its use is of very high antiquity, therefore its use is of very high antiquity, although not so remote, we have reason to believe, as that of either gold, silver, or copper. The inferior brilliancy of its colour may, perhaps, in some degree, account for this circumstance. stance, as well as the greater skill required to obtain it from its ores and apply it to purposes While gold and silver glitter often in their native state, and the ores of copper are of brilliant colour, the less apparent but more useful iron in its ore or native state holds out few of these lures to the finder. The native colour is still gray, and it is found in masses sometimes of meteoric origin; it also occurs in the state of pyrites, magnetic ironstone, ochry ironstone, &c. &c. It is, as we know well, a malleable and ductile metal, susceptible of very high polish, especially when united in a peculiar manner with carbon, in which state it is called steel; and this most useful combination must, we suppose, be of remote origin, for iron is mentioned repeatedly in the Pentateuch as employed for the fabrication of swords, knives, and various other sharp-edged instruments. We may estimate in some degree the value that was then attached to it from an expression in the eighth chapter of Deuteronomy, where Moses tells the Israelites, in his descriptive eulogy of the land of promise, that it is "a land whose stones are iron, and out of whose hills they may dig hrass." An illustration of the same fact, at a later date, occurs in the *Hiad*, where Achilles proposes a ball of iron as one of the prizes to be distributed at the games instituted in honour of Patroclus. Within a few centuries after this, the working of this metal seems to have arrived at much of this mean seems to have arrived at much perfection, as Herodotus speaks of a saucer of iron, very curiously inlaid, that was presented by a king of Lydia to the Delphic oracle, and addls, that "it is of surprising workmanship, and as worthy of observation as any of the offerings preserved at Delphi."

SEDIMENT IN CISTERNS.—A correspondent says,—" Allow me to propose to those who like pure water, to have the bottom of their cistern shaped conically, with the dis-charging-pipe attached to the extremity: thus no sediment could be formed; and when the water was agitated by a fresh supply it would still be as clear as ever." This would prevent

sediment, hut not give pure water.

PROJECTED WORKS.—Advertisements have been issued for tenders, by 25th October, for completing a Wesleyan chapel and schools at Southampton; by 7th November, for the erection of buildings for public baths and washhouses at Westminster; by 13th November, for the erection of a goods and corn warehouse at the Midland Railway station, at Leeds; hy 27th October, for the erection and completion of a new prison at Lewes; by 7th November, for boilers, pipes, and fittings for baths and washhouses at Westminster; by 16th October, for 50 covered goods waggons, with folding doors, for the Great Northern Railway; by 16th, for turn-tables, traversing frames, switches and crossings, water cranes, and water piping for Lancashire and Yorkshire Railway Company at Liverpool; by 30th, for the execution of that portion of the East and West-India Docks and Birmingham Junction Railway lying between the Leacut canal and Blackwell; by 13th, for building a store-house of corrugated iron (not galvanized) at Southampton harbour; by 24th, for continuing the boring at the Artesian Well, on Southampton Common, to a depth of 50 feet, or farther, below the bore-hole, which is 1,260 feet deep,—by 24th, for constructing a new deep pump and fixing same at Southampton Common, and for repairing and lengthening present pump, and altering steam-engines, &c.—by same date, for 500 yards of 5-inch cast-iron water-pipe, and 500 yards of 5-inch cast-iron water-pipe, and

ST. Jude's, Bristol.—A new district church is very nearly completed on Poyntz Pool, Bristol city, dedicated to St. Jude, under the direction of Mr. Gabriel, architect. It is in the Decorated style (Edward II.), and consists of a nave and charcel, tower at the west end, with revestry north of the chancel. The tower is of four stages, having a deeply-recessed doorway, above which is a 3-light window; the belfrey is lofty, with a 2-light window on each side; it is surmounted by a parapet of wavy and quatreful tracery, having a pinnacle at each angle, with buttresses set diagonally. The turret staircase is entered by a door inside the tower. The nave has a south doorway. The whole of the windows (except the east and west) are of two lights, and each of different tracery. There is a priests' door in the south wall of the chancel. The nave has open benches: the font is situated near the south door, and is large enough for immersion: the pulpit, which is on the north of the chancel arch, is of stone, with good panelling: the upper part of the tower arch is open, with a door beneath: the chancel arch is crossed by a screen of oak: the roof of the nave is open, and of a good pitch. On each side of the chancel is a row of four stalls. Further eastward, to the south, are sedlia and piscino, with drain complete (?); and in the thickness of the north wall an aumbry is formed. The roof of the chancel is vaulted with wood, and the bosses gilt. The floor is to be haid with encaustic tiles. The church is to be laid with encaustic tiles. The church is built of Hanham stone, with freestone dressings: and the roof is covered with stone slabs, peculiar to the churches of the middle ages. Interior length of nave, 65 feet; breadth, 29 feet: length of chancel, 25 feet; breadth, 29 feet; length of chancel English Pointed architective.

SMORY CHIMNEYS.—"A smoky chimney and a scolding wife are two of the worst evils of domestic life," says the old proverh; and to obviate the first evil ingenuity is ever racking its brain. Hence, Regent-street and every part of the metropolis has its house-tops bristling with pipes and d. formed by cowls in every conceivable and almost inconceivable variety. Now, I have built many chimneys in all possible situations, and have found one simple plan everywhere succeed, the secret being only to construct the throat of the chimney, or that part of it just above the fire-place, so small that a man or a boy can barely pass through. 2ndly. Immediately above this the chimney shaft should be enlarged to double its width, like a purse, to the extent of about 2 feet in height, and then diminish again to its usual proportions. No chimney that I ever constructed thus smoked. — W. Mason, Lieut. Colonel.

MECHANICS' INSTITUTES SUGGESTED.—In Mr. Weld's "History of the Royal Society," the author says:—"In a curious letter from Hartlib to Boyle, dated Amsterdam, May 18, 1649, and preserved in the archives of the Society, is the following memorandum:—
'Fouxhall is to be sett apart for publick uses, by which is meant making it a place of resort for artists, mechanicks, &c., and a depôt for models and philosophical apparatus.' It is further proposed, that 'experiments and trials of profitable inventions should be carried on,' which, says the writer, 'will be of great use to the Commonwealth.' Hartlib adds, that the late king (Charles I.) 'designed Fauxhall for such an use.' In another letter to Boyle, dated May, 1654, Hartlib says, 'The Farl of Worcester is buying Fauxhall from Mr. Trenchard, to bestow the use of that house upon Gaspar Calehof and his son, as long as they shall live, for he intends to make it a College of Artisans. Yesterday,' he adds, 'I was invited by the famous Thomas Bushel to Lambeth Marsh, to see part of that foundation.'"

ELECTRO - TELEGRAPHIC PROGRESS, — While the cost of a telegraphic line in England is 1501. a-mile, in America and Prussia it is under 201. a-mile. The telegraph in Prussia consists of one wire, extending over 1,402 miles, under ground, and covered with gutta-percha. Like those in America, it is by Morse, and is said to be capable of transmitting 1,000 words an hour. There are upwards of 10,000 miles of telegraph line in America, all worked cheaply. In England there are only 2,000 miles in operation. — Complaints of delay and neglect, as well as high charge here, still prevail. It must be admitted, however, that some of these complaints are most actively taken up and published by parties who have an interest in the substitution of a competitive line which is on the tapis, but of the real merits of which we are not yet present to indea.

pared to judge. PUBLIC CEMETERIES.—Not many miles from London there are barren waste lands that at present yield not a fraction of good us, but with a little energy and capital might be converted to uses that would be as profitable as any speculation. Cambridge-heath is well known, and none will venture to dispute what an unprofitable tract of land it is; and what an unprofitable tract of land it is; and there is another which is as much so, near the Southampton Railway. It extends from Woking to Bishopstoke, and is upwards of 20 miles in extent, the centre of which is crossed by the railway and a canal. This spot is as well calculated for a great public cemetry as any that can be named. It is so close to the railway that it is very easy of access; and a quality of land that might be purchased at as small a cost as any, owing to the nature of the soil, nearly all being composed of sand and loam. It may be questioned whether and loam. It may be questioned whether such a soil is calculated for interment, as sand is apt to fall in from the sides of any pit. feet is deep enough for any grave, and coffin laid on coffin is all that is needed, which might as well he done in sand as clay or gravel: such an arrangement as this must eventually be made, either with reference to the abandonment of the uses of the water which is obtained from various sources near London, or the final removal of cemeteries round the or the final removal of cemeteries round the suburbs. There must be percolations from any cemetery, and, placed as they are at present, namely, Highgate, Abney Park, Norwood, &c., there can be but little doubt that the water from the artesian wells will, by them, be eventually affected.—It is but half doing a thing to have a little cemetery bere and there; why not have a good one at once, and once for all? Why have charmel-houses so near our homes, when other charnel-houses so near our homes, when other and better opportunities offer for their position elsewhere. Were all the little cemeteries now elsewhere. Were all the little cemeteries now about us, with the addition of more land, made about us, with the addition of more tand, made public grounds and parks, and each of these spots of grassy land connected the one with the other by avenues, planted with rows of trees, so as to form one large belt to connect the parks round the metropolis, it would be better calculated for our health and happiness. The present parks are insufficient, and were London to take a walk some fine day, there would be searcely standing room for its worthy citizens. London, with a little foresight and care, might be made the grandest city in the world.

Provincial.—At Charlton, near Woolwich, the foundation-stone of a new church, to be called St. Thomas's, was laid on Thursday week.—Sandgate Church has been remodelled under the direction of Mr. Keeble, of Folkestone, architect, and will now accommodate upwards of 800 persons.—The Pontypool town school-room has been enlarged and opened as a church. The original building, 60 feet by 30, intersects the room at right angles, opening the whole width into it, but separated hy a curtain.—The foundationstone of St. Margaret's Church, Prestwich, was laid by the Duchess of Camhridge, on Wednesday week. The Earl of Wilton gives the land and 500t. towards the building fund.—A large portion of the wall surrounding Heaton Norris gas-works fell in on Sunday week. It had bulged inwards from the weight of earth outside; and being neglected, some heavy rain completed the destructive process.—The foundation-stone of St. Thomas's Church, Leylands, Leeds, was laid on 29th ult. The chief expense will be defrayed by Mr. M. J. Rhodes, now of Dursley, Gloucestershire, but at one time of Leeds, and by 500t. from the Diocesan Church Building Society.—Plans of a new crescent, to be erected at Stobcross, near Glasgow, have been prepared by Mr. Kirkland, architect, on a principle intended to afford to the middle classes, and at moderate rents, all the conveniences and elegances of the first-class dwelling. The elevations are proposed to be houses of three stories, to be let in 'flats,' or floors, of five and seven rooms, consisting of dining and drawing-room, and from three to five sleeping-rooms, with the necessary offices and conveniences. The proposed buildings have been projected by a company of private eventseme.

Edinburgh.—The new Corn Market is rapidly approaching completion. It is floored with heavy timber, and forms the largest saloon in the city.—It is creditable to the fleshers of Edinburgh, says the local Register, that they have taken the initiative in urging the town council to the immediate erection of public slaughter-houses. The example is deserving of initiation by all the members of that calling throughout the country.—The provisions in the New Police Act relating to the improvement of drainage in the city, are now being put into vigorous operation by the inspector of streets and buildings, and it is satisfactory to know that the proprietors have generally evinced no reluctance to carry the provisions of the Act into effect.

GLASS MANUFACTURE.—A patent has been granted to Mr. 11. Howard, Railway-place, Fenchurch-street, for—1. A peculiar construction of furnace for melting and casting glass, in which the flame is made to encircle and impinge directly against the sides of the pots, effecting thereby uniformity of heat, and an improved quality of material. 2. A portable furnace for melting glass, with one or more working holes. 3. The adaptation of a sheet of platina to the crown of melting and refining furnaces, to prevent the droppings falling into the pots. 4. A peculiar form and construction of annealing furnace with flues in the centre near the bottom, and holes in the top for allowing the heat to escape, and admitting light when ampriying it of its contents.

the centre near the bottom, and holes in the top for allowing the heat to escape, and admitting light when emptying it of its contents.

A CHEAP FILTER FOR WATER.—Having had occasion to offer a suggestion, with reference to the use of charcoal (and a friend suggests the preference to be given to that of peat) for stuffing coffin mattrasses in lieu of saw-dust, filling up others in putrescent diseases, &c., I beg to remind the public that as the water in daily use in this metropolis is any thing but what it 'should be, thanks to an overheaving monopoly of destructiveness, which might have been lessened long ago, if the various parish hoards would have sunk artesian wells,—a very simple means exists, by which any poor family may filter all the water required, viz., by using a large pan or tub as the tabk, and filtering the water (by ascension) through a sponge stuffed into the hole in the lower one being half filled with charcoal, and loosely covered with thin flannel, the upper one placed in it so as to sink the flannel with it, and then secured by a string: nothing can be more simple or more easily cleansed.

W. Ord, M.D.

PATENT FOR INCREASING THE EFFECTIVE STRENGTH OF BEAMS.—We learn from the Journal of the Franklin Institute, that a patent has been granted to Mr. J. R. Remington, for "An improvement in the method of increasing the effective strength of beams or rafters of wood or other materials, used in bridges and other structures." The patentee says,—"The nature of my invention consists in so arranging timhers or beams as to avoid their ten-dency to break in the middle of their length, this is effected by extending the ends of the timbers beyond the points of support, and there bracing or tying them down, so as to render the points of support fulcra; the tendency to break in the middle of the length is thus in part transferred to the points of sup-port, for it will be evident that thus supported the timbers cannot break in the middle without breaking also at the two points of support." Claim.—" What I claim as my invention, and desire to secure by letters patent, is the method of increasing the effective strength of timbers or sleepers, or preventing their tendency to break in the middle of their length, by tying or bracing down their ends beyond the points of support, in the manner and for the purpose set forth. It is to be understood that this set forth. It is to be understood that this method of increasing the effective strength of beams is applicable to all kinds of material of which beams are made in various constructions.

INDIAN ANTIQUITIES IN KENTUCKY. Kentucky, says the Ausland, abounds in ancient earthen mounds and tumuli, much resembling those found on the shores of the Gulf of Mexico, and for the greater part like those found in Ohio, of a religious character. They generally consist of small circles and parallelograms, the mounds being generally more regular, and in the average, perhaps, greater in diameter than those northwards from Ohio. The rectangular-terraced mounds in Onlo. The rectangular-terraced mounts in particular are comparatively numerous and frequently of considerable size. Professor Rafincsque has mentioned the sites of many of them in his "Notes," but has given no very clear insight into their true character. He estimates the number of distinct groups in this State, are not less than 600. These projects State at not less than 600. These remains occur in singular abundance in Montgomery County, and several are of peculiar in-terest. It may be assumed with certainty from the descriptions, that each group formerly belonged to a separate city, so that there must once have been six cities on an area now occupied by one. These imperfect glimpses of American antiquity show, that at the time of the discovery of America, her age of civilization was already over, that through the force of circumstances, the solution of which is now impossible, one great nation had disappeared, and another and ruder race, which had, perhaps, fallen from a higher state into their pre-sent barbarism, took its place. An unmistakeable family relationship shows itself in all these buildings, from those in the centre of North America, to those spread far and wide over Mexico, or even to those deep in the woods of South America.

woods of South America.

Monry for Public Works.—In your number for the 18th August, a suggestion was made, and the means for carrying on large public works pointed out;—there is another and most crying want which will prohably be delayed or crippled for lack of funds—"The general drainage of the metropolis, and large towns and cities." These works, if properly carried out, will last for many generations, and the question would then naturally arise, Why should the present generation bear the whole burthen? Why not (as in the suggestion for public works) let the amount required be at once borrowed, and the interest, and such further interest as would, say in the space of 100 years, liquidate the whole, be charged on the public funds, and the sewage manure be sold to adjacent lands, at prices just sufficient. the public funds, and the sewage manure be sold to adjacent lands, at prices just sufficient to meet the expense of conveyance. The article of the 18th might most advantageously be again brought before the public. It suggests means of effecting vast good. For the purposes of war there was no lack of borrowing, and we have a heavy interest to pay for what is now deemed a very questionable advantage; surely, for the purposes of peace, of national improvement, and positive good, there ought to be no hesitation.

ARRANGEMENT OF STAIRCASES IN BUILDings.—A patent has heen taken out, in America, by Mr. W. P. Gibbs, of Boston, for a mode of arranging staircases in buildings. The patentee says,—" By my improvement in building houses, or blocks of houses, I am enabled to obtain two staircases, with the requisite entry room, in the same, or about the same space or superficial area which is generally consumed in the construction of one, according to the common practice of arranging the same; thereby saving, in a block of houses, a frontage of 5 feet on the street or passage, in each two thereof; or, in other words, if we suppose each of two houses, as generally con-structed, has a width in front of 20 feet, or 40 feet including both fronts, such may be erected on my improved plan (that is, houses having their parlours and chambers, or other rooms, of the same size as those having a frontage of 20 feet on the street) on a lot of land having a front of 35 feet. Instead of the straight stairgrowth of 35 leet. Instead of the straight sant-cases, which denote my second improvement, two circular flights, winding around one central post, may be adopted." Claim.—"I claim the method or methods of arranging staircases in connection with each other, and in com-bination with the several suites of apartments leading thereto from said staircases, the whole being constructed and arranged substantially in the manner and for the object set forth.

Fire.—The Hall of the Carpenters' Company, London, mentioned last week, which escaped the great fire of 1666, narrowly avoided destruction by the same agent on the 6th inst., when some warebouses in Londonwall, filled with costly goods, were burnt down.—Two other fires occurred while the above was raging, one in Shouldham-street, Bryanstone-square, the other in Bedfordstreet, Covent Garden.——At the end of last month Quebec again suffered severely, twenty-five buildings were destroyed, worth about 25,000l.

STEYNING MECHANICS' INSTITUTION.—
On the 20th and 27th ult., Mr. Cordwell, of Brighton, delivered two lectures to the members of this institution, on architecture and drawing. On the first occasion, assisted by diagrams, he gave a description of the progress of architecture, from the rude wigwam to the establishment of the "orders." The second lecture was devoted to the subject of drawing, the origin of perspective, and its utility,—ex-plaining the various necessary points by geo-metrical lines and figures, and concluding by

describing the nature of colours.
WESTERN LITERARY INSTITUTION, LEI-CESTER SQUARE.—The lecture season here was opened on the 1st inst. with a conversazione. On the 4th, Dr. Snow lectured on causes and prevention of cholera. A new and attractive feature has been added to the programme here in the sbape of a series of glee

DESICCATED FLOOR OF THE LONDON COAL EXCHANGE.—The patentees of the desiccating process, Messrs. Davison and Symington, have published a representation of the floor of the merchants' area of the New of the noof of the merchanis area of the New Coal Exchange, London, which consists alto-gether of upwards of 4,000 distinct pieces of wood, of various kinds and qualities. The great feature of the affair is, that the whole of these pieces were, only a few months since, either in the tree in the growing state once. either in the tree in the growing state, or cut from wet logs, and were prepared for use in the course of a few days, by their method of seasoning. The names of the woods thus introduced are black chony, black oak, common and red English oak, wainscot, white holly, mahogany, American elm, red and white walnut (French and English), and mulberry. It is mentioned as a proof of the rapidity of this mode of seasoning, that the black oak is part of an old tree which was discovered and removed from the bed of the Tyne river, about the latter end of last year. The mulberry wood, introduced as the blade of the dagger in the city shield, is no less than a piece of a tree which was planted by Peter the Great, when working in this country as a shipwright. They state that no one piece of the 4,000 occupied more than ten or twelve days in seasoning.* from wet logs, and were prepared for use in the

NEWCASTLE SCHOOL OF DESIGN.—The annual meeting of the friends of this institution was held on Friday last, Mr. W. Ord, M.P., in the chair, when the report of the committee was read, and the prizes were distributed. The report spoke encouragingly of the present state and prospects of the school, which had been more fully and steadily which had been more they and steadily attended than heretofore, the average throughout the year being 87. By a removal to rooms belonging to the Natural History Society a considerable diminution of expense would shortly be incurred, and it was designed to hold was to be regretted that, in the very midst of previous great exertions in the getting up of the Polytechnic Exhibition, the Board of Trade should have thrown cold water on all such exertions by withdrawing the usual assistance; but the Board had since seen its error, and not only restored the Government allowance, but held out the promise of an increase should the local efforts be efficiently sustained. Thanks were voted to the teacher, Mr. Scott, for his

MAKE KNOWLEDGE OF ART GENERAL.— Mr. Young Mitchell, of the Sheffield School of Design, lectured at the People's College, in that town, last week, on Italian art in the fourteenth, fifteenth, and sixteenth centuries In the course of his remarks he said,—Art has in England hitherto been a sealed book. Let us hope that time is nearly at an end, For myself, I wish to see it diffused ahroad amongst all classes. I would have it a necessary part of the education of every boy. There are some timid souls who fear hy this means we should he inundated by Raphaels and Cellinis, There is, alas! no fear. As soon might we refuse to allow a boy to learn to read, for fear he should become a Newton or a Locke. Let us rather view the matter in its true light, and consider that, as reading gives to its possessor the power of appreciating the works of the great men of all ages, so would a knowledge of art give to its possessor a like pleasure and a like appreciation. I have been called Utopian in the idea I have of a universal art education. Let those who call me so recollect that, three centuries ago, the man who could read and write was considered a prodigy. These arts are too widely spread at this day to be considered accomplishments, and to be wanting in them is considered a reproach. I believe that a general knowledge of art would add to the wealth and consequence of the nation, and to the material comfort of the people. But this would not be all. It would elevate their minds and refine their tastes, thus increasing their intellectual enjoyments, and proving one of the most powerful helps to our onward progress.

Compression of Fuel into Blocks for COMPRESSION OF FUEL INTO BLOCKS FOR STOWAGE.—A patent has been granted to Mr. W. Buckwell, Civil Engineer, of the Artificial Granite Works, Battersea, for a mode of compressing coke or other fuel by percussion of a steam-hammer, which may be made of three tons weight, for example, and giving fifty strokes a-minute. The granulated and moistened fuel is placed in a stout cast-iron cylinder, faced inside with wrought-iron or steel and then exposed to the action of the steel, and then exposed to the action of the hammer. Means are also provided for retaining the block of fuel in the cylinder for a short time till fully set in its new form.

CELLARS INHABITED IN CONTRAVEN-CELLARS INHABITED IN CONTRAVEN-TION of BUILDINGS ACT.—A keeper of lodging-houses at Nos. 2 and 3, Church-lane, St. Giles's, has been fined 20s. for allowing a sub-tenant or lodger to occupy, and allow eight persons to sleep in, a cellar 14 feet by 6, and 7 feet high, with one window, but without fireplace or front door, a practice which appears to have gone on in the same tenantry for four-teen years: the fine to be repeated daily till practice discontinued — with costs. There were in all, forty-eight lodgers in No. 2, and seventy in No. 3.

BUCKS COUNTY LUNATIC ASYLUM COM-PETITION.—The commission of magistrates for providing a pauper lunatic asylum for this county invited seven architects to submit designs for the building. Some of them declined, but four declined, but four designs were sent in for the approval of the magistrates; and at a meeting held on the 15th ult., one, by Messrs. Wyatt and Brandon, was selected,

^{*} Drying Closels for Oats.—In reply to an inquirer last week, the patentees of the above-named process have forwarded a certificate of the successful application of their apparatus for drying oats,

LIQUID FOR CLEANSING METALS.-One of the first operations in finishing metallic of the first operations in finishing metallic work after it comes from the casting, or from the hammer, is to free it from the coat of oxide which adheres to it; this is done generally by keeping it for some time in water, strongly acidulated with sulphuric or muriatic acid. But an inconvenience in this process arises from the fact that the metal is liable to be attacked on its lines and angles, and whereever it presents a point or edge. Hence arises a double loss, both of the acid employed and of the metal. MM. Thomas and Dellisse state that they have succeeded in avoiding these in that they have succeeded in avoiding these in-conveniences, by combining with the acid of the bath certain organic matters which have conveniences, by combining with the acid of the bath certain organic matters which have the property of preventing, or at least of considerably diminishing, the influence on the metal of the acids. According to them, glycerine, artificial tannin, napthaline, and crossote attain this end. In the baths thus composed, the scale of oxide detaches itself without dissolving, and without the metal being attacked, so that the pieces may remain in the bath as long as may be desired without alteration. These facts, announced by MM. Thomas and Dellisse, are corroborated by the experiments of M. Flachat, chief engineer of the Versailles and St. Germain Railroad, M. Mertain, proprietor and director of the forges of Montataire, and M. S. Falaiteu, forge master at Bains, testify that they have tried this process upon sheet iron, and have adopted it to the exclusion of all others. The economy of this process, compared with the former ones, is about two-thirds of the acid employed, and 50 per cent. of the loss of metal in cleaning.—Bull Soc. Enc. Indus. Nat.

The American Art-Union (New York) have erected a gallery in that city for the reception of paintings purchased for distribution. It is 84 feet long and 24 feet wide, and is said to be superior to anything of the sort in the country.

RUTLAND STATUE.—The competition mo-

Country.

RULLAND STATUE.—The competition models, according to the Leicester Journal, have been received and deposited in the local Assembly-room, for the subscribers' inspection and the committee's decision. Eight sculptors were applied to, four of whom declined to compete, though willing to undertake the commission at the price offered. One, Campbell, declined allowether, being engaged with the declined altogether, being engaged with the Bentinck statue. The models, four in number, were sent by James Westmacott, James Wyatt

were sent by James Westmacott, James Wyatt (two of the four), and Edward Davis.

RALWAY COMPENSATION CASE.—The tenant of the "Neptune" inn, Bradford, had been offered, by the Lancashire and Yorkshire Railway Company, 300l. for his interest for seven months in the premises, during a remainder of his lease, including all other claims. The tenant refused this sum, and led evidence in court to the effect that his business yielded a profit of 803l. odds (although he only paid income-tax on 160l.); that therefore he ought to have 150l. as compensation for the good. to have 150*l*. as compensation for the good-will of his business alone, 350*l*, for loss of seven months' business, and 219*l*. for loss on forced sale of furniture, &c.—in all, 719*l*. The magistrates awarded the sum of 260*l*, without any expenses.

BUILDINGS AND MONUMENTS,

MODERN AND MEDIEVAL, Edited by GEO. GODWIN, F.R.S.,

Fellow of the Institute of Architects; Corresponding Member of several Societies.

Member of several Societies.

Part IV. of this work, price 2s. 6d., containing Views of Ware Church, Hertford; Hungerford and Lambeth Suspension-bridge; New Front of Buckingham Palace; Fire-place in the Palace of the Dukes of Burgundy, at Dijon; All Saints' Church, St. John's Wood; the Interior of the House of Lords—the Throne, the Victoria Lobby, the Reporters' Gallery, and Ground-plan; with descriptive letter-press, and numerous details; will be published at the end of the month, in time for the magazines of November.

Office of The Builder, 2, York-street, Covent Garden, or by order of any bookseller,

No. CCCL.

SATURDAY, OCTOBER 20, 1849.

ICCADILLY bas been considerably improved during the last three or four years: by widening the road and footways, and reducing (though less than

should have been done) its steep acclivity, it has been rendered a very noble and commodious entrance to the metropolis. The ground-owners on the north side have further improvements in view, and it is proposed, if we understand rigbtly, as the present leases expire, to prohibit shops, and reserve the frontage solely for private residences of good class.

A map of London, of the time of Elizabeth, shows what is called Piccadilly as a rudely defined road out of the town, with one or two houses at the angle where the road which afterwards became Regent-street turned off, and a windmill a little to the east of this, the recollection of which is still preserved by "Windmill-street." The origin of the name, Piccadilly, seems uncertain, but it was thought by some, at the commencement of the seventeenth century -when it was equally as now a matter of doubt to have been given to a noted house there, as being the skirt or fringe of the town,-picardill, or pickadil, being a kind of stiff collar, also a fringe or edging to the skirt of a garment; while others said it took that name, hecause "one Higgins, a tailor, who built it, got most of his estate by pickadillies, which in the last age were much worn in England;" * and a third set, that it was because the pickadillies were sold there. Mr. Cunningham, in his "Hand Book for London," gives many curious particulars in connection with Piccadilly: he says the earliest allusion to it is by Gerard, who observes in his "Herbal" (1596), "that the small wild buglosse grows upon the drie ditch bankes about Pickadilla." "Pickadilley Halle" is mentioned in the accounts of the overseers of St. Martin's-in-the-Fields, 1623. This building was afterwards sold to Captain Panton, who gave his name to a neighbouring square and street. Lord Clarendon (1641) describes Pickadilly as "a fair house for entertainment and gaming, with handsome gravel walks with shade," with an The first upper and lower bowling-green. Pickadilly, as a street, was a very short line of road running no farther west than Sackville-street. Coventry-street preserves the name of Mr. Secretary Coventry, of the reign of Charles II., whose garden wall ran along part of Pantonstreet and Oxendon-street. Part of Piccadilly, namely, from Devonsbire House to Hyde Park-corner, in 1734, resembled the New-road in the number of statuaries' yards, and it was the same in 1757, when it was said,-

"And now from Hyde Park corner come The gods of Athens and of Rome; Here squabby cupids take their places, With Venus and the clumsy Graces.";

Many of our readers remember the little toll-house at the "Corner," and its rude and rural accompaniments:—Apsley House, St. George's Hospital, and the stone Entrances to

* Blount's "Glossographia," 1656.

the Parks bave all been erected within a few years.

The last and most important improvement to the locality comes in the shape of the mansion now in course of completion for Henry Thomas Hope, Esq., the member for Gloucester, at the corner of Down-street, erected under the joint superintendence of M. Dusillion, a French architect, and Professor Donaldson. Annexed we give a view of the house from the south-west.* It has a frontage of 70 feet in Piccadilly and 64 feet in Down-street, measuring the two faces to where they would meet at the point; hut the angle is cut off to give a face of 10 feet, which admits an angle window on each of the principal floors. The fronts are wholly faced with Caen stone,† and have panels of decorative marbles in the piers between the windows. The total height from the level of the street to the top of the balustrade may be called 62 feet. The windows are novel in the arrangement, and the treatment of those in the attic story particularly good. The general effect of the exterior, as a whole, is much injured by the oppressive pile of chimneys on the east side. The details throughout, especially inside, show very careful and elegant drawing, and the carving, wholly by French carvers, is exceedingly well executed.

The entrance, beneath an enriched porch, is in the centre of the Down-street front, and includes some of the best work ahout the building. The door is of wainscot, enriched with carving. The grand staircase and hall occupy the centre of the huilding, extending from the entrance eastward, and will present, when finished, some novel and piquant effects. A short central flight of stone steps leads from the entrance to the upper hall, which is paved with various coloured marbles in patterns (and on the level of the dining-room floor), and thence a long flight, not yet up, will conduct to the drawing-room floor. The upper hall is fenced by an enclosure of mahogany and glass at the head of the stairs from the entrance-hall, and there is a similar enclosure at a short distance from the front wall, over the entrancedoor, from the level of the dining-room floor, so as to form a communication, next Downstreet, between the rooms separated by the

The walls of hoth halls are formed into panels and ornamented pilasters, with white plaster, polished, the lower part having varied seagliola panels, and a marble plinth. The ceilings are enriched; and the upper hall has a skylight.

The two principal floors consist of three rooms each. Those forming the suite on the drawing-room floors are 36 feet by 22 feet, 28 feet 6 inches by 24 feet, and 34 feet by 24 feet,—a range of about 100 feet long. The principal floor is 16 feet 6 inches high; the dining-room floor, 15 feet 6 inches. The floors are fire-proof, consisting of cast-iron girders and tile arches.

And here we would, in parenthesis, make a remark. The Kent Fire Office bas issued a list of instructions to assist persons to escape from premises when on fire. We will give one, which, if followed out, would bereafter render all others unnecessary, and that is, let buildings he so constructed that they will not take fire. As we have again and again shown, the majority of our ordinary dwelling-houses are positively built to burn. The loss which the community annually sustains through want

* See page 498.

 \dagger All the projections, cornices, window-caps, &c., are protected by sheet lead.

of foresight in this respect, is enormous, and the amount of grief, trouble, and privation which follows, can scarcely he estimated. Prevention is better than cure.

The ceilings are panelled and but slightly enriched, being prepared to receive coloured decorations, but these are not yet determined on. The windows are fitted up with French casements and are very large. They are provided with Snoxell's patent rolling shutters.

In the angle-room (so to call it) the fireplace is beneath the window. The doors of the best rooms are of oak, carved, with the initial H, in shields. The room in Down-street, on the dining-room floor, north of the hall, is painted to imitate the same material. The wall above the panelling is hung with a green flock paper. The chimney piece here, the only one in the principal rooms yet up, is particularly elegant in the details, and will afford a subject for illustration hereafter. It is of Pierre de Tonnerre, with panels of Languedoc and other French marbles.

There will he no more pictures in the house than will serve as decorations to the rooms: Mr. Hope's collections have heen removed to Deepdene.

There are two staircases besides the grand stairs, both somewhat confined. The only approach to the chamber floors is by one of these.

We have not space to say more of the upper rooms, than that they are provided with double sashes, that some of them have cast metal chimney-pieces bronzed, including caryatid figures, and that the walls are hung with monochrome flock papers.

The stables and coach-houses appear to bave been designed and executed with great care, so as to combine all possible conveniences, particularly as to access, light, ventilation, and easy communication. They open into Marketstreet. The coach-houses on the ground-floor are paved with Orsi and Armani's lava on concrete, and are warmed by hot water. The stahles are over these, and are approached by an inclined plane. The floor here is formed with brick arches and iron girders, and has first a layer of concrete on the arches, then a layer of lava, and, upon this small paviours, red and white, are laid herring-bone wise. There is accommodation for twelve horses; the mangers are enamelled on cast-iron, and the wall above these has a zinc lining. There is a lantern for light and ventilation; and around this, over the other part of the stable, are rooms for the

The kitchen department of the house is very complete, with a "lift" communicating with each floor, speaking tubes, &c. Gas is laid on throughout the mansion, except in the drawing-rooms and in the stable huilding; and there is a complete system of apparatus for warming the vestibule, staircase, and passages throughout.

The divisions of the bins in the wine-cellars are of slate. The ceilings and walls of the principal apartments are rendered wholly with plaster of Paris.

Messrs. W. Cuhitt and Co. are the general contractors; but all the ornamental work, including the wainscot doors, the ceilings, stone carving, mahogamy casements, iron railing, are hy Frenchmen,—many of them indeed executed in Paris, although for what good reason it seems hard to say.

The building is enclosed with a particularly bandsome iron railing, cast in Paris for the purpose, a portion of which we show on a

[†] The zine-workers appear to have taken possession of d the few houses in the New-road left unoccupied by the w statuaries and artificial-stone makers, and have surpassed d their neighbours in the process of disfigurement.

larger scale than in the general view. The shields here, as elsewhere, bear the letter II.

The carcase of the house cost 9,000*l*.; the stables about 3,000*l*.; and the cost of the whole, exclusive of the final paintings and similar class of decorations, ahout 30,000*l*.

ON THE MEANS OF PROGRESSION IN ART.

THE ARCHITECTURAL ASSOCIATION.4

The foremost question of the day, in reference to our profession as a fine art, would seem to be this:—"What are to be the sources of that inspiration which shall infuse into it life and progression?" And, looking at the various ideas propounded upon the subject, we find them to be somewhat as follows:—First, 'study nature:' advice which has a volume of truth in it, but, unfortunately, it leaves every one to his own interpretation of a most comprehensive term. He may take it objectively, prototypically, or abstractly,—or even dogmatically and arbitrarily. For purposes of mental culture and art education, it is too unbounded in its import as generally set forth. Its practical use, hitherto, has been little else than as a phrase bandied about, containing, as we must admit, a very concentration of truth, but which as yet has received very little intelligible exposition, nor ever will prove of much value until divested of its cosmopolite form.

A second solution offered to this question its,—To study the spirit and requirements of our age, and adapt the present resources of our age, and adapt the present resources of our art to embody them. A third is,—To concentrate all efforts upon the least-developed but distinctive style: first render it exclusive and predominant,—it will then progress and hecome national. A fourth, rests the progression of art upon the application of new materials, and upon increased facilities of construction; whilst others impatiently clamour for 'something new,' 'something original,' as a new generic form, capable of modification and development. I venture to add to this summary of agencies one, not usually classed, as likely to give impetus to architectural art, and it is, 'the study of criticism as a science.' There is, I fear, too much agreement upon one point, to be favourable to true progress; there is a very general impression that in our present system, condition, or prospects, we have little else than evils to deprecate. There is no admission or acknowledgment of anything favourable or in the right direction. Whether there is more power in this cynical spirit than there would be in generous observance of the good, would seem to be a question settled in the affirmative; yet of all the drawbacks to that common bond which should subsist among members of the profession, as in itself a powerful stimulus to art, this captious and complaining spirit is chief. This dogmatic condemnation of that which is, and visionary requirements as to what ought to be, come neither in the form of enlightened criticism or creative genius. There are some who can relish no criticism unless it be a pungent and distilled attack,—a criticism which mistakes its way so much as to degenerate into invective,—venom for wit, and a joke for a proof.

its way so much as to degenerate into invective,—venom for wit, and a joke for a proof. We ought to be as much open to the observation of right tendencies as to admitted evils, and do honour and yield homage to successful art: the feeling of confidence and emulation that would spring up from thus aeting would be favourable to its study and cultivation.

Every historical period hrings with it its own characteristics, which become more or less evidently the sources from which the art ef its day receives its inspiration and tone. That which fostered it in one age may be wanting in a succeeding, or the current of popular feeling and sympathy may even run counter to any prospects of its high cultivation, and accordingly as the intensity of art-feeling declines, its patronage will be limited, and its cultivation correspondingly feeble and superficial; when, and as this feeling revives, we may expect also a higher estimate of art as a study, and proportionate intensity of thought will be hestowed upon it by its followers. This

is the condition to which we appear to have arrived—a revival of feeling—a resuscitation of all art that has preceded us; and it becomes a question what shall be the speciality of our day, not only as to art, but what shall be the presiding and inpelling spirit that secretly inspires its votaries. But, independently of this change in the characteristics of the period which give the impetus to art, the condition of art itself necessarily results in altering the manner in which it is cultivated, and our condition, surrounded as we are hy styles of art dition, surrounded as we are by styles of art so fully developed, lessens the field yet unexplored; we and art come under new condi-tions, and new and peculiar forces are needed for it to become progressive. It will not, I know, be a favoured idea to speak of finality in the powers and expressions of our art; but infinite as may be its capabilities of expression, the development of the great cardinal styles, classic and mediæval, with all that preceded or accompanied them, must of necessity hedge in, and even have made use of the possible or applicable geometric forms. I would suppress the idea of new styles as a something to he sought after, until progress itself revealed it. Let the aim be not for novelties, hut for perfecting the adaptation of that art we have handed down to us, until its expression become assimilated to our own society and its characteristics, as it has been made to do that of previous. The forms of art are not the proprevious. In forms of art are not the property of one age—only let each clothe itself in them with truthful and harmonious adaptation. The spirit of close observation and earnest appreciation which this would beget, would correct the bane of more copyism; the transition from existing characters of art would be gradual but them call accepts. gradual, but they would proceed upon a sound principle, and one that would be a thousand-fold more ennohling to the study, and more productive of results, than the loud and visionary clamours for new styles, as if art were like a series of fashions, to be altered at will. Neglect the study of that art which descends to us, in the eager expectation and looking for "some-thing new," and we shall sink in our apprething new, and we shall sink in our appre-ciation and conception of art altogether; but aim to master that which is, and to accomplish their happiest powers of expression, and fresh-ness and navelty may emerge; but nothing ever came from mere outcry and expectancy. Perfect its expressions as required by the aspect and character of our own times and institutions, and I entertain—as a means of con-ferring upon it more character and dignity as a study, and as counteracting false taste—that architectural criticism should be investigated and advanced to the fixity and position of a science.

of a science.

The distinction which was obtained hetween the terms science, art, and fine art, has gone very far to mislead and intercept a clear view of the great central laws to which all arts, fine arts, and sciences are amenable, as parts and dependencies of a great whole. The one has been thought to be the realities of the world,—hence, whatever is conducted upon known principles is termed scientific,—the other has been represented as the poetry of the world; one as a matter of fact,—the other as a reflection only of mind, whose ideas and images are not cognizable to science, called up by and addressed to fancy,—an irresponsible, and in all cases an arbitrary and absolute award or rejection. This is the foundation of the error, that each one has an inherent judgment upon art; for while no one ventures to exercise his taste in respect to the facts of nature, or in the domain of the applied sciences, all seem to assert the correctness of their own judgment upon questions of art, upon this assumption that the fine arts are amenable to no law. There is nothing without law; there is no such thing as a fine art having fancy for its foundation and guide,—laws which are the birthright and endowment of genius, so that his thoughts and productions accord with them, but which the ordinarily gifted must condescend to learn and observe cre they can judge aright. I gnorant taste is the upas tree blighting all the fair promises of art, the conceit that claims innate perceptions because it has not mind enough to search out and acquire. And if this presumption that art is amenable to no law is an evil affecting the popular taste, inasmuch as it leaves it to be formed by the unrestrained admission of whatever may be presented to its undisciplined observation, how much better does the subject

present itself to the professional student? To what do the clearly affirmed and defined principles of our art amount? Put them together, place them in their sequential order, they as yet remain almost in the region of metaphysics, they shed but a tremulous light upon the path of the student, they exist like nebula, suresolved, emitting rays which lead the inquirer only into abstraction of thought, bewildering by their intangible and formless Instre. Art disquisitions, theories, and principles are considered, so far as they relate to architectural art, to he such transcendentals as are little better than pure nonentities—"not practical." Yet we continually speak of principles, of canons, harmonies, and proportion, while scarce any are reduced to clear and distinct conceptions, so that the mind may analyze its emotions: none have yet given up that shadowy form of generalization which renders each so feeble, that their very definition is a controversy and debate.

Controversy and debase.

The very fact that our criticism exists, as it were, mental and unwritten, assuming all the forms and dogmas of individual fancy, its very terms so involved in doubt as to the strict ideas they really stand for, is an evidence how backward we are in the collocation and registry of those facts, which, though constantly operating upon and determining our minds, are yet unreduced to axiomatic and propositional form, so as to be worthy of reliance, and accredited vehicles of demonstration.

It may be said that the subject of architectural criticism does not come within the range, and is not of the nature of the inductive sciences; that appreciation, or the emotion of art feeling, is purely a mental phenomenon,—that they are intuitive,—that beyond the simple admission of sensation we cannot reach. To this I would suggest the reply, that in criticism the process is to be the reverse of this order. This mental is to he the reverse of this order. This mental phenomenon of appreciation and emotion we take as a result, and our object is to ascertain the forces in operation; these we shall find to be of two distinct sources,—the one external and objective, the other mental,—the criticism we want as efficient for the cultivation and progress of art must regard both. The very theory of fine art is based upon this conjoint action of the external and the mind, not chancefully, but, if truthful, according to the design and ordination of the great Framer of Nature, who has made the human mind and the objective world heyond it as parts of one system, to attain their highest excellences when faithfully responding to each other. We want a criticism that shall define the several parts which the mind and the objective play in the phenomena of fine-art emotions. That the one be according to what are termed 'trne artistic principles,' and that the other may be rightly informed, that it may correctly receive the impression of the images, and give rise to corresponding emotion; for if this be not the case, we pronounce the judgment perverted, the taste false; but we dispute not the reality of the impression,—such as it is let the possessor enjoy it,—'tis not the only instance in which the mind may love a lie instead of truth, through its perversion and blindness. If this he not the case, what is the meaning of "art education," "cultivated taste," and what mean their opposites? Are all forms upon the same dead level? and is every mind to exalt that it pleases? But if the appreciation in some cases is to be pronounced false, from what are those principles to be derived by which the judgment is to proceed? This is the real question. Is the method of induction inapplicable to these matters? By no means, Difficult it may be, and very few may be the arrows and laws that could be glossly defined. axioms and laws that could be clearly defined and written; but if they are laws and not merely 'trains of ideas,' let them be compre-hended so distinctly as to become axiomatic and propositional, and criticism then will rise to possess higher attributes than does mere controversy and debate, which it scarcely does at this present time.

at this present time.

"Some law known or unknown rules each," is a quotation you will recognize; and this is the present condition of architectural thought, a series of queries answered in the affirmative or negative. But affirmation does not tell us what that law is. You can violate it by an experiment with your pencil, yet you can scarcely say what law you have infringed. The fact of the difficulty of resolving criticism into

⁴ The following is a portion of the president's address, read at the opening meeting, and mentioned in our last number.

a science of æsthetics ought not to deter us from attempting it. The doubt seems to be, if there are sufficient primary and absolute facts or impressions, that is, impressions having the force of universal concurrence and self-evidence, to form sufficient bases for the deduction of first principles? However limited they may prove, let the solution of this problem be our aim. We are so accustomed to regard the phenomena of nature, through the light and teaching of science, that it is to us im-possible but to regard them only as effects of hidden causes. But had we lived before the great revelation of induction, we doubtless should have yet the same overwhelming complexity as now in respect to the phenomena of our art,—a hopeless enravelment of forms and images, the cause of whose impressions

it is impossible to reduce to general principles.

We have in respect to art certain fixed or prevalent impressions; these gradually accumulated, affect our judgment in every instance that objective art is before it. We know that these impressions form to us the axioms of art; each has his own; but do we not allow that some are universal? if so, we want such to be defined,—they would constitute the science of æsthetics.

Some indications of effecting this study of Some indications of effecting this study or eriticism, and reducing it to proportional and axiomatic form, have appeared. The "Maxims and Theorems" of Professor Donaldson, contains the following remark in its preface:—
"Some of the maxims may appear paradoxical, others empirical, but it is time that architects should apply themselves in earnest to the subject, so that just principles should be thoroughly should apply the distributions in earnest to the sub-ject, so that just principles should be thoroughly investigated. We ought no longer to bave to wander in uncertainty as to the laws of our art, after the experience and lessons to be derived from the monuments erected during 4,000 years. It may appear remarkable that this has not been done before; but the prin-ciples of a science are always those which are learned last; a full clear and comprehensive grasp of those fundamental notions on which a science is founded, is only attained after a very long course of intimacy with the working of the details."

Very long course of intimacy with the working of the details."

It would seem, then, not only to he a subject likely to give a higher tone to the study of art, but an effort eminently becoming this age, a duty arising out of our very condition and privileges as those who inherit the rich bequeathment of art. The successors of those who developed art to such perfection, and in such distinct phases, ought to make some use of such spoils, beyond delineating or patching them up. Let it be to define and group together those laws, which they so successfully illustrated. And to this end, if I mistake not, is intended the valuable contribution of Mr. Fergusson, that from the history of art as the experimental phenomena, the science or principles of criticism shall be deduced. And what shall we say of the brilliant but erratic Ruskin? his "Seven Lamps" are evidently an effort to the elucidation of art, by giving the spirit, motive, and principle, which constitute at once its law and inspiration. Let not such works fall to the ground. They are the dawn of a loftier literature than has hitherto been associated with our profession.

All our percentions of chiefer, whether of ciated with our profession.

ciated with our profession.

All our perceptions of objects, whether of nature or art creation, take their complexion from the truthfulness or error of our knowledge in relation to them;—to properly perceive we must be correctly informed. There is throughout art and our perceptions of it, a philosophy of emotion; and surely I rightly apprehend the intent of our studies, when I say that one of its highest aims is to pierce through the mystery that veils all that is beautiful in art, to detect that mechanism, the system and law that every where pervades it.

C. C. CREEKE.

C. C. CREEKE.

FALL OF A NEW CHURCH.—At Kingsdown, near Walmer, a new church is building, at the expense of an individual, and was externally approaching completion, but last week the west-end, which comprised a traceried window, and a bell-turret, suddenly fell to the ground with a tremendous crash. Providentially the workmen had not arrived. The accident is ascribed, locally, to wet weather, and a gale of wind. and a gale of wind.

ON THE GOTHIC ERA OF ORNAMENTAL ART.

In pursuance of the series of lectures ancient ornamental art delivered by Mr. Ralph Wornum, at the Government School of De-sign, Somerset House, the lecturer proceeded, on Friday in week before last, to treat of Gothic Art, more especially as regards its ornamental interest to the designer.

After slightly recalling the subjects of his two previous lectures * on the Ornamental Art of the Middle Ages, in which he had treated, firstly, of Christian symbolism and the most prominent features of Byzantine art; and, secondly, of its modification into Saracenic art; the third and final development of these into Gothic principles was then entered on.

The elements, said the lecturer, are still identical, the combinations only are diversi-fied. Such are the three great styles of middleage or, critically speaking, Christian art; for the Renaissance, and its final result, the Cinque-cento, were a decided repudiation of the Chris-tian forms, and as positive a re-adoption of the Heathen. That the Saracenic art was Chris-tian may seem refer a tording that its may care Heathen. That the Saracenic art was Christian may seem rather startling, but it was so, inasmuch as it was developed by Christian Greeks out of Byzantine elements for Saracenic masters. On the other hand the Cinquecento is a Heathen style, not that they were Heathens that practised it, but that its types were Greek and Roman.

were Greek and Roman.
In pointing out the distinctive feature of Gothic architecture,—its verticality, in contrast with the horizontality of the Romanesque, the lecturer then alluded to Schlegel's idea that, as the whole tendency of the Gothic is vertical, the motive to its adoption must have vertical, the motive to its adoption must have been to carry the eye upwards, and with the eye the mind, to the contemplation of things holy and above the sphere of this world. But whatever may have been the motive, he must observe that the fact of verticality did not necessarily imply that the design was absolutely lofty in itself,—its individual members are only higher than they are wide: it is such a distinction as that between the human and other animal forms, in their respective natural other animal forms, in their respective natural postures,—the human being vertical, the quadruped horizontal, although the latter may stand ruped horizontal, although the latter may stand absolutely higher than the former. The extreme into which this verticality ran is the Perpendicular style, in which the Gothic was exhausted, and ceased in a sudden transition to the Horizontal, in the sixteenth century, when the Tudor or late Perpendicular appeared in the flat Tudor arch and its square and oblong commartments. compartments.

So early even as the seventh century the pointed arch was a standard form in the buildings of Cairo in Egypt. The Saracens carried it into Sicily, of which in the eleventh century the Normans became masters, and the profusely decorated Norman arose, with its zig-zag and its pointed arch, as an amalgamation of styles. Spreading to England, the richest remains of our early architecture date from the

twelfth century.

The history of architectural ornament in England from the eleventh until the sixteenth century, is a history of perpetual changes. During this era of five centuries we had no less than ground different tables of partial changes. During this era of five centuries we had no less than seven different styles of architecture,—Saxon or Romanesque, Round Norman, Pointed Norman or Transition, Early English, Decorated, Perpendicular, and Tudor. Hence it is that a building which occupied more than one generation, or at least two, in its completion, was not carried out in the same style,—as in York Minster or St. Alban's Abbey, for example. Subsequent artists would not work out the ideas of their predecessors, except in so far as a nave, for instance, commenced with the round arch, had a chance of being so completed, but with different decorations. Even this, however, was not the case with St. Alban's, or with Westminster Abbey. In fact our ancestors took much greater pains to eclipse or demolish the works of their fore-fathers than to preserve or imitate them. The fathers than to preserve or imitate them. The circumstance of a thing having been done appears to bave been sufficient reason why it should not be done again. How true this is, is evident from the fact that the average duration of every style, and very nearly the actual duration, was only 70 years—the age of a man. Thus, from the building of the old Abbey of

* See p. 328, ante

Westminster by Edward the Confessor to the spoliation of the monasteries by Henry VIII., when all Gothic art ceased in this country, is exactly seven times seventy years, and comprises as exactly the seven styles of English ecclesiastical architecture. From this you have a formula which will give you very nearly the period of any particular style, as exact as the transition from one style to another will possibly admit. All you have to recollect is their consecutive order, and the starting date which you may take as 1066, the ing date which you may take as 1066, the close of Edward the Confessor's reign, or about the middle of the eleventh century.

Let us suppose that in 1066, the year of the Norman accession, the Romanesque style was extellible to the confessor.

Norman accession, the Romanesque style was established: after a lapse of seventy years you will find the Norman, or Zigzag style, flourishing; in another seventy years the Transition, or Plantagenet; in another seventy the Early English Gothic; again, after an equal period, we shall find the Decorated to prevail; and after a sixth seventy, at Henry VII.'s accession, we find the Lancasterian style, the Perpendicular: and after the sevently seventy.

sion, we find the Lancasterian style, the Perpendicular; and after the seventh seventy, or at the close of Henry VIII.'s reign, we have the Tudor, in which the Gothic expires.

I am quite aware, continued the lecturer, that these seven styles are now commonly spoken of as four—Norman, Early English, Decorated, and Perpendicular; but this is not a critical distinction of styles; Norman here comprises three styles, Early English two, and Perpendicular two,—Tudor, or the late plain and square Perpendicular, or rather Horizontal, being overlooked as a distinct style.

being overlooked as a distinct style.

There is no advantage in reducing the number of distinctive designations; for where so much is comprised in a single term, it renders it very difficult to comprehend in what renders it very difficult to comprehend in what the characteristics consist: the exceptions are far more numerous than the examples of the rule. Norman, as a designation of style from the conquest to Henry III. is no more specific than that of Gothic for the architecture which prevailed in England from Henry III. to Henry VIII. In one sense, every building in England is Norman, erected during the Norman dynasty, from Edward the Confessor to James I.

The ornamental designer cannot have too.

The ornamental designer cannot have too many distinctions of style, for every distinction implies some one well-understood class of ornamental forms, and his success, and the success of the ornamental manufactures of his

success of the ornamental manufactures of his country, depend upon his mastery of these distinctions, for each distinction is a store of invention, and will bear its fruit. Gothic ornament is quite as applicable to printed and woven fabrics as to bard wares.

With the aid of numerous drawings, &c., the lecturer then proceeded to point out the characteristics of each separate style, remarking that in this investigation they must, of course, look at the styles as ornamentists, not as architects. The examples were from stone, wood, iron, and ornamental manufactures. manufactures

manufactures.

While exhibiting the diagrams, &c., illustrative of the details of his subject, the idea of Metzger, the German architect, that the varieties of Gothie bases may be deduced from crystaline forms, was favourably viewed. This idea, said the lecturer, is a good one, and if we follow it up, we may produce ten thousand follow it up, we may produce ten thousand beautiful arrangements, all as new as beautiful. The snow crystals from the interesting work of Captain Scoresby (exhibited) have only to be developed into bases and shafts with a fcw be developed into bases and shafts with a few splays and bands, and you will have a clustered pillar to rival anything in Cothic architecture, early or decorated—uniting the prominent points of the crystals by straight lines for the bases, and round and hollow lines for the shafts: the mouldings of the arches are a species of continuation of the shaft. These crystals, however, he remarked, will suggest forms for many other species of ornamental art besides Gothic shafts; as, for instance, diapers for encaustic tiles; and certainly

stance, diapers for encausate these, and certainly an endless variety of patterns for cotton prints, or diapers, indeed, of any kind.

Recapitulating briefly the most prominent characteristics of the seven styles, we have,—

In the Saxon, or early Norman Romanesque, the repud arch source abacus, cushion In the Saxon, or early Norman Romanesque, the round arch, square abacus, cushion capital, sometimes with a little Byzantine foliage: no other ornament. In the specifically Norman, introduced

about the time of Stephen, but established under Henry II., we have the zig-zag as the great feature, with the round and with the pointed arch; and still the square abacus as a

In a short time we lose the mass of the Norman ornaments and the round arch, and find in its place the Transition, a most simple pointed style, with little beyond the tooth ornament to decorate it, and small windows of single lights. When much light was required the second of the s required, these windows were clustered together. The round, or hexagonal abacus now comes into common use,—the buttress is more developed, and the pinnacle an ordinary feature

feature.

In the Early English, we bave the first development of Gothic tracery,—mullions in place of piers,—windows of several lights,—Aying buttresses,—crocketted pinnacles,—complicated mouldings, and a more extensive application of foliage,—the columns clustered and the capitals generally round,—the trefoil leaf the most characteristic ornament

On this succeeded the Decorated, chiefly characterized by a more magnificent develop-ment of the leading elements of the preceding style; but it has its own features,—the ogee-arch and the pinnacled canopied recesses, which produce a prominence of diagonal lines

In the Perpendicular or Lancasterian style, the new features are the horizontal line, the panellings, and the substitution of Perpendicular for flowing traceries.

In the Tudor, the art returns to what it was in the Romanesque, and again becames Hori-

I point out these distinctions, proceeded the lecturer, not for the mere sake of distinction, though that is something, but to show the vast store of ornamental materials which these various styles display, especially the Norman, the two later Plantagenet styles, and the Lancasterian, not only for architectural purposes, but for all purposes of ornamental art.

but for all purposes of ornamental art.

Some allusion was then made to painted glass as an ornament in Gothic edifices, and as a branch of art commanding a daily-increasing interest. Of this the lecturer proposed treating in his next lecture, on 2nd proximo, and in the meantime he concluded with an address more particularly designed to encourage the numbs in leaving the foundations of future expension. pupils in laying the foundations of future ex-cellence and originality in design, by patient labour and an avoidance of all premature and unavailing endeavours to reap the fruits with-out sowing the seeds,—this latter being really the slowest method of attaining the object that can possibly be pursued.

SUPPOSED SAXON WORK IN IVER CHURCH, BUCKS.

IT seems to me that the church of Iver, near Uxbridge, in Buckinghamshire, may be added to the list of those containing vestiges of Saxon architecture; and that there are grounds for assigning an approximate date to the remains I allude to.

Immediately above one of the arches on the north side of the nave, is a small semi-circular arch, now blocked up with wall, the lower arch, now blocked up with wall, the lower part of which has been destroyed by the sub-sequent erection of the arches of the nave; and these arches being Norman, it is clear the small arch must be of earlier date, and conse-quently Saxon,* with which its appearance well agrees.

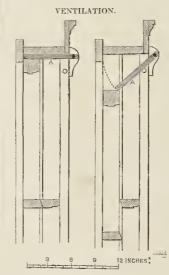

The inner side of the small arch, towards The inner side of the small arch, towards the nave, is quite red, and has evidently been rendered so by the action of fire; the outer side towards the aisle has escaped. Now we learn from the Saxon obronicle that A.D. 905, "Ethelwald enticed the army that was in East Anglia to head the process of the their managed. Anglia to break the peace, so that they ravaged over all the land of Mercia until they came to Cricklade, and there they went over the Tbames." It is true Iver is not expressly mentioned in this notice, but besides being within the limits of the kingdom of Mercia, it

* Not necessarily: there may be early Norman work, and late Norman work, -ED.

lies in what would then be the direct route East-Anglia to Cricklade. that in Saxon times, armies, whenever it was possible, followed the course of rivers in their marches, so that we may trace this army up the valley of the Ouse to Newport Pagnell; then following the Ousel to its source, whence to the head of one branch of the Colne is but 6 miles; then along the latter river past St. Albans, Watford, Uxbridge, and Iver, to Colnbrook, soon after which they would reach the Thames, and follow its course to Civillade. Cricklade.

I think, therefore, it is by no means an improbable inference that the arch I have described, incorporated by the Normans into sended, incorporated by the Architage was a window—of a church in existence before A.D. 905, and which was then destroyed and burnt by the Danes.

I saw this arch directly after its discovery, now about two years ago, during the restoration of the church, and I intended to have communicated it to you at the time, but I do not regret that the subject escaped my memory, since it was only the other day that I met with the passage that led to my conjecture

As ventilation is the order of the day, As ventuation is the order of one cap, I send you a simple and effectual plan (if you think it worth inserting in your valuable journal), for getting rid of the foul air and admitting fresh air into rooms or offices, by lowering the top sash. The flap A is bung to the sash frame by a centre in a bracket or otherwise, and when the sash is lowered, drops on the top rail of the sash the whole width of the window, and forms a ventilator with the draft upwards, to emit or admit air; by a stop on the inside bead, the flap is not per-mitted to durn human. stop on the inside bead, the flap is not permitted to drop beyond a certain point, so that the sash may be lowered in the usual way, and in raising brings the flap up under the head of the sash frame. I have fixed three at the Savings' Bank, Chelsea; they answer exceedingly well. I send this, as it may be of carried to some of your readers, being a cheap service to some of your readers, being a cheap and easy way of obtaining air without a direct draft upon the heads of persons who have to sit in rooms and offices with the top sash lowered, not having this protection.

JOHN CALLOW.

CISTERNS: PURE WATER.—Allow me to suggest what I think would be a remedy for the fault found in your last number with the conical-shaped cistern, having the tap at bottom. Let there be a tap there, but let it be a waste tap, and have another a little way up the side of the cistern. By this means the cistern could be kept clean, and no sediment cistern could be kept clean, and no sediment would find its way into the tap used for supplying water for household purposes.-W. B.

BRASSES OF NOTARIES

Brasses of this important class of the civil community, of which hut few now remain, may be divided into two classes—the ecclesiastical and the civil; of the former I only know of one instance, and of the latter but five, of which I beg to subjoin a short account. 1.—C. 1475, St. Mary Tower Church, Ipswich. This is the earliest example that has yet been met with; it consists of a large figure standing on a mound of grass, on which a scull and other bones are scattered; he is habited in a close fitting tunic, over which is a long looseseleved gown faced with fur 1 a circular cap, in form not unlike a turban, from which a broad scarf hangs down to the ground in front, is thrown over his left shoulder, concealing his gypciere, which is attached to the left side of his girdle, from which depends an inkhorn and a pencase richly ornamented with quatrefoils; the hands are united as in prayer, and the feet have low, laced boots. The absence of the tonsure shows that this was not an ecclesiastical notary. A scroll placed on his breast bears the following legend, invoking the ever-blessed Trinity, and at the same time expressing his belief in the resurrection :-

"Reposita est bæc spes mea ī sinu m Scā Trinitas Dñ Dē miserere mei."

Over this figure was once an elegant canopy supported on slender shafts; at equal distances down each side were small scrolls, one of which still remains, and is inscribed-

" Tibi laus, tibi glia,"

There was also a marginal legend and a shield beneath the figure, both lost. The figure (stolen since 1845) is engraved in Mr. Boutell's work on Monumental Brasses, p. 112, and in Messrs. Waller's work on the same subject, in the latter of which is a concise account of the origin, &c., of notaries.

2.—C. 1475. Great Chart, Kent. 3.—1490. W. Curteys, Holm Hale, Norfolk.

A figure in a long flowing gown, with loose sleeves, confined at the waist by a simple cincture, from which depend an inkhorn and pencase. He has long flowing hair; neither cap nor gypciere are apparent. His wife is lost, but the following inscription remains.

"Orate p alabz Willi Curteys notarii et Alicie uxis' ei ql obierunt vo kalēdas Marcii ao Jhū Mo cccclxxxx quorr alabz ppiciet de ame."

Engraved in "Cotman's Brasses of Nor-folk," p. xxxiii. p. xxxiii.

4.-1506. R. Wymbyll, S. Mary Tower Church, Ipswich.

A notary in loose-sleeved gown, thrown open A notary in lose-sleeved gown, thrown open in front and faced with fur, confined at the waist by a girdle, from which depends on the left side an inkhorn and penease, and from the right a plain gypciere. This figure forms a portion of a brass representing Thomas Baldry, merchant, Robert Wymbyll, notary, and their wife, to whom the two former figures are turned sideways. Scrolls proceeding from their mouths hear the following legends: their mouths bear the following legends:-

" Seta trinitas unus deus miserere nobis. Sps sete deus miserere nobis. Fili redemtor mudi deus miserere nobis."

Beneath the figures.

" Of your charite pray for the soull of Alys, late the wyfe of Thomas Baldry, marchant, sumtyme the wyfe of

master Robert

master kobert Wymbyll, Notari, which Alys decessed the iiijth day of August the yere of oure lord thoussand cocceyj on whose soull ihu haue mercy and on all cristin soullis. amen."

Beneath the figure of Baldry are the Mercers' Arms, impaling Baldry's merchant's mark (the corresponding shield under the notary is unfortunately lost), also five daugh-

notary is unfortunately lost), also five daughters and four sons, in two groups. For an engraving of the figure of the notary, vide introduction to the "Oxford Manual for the Study of Brasses," p. xcii.

6.—1517. Bernard de Turia, S. Sauveur, Bruges. A figure of a notary, standing on a tesselated pavement, beneath a single canopy supported by two arahesque columns, at the back of which is hunca a rich fringed diager. back of which is hung a rich fringed diaper. He is liabited in a tunic, over which is a loose gown thrown entirely open in front, and

⁴ Since the above was written, I learn that a doorway, in the middle of the piers, against which the font is now placed, presents the same appearance as the arch above described, and that charred wood was found near it; thus making it clear that the church to which these remains be-longed persished by fire.

reaching to the knees: the former is secured round the waist by a narrow girdle, attached to which, on the right side, are an ink-horn and pen-case. He has the clerical tonsure, and a pen appears hehind his right ear. He wears tight hose, and low square-toed shoes. Over his head is a scroll, charged with the words-

" In Virgine posui spem meam;" And heneath a shield hearing, gules, a lion

passant.
The whole is surmounted with the following

"Hie jacet Mag' Bernardin' de Turia dü vixit nota pub, et scriba Curie Tornacësis precipuus füdator choral' et augmetator lucri dicor Installator hui ecclie qui obiit \(\tilde{a}\) dni xvxvii."

This forms the centre-piece of a very fine brass; but, being pressed for time, I was unable to finish it: I shall, however, engrave the whole in a work on the Brasses and Incised Slahs of Belgium, which it is my intention to publish early next year.

W. H. WEALE.

PICKED UP AT BRIGHTON.

The extension of Brighton on the high ground, from the old church towards the Dyke-road, though less obvious to the visiter than what has been done next the sea, is very considerable, and would surprise those who know considerane, and would spirise mose who know the town only as it was some years ago. There is a quaint little house some distance on the Dyke-road, called Port Hall, full of "knick-knackett things," the residence of one of the most ingenious men in the county,—Sir Page Dick;* and we well remember this, the scene Dick;* and we well remember this, the scene of many pleasant days in early life, a good walk out of the town, and with little apparent chance of a neighbourhood. Gradually, however, the houses have crept along the highway; new roads have been opened; occupants have come; and, in a very short time, if the process continue, we shall find Port Hall in the midst of a row of houses. A new church is huilding close hy, and will further expedite this result. This is a large structure of flint, with Caen stone dressings. It is to consist of chancel, nave, and aisles, with a tower at the west end of the dressings. It is to consist of chancel, nave, and aisles, with a tower at the west end of the north aisle. The style, almost as a matter of course, now-a-days, is Decorated. The windows of the aisles, as well as those of the chancel, are in, and the walls up ready for the aisle roofs. The main pillars of the nave are not yet commenced. The tower is of large size; placed where it is, the foundation for it must have heen looked for at some depth and cost. Mr. Carpenter is the architect; the dedication is to All Saints.

The last new church built in Brighton, St. Paul's, was to be consecrated on the 18th. It is built of flint and Caen stone, and has presented the phenomenon of a church requir-

presented the phenomenon of a church requir-ing repair before it was consecrated. A consi-derable quantity of the stone used failed, and has been taken out and reinstated: what re-mained, as well as the newstones, have been oiled. It would be useful to ascertain the cause of the failure,—whether the stones were marked by failure,—whether the stones were marked by the merchant as from the sound beds and fit for external work; if they were laid bed-way; or were wetted by the sea. Information of this sort would assist in arriving at some degree of certainty with respect to the material; and it is only with this end in view, and not from any desire to annoy individuals who may he blameless, that we mention the circumstance.

St. Paul's Church is lighted by corone hearing candles. Some excellent stained-glass windows, by Hardman, have been put up in the chancel within the last week,—the gift, as Mr. Wagner stated in his sermon last Sunday, of henevolent individuals. The east window, a "Jesse," is very large, and must have cost

a "Jesse," is very large, and must have cost a considerable sum of money. Four smaller windows contain the Apostles,—three in each. The painted decorations of the chancel are not satisfactory, the effect heing mean. There is an oak rood-screen. The "Commandments" are placed at the east end of the south aisle.

None of our readers should go to Brighton without visiting the two churches at Shoreham,—old and new. The latter, New Shoreham Church, is full of interest to the student, exhibiting the passage from the Norman style to the Early English. It was originally a cross church of large size, but the nave has been destroyed, so that it now consists of transepts and chancel only, with central tower; the chancel has aisles, the walls of which show an interesting Norman areade.

When we entered the church we saw a sign None of our readers should go to Brighton

interesting Norman areade.

When we entered the church we saw a sign of the times in a bevy of pretty long-ringletted damsels squatting on the floor in the centre of the building; and it was not till we heard—"Rosa, dear, give me some more heel-ball,"—"Now, Emma, you begin at his legs,"—that we comprehended their position. They were rubhing with much gusto the only two hrasses which remain there,—the figures of a civilian and his wife, without any inscription, but which may apparently be dated about 1450.

Old Shoreham Church, also a Norman Southwick Church (which has a Norman tower, with Early English belfry story and short spire), has been miserably treated by rebuilders.

DEATH IN THE SEWERS.

THE sudden destruction of five fellow-heings by those deadly poisons which pervade the atmosphere of imperfect sewers and drains and emanate from them in diffusion, by the law of gaseous mixture and dilution, through the streets and dwellings of a district, is certainly an appalling occurrence, and at Pimlico such a fatality has just been exciting the sympathy and horror of thousands. But painful as it is, the suddenness and the but too obviously and totally unmistakeable and undeniable nature of the cause—a cause to be in this case neither mystified nor pooh-poohed in this case neither mystified nor pooh-poohed —can alone, by inference, excuse, since they cannot justify, the want of such a concentration of excitement and feeling—sustained and never ceasing, as it ought to be—for the thousands and the tens of thousands who are ever—and though more slowly, not more surely—being doomed to death, by the self-same cause, in every imperfectly or improperly sewered and drained street-district, town, or city. Could the mere matter-of-fact mind of the public in general but trace that cause, and forcibly the mere matter-of-fact mind of the public in general but trace that cause, and forcibly realize it, through all its stages and degrees of still pernicious dilution, from the concentrated state in which it strikes its victim down as if ylightning, to those states of less or more dilution in which it can only effect its deadly purpose in the course of minutes, hours, or days,—or even months or years, in a gradual and constant undermining of the strongest constitution,—such is our estimation of the public feeling, apart altogether from its more self-seeking fears and interests, that we believe, the truly vital question of the sewerage of towns, would unterly absorb and annihilate every other question of worldly interest, till the work were done, and that effectively, and on the most improved and enlightned principles that money could either call forth in principles that money could either call forth in design or realize in detail. It is simply because the evil agency is gradually lost to the public sense and mind in the distance, as it were, of its successive stages of dilution, that it is still allowed to dispense its subtle deadly venom through the otherwise healthful atmo-

In the case at Pimlico, a "junction reversed" had been run off through Kenilworth-street, which is at right angles to Warwick-street. This junction, or branch sewer, was imperfect, or rather, it only reached as far as the new or rather, it only reached as far as the new tenements were erected, and there it ahruptly stopped, as a butt-end, in fact, although its continuation for a few hundred yards, as observed by the Times, would have hrought it to the Thames. "Like most of the sewers of that district," the "hranch" and "main" are very nearly on a dead level, so that the filth in the "branch" had quietly accumulated for two years, till now that it was four feet deep throughout. The main was also foul, and so were other adjoining sewers. They were all examined and oraccumulated for two years, till now that it was four feet deep throughout. The main was also foul, and so were other adjoining sewers. They were all examined and ordered to be cleared out, and the process of contract-measurement was in progress on greens, and others. It is to be hoped that if

Friday last, at five a. m., when the party, three in number, entered the Kenilworth-street sewer, although cautioned previously not to do so. Not re-appearing till afternoon, a manso. Not re-appearing till alternoon, a man-hole in the main was opened, and some labourers entered, and saw the party all lying in the branch apparently dead. The end of the branch, which had been bricked up, was then broken open, and other three persons, one a surgeon and another a policeman, immediately entered, and in two minutes the latter re-appeared with the hody of the former, who had been struck dead instantaneously. Returning, he also brought out his other companion, insensible, but not dead. A third time this poor fellow re-entered, to bring out the dead bodies first sacrificed, and was himself at length struck dead, and his hody not got out till some hours after. Precautions, then only, were taken; and next morning the three first corpses,—discoloured and hlue, as if killed by cholera,—were got out. An inquest, at which these facts were elicted, was then held, and has been adjourned till to-day

(Thursday).
There are "a thousand or two," it appears, of such "butt-ends" as those in Kenilworthstreet among the metropolitan sewers, and the necessity of caution in such cases is well known, so that the occurrence of a succession of fatalities like the present appears to be the more extraordinary, and might have been avoided by the adoption of the usual precautions, or of the means taken to remove the gaseous sewage, and to ventilate the sewer itself, in Friar-street, where the late explosion occurred, —namely, Gurney's high-pressure steam-jet, hy which coal mines, as our readers steam-jet, by when coal mines, as on readers will remember, have been successfully ventilated. In this case, too, the poisonous compounds might have been destroyed on the spot. At Friar-street this process enabled the officers to clear out at least 500 tons of foul

matter. A correspondent (T. H.) suggests,—that a dress and helmet, &c., similar to what a diver uses at the Polytechnic Institution for example, might he adopted effectively for examination of sewers. "The suggestion adamination of sewers. "The suggestion advanced may not he of any immediate use to vanced may not de of any finished sets to those who have to travel any distance along the sewers, but that help may be afforded in case of need, and thereby preventing further loss of life. Every police office in the metropolis ought to be furnished with a dress and apparatus complete; the expense would be nominal, considering the amount raised by sewers rates."

PARKS FOR THE PEOPLE.

HAVING observed an extract from The BUILDEN, extensively quoted in the daily prints, remarking upon Copenhagen-fields as a fit place for a public park, I forward a copy of a letter which I wrote to Lord Morpeth, who acknowledged it, expressing his readiness to follow its recommendation in every manner that came hefore him, but that want of funds was the usual obstacle.—J. W. Hale.

The following is a portion of the letter re-

ferred to:—

"Without heing unmindful of what has heen done, and the great attention shown by your lordship and the other commissioners to the health of the people, by regard to important measures in their behalf; additional steps are needed, absolutely and incontestibly needed, on the ground of common humanity and sympathy with a pent-up population, hankering after fresh air and green sod or leaves in a hot and oppressive summer season, when thousands of the people in the internal parts of the metropolis find it intolerable to dwell pent up in heat and unwholesomeness, and pent up in heat and unwholesomeness, and seek the shortest routes to the nearest open seek the shortest routes to the hearest open spots or green places;—even an open alehouse court, where there may be a green shruh or a green seat, is eagerly sought for, and occupied with avidity by many of the thousands of women, children, and infirm persons who cannot reach the parks at the extreme ends of

^{*} The ancestor of Sir Page Dick advanced a large sum of money in 169-41 for securing the Established Church of Scotland, suppressing a rebellion in Ireland, &c.; and, though guaranteed, as he thought by Perrs and Commons, was never able to recover; it, and dick in poverty. An undeniable and very interesting case has been made out by the present barrout, who is making efforts to obtain a restitution of money most justly due to him.

MANSION OF II. T. HOPE, ESQ., M.P., PICCADILLY, LONDON.* MESSES. DUSILLION AND DONALDSON, ARCHITECTS.

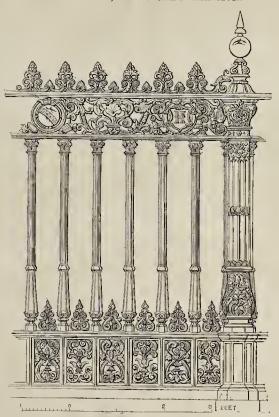

Smithfield Market be removed, that the space will be immediately converted into a City green. What was formerly necessary when London was much smaller, and from its hitherto long form and narrow width, more healthy in its internal parts than it can be in foure (unless care be taken, whilst there is yet time and opportunity), is much more necessary now, and the consequences will show themselves, if precautions be neglected. One grand benefit to London will be to preserve an * Sec page 493.

opening into the sides of it, both north and south; and the effects of this will be manifest: it will cause a current of comparatively purair into the very centre of the metropolis, and also be the means of a pleasant, safe, and short access to open ground, green fields, or walks parks, or broadways (as may be provided), for the benefit of health and morals of thousands of individuals who otherwise must be deprived of one of the greatest blessings of heaven.

On the north side of London the opening that would be beneficial is from Holborn to

IRON RAILING, MR. HOPE'S MANSION.

a general service to the inhabitants of the middle portion of London, than 100 acres at the extreme ends.

The high ground about Copenhagen is an invaluable spot for the formation of a reservoir of air, both for the supply of the centre of London and for the access thereto of the inhabitants. This spot (he it secured on a large or small scale, whether from King's-cross to Highgate, or less) is invaluable; the thousands

Highgate, or less) is invaluable; the thousands who are wont to resort thereto indicate its need of being, in some shape or other, secured as a public convenience. A space is taken for a model prison in this neighbourhood, and surely the consideration of the health and morals of thousands is worth a similar-sized spot, at least, for public recreation of a simply natural kind, viz., to obtain fresh air, and observe green herbage of some sort.

If the opportunity of forming a large or small reservoir of air in the sides of London be neglected now, when small comparative expense will effect it, the time will come when the most extensive demolition most be effected in order to air. London, and give space for its inhabitants; fever and plague will not be stayed till thousands upon thousands be expended in this manner, and the very spots now uncovered will be then again laid bare for obvious purposes of general need."

PROJECTED WORKS.—Advertisements have been issued for tenders, by 1st proximo, for extensive works at the South-Eastern Railway stations at Old Kent-road and at Ashford; by 24th inst., for a warehouse and three coal sheds at the London and Brighton Railway station, at Croydon, and a warehouse at their East-bourne station; by 1st January, 1850, for a bridge, wharfing, widening river, and removing old bridge, at Great Yarmouth; and by 29th inst., for works at two third-rate houses at Wilmington-square. Wilmington-square.

RAILWAY JOTTINGS.

RAILWAY JOTTINGS.

The traffic of branch lines in general, if not, too, of some main ones, it would appear, may ere long be altogether conducted by light engines, at great saving of expense. Experiments have occasionally been recorded in The Bullber that seemed to promise fairly for such a result, which further experience only appears to confirm. The Railway Times of 13th inst. gives the particulars of a personal examination of the doings and dimensions of one of these little, active, and even singularly powerful agents, built by Messrs. England and Co., of the Hatcham Ironworks, and at present at work on the Bow branch of the Blackwall line. It whirls a train of seven of the heavy Blackwall carriages, equal, it is said, to ten of the earriages in general use on other railways, up an incline of 1 in 100, at a speed of 35 miles an hour, starting as freely and getting into speed as readily as any other engine. The dimensions of this Pigmy Giant, as it is named, are as follows:—Cylinders, s inches diameter; stocke, 12 inches; driving-wheels, 4 feet 6 inches; four carrying wheels, 3 feet diameter; 80 tubes, 1½ inch diameter, 11 feet 4 inches long. The engine and tender are constructed on the same frame, with six wheels, and she is capable of carrying coke and water in her tender sufficient for a journey of 30 or 40 miles. The consumption of coke is water in her tender sufficient for a journey of 30 or 40 miles. The consumption of coke is 30 or 40 miles. The consumption of cole is less than 5 lbs. a-mile, producing, nevertheless, an immense quantity of steam. The weight of the whole engine, when in full working order, is about 10 tons. The centre of gravity being very low, there is no oscillation, even at a very high velocity. The day's work on the Bow branch is a run of about 200 miles.—

A slip of the embankment at Bosley, on the North Staffordshire line, took place last week, extending to about 100 yards.—The Whitehaven and Furness Junction line is now open from Whitehaven to Ravenglass. The con-

tractors are busily engaged in pushing forward the work from Ravenglass to Bootle, with 300 'navies' and artizans. The contract for the line between Bootle and Broughton-in-Furness, has been let to Messrs. Fell and Joplin, of Greenodd, near Ulverstone.—The contract for the extension of the Furness line from Crooklands to Lindal has been taken by Mr. Wheateroft, of Matlock.—One of the engines on the Furness Junction, with a passenger-train, on 13th inst., ran through the Whitehaven terminus, knocked down the yard wall, stove in the side of a school-house substantially built of stone, carried away the kitchen, and lodged in the back parlour. So far, fortunately, none of the little scholars were in the way, but a poor young girl, who was singing to herself while preparing food at the kitchen-fire, was dreadfully mutilated and instantaneously killed, and her brother was much bruised and burnt. The line slopes down to the terminus at a gradient of 1 in 100. The cause of the accident is said to have been want of sufficient breakage in the state of the rail, which was covered with ice.—The Caledonian Company have completed their tunnel at Glasgow. Entering at St. Rollox, it passes over the tunnel on the Edinburgh and Glasgow on the one hand and under the Monkland Canal on the other, and runs within a few feet of both towards the station at the head of Buchanan-street.—Mr. James Mitchell, of the firm of Ross and Mitchell, contractors, and Mr. G. Glennie, resident engineer of the Hawick branch of the North British Railway, were placed at the bar of the circuit court at Jedburgh, on 2nd instant, on a charge of culpable homicide, and neglect or violation of duty. The case, it may be remembered, arose out of the fall of a viaduct in course of erection over the river Tevic, at Rox-burgh, for the Kelso branch of the Hawick line, whereby eight persons were killed and course of erection over the river Teviot, at Rox-burgh, for the Kelso branch of the Hawick line, whereby eight persons were killed and several others injured. The indictment charged Mr. Mitchell with having allowed the pier of the viaduct to be constructed of insufficient materials. Mr. Glennie was charged with cul-pable neglect of duty in having failed to super-intend and inspect the erection of the viaduct, and to see that it was properly and safely built with good, sufficient, and safe materials. The and to see that it was properly and safely built with good, sufficient, and safe materials. The case went on till suddenly stopped by the alarming intimation, that one of the Jury was seized with premonitory symptoms of cholera, on the announcement of which the court adjourned, and the trial, we presume, will begin de novo, unless the juryman speedily recovered.

THE SYPHON VENTILATOR.

Ingentous men, delighted with any new observation that occurs to them, too often take it for granted that the same discovery never occurred to any other human being, and place themselves in a false position, when a little inquiry would dispel the delusion. In this respect the mania for patents of invention, with the necessity for secreey on their object, frequently leads to mischief, and causes a man of intelligence to throw away 400l. on a patent, that not only is not worth somany farthings, but of intelligence to throw away 400l. on a patent, that not only is not worth so many farthings, but which may drive him into litigation and ruin. As the average of successful patents is but three in a hundred, I need not say how often this must be the case. I have known many crude cases of this kind, but that of Dr. Chowne particularly surprises me. One would think that gentleman must have been blind, deaf, or asleep,—anything but alive to the progress of science and its application to buildings, if he supposes himself the discoverer of a new system of ventilation by means of an "up shaft and a down shaft." He is equally in error if he imagine that he can maintain a patent for a principle: our law allows the patent right for a mode of operation and construction, not on a principle. As amows the patent right or a mode of opera-tion and construction, not on a principle. As to the mode of ventilating by the syphon or atmospheric gravitation process, it is known to every miner, and ought to be to every architect, since Mr. Griffith's excellent lectures architect, since Mr. Griffith's excellent lectures some years ago, at the Royal Institute of British Architects, in which it was clearly shown and explained. There are also various applications of it in London and its vicinity, Mr. Place, of Brompton-square, has for may years had his library warmed by a simple adaptation of the law of gravitation of hot

and cold air on each side of his stove-grate, clearly demonstrated by the suction and repulsion of the flame of a candle placed near the bottom and upper part of the openings.*

Mr. Geo. Field, of Sion-hill-park, the author of various works on optics, &c. &c., has made his little parlour perfectly free from any perceptible draft by a pipe from the park through the wall into the hinder portion of stove, whence, after being warmed, it replaces the consumed air of the room, supplies the grate with oxygen, and assists the up-draft of the chimney, which being overhung by very tall trees, afforded a severe trial, but a very successful one. On a more extensive scale, in and cold air on each side of his stove-grate, trees, afforded a severe trial, but a very successful one. On a more extensive scale, in the heart of London, at the Hall of Commerce, in Threadneedle-street, every chimney has a small flue or down-shaft, to supply cold air to fill up the vacuum caused by the combustion. This was made when the building was erected in 1841. I could refer to other cases, but will in 1841. I could refer to other cases, but will conclude by mentioning a very pretty model for ventilating mines, by John Martin, the artist, and propounder of many improvements. I again repeat that our patent law allows no monopoly of the principles of nature, and I entertain no apprehension of an exception in favour of this "assumed new discovery." I feer no new toy on pure oir Cases of fear no new tax on pure air. CENSOR.

ON THE OXIDATION OF RAILWAY BARS.

A PAPER on this subject, by Mr. R. Mallet, was read at the recent meeting of the British Association. It suggests an important consi-Association. It suggests an important conderation. The writer states that the top surderation. The writer states that the top surderation. served in a state of perfect cleanliness, freedom from oxidation, and polish; while the remain-der of the bar is rough-coated originally with der of the bar is rough-coated originally with black oxide, and soon after with red rust. Not only is every metal electro-positive to its own oxides, but the polished portion of a mass of metal partially polished and partially rough is primarily corroded on the rough portion. Hence a railway bar while in use is constantly preserved from rusting by the presence of its polished top surface. Such polished surface has no existence on the rail out of use. The upper surface of the rail in use is rapidly condensed and hardened by the rolling of the traffic over it; and it is also shown in his report that, all other circumstances being the same, the rate of corrosion of any iron depends report that, an other circumstances being the same, the rate of corrosion of any iron depends upon its density, and is less in proportion as this is rendered greater by mechanical means. As every metal is positive to its own oxides, the adherent coat of rust upon iron, while it remains, powerfully promotes the corrosion of the metal beneath, and this in a greater degree in proportion as the rust adherent is of greater antiquity. It has been shown that the rist produced by air and water, which at first contains but little per-oxide, continues to change slowly, and becoming more and more per-oxidized becomes more and more per-oxidized by the court has a work of the contract of the court has a work of t electro-negative to its own base. Now, the rust upon a railway bar out of use continues always to adhere to it, and thus to promote and accelerate its corrosion; while the rust formed upon a railway bar in use is perpetually shaken off by vibration, and thus this source of increased chemical action is removed. source of increased chemical action is removed. To recapitulate, railway bars forming part of a long line, whether in or out of use, corrode less for equal surfaces than a short piece of the same iron similarly exposed. Rails in use corrode less than those out of use. This difference is constantly decreasing with the lapse of time. The absolute amount of corrolating is a source of destruction of the resion is a source of the resion of sion is a source of destruction of the rail greatly inferior to that due to traffic. It is highly probable that the electrical and magnetic highly probable that the electrical and magnetic forces developed in the rails by terrestrial magnetism and by rolling traffic re-act in some way upon the chemical forces concerned in their corrosion; and that, therefore, the direction of lines of railway in azimuth is not wholly indifferent as respects the question of the durability of rails. Mr. Mallet suggests:—1st. Of whatever quality iron rails are rolled, that they should be subjected prior to use to an uniform course of hammer-hardening all over the top surface and sides of the rails; and, 2ndly, that all railway bars before being laid down should,

• According to Dr. Gowel's statement, bis other controls and the controls of the rails.

* According to Dr. Clowne's statement, his system is not dependent on heat.—En.

after having been gauged and straightened, be heated to about 400 degrees Fahrenheit, and then coated with boiled coal tar. This has been proved to last more than four years, as a coating perfectly impervious to corrosive action, while constantly exposed to traffic.

WESTMINSTER ABBEY AND PUBLIC STATUES.

I VISITED Westminster Abbey yesterday morning, and was much struck with the imposing statue of the late Sir W. Follett, by Behnes; at the same time I could but feel that it appeared sadly out of its place, and in too crowded a situation. What a fine occasion this would have been for the commencement of a series of statues of eminent and great an (westerlaylerly with so distinguished a lawyer men (particularly with so distinguished a lawyer as the late Sir Wm. Follett), by placing it in Westminster Hall instead of the Abbey. It is colossal, and is placed by the side of another statue, which it throws into utter insignificance. Again, how much grander the statue of Lord Mansfield would appear if removed to such a situation as above suggested. Further, they mar the Abbey. When will this country think properly as to works of art?

Apropos of Westminster Abbey, we give some stanzas from a little poem under this title by Mr. Owen Howell,* which has been forwarded to us.

"Gaze on this Gotbic relic of the past,— See o'er its towers does Ruin surely creep; Time has her mantle o'er each huttress cast,— On each grey battlement Time's shadows sleep What will not fade?—all records cease at last; A few short years temple and tablet sweep Into the mighty gulf that gathers all: The slow destroyer, Time, sees tottering empires fall.

Far from Life's busy crowds awhile we stray To where the dead within these walls repose, To where the dead within these walls repose, Here to hold council with the mouldering clay That antique tombs and sepulchres enclose,-'Midst dusty banners fading fast away, Old monumental slabs, and funeral shows, o walk with noiseless tread and held-in breath,

To muse on human life, and meditate on death

In hollow gusts, the wind with solemn tones Murmurs sad dirges as we musing walk Murmurs sad dirges as we musing walk
Over old epitaphs on foot-worn stones:
Each monument, though silent, seems to talk
Of mouldering coffins and of bleaching bones;
While voiceless phantoms roundus gravely stalk,
Wrapped in the dark shades of obscurest night: ioon pours down, o'er all, her 'dim religious

Cbapels and shrines all speak of what has been, And sad the moral that they ever preach! There sleeps Elizabeth—there Scotland's Queen, Victor and victim solemn lessons teach: Their bloodless ghosts in yonder aisle are seen A thousand phantoms fancy sees in each;
While the old banners banging up on high
Flutter, as one hy one, beneath them, they glide by.

Over each monument and time-worn bust Over each monument and time-worn bust Wisdom does well to pause and meditate. Here are interred the good, the wise, the just,—Here, with rich trappings, the departed great Were brought in glory, and laid in the dust: Beneath these tombs, in darkness, now they wait. Covered with moss, time-eaten, black and quaint: Lo! yonder sleeps a King, and there a Gothic Saint.

The graves and vaults that at our footsteps lie—
The marble saints and carven busts of kings—
All seem to say 'Prepare, prepare to die!
The world and life are quickly-passing things:'
Whilst each uncouth and ghastly effigy—
Cherub and angel, with their outspread wings—
Witb sightless eyes upon us ever stare,
As wondering whence we came, and wondering what we are.'

THE ADELPHI THEATRE.—The additional entrances and stairs here, mentioned by us some time since, have been opened to the pubsome time since, have ocen opened to me pun-lic, and increase considerably the means of escape in the event of fire. The manager deserves the thanks of the public for the step: we should be glad to see it followed in some other theatres we could name. The last time other theatres we could name. The last time we looked in, a crowded house was laughing spasmodically all night.

NOTES IN THE PROVINCES.

A FEATURE unnoticed in the existing plans of the Abbey Church at Bury has just been revealed in course of the archæological diggings there, namely, that at the circular apse of the choir (plan in Yates's history) a semicircular chapel (besides the small Mary Chapel) jutted out about 15 feet in diameter from the porthern curve of the area. Beneath it the northern curve of the apse. Beneath it appears to have been a crypt, in which are remains of a pavement of encaustic tile, and part of an erection supposed to have been a loculus, or shrine, below the altar. The committee require further aid in the development of the plan of the choir.—The shroud of rougheast in which the exterior of the Saxon tower of Halt Think Church Colchestes he show the Holy Trinity Church, Colchester, has long been buried, is now stripped off, we are told, and the whole, as far as possible, restored. An ancient arch in the interior has been re-opened to view by the removal of a gallery, and the organ placed under it. Some additional open seats have thus been secured at west end of nave; estimated expense of alterations 901., deficient 201.—The parish church of Maiden Newton, Dorset, is to be restored and en-larged.—The Commissioners of Lunacy have larged.—The Commissioners of Lunacy have called on the Secretary of State to order the erection of a new asylum for the pauper lunatics of Bristol. The cost, it is said, will not be less than 50,000!.—The widening of Bristol-bridge is again talked of.—Conway Castle, it is said, is to be restored, at the public expense.—The Merthyr Union guardians have decided on the erection of a new workhouse on a large scale.—Efforts are about to be made to erect two additional clurches in the narish of St. Mary. Nottingham. Earl house on a large scale.—Efforts are about to be made to erect two additional churches in the parish of St. Mary, Nottingham. Earl Manvers has promised 5002. and Lady Manvers 1002, besides which about 4,6002, have been contributed or promised from other sources, and there is land secured for one of the churches.—The directors of the New Exchange, Wolverhampton, have fixed on plans for their new building, furnished by Mr. G. T. Robinson, of Wolverhamton, architect.—The new church of St. Matthew, Toxteth-park, Liverpool, was opened on Sunday week. It is a plain Gothic edifice, with open-timbered roof and bench fittings. The official part is slightly elevated into a sort of dais with tesselated pavement, and octagonal pulpit supported by a central octagonal pillar.—The Bridgewater Canal Company are carrying passengers between Liverpool and Manchester, 40 miles and upwards, for 3d. each!—The Bradford guardians, after an immense deal of talk about it for the last twelvemonth or two, are now said to have ordered that an advertisent the suppose of the support of the support of the surface of the support of about it for the last twelvemonth or two, are now said to have ordered that an advertisement be prepared, calling for plans for a new workhouse. — The chief stone of the church of St. Luke, East Morton, near Bingley, was laid on the 9th inst. The plan, says the Leeds Intelligencer, consists of a nave, south aisle, chancel, south porch, vestry, and bell gable, about 65 feet above the floor. The nave is 70 feet long hy 22 feet 10 inches wide. gable, about 65 feet above the floor. The nave is 70 feet long, by 22 feet 10 inches wide, and 45 feet high to ridge of roof—aisle, 70 feet long, by 14 feet 8 inches, and 13 feet high at lowest side—chancel, 30 feet long by 16 feet wide, and 33 feet high to ridge of roof. The sylve is First Pointed. The roofs will be of steep pitch, and the timbers open in the interior.—The church of I(0)y Trinity, Meaning and I was a lot of the steep letter of I(0)y Trinity, Meaning and I was a lot of the steep letter of I(0)y Trinity, Meaning and I was a lot of the steep letter on secretary is cruciform. wood, Leeds, lately consecrated, is cruciform, and in the style of thirteenth century; length, 111 feet internally, 78 of which in nave and 32 111 feet internally, 78 of which in nave and 32 in chancel; width at transepts, 42 feet; height of spire, 130 feet; sittings, 400. The area and foundations are laid with concrete. In a vault below the cross is a furnace, whence the building is heated by pipes. The walls are of Meanwood stone. The architect was Mr. W. Railton; and Mr. G. Bridgart, of Derby, was the general contractor; Mr. Boumphrey, clerk of works. The contract cost was 4,300l., "exclusive of ornamental parts." The founders were two ladies named Beckett.—The foundation-stone of the cburch to be erected at Moor-Allerton, near Leeds, was laid on Wednesday week. the cburch to be erected at Moor-Allerton, near Leeds, was laid on Wednesday week. Mr. Thompson, of Leeds, is the architect. The building is to be ready for consecration in about six months.—The church of Corningham, near Gainsborough, is undergoing extensive repairs, at the expense of Sir Thomas Beckett, Bart., of Somerby Hall.—A return

^{*} London : Matthews, Paternoster-row.

of the outlay and profits of the Durham Gas Company shows that their gains for 1848 at the rate of $27\frac{1}{2}$ per cent. —The Whittle Dean water, with which Newcastle-on-Tyne is now supplied, in place of from the filthy river itself, would appear to bave prevented a repe-tition of the dreadful mortality by cholera in 1832, the epidemic of 1849 having been 1832, the epidemic of 1849 having been "comparatively harmless." A few such facts, together with those presented in the metropolis itself, will surely decide the question of the necessity for a speedy and abundant supply of pure water, both here and elsewhere.——A subscription for the erection of a new courch at Ambleside was lately opened, and 2,000l. at once obtained.—John Knox's house at Edinburgh is under repair, although the question of its demolition is still an open one.—A bridge of 230 feat in largeth has been A hridge of 230 feet in length has been thrown across the Doveron, at Milltown, of Rothiemay, N.B.

OPENING OF THE NEW METROPOLITAN COMMISSION OF SEWERS.

The members of the new commission met on Wednesday, at the Court-house, Greek-street, pursuant to clause 4 of the Sewers' Act. There were present—Lord Ebrington, M.P., Sir H. de la Beche, Lieut.-Colonel Alderson, Sir John Burgoyne, Capt. Vetch, Capt. Dawson, Capt. Harness, Mr. S. M. Peto, Mr. P. Hardwick, Mr. Thomas Hawes, Mr. Edward Lawes, and Mr. J. M. Rendell. The Secretary (Mr. Woolrych) read the commission issued by the Lord Chancellor, containing the appointment of the above-named gentlemen, and which hore date the 10th of October.

Some other formal proceedings being gone

pointment of the above-named gentlemen, and which hore date the 10th of October.

Some other formal proceedings being gone through, Viscount Ebrington was voted to the chair, and addressed the court. In the course of his observations bis lordship said, that for reasons that need not be mentioned, and which were well known to the public, it had been deemed expedient to supersede the late commission, and to issue a new one. He would not dwell upon the responsibility of the trust that had heen conferred upon them. The work was of the deepest interest to the health and lives of all comprised within the area of their jurisdiction,—an area comprising the greatest, the wealthiest, and the most populous city in the world. They had many difficulties to encounter,—not only as to the views of the commissioners, but difficulties arising out of the actual state of affairs in their own office. He helieved that neither could their duties be properly and efficiently performed, nor could their difficulties be surmounted, unless a better feeling gained ground, not only amongst the commissioners, but amongst their officers, for "a house divided against itself could not stand." He hoped, however they might differ in opinion, they would discuss all without wrangling, and after opposition, that it would not end in acrimony or ill will. Under God's blessing, therefore, he trusted they would be enabled to confer additional comfort and length of days to the citizens and to their families, and that the public would not them by their professions or their intenadditional common and length of days to the cluzens and to their families, and that the public would not judge of them by their professions or their intentions, but by their acts. Without saying more, he thought they might at once proceed to the business of the court

Sir John Burgoyne moved the re-appointment of

Sir John Burgoyne moved the re-appointment of Mr. Wooltych as secretary to the commission, and also the re-appointment of the accountants and clerks in the secretary's department. Agreed to. A letter was received from Mr. Austin, consulting engineer, stating that, in consequence of certain resolutions come to by three of the Commission of the Board of Health at Gwydyr House, he had thought it his duty to tender his resignation of his office. At the same time, he should at all times be most happy to render any advice or assistance in his power, and should be ready to further develope most happy to render any advice or assistance in bis power, and should be ready to further develope bis views in his plan of drainage, if such should he required, either as a whole or part of any system that might be ultimately agreed upon. This letter was accompanied by one from Lord Carlisle, who dawled to the somewhat anomalous position of the members of the Board of Health, being also Commissioners of Sewers, and vindicated especially be conduct of one of them—Mr. Chadwick—which had been the subject of much unmerited attack.

The letter was received, and ordered to be entered upon the minutes, and upon the motion of Captain Dawson, a vote of thanks was passed to Mr. Austin, for the offer he had made of assistance to ithe commissioners.

Austin, for the offer he had made of assistance to the commissioners.

Capt. Dawson said he looked upon this as a fitting sand proper opportunity for remodelling the whole of the engineers' and surveyors' department. His klordship in the chair, in his address, had alluded to the officers of the court, and the division among them had been productive of great inconvenience. Without a proper understanding, however proper the officers, it was impossible that works could be

efficiently performed. With this view, and as a step towards remodelling the whole of the engineering department, he moved that the surveyors and officers be re-appointed for three months only.

Mr. Hardwick seconded the motion, and considered it of the bighest importance to the public that the whole performer as this bighoust should be

sidered it of the bighest importance to the public that the whole engineering establishment should be re-modelled.—Agreed to.

Sir H. de la Beche said it was of the utmost importance, and it was absolutely necessary that they should have well-considered official arrangement, for without them the organization of their department could not be efficient. Yet, notwithstanding these arrangements, however good the individual persons might be, there was nothing so essential to the service that might be derived from them as that they should be well placed, and then individual persons might be, there was nothing so essential to the service that might be derived from them as that they should be well placed, and then good results would he sure to follow. It was highly desirable that they should not lose the benefit of the investigations that were in progress, and which were stopped by the ending of the commission. It was also desirable that they should ascertain what had been done before they could carry on their works, and above all it was necessary that they should have before them the ordnance map and the results of the subterranean survey. The ordnance map was now available for portions of their districts, and the subterranean survey. The ordnance map rogress, giving them a proper insight into what existed below the suffice of the metropolis. When these documents were presented, the court would see what had been done, and he hoped that they would not regret the step that had been taken by their predecessors. To see this, and perhaps to chalk out their progress for the future, he thought it would be desirable that a committee of the whole body should be appointed to ascertain the official arrangements of the commission, the state of the various works undertaken by the previous commissioners and not completed, and to report the same to the court.—Seconded and agreed to.

Sir H. de la Beche then read the resolutions that

Sir H. de la Beche then read the resolutions that Sir H. de la Beche then read the resolutions that had been passed upon the question of the various plans sent in for the proposed drainage of Loudon, and said that it would be courteous on the part of the comissioners to state that they should receive proper consideration. It was, however, necessary, before doing so, that they should have the City Commissioners present, as the plans proposed had reference to the City as well as the parts of their own jurisdiction. He therefore moved that a communication should be made to the Lord Mayor, stating that a new commission had been granted, and the old one had been superseded, and to request that four persons, in addition to his lordship, might that four persons, in addition to his lordship, might be appointed as commissioners to that court.—

Agreed to.

De appointed as commissioners to that court.—
Agreed to.

Upon the recent accident in Kenilworth-street,
Plimlico, being reported to the court,
Mr. Lovick, the assistant-surveyor, presented a
voluminous statement, detailing the nature of the
works that had been ordered in that district, and
giving it as his opinion that the fatal results there
had arisen from a quantity of offensive lime from
gas-works being shot down for the purpose of filling
up open spaces in the road, and that the poisonous
qualities of the gas absorbed by the lime had, by a
fall of rain, percolated the top of the sewer (over
which it was placed), and mixing with the refuse
within the sewer, had liherated certain pernicious
gases, and thereby led to the deadly effects that had
followed.

The report was received, and on the motion of the

followed. The report was received, and on the motion of the chairman, it was agreed that the circumstances should be investigated by the committee, in accordance with the suggestion of Mr. Phillips and Mr. Gotto, chief and assistant surveyors; and that every facility be afforded to the officers in attending inquests whenever they may be required.—Adjourned.

Miscellanea.

PROPOSITION FOR A PROFESSIONAL CLUB House.—I cannot help thinking it is much to be regretted that an institution or club-house cannot be formed by the members of the different professions, viz., architects, painters, sculptors, engineers, engravers, and surveyors, and it might have chambers attached to it which would both convenient and profitable, and tend to sup-port the expenses of the establishment. It is true you have the Institute of Architects and Engineers, but what I think is required is a general place of meeting, where members could go in to read the papers, write letters, have letters directed to them, or a library, &c., to refer to; there might also be a lecture-room, museum, &c. It should be central, and such a spot as the vacant space in Leicester-square would be convenient to the generality of persons.

A. S.

This proposition was made in our pages some time ago, but it did not then elicit suffi-cient response to induce any further steps. We should be glad to see it carried out.

FREEMASONS OF THE CHURCH.—At a meeting of this society, held on Tuesday evening (Oct. 9), Mr. R. Williams in the chair, Mr. J. W. Archer exhibited a collection of original water-colour drawings of architectural remains in the county of Kent. Many of them represented domestic specimens in and about Rochester, and one a newly-discovered crypt. Rochester, and one a newly-discovered crypt, which be thought must have formed part of which be thought must have formed part of the ancient courch of St. Mary in that city, now destroyed. Mr. A. also exhibited some rubbings of incised slabs in the church of St. John, Chester, and the possibly unique specimen of a monumental brass having one portion (a curious incident in the life of one of portion (a curious incident in the first of the Lords Arundel), executed at a much later period than the date of the inscription. Mr. W. Harry Rogers then read a paper on the "Decorative Resources of the Modern Architect," dividing them principally into five classes, viz. the human figure: drapers, under its viz., the human figure; drapery, under its various forms; animals, only when these are various forms; animals, only when these are by common compliance acknowledged as the representatives of certain appropriate ideas; flowers; and, lastly, conventional ornaments, mainly derived from natural types.

Sewerage of Lincoln.—The following, says the local Times, is Mr. Giles's estimate of the cost of a complete sewerage for Lincoln, as indicated by the plane, for which will shortly

the cost of a complete sewerage for Lincoln, as indicated by the plans, &c., which will shortly be laid before the public:—Construction of the sewers, 20,576l; flushing apparatus, 1,200l.; engine-well, steam-engines, pumps, &c., 1,900l.; two acres of land, 400l.; raising land and roads, 150l.; draining-shed, 500l.; office, 150l.; precipitating tanks and apparatus, 1,650l.; contingencies, 2,671l.; total. 1,650*l*.; contingencies, 2,6711.; 29,388l. The proposed extent of sewers is nearly 17 miles. The gross rental of the city being estimated at 40,000l. to 50,000l. per being estimated at 40,000% to 50,000%, per annum, it is calculated that a rate of sixpence in the pound a-year would cover the cost. Under the Health of Towns Act the money could be borrowed, and the repayment spread over thirty years. Part of the proposal is to convert the collected refuse into inodorous cake manure, under Mr. Higgs's system. The liquid, deprived of smell, would run into the Witham. Mr. Giles has offered to undertake the works at the sum stated.

Bristol Atherneum.—Lectures at this institution (which promises to be valuable for the young men of Bristol) were commenced on Thursday in last week, by the Rev. N. Haycroft, M.A., on the Formation of Character, which was delivered in the exhibition-room of the Fine Arts Academy. The programme

the Fine Arts Academy. The programme promises a good series, and it is to be hoped, as Mr. Haycroft said, that many will noped, as Mr. riaycrott saut, that many win take advantage of opportunities of increasing knowledge which our forefathers never had. The room, it may be observed, is not alto-gether well adapted for the purpose; it is hung with baize, which muffles the voice to an

uncomfortable extent.
St. Many Abbot's, Kensington. petition is about to be presented to the House of Commons by the ratepayers of this parish, praying the House to devise such ample and equitable measures as shall lead to a sufficient

equitable measures as snan read supply of good water.

VENTILATION OF SEWERS.—The frightful accident in the sewer at Pimlico has induced me to offer a plan which I have for years considered as the most effectual for ventilating the sewers. They have been for ventilating the sewers. They have been usually ventilated through the gullies, and more recently, they have been trapped. Small gratings have been fixed in the centre of the carriage-way, by which horses are often frightened, as I know to my cost. I would propose that when any house or party wall is rebuilt, or when a street is built, a 6-inch air flue, formed of glazed pipe, joints well cemented, be carried up adjoining the kitchen flue, to the chimney top, and communicated along the area party-wall, with the nicated along the area party-wall, with the crown of sewer in road, then we should not be annoyed in the streets as we now are with bad smells. One bouse in, say, twenty would be enough in the new streets. I am aware that smells. One bouse in, say, twenty would be enough in the new streets. I am aware that this is only a modification of the ventilating shafts that have been proposed: the powers for requiring the owners of houses to do this might be provided in the proposed new Buildings Act. I find the rain water pipes are sometimes used for this purpose, but the chimney shaft would be much better. E. O. Symons.

BURSTING OF THE WEIR OF THE MAN-HESTER WATER WORKS. — On Sunday CHESTER WATER WORKS, — On Sunday week, in consequence of heavy rains, the Headon weir, and the Woodhead reservoir below it, were successively filled to overflowing, so far as already formed, and the massive coping of the weir, with some 10,000 or 12,000 feet of earthwork from the Woodhead embankment, earthwork from the Woodnead embankment, were earried away by the pressure acting on an uncompleted structure. The land adjoining was, of course, flooded, and much further damage was done to mills and bridges. The water works at Woodhead are very extensive. The embankment across the valley, damming up five or six considerable mountain streams, is about a mile and a half in length. The weir above it, on the Headon brook, was a massive stone structure, with top boards removable during floods, but unfortunately without attendance at the time, so that a stream of about 1,000 cubic feet in a second was allowed to accumulate against the weir till its coping was washed away, and the reservoir below over-flowed. The latter had been raised to about 24 feet above the level of the pipes. The cost of the several works to the Corporation of Manchester, when completed, is estimated at not much less than a million sterling. The loss to the contractor by the present casualty will be heavy, and it will require about two months to reinstate the works destroyed. Mr. J. F. Bateman is the engineer.

PEAT CHARCOAL TO SWEETEN THE ME-TROPOLIS.—Mr. Jasper Rogers made a further demonstration of the deodorizing powers of Irish peat charcoal, at the Mechanics' Institution, Chancery-lane, on Monday last, when experiments were exhibited that certainly did appear to bear out his enthusiam in the good cause which he desires to promote. In-deed, the fact that charecal bas a very remarkable power of absorbing immense quan-tities of deleterious gases, and of thereby even restoring corrupted animal food for instance, purifying and sweatching foul meta to the purifying and sweetening foul, water, &c., has long been familiar to us; but it is the peculiar power of peat charcoal, and above all of Irish peat charcoal, to absorb the odour and moisture of sewage precipitate, and convert it into dry and inodorous 'poudrette' manure, for which Mr. Rogers contends.

BIRMINGHAM WORKHOUSE COMPETI-TION .- In consequence of receiving congratulations on my approaching marriage to a lady of whose existence I was and am unaware, I of whose existence I was and am unaware, I was induced to refer, upon my recent return from the continent, to a letter from a correspondent, which appeared in No. 347 of THE BUILDER, when I found to my great surprise an announcement to that effect, together with other calumnious aspersions, only to be excused as uttered doubtless under the momentary sting and irritation of hitter disempoints. tary sting and irritation of bitter disappointment. The truth is, I neither have now, nor at any time have had, the slightest acquaintance with any of the guardians, the architects, or their families, beyond the fact of having met Mr. Drury once only upon other business, and then in the presence of two pro-fessional men, which was prior to my having any idea of my appointment as one of the selecting architects, and at which time I was not even made aware of his being a competitor. not even made aware of his being a competitor. I beg leave also to deny most unequivocally the existence of "an architect's name" upon any of the plans reported upon at the time of our inspection, and allow me also to assert, that the whole of such plans were in strict according to the plans were in strict according to the plans were in the plans were ance with the instructions issued by the Board.
Permit me further to affirm that 1 was (as I Fermi me further to affirm that I was (as I believe were Messrs. Edge and Stevens) perfectly ignorant of the names of the authors until they were publicly announced, and we were actuated with but one common feeling, which was to do impartial justice to the architects and the public, and that duty we most conscientiously discharged.—I am, Sir, &e. JOHN GIBSON.

*** For the personal statements denied by Mr. Gibson and Mr. Edge, we are in no way responsible. We offer the author of them the opportunity of substantiating his charges, altbough we would prefer to let the matter end here, and in the event of his not doing so previously to our next publication, shall feel ourselves at liberty to forward bis name to the parties concerned. Our own views and statements remain precisely as they were, ments remain precisely as they were.

MACHINE FOR JOINERS,-A machine for mortising, boring, &e., has recently been patented in this country, by Mr. William Furness, of Lawton-street, Liverpool. It is the invention of Mr. J. A. Fay, an eminent American engineer, and has recently been brought to a state of great perfection. One has been made by Messrs. E. F. Bellhouse and Co., of Manchester. According to our informant, it is on the principle of the slotting machine for iron, but with a power of adjustment of the point of but with a power of adjustment of the point of the tool which enables a great variety of work to be done by it. The chisels employed are peculiar in shape, not being solid like the ordinary mortice chisels, but flat like the commo joiners' chisels, with the edges turned up at right angles, so that the chips are drawn out of the mortice of the head by head of the mortice of the m of the mortice, after the hole has been cut. The machine can be used with any size of chisel from an eighth of an inch up to two inches; it will also set out and mortice naves for wheels not exceeding 10 by 15 inches. Pins and dowels are made by it. It can be made to operate either by foot or steam power, and one machine, it is said, will perform the work of eight men. The cost of the machine is about 201. The inventor of this machine has also invented a machine to make tenons, and exeeute rabbeting, sash scribing, and boring in any kind of wood.

LILLE,—A statue is in progress here by subscription, in honour of General Negrier, who fell at the barricades in Paris, June, 1848, It is in bronze, from Bra, the sculptor, in Paris. The works of the new Town-house are advancing rapidly. The Museum of pictures, &e., is open to the public two days per week, &c., is open to the public two days per week, viz., Thursdays and Sundays. There are some good pictures by Claude, Rubens, Salvator Rosa, Leonarda da Vinci, Vandyke, and some by modern artists, Roqueplan, Delaroche, &c., which are very good. Also some very remarkable sketches by the old masters, presented to the town by the eitizen Wicar. Altbuugh the collection is but small, it is not a bad place to spend an hour in. In the course of the to spend an hour in. In the course of the restoration of a church at Tournay, some interesting discoveries have been made.

THE INDUSTRIAL EXHIBITION OF ALL NATIONS.—On Wednesday a large assemblage of gentlemen met at the Mansion-house, by of gentlemen met at the Mansion-house, by invitation from the Lord Mayor, to receive a deputation on this suhject, when Mr. II. Cole submitted an outline of the proposal, and resolutions were agreed to for the promotion of the object in view. We need only now repeat the caution which we have already felt it and that a Charles and in which we have it our duty to offer, and in which we perceive that the Times, in noticing the report of this meeting in its columns, fully concurs, that the utmost care be taken in the selection of those to whom the management of the affair, and the choice of prizes, must be left, so that all charges or super picture in the results of the charges or super picture in the results of the charges or super picture in the results of the charges or super picture in the results of the result chance or even insinuation of jobbery may be obviated.

BATHS AND WASHHOUSES are likely to be, BATHS AND WASHHOUSES are likely to be, ere long, established, for behoof of the working classes, at Oxford. A subscription list has been set agoing, and has been headed with a donation of 50*L* by the keeper of the Ashmolean Muscum. The directors of the Washandara Cubestinian Bathe Campany Wolverhampton Subscription Baths Company have, out of twenty-three sets of designs, fixed on one by Mr. G. T. Robinson, of Wolverhampton. It is in the Lombardic or Romanesque style of tenth century. There will be a tonid swimming the left of feet long by the set of the se There will manesque style of tenth century. There win be a tepid swimming bath, 70 fect long by 30 wide, with a cold plunging bath, 20 feet long by 10 wide, with numerous dressing rooms. A staircase leads to a gallery partly encircling the tepid bath. Private baths will be attached.

SUGGESTION FOR SCAFFOLDING .- Having frequently observed accidents to happen from the putlogs of scaffolding coming away from the putogs of scattoring coming away from the wall of a building, a suggestion has occurred to me, which if published in your journal, may be the means of saving life for the future during the operation of building. This improvement consists in making a slit in the and of the pullar before plaging it in the This improvement consists in making a sate in the end of the pullog, before placing it in the wall, if a hard wood wedge be then driven into the slit just in face of the wall, a much more secure fastening would be effected than is obtained by the means hitberto adopted. is obtained by the means inther to anopeed. The putlog may be further bound round with iron at a certain distance from the end to prevent the wood splitting further than is required.

E. J. P.

ALLEGED GLUT OF LABOUR IN SOUTH AUSTRALIA.—A young man whose correspondence, dated from Adelaide, appears in the Bradford Observer, states that on inquiry he finds that "there are more men of all trade and professions than can get work; there are scores of earpenters, masons, bricklayers, plasterers, &c., who are out of works. terers, &c., who are out of work, simply because there is no work for them. The im-mense influx of emigrants continually coming in has completely overstocked the market The four classes of tradesmen named re-ceive 7s. 6d. per day; day-labourers ear 4s. 6d." Provisions appear to be as cheap as Provisions appear to be as cheap as

heretoforc.

WHITE ZINC.—The French Government, according to Galignani, has recently ordered that in future the white paint used in public buildings shall be made of white zinc, instead of white lead. Considering the injurious results of the use of paint made from white lead, adds the same authority, and the dreadful effects that the lead produces in the manufacturing when it is received. I'll effects that the lead produces in the manifactories where it is prepared, it is much to be hoped that the example set by the Government will be followed by the public.—A poor fellow, seized with painter's cholic while grinding white lead with colours, at a shop on the Quai Napoleon, the other day, committed suicide to end his sufferings.

The Britannia Tube.—The final lift of this tube was successfully accomplished on

this tube was successfully accomplished on Monday last. It is now 3 feet above the permanent level,—a circumstance requisite to enable the engineers to join it on to the end or land tube, before laying it down on its bed plates and rollers when placed beneath it. This process will occupy other three weeks. It is intended by the directors to give some chearman exeursion trains periodically to the Straits, to enable the middle and humbler classes to visit the tubes. Two additional cylinders have been cast for the lifting of the next, as a reserve. All the preparations are complete for the floating, which will take place about the middle of November. The day fixed for the transit of the first train over the Straits is the 1st of March next

March next.

GUTTA PERCHA.—The first ship ever fairly loaded with this now staple article of eommerce, for British import, is the Bangalore, recently arrived in the London Docks, with 500 tons of it from the East Indies. This most plastic and useful substance has of late been applied to the conveyance of water into Birmingham, and found it is east to be critical. mingham, and found, it is said, to be quite

well adapted to the purpose.

Water.—We would direct attention to an advertisement in our paper, convening a public meeting at the Hanover-square Rooms on Monday evening next, for the purpose of taking into consideration the best means of improving the water supply of the metropolis.

Competitions.—Advertisements have been

COMPETITIONS.—Advertisements have oeen issued for plans, &c., by 1st November, of a workhouse at Bradford for 300 inmates, hesides vagrant ward and fever shed—particulars as advertised; and by a date not specified, for designs and drawings for a Blind Institution at Birmingham.

WALL PANNITIES, BISHOP TAWTON'S CHARGE BANNETIES.

CHURCH, BARNSTAPLE.—Itmay be interesting to you, and worth a remark in THE BUILDER, that in the restoration of the north aisle of that in the restoration of the north aisle of Bishop Tawton's Church, which is going on under my direction, a series of interesting freesces (?), in a good state of preservation, have been discovered. They cover the whole of the north side, and are surrounded by a border of good design. One compartment re-presents St. Christopher earrying the infant Saviour over a river: in the other hand is a staff much resembling the stack of a firther staff much resembling the stock of a fir-tree with the branches lopped off. Another com-partment represents St. Michael weighing departed spirits with one hand, and wielding a sword with the other,—the dragon is under sword with the other,—the dragon is under his feet; in this compartment there is also a female figure, which, I think, is intended to represent the Virgin interceding, as the scale on that side is down. The whole of the plastering has not yet been scraped off, but as soon as this is done, I purpose making a correct reduced drawing of the whole, with reference to the restoration of those parts now defaced. Some idea of the size of these paintings may be formed when it is considered that the principal figures are upwards of 10 feet high.

No. CCCLI

SATURDAY, OCTOBER 27, 1849.

HE late frightful loss of life in the Kenilworth - street sewer involves circumstances which affect the whole community, and, as might have heen ex-

ected, has greatly excited a large portion of The number of letters we have received on ne subject, were there no other evidence of ne excitement we_allude to, would suffice to rove it,-letters calling on us to do all sorts f impossible and unjust things, and in the ajority of cases calculated to work a great nount of injury to individuals and property, ad very little public good.

The inquiry before the coroner has been ursued very rigorously: it occupied three ng days, very contradictory cvidence was iven, and much personal feeling evinced. We mst give, briefly, some few particulars.

Warwick-street and Kenilworth-street are vo rising and incomplete streets in a new istrict now taking shape under the hands of Ir. Thomas Cubitt, adjoining the Grosvenor anal, not far from Vauxhall-bridge-road, and herein a large amount of capital has already een invested. Warwick-street has a scwer ommunicating at one end, by a side street, ith the Grosvenor Canal (as the means of ushing), and discharging itself into the ing's Scholars' Pond sewer, in Vauxhallridge-road. Kenilworth-street, wherein there e hut six houses and three of these uninahited, runs into Warwick-street at an angle, ad has a sewer that will ultimately discharge self into the Thames. At present, however, it built only to the extent of the land likely to s immediately brought into use, where it is osed by a brick wall, and finds vent into the Varwick-street sewer.*

The metropolitan sewers, as our readers now, are very properly not permitted to run ne into another at right angles, but by a curved nction, so as to throw the subsidiary stream to the line of the main current. Had the innded permanent discharge of the Kenilworthreet sewer heen into the Warwick-street sewer. e junction would have been thus formed; it, as we have said, this was not the case, and order that a body of water might he brought to the former from the canal, by means of e Warwick-street sewer, the connection urved the other way, so as to meet the current, hd, as a matter of course, would receive a poron of the sewage flowing down the Warwickreet sewer, if there were no flap, or other menanical arrangement to prevent it; -and here was not. This was the "reversed juncon," concerning which so much has been

Now, it was in the butt-ended sewer in a arwick-street that the poor men found their eath; and when Messrs. John Phillips and botto, the commissioners' officers, went to ininire into the accident, they found, on examining etrench which had been opened over the crown the sewer, two layers of lime refuse used purifying gas, and were led to deny that the

emanations from the sewage were, "by any possibility," the cause of the accident, and to attribute it to gas emanating from this lime refuse, and carried down into the sewer by the percolation of surface water. Dr. Ure analyzed the lime refuse and the deposit in the sewer, and agreed with them in attributing the poisonous gases in the sewer, which he said prussic acid, or sulphocyanogen, poisons," to "the layer of gas lime imprudently shot as a filling-up rubbish over the

Our general remarks last week will show what credence we gave to this theory. The tendency of it, together with Mr. Phillips's evidence, was to shift the blame on to anyhody's shoulders but those of the officers of the commission, and Mr. Cubitt found it not merely to fall on his, but hy inference to threaten serious injury to the estate. It was proved that the sewers were better built than in many other places; had been constructed wholly under the direction of the commissioners; that he had now no control over them whatever, could not even enter them, and that his tenants paid rates for their maintenance and repair. He felt it too bad, then, we are imagining, that any injurious imputation should rest on him. At the adjourned inquest, therefore, he brought down Mr. William Allen Miller, Professor of Chemistry at King's College; Mr. Dugald Campbell, Demonstrator of Chemistry at University College; and Mr. Phillips, Chemist and Curator of the Museum of Practical Geology, who completely disproved the assertion that the gas refuse was the cause of the disaster, asserted that no prussic acid or cyanogen compounds could be detected in the sewer, and wound up a joint written report, which they put in, hy saying,-

"In conclusion, we beg to express our decided conviction that the deaths in question were occasioned by the presence of sulphuretted hydrogen, generated from the ordinary contents of sewers in a state of stagnation, and the absence of a sufficient quantity of atmospheric air, and that the lime waste had nothing to do with the accident in question; also that its presence in the road materials, as described, can be in no way prejudicial to health. We wish to add, that if the precaution had been taken of ventilating the sewer, and of destroying the noxious gases by the introduction of chlorine gas, no loss of life would have been occasioned,"

Beyond this, Dr. Lyon Playfair (of whom, hy the way-such is fame !-- the worthy coroner, Bedford, had never heard. calling him "Fairplay," and everything hut Tiger instead of Lyon), came down on the part of the commissioners of sewers themselves, to their credit be it said, and, in a piece of singularly clear and logical evidence, disproved at once and for everthe "refuse theory," admitting, however, that to a person not a chemist, the à priori idea that the gas lime had caused the mischief was a very probable one. +

* We understand that the quantity of gas lime interspersed with the other materials in the piece of road 418 feet in length, is about twenty cart loads of gas lime to about 5,000 of other materials.

with the other materials in the piece of road 418 feet in length, is about twenty cart loads of gas lime to about 5,000 of other materials.

I then proceeded to ascertain if there was any evidence of a little produce the soluble substance to the strata below from the upper bed of gas rotate. I first found that, on

The jury, after an hour and a half's consultation, found that the deceased men "died from the inhalation of noxious gas generated in a neglected and unventilated sewer situate in Kenilworth-street;" and added, "the jury unanimously consider the commissioners and officers of the metropolitan sewers are much to hlame for having neglected to avail themselves of the unusual advantages offered from the local situation of the Grosvenor canal for the purpose of flushing the sewers in this district."

We should not discharge our duty if we failed to protest against the tone adopted towards Mr. Phillips, both by Mr. Cubitt's able solicitor, Mr. Hopgood, who allowed feeling on this occasion to swamp his usual good taste, and, with much less excuse, by one of the jury. We allude to it for the sake of other witnesses who may be in the same position, hut say nothing further, as both gentlemen withdrew their observations. Phillips made a great mistake in persisting in the assertion, that there could be no great accumulation of refuse from house drainage in the fatal sewer hecause there were only three inhabited houses in the street which drained into it, although reminded of the reversed junction, which must necessarily take into the sewer a large amount of sewage that would deposit before it flowed out again. Moreover, the miserable state of the Warwick-street sewer was well known. We find it thus described in the "Descriptive Report of the State of the Sewers in the Westminster District," for the subterranean survey, under the date Sept. 2, 1848 :- " Kenilworthstreet.- Has two feet of deposit, and the smell so had that the leveller's watch turned quite black in an hour!" The wonder is, that the poor leveller was not himself levelled. On this occa-

black in an hour!" The wonder is, that the poor leveller was not himself levelled. On this occamining the earth with water, no soluble sulphuret was cotained. That showed that there was no soluble sulphuret below the gas line; but I found that there was evidence of a percolation downwards of this soluble sulphuret; and my proofs are these;—I observed that, immediately under the upper layer of gas line, where it was in junction with the clay the clayer earth was exceedingly black, and that this oway from the sulphuret. The further however the sulphuret is a superior of the clayer earth was exceedingly black, and that this brown from the presence of sulphuret of iron, which the soluble sulphuret in the presence of sulphuret of iron, which the soluble sulphuret of hydrogen was produced, and there was much more from the presence of sulphuret of an acid, shundance of sulphuret of hydrogen was produced, and there was much more from the unced was muriatic acid, for with excent. The nedd which unced was muriatic acid, for with excent. The nedd which unced was muriatic each of the with excent in the clayer of the clayer curt on the top of the sever, in order to ascertain if there was evidence of the sulphuret reaching so far. In certain parts I found a small quantity; in certain other parts I did not find a trace. I therefore though it possible that stratum of gas line, single be die sold from the upper stratum of gas line, single be drawn of the upper stratum of gas line, single be drawn of the upper stratum of gas line, single be drawn of the upper stratum of gas line, single be drawn of the upper stratum of gas line, single be drawn of the upper stratum of gas line, single be drawn of the upper stratum of gas line, single be drawn of the carrier of the clay in a filter of it brough the lowest hold of lay—accentage and the single bedre drawn of the carrier of the clay in a filter of it brough the lowest hold of lay—accentage and the single bedre drawn of the carrier of the clay in a filter, by placing some of the eart

The sewer in Kenilworth-street is of hriekwork, 418 at in length, 4 feet high by 2 feet 6 inches wide, and is a strion of a sewer, leave to build which was granted by the maintained in the way of the sewer in November, 1847. It was huilt in January,

sion, however, if we are rightly informed, the wall at the end of the sewer was knocked down to give air.

The descriptive report, to which we have alluded, gives a fearful picture of the sewers generally in the Westminster district, and we must quote a few lines of it, to prevent the possible inference, from the short extract just given, that the new neighbourhood of which we are speaking is in any degree worse than other places,

In the Knightsbridge sewer, near the end of Sloane-street, "the deposit is so great, and the stench so strong, that one of the men came out in a fainting state." Lowndes-place, "one to two feet of deposit." Esher-street, "two feet of deposit." Oxford-street, "on the north side from Portman-street, westward, in so ruinous a state as to be in danger of falling. * * * Must be nearly choked with deposit before it can have any discharge." Whitehall-place, "wretched state. * * * Two or three feet deposit," Tothill-street and Westminster Workhouse, indescribable. St. George'ssquare, "one to two feet of putrid matter." Chesterfield-street, "so filled with deposit that portions of them cannot be perambulated." Parliament-street, " nearly filled with deposit smell horrible;" and so from bad to worse. And "even throughout the new Paddington district, the neighbourhood of Hyde-park Gardens, and the costly squares and streets adjacent, the sewers abound with the foulest deposit, from which the most disgusting efflu-

One of our correspondents, "Philo Medicus," asks, " of what avail are such expensive reports, if nothing of a practical nature be to follow? In this district of the Pimlico sewers, the commissioners appear to have most ample and easy means of flushing and cleansing at their disposal, by a communication with the water of Grosvenor Canal. How are the public to be reconciled to the want of attention on the part of the commissioners, with such easy appliances at hand, that could almost at any time be made to cleanse most effectually all the sewers in this particular locality?

Another wishes to know how the present state of the sewers and the enormous sums paid by the public for flushing (and concerning which some inquiry must yet take place), are to be reconciled. We will not, however, now enter on this inquiry.

The absence of gully-holes in the closed-up sewer was not sufficiently dwelt upon at the inquest; there were none, excepting two near the junction with the Warwick-street sewer, and these, if we understand rightly, are trapped. Serious as are the evils of open gullies, they must not be trapped under present arrangements, without the provision of other means of ventilation, so long as it is necessary for men to go into the sewers.

Mr. Phillips stated, in his evidence, that formerly the commissioners put in the gullyholes, but, according to the recent regulations, Mr. Cubitt was bound to do so. But we are told, in reply to personal inquiry, that Mr. Cubitt's people have never put any in, leaving the matter wholly in the hands of the commissioners. If there had been two open gullies next the butt-end of the sewer, we should probably not have had to record this sad disaster.

We earnestly hope that the distressing occurrence which has brought from us these remarks may lead to immediate steps for permanent improvement. The effect of the direful gases evolved by decomposing animal and

CARVED STALL, STA. SALUTE, VENICE.

vegetable matter is seen when, in a concentrated form, they kill with lightning speed.

But it is not alone when this is the case that But it is not alone when this is the case that the foe requires repulse. Even when diluted, these gases spread sickness and death around, although (the result not being so speedy, the connection not being so apparent) the real cause may remain unguessed at.

We would direct attention to a communication ou another page in advocacy of the proposed Building Artificers' Provident Society.

> OAK STALLS. STA. SALUTE, VENICE.

THE church of Sta. Salute was built by The church of Sta. Salute was built by Baldassare Longhena, pursuant to a decree of the Senate in 1632, after the cessation of the great pestilence, in which 60,000 of the inhabitants are said to have died. The annexed engraving represents one of the carved divisions which form the lower range of stalls in the tribune at the east end.

the east end.

The carving is similar in style to that seen in the stalls of St. Giorgio Maggiore, and much resembles it also in character. These stalls were executed by a Flemish artist, as we may judge from an inscription on one of the divisions, and were completed about thirty-four years before the building of Sta. Salute. years before the building of Sta. Salute.

Example to Employers.—Workmen's NEWS AND READING ROOMS. — Messrs. T. Hoyle and Sons, says the Munchester Spectator, have converted one of their own spacious dwellings into decorated and commodions reading-rooms, for the work people at their print works at Mayfield. The principal room is furnished with a dead of the commodities of the commo print works at Mayfield. The principal room is furnished with a selection of newspapers and periodicals, and adorned with great maps on Mercator's projection, &c. A smoking-room has been provided, and chess and draught boards, &c., supplied. By an attendant appointed by the people themselves, hot coffee, tobacco, and cooling beverages, at cost price, are supplied before work hours in the morning, as well as throughout the day. One evening in the week the principal apartment is devoted to musical and other innocent or rational to musical and other innocent or rational entertainments

THERE are but few ancient ecclesiastical buildings left us within the walls of the City. The churches which escaped the destructive flames of the year 1666, may be soon reckoned. The dismal fire, as it is called in the manuscript records of St. Dunstan-in-the-East, made cruel havoc with many a "beautiful house" where our fathers worshipped. Still, though we no longer behold the identical old fabric, within whose hallowed walls the merchants of by-gone days, when merchants were as princes, by-gone days, when merchants were as princes, offered up their prayers and praises, we have churches on their original sites, and even on the former foundations. The "fair and large church" of St. Dunstan, which was well nigh destroyed by the fire of London in 1666, gave place to a building by Sir Christopher Wren, in which he tried his hand at the Gothic style of architecture. The elegant tower and spire shown in the engraving are his. The details of these, it is unnecessary to say, are questionof these, it is unnecessary to say, are questionable. The body of the church is of modern construction. There is a tradition, that the plan of the tower and spire, suggested by St. Nieholas, at Newcastle, was furnished by the daughter of the great City architect, Jane Wren, daughter of the great City architect, Jane Wron, who died in 1702, aged 26, and was buried under the choir of St. Paul's Cathedral. And if female talent was thus enlisted in the production of the airy spire before us, female benevolence was not wanting in the completion of the structure. To the honour of Lady Dionysia Williamson's memory be it told, that she, in 1670, gave 4,0001. (an enormous sum in those days) towards the building. On the occasion of the dreadful storm which raged in London through the night of the 26th November 1 and 100 the London through the night of the 26th November, 1703, until the morning, Wren, on hearing that some of the steeples and pinnacles in the City had suffered serious injury, observed that he felt sure of finding St. Dunstan's tower and spire secure.

In 1817, the walls having bulged, it was de-termined to rebuild the body of the church. The architect employed was Mr. David Laing. He, with the active assistance of Mr. Wm. Tite, now known as the architect of the Royal Exchange, erected the present fabric, which was opened in January, 1821. It is constructed of Portland stone, and is a very fair specimen for that period, of the style of Gothic architecture termed "Perpendicular." The principal entrance is from the north-east, by a ST. DUNSTAN'S-IN-THE-EAST, LONDON.

materials for building. The colony migrated to the Tower of London, when disturbed for the pulling down of the church in 1817, and to the east wall, is 115 feet; the breadth is 65 feet 6 inches; the height 40 feet. There is sometimes the builder and the work without an architect; sometimes the work without an architect; or an architect without the intermission of the builder; or again, the proprictor may employ the work without the intermission of the builder; or again, the proprictor may employ the work without the intermission of the builder; or again, the proprictor may employ the work without the intermission of the work without the intermission of the builder; or again, the proprictor may employ the work without the intermission of the work without the intermission of the builder; or again, the proprictor may employ the work without an architect; sometimes the work without an arch entrance at the west-end beneath the tower. The extreme length, from the western entrance to the east wall, is 115 feet; the breadth is 65 feet 6 inches; the height 40 feet. There is room for between 600 and 700 persons. The interior is good as a whole; and a harmony of appearance has been preserved in the several arts. There are three aisles of nearly equal width, divided by slender clustered columns, and pointed arches of stone. The only gallery s that at the west-end for the organ, and for the children of the Tower Ward Charity School. The east window corresponds in size and details with the window of the ancient church (before the fire). The painting in this window (by the late Mr. Backler), describes symbolically the Law and the Gospel. On each side of this is a stained window, lately executed by Mr. E. Baillie. That on the north side represents "Christ blessing little children." The subject of the south window is the Adoration of the Magi. The higher compartments of the windows of the south aisles are occupied by the armorial bearings of mancient benefactors of the parish, with scrolls containing suitable inscriptions from the Bible. These are also Mr. Baillie's work.

The Custom-House, and a portion of the New Coal Exchange,* are situate in the parish of \$8t\$. Dunstan in the East. Both these buildangs are in the immediate neighbourhood of the Clurch.

angs are in the immediate neighbourhood behie Church.

Some of our readers may probably have croticed the rooks which build in the trees in the south church-yard. The rookery before the last church was removed, consisted of uppwards of twenty nests; and they were annually supplied with osier twigs, and other

RESPONSIBILITIES AND RIGHTS OF ARCHITECTS AND BUILDERS. DW THEY MANAGE THESE MATTERS IN FRANCE.

The discussion which has arisen relative to the remuneration for Mr. Barry's services in the remuneration for Mr. Barry's services in designing and superintending the works of the Houses of Parliament has very naturally excited much attention amongst all parties directly or indirectly connected with the profession. But the clearest conclusion to be drawn from all that has been said or written thereupon seems to be, that we, in England, have no principles of legislation, no well-defined system, either as regards an architect's responsibility or the amount of retribution he is entitled to claim. This being the case, an responsibility or the amount of retribution he is entitled to claim. This being the case, an account of the French law upon the subject may be useful. It is far from perfect; but it were much to be desired that our legislators should trace, in a somewhat similar manner, the rights and duties of the members of, perhaps, the noblest of the civil professions.

A proprietor, or any party about to build, is supposed by the French law, and in fact is obliged, to deal with one of the three parties connected with construction, either with the architect, the builder, or the workmen. Sometimes a building is directed by an architect, who employs a builder to erect the construction, by means of the workmen under his

We will consider the student simply fur-lowing heads;—

Thirdly.-When they verify and settle the accounts

accounts.

Fourthly.—The position of builders under an architect's orders, and also their responsibility as to materials, &c.

Fifthly.—The position of those who work without architects: and

Sixthly.—The position of the workmen who either work for or independently of the builder.

builder.

Firstly, then,—"Of the rights and responsi-bilities of an architect who merely furnishes plans, specifications, &c."

An architect is he who makes the plans,

prepares the indications, and directs the works of a building, by whomsoever executed. Under the name "plans" are comprised all the drawings of the object to be built, whether considered horizontally, in elevation, in sec-tion, or in details for the execution of the ornamentation. The specification is the detailed account of the works, with an explanation of the mode of executing the separate parts, such as the masonry, carpentry, joinery, smith's

^{*} The Coal Exchange is to be opened by her gracious Majesty on the 31st. A good view of the interior of this woulding will be found, page 462, ante.

work, &c. The estimate contains the quanti-ties of each sort of work, and the separate

price of each article.

The Civil Code is silent as to the remuneration to be paid to the architect for furnishing such plans and estimates, as it is likewise upon the whole subject of his remuneration. The article 1793, indeed, places the relations between the architect and the proprietor in the condition of a hiring of services (louage d'ou-vrage). Now in all such cases the considera-tion may be either a matter for special agreement, or, in default of such, it is regulated the custom of the locality. Should a written agreement have been made to settle the respec-Should a written tive conditions of the contracting parties, and sbould any new or unforeseen circumstances arise during the execution of the work, these last are regulated by the usual custom, without in any way affecting the previous agreement. It is considered to be the duty of the proprietor to ascertain the existence of these supple-mentary conditions: the fact of his allowing a commencement of execution, is held to he a tacit acceptance of his own new obligations. In fine, such contracts are regarded as a portion of natural law (un contract du droit des gens), and are not subjected by the civil code to any definite form, to insure their enforce-ment; they are regulated by the principles of natural equity in all cases where the special

natural equity in an eases where agreement, or the text of the law, is silent.

In Paris the usage is to pay 5 per cent, for furnishing the drawings and specifications, for superintending the execution, and settling the accounts for the different works. accounts for the different works. We are not quite certain as to the subdivision of this sum; but, if we are not mistaken, the furnishing of the drawings and specification only is paid for at the rate of 2½ per cent.; the superintendence at 1½ per cent.; the measuring and settling of the accounts at 1 per cent. of the value of the works; all office expenses, and navnents for clorks of the works(1) being at payments for clerks of the works (1), being at the cost, or charge, of the architect. The large public works are paid for by fixed salaries per annum, to the architects; an allowance is made for office expenses; and the superintendence is paid for separately. We will revert hereafter to the consideration of this system, and its practical results, as also to that of the conditions, implied or expressed, of the agreement hetween the architect and the pro-

When the architect has furnished the plans

and specifications, but does not superintend, and specifications, but does not superintend, he becomes responsible to the proprietor for any accident resulting from the indications contained in the said documents; but, of course, his responsibility ceases there. Thus, he is not liable to any damages caused by the bad execution of the works; but only to such

Date execution of the works; but only to such as are the necessary consequences of the plans and directions he has given; for example, Suppose that, from any motive, Λ. builds by workmen, and superintends, himself, any construction upon the plans and specification of an architect, after having feithfully observed all struction upon the plans and specineauon of an architect; after having faithfully observed all the details as to the dimensions of the walls, the quality of the materials, &c., if the construction appear likely to fall during the first ten years, either totally or in part, A. has a claim against the architect. Upon his demand, two "experts" are named, who examine when claun against the architect. Upon his demand, two "experts" are named, who examine whe-ther he has in all cases followed the plans and specifications; and upon their decision, an action may be commenced. Such actions,

action may be commenced.

however, are very rare.

In this case the architect is not responsible for the defects of the soil; he is authorized to presume that it is of a sufficiently resisting native building. The person who ture to support the huilding. The person who executes the works assumes this risk; whether executes the works assume that it is the the proprietor who executes, or a contractor. Nor is the architect responsible for any infraction of the laws which regulate the rights of neighbours, or of the municipal or police regulations.

Secondly .- " Of the responsibilities of the

architect who directs the constructions after furnishing the plans."

Beyond the legal obligation by which and Beyond the legal obligation by which an architect is bound to possess the abilities and instruction necessary for the preparation of the plans and specification, if he be intrusted with the carrying out of his own design, he becomes responsible for the faithful execution of the works; for it is he who undertakes to give the workmen proper instructions as to the kinds of

materials to be employed, the manner of using them, and the dimensions of the separate parts. If the builder, or his workmen, deceive him in such a manner as to induce an impartial person to believe that, with proper caut the architect might have detected the fraud, he naturally hecomes responsible; but he has his recourse against the said parties. But if the deceit were of such a nature as to defy ordinary inspection, then he is exonerated, responsibility lies only with those who have been guilty of the fraud.

my part of the building, or the whole of it, fails, within ten years of the completion of the work, either from defective construction, a defect of the foundation, or neglect in the execution, the architect firstly, and subsidia-rily the builder, are responsible. Moreover, as rely the builder, are responsible. Moreover, as nothing of importance ought to be executed without his orders, any infraction of the laws regulating the rights of neighbours, or of the municipal or police regulations, exposes him (the architect) to a claim for damages. Nor, in this case, would the proprietor be obliged to attack anybody but the architect; for it was his duty to superintend the work so was his duty to superintend the work so closely as to prevent any serious breach of the above-named laws and regulations. These obligations on the part of the architect result clearly from article 1793 of the Civil Code; the duration of the guarantee for ten years is fixed by the art, 2270. The right of a attack the proprietor in case of loss, damage, or injury, results from the text of art. 1386. The proprietor then has his recourse against the party he employs

Thirdly. — " Of the responsibilities of the chitect who verifies and settles the acarchitect counts."

When an architect has directed the works, he is charged with the settlement of the accounts. If the proprietor pay any money without the certificate of the architect, he, by that fact, releases the latter from his responsibility, for he takes from him the only efficient mode of controlling the execution of the works hy the builder. But this release only extends of a substitute of the building fail from improper construction; if the building fail from improper construction in a purely scientific point of view, the architect is still liable.

If an architect be merely called in to affix a just value upon works executed, he is only bound to fix such prices as are fair and reasonable, according to the tariff of the locality, and according to the qualities of the materials furnished, or the workmanship executed. He is not in any way responsible for the execution or the solidity of the work; but it is his duty to make a report, if he observe that the laws either of the art of huilding, or even the municipal laws, have been violated in such a manner as to involve serious consequences. The obligation in this case is simply to render

strict justice to both parties.

Fourthly.—" Of the position of builders under an architect's orders; and also their responsibility as to materials, &c."

Occasionally architects, renouncing the consideration due to their profession, become sideration due to their profession, become builders. At times, also, the builders become architects; but this rarely occurs for construcarchitects; out this rarely occurs for construc-tions of importance, because the time and attention required for the preparation of the plans are greater than a builder can afford to bestow. In either case, the party who accu-mulates the functions contracts the responsibilities which attach to hoth.

Although the direction of the works be con-Although the direction of the works be confided to an architect, the builder or contractor is still bound to the proprietor by a contract for the hire of his services,—which is defined by the article 1710 of the Civil Code as an other propriety in the contract of the contract to the contract of the civil code as an other propriety of the contract to the contract of the contract o engagement to execute a work upon receiving a sum of money. This contract may be made with the understanding that the contractor shall only give his labour and talent; or, he may agree to furnish the materials.—Article 1787.

When an architect is engaged to direct the works confided to a builder or contractor, the engagement of this latter implies, at least, the engagement of this latter implies, at least, the condition that, in all cases in which he can legally do so, he is faithfully to follow the directions he may receive, so that the building may be executed as designed. In order that hay be executed as designed. It is the builder he perfectly secure against any claim in consequence of changes introduced during the execution of the works, it is necessarily sary for him to have all such alterations or-

dered in writing. Any verbal orders given by the architect are only supposed to warrant the builder in so far as they are conformable to the rules of art; and, by extension of this principle, if a builder execute any work without plans, specifications, or written instruc-tions, he alone is responsible during the ten years of the guarantee. In fact, nothing ex-isted to prevent his taking proper measures to secure the stability of the work; the conse-quences of the failure, then, justly fall upon him. Should the architect, in his plans of specifications, demand any new mode of construction, or indicate any works likely to involve an infraction of the rights of the neighbourhood, or of the municipal or police regulations, it is the duty of the builder to point out the objections to their adoption. His promote the objections to their adoption. This responsibility is covered if he obtain a distinct written order ad hoc, mentioning that it was given with the express intention of safe-guarding his rights. The intervention of the proprietor is also necessary, for his claim against the builder cannot be alienated without his covered and surveyed to the control of the distinct of the safe and the his consent; and even after all these precau-tions, the builder is still liable to be pursued hy the municipal authorities in case the works contain infractions of their laws, either as affecting public health or the security of the bnildings. No private convention, in fact, is allowed to interfere with the public rights: Privatorum pactis juri publico derogari non potest. Nor can the builder plead ignorance of these laws, for he is bound to know all the obligations with the design of the property of these laws, for he is bound to know all the obligations attached to his position, amongst which the municipal regulations are the most important as well as the most easily ascertained. The old Roman law, which in this case is still retained, lays down the principles that "magna negligentia culpa est," and "culpa lata est, non intelligere quod ownes intelligent." The public authorities, therefore, can pure. The public authorities, therefore, can pursue the parties who are the most likely to be in a position to insure the fulfilment of their regulations; but they still retain a claim against all the parties concerned in the infractions. A builder should, then, in self-defence, distinctly refuse to execute any works which may place him in such positions.

The responsibility of the builder, as to the

quality of the materials supplied, results necessarily from the condition of his undertaking with the proprietor. The reception by the architect in nowise exonerates him; for it might happen, either that the architect did not superintend the execution with sufficient attention, or that he had been deceived, or that he had entered into an understanding with the builder. In neither of these cases would it be just that the proprietor should suffer from the faults of those in whom he places his confi-dence. The law, then, gives him a claim upon both architect and builder, so that he may pursue the party who is the more likely to he in a position to insure his obtaining speedy justice. Should the bad quality of the materials be such as the ordinary care of the architest could not detect, the latter has a claim upon the builder; for he is, in fact, in the condition of a merchant, who, by article 1641 of the Civil Code, is responsible for the hidden defects of the goods sold. But the conditions under which a builder contracts differ so far from a common sale, that, as he undertakes to execute work, he is responsible not only for the hidden, but also for the apparent defects of the materials necessary for the completion of the huiding.

of the building. If the proprietor furnish any portion of the materials to be employed, and the builder re-cognize in them such defects as to render them unit for the purpose, he is bound to call the attention of the proprietor thereto; nor is he released from his responsibility unless he obtain a written order containing a discharge

We must break off here, till next week.

CAUTION TO BRICKMAKERS .- At Wolverhampton lately, the owner of a brickyard was fined in the initigated penalty of 50l. for allowing his tenant or manager to remove bricks to the kilns before the proper duty had heen levied on them. The owner was quite ignorant of the frank him to be levied on them. The owner was quite ignorant of the fraud, being supplied by the party making the bricks at a certain rate per 1,000 including duty. In another case of a similar kind nearly 14,000 bricks were forfeited, and a penalty of 50*l*. inflicted.

PROPOSED BUILDING ARTIFICERS PROVIDENT SOCIETY

THE scheme of the Building Artificers' Provident and Benevolent Society, propounded by the professor of architecture, and so ably ad-vocated by yourself on the 15th ult., is already vocaced by yourself of the 15th title, is already justified in every man's breast; but we want such statistics and practical views as shall no less justify it to his head, and satisfy those of your readers who regard it rather as a beau ideal than an attainable good, and take fright at its apparent magnitude and difficulty. I am glad to find that your invitations to correspondents on this subject have not been in vain, though the valuable letter of Mr. Grant vain, though the variance leaves of the success of deferred annuities, is the only one which has appeared in your columns. The following, gathered from the "Report on the Friendly Societies' Bill," by a committee of the House last year, and other sources, may be acceptable to your readers.

The Architects' and Builders' Insurance

The Architects' and Builders' Insurance Society estimates the number of persons connected with building, at 800,000 throughout the United Kingdum. The Builders' Benevolent Society estimate those in and about the metropolis at 300,000; probably including families also. The "Directory" gives us 785 capitalist builders in London, 678 architects and surveyors; 161 civil engineers, and 245 mechanical engineers. Such is the host on which we have to operate, and such the mate-rials, in knowledge, skill, influence, and num-

hers

The probable success of such a scheme may be illustrated by that of Mr. Biers, who, with able seconds, in less than two years, has created the Builders' Benevolent Society; at this moment endowed with 1,2001. stock, and in November to award five annual pensions, amounting to 120%. At their first dinner the sum of 600% was raised.

sum of 600l. was raised.

A few weeks ago 11,000l. were raised by a bazaar at Liverpool, in three days, for the relief of a hospital. The annual dinners at Freemasons'-hall, for the numberless charities net of a hospital. The annual dinners at Free-masons'-hall, for the numberless charities meeting there during the year, raise an astonish-ing revenue. To a justifiable claim, fairly put forth, John Bull is ever ready to yield, and "his hand, open as day to melting charity," willingly pours forth its abundance.

How entirely this claim is justified, appears from the "evidence" that there are from from the "evidence" that there are from 13,000 to 14,000 friendly societies, producing about 6,000,000l. annually; and by so much, in consequence, diminishing the poor's-rates. Of this great number it is melancholy to be assured by the first actuaries of the country, "that the majority are insolvent," "that the clubs throughout the country are almost universally broken up," "that nothing can save the old societies," "that this deplorable state of things has arisen from ill constructed of things has arisen from ill constructed tables;"—" from peculation which often the law cannot touch ;" from strikes and trades unions in which artificers have been tyrannically compelled to subscribe 2s. 6d. per week: the loss pened to subscribe 28. On per week: the loss to the artificers in Liverpool alone, during eighteen weeks' turn out, in 1833, (on the respectable authority of Mr. Holmes) amounted to 45,000l.;—"from competition of benefit societies," unauthorized by opinions of actuaries or Government confirmation, and got up by interested publicans, who have in some cases three and four under their direction;—a fertile source of failure. In fact, we scarcely meet an artificer of sixty years old who has not for many years paid contributions for benefits which he ought now in his age to enjoy, but which have lamentably disappeared; leaving him to the pawnbroker for a time, and, lastly,

thin to the pawnbroker for a time, and, lastly, to the workhouse.

Amongst the many reasons for this deplorable state of clubs, is undoubtedly the fact, that superiors, master builders, and architects, and manufacturers generally, have not taken that interest in the industrial classes under their guidance, which the clergy and country gentlemen have done, amongst the rural population, where there are members, and conductors, and even insurers and honorary members, "sufficient to save them in some cases from insolvency."

Thus deserted by their natural advisers and protectors, and cheated of their hard-earned

protectors, and cheated of their hard-earned savings, by interested and knavish delusions, we are prepared for the evidence, "that the working classes are sensible of the great dis-

advantage the breaking up of these clubs is to them;" that "there is a strong feeling amongst the working classes to enter sound societies; "recklessness of the people produced by so many friendly societies breaking up," &c. &c.

an we be surprised or indignant at the strikes, the unions, the menaces, the incen-diarism (which has brought fire-proof shops so much into fashion, in Liverpool, particularly), which such a state of things has produced? or, at that last sad symptom of alienation and sullen disloyalty, in the declara-tion of some workmen in 1848, on the memorable 10th of April, "that they should take neither side, that they would defend their own premises and tools, but use no active ex-ertions in support of order." Such a neutrality explains itself, for "he that is not with us,

But, Mr. Editor, it is in the perfect conformity of interest and duty (that essential condition of success), that I am most sanguine as to this scheme; for, first, the builders, as the natural protectors, the fathers and advisers of the artithe very keys of the undertaking, would find in it their immediate advantage. Their personal exertions, and their annual subscriptions in its favour (well known), would present at once a full and conclusive recommendation with the operative-a new means of patronage, and a material alleviation to their own pockets from all those calls which casualties, ill-health and long services, accumulate on an old and worthy firm. And though, from the liberality of builders,—a Peto, and others whom we could name amongst the fortunate builder capitalists—the real staple support of the scheme would be derived, let them never forget that, alone and unassociated with the architect and engineer—the public man—the artificer himself, and open reports and books, and audited accounts, their benevolence would fall to the ground, from the jealousy of the opera-tive, and his suspicion of some sinister motive in the master builder. In Liverpool, from this very cause, a most beneficial scheme in their favour totally failed.

The advantages to the architect and engineer, though of an honorary character purely, not the less real in respect of their into rests; their authority and influence would be asserted and exercised; the artificer would acknowledge their disinterested and mediatorial exertions, as a sort of nobility in the art of building. They would dignify and exalt the building. They would dignify and exalt the workman by association with him; but especially they would see the shrewd advantage of addressing and engaging the highest ranks and the most conspicuous public spirits of the day in favour of so formidable and meritorious a class as the building artificers. The entrée alone to these higher powers would always be found a sufficient motive for their busy extrions in favour of the society, and offers them the ornament of benevolence in addition to their other claims on the regard and estimation of the great. Thus, through a better feeling in-fused amongst the rich, a better feeling would gradually spread amongst the poor, and restore our cankered society to a more hopeful and more natural state.

Thirdly, the advantages to the workman need no comment; his savings would be secured, by following good counsel of an established and responsible committee and office of agency, to embark cither in deferred annui-ties, or other beneficial means supplied hy Government, or even the ciubs of acknowledged solveney, — the motto of the society being, "Help yourselves, and God will help you."

The benefit fund raised hy at least 1,000

contributors of a shilling to a pound, and as much more as the conscience and the published returns of the subscribers would suggest, would defray all expenses, and save many a poor family from destitution. The labourer would embrace a society so warranted by public and responsible character, and so exempt from the wretched delusion of which he has hitherto the wretched delusion of which he has hitherto been the unhappy and melancholy victim: assured of the good feelings and honest counsel of his betters, he would cease to wage that futile and desolating war against capital, in which he has been heretofore so vainly encountry a warrend a warrend of the gaged;—a more cheering prospect of the future would open to his thrift, and thence every virtue, domestic, public, and social, would abundantly flow, for the good of the country as well as himself and family.

We do not dream of impracticable benevolence. The laws of social and political economy are as immutable as those of the physical sciences. Louis Blanc can no more alter them than he can the law of gravitation. The remuneration of capital, intellect, and manual lahour, settle themselves, and will endure no interference, whether caused by interested or benevolent motives. The present scheme presents no such attempt, it does not profess to give men more than a market price for their labour, nor more in sickness than their own contributions can supply, nor larger interest for their savings than Government security and provident Acts of Parliament can afford,—but it calls upon us to exercise and to understand those true principles of communism by which the Pharisee in the Temple, and Zaccheus in the sycamore recommended themselves to the of the Almighty-the only means by which we can secure his favour, and avert that evil day which will surely fall upon a country-

" Where wealth accumulates, and hearts decay." If, as Mr. Macanlay has shown, the condition II, as Mr. Macaillay has shown, the condition of the working-classes has greatly improved in the last 200 years in this country (as M. Thiers has also done in respect of France), it is no less certain that capital, and master builders, and manufacturers have risen into enormous power and wealth. Also the use which the humbler classes have made of these advantages in their unassisted and invaluable mechanics' institutes, headed by the generous Birkbeck and others, points to a noble issue of their improved con-dition; and no less their use of savings banks, and even clubs, however delusive they have often turned out. Shall we not aid these worthy efforts, to show an equally worthy use of our improved condition? or shall we lend a sullen and ungenerous attention to these fair claims on our aid and exertions?

It gave me pleasure to learn that the Builders' Society of London (the Builders' Union as you have fairly termed it) has a real and earnest intention to promote some such measure as the Building Artificers' Provident and Benevolent Society. Pray, Mr. Editor, urge them to advance it by some readier means than their vance It by some readier means than their monthly gatherings alone. They should be reminded that while the Builders' Union is dissolved at Liverpool, as temporary only, and maintained during the strike, and no longer, theirs is permanently sitting in London; and unless some general and generous good is to come out of this permanent sitting, the public and capitalist patrons will begin to suspect combination and monopoly in the market, as much, or more formidable amongst them, than amongst their humbler brethren.

Trusting that you will excuse so long a justification of my adherence to the Building Artificers' Provident and Benevolent Society, and wishing all success to your spirited and generous furtherance of the scheme, I remain, with gratitude and respect, your faithful friend and fellow-labourer,

A FREEMASON.

AMENDMENT OF THE INSTITUTE OF ARCHITECTS.

Your remarks, Mr. Editor, in the leading article of THE BUILDER for the 21st of July, headed as a few words to the council, upon the closing meeting of the session, are well the closing meeting of the session, are well worthy their notice. There and elsewhere I am glad to see you condemn, in toto, the "narrow, injurious, and impolitic regulation," which keeps men who measure artificers' works for builders from becoming members of their body. These remarks, if unheeded hy the council, will have their full weight with the other members. Pray, do not give up this subject.

W. X. W.

Several other correspondents bave addressed us on the same point. They may rest assured that we shall not be inattentive to the assured that we shall not be inattentive to the report of the council, to whom the question was referred, when it is made. Our views are un-changed, and we sincerely hope that the coun-cil will recommend the omission of the illiberal and unwise disqualification in question. are bound to say that, knowing the feeling of some members of the present council, we are not very sanguine as to the desired result. In the event of the council declaring against the alteration, it will be for the body of the members to express their opinion upon

it.—As to obtaining a legislative enactment, forbidding any to practice as architect or engineer without a diploma (concerning which some have written to us), this is by no means likely, even if it were in all respects desirable; the spirit of the time is directly opposed to such a restriction.—"T. Square," who writes as to the "Soane Medallion," is in error. Neither the prize so named nor the 501, offered with it, was given by Sir John Soane;—it is simply so called by the Institute in honour of him and in return for a money bequest to the society. The premium of 501, was first offered in connection with the Soane medallion in the year 1847,* and was awarded in 1848 to Mr. Maclaren, of Edinburgh, who has not yet claimed the 501, which, however, he was informed, he would be entitled to at the end of one year's absence from England, on sending a satisfactory evidence of his progress and his studies,—provided he did so within five years of the medal and premium being awarded to him. Since that time the Soane Medallion has not been awarded, nor consequently the 501, and we think we may safely say the council regretted as much as "T. Square" that the drawings submitted in competition for it were not up to their mark. Another writer objects to the comparative terms in which the votes of thanks to neartise terms in which the votes of thanks to neartise

Another writer objects to the comparative terms in which the votes of thanks to parties who read papers were recorded last session. One, he says, was thanked "for his paper;" another for "his interesting paper;" a third for his statement, "which showed great knowledge, &c.;" a fourth for his "very important paper," which "was not important at all;" and so on. We agree with him in considering that this course, probably fallen into through accident, is very objectionable. One form should be

adopted and adhered to. Opinions should not be given as those of the Institute, unless proposed to and formally accepted by the body.

As it is in contemplation to print after each meeting, in the coming session, a full synopsis of all communications, this observation is the more called for.

BISHOP STILL'S ALMSHOUSES, WELLS.

The almshouses at Wells were originally founded by Bishop Nicholas Bubwith, who was translated from the diocese of Sarum to that of Bath and Wells in 1407; and who, in addition to founding the almshouses that bear his name, contributed considerably towards the erection of the north-west tower of the cathedral, built the library over the eastern cloisters, and constructed a chantry chapel on the north side of the nave in the cathedral, immediately opposite that of Hugh Sugar, illustrations of which have already appeared in The Builder. The almshouses erected by Bubwith remain nearly entire, and are interesting memorials of the period.

teresting memorials of the period.

Bishop John Still, who was promoted by Queen Elizabeth to the see of Bath and Wells, in 1592-93, added the buildings represented in the accompanying engravings, southward of those erected by Bubwith. The details, it will be seen, are peculiar, and exhibit, quaintly enough, the transition from Gothic to classic architecture; the general effect of the whole is characteristic and picturesque.

Our engraving is from a drawing by Mr. Dollman, made originally for Mr. B. Ferrey, whom we have to thank for our knowledge of the building.

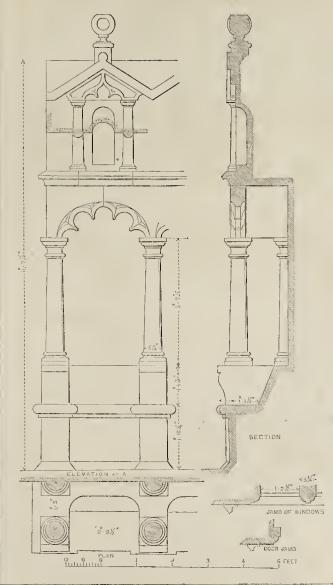

THE BRITISH ARCHÆOLOGICAL ASSOCIA-TION will resume their meetings this (Friday) evening, at their rooms in Sackville-street.

NOTES IN THE PROVINCES.

A NEW gas company is in course of formation at Lincoln, 'to supply gas on more favourable terms than those now offered by the existing company.'—Houses, it is said, are being built by wholesale at Boston. New streets are springing up in different parts of the town. The houses are generally small, and built for letting at about 7L a-year, this class of houses being much wanted.—The shirehall at Chelmsford has been repaired and altered so as to afford more accommodation, and the old petty sessions room is being converted into 32 cells, for prisoners before trial.—Some property in East-street, Point, Portsmouth, has been sold of late, at an advance of 75 per cent. on its value a few years since, or equal to what it yielded during the war in 1805.—The inhabitants of Dudley propose to sell the four workhouses of the Dudley Union, and erect one new edifice for the whole Union in a lealthy situation, near Dudley.—The Bishop of Gloucester and Bristol has subscribed 200L towards the erection of a national school in the hamlet of Fishponds, parish of Stapleton.—The new Lunatic Asylum for Monmouth, Messrs. Fulljames and Waller, architects, will, it is expected, have its four wings roofed in before winter. The sum of 7,864L odds had been expended down to 29th ult., and 3,000L more will be laid out on it before 5th December.—The propriety of creeting a building at Birmingham, says the local Journal, suitable for concerts and assemblies, smaller and more manageable than the Town-hall, and more accessible than any other room in the town, has again been under consideration. The building is proposed to be erected in New-street by a Company holding shares of 5t. each.—The Leicester Improvement Committee having purchased all the buildings to be demolished for the enlargement and improvement of the market-place, now recommend the erection of a Corn Exchange, with butter

The first time the premium of 50l. was offered was in 180, to be awarded to the successful competitor of the Royal gold metal; but the drawings received in competition not being satisfactory, neither was awarded; and in the subsequent year, the change being made in the regulations respecting the gold metal, the council put the offer of the additional 50l. in conjunction with the Soane metallion.

DETAILS OF BISHOP STILL'S ALMSHOUSES.

and poultry market below, on the site of the "Green Dragon," purchased at 3,900l. In the council it was urged, that in place of pulling down the present Exchange, it might he converted into a Corn Exchange in the mean time. The committee reported a proposal from Mr. Henry Rawson, to erect a hath for the use of the working classes in Burley's-lane. He would take down some cottages, and make a swimming-bath ahout 60 fect long by 27 feet wide, with dressing-rooms and other conveniences, on the council paying him 150l, within one month after completion; Mr. Rawson agreeing to keep open the bath for five years, charging 1d. only for each bather.—
The remains of a Roman wall have been discovered at Moulsham, three feet from the surface, about a yard in width, and consisting, apparently, of Roman pavements, two inches thick, and scored in a diamond pattern, embedded in concrete.——The committee of the Chester public baths and washlhouses report that "a swimming-hath has been constructed, measuring 45 feet by 30 feet, with dressing-trooms, &c., and a supply of fresh filtered water of Glasgow.—The Bank of Scotland, Ingram-

continually running through it; a shower-bath and a range of washhouses have also been completed, with an apparatus for drying. The washhouses afford convenience for washing to at least 250 poor families per week, at 1d. each." Since the opening the whole has been in full and profitable use.—The top reservoir of the Barnsley Water Company has given way, through the abstraction of coal beneath it. The pipes are to be supplied from a higher level, so as to supply every part of the town, the level being that of the top of St. Mary's Church tower. — The Houghton-le-Spring Church organ is in one of the transepts; but the organist, with the keys, sits at a distance of about 30 feet, in order to be near the choir, who are placed in the chancel.—In the case of a house which fell at Carlisle lately, the proprietor blamed the Caledonian Railway Company, they having pulled down some adjoining houses with great violence. The compensation demanded was 7001. A jury awarded 1501. damages.—It is proposed to erect an equestrian statue of her Majesty in Glasgow.—The Bank of Scotland, Ingram-

street, Glasgow, at the end of Glassford-street, has been ornamented with a piece of sculpture in high relief, erected over the perforated parapet surmounting the edifice, and representing the heraldic arms of the bank, a shield or crest, supported by Justice and Plenty, and bearing a cornucopia. Each of the supporting figures, as described by the Reformers' Gazette, is 8 feet 2 inches in height; and the central compartment, or blazoning, crowned with the cornucopia, about 11 feet in height. The whole is executed in stone from the Binmey Quarry, near Edinburgh. The sculptor was Mr. Handyside Ritchie, who prepared it from designs by Mr. Burn, architect. It was brought from Edinburgh, and erected by Mr. York, builder, of Glasgow, and Mr. Garnett, elerk of works. We may state that it is in three pieces. There is a similar piece of sculpture on the offices of the bank in Edinburgh.—The additional wards to Huntingdon County Gaol are completed. Mr. Parker, of Thrapstone, was the contractor, under the direction of Mr. Thomas Smith, architect. It is said that the drainage of the gaol and the ventilation have been carefully attended to. street, Glasgow, at the end of Glassford-street,

THE WATER QUESTION.

Mr. Lushington, M.P., presided over a numerous meeting held on Monday evening last, in the Hanover-square Rooms, to consider last, in the Hanover-square Rooms, to consider the best means of improving the water supply of the metropolis. Dr. Lankester, Dr. Alison, Mr. Taberner, Sir Charles Aldis, and others took active part. Dr. Buckland, too, addressed the meeting at considerable length, and pledged himself to the fact that a sufficient supply of water for London could not be obtained from Artesian wells,—it was physically impossible, he said.—Mr. Pallisor said, let each parish select two or three delegates; let themselves a good working committee. This Impossinite, he said.—Mr. Pallisor said, let these delegates neet and select from amongst themselves a good working committee. This committee would then call before it all persons having plans to improve the supply of water to London. Then let a number of scientificmen be called in to give their opinion as to the best plan, and this having been established, let all the parishes go to Parliament and do all in their power to get this plan passed into a law.—The meeting would not pledge itself to any particular scheme, and went no further than to approve by resolution "of the principles adopted by the Metropolitan Water Supply Association, for ascertaining, by scientific inquiry, the most pure and ahundant sources of supply, and the best mode of service, at the least possible cost to the public, and or placing the control and management thereof under a public, popularly elective, and thereby a disinterested, board."—The Lambeth Waterworks, we see, are proposing to obtain an improved supply of water from the Thames at Ditton, and to abandon altogether the present source of supply. Than the present source nothing can be worse; and if all we have heard be true, the company have much disease and misery to answer for. If we were to publish the statements which have been made to us, touching this matter, it would spread alarm through Lambeth. The question must be taken up by Government. Our contemporaries of the London and provincial press (and we are grateful to them for doing so), have spread far and wide, toan extent we could not have ventured to anticipate, our assertion, that "all London ought to cry as loudly as if next door were on fire, 'Water! water!! water!!!" We must have not merely sufficient water, but pure water; not merely pure water, but cheap water, or else we perish.

London Mechanics' Institution. —
Mr. Grayson, teacher of architectural, mechanical, and ornamental drawing, has been appointed teacher of these branches of drawing to this institution. As Mr. Grayson's name is favourably known to the architectural and building portion of the public, we may reasonably conclude that his appointment will be of service to the Institution. We have heard with regret that this institution, in common with others at the present time, is not in so good a condition as it should be. It has been the means of much good, and should be supported by all interested in the general welfare and advancement. LONDON MECHANICS' INSTITUTION. -

RESTORATION OF SPIRE, ST. JAMES'S CHURCH, CLERKENWELL.

St. James's, Clerkenwell, was built in 1788—92, and stands on part of the site of the church formerly belonging to the priory called Ecclesia Beata Marie de Fonte Clericorum, for nuns of the order of St. Benedict, founded in the year 1100. The priory was suppressed 26 Henry VIII., and, after passing through various hands, the church, by purchase, became vested, in 1656, in trustees, for the use of the parishioners of the parish.

For some months past the spire of the church has been in a dangerous state, and the hurri-

has been in a dangerous state, and the hurri-cane in March last throwing off the vane, rencane in March last throwing off the vane, ren-dered it necessary that steps should be taken to rebuild it. The trustees accordingly gave instructions to Mr. W. P. Griffith, architect, to prepare drawings and a specification, and to obtain tenders from masons for executing the works; these were submitted to the trustees, who accepted the lowest offer, which was Messrs. Hemmings and Foster's.

Messrs. Hemmings and roster s.

Upon taking down the spire it was found that
the iron cramps had become oxidized and had
burst, leaving the joints of the masonry open;
the stones facing the W. and S.W. were much
decomposed, but those towards the N.E. had the tool marks perfect. In the rebuilding, the hardest stones were placed opposite the S.W., and all deficiency made good with new Portland stone; each joint was saddle-jointed, and in every joint were inserted iron dovetailed cramps enveloped in sheet copper (soldered) and run with lead.* The spire is hollow, and its sides about 10 inches thick, and a new and its sides about 10 inches thick, and a new solid course of Portland stone has been now introduced about mid-way, and the spindle passes through this, and is secured with a nut; the spindle has also been painted and wrapped in lead. Between the solid course and the capstone were deposited lists of the trustees, guardians, and veters of the borough of Finsauri The many in receives of the course. bury. The vane is a new one of copper, 6 feet long by 2 feet deep, which, with the staff 12 feet 2 inches long, has heen gilt. The new lightning 2 mches long, has heen gilt. The new lightning conductor is 180 feet long, and passes from the vane to below the foundation, and terminates in a furcated form; it is of wrought solid copper, cylindrical, and \(\frac{1}{2}\) inch in diameter; the holdfasts are of glass, and let into the masonry. Portland cement has been used for the masonry, and the lightning conductor and all metal work have been painted with anti-corrosion little paint. corrosion lithic paint.

CHURCH BUILDING.

ST. NICHOLAS CHURCH, Witham, is to be roofed with slates, and otherwise repaired. The organ-gallery is to be taken down, and the lower part of the church repaired. All Saints' Church parsonage is progressing towards completion.—The new Church at Wickham Bishops is being covered in.—The repair -The repair and restoration of the chancel of Soham Church have been completed. Messrs. Bonomi and Cory, of Durham, were the architects, and the expense was incurred by the rector and vicar. Mr. T. Dickens, of Durham, was the clerk of works. The floor is paved with Minton's encaustic tiles, made from designs by the architects. In cleansing the walls a paintings were discovered, and have been preserved. Two new windows have been added on the south-east side, and the large east window is restored. The carved work, screen, ceiling, stalls, sedilia, &c., have also been restored. —The idea of erecting a new district church at Winchester as a chapel of ease to St. Peter's Colebrook, &c., seems to be giving way to a desire for the restoration or rebuilding of St. Peter's itself, the site of which has been offered by Mr. Filer for the purpose. —A church-rate of 2d. in the pound for the repairs of Bideford Church has been most grudgingly granted. The churchyard is in a shameful of Bideford Church has been most grudgingly granted. The churchyard is in a shameful state, and a rate was proposed for inclosing it, hut was not acceded to.—The laying of the first stone of St. Jude's Church, Moorfield, Sheffield, will shortly take place, the architect, Mr. Mitchell, having got possession of the site.—On: Friday week Ellesmore parish church was re-opened. The cost of restoration is said

to have been 8,000*l*., the subscription list having been headed by 3,500*l*. from the Bridgwater family, 500*l*. from Mr. C. K. Mainwaring, and other handsome sums.—A new Roman Catholic Church, to be dedicated to St. George. Catholic Church, to be dedicated to St. George. the patron of England, is about to be erected at York. This church is intended to be one of two or three which it is proposed to erect in that city. It will be in the style of the Decorated period, and is to accommodate about 700 persons.—On 11th inst. the new church of St. Mary the Virgin, in Oxenhope, was consecrated. It is built in the very early Norman exclusivity cardiocapure as the supercovery. secrated. It is built in the very early 20 mass style, with semi-circular arches, narrow windows, and massive walls. It consists of a tower, nave, north aisle, and chancel. The arch of the latter is inlaid with highly glazed encaustic tiles; the floor of the chancel outside the altar rails is laid with blue and red tiles of Minton's manufacture; within the rails they are encaustic; the windows of the chancel are of stained glass; those of the body of the church are each of one piece of plate glass. The design was prepared by Messrs. Bonomi and Co., of Durham.

RAILWAY JOTTINGS.

	TOTAL BOOK TOOLS OF THE PARTY O		

-Some of the Railway Companies, says ——Some of the Railway Companies, says Herapath, are in a great hurry to take advantage of the Government disposition to buy or take their lines, and have quietly tendered them to pay 3 per cent. A great deal of negotiation, we hear, is very quietly and snugly carrying on.—The system of sub-letting contracts three or fourfold, the dishonesty of gangers, and the ways of all other responsibility to the and the want of all other responsibility to the poor labourers who are duped, is at present poor abouters who are outped, is a present exciting no little commotion at Cardiff and Merthyr. The local Gnardian appeals to Boards of Directors, failing chief engineers, for the protection of the workmen, some of whom have been quite outrageous at the treatment they have been receiving in that quarter. ment they have been receiving in that quarter. "A ruinous competition is everywhere going on," says the Liverpool Standard, referring to this contract system. "Every man is seeking to undersell and to supplant his neighbour; and our very largest purchasers, our public boards and corporations, even the legislature itself, encourage the practice, and invite tradesmen to ruin themselves or each other by the system of contracting for every article supplied. system of contracting for every article supplied system of contracting for every article supplies to them, and every species of work done. We see every day men taking such contracts at prices which leave, if any, the bare shadow of profits, to be wrung too often from decrease of the wages of their miserable working people, and sometimes from the substitution of inferior for first-class goods; and how often do we see such contracts result in ruin to those engaged in them.—
The Windsor line, lately opened, runs most of its length from Slongh on an embankment to within a quarter of a mile of Windsor, where a relative terms. viaduct carries it, hy a continuous curve, into the centre of the town. This viaduct is between 5,000 and 6,000 feet long, and in the middle of it is a bridge of novel construc-tion, designed by Mr. Brunel, with a span over the Thames of 187 feet, so as to allow of vessels

* Including Northern and Eastern, and Norfolk: length of combined lines from 17th August, 1847, 277 miles; from 2nd April last, 295 miles.

passing in sail. The station at Windsor abuts close on the High-street, and is 230 feet long, with an iron roof of 70 feet span. — It is in contemplation to construct a railway from Halesworth, by Framlingham, to Ipswich, and at Framlingham to erect capacious granaries and warehouses.—Mr. Fairbairn, C.E., has been warehouses. — Mr. Fairbairn, C.E., has been invited by the Prussian Government to offer his advice and assistance in connection with an important work about to be undertaken in Rhenish Prussia. It has been determined that the Rhine shall be no longer a barrier to an uninterrupted railway communication between the shores of the German Ocean and the great cities of central Germany; and the neighbourbood of Cologne has been selected as the fittest site for effecting this junction. Chevalier Bunsen, while in Manchester lately, became deeply interested in the system of bridge build-ing which Mr. Fairbairn has carried out by the employment of wrought-iron as a material for the construction of great girders; and expressed his conviction that this system was, perhaps, the only one calculated to meet the requirements of his government and the corporate authorities of Cologne. Mr. Fairbairn has been called to Berlin to submit his design to the King of Prussia and the local authorities. It best his best have been called to Berlin to submit his design to the King of Prussia and the local authorities. It has hitherto been considered an impossibility to erect permanent structures able to withstand the enormous masses of ice brought down from the Alps.

PROPOSED SITE FOR THE NEW BRIDGE AT WESTMINSTER, COMBINED WITH IMPROVEMENTS IN THE IMMEDIATE NEIGHBOURHOOD.

A CORRESPONDENT says: -It is proposed, both for the sake of affording a better view of the new palace, and diverting the great traffic of Westminster-bridge from the immediate vicinity of the Houses of Parliament, to rebuild the bridge a little farther north, commencing on the Surrey side at a spot immediately opposite the wharfs in Cannon-row, having the Board of Control for its southern boundary on the Middlesex shore. This will cause the removal of the block of houses between Derby-street and Richmond-terrace, but at the same time afford sufficient space for a row of houses looking south, of a similar character, and thus giving a handsome approach to the bridge on the north side. It will then be requisite to open Charles-street to the south of Great George-street, having an outlet into St. James's-park, and terminating with a drive leading by a curve to the Bird Cage-walk. By the clearance of the houses in Charles-street an opportunity would be afforded of appropriating that space to the purpose of the depôt for records, connected as it might then be with the State Paper Office, and returning along the west side of King-street to the ground so many years lying waste in Downing-street, and reserved for Government offices. When these plans shall have been carried out it will be found necessary to remove the block of houses in Parliament-street north of Charles-street, and possibly at some future time the entire mass towards the Houses of Parliament. As so much of importance depends on the selec-tion of a proper site for the bridge, and the matter has been referred to Sir John Bur-goyne, his report is looked for with no small anxiety.

DRAINAGE OF THE METROPOLIS.

THE time has now arrived when this great metropolis can no longer defer possessing a comprehensive and a perfect system of drainto accomplish this, three conditions

must be observed, viz.:—
1. The non-pollution of the river Thames

1. The non-pollution of the river Thames; with an injunction to prevent the discharge of a single sewer, house drain, &c., thereinto.

2. The demon of foul sewerage must have the focus and discharge of his interior veins, with his venomous and pestilential breath, and consequent effluvia and noxious gases, hermetically sealed within his own body, and discharged by one grand embouchure, far distant from the inhabitable precincts of this great Bahylon, and the product there manufactured for productive purposes.

for productive purposes.

3. An unlimited supply of pure water, forced by high pressure to every house, street, court,

^{*} We offer no opinion on this arrangement of the cramps; any statement of results where such have been used would

&c., without the necessity of tanks or eisterns, combined with an incessant current of water through all sewers and drains, &c. I am prepared to prove to a demonstration that the above three conditions can be fully accomplished for 2,000,000l., which, compared with the wealth, health, and rapid increase of hours 2,000,000 of hours hours and rapid increase of above 2,000,000 of human beings, is not worth a moment's consideration.

How does the question stand at present? About 116 scientific men have sent in plans to the commissioners of sewers, and amongst this number figure about thirty engineers; yet it is a fact, that not one of their plans complies with the above three conditions. Further, not one of them has brought forth a new idea, or proposed an original scheme for the complete and effectual drainage of London. of London.

What is to be done? Here is my proposition. What is to be done? Here is my proposition. It is probable that many an engineer, like myself, has refrained from sending in plans, &c., owing to the disagreement among the commissioners, and their not offering any distinct reward for the best scheme of drainassumet reward for the best scheme of drainage, &c. Now let the commissioners pay a
reasonable sum to those who have already sent
in plans, for their trouble, with liberty to compete again. The commissioners to print or
exhibit every document they have, and the
"concise statements," for the use of the com-"concise statements," for the use of the competitors at large, and advertise for fresh plans to be sent in hy January 1st, 1850, offering a prize of 2,000l. for the best scheme, 1,000l. for the second, 500l. for the third, &c. Every plan to be sent in under a motto, accompanied with a sealed envelope, containing the competitor's name; the envelopes of those obtaining the prizes alone to be opened.

Hyparius Exchange

HYDRAULIC ENGINEER.

WROUGHT-IRON WATER PIPES.

Our attention has heen called to a letter from Mr. G. R. Burnel, which appeared in your valuable paper on the 29th ultimo, respecting M. Chameroy's patent wrought-iron pipes. We are much obliged by the courteous and friendly manner in which the remarks are written. The nature, however, of the defects mentioned leads us to the conclusion that the pipes which have fallen under the writer's notice in France were those manned factured by a person named Ladru, who has factured by a person named Ledru, who has had to pay heavy damages for infringing M. Chameroy's patent, and whose pipes have in many instances been taken up and replaced by M. Chameroy's. M. Chameroy's.
The objections which Mr. Burnel raises are

1. Insufficiency of strength to resist the compression arising from lateral or transverse strains. 2. Liability of soldered joints to be detached

from the pipes.
3. Liability of the outside asphalte coating to be destroyed by the settlement of the sur-

to be destroyed by the settlement of the surrounding earth.

Mr. J. H. Tuck, the agent for the patent pipes, confirms in the strongest terms our impression that the abovementioned are precisely the defects which rendered Ledru's infringements valueless, but from which M. Chameroy's own pipes have been found entirely free. Be this, however, as it may, we are anxious to state that we had not failed to notice the importance of the points which have been raised; and that, in reference to the pipes which we manufacture, the following are the facts in reference to the three objections raised, Viz.:—

viz.:—

1. The strengths of the pipes have been calculated upon careful experiments, so as to resist all strains from without as well as the internal pressure.

The screw joints are not soldered on, like Ledru's, but are cast (?) upon the body of the pipe in such a manner as not to be liable to be

detached.

detached.

3. We are satisfied that liability to abrasion and corresion cannot be objected to M. Chameroy's pipes. We have ourselves seen, in Paris, pipes 11 inches diameter which had served for seven years as a sewer to an urinal, and which were still in a perfect state.

We are glad to see the remark that "the pipes in question do not affect the quality of the water like those generally used." You

have already remarked that, when used for gas, they are free from the usual leakage—as may be ascertained from the present state of those which were laid down in Battersea-fields four years ago.

Experimental water pipes on this patent have been laid down in St. James's-park, and are in progress for the Chelsea water-works. But if you, or any other gentleman who takes an interest in drainage and in the safe and wholesome conveyance of gas and water, should wish to go into the subject, so as to examine the objections raised on the one hand and the good qualities alleged on the other, it will give us much pleasure to afford the fullest information in our power. in our power,

Fox, Henderson & Co.

Books.

Tables and Formulæ for the Computation of Life Contingencies, with copious examples of Annuity, Assurance, and Friendly Society Calculations. By Peter Gray, F.R.A.S., &c. London: Longmans and Co., 1849.

THIS new work of a standard author claims to afford greater facilities for the formation of such elaborate tables and other intricate calcu-lations as those with which it is itself abund-antly stored; and as methods of constructing antly stored; and as methods of constructing such tables have been in a great measure over-looked by preceding writers, we doubt not that a work such as this, by an author like Mr. Gray, who is himself an associate of the Institute of Actuaries and an able mathematician, will be found highly acceptable. The work is well printed and the tables are in clear large figures, so as to be promptly available in reference and calculation

The First Three Books of Euclid's Elements of Geometry, from the Text of Robert Simson, with various useful Theorems and Problems as Exercises. By Thomas Tate, Mathe-matical Master of the National Society's Training College, Battersea, &c. London: Printed for Messrs. Longman and Co.

Another of Mr. Tate's useful little books, in Another of Mr. late's useful fittle books, in form of a small pocket Euclid, published in a cheap form, with the hope that it may tend to advance the mathematical education of this country, and with an especial reference to the instruction of schoolmasters who may be desired. sirous of obtaining a government certificate.

Miscellanea.

SOCIETY FOR THE ABOLITION OF BURIALS IN Towns.—On Tuesday, 23rd, this society met at their rooms in Bridge-street, Blackmet at their rooms in Bridge-street, Black-friars, Mr. G. A. Walker in the chair, Dr. Evans, Mr. Rogers, Mr. Godwin, Mr. Watts, Dr. Johnson, and others took part, and a letter from the Board of Health having been read, inviting Mr. Walker to aid them with suggestions as to the means of "remedying the vast and increasing evils of the present practice," a vote of sympathy with the Board, and expressive of the willingness of the society to aid them in their efforts, was passed unani-

mously.

Our Plasterens.—In a recent number "A Plasteren" writes some very truthful lines. I think every accurate observer of artificers in the building trade will have noticed how rare it is to find a thoroughly skilful plasterer; in all the other trades (bricklayers, perhaps, excepted) the moderately skilled and the thoroughly skilful are, perhaps, in proportion of three to two; in the plasterer's craft I am bold to say the proportion would be as five to one. Now, I think your correspondent has hit the right explanation of this deficiency of skill among plasterers, in the number of taskskill among plasterers, in the number of task-masters, and the regular practice amongst all but the very large builders, of carrying out their plasterers' work by task-masters: as your correspondent justly observes, "have boys soon assume to be plasterers." Good work is soon assume to be plasterers." Good work is in our day the exception, and not the rule; shall we ever see the day when the tale shall he reversed? The tradesmen have it in their power, if, as a body, they felt the true love of their trades, which was wont to be felt in days

DISCOVERY OF ANCIENT SCULPTURE AT BLUNHAM CHURCH, BEDFORDSHIRE. — A few weeks since, as some workmen were engaged pointing the joints in the stonework of the chancel of Blunham Church, they discovered the control of the chancel of Blunham Church, they discovered the control of the chancel of Blunham Church, they discovered the control of the chancel of Blunham Church, they discovered the control of the chancel of Blunham Church, they discovered the chancel of Blunham Church, they discovered the chancel of the c covered an opening in the wall immediately beneath the east window, 2 feet high by 1 foot 9 inches wide, which penetrated the whole thickness of the wall, there about 4 feet. On clearing away the rubhish with which it was filled, four fragments of ancient sculpture were discovered, composed, according to an informant, of statuary marble.* The first, a standing figure of the Virgin and Child, both the heads knocked off. Secondly, a figure with white robes, kneeling before another, the feet of which only remain. Thirdly, a fine group in the will a proper than the second of the the heads knocked oil. Secondly, a ligure with white robes, kneeling before another, the feet of which only remain. Thirdly, a fine group in alto relief, representing the Saviour bearing the cross; immediately behind is the Virgin Mary, who is endeavouring to hear some portion of the weight of the cross; a female figure bearing a palm branch, probably intended for Mary Magdalene follows next: in the centre of the group, behind, is the Roman Cectarion. Next was a figure, the head of which is destroyed, whose hands are placed upon the upper part of the cross as if in the act of steadying it. On the left hand corner is seen the executioner, with a hammer in his hand, the cruel malignity of whose countenance is in striking contrast with the calm subdued grief depicted in the features of the Virgin Mother, at the opposite corner. In front is one of the Jewish rabble, with a rope over his shoulder, leading, or rather dragging, the suffering Saviour as a lamb to the slaughter. The lower part of this piece is broken off; but the heads, with but one exception, are in good preservation, and exhibit full proof that physiognomy was well understood at the time the work was executed. Fourthly, the lower part of the figure of Joseph of Arimathea, who is represented as sitting on the edge of a tomb, with ample folds of fine linen in his lap, on which lies the dead body of the Saviour; the right hand of Joseph, beneath the linen cloth, supported the head which has been broken off. The death-like appearance of the body, and the strained appearance of the muscles, serve to elucidate that seripture, "All my bones are out of joint." Gilding and painting, with brilliant colours, were employed on each specimen to add to the effect, which, when entire, must have been very good. The height of the specimen was originally about 18 inches.

Welverhampen Exchange.—We men-tioned last week, in our provincial notes that

18 inches.

WOLVERHANDETON EXCHANGE.—We mentioned last week, in our provincial notes, that the design for the Exchange selected is by Mr. Robinson. We are enabled to add, that it is in the Italian style, and comprises a large hall, 100 feet long and 50 feet high, lighted at the top by a dome, upwards of 30 feet in diameter. At the north end of the hall is a large alcoved space (also lighted from the top by a semidome), for the purpose of a settling room, and in connection therewith is a large private room for the corn inspector and for other purposes. At the south end of the hall is a spacious area for the use of the iron-masters, having private rooms for business. The principal entrance to the hall and to the adjoining rooms is on the west side, through an archway in the centre of the building, and from this archway is an ascent by steps, which lead up on either side to a vestibule and entrance to the hall at each end. A design by Mr. Meyrick was selected as second.

How to resouve the Question whether lapture Water promotes Chollera.

—A correspondent of the Morning Herald, while alluding to the apparent connection of cholera with the metropolitan supply of water WOLVERHAMPTON EXCHANGE.-

—A correspondent of the Morning Herald, while alluding to the apparent connection of cholera with the metropolitan supply of water south of the Thames, already pointed out in The BUILDER, suggests that the Board of Health might be able, by parocibial assistance, to obtain returns from every house respecting the source from which its inhabitants are supplied. The activities should also state the authority. The returns should also state the number of cholera cases that had occurred in each house. The result would be, that, by means of a little classification, we should be acquainted with the particulars that there had been so many cases where spring water, so many where New River water, so many where the Grand Junction Company's water, &c., was used. Such data would be of service to the investigation of the question above alluded to.

* Query : Alabaster?

PROJECTED WORKS .- Advertisements have PROJECTED WORKS.—Advertisement have been issued for tenders, by 5th November (extension of time), for locomotive, carriage, waggon, and general stores for the London and North-Western Railway; by 29th inst., for cast-iron pipes and other castings for the Newcastle and Gateshead Union Gaslight Newcastle and Gaussieau Chiloi Gaussieau Company; and by 1st November, for 2,000 yards of good ballast, picked flint, or Kentish rag, for Bethnal Green parish.

COMPETITIONS.—Civil Engineers, Surveyors, and others, are invited by the Warwick

ors, and others, are invited by the waters. Board of Health, to offer plans and specifications for the entire drainage and water supply of the town, with estimate of probable cost. A premium of 50% offered according to advertisement. —Plans are also wanted from architecture. tects for a new church at Hawes, Yorkshire for 450 adults and 100 children, to cost not more than 1,800l. commission inclusive.

CLEANSING PROCESS.—At a meeting of the Liverpool Polytechnic Society, held Oct. 8th, Liverpool Polyteening Society, near Oct. Star., Mr. Knight described a new apparatus for regulating the flow of water from cisterns, applicable to sanitary purposes. After some remarks on the necessity of public urinals at railway stations and elsewhere being effectually washed, and the inefficiency of the present washed, and the inefficiency of the present neans of doing so, Mr. Knight described the apparatus provided for the purpose at the Lime-street railway station, which, he observed, had been in use for the last eighteen months. From one of the ordinary cisterns which were found in most large establishments, a small pipe led to the place where the water was required to be used. Here another cistern was erected above the urinals, and by means of the door-latch which is over the door, acting on a wire and crank connected with this pipe, whenever the door of the urinal was opened, a small quantity of water was let in to the second cistern. This cistern was supplied with a valve at the bottom, opening by means of a hori-zontal lever in connection with two balls, so placed, that when the water in the cistern was low, one of them hung directly downwards, while the other, on the same axle, was elevated at right angles with the last. As the water rose, the latter rose with it, and, by degrees, hrought the former past the centre, when, by its buoyancy, it flew upwards, opened the valve, and the cistern was rapidly discharged of its contents. The balls resumed their former position, and the process of filling recommenced.

WESTMINSTER IMPROVEMENTS. - COM-PENSATION.—The commissioners for these improvements having given notice to the guardians that they required the workhouse premises in Dean-street, helonging to the parishes of St. Margaret and St. John, for the purpose of forming the new street, the guardians claimed the sum of 19,750l. as compensation. The commissioners offered The matter was referred to Mr. Shaw, of Christ's Hospital. The witnesses on the part of the guardians were Messrs. Hunt, Angell, of the guardians were Messrs. Hunt, Angell, Fowler, and Pownall, whose valuations varied from 22,000l. to 23,000l. The witnesses on the part of the commissioners were Messrs. Abraham, Hardwick, Tite, and Hammick, who assessed the compensation at 10,000l. The sum awarded is 21,000l.

THE TESSELLATED PAVEMENTS AT CI-

THE TESSELLATED PAVEMENTS AT CIRENCESTEN. — Another very fine head has just been exposed to view, in the room last discovered, corresponding with those of Ceres and Flora previously found. This is the fifth circle as yet wholly uncovered; two others are partially so, and thus only two will be lost (out of the nine which originally formed this splendid room), and not fur as was at first feared did room.

did room), and not four as was at first feared, in consequence of the proximity of a house. The pavennent is being carefully removed, and the whole arrangement of the warming apparatus is thus clearly shown to perfection. SALE OF DUKE OF BUCKINGHAM'S ESTATES.—The Foscott, a fine estate containing upwards of 700 acres, in the county of Buck-

ingham, was on Saturday week sold for 32,000l. Six closes of arable and pasture land, in the borough of Buckingbam, containing in the borough of Buckingbam, containing 73a. 2r. 5p., and producing a rental of 75z. 10s. 8d., were sold at 1,730. A tithe-free piece of woodland, containing 15a. 3r. 16p., in the parish of Preston Bissett, sold at 3a0. The Hillesden, a very fine estate, containing upwards of 2,900 acres, was offered, but bought in.

A LESSON FROM THE LYCEUM. — Last week we met a poor friend of good abilities,—shall we call him Waver,—who never effects anything, simply through thinking that be can do something else much better. He was half to the Bar, when it occurred to him that the Church offered a wider field for the exercise of his abilities; and now, though just on the point of being ordained, he declares that he is better fitted to build churches than to teach in one, and has resolved to be an architect! If we had seen him yesterday, instead of last week, we would have sent him to see Mr. Charles Matthews play The Practical Mun at the Lyceum Theatre, in the Strand,— a most finished and pleasant picture of our poor friend's foible carried out. Undecided, wanting fixed purpose, hesitating, delaying, energy is wasted, everything missed. It is a good lesson as well as an admirable piece of acting, and if we have more "Wavers" than our first-named friend amongst our readers, we advise them not merely to go and see it but to profit by what they do see.

CAEN STONE .- In your number of last CAEN STONE.—In your number of last week, in remarks about Brighton, you say that some of the stone had failed at the new church, "St. Paul's," lately built, and that "it would he useful to ascertain the cause of its failure." The church was commenced wildling though four wares back, and my to that building about four years back, and up to that time it was not discovered to be necessary to select Caen stone specially for external purposes; therefore no blame can attach to any one. Since then it has been considered a duty, with the knowledge of the fact that selection was necessary, to bave that properly attended to; and, in confirmation of which, we refer your inquirer to the college recently built at Brighton, also to the church now in the built at Brighton, also to the church now in the course of erection by the same contractors, and under the same direction as the one referred to. We are now making selection, in accordance with analysis and suggestions made and published in your No. 114, Vol. 7, February 10, 1849, which showed that Caen stone can now, with precaution, be obtained as good as it was many centuries back, and which is still in excellent preservation. In reference to the necessity of the stone being laid on its natural bed, there are conflicting opinions; but that builders and masons may not mistake the bed-way of the stone, information is supplied to them, and in such a way that they need not mistake it, thereby leaving that they need not mistake it, thereby leaving it for their discretion. As to Caen stone being injured by sea water, there is abundant evidence to the contrary. — Subscribens on The Spot.

SUPPLY OF WATER TO TOWNS.—It is suggested by a writer in the Journal of Health, that the metropolis might be supplied with water from Bala Lake, in Merionethshire, every town or neighbourhood that required water on the route being provided by the way. Bala, it is remarked, being 1,000 feet above the level of the sea, and a line by which water would descend quickly being readily found, not exceeding 250 miles in length, even without putting the water into pipes, there could be no difficulty in supplying London by gravitation. This grand scheme seems to have been itself sted by a proposal formerly noticed in THE BUILDER to supply London and towns on the way with gas from the western coal mines.

EXPORTS OF METALS .- The foreign iron exported from London, Liverpool, and the Clyde, to the three Presidencies of India, Clyde, to the three Presidencies of India, during the first nine months of this year, was 1,580 tons, against 379 in all 1848; of British iron, 13,772 tons, against 12,580 in all 1848; of hoop ditto, 2,246 against 756; of sheet ditto, 3,749 against 2,505; of pig ditto, 413 against 40. Of foreign steel the exports this year were 673 tons, against 207 in all 1848; of foreign copper, 29 against 36; of British ditto, 1,422 against 1,424; of sheet ditto, 2,532 against 1,210; of foreign lead, 32 against none in 1848; of British ditto, 1,029 against 527; of sheet ditto, 339 against 75; of spelter cakes, 3,288 against 2,831. The exports to China direct from London, Liverpool, and the Clyde, during the first nine months exports to China direct from London, Laverpoot, and the Clyde, during the first nine months of this year, were—British iron, 1,854 tons, against 1,414 in all 1848; ditto hoop, 234 against 191; ditto sheet, 24 against 19; ditto against 197, and sheet, 24 against 197, and pig, 125 against 200; foreign seel, 35 against 44; sheet copper, 71 against 11; foreign lead, 347 against 101; British ditto, 462 against 50.

SALE OF THORWALDSEN'S WORKS .-- It appears from a report made by the Director of the Fine Arts to the French Minister of the Interior (quoted in the Morning Post), that some of the marbles have been purchased for England. The director went to buy what he England. The director went to buy what he thought worthy of a place in the French National Collections. He says:—"The sale was composed of marbles executed for the second and third time after the models of Thorwaldsen and plaster casts. Having ascertained on the day before the sale that the marbles were not very well executed, and knowing besides that Thorwaldsen seldom touched them, I gave up the idea of purchasing them, under the idea that our practical men in them, under the idea that our practical men in France could, in case of need, produce better and more highly finished. I therefore aban-doned to my competitors the statue of Mercury, Cupid, the Ganymede on her knees giving water to the eagle of Jupiter, the Three Graces, and several others. Almost all these marbles were purchased for Spain, for England, and by were purchased for spain, for England, and by amateurs at Copenhagen. The plaster models were afterwards put up, and I have been fortunate enough to purchase the finest. That of Mercury preparing to kill Argus, has the winged heels, which is not to be found in the model and at the Sarakh Endoger. It is a world and the Sarakh Endoger. winged neets, which is not to be found in the marble sold at the Spanish Enhansay. It is a chef-d'œuvre. Thorwaldsen is not the bold artist of modern days; his style is purely classical. The Venus, the Hebe, and the Ganymede standing erect, were knocked down to me at very moderate prices, the directors of the Museum having abstained from running up the prices. The Hebe, in particular, is remarkable for the charm and naïveté of its attitude."

THE RUTLAND COLOSSAL STATUE .- A committee of the Leiestershire gentlemen assembled at the County Public Office, Leicester, on Wednesday, the 24th inst., to inspect the competition models, and decide as to the artist. The meeting, which was numerously attended and presided over by the high sheriff, were unanimous in resolving that the commission should be intrusted to Mr. Edward Davis, the successful competitor for the General Nott statue. The Rutland statue is to be in bronze, and not less than 8 feet 6 inches high.

ELECTRO-TELEGRAPHIC,-Mr. H. G. Hall, ELECTRO-TELEGRAPHIC—Mr. H. G. Hall, of Kirkersville, Ohio, has patented an improvement in posts for telegraphs, stating his claim to be for the "manner of combining cast-iron or artificial stone shoes with the posts, by casting the shoes with sockets, of a depth greater than the length of the tenons, on the lower ends of the posts, to be inserted into said sockets, and with fillest or hands around the attempt surfaces to strengthen the concave the external surfaces to strengthen the concave ends, which are also made flaring and sharp, so as to be forced into the shoulders of the posts, which are to be of greater diameter than the shoes, in order to overhang and protect them, and to prevent the water getting into the shoes at the points."

SATURDAY, NOVEMBER 3, 1849.

vould urge upon proprietors and farmers the pressing necessity which has arisen for greater ttention to this and every other matter affectng the profitable working of land. They nust not be contented with doing what their athers have done if their sons can do better. et them not be afraid of what is new, or be ed to disregard the teaching of science; let hem adopt the best principles of construcion; avail themselves of every local advanage; and, in order that they may do this, ake good advice early. Architects themselves, being comparatively seldom applied to on such natters, have not turned their attention geneally to them, and may usefully think a little nore on the subject than they appear to have lone in two or three instances which have ately come under our notice.

Amongst the books recently published, now ying on our table, is one treating of this class of structures,-" Essays on the Construction of Farm Buildings and Labourers' Cottages,' by Mr. G. A. Dean,* which, without proessing to give much that is positively new, vill be found to contain much useful informaion. It comprises plans of three farms, elevaions and sections of farm buildings, rick rame, cattle-boxes, isometrical views of the arms, and three sets of plans for labourers' ottages, with specifications and general esti-

Convenience of arrangement, economy of naterial and space, ventilation, good drainage, and a facility of obtaining wholesome water, are the chief points, says the author, to ne considered in designing farm buildings. Farmers pay largely for labour; it is, herefore, essential to economize this item n every manner possible; and much is to se effected by having a good arrangement n the homestead, particularly of the cattle heds." The house should be placed where he farmer can have a good view of the other muildings. The position of the house is of importance : where "practicable it should be on he south side of a hill, and as nearly central s possible with the arable land. This position vives great facility for manuring the soil, carting home the produce, and performing the sarious farming operations in the most economical manner. Railroads having become the highways of England, they should be made serviceable by erecting the homestead as near o them as possible. Several farmers, whose ands abut upon railways, have already made, er are making, tramways to them from their sarm-yards, for the purpose of conveying their produce to market, and for bringing home manure,"

To the plan of covering the entire area of the farmstead with buildings he objects: "It appears to be bad in principle and costly in construction; as thus, when the roofs are

* Publiched by Florris, Stratford; Simpkin and Marshall,

several, and join, valley-gutters must be formed; these must, or should be, of lead, which is expensive. Some of the roofs will also be higher than others. Under such an arrangement of sheds, the heat from its large expanse of roofs must be very great during the market specific and the second se the summer months; neither can any con-venient mode of ventilation be adopted besides, horses require a different temperature from oxen; the latter, while fattening, should he kept very quiet, which cannot be the case here, as they will be continually disturbed by workmen feeding them, by horses coming in from and going out to their work, and by the carters who attend them.'

As to cattle sheds, he says :-

"The fundamental principle by which an architect should he guided in forming sheds for cattle, is their size and form, the latter being, more or less, wedge-shaped; thus:—a moderate-sized horse is about 8 feet long, for the latter than the state of the long. 6 feet 6 inches high to the top of the head 2 feet broad behind, and 10 inches across the head. A bullock, about 7 feet 6 inches in length, 5 feet in height, 2 feet 6 inches broad at the hind quarters, and about the same across the horns (although the latter dimensions depend upon the breed of the animal). Sheep are on the average 3 feet 6 inches long, 1 foot 8 inches across the hind quarters, and about 12 inches at the head, allowing for the horns. Swine are about the same size as sheep, varying like them according to the breed. From these data huildings may be erected in the most economical and commodious manner, especially when the sheds are to be circular. More loose cattle can be fed in a circular More loose cattle can be as ..., and may shed than in one of any other form, and may coult circumstances. The proper be divided to suit circumstances. Tradius for the inner circle is 54 feet."

Practically, nevertbeless, we are disposed to give the preference to the parallelogram.

Speaking of roof coverings he gives the following memorandum :-

"The cost of a square of 100 feet super. of thatch is about 2l.5s.; plain tiles, 1l.18s.; pantiles, 1l.8s.; slate, 1l.5s.; felt, 14s.; galvanized iron, not corrugated, 2l.14s.; if corrugated, 8s. extra."

These prices, bowever, would be varied by

The barn, being generally the highest building in the farmstead, be would place on the north side of the yard, thus giving shelter from the cold winds, and "as a great portion of the food consumed by live stock is there prepared, the cattle-sheds and stables should be contiguous, which will save much labour in the carrying of fodder to and fro. The same reasons should determine the site of the granary, which should be near, if not immediately adjoining. In the barn there should be two bays for the storing of unthrashed corn or straw, with a thrashing-floor in the centre. The thrashing-floor being thus placed, waggons and carts may be conveniently brought in to unload during harvest, or from the ricks. The bays should be sufficiently capacious to hold the contents of a moderately sized rick, although it is desirable to make them as small as possible, on account of the cost of erection."

A steam engine might be profitably fitted up on many farms:—"The application of steam power on farms is yet in its infancy; and it is objected to by many, that for the purpose of small farms, it is unnecessary and expensive,—but on those consisting of 800 to 1,000 acres or upwards, it is recommended. The number of operations that can be so readily performed at one time with the aid of proper machinery—the great dispatch—the proper machinery—the great dispatch—the amount of work that can be accomplished—and the small cost of the sustaining power, being only that of a few busbels of coals per diem, are

must not be considered as endorsing the taste displayed in the external adornments of the buildings; for example, in the "bird's-eye view of plate 9." Should a second edition be required, he should cancel this plate, if he would maintain his right to the title of "architect."

The improvement of labourers' cottages has recently received a fresh impulse from the Duke of Bedford. His Grace had been erecting cottages on his own estate, and forwarded plans of them to the Royal Agricultural Society, with a Jetter to Lord Chichester, which appears to have had good effect in several quarters. The Duke said wisely :- "To improve the dwellings of the labouring class, and afford them the means of greater cleanliness, health, and comfort, in their own homes, to extend education, and thus raise the social and moral habits of those most valuable members of the community, are among the first duties, and ought to be among the truest pleasures, of every landlord. While be thus cares for those whom Providence has committed to his charge, he will teach them, that reliance on the exertion of the faculties with which they are endowed, is the surest way to their own independence and the well-being of their families."

At Tavistock, for some time past, the labouring population has been miserably crowded, and this being represented to the Duke of Bedford, he has commenced the erection of 64 cottages, on plans prepared by Mr. Jones, his resident surveyor there. These are to be in detached blocks, varying from four to eight in a block. Each cottage is to consist of a living room or kitchen, 14 fcet by 11 feet 3 inches: washhouse, or scullery, with a furnace, 9 feet 8 inches, by 7 feet 10 inches, and a pantry 7 feet 10 inches, by 3 feet 6 inches, on the ground floor; and a bedroom with fireplace, 14 feet by 8 feet 4 inches, and two other sleeping apartments, 11 feet 6 inches by 7 feet, and 9 feet by 7 feet, on the chamber story. The rent is to be 1s. 6d. per week, which would scarcely pay as a mere money speculation. It is however as much as an agricultural labourer can possibly afford; and what is to be desired is a mode of building by which a healthful and convenient habitation can be erected for him at such a cost as this sum would be a fair return for. Until this be the case, the amelioration will not be

At the last meeting of the Northampton Architectural Society, the Rev. T. James, in the course of a discussion on labourers' cottages, which followed a paper read by him on the subject, said, that cottage building could never in direct payment give the most moderate return for the outlay which a capitalist might fairly in other cases expect. That the landed proprietor must be content to look for his return from improved cottages just (only in a bigher sense, and, in a more direct way) as he does from improved farmbuildings or farm-houses, viz., in the general and permanent amelioration of his estate thereby.

We think differently, and look for those improvements which shall make a fair return quite possible. In the course of his paper, Mr. James very properly urged the importance of attending to the external character of the Cottage as well as internal arrangement. The speaker said :-

only that of a few busbels of coals per diem, are facts too important not to attract the attention of every scientific farmer."

The remarks on labourers' cottages are sensible.

In awarding general commendation to Mr. Dean's volume as a very useful production, we

the contemplation of buildings, beyond that resulting from mere beauty of form and cost-liness of material, may be inspired as well by a neat-built cottage as by a gorgeous palace. This it is which so much strikes a foreigner on his first arrival in England. Ashe passed along the road from Dover to London in those days when old-fashioned travelling allowed wayside observations to be made, there was nothing that caught his attention so much as the neat and comely cottages dotted or grouped along his journey. All books of English travels are full of re-marksuponthem. 'Thereis scarce a cottage,' says Willis, just landed from America and France, Willis, just landed from America and Assets, of between Dover and London, where a poet might not be happy to live. I saw a bundred little spots I coveted with quite a heart-ache.' Now it is quite certain that such cottages were not the prim red brick things, with flat slate of the control o roofs, their caves clipped like a man's hat with the brim ent off, a door in the centre, a semi-sash window on each side,—town houses in mi-niature—such as it delights bricklayers and carpenters now-a-days to build.

These neat modern 'tenements,' made to let (tenements, I say, for cottage is too vulgar let (tenements, I say, for cottage is too vulgar a name), would never give a poet the heart-ache, except to think that they were ever built at all. And though, no doubt, in those thatched and woodbined huts,—those 'cots beside the hill,'—that poets have professed to covet, and been proud to sing of, there will often be found a merely outside show, with little real comfort within; yet it is by no means processing true, as utilitarians of the present becessarily true, as utilitarians of the present day seem to think, that comfort and convenience are in the inverse proportion to the picturesqueness of the dwelling, and that the uglier it is on the outside, the more likely it is to be comfortable within " to be comfortable within.

Lord Ashley has written an able and important letter to the Times, calling on the public to second the endeavours of those who have latterly been engaged in the no less profitable than philanthropic establishment of improved dwellings and baths and washhouses for the people. The present moment, as his Lordship remarks, is a singularly favourable one for such an effort, and henceforward, it is be hoped, such provisions may form an incipient, if not a realized portion of our normal state, and an inseparable and extensive item of our parochial system. One remarkable, though natural and reasonable result of the provision of cleanly, ventilated, and, in every way, improved dwellings for the working-classes, such as those of the Metropolitan Society, of which his Lordship is so active and important a member, has been, that not a single case of cholera has occurred among those inhabiting these dwellings. The Times, in allusion to this fact, draws an instructive contrast between those "two great and signal cases of interference with the state of the dwellings of the poorer classes,—one sweeping, inconsiderate, and tyrannical," viz., that of the Parliament at Church-lane, whereby the state of the miserable inhabitants has been made tenfold worse than ever,-"the other, gentle, prudent, and kind," namely, that of Lord Ashley and bis coadjutors, at the Metropolitan Buildings in Saint Pancras parish, and other model dwellings. The population in Church-lane is about the same as that in the Metropolitan Buildings; but the former, always sickly, have been decimated by cholera alone during the scason just past. "We are sorry to say," adds the Times, "that this metropolis presents many other contrasts equally painful and equally significant. Our improvements are in every direction except that which is the most important of all, and which affects the broad NEWballs WE enlarge and rebuild churchs, exchanges, streets of mansions, shops, and warehouses; we occupy the spare space of the inetropolis with docks and with railways; the one thing most needful we not

only omit, but we even aggravate the difficulties in the way of its attainment. We not only neglect, we absolutely prevent proper habitations for the labouring poor." And yet " selfishness, even more than philanthropy, is concerned in the question. Self-interest impels us to see that, if possible, the people about us shall not live in the burrows of vermin, or the lairs of wild beasts; that we shall not be surrounded with the stills of malaria, and the nests of typhus; and that the spreading rot of the great human flock shall be checked in its beginning."

This requisite amendment, indeed, is, in no sense, a subject for mere charitable contribution or display; it is simply a profitable money speculation, based on the establishment of improved health to the public at large, and even to the speculators themselves as well.

We intended to refer to a description of proposed plans of houses for the very poor labouring classes, by Robert Netherway, an intelligent clerk of works; and to a paper on improved buildings for the middle classes, by Mr. W. Young, but our present space is exhausted, and we must seek another opportunity to do so.

RESPONSIBILITIES AND RIGHTS OF ARCHITECTS AND BUILDERS

HOW THEY MANAGE THESE MATTERS IN FRANCE,* fifthly,

WE come now to treat, fifthly builders who work without architects The responsibilitie of the builders in this case clearly result from what has been stated before. He becomes immediately responsible to the

proprietor for all the defects of the building, of whatsoever nature they may be. He guarantees the solidity of the work for ten years against any defects of the soil, any deviations from the laws of art, or any infractions of the municipal

or other regulations.

Neither in this case, nor any other, can be allege as a justification that the workmen he employed were not sufficiently skilful, or that they acted with ill-will towards him, purposely to spoil the work. By the art. 1797, be is responsible for their acts, but he has a remedy against them. It is, therefore, his place only to employ such as are fit and proper to execute the works.

Sixthly.—" Of the position of the workmen who either work for, or independently of, the

builder.'

When the workmen are in the immediate the working are in the ministration of the builder, it is to him only that they are responsible. The proprietor has no right to give the slightest order of any kind or description so ever, even relating to the work in hand, nor has he any recourse against the in hand, nor has be any recourse against the workmen, as their agreement is simply with the builder. The architect, also, has no right to issue any instruction to the workmen; all his orders must be addressed either to the builder or to his representative. The responsibility of the builder thus remains entire both to the proprieter and the architect.

proprietor and the architect.

The workmen are responsible for the full employment of their time, and for any consequences which might result from their neglecting their work through idleness or Thousand hand their works their works their their secretarians. negligence. They are bound to execute their tasks according to the rules of art. Should they spoil any tasks according to the rules of art. Should they spoil any materials from a neglect of these, they are legally responsible to their employers in a pecuniary manner. They are bound also not to commit any fraud in the execution of their works; such fraud making them also preparable, responsible to their them, also, pecuniarily responsible to their employers. No distinction is made between employers. No distinction is made between workmen employed on piece-work or upon day-work, for both are hiring of services, and they only differ in the mode of the appreciation of the value of the remuneration. Such are the legal responsibilities of workmen; but as they are usually too poor for any pecuniary action to lie against them with effect, in reality the only remedy a master has, unless in cases of extreme malevolence, is to discharge them, and sometimes to retain the wares. and sometimes to retain the wages.

* See page 508, ante

The workmen are not supposed to know the laws of scientific construction, and are therefore in nowise responsible to the builder for the solidity of the work they execute under his orders. Nor are they responsible for any infraction of the laws of neighbourhood, nor of the municipalities. They are supposed only to hire their labour to the builder, who is bound to see that it he analysed in supposed only to see that it he analysed in supposed only to to see that it be employed in conformity with the legal requirements.

Inasmuch as the builder is the only person

responsible towards the proprietor, and as the latter has no control over the workmen, they have no claim upon him for the amount of their wages. The proprietor only has to deal with the builder, and bas nothing to do with the arrangements the latter may make with his men. He cannot, therefore, refuse to pay the builder, on the pretext that the workmen em-ployed on the work have not been paid their proyec on the work have the right to lay an opposition against the payment of any money that may remain due, which sum is to be distributed pro ratid amongst the men, according to their wages. They can, however, only claim the balance which may be due to the builder at the moment of bringing their setting those the moment of bringing their action, those being the express terms of the article 1798 of the Code Civil.

When the workmen treat immediately with the proprietor, their responsibilities vary with the conditions under which they treat. If as simply day-labourers, they do not contract any others than those they labour under when in the employ of the builder; namely, to devote the whole of their time, and to employ such skill as can reasonably be demanded of them. But if they undertake piece-work in such a manner as to place themselves in the position of contractors, then they are bound to guarantee the work for ten years. If the work be subdivided so that the masonry, the carpentry, &c., be intrusted to different parties, then, of course, the responsibility of each is merely confined to his own especial trade; a defect in any other does not involve him in any manner soever. The obligations are, of course, the same if an architect be employed.

In all these cases it is evident that the inten-tion of the legislators was to insure a faithful discharge of an equitable contract hetween the several parties. To render it obligatory, it must, therefore, be founded upon a reasonable consideration. If the price fixed be either too high or too low, the contract ceases to be a contract for services, and becomes, what is called, a contract of beneficence, subject to the laws which regulate such transactions. Minors, or parties under legal impossibility of contracting engagements, cannot enter into any of this nature, as a natural consequence of their posi-

The work must be specified; but no necessity exists for doing so in all its details. If the price be not settled beforehand, it is presumed that a tacit understanding exists by which the work is to be valued, and paid for, at the usual price, upon completion. The same remark holds good also as to the payment of architects, surveyors, or others. In all cases where it is not specifically fixed by agreement, the usage of the locality decides the amount. No definite form, as was said before, is necessary to legalize such contracts. They may be made verbally as well as in writing. The advantage possessed by the latter is simply that they are more easily proved in court.

If the delay be not fixed in the contract, the proprietor can apply to the tribunal to have price be not settled beforehand, it is presumed

proprietor can apply to the tribunal to have one fixed judicially; and in ease the builder does not conform to this, he becomes responsible for any loss which may ensue, or any extra price the proprietor may bave to pay upon employing another builder to complete the

work.

The guarantee of the builder and of the architect also has been named above as extending over ten years from the reception of the work. But even after the ten years have expired, the respective parties are liable to an action in case a fraud be discovered, which action may be commenced at any time within action may be commenced at any time within thirty years from its discovery: after thirty years, prescription covers it, and the several parties are discharged from their guarantee; but it is to be observed that the thirty years only begin to run from the date of the proprietor's becoming aware of the existence of the frank

The obligations of the proprietor are simply onfined to the payment of the money, either pon the completion of the works or at the oochs specifically agreed upon. If any terations in the work contracted for be made ound to pay for them; but it is advisable at the builder do not commence any such xtra works without previously receiving writen instructions.

It is not allowed to alter the conditions of It is not allowed to alter the conditions of rice which may have been agreed upon etween the parties, upon the pretence that n augmentation has taken place either in the ate of wages or the value of materials subsequently to the conclusion of the bargain. So nany lawsuits had been commenced upon nat ground, that a special article, No. 1793, as introduced into the Code Civil, to guard as introduced into the cone civit, to guard gainst any future litigation upon the subject. he same article also states that no augmenta-on can be claimed for extra works unless be ordered as such, and Vorks to be measured and paid for after com-letion are regulated, as to the fixing of prices t least, by their value at the time of measure-

nent.

The proprietor is also bound to procure the uilder proper access to the works, and to ulfil all the legal observances necessary to btain the authorization to commence their xecution; such as the settling of the "alignenent," or the front line upon the street, or ny other formalities imposed by the munici-

sality before commencing the works.

Any risk attached to the works during their xecution falls to the charge of the builder, or the proprietor, according to the conditions of the bargain. Thus, if the builder agree to eliver a construction of any kind, and to urnish all labour and materials, the loss is is in case of fire, flood, lightning, or armed iolence. If he only furnish labour, he loses hat portion which has not been received and aid for. In both cases it is assumed that he as no claim until delivery has taken place, nd this is proved either by the reception of and this is proved either by the reception of he building or the payment of the labour dready executed. The article 1788 says dis-inctly, that if the things to be delivered perish y any accident before the completion of the lelivery, the loss is to be at the charge of the workman, if it be he who furnish the mateials, unless the party contracting with him lave been legally summoned to proceed to he reception. Article 1790 says, that if the work excuted upon materials furnished by the other party fail from defect of materials, the workman an claim to be paid for his labour. Article 791 provides, that if the work be executed by the piece, the workman or even the builder an claim to have it measured as it proceeds.

As soon as each portion is measured it is conidered received, and ceases to be at the risk

of the contractor, the builder, or workman.

By article 1794 the proprietor can annul die whole bargain at his own discretion, upon cimbursing all previous expenses, paying for the works executed, and compensating for the rofit the builder was authorized to expect apon the completion of his contract.

Having premised thus much upon the spirit of the French legislation, we proceed to give a granslation of the text of the Civil Code immediately bearing upon the question of the gights and duties of architects and builders.

BOOK 3, TITLE 8, CHAP. 3, SECT. 3. " Of Estimates and Contracts."

Art. 1787. When any person charges another o execute a work, it may be agreed either that he furnish his labour or industry, or that he urnish at the same time the materials.

1788. If, in the case of the workman fur-hishing the materials, the thing, or work ("la those") fail or perish, in whatsoever manner t may be before delivery, the loss falls upon the workman, unless the employer had been regally summoned (mis en demeure) to receive it

1789. If in the case of the workman's only murnishing his labour, or industry, the thing perish, he is only responsible for his own Hault.

1790. If, in the case of the preceding article, the thing fail, even though without any fault on the part of the workman, before the work were received, and without the employers aaving been legally summoned to receive it, the workman cannot claim any wages, unless

the work were lost by a defect of the mate-

1791. If the work be of many pieces or kinds, or such as can be measured, the verification can be made partially: it is supposed to be made for all the parts paid for, if the employer pay the workman in proportion to the work executed. the work executed.

1792. If the edifice constructed for a determined price fail, in part, or totally, from any defect of construction, even by a defect of the soil, the architects and contractors are responsible for ten years.

When an architect or a builder has undertaken to execute a construction for a fixed sum, upon a plan settled and agreed with the proprietor of the soil, he cannot demand any augmentation of price, either under pre-tence of an augmentation in the value of labour of materials, or under that of changes or additions to the plans, unless these changes or additions be authorised by the proprietor, in writing, and the price be agreed upon with

1794. The employer, by his own will, may set aside a contract, although the work be commenced, on the condition of reimbursing the contractor for all his preliminary expenses of paying for all the works, and all that he might gain by the completion of the contract. 1795. The contract for the hire of services

is dissolved by the death of the workman, the

is dissolved by the death of the workman, the architect, or the builder.

1796. But the proprietor is bound to pay, in proportion to the pice agreed upon, to their heirs, administrators, &c., the value of the works done, and of the materials prepared, on the supposition only that these works and materials are useful. It has materials are useful to him.

1797. The contractor is responsible for the conduct of all whom he employs.

1798. The masons, carpenters, and other workmen who are employed in the erection of a building, or of any other works executed by contract, can only establish a claim against the proprietor for the sum which he may owe to the contractor at the moment of commencing

1799. The masons, carpenters, smiths, and other workmen, who execute contracts without any intermediary party, are bound by the rules prescribed in the present section: they become contractors for the part they undertake.

contractors for the part they undertake.

2110. The architects, contractors, or workmen employed upon building or repairing houses, canals, or other works, and those who, in order to pay and reimburse them, have lent money to the proprietor, in case the due employ of this money be proved, are entitled, on registering—1st. The proces verbal which authenticates the state of the premises or places—2nd. The proces verbal of recepor places—2nd. The proces verbal of reception—to have their claims considered as first mortgagers, to the exclusion of any other claimants but those provided by law.

2270. After ten years, the architect and builder are exonerated from the responsibility attached to the main works (gros ouvrages) which they have directed.

BOOK 2, TITLE 2, CHAP. 6.

Art. 159. On taxing costs there shall be Art. 199. Or taxing costs there shall be allowed to Experts (referees?) for every vacation of three hours, when they operate in the localities where they reside, or within 2 myriamètres (12½ miles) as follows:—

In the department of the Seine, for archi-

or other artists, 8 francs (6s. 4d. English).

In the other departments, 6 francs (or 4s. 9½d. nearly).
160. Beyond 2 myriamètres, the travelling

allowance per distance of 64 miles, 1 myria-mètre, is, for the Paris architects, 6 francs; for those of the country, 4 fr. 50 c.

161. During their residence, they are, more-

over, allowed, on the condition of making four vacations per day, as follows:—The architects from Paris, 32 francs (or 25s, 1d.); those of the departments, 24 francs (or 19s. nearly).

General Observations.—As may in all pro-bability strike the reader, the intention of the framers of the French code was to protect the interests of the proprietor in every possible manner, and certainly the tendency of the legislation is very partial in his favour. It is also subject to the reproach which may be ad-dressed to all the codes based upon the old Roman law; firstly, of precising over much

the duties of the inferiors; secondly, of treating every man of business too much in the light of a cheat; of taking too many precautions against his becoming so; and, by the same rule, suggesting too many modes of de-ceiving. Our own common law is more lax; but it trusts to the good faith of the respective parties, and by so doing calls into play the quality it supposes. The tendency of the French law is just the reverse.

Much good, however, results in practice from the fact of the architect being made re-sponsible for the durability of his works. We rarely hear in France of the fall of important buildings in consequence of their ignorance, or the employment of bad materials. Public opinion is also far more severe in that country opinion is also far more severe in that country than with us, when such instances occur. Navier, perhaps the first mathematician who ever practised as an engineer, is reported to have destroyed himself, because his suspension bridge of "les Invalides" fell into the Seine. The engineer of the Central Railway, who executed the bridge over the Loire, which who executed the bridge over the Doile, which sank during the execution, and afterwards fell down during the floods of 1847, was obliged to retire into private life; whilst English engineers allow bridges and viaducts to tumble down, and no notice is taken of it. Indeed, as long as the decision as to who are the parties the blancal in those geographic life, which is the balleting of the life to invise the life to invise the life to th to be blamed in these cases is left to juries, composed of the first twelve people who come to hand, such must ever be the case. We require some competent authorities to decide in these instances; and then our common sense would not be insulted by the fact of the fall of a viaduct being attributed to the washing out of the mortar in the arch joints, or to an unequal loading of the arches by the spreading of ballast in an irregular manner. In the first place, hydraulic mortar should have been used; in the second, a viaduct which could not resist an extra quantity of ballast is not fit for locomotive traffic.

It is true that the constant sense of responsibility is likely to restrain the adoption of new principles; but it is certainly likely to prevent architects or engineers from running unjustifiable risks.

The code is silent upon the subject of the The code is sient upon the subject of the architect's retribution. There are certain works which would be egregiously underpaid at 5 per cent, on the cost, whilst others would be as much overpaid at the same rate. Custom then decides, and the trihunals refer the enunciation of what is the custom to proressional men, independent of both parties named "experts," for the particular case.

As far as regards public buildings, the sys

tem of not paying a commission, but a fixed salary, is open to discussion. Certain it is, in salary, is open to the drawn. Certain Its, in the first place, that it puts a stop to un-dignified squabbles for money, which in no case can raise the reputation of an artist. From some cause (it cannot be this) the French government buildings are more profoundly studied than with us. The greater part of what is done in London and throughout England, shows that architecture is here more a trade than an art. There is a want of con-scientious study, such as is to be met with in best buildings erected by the municipal the best buildings erected by the municipal architects of Paris. Any person who will examine the details of the Madeleine, N. D. de Lorette, St. Vincent de Paul, must confesseven without agreeing with the taste in which they are conceived—that they exhibit traces of student dearful architecture and he are unlessed. studyandcareful execution such as are unknown to us. We certainly dare more. We do the most wondrous works in the world; but we do not put the requisite amount of taste in

A USE FOR A BALLOON.—Lieut. Gale, the aeronaut, suggests that a balloon might be usefully employed in the search for Sir John usefully employed in the search for Sir John Franklin. At an altitude of two miles he says a panorama of 1,200 miles would be placed within observation.—An American paper speaks of a large flying machine now being made in that country. "The canvass is all ready, and is about 80 yards in length and 50 in diameter. It is to be propelled by two oscillating five-horse power engines, which are already provided and secured in the car. They already provided and secured in the car. They occupy a very small space and are well made; they are to propel the huge gaseous monster, by fan wheels, we believe."

ST. NICOLAI KIRCHE, HAMBURG. FATAL ACCIDENT TO THE CLERK OF THE WORKS

Our readers are probably aware that the church of St. Nicholas, being one of the three eburches either wholly or partially destroyed by the great fire of Hamburg in 1842, is now being rebuilt on a scale both of dimension and decoration, nearly equalling many of the ancient eathedrals. The work, like its ancient predecessors, proceeds slowly and gradually as funds permit, hut the eastern portions have now attained nearly to the full elevation of the aisles. The work, though under the direction of an English architect, Mr. Scott, is carried of an English architect, Mr. Scott, is carried out exclusively by German contractors and workmen, and has been superintended from its commencement by Mr. Mortimer, an excellent and talented English clork of the works, who had heen in Mr. Scott's employ for about twelve years, and is stated by him to have been decidedly the most efficient and trustworthy superintendent be has ever had under him. Mr. Mortimer's attention to the work in question has been as zealous and unremitted as his duties were difficult and arduous. Being a man of limited education, though of unusual natural talent, it was no easy task to be intrusted with the entire was no easy task to be intrusted with the entire direction of contractors and workmen whose language he did not understand, yet he succeeded from the first in superintending the work as perfectly and efficiently as if it had been in his native country. When to this is added the extreme difficulty attendant on the construction of foundations at Hamburg where excavations have to be made to a depth of 25 to 27 feet, of which the last 8 or 10 feet are below the level of the tide, and have to be pumped by steam power,—and also the elaborate nature of the architecture, and the circumstance of most of the workmen employed having never before been engaged on a work of this kind, it will be seen that his duties were very different from those ordinarily expected of a clerk of the works. Mr. Mortimer's uniform practice was to be on the ground the whole time when the men were at work (which in summer was from five in the work (which in summer was from five in the morning till eight at night), excepting only when he had to make journeys to stone quarries or brick fields, which lie at great distances from Hamburg. But his duties did not end with the working hours of the men, for after their works were a war his recommenced and their works were over his recommenced, and their works were over in a recommenced, and he continued preparing his working drawings often till midnight. The number of large and most elaborate working drawings he had prepared for this building alone amounted to several hundreds, showing the work with a minuteness which is not several hundreds. several minuterests, showing the work with a minuteness which is not required by builders in this country, for it was one of his rules never to place the drawings received from the architect in the hands of the workmen, but to keep them as documents for his own reference, and to work them out afresh himself, both to insure his own perfect acquaintance with them, and that any error which might have crept into them might be detected before the work was commenced. When remonstrated with hy his commenced. When remonstrated with hy his employer for giving himself this unusual amount of labour, he would say, — "Your drawings may be correct, Sir, but I do not know wbether they are so till I bave worked them out for myself." It may readily he judged from this, that the same principle would apply with double force to those placed under him. Not a brick or a stone wrongly. under him. Not a brick or a stone wrongly laid or worked would escape him; indeed, on one occasion the workmen, unused to such vigilant superintendence, made a formal application against it to the Government authorities, as being inconsistent with the laws of their ancient huilding guilds

their ancient huilding guilds.

Mr. Mortimer, during the last few years of his life, added to his professional qualifications the unhappily less usual qualification of being an earnestly religious character. He had formerly been as eareless on such subjects as too many of us are; but having had a very dangerous attack of illness shortly after his going to Hamburg, during which he was very kindly attended by the excellent English chaplain, the Rev. Mr. Stirling, he was ever after a consistent Christian. It may be mentioned, as an example worthy of imitation, that though his duties, hoth necessary and self-imposed, were heavier and also better attended to than is common with persons in his position, and

though in summer he was usually on the works at five o'clock in the morning, he never left his lodgings without having first gone through the litany or some other part of the church service, and reading some not very scanty portion of the Bible. He said that had it not been for the support he felt from attention to religious duties, he could not hold up against the harassing nature of his labours.

It is stated in the Hamburg papers, and gathered from elsewhere, that on the morning of the 22nd ult. he entertained, from several apparently trivial circumstances, a strong presentiment of his approaching end; and when the foreman bid him "good day," he said he feared it would not be so to him, and mentoned some circumstances which produced such an impression, and later in the day he mentioned some others which confirmed the conviction that something would happen to bim on that day. However this may be, it appears that in the afternoon of that day, while examining one of the springers of the groining which was inaccurately worked, he stepped hastily down from a higher to a somewhat lower scaffolding, when the board on which he lighted snapped, and he was precipitated nearly 50 feet into the crypt of the church, and killed on the spot. The templet which fitted to the stone he is supposed to have been examining was found beside him; while the slightly inaccurate stone above clearly showed that he had not suffered his presentiments to relax his vigilance in the exercise of his duties.

The respect he had won from all wbo knew him caused the deepest feeling for his natinely end. The committee for the church, as a last trihate of respect and gratitude, gave him such a funeral as is usual among their most distinguished citizens. All the members of the committee attended in person, as did all the clergy of the church, the contractors, foremen, and many others, while crowds followed on foot. The workmen wished to attend enmasse, but were advised not to do so on account of the jealousy of the Prussian military at any large concourse of people. The latter, however, showed their sympathy by suspending their exercises, in which they were engaged near the cemetery, while the funeral service was performed.

Above the hearse, on a pointed arched eanopy was bung a silvered shield, containing the name, age, &c., of the deceased. The masonic badges (the compasses, level, &c.) and a black crown of foliage were laid npon the coffin, with the inscription, "Henry Green Mortimer, of Witham, Essex, England, born Apr. 10, 1810, died Sept. 22nd, 1849."

The English service was read by the Rev. Mr. Stirling, the chaplain, after which a funeral oration was pronounced by the Rev. Dr. Strauch, the chief incumbent of St. Nicholas's Church, in which he spoke feelingly of the merits of the deceased, both in a professional and a Christian point of view.

About sixty of the workmen afterwards, according to the picturesque and expressive custom of the country, went to the grave, and deposited upon it a rich and costly garland of evergreens and silk, on which was the following inscription:—

"MORTIMER,
ihrem Baumeister:
die Traurenden Steinhauer
des St. Nicolai Kirchenbaues."

"To Mortimer, their master-builder, from the sorrowing stonemasons of St. Nicholas's Church."

We have inserted the above particulars at length, from a feeling that while such obituaries are usually accorded to persons of higher stations, it is hardly just to deny them to those who in humbler positions have evinced an amount of talent, zeal, and uncompromising devotion to their duties equally deserving of commemoration, and that the qualifications and conduct of the party thus suddenly cut off in the prime of his days, are worthy of being recorded as an example to those to whom similar duties are committed.

Galvanized Iron Company.—According to the Mining Journal, this company is to be wound up. The paper mentioned attributes the failure to want of knowledge on the part of the management.

NEWS OF THE HOUSES OF PAR-LIAMENT.

Mr. Herbert has completed his fresco from "Lear," in the Upper Waiting Hall, or "Hall of Poets," as it is to be termed, the eight available panels which it affords being appropriated to the illustration of Chaucer, Spenser, Milton, Shakspeare, Dryden, Pope, Byron, and Scott. That of Milton was given to Mr. Horsley, that of Chaucer to Mr. Cope, and both are finished. Mr. John Tenniel has Dryden, and is now proceeding on the wall. The artists for the remainder are not yet named, so far as we know. Mr. Tenniel's subject is the St. Cecilia, the clever original drawing for which was lithographed by the Art-Union of London: copies were distributed as prizes. The artist has altered the composition of the foreground by the introduction of a reclining child on the left hand side, and the substitution of a young knight in armour for the old man on the right hand side. Mr. Tenniel is one of the rising artists of the day; he has nothing to do to command success but think and work hard.

think and work hard.

Of Mr. Herbert's fresco we must speak in warm terms; it is a noble work, full of power and beauty,—an evidence as well of perseverance and determination to overcome difficulties as of artistic skill. The subject was exhibited by Mr. Herbert last year, at the Royal Academy, in oil. Lear is on his throne (of Byzadnie workmanship sparkling with mosaics and gilding), the elder sisters are on their knees, to the left, and Cordelia, having refused to "heave her heart into her mouth," stands meekly on the right. The exact words illustrated we will take to be Lear's expression—

"So young and so untender?

Cordelia. So young, my lord, and true.

Lear, Let it be so—Thy truth, then, be thy
dower:

For, by the sacred radiance of the sun,

For, by the sacred radiance of the sun,
The mysteries of Hecate, and the night;

* * * * *

Here I disclaim all my paternal care, Propinquity, and property of blood, And as a stranger to my heart and me Hold thee, from this, for ever

Hold thee, from this, for ever

* * * *

The sway,
Revenue, execution of the rest

Beloved sons, be yours; which to confirm,
This coronet part between you."

The countenance of Cordelia is one of

The countenance of Cordelia is one of singular sweetness.

The artist resolved, on commencing the work, that the whole of the picture should be positively in fresco,—i. e., not made out or rectified in tempera; and to effect this the whole picture has been executed three times over, part after part being cut out and replastered, and cut out again before a result could be obtained satisfactory to the artist. We may add that the picture is lighted from a window at the side high up, and that the shadows are arranged to suit this.

In completing the decoration of the ceiling and walls of the hall, it will be necessary to have reference to the frescoes, or their effect may be considerably interfered with.

Looking in at the House of Lords, we saw Mr. Maelise hard at work, perched up in the far distant recess, wherein he has nearly finished the Spirit of Chivalry. The House of Commons is so near to completion, that if it were desired, it might be made ready in time for the coming session. The whole of the woodwork here, panelled ceiling, galleries, wall panellings, are of polished oak, without colour or gilding, contrasting strikingly with the profuse decoration of the House of Lords. The Commons' lobby and libraries are also very nearly ready for use.

Some time since we took occasion to mention that the piles which formed the coffer-dam in front of the terrace were being drawn, and we pointed out the impolicy of the proceeding and the danger which attended it. We are glad, therefore, to find that this course has been abandoned, and that the piles are now heing cut off close to the surface of the ground, so as not to disturb the bottom.

The question between Mr. Barry and the Government is still open, but we understand there is every willingness on the part of the latter to meet it liberally.

INAUGURATION OF THE LONDON COAL EXCHANGE.

ON Tuesday last crowds filled the streets in the neighbourhood of the Thames, obstructed the bridges, and lined the river, to see her Majesty and Prince Albert pass along "the silent highway," to open the new edifice which has been erected in Thames-street for the purposes of the coasting trade. The Queen was unable to be present, but her illustrious consort brought the Prince of Wales and the consort brought the Prince of Wales and the Princess Royal. Many, many thousands of people were out, so fond of sights and so loyal are we English; and every where such a recep-tion was given as must have delighted those for whom the sweet voices were raised. The building we have already described and illustrated, both externally and internally; and we have commended its architect for the invention,

novel applications, and suggestive decora-tions which it displays.

"To meet the demands of a rapid extension "To meet the demands of a rapid extension in the great element of British commerce—the consting trade, the nursery of seamen and of our commercial manine," said the Recorder, in his address to the Prince, "this capacious building, the Coal Exchange, chiefly constructed of iron, at once light and durable, has heen erected. When with the purposes of this Exchange are associated the creation and increase of commerce and manufactures, and the awal superiority of this kingdom,—when the essential article of coal ministers by appliances in numerically to the wants and prosperity of innumerable to the wants and prosperity of millions, illuminates our houses, streets, and manufactories,—when every metal at the forge is obedient to the fire it feeds, whilst it com-mands as its agent and its instrument the mighty power of steam,—ti hecame the wisdom, and accorded with the enlightened beneficence of her Majesty the Queen, to regard this edifice

with the favour and consideration ever gra-ciously extended by her Majesty to objects of national importance."* It is not our purpose to describe the ceremony; to speak of the glittering multitude which filled the Exchange and its galleries, elad in robes and uniforms of every hue; the profuse hospitality of the corporation; how that Mr. Bunning, when presented to the Prince, was justly cheered; and how Sir James Duke, Knight, the Lord Mayor, is to be created a baronet. We have but to record the event and its most brilliant accomplishmen; adding here. its most brilliant accomplishment, adding, however, a note of the curious circumstance (forced on us by two strong letters on the subject), that the coal factors had nothing to do with the ceremony, and scarcely obtained the means

of being present. We congratulate Mr. Bunning on a fortunate concurrence of circumstances, which will serve to connect his name lastingly with the city of London.

BRITISH ARCHÆOLOGICAL ASSO-CIATION.

At the opening meeting, held Friday, Oct. 26th, Mr. Pettigrew, treasurer, presided, and after briefly congratulating the members on the resumption of the public meetings, read a paper from the president, Lord Albert Denison, detailing the opening and contents of two barrows, in the neighbourhood of Scarborough. The first, called Way Hagg, was opened in the autumn of 1848; its diameter was 36 vards. autumn of 1848; its diameter was 36 yards, and depth 8 feet, with a slight depression on the top. The cutting was commenced on the north side; and at about 18 inches from the surface and 4 feet from the top (on the slope) was discovered a small urn containing wood ashes Eight or ten feet nearer the centre four stones were discovered, one having three holes of unequal size worked on its surface, another of unequal size worked on the scrines, another five holes, a third four holes, and the fourth thirteen holes. These stones varied in length from 33 to 16 inches. Upon removing these, an urn 15 inches in height was exposed to view, standing upon two large stones, and containing calcined bones, flint arrow-heads,

bone pins, and the bones of a small animal which had been burnt with the body. The second, Ravenhill tumulus, was opened 21st August, 1849, and was 42 feet in diameter and 5 feet deep. The cutting was made on the south side. After removing the sandy earth on the surface, a wall of large stones was cut through. Two stones, one with five holes and the other two, were discovered, and immediately afterward an urn 63 inches high. A little to the left of this was found a small vessel embedded in wood ashes, calcined bones, and earth. bones, and earth.

Another investigation, on 31st August, proved the stone wall to exist on the east side, and apparently encircling the whole mound. The paper was followed by some observations from Messrs. Saull and Keet, on the stones with holes worked on their surface, and Dr. Bell remarked, that they resembled druidical

stones, called in Germany porringer stones. Mr. Planché read an interesting paper the "Effigy of a Lady in Worcester Cathedral," which had been alternately appropriated, dral, "which had been alternately appropriated, to the wife of William Montacute, Earl of Salisbury, temp. Edward III.; to a countess of Warren and Surrey; to Andela, wife of John de Warren, a natural son of the sixth earl; and to Maude d'Evereux, the sister of Giffard, Bishop of Worcester. Mr. Planché disproved every one of these assertions, and suggested, that the effigy was that of Maude Longespee, titular countess of Salisbury, being Lady de Clifford, of Corfham, in her own right; who, according to the annals of Worcester, was huried in the cathedral in 1301, having been then removed from some other edifice, 18 years after her death. She was the grand-daughter of Llewllyn, Prince of Wales, and of King John, mother of Margaret de Lacy, countess of Lin-coln; and had to her second husband John, Lord Giffard, of Brimsfield, so that the magnificence of her monument was due to her rank, and its position, to her relationship by

rank, and its position, to her relationship by blood to King John, and by marriage to Bishop Giffard.

Mr. Planché prefaced his paper hy some strong and proper remarks on the devastation that had been committed in our cathedrals, by their former soi-disant conservators; and particularly in that of Worcester, in which, with the exception of Prince Arthur's monument, there was scarcely a mediaval tomb or effigy that could be positively identified.

that could be positively identified.

Mr. Godwin, as an evidence that in early times they had treated the monuments of their progenitors as badly as had been done more recently, mentioned the discovery, a few weeks ago, of a carved monumental slab, of the thirteenth century, under one of the buttresses of the north porch of Redcliffe church, for which

had been made to serve as a foundation.*
Mr. White exhibited the rubbing of a brass Mr. White exhibited the rubbing of a brass from St. Michael's Church, near St. Alban's. The figures are those of a civilian and his wife, John and Maude Pecok. The rubbing was taken by the son of the clerk, during the few hours required to repair the flooring of a pew, and it was exhibited to shew, that this and other and it was exhibited to sheet, that this such societies are producing much good, by giving those engaged in our churches a taste for the antiquities contained in them, and a desire to preserve, and even illustrate such things when an opportunity offers. This brass is now removed from sight by the new flooring.—Mr. Waller said, he believed he had a rubhing of the inscription only. He considered the brass early and interesting, and one he had long wished to see.—Mr. H. W. Rolfe exhibited rubbings of brasses in the courch of Boughton Malherb, in Kent, belonging to the family of Wotton; and Mr. Planche exhibited a cast of the seal of John-de-Scott, Earl of

ENTHUSIASM .- We are told that the infant ENTHUSIASM.—We are told that the intain daughter of a gentleman employed at the works of the Britannia-bridge was taken to the Britannia rock, the other day, in the middle of the straits, where she was christened Britannia Ann Stephenson, in compliment of the bridge and the engineer. We remember a worthy builder, who, having erected a chainbridge some ten years ago, with similar feeling, but less tact, christened his little daughter Suspension Maria.

CHURCH BUILDING NEWS

THE foundation stone of the new chapel of the Wesleyans at Southampton was laid in East-street, on Wednesday in last week, by the Mayor, accompanied to the site by a large proportion of the Town Council and bailiffsbeing an infraction of the old statute thereanent:—at least it was held by the counsel applied to (Mr. Barstow), that "in strictness the letter of the law would be violated," albeing he main plaints was the law. though the main object was the mere laying of a stone, and not public worship, that being in this case but an accessary. The architect is Mr. James Wilson. His design is in the Gothic manner. There will be a centre window over the door-way, flanked by two towers and pinnacles, and two side windows, with but-tresses and pinnacles surmounting them at the extremities of the front. The area of the chapel will be 45 feet by 72 feet in the clear, its superficial extent being 116 square feet chapel will be 45 feet by 72 feet in the clear, its superficial extent being 116 square feet more than any public room in the town. There will be 300 free sittings in the body of the chapel, and, in addition, a second gallery, which will contain 200. Underneath the chapel there will be a school-room capable of accommodating 700 children. The cost of erection is estimated at 3,500k, or with site, &c., 5,300k. Of this the mayor has presented 400k, and Mr. W. Betts 700k.—deficiency still 2,000k. odd. We hope it will he better than one by the same architect in St. John's-square, Clerkenwell.—The foundation stone of a Baptist chapel was laid in Wadham-street, Westonsuper-Mare, on Tuesday week.—It is intended to take down a portion of the parish church of Bremhill, Wilts, and rebuild the same, and also reseat the church.—Dr. Warneford has placed in the hands of the bishop of the diocese of Gloucester and Bristol another 1,000k, to promote the building of parameters. another 1,000% to promote the building of parsonage houses in benefices of small value at present without them.—A little chapel has been built at the Bath united hospital, from a design supplied by Messrs. Manners and Gill. It is to be provided with hot air pipes, and will cost in all 340?.—The church of St. Augustine, Bristol, has been re-opened after being some weeks under wrong for the church of St. Augustine, Bristol, has been re-opened after being some weeks under process of restoration. The side galleries have been removed and the seats re-arranged. The tradesmen employed were side galleries have been removed and the seats re-arranged. The tradesmen employed were—Mr. C. Williams, Hanover-street, mason; Messrs. Naylor and Heaven, Park-row, painters; and Mr. Martin, Orchard-street, carpenter.—The foundation stone of a Baptist chapel was to be laid at George's-place, Leeds, Monkwearmouth, was consecrated on Tuesday week.—A tower, 76 feet bigh, with spire and vane, has recently been erected at Low-wood, Windermere, and a clock with two dials placed in it. We don't exactly know, however, windermers, and a clock with two dials placed in it. We don't exactly know, however, whether this comes properly under head of church building news: perhaps the church is expected to follow.—During the relaying of the floor of the Abbey Church of Dunfermline, the workwen lately came upon two means. the workmen lately came upon two massive stone coffins lying side by side, and very near the spot where "the rude awtare" of the ori-ginal abbey stood. The coffins were hollowed the spot where "the rude aware" of the original abbey stood. The coffins were hollowed out of one single block each, with a circular space for the head. In one was found a body completely cased in leather; the other was full of dust. The leather casing was in excellent preservation, but the hody within completely gone, scarcely a little bone left. The casing was found to have heen carefully laced down the back and round the soles of the feet.

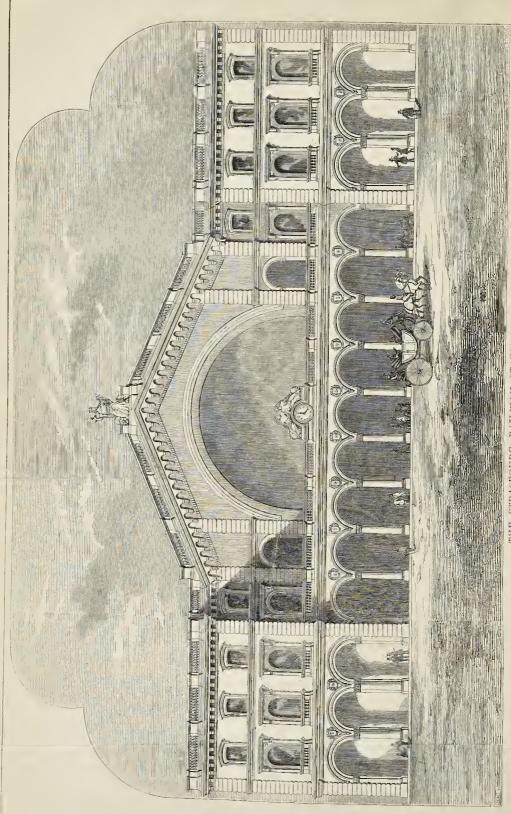

Bradford Union Competition. — Wishing to compete for the new union work-house for the Bradford union, I applied for the plan and instructions to architects, which have been obligingly forwarded to me hy the clerk. In the concluding clause is the follow-ing notice—"The guardians do not pledge themselves to employ the architect whose plans themselves to employ the architect whose plans are preferred; but in case of his not being employed in the direction of the work, a premium of 30l. will he given for the plans, which will he the property of the guardians." Now, Sir, is not this as good as telling the successful competitor that however excellent his plan may be, the value placed upon the same is 30l., a sum far below the actual cost that must be incurred by each party who thinks of competing?—Truth and Justice.

^{*} The increase which has taken place in the coal trade is extraordinary. We are told that in 1705 about 609 ships sufficed in the supply and demand of London, and that in 1805, 4,856 cargoes were required, containing about 1,359 000 tons; while last year (1818, 2,717 ships made 12,267 vorgaes, and conveyed 3,418,340 tons!

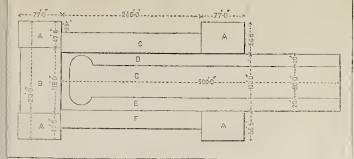

† In the previous week the foundation of the new Billingsgate Market (under the same architect) was laid. It includes an architectural frontage of 172 feet (we are told), extending from the Custom House quay to Nicholson's Wharf.

The slab shows a cross occupying the centre, with two ptured heads projecting from the plain face of the stone, over each arm of the cross.

THE STRASHOURG RAILWAY STATION, PARIS.

BLOCK PLAN OF STRASBOURG RAILWAY STATION.

THE STRASBOURG RAILWAY STATION, PARIS.

THE accompanying engraving represents the south elevation of the station lately erected in Paris for the railway to Strasbourg. It stands between the Rues du Faubourg St. Denis and du Fanhourg St. Martin, being bounded on the south by la Rue Neuve

The Strasbourg line is one of those executed under the law of 1842. The State purchased the land, executed all the earthwork, hridges, culverts, &c., to formation level, and is to build all the stations, shops, and offices. The company furnish the ballast, lay down the rails, and put all the rolling stock upon the line; which, at the expiration of the lease, becames the property of the State, the rolling stock being paid for at a valuation.

stock being paid for at a valuation.

This elevation is a noticeable production, from the originality of its conception, the picturesqueness of its effect, and its consistency with the use of the huilding for which it was designed. On the first inspection we feel that it is not on the model of a Roman or Greek temple, of an Italian palace, or a conventual building. It tells its own tale at once. The architect has thought for himself, and has endeavoured to design a building in accordendeavoured to design a building in accordance with the wants and the taste of his own times. The monument he has produced is not without errors of detail, and its internal arrangements are very faulty; hut on the whole there are marks of originality which are quite refreshing (if such a vulgarism be allowable) in the present day, when architects appear to consider the greatest merit to consist

in copying what has been done before.

With reference to the block plan of the station-building annexed, it may be necessary station-building annexed, it may be necessary to observe that the custom in France is not to allow strangers to enter either the waiting-prooms or the sheds. Travellers remain in the rooms until the moment of departure, and therefore do nothing more than traverse the quays on the way to the carriages. This system is preferable to our own, in which the hamuler of people walking about renders the service more difficult and slovenly. We are, showever, so fond of shaking hands at the last unoment that an attempt to change the system moment that an attempt to change the system would be attended with great obloquy.

The large shed is covered with a wrought-

The basement of the whole of these buildings is executed in the "roche" of the "earle grossier;" the upper part in Pierre Franche, of St. Leu, I'ile Adam, or of Condians. The roofing is covered with zine.

The whole length of the shed is 500 feet; the width, 100 feet.

* "John Howard and the Prison World of Europe : from Original and Authentic Documents." By Hepworth Dixon, London: Jackson and Waltord, St. Paul's Churchyard.

1849.

† To Howard, and to his scarcely less noble-minded wife, Henrietta, their fellow-countrymen were indebted for an exemplary endeavour to lay the foundations of an improved order of labourers' cottages, to which not only Howard's money, but his wife's jewels and savings for recreation and travel, were devoted.

to have been excellent compared with what Howard himself had at Brest, as a prisoner during war with France.

"When they were at length landed," says Mr. Dixon, "he was confined, with many other prisoners, in the castle of the town, in a dungeon, dark, damp, and fifthy beyond description, where they were kept for several additional hours without nourishment. At last a leg of mutton was brought and thrown into the cell—as borsefiels is thrown into the dens of wild beasts—for the starving captives to scramble for, tear with their teeth, and devour as best they could. In this borrible dungeon, thus fed, they were detained for a week."

The world is eternally indebted to the Brest dungeon, as the turning point in the character and destiny of Howard, who, guided as it were by Providence, "with no distinct and definite object before him," had thus gone abroad and lived—an unwilling denizen—in the 'wild beasts' den' devoted to a future reform of abuses so universal.

Into the history of Howard's career we cannot here enter, and indeed our only business with this very interesting book, is to present our readers with a brief recital of some of the horrid details of dungeon-architecture and the horrid details of dungeon-architecture and prison mismanagement witnessed by the great philanthropist,—by way of exemplar, and exclusive even, as much as possible, of any enlargement on the diabolical and scarcely credible treatment suffered by the miserable objects who were thrown into such inhuman dens. To this end, one or two further extracts ways of the contract of the co may suffice.

may suffice.

"The gaol at Plymouth had a room for felons called the Chink, 17 feet long, 8 wide, and only 5½ high—so that a person of ordinary stature could not stand erect in it! This diabolical dungeon was also dark and stifling—having neither air nor light, except such as could struggle through a wicket in the door, 5 inches by 7 in dimensions. Yet Howard learned, with horror, that three men had been kept in this den, under a sentence of transportation, for nearly two months! They could neither see, nor breathe freely, nor could they stand upright. To keep alive at all, they were forced to crouch—each in his turn—at the wicket, to catch a few inspirations of air; otherwise they must have died of suffocation—for the door was rarely opened. When Howard saw it, the door had not been opened for five weeks—and yet it was inhabited. He caused the bolts to be shot and an entry made; but the indescribable stench which issued, would have driven back any less courageous visiter."

"state."

"As a specimen of the condition in which he found some of the bridewells, we transcribe his account of one in Folkingham, in Lincolnshire:—

'In this prison, under the keeper's house, are five damp rooms; two of which were used for a lunatic, who was confined here for some years. The men's lodging-room (18 feet by 9\footnote{3}, and 6 feet 9 inches high), has only an aperture in the door, a foot square, into the work-room. The women's room is 13 feet by 8, and 6 feet 2 inches high. In another room, 20\footnote{4} feet by 12, you go down by a trap-door in the floor seeven steps into a horrid dangeon (10 feet square, 5\footnote{4} feet high); no chimney; small court; no pump; no sewer. Yet a woman, with a child at her breast, was sent hither for a year and a day! The child died.'"

A place of confinement for debtors at

A place of confinement for debtors at Knaresborough is thus described by the humane inspector :-

" 'No fire-place; earth-floor; very offensive, a "'No fire-place; earth-floor; very offensive, a common sever 'from the town running through it uncovered!' Only a short time before Howard's visit, an unfortunate officer had been cast into this borrible kennel. Having some knowledge of the place, he had the precantion to take his dog in with him, to defend him from the vermin, which the stench, arising from the open sewer, produced in myrinds. In a few days the dog was destroyed, having been actually devoured by its insidious enemies; and, at the same time, its master's hands and face were so bitten as to present to the eye nothing but three great and loathsome sores!!"

We cannot conclude without adverting to

We cannot conclude without adverting to the circumstance that Mr. Dixon indignantly the circumstance that Mr. Dixon indignantly denies the charge alleged against Howard, that in his philanthropic efforts on behalf of criminals and other prisoners in gaols throughout the civilized world, he neglected his duty as a father to his only son. The author adduces what he conceives to be more than sufficient evidence to the contrary.

The utmost that can be said is, that if Howard's attention had been less absorbed by the work for which the world is bis dehtor, the conduct and fate of this son might have here

conduct and fate of this son might have been

PRISON REFORM.

DIXON'S LIFE OF HOWARD.*

THE cosmopolitan and revered name The cosmoploitan and revered name of Howard re-appears under the hand of the present author with fresh interest, and within limits so available to the impatient temper of the present generation, that many are now likely to realize some little knowledge of a man whose name has hitherto, it must be admitted, been much better known than his history.

mitted, been much better known than his history.

Mr. Dixon appears to have been for some years engaged in rescarches which naturally led him to give close heed to Howard's labours, and the result of which researches, is about to appear in a new work under the title of "The London Prisons," with a description of the chief misons in the provinces. It was while so engaged that he became convinced of the public need of such an account of John Howard's life as he has now given his.—and especially at the present. now given 11s,—and especially at the present time, when the interest felt in prison reforms is on the increase, and the prison world a popular

Much as there is yet to do in this wide field of reform, the inmates of prisons in general now stand in a most enviable position by comparison with those of the time of Howard, as every one knows in general terms, but few, probably, in special detail. How strongly does even the following exceedingly moderate and favourable specimen of gaol-accommoda-tion, in the Marshalsen, heginning of last century, remind us of another vast field of re-form, as yet scarce broached by any modern Howard, even though loudly called for in behalf of those whose honest spirit of struggling poverty prevents them from enjoying the benefits now so frequently conferred on prisoners!

"The common side," says a Parliamentary report,
"The common side," says a Parliamentary report,
"is enclosed with a strong brick wall; in it are
now confined upwards of 330 prisoners, most of
them in the utmost necessity; they are divided
into particular rooms called wards, and the prisoners
belonging to each ward are locked up in their respective wards every night, most of which are excessively crowded, thirty, forty, nay fifty persons
having been locked up in some of them, not 16
feet square. * * All the last year there
were sometimes forty, and never less than thirty,
which is a room of 16 by 14 feet, and about 8 feet
high; the surface of the room is not sufficient to
contain that number when laid down, so that onehalf are lung up in hammoeks, while the other lie
on the floor under them; the nir is so wasted by the
number of persons who breathe in that narrow compass, that it is not sufficient to keep them from
stifling, several having in the heat of summer
perished for want of air."

Even the more offensive details, which are

Even the more offensive details, which are here omitted, cannot be worse than those that still prevail outside the walls of gaols, though not now within.† The Marshalsea, however, was only inhabited by debtors and pirates; and the accommodation may be said

THE MODE OF DISCHARGING WORKMEN.

A CASE was heard at the County Court, Clerkenwell, on the 15th instant (Tuffs against Mansfield), a few remarks on which may not be uninteresting to a great portion of the readers and subscribers to your journal. The plaintiff in this case sued for the sum of 5s., the amount of a day's labour which he lost on defendant's account : the facts are as follow :-The plaintiff, who had been in the employ of the defendant some months previously to Saturday, the 22nd of September, was, on Saturiay, the 22nd of September, was, was, that day, ordered to take his tools from the job he was then at, to the yard of the defendant, which he did accordingly, and received the amount of wages due to him by the defendant. Nothing was said to the plaintiff defendant. Nothing was said to the plantiff about being discharged: of course the plaintiff went to defendant's premises on the following Monday morning, with the expectation being sent to another job, which is usually the case when a man is ordered to the yard with his tools, but on this occasion the plaintiff was informed that his services were no longer

required.

Now, Sir, as the plaintiff had refused an engagement with another builder on the pre-vious Saturday night in consequence of being still in the employ of defendant, I think it is quite reasonable that he should be paid for

After having heard the case, his Honour severely reprinanded the defendant on the injustice and impropriety of discharging men in that way, to which the defendant replied that it was the usual way of discharging men, and that ordering a man to bring his tools to the yard was equivalent to his discharge. Mr. Boresley, a carpenter and builder in a small way, was then called by the defendant, who made the same statement as defendant,

adding that it was the plan that all builders adopted in discharging their men. His Honour then said that the plaintiff's experience ought to have told him that it was the general way of discharging men, and he should therefore decide for the defendant.

his loss of time.

I shall leave it to your readers to judge for themselves, whether it is a just way of discharging a man, or whether such a plan would be adopted by any respectable builder in London; but as it has become very prevalent with the small builders of London, regardless of the interests of their men, to treat them with the utmost indifference, and I think it is high time that something was done, so that there may be something like an understanding between master and man, in order that when he was discharged, he might be informed of it on the same night, so that, if he was offered another job, he might accept it. I rely for the insertion of this on your known impartiality in the advocacy of justice, as well for the operative as the master

R. S. Tuffs.

ARCHITECTS' REMUNERATION. WINDSOR CASTLE.

A CONNECTION of the late Sir Jeffrey Myatville, with reference to a remark in our leading article of September 29th (page 457, ante), that "Sir Jeffrey Wyatville received 5 per cent, on the amount expended at Windsor Castle, and was also paid for measuring the works," says that the statement is not correct. "At the commencement of the works, and with the sanction of the authorities, the late Mr. West was appointed to measure them, and Mr. West was appointed to measure them, and they were all measured by him and his successor, Mr. William Corderoy, whose bills were made out and delivered quarterly in their own names, and paid by the department, like all other charges, to the individuals whose names they bore." The writer further says, that "the renmeration for Windsor Castle was, as for the Houses of Parliament, settled by agreement at the beginning of the works, and that 5 per cent, was to be paid in lieu of the that 5 per cent. was to be paid in lien of the usual per centage paid to the architects employed by Government, and travelling expenses, which the architects were entitled to, and were always paid for, at certain rates, but which were not to be charged in this instance according to the agreement entered into. It would not be too much to state that the expenses compromised for under the head of windows exists; but I trust these few observa-travelling expenses for himself and his clerks, tions will excite attention in those quarters

amounted in the first year of the works at Windsor Castle to 2 per cent., and throughout the whole of them formed a very considerable

Admitting it to be correct that Sir Jeffrey

was not himself paid for measuring the works, this will not interfere with the only inference we wished drawn from the statement, namely, that the cost of measuring and making out the works was not included in the 5 per cent. commission. In Mr. Noble's volume, on "Professional Practice," we find this passage (p. 32): "In reference to measuring, it does not

seem that at an early date in professional practice, architects ever claimed remuneration for that difficult duty; but in 1794, and at recent periods, variations have and still do occur in the profession, respecting that important business. This is borne out by an inspection of the report of the select committee of the House of Commons in 1828, in which Sir Jeffrey Wyatville's evidence shows, that in his very extensive and long practice, he always received 5 per cent. commission on the expenditure, as ll as the expense of measuring; and was also paid for his journeys and wages to the clerk of works."

SANITARY MEASURES AND THE WINDOW TAX.

Among the sanitary measures suggested for the improvement of dwellings, it is singular that the effect of the window tax upon the question of ventilation has of late been forgotten, or else shirked, under the pressure of the revenue deficiency. It is, however, of so great importance that, having formerly been discussed in your columns, I trust you will again lend your aid to bring the subject before the public, and invoke the Board of Health to take up the matter, as one peculiarly connected with their inquiries.

There has always been an outery against the tax from its first imposition; and, when increased by the necessities of the war, it excited

the savage epigram—

"God gave us light, and saw that it was good;
But Pitt denied it—d — his blood."

It has, however, never been alleviated, but the time seems now to have arrived when its influence upon the health of millions demands that it be reconsidered. As an architect called upon to plan resi-

dences for all classes, I can, in common with the profession, speak decidedly upon its injurious tendency. In a residence for a noble-man I have blocked up lights in passages and corridors, to avoid excess of taxation; in houses of the middle class I have deprived staircases and attics of their due modicum of light and air; in the dwellings for the poorer classes I have stinted rooms to small single windows; and recently, in the case of par-sonage houses, the economic incumbent has blocked out the light and air of the waterclosets, to save the increased number of taxable lights. These are positive evils, which no Legislature, especially one which has proclaimed the importance of securing the health of a civilized community, ought any longer to allow to exist.

It is, perbaps, vain to hope for a total aholition of the tax; but if our legislature wish to show that they are earnest in promoting the health of towns, an extensive exemption of windows subject to the duty should at once be made. This exemption should extend to all windows on the underground stories of houses, where ample light and air are of vital importance: it should extend to all waterclosets and lights used for ventilation, and even to staircases and passages, which are in a great measure the reservoirs of air in a house. The absurd restriction respecting the size of windows should be also removed, as it tends greatly to impede the arrangement and effect of a design, while it affects very materially the light and air of the single windows

in the poorer dwellings.
I could go further into detail, and show that while a great impetus has been given to the glass trade by the removal of the duties on its manufacture the public cannot enjoy half the benefits which this removal confers, so long as the restriction upon the number and size of windows exists; but I trust these few observa-

where the question ought to be taken up, as a matter which the recent sanitary investigations show has a great influence on the health and well being of society.

T. L.

NOTES IN THE PROVINCES.

HOUSE-VENTILATING apparatus, we hear, is getting extensively into use in Lincoln. In some cases the vitiated air is taken off by communication with the chimney; and perforated glass has been introduced into windows for the admission of fresh air.—The Man-ningtree Mechanics' Institution are about to erect a building, with lecture room 40 feet hy erect a building, with recture room 2 feet by 14. It is to be in the Elizabethan style, from a design furnished by Mr. Samuel Teulon, to be carried out by Mr. Samuel Simpson, builder.——The sewage excavations at Colchester are in active progress: coins and other relics are turning up. -- A writer in the Bury Post, while advocating cheap gas for that town, gives the following estimates of cost of gas works: "There are," he remarks, "no works, I believe, in the counties of either Suffolk, Norfolk, Essex, or Cambridgesbire, of fifteen years' standing, with the same extent of main and public lights, so cheap as these [for Bury], as will appear by the cost of-

Ipswich works £26,000
Colchester, exclusive of lamp-posts. 22,000
Cambridge, about 40,000
Norwich 10,500 Bury, say

Nor am I aware," he adds, "of any works in England, of the same standing and extent, cheaper than the Bury works."—Halsted, cheaper than the Bury works."—Halsted, too long unlighted, is to be provided with gas lamps, and lighted by voluntary contribution.

—According to authorized certificate, the quantity of gas consumed in Worcester from June, 1848, to June, 1849, was 17,668,600 feet. — The Edinburgh Council Committee, to whom the petition of the city fleshers for a new slaughter-house was referred, have reported favourably on it, and propose that the city provide 20,000l. as the propose that the city province 20,000. as the requisite capital, and apply to Parliament for three acres of ground in a proper situation. The fleshers are to pay 1001. expenses if the finished in a few weeks. The hall is 152 feet long to be a controlled the leavest of the finished in a few weeks. The hall is 152 feet long to be a controlled the leavest of the City. For the controlled the leavest of the City. by 92 broad-the largest in the City. Extensive operations are in progress for the formation of a great reservoir on the Castle-hill for the better supply of water to the citizens. The etter supply of water to the citizens. whole of the water company's present buildings there, with adjoining properties, are in course of demolition, and the new reservoir will be made capable of holding about a million and a thalf of gallons, in place of forty to fifty thousand only, as the old one did. The works are under the immediate charge of the company's engineer, Mr. Leslie, with the advice of Mr. Adie and Mr. Rendall. The designs for the building have been furnished by the company's architect. Mr. Clarke. Measures are also in progress for the better supply of Glasgow with water, by an extension of the Gorbals Gravitation Water-works.

DRURY-LANE THEATRE. - Mr. Frederick Gye has been waving his wand again, harlequin like, and lo! the stage of Drury-lane, and the dirty receptacles of scenery and lumber at the back, glow in the purity of a brilliant white, powdered with sprouting roses in a golden trelliage, for the purposes of Jullien, the popularizer of good music. It is quite startling to see what can be done in a week with an unlimited quantity of glazed calico, gold banding, artificial flowers, and Mr. Gye's aptness and good taste. Of the banding there is not less, we calculated, than three miles in length! Considerable improvement has been effected hehind, by the removal of two translike, and lo! the stage of Drury-lane, and effected hehind, by the removal of two transeffected hehind, by the removal of two transverse walls, hy which means the whole space is thrown into one apartment. The music-lowing portion of the English public have much to thank M. Jullien for.

INSTITUTE OF BRITISH ARCHITECTS.—The first ordinary meeting of the session will be held on Monday evening next, when will be read, "Remarks on the earlier and later Gothic Architecture of Germany," by the Rev. Dr. Whewell.

THE KENILWORTH-STREET SEWER

IT is due to Dr. Ure to state that he has issued a 'supplemental report,' in which he still maintains his point, and says that the evidence given on oath "by the two Government chemists, Mr. Richard Phillips and Dr. Playfair, of the Woods and Forests, and by the two chemists of King's and University Colleges, Dr. Miller and Mr. Campbell, may be regarded as one of the most marvellous scientific phenomena of this age of pretension, but which could not occur in any capital of Europe save our own." He adduces the experimental and testimonial evidence on which he rests his conviction that the sewer in question did contain cyanogen compounds, and that these compounds were derived from the lime; but he also points out the fact, that such compounds, or cyanogen itself, at least, may be variously formed, where carbon and nitrogen co-exist—as even from common coal and atmospheric air. There are thus two questions fairly at issue between these equally respectable authorities,—firstly, whether cyanogen did exist in the Kenilworth-street sewer; and, secondly, whether that cyanogen was derived from the gas lime, or from the lete-rogeneous mass of carbonaceous and other substances in the sewer itself. The reputation of one or other seems at stake.

Have you not (unintentionally, I am sure,) done me wrong in your leading article of last Saturday, wherein you protest against the tone taken by me in examining one of the witnesses at the late inquest on the accident in Kenilworthhate inquest on the accident in Kenilworth-street sewer? In the re-examination of the witness in question, I entertained a strong impression that he did not manifest that candour which every witness under similar circumstances ought to manifest. Your own remarks in the article in question show that you entertain a similar idea. I did press the witness closely and carnestly, but I think not more so than my dathy required. The witness cost closery and earnessty, but I think not more so than my duty required. The witness complaining that asperity of feeling was manifested towards him, I at once stated that if I had offended in that particular, I regretted it. I did not plead guilty to the charge; and I really think such a plea would not have been appeared. From the think this charge is a proper of the think think such as the charge is and I would not have been a proper onc. Excuse me for thus taking up your time; but as your paper has (deservedly) a large and influential circulation, I am of course unwilling that any strictures on the part of its editor should remain unanswered. JAMES HOPGOOD. King William-street, Strand, Oct. 31, 1849

METROPOLITAN COMMISSION OF SEWERS.

A GENERAL court was held on Friday, the 26th, at the Court House, Greek-street. Lord Ebring-

at the Court House, Greek-street. Lord Ebrington in the chair.

The late Fatal Occurrence in the Sewer at Pinitico.—Sit Join Burgoyne, after a few prefatory observations, alluded to the late fatal occurrence in the sewer at Pinitico, and said the subject had occupied the serious attention of the commissioners, who were collecting all the information to be obtained upon it. Having this object in view, and to guard against similar occurrences, he begged to move—

' That the surveyors be directed to rep cially on the case of any sewer closed up at the end, and nn any sewer in a more than usually noxious condition; and that they be held responsible for the necessary precautions before workmen enter

The motion being seconded, was unanimously

The motion being seconded, was unanimously adopted.

On the motion of Captain Dawson, seconded by Mr. Hardwick, it was agreed:

"That the tide-table of the Thames prepared by the assistant-surveyor (Joseph Smith) be lithographed for the information of the commissioners. That the tide observations of the Ordnauce survey in June and July, 1819, Deptford, &c., be printed for the information of the commissioners."

Lord Ebrington thought it would be desirable that the present commissioners should have the benefit of the investigations of those geguttemen who had been on committees in the last and former commissions, and therefore moved "That the members of former or late commissions engaged on committees be requested to report the results of their respective investigations for the information of the commissioners."—The motion was agreed to.

It was next resolved, on the motion of Mr. Haves,

commissioners."—The motion was agreed to.

It was next resolved, on the motion of Mr. Hawes,
"That the tender of Messrs, Radley and Rogers for
works in Webb-street, Southwark, be accepted.

(Phillips.)—That the tender of Messrs. Williams for cleaning sewers at Hammersmith be accepted.

Lord Ebrington said, that he believed from the importance attached by the public and the court to the late occurrence in Kenilworth-street, it would be expedient to procure a copy of the evidence wound be expecient to procure a copy or that occasion, and accordingly moved, "That the notes of the short-hand writers be procured for the use of the commissioners."—Agreed to.

Lord Ebrington next moved—"That such notes be referred to the general committee of the whole body of the commissioners, to report on the facts, and to give their user in an expectation.

and to give their opinion on the course to be taken thereon." Upon inquiry into the facts, he felt, most and to give their updates thereon." Upon inquiry into the facts, he felt, most undoubtedly, that others than the Commissioners were to blame; but at the same time every opportunity would be afforded any persons implicated to give any explanation that they might see fit to the commissioners. He did not deem it prudent to say more upon the question until the commissioners had every information before them.

The Ventilation of Sewers by a Steam Jet.—Mr. Lawes said that it appeared that Mr. Goldsworthy Gurney's system of ventilating sewers by means of a steam jet, in the experiments at the Friar-street sewer, had been eminently successful; Priar-street sewer, had been eminently successful; in consequence of which, he understood a letter had been sent by that gentleman to the commissioners. The letter having been read, it was resolved, that a letter be sent to Mr. Gurney, conveying the thanks of the commissioners to him for his services, and that he be informed that the commissioners are not at present in a situation to proceed further with the ventilation of sewers by means of his steam jet. Upon the motion of Mr. Lawes, seconded by Mr. Rendel, it was agreed that the general committee he instructed to examine and arrange the business to be brought before the next court. By this means, it

instructed to examine and arrange the business to be brought before the next court. By this means, it was said, the court would be fully in possession of the subjects which were to be brought under its notice, and any discussion which was necessary for the information of the public would take place in

The effect of this arrangement would seem to be, that the public will know simply just so much of what is going on as the commission like, and nothing more.

Miscellanea.

APPEALS AGAINST RAILWAY RATES.—
At the West Riding Michaelmas Sessions, reported by the Bradford Observer of last week, the Midland Railway Company appealed against an assessment at the rateable sum of 3,125f. on about 3 miles and 5-6ths of the Leeds and Bradford extension in the township of Bingley, station buildings, &c., inclusive. Some discussion arose as to the desire of the churchwardens and overseers to charge on churchwardens and overseers to charge on prospective estimates in preference to actual receipts. The court ruled that actual receipts he taken as the criterion, and on these the rate was ordered to be made on 1,500%, in place of 3,1251. Appeal to Court of Queen's Bench refused. The sum offered by the Company exceeded that fixed by the court.—The Lancashire and Yorkshire Railway Company then appealed against Heckmondwike highway rate, and the court reduced valuation from 1601. to 241., and rate from 61, 13s, 4d, to 11. An appeal by same against Cleckheaton highway rate resulted in reduction of rate from 261 to 31. 18s. 2d. The Oakenshaw highway rate was also reduced. There were twenty-six appeals entered, but only six or seven tried.

BOILER EXPLOSION.—The whole of the north end of Liverpool was suddenly roused out of sleep into a state of great alarm on Saout of sleep into a state of great alarm on Saturday morning last, about one o'clock, by the explosion of a boiler, which, though only of four-horse power, destroyed a whole brewery, and injured fourteen cottages, blowing roofs out and crushing them in, knocking down walls and emptying vats and a reservoir, the latter of which it turned right over, and emptied a great quantity of water among the fallen timbers, which it is supposed to have thus prevented from being altogether consumed by fire. No life was lost, though three persons were buried in the brewery ruins and whole families under the cottage roofs; so that—unfortunately, shall we say—this is not a case fortunately, shall we say—this is not a case likely to go far towards the establishment of that end for which we have so long contended, namely, the authorized and general regulation and inspection of steam boilers, and the great saving of life and property thereby.

GOODRICH COURT, ON THE WYE.—We hear that the interior of this "romance in stone and lime," the residence and museum of the late Sir Samuel Meyrick, is undergoing consi late Sir Samuel Meyrick, is undergoing considerable alteration: a banqueting-room is to replace a portion of the galleries. The Gloucestershire Chronicle mentions that the latter have been stripped of their rare and valuable contents to a great extent, and that much of the armour is deposited in a stable! Can this be see? Goodrich Court is notional in its be so? Goodrich Court is national in its character, and we sincerely hope that its present owner will preserve the valuable and almost unique assemblage of antiquities within its walls, intact.

its walls, intact.

ROMAN CIRENCESTER.—We are glad to learn that Messrs. Buckman and C. H. Newmarch are preparing for publication "Illustrations of the Remains of Roman Art in Cirencester, the Site of Ancient Corinium." Correster, the Site of Ancient Corinium." Correster, the Site of Ancient Corinium. nium-caester was so important a station during the occupation of Britain by the Romans, that it is not surprising many memorials of a people so advanced in the arts of civilization should, from time to time, be found upon its site, of value in enabling the antiquary to arrive at important conclusions concerning the history of a people whose protracted residence in our island has ever since exerted great influence even upon the manners and customs of the present inhabitants.

WINDOW GARDENS .- Those who are de-WINDOW GARDENS.—Those who are uebarred from the enjoyment of a garden by sickness, residence, or fortune, should take a leaf out of the book of the French and Belgian ladies, who succeed, by means of double glazed of the activity of the statement of the succeeding the statement of the succeeding the succe windows and other contrivances, in providing themselves with an ample supply of fresh flowers at all seasons of the year. "In Belgium," says M. Victor Paquet, "wherever you go, you see spaces between double sashed windows filled in winter time with the most charming flowers. Elsewhere, the halconies are turned into greenhouses, and you may find on a fifth or sixth floor a miniature stove, gay with the brightest flowers and the greenest foliage."

INDUSTRIAL ART. — In viewing the engravings contained in the Art-Journal, of works in the Birmingham exhibition of manuworks in the Birningham exhibition of inanufactures and arts, I was astonished to find that in nearly all articles designed for domestic utility, there was a prodigious display of the floral character to be executed as like unto nature as the various metals would by their nature permit. Now in the designs for curtain hands, cornices, cornice pole ends, their character is peculiarly inapplicable for their purposes. The end of a round brass pole, with its jingling rings, seems to me to be rather an outré place, acting in its horizontal position, for the springing out of flowers, such as the tulip or convolvulus; they certainly are most capitally adapted for places of refuge for spiders to set their snares for the unwary flies, or for the deposit of dirt and dust. As to the bands, I am sure they will contribute largely to the hourly occupation of the neat domestic wife, in repairing the rents produced in the wite, in repairing the rents produced in the muslin, &c. (both curtains and gowns), by the elegant sharp pointed leaves, let her even have that 'rara avis, a careful and thoughtful servant. The next subject is the stove and fender ends (Messrs. Hoole's). The stove is a clever puzzle to those who want to stir the fire, but a far greater puzzle it is to the cleanly donestie, who has daily to run the risk of scarifying her knuckles and elbows in cleaning the grate, and how she is to take away the dust and ashes is to me a wonder. terminations have the same danger difficulty attending them, but it will the inventive genius and patience of put the inventive genius and patience of the mistress to a severe trial, when she attempts to sweep her fender clean. The same want of necessary thought prevails in all the articles designed for domestic pur-poses. How much wiser and advanced were our forefathers in such matters, when they produced simple and elegant forms, intro-ducing only now and then ornament to give them a character of a pleasing quainters dueing only now and then ornament to give them a character or a pleasing quaintenses. Far better would the time of the artists be spent if they would study a little more the practical use to which their works are intended to serve.

"Use with elegance combined Denote the cultivated mind."

C. E. M.

PROJECTED WORKS .- Advertisements have been issued for tenders, by 5th instant, for been issued for tenders, by shift means, for the erection of prison cells, dwelling-houses, &c. at Gravesend; by 15th, for 70 tons of iron rails for the West Cornwall Railway; by 5th, for 500 tons blue Guernsey granite; by a date not specified, for the erection of a tavern at Peckham; and by 6th, for building sewers in various streets at Birmingham.

RAILWAY COMPENSATION CASES .- At the Borough Court, Bradford, the magistrates were recently called on to award compensation to occupants of houses in Goodmansend required by the Lancasbire and Yorkshire Railway Company. The first case was that of Mrs. Stell, for the "Moulders' Arms" beer-house, her interest in which the company estimated at 30%, for three months' loss of business, but had offered 40l. In cross-examination of the occupant, "Mr. Higham asked her if she had not been convicted by the magistrates for keeping a disorderly house. Mr. Bond strongly disclaimed the imputation as most atrocious, because it was intended by it to punish twice, and he declared that none but a railway company, who had neither a soul to save nor any thing behind to kick, would so boldly bave dared to injure a poor woman."

Mr. Bond estimated the loss to the occupant at sixty guincas on twelve months—the question turning on the terms of the widow's occupancy. The magistrates awarded 70l. occupancy. The magistrates awarded 701., each party to pay their own expenses, but Mrs. Stell to take the fixtures. Several other cases were settled amicably, though much higher terms were asked, and much lower offered. The good-will and interest in a gropremises in same vicinity to 22l. 10s.

SMOKY CHINNEYS.—With reference to

Shory Chinneys,—With reference to smoky chimneys, the cause is frequently in the bricklayer not starting bis gathering at the proper place: the gathering should start not less than 6 inches below the underside of the chimney bar, and should not gather less than 2½ inches every course of bricks, until the athering is brought to the exact size of the flue, the flue being in the centre of the breast. Build 1 foot perpendicular: you may then start your flue either right or left, which you think most proper to the entrance into the room, as also to the section of chimneys. Avoid elbows; give easy curves and slopes. fixing chimney-pots or moulds, the flues should be to the exact size of the pot or mould, whether it be round or square; and the formation should commence not less than 1 foot 6 inches below the seat of the pot or mould: this is also very essential to prevent any obstruction at the mouth of the shaft. If not so formed, it is more than probable that there may be a check, and so prevent the rapid current it otherwise would have. The usual The usual way in which bricklayers start their gatherings way in which brenkayers start their gatherings is from the top of the arch, 15 inches higher than they ought to do; this causes two air chambers, one on each side. I have proved beyond doubt that I inch gathering below the breast of a chimney is worth three above the

chimney bar .- J. B. H.

MIDLAND MECHANICS' INSTITUTES, &c.
The anniversary of the Midland Association of Mechanics' and other literary institutions, was held at Nottingham, on Tuesday last, Mr. J. E. Denison, M.P., and afterwards Mr. Walter, M.P., in the chair. Mr. Denison first addressed the meeting, and was afterwards followed by Mr. Walter, in an eloquent speech, which he summed up by saying—"Remember that the true object of this and all similar institutions is to train the mind to liabits of thoughtfulness and patient industry; not to impart to it a mere smattering of all sorts of knowledge, which is only another name for conceit. Whatever progress you make in the difficult path of self-improvement, remember that it must be the effect of your own individual exertion, just as if no institution of this kind existed to assist you. Century after century may mount higher in the lofty regions of science; discoveries which our forefathers would have ascribed to witchcraft, and which appear like magic to ourselves, will fail to excite the least surprise in the minds of our im-mediate descendants; but there is no royal road to self-improvement and self-discipline: each individual must work out for himself that difficult problem, and stand or fall by the

A FAMILY FIRE ESCAPE. - In order to prevent the awful sacrifice of life which so frequently occurs from fire, it seems desirable that Government should offer a handsome re-ward to the inventor of a fire escape, which, by the simplicity of its machinery, and the low the simplicity of its machinery, and the low-ness of its price, would be available for all classes. I mean an apparatus that every family could possess. If, however, the Govern-ment decline encouraging so laudable an ob-ject, I am sure the public would respond to call that might be made upon them, to testify their gratitude for ingenuity so applied, and I would therefore suggest that mechanics should (if only on the ground of humanity) direct their best attention to this subject, do their utmost to produce an apparatus which should be among the "lions" of the proposed national exhibition of 1851 .- P. W.

THE BUILDER.

INCREASE OF IRON BUSINESS IN WALES. The population during forty years, from 1801 1841, increased in Newport from 1,423 to 13,766; in Trevetbin, from 1,742 to 14,942; Aberystwith, from 805 to 11,272; Bedwelty, from 619 to 22,413. In Glamorgan the increase has also been enormous. In 1820, the iron sent from the worker for shipment to Newport, was 45,462 tons; in 1847, 240,637. The quantity at Cardiff, in 1820, was 50,157 tons 'in 1847, it was 220,953. The coal sert in 1846 from Cardiff, Swansea, Llanelly, and Newport, amounted to 1,847,318 tons. The shipment of iron alone from the counties of Monmouth, Glamorgan, and Carmarthen, was estimated, in 1847, at 4,000,000*l*. sterling.

FIRE AT WHITECHAPEL BATHS AND Washnouses .- On 27th inst., a fire, originating in a temporary wooden dryinghouse, rapidly consumed that structure, and spread to the roof and fittings of the washhouse. The hon, secretaries have written to the explaining that the property destroyed is amply covered by insurance. Unfortunately, however, this will not prevent additional delay in the completion of an establishment which appears to be doomed to suffer a succession of talities or hindrances to its ultimate utility

to the public.

PRESERVATION OF WOOD FROM WORMS, FIRE, &c.—M. Louis Vernet, Buenos Ayres, has enrolled a patent specification for a method of preserving from destruction by worms, insects, decay, and fire, certain vegetable and animal substances. To preserve timber from fire, it is to be impregnated with a solution of 1 lb. of arsenic, 6 lbs. of alum, and 10 lbs. of potass, in 40 gallons of water. To preserve timber immersed in water from decay, ravages of the worm, it is to be painted over with the solution mixed with oil or any suitable

tarry matters. ASTNESS

OF RAILWAY WORKS. great Pyramid of Egypt was, according to Diodorus Siculus, constructed by 300,000 according to Herodotus, by 100,000 men; required for its execution twenty years, and the labour expended on it has been estimated as equivalent to lifting 15,733,000,000 (fifteen thousand seven hundred and thirty-three milons) of cubic feet of stone, one foot high. pended in constructing the southern division only of the present London and North-Western Railway be reduced to one common denomination, the result is 25,000,000,000 (twentyfive thousand millions) of cubic feet of similar material lifted to the same height, being 9,267,000,000 (nine thousand two hundred and sixty-seven millions) of cubic feet more than was lifted for the Pyramids, and yet the English work was performed by about 20,000 men

only, in less than five years.—Sir F. Head.
Tankes for Setting out Curves. Messrs. Archibald Kennedy and R. W. Hackwood have recently published in the smallest possible form (a waistcoat-pocket edition), a series of tables for setting out curves, which be found very useful by the profession.* They contain, ready calculated, all the dimensions required for setting out curves varying from a radius of five chains to three miles, according to either of the three most generally employed methods of performing the operation. Accuracy is the great point to be achieved in these matters, and this seems to have been carefully

striven for. " Tables for setting out Curves for Railways, Canals, Roads, &c., either with or without a Theodolite." London: 1849. Wealc.

THE PERPETUAL PROBLEM AGAIN. George Murrell, a wheelwright, at Upwell, says the Worcester Journal, "professes to have discovered the means of putting a machine together that will drive itself; that is, requires no motive power of any kind, neither steam, water, nor hand, but is a mere combination of wheels, that, once set agoing, will never stop unless thrown out of gear, or worn out by friction. He is very sanguine of success, and says, that before many weeks have elapsed," &c. &c.—the old story. It is odd we never hear how matters have turned out when the hrief period of sanguine hope has elapsed.

ELIZABETHAN CHAPELS,—"An Amateur" wishes to be referred to some good illustrations of an Elizabethan chapel, and to know which are the best examples of that class of buildings. So far as we are aware, no good view of any ancient Elizabethan chapel has ever been published. Good examples may be seen been hunder. The chapel at Lampetal originally Early English, bas Elizabethan fittings, but the ornamented ceiling has been the chapel at Lincoln's inn is a removed. The chapel at Lincoln's-inn is a good example. Perhaps the best in London is the chapel at the Charter House, entirely Elizabethan: it has been enlarged by Mr Blore. In the country there are numerous examples: that at Crewe Hall is one of the finest.

EVADING THE BRICK DUTY .- The magistrates sitting in petty sessions at Halesowen, last week, adjudicated on no fewer than ten informations against brick-makers who had defrauded the revenue by removing the bricks from the kilns without paying the duty. All the cases were made out, and fines were inflicted varying from 150l. to 25l.; while a large number of bricks were declared to be forfeited—in one instance 84,782.

ELECTRO-TELEGRAPHIC PROGRESS.telegraph will shortly be open from Halifax to New Orleans throughout. Mr. W. S. Thomas, of Norwich, New York, has invented a tele-graphic "manipulator," which is said to "transcribe the 'lightning,' writing as fast as the apparatus can turn out the paper."

THE ARCHITECTURAL CHARACTER THE AGE.—The political condition of our day is a war of great principles. As heterogeneous in its character is Art among us. Here we have an imitation of the antique, there a revival of the middle ages, while sculpture itself is sometimes compelled to relax its severity, and copy the rude attire of our northern yeomen. By what term could we describe the architecture of the day? In our rising cities we find a Gothic church close to a Byzantine fane or an Italian basilica, and their immediate neighbourhood a town-hall like a Greek temple, a mansion like a Roman palace, and a club-house after the fashion of Louis XIV. The age in which we live may have a character of its own; but that character is not written in its face.- Edinburgh

COST OF PRISON ACCOMMODATION. sums hitherto expended on prison buildings have in some cases been enormous. The cost is seldom less than 1001. or 1501. per prisoner (a sum sufficient for building two or three neat cottages, each able to contain a whole family), and in some instances it has been much more A portion only (the newest) of the county prison at York, capable of accommodating prison at only 160 prisoners, cost 200,000%, which is more than 1,200*l*. per prisoner; enough, if it had been desired, to build for each prisoner a separate mansion, with stable and coach-house. -Fourteenth Report of Prison Inspectors.

BUILDINGS AND MONUMENTS, MODERN AND MEDIEVAL

Edited by GEO. GODWIN, F.R.S.,

Fellow of the Institute of Architects; Corresponding Member of several Societies.

Part IV. of this work, price 2s. 6d., containing Views of Ware Church, Hertford; Hungerford and Lambeth Suspension-bridge; New Front of Buckingham Palace; Fire-place in the Palace of the Dukes of Burguady, at Dijon; All Saints' Church, St. John's Wood; the Juterior of the House of Lords—the Throne, the Victoria Lobby, the Reporters' Gallery, and Ground-plan; with descriptive letter-press, and numerous details; is now ready. now ready.

No. CCCLIII.

SATURDAY, NOVEMBER 10, 1849.

OVEMBER opens the doors of the majority of the London scientific and artistical societies, up to that month closed, and if it bring fogs and catarrh, brings

also many pleasant and useful re-unions. The Institute of Architects, the Royal Society, the Antiquarian, the Archæological, the Society of Arts, and others with which we have less to do, are amongst these; the covers are taken off, the bookcases are unclosed, and the habitués find their way to the meeting places from all parts of the world, their resorts during summer, to renew kindly relationships, idle an hour, put themselves pretentiously before the world, gain information, or really increase the general stock of it, as the case may be. All are busy in their own little way,-little, indeed, alas I even with the most powerful,-digging in the great mine of nature. What one disregards, tbe other considers the object of life; (to use an old metaphor, a man, a dog, a bird, and a worm find very different objects of interest in the same grass-field) and so the great work of advancement best goes on.

The opening meeting of the Institute of Architects was held on Monday, the 5th inst., at their rooms in Grosvenor-street, when the Right Hon, Earl de Grey took the chair, and 149 members and visiters attended. Amongst them, in addition to those spoken of hereafter as taking part in the proceedings, we will mention: Messrs. Cockerell, Scoles, Mee, Mair, Penrose, G. Pownall, S. Angell, Salvin, Bellamy, Kendall, Booth, Garling, D. Brandon, Jas. Thomson, Papworth, W. Burn, Ferrey, Sibley, James Fergusson, Nash, T. Bury, H. Williams, C. C. Nelson, Jennings, H. Ashton, Knowles, Tarring, Hopkins, H. Clutton, Heneker, C. H. Smith, G. Foggo, Dr. O'Callaghan, J. Wilks, John Britton, Colonel Sykes, Thomas Little, Henry Thomas Hope, M.P., and the Dean of Westminster.

The president, after a few general observations, said that as he had at the last meeting mentioned the probable intention of the London University to institute an examination in architecture, and to give certificates of proficieucy, it was necessary he should state that the council bad entered into correspondence with the university, and found that at present they intended to confine their certificates to chemistry, navigation, and hydrography. In due time, however, architecture would have its share. Relative to certain points in dispute which had been referred to the council of the Institute, he would remark, that many things which seemed desirable at first sight, were not found so on reviewal. The council had given the matter mucb consideration, and their report was now being printed. It would be circulated preparatory to a special meeting on the 26th, for its consideration, when it would of course rest with the members to adopt it or not.* During the recess the council had made application to many individuals distinguished in different branches of scientific investigation,

* The tenor of the report may of course be inferred from this without difficulty.
