Mr. Beloe observed that the timber roofs of the ancient regal and baronial halls merited in an eminent degree the attention of all to whom the science of construction is an object of interest, although he was unable to enter into it, then, at the length which its import-ance demanded. He could then only furnish a few observations, which might prove not un-interesting. He remarked that the artificers of the early Saxons appeared to have been, for the most part, either monks or slaves. They were in fact nothing more than mere necessity made them; and they lived and died poor, unhonoured, and unimproved. Mr. Sharon Turner, the historian, had remarked that "the habits of life were too uniform, its luxuries too few, its property too small, its wants too numerous, and the spirit of the great mass too servile and dull, to have that collection of ingenious, respected, and inventive men, who make and circulate our internal and external commerce, with eager but not illiberal competition, or to have those accomplished artificers and manufacturers, whose taste in execution equals the most elegant fancy of its invention." Mr. Beloe went on to remark that the Anglo-Saxon carpenter was considered as part of what we are accustomed to call the plant of an estate, transferable with the land. He was called the Treow-wyrta (tree or wood workman), and the Anglo-Saxon verb used in speaking of building is getymbrian (to make of wood). It was well known that churches were at times constructed of wood, one of them

Greensted, Essex—still remaining.

The Norman period was touched upon by

the lecturer, who observed that it was marked by the introduction of more durable materials, which were used for several centuries before the construction of any wooden roof. This art the Norman architects practised with such admirable skill and effect, that their works have not unfrequently been considered beyond the pale of modern imitation. After alluding to various instances of this style, the lecturer passed to the Semi-Norman (1154 to 1189), which he remarked possessed all the characwhich he remained possessed at the characteristics of the Norman, combined with the pointed arch. Castle Acre Priory was selected as an example. The Early English or Lancet (1189 to 1272) was next explained, the illustration being a door-way at Paul's Cray, Kent, and the lecturer referred to the beautiful winders.

dows of this style in our cathedral, as well as at York, Salisbury, &c.

The lecturer then proceeded to explain the form and idea of the open-timbered roof, remarking that the upright strut or queen-post, which rises from the extremity of the hammerbeam, in most of these roofs, suggested the idea of a pillar being cut away at that point. The whole roof, therefore, reminded one of two lows of pillars, dividing the area into three aisles. He observed that the palace of the Bishop of Hereford, and Westminster Hall, as originally built by William Rufus, were built on this plan, which indeed seemed to be the usual mode of constructing halls of large dispersions of the constructing halls of large dispersions. large dimensions previous to the fourteenth century, when an improved manner of constructing arched roofs of timber superseded the necessity of columns.

The Decorated period, including the greater The Decorated period, including the greater part of the fourteenth century, was next referred to. After explaining the architectural characteristics of the style, the lecturer remarked at length upon the timber roofs of Nursted Court, Kent; Balsall Temple, Wor- 1821. 6s. 9d.

cestershire; Coventry School; Croydon Pa-lace, &c. The roof of Crosby Hall, and other buildings, though erected in that period, was perfectly distinct in principle from those yet considered, heing based on the property of the triangle to resist reaching or charge of form

triangle to resist racking or change of form.

He then passed on to consider the Perpendicular style (1377 to 1485), illustrating the architecture from a sketch of a doorway in St. Mary's, Beverley, and explaining its characteristics. In considering the timber roofs of the period, he gave a detailed description of that of Westminster Hall. That edifice was rebuilt by Richard II., almost from the foundation; he said almost, because Mr. Pugin says that some of the lower portions of the side walls are the original works of the time of William Rufus. As it now stands, the span of the roof is nearly double the ordinary width of Gothic groined roofs, which seldom exceeded 35 feet. Numerous obstacles to the erection of a stone roof in that case must have presented themselves, and the builder was thrown upon the resources of his art. The result was a novel as well as elegant application of that great element of lightness and beauty in the great element or lightless and detailed material was exchanged for one equally susceptible, and greatly superior in both tenacity and trability. The lecturer went on to refer to the roof of Romscy Abbey Church, and that of Eltham Palace. The nearest example to the Editian Palace. The Heartst example to the latter in this locality was the roof of St. Martin's Church, in this city; but the idea was not carried out to its fullest extent of beauty, some parts heing plastered over. The lecturer then referred to the Guard-room, Lambeth

At that period, he remarked, ceilings were valued ornaments of palaces. They usually contained representations of memorable actions, but our azure church ceiling with stars occurs in ancient crypts; in other cases the ceiling is in hlack, with painted and gilt lattice-work, and grotesque heads, &c.; and others were of and grotesque heads, &c.; and others were of wood, painted or plastered in panels. After explaining the construction of the roof of King's College Chapel, Cambridge, the lecturer went on to allude to the interesting specimen of the roof of the cloisters of Hereford Cathedral, at the same time expressing his acknowledgments to the Very Rev. the Dean,

acknowledgments to the very key, the Dean, for having drawn his attention to that roof, and to the President, for a specimen of carving. In speaking of the Tudor period, the lecturer referred at some length to Wolsey's Hall, Hampton Court, perhaps the most elaborate specimen extant of the style. As a scientific on Westminster Hall, although it displayed much ingenuity. Reference was then made to much ingenuity. Reference was then made to Westminster School, the Middle Temple Hall, and other excellent specimens of the period. The lecturer proceeded to glance briefly at

the general heaviness and inelegance of the Debased style (1547 to 1640). The illustration was from St. Peter's-in-the-East Church, Oxford. An interesting roof of this period exists in the chapel on the estate of Mr. C. T. Bodenham, of Rotherwas

He concluded by dividing Gothic roofs into four classes:—first, those of simple arched ribs; second, those which have a grand arch spanning the entire width; third, those that have the arch supported on brackets; fourth, such as are formed of two intersecting triangular frames, in which the lateral pressure is counteracted by the longitudinal stress upon the connecting beams. After that period it became very difficult to trace the principle of the style at all.

BEDFORD ARCHITECTURAL SOCIETY .-- At a committee meeting held on Monday, the 26th ult., Sir H. Dryden, Bart., in the chair, a grant of 4t. was made to be placed in M. Hartshorne's hands, for the purpose of securing plans to be made of an ancient barn, near Peterborough, called the Saxon barn, which is about to be pulled down for some railway works. A donation of 11. 1s. was made towards the spire of St. Edmund's, in memorial of the late treasurer of the society, Mr. Percival.

THE THAMES TUNNEL.—It is said that the number of passengers who passed through the tunnel in the week ending March 31, Amount of money received, SCENERY AND SATIRE. THE LYCEUM THEATRE.

IT says something for our own and other efforts to set before the public the merits of some of the scene-painters of the day, when we find the much greater attention to the scenery of our theatres which is now paid by the periodical press generally, than was the case not long ago. The Easter spectacles pronot long ago. The Easter spectacles produced at the various houses have given opportunities to the artists, which they have not failed to take advantage of in a greater or Iess degree. We shall glance at them as we have heretofore done, when an opportunity occurs, to glean any point that may interest our readers, but at this moment confine ourselves to a few words on the piece at the Lyccum, "The Seven Cham-pions of Christendom," written by that arch-magician, J. R. Planché, to whom the public have reason to be grateful for realising, though temporarily, many bright dreams, and pleasant myths, without taint of immorality or coarse-

Mr. Planché has the talent of seizing on the things of the day, and while turning them to use, shews their absurdity. He must rank amongst the opponents of "sham" in architec-ture, for in the new piece, Mr. Charles Mathews sings (in the way that is his own),—

"O such a town, such a wonderful metropolis, With mysteries and miracles all London teems Humbug has there got the snuggest of monopolies, Every thing is any thing, but what it seems, You sleep upon an iron bed, and fancy it a feather

one, You think your ceiling's carved in oak—why, bless you its a leather one; Your marble mantle-piece turns out of slate, if

you're a scrubber, Sir,

And paving stones are made of wood, or else of
india rubber, Sir."

He touches very cleverly the love of Latin and Greek names,

" Here is a Pantechnicon, and there is an Empo-

Your shoes are 'antigropelos,' your hoots of 'pan-

our shoes are 'anagroperos, your nous or par-nus-corium;' Fumi-porte chimney-pots,' 'Eureka shirts' to cover throats, Idrotoholic hats,' and 'patent aqua-scutem' over

And then gives an immense amount of in-formation on art, a reference to the weak state of our School of Design, and the improper manner in which the Vernon collection has been treated, all in the space of eight lines :-

"O such a town, such a picturesque metropolis,

Taste is polychromical for painting wild; Frescoes for peers, and Art-unions for the populace, Schools where young designers learn to draw it

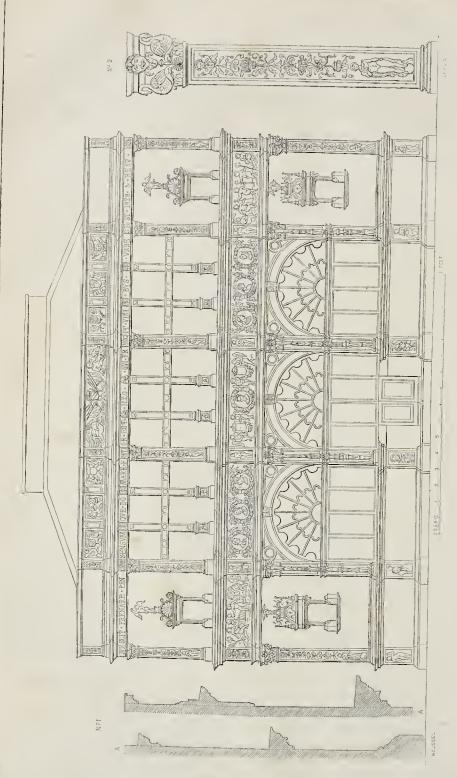

Dioramas, Cosmoramas, Cycloramas, charming ones, Missisippi panoramas, four miles long—alarming

A national collection, where they never ask a fee at all. Besides the Vernon Gallery, a sight no one can see at all."

We must not forget the scenery. verley has quite maintained the character we have before this given him. "The Fairy Lake and Grotto of the Swans" is a beautiful piece of imaginative rock work; the "Ruins in the Valley of the Nile," is a morsel of David Roherts,' magnified (which might have been made a little more of), and as to the "Camp of the Champions," the last scene, we are quite willing to adopt the lines of the epi-

And be kind enough to say, in our usual goodnatured way,
That the scenery hy Mr. Beverley,
Has been painted very cleverly."

ROMAN REMAINS FOUND NEAR COLCHES-TER.—On ground belonging to Mr. J. Taylor, of West Lodge, about 250 funeral vessels, and a great variety of other remains, have been found in such circumstances as lead to the supposition that there are at least twelve times as many urns in the same ground still unex-humed. Mr. R. Smith and some other members of the Archæological Association have been at Colchester inspecting these remains.

HOUSE OF FRANCIS I, CHAMPS ELYSEES, PARIS.

DETAILS: HOUSE OF FRANCIS I., CHAMPS ELYSEES, PARIS.

HOUSE OF FRANCIS I., CHAMPS ELYSEES, PARIS.

This house, formerly under the name of "Maison du Tonnelier," was, according to tradition, built at Moret, by Francis I. The little town of Moret, of very ancient origin, is situated two leagues from Fontainbleau. As forests bound it on all sides, Francis I. had an idea of establishing there a meeting these for huntimental head and the state of the state had an idea of establishing there a meeting place for hunting; and he caused the elegant edifice, which our drawings illustrate, to be erected. Its interior clearly shows for what object it was constructed. The three great arches which decorate the front occupy nearly the whole space of the ground-floor.

This house being sold in 1826 by the Government, it was bought by a lover of the arts, who caused it to be transferred, stone by stone, to Paris, where, in the Champs Elysées, the house of Moret was rebuilt, uninjured, with its own debris. The sculpture is attributed to Jean Goujon.

htted to Jean Goujon.

A section of the cornices, strings, &c., on the front wall is given, and some of the details to a larger scale. The date 1828, in the frieze, refers to the installation of the rebuilt structure. This house is an excellent example of the Renaissance period in France.

BEAUTY IN TOWNS AND VILLAGES.

THE following extracts from Mrs. Tuthill's American "History of Architecture," reviewed

American "History of Architecture," reviewed by us some time since, are interesting as affording evidence of the growth of a right feeling in America, in respect of beauty, and, moreover, may have their use in England:—
"The public squares of Philadelphia are incalculably important to the health of the city, Beneath the dense foliage of Washington-square, crowds of merry children enjoy, unmolested, their healthful sports. Within the enclosure of Independence-square, was first promulgated the Declaration of Independence. Franklin-square has in the centre a fountain, falling into a handsome white marble basin. Penn, Logan, and Rittenbouse-squares are also ornamental to the city.

The New-Haven-green has been justly celebrated as one of the most beautiful public squares in this country. Its elms are remarkably fine; it has recently been enclosed with a light and tasteful iron-railing, which adds

much to its beauty.

Many of our large cities are entirely destitute of such green retreats. Gardens and squares are so necessary to the health, as well as the enjoyment of those who are shut up in the close streets of a city, that it should be considered an imperative duty to provide them for all classes of the inhabitants. It may be urged, that if left open and free, the decorations would soon be destroyed by the populace; some few rude hands might occasionally make sad havoe among them, but when the people have once learnt how much such places of rehave once learnt how much such places of re-sort contributed to their health and pleasure,

they would carefully protect them from injury.

The beauty of the edifices constitutes the principal beauty of the streets, squares, and

city in general. And who should preside over this department? Every city should have its Academy of Architecture, without whose approbation nothing should be erected.' (The independence of American taste would not submit to such dictation.) 'The height of the houses should never be more than three stories, their façades regular and well proportioned, all equally simple, but differing in their style and ornament. Uniformity should be admitted in the squares only.'

The public edifices should be so placed as to suit public convenience. The university, colleges, and high schools, should stand upon commanding situations, with squares and courts about them, planted with trees and ornamental shrubbery, excluding as much as possible the noise and dust of the city. A correct taste would thus be early implanted in

correct taste would thus be early implanted in the minds of the young, and a love of the beautiful 'grow with their growth and strengthen with their strength.' Banks, exchanges, and enstom-houses should be built where 'men most do congregate,' and have the expression of richness and durability

Markets, with ahundant space about them, should be as near the suburbs as convenience permits, and should stand at the termination of some of the principal streets. The Boston market-house is finely situated, and is a beau-

tiful building.

Hospitals, manufactorics, and magazines, should be without the city, in open elevated places, where they can enjoy a free, fine atmosphere. Cemeteries should be laid out with taste; planted with suitable trees and evergreens, and kept with scrupulous neatness. Architecture ought to be displayed with the greatest sublimity in churches, which neither on the exterior nor within should have anything mean or inelegant. They should stand upon an open square, or at the termination of street presenting the whole façade to close the vista.

the vista, Villages.—Bad judgment and bad taste have prevailed in the laying out of many of the villages in the United States. The New England villages have been much admired for their neatness and beauty. An observing and venerated author,* whom we have once or towice quoted, thus contrasts the villages, or towns, in the Connecticut Valley with those on the Hudson River:—'They are not, like those

along the Hudson, mere collections of houses and stores, clustered round a landing, where nothing but mercantile and mechanical business is done, where the inhabitants form no connections nor habits beside those which naturally grow out of bargains and sales; where the position of the store determines that of the bouse, and that of the wharf often commands both; where beauty of situation is disregarded, and every convenience, except that of trade, is forgotten. On the contrary, they are villages destined for the reception of men busied in all the employments existing in this to acquire property, but to sustain the relations, perform the duties, and contribute to the enjoyments of life. Equally, and, to my eye, happily, do they differ from most European villages. The villages on the other side of the villages. The villages on the other side of the Atlantic are exhibited as being generally clusters of houses, standing contiguously on the street, built commonly of rough stone, clay, or earth, and roofed with thatch, without court-yards or inclosures, and of course incapable of admitting around each house the beautiful appendages of sbrubs, trees, gardens, and meadows.

New England villages, and in a neguliar

New England villages, and, in a peculiar degree, those of the Connecticut Valley, are built in the following manner.

'The local situation is pitched on, as a place in itself desirable; as a place, not where trade compels, but where happiness invites to settle. Accordingly, the position of these towns is usually beautiful.' One wide street, planted with trees, generally passes through the whole length of the village. 'The town plot is originally distributed into lots, containing from two to ten acres (not twenty feet by fifty!) In a convenient spot, on each side of these, a house is erected at the bottom of the court-yard, often neatly enclosed, and is furnished universally with a barn and other convenient outbuildings. Near the house there is always a buildings. Near the house there is always a garden, replenished with culinary vegetables, flowers, and fruits, and very often also, prettily enclosed. The lot on which the house stands, universally styled the home-lot, is almost, of course, a meadow, richly cultivated, and containing generally a thrifty orchard. It is hardly necessary to observe, that these appendages spread a singular cheerfulness and beauty over a New England village, or that they contribute largely to render the house a delightful residence.'

These villages have been the models of many in the western part of New York, and still farther west. The buildings in some of these villages, especially in the State of New York, are superior to those of New England. Who has not admired the beautiful location of Who has not admired the beautiful location of Canandaigua, Geneva, and Skaneateles, upon their lovely lakes? The refined taste exhibited in their style of building, too, has excited the surprise and pleasure of travellers. We have been accused of a want of patriotic and generous feelings as a nation; of possessing strong individuality of feeling and interest, amounting to absolute, controlling selfishness. This accusation may, or may not be true; it is perhaps as difficult for us to know ourselves as a nation, as the wise Milesian considered it for each one to be acquainted with himself. It is certain that we have too few objects of common interest. Every state, county, and even village, is divided into innunerable jarring and contending parties and sects. Though a prosperous, we are not a cheerful people. Anywillage, is divided into innumerable jarring and contending parties and sects. Though a prosperous, we are not a cheerful people. Anything that would contribute to unite public feeling, by bringing men to act together for the general good, would be a great benefit to a community. Suppose it to be a public garden and promenade, open and free to all. Every villager contributes according to his means to this object. Some suitable persons are chosen whinger combines according to me inclusion this object. Some suitable persons are chosen to lay out the grounds, others to keep them in order. It belongs to the village, it must be beautiful, for the good of the village. It is a common object of thought, feeling, and action. The moral influence of it will soon be felt. The man, instead of going to the tavern for the news, may walk out at the sweet bour of summer twilight, and beneath spreading trees enjoy the society of his neighbours, and at the same time have his children under his eye.

If this public garden or promenade were richly and tastefully arranged and ornamented, a desire for neat and pleasant dwelling-houses

* President Dwight.

would naturally arise among the villagers Lord Kames, in his 'Elements of Criticism, remarks, that, 'In Scotland, the regularity remarks, that, 'In Scotland, the regularity and polish even of a turnpike-road has some and poish even or a turnpike-road has some influence of this kind upon the people in the neighbourhood. They become fond of regularity and neatness; which is displayed first upon their yards and little enclosures, and next within doors. A taste for regularity and neatness thus acquired, is extended by degrees to these read equations.

to dress, and even to behaviour and manners.

Two little girls from a city had one day Two little girls from a city had one day taken a long walk beyond the city, upon a public road. A sudden shower of rain threatened to drench them to the skin. Several houses upon the road offered themselves as places of shelter; the youngest girl proposed to enter the nearest one. 'No,' said the elder, 'we will not go in here, nor into the next, but yonder is a next, pretty cottage, with flowers in der is a neat, pretty cottage, with flowers in the front yard; I know they will be kind there.' But this is the higgest house,' urged the younger sister. 'Oh! but I am afraid to the younger sister, 'Oh! but I am afra go in here, it looks so dirty and care go in here, it looks so dirty and earless; hurry, hurry, sister! for I know they will treat us well where they take so much pains with their neat house and garden.' And the girl's reasoning was correct. There was gentleness and kindness within, as well as neatness and taste without.

Would it not be well if some of our states men would condescend to pay more attention to this subject? How often might they hecome public benefactors, at a small expens come public benefactors, at a small expense of time and money, if they were men of cultivated taste and generous public spirit! Those beau-tiful avenues of elms in the city of New Haven, are they not graceful, magnificent monuments to the memory of the noble states-man who placed them there? Who can estimate the influence that his tasteful benevole has exerted upon the community to which he

was so great a benefactor?

On a review of this subject, it may be urged, that we are a business people, an industrious people; we have no time to devote to amusebesides, we are a serious people, and such objects as are here proposed, are not in unison with our habits and feelings. Our cities must grow up and increase as they have done hitherto, without the fostering hand of done hitherto, without the fostering hand of taste; we are young, and not yet prepared for such improvements, if indeed they are improvements. With due deference to those who differ, and with becoming modesty, we must still urge that the purity of morals, the simplicity and sobriety of the citizens of the United States, would not he endangered by suitable attention to the cultivation of a taste for architecture, and the beautifying of cities and villages. It is as easy to plan a city, a village, or a hnilding, in good taste, as in had taste, and as cheap too, since that is an all-important consideration. Simplicity of style in architecture is in itself a beauty. A Doric portant consoleration. Simplicity of style in architecture is in itself a beauty. A Doric temple is perfectly simple, yet what object of art is more imposing and beautiful? We have wealth enough, if we have only taste to use it, wealth enough, it we have only taste to use it, to render our country as superior in artificial, as it is in natural beauty, to almost any country in the wide world. When Athens was at the height of her glory and splendour, she had not one quarter of the population or the wealth that the State of New York now possesses. And New York is arousing, herself like a And New York is arousing herself like a giantess, and soon, we trust, will exhibit to the world buildings which, for, 'nobleness of design, vastness and grandeur of conception, proportion and harmony of parts,' shall rival the decaying glories of republican Athens.

But this is not what we would mainly urge There may, and ought to be, taste, and even elegance, where there is but little wealth. Every town and village may appear heautiful, if proper attention be paid to the houses and grounds. A rustic farm-house may be convenient and picturesque. A turnpike gate, now a most unsightly object, might be made even ornamental. If we are not yet prepared for these things, we ought to be. Professing ourselves free library advisors. selves free, liberal, enlightened, refined, without any perception of beauty!

Beauty was sent from Heaven,
The lovely ministress of truth and good,
In this dark world; for truth and good are one,
It is a sent world; for truth and good are one,
With like participation. Wherefore then,
O sons of earth! would ye dissolve the tie?"

THE BURIAL GROUND QUESTION

SIR JAMES MURRAY, the physician, of Dublin, in a letter to a friend on this subject, says, "I remember during many years when I resided in Belfast, there was an extensive graveyard along the cast side of Church-lane, from one end to the other of that narrow street. The hack windows of all the houses opened into that damp Golgotha, so low as to be on a level neighbouring docks and quays, well recollect that scarcely a house on the eemetery side of the lane was ever free from some kind of low sickness, or its consequences, whilst the south side was comparatively exempt from disease.

At length, burial was prevented in that ground, and a handsome church was erected on it. I understand the adjoining families are now as healthy as any in that vicinity. You are aware, that during thirty years I have been making experiments upon the insalubrious making experiments upon the insalubrious effects of localities where damp, variations of temperature, and decomposing bodies form what Local work and decomposing bodies form temperature, and decomposing bounds what I call vast yalvanic troughs. Fens and marshes, low and filthy streets, crowded lanes and moist situations, are all batteries, emitting and moist situations are manations around. But if you insert deep wires into festering grave-yards, and bring them into electrical contact, you will find that there is no battery whose communications are so lethal, as the break of galvanie equilibrium inflated by the vast and continued decomposition evolving in burial-

As Lord Dudley Stewart said, at the public meeting mentioned by us last week: — We are proud of our riches, of our talents, of our are proud of our riches, of our talents, of our civilisation, and of our progress in commerce and in all the arts and sciences, and we should be oftended if any person presumed to say that this country was not the most moral and most religious in the world, and yet, gracious Heaven! we suffer such things to be in the midst of this great metropolis. But when I mention to you the shocking state of things to which I have alluded, and which is of a nature to harrow up your feelings, and, as I nature to harrow up your feelings, and, as I must think, to blunt the sensibilities, and make men careless of the respect to the dead, and also irreligious,—when I mention these things I have not told you all, for a very great deal remains behind. If burials amidst crowded cities are injurious to the morals, they are also fraught with deadly poison to the public health. No subject has engaged the attention of the public or of the Legislature of late years to a greater extent than that of the public health. Sanitary measures have engrossed much of the attention of Parliament, and have occupied the minds of men throughout the country; writings have heen poured forth from the press on the subject; meetings have heen held again and again, and information to a great extent has been supplied, with the hope of improving the bealth of the public,—but it may be said that all these endeavours will be in vain, as far as regards the health of towns, as long as the system of burying in the heart of towns is permitted. You say, let us have good sewer-age, let us have good ventilation, let us have fresh air and a good supply of fresh water and I say so too. I know nothing more important; but, alas! it is in vain to have improved sewers, good supplies of water, and fresh air; it is in vain to make the attempt which has been made, and will be renewed, to give poor people an unstinted supply of light by the repeal of the window-tax, if with these advantages we do not also succeed in rooting out and drawing away all interments from the heart of the metropolis. For what would be the use of breaking open the small eramped-up windows of the poor to let in light and air, if that air brought in with it poison? and arr, it that air brought in with it poison. Men say give us air—aye, but give us fresh air—don't give us polluted air, charged with miasma and poison from recking bodies in a state of putrefaction, which are heaped up at

our very doors.

Mr. Walker, in the course of his speech, Mr. Walker, in the course of his speech, observed,—The other day I saw a gentleman just returned from Constantinople, who told me that the plague invariably hroke out in Turkey in the neighbourhood of burial-grounds. Madden, in his travels in Falestine, says that plague miasma originates in the putrefaction of animal matter; and decidedly

the best authority who has ever written on this subject, M. Pariset, whose name is well known, subject, M. Pariset, whose name is well known, and possesses a European reputation, says, that with pure air and water, with healthy food in moderate proportions, none of the singular mutations, productive of death in man and animals could exist. He says, as the result of his long experience and observation in the Levant, that there is only one country is the world in which the only one country in the world in which the plague is permanent, and that country is Egypt. He states further, as the result of his observation, that he believes its origin is en-tirely due to the emanations from human and animal corpses, but especially from human

How much longer shall we refuse to listen?

DWELLINGS FOR RICH AND POOR.

UNION OF CLASSES.

THE arrangement of towns has been but too little attended to; as it must tend very considerably to alter, for better or worse, the chasiderably to alter, for better or worse, the character of the city, it should meet with more consideration. An evil is now growing around us of large districts entirely destitute of dwellings for the poor; the consequence is, they lose the advantage of the example of those of superior education; the rich, on the other hand, have not that control over their indulgenees by the constant exhibition of poverty; two classes, instead of growing up together on each other's sympathy and support, are so entirely estranged as to become dangerous to each other (this is clearly shown in the July riots in Paris, when fauhourg fought against faubourg); another evil is also very pressing, viz., the poor's-rate. In the more wealthy viz., the poor's-rate. In the more wealthy parishes it is diminishing, while in the less fashionable quarters it is increasing to a most frightful extent.

As new communications are about to be opened in districts that are crowded with poor, who must necessarily be driven to the outskirts of London, or press more closely upon the already too densely inhahited rooms of their former haunts, this is a subject not unworthy of the architect's profession, as to how far these evils may he alleviated, and these new thoroughfares be made available for the amalgamation of the rich and the poor. The problem is this, can houses be built in leading streets which will pay better than mere houses over a shop, the present usual mode of building a new street? The plan the writer would suggest that a block with a frontage, say 300 and 60 feet deep, should be built on the follow-ing plan:—The ground floor to consist of a shop, and over that an entresol; this portion of the huilding to be entirely separate, so that a tradesman should be enabled to have a good frontage without the risk of lodgers, the en-tresol of course forming the dwelling of the shopkeeper. In an artistic point of view this would be a gain, as the proportion of hase would be better than in the more ordinary mode, and the piers would be of a more solid con-The shop decorations would by that means become accessories to the con-struction, and not form part of the building. Over this might he placed four stories, to he thus arranged. The two first floors to be inthus arranged. The two mist works to single habited by small gentlemen's families or single persons, each set of chambers forming a complete small house within one door; the two persons, each set of chambers door; the two plete small house within one door; the two next floors would be occupied by clerks, or the superior artizan. Two staircases would be sufficient for 300 feet frontage; these might be so constructed that two staircases should ocone well, one leading to the drawing-room and first floor, the other the full height. The whole building to be fire-proof, and warmed and ventilated on the plan of public buildings, say a temperature of 55 degrees. This class of building would suit a principal thoroughfare, and inferior classes would occupy the side street. It is a matter that cannot be too often enforced upon the public, that an ordinary mechanic cannot obtain, even at the high rate he pays in proportion to bis income and quality, a really wholesome apartment. It should be enforced upon the profession to make their art popular; many of our most wealthy districts have grown up almost without their aid. It is but too generally thought that the architect designs only public buildings and country mansions; let it be shown that his science can administer to the

comfort of all classes, and that all art is only good as it is utilitarian, not in the ordinary acceptation of the term, but as it is productive of good. Painting and sculpture are useful not only as affording pleasure; but while the eye is pleased, so is the mind elevated and raised to purer and holier thoughts. So let the architect, the professor of the cbief sister's art, endeavour by his skill to allure even the humblest of his fellow citizens from the baneful influence of an ill-regulated home; let his science penetrate to every part of the house, in warming, ventilation, drainage, and arrangement; it is then that the world will begin to appreciate architecture, and clearly understand the duties of its professors.

T. comfort of all classes, and that all art is only

SUPERVISION OF BUILDINGS IN VIENNA.

DIPPING the other day into Thompson's new work on "Austria," we fell upon some particulars of the means taken in Vienna to control new buildings, which will probably interest our readers; and here they are:—

"Attached to the staff of the police is a board of architects with numerous employés to attend and enforce the different regulations laid down to insure the bealth and security of the inhabitants by sufficient drainage and ventilation. Three plans of a house to be built must be lodged at a magistrature, when a commission is appointed to examine them, and if no objections present themselves the work is allowed to proceed. The chief points insisted on are, that the scaffolding shall be so constructed that nothing can fall through it into the street, and that it shall not project more than 6 feet; that though the cellars may be carried to any depth, the foundation must be laid one-sixth as deep as the house is in-tended to be high, the maximum beight being restricted to four stories. The ground-floor must be arched, and the walls of the upper story must be 2 feet thick, while each one above the ground-floor increases 6 inches, so that in fact a house of four stories high must be 4 feet thick at the ground-floor. No story be 4 feet thick at the ground-floor. No story may be less than 9 feet 6 inches high, and the ground-floor must be at least 6 inches above the pavement of the street. All kitchens, on whatever floor, must be arched; and as each floor is usually occupied by several sets of tenants, each stove, to prevent annoyance, must have its separate flue, of at least 7 inches in diameter, carried up at an angle of 60 degrees, to facilitate cleaning, into the main chimney, which must be at least 4 feet above the roof, and be secured both above and below by an iron grating. The staircases below by an iron grating. The staircases must be entirely of stone, and the window frames of either stone or hrick; and a drain, Hames of ether stone or hrick; and a drain, at the expense of the proprietor, must be carried into the main sewer. The houses are built of brick, cemented over, which, besides presenting a more uniform appearance, is necessary, as the bricks are coarse unsightly affairs; they are of large dimensions, measuring, by statute, 11½ inches by 5½ and 2½ inches thick, and cost about 30s. the thousand.

thousand.

The value of land in the best parts of the city ranges from five to six hundred florins 50t. to 60t.) the square fathom, and in other parts from two to three hundred; but in the suburbs it is much less, and ranges from five to fifty florins. In the rebuilding of a house the magistrature has the power of setting it back, to widen the street, on paying for the land at the average value of that in the district. Leasehold property is unknown: and trict. Leasehold property is unknown; and thus the owner of the land, even if another person should build the house, is registered as the proprietor in the Grundbuch, which is the complete record of all the household and landed property in the empire. In all towns this register is kept by the grundgericht, a peculiar kind of magistrate, and in country places by the landowners, or herrschaft. In Vienna there are four of these registers, two civil and two ecclesiastical—one of which letter beloves to the horizontal and two latter belongs to the metropolitan diocese, and is under the charge of the archbishop, and the other to the clergy of the Schotten order. All amounts of money advanced on mortgage, or otherwise on houses and lands, must be entered on these records, to make the transaction valid, and to prevent fraudulent practices." CONSTRUCTION OF LIGHTHOUSES. LIGHTHOUSE ON COHASSET ROCKS, U.S.

FROM the official report of Captain Swift, under whose direction this lighthouse is being constructed for the American Topographical Bureau, we learn that the form of the lighthouse frame is an octagon, of 25 feet diameter at the base; the structure is formed of eight heavy wrought iron piles, or shafts, placed at equal distance from each other, with one also at the centre. The piles were forged in two pieces each, and are connected together by very stout cast-iron or gun metal sockets, the interior of which is bored, and the pile ends are turned, and secured to the sockets by means of large steel keys, passing through the piles and sockets. Above and below the joints or sockets, and connecting the middle pile with each outer pile, there extends a series of wrought iron braces, and the outer shafts are connected together by similar braces, extending from one to the other,—and thus the whole structure is tied together.

The keeper's house is octagonal in shape, and 14 feet in diameter; the uprights, or stanchions, are of cast-iron, and rest upon the cap immediately over the pile heads, where they are secured with bolts and keys. These uprights are cast with double flanches, between

uprights are cast with double flanches, between which 2-inch plank, grooved and tongued, are to be fitted horizontally: and at right angles another series of plank is to he set on end vertically, and, together, these form the side or frame of the house; upon this frame the roof will be placed, and, finally, upon this, the lantern will be set up.

The drilling of the holes for the lighthouse occupied the better part of two seasons. The erection of the iron structure in place, it may be conceived, was comparatively a work of much less difficulty, and, with favourable weather, an undertaking not requiring much time. The triangle and drilling machine was swept from the rock twice during the first time. The triangle and offiling machine was swept from the rock twice during the first season's operations, and the men were frequently washed from the rock, but happily no lives have been lost. The holes were all finished on the 16th August, that is to say, nine holes of 12 inches diameter and 5 feet

mine noise of 12 means and the deep.

The entire height of the structure from the surface of the rock to the top of the lantern will be about 70 feet, and upwards of 50 above the line of the highest water.

The entire weight of the iron work is about 70 tons; of this upwards of 40 tons is wrought iron, the residue of cast iron. The average weight of each complete shaft is about 8,200 lbs. The cast-iron couplings for connecting lbs. The cast-iron couplings for connecting the upper piles with the lower are 3 feet long, and weigh nearly 800 lbs. each; they are made of the best gun metal. The weight of the lantern and illuminating apparatus is about

RAILWAY JOTTINGS.

THE contracts for the execution of the Bishop Auckland and Pensher and Sunder-land branches of the York, Newcastle, and Berwick line, have been let to Messrs. Rush Berwick line, have been let to Messrs. Rush and Lawton—the former for 235,000l. and the latter for 63,000l.—The strengthening of the permanent way of the Bristol and Birmingham line from Gloucester to Birmingham has been completed to an extent of 16 miles. The rails are of a weight of 84lb. to the yard, in the place of 40lb. as heretofore.—A range of old buildings at Wolverhampton have been removed averaged of the part of hampton, have been removed preparatory to the erection of the entrance to the station of the Shrewsbury and Birmingham line. Besides the offices, a double row of new shops and houses will be erected, so that with the removal of unsightly buildings, a twofold improvement of that part of the town ex-tending from Railway-street towards the canal

box usually left open, so as to prevent either the waste of grease or the access of dust. A saving of several thousands of pounds a-year is anticipated from the adoption of this axlebox, which is an invention of one of the company's engineering officers, Mr. Normanville,
—The Daily News states that a discovery has been made of fraudulent practices or in tentions with reference to the South-Eastern Company's passenger tickets, on the part of a subordinate officer on the North-Western.

LAUNDRY DRYING-CLOSETS.

A CURRENT of air having been long considered essential to the evaporation of moisture in laundry drying-closets, I beg to send you the result of some experiments tried with the new closet at the Middlesex Hospital, which prove that at high temperatures an external air drain man a continuous.

which prove that at high temperatures an external air-drain may be entirely and advantageously dispensed with.

The closet alluded to is 6 feet wide, 7 feet high, 8 feet long, and is heated by the direct radiation of the heat produced by the flue of the ironing stove passing through it, by which means it is kept at a temperature varying from 180° to 200° Fahrenheit, with little more fuel than would be required for the working of the ordinary ironing stove. The closet was originally constructed with an external air drain, but the drying not being satisfactory the drain was closed, and the following result obtained:

	Weight when put in.	Weight when taken out.	Water evaporated.	Time in evaporating.	Temperature of the Closet when rugs, &c. were put in.	Temperature when taken out.
Six Blankets Eighteen Rugs	1bs. 44 169	1bs. 23½ 87½	1bs, 20½ }	h.m. 1.35	200°	160°

The closet, after the linen was taken out, gradually rose to the temperature of 200°. The quantity of fuel required to keep the closet and ironing stove in full work was found to be about 16 lbs. weight of coke per hour.

It will be observed that the water evaporated from this closet is compared.

from this closet is equal to 1 lb. per minute, and the fuel consumed about one-fourth of the weight of water evaporated.

WM. JEAKES, Jun.

Miscellanea.

TENDERS FOR HAMPSTEAD WORKHOUSE, —Sir: I observed in your journal a striking example of the contracting monomania exhibited in the amounts of the several tenders sent in for the proposed alteration to Hamp-stead Workhouse. The lowest tender, Mr. Pilbeam's, was accepted, but in a day or two, I heard that Mr. P. had discovered a trifling, and of course, accidental error, of some 1,500L; the guardians declined accepting his have seen an advertisement calling for more tenders. Were there none of the other contenders. Were there none of the other contractors responsible men, or are the guardians so very ignorant of the usual method of proceeding in such a case? Is there no man of business among them to set them right, or do they imagine that it is no trouble to builders to take out their own quantities and estimate for such works for the amusement or instruc-tion of Boards of Guardians? May I beg the favor of your inserting this, as I think it only be carrying out the great principle of fair play to all which you have so long and so fearlessly advocated.—A LOOKER ON.

THE GAS MONITOR. - Sir: My object in tending from Railway-street towards the canal will he thus effected.—A new axle-box has been tested on the North-Western carriages. The escape of grease and the admission of grit or dust are both obviated, it is said, in this invention, so that a carriage has been found to be capable of running 4,000 miles without either renewal of grease, access of dust, or hot axles. The grease, access of outs, or hot axles. The grease is supplied through a serew opening, and a valve acted on by vulcanized rubber springs is fitted to the axle at the end of the pointing out the incorrectness of the advertise-ment of the Gas Light Monitor, was to avoid contributing by my silence to misleading the

PROJECTED WORKS .- Advertisements have been issued for tenders,—by May 26th, for the erection of sundry buildings and works, at the erection of sundry buildings and works, at the new barracks, at Awlerton, near Sheffield; by April 14th, for sundry earthwork to be done in the removal and levelling of ground at East Hill, Wandsworth; hy 25th, for the erection of St. John's Church, Kingsdown, near Wal-mer, Kent; by May 2nd, for the erection of additional buildings at the Queen's College, Birmingham; by 23rd instant, for certain works and additions to the laundries and dry-ing rooms of the workhouse at St. Martin's-ining rooms of the workhouse at St. Martin's-in-the Fields; by 26th, for the erection of an the Fields; by 26th, for the erection of an infirmary and other works, as an addition to the Wandsworth and Clapham Union Workthe Wandsworth and Clapham Union Work-house; by a date not specified, for the erection of a new Pauper Lunatic Asylum, for Wilts, at Devizes, and for a large quantity of cast-iron columns, sashes, and joists for same, separate tenders; by 30th, for the erection of the Normal College for Wales, at Swansea; by 24th, for the erection and completion of a bright warehouse at Rultan, by same date for hrick warehouse at Bolton ; by same date, for the supply of boiler plates, bar and angle iron, spring steel, copper, brass tubes, &c. for Lancashire and Yorkshire Railway, also for materials for waggons for same; by same date, for various articles in iron, copper, brass, &c., and for paints, glass, &c., for Glasgow and Ayr Railway Company; by 2nd May, for the supply of materials for the metropolitan roads; and by 24th April, for a supply of English tough cake copper at Chatham.

Competition.—Resident architects in St. Martin's-in-the-Fields are invited to compete "for the erection" of new national schools in that parish.

THE ORDNANCE SURVEY OF THE CIVIL SURVEYORS.—Sir: In your paper of last week, under the heading "Ordnance Survey," is the following paragraph:—"It also stated the fact, that although the estimated cost of the survey was 24,000*l*, the work would be completed for 3,000l. within that amount, and 5,000l. below the estimate given in by the Civil Surveyors." In this there must be some mistake, as on referring to the published papers of the "Surveyors' Association," I find, that while the estimate furnished by the Ordnance Department to the Commissioners of nance Department to the Commissioners of Sewers for a block plan and levels of London, within a radius of eight miles round St. Paul's, was 19,945*l.*, exclusive of 4,270*l.* for the triangulation, making together 24,215*l.*; the estimate of the Civil Surveyors was 18,200*l.*, at which sum they were very desirous to under-take the work, and offered to give approved security, and suffer heavy penalties if it was security, and suiter neavy penautics it it was not completed within six months of the date of contract. By your paragraph we are to assume that the survey will be completed by the "Ordnance Surveyors" for about 21,0001, and my object is to show, that that sum is not 5,000% below the estimate of the "Civil Surveyors" but on the contrary 5,000. below the estimate of the veyors" but, on the contrary, exceeds it.—
EDW. RYDE, Upper Belgrave-place.
Disculsifion on GUTTA

Learned Disquisition on Gutta

Learned A.—A lively controversy has been

Percha.—A lively controversy has been

the Edinburgh journals be
McLean, the well-known

on the pro-Percha.—A lively controversy has been going on in the Edinburgh journals between Professor M'Lean, 'the well-known linguist,' and Mrs. Jamieson, on the pronunciation of the 'percha' in 'gutta percha.' It is 'perka' according to the lady, 'persha,'—the linguist. Now, we are greatly mistaken if both be not wrong. The word is native Malay, and not only the original importers of the article, but the Malays themselves are said to have declared it to be 'pertsha,' and if so, not being very profoundly versed in the Malay lingo, we certainly prefer yersed in the Malay lingo, we certainly prefer following the authority even of a native barbarian rather than that of the best known 'linguist' in the north. But the professor of botany, then, must be supposed to know something about it, seeing that the tree which yields it babbe extractions. yields it holds, or ought to hold, a place in his 'alhum,' and the professor, as an umpire, authoritatively declares in favour of his fellow professor, stigmatising the lady's dictum—moreover, as "an unadulterated cockneyism." The cockney naturalist, however, whose re-searches led him to the fishmongers' museum of piscatorial history on the look out for gutta percha soles, must have ranked the gutta per-cha with the sole tribe as a hybrid with the 'perch' and, being doubtless versed in Latin terminology, must have asked for "gutta pertsha soles,"

DOCKYARD REDUCTIONS.—"From every dockyard," says the Morning Herald, "we have the most lamentable statements of reducnave the most amentable statements of reduc-tions on Saturday last—hundreds of poor fellows left her Majesty's service to starve, or to hecome chargeable to the parish; whilst others—the very best men of the establish-ment, and quite as good as those left behind men who have 'borne the heat and burden of the day '—were seen, with heavy hearts, lug-ging their chests of tools out of those gates which they have been accustomed to enter for the last thirty years. The Government have the last thirty years. The Government have much to answer for in respect of these reductions, which should have been gradually, and not so summarily made. Confidence is utterly not so summarily made. Confidence is utterly shaken throughout the Royal establishments, and the result is, every good man without influence, will try to better himself out of the man without inductive, win try to better inductive in an opportunity."—" One of the consequences," remarks tunity."—" One of the consequences," remarks tunity."—" One of the Control of the Hampshire Advertiser, "must be an inthe Humpshire Advertiser, "must be an increase of the poor's-rates. We think, if reductions are inevitable, and we fear they are, they might have been made in a different way. In all cases of this kind, Government invariably begin at the wrong end. Why not cut down high salaries? abolish useless offices?" Between 600 and 700 men are here thrown out of employ, whereach it is the salar in the s employ, whereas by the course suggested pro-bably not even a dozen might have been de-prived of their sinecures, and yet have had abundant other means of upholding life, not only in all its essentials, but in all its comforts and luxuries too. Here is the way in which the heart of the more man is sourced and disthe heart of the poor man is soured and disthe heart of the poor man is soured and dis-gusted with his rulers—one and all, and the prolific seeds of Chartism and crime but too abundantly sown,—not amongst discharged officials alone, but amongst all of the same class, ay, and of others also, who sympathise with them with them.

WANT OF AMBITION AMONG WORKING
MEN.—There is no such startling difference
in the emoluments of classes, as in their habits
and social peculiarities. 'The half-pay officer, the dissenting clergyman, or curate of the establishment, the government or mercantile clerk, draw salaries which are often exceeded by those of working men, yet they do not consider it their duty to appear in filthy attire, or to expend a third of their income at the tavern; and, on the other hand, they do not give testimony to their utter want of mand by requiring that their wages should he paid weekly. It is an appalling thing to reflect mand by requiring that their veges to reflect paid weekly. It is an appalling thing to reflect how large a fund, if we look on it merely as a pecuniary question, is sunk in that unfortu-nate peculiarity which prevents the workman from raising the tone of his mind, and the character of his habits, above the level of the lowest of his fraternity. It is natural to anti-cipate that when accident throws enlarged funds into the possession of the more unskilled hand-labourer, they should be wasted and misapplied; but the class influences rise higher, and are found so tainting the able and accomplished workman, as frequently to make his ingenuity and energy contribute to demo-ralise and degrade him. An employer of ralise and degrade him. An employer of skilled workmen lately told the author of these remarks that he gave out work occasionally to a man who could make 1l. a-day, and who, both by his skill and his income, might be expected to take his rank among professional men. But nominally he was a worker; he stuck to his order, and would not permit his capacities to raise him above his brethren, so that he never saved a farthing from the tavern,

and was then lying penniless in a public hospital.—Burton's Political and Social Economy.

Supply of Water.—At the last returns there were 70,000 houses out of 270,000 that there were 70,000 houses out of 270,000 that had no water supply whatever; and though it is asserted that the number has since diminished, the supply of water to the poor in general is so exceedingly scanty in many districts, that it is practically a perfect mockery. Seventy thousand houses inhabited by the poor, with an average of only two families to have small give 700.000 person who have a house, would give 700,000 persons who have to beg or steal water every day for the ordinary necessities of existence. Although the nary necessities of existence. Although the practice of reducing to figures and to a money value, the sanitary ills endured, is to a certain extent a pandering to the vicious system which prompts an Englishman always, when first considering a new project, to regard it in a mere money point of view, still it has its

benefits in being an argumentum ad hominem, of no inconsiderable value, in determining a speedy conclusion. Now, if the very hardness of the water of London alone leads to an outlay of soap and soda of, at the least, double the amount absolutely requisite, and that amount be 630,000l., it is surely worth while amount be 030,000th, it is surely worth wine to determine whether an actual waste of 315,000th should be annually tolerated in the metropolis. But if we embrace the moral and physical evils, and combine with them the sum of the pecuniary loss entailed by the present scanty and intermittent supply of impure, of the distribution of the product of the produ often dirty, water to London, such an array of facts would stand forth as to cause every inhabitant to cry shame upon those whose duty it should happen to be to present a remedy for such a condition of things.—Health of Towns Journal.

NEW CALCULATING MACHINE. - Two miserably poor young men, residing in an obscure village in the department of the Isere, in France, have succeeded, it is said, after ten years' labour, in completing a machine deyears labour, in compresing a machine ca-clared to be superior to any yet invented. The Academy of Sciences have issued "a most eulogistic report" on it. What has become of Mr. Babbage's machine? The only cal-culation of any importance yet effected by it, we fear, is a never-ending multiplication of expense to the country. What has the calculator been about for so many years, while young men have been growing old and grey, and the middle-aged falling into second child-hood—all forgetting that Babbage or his machine ever existed. We will be bound to machine ever existed. We will be bound to say that thousands of intelligent young men have sprung up from childhood since this hopeful machine was produced, and are at this moment ignorant of the fact that it ever was produced, far less of the hope that it ever will come to maturity.

THE BRISTOL WATER-WORKS are in an advanced state of progress, and the directors report that the engineer expects to bring the water from the Harptree Coombe springs into the city in the ensuing autumn, and from those at Chewton Mendip in the spring of 1850. More than 50 miles of pipes are laid through the city and suburbs.

WINDOW DUTIES .- The amount of window duty assessed during the year 1847-48 was 1,880,325l.; the amount received, 1,811,742l.; the number of houses charged to 485,143; and the number of surcharges made to 2,166.

THE SUBTERRANEAN MAP OF PARIS, commenced in 1844, is said to be nearly completed, and will form an atlas of forty-five sheets. It will exhibit, quarter by quarter, all the labyrinthine sinuosities of the ancient quarries and catacombs over which Paris is built, with the corresponding edifices, squares, and streets, above ground.

"Buildings and Monuments, Modern and Medleval," being Illustrations of recently erected Edifices, and of some of the Architectural Works of tae Middle Ages, with Descriptive Particulars. Edited by George Godwin, F.R.S., Fellow of the Royal Institute of Architects, &c., &c., &c.

Under the above title it is proposed to publish, in bi-monthly parts, price 2s. 6d. each, the principal Illustrations of Modern and Mediæval Buildings Illustrations of Modern and Medieval Buildings which have appeared from time to time in The Buildings, with their accompanying descriptive particulars. Each part will contain about eight BUILDER, with their accompanying descriptive particulars. Each part will contain about eight plates, folio size, and eight pages of letter press, with plans and details. The engravings will be printed separately, with care, on a tinted paper.

The first part will be issend in time to the few to t

No. CCCXXIV.

SATURDAY, APRIL 21, 1849.

E are anxious that the committee of the House of Commons appointed to investigate the [want of] constitution, [mis] management, and [strange] proceedings

nf the Schools of Designs, should get earnestly to work; and, still more so, that the result of the inquiry may he reformation and satisfactory progress. For some years we have endeavoured strenuously and continuously, hy directing attention to ahuses in the schools, and to the lamentahly small results of a large nutlay upon them, to lead to improvement. We were very unpopular in some quarters in consequence,-THE BUILDER was positively a forhidden hook at one time in Somerset House,-hut our opinions hecame ultimately the universal opinions, and a certain amount of good was done.

We will not compare the present condition nf the London school with what it was at the time to which we are referring, when undisguised incompetence reigned, and entire disorganisation resulted. Still, the proceedings appear to he far from satisfactory in some respects, and the issue unsatisfactory in all. In architecture we want artistical operatives, and we have heen looking to our schools of design tn produce them. Where are they? Echo derisively answers, where? The Journal of Design, which has commenced an onslaught, says,-

"What a specimen these schools afford of Government administration, when we recollect that there has been expended, in one way or another, hy Parhamentary grants and local subscriptions, &c., something near 100,000l. nn these schools, and that it is a doubt whether it he possible to instance, out of all last year's manufactures, any one single useful article of first-rate quality which is the unassisted design of a pupil who has been wholly educated in these schools! We may he wrong in the sweeping doubt here implied, and we shall he glad to he proved to he so; and we shall he greatly ohliged to manufacturers and designers who will point out to us any articles of manufacture of original design, produced within the last twelve months, as the hest fabrics of their class, which have heen designed by a student educated altogether in the school,-one who has studied in the school, say not less than four years, and who does not exceed the age of twenty-five years. We do not want to be informed of the designs of those who were practising designers hefore they entered the school, and had mastered the difficulties and rudiments of their profession before they entered it. We want to know the works of the real scholars of the school.'

We have again and again shown that to call the establishment a School of Design was ridiculous, it was simply a drawing school-design was not thought of; it was even asserted hy some in authority that to consider it in the system of instruction was quite unnecessary,-drawing, and merely drawing, was all they had to think of.

That this is not the opinion there now, may appointed in consequence. he gathered from some of the very good lec-

tures recently delivered to the students. Thus, Mr. Dyce said ;—

"The power of imitation, that is to say, skill in drawing, painting, modelling any given object,-although to a great extent the ultimate purpose of the instruction in an academy of fine art, is, in a School of Design, hut the means to an end. The opposition formerly made to introducing into this school certain hranches of instruction, which were reckoned proper only to academies of fine art, was partly grounded on the supposition that, if the means of elementary study were unlimited, the effect of the school would be to overflow the country with artists; and so it was thought that if these branches were excluded, or if not excluded, were taught only up to a certain point, the school would he made to keep its due place in the scale of art. Now, although these views arose from an indistinct apprehension of the purpose of the school, and of the means required to effect it, it must be admitted that the fear lest the means should he mistaken for the end, was not without reason. If the school were to stop short at the point of having taught the art of drawing, painting, or modelling-that is to say, if the studies terminated in a purpose which is common to it and general drawing-schools, not only would the fears I have spoken of he realised, hut the school would, in point of fact, have ahandoned its specific claim on public support. It was established by Government, not to afford general instruction in art, but to teach the special art of designing ornament, and its application to manufactures and decoration. The proper husiness of the school, indeed, may he said to commence where other schools of art leave nff; at all events, however much, in certain respects, the school occupies ground common to it and to general drawingschools, it has beyond this the definite and specific object of cultivating ornamental art. This is its peculiar province: this is its primary business and occupation."

It is something to find that this apparently ohvious fact has been at last arrived at. We shall keep an eye on the course of proceedings before the committee.

We should he glad to know what has hecome of the Female School, formerly of Somerset House. It was sent into lodgings somewhere in the Strand,-on the same grounds, it would seem, which led hoards of guardians to send pauper children to Tooting, and has never heen heard of since.

Concerning the provincial schools we have lately received several communications, including an amusing hudget of complaints from Paisley, written hy a resident manufacturer; but as they are wholly ex parte, they need inquiry hefore publication.

In Glasgow, a fortnight ago, the annual meeting of the School of Design was held, and the committee said in their report that the number of students had increased (there are now 856, male and female), that the works of art had heen arranged by the present master (Mr. Wilson), and that arrangements had heen made to render the Lihrary of Reference there accessible to designers, for whom a commodious apartment had heen appropriated, where they might study four days in the week.

To the Sheffield School of Design the Government grant has been increased from 2001. to 5501. per annum, if our informant is correct, and twn assistant masters have been

in aid of art, that the sums appropriated to the School of Design seem large. If it were well applied, however, and produced due fruit, the public, so far from nhjecting to such votes, would willingly see them increased. A correspondent of the Literary Gazette gives a list of sums just voted by the National Assembly of France, for the encouragement of science and art, including the following, which contrasts strongly with the doings of our own Government in that respect :--

	Francs.

In other parts abroad, they seem more inclined to dissipate than to collect works of art, to knock down rather than build up. The revolutionary government of Rome are said to he in treaty for the sale of the Apollo Belvidere tn American agents, and of many other treasures of art garnered in the Eternal City, to English and French speculators. The Times, in a leading article, deprecated the removal of the inestimable monuments which form the chief glory of that city, and with the view of preventing Englishmen from heing a party in the disgraceful proceeding, urged, that should the legitimate government be restored, it would he difficult to defend a possession which had been acquired with a full knowledge of the circumstances attending the sale. "It appears to us," continues the journalist, "that the purchase of these monuments from Mazzini's committees can no more he justified than the purchase of diamond necklaces from those gentry who at this season of last year were so comfortably housed in the Tuileries. The huyers of this stolen jewellery were unhesitatingly prosecuted, and if the huyers of pictures and statues escape a similar summons, it will he owing less to the essential difference of their acts than to the fortunate difference of their position. It would be the height of injustice if through the interested concert of those who should he more uprightly minded, such a gang of desperadoes as that which now lords it over Rome, should he enabled during their ephemeral usurpation to inflict so grievous a loss upon their country, and to damage sn irreparably the government which will presently supersede them. We hope hetter from the generosity, if not from the prudence of Englishmen."

A friend writing us on the subject of art, says, with reference to these remarks,-"I was amused the other day with reading the leading article of the Times on the shameful proceedings of the anti-papal government of We are so little used to Government grants | Rome in disposing of the 'works of art,

just as if these works had been indigenous productions, and not the collective plunder of other countries. If King Otho had purchased the Apollo surely it would have been no extraordinary act of vandalism to have transported it to Greece and set it up in Athens? What gives Italy the prescriptive right of possession in the higher productions of the art of foreign nations? Some day or other, some thousand years hence, we may have an American editor lamenting that the confederated republics of Greece have repurchased from the Provisional Government of Britain the Elgin marbles, and certainly they are as much art-products of England as the Apollo of Rome."

We cannot agree with our excellent correspondent in regarding this lament as an evidence of " untimely sensibility;" but join in deprecating earnestly any steps which should tend to break up the museums and galleries of Rome.

When the collections of private individuals, gathered together with time, discrimination, and pains, are distributed and sent east, west, north, and south, it is matter for deep regret. How much more so would it be in the case of those wonderful agglomerations of the results of human skill in Rome,-connected with it by so many associations, and which have formed for so long its chief glories!

If they are destined to be distributed, we should desire that they might come to England rather than be sent elsewhere, but so long as that can be prevented, we hope to see no inducements offered by our country-

The newspapers say that the Edinburgh artists have been deprived of the opportunity of exhibiting their pictures this season at the Royal Academy, through the detention of the steamer which carried them. They did not arrive in London until the 9th, the day after the time fixed for receiving at the Academy, and the statement is, that the council considered the regulation imperative, and declined to receive them. If it were shown that the delay occurred through no fault of the artists, it may be thought that the council would have been justified, by the peculiar circumstances of the case, in overlooking the few hours by which the date had been exceeded. It is a hard thing for the artists, as the chance of obtaining a return for their labour is, in all probability, postponed until next season.

Apropos of which, we may mention that the general meeting of the Art-Union of London, for the reception of the annual report, and the distribution of the funds for the purchase of works of art, will be held in Drury-lane Theatre on Tuesday next, and will be open to all members and their friends. We shall give, as usual, a full report of the proceedings, and a correct list of the prizeholders.

As our gossip has fallen on matters of art, we may mention as amongst the works now exhibiting at the Cosmorama, in Regent-street, a remarkably beautiful model of Cologne Cathedral, with its spires completed, and forest of 5,000 pinnacles. It is the work of a German, Herr Charles Schropp, and is formed in wood and iron coloured; the niches are filled with their statues, and the windows with painted glass. It is 8 ft. 8 in. in length, 4 ft. wide, and 8 ft. high, and was completed, the

around it, from all parts of Germany and many parts of Europe. The King of Prussia was about to lay the first stone of the new works, and the words he used on the occasion are still ringing in our ears. " Here where the ground-stone lies," said he, " here by these towers, will arise the noblest portal in the world. Germany builds it,-may it be for her, with God's will, the portal of a new era, great and good! Far from here be all wickedness, all iniquity, and all that is ungennine and therefore un-German! May dis-union between the German princes and their people, between different faiths and different classes never find this road; and never may that feeling appear here, which, in former times, stopped the progress of this temple,-aye, even stopped the advance of our fatherland! Men of Cologne, the possession of this building is a high privilege for your city, enjoyed by none other, and nobly this day have you shown that you recognise it as such. Shout, then, with me, and while you shout will I strike the ground-stone; -shout loudly with me your rallying cry, ten centuries old, 'Cologne for ever!'

And loudly was it echoed far and wide, Cologne for ever !"

Since then great changes have taken place in Germany, calculated, we fear, to retard the progress of this important work.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AWARD OF MEDALS

Ar an ordinary meeting of the Institute held on the 16th inst, Mr. Sydney Smirke, V.P., in the chair, the following report from the council, on the award of the royal medal, and the essays and drawings submitted in competition for the other medals, was read:—

"The council have to report to the meeting, that pursuant to the notice publicly given, they proceeded, on the 20th of January last, 'to take into consideration the awarding of the Royal Medal for the year 1818, to the author of some literary publication connected with architecture; and having reeation connected with architecture; and having re-ceived and examined the several claims submitted, at a subsequent meeting, on the 12th of March, it was resolved, That the Royal Gold Medal he awarded to the Signor Cavaliere Luigi Canina of Rome, as the historian of architecture from the earliest period, and for his antiquarian researches; he having published a series of important works on the various styles of art, and likewise on the tombs of Etruria, the cities of ancient Latium, and other antique remains.' antique remains.'

This resolution of the council having heen duly

notified to her Majesty the Queen by the president, his Lordship was authorised to express to the council the full approbation by her Majesty of the

For the medal of the Institute offered for the best essay 'On the Peculiar Characteristics of the Pal-ladian School of Architecture, and a comparison and contrast of its elementary principles and details with those of Angient Roman Art."—three essays and contrast of its elementary principles and details with those of Ancient Roman Art,"—three essays were submitted in competition, distinguished by the following mottoes and marks:—No.1. There's something of Magnificence about us we have not seen at Rome; 2. How different, yet how like the same; 3. The Letter X. The council are of opinion that the essay designated by the motto, 'There's something of Magnificence about us we have not seen at Rome; possesses considerable merit, and is entitled to the reward offered, and they therefore recommend that the silver medal of the Institute be awarded to it accordingly.

For the medal offered for an essay 'On the best manuer of covering the roofs, and forming the flats

For the medal offered for an essay 'On the best manner of covering the roofs, and forming the flats and gutters of huidlings', &c., there are two competitors: one essay hearing the motto 'Finis coronal opus,' and the other 'Spe,'—hut neither of them possesses sufficient merit to justify the council in awarding the medal on this occasion.

For 'the Soane Medallion,' the subject being, 'A Design for a Building to serve as a national

wide, and s ft. high, and was completed, the modeller says, in eight years. It gives an admirable idea of this wonderful structure, and deserves a visit.

The last time we saw the catbedral of Cologne, thousands of persons were crowded

For 'the Soane Medallion,' the subject being, 'A Design for a Building to serve as a national Repository and Museum for the illustration and exhibition of the productions of the industrial arts, with all suitable accessories, &c;' six designs have heen received, thus distinguished. I. Simplicitas,' 2. 'Solidity, Convenience, Delight,' 3. 'Endymion,' 4. 'Esticot,' 5. 'Justitia! imploro

Fidem,' 6. 'Usui populi decori Regni.' It is with feelings of sincere regret the council announce that they cannot recommend the award of the Soane Medallion on this occasion. They deem it proper to state that the designs submitted exhibit generally a surprising deficiency of the recognised elementary principles of architectural composition, together with a lamentable want of constructive knowledge. In some, prominent and integral portions of the structure are impracticable as to execution; in others, the most glaring discrepancies are apparent others, the most glaring discrepancies are apparent hetween the plans, sections, and elevations, and although it may be thought of minor importance, the drawings in general exhibit great negligence in execution, both as regards outlining and shading. the drawings in general exhibit great negligence in execution, both as regards outlining and shading. The council consider that with a just regard to the best interests of those who aspire to be distinguished for their education and taste in the art, they are necessitated to withhold the reward offered, lest it might be inferred that the institute adopts, as a standard of merit, either of the productions now submitted."

Mr. C. Fowler said he thought it desirable that the award of the medals should be the act of the Institute, and not of the council alone: but in this case, as the report must be put the meeting for confirmation, it would also be open to objection.

Mr. Godwin said, that to alter the award now was, of course, out of the question, as it had been communicated to her Majesty, and had received approval; but he would nevertheless press his dissent from the policy of the council in sending the Royal medal abroad so early, considering bow few honorary rewards were open to English architects and architectural investigators.

It was ultimately ruled that the award was in the hands of the council, and did not need the confirmation of the meeting. therefore, was not put for reception hy the meeting, a departure, to the best of our recollection, from the proceedings in similar cases before.

The letter which accompanied the selected essay being opened, the author was found to be Mr. Wyatt Papworth.

Mr. Robert Rawlinson, one of the superintending inspectors in the General Board of Health they would a reverse reverse the second of the superintending inspectors in the General Board of Health they would a reverse reverse for the second of t

Health, then read a paper, prepared for our columns, and which follows this notice, on the hollow brick ceiling recently turned over St. George's Hall, Liverpool, and on

bollow brick constructions generally.

During the discussion which afterwards ensued, the Chairman said that, as to the use of terra-cotta, we were quite in our infancy, and might with advantage look back to the works of the ancients. Some time ago he had applied to the principal drain-pipe makers respecting some tubes 3 feet in diameter, and found they could not he had. Twenty years ago he had seen abroad earthenware pipes of this diameter, lining a well 3,500 years old, with holes for the toes in the event of desiring to descend.— Mr. Garling reminded the meeting that hollow bricks had been used by Soane and others, and were probably abandoned because of ex-pense.—Mr. Fowler spoke of their use for floors in Barlin

Mr. Edwin Chadwick said the expense now was much lessened: 1,000 tiles made by the machine cost about ten or twelve shillings, and it was thought 1,000 bricks could be oband it was thought 1,000 bricks could be ob-tained for 2s. more. Wherever tiles were made, these bricks could be made. As to strength, the hollow brick was stronger than the solid, probably because more dense and better burnt.

THE HEALTH OF TOWNS ASSOCIATION held their annual general meeting on Tuesday at the house of the Statistical Society, St. James's the house of the Statistical Society, St. James's-square, the Hon. Frederick Byng in the chair. The meeting was addressed by the president, by Dr. Guy, Dr. Aldis, Mr. John Gunter, Mr. Mackinnon, M.P., Mr. P. H. Holland, Dr. Oliver, Mr. Grainger, Mr. Liddle, the Hon. H. Melville, and Dr. Melroy. The usual business of the year was moved and adopted, and a vote of thanks to the chairman passed before the meeting separated. An appeal to the public for subscriptions was made, and ought to be listened to.

GREAT GRIMSBY DOCKS .- On Wednesday the first stone of the Great Grimsby Docks (weighing 11 tons!) was laid by his Royal Highness Prince Albert. We shall give some particulars of this undertaking next week,

REMARKS ON HOLLOW BRICKS, USED IN THE GREAT ARCH CEILING OVER ST. GEORGE'S HALL, LIVERPOOL, AND ON BRICK AND ARCH CONSTRUCTIONS IN GENERAL.

In the following brief and imperfect remarks, on the peculiar structure of the ceiling of St. George's Hall, I beg to disclaim any of St. George's Hall, I beg to disclaim any pretensions to originality in the matter. My only desire is, to give a plain statement of facts. The use of bricks and tiles, solid and hollow, appears to be as old as the records of history. They are dug from the buried ruins of a forgotten civilization in Asia; the Egyptians converted their manufacture into an intolerable burden to the enslaved Jews; the Etruscans and Greeks were skilled in the the Etruscans and Greeks were skilled in the art of working clay, to an extent even now considered almost perfect; the Romans constructed vast works with bricks and tiles, moulded into forms of use and beauty, unknown even in this age of invention; and the Italian architects bave used bricks and tiles in their buildings, following the examples set them by their Roman predecessors. There are many old examples of brick and tile work where the material has been moulded into forms of ornament as well as utility of construction.

In the fifth and sixth centuries, bricks were used in walls and arches as a facing to rubble and concrete, as seen in the sections given of palaces, churches, and other constructions of the time of Theodoric, at Terracina. The ancient temple of the Caffarella, two miles from Rome, one of the earliest examples of a pagan temple consecrated to the Christian religion in the construction. gion in the fourth century, is of brick, and the cornices, which are bold in their projection and elaborate in relief and ornament, are also of brick, and terra-cotta ornaments adorn the

structure.

St. Stephen's, the round, at Rome, was ceiled with small vases or tubes of terra-cotta; these tubes were from six to seven inches in length, three inches in diameter, the exterior surface spirally channelled to give greater hold to the mortar. This building was converted from a heathen temple to a Christian church,

in the fifth or sixth century.

The church of St. Vitali, at Ravenna, built under the reign of Justinian, and from drawings brought from the East, in the sixth century, has a dome constructed in spiral lines with small terra-cotta vases, seven inches long and two inches diameter, the lower part of the structure being built with vases of terra-cotta twenty-two inches high and eight inches

in diameter.

The house of Pilate, at Rome, eleventh century, exhibits a knowledge of construction and adaptation of brick and tile to the purposes of ornament and use, for which we shall look in vain to find many modern examples to compare with it; there is beauty, utility, fitness, and variety combined, so as to give strength and grace to the structure. If we would learn how to construct arches for durability, we must (except in rare cases) most certainly refer to the realist refer to the works of men two thousand years dead and buried. We shall assuredly not find in their great works any examples of flat lintels over openings, with parallel bricks, set in parallel beds, until the courses meet in a point on the under side, leaving a triangular space for the key, which is fitted in with similar parallel courses, and yet this abortion of an arch is the modern mode of construction in too many instances throughout this country; examples of it may be found in new houses and public buildings not six months old; the cement and stucco-fronted shams of modern London have rarely any other form of con-struction, and the result is exhibited in ugly cracks and rents over the door and window openings.

I would beg to mention, incidentally, that fitness and propriety are not so much considered as they ought to be in the construction of arches for architectural purposes, and I could bring hundreds of examples, even from those termed our finest buildings, to prove this. The purpose of an arch is to span and must be the deepest on bed; at the crown, or key, it ought to be the lightest and thinnest, so that if it was divided along the line of key and erected into a wall on each abutment there would be a gradual diminution of thickness and strength from the base to the summit. I would sel, is this the roads of construction would ask, is this the mode of construction generally used? Do we not see all forms of generally used? Do we not see all forms of arch, the semi, the segment, and the elliptical, with a bed at the springing several times less than the depth at the key. Divide such arches, and rear them up on their ahutments, and we should have the pyramid on its apex. Then we have faulty jointing; the beds of an ellipsis and the second of all drawn to one point, as seen in the arch at Temple Bar; or the inner and outer line is equally divided to produce the bed lines; archstones bent in the form of an Γ , as seen in semi's, &c.

The bent joint, or bed, in masonry ought never to be used. All masonry must depend, principally, up onits gravity, for stability; stones cannot, legitimately, be hung together; they may, however, be joggled for some pur-poses of strength in their vertical joints and horizontal beds, but no form of arch should depend upon joggles. Stone ought to be considered as having no tensile strength, and be treated and used accordingly. Bricks should

be made subject to the same rule.

In bridge-huilding we frequently see a heavy ponderous key-stone, and over it a break in the cornice, with a massive solid pedestal in an otherwise open balastrade, on which at times a heavy is also a subject to the same rule. which, at times, a lamp is placed. All this is false; the pedestal should be over the pier or false; the pedestal should be over the pier or abutment, and not over the key, where all should be light and graceful: unbroken lines over an opening always have the best effect; there should be no massing or adding of weight at the crown of an arch.

The bridges of Telford and Rennie display constructive skill of the highest order; Mr. Buck the engineer, has studied bridge of the state of th

constructive skill of the highest order; Mr. Buck, the engineer, has studied bridge construction thoroughly, and his examples may be considered perfect. Some of his bridges can be seen in Manchester, near the Birmingham and Sheffield Railway Station. mingham and Sheffield Railway Station. The great bridge over the Dec at Chester, designed by the late Mr. Harrison, and constructed by Mr. Jesse Hartley, Engineer of the Liverpool Docks, is one of the finest examples of masonry in the world. Mr. Hartley is perhaps one of the most perfect masons and constructive engineers of the age, of which his Liverpool dock-works are an enduring testimony; he is always perfect in his arrangement of masonry beds and joints. There are also good examples by other architects and engineers. tects and engineers.

Columns and architraves, forming the appearance of a door or porch, have no business with the abutments or piers of bridges; they are not useful, and most certainly are not ornamental, and yet we find them added to the finest bridges in the world; some of those over

the Thames

In making these remarks I may be considered bold, and presumptuous; but I must dare the censure in advocating propriety and fitness in construction, and asserting that construction must be the first consideration. If ornament will not harmonize with construction, ornament must give way; if precedent rebels against construction, precedent must be abandoned,

It has been shown from the ancient exam-It has been shown from the ancient examples quoted, that the use of hollow bricks, tiles, and terra-cotta vases for arch and dome structures, is at least 2,000 years old, and that some of the work is now perfect; an enduring the the apparential work of the structures. some of the work is now perfect; an enduring testimony to the constructive skill of the architects and builders. We may not then claim the honour of invention in the use of hollow brick or tile; but we may follow the example set to us, and, with modern means and appliances, improve upon our models. We have clay in abundance, fuel cheap, tile and brick-making machines to economise labour, &c. There has hitherto been one great drawback to improvement in brick and tile construction, the excise duty. This in a great measure has arisen from an idea that the law dictated the form and size, namely, 10 this. The purpose of an arch is to span and cover in a space not attainable by horizontal lintels. This may be termed its prime purpose on a great scale, such as in the ceiling immediately under notice; this is only accomplished by a judicious distribution of strength and weight, so as to balance equally all the parts. At the springing line, the arch

than this number of inches, it will be allowed at the single duty. But even with this relaxa-tion, the law is more fitted for China than for Great Britain, as it cripples invention and cramps construction.

I will now quote some passages, from a MS. volume by Mr. Edwin Chadwick,* on the

subject of hollow bricks :-

If we suppose that improvement were to stop at the adoption of constructions of hollow brick, made of the common sizes and shapes, so that they might be worked by the common brick-layers without change of their practice in any other respects, the gain would be considerable in getting rid of a large proportion of the absorbent qualities, and the damp incident to the use of common bricks, apart from the gain in the more economical manufacture of the hollow bricks.

There appears to be no reason to doubt that all

facture of the hollow bricks.

There appears to be no reason to doubt that all the observations which we have collected, in respect to the superior warmth of double walls, and of walls made hollow as described by means of half bricks, of battened walls, and of hollow walls of wninsock, will be found applicable to walls of the proposed hollow brick construction. In reducing the amount, of heat requisite to repel extraneous damp, we economise the labourer's fuel, in other words, increase its power and his means of comfort.

Suppose the walls of a cottage constructed 9 inches thick with 9-inch hollow bricks, the possible absorbent power of the walls of a cottage, say of 500 cubic feet, will be reduced from 306 gallons to 102 gallons of water.

102 gallons of water.

Any gentleman who has a tile machine and a

102 gallons of water.

Any gentleman who has a tile-machine and a kiln, may with it use almost any description of clay, and more conveniently apply it to the manufacture of hollow than common hricks for the construction of dwellings for his labourers; which dwellings with the drier and warmer, and he may afford to let them at a lower rent than the common cottages.

For farm steadings, also, and for garden walls, the less absorbent and drier walls, constructed with the harder-burnt and less porous hollow hricks, will be found of great advantage.

But the remaining absorbent power of the hollow bricks, it may be submitted, is an ill quality, for the removal of which it is worth while to make exertions. To this end I have requested a trial to he made of a machine, for giving additional density hy additional pressure to the bricks made by the machine. The trials are very satisfactory, and the work is promised to be done at a very cheap rate. I propose to have the hricks glazed, to save whitewashing and paint inside the bouse, and to repel the weather. The process, judging by that for pottery, need not be an expensive one. It would, moreover, be worth the while to increase the density of the clay, by a careful preparation of it in the mode of potter's clays.

By the additional pressure, greater exactitude to form will be given, and larger bricks made, fit for more will be given, and larger bricks made, fit for more will be given, and larger bricks made, fit for more will be given, and larger bricks made, fit for more will be given, and larger bricks made, fit for more will be given, and larger bricks made, fit for more will be given, and larger bricks made, fit for more will be given, and larger bricks made, fit for made of each and the construction of the nature of ashlar or stone construction.

To keep, bowever, to the construction of such such as the mode of potter's clays.

To keep, bowever, to the construction of walls, there appears to be no reason for supposing that a 5 or 6 inch wall may not be made by means of hollow bricks sufficiently dry and warm, to render any further increase of thickness of little moment compared with the expense.

pared with the expense.

In towns, space in houses is of the greatest consequence.

There, the space for the houses of the poorer classes may be taken as small and fixed; and this being so, all that can be gained from the tbickness of walls, within that fixed area, is gained as breathing space.

breathing space.

Thus, the difference between a 9-inch and 5-inch Thus, the difference between a y-inch and p-inch wall, in a fourth-class two-story house, is about 500 cubic feet, equal to the space for two hed recesses, or one small sleeping room.

The improvement in the manufacture of bricks.

so as to ensure to a thick wall greater dryness and warmth than to a practically thick wall, is a highly

warmth than to a practically thick wall, is a highly important object.

Ifollow bricks, it may be stated, from the experience of bollow walls, will transmit far less sound than solid walls. Partitions may be made of 3-inch hollow brick, which will not only attain this end excellently well, but another,—that of superseding the bollow wooden partitions, which give dreadful facilities for the spread of fires.

In confined space and crowded apartments, the noise and disturbances from the tread of adults (not to speak of children or their noises) is the occasion

to speak of children or their noises) is the occasion of much irritation, and, in the cases of sickness, of

of much irritation, and, in the cases of siekness, or pain and injury.

To prevent this, and to isolate as far as possible one family from another, and the living rooms from the sleeping rooms, the floors of some of the improved dwellings for the lahouring classes at Birkenbead were constructed of brick in flat arches of about 6 feet span. The arches were

^{* &}quot;On the chief evils affecting the health and comfort of the population, which appear to be preventable by improve-ments in the materials and for the construction of dwelling-houses, more especially of the dwelling-houses for the poorce classes."

tied together hy iron ties, and ahutted in the centre tied together hy iron ties, and abutted in the centre on an iron hearn. The spaces hetween the upper surface of the arches and the spandrils were filled in by mortar, on which flat tiles were imhedded. They answered the purpose perfectly; but the weight of a floor of such a construction must he wery great. Observing this construction, and, generally, the economy of constructions of groined arches in thrick, where the same centreing was used successively for many arches, it occurred to me to propose the construction of such floors of hollow hrick, moulded in form for the purpose. The precise thickness, and the best forms of hricks for the purpose, many not he readily determined. The expense pose, may not he readily determined. The expense of an ordinary wooden floor, of 12 feet square, would be about, I am informed, 77.; the expense of an arched floor of the hollow hrick construction, tied together with iron ties, taking the hollow hrick at one-third less price than the solid hricks, is estimated at 41. estimated at 41.

With constructions of these hollow bricks experiments were made-

1st. For a series of arches of small curvatures without iron ties.

National from thes.

2nd. For circular arches without iron ties.

3rd. Elliptical arches with iron ties. The experimental arches were 2 metres, or 6 feet 6 inches wide, or 43 square feet, heing a portion of a surface of 600 feet.

The ordinary weight of a common wooden floor

of 690 feet.

The ordinary weight of a common wooden floor of that extent, as constructed in England, would he ahout 700 lhs., and it would he expected to bear say 2 tons. Each ton would he expected to bear say 2 tons. Each ton would he expected to bear say 2 tons. Each ton would he expected to bear in England. The results were—That the elliptical arch made of earthenware pots or hollow hricks, 6½ inches bigh and 3½ inches in diameter, without inon ties, supported, besides its own weight, a load of ahout 2 tons 10 cwt. on each 10 superficial feet.

That an arch of small curvature, made of hollow hricks 9¾ inches high and 5½ inches diameter, supported hesides its own weight a load of 3 tons 18 cwt. on 10½ superficial feet.

That a portion of a circular arch, constructed with earthenware pots 12½ inches deep and 5½ inches in diameter, supported besides its own weight a load of upwards of 5 tons, or the weight of more than 67 adult persons of 165 bls. each; that a floor of earthen pots, 4 inches high and 3½ inches in diameter, tied with iron ties, supported hesides its own weight a load of 2 tons per square foot; that a floor, formed with earthen pots 7½ inches high and 4½ inches in diameter, and tied with iron ties, supported more than 3,941 lbs., or the weight of 24 adult persons, hesides its own weight.

The experiments and practical experience in rivate and public buildings of the Parisian architect

The experiments and practical experience in private and public buildings of the Parisian architect corroborate the general conclusions which are submitted as established in relation to the hollow brick construction, as heing superior to the common stone and brick construction.

and hrick construction :-

In preventing the passage of humidity and heing

In preventing the passage of heat, and heing armer in winter and cooler in summer.

In heing a security against fire.
In preventing the passage of sound.

In baving less unnecessary material and being

In being hetter dried and hurnt harder and stronger

heing more cleanly.

In heing more cleanly.

In being cheaper.

The extent to which these qualities are attainable must depend upon the extent of denand for them, upon further attention and experience heen brought to hear upon them, and on the approved application of machinery to the construction of the various eligible forms of hollow hricks.

similar in their results. Two men, wide apart. in distant regions, may strike at the same idea, when investigating the same causes; and we, when interesting the every great invention dis-consequently, have every great invention dis-puted by rival claimants. It was so with Franklin and electricity; and one of the most recent instances is the discovery of the planet Neptune, in astronomy. If, however, all men were honest to themselves, they would care little about priority of discovery, as the man who is anxious to earn fame from one lucky thought or invention, is seldom deserving of the honour. True genius will not rol for an idea, and has no fear of rohbery from others; but it will adapt, mould, and use the ideas of every age, for purposes of utility, ornament, and truth

and truth.

The ceiling now turned over St. George's Hall, Liverpool, was designed by my late friend, Mr. Elmes, a bill of quantities for which was made out by him in March, 1843. The arch was to be of solid brickwork. Patent compressed bricks were specified for, and for this read-of construction the contract was let. this mode of construction the contract was let to Mr. Tomkinson, the builder. I had many conversations with Mr. Elmes from time to time ahout the arch, and I always expressed myself confidently as to its practicability. Several forms of section were made, and Mr. Elmes sought up all the known examples of great ceilings to guide him in the construction of his own. The form and sectional strength settled, own. The form and sectional strength settled, another difficulty presented itself. The room must be ventilated according to plans devised by Dr. Reid, and the doctor required 400 square feet of open space, as equally diffused throughout the arch as possible.*

When the time for preparation to commence the work came, Mr. Elmes was stricken with his fatal malady; his strength was failing, and the physicians had ordered him abroad: he sent for me to come and see him, and as I was not

me to come and see him, and as I was not for me to come and see nim, and as I was not at the time much engaged, I commenced some sections of the arch to provide for the required space for ventilation; and the plan decided upon at the time was, to leave out alternate headers, as frequently seen in the sides of a

barn.

had quite forgotten seeing hollow bricks in Mr. Chadwick's office at Somerset-house, although I had written to Mr. Elmes at the time recommending their use. But it was certainly with Mr. Chadwick that I first saw

them. These were of the ordinary size.

Mr. Elmes left England never to return, and Mr. Elmes left England never to return, and as the time for commencing the arch drew on, I was constantly turning the subject over in my mind how I could obtain lightness, open space, and strength. About this time I was called over to Castle Howard on professional business; and, in the steward's office I saw some beautiful drain-tiles, 12 inches long, with a hore of 2 inches in diameter. I took one up a bore of 2 inches in diameter. I took one up. examined it, and asked how and where it was made, when I learned that they had machines which made them on their own estate. My first idea was, why not construct an areb of circular tile, set in cement? My next question was, will the machine make other shapes than circle? and the answer was,

the circle? and the answer was, "any the hear upon them, and on the approved application of machinery to the construction of the various eligible forms of hollow hricks.

The modern French architects use a kind of pottery vase in construction for partition walls, floors, stairs, and ceilings; but they depend more upon the lightness of the material and the strength of their mortar and cement, for the stability of their works, than upon skill in constructive adaptation of their hollow pots. If fact, the stability of their work depend upon the strength of the mortar or cement (gypsum), and iron bond, altogether, as a glance at their forms of hollow ware will show. We are not without some modern examples of hollow brick or tile work even in London—floors and arches have heen found of such material, as when the old Carlton Palace was taken down, as mentioned in the manuscript volume already referred to. It is difficult in this our day, to settle satisfactorily where or how an idea is obtained. "Necessity is said to be the mother of invention," and no doubt many inventions are new to the person, which are old to the world; the faculties of the mind are infinite for purposes of combination in thought, but frequently

like." shape you I then thought hexagons, and finally adopted the square, settled the present dimensions, four and settled the present dimensions, four inches by four inches, by twelve and a half inches, for purposes of bond. On my return to Liverpool, I wrote to Mr. Scragg, the maker of the machines, and asked him to meet me on the ground at St. George's Hall. I shewed him the sections, and the building, explained what I required him to make, and ordered fifty tiles to be made of the dimensions above stated; half with a longitudinal perforation of three inches, and half two inches. I tion of three inches, and half two inches. I then weighted them singly, and decided upon the two-inch perforation. I drew up a report,* and presented it to the committee, when they decided at once to adopt the hol-low tile. I consulted Dr. Reid about them, and had his full concurrence for their use. loaded four of the tiles, placed singly, with upwards of thirteen tons, without their shewing any tendency to fracture, and I left them loaded as an answer to all objections to their use on the score of strength (and there were many), intending to have loaded them to crushing, but they were removed without my knowledge. For equal drying, I had fifty thousand moulded with square perforations, but the maker said he found little or no advantage over the circle. Not only was the great hall ceiling intended to be of brick, but the ceiling over the two courts, which are about fifty feet square. These, however, have been formed of timber, notwithstanding the loaded four of the tiles, placed singly, with been formed of timber, notwithstanding the order of the committee to the contrary, and although the hollow bricks for their construction were delivered on the ground.

The great arch is struck from three centres.

and the soffit is divided into panels, the rihs to form which are worked in the tile. These longitudinal ribs are bonded with York paving, four inches in thickness, cramped together at the joints. The main ribs of the arch are two the joints. The main ribs of the arch are two tiles, or two feet in depth; the plain portions of the panels are twelve inches, or one tile in depth, so that the strength of the arch, of sixty-five feet span, is reduced to twelve inches in depth, with the weight of the panel ribs added. The accompanying section + will further explain the construction.

That hollow brids may be used in each or the panel in each or the panel in the construction.

ther explain the construction.

That hollow bricks may be used in arches, with perfect safety to the structure, is, I think, fully proved, and I have no doubt but that he researches of Mr. Chadwick will soon be brought into practical use. The machines are an advantage unknown to the ancients, and we may obtain from them a truth of form which will be a decord agree the state. shall not depend upon the strength of the cement alone for the stability of the structure. the surface of all pulleys to make the driving strap adhere. This not only lost power, but strap adhere. This not only lost power, but it rapidly wore out strap and pulley; so we shall find in another way, with our brick and tile work: mould the correct forms, put them together in a proper manner, and we shall require mortar to bed them, but not to be also the sole means of stability and support.

In these modern times we are too much wedded to "precedent," without always fully considering if it is worth imitation, and we are apt to make "ornament" the first consideration, when, in all cases, it ought to be construction. Nature, in this, should be followed. The skeleton of the building ought to be perfect; skeleton of the binding ought to be perfect; then clothe and beautify in accordance with that skeleton structure. Nature is ever beau-tiful because most perfect; but the beauty of nature is not always for the sight. The external forms of grace alone, are present to the eye, but that which is hidden is frequently more complex, wonderful, and beautiful than that we see. Take the skeleton of any animal, and what a combination of structural beauty does it unfold; joint fitted to joint, bone adapted to bone, solidity where solidity is required, tuhular where advantageous; notice the graceful curves, the swelling joints, the arched spines, the flattened blades, the serrated arched spines, the flattenen mades, the sermand skull, and answer if the build of any creature could be improved by all the ingenuity of the skilled mechanic, or the calculations of the most profound mathematician. Take the graceful nautilus, examine its plated chambers,

^{*} This we will give, with the specification, next week .- En. † The section is to a scale of 1.16th of an inch to 1 foot. We likewise give a plan of the great hall and adjoining apartments, which serve as abutments, (see page 186). The spaces marked AA on plan are for ventilation.—ED.

see how they are curled over, backwards and forwards, to give the greatest quantity of support, with the least expenditure of material, over the greatest external surface. Look at the more graceful fossil ammonite, and consistier the enriched markings of its air chambers, varied to every form of section, and then say if man has not much to forget, and more to learn in his structural arrangements. The hee has constructed, age after age, and in all countries where it can exist, the same perfect hexagon, which is proved to be the best form for economising space, and giving strength with the least expenditure of material.

with the least expenditure of material. Used with iron, wrought and cast, hollow bricks may be combined for purposes where, at present, wood alone is introduced. Palaces and churches may own their adoption with singular advantage. In hospitals, gaols, workhouses, and asylums they will give ready means for a general diffusion of warmth and ventilation; barracks in tropical climates, so constructed, with hollow walls, would resist the intense action of the sun, and the solid material of the tile the attacks of insects, and, what is almost of as much consequence, their carriage would be about one-third that of solid bricks. Factories and warehouses would be made fire-proof at the least cost, as much weight in the floors would be avoided. Museums and picture galleries would be freed from damp and rot, to the preservation of the wonders of nature and the glories of art; the dwelling-houses of the wealthy may have, in every room, a completeness of ventilation at present unattainable with solid bricks. The humblest cottage may have walls, stairs, floors, and roof of the same hollow material; they may be made dry, warm, and fireproof; ventilation may be simple and effective, and fuel may be economised to an extent not at present practised, by expending much of the heat of the firc in the hollow walls and floors. With these advantages, Mr. Chadwick proposes to combine extreme solidity of substance and colour; solidity and finish he will obtain by mechanical pressure; colour by thin layers of tinted clay pressed on the surface, or by washing the semi-dried brick or tile in a mineral solution. The tile making machines will press out any form of section, plain or moulded; and any raised form, not undercut, may be obtained by pressure, as practised in terra-cotta. Hollow bricks can be made subservient to improved construction; they may be worked and combined with stone, solid brick, iron, and timber; they may be made to serve in numerous instances all the purposes of solid material, with advantages peculiarly their own. Muc

Before leaving the subject, I beg distinctly to remark that I do not contemplate a super-seding with hollow bricks all practised forms and modes of construction, but an adaptation where reason can clearly demonstrate an advantage. One material and one method is the project of a theorist of one idea, or of a quack.

Nature revels in infinite variety of structure, but is always perfect in adaptation and usefulness: let us break the shackles of precedent, and try to imitate nature in her economy, use, and beauty. To do this, construction must ever be our first consideration; this must be adapted to utility, and we may then add ornament for beauty, but ever with consistency.*

ROBERT RAWLINSON.

Monument to Mr. Peter Nicholson, Architect, at Carlisle.—In respect to the statue, or other suitable and lasting memorial of this useful member of our profession, which it is proposed to erect in Carlisle, a correspondent, "Alpha," suggests that the fact ought not to be lost sight of that he died in very poor circumstances. It is to be hoped, therefore, that while his talent is honoured his family will not be neglected, otherwise a monument to his memory would be but a sorry mockery of the man.

NOTES IN THE PROVINCES.

The repairs of the rood tower of Lincoln Cathedral are proceeding. The south and west sides have been repaired, and the west sides have been repaired, and the east side is in progress. — A hotel, built by Messrs. Grissell and Peto, near the Colchester Railway station, at a cost of 12,000l. to 15,000l., has been charitably converted by Mr. Peto into an asylum for infant diots. — The new Wesleyan Chapel in Hobson-street, Cambridge, is of white brick with stone dressings; the vertice Cavinthian columns and Cambringe, is of white brick with stone dressings; the portice, Corinthian columns, and antæ, are of Ketton stone. The length of the building is 61 feet; widtb, 45 feet 4 inches; accommodation, 1,000 sittings,—400 free. Mr. Trimer was the architect, and the builders were Messrs. Quinsee and Attack, of Cambridge. The final cost was 2,100%. There are school-rooms under the chapel.—The grey building near the Sussey County Hospians. new building near the Sussex County Hospi-tal, Brighton, intended for the Brighton Col-lege, the first stone of which was laid on 27th June last, is rapidly approaching completion. Mr. G. G. Scott is the architect, and Messrs. Wisden and Anscombe are the builders. The style is collegiate of fourteenth century, with cloisters along the front of the building. The cloisters along the front of the building. The principal front of the design only has been hitherto undertaken. The class-rooms, however, will accommodate 300 pupils. The plan includes a school-room, dining-room, and chapel; the whole to form three sides of a quadrangle, with houses for the master and wardens arranged about the front.—The market improvements at Worcester, in the conversion of a space of ground, recently occupied as a market for green-grocery, into a butchers' and fish market, are rapidly pro-gressing, under the superintendence of Messrs. gressing, under the superintendence of Messrs. Rowe and Son, architects, of that city. The butchers' market will be 112 feet in length by 40 feet wide, and fitted up with four rows of stalls, and lighted by side lights. The fish market will be divided from it, and lighted from the roof. The height of the market to the apex of the roof will be 31 feet, and the timber supporting the prof. will be aversed to where apex of the root with be 31 rest, and the timber supporting the roof will be exposed to view. The Journal speaks favourably of the design.

— The church at Heywood, Westbury, builtat the expense of Mr. H. G. G. Ludlow, of Heywood, was consecrated on Thursday week. wood, was conservated on Indicated week. The building is in the early English style, with open benches for about 360 persons. The old parish church has lately been restored at the cost of 2,000l.—The new chapel at Copston, near Monk's Kirby, Warwickshire, was consecrated on Tuesday week. It is in the decorated style of architecture, and capable of holding two hundred persons. It has been built at the expense of the Earl of Denbigh. The cost was 1,000% exclusive of carriage of materials by the Earl's tenants, free.—On Thursday week the inscription stone of the Birmingham Free Industrial Schools, in Gem-street, was laid with the usual ceremonies. The cost of the erection will be upwards of 2,000%, and the accommodation sufficient for 200 children of both sexes.—The new Concert-hall, in Hope-street, Liverpool, noticed by cert-hall, in Hope-street, Liverpool, noticed by us lately amongst buildings in progress there, is about to be formally opened with a series of grand musical performances.——Mr. Samuel Addison, banker, Wednesbury, has contributed 7001. for the completion of the tower and spire of the new church there. The same gentleman gave 5001, in addition to the site, towards the erection of the church itself.——At the Jarrow Docks the operations commenced by the contractors have been suspended, and the workmen tractors have been suspended, and the workmen discharged, owing to the unsettled state of the affairs of the Railway Company, and the pro-bability of such schemes being, for the present, abandoned. It is said that the arrangements abandoned. It is said that the arrangements for purchasing the land in the locality were not completed.—The first stone of St. Peter's Church, Ascot Heath, was laid last Monday by the Bishop of Oxford. Mr. Ferrey, architect; Messrs. Higgs and Sons, builders. It is in the Decorated style, and is to cost about 1,400l.—The time for lodging plans in competition by certain architects, for the Essex County Lunaite Asylms at Brantwage in competition by certain architects, for the Essex County Lunatic Asylum at Brentwood, has been extended to 1st May.—A site for a new asylum at Hampshire has been selected at Titchfield.—The church of St. James, Lower Gornall, has been enlarged and refitted. The chancel, entirely new, is laid with cn-caustic tiles. Mr. Bourne, of Dudley, was the

architect employed.—A large building in Great Ancoats-street, Manchester, according to the local Spectator, is to be fitted up, under the direction of a competent architect, as a model lodging-house.—A sum of 1,600t. has been voted, at the West Riding sessions, for the enlargement of the second court of the Wakefield Court-house.—The foundation stone of the Durham Mechanics' Institute was laid, on the 30th ult., by the leader of a procession of Freemasons.—The chancel window of Crosscannonby Church, near Maryport, has been filled with stained glass, supplied by the parishioners. The window consists of three lancet lights; in the centre one of which is represented the Crucifixion. In the left lancet is St. Peter, and in the right, the saint to whom the structure is dedicated. The remainder of the window is fitted with flowered quatre-folls, enclosed in circles. The designs were furnished and the work executed by the Messrs. Scott, of Carlisle.

A NOTE TO WORKMEN.

OBSERVING in your publication of last week some remarks on the want of ambition among working men, I beg to make a few observations on the subject. The stateobservations on the subject. The state-ments in the article are certainly lamentable facts, the extent of which is very considerable. The evils resulting from them greatly impoverish the nation, and entail misery and wretchedness on posterity. The following remarks relate alone to myself. They are not given as a boast, neither as reproof, but rather to excite an honest ambition in the minds of the working classes. I am a married man, with a wife and five children, who are dependent on my exertions for their support.

Being a working mechanic, my income is (when employed) 11. 10s. per week. My ware the higher ware accounted to the property of t parents, thirty years ago, were similarly situated, with about one-third of this income. From them I learned a lesson of economy. The great question with me is, what quantity and quality of the necessaries of life are most conducive to promote health, strength, and happiness. Guided by the wise in former ages, and by my own experience, I have long since come to this conclusion—that man's real wants are comparatively few. I have found, therefore, in past years, that two-thirds of my income will sufficiently supply myself and family with the necessaries of life; the one-sixth of the same will meet the casualties of loss of employment; the other sixth, which is 5s. per week, or about 10l. per year, is laid by for sickness or age. This trifling sum, with interest and compound interest, in a few years will make a poor man comparatively rich. Now, I am persuaded that there are thousands of working men, if they would make an honest statement of what they spend foolishly, the amount of money so spent would be more than amount of money so spent would be more than I pretend to save, and they are often laying themselves under the necessity of giving 20 per cent. for pledges of their property, when at the same time they might, by resolution and good management, be receiving instead of giving interest for money. Let these hints be reinterest for money. Let these hints be re-ceived in the spirit they are given. Let them excite an honest ambition to raise ourselves from that state of degradation in which too many of us are found. Better times approach but slowly to the sluggard and profligate,—I might rather say, they are always retreating from him, while the industrious and frugal are overtaking them every day.

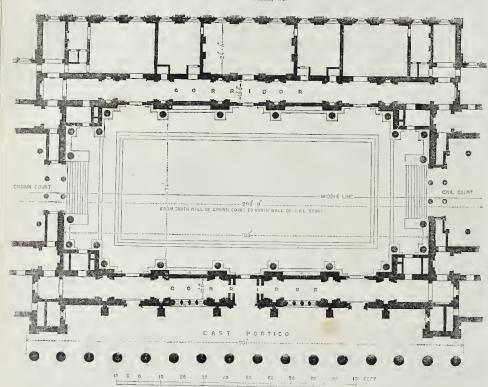

A Working Man, Formerly an "Old Mason."

BURSTING OF A RESERVOIR NEAR KEIGHLEY.—At Cowling, on the top of a moor, a reservoir, which supplied a small cotton mill with water, lately gave way, and carried all before it with a stream occasionally 15 to 20 feet deep; but fortunately without the loss of a single life, though several were in imminent jeopardy. A bridge was carried away, and rocks of several tons weight were bowled along with a noise like prolonged thunder. It is even alleged, that "in one place the living solid rock has been scooped away to such an extent that a basin big enough to contain a large house has been formed in one hour."

^{*} The great arch was keyed on March 3rd, 1849, the centres were lowered on the 5th, and it bad deflected 3-8ths of an inch by the 12th, and was found in precisely the same position April 14th. The whole of the timbering forming the great centres will be taken down by the first week in May. The arch, however, stands perfectly clear of everything.

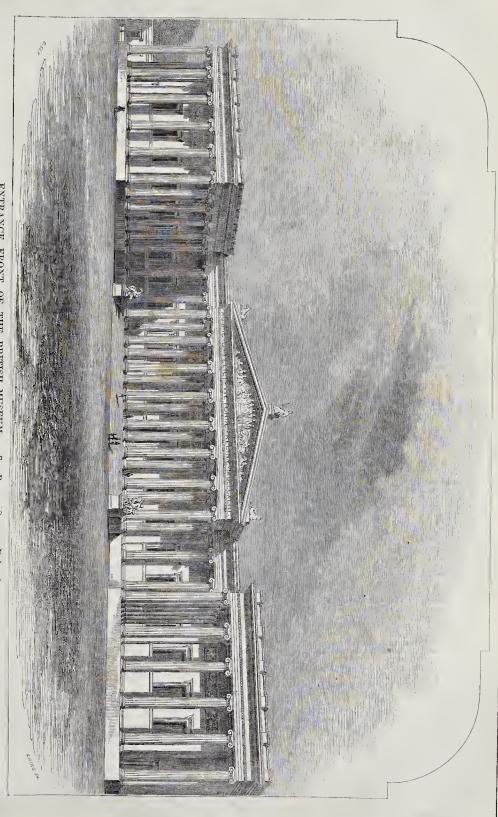

ST. GEORGE'S HALL, LIVERPOOL.*

PLAN OF HALL, &c.

SECTION OF GREAT ARCH.

ENTRANCE FRONT OF THE BRITISH MUSEUM.—SIR ROBERT SMIRKE, R.A., ARCHITECT.

THE NEW BRITISH MUSEUM.

On the preceding page we place hefore our readers a perspective view of the entrance-front of the British Museum, now nearly completed. In the second volume of our journal a view was given of the old Museum, known as Montague House, together with some historical parti-

The order of architecture adopted throughout the exterior of the new building is the Grecian lonic. The southern façade consists of the great entrance portico, eight columns in width, and two intercolumniations in projection. On either side is an advancing wing, giving to the entire front an extent of 370 feet, the whole of which is surrounded by a colonnade, consist-ing of forty-four columns, raised upon a stylobate five feet and a half high. The columns are five feet at their lower diameter, and fortyfive feet high; the height from the pavement of the front courtyard to the top of the entablature of the colonnade, is sixty-six feet and a

The principal floor of the building is reached by a flight of twelve stone steps at the foot of the portico, one hundred and twenty-five feet in width, terminating on either side with pedestals intended to receive groups of sculpture.

The tympanum of the portico is proposed to be enriched with historical or allegorical sculp-ture in full relief, and colossal statues are to surmount the pediment. These are not yet executed.

The principal entrance to the museum under this portico is by a carved oak door, hung to a door-frame of stone, nine feet six inches wide, and twenty-four feet high, through which we shall pass next week, and give a view of the great hall and staircase.

grean an and sturcase.

The majority of our readers know that the Museum has been erected from the designs of Sir Rohert Smirke, but that since 1846, in consequence of the ill-health of Sir Rohert, his brother, Mr. Sydney Smirke, has heen engaged in completing it.

RECOVERY OF EXPENSES INCURRED BY OVERSEERS IN PULLING DOWN RUINOUS STRUCTURES UNDER THE BUILDINGS ACT.

LAST week a case was heard at the Thames LAST Week a case was heard at the Thames Police-office, arising out of a suit for the recovery of 13t. 16s. from Sarah Moncar, of Shipwrights'-terrace, Poplar, being the residue of expenses incurred by John Coombs, overseer of the parish of All Saints, Poplar, in re-

seer of the parish of All Saints, Poplar, in respect of a certain building.

The defendant was the owner of a small tenement in a place called Cold Harbour, Blackwall, which has been for many years in a ruinous state, and was inspected by the district-surveyor so far hack as 1845, when, it is stated, he reported to the official referees that it was in a dilapidated and dangerous condition, and that it was expedient and necessary that the building should he taken down, and a hoard put up for the safety of passengers. and a hoard put up for the safety of passengers. Nothing, however, was done heyond shoring up the huilding until February last, when, owing to repeated complaints from various persons, the law was set in motion and the Act-was brought into operation. The defendant was first waited upon, and the ruinous and perilous condition of the building was fully represented, but without effect. The overpersons, the law was set in motion and the Act represented, but without effect. The over-seers, accompanied by the surveyor of pave-ments and the vestry-clerk, surveyed the premises on the 12th of Fehruary. The roof had then fallen, and the tenement was in the most dilapidated condition imaginable, and in danger of falling and hurying the defendant, the only occupier, in the ruins. The next step was to send a notice to the official referee of metropolitan huildings, who gave Mr. Good, metropolitan hullings, who gave an account the district-surveyor, orders to make a survey, and he did so, and certified that the premises required to he wholly pulled down. After the various other formalities required by the Act, various other formainties required by the Act, and a copy of the surveyor's report had heen served on the overseers, a notice was served on the defendant to pull down the premises at the expiration of fourteen days from the date thereof. The defendant still refused, and after repeated notices had been given

to her by Mr. Kemp, the overseers employed a builder to raze the huilding to the ground, caused the materials to be sold hy public anction, and now sued the defendant for the balance of the fendant for the halance of the expenses, amounting in all to 21*l*. Credit had heen given to the defendant for 7*l*. 4s., the sum which the old materials realised by the sale, and proof was given that a formal demand of the halance now sued for had been made. The payment of the district surveyor's fees, auc-tioneer's expenses, the solicitor's costs, and noncer's expenses, the sonicion's costs, and the services of notices, &c., were proved by numerous witnesses, and there was no question raised by the defendant's solicitor as to the ruinous condition of the huilding. An objection was taken to the service of a notice, thrust through a broken window-pane, which was overruled. Likewise to the charge of a guinea overfined. Ensewise to the charge of a gainea made by Mr. Kemp, the vestry clerk, including 4s. for coach hire. It was said that Kemp was paid a salary, and it was part of his duty to advise the overseers, and that when he attended the court, or went to the premises in question, he was on parish duty. Mr. Kemp insisted that the duty was special, and had nothing to do with his appointment as vestry clerk, and that he laid out 10s. 6d. for coach hire and fees of court.—The magistrate was at first disposed only to allow Mr. Kemp the money he had actually expended, but finally waived the objection, and 21s. was awarded to him. He directed a warrant to issue to distrain the goods and chattels of the defendant for the sum claimed.

INSTITUTION OF CIVIL ENGINEERS.

LIGHT.

AT a meeting on April 17, Mr. R. Stephenson, M.P., in the chair, the paper read was, "On an application of certain Liquid Hydrocarbons to Artificial Illumination," by Mr. C. B. Massfield, B.A. The paper first noticed that liquid hydrocarhons had heen comparatively little used for the production of artificial light, and that in the instances in which they had heen applied, their liquidity, and not their evaporability, had heen turned to account.

The paper represented that a difficulty had heen solved by the discovery of a liquid hydrocarbon as volatile as spirits of wine, but containing sufficient carbon for the most perfect light, and obtainable in any quantity. This

light, and obtainable in any quantity. This hydrocarhon was procured from coal tar, and was called "Benzole." Its volatility was such as to enable it to napthalise atmospheric air as effectually as ordinary naptha did coal gas.

The system proposed by the author (which was illustrated in the room by a working apparatus) consisted in conducting a stream almost any gas, or even of atmospheric air, through a reservoir charged with Benzole or some other equally volatile hydrocarhon; the gas or air so napthalised being then conducted like common coal gas through pipes to the hurners. It was stated that the system was applicable on any scale, from the dimen-sions of town gas-works to the compass of a table lamp. In the apparatus exhibited, a small gas-holder, filled by a pair of hellows, supplied common air through pipes. The gases formed hy passing steam over red-hot coke would answer well for this purpose, and it would depend on local circumstances, whether this mode of generating the current would he preferable to the expenditure of the mechanical force necessary for driving atmospheric air through the pipes. Pure oxygen charged with the vapour would explode on ignition; it was therefore suggested that this might prove a useful sonrce of motive force The system was shewn to he a great simplification of the ordinary system of gas-lighting, as no retorts, refrigerators, purifiers, or meters were required, and the products of comhustion were as pure as those from the finest wax.

The apparatus and conditions necessary for the purcease of the worked were a flavor of the system of the sys

the success of the method were, a flow of o gas, or of air, driven through pipes hy any gas, or or air, driven through pipes by any known motive power, and a reservoir of the volatile spirit through which the main pipe must pass in some convenient part of its course; these pipes and reservoirs heing pro-tected from the cold.

It was stated that a gallon of Benzole, of the degree of purity requisite for the purpose, would cost ahout 2s. 6d.; to this, the expense of the air-current and the interest of the

original outlay on apparatus, was to he added. original dutay on apparatus, was to lie auteur. This, the author presumed, would not raise the cost to more than 4s. for the consumption of a gallon of Benzole. It was stated that one ounce of that liquid would give a light equal to four wax candles of four to the pound, for one hour, or one gallon for about one hundred that the theory. and twenty hours. It was inferred that a gallon of this material was equivalent to about 1,000 cuhic feet of coal gas.

SCIENCE AND SCENERY AT HER MAJESTY'S THEATRE.

In the last scene of a heautiful ballet, called Electra, or the Lost Pleiade, played for the first time at Her Majesty's Theatre, on Tuesday night, an effect quite wonderful is obtained by the introduction of the electric light, opening new views in stage arrangements, and hearing strongly on some ideas as to the lighting of their was excessed in a provious lighting of theatres expressed in a previous volume of our journal.

The story of the ballet is one that has often

been used in other forms, and often will be,— it symbolises the struggle in man's mind be-tween the real and the ideal,—the thought, and the thing. We have only so much to say of it, however, as will serve to explain the par-ticular incident in question: although looked at philosophically, a ballet is not without its

One of the Pleiades hecomes enamoured of a mortal on the eve of his marriage, and leads to the struggle to which we have referred. By this act the Star is deprived of her station, hut is ultimately forgiven and restored. The scene is a lake, in the hright moonlight, a charming piece of deception, hy Mr. Charles Marshall: changes to the Empyrean, the "highest Heaven of the poets, where the pure element of fire is supposed to exist. The six pleiades rise amongst the clouds, with each her bright particular light, and the seventh, the forgiven, is then seen sailing up and forwards to the front of the stage, with a star so hrilliant and far-piercing, that the gas, as sporting men say, is "no-where." Hyperhole apart, however, the effect when we saw it was very striking and very heantiful.

Some of the previous scenes and effects, a forest, and a Norwegian view with torrent and bridge, are creditable specimens of Mr. Marshall's art.

DILAPIDATIONS.

SHERIFFS' COURT.—Birch v. Edgecumbe.
This was an action to recover damages for —This was an action to recover damages for dilapidations, &c., under peculiar circumstances. The facts were these:—The defendant took the premises, situate in St. Anne's, Soho, on a lease, in which was a covenant to keep the premises in repair. After being in possession four or five years, defendant set about performing some repairs, but in the hurry gave no notice to the district surveyor, and as the alterations were not in conformity and as the alterations were not in conformity with the new Building Act, and in consequence the house was condemned, and almost wholly pulled down, the expense in rehnilding was about 5001., which was now sought to he

The Under-Sheriff (Mr. Burchell) said this was not a repairing lease, but the covenant was merely to keep in repair; that was, he was to keep it in repair according to the length of time he occupied, but not to make the house perfect

Mr. Prentis, for the plaintiff, suhmitted that the damage had heen wholly caused by defend-

ant's negligence.

Mr. Wiltshire, surveyor, was called, and made a calculation that the house, if properly repaired, would have lasted for twenty-one ars; hut taking the difference of value in the old and present house, he thought 150l. a fair equivalent for the loss.

The jury, after a short consultation, gave a verdict for 150l. damages, and 20l. for rent in all 1701.

THE NEW CITY PRISON AT HOLLOWAY. e understand that the contract for the huilding of the new city prison at Holloway has been regularly signed by the contracting parties, and that operations are to commence on the ground. The first stone will he laid at Midsummer.

^{*} In the same volume of THE BUILDER, p. 324 and p. 360, will be found two views of the entrance gateway, now about to be removed.

STATE OF WESTMINSTER ABBEY.

SIR,-It has been stated that the Dean of Westminster has, with his well-known liberality and enthusiasm, resolved to apply a considerable portion of his income to the repairs and improvements of the Abbey; but the following extraordinary circumstances bave not yet been made known to the public, though

Dr. Buckland having determined to set a noble example, very judiciously began by a close investigation of the actual state of the edifice; and lo! it has been discovered that buttresses and other essential parts of the building are in a dilapidated, and even imminently dangerous condition, so as to threaten with destruction some of the venerable Royal chapels, and the unequalled national relies they contain. It is, indeed, fortunate that the appointment of a dignitary alike remarkable for rare acquirements in science and a generous disposition, has saved the country from the impending misfortune, and the abbey authorities from unavailing reproaches. attributes from unavaning reproaches. But the case naturally leads to the question,—how it happened that the ruinous condition of parts of the admired structure was not observed and remedied by others previous to the present Dean's appointment. Appended to a return, printed by order of the House of Commons, on the motion of Mr. Hume, 25th July, 1845, and signed by the auditor of the Dean and Chapter, is a declaration that the moneys received at the entrance are appropriated to "such ornamental improvements of the Abbey and buildings belonging thereto, as do not fall within the ordinary re-pairs of the fabric (which is maintained out of the funds of the Dean and Chapter, usually appropriated to that specific purpose), or in any manner at the discretion of the Dean and Chapter, so that it be not made use of for any other object for which the Dean and Chapter collectively, or the Dean and Canons indivi-dually, are bound to provide."

Four years after this declaration, we learn that the funds usually appropriated to that specific purpose have not been applied to the necessary repairs of the fabric; that the objects for which the Dean and Chapter are bound to provide have been miserably neglected, and at last it devolves individually on a new dean, and he a rare example of liberality and science, to stop the onward course of ignorance, neg-lect, and utter ruin to the most important of our national antiquities. Surely it would become Mr. Hume or Lord John Russell to ascertain the cause of these inconsistencies; nor should our archæologists cease agitating until similar neglect is rendered impossible throughout the land.

A TRUE ENGLISHMAN.

RAILWAY JOTTINGS.

From official returns it appears that the amount of traffic for the last week, on 4,432 miles of railway, was 186,473 l., thus accounted for: -81,461l. for the conveyance of passengers only; 55,942l. for the carriage of goods, and a remainder of 49,070l. for passengers and goods together, not respectively apportioned; being an increase of 27,842l. over the corresponding week of last year, when the mileage was 3,543. The average earnings per mile were 42l., whilst last year they were 44l.—The increase of receipts on the London and North-Western for the last eleven weeks, over and above the corresponding period of last year, amounts to 26,845*l.*, or 2,444*l.* per week. The gross receipts for the eleven weeks have been 405,635*l.*, or at the rate of nearly 2,000,000*l.* per annum.—The London and Brighton have made considerable reductions in the charge for periodical tickets, with the view of encouraging building, and extending facilities for suburban residence in connection with the short stations between London, Croydon, and Epsom.— In place of bells, clocks, &c., as time signals at stations, Mr. J. S. Torrop, of Edinburgh, has devised a new one, or rather adopted an old one, as a railway-train-monitor, namely, a moveable ball mounted on a lofty pillar, wound up to the top by clock-work, and taking a definite time to descend. This time is set to that startle public r ten minutes. When the ball is seen at the top of the pole or pillar, passengers approaching milder suggestion."

ing the station are informed that they have ten minutes; if half down, five minutes, and so on. Being capable of being made a conspicuous object, its indications can be distinguished at a considerable distance by intending passengers, who may be thereby saved all unnecessary excitement and uncertainty in making their way to the station, while the officials will he also saved from the annoyance of questioning as to the time the train is due.

Mr. Bushby, of Littlehampton, has contracted for the erection of the railway terminus We understand the sum is 01 and 11,0001. The entire at Landport. We understand between 10,000l. and 11,000l. works are to be completed within five months. -The Admiralty have assented to the proposed South-Western extension line from Richmond to Windsor, on condition that the navigable channel of the Thames be crossed by bridges of one span, with as much headway as the limits of deviation will allow. The point at which the line is to cross the river is about three quarters of a mile below Windsor-bridge. The past week has been an important one in the modern history of Gainsboro', from the opening of a line of railway, which places the town within an hour and three-quarters of The Great Northern line to Lincoln, also lately opened, will be felt as a still greater convenience.

SALE OF JOHN OF GAUNT'S PALACE. LINCOLN

THE old mansion called "John of Gaunt's Palace" has lately been sold, and the beautiful oriel, or bay window, at the south end of the building, was offered for sale separately. It has not, however, been taken down, nor has any part of the huilding been pulled down or altered, and it is to be hoped that the destruc-tion may be prevented. There is a view of this old mansion, done by Nathaniel Buck, in 1726, which gives a general idea of the whole eastern front. A great part was taken down soon afterwards, but the oriel, and a window which is engrayed in Pugin's Specimens, from sketches by Mr. E. J. Willson, of Lincoln, were left standing, and are yet remaining. The former is blocked up, and a modern chimney stands behind it.

Part of the eastern front remained standing until the early years of the present century, and a drawing of it is in the British Museum. This was made by Mr. Grimm, an artist who was employed by Sir Richard Kaye, Bart., when Dean of Lincoln. It is to be feared that the beautiful oriel (to use a common term, if not strictly a correct one,) will tempt some amateur to a purchase, and then it may be pulled down and stuck into a modern villa, and thus be deprived of its real value. It has never been thoroughly examined withinside, and, consequently, the delineations that have been made are imperfect. It is unequalled for richness and elegance.

The other window is also very elegant; it has been adopted, by the late Mr. Wilkins,

at Cambridge.

Miscellanca,

RE-ERECTION OF THE OLYMPIC THEATRE. We reged a short time since the impolicy and impropriety of rebuilding the Olympic Theatre in Wych-street. The Athenaeum, taking the same view, says,—"We regret to hear that it is proposed to rebuild the Olympic Theatre on its recent site,—the front, for the better convenience of carriage approach, being turned towards Newcastle-street. We wish there were somewhere an authority to prevent this; and are of opinion that had the fire by which this edifice was recently destroyed taken place two hours later in the evening than it did, this authority would speedily have been found. There have surely been calamities and warning account of the state ings enough of late to point out the pressing necessity of providing ample passages of egress and spacious approaches to buildings in which multitudes of human beings congregate .-Covering an insufficient area of ground and hemmed closely in on every side, the site of the old Olympic seems well chosen for converting such another accident as that which has just destroyed it into one of those terrible events that startle public remorse into such measures of prudence unaccountably neglected on any

PROJECTED WORKS.—Advertisements have been issued for tenders,—by a date not specified, for the erection of a district church at Brompton, Middlesex; by a date not specified, for the whole or either of the following churches: a district church at Clay Cross, Northwingfield, and a district church at Belper, in the county of Derby, and a parish church at Bulwell, in the county of Nottingham; by May 8th, for the several works required in erecting the general station at Wolverbampton, with carriage-sheds, platforms, &c.; by 27th inst., for the erection of a new Wesleyan Chapel at Witney, Oxfordshire; by a date not specified, for the erection of a gasa date not specimed, for the erection of a gas-holder, &c. for the Sheerness new gas works; by 27th, for the several works to be done in the erection of a parsonage house at Chapel-en-le-Frith, Derbysbire; by 5th proximo, for filling up the site required for the cattle market in Shrewshur; by 25th, for the erection of farm-buildings for Mr. Adam Eve, Jun., at Hangham, near Louth; by 28th, for the erection of a rectory house at Lambley, Nottingham; by 24th, for the erection and completion of a brick warehouse at Bolton; by 26th May, for the erection of sundry buildings and works at the new barracks at Owlerton, near Sheffield; by 7th May, for about 5,000 tons of cast-iron pipes, from 2 to 26 inches in diameter, for the Manchester Corporation waterworks; by 23rd inst., for certain works and additions to the laundries and drying-rooms of the workhouse, Leicester-square; by 8th May, for certain alterations and additions to the kitchen of the Bedford Lunatic Asylum; by 2nd, for the erection of additional buildings at Queen's College, Birmingham; by 15th paving and repairing carriage ways and foot-ways in St. Clement's Danes parish; and by 30th inst., for the execution of the cast and malleable iron-work required for the slied and roof of the central station at Newcastle-on-Tyne; also for building a small station-bouse at Gateshead, and another at Newcastle. A large contract for sheet copper is shortly expected to be announced by the French Minister Marine for sheathing a great portion of the national navy.

THE FOUR-MILE PANORAMA. Sir : On paying a visit last week to the Misissippi panorama in Leicester-square, it struck me that it would be worth while to test the accuracy of its alleged dimensions, viz., four miles. I therefore noticed how many lengths of canvas of the size of the disc passed across it in three successive quarters of an hour: the average for each fifteen minutes was ten lengths. The exhibition lasted $1\frac{1}{2}$ hour. The width of the disc was then paced, and found to be about 20 feet; consequently, 20 × 10 × 6 gives 1,200 feet as the real length; so that if even 120 feet be added as compensation for any possible error, the result is still only 4 of a mile, or 1-16th of the pretended length. This a lime, of 1-1000 the precenced length. This is too palpable a Jonathanism. Of course, if the advertisement be correct, the canvas must, during exhibition, be constantly travelling across the stage nearly at the rate of 3 miles an hour, which would hardly allow the painting to be seen at all, and certainly would give no time for the lengthy stoppages and explanations that actually take place.—A.

NATIONAL GALLERY OF ART FOR IRE-LAND.—At the last meeting of the committee of the Royal Irish Art Union, Mr. Blacker announced that a munificent donation had just been made to Dublin, being no less than two cartoons of Raphael. The subjects were, just been made to Dublin, two cartoons of Raphael. The subjects were, two cartoons of Raphael. The subjects were, "St. Peter and St. John Healing the Lame Man at the Beautiful Gate of the Temple," and the Sorcerer, Struck Blind." "Elymas, the Sorcerer, Struck Blind." Early in 1847, he (Mr. Blacker) had some correspondence with Mr. Nicolay, of Oxford-square, London, when getting up the exhibi-tion of the works of ancient masters for relief of the then general distress. He received the other day a letter from Mrs. Nicolay, saying that she was but carrying out the wishes of her late bushand in asking him, Mr. Blacker, to take charge of two cartoons of Raphael, which he wised most highly need to be the control of to take charge of two carroons of raphaet, which he prized most highly, and was desirious should be presented for the formation of a permanent gallery of art in Dublin. Mrs. Nicolay, as an Irishwoman, felt peculiar, Nicolay, as an Irishwoman, felt peculiar, although mournful pleasure in carrying his wisbes into effect. Mrs. Nicolay accompanied the gift with a short statement of their history, and how they came into Mr. Nicolay's possession, which appears to have been simply this:—These spectmens of the Italian school of art were picked up by Sir Joshua Reynolds during his tour in the Low Countries, in one of the towns where they had been originally sent for the purpose of manufacture into tapestry. At Sir Joshua's death, and at the subsequent sale of his effects, they passed with one intermediate hand into the possession of Mr. Nicolay. A committee was appointed to consider the propriety of having forthwith an exhibition of old masters in connection with the newly-arrived cartoons, the proceeds to form a reserve fund for a permanent public gallery and studying school, and are proceeding to carry this desirable project juto effect.

SEPARATION OF PAUL'S WHARF SEWAGE FROM THE RIVER.—Mr. Moffat, C.E., for-merly engineer to the London Sewage Chemical Manure Company, has offered to the City Sewers Commissioners 2s. 6d. per ton of dry manure, to be manufactured by him from this sewage in premises to be erected at his own the mouth of the sewer. expense near proposes to sink an intercepting well, with a shield to prevent the ingress of the tide, and to raise the sewage out of this well by steam-power into tanks, where it will be chemically treated by mixing it with hydrate or milk of lime, so as to precipitate many of the matters in solution, along with those in suspension, to un solution, along with those in suspension, to the bottom, after which the water will be allowed to flow off into the Thames, and the residual matter removed and dried, and moulded into portable shape. In storms, when the sewage will be greatly diluted, there will be an intermission of the process. The medical officer of health, and the surveyor to the City Commissioners have recorded without the City Commissioners, have reported rather favourably of the proposal,—recommending, however, that such works should only be al-lowed as an experiment for one or two years, in case of turning out either a nuisance, or a hindrance to the realization of any more complete or comprehensive measure. processor or comprehensive measure. In their re-port they also point out the fact that objec-tions had been taken by adequate chemists to much the same proposal when made by the late Sewage Chemical Manure Company, and that, although such a measure would tend to clear the river of deletaring matter. the river of deleterious matter, much of its more subtle essence would still remain in the water ultimately turned into it as heretofore. Mr. Moffat proposes, of course, to dispose of the manure to his own advantage, in fertilising Plumstead Marsh, or othewise.

Granaries, for othewise.

Granaries, &c., at Mancitester.—In connection with the lately opened extension of the Manchester, Sheffield, and Lincolnshire Railway to Gainsborough, and for agricultural traffe, arrangements on a large scale are being nade. The goods station is on the level of the street, and some 20 feet below the passenger station. But the goods warehouses, as well as the corn warehouses, will be connected by a viaduct, on the same level with the railway, and thus save the cost of "lifting." At present every truck of goods is lowered and hoisted by steam, worked on the locomotive principle, for the sake of economising the working. The arches below the station are arranged and subdivided for the different local traffic, which has grown so much of late, that the company uses them itself, and foregoes a rental of 300%. a-year on each of seventeen such arches. Of these, eleven or so are used by the London and North-Western, and the rest by the Lincolnshire line. For the corn stored in the warehouse, no one is directly charged with rent. The warehouse more particularly used for this purpose consists of a series of flats, about 9 feet high, supported by cast-iron columns. The sacks are lifted in and out by steam power. Each flat is about 180 feet long. The mere fact of making a connection between the stations of the two companies at Sheffield, snys the Railway Chronicle, at once created a corn traffic in Manchester, which has steadily increased. It has heretofore come from Nottingham and Lincolnshire either by canal, or by the more circuitous course of the Manchester and Leeds Railway.

The Benning Parker Marker Marker and Leeds Railway.

The Benning Parker Marker Marker Marker and Leeds Railway.

THE BENTINGN TEST MONIAL.—Workmen have been boring near the centre of Mansfeld Market-place, to ascertain the nature of the proposed foundation of a structure which is to be erected from a design by Mr. Hind, after an early English market-cross.

THE WONDERS OF GUTTA PERCHA are by no means at an end. Its Protean purposes appear to be themselves outvied by its singular Several new ones have cently discovered. Mr. Torrop, of Edinburgh, has communicated to the Royal Scottish Society of Arts, a notice of one peculiar property. When cast and rolled into shects, it assumes the nature of a fibrous substance-it acquires tenacity in a determinate direction. When in the roll or sheet this tenacity is longitudinal. But if a strip be cut from the breadth, two peculiarities occur: the strip is susceptible of a definite elongation to nearly five times the original length, and its direction of tenacity is reversed. When it is considered that gutta percha is originally a fluid substance, or gum, these peculiarities are indeed curious and re-markable. In fact, when we keep its multiform uses and its other properties in view, together with such a peculiarity, it assumes all the importance, or at least the simulative form, of a sort of vegetable iron; an idea, however, fanciful as it may be, which another contradictory property, also newly discovered, only tends to projectly, also newly discovered, only tends to upset; for it is said to be, like glass, an electric, only it far excels glass itself as such. A Liverpool correspondent of the Carlisle Journal, drawing attention for the first time to this peculiarity of gutta percha, says—"Its electric remorations of force I meaning the such cases. properties, so far as I am aware, have not been publicly noted; and I venture through your columns to call attention to this quality, which it possesses in a remarkable degree. If a piece of sheet gutta percha be laid upon a table-cloth or silk handkerchief, and stroked quickly with the hand, and then lifted from the table, it emits brilliant flashes of electric light, and considerable sparks may be drawn from it by any conducting substance. The ease with which gutta percha is excited contrasts strongly with the difficulty of exciting glass and resinous substances, especially in damp atmosphere; and there can be no doubt that it may be successfully employed to produce large quantities of electricity. The machine large quantities of electricity. The machine for this purpose may be extremely simple: an endless band of sheet gutta percha stretched over two rollers (one of them turned by a winch), pressed slightly by a cushion and having a rod or wire touching the revolving band and in connection with the conductor of band and in Confection with the confection of an ordinary electrical machine, would produce a constant supply of electricity, in a quantity proportioned to the surface employed, which may be very considerable; and I shall not be surprised if, by these simple and economical means, effects are produced equal to those visited by the layoret electrical participation. attained by the largest electrical machines now attained by the largest electrical machines now in use. I may add, as a useful hint to experimenters with the sheet gutta percha, that it may be readily joined by laying the edges together, and cutting off a shaving with a pair of scissors moderately heated."—The supply of the article is still going on. The vessel Duke of Bronte, arrived from Singapore, has recently hought 36 hours 112 below 1321. Dake of Brome, arrived from Singapore, near recently brought 36 bags, 112 bales, 11,347 blocks, and 1,934 other packages, as a portion of her cargo, consigned to order; and the Anne Watson, also from Singapore, has brought 7,402 packages, 120 blocks, and 2 backets to order. 3 baskets to order.

Use for the Pitch Lake of Thinidad.

—An important communication has been made by Earl Diundonald to Lord Harris, governor of Trinidad, on the substitution of bitumen from the pitch lake of La Brea, in place of coal, to the extent of two-thirds of this fuel, for the generation of steam, in the manufacture of sugar, &c.; thus also restoring to the soil, in form of manure, the refuse of the cane fields now used for fuel. In a furnace, in which it has been successfully used, the bitumen, it appears, is poured into a recess, or pit, just below the fire-bars, leaving sufficient room for a rapid current of atmospheric air, and as it is decomposed, the dense smoke and gases are carried through the incandescent fuel, and go off in flame and great heat. Earl Dundonald has forwarded a plan of this furnace to the governor. The Port of Spain Gazette expresses a bope that the subject will attract the attention of the Royal Mail Steampacket Company, whose intercolonial steamers consume a vast quantity of coal, conveyed at great cost from England to the several depôts, for the whole of which, under a proper adaptation of their furnaces, the pitch might prove a cheap and effectual substitute.

ELECTRO-TELEGRAPHIC PROGRESS.—The admiration excited when first the locomotive express went ahead of all other conveyance of intelligence was only lately excelled, we may say for the first time in this country, by the transmission of a full report, three close columns in length, of the Cobden banquet proceedings, at Wakefield, per electric telegraph, to the Times, in which the whole, down to their close, on the way to 12 p.m., was published by 3 a.m.; the whole process of reporting, transcribing, telegraphing, retranscribing, type-setting, and printing, being accomplished,—actually finished—at one end of the country in less than four hours after the words were spoken almost at the other end of it. The telegraph is now beginning in earnest to do its duty; and it is to be hoped that the honly drag upon its lightning speed that now remains, viz., extravagant and impracticable charges, will ere long be cast off as an incubus that can no more profit the conveyancers of intelligence than its publishers.—So constantly is the telegraph in requisition for the purposes of the press on the other side of the Atlantic, that one of the New York papers is about to have an "independent" track constructed from New York to Washington and Boston, for its own exclusive use. The eastern route will be 245 miles, and the southern 225 miles.

YORNSHIRE ANCHITECTURAL SOCIETY, At the meeting of this society, the Hon. and Rev. P. Y. Savile, rector of Methley, gave notice, that at the next meeting he should ask for a grant of 104, for the restoration of a fine onk roof, which he had discovered during certain repairs in his church, concealed above a flat plaster ceiling, and he also particularly invited the attention of the members to the peculiar features of the building. It was accordingly resolved that a special meeting of the society should be called at Methley early in May, for the purpose of examining the church. A paper was read by Mr. W. II. Dykes, architect, of York, "On the form and Management of Churches," giving some account of the various types of churches which had been common in different ages, through the Christian world, and showing that, nevertheless, they had all agreed in certain peculiar features, and especially in their having had a distinct chancel, separated by screens from the body of the church.

body of the church.

THE TYNE GLASS TRADE, according to the Newcastle Guardian, is only now reaching the climax of its decline. Out of the numerous firms formerly engaged in the window-glass trade, two only remain, and these appear to be not only languid but expiring also. Ridley and Co., a firm of a century standing, have suspended their works, and will probably not resume them. Only two of the finit-glass works remain. Various causes, none of them our authority thinks sufficient, are alleged for the depressure of this trade.

NOTICE.

"Bulldings and Monuments, Modern and Medieval," being Illustrations of recently erected Edifices, and of some of the Architectural Works of the Middle Ages, with Descriptive Particulars, Edited by George Godwin, F.R.S., Fellow of the Royal Institute of Architects, &c., &c., &c.

Noyal institute of Architects, &c., &c., &c., &c. Under the above title it is proposed to publish, in bi-monthly parts, price 2s. 6d. each, the principal Illustrations of Modern and Mediewal Buildings which have appeared from time to time in The BUILDER, with their accompanying descriptive particulars. Each part will contain about eight plates, folio size, and eight pages of letter press, with plans and details. The engravings will be printed separately, with care, on a linted paper.

The first part will be issued in time to be forwarded with the magazines for May 1, and will

contain :—
Her Majesty's Marine Residence, Osborne; with

The Carlton Club House, Pall Mall,
Church of St. Isaac, at St. Petersburgh; with

No. CCCXXV.

SATURDAY, APRIL 28, 1849.

RURY-LANE THEATRE was, as usual, crowded to receive the report of the Council of the Art-Union of London, and to distribute the funds, on Tuesday

last, the 24th. The Duke of Cambridge, the president, being confined to his room by indisposition, was unable to take the chair, and Lord Monteagle, one of the vice-presidents, had arranged to do so. A summons to attend the Select Committee on the Operation of the Irish Poor Laws, of which his lordship is chairman, and which circumstance was communicated to the council only at the moment for opening the meeting, prevented him, however, from presiding. Under these circumstances, the letters from Lord Monteagle, and Baron Knesebeck on the part of the duke, were read; Mr. Serjeant Thompson, a member of the council, was voted into the chair, and Mr. G. Godwin, the honorary secretary, then read the

REPORT.

According to annual custom, the council of the Art-Union of London proceed to lay before the subscribers an account of their operations during the past year, the present position of the society, and their views and anticipations for the future. In commencing this report, the thirteenth which the council have had the pleasure to make, they consider it their duty to state the substance and issue of the renewed correspondence with the lords of the Committee of Privy Council for Trade since the date of the last report. It will be remembered that at the general meeting in 1848, the question between the Board of Trade and the council was,—whether the council should select the prizes for the prize-holders, or the prizeholders select them for themselves, in accordance with the characteristic and foundation law of the association, recognized by Act of Parliament and confirmed by the royal charter, and that the council, strengthened by the unanimous opinion of the meeting, had determined to omit no effort to maintain for the prizeholders this right of it their duty to state the substance and issue maintain for the prizeholders this right of choice. In the month of May following, a meeting was called by the Institute of Fine Arts, and a memorial to the Board of Trade, setting forth their opinion that "if the prizes were to be chosen by a committee instead of each prizeholder being at liberty to select for himself, the society would be virtually de-stroyed," and praying that "the Art-Union of London might be permitted to pursue untram-melled that course which has hitherto been melled that course which has hitherto been so conducive to the interests of art and artists," was unanimously agreed to. This was afterwards signed by more than 300 artists, including twenty-four royal academicians, and was taken up by a deputation representing the Royal Academy, the Institute of the Fine Arts, the old and new Water Colour Societies, and the Association for Promoting the Free Exhibition of Wodern Art.

bition of Modern Art.

The Incorporated Society of British Artists had previously, by a separate memorial and deputation, addressed the Board to the same

effect.

In July the council were informed, by a In July the council were informed, by a communication from Sir Denis Le Marchant, that their lordships proposed to withdraw for the present their requisition that the prizes should be selected by a committee, "and to postpone the question to another year," but that they should require that so long as the right of selection remained absolutely with the prizeholders, they should be allowed to exercise it freely, by such an alteration in the laws as would enable them to give commissions to artists, or to purchase any works excepting artists, or to purchase any works excepting

portraits, being the productions of a living artist and in his possession at the time the selection was made,—instead of being con-fined, as now, to the public exhibitions of the year, and that the Board could only consent to withdraw the regulations previously forwarded, on the understanding that such freedom would be secured.

Outlines of proposed new regulations to effect this were forwarded, to enable the council

to judge of them more easily.

The council required little consideration to arrive at a conviction of the inexpediency and destructive tendency of the proposed altera-tions, and a letter was accordingly addressed to

the Board of Trade, setting forth their objections, and containing the following passages:—
"The council of the Art-Union of London are anxious, with their lordships, to give to the prizeholder the most perfect freedom of choice, with such limitations only as may be necessary to guard against fraudulent trans-

The regulations of the society, the result of twelve years' experience and constant attention to the subject on the part of the council, have been made with reference to the prevenion of the perversion of the funds to individual advantage, without interference with this freedom of choice desired for the prizeholders.

freedom of choice desired for the prizeholders. The regulation binding the prizeholders to select from specified public exhibitions works of which the prices have been recorded, have this end especially in view, and appear to the council to meet the case. The field of selection thus given is large; it has heen increased as opportunities occurred (as by the addition of the 'Exhibition of the Royal Commissioners of Fine Arts,' and of the 'Free Exhibition'), while, by the previous record of the wrice, and while, by the previous record of the price, and the publicity which attends the transaction, the possibility of fraudulent proceedings is rendered very small, if not altogether prevented.

Should the regulation proposed by their lordships be brought into operation, this cbeck would no longer exist, and the opportunities for collusion and improper arrangement would he so greatly increased as to lead to these irregularities, and ultimately to destroy the

Under the present arrangement, the knowledge that a certain number of pictures must be purchased from the current exhibition serves as a stimulus to artists, course, would no longer exist: the prizes awarded each year are in fact so many premiums for competition open to all artists

Under the arrangement proposed, private friendship, in the absence even of improper would often lead to the perversion of

the funds.

The council are quite unable to reconcile The couldn't are quite inable to reconcine the regulation now suggested by the Board of Trade with the desire expressed by their lordships, in proposing the regulations since withdrawn, to narrow the field of selection so that the choice of the prizeholder should be confined to works of real merit.

The authorities of the various bodies of artists exercising a discretion in the admission of pictures, each exhibition has, to a certain extent, the character of a selection of works of merit; but if the prizeholder is to be permitted to select any work of art anywhere, permitted to select any work of art anywhere, provided it is 'the production of a living artist and in his possession at the time,' and, further, to give commissions to last a twelvemonth, if not more, the field of selection will be so widely extended that it would be impossible to embrace it by any sufficient regula-

Soon afterwards a deputation of the council had an interview with Lord Granville, at the Privy Council office, further to explain the grounds of objection, and the result was, in January last, a letter from Sir Denis Le Marchant, which, after reiterating the opinion of the Board, that either of the courses which they had suggested (opposite enough, it must be confessed), would be preferable to the present system, concluded thus:

"Their lordships, however, are reluctant, that the system county is the system of the

at least at present, to urge their views against the strongly expressed and deliberate sentiments of the committee of the London Art-Union, with whom they have been all along most anxious to co-operate. They have, therefore, directed me to inform you that they shall | these works, -works which if published in the

not now insist upon their proposal, but it must be distinctly understood that they do not re-linquish the right of subsequently requiring these, or any other amendments, in the exist

ing system, as circumstances may appear to them to render expedient."

This, then, is the position of the matter at present, and here, it is to be hoped, it will be allowed to rest. As the council have already said to the Board of Trade — Regarding the successful progress of the Art-Union of London as of great national importance, they would view with fear the possibility of a renewal of a discussion which tends to unsettle the public mind in respect of the association, is greatly opposed to its success, and they feel it to be their duty, therefore, in consequence of the wording of the communication, respectfully but most earnestly to express a hope that their lordships will not again raise a question on which the well-wishers of the society and the great body of English artists and art-lovers have so unanimously and un-mistakeably expressed themselves.

An examination of the published reports for several years past will convey to the sub-scribers some idea of the extent to which the time and attention of the council have been occupied by legal objections and fruitless interference. When Acts of Parliament had removed all doubt as to the legality of the system adopted by the Art-Union of London, and the association bad been incorporated by charter, the council anticipated that they would be enabled to apply themselves wboily to the furtherance of its great objects.

They still look forward to this, and depre-

cate earnestly any renewal of the unnecessary obstructions which have been thrown in the

way of their progress.

Before concluding this part of the subject the council would remark that, harassing and injurious as the proceedings in question been, they were not wholly without advantage, since they served to elicit from various quarters expressions of good will and consideration, very gratifying to those who have the welfare of the association much at heart.

Foremost amongst these expressions they place the communication, that at the meeting of artists at the Institute of Fine Arts in May last, already referred to, it was unanimously resolved,—"That this meeting take this opportunity of expressing the warmest thanks of the body of artists to the Council of the Art-Union of London, convinced that the council have manifested at all times an anxious desire, in the face of many difficulties, to promote the diffusion of a love of art among the people, and the elevation of the position of the artist, and more especially for their disinterested and determined resistance to the measures pro-posed by the Board of Trade, which would inevitably place in the hands of the council a

vast amount of patronage."

Turning now to the financial position of the society,-the council have to report that the total amount subscribed for the current year

is 10,391l. 17s.

The commercial depression which bas unithe commercial depression which has universally prevailed, political excitement, and the distrust which was for a time produced, have effected seriously all the institutions throughout the country which depend on the co-operation of the public, but have no absolute claim on it. When the council say that the revenue of the Art-Union of London has suffered, it is simply stating, therefore, that this society is not a exception amongst its this society is not an exception amongst its contemporaries.

Other causes have probably aided in producing the diminution,—the check which was given last year, and the lessening of zeal on the part of some of the numerous voluntary unpaid co-adjutors, to whose continued exertions for several years the society owes so much. It is satisfactory to the council to know that no share in the diminution of subscribers can be attributed either to the chascribers can be attributed either to the character of the engraving and illustrated work obtained by each subscriber of the past year, or to delay in issuing them. The "Prisoner of Gisors," and the "Allegro" and "Penseroso" of Milton, which have been distributed, have elicited none but gratifying expressions. It may be mentioned as a striking illustration of the result of association, that 6s.

tion of the result of association, that 6s. 5d. of each subscriber's guinea sufficed to produce

ordinary way could not have been purchased for the whole amount of the subscription; and that after paying for illustrating and printing the report, printing almanaes and prospectuses, the cost of the general meeting and the exhibition of prizes, a proportion of the cost of the charter, the reserve of 2½ per cent. to provide a gallery hereafter, and the expenses of carrying on the large operations of the society,— laif the total amount subscribed was distri-buted in the shape of prizes at the annual meeting, and in which distribution every mem-

ber had, of course, one or more chances.

With the funds then allotted, 137 works of art were purchased from the various public collections, and were exhibited in the Suffolk-street Gallery, by the kind permission of the Society of British Artists. The exhibition was open for four weeks, and was visited, as hereby an immense number of persons,

without any accident or injury.

The engraving for the current year, "Sabrina," by Mr. Lightfoot, from the painting by Mr. Frost, A.R.A., is ready for electrotyping.

In addition to an impression of this, each subscriber will receive an engraving after a design in basso relievo, by Mr. John Hancock, "Christ entering Jerusalem," submitted in competition for a prenum of 100t, offered by the council for the best design in basso relievo, this purpose.

In reply to the advertisement of this pre-mium, twenty-five designs were sent in, several of them having great merit. To one of these, "The Death of Boadicca," by Mr. Armstead, the council awarded an honorary premium, and have arranged to produce a certain number of copies of it in bronze, by the electrotype process, to be distributed hereafter as

Copies of the prize design in bronze will also be made.

The council take this opportunity to thank the various artists who responded to their invitation.

The satisfaction with which the illustrations of Milton have been received, has led the council to determine on producing a similar volume for the subscribers of the ensuing year. The poem selected is Coldsmith's "Traveller," which will be illustrated by thirty engravings on wood. Messrs. Richard Ansdell. John Absolon, Edward Corbould, Frederick Taylor, Absolon, Edward Corbould, Frederick Taylor, W. E. Frost, A.R.A., John Gilbert, F. Goodall, John Martin, R. Huskisson, W. L. Leitch, Clarkson Stanfield, R.A., E. H. Wehnert, E. M. Ward, A.R.A., J. D. Harding, C. Dodgson, F. W. Topham, E. Duncan, E. Armitage, and Thomas Webster, R.A., have already accepted coumissions for the drawings.

The engraving of "The Crucifixion," by Mr. W. Finden, after Hilton, is advancing towards completion.

wards completion.
Messrs. Bacon, Edward Goodall, and Shenton, are making progress respectively with "The Burial of Harold" (after Mr. F. R. Pickersgill); "The Irish Piper" (after Mr. F. Goodall); and "Richard Cœur de Lion forgiving Bertrand de Courdon," after Mr. John

In addition to these, which, as mentioned in the last report, are being engraved on steel, as the last report, are being engraved on steek, as an experiment on the practicability of cessing to electrotype the same plate for all the subscilbers, the council have placed "The Villa of Lucullus," by Mr. Leitch, in the hands of Mr. Willmore, to be engraved for the society. Each subscriber of the ensuing year will be entitled to obtain an impression of one of these engravators, extended to the property of the particular wint which such will

to obtain an impression of one of these engravings,—the particular print which each will receive being decided hy lot.

Statuettes in porcelain of "The Dancing Girl reposing," allotted last year, are in the course of completion, and will shortly be distributed to the prizeholders entitled to them.

The engraving of "Queen Philippa inter-ecding for the Lives of the Burgesses of Calais," by Mr. II. Robinson, after Mr. Sclous, is in progress. It is proposed to allot to-day

Catals, by Mr. H. Hobmson, after Mr. Sclous, is in progress. It is proposed to allot to-day the right to 282 proof impressions of this work.

The bust of her Majesty the Queen, in hronze, after Chantrey, being coveted by many of the subscribers, it is proposed that twenty additional copies of it shall be distributed to-day as prizes. The greater number of those allotted last year are in the hands of their last year are in the hands of their

The figure of "Thalia," in cast-iron, already mentioned on several occasions, is now so near

eompletion that the members to whom it was allotted may expect to obtain it forthwith. The council, although in nowise accountable for the delay which has attended the publication of this figure, feel indebted to the prizeholders for the patience with which they have waited for it. The council mercine of the patience with which they have waited for it. for the patience with which they have waited for it. The council mention as a subject of gratification that they received intimation, some time since, on the part of the Prince Albert, that his Royal Highness would be glad to have a copy of each of the bronzes issued by the Art-Union, and wished that they might be prepared at his expense. Copies of the majority of them were accordingly obtained and forwarded, and the remainder are in course of execution. The council, who view with deep interest every event affecting the progress of execution. The council, who view with deep interest every event affecting the progress of the fine arts in the United Kingdom, congratulate the country on the enlightened desire uniformly displayed by his Royal Highness to assist in this important object.

The impulse that has been given to the production of bronzes in this country, by the efforts of the Art Union of London, and which has since extended to the manufacture of statuettes in other materials, is so obvious and so fully recognised, as not to require asser-

and so fully recognised, as not to require assertion. To lead the arts to the aid of our mannfactures, has been one of the objects kept steadily in view by the Council of the Art Union of London from the date of its estab-lishment. Apart from the increased commercial value thereby given, it is much to be desired in an educational point of view, that all articles of furniture and in daily use, should have the forms of beauty which art can give. As these become familiar to the eyes of all, that which is inelegant and unsymmetrical be-eomes unpleasing, and the general standard of taste is necessarily raised. Art can give value to the meanest material, and make a lump of

to the meanest material, and make a lump of clay, a "joy for ever."
The things which are around us mould and influence the mind more powerfully than some suppose. Homes are the manufactories of men, so to speak;—the well ordering of them is surely a matter of no trifling moment.
The die for the reverse of the "Wren" medal has been completed by Mr. Benjamin Wyon, and is now being hardened to supply the necessary number of impressions.

sary number of impressions.

The medals commemorative of Hogarth, allotted at the last meeting, have been delivered to those entitled to receive them.

The Plaxman medal, allotted some time since, and delayed by circumstances which the council were unable to control, has been undertaken by Mr. W. Wyon, R.A. It has been already stated that prizeholders entitled to this madel, who may need to be the control of the council of t medal, who may prefer to obtain at once, in lieu of it, either of the medals already published

by the Society, are at liberty to do so.

Dies for a medal in honour of Inigo Jones are in course of execution, by Mr. C. F. Carter; thirty impressions of this in silver will be

allotted to-day. The council mention with regret, that within the last few days they have been deprived, by death, of the services of Mr. Collard, who, for several years, had given his continuous attention, as a member of the council, to the financial affairs of the society. James Stewart, Esq., assistant secretary of the Bank of England, has been elected to supply the vacancy thus caused. Further, to complete the number of the council limited by the abovers, estimated to the council limited by the abovers. ber of the council limited by the charter, and comply with the regulation which requires that four new members shall be appointed annually, Dominic Colnaghi, Esq., John Martin, Esq., M.P., and C. R. Beauclerk, Esq., have been elected.

The reserved fund now amounts to the sum

of 3,4091. 1s. 5d.
Details will be given in the printed report.
And it may here be mentioned that arrangements have been made for issuing this report, with the list of subscribers, much sooner after the distribution than has heretofore been the ca

The following is a statement of the receipts and expenditure :—

Amount of subscriptions..... £10,391 17

Set apart for purchase of pictures, busts, statuettes, medals, proof engravings, and lithographs. 4,158
Cost of engravings of the year. . . 3,372
Expenses and reserve of 2½ per cent 2,861

£10,391 17 0

The accounts have been audited by three members of the Finance Committee and two gentlemen from the body of the subscribers, viz., Mr. J. H. Mann and Mr. G. Gillott, to whom thanks are due.

The sum set apart for the purchase of works of art by the prizeholders themselves (3,205*l*.) will be thus allotted:—

100.)	will be u	rus arrotted:—

To these are to be added-

20 bronzes of "The Queen,"
50 statueties of "Nariessus," after Gibson,
282 proof impressions, "Queen Philippa interceding for the Lives of the Burgesses of
Calais,"

282 lithographs of "St. Cecilia," by Mr. Maguire, after Mr. Tenniel, and 30 medals, commemorative of "Inigo Jones;"—

making in the whole 755 prize

The total sum appropriated to the purchase and production of works of art, including the estimated cost of the engravings, is 7,5301. 9s. 2d.

The bronzes will be allotted to the first twenty names drawn consecutively at the close of the general distribution; the statuettes to the of the general distribution; the statuettes to the next fifty similarly drawn; and the medals to the following thirty. The proof engraving of Queen Philippa will be appropriated to the names standing fiftieth in the list preceding and succeeding that of each prizeholder in the general distribution, and of each of those entitled to a porcelain statuette. The lithographs will he appropriated to the names standing in a similar manner one-hundredth preceding and succeeding those above pentioned. and succeeding those above mentioned. tice will be sent to the subscribers entitled to the statuettes and proofs in the course of two days; the other prizebolders will receive inti-mation of the result by to-night's post.

Passing from the present to the future—the year which is to come—the council are most nxious to re-awaken the zeal of the numerous friends scattered over the kingdom and its colonies, to whose cordial co-operation and gratuitous exertions in the cause of art and artists the great extension of the society is mainly owing. Simply as an evidence of appreciation, the council have recently determined on presenting to each local honorary secretary who forwards the names of forty or more subscribers, one of the porcelain stamore subscribers, one of the porcelain sta-tactics produced by the society. They would not have it supposed that they appreciate less the exertions of those coadjutors who, with equal good will and energy in the cause, are unable to obtain this number of subscribers, but come livit season the subscribers. but some limit seemed necessary. The council earnestly invite the renewed co-operation of all former friends and the assistance of feel assured that the subscribers at large will agree with any step which may hereafter be taken to acknowledge, in some fitting manner, these services, without reference to their re-

Desiring to avoid the appearance of invi-diousness, the council do not propose to par-ticularise the efforts of local secretaries, but they cannot avoid stating that from Boston, in the United States, through the exertions of Mr. Dennet, more than 200 subscribers have been obtained. The council have before this expressed their sense of the importance of thus connecting our trans-atlantic brethren with us in furtherance of the arts of peace and refinement.

It may be mentioned that there are now three Art-Unions in the United States, namely, those of New York, Philadelphia, and Cincinnati. The effect of their operations thus stated in one of their leading literary

is thus states."
journals:—

"It is hardly necessary," says the writer,

"to speak of the great good the Art Union
has accomplished; it is too evident to need
to be insisted on; its effects are so palpable
that he who runs may read. It has raised art that he who runs may read. It has raised art from the lowest depths of degradation; it has

taught the people, by making them familiar with it, to reverence and appreciate it. years ago, what was art among us? It is true years ago, what was are among us: It is true that really fine pictures found, among the few of wealth and taste, an occasional purchaser, but the young artist who felt that he must creep before he could walk, had no encourage-ment to begin. He must smother his aspira-Trains or starve. All this it has remedied. Then our men of wealth filled their walls with counterfeit originals, and bad copies, the refuse of European markets.

Amongst the mass art was not understood at all. Pictures were merely things in frames pleasant enough to look at once. The prettiest were always the best, they never studied them, they never saw any relative merit in them, least of all did they desire to spend money for them. There was no taste among them, but the Art-Union has created one, and now almost every man we meet can say something about pic-tures, and likes to talk about them, and see them. In the increased attention to the subject of painting; in the improved taste and discrimination in judging of the merits of pic-tures, and in the numerous and beautiful works of art that now adorn the houses of many of onr citizens, we see ample proofs of the good the institution has already done, and strong indications of the further benefit it is destined, under proper management, to confer on our country."

The council have so often dwelt on the objects and plan of the Art-Union of London, that it would seem unnecessary again to refer to them, nor can they say more than has been said in former reports, to impress upon those who may gain to-day the right of purchasing works of arts, the importance of using the greatest care and judgment in the selection.

The Art-Union of London has not worked in which alone and broadbags of arts.

in vain: a love and knowledge of art are spreading, the real purpose and value of art are beginning to be understood, and the artist is more properly appreciated. Much, however, is yet needed to be done to place the arts in their position amongst us, and the council feel that they cannot dwell too often or too forcibly

on their importance.

Is there one of us who has not had his views cleared, his thoughts elevated, his heart cleared, his thoughts elevated, his hear-lightened by the presentments of genius—by genius whose power it is to discover everlasting beauty beneath deepest disguises, and make it clear to the minds of commoner men? Great are the victories of the true artist—greater and more enduring than those of the warrior, and

equally worthy of reward.

Art teaches us to see nature, and opens

fresh views to the mind, providing
"An endless fountain of immortal drink,"
and high inducements for exertion. But for and high inducements for exertion. But for art, the most perfect form of man, and some of his highest powers, would be unknown, for art, from specialities and incompleteness, has produced the general and the perfect. This is the true province of art, to set forth thought. "Always and universally," says Schlegel, it is thought, the idea of some subject or form as the inner sense or significance thereof, that constitutes the essence of a work of art, and with which art in general is concerned."

We would urge this as well on our younger and rising artists as on those who are to judge and aid their efforts, and, suggesting to them that little minds cannot produce great things, nor vulgar minds pure things, would bid the pursue their art not as a plaything or a trade, but thoughtfully, earnestly, and with high motive, for the enjoyment, instruction, and elevation of mankind.

Let it be the province of the Art-Union of London to provide a public capable of appre-ciating such efforts, and willing fittingly to reward them.

On the motion of Mr. John Rannie, se-conded by Mr. T. C. Harrison, the report was received unanimously, and the Chairman then received unanimously, and the Chairman then addressed some observations to the meeting, in the course of which he said, —As for the matter of the lottery, people have found out that it is a very different thing to seduce people to throw away their money on foolish schemes, and to take their money and so place it out as to produce an effect advantageous to the fine arts in this country. Many men of genius are not men of opulence; many who have great talent in art have no opportu-

nities of making that talent available,—or had none rather till the Art-Union was instituted; and, certainly, if the public could have seen what the council had seen in some instances, and what they have oftener had great reason to suspect,—if they had seen the struggles with which artists have to contend, against the effect of property in your instances, and these with which artists have to contend, against the effect of poverty in many instances, and those other circumstances of adversity which press upon them, they would know that this ranks not only among those societies which are intended for the entertainment of mankind, but amongst those whose object is of a solid and useful character. And I would impress upon those ladies and gentlemen especially, who have come to the metronolis at this time of the come to the metropolis at this time of the year, for the sake of seeing those specimens of art which are now generally exhibited, to con-sider when they go back to their homes, and to deliberate upon the fact, that the artists whose works they have seen arc not all of them whose works they have seen are not all of them in the same opulence as the spectators of them; and may you reflect also, that a very small sum given to the Art-Union would be the most effectual means of aiding them; for these effects can only be produced by union and strength among people who have the same object before them. No one can have seen the effects which have been produced by the genius of the artist without having the mind carried along with them into a region which certainly is favourwithout having the mind carried along with them into a region which certainly is favourable both to virtue and to happiness; and if those ladies and gentlemen who have witnessed these effects will reflect when they return to their homes, that a very small sum at that time would be the means of encouraging art raising probably the struggling mind when it is almost yielding to the effects of adversity, they will see one of the advantages in giving their mite to the Art-Union.

The Rev. Mr. Blaithwaite objected to the character of the engravings which had been issued, and, admitting that in this respect the council were greatly in the hands of the engravers, thought some means should be adopted

gravers, thought some means should be adopted

to ensure a better result.

The Chairman and the Honorary Secretary having reiterated what was contemplated in this respect, and explained the position of the council,
Mr. F. Y. Hurlstone moved, and Mr. J. H.

Mann seconded a vote of thanks to the council,

Mann seconded a vote of thanks to the council, which was carried unanimously; as was also a vote of thanks to Mr. Lewis Poccock and Mr. Godwin, on the motion of Professor Donaldson, seconded by Mr. G. R. Ward. Miss London (her father's name was not forgotten by the meeting) and Miss Susan Bagueley undertook to draw the prizes, and Mr. J. H. Mann and Mr. Sedon to act as scrutineers, and the drawing of the prizes commenced. The following is a correct

LIST OF THE PRIZEHOLDERS ENTITLED TO SELECT FOR THEMSELVES.

Entitled to a Work of Art of the Value of Two Hundred Pounds,

Appleyard, G., 27, St. James's-place.

Entitled to a Work of Art of the Value of One Hundred and Fifty Pounds. Lane, Rev. C., Wrotham.

Entitled each to a Work of Art of the Value of One Hundred Pounds. Biggs, W., Conduit-street. Martin, J. U., East Dereham.

Entitled each to a Work of Art of the Vatue of Eighty Pounds.

Jenner, Mrs., Bridgend, Glamorgan. Jennings, Miss, Caldbeck, Wigton. Lamb, Miss Jessie, Liverpool. Stones, J., Bolton.

Entitted each to a Work of Art of the Vatue of Seventy Pounds.

Fletcher, S., Manchester. Hanbury, P., Lombard-street. Hardman, H. H., Manchester. Newman, Rev. Dr., Magdalen College, Oxford. Entitled each to a Work of Art of the Value of Sixty Pounds.

Dodd, G., M.P., Grosvenor-place.
Doyle, M., jun., Old-square, Lincoln's-inn.
Lambton. William, Brompton.
Minton, H., Stoke-on-Trent.
Strange, J. C., Streathly.

Entitted each to a Work of Art of the Value of Fifty Pounds.

Allan, T., Alnwick. De la Costa, J. B., Bolivar. Hall, Mrs. Colonel, Chertsey. Mould, J. T., Brompton. Smith, W., Wisbeach. Sthamer, Dr., Whitefriars. Thorne, C., Upper Holloway.

Entitled each to a Work of Art of the Value of Forty Ponuds.

Forty Pounds,
Bailey, H., Gracechurch-street.
Boardman, C., Blackburn.
Briggs, J. H., Gloucester-road.
Carpenter, Lieut.-Cel., Potter's-bar, Barnet.
Christian, W., Baldock.
Dymock, Dr., Louth.
Hesseltine, R., Hamilton-house, Thirsk.
Hill, Mrs. R., Hampstead.
Homer, J., Hackney.
Richards, E. P., Cardiff.
Taylor, J. Windsor Castle.
Wineder, Mr., New-hall Inn, Birmingham.

Entitled each to a Work of Art of the Value of Twenty-five Pounds.

Twondy-five Pounds.

Bentley, J., Shoe-lane.

Buckland, Rav. J., Lalcham, Chertsey.
Field, Henry, Cambridge-heath.

Fox, G. J., Atherstone.
Gerdes, J., Liverpool.
Guthrie, Dr., Brechin.
Harrison, T. R., St. Martin's-line.
Heginbottom, G., Manchester.
Hickson, S., Welbeck-street.

Northampton, the Marquis of.
Payne, E., St. James's-place.
Rickards, C., Piccadilly.

Entitled each to a Work of Art of the Value of Ticenty Pounds.

Ackworth, Mrs., Chelmsford.
Bacon, Thos., Woburn-square.
Balston, W., Jun., Maidstone.
Chapman, J., Edmonton.
Cornwall, Miss, Holland-place, Camberwell
New-root New-road. Faulkner, W. C., North Hinsley. Power, R., Atherstone. Proctor, Thos. Cathay, Bristol. Reynard, E. H., Sunderland-wick. Salt, J., Lombard-street. Spencer, Mrs., Stockwell. Triscott, H. T., 33, New Bridge-street, Black-

Entitled each to a Work of Art of the Value of Fifteen Pounds.

Fifteen Pounds.

Armstrong, H. H., St. George-street, East, Wellclose-square.
Bennett, J., Pall-Mall.
Boddington, R., Ditchling.
Brooks, J. H., Farringdon-street.
Erskine, Lady, Conway.
Gandy, G., Kendal.
Haucock, J. L., Goswell Mews.
Haucock, J. L., Goswell Mews.
Hase, J., Throgmorton-street.
Light, J. D., Prerogative Court.
Miller, R., Glasgow.
Mills, C. H., Oxford-street.
Shaw, R. A., Selby.
Sherriff, H., Aylesbury.
Stacey, R. H., Carmarthen.
Taylor, J. L., Saffron Walden.

Entitled each to a Work of Art of the Value of Ten Pounds.

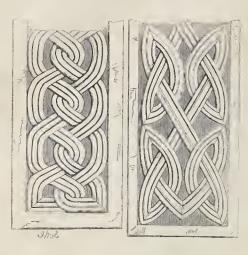

Ten Pounds.

A. Z., Halifax.
A. Z., Halifax.
A. I., Halifax.
Arklay, P. Boston, U.S.
Barry, R., Cork.
Brassey, Mrs., Lowndes-square.
Collman, L. W., Curzon-street.
Cooley, G., Pontefract.
Crook, S., Melbourne, Port Philip.
Dagenport C. Mark Joyn Crook, S., Melbourne, Port Philip.
Davenport, C. Mark-lane.
Gale, W. F., Kew.
Grey, Hon. W. B., Charles-street, Berkeley-sq.
Hawkins, C. Petworth.
Lyon, Mrs., Hull.
Nilkens, Mrs., Coblentz.
Twentyman, A., Croydon.
Wiggins, W., Horley.

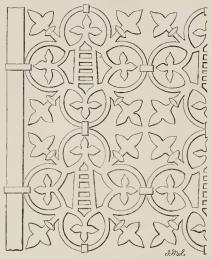

The following were entitled each to a bronze from Sir F. Chantrey's Bust of "The Queen:" Messrs. Brooks, G. B. Bryden, A. Chabbot, Miss Churchill, Mr. John Cragg, Dr. Dickson, Messrs. T. T. Drinkald, R. C. Dunn, W. Greenwood, C. Lawrens, J. Lumsden, J. G. Lynd, E. J. Mawley, W. T. Mitford, H. Pilkington, Major-General Taylor, Messrs. J. Thompson, R. Thompson, J. H. Walker, and Moses Ward.

LICENSED VICTUALLERS' ASYLUM.—THE PROPOSED "LADIES' WING."—Prince Albert is to lay the first stone of the increased number of habitations which have been determined to be added to this institution, on Tuesday, 29th

DECORATIONS, &c., FROM ABROAD.

FRETS-EIGHTH CENTURY.

IRONWORK-FOURTEENTH CENTURY.

DECORATIONS, &c., FROM ABROAD.

FRETS FROM SANTA MARIA, IN COSMEDIN, AND SAN CLEMENTE, ROME.

The first of these churches was restored by The first of these churches was restored by Hadrian I., in 782, to which period this ornament must be ascribed. San Clemente was restored by the same Pope ten years earlier. The second fret forms a portion of the architrave of door to the ancient porch leading from the street into the Atrium, or quadriporticus, in front of this church. These two frets are precisely similar in style and execution (the triple band is a very common organical content of the problem of th cution (the triple hand is a very common ornament of the period), and undoubtedly of the time of Hadrian I., 772-798.

IRON TRELLIS WORK OF ENCLOSURE TO TOME OF CAN SIGNORE (1359-1375), VERONA (QUARTER FULL SIZE).

A beautiful example of medieval iron-work, in which the canting arms of the family (Scala-Scaligeri), a ladder, is happily introduced.
These engravings, with two others already given under the same general heading, are from the sketch-book of Mr. J. M. Lockyer.

SOME MATTERS ARCHITECTURAL.

The Birmingham Workhouse Competition .-The Birmingham (late) board of guardians have entailed upon their successors much trouble and ar noyance by their proceedings in trouble and ar noyance by their proceedings in respect of the competition designs for the new workhouse, which were reported in our pages. If we may believe local informants, the board themselves lost their re-election to office through it, and have been succeeded by an entirely fresh set of men.

The selected design, by Mr. Hemming, had heen sent to the Poor-law Board, and returned with various suggestions. These had been attended to, and fresh plans, we believe made.

attended to, and fresh plans, we believe, made, but, nevertheless, at a meeting of the new board on the 18th instant, a motion that these plans be adopted was lost by 78 to 2. An amendment to the effect that the six selected Board for their opinion upon them; and another, to the effect that these six should be submitted to three London architects for their decision, shared the same fate.

It was then moved by Mr. R. Wright, "That all the resolutions of the late, but he had a submitted the resolutions of the late, but he had a submitted the resolutions of the late, but he had a submitted the resolutions of the late, but he had a submitted the resolutions of the late, but he had a submitted the resolutions of the late, but he had a submitted the submitted that he was a submitted to the submitted that he was a submitted that he was a submitted to the submitted that he was a submitted that he was

It was then moved by Mr. R. Wright, "That all the resolutions of the late board of gnardians, and of its special committee, respecting the erection of a new workhouse, since the 30th of Octoher last, be rescinded, and that the present board proceed as if no such

resolutions had been passed; and the clerk be directed to advertise for plans, specifying the conditions required; that such advertise-ment should set forth that the cost of such erection is not to exceed 25,000 t, and that the plans sent in should be referred to three archi-tects, to be selected by the guardians, to ex-amine the same, and report their opinion thereon to that board."

This was to be discussed on the 25th. This was to be discussed on the 25th. It the board had followed our advice in the first instance, and obtained proper professional assistance in the selection, they would have spared themselves much obloquy, their successors much trouble, and their constituents much expense. According to the Birmingham Journal Vir. Hemmingham have a chief of selections of the second control of the property of the second control of cessors much trouble, and their constituents much expense. According to the Birmingham Journal, Mr. Hemming has a claim of nearly 500L on the parish, for the expense to which he has been put, and this will probably have to be settled in a court of law. We shall be glad if other hoards are led by this occurrence to consider what they owe to architects who, confiding in their honour, submit plans in competition at great cost of time and of money, and so be induced not merely to act without reference to local connections or private. reference to local connections or private friendship, but distrust their own capacity in a matter out of their usual course, and call to their assistance properly-qualified men.

their assistance properly-qualified men.

The Beutinck Testimonial has been already mentioned by us to the effect, that the design selected is a Gothic cross, and is to be placed in the centre of Mansfield market-place, which is about half-way between Nottingham and Welbeck Abbey. The memorial is to be about fifty feet high, of the style that prevailed in the fourteenth century. A local paper gives the following particulars:—"It is square upon the base, and occupies a space, including the steps, of twenty feet square. The whole is divided of twenty feet square. The whole is divided into three compartments, or stages, the lowest forming the pedestal; the centre a gabled canopy, supported on pinnacled buttresses and clustered columns; the highest a lofty spire roof, pierced with traceried and galled lights, terminating with a gilded vanc. The lowest stage consists of a flight of steps, surmounted by an arcaded pedestal containing shields with the armorial bearings of the family of Lord the armorial learning of the family of Lord George, and a deeply-weathered set-off to re-ceive the buttresses and columns of the canopy. At the four angles of the set-off are pedestals surmounted hy lions in a sitting posture, sup-porting vanes, upon which also will be em-blazoned the arms of the family. The gables of the canopy are filled with diaper work, and contain carvings emblematical of the interests which his lordship specially advocated. The whole of the pinnacles, gables, and spire-lights are covered with crockets." The architect is Mr. T. Hine, of Nottingham.

The Exit Eastward from Long Acre.—Com-

menting on the error which was committed (for no want of protest on our part), when the destroyed houses which form the abominable obstruction known as Middle-row, Holborn, were permitted to be rebuilt, the Monning Herald, says—"Just in like manner, only a few weeks since, two bouses were removed, averally around the first manner. exactly opposite the eastern end of Long-acre. That the site on which they stood ought to have been thrown into the street, so as to form a convenient sweep from Long acre into Queen-street, was obvious to every passer-by. But no one took any step in the matter, and new houses are rising where the old ones stood,—just as if there was no eye or mind in the whole metropolis, to take the least interest in the improvement of the public thoroughfares."

As respects ourselves, it happens that we As respects ourselves, it happens that we are personally interested in this property, and were therefore forced to be silent, to avoid personal imputation. Our interests, in a pecuniary point of view, would probably have surfered rather than have been benefitted by the purchase of the property to widen the road, but others might have asserted differently, if we had advocated the enlargement. we had advocated the enlargement.

To say that no one took any steps in the matter, however, is scarcely correct. Various strong representations were made to the parish authorities, and a deputation of the Bloomsbury Paving Board, a very influential body, attended the Commissioners of Woods and Forests, to induce them to take advantage of a good opportunity to remove what has ever been a opportunity to remove what has ever oeen a great obstruction, and to effect, comparatively cheaply, an improvement which has been so often planned and desired. The commissioners told their surveyor to look at it, but beyond this nothing has been done, and new houses are now rising which will probably house. are now rising, which will probably have to be bought and pulled down before many years have passed away.

In connection with the condemnation of the houses here, entailing a large outlay and loss on individuals, we would arge on district surveyors individuals, we would arge on district surveyors the importance of always well considering such cases, and exercising the power given them by the Act with the greatest caution. We do not wish it inferred that any want of caution or unwise exercise of power was shown here hy our friend, Mr. Pownall, but simply take advantage of the occurrence to make the remark. And à propos of district surveyors, we may mention that the election for the Clerkenwell surveyorship, on the 19th, terminated in favour of Mr. R. L. Sibley, son of the late surveyor. He had 44 votes. The other candidates who went to the poll were Mr. Thos. Little (26), Mr. Jennings (22), Mr. Groves, and Mr. East.

ON THE NATURE AND PROPERTIES OF THE METALS USED IN THE BUILDING TRADES.

TRON

ITS intimate and essential relationship to the earth's magnetic polarity even alone would entitle iron to be regarded as, without exception, the most remarkable and important metal he surface of our own little magnet, earth. And, in fact, the consideration of this peculiar relationship led, very naturally, to the idea, that either the whole nucleus of the globe consisted of iron, or that an immense cosmical mass of it, at least, imbedded within the crust, could alone explain the phenomena of polar needle; and even yet, though the modern wonders of electro-magnetism have considerably modified our ideas on this subject, it is certain that the crust itself, at all events, is so universally pervaded and impregnated with substance, that there is scarcely single mineral combination of which it can with certainty be anticipated that it will not be found to contain more or less iron. And not only in the mineral but in the vegetable and animal creations does it equally prevail. "It is probably generated at the first breath of the youngest creature in the world, and it is abundant in the oldest granite." It exists in the blood and tissues of animals, and in the texture of plants. "It constitutes a large proportion of mica, hornblende, and clay-slate, which with the state of the which, with quartz and felspar, that are seldom altogether free from iron, compose almost the whole crust of the earth. Besides this there are immense deposits of iron-ore, both in primitive and secondary countries, and some very learned philosophers have thought that the quantity of iron in the interior of the earth must be immense. It enters also, as colouring matter, into most bodies which possess colour. It is found in the ashes of vege-tables and in the fluids of animals. Ferru-ginous dust and pyritic hailstones are some-times showered down from the skies; and from these regions there have fallen hun-dreds of masses chiefly composed of iron, several of which are of great magnitude." To such evidence of truly cosmical properties in iron we might go on adding in almost endless detail,—considering that it is found in mineral waters and in the ocean, -in the most lustrous gems, in the colours of which it forms an essential element, &c. &c. But even when all assential element, &c. &c. But even when all natural productions are exhausted, do we not find it reappearing throughout every artificial production, manufacture, art, trade, science, and invention of the human race within the bounds of civilization, and even beyond these bounds? What article of clothing, ornament, furniture, or shelter, is it that—directly or in-directly—is not beholden to iron in its manu-facture? Iron seems, as a recent chemical writer remarks, to be somehow an essential ingredient in the process of civilization. What even the golden age would be without it were hard to say, but certainly the era of natural progress is, in a much more amenable and noble sense than usual, the age of iron.

Is it to be wondered, then, that the retrospective thread of human history in the art of working iron has been lost in the myths of the most remote antiquity? Even in the theocratic era of Moses, iron was used in the manufacture of knives and swords, of axes and of tools for cutting stone; and even the furnaces for extracting the iron from its ores are spoken of as then, as now, the source of its acquisition and its manufacture. Thus, it needed not the intimation of a still earlier period, when the antediturian Tubal-Cain was "the instructor of every artificer in brass and iron,"—or, in short, "the earliest iron-master on record,"—to assure us that at least centuries previous to the time of Moses (B.C. 1635) the iron manufacture was a regular branch of trade. In Egypt, Phrygia, Phenicia, and subsequently Greece—into which it was introduced from Phrygia by the Dactyli,—we have records of its use in very early times, but more especially

in Egypt, whence the Jewish leader Moses drew his natural "wisdom and knowledge." Yet, though Egypt then was old and used the science, two hundred years after the Dactyli settled in Crete (B.C. 1431), and brought with them the knowledge of iron into Greece, we find that so slowly had it progressed that, during the Trojan war, no weapons were formed of iron, although then the substance itself was so highly esteemed that Achilles, at the funeral obscquies of Patroclus, offered a hall of it as a prize. Homer's knowledge, however, of its usual processes, may be seen from his striking but homely comparison of the hissing of the hurning hrand, when thrust by Ulysses into the eye of Polyphemus, to the effect of red-hot iron quenched in water by the smith,—that ancient son of Vulcan whose identity with Tubal-Cain is obvious enough, whether we regard him as an earth-born go or as one of the or as one of the "giants in those days—the mighty men of old," of whom King Og, of Basan, whose iron bedstead measured 9 cubits in length by 4 in breadth, appears to have been 'ultimus gigantum'—the latest posterity.

Thus much, then, and more than enough, of the ancient history, or rather the antiquity and inythology, of the mineral Mars—as the ancient chemists styled this even modern essential in military warfare. Our further remarks must be moulded, as far as possible, on a practical exemplar, although we only pretend, present series of articles, to give a mere com-pilation, from the best available professional and other authorities, of the main features and peculiarities in the nature and properties of those metals more particularly used in the building trades, and not so much to afford any direct or explicit instruction as to their practical uses in these trades. But while as practically useful as possible, we shall not hesitate bring to notice several facts of a curious, rather than a practical tendency, and more especially facts over which the element of beauty, either in form or colour, quantity or er, cannot but shed an interest in the thoughts of every intelligent mind.

But first of the sources whence this particular metal arc derived, and of its more obvious and essential properties. It exists in nature almost exclusively in the state of ores, and rarely in the metallic state, a fact which only renders it the more remarkable that its pro duction should have formed a branch of business almost as early as the fig-leaf manufacture. The principal ores of iron are its oxides carbonates. Others are its sulphurets, and carbonates. Others are its suphurets, one the magnetical pyrites, the other, in which a larger quantity of sulphur contaminates the metal, yellow pyrites—"fool's gold," as it has been called, from the fact that it has frequently, even in California, been mistaken for gold, as indeed it was by Columbus himself and the Spanish grandees who bore it in triumphal procession into Madrid, and pre served it as heir looms, some of them for several generations. Pyrites is often round as an apple and concentradiate in interior crystallization. This form of it used to be called Jove's thunderbolts forged by Vulcan—fire, or fire. It is so hard too as to strike fire like flint. In the chemical carting a strike fire like In the chemical action of its elements under ground, it is capable of simulating earth-quakes. Beautiful fac-similes of leaves and other vegetable and even animal remains are often found entirely composed of pyrites, by which the organic particles have been re-placed. This ore, however, is never used in the manufacture of iron. The hest of all ores for that purpose are those in which the metal is simply oxidated. The ore of most abundance in the primary or oldest formations of the earth's crust is the black oxide or magnetic ore-the loadstone itself in fact, which affords the most celebrated and valuable ores Sweden and the north of Europe, but of which the use is greatly circumscribed from its not being associated with coal. In the secondary and tertiary formations the anhydrous and hydrated peroxide-red and brown hæmatite, or blood-stone-occur occasionally in considerable quantity. It is employed in this country to some extent for mixing with the commoner ore. The others belong to this class of ores. When fully hydrated these are of a yellow colour, and as the water is expelled the ochre becomes gra-dually redder as it approaches the state of colcothar of vitriol, or calcined copperas or sulphate of iron. Hence, by various roastings, various pigments may be thus procured from one natural substance. Peroxide of iron, too, is that form of iron which pervades the blood, at least the arterial, while, on Liebig's beautiful theory, the venous, or black blood, actries off the carbon consumed in the production of animal heat, in the form of carbonate of the protoxide or black oxide of iron, to be liberated in the lungs in form of carbonic acid, while the iron protoxide is again converted there, by the oxygen of the atmosphere, into the red peroxide of the arterial blood, as a vehicle of oxygen to the carbon acid, it keeps up the animal fire or heat. Thus, the oxides of iron are, to the whole animal creation, a fountain of vital heat and living energy; and iron is the only truly sanative metal in existence. So much of it exists in the blood, indeed, that the strange idea of converting it into memorial rings is said to have actually been adopted in France.

The ore that is chiefly used in the manufacture of iron, at least in this country, is the clay iron stone of the coal measures. This is essentially the carbonate of the protoxide, though mixed with variable quantities of clay and carbonates of lime, magnesia, &c. It is nodular, and often called the argillaceous carhonate of iron. It occurs in strata, beds, or bands, from two to ten and fourteen inches thick, alternating with beds of coal, clay, hituminous schist, and often limestone. fuel and flux with which it is to be smelted are thus ever at hand. The proportion of iron in this ore varies considerably, but averages about 30 per cent.; and after calcination or expulsion of water, carbonic acid, &c., 40 per cent. A crystallized carbonate, or spathic is smelted in some parts of the continent, and gives an iron often remarkable for often remarkable for a large proportion of manganese. The celebrated iron of Elba is derived from a specular or oligistic iron, a crystallised peroxide, forming a beautiful mineral, which Fourcroy states that Duke d'Ayen, a French chemist, once artificially produced while decomposing the green muriate of iron by heat, during which same process were yielded crystals of sublimation of the clearest and most pellucid lustre, in the form of blades of razors, with tinges of iridescent colours, bright as those refracted by the best of prisms.*

Having thus given some account of the sources whence iron is derived, we shall, in the next place, treat more particularly of its nature and properties, and of its three chief varieties—cast-iron, wrought-iron, and steel.

St. David's Cathedral.—According to Archæologia Cambrensis, the restoration of this venerable structure has been going on since the subscription for that purpose in 1846. The stone rood-screen has been restored, and the unsightly wood-work which surrounded it cleared away, and replaced, where necessary, by parcloses of wrought-iron. A projecting cornice of oak has been substituted for the balustrade which formerly disfigured the rood-loft. The choir arch, before walled up, has been partially opened, and the large platform before the screen and the passage into the choir, have been laid with encaustic tiles.

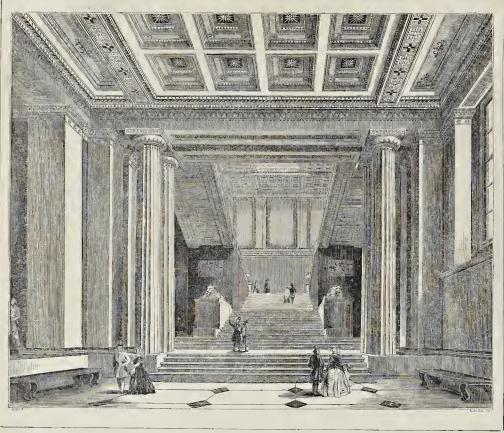

BRICKS.—A return obtained by Mr. Cocks, M.P., shows the duty paid on bricks in the several excise collections of England in the year 1848 to have amounted to 448,3101., of which 10,386t. were paid in the metropolis alone.

alone.

* We may here observe that we have repeated Duke d'Ayen's experiment, but with pure muriate of from have failed to observe the prismatic lustre. Crystals of the precise form and texture of fishes' scales were sublimed. In an experiment with other clements altogether, however, there occurred precisely such crystals as those described, some of them with stripes of the richest rainbow colours, and others of a single hue of the purest brilliancy; but what was most remarkable, these crystals, even when each of a single hue of the purest brilliancy; but what was most remarkable, these crystals, even when each of a single hue of the purest brilliancy; but what was most remarkable, these crystals, even when can be also a single hue of the purest brilliancy; but what was most remarkable, therefore, that the carrelative as singular a phenomenon in optics as it still appears to he whose spackfulg like a distens,—estimate a singular a phenomenon in optics as it still appears to he control of the specular ore itself was assisted by the imparities mixed up with the muriate.

HALL AND STAIRCASE OF THE NEW BRITISH MUSEUM.

SIR R. SMIRKE, ARCHITECT.

THE HALL AND STAIRCASE OF THE BRITISH MUSEUM,

Above is a representation of part of the Hall, in the British Museum, and the stair-case,—one of the most effective portions of the new structure.

new structure.

The order is Grecian Doric. The ceiling is trabeated and dceply coffered, and is enriched with Greek frets and other ornaments in various colours, painted in eneaustic. On the east side are the apartments devoted to the MS. department. On the west is the principal staircase, and a gallery which forms the approach to the collection of antiquities. The centre flight is seventeen feet wide, flanked by two pedestals of grey Aberdeen granite, incentre fight is seventeen feet wide, flanked by two pedestals of grey Aberdeen granite, in-tended to receive colossal sculpture. The walls on either side of this centre flight are cased with red Aberdeen granite, highly polished. On the first landing are pedestals and carved vases of Huddlestone stone. The balustrades on the first naming are petiestas and carved vases of Huddlestone stone. The balustrades are of the same. The ceiling and walls are partly in calcustic colours, the former being trabeated and coffered to correspond with the entrance hall, and similarly decorated.

The polychromatic enrichments have been applied with very considerable success. The sunk panels are blue, with a yellow star in each; the enrichments are variously coloured, red and white predominating; and the stiles, beams, &c., are covered with frets, guilloche, and serolls, in flat colours, for all of which precedents were sought in the museum collection. These decorations were executed by Messrs. Collman and Davis.

Our engraving is from a larger drawing hy Mr. Collman, which was exhibited some time

Knowing that comparatively few of our readers possess the early volume of our journal in which, as mentioned last week, was given a view of the building that occupied the site of the new structure, we have, at the request of several correspondents, reproduced the entrained of the contractions of the results of th graving as an interesting record.

THE HOLLOW BRICK CEILING OVER ST. GEORGE'S HALL, LIVERPOOL.

THE following is the specification for the construction of the ceiling over St. George's Hall, under which the work was executed. It will be found suggestive for other matters :-

will be found suggestive for other matters:

1. The contractor must furnish, at his own cost, all labour, mortar, cement, and bond-timber, as hereinafter described.

2. The centres have heen put up and the panelling set out, and hollow bricks will be furnished to the contractor on the ground, for the full and complete performance of the work.

3. The contractor is to find all stageing and implements necessary for the execution of the whole work.

work.

4. The mortar must be made from the best
Halkin mountain or blue lias lime, fresh hurned, Halkin mountain or blue lias lime, fresh hurned, composed of one part, by measure, to two parts of perfectly clean-washed fresh-water sand, free from dirt, clay, or saline particles. The character of the sand must be most particularly attended to. The mortar must he well mixed in a steam mortar mill, and must be so made and delivered on the ground as to insure its being used perfectly fresh. On no account must mortar once set be remixed for use on this work. on this work.

5. The cement must be the "patent lithic," fresh and good, and mixed, by measure, with an equal proportion of sand, as described for the mortar. The cement must be used immediately it is mixed; softening or re-tempering will not be All cement once set, before use, must be

allowed. All cement once set, before use, must be immediately removed from the work.

6. The arch and spandrils must be formed and honded according to the plans and sections furnished, and in strict conformity with such instructions as shall from time to time be given during the

tions as shall from time to time be given during the progress of the work.

7. In setting the bricks, the straightest and truest sides must be chosen for the beds, and the thickest end placed outwards. Where the arch is more than one brick in depth, they must be carefully and truly bonded according to section, and instructions furnished at the time. The bond, in all cases, must be set in cement; and, if required, hoop iron, stone, wood, or flag, is to be used, as shall be directed.

8. The work must be carried on equally, and regularly, in perfect courses on each side of the centres. The spandril walls are to be carried up with the arch.

centres. The with the arch.

with the arch.

9. When the arch shall have been raised 10 fect, on cach side of the centres, the crown must be regularly and evenly loaded with dry bricks, so as to give the centres their full weight. These bricks will be for use in that portion of the arch to be completed. The bricks must be so stacked as not to injure themselves or the centres, and they must be taken gradually and regularly from thence, and used in the arch, on each side, so as to keep the new work in equal course, and the crown of the centres regularly loaded at the same time.

10. Where the double brick ribs are liable, from their depth, to come into contact with the principals, the rib must be reduced in depth, by hond, to

pals, the risk must be reduced and depth, by hond, to one and a half brick.

11. For 5 feet on each side the borizontal centre line of the arch, the whole work is to be set in the hest "Patent Lithic Cement," mixed and used as specified.

12. The whole of the work must be full bedded and jointed throughout the entire area of all the beds and joints, whether mortar or cement he used. The beds and joints must be evenly spread, not less than one-eighth of an inch in thicknees, in the thinnest THE BRITISH MUSEUM OF OLD TIME.

part, and each brick pressed well home into its place, so as to cause the mortar or coment to curl out full and flush along the whole line of each bed and

13. The openings in the spandril walls must be set out fair and true with each other, and the entire rings of all set in cement. The triangular 4-inch portion of each spandril must also be set in cement

14. The mortar and cement flushed out of the beds and joints must be cut off clean with the trowel while wet, and the joints filled and rough pointed with the trowel at once.

with the trowel at once.

15. The hond, and joist timher, must be of the size and scantling figured, and must be cut out of the best crown Memel or Baltic timher, perfectly free from sap, shakes, or large dead knots.

16. The work must be estimated for in one lump sum. Any hoop iron, bond stone, or flags, required for purposes of bond, will be provided to the contractor on the ground; but he must take them from thence and set them in the arch for the sum named in his general estimate.

named in his general estimate.

17. The plans, specification, and sections must be taken according to the full hearing of each on each; and where any discrepancy shall be found to exist, the engineer shall decide its proper meaning.

the engineer shall decide its proper meaning.

18. Any alteration in the bond, depth of ribs, form, and number of spaudril walls, or any other portion of the work, shall not vitiate this contract; but should nore or less work be put into the arch than is shewn by the plans and sections, it shall he ascertained by measurement, and then be added to or deducted from the amount of tender, according to the schedule of prices annexed. to the schedule of prices annexed.

ROBERT RAWLINSON.

than is specified in this report, on account of the paneling which has been formed in the construction adopted.*

HOLLOW BRICK CONSTRUCTIONS.

In your last week's paper, Mr. Robert Rawlinson mentions that he first saw specimens of the hollow bricks in Mr. Chadwick's office. I imagine that the bricks he there saw were those left by me in the Sanitary Commissioners' office about eighteen months since. The idea of using hollow tubes of clay of large size in construction occurred to me seven or eight years ago. At that time I proposed it to a client of mine, who was about to erect a large quantity of walling, but the misfortune which overtook him lost me that oppor-

Thus, 146,322 tiles will cost 239l. 17s. 2½d. tess than 216,773 bricks; the quantity required to do the work of the tiles and the building will be relieved of a straining weight to 239 tons 5 cwts. 1 qr. 6 lbs.

The greatest pressure the tiles can have to sustain in the great arch is equal to 30 lbs. to he square inch.

I have subjected them to a test of 90 lbs. pressure to the square inch, under which they lid not fracture.

tunity of trying my plans; and it was not till about two years and a half ago that I again turned my attention to the subject. Deeply impressed with the conviction of the vast importance to this nation that her the vast importance to this nation had her labouring poor should possess bomes fit for human beings to dwell in, it struck me that a system of constructing such buildings of hollow tube was practicable, and having ex-pressed this opinion to the Duke of Riehmond, whose architect I have the honour to be, his Grace desired me to send him my plans, which I did, accompanying them with a written statement of the advantage likely to accrue from the use of such a material, not accrue from the use of such a material, not accrue from the use of such a material, not accrue from the use of such a material, not only in huilding cottages, but in the erection of farm buildings, and suggesting that, as the cost of such works was thus, wherever clay existed on an estate, resolvable into labour and firel, my plan of construction would afford a great amount of employment to the Irish poor, the result of whose labour thus directed would take the construction. directed would tend to ruise them in the scale

His grace, whose ear is ever open to any practicable plan of improving the condition of his poor neighbours, told me at once that he would give my scheme a trial, and that the tubes should be made at his tile-yard, and a cottage built with them. Mr. Webster, of Hounsdown, was kind enough to lend me one of his hand tile machines, and with one of the m the tubes I employed were formed; some of them being 20 inches long and 7 inches square, weighing, in proportion to an equal cubical quantity of solid brick, about four-fifths less. It was part of my original to twas part of my original purpose to form roofs, walls, floors, and partitions of these tubes; but in the first experiment the roof and walls only of the cottage were con-structed; and as a piece of construction it answered admirably; but the form I then used I should not employ again, as the wet, not from any leakage, but owing to capillary attraction, finds its way in at the haunch of the arch,— a defect which I believe I can wholly obviate in my next essay. Mr. Rushidge, the duke's agent, who gave me every assistance in carrying out the work, prognosticated a failure in this point, and his judgment proved better than mine; still, as a first experiment, it must be considered a successful one, and I feel assured that it will be the commencement of a assured that it will be the commencement of a new era in the system of constructing cottages. Lord Rohert Clinton, who was staying at Goodwood at the time, appeared much inte-rested in the subject, and by his request I made a series of designs for cottages to be constructed with these tubes, which designs, and specimens of the tubes, he sent to the president of the Royal Agricultural Society in Ireland. I also called on Mr. Chadwick, and left him an essay of mine on the subject of cottage construction, and also gave him specimens of the bricks made at the Duke of Richmens of the bricks made at the Duke of Richmens. mond's works. I am about to make experiments to determine the best forms for the ments to determine the Dest forms for the various purposes to which these tubes are applicable, the result of which I shall be happy to communicate to you. Such a method of construction will be as durable as it is economical, and will thus remove one of the obstacles to a legislative measure which shall relieve from the cottages of this country the stigma of being nurseries of vice and pauperism.

Southampton, April 24. JOHN ELLIOTT.

CITY COMMISSIONERS OF SEWERS .-- At a meeting of the Commissioners of Sewers, on Tuesday, Mr. Deputy Peacock in the chair, Tuesday, Mr. Deputy Peacock in the chair, measures were taken to improve the condition of the carriage way in Leadenhall-street. Several persons were fined for cesspool nuisances, and, in consequence of a report from the surveyor, a stricter rule as to the emptying of these into the sewers was ordered in future to be adopted. A conversation then ensued upon the position of the Great Central Gas Company, which was originated by a letter from the secretary. The communication stated that "this company's mains will be laid under the superintendence and control of the commissioners, and the directors are most anxious the superintendence and control of the commissioners, and the directors are most anxious to acquire information on the mode of effecting these necessary operations in a manner which shall provide for the public convenience in the most ample manner." The letter was referred to the General Purposes Committee.

ARCHITECTURE AND THE ROYAL ACADEMY.

SIR,—Of four designs which I had sent to the Royal Academy for their exhibition, three have been rejected, and among them that which I had made myself sure of being accepted, it being by far the best in regard both to subject and execution—in the latter respect fully wrought up to exhibition proof as a drawing. I cannot help thinking, therefore, that great error as to selection has been shown by those with whom the selecting works for exhibition rests. Very probably the drawing which is admitted is so increly because it happens to fit in conveniently among others, and it is as likely as not that I shall find it where, being a small one, it can scarcely be seen at all

Certain it is that at the Academy not even decent attention is paid to the arrangement of the architectural subjects, which was last year more than usually unsatisfactory, for while an interior of the new coffee-room at the Carlton club-house was hung in the topmost row, so that it was quite impossible to make any thing out of Mr. Sang's decorations, several very uninteresting subjects-some of them not de signs at all, but merely views consisting of bits of ruins and trees—were placed just upon the line. There being at the best so very little space at the academy for hanging architecspace at the academy for hanging architectural drawings so as they can be properly seen, surely the least that can be done is to make the most judicious use of that space, and it is nothing less than preposterous to give up to oil pictures any part of "the line," as it is termed, or, indeed, any other situation where the larger architectural subjects would show themselves at least tolerably well. To the upper part of the walls being covered with oil pictures,—since, it seems, covered they must be,—there can be no particular objection, it being better that it should be so, than that, under the pretence of being exhibited, designs should be put out of sight.

What is the Professor of Architecture about, that he does not at least remonstrate? and, if such be really the case, give us to understand that he has no authority, and remonstrates to no purpose. At any rate, we architects look to you, each Editor, for upholding, as far as may be in your power, the interests of architecture, by protesting against the slights and indignities put upon the Academy's exhibitions. It has been it at the Academy's exhibitions. It has been suggested before now, that it would be an improvement were there to be at least one screen for the reception of smaller architectural draw-ings. But as it seems screens must not be lings. But as it seems screens must not be thought of,—perhaps because the Academy do not wish to appear to screen themselves either in that or any other way,—allow me to point out a different and still better mode by which so many drawings might be accommodated, that, perhaps, all the walls of what is now called the architectural-room might be given up to oil pietures. It is simply this: let there be in each room a long but narrow show-table or desk, with two sloping sides, upon which the drawings have merely to be placed, their frames resting against the ledge of such desk. Tables of the kind placed in the rooms, would be no more an obstruction than forms now are. therefore free from the inconvenience, or supposed inconvenience, attending screens, while, at the same time, they would be better for looking at the drawings placed on them.

There is, indeed, one thing which such plan would render necessary, viz., that the frames must not exceed in their upright dimensions the width of the sloping surfaces of the desk.
That would be the only regulation required;
for the frames—and perhaps mere narrow
beadings, similar to those used for prints,
would be hetter than "picture-frames"—
width the wider or nearways as might happen. might be wider or narrower, as might happen, and also shorter than the breadth of the slope on which they would be placed. Of course the necessary regulation must be properly announced to those whom it concerned As matters are managed at present, it looks as if the Academy were anxious to get rid of architecture, not, indeed, by actually kicking it out of doors—for were they to do that, they might chance to get some hard kicks in return,—but by "bowing it out," in a sort of fashion which plainly tells a person that his speedy departure will be more agreeable than his stay.

It is a pity there cannot be an election for representatives of architecture in the academy,
—for in that case I do not think that any of
those who now sit for it would be returned;
most assuredly not out of gratitude for their
past services and zeal.

Outris.

THE NEW SOCIETY OF PAINTERS IN WATER COLOURS.

THE report of the Art-Union of London occupies so much of our space, that we can afford but little more in our present number to matters artistical. We must say, however, to these when the surface these spaces are supported to the say the say of the say the say of the matters arisincal. We must say, nowever, to those who through these proceedings have gained the right of selecting pictures, that they will find in the New Water Colour Gallery some channing works. Although there are,

some charming works. Although there are, perhaps, fewer prominent pietures than usual, the whole are more evenly good than is sometimes the case. In the landscape department especially, there is a great improvement.

Mr. L. Haghe has a remarkably one pieture, "Vespers in the church of St. Anne, Bruges" (102); and Mr. H. Warren's "Joseph's Coat brought to Jacob" (276), displays some of the highest qualities of the art, and has narrowly escaped the epithet "grand." Mr. Edward Corbould's chief work "The Murderers of Thomas Chase, of Amersham, drawing up 'the Letter to the Clergy," displays a wonderful depth of colouring, and is drawing up the Letter to the Clergy, unsplays a wonderful depth of colouring, and is in other respects a picture of great merit. Mr. Absolon, always excellent, is not quite up to Absolon, always excellent, is not quite up to his own mark in his nevertheless charming picture of harvesting, under the title of "Plenty" (55). Mr. Vacher has some beautiful views in Rome and Sicily.

Mr. Weigall has deserted his "poultry," and given a pleasing companion to his "Rape of the Lock" last year, called "Philandering."

Mr. Wehnert's "Precincts of a large City, Evening," is an agreeable and clever drawing, but we miss the more ambitious works he has been accustomed to exhibit. Mr. Fahev, Mr.

but we miss the more ambitious works he has been accustomed to exhibit. Mr. Fahey, Mr. Kearney, Mr. W. Lee, Mr. Davidson (for some nice green landscapes), Mr. Mole, Mr. Riviere, Mr. Howse, Mr. M'Kewan, Mr. Harrison Weir, Mr. Rowbotham, jun. (for a clever drawing of Rouen), Miss Fanny Corbaux, &c., should all be named.

LORD ROSSE'S SOIREE.

THE new president of the Royal Society, the Earl of Rosse, gave his first conversazione on Saturday evening last, which was attended by a large number of persons. The president by a large future of persons. The present having no house in town, it was held in the suite of rooms occupied by the Royal Society and the Society of Antiquaries, in Somerset House. This change, from the private resi-dence of the late president, Lord Northampton, is not by any recession in the second of the conis not by any means an improvement: it gives the entertainment the character simply of some special meeting of the society itself away the charm of a private reception. This feeling was increased by the circumstance that the Prince Albert, who was present, came early, and being necessarily attended round the rooms by the noble host, the latter could not personally receive his guests, so that it became simply a public assembly where a number of celebrities might be met.

In other respects the arrangements were the

In other respects the arrangements were the same as at Lord Northampton's.

Amongst the many interesting objects in the rooms were models of the president's colossal telescopes, a clever machine for cutting ship-timber, Mr. Whishaw's telegraphic arrangement for obtaining uniformity of time, a number of the best daguerrecypes we have yet soon, and some of Mr. Rocard's we have yet seen, and some of Mr. Rogers's most recent carvings.

There was also an extraordinary and heautiful tryptych, painted at the commencement of the sixteenth century, and attributed to Lucas de Cranach. Cranach was the contemporary of Albert Dürer, and in some respects not inferior to him.

PROGRESS OF LITERARY AND SCIENTIFIC INSTITUTIONS.—A return obtained by Mr. Scholfield, M.P., shows that applications have been received from upwards of 100 literary and scientific societies or institutions for certificates of exemution from local rates. of exemption from local rates.

THE COLLECTION OF ANIMAL REFUSE OF TOWNS.

AT a meeting of the Society of Arts, on the 11th, Mr. B. Rotch in the chair, Dr. Ayres read a paper on the importance of the animal refuse of towns as a manure, and the methods of rendering it available to agricultural purposes. The author commenced his paper by calling attention to the necessity of preserving the animal refuse of towns, and the import ance which is attached to it in China and Flanders, in many departments of France, Tuscany, &c., and also to the various forms in which it is applied to the earth.

Having alluded to the importance of this

subject in connection with the improvement of the sanitary condition of towns, and the injurious effects upon the inhabitants of London in particular, by allowing the putrid matter to be carried into the Thames, there to be tossed upon the waves and left exposed upon the shores at each retrocession of the tide he proceeded to consider the contents of the cesspools of London alone, which he has calculated cannot yield less than 46,500 tons of perfectly dry matter annually - a quantity, according to the analysis of Liebig, sufficient to fertilise at least a million acres of land, and the monetary value of which cannot be stated at less than 340,000l. Having next alluded to the plans which have hitherto been pro-posed for drying and rendering this great mass of matter portable and available for agricultural purposes, he proceeded to describe a plan which he has recently patented for effecting so desirable an object.

My process (he observed) essentially de-pends on the fact, that all the gaseous and volatile products of putrefaction are combus-tible, and are resolved into the ordinary products of combustion when carried over any incandescent surface, or over or through burning fuel, when mixed with atmospheric air. Thus, ammonia is resolved into nitrogen and water; sulphuretted hydrogen into sulphurous acid and water; carburetted hydrogen into carbonic acid and water; phosphoretted hydrogen into phosphoric acid and water; the volatile organic matters associated with the gases are completely destroyed; car-bonic acid alone passes through the fire unchanged. All these gases, with the exception of ammonia and carbonic acid, exist only in very small proportions in putrescent animal matter. It follows, from what has heen stated, that all the volatile products of putrefaction are thus resolvable into the ordinary products of combustion, which are well known to be innocuous. It suffices to conduct these gases and vapours through a fire to effect their entire decomposition and destruction.

The apparatus by which this process may be worked, he thought susceptible of many modifications; but that to which he particularly desired to direct the attention of the society consists in drying the animal refuse by the application of heat, either obtained from steam-pipes or otherwise, and at the same time destroying the volatile products of putre-

faction by burning them.

NOTES IN THE PROVINCES.

Another obituary window has been put up in Chichester Cathedral. It is the work of Mr. M. O'Connor, of London.—The re-storation of the west front of Gloucester Cathedral is about to be resumed, it is said, Cathedral is about to be resumed, it is said, with vigour.—The new dock at Gloucester was opened on 18th inst. The new basin nearly doubles the quayside accommodation, and there are two additional cranes, each capable of lifting upwards of 20 tons. At present the basin will be appropriated to the discharge of cargoes sent by rail.—The foundation-stone of the Lazarus Almshouses was laid last week, at Hereford, by Lady Emily Foley.—A new church, says the Hereford Times, is about to be creeted in the parish of Clifford.—The new Exchange Market at Bristol was opened on Saturday week.—The architect of the projected Wilts County Lunatic Asylun, on Wednesday week exhibited the plans, &c., and pointed out the site to builders, ironfounders, and others intending to send in estimates for the construction of the building. Amongst those construction of the building. Amongst those present are said to have been several London

firms, with Messrs. Willcox and Son, Bristol; Messrs. C. and R. Gane, and Mr. W. Hancock, Trowbridge; Messrs. Simpson and Bennett, Lyme; Messrs. Daniel and Charles Jones, Bradford; Messrs. James and John Hodges, Doulting, Shepton Mallet; Messrs. Young and White, Devizes; Mr. John Mitchel, Pewsey; Mr. H. B. Hale, Warminster.— The Lion Barracks, at Portsea, are to be given up to the authorities in a finished state on 1st May, or within the time specified by the contractors, Messrs. Locke and Nesham.—The following tenders, according to a provincial authority, were given in for the restoration of the parish church of Atherstone:—Messrs. Broadbent and Hanley, of Leicester, 2,8451. Mr. Spencer, of Lutterworth, 3,298l. 10s.; Mr Mr. Spencer, of Lutterworth, 3,293l. 10s.; Mr. Lilly, of Measham, 3,283l. 2s.; Mr. Lloyd, of Atherstone, 3,312l. 7s.; Mr. Spencer, of Atherstone, 3,452l. 7s.; Mr. Hardy, of Coton, 3,470l.; Messrs. Miller, Fox, Pullon, and Stanton, Atherstone and Hilton Building Company, 3,973l.; Mr. Cooper, of Derhy, 4,272l. The lowest tender, that of Messrs. Breadlent and Hanky accepted. Broadbent and Hanley, accepted. - The cost of the recent alterations and additions at the Bedford Lunatic Asylum, affording accommodation for about seventy additional patients, besides offices, enlargements of airing yards, warming and ventilating, and a supply of hot and cold water apparatus, is upwards of 5,000*l*.—On Tuesday week the foundation stone of St. Alban's Church, Liverpool, was laid at the end of Bond-street. The building is to accommodate 1,000 persons, at a cost of 5,000*l*.—St. Matthias's Church, Great Howard-street designed by the cost of t street, designed by Mr. A. Holme, with accommodation for 1,000 persons also, was consecrated on same day.—St. Jude's Church, Bradford, is at present under repair and re newal.—The sewerage of Gateshead is about to he commenced by call for tenders for a main

SUPPLY OF WATER TO CONSTANTI-NOPLE.

I BEG leave to send you the following reply to the query of your correspondent relative to the supply of water to Constantinople. The numerous erections which he terms pipes," are called "souterazi," or water towers, and are used for the purpose of passing the water across the valleys upon the principle of the syphon, instead of the more expensive construction of aqueducts. These towers, it is stated, were erected at about onefifth of the expense of aqueducts, and are generally attributed to the ancient Greeks. The supply of water to Constantinople is obtained from the mountains, bordering on the Black Seas, where it is collected in reservoirs, which are situated about 15 miles from that city, and is conveyed by means of four conduits, posed of earthern pipes, having at intervals the "souterazi" to the central reservoir con-"souterazi" to the central reservoir con-tiguous to the city, and from whence it is dis-tributed by conduits to the seraglio, and the fountains that are established in almost every street.

These "sonterazi" form a regular inclined plane from the mountains to the city, and they also have the same effect as the "columnaa" of the ancient Romans, in relieving the hydraulic pressure on the pipes, and at the same time allow the escape of the air, and the basin on the top serves as a place of deposit for any sediment or feculent matter.

B. BAYLIS.

METROPOLITAN COMMISSION OF SEWERS.

A GENERAL court was held on Thursday, the 19th inst., at the Court House, Greek-street; Lord EBRINGTON, M.P., in the cbair.

The Retirement of the Hon. Fred. Byng from the Commission.—Upon a recommendation from the Works Committee being read, that 455 feet of pipe sewer he put down in Parker-street, Drury-lane, and 135 feet of invert of the existing sewer be lowered, at an expense of 140t.,

Mr. R. L. Jones briefly complained that this

Mr. R. L. Jones briefly complained that this question was now hrought before the court for the first time, and protested against such a system. Mr. Bullar rose to order. This was going into the old question of committees.

The Hon. Fred. Bying then rose and said, that he hoped the court would hear a few observations from him, and probably they would he the last he should offer in that court. Mr. Chadwick had charged

him with "obstructing" the business of the court, but he felt that the Works Committee had almost him with "obstructing the works Committee had almost but he felt that the Works Committee had almost hecome the court, and he was useless there unless it were to bold up his band for the confirmation of their proceedings. That committee, from the very large number of which it was composed (13) was in large number of which it was composed (13) was in effect, though not quite in number, a majority of the court, and when himself and other commissioners came down to the court they knew nothing ahout came down to the court they knew nothing about what was going on, the business having heen done by the Works Committee. Mr. Chadwick had frequently boasted of the sub-division of labour, but the term was most extraordinary, and the application of it rather droll. The Works Committee had taken or imposed upon itself duties as regarded "all complaints and applications for works and operations, and leave to execute works and operations as to sewers and severage—as to house drains and cesspools—as to surface drains and gullies—as to paving, water supply and cleansing—and as to miscellaneous matters relating to works," matters enough to overwhelm an ordinarily-constructed committee. Call this a sub-division of labour!—he called mittee. Call this a sub-division of labour!—he called it a concentration of labour. It was a most extra-ordinary sub-division of labour, for he found that the ordinary sub-division of labour, for he found that the attendance at the Works Committee was not numerous, taking the average; but what appeared to bim most extraordinary with reference to it was the fact, that the persons most frequently present at it, were persons who, like his lordship in the chair, and Mr. Chadwick, held overwhelming appointments under the state. He helleved, also, that the appointment of officers was illegal. By the course that bad been adopted, be found his attendance extremely irksome, and he felt compelled to take a similar step to that taken by an excellent commissioner (Mr. Hutton), with whom he acted for fifteen months, and who had expressed his determination to attend no longer. He had waited upon that gentleman to ascertain bis reasons for so doing, and found the grounds for his retirement to be found the grounds for his retirement to be ar to his own. He had come to the same conand found the grounds for his retirement to be similar to his own. He had come to the same conclusions that had induced Mr. Hutton not to attend, and should now follow his example. He had, for his opposition, been threatened to be superseded, and had heen recommended by Mr. Chadwick to withdraw if he was dissatisfied with the order of proceedings. He (Mr. Byng) could not agree to take his advice, but should take his own, and he had come to this conclusion because he beand be had come to this conclusion hecause he be-lieved the Government approved of the views of Mr. Chadwick, and the manner in which measures for the public service were carried out in that court. for the public service were carried out in that court. However, he could only see in their proceedings an illegality and an unwarrantable outlay of money by the court in a way that had never heen intended. He held in his hand two jublications,—one given by his friend Mr. C. Johnson, the other by Mr. Chadwick, on agricultural subjects,—clever pamphlets, certainly, in their way, but not of pressing importance, and, therefore, he contended, they ought not to have been entertained by the court. The one had been ordered to be printed by the court; but he bo have been entertained by the court. The one had been ordered to be printed by the court; but he found the other had heen ordered by the Works Committee, to be printed exclusively for their use, having no regard whatever to the rest of the commissioners, and he believed they were not at all justified in going into any expense of this kind. He intended, after the present meeting of the court, withdraw from the court, and the present meeting of the court, to withdraw from any active interference in the affairs of this commission, which he regretted sincerely, as it might deprive him of his share of the applause if success should attend the action of the commission for the benefit of the public; but he believed they acted illegally, and that their acts would bring them into the Court of Queen's Bench.

Lord Ebrington hoped the court would not re-open the long-vexed question as to the business of the court. Mr. R. L. Jones believed every question ought first to be brought before the court, for the mode of carrying on the business was the most irregular he had ever witnessed. In fact, those commissioners who were not on the Works Committee were a mere

No other commissioner rising to address the court,

No other commissioner rising to address the court, the chairman put the motion for the adoption of the recommendation of the Works Committee, which was passed without opposition.

The Jurisdiction of the Commission.—A long report was presented on the subject of the recent fine imposed by Mr. Burrell, the magistrate at the Westminster Police Office, on John Merry, a foreman of pumps and hose, for having created a nuisance during the process of emptying a cesspool in York-street, Westminster, the odour being so great 1 ork-street, westmixer, the dudit being so great as to compel the tradesmen to close their shops and windows. In giving judgment, under the provisions of the Police Act, the magistrate contended, sions of the Police Act, the magistrate contended, notwithstanding the extraordinary powers vested in the Commissioners of Sewers, they had no right to relieve the ecespools in the day-time, or to create a nuisance in so doing, and thereupon fined the defendant in the nominal amount of 10s. to try the question, as Mr. Smith, the solicitor to the commissioners, had signified his intention, on their behalf, of appealing against this couviction.

It appeared that the information had been laid by

Mr. Sugg and Mr. Crow, inspectors of pavements

Mr. Sogg and Mr. Crow, inspectors of parements and unisances for the parishes of St. Margaret and St. John, Westminster.

Mr. Chadwick, in reference to the evidence given by Mr. Crow before the magistrate, as to the annoyance received by the inhabitants from the use of the pump and hose, read the evidence of the same person on this subject contained in the third report of the Sanitary Commissioners, in which he stated that he had introduced the use of the pump and hose in emptying between 300 and 400 cesspools; that it was cleaner, and cheaper by one-third; that he had had his own house cleaned by this means, and that the only dissatisfaction expressed by any party was that it would not remove the bard and solid substances. In conclusion, he remarked that if if substances. In conclusion, he remarked that if cholera appeared in the neighbourhood, and he was left to himself as to what was to be done, he should apply the pump and hose as actively as pos-

sible.
This report led to a long desultory conversation, in which it was asserted by Dr. Southwood Smith that if any odour exemped in the night more danger was to be apprehended from it than if the work was performed by day, to say nothing of the additional performed by day, to say nothing of the additional expense that would be incurred in having it removed by night. But if the work was properly performed that no odonr whatever could be detected formed that no ottom whatever count in accretion and that it might even he performed in a drawing-room. It was also necessary that the commissioners should have the entire control over these works, to carry them out in the way most conducive for the

carry them out in the way most conducive for the public interests.

John Merry, the foreman, was suspended from his duties audil further orders, and a committee appointed to investigate his conduct.

Mr. John Grant, of Exeter, was appointed an assistant-surveyor at a provisional solary of 250t, per annum. After some severe comments from Mr. Lesbe and Mr. Jones that no information was received from the Committee of Worker as wheeling. Leave and Mr. Jones that no information was re-ceived from the Committee of Works us to the cli-gibility or qualifications of any of the other candi-dates for that appointment, some works were ordered, and the court adjourned.

STREAMPRICATION.

INSTITUTION OF CIVIL ENGINEERS. a meeting on Thesday, 24th, Mr. W. Cubitt, Vice-President, in the chair, the paper read was "On the Construction of Locomotive was On the Construction of Locomotive Engines, especially those modifications which enable additional power to be gained without materially increasing the weight, or unduly clevating the centre of gravity," by Mr. T. R. Crampton. It was contended that the durability of the working parts of the engine, the stability of the perspace to we would be fore stability of the permanent way, and the free-dom from oscillation, so essential for the comfort of travelling, all depended upon the steadiness of the engines when at high speeds. This consideration led the author to introduce several modifications of the ordinary construction of locomotives; the driving wheels were removed from the centre of the engine to behind the fire-box, placing all the weight on and between the extreme points of support. The centre of gravity was so reduced, that on the narrow-gauge railways the angle of sta-hility equalled that of the broad-gauge en-gines. All the moving parts of the machinery were removed from beneath the boiler and placed on the two sides, within the easy spection of the workmen, and chabling the repairs to be effected with ease and despatch. These dispositions had the effect of enabling a larger amount of heating surface to be given in the boiler, within a certain length of engine, than even in the larger class of engines of much heavier weight; thus, in fact, simul-taneously concentrating the power and reducing the weight.

PORTLAND. We are happy to observe that within this past week the Breakwater hegins to show itself, so that from the road leading to Portland it now forms a conspicuous object. The "navvies" are putting their hest leg foremost; in fact, all hands are putting their shoulder to the wheel in good carnest.—Somerset Herald

INDIA-RUBBER RIGGING SPRINGS .- Mr. Newall, wire rope manufacturer, has patented an elastic support for rigging. It consists of an elastic support for rigging. It consists of a long hox of iron plates, at each side of the ship, containing square blocks of India-rub-ber, divided by thin plates of sheet-iron. By a regulating screw the rigging can be strained to any degree of tightness, and whatever strain is afterwards produced by winds, lurching of the vessel, or other cause, the spring, by its reaction, pulls the rope hack to its place when the strain is removed

PROJECTED WONKS .- Advertisements have been issued for tenders,-by May 7th, for the erection of an additional wing to the Licensed Victuallers' Asylum, Old Kent-road; by 9th, for the erection of the Seamen's Infirmary, Ramsgate; by 11th, for the erection of dwell-Ramsgate; ny itit, for the erection of a weiting house and farm huildings upon the Bedlam estate; by 11th, for the erection of an infirmary at Uxbridge Union Workhouse, Hillingdon, Middlesex; hy 30th April, for taking down and rebuilding Upper Chapel, at Idle, Bradford; by 5th May, for filling up site required for cattle market, Shrewsbury; by 14th, for erection of proposed lock-up house, &c., at North Sunderland, Bamburgh; by 8th, for extensive alterations and additions to St. Ives Union workhouse by 8th, for the conversion into embankment of present pilcway of Preston and Wyre Railway into Fleetwood; by 14th, for completion of works of Plymouth Great Western Docks; by 1st, for works in remodelling fittings of lecture-room of Portsmouth and Portsea Literary and Philosophical Society; hy a date not specified, for erection of gas-holder and station meter, for erection of gas-holder and station meter, also for setting up retorts, and for other gas works for Western Gas Light Company; by a date not specified, for erection of gas-holder and other works, and for supplying and laying down necessary mains and pipes in Blue and Mile-towns, Sheerness, for new gas company there; by 1st May, for lamp-posts, to contain hydrants or water valves, for borough of Liverpool; by 2nd, for excavation and formation of public sewers at Gateshead; by 4th, for construction of new road, embankments, culverts, fencing, &c., at Stafford-bridge (Bedford); oy 1st, for 36 mile-stones, with cast-iron plates, for Hereford Turnnike Trust; by 8th, for the supply of soft melting pig-iron, for the dock-yards at Woolwich, Chatham, and Portsmouth; yards at Woolwich, Chatham, and Portsmouth; by 1st, for the supply of works and articles in numerous branches of the building trades, including gas fitters, iron founders, painters, &c., for Shoreditch parish; also by 7th, for lighting St. Paul's, Deptford, with gas, for three years.

COMPETITION .- Plans and estimates are required for the erection of a new workhouse for the parish of Birmingham, to contain 1,550 inmates. Premiums of 150l. (for the plan finally adopted), and 50l. for the second, as

SHAKSPEARE'S llouse.—It appears that the sum of 478*l*. is yet required to make up the amount for the purchase of the house, and that this has been borrowed on the usual terms. of the Stratford bank, on the security of the deeds of the property. The amateur performances have realised 1,500% for the endowment of a custodianship, and this sum has been invested in the funds. Would it not he better and safer to borrow the 478*l*. from this amount, and pay the interest to the fund instead of to the

New Church, Westminsten. - It is stated that another new church is about to he huilt in Westminster, at the cost of the W. H. E. Bentinck, one of the canons residentiary of Westminster.

BURIALS IN TOWNS .- A public meeting, to petition Parliament to close burial-places in towns, will be held this (Friday) evening, at the Western Literary Institute, Leicestersquare.

COMMONS' COMMITTEE ON SCHOOLS OF COMMONS COMMITTEE ON SCHOOLS OF DESIGN.—This committee began its labours on Friday, the 20th, by electing Mr. Milner Gibson its chairman. The examination of witnesses commenced on the following Monday, and Mr. Stafford Northcote was summoned give the hest account he could of the recent to give the nest account he could of the recent management of the school by the Board of Trade direct. We have understood that he at once admitted that the schools were too elementary, and that he was rather puzzled to say what progress had heen made in actual "design!" He did not appear very well informed ahout the state of the finances, although he said he was one of the course. he said he was one of the managers of them. Sir Robert Peel was present during the examination, and seemed most attentive, and ataking an evident interest in the subject. Indeed, all the members present seemed thoroughly interested, and they mustered strongly. Besides Sir Robert, there were Sir G. Clerk, Mr. Labouchere, Mr. Rich, Mr. Scholefield, Mr. Moffatt, Mr. Hastie, Mr. H. Hope, Mr. Baring Wall. So that there is every promise of the committee being tolerably effective. We understand some questions were ordered to he sent to the principal mannfacturers, soliciting information as to the benefits they have derived from the schools, and

asking to have specimens of designs forwarded.

THE LATE TRADES' CONVENEN, DAVID
SMITH, OF LEITH,—A correspondent has
forwarded the following paragraph, recording the death of this gentleman, who was a master builder in Leith, and convener of the trades, and departed this life there on the 21st ult. and departed this life there on the 21st ult., after an hour's illness, aged fifty-one. Few public men in Leith, of late years, have been more universally regretted. Energetic in business, affable in manners, and humane in his disposition, it may safely be affirmed of Mr. Smith that he belonged to that honour-label class of men who from the resulting resulting the control of the able class of men, who, from their conciliatory spirit, "sweeten the breath of society." Within spirit, "sweeten the breath of society." Within the last twelve or fifteen years, in conjunction with his late partner, Mr. Watson, be contracted for and erected the martyr's monument on the Calton Hill and Professor Dick's class-rooms and residence in Clyde-street, Edinburgh; and hesides being engaged in the extensive improvement of the old harbour, in Leith buyll; the Ber Met. in Leith, he built the Rev. Mr. Lewes' church and tower, in Constitution-street, Dr. Bell's public seminary, in Junction street, and very recently he completed the renovation of the ancient cathedral church of St. Mary's, in South Leith.

Cold-Harbour," Again .- At a mecting of the British Archæological Association on the 13th, Captain Shortt asked permission of the 13th, Captaio Shortt asked permission of the chairman (Mr. Crofton Croker), to make an observation on the meaning of the term 'cold-harbour,' which he perceived had en-gaged the attention of the Society of Anti-quaries. He considered it to be derived from the Saxon "yld herebeorga," the old mansion or resting-place of the soldiers, with the Scan-dinavian prefix, c.; or it may be from ceal yld herebergum the cattages. or could of the Merekeorya, the cottages, or ceold of the soldiers' halting or resting-place.—Mr. Gould said that he had hoped the discussion on this word had ended; for his part he thought it a pity to go away from that which was obvious and at head to they thick which was obvious pity to go away from that which was obvious and at hand, to that which was abstruse and far-fetched. He believed the word to be what it expressed,—a harbour, or shelter, or dwelling of some sort, in a cold, exposed, or barren situation,—that he was acquainted with about a dozen cold-harbours, and nearly all of them sufficiently established their name from their leading. locality. In the ridge of hills beyond Guild-ford he remembered half-a-dozen such places. The word arbor or arhour is one common to the languages of German or Saxon affinity; in the Dutch language herberg is a shelter, a cover, a public house, and in French we have also "herberg," now written "Auberge," for the same; and even in Italian "albergo Johnson, an authority he was not generally fond of, however, gives harbour and harbinger as derived from the Dutch word. From the he had acquired of the Gaelic language the did not helieve that anything could be got from it, without a stretch of imagination, and the same of the Latin language. Mr. Windus considered that the term was derived from the hurning of charcoal.

NOTICE.

ON May 1 will be published, Part I., price 2s. 6d., of "BUILDINGS AND MONUMENTS, MODERN AND MEDIEVAL:" being Illustrations of recently-AND MEDIEVAL: Design inustrations of recently-creeded Edifices, and of some of the Architectural Works of the Middle Ages, with Descriptive Par-ticulars. Edited by George Godwin, F.R.S., Fel-low of the Royal Institute of Architects, &c. No. CCCXXVI.

SATURDAY, MAY 5, 1849.

HE summer weather is coming, with light mornings and long days, and our student readers will do well to avail themselves of it, whenever opportunities

occur, to see all that is to be seen in their respective neighbourboods, hy which habits of observation may be formed, their store of knowledge increased, their taste formed, or tbeir judgment strengthened. See all the best pictures, and the best huildings you can find : by accustoming the eye to what is good, it will soon be led to reject what is bad. When you have a leisure day, get off to some of the old churches near you, or to one of our noble cathedrals, and fill your sketch-book and your note-hook with records of what you see and what you think. Make it an enjoyment; a relief from stricter study. Even without reference to the "good" that is to come from such jaunts, in the work-a-day sense of the word good, they give tone to the mind, fill it with pleasant memories, enlarge the store on which thought may afterwards draw, and invigorate the body.

And these are not trifles. As we have before now said, to make a good architect or a good builder is something; but to make a healthful, well-judging, virtuous, and happy man, is something more. Recreation is necessary for all; and it is most desirable that we should so tutor ourselves as to find this in pursuits which, so far from being burtful, are advantageous as well as innocent.

When we took up the pen it was for the simple purpose of introducing to our readers a view of that extraordinary architectural production, Roslin Chapel, near Edinhurgh; and we were led to make the preceding remarks by the recollection of the enjoyment which the jaunt to this very curious and interesting remnant of the fifteenth century had afforded us.

The vale of Roslin, a sequestered and beautiful spot, varied by wood and waterfall, is on the north Esk, and ahout 7 miles south from Edinhurgh. The day was superh, our companions (one of the best of the modern Scotch song-writers, and a well-known sculptor,) abounding with information and good feeling, and the road so sequestered and romantic, that a notice, which we saw on a hoard in a hedge,—"Beware of thimblers and chaindroppers," seemed singularly out of place and uncalled for.

It is not our intention, however, to chronicle the journey, beyond alluding to a remarkable natural amphitheatre (forming part of the valley of the Esk), with a paper-maker's bouse at the hottom of it, and pointing out, as a warning to those who would design without constructive skill, a monument to James Lockart Wisheart, of Lee, which was built in 1790, and is passed on the road. This structure consists of four piers, enclosing a small square area, in the centre of which is the memorial. Four pointed arches connect the piers, and were to carry the covering, but having no abutment, and being constructed without reference to statics, they failed, and were a ruin before they were perfect.

Roslin Chapel (or Collegiate Church as it was), was commenced in 1446 by William St. Clair, Earl of Orkney. "Age creeping on says a MS. in Hay's Collections,* "made him consider how he had spent his time past, and how to spend that which was to come. Therefore, to the end he might not seem altogether unthankfull to God, for the beneficies receaved from him, it came in his minde to build a house for God's service of most curious work, the which, that it might be done with greater glory and splendor, he caused artificers to be brought from other regions and forraigne kingdomes, and caused dayly to be abundance of all kind of workmen present as masons, carpenters, smiths, barrowmen, and quarriers, with others. The foundations of this rare worke he caused to be laid in the year of our Lord 1446; and to the end the worke might be more rare, first he caused the draughts (or designs) to be drawn upon Eastland boards, and made the carpenters to carve them according to the draughts thereon, and then gave them for patterns to the masons, that they might thereby cut the like in stone. Because he thought the masons had not a convenient place to lodge in, near the place where he builded this curious colledge (for the town then stood half a mile from the place where it now stands, to wit, at Bilsdone Burne), therefore he made them build the town of Rosline, that is now extant, and gave every one of them a house and lands answerable

The founder died in 1479, and left the huilding unfinished: the completion of it is attributed to the end of that century.

This chapel is an extraordinary combination of the massive and the minute, some of the parts being large and coarse, while the decoration over the whole is most elaborate and continuous. But for documentary evidence it would be ascribed to the following century, when Gotbie ran mad; it is like nothing else,—cannot be classed,—and ought not to be imitated. Externally, some of the pinnacles bave a Chinese aspect, and other parts are Indian; there are flowers carved on the face of the buttresses, and a semi-circular arched porch over the south door.

The character of the inside is conveyed hy our engraving, which shews the east end of the building, with the aisles heyond.† All the parts, roof, jambs, strings, arch mouldings, are sculptured, and much of the carving is well executed and now in a good state, considerable works having been done there eight or nine years ago, at which time the east window (not seen in our view), was put in. The effect would have heen better if, instead of this window heing, as it is, one of the existing windows enlarged, and having consequently only one mullion, the opening had been more subdivided by tracery.

The vaulting of the aisles is received on straight lintels, which run from the main columns to the aisle wall. These lintels are all sculptured; one of them displays the Vices, with the Evil One looking on out of the jaws of hell. In the arches at the east end, where there is the greatest luxuriance of carving, the Dance of Death is represented.

At this end a striking peculiarity occurs, which has been already noticed in our pages. The vaulting here terminates next the wall on large corbels of singular design, which

project to such an extent as to have led to the supposition that the east wall was pulled down after the groining was finished, and set further eastward, to give 3 feet more room, and that the corbels were then put in to prevent the necessity of pulling down the vaulting. We are not disposed, however, to coincide in this theory, but regard the arrangement in question simply as one of the many ingenious vagaries which distinguish this remarkable, and, in its general effect, heautiful building.

The "Prentice's Pillar," as it is called, with its sculptured decoration around it, is seen in our view,* also the entrance (to the right) to the crypt-like chamber at the east end, where, according to tradition, made current by Sir Walter Scott,

"Twenty of Roslin's barons bold Lie buried. "

in their mail :-

"That chapel proud, Where Roslin's chiefs uncoffined lie, Each baron, for a sable shroud, Sheathed in his iron panoply."

Mr. Burn, the architect, disproved the story in a degree by excavating both in this chamber and in the chapel. But those who are unwilling to give up the story suggest, that the bodies were placed on the ground, and not under it; and were carried off when the chapel was descrated.

Nearly every stone in this chamber bears a "mason's mark," and in the chapel above, also, the marks are very numerous.†

Roslin Castle, with its strong walls, curious outer buttresses, and singular series of vaults, increased the pleasure of the visit: we returned by way of Lasswade; and it was light enough when we got back, to see the glorious picture which Edinburgh presents viewed from a short distance.

THE LATE MR. AUSTIN,
THE RESIDENT ARCHITECT OF CANTERBURY
CATHEDRAL.

For many years up to about 1819, the cathedral of Canterbury bad been allowed to run to decay, the only moneys laid out on the fabric being those barely sufficient to keep the roofs dry and the main walls from falling. Some of the most beautiful portions of the cathedral, as they became decayed, requiring more skill or outlay to repair them than was possessed by the director of the workmen, or was approved by the treasurer, were gradually swept away: amongst the latest destructions we may mention the beautiful turret, which surmounted the staircase of the north-west transept.

It was at this time that Mr. Austin, being a resident in Canterbury, suggested the absolute necessity of some repairs and works, in order to save the main fabric from falling into such a state as would endanger its existence; and by the praiseworthy exertions of the Bishop of Carlisle, then Archdeacon of Canterbury, the hullding was afterwards placed under his care, with directions for the suggested works to be carried out.

It would be impossible in the space of a short notice to recapitulate the various works found necessary and undertaken by Mr. Austin, or the many ingenious methods adopted to overcome the difficulties which surrounded

^{*} Quoted by Mr. Britton, in a paper read at the Institute of Architects. See Vol. IV., p. 27.

[†] Sec p. 210 in present number.

[‡] See p. 51 and p. 64, Vol. IV

^{*} The story (which probably every one knows), is, that the master mason, being unable to execute this pillar, went of Rome to see one of a similar description there. During his absence, his apprentice proceeded with the execution of it, and the master on his return found the column as wo mose it. The story runs that envy led the master to kill his apprentice on the spot with his mallet. This story is told a other places besides Roslin, and is probably equally veracious at all.

[†] In connection with the subject of "masons' marks,"

It handwside Ritchie showed us, when in Secoland, a copy
of an old document, dated 1988, purporting to be the charter
of St. Jiary's Chapel Lodge, Edinburgh, wherein the signature of every member is followed by his masonio marks.

[†] In "Britton's Architectural Antiquities," vol. iii., will be found a ground-plan of Roslin Chapel, with views and details.

him, with a comparatively small annual sum to lay out, and a building of such extent and magnitude, requiring extensive repairs in every part,—but amongst them we may mention, that the south-eastern transept, through long neglect, and worse measures adopted for its relief (as, for example, a number of massive unsightly wooden pillars in the interior of the cathedral), was found to he in a very alarming condition,—so much so that it was considered necessary that it should be pulled down, in order to save the surrounding portions of the cathedral, but no workmen had been found who would venture on the work of demolition. By an ingenious mode, Mr. Austin removed the superincumbent weight from the walls, forced them into an upright position, and firmly fixing them there, reset the large oriel and other windows, which had assumed all kinds of shapes; and, taking off the massive groining of the roof, re-turning the arches, replacing such portions of the ribs as had fallen, and removing the wooden supports in the interior, restored the transept to its former beauty. After some years, the Norman gable, which had been taken off years before to re-lieve the crumbling walls, was rebuilt, and the walls are now firm and strong.

The whitewash, accumulated for centuries on the interior of the building, was removed, and the whole face of the walls and pillars restored, including the innumerable small purheck pillars, which were refaced by a composition made by the architect; and the hosses and ornaments of the roofs and tower were gilded and painted, according to their former

During these works, a great number of half-destroyed wall paintings were discovered, drawings from which were made, and are now in the possession of his family. At this time the stained glass of the cathedral, which stands unrivalled for its beauty, was much in need of repair, having suffered greatly from ignorant workmen; but the art of staining glass heing considered at low ebb, it was thought irreparable. Mr. Austin, however, undertook himself to restore some of the worst lights, and the vacancies of one or two other lights of figures he filled with new glass,—though without the slightest previous knowledge of the art; and it is told to us (we do not remember to have noticed the fact ourselves) that the imitation is so curiously correct that many artists, when asked to point out the new glass, have failed to fix on the right lights. The most difficult work of Mr. Austin was

glass, have tailed to it on the right lights. The most difficult work of Mr. Austin was perhaps the north-western tower. The ancient Norman tower which originally occupied this site, and against which the present nave was built, had long been found to be in a dangerous condition; and in order to relieve the walls, the spire which once surmounted this tower was removed ahout a century since. This tower had at last become so ruinous that portions fell during every storm, and it gave unmistakeable signs of falling towards the north, in which direction the wall of the nave, deprived of its support on that side, began to heel over, and the groining in consequence was much crippled. At this juncture Mr. Austin, by a combination of mechanical power, after separating the nave walls from the falling tower, raised the crippled groining, and strained the walls into their upright condition, fixing them there until the new tower might be built and be sufficiently set to withstand the lateral pressure. The old Norman tower was then taken down, and the present tower erected,* for which the foundation required care, the site having been once a bog or marsh, which was clearly proved by the remains of plants, &c., there found; and lower down, 16 fect from the surface, were discovered the entire skeletons of a man and an ox, in such positions as to render it almost certain they had been smothered by sinking in the soft soil.

tions as to render it almost certain they had been smothered by sinking in the soft soil.

In the interior of the cathedral many restorations were executed by Mr. Austin. The old painted organ, the case of which entirely stopped up the fine arch between the choir and the central tower, was removed, and the various movements of the organ and its multitudinous pipes were arranged in the triforium—thus opening the view from the westernmost end to the extreme east.

The incongruous oaken screen and altarpiece which surrounded the choir, and reduced it to half of its ancient proportions, was removed, and the beautiful screen of Henry d'Estria brought to light and restored, and the altar carried back to its ancient position. The present altar screen was then designed and erected, forming a veil, through the fretted openings of which the most beautiful and interesting portions of the cathedral are seen. In clearing away the rubbish for the foundation of this screen, and directly beneath the spot fixed upon by Mr. Austin for the altar table, were discovered the remains of the ancient high altar, surrounded by the jasper pavement, the destruction of which, in the fire of 1174, is described by Gervase, the contemporary of Becket. This would serve to shew the correctness of Mr. Austin's views as to the restoration.

The new throne, illustrated by us some time since, was the last addition to this cathedral by Mr. Austin. The design is in character with that of the altar screen, and also with a design for the erection of stone stalls, which were proposed to be substituted for the present oaken ones (a design which was preferred to those of Mr. Blore and Mr. Rickman, who also sent in drawings), but which were afterwards abandoned by the dean and chapter for want of funds. The throne was designed, and for the greater part erected, in the short space of about six weeks, in order that it might be ready for the triennial visitation of the archbishop. The ornamental parts were prepared by workmen who had been employed in the eathedrals of Brussels and Cologne, as Englishmen could not be obtained at the moment. It was erected at a cost of about 1,200%, which was defrayed by the late archbishop, whose armorial bearings ornament the interior of the throne. It has been proposed to paint and gild some portions of the throne and alar screen, but we are not anxious that this should be done.

In justice to Mr. Austin it should be stated that the stone pulpit which has heen lately erected opposite the throne was not erected by him or from his design, though some portions of it were afterwards altered and adopted by him

Mr. Austin, to whom it may be justly said all admirers of ecclesiastical architecture are indebted, died in October, 1848, having held office under the dean and chapter for thirty years; and it was a graceful act of the dean and chapter, by which even his death was rendered a continuation of the services of his life in beautifying the cathedral, that they have directed the large window in the north-western tower to be filled with stained glass to his memory. Mr. Austin died at the age of 62, and was a native of Woodstock, being born in "Chaucer's house." It should be remembered, when estimating the merit of his work, that he was one of the earliest of those who gave attention to the restoration of our cathedrals, and began the good work which has of late years been so largely carried out.

" PERFECTION IN BUILDING—A WORK OF PROGRESS,"

Ir is an undeniable fact, that thousands of houses are rapidly built, tenanted, and-sold in this London of ours, devoid of anything like comfort or novelty of arrangement, though in a scientific age like unto the present, when numberless improvements are heing patented, or at least registered (and none are brought to more perfection or in greater number than those connected with building), yet is the tradesman or clerk content to go on year after year, in the occupation of the ill-arranged and scantily-constructed dwellings with which the metropolis swarms. Scarce a district where, but a short space since, notice boards said, "Horses taken in to grass," but now, alas! the fashion's changed, and "Apartments for single gentlemen," with houses to let, or perhaps to sell, with the temptation of paying a large per centage, take their place. That argument of the purchase or sale of house property to pay a "per centage," annoys me! Examine some of the lists put forth by auctioneers, and property will be found to pay from 4 to 20 per cent; surely the one must be too cheap, while the other must be too dear.

tenements to be sold to pay 10 per cent.; now, without reference to whether they are well or ill built, I would wish the question to be canvassed—whether the materials of which the house is built, together with the labour, and with these a fair tradesman's profit, should not rather be the basis for calculation of value, adding value of land, than by extorting an exorbitant rent in order to make the purchase-money larger? How the houses ever find tenants at all is astonishing, were it not a known fact, that as soon as they are finished, the builder will let them to any one who will agree to pay a high rent; he, intending to dispose of the property, cares not to see quarter-day, to ascertain the stahility of the occupants, but is then in a position to sell "the desirable house, let to a most respectable tenant, at a low rent, and the investment will pay the purchaser 10 per cent."

sell "the desirable house, let to a most respectable tenant, at a low rent, and the investment will pay the purchaser 10 per cent."

How forcible are the truths of old Gerbier, who, as far back as 1660, said, "Let all owners of houses he prepared to repent, whether they build or not; for it is like the fate of the many who marry and who marry Nor: let both, the one and the other, lay as it were in a scale their several vexations, cares, lahours, and pleasures, they will find this to be true, and pleasures, they will find this to be true, wire,.—if they build, they must be at greater present disbursement; while if they build Nor, they are subject to the inconveniences of houses built according to the fancies of others; and when they cast up the sums of money spent in rent, besides many chargeable alterations, they will find that they might have built a better and more fit habitation for them and their posterity." Well, nearly two hundred years ago do we find advocates were to be found trying to teach the public that the art of building was intimately connected with the convenience and comfort of life, and, as such, was most deserving of the best attention of all.

was most deserving of the best attention of all. Building is essentially a work of progress, not positive inaction, letting what was before be now but the reducing of a system by which stability and elegance are blanded, and also a judicious choice and application of all materials. Many parts of the globe present strong pictures of from what a mean original buildings arose; for instance,—the necessity of providing protection from the changes of the weather led men, in the first instance, to select natural cavities or grottoes; but when a colony of men joined together, these natural dwellings became insufficient: then, stern necessity compelled them to unite in erecting a sort of hut,—and of this primitive type the Indians of the present day have striking examples, being constructed of boughs and trees tied together by bands uniting at the top, not unlike in outline our tents. From this we can conceive the origin of building; and though the first efforts may (to us moderns) appear rude, still they were such as answered the wants of the inhabitants,—more than can be said of many a noble erection built in the age of refinement and civilisation. We could go on suggesting and imagining that the different productions of old dame Nature began to be regarded and eagerly sought after, and that stone began to take the place of boughs and trees in walls. Then the erections first began to have an appearance of regularity and strength; then this was further assisted by the ambition of each endeavouring to excel his neighbour in his dwelling, and this rivalry must have materially aided the introduction of ornament. Then commenced and progressed civilisation, and, perhaps, even proportion was not lost sight of: certain it is that many of the former rude appliances came to be suggestive of ornament. Thus, the bands, encircling and keeping the trees together, when copied into stone, became mouldings. Again, the stone under the tree, placed to prevent it driving into the ground, may have given the first idea of the base of the c

Look at the ponderous works raised by the mighty Egyptians four thousand years ago! Do not their remains, even in a ruinous state, still show a boldness of outline and a truly impressive appearance? But grand as the works in Egypt were, they were improved upon in succeeding ages by the Greeks, who, though

⁶ We do not enter into the question which arose as to the propriety or otherwise of retaining the early design.

not producing works of the same astonishing magnitude, still formed successful rivals, by adding perfection of proportion and simplicity of form; and the Romans subsequently, though adopting the architecture of the Greeks, still further advanced the arts by adding magnificence. Perhaps they did not make so distinct a step to originality of conception as the Greeks did, when borrowing from the parent source, Egypt. On the decline and fall of Roman power, purity and perfection in the art became entirely disregarded, giving place to a most curious mixture of arches, columns, and ornament, without any certain rule to determine the proportion. Then flourished, in more or less perfection, all the several styles and stages of Gathia conditions which must be supported by the several styles and stages. of Gotbic architecture, which was likewise without precedent; sometimes expressing dura-bility and strength hy circular arches and large columns—at others, with pointed arches with groups of columns tied together, models of lightness and marvels of construction. And all these, singularly incongruous one with an-other, have been adopted by us moderns: in fact, this London has copies, or at least repre-sentatives, of every known building peculiar to every age and country, though some are such vile productions, that one is tempted to wish that

would relieve us of their presence. In speaking of the architecture of any country we usually hear something about the "Augustan age," or that period when the arts were cultivated in that period when the arts were cultivated in the most pure style; now, whether England has ever seen that age, or if it is in the good time coming, it would be difficult to say, for it is not a little amusing to find each wishing to claim his own as the period. Elmes was for fixing the reign of George IV., when Nash and others produced works that have since been pulled down, or new fronted, perhaps, with no greater reason than that the fashion has cbanged. Thirty years ago it would have been positive madness to have proposed a Gothic church, and now it would be equal madness to propose one in the classic style. Every dog has his day, so truly has every idea. Professor Cockerell made mention in one of his lectures that he himself had known four distinct changes. We have shown, then, that building should be a work of progress pot insertion. We have shown, then, that building changes. We have shown, then, that building should be a work of progress, not inaction, but this has hitherto more particularly referred to public buildings alone, not to our private dwellings. Hence is it that old houses find more respectable tenants than the modern fashionable residences. The fact is, in the erection and arrangement of these houses, no newidea is thought of, because of the expense, but they are modelled after the "what was before," with this exception, that every part is to be cut down and reduced to a marketable price, and to pay the good per centage.

"The Goth, the Christian, time, war, flood, or fire"

pay the good per centage.

It will be noticed that our remarks apply to the numerous small houses erected by builders on the speculation of finding a purchaser; in fact the ready built houses are the stock in trade of these builders, built expressly for sale, with dashing fronts, ornamented enough to produce the "how nice!" from the public, produce the "how nice!" from the public,—
such as those who occupy and who are the
patrons of houses with porticoes of two Doric
columns, perched on a flight of steps high
enough to serve for an ancient temple, and
finally, in the entablature, Gothic battlements
for a cornice, guarded by sphinxes or curious
lions, anything but thorough-bred. Depend
upon it, however small the edifice may be, it uons, anything but thorough-bred. Depend upon it, however small the edifice may be, it will be best to consult some person to make a plan, and then abide by it, rather than purchase the work of men which is the result of but "little knowledge," which is admitted to be "a dangerous thing." Does not the following speak for itself? "T——S——, bricklayer and plasterer; jobbing in all its branches; buildings designed in all the five orders of architecture." This is to be seen suspended in very large letters in front of a house in Tottenham, and this perbaps is notified to the public on the strength of having spent a month in some engineering college, where everything is taught at first sight. Depend upon it, so long as the public remain indifferent to becoming judges of building, there exists but little prospect that better houses will be brought into the market. The utility is surely self-evident, in fact it is a point of self interest. Let the study be taken up by educated

people, and instead of being, as now, simply a professional one, it would acquire a popularity that would have a most beneficial and salutary effect on the art itself;—then would this ennobling art find a refuge from those who play such fantastic tricks with bricks and mortar, as make us "wipe the tear of pity from our eyes."

Francis Cross.

NEW GAOL IN THE CITY OF BOSTON, U.S. FOR SUFFOLK COUNTY.

NEW gaol is about to be built in the city

A NEW gaol is about to be built in the city of Boston, from the designs of Mr. G. J. F. Bryant, architect. As it differs greatly from any arrangement yet adopted in England, we annex a plan of the ground-story, and a description by the architect.

The gaol will be cruciform in plan, and will consist of a centre octagonal building, having four wings radiating from the north, south, east, and west sides thereof; the north, south, and east wings will contain the cells for the use of the prisoners, and the west wing will be of the prisoners, and the west wing will be appropriated for the jailor's family, officers' quarters, and the necessary incidental offices and apartments required for the building, together with a chapel and hospital.

The three wings containing the cells are to be constructed upon the "Appler" and "are to be constructed upon the "Appler" and "are to be constructed upon the "Appler" and "are to be constructed upon the "Appler" are to be const

constructed upon the "Auburn plan," so called (being a prison within a prison), the north and south wings will cach measure 80 feet 6 inches in length and 55 feet in width, and 56 feet in height above the surface of the ground; the block of cells within each of the north and south wings will measure 63 feet 6 inches in

above the surface of the ground. The block of cells within this wing will be 147 feet 6 inches long, 21 feet wide, and 54 feet bigh; it will also be divided into five stories in height, each story will contain twenty-four cells of uniform size, with the cells of the northern and southern wings before described these initial southern wings. wings, before described, thus giving to this wing 120 cells.

The spaces around the outside of each block of cells in each of the before described wings (between the cell walls and the exterior walls of cells in each of the before described wings (between the cell walls and the exterior walls of the wings) are to he appropriated as "areas," which are to be open from the floor of the lower story of cells in each wing, up to the ceiling of the upper story of cells in the wings; galleries of iron will extend the entire length of each of these spaces, outside of the cells, on a level with each of the floors; these galleries which are to encircle the interior of the "centre octagonal building" aforesaid, on the same uniform level with the first-named galleries. Each cell willcontain a windowand a door communicating immediately with the galleries of the "areas." The west wing will measure 55 feet in width, and 54 feet in length, and be of uniform height with the three first named wings: it will be four stories in height, the lower one of which will contain the family kitchen and scullery of the gaoler; the second story will have the gaoler's office, officers' rooms, and gaoler's family pailours; the third story will be devoted entirely to the sleeping rooms of the gaoler's family and officers; and the fourth story will be appropriated for the hospital and chapel of the prison.

The "centre octagonal building" will measure 50 feets source, and 85 feet in height shows

south wings will measure 63 feet 6 inches in length, 21 feet in width, and 54 feet in height, and will be divided into five stories; each story will contain ten cells, each of which will measure 8 feet by 11 feet, and 10 feet high, thus giving to each of these two wings fifty cells.

The east wing will measure 164 feet 6 inches in length, 55 feet in width, and 56 feet in height

story will be finished as one "great central guard and inspection room," reaching from the ceiling of the first story up to the roof of the huilding; this room will measure 70 feet square, and will contain the gallerics and staircases connected with the galleries around the outside of the cells in the three wings.

All the areas around the outside of the cells

of the north, south, and east wings will receive of the north, south, and east wings will receive light from the great windows in the exterior walls of the wings; these windows will he thirty in number, each measuring 10 feet in width, and 33 feet in height, heneath which other windows, 10 feet wide and 9 feet in height, will be placed, thus yielding an amount of light to the interior of the cells probably four times as great as that in any prison yet constructed upon the Anhurn system.

The cost of this prison is estimated at 150,000 dollars, hut, according to our informant, it will probably cost three times that amount.

amount.

THE CHARGES OF THE ELECTRO-TELEGRAPHIC COMPANY.

WE have received a letter from Mr. J. Lewis We have received a letter from Mr. J. Lewis Ricardo, M.P., chairman of the Electric Tele-graph Company, calling our attention to a paragraph of our own regarding the tele-graphed report of the Cohden banquet at Wakefield, wherein, after doing justice to the expedition with which that first and only great effort in this country was accomplished, we expressed a hope, "that the only drag upon the lightning speed of the electric telegraph that now remains, viz., extravagant and im-practicable charges, will ere long be cast off as practicable charges, will ere long be east off as an inculua that can no more profit the convey-ancers of intelligence than its publishers." Mr. Ricardo enters into a lengthened and interest-ing explanation of the heavy outlay and expense attendant on the construction and maintenance of the extensive apparatus and property of his company; an explanation we property of his company; an exp would the more regret our inability to offer in full, were it not that the same explanation in full, were it not that the same explanation has already appeared in the Times, and more or less fully in other papers, through which our paragraph had previously circulated. Of course Mr. Ricardo's object is to shew that, every thing considered, the company's charges are moderate, and that therefore our accusation is unjust and unmerited. "As I am tion is unjust and unmerited. "As I am quite satisfied," he says, however, "that you had none but public motives in the charge made against us, I am anxious to set ourselves right with you, and through you with the public, on a charge which is calculated to do serious damage to our undertaking, the im-portance of which you have fully and hand-somely acknowledged."

we should be exceedingly sorry indeed to do even the slightest damage to so important and almost national an undertaking. Our sincere intention, on the contrary, was to do good service to the company no less than to the public, and it still remains to be seen, whether a very considerable reduction of the present charges for the conveyance of intelligence,—even of mere messages, though we principally alluded to such lengthened reports as that to which we had just referred,—would not very considerably increase the company's profits, even while additionally benefiting the public. Mr. Ricardo himself, while limiting the public. Mr. Ricardo himself, while limiting the very design or purpose of the telegraphic system at large to important and urgent messages—thus plainly showing that the eyes of the company are not even yet opened to those wider and more extensive purposes recently displayed in their tensive purposes recently displayed in their own striking and meritorious achievement for the Times,—admits that "many of our wires are in far from complete and continuous employment." Why should this be still the case, if the charges, even for messages, he not to a greater or lesser extent impracticable? Nay, why should the company calculate their charges hy any exclusive reference to urgent or even important messages atall? It is cercharges by any exclusive reference to urgent or even important messages stall? It is certain, that so long as the charges are so estimated, inessages of a less urgent or a less important nature will be permanently excluded. Does not the very fact that many of their wires, even though only capable of conveying a certain more or less limited number of messages in a viven time, are in far from consideration. sages in a given time, are in far from complete and continuous employment, clearly prove

that the company pitch their charges at too high a figure for those less urgent or less important messages, which otherwise would keep their wires in complete and continuous employment? Ay, and in all prohability, call for duplicates, triplicates, or manifold repetitions of separate sets prohability. Call for duplicates, tripicates, or manifold repetitions of separate sets of many of them for separate and simultaneous purposes? It is not such mere "statements" as ours alone that may "have the effect of preventing the public from making the full use of the telegraphic accommodation provided for them." or he calculated to "invasion" or he calculated to "i vided for them," or be calculated to "impede an extension of that accommodation," and an extension of that accommodation;" and the company may depend on it that the initiative in "diminishing the cost at which it is provided" rests, not with the public who do not fully patronise their wires, but with themselves, who do not afford them a sufficient translation. temptation to do so,

In allusion to the magnitude and expense of the establishment, the numerous staff of clerks, mechanics, batterymen, and higher officials, kept up, the tear and wear, improvements, substitutions, &c., continually going on, Mr. Ricardo says, if these things he considered-

"I submit that a maximum charge for a message amounting to 1d. per mile cannot fairly he considered as an exorbitant demand for the accommodation afforded to the public in keeping open so many receiving stations, and the maintenance of the expensive establishment to which I have adverted. The telegraphic system is designed for important and urgent messages, and could I violate the secrecy which I feel hound strictly to observe, I could show that notone despatch in a hundred bas been forthat not one despatch in a hundred bas been forwarded which has not been worth many times the amount paid for it by the sender. A commercial house at Liverpool will scarcely grudge 8s. 6d. for a communication by which are the sender. house at Liverpool will scarcely grudge Ss. 6d. for a communication by which a necessary payment may be made, an important order given, or a profitable operation facilitated in London; and the message from Glasgow, which traverses a distance of 520 miles in an instant, to summon a son from the metropolis to the bed-side of a dying parent is scarcely to be judged overpaid at a charge of 14s.—considerably less than a halfpenny per mile. An express message, sent by porters or by a cab from the city to the west end of the town, say from this office to the Ilouse of Commons, a distance of four miles, will cost 2s. 6d.; and if the same message can be sent from Manchester to Liverpool, a distance of thirty miles, for the same sum, and in a shorter time, it cannot surely be deemed an extravagant demand."

Now. over and above what we have already

Now, over and above what we have already said as to the design or purpose to which the Electric Telegraph Company seem to desire to limit their ramifications throughout the country, it appears to us that they are not very much entitled to compare or contrast their charges in this way. What would they say to much entitled to compare or contrast their charges in this way. What would they say to such an argument as this, by way of contrast, against themselves?—Your charges are exorbitant, for while you are exacting 1d, per mile for the mere conveyance of twenty words through a wire not a quarter of an inch in diameter, a wite not a quarter of an incident manager, railway companies are conveying passengers themselves, even though they he 20 stone weight, at that very charge, and expensive carriages, and hy steam-power, along a vasily more expensive line of massive rails, and levelled trunglish divided embarked and more expensive line of massive rails, and levelled, tunnelled, bridged, embanked, and stationed and officialed railways; and this they do, however urgent and important the object may be which the passenger has in view, or however much he may henefit by his journey! But let us see what they do say at Liverpool to all this special pleading of our correspondent.

"Several Liverpool merchants on 'Change,' says the European Times, "called our attention to a letter in the Times of yesterday from Mr. J. L. Ricardo, chairman of the Electric Telegraph Com-

"We may here give a summary of this part of Mr. Ricardo's letter. The wires of the company stretch from Glasgow on the north to Dorchester on the south, from the cast

winders attached to each.

pany, upon which we would at present merely remark that it is not surprising that the electric telegraph is but little used in England, when the company demanded, on the 26th inst., 13s. ! for transmitting from London to Liverpool the follow-ing short message:

transmitting from abonature ing short message:—

Lil. Hi. Dh. Sixty-eight half Nine-fourth.

E. Ayax. O. G. S. T. Three-ten.

Only forty-eight letters. And at this exorbitant rate they say they do not guarantee the correct transmission of a message unless paid for as a "repeated message;" so that under that infliction the public would have been muleted of 21s. for sending forty-eight letters. See how the thing is done in America. We lately sent a message of greater length from New York to New Orleans and back, about 4,000 miles, for 8s., and it was accomplished in 70 minutes. Here is another fact. We had, on the same day, a message, containing more had of the same day, a message, containing more sent from Philadelphia to plished in 70 minutes. Here is another fact. We had, on the same day, a message, containing more than forty-eight letters, sent from Philadelphia to New York. On its delivery we paid one shilling for its transmission, and (one penny) for delivery. for its transmission, and tone penny for derivery. In these two American messages there was not a single mistake!* As this is a subject of great public interest, we will prepare and publish a full statement of our business with this company for the 117 days of this year.''

But, again, we must remark, that our allusion to impracticable prices hore direct reference to the charges made to newspaper proprietors for the conveyance of general in-telligence in such reports as that which appeared, we may say, for the first and only time in this country. And it is a remarkable circum-stancethat in so elaborate a reply to so incidental stance that in so elaborate a reply to so incidental an allusion, not one word relates to this our real complaint against the company. Charges of one halfpenny, or even one penny per mile, for a message of twenty words, might, after all, he unobjectionable, though even these, it appears, ought to have come within the sweep of our denunciation of extravagant and impracticable prices; but even ethernise, and practicable prices; but, even otherwise, such charges, for everytwenty words, in a long report of a meeting, must be preposterous, even were theymoderate formere brief messages of urgency and importance. It cannot be denied that the first announcement of their charges by the Telegraph Company completely damped the hopeful prospect of mutual benefits in constant intercourse between these conveyancers of intelligence and its publishers, and pre-determined the latter against the former altogether. Thus it seems to be that the promotion of public and general intelligence of more or less importance, by regressing reports, and the proposed in the contract of the proposed in the p importance, hy newspaper report, is not even comprehended in the category of the purposes or design of the telegraphic system at all, or design of the telegraphic system at all,—whereas, until it be so, and until temptations in the shape of considerable reductions in charge be offered to the public and the press itself, to transmit intelligence of second, third, or even fourth-rate, far less of first-rate, importance or urgency, we do fear that there will be no such profitable return as we would desire to see reaged in as spirited and large an desire to see reaped in so spirited and large an undertaking as was the establishment of the Electro-telegraphic Company.

THE NEW DOCK AND WHARVES CON-STRUCTING AT GREAT GRIMSBY.

THE plan of these works includes an entrance basin, area 19 acres, accessible for the largest vessels at all times of the tide, with piers vessels at an times of the day, with piets suitable for all vessels not requiring to enter the docks. The great bock is 300 feet long, and 65 feet wide. The small lock 200 feet long, and 45 feet wide. The dock, area 29 acres, is accessible for all vessels for twenty hours out of the twenty-four. The east wharf is 2,000 feet long, and 670 feet wide, to be appropriated to warehouses and a goods station, railways laid to every part, area 42 acres.

Great Grimsby has every prospect of becoming very important harbour and port, and when

^{*} Here we must observe that the Americans night have breed the very argument addreed by Mr. Ricardo in favour of his higher clarges. Yet no one complete the very argument addreed by Mr. Ricardo in favour of his higher clarges. Yet no one complete clarges where the property of the contrast between American and English charges are given in the Times.—Nessages of en words or under are as follows:—From New York to Endown the New York to Polisal (New Orleans, 150c.; Baltimore to Washington, 30c.; Boyer, Bo

spacious tidal basins and large floating docks are completed, there will be every advan-tage which a port can possess afforded to the shipping which carries on the eastern com-merce of the country. Even at present the harbour of Grimsby affords shelter to a large traffic; the natural advantages have already rendered it an extensive port, and the floating docks, although not on a large scale, are oftentimes full of ships, chiefly from foreign coun-

Rendel is the engineer-in-chief, and

Mr. Adam Smith, the resident engineer.

At the lunch which followed the ceremony of laying the first stone on the 18th, the Earl of Yarborough, who presided, said in the course of his speech, Perhaps strangers may not be aware of the enormous quantity of timber necessary to construct these docks. That timber has been imported from the Baltic. We have succeeded, though it was prognosticated that we could not, in shutting out the water as you have seen to day, and we may consider it fortunate, as I believe we are at this moment 19 feet below the level of the water. The first pile of this timber was driven in 1846, and I recollect that it was stated in a neighbouring port that there was an end of the Grimsby docks. It was said that when the first pile got tapped on the head by the engine it engine it went through the quicksand, was no where to be found. But it v But it was a mistakc, for since that time the coffer-dam has been extended to the length of 1,600 feet, and to construct it there have been obtained 70,000 pieces of Mcmel timber, of the average length of 50 feet. The measurement of these works is in circuit a mile and three quarters.

We may probably lay before our readers a notice of some of the peculiarities observable in the construction of these docks.

"WONDERS IN LOCOMOTION: NEW MOTIVE POWER."

In this age of spanking locomotives, such an In this age of spanking focomotives, such an announcement as that now quoted from the columns of a contemporary is, to say the least of it, somewhat startling. Yet it turns out that the "new motive power" by which these wonders are to be accomplished is by no means very new, even as a motive power; and although the author of the announcement, "Adolph Count de Werdinsky," intimates Adoph Count de Werdinsky, Indinates that this new motive power has been patented, he will find, by reference to No. 230, Vol. V. of The Builder, that even that fact is not very new, the same power, or "patented ingredient," having been patented in this country that the West Country of the patents of the country of the patents of the country of the c try, by Mr. Fox Tallott, as, a motive power, previous to 3rd July, 1847. In short, this great discovery consists in the use of gunoction, xyloidine, pyroxyline, or whatever it is to be called, as a motive power. Amongst various modes of adapting it, says the Count, it may be applied directly under the piston, and fired by electricity, so as to supersede the necessity of boiler, furnace, or other cumbrons. apparatus. Such is the very nature and description of Mr. Fox Talbot's patent. The osive material is supplied by a tubular slide under the piston, and that portion of it which protrudes or is pressed through the slide into the piston is to be fired by a plati-num wire, thrust through the cylinder,—xyloi-dine, it appears, having the peculiar and invaluable property of exploding only when and where not under pressure. The Count is hopeful that this new patent will be applied even to street cahs, old ladies' Bath chairs, and dandy's velocipedes, far less to omnibuses and mail-coaches, or common-road locomotives in mail-coaches, or common-road rocumbers in general,—the economy of it being, as he remarks, enormous, when it is considered— that "all kinds of vegetable fibres or lignine, such as cotton, flax, hemp, tow, sawdus, straw, hay, rags, paper, &c., can be rendered straw, hay, rags, paper, &c., can be rendered explosive by their being merely dipped for eleven to fifteen minutes in nitric acid, strengtheleven to liteen minutes in nutric acts, strength-ened by an admixture of an equal quantity of sulphuric acid, then well washed in water, and dried for about two hours,"—and that "for an engine of two-hovse power [thus supplied (see Manchester Examiner of 6th March, 1847) at New Jersey] a thread not larger in size than ladies' sewing cotton is quite sufficient." But not only so: for although "small and compact xyloidine engines are easily attachable to

carriages, street cabs, tradesmen's cars, farmers' waggons, dandy's velocipedes, or old ladies' Bath chairs," the Count tells us that since writing the above he has "made a further discovery, and this last one is verging almost on a miracle"—the most prominent of its features being, that not even engines are its features being, that not even engines are necessary! far less boilers, "steam, fire, water, magnetism, air, or animal power;" so that if "a thread not larger in size than ladies' sewing cotton" be quite sufficient to propel with a power equivalent to a couple of horses, and without even an engine, we are likely to see Punch's ingerious idea of propelling 'old ladies' with gun cotton 'stay laces' briskly drawn through 'pie holes,' and even without Bath chairs, any more than engines, in one sense realised, or more than realised, indeed, had lifterence between the power of a by all the difference between the power of a cotton thread and that of a stay lace. More-over, by the same wonderful means—or want rather of apparently adequate means, slips may be propelled "without paddles, or any propellers whatever," — pyroxyline, as the naked "propeller" itself, we presume, excepted. naked "propeller" itself, we presume, excepted. After all this, it is useless urging the objection already started, that the gaseous proceeds of gun cotton may corrode the pistons of engines; the Count does not even admit that. But, however ultra-enthusiastic he may be in hopes which themselves remind one of the like, herestofore entertained as to other expansive forces; that wonders may yet be excusably anticipated from the compaction of such forces into forms so convenient as those of which gun cotton is so convenient as those of which gun cotton is capable, can scarcely be denied, when it is considered, that while, in a simple and most eco-nomical way, "all the vegetable fibres in the creation become highly explosive," they never-theless remain perfectly tractable and manageable by mere matting compression.

NOTES IN THE PROVINCES.

THE foundation-stone of the new buildings for the Farm School at Redstone-hill, Reigate, for the reformation of juvenile offenders in-trusted to the care of the Philanthropic So-Monday last. The new huildings will accommodate 120 hoys, besides 50 in the old farm buildings; an increase to 500 is expected in a few years. A chapel and school-room are to be built.—St. Lawrence's Church, Winto be built.—St. Lawrence's Clurch, Winchester, is being re-opened, after a closure of nine months, during which a new east stained-glass window has been put up, at a cost of 2001. by Miss Littlehales; the old pews have been replaced by others, and the old flat ceiling taken down, and the roof timbers thrown open.—Upwards of 1,2001. have been subscribed for the repewing and other restoration of the ancient church of St. Martin, Salisbury. Two of the principal windows. Stonned up same Two of the principal windows, stopped up some years since, are also to be re-opened, and the years since, are also to be re-opened, and the spire is to be partly rebuilt, and other improvements effected.—An infirmary chapel is to be built at Worcester, at an outlay of 1,200/. partly obtained (300/.) from the Jenny Lind fund, and from a subscription list headed by 1004. from the dean.—The foundation-stone of the Cheltenbam Church of England Training Institution was laid by Lord Asbley on Thursday week before last.—Thornbury Church was to be re-opened on the 1st inst. It has been new roofed, new pewed, new clerestory windows put in, the gallery removed, the in-terior of the tower restored, and the west win-dow thrown open to view. The floor of the dow thrown open to view. The floor of the chancel has been relaid with encaustic tiles, chancel has been relaid with cheatest the, and a five-light decorated east window, by Mr. Clarge Rogers, of Worcester, inserted. The and a nverigin decorated east window, by Mr. George Rogers, of Worcester, inserted. The architect employed was Mr. F. Niblett, of Gloucester; and the contracting builder, Mr. John Brown, of Bristol.—The new church of Upton, parish of Tormoham, Torquay, lately consecrated, accommodates about 1,000 persons. All the seats are open. The style of the building is Early English, and the material, grey lime stone, with wrought quoin-stones and carved work and dressings of Caen stone. The elevation is massive, consisting of a nave and aisles, with massive, consisting of a nave and asset, circular chancel, and the foundation of a tower and spire for the complete design. Total and the of interior with chancel, 120 feet; length of interior, with chancel, 120 feet; hreadth, 60 feet; height, 70 feet. The chancel and west windows are decorated. A row of

circular pillars runs between the aisles and circular pillars runs between the aisles and nave.—The lower compartment of the Phœnix tower at Chester is being put into a state of repair.—At Chowbent, a locality not long since notorious for barbarous usages, a mechanics' institute has just been opened, with a lecture by Dr. Hodgson.—Miss Sharpe, of London, has presented additional decorations for the completion of the two chancel windows of the church at Tibshelf.—A public subscription has been Tibshelf.—A public subscription has been announced to be made for repairing the roof of Honiton Church, at an estimated cost of 800%.

THE OLD WATER-COLOUR SOCIETY.

THE current exhibition of the Society of Painters in Water Colours contains 365 tures (one for every day in the year), and is as a whole one of the most perfect annual collec-tions ever seen. The sales have been propor-tionably great, the blue ticket meets the eye in every direction.*

Prout, Copley Fielding, Gastineau, D. Cox, P. De Wint, G. Fripp, Frederick Taylor, J. M. Wright, V. Bartholomew, F. Mackenzie, W. Hunt, have all done their best, and the picture-loving public know well what that is. Cattermole has several small works of great excellence,—amongst them "The Exhortation" (283), and "The Göldsmith" (328), may be pointed out as two of the most perfect things in the room. Oakley has fallen into a manner (the one fault with many of the mem-hers), and will need an effort to retrieve

Amongst the secoders from the new society, Amongst the seconders from the new society, J. J. Jenkins appears to have made the greatest advance upon his former productions. Topham has several charming drawings,—but, to our mind, less so, than some of his previous admirable works. Duncan is, as usual, excel-lent. Branwhite's 183, "On the East Lyn, North Devon," is a wonderful piece of distem-

per painting.

Mrs. II. Criddle, who has but recently turned her attention to water colours, exhibits several pictures of considerable pretence and power, and will be found an acquisition.

LAUNDRY DRYING CLOSETS.

GREAT attention being now called to the subject of drying clothes and linen, in conse-quence of the number of public laundries and asylums requiring improved means of effecting that object, I am induced to trouble you with a few remarks, which I trust may be con-sidered of public interest.

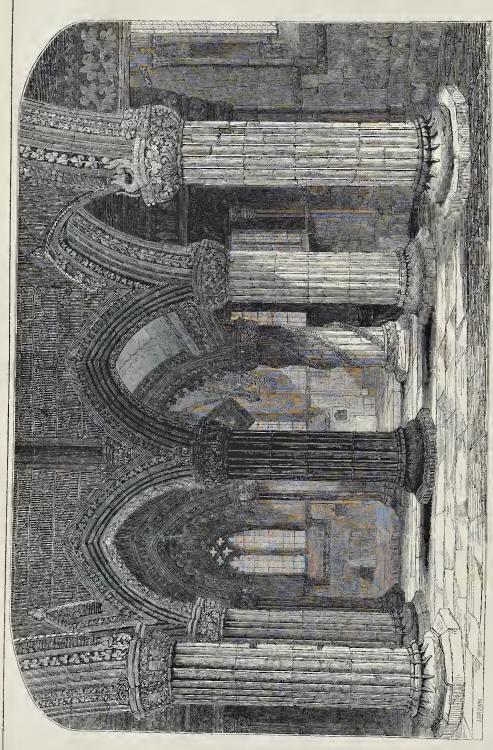

It has always been a received opinion (and very justly), that a current of pure fresh air is an important part of the process of drying, but which would appear from the remarks of Mr. Jeakes in your last number to he unnecessary. I have recently erected two very powerful drying closets at the Surrey County Lunatic Asylum, one 20 feet long, 15 feet wide, and 10 feet high; the other 20 feet long, 10 feet wide, and 10 feet high. In each of these a temperature of 230 degrees can be easily attained. Mr. Jeakes's closet, according to his statement, contains 336 cubic feet of space: the smallest of mine is equal to 2,000 cubic feet, and the largest 3,000 cubic feet of has always been a received opinion (and cubic feet, and the largest 3,000 cubic feet of space. The usual working temperature of these two large closets is 180 degrees with ventilation constantly going on. I should judge the reason Mr. Jeakes's closet does not dry satisfactorily with ventilation, is on account of deficiency of power in the heating apparatus, as with each of mine there is at least 144 inches area of ventilation always acting, notwithstanding the high temperature maintained.

WM. HEALY.

ROSLIN CHAPEL, SCOTLAND.

HINTS TO THE WORKING CLASSES.

We have received a number of letters from working men, relative to a "note" which ap-peared a fortnight ago in our pages. They deny that a mechanic with a family can save money out of 30s. a-week, and seemed to conclude that the object of the note in question was to cut down wages. This, however, was not the case. The intention of the writer,—a not the case. The interior of mechanic like themselves,—was to induce men of his class to spend less than they get. We will let him further speak for himself. Personally, let him further speak for himself. Personally, we will only say, that, so far from making any endeavour to lower wages, or countenancing any endeavour to do so, we would most gladly assist in getting for the workmen better times, assist in getting for the workmen better times, consistently with justice to others. Whatever the wages may be, however, we must always urge our readers to spend something less than their amount, if possible. "Another Working Man," or "A Young Joiner," may live very economically, and yet find it impossible to save anything out of 30s. a-week; still, if he look round, he will find thousands who are compelled to exist with a family on 20s. a-week. It is not that we would see our artizans in such It is not that we would see our artizans in such a strait,—far from it—but, being there, we would have them guard against a worse.

The poverty, wretchedness, and want of employment prevailing so largely at the present time, demand the attention of all parties, but more especially of the working man himself.

If working men were placed in their proper

position, they ought to be enabled, during the thirty or forty years' toil they have to pass through, to secure to themselves something

like an independence for old age.

It is to the interest of the public at large that every man should have a fair day's wages for a fair day's work; for if the honest and industrious are not sufficiently remunerated to support themselves, they must be supported as panpers, vagrants, or convicts; and when the latter are better supported than the former, it is not surprising that the numbers of the latter

should be considerably augmented.

But the difficulty arises in giving any definite sum that may be considered as fair hetween the employer and the employed. That man who receives 15s. perweek complains, and justly too, that it is not enough; the man who justify too, that it is not enough; the man who receives two or three pounds per week finds it too little; but let a man who has been accustomed to receive only 15s. per week be raised to 30s. per week, he deems himself raised to affluence and plenty; reduce the man who has been accustomed to receive 3l. per week to the same standard, he deems himself reduced to starvation: such are the different views of different individuals. views of different individuals.

But these remarks are not intended to show what is too much or what is too little, or what is enough; but rather to improve that which we receive, which is the surest way to get

We take the average wages of mechanics to be about 1l. 10s. per week; but the fluctuation of trade renders their employment uncertain. No work, no money; consequently, with many, little or no bread. Now supposing a man to calculate upon working ten months during the year, and every month he lays by 11,—he saves 101. for the two months he expects to be unemployed, making an average income of 1l. 5s. per week. But many may object to this rule of saving the sum proposed: I see a greater objection in endeavouring to live without any income when unemployed.

out any income when unemployed.

There is another stage of life which should excite our attention, viz., old age. Old age is not so tardy in his approaches as many of us imagine. Our abilities for labour soon become enfeebled. The services of the young and active are preferred to ours, and long before we are prepared or willing we are obliged to give place to them. Now that man's case is truly pitiable who has toiled for thirty or forty years and always lived up to his income, and when he most stands in need of the comforts of life, has little or nothing for his support: it is a hard case to supplicate the tender mercy of others, and to receive for his miserable pittance only about the sixth or seventh part of his former money, and that to be doled out with a grudging band and a reproachful look. reproachful look.

Forseeing such evils as these, which every what was used at Enys and Penrose I think was artificial.

working-man without a capital has reason to expect, can it be unwise to make a provision for this season of life? If we take another 5s. per week it reduces the mechanic's cal-5s. per week it reduces the mechanic's calculated income to 1l. per week; the money so
taken makes 10l. per year for old age. Now
let us look at the benefits resulting from such
conduct. The man who saves 10l. per year
out of his wages has very soon a little capital
at command, with this advantage, his pound
per week is worth or equal to 1l. 5s. of that individual who runs in debt. He can save all
this in his surphases by his former savings. dividual who runs in debt. He can save all this in his purchases by his former savings. By adopting this plan, in the course of thirty years he may calculate on saving sufficient to obtain comforts for his old age. Let young men take the hint; they have a fair starting Further, if this plan were generally adopted it

Further, if this plan were generary accounts would cause a great increase of trade, which is just what we want. We cannot suppose working men in the possession of a small capital woul consent to live in hovels stinking with filth and vermin, and paying after the rate of ten or twelve pounds per year for the same, when they themselves could build respectable cottages, the rent of which would not cost them half that sum. Old ruinous houses would then be forsaken, new ones built, and inhabited by the respectable working classes; we might then calculate on having full employment, which would restore us our other 5s, per week. We hear that poverty and crime are increasing; if so, labour will decrease accordingly. Poverty and crime are like the overflowings of water; as the torrent increases. increases, the embankment yields to its fury; so by the increase of poverty and crime, a nation is involved in ruin.

nation is involved in ruin.

Further, if this plan were adopted generally, it would be the surest way to keep up good wages; working men would be in a position to resist any encroachment on their rights, but in a state of poverty, they are compelled by circumstances to accept any and every unreasonable offer that is made to them for their labour.

I might continue to enumerate advantages. I might continue to enumerate advantages; rength continue to enumerate advantages; everything reasonably desirable might be gained,—nothing lost but poverty and disease. It is the shortest way, the smoothest passage, to the gold regions of California.

An Old Mason.

PISE AND COB WALLS,

THE substance of cob is loam or clay mixed with straw; it is put on in a moist state by means of shovels, so that a course can hardly he raised higher than 1 foot or 1½ foot at a time, without risk of bulging, and then must be left some time to dry and become consolidated, before a second course can be imposed upon it; and when the whole wall is huilt up it must be pared down to make the surfaces true and even, whereas the Pisé gravel is rammed in frames, is perfectly dry, and comes forth from the frame a hard, and solid, and dry mass, and the wall may be carried to its full without any interruption or delay, except what arises from moving the frames: the surfaces are quite even and perpendicular; and nothing remains to be done but to fill up the holes where the bolts passed, which is done by ramming in fine Pisé gravel on both sides at the same time, * with cylindrical pieces of wood of the size of the bolts.

The cob walls being put up wet, no bond timber can be inserted for door-posts, winder face of the bolts.

dow-frames, or floor-joists; but in the Pisé walls these may be put in, as the work rises, wherever they are wanted. One could pull down a cob wall with the hand; but it requires iron to pick down the Pisé gravel, unless it be previously wetted: vermin can make their way through cob, but no animal can penetrate the Pisé; the one kind of work is penetrate the Pisé; the one kind of work is tedious, from the necessity of allowing the different courses time to dry, and is often unsatisfactory from the fissures which occur from the inequality of the substance that is used, according as it is worked up more or less stiff; the other suffers no interruption; and if there be any fear of fissure, it can easily be guarded against by laying strips of deal 3 inches wide, and ½ or ¾ inch thick; the one is feeble and perishable in comparison, the

other is said by Pliny to be eternal. The only thing I can compare with Pisé is the old grouting which was formed by filling frames, such as the Pisé frames, with flints or other stones, and then pouring in upon them hot mortar, so liquid that it will make its way into the intentional former and former than the property of the prope

tar, so liquid that it will make its way into the interstices, and form a compact mass.

Directions for making cob walls 2 feet wide.

—The quantity to build a perch of work, that is to say, 18 feet long and 1 foot high, and 2 feet wide,—two loads of clay, and one load of coarse shilf* mixed and wetted, and trodden together to lump, just the same as clay for brick before it is put in the mould. Then take three bundles of barley straw, and turn in on straw part of the above mixture, well treading in the three bundles of straw into the above mixture of three loads of clay and shilf: then build it on the stone wall, about then build it on the stone wall, about 6 inches at a time, treading every layer down well and solid. The stone wall under the cobought to be 2 feet in height from the foundation, to keep the damp off from the cob. The cob wall should project over the stone wall about 1½ inch. If the weather be dry, you may build about 5 feet in height at a time; then it may rest about three weeks, till the wall is got dry to build on again, then bind on 5 feet more on the top, if required.

EFFECT OF OXYGEN ON COLOUR OF GLASS.

AT the Society of Arts, on the 18th, Mr. F. Pellatt read a paper on the sup-posed influence of oxygen on the colour or tint of flint glass.

The author, in commencing his paper, stated that the remarks contained in the same are entirely the result of experience in the manufacture of glass in large quantities, it being only under such circumstances that many of the changes there noticed can be observed, because they are so minute, that in dealing with small quantities, their occurrence would not be perceptible. In speaking of white glass the term is comparative, as no glass is perfectly colourless, and to the practised eye of the glass maker there exist no two pieces of the same tint or shade; the word colour, therefore, is used to denote that particular tint or shade, whatever it be, which all white transparent glass possesses. With these remarks the author proceeded to consider the action of overcer as effective the solver. marks the author proceeded to consider the action of oxygen as affecting the colour of flint glass in two distinct particulars. First, its action upon the glass mixture during its melting or founding whilst in a state of fusion; and secondly, during its annealing or gradual cooling. cooling.

cooling.

The constituents of flint glass are silica, lead, carbonate of potash, and nitrate of potash. The silica is found sufficiently pure as fine sand, which abounds in some districts,—that from Allum Bay, Isle of Wight, is much esteemed. The protoxide of lead—litharge, or the deutoxide—red lead, is the state in which the lead is used, and the potash is the ordinary curl and nitrate of potash of commerce. These, when mixed in certain proportions, and These, when mixed in certain proportions, and subjected to a strong heat for sixty or seventy hours, produce flint glass. The purer the metal the more transparent the glass, but although all the materials be chemically pure a colourless glass is not the product; owing to some chemical change which takes place during the melting, the glass is tinted with green. This is generally stated to arise from the presence of oxide of iron, but the author helieves that in most instances it is owing to the want of a necessary proportion of oxygen in the mixture, which the following experience will go far to prove. The tint of green is always minus when the lead in the glass mixture is in the highest state of oxygenation, that is, when red lead is used, and lowest when litharge is employed in the mixture. When an excess of carbonate of potash is used the green tint is deep, but it may be entirely green tint is deep, but it may be entirely overcome by the use of the nitrate of potash, and superseded by a purple tint when no metal but lead is present.

Oxygen being the agent by which these changes in the colour of the glass are effected, the glass-maker, in order to overcome the

green tint always present when oxygen is

^{* [}Shilf means broken slate, in small pieces, such as is used for mending roads in parts of Cornwall.—Ep. Ecclesiologist.]

minus, uses the oxide of manganese, which has the property of giving off its oxygen very slowly. An excess of manganese gives to glass a purple tint, and where attogether absent the

glass is always green.

Having thus called attention to the peculiar composition and mode of manufacturing flint-glass, he proceeded to describe the changes glass, he proceeded to describe the changes which take place in the colour or tint of glass, and the methods employed by the glass-manufacturer to convert the mass from a green, purple, amber, or other tint, to a pure or colourless metal, and brought forward examples tending to prove that the changes in the colour of the glass are due to the presence or absence of a given proportion of overen. or absence of a given proportion of oxygen. Manganese, as a metal, gives no colour to glass, although by the oxygen it yields to the lead in the mixture, a purple colour is produced, hecause by reducing the quantity of oxygen, either by polling or subjecting the glass to a long-continued heat, or by submitting it to the action of carbon, the purple colour is removed, though the manganese still remains. Iron and copper also assume dif-ferent colours when combined with different proportions of oxygen. If this he true, may not all colours of the oxygen of other metals, such as iron, copper, and lead, be due to the combination of certain proportions of oxygen certain proportions of oxygen with the metal or metals present, so as to induce a particular molecular arrangement, from which the glass has the power of absorbing a particular colour?

THE MANCHESTER SCHOOL OF DESIGN.

AT the annual meeting of the Manchester School of Design, held on Tuesday in the week before last, the Bishop of Manchester, who presided, said the advantages of schools of design, in whatever point we looked upon them, sign, in whatever point we looked upon them, stood out pre-eminently conspicuous. Whether we regarded them as a means of improving the manufactures, and consequently the trade of this country,—there they stood pre-eminent; whether we looked upon them as means of mixing the longer leaves in the scales. of raising the lower classes in the scale of civilisation,—there again they were most effective; whether we regarded them as a means of opening a source of happiness to every class of our fellow-creatures, who had hitherto had the study of art placed out of their receipt there can be there expends there expends there expends there are the contents of the contents reach,—there again they were most ble. But he could take even higher their valuable. But he could take even many valuable. But he could take even many valuable in school of drawing and design most valuable in providing a means of innocent, useful, and valuable instruction to the lower classes, at a time when temptations of a diametrically opposite character were calling them from their homes to vice and indulgence; he had found that, independently of enabling them to carry home a new feeling and sensation to their dwellings, it had rendered them more keenly alive to the heauties of nature, and more capable of understanding and admiring the wisdom and henevolence of their God.

The report, which was read by Mr. Gregan, expressed regret that the great body of the manufacturers engaged in that particular branch of trade to which the school is so debranch of trade to which the school is so de-cided an auxiliary, still continued to manifest so small an interest in its proceedings, and to contribute in so slight a degree to its support. "We are all sensible enough of the impor-tance of good design in our industrial productance of good design in our industrial produc-tions, and it is surprising that so little pains should be taken by those most nearly con-cerned to secure it. In many cases, indeed, corporations and town councils have publicly supported these schools, while, in the manu-facturing metropolis of England, no public aid whatever is granted to an institution, which, if endowed with more actualed women of neef-1 endowed with more extended means of usefulness, is calculated so much to enhance the commercial value of our manufactures."

From the treasurer's statement it appeared From the treasurer's statement it appeared that the receipts for the year ending December 31, 1848, were:—Government grant, 390l.; annual subscriptions. 302l. 8s.; students' fees, 142l. 10s.; fees from private classes, 87l. 3s.; halance due to treasurer, 212l. 1s. 11d.; total, 1,134l. 5s. 1d. The expenditure amounted ten 1,134l. 5s. 1d., of which the principal items were:—salaries of masters, 465l. 17s. 9d.; secretary's salary, 50l.; rent of rooms, 220l.;

printing and advertising, 41l.; gas rent, 50l.; books and works of art, 31l. los.

Mr. F. C. Calvert contended that the School of Design had not hitherto flourished, simply of Design had not inthered nourished, simply because of the system of working adopted, which he helieved neither met the hopes of the pupils nor the wishes of the supporters. He suggested that, after three years' study, five of the most proficient pupils in the institution should be selected, to whom assistance should be given if they were not able to superior. tution should be selected, to whom assistance should be given if they were not able to support themselves, while they were advancing themselves in their studies; afterwards the most proficient of them should be sent upon the continent, under the protection of the school, to study in France, at Rome, or any other great centre of art, where those arts might he cultivated which would be most beneficial to that district.

ARCHED BRICK FLOORS, BIRKENHEAD.

In a report, in your valuable journal, of the paper read by Mr. Rawlinson, that gentleman, quoting from a manuscript by Mr. Chadwick on the improvement of building materials, mentions that the floors of the "improved were constructed of brick, in flat arches about 6 feet span. The spaces between the upper part of the arches and the spandrels were filled in by mortar, on which flat tiles were imbedded."

As the architect of these dwellings, which were designed by me and commenced in 1845, you will perhaps allow me to make a slight correction in this statement. The arches, some correction in tins statement. In a arches, some of which were 7 feet in span, were turned in what is termed half brick, except at the springing and the skew backs, I caused also a certain number of three-quarter and other parts of bricks to he inserted, so as to form a toothing or vertical bond with the concrete with which the spanderls were filled in, and not with mortain. The six or seven courses. with mortar. The six or seven crown courses were wedged in with slate while the mortar was wet, and the consequence is, that in no one instance has the least subsidence taken place at the crown, although subjected to very severe trials,—the stairs having heen used by the labourers for carrying up all the materials, and the men often jumping from the walls upon the arches. I think, however, 7 feet is the limit of a half-hrick arch turned in mortar with the ordinary rough hrick. The arches rise about one inch to every foot in span. The tiles were laid in mortar on the concrete, which made the thickness of the floor at the crown of the arch about 54 inches. There were altogether about 1,200 arches of this kind turned, and without the slightest accident.

CHAS. EVANS LANG.

USE OF HOLLOW BRICKS.

As much attention has been drawn to the subject of hollow bricks or pots, by your notice of the erection of the great arched ceiling at Liverpool, I beg to observe they were, I believe, first introduced in England about 55 or 60 years ago, by Henry Holland, the eminent architect of his day, at Drury-lane theatre, Carlton House, and other of his buildings.

I am not aware of any reason for their not being generally adopted, but that they were probably more expensive, and also were some-thing out of the common way, and required more attention and care in execution, and therefore gave trouble to the operative builder, who would in consequence perhaps discountenance and shirk them.

The building world was sleepy in those days compared with the present, and were content to follow in the footsteps of their forefathers without much thought. But "we have changed all that," and as in the political changed all that," and as in the political world so in buildings, there is a rage for new things, and the difficulty is in steering clear of extremes. "There is a moving power and a steadying power—there is the sail and ballast; without the former there would be no progress, without the latter little safety." This has been said in a well-known Review of Whig and Tory in pulities, and way he applied to all and Tory in politics, and may he applied to all matters where much change is contemplated.

With reference to large arches, it may not irrelevant to observe that the Adelaide

Gallery, in the Strand, is arched with three or four courses of plain tiles in cement, forming at once roof and ceiling. It was thought a bold novelty at the time, and particularly as it is perforated with circular openings for skylights.

This was done, I believe, hy a huilder, Mr. Herbert; the principal thing, however, that the world looks at is

"Non quo sed quomodo."

COMMONS' COMMITTEE ON SCHOOLS OF DESIGN.

On Friday, the 27th ult., the examination of Mr. Stafford Northcote was resumed. It was somewhat vague. He knew nothing of the proportionate value or importance of the various classes of manufactures in this country. He approved of public exhibitions of designs, but there had been none for more than two years: they had been overlooked. Mr. Poynter followed. He thought the provincial schools "mere drawing schools," as late as 1847; but that this defect was remedied by Mr. Wornum's lectures, and he could suggest no further improvements.

On the 30th, Mr. Dyce was examined. Showed, that at one time design was really cultivated in the school, and then abandoned. He thought the present system impracticable, and had resigned in consequence. The present committee of management ought sent commutee of management ought to he changed. The responsibility was divided and uncertain. Mr. J. C. Horsley, formerly a master, followed. His evidence proved that the present system was wrong and impracticable, and that he had resigned because he found it so. There had been constant changes and There had been constant changes and no fruits

no fruits.

May 2nd. Mr. Wakefield, one of the largest garment fabric printers at Glasgow, proved that the school had not influenced the designs in his trade. He was friendly to the schools; hut thought them failures in that respect. The masters ought to know the practical working of manufactures. The evidence of Mr. Nickisson, an agent for manufactures was to the son, an agent for manufacturers, was to the same effect: he had heen a student in the school for five years, and did not think "design " was properly taught.

RAILWAY JOTTINGS.

That tricks can he played with railway tickets appears but too plainly, from the detection of a clever system of fraud practised on the Yorkshire and other lines, by a traveller to a London chemical firm. He appears to have been allowed to retain his legitimate tickets by wholesale, eighteen having been found in his possession, with chemical erasures ready for future occasions, hesides an altered one, by means of which he was detected. Types were also found in his pocket. With these he appears to have managed to make all the requisite alterations which enabled him to 'come over' the officials again and again in his travelling trips from one town to apply. from one town to another. The only question in his prosecution was whether to charge him with fraud or forgery, for the latter of which it was ultimately decided that he shall stand his trial at the next York Assizes.—Another system of fraud with tickets by conspiring officials themselves was lately discovered on one of the Northern lines. By connivance one of the Northern lines. By confinance with the issuer of the tickets, a guard returned so many to his confederate at every trip for reissue, the parties sharing the proceeds between them to a heavy amount.——The London and North-Western Company constitution. ceiving themselves entitled to open carriers' parcels of parcels, and charge separately for parcels of parcels, and charge separately reach separate article in the aggregate package, did so in the case of a Mr. Crouch, who brought an action against them lately at the Warwick Assizes. The Judge (Chief Justice Wilde) said the defend-ants were hound to charge an equal price to all alike, and he could not see what other conall filter and the count of see what other con-clusion could be come to but that in the pre-sent case they had made an excessive charge. Verdict for the plaintiff; damages, 491. 4s. 2d. A special jury case, in the Court of Exchequer, stands adjourned to Trinity term, in which Mr. Crouch, the plaintiff in this action, sues the company for special damages.——In a case of compensation at Bradford, to Messrs, Ripley,

dyers, by the Lancashire and Yorkshire Company, the evidence for the claimants went to prove that they would suffer to the extent of from 1,000l. to 1,500l. by the loss of light and roin 1,0001, to 1,3001. By the loss of light and ventilation; that the value of 4,190 yards of land required by the Railway Company would be 8381, being 4s. per yard; and that the loss by severance, upon the rest, 11,673 yards, would be 8751,9s.; being 1s. 6d. per yard. An arrangement was come to with respect to the loss of light and ventilation, and the jury, in reference to the land required, gave a verin reference to the land required, gave a ver-dict for the claimants—damages, for 4,190 square yards of land, 2s. 6d. per yard, or 523*l*. 15s., and for injury by seve-rance, 150*l*.— What will competition do? says a contemporary. The London and North-Western and the East Lancashire are rival lines. The North Union used to charge 6s. first class, 4s. second-class; 3s. 3d. third-class. The present fares are 1s. 9d., and 6d. class. The present fares are 1s. 9d., and 6d.
—Perhaps many are not aware that the
Great North-Western have still competitors in
the shape of canal fly boats which ply regularly
between London, Birmingham, Wolverhampton, Liverpool, Manchester, Stafford, "and all
parts of the kingdom."—It is said that the
engine manufactory of the North-Western at
Crewe, turns out a new locomotive and tender crewe, turns out a new locomotive and tender every Monday morning——The atmospheric tubes on the South Devon line are about to be sold as old iron.——A novelty in railway excursions is to come off in May, namely, a trip between Dublin, London, and back, for two guineas, vid the Chester and Holyhead and the North Wester. guineas, vid the Chester and Holyhead and the North-Western.—It is stated that one half the receipts of the Bristol and Exeter have been offered to the Great Western if they would work the traffic, but that the proposition was not entertained by the Paddington authorities.

—The directors of the Great Western, says the Times, have at length found that the abo-lition of 'return-tickets,' more especially on short distances, has tended considerably to decrease the traffic on the line, and on and after the 1st of May it is their intention to reissue return-tickets, for the day only, to be available until 12 o'clock at night. The reduction will be 25 per cent on the single ounce, that is, the cost will be a fare and a half for a return-ticket. No return-tickets will be issued for third-class trains.—The South-Western have adopted the system of second-class season tickets, and made a reduction in charge on first-class tickets, 'to encourage residents in the vicinity of their railway.
While clearing away old buildings at the
Landport joint terminus, Portsmouth, four
workmen were lately buried under the wall of a workmen were many oursed under the wall of a house, which they presisted in further undermining, although warned of the risk,—
The opening of railway communication between Edinhurgh and Galashiels has had between Edinhurgh and Galashiels has had the rather odd effect of opening up an insatiable demand at Galashiels for milk from Edinburgh: think of London supplying a country town or village with milk! Coal and other articles of general consumpt have also been greatly cheaper at Galashiels, since it has had the advantage of railway communication.

—The post-office authorities have authorised the opening of past office letter haves a warehorsed. the opening of post-office letter-boxes at every 'first class' railway station in the kingdom.

—With reference to late proceedings, there has been some talk in the Houses of Parliament about the appointment of a more effectual system of auditing railway accounts. Mr. Lahouchere stated, that if a measure did not emanate as he expected from a Committee of Lords now sitting, he should himself submit to the Commons a measure on the part of Government to that end. Some of the disclosures

PARIS EXHIBITION OF MODERN ART. TARIS EXHIBITION OF MODERN ART.—
The National Assembly has determined that the annual exhibition of the modern productions of art shall take place in the ci-devant palace of the Tuileries, now named the "Palas National." It will not open before the 15th of June. The Exposition of Industrial Art will one I live.

recently have been startling.

will open June 1.

Coal Tar.—Mr. R. A. Smith, of Man-

THE MINER'S LIFE.

WE take the following graphic sketch of the discomforts and perils which environ the discomforts and perils which environ the miner, from a recent article in the Times:—
A large and increasing part of the British population lives a hazardous, uncouth, and cheerless life in the bowels of the earth, further than Lynceus ever saw, and deeper than Cyclops ever descended. So little are we, of this upper earth, accustomed to dive below the surface, that in order to form any idea of the largel at which a colling does his deliverage were level at which a collier does his daily work, we must measure it hy something above our beads. We must suppose our wives and children on a We must suppose our wives and children on a level with the cross of St. Paul's, perhaps twice or even three times higher, and ourselves daily descending by ropes to the sewers of this city. We shudder at the thought of hardy islanders suspended over the precipice in quest of birds' eggs. The collier's descent is often deeper, and his doom, should he fall, more certain. Should he miss a step at the "bank," should the rope break in his descent, should a wheel in the engine he out of gar, or a peg out wheel in the engine he out of gcar, or a pcg out of place, or should the boy at the pit's mouth be inattentive for a moment, the next instant hasket, rope, and man lie an undistinguishable mass at the bottom of the shaft. But that is only one, and not the greatest of his dangers. The miner moves in an atmosphere into The miner moves in an atmosphere into which a million chinks and pores distil a deadly vapour. The very air he breathes is a magazine of destruction. Wherever he extends his labours he lays bare a new surface, and starts a fresh foe. In these upper regions the natural currents of the air diffuse and carry off all noxious effluvia as fast as they arise; but the natural atmosphere of these wonderful vaults is itself a poison, and the vital air we breathe must be artificially introduced, in quantities sufficient, not only for human consumption, but for the expulsion of local gases. A strong current of fresh air must be brought down a shaft, conducted through the whole mine, carefully sweeping every corner and recess, and so passed up another shaft to the surface. brought down a If this current is insufficient, or accidently interrupted, the foul vapours accumulate, and a terrupted, the foul vapours accumulate, and a naked candle, a spark, or a lighted pipe explodes the whole mine, burning, suffocating, or dashing to pieces every living being in its range. The explosion which drives out by the pit's mouth the whole mass of air within entails a reaction not less deadly. The "after-blast" finishes the work of destruction. The list of perils is not complete unless we add that everywhere are superioded ever the solitions. everywhere are suspended over the collier's head vast masses of material ready to fall and bury him at his work.

THE AMERICAN BOWLING SALOON. DECORATION.

A LARGE apartment at the back of 393, in the Strand, formerly an auction room, has been suddenly converted, at some cost and with considerable taste, into a bandsome saloon for bowling on the American system. walls are formed into panels, containing pic-tures and glasses, by pilasters, with other segmental panels above, containing children and scroll-work on a maroon ground. The ceiling is in panels and painted medallions,—bas-reliefs, wreaths of flowers, &c. fill various spaces. It is lighted by skylights, and tastefully fitted up. At the far end are casts of the Graces and the Nymphs of Canova, Diana, Ceres, &c. It is altogether a clever piece of decoration of its kind, and very creditable to Mr. C. Norwood, of Hoxton, by whom it has been

THE LOUVRE. - The wing of the Louvre called the Gallery of Apollo is undergoing extensive repair, and a great number of workmen are employed in it. The timbers of the need at employed in it. The timpers of the roof were found so much decayed that the entire reconstruction became necessary. Visi-tors to Paris before the Revolution of February may recollect the statue of the unfortunate son of Louis Philippe, the Duke of Orleans, adorning the centre of the Court of the Louvre. This has been removed, as offensive chester, has obtained a patent for some improvements in the application and preparation of coal tar, which are described to consist in the preparation and application of coal tar to coating the interior surfaces of water-pipes.

LA Smith, of Man-louve. This has been removed, as offensive to repulsion to removed, as offensive to replace the proparation and application and preparation and preparation and application of coal tar to coating the interior surfaces of water-pipes.

Books.

The Ecclesiastical and Architectural Topography of England. Parts I, and II.— J. H. Parker, Oxford and London.

In Mr. Parker's late excellent edition of Rickman's work, the brief notices of churches which were given by that author were omitted, with the intention of publishing them sepa-rately, with such additions as should render the list a complete dictionary of the ecclesias-tical edifices of England. This intention is now being carried out under the title at the head of this notice. Each part contains one head of this notice. Each part contains one county (No. I., Bedfordshire; II., Berkshire), and it is intended to publish the succeeding parts at the rate of four in the year. Buckingbamsbire will form No. III.

Outlines of General Knowledge, By H. INCE, M.A. Ince's Outlines of English History. Ince's Outlines of French History. Gilbert. Paternoster-row.

Very useful little books, well deserving the circulation they have obtained.

Miscellanea.

THE METROPOLITAN SEWAGE MANURE COMPANY held their usual half-yearly meeting on Tuesday last, when the reports of the directors and engineer were read and adopted, after a somewhat lengthened discussion. The report of the directors congratulated the shareholders on the amicable relations established between the company and the Metropolitan Company of the permission of Sewers, and the permission Commission of Sewers, and the permission Commission of Sewers, and the permission given them to communicate, by means of a pipe, with the Ranelagh sewer, and with the Eel Brook and Stamford Villa sewers. By these arrangements the company would be enabled forthwith to carry out its operations within the Fulham district, without incurring the large outlay that would have been required that they receased to the construction of the had they proceeded to the construction of the tunnel sewer. Contracts had been entered into with market gardeners for the supply of about 100 acres, for 70 of which service pipes were being laid. Recriminations and expla-nations were entered into as to the treatment of Mr. Moir, the late secretary of the Com-pany, who had been defied, it was alleged, to 'do his worst,' and who accordingly did his worst, by taking the company to law, at a cost to them of 600l. to his legal supporters, besides several hundreds to their own solicitor, and 400l. a-year as salary to himself. He had then, as a shareholder, thrown the company, for contravening their Act of Parliament, into Chancery. During the discussion it was elicited that more than half of the nominal capital of 175,000. had been taken up. On the whole, although the 'bandying of reproaches,' as one shareholder termed it, was still considerable on various points, there did not appear to be so strong an animus against the proceedings of the directors as at the last general meeting.

THE DIORAMA.—The new view at the Diorama, "the Valley of Rosenlaui" in the southern part of the canton Berne), painted by M. Diosse, is a pleasing picture of mountain scenery, diversified by the effects of a storm in the Alps. When the clouds are clearing offer and the arturning sun, gilds the highest perfectly and the arturning sun, gilds the highest perfectly the second of the storm in the Alps. the Alps. When the clouds are clearing off and the returning sun gilds the highest peaks of the mountains, the view is at its best and exceedingly effective. The second picture, "the Church of Santa Croce," at Florence, was exhibited some years ago, but is none the less deserving of a visit. The changes in light and shade are quite marvellous. From the broad light of day, shewing every tile with which the immense area is paved, and every stone of the Corinthian columns which form the numerous changels down the aisle, to the the numerous chapels down the aisle, to the deep darkness of midnight, when a few candles bring into view merely one altar, the figure of the Virgin, and a few projecting cornices, the various gradations are exhibited with such surprising effect that it is difficult to believe we are gazing on a picture painted on a per-fectly flat surface of canvas.

ROYAL ACADEMY.—The following gentlemen have been recently admitted as architectural students, namely, Messrs. F. C. W. Anderson, James Brooks, Richard Norman Shaw, Horatio Nelson Goulty, Harry Robert Newton, John Nicholls, Cyril Jackson Stafford, and Sidney Godwin. and Sidney Godwin.

PROJECTED WORKS .- Advertisements have been issued for tenders,-by dates not specified, for the erection of parsonage-houses at Maplebeck, Rihoulton, and Nottingham, and for a church and parsonage-house at Has land, Derby; by 16th inst., for rebuilding the upper part of the spire of St. James's Church, Clerkenwell; by 31st, for the erection of judges' lodgings at Aylesbury; hy 16th, for repaying and repewing Cowbridge Church, Clamorganshire; by 11th, for the erection of a block of dwellings near Spicer-street, Spitalfields; by 12th, for the various fittings required for lighting with gas the Borough quired for lighting with gas the Borough Asylum for insane paupers, at Birmingham; by 8th, for deepening the bed of the river Medway; by 23rd, for the erection of an asylum for pauper lunatics in the county of Warwick; by 11th, for the erection of an infirmary at the Uxbridge Union, Hillingdon, Middlesse; by 21st, for the erection of five small houses near Blackheath; by 14th, for the erection of the Normal Col-lege for Wales, at Swansae (extension of lege for Wales, at Swansea (extension of time); by 16th, for the construction of brick arches and piers, &c., in widening Manchester station of North-Western Railway; by same date for the construction of an iron viaduct for same; by 12th, for the erection and com-pletion of portion of an extensive range of farm steading, near Warrington; by 8th, for the erection of a farm-house at Broom, Warwickshire; by 10th, for the labour in erecting farm buildings at Preston-upon-Wye; by sarm buildings at Preston-upon-vye; by 30th, for the execution of cast and malleable iron work for passenger shed and roof of central railway station at Newcastle-on-Tyne, and for supplying the glass for roof and other parts of same; by 7th. for the erection of a third portion of market avenue at Ashton-under-Lyne; by 26th, for the erection of sundry buildings and works at the new barracks, Sheffield; and by 9th, for a supply of pigiron, pig-lead, ironmongery, &c., for the East-India Company.

India Company.

Competition.—The time for receiving plans for the restoration of Bridgewater Church is extended to 14th inst.

Land Surreyors. Association.—The general association, some time since noticed in THE BUILDER, has given rise to a more select institution, under the title of "The Surveyors' Association," with rules of a more or less stringent order for the admission of members, the regulation of the affairs of the association, and the protection and promotion of the in-terests of the legitimate members of the profession. By section III. of the published code of regulations, it has been resolved that the association shall consist of three classes-viz., members, graduates, and honorary members. Every candidate for admission as a member must be twenty-four years of age, and have been regularly educated as a land surveyor, according to the usual mode of pupilage, or have acquired a knowledge of the profession in the office of a land surveyor for three years, and had a subsequent employment as and had a subsequent employment as such for three years further, one of them at least on his own account. — Craduates must be eighteen years of age, and have been two years in the office of a land surveyor, or under a course of instruction as land surveyor with the subsequent of the surveyors. veyor, and still in the profession. By section V. it is appointed that each member shall by the saponted that each member shall be an annual subscription of one guinea, and each new member an entrance fee of one guinea. Each graduate shall be annually half-a-guinea, and each new graduate an entrance fee of half-a-guinea. Members may compared for earter acts to the process of the same and th compound for seven years by payment of five guineas, or for life, twenty guineas. The association already numbers fifty members, admitted in accordance with the regulations. Mr. Thos. Thurston, Ashford, is the chairman for the current year, and Mr. William Murray, 21. University extent is the hone scoretory. 21, University-street, is the hon. secretary.
YORKSHIRE UNION OF MECHANICS' IN-

STITUTES. The Earl of Carlisle has consented to preside at the evening meeting of the York-shire Union of Mechanics' Institutes, which will be held at Hull, on Wednesday, the 30th of May. There are now seventy-nine insti-tutions in the union, and nine more seeking to be admitted at the annual meeting-making a total of eighty-eight institutions, containing meeting there will be an excursion to Flam-borough Head,

THE STEAM DOCKS AT KEYHAM, DEVON-PORT .- It appears from a late debate on ways and means, that Government, about six since, proposed an expenditure of 400,000l. for steam-dock accommodation, whereby, it was alleged, no less than 25 per cent. would be saved on repairing contracts. First, therefore, the comparatively modest instalment of 30,000l. was called for and voted; but the appetite for more appears to have grown, as did the esti-mate, with what it fed on, even down to the present moment: the following summary will shew the past and present state of these works of economy and saving :--

Total estimate for Instalment granted Leaving New Steam Basin. for the year. still due. 1844-45. £400,000 . £33,000 . £37,000 . £37,000 . £35,000 . £35,000 . £35,000 . £35,000 . £35,000 . £35,000 . £35,000 . £35,000 . £35,000 . £35,000 . £35,000 . £35,000 . £35,000 . 545,000 1845-46 . . 675,000 1846-47 . . 675,000 100,000 .. 545,000 133,000 .. 412,000 1847-48 . 675,000 .. 1848-49 . 1,225,000 .. 1849-50 . 1,225,000 .. 120,000 ... 150,000 ... 120,000 ... 292,000 572,000 And, moreover, it is now said that the works were so hastily and injudiciously begun, that their chief utility will be entirely neutralized by their crite utility will be entirely neutralized by their very situation, on a lee shore, with a depth of water too small to admit large steamers at ordinary full tide. Of course, with 572,000l. still to follow the 653,000l. already paid out, the works are as far from completion as they appeared to be when founded.

IMPROVEMENTS IN CHISELS AND COUGES Mr. H. Wilson, a foreman at Sheffield, has obtained a patent, in the specification of which he states, that in the manufacture of chisels and gouges it has been the practice to make some with sockets and others with tangs, for the purpose of affixing the handles to the same, the tangs and sockets in each case being used alone. The object of this invention is to same, the tangs and sockees in each case being used alone. The object of this invention is to combine the use of a socket and a tang with the same chisel or gouge, whereby each of such tools may be applied to the ordinary uses of a chisel and gouge, and to morticing, so that the workman will not require to have a treat for each suppose. tool for each purpose. The old socket-chisels and gouges have wooden handles inserted into their sockets; these handles, when the tool is being used, receive the blows or strokes of a mallet, and often those of a hammer, and are much subjected to lateral strain, from which circumstances the handles are liable to break off at the upper edge of the sockets, and the patentee considers that the addition of tangs to such tools will give greater stability to the handles. The ordinary tanged chiesls and gouges also have wooden handles, which are drilled, and the tangs are driven into them, and in some cases ferrules are applied to the lower parts of the handles. The handles of these tools are liable to be split, not only by the side strain to which they are subject when in use, but also by reason of the tools being often driven by a present of the tools being often driven by a present of the tools being often driven by a mallet or hammer, and it is to obviate these defects that the patentee proposes to combine sockets with the tangs.
Steam 'Cutters' for Frozen Seas.

STEAM CUTTERS FOR TROZEN SEAS.—
Commander Joseph West, an officer of expeprience and skill, says the *United Service*Gazette, has proposed the construction of ice
hammers and saws, to be worked in steamers
by the engine shafts. The main object appears
to be the naviewton of the article respectively. to be the navigation of the arctic region in search of Sir John Franklin's expedition; but the like invention seems to be feasibly appli-cable to the rapid opening of a way for shipping and commerce in northern ports when frozen up, and at a stand in winter. Ice 4 to 5 feet thick, it is calculated, may thus be broken up by hammers of 15 to 20 cwt., working alternately on each side before the stem of the vessel, which may be worked either by screw or raddle. screw or paddle.

Series or paque.

BATTLE MAPS. — With singular rapidity
Mr. Wyld has published plans of the last
battles in India, which will be examined with
interest by those interested in military tactics, or who have friends fighting there.

BRIDGES IN CHINA, &c .- The bridges are variously constructed: some consist of a single arch, others of three or more arches, and some variously variously variously variously variously variously a series of stone piers, with large stone slabs laid across them, as described by us in our account of the famous bridge at Foochow-foo. Some bridges are built of red granite, and others of a greyish marble, cut into blocks 5 feet or more in length, which are laid alternately end-ways and cross-ways. The and polygons in shape, and the bridges have steps at either end. Some are very handsome steps at either end. Some are very handsom structures, particularly one a few niles to the west of Pekin, which is composed of white marble, beautifully cut and ingeniously devised. The balustrades are composed of 76 small village on either cite interview draft small pillars, on either side intermixed with marble tablatures, carved with birds and animals, foliage, and flowers.—China and the

RIPON DIOCESAN CHURCH BUILDING Society. — The half-yearly meeting of the Central Committee was held the week before last, at Ripon, when grants were made towards last, at Ripon, when grants were made towards the following objects:—400l. for the erection of a new church at Gomersal, which will contain 466 free sittings; 200l. for the endowment of St. John's Church, Bradford, and a like sum for the endowment of St. Mary's Church, in Security was Illifer 2002. in Sowerby, near Halifax; 2001. each for the erection or purchase of parsonage houses for Holy Trinity, Ripon, St. Jude's, Bradford, and Ingrow-cum-Hainworth, near Keighley. INSTITUTE OF BRITISH ARCHITECTS.

At a meeting on the 30th April, Messrs. R. C. Baxter and R. J. Withers were elected associates. The first part of the following paper was read by Mr. J. W. Papworth:—"On was read by Mr. J. W. Papworth:—"On some features of the connection between the Architecture and Chronology of Egypt; with an account of the Work lately presented to this Institute by Mr. J. B. Le Sueur, Architect, of Paris, being his Essay 'On the Chronology of Egypt illustrated by its Monuments,' to which the medal of the Institute of France was awarded in 1847."

EXHIBITION OF MACHINERY AT GIRROW.

EXHIBITION OF MACHINERY AT GHENT. -A special exhibition of machinery, frames, looms, and implements of trade (of Belgian or foreign make) employed in the manufacture of yarn and tissues of all sorts, is to be opened at Chent (on the occasion of the exhibition of the produce of the industry of Flanders) in the month of July. Special rewards, consisting of commemorative medals, of gold, silver, and bronze, will be awarded to such exbibitors as shall appear to merit such a distinction.

BEDFORDSHIRE ARCHITECTURAL SOCIETY.

A joint meeting of the Northamptonshire Architectural Society and the Bedfordshire Architectural Society is appointed to take place at Higham Ferrers, on Tuesday, the 8th. The at Higham Ferrers, on Tuesday, the 8th. The Marquis of Northampton will preside, and an excursion is proposed to some neighbouring churches on the following day.

RATING RAILWAYS.—We understand that

RATING RAILWAYS.—We understand that the South-Western Railway have successfully appealed against the rating of their line by the parish of Romsey. The parish wanted 2001. per mile, the court gave 251.

THE IRON TRADE.—At present the prices of wanted and nignition are wretty well sustained.

wrought and pig-iron are pretty well sustained, though we fear very little of the former has realised the nominal price of 7l. 10s. per ton.

NOTICE.

ON Tuesday was published, Part I., price 2s. 6d., of "BULDINGS AND MONUMENTS, MODERN AND MEDIEVALL" being Illustrations of recently-erected Edifices, and of some of the Architectural Works of the Middle Ages, with Descriptive Particulars. Editled by George Godwin, F.R.S., Petlow of the Royal Institute of Architects, &c. The first part of this work (to be continued every alternate month) contained Engravings on Wood, folio size, of—

folio size, of-

Her Majesty's Marine Residence, Osborne; with

No. CCCXXVII.

SATURDAY, MAY 12, 1849.

HE aggregate number of works of art exhibited in the six gallerics open in London at this time last year was 4,023, and the total number produced,

calculating that at least 1,500 were returned to the artists, 5,523, without counting those exhibited only in the provinces. In the present year the number exhibited is rather less, namely, 3,796, and is thus made up, namely—at the British Institution, 518; the Society of British Artists, 639; the Free Exhibition, 531; the Water-Colour Society, 365; the New Water-Colour Society, 402; and at the Royal Academy, 1,341. The number produced, however, was doubtless as great, if not greater: from the Academy alone, we understand, 1,300 pictures were sent back,—many of them, as we can assert of our own knowledge, very meritorious productions.

In consequence of the size of some of the works which are hung, and the arrangement generally, there are 110 works fewer than were exhibited there in 1847, and 133 less than last year. More space is needed. The rejection of an artist's picture involves anguish and trouble of which the public have scarcely any idea. Many of our readers have already seen the particulars of a brutal attack made on Mr. J. P. Knight, the worthy secretary of the Academy, by an artist who had received an official letter from the secretary, stating that his picture could not be hung. The assault was infamous and indefensible, and we would not say a word which would seem to make it appear less so. It may serve as an illustration, however, of the effect of rejection on exciteable minds, even where serious pecuniary interest, so far as we know, was not involved.

The exhibition, as a whole, is fully of the average degree of merit, and creditable to the country. Attempts at the highest style of art are rare, but this is less the fault of our artists than of the state of education in art generally. The elder artists, for the most part, maintain their ground, and the younger and rising painters give evidence of a decided advance.

In the architectural room, to which we must first direct our attention (though at present we can go no further than the door, so many matters have pressed upon us), there are 105 works, which specially belong to it,* mixed with very nearly the same number of oil paintings. They are better disposed, however, than they were last year, the architectural drawings occupying the lower part of all four sides of the room, and the paintings the upper part.

It is small space to afford to the hig-sisterart, and admits of but trifling illustration of what is doing in architecture among us. As one of our correspondents observed in a recent number, few thanks seem to be owing to the present architect-academicians for the provision for and honour there of the art they profess.

There are no models, and it is desirable that the refusal of the academy to receive them should be known, to save architects unnecessary expenditure and annoyance. Ignorance of this led to the preparation of a model of a large building now being erected under a government department, for exhibition at the academy, and the annoyance to the architect will be better conceived than described when he found that, after all the pains and expenditure, admittance was refused to it. It is sufficient to say that the model was made by Mr. T. D. Dighton, to prove that its rejection is not to be attributed to want of excellence as a work of art.*

Mr. Cockerell, R.A., has a very remarkable drawing, called "The Professor's Dream" (1,102), and which is a synopsis of the principal architectural monuments of ancient and modern times, drawn to the same scale, in forms and dimensions ascertained from the best authorities, and arranged on four terraces-Egyptian, Grecian, Roman, and Mediaval and Modern; the last of these shows more particularly the comparative heights, The Egyptian temples and propylea form the foreground, including also the sphynx, the Memnon, &c. Then come the Athenian wonders; and the Roman Coliseum, Pantheon, and (once called) Jupiter Stator: the Pisan Tower, the Cathedrals of Cologne, Strasburg, Antwerp; the Brussels Town Hall, &c., represent the mediæval skill. The Italian domes of the Revival, with St. Paul's and other of Wren's works, are crowned by St. Peter's, and the whole are hacked by the dim pyramids, which, as old Fuller says, have outlived their makers' names. The huildings are brought into combination most artistically, and the result is an extraordinary work.

Mr. Pugin, who is not usually an exhibitor, has sent four prominent drawings,-No. 1,057, "An Elevation of St. George's Catholic Church, Lamheth," showing the tower and spire as they are intended to be finished; No. 1,013, " New Dining-hall, now erecting for the Earl of Shrewsbury, at Alton Towers;" No. 1,085, "A View of St. Augustine's, Ramsgate," and No. 1,117, "A View of Bilton Grange, Rugby," the seat of Washington Hilbert, Esq. St. Augustine's is the residence of the architect, and includes a church, now huilding, cloisters, school, &c., all shown isometrically in this "true prospect." Around the main drawing, in compartments tied together by foliage, admirahly drawn, are small views of the interior of the church, the " Herbert" Chapel, &c. The style is Early Decorated: propriety rather than ornament is studied. The view of Bilton Grange is finished in the same manner as the last: the interior of the library, the conservatory, the long gallery, &c., occupy the sides. The building itself is Tudor, of red brick and stone, and has an entrance-tower open on three sides, to admit a carriage-drive. The elevation of St. George's tower and spire is several feet in height. The straight heads of the windows in the second story deserve reconsideration.

Mr. Ferrey has three designs,—No. 1,140,
"The Training and Middle School for the
Diocese of Worcester;" geometric in style,
plain and appropriate in appearance; No.
1,173, "Some Additions made to the West

Front of the Episcopal Palace, Wells;" and No. 1,187, "St. Stephen's Church and Schools, Westminster," of which we gave an engraving some time ago.

Mr. Dankes, who seems to be one of those fortunate individuals graphically described in the old saw, as having "somebody else's luck and his own too," exhibits most of the works which have recently fallen into his hands,-No. 1,036, " Church of England Training College at Cheltenham;" No. 1,075, "The Middlesex County Lunatic Asylum, Colney Hatch;"* and No. 1,141, "Aged Freemasons' Asylum, at Croydon" (a very every-day affair); while Mr. Wehnert exhibits a "View of St. Peter's Church, Cheltenham (No. 1,032), and Mr. Coe, a drawing of St. Stephen's Church, Avenue-road, Regent's-park" (in the Decorated style), both in course of erection by the same architect.

TRAVELLING NOTES IN ITALY. BY AN ARCHITECT.

PÆSTUM.

Here we have more stupendous and more mysterious memorials of the Italo-Greek race. These Greek colonists seem to have selected the most enchanting spots for their cities. The site of Pæstum equals, almost surpasses, that of Pompeii;—on the shore of a fertile plain, spreading itself at the foot of the lofty snow-capped ranges of the Calabrian Apennines, and laved by the blue waters of the magnificent Gulf of Salerno—a gulf at least equal in heauty to that of Naples. These three temples of Pæstum, like those of Baalbec, stand like solitary rocks in the chart of ancient history. The annals of the races that founded them have perished. History has not a word to say in regard to their origin or their object. Doubtless they were already ancient when Pompeii was overwhelmed, and they may have been visited by the Pompeiians as vestiges of remote antiquity. There they stand in silence and solitude, like the great triad of pyramids on the rocky edge of the Egyptian desert, lone monuments of the genius of their aspiring founders, whose bodies have ages ago been re-united to the dust of their native plain; and still they greet successive generations of tra-vellers with that same august and tranquil

aspect they have ever worn.

If the traveller were to select from the thousand objects that challenge admiration in Italy those which had most moved his soul at the moment, and had traced the most indelible images on his memory, he would probably name the interior of Milan Cathedral, the cupola of St. Peter's looking up from the pavement, the Coliseum by moonlight, and the temples of Pæstum. Of these the dome of St. Peter's is emphatically a monument of the towering genius of the great architect; but the other three may be regarded as hodying forth the spirit, and genius, and habits of thought of the three great ages of Italian civilization—the Hellenic, the Roman, and the Mediaval age. At the Duomo of Milan, that sublime vista of piers and arches, those gorgeous stained windows, that high emhowed roof, and those unparalleled effects of chiaroscuro, how exactly adapted are they for priestly pageantry, for awakening all the fervour of devotion, or at least of devoteeism, for which that age is remarkable. At the Coliseum the grandosity of the design, the rapidity of its execution, the bloody associations of its vast arena, where ladies would sup while it was still reeking with the blood of the gladiator or the Christian martyr, all vividly recall the characteristic traits of the Roman mind. Then recur to Pæstum. How dissimilar are these monuments to the other two. In that sublime unity of conception, that severe simplicity of mass combined with finish of detail, above all, in that

^{*}We have received some complaints as to errors and omissions in the catalogue. Mr. F. E. H. Fowler says, the title of his drawing, No. 1,139, which stands thus—"Design for the Army and Navy Club-house, to which the scond premium in the first competition was awarded," was further described as—"modified to suit the extension of the frontage afterwards made by the committee, given as that which might have been submitted (in fleu of that actually sent in) in the second competition, had the instructions prescribed in that case not been adhered to, or had they been rescinded in that case not been adhered to, or had they been rescinded and that case not been adhered to, or had they been rescinded and the competitor." Mr. Talbot Bury's trading of the competitor. We will be supported to the support of the competitor of the competitor of the competitor. The competitor of the competition of the competitor of the competition of the com

^{*} This was described in our pages at the time of the competition. The first stone of the building was laid by Prince Albert, a few sizes. According to the newspapers, the extreme length of sizes to swide the first will be two wings, the right for females and the left smalles, to each of which will be attached a surgeous reformable, to each of which will be attached a surgeous restrict smalles of which will be attached a surgeous restrict smaller firmary. The descent to the basement story is to be directed by a corridor of inclination, instead of steps. The roofing and flooring are to be covered with metallic lava.

faultless claboration of the original idea, you have the qualities that mainly characterise every production of the Greek mind, where all had to undergo the ordeal of fastidious

criticism from a nation of critics.

The Pæstum temples differ from those of Greece, chiefly in the greater massiveness of their columns and the flatness of the mould-One of them has a column instead of an interspace in the centre of the portico, and a range of columns up the middle of the interior. This peculiarity of plan, which has caused so much speculation, is satisfactorily explained by a reference to the temple of Kom Ombo, in Upper Egypt. There, too, the portice has an odd number of columns in front, and two entrances lead to two suites of inner doorways. An inscription still extant explains the cause of the peculiarity; it was a double temple dedicated to two gods.

THE BAY OF BALE.

While the cities of the Greek colonists were flourishing along the gulfs of Sorrento and Naples, the shores of the bay of Baiæ became, under the empire, the favourite retirement of the patricians of Rome. It was, in fact, to them what the Lake of Como is to the magnates of modern Italy. Its beauties are of a more ordinary and homely kind, and more circumscribed in extent, than those of the two larger bays. Its vicinity to the harbour and arsenals of Misenum may have contributed to render it so favourite a haunt with the Romans. Every beautiful point and headland became the site of some aristocratic villa, the walls and terraces of which were washed by the ripple of the landlocked bay; and fragments and sub-structions of these villas are still seen all along the now deserted coast, standing in the water and under it. As every ruin must have some name, the ciceroni have affixed to these sbat-

name, the ciceroni have athised to these shat-tered fraginents the high sounding names of Marius, Sylla, Pompey, Cæsar, &c. Under the empire magnificent public struc-tures arose around the bay, usually octagonal or round in plan, and roofed with vast hemi-spherical vaults of tufo, which, from its light-ness is admirable advant for the market. ness, is admirably adapted for the purpose. Although the whole coast has been rocked and rent by earthquakes, some of these immense rotondos still remain tolerably perfect; others having been riven by earthquakes, huge rock-like fragments have fallen from the vault, and thus let in glimpses and stripes of the blue sky, the ragged edges of which are beautifully fringed with shrubs and pendant foliage. It were equally easy and unprofitable to descant on the object and purpose of these structures. Local antiquarianism styles them temples. They have more analogy to the immense circular exhedree of the imperial baths than to any other buildings in Rome. They are con-structed with brick quoins and courses, filled in with reticulated work in tufo. The vault is solid, and narrows in substance as it ascends. The tufo has been corroded by the sea breeze, but the brick and cement resist it. Within the solid of the walls are arches of construction, with voussoirs formed of immense tiles, the wide intervals between which are filled with brickbats. Though the walls have been riven asunder and sometimes thrown down by volcanic or some other terrific agency, they stand as hard and compact as rocks, it being easier to fracture than to disunite the materials.

One of the octagonal temples of Baiæ is

One of the octagonal temples of baise is remarkable as offering probably the only ancient examples of a balcony supported hy small arches, on brackets or corbels. These project from large openings, one on each side of the octagon. They are doubtless the prototypes of the arched balcony now so common

in southern Italy.
At half an hour's distance from Baiæ, on the promontory of Misenum, is the Piscina Mirabile, a square block of massive and lofty Mirabile, a square block of massive and forty vaulted galleries in brick, still perfect. In the palmy days of Rome they formed the reservoir which supplied water to the Roman fleet lying at anchor in the port below. This magnificent cisternisworthy of the people whose stately aqueduct stridge over the approximation. ducts strided over the plains of the Campagna to supply their capital with the purest water from the distant mountains. The great architectural monuments of Greece and Egypt were sepulchral or religious; but the most original and wonderful works of Rome were utilitarian,-roads to unite the distant pro-

vinces to the mctropolis and heart of the empire, aqueducts and cisterns to supply fleets and cities with water, baths to promote the health of the myriads of a crowded metro-

Not far from the Piscina Mirabile are the prisons of Nero, an extensive range of sub-

terranean excavations

At Pozzuoli, on the opposite side of the bay, are several remains of the ancient Puteoli, which stood on the same site. The most interesting are the mole or pier, the temple of Serapis, and the amphitheatre. The plan of the Serapeon is unlike that of any other building existing in Italy, or in the world quadrangular court was inclosed by colon-nades; in the middle of the quadrangle stood a circular temple on a raised basement which still exists. A portion of taller columns occupied the centre of one side of the quadrangle, and seems to have formed the entrance to the temple. temple. There were also numerous small chambers and cells, which appear to have heen indispensable to all Egyptian temples. It is thought that some of these were baths, whither patients resorted to hathe in consecrated water. The pavement of the quadrangle is now flooded by the sea. The marble columns of the palace of Caserta were taken from this building.

The Amphitheatre, which for ages had been half-buried under a diluvial deposit, has been recently disentombed in excellent preservation. Like all other Roman ruins in the vicinity, it is built of bricks and tufo. It had seats for 45,000 spectators. There were vaulted cham-bers and galleries under the arena, lighted by large square openings in the vault, which were covered with planks when the arena was used for the shows. An inclined plane, passing under the chief, or Consular entrance, gives access to these subterranea. It was at Puteoli that St. Paul first set foot on talian ground, whence he proceeded towards Rome

Along the whole of this wonderful coast the action and effects of subterranean fire meet you at every step. No fewer than 20 craters you at every step. No fewer than 20 cran-have been counted here. At one of these, the configuration of the fire is rather smouldering the fire is rather smouldering small sandy have been counted here. At one of these, the Solfatara, the fire is rather smouldering than extinct. The Solfatara is a small sandy sulphurous plain, in a basin of white sulphurous rock, and resembles, except in size, that most arid of deserts, the Desert of the Dead Sca. Hot vapour issues from crevices in the rocks; when you stamp on the ground, it reverberates with a hollow sound—and hot water was found at the depth of 100 feet when the basin was bored by the French. A natural sweating-bath may be immediately formed by constructing a low building around one of the perforations in the rock, and thus confining perforations in the rock, and thus confining the vapour. Such are the baths of S. Ger-Alum and sulphur are prepared at the Solfatara, and there is also a manufactory for the famous Pozzulana cement.

The host of travellers that resort to the Bay The host of travellers that resort to the Bay of Baiæ from Naples to visit the wonders of nature and art in its neighbourhood, have called into being a troop of hungry ciceronia and showmen, who hold a kind of vested interest in old ruins, steaming fountains, and sulphurous caves. Some he in wait for the travelt it is the visitive of the Schilly, Cave lead suppurous caves. Some in wait for the tourist in the vicinity of the Sybit's Cave, lead him along a narrow, dark, rock-hewn gallery, to two or three subterranean grots filled with water, through which you are carried and landed in what they gravely assure you was the different to the subtraction. the sybil's hath! The flaring torches throw a wild and fitfal light through these gloomy shades; but the loud laugh, the merry non-sense, the genuine English and the bad Italian with which the dark galleries resound, banish all ideas of the supernatural and the ghostly.

At the baths of Nero, on the margin of the bay, another exhibition awaits you. The custode having stripped to the waist and lighted a torch, runs with it down a subterranean adit, intensely hot with vapours from a spring at the extremity; in two or three minutes you begin to hear the groans of a dying man along the adit; they grow more and more distinct, and presently the poor fellow reappears streaming with perspiration, his face wild haggard, and deeply furrowed,—in his hand a small vessel of hot water, containing an egg, a small vessel of not water, containing an egg, which he has brought from the hot spring. He throws himself on a seat, half dead with heat and exhaustion. The egg is presently boiled. In the outer cave, where we stood,

the air under the roof was very hot, while the lower stratum was cool, so that when stooping low you might walk without inconvenience. At the Grotta del Cane a dog is made the

victim to scientific curiosity. The poor heast is held over the poisonous gas as it issues from the rock, and in a few seconds becomes stupified and senseless; but on being removed to fresh air, presently recovers, to be again

to fresh air, presently recovers, to be again similarly tortured before another audience.

The low headland between Naples and the volcanic plain skirting the bay of Baire, is pierced by the ancient gallery called the Grotto of Posilipo, about half a mile in length, and at present upwards of 100 feet high. It still forms part of the high road between Naples and Pozzuoli. Two or three similar tunnels, through this ridge, have recently been re-overed by Government. been re-opened by Government.

MOVEMENT AT THE ROYAL INSTITUTE OF ARCHITECTS.

THE ANNUAL GENERAL MEET

THE annual meeting was held on the 7th inst., Mr. Bellamy, V. P., in the chair. On the motion to suspend the bye-law 23, that "No member who has filled the office of president for two successive years shall be again. eligible to the same situation until the expiraengine to the same situation than the expira-tion of one year from the termination of his office," with a view to the re-election of the Earl de Grey.

Mr. Tite said, no member entertained greater

respect for their noble president than himself, or had a fuller sense of the obligations conferred by him on the Institute; he should not be misunderstood, therefore, when he said it be misinderstood, therefore, when he said it appeared to him important to inquire whether or not they should have for president some distinguished member of the profession. A certain degree of success had attended the establishment of the Institute, but in his establishment of the Institute, but in his opinion it did not occupy the ground it should. The principal architects did not support it as they should, and it occurred to bim that if the honour of the presidency were open to them it would be an additional inducement for them the control of the presidency when they sociative had found would be an adminished interesting the tree to come forward. Other societies had found such a course desirable. There were some reasons why the Institute had not taken the ground it ought, and it seemed to him worth inquiry if this were one of them. He threw they are referred to the course of th quiry if this were one of them. He threw this out without any reference to the present election, but for a future year, and renewed his desire to have his motive properly understood.

The chairman, and Mr. Kendall after him,

agreed in thinking the inquiry desirable.

Mr. Godwin said, that without expressing an opinion at that moment on the particular question which had been raised, he entertained strong conviction that a fuller and searching inquiry into the position and scope of the Institute was necessary. He could assert of his own knowledge, that it did not occupy that position in the opinion of the great body of the profession throughout the king-dom which it should do. The number of mem-bers was not half what it ought to be, and its usefulness was not man what it ought to be, and its usefulness was not minersally admitted. He attributed it himself to an exclusive spirit which pervaded the laws; he desired to see the opportunity given for other classes immediately connected with architecture to become co-operators. In the Institution of Civil Engineers this way the case and great admits the property of the control of the c gineers this was the case, and great advantage had resulted from it. That some alteration was necessary seemed to him evident, if only from the existence of the Architectural Asso-ciation. If the Institute were liberally constituted and did its duty, surely there could be no occasion for this second society: the gentlemen forming it ought to be able to find within the walls of the Institute greater advantages for the same amount of subscription than they could provide for themselves. He felt so strongly the necessity of some change, that if no other member took any step in the matter, he would move for the appointment of

matter, he would have to the appointment of a committee of inquiry.

Mr. Pownall quite agreed with the last speaker that an extended inquiry was necessary, and that more liberal views should prevail. The laws as they then stood, excluded all who measured for tradesmen. It was well known that many educated and properly qua-lified architects also practised measuring, and for this they were to be excluded from the

Institute. Instead of putting a ban on measurers, the object should be to elevate their character as a body. The Institute could discriminate between the worthy and unworthy; but to exclude every man simply because he practised as a measurer, seemed to him most unreasonable.

Mr. Tite was convinced that the suggested inquiry was the right step. Putting the Institute on one side, architects, as a body, did not occupy the position they should. Most people knew that he had no reason to complain of lack of employment. Still he did not besite the state of the state o hesitate to say that persons moving in the upper circles of life, did not employ architects

as they should do, nor did they properly rate their services. Architects must take a place for themselves and maintain it, or the world

would not do so. Mr. C. Fowler, as one of the original founders of the Institute, could say that some of the principal members of the profession made exclusion the condition on which they gave their support. For himself, he thought the subject well deserving investigation; and moreover was stricted the constituents.

over, was satisfied that something must be done. Ultimately, on the motion of Mr. Tite, se-conded by Mr. Godwin, a resolution was passed unanimously, requiring the new council to examine to what extent the objects of the founders of the Institute had been effected, and if any and what alterations in the laws were desirable.

The motion for suspending the regulation as

The motion for suspending the regulation as to president having heen carried unanimously, Mr. G. Bailey, Hon. Sec., read the report, which showed, amongst other things, that the receipts for the current year were \$57l. 12s., and that there was a balance of 267l. at the bankers'. A discussion ensued as to the award of the royal medal, in which Mr. Fowler, Mr. Woodthorpe, Mr. I'Anson, &c., took part; and it was shown conclusively that the council, by committing the institute to their award, by applying to her Majesty before coming to the general meeting to confirm their report had general meeting to confirm their report had general meeting to confirm their report, had

exceeded their powers.

The report having been received, thanks were voted by acclamation to the president, Earl de Crey, and afterwards to the vice-

Mr. Bailey, who had acted as honorary secretary for seven years, having expressed his intention of not serving again, a vote of thanks was passed, expressive of the high sense of the intention of the service of the high sense of the service of the service of the service of the high sense of the service of the serv

institute of his services.

Other complimentary motions having been carried, the ballot was taken, and the following were elected the officers for the ensuing year:—
President, Earl de Grey; Vice-presidents,
Messrs. Bellamy, Salvin, and Sydney Smirke;
Honorary Secretaries, Messrs. T. L. Donaldson and Scoles; other members of council, Messrs. Donthorne, Kendall, Mayhew, Mair, Mee, Mocatta, Nelson, C. Parker, Penrose, and Wyatt; Auditors, Messrs. Kendall, jun., and C. Barry, jun.

SELECT COMMITTEE ON SCHOOL OF DESIGN.

On the 4th inst., Mr. R. Solly, chairman of the Sheffield School of Design Committee, was examined, also Mr. Young Mitchell, the mas-ter of that school. The latter produced some designs made by pupils, and showed that public tastc, with regard to designs, is so bad in Sheffield, that a pure design has every chance of being rejected by the manufacturers.

Mrs. M'Ian, being examined, said the progress of her pupils had been less satisfactory

since their removal to the lodgings in the Strand, and that if the committee had desired to find a

and that if the committee had desired to find a place that was ill-adapted for the school, they could not have succeeded more eminently.

Mr. C. J. Richardson, one of the masters, said he was convinced, if the school were made more practical and the masters in each class allowed to instruct their pupils in design, that it would be much more frequented by artisans than it is. He considered the school in its practical results a failure, and thought the control exercised by the committee injurious.

THE SUSPENSION BRIDGE AT PESTH, it is said, has been destroyed by the Austrians, in order to cover their retreat before the Hungarians; the bridge of boats is also said to have been burnt for the same purpose,

DRYING CLOSETS.

Many experiments have been made by Mr. Baly, the engineer to the Committee for pro-moting the establishment of Baths and Washhouses for the Labouring Classes, and recently under the immediate superintendence of Mr. William Hawes, the deputy-chairman of the committee, for the purpose of ascertaining the best mode of drying clothes, &c., quickly and economically. For some time past Mr. W. Hawes, as one of the board of the Middlesex Hornite her bear parents to Middlesex Hospital, has been superintending such experiments for the purposes of that institution, as well as for those of the Model Establishment of Baths and Washhouses. Mr. Jeakes's letter to you announces the result of one of the experiments suggested and superintended by Mr. Hawes, and which appears likely to insure economy as well as rapidity in drying. The previous experiments were generally, and some of them were strikingly successful, as regarded quickness in drying clothes,—it being found that a clothes'-horse load could be well dried in the light of the successful as the succes dried in half-an-hour; but the committee were constantly foiled in their endeavours to do the work with a small consumption of fuel.

The subject is one of considerable importance; and perhaps Mr. Jeakes and Mr. Healy would be so obliging as to state what are the quantities of fuel necessary for evaporating, in given times, by their respective plans, given weights of water,—for the more light from experience that can be thrown on the matter

the better.

In order that washhouses for the labouring classes may, with low charges, be self-supporting, the greatest economy of fuel is most desirable. The dilatory habits which those who have been forced to boil their water for washing by the half gallon or the quart at a time, have unavoidably acquired, cannot be corrected immediately; but by enabling them to wash and dry quickly, they may be led to use more dispatch. For such institutions as hospitals, workhouses, &c., economy may be the chief requisite, while for many manufacturing processes rapidity is of more importturing processes rapidity is of more importance. The great object of the committee is to combine rapidity with economy, and they have combine rapidity with economy, and they have not hitherto found any existing practice sufficient for insuring the combination. It may be of service to give publicity to a hint, for which the committee are indebted to Mr. Brunel, that drying would, in some cases, be effected much more quickly and better by high-pressure steam than by hot air. Mr. W. Hawes's plan makes an approach towards the high-pressure steam plan.

high-pressure steam plan.

I may add that the experimental labours, expenditure, and failures of the committee promise to bear the good fruit of eventual promise to bear the good film of eventual success, and fully to reward the generosity with which their perseverance has been supported by the public. The success which has attended the adoption of the plans of the model establishment for the St. Martin's baths and laundries, may be referred to as an illustration of the beneficial results of that perseverance. Even during the winter months the receipts at those baths have yielded a decided profit over the working expenses. It cannot be too strongly impressed on those who have to design baths and washhouses that it is true economy to spend 200l. or 300l. extra, for the purpose of enabling the services of a single attendant to be dispensed with, or for making one ton of coals a-week do the work of three.

John Bullar, Hon. Sec.

** We have great respect for the intentions of the committee, but we cannot, even by silence on the point, justify the extraordinary waste of time and money which has taken place at the model establishment. Some of the statements forwarded to us by parties who ought to be correctly informed, would almost justify a committee of inquiry on the part of the subscribers.

Mr. Jeakes's notice under this head in your Mr. Jeakes's notice under this head in your number of April 14th states, that his experiments on a small closet "prove that at high temperatures an external air-drain may be entirely and advantageously dispensed with;" and leads to the inference that a change of air in drying-closets is not an assistance, but an impediment; which is so much at variance with received theory and successful practice,

that I am induced to think there must be some-thing in the case which has been overlooked. In your last number (May 5) Mr. Healy correctly gives it as a received opinion, that a current of air is an important part of the pro-cess of drying,—perhaps as important as heat; for linen may be dried out of doors, where it will be subject to constant change of air about its surface, without artificial heat at all; but if hung in a saturated medium, it will not dry hung in a saturated medium, it will not dry though at a high temperature. Any laundress practising open-air drying, will say that the difference between a good and a bad drying day lies here: in the former, the atmosphere is in brisk motion, and dry; in the latter, it is still and moist. In other words, the linen dries most quickly, when there is a rapid succession of dry particles of air passing over its surface.

Artificial drying is in fact a two-fold operation. By heat, the moisture is quickly converted into vapour; by ventilation, that vapour is carried away, and replaced with dry air. If no fresh air were introduced, successive charges of wet linen would soon saturate the atmosphere of the closet, at which point drying must altogether cease.

altogether cease.

But ventilation may be in excess. The utmost effect will be obtained from a closet and heating apparatus, of given size, when the air admitted bears a definite and not to be exceeded proportion to the quantity of vapour to be evolved in a given time,—to the temperature,—to the thickness of the textures,—to the state of the atmosphere at the time as regards drupses, and motion. Hence, there should be dryness and motion. Hence, there should be area for ingress and egress, sufficient for the greatest required quantity of drying under the least favourable state of the external air, with means of reducing that area for smaller quantities and a drier or less stagnant atmosphere.

In many drying closets which I have been engaged on in this district, on the large scale engaged on in this district, on the large scale for manufacturing purposes, rapidity of drying has been materially promoted by increasing the ventilation: in some cases where the tex-tures were very thick, and introduced in a very wet state, still greater acceleration has been produced by the application of powerful forcing-apparatus, such as air-pumps or fans, worked he a steam earing.

worked by a steam-engine.

At the Lancaster County Lunatic Asylun, I have recently completed a closet for drying all the linen, bedding, &c. for 700 to 800 patients. the linen, bedding, &c. for 700 to 800 patients. The textures are unusually thick and heavy, and not easily wrung by female hands, and hold, on the average, twice their own weight of water when placed in the closet, thus:—Weight of a dry rug 4½ lbs., wet 13 lbs.; weight of wet clothing dried daily in twelve hours, 4,006 lbs; water evaporated in the same time, 252 gallons; temperature, 120° when the clothes are put in, increasing to 170° when dry; cubic contents of closet, 5,040 feet; constant ventilation, 288 square inches, with means for increasing it in moist heavy weather. The foregoing considerations applied to the case in question lead to the conclusion:—1st, that the quantity of air admitted was too great

that the quantity of air admitted was too great for the size of the closet and for the heating 2nd, that though the original provision has been abandoned, there may still be left crevices or accidental openings, permitting sufficient change of air for so small a closet. Manchester. W. Walker.

My remarks on the drying closet at the Middlesex Hospital have been entirely misconceived by your correspondent in the last number of The BUILDER. By repeated experiments on that closet, it has been proved capable of evaporating 1 lb. of water per minute by employing merely the waste heat derived from the flue of the ironing stove; and although containing, as your correspondent observes, but 336 cubic feet, dries with ease the whole of the linen for 250 patients!

That this great effect is owing to the absence of the cold-air drain, has been satisfactorily proved by experiments tried before this drain was closed. Its economy cannot be disputed; for assuming your correspondent's statement of having an air-drain containing 144 inches, and allowing the air to travel at the rate of 3 feet per second, 180 cubic feet must then be

and anowing the arrival that the late of the same that of the heated per minute from the temperature of the external air to that of the closet, which, in the case of the closet at the Middlesex, is dis-pensed with. W. JEAKES, Jun.

THE ARCHITECTURAL ADVANTAGES AND DEFICIENCIES OF LONDON.*

THAT there are certain sites so admirably suited by nature for the development of a city, that so long as the district where they exist be civilised or even populated, they must form its foci, is a fact historically demonstrated. Of such sites, perhaps the one most remarkable is that spot where two large political divisions of the earth's surface are only separated by a narrow tranquil strait. On Europe's side a platform but a few feet above the level of the sea, with a soil exuberantly fertile and a climate unexcelled, protected from the attack of either man or the elements by a forest-covered range of mountains commanding the resources either of the Mediterranean or the Euxine, receiving its merchandise from all parts of the world upon an almost unexcitable sea, -Constantiupon an almost unexcitance sea,—constantinople, whether its rulers be Frank or Turk, will never cease to rank the 'queen of cities.' So in Italy, where Greek, Goth, Italian, all bave stood in turn as corquerors, all bave consented to the supremacy of Rome; but where on the conference are uncongenity size. where, on the contrary, an uncongenial site, destitute of natural qualifications, has been selected, as in the old cities of Assyria, in Carthage, or the modern Munich, imbedded in a barren sandy plain, and relying solely on the acquired wealth or warlike character of its inhabitants, although raised to a dazzling but ephemeral splendour by the munificence of some imperial master,—on the first reverse of fortune they fall, never to re-appear. And when we consider attentively the site of Lonalthough superior in those last mentioned, yet, should its dissolu-tion be decreed and another race tread over the earth in which its ruins are entombed they would pass it by and find in England many sites far more naturally pointed out as its metropolis.

The chance-favoured Romans, on whom devolved the task of selecting a position for their intended fort,—for we must not suppose them as foreseeing its growth even to a town,—guided by their warlike wants alone, pitched their camp as the sea-wave raises a rim upon the stony heach, that they might halt, return, recruit, and sweeping it before them, impress their brand higher up upon the concurred country. It chanced otherwise; the stragglers who remained, while the main army returned to a more congenial home, unable, with the trifling shelter of a camp, to resist the cold wet winter of the then, as now, inhospitable clime, felled some trees around them, and, with a process the same as, at the present day, goes on in some embryo empire of the far west, they raised unconsciously the first germ of the future London.

As architects—as artists—aiming at beauty and picturesqueness equally with practical materialism, we must confess nature has done materials in, we must come a natural has come but little for London. The atmosphere, misty and rarely clear in any part of England, is still less so in London; at the bottom of a natural basin, all the dense clouds from the neighbouring hills gravitate towards it, and the east wind never reaches unless burdened with the damp evaporation of the marshes which form the horder of the Thames so many miles eastward. The sea, which like a bright and sparkling eye to a face otherwise but plain, animates and gives expression and brilliancy to the scenes of nature it adorns, is far distant. We cannot We cannot boast, like Naples and Constantinople, of boust, the values and constantinope, or a bay reflecting as a mirror the bright mass which seems to float so calmly on its surface. Neither, as in the cities of antiquity, can we point to a natural capitol which should form a dome—a culmen—to the whole, giving to the spectator, on whichever side he stands, the full command of all the beauties which are around him. With us no seven hills give the variety of undulation to our too monotonous levels; no quarries are at hand to yield the only heauand permanent material for its huildings, to give to each one not the appearance of being raised up piece hy piece with mortar and with sand, but to have been at once carved outsculptured from the native rock-resting upon the earth as a block that has issued from its bosom, and promising an almost coeval existence. But, although we must come to the conclusion that the site of London is far from naturally

heautiful, let us remember, in the words of Macaulay, lately, at Glasgow—"It is not on the fertility of the soil, it is not in the mildness of the soil, the second of a city. of the atmosphere, that the prosperity of a city or a nation will depend.—slavery and super-sition can make Campania a land of beggars, can change the plain of Enna to a desert; nor is it beyond the power of human intelligence and energy, developed by civil and spiritual marshes to magnificent cities and luxuriant marshes to magnificent cities and huxurnau-gardens." Let us see, then, what man has done as his share to supply these natural deficiencies, and hy the creation of his art transform the disadvantages he his art transform the disadvantages he labours under till they become the hasis of anow peculiar character. Atmosphere must ever be the primary consideration. The Londoners found theirs naturally foggy: how have they endeavoured to improve it? Alas! day by day the refuse of 2,000 tons of coal is added to its foul burden. The Englishman is proud of the possession of that gloomy mineral, but what an enemy is it to the mineral, but what an enemy is it to the English architect,—through what a dirty glass does he behold his pretty picture when it is executed,—with what obstinacy do its foul black stains counteract the well-studied lights and shadows of his design! Let us take the south side of St. Paul's any time that the sun may have discovered that magnificent pile, and then examine the anomalies presented to our view, every projection probably with each side in shadow, as though all its illumination pro-ceeded from the parallel gas-lamp in the street helow,—mouldings and ornaments filled up and lost,—every variation of shadow that should constitute superficial effect in architecture, reversed, perverted, or obscured. And is there no remedy for this? Chemically, there is no portion of that sooty refuse incombustible: why should there be practically?

We have seen that London has no natural

We have seen that London has no natural capitol; it were well, then, to supply its place with such a concentration of public buildings, as should afford a resting place for the wandering eye, and give the epithet magnificent to at least one quarter of the city; but, alas, how are they scattered! We fall mpon them with such intervals, that our first idea must be they are few and insignificant; nor is such an idea far from the fact. If there he such a principle as proportion in art, it would follow that the public edifices in our cities should have some relation to their extent, and since London is in reality the largest of any city, it follows it should show an equally unexcelled array of public buildings. It is notoriously otherwise. Rome, Paris, Naples, very far exceed ns even now, and how many of our noblest huildings date no farther back than the last ten or twenty years! London has but one character, that of extent, wearisome, monotonous extent: the complex arrangement of its streets, the smallness of its component parts, all contribute to this effect. But this extent must not be taken as implying grandeur, or vastness. It is not a city, but rather a mass of towns joined one to one, — respectable when viewed independently, but meagre and tame when considered in relation to the harmony and proportion of the whole. Nothing adds so much to this apparent petiteness as the jagged varying hooken outline of our roofs; how have we jumbled together the horizontality of Italy and Greece with the high picturesqueness of the German roof, and produced a mongrel, destroying all beauty, dishonouring all architecture!

Hamburgh, considerably nearer the cold north than London, affords an example of the practicability and heauty of flat roofs, worthy of our attention; there, since the late fire, the roofs have become, as in the cities of the East, the gardens of the town, with the air purer than below, less disturbance from the traffic in the streets; may we not hope at some early period having enticed 'rus in urbe,' to rival the mystic Babylon in our hanging gardens.

And here one word against the projects broached of late against the existence of our quiet tranquil squares, the only feature we can really mention as peculiar to London. "Naturam expellas furca tamen usque recurrit" was the taunt of the Roman poet to his city-loving fellow citizens, and does it not apply to ns? in vain do we imbed ourselves in material of our own creation; in vain smother all the yearnings of an innate love of nature; how

often has not the view, even of the pervérted green of our melancholy squares, thrown a ray of cheerfulness over our moody mind, and touched the spring which lets loose at once upon us a crowd of happy associations and inspiring hopes! Mark the most dirty and neglected streets, you will still find some window where the poor inmate, with grateful heart, puts forth his humble offering to the shrine of nature. Better our squares, exclusive as they are, and selfishly enclosed from the tread of those who would enjoy them without thought of injury, than see them transformed into barren arenas for the strut of policemen, the nurseries of the mendicant and the thief, the noisy playground of the idle and the vagabond, the blank and meagre site of still more meagre statues.

Hamburgh is perhaps the chief instance of a city rising from its ashes in greater splendour than it descended to them. The opportunity is generally lost, and for this reason, that the hurried and unexpected demand thus made upon the architectural talent of the time must produce much that is commonplace and unstudied; that men half ruined by their misfortine, and waiting for a sheltering roof, care little for its decoration, and would be sadly disposed, in their rebuilding, to merge every other consideration in that of economy.

The fire which in 1666 gave London an opportunity of regeneration on the grandest scale, gave, alas! that chance in vain; and although the loss was greatly qualified by the impetus thus given to the genius of Wren, there was but one Wren; and, worried as lee was but one Wren; and, worried as lee was but the stupidity of the officials of his time, it is but natural that smaller works, left to the inguided rawness of a pupil, suffered accordingly. It is true he formed a comprehensive project for the rebuilding of the city,—a project of which it is idle to regret the execution. A time of unparalleled misery, discord, and selfishness, was not the fittest to ask of men that they should merge the right of property and frontages, the advantages of established husiness, for the chimerical compensation the new project offered. A vast and firm government would have been the only chance of appeal. The government of Charles II. and his ministers was never otherwise than careless and indifferent; nor was Wren's project faultless. I question, if carried out, whether it would meet the approbation it receives on paper.

A peculiar feature is the frequency of certain points, where six or eight converging streets constitute an arrangement, of which almost the only perfect type we possess is Seven Dials,— an idea excellent and highly admissible when the project is a lahyrinth; but the few specimens we are acquainted with warn us against its adoption, save as an occasional curiosity. The traffic of each wide street poured at or the central space would produce a jumble and confusion unparalleled even in the narrow crowded thoroughfares of the present day; besides that, the triangular wedge-shaped pieces left by this convergence are the most extrava-gant and ill-judged areas for building. The plan of a large collection of buildings he as simple as practicable, adhering to straight lines, not only from the convenience of the parallel building areas, but from the greater grandeur produced by an arrangement of vistas and long-continued façades, than when the view is interrupted and checked by angles or view is interrupted and checked by angles or abrupt curves; not that an occasional violation of this rule, where it is truly occasional, as in the Quadrant here, does not form, from its agreeable contrast, a heautiful and striking feature. And this leads us to the consideration of the canse of the apparent insignificance of London—the scarcity of continuous heaviered the consideration. apparent insignificance of London—the scar-city of continuous horizontal façades: each separate slice of our principal streets seems to pride itself upon its independence as a house, piled up like books of all sizes and all bind-ings on a library shelf; the elaborately deco-rated front, 60 feet frontage and the same in height, abuts upon a mean and narrow shop one-third the width, and with its paraget in one-third the width, and with its parapet in line with its proud neighbour's first-floor win-dows—the chrysalis by the side of the gay butterfly, taunting it with its origin. continuous string-courses, ranging windows far apart, and a bold crowning cornice, give an effect of granderr unattainable by far more extravagant superficial decoration,

^{*} The following forms part of a paper read at the Architectural Association on Friday, the 30th ult.

quiet streets, too, there is the same character of exclusive meanness to each house. What strange pride it is to forego so much extra comfort, to pay double rent, and live in sordid shabby state, for the mere satisfaction of being dubbed a householder, paying rent and taxes and possessing unshared, unquestioned, the key of one's own street door! Let us not believe such is the selfish disposition of the Englishman; it is not the will, but only the opportunity he lacks. When he has seen more of his continental friends, he will not scorn to take a note from them, and adopt their far more rational, far more economical system of habitation. It is statistically a fact that 75 per cent. of London houses are inhabited by more than one family: built upon the narrowest frontage, the smallest of them must be still too large for many of the poorer house seekers; they divide it, and bow awkward, how incon-venient this division,—the one kitchen and one entrance are the scenes of perpetual contests entrance are the scenes of perpetual contests for precedence, till the one party falls into the position of the victimised and ever-grumbling lodger,—the other ranks as the grinding and exacting landlord; and yet the remedy for this is easy. The poor-law union of the present day boasts the façade of a palace, why should not the dwelling of the honest workman claim some share of housty and exchictance of the contest work and the same share of housty and exchictance of the contest was expensely and exchictance of the contest was expensely and exchictance of the contest was except as the contest was except was except as the contest was except w some share of beauty and architectural effect,suites of rooms, neatly, plainly furnished, well drained, well ventilated, opening to public corridors, and occasional statreases, might be encased in a front truly palatial, and yet form a safer investment for the capital of its province the the same process. prietor than the trumpery house property of the present day. And there is another advantage in this: all the London bouses of the present day are built upon erroneous constructive prin-ciples; the ground-floor is necessarily the least subdivided by partitions, the first floor more so, and the second most so; consequently it is impracticable, without great expense, to construct these partitions, hanging over voids, fireproof, or even so far substantial that they should intercept the passage of sound; but when one range of chambers stand perpendicularly upon another these difficulties vanish, and the brick partition goes up cheaply, and solidly, to the roof.

London is yearly spreading wider the huge net of its entangled streets; one by one the fields and gardens of our suburbs merge into the brickfield, and soon into the little colony of villas: once the colony established, a market becomes its natural demand,—and it is the formation of this market that increases so visibly the size of London. The suburb, boasting its long rows of small but comfortable tenements, once the humble retreat of the retiring tradesman, in comparison with the colony beyond, soon loses its rustic reputation; the owner finds it his interest to seek more adventurous tenants, and one by one each house casts a proboscis forth, and in the shape of a long, low, narrow shop, covering the dull patch that once was dignified as the front garden, opens its greedy mouth to snatch the passing customer; and when in course of time earh shop has thus stepped forth, the first has thrived so much that, taking down the little origin of all, he raises in its place another specimen of the gaudy compo-bedecked modern shop-front, and very soon the area wide feditord.

in its place another specimen of the gaudy compo-bedecked modern shop-front, and very soon the once wide foliated road becomes a narrow, money-grabbling street.

But London is already too extended for convenience or sociality; and it is with regret that we behold every fresh encroachment on the country round, unless, indeed, we could discover something superior to the slow, tedious system of communication of the present day. It were easy to imagine an Utopia of London, to build its river-terraces and palaces upon them, to project large thoroughfares for the relief of its over-crowded traffic, and to line them with public buildings, museums, and galleries of magnificent façades: but as easy in imagination so much the more impossible in execution; we must proceed in slower, surer steps—blunder no more over our public buildings—lose no opportunity of widening and straightening our streets—and, last of all, inculcate in the shop-keeper and petty landlord a sense of the advantage he will derive from the decorative improvement of his property; for it is useless to talk of art to those who regard as everything the world plapable and material, resolving itself to system,

to interest, to calculation, and despise those who would preserve in it some worship of the beautiful and ideal, and interpret some few words of that mute language which so mysteriously connects the world invisible with the world revealed.

F. CHAMBERS, JUN.

NOTES IN THE PROVINCES.

THE exterior of the tower of Trinity Church, Colchester (a very early work), has been partly stripped of its old coat of plaster: but it has been found that some of the material of which it is built, is so decayed, that the plaster must either be restored or a more substantial repair subscribed for. "The building," says the Chelmsford Chronicle, "now stands half Chemister Caronice, how stands had stripped and in a very doleful predicament."

The restorations in the parish church of Elsenham have been completed. The flat ceiling has been removed and the roof laid open from the interior. The pews have been replaced by benches with carved oak ends. The quaint old carved pulpit has been restored.

The south porch, roofed to correspond with the church, has been renovated. The church and chancel floors have been laid with chequered Derbyshire tiles, black and red.

These and other renovations have been made the correspondent of the characteristics. under the superintendence of Mr. Ollett, carver and builder, Norwich.—In laying down the water pipes at Boston, according to the Lincolnshire Times, the workmen have in several places met with the remains of the wooden pipes formerly used for the same purpose. Nothing is known of the time when these pipes were laid, but there can he but little doubt, it is thought, that more than 150 years have elapsed. The pipes appear to have been merely trunks of trees, hollowed in the centre, and made to fit into each other at the ends, where they were fastened together by some kind of cement. —Advertisements have been issued announcing the opening of a subscription for the restoration of Felmersham Church, Beds., at an estimated expense of Church, Beds., at an estimated expense of 500L, independently of the chancel and those necessary substantial repairs which will be borne by parish rate.—Trinity Church, Penn, Bucks., was consecrated on 1st inst. It is Bucks., was consecrated on 1st inst. It is in the decorated style and cruciform in structure, with nave, chancel, two transepts, structure, with nave, chancel, two transepts, and a central tower surmounted by a spire, in all 135 feet high. Mr. Ferrey was the architect. The building has the advantage of a site on the verge of a large collection of beech trees, named Penn Wood. The east window, a decorated one, was presented by the Queen Dowager. There are also two other stained glass windows, executed hy Mr. Willement, in the chancel. — Widley Church, Winchester, a sufficient sum (nearly 700!.) having been already subscrihed. The architect is Mr. J. Colson, of Winchester, who, by the wav, has arready subscribed. The architect is Mr. J. Colson, of Winchester, who, by the way, has just completed a school and master's house for Widley and Wymering, towards which Mr. T. Thistlewayte subscribed 300.—A painted window in the chancel of Almondsbury Church, Gloucestershire, has just been put up by Mr. O'Connor, of Berners-street.—A stained glass east window has lately been placed in Wilton Church, near Taunton.—The church, near Taunton.—The temporary church, recently erected in the district of St. George, Kenwin, was opened on St. George's day. It is built of wood. The design is first-pointed, and consists of a chancel and nave, with sacristy on the south side. The exterior is plain. The dimensions are—Chancel, 19 feet by 20 feet; nave, 56 feet by 20 feet; height throughout 10 feet to the The exterior is plain. The dimensions are—Chanacl, 19 feet by 20 feet; have, 56 feet by 20 feet; height throughout 10 feet to the eaves, and 25 feet to the ridge. It will accommodate about 330 persons. The entire cost, we understand, will be, when completed, about 250l. The architect was Mr. White, of Truro.—On lately removing the floor within the altar-rails of Sithney Church, Cornwall, the old Norman font was discovered. This piece of antiquity will probably be restored to its original purpose.—The Vicar of Whitchurch Canonicorum, is to restore the parish church, which is a specimen of the architecture of twelfth century.—Mr. S. Hemming claims 392l. 17s. from the Birmingham workhouse authorities, as remuneration for his plan of the new workhouse, accepted by the late board.—A plan for an erection for shelter on the

new landing stage at Liverpool, at an estimated cost of 1,000l., is about to be carried into execution. A portion of the building will he let off as a refreshment room, and so nearly redeem the interest on the whole expense. In addition to the large hotels forming the crescent at Buxton, an extensive inn is in course of erection there on the site of the old Angel Inu. The corner stone was laid on 1st inst., in presence of Mr. S. Worth, of Sheffield, architect, and others. The elevation will form a frontage of 150 feet, in the richest talian style.—An individual has just presented to St. Peter's Church, Derby, stained glass for the chancel window, which is of five lights, in the perpendicular style, and richly traceried.—A new church is about being executed to Deahy are sential of including the control of the perpendicular style in the perpendicular style. lights, in the perpendicular seyre, and them, traceried.—A new church is about being erected at Derby on a portion of inclosed land formerly called Nunn Green. To judge from the plan, it will probably accommodate, without galleries, about 500 persons. Subscriptions are afloat for another new church, training-school, and national school, to each of which two gentlemen have handsomely contributed 100l. each, making 600l. A new entrance is about being formed to the Arboreturn, at which a lodge will be erected. extra room for the accommodation of visitors is also being built.—A portion of the founda-tion of the walls of the Victoria Dock entrance lock into the Humber has settled down into the ground, and until the water is again drawn off, the extent of the repair which will be needed cannot exactly be ascertained. The works for a new congregational church to be built at Berwick were let on the 23rd ult. The build-ing is to be erected under the superintendence of Mr. T. Oliver, architect, Sunderland. It is in the Early English style, and has a bell-turret on the west gable. The following is a list of the tenders, and a pretty specimen of esti-

1st class	£1,428	15	0
		13	6
4th ditto	979	5	0
	949	2	0
6th ditto	793	15	9

As the works were tendered for separately, and not in all cases by the same parties, the sums have been classified. The lowest estimates have not been accepted.

IRON HOUSES.

A CONSIDERABLE number of iron houses and warebouses have been lately shipped to California from Liverpool and other towns. One of these structures has just been erected by Messrs. Edward T. Bellhouse and Co., of Manchester, for Messrs. Pim and Roberts, who are proceeding to San Francisco.

The total length is 60 feet, the width 24 feet, the height to the eaves 10 feet, and to the ridge 17 feet. There is a partition of iron 15 feet from one end, forning a compartment for a dwelling-house; the remainder is for a warehouse, 45 feet by 24 feet. The foundation is formed by a strong framework of timber, upon which is screwed a moulded base of castiron, rising 6 inches. The uprights and principals of the roof are formed of wrought iron of the T section, the roof principals being strongly trussed. The plates, in lengths of 4, 5, and 6 feet, hy 2 feet 6 inches in width, and a for an inch in thickness, are bolted to the uprights and to the principals of the roof by \$\frac{1}{2}\$ bolts, and to each other by lap joints with bolts \$\frac{1}{4}\$ of an inch in diameter.

The doors are of wrought iron, framed with angle iron, and the windows and skylights are of cast-iron. The mode of construction, and the care taken in the execution of the work, make it a remarkably stiff and substantial edifice. This is an example of the celerity with which these erections can be fitted up, as the iron of which this house is made was received only a fortnight before the day of completion of the work.

VERY MODEST.—A petition has been presented to the House of Commons from certain parties, stating that great injury was done to the public morals in consequence of the objectionable character of some of the pictures in the National Gallery, and praying that the objectionable portions might be painted over or expunged.

DORIC PORTAL OF THE PALAZZO, SCIARRA COLONNA, ROME.

[A.D. 1603.]

DORIC PORTAL OF THE PALAZZO, SCIARRA COLONNA, ROME.

This fine doorway, which graces the façade of a simple but noble palace on the Corso, has been attributed to Vignola, but is more probably the work of Flaminio Ponzio, who, in 1603, was employed to build the palace. The great projection of the keystone is a peculiar feature, and the management of the triglypbs at the ends of the entablature is worth observation. Quatremère de Quiney, in his Histoire des plus célèbres Architectes, speaks of this doorway as one of the best examples of its class. The whole beight is about 34 feet, and the width, from centre to centre of column, is 17 feet. The drawing was made on the spot by Mr. Lockyer. on the spot by Mr. Lockyer.

Amongst the other works of Flaminio Ponzio are the great double staircase of the Quirinal Palace, and the restoration of the Church of St. Sebastian, beyond the walls.

A BLOW AT INTRAMURAL BURIALS. WATERFORD-GLOUCESTERSHIRE.

THE following memorial has been signed by the leading medical men of Waterford :-

the leading medical men of Waterford:—

We, the undersigned, declare it to be absolutely necessary to the safety of the public, that no more interments should take place in the churchyards of this city. The state of them, and especially the older ones, is at once an outrage on public decency, as well as detrimental to the public health. In the cathedral churchyard, which is altogether uninclosed, and a public thoroughfare, as well as the resort during the night of bad characters, the carth is continually falling into the old graves, leaving passages or vents which lead to the remains deposited below, and serve for the escape of noxious gases; and when the earth is thrown up to form fresh graves, it is found so loaded with animal matter, as to be actually offensive to the nose as well as eyes. In Olave's Churchyard, the bodies have of late years been deposited in tiers, above each other, just under the east window of the church, till they are within less than 3 feet of the surface, and

actually above the level of the ground within one or two yards adjacent; whilst at certain periods, and in certain states of the atmosphere, a putrid smell can be distinctly perceived in the neighbourhood. John's and Patrick's Churchyards are in much the same state; and we therefore submit, that it is the duty of every one, and especially of public bodies, to co-operate for the abatement of a nuisance so dangerous and disgraceful to one city.

In Gloucestershire, also, the medical men are bestirring themselves. Last week Mr. Mackinnon presented a petition to the House of Commons from the president and council of the Gloucestershire Medical and Surgical Association, representing a large body of practitioners. It sets forth,—

That your petitioners are of opinion that the in-terment of the dead in towns and populous dis-tricts is highly injurious to the public health, and that no measure of sanitary reform is complete unless this obnoxious system is at once and for ever abolished by legislative enactment. That your petitioners cordially support the efforts

DESIGNS FOR KNOCKERS.

AT THE HOTEL PORTALES, PARIS.

AT THE HOTEL ROTHSCHILD, PARIS.

now making by the "National Society for the Abolition of Burials in Towns," and they desire respectfully to add their testimony and influence as experienced medical practitioners, in aid of a measure at once politic and humane, and worthy of an advanced civilization.

DESIGNS FOR KNOCKERS.

The accompanying engravings, from drawings made for us by Mr. Roussel, represent two metal knockers cast from the designs of M. Duban, architect, and put up in Paris. The first is at the residence of Count Portales, Rue Tronchet; the second at the Hotel Roths-child, in the Rue Laffitte. They are drawn one-third the real size.

DECORATIONS FROM ABROAD. MARBLE PANEL FROM SAN MARCO, ROME.

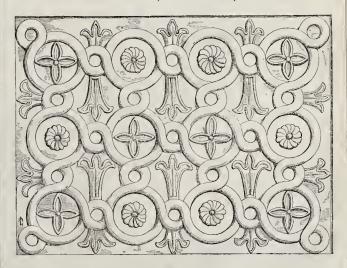

The church of San Marco (which immediately adjoins the Palazzo di Venezia) is said to have been founded as early as the fourth century. In \$33 it was rebuilt by Gregory IV., but, with the exception of the tribune, and a few scattered fragments in the portico, there are now no remains of these earlier constructions. In \$1468, the Palazzo di Venezia was built by Paul II. (a Venetian), and at the same time San Marco was entirely reconstructed: the ancient tribune alone, on account probably of its fine mosaics, was suffered to remain.

The accompanying panel, which is in white marble, appears to have formed a portion of the enclosure to the presbytery of the church as rebuilt by Gregory. These enclosures (of which the most perfect example now remaining is in the church of San Clemente on the Esquiline) were usually richly decorated with sculptured marble panels, often inlaid with mosaic. The design before us might be successfully adapted to iron-work.

THE WELFARE OF WORKMEN.

is gratifying to read such sound, practical remarks as those expressed in The Builder, by your correspondent "An Old Mason." I am a working man myself, and feel deeply interested in any thing which will tend to the intellectual and moral advancement of my fel-When, in the shape of abstract and impracticable theories on government, there are so many injurious influences operating to disturb the mind of that large and important abstract and in any thing which will tend to the section of the population called mechanics, it

MARBLE PANEL, SAN MARCO, ROME.

allow me, strengthen his "assertion" that allow me, strengthen his "assertion" that mechanics who are receiving 30s. per week may contrive to save a trifle out of that sum, which, in the course of a few years, would accumulate to something important. It is well known that in the country a carpenter, or mason, seldom gets more than 22s. per week, and yet I know many a man, with a wife and two or three children, who lives respectably and contrives to save a trifle out of that; and there are many young men who, with 20s. per and condivies to save a triffe out of that; and there are many young men who, with 20s. per week, save a sum which would scarcely be cre-dited. But they are, of course, steady and economical; they are not addicted to morning drams, nor do they spend their evenings and Sundays in dissipation at the alchouse; and while you would see the street of the street. while you would see them attired with good and enduring apparel, you would not see in their dress an attempt to mimic the folly of some above them. Now, if my fellow-workmen would study the first principles of economics as well as "mechanics;" if they would see what they could do with, and what they could do with, and what they could do without, they would find that their present wages (which, in my judgment, are not at all a just and equitable remuncration for their skill and labour) could be used, so as to put them in a much more respectable position than that in which too many, alas! are now to be found. That happiness which is sought ineffectually at the tavern, may certainly be found at the reading-room, or in the private study of those great principles which stamp the building art with such interest and importance. Self-culture, mental discipline, the development of the finer feelings of humanity, will doubtless make us better and happier men, if it will not make us better mechanics. It is only by making the best possible use we can of our present means that we can hope for a better future. Let our skill and intelligence, together with a high moral influence, solicit a more equitable adjustment of our time and wages, not—any farther than can be avoided—our poverty and destitution while you would see them attired with good and enduring apparel, you would not see in influence, solicit a more equitable adjustment of our time and wages, not—any farther than can be avoided—our poverty and destitution demand it. Of all reforms, individual reform is the most valuable, and is the surest and safest road to governmental reform.

A Young Carpenter.

BUILDERS' RIGHTS AND FOLLIES. TENDERS, ST PETER'S CHURCH, CHESTER.

You will much ohlige several individuals by You will much ohlige several individuals by inserting, in your valuable paper, the following note respecting the estimating for a new gallery, and three new windows, in St. Peter's Church, Chester, in the decision on which there is something too much savouring of unfairness, to he passed over unexplained. A number of respectable tradesmen were invited to give in touders. The two lowest tenders were from respectable tradesmen were invited to give in tenders. The two lowest tenders were from first, a citizen of thirty-five years' standing, and, secondly, a builder who had done the whole of the carjenter's and joiner's work at the new station, and many other large works. The last was invited by Mr. Harrison, the architect, who, unsolicited, sent him the plans architection desiring him to give a tender and exceptional desiring him to give a tender.

architect, who, unsolicited, sent him the plans and specification, desiring him to give a tender. He complied with the architect's request, and gave in an amount 27l lower than the accepted tender. The public and the two lowest competitors are at a loss to account for such a digression from fair play. If the Committee have a surplus fund at their command, will there he any impropriety in allowing the unsuccessful competitors a fair remunerative per centage for their trouble, expense, and loss of time, in taking off the quantities, and estimating for the works?

The lowest estimate was accepted.

There is much business done upon this principle: men who have nothing to lose compete ciple: men who have nothing to lose compete with respectable tradesmen, send in one contract after another, always doing the work lower, and gain much trade in a short time. The system tells its own tale, and their goods are brought to the hammer, and yet there are those who will come forward, and will offer them sympathy, and say—"Poor fellow, he worked hard when he had it to do, but did not take sufficient care of himself, for we know he worked hard when he had it to do, but did not take sufficient care of himself, for we know he worked very low;" and they, under the impression that another hody of men are "dear," man, and recommend this "chear," man, and recommend employ this "cheap" man, and recommend him to their friends out of charity. What a pity hut that they could see hehind the scene, and find out the motives actuating such proceedings,—proceedings not only morally wrong and unjust, but dishonest! If the multitude acting upon the principle of "cheap work" would look a little to the private character, it might convince them that high chargers are not necessarily knaves, but that the very low chargers must be fools,—i.e. c. to work for less than it costs them,—or knaves, to use material for which they never intend to pay. This is no exaggerated case, but a simple every day fact, and one which I could illustrate hy many examples that have come under my own eye.

RAILWAY JOTTINGS.

THE returns called for by the House of Lords, on the motion of Lord Brougham, are to embrace a return of the share capital, divi-dends, costs, receipts, expenditure, and other to emprace a renir of the share capital, divi-dends, costs, receipts, expenditure, and other accounts, of every railway in the three king-doms, and will be the most comprehensive, searching, and complete exposure possible, so far, at least, as the order itself intends it to be, the stand in reference to the Festers far, at least, as the order itself intends it to be.

—It is stated, in reference to the Eastern Counties accounts and investigations, that the sum of 621. per share has been paid as dividends from 1845 to 1849, while the earnings applicable to dividends (nothing, however, having been allowed for wear and tear of locomotive stock.) have only reached 281, per share for the same period of four years. Arrangements are said to he in progress for working this line by contract instead of by the Company itself, and it is alleged that the saving to the Company the will be 90,0001. a-year. pany itself, and it is alleged that the saving to the Company thus will be 90,000. a-year.— A letter, lately published, as to the doings of others than the noted prime mover of 'direc-tors,' adds another argument in favour of an improved system of auditing railway accounts. One object of the writer is to show that share-bodders are been in ingranges of the real state-One object of the writer is to show that share-holders are kept in ignorance of the real state of things until fresh calls for money become necessary; and that, as he contends, is the case with the Chester and Holyhead Company, their original capital is to be mortgaged, and even sacrificed, in favour of what are called "preference shares." He states that there has been a substantial concealment of the amount required. a systematic concealment of the amount required to complete the undertaking, and that the traffic and receipts are utterly insufficient to LOWTON CHURCH, LANCASHIRE.

To show the state of the contract system in the provinces, I beg to send you the following particulars. The parish church of Lowton (Lancashire) had to be painted outside, and papers were printed and distributed the Menai-bridge is travelled by a well-apmake any return on the original capital, while

pointed omnibus. "If, then, they do not all the traffic they should, it is owing to of causes than the so-called partial opening, is because travellers go cheaper another w. Now, credulous shareholders," he adds, "It to your liabilities, as swelled hy gross m management. Capital required, 4,427,60 will require for interest 232,7021, or upward 4,0001.per enter 523,7021, or upward 4,0001.per est bett 20,8001, per annum, or "4 per week to pay interest amounting to 4,00 per week." Among other charges against the rectors he brings that of "deluding the sha holders with the prospect of 6 per cent. didend on the original shares, whereas they get no dividend at all."—The tender Messrs. METROPOLITAN COMMISSION OF SEWERS.

A GENERAL court was held on Thursday, th 3rd inst., at the Court-house, Greek-street, Soho square; the Right Hon. the Earl of Carlisle in th

square; the Right Hon, the Earl of Carlisle in the chair.

The Jurisdiction of the Commission.—A report was presented from the special committee appointed to consider the conduct of John Merry, the foreman of pumps and hose, who was suspended for alleged misconduct in the use of that apparatu in Westminster, and who, for the nuisance occasioned, had heen fined 10s. by Mr. Burrell, the sitting magistrate. The committee now reportee that they had fully investigated the subject, and that the great halance of the evidence obtained was it favour of Merry; that the temporary nuisance was occasioned by a defective hose, which was immediately replaced by a proper one; and that large quantities of the decolorising fluid were used in the course of the operation. Therefore they recommended that the order for his suspension should he withdrawn, and that he he restored to his employment.

Mr. Hertslet, the clerk, in reference to this subject, reported, that since the last court a request having been received from Messrs. Evans, of Parliament-street, for the relief of a cespool on their premises by the pump and hose,—on their servants proceeding to the place with their apparatus, they were seized by the authorities of St. Margaret's parish, who expressed their determination to do so on every occasion where it was used in the daytine, viz., hefore eleven o'clock at night, or after five in the morning.

Mr. Lawes said this subject had occupied the attention of the Bye-Laws Committee, and they

viz., hefore eleven o'clock at night, or after hive in the morning.

Mr. Lawes said this subject had occupied the attention of the Bye-Laws Committee, and they thought that to give the court a greater prohability of success in their appeal against the magistrate's conviction on this subject, they should make a bye-law in reference to it. If the court at present possessed the power of cleaning cesspools in the day-time, that power would be strengthened by making the hye-law. The Pahlic Health Act regulated the time and manner of emptying cesspools, hy day as well as night, and it was highly necessary for the public interests that the Sewers Commissioners should exercise a similar power. He thought the best course was to give notice of a hye-law, and at the proper time to move its confirmation. He concluded by proposing a resolution to that effect.

Mr. Bullar seconded the motion.

Mr. Leslie remarked that, at a former court, he MY. Lessie remarked toat, as a tothic court, the ad urged the necessity of the court giving a written utbority to their officers to cleanse a particular esspool. Ile considered the shortest way was the est way, as they could arrive at the point much uicker to try their right. The parish authorities aid they had no power, but be believed they were ally authorised under the 49th section; therefore be

ally authorised under the 49th section; therefore be reged the court to make the order at once, and if he parties were dissatisfied, they could remove the uestion to the court of Queen's Bench. They ould make no bye-laws that were repugnant to the two first country, and without any, he believed hey had full power under the 49th section to order ny cesspool to be at once cleansed.

Mr. Grove said that a bye-law must be reasonable nd in conformity with the laws of the land; and that they were unable to do by their Act they could ot do by a bye-law. They could not take to themelyes that power that Parliament did not give them. Is he found a provision on this subject was considered in the Public Health Act, and was not in heir own, he thought the less they said upon the ubject the better.

Mr. Chadwick believed, if they were compelled

heir own, he thought the less they said upon the ubject the better.

Mr. Chadwick believed, if they were compelled of discharge their cesspools in the night-time, it would occasion great additional expense upon the ate-payers. He thought they might stand by the easonableness of the order and of the byc-law.

The Earl of Carlisle suggested, as doubts had risen on this point, whether it would not be desirble to have the opinion of counsel as to whether it was necessary to have a byc-law, or could the work so done without it. If there were doubts, be rusted they would not unnecessarily get into law, but do such works as were pressing by night, and in the meantime go to the Legislature for fresh bowers in an alteration of the law.

The mover and seconder of the resolution expensed their readiness to withdraw the same, and the suggestion of the Earl of Carlisle was embodied in a resolution—" "That, until further orders, all cesspools be cleaned at night." The resolution was unanimously adopted.

Public Commeniences.—On the motion of Mr. Bullar, the following resolution was carried;—

Public Conveniences.— On the model of an Bullar, the following resolution was carried:—
"That the officers of this commission do report on the conveniences, and the conveniences, and the conveniences, and the conveniences, and the conveniences and the conveniences.

"That the officers of this commission do report on the most eligible sites for public conveniences; and that they do place themselves in communication with the parcolaid officers for that purpose."

The Ordnance Survey.—A report was presented from the Ordnance Survey Committee, recom-mending that the maps of the three-mile radius of the survey, on the enlarged scale of 16 feet to the mile, should be engraved or lithographed, as the original plans would be greatly injured by frequent tractions.

traci

tracings.

Sir H. De la Beche produced a sheet on the enlarged scale, prepared, according to the order of the court, on the scale of 16 feet to the mile, executed by their own officers,—and a more beautiful work, he said, he had never witnessed. This work would be not of value alone to themselves, but would afford the greatest facility in all parochial matters for the supply of gas and water, and in the valuation of property. They would be no longer in the dark as to the fractional part of an inch, and could at once lay down, where desirable, drainage for any part of the metropolis. They would secure these enlarged plaus at an extra expense of 11, per acre, and that charge would be distributed over a series of years.

Mr. Chadwick said these plans would be very useful, even for the purpose of bouse-drainage.

Mr. Leslie expressed his entire approbation of the

work.

Proposed Drainage for Jennings's Buildings,
Kensington.—An elaborate report was presented to
the court by Mr. Gotto, surveyor, on the state of
the above locality, with a plan for its relief. This
place is remarkable from the fact that, in January
last, from the 17th to the 29th, twenty-two cases
of cholera occurred, of which ten were fatal, many
of the houses being very crowded, five or six persons occupying the same bed, and frequently two
or three families the same room. This overcrowding
would naturally predispose the inhabitants to cholera. or three families the same room. This overcrowding would naturally predispose the inhabitants to cholera, yet, in addition to this evil, there was scarcely any drainage, producing atmospheric impurities inviting disease, and upon which it may be said to feed. This locality is occopied almost exclusively by the lower class of Irish, and its dangerous condition has been several times reported upon by Dr. Grainger to the Board of Public Health. Mr. Gotto proposed to lay down a drainage at an expense of 285%, to be paid for by an improvement rate (the first application of this part of the new Act), spread over a period of twenty years, which would amount to only 4s. 4½d, per annum, or about 1d, per week per louse. per house.

per house. This report led to a conversation, in which the Earl of Carlisla, Mr. Cbadwick, Mr. Slaney, Mr. Leslie, and Mr. Bullar took part; when it was resolved, "That the recommendations of the surveyor as to works, improvement rate, &c., iu Jennings's Buildings, Kensington, be received, and copies of the report be distributed among the owners and occupiers of the property."

It was agreed that separate sewerage districts be formed, under the 34th section, Lord Carlisle urging the necessity of measures being taken to prevent the further pollution of the Thames. It was ordered that 800 feet of sewers be laid down in the main line of the Counter's Creek Sewer.

Books.

The Historic Lands of England. By J. B. BURKE, ESQ., author of the "Landed Gentry," &c. 2 vols. imp. 8vo. London, 1849. Churton.

This new and kindred effort of one already so well known as Mr. Burke is for his interesting labours in genealogy and other cognate sub jects, is likely not only to sustain but to en-hance his reputation as an antiquarian chro-nicler, while it also affords us evidence of nicler, while it also affords us evidence of other powers than those of a mere chronicler, the text being full of descriptive imagery, the well-told tale, the quaint quotation, and the poetic fragment of the olden time. That the author is deeply imbued with the right spirit for such a task, and that his labour is one of love, is evident. He chooses his subjects with discrimination, in general avoiding all that is not mellowed by historic interest,—no more allowing his course to be arrested by mere modern topics, "than the epicure," to use his own simile, "would pause in a well-filled wine-cellar on a pipe of new wine, when so many others of older vintage were demanding his attention." And many choice old tuns he taps. But, in the meantime, all that we can taps. But, in the meantime, all that we can offer our readers is a sample of the introductory foretaste.

"The subject we have undertaken to illustrate," he with truth remarks, "is one of great national interest. There is scarcely a village or nook in England that has not its local tradition or historical association; and numerous, indeed, would be the volumes necessary to do justice to so important a theme. All we can attempt in the following pages is to afford a rapid glance at the more striking spots of this fair realm, around which the halo of departed greatness sheds a peculiar attraction; and to give a of this fair ream, around winch the halo of departed greatness sheds a peculiar attraction; and to give a description of some of the most important 'historic lands,' referring, as copiously as our limits will permit, to the annals and ultimate fate of the various families which, in the course of time, succeeded to their possession, and enlivening the narrative with anecdotes and traditional reminiscences. If this contracts the register with anely of the property of the prop anecdotes and traditional reminiscences. It this endeavour be received with public favour, we hope, in subsequent annual volumes, to carry out the plan fully and completely; and thus to produce an amusing and comprehensive history of the celebrated estates of the kingdom."

The work is of course full of illustrations (some of which might be better), the type is clear and good, and with the general style of the 'getting up' of the book, does credit to the publishers.

Miscellanea.

MILITARY, NAVAL, AND COUNTY SERVICE CLUB-HOUSE.—The club-house at the Piccadilly end of St. James's-street, formerly known (not well known) as "Crockford's," has been taken by a club of military, naval, and military of the property of the strength of the property of the strength of the officers, and has been decorated and furnished in a costly manner. The walls of the library are sage green, with the mouldings gilt; the drawing-room cream-colour, mouldings very heavily gilt (the old ceilings, also heavily gilt, remain); and the writing-room has a deep gilt, remain); and the writing-room has a deep blue paper on the walls, cream-colour wood-work, and more gold mouldings. On the staircase, too, with very good marblings, it is gold, gold, gold; so that it might be thought, whether originally or now, that the tradesman, rather than the artist, had been the director of the works. The effect, nevertheless, is one of magnificence magnificence.

EMERSON'S PATENT MINERAL PAINT.— Some who have used this "Patent Mineral Paint" in place of tar for outhouses, fences, &c., give it so good a character, that we are led to name it to those of our correspondents who have inquired for some such cheap mate-

Manogany.—On Friday a sale of Honduras mahogany took place at Birkenhead. It was well attended, and the spirit of competition ran high. One of the cargoes offered, and sold without reserve, realized the high average value of 81d. per foot.

ELECTRO-TELEGRAPHIC PROGRESS,-ELECTRO-TELEGRAPHIC PROGRESS.—A gentleman formerly in the service of the Electro-telegraphic Company, who, he says, dismissed him in consequence of matters arising out of inventions of his which he calls "current deflectors," for the improvement, we presume, of the electric telegraph, has been lecturing of late against the electric telegraph altogether, and in favour of the hydraulic telegraph,—an invention, we believe, of Mr. Whishaw. The charges hrought against the electrant in ordinary use are, that it is liable whistaw. The charges mought against the telegraph in ordinary use are, that it is liable to continual disarrangement and uncertainty from fluctuations in the galvanic circuit, and the interference of atmospheric and terrestrial electricity, producing oscillations and variations of the needles, so that "a certainty of accutions of the needles, so that "a certainty of accuracy is what cannot be attained so long as the letters of the alphabet are signalled as they now are." The evidence of this brought forward by the lecturer is said to have been very convincing. Perhaps, too, he might have adduced the costly practice of repeating messages without which the company are said to refuse to guarantee the accuracy of their transmission. It seems to be a grave question, however, whether on the whole the hydraulic tion, however, whether on the whole the hydraulic telegraph would be a desirable substitute, even keeping in view the various other difficulties keeping in view the various other difficulties to contend with in the working of the electric, as also pointed out by the lecturer, such as accidents hy high winds, breakage of posts, twisting of wires, and loading and derangement of same with hardened snow, &c.; or the complex arrangement of signals, and accidents in the use of the battery. The hydraulic telegraph, described by him, consists of two cylinders, one at each of two stations, consected by a water-light the. In each cylinder rected by a water-tight tube. In each cylinder is a free moving piston surmounted by its rod, connected to which is the index or pointer, running up and down a graduated scale. That used by the lecturer was the complete alphabet used by the lecturer was the complete appander of twenty-six letters, a sign for 'stop,' and the ten numerals. He pointed out how words were to be spelt and read off with scarcely the probability of error. It was also possible to represent entire words, and every letter might be used as a station signal. Modes of preserving the water from frost, and of ascertainserving the water from rost, and or ascertaining the point at which any accident may have occurred, and leakage taken place, were alluded to, and a patent for a plan by which he should be able to print, not, as by Mr. Brett, merely with marks in a straight line and requiring the essistance of several persons, but so as to be assistance of several persons, but so as to be carried on, although no person was at the station to which the message was to be sent. He could also communicate with any number of could also communicate with any number of stations, or select any particular one from the whole. He said the expense of the electrotelegraphic system, where the wires were suspended, had been about 260*l*, per mile, and was now, he believed, about 200*l*,—cost of street work, 616*l*. The hydraulic system, however, would only cost 60*l*. per mile, and would not be a suspension but a subterranean plan.

plan.

Speedy Suppression of Fire in a Coal Mine. — The proprietor of a mine near Manchester describes, in the Times, the means whereby Mr. Goldsworthy Gurney has lately effected this important object. In place of either shutting up the mine and keeping it so for marking the propriets for years, and but the either shitting up the mine and keeping it so for months, sometimes for years, and but too often after all unavailingly, or filling it with water at an enormous loss,—Mr. Gurney, by means of a furnace, tank, cylinders, and other apparatus, filled the mine and its galleries and lateral workings, three miles in length, with carbonic acid and nitrogen gases, or, almost literally, with choke damp,—completely extinguishing all vestige of fire. An equal quatity of fresh air was then thrown in by help of the same apparatus, and the choke damp thus expelled, and the mine so well ventilated, and expelled, and the mine so well ventilated, and rid of fire-damp as well as choke damp, that in two days from the commencement of the operations the miners were at work throughout the mine with naked candles! It is "a public remedy for a national loss," as remarked by the grateful owner of the mine in which this inven-tion has been thus for the first time so successfully tested. And henceforth "the mineral property of the kingdom has been insured against the destructive element of fire." Our readers will remember a suggestion to this effect, as referring to ships, discussed some time ago in

our pages

PROJECTED WORKS .-- Advertisements have been issued for tenders,—by 19th inst., for the erection of a district church in Brompton. Middlesex; by 21st inst., for the erection of a new vicarage-house, &c., at St. Neot's, Huntingdonshire; by 21st inst., for building 800 feet of brick sewer at Notting-hill; by 16th inst., for sinking a well, and other works, in High-street, Norton-folgate; by 28th inst., for The rection of an engine-house, boiler-house, &c., at the water-works, Stone Ferry, near Hull; by 23th inst., for the construction and erection of pipes and fittings for the baths and erection of pipes and numes for the baths and wash-houses now huilding in Treppet-street, Kingston-upon-Hull; by 21st inst, for the erection of additional buildings at Hambledon Workhouse; by 24th inst, for the supply of granite, gravel, &c. to the parishes of St. Gilesinston, Bulley, and St. Gangara's Milesynburg. in-the-Fields and St. George's, Bloomsbury; by a date not specified, for the erection of a chapel at Gunthorpe, in connection with the parish of Lowdham, Nottingham; by 17th inst., for repairs to Middle-bridge, Romsey Infra; by same date, for executing certain works at various public building in Southampton; and by 16th, for the supply of British iron, bellows, &c., for the East-India Company.

COMPETITION .- Premiums of 151, and 101. are offered for the two best plans for repewing that portion of Northfleet Church, Kent, at present pewed, and pewing that portion not

hitherto pewed.

INSTITUTION OF CIVIL ENGINEERS On the 8th inst, the discussion on Mr. Crampton's paper, "On the Construction of Locomotive Engines," was continued, without arriving at any definite result, other than that desirable in all engines to lower the a desirable in all engines to lower the centre of gravity, in order to establish a great angle of stability, and to arrive at a ratio between the circumference of the driving-wheel and the cubic content of the cylinders, such as whilst the greatest speed might be maintained with an economical consumption of fuel, every facility should be afforded for of ited, every mainly should be anorated for starting rapidly. A short paper was read, de-scribing a kind of permanent way, which had been somewhat extensively laid down on the Lancashire and Yorkshire, and other railways, in the north of England, by Mr. Houldborn, "Continuing the control of the control other railways, in the north of England, by Mr. Hawkshaw. The principle was that of a bridge rail, weighing seventy-five pounds per yard, placed upon continuous longitudinal timber bearing, and the novelty consisted in having at each joint a malleable iron plate chair, with a projection on the upper surface, fitting within the interior of the rail, and the flanches which were fourtening the properties. and the flanches, which were fourteen inches long by eight inches wide, and half an inch in thickness, attached to the rail by rivets in such a manner as to fix them firinly together, and yet to allow for the expansion and contraction caused by the variations of temperature. The paper announced to be read at the next meeting of Tuesday, May 15th, was "On the Theory of Transverse Strain of Cast-iron Beams," by Mr. W. T. Doyne.

FREEMASONS OF THE CHURCH.—A meet-

rheemasons of the Church.—A meeting of this institution was held on May sth, the Rev. George Pocock, Vice-President, in the cluir. Mr. W. H. Rogers exhibited two elaborately carved hoxwood friezes executed by his father for her Majesty the Queen; a'so a curions ancient vase of "faience de Nevers" and a Byzantine figure of the Blessed Virgin, of the 12th century, both the property of Messrs. Falcke, together with an enlarged drawing, taken by himself, from the coronet of the figure, showing the care and taste which in the middle ages were expended on the minute details of works intended for sacred use, Mr. C. H. Smith offered some observa-tions on the great importance, for the sake of truth, of preserving all records of date or origin which may attach themselves to such relics as the figure contributed by Mcssrs. Falcke, and urged it as the duty of the society to inquire into the histories of any similar objects exhibited at its chapters. Mr. G. R. French then delivered a discourse on "Roman

Architecture."

A VALUABLE PICTURE has been discovered A VALUABLE FIGURE has been discovered at Leeds, according to the local Intelligencer, in one long deemed valueless. It is said to be one of Gerard Lairope's. The subject (the Abduction bf Ariadne, by Bacchus), consists of twenty-two figures, grouped and painted in the manner of Nicholas Poussin.

BRICK DUTIES .- I was glad to see, in a late number, the smalluess of the amount received from the duty on bricks. I hope that it will induce the Government to relin-quish the duty as early as possible, as it causes the bricks to be twice the price they would be if free from duty, and prevents persons making them where they intend building, which would be done in many cases if it could be done without having the exciseman to contend with, which few men with small capital choose I have many times carted brick-earth away from places where there has been a basement story with cellars to the buildings, and had bricks brought 70 miles, by water, besides having to pay for unloading, cartage, &c., which cause great waste of time and materials. We know that it is the wish of most persons to improve the condition of the working man, and many plans have been mentioned as likely to do so: I know of no step so likely to do this as the repeal of this duty, as we know that most of the working classes are laudably anxious to bave a house of their own, and would exert themselves every way to get one, which is proved by the number of building societies established amongst us. It would also benefit the ground landlords very materially, by causing land now letting as grass land for 5l. or 6l. per acre to be worth 50l. or 60l. per acre, besides the reversion. 50l. or 60l. per acre, besides the reversion, which would be the case if the cost of building was lowered, as it would enable persons to make roadways to ground lying a distance from the public roads. It would also give scope to the enterprise of our industrious middle classes, and instead of calling upon them to leave the land of their birth to improve other lands, they might benefit their own.--*

Excise Information against a Brick-MAKER.—On Wednesday, at the Wolver-hampton Public Office, before John Leigh, G. B. Thorneycroft, and John Barker, Esqrs., Mr. John Guest, brickmaker, of West Bromwich, was charged by Mr. Coomber, Super-7,000 bricks, with wilfully concealing about 7,000 bricks, with intent to defraud her Majesty's revenue. Besides the penalty, the information sought a forfeiture of upwards of 20,000 bricks, which were alleged to have been used in concealing the 7,000. The magistrates, however, did not consider the proof on this point sufficient to warrant them in declaring the bricks to be forfeited, and after hearing Mr. T. M. Whitehouse for the defence, fined the defendant in the mitigated penalty of 25%.

INSTITUTION OF MECHANICAL ENGI-NEERS.—The general meeting of the members of this institution was held in the theatre of the Birmingham Philosophical Institution on Wednesday week, Mr. Robert Stephenson, M.P., the newly-appointed president, in the chair. Mr. Baines, of Norwich, entered into explanations relative to his impressed reliance. explanations relative to his improved railway chairs and switches. A paper by Mr. Weal-lens, of Newcastle, "On an Express Locomo-tive Engine" was read, and was followed, as some of the other papers were, by a lengthened discussion. A paper, by Mr. Henry Smith, of West Bromwich, "On a new Solid Wroughtiron Wheel," was then read, and a vote of of West Bromwich, "On a new Solid Wrought-iron Wheel," was then read, and a vote of thanks accorded. The next paper was "On the Construction of Permanent Way," by Mr. Hoby, of Brighton. "A paper, by Mr. Ramsbottom, of Manchester, "On an Im-proved Locomotive Boiler," was postponed till next meeting. A number of new members were halletted for and elected were ballotted for and elected.

BRIDGEWATER CHURCH COMPETITION. I observe in a retired page of your journal, which sometimes does not in the far west reach which sometimes does not in the rar west reach us till three or four days after publication,* an extension of time in Bridgewater Cburch competition. Being one of the parties who hurried his plans in by May 1, I naturally demand what is the use of this public advertisement on the 5th unless to advertisement on the 5th unless to advertisement on the 5th unless to advertise ment of the state o tisement on the 5th, unless to advantage some favoured individual. The time given was favoured individual. The time given was ample, even for designing a new church. Pray, Mr. Editor, plead for fair play for us in that voice wherewith you are wont to espouse the cause of competing architects generally, and for which you have the cordial thanks of yours faithfully, A GREAT WESTERN.

* This is the fault of the parties through whom it is obtained, -ED,

Sanitary Inquiny at Birmingham.
Mr. Rawlinson proceeded on Monday week to complete his adjourned inquiry, as surveyin inspector for the Board of Health. Various control of the statement of the Board of Health. parties were heard as to local nuisances, and discussion took place as to houndaries. The state of the Worcester Canal and its vicinit was complained of, and Mr. Beilby blame "parties so indiscreet as to take land at a hig price for building purposes, without requirun the owner to make any provision for drainage. A deputation from the new board of guardian attended. The inspector, in asking for returns &c. from them, observed that as we had carrie our civilisation so far as to take good care cour paupers and criminals, the Board of Healt our paupers and criminals, the board of Heart would now take good care of those who wer honest. The inquiry itself was formally close on Wednesday, but during the rest of th week Mr. Rawlinson was engaged in a person inspection of the town and outlying hamlest more especially with a view to determine the houndaries within which the Sanitary Act shall boundaries within which the Sanitary Act shal be brought into operation.

SALE OF WORKS OF ART AT ROME .-SALE OF WORKS OF ART AT KOME.— It is said that upwards of 40 boxes, containing sacred vases, marbles, statues, and pictures have been sequestered by the French custom office. These articles were purchased at Roun by an association of German Jews, formed a Frankfort, under the direction of M. Brucker. The advantageous terms on which Mr Francis Warton had obtained the Virgit and Angels of Benvenuto Cellini had excited and rangers of behiving the merchants of works of art. The catalogue of articles sold by the Revolutionary Government of Rome amounts Revolutionary Government of Rome amounts, it is said, to 2,500; they only produced 3,000,000f, although worth 10,000,000f, at least. Their restitution will not be easily effected, though the names and addresses of the buyers are inscribed on the margin of the catalogue.

catalogue.

Important to House-Agents.—At Nisi
Prius, before the Chief Baron, a case was recently tried which mainly turned on the fact
that the plaintiff, proprietor of a furnishedhouse to let, while employing a honse-agent,
also made personal inquiries as to the sufficiency of the means of a tenant, and expressed
herself satisfied, on which the agent, after
also making inquiries, let the house. It shortlyl
afterwards appeared that the tenant was insolvent, and had even been in confinement
immediately previous to the letting. Plaintiff
therefore claimed compensation for neglect on therefore claimed compensation for neglect on therefore claimed compensation for neglect on the part of defendant; but the judge appeared to be of opinion that the plaintiff was quite out of court, having inquired herself, and the jury returned a verdict for the defendant.

GUILDFORD DRAINAGE PLANS .-- After long hesitation, the various plans for the drainage of Guildford, sent in competition, were submitted by the Committee to Professor Were submitted by the Committee to Processor. Hosking for examination, to assist them in making the award. It will be seen by an advertisement that three plans have been selected for final consideration, marked "Pioneer," "Specula," and "C. Engineer."

NOTICE.

On May 1st was published, Part I., price 2s. 6d., of "Buildings and Monuments, Modern and Medleval:" being Illustrations of recentlyerected Edifices, and of some of the Architectural Works of the Middle Ages, with Descriptive Particulars. Edited by George Godwin, F.R.S., Fellow of the Royal Institute of Architects, &c.

No. CCCXXVIII.

SATURDAY, MAY 19, 1849.

HE announcement of a new book on architecture by Mr. Ruskin, the author of "Modern Painters," at first known only as "an Oxford Graduate," has,

douhtless, excited the curiosity of such of our readers as are acquainted with the latter remarkahle and interesting work. Mr. Ruskin has long given attention to the picturesque in architecture. He wrote the series of papers "On the Poetry of Architecture," signed Kata Phusin, in Loudon's Magazine (if we remember rightly), and we anticipated much gratification in the perusal of his more extended observations and matured opinions.

The volume has come into our hands too recently for a careful examination of all the writer's views on the present occasion, and we must content ourselves mainly with giving some idea of the contents of it.

The title is a taking one,—"The Seven Lamps of Architecture."* It sounds romantic, recalls Aladdin, and, moreover, is not at once understood, and so whets curiosity. What are these lamps? say many :- they are lamps which, of themselves, throw no light on the author's meaning. Let us give them some oil. The author's endeavour has been to extricate from the confused mass of partial traditions and dogmata with which the art of architecture has become encumhered, those large principles of right which are applicable to every stage and style of it,-to determine, as the guides of every effort, some constant and general laws of right, based upon man's nature, and not his knowledge. To do this would indeed he something. "Their range," he says, "necessarily includes the entire horizon of man's action. But they have modified forms and operations helonging to each of his pursuits, and the extent of their authority cannot surely be considered as a diminution of its weight. Those peculiar aspects of them which helong to the first of the arts, I have endeavoured to trace in the following pages; and since, if truly stated, they must necessarily he, not only safeguards against every form of error, but sources of every measure of success, I do not think that I claim too much for them in calling them the Lamps of Architecture."

And thus the author names them,—The lamp of Sacrifice, the lamp of Truth, the lamp of Power, the lamp of Beauty, the lamp of Life, the lamp of Memory, and the lamp of Obedience; or, as they stand on the cover of the book, Religio, Observantia, Auctoritas, Fides, Obedientia, Memoria, and Spiritus. From this the tone of the work may be pretty guessed at; this is a brick from which the character of the house may be judged.

Enthusiasm, strong convictions, and high religious feelings, mark the work; and though we are disposed to think they have carried the author in parts out of the regions of plain sense, claim attention and consideration. He enters upon the task almost solemnly; says the aspect of the year is full of mystery, the

* "The Seven Lamps of Architecture." By John Ruskin, gathor of "Modern Painters." London, Smith, Elder, and Co. 1849.

weight of evil against which we have to contend, increasing like the letting out of water, and that it is no time for the idleness of metaphysics, or the entertainment of the arts. There is no action so slight that may not be done to a great purpose, nor any purpose so great hut that slight actions may he so done as to help it much, "especially that chief of all purposes, the pleasing of God." To the strength of this motive, desire to please God, he attributes the excellence of the mediæval structures; on this ground he calls for "the offering of precious things, merely hecause they are precious, not hecause they are useful or necessary," and condemns, as others have done hefore him, the "nicely calculated less or more," in church huilding. It is not the church we want, hut the sacrifice; not the emotion of admiration, hut the act of adoration; not the gift, hut the giving." Without advocating meanness in our own dwellings, he would get rid of "cornicings of ceilings and graining of doors, and fringing of curtains, and thousands such; things which have become foolishly and apathetically habitualthings on whose common appliance hang whole trades, to which there never yet helonged the blessing of giving one ray of real pleasure. or becoming of the remotest or most contemptible use,-things which cause half the expense of life, and destroy more than half its comfort, manliness, respectability, freshness, and facility." And he says that "the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, huild a marble church for every town in England; such a church as it should he a joy and a hlessing even to pass near in our dady ways and walks, and as it would hring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs. I have said for every town: I do not want a marble church for every village; nay, I do not want marble churches at all for their own sake, but for the sake of the spirit that would build them."

The two conditions which he considers enforced hy the spirit of sacrifice, are, first, that we should in everything do our hest; and, secondly, that we should consider increase of apparent labour as an increase of beauty in the building.

" For the first: it is alone enough to secure success, and it is for want of ohserving it that we continually fail. We are none of us so good architects as to he able to work hahitually beneath our strength; and yet there is not a building that I know of, lately raised, wherein it is not sufficiently evident that neither architect nor huilder has done his best. It is the especial characteristic of modern work. All old work nearly has been hard work. It may be the hard work of children, of barbarians, of rustics; hut it is always their utmost. Ours has as constantly the look. of money's worth, of a stopping short wherever and whenever we can, of a lazy compliance with low conditions; never of a fair putting forth of our strength."

The extent to which the author would carry this out is shown hy his remark, "that whenever, hy the construction of a building, some parts of it are hidden from the eye which are the continuation of others hearing some consistent ornament, it is not well that the ornament should cease in the parts concealed; credit is given for it, and it should not he deceptively

withdrawn: as, for instance, in the sculpture of the backs of the statues of a temple pediment; never, perhaps, to he seen, hut yet not lawfully to he left unfinished."

It is scarcely necessary to say that all imitations and architectural deceits are denounced, as positive sin: and though we do not view the question in quite so serious a light (we have more than once fully argued the subject), we go with him when he says,

" For, as I advocated the expression of the Spirit of Sacrifice in the acts and pleasures of men, not as if thereby those acts could further the cause of religion, hut hecause most assuredly they might therein be infinitely ennohled themselves, so I would have the Spirit or Lamp of Truth clear in the hearts of our artists and handicraftsmen, not as if the truthful practice of handicrafts could far advance the cause of truth, but hecause I would fain see the handicrafts themselves urged by the spurs of chivalry; and it is, indeed, marvellous to see what power and universality there is in this single principle, and how in the consulting or forgetting of it lies half the dignity or decline of every art and act of man.'

We may convey our author's opinion on the limits of license, by saying that if graining he so ill done that no one can mistake it for the wood it represents, it is lawful, hut if so good as to deceive it is illegal and a lie!

The use of cast work he considers a downright and inexcusable falsehood. "You use that which pretends to a worth which it has not, which pretends to have cost, and to he, what it did not, and is not: it is an imposition, a vulgarity, an impertinence, and a sin. Down with it to the ground—grind it to powder," &c. &c. Down with it to the ground if you like, when you can put something hetter in its place. We have no love for cast work, generally speaking; but we cannot afford to give it up altogether, and as to calling it a sin (except in many cases against good taste and propriety), we would not venture on such a step.

No one is ever deceived into taking "compo" for stone: it is exactly what it seems to he —"compo," and (like Wordsworth's yellow primrose) nothing more. It has many sins to answer for; hut still it would not be wise to give it up.

The use of cast-iron he considers one of the most active causes in the degradation of our national feeling for beauty.

In designing, the author thinks light and shade the great points to be considered: "after size and weight, the Power of architecture may he said to depend on the quantity (whether measured in space or intenseness) of its shadow;" and he urges, that among the first hahits that a young architect should learn, "is that of thinking in shadow, not looking at a design in its miserable living skeleton; but conceiving it as it will be when the dawn lights it, and the dusk leaves it."

No matter how common or clumsy the means,—so that shadow be got, our author is satisfied; he seems to attach little value to the beauty resulting from proportion, fitness, and propriety;—he finds charms only in the massive, the rude, or the ruined.

In treating of heauty, Mr. Ruskin, insisting on the fact that "all most lovely forms and thoughts are directly taken from natural objects," assumes the converse of this, namely, "that forms which are not taken from natural objects must be ugly," and then attacks the Greek fret, on grounds which cannot be admitted as valid. He says, — "The first so-called ornament, then, which I would attack is

that Greek fret, now, I believe, usually known by the Italian name Guilloche (!), which is exactly a case in point. It so happens that in crystals of bismuth, formed by the unagitated cooling of the melted metal, there occurs a natural resemblance of it almost perfect. But crystals of bismuth not only are of unusual occurrence in every-day life, but their form is, as far as I know, unique among minerals; and not only unique, but only attainable by an artificial protess, the metal itself never being found pure. I do not remember any other substance or arrangement which presents a resemblance to this Greek ornament; and I think that I may trust my remembrance as including most of the arrangements which occur in the outward forms of common and familiar things. On this ground, then, I allege that ornament to be ugly; or, in the literal sense of the word, monstrous; different from any thing which it is the nature of man to admire; and I think an uncarved fillet or plinth infinitely preferable to one covered with this vile concatenation of straight lines: unless indeed it be employed as a foil to a true ornament, which it may, perhaps, sometimes with advantage; or excessively small, as it occurs on coins, the harshness of its arrangement being less perceived."

First, the fret is not known as the guilloche: the two are quite distinct, the latter being no " concatenation of straight lines" at all ("vile" or otherwise), whatever the fret may be.

The fret, our readers will scarcely need to be told, is formed of one or more fillets meeting each other vertically and horizontally, whereas the Gudloche is formed by two or more bands twisting over each other so as to repeat the same curved figure by the spiral returning of the bands.

Passing over this, however, are all geometrical patterns to be condemned as "monstrous," if not taken from natural objects and composed of curves?

Architecture, as the author is forced to admit, deals necessarily with straight lines, and with forms which have no precedent in

Mr. Ruskin lays down as "a law of singular importance in the present day, that we are not to decorate things belonging to purposes of active and occupied life." "Wherever you can rest, there decorate; where rest is forbidden, so is beauty." Adorned shop-fronts are abominations in his eyes; and as to railroad stations,-but let him speak for himself :-

"Another of the strange and evil tendencies Another of the strange and evil tendencies of the present day is to the decoration of the railroad station. Now, if there he any place in the world in which people are deprived of that portion of temper and discretion which are necessary to the contemplation of heauty, it is necessary to the contemptation of hearty, it is there. It is the very temple of discomfort, and the only charity that the builder can extend to us is to show us, plainly as may be, how soonest to escape from it. The whole system of railroad travelling is addressed to system of railroad travelling is addressed to people wbo, being in a hurry, are therefore, for the time being, miserable. No one would travel in that manner wbo could help it—wbo had time to go leisurely over hills and hetween hedges, instead of through tunnels and hetween banks: at least those who would, have no sense of beauty so acute as that we need consult it at the station. The railroad is in all its relations a matter of express business, to be its relations a matter of earnest business, to be got through as soon as possible. It transmutes a man from a traveller into a living parcel. For the time he has parted with the nobler

which you endeavour to do so. There never was more flagrant nor impertinent folly than the smallest portion of ornament in any thing concerned with railroads or near them. Keep them out of the way, take them through the ugliest country you can find, confess them the miserable things they are, and spend nothing upon them but for safety and speed."

We have great respect for our author; his eloquence and earnestness in parts have warmed and delighted us: but we cannot avoid saying that, to our poor comprehension, this last paragraph is simply nonsense.

THE ROYAL ACADEMY EXHIBITION.

Such an exhibition as the present ought to source of gratification to all interested in the progress of British art. Each successive visit brings fresh conviction of its excellence. Notwithstanding the ohservable absence of Maclise, and the weakened efforts of absence of Maclise, and the weakened efforts of Etty, no other nation could produce in a collection of the year so large a number of works of art of such pretensions. High art is ably supported by Mr. Herbert and a few others this year, whilst the poetry of Messrs. Stanfield and Danby's noble landscapes, and the intense feeling and elevated intention so elaborately yet graphically worked out by Mr. E. M. Ward, in bis picture of "De Foe," almost entitle them to be considered in the same category. A them to be considered in the same category. A feeling seems obviously to have arisen that a dip into past catalogues, or a selection from the old repertoire of subjects, will no longer pass current with the public, who are becoming

discerning.

Amongst the strictly historical pictures, Mr. Amongst the strictly historical pictures, Mr. Egg, A. (8), "Henrietta Maria in distress, relieved by Cardinal de Retz," has high claims to praise; in fact, as far as colour and painting are to be considered, it is perfectly wonderful, but the conception of the desolate queen does not please us. The same artist has another extraordinary picture for colour and execution, evidently founded on Paul Veronese,—(473), "Launce's substitute for Proteus's dog," Mr. Egg exhibits painstaking and research in all his productions, in these last particularly, and great power over the mechanical part of the profession. (13) "The Desert,"—a dead lion, painted with Landseer's sweeping pencil, has not that charm

Landseer's sweeping pencil, has not that charm which belongs to the majority of this artist's work. which belongs former agority of this arcses sworks. Through accident, portraits of M. Guizot and Prince Metternich form pendants on either side of this dead representative of royalty. (23) "Religious Controversy in the time of Louis XIV.," A. Elmore (A.), is a work of art considered to a new green dead to the conditions. (23) "Religious Controversy in the time of Louis XIV." A. Elmore (A.), is a work of art creditable to any age, characterized by qualities of the highest order. The head of the Protestant clergyman,—indeed, the whole figure,—is finely conceived; the composition of the heads to the right of the spectator, strikingly beautiful; and the drapery of the cardinal, to the left, is painted in a masterly manner. The figure of the boy whispering to the gorgeously-attired lady, and, amongst the accessories, the table-cloth and carpet, with the back ground generally, exhibit great facility and knowledge. (378) Subject from Tristram Shandy, out of the artist's way, is not equal to some other productions; whilst (71) "Lady Macbeth," though melodramatic and exaggerated, is an extraordinary piece of painting. (43) "Omnia Vanitas," W. Dyce, R.A., represents a female in the zenith of her charms, with a skull on which her hand is resting. It is beautifully painted: the drawing of the arm a skull on which her hand is resting. It is beautifully painted: the drawing of the arm

seems questionable.
(60) "Amoret Chained," by Etty, R.A. (60) "Amoret Chained," by Etty, R.A., may not be compared with former works by this master; nevertheless the flesh tints are scarcely to he surpassed. (72) "Lear Disinheriting Cordelia," by J. R. Herbert, R.A., in progress in fresco in the new Houses of Parliament, is wonderfully grand in treatment, and brings back to memory some of the past great ones. Such a production is an honour to the time. The austere old king, devoid of strained exaggeration, presents the crown to the already For the time he has parted with the nobler characteristics of his humanity for the sake of a planetary power of locomotion. Do not ask him to admire any thing. You might as well ask the wind. Carry him safely, dismiss him soon: he will thank you for nothing else. All attempts to please him in any other way are mere mockery, and insults to the tbings by

A picture on a loftier theme (489), "The Outcast of the People," by the same painter is still more elevated in its character, an may almost be called sublime.

may almost be called sublime.

A covetable and delicious picture is (106 "The Forester's Family," by E. Landsecr, R.A A lovely heather belle feeding fawns, the assemble around her with all their characteristic half-timidity and half-confidence, rub bing the fodder she is loaded with, whils others are trotting up to receive the accus tomed caress from the well-known hand. Th upper part of the girl's figure seems somewha small for the size of her feet and length o limb. (196) "The Free Church" is anothe beautiful contribution by the same painter; the head of the girl in this is a sweet study of a brunette. (127) "The Syrens Three," W. E Frost, (A.), is scarcely up to the usual mark notwitbstanding its many excellences and Frost, (A.), is scarcely up to the usual mark interest and beauties, whether from its being in juxtaposition with Mulready, it looks blacker than usual, and cold compared to the luminous back view (135) "Women hathing." Mr. Mulready in this walks out of his beaten path to exhibit his proficient knowledge of art in all its branches. Perfect drawing and close observance of natural action are the most apparent qualities of this masterpiece.—a severe rent qualities of this masterpiece,—a severe lesson to the student of the nude figure. Professor Leslie produces a picture from his favourite "Don Quixote," wherein his taste,

his favourite "Don Quixote," wherein his taste, humour, learning, and the apparent ease with which he works pre-eminently shine forth. (141) "The Duke's Chaplain, after attacking Don Quixote for his devotion to knight errantry, and Sancho for his belief in his master, reprimands the Duke for encouraging their fancies, and leaves the company in a passion." The expression of extreme disgust and content of the choleric chaplain, the and contempt of the choleric chaplain, the refined mirth of the duchess, the ill-concealed laughter of the duke, the affronted dignity of laughter of the duke, the attronted dignity of the chivalric knight, and the astonishment of Sancho, are rendered with astonishing truth, whilst the suppressed risibility of the domes-tics inclines the spectator to wait until they gave vent, so truthfully is it portrayed. Mr. Leslie is the leader in genre painting, and has made Cervantes and Le Sage almost his own by strictly working out their texts. A smaller by strictly working out their texts. A smaller picture from Henry VIII., by the same painter (55), is a genuine embodiment of Sbakspeare.

THE ARCHITECTURAL ROOM.

(1015) "Private chapel and cemetery recently erected at Carnsallock," by E. B. Lamb, is designed with Mr. Lamb's usual propriety. It is decorated in style; and the pointed arch over the doorway is filled with tracery, and serves as a window. The same architect exhibits "The selected design for the Judges' Lodgings, about to be erected at Aylesbury," a plain substantial building of brick in appearance are deciried. the Judges' Lodgings, about to be erected at Aylesbury," a plain substantial building of brick, in appearance as close upon a prison as a judge is to a prisoner. (1021) and (1022), two interiors of "Ormond Quay New Church, Dublin," are perfect abominations. On what grounds they were admitted, to the exclusion of better things, and moreover placed in one of the best situations, it is difficult to guess. (1038) "Design for the Normal College, Swansea" (to which the second premium was awarded), by R. A. Potter, is Tudor in character and not without merit. The title of (1043) "Proposed Foundation of an Archway in the front of St. Benet, Gracechurch-street." by E. Panson, jun, seems scarcely a right description, if the drawing show, as we understand it to do, the alteration proposed to be made in the lower part of the tower itself, so as to admit of a public passage-way through the side and front of it, for the improvement of the thoroughfare. Mr. Panson has a second drawing, "The Front of the Branch Office of the Argus Lafe Office, Pall-mall" (1118).

(1044) "Meanwood Church, erected near Leeds," by W. Railton, is Early English, with high-pitched roof, and of better character than some of this architect's other works in the same style. (1064) "The New Chapel of Ripon Palace," by the same, is Perpendicular, and includes carved throne, reading-desk, and altar rail. (1050) "South-east View of a Design, Celsus, for the Small-pox Hospital," by G. Low, represents a building which is exhibited in another part of the room as by R. H.

Shout (1,148): it is Elizabethan, with cortile; has a square turret at each end, octagonal lantern in the middle, and two projecting buildings in centre of the long front, with entrance gateway between them. (1060) "The Terrace now erecting at Windsor, on the road to Ascot," by S. S. Teulon, is of Tudor design (with range of gables), and red brick construction. (1103) "Schools recently erected in the Village of Roby, Lincoln," and (1161) "Schools recently erected at Elvetham Park, Hants," are by the same architect and in the same style, cleverly treated. (1073) "A Design for the proposed Restoration of the Poultry Cross, at Salisbury," is nicely drawn by O. B. Carter. (1074) "Interior Part of the New Buildings at East Sutton, Kent, the seat of Sir Edmund Filmer, Bart.," by C. J. Richardson, is so placed that it can scarcely be examined, but being in the style with which Mr. Richardson is thoroughly embued, may safely be pronounced satisfactory. (1179) by the same, "Designs for Villas in various Elizabethan Styles," would delight old Thorpe, but are not what we wish to see revived. (1091) "Design for a building for the reception of the Vernon gallery, and other productions of modern painters," by R. M. Phipson, must surely be miscalled; it has a rustic character, and might be taken for the market-house of a provincial town. (1108) shows the "North end of the great hall, Enston station," by P. C. Hardwick, whereof we in our present number give a representation, and express an opinion.

representation, and express an opinion. Enough for the present.

THE HIEROPHANTINE FRAGMENTS.

THE following are eight fragments from the archives of Hierophantus, master architect of the pre-Adamite schools of the Dom-Daniel:-

Whatever ye do, Work solid and true, Go thorough and through.

II.

If a zealous Fellow-craft have not the patience of a dog, he will lead the life of one. III.

Never ride the free horse down.

IV.

He that would keep a fortress this must do,—Casemate his flanks, and flank his casemates too.

v. Consider what you undertake, And analyse it well; And ever work from Whole to Part— Grand principle of master art— That makes that work to tell.

VI.

Tell me not "I bave no ground!"
"There's no foundation to he found!"
If the ground is there,—you take it;
If the ground is not,—you make it.

Hold on in office—just as long
As health is good and nerves are strong:
That is, for health; whilst the complexion
Hath yet the "Carrot" in perfection:
Parsnips' or parchment's neutral tint
Cadaverous, give more than hint
*

Mistake the knowledge of routine For deep and sage experience a last farewell
To thought deliberate and cool reflection. Passed Tension's modulus verve—

VIII.

Eschew the hollow work !\(\frac{1}{2}\)—bead, heart, or wall—Folly or fraud involve the certain fall.

How stands the torrent's force, the flinsy dam? How stands the ill-hull wall, the battering ram? Low though the stated cost,—low the deceiver's

bow; Smooth though the offer be,—smooth as the servile brow

The CRAFT'S dishonoured! by the crooked bent

. . denote lines so blotted and fisheaten as to be illegible.

† An ancient and venerated predecessor of Hierophantus, celebrated for his constructional knowledge.

! No offence to patent hollow bricks of all sorts.

Of knaves who from the first unfairly meant To carry out the ill-conceited pact
In towers tumbling, and the walls all cracked,—
Crumbling cement,*—a quick-sand treacherous

A beart of rubbish, and a shiner † face,—
Their own vile image and (unfelt!) disgrace.

These are all the fragments that our diving-bell swept over; and they owed their protection to having been encased and petrified in a huge pinna that had contrived to bolt, though it could neither masticate nor digest them.

Judging from circumstances, it would appear that the last of these lines were written not many centuries before the Dom. Daniel

not many centuries before the Dom. Damei vaults were blown up by Thalaba.

Dr. Southey bas been at much pains to mystify this Tbalaba, the mystic and professional progenitor of Major-General Sir C. Pasley, of voltaic and otherwise well-earned celebrity. The Dom-Daniel fell from a schism is the aversignth degree of the property of the programme in the worshipful body-corporate; they broke gradually and virtually into "conservatives and abolitionists."

Now, young Thalaba was sub-prefect of the

gradually and virtually into "conservatives and abolitionists."

Now, young Thalaba was sub-prefect of the demolitors, corresponding, I presume, to a major of miners and sappers and engineers—(is that one regiment or two? I can't inake it out at all!)—who engaged to play the Guy Fawkes to the old "conservatives" when assembled in conclave under the august presidency of that Megatherium of self-impostors, the imperative, the potential, and pot-bellied Magnarch,—HURLOTHRUMBO SMELL-FUNGUS SAP,\$—very limited, and therefore very conceited: ex officio, privileged to be dictatorial and pragmatic.

This dignitary, by the way, was the son of a dirty servile election-jobber, who contrived to force his scion into a place unsuited to his age, education, or natural ability:—hence this piece of sappy "albern" albernum, was constantly verging towards the dry-rot and dotage so remarkable in unsound beech:—from under a pair of ragged bushy eye-brows and enormous round spectacles, be was fond of proclaiming himself to be a "matter-of-fact man of plainsense, and v-a-i-r-y few words indeed!" His answer in all cases beyond mere routine, was a negative, in a portentous oracular tone, delivered slowly over a double chin from the back of his tbroat and the bottom of his belly, to the following effect: "It-is-un-u-su-al, and THEREFORE cannot be re-com-mend-ed!" He was just the type of that curse of so man public offices,—the class of man specified in Fragment VII. as ever confounding the knowledge of mere routine with experience.

Thalaba, in order to destroy his opponents, condensed several cubic miles of etherial imagination by "surface action" on the central point of a spongious syllogism. On this was to be brought to bear suddenly the moonshine of the lunar caustic of the angry but silly remarks of the Magnarch excentrated by

imagination by "surface action" on the central point of a spongious syllogism. On this was to be brought to bear suddenly the moonshine of the lunar caustic of the angry but silly remarks of the Magnarch, concentrated by lanticular form and power of an approximate and preceding lucid interval.

The "imagination" thus condensed into what Thalaha's utilitarian impertinence called "the semblance of a single solid grain of common sense," was slightly but carefully dusted over with humbug and mill-puff; the intended 'fuse' for the sudden development of the 'moonshine' was the short ironical and inflammatory speech with which it was delivered to Mr. Magnarch. But here he failed,—he cut his fuse, and thereby his stick,—too shoft: Magnarch took fire too soon, and, by a premature thump of indignation on his desk (always his resource when he felt very angry or very empty), 'detonated' and exploded the whole chamber and sub-prefect, Thalaba, submarine vaults and all, into an inconceivable state of atomic comminution. The "Dom-Daniel cavern under the Root of Ocean," was simply an enormous series of caves in the simply an enormous series of caves in the

mountain limestone formation; and the lifting of a remote corner (at a considerable depth under the surface) produced the bank at Spit-head, on which Gen. Pasley operated so successfully in later days; but bis explosions were but the

Gentle breath of Zepbyr, o'er the swell Of Ocean's bosom as it rose and fell—

to that of the unlucky Thalaba. So much for

Or. Southey's mystification!

"I like good plain prose," said a hard-fighting old soldier to me one day, "but as to pott'hery—'tis all GAMMON!"

X + Y + Z.

ELEVATION OF THE WORKING CLASSES.

It must be a strong motive to make a toiler, like myself, set aside the chosen pursuit for his leisure evening time, and task himself with "the stringing together of sentences," but the truth is, I cannot well help it. The pith of the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has warned my dull plagmatic network in the communications of the "Old Mason," has a supplication of the "Old Mason," h

the communications of the "Old Mason," has warmed my dull phlegmatic nature into nervous life; and having given insertion to his advice, perhaps you will spare me a little room for a few comments upon it.

Simplify your wants. Do as I have done. I have kept myself, wife and children, upon 1l. per week; and thus out of my weekly stipend of 1l. 10s., saved 10s. This, I think, is the cream and marrow of his advice.

I shall not inquire how much, or how little.

stipend of 11. 10s., saved 10s. This, I think, is the cream and marrow of his advice.

I shall not inquire how much, or how little, they eat or drank; how often sickness, with its gloomy shadow darkened their homestead; how often he was out of work; what rent they paid, &c.; such details would be quite unfit for publication. But I must say, is this a time to be chosen to talk to us of saving 10s. out of 30s.? Where are the 30s.? Not one-half of us engaged in the building trade in London, have had it for these last eighteen months; we have either been "totally without employment, or working short time."

My first objection to his advice is founded upon the negative of the following question:—Ought we, for a contingent evil, to sacrifice a certain good? I think not; the cvil in this matter (want, dependence in old age) is in time future, and therefore contingent. The certain good I shall now explain.

Let any man take 30s. Let him find the bread necessary for the sustaining of the animal natures of himself and family. This done, let him think of that other nature which God hath given them; let bim consider this second want—this bread-finding for the intellectual—for the spirit nature, and God help him in his sore trouble; God forgive him for the bitterness which venoms his soul, when he sees in what poor doles he must mete it out to the

ness which venoms his soul, when he sees in what poor doles he must mete it out to the children of his own blood, whose very sympathies are his own; and for whose well-doing he must face to face with them answer to his

And let this not be forgotten (suppose those children are sent to a good school, there they acquire the means, the tools of education), it acquire the means, the tools of education), it is the parent who ought and must be the trainer; be must teach the application, he must mould their minds, and lead them forward towards ultimate results. And to do this, his own soul-work—his own education—must be pursued, and this will be another cause of expense; it is true, in one sense, books and education are cheap enough now-adays. Yes, and always were—even worthy the shedding of one's blood to obtain; but, alas! dear, very dear, to a man with only 30s. per week; for of a surety there will come a time to every brain-worker, who works truly and well, when his mind will need something not quite so elementary as penny magazine treaquite so elementary as penny magazine treatises; and then, woe—woe to his saving, he bas crossed the rubicon—his march of education is, in other words, eternal progression (i. e. an endless expense). Good books, such (s. e. an endless expense). Good books, such as he may now require, are only to be purchased with large sums. And here let every man think over bis own mind's progress, and think over a few of the tortuosities he has been forced into, hy wanting a book that he could not afford to procure. Talk of saving for old age!—the "Old Mason" bas never witnessed the feverish anxious thrift of a workingman saving to huy a book.

man saving to buy a book.

A little while agone, back in the winter-time, a fellow-workman lay upon his death

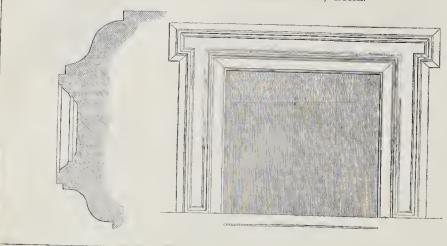

No offence to Dr. Parker's ghost, or present makers of Roman cement, notwithstanding its celipse by Mister White. † Teutonic? "Scheinen?" No offence to Mister Tay-lor's patent facing.

lor's patent facing.

**X + Y + Z stands corrected. "Rayal Suppers and Miners," and "Rayal Engineers"—two distinct corps: the former has no officers of its own; and the hard-has no ment, though they always command the sappers on a footing of temporary attachment. Hence the former is a regimental corps.—the Royal Engineers a staff.—En.

**Ow have suggested to X + Y + Z the probability of this being considered as a personality; but he assures us that, like the Magnarch, the character has no specific originality,—a thing of threads and patches,—a compound old goose of many fighlest, collected from many birds in John Bull's large official farmyards—civil and military,—En.

CHIMNEY PIECE, VILLA MADAMA, ROME.

hed; but in death as in life, his thoughts were of his children, and his cry was, "My poor Willy, my poor Mary! what will hecome of them?" And friends came—and the minister amongst them—and with the grief gurgling in their threat, there there are a submission processors. amongst them—and with the grief gurgling in their throats, tried to administer peace, consolation, to the dying man; but in vain—hetween himself and consolation he saw his pale-faced children fatherless? At last one friend came and said, "Fear not, you leave them a rich legacy,—rest assured your teachings will not be forgotten: the seed you have sown will not be lost. And your books—which to you have been such household gods—will he the same to them, and open their minds, and through them minister lovingly to the Great God of all!"

Oh peace—consolation, said the dying man, and he spoke no more.

Would that every working man, whose hour was come, had as rich a legacy to leave!

Besides this error of sacrificing the present Besides this error of sacrificing the present to the future, there is another which should he noticed. It cannot he doubted but that the simplification of our wants is an end worthy the striving for; but is it not one of the results of pursuing a system of morality?—a consequence, not a beginning? Diogenes had seen and thought much hefore he retired to his tub; and there he had cogitated much hefore, in reply to Alexander's offer to grant him a favour, he mildly replied, "Stand aside, that the glorious sunshine may reach me." the glorious sunshine may reach me."

the glorious sunshine may reach me."

It is a very great hut common error that the working classes must be written "down to"—that we need a particular literature, or a literature of a particular style. No; train us to habits of thought,—teach us to think, and to try to think aright; this is all we want,—it is all every class wants; in this particular we are not neguliar.

From the time of Franklin to the "Old Mason," one particular style has heen adopted towards us—a style that we especially dislike. Philanthropists and economists come into our habitations, ransack and take an inventory of hadraudis, raisack and take an inventory or the contents of our cupboards, how much we eat and drink—in short, study our habits as they would wild animals—and then publish a they would wild animals—and then publish a little truth sometimes, but always a great deal of error ahout us. Would this be endured by any other class? Would John, duke of Plantagenet, endure it? Then why John Noakes, the mason? However well-intentioned this philanthropy may he, it always has failed—it always will fail; hecause the writers seek to eradicate an effect, and leave the cause to germinate afresh. Admitting that waste and extravagance exist among the working classes, it is hut the necessary and inevitable effect or consequence of a cause. And what is that consequence of a cause. And what is that cause? I think hut few will doubt that it is ignorance. Then, decrease the power of the

cause, and the effect will, in a like ratio, also decrease. And let him who would benefit us set to work, and hew and cut slashingly, like another St. George, at the dragon Ignorance; let him shew the mechanics upon what heautful mathematical principles their crafts depend—what they know (without heing sensible of it) practically, let him teach them theoretically, and so set them thinking—as they will when this is done—and trying to work out new results from old Euclidian and Archimedian principles; for, of a certainty, it is strange if we have arrived at perfection in joinery, or even masonry. And further, he may show us how our lives, which too often pass so wearily, may be made pleasant—aye, hard muscle-tearing work pleasant—by teaching us to work intelligently.

Do you think that the Theurgic hrotherhoods—the "masonries" of architecture—the architects who individually and collectively dotted Europe in the twelfth and thirteenth centuries with churches and cathedrals of wondrous beauty and varied design, had often to complain, like the architects of the present day have, of bad and indifferent workers? Oh, no; the Celtic nations, fresh from their wood-

have, of bad and indifferent workmen? Oh, no; the Celtic nations, fresh from their woodland haunts, with the remembrance of nature mingled with a strong passionate faith in their new religion, were true and intelligent workers; they felt the ideas of the architect, great as his they felt the ideas of the architect, great as his genius might he; there was a sympathy hetween them, that, alas! is in a great degree wanting now; and unity, harmony of design, from the spires to the slightest ornament, was the consequence of this intelligent working.

Then, up and to work, good spirits! Teach, teach; lessen our ignorance—be it never so little, do something towards it; helieve me, it will he far better, nobler work, than teaching us to hoard nence; and should you he dis-

will be far better, nobler work, than teaching us to hoard pence; and should you he discouraged, think into how many poor, dark, benighted souls this Publication has shed a little light, and how that light is increasing, growing brighter and stronger, and what a glorious army of workers we may have in the future time. See to this; begin—there is a magic in heginning—and no cheer will he heartier, no prayer more fervent, than the "God speed you" of

hope they helieve us when we repeat, that we have no desire to keep down wages—quite the reverse: or even, at this moment, to discuss what are and what are not sufficient. We would assist in leading the working classes to do the best that can be done with what they have, improve the present, and be not forgetful of the future. We heartily wish their position was better than it is, and would gladly aid in improving it. We have good reason to know that great distress prevails in parts. hope they helieve us when we repeat, that we

CHIMNEY-PIECE, VILLA MADAMA, ROME.

THE villa was built for Giulio, Cardinal Medici (afterwards Clement VII.), hy Giulio Romano, who, as Vasari says, had 'il carico di tutto' connected with the place, and l accordingly was both architect, landscape gardener, and house decorator, to his emi-nence. The clear opening of this chimneypiece is 5 feet by 4 feet 81 inches, the effect of the mouldings very good. Chimney-pieces of this description were common throughout Italy at that period.

SMALL DRAINS.

Last week Mr. Freeman, of Kennington-LAST week Mr. Freeman, of Kennington-road (from whom a letter as to trapping-drains appears in our present number) applied to the magistrate at the Lambeth office for his advice under the following circumstances.

From the statement of Mr. Freeman it appeared that, in the early part of the month of February last, he had applied to the Sewers Commissioners to have a drain or communication from his premises with the common benighted souls this Publication has shed a little light, and how that light is increasing, growing brighter and stronger, and what a glorious army of workers we may have in the future time. See to this; begin—there is a majic in heginning—and no cheer will he heartier, no prayer more fervent, than the "God speed you" of "BEOWULF, Y" CARPENTER.

** "Beowulf" and the "Old Mason" are not opponents, hut fellow-workers in a good cause: and most sincerely do we hope that both may be listened to. Prudence, forethought, avoidance of evil and improvident habits, self culture, and an honest ambition to advance in the scale of society, are the objects sought to he inculcated.

We have received several other letters on the subject. The drains were opened a third time, the hoard was called on twice to report on the subject. The drains were opened a third time, because in the scale of society, are the objects sought to he inculcated.

We have received several other letters on the subject from working men, the majority of them most creditable to their virtiers. We

TRAPPING DRAINS.

I BEG to call your attention to one of the serious errors daily committed by the Commissioners of Metropolitan Sewers, which is, in having a trap fixed at the end or outlet of every house drain in the sewer, for the purpose of keeping the poisonous air and gas of the sewers out of the house: but instead of doing so, it insures a regular supply of the obnoxious fluid into the houses. To explain, when a regular supply affine of the serious field of water enters a drain a pailful noxious fluid into the houses. To explain, when a pailful of water enters a drain, a pailful of air must escape out, and does so where there is the least resistance, and this is at the sink trap or the closet pan trap. When the water reaches the end of drain, and opens the trap, as it runs out the same quantity of air must go in over the stream from the sewer, the inlets being closed with water traps; so that for every separate pailful of water which enters the drain, the same quantity of air is measured out into the house. I think you will see it is evident drains can be trapped only at the inlets; and where back-water is troublesome, each inlet might have the same trap which is now used for the outlet.

Kennington-road.

RD. FREEMAN.

SCENIC ANACHRONISMS.

ROYAL ITALIAN OPERA HOUSE, COVENT GARDEN.

AFTER seeing and listening to the truly magnificent ensemble presented by Mayerbeer's Robert le Diable, as given at the Italian Opera House, Covent Garden, it seems almost ungrateful to those who have done so much for the gratification of the public to find fault on what may be considered minor points. If we thought that doing so would keep away one intending visitor, it would probably remain undone, but so far from this being the case, the admiration we can honestly express, in making the observation, may, perhaps, lead some to go there who had no such intention previously. What we have to say, then, is this:—Robert,

what we have to say, one; is this '-moort, surnamed the Devil, is an historical personage, and belongs to the eleventh century,—the Norman period; yet in the scene of the second act, a stone screen, the whole width of the stage, is shown of fourteenth century Cothic and worse still, in the back ground is

Gothic, and, worse still, in the back ground is seen an Italian palace of the sixteenth century. Every one now appreciates the absurdity of playing Julius Cassar in a modern court dress, but what we are now speaking of is, in reality, no less absurd to the discriminating portion of the public. Mesers, Grieve and Telbin are masters in their art, and it is therefore the more important that their attention should be kept to the importance of chronological accuracy. The first scene, a view of Palermo, is charmingly painted. The opera itself is magni-

REMOVAL OF SMOKE, AND VENTILATION OF SEWERS.

WE make the following extracts (which have We make the following extracts (which have been for some time in type) from a pamphlet by Mr. W. Flockton, surveyor to the town trustees of Sheffield,* not because we think the scheme practicable, but that our readers, wbo are interested in the questions to which it

refers, may know what others are doing.
"We propose to carry away and disperse or
consume smoke, noxious gases, and foul air, and, instead of permitting them to injure and destroy, to turn them, or at least the heat that accompanies them, to a very useful and valuable purpose. It may be well to state the considerations which first suggested our plan. Ohserving an ordinary house fire, we were led to a conclusion which no doubt many persons have arrived at before, viz., that probably as much heat was discharged up the chimney as into the room: it also occurred to us, that in the case of furnaces, and gas and other retorts, considerably more in proportion passed up the chimneys. As a striking instance of this, we may remark that the heat at the top of a steel-melting furnace flue, which may pro-bably be ten yards from the furnace, is so in-tense that the colour of the flame is nearly white. Then in the case of fires used to generate steam, although a considerable quantity

* Published by Hamilton, Adams, and Co. London, 1849.

of the caloric is carried off by the water, it is well known that the heat is very great after it has passed through the boiler flues and entered into the stack or great chimney; indeed, this is proved by the necessity of lining all those chimneys with firebrick from the bottom to some considerable distance upwards; but without referring to other cases, we were, from noticing these facts, led to believe that the total quantity of heat which is constantly being discharged from the chimneys in a large town must be enormous, and that if it could be collected and concentrated it would place at disposal an immense power, which might be disposal an immense power, which might be used to remove and probably destroy its accompanying and disagreeable partners—smoke and sulphur and noxious gases; and, at the same time, furnish the hest, the most powerful, and cheapest means of effecting ventilation that has yet been discovered, and that, too, on a scale commensurate with the wants of a town—no matter whether large or small, for in proportion to the number of houses and other buildings would be the number of fires, and in buildings would be the number of fires, and in the like proportion the extent of ventilation required and the power to accomplish it. Reflecting on the fact that the powerful agent which is so admirably adapted for the purpose was in such abandance that every contrivance the ingenuity of man could invent bad been tried to carry it over our heads, there to mingle with and poison the air, producing disease and premature death, we were led to the conclusion that, if it were passed under our feet and properly applied, it would not only greatly assist in purifying our dwellings and work rooms, but while performing these important corresponding hut while performing these important opera-tions, he instrumental in destroying smoke and probably prove as great a blessing as it is now an evil to the inhabitants of towns.

The arrangements of the plan aré as fol-

Under the footpaths along each side of every street and lane, it is proposed to construct flues of sufficient capacity to carry off all smoke and other atmospheric impurities from the buildings of a given district. The flues and their dimensions to be arranged on flues and their dimensions to be arranged on one general plan, so that they shall increase in capacity as they approach the outlet, in the requisite proportion to the increase of the smoke, &c., intended to pass through them; and so also that a flue may at any point be closed up for the purpose (if such stoppage be necessary, which it is thought it will not) of making fresh communications with it, or for require or any emergency that may arise, and repairs, or any emergency that may arise, and the current either turned in two opposite di-rections, or across the street to the flue on the other side, but, of course, always providing that there be but one way for the general current to the outlet at any time. In towns of moderate size, it is proposed that the main flues be carried out of the town, in as many and such directions as shall be in as many and such directions as shall be most convenient, terminating in each case with lofty towers or stacks: in which it is confidently expected that, after being once ignited, a fire, produced by the combustion of the infammable gases accompanying the smoke, &c., would burn spontaneously, in a similar manner to the combustion of foul air from some old shafts connected with coal mines. That this would be the result, there can be That this would be the result, there can be very little doubt, taking into consideration the nature of the gases drawn from various sources, together with the large quantity of uncon-sumed carbon accompanying the smoke—and that both gases and smoke being supplied at that both gases and smoke being supplied at the base of the tower with oxygen to any required extent, so as to produce perfect combustion, would, in all probability, produce a constant flame of such magnitude and brilliancy as to assist materially in lighting the district by night. However, should this not be so, the combustion might be assisted by jets of coal gas, or a fire of coke, as the case with two processing the computation of the case with two processing the contract of the case with two processing the contract of the case with two processing the contract of the case with two processing the case.

might require or circumstances permit.

It is submitted that the draft caused by the great length of the flues, and height of the towers, combined with the impetus given by the furnaces in the towers, and the vast body of heated air poured into the flues from the whole of the fires in the district, would form an immense power, much more than equal to the ventilation of a town to any possible extent; and would, at the same time, insure a regular and constant draft through every flue into the street mains, which might be in-

creased or diminished by valves or dampers at pleasure, rendering a smoky chimney a thing unknown; for it may be fairly presumed, that neither the variable state of the atmosphere, nor the changeableness nor violence of the wind, would have any effect on the flues and great towers.

The next important feature of the plan is, its connection with the sewers. Communications are proposed to be made at proper intervals between the sewers and the street flues, sufficient in size to carry off the sulphuretted hydrogen, and other noxious gases, generated in or passed through the sewers and thus effectually urevent their sewers, and thus effectually prevent their transmission into the houses through cellar drains, and into the streets through the gulley

It may be imagined that an enormously large flue would be required to carry off all the smoke from a district, but we submit that, when the velocity of the current is increased to the extent which may reasonably be expected, a flue will carry off a very much greater quantity of smoke, in a given time, than under existing circumstances

We therefore apprehend, that a house flue, as at present constructed, is of at least ten times as great a sectional area as would be necessary with the powerful draft we propose to apply; and that a flue of the present size, would be capable of carrying off the smoke from perhaps ten, or more, house fires, and the reduction would apply in the same degree to furnace and other fires."

THE NEW BOROUGH PRISON AT PLYMOUTH.

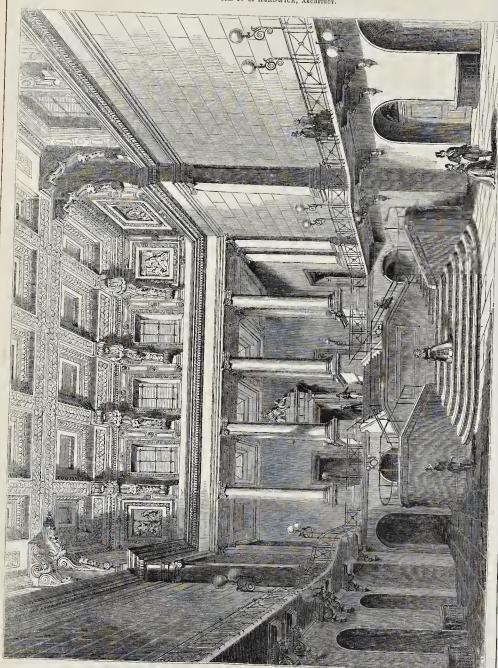

This building, which has been erected under the superintendence of Messrs. Fuller and Gingell, of Bristol, is now complete, and is about to be delivered over to the corporation. A correspondent sends us the following particulars:—It is built of the blue limestone from the quarries at Catdown, relieved by Coan stone and the seales are all of costs. by Caen stone, and the sashes are all of castby Cach stone, and the sames are and tast-iron, glazed with plate glass, a quarter of an incb in thickness. The governor's house and porter's lodge, are detached from the prison buildings—the former being on the right and the other on the left of the entrance gate. The main building comprises offices for the gover-nor, and apartments for the matron, in case should not be the governor's wife,-a chapel and surgery, reception cells, visiting cells, convalescent rooms, hath room, and cells for sixty prisoners. The female prisoners will be confined in one wing of the building; their be confined in one wing of the building; their airing yards and punishment cells (which are so constructed as to admit air, but not one particle of light), are entirely distinct from those appropriated to offenders of the other sex. The dehtors will occupy a distinct portion of one wing of the building—and will be divided into two classes, each of whom will have an airy and comfortable day-room, but their sleeping cells do not differ from those of the other prisoners. The arrangement have been made with a view to carrying out the spearate oner prisoners. The arrangements have been made with a view to carrying out the separate system of confinement, in all its completeness. Each cell is fitted with a water-closet and washing bowl, a bed and bench; and the gas and water are introduced into each. The airingyards are twenty-four in number, radiating yards are twenty-four infinitely and each one of them will be occupied but by one person at one time: an officer of the prison will be so placed as to have the command of all the yards at one and the same time. A similar arrangement is carried out in the chapel. The buildings are 270 feet in length, and 150 in breadth, and they have been completed in less than fourteen months from their commencement. M Clift and Goodyear were the contractors.

BLIND DREDGERS .- A correspondent sends the following list of extraordinary tenders for deepening the bed of the River Medway, near Maidstone; Messrs. Whichcord, architects:—

Couchman (Sheerness)	£3,199	0	0	
Jarvis (London)	873	5	0	
Diggle	750	0	0	
Court		0	0	
Rook, Thomas (London)	748	0	0	
Cooper (Maidstone)	730	0	0	
Sampson, R. (Maidstone)	376	0	0	

THE GREAT HALL AT THE EUSTON STATION.

ME. P. C. HARDWICK, ARCHITECT.

THE GREAT HALL AT THE EUSTON STATION, LONDON AND NORTH-WESTERN RAILWAY.

The public are aware that very considerable works have been in progress at the Euston station of the London and North-Western Railway for some time past. These are now drawing to a close, and the new building will he opened to the public in a few days. It comprises two booking offices: the one to the

east occupies the site of the old one, and will be used for the principal part of the traffic; the other is quite new, and is intended chiefly for the smaller trains. These open from a Hall of large size, which is the great public anternom to all those apartments which are appropriated to the passenger traffic. Into it will be placed notice of the destinated the passenger traffic. Into it will be placed notice of the destination and time of departure of the train next leaving the station, so that a passenger can at one see to which booking-office he is to direct his steps. In the centre of the hall will he a large refreshment counter, and it is intended that persons may be served in the waiting-rooms, which will be fitted up accordingly.

Opening from the hall is the lost-luggage office, and access to other departments,—all more or less connected with the passengers. A very necessary part of the arrangement of such a building is the clear division of the passengers from the transfer and other business sengers from the transfer and other business of the company; and, in this case, such a sepa-ration is effected by means principally of the great hall. Immediately opposite the entrance of the ball will be placed the electric-telegraph office, easy of access alike to the public and the officers of the company.

In the four angles of the building there are

four staircases leading to the secretary's, transfer, engineers', and other offices, com-mittee-rooms, board-room, and the various

branch railway offices.

Annexed we give a view of the public hall, an apartment of large proportions and striking effect, and we will now speak a little more in detail of that and the other parts of the new building. The length of this vestibule is 125 feet 6 inches, the width 61 feet 4 inches, and the height 60 feet;—or as nearly as may be two cubes. It will be seen that the eeiling is panelled, deeply recessed, with all the members fully enriched. It is connected with the walls by large ornamented consoles of bold design. The walls, which are rendered with grey Martin's cement, are splashed as granite, and the lonic columns, seen in the view, and at-tached to the wall at the other end of the room, are painted like red granite, with white caps and

A bold flight of steps at the end of the hall leads to the vestibule of the general meeting-room, and the board-room, and forms a striking and original feature. The door of the general meeting-room, seen at the top of the general meeting-room, seen at the off of the stairs, is surmounted by a group of sculp-ture, ably executed by Mr. John Thomas. It represents Britannia, with Mercury on one side, and Science on the other. The light comes down on this group very effectively. In the angles of the great hall, immediately under the ceiling, are eight panels in alto relievo, by the same sculptor. These represent by sym-bolical figures London, Birmingham, Man-

chester, Chester, Northampton, Carlisle, Not-tinghamshire, and Liverpool.

There is a gallery all round the hall; the area is paved with Craigleith stone (a good specimen), and it is heated by hot-water pipes on Perkins's system. Some of the panels in the ceiling are perforated; and behind these are disposed other coils of hot-water pipes to promote ventilation. The same arrangement is made in the general meeting-room; and in the whole there are some miles in length of

these pipes.

Of the general meeting-room we shall give an illustration hereafter. It is a handsome apartment, 75 feet long, 45 feet wide, and 40 feet high, calculated to accomodate 400 persons. Around the wall are coupled Doric columns on a podium. The coved and panelled ceiling is cleverly managed. There are windows on one side of this room, and lights in the cove of

she of this room, and ights in the cove of the ceiling on both sides.

The board-room, adjoining the last, is wholly of wainscot, with the exception of the ceiling, and has Corinthian columns of the same material. The size of it is 34 feet 6 inches, by 27 feet 2 inches. Two large rollers with corrections strong show learn fitted with the corrections throughout the same fitted with the corrections throughout the corrections through the corrections throughout the correction throughout the corrections throughout the correction throughout throughout the correction throughout the correction throughout throughout the correction throughout throughout the correction throughout throughout throughout the correction throughout throughout throughout the correction throughout th with connecting straps, have been fitted up here for a remarkable map of all the railways which belongs to the Board. The ceiling is coved, and has one rectangular panel, formed by flowers and fruits, subdivided into three.

The booking-offices, are, one 56 feet by 39 feet 10 inches; the other, 60 feet by 40 feet 6 inches, and have each a domical skylight of cast-iron, 28 feet in diameter. The pendentives of the ceiling are received on double consoles, which have the bead and body of a lion between them and the penden-tives. There is a gallery all round each office.

In the rooms on the second floor are some offices for branch lines, and a number of rooms to be occupied in a short time for similar purposes. In the basement are numerous store and other rooms, most of which are in use.

The whole of these works have been executed from the designs of Mr. P. C. Hardwick,

to whom they are highly creditable. Messrs. W. Cubitt and Co. were the contractors. The total amount expended is not yet arrived at but will probably not be less than 125,000l.!

NOTES IN THE PROVINCES.

Mr. Petrie's ingenious mode of protecting premises by the aid of electric shocks, as first suggested in The Builder, is about to be suggested in The Bullbark, is about to be applied, it appears, to an extensive factory at West Ham. The battery will be a very powerful one, and will effect the two-fold object of ringing a large alarm bell, and prostrating all who may attempt to enter the premises. The application of such an apparatus is suitable for application of stein an apparatus is suitable for banking houses or the mansions of the nobility and gentry as well, and may be applied to one room or the whole dwelling.—The repair of Salisbury Cathedral spire has been resumed.

—A recent report of the boring at Northam the Scatthern than Artesian, well estates the for the Southampton Artesian well states the depth arrived at to be 286 ft., and that the work-men could not bore any further with safety till they had iron piping to the depth of 290 feet, and the present depth of the bore was 296 feet in hard clay.——Some further improvements are now being carried out at Southsea in the drainare now being carried out at Soithsea in the dramage and planting of 100 acres of ground, called Webb's marshes. A number of villas are to be afterwards erected on the site.—The old mansion named Bourne-park House, near Bridge, in Kent, is at present undergoing a thorough restoration, under the superintendance of Mr. J. Shaw, architect, and by Messra. Locke and Nesham, builders. The building lead been very nuch decayed and almost Locke and Nesham, builders. The building had been very much decayed, and almost uninhabitable. The ceilings, carvings, &c., have heen renewed, a stone portice added to the doorway, the basement lowered and vaults constructed, the exterior tuck-pointed with stone dressings, and the grounds laid out with artificial water, garden, and other arrangements. — St. Margaret's Church, Whalley Range, in the parish of Manchester, was consecrated on the 29th ult. It is geometrical in style (the transition from Early English to Decorated), has a tower and broach spire, and was built from the designs of Mr. James P. Harrison. — The rational mode of self-employment by some of our surplus hands, in the production of a subour surplus hands, in the production of a sub-sistence for themselves out of the bounties of nature in spade cultivation, is being carried out nature in spade cultivation, is being carried out at Huddersfield, where 75 workmen have lately formed an association, and purchased an eight-acre field for this purpose. Whenever any of the members are out of employment they will receive a ticket for six days' work, or twelve days' work, and be paid a fair day's wages for a fair day's work, and thus be prevented from becoming burdensome to the town, and horizon purpose with full the case two such and having pauper relief. There are two such societies in the town already: this is the third. There is now hardly a village within 7 miles of Huddersfield, says the Leeds Intelligencer, but has its allotment society or industrial farms.—A meeting was to be held at Gainsborough last week, to prepare the way for the erection of a corn exchange.—The con-struction of the first of two extensive sheds on the sides of the Humber Dock Basin has been commenced by the Dock Company. Each is to be 150 feet long and 40 feet wide. Fourteen cast-iron pillars, emheddedin solid masonry, and rising about 12 feet, are to support each of the sheds.—"Mr. John Pearson, the contractor sheds.—"Mr. John Fearson, the contractor for the execution of the great sewer in the High-street of this borough," says the Gateshead Observer, "made a beginning of the work on Wednesday, on the site of the departed tolbooth, nearly opposite the departed almshouses of the late Mr. Powell. The excavations have laid bare the foundations of the old prison, which stood in the middle of the street, and appears to have companied in a line with the appears to have commenced in a line with the south end of the almshouses. The contractor south end of the almshouses. The contractor bas also had the luck to hit upon the 'high main' seam of coal; and this, we presume, may appropriate as a perquisite, and vend under the name of 'Pearson's Wallsend' [or what says our cotemporary to 'Pearson's Godsend?'] At the foot of West-street, Messrs. Wilson and Gibson are about to begin the erection of the new railway bridge across Slant-street (which, we hear, has been rechristened by the less expressive name of 'Hills-street.') Thus, both underground and

aboveground, the work of improvement goes aboveground, the work of improvement goes on in our ancient borough." — Public attention in Sunderland being directed to the establishment of public baths and wash-houses, we, says the Sunderland Herald, give publicity to the following results of the institution in Newcastle:—During the two last months, 1,200 warm baths have been taken, showing (if the average be taken individually) that one in every 84 of the entire population of Newcastle and Gateshead has had a warm bath within the last two months. The average weekly number of houses occupied by those who got their clothes washed, dried, and ironed, in a very few hours, during the same period, amounts to 4,300. The receipts amounted to \$28.15s.; and if March and April could fairly 284. 15s.; and if March and April could fairly be taken as average months, the annual receipts in that case would be 1724. 10s. It is confidently asserted that the baths will be self-supporting this year, and yield a profit afterwards.

IMPROVEMENT OF POOLE, DORSET-SHIRE.

Our attention has been lately called to a port on the south coast of England, possessing great capabilities, and although long used hy mer-chants trading to the North American colo-nies, nevertheless not so extensively known as from its position and convenience it deserves. We allude to the port of Poole, in Dorsetsbire. The harbour is an extensive estuary of about of miles in circumference, the quays are large, with the advantage that vessels lie afloat at all times of the tide. The dues are nominal; the neighbourhood abounds in clay and stone, the former forming the chief ingredient used in the Staffordshire Potteries, and supplying London with the entire material used in the numerous potteries springing up in that locality. On the completion of the Wilts and Somerset Railway, a direct opening will be effected through the port of Poole, between the English and British channels, a conve-The harbour is an extensive estuary of about the English and British channels, a conve-nience desiderated for the last half century, and first recommended by the late Sir Thomas

We hear that potteries on an extensive scale are contemplated on the estates of Sir J. J. Guest, Bart., in the neighbourhood. Lord Eldon is also outlaying a large sum of money within the harbour, principally for the purpose of bringing the most valuable of the Purbeck stone from the surrounding bills. It certainly appears strange that efforts have not been sooner made to develope the resources of this eountry, it can only be accounted for from the want of enterprise in the county of Dorset. It is said that Sir J. Guest has lately become the possessor of the greater part of the country near the port, and if so it may be prophesied that its resources will very soon be developed.

THE CHELTENHAM GENERAL HOSPITAL AND DISPENSARY.

Tris building, lately erected in Sandford-fields, Cheltenham, by Mr. Darby, builder, from plans prepared by Mr. D. J. Humphris, architect, and recently opened to patients, has an entrance front on the ground-floor, beneath a portico supported by four fluted Ionic columns, and approached by nine steps. The entrance hall is 24 feet 10 inches by 16 feet. It is separated from the corridor by two pillars. is separated from the corridor by two pillars. Branching off from the hall are various official apartments, and in each wing there is a ward 42 feet by 21 feet 6 inches, and 14 feet high. There is a museum 33 feet by 21 feet 6 inches in the front of the east wing. The basement story contains kitchens and other offices. On the next floor above the ground range there are also two wards, with a bath room, matron's and other apartments, and in each of the front wings is another ward. At the back of the centre is an extra floor (contrived by reducing the height of the rooms beneath), containing an operating room 24 feet 10 inches by 16 feet 4 inches, a room 20 feet by 11 feet 6 inches, and other apartments, with hot and cold water cisterns. The whole of the rooms are supplied with gas and hot and cold water. There is a corridor on each floor extending the entire length of the building, and 9 feet in width. Around the building is an area of two acres in garden ground.

^{*} These columns are of brick, with iron stanchoons run-ning through them. An accident which happened to these columns during their first erection, and led to an inquiry, fully reported in our; pages at the time, will be remembered by nany of our readers.

RAILWAY JOTTINGS.

THE Commissioners of Railways have issued their report, dated 1st inst. Amongst other statistical details, it states that probably one-half at least of the 4,800 miles of authorised railways, of which the works are not in progress, will never be completed under existing gress, will never be complexed under existing Acts of Parliament; that at end of last year rather more than 200,000,000*l*. had heen expended on railways,—besides which companies retain power to expend, in authorised lines, about 140,000,000*l*. more, within five or the part of the parliament of the six years, 50,000,000? of which, however, will probably not be required; and that the average depreciation of the stock of four great lines,—the North-Western, the Great Western, the South-Western, and the Midland,—during the last two years, has been 53½ per cent. "Confidence in the managers and directors of railways," they state, "is now so generally and so justly whather that the commissioners can be considered." ars, 50,000,000l. of which, however, will ways," they state, "is now so generally and so justly shaken, that the commissioners consider the appointment of competent and impartial auditors, and the adoption of an uniform system of accounts and vouchers (carefully adapted to each other). uniform system of accounts and vouchers (carefully adapted to each other), indispensable to the restoration of that confidence."

—The mails are now conveyed between London and Dublin within 17 hours; and when the unbular hridge across the Menai Straits is completed, another hour will be saved. The mason-work of the pier for the first of the tubes is progressing, so as to enable the tube to be placed across the straits early in June at latest. Other preparations are also being made, the tubes are nearly all ready, and the other mason work is quite finished.—The first stone of the are nearly all ready, and the other mason work is quite finished.—The first stone of the paddock viaducts on the Huddersfield and Sheffield line was laid on Thursday week before last, "by the infant son of Mr. Frazer, resident engineer on the works." The viaducts, with the first fi says the Leeds Intelligencer, will be a work of immense labour, and when completed, will connect the Huddersfield and Sheffield with connect the Huddersfield and Sheffield with the Huddersfield and Manchester line, in an open cutting in Spring Wood Tunnel. In order to make way for these viaducts, a mansion, which had been erected within the past few years at a cost it is said of 1,400l., and four other large and respectable houses, have heen razed to the ground.—Three individuals from Edinburgh, detained on a pleasure excursion at Burntisland till too late to proceed to their proposed destination, were lately found entitled, under a judgment of the sheriff, to repayment of the price of their tickets for the whole distance.—A new locomotive for burning anthractic or hard and ultramineralized coal, has been built in America by Hinckley coal, has been built in America by Hinckley and Drury, for the Fitchburg Company. It is a freight engine, and is said to "work well so far" with a beavy train.

ELECTRO-TELEGRAPHIC PROGRESS.

The hydraulic telegraph, it is said, is to be tried on a line of railway at Nottingham.—
On 13th lith the Baltimore Telegraph Company declared a dividend of 4 per cent. on the previous three months' working.——From Boston to New York, a trade circular, containing 1,300 words, was lately transmitted, and rewritten, in forty-five minutes.——Some of our contemporaries of the past week have been following up and fully exoncrating our previous remarks, not only on the impracticability of the present prices of our metropolitan, or rather national, company, for general utility to the public, or even for adequate profit and prosperity to the company,—but also on the prudence of centering so much power in one company as this one possesses, without some limit, restriction, or regulation by Government, such as we suggested with reference to a circumstance that occurred some time ago at Manchester. As to the former point, one contemporary says,—We called attention, in our journal of 28th April, to the outrageously extravagant terms which the Telegraph Company impose on the public, and the necessary consequence resulting from exoritiant charges, either by individual tradesmen or public Companies,—the loss of business by the former, and the indignation and neglect of the public in the latter to whatever useful purposes the company may have been established. We have since received considerable information

on the charges and working of the American telegraphs; and from the smallness of the charges and the general civility and accommodation afforded in the working, all the American lines have already paid dividends exceeding those of other enterprises or of ordinary stock. No wonder that the telegraph should have made such rapid strides, or that is should be still rapidly extending, in all parts of the Union. We have before us a list of twenty-seven distinct systems of telegraphs, the longest of which is from Washington to New Orleans, a distance of 1,716 miles, and the aggregate being 6,768 miles; these are all in daily use, and several in the western states which were to have been completed last year, extend over several hundred miles.

SUPPLY OF WATER TO CONSTAN-TINOPLE.

The account given in a late number of The Builder, page 201, of the "Souterrazi" of Constantinople, seems to me unsatisfactory. The "Souterrazi" are rows of towers, with cisterns on the top of each, communicating through inverted syphons; and your correspondent states that this construction "relieves the hydraulic pressure on the pipes." Now any one acquainted with the principles of hydraulics must see that the pipes are relieved from an amount of pressure quite insignificant, that cannot possibly exceed the pressure of a column of water which would reach from the level of each cistern to the level of the original source. The result is, that the Turkish system, though much less expensive than an aqueduct, is much more expensive than a continuous line of pipes, over which latter system it has no adequate advantage. If your correspondent had explained how earthen pipes are made large enough to supply a great city with water, and how the joints are made tight against the unavoidable great pressure, he would have rendered an acceptable service.

The following show the greatest possible pressure at different points, on the supposition that each tower is one foot lower than the preceding tower,—and also what the pressure would be if the towers were swept away and a continuous line of pipes substituted:—

METAL WORK AND ITS ARTISTIC DESIGN.

At the Society of Arts, on May 9, Mr. W. Tooke, F.R.S., in the chair, Mr. D. Wyatt, arch., read a paper on "Metal Work and its Artistic Design." He commenced with some remarks on the absolute necessity of the study of specific design, in order to confine the errant imaginations of artists within reasonable bounds, and in order fully to take advantage of all the natural properties, mechanical capabilities, and recorded experiences, peculiarly helonging to all materials, in the elaboration of which it is requisite that an alliance between use and beauty may he effected. The author maintained that all propriety and perfection in manufacturing design were derivable from the result of such studies,—and that the more clearly the objective individuality of every ingredient was preserved and enunciated in the finished article, the more satisfactory to both eye and mind would the character of its ornamentation appear.

mentation appear.

The specific design of metal work was described as based on three great studies, a thorough knowledge of which was requisite to all who would either manufacture, compose, or criticise, in any one of its various ramifications. The first of these was that of the distinctive characteristics and appliances of each metal; the second, its form as modified by all the mechanical processes of manufacture; the third, a thorough analytical and critical acquaintance with all the best models in which reasonable and good principles of art can be traced, and through modifications of which pleasing associations of idea may be commanded at the will of the designer. In accordance with his scheme thus laid down, the

author proceeded to deduce the correct theory of the manufacture of each metal, from the properties with which it had been endowed by nature. He then described, at considerable length, the process by which almost all objects in metal must be produced, dwelling on those best harmonising with the character of each substance, and the accredited conventionality of its use. Thus he emphaticised the refining, beating into sheets, wire drawing, stamping, and torsion of gold; the beating in a plate, gidling, dead silvering, parcel gilding, soldering, &c., of silver; the hollow casting of bronze by means of wax and of moulds, "à bon creuz;" and the solid founding of iron in complex forms. Having disposed of the structural processes, the author rapidly analysed the decorative or superficial, enumerating and sketching out the leading peculiarities of engraving, matting, niello, cooking, burnishing, the six chief divisions of enamel, and three or four varieties of damascening. The mechanical limits of the art being thus pointed out, the impressions suggested by the history of past chefs-d'æure were then cursorily examined. The extreme antiquity of metal work, and its details among the Jews, Egyptians, Assyrians, Persians, Greeks, Eturians, and Romans, were demonstrated from descriptions furnished by various authors, and by monuments of wonderful merit still existing. The speaker then passed over the medieval portion of the subject, and concluded by calling attention to the examples by which he was surrounded, and urging a systematic recognition of first principles and practical details, to be superadded to the study of beauty and fine art in the abstract.

IRON STEAMERS.

IRON steamers seem now destined to carry the tsway in our steam marine, not without reason, for the advantages they possess over vessels constructed of wood are manifold and momentous. They are much less susceptible of injury from getting ashore than vessels built of wood, not simply on account of the toughness and tenacity of iron, but in consequence and the properties of the plan of separating the hold into compartments, by means of water-tight bulk-heads, being carried into effect with the greatest ease and efficacy. Iron vessels are much stiffer than wooden ones, not in a nautical sense, but in their capacity of resisting working and vibration. There is no play of joints, no opening and closing of seams, as in a wooden vessel; and in the case of a steamer there is scarcely any tremulous motion: there is but little smell from bilge water, no rats eating their way through the vessel, and no dry rot. There are, however, certain evils peculiar to iron vessels, though not insuperable. Some of the most conspicuous may here be enumerated. The most formidable of these by far is corrosion. Iron, when immerged in water, and especially in sea water, will rust very quickly if left unprotected, and, although its surface may be protected by a paint, yet this is not an effectual safeguard. In passing up and down rivers, and, indeed, in other situations, steamers will sometimes get aground, and the protective paint may thus be rubbed off the bottom in particular places, leaving the iron exposed. But, independent of this objection, there is auother arising from the want of a soluble poison on the bottom of iton vessels, in consequence of which the bottom is liable to be covered with seaweeds and barnacles. A poisonous paint, into which arsenie has been introduced, is sometimes used as an antidote to barnacles, and operates for a time satisfactorily. But, after a certain period, the poison on the surface of the paint is all dissolved away, leaving only an insoluble stratum for the water to act upon, and the effect then is ju

It would appear that both of these evils might be effectually prevented, if it were possible to plate the bottom of the vessel by means of the electrotype process, with a metallic alloy of arsenic and zinc; but it seems doubtful whether this could be accomplished, as the electrotype seems to show a preference for pure metals. If this cannot be done, it would suffice to work zinced plates into the bottom of the vessel, during its construction, and then to

paint the bottom with a compound formed of marine glue, and the ordinary proportion of arsenic.

arsenic.

Another rather important objection to iron vessels is, that they are liable to break in the middle, and a long list of steamers could be named that have cracked in that part, and some of them have foundered. This has arisen not from the direct tearing of the iron, but from its huckling in a sea way, and it has heen rent hy bending it first to one side, then the other, just in the manner pursued in hreaking a piece of tin. The remedy for this evil is good strong keelsons, good stringers, and a strong wide iron covering board running entirely round the ship, and stretched for several feet in width hetween the main deck. It is also a good plan to have diagonal plates running between the main deck and the beams.

G. J. Rhodes.

Miscellanca.

INSTITUTION OF MECHANICAL ENGINEERS, BIRMINGHAM.—At the general meeting, already mentioned by us, Mr. Rohert Stephenson, on taking the chaiv, said, it was necessary that he should express to them how apprehensive he was—at least that he had apprehensions—of an institution of that kind failing for want of energy on the part of its members. What had hitherto been the character of almost every institution of this kind in this country? almost universal failure. It was a remarkable circumstance, that in a country like Great Britain, whose wealth and power are so closely connected with the development of the mechanical arts and sciences—it appeared to him, in fact, a complete anomaly—that institutions of that kind should not appear to reach a higher standard than they now had. They saw astronomers cultivate and maintain a society for extending their knowledge of the movements of the heavens. They saw geologists maintaining and extending societies for investigating and developing the structure of the earth. They saw physiologists and botanists maintaining and extending their societies for investigating and developing the knowledge of the animal and vegetable productions of the earth. They they had witnessed only languidness and inactivity in the pursuit of those arts and sciences on which the nation's wealth absolutely depended. That it should be the case was to him the more remarkable, hecause the nation stood pre-eminent for their mechanical abilities. It was not egotistical in him to say this in Britain, hecause all foreigners conceded to them an unmeasured pre-eminence in those particular arts. Without despairing therefore of the success of the institution, he felt that in undertaking the task he was now doing, it was necessary that he should impress upon the members the absolute necessity of co-operating with him with energy in the further development of the institution. With that strong conviction on his mind, he wished also strongly to impress it on them; for without energy and industry they must fail as hereto

YORKSHIRE ARCHITECTURAL SOCIETY.—
A special meeting of this society was held on
Monday last, at Methley, for the purpose of
examining the church of this village, which is
now in the course of restoration. A fine oak
roof over the nave, which had heen discovered
during the progress of the works, concealed
ahove a flat plaster ceiling, excited admiration,
and several other features of the church were
considered as singular and interesting.

Bringewater Church Competition.—Sir: Will you permit me to explain to "A Great Western," that the advertisement for an extension of time for receiving plans for the restoration of the above church was forwarded by me to your office, on the 26th ult., for insertion in The Builder of April 28th; its non-insertion is for the publisher to explain. I trust your correspondent, after this explanation, will be assured that its non-insertion at the proper time was not for the purpose, as he insinuates, "to advantage some favoured indidual."—H. C. Heard. Bridgewater, May 15.

"* The advertisement in question, dated 26th, did no reach the publisher till after the publication of the paper on the 27th. The Builder, it should be remembered, is published early on Friday morning.

TRADE IN BIRMINGHAM AND LIVER-POOL.—The prospects here, says the Birming-ham Journal, "are not so cheering as previous to Christmas. The diminished duty on glass caused such an increased make as inundated the market, and it remains so glutted, that the the market, and it remains so gittied, that the demand, at the manufacturers, even at low prices, is very limited. Low prices alone will not hring an article like glass into universal use at once. We require to be educated to perceive its advantages. Hence the mistake. With respect to the general ironmongery business our reports are more favourable. business, our reports are more favourable; nor do we believe all we hear, that, notwith-standing the low price at which it is said the Germans can manufacture tools (such as files, vices, nippers, &c.), any quantity of foreign make has yet found its way, or can find it, into the markets of this country. We are into the markets of this country. We are aware that pattern cards of German manu-factures are in circulation in Birmingham, and factures are in circulation in Birmingham, and that after paying an import duty of about 10 per cent., the brokers and their agents profess to supply English dealers and consumers with articles of equal quality, at 40 per cent. less than the articles in question are now made by the British manufacturers. The artisans of Birmingham dispute these assertions, and it would be strange if, while Stubb's files bring high prices on the continent, German manufactures should supersede them in England." factures should supersede them in England."
At Liverpool, the disorganized state of the con-At Liverpool, the disorganized state of the continent affects unfavourably the market for timber. Prices, however, since 1st instant, continue without much change. During the week two cargoes of St. John's spruce deals have been sold on the quay at 7l. 15s. and 7l. 10s. per standard. By auction, 14,864 St. John's spruce deals and hattens, &c., at from 7l. 10s. to 8l. 5s. per standard; 2,665 St. Stephen's spruce deals, at from 7l. 17s. 6d. to 8l. 2s. 6d. per standard; 378 Quehec, third quality, inferior pine deals, at 7l. 17s. 6d. per standard; 300 logs St. John's pine, averaging 19\(\frac{1}{2}\) inches calliper, at 18d. per foot, and 50 standard; 300 logs St. John's pine, averaging 19\frac{1}{4} inches calliper, at 18d, per foot, and 50 logs at 18\frac{1}{4}d. per foot; 28 logs elm, at 16\frac{1}{4}d. per foot; 35 logs ash, at 14d. per foot, 78 logs oak, at 1s. 8d. to 2s. per foot; 110 logs Savannah pitch pine, at from 2s. 1d. to 2s. 4\frac{1}{4}d. per foot; planks ditto, 3\frac{3}{4}d. to 3\frac{3}{4}d. per foot; considerable of the constraints of the constra Iron continues dull of sale, and a further de-cline to a small extent has to be reported. For common hars 6*l*. is now the highest obtainable rate; whilst for cargoes in Wales, the rates are nominal, with a wide range from 5*l*. 15s. to 5*l*. 7s. 6d. Copper is steady and in fair demand."

SILVERING GLASS BY AID OF GUN-COTTON.—M. Vohl has recently discovered that a solution of gun-cotton, in a caustic ley, possesses, in a high degree, the property of precipitating silver from its solutions in the metallic form. On pouring into it a few drops of a solution of nitrate of silver, and adding ammonia until the oxide of silver formed is redissolved (the mixture being slowly heated in a water bath), the liquor will, at a certain period, assume a deep brown colour, and effervesce, the whole of the silver being precipitated on the sides of the vessel. The mirror thus produced is much superior in brilliancy to those produced hy means of etherial oils or ammoniacal aldehyde; and the facility with which it is produced will doubtless render it of practical importance.—Technologists

Our 'Wooden Walls' in Danger.—
Our 'Wooden Walls' in Danger.—
On Monday evening, there was a considerable concourse of persons on Tyne Bridge, and on the shores of the river, to witness a race hetween an ordinary wooden skiff, or gig, and one made of gutta percha, 26 feet long hy a broad. When first we caught sight of the competitors struggling for the goal, 'Gutta Percha' was several lengths in advance, and she kept her 'proud position' to the end. Our old 'wooden walls' were thus defeated by an innovation in nautical architecture, built of a mongrel material, half leather, half Indiaruhber. What with a reverse like this, following upon the use of iron in shiphuilding, our good old English 'heart of oak' may well be heartace, next made trial of a gutta percha 'life huoy.' A lad, who had consented to have his life saved and his clothes spoiled, jumped into the river in 'full dress,' and was rescued, as we understand, by the buoy.—Gateshead Observer.

ARCHITECTURAL AND ARCHÆOLOGICAL MEETING.—The spring union-meeting of the Northampton and Bedfordshire Societies was held at the Town Hall, Higham Ferrers, on Tuesday week, the Rev. Sir George Rohinson in the chair, in place of the Marquis of Northampton, who was indisposed. The Rev. H. Rose, rector of Brington, read a paper "On the Chicheley days of Higham Ferrers," and one, by Lord Alwyne Compton, "On encaustic tiles." The Rev. H. J. Rose, rector of Houghton Conquest, then read a paper "On Hebrew shekels, and on some architectural devices found in coins."—Mr. Matthew H. Bloxam, one "On an ancient stone offertory box in Bridlington Church, Yorkshire, and on an ancient stone offertory box in Bridlington Church, Yorkshire, and on an ancient stone offertory box in Bridlington Church, Yorkshire, and on an ancient stone offertory bason in East Kirby Church, Lincolnshire;" and Mr. G. G. Scott another, "On the principles of church restoration;" in the course of which he made some remarks upon the injudicious manner in which some attempts at restoration had been made. In these attempts more had been done to ohliterate good examples than if they had been left in the mutilated condition in which the "restorer" found them. Sometimes well-meaning, but crotchetty individuals would take upon themselves to alter that which was old, because it did not suit their taste, and so destroyed the authenticity of the work; and many had destroyed portions of really choice works of art to make room for their own. Against such "restoration" as this he vehemently protested. This style of the work and many had destroyed portions of really choice works of art to make room for their own. Against such "restoration" as this he vehemently protested. This style of the work and many had destroyed portions of really choice works of art to make room for their own. Against such "restoration" as this he vehemently protested. This style of the work and many had destroyed portions of really choice works of art to make room for their own. Against such "

Fountains Abbey.—The excavations of the site of the Abbot's house at Fountains Abbey are proceeding very satisfactorily. The arches on which the house has been built cover the river for nearly 300 feet; hut how far the huilding has extended north and south it is at present impossible to say. According to the Times, the most interesting apartment hrought to light within the last week or two is the private oratory of the Abbot, near the eastern portion of the remains. It has been an elegant little chapel, of a style of architecture different from any hitherto noticed at Fountains, viz., the dog-toothed Early English, and has been, no doubt, as Mr. Walbran, of Ripon, states, the work of an immediate successor of the three Johns, som etime between 1245 and 1290.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

—The congress will be opened at Chester on the 30th of July. An influential local committee has been formed.

Can you afford me any information relative to the Dundee Arch Competition?—for from Dundee itself I can obtain none. Understanding that a design had heen selected, and not receiving back the one that I had sent in, I wrote to request that it might he returned to me. Not obtaining either my drawings or any reply, after waiting about a fortnight, I wrote again in somewhat peremptory terms, but without any better success. Another competitor has experienced just the same treatment, or even worse, for he has written no fewer than four times, yet has not been able to obtain a single syllable in reply!—which is surely highly monstrous. There ought to be no occasion for writing at all, but designs ought to he returned to the respective competitors as matter of course. The only reason there can possibly be for detaining them is that the Committee have, like that of the Army and Navy Clubhouse, rescinded their first decision, viz., that in favour of a Norman Arch, and not yet come to any other. Yet if such a really the case, wherefore, in the name of common sense, is not such reason assigned, in answer to the first inquiry. Neither common sense, however, nor common decency, seems to be regarded on such occasions.

*** To this question, put also by five other correspondents, we are unable to reply. The competitors have just reason to complain of want of courtesy: we hope the cause of complaint may be confined to this.

ECCLESIASTICAL DILAPIDATIONS. writer in the Cartisle Journal draws attention to the great expense often entailed on clergymen by the size of the glehe house, and the repairs consequently required. Every unnecessary building entails a burthen upon the succeeding clergyman. "Very great disputes," he continues, "often arise about dilapidations. I will give you an instance of a case in Cumberland which took place not many years ago. A clergyman came upon his predecessor for dilapidations; valuers were employed from different parts to ascertain the amount of damages. One valuer's estimate amounted to 1471. Os. 6\frac{1}{2}d., the second to 1471. 2s. 9d., the writer in the Carlisle Journal draws attention damages. One valuer's estimate amounted to 1471. 9s. 6½d., the second to 1471. 2s. 9d., the third to 1551.—none of which values proved satisfactory. The case came before a jury, whose verdict was, I believe, 501.! A case of dilapidation came before the late Judge Bayley. The mode of valuing was stated—the first plan was including pageing whitewashing and The mode of valuing was stated—the first plan was, including papering, whitewashing, and painting, 3991. Iss. 6d; the second, exclusive of the above three articles, was 3101; the third, similar to an outgoing tenant, was 751. IIs. His lordship said that none of the rules were precisely correct, but the middle one seemed nearest the truth. He said that papering, whitewashing, and painting, except for preserving the wood from the external air, were luxuries, not properly diapidations."

INSTITUTION OF CIVIL ENGINEERS .-- On INSTITUTION OF CIVIL ENGINEERS.—On Tuesday, May 15, 1849, the president in the chair. The discussion on Mr. Hawkshaw's paper, "On a longitudinal continuous bearing permanent way," was continued throughout the evening, to the exclusion of every other subject. Some interesting observations were made on the actual destruction of the cast-iron chairs and double-headed rails, and the advantages that would result from the more general substitution of continuous longitudinal timber bearings for the present transverse sleepers and cast-iron chairs. The system of incerting The system of inserting a piece of hard wood between the rail and the main timber, as on the Great Western Railway, main timber, as on the Great Western Railway, was much approved, as was also the plan of side transoms halved into the main timbers, as it enabled a better system of drainage to be employed than had been usual with that kind of permanent way. The general opinion seemed to be in favour of the longitudinal bearing.

School of Design .- The following has been sent by Mr. Milner Gibson, as chairman of the committee, to several eminent mann-facturers. A request for "a general return, applicable to all classes of manufacturers in each class), to be filled up according to the peculiarities of each class of manufacture. A return of the numbers of designers, drawers of patterns, putters on, modellers, chasers, and other artisans engaged in the production of ornamental designs, requiring artistic ability, at present employed by you; distinguishing them into two classes:—Class I. Numbers of those who have not attended any School of of the committee, to several eminent mannthem into two classes:—Class I. Numbers of those who have not attended any School of Design; Class II. Numbers of those who have attended any School of Design; with the following details, so far as applicable to Class II. only:—Designer's, &c. name; age; whether designer, &c. or not before he attended any School of Design; name of school he has attended; length of time he has school he has attended; length of time he has attended the school; how long employed by your firm." The results will show to a certain extent how far the school is practically at

A Novel Exportation. - There is a story current that some short time since a whole army of "Lord Broughams," executed in lead, and of colossal proportions, disembarked in the United States, and were drawn up on a a public quay in two lines, resembling an avenue of Egyptian statues. The Custom-house offiof Egyptian statues. The Custom-house officers were lost in wonder at the sight of so many giants turning up their noses at Brother Jonathan, and inquired what the monster importation meant. "Statues of Lord Brougham," replied the skipper; "one for every city in the union; being the gift of his lordship's English admirers to the American Republic." Lead, as such, is subject to a heavy import duty, but admirers to the American Republic." Lead, as such, is subject to a heavy import duty, but "works of art" are admitted free. What could the officers of customs do? They did not swallow the skipper's story, but they could not detain his statues; and in a short time Lord Brougham was in the melting-pot, and "cast into bullets for the Mexicans."

PROJECTED WORKS.—Advertisements have been issued for tenders,—by June 7th, for the repairs, repewing, &c., of West Ham church, Essex; by June 4th, for the construcchurch, Essex; by June 4th, for the construc-tion and erection of the pipes and fittings con-nected with the baths and washhouses in Trip-pett-street, Kingston-upon-Hull; by date not specified, for the erection of twenty semi-detached villa residences, about three miles from the bridges (Surrey side); by June 1st, for the erection of schools, &c., at Minera and Brymbo, for the trustees of the Wrexham Charities: by 21st instant, for the erection of Brymbo, for the trustees of the Wrexham Charities; by 21st instant, for the erection of a vicarage-house, offices, and boundary wall, at St. Neots; by 23rd, for the erection of a detached station for constabulary, near Newbury; by 25th, for the several works required in the erection of a Presbyterian church in Grosvenor-square, Manchester; by 24th, for the erection of a bakehonse and storerooms, and enlargement of washhouse in Chorlton union workhouse, Hulme; by 26th, for the erection of a warehouse at Salford, of brick or stone; by 21st, for sewering, paving, &c., at Chorlton-on-Medlock; by 21st, paving, &c., at Chorlton-on-Medlock; by 21st, paving, ec., at Chorton-on-Medicek; by 21st, for 800 feet of brick sewer at Counter's Creek sewer, Notting-hill; by 14th June for 2,800 tons of granite, 1,800 tons of flint, &c., at Paddington; and by 26th inst., for the erection of a steam-engine and engine-house at Marchland Ren Marshland Fen.

Marshand ren. — Plans and specifications for a church at Bracknell have been advertised for, to be lodged by 28th instant: the usual commission offered for the selected design.

ARCHEOLOGICAL DISCOVERY.—We learn from Winchester, that during the progress of the restoration of the church of Stoke Charity, now in hand, a very curious discovery was made, namely, a sculpture representing a bishop celebrating mass, he holding the host in one hand and the chalice in the other, above whom is a representation of the deity of in one hand and the chalice in the other, above whom is a representation of the deity, attended by angels. It was found concealed in a niche in the chancel, which had been bricked up for the probable purpose of concealing the sculpture, which doubtlessly occupied in Catholic times some other situation in the church.

Mr. F. Baigent of Winchester has taken a tholic times some other situation in the entirent. Mr. F. Baigent, of Winchester, has taken a sketch of it, which he has forwarded to the Archæological Association. Stoke Charity is about seven miles' distance from Winchester, the church is of Norman structure, and con-tains, in addition to the above, several curious monuments and sepulchral brasses.

ARCHÆOLOGICAL INSTITUTE. ing on the 4th, the Hon. Richard Neville coming on the 4th, the Hon. Richard Neville communicated a memoir on his investigations at a Roman site on Lord Braybrooke's estates, near Billingbear, Berks. The remains of a Roman structure had been first noticed there, at Weycock, in the parish of Waltham, by Camden, and subsequent discoveries are slightly recorded by later antiquaries. The excavations directed the Naville have beid onen the ground plan. by later antiquaries. The excavations directed by Mr. Neville have laid open the ground plan by Mr. Neville have laid open the ground plan of the building, which seems to have been an octagonal tower, about 20 yards in diameter. Numerous vestiges of Roman occupation had been found. Mr Neville gave an account also of a curious discovery of numerous interments, discovered near Waltham, in the course of construction of the Great Western Railway; with a line of shafts resembling wells, such as have been recently described in the neighbourhood of several Roman sites in England,—as at Ewell, Chesterford, &c.

The ADELPIN TREATRE.—We are glad to

THE ADELPHI THEATRE.—We are glad to see that, prompted by the late occurrence at the Glasgow theatre, the proprietor of the Adelphi Theatre has formed an additional outlet, from both boxes and pit, into Bull Inneant. Stead It was constituted by the court of the outlet, from both boxes and pit, into buil innecourt, Strand. It was greatly needed. We hope the example will be followed. There is some pretty scenery in the new burlesque here, "The Revolt of the Flowers."

DECORATIVE ART. Miss Wallace, a lady of fortune, has discovered a mode of gilding and colouring the interior of glass tubes, which, when so prepared, form a beading for the decoration of rooms.

Caution of Roma.

Caution to Artists.—Mr. A. F. West, a young artist, died on the 23rd; and after a post mortem examination, a jury returned a verdict, "That the deceased died from the effect of carbonate of lead." It appeared that he was in the babit of drawing his brushes in the babit of drawing his brushes through his lips,

THE AMPHITHEATRE AT ARLES.—A writer in the Athenaeum says, the care expended by the city of Arles on the preservation of its monuments—the memorials of its palmy state when it was the Rome of Gaul, as Ausonius calls it—is bighly creditable. Its exquisitely proportioned little amphitheatre, a veritable miniature Collseum, is still under the hands of the masons. Indeed, the only foar scems to be the masons. Indeed, the only fear seems to be lest the authorities should fall into the fault so common to the French in such matters, and push the indispensable work of preservation too far towards an attempt at restoration. It has been at length thoroughly isolated from the mean surrounding buildings, which well nigh suffocated it; the interior has been well cleared out; and a light iron railing as a de-fence from wanton injury has been erected around it. Evidently, the good city has not spared cost in the matter.

THE LINCOLNSHIRE ARCHITECTURAL THE LINCOLNSHIRE ARCHITECTURAL SOCIETY Held a meeting in the manor-house rooms, Gainsboro', on Wednesday. Amongst other papers was one by Sir Charles Anderson, Bart., on Lea church, which has been almost rebuilt by Sir Charles himself.

AN ORDER OF MERIT.-I believe it has been already suggested, though not yet aetcd upon, to establish an order of merit to be conferred on distinguished individuals in this country. That such a mark of distinction ferred on distinguished mark of distinction country. That such a mark of distinction would be appreciated, and is wanted, there can be but little doubt, but then let it be an order of merit conferred solely on those who have distinguished themselves by their talent in the arts and sciences, for great learning, and those who are at the head of the several learned institutions. They have such a mark of distinction in Paris, why not in this great country? tinction in Paris, why not in this great country?

A SUBSCRIBER.

TENDERS

Delivered to the Mctropolitan Association for Improving the Dwellings of the Industrious Classes, on Friday, May 11, for blocks of dwellings for families, to be erected in Spicer-street, Spitalfields; Mr. William Beck, Architect:

No. CCCXXIX.

SATURDAY, MAY 26, 1849.

EVERAL points of considerable interest, as respects our antiquities and the history of architecture, were discussed at some length at the last meeting

of the Institute of Architects, held on the 21st The conversation hegan with the annonncement of donations, and ran on till the meeting was adjourned. Mr. Donald-son, who took once more his old seat as one of the secretaries, commented in his usually good-natured, rose-coloured way on the various hooks and drawings which were presented (including a new work hy Mr. Fergusson, on fortification, Mr. Brandon's nice volume of parish churches, the second collection of sketches issued by the Architectural Publication Society,* and a drawing by the late Mr. Dance, giving the measurements of old London-bridge), and did not omit a few words of commendation, afterwards repeated hy the chairman (Mr. Bellamy), of the first part of our "Buildings and Monuments." A little volume relative to the city antiquities, the secretary said he should leave in the author's own hands, in order that he might make some statements on the subject. Accordingly up got Mr. Tite, and presented "A Descriptive Catalogue of the Antiquities found in the Excavations at the new Royal Exchange, preserved in the Museum of the Corporation of London,"† and he did so in order that he might remark how easily public bodies might he impugned without cause, and to show that the citizens of London had never been unmindful of their antiquities, even at a time when they were held in little esteem elsewhere. The catalogue itself, the speaker said, was written by Mr. Thompson, of the London Institution, hut the introductory essay was written by himself, and he would read a few passages to show, first, that he did not consider Roman London was so important a place as some helieve; and secondly, to answer what he thought the inconsiderate and gross attacks which had heen made on the officers of the corporation.

The chairman took the same view, and said Mr. Tite's book would have the effect of disahusing the public mind; and if for that effort alone, could not he too much applauded. He afterwards made some observations as to the universally erroneous nature of the statements of the periodical press, which it would be difficult to maintain. As to the "city" question there are certainly two opinions upon it. It will he remembered that it was the subject of a sharp correspondence in our pages some time ago, hetween Mr. Tite and Mr. C. Roach Smith; and as the corporation book will prohahly not get into the hands of many of our readers, we turn to it and give the portions which were read.

Speaking of the first collection of London antiquities, the author says,-

"These reliques must always possess a con-

siderable intrinsic value as illustrations of society and manners, and also a peculiar local interest, as indicating the condition of the place and people where they were found; though they cannot always be implicitly relied on as conclusive evidence of the nature of the huildings formerly standing on the spots where such antiquities were discovered.

The Tradescant family is usually regarded as having formed the first considerable collec-tion of natural and artificial curiosities in England; hut, with the exception of coins, England; nut, with the exception of coins, only six Roman articles occur in the catalogue of the Museum published by John Tradescant, junior, in 1656, and only one of these is distinguished with the name of the place where it was found. After the collection passed into the possession of Elias Ashmole, it was very considerably increased, and each each each experience. considerably increased; and, as it was not transmitted to Oxford until 1682, he prohably added to it many specimens of London anti-

added to it many specimens of London anti-quities discovered after the great fire. From the time of the rehuliding of the city, the importance of preserving such reliques, especially Roman remains, appears to have begun to he rightly perceived; and one of the first and most successful collectors of such specimens was Mr. John Coniers, an apothecary of London, who was living at the period. By his researches and industry were hrought together most of those numerous Roman vessels and articles of every kind which aftertogether most of those numerous Roman vessels and articles of every kind which afterwards formed the extraordinary museum of Dr. John Woodward, who bought the principal part of the collection. After his death in 1728, such parts of his museum as were not hought by the University of Camhridge were 'sold by anction at Mr. Cooper's, in the Great Piazza, Covent Garden,' in a thirty-three days' sale, the last three of which were occupied by the celebrated Roman shield and the miscellaneous antiquities." laneous antiquities.

Three other contemporaneous collectors of London antiquities were Dr. Harwood, John Bagford, a hookseller, and John Kemp.

"From the time of these original preservers of London antiquities, the custom of observing and recording their discovery appears to have generally commenced, with more or less of intelligence and accuracy in the description and delineation of such remains. At the present time, however, the practice has heen long since established in a highly improved form; and the reports which are now so frequently published, in illustration of the ancient reliques of all periods, often exhibit such an amount and variety of antiquarian learning as seemed in the last century to he almost unknown. This increased intimacy with the nature and value of antiquities has led to their more careful preservation and hetter exhibition, as well in public local depositories as in private collecions. One of the former is the museum estahlished in connection with the Corporation Library at Guildhall, for the reception of antiquities relating to London, especially such as may he discovered in the execution of civic public improvements, which it is certain cannot rightly belong to any other depository.

The author says, in concluding his "attempt to illustrate a series of antiquities, full of interest at the present time as heing the types of places and manners long since departed,

" It has been also attempted in this sketch to show that the citizens of London have never been unmindful of their ancient civic remains; and even in times when such memorials were held in little estimation, and the nation had held in little estimation, and the nation had no national museum, they possessed in Gresham College not only such a receptacle, hut apparently a niche for local antiquities. The liberal willingness with which every suggestion has been met, with reference to the preservation of these reliques, also shows the inconsiderate injustice of those gross attacks on the corporation and its officers in this respect, which are so constantly made, and which it is impossible to reconcile either to candour or to truth."

We must leave this to those who are personally concerned, hut are compelled to admit a strong impression that the corporation, as a hody, have done grievously little towards the preservation and collection of their antiquities, whatever they may be disposed to do now.

To confine ourselves, however, to the proceedings of the meeting. Mr. John W. Papworth then read the conclusion of his paper on some features of the connection between the architecture and chronology of Egypt, with an account of Le Sueur's essay "On the Chronology of Egypt, illustrated hy its Monuments." Afterwards Mr. Papworth laid hefore the meeting the opinions of thelearned Dr. Lepsius, "On the relation of the later Egyptian orders and the Greek column," and as the discussion which followed referred chiefly to this, we must for the most part confine ourselves at this moment to it. We give the reader's own words.

I hope to be excused, he said, if I venture to add what Lepsius himself says on the subject, at the end of the valuable paper which I have so often quoted, containing the grounds for the conclusion, in which he is supported by the authority of Barry and Jomard,—a conclusion in which I humbly concur, although for very different reasons to those which he gives as the steps by which he attains his object; and I am beg it may be understood, that what I am beg it may be understood, that what I am ahout to read are his opinions, and not mine.

At the first glance, says Lepsius, it is evident that the division of the Greek column into hase, shaft, capital, and abacus, supposes more than a natural analogy founded upon mathematical laws, or the practice of archi-tecture in general, and consequently neces-sarily seen wherever there is an architecture

with ceilings, and supports to those ceilings. In vain will "historic relations" he denied; they are relations which manifest themselves the more that the several parts are taken into consideration.

To commence with the capital: we have no need to go further than that of the Corinthian order, to find, with Jomard, its type in the Egyptian leafy capitals.*

The echinus of the Doric order corresponds The echinus of the Doric order corresponds altogether as evidently with the large expanded calix of Egyptian columns. This is not only proved by the analogy of the principal forms, but also by the ornament, which, according to Semper's researches, appears to have been generally painted, but of which we have seen one sculptured example in the columns of the great Portico and of the small Temple at Pastum.

So, too, the colors of these ornaments, which are hlue and red, with green leaves interposed, are the same which are ordinarily employed in Egyptian columns. But that which appeared to Lepsius decisive for his connection of the calix cap with the Greek echinus, was the calix cap with the Greek echinus, was the existence of the listels, or annulets, helow the echinus, and the groove so often seen at the necking or hypotrachelion of the Doric and other columns. These listels, or annulets, he have the columns of the conserved with the other columns. These insens, or animees, ne thought, evidently corresponded with the Egyptian ribbons which tie the bundles of stems, and which annulets are generally found three in number, or, as at the Parthenon and elsewhere, so many as five, the ordinary numbers of Egyptian base of Egyptian base of her of Egyptian hands.

Above the plant-capital we have the ahacus, square in Greece as in Egypt, with the single difference that, while the Egyptian die remains of the same width with the architrave, the Greek ahacus advances heyond it.

Other points of relationship present them-

Other points of relationship present them-selves in the shafts of the columns. Here we recall the entasis, corresponding exactly to that of the Egyptian plant column, which also that of the Egyptian plant column, which also finds itself greatest at one-third of its height in many cases, but frequently, nay, generally, lower, at one-seventh, which indeed agrees hetter with the swelling of the aquatic plants which it was the intention to imitate.

In saying of channelling—that habitual ornament of the three Greek orders—that it is never wanting in the Doric (the Roman and Etruscan examples are not forgotten), the temple at Segeste might be cited as a contradiction; but then this has never heen finished, forgotten), the as is evident from the cases in the great temples as is evident from the cases in the great temples at Eleusis and Rhamnus, and from those at Delos and Thoricus, all which have the channelling at top and hottom, hecause the remainder was to have heen worked in place.

^{*} The second part issued by the Architectural Publication Society is full of valuable hints. We will look to it next week.

† "Preceded by an introduction, containing an account of their discovery, with some particulars and gugestions relating to Roman London." By W. Tite, F.R.S., F.S.A., Architect of the Royal Exchange. Printed for the use of the Corporation of the City of London.

^{*} The preceding paper mentioned several capitals as being probably borrowed from the Corinthian capital in the Ptole-maic period.—Ep.

But in this very fact of channelling at all, Lepsius thinks that he has found a new and very clear proof of "historical relationship" to the Egyptian works. The general number of Doric channellings is 20, but instances of 16 (the ordinary number in Egypt) are not rare; they are found in the Temples of Minerva at Sunium, and of Jupiter at Syracuse, in the interior of the great temple at Pestum and of Jupiter at Ægina, in the theatre at Segeste, and in many other places.

Polygonal columns intended to remain withstate of the property of t

Polygonal columns intended to remain without channels, are scarcely found in Greece, to his knowledge, by the side of channelled relimns, as in Egypt, though there may be examples in private houses at Pompeii. As to the isolated instance of octagon brick columns in the Roman temple of Redicolus, it would seem that they had anciently a channelled stucco which had at a later period fallen away.

Still less are plaster columns, or pillars way. Still less are plaster columns, or pillars with four faces, known in Greece, or in Greek art; for the only example known is found in the Temple of Minerva, at Priene; for the pillars of the Temple of Jupiter Olympius, at Agrigentium, so extraordinary in many other respects, are joined by walls up to the very top. But the intimate relation of Greek channel-

But the intimate relation of Greek channelling to plain facets is not the less true; it is, first of all, stated by these words of Vitruvius, lib iv. c. 3:—

"Columnas autem striari viginti striis oportet que si planæ erunt angulos habeant viginti designatos. Sive autem excavabuntur sie est forma facienda ut quam magnum est intervallum strie tam magnis striature paribus lateribus quadratum describitur;" words which, at the least, prove that he know that, before Doric columns were channelled, they must be facetted; at the Theatre of Segeste, columns with sixteeu channels by the side of others with as many faces, would seem to show that these last once were intended to have been channelled; and, lastly, there are cases where a third part from the base upwards has been left polygonal; whilst the remaining portion is channelled, as in the Temple of Hercules, at Cori; and in that called "of Philip." at Delos, in both cases twenty changels above and tremt foret being the remaining position and in that called "of Philip." at Delos, in both cases twenty changels above and tremt foret being the remaining position and the properties of the properties of the properties of the properties of the properties and the properties of the properties

The form of the Egyptian channels above and twenty facets below.

The form of the Egyptian channels is very slightly hollow, and is not always a pure segment; at Amada they are almost flat in the middle, in which feature is conveyed another point of resemblance in the Doric channels, which are also not hollowed in a purely circular form, but pretty frequently are almost flat in the centre, with a much more perceptible curve toward the arrises, as in the Propylea of Sunium, and of the Temple of Diana, at Ephesus, in the great Temple at Rhamnus, and in the Temple of Minerva, at Sunium. There is only a difference in their depth; for instance, at

It seems, continues Lepsius, that this resemblance in general portions, and these striking sunalogies in the most special peculiarities, between the Greek and Egyptian columns, can admit no doubt as to their "exterior and historic relation."

But it seems also evident, in the second place, that the Greek column* is composed of two orders, which in Egypt are very distinct, and which never mix, that is to say, of pillar-columns and plant-columns.

We have seen that since channels can only be found in pillar columns where, on principle, they are perfectly proper and natural, they must be exotic and incompatible in plant columns.

In Greece they are seen employed as a constant ornament for Doric columns, together with the echinus corresponding to the Egyptian calix, with listels representing the Egyptian calix, with listels representing the Egyptian ribbons, and with the entasis, whose prototype is found in that of the Egyptian columns, which imitate aquatic plants: in short, the channels of pillar columns are seen applied to the shafts of plant columns; for at the least, no one will pretend that the Greek channels, which show themselves in the same numbers, 16 and 20, and of the same difference of curvature, have no connection with the Egyptian channellings, and are an ornament which

could develop itself at entirely different periods, and from entirely different origins, in two separate nations, and without the supposition of "historic relations."

On the other side, Lepsius himself urges that it is not to be thought, with Jomard, Rosellini, and Wilkinsson, that the mere identity of these channels would suffice to authorise the denomination "Protodoric," which Champollion wished to give to the second Egyptian order; for we see that, on consideration of the actual elements which exist in all columns, the three Greek orders form but one, in opposition to the two styles of Egypt: and that the Doric order, as well as the two others, presents a mixture of plant and pillar columns.

columns.

Now, if it be considered that success has attended this attempt to prove that the mixture of the two styles exists, there remains a final result, viz., that principles confounded and misunderstood from very ancient times, carry always in themselves a very sure proof that they are of exotic origin, and that their true birth must be sought in that country where they are still to be seen pure and simple, and easily to be recognised and understood, that is to say, that it is necessary to seek the origin of the Greek column, not in Greece, but in Egypt.—an opinion not enunciated as original, but which he thinks he has established for the first time, by arguments which sound criticism will not be able entirely to blame.

Mr. Tite, after complimenting Mr. Pap worth, proceeded to make some comments on Lepsins's theory, first saving a few words as to Le Sueur's book, which was the first product of the French national press, and was remarkable as having the hieroglyphics printed in moveable type, showing that, although apparently so arbitrary, these consisted of only a limited number of forms. Egyptian chronology was an obscure and difficult subject; looking at some of the early cosmogonies, they reminded him of the Welsh pedigree which midway contained,-" About this time the world was created." Confining himself, however, to the Protodoric theory,-the development of Greek architecture from that of Egypt,-he believed nothing of the sort. It was true that the Greeks were a colony of Egyptians, but they had nevertheless borrowed nothing. Egyptian architecture was that of a people who excavated, the Greek the architecture of those who built. If Lepsius had been an architect, he would have made no such mistake. Much stress had been laid on the tomb of Benihassan, given from a sketch by Mr. Barry, in Mr. Gwilt's edition of "Chambers," but he could not, from that one coincidence alone, believe that Greek architecture was indebted to Egyptian architecture. Although there was communication between the countries, and Cadmus came from Egypt, it was 300 or 400 years after that event before there was anything like government in Greece, and 700 years before Doric architecture grew up. The interval was so long, he could not connect one with the other.

Mr. Donaldson gave an interesting account of the circumstances which had led M. Le Sueur to devote attention to Egyptian chronology. He said he fully agreed with those who denied that Greece owed anything to Egypt in architecture. Egyptian architecture was purely that of the cavern, Greek that of the cabin. The proportion and refinement of the latter showed quite a different sentiment.—Mr. W. Pocock said he was satisfied that Greek architecture originated in wood. In a decree hy Lycurgus the builders' tools mentioned were the axe and the saw, showing that the buildings were of wood.

A Visitor argued, with sound reason, that

* The engraving of Benihassan occurs at page 38 of the introductory essay. The tomb is excavated in the rock, and presents fluted columns, and a lapproximation to mutules.

genius, although prompted by what is aroundand making use of others' materials, so assimilates them and makes them so entirely his own, that it is scarcely possible to say whence they came. The influence of one nation upon the other was not to be doubted, he thought. He would point to the Gothic and the Greek. Surely there was more apparent difference between these than between Greek and Egyptian architecture, yet one had grown out of the other.

Mr. Wathen (whose work on Egypt is known to many of our readers) thought that the age of Benihassan had been greatly overstated, and that it was imitated from the Greek Doric, It was the practice with the Egyptian to put before their own names the title of their most distinguished ancestor,-this was called the prenomen. The title of Orsotosen having been found on the tomb of Benihassan, the tomb had been ascribed to his reign; but he (the speaker) would maintain, that this tomb had been formed by the latest of the Pharaohs, and that the title of Orsotosen was mcrely the prenomen. This view was confirmed by the fact that an obelisk, indisputably of a more recent period (fifty years before the conquest by Alexander), had also upon it the title of Orsotosen.

Mr. Papworth, in the course of his reply to some of the objections, said the Greeks certainly used wood construction, as they were necessitated, and so it appeared in their later buildings, but they began with a stone idea; and Wilkins constantly speaks of temples which were burnt being restored, i. e. not rebuilt, but repaired. Further, if Cadmus left Egyptian Thebes for Phonicia and Crete, at the period fixed by the Arundel marbles, and if after that time Atliens was Cretan, a colony tributary to Minos, where would be the wonder that a general notion of a column should have gone thither with the emigrants, which grew up afterward, under their scientific progress in every department of the fine arts, into principles self developed?

We do not agree with those who deny altogether the obligation of the Greeks to the Egyptians, although we would in no way depreciate the merit of the Greeks. The influence of one over the other has always seemed to us too evident to be questioned. A large number of the early inhabitants of Egypt dwelt in constructed cabins, from which a system of architecture was developed quite distinct from that which grew out of their excavated structures, and it is undeniable that the earliest temples of Greece are the most like Egyptian work, and the least like the timber hut, a fact which was not brought into view during the discussion.

What we have written will suffice to shew that the evening was passed pleasantly.

Burial in Towns.—A public meeting of the national society for the abolition of burial in towns, was held on Wednesday, last week, at the royal national schools, Cowper-street, City-road, to petition Parliament for the immediate closing of all burial places in cities and towns; Mr. George Thompson, M.P., in the chair. The meeting was very numerously attended, and its more immediate object was explained by the chairman, who remarked, that as the evil, though a great one, and an outrage to public decency, and to the holiest feelings of humanity, was likely, neventheless, to be defended by some who thought they had a vested interest in the abuse, its remedy could only be applied by the Government with the aid of the Legislature, backed or enforced by a pressure from without. After a detail of the grievance to some extent, the meeting was addressed by Mr. Walker, Mr. Luke Hansard, and others, and resolutions unanimously adopted.

CHRONOLOGICAL ACCOUNT OF BUILD-INGS IN ITALY AND SICILY.

In tracing the dates of buildings solely from the records of the most accurate historians, many and great difficulties are presented to the

careful inquirer.

We find, to take an instance, in Severano's "Rome," that S. Giovanni Laterano was built by Constantine, restored "almost from foundaby Constantine, restored "almost from founda-tions" in 772-95, after an earthquake; added to by Leo IV. 847-55; repaired in 1183, 1276, 1290, and 1300, besi-les being embellished at various other times. Now this, at first sight, seems tolerably exact, as giving the chief part of present building the date of c. 772. But how are we to say how much, if any, of its predecessor still remains? How far its plan and arrangement were followed, what precise and arrangement were followed, what precise parts were added, and how much escaped intact during the after repairs and alterations? We know too well what restorations often mean with us. The works in 772 might have been executed quite unlike their originals, as the rebnilding of Canterbury by the Williams, or of St. Panl's by Wren,—or after their model, as so many of the late restorations in England. The additions and repairs might have been done as they were by Jones to St. Paul's, by Wykeham to Winchester. The building might have been restored and spoilt as Wren spoilt Westminster, and some ignorant person the nave of St. Saviour's.

Yet, to shed upon us a ray of hope, we are told that in one particular instance (and from the care with which the fact is noted we fear an exception), viz., S. Clemente, Rome, the chief part was actually rebuilt in the likeness of its predecessor from the very ground. Thus it is seen that the church historian must

fall back for assistance on the architect, and that a critical examination of the works themselves is necessary before any good judgment can be formed as to the changes they have undergone. A personal examination is the more necessary, as very few Italian writers furnish any accurate details of mouldings ornaments, or construction. Very many excellent works are, indeed, to be met with among them, which enter, with great research, into the various documents and histories connected with the buildings, so as to arrive at as accurate a knowledge as can be obtained, by that means only, of their eras. Such are Fahri's "Ravenna," Rossi's and Severano's "Rome," Richa's "Florence," &c. But very few have brought architectural knowledge to their assistance, sought information on doubtful points from the buildings themselves, or given details such as might have allowed others to work on. Except Cicognara, the Duke di Serradifalco, and D'Agincourt, I am not aware of any Italian work giving such information; and even there it is meagre. In fact, I know of no work of the sort in Italy itself that gives any thing like the real information drawn from the buildings themselves that is supplied by Professor Willis in his work, intended merely as a sketch, of the Italian mediæval architecture.

It was trusting too much to written authority, and too little to the clear evidence of the edifices themselves, that led that enthusiastic writer and brilliant theorist, Hope, to assign to the tenth and eleventh centuries the use of the pointed arch, by reference to its introduction at S. Ambrogio, S. Ciriacco, and S. Giovanni Laterano, when a careful examination would have shewn it due to the additions in the fourteenth.

The following gives an abstract of the dates of building, restoring, &c., the principal edifices in Italy and Sicily, together with the authorities for the same :-

Nocera Baptistery .- 330 (D'Agincourt). Con-

Nocera Baptistery.—330 (D'Agincourt). Converted from an antique temple.

S. Constanza, Rome.—331 (D'Agincourt) "Oxford Glossary," and Nardini, who supposes it to have been built as a baptistery to S. Agnese. Hope believes it to have remained almost unaltered. Nothing certain known of its date, except that, in 1256, it was dedicated to S. Constanza (Vasi).

S. Giovanni Laterano Baptistery.—331 (Severano); 330 (Vasi; the columns under cupola added 1475); 440 (H. G. Knight); 462 and 638, the chapels added (Severano); but restored almost from foundations, 1600 (Vasi); 1153 (Knight). Baptistery much altered and walls raised. Constantine was not baptised at Rome (Gibbon); 330 (Vasi). He says the second row of columns under

cupola was added 1480. The chapel of S. Venanzio added, 640; S. Ruffina, 1253; that of S. llario restored, and the fourth rebuilt from foundations, c.

[All these baptisteries seem to have been built in the same way. The builders got some old colunns, on which they put as many old capitals as they could find, without much regard to fitness. A large base made amends for a small capital. Where enough old capitals were not to be found, new ones, it and builting were made. The calpung, were

base made aniends for a small capital. Where enough old capitals were not to be found, new ones, in rude imitation, were made. The columns were theu arranged in civeles, arches turned from column to column, without mouldings or ornaments of any kind; a flat roof put over aisles, and a dome over the centre. Yet, rude as they are, these old baptisteries, from their fine circular outline, have a vastly picturesque internal effect.]

S. Maria Maggiore, Rome.—432 (Severano). He says it was originally built 333; restored and enlarged, 442, as now (1675) seen, except some chapols; altered, and roof, &c., restored, 732; tribune rebuilt, 1295; porch, 1115—1575; present roof formed, c. 1500; chapel of S. Cosmo e Damiano, 498. [Altar to notth-west. The general plan gives scarcely any idea of a cross. No mention is made of any atrium.] Rossi says porch was reconstructed, 1150; great repairs done to church in 1288 and 1450; it was rebuilt from foundation in 432, and enlarged. Vasi dates the campanile, c. 1275. Ryeaut and Severano give its date as 1376; Ryeaut says the porch, tower, and roof were constructed in later times than the rest. [This tower is clearly very late in date. The lower arches are pointed, and all the mouldings more elaborate than usurl. Were it not for the ugly steeple, this would be, perhaps, the finest tower in Rome.]

Domoo Ravenua.—380 to 398 (Fabri), conservated 344; entirely rebuilt, 1734—15; supposed to have been built by S. Orso with remains of Temple of Jove.

[Apsidal end, two rows of columns on each side,

[Apsidal end, two rows of columns on each side, forming aisles, going right up to end wall, without any triumphal arch or sign of the cross on plan. It has its old circular tower diminishing towards the top (much rulued), but seems of about the same date as the square Roman brick ones.]

SS. Silvestro and Martino, Rome—320 (Fliippini). This is the date of ordory, which was built in the baths of Titus; 498 (Fliippini), church restored, 780 and 844; c. 500 (Rossi), was rebuilt from foundations. The roof by S. Carlo Borromeo; 845 (Rycaut), church rebuilt; 1200 (Milezia), was restored by Marchione of Arezzo.

S. Lorenzo Basiltea, Rome.—(Severano and Nar-[Apsidal end, two rows of columns on each side

S. Lorenzo Basilica, Rome.—(Severano and Nar-dini), built by Constantine; 579 to 590, rebuilt from foundations. It had been altered and restored 435, 450, and afterwards 720 and 780 (Rossi and 135, 450, and afterwards 720 and 780 (Rossi and Severano).—Again from foundations, 1220; when north was built with twenty-two columns. The work in 578-90 included rebuilding the church from foundations, the part then built being the present tribune end. In 780 the form was changed, aisles being added, and the entrances altered; and in 1220 the orientation was changed. 780, old nave formed into eboir. Now nave added, 1220 (110pe).—The cloisters are clearly of the same date as the Roman brick towers, the columns being precisely similar to those in the towers. Much of the ornamental work of choir is well done; but some of the pilasters, capitals, and scrollwork are badly executed. The Ionic capitals of portice equal in freedom and beauty of carving, almost any existing.

S. Giovanni Luterano, Rome.—By Constantine.

S. Giovanu Laterano, Rome.—By Constantine. Rebuilt almost from foundations, 772. The ambulatory behind tribune, 850. Restored or repaired, 1130, 1183, 1276, 1290, 1305, &c.; 1140, Campanile; rebuilt 1506; 1500, principal arch of nave supported by two great columns (Severano); 1290, being ruined by heretics was restored (Rossi); 1303, hairy hunt was restored (Vash); 750, tower and S. Giovanni Laterano, Rome. burnt was restored (Vasi); 750, tower and

being burnt was restored (Vasi); 750, tower and porch (Rycaut).

S. Glovanni e Paolo, Rome. — 398, nearly rebuilt, 770 (Rondinino); 398, originally built towards the east, the present tribunc being in site of old façade (Rossi); the oburch is on the site of the Curia Hostilia (Nardini and Rossi); the tower 1200 Hone, 1570, apreh printif an grander scale. c. 1200, Hope; 1370, porch rebuilt on grander scale (Rondinino). The tower is one of the peculiar brick ones, and a string course, similar to those of tower, is used as a cornice to the ionic columns of

tower, is used as a cornice to the ionic columns of portico. It has an egg-shaped ornament, being the only instance of its use I recollect. Altar to west. S. Pietro in Vincoli, Rome.—400, anciently the Basiliae Eudoxiana (H. G. Knight); 440, rebuilt, its original date being very ancient; restored, 555 (Vasi); eighth century restored (D'Agincourt and Willis); 442 (Bunsen); 1500, restored (Rossini). Altar to north-east.

S. Clemente, Rome.—c. 450: in eightli century rebuilt nearly on the old plan (H. G. Knight, Rondinino, and D'Agincourt); in 872 rebuilt nearly on the old plan (Bunsen); 1112, repaired (Rondinino); 1112, amboni added, and cathedra in 1123 (Crescembini). Altar to the west. was found from the control of the

S. Saba, Rome.—Fourth century; west front, 770 (Willis). Altar to south.

S. Agnese Maggiore, Ravenna.—400, on site of Temple of Hercules (Pabri). S. Agata Maggiore, Ravenna.—431 (Fabri); 400

S. Agata Maggiore, Ravenna.—430 (Fabri), (D'Agincourt).
S. Andrea Maggiore, Ravenna.—440 : the pulpit 660. The church much ornamented 553, with Greek marble columns still there, 1661 (Fabri).
S. Apollinare Nuovo, or Di Dentro, Ravenna.—Fifth century, by Theodoric, king of the Goths. The twenty-four marble columns brought from Constantinople (Fabri). It has a round tower, with openings almost exactly like the Roman ones, having also the flush arebivolt, not very common in Ravenna. The old pulpit still remains on its five columns a columnar supports. The capitals of columns at the columnar supports.

S. Giovanni Evangelista, Ravenna. —425: once adorned with most splendid marbles and mosaics. Built by Galla Plaeidia (Fabri). It has a square tower like the Roman brick ones. The capitals of columns inside church are all alike.

S. Croce, Ravenna. — 149, by Galla Placidia (Fabri).

Giovanni Battista, Ravenna. - 140, by Galla Placidia. The entrance was by a long portico of eighteen little columns. They were removed in 1634, and a new piazza formed (Fabri). Has clerestory of three arches on columns under one large arch (D'Agincourt).

Nazareo e Celso, Ravenna.-440, by Galla

arch (D'Agincourt).

S. Nazaroe e Celso, Ravenna.—440, by Galla Placidia (Fabri)
S. Sabina, Rome.—c. 430, restored 795 and 825 (Severano); 124, restored 795 and 1633 (Ciampini); c. 340 (Crescembini). Supposed from Temple of Juno Regina (Nardini); 422, rebuilt from foundations, and consecrated 435. Rebuilt in 824 and 1441, and much embellished and repaired in 1587 (Rossi); 425, 824, 1233 (Willis). Altar to north-east. Built c. 430 (Vasi).

S. Crisogono, Rome.—400, supposed, but data unknown. Restored in 741. Again from foundations in III) and II24. Again restored 1624 (Severano); 730 (Bunsen); 741, roof, &c. restored, (Rycaut). Supposed by Constantine. Restored 730 and 1500 (Vasi). The columns are from the baths of Severus. The plan like S. Paolo fund. Altar to the west.

S. Giovanni de Catene, Ravenna.a circular tower with openings like the Roman brick

ones.

S. Francesco, Ravenna.—450: first dedicated to
S. Pietro Maggiore (Fabri).—It has a square brick
tower like the Roman.
S. Stefano Rotondo, Rome.—467: restored and

S. Stefano Rotondo, Rome.—167: restored and dedicated, it having been an old temple; again restored 789; altered to present form 1450 (Rossi and Severano).—c. 475, and repaired 1450 (Vasi and Bunsen).—c. 1450, reduced to form now seen, it having, before that time, been larger, and with three rows of columns; what it originally was is not well proved (Nardini).—170: not an old temple (Hope).—The outer columns were not walled up in 1450 (Quarterly Roview).—All the Ionic capitals are excerably carved, the outer row (blocked up in wall) especially.

capitals are execrably carved, the outer row (blocked up in wall) especially.

S. Bibiano, Rome, 363, by Olimpiana; restored 467, 1216, 1560 (Severano).—Built, 470 (Rossi).—Very ancient; rebuilt, 1216; restored, 1630 (Vasi).

S. Agata, in Trastevere .- 714, 717 (Rossi and

Severano).

S. Agata in Suburra, or de' Goti, Rome.—500 (Rycaut).— Reconstructed 600; being ruinous, was restored and embellished in 17th century (Rossi).—714 (Severano).—Very ancient; restored, 600, laving been profaued by the Goths (Vasi).—472 (Ciampini) (Ciampini).

Theodorie's Tomb, Ravenna.-Theodorie's Tomb, Rayenna.—490; consecrated 1221 (Fabri).—Its use is disputed and date uncertain (D'Agincourt).—The workmanship is so very much better than that of cotemporaneous buildings, that one almost suspects the correctness of the date usually assigned to it.

Theodoric's Palace, Ravenna.—190 (Fabri).—Date very doubtful (Quarterly Review, 1815).—The general appearance of the façade gives the idea of its being of about the same date as the Roman brick towers. 490; consecrated

brick towers.
S. Pancrazio, Rome.—360: rebuilt 500 (Rossi).

S. Pancyazio, Rome.—300: reputit 500 (Rossi).
500: repaired 630; rebuilt 1630 (Rycaut).—There was a small chapel here 272; enlarged, 350: in 510 as now seen; restored, 630 and 1609 (Vasi).
1249: the Ambone. Date sculptured on it (Ciam.

pini).

SS. Cosmo and Damiano, Rome.—528 (Crescembini, Vasi, Rycaut, Ciampini): 780—restored and rebuilt 1630 (Vasi): converted from temple of Remus and Romulus (Nardini): the bronze gates brought 780 from Perugia (Rossi).

Pavenzo.—540 (Hope and D'Agincourt).—The plan is interesting, shewing the complete arrangement of the early churches.

S. Maria Maggiore, Ravenna.—541 (Fabri): circular tower with openings in it, like the Roman brick ones.

S. Michele, Ravenna.—545: the front and campanile afterwards added (Fabri).—545 (Ciampini).
S. Apollinare in Classe, Ravenna.—545: em-

bellished 748.69; injured by Saracens, 850 (Fahri); 549 (Hope, Willis).—The capitals are all curious middle-age imitations of the antique, and all alike.

S. Andrea Maggiore, Razenna.—440: rehuilt 550, when the Greek columns, still there, were added (Fahri).

Altars.—Up to this time we find no vestiges of side altars, and little or no attention paid to orientation.

-The chancels were no farther distinguished Apse.—The chancels were no tarther distinguished than by the semi-circular apse, except at S. Apollinare Nuovo, where the apse is thrown back nearly its own diameter. I am aware of no church having apse at each end. Some, but very few, have apses to aisles as well as nave; but then the cross arms

to aisles as well as nave; but then the cross arms are given up.

Chapels.—Side chapels were scarcely known.
Severano says, indeed, those of S. Giovanni Batt. e Evang, were built 462; but they are almost distinct, though small, churches.

The arches are, I believe, invariably unmoulded. I remember none having mouldings except those of S. Clemente, and this was rebuilt in later times.

In the two centuries after Constantine, the greatest simplicity prevailed in form and arrangement. The only appearance of any marked change shews itself at Ravenna, where S. Nazarea e Celso shews a bold change of form, and the brick towers (if, as I helieve, of this date) of outline.

With this ends the list of the fine Ravenna.

(if, as I helieve, of this date) of outline.

With this ends the list of the fine Ravenna hasilican churches. They contain, usually, a very great quantity of middle-age sarcophagi, rounded or coped at top. Few have inscriptions. I saw no capitals in any of the churches earlier than the lower empire, and in almost every case the capitals in each one church are all similar.

The windows in the towers, square and round, are almost all similar in the peculiar deeply-recessed columns and small arches above to the Roman brick ones. Few, however, have the small archivolt, and none the imposts. There are very few strings, and those few are formed merely of bricks laid anglewise between two plain rows of bricks, almost flush with the face. They have no dentils. The crowning cornices are in similar dentils. The crowning cornices are in similar style, but larger and bolder. The columns have, sometimes, the Norman style. sometimes, slightly carved capitals in

Altogether, these Ravennese towers are less

Attogether, these Ravenness towers are less finished, and seem earlier than the Roman.

It is worthy of notice, that the churches in Greece have the windows formed on the same principle as those of the above towers.

T. H. L.

ST. MARY-AT-HILL, THAMES-STREET, CITY.

We spoke some time ago of the internal restoration of this church, if we may use the word, in the style of Wren's period. The original church was greatly injured though not destroyed in the great fire of 1666, and the interior and the east end were rebuilt by Wren between 1672 and 1677. The west end and tower which remained were in recent times taken down and rebuilt.* The whole area of the building is an ohlong figure, about 96 feet by 60 feet can ambulature is fread at the by 60 feet: an ambulatory is formed at the west end of it by a screen, and the body of the church is thereby rendered nearly square. Four Italian Doric columns support entablatures, proceeding from pilasters against the side walls, so as to produce a cruciform arrange-ment of the ceiling. The centre space be-tween the four columns is covered by a cupola, in which an octagon lantern has been intro-

The building was gutted: the ceiling is entirely new, and the wood work, comprising the pulpit, priest's desk, organ gallery, displays such an extent of carving in this particular style, as has not been executed before in

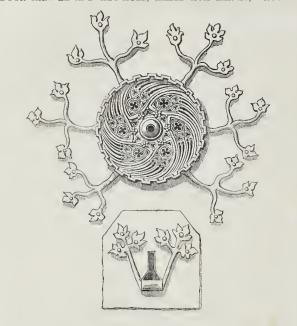

that a syste, as has not been executed before in the city for many years.

To the organ gallery have been added new wings, which are supported by square pillars rising from the churchwardens' pew, and ornamented with fruit and flowers. The great screen is articultural square of the square pillars are strongly as a strongly ornamented with fruit and flowers. The great screen is entirely composed of plate glass, in a framing of oak. The rector's pew and reading desk are enriched with carved open tracery, and brackets surmounted with the royal supporters, bearing shields with V. R., 1849.

The pulpit is entirely new, and is very elahorately carved. In the sounding-hoard are bosses of flowers of 12-inch projection. On the back of the pulpit are two carved trusses. From the eyes of the volutes garlands of flowers

* Godwin's "Churches of London." Vol. II.

DOOR HANDLE AND KEY-HOLE, HALLE AUX LAINES, BRUGES.

are suspended, which pass through the split trusses, and fall down, crossing and uniting behind. Within the pulpit, at the back, there is a well-executed drop, composed of fruit and flowers. The stairs are of unusual extent, and show that neither cost nor pains have been spared.

On the front of the organ-gallery there On the front of the organ-gallery there are clusters of very bold carving, consisting of musical trophies and garlands of flowers, with birds and fruit. The Royal arms, with a mantle scroll, is about 10 feet long, and forms a perforated screen on the top of the organ-gallery. The organ was built by Mr. Hill.* The whole of the pews are custioned and carpeted. The fittings of the altar-table, pulpit, &c., were executed by Mr. Geo. Haines. All the carved work is by Mr. William Gibbs Rogers,

All the carved work is by Mr. William Mr. Rogers.
The works were executed under the direction of Mr. James Savage, Architect; the builder employed was Mr. Ryder; and the plaster work was by Mr. Newport. A very large sum of money must have been spent; and such is the good feeling on the subject working in the parish, that the windows are prevailing in the parish, that the windows are about to be filled with stained-glass at the expense of individuals.

CURE FOR THE CORN WEEVIL .- In granaries with damp walls, it has been found that the weevil breeds in incredible numbers; while the deption of means to insure dryness in the construction of the building, otherwise so ne-cessary to the preservation of the corn itself, will also prevent the generation of the weevil, or destroy it is previously generated.

* This organ is constructed on the German plan, and contains two manuals and a pedal organ. The compass of the manuals is from CC to F, the pedals from CC to E, the season, selecting the construction of the contains the following the contains the conta

GOTHIC TRONWORK.

Annexed is a representation of all that is left of the door-handle and key-hole at the Ancienne Halle aux Laines, Bruges; the knob (or ring) has been broken off. 'The diameter of the circle is 9 inches. The variety discoverable in medieval metal-work is quite extraordinary.

THE ROYAL ACADEMY.

(144) "Helena," the only contribution of Mr. Eastlake, R.A. The character and expression of the features beautifully realise the poet's conception; it is painted in a manner suggestive of the combined styles of Titian and

suggestive of the combined styles of Tiolan and Raffaelle.

(159) "Girce with the Syrens three," F. R. Pickersgill, (A). A composition signalised by much beauty, although not a favourable picture for an exhibition, from its delicacy of colour, verg-ing on weakness. Few artists, however, could put together a like number of figures with more masterly arrangement of beautiful lines.

The same appearance of weakness is observable in (463) "The Maids of Alcyna, the enchantress, endeavouring to tempt Rogero," by the same artist, but this also is an elegant

by the same arose, but composition.

(171) "A Slide," T. Wehster, R.A. An essentially English picture, and the most perfect of its class in the collection. The genuine manual treatment (although refined), humour, natural treatment (although refined), and probable disposition of the performers in the scene,—the sunny little face of the red-cloaked girl, plain as she is, are beyond all praise. The individuality of the figures and heads is something surprising, as well as is the absence of conventionality, the only drawhack to its exciting unqualified pleasure is the truth with which the cracked ice is painted: one imagines momentarily to perceive it give way, and expects to lose sight of the falling and fallen together. Mr. Webster's lesser performance, entitled (91) "A See-saw," wherein a small boy is elevated above his expectations,

a small doys elevated above his expectations, to his no small uneasiness and the heavier one's enjoyment, is also a charming production. (174) "The Stream at Rest," and (392) "The solitary Pool," R. Redgrave, (A.) are astonishing facts to certify that the artist has

hitherto mistaken his walk. "The solitary Pool," particularly, is second to nothing of the sort; it is painted with the precision of a daguerreotype as to form, and in colour, is

nature reflected.

(177) "The Chevalier Bayard wounded at Brescia." This is the best of three excellent productions by J. C. Hook, which satisfactorily prove a continental tour is not always an artist's ruin. Exquisite in colour throughout, the head of the Chevalier is remarkably fine in conception; whilst the delicacy of character and execution of the virtuous, fair, and welltrained damsels bespeak a refined taste, free from all taint of prettiness. A little more con-fidence and decision would perfect it. The same remarks will apply to a smaller but no less excellent contribution, (382) "Othello's first Suspicions," which exhibits great feeling for the first order of art. (517) "Bianca Capello," the last and least original of the three, has, nevertheless, traits of great excellence. Mr. Hook

uneress, traits of great excellence. Mr. Hook promises to be an honour to the school. (8) "The Wreck Buoy," and (206) "Venus and Adonis," painted in initiation of the old Venetians, are specimens of the wonderful art of Mr. Turner, R.A.,—superior to many of his late works. For years he has not been so strong, and in two opposite manners.

(207) "The First-horn," C. W. Cope, R.A.

A sleeping child, and its young mother bending over it in happy contemplation of its love-liness, with the fond husband, painted in the manly style of this artist: it demands the appreciation of all. The grey and general tints of the girl's neck and shoulders vie with the colours of Etty.

(117) A coloured study for fresco in House of Lords—"Griselda's first Trial," and (903) cartoon of the same, wherein all the ample resources of the artist have been called into requisition, promise the fresco to be not inferior to what might have been expected from the painter of "Cardinal Wolsey." The draw-ing of "Griselda," the arms in particular, is

marvellously beautiful, as is the composition.

The six productions of Mr. Stanfield, R.A., set forth his characteristics to advantage.

(498) "Moonlight off the Reculvers," is (498) Mooning of the Recuivers, is to us his most extraordinary work, being accurate delineation of a most difficult natural effect. The cloud that seems to float over the middle distance startles the spectator from its truth: there is a freedom too from the coldness and blueness, so often pervailing moonlight pieces, that renders it remarkable. (12) "Tilbury Fort—Wind against Tide;" (151) "Lugano;" (211) " Salvator Inde; (151) Lagano; (211) Salvacon Rosa's Studio" (less worthy of the master); (325) "Lago Maggiore;" and (331) "Near Miori, Gulf of Salerno;" are the other works of this our best marine painter. (242) "The Cup found in Benjamin's Sack,"

Sir W. Allan, R.A., gives proofs of labour and

research during the artist's sojourn in the East. (284) "Drawing for the Militia," J. Phillip, full of the incidents belonging to the scene, and, from what we can see of it, replete with the fruits of exercised talent, skilful perception of character and expression, and an education in the manual part of the profession of no small limits. Surely the producer of the "Presbyterian Catechists," and the "Scotch Fair," deserved more consideration than the position of his picture shows he had. (286) The duet, "Andante con Moto," F. Stone, remarkably pretty and Mr. Frank

Stone-y. (290) "The Destruction of Jerusalem" hy

the Romans, under the command of Titus, A.D. 71, D. Roberts, R.A.—a concentration of A.D. 71, D. Roberts, R.A.—a concentration of topographical, professional, and historical knowledge, forming a really grand work—the only exhibited one of the artist, and, perhaps, his chef-d'œuvre.

(303) "Benjamin West's first Effort in Art," E. M. Ward (A). Little Benjamin, the embryo President of the Royal Academy, is represented intently bent unon compilitive to paper the

intently bent upon co-amitting to paper the transient smile of his sleeping nephew, struck with its beauty whilst sleeping. The earnest desire to consummate his intention, and the quiet admiration depicted in his expression, are beautifully pourtrayed. The sleeping infant is a nice study; and the treatment and composition of the work, as a whole, bespeak an advance upon any of his preceding pictures. In Mr. Ward's productions may be always discerned research and persevering industry: few possess more determination to think for themselves, or labour more zealously to find novelty in choice of subject,—still fewer who determine to leave as little undone as possible, and invest such an amount of thought in one performance. (318) Daniel Defoe and the Manuscript of Robinson Crusoe" is a striking instance; his per-ception of the human feelings, and power of expressing them, bave never been brought into play with more success; the despair of the poor author, who has hawked about his work until almost ashamed of it—the sympathy of his wife and child—the nonchalance of the dandy bookseller, who is extinguishing the smouldering wick of the taper with the nih of his pen—the assumption and egotism of the fashionable authoress of namhy pamby odes to expiring bullfinches, fickle butterflies, and

expiring bullfinches, fickle butterflies, and arched eyehrows—the sycophantic and complimentary senior partner,—are to the life.

(311) "Isabella," J. E. Millais, is a singularly clever reading of Keats's poem: the personages are a succession of well studied and portrayed individuals, every one of them distinct As the work of a young artist, it may be called

extraordinary.

(324) "Rienzi vowing to obtain Justice for the Death of his young Brother, slain in a skirmish hetween the Colonna and Orsini fac-. H. Hunt, is much in the same style as that of Mr. Millais, and scarcely less clever; perhaps there is even a higher feeling about this that promises well for the hereafter

(326) "The Fountain, a Scene at Mola di Gaeta," P. Williams, a repetition of one of the artist's most pleasing and elaborate en-graved works. Several other transcripts of Italian life contributed by him this year will

anply repay inspection.

(131) "A Glade in the Forest," (343) "A
Stream in the Hills," (371) "Passing Showers,"
(417) "The Shade of the Beech Trees," and
(544) "The Quiet Lake," are some of the most successful attempts of Mr. Creswick (A.) to show nature as it is; he affords one of our strongest arguments when the superiority of English landscape painters over all others is asserted no one represents nature in truer colours; it is quite a treat, requiring little imagination, to take off your hat and fancy yourself in the enjoyment of the invitingly cool shade ever present in his delicious pictures,—a welcome escape from the heat and glare of a crowded exhibition room.*

LAUNDRY DRYING CLOSETS.

The great importance of the subject induces me to attempt an elucidation of the two systems of drying; viz., with and without a current of fresh air; and I trust that although both practice and prejudice are strongly in favour of the former, I shall be able satisfactorily to prove the latter system to he not only the most economical, but the most effective.

As your correspondent Mr. Walker ohserves, As your correspondent Mr. Walker onserves, "Artificial drying (has been) in fact a two-fold operation. By heat, the moisture is quickly converted into vapour; by ventilation, that vapour is carried away, and replaced with dry air;" or in other words, drying has been effected by the joint action of a radiating surface, and a current of heated air, distributed in face, and a current of heated air, distributed in such a manner as to bring it as nearly as possible in contact with the linen suspended in the chamber. By these means, the tempera-ture was raised from 50° or 60° to about 200°, according to the extent of the heating surface, and the quantity of air admitted. Now, supand the quantity of air admitted. Now, supposing the air in its passage to he perfectly heated to the temperature of the chamber, then every particle passing off represents a waste of fuel equivalent to the raised temperature; and if any air enters the chamher, and passes through without being sufficiently heated, the effective power of the chamber is then lessened, and time, a most important element, is lost in the drying. By placing thermometers in different parts of a chamber thus heated, after it has been filled with wet linen, the unequal temperature of the stream of air be shewn; and that it is so, will be proved by the rate of evaporation varying in different parts of the chamber; but if you close the air flues, and expose your heating surfaces, whe-

* We are compelled to postpone continuation of notice of the Architectural-room.

ther of brick or iron, to the linen of the chamber, with only a slight net work of wire between them and the linen to prevent accidents, then the temperature of the chamber will quickly rise above the boiling point of water, and eva-poration will take place rapidly; not a particle of heat will be wasted, and nothing but the steam produced by the evaporation of the water will escape from the outlet, which ought be small, and capable of regulation. this mode, the heat radiated from the flues acts through a rarified medium, directly on the water in the linen. All the heat is employed, and none escapes except charged with vapour; and as water evaporates at the boiling point much more rapidly than at any lower temperature, so will a chamber thus heated and closed (and which may with strict truth be compared with a steam boiler, or evaporating pan), dry the linen more economically and rapidly than if supplied by " an ample current of fresh air."

Everything in this arrangement tends to economy, and the whole of the heat derived from the fuel is employed.

Tbe difference between the two methods is this: -in the one case, you are constantly heating a large volume of air, and by thus altering is hygrometric capacity, you enable it in its passage through the chamber to take up the water converted into vapour by the radiant beat of the flues,—every atom of air thus passing out at a raised temperature being a waste of fuel. In the other, you employ the whole of the heat derived from the fuel, di-rectly to evaporate the water in the linen, which passes from the chainber in the form of vapour, robbing the flues only of so much heat as is due to its conversion.

The object of either method being to evaporate water, the question is, by which means it can be evaporated most rapidly and economically. Were there not experiments to prove the efficiency of the one method over the other, the question might easily be decided by reasoning upon the respective plans. But that

is not necessary.

In a chamber with a given heating surface supplied with fresh air, and maintained at a temperature of 200° before it was filled with wet linen, it was found that not more than one-third of a pound of water per minute could be evaporated. The same chamber with its be evaporated. The same chamber with its air-flues closed, and maintained at the same temperature, regularly evaporated one pound of water per minute. To ascertain whether the whole of the heat given off by the fuel was radiated in the chamber, a sheet of writing paper was introduced into the flue at its exit from the chamber. After being there ten or fifteen minutes it was removed, and found discoloured, but scarcely scorched. Now, as economy is so large an element of success as applied to the "Laundries for the Working Classes," the importance of this subject to them cannot be over-estimated, and it is to the pertinacity with which the committee and engineer adhered to the old system of drying that the expense on this part of the model establishment at Goulston-square is to be attributed. Had it been known that drying could be accomplished by the simple radiation of heat in a close chamber, and with the conditions required for such an establishment, autous required for sain an estimation much time, money, and anxiety would have heen saved. The "close" system of drying has now been adopted there, and I have no doubt will be followed in all public establishments where economy is studied.

WM. JEAKES, Jun.

HOLBORN-HILL AND ITS VICINIT meeting of the ward of Farringdon-Without was held on the 16th inst., for considering the was held on the 16th inst., for considering the propriety of applying to Government for aid in carrying out the improvements on Holborn-hill and Victoria-street,—the Lord Mayor in the chair. The meeting was addressed by his lordship, and by Messrs. Walker, Barnard, Galloway, Williams, Taylor, Herepath, Meeking, Buckmaster, Lamplow, and others. Resolutions were unanimously adopted in accordance with the objects of the meeting, and a committee was anyonized to carry them out committee was appointed to carry them out.
Surveyor to Ironmongers' Company.

-Mr. G. R. French has been elected surveyor to this Company in the place of the late Mr. Sibley. There were eight other candidates. Four of them went to the poll.

GENERAL MEETING ROOM, EUSTON STATION.

MR. P. C. HARDWICK, ARCHITECT.

THE GENERAL MEETING ROOM, EUSTON STATION.

LONDON AND NORTH-WESTERN RAILWAY.

We said last week in our notice of the great hall at the Euston Station, that the new general meeting-room was a handsome apartment, 75 feet long, 45 feet wide, and 40 feet high, calculated to accommodate 400 persons; and we now give a view of the apartment, which will be found, we think, to justify the epithet.

The walls, columns, &c., are formed in grey Martin's cement, painted in imitation of granite. There is a fire-place at each end; the chimney-piece is of dove marble.

THE SEVEN LAMPS OF ARCHITECTURE.*

The following detached passages, marked when reading the book, will further elucidate Mr. Ruskin's views:—

Position of Buildings.—It would not be well to build pyramids in the valley of Chamouni; and St. Peter's, among its many other errors, counts for not the least injurious its position on the slope of an inconsiderable hill. But imagine it placed on the plain of Marengo, or, like the Superga of Turin, or like La Salute at Venice! The fact is, that the apprehension of the size of natural objects, as well as of architecture, depends more on fortunate excitement of the imagination than on measurements by the eye; and the architect has a peculiar ad-

vantage in being able to press close upon the sight, such magnitude as he can command. There are few rocks, even among the Alps, that have a clear vertical fall as high as the choir of Beauvais; and if we secure a good precipice of wall, or a sheer and unbroken flank of tower, and place them where there are no enormons natural features to oppose them, we shall feel in them no want of sublimity of size. And it may be matter of encouragement in this respect, though one also of regret, to observe how much oftener man destroys natural sublimity, than nature crushes human power. It does not need much to humiliate a mountain. A hut will sometimes do it; I rever look up to the Col de Balme from Chamouni, without a violent feeling of provocation against its hospitable little cabin, whose bright white walls form a visibly four-square spot on the green ridge, and entirely destroy all idea of its elevation. A single villa will often mar a whole landscape, and dethrone a dynasty of hills; and the Acropolis of Athens, Parthenon and all, has, I believe, been dwarfed into a model by the palace lately built beneath it. The fact is, that hills are not so high as we fancy them, and, when to the actual impression of no mean comparative size, is added the sense of the toil of many hand and thought, a sublimity is reached, which nothing but gross error in arrangement of its parts can destroy.

Our Street Architecture.—Of domestic

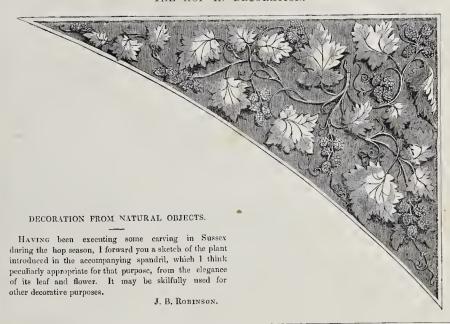

fancy them, and, when to the actual impression of no mean comparative size, is added the sense of the toil of manly hand and thought, a sublimity is reached, which nothing but gross error in arrangement of its parts can destroy.

Our Street Architecture.—Of domestic architecture what need is there to speak? How small, how cramped, how poor, how miserable in its petty neatness is our best! how beneath the mark of attack, and the level of contempt, that which is common with us! What a strange sense of formalised deformity,

of shrivelled precision, of starved accuracy, of minute misanthropy have we, as we leave even the rude streets of Picardy for the market towns of Kent! Until that street architecture of ours is bettered, until we give our windows recess, and our walls thickness, I know not how we can blame our architects for their feebleness in more important work; their eyes are inured to narrowness and slightness; can we expect them at a word to conceive and deal with breadth and solidity? They ought not to live in our cities; there is that in their miserable walls which bricks up to death men's imaginations, as surely as ever perished forsworn nun. An architect should live as little in cities as a painter. Send him to our hills, and let him study there what nature understands by a buttress, and what by a dome. There was something in the old power of architecture, which it had from the recluse more than from the citizen. The buildings of which I have spoken with chief praise, rose, indeed, out of the war of the piazza, and above the fury of the populace; and Heaven forhid that for such cause we should ever have to lay a larger stone, or rivet a firmer bar, in our England! But we have other sources of power, in the imagery of our iron coasts and azure hills; of power more pure, nor less serene, than that of the hermit spirit which once lighted with white lines of cloisters the glades of the Alpine pine, and raised into ordered spires the wild rocks of the Norman sea; which gave to the temple gate the depth and darkness of Elijah's Horeb cave; and lifted, out of the populous city, grey cliffs of lonely stone, into the midst of sailing birds and silent air.

^{*} See p. 229, ante.

THE HOP IN DECORATION.

Proportion.—I believe that all that has been partly because more durable, but also because more perfect and graceful. For to conquer the harshness and deadness of tone laid upon written and taught about proportion, put toge-ther, is not to the architect worth the single rule, well enforced, "llave one large thing and several smaller things, or one principal thing and several inferior things, and bind them well together." Sometimes there may be a regular gradation, as between the heights of stories grantation, as between the lengths of stories in good designs for houses; sometimes a monarch with a lowly train, as in the spire with its pinnacles: the varieties of arrangement are infinite, but the law is universal—lave one thing above the rest, either by size, or effice or interset. Don't put the pinnacles or office, or interest. Don't put the pinnacles without the spire. What a host of ugly church or office, or illierest. Don't put the pinnasses without the spire. What a host of ugly church towers have we in England, with pinnacles at the corners, and none in the middle! How many buildings like King's College Chapel at Cambridge, looking like tables upside down, with their four legs in the air! What! it will be said, have not beasts four legs? Yes, but be said, have not beasts four legs? Yes, but legs of different shapes, and with a head between them. So they have a pair of ears: and perhaps a pair of horns: but not at both ends. Knock down a couple of pinnacles at either end in King's College Chapel, and you will have a kind of proportion instantly. So in a cathedral you may have one tower in the centre, and two at the west. and two at the west end; or two at the west end only, though a worse arrangement; but you must not have two at the west and two at the east end, unless you have some central member to connect them; and even then, buildings are generally bad which have large balancing features at the extremities, and small balancing features at the extremities, and small connecting ones in the centre, because it is not easy then to make the centre dominant. The bird or moth may indeed have wide wings, because the size of the wing does not give supremacy to the wing. The head and life are the mighty things, and the plumes, however wide, are subordinate.

Colour in connection with Architecture.—I do not feel able to speak with any confidence respecting the touching of sculpture with colour. I would only note one point, that sculpture is the representation of an idea, while architecture is itself a real thing. The idea may, as I thinh, he left colourless, and coloured by the beholder's mind: but a reality ought to have reality in all its attributes: its colour should be as fixed as its form. I cannot, therefore, consider architecture as in any wise perfect without colour. Farther, as I have above noticed, I think the colours of architecture should be those of natural stones;

stone or on gesso, needs the management and discretion of a true painter; and on this co-operation we must not calculate in laying down rules for general practice. If Tintoret or Giorgione are at hand, and ask us for a wall to paint, we will alter our whole design for their sake, and become their servants; hut we must, as architects, expect the aid of the common workman only; and the laying of colour hy a nechanical hand, and its toning under a vulgar are far more offensive than rudeness in

cutting the stone. Whatever harmonies there may be, are distinctly like those of two separate musical parts, coinciding here and there only—never dis-cordant, but essentially different. I hold this, then, for the first great principle of architectural colour. Let it be visibly independent of form. Never paint a column with vertical lines, but always cross it. Never give separate mouldings separate colours (I know this is heresy, but I never shrink from any conclusions, however contrary to human authority, to which I am led by observance of natural principles); and in sculptured ornaments do not paint the leaves or figures (I cannot help the Elgin frieze) of one colour and their ground of another, but vary hoth the ground and the figures with the same harmony. Notice how nature does it in a variegated flower; not one leaf red and another white, but a point of red and a zone of white, or whether it was the to each. In contrast, or whatever it may be, to each. places you may run your two systems closer, and here and there let them be parallel for a note or two, but see that the colours and the forms coincide only as two orders of mouldings do; the same for an instant, but each holding its own course. So single members may sometimes have single colours: as a bird's head is sometimes of one colour and bird s nead is sometimes of one colour and its shoulders of another, you may make your capital one colour, and your shaft another; but in general the best place for colour is on broad surfaces, not on the points of interest in form. An animal is mottled on its breast and back, rarely on its paws or about its eyes; so put your variegation boldly on the flat wall and broad shaft, but be shy of it in the capital and moulding; in all cases it is a safe rule to simplify colour when form is rich, and vice versa; and I think it would be well in general to carve all capitals

and graceful ornaments in white marble, and so leave them

Value of Architecture,-We may live without her, and worship without her, but we cannot remember without her. How cold is all history, how lifeless all imagery, compared to that tory, how lifeless all imagery, compared to that which the living nation writes, and the uncorrupted marble bears! how many pages of doubtful record might we not often spare, for a few stones left one upon another! The ambition of the old Babel builders was well altered, for this result, these are but two directed for this world there are but two strong conquerors of the forgetfulness of men, poetry and architecture; and the latter in some sort includes the former, and is mightier in its reality; it is well to have, not only what men have thought and felt, but what their hands have handled, and their strength wrought, and their eyes beheld, all the days of their life. The age of Homer is surrounded with darkness, his very personality with doubt. Not so that of Pericles: and the day is coming when we shall confess, that we have learned more of Greece out of the crumbled fragments of her sculpture than even from her sweet singers or soldier historians. And if indeed there be any profit in our knowledge of the past, or any joy in the thought of being remembered hereafter, which can give strength to present exertion, or some sort includes the former, and is mightier can give strength to present exertion, or patience to present endurance, there are two duties respecting national architecture whose importance it is impossible to overrate: the first, to render the architecture of the day historical, and the second, to preserve, as the torical; and the second, to preserve, most precious of inheritances, that of past

THE LATE AFFRAY AT THE ROYAL ACADEMY.—Mr. Evans, who assaulted the secretary on the rejection of his artistic labours, was sentenced lately at the Middlesex Sessions to pay to the Queen a fine of 25l., and enter into his own recognizance in the sum of 40l., with one surety in 201., to keep the peace for six months. The fine was paid, the recognizance entered into, and the surety given, on which the defendant was liberated. The case appeared to excite great interest.

to excite great interest.

Electro-telegraphic Progress.—The Common Council of the City have agreed to offer no hinderance to Messrs. Blunt, C.E., in their intended deposit of the wires for their projected coast line of telegraph in the Thames, unless they prove a nuisance either to the public or to individuals.

EARLY CHRISTIAN ART.

HAVING completed his review of ancient art, Mr. Wornim proceeded, on Friday week, at the School of Design, Somerset-house, to lecture on art in the middle ages—the "dark ages,"—so called, said the lecturer, because we are pretty well in the dark concerning them. This period he comprised in the interval between the establishment of Christianity and the renaissance or revival of art,—a period of about 900 years, from the fourth to the thirteenth century. He proposed, therefore, to devote to this period three lectures, including the consideration of the various styles of Cothic ornament, comprising, of course, architecture. In this first of these, however, a general historical view of the period merely was taken, and the character of its ornaments and symbols examined in detail.

Ancient art, he proceeded, might be said to have ceased when Rome ceased to be the capital of the world, namely, from the time of Constantine, in the fourth century. The establishment of Christianity, the division of the empire, and the incursions of barbarians, were empire, and the incursions of darbarians, were the chief causes of the important revolution experienced by the imitative arts, and the serious check they received; and the founda-tion of Constantinople, and the Exarchate, were equally fatal to the magnificence of Rome.

Byzantium, the Rome of the East, became more rich in works of art than Rome herself: Europe and Asia were despoiled to enrich the new city of Constantine: its great thorough-fares were adorned with colossal figures in bronze; and before the church of St. Sophia alone were disposed many hundred statues, the masterpieces of ancient art.

But nearly all these works, and many more in the various capitals of Europe, Asia, and Africa, became a prey to religious fanaticism, or were carried away for the value of the metal by the many hordes of Huns, Goths, and Vandals, by whom nearly every trace of ancient graphs are supported by the support of the support cient grandeur was swept from the earth. The volcano, even, was a protection compared with the destructive fury of those middle-age fanatics, the iconoclasts, whether Christian or Mahomedan. So effective was their system of Maninegam of the the fortunate preservation of Pompei, by Vesuvius, we should have had to glean our knowledge of ancient manners and customs almost entirely from In the third century, however, as the church hecame more general, and accordingly more firmly established, the antipathy and

dread of images proportionately declined.

During the first and second centuries, Christian works of art were limited to symbols, and were then never applied as decorations, but as exhortation to faith and piety; such we find, for instance, on their tombstones. The first exhortation to faith and piety; such we find, for instance, on their tombstones. The first of all symbols was the monogram of Christ. It was sometimes combined with the figure of the cross, with the letters alpha and omega on the sides. Another very common symbol was the fish; it is what is called an acrostic symbol: the Greek word for fish, \$\chi \text{v\text{0}}\ceps_{\chi}\$ being composed of the initial letters of the words of the following Greek sentence—Inspec Nourge. the following Greek sentence—Inσους Χριστος, θεου Yιος, Σωτηρ,—Jesus Christ, of God the Son, the Saviour. This is the origin of the common symbol known as the Vesica pisces, which is the shape of the glory that we find occasionally surrounding the whole figure of Christ, especially in representations of the transfiguration in Byzantine MSS. The five letters of the ward occur as well as the field letters of the ward occur as well as the field. the following Greek sentence-Inσους Χρισ letters of the word occur as well as the fish, but in this ease written vertically. Other symbols employed in early decoration were then adverted to by the lecturer, together with then adverted to by the necessity, together the pictorial and plastic representations mixed up with them in and after the third century. The most ancient figure of the Saviour de-picted in the catacombs at Rome and copied by Raffaelle, and others of a subsequent date, with the nimbus, or glory, introduced only in the fourth century, were then described; and the mosaics of the old Christian churches or basilicas in Rome, Ravenna, and other parts of Italy, pointed out as our principal monuments of early Christian painting. As works of art, he remarked, these latter decorations have little value, hut their interest is great as bistorical and ecclesiastical monuments.

The basilicas, which mean literally, houses of the king, or lord, spiritual or temporal,

were originally used as halls of justice; and the upper end is called the tribune or tri-bunal, from the seats of the judges and magistrates, the tribunes, who held their official sittings in that part. The tribune is frequently built in the form of a large semicircular recess, surmounted by a semi-dome. The altar was sometimes placed in the recess, and sometimes before it. The whole upper concave surface (called the apsis) was gilded and adorned with figures of Christ and the apostles, variously arranged, though generally similar in the essentials, and nearly always executed in Mosaic work.

In the large hasilies in which a transact is gistrates, the tribunes, who held their official

In the large basilicas in which a transept is introduced before the tribune, the ground plan thus forming what is called the Latin Cross, the transept is divided from the nave by a large arch, called the arch of triumph; and in this case subjects from the Apocalypse arc frequently represented on the arch. Other subjects from the various religious cycles were introduced in other parts of the church.

These mosaics, mostly executed from the fifth to the ninth centuries, are similar in character to the illuminations of the MSS., espe-eially those of the Byzantine school. As regards pavements, less change, perhaps,

took place than in any other class of orna-mental designs; that is, the purely geometrical mental designs; that is, the purely geometrical patterns, which, even though heathen works, could present nothing offensive to the most scrupulous Christian. We accordingly find, in many churches of the middle ages, mosaic pavements nearly identical in pattern with those lately discovered in Pompeii.

Some interesting remarks on embroideries, representations of the Divine Trinity, &c., then followed, and reference made to the

then followed, and reference made to the "Guide to Painting," by the monk Dionysius, recently translated and published at Paris as a manual of Christian iconography.

In the extraordinary peninsula of Mount Athos—the 'holy mountain,' as it is called, there are no less than 935 churches or chapels, every one of which is either covered in the in-terior with frescoes, or ornamented with pic-tures on panel, and occasionally with mosair, and many of these works, said the lecturer, date from the early period of which we are now treating. The monasteries of Mount Athos also possess many ancient relics of the jeweller's art, as the magnificent triptic of St. Laura, presented to that monastery by Nicephorus Phocas, in the tenth century. It is set externally with emeralds, pearls, and rubies as large as sixpences, and a double row of diamonds. The most singular peculiarity of this remarkable peninsula is, that no woman is allowed to enter it—no female has ever trod in one of it. 225 should be and not these church in one of its 935 chapels, and yet these chapels are decorated with the figures of female saints, hy painters who perhaps never saw a woman from the time of their infancy: this is, however, of little consequence, as the images of the saints are strictly traditional. Such, continued the lecturer, is the nursery of the Byzantine school, until lately without a rival where the Greek Church prevails, and formerly of almost

equal influence in the west.

A point which the educated artist ought to know, relates to the representation of the divine Father, by the hand in the attitude of benediction,—a very common symbol in early Cristian art,—but differing in the Greek and Cristian art,—out thirting it in the characteristic that churches, so as at once to determine the origin of a work of art; for where the Greek form occurs, it is infallibly a sign of the Byzantine School. The Greek form represents Byzantine School. The Greek Both Captaches the monogram of Christ, IC XC,—the first finger or index pointing upwards, the second slightly curved, the thumb and the third crossed, the control of the con and the fourth or little finger also slightly curved. The Latin shows the thumh and the and the folder of curved. The Latin shows the thumh and the two first fingers, a symbol of the Trinity. The artist will find this distinction of frequent use in studying old monuments: it throws a light on the origin of several so-called Gothic

The memorable image confroversy between the emperors in the east and the popes in the west, which ultimately separated the eastern and western churches, and indeed convulsed the whole of Christendom for a century and a half, commenced shortly after the Council of Constantinople, in the eighth century, deprecating symbols,—as the Council of Illiberio, nearly symbols,—as the Council of Illiberio, nearly four centuries earlier, had prohibited the deco-ration of churches with images. Into the par-

ticulars of this controversy the lecturer entered pretty fully, and afterwards proceeded, with the help of illustrations, to examine more in detail, the character of the ornaments, or symbols rather, of the whole of this period of art, apart altogether from its architectural arrangements. Here, said the lecturer, a new world as it were presents itself to the ornamentist, and one wholly unintelligible to him without some slight knowledge of symbolism, though much is not required, it being sufficient to point out the leading forms, and before all the cross and dome or circle; the latter, the dome or circle, referring to heaven and eternity, and the former, the cross, to the means of attaining them. These forms pervade almost every ornamental design of the middle ages, especially for the action provides and the ages that the cross still for of the earlier periods; and they are still fur-ther developed by a host of secondary symhols, some of them already explained. In architecture too, though we cannot enter into it at present, the cross and dome supplanted every other form, and constitute the great elements of the Byzantine style, completely illustrated in St. Sophia of Constantinople, San Vitale, of Ravenna, and St. Marks, of Venice.

The symbolism of middle-age art gives its ornaments no beauty; their effect in most cases is to be attributed to the richness of their cases is to be attributed to the richness of their colouring and materials. But we shall find as we proceed, that in one subject at least—in geometrical design—the artists of the middle age are yet unapproached; and it is not to be overlooked that the whole range of medieval monuments offer a vast source of suggestions to the decorator and designer, which he cannot too frequently compute not for five their them. not too frequently consult, not for imitation, but for hints.

In my next, concluded the lecturer, I shall The my next, concluded the fecturer, I small treat of some of the middle-age mosaics, and of Romanesque, Lombard, and Saracenic architecture, and their characteristic decorations.

NOTES IN THE PROVINCES.

THE colossal statue of Dr. Jephson, by The colossal statue of Dr. Jephson, by P. Hollins, is to he publicly inaugurated at Leamington on 28th inst.—The new ship dock at Portsmouth, opening into the lately-finished steam-basin, has been completed by the contractor, Mr. Rolt. Its dimensions are length on the coping, 300 feet; width, 90 feet; length at bottom of dock, 260 feet; width, 35 feet. It is capable of receiving the largest modern-built ship affoat.—A sum of 10,000l. has been bequeathed by a Mr. Parsons, of Dudley, for the establishment of a free school for poor boys and girls of that town and parish.—The restoration, as it is town and parish.—The restoration, as it is still called, of St. Michael's Church, Gloucester, the idea of which had been abandoned, is about to be carried out by "taking down the whole of the present edifice except the tower, and erecting a new building, composed of a nave and two aisles with a chancel." Messrs, Eullians and Welling and which had Fulljames and Waller had prepared a plan of restoration, and made an estimate, which has been modified in cost from 3,000*l.* to 2,000*l.* The walls are to be slighter, and the aisle pillars lighter than those of the present edifice. From a re-arrangement of the seats, increased accommodation (for 50 persons) will be provide I.—The corner-stone of a new Unitarian Chapel has heen laid at Tipton.—The bank of the Oxford and Coventry Canal, at Rugby, lately burst and inundated the village: what was the cause we have not yet ascertained.

—A small edifice, to be called St. Alban's
Church, is in course of erection by the Liverpool Clurch Building Society, in Bevington district. The chief stone was laid on Tuesday week. The design is by Mr. A. H. Holme, and the building is to be of rock-faced and the building is to be of rock-faced York-shire stone. It is to be in the Early English style, 108 feet long and 48 feet wide; height of the roof, 55 feet; spire, 120 feet in height from ground. There will be 1,000 sittings, and the cost will be 5,000. Messrs. J. and R. Duckworth, G. Glaister, T. Mackerell, P. E. Weber and Co., J. Crellin, and W. Goodall, are the contractors. are the contractors.—The foundation-stone of the Manchester Baths and Washhouses is to be laid on Whit-Monday with all So be laid of Whit-Monday with all due ceremony.—Some alterations and im-provements are about to be made at the Salford Townhall, from plans by Messrs. Travis and Mangnall, at a cost of about 500%, according to estimates sent in .- The South Cliff

Building Company at Scarborough have applied to the town-council there for leave to build a bridge over Ramsdale Valley, and to make a carriage and foot road from the pavilion adjoining the railway station to the South Cliff. Opposing interests are astir against the -The whole work of restoration at project.— Are the troop of troop of the troop of the troop of the troop of the troop of troop of the troop of troop of the troop of the troop of the troop of the troop of troop of the troop of troop of the troop of troop derland, was opened on Sunday week. This church was built from a design by Mr Dobson, of Newcastle, and is calculated to hold 500 people. A great portion of the sittings will be free. The cost of the erection is upwards of 2,000%, chiefly public subscription.

LIFE ASSURANCE.

THE Manchester agent of the British Mutual Assurance Company (a respectable life office, in the success of which we feel interested), gives the following curious results of a personal canvass at 1,349 in 70 streets, in the districts of Hulme and Charlton, chiefly rentals from 12l, to 24l, per annum. The inquiry showed that there were 29 insured; 8 persons too old; 11 who never heard of life assurance, and who were anxious to have it explained to them; 471 who had heard of it, but did not understand it; 419 who were disinclined to assure; 19 favourable, if their surplus incomes were not otherwise invested; 89 persons who had it under consideration, with a view to insure as soon as their arrangements were completed, and who appointed times for the agent to call again; 21 refused the circulars, or to allow an explanation; 171 doors not answered; 102 houses empty; 3 had sufficient property not to require it; 1 favourable, but afraid of liti-gation; 1 preferred the savings' bank; 1 used abusive language; 2 would trust their family to provide for themselves; and 1 had been rejected by an office, although he never was unwell, and was consequently afraid to try again, although very anxious.

LANDLORDS AND TENANTS.

IMPORTANT DECISION UNDER THE COUNTY COURTS' ACT.

Garrett v. Saunderson .- In the Brompton County Court on Friday, May 18, the defendant (a widow) appeared to a judgment-summons requiring her to shew cause why an order of the Court, which was made on the 16th of February last, for the payment of 5l. 5s. for a quarter's rent, had not been complied with.

Mr. Dodd, the plaintiff's solicitor, said he should be able to satisfy the Court, that the defendant was not justified in taking the house, and submitted that by refusing to give up pos-session, she had contracted a deht without reasonable means of payment. The plaintiff had offered to forgive the defendant the rent if she would give up the key, but she refused to quit the premises on the ground that she had no place to go to. The 122nd clause of the 9th & 10th Vic. cap. 95, compowered his Honour to issue a warrant requiring the defendant to give up possession; but he (Mr. Dodd) would submit that this was a case which clearly came within the meaning of the 99th clause of the same statute, which enacts that if it shall ap-pear to the judge that the defendant has in-curred a debt under false pretences, or has wilfully contracted such liability without rea-sonable expectation of being able to pay the same, the judge may order such defendant to be committed to the House of Correction for any period not exceeding forty days. He should be able to show that the defendant did incur this debt under false pretences, having represented herself to be a person of property when she took the house, and that she would shortly come into possession of 1,000l. through the death of a brother. At that time she was, and has since been, in the receipt of parochial relief. In proof of that fact, he bad obtained the relieving officer's certificate. It was perfectly clear that the defendant had no right to keep possession of the house, not being in a condition to pay the rent; and by so doing, coupled with the facts he (Mr. Dodd) had stated, she had evidently incurred a debt without any reasonable expectation of payment, and bad subjected herself to imprisonment.

This statement having been borne out by evidence, the Court held,—that the defendant remaining in the house was equivalent to a representation of being able to pay, and ordered her to be committed for seven days.

METROPOLITAN COMMISSION OF SEWERS.

A GENERAL court was held on Thursday the 17th, at the Court House, Greek-street, Lord Ebrington, M.P., in the chair.

The Ordnance Survey.—A recommendation wa

read from the Ordnance Survey Committee, " that an application be made to the Ordnance Survey Dean application of made to terror the acres from the Counters Creek Sewer to Brentford, &c.—Mr. Chadwick, in support of the motion, said that the inhabitants of this district were most anxious for the active operation of the powers of this commission for a system of improved drainage.—Mr. Leslie, seeing Sir John Burgoyne present, wished to ask of him whether by consenting to the requirements of this new district, it would not bave the effect of impeding the works required most urgently for the metropolis itself?—Sir John Burgoyne gave it as his opinion that the placing this district under their active operation, might be effected with but trifling

delay, and at a very small expense.

Mr. R. L. Jones wished to be informed whether
the proposed increased scale of ten feet to a mile
was to apply to the whole of their districts; for if so, the expense of it might become avery serious consider-ation.—Mr. Chadwick said that it would be undesirable that the whole of their districts should be able that the whole of their districts should be laid down on that scale, as in many parts, consisting mainly of fields, they should present but so many sheets of paper with scarcely a line upon them; but that they should have the enlarged scale for the closer and more densely populated districts. He might now mention that for sanitary purposes in Liverpool, it had been found necessary to bave their maps enlarged to the 20 feet scale.

The motion was then put and unanimously agreed to.

agreed to.

A further recommendation from the Ordnance Survey Committee was read,—"That 281 acres of the Ordnance plan of Westminster he enlarged to the 10 feet scale."—This recommendation, it was the 10 feet seale."—This recommendation, it was stated, was brought forward at the pressing solicitation of the Westminster Improvement Commissioners, who were unable to proceed with their works until a defined and settled plan of drainage was laid down.—Mr. Slaney said that there was not a more unhealthy district than this city.

Mr. Leslie expressed an opinion that these works ought to be effected for the benefit of the public at large.—It was explained, in reference to the application, that the Westminster Improvement Commissioners bad no interest in the question but for

missioners bad no interest in the question but for public henefit. It was proposed and agreed to unanimously,—"That in consequence of the pressing representations of the Westminster Improvement Commissioners, and the urgent requirements of the district, the recommendation be agreed to."

It was also proposed,—"That 300 sheets of the Ordnance plan of the town area and suburbs be

errusance pian of the town area and suburbs be engraved by the Ordinance Map department, their estimate for an average sheet being 8l. 15s. 7d.

In support of this recommendation, Mr. Chadwick stated that the whole cost of the engraving of these plates would be defrayed within the estimate posed for the Ordnance Survey alone, as charge would be incurred on that account.

The motion was put and agreed to unanimously. A report was received from the Bye-laws Committee, to the effect that the commissioners had no mittee, to the effect that the commissioners had no right to dispose of any earth, stones, or gravel remaining after making good the ground for a sewer. This subject led to a long conversation, and, on the motion of Mr. Bullar, it was agreed that the doubtful points of the Act of Parliament should be referred to the Bye-laws Committee, with a view, if necessary, to obtaining fresh powers for the amendment of the same.

A communication was received from the Kent Surrey Waterworks Company, on the subject of a definite and formal arrangement for a supply of of a definite and formal arrangement for a supply of water for the use of the sewers. Mr. Chadwick said it was a question open to them to consider whether they should provide water for themselves, or make arrangements with any of the existing companies. Several of the commissioners expressed opinions that no definite arrangement could be come in the control of the commission of the commi to until it was ascertained what quantity of water would

was agreed that terms for a provisional agreement for a supply of water be drawn up between the commissioners and the water companies.

the commissioners and the water companies.

It was agreed that application be made to the
London, Brighton, and South Coast Railway Company, for a contribution of 500? for proposed new
works in the neighbourhood of Weston-street,
Southwark, the company having accepted the offer

made to them.

The Salaries of Officers.—On a recommendation from the Works Committee—that the salaries of Mr. Lovick and Mr. Donaldson, assistant sur-

veyors, be from the end of the first year's service at

the rate of 350*l*. a year—being read,

Mr. Chadwick moved the adoption of the report Mr. Chadwick moved the adoption of the report in the case of Mr. Lovick, who, he stated, had been appointed to the office from a perception of his worth alone, which was a rule he hoped to see followed in every other instance. He moved the adoption of the recommendation. Mr. Bullar seconded the motion.

adoption of the recommendation. Air. Buttar seconded the motion.

Mr. Hawes wished to know whether this advanced salary was to include all charges made on

account of their surveyors?

Account of their surveyors?

Mr. R. L. Jones complained of the large amount expended by their officers in cabs and other vebicles, in one case reaching 134, in the quarter for this item alone. He could not, therefore, but again complain of the manner the husiness was being carried on in that court, by the officers being so continually called away from their duties in their attendance on committees. He then referred to a report made by Mr. Grant, their new assistant-surveyor, on a system of tubular drainage laid down by Mr. Phillips, their chief surveyor, a work that any common bricklayer could have performed. Here he was set to watch the work of their surreveror—they called upon a subordinate officer to give them that information they could have obtained from Mr. Pbillips bimself. It was quite idle to make such a reference at all.

Other commissioners having complained of the

officers' charges,

omeers charges,

Mr. Lestic believed that the purchase of two
silver watches for the officers was the point some
gentlemen were aiming at, but they were unwilling

Mr. Bullar said these watches were the property of the commission. They were stop-watches, to be used for experimental purposes; they were mere tools required to be used in their business, and the officers had as much right to order them as they

had a spade or a pickaxe.

Lord Ebrington protested against it going forth Lord Ebrington protested against a going form to the public that they were squandering the public money. He had, bowever, heard of a pennyworth of wisdom and a poundsworth of folly.—Mr. Chadwick said the chief part of the expense of cah-hire was incurred during the raging of the cholera, when time was of the greatest importance, and even human life was at stake.

human life was at stake.

Mr. R. L. Jones thought these charges were highly improper, as they might as well furnish all the officers of the Orduance with watches. He found one charge of 13t. 13s. for a quarter's cabhire, and helieved that the area of their district was not so large that there should be any necessity for these aboves. After some other, observations

these charges.—After some other observations, the recommendation as regarded Mr. Lovick was agreed to.—A similar motion was agreed to in the

case of Mr. Donaldsou.
On the motion that 800 feet of half-brick s 3 feet 6 inches by 2 feet 3 inches, and 158 feet of 12-inch pipe sewer be laid down in St. George and Gloucester-terraces, Kensington, it was stated by Mr. Hertslet, the clerk, that the work would be done entirely at the cost of Mr. Inderwick. That gentleman had hitherto resisted the applications of the late Westminster Commissioners, to contribute a proportion of the expense of the drainage of that locality, but be now came forward and was willing

locatty, but be now came forward and was writing to pay the whole amount.—Agreed 12-inch pipesewer be put down in the open ditch at the back of Marlborough place, Old Kent-road. It appeared that the market gardeners had been in the habit of damming up the waters of this ditch for the purpose of irrigating the adjoining land, through which

nose of irrigating the adjoining land, through which refuse accumulated, and it now contained upwards of 4 feet in depth of filthy deposit. In the plan for its improvement, certain apertures were to be left in the pipes, from which, if desired, the sewage water could be withdrawn. The plan was greed to. The following resolution was agreed to on the question of detailed estimates for works:—" That the order of court of April 19th, 1849. No. 42, as to detailed estimates, be rescinded, and that all future estimates for works be made on detailed calculations as to separate cost of work and materials; and that the surveyors be prepared whenever called upon by the court or any committee to support their estimates. the court or any committee to support their mate hy such calculations."

The Drainage of St. James's Parish, Westmin-The Drainage of St. James's raiss, resimilare—It heing stated to the court by the Paving Board of St. James's parish, Westminster, that as they were about to expend 3,000 Lin the paving of that parish, they wished to know whether this commission contemplated making any new sewers in that district, as a new sewer for Pall Mall had been spoken of. The question was referred to the surspoken of. The question was referred to the surveyors, who reported that the sewers in Pall Mall, Bentinck-street, Berkeley-street, Sherrard-street, Gueen-street, Blenheim-mews, and Marlborongh-mews, were in bad condition; that particularly the sewer in Pall Mall was defective, being flat-bot-tomed with upright sides, 7 feet in height and 6 feet wide, but that a new sewer there could be effected without disturbing the pavement. Other improve-ments were proposed, on a minor scale, for the rest of the district.

Miscellanea.

PURIFICATION AND SOFTENING OF PURIFICATION AND SOFTENING OF WATER.—By means of a union of chemical and mechanical processes, patented by Mr. Horsley, of Ryde, Isle of Wight, chemist, it is proposed not only to purify water, as in filtration, but to soften it by the withdrawal of its sulphates or other 'hardening' salts, if not also to deprive it of all animal or vegetable impregnation, and thus to render it wholesome impregnation, and thus to render it wholesome for human and animal use, and economical anil useful for domestic purposes and for many processes of art and manufacture, as well as for the prevention of incrustation in steam and stove boilers, which arises chiefly from the deposit of the sulph ate of lime during the evaporation of the water into steam. For this latter purpose, we remember, a patent was some time since taken out, under which salsome time since taken out, under which saramoniac was inserted into the boiler and became decomposed, the sulphuric acid of the incrustation uniting with the ammonia of the sal-ammoniac, and its line with the muriatic acid forming a very deliquescent salt in place of the incrustation. It may be by some combination of a cardiactory process with the other bination of an analogous process with the other means alinded to that Mr. Horsley's patent operates. And at all events, the idea is a very important one, and its realization most desirable, especially in localities where there is good reason to believe that calculous and other

reason to believe that calculous and other diseases are generated by hard or impure water. RAILWAY GUARDS' AND BREARSMEN'S FRIENDLY SOCIETY.—A numerous meeting of the guards and hreaksmen of the various metropolitan railways was held lately for the purpose of establishing a "Railway Guards' Universal Friendly Society." The object in view is to provide a sick fund; a sum to the family of a member killed; a pension fund for disabled members; but especially a fund for relief of widows and orphans of deceased members. The society has been originated by the guards of the London and North-Western; for refer of wows and open originated by the gnards of the London and North-Western; and Mr. G. C. Glyn has given his earnest support to it, and become one of the trustees. Upwards of 1,000 guards and breaksmen have signified their willingness to become members. The preliminary rules and regulations were approved of, and the rates of weekly payment to recipients of relief are under the considera-tion of Mr. Neison, the actuary.

INSTITUTE OF GAS ENGINEERS.—We are

INSTITUTE OF GAS ENGINERRS:—We are informed by a correspondent that a new institute, or college, is about to be established, for the collection and discussion of all data relative to the manufacture, price, purification, and distribution of gas, and the best mode of country the symbol of the symbol or that it may be considered. regulating the supply, so that it may be conveyed to consumers at a cost much less than that at present charged, and on more consistent that at present chargett, ant on more consistent and equable terms than those anomalous and variable ones which still prevail throughout the country. The adaptation, if possible, of the many new and improved methods of manufacture to old works should also be considered, for behoof of those companies who find the access of male classifiers which we have the considered to the considered that the considered the considered that the considered that the considered the considered that the considered the considered that the cons find the expense of such adaptation a hinderance to their adoption. Another important object is the regular training and instruction of gas engineers, so as to reduce to one uniform system and science that diversity of modes system and science that diversity of modes which still prevails together with extravagant and ill-directed expenditure. The projectors of this new institute are said to be Professor Wilson, of the Andersonian University, Glasgow, and Mr. Angus Croll.

The Luon Thadde.—Scarcely were the promising arrangements for a rise of workmen's wages, with an increase of nominal prices, settled at the quarterly meetings, when everything as usual has been unsettled again in the interim, by the lowering both of wages and of

interim, by the lowering both of wages and of prices to their previous standard. This renewed exposure of the vain attempts to impose fictitious and impracticable prices at the quarterly meetings, has at length induced the Times and other of our contemporaries to con-Times and other of our contemporaries to confirm the truth of our repeated exposure of so hollow and unavailable a practice, by a declaration that they now perceive that "no dependance is apparently to be placed in the decision of quarterly meetings."

The LATE MR. VERNON. — Our readers will hear with regret that Mr. Vernon has passed away from amongst us, before receiving any fitting acknowledgment of a nation's gratitude.

ECCLESIOLOGICAL LATE CAMBRIDGE CAMDEN SOCIETY.—The tenth anniversary meeting of this society was held on Thursday, May 10, in the school-room of Christ Church, May 10, in the school-room of Christ Church, St. Pancras, in Albany-street,—Mr. A. J. B. Hope, M.P., in the chair. The report read by the Rev. B. Webb, bonorary secretary, stated that fifteen new members had been added to the society during the year, and that the rooms in Bond-street had not been found practically useful. It mentioned that the New York Ecclesiological Society had established a magazine, entitled the "New York Ecclesiologist," conducted with much ability and principle. Le Père Martin, a French ecclesiologist, and in Père Martin, a French ecclesiologist. ondicted with much ability and principle. Le Père Martin, a French ecclesiologist, read, in French, two short papers, one of them on the "Stone Chair," at Canterbury, to which he assigned no carlier date than the time of Cardinal Langton. A paper on the "Draining and Drying of Churches," was read by the Rev. B. Webb. The Rev. J. M. Neale, another of the secretaries, read a paper on "Ecclesiastical Ironwork," showing how village smiths might be taught to execute it, and exhibiting examples in proof. examples in proof.

NEW CHURCHES .- The number of additional churches erected during the last thirty years is variously estimated at from 1,000 to 1,400; the latter amount probably includes 1,400; the latter amount probably inclindes the whole number consecrated, many being churches rebuilt only. In the diocese of London, 161 new churches were consecrated (to 29th of July, 1847). In the diocese of Winchester, 155, of which 55 were rebuilt (to November, 1847). In the diocese of Lichfield, 133, new churches 133 new churches were consecrated (to October, 1847). In the diocese of Chester, during the twenty years it was held by the present Archbishop of Canterbury, 230 new churches were built.

RESTORATION OF BRIDGEWATER CHURCH RESTORATION OF BRIDGEWATER CHURCH COMPETITION.—On Monday in last week being the day appointed for receiving designs for the restoration and re-pewing of Bridgewater Church, nine were received by the vicar and churchwardens. The Bridgewater Times says, "we apprehend the next step will be to select from these, and we believe that if any difficulty should arise in the selection of a design, it is the intention of the vicar and churchwardens and the gentlemen nominated to co-onerate with them in carrying out the work co-operate with them in carrying out the work, all in the assistance of an able architect wholly unconnected with the town and with the different competitors who have forwarded The following are the mottoes atdesigns." The following are signs received: tached to the various designs received: "Venerator Temporis Acti." "Nil sine "Venerator Temporis Acti." "Nil sine magno vita labore dedit mortalibus." "Laus Deo." "Delectare in Domino." "Spe." "F." "A Cross." "A double triangle." "Suum cuique."

Conversazione at the Institution of Civil Engineers.—On the 22nd, Mr. Field, the president of the institution, held his annual conversazione, and was efficiently assisted by Mr. C. Manhy, the secretary, whose general arrangements, and distribution of the works of art and the models, claim praise. The visitors were very numerous, and the collection of works of art and science large. Thomas contributed a marble chimney-piece, intended for Mr. Peto, including in the design figures of Science and Art. Mr. Dighton's model of the Kneller Hall training school, designed by Mr. Mr.

signed by Mr. Mair, excited attention.

The Working Classes.—On Tuesday, Mr. Slaney moved the appointment of a standing committee, or unpaid commission, to consider and report from time to time on practical measures (unconnected with political changes) likely to improve the condition of the working classes, to encourage their industry, and in-crease their contentment, but notice being taken that forty members were not present, the House was adjourned.

CRYSTALLIZATIONS ON NEW WALLS. Sir,—In walls of old habitations, the nitrate of lime is formed from whence nitrate of potash is subsequently manufactured. Will some of your readers say, what is the efflorescent crystallization that forms so rapidly on walls of new houses long before they are fit for Will some of new houses long before they are fit for cupation? The taste is powerfully alkaline. occupation? The taste is powerfully assume generally sodaic. It is proposed to remedy the mischief of the latter by covering the surface affected with tin-foil, fixed to the place by N.

PROJECTED WORKS .- Advertisements have PROJECTED WORKS.—Advertisements have been issued for tenders,—by June 1st, for supplying and laying down about 1,800 yards of 3-inch tooled York paving, 1,100 yards of quarry-worked Purbeck eurb, and 500 yards of quarry-worked carlinose, or Aberdeen enrb; by 4th June, for building 800 feet of brick sewer, and 158 feet of glazed stone-ware pipe square, in the parish of 5th Mary Albots, Kensager, in the parish of 5th sewer, in the parisb of St. Mary Abbots, Kensington; by 31st, for the erection of a Wes-leyan chapel at Kingswinford; by 2nd June, for the erection of a warehouse at Salford; by 4th, for the construction and fitting up of pipes, &c., connected with the Hull baths and washhouses; by 29th inst., for the erection of school-houses at Norwood; by same date, for school-houses at Norwood; by same date, for the maintenance of the permanent way of the Blackwall Railway; by 6th June, for the construction of the works of the Waterford and Kilkenny Railway from Thomastown to Knockwilliam, county Kilkenny; by 29th inst., for making 200,000 stock bricks at Buxton; by 30th, for painting and whitewashing the Ecclesall Union Workhouse; by 20th June, for the supply of 2,600 loads of English elin timber for the nave; by 7th, for repairing. June, for the supply of 2,000 loads of english elin timber for the navy; by 7th, for repairing, repewing, and other works, at Westham Church, Essex; by 4th, for a gasholder and cast-fron tank for the Rielmond Gas Company, also for the erection of a retort stack and pany, also for the erection of a retort stack and setting 23 retorts for same; by 7th, for alteration and improvements to five houses at Poplar; by 1st, for paving and repairing carriage and footways of St. John's, Clerkenwell; by 31stinst, for the excavators', masons', and brickly and the state of the 31stinst., for the excavators', masons', and brick-layers' works, in erecting a large gas holder tank at Sheffield; by 31st, for taking np and repaying the High-street of Bridgnorth; by 5th June, for the performance of bricklayers', carpenters', masons', painters', paperhangers', paviers', plasterers', plumbers', and other works at Birmingham, Coventry, Weedon, North-thampton, Nottingham, Mansfield, Burslem, Newport, Brecon, and Carmarthen, for the Ordnance department.

EMPTY HOUSES IN LIVERPOOL.—An official return of the unoccupied houses in

official return of the unoccupied houses in Liverpool, of a rental of 30*l*. and upwards, gives the extraordinary number of 5,000; and yet the population, it is said, has not decreased. Rents are beginning to fall; and a shop in Bold-street, which let for 120l. is now, says the Manchester Guardian, untenanted, though

only 70l, is asked.

METHOD OF SOLDERING CAST-IRON WITH WROUGHT IRON .- The following prohas been recommended for this purp First melt filings of soft cast-iron with cal-cined horax in a crucible; then pulverize the black vitreous substance which is thereby produced, and sprinkle it over the parts which are intended to he united; after which, heat the mended to he united; after which, heat the pieces of cast and wrought-iron and weld them together on an anvil, using only gentle blows. This method is peculiarly applicable for the manufacture of iron articles which are intended to he made red hot, and are required to be impervious to fluids or liquids, as such a result cannot be obtained by simple fastening.—Skeffeld Times.

ing.—Sheffield Times.

SOMERSETSHIRE ARCHÆOLOGICAL AND
NATURAL HISTORY SOCIETY.—A society
bearing this title has heen formed.

Its objects bearing this title has heen formed. Its objects are—the cultivation of, and collecting information on, archæology and natural history, in their various branches, but more particularly in connection with this county. One of the objects of the society is to collect, hy donation or purchase, a library and mnseum, more particularly illustrating the history, natural, civil, and ecclesiastical, of the county of Somerset.

The Gymnerrus Northumherland, is now exhibiting at the Cosmorana Rooms in Regentere. Its form and the peculiar arrangement of the dynamics of the dynamics. of the dorsal fin, lead its owners to exhibit it as coinciding with the description of the sea serpent. Those who go to see it as this hypothetical being will be disappointed: simply as a specimen of a rare and curious fish it is

a specimen of a rare and curious fish it is very interesting.

DUBLIN SCHOOL OF DESIGN. — Mr. McManus, who was so unceremoniously bowled out at Glasgow, as some of our readers will remember, has been appointed head master of the Government School of Design in Dublin, with full power to carry out the objects of the institution.

ARCHITECTURAL LENDING LIBRARY .-A correspondent mentions that an architectural subscription library is forming at Edin-burgh, and thinks that Londoners ought not to be behind-hand.

MEETINGS OF SCIENTIFIC BODIES

Held during the ensuing week. WEDNESDAY, May 30.—Society of Arts, 8 p.m. FRIDAY, June 1.—Archicological Institute, 4 p.m.

TO CORRESPONDENTS.

TO CORRESPONDENTS.

"St. Peter's Church, Chester,"—Mr. James Harrison, the architect, has written to deny that he specially invited Mr. Freeman to tender for the work at St. Peter's Church.
"Bedford Corn. Exchange Compelition,"—We have no information yet as to the result.

"J. J.D." (Ken).—Our remark on Nos. 1921 and 1922 applied, as a matter of course, to the design, and not the drawing. We appreciate the feeling which led our correspondent to address us. Had the catalogue given any intimation that the exhibitor was not the designer, we should have drawn a distinction.

Received.—"J. B." (Gock shall be looked at), "A. P. M.,"

"W. J. D.," "H. S.," "F. P. B." (me have no reason to doubt the good faith of the alvertiser. Some mistake must have occurred), "J. L. P." (in the engraver's hands), "J. D.," "T. S." (no personal offence meant), "W. T. C. (the charge appears enormous, but we should be wrong to express an oppnion without full knowledge), "An Old Subscriber," "J. B.," "S. H." (shall appear), "A Constant Renders", "D. B. H., "L. H. L.," "R. H. P. R., "G. W.," "E. B.," "T. H. L.," "R. H. P. R., "G. W.," "E. B.," "T. H. L.," "R. H. P., "G. W.," "E. B.," "T. H. L.," "R. H. V. H. J., " "J. C. W.," "A. J." "J. C. W.," "A. J." "J. C. W.," "A. J." "J. W. W.," "J. D.," "J. D.," "A. J. "W.," "J. J. W.," "J. W.," "J.

"J.C. W.," "A. J."

Note.—In list of tenders for model dwellings last week, the amount of Mesars. Haynes' tender should be 11,959/., instead of 21,959/. The error (of the press) is obvious.

"Baoks, Prices, and Addresses."—We have not time to point out books or find addresses. "We have not time to point out books or find addresses." The have not time to point out books or find addresses.

NOTICE.—All communications respecting advertisements should be addressed to the "Publisher," and not to the "Billior;" all other communications should be addressed to the EDITOR, and not to the Publisher.

ADVERTISEMENTS.

THE NEW PATENT GAS - LIGHT MONTHIR, adapted to retry description of Burner, and supplied at a cost placing it within the reach of every Consumer of Gas, regulates the llame to any required height, comonising the consumption, and percentiag the dance and linear rendered from the flaring and smoking of ights. It may be seen in daily use at the office of the Patentees, 20, Killy William-street, Charing-cross. A saving of \$3 per ceuk has been effected at several public calablalments by its use.

CAS, in which a GREAT SAVING is to be elected by the use of the new PATENTGAS MONITOR.

—STEWEN'S and SON, having mode arrangements with the patentees of the above very useful article, are manufacturing the same, and are propared to supply the trade wholesale, or consumers with any quantity they may require, and will send experienced sure a steady flame, rendered impossible to fine or smake, with any variation of pressure, and effecting an important reduction in the quantity of saw consumed, for which see testimonials—NTEVENS and SON, Gas Regimeers and Fitters, Darlington Works, 18, Southwards Pringer read.

GAS at 4s. 6d. per 1,000 feet.—The use of dwm to this price. The Montrol R brines the neural cost of gas dwm to this price. The Montrol R brines the neural cost of gas for the cost is that more than nominal; it may be fixed in possibility of wate, and brivates all risk of accident. The Monitor is manufactured and sold, who leads and retail, by the tenses, 3.0 Mes. 30 Mes.

PAPER-HANGINGS by MACHINE and BLOCKS.—The trade supplied in teven and country, with machine goods, from first-net near designs, at the lower strices they have ever been sold in this country; and knok goods, for skyle and quality, must be surpassed by any house us Encland. All the patterns are registered, and can only be supplied by HENNRIAL and CRUSKIY, Queen-steed, Southward-fride-road. Clespest lenuse in London for task, marthes, and pauci decorations. A set of patterns, & et he doluted old an order of de-Pornis, each.

TRENCH PAPER-HANGINGS made in CAPBLE-NOT FAFBIG-HANGINGS made in NOILNII-L MARKS and Co, in order ta go with the town, have, in addition to their usual large and manifestent Note-of French Pagara, printed some very choice FRVAUI BAJINN, and French Pagara, printed some very choice FRVAUI BAJINN, piece of twefre yards long, including some new and choice special cuts of marking, anks, and grantes, all made by Improved manual carnass at mill prices.—Warchouse, 50, Princet-street, Leices-fer-square.

No. CCCXXX.

SATURDAY, JUNE 2, 1849.

OME of our readers have expressed surprise that we have not made more specific remarks on the recent exposures in connection with the railway system,

the dethronement of the railway potentate, and the present state of the railway world, than have been given occasionally in our weekly budget of notes connected with the subject generally. We bave avoided doing so, simply because we did not see that any positive good was then to be achieved by such a course; it was not because we had formed no decided opinion upon recent disclosures, or that we had joined in an absurd adulation and were ashamed to spurn what we had worshipped, or that we had words to eat and no stomach for the task. reference to our past volumes would justify some amount of self complacency in this respect. We have uniformly discouraged reckless expenditure by railway directors, and the want of efficient supervision of works and expenditure; while discountenancing jobbing in shares, we have urged the value of railways as an investment, if economically constructed and wisely managed; and, at a time when all England was bowing at the feet of Mr. Hudson, and subscribing their thousands for a permanent testimony of admiration, we pointed out the absurdity of such a proceeding, sketched in different colours from those which were being employed for the same purpose, what be was and what he really had done, and contrasted his reward with the treatment received by men who had, with self sacrifice, benefited their fellow creatures.*

At that moment the public, who will not give themselves the trouble to investigate for themselves, or even to judge, had taken Mr. Hudson for their guide. When he joined a line the shares rose; if even seen on the site of a proposed railway, it had an effect on the value of the scrip, and he bought and sold, and all went on swimmingly. We then remarked— "The career of Law of Lauriston, the proector of the Mississippi scheme, forces itself as a parallel on the recollection. Let us hope," we said, "that Mr. Hudson may never equally abuse the power that public weakness bas placed in his hands."

He took too high a place, and we looked for a fall. It came! The honours were not borne too meekly, and the fall has been received with a yell, which is as little creditable to the utterers as their blind and selfish adoration

was at an earlier period.

We will not, however, underrate the magnitude of the evil which has been committed, though we say that much of it attaches to a degrading system rather than to the individual, and that, if we mistake not, a strict investigation would convict many others of similar acts. It is even greater in its consequences than many suppose, much greater. "Cooking the accounts," as it has been termed, does not seem a frightful charge to make,—declaring a dividend of 9s. per share when the earnings would not justify one of 3s., and paying the difference out of capital, perhaps borrowed for the purpose, appears to some simply unbusinesslike and well calculated to lead to bankruptcy. But it is much more than this. The dividend declared by a body of Directors. supposed to be bonest and honourable men, is taken by the world implicitly as evidence of the state of the undertaking, and this regulates the price of the shares, and quickens or lessens the demand. On the faith of this, trustees invest the dependence of orphans and widows,-the thrifty father, his savings. The declaration of a dividend greater than the earnings of the line will pay, is a fraud of the grossest kind, meriting the severest punish-

Such, however, is the laxity of principle which has been induced by share-dealing, that those who have been party to such an act, have viewed a resort to it, with a dozen other equally dishonest modes of raising the price of shares, as perfectly legitimate. Inordinate desire to make money is a hlot on the English character, and leads to such acts as would be otherwise shrunk from. When we think of much that we have seen and heard of in connection with railway schemes and the share market, we blush for our countrymen, and ought to say, countrywomen too.

Dealing in shares since 1845 has been mere hocus-pocus :- nothing was known, the data were untrue. The change which has taken place in the value of shares since 1847, is very striking. It has been shown that the average depreciation since that date, taking ten of the leading lines, amounts to 65 per cent. case of the South-Western, it is 911 per cent, that is, 50%. shares were at 28 5-8ths premium in 1847, and are now at 17 discount: 20%. Eastern Counties are depreciated 106 per cent, and 50% North Midlands, 139 per cent. Even with the London and North-Western there is a difference of 76 per cent.; 100l, shares were then at a premium of 102, and are now at premium of but 26.

The expenditure on most of the lines has been much greater than it ought to have been; money has been squandered thoughtlessly and uselessly: in obtaining Acts no amount of money was allowed to stand in the way of success, and in their after works no thought as to the extent of traffic which would be required to pay the interest of the money expended, seems to have crossed their minds. Take a recent instance, and one for which an excuse could be found more easily than in most other cases. The cost of the new hall and offices at the Euston Station of the London and North-Western is understated at 125,000l., the interest of which, at 5 per cent., is 6,250%. per annum. The company must therefore earn more than 171. per day for every day in the year, including Sundays, simply for the use of these new buildings, exclusive of the cost of repairs.

It is scarcely necessary to say, that public opinion is now very different from what it was when these extensive works were commenced.

Advantages can scarcely fail to result ultimately from the stop which has been put to the present system. Various suggestions are now occupying attention: amongst them, one to work railways by contract,-a suggestion which has been received with considerable favour. The Eastern Counties, it is said, are about to effect an arrangement of this sort, and some other companies have already done so.

An bonest and searching inquiry must be made into the affairs of all the Companies; Boards of Direction must be weeded and reformed, and where new lines are to be con-

structed, the works must be done with due regard to economy, and with a view to a sufficient return for the capital invested.

When we remember that up to the end of last year more than two hundred millions of pounds sterling had been expended on railways, and that Companies have power to expend on authorised lines one hundred and forty millions more (the sums are too large to grasp at once), it will be seen, that this is a question affecting the prosperity of the whole community in a remarkable degree

The reign of pompous mystification, humbug, and fraud, must be brought to an end.

LECTURE ON ROMAN ARCHITECTURE.

In previous papers we have traced architecture from its infancy to its prime—we have noticed the first rude attempts as seen in the unhewn monuments of the patriarchal ages and of Druidical times—we have contemplated the colosal splendours of the Egyptians, those vast and enduring remains which yet stand the gigantic spectres of departed greatness, the Titan progenitors of future ages—and we have seen the perfected greatness of art and science in the unrivalled glories of Greece—glories which yet shed their lustre, although somewhat dimmed, upon the nations of the earth. We are now to record some of the architectural wonders of Rome-

"The city that so long Reigned absolute, the mistress of the world,"

We shall not, it is true, find in Roman We shall not, it is true, find in Koman architecture the massive solidity of the Egyptians, nor the chaste simplicity of the Greeks, but we shall see the utmost height to which the art could reach in sumptious decoration, in vastness of design, in great and varied applications, as beheld in those magnificent structures, which made the seven-hilled city indeed. city indeed

"A dream of glory; temples, palaces,
Called up as by enchantment; aqueducts
Among the groves and glades rolling along
Rivers, on many an arch high over head;
And in the centre like a burning sun
The Imperial city."—Rogers.

In no one spot were so many splendid buildings congregated, as we are assured were collected in Rome, when the enormous wealth of which her citizens became possessed was lavished on the sister arts. The stern simplicity which marked the habits of the earlier Republicans gave way before the enervating effects of the riches which poured in like a flood upon the conquering Romans, and thus Horace complains in his fifteenth ode of the increasing fondness for architectural splendour at the expense of humbler pursuits at the expense of humbler pursuits-

"In royal pride our buildings rise, The useless plough neglected lies;" and he still further inveighs against Roman luxury in his eighteenth ode:-

" No walls with ivory inlaid Adorn my house, no colonnade Proudly supports my citron beams, Nor rich with gold my ceiling gleams: Nor have I, like an heir unknown, Seized upon Attalus's throne."

Indeed, there was a wide contrast between the aspect of Rome in the Augustan age and that which marked it in the days of her early kings, when the temples were only large enough to contain a statue of the god, and when the houses were only cabins, with their walls of mud and their roofs of straw, so that Ovid calls the palace of Romulus a cottage, which it must really have been.

calls the palace of Romulus a cottage, which it must really have been.

But the Roman consuls and pro-consuls, who, going forth as private citizens, returned from their conquests and vice-royalties with the revenues and the tastes of kings, could not be satisfied with the simple habits and unadorned dwellings which contented their ancestors, the Decii and Fabricii of old; and, although even Julius Caesar, in the height of his power, obtained with great difficulty permission to ornament his house with a pediment—an architectural luxury till then denied to private dwellings, and considered worthy of a place on buildings in Olympus—the restrictions against the indulgence of expensive tastes in art must soon have been swept away, tastes in art must soon have been swept away,

since we find even in the Julian period a record of the sumptuous palaces that were raised by the illustrious citizens of Rome, vying with each other in the display of all that wealth could procure or art produce. The union of architecture, painting, and sculpture could The union of architecture, painting, and sculpture could never have been surpassed, as seen in some of the palaces, as we should call them, or villas, as they were termed by the Romans, when we find that even the house of Sallust, who could hardly have possessed much wealth, was released to the could hardly have possessed much wealth, was released to the could be and the could be and the could be are the could be and the could be are the co adorned with such figures as the Dying Gla-diator, the Silenus, and Infant Hercules, as discovered in the ruins; and the astonishing beautiful fresco paintings on the walls of the exhumed city of Pompeii, a fourth or fifth-rate town, lead us to conclude that not less valuable works of art ornamented the residences of a Mecænas, a Lucullus, or a Hadrian in the capital of the world; and we know that Hadrian possessed those matchless triumphs of the sculptor's power, the Venus de Medici, the Fain, the Flora, as found in the ruins of his villa, and of course the Antinous,

These sculptures and paintings, however, were the productions of Greek artists, and there can be no doubt that much of the best architecture of Rome was also the offspring of Greek taste. Sylla is said to have first intro-duced Greek architects in Rome; in the time of Pompey and Casar the Grecian artists Arcesilaus, Pasiteles, Zopyrus, and Criton resided in Rome. The architect who planned the temple of Jupiter Stator, was Hermodorus of Salamis; many temples were designed by two retires of Learning Company. two natives of Laconia, Saurus and Batrachus, who bave perpetuated their fame by the lizard and frog, the symbols of their names, still to be seen sculptured on the columns in some of the churches* of Rome, which once belonged to Pagan temples, whilst the two architects, Chrysippus and Cluatius, employed by Cicero. were also Greeks.

Certain it is that after Greece became a Roman province in the year 145 B. c., we begin to find architecture employed by the conquerors of the world to record their triumphs in the temples to which they consecrated their spoils, in the theatres in which the wild beasts, or men as wild, of far distant climes, were ex-hibited to the admiring multitudes, in the arches under which the proud victors entered

" With acclamation, and the martial clang

Of instruments, and cars laden with spoil," or in the private dwellings which yet contained of in the private aweings which yet contained within their walls treasures which kings might envy, yet hardly purchase, those beautiful creations of the sculptor's chisel and the painter's pencil, of which, though the latter are lost to us, many of the first still survive the admiration where the the admiration, almost the homage of pilgrims to the shrines of art in the eternal city; when to the actual possession of the matchless works of art with which Rome abounds, we add the charm which the memory of her great men imparts to the localities, where

"The very dust we tread stirs us with life, And not a breath, but from the ground sends up Something of human grandeur."

When we recall the mighty names of Pompey, Casar, Brutus, Cato, the Scipios, the Decii, and the softer shades of Virgil, Horace, and Ovid, we cannot wonder at the profound interest which has always been attached to her who was once the mistress of the world, but is now the Niobe of nations,

In addition to the magnificent buildings erected in the time of the Cæsars,—

"When Rome in noon-tide empire grasp'd the world.

modern Rome attracts the observation of the visitor by the scarcely less splendid structures which arose under the auspices of the popes, who, calling themselves the servants of servants in the pride of humility, assumed a power scarcely inferior to that of the former imperial masters of Rome. But whilst we condemn their presumption in arrogating to themselves universal dominion, we must do them the justice to admit that they patronized the fine arts, encouraged learning, and promoted taste. The religious structures erected under their The religious structures erected under their auspices were adorned with the performances of men "whose pencil bad a voice," and which

have made the names of Michael Angelo, Raffaelle, and Correggio, immortal.

The chief, if not almost the only public buildings on which the Greeks delighted to bestow the graces of architecture were temples, as if to none but the divinities were its glories appropriate. But the Romans applied architecture in all its pomp to a great variety of purposes unknown to the Greeks, and not only magnificent temples for worship, and stately porticoes for recreation, but to colossal theatres and hippodromes for amusement, aqueducts of wondrous length, triumphal arches, lofty columns of commemoration, and palaces rivalling towns in extent, and public baths of astonishing splendour and size, and halls of justice.

The Romans adopted chiefly in their public buildings, the latest and richest of the Greek orders, the Corinthian, on which they grafted another order, the Composite, which has only the distinction of being encumbered with a profusion of ornament conceived in a for removed from the purity of the Greeks. The Doric order, which was brought to such a height of perfection in Greece, was evidently no favourite with the Romans, to whom its severe requirements were a restraint in the way of indulging in a fondness for gorgeous embel-

With the exception of the Trajan and Antonine pillars, I am not aware that Rome pos-sessed any specimens of the Doric order in the manner of the Greeks, and even these can hardly be considered as specimens of attic taste and simplicity, since they have moulded bases, and the capitals have the Ionic ovolo cut in the echinus, whilst the lowest stages in which the Coliseum and theatre of Marcellus are divided, are adorned with columns after the fashion of the so-called improved Roman Doric style,

The examples of Ionic also are not numerous in Rome, nor are these in the hest taste:—the temples dedicated to Manly Fortune and to Concord are proofs of this assertion, and, in fact, only deserve to be mentioned, that imitation should be avoided,

But if we cannot award any praise to the Romans in their employment of two out of the three ancient orders, we must admit their claim to admiration for the manner in which they introduced the third. This, the latest order among the Greeks, was only making a place for itself in Athens at the time of the Roman conquest, and our specimens of the style are limited to very few examples, and those of very small buildings; and it is rather remarkable that Corinth, whence the name of this order that Corinth, whence the name of this order is derived, should not only have no specimen remaining, nor is it known ever to have possessed one, but exhibits in its temple perhaps the oldest example of the Doric order in

Attica.

The temples built at Rome of the Corinthian order were the stateliest examples ever raised; those dedicated to Jupiter Stator, to Jupiter Tonans, and to Mars Ultor, of which only fragments remain, must bave been truly magnificent buildings with columns nearly 50 feet high, and 5 feet in diameter, and evidently they were designed by Greek taste before the lines of the cutablature were bridges are the lines of the cutablature were bridges are the lines of the cntablature were broken, or other

derelictions from purity were introduced.

The great distinction between the pure Greek styles, and the later or debased Roman orders, was caused by the introduction of a feature which has had a wonderful and saluteature which has had a wonderful and salu-tary influence upon architecture. The origin of the arch, like other vexed ques-tions, may serve to amuse and bewilder the learned, who seem to find glimpses, rare indeed, and almost isolated, of its exist-ence among the monuments of Egypt, of India, of Assyria, and of early Greece. But these few instances only cover these these few instances only prove that the arch, if known, was not used in general among these nations. But the Romans, although not strictly entitled to the parentage of the arch, have, by their adoption of that feature, earned for themselves as much honour as if they were discoverers; and to them alone is clearly due the merit of first appreciating and employing its wonderful properties. And if in some instances we must regret to see its application, as in cases where the continuous architrave is dispensed with to make way for arches spring-ing at once from column to column, yet in others we cannot but applaud the daring in-

genuity with which wide spaces are vaulted, as in the Temples of Peace and Minerva Medica. We must admire the invention which enables us to cross mighty rivers, -to hang the lofty dome in air,—and ahove all, instead of being obliged, as in former times, to employ ponderous blocks for imposts and architraves, from the difficulty of otherwise spanning large from the difficulty of otherwise spanning large spaces, we must confess our obligations to a feature which can be formed into the most magnificent proportions by small and con-venient materials, accessible in all climates and in all situations; and more than all, it may be safely asserted that, to the employment of the arch hy the Romans, afterwards by the the arch by the Romans, atterwards by the Byzantines, and again returning to its first country, by the Italians, we are indebted for the introduction of a system of architecture which has enchanted the world for several centuries with its beautiful conceptions, and which has enriched Europe in particular with so many subgridid exhaustics. so many splendid cathedrals and churches and which now, by common consent, is looked upon as most suited to edifices of a religious

In the limited space to which, of necessity, a paper of this nature must be confined, only a few of the important works of the Romans can be noticed, for the bare enumeration of them would fill a volume. The most striking monuments of their taste are temples, theatres, aqueducts, triumphal arches, and commemorative columns,

Very few, if any, remains can be found in Rome of buildings before the time of Julius Cæsar, who, as well as his great compeer, Pompey, built many temples. The latter built the Temple of Minerva out of the spoils of the Mithridatic war (B.C. 60), and a temple in honour of Venus close to the theatre, which he also erected. Casar built temples in honour of Venus and Clemency; and it is a curious trait to observe these stern warriors dedicating temples to the benignant divinities. Carsar besides projected many magnificent and useful works which he might have carried out, had not his great career been stopped by a violent death, when

" The foremost man of all the earth"

fell under the daggers of the conspirators. But it was to his successor, the fortunate Augustus, that Rome owes the commencement of its architectural greatness; his was not an empty boast, that he found it built of brick, but would leave it of marble. Three such il-lustrious patrons of the arts have rarely been found at the same time as Augustus and his celebrated friends Mecenas and Agrippa. As Gibbon well observes, "The example of the sovereign was imitated by his ministers and generals, and his friend Agrippa left behind him the immortal monument of the Pantheon.

Augustus built a temple in honour of Apollo Augustus onthe a temple in nonour or apone of white marble, in which the Sybilline books were kept; another magnificent temple in honour of Mars the Avenger, in which he directed that the Senate should always hold their rected that are the self-time of war. The recombining on the self-time of war. consultations on the affairs of war. He reared another temple to Jupiter the Thunderer; a superb memorial of his gratitude for his escape from the lightning which killed his armour-bearer at the side of his litter. With the ex-ception of the temple of Jupiter Stator, the two temples just mentioned were the most stately and magnificent in Rome; they are of the Corinthian order; that dedicated to Mars as the Avenger on the occasion of Augustus going forth to avenge the death of Julius Cæsar, consisted of a noble portico of eight columns in front, and eight on each flank, and occupying an area of 116 feet by 73 feet. These columns were 6 feet in diameter, and 58 feet high, the loftiest of their kind in Rome. Ovid in his Fasti (v. 549) alludes to this temple and its place in the Forum:

"Ultor, ad ipse suos cœlo descendit honores Templaque in Augusto conspicienda foro."

The temple of Jupiter Tonans has only three fluted columns remaining to attest its former magnificence. They are of white marble, 46 feet high, in three blocks; the diameter is 4 feet 8 inches. It appears to have resembled the temple of Mars in its general plan, except that its portico consisted only of 6 columns. I'hose which remain were buried nearly up to their capitals when Camporesi reduced the hill and laid them open.

But the most splendid example of architec-

^{*} The church of St. Eusebius, and of St. Lorenzo beyond he walls, have these interesting relies of the sculptor's

ture in Rome, or in any other capital, was the temple of Jupiter Stator, the name by which it is best known to us; its era is not exactly ascertained, but from the fine character of its ascertained, but from the fine character of its design and execution, it may with great probability be ascribed to the Augustan age. Its destination has been the subject of great variety of opinions. By Albertino (1510), Labacco, Palladio, and Pomponio Leto (1520), it was considered to be a temple of Vulcan. Nardini, Versuti, and others contend that the columns helogged to the Comiting. Gaussian columns belonged to the Comitium. Gamucei (1565), Fauno (1553), and Ficoroni, held that the columns were part of the Temple of Jupi-ter Stator, which is the opinion held by Piero Ligorio and Marliani. Of this superb edifice only three columns remain, of white marble; and of these remains Valadier justly remarks, that "they are a monument of the best age of Roman architecture, in which are united magnificence with beauty, sublimity of idea with perfection of execution, the acme of architec-ture with that of sculpture." These columns were 4 feet 10 inches in diameter, and 40 feet high in the shaft alone, and eight columns formed the portico. The capitals of these columns are the richest that were ever executed; they differ from all others of the Corinthian in that the central caulicoli are intertwined: they that the central caulicoli are intertwined: they were imitated with the entire entablature in the portio of Carlton House, the columns of which now form part of the façade of the National Gallery, but with a plainer and therefore less appropriate entablature. Sir John Soane also copied them in his façade of the Privy Council and Board of Trade in Whitehall, where the architectural public have seen the late professor's columns cut in halves to perform double sor's columns cut in halves to perform double duty

duty.

The Campo Vaccino, or ancient Forum Romanum, was crowded with magnificent temples and edifices, built by successive emperors. One of these, in the best taste after those we have just noticed, was built by Marcus Aurelius, and dedicated in honour of Antoninus, and Faustina, daughter of the latter and wife of the former emperor. It has a portice of six Corinthian unfluted columns, with three on the returns, of good proportions. The frieze in front is plain; but on the flanks of the temple it is adorned with sculptured griffins and candelabra.

In front of this temple was placed the bronze equestrian statue of Marcus Aurelius, now in the square of the capitol, and which so excited the admiration of Michael Angelo that he cried out to the figure, "Cammina!"

excited the admiration of Michael Angelo that he cried out to the figure, "Cammina!" This ancient temple, like many others of pagan origin, is now a church dedicated to St. Lorenzo, in Miranda; and to the care of the pontiffs in thus consecrating such struc-tures, we are indebted for much that remains

of Roman art.

With the exception of the little gem of the choragic monument of Lysicrates, at Athens, we are not acquainted with any specimens in Grecian architecture of circular buildings, whilst we are not acquainted with any specimens in Greeian architecture of circular buildings, whilst we have many examples amongst the Romans: two of these, though small, are very beautiful; one was in Rome itself.—a Corinthian temple, dedicated to Vesta, and it was considered that the circular form of building was appropriate to the goddess who personified the earth.* This temple consisted of twenty fluted columns, one only of which is wanting, but the entablature is entirely gone. It appears to have been repaired at different periods, as the capitals vary in their design and execution. It had two windows; and the building is now used as the Church of La Madonna del Sole. The whole height of the columns is 34 feet 7 inches, and their diameter 3 feet 2 inches.

About 18 miles from Rome stands the relic of one of the most graceful temples ever erected: Twol, the ancient Tibur, immortalised by the pencil of Turner, recals some of the most famous names of Roman story. Here the illustrious Meccenas had a villa, where he was often visited by his imperial friend Augustus. in company with Horace who is said.

was often visited by his imperial friend Augustus, in company with Horace, who is said to have also had a residence here, a legend so happily alluded to by the author of "Italy" when speaking of this locality—

"Where the precipitate Anio thunders down, And thro' the surging mist a poet's house (So some aver, and who would not believe?) Reveals itself."

Tibur also served as a refuge to those great spirits who were checked in their ambitious enterprises. Thus we find that Cinna, the consul, came here in a temporary exile, as did Brutus and Cassius; and therefore Ovid says— Quid referant veteres Romanæ gentes apud quos Exilium tellus ultima Tibur erat."

Here also the Romans sent some of their noble captives into an honourable retreat, among whom were the Numidian Emperor Syphax and the celebrated Queen Zenobia. The villa of Hadrian, at Tivoli, resembled a town in extent, and here also were the residences of Caius Marius, of Scipio Æmilianus, Virgil, Catullus, and Vopiscus, whose porphyry pillars were celebrated in song.* Of the beautiful temple itself ten columns remain of the eighteen which formerly surrounded the cell, which is only 24 feet in diameter; it was built of travertine stone, and the Corinthian nult of travertine stone, and the Comminan capitals of the columns are very original, and this example was finely, and for the first time, imitated by Sir John Soane in the exterior of the Bank of England, and the small circular corner next Lothbury may serve, and that very happily, to convey some idea of the temple itself, since its peculiar ornaments of ox skulls and garlands are introduced on the frieze t and garlands are introduced on the frieze. +

GEORGE R. FRENCH.

THE ROYAL ACADEMY EXHIBITION.

Mr. Frith (A.) is another of those few artists whose works hear evidence of great perseverance. He seems properly impressed with the necessity of labouring to improve the power he has. His picture this year (349), "Coming of Age," shows great research, and no sparing of trouble and pains. The diversity of incident attendant on such a scene is well calculated to allow scope to the painter's imagination; each individual is conceived with great delicacy of perception, from the mumbling old reader of the address, to the difficult but beautifully conveyed expression—half smile, half tear—of the happy mother; the noble old but occurring conveyed expression—nair smile, half tear—of the happy mother; the noble old grandmother, proud in ancestral rights; the jollity of the retainers; the husy importance of the cook (a head worthy the best of Dutch painters) carving from an ox roasted whole; the simplicity of the children, one of whom, on the shoulders of perhaps its father, in order to insure its position, has twisted its little fingers amongst the sharger barr so redundant on the insure its position, has twisted its little ingers amongst the shaggy hair so redundant on the boor's head, quite unconscious of the grimaces that bear witness to his discomfort; another dropping the flowers brought to strewthe young lord's path, with its mother stooping to pick them up, forms a sweet little episode. The conception of the principal figure is not the most successful; it presents that nervous determination of going through the necessary ordeal tion of going through the necessary ordeal with as much ease and grace as possible, but the youth is too old for one who had but just

attained majority.

(383) "Ferdinand declaring his love to Miranda;" (384) "The Conspiracy of Sebastian and Antonio;" (385) "Ferdinand and Miranda discovered by Alonzo, at the entrance to the cave, playing at chess" (a picture in three compartments), all by P. F. Poole (A.), are marked by originality of treatment. The admirable arrangement of colour in all three productions, strikes the spectator at once, but where Mr. Poole finds his authority for introducing female courtiers attendant on the king, is a theme of astonish-ment to all readers of Shakspeare. He has ment to all readers of Shakspeare. He has certainly made great use of this artistic liberty, and the sleeping ladies in the middle compartment cause one to forget the deviation in admiration of their pose, and the unusually nice drawing for this colourist. The "Blackberry Gatherers" (514), demands praise for effect and colour: the head of the girl is lovely, and the painting of the red petticoat is very remarkable.

and the painting of the red petacoat is very remarkable. (397) "Innocence and Guilt," A. Rankley. An unaffected relation of an eloquent story. The picture represents the interior of a country church; the right-hand side presents an open pew, wherein are seated a gay young spend-

† To be continued.

thrift squire and his courtezan; he is struck with remorse,—the effect of the honest pastor's words is visible in his whole deportment; his companion perceiving it, is bantering him; but the sense of having erred too strongly affects him; he remains transfixed in selfexamination and mental trouble. Before these, sitting on the free-seats, are two rustic lovers. The beautiful girl,—heautiful in her confidence The beautiful girl,—heautiful in her confidence and innocence,—kneels reverently; whilst her lover, manly devout, nevertheless hardly able to resign his whole thoughts to the time and ecremony, reads from the same book. The father and mother, who accompany them, are intently bent upon the responses. To the left of the spectator is a long row of charity girls, arrayed in the white capes and caps, leading perspectively into the picture, capitally managed. It is certainly a charming work, and displays an amount of thought that is highly commendable.

and displays an amount of thought that is highly commendable.

(404) "Sand-pits." This unpretending title applys to a marvellous production by Mr. Linnell. It defice criticism, further than claiming the observation of its being nature in her best colours. The "Sand-pits" of J. Linnell, and the (531) "Morning on the Banks of Zurich Lake" of F. Danhy (A.), are, without question, two of the finest landscapes in the collection: the total absence of the appearance of lection: question, two of the finest landscapes in the col-lection: the total absence of the appearance of paint is one of the minor characteristics of the latter. (407) "The Wise and Foolish Builders" of G. Harvey, had much better have returned to Edinburgh than have been placed where it is. In 413, "The First Pair of Trews," by R. McInnes, much that is clever is counteracted by the disagreeable smoothness of style so applicable to spuff-hop microrishing.

of style so applicable to snuff-box pictorialising. (420) is a charming North Welsh landscape, entitled "Crafnaut Mountain," by T. Danby. (434) "Evangeline in the Church," C. Lucy. An advance upon former works, but few youths would have fixed their eyes upon any thing quite so plain as the heroine, much less have

considered her

. . . " as the saint of his deepest devotion."

(447) A picture without a title, by E. Armitage, accompanied by a long extract from Thierry's "History of the Norman Conquest," is utterly unworthy of De la Roche's pupil, who has eminently distinguished himself in the Westminster Hall competitions. It is ill

the Westminster Hall competitions. It is ill drawn, and trite in general treatment.

(470) H. Pickersgill, jun. "The First Interview of Robert, surnamed 'the Devil,' with the young Girl of Falaise, who was afterwards the Mother of William the Conqueror." A very clever picture from 'Thierry's history, evincing both painstaking and ability, but placed somewhat too high for close inspection. somewhat too high for close inspection. Mr. Pickersgill (the son of the veteran academician),

is a very accomplished man, but too modest and retiring for these pushing days. (474) "Malvolio," J. C. Horsley. Not what might have been expected from the author of many first-rate poetical compositions.

many irst-rate poetcat compositions.

(488) "Mozart's Last Moments," H. N.
O'Neil. A fine subject, and, as far as discernable, well treated. Much labour and study are observable here, although it is bally placed: it is evidently the work of a musical enthusiast.

(497) "Academy for Instruction in the discipline of the Fan, 1711." One of those quaint subjects of which Mr. A. Solomon, with his nice perception of beauty and clean painting and drawing, knows so well how to make the most of. This also is badly hung.

(538) "The Wolf Slayer," R. Ansdell. A very powerful picture, richer in colour than Mr. A.'s works are ordinarily, approaching the grand in composition. The foreground group of dogs and wolf would not have been unwarter of Snyders. The wolfslayer is the worthy of Snyders. The wolf-slayer is the least best part; but the work, as a whole, claims the highest praise.

(612) "The Orphans of the Village—Harvest Time," T. F. Marshall. A refined and well thought of subject, from "Thomson's Seasons," deserving of a much better situation than that assigned to it. From what can be seen of it, it is evident great care has been bestowed upon the arrangement and support the state of the season of bestowed upon the arrangement and execution; it is a striking advance upon former works, and, from its nice sentiment and agreeable ensemble, a very favourable specimen of the painter.

^{*} These names prove that Tivoli was a favourite retreat when the summer heat of Rome compelled her emperors, her stern warriors, her wise statesmen, or her gentle poets, alike to seek amidst the cool groves and matchless scenery of the Tiber, and silver waters of the Anio, a temporary refuge from the cares and turnoil of the busy capital.

THE ARCHITECTURAL ROOM.

Resuming our notice of the works exhibited in the Architectural Room, we may point to a satisfactory "Design for School and Master's House about to be erected near Trinity Church, Tonbridge Wells," by E. N. Stevens (1063). Tonbridge Wells," by E. N. Stevens (1063). The materials are flint and stone, with tiled roof. If the interesting old church, St. Giles's, Cripplegate (where Cromwell was married and Milton buried), is to be restored in accordance with the drawing 1072 (A. D. Gough), the flanks of nave will look bare and little accordant with the tower. (1114), by the same, "St. Matthew's Church, Denmark-hill, Camberwell, in course of erection," has a very attenuated tower, too telescopic in outline. The west end is polyof erection," has a very attenuated tower, too telescopie in outline. The west end is polygonal, with gablets. In 1100 we have a view of "The lower market at Exeter, from the northern entrance," by C. Fowler. Mr. Fowler also exhibits a drawing of the "Conservatory at Syon, erected for the late Duke of Northumberland" (1156), some years ago. 1120 is the selected "Design for the Savings Bank at Newbury, Berkshire," by G. Truefitt. It is Tudor in style, standing on open arches, red and white in colour, and has much of the right feeling.

right feeling.
(1122) "The new library at Mostyn Hall, North Wales," by A. Poynter, is Elizabethan, with an elahorately panelled ceiling (of good design) fully chromatised: the larger panels are blue, the smaller red. The chimney-piece are out, the smaller rea. The chimney-piece is carried up to the ceiling, and ornamented with shields of arms. (1123) "View of a Design for a County Lunatic Asylum," by F. W. Porter and W. A. Boulnois, is clever and original: the style is Italian, with a campanile. (1129) "Interior of St. James's Church, to be built at Hatchem, Old Kent read one of

(1129) "Interior of St. James's Church, to be built at Hatcham, Old Kent-road, one of the new districts of the metropolis," by W. L. B. Granville, is of the Geometric period, and would seem to be a large and imposing structure. There is a rose window in transept, the tracery of which is scarcely so elegant sept, the tracery of which is scarcely so ergant as it might be. 1157 is the "South-east view of the Derby County Lunatic Asylum," now in progress of erection, from the design of Henry Duesbury. This design, which is Elizabethan in character, has a nice play of a surface and is for form some of the yellow. outline, and is free from some of the vul-garities of the style occasionally indulged in. gardes of the style occasionally indulged in. 1172 is a view in the nave and transcripts of Sherborne Abbey Church, Dorset, shewing the proposed restoration and arrangement," from the designs of R. C. Carpenter; and 1189 is a view of the choir of the same fine building. building. The organ is to be placed in the upper part of north transept, with a circular staircase up to it: the sittings are to be building. open. In the choir a good coronal is shown. Amongst the designs for churches beyond Amongst the designs for churches beyond those already noticed, may be mentioned (1159) for the West of Ireland, by C. Geogliegan (early English), (1169) by H. Wyatt (decorated), and (1144) "Church of St. Mary the Virgin, Biscovey, Cornwall," by G. E. Street (tower of which is somewhat disproportioned). The "Church of the Confraterith of St. Reventioned of the Confraterith of St. St. Reventioned of the Confraterith of the C portioned). The "Church of the Conternità di San Bernardino, at Perugia," which a nice view is given by J. M. Lockyer, is a curious example of polychromic architecture produced by marble and glazed blue and wbite porcelain.

VANISHING LINES IN PERSPECTIVE.

Most professional readers are no doubt acquainted with the use of proportional scales on each side of their picture, for obtain-ing the direction of the vanishing lines where the points of distance lie a long way out of the picture. The rules for fixing the proportion of these scales are not always simple. The following method may prove useful to many, especially on an emergency, when a long drawing board or long rule is not at hand.

Obtain as nearly as may be, by a tape, or pocket-rule, the distance of the point in question beyond the margin of the picture, and the intersection of any one of the principal lines with the edge of the picture. Any one used to perspective sketching will readily do this. All that remains to be done is a very simple ruleof-three sum.

Upon the common principle of similar triangles, AB and ab will be in the same proportion to each other that AV and av are to each

Hence, if in the above figure V is 4 feet beyond the margin of the picture, the picture being 2 feet in width, AB: ab::6:4; or ab will be two-thirds of AB.

So, if ab is 6 inches, AB will be 9 inches; and if a length of nine inches set upon the horizontal line be divided into fifteen parts on the left hand side, and a 6-inch length be divided into fifteen parts on the other side, or into any equal number of divisions, the lines which connect any two corresponding divisions will be lines in the direction of the vanishing point. The same principle applies below the horizontal

The convenience of this method is, that the length of the scale (as AB) for one side can be calculated readily from the other (ab) in any case where it might be difficult (and it often would be) to lay down in the first instance the entire line, Bb.

CHRONOLOGICAL ACCOUNT OF BUILD-INGS IN ITALY AND SICILY.*

S. Vitale, Ravenna.—Not the least trace of the so vituee, Navenna.—Not the least race of the cross form is here apparent. There is a marked peculiarity of the capitals, not only in their shape and carving, but in the method of working then. Those nearest the altar are like hasket-work, so cut away from the stone block as to seem formed of cast-iron, keptaway a few inches from it. The fewex-ternal mouldings are like those of the Roman brick

cast-100, kept away a tew inters from the fewest-ternal mouldings are like those of the Roman brick towers; 550; consecrated 555 (Fabri); 510 (Cock-erell); 547 (H. J. Knight). Monca Cathedral.—595; fagade, 1350 (Hope). S. Balbina, Rome. — 366, founded; restored in 600, 731, 1464, and 1600 (Rossi); 600 and 720 restored (Vasi.). Altar to south-west. SS. Quattro Coronali, Rome.—311; restored 775, 847, and 1099, after that quarter was fired hy Robert Guiscard (Rossi); 625 (Bunsen); 625, hut rebuilt 1105 (Nardini); 311, hut rehuilt from foundations 1105 (Vasi). Altar to west. S. Adriana, Rome.—626 (Crescembini); 630, rebuilt; again 911, it heing in a ruinous state. The bronze gates brought, 780, from Perugia (Rossi); 600; restored in 1586. It was an ancient temple, used as a church until 600 (Vasi). S. Anastasia, Rome.—630 (Rycaut); it is known

used as a church until 600 (Vasi).

S. Anastasia, Rome.—630 (Rycaut); it is known to bave heen originally huil before 500; restored 1120, again 1471; repaired 1605; the façade, 1636 (Rossi and Vasi). Altar to south-east.

S. Aguese, Rome.—Fourth century built; restored 500 and 621 (Rycaut and Rossi); 621; no part considered older than this (H. G. Knight); 625 (Bunsen).

S. Tomaso in limine, Bergamo.—Seventh century, supposed (H. G. Knight); eleventh century, supposed (Quintiliano).

S. Michele, Pavia.—660 supposed. In 916 and 1004 it was repaired (H. G. Knight); c. 1000 (St. Quintilo).

Quintino).

S. Frediano, Lucca. — 670; the campanile c. 1150 (H. G. Knight).

S. Freduno, Lucca., -670; the campanile c. 1150 (H. G. Knight).

Florence Baptistery.—c. 550 (Cicognara); c. 675. Tbis date is supposed, but is uncertain. The church is known to have heen finished hefore 725 (H. G. Knight). The lantern built 1150, by Lombards; façade covered with marhle, by Arnolfo, 1293, when the new doorway was made. It is supposed to have heen an old temple of Mars, and open at top. The internal decorations, cupola, &c., done under Constantine. The pavement raised, hiding the steps, 1288. Originally there was only one door, which was where trihune now is. Tbis was closed, and three new opened c. 1200 (Richa).

S. Giorgio in Velabro, Rome.—600; huilt before this date; restored and adorned 682 to 742 (Severano); 682, restored; repaired 741 and 1611 (Rossi); 740 to 750, huilt (Rycaut); 682 (Bunsen); 827 to 844, enlarged, and porch added; repaired 1610 (Crescembini); 682: at this date rebuilt almost from foundations, having been previously restored, 600; sgain restored 745 and 1611. It is on site of Seupronian Basilica (Vasi). The cornice

almost from foundations, having been previously restored, 600; again restored 745 and 1611. It is on site of Sempronian Basilica (Vasi). The cornice and antes seem of the same date as the hrick towers, S. Stefano, Bologna.—Eighth century (Knight). Brescia Cathedral.—662 to 671 (Knight). S. Teodoro, Pavia.—Before 750 (Knight). S. Nicolo, Ravenna.—768: the convent, &c., 1236 (Pahl.)

1256 (Fahri) S. Maria S. Maria in Cosmedino, Rome.—c. 270: originally founded on ruins of temple "della Pudicizia

* See page 244, ante.

patrizia." Rebuilt 772, from foundations; 860, porch restored. The amhorni 1123 (Crescembin); patriza." Rebuilt 7/2, from loundatous, volume porch restored. The ambroni 1123 (Cresembini); 772: the founder unknown. Porch built 858; the church adorned 858 and 1118 (Severano); 799 (Bunsen). The mouldings of tower are similar to those of S. Giorgio in Velabro, but much dilapi-dated. Altar to west.

those of S. Giorgio in Velabro, but much anapudated. Altar to west.

S. Pudenziana, Rome.—51 (by S. Pietro); re-thuilt 772; also restored 1073, and heing ruinous, rebuilt in 1600, from foundations (Rossi). This date, 772, is probably that of tower. Its mouldings are similar to those of S. Giorgio.

S. Conce Rome - Row Construction who threw

are similar to those of S. Giorgio.

S. Croce, Rome.—By Constantine, who threw down part of Temple of Venus to huild it. Chapel of S. Elena restored 426; the church restored c. 720 and 976; the roof rebuilt 1493 (Severano).

Attar to east.

S. Vincenzio alle tre fontane.—790 (Bunsen);
c. 790, restored from foundations after a fire (Ciampini); 780, restored from foundations (Crescembinia and Severano).

and Severano).

S. Giovanni a P. latina.—790 (D'Agincourt and Bunsen). Altar to south-east.

S. Nerco e Achilleo, Rome.—498: date of erection unknown, but mentioned at this time; restored. 795 from foundations; again restored, it being im ruinous state, in 1480 and 1596 (Severano). Once a temple of Isis. Restored 526 and 1595, according to the ancient forms (Vasi). Altar to south-west.

west.

S. Vincenzio e Anastasio, Rome.—625, originally built; rebuilt from foundations in 795 (Severano); 625, rebuilt from foundations, and in 800 restored. Splendidly enriched by Charlemagne

(Rossi).
S. Maria in Navicella, Rome.—817, rebuilt

Rossi).

S. Maria in Navicella, Rome.—817, rebuilt from foundations. Its original date is unknown. Restored 1500, when porch was added (Rossi and Severano); 817, rehuilt, with two orders of columns (Vasi). Altar to west.

S. Cecilia, Rome.—745 (Rycaut); ninth century. (D. di Serradifaleo). Its date unknown, hut before 552. Restored 600 and 821 as now seen (Vasi); 1518, much ornamented (Rossi). Altar to west.

S. Lorenzo, Verona.—813 (Maffei).

S. Prassede, Rome.—160; rebuilt 817, with chapel of S. Zeno (Vasi); 820,—Bunsen, Rycaut, Severano, &c., agree that it was then entirely rehuilt. Original date unknown, but spoken of in 499. Chapel of S. Zeno 820; sacristy, 1605) (Severano). S. Carlo Borromeo rebuilt porch and façade, decorated interior, aftered altar-steps and the balustrades, restored the ancient seats round choir, and the ancient marble tables (Rossi).

S. Marco, Rome.—833, from foundations; in 1468 restored; 336 first huilt (Nardioi); 772, the hird part rebuilt and enclosed with portices all round; in 833 rehuilt from foundations; in 1468 palace adjoining huilt (Rossi). This church is very curious. It is very small, and huilt on hasilican plan. The aisle columns Roman, with circular-arches over. The clerestory windows are Gothic. Subiaco.—347: the pointed arches clearly helong to this date (D'Agincourt). The chapels much injured 1299 and 1350 hy cartbquakes, and the pointed arches introduced at the restorations (Knight).

(Knight).

(Knight).
S. Ambrogio, Milan.—800 to 861; the vestibulel
861 to 882. One campanile 850, and the other 1143.3
The pointed arches introduced 1300 (Knight). The

capitals of the vestibule columns are, generally, very flatly carved, partly of foliage and partly of animals. The general appearance of the interior is decidedly

Ciriacco, Ancona.—950 (D'Agincourt, Hope, e S. Ciriacco, Ancona.—930 (D Agmount, 100ps; Serradifalco); 1100, supposed by Greeks (Knight); 1300, Milezia—(Is this the date of the porch?).— The transepts floor is raised seven steps, and was soi built. The south doorway under porch, the porch! itself, and all the west front have every appearance of having undergone extensive repairs. The roof is itself, and all the west front have every appearance of having undergone extensive repairs. The roof isi of later date than the church, as the front and transepts have false gahles. The principal front has also undergone very extensive alterations. This church seems worthy of very attentive study. Itsiplan, the arrangement of its dome, and its generals details are very interesting. It may be classed with S. Pietro and S. Maria della Piazza, Ancona, and state of the second study. like a plan or scheme for forming it; and both Smyth and Stratford lamented that such a desideratum was not promptly and substantially adopted. I ventured to remark that it was a subject I had often meditated on, and that I had, at one time, penned something of a prospectus, expressly on the subject, and if they would breakfast with me the next morning I would show them what I had written, or at all events explain my opinions on, and wishes to see, a practical society formed to promote and give additional interest to the science of geography. Five of our friends assembled the next morning, when resolutions were passed and written down; and I volunteered to act as secretary pro tem, and write a more matured prospectus than the one I had previously and hastily prepared, and that it should be submitted to each person then present for comment, improvement, and adoption. I had it set up in type, and sent a copy to each gentleman. They were returned with various suggestions, &c., and a proof combining the whole was sent to the printer: revised proofs were soon provided, and clean copies sent to the same parties. One of them was shown to Mr. Barrow, secretary to the Admiralty, who soon manifested not only angry hostility to the scheme, but wrote intemperate letters to one or two of the officers who were and are connected with the Admiralty. The language used by the secretary was very irritating to the gentlemen he addressed, and it was feared that serious consequences might ensue. A meeting of our preliminary committee assembled, and it was agreed that the prospectus should be issued, and an appeal made to the public, to ascertain who were willing to co-operate in forming a new society therein explained. The secretary, who was prompt, peremptory, and resolute, instead of asking the advice and aid of friends, issued a prospectus, named a committee, and told the public that such a society was formed, and invited members to join it.

join it.

Too much engrossed with the literary works I had in hand, I did not feel disposed to enter the field. I declined to involve myself in a paper contest, but both I, Captain Smyth, and Mr. Baily were named on the first committee, where we both saw and lamented, that a man of such rougb bearing and manners should overawe and govern the society which had thus been formed.

In the autobiography which I am now print-

In the autobiography which I am now printing, I may be induced to give a further explanation of this public subject, from papers and dates of the time, as the *Literary Gazette* of May 26th has endeavoured to invalidate my claims to credit in the origination of the Geographical Society.

GUTTA PERCHA.

In a late number of your journal, No. 323, page 178, you have some remarks as to the right pronunciation of the word "percha," in the article "gutta percha." As I have before me two letters relating to the subject, which may, I think, be considered good authorities, (one from my brother, for many years resident at Sumatra and the adjoining settlements, and a perfect Malay scholar, and the other from a native of that island, a lady, whose husband holds a responsible situation on the spot in the East-India Company's service, and who has also published an essay on the properties and uses of the substance), I take leave to send you extracts for the information of your readers; and I would heg attention to the very injudicious method at present in use for procuring the article, in the hope that a practice so injurious to its future supply may be abandoned hefore its effect is felt in the market. "The gutta effect is felt in the market. "The gutta percha is in our forests," but the people are too indolent to procure it. At Singapore, considerable quantities are brought from the neighbouring islands, hut from the injudicious mode of collecting it, that of felling instead of tapping the trees, the supply is likely to decline, unless measures are speedily adopted to remedy the evil." Gutta is the Malay for gum, and percha is properly "runnant," but

""Our forests." The letter is dated Penang, in the straits of Malacca.

straits of Malacca.

† "Runnant." I do not at present know the meaning of this word as here used, though it may be surmised.

BISHOP DUPPA'S ALMSHOUSES, RICHMOND.

VIEW EROM ROAD

ENTRANCE

the gutta having been first introduced from Sumatra, which the Malays call "poolow percha," it has gone ahroad as Sumatran gum. Gutta percha is soft, as in perch, the fish of that name, and is pronounced by the natives thus, gutta-perch-a.

HENRY GARLING.

BISHOP DUPPA'S ALMSHOUSES. RICHMOND, SURREY-1661.

These almshouses, affording accommodation to ten poor women (each inmate laving two rooms), were erected by Bishop Duppa, tutor to Charles II., on the spot where his life was saved, when that prelate was pursued by some of Cromwell's adherents. On that occasion the Bishop made a vow that, if the King were restored to his throne, he would perform some work to the bonour of God —hence this pious work. The charity is under the management of trustees, the present receiver and paymaster, Mr. Wm. Smith, having held that capacity for the last forty years.

The entrance doorway here represented is a correct and graceful example of Italian architecture, and constitutes a leading feature of the ahove-named structure, which bears the date of 1661. Sir Wm. Chambers, in his treatise, describes this style of doorway, and says "it is a disposition of Micbelangelo. The windows of the capital are of this kind; and Sir posterity.

Christopher Wren hath executed doors of this sort, under the heautiful semi-circular porches in the flanks of St. Paul's."

The almshouses of this period are well worthy of attention: freed from all ostentation of design, these structures are generally wisely planned and substantially built; and if any display of art is made to enter into the composition, it is ever accompanied by a marked sobriety of feeling. It is to be regretted, in this instance, that the front wall, which bad a picture sque appearance, has been pulled down, and a common brick one substituted, and built in a direction wbolly irrespective of the huilding, to which it serves as a screen. Such manifest indifference for works of skill and taste is too frequently exhibited amongst us. When, through imperative necessity, an interesting structure of by-gone times must be demolished, would it be requiring too much at the hands of the destroyers that they should deposit in the public archives of the neighbourhood a correct representation of the doomed structure? For the want, in this instance, of the information which such a document would supply, it is not possible to learn the true character of the demolished portion of the building,—a circumstance the more to be regretted, since it appears to be not improbable that the work in question is from the hand of Inigo Jones. There is something very barbarous in thus consigning to oblivion the thoughts of those whose names are revered by posterity.

A. P. Hakewille.

THE CITY ANTIQUITIES.

In a report of the proceedings at a meeting of the Royal Institute of Architects, which appeared in your paper of last week, Mr. Tite (who seems to have taken up the cudgels and become the champion of the City authorities) endeavours to prove that the citizens have never been unmindful of their antiquities, and that they have been impugned without cause. To support this assertion, he goes on to state that Gresham College has always possessed a niche devoted to local antiquities. I have now before me "A Catalogue of the Rarities preserved at Gresham College," by Nehemiah Grew, Esq., F.R.S., extending over nearly 400 pages, with plates of the more curious specimens, dated 1681, in which are enumerated many antiquities presented by Sir Christopher Wren, John Aubrey, Esq., and other distinguished antiquities of that day, such as tesselated pavements, Roman urns and coins. The museum also contained some valuable gems; and, amongst these, "a rock of diamonds," amethysts, sapphires, emeralds, &c.; specimens of natural history, plants, metals, minerals, &c. Perhaps the architect of the Exchange can inform me what has hecome of this collection? I have in vain endea-voured to ascertain its fate; and as he has in-stanced this "local antiquity niche" as a proof of the "regard the citizens have always had" for the remains of our ancestors, he can, or onght to give us some little information relating to it. I certainly do remember a "local antiquity niche" in Guildhall, about 3 feet hy 6 feet in size (with about as many inches of dust and dirt), illumined by a pane of glass at the top of one of its sides, admitting just enough light to make darkness visible, which appeared as if, in remote times, it had been a temple dedicated to the goddess Cloacina. These isolated antiques are now removed from this apartment, and, with others discovered on the site of the Royal Exchange, placed in a larger room, and, within the last month or two, have heen arranged in a glass case, protected by sheets of cartridge, to prevent the rays of the sun from injuring the crimson hue of the paper for the remains of our ancestors, he from injuring the crimson hue of the paper on which they are laid. Since 1841 (the time the Exchange antiquities were discovered) I the Exchange antiquities were discovered) I have been year after year looking for their production, and at last we are favoured with a sight of them. But to whom are we indebted for this one room, now allotted to the reception of local antiquities, save to Mr. Lott, the only member of the corporation who, through a series of repulses and oppositions, which would have daunted a less enterprising man, at last prevailed upon the Common Council to devote this space? Should it he requisite in any public manner to detail the long account of negligences on the part of the corporation any public manner to dean the rong account of negligences on the part of the corporation towards their antiquities, as well as numerous glaring instances of the manner in which valuable remains have been destroyed, I am ertain abundant evidence will be forthcoming. But who are to be the judges? I think the best tribunal is the public press—the best judges, the public.

A LONDON ANTIQUARY.

PAINTINGS BOUGHT BY THE ART-UNION OF LONDON.

THE following is a list of the works of art purchased by the prizeholders up to this

purchased by the prizeholders up to this time:—

NOTES IN THE PROVINCES.

A DRAWING and designing class has been formed at the Literary and Mechanics' Institu-tion, Chelmsford, and the authorities at Somerset House have presented their elementary course for the use of the students, twenty in number, and almost all operatives. —Mepal Church is about to be restored at an estimated expense of about 600l.—The example of Sir C. Anderson is about to be followed in the erection Anderson's amount to be followed in the erection of stained glass memorial windows in Lincoln Cathedral.—The public baths at Hinckley are in an advanced state. The building is in the Tudor style, and has been erected by Mr. Harrold, builder, who is also to form a swimming buth 60 fort the state of the s Harrold, builder, who is also to form a swiming bath, 60 feet long by 20 feet wide.—
Brighton appears to be on the increase. According to the Sussex Express, Baron Goldsmid is to complete Adelaide-crescent forthwith, and to form a square at the top, similar to that at Kemp-town, the road for which is partly laid out. The whole of the west side of Lansdowney lace here have the complete the com place has been built on. Opposite the Wick Inn detached villas are to he built. A great number of houses have also sprung up east of Montpellier-crescent, forming quite a new town.—The restoration of Romsey Abbey Church is still going on. The outside of the Church is still going on. The outside of the morth transept is now under repair.—The Hon, and Rev. W. H. Scott has taken in hand the repair of Maiden Newton Church, according to the Poole and Dorset Herald, on condition that the parish contribute 100l., according to estimate.—An asylum for middle class lunatics is about to be erected near Stafford, at a cost of 10,000l. besides funds in hand.—The consecration of a new church, erected at Tixall, Staffordshire, at the exhand.—The consecration or a new curren, erected at Tixall, Staffordshire, at the expense of the Hon. J. C. Talbot, was to take place on the 28th instant.—The nave of Atherstone Church, Warwickshire, having been taken down, the first stone having been taken down, the first stone of the new building is to be laid on the 2nd of June. The accommodation provided is for between 1,200 and 1,300 people, including children.—Two painted windows have heen put up in the chancel of St. Mary de Lode Church, Gloucester, at the expense of Miss

Coglan, sister of the Vicar. The artist was Mr. Rogers, of Worcester.—The completion of the extensive buildings at the Manchester Exchange (already described by us) was celebrated on Friday week, by a ball in aid of the baths and washhouses funds.—Methley Church has heen extensively repaired, and was to be opened on Thursday last. The oak ceiling has been restored. Messrs. Vickers and Hugall, of Pontefract, were the architects employed.—The first stone of a new Baptist chapel at Kirkstall was laid on Tuesday week. It is to be a plain building, at an estimated cost of 4501, already subscription of 1,2001, realised, in honour of the late headmaster, Mr. Canon Tate. The plans of Mr. Andrews, of York, have been adopted, and the sub-structures were commenced in April,—the chief stone on 19th May.—The foundation-stone of Holyrood Free Church, at Edinburgh, was laid on Thursday week, at the ste at head of Horsewynd, near St. Ann's-yards. Coglan, sister of the Vicar. The artist was

DUNDEE ARCH COMPETITION.

I semp you a printed circular which I have this morning received from Dundee, after wait-ing upwards of a month without being able to ing upwards of a month without being able to obtain either my drawings or any reply to my inquiry respecting them. No doubt, better late than never is quite Shaksperian; nevertheless a little more promptitude in issuing these circulars would have been better still. After all, too, mystery and suspense are protracted very unnecessarily. It is not even quite clear that the design first chosen will be set aside, but merely that it possibly may be, and that "another may yet be preferred." It is not, however, at all likely that there can be many others.—perhas not above three or many others.—perhas not above three many others,—perhaps not above three or four,—between which the choice in the second instance would lie; therefore those designs instance wound ne; therefore those designs which are already finally rejected might as well have been returned, instead of heing very needlessly detained, merely in order that those who sent them may have the trouble, or, as the committee seem to think, may bave the pleasure of surlying for them poning.

volume to the survey of the plants are the plants sure, of applying for them again.

Possibly, the keeping all the designs a few weeks longer has been determined upon with the good-natured view of also keeping the competitors in good spirit, each of them being thus left to suppose that his design has still a thus left to suppose that his design has still a very fair chance of being selected,—that is, should there really be any second selection. Surely committees must have more of feline playfulness than of feeling in their nature,—of feeling at least for the feelings of unlucky competitors, with whom they sport, just as cats do with mice, instead of inflicting the coup degrace as quickly as possible.* grace as quickly as possible.

Competitor.

Banks.

A Manual of Logic. By B. H. SMART, author of "Beginnings of a New School of Metaphysics," "Grammar on its True Basis," &c. London, 1849. Longman and Co.

&c. London, 1849. Longman and Co. Mr. SMART completely, and we think very properly, discards the old wordy Aristotelian logic, and substitutes a new logic in which there is something more than a mere play of words—the shadowy signs of thought. He would have us reason by means of words, but not altogether with and about words. Mr. Smart confesses himself a disciple of Locke and Horne Tooke; yet we very much mistake if he is not far more apt to be regarded as an adapter to logical purposes of Dr. Brown's admirable, though still imperfect, theory of relaanapter of logical purposes of Dr. Brown's admirable, though still imperfect, theory of relationism. He wonders why Morell, in his able "History of Philosophy," places him in the class to which this very metaphysician belonged: he may depend on it that Morell

a The circular (dated May 26) says:—"In reference to the competition designs received for the proposed Royal Arch at Dundee, I think it necessary to inform you why the committee has not yet been able to come to a final decision re-garding them. A design has been selected as the most suitable, but as it is yet uncertain whether it can be erected for the sum originally fixed, another design less expensive may yet be preferred; in a few weeks, however (say two or three), this point will be assertationed, and, in the meantime, the properties of the superiority of the superiority of the in The Builder has been able to the superiority of the papers, when the unsuccessful competitors may apply for their designs."

had Brown in his eye when be did so. Yet Mr. Smart may not be indebted to the latter, even for his relationism, and indeed he displays a want of familiarity with Brown's doctrines, as where he calls the idea that tactual not visible impressions are the early inlet of all our fundamental knowledge a new one, suggested by an anonymous correspondent of his own. Familiar or not, however, he is plainly on the right tack, and bas obtained a glimpse of the concentradiative nature of the mind, as yet so little known. The capability and tendency in the mind to pass inwards from subjective terms to relations in common, more or less abstract, is so far worked out in his theory of inductive logic, as is its perfectly parallel capability and tendency to repass outwards from relations, so begotten, to subjective terms, in his theory of deductive logic; and the threefold distinction of the faculties in general into the potential, the sentient, and the sciential, we trace in his definition of the difference between grammar, reletoric, and logic, in the outset.

"Logic," he remarks, "is a branch of learning connected with grammar and rhetoric. While grammar looks only to correctness of construction, or putting properly the parts of speech together so that they shall be accurate forms of language, and rhetoric varies those forms in order to make them expressive of emotion, logic looks to the sense which language has to convey, clear from any emotion which may or may not be its effect......

The process of the understanding hy which knowledge is accumulated and included under a knowledge is accumulated.

The process of the understanding by which knowledge is accumulated and included under a sign, is called Induction; the process by which the knowledge so accumulated is spread again before the understanding in words, which heing joined together make evident sense,—that is to say, make one expression with one meaning, is called Deduction."

In the form of an Appendix, the work contains an introductory course for students, and there is also an instructive Index of terms, &c.

Digest of Evidence taken before a Committee of the House of Commons appointed to inquire into the Agricultural Customs of England and Wales, in respect to Tenant-Right. Compiled and arranged by WILLIAM SHAW, Editor of the "Mark-lane Express," &c., and HENRY CORBET, Secretary of the London Farmer's Club, &c. London, 1849. Rogerson, Strand; Ridgway, Piccadilly.

This is a book that ought to be in the hands of every landlord and every tenant-farmer in the three kingdoms. We have long advocated the cause of land tenant-right, which in fact (pity it had not a hetter name) is just another term for mutual-right and advantage between land-owner and tenant. To deprive an outgoing tenant of all due compensation for improvements made by him on his landlord's estate, so far from benefiting the latter, or enabling him to grasp at anything of essential value, can only tend to injure his own interests. It is virtually to insist that his tenant shall not improve his property. Whereas, if duly com-pensated, every outgoing tenant with capital and enterprise would leave the land in a and enterprise would leave the land in a higher state of cultivation and improvement, yielding increased produce and higher rents. Yet from this excellent digest of important evidence, it appears that an immense proportion of England is without such tenant-right at all, either by custom or law. Indeed two-thirds of it is held by the proprietors themselves on life leave the proprietors themselves on life-lease only, or by entail, so that no adequate security at pre-sent can be afforded for improvement of the property of heirs not bound to pay for it. The andlords even thus, then, have as deep an interest as the tenants in the adoption of means for the establishment of 'tenant-right' as the law of the land. Without security to his capital, either by tenant-right or lease, it clear that the farmer cannot prosecute his calling with energy and confidence, or bring the land to so high a state of cultivation as he is perfectly capable of doing. The Committee, themselves landowners, have unequivocally admitted the soundness of the principle (see 13th clause of report), and indeed the highly cultivated state of Lincolnshire and part of Scotland, where this form of tenant-right (not the Irish of course), prevails by custom, speaks for itself still more unequivocally in its favour. The Committee, too, have recommended an Act of Parliament applying it to entailed estates (see 15th and 16th clauses). In fine, we cannot but recommend such a digest as the present, as a capital improvement on the horrid blue books, through acres of which one may wade without gleaning more than a mere handful of the really valuable matter which they generally contain.

Popular Rhymes and Nursery Tales: a Sequel to the Nursery Rhymes of England. By Mr. James Orchard Halliwell. London, 1849. J. R. Smith.

THAT the nursery has an archæology, the study of which may eventually lead to impor-tant results, and thus redeem the songs and jingles of our childhood from the imputation of exclusive frivolity—as, indeed, it has already done in not a few isolated instances,—is what we quite agree with the author of this little in thinking. But, as he observes, those who have the opportunity, and do not consider it a derogatory task to add to such memorials, must hasten to the rescue. The antiquities of the people are rapidly disappearing before the spread of education; and before many years have elapsed they will be lost, or recorded only in the collections of the antiquary, perhaps requiring evidence that they ever existed. Let it not be thought, however, that it is from any comparative paucity of those interesting little subjects of universal reminiscence in the present collection, that the early recollections, or the mannikin acquaintance, of others are thus appealed to. On the contrary, this first endea-vour of any gifted mind to gather together the decaying fragments of the literature of the little men and women of England, is-all obstacles considered —a perfect monument of industry. This could only be realized by the con amore help of others, and hence a further appeal for information, to which we gladly give increased publicity.

The learned and able author has, moreover,

The learned and able author has, moreover, another purpose in view besides a merely archæological one. "It were greatly to be desired," he remarks, "that the instructors of children could be persuaded how much is lost by rejecting the venerable relics of nursery traditional literature, and substituting in their place the present cold, unimaginative—I had almost said unnatural—prosaic good-boy stories." And, indeed, he might have altogether said so; for the imagination is one of the most vivid of all faculties in the little, wondering, radiative, souls of children, and is hence the main material or ground on which to work, in rearing them

into orderly maturity of mental structure. But although even architects and archaelogists have, doubtless, once been fellows of the peculiar and extensive literary and scientific society, a volume of whose varied records now lies before us,—and, although we believe that many of our readers are now patrons, or at least honorary members, of that interesting community to which they once more exclusively belonged,—nevertheless any further encroachment on the really refreshing pages of Mr. Halliwell would be scarcely within our province—unless, indeed, his archæological researches into the foundations of the bouse that Jack built, be a legitimate exception: even the discussion of that important question, however, we must postpone for the present, sine die.

Miscellanca.

A WHOLE TOWN AND GREAT PART OF ANOTHER GOING BY AUCTION.—Amongst the items of 284 lots of a "momentous sale" of property by auction, in Cheshire, beginning on the 4th inst., by Messrs. Churton, of Liverpool, as advertised in the Albion, are "the whole town of Parkgate, and the greater portion of Great Neston," with lots of "brick clay, sand, building stone," for preparing a few more of such subjects for the hammer of some future wholesale knockerdown of towns and villages,

PUBLIC RECORD OFFICE.—Mr. Monckton Milnes has given notice of a motion—That a humble address be presented to her Majesty, praying that she will be pleased to give directions for the immediate commencement of a building suitable to contain the public records and State papers, and relieve them from that dangerous condition to which Mr. Braidwood, superintendent of fire brigade, has stated in evidence—"no merchant of ordinary prudence would subject bis books of account."

To FIX DRAWINGS IN CRAYONS.—The Marquis de Varrennes has discovered a method, which is equally simple and ingenious, of giving to drawings in pencils and crayons the fixidity of painting, and with-out injury. He succeded in obtaining this result by varnishing them on the back; that is, by spreading over the back of the paper an alcoholic solution of white gum-lac. This solution quickly penetrates the paper, and enters even into the marks of the crayon on the other side. The alcohol rapidly evaporates, so that in an instant all the light dust from the crayons and chalk, which resembles that on the wings of a butterfly, adheres so firmly to the paper, that the drawing may be rubbed and carried about without the least particle being effaced. The following are the accurate proportions of the solution:—10 grammes of common gum-lac are dissolved in 120 grammes of alcohol; the liquid is afterwards bleached with animal charcoal. For the same purpose may be used even the ready-made paint that can be purchased at the colour shops, containing a sixth of white-lac, and adding two-thirds of rectified spirits of wine. After it has been filtered, there is nothing further to be done than to spread a layer of either of these solutions at the back of the drawing, in order to give them the solidity required.

THE RE-ADORNMENT OF LINCOLN CATHEDRAL.—With pleasure we desire to draw the attention of our readers, especially those of "the nobility and others, owners of property, or residents in the diocese of Lincoln," to an endeavour of the dean of the cathedral, by letter, to raise by subscription the balance of a sum of 1,5001. (of which 5001. have been already provided by the Dean and Chapter themselves, and others), in order to restore the east window to its pristing glory, by replacing the present inferior material with "glass in the best and most splendid style of modern art." We agree with the dean in thinking that "for the honour of Almighty God in this his glorious house," the present opportunity of manifesting good-will in such a cause will be promptly embraced hy a number of the wealthier sons of the church, even to a greater extent than sufficient to complete this really trifling snm.

LOMSDEN'S MODEL DWELLINGS FOR THE WORKING-CLASSES.—On the 25th ult., these dwellings, situated in Garsenbe-road, Glasgow, and already described by us, previously to being occupied by the tenants, were visited and inspected by the magistrates and other members of the town council, as well as by numerous other gentlemen interested in the prosperity and comfort of the working-classes. Mr. Lumsden himself was present, and, aided by Mr. Wylson, the architect, afforded every information and explanation to the visitors, all of whom expressed themselves in a high degree gratified by the many admirable arrangements for the accommodation of those by whom domestic comforts of the humblest kind have been hitherto all but unattainable. The houses have been long since all let. The scheme is worthy of imitation, and reflects lasting credit on all concerned.

QUEEN ELIZABETH'S GRAMMAR SCHOOL, SOUTHWARK.—Painters have been busily employed marking the stonework and other portions of the buildings situate not far from the Railway terminus at London Bridge, and known as the grammar school of Queen Elizaheth for the parishes of St. Olave and St. John, Southwark, in order that they may be taken down and re-erected in the same form elsewhere. Neither does there appear to be any excuse for such parsimony on the part of the institution. A correspondent, who says that it is possessed of immense property, and has received a large compensation from the Brighton and South Coast Railway, calls upon us to object to this course as niggardly and inexpedient. It does not seem to us, however, a case calling for interference.

HYDE PARK GALLERY OF MODERN ART.

—We are much pleased to hear that the committee of the "Hyde Park Exhibition," have granted free admission to their gallery to the students of the Government School of Design, Somerset House. This is an example we hope to find followed by other exhibitions in this metropolis, as such a step is well calculated to improve the taste of our designers.

THE PATENT-EATER. — Dickens' Model Patent-Eater is graphic: "The Patent-Eater is of a peculiar species—he is a 'chance' child —of foundling descent—sharp and thief-like on teeth—(glass corrodes the Enamel)—Cambridge hred—quick at L. s. b.—a smatter of the law—particularly, bankruptcy—meum and tuum not in his vocabulary—a breed of them was lately imported from Bristol to Birmingham where they there was lately law they are the stately and the stately are the stately and the stately and the stately are the stately and the stately are the stately and the stately are stately as the stately as the stately are stately as the stately are stately as the stately ham, where they thrive marvellously well in lane a few miles out of town, via canal." The Patent-Eader has various plans laid for indulging in his favourite pastime since the repeal of the glass duties. We know one case in point which occurred a few years ago. A patentee in the glass trade, who had expended his hard earnings and a number of years' labour in bringing out a very neeful view. labour, in bringing out a very useful patent for ornamenting glass, by "chance" fell in with one of these gentlemen. A protection of his patent, and large promises of reward were held out to the patentee, if he would join the Patent-Eater, to establish a connection and set Patent-Eater, to establish a connection and set the process a-going, of which the Patent-Eater had no knowledge whatever. The young patentee, open, generous, and confiding, was very easily persuaded, and a written agreement was entered into. The process was set a-going, ademandfor the article created, and a good trade in prospective, certain. Then the cloven foot began to show itself. The junior partner has his part of the game to play. Jacques (hopeful youth, half-way bred between Cambridge and Billingsgate) is sent to annow the patentee in his part of the game to play, suggest and pound, half-way bred between Cambridge and Billingsgate) is sent to annoy the patentee in every possible way, and to assall him with such names as liar, &c. The patentee begins to smell a rat (in reality), and on referring to his agreement (written by Jacques), he finds that it is not worth one straw. The result may easily be guessed at. The patentee is turned adrift without a penny, and the noble Company enjoy a flourishing business with forty or fifty hands employed in it. This is what is technically termed "scotching a patentee," and is of frequent occurrence. You will ask, honest reader, is there no remedy? There is, virtually speaking, none whatever. It would be a fruitless waste of money. The Courts of Chancery, speaking, none whatever. It would be a fruit-less waste of money. The Courts of Chancery, Exchequer, Old Palace, Bankruptcy, or any other court, are all one and the same thing to Rob Roy, "the Paten-Etater." Surely the patent laws might be amended so as to prevent and punish such base injustice.—Cooper's "Glass Manual."

THE FILE TRADE.—We have learned with very great pleasure that there are some pal-pable indications of an improvement in this

trade at Sheffield.

REMOVAL OF VITLATED AIR.—The article under the head of Removal of Smoke and Ventilation of Sewers, which appeared in a late number of The BULLDER, has suggested to me the idea of a cheap mode of carrying the vitiated air from dwellings by means of tubes leading from the rooms to the gas-lights in the street, the heat from which would cause the confined air to pass off with great velocity, by which a constant fresh supply would be insured to the inmates, and at a time, too, when they most need it. The same principle might, to a certain extent, be applied to the ventilation of

BOOKBINDING.—Some idea may be formed of the extent of the London bookbinding trade from calculations which have been made, to the effect, that the weekly consumption of leaf gold, for enriching the exterior of books, amounts to about 3,600,000 square inches; and that 350 tons of paper shavings from book edges are sold annually by the London binders. binders.

ASTOUNDING LIBERALITY TO PRESERVE ANCIENT WORKS OF ART.—The Earl of Guilford has ordered that the beautiful frescose (?) whiteb literally cover the walls of the Church of St. Cross (Winchester), shall next week receive an additional coat of whitewash!—Hampskire Independent.

—Hampskire Independent.

St. Paul's Church, Camden-town.—
The first of several churches proposed to be built in St. Pancras parish was consecrated on Thursday in last week. It is in the Pointed style, from designs by Messrs. Ordish and Johnson, and accommodates 1,200 persons. The vicar and his active coadjutors in committee are responsible for a considerable amount, yet to be subscribed in order to defray the cost.

PROJECTED WORKS .- Advertisements have PROJECTED WORKS.—Advertisements have been issued for tenders, by 7th inst., for the erection and completion of a large building at the Infantry barracks, Manchester; by 21st, for the erection of a new chapel to the hospital for consumption, Brompton; by 14th, for the erection of additional wards to the St. Saviour's Union, Southwark; by 11th, for the erection of a farm-house at Hermitage, Dorset; by 26th, for the erection of a farmery at Arsley. of a farm-nouse at Herminger, Dorset, of 26th, for the erection of a farmery at Arsley, Bedfordshire; by 30th, for the erection of a church in the district of St. Paul's, Devonport; by 6tb, for alterations and improvements to five houses in the parish of All Saints, Poplar; by a date not specified, for covering a large tavern with 1½ inch planed slates, rabitted together; by 12th, for the erection and com-pletion of a stone warehouse at Bradford; by 5th, for the erection of farm-buildings, near Laignsten, by the for building so, pear 5th, for the erection of farm-buildings, near Leicester; by 4th, for huilding 800 feet of brick sewer and 158 feet of glazed stoneware pipe sewers at Kensington; by 5th, for repairing sewers, &c., in the City; by 6th, for painting and repairing lanterns and fittings of gaslamps at Islington, and painting lamp-posts, &c.; by 5th, for the supply of 670 yards of iron water-piping for the Lancashire and Yorkshire Railway; and by 7th, for 50 fathoms yellow deal ends at Kensington Workhouse.

RICHBOROUGH CASTLE,—Mr. Rolfe has been excavating round the castrum at Richborough, and has laid open some square towers and two circular ones at the angles.

A CURIOUS ENCAUSTIC TILE, richly em-

A CURIOUS ENCAUSTIC TILE, richly embossed, was found a few days since in excavating for a new sewer in Broad-street, City. It was presented by Mr. Haywood, the surveyor, to the Commissioners of Sewers. The design, we are told, represents an empress wearing a crown, the hands being uplifted as

THE PORCELAIN TOWER OF NANKIN.— The great Porcelain Tower at Nan-kin, in the The great Porcelain Tower at Nan-kin, in the province of Kiang-nan, is the most extra-ordinary building in China; it was built by the Emperor Yong-lo, and is called by the Chinese the "Temple of Gratitude." The tower is erected upon a pile of bricks, and is formed upon a most substantial timher framework; it stands about 200 feet high, and is of an octangular shape. It is surrounded by a very thick wall of the same form, over which a roof is thrown from the tower, covered with green porcelain tiles, which makes a very hand-green porcelain tiles, which makes a very handgreen porcelain tiles, which makes a very handsome promenade, the walls and roof being painted in arabesque. On the eastern side a marble staircase leads to the first floor, which is surrounded by a gallery or verandah, the roof of which is covered with green tiles, being supported by several pillars; on the top of the marble staircase there are three large doors leading into the hall or temple, which is not the fart floor and presented the server floor a doors leading into the hall or temple, which is on the first floor, and measures 40 feet across, which gives 15 feet for each of its sides. The floor is of marble, which has the appearance of projecting through the wall, as a cornice of marble 2 feet thick runs round the building on a level with the floor. The temple or hall is 100 feet in height, and it is only lighted by means of the three doors we have already described. The tower is composed of nine stories, each one above the hall being of already described. The tower is composed of equal height, hut the diameter of each succeeding one decreases in equal proportion up to the top. The walls externally and internally are covered with porcelain, and a verandah surrounds each story covered with porcelain tiles, while small bells are pendent to every corner of them. The beautifully sloped roof is appropriately finished by means of a very thick spar, which is planted in the floor of the eighth story, and passing through the centre of, and extending above, the roof some 30 feet. This spar is surmounted with a large golden hall. spar is surmounted with a large golden hall, and from its junction with the spar, a thick and from its junction with the spar, a thick gilt wire is carried down like a screw in a conical form, which gives a novel and light appearance to the building; the second, and each succeeding story, has a window on each of its sides; the floors are laid upon thick cross beams, which are carved and painted in arabesque to form the ceilings of the rooms below them. The walls are covered with porcelain tiles, stamped with various figures and devices; small niches are filled with figures in basso relievo, and rich gilding adorns the in basso relievo, and rich gilding adorns the whole of the interior; a winding and inconvenient staircase runs up to the ninth story.—
China and the Chinese,

New Gas Works at Walsall, Near Birmingham.—The Corporation of this borough lately determined to erect new gas works, and having selected an eligible site requested that plans might be laid before the Town Council for their approval. Eleven designs were submitted, out of which they selected the design jointly made by Mr. H. C. Saunders, Wolverhampton and Stratford, and Mr. Ewinson. The buildings will cost np-wards of 5,000l.

DISTRICT SURVEYOR'S FEES.—I have been called on to pay a fee of 10s. by the

DISTRICT SURVEYOR'S FEES.—I have been called on to pay a fee of los, by the district surveyor of —, for rebuilding the eight upper courses of a chimney stack and resetting the pots. Is this the spirit of the Building Act? The work has cost something less than 40s., and I do think it very unreasonable to pay a fee for such an operation. The chimney stack is not in many stack. The chimney-stack is not in party; that is to say, belongs exclusively to one house. I have paid the fee under protest.

No. CCCXXXI.

SATURDAY, JUNE 9, 1849.

OTHIC exemplars multiply apace, and architects are ensured a safe road, though it be a low one, and are saved the trouble of thinking. Soon there will

be nothing left to draw but the nail-holes, and this will probably be done, so that the mediæval disposition of these may be rigorously followed.

Regarded as evidences of the spirit in which the Gethic architects proceeded, and illustrations of the principles which guided them, -as materials for us to work with, and suggestions by means of which we may proceed onwards, these illustrations are of great value; but, if used only for the purpose of servile imitation, as is too much the case, so far from advancing architecture amongst us, they will necessarily tend to stay its progress. Nothing great in art can be done without progressive efforts: retrogression, except so far as may be necessary to get out of a wrong road into the right one, is not the way forward.

We have several works of the class to which we have been alluding, now before us, some of them of great excellence and beauty. Amongst these we will name Dollman's "Examples of Antient Pulpits," just now published by Bell,* and Brandon's "Open Timber Roofs of the Middle Ages," published by Bogne.†

Up to this time there was no series of delineations of the ancient pulpits remaining in England. Mr. Dollman has given on thirty plates twenty-three specimens, mostly to the scale of one inch to a foot, with details a quarter the real size. Thirteen of these are stone pulpits, and ten of wood. The former are from St. Werburga, Chester (circa 1270); St. Peter and Paul, Shrewsbury (1320); All Saints, North Cerney (1460); Holy Trinity, Nailsea (1500); St. Peter, Winchcombe (1520); St. John Baptist, Circnester (1450); St. Mary, Totnes (1500); St. Mary, Frampton (1450); St. Benedict, Glastonbury (1500); St. Peter, Wolverhampton (1480); St. Andrew, Cheddar (1500); St. Andrew, Banwell (1480); and St. Saviour, Dartmouth (1530).

Those of wood are from St. Michael. Coventry (1400); St. Mary, Wenden (1440); St. Mary, Fotheringhay (1435); Iloly Trinity, Cold Aston (1500); St. George, Brockworth (1520); Holy Trinity, Long Sttton (1530); All Saints, Sudbnry (1500); All Saints, Hawstead (1540); St. Mary de Lode, Gloncester (1480); and St. Mary, North Petherton (1500). They are all very carefully and beautifully drawn in outline (Mr. Dollman's careful style of drawing is not unknown to the readers of THE BUILDER); and the examples from St. Andrew's, Cheddar; Holy Trinity, Long Sutton; and St. Saviour's, Dartmouth, are coloured and gilt in imitation of the originals.

It will be observed, that with the exception of the subjects from Chester and Shrewsbury,

* "Examples of Antient Pulpits existing in England, selected and drawn from sketches and measurements taken on the agot, and descriptive letter-press. By Francis T. Dollman, architect London G. Bell, Fleet-street, and Dy the author, 27, Mornigton-place, Hampstead-road.

† "The open timber roofs of the middle ages. Illustrated by perspective and working drawings of some of the best wateriets of church roofs, with descriptive letter-press." By R. and J. A. Brandon, architects. London: D. Bogue.

both refectory pulpits, with characteristic features of their own, the examples given are of the Perpendicular period. This, the author remarks, could not have been otherwise, "inasmuch as it was not till the fifteenth century that the pulpit appeared as a distinct feature of interior church arrangement." He says, in the course of his introductory remarks,-

" As soon as the rood-loft became a feature of importance in church arrangement, it supplied in a great measure the place of the ancient ambo; and from it the epistle and gospel were read by the dean and sub-deacon. gospet were read by the dean and sub-deadow.

Owing to the depth of the chancels, the view,
as well as the hearing, must have been considerably impeded by the intervention of the
rood-loft; and therefore it may fairly be assumed that from the necessity of the case originated the pulpit as best suited for its dis tinctive use, viz., that of preaching; and the part of the building that appeared most adapted for the purpose was the east end of the nave, immediately westward of the rood-screen. Possibly also the increased attention devoted to preaching in the fifteenth century may have been a reason. Since that period pulpits have been almost universally adopted, and the examples prior to the Reformation are far from uncommon, but previous to the year 1400 few, if any, are known to exist; one of about the date of 1340, at Fulbourn, in Cambridgeshire, which is figured in Part VII. of the "Instrumenta Ecclesiastica," being an exception. By a canon of 1603, every church was ordered to have a pulpit; a requirement to which the undue exaltation of preaching, which characterised the succeeding period, re sponded in the great number of pulpits erected in what is known as the Jacobean style. Of their kind these last are often very rich, though debased in style and more than questionable in detail. Among the most elaborate are the examples in the churches of St. Cuthbert at Wells, and St. Thomas at Newport, in the Isle of Wight. They are mostly of wood; but, of examples in stone, are to be found one at Din-der, near Wells, bearing date 1621, with the inscription, 'Blessed are they that hear the word of God and keep it,'—and another on the south side of the nave of Wells Cathedral (the entry to which has been made through Hugh Sugar's chantry), on which are inscribed the words, 'Preach thou the worde; be fervent in season and out of season; reprove, rebuke, exhort with all long suffering and doctrine.'

Mr. Brandon's subject, the open timber roofs of the middle ages, affords wider scope than that last mentioned, and has received ample justice at his hands. Mr. Brandon, in conjunction with his late brother, has already done good service: bis "Analysis of Gothic Architecture," and his "Parish Churches," are excellent works, and this, his last production, is worthy to stand on the same shelf with them.

In some places they would of themselves 'set up" a Gothic architect, as times go. "Parish churches" would give the general arrangement; the "Analysis" supply doors, windows, mouldings, ornaments, sittings, and fittings; and the book now before us enables our artist to roof the whole in the most improved and effective manner. We sincerely hope, however, as the author himself urges, that they will be used to better purpose.

The book contains 43 quarto plates, and illustrates 35 roofs, 18 of which are supplied hy Norfolk and 7 hy Suffolk. Two of the roofs are coloured, and serve to illustrate different methods in which colour was introduced. Our own experience coincides with that of the author, in leading us to consider it almost a

" Where the windows of a church present any remains of stained glass, other portions of the edifice have likewise been enriched with colour-ing. This style of emhellishment, which dates from the remotest antiquity, appears to have been held in deservedly high estimation by the mediæval architects, nearly every portion of whose structures admitted of and profited by

its application; and there is scarcely a church of their times that does not bear witness to this favourite style of decoration. We see it this favourite style of decoration. We see it in the mosaic pavement, the frescoed walls, and the brilliant hues of the stained-glass windows; in the rood-loft and screen, rich in gold and gorgeous colouring, the lower panels adorned with paintings of the apostles and saints; in the sepulchral monuments, the pulpit, and lectern, and the font and cover, and finally in the roof itself, the crowning ornament of the whole edifice."

Our author classes the roofs in four main divisions, namely :- roofs with tie-beams; trussed rafter, or single-framed roofs; roofs framed with hammer beams and braces; and roofs constructed with collars and braces, or with the latter only. In speaking of the first division, he remarks :-

"In the churches of the Middle Ages, a perfectly horizontal tie-beam is of extremely rare occurrence; where a tie-beam is used, we almost invariably find it cambered, as are also the collar-beams; even the hammer-beams will be generally found, on close inspection, to in-cline upwards from the walls. The disagreeable effect of a straight tie-beam was often further counteracted, by having curved braces framed from its underside connecting it with the wall-pieces, thus forming an arched sup-port for it, as at Outwell Church, Norfolk. In roofs of higher pitch the builders still en-deavoured, with varied success as to effect, to retain the arched shape in conjunction with the tie-beams: a curious specimen exists at the church of St. Mary the Virgin, Pulham, Norfolk, where the beam literally divides the arch in two, and a similar instance is met with over the nave of Morton Church, Lincolnshire; the effect, however, is anything but agreeable or satisfactory."

Of the curved braces be says :-

"The curved braces in all the foregoing descriptions of roofs, besides binding the different timbers together, serve two other highly important purposes; in the first place, at of conveying the thrust or strain of the roof lower down on the walls, where of course they can offer a greater resistance to any lateral pressure; and, in the next place, serving as a great steadiment to the walls; this latter being hy far the most important to the property of their carriers for they are to be until the control of their carriers for they are to be until the carriers. part of their services, for they are to be met with in roofs where no lateral thrust occurs, such as most tie-beam roofs, or the flat roofs such as most tie-beam roots, or the flat roots which cover the late perpendicular clerestories of many of our churches: in neither of these cases is there any danger to be apprehended from an outward thrust of the roofs, and though the arched braces act as a great support to the massive beams, yet in conjunction with them they form a most effectual counter-fort to the walls themselves—a very necessary provision when we contemplate the lofty clerestories, so perforated as to present almost the appearance of one long window opening, and call to mind that these are not supported on a solid foundation, hut nicely poised on slender shafts placed at wide intervals apart."

This book is a very valuable contribution to the architectural library.

" A Book of Ornamental Glazing Quarries," by A. W. Franks, B.A., is another collection of examples, just now published by J. H. Parker, This is a handsome octavo volume, in red, nicely got up, and ranging with Mr. Winston's excellent "Hints on Glass Painting." Whether the subject justifies the cost and pains seems to us doubtful. By quarries are meant the lozengeshaped panes with which windows in old buildings are generally glazed. "The word is apparently derived from the French carré, or carreau, meaning a four-sided figure; or perhaps it is a corruption of the older word quarrel, + which seems to come from quadrellum, a small square."

^{* &}quot;A Book of Ornamental Glazing Quarries, collected and arranged from Ancient Examples." By Augustus Wollaston Franks, B.A. London and Oxford. J. H. Parker, 1819.

[†] This word appears in the account of Little Saxham Hall (vide" Glossary of Architecture,") and in the account rolls of the reign of Edward III. ("Hints on Glass Painting," vol. i., p. 337). In the latter case it may possibly be in-

One hundred and twelve of these quarries are given full size, on 112 pages, bearing ample testimony to the industry and perseverance of Mr. Franks, who adopts for his motto on the title-page a line from George Herbert,--" If studious; copy fair what time has blurred." It should be taken, however, with this condition, that it be worth copying, which is certainly not the case with a number of the patterns here figured; while the majority of the best of them have been reproduced by Messrs. Powell in their patent stamped quarries, which, by the way, make excellent work.

In an introductory chapter the author sets forth, when showing how to determine the date of different examples, that the chief characteristics of Early English quarries consist in the stiff and conventional character of the foliage, the cross lines with which the ground of the pattern is usually covered, and the breadth and distinctness of the outlines. To these may be added the absence of the yellow stain, and the almost universal presence of bands or borders at the edges of the pane.

In the quarries of the Decorated style the hatched ground very generally disappears, and the foliage becomes more natural and flowing, About 1310 we find the yellow stain introduced, and it generally appears in quarries after this date.

In the Perpendicular style the lines are generally thinner and less elegant than those of Decorated quarries. The yellow stain is almost universally employed to heighten the effect of the patterns, and elegance is replaced by rich and elaborate workmanship. In later examples the patterns are frequently shaded, and the enamel is of a purple black instead of a rich brown. None of these characteristics, however, can be wholly depended on.

LECTURE ON ROMAN ARCHITECTURE.*

THE poblest circular temple in Rome as well as in itself a fine example of the Corin-thian order, is the unrivalled Pantheon, the splendid monument of the taste and munificence of the illustrious Agrippa—friend, general, and son-in-law of Augustus, patron of Horace, and the theme of Virgil,-this great man, and who had the magnanimity to refuse the honours of a triumph, is yet rendered greater by the superb huilding which was raised by him. For his victories at sea over Sextus Pompey a mural garland was decreed him the second ever heatures! to which honour him, the second ever bestowed, to which honour Virgil alludes :-

"Agrippa seconds him with prosperous gales, And with propitious gods his foes assails, A mural crown that binds his manly brows The happy fortune of the fight foreshows."

We may form some notion of the magnificent scale on which the Romans delighted to construct all their public buildings, when we find that the splendid portico of the Pantheon, and the noble circular hall behind it, were only intended as an approach and vestibule to the hatbs which Agrippa projected. Some writers have supposed that the Rotunda was erected in the time of the Republic, with a very plain interior, but the portico was certainly the work of the great man whose name it bears, as the inscription of the frieze, and which records his having been thrice consul, informs us. This superh temple is well apostrophised by Lord Byron :-

"Simple, erect, severe, austere, sublime— Shrine of all saints and temple of all gods, From Jove to Jesus—spared and blest by time;

tended for the small openings in the heads of the windows, as the word is so employed in the agreement for glazing the Beauchamp Chapel, Warwick, printed in Niehols's description of the building—"Rem, all the kature (quartelles), quarelles, and opiem ints." In France, the common paving bricks still used in houses are called carream.

Shiver upon thee—sanctuary and home
Of art and piety—Pantheon!—pride of Rome!'
Child. Trans.

theon!—pride of Rome!"
—Childe Harold, iv. 146.

The only light to this vast edifice is by the circular eye, or opening, in the apex of the dome, 27 feet in diameter, by which a soft and agreeable and sufficient light is diffused throughout. The hall itself is 139 feet in diameter, and the magnificent vault springs from the walls at the height of 75 feet from the ground, and is divided into coffers, or panels, in five rows. The lower part of the interior is supposed to be of more modern date than the outer walls.

The portico consists of sixteen columns in all, whereof eight are in front; each shaft of granite is in one block 46.5 high and 5.0 in diameter; the capitals and bases are of white marble; the architrave and frieze form together one block in height, each being 15 feet long, extending from centre to centre of the columns. In one of the two great niches at the back of the portico was placed the statue of Augustus, who would not permit it to be set up inside the temple, and in the other that of Agrippa; this is now in the Palazzo Grimani in Venice.

The ceiling of the Pautheon, if the superb

vault may be so termed, was formerly covered

with bronze, which was taken away by Pope Urhan VIII, (whose family name was Barberini), for the double purpose of making the four colossal twisted columns of the haldacchino, or canopy, over the high altar of St. Peter's and the cannon of the castle of St. Angelo, and this spoliation gave rise to the bitter taunt of the Pasquin of the day,

" Quod non fecerunt Barbari Romæ, fecit Barberini."

The columns of the portico are unfluted, differing in this respect from the uniform practice of the Greeks, and also from other examples of the Augustan age. Two great masters of their art, the divine Raphael, and the tender Metastasio, are buried under the pavement of the Pantheon.

From its name and dedication we may pre-

that the statues placed in the temple, and which were of bronze and silver, were those of the gods or deified emperors; that of Julius Cæsar was in the most conspicuous situation, and many emperors seem to have taken a delight to enrich it in a costly manner, and it is said to have been originally covered with silver tiles

The east front of the New Royal Exchange is an imitation of the portico of the Pantheon, with the omission, however, of some of the

internal columns, In noticing specimens of Roman magnificence in temples of the Corinthian order, we must glance at one, although it adorned the plains of Athens instead of the streets of Rome. This is the temple of Jupiter Olympius, of which now only sixteen columns remain,sufficient, however, to prove that the temple in its integrity, must have been the most splendid of all the sacred structures of antiquity, and only second in size to the temple of Diana at Ephesus, and a superb proof of the taste of the architect Cossutius, who commenced, and of the imperial Hadrian, who finished it. The temple, in which stood the masterpiece of Phidias, the statue of Olympian Jove, was surrounded by 148 columns, more than 6 feet Findas, the statue of Olympian Jove, was surrounded by 14s columns, more than 6 feet in diameter, and exceeding 60 feet in height. Many of the original columns were carried away by Sylla to adorn the temple of the Capitoline Jupiter, at Rome.

The other temples, of which remains still exist in Rome, have little to recommend in them for imitation. In the temple of Manly Fortune of the Ionic order, although the entais continuous, we see engaged or only half columns to the flanks; and Temple of Concord, the columns, also Ionic, are actually of different diameters. It is supposed to be of the time of Constantine, and is a restoration of an earlier building.

enjoyment of intellectual pleasure: there they met to hear and see represented the glorious works of an Æschylus, a Sophocles, or an Euripides. Confined entirely to dramatic re-presentations, we associate none but pleasing recollections with a Greek theatre, for the mur-ders committed therein were only of a mimic nature. But the very mention of a Roman amphitheatre calls up visions of or cruelty, slaughter, and ferocity, the more lamentable because the offspring of pastime, in which that mighty, but in many respects barbarous people indulged their appetite for spectacles, in those vast receptacles of crowding thousands, where

" The buzz of eager nations ran In murmur'd pity or loud roar'd applause As man was slaughter'd by his fellow man."

Julius Cæsar erected the first regular amphitheatre, which was of wood, whilst Statilius Taurus erected the first which was built of stone, although by some writers it is said that Pompey was the first who built in that material. Afterwards Augustus raised the theatre called after his much loved nephew, the early-doomed Marcellus-immortalized in the verse of Virgil;

"Heu miserande puer! si quà fata aspera rumpas, Tu Marcellus eris."—Æn. vi. 882.

But all the theatres, whether that built by Curio, which turned round on hinges so that two separate entertainments could be carried on at the same time, or that of the great Pompey, with its statues of celebrated male and female persons, or that magnificent one in honour of Augustus by Cornelius Balbus, or that of the Ædile Æmilius Scaurus, for 30,000 spectators, with its 360 marble columns, and 3,000 brazen statues, all fell short of the mighty structure which we are now considerand which in its vast circumference exhihits .--

'Arches on arches! as it were that Rome Collecting the chief trophies of her line, Would build up all her triumphs in one dome, Her Coliseum stands."—Byron.

It was built over the marshes of Nero, as appears from the lines of Martial :-

"Hic ubi conspicuè venerabilis amphitheatris erigetur moles, Stagna Neronis erant."—Epig, II.

The Emperor Vespasian demolished the golden house of Nero, and from the materials constructed the Coliseum, which was finished by his son Titus. It is of an oval form, the by his son 100s. It is or an oval form, the conjugate diameter being 620 feet, and the transverse 513 feet; the height is 157 feet, and it occupies a space of 6 acres. It is decorated with four orders of Roman architecture, the Doric, Ionic, Corinthian, and Composite, form-Doric, Ionic, Corinthian, and Composite, forming as many stories in height. Arches to the number of eighty are placed hetween the columns in each story; those of the second and third stories were originally filled with statues. Nothing can be better planned than the arrangement of the seats around the arrangement of the seats around the area, where levest dispract wars 327 feet and the whose longest diameter was 287 feet, and the shorter 180 feet. Rising in symmetrical rows, the seats were appropriated to the degrees of rank, the lowest being the most honourable. Next the podium, which separated the spectators from the arena, were the seats for the emperor, the senators, ambassadors, and persons of distinction; above these were ranged the equestrian order, the civil and military

In the upper rows were persons of inferior rank, and females; and above these again were the common people. In the seats and lobbies, and what we should term the standing-room, altogether, 109,000 spectators standing-room, amogenier, 109,000 speciators could find accommodation; yet so admirably contrived were the means of ingress and egress by the appropriate entrances without, all being numbered, and the numerous passages and corridors within, that the vast multitude could leave the amphitheatre without confusion or delay. Although open to the sky, yet at times an enormous velarium or awning was spread over the vast surface, supported on 240 masts or poles, placed on the Beneath the seats were ample vaults for the Many noble structures were raised by the different Cæsars, of which we shall only be able to notice a few. One of these was the largest building of its kind, the Coliseum, or amphitheatre of Vespasian. Among the relationship of the warious parts of the globe to which the amphitheatre of Vespasian. Among the relationship of the globe to which the Roman arms had carried their conquests, fined Greeks, the theatre was used for the

entertained the people of Rome with shows for 100 days, and 50 wild beasts were slaughtered each day; and battles on foot and in boats were represented by hired gladiators. Afterwards the ferocious nature of the Romans was gratified by contests between animals and men, and Christians were chiefly selected for this cruel and generally unequal comhat, and, lastly, man was pitted against his fellow. As Cassiodorus properly observes, "the people went with pleasure to see what human nature ought to have looked noon with borror."

ought to have looked upon with horror."
There is no doubt that much of the excellence of the antique sculpture was owing to the opportunities afforded to artists of studying the human form in the different games which, as the parties engaged in them were always naked, where thence called gymnastics. Two of the finest works of art which have been preserved to us are the "Fighting Gladiator," discovered at Antium, and the figure still better known under the title of the "Dying Gladiator," ascribed to Ctesilaus.

The gladiatorial combats, in which even emperors could sometimes take an active part,*

The gladiatorial combats, in which even emperors could sometimes take an active part,* were continued to the year 404, A.D., when a monk, Telemachus, rushing in to separate the combatants, was killed, and the inhuman shows were immediately abolished by the Emperor Honorius.

When it was abandoned for the purposes of display and spectacle, it seems to have been regarded as an exhaustless quarry for building uses, and accordingly we find that, among other palaces, the Farnese palace, erected by the nephew of Pope Paul III., and designed by Michael Angelo, was built almost entirely from the Travertine stone of the Cohseum, and so also was the palace of the Cancellaria, by Bramante. This spoliation was at length checked by Benedict XIV., who erected altars and a cross within the area, consecrating the place to the memory of the martyrs who perished in it during the persecution of the Christians. It is therefore at this moment very much reduced in size, and is, indeed, become

"A ruin—yet what ruin! From its mass
Walls, palaces, half cities, have been rear'd.
Yet oft the enormous skeleton ye pass,
And marvel where the spoil could have appear'd.
Hath it indeed been plunder'd, or but clear'd?"

Byron.

Every considerable town had it.

Every considerable town had its amphitheatre, in which the inordinate passion of the Roman people for spectacles could be gratified, and important remains are still to be seen of amphitheatres at Pompeii, at Pola, at Puzzuoli, at Capua, at Nismes, and Verona; this last is of very large dimensions, and in tolerable preservation, especially in the noble ranges of marble seats; and, if I recollect rightly, the Emperor Napoleon held spectacles within its walls. It was probably built either

within its walls. It was probably built either by Domitian or by Trajan.

We must now take some notice of another kind of building, and one peculiar to the Romans, who gratified their love of architectural splendour at the same time that they paid homage to the illustrious deeds of their imperial leaders, in the erection of triumphal arches. Simple at first, consisting only of one arch, with a statue placed above, by degrees these portals of triumph became imposing from their size and magnificence. At Susa we find that a triumphal arch, with the opening, was dedicated to Angustus: at Rimini was one in like manner to him. At Ancona, that in honour of Trajan, a fine example, has only one opening, as had the arch at Vicenza, a simple and elegant design; that at Beneventum, to the same emperor, is pronounced by Sir R. C. Hoare to be superior to any in Rome; and it deserves this commendation, and its name of Porta Aurea, and is supposed to be the design of the great Apollodorus, with whom the Emperor Hadrian even condescended to enter the lists as an architect, though met by the rebuke, more honest than courteons,—"Go and paint gourds," when he submitted a design from his own juveril beard.

and pane gourds, when he submitted a design from his own imperial hand.

The Arch of Titus at Rome is highly interesting from its association with the conquest of Jerusalem; it consists, also, of only one opening; it is built of the white marble of Paros, and had four columns on each front, of the Composite order—the first instance of its

application; the sides of the archway were decorated with bas-reliefs, in which are seen representations of the spoils of the Holy Temple, the golden candlestick of seven branches, the table of shewbread, the silvertrumpets, the cups (the symbol of the river Jordan), which were actually carried in the procession at the triumphal entry of Titus into Rome, and therefore we can well believe that the Jews will never pass under this arch, which must constantly remind them of the disasters which befel their fatherland.

At Verona there is a triumphal arch, called the Gate of the Lions, of two openings, the only example which occurs to me of this arrangement, and which was said by Palladio to be exceedingly beautiful, whilst of arches of three openings the specimens were very numerous. That of Trajan, in his forum at Rome, was barbarously stripped of much of its decorative sculpture to enrich the triumphal arch of Constantine, for the reason which Gibbon gives—"that it was not possible to find a sculptor in the capital capable of adorning the arch of Constantine," and therefore we see the glaring discrepancy of bas-reliefs commemorating Trajan's defeat of the Dacians placed on a building erected in honour of an emperor who lived so long after him.

The arch of Constantine, like that of Septimus Saverus both et Essentiat of

The arch of Constantine, like that of Septimus Severus, both at Rome, consists of three arches, that in the centre being considerably wider and higher than those at each side. In these structures we see departures from the simplicity of the Greek school, in the entablature broken over the columns, and in many other respects, as the coupling of columns, and placing them on stilted pedestals, confused and redundant mouldings.

Noble arches of three openings were raised

Note arches of three openings were raised in many of the provinces, one at Orange, called the arch of Marius, a good composition; at Rheims are the remains of one which appears to have three equal openings, not a common arrangement, and in the city—little known, but wonderfully rich in architectural ruins—of Geraza, in Palestine, a spiendid arch of triumph

of three openings leads to the principal street. Another specimen of magnificent commemoration is the lofty single column erected to the emperors, a mode of honouring the memory of departed greatness, which has much imitation in modern times, although its architectural propriety is very questionable. The first which we shall notice is the column of Trajan, which rose in majestic dignity from the midst of his forum, the pavement of which is discovered to be 15 feet below the level of the modern streets; this forum was 180 feet wide, and was divided into five avenues by four rows of columns, traces of which have been found, and it is believed that the whole of this forum was under cover, and paved with squares of different marbles, viz., white, veined, giallo antico, and pavonazetto. In the centre stood a noble equestrian statue of Trajan, and on the top of the porticoes were statues and military ornaments, whilst the forum was surrounded by a library, a basilica, and a temple, the triumphal arch heigreen the favilty side.

by a library, a basilica, and a temple, the triumphal arch being on the fourth side. Apollodorus designed this column, and we may presume its surrounding accessories, in honour of him whom Byron calls

"The last of those who o'er the whole world

reign'd
The Roman globe, for after none sustain'd,
But yielded back his conquests."

This superb object is, with its pedestal, of white marble: the latter is 17 feet 11 inches high, and the column is 97 feet 9 inches; the lower diameter is 12 feet 2 inches; the order is Doric; it is fluted a few inches at top and bottom, the rest of the shaft being entirely covered with sculptured figures, which proceed in a spiral direction from the base to the capital, commemorating the exploits of Trajan in his different expeditions: there are but nine-teen blocks in the column.

teen blocks in the column.

The Antonine column was erected by the Emperor Marcus Aurelius, in honour of the victories obtained over the Germans, Armenians and Parthians, and dedicated to Antoninus Pius. It stands in the square, which is from it called the Piazza Colonna. In height it is only 6 inches less than that of Trajan, but its diameter is nearly a foot more at the base, whilst the upper diameter is only 1 inch less than the lower diameter of Trajan's pillar, consequently its proportion is not so good.

Including the pedestal, which is loftier than that of the other column, the Antonine pillar is 123 feet. It is also sculptured in a spiral direction, with figures in imitation of the other column. On each of these pillars the summits had statuces of the emperors, to whose honour they were raised; these have been superseded by figures of saints: that of Trajan has given way to St. Peter, whilst St. Paul has displaced the Emperor Aurelius, whence the sarcasm of the noble poet,

"And apostolic statues climb
To crush the imperial urn whose ashes slept
sublime."

The column of the Emperor Phocas is a simple Corinthian fluted column, about 4 feet in diameter, and its whole height, including the pedestal, is 54 feet.

By way of comparison, we may remark that the single columns erected in England, if not so decorated as those in Rome, yet carry off the palm in respect of size. Nelson's column, at Yarmouth, of the Doric order, is 144 feet high; but the column in London, called the Monument, by Sir Christopher Wren, is 202 feet, or nearly 80 feet higher than the Trajan and Antonine pillar, whilst its diameter is 15 feet, and being fluted throughout, this noble pillar, the finest in the world, has a greater air of simple grandeur than its Roman rivals; and I may here remark that the Duke of York's column, in Waterloo-place, has a very cold and naked appearance, from the absence of flutings in the shaft,—this is the more to be lamented since the situation is so fine.

The edifices we have lately noticed were the offspring of the vanity and love of display of the Romans; but there were others in which, though these qualities may also have had some share in instigating the erection, we must also admit their usefulness—these were their bridges, their aqueducts, and their baths. For the former the arch was a mighty invention, for which we cannot be too grateful to the Romans, who seem to have had as splendid notions in bridge-building as in all other instances. Trajan threw a bridge, designed by Apollodorus, over the Danube, whose piers were 150 high whilst the arches were 170 feet wide, and the hridge itself was 60 feet in width and upwards of a mile in length. This was destroyed by Hadrian, it is asserted, through jealousy of his imperial predecessor.

Quite as wonderful as noble works of art were the aqueducts, of which there were several to supply Rome. The first was built by Appius Cæcus, whose name has been immortalised by the splendid road called, after him, the Appian way—which has been appropriately called "the Queen of Roads."*

called "the Queen of Roads."*

The second aqueduct was constructed by the censors Papirius Cursor and Curius Dentatus, and the water was brought from a distance of more than 20 miles. The Aqua Julia and the Aqua Virgo were introduced by Agrippa, that munificent benefactor of the Roman people. The purest water was that brought in by the aqueduct of the Pretor Marcius from Subiaco, of which Pliny says, "We may esteem this water for one of the greatest gifts that the gods have bestowed upon our city." To its agreeable coolness, Statius alludes,

" Marsasque nives et frigora ducens Marcia."

The aqueduct introduced by Augustis was chiefly for supplying water for the sea-fights which he had formed in the fourteenth region.

The last aqueduct was the work of Caligula, and finished by Claudius, after whom it was called.

The eight aqueducts by which Rome was supplied were carried over valleys by tiers of arches, two, three, and four in height, or brought through hills; and in some of the provinces the aqueducts are really astonishing works of construction. The celebrated Pont du Gard, where it crosses that river, is 160 feet high, with arches in three tiers, some of which are 60 feet wide and 70 feet high. That of Nismes is another famous work, and believed to be the production of Agrippa when he was governor of that city, and even now rich in Roman remains, of which the famous Maison Carrée is a noble instance.

The time would fail to speak of the other works which were raised by Roman wealth and enterprise. Of much that has been described we have now only ruins, so that old Tiber

indeed flows "through a marble wilderness." We have not time to speak of that "stern round tower of other days," nor of

round tower of other days, "nor of "The mole which Hadrian rear" don high, Imperial mimic of old Egypt's piles." T—Byron. We have not time even to glance at the \$50 baths, the 300 palances, the basilicas, the forums, nor at the domestic architecture of the forums, nor at the domestic architecture of the Romans, as made clear to us in the buried. cities, Pompeii and Herculaneum; but we must always feel unbounded admiration at the genius of a people who have left behind them such records of their power,—whose noble roads and walls we find even yet in Britain, the ultima Thule of their conquests; whose arches and pillars are to be seen in Africa; whose whose

"Temples, palaces,—a wond'rous dream,
That passes not away, for many a league
Illumine yet the desert."—Rogers.

And still gleam in Tadmor, in the wilder-ness, and Geraza in Palestine, relics of that Rome, who, if she conquered the world, also diffused with liberal hand the blessings of peace in works of usefulness and beauty.

" She who was nam'd Eternal, and array'd Her warriors but to conquer—she, who well'd Earth with her haughty shadow, and display'd, Until the o'er-canopied horizon fail'd, Her rushing wings."—Byron.

And if, in the song of the Italian peasaut

" Roma! Roma! Roma! Roma non è più come era prima,"

we hear the mournful dirge of a mighty race, we, who have still their wonderful works to gaze upon, must feel gratitude to those great spirits of the past, who, in their architecture, have raised up immortal trophies of their enterprize, their dominion, and their taste, and bequeathed them as a rich legacy to after ages. G. R. French.

BUILDERS' BENEVOLENT INSTITUTION.

WE would direct the attention of our readers to the circumstance, that the anniversary dinner of this valuable institution is fixed for Wednesof this valuable institution is fixed for Wednesday, July the 18th, and wewould, further, solicit them to assist in the objects of the institution. The Earl of Carlisle has promised to take the chair, and the advertisement in another column shews that the list of stewards is already very strong and influential. We are disposed to anticipate a brilliant mecting.

Some alterations have been made in the laws, with the view of enabling the committee to grant pensions sooner than was at first proposed, and they hope before long to get into work. We sincerely wish them success.

It is worth noting, as supplying a sign of

It is worth noting, as supplying a sign of the times, that to fulfil the duties of secretary to this institution, which demand the whole time of the officer, and are paid for by a salary of 50t, per annum, the committee had no less than 105 applicants.

AMENDMENT OF THE BUILDINGS' ACT.

At a meeting of the Carpenters' Society, held on the 30th ult., Mr. Nesham, the president, in the chair, it was resolved, "That owing to the uncertainty which prevails as to the progress of the intended New Buildings' Bill, the president be requested to address a letter, on the part of the society, to the Earl of Carlisle, representing the urgent necessity for its introduction during the present session of Parliament." A letter has been accordingly addressed to his Lordship, and it is to be hoped that the new Bill will be no longer delayed. The seventy-fourth anniversary dinner of this old established society is about to take place. a meeting of the Carpenters' Society, to take place.

THE PARIS Exposition was opened on the 4th inst., and comprises 4,500 exhibitors. The building is 800 feet long and 350 feet wide, containing three courts, one of which is filled with metal work, chiefly cast-iron and zinc. The erection of the building alone is said to have cost 36,000L, but this seems scarcely credible.

CARVED STALLS FROM FIEZOLE, TUSCANY.

[16TH CENTURY.]

CARVED STALLS FROM FIEZOLE, TUSCANY

THE stalls in the cathedral of Fiezole were executed in the sixteenth century, and are good specimens of the art of that epoch. We give a representation of one division from a drawing made purposely for us. The heights are figured in inches.

The sketch added by our artist in the lower part, appears to represent the disposition of another portion of the stalls, but is not clearly

NOTES IN THE PROVINCES.

A NEW stained glass window has been presented to Ely Cathedral, by Mr. Warrington: subjects, the Nativity and the Annunciation. It is put up near the font.—Halstead old church is now, it seems, about to be repaired. Estimates have been got, and the requisite means, it is thought, will be provided altogether by voluntary subscription. In the ingesther hy voluntary subscription. In the ingester hy voluntary subscription. gether by voluntary subscription. In the in-terior the pews are to be replaced by open benches.—The Independents are about to build a new college in St. John's Wood, in the build a new college in St. John's Wood, in the place of the Homerton, Highbury, and Coward Colleges, the sale of the two former of which was lately announced.—The yearly receipts at the Canterbury Museum, since the charge was reduced to one penny, have been double the amount realized when the charge was sixpence.—Some large factory buildings have been erected at Northam, by Mr. Gambling,

builder, for Messrs. Summers, Day, and Baldock, steam engineers and boiler makers, who already possessed an extensive series of factories, shops, &c., there. The slate roofing of the new erections alone comprises 500 slaters' squares of 100 square feet to a square. It includes foundries, smith's shops, turning factories, &c. The blasts to the whole are produced by two fans, making 1,270 revolutions a-minute, and these, with the lathes, &c. are worked by a steam engine of 10-horse power. Northam is now all new hricks and mortar: the river side path is covered with factories. Northam is now all new bricks and mortar: the river side path is covered with factories.—
St. Mary's Church, Truro, is re-opened. The pews have been replaced by low open seats of oak, with ornamented ends. The passage-flooring throughout is laid in patent tiles of warm colouring. The organ has been removed from the nave gallery to the western arch of the north aisle, a portion of the north gallery having been taken away to make room for it. A western window of stained glass, it is said, will be provided in connection with alterations in that part of the church.—A new church is in contemplation for the hamlet of Charlton, parish of Downton, Wilts, at an estimated cost (including a sum for repairs) of about 1,250f.
The endowment has been provided conjointly

^{*} The tomb of Cecilia Metella, called Capo di Bove. † Now the castle of S. Angelo.

-The foundation stone of the new free grammar school of Queen Mary, at Walsall, was laid on Wednesday week. The building will have two fronts, one to Lichfieldstreet, the other to Littleton-street, and will be built in the light Elizabethan style of the Sonth Staffordshire railway station at Walsall, and composed of brick, with stone facings, from a design by Mr. Edward Adams, of Westminster, architect. In addition to the school will be houses for the head master, second master, and master of commercial department. Mr. J. Highway, of Walsall, is the builder.—An Odd Fellows' Hall is now in progress of building in Temple-street, Birmingham: architects, Messrs. Coe and Goodwin, Lewisham; builders. Messrs. Branson and Charles beilders, Messrs. Branson and Gwyther. Amount of contract, with commission, 2,600l. It will consist of a suite of rooms for secretary, library, and reading-rooms, cloak-rooms, &c. The stones for the Leichter and scholl of design are also about to be opened.—The founda-tion stone of a methodist chapel was laid at Kingswinford on 29th ult. The design of it is by Mr. Robinson, of Stourbridge, architect,by Mr. Robinson, of Scourbridge, arcmet.

On Saturday week the foundation stone of a
new church was laid at New burgh, near Wigan.
The Earl of Derby pays the cost of this
and another about to be built in that quarter.

The foundation stone of another church was laid at Clayton on 29th ult. It is to be dedicated to St. John the Baptist, and has been "talked about for thirty years last past," according to the Leeds Intelligencer. The site has been given by Mr. John Hirst, of Clayton House. Messrs. Mallinson and Healey are the architects. The edifice is to consist of a west tower, nave with clerestory, and aisless and chancel, and to accommodate 800 persons. The dimensions are to be as follows:—tower: dedicated to St. John the Baptist, and has The dimensions are to he as follows :- tower; The dimensions are to he as follows:—tower: height, 67 feet; east to west, 20 feet; north to south, 20 feet. Nave: length, 70 feet; breadth, 20 feet. Aisles: length, 86 feet; breadth, 10 feet. Chancel: length, 29 feet; breadth, 18 feet. It is to be in a style of what the vicar calls 'decent simplicity,' a—willage church devoid of ornamental decorations; the pecuniary means at the disposal of the architects being apparently very limited.—Of the sum requisite to the crection of a corn exchange, as site to the crection of a corn exchange, as designed at Gainsborough, namely, 4,000*l.*, scarcely a fourth can be mustered, and there is some talk of converting the theatre into a substitute for the new structure.

SCENERY.

HER MAJESTY'S THEATRE.

THE production of Mozart's immortal opera, The production of Mozart's immortal opera, "Don Giovanni," at her Majesty's Theatre, having been long contemplated, and delayed by the "Lind rage," Mr. C. Marshall was enabled to give more time and thought to the preparation of the scenery for it than is usually the case, and has succeeded in pro-ducing a very fine work. The locality is ducing a very fine work. The locality is Spain, and Spain, accordingly, he has de-picted; but, in order to obtain variety, he has assumed that Giovanni occupied palace erected during the dominion of the Moors. The fifth scene of the first act—the hall of the pulace illuminated for the ball,—and the last scene of the second act, are accordingly Moresque—Alhambra-ish,—capitally drawn and brilliantly coloured.

The opera is altogether produced with great completeness.

ROYAL LYCEUM THEATRE.

The second scene in the successful comedietta, "A Wonderful Woman,"—a view of a French road, tree-bordered,—is a charming piece of landscape painting, by Mr. Beverley.

NEW WING OF LICENSED VICTUALLERS NEW WING OF LICENSED VICTUALLERS ASYLUM.—His Royal Highness Prince Albert laid the first stone of the addition to the Asylum, which is to be called "The Ladies' Wing," on the 2nd instant. It is to cost about 4,0001. We were not present on the occasion; and if the statement forwarded to we have greated by the little present prepared the us be correct, have little reason to regret this, small courtesy having been shown to those gentlemen connected with the periodical press who took the trouble to attend.

COST OF SEWERS IN CHESTER.

The streets marked thus * are in rock.

The tenders marked thus † were accepted, founded upon a schedule of prices (at per linea yard), and including excavation.

CHURCH ARCHITECTURE.

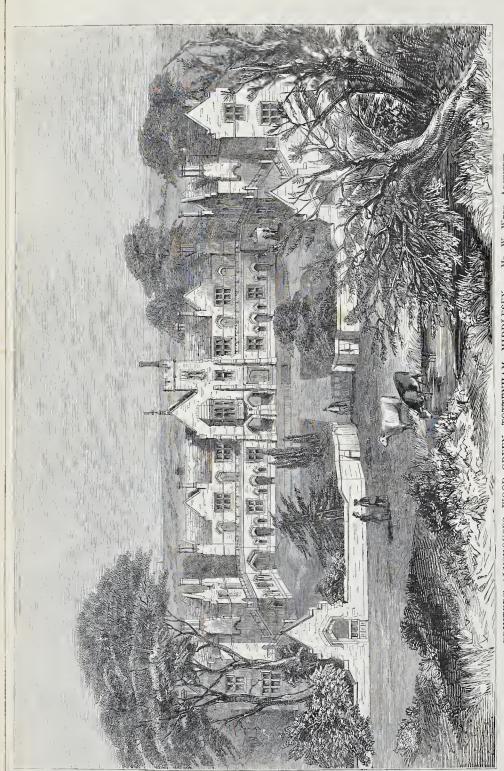

AT the opening of Thornbury Church, At the opening of mornoury course, Gloucestershire, recently restored, as already mentioned, under Mr. Niblett,* the Rev. George Madden, the rural dean, said in the course of his sermon—"We should recollect the purposes for which we build churches. We should make them suitable for Christian worship. We should make them in all their design, arrangeshould make them in all their design, arrange ments, furniture, and ornaments, such as may meet the requirements of devout members of Christ's church, who desire to meet together for public worship. We should recollect the various parts of Christian worsbip-confession, prayer, praise, preaching, and administration prayer, praise, preacing, and administration of the sacraments, and we should make our churches, in all their parts and arrangements, suitable for these holy purposes. Whatsoever is calculated to remind us of our faith and of our duty—whatsoever is calculated to excite feelings of awe, and reverence, and devotion—whatsoever is calculated to halp us in regions. whatsoever is calculated to belp us in raising our hearts and thoughts to God—that should meet our eyes when we enter into the House

We all know, brethren, that God will hear a Christian's prayer at all times and in all places. From our beds and from our fields from the shop—from the market—from the highway, may prayer rise acceptably to the Throne of Grace. The poor settler, in the wild forests of America, may rest from his work, and kneel down and make his voice to be heard on high, as easily as the queen of this local in a supplied to the control of the control o land in our nohlest cathedral; but still both reason and piety teach us that whatever we offer to God should he of the best which our circumstances will enable us to obtain. David refused to offer unto God that which cost him nothing. Let all church building and church nothing. Let all courch building and courch restoring be carried on in the same excellent spirit. Next, as to the internal arrangements of our churches. The time will not allow me to notice many, but I will say a few words concerning the chief. Our Lord commanded his apostles to go and teach all nations, haphis apostes to go and teach all nations, pap-tising them in the name of the Father, and of the Son, and of the Holy Ghost. In every church, therefore, the first object which should meet the eye upon entering is the font. It is placed generally near the principal entrance, to signify to us that by baptism we enter into the church, and that until we have been bap-

tised we are unfit to join in Christian worship: it should be raised somewhat higher than the ordinary seats, in order that every one may see infants baptised, and thus be reminded of his own Christian profession, and urged to live according to it, and it should be large enough to allow of an infant being baptised hy immersion,—because though, in this cold climate, the practice of the church is generally to bapby sprinkling (which is doubtless sufficient), yet if any one is scrupulous upon this point he may have his scruples satisfied, and no unnecessary stumbling-block thrown in his way.

Next, at the entrance of the chancel, either in it or near to it, should be seen the prayer-desk at which the minister is to stand or kneel in leading the devotions of the assembled congregation. Among those objects which constitute Christian worship, and for which we assemble ourselves in the house of God, areconfessions of sins, confession of faith, prayer, praise, thanksgiving. In these, the office of the minister is to lead the congregation, not to the minister is to lead the congregation, not of pray to thein, or for them (himself alone), but with them. Prayer and praise is addressed to God by the whole congregation; and though the minister alone utters the words of the prayer, the whole congregation are to join mentally, and make it their own by saying Amen at the end of it. In many churches, especially small ones, where there is no objection on the ground of hearing, the prayer-desk may be turned to the east end of the chancel, or, at all events, not towards the people, in order to remind us not towards the people, in order to remind us that our prayers are addressed to God by all, both minister and people,—that they are not what the congregation are merely to sit and listen to, but to join in and offer up, on their knees, as their own humble supplications before the throne of God. The pulpit, on the contrary (which is generally placed near it), is invariably turned towards the congregation, because the sermon is an address to the congregation. When a person speaks to others, he naturally turns to them, so that he may best be heard by them. On this account the pulpits in our churches are generally raised pulpits in our churches are generally raised somewhat higher than the prayer-desks, and are so placed that all present may best hear the words spoken,—not unnecessarily high, so as often to exalt preaching above prayer and the sacraments, and to encourage the notion (which is, alas! too common among ignorant (which is, atas! too common among ignorant persons,) that the sermon is the most im-portant part of the service, but sufficiently high, so as best to answer the purpose in-tended, and to give to preaching its due place tended, and to give to preaching its due place and importance among the ordinances of Christ's Church. The communion-table is allowed by the rules of the church to be either in the body of the church or in the chancel, but it is almost universally placed at the east end of the chancel. The receiving the holy communion of Christ's body and blood being the highest mystery of our faith, and the most solemn religious act which we can perform solemn religious act which we can perform, it is natural and reasonable to choose for its administration the more quiet and sacred part of the building, designed especially for that sacred purpose."

^{*} The author of the "Church Goer," an interesting series of papers published in the Bristol Times, says,—" Thornbury church is one of the most aucient in the neighbourhood, and pattern at long time previous to the Reformation in the pattern at long time previous to the Reformation in the pattern at long time previous to the Reformation in the pattern at long time previous to the Reformation in the pattern at long time property of the pattern at long time previous the pattern at long time pattern at long t

PRINTERS ALMSHOUSES, WOOD GREEN, TOTTENHAM, MIDDLESEX .- MR. W. Webb, Architect.

PRINTERS' ALMSHOUSES, WOOD-GREEN, TOTTENHAM, MIDDLESEX.

THE working printers of the metropolis, as a body, are a thinking, well-informed, and sensible set of men. "Who slays fat oxen" need not "himself be fat," but be who ponders over and communicates the best thoughts of others, possessing too the amount of preparatory education which the occupation requires, may well be expected now and then to get some good thoughts of bis own, or at all events to have his comprehension enlarged and

his perception sharpened.

It was reasonable to expect that amongst men of this class a desire would grow up to provide for such of themselves as should be stricken by misfortune, a refuge in their old age,—and such was the case. For several years past accordingly a committee has been at work with this object in view. The master-printers approving their intention afterwards lent their aids (Messrs, Baldwin, Clowes, Cox, Hansard, R. Taylor, and other of our most Hausard, R. Jaylor, and other or our most influential printers, are amongst the subscribers), a plot of ground at Wood Green, Tottenham, has been purchased, and on Monday next the Right Hon. Lord Mahon,

M.P., president of the Society of Antiquaries, will lay the first stone of the proposed Asylum. Connected as we are with printers, and knowing, moreover, that they are eminently entitled to the consideration of all classes, we feel a pleasure in calling the attention of the public to the claims of this institution.

Annexed we give a view of the proposed building, designed by Mr. Wm. Webb, architect, and which is to be erected by Mr. Roherts, builder, for the sum of 1,7501.

The building is intended to accommodate twelve persons; it is to be in the Tudor style of architecture, and will be effective and pictures que in its character. The foundation stone will form a large buttress in the centre of the building, under the bow-window, bearing the name of the institution and the arms of Lord Mahon. On the ground-floor of each house two rooms and a scullery will be provided, namely, a sitting-room in front about 12 feet square, a bed-room about 11 feet square, and scullery about 9 feet square, with other conveniences: and the same on the floor above. Eac will he 10 feet in the clear height. Each floor will be a separate entrance to each person's apartments, the upper floors having their entrance by means of an external gallery with iron railing in front, and steps at each end. This gallery will have the advantage of not only affording separate entrances, but can be used as a terrace for exercise, similar to that on the ground-floor, on which the building will stand elevated about 4 feet. All the doorways on the ground-floor will have a

comfortable seat on each side, under cover.
The centre building will contain a large room, with a bow-window and open roof, the latter stained oak colour, to be fitted up and used as a library and general meeting-room. This will be approached by a staircase in the This will be approached by a staircase in the old style, in the tower adjoining. On the right there will be a secretary's or waiting-room, and stairs leading to top of tower, with other conveniences. On the ground-floor will be an open hall, with a lavatory, the open hall being used to disstores, &c.,-the open hall being used to dis-

tribute coals, &c., to the inmates.

The whole of the buildings, front and back, are to be faced with red bricks, with darkcoloured mortar, and Bath-stone dressings (mullions, jambs, quoins, plinths, strings, and copings), and roofed with the Delabole slating,

of a greenish colour.

On the other side of the road stands the Fishmongers and Poulierers' Institution, for a similar benevolent purpose, and which was designed by the same architect. The two buildare separated by the village church, and will, when complete, form a very pretty whole. Each person in this latter institution has a house to himself, sitting room and scullery on the ground floor, and hed-room on the first floor; the whole of the principal rooms being in the front.

Confining ourselves, however, to the printers, a few years ago much stir was made ing a monument to the memory of William

Caxton, as the first English printer, but although many subscriptions were announced, no definite result ensued. Now, here, we think, is an admirable opportunity for the suhscribers to that monument to carry out their views. A large plot of ground in front of this institution is unappropriated; it will be devoted to an ornamental arrangement of shrubs, unless the aforesaid subscribers to the monuto an arrangement for placing a statue of William Caxton in front of the alms-houses designed for the needy professors of the "divine art" which he was the means of introducing into England. Or, what would be better still, let the funds subscribed be applied to double the number of almshouses proposed to be built, and endow them as

The Carton Asplum.

We commend this suggestion to the consideration of all parties concerned.

Our sympathies are enlisted in the cause of the printer, and we shall be glad to be the medium of conveying any subscriptions from our readers, to aid the committee in the prosecution of their object.

LONDON ANTIQUITIES AND THE CORPORATION.

I AM sure any lover of antiquities will feel grateful to Mr. Tite for his services in securing for the Guildhall the fragments of Roman vases and other objects found on the site of the new Royal Exchange. I cannot say museum, for it would be absurd to dignify a merc cupfor it would be absurd to dignify a merc cup-board by such a title, or to designate a few cases of relics from a few yards of the great area of the city as "antiquities illustrative of Roman London."

Neither, while I thank Mr. Tite for saving some scraps from the general wreck, can I admit that our citizens have ever been mindful of their antiquities. They never knew aught about them, or cared to know. I am anxious to read the answer to the questions put to Mr. Tite by "A London Antiquary;" and, at the same time, I should like to know whether, within the last few years, a most valuable series of documents relating to the management of the city property hy Henry IV. was not sold out of the Guildhall as waste paper? Secondly, whether the Common Council did not give up the ancient wall on Tower-hill to be pulled down? And, thirdly, I should like to be informed by Mr. Tite where all the antiquities discovered in making the approaches to new London-bridge are de-

Mr. Tite accuses public opinion of wronging the Corporation. Let these three questions be fairly answered, and we shall then be better able to judge whether Mr. Tite or the general voice be correct.

I am also sorry to see the name of Mr. Thomas Lott, F.S.A., omitted in Mr. Tite's brochure. To him, and to his dauntless perseverance, is owing the grant of the trifling sum which the corporation have given for this apology for a museum. And, last, not least, how could Mr. Tite avoid montioning the tesselated pavements discovered near the Royal Exchange, and excavated and deposited in the British Museum by the late Mr. Moxhay, or rather, at his private expense? In fact, every object of ancient art that has been preserved has been saved by individual exertion, and not by any provident care exercised by the corporation,—except, perhaps, the few remains found ration,—except, perhaps, the few remains found on the site of the Royal Exchange.

AMOR VERITATIS.

SOLUBLE GLASS .- What is called soluble glass is now beginning to come into use as a covering for wood, and other practical pur-poses. Some of our clever artisans may like to experiment upon it. It is composed of fif-teen parts of powdered quartz, ten of potash, and one of charcoal. These are melted together, worked in cold water, and then boiled with five parts of water, in which it entirely dissolves. It is then applied to woodwork, or any other required substance. As it cools it gelatinizes, and dries up into a transparent colourless glass, on any surface to which it has been applied. It renders wood nearly incombustible.—New York True Sun.

RAILWAY JOTTINGS

THE works on the Direct Northern line, in the neighbourhood of the metropolis, are progressing rapidly towards completion. The line as far as the Caledonian-road, above the Caledonian Asylum, has been excavated, and a bridge is constructed across the railway on a line with the Caledonian-road. Above 100 men are now employed on Copenhagen-fields, under which a tunnel will be formed several hundred yards in length, to the Regent's Canal, passing under Maiden-lane. For this purpose three shafts are in course of formation, at equal distances from each other. Between Hollowayroad and the Seven Sisters-road, an embankment is being raised, the materials being sup-plied from extensive cuttings between Hornsey Wood House and Wood Green. The line after passing under Copenhagen-fields and Maiden-lane, will be taken under the Regent's Canal, and it is intended that the water of the canal shall be carried by an iron viaduct over the railway.—The great tunnel on the Leeds and Thirsk line, under Bramhope-ridge, which has been in progress since November, 1845, is so far completed that a locomotive and train passed through it on Thursday week passed through it on Thursday week with some of the Directors, Mr. Bourne, the Company's engireer, and others, among whom were Mr. Bray, the contractor; Mr. Watson, the contractor's engineer; Mr. Champion, the contractor's superintendent of tunnel works; Mr. Nachar the companying residuate works. Naylor, the company's resident engineer; Mr. Thornton, contractor for the Leeds contract, &c. The tunnel was designed originally to be two miles in length, but the 'greasy' nature of the ground has induced its extension 200 yards further. There were nineteen working shafts sunk, besides four permanent ones. Where deepest, almost under Bramhope village, three of the working shafts were sunk, over and ahove the number originally designed, on account of obstacles to progress arising from an influx of water. The dehris is not yet all cleared out, but the whole will be completed during the present month. The interior is being sheathed with galvanized iron where the water oozes, out to any extent. This line of railway throughout will be opened in the autumn.—The opening of the Burnley branch of the Lancashire and Yorkshire is retarded by another earth slip at the Holmes Chapel tunnel. This last fall has rendered Chapel tunnel. This last fall has rendered fruitless the labours of many months. The fall was so sudden that the men had to leave their working implements behind them in escaping with their lives.—
It is only of late years, says the Gateshead Observer, that Whitsuntide has been much observed at Stockton as a holiday. But the Stocktonians—and, indeed, Englishmen generally—are becoming more of a holiday-making neonle. Thanks, nartly, to the railways, which people. Thanks, partly, to the railways, which afford the means of rational, healthful enjoyment—and where should the advantages conferred by steam locomotion be enjoyed, if not at Stockton, the birthplace of the passenger railway? This year, on Whit-Monday, the town was turned inside out. Nobody was at home but the letter-carrier and the town-pump. The iron horse ran off with the inhabitant is all disasting to the property of the passenger railway? pump. The iron horse ran off with the inhabitants in all directions—to Ripon and Studley Park—to Redcar and Kirkleatham—to Scaton and Hartlepool—to Durham, Sunderland, Newcastle, &c. Though the rail in truth, even while saving so much of our 'valuable time,' makes most of in soccasionally grudge still more the loss of the smallest portion of that precious saving which now offer reaches. that precious saving, which now often renders harely possible what heretofore was not to be seriously thought of at all, it is pleasant indeed to think that nevertheless it is thus begetting such a national disposition to expend a little of its own wondrous savings in healthful holiof its own wondrous savings in heating non-day recreation to the people at large, whose life of lahour so much requires it, even for the sake of that labour and their power to sustain it with spirit and profit to all.—The Shrop-shire Union line of railways has been publicly opened. This line will now enable a pas-senger to take his seat at Euston station and reach Shrewsbury direct (160 miles), by express train, in five hours. The Union line is 30 train, in five hours. The Union line is 30 miles long from Shrewsbury to Stafford. The total cost of it has been 500,000l. It is to be worked by the London and North-Western.
—Some of the leading Staffordshire ironmasters bave had an interview with the North-

^{*} Although not to the extent which may yet be hoped for. † Our readers will remember that there was a startling difference in the amounts of the tenders sent in by builders.

Western authorities as to the manufacture of metal for the rails. The ironmasters undermetal for the rails. The ironnasters under-took to guarantee their rails for two years, and to institute a series of experiments for the purpose of producing iron of a quality hest suited to the wear and tear of railway traffic. —It appears from a return of French rail-ways that the artipress period for the railways, that the estimated cost of constructing eighteen lines amounted to 927,410,000 f. (37,096,4001.), of which thirteen were estimated to cost 624,110,000 f. (24,964,400L), and it has since been ascertained that they will cost has since been ascertained that they will cost \$49,422,000f. (33,976,850l.), being on the average 36 per cent. above the estimates. Some of the lines cost hetween 60 and 75 per cent. above the estimates, while others cost no more than from 2½ to 16 per cent. above the sum specified. Two of the lines were completed within the estimates—viz.: the Paris and Rouen, and Boulogne and Amiens.

ELECTRO-TELEGRAPHIC PROGRESS. ANOTHER matter-of-fact proof of what the telegraph can do, and ought to be now daily doing, together with the co-operative aid and expedition of the press, has of late occurred in the transmittal to London of a verhatim report of a public meeting at Liverpool, held on 18th ultimo, from two till four o'clock, p.m.,

on 18th ultimo, from two till four o'clock, p.m., and in which ten speeches and four resolutions were read and reported, besides a petition. The whole, by piecemeal, was reported, transcribed, dispatched, telegraphed, re-writen, type-composed, corrected, printed, and published in London, hy the Shipping Gazette, at thirty-three minutes post four o'clock—the very hour when the proceedings closed at Liverpool, 200 miles across the country.* pool, 200 miles across the country.3

COMPETITIONS.

Restoration of Bridgewater Parish Church.

We learn that the committee appointed to adjudicate upon the designs sent in for the restoration of this parish church, have decided in favour of those bearing the motto "Suum Cuique," and which prove to he the production of Messrs. Dickson and Breakspeare, of Man-

chester.

Bedford Corn Exchange.—Forty designs were received and the committee have selected one by Mr. Abbot. The style is Italian.

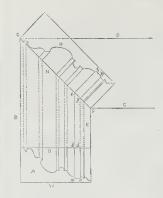

For laying out Ground at Coventry.—Correspondents complain of the length of time which has clapsed since these plans were sent in and that to design has been page. in, and that no decision has been announced.

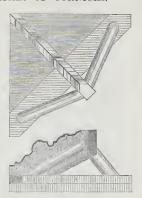

in, and that no decision has been amounced. Asylum for Aged Governesses.—The new asylum erected for this purpose in Kentishtown will be opened on the 12th, with a fancyfair in aid of the building fund. The object is a noble one.

fair in aid of the building fund. The object is a noble one.

* What a pity it is that while thus doing all due justice to our really magical 'electro-telegraphic progress,' truth compared to the progress of the progress o

MOULD TO RUN THE MITRES OF CORNICES.

MOULD TO RUN THE MITRES OF CORNICES.

HAVING had occasion to complain of the imperfect manner in which plasterers finish mitres in moulded cornices, &c., I was led to seek for a remedy in the form of a mould that would run them perfectly, in lieu of the old system of hand-working; and, as you are always ready to give publicity to any thing advantageous to the huilding classes, I beg to submit the inclosed sketch and explanation for a mould, beset that will run a moulding at mould, horsed, that will run a moulding at right angles, and leave the mitre as perfect as any other portion of the work. Another advantage it has is a great saving of time, as, instead of taking off the mould at the mitre (according to the old system), it is taken off in the straight part of the work and finished with a small kinnt mit the correct families. with a small joint rule, the same as floating a plain piece of work, as the moulding each side of the vacuity would form a screed for the rule to work against.

The first thing to be done is, to trace the required mould from the given mould at the angle you wish, in the same manner as an angle hracket is traced. But as the generality of plasterers are but little acquainted with geometry, it may not he out of place to show the method for laying down a section of the given mould (which lays no claim to architec-tural beauty, but merely to illustrate the suh-ject), and tracing the mould required for a

right-angle from it.

Let A be the section of the given mould, Let A be the section of the given mould, and from it draw the line B at pleasure, and on the line B erect the perpendicular D, then from the section A draw the line E parallel to B; on the line E erect the perpendicular C the same distance from D as E is from B; then connect the angles F G with the line N, which will be the mitre line; draw the line O parallel to W, then draw the lines ab, ca, &c. to the line N, but parallel to E B; on the line N erect perpendiculars, and make rf, gh, &c., equal to ab, cd, &c. (the more lines drawn, the nearer truth will be the moulding required. required.

The mould thus traced is then horsed at a right-angle mitre, on a double horse, forming a right angle, as the lines B, G, D, and the mould is in the same position when horsed as the line N stands with the lines B, G, D: the sketch P is the plan of a mould horsed and R the elevation.

Before commencing to run the moulding, the running rules must be fixed on each side of the mitre, so that when the mould is run up at the mitre the rule on the other wall is in up at the mitre the rule on the other wall is in its place to take the mould along the wall, and to finish the mitre, and on any part of the wall take off the mould and turn it; then it will he in its work for the next angle, those heing the places that I before mentioned that will have to be finished with the joint-rule. For running external angles there must be a stop fixed to the running and at the mitre, to keep fixed to the running rule at the mitre, to keep the mould from cutting the "throats" of any undercut mouldings.

It must be understood the above mould will only run a moulding at right angles, that is, to finish the mitre. If, for instance, it was required to run the same moulding in an obtuse angle, the mould before you would be too long, and if to run an acute angle it would be too long, and if to run an acute angle it would be too short; consequently, if you wish to run a mitre clean, the mould must be traced and horsed accordingly, but in the same way as I before described.

as I before described.

It must be understood, that whatever angle the mould is traced for, the *horse* must be made to the same angle, so that they be in conformity with each other.

James Drake.

DOUBLE TRAPPING DRAINS.

WITH reference to the letter on this subject. p. 233, aute,—if your correspondent will invert an empty wine-glass, and keeping the mouth norizontal, press it below the surface of some an empty wine-glass, and keeping the mouth norizontal, press it below the surface of some water, in a tumbler, he will see that a considerable quantity of water will enter the wine-glass, without any of the are seaping; and, therefore, that it is possible for a pailful of water to pass through a trap, along a drain, heneath the gas, through another trap, without measuring a pailful of gas into the house. Double trapping drains is not new—the fact, the probable evil, and the effectual remedy, are given in The Builder, vol. iii., p. 453, as an extract from the "Penny Cyclopiedia." I have no doubt but that the necessity for the ventilation of all receptacles, where decomposition takes place, is fast forcing its way. Professor Hosking, in his admirably suggestive work on the "Regulation of Buildings in Towns," points out the necessity very clearly, but it occurs to me, his barrel of beer illustration, p. 234, a little modified, would illustrate the retort formed by a double trapped drain, for it is (unless perfectly clean from deposit of every kind) a retort of certain capacity, in which gas is generated, but confined by the trap at each end, until a sufficient quantity is evolved, to overcome, by its clasticity, or expansive force, the combined resistance of the trap and atmosphere: an its clasticity, or expansive force, the combined resistance of the trap and atmosphere: an escape then takes place, at the highest point of communication, where there is least resistance, until equilibrium is restored; and will continue to do so at intervals, unless no gas is gene-rated, or provision is made for its harmless

The article, p. 232, respecting small drains, appears opposed to the evidence given in favour of them (fine Builder, vol. iii., p. 523, and vol. iv., p. 109), but how often it occurs that the blame attached to an instrument should be attached in influidue. attached to individuals. I have no doubt a 6-inch pipe would be stopped at one house when a 2½-inch would suffice at the next, entirely from the difference in the habits of servants. If parts of heath-brooms, mops, flanges and their serve of the servants. nels, and hair are to pass through traps and drains, then greater capacity must be allowed

than is necessary where ordinary sewage passes. If any one of your readers interested in the

subject will rule about half-a-dozen columns in their common-place book, and, under the head of drains and sewers, collect and enter in their respective columns the pages in The BUILDER referring to those heads which are important (and the index will belp them much), they will find they bave a map of valuable information on the subject, which I do not think they can find elsewhere; they will find, I think, that facts are the things we want collected now,—other parts have been pretty well sifted; but why what answers well in fifty cases does not in the fifty-first, wants exposing, so that the right remedy may be applied

A. P. M.

DOINGS IN DERBY.

A MEMORIAL has just been placed in All A MEMORIAL has just been placed in All Saints' Church, Derhy, to the memory of the late Mr. Rawlinson, artist of that town; it consists of a tablet surmounted by a figure of Faith; executed by Mr. Loft, of London.—The second experimental trip on the Manchester, Buxton, Matlock, and Midland Junction Railway took place on Monday, in last week, under the direction of Mr. G. R. Stephenson and Mr. Campbell the resident engineer. The and Mr. Campbell, the resident engineer. The and Mr. Campoet, the resident engineer. The trains consisted of one first-class and one second-class carriage. The whole length run over was in excellent working order, and the train ran very smoothly. On passing through the Willersley tunnel some blue and crimson fire was living and the works. fire was lighted, which had a fine effect. line is now open for traffic.—A new bridge of two arches has just been completed across the large brook running through Derby. A new bridge is also in course of erection at the same place, spanning the river Derwent. Towards defraying the cost of the latter, Mr. Alderman Moseley has contributed 500l.

A new gallery has just been erected in St. Mare's Church Little Darley Tho Mary's Church, Little Darley!— The stained glass in the chancel window of St. Peter's Church, Derhy, consists of a figure of Mary's our Saviour on the Cross; on his right, those of St. Peter and the Virgin Mary; on his left, St. John and Bishop Chad. Some of the good people ask why they should have a Romish bishop made so prominent. They also object that the Saviour is represented smiling, when we know that his sufferings on the Cross were of the most agonizing description. The window was put up by Mr. Barker, of York. The tracery above is to be filled in with plain yellow stained glass, and the whole (with exception of tracery) is the gift of a lady.

REMOVAL OF SMOKE OF TOWNS

I OBSERVE in a recent number a notice of a recently published pamphlet by Mr. Flockton, on a proposed method for obviating the discharge of smoke into the atmosphere from duraling house and proportions by dwelling-houses and manufactories by means of underground flues in the streets, leading to lofty towers or chimney stacks out of the town; and for readily obtaining in this way a more perfect ventilation of sewers.

Perhaps you will permit me to trespass on your columns with a suggestion on this subject which has long occupied my thoughts, viz., that the sewers themselves should be made use of for the purpose of such underground flues, of for the purpose of such underground liues, by employing the upper part, now the receptacle of the noxious gases generated in them, for the underground passages for smoke, in passing along which the coldness of the water beneath would cause part of the soot to precipitate, and be carried to the outlet of sewage trates with the ather refuse. While the unconwater, with the other refuse; while the uncondensed smoke would be drawn out by mechanical or other means, and discbarged at chimney shafts erected in the most convenient places at

shans elected in the most convenient places as a distance from the town.

A paper on this subject was drawn up by me in January last, without any previous knowledge of Mr. Flockon's, or any other such plan; and with the view of obtaining a more plan; and with the view of obtaining a more plan; and with the view of obtaining a more plan; and with the view of obtaining a more plant to the plant of the moral calculation. competent opinion of its practicability before venturing to publish so seemingly extravagant an idea, I submitted it to an eminent engineer, Mr. Farey. The method of procuring a suffi-cient draught by the heat contained in the smoke itself was considered by that gentleman wholly impracticable, *owing to the cooling effect

* This, I perceive, is also your opinion. Builder, No. 328, page 233.

of long underground flues, and particularly of damp sewers, upon the smoke passing through them. The general idea, however—one which had many years ago occurred to Mr. Farey bimself—was thought not unworthy of consideration, and, to a certain extent, practicable, provided adequate means for producing the draught were employed; such, for example, as are adopted in the ventilation of extensive

I hope the desire to avoid encroaching too much on your space has not rendered this communication obscure. I make it that those of your readers interested in the question to which it refers may know" what others are contemplating, and in furtherance of the object—the public benefit—evidently aimed at by you, which appears also to be the laudable aim of Mr. Flockton.

GEORGE DEVEY.

CONVEYANCE OF WATER. CONSTANTINOPLE.

YOUR correspondent "Spec.," p. 236, misunderstands the nature of the question asked in a former number of THE BUILDER, and the reply given; the allusion to the hydrostatical pressure referred to the earthern pipes connecting the souterazi together, and not to the leaden pipes in the souterazi themselves

The cistern or reservoir formed at intervals must necessarily relieve the hydraulic pressure; as, if water is to be brought from an altitude of 1,000 feet, and it descends in stages of 100 feet into reservoirs at those intervals, your correspondent must admit that the pressure upon the pipes connecting the reservoirs together will be less than if the water is conveyed down

in one continued conduit.

Although the stone-ware pipes of the present day will bear a pressure of a column of water equal in altitude to from 300 to 400 feet, I imagine that in those days (probably in the year 404), the ancients were not so well acquainted with the manufacture of those articles as in the present day, although they show by their works they were not totally unacquainted with the science of hydraulics

There is a tendency to return now to the use of carthen pipes as conduits for water in preference to iron, probably on the ground of economy; but if it be true, as I hear from Aberystwith, that vegetation occasionally takes ference to place inside them, it will be an obstacle fatal to their use. For the information of your corres-pondent, I may further state that earthenware pes can be manufactured 3 feet diameter pipes can be manufacturers prefer making the (although manufacturers prefer making the smaller sizes), and their use must be regulated by the hydrostatical pressure they will bear, which has a limit in that material as well as iron; the joints of the pipes in towns where which has been used, were made secure with they have been used, were made secure with B. BAYLIS.

Miscellanea,

DRYING CLOSETS .-- Amongst other letters received by us on this subject is one from Mr. A. Jennings, on the part of the Dessicating Company, objecting in toto to the close system, but containing nothing to controvert the experiments of former correspondents. "it does appear to me most extraordinary that such a principle should for one moment be contended for. The water (in prohably be contended for. The water (in prohably foul or infected blankets) converted into noxious vapour, for want of a proper current to carry it away, is to a great extent died up in the articles themselves! Is this the way to obtain pure linen? Those who happen to be of such opinion had better consult the of Dr. Henry, of Manchester, Dr. Copland's Medical Dictionary, vol xi., page 245, and, more recently, the Medical Gazette of Feb. 2, 1849, where they will find that impelled rapid currents of dry heated air are the requisites for invariant was feet height. insuring perfect drying as well as perfect disin-fecting. As to a chamber of 300 feet or even 5,000 feet ubic capacity, it is as nothing compared with those now in daily use upon the desiccating principle in the manufacturing districts and elsewhere. In some cases these chambers contain upwards of 30,000 cubic feet."

PROJECTED WORKS .-- Advertisements have been issued for tenders, by 9th inst. (extension of time), for the works required for West Ham Parish Church; by 11th, for building about 100 feet of wall round the head of the about 100 feet of wall round the head of the Middle Dock, Rotherbithe; by 18th, for making two oval sewers at Bristol; by 19th, for the erection of a new congregational church in the City-road; by 25th, for the erection of the new York County Hospital; by 12th for rehuilding St. Mary's Church, Foulness Island, Essex; by 29th, for the erection of a stone bridge at Yowychurch. erection of a stone bridge at Vowchurch, Hereford; by 12th, for the erection and com-pletion of a stone warehouse at Bradford; by 21st, for the erection of a police station at Ormskirk; by 23rd, for alterations and additions to the Peterborough Union Workhouse ; buildings at Kirtling, Cambridgeshire; by 22nd, for building a sewer at Birmingham; by 12th, for sinking an engine shaft at the Dudley Waterworks; by 12th, for supplying and fixing a galvanized corrugated iron roof to a large tank at St. Pancras Workbouse; by 19th, for hewed wedges of beech for the navy at Portsmouth; by 12th, for mineral black for paint for the navy; by 16th, for various works in churches, &c., in St. Marylebone, and for flints, cement, lime, hammers, &c., for same parish. Tenders also wanted by 21st for surveying and mapping a township in Whalley

Parish, Lancashire.

Instruction of Civil Engineers.—On Tuesday, June 5, Mr. Field, president, in the chair, the paper read was a "Description of a Method of Rolling Bars for Suspension Bridges of Suspension Bridges and August 1988. chair, the paper read was a "Description of a Method of Rolling Bars for Suspension Bridges, and other-like Purposes," by Mr. Thomas Howard. It was described that by the ordinary process of manufacture, the head, or end of the link, out of which the eye, or hole for the connecting pin, was bored, had been sometimes welded on to a parallel rolled bar, or, at other times, been hammered to the bar, or, at other times, been hammered to the required form; hoth these methods were, however, objectionable, owing, in the former case, ever, objectionable, owing, in the latter to the to the insecurity, and in the latter to the tediousness and expense. By the method introduced by Mr. Howard, the bars were rolled troduced by Mr. Howard, the bars were rolled at once into the requisite form; the shingle, or faggot, was first passed longitudinally, at a welding heat, through grooved rollers, in the ordinary manner, and then, before being drawn down to the intended thickness, was carried to rollers having bosses, or incr ased diameters at the places corresponding to the heads to be produced, and there passed to and fro between the rollers transversely, or across the breadth of the bar, thus receiving a pressure only at the enlarged parts of the rollers, which gave the necessary increase of breadth at the heads; it was then taken to plain finishing rollers, and drawn out longitudinally in the usual manner, until it attained the required length and thickness; the heads being afterwards trimmed by machinery to the exact dimensions, and the the chains of the exact dimensions, and the holes drilled for the pins. It was stated that the chains of the large suspension bridge, erected by Mr. W. Tierney Clarke over the Danube, at Pesth, which lately so satisfactorily withstood the heavy strain brought upon it by a retreating army, were constructed on this content.

SMITHFIELD MARKET. - The protracted inquiry of the Parliamentary committee into the eligibility of Smithfield-market is about to be brought to a close. The last few sittings of the committee have been principally occupied with the evidence of some of the principal butchers, graziers, and salesmen of the metro-polis and the market, who are in favour of the continuance of Smithfield, on account mainly of its central situation, and its proximity to their premises and slaughter-houses

THE METROPOLITAN ROADS.—The twentythird report of the Commissioners of the Me-tropolitan Roads states that the receipts from tolls during the past year amounted to 64,019l. and the total receipt from all sources of income. including the balance in hand on the 25th of March, 1848, to 71,036l. The total concurrent expenditure amounted to 68,773*l*., including the interest and the instalment of the mortgage debt. The state of the roads on last, at the west end of the metropolis, for want of watering, was abominable. Why health and property should not be protected on a Sunday as on another day, it seems hard to

THE BRICKLAYING LEGISLATOR. Naudaud, a steady hard-working fellow from Creuse, whence all Paris is supplied with masons, came trudging to the capital with hod and trowel as his only capital, some short time previous to the revolution. Madame Naudaud accompanied him with her frying pan, where-with to supply with fried potatoes all the bons camarades of Naudaud, at the same time honestly earning more in a single day, as it turned out, than poor hard working Naudaud could do in a week. The grand revolution came, and made all the masons gentlemen at once, so far as work was concerned. But their stomachs were light as well as their pockets, and though they could fill the latter with their idle hands, they could not do that with the former. In this dilemma Naudaud made a speech. "Madame Naudaud," said he, "has saved 6,000 francs. Had you not been honest saved 3,000 ranges. Has you not been nonest bons camarades we would have been poor like you: come, let us live together and divide the proceeds till better times." Notwithstanding Naudaud's latter filing at the grand revolution, his proposal was deemed not only a fair one, hut worthy of all acceptation. Naudaud's wife, however, was not only a prident woman but an ambitious one. She, therefore, under the rose, appended what she conceived to be a reasonable condition to her husband's truly generous offering, namely, that in return they should elect him a member of the Legislative Assembly! Naudaud was so elected, and he almost merited the distinction, all the more indeed that he knew his own unfitness to fulfil its duties. To oblige his camarades, however, and to please his wife, he laid down his hod, with reluctance, and not till the very day of meeting, when he presented himself in his ordinary blouse and casquette. The self in his ordinary blouse and camp.
huissier on duty refused to admit him. Do as you please, mon ami, said Naudaud. I'll go to work again. "What a good excuse I'll have! They won't admit me!" Naudaud's soliloquy, however, was rather premature, for the buissier on second thoughts called him back, and ushered him forthwith into the midst of his new camarades of the Assembly, one of whom, inquisitive as to his speechifying powers, he sensibly assured that he did not mean to open his mouth at all, contenting himself with voting amongst those who upheld the constitution. Such is the substance of a little gossip by the Paris Correspondent of the Atlas.

HUDDERSFIELD AND PENISTONE RAIL-WAY OPENING. — Mr. Miller, of Miller, Blackie, and Co., the contractors, ran an engine throughout this line on 25th ult. The length of the whole is only 13 miles, but in the course of it there are no less than four great viaducts; six tunnels, one nearly a mile in length and another half a mile; twenty excavations, many of them very deep and long, and as many embankments, many of equally labor ous formation; with 30 bridges, some of great expense, others varying from 200 to 2,000 cubic yards of masonry in each. One of the viaducts, the Paddock, first from the junction with the Manchester line, at Huddersfield, hy a deep cutting in the Spring Wood tunnel, is not yet erected, owing to an arbitration for half an acre of ground, near some silk mills. For this the claim of 10,000l. has been allowed. Another of the viaducts, that in the Lockwood valley, 478 yards long, and 146 feet high in the centre, with 32 arches of 30 feet span, and two skew arches, one 70 feet span, at an angle of 330, is wholly built of rubble, excavated near the spot, and is thought to be a fine specimen of workmanship. It contains 34,000 cubic yards of masonry, and cost 30,000l. A third viaduct, at Denby Dale, 400 yards long and 109 feet at Denby Dale, 400 yards long and 109 teet high above a rivulet, is of timber, of great lightness of aspect. A branch line is nearly completed between Brockhole's embankment on this line and Holmfirth. It also contains on this line and Holmfirth. It also contains some rather heavy works. None of the stations have yet heen built.

THE IRON TRADE.—BIRMINGHAM -The reduction of 11. per ton in the price of iron has been generally adopted, and it now appears that many of the masters never sold at the advanced rate resolved upon at the January quarterly meeting. Some dealers are of opiquarterly meeting. Some dealers are of opi-nion that it will be difficult to maintain even the present price, and that a further reduction may be expected at or before next quarterday.

CARBONIC ACID GAS ENGINES.—In lately recommending Baron Von Rathen to try the condensation of carbonic acid gas in his locomotive air-bottles, generating it from such carbonates of line as marble or challs, we scarcely expected to hear so shortly of a defiscattery expected to lear so shortly of a deninite invention for the very purpose. Such is the case, however; and it is proposed, in order to cheapen the process and render it all the more likely to be economically practicable, that the condensed or liquified carbonic gas, after the expenditure of its provenience process. the expenditure of its power in expulsion from the air-bottles or reservoirs, should be reabsorbed by quicklime, so as to be as ready for re-agency, with the help of sulphuric acid and the air-bottles, as ever; leaving sulphate of lime as a markctable residuum. It is calculated that, as a mere auxiliary, a steam-engine of 50-horse power, hy aid of such a carbonic acid engine, would be equivalent to one of 95-horse power; and that, from the saving of fuel, both marine and locomotive engines could be worked with it to great advantage.

THE JEPHSON STATUE AT LEAMINGTON was inaugurated on Monday week by Mr. Serjeant Adams, at the ornamental temple in the Jephson gardens, erected for its reception. At a convivial meeting in the evening, Mr. Hollins, the sculptor, explained the reason of the temporary want of likeness in the features when the statue was got ready for exhibition at the Royal Academy, and defended the Committee and himself against objections made to the enclosing of it in a temple, where it had all the advantages of a preconcerted arrangement of

light and shade.

NAIL-MAKING .- Mr. Moses Poole has obtained a patent for some improvements machinery for making nails. The metal is passed between the edges of a top and bottom roller, to split it into rods of the requisite thickness, which are then passed between the edge of a second top roller and the other edge of the bottom roller, whereby they are formed into a succession of rectangular triangles. These triangular-shaped rods are then forced between a pair of vertical or horizontal matrices, to point them, and likewise a pair of cutters to separate them, and subsequently through a punching machine, by which the heads are formed. Claim.—The mode of arranging machinery for making nail-rods, by first splitting the metal and then shaping it. Making nails by means of the matrices in combination with the heading machine. The application of the machine last described.

NEW YORK AS IT IS TO BE .- We know nothing more frightful (says the Daily News) than to look at a plan of New York, and fancy what it will be when the whole island is built upon. Never was so nohle a gift of nature so sacrificed to mathematical precision and utilitarian caprice. Let the reader imagine a dozen of Harley-streets, Baker-streets, and Edgeware-roads, all to each other, and extending in a straight line from six to ten miles in length, without a Hyde-park, a Regent's-park, or a Hampstead intervening, and intersected rectangularly at unvarying intervals hy a couple of hundred cross streets, all the ditto of each other, and he will have some notion of what New York is to

THE METAL TRADES PENSION SOCIETY held a general meeting, on 28th ult., at the London Tavern, for the election of six addi-tional pensioners and other business. There are now 25 annuitants on the roll of this useful society, with pensions, as we understand, of twenty guineas each per annum. More than 200 names of new subscribers or donors appear in an appendix to the report, and 100 more are greatly desired before 1st August, to enable six more pensioners to be added to the list.

THE CORROSION OF IRON RAILINGS. Where they are united to their sockets by lead, it may be lessened in the following manner: The cause of the corrosion, as is well known, is the galvanic action which goes on between the two metals, through the medium of the water collected at the angle of juncture by capillary attraction. If, then, the lead, instead of being flush with the stone into which the iron is fixed, were to be levelled from the iron to the stone at an angle of about 60 degrees, all the water would drain off, and, consequently, the galvanic action would be stopped.

J. C. W.

THE CAMPANILE OF GIOTTO AT FLORENCE. I HE CAMPANIE OF GIOTTO ATTLORENCE.

I remember well how, when a boy, I used to despise that Campanile, and think it meanly smooth and finished. But I have since lived beside it many a day, and looked out upon it from my windows by sunlight and monalight, and I shall not soon forget how profound and gloomy appeared to me the savageness of the Northern Gothic, when I afterwards stood, for the first time, beneath the front of Salisbury. The contrast is indeed strange, if it could be quickly felt, between the rising of those grey walls out of their quiet swarded space, dark and barren rocks ont of a green lake, with their rude, mouldering, rough-grained shafts, and triple lights, without tracery or other ornament than the martin's nests in the height of them, and that bright, smooth, sunny surface of glowing jasper, those spiral shafts and fairy traceries, so white, so faint, so crystalline, that their slight shapes are hardly traced in darkness on the pallor of the eastern sky, that serene height of mountain alabaster, coloured like a morning cloud, and chased like a sea shell. And if this be, as I believe it, the model and mirror of perfect architecture, is there not something to be learned by looking back to the early life of him who raised it? I said that the power of human mind had its growth in the wilderness; much more must the love and the conception of that beauty, whose every line and hue we have seen to be, at the best, a faded image of God's daily work, and an arrested ray of some star of creation, be given chiefly in the places which He has gladdened by planting there the fir-tree and the pine.—Ruskin.

East Anglian Architectural Society.
On Monday last, a number of the memhers of the East Anglian Architectural Society had an excursion, upon which occasion they visited Ely Cathedral, when the Rev. Mr. Boutell, of Downham Market, delivered a lecture on the

various styles of architecture.

SKETCHES AND STUDIES FROM NATURE An exceedingly interesting collection of sketches and studies from nature by English painters, 239 in number, is now being exhibited by Mr. Hogarth, at his gallery in the Haymarket.

THE MARNLE ARCH.—In reply to some remarks by Mr. Osborne in the Commons, on the 'ways and means' to he voted for taking down the arch at Buckingham Palace, Chancellor of the Exchequer confessed that where it was to be put was even yet not quite decided

No. CCCXXXII.

SATURDAY, JUNE 16, 1849.

AST week we endeavoured to make known to our readers the nature and character of some of the more recently published collections of Gothic Architectural Exemplars. In our present

number we would in like manner bring before them two or three new books connected with the art of painting, to which we have not yet had an opportunity to refer, namely, Mrs. Merrifield's translation and notices of ancient "Original Treatises on the Arts of Painting," published by Murray; "The Picture Collector's Manual," by Jas. R. Hobbes, published by Boone; and Mr. Henry Twining's "Philosophy of Painting," published by Longman.

Hazlitt scoffs at the "ambiguous quackery of rules" for the production of beauty; they have been called the "fetters of genius," and many inquirers who do not repudiate them altogether, are undetermined as to what extent they may be made available. There can be no reasonable doubt, however, as to the utility, and indeed necessity, of guiding principles. Rules are no substitute for genius, but without them genius may waste itself or be perverted; and as to their being fetters, says Reynolds, "They are fetters only to men of no genius, as that armour, which upon the strong is an ornament and defence, upon the weak and misshapen becomes a load, and cripples the body which it was made to protect."

We are glad, therefore, to find the theory of art occupying the attention of competent minds, and augur from it much advantage. "Theory," remarks Mr. Twining, "would indeed be worse than useless in the art of painting, were it to claim, as its special office, to rule the inspired thought, and to assert principles of grace in the lively creations of the fancy. Its advantages are chiefly shown in correcting the errors, and in chastening the productions, of those who want the penetration and experience necessary to proceed unguided. A more extended knowledge of the principles on which art is founded, might not add many to the best of the yearly productions of our artists, although it might diminish immensely the number of the inferior ones; and by thus rendering the attainment of that which is at least genuine and good, more easy and certain, it doubtless confers a benefit on art in general, which ascends less obstructed, and, it may be, to a loftier position, when seated on the foundation of truth, than when based on inconsistency, chance, or extravagance."

Mrs. Merrifield's work relates to the technical part of painting, and is a most satisfactory testimony to the learning, accomplishments, and ability of the author.* Mrs. Merrifield was deputed in 1845 to proceed to the north of Italy for the purpose of collecting MSS. relative to painting, with the view, principally, of ascertaining the processes and

* "Original Treatises, dating from the Twelfth to the Eighteenth Centuries, on the Arts of Painting in Oil, Miniature, Mossic, and on Glass; of Gidling, Dyeing, and the preparation of Colours and artificial Gems; preceded by a general Introduction, with Translations, Prefaces, and Notes." By Mrs. Merrifield. In two volumes. London, John Murray, 1690.

methods of oil-painting adopted by the Italians. On Mrs. M.'s return, Sir Robert Peel entrusted to her the publication of the MSS., with an intimation that part of the expenses would be defrayed by Government; and this book is the result. As a matter of course, much of the information given in these MSS, is practically useless, although in an antiquarian and historical point of view the whole are valuable.

Prefixed, Mrs. Merrifield has given an interesting sketch of the history and technical processes of the different kinds of painting and other arts which are alluded to in the manu-

The MSS, given are those of Jehan le Begue (fifteenth century); Petrus St. Audemar (thirteenth and fourteenth centuries); Eraclius, Archerius (fourteenth century); the Bolognese MS. (fifteenth century); the Paduan MS. (beginning of seventeentb century); the Brussels MS., written by P. Lebrun, 1635, and some others.

Mrs. Merrifield has executed the task confided to her very satisfactorily, and fully justified Sir Robert Peel's selection.

"The Picture Collector's Manual," besides being a dictionary of painters, supplies an omission which has long been felt, namely, an alphabetical list of the various pupils, imitators, and copyists, arranged under the heads of the different masters. There is also a classification of subjects, showing the names of those who painted in the several departments of art, thus affording, as the author says, "in all uncertain cases, a clue by which the judgment may be guided, the opinion strengthened, and the doubt [sometimes] removed." A want of care in the collation of dates is observable, and is to be regretted. Thus the death of Lucas de Cranach, who was born 1472, is put in the year 1586, but in truth took place in 1553; and Cuyp appears to have been born in 1768, and to have died in 1649!

In plan, however, the work is excellent, and, in spite of what we have said, we do not hesitate to recommend it for purchase.

The author concludes his introduction, which consists of a brief description of the various schools, with the following outline of the characteristics of a few of the principal

" Titian's lights are generally in the centre; his shadows are broad and extended; his middle tints in the extremities of his figures, such as the hands, feet, &c., are of a reddish hrown; those parts most distant from the light, are weakened in colour, and have a dusky appearance; his receding figures, and those on the outside of his groups, are always the most obscure; his dead colours are made with cold middle tints, and finished by laying on warm colours, extremely thin, light, and transparent; his middle tints of shadows are thinly covered with yellow, and in the darker parts with red and black; he used but little white in his lights, and none at all in obscured parts of his pictures: whilst Raffaelle used it largely, he is neither so bright in his lights, nor dark in his shadows as other masters; and in the old men of Rubens and Titian the principle appears to be the same, little or no white in the carnation, and a sort of orange colour, made up with yellows and reds; in historical compositions, his great light is in his skies and behind his figures,—he does not affect a whiteness and glitter when the light is thrown upon the fleshy part in his female figures: it shines but is subdued, and not opposed to dark shadow in obscure parts. Conceive a scale of colouring between the chalky hard manner, and the opposite extreme of obscurity, the Conceive a scale of

* "The Picture Collector's Manual, adapted to the Professional Man and the Amateur; being a Dictionary of Painters, containing 1,500 more names than in any other Work." By J. R. Hobbes. 2 vols. London, 1849. T. and W. Boone.

strongest light heing at No. 1; we then arrive at this comparison: Guido's strongest light on the flesh is at No. 1, his middle at No. 3, and his dark at the extreme; Titian's strongest light is at No. 2, his middle at 3, and his dark at the flesh; Agostino Carracci's are at 3, and bis middle at 1; and Vandyck's are almost as strong as those of Guido, but bis strongest shadows are off the flesh, and in the draperies and backgrounds."

"The Philosophy of Painting "* is a continuation of a work by the same author, Mr. Twining, entitled "Elements of the Picturesque," printed originally for private distribution only, and which was reviewed in our columns some time ago. The present volume is divided into three parts. The first is appropriated to remarks on the elementary principles which constitute the Beautiful, and those conducive to the perception of the Beautiful, and includes an analysis of the views entertained by various authors on the same subject. The second part comprises the consideration of subjects connected with imitation in painting, such as composition, expression, light and shade, styles, &c.; and the third part treats of linear perspective, projected shadows, and the perspective of reflections.

This work is the result of personal observation and thought, rather than of reference to the writings of others, and requires, for its due mastery, the corresponding exercise of thought by the reader. Those who will give this will find it eminently suggestive, and will not fail to derive from it much advantage. Mr. Twining is an enthusiastic lover of art, and for his disinterested efforts to advance the knowledge of it, is entitled to our praise,—he has his return, however, in the enjoyment the pursuit affords.

To all our readers we say, as we have often said before, cultivate a knowledge of art,-improve your taste,-and as one of the best means of doing this, lose no opportunity of exercising the eye by examining fine specimens of art. As Leigh Hunt remarks, in his pleasant "Book for a Corner," "We have reason to regard the having been conversant with a house full of paintings during childhood, as one of the blessings of our existence. We have never since entered a room of that sort without a tendency to hush and move softly, as if in the presence of things above the ordinary course of nature, of spirits left behind them by great men, looking at us with divine eyes, or informing the most beautiful visions of nature with art as wonderful."

ON THE BUILDING MATERIALS EM-PLOYED IN PARIS AND IN THE VALLEY OF THE LOWER SEINE.

AT the present day, when the attention of the profession has been so powerfully directed to what may be called the physiology of the materials employed in the execution of the works committed to their charge, it may be interesting to examine the practice of the architects in the neighbouring capital. Such an examination, moreover, becomes more interesting from the comparatively superior attention paid by the French architects and engineers to the study of the philosophy of the mechanical parts of their pursuits. With the glorious exceptions of Rennie, Tredgold, Barlow, and Hodgkinson, nearly all that we know of the chemical and mechanical nature of the metals are the state of t of the materials we have to employ is derived from the works of the French authors. The practical lessons they have drawn from their researches become, therefore, of much more immediate importance; and, although the geological nature of the country in which they are applied differs so entirely from that of our

s "On the Philosophy of Painting: a Theoretical and Practical Treatise; comprising Æsthetics in reference to Art, the application of Rules to Painting, and general Con-siderations on Perspective." By Henry Twining, Esq. London: Longman and Co. 1849.

own, yet the mode of analysis adopted, and the conclusions arrived at, are as applicable here as elsewhere.

Building materials may be separated, for the purposes of classification, into the following groups:—lst, stone; 2nd, bricks; 3rd, limes; 4th, woods; 5th, metals. Under the head of bricks are included tiles, pottery, and artificial stones; under that of limes are included plaster, coment, sand, stuccos, &c. These materials are to be examined, firstly, as to the nature and qualities of their constituent parts; secondly, as to the unanner of their use.

1st. Stones.—The stones employed in building are grouped thus—1st, the argillaceous; 2nd, the calcarcous; 3rd, the gypseous; 4th, the silicious; 5th, the volcanic and divers

natures.

The Argillaceous Stones.—These are comprised of a base of alumina, generally combined with silicates and the oxides and sulphurets of iron. They do not effervesce with the acids, and are composed of successive layers, easily separated. The schists and slates are of this class.

The slates used in Paris are extracted at Angers, in the department of the Maine and Loire. The quarries are opened in a bed of silurian argillaceous schist of an enormous thickness, which outcrops for a length of ten miles, between Avrillé and Treluzé, passing under the town of Angers, where the Mayenne cuts the direction of the formation at right angles. There are eight quarries opened in a direction from east to west. Immediately under the vegetable soil is found a bed of incoherent schist, named in the country "cosse." This is followed by a bed difficult to cleave, and, therefore used locally as a rubble huilding stone; and lastly occurs, about 14 or 15 feet from the surface, the useful slate. It is worked in patches about 400 feet wide, leaving underneath an unknown thickness, though the depth quarried in many cases extends to 300 feet.

The quarries of Angers furnish a slate of a very fine grain, remarkably thin and light; although the specific gravity of the slate itself is very great. It is 3'000, water being 1'000, or 183 lbs. per foot cube. Four sizes are worked for the Paris market, viz.: the "grande carrée forte," 11½ long by 8½ wide, and ½ thick (0m 293 × 0m.217 × 0m 003); 2nd, the "grande carrée fine," of the same dimensions as to length and breadth, but of about half the thickness; 3rd, the "cartelettes," 8½ long by 6½ wide by ½ thick (0m.217 × 0m.162 × 0m.003); and 4th, the "cartelette fine," of about half the thickness. According to the statistical returns of the Ingénieurs des Mines, the value of the slates extracted at Angers in the year 1845, was at the pit's mouth 1.420,056 f. (56,400L); and there were employed in the quarries 2,366 workmen.

employed in the quarries 2,366 workmen. The quarries of Charleville, in the department of the Ardennes, are worked upon a larger scale for the supply of slates for the east of France, Hollaud, and the Low Countries; but the expensive land carriage prevents their being employed in the capital. The value of their produce is about 1.793,945f. (72,000l.); they employ 2,843 men. The slates are somewhat softer than those of Angers, consequently they decayed rapidly in the damp countries where they were usually cumployed. M. Vialet, Ingénieur des Ponts et Chaussées, overcame this objection by roasting the slates until they assumed a red tinge; their durability was doubled by this process. In the neighbourhood of St. Lô, in the department of Calvados, are some slate quarries in the Cambrian strata, which are used to a considerable extent in the neighbourhood, and which, if the land carriage were not so ruinous, would doubtlessly be formidable rivals to those of Angers. The cathedral of Bayeux is covered with the former; but even there, the price of the Angers slate is so much inferior to that of St. Lô, as to ensure the preference for ceneral use, in spite of the superiority of the latter. The value of the slates extracted in the department of the Calvados in 1845 was 10,360f. (414f.)

The usual practice in Paris and in the departments of the Lower Seine, is to nail the slates with two nails upon battens half an inch thick, and from 4½ inches to 7 inches wide, that is to say, either of deals cut in two, or of battens. Some times these "voliges," as they

are called, are of poplar or sycamore, but they decay very rapidly. The slates lap over one another two-thirds of their length, leaving a "pureau" of one-third, when the inclination of the roof is not above 33°: at 45° the pureau is one-half of the slate; at 60° two-thirds. The battens are rarely laid close, for the slates are found to decay more rapidly if there be no circulation of air. The usual space between the battens is about 1½ inch. Hips, ridges, valleys, and gutters are executed as in England, with the trilling exception, that step-metal flashings are unknown; the slates are made good to the Pignon walls by merely covering the meeting angle with plaster.

The Calcareous Stones.—The formations

The Calcareous Stones.—The formations which furnish the building stones of this class occur in the neighbourhood of Paris, and of the basin of the Lower Seine, in vast deposits. The ease with which they are extracted, and the proximity of the quarries to the places in which the stone is to be used, render their employ almost imperative; and it is to the use of these materials, that the monumental character of Paris is in a great measure to be

attributed

The nature of this class of stone is too generally known to render it worth while to dwell npon it at present. Our geological observations will therefore be merely confined to an enumeration of the great sources of supply. These are, for Paris itself, the vast tertiary formation, which nearly covers the whole of the departments of the Seine, Seine and Oise, Seine and Marne, l'Oise, and extends into those immediately around. Rouen, and some of the small towns above and helow it, use large quantities of an indurated chalk met with on the banks of the Seine, whilst Havre and the intermediate towns derive their building stones principally from the oolitic formations of the department of Calvados.

Nearly the whole of the department of the

Nearly the whole of the department of the Seine in which Paris is situated, may be considered as capable of furnishing calcareous stones for building purposes. The excavations which have been, and still continue to be, made, in and around Paris, are immense. About one-sixth of the town is built over the abandoned quarries, which are known under the name of the catacombs. The quarters St. Marcel, St. Jacques, St. Germain, and Chailtot, are in this condition; and it is calculated that the mass of materials extracted thencefrom is not less than 385 million cubic feet. At present the bulk of the superior stones furnished by the department, comes from the quarties of Arceuil, Bagneux, Montrouge, and St. Cloud, which lie to the south-west of Paris.

The department of the Seine and Oise, is rich in quarries. Amongst them may be cited those of Saillancourt and Conflans, near Pontois, of Poissy, St. Nom, St. Maure, l'Île Adam, and Chèrence, near Mantes and upon the borders of the chalk. The department of the Oise furnishes the lias of Senlis, and the Vergelée of St. Leu. The Seine and Marne furnish the very beautiful stone called the Chateau Laudon.

This stone of the Chateau Laudon is the hardest, densest, and, consequently, heaviest, employed in Paris. It is nearly a pure carbonate of lime, containing in 1,000 parts 18 only of magnesia, and eighteen of silicate of alumina. Its colour is a grey, slightly tinged with yellow; it is subcrystalline, resists the action of the atmosphere, and bears a kind of polish. The quarries from which it is extracted are about 63 miles from Paris; yet the great superiority of the stone causes it to be preferred wherever great solidity is desired. It was first employed in the erection of the bridge of Nemours; subsequently Rondelet used it for the paving of the Pantheon. The Barrière de l'Etoile is faced with it; the pedestals of the Pont d'Iéna, the large basins of the Chateau d'Eau, and of the fountain of the Innocents, and the parapets of the terre-plein of the Pont Neuf are executed of this stone, as are also the steps, parapet walls, and balustrades of the church of St. Vincent de Paul.

The specific gravity is 2.605; its weight about 163 lbs. Eng. to a foot cube; and it is able to resist a crushing weight of 332 kilo. per centimètre square.

The lias, which was formerly extracted to the south of Paris, was an excessively hard stone, but the quarries are nearly exhausted. The

name is still retained amongst the quarrymen, and is by them applied indiscriminately to the hardest beds of the calcaire grossière, which rarely occur in any great depth. At Arceuil, Bagueux, Montrouge, &c., the lias is fine grained and compact, but is rarely raised in blocks of more than a foot thick. At Montereau it is occasionally 2 feet thick. At St. Cloud, it is soft; at Maisons, in the south-west of Paris, it takes a rose tint, and occurs in beds of from 9 to 10 inches thick. The specific gravity of the lius is, on the average, 2·439; the foot cube weighs 152 lbs.; the crushing weight per centimetre square is even greater than that of the Chateau Laudon; it is 445 kilog. It was doubtlessly for this reason that it was chosen for the execution of the columns of the exterior of the Madeleinc and of the Bourse. The crown moulding of the large pediment of the Louvre is executed in lias, extracted at Mendon; it is of two pieces each 16 m. 24 c. long, by 2 m. 60 c. wide, by 46 c. high (53 feet 3 inches × 8 feet 6 inches × 1 foot 5 inches). The "cliquart" extracted at Vangirard and

The "cliquart" extracted at Vangirard and Mendon is a species of lias of a rather looser texture.

The stones called the "roches" are hard, of a coarse grain, very shelly. They occur in beds varying in thickness from 1 foot 4 inches to 2 feet 2 inches; their specific gravity is between 2.415 and 2.305, the heaviest being, as usual, the best. The foot cube weighs between 151 lbs. and 141 lbs.; the crushing weights 302 kilogs. and 283 k. p. c. square. The roche of St. Cloud is red and shelly, but of a very superior quality; it occurs in beds from 18 inches to 2 feet thick, and has the peculiar quality of being able to be employed on the wrong way of the bed. The isolated columns of the court of the Louvre and of the garden front of the Tuileries are of this stone, and have stood well for upwards of two hundred years. We shall have occasion to revert to this apparent anomaly on some future occasion. The basements of the Madeleine, St. Vincent de Paul, Notre Dame de Lorette, of the Palais da Quai d'Orçay, and of the Bourse, are executed in the "roche de Bagneux."

The bridges of Neuilly, the Pont d'Iéna, of Louis the 16th, and numerous similar constructions, are built of the "roche" of Saillancourt. At Rouen large quantities of the roche of Chèrence are employed in works which require solidity: for instance, the stone bridge and the basement of the Custom House. The rubble filling of the bridge is, however, of the Vethcuil stone, one of the lowest members of the tertiary formations. At Havre, the plinth of the Museum is executed in the Chèrence stone. The practice of the French architects is never to employ the softer materials, such as the Caen oolite, near the ground.

The "pierre francle" is a fine, close-grained stone, less dense and hard than the "roche," but preferable for the decorative purposes of architecture, on account of the superior homogenity of its grain. Its specific gravity is about 2:130; the foot cule weighs 133 lbs. nearly; the crushing weight is about 126 kilogs, per centimètre. The lower parts of the Pantheon are of this stone, extracted at Arceuil. The angle stones of the façade of the same building are executed in blocks from the bane royal of Conflans, of the same nature; they were 10 feet square by about 6 feet 6 inches high, and weighed about 24 tons. The arches of the portico and of the interior of the church and the dome, the entablature, and the capitals of the exterior order, are of the same stone. The Vergelée and the St. Leu are of the same category, as is also the stone of l'He Adam; they are extensively used in Rouen and the neighbouring cities, on the banks of the Scine and the Oise, in those of the canal, and on the Northern Railway. The exterior dome of the Pantheon is in Vergelée stone.

The lambourde is a soft stone of an even, coarse grain; it decomposes when exposed to moisture, and is therefore only used in positions in which the action of the atmosphere is the slightest. The best stone of this description is extracted at St. Maur, where it reaches 1 foot 8 inches in thickness. Some beautiful stones for internal works are obtained in this series at Conflans and at St. Leu, which attain 2 feet 2 inches thickness. The specific gravity varies between 1897 and 1709; the weight per foot cube is between 113 lbs, and 107 lbs;

the crushing weight is about 59 kilogs, per

the crushing weight is about 59 kilogs. per cent. square.*

At Vernon, in the department de l'Eure, a species of indurated chalk is largely quarried for local uses. The church of Vernon, and that of Louviers, are exceuted in this kind of stone, as are also those of Pont de l'Arche, and of les Andelys. When fresh from the quarry these stones are soft, but they harden by exposure to the atmosphere; so much so as to resist atmospheric action in a very extraby exposure to the atmosphere; so much so as to resist atmospheric action in a very extra-ordinary manner. In the instances of the three first-named churches, all the external orna-mentation is of the most elaborate character of the "flamhoyante" architecture; and in all cases where the water does not lodge, the de-tails of the foliage, and the arrises of the mouldings, are preserved in a very resmarkable. mouldings, are preserved in a very remarkable nanner. The blocks are sometimes 3 feet 4 in. nanner. The blocks are sometimes 3 feet 4 in.

ligh; their specific gravity is 2 155; the foot

ube weight 135 1hs. nearly, the crushing

weight is about 220 kilogs. per centimètre square.+

square.†

A similar description of indurated chalk is extracted at Caumont, in the Seine Inférieure, to the north-west of Rouen. This, or a like stone from St. Etienne, nearer still to the own, was much employed in the middle ages n the buildings of Rouen. The cathedral, St. Ouen, St. Maclou, the Archbishop's paters may be sited as instances.

lace, may be cited as instances

lace, may be cited as instances.

The lateral elevations of the Madeleine are of the Pierre Franche of l'Ile Adam, the upper parts of St. Vincent de Paul, of N. D. de Lorette, of Vergelée de St. Leu; those of the Palais du Quai d'Orçay, are a mixture of the pierres ranches of Carrières St. Denis, Montesson, and Carrières sous bois, near St. Garmain. The façades of the Bourse are in stone of l'Ile Adam and of Conflans. The restoration of the Palais de Justice, the completion of St. Duen, the upper parts of the Douane and of Entrepôt des Sels, at Rouen, are in Vergelée de St. Leu.

At Havre, and generally in the embouchure

de St. Leu.

At Havre, and generally in the embouchure of the Seine, the calcareous stones of the Calvados are used. An examination of them would lead us into too many details at present; but they have become so interesting to us, from the extensive use made of them in England, that it is much to be desired that a more although a variety than we have the same than the content of the same than the same tha and that it is much to be desired that a more laborate examination be made than we bave at present. The notices contained in The Builder, notwithstanding their undoubted merit, present questionable points. The chemical analysis, firstly, I am convinced, is not correct; masmuch as the Caeu stone is stated only to contain a trace of magnesia, whilst it is noto-ious that the lime it yields is thin, without being hydraulic, which would not occur unless there were present a very considerable quantity of magnesia. The use of the franc bane is justly objected to, but the use of the stone from the quarries of la Maladrèrie is much more dangerous, and this, I observe, is sent over to London in very large quantities. It is, if not asserted, at least given to be understood, that no inconvenience would arise from the use of Caen stone placed the wrong way of the bed; whereas all the most accurate and cientific observers who have made any researches into the subject—namely, Rondelet, Soufflot, Peyronnet, Ganthey, Sganzin, Reihel, and Vicat,—all agree in asserting that the reand Vicat,-all agree in asserting that the re-

* The chemical type of the building stones of Paris may be regarded to be that of the stones found near Marly; they are thus composed—
Carbonate of lime 89
Magnesia 1
Silicate of ammonia 10

Total 100

† The most correct chemical analysis of the chalk in the epartment of the Lower Scine was made upon some ex-racted at St. Catherine. It is more fissured than at Ver-on, St. Etlenne, or Caumont, but may be regarded as of he same nulneralogical rye. It contains.

Carbonate of lime	. 63
Silicate of ammonia	6
Jaide of iron	. 9
Water	. 12

[†] The name of Professor Phillips, by whom the analysis as made for us, should be a sufficient guarantee of its orrectness.—Ep.

sistance of stones is much greater when they are employed upon their natural bed. As to the action of the sea water upon the Caen stone the action of the sea water upon the caen stone, it is universally received amongst the French practical masons that the sea water destroys it very rapidly; and chemistry teaches us that the muriates and sulphates of magnesia, present in the contract of the sea water are sulphates.

the muriates and sulphates of magnesia, present in the sea water, enter into energetic combination with the salts contained in the limestones, and produce rapid disintegration.*

Practically, at Paris, where from the nature of the subsoil it is expensive to form cellars, and where the bulk of the houses are built upon the ground, without deep foundations, where the land is all freehold, building leases are unknown, and consequently where the interest of the proprietors is evidently to obtain the greatest number of dwellings upon the least possible surface, and the houses, therefore, are generally from six to seven stories fore, are generally from six to seven stories high, the lower parts of the houses are built high, the lower parts of the houses are built of the roche stone, towards the street and up to the first floor; from thence two stories are carried up in la pierre franche; and the remainder is executed in lambourde. The party walls are mostly executed of moellon, or small coursed stones, of similar natures to the corresponding parts of the façade. The back walls and partitions are of wood, filled in with light rubble, and plastered. Such construction is about as had as can be: the front wall, built of carefully-squared ashlar, sinks very little. The party walls, of rubble and plaster, not only sink more than the front, but, from the fact that the plaster in setting expands, it becomes necessary to build these walls totally independent of one another. The back walls,

the tack that the plaster in setting expands, it becomes necessary to build these walls totally independent of one another. The back walls, of wood framework, shrink still more. It is therefore almost impossible, in the new quarters of Paris, where this style prevails, to find a house which is not disfigured in all directions with cracks and settlements of every kind and size imaginable.

The mode of using the stone is, however, logical, and merits imitation. The harder and less hygrometric stones are placed at the bottom, as being the most fit to resist the crushing weight and the capillary action of the stone upon the himidity of the soil. The finer grained stones are employed at the heights destined usually to be ornamented; the lighter and more perishable stones are used above, where they load the foundations less than the others would do, and where they meet with the atmospheric conditions the most adapted to their own recessivities.

tess than the others would do, and where they meet with the atmospheric conditions the most adapted to their own preservation.

In Rouen, the Chèrence stone, or that of Vernon, are used in the situations where the roche is used at Paris; the upper parts are of the softer stones. At Havre the same rule is observed: the Chèrence, Caumont, Ranville, or granite, are used in all cases where there is or granite, are used in all cases where there is of grante, are used in all cases where there is adager to be feared from humidity; the Caen stone is only used in the upper works. Wherever I have seen the Aubigny stone used, it has decayed rapidly. Indeed, the French architects do not much advocate its use externally.

architects do now much ternally.

3rd. The Gypseous Stones.—These stones, from their soft and friable nature, and the facility with which they decompose in the atmosphere, are not allowed to be used as building materials in Paris. Sometimes enclosure walls are built of them, employed as mocilion. The principal use is in the fabrication of plaster.

tion of plaster.

The chemical nature of these stones as found The chemical nature of these stones as found at Montmartre, Belleville, Charonne, Menilmontant, le Calvaire, Triel, and Meulan, is, according to Fourcroy, 32 parts oxide of calcium, 46 parts of sulphurie acid, and 22 parts of water. They differ from the gypsums of other countries in the large quantities of lime they contain, which gives them greater powers of resistance to the action of the moisture of the atmosphere. The operation of burning consists simply in driving off the water of crystallization. In this state the plaster has a remarkable avidity for water, and immediately that any is presented it absorbs it, and crystallizes around the bodies in its immediate vicinity. I noticed previously the singular fact of the swelling of the plaster during this process; it is one that requires great attention in the employ of the material. Another fact worthy of notice is cited by Rondelet, namely, that two bricks set together with plaster adhere with lime during the first month; but that afterwards their adhesion diminishes, whereas that of the bricks and mortar increases almost incrystallization. In this state the plaster has a of the bricks and mortar increases almost in-

definitely.*
4th and 5th. The Silicious Stones, &c.—They

4th and 5th. The Silicious Stones, &c.—They comprehend the grès, flint nodules, the meulières, the granites, porphyries, and the basalts. The grès is a species of imperfect sandstone formation, at least as it occurs near Paris, and in the department of the Lower Seine. It is composed of a fine sand of a whitish tinge, cemented together hy a silicious cement. Generally speaking it occurs in detached nodules, named "rognoms;" sometimes it occurs in layers of different thicknesses. The quarrymen observe that the lower they descend the softer the grès becomes, and that the harder softer the grès becomes, and that the harder nature of stone is the most easy to quarry in regular forms. It has no definite planes of regular forms. It has no definite planes of stratification or crystallization, and is therefore easily worked into any shape required. The streets of nearly all the towns between Paris and the sea-board are paved with these tertiary grès, which occur in isolated patches along the whole course of the river. At Havre, of late, the red sandstone of May, near Caen, a memwhole course of the river. At Havre, of late, the red sandstone of May, near Caen, a member of the Cambrian system, has been employed instead thereof, with remarkable success. 'The usual size of the paving stones is 9 inches square; but some of the last works of this kind have been executed with narrower stones, about 4 inches wide.

about 4 inches wide.

The flint nodules are sometimes used for rough rubble masonry. They occur in chalk and in the gravels overlying the tertiary for-

mations.

mations.

The meulière is a species of quartzose concretion, with numerous small holes. It is met with in two forms; one which occurs in masses sufficiently large to form millstones of one summently large to form millstones of one piece; the other in detached nodules scattered over the country. The principal quarries of the first, for the supply of the Paris market, are at Montmirail (Marne) and la Ferté sons Jonarre (Seine et Marne). The second sort are found nearer Paris, and in the department de l'Eure.

As the meulière is excessively hard, and resists all external action in the highest degree, it is much used by engineers and architerts in

resists all external action in the highest degree, it is much used by engineers and architects in situations where those qualities are required. The fortifications of Paris and of the detached forts are faced with it. Many of the works of the Canaux St. Martin, St. Denis, and de l'Oure, the sewers of Paris, and the abattoirs also, are faced with the meulière; for all those works it is admirably adapted. One species is, however, to be avoided,—"la caillasse;" its surfaces are so perfectly even that they offer no key to the mortar.

key to the mortar.

key to the mortar.

The granites, a description of which would here he unnecessary, are only used in Paris and the other towns in the interior as borders for the foot-paths, and occasionally as flagging. That used in Paris is mostly extracted at the island of Chaussey, and is of a nature closely resembling the best Devonshire granites. The plinths of the columns of the Law Institution in Chancery-lanet are of this granite, and may pintus of the columns of the Law Institution in Chancery-laner are of this granite, and may give a correct idea of its nature. The enormous cost of the granite, owing to the land carriage, must at all times limit its use in the interior. At Havre, however, and at Hontleur, it is much used in the different docks, and the fortifications towards the river are entirely faced with it faced with it.

The porphyries are very little used, nor do they occur abundantly in any position suitable

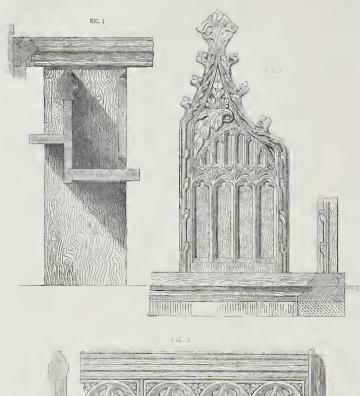

^{*} The value of the building materials extracted in 1813 was, for the departments before cited, as follows:-

	Building	
	Stones.	Plaster.
Seine and Marne	F.647,000	F.750,000
Seine	2,413,212	1,295,067
Seine and Oise	1,375,576	504,500
Seine Inférieure	109,593	
Eure	222,958	182,784
Calvados	837,551	
Oise	300 400	148,350
sides the value of the slates	cutoted manufact	110,000

† That is to say, of the columns of the portico,

^{*} The calcareous stones when first extracted are certainly in a very different state to that in which they appear after losing the quarry damp, to use the extent of the guarry men. I suspect that they exist in the quarry of the carbonate of lime; at any rate, it is certain that they are hydro-carbonates. In either case the lime is, comparatively speaking, free to enter into new combinations. If sea water be introduced, the magnesia enters into combination with the lime, the more readily if carbonic acid be pursent, giving rise to the formation of a magnesian carbonate of lime. The sulting the state of the combination with the lime, so the combination of the combination of a confused crystallization, the mass is disintegrated, and falls to powder.

CARVED BENCH ENDS.

to their being worked for the Paris market. The basalts also are rare, at least for practical building use. They are, however, occasionally used for flagging, as in the Rues de la Paix, de Richelieu, &c.*

GEO. BURNELL.

CARVED BENCH ENDS.

WE add to our collection of hench ends, Figs. 1 and 2, from Atherington Church, Devon, with section showing seat and bookboard; and Fig. 3, from Plympton Church, in the same county. The form of the capping in Fig. 1 would not conduce to the comfort of the sitter.

ETTY'S WORKS—AN HONOUR TO THE NATION.

In conformity with the proposition made by the Society of Arts, in 1848, to "assist in the formation of a National Gallery of British Art, by means of public voluntary contributions, arising from donations and annual subscriptions, and from the proceeds of an annual exhibition of the pictures and studies of some one eminent artist," a collection from the finished works and studies of Mr. W. Etty, R.A., has been opened in the Adelphi, wonderful for its richness in all the attributes and excellencies of art, as for the evidence it affords of the untiling perseverance exhibited by this great artist through the ups and downs of some thirty years, the manly energy that characterised his determination of succeeding, in spite of the many difficulties that beset his early career. The repeated rejection of his pictures (as we hear from himself in his own

unvarnished biography*), the heart-burnings of disappointed ambition, seem only to have stimulated him to further efforts. When it is seen that such pictures as his "Judith and Holofernes," "Mercy interceding for the Van quished," and "Benaish," could meet with me purchasers until bought by the Scottish Academy for a comparatively trifling sum, our young artists will be encouraged against similar disheartening freaks of fortune. The possessors of such treasures may well congratulate themselves,—certainly, few could place then better.

The variety in the collection is not the leas striking feature of the exhibition; one would imagine, from surmise, that it would be impossible for one man to produce so many dissimilar works, particularly taking into consideration the repetition of materiel; and although at first glance.

^{*} To be continued. The foregoing paper was read at a meeting of the Institute of Architects on the 4th instant.

^{*} In the Art-Journal.

the walls present the appearance of a dazzling melée of flowers, fruit, jewels, and rich drape-ries, indiscriminately but beautifully associated each work on inspection displays a study and arrangement of colour perfect in itself. The arrangement of colour perfect in itself. The earlier productions are easily distinguishable from their marked care and study. What amazement will the glorious inspiration of "Judith" excite in those who behold it for the first time I—those who hardly glance at the marvellous blots with which his name has of late years been associated, will hardly recognise Etty in it, or in the still more sublime conception of "The Listening Maid," which compartment is to us the most extraordinary of the three. Who of the ancients produced a finer "Mercy interceding for the Vanquished?" wherein the most perfect drawing is combined with scarcely approachable colour. The en-treaty so beautifully depicted in the female, the ponderous strength of the victor, and the horror and despair of the vanquished, are too well known to call for remark. This glorious allegory is priccless. "Benaiah, one of David's chief captains," allegorical of valour, is another foundation-stone of Etty's "high-piled" fame.

Who, past or present, depicted more in accordance with Homeric text, and yet with more original fancy, "the Syrens three," an exemplification of the importance of resisting sensual delights?—the voluptuous loveliness of the nymphs, whose

" Song is death, and makes destruction please,"

modelled with the grace and truth of a Phidias, and coloured in such a manner as to preclude all possibility of mistaking the author, —the positive grandeur in treatment of the infatuated Ulysses struggling with his soldiers, and the whole of the background. Who, in any case, combined so many of art's highest excellencies with so little to detract? and what further proof is requisite of Etty's greatness than that existing in this mastergreatness than that existing in this massive piece? One is inclined almost to regret the exhibition of "Joan of Arc" placed in juxtaposition with his noblest triumphs; but considered as a consumnation of his desire to sidered as a consummation of his desire to paint "three times three" colossal pictures, it is a necessary and interesting appendage.

As evidencing the careful study and per-fection present in his earlier compositions, (25) "The Storm," worthy of Michelangelo (25) "The Storm," worthy of Michelangelo in feeling, and of Etty in colour (painted in 1831); "Venus and Cupid descending" (32), exquisite beyond expression (painted 1822); (42) "Pandora," another fine specimen, to which the remark that, if "pricked with a pin the flesh will hleed," applies; (44) The Parting of Hero and Leander," a miracle of moonlight painting (painted 1827); (46) "A Composition from Paradise Lost," the prototype of many a later picture by other hands; (102) "The Choice of Paris;" (104) "Sabrina," exquisitely chaste, and a perfect gem (exhibited 1831); (105) "Cleopatra's Arrival in Cilicia," another perfect work of art (painted in 1821); (112) "Cupid and Psyche descending," radiant with mythological loveliness; and (128)" Britomart redeeming fair Amoret," may he mentioned. They all show how unceasingly industrious and studious he was, and how he gloried studious he was, and how he gloried his profession. The elaborate finish, and in his profession. The elaborate finish, attended with so much success, determines that, to acquire the freedom so con-spicuous latterly in all his contributions to art-exhibitions, a devoted attention to every minor detail, attended necessarily by hard work and perseverance in finishing to the utmost,

and perseverance it infishing to the canalogy is indispensable.

(39) "Study of a Little Girl," (61) "Portrait of Miss Wallace," and (81) "Preparit for a Fancy Dress Ball," evidence, beyond a doubt, his admiration of the style of Sir

Thomas Lawrence, his master.
(14) "Diana and Endymion;" the poetic notion of Diana assuming the crescent form is strikingly beautiful, as is the general tone con-

sistent with a moonlight effect.
(22) "Samson betrayed by Delilah" is signalised by many incongruities, but by more excellencies

(27) Pluto carrying off Proserpine;" the two principal figures are as fine as anything in the collection (33) "Waters of Elle;" a beautiful bit of pathos charmingly rendered; exhibited some ten years back at the British Institution. (40) is a powerful bit of colour,

Samaritan;" a beautiful specimen, abounding in fine points, never excelled in colour. (45) "Phædria and Cymochles"—a bouquet of

flowers.

(50) "The Repentant Prodigal's Return to his Father." The expression of the son is exquisitely appropriate, and the painting and colour inimitable; a little bit of still life painting is particularly attractive from its truth and

apparent finish.

(60) "The Sea Bather;" a finely coloured half length figure of a female, in the recollection of all, from its being but five years ago in the Royal Academy.

(62) "The Saviour;" wrongly entitled, but

a beautiful work of art, remarkably slight in execution.

Every lover of art ought to pay at least one visit to this most interesting exhibition.

BITS FROM BRISTOL.

The Bristol and West of England Architectural Society held their annual meeting on the 21st ultimo, when Mr. Norton read a paper on the Bristol High Cross, of which a fac-simile is about to be erected in College-green. It is now at Stourhead, in a miserable state of decay, the cause of which the reader thus explained:—The material used is a very coarse-grained colite, the ova being large and distinct, and readily absorbing mois-ture and frost. This, however, was remedied for many centuries by the application of polychromatic colouring, which evidently formed an effectual preservative against the weather. It presents, in its mutilated state, sufficient It presents, in its inutilated state, sufficient proof that originally not the figures only, but the entire surface of the stonework, was thus enriched: the figures have best preserved these remains of colouring. The colours used were vermillion, blue, and gold. The gilding may be traced in every part,—on the ribs of groining, &c., &c.; but the vermillion is by fare the best preserved being even now of a far the best preserved, being even now of a rich hue; the blue has faded to a pale gray. The dresses of the figures are usually painted vermillion; mantles, and such portions of dress, blue; borders, and other subsidiary orna-mental parts, being relieved with gold. This surface of painting has long fallen to decay, and hangs in loose flakes. Generally one of the above-named colours may be seen in an intermediate coat or stratum.

In addition to this cause of decay (the neglect of repainting the surface), another very fertile one is discoverable in the use of iron cramps; whether these are original, or only placed on the removal, cannot easily be deter mined : but in many instances the iron has become oxidated and increased in size to such an extent as literally to heave and thrust the stones off their beds, and a fissure thus com-menced has ended in the disruption and fall of large masses of stonework. Lead is also very generally used, both constructively, between the joints, and as flashings above the canopies, &c., and in the case of the ogee arches, circular bar iron is placed within a circular roll of lead, thus forming a kind of continuous tie or bond. The lead has affected the iron in a very extraordinary manner, and from some chemical cause has completely pulverized it; in other cases the expansion of the iron has burst asunder the lead roll and the stonework in its

turn,—a practical lesson we may all profit by.
The exhibition of The Bristol Academy for the promotion of the Fine Arts is now open, and consists of 244 works of art. The principal feature of the exhibition is Wilkie's fine picture "Columbus explaining to the Prior of the Convent of La Rabida his plan for the discovery of a new continent." Lucy, Townsend, Herbert Smith, Joy, Bramwhite, and others, exhibit pictures which have been seen in London before, and there are several mice land-scenes by local artists. Amongst the latter don before, and there are several mee land-scapes by local artists. Amongst the latter W. West has several, which are very clever, 32, "On the Conway" (figures not so good as the landscape), and 43, " Deep Shade" (something like Cresswick); and there are some good pieces of foliage, by Tucker, 114, "In the New Forest," and 132, "Wood Scene." There is a good likeness of a good antiquary,
Mr. Thomas Garrard, ("the Chamberlain") by Curnock, and a painting of the "St. George, at anchor, off Devonport," by Colling-

"The Bridge of Sighs." (41) "The Good wood Smith, which has much poetical feeling, and with a little more care, would have been a fine picture. "The Normal College for Wales, to be erected at Swansea," by Fuller and Gingell (231), is Tudor in style, with an octagon tower in centre,

There is an Art-Union in connection with the exhibition.

A new church is being built, dedicated to St.

Jude, which promises fairly. It is in the
decorated style, and has a tower. The roof,

of course, is open.
St. Mark's, Easton, recently finished, is imitation Norman, and has a tower and low flat spire (or rather high stone roof), with gro-tesque animals creeping down the angles. There is a semi-circular absis, and within, the huilding is decorated in what seemed to us a somewhat tawdry and flaunty manner. We are glad to see a desire abroad to apply colour to the interior decoration of our churches, but

it is absolutely necessary, if used, that it be applied artistically and with discretion.

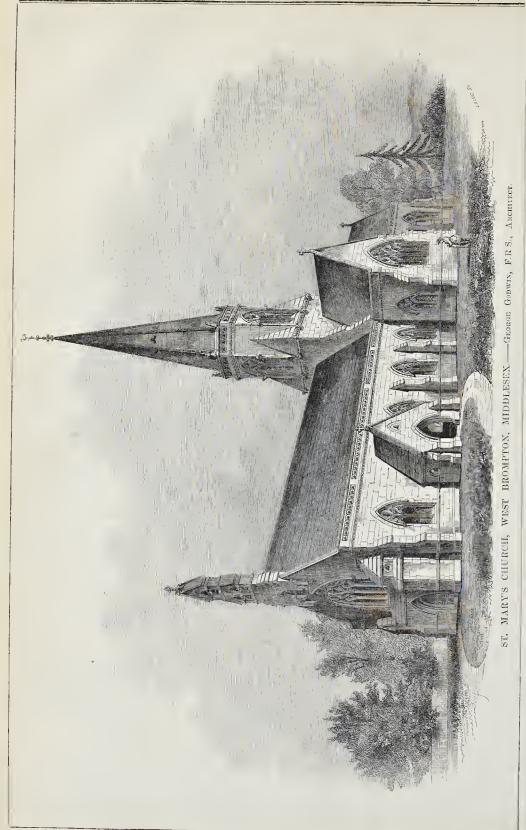

At St. Simon's, an early English church (having a north aisle), with open roof, and stalls in chancel, the pulpit and desk are placed at the south-east angle of the nave, so as, very properly, not to obstruct the view of the altar, but a large stove is nevertheless erected in the centre of the chancel arch, and, with a monstrous smoke pipe, sadly disfigures the interior. This and an ugly common street lamp affixed to the outside of the porch, should be sent to the right about. The church has a tower and broach spire, the outline of which is not very elegant. Two or three Independent and Wesleyan Chapels are about to be built in the neighbourhood of Bristol, under the di-rection of Mr. Austin, of that city.

THE DUNDEE ARCH COMPETITION.

Some of your correspondents may feel relief by knowing that the Dundee Arch affair is now closed. The architect whose design was sclected brought three estimates from Glasgow and obtained two in Dundee; and that of a Mr. Harvey, of Hamilton (a village near Glasgow), amounting to 2,173L, is accepted. The estimate seems close to the sum prescribed,— but here's the rub: the stones are to be taken from a quarry in Fifeshire, and are so soft and easily worked, that by using them instead of the Dundee stones a saving of between twenty and thirty per cent. is effected. So that, had the design in the "Enriched Saxon" style (thus the architect designates it) heen executed of the stone which the Committee not only specified, but sent the prices of to the competitors, to enable them to make up their estimates, it would have cost above 2,700l. the discussion on the subject it was stated as a reason for the change, that the architect had inspected some of the balustrades in Reform-street, of Lochee stone, and found symptoms of decay, which were also stready visible in the masonry of the new churches. The churches, masonry of the new churches. masonry of the new churches. The churches, curiously enough, are not built of the stone in question at all; and even admitting that Lochee stones are ineligible, which is rather startling, why are the Mylnefield stones rejected, the durability of which it would be folly to question while, the old toward for the constitution while the old toward for the constitution. to question while the old tower, after seven centuries, exists in such good preservation? "Expositor" can now proceed, albeit his terms are not greatly relished by some of the com-

** Competitors will find an advertisement from the committee in our present number, The Chairman, Mr. Neish, informs us, as to the delay complained of, that it "arose from the competitors not complying with the terms stated in the first advertisement, as inserted THE BUILDER. The competitors were 151, and the designs sent in (from England, Ireland, and Scotland) about 300. The one preland, and Scotland) about 300. The one preferred is by Mr. J. T. Rochead, of Glasgow, and is of the Saxon style."

LONDON ANTIQUITIES.—There is a trifling error in my letter addressed to you on the subject of the City antiquities, which, although of no great consequence, and not affecting the question, should be corrected. I intended to say that some of the City documents, alleged to have been sold from the Guildhall, are believed to date as early as the time of Henry IV. -AMOR VERITATIS.

ST. MARY'S, WEST BROMPTON.

Additional church accommodation being required for the western portion of Brompton, im Middlesex, the incumbent, the Rev. W. J. Irons, B.D., took steps to obtain it; Mr. Gunter, a wealthy and liberal proprietor, of the neighbourhood, generously presented a plot of land for the site of a new building, situated between the Fulham-road and Earles Court-road; and an energetic coadjutor being found in the Rev. Hogarth J. Swale, plans were prepared by Mr. G. Godwin, architect, and being approved of by the Lord Bishop of London and the Church Commissioners, are about to be carried out forthwith, although, as yet, the amount subscribed by the neighbourhood is small.

Our engraving represents the church as it will appear seen from the south-west, when completed. It is a cross church without aisles, with an octagon lantern at the intersection, open to the building, ornamented by kneeling angels on the parapet, and surmounted by a spire with ball flowers at the angles. In the first instance, however, it is proposed to build the nave and south porchonly, with the lower part of the tower, which is to be roofed to form the temporary chancel, and a bell cot is therefore provided at the west end. The length of the nave is 86 feet, and the width 33 feet; the temporary chancel about 18 feet square. The height to the ridge is 46 feet. There is a small open gallery of wood for children at the west end (the turret seen in the view contains the stairs to it), with screen beneath; and there is accommodation in the part now to be built for about 500 worshippers.

The style of architecture adopted is the Decorated; the materials, Kentish rag with Bath stone (from the Coombe Down quarries) for the dressings. The walls are 2 feet 3 inches thick, on a concrete bottom. The roof is open, of course, having arched ribs at intervals springing from carved stone corbels: the covering of green slates. All the seats are open, and have ornamental ends.

The following tenders were sent in for the execution of the work:—

Carter and Ellis £3,297
Glenn 3,251
Haward and Nixon 3,240
J. Barr 3,096

The estimated additional cost of Caen stone for the dressings in lieu of Bath stone varied

from 130l. to 100l.

The church will occupy the centre of an ornamental enclosure, which will have detached villas, in a crescent form, around it.

POPULAR EDUCATION. YORKSHIRE MECHANICS' INSTITUTES.

At the Hull Athenæum soirée, held on the 30th ult., after a meeting of the Yorkshire Union of Mechanics' Institutions,* some admirable addresses were delivered by the Earl of Carlisle, who presided, the Earl of Yarborough, the Dean of Ripon, Dr. Hodgson, Mr. E. Baines, Mr. Clay, M.P., the Rev. James Aspirall and others.

pinall, and others.

Lord Carlisle, in the course of his speech, said, I should think that person a very injudicious friend of mechanics' institutions who should pretend that in your reading rooms and lecture rooms, the means were afforded of turning all your members at once into finished scholars, or ready-made philosophers; or should say that they put it in your power to grasp that eminence which must always be the reward of the midnight toil of the student, or the life-long research of the experimentalist. But if it be the object how to raise the toiling masses of our countrymen above the range of sordid cares and low desires—to interweave the daily drudgery of life with the countless graces of literature, and the glowing web of fancy—to clothe the lessons of duty and of prudence in the most instructive as well as the most inviting forms—to throw open to eyes,

dulled and bleared with the irksome monotony of their daily task-work, the rich resources and the boundless prodigality of nature—to dignify the present with the lessons of the past and the visions of the future—to make the artizans of our crowded workshops and the inmates of our most sequestered villages allive to all that is going on in the big universe around them—and, amidst all the startling and repelling inequalities of our various conditions, to put all upon a level in the equal domain of intellect and of genius; if these objects, and they are neither slight nor trivial—if these objects are worthy of acceptance and approval, I think they can be satisfactorly attained by the means which mechanics' institutions place at our disposal, and it is upon grounds such as these that I urge you to tender to them your encouragement and support.

His lordship mentioned that the London School of Design has consented to give elementary drawing books to all mechanics' institutes which may choose to enter into the proper arrangements for obtaining them, and that drawing is taught in 27 institutes to 682

In concluding, the speaker said,—There is hardly a country, hardly a community, which is not disastrously suffering from the evils of the revolutionary wars which are now going on. Look at the condition of Europe at this moment—the Russians on the Danube, the French on the Tiber—why, it would really seem as if the nations of Europe, in some species of wild bacchanal, were seizing the torches of civil discord and foreign war, and throwing them in furious glee from frontier to frontier, river to river, rampart to rampart,—scaring the homes of peace and the haunts of industry with uncouth dissonance and hideous glare. While such are the appalling sights and sounds of which we catch the reflection and the echoes here, let us in Yorkshire,—let us in England,—while we in our accustomed occupations move on in our allotted spheres in the broad and equal light of freedom, let it be our care to light the genial lamp of knowledge, and to transmit it from hand to hand, from institution to institution, from wold to plain, from college to college, from the workshop to the cottage, through every portion of our land, till there shall be no haunt of human revelry unrebuked, till there shall be no haunt of peaceful industry uncheered.

The Dean of Ripon mentioned three individuals who had recently gone out of the Ripon Institution:—One of them, a common bricklayer, came to seek for instruction and the vantages to be derived from the school in that place. He is now a person of considerable comfort and station in Australia, and he subscribed fort and station in Austrana, and it of 51, said the dean, for our new building, and states that he owes all that he has from having had an opportunity of entering our Mechanic stitute. Another man came in, whose abilities became quickened, his ambition turned, and his full purpose of mind excited. He is now in most comfortable circumstances in Sweden, and writes continually with a bosom full of gratitude for the benefits he received. Another individual who came into the institution first got education himself; then he became a teacher; afterwards he put himself forward, until he was made master. He is now an engineer in a most important situation, and rising rapidly in the comforts of life. I may just add, continued the rev. gentleman, two other cases, which I think were exceeding good: they were two poor "navvies," who came to the institution, after working fourteen bours in wheeling and labouring at a railway, to learn to read, write, and to cypher. These men, at the conclusion of the railway work, came to the institution, tbanked the secretary for the knowledge they had acquired, and for what was of more value to them,—the habits of sobriety, temperance, and retirement, apart from the evil ways of their companions. They were both going to America, and came to take their leave. One had saved 80l., and the other 100l. These are the practical everyday events, which I believe are taking place in

to take their leave. One had saved 80%, and the other 100%. These are the practical everyday events, which I believe are taking place in the bosoms of our institutions.

And then chimed in Mr. Baines, and said,—It is not poverty that is vulgar. Poverty may be most honourable and most highly to be respected. But it is ignorance that is vulgar,—it is vice that is vulgar. It is the habits of a

low, sensual, and degrading kind, which are vulgar. These are things which, if a man carries with him from a lower station to a higher, will make him vulgar in spite of all the dignity his position may give him. Our object is very unambitious. We have to labour by most homely means, and to labour in a very elementary way upon the very humblest classes, and there it is that we do our good.

NORTHAMPTON CORN-EXCHANGE COMPETITION.

Many of your readers will doubtless be glad to know bow this affair is progressing. Between fifty and sixty very elaborate designs have been sent in, the mere cost of which, wholly irrespective of the labour of each individual competitor, cannot have fallen far short of a thousand pounds, or one eighth of the actual sum required to erect the building,—so that there is, I think, a strong case for assuming, as a friend of mine did the other day, that, take them on the whole, architects are a very wealthy, public-spirited body of men. Henceforth, Sir, let us hear no more of poor architects, since this is the every-day style in which we respond to advertisements for competitions; and, in fact, you may say, why should we trouble you with our individual complaints of the mode in which competitions are conducted and decided, since it is evident, from our torpulity as a body, that we are extremely well satisfied with the system?

In the present case I understand the committee have selected three designs, one of which they propose to adopt. The rest may be seen, not hung up (for even simplicity's sake), but laid out flat upon tables, one drawing upon another, or, as the case may be, one design upon another; so I leave you, Sir, to judge what must have been the expertness, discernment, and not merely mental but downright manual exertion of these gentlemen, to have thoroughly examined in so short a time (for their meetings are few and far between), this vast and cumbersome stratified surface of architectural drawing.

They'll settle the mystery sine timore, And (as we must all suppose) sine favore; But both things they'll never do, sine sudore.

But to be serious (and it is indeed a serious matter): How was it possible thus to do justice to the very many competitors, some of whom I know to be eminent men?

I write to The Bullder because this affair is still undecided; and your journal will be again published ere the next meeting of the committee can take place. I do not at all assume that these gentlemen would knowingly act unjustly in this matter; the blame, in fact, lies at our own doors; for architects, and they alone, have the power to remedy this state of things. I must add, that although the Committee have thought themselves competent to select the three best designs out of the fifty or sixty, and have ascertained the names of their respective authors, they are completely at fault as to which one of these few to choose; and they have therefore called in a F.R.S. from London to decide which is the best of all the three. Whoever this gentleman may be, his being called in at all speaks well, I think, for the good intentions of the committee; and I entertain a hope that he will explain to them that if they really desire their project to be benefited by his professional experience and ability, they will at once take his opinion, not merely of these three designs, which, by the by, they will not admit any competitors to inspect, but of the entire fifty or sixty submitted.

By publishing these particulars the adjudication of this competition will become more or less what that of all public architectural competitions ought to be, a public transaction, open to the face of day; and I am convinced that the more they are made so the better it will be, not for architects merely, but for our public buildings, and still more especially the interests of those most mysterious, invisible, and much-abused gentlemen, the architectural competition committees.—I am, &c., W. Y.

THE ROYAL ACADEMY OF FINE ARTS AT BERLIN have elected Mr. Donaldson an honorary and foreign member of that body.

^{*} The total number of Mecbanics' Institutions, as comprised within the Yorkshire Union, amounts to 84, and the aggregate number of members thus united is 15,728. Within the period of this last year there has been an addition of five institutes and of 1,623 members to the ranks of the institution.

LORD LOVELACE'S COLLAR ROOF.

At the meeting on Tuesday, June 12, Mr. J. Field, President, in the chair, "A description of the construction of a collar roof, with arched trusses of bent timber, at East Horseley Park," by the Earl of Lovelace, was read.

The roof, which covered a hall of 56 feet

The roof, which covered a hall of 55 feet long by 24 feet wide, was described as being sustained by four arched trusses, springing from stone corbels. The ribs of these were each composed of four layers of deals, 3 inches thick, bent to the required form by steam heat. All the mouldings surrounding the tracery were also bent to the required forms in the same manner, thus giving, as was thought, great strength and lightness, as well as performing the work with greater economy of labour. The tracery was cut out from two thicknesses, half-an-inch each, of tub-stave oak, glued together, with the fhree at right angles to each other, which facilitated the carving, and gave greater strength to the minute tracery.

raining, and gave greater strength to the minute tracery.

The ceiling was formed of half-inch diagonal boarding, and as the slate battens crossed it in a horizontal direction, the roof was strongly braced against the action of wind, and the string of the clueration of the cluerati

stations of the alternate boards gave a pleasing variety of effect.

This kind of construction was first suggested by Colonel Emy, in his work on Carpentry, but he had applied it to much flatter roofs of large spin whereas the deal construction. large span, whereas Lord Lovelace's intention was to demonstrate its applicability to roofs for edifices in the Pointed and Tudor styles, and to show that great advantage would result from bending timbers rather than cutting them to the requisite forms; that the thrust of the roof might be entirely taken from the upper part of the walls, and carried far down them, and that such a construction might be adopted as would satisfy every condition of solidity, and, at the same time, admit of considerable decoration.

THE DOVER BREAKWATER.

THE formation of the breakwater at Dover The formation of the breakwater at Dover appears to be proceeding satisfactorily. It commences near the look-out house, and will run out into the sea, in cants about 800 feet, so as to form a harbour. A length of about 270 feet is done, and about 100 feet more will be added this season: the progress is regulated by the amount of money voted.

The outer faces of the breakwater are of Verkshire stones (Brambleith Fall), backed up.

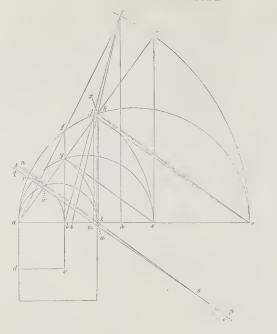

The other faces of the preakwater are of Yorkshire stones (Bramleigh Fall), backed up with a course or two of Portland stone. The stones are very large, measuring above 80 feet cabe in each. The space between the two walls is filled in solid with concrete. Large wans is fitted in solid with concrete. Large blocks of concrete are prepared (hard and dry), ready to use as they get out more into the sea, and two diving-hells are in daily use by the workmen. There is a steam-crane to raise the stone out of the ships, and crane to raise the stone out of the ships, and the mills to grind lime for concrete, and brick-earth burnt for mortar, are worked by steam power. There is a large quantity of stone ready for setting.

The work appears to be well and carefully done, and is creditable to the contractors, Messrs. Lee, of Chiswell-street. Mr. Walker is the engineer.

is the engineer.

BREAKWATERS AND LANDING PLACES,
—We have lately inspected models of some inventions connected with landing-places, which seem to deserve the inspection of those whose attention is directed to such matters. They consist of a floating pier and buoys, double action yielding moorings, also an attached self-adjusting tidal ladder, constructed on a new principle, and which seems well suited for the purposes intended. The inventor has also constructed a life-boat and travel-ling crane, for the preservation of life from stranded vessels: this is attached to his floating pier,-which, from its construction, he considers will be enabled, at all times, and in considers will be enabled, at all times, and in all weathers, to maintain its position. The name of the inventor is Savage. A floating bath and breakwater, a floating light, and a plan for extinguishing fires on board slips, by the provision of a series of perforated pipes under the decks, bear further testimony to his ingenuity and skill.

MULTIPLICATION OF THE CUBE.

MULTIPLICATION OF THE CUBE.

THE attention of the writer was directed to this subject by the following passage, in the Mechanic's Magazine, for the 7th of last October, page 355:—"At this time Mr. Mackie, a ber, page 355;—'At this time Mr. Mackie, a Roman Catholic priest, published a duplication of the cuhe, the plausibility of which attracted attention, and, it is said, even obtained the assent of the teachers of Maynooth, Young Murphy, then eighteen years of age, answered this duplication, a regulate certified (Be. Murphy, then eighteen years of age, answered this duplication in a pamphlet, entitled "Refutation of a pamphlet, written by the Rev. John Mackie, R.C.P., entitled 'A method of making a cube double of a cube on the principle of elementary geometry,' wherein his principles are proved erroneous, and the required solution not yet obtained." By Robert Murphy, Mallow, 1824, (20 pp.)

Let abde be equal to one of the sides of the cube to be multiplied. Make the line ae as many times greater than the line ab as the re-

many times greater than the line ab as the required cube is to be greater than the given one; ab is the linear unit, abcd the square

Upon ae describe the semicircle aef, draw bf Upon ae describe the semicircle aef, draw bf at right angles to ae, with radius ae describe the arc eg, through the point f draw ag, draw gh parallel to fb, bisect the angle agh by the line ig, from the unit point b draw bg, from the points of intersection j and k draw jm and kl parallel to fb, draw ke and je, draw no and pq respectively parallel to ke and je, with ab fur a radius describe the arc br, from the point of intersection s draw st tangential to the arc br; the square described upon an is equal to one of the sides of the required cube.

the square described upon an is equal to one of the sides of the required cube.

Demonstration. Upon an describe the semi-circle ann, cutting the tangent no and the arc rb in their common point v, through v draw an, draw wx at right angles to ae, and complete the figure.

The apex z of the triangle aez in one particular case, will coincide with the points j and k; in all other cases, it must lie between them; the angles iek and asn (formed by cork; in all other cases, it must lie between them; the angles jek and qsu (formed by corresponding parallel lines) are equal, and are similarly divided by the parallel lines ze and vs (the last by the construction at right angles to the unit radus av); the right-angled triangle auv inscribed in its semi-circle is equal to the right-angled triangle aby, and the hypothenuse au is equal to the hypothenuse au;

the right-angled triangle awx is equal to the triangle aez inscribed in its semi-circle, and the side ax is equal to the side az.

By similar triangles, $av = 1 : ay = au : : au : ax = az = au^2$ $av = 1: az = au^2:: au: ae = au^3$ Numerals, Cubes, ab = 1

 ab^3 = 13 $ae = au^3 = ae \times 1^3$

The cube represented by the numeral au3 is as many times greater than the cube denoted by ab^3 as the line ae is greater than the line

 $bx = ax - 1 : by :: by : ab = 1 . by = \sqrt{ax - 1}$ $ab = 1 : by = \sqrt{ax - 1} :: au =$ \sqrt{ax} : $uz = xy = \sqrt{ax}$. $\sqrt{ax - 1}$.

 $ay = \sqrt{ax}$. $xy^2 + ay^2 = ax^2 - ax + ax$

Squares described upon xy and xy are together equal to the square described upon the hypothenuse ax.

J. P. W.

** The above is to be regarded merely as an approximation, our correspondent's demonstration being incomplete.—ED.

METROPOLITAN COMMISSION OF SEWERS.

SEWERS.

A GENERAL court was held on Thursday, the 7th instant, at the Sewers Court, Greek-street; the Earl of Carlisle in the clair.

The Sewage Manure of the Metropolis.—A report was read from Mr. Donaldson, assistant-surveyor, on recent experiments made by him with sewage manure at Brentford, Hanwell, &c., and with very satisfactory results. The operations had been conducted by the use of the hose and jet. The average quantity supplied was 110 tons per acre; the time occupied being one hour and five minutes per acre, and the cost 1s. 8d., exclusive of its conveyance. In reference to this repo.t, a recommendation was received from the Sewage Manure Committee that advertisements be issued, inviting offers from the owners and occupiers of land at a moderate distance from town to take the sewage, the supply to be at the rate of eighteen irrigations per annum of 250 tons each, and stating that the metropolitan districts would yield sewage matter equal to the irrigation of 150,000 acres.

Mr. Chadwick rose to move the adoption of the recommendation, and in doing so, remarked on the important results arrived at by the use of

manure in Edinburgh, in Milan, aud the whole of Belgium; and boped they were now in a condition to bring those advantages neares home, not only in converting the sawage to the use of lands near to the metropolis, but to offer it to farmers, on very low terms. The results showed, to farmers, on very low terms. The results showed, by the use of the manure they obtained double the by the use of the manure they obtained adoubte the quantity of grass, and from other results they were fully satisfied that through its use the metropolis might be amply supplied with grass-fed lamb, at least one month earlier than beretofore. In confirmation of this statement, Mr. Cbadwick read an extract from a letter received from Mr. Roe, the for-mer surveyor to this commission, which stated that by the use of liquid manure, he was last year enabled to cut five crops of grass, leaving besides a good feed, and that this year he expected to cut seven crops, worth to cowkeepers from 61. to 71. per acre each crop. He might mention Edinburgh per acre each crop. He might mention Edinburgh as an example of the productiveness of sewage waters, and also the waters of Milan. Experiments of a most important nature had been made, not noticed in Mr. Donaldson's last report, as it was of the first consequence to surmount the difficulty of the removal of the manure, and the cost of its conveyance. By Mr. Donaldson's plan, the top dress-ing of an acre of land would cost but is. 8d., while

e usual expeuse was II. 7s.

The Earl of Carlisle—Does that include the cost of the article?

Mr. Chadwick said that was only the cost of the delivery, but it was an established fact that they should be able to supply it at one-sixth its former amount, or to give six times the number of doses amount, or to give six times the number of doses for the same charge, and the labour of an acre could be performed by a man and a boy in about forty-five minutes, and in the course of balf an hour no person could distinguisb in walking over the land that anything had taken place. This was an immense gain, as it did away with the question of its oftensiveness, and removed the objection in a sanitary point of view to the use of this manure. With these advantages, it might be asked, why not advance the state of the land in the vicinity of the metropolis? Mr. Doualdson had stated that on all the lands irrigated he found the crops look better, the lands irrigated he found the crops look better, except on the undrained lands, of which there was a great deal in the vicinity of London, of pestilential a great deal in the vicinity of London, of pestilential marshes in almost their primitive condition. The consumption of this manure would not be impeded by a distance of twenty or thirty miles, provided large quantities were used, for beyond the metropolis, in the sandy lands it might be used with advantage and a strong manure obtained for about 2s. per acre There had, unfortunately, been great obstacles to their proceedings in various ways, and necessarily a corresponding delay in their operations; but great works were now in progress, and with the most promising results. A committee had been formed, consisting of Sir John Burgoyne, Sir H. de la Beche, Captain Dawson, and Captain Veitch, of the Royal Engineers, who were considering the best means available of getting rid of the pollution of the Tbames, and were seconded in their labours by the Sewage Manure Committee. He hoped, therefore, on the completion of the survey, they should be enabled to distribute the sewage that at present flowed into it at a distance of 20 or 30 miles from the metropolis. There were many persons who could There had, unfortunately, been great obstacles to their metropolis. There were many persons who could not see what relation these measures, or agricultural land drainage, had to do with the sewerage of the prisan districts; but he contended that the health nrban districts; but he contended that the health of the metropolis was mainly dependent on the external operations. There were other questions under consideration, and amongst them a plan for intercepting the sewage, and conveying it to an immense reservoir at the Isle of Dogs; and as to how they could get by the docks;—all subjects of considerable importance. However, the whole question would be examined, and fully reported upon by the officers and engineers of the commission. He concluded by moving the adoption of the recommendation of the Sewage Manure Committee.

mittee.

Mr. C. Johnson seconded the motion, and said that the grand object in the interception of the sewage of the metropolis was, that there was sufficient of it poured into the Thames to irrigate 1,000 acres of land daily, allowing at the rate of 250 tons per acre; which would yield a great return of revenue for any expenses incurred. They must, however, look forward to the day when they could remove this sewage to a greater distance from London than they were now justified in announcing, and this might be done without putting the public to any expense. There were large breadths of land to any expense. There were large breadths of land in Sussex, on the banks of the Crouch in Essex, and in Hertfordshire, where it might be used with the most advantageous results. They proposed to carry it through open or closed pipes, according to the facilities given. At present all sewage was

tion, and had the greatest respect for the opinions of his friend Mr. Chadwick; but thought that it was extremely desirable, for sake of the success of their endeavours, that the advantages should not be placed in too broad or too favourable a point of view. He bad no objection to the form proposed, and that they should receive tenders for the sewage, but that it would not be wise to go to large expenses until they were well assured of the success of their experiments. The statement that had been made hy Mr. Chadwick, and supported by Mr. Johnson, my air. Communes, and supported by air. Johnson, would go before the public, and no doubt its merits would be well sifted and tested, and then, if satisfied with the practicability of the plan, it would be taken up by enterprising individuals, not alone in the metropolis, but in many provincial towns, whose situation for its use was much better than the lands near to Loudon. In the high lands particularly it would be of great value. It appeared that 18,000 acres of land could be manured with 250 tons per acres of land could be manured with 250 tools per acre, and taking this to increase its value but 10s. per acre, at 6 per cent., it would then yield an annual increase of 200,000t., and therefore he believed that numerous parties would be found willing to come forward, and by themselves carry out these important results and advantages.

Lord Ebrington was as desirous as Mr. Slaney to Lord Ebrington was as desirous as a desirous as a understate, rather than otherwise, the advantages to be derived, but must altogether demur to the mate of I0s. per acre as the increased value from this irrigation. He was cognizant of a fact that, in Devoushire, a clear stream of water merely heing passed through a track of land, increased its neing passed integral states of land, matesaca is value from 21. to 31. per acre; but to give but 10s. per acre as the increased value from sewage manure was quite out of the question. He would mention that the Duke of Portland had converted land worth that the Duke of Fortland had converted mind work not more than 7s. per acre into water meadows, by means of the sewage received from the town of Mansfield, which was not very strong, and its value had been increased to 14t. per acre. In Edinjurgh, had been increased to 14l. per acre. In Edinburgh, too, the value had been raised from 5s. to 25l. per acre. Such being the case, be believed the calculations of Mr. Johnson were not overstated in giving the increased value at 101. to 121. per acre. H found that water could be conveyed 5 miles at 2½d. per tun, and therefore the charge of conveying fresh water to towns need hardly differ from the cost of conveying the dirty water back. Pure water was not more necessary in towns than the fertilizing fluid was to the farmers for the purposes of vegetation.

Dr. Southwood Smith said as to the operation of Dr. Southwood Smith said as the operation of the fluid in a sanitary point of view, be found that the deodorising fluid entirely destroyed the offensiveness of the manure, increasing at the same time its value to the land. He had himself tried experiments upon two acres of land, and bad used a great deal of the most offensive manure, but by applying deodorisers, in half an hour not the slightest odont was perceptible. He used nitrate of lead, which very cheap.

The motion was put and unanimously agreed to.

Amendment of the Sewers Act .ation was received from the Works' Committee, To consider as to representing to her Majesty's Government the necessity of applying to Parliament for amended powers."

Mr. Bullar, in support of this recommendation, AIT. Dunar, in support of this recommendation, said the cleansing operations in one district were brought to a complete stand. By the decision of Mr. Burrell, under the provisions of the Police Act, they were prevented from cleansing cesspools in the day time, and in their endeavours to conform to this decision by cleansing them at night, they were met with a fresh difficulty, the Chelsea Water Company then refusing to supply them with water; so that they were prevented from doing the work either by night or by day.—This subject led to a short conversation, and it was agreed that the heads of a Bill be drawn up by the Bye Laws Committee, and transmitted to her Majesty's Government for presentation to Parliament.

A resolution was passed that all fossils, coins, &c., found in the excavation of works under the commission, be the property of the commission.

THE NEW BUILDINGS' BILL. - Your remark last week was loudly called for. It is exceedingly desirable that the intended Build-ings' Bill should be passed through Parlia-ment without further delay. When we know that the amendments proposed occupied a commission, supposed to be well able from their practical experience to deal with them, several months, that this commission was appointed by the noble lord at the head of the Woods and Forests, there would seem to be little cause for delay, and I cannot but think that somewhere or other there must be apathy or inattention to the wishes of those interested carry it through open or closed pipes, according to the facilities given. At present all sewage was carried through closed pipes.

Mr. Chadwick remarked, that having taken the average drainage of 1,000 houses for sixteen honrs, they found that, with an ordinary flow, the whole of the sewage of the metropolis could be passed through a three-feet pipe.

Mr. Slaney felt the deepest interest in the questions and the present inadequate piece of legislation.

Several months, that this commission was appointed by the noble lord at the head of the Woods and Forests, there would seem to be little cause for delay, and I cannot but think that somewhere or other there must be apathy or intention to the wishes of those interested in the amendment of the present inadequate piece of legislation.

A. B.

Miscellanea.

PROJECTED WORKS.—Advertisements have been issued for tenders, by 19th inst., for the erection of baths and washhouses in Kentstreet, Birmingham; by 25th, for certain repairs, and painting, whitewashing, &c., at St. Martin's workhouse; by 3rd July, for constructing a new sluice, and other works at Outwell; by 6th July, for relaying the carriage way, &c., of High-street and Spital-square; by 30th inst., for putting up new roof on Kirton in Lindsey parish church; by 25th, for the various works to he done in erecting the York county hospital; by 25th, for the erection of a granary and dwelling-house at Huntingdon; by 23rd, for alterations and additions at Peterborough union workhouse; and by 26th, for copper, gas-fittings, &c., lead, zinc, glass, nails, screws, and other stores, for the ancashire and Yorkshire Railway.

CHURCH DECORATIONS .- At the last meeting of the Archæological Institute, held on the 1st inst., drawings of two ancient reredos, recently discovered during some alterations in the church of St. Cuthbert, at We'ls, Somerset, as mentioned by us some time since, were presented, and detailed descriptions given. reredos was found in "Tanner's Chauntry, and presents a series of nineteen gorgeously carved and gilded and elaborately groined canopied niches, some of which contained mutilated figures, with scroll and descriptions, such as are usually represented in the history of The other is of a still more highly enriched character, and was found in the Lady Chapel: it bas two rows of niches and pedestals, five in each row. Previously to these discoveries, a fine painting of the "Salvator Mundi" had been found on the walls of the chapel of the Holy Trinity in the same church. The Marquis of Northampton in some observations on the frequent discovery of the ancient decorations of our churches, mentioned to the meeting some wall frescoes (which, on removing some plaster in the church at Castle Ashby, he had found decorating the splay of one of the chancel windows. These were in outline, and bore no traces of having been coloured originally. The style of art was been coloured originally. The style of art of about the date of the fifteenth century.

SOCIAL IMPROVEMENTS .- Under this head Mr. Charles Cochrane has published a sensible address on a broad-side, drawing attention to the Acts of Parliament which afford to the public a power to remedy most of the evils relating to bad drainage, overflowing cesspools, nuisances of every kind, offensive privies, filthy streets, courts, and alleys, expensive means of bathing and washing, impure and expensive water, fetid and expensive dwellings for the poor, the overcrowding of churchyards, &c., evils which tend to retard the social progress of the human race. In conclusion, he says wisely, "local meetings will prove of service; but care must be taken that the discussions are conducted free from any angry or personal feelings. A temperate, conciliatory, course is almost sure finally to win over the most prejudiced or the most obstinate. Above all things, never allow party or political ques-tions to be obtruded on your meetings con-vened for social purposes."

RAILWAY JOTTINGS .- The first tube of the Britannia-bridge is to be floated on Tuesday, 19th inst., at an early hour, unless the weather induce a postponement till next morning The works of the Tunbridge Wells and Hastings Railway are now in active progress from Tunbridge Wells southwards, to near Ticehurst. Gangs of men are working night and day the heavy tunnels at Wadhurst and Strawberry-hill, which give employment to upwards of 1,000. Tunnel bricklayers seem much in request, getting high wages. Eight large request, getting ingle wages. Edgib large brick-fields are in full operation.—A correspondent of the Gateshead Observer describes the railway bridge at Yarm as spanning the river Tees "by two oblique arches of 66 feet span each, built entirely of stone (and not a suspension bridge, as the Herold says.) There was the boreth side of the river section. at the north side of the river arches three land arches, and at the south side thirty-eight, making altogether forty-three arches. land arches are 39 feet span. The height from low water to the rail is about 63 feet; and the average height of the land arches, from the surface of the ground to the rail, about 55 feet."

The High Level Bridge on the York and Berwick line of railway, will, it is expected, be opened with great ceremonial on 1st August. The key of the last arch was driven home on Thursday week, by the Mayor of Gateshead, Mr. Hawks, of Hawks, Crawshay, and Co., the contractors for the ironwork. His worship stripped for the occasion, and in a business-like manner, as became a captain of industry, with a rosewood handled brassheaded hammer, struck the last few blows that united this great work from end to end. The first pile, according to the Gateshead Observer, was driven on 24th April, 1846, in presence of its designer, Mr. R. Stephenson, M.P.; and the first segment of the first arch was placed so lately as 10th July last. The iron work rising to a height of 120 feet above the bed of the river, much caution was called for, and from the careful and expensive arrangements therefore made, there has been neither loss of life nor limb in the fixing of the six massive arches, many of the castings of which weighed from 10 to 12 tons each. The cost of the bridge when completed is estimated to be 243,0906.; the viaduct through Gateshead and Newcastle, 113,057l.; land, compensation, &c., 135,000l.; total 491,153l. Large as this sum is, however, it is only half the amount that rumour assigned as the cost of the bridge alone.

alone.

A TREAD-WHEELED COACH.—We have already had schemes for the complete inversion of the railway system, with wheels on the sideway and rails on the train,—so that no one need now be surprised to hear of an inversion of the old jog-trot highway system, with the horses riding in the coach, and the passengers hanging on by the wheel. Such is literally the fact alleged to have been recently realized in Ohio, U.S., where a single broad wooden wheel or roller, 14 feet in diameter, and 6 feet in breadth, has been fitted up with tread-boards for the horses within, and an adventure of the driver, and the support of the driver, who, it would appear, can turn about and wheel about as quick as Jim Crow, or at least much quicker than a coach and six. We should prefer seeing it running straight on up-hill, however. Two heavy draught horses, it is said, can easily bowl along two dozen passengers (on a level, we presume), at the rate of one dozen miles per hour, and win easy too, their work on the tread-mill being mere amusement.

amusement.

MURAL PAINTINGS AT ST. CROSS.—
Coloured drawings of these paintings, recently
discovered on the walls of the Church of
St. Cross, were exhibited by Mr. Francis
Baigent, at a recent meeting of the Archeological Association. Some are exceedingly
elegant in design, and apparently of the early
part of the fifteenth century. Mr. Baigent
was stopt in his efforts to obtain complete
sketches, as the Earl of Guildford ordered the
walls to be immediately re-whitewashed, as already mentioned.

ROYAL COLLEGE OF CHEMISTRY.—It seems but yesterday since we had the plan and elevation of this new college in The BUILDER, as a novelty not yet realized, and now we have before us a goodly volume of the "Researches conducted in the Laboratories,"* with an able 'Introduction' and 'Remarks,' by Professor Hofmann, their presiding genius. The institution is now in a flourishing state, free of deht, and already nearly independent. The lecture theatre, however, of the original design (cost 1,800/L) is much wanted, together with some further temporary assistance, which we bope will not be denied to so thriving and hopeful a germ of future scientific greatness. We are pleased to observe amongst the items of chemical advancement within the last year or two, enumerated in Professor Hofmann's introduction, one in the reception and establishment of which The Builder may justly claim some little credit, namely—"the happy substitution of the stable and innocuous oxide of zinc, as a pigment, for white lead, which is so easily injured, and so frequently gives rise to serious diseases."

The Iron Trade.—On the only few occasions on which we have felt inclined to put the slightest trust in quarterly meetings, namely, on a recent show of onerous motive in the raising of wages along with prices, our partial confidence has very speedily proved to be misplaced. The present state of the trade is thus announced by the Birmingham Gazette,—one of the staunchest upholders of the masters' interests:—"The depression in every hranch of this trade still continues, nor has the declared reduction of 20s. in price been followed by the slightest revival of demand. On the contrary, it seems to have had a prejudicial effect; and, combined with the astounding disclosures that sales of manufactured iron had been previously made from 20s. to 30s. below the nominal rates, and that good mine pigs were in the market under 3l. per ton, has done much to impair general confidence, and to prostrate any expectation of an early revival of business. The workmen, as was expected, have quietly acceded to the proposed reduction in their wages."

to the proposed reduction in their wages."

THE BUCKINGHAM ESTATES IN IRELAND.

—A renewed attempt was lately made to sell these estates by auction. They are situated in Westmeath, and consist of 4,270 acres of land, with 121 labourers' and other bouses, mills, &c., producing in all a rental of 2,300. a-year. The whole was divided into four lots, for the first of which—653 acres of 'very excellent' land, with fonteen houses, rental in all 430l. a-year,—6,100. had been previously offered and refused. The only offers now made were 4,5001. and 5,000l., by one bidder—also refused. For the next two lots,—one of 1,279 acres 'of a very superior quality,' with 23 houses, and a corn-mill, rental 579l. a-year, upset price 7,000l.; and the other of 1,001 acres, 'average quality,' with thirty-nine houses, rental 526l.—upset price 4,000l.—there were no hidders. Lot No. 4 contained 1,338 acres, a moiety of 'the most superior quality,' with forty-five houses, and a 'well-paid rental' of 766l. 17s. a-year. For this lot 11,000l. were previously offered and refused. The previous bidder, Mr. Gibbings, now offered 9,000l. for this lot, but it also was bought in, as were all a second and third time without further offer. The sale was then adjourned sine die.

then adjourned sine die.

ENEMPTION OF LITERARY AND SCIENTIFIC SOCIETIES FROM LOCAL RATES, &c.—
A meeting on this subject, consisting of delegates from a large number of these societies, was held at the City of London Literary and Scientific Institution, on Wednesday, the 6th instant; Mr. W. Brown, M.P., in the chair. The report of a committee appointed at a former meeting was read, setting forth the difficulties and injustice which attend the administration of the present Act; and stating, that a measure had been prepared, which, providing for the annual issue of a certificate of exemption, founded on an annual return, and simplifying the legal procedure in cases of litigation, would, it was believed, secure to these institutions the immunity intended to be conferred by the 6 and 7 Viet., c. 36. It appeared, that influential deputations had waited on Sir George Grey and Lord John Russell, and that the Government had promised to give immediate attention to the subject. The meeting was addressed by Lord Wriothesly, Mr. Wyld, M.P., Mr. Lacey, M.P., Mr. Birkbeck, Mr. Toulmin Smith, and other gentlemen; and it was determined to take active means to secure an efficient Bill.

secure an efficient Bill.

DARTMOUTH PARK.—Lord Dartmouth, under the directions of his agents, Messrs. Peurce and Thynne, has laid out a large area of land at the Forest Hill station of the Croydon and Epsom Railway (close to Sydenham), as a park, with the view of inducing the erection of villas, and builders have already commenced operations. Several thousands of trees and evergreens have been planted, and a site has been appropriated for a church, much needed in the neighbourhood. The beauty of the locality, its reputed healthiness, and close proximity to London, are strong claims in favour of this new "settlement."

BRACKNELL CHURCH COMPETITION.— Fifty-one designs were sent in, from which three were at first chosen. Ultimately the committee decided upon one by Messrs. Coe and Goodwin.

and Goodwin. — Plans and specifications are wanted for the widening and improvement of Bristol bridge; premium 251., as advertised.

ARTIFICIAL MAHOGANY.—The following method of giving any species of wood of a close grain the appearance of mahogany in texture, density, and polish, is said to be practised in France with success. The surface is plained smooth, and the wood is then rubbed with a solution of nitrous acid; 1 oz. of dragon's blood is dissolved in nearly a pint of spirits of wine; this, and one-third of an ounce of carbonate of soda, are then to be mixed together, and filtered, and the liquid in this thin state is to be laid on with a soft brush. This process is to be repected, and in a short interval afterwards the wood possesses the external appearance of mahogany. When the polish diminishes in brilliancy, it may be restored by the use of a little cold-drawn linseed oil.

Incised on.

Incised Inscriptions.—Mr. J. Williams, an ingenious stone carver, of Ipswich, has submitted to us some specimens of a mode of inscribing stone which seems entitled to encouragement. The letters are incised and filled in with a composition (either black, or coloured for the capitals, as the case may be), and the whole face may then be either varnished or not. He has put up several Tables of Commandments in this way, and says he can execute them as cheaply as a competent painter could write them. The mode would seem to be applicable to other matters.

The Valley and City of Kashmir, painted by Mr. Burford, and now exhibiting at his establishment in Leicester-square, is a very successful and interesting work, the merit of which, as of other paintings by Mr. Burford, is not sufficiently appreciated by the public although they visit them. The rapidity with which, assisted by Mr. Sclous, he produces what are in reality well-finished oil paintings, fall of nature, is onlite marvellous.

what are in remay wearmined on femiliary which are in remay wear fall of nature, is quite marvellons.

The Old Market-House, Berkhemp-stead, —A correspondent is anxious to draw attention to the old market-house at Berkhempstead, in order, if possible, to induce its repair, before it finally falls to the ground. It is one of those quaint timber erections of the Tudor age which are so picturesque, and which we do not desire to lose. A few well-timed repairs to the roof and posts which carry the building, and form a covered-way, may supersede the necessity of erecting a new one, and at present it accords well with the Grammar School.

LABOURERS' COTTAGES PRIZE ESSAY.— We understand that the Council of the Royal Agricultural Society of England have awarded the society's prize of 501. "For the best Essay on the Construction of Labourers' Cottages" to Mr. Henry Goddard, architect, of Lincoln.

AN ARCHITECTURAL SOCIETY AT CHESTER has been formed, combining archeology and history. The Marquis of Westminster, lord lieutenant of Cheshire, the bishop of the diocese, and other influential persons have joined it.

No. CCCXXXIII.

SATURDAY, JUNE 23, 1849.

HE superintending inspectors under the Public Health Act, are making their reports to the general board, on the preliminary inquiries instituted in

various towns; and a few of these, namely, the reports on Whitehaven, Fareham, Ware and Amwell, Uxbridge, and Croydon, are now before us. A large section of our readers look to know something of the result of these inquiries, and, although we cannot pretend to put before them any complete view of the matter, we will endeavour to satisfy them to a certain extent. The reports are printed in an octavo form,* and consist of from twenty to forty pages each. They one and all give a miserable picture of the existing state of things, and show "that the application of the Public Health Act is not only imperatively necessary, but will be of the greatest advantage, morally, physically, and pecuniarily, as the benefits will be reaped alike by rich and poor. The labourer will be relieved from much preventible sickness, poverty, and despair; the health of all classes will he improved, and the present oppressive rates reduced."

To the statement, as to the pecuniary advantages,-"that the requisite measures may be carried out at a positive saving to the inhabitants,"-the said inhabitants do not all seem disposed to give credence, whatever may be their opinion of the report in other respects. Of this, however, hereafter.

Looking to one of the fullest of the reports (that on Whitehaven), we find the inspector (Mr. Rawlinson) saying, that in every town he has visited, "few beside the medical gentlemen know any thing of the utter wretchedness and misery produced by a want of proper sanitary regulations;" that this particular town has a great excess of disease distinctly traceable to preventible causes; and that the health of the inhabitants may be improved, and the poorrates reduced by, "first, a full and constant supply of pure water laid on in every house and in every room-tenement. Secondly, by a system of sewers laid down in the town, and of drains properly arranged and taken into every house, back street, court, yard, and alley. Thirdly, by the general adoption and use of water-closets or soil-pan apparatus, fitted up with proper tubular drains to convey away the refuse from each, and by the removal of all liquid refuse in similar drains laid at such a depth as shall insure, by means of the same excavation, the perfect drainage of the foundations of all dwelling-houses. Fourthly, by opening out blind courts and alleys, by removing all open middens in confined places, and forbidding their accumulation, by closing all objectionable cellar and room-tenements, by improved paving of all yards, courts, and alleys, and by a regular system of surface cleansing with water."

He further recommends that a cemetery should be provided, the existing burial grounds being amidst houses, and unduly crowded; that the place should be better lighted, and that the refuse of the town, by being applied to agricul-

* "By W. Clowes and Sons, Stamford-street, for her

tural purposes, might be made to lessen the rates, and produce a fund for improving the place. There is a public school here, the yard and convenience of which are in an indescribable state; "the children have to pick their way in and out of it as best they can." The inspector found it difficult to thoose his way in broad day-light!

A pretty place in which "to rear the tender mind, and teach the young idea how to shoot," -to induce careful habits and love of order! The effect of external circumstances in the formation of character is ignorantly overlooked by all classes of society. What is attributed to disposition (and the Inevitable) in after days, and affects not merely the well-being and happiness of the individual through life, but of society generally, is oftener the result of the circumstances under which he was placed, and might, without difficulty, have been changed or regulated.

In Whitehaven the habitations of the labouring classes are most injuriously crowded together, and unfit cellars are used as dwellings to a great extent. A report made to the local Board of Health there says properly :-

"Your committee cannot condemn in terms too strong the habitation of cellars, which exists in many parts of the town to a great extent. Nothing can be more injurious to the health of a labouring community than being obliged to occupy abodes of such a nature. Deprived alike of the cheering and invigorating influence of light and fresh air, it is in these dens of misery and wretchedness that disease, particularly of an infectious nature, seizes upon its unresisting and helpless victims. From these, fresh sources of infection spring up, and a neighbourhood that might otherwise he healthy is rendered the reverse of this, from the habi-tation of cellars being permitted to exist."

And not merely is it rendered less healthy bodily, but less happy, less good. A moral infection spreads, even more disastrous in its

The cost of such districts to the community is placed beyond cavil. "Bad sanitary regulations, excessive sickness and mortality, with burdensome and oppressive poors'-rates, must ever be associated. They are cause and effect."

A statement as to the gas-lighting of the town bears out the truth of our often repeated assertion (so often repeated that the echo of it is now to he heard in all quarters), that with reduced prices comes increase of consumption, and advantage as well to the shareholder as the public. The price charged for gas here, when the works were first established, was 12s. 6d. per 1,000 cubic feet. This was reduced, the chairman of the company said, "as the consumption increased, to 10s., 8s., and, in 1847, to 4s. per 1,000 feet. Since the last reduction, a very considerable increase has taken place in the consumption, and ground has been purchased to increase the works, which will be commenced immediately. Generally speaking, we divide an annual dividend of 10 per cent. But after the price was reduced to 4s. per 1,000 feet we did not divide so much. The first year was only 5 per cent., but for the last half-year we did divide 10 per

"The gradual reduction in price detailed by the chairman," says the Inspector, "is a strong incentive to comprehensive and liberal measures, as the increased consumption consequent upon a reduction of 4s, from 8s., in the space of one year, raises the per centage up to the same rank, namely, 10 per cent., and there is no proof that this is the final limit of reduc-

Existing evils are said to be frightful, and the inspector remarks that those who have hitherto had the management of the town affairs must have thoroughly neglected the condition of the inhabitants, or such an amount of human misery and degradation as is there found could not have been accumulated.

Will succeeding trustees commit the crime which a continuance in such a course, now that the evils of it are known, unquestionably in-

The report on Fareham, by the same inspector, shows, amongst other things-

"1. That the town of Farebam is not so bealthy as from its pleasant and open position it ought to be. That, in a great measure, this arises from the want of proper sewers and drains. That the stagnant ditches and open dung-heaps render the inhabitants liable to any epide mic disease whenever such unfortu-

any space has a control of the medical testimony, according to the medical testimony, excess of disease and fever may be distinctly traced to this want of drainage, and to an imperfect and impure water supply; and that a low state of morality is ever attendant upon bad or imperfect sanitary regulations, as stated

by the vicar.
3. That many grievous public and private nuisances exist, such as open and stagnant ditches, privies, and pigsties, in contact with dwelling-houses, exposed middens near open and shallow wells of water, and cesspools in confined yards and houses.

4. That the present churchyard burial-

ground should be closed, and another cemetery provided."

It maintains that the health of the inhabitants would be improved and their moral condition raised, by a perfect system of drainage, a constant and cheap supply of pure water, the use of soil-pan apparatus, improved roads properly cleansed, and the application of the Public Health Act to the town.

The inbabitants, however, or a section of them, decided, at a public meeting held two or three days ago, against the introduction of the Act. The vicar of Fareham, the Rev. Wyndham Madden, and an intelligent minority, sought to prevent a hasty decision, but the resolution was nevertheless carried.

In the report on Ware,* the inspector, Mr. W. Ranger, dwells on the importance of ventilation in preventing disease, and mentions the following illustrative facts which occurred at Aylesbury :-

"Soon after the formation of the union in 1835 and 1836, the parish workhouse, which then stood in a meadow, was purchased by the guardians of the union: the building itself underwent much alteration and considerable enlargement, so that the space around, which hefore was free and open, became occupied by new buildings, outhouses, &c., and a high boundary wall was erected. In these premises the inmates of the union-house year after year were severely and fatally affected with gastric fever, diarrhea, and dysentery; this state of things led to various measures, and all that were practicable were in succession adopted, but without effect, so that it hecame necessary to decide on abandoning the building as unfit " Soon after the formation of the union in to decide on abandoning the building as unfit for the purposes of the union (after having expended a considerable sum on the additions, sec.), solely from its insalubrity. A new union-house has since been erected on an open elevated situation; and in this building, which has been occupied since 1844, dysentery has never arisen, and the autumnal gastric and intestinal affections are far milder and infinitely more rare than in a contract than in the similar and infinitely testinal anections are far indice and mininely more rare than in any other part of the district, though no alteration of the diet of the inmates has been made. The union-house hospital is made the receptacle of most of the chronic and protracted cases for different parts of the union, and in the winter months nearly of the union, and in the winter months nearly of the union, and in the winter months nearly all the beds are often thus occupied. The new union-house is thus made subservient to

^{*} We referred some time ago to the efforts of the vicar, the Rev. J. W. Blakesley, and the parish authorities, in promoting a sanitary inquiry here,

the interests of the union, and the hospital a benefit to the sick poor instead of being the hot-bed of disease, which the old union-house most assuredly was. That huilding heing sold, it was partly pulled down and converted into distinct dwellings, and other detached houses have been erected on the same site: by clearing some of the ground and attention to drainage (although the latter is very imperfect), and hy rendering the place more open, it has been restored to an equal degree of salubrity with the rest of the vicinity. Exemplifications of similar causes of disease (i.e. want of adequate ventilation) abound in Ware, particularly Cage-yard, Blue Coat-yard, and the courts of Amwell-end."

The inspector comes to the conclusion that "a very large amount of excessive sickness, and the great excess of premature mortality, and the expense contingent thereon, may be materially alleviated by the application of the provisions of the Health Act to the township of Ware and that portion of Great Amwell immediately adjoining," He recommends that powers be taken for carrying out the following measures:—

"First—For an abundant supply of pure water upon the constant system, filtered and carried into every tenement, for domestic use, for cleansing, and household purposes, the cost of which, I am of opinion (judging from the cost of existing water-works), will not exceed the amount of 1d. per house per week.

Second—For converting existing privies into water-closets, and, in the numerous instances where neither privies nor water-closets exist, for erecting water-closets, which have been estimated at the cost of 3l. per eloset, or 4s. per annue

per annum.
Third—That powers be taken for systematically draining, by means of tubular or other efficient drains, houses, courts, areas,

and roads.
Fourth—That powers he taken for daily cleansing the carriage and foot ways, so as to prevent the accumulation of mud and filth.

Fifth—That powers he taken to render the manure of the town productive, which, I am of opinion, may be done in a way alike beneficial and profitable to all parties—the farmers as well as the inhabitants—when the necessary arrangements are made for its distribution.

Sixth—That all blind alleys, where prac-

Sixth—That all blind alleys, where practicable, be converted into thoroughfares, in order that the noxious vapours may be dissipated by currents of air, or diluted by access to large open spaces. In furtherance thereof I am of opinion that all dead walls should be taken down or made as low as possible, and open fencing substituted.

I am of opinion that all dead walls should be taken down or made as low as possible, and open fencing substituted.

Seventh.—That powers be taken for insuring a complete system of ventilation of the several rooms of tenements and parochial and other schoois for the children of the poor, and also for preventing overcrowding by regulating the number of persons sleeping in rooms, according to their sizes."

In the report on Croydon, also by Mr. Ranger, the writer urges, as he does in others, that benefits would he derived by the ratepayers from general contracts for the erection and repair of drainage and water apparatus.

"Under ordinary circumstances, when accidents happen within or without a huilding, the tenant has to consider in what manner the repair is to be done, and, not unfrequently, how he is to pay for it: but the first question is, who is to he sent for? The men when they arrive make the repair in their own way, and regardless of any system. In a majority of cases where the plumber is sent for, more than one-half of the time is absorbed in journeys. It is suggested that much of the loss arising from the journeys, &c., would be saved, and the inconvenience much more speedily remedied, if general contracts for the repairs were adopted.

There can he no doubt of the fact that hy general contracts the rate-payers would derive a very considerable henefit. By the present mode separate plumbers are employed, each doing the work in his own way; by the plan of general contracts a considerable saving of capital would be made, and the work done on

principle, in a superior manner, and at a much less cost. If the apparatus for each house require an expenditure, say of 5l. from the owner, then, instead of enforcing an immediate outlay from him to that amount, or of obliging him to send for a plumber and bricklayer, the whole might be commuted for an improvement-rate, say 1d. or 2d. a-week, payable half-yearly by the tenant."

It appears that there are in Croydon forty-five public-houses and thirty-three beer-shops. "Taking the receipts at 6*l*. per week on the average for public-houses, and 2*l*. per week at the heer-houses, the total annual expenditure of the parish at such houses will amount to 17,272*l*."

This is a suggestive sentence. Let some of our readers think over it.

It will not be difficult for those who are blindly opposed to the movement to cavil at parts of these reports, but that is not our role: we would by every means in our power help it forward, and aid in leading to the adoption of measures calculated to lessen suffering, and lengthen life; to save money, and elevate the moral character of the community.

ON THE HISTORY OF THE POINTED ARCH.

In attempting to trace the history of the pointed arch, it is not my intention to enter upon the various theories which have been proposed to account for its invention: it would be irrelevant to my present purpose to discuss whether it arose from the intersection of two round arches, as proposed by Dr. Milner, or whether it was suggested by the intertwining branches of a grove of trees, as proposed by others, even if it could be shown that it arose from any such circumstance, which I do not myself believe it can. As the question was very distinctly stated by Dr. Whewell, in his notes on German Churches, —"These only tend to show how the form itself, as an arch. may have been suggested, not how the use of it must have become universal," It appears to me that the discussion of such questions can lead to no really practical result, and, on the contrary, tends to do harm,—as, while men are discussing purely theoretical points, their attention is diverted from the real facts of the The tendency to theorise instead of ohhave been the first great serving, scems to have been the first great mistake committed in treating this question; but a second has been, confining the question to the eleventh or twelfth centuries, and discussing only whether it was then invented by the French, English, or Germans, instead of treat-French, English, or Germans, instead or creating the question as a whole. What I propose is, to widen the base of the inquiry, by placing the whole history of the pointed arch before you; and if I succeed in doing this distinctly, though it must be very succinctly, you will be as able as I am to answer the previous question for yourselves, as the whole will resolve itself into a question of probability. The principal point, however, is to place the facts of the case before you. In doing this, I shall have to hring hefore you four different series of pointed arches.

The first, commencing with the ancient known buildings, and extending down to the period of the Roman empire.

The second, commencing with the decline of the Roman influence, and extending to the present day,—in the countries of the east, to which these two classes of arches are confined.

The third class appears in the south of France alone, in the age of Charlemagne, and extends to the eleventh century, when it was superseded by the round-arched, or Norman or Lombard style; which last again gave way, in the twelfth century, to the true Gothic pointed arch, which forms the fourth class, and which prevailed almost universally over the whole of Europe till the time of the Reformation, in the sixteenth century.

mation, in the sixteenth century.

There may, perhaps, at first sight, be some difficulty in admitting the four series into the category of arches at all, as none of them are constructed on the radiating principle; and in modern times, at least, the usual definition of

an arch is,—"A curvilinear archivault, composed of two or more stones radiating from one or more centres, and so placed as to retain their position from their force and gravity, without the aid of cramps or other subsidiary means." We never build arches on any other principle, and consequently restrict the term to them. In the east, however, the case is different, and the word 'radiating' must be omitted, as there the arches are as often, perhaps more frequently, constructed by placing the stones horizontally, rather than in a radiating position; and I am not quite certain if, in some cases, we would not do well to imitate the practice, as it has the advantage of getting rid of the lateral thrust, to which I attribute mainly the durability of the specimen I am about to allude to; but he this as it may, and whether it is determined to call them only pointed openings, and not pointed arches, the history of the subject will never be correctly understood till we take both into account—for the second, I think, almost certainly arose out of the first.

The specimen I will name is from the third pyramid of Gizeh, and from the roof of the sepulehral chamber. It has perhaps less title, in one respect, to he considered as an arch than any of the others as it consists only of two stones; but it is interesting, as showing how early the curvilinear form, with a point in the centre, was used, and, consequently, how familiar it must have heen to the architects of all ages.

The second example is from the pyramids

The second example is from the pyramids of Meroe. Its age is not very well determined, hut I do not think it can be far from the period I have assigned to it, or ahout 1000 n.c.; at all events, it is anterior to the age of Greek or Roman influence, which is all that is necessary for my present purpose. Mr. Hosking is quite positive about its being a radiating pointed arch; though, without his distinct testimony, I would have been rather inclined to believe that it was horizontally constructed; at least, I do not know of any other of that age built on the same principles. But assuming it to be as described, if radiation and thrust are the true characteristics of an arch, these two have, in this respect, more title to be considered as arches than the following, the first of which is from a tumulus near Smyraa, in Asia Minor, and interesting as being, both in size and purpose, almost a counterpart of the chamber in the third pyramid. The form of the vault, however, and the mode of construction, vary considerably in the two examples, though they are still so similar as to admit of their ascribing them to the same idea at least, though not, perhaps, to the same people.

The next example is of a gateway near Missolonghi, an instance which I quote here as serving to explain the mode of construction adopted in these buildings, which is simply that of allowing the corners of masonry to project beyond one another till they meet in the centre, thus bridging over the opening to be spanned.

Another example, from the tombs of the Atride, at Mycene, combines the methods shown in the two last, the curvilinear form being retained for the vault as in the first instance, the straight-lined for the openings, but with the addition of an architrave cutting across the opening at a certain height, which was, no doubt, a great improvement on the preceding mode.

A further example, from a city gateway at Arpino, in Italy, shows the curvilinear form adapted to an opening, which, in the previous examples, was only applied to vaults, and was so obvious an improvement, not only from its greater heauty, but from its convenience, that the straight-lined form was never afterwards, so far as I know, adopted.

In an example from an aqueduct at

In an example from an aqueduct at Tusculun, we have a further innovation, insamuch as the horizontal construction is not continued to the summit, but an Egyptian arch is used to complete it. It is evident that the next step to this would be using the radiating arch, as we now use it, but it seems to have stopped there, for some time at least, as I shall have occasion to show in speaking of the Saracenic style in India.

The last of this series I shall name is from a gateway at Apos, in Asia Minor, which, from the character of its masonry and other

circumstances, is known to belong to the best period of Greek art, and is, in fact, coeval, or nearly so, with the Parthenon. Notwithstanding, however, the perfection of its masonry, it retains all the constructive peculiarities of the preceding examples. The opening is roofed, if I may use the expression, by a norizontal architrave, and a horizontal architrave, and constructive retains an expression of the procedure of th placed over it to discharge the superincumbent weight, as in the tomb above quoted, and the well known Gate of Lions, at Mycenæ. One, however, of its most singular peculiarities is, that on the inside the discharging arch is semicirular, though constructed borizontally, and of he same course of stones as the outer or he same course of stones as the outer or pointed arch, showing, I think, evidently, that hough the architects used the horizontal construction, they could not be ignorant of the principles of the radiating arch, for nothing can be more clumsy and unscientific than an unbroken circular form and horizontal and account of the property of the course of t construction, and I am convinced it never would have been adopted in this instance, hut from its familiarity rendering it beautiful in the eyes of the architects.

These examples are, I believe, sufficient to explain all the peculiarities of this mode of construction; though, if it were worth while, their number might be multiplied to almost any extent, for they exist not only in Asia, but in Italy and Greece, and indeed in all those countries inhabited by those races whom, in my
"Historical Inquiry into the True Principles
of Beauty," I have called Pelasgic, and they of Beauty, secm to have formed a substratum to all the other nations of Europe, and to most of those in Asia also.

With the appearance of Rome, however, this form entirely disappears from the countries to which her influence extended, and is universally supplanted by the circular radiating form, which, whether she invented it or not, she introduced everywhere, and left it in every country to which her dominion extended, as one of the most marked and distinguishing architectural memorials of her sway. So completely did the Roman form supplant the older Pelasgic one, that I do not know of a single instance of pointed arch of any form or mode of construction during the period of her supremacy, in any of the countries to which ber influence extended.

The moment, however, that her power declined, the pointed form re-appears; but it is not in Italy or Greece, where her influence had been so innate and so long felt, that the previous civilisation and races had been entirals ablitantials. tirely obliterated, but in Asia, its native seat; and I am convinced it would also be found in Egypt, if we had a single building of the period; but, as none exist, we are forced to recur to the very few that remain in Syria and

recur to the very lew toat remain in Spinial Western Asia for our examples.

The first of these that I shall quote is from the church of the Holy Sepulchre, built by Contact the Great now known as the mosque stantine the Great, now known as the mosque of Omar. Its arches are throughout pointed, but so timidly as to be scarcely observable at first sight, as might indeed be expected at the first revival of a long obsolete form. You will observe, also, that besides the pointed arch which looks so strange mixed with Roman details, as we here find it, it contains reminiscences of another Pelasgic form, inasmuch as the architrave rests freely on the supports, relieved from the superincumbent masses by a discharging arch, as pointed out before.

This is the only specimen of an architectural This is the only specimen of an architectural building with pointed arches of the age to which I am able to refer on this occasion,—a deficiency which arises from two causes; first, the paucity of buildings of any class erected in these countries during the period that clapsed between the age of Constantine and that of Mahomet, so that whether we are looking for round or pointed arches, we we are looking for round or pointed arches, we would be almost equally at a loss to find examples. The church in Bethlehem, which has amples the high the pullet. nampies. The church in Bethlehem, which has no pier arches at all, is the only other building I know of. In Syria and in Egypt not one specimen of any such remains; nor do I know of one in Asia Minor; and, of course, it will not do to look for pointed arches either in Italy or Greece, where the Roman influence remained measured to the control of the mained paramount far beyond the limits of the period we are now speaking of. Another cause of the want of examples is, that they have not hitherto been looked for, but

wherever a pointed arch is seen it has hitherto been put down at once as belonging to a Saracenic edifice or to some other epoch; but once it is known that the pointed arch is a characteristic of the age, and antiquaries open their eyes and look for them, I am convinced many will be found. In the meanwhile I am happy to be able to quote so valuable an au-thority as the Baron Texier in support of my views. I need scarcely remind you that the baron was employed by the French Government for many years in exploring the countries of the East, and is now publishing the result of his researches, under the direction of the Minister of Public Instruction, and I believe, that both from his experience and his character, there is no man living more qualified to give an opinion on the subject than he is.

In speaking of the Cathedral of Am, which is built with pointed arches throughout, he says, after quoting an inscription, which proves that it was finished in the year 1010, "It results from this document, that at a time when the pointed arch was altogether unknown, and never had been used in Europe, buildings were being constructed in the pointed arch style in the centre of Armenia.

At Diarbekr there is an extremely remarkahle building now converted into a mosque, which is also constructed with pointed arches. The Armenians call the building the palace of Tigranes, and there is nothing to show that it may not have served as a residence to that prince. The lower story of the palace is ornamented with columns, Roman in style, and with capitals of the Corinthian order, tolerably well executed. These columns support pointed arches. The order of the upper story is also of a very ornate Corinthian order. The friezes and cornices are executed according to the principles of Roman art of the fourth century; nevertheless the pointed arch is found everywhere mixed with the architecture as if it was currently practised in the country.

I have already spoken of the palace at Modain, the ancient Ctesiphon, a building of the sixth century, whose gigantic portal is also of pointed architecture."

The baron then proceeds to remark, "Although it is difficult to fix exactly the period of the introduction of the pointed arch into architecture, it is impossible to draw any certain conclusion regarding the date of a building from its being used in it. The question is at present far from being solved in a satisfactory manner. One thing, however, is certain, that the pointed arch is an eastern invention, and was employed in Mesopotamia long before it was known in Europe."

From the above description it is evident that the upper story at least of the mosque at Diarbekr is a building identical in age and style with the so-called mosque of Omar at Leggeslam for the age. Jerusalem, for the words the baron uses in speaking of it apply as correctly and graphically to the one as to the other, and if he is correct in ascribing the lower story to Tigranes we have at least three specimens on the Tigris, extending from the Christian era to the Mahometan conquest, and, though few and far between, it must be confessed, I have no doubt but that with a little industry more may easily be discovered, and the lost links in the cbain thus supplied.*

JAMES FERGUSSON.

OSBORNE.-LIGHTNING CONDUCTORS. We learn that on the 8th a beavy electrical discharge fell on her Majesty's palace at Osborne, and did some damage to the new tower nowabout being completed at the east end of the building. Some of the cornice was destroyed, the windows shattered, and three men struck down. The high tower and flag-staff at the down. The high tower and Hag-stan at the west end, fitted with lightning-conductors, was unharmed. The tower which suffered, not being complete, had not any such protection, and was about 200 feet distant from the more elevated tower at the west end, and which escaped damage, thus furnishing an illustration of the advantage derived from a system of electrical conductors in disarming the thunder-

N ATTEMPT TO EXHIBIT THE TRUE PRINCIPLES OF ARCHITECTURAL AND PICTORIAL EFFECT IN REFERENCE TO STREETS, AND TO TOWNS GENERALLY.

BEFORE proceeding to our immediate subject, it will not be amiss, briefly to remind you what is the real nature and influence of architecture generally, and its rank among the arts.

Architecture, in its largest sense, comprises a scientific and mechanical department, as well as an artistic; and they are most intimately connected; the latter arising in a great measure out of the former; but it is with the profession as a fine art that we have chiefly to do in this paper. Architecture as such is worthy of the consideration of the most exalted intellects; it has an influence from infancy upon our daily life, entwines itself with household virtues, and excites in our breasts a love of country and home. In its loftier effects, with painting and sculpture (from which it differs only in mechanism and application), it ballows and ennobles the mind, elevating it above trifling and vicious pursuits, and becomes, in the words of Fuseli, "the highest degree of education—the ultimate polish of man." For in the architectural pile, poulsn of man. For in the architectural pile, no less than in the poem, may be enshrined "undying thought." York Minster and St. Paul's Cathedral are equally exponents of mind with the volumes of Shakespeare and Milton. A piece of genuine architecture may be read, and become productive of the loftiest emotions of which the heart is capable. Erecting an edifice then, artistically, is the expressing of a sentiment, giving to stone and wood an idea, "fixing" as Bulwer bas it, "into substance the invisible." Coleridge wood an idea, "nxing as Duiver vas is,"
into substance the invisible." Coleridge
calls a Gothic church, "a petrifaction of relicion." Goethe terms architecture, "frozen gion." Goethe terms architecture, music." Madame De Stati music." Madame De Stael has the same beautiful conceit, and Lamartine in his "Me-moirs of my Youth," calls St. Peter's courch "an apotheosis in stone, a monumental trans-figuration of the religion of Christ."

We run counter to analogy if we deny this, and suppose that the spirit of beauty embodied in the creations of the artist, is intended increly to please the eye while it continues a novelty. It is opposed to the whole economy of nature, of which art is a reproduction; "A thing of beauty," sings the poet—

Is a joy for ever; Its loveliness increases, it can never Pass to forgetfulness.

There is an instinctive yearning after the beautiful in the breast of every man, and the mission of the architect is, with the poet, the sculptor, and the painter, to co-operate with nature in ministering to that want.

Houses were so arranged in cities as to form regular streets, from the earliest time; frequent mention of them occurs in Scripture the earliest in reference to Sodom in the days of Abrabam), where much figurative use is made of the word. "The golden streets of the New Jerusalem" are familiar to all readers

The streets of Babylon are the first of which we have anything like description. They are said to have been in straight lines, fifteen miles long, and at right angles to each other. The houses were detached and richly orna-mented towards the streets. The streets of Athens were not remarkable for beauty; the houses were ill-constructed and mean, the lanes dark and narrow; some, as may be gathered from ancient authors, were tolerably spacious; of a few mention by name has been made, as the street of Theseus—the way which led to Eleusis,—Tripodian-street—a way near the Prytanæun,—and some others.

However erroneous the principles on which streets in various times and cities were formed, the subject was generally deemed one of importance; street magnificence having not un-frequently been an object of ambition to kings and conquerors, not only in ancient but in modern times; and so much talent and wealth have of late been expended, and are now expending, on improvements in our large towns, that an inquiry into the true principles of effect in reference to street-formation is not without importance, and cannot be altogether void of

interest to the present meeting.

It has been the practice, as is well known, in the improvements alluded to, in London, Liverpool, Birkenhead, and elsewhere,—in fact it is a feature of the day, to form the new streets

^{*} The paper, of which this is the commencement, was read at a meeting of the Royal Institute of Architects on the 18th instant. We shall give the remainder hereafter, together with a report of the discussion which followed.

invariably in straight lines, with long double rows of attached houses, exactly alike, and frequently to unite under one design, in the form of terraces, a number of dwelling-houses, giving to a dozen or more of such the appeargiving to a dozen or more of such the appearance of one large mansion or palace. The object of the following paper is to show that these and some other practices have not heen adopted in conformity with correct principle. With respect to the straight line, its use, I apprehend, originated in a just aversion to the crooked, jagged, tortuous forms, with sudden (almost right-angled) bends, so much repre-hended in the old cities, and under the im-pression, on the part of the projectors, that by introducing a form the antithesis of all these, they would doubtless be right. In other words, the re-action in favour of a better practice was not attended by a due considera-tion of the laws upon which beauty depends, They took the course diametrically opposite to the rejected one, instead of instituting an inquiry into natural principles. In the practice of invariably joining houses together, and put-ting them in "uniform," principles everywhere ting them in "uniform," principles everywher manifested in nature have been unlieded, viz. individuality and diversity. Between human habitations and human heings an analogy exists, and if we look into nature in reference to the latter, we find a plan pursued very dif-ferent to that of builders; nature never loses sight of individuality; she does not occasionally usher into the world, to lighten, as it were, her task of invention, half a dozen or a dozen men, exactly alike in size, form, and feature fac-similes of each other; and we should shrink with horror at the sight of a dozen corporeally attached men; yet the practices to which I have alluded in reference to houses, are no less opposed to the dictates of good taste and enlightened judgment than such phenomena would be to the usual course of nature. In short, it cannot be disputed, if we follow the analogy of nature, that in dwelling-houses, as in the human species, there should be individuality, and that houses for different persons to inhabit should be of different designs, if not suiting the varied tastes of the occupants, at least symbolising the peculiarities of human character; and, in reference to street formation, that every house should not only be a picture in itself, but that the houses collectively should form a picture of greater variety, and that they should be, where possible, arranged with respect to composition, light and shade, shade,

respect to composition, light and shade, hreadth, colour, union and harmony with the ground, variety, and other qualities, just as a skilful artist composes his picture.

We shall, however, look in vain for the highest attributes of street perspective in the straight line, however beautiful and varied the buildings, individually, may be; that continuity of charm, or series of fine effects, of which a street is capable, cannot, I consider, be given to a straight line, however great the means employed. I am not insensible to the graces of columnar perspective as exhibited in an avenue formed by colonnades, whether interior or exterior. The long drawn aisle also of our Gothic cathedrals awakens ideas of the sublime. Than the vista of the pointed nave, continued by that of the choir, combined with chantries, screens, and shrines, nothing can be imagined more overwhelming in effect, or more in keeping with the sacred destination of the edifice. They symbolise infinity, and are productive of mysterious and sublime sensations. I mention these, because I have heard them cited in support of the straight line in reference to streets; but the office of such, I consider, is confined to a surprise—to a single and occasional view,—and look upon that office as fulfilled when they have produced their first overwhelming effect upon the spectator, to which end every means has been directed. Whilst streets, on the contrary, are for promenade and constant use, and a succession of effects and ideas are required.

The line I would suggest as most conducive to this, is one in which nature may be said to revel, viz. the winding serpentine line of a very gentle sweep; or the simple arc of a circle. Streets so formel, I consider, would not only he susceptible of the highest architectural beauty, but possess that exbaustless charm, that endless variety of effects which I have endeavowed to describe

endeavoured to describe.

It will be understood, I trust, that I do not recommend these curves for the beauty of the

lines themselves, as in a picture,—their own immediate beauty could not appear, except upon the map; the merit of the curve consists in its continually altering the point of view, and in the variety and beauty it thus produces. In such streets, the spectator of intellect and susceptibility would find a continued development of beauty, and as the disposition of light and shade, and atmospheric effect, is never the same for two minutes together, the variety will seem infinite, the pleasure endless; whilst on the other hand, a straight street flanked on either side by columns, however lavishly the riches of architecture may have been expended on it, must soon, not only cease to please but grow wearisome to the eye.

The mathematical fact that the straight line

The mathematical fact that the straight line is the shortest distance between two points, cannot, I consider, be urged against this in reference to utility. In giving a winding line to a leading thoroughfare running through a town, as a trunk for branch streets, no ground would be lost. The gentle curvature which I recommend, would make but little difference in the length, and the passenger would be recompensed for a longer walk by its containing a proportionately greater number of shops or places of business, while its devious course would enable it to embrace a greater number of distinct points or localities necessary to be united.

I do not insist, however, upon the curve as a form that should he invariably employed; there are circumstances under which the straight line would be more proper. In short streets, for instance, running from one great thoroughfare to another, the latter form would be most beatting, as no purpose could be answered by the curve. Width is the chief means of giving effect to these. Neither can the detached principle be insisted upon, except in streets where magnificence is the leading aim. The high value of land in the centre of a town would forbid it. What I would invariably insist upon, is the detaching of character—individualizing the houses; and, after all, that is the most important point, as it immediately produces the great desideratum—variety; while the other qualities for which I contend, do it in but an indirect manner.

To a curved street, distinct character to the houses is an advantage which should not be dispensed with; it is requisite to the full development of that variety which the eye requires, but in a straight street it is absolutely necessary, as an escape from the most wearisome and complete monotony: in such a street the houses should present every variety of form, size, hue, style, and design, and thus produce the greatest possible change of shalf with the street of the street

of sky-line.

There are four streets in the city of Oxford that will serve as examples here—two ancient and modern; of either kind one is curved, the other straight; in the ancient ones the bouses vary in character, in the modern ones they are all alike. To any unprejudiced mind that examines and compares the several effects of these streets, the general truth of the remarks I have made, will, I think, be apparent, without further comment of mine.*

I am aware that the projectors of modern streets in adopting the straight line have had ample precedent. If we turn to the great cities of ancient and modern times, which have heen executed throughout or for the most part upon a complete and digested plan, we find, though magnificence has been the leading aim, that this principle has been followed. Babylon, as I have said before, was huilt in straight lines, each street crossing the other at right angles. It had, however, one quality conducive to the pictorial—the houses were detached.

In Washington, evidently intended by its founders to unite in its plan all the heauties of which a city is capable, the same principle has guided, though in many respects it is an advance upon Babylon and others: besides its intersection by the principal streets running due north and south, from the president's house, the capitol, and other important points of the city, run diagonal streets, east and west, connecting them with other ornamental and imposing objects, which with the former close the perspective at either end: this arrangement is well worthy of notice, it tends greatly

to promote diversity of view, and is highly conducive to grandeur of general effect. There are open areas at the intersection of the principal streets, formed into various regular figures, destined for the reception of statues and obelisks to their eminent men; the great leading streets are 160 feet wide, with not only a foot walk and carriage way, but also a gravel walk, planted with trees on each side. St. Giles's-street, Oxford, in all probability sug-

gested this arrangement.

The streets of Philadelphia, and of most of the new towns of America, are straight and

cross each other at right angles.

In Rome, some of the principal streets are of considerable length, and by dint of churches, palaces, and fountains, have an imposing effect: the Corso, which contains several palaces ranging in a line with the houses, is perhaps the finest; but the streets are perfectly straight. The streets of the principal towns of the Romans were straight, and Tacitus informs us that for protection from the sun they are so narrow that Pompeil was called a city of lanes. Antinöe, built by Adrian, and considered a perfect model of the Roman city, had its streets straight. The principal ones had on each side of the way piazzas 5 or 6 feet broad, and running the whole length of the street, by means of which the city from one end to the other might be traversed without exposure to rain, or to the heat of the sun.

In Mexico, almost entirely rebuilt after its conquest by the Spaniards, the streets are straight, and so regularly arranged, that, if uniformity were identical with beauty, it would perhaps hear the palm over all other cities.

perhaps hear the palm over all other cities. I can, however, refer to cities whose chief beauty may he traced to the agency of the principles for which I am contending. The amphitheatrical form of Naples is evidently the secret of its beauty, and no street in Washington, Rome, or in any other city, where the straight line prevails, can vie with the Strada di Toledo, or with the beautiful streets upon the bay.

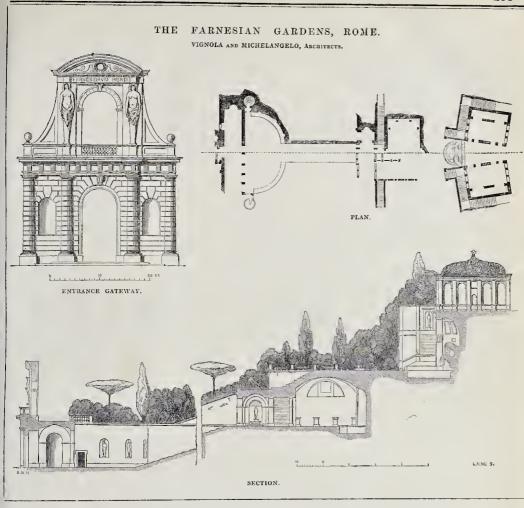

Venice also, beautiful as a dream, may be cited for the same reason. The Grand Canal, of an expansive width, takes a serpentine course through the sea-girt city. The view from the Rialto along this canal, flanked on either side by the most gorgeous palaces, churches, domes, and spires, with their sculptured arabesques, and purple marble, where the beauties of art as reflected on the pictures of Claude and Canaletti and our own Turner stand forth as rivals to those of nature, must, to those who are capable of appreciating the glories of sunshine and shadow, have an effect that words are inadequate to describe. Detail after detail," says an eloquent writer, "thought heyond thought, you find and feel them through the radiant mystery, inexhaustible as indistinct, heautiful hut never all revealed, secret in fulness, confused in symmetry as nature herself is to the bevildered and foiled glance, giving out of that indistinctness and through that confusion, the perpetual newness of the infinite and the beautiful."

But I have an example to refer to nearer home, in the interesting city of Oxford beforementioned, where though architectural beauties meet the eye at every step, and there is perhaps a greater amount of architectural wealth, in proportion to its size, than in any other city of the kingdom,—though colleges, churches, and halls are the chief objects in the view, the whole charm may he traced to that wonderful variety of form, hue, disposition, and style, that harmony with nature, and obedience to her laws, which is seen around.

The High-street, like the Grand Canal, is an analysis of the seather than the content of the seather that the content of the content

The High-street, like the Grand Canal, is an emhodiment of Hogarth's line of beauty. It is of a gentle flexuous curve, meandering through the city, and exhibiting beauties confessedly beyond what any other European city can hoast; beauties which have at least been felt by Wordsworth, who in a sonnet on Oxford, forgets not the "stream-like windings of that glorious street." "Sweeping along," observes an old writer, "in a gentle curve of a most expansive width, and bordered by a picturesque assemblage of public and private edifices, it is indeed, perhaps, without a rival. In viewing it the eye does not repose on splendid uniformity, but on an enchantingly varied whole, and when, satisfied with viewing the entire perspective, we commence an examina-

^{*} The four streets of Oxford are, High-street, St. Giles'sstreet, Beaumont-street, St. John-street.

race, with its semi-dome and rock-work basins are considered to be the work of Micbelangelo, as also the flights of steps which, winding round on either side of the pavilions, lead to the upper terrace. The pavilions themselves, which served as aviaries, and crown the summit of the gardens are the work of Reinardii.

of the gardens, are the work of Rainaldi.

It will be remarked, that these buildings are placed obliquely, in order to enhance the beauty of the perspective view, as seen from the entrance gateway below.

It may be observed, that the Italian archi-

tects frequently adopted this peculiar mode of grouping buildings, with the view to add to their picturesqueness of effect, and that Bernini, in particular, often had recourse to this expedient both in the interior as well as in the exterior of the edifices which he erected.

The gracefulness of the entrance-gateway, and its fitness of expression as an entrance to a garden, cannot fail to strike the beholder. The graces of art have been lavished with a profuse hand upon this agreeable retreat, which must, in its pristine state, have resembled those enchanted abodes which are sup-posed to exist in fiction only. The whole composition, in fact, is the realisation of a composition, in fact, is the realisation of a poetical idea: its contrivers and designers were poetical beings. Those who visit Italy are made to feel how often the beauty of her landscape is increased by the magic of her architecture. Terraced or banging gardens form a conspicuous feature in Italian landscape; and the Farnesian gardens are amongst the most beautiful, of these which, about the provider of these which, about the provider of these which, about the poeting of the provider of the poeting of the provider of the poeting of the poeti the most beautiful of those which abound in the neighbourhood of Rome; and though now in a neglected state, afford valuable suggestions to those persons whose taste or calling leads them to attempt similar undertakings. A, W, HAKEWILL,

the apparatus fixed to the eye or centre. I had, however, known for a year, the motion which produced it; but I had no apparatus to carry it out, nor had it occurred to me, to fix one part in the centre of the eye. On the same On the same one part in the centre of the eye. On the same day that this idea was presented to my mind, I first connected some sliding pencil sockets with strips of wood, and short pieces of pencil, and then attached a part to a fixed point to re-present the centre of the eye of the volute. I now saw that it would do, and various ideas of

a fixed centre occurred to me.

In the Grecian volutes it has been found that a separate piece has been inserted in the eye; and it has been conjectured from this that something had been previously introduced into the hole—it has been supposed a spiral shell, and that the volute had been formed by the unwinding of a string.

I therefore thought of a hole in the drawing

board, in a slate, or in a copper plate, in which to fix a pin for a centre. Then in all these cases, I considered that the centre might be fixed by means of cement, without a hole, which in many cases and materials would be objectionable. I did not like to make a hole in my drawing board, and I had not anything handy or fit for the others. Next the "weight of a pentagraph" occurred to me. I took it out of the case, but the pin was too small for the hole in the pencil socket, but for a trial I thought it might do. I therefore cut off some slips from a card to fill the space the pin did not occupy. I then arranged my temporary apparatus, and drew the first revolution of a spiral by this means. cases, I considered that the centre might be

As soon as I had drawn this one line, I reflected, and considered that I ought to stop reflected, and considered that I ought to stop a while, and record my first impressions. I looked at the line, and at the apparatus by which it was produced; the one was so beautiful, and the other was so simple and obvious, that I felt as if I bad seen it, and must have known it all before. It was so clear, that if a centre was thus fixed to a block of marble or stone intended for a volute, a line. if a centre was thus fixed to a block of marble or stone, intended for a volute, a line, or part of a line might be drawn without any mould, and worked, and its accuracy tried with the greatest ease as often as might be wished; and, in fact, that the line could be continued, left off, or introduced when and where the sculptor might wish,—in short, that he or an artist on any material might design with the apparatus as he proceeded, bit by bit, in the execution of the work, during which the apparatus need never be in his way.

It was equally obvious that, where a centre could be fixed in the eye of any example of a Grecian volute in the British Museum, an apparatus might be adjusted so as to compare the path of the motion with any line, and thus

apparatus might be adjusted to the path of the motion with any line, and thus prove, beyond a doubt, whether this is the identical method that was used by the Grecians

It is strange, that man should know the motions in the heavens and not know this!

motions in the heavens and not know this!
Professor Donaldson may perhaps remember
that I measured a cast of a volute in bis possession many years ago. The paper with sixteen radiated openings, on which the centre
was marked, was applied to the centre of the
eye of the volute, and then seventeen points in
one revolution were obtained. This paper
has been long lost, but I still have a slip of
paper, on the edge of which, at the time, I
formed a scale of the radii, and which indiformed a scale of the radii, and which indi-

cated an error in one of the marks first made on the radiated paper; and that was then proved to be an error, by placing the paper again on the cast, and then correcting it. The measures on this scale, some time ago, I transferred from a centre to sixteen radiating lines; and, on turning over some papers and seeing it, I considered that, without going to the it, I considered that, without going to the "British Museum," I could make one comparison. I therefore placed the "pentagraph weight" in the centre, and adjusted my temporary apparatus to it; and it has thus become the first, and a most powerful, evidence of the great probability that this is the identical method used by the ancient Greeks. Indeed, nothing but the most inveterate prejudice could hind the eves of any person who would nothing but the most inveterate prejudice could hlind the eyes of any person who would give the least attention to the subject.

The particular adjustments of the apparatus also clearly indicate that the ancient architects

also clearly indicate that the ancient architects worked by rule: the adjustments for the apparatus in this case heing, in their proportions to each other, as 2, 6, and 12,—each heing a little more than so many English inches.

The application of forms produced by varying motion was not "problematical" to the "ancient Greeks," whatever it may appear to be to Mr. Cockercil,—who by such imaginations, has perhaps contributed to prevent such simple facts being known.

The spiral lines now produced have in their

The spiral lines now produced have in their general character, when compared by scales of radli, a similar appearance to the variation in the lines which I had previously supposed, from that circumstance, and from the equal simplicity of motion, to have been the Greek spiral; although no one, to my knowledge, has attempted to disprove the correctness of such a supposition, and it may yet be found to be a variety, but in this instance it must give way to this new (doubtless very old) character of motion; and the variation of adjustments which this motion admits of, furnishes such strong presumptive evidence that it has been the origin of all scrollwork; and this will not appear the less obvious when it is known and appear the less obvious when it is known and seen, that by the most simple variation in the adjustment, every variety of "inflected lines," —"lines of beauty" for connecting the two scrolls at the ends of a man,—whether equal or unequal,—can be obtained.

I had ascertained how to produce these "lines of beauty" about a year ago, although I had not an apparatus to draw one complete on this principle. I should be ashamed of saying this, if this simple principle of motion had been apparatus to the saying this, if this simple principle of motion had been apparatus to a saying this, if this simple principle of motion had been apparatus of a saying this. had not also escaped the observation of, as far as I know, all others, even mathematicians.

Professor Willis has not included it in his attempt at classification of motions. Nothing is more easy than to build up complicated apparatus, or to hide, to common observers, imperfections in form, by colour and ornament; while experience daily proves that the most simple principles, which, when known, require no demonstration to make them obvious, have

no demonstration to make them obvious, have not been so easily discovered.

Upon the whole, I am not sorry that the present race of architects, and especially the professors, have looked upon my endeavours with so much prejudice and indifference—perhaps I may say absolute contempt—although they have been incapable of offering anything as a substitute

anything as a substitute.

Had it been otherwise, and had they given Had it been otherwise, and had they given just so much attention to my discoveries, as to understand the subject, they might then, before me, have discovered some of the most important and interesting adjustments in the septenary system, which I had hitherto passed over. This, however, they have not done, and Mr. Cockerell may long look at the object in the wall—"a fossil of beautiful spiral outline,"—before he discovers a simple practical method equal to "those refinements which marked the smallest productions of the Greeian chisel, testimonies of the science of the Greeian chisel, testimonies of the svience of the facility the apparatus now before me is capahle of. To incur the cost, however trifling, of getting an incur the cost, however trifling, of getting an apparatus made to work very accurately, would be a risk that the invention would be at once copied; and it would be the same if even the temporary apparatus was applied, for additional proof, to a volute in the British Museum

All, therefore, that I can do is to draw a few lines, and to exhibit an example of a volute,

drawn with the temporary apparatus, at the Polytechnic Institution, and invite architects to look at them, and to invite all to ask archi-tects the question,—whether they can produce as correct a specimen by simple continuous varying motion, either for volutes or entasis, and what they really know of the septenary JOSEPH JOPLING.

NOTES IN THE PROVINCES.

THE Fitzwilliam Museum at Cambridge is now open to all respectably-attired persons on Wednesdays and Saturdays, from twelve till four o'clock.—A new chapel has been opened at Prickwillow, Ely. It is built on a site near the bridge on the Dark river, and is of flint, with stone and brick dressings and slate roof. The restoration and repair of the chancel of the old church at Soham have commenced, on plans by Messrs. Bonomi and Cory, of Durham. Carved oak stalls will run round the two sides; the floor will be relaid with encaustic tiles. The repewing of the whole body of the church is thought desirable.—

The repeirs and restoration of Meltru Mowhays. The repairs and restoration of Melton Mowbray Church by the contractors, Messrs. Broadbent and Hawley, of Leicester, are in progress. The large window on the west side of the church is to be repaired, it is said, and replaced with new stained glass.—A tomb of Caen stone, representing a railway arch or tunnel, surmounted by embattled towers or lanterns, has been built in the parish church of Otley, in memory of the thirty-four unfortunate workmen killed at the Bramhope tunnel during the progress of the Leeds and Thirsk Railway works.—The harbour of Lowestoft has now cost 177,385l., and when completed will cost about 200,000l.
It is capable of containing 200 vessels, independently of the outer hasin. At its entrance at low water there is a depth of 19 feet 6 inches. at low water there is a depth of 19 feet 6 inches. The dues for last year amounted to 3,9544., and the present are 60l. per week higher than the average of the past year.—The Bristol council have commenced rebuilding the landing-pier of Portishead; Messrs. Charles Emett and John Gay, contractors: plans by Mr. Joseph D. Green, engineer to the Bristol Docks, under whose direction the works are row, in progress.—The Allian Charal now in progress. — The Albion Chapel, Southampton, was opened on Wednesday week. t is 80 feet in length, 50 feet in width, and 32 feet 6 inches in height from floor to ceiling. The entire cost is hetween 5,000*l*. and 6,000*l*. Mr. entire cost is between 5,000t. and 6,000t. Mr. W. Hinves, of Southampton, was the architect, and Mr. T. A. Gates the builder: plasterer, Mr. C. Scorey. The building is described as "a structure in the Ionic order of classic architecture." The front is of white brick, with columns, &c., faced in Portland cement. A flight of stone steps ranges the entire length of the front, and the whole is entire length of the front, and the whole is inclosed by an iron railing from the street.

—The Brighton Commissioners, with reference to the projected sale of the Pavilion, &c., have passed a resolution that it would he highly injurious to the town of Brighton to suffer the lawn and pleasuregrounds to be built over. —The first stone of a church, to be built at Wickham Bishops, was laid on Friday in last week. It is in the perpendicular style; cost. ham Bishops, was laid on Friday in last week. It is in the perpendicular style: cost, when finished, ahout 3,800l. The church is the gift of a lady,—Mrs. Lee, of Wickham Bishops, Essex. Mr. Christian is the architect.——Fifty acres of Wimbledon Common, it is said, are to be enclosed, and an establishment for pauper children, from the Surrey Union, creeted there.——St. Peter's Church, Canterbury, according to the Dover Chronicle, is about to be placed under a process of restoration, which it much requires. The plaster covering the film is being cleared off, and the work fresh pointed.——The Rochesterbridge wardens have resolved on the erection of a new bridge forthwith. The plan is not of a new hridge forthwith. The plan is not yet determined.—A temporary church, in the form of a spacious tent, to hold between the form of a spacious tent, to hold between two and three hundred persons, has been erected in Datchet-lane, Windsor, under the Castle walls, for the families of labourers engaged in forming the branch railway to the Great Western, at Slough, and the continuation of the Richmond line from Datchet.—
The Macclesfield baths and washhouses for the working classes have been formally opened.
—On Monday week the Bishop of Manches-

ter laid the first stone of Christ Church, Friezland, near Ashton. The edifice is to he in the early English style, from a design by Mr. G. Shaw, of Upper Mill, Saddleworth, to accommodate 500 persons, and to consist of a chancel, nave, and north aisle, a tower and spire, and a south porch, the vane of the spire to rise 180 feet from the base course. A school has been already erected in the same style, has been already erected in the same style, and there is to be a parsonage and a house for the schoolmaster, also in the same style: estimated cost, schools, 1,000*l*.; church, 3,000*l*.; parsonage, 1,500*l*. master's house, 300*l*. The whole are to be built of irregular coursed parpoints, and ashlar coigns. The contractor is Mr. Wade, contractor for part of the Huddersfield Railway.—The Doncaster New Market, erected by the corporation, was recently opened. It is a long, wide building. recently opened. It is a long, wide building, in the shape of the letter L, placed on the site of the old Town Hall, in the centre of the Mag-dalens. There are eight public entrances into it. Round the inside are fifty-five shops, and up the centre at one end thirty-nine stalls: the other end is used as a butter and poultry market. The whole is already let, and at present rents, upwards of 500*l*, annually will be realized.——Eldon Church, to be consecrated sent rents, upwards of 5000, annuary win be realized.——Eldon Church, to be consecrated on 16th inst., will accommodate 800 persons. The font is of Roche Abbey stone, and the pulpit is moulded. A tower is much wanted, and the unfinished state of a street close by is and the unfinished state of a street close by is an eyesore in the view of the whole.—Messrs. Wilson and Gibson, the contractors for the southern approaches of the High Level Bridge, at Newcastle, and for the new Durham Inframary, and other buildings, have got the contract for the erection of the new Public Hall in the city of Durham, under Mr. Hardwick, architect.—Some workmen having hearn architect. — Some workmen having been employed in taking down a portion of the screen in front of the Register-house, at Edinburgh, preparatory to the erection of the equestrian statue of the Duke of Wellington, an interdict was immediately obtained, on its being learnt that the Government had no intention to allow the whole screen to be thrown back as desired by the citizens.—The Marchioness of Waterford is building, at her own cost, a new church at Guilcoh, in the diocese of Waterford. The first stone has lately been laid. The inscription on it is,—"To the Glory of God. Laid May, 1849, by George Wilson, aged 106 years; erected by Louisa, Marchioness of Waterford."—On Tuesday, June the 5th, the chapel lately built in the hamlet of Frieth, in the parish of Hambleden, Bucks, was, with its burial-ground, consecrated by the tention to allow the whole screen to be thrown of Frieth, in the parish of Hambleden, Bucks, was, with its burial-ground, consecrated by the Lord Bishop of Oxford. It is dedicated to St. John the Evangelist, and contains seats for 150 persons. Mr. J. P. Harrison is the architect. At the east and west ends are memorial windows of stained glass: the west window, in memory of the Rev. H. C. Ridley, is the work of Mr. Hudson, of Pentonville; the east window was executed by Mr. Hardman. The carpet for the chancel is a joint contribution from the labours of several ladies. The chapel is well placed on the slope of a The chapel is well placed on the slope of a hill, and is built of flint, with Bath and Caen stone dressings. The roof is of deal, the seats of cedar, the lectern of oak, and the altar-fence, pulpit, and prayer-desk of oak and cedar intermixed. The belfry is of oak, filled in with decorated work. The cost of the church and its fittings is about 1,200l. Mr. Bond, of Marlow, was the builder.

METALS .- Returns for 1848 show that METALS.—Returns for 1848 show that 3,788 tons of pig and sheet lead were imported into the United Kingdom, together with 1,298 tons of lead ore, and 64 tons of white lead. Export of lead ore, 134 tons, of pig and rolled lead, 4,977 tons, white lead, 1,168 tons, red lead, 9,320 tons, and pig and sheet lead, 3,747 tons. Copper ore imported, 50,053 tons. Value of conver manufactures imported 9, 2007. Conver copper manufactures imported, 9,2001. Copper ore retained for domestic use, 51,307 tons; duty, 10,227l. net. British copper exported, 13,466 tons. Zinc or spelter imported, 13,529 tons, duty free. Zinc exported, 562 tons British, and 3,766 tons foreign.
SALISBURY CATHEDRAL.—It is reported

in the neighbourhood, that the dean and chapter have it in contemplation to throw Salisbury Cathedral open to the public. We sincerely hope that the report in question is founded in truth.

EXEMPTION OF EDUCATIONAL INSTI-TUTIONS FROM TAXES.

OBERVING in your able periodical of last week a paragraph relative to the exemption of literary and educational institutions from the payment of rates, permit me to draw attention to the want of equity, under the present Act, in saddling a particular parish with the entire loss of rate. In a country town, for instance, with some dozen parishes, why sbould the parish in which a museum or mechanics' institute happens to be located be alone taxed by the loss of a rate on a large property, and the other eleven, which derive equal benefit from the institutions, be exempted?

Could not this injustice be obviated by di-

Could not this injustice be obviated by directing the treasurer of the union to CREDIT the individual parisk in which an institution might be situated with the amount of rate which would, but for the special exemption, be due to it, and DEBIT the union account with the same sum? I believe some such arrangement as that suggested would obviate much of the objection and opposition with which the working of the Act has been impeded.

Of course this is only suggested in the absence of a "national poor rate,"—the only effectual remedy for this and many other more important and equally inequitable anomalies.

LIVERPOOL ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY.

The annual excursion of this society took place on Saturday, the 16th inst. The locality fixed upon was the village of Gresford, in Denbigbshire, famed for its beautiful church and the picturesque scenery in its neighbourbood. The party from Liverpool was joined at Chester by a deputation from the Chester Archaeological Society. On their arrival at Gresford they were conducted over the church by the reverend vicar. The church is a fine specimen of late Perpendicular work, the tower being particularly rich in panelling and niched and canopied huttresses, the statues, for the most part, still remaining. After staying a sufficient time at Gresford, to sketch the most interesting portions, and to delineate the details, the party proceeded to Wrexham, and made an inspection of the church there, which is generally considered the pride of North Wales, after which they sat down to an excellent dinner at the Wynnstay Arms Inn. Covers were laid for forty. The chair was occupied by Mr. J. A. Picton, F.S. A., vice-president of the Liverpool Society; the vice-chair was taken by Mr. C. Reed, the secretary, and the meeting was addressed by them, by the Rev. Mr. Massie, rector of St. Mary's, Chester, Mr. John Hicklin, secretary to the Chester Society, and editor of the Liverpool Mail, and other gentlemen.

ARCHED TRUSSES OF BENT TIMBER.

I observe in your Saturday's number a report of a description of the construction of a collar roof, with arched trusses of bent timber, at East Horseley Park, read by the Earl of Lovelace.

I have never heard of, or seen Col. Emy's work on Carpentry, but the idea of bending the timber in lamine occurred to me in the beginning of 1843, when plans were wanted for temporary churches for the clergy that left the Established Church of Scotland, a model of which I had prepared and deposited in the studio of Handyside Ritchie, the sculptor, which was examined and highly approved of by a great many scientific gentlemen in Edinburgh. Since that time I have designed and carried out several churches in the pointed style, with the ribs of the trusses bent, and I have at this moment six churches in hal have at this moment six churches in hald erecting on the same principle as regards the roof, in different parts of the kingdom. Independent of the beauty of appearance and unquestionable strength gained by such a mode of construction, the great economy is, perbaps, the most striking.

About twelve months ago I was called upon to prepare a design for re-roofing a cburch in Cheshire, 48 feet wide, built in a sort of bastard Norman style, and I adopted the semi-tion of the alterations effected.

circle, as more in keeping with the rest of the work, the inner angles of each rib moulded with a notched billet. Another architect prepared a design, consisting of the common tie beam and king post, and both were estimated by the same tradesman; for the former his tender was 420l., for the latter 730l., showing a difference of 310l. in favour of this system of construction.

In no case have I had the slightest accident or giving way of the work.

The notice in The Bullder is the first intimation of this principle being applied by any one but myself to the purposes of roofing, and in a new edition of Nicholson's Carpenters' Guide, now publishing by Virtue, of Ivy-lane, under my revision, I intend to embody this mode of roofing in the work, illustrated by drawings and details.

Liverpool.

JOHN HAY.

NINEVEH.

SYRO-EGYPTIAN SOCIETY.

AT a meeting of this society, on the 12th, Mr. Ainsworth, the secretary, read a commincation "on the topography of Nineveh." After pointing out the received distinctions of Assyria proper and of the Assyrian empire, the writer proceeded to argne, that whichever of the disputed versions of Genesis x., 11, is adopted, it still remains certain that there was an Assur, or Athur, existing before the foundation of Nineveh. That the Arabian geographers Yakut, Abulfeda, and Ibn Said describe the ruins as the modern Nimrud, as those of the said Asshur, or Athur (sometimes Akur, with a kaf). That Mr. Rich, in his "Kurdistan" (vol. ii., p. 129), the Rev. N. Morren, in art. Assyria ("Cyclop. of Bib."), and Dr. Layard, in his "Nineveh, &c.," vol. ii. p. 245, admit that all well-informed natives designate Nimrud as Al Asshur, or Athur. That the name which occurs in the inscriptions found in the north-west edifice at Nimrud has been read by Major Rawlinson as that of the Asshur of Genesis, and that Dr. Hincks Ins also published his conviction that the first word of the inscription is either the name, or an abbreviation of the name of Athur; but the Doctor also adds, which is a non sequilur, that the same name stands for the city, of which the historical name is Nineveb.

That Dr. Layard's archæological investigations have already shown that the builder of the central palace—the second in succession of time—at Nimrud, also erected edifices, if he did not found the sites of what are now called 'Ba'asheikha and Kaláh Skirgat; that Dr. Layard also admits that the more modern Assyrian ruins at Koyunjuk, Khorsabad, and Karamles, represent the Nineveh of the Books of Jonah and Nahum, and of profane history and of travellers. But Dr. Layard also comprises within the same denomination, a palace of the same age that was erected upon the ruins of Asshur.

Mr. Ainsworth showed, upon a map of Assyria on a large scale, which he had drawn up, that no arbitrary grouping of the Assyrian ruins would be satisfactory at the present moment, and that in the present state of the inquiry there are no other data than that Nimrod or Ninus, or his or their successors, erected and continued to erect edifices at Athur, one of the oldest cities of Assyria proper, and that the second dynasty also erected edifices at the same spot after its fall and the rise of the historical Nineveh, to identify the one with the other; but that the greater number of prohabilities, at least topographically speaking, are that the two sites were always distinct, and that Athur or Nimrúd was a separate site from the abode of Ninus, as well as from the historical Nineveh.

St. Mary's Church, Ware, will be reopened for service on Thursday, July 5, and a sermon will be preached to aid the restoration fund, by the Rev. Henry Melvill. The restorations here, which commenced with the outside, have been carried out very extensively inside, through the zeal of the vicar and parish officers and the liberality of the inhabitants. Although personally concerned, we shall be tempted to give bereafter some little description of the alterations effected.

Books.

The Architectural Scrap Book, containing sketches of parts of buildings, English and Continental. By J. Butler and H. Hodge, architects, Beaufort-buildings.

The north aisle of Hallaton Church; Churchyard Cross, Houghton; Turrets from Boulogne and Oxford, and two Elizabethan doorways, constitute No. 3 of this work, and in No. 4 are hrick chimneys, at Assington and Terling, an oriel window from Colmar, France; and two wooden porches, from Trowlesworth Cburch, Leicestershire, and Heston Church, Middlesex. The last number is an improvement on those which precede. The oriel window from Colmar, belonging to the seventeenth century, is a curious renaissance version of the angle turrets to dwellings of the medieval period abroad. "The plan of the window is a parallelogram, placed on the angle-house of a street, offering facilities for seeing up and down four streets; it looks remarkably picturesque and rich."

Touching our remark on a previous occasion that "the idea of the 'Architectural Scrap Book' would almost seem to have been taken from the announced intention of the Architectural Publication Society," the authors have written us to say that "whatever might be inferred from appearances, the prospectus of the work was written and printed many months before they were aware of the Publication Society's existence, and that they have too much respect for the praiseworthy efforts of the society to interfere with their work or intentions."

Antiquarian Gleanings in the North of England. Drawn and Etched by W. B. Scott, of the Newcastle School of Design. No. I. Bell, Fleet-street.

This is the commencement of a laudable attempt by Mr. Scott to preserve records of the moveable antiquities of "the Nor-Humbrian province." It includes the carved reading-desk in Jarrow Church, various cinque-cento cups, a carved chimney-piece in the Guild-ha'l, Newcastle, chairs, and wall paintings.

The History of Ireland, from the earliest period of the Irish Annals to the present Time. By Thomas Wright, M.A., &c. London: Tallis. Nos. to 12.

MR. WRICHT is advancing with his history, the last number (12) bringing us to the year 1601. It seems to be carefully written, and is well calculated to supply an existing deficiency.

Miscellanea,

John Knox's House at Edinburgh,— The old house in the Netherbow, in which the stern old Calvinist lived and died, is now so dilapidated that the dean of Guild-court has ordered its removal, notwithstanding an endeavour of Mr. R. Chambers and other members of the Scottish Society of Antiquaries to prevent it. Some time ago it was proposed to errect on this spot a monument to the memory of Knox, to consist of a tower and two churches. It is to be hoped that nothing worthy of preservation in this ancient edifice will be destroyed.

A Forthcoming Panorama.—Mr. Henry Marren, Mr. Haghe, Mr. Bonomi, and other good men and true, are engaged on a panorama of the Nile, of very considerable extent, and will soon bring their labours to a close. The novelty of the subject, and the goodness of the authorities consulted, can scarcely fail to obtain for it a large amount of popularity, if the idea be carried out as efficiently as the names above-mentioned give us reason to believe it will be.

believe it will be.

A New Street Waterer has been patented by Mr. Salter, of Birkenbead. The tank is of cast-iron, mounted on cart wheels, which in rotating work a force pump, projecting the water into an air chamber, and thence in a steady stream into pierced pipes as usual. A breadth of 30 feet, or only one-half, can thus be effectually watered, or the force pump thrown altogether out of gear, by treadles at the driver's feet and handles at his side. The cost of the forcing apparatus is 15 guineas, and of the whole 45 guineas. The machine, it is said, can do the work of three ordinary water carts.

PROJECTED WORKS.—Advertisements have been issued for tenders, by 30th inst., for building a covered corn-exchange at Bedford; by July 2nd, for the erection of a bank at Darlington; by 4th, for the erection of schools at Margate; by 10th, for the erection of townhall, county court, and mechanics' institute, at Stonehouse, Devonport; by 11th, for the erection of a pensioners' establishment at Regent's-park barracks; by 10th, for the erection of separk barracks; by 10th, for the erection of separk barracks; by 20th, for the erection of extensive farm buildings at Kirtling, Cambridgeshire; by 3rd July, for cutting trenches for water mains near Manchester; by 28th inst., for the whole or any portion of the works in erection of a north wing and additions to Manchester Royal Infirmary; by 3rd July, for enterty of the erection and completion of a warehouse at the Huddersfield Station of the Lancashire and Yorkshire Railway; by 3rd, for constructing a shice at Outwell and for excavating the canal from Wisbech to Outwell; by 6th, for relaying carriage way in High-street and Spital-square, and other works: hy 26th inst., for building sewers in Little Moorfields, &c., City; by 25th, for the construction of an outlet sewer at Toxteth-park, Liverpool; hy 27th, for making roads and footpaths in Walthamstow parish; and by a date not specified for improving turnpike roads at Worcester.

Competitions.—Advertisements have been issued for plans, &c., of a church for Cheltenham; and for workhouse accommodation at Chelses, particulars as advertised

at Chelsea: particulars as advertised.

Society of Arts.—On Thursday in last
week, the annual distribution of prizes took place, H. R. H. Prince Albert, the president, in the chair. In his speech, the prince stated that he had been induced this year to offer two medals on his own account. to be competed for on two subjects, very different in themselves, but appearing to ask for competition, and to be particularly eligible as subjects to which public attention should be drawn. The first was for making a good cement to bind glass together. The sub tion of glass for metals was a matter of great importance as regarded cleanliness, and consequently the promotion of the public health, and that had been prevented to a great extent by the want of a cement that would hold. All connected with the manufacture of glass well knew that slipperiness of surface was a great cause of the difficulty experienced. But the subject of the next medal was one of national importance, and was intended to promote an improved system in the production of sugar. His Royal Highness then entered Highness more fully into this question, which is out of our province. He expressed his satisfaction our province. He expressed in same to see in the Colonial Secretary's presence a proof of the importance attached by the Government to this subject. The latter medal was awarded to Dr. Mitchell, but the former was not conferred on any one. The report read by the secretary stated that the revenue had increased during the past year from 800l. The report to 1,6001. per annum, and that the society had applied to the Board of Trade and the Woods and Forests for a space of ground for exhibitions of manufactures, the first of which it was proposed to hold in 1851. was proposed to hold in 1851. The prizes were then distributed, and the meeting was addressed by the Bishop of Norwich, Chevalier Bunsen, Sir E. Codrington, and others, and avote of thanks accorded to the president.

The Parisian Portable Alarum.—A cheap portable alarum has been submitted to us by Mr. Adams, and seems worthy the attention of those who require occasionally to rise early. The all-important point in an alarum is, of course, that it should go off at the desired moment; and if all comply with this condition as well as the specimen now in our hands does, buyers will have no reason to complain.

The Paris Exhibition of the Works

THE PARIS EXHIBITION OF THE WORKS OF LIVING ARTISTS was opened on the 15th, at the Tuileries. As might almost be expected, it is not of high character.

MURAL PAINTINGS AT ST. CROSS.—Mr. Baigent wishes us to state that the report that he was stopped in his efforts to obtain complete sketches of these paintings is not correct, as "nothing was done to the walls until several days afterwards."

Breach of Contract in the Iron Trade.—A case was recently tried in the Court of Exchequer, in which Baron Parke held that a firm-offer, authorising a party to sell at a stated price "till" a specified date, included the date so specified, till the evening of that day. But such an offer, he held, was not a binding contract till the bought and sold notes were communicated, and in this case that was not done till the day following. Evidence of this being the usage of the trade he did not think satisfactory, as offered in this case. A majority of the jury, however, held it to be so. But the Baron started another difficulty. The contract he was of opinion was revocable, and in this case it was revoked by the defendant in due time, namely, on the last date specified in the offer, on its acceptance by the plaintiff. His lordship, therefore, directed a nonsuit in the claim of 187L 10s. paid to another party on 300 tons of bar iron, on a rise in price from 51.7s. 6d. to 61.,—with leave, however, to move to enter a verdict for the sum claimed. Eventually, to prevent further bligation, a juror was withdrawn, and the judge asked to decide whether the plaintiff were entitled to recover any, and if any, what sum. His lordship approved of this on account of various legal difficulties in the way, and awarded half the sum claimed.

BATHS AND WASHHOUSES. — TIMELY ADVICE.—A foreign visiter to some of our public baths, the Baron de Suarce, while honoming the English of all classes for the establishment of such noble institutions, advises the exercise of great and even scientific care in the cleansing of towels and flannels, particularly in such a season as the present, and, above all, in the metropolis, "whither crowd strangers from every quarter of the globe, many of them from countries deplorably unhealthy, and where disease has an increased malignity." It is not sufficient, as the Baron urges, that the towels be boiled in alkaline water—the ordinary mode of cleansing,—for thus "the corrupt humours of the diseased may be enfixed in them. That," he adds, "is what your medical men, agreeing with me, will tell you, and particularly your manufacturers in wool and cotton. At Leeds, and in the west of England, the operation of cleansing the wool is known to require a wash possessing a certain precise amount and no more of alkali and heat, as the slightest deviation irremoveahly fixes the oil in the texture, instead of separating the two."

IMPROVEMENT AT PRINCES-STREET GARDENS, EDINBURGH.—Atrangements are in progress between the Government and the Edinburgh Town Council for a grant of ground on the mound, Princes-street, for the purpose of erecting buildings for the annual exhibitions of the Royal Scottish Academy, the extension of the Schools of Design, and the institution of a National Gallery of Painting and Sculpture. A design by the city architect, Mr. Cousin, has also been favourably considered by the council for the appropriation of a sum of money paid by the Edinburgh and Glasgow Railway Company, in the adornment and public opening of the gardens across which the mound runs. The scheme includes a terrace 95 feet wide along the eastern division, with the Scott monument in the centre, on the side next Princes-street, and a range of statues on pedestals. The plans, which comprise further improvements, are to he submitted for suggestion to other architects or artists.

Railway Jottings.—Contracts have been entered into at Glasgow, for the construction of part of the Nithsdale line between Sanquhar and Cumnock, a distance of 14 miles. Mr. Ritson is contractor for one-half the distance, and Messrs. Jeffs for one-fourth. The works are not heavy, and as the labour is cheap, they have been taken at 66,100t., to be completed in eighteen months. At the Drumlanrig tunnel there is now a drift through the whole excavation. —Another fatal accident has occurred at the Bramhope tunnel, where a stone from a blast in one shaft entered another 210 feet apart, and killed one of the workmen.—Large sales of rails, to the extent of some 13,000 tons, are rumoured to have been charged to the York and Berwick Company, at 3t. or more per ton than they cost. It is said that a large iron house will undergo close exa mination on this point.—The

railway clocks on the Great Northern and other principal lines in France are now regulated by electricity, the mean time emanating from one regulating clock on the Great Northern.——In Massachusetts there are 37 railway companies, with a capital stock of 50,004,100 dollars. The length of road is 954 miles, besides 88 of branches, cost 46,777,009 dollars. The earnings for last year were 6,067,154 dollars, working expenses 3,284,933 dollars. Only 220 miles are of double track. Mean speed of passenger-trains about 23\(^4\)—of luggage-trains about 12\(^4\) miles. Return of casualties,—56 persons killed, and 65 injured. During the year 300 miles of new road have been put in operation on the lines leading to Boston. The total mileage in the United States being 6,421, nearly one-sixth is in Massachusetts.

LORD ROSSE'S LAST SOIREE .- At the fourth and last conversazione given by Lord Rosse to the Fellows of the Royal Society on the 16th inst., there was a considerable attendance of men eminent in art, science, and literature. Amongst the matters exhibited which more particularly bore on our speciality was an extraordinary model of the Go Prum, or great gate of the Pagoda at Cimhaconum, near Tanjore, in the East Indies. This singular work is of pyramidal form above the gateway, in twelve stories, and displays about 300 carved Mr. Perigal exhibited his instrument figures. ingures. Mr. rengal extinued his institution to develop a peculiar law of compound motion generating "retrogressive" curves, which has been seen before at similar meetings; and Mr. Scriven exhibited a model of the Ainslie Tile Economic Kilns, wherein the heat, generated in onekiln, and having there done its work, is made to pass into another, and advance the ware a certain stage. There were some pretty mens of the vitrified lace-pattern glass, There were some pretty speciadmirable collection of photographs by Messrs. Henneman and Co., of Regent-street, and Mr. John Woolley, an amateur. The architects John Woolley, an amateur. The architects mustered strongly, and the builders were not unrepresented

VULCANIZED INDIA-RUBBER JOINTS.—
In reply to inquiries, we have had no personal experience in the durability of Mr. Brockedon's vulcanized joints. There are reports, however, on the subject by Mr. Wicksteed and Mr. A. Aikin, which are strongly in their favour. Caoutchouc is vulcanized by comhination with a certain small proportion of sulphur.

Society of Arts; Labourers' Cottages.—We have received several letters, complaining, in strong terms, of the nonadjudgment of the premium offered by the society for the best design for labourers' cottages. The society assert that the condition as to cost (100% for each five-roomed cottage) was not adhered to.

A Word IN SEASON.—Never be cast down by trifles. If a spider break his thread twenty times, twenty times will he mend it again. Make up your minds to do a thing in compass, and you will do it. Fear not if trouble comes upon you; keep up your spirits, though the day be a dark one.

Troubles never stop for ever,
The darkest day will pass away.
Fight hard against a hasty temper. If anger come, resist it stoutly. A spark may set a house on fire. A fit of passion may give you cause to mourn all the days of your life. Whatever you do, do it willingly. A boy that is whipped to school never learn his lesson well. A man that is compelled to work, cares not how badly it is performed. He that pulls off his coat cheerfully, strips up his sleeves in earnest, and sings while he works, is the man for us.

A cheerful spirit gets on quick; A grumbler in the mud will stick.

BUILDINGS AND MONUMENTS, EDITED BY GEORGE GODWIN, F.R.S., &c.

Part II., containing views of the Army and Navy Club House, Pall Mall; St. Stephen's Church and Schools, Westminster; Interior of the Museum of Economic Geology, with details; Chapter House of Lincoln Cathedral; New Hall, Pembroke College, Oxford; South Hackney Church; Interior of the Royal Italian Opera House, and University Galleries and Taylor Institute, Oxford, will be published on Saturday next. TENDERS

Received by the Society for the Improvement of the Labour-ing Classes for building the New Model Lodging House for families in George-steet, Bloomebury; Mr. Roberts, hono-rary architect. The estimates provide for two modes of constructing the filors and roof; that consisting of hollow tile arches is to be the method adopted. The quantities were supplied.

	General esti- mate exclu- sive of floors and roof.	Floors and roofs con- structed in the usual manner.	Floors and roof con- structed with hollow tile arches.

No. CCCXXXIV.

SATURDAY, JUNE 30, 1849.

ONDERFUL LONDON! "London; - opulent, enlarged, and still increasing London! Babylon of old, nor more the glory of the earth than she, a

nore accomplish'd world's chief glory now." 'If you wish," said Johnson, "to have a ust notion of the magnitude of this city, you must not be satisfied with seeng its great streets and squares, but must survey the innumerable little lanes and courts. It is not in the showy evolutions of huildings, out in the multiplicity of human habitations which are crowded together, that the wonderful mmensity of London consists." And Byron has the same idea of it when he says-

' The man who has stood on the Acropolis, And look'd down over Attica; or he Who has sail'd where picturesque Constanti-

nople is,
Or seen Timbuctoo, or hath taken tea
In small-eyed China's crockery-ware metro-

polis, Or sat amidst the bricks of Nineveh, May not think much of London's first appear-

But ask him what he thinks of it a year hence?"

That he may answer with truth, however, even then, he must have looked a little beyond the surface, and have seen, as well as the town, the ast and complicated operations going on in itts trade and commerce, administration of jusice, monetary system, legislature, machinery, traffic, markets, clubs, places of worship and amusement, scientific and literary associations, the habits and manners of the people. Its old streets are all histories:-

"The stones have voices; and the walls do live;" and its new squares are most eloquent utterances of the present time, to those whose eyes and ears are open. Far outstretching on every side, long strings of residences tie it to the adjacent country, and render its limits indefinable. The Thames links the world to it: its institutions have made it the focus of civilization: ability from whatever clime there will have reward, and deposed kings, exiled ministers, and flying "red republicans" find refuge side by side,-

"Where London streets ferment in full activity,

secure so long as they respect the laws. A year may give a good notion of London, but to know it requires much more time than this.

Even those who have lived in it all their lives, if they will glance through Mr. Cunningham's "Hand-Book," just now puhlished,* and which being before us has led to the foregoing ohservations, will see how much there is in London of which they know nothing, and how full of interest and wisdom are scores of places that they have passed listlessly scores of times. To those who see rightly, London is much fuller than it is to the unknowing, who see only with the eye.

Horace Walpole has this memorandum,-"There is a French book, called 'Anecdotes des Rues de Paris.' I had hegun a similar work, 'Anecdotes of the streets of London.' I intended, in imitation of the French origi-

* A Hand Book for London, past and present. By Peter Cunningham. 2 vols. London, 1819. John Murray.

nal, to have pointed out the streets and houses where any remarkable incident had happened; hut I found the lahour would he too great, in collecting materials from various streets, and I ahandoned the design, after having written about ten or twelve pages." Some years ago, we fell upon the notion ourselves, as probably many others have done, before meeting with it in "Walpoliana," and began "Stories of the Streets,"* but the intention went to pave a nameless place. Mr. Crofton Croker, in a series of most interesting dissertations, printed in "Fraser's Magazine," two or three years since, under the title of "A Walk from Hydepark Corner to Fulham," showed to what an extent the idea might be carried out hy intelligence and industry. And now, in the volumes hefore us, Mr. Cunningham has made Walpole's remark the motto on his title-page, and has to a considerable extent, but necessarily in a terse and condensed form, acted upon it in this " Handhook ;" and he has brought to bear upon it an immense amount of reading, especially of the poets and essayists of the two last centuries, showing industry and powers of research in the examination of parish papers and other MSS., and discrimination and skill in the use made of the matter collected. The book is in the dictionary form, similar in that respect to Elmes's "Topographical Dictionary of London:" it contains a great deal of new matter, and must have cost its author much pains and lahour during the seven years it has been in hand.

Mr. Cunningham commences his work with an interesting "Chronology of London Occurrences," brought up to the present time; and from this, without stopping to check the dates, we have selected some of the events relating to buildings :-

" 886-London repaired or rebuilt by Alfred the Great.

1078-81—White Tower, in the Tower of London, built by Gundulph, bishop of Rochester. 1083—Old St. Paul's (the church described by Dugdale) began to be huilt. 1097—Westminster Hall built by William Rufus; part of this huilding still remains.

1133-St. Bartholomew's Church founded by

tanere.
1176—London-hridge "began to he founded."
1185—Temple Church, dedicated by Heraclius,
atriarch of Jerusalem. The inscription recording

patriarch of Jerusalem. The inscription recording the circumstance was destroyed in 1695.

1189—In this year it was directed that all houses should be built of stone up to a certain height, and covered with slate or baked tile.

1208—The church of St. Mary Overy in Southwark "hegonne."

1221—The foundation-stone of the Lady Chapel in Wastington Albew laid by Henry III.

1221—The foundation-stone of the Lady Chapel in Westminster Abbey laid by Henry III. 1222—St. Paul's steeple built and finished. 1245—Henry III. ordered the east end, the tower, and the transcepts of Westminster Abbey Church, to be taken down and rebuilt on a larger scale, and in a more clegant form, at his 'own expense.'

expense.'

1245—Savoy Palace built.

1285—The great conduit in West Cheap commenced building; this was the first cistern of lead castellated with stone erected in London; the water

was conveyed by leaden pipes from Tyburn.

1290—Stone cross in Cheapside erected by Edward I. to Queen Eleanor.

1397—Westminster Hall repaired by Richard II.;

1537—Westimister that repaired by inchard 11.; the walls were carried up 2 feet higher; the windows altered; a stately front and a new roof constructed, according to the design of Master Henry Zeneley. 1431—Fleet-bridge repaired or rebuilt; this was the bridge standing in Stow's time.

1503-4, Jan. 24—First stone of Henry VII.'s Chengl laid.

Chapel laid. 1505—He Chapper 1810.

1505—Henry VII. rebuilds the Savoy, as an hospital of St. John the Baptist, for the relief of a hundred poor people; Stow says about 1509, but Weever tells us that the date 1505 was over the

gate.
1518 — Lincoln's - inu Gate, Chancery - lane,

1540-41-High Holborn paved.

* Under this same title, if we remember rightly, Mr. Leigh Hunt wrote some papers not long ago.

1548-49 - Old Somerset House commenced

1548-49 — Old Somerset House commenced huilding.
1552—May, Covent Garden and Seven Acres, called Long-acre, granted to John, Earl of Bedford, Lord Privy Seal.
1561—June 4, the steeple and roof of old St. Paul's consumed by lightning.
1566—June 7, the first stone of the Royal Exchange laid.
1571—Whitechapel first paved.
1572—Middle Temple Hall built.
1580—July 7, the Queen's proclamation deted, prohibiting the erection, within three miles of the city gates, of any new houses or tenements "where no former house hath been known to have heen."
1582—Thames water first conveyed into men's houses by pipes of lead from an engine near London-bridge, made by Peter Morris, a Dutchman; this engine supplied the Standard in Cornhill, which was first erected this year.

engine supplied the Statute of Prist erected this year.

1586—Ludgate rehuilt, and the statue of Queen Elizabeth, now at St. Dunstan's, set up.

1594—An engine erected by an Englishman (Bevis Bulmer) to convey Thames water into West-

cheap and Fleet-street. 1603—Sept. 16, Proclamation issued by King James against inmates and multitudes of dwellers in streets, rooms, and places, in and about the City

of London.

1606-7—Moorfields drained.

1608—June 10, first stone of the New Exchange in the Strand laid.

I609—April 11, New Exchange in the Strand

opened.
1617—July 7, Church of St. John's, Wapping,
consecrated by King, bishop of London.
1618-19—Jan. 12 (Tnesday), the old Banquetting
House at Whitchall hurnt down (Hoves, p. 1031).
1619—June 1, Inigo Jones's banqueting-house,
at Whitchall, commenced building.
1620—Sept. 20, New River finished by Sir Hugh
Myddelton.

at Whitehall, commenced unusing.

1620—Sept. 20, New River finished by Sir Hugh
Myddelton.

1630—July 24, proclamation dated "concerning
new buildings in and about the Cittie of London,
and against the dividing of houses into several
dwellings, and harbouring inmates; forbidding the
erection of any building upon a new foundation,
within the limits of three miles from any of the gates
of the city of London or Palace of Westminster."

1632—Sept. 14, first stone of the chapel at Somerset House laid by Henrictta Maria (Ellis's
Letters, iii., 271, 2nd series).

1633—Church of St. Paul, Covent Garden, huilt;
it was not consecrated till 1638, owing to a dispute
between the Earl of Bedford, at whose expense it
was built, and the vicar of St. Martin's-in-theFields, who claimed the right of presentation.

1633—Injo Jones's classic portice to Old St.
Paul's commenced.

Paul's commenced.
1635—Lincoln's-Inn Fields laid out according to

1033—Sanch stan retos and out according to the plan of Inigo Jones. 1633—Sept. 27, Church of St. Paul's, Covent Garden, consecrated. 1043—London fortified: Mount-street, Gros-venor-square, derives its name from one of the fortifications.

fortifications and the first ham from one of the fortifications. 1652—July 21, Inigo Jones died. 1657—June 20, "Much dehate was upon the Bill for restraint of new buildings in and about London" (Whitelocke, p. 661). 1657 — Portugal - row, Lincoln's Inn - fields,

1662—July 17, supervisors appointed by the Commons for repairing the highways and sewers. 1562—Nov. 15, Hugh Audley, "the rich Aud-ley," died; North and South Audley-streets were

called after him.

called after him.

1666—Sept. 13, proclamation dated for the rebuilding the city.

1667—May 8, Order in Council for rebuilding the City dated.

1667—Oct. 23, first stone of the second Royal Exchange laid.

1667—The Rebuilding Act passed (19 Car. II., c. 3); a monument to be erected in memory of the fire, near the place where it broke out (sec. 29).

1670—An additional Act for the rebuilding of the City passed (22 Car. II., c. 11). Water from the tops of houses to he conveyed down the sides of houses by pipes.

the tops of houses to he controlled to the controlled of houses by pipes.

1670—Temple Bar huilt.

1671—The Monument commenced building.

1674—Charles I.'s statue at Charing Cross

erected.

1675—June 21, first stone of St. Paul's laid; warrant to commence dated May Ist, 1675.

1678—Parish of St. Ann, Westminster, made.

1689—St. Bride's Church, Fleet-street, built.

1682—March, Charles II. laid the first stone of Chelsea Hospital.

1682—First fire insurance established; the Phosnix, at the Rainbow Coffee-honse, in Fleet-street.

1684—July 13, St. James's Church, Piccadilly, consecrated.

consecrated.

1684—Dover-street built.

1686—March 21, Church of St. Ann, Soho, consecrated by Compton, bishop of London.

1696-June 30, first stone of Greenwich Hospital

1698-First workhouse erected in London; ected in Bisbopsgate-street, next door to Sir Paul Pindar's.

1705-Tottenham court road first paved.

1709—Mariborough House built.
1701—Mariborough House built.
1714—Feb. 25, first stone of the church of St.
Mary le-Strand laid.
1715—Cavendish-square commenced.

1720-House designed for the Duke of Chandos, the north side of Cavendisb-square, began to be

rage laid. 1753—Horse Guards built. 1753—Mansion House finished. 1764—Portman-square commenced. 1775—The present Somerset House commenced

building.
1777-Portland-place built.

1777—Portland-place built. 1778—Marybone Gardens closed and the site let to huilders (*Lysons*, iii. 245). 1790—April 9, first stone of Novosielski's Opera House laid.

1795-Sept. 17, Covent Garden Church, built by Inigo Jones, burnt down.

Inigo Jones, burnt down.
1807—Jan. 28, gas first employed; Pall Mall the first street lighted with gas, through the sanguine perseverance of a German named Winsor; Bishopsgate-street was the second street in London lighted

with gas.

1811—Oct. 11, first stone of Waterloo-bridge laid; it was then called the Strand-bridge."

In seeking to give an idea of the hook, our object must be to extract those portions which may he most interesting to our readers.

Speaking of Aldersgate-street, and first quoting Howell, who, in his "Londinopolis," published in 1657, said this street resembled an Italian street more than any other in London, "by reason of the spaciousness and uniformity of huildings, and straightness thereof, with the convenient distance of the houses," he says,—

" On the east side (distinguished by a series "On the east side (distinguished by a series of eight pilasters) stan-Is Thanet House, one of Inigo Jones's fine old mansions, the London residence of the Tuftons, Earls of Thanet. From the Tufton family it passed into the family of Anthony Ashley Cooper, Earl of Shaftesbury (d. 1682-3); hence Shafteshury-place and Shafteshury House, as Walpole calls it in his account of Inigo Jones. In 1708 it was once more in the possession of the Thanet. was once more in the possession of the Thanet family; in 1720 it was a handsome inn; in tamity; in 1720 it was a handsome inn; in 1734 a tawer; in 1750 the London Lying-in Hospital; and in 1848 a general dispensary.*
A little higher up on the same side, where Lauderdale buildings stand, stood Lauderdale House, the London residence of John Mailand, Duke of Lauderdale (d. 1652), one of the sold-based cachel in the saign of Charles II. the celebrated cabal in the reign of Charles II. the celebrated cabal in the reign of Charles II. On the same side, still higher up, and two doors from Barhican, stood the 'Bell Inn,' of a pretty good resort for waggons with meal.' From this inn, on the 14th July, 1618, John Taylor, the Water Poet, set out on his pennyless pilgrimage to Scotland.† On the west side, a little heyond the church of St. Bottalbh Aldergata is Tripity.court, so called west stac, a little heyond the church of St. Botolph, Aldersgate, is Trinity-court, so called from a hrotherhood of the Holy Trinity, licensed by Henry VI., suppressed by Edward VI., and first founded in 1377, as a fraternity of St. Fahian and Sebastian. The hall was standing in 1790." ‡

Under the head, Bow-street, Covent Garden, built 1637, we hear something of Grinling Gibbons, the carver, who "lived in a house on the east side (ahout the middle of the street), from 1678 to 1721, the period of his death. The house was distinguished by the sign of 'The King's Arms.' " 'On Thursday the house of Mr. Gibhons, the famous carver, in Bow-street, Covent Garden, fell down; hut by a special Providence none of the family were killed; but 'tis said a young girl, which was playing in the court [King's-court?], heing missing, is supposed to be buried in the rubhish.'-Postman of Jan. 24, 1701-2."

In a house at the upper end of this street, Bonnell Thornton "opened an exhibition of sign paintings,-a piece of inoffensive drollery, taken from the annual exhibition of pictures made hy a society of artists, previous to the institution of the Royal Academy."

Of Covent Garden Mr. Cunningham says, "Covent Garden, particularly so called, is the large and well proportioned square in which the market stands; with the arcade or piazza on the north and north-east side, Tavistockrow on the south, and the church of St. Paul's, Covent Garden, on the west. The square was formed (circ. 1631) at the expense of Francis, Earl of Bedford (d. 1641), and from the designs of Inigo Jones† (d. 1652), though never completed or even perhaps designed in full. The areade or piazza ran along the whole of the parts and controlled the controlled to the complete of the controlled the contr orth and east side of the square; the church completed the west; and the south was girt hy the wall of Bedford House garden and a grove or "small grotto of trees most pleasant in the summer season," ‡ and under which the first parket was originally held. market was originally held. In the centre of the square was a column surmounted by a the square was a column surmounted hy a dial (but this was suhsequent to Inigo Jones's times), and the whole area was laid with gravel, and dry and well kept. The scene of Dryden's Sir Martin-Mar-All' is laid in this once fashionable quarter of the town, and the allusions to the square, the church, and the piazza, are of constant occurrence in the dramas of the age of Charles II. and Queen Anne."

Speaking of Cheapside, our author thus epitomises the history of the "Cross" which formerly stood there :-

"The Cross (one of the nine crosses erected by Edward I. to Eleanor his queen) stood in the middle of the street, facing Wood-street end. Eleanor died at Hardeby, near Lincoln, the year 1290, and the king caused a cross to be set up in every place where her hody rested on its way to Westminster Ahhey. Cheapside was the intermediate resting place between Waltham and Charing-cross, and 'Magister Michael de Cantuaria, cementarius,' was the mean envolved in the receiption of the contraction of the was the mason employed in the erection of the Cross. Its after history is interesting. John Hatherley, mayor, 're-edified the same in more beautiful manner' in 1441. It was new gilt over in 1522 against the coming of the Emperor Charles V., and again in 1533 against Emperor Charles V., and again in 1533 against the coronation of Henry and Anne Boleyn; new hurnished against the coronation of Edward VI.; new gilt in 1554 against the coming in of King Philip; 'broken and defaced,' 21st June, 1581; 'fastened and repaired' in 1595 and 1600; again defaced in 1600, and finally demolished Tuesday, May 2nd, 1643, in the mayorality of Isaac Pennington, the regicide; 'and while the thing was a doing,' says Howell, 'there was a noyse of trumpets hlew all the while.'"

The new Houses of Parliament are somewhat fully described, and a plan of the buildings is

Black's Ashmole MSS., col. 209.

† "They show, at Wilton, Inigo's designs for the piazzas o Covent Garden and Lincoln's-lnn. They are not lnigo's, I think, but interesting, and of a later date."

mens ... 0 8 0 Churchwardens' Accounts of St. Paul's, Covent Garden.

Respecting Whitehall the author has muccurious information-

"The old Banqueting House was hurn down on Tuesday, the 12th of January, 1618 19, and the present Banqueting House, de signed by Inigo Jones, commenced on the 18 of June, 1619, and finished on the 31st of March 1629, 371, is appears was paid to of June, 1619, and finished on the 31st of March, 1622. 37l., it appears, was paid to March, 1622. 37l., it appears was paid to June 27th, 1619, 'for making two several models—the one for the Star Chamber, the other for the Banqueting House.' This payment to Jones escaped the researches of Vertue, and the inquiries of Walpole; but still more curious discovery which I have had the good fortune to make connected with our great architect, is the roll of the account of the Paymaster of the Works, of the 'Charges in huilding a Banqueting House at Whitehall and creeting a new Pier in the Isle of Portland, for conveyance of stone from thence to Whitehall.' The sum received by the Paymaster 'for the new huilding of the Banquet Whitchall.' The sum received by the Paymaster 'for the new huilding of the Banqueting House, and the erecting a Pier at Portland,' was 15,6481. 3s. The expense of the Pier was 7121. 19s. 2d., and of the Banqueting House, 14,9401. 4s. 1d.; the expenditure exceeding the receipts by 51. 0s. 3d. The account, it deserves to be mentioned, was not declared (i. e., finally settled) till the 29th of June, 1633, eleven years after the completion of the huilding, and eight after the death of the of the huilding, and eight after the death of King James; a delay confirmatory of the un-willingness of the father and son to hring the works at Whitehall to a final settlement. The Banqueting House at Whitehall is described in this account as 'a new building, with a vault under the same, in length 110 feet, and in width 55 feet within; the wall of the foun-dation being in thickness 14 feet, and in depth dation being in thickness 14 feet, and in depth 10 feet within ground, hrought up with brick; the first story to the height of 16 feet, wrought of Oxfordshine stone, cut into rustique on the outside, and hrick on the inside; the walls 8 feet thick, with a vault turned over on great square pillars of brick, and paved in the bottom with Purheck stone; the walls and vaulting laid with finishing mortar; the upper story heing the Banouting House. 55 feet in story heing the Banqueting House, 55 feet in height, to the laying on of the roof; the walls 5 feet thick, and wrought of Northampton-5 feet thick, and wrought of Northampton-shire stone, cut in rustique, with two orders of columns and pilasters, Ionic and Composite, with their architrave, frieze, and cornice, and other ornaments; also rails and hallasters round about the top of the huilding, all of Portland stone, with fourteen windows on each side, and one great window at the upper end, and five doors of stone with frontispiece and cartoozes; the inside hrought up with hrick, finished over with two orders of columns hrick, finished over with two orders of columns and pilasters, part of stone and part of hrick, with their architectural frieze and cornice, with a gallery upon the two sides, and the lower end borne upon great cartoozes of timher carved, with rails and ballasters of timher, and the floor laid with spruce deals; a strong timber roof covered with lead, and under it a ceiling divided into a fret made of great cor-nices enriched with carving; with painting, ntees enriched with carving; with painting, glazing, &c.; for performance thereof a great quantity of stone hath been digged at Portland quarry, in the County of Dorset, and Huddlestone quarry, in the County of York.' The masons' wages were from 12d. to 2s. 6d. the man per diem; the carpenters were paid at the same rate; while the bricklayers received from 14d. to 2s. 2d. the day. The master mason was Nicholas Stone, the sculptor of the fine monument to Sir Francis Vere in Westfine monument to Sir Francis Vere in West-minster Abbey. His pay was 4s. 10d. the

When the reader has been through Mr. Cunningham's book he will he quite ready to exclaim with us,-Wonderful London!

IMPORTATION OF ZINC .- Rods for holts heing considered chargeable with duty as heing in a partly manufactured state, importers recently urged the authorities for their decision. Directions have accordingly been given for the free admission of zinc rods

TILE PAVEMENT: CAPRAROLA.

TILE PAVEMENT FROM CAPRAROLA.

THE palace at Caprarola possesses a great ariety of ornamental pavements in tiles; the ne in the chapel (in which marhle-pateræ are utroduced) is especially handsome. The one ere engraved is a simple and useful example om an apartment, on the "piano nobile." It in red and white tiles. These are mostly pares fall incheditions. in red and white thes. I ness are mostly quare, 5½ inches diameter; circular and other prins are sparingly employed, and then always djusted with nicety and care. The dimen-ions of this pavement are 27 feet by 19 feet.

ON THE HISTORY OF THE POINTED ARCH.

As I said before, it is needless to look in lose countries where Roman influence was mong for specimens of pointed arches—in ecorative art, at least. Like our forefathers ecorative art, at least. Like our forefathers ome fifty years ago, the Romans believed that he pointed arch was an ugly thing in itself, and never used it when they could help it. a some of their engineering works, however, then they were off their guard, and thinking lore of the use of the construction than the ffect it was to produce asthetically, we find nem reverting to the native form; as, for instance, in the aqueducts that supplied Contantinople with water. These were commenced tantinople with water. These were commenced nder Constantine, indeed, must have been ne of the first works undertaken after foundthe city, though their completion seems be due to the Emperor Valens (364 and 78 A.D.) Throughout these constructions enerally, in the lowest story, and always in the oldest parts, we find pointed arches used, s in the instance of the aqueduct near Pyrgos, there was see two stores of round stakes. here you see two stories of round arches sed over a lower range of pointed ones; or a this other example from the same place where he pointed arch is used throughout, except at the decorative parts of the structure, where he round arch is reverted to, as might be spected.
In speaking of the aqueduct of Valens, in

In speaking of the aqueduct of valens, in the city, General Andreosy remarks,—"That here is an older part of a better construction can the new,—the latter being so carelessly uilt that it is now falling to ruin; besides, he newer part is not constructed on the same can as the older, all the arches of which are art are semi-circular." The lower and older art he ascribes to Valens, or to the years 366 and 368.

nd 308.

In this instance, it is true, the pointed arch
more an engineering than an architectural
eculiarity,—but it shows, at least, that it was
nown and used during the age of which I am

ow treating.

These specimens are, I trust, sufficient to now that the pointed form of arch was not

unknown at the period of which we are speaking; but even if I had not a single example to adduce, I would have no hesitation in asserting its existence and general use in these countries, from the fact of its being universally used by the Mahometans from the earliest years of their existence to the present

The Arabs, it must be recollected, when they The Arabs, it must be recollected, when they left their deserts to subdue the world, were mere nomadic tribes, who had no cities, no temples, and, indeed, no buildings worthy of the name; they were warriors, not architects, and consequently were obliged to employ the natives of the conquered countries to erect their mosques; yet, with scarcely a single exception, all their edifices are erected with nointed arches. pointed arches.

pointed arcues.

I have here, for instance, a drawing of the oldest part of the Mosque of Amru, at old Cairo, enlarged from a daguerrectype made by Girault De Prangey, in which the pointed arch is used, not only in the built-up arcades, but also in the smaller windows; yet this portion of the mosque, at least, was errected in the twenty-first year after Hegira this portion of the mosque, at least, was erected in the twenty-first year after Hegira, A.D. 643, or only twelve years after the death of the prophet. In speaking of these arches, M. de Prangey says.—"The pointed arch, therefore, appears in the Mosque of Amru certain and indubitable, but, at the same time, only exceptionally—in some five or six arcades; and, perhaps," he adds, "even this may not be the work of the Arabs, if we admit the testimony of Edrisi regarding the pre-existence of a Byzantine church on the spot, of which these may have made a part." of which these may have made a part."

Judging from my own knowledge of the building, I should say they were the work of the Saracens; but whether they were or not, is immaterial to my argument. The Saracens certainly copied the pointed arch from the Byzantines, and whether, then, these are the work of the former or of the latter, is of little consequence; it certainly is of the determined. consequence; it certainly is of the date quoted, or antecedent to it, which is all that is contended or antecedent to it, which is all that is contended for. Except the mosques of Amru (there are two in Egypt), I do not know of any erections of the Saracens anterior to the end of the century. I have here, however, a specimen of one erected by the Calif Walil, at Jerusalem, in the year 87, or about A.D. 705, in which the pointed arch is used throughout. The great mosque at Damasques is of the same area. pointed arch is used throughout. The great mosque at Damascus is of the same age, and from this period to the present time there is no difficulty. The mosques of Cairo and Bagdad, and generally the buildings of Egypt, Syria, and Mesopotamia afford an uninterrupted series of examples, and all are executed in the pointed arch style; indeed, I scarcely know of a single round arch in any erection of this people in these countries; or if one does appear, it is so singular and exceptional as not to bear upon the argument, for round arches to bear upon the argument, for round arches

are found in the Gothic buildings of the four-teenth and fifteenth centuries, but they, too, are so few that no one thinks from their exist ence of denying the universal prevalence of the pointed style. In Sicily, too, which the Saracens occupied for two centuries preceding 1037 A.D., they used the pointed arch in all the monuments they have left there. I need scarcely refer to the well known examples of la Cuba and la Ziza in support of this asser-

The exception to the rule, that will occur to every one, is Spain. It is true that pointed arches are found in the baths at Gerona, at arches are found in the baths at Gerona, at Barcelona, and other places in the north of Spain, whose date is tolerably well ascertained to be of the ninth or tenth centuries; but, as a general rule, the Moors used the round or horseshoe arch almost universally in their erections in this country. But this is just one of those exceptions that prove the rule, and is one of the extrement arrungents. Lean use to one of the strongest arguments I can use to prove the prevalence of the pointed arch in the Byzantine period; for it shows, that when the Saracens entered a Roman province, where the pointed arch never had existed, they adopted the Roman form with the same facility as they had adopted the Pelasgic one, and having no style or predeliction of their own, used what they found and worked it eventually into those forms which suited their purposes, but retaining the local germ throughout all the variations to which they subjected it.

The universal prevalence of the pointed arch in Saracenic countries being so indubitable, I shall not detain you by dwelling longer on it here. There is, bowever, one other example to which I would wish to refer before leaving

this part of the subject,—the celebrated mosque at the Kutub, at Delhi.
When the Patans conquered India, in the beginning of the thirteenth century, they brought with them their own style of architecture, and as more than they they are brought with them their own style of architecture, and, as was then the custom, commenced erecting edifices to commemorate their
triumphs. The example I am now referring
to was commenced by Shems-ood-deen Altensh, about the year 1230, and was completed by him during the ten years of his
reign. The principal arch, though of the
pure equilateral Gothic form, and 22 feet
span, and about 40 feet high, is erected
with horizontal courses to nearly the summit,
when courses of stones are placed on their

with horizontal courses to nearly the summit, when courses of stones are placed on their ends, forming an Egyptian arch, exactly in the same manner as is done in the aqueduct at Tusculum, before quoted.

It is this peculiarity of construction that induces me to draw attention to it, as showing a persistence in a certain primeval mode of construction during more than 2,000 years, and long after the radiating or common form of arch was known and commonly used, and showing how we must extend our definition and showing how we must extend our definition of an arch, if we would understand these eastern styles. For it would be evidently absurd to say that these Indian examples were not arches, because not constructed according to our principles; yet if we admit them we must admit the whole of the first series alluded to.

To return, however, from these eastern styles to those of the west. The first series I have to bring to notice is, as I said before, that found in the south of France, which for the nonce I shall call the Provençale style. It wists to the coult of the country o nonce I shall call the Provençale style. It exists to the south of the Loire, to the north of the Garonne, and extends from the gulph of Nice to the shores of the Bay of Biscay, and its date extends from ahout the age of Charlemagne till about the middle or end of the eleventh century, when it was superseded by the round arch styles.

I shall perhaps startle most readers by such

I shall perhaps startle most readers by such an assertion, as it has been singularly overan assertion, as it has been singularly over-looked, or, at least, misunderstood hitherto; hut the facts of the case appear to me to admit of no doubt, and that they would long ago have been received as well-established facts had it not been for the pre-conceived opinion that no pointed arch existed in Europe anterior to the twelfth century, and in consequence they pointed arch existed in Europe anterior to the twelfth century, and, in consequence, they have been ascribed to repairs or alterations, or, indeed, to anything but what they are, which is, integral parts of the original design of the edifices in which they are found.

One of the best known examples is that of the Cathedral of Avignon,—Notre Dame de Doms, as it is called. The porch and general details of the church are so nearly classical,

that they are usually ascribed to the age of Cbarlemagne, and by some thought to be even earlier; but though the same details are continued around and in the roof, it is said it must have been a repair, and that these details are imitations of the original part of the edifice. If they are, they are the only instance of imitation in that age I ever heard of.

tation in that age I ever heard of.

At Vaison, not far from this, are two well known churches, so classical also, that they are often called by antiquarians, Roman temples, and are so described in La Borde's great work. This, however, they certainly are not, but Christian churches, though of a very early age: both are roofed throughout by waggon vaults of a pointed form; and as Vaison was destroyed and deserted about the middle of the twelfth century, before the Gothic pointed arch came into vogue, these vaults must at all events be anterior to this period; and if you once admit that they are ante-Gothic, there can be no difficulty in ascribing them to any age the other circumstances of the case seem to indicate. To me there appears to be no doubt but that they are coveral with the church they cover, and probably therefore of the ninth or tenth centuries. The same remarks apply to the churches at Pernes, at Souillac, Moissac, Carcassone, and many other churches of that age, all of which are covered with pointed vaults, but of a form extremely different from the true Gothic vaults of the thirteenth and sixteenth centuries. There is not for instance a single example of an intersecting vault in this style; the roofs are either waggon vaults with or without transverse ribs, or they are transverse arches supporting domes on pendentives, as used in the Byzantine and pure Saracenic styles: but such as never were used in pure Gothic edifices.

There is a church in the Castle of Loches, in the Loiraine, which will explain most of the peculiarities of the style. The original huilding was founded by Geoffrey Grise Gonnelle, Count of Anjou, in the year 962; and the western tower certainly belongs to him. The nave is either a part of the original edifice, or was erected by Foulques Nerra, between 992 and 1040. The supposition that it helongs to the latter receives confirmation from its singularly eastern aspect, and the fact that this Count three times visited the Holy Land, and died there in the year above quoted. If this were the only instance of the style in this country, this evidence might have some weight, but the churches of Moissac and Souillac, S. Frout, Perigueux, and several others in this country and of this age are even more eastern in their appearance than this, so it would not do to lay any stress on such evidence.

The choir was erected between the years 1140 and 1180, by Thomas Paotius, prior of the church, and is in the late and elegant Norman style, universal in that country just anterior to the introduction of the true pointed style.

We have, therefore, in this edifice a pointed style anterior to a round arch style; and though the drawing may not make this quite evident, an examination of the building itself leaves no doubt on the subject. Indeed, the French antiquaries almost all admit that this early pointed style did precede the round arch style in the south of France; but they bring the latter so far down into the period of the middle ages—and they are correct in so doing—that they are almost able, even with this admission, to squeeze the pointed style into the place they wish to assign to it. But the only true solution of the problem, I am convinced, is to ascribe it to the period I have assigned to it.

Indeed, I think the inspection of the drawing alone will show you that the pointed part of the edifice is not of that form which we find in France and England growing out of the Norman and Lombard styles. It is something totally different; the pendentives in particular are singularly eastern in their construction, and though the vault is pointed, it will be observed that in this, as in every example of this style I am acquainted with, all the openings, whether for windows or doors, are roundheaded, whereas in the true Gothic the openings became pointed almost before the vaults assumed that form. Indeed, so different are they in every essential respect, that I do not think there is any danger of any one familiar

with the two confounding this proto-Gothic, if I may so use the expression, with the true Gothic that succeeded the Norman, which I shall now notice, but dismiss with as few words as possible.

possible.

It appears to have been introduced in the north of France, ahout the year 1150, and was used at first timidly, and mixed with round arches, in all the great cathedrals and churches erected in that country, whose date is ascertained to be between the years 1150 and 1200, Before the latter date it had entirely superseded the round arch, and the style may be said to have been then perfected in all its essential particulars. In this country it was in every respect above twenty-five years later. The first really authentic example of its use is in Canterbury Cathedral, where it is found in new works erected after the great fire in 1175, apparently introduced by William of Sens, who was the architect employed to reconstruct the edifice at that period. With us, as with the French, it took nearly half a century before it can be said to have entirely superseded the Norman, and acquired a fixed and certain character of its own. In Salisbury Cathedral, however, we find it so certainly and surely established, that no relapse or backsliding of any sort marred its future onward course to that perfect development of beauty which it afterwards reached.

reached.

In Germany it was somewhat later; and I do not know of any authentic specimen of the pure Gothic anterior to the commencement of the thirteenth century; and even then it was nearly half a century longer hefore it entirely superseded the round style. As is well known, the church of St. Martin at Cologne was finished in the round arch style only the year the first stone of the celebrated cathedral was laid. And during the whole of the first half of the thirteenth century we find round arches mixed up with the pointed ones, which were then coming into fashion.

Before concluding, I would wish to say a few words regarding another branch of my subject, viz., as to the invention of the pointed arch, though if I have made myself understood in what I have stated regarding its history, that ought not to be a matter of difficulty, and every one may form almost as correct an opinion on the subject as I can myself. The eastern invention, as I think is nearly self-evident, arose from the mode above pointed out of building arches horizontally, which requires the adoption of some such form as this.

The question of the western invention is very similar to one discussed at the Institute a few weeks ago, as to the invention of the Doric column. The facts of the case were—that Doric columns were found existing in Egypt at least 1,000 years before they were used in Greece. At the time the Greeks first used them they were in constant communication, as traders and travellers, with Egypt, and consequently numberless citizens of Greece saw these columns before they thought of using them in their own country. This being the case, are they entitled to be called the inventors of the order? The entablature is of course their own; so is the use they made of them, and so are the refinements and improvements they added; but it appears to me singularly bad logic to call them the inventors of what existed so long before their day.

The same is the case with regard to the pointed arch; it existed in the east for centuries, and I may say for thousands of years before it was adopted in the west, and was used by the Saracens in Europe,—in Sicily, and in Spain, if not in France,—before adopted by the Christians in the latter country. I think, therefore, they have no right to claim it as an invention. At the same time, it must not be understood that they copied it for mere copying sake; on the contrary, they certainly would not have adopted it unless they had conceived it to be the best possible form for the purposes to which they applied it.

In the case of the waggon vaults of the Provençale style, it is not difficult to see what that purpose was. The object of the architect in adopting it was twofold. First, to get rid of a certain amount of thrust in his roof, as is well known was one of the principal causes of its universality in the true Gothic. The other, and perhaps more important object, was to enable him to dispense with the wooden

roof by laying his tiles directly on the vault with a circular form this would be impossible as he would be obliged to load the crown o it to such an extent, to get the necessary water shed, that it would certainly bulge at the haunches and fall. Notwithstanding this however, it was used unwillingly, and abandoned afterwards, as soon as improved model of construction and the introduction o wooden roofs enabled the builders to dispens with it.

With regard to the other class of roofs be longing to the Provençale Gothic style, those namely, whose vaults are domes resting opendentives, such as those of Loches, Souillas St. Front, Perigueux, and others in that country—their form is so complicated and their construction so scientific, that it must have taken centuries of experiments and trials to elaborate their complication, and as none of the step by which the form was arrived at have heer traced in France, I think we must allow that it is an importation, more or less direct, from the east. As such, however, it seems never to have been admired, certainly never took root in the country where it is found; and as, in the other instance, as soon as improved skill and improved modes of construction enabled the architects to dispense with it, they returned at once to their favourite round archeoforms, and continued to practise them til the growing influence of the north induces them to abandon them again, and adopt the true Gothic, which had in the mean time been perfected in the north. There is, however, no early true Gothic in the south of France; the style did not arrive there till it was full blown and then soon degenerated in the flamboyan and after Gothics of the later age.

With regard to the true Gothic, the view by

With regard to the true Gothic, the view I take of the question is this:—As every one knows, who is at all familiar with the Normar or round Gothic styles, the architects trice numberless expedients to get over the diffidulties of using intersecting vaults with round arches; they stilled the smaller arches, depressed the larger ones, they tried quadripartite, sexapartite, and domical vaulting, and fifty other expedients, but without ever attaining perfect or even satisfactory success. The curves of the ribs of the vaults were generally unpleasing, frequently waving, and apparently crippled; and indeed the problem seemed almost insoluble. Still they seemed determined to persevere in same path rather than use the broken or pointed arch in lieu of the graceful sweep of their own unbroken curves.

When things were in this state, the Crusades took place; half Europe visited the east, and a Latin kingdom was established over the pointed arched people of the Levant; and when they had thus become familiar with it, there can be but little doubt but they would perceive that so far from being necessarily ugly, the pointed arch could he worked into forms of as great beauty and elegance as the circular one, and had besides a lightness and, for some purposees, an appropriateness the other did not possess.

Once convinced of the fact, the problem was solved, the pilgrim architects returned from the Holy Land and immediately applied this discovery to their western churches; once the prejudice was overcome they adopted it every where and in every thing, and I need not add with what success.

In adopting such a view of the question as this, there are two things to he guarded against the first confounding the invention of the Gothic style with that of the pointed arch,—a mistake too often fallen into. The first, however, is a purely indigenous and native elaboration from Roman art, without any trace of copying or even imitation. The latter is a mere subdordinate characteristic of that style, and not at all entitled to the rank it has hitherto assumed in the controversy.

in the controversy.

The other mistake is to assume that it was copied from the east for copying sake; the truth being, if we admit the above view, that the hint was given by the east, but nothing more: it was applied to Gothic buildings in a manner in which it had never been used in the east, and was so incorporated with and worked into the native style, that it soon lost all trace of its origin, and became as native as any other part of the true Gothic

part of the true Gothic.

Though, therefore, I do not think it can be denied but that the origin of the pointed arch

is from the east, it must, I think, at the same time be admitted that all its appropriateness its beauty, as found in our mediæval and an its beauty, as found in our mediaeval cathedrals, is wholly due to the talent and ingenuity of our northern architects, who wrought it into those forms of beauty and grace which we all now so fully appreciate and so universally admire.*

JAMES FERGUSSON.

STIR IN METROPOLITAN COMMISSION OF SEWERS.

THE following report of the proceedings of the court will be read with more than usual interest. Mr. Hertslet has resigned his appointment; Mr. Phillips, the surveyor, has thought it necessary to denounce the proceedings of the commission, and a general disor-ganization prevails. The length of the report, and of some other papers in our number, pre-vents us saying any more at this moment than that circumstances have since occurred which proposettificials the instructs of containing prove strikingly the justness of our opinion, before this expressed, that the constitution of the commission is not exactly in all respects what it ought to be.

A general court was held on Thnrsday, 21st, at the Court-house, Greek-street, Soho-square; the Earl of Carlisle in the chair.

Earl of Carisle in the chair.

The Drainage of Goulston-street and the Neighbourhood of Whitechapel.—A long report was presented by Messrs. Phillips and Gotto, surveyors, on the state of Goulston-street, and the neighbourhood of Whitechapel, which stated that their attention had been especially directed to an area of about 9 acres in that vicinity, with a population of 3,674 persons, or about an average of 9 to each house. The consequence of this over-crowding was the accumulation of more than the usual amount of filth, and the cause of nuch disease, vice, and misery. and the cause of much disease, vice, and misery Very many of the houses have neither yards, sinks nor other conveniences, and no sort of provision for drainage or ventilation. The effect upon the con-stitution of the inmates was evidently indicated in their countenances, and rendered them susceptible their countenances, and rendered them susceptible of those fearful diseases which were accustomed to attach themselves to such spots. Being aware that cholera had in many places recently re-appeared, and that several malignant cases had occurred in this place, they urged upon the commissioners the importance and necessity of enforcing sanitary regulations without delay. To effect this they recommended that notice should be given immediately of making a special sewers-rate, under the 91st section, to lay down sewers-rate, under the 1st section, to lay down sewer-pipes, and to serve notices upon the occupiers to cruptly and destroy the exist-

tion, to lay down sewer-pipes, and to serve notices upon the occupiers to empty and destroy the existing cesspools, to substitute water-closets, and to construct efficient drains into the main pipe sewer.

Mr. Chadwick moved that the report be received and adopted.—Sir H. de la Beehe supported the motion, and said that the Ordnance Survey Committee were using every effort to carry out the wishes of the Court, by a progress of the subterranean survey, in connection with the Ordnance survey, and in a very short time they honed to bring forward a very short time they honed to bring forward a vey, in connection with the Ordnance survey, and in a very short time they hoped to bring forward a large area of the metropolitan district:—viz., the Westminster district. The maps were now in a proper state, and they had taken into their serious consideration the necessity of adopting certain principles in lieu of the present mischievous system, and thus give in their operations relief of a very substantial kind. Although the whole of Westminster was helow high-water tide, they had no doubt whatever as to rendering the drainages of it as perfect as that as to rendering the drainage of it as perfect as that of any other district in the metropolis, and at the same time to utilise the sewage here collected. The semble the to district the sewage after contected. The present lines of railway would afford them great facilities for such a purpose to get rid of their sewage, and concurrently with the purification of the river Thames. For the suburban district, too, of Hammersmith, means would be devised for ool, of Hammershuth, means would be devised for allogether removing the sewage from it, to throw it back into the country, instead of, as at present, falling into the Thames. The district comprised between Battersea and Daptford bad also received between Buttersea and Daptford bad also received their most anxious consideration: they were collecting all the information requisite and essential for these plans, and they had required their con-sulting engineer, who was conversant and acquainted with these principles, to give a general statement, plan, and estimate for carrying out these views. That nothing might be done hastily, these plans would be submitted to the Court, and he might now observe that the Sewers Committee were unanimous in their desire to relieve the Thaues, and to throw in their desire to relieve the Thames, and to throw the sewage into the country. He trusted that not more than a month would elapse before they should

* The remarks which followed the reading of the foregoing paper at the Institute are necessarily postponed. In the first part of the paper, p-99, ec.l. 3, for 'Mr. Hosking's testimony' read 'Mr. Hosking'. The name of the professor is better known to our printers than that of the Ethiopian traveller,—whence the mistake.

lay before the Court a plan for the entire relief of the whole of Westminster.

Mr. Slaney urged the adoption of immediate measures for the relief of the poor.

Mr. Chadwick said there was every disposition to afford immediate relief to the poor, but in many cases when relief had been brought to their doors the landlords would not avail themselves of it by

the landlords would not avail themselves of it by making the necessary junctions.

Lord Ebrington said that legal proceedings occupied a considerable time. As regarded, for instance, the Bermondsey district, helonging to the Surrey and Kent division, there were upwards of 70 miles of open ditches, 5 feet in width, cxhaling the most noxious and pestilential gases, which embraced a vast area, and even were they to afford only temporary relief, it was not so short a proceeding as Mr. Slaney might imagine.

The Earl of Carlisle thought they should consider how far it would be safe to undertake these works without the chance of the ground baving to be gone over again.

over again.

Mr. Chadwick replied, that in this district there was a very good outfall, and the drainage might be effected with little variation as a permanent work.

Mr. Hertslet, with great submission, hoped he might be allowed to state, that the officers of the commission were not in a position to carry out these marks. these works.

Mr. Slaney was of opinion that they should use

Mr. Slaney was of opinion that they should use great caution in their proceedings.

Mr. Chadwick said, if they waited for a perfect combination, they might postpone all their works to an indefinite period, and in every step a difficulties was as to a supply of water, and he thought that should be met at once.—A long discussion ensued on the legality of the commission obtaining a supply of water, independently of the water companies.—The motion that the works recommended be adopted was then put and agreed to.

Resignation of Mr. Hertslet, the Clerk,—Mr. Hertslet said, in the course of the discussion he had taken the liberty, respectfully, of offeining a few observations; but now, in consequence of the vote they land just come to, he felt that he had no alternarive but to tender his resignation of the office he had the honour to hold. Mr. Hertslet then read the following document:—

the following document:—

"My lords and gentlemen,—After a public service of eighteen years, tlinteen of which have been passed in this department, I take leave most respectfully to tender you my resignation. For the great kindness and consideration which you have some with which you were recently pleased to lonour me, I most sincerely thank you, and I trust that I may earry with me into private life the kindly feeling of which I have had so many proofs.

The affairs of life are so very unstable, that I hope you will may not be considered that all though I do not now present, I may not be considered that early to have waived, my claim any not be considered that sithough I do not now present, I may not be considered that, although I do not now present, I may not be considered that withough I do not now present, I may not be considered that with the considered the considered the considered the considered the considered the considered the step, but as they contain an expression of opinion upon the working and future management of the commission, which might be considered out of place, I have withdrawn them.

It remains for me only to request that a successor may be appointed as soon as possible. I shall, of postes, be most happy to render over a weighter and which high will permit until the appointment is affect by.

Mr. Bullar expressed his surprise at this sudden

mit until the appointment is filled up."

Mr. Bullar expressed his surprise at this sudden step, and his regret for losing so efficient an officer as Mr. Hertslet.

Mr. Slaney regretted that the communication had been made without notice, and the loss of so excellent an officer. The commission had had the benefit of Mr. Hertslet's experience, and they had bitherts regreated with the tracket. If he presisted in benefit of Mr. Hertslet's experience, and they had hitherto worked well together. If he persisted in his determination, they must, of course, accept it; for considering the difficult and arduous situation in which he had been placed, he must say that Mr. Hertslet's services had given great satisfaction. Mr. Chadwick thought that this subject might be much hetter and fully discussed in a committee.

Mr. Hertslet said that the establishment was not caused to carrying out their duties efficiently, and

Mr. Hertslet said that the establishment was not cqual to carrying out their duties efficiently, and however willing he might be to go fast, he could not keep pace with them consistently with the opinions he entertained. He was willing even to gallop with them if it were necessary, but he was determined not to do so blindfolded.

The Earl of Carlisle said there could be but one circumstants to the value of Mr. Hertslet's corriects.

opinion as to the value of Mr. Hertslet's services.

The further consideration of the subject was re-

The further consideration of the subject was referred to a committee of the whole court. The Ordnance Survey Committee being read, Mr. Phillips, the survey, or wished to be allowed to make a communication upon the subject, and upon leave being granted, a startling document was read; which stated that an assertion made at the last court, that a three-feet pipe would carry off all the sewage of the metropolis, had gained currency through the public press, and was now passing through the provinces with great rapidity. Such a statement, bearing the authority of the commission, which was wholly impracticable, and so contrary to fact, was calculated to bring the commission into ridicule, and destroy public confidence. It also

condemned the converging system of drainage recommended for Westminster, and pointed out how, by a mere nominal sum per annum, payable for 20 years, a tunnel sewer might be constructed from Hammersmith to Woolwich Marsbes, to take off the Hammersmith to Woolwich Marsbes, to take off the whole drainage of the metropolis by a regular and steady fall, and by this means the River Thames would be rendered as pure as it was 300 years ago the said a just dissatisfaction was spreading, and be thought it time for him to speak out for the credit of the court and the reputation of its officers. Sir H. de la Beche considered this course of proceeding on the part of an officer both unprecedented and unjustifiable, as the committee had come to no decision upon the subject. Until the Survey Committee bad reported, these remarks were entirely out of place.

mittee bad reported, these remarks were entirely out of place.

Mr. Chadwick said, the statement as to a three-feet pipe be bad noade on the authority of experients made by Mr. Lovick, but that was only to apply to house-drainage, independently of storm or rain waters. Two reports, from Mr. Austin and Mr. Phillips, bad been for some time before them, and they had taken the opinion of impartial engineers on their respective merits; but the present plan of Mr. Phillips was totally different, and of which they now beard for the first time.

Captain Dawson and several other commissioners reprobated the course taken by Mr. Phillips.

A motion was then proposed and carried, that the letter should be referred (with that of Mr. Hertslet) to a committee of the whole court.

Reports were presented by Mr. Gotto on the

to a committee of the whole court.

Reports were presented by Mr. Gotto on the drainage of Sydenham, and by Mr. Grant on the open ditches of the Kent and Surrey district.

The Cholera at Bermondsey.—A deputation of the Improvement Commissioners and ratepayers of

Bermondsey attended the court on the subje Bermondsey attended the court on the subject of the recent cases of cholera in that parish. It having heen represented to the Works Committee that the open ditches and mill streams were the main cause of the raging of this malady, the chief surveyor was ordered to attend immediately to the same, and he now presented a report, which shewed that,—

"The artificial streams are upwards of a mile in "The artificial streams are upwards of a mile in length, helonging to private persons, and have existed for upwards of 300 years. The tide is admitted into them in order to provide power for working the St. Sayionr's Mill, Doekhead, and consequently they are periodically left dry. A branch running along Horney-lane, a length of about 700 feet, and averaging 10 feet in width, contains an accumulation of putrid animal and vegetable matter, the refuse of house drainage and chemical works, and exposing an evaporating surface of 7,000 feet in the midst of a densely - populated neighbourhood. Another branch running at the back of, and receiving the foul drainage of Albert-street, Bermondsey New Town, of about the same length and width, and more prejudicial to health than the branch above described, being immediately under the windows of the houses."

the houses, one of the deputation, said there had been nine fatal cases of cholera in this neighbourhood within a few days; it was an insufferable nuisance, and highly dangerous to the public health nusance, and lighly dangerous to the public heatin

Mr. Raines, owner of a paper mill, admitted tha
the stream was a nuisance, but if the supply o
water was cut off, his mill would be stopped, and his
workmen thrown out of employ.

Dr. Southwood Smith said he had the assurance

Dr. Southwood Smith said he had the assurance of a medical practitioner, that he had under his charge twenty cases of cholera in this district, nine of which were fatal, within fifty yards of ench other. On Monday the deputation again attended the sitting of the Committee; Lord Ebrington in the colair. Several owners of property on the banks of the stream presented plans, showing how, if the water was withdrawn, their property would be injured, while the Improvement Commissioners contended that as claum proper was now much the water was that as steam power was now used, the water was only occasionally used to preserve a right to it, and to claim a compensation on the abolition of the streams.

streams.

It was suggested that an 18-inch pipe would carry sufficient water to supply all the parties concerned, which suggestion was agreed to.—Mr Martin, the medical officer and registrar of the district, sold that five cases of cholera bad occurred

since Thursday last, three of which were fatal.

It was ordered that the surveyor do take such steps as he may deem necessary, and specially report on the subject forthwith.

PAWNBROKERS' ALMSHOUSES .-PAWNEROKERS ALMAHOUSES.—The first stone of the Pawnbrokers' Almshouses was laid (at Forest Gate, Essex) on the 22nd, by the Lord Mayor. The architect, in the news-paper accounts, is said to be Mr. Francis. Some of our readers will remember the particulars given by us some time ago, when selected design in the public competition which took place was thrown overboard, the estimates exceeding the amount stipulated in the con-

VIEW OF STOKE GREGORY CHURCH.

STOKE GREGORY CHURCH, SOMERSETSHIRE.

SOMERSETSHIRE.

Annexed I send you rough sketches of Stoke Gregory Church, in Somersetshire.* I quite agree with you in condemning, as a general practice, the substitution of servile copies for original designs; still I cannot think that the occasional reproduction of a beautiful specimen, undertaken by an architect capable of appreciating its merit, as well as its fitness for the locality he may select, would be injurious to his own professional character, or to the interests of his employers, or the advance-Jurious to his own professional character, or to the interests of his employers, or the advance-ment of art. And it is easy to imagine cases where such reproduction would be more prac-ticable or desirable, than an elaborate restora-tion of the building itself.

But bowever sparingly we would admit of close and accurate copies, I believe no one will deny the right of an architect to appropriate any feature that pleases him in the works of his predecessors. At least, his claim is only invalidated by his own want of judgment in selection, or his incapacity to carry out the idea.

Selection, idea,
idea,
The church of which I send you a notice,
though it presents nothing very complicated
though it presents nothing turnish a useful limit
in its construction, might furnish a useful limit
in its construction, might furnish a useful limit
in its construction. to builders of modern churches. It has a central octagonal tower, springing, you will observe, as it were from the roof of the building itself, and not from a square base or stage,

Our engraving is made from these .- ED.

appearing above the parapet, like those of Stafford, Tong in Shropshire, and, if I rightly remember, Nantwich. There may have been examples at Lynn and Coventry, where the towers are all that is left of the original work. But in Somersetshire we notice South Petherton, North Curry, Barrington, and Doulting (which last has a spire), similar in this respect to the example under notice. The feature must be familiar to the traveller through Rhenish Germany, and some parts of the south of France.

Germany, and some parts of the south of France.

The continental architects knew the value of the octagonal tower. This consists, I conceive, in the circumstance of its proportions appearing unvaried, or nearly so, in whatever point it is viewed. With a square tower, the character of the outline is often materially altered, according as it is viewed cardinally or diagonally. And when the tower is crowned with an octagonal spire, the change of proportion between the two, as seen in front, or at an angle, is very manifest. I was much struck with this in Chichester Cathedral, where the effect is somewhat increased by the oblong plan of the towers. It is probably from this feeling on the part of the architect that some of the most beautiful steeples on the continent spring from towers of which the upper, stages are octagonal, which ensured the keeping of the proportions intended from whatever point the building might he viewed. Freyburg is an exquisite example of this arrangement.

I will now point out the peculiarity of con-

I will now point out the peculiarity of con-

struction which might be adopted with advan-tage in the present day. The central octagon in the specimen before us is narrower than the chancel, or the nave between its piers. It might almost spring from the floor without touching any of the walls. Now its eastern and western arches pretty well span the church, without any great projection of the piers into without any great projection of the piers into its area. The transepts are not so wide; these nearly represent the width of the tower. But that their arches may correspond with its northern and southern sides, their faces must northern and southern stock, their races must of necessity somewhat overhang the springs of the other arches; that they may not, however, lose their natural abutment, namely, that given by the walls of the body of the church, they consist of a series of receding orders, of which the outer or upper one is properly placed for the support of the tower, and the lowest, or innermost one, for the abutment of the walls. A somewhat similar arrangement occurs in the A somewhat similar arrangement occurs in the cathedral of Avignon, which has a small Romanesque central octagon, but no transepts. At Hempstead, near Gloucester, the tower, which is central, and narrower than the nave and chancel, has much the same kind of arch under its northern and southern sides.

The western arch (at Stoke Gregory) has three chamfered orders to the westward, and two to the eastward. The transept arches, four towards the area of the tower, two towards, four towards the area of the tower, two towards

four towards the area of the tower, two towards the transepts. The imposts of the eastern and western arches are continuous, without capitals, The squinches form pointed arches, of two chamfered orders. The style of the church is Perpendicular, and the whole appears to be of nearly the same date; probably about the middle of the fifteenth century. The nave has aisles and a clerestory, and is divided into four bays by shafted piers. The chancel and transept are low and short as compared with the nave. The aisles, south porch, and north transept, have an elegant parapet of openwork, a feature very common in this county. In the angle hetween the chancel and north transept is a low square stair-turret, communicating with the tower by a passage. The tower has two tiers of windows, the upper ones of two lights with a transom, the lower, single lights with a very deep splay. The parapet is emhattled, and the whole is finished with a small low spire covered with lead. The font is rather curious.

Stoke Gregory is ahout 9 miles south-east Bridgered.

rather curious.

Stoke Gregory is ahout 9 miles south-east of Bridgewater. On our way we notice the fine western tower of Weston Zoyland; by a slight detour we may take Middlezoy, which has also a handsome tower, Othery, a cross church with a lofty central tower, and the picturesque ruined chapel of Burroughbridge, situated on an abrupt mound near the junction of the Thone and Parret. Ahout 4 miles between its property of the property which has been menyond is North Curry, which has been mentioned, and from this the route may he continued, in one direction to Ilminster, or in another to Taunton, both affording specimens of the highest architectural richness and heauty.

John Louis Petit.

INAUGURATION OF THE WEST LONDON SYNAGOGUE OF BRITISH JEWS.

A NEW synagogue has just been erected from the designs of Mr. D. Mocatta, in Margaret-street, Cavendish-square. It appears that this congregation, formed in 1842, and that this congregation, formed in 18-22, and located until the present time in Burton-street, have adopted changes in the ritual which, if they are as was explained in a discourse delivered on the occasion by the Rev. D. W. Marks, are certainly improvements. The inoreasing number of the congregants who have joined this body, has heen the cause of a new building heing necessary. The inauguration service, which was performed a few days ago, consisted of chaunting of hymns hy the choir, the introduction of, and depositing, the rolls of the Law in the ark, &c., and was not without interest.

The present huilding is divided into two parts for the sittings,—wide galleries round three sides, for the ladies, capable of holding 150 persons,—and the ground floor for gentlemen, arranged with benches, in rows on hoth sides, leaving the space in the centre open, accommodates 250 persons. The synagogue has residences connected with it for the two ministers, besides other conveniences. The design is simple, in the form of a square, and consists of Desides other conveniences. The design is simple, in the form of a square, and consists of Ionic columns, supporting the gallery, from whence rises a second order of columns, which receive semi-circular arches. These are crowned hy a bold cornice, over which is a lantern light. Although the general character of the edifice is modest, yet most of the parts which form the architectural features are ornamented. The ark has features of design that are not the control of the parts which are not provided that the second of the parts which are not provided that the second of the parts which are not provided that the second of the parts which are not provided that the second of the parts which are not provided that the provided th form the architectural features are ornamented. The ark has features of design that are new, and composes cleverly with the semi-circular arches which hang as pendants before it, and complete the fourth side of the building; the steps, platform, stylobate, and columns which form the design, are all of scagliola, aurmounted by a decorated entablature, which supports a niche head, in which is placed the tablets of the Ten Commandments, surrounded and shadowed by the palm leaf. and shadowed hy the palm leaf.

The total cost of the building, including the repairs and part rehuilding of the houses, was about 4,000l.

LONDON UNIVERSITY.—After the delivery of Mr. Donaldson's concluding lecture on the 19th inst. to the students in the classes of architecture for the present session, the senior student of the classes made a gratifying address to the professor, and offered to him, in the name of the class, a parallel ruler, with silver mountings, as an earnest of their appreciation of his exertions and kindness.

ST. PAUL'S CHURCH, DERBY.

MESSES, BARRY AND BROWN, ARCHITECTS.

ST. PAUL'S CHURCH, DERBY.

On the 11th inst., the first stone was laid of a church in memory of the late Dr. Shirley, Bishop of Sodor and Man. Our engraving gives a view of the church as it will appear when completed. It is in the decorated, when completed. It is in the decorated, or middle pointed style, cruciform in plan, and consists of a chancel, nave, north and south transepts, north aisle, north porch, and tower at north-east angle of chancel and transept, with vestry at south-east angle. It is intended to seat six hundred worshippers on the ground

floor, without a gallery.

The church will stand east and west, having the chancel and north-east tower facing the

road.

Owing to the marshy nature of the site, a substratum of concrete is formed under all the walls; and this, as we are told, is laid on the surface without removing the turf.

The walls are to be built of Little Eaton stone, with Duffield stone dressings and window tracery. The roofs are all to be opentimbered, stained, and varnished.

Messrs. Barry and Brown, of Liverpool, are the architects. The execution of the works has been undertaken by Mr. Wood, a towns-

has been undertaken hy Mr. Wood, a townsman, for the inadequate sum of 1,750l. The contractor would seem to he actuated hy another motive than that of making money.

BOILER EXPLOSIONS: CAUTION TO STEAM-ENGINE TENDERS.—At Bishopwearmouth Iron-works, recently, a hoiler exploded, ascend-ing 60 feet in the air, the roof above it heing scattered in all directions, and several of those in the streets adjoining riddled with stones and brick. The engine-man was killed.— At Wolverhampton, lately, an engine tender and brick. The engine-man was killed.—
At Wolverhampton, lately, an engine tender, employed at the Shrubhery Iron-works, was committed to hard labour for a month, on evidence led that he had got drunk, and allowed the water to get so low in the boiler as to render an explosion probable. It was his first offence, and he had promised it would be his last. The magistrate threatened a severer punishment should a similar case be hreafter proved before him. hereafter proved before him.

N THE BUILDING MATERIALS EM-PLOYED IN PARIS AND IN THE VALLEY OF THE LOWER SEINE.*

2nd. Brick and Tiles.—In Paris, the use of bricks is entirely confined to carrying up the flues, and turning the trimmers to the hearths. flues, and turning the trimmers to the hearths. The best that are employed are the hricks made in the department of l'Yonne, known under the name of the "Brique de Bougogne;" it is 1 foot long, 4 inches wide, by rather more than 2 inches thick. It is burnt to a very high degree. The colour is a pale rose, leaning towards the violet. The thousand weigh about 2½ tons. Rondelet found that the force necessary to crush them varied hetween 73 lb. and 80 lb. per centimètre. varied between 73 lh. and 80 lb. per centimètre square.

The bricks made at Montereau are very

The bricks made at Montereau are very mearly as good as the hriques de Bourgogne; they are of the same size and colour; resist nearly as well. The thousand only weighs 2 tons ½ cwt.†

The hricks of Sarcelles are those most used, hut they are extremely brittle: they are about 8 inches bong hy 4 inches by 2 inches; the thousand weigh nearly 1 ton 14 cwt.

Some bricks are made of the clays which corn in the gauseous formations immediately.

some bricks are made of the clays which occur in the gypseous formations immediately round Paris. They resemble those of Montereau in quality, but differ a little in colour, being of a deeper red, and they are rather thinner and narrower. The thousand weighs 1 ton 18 cwt.

In the neighbourhood of Bonnicres, in the valley of the Seine, a mass of clay occurred, from which the white bricks used on the Paris

and Rouen Railway were made. Generally, bricks used between Paris and Harfleur are, however, of a red colour, and made of a ferruginous clay. At Harfleur and Havre they are white, the clay being calcareous and impregnated with the marine salts. The mode of burning usually employed is in kilns; but of late, near Rouen, many brickmakers have begun to hurn in clamps. Their success hitherto has been very equivocal.

been very equivocal.

Of late years wooden floors have become general in Paris, but the houses of the poor, and all the offices, passages, and kitchens of the best lodgings, are still paved with tiles; and it may, perhaps, be owing to this custom that Paris is so comparatively free from fires. The tiles are of four sorts for flooring purposes The tiles are of rour sorts for nooring purposes—viz., the large hexagon, of 6½ inches over the angles; the bastard hexagon, of 5½ inches over the angles; and the square tiles, 6½ inches, and 8½ th of a side: the thickness varies from ½ the to ½ the. The square tiles are the beauties the hexagonal tiles. are used for the hearths, the hexagonal tiles for flooring. The best are made at Montereau, but their price is so high that the preference is generally given to the tiles made at Massy, near Polaiseau. Almost all the brickmakers of the neighbourhood of Paris, however, make tiles at the present day, both for flooring and roofing pur

Many of the houses of Paris and the neighbourhood are covered with tiles, though the use of this material is rapidly going out of fashion. The best are made at Montereau, as is the case with flooring tiles. They are of two sizes; for it is to be observed that there is only one shape in general use-the pan tile. Le grand moule is about 1 foot long by 9 inches Le grand moute is about 1 toot long by 9 mehes wide and \(\frac{1}{2}\) inches thick; the part left uncovered is about \(\frac{1}{2}\) inches. Le petit moule is a not from \(\frac{1}{2}\) to \(\frac{1}{2}\) wide, by from 10 inches to 11 inches long. The rulge tiles are 1 foot 3 inches long by 1 foot 1 inch development,

A very great number of glazed tiles and common pottery chimneys and stoves are used throughout France. The dearness of comthroughout France. The dearness of com-bustibles renders the use of open fire-places too expensive for the lower classes. Iron also is too dear to be employed for grates, stoves, ranges, cheeks, and the thousand uses we make of it in England.*

One of the most ingenious use made of pottery was in the construction of the floors of some houses in a street recently erected in the centre of the grounds of the ancient hotel Rouge-mont. At the time of the erection of these houses, there was a strike amongst the carpen-The contractor adopted this manner of executing the floors simultaneously with the walls,—that being the invariable mode of proceeding adopted in Paris. These floors, ever, cost more than those executed in the usual manner, and, consequently, have not been imitated. They were executed about

3rd. Limes and Cements.—All calcareous stones, when exposed to a sufficient heat, part with the carbonic acid gas which enters into their combination; but the limes resulting from the calcination assume different appearances, according to the chemical composition of the stones. These appearances are four in number,—at least of those sufficiently frequent in their recurrence to form the basis of a They are :- Firstly, as in their recurrence to form the mass or a com-mercial classification. They are:—Firstly, as regards the manner of taking up water, divided into fat or thin lines. The fat lines are those which, it a slacking, augment at least one-fourth in volume; the thin limes are those that remain constant in their bulk. Secondly, as regards their setting properties, limes are divided into the hydraulies and the non-hy-The hydraulic limes are invariably thin,-but all thin limes are not hydraulic.

An examination of the elaborate discoveries and researches of the French chemists and

engineers into this still very little cultivated branch of the chemistry of building, would lead us into far too long a discussion at present. Suffice it to say, that the practice of the best architects, and of all the engineers in France, is to use bydraulic lime to the exclusion of others, unless almost insuperable difficulties, owing to their price, occurdamp a climate as our own, we should do well to imitate their example; the more especially as we have at hand the means of procuring both natural and artificial hydraulic limes in unlimited quantities.

unimited quantines.

The fat limes used in Paris are made at Senlis, Melun, Essone, Champigny, Marly, Sevres, &c. The natural hydraulics are made at Senonches, and of late years at Meudon; the artificial hydraulics are made wherever chalk is found, in the proximity of clay, as at Marly, Mantes, and in the neighbourhood of Renez. Rouen.

The Lower Seine, from the neighbourhood of Mantes at least, runs through the chalk formation; the country, right and left, same geological character for a great dis-tance. Natural hydraulic limes do not occur until we reach Havre, and all the local con-sumption is therefore supplied by the factories of artificial hydraulic limes. The most important of these are at Rouen, where they assume very great importance, from the chemical and mechanical skill employed. The from the materials used are the chalk from the Mount St. Catherine, and the argillaceous deposits of the neighbourhood; the proportions of the different ingredients, and the degree of hurn-ing, depending upon the rate of setting re-

quired.

At Havre, upon the outcrop of the chalk, or rather at the junction of the chalk and the Wealden formations, a bed of argillaceous limestone is met with, which yields a very superior bydraulic lime. In the valley of Harfleur a large establishment has lately been formed for the making of artificial hydraulics; and all the immense dock or fortification works executed at Havre lave been constructed with either one or the other. Cement structed with either one or the other. Cement is only used for pointing, or, on extraordinary occasions, for rendering works exposed to the action of the sea immediately after being finished.

The cements used in Paris are principally made in Burgundy, at Ponilly. They participate of the nature of our Roman cements; hut lo not acquire so great a degree of hardness. The same objection is to be made to the Vassy cements; and to the artificial cements made at Rouen with chalk and pounded bricks. French architects and engineers do not advocate the use of cement to the same extent we do in England. Personally, I think they are nearer the truth than we are. It is much be feared that materials which set so rapidly may decay in the same manner. The pronearer the truth than we are. cesses of nature are slow, at least where great duration is its object; and we are most likely to succeed by following the same course. competition, moreover, in the supply of cement o great, that the article, as usually sold, is better than sand. Even the extreme little better than sand. Even the extreme rapidity of the setting of cement is an objection to its use in many ordinary cases, for requires so much care in its manipulation as to render it liable to be slighted where the interest, or even the carelessness of the workman, may oppose its receiving proper attention.

Occasionally, in the neighbourhood of the large towns, the houses are entirely built with rubble-stone, or of bricks, and covered with a rubble-stone, or of bricks, and covered with a coat of plaster. Cement is never used for this purpose, nor does there appear to be any necessity for its introduction; the climate of France is sufficiently dry, and the plaster, as usually employed, is sufficiently capable of resisting the atmospheric changes, to render the use of the more expensive material unnecessary. Prezutions require however, to be sary. Precautions require, however, to be taken in the application of plaster. The tops of cornices, and all weatherings, require to be overed with zinc; the parts of the houses near the ground must be rendered with a less hygrometric material; but for all other posiplaster succeeds remarkahly tions plaster succeeds remarkanty wen.
Internally, it is the only material used in any
part of France within reasonable distance of
water-carriage from the gypsum-quarries.
Stuccoes and imitations of marbles are sometimes employed in public buildings, but very

rarely in private houses.

4th. Woods.—The practice of the French architects in the use of wood differs little from our own. On the sea-board, and in the large commercial towns, Swedish and Baltic fir is principally employed; in the interior oak is cheap enough to insure the preference. The oak used in Paris comes principally from Champagne and Burgundy; lately, however, the Prussian oak has been imported in considerable quantities. For large roofs, Dantzic and other Prussian fir is used; but the architects pay such very low prices that the hest woods invariably are sent to England. Indeed, there are few architects who seem to be able to distinguish the Swedish from the Prussian timber, for in all cases I have noticed that for roofing purposes the former is employed where the latter is demanded by the specifications Indeed, so small is the supply of Baltic timber in France, that in 1848, after the bridges over the Seine had been burnt down by the mohs, it was impossible to find 50,000 cubic feet in all the markets of Dieppe, Fecamp, Havre, Rouen, and Paris.

Norway timber is used largely for purlins, and for partition stuff. The deals and battens imported are of the second and third quality; but as all the better class of joiner's work is executed in wainscot, this becomes of less moment. Some of the French oak is very beautiful, and admirably adapted for joiner's work; but its gradually increasing price, owing to the clearance of the forests, renders necessary the importation of the German, or, as we commonly call it, the Dutch, wainsoot. Mahogany is only imported for cabinet making: its use for joinery, or for ship-building, is almost unknown. Rosewood and ebony are also imported for cabinet-makers. timber, e.g., pine, spruce, &c., rarely enters France, except for the purpose of making masts and spars of ships; task is totally unknown, as are the whole tribe of African or Australian woods.

France furnishes very beautiful nonlar, ash and beech timber, which are much used in building. Almost all the slate battening for provincial use provincial use is made of poplar; the ash serves for cart-building and carriage-works; ash the beech is principally employed for piles and gratings, &c., under water. The department of Calvados furnishes some of the finest beechtrees I have ever seen.

In practice the French architects are much behind our own as far as carpentery is con-cerned. There are, certainly, exceptions. Some of the roofs in Paris are light, elegant, strong, the thrusts well balanced, the resistances most skilfully calculated; rule, the scantlings are far too heavy, the framing clumsy, the affectation of mathematical construction too glaring. Little or no cautions are taken to prevent the decay of Little or no pretimber from the moisture of the walls; the wood itself is often used full of sap, and thoroughly wet—an objection, by the way, which may be made to carpentery in London, way, for we often see the wood taken from the river, cut up, and placed in buildings long before it can have dried. It is, however, to be observed with reference to the heavy scandlings used by the French architects, that the price of wood-work is about 25 per cent higher with them than with us. Motives of economy serve as vast incentives to scientific investigations in all countries

5th. Metals .- The metals used in building are iron (cast and wrought), lead, copper, zinc, and some of their compounds.

1 (a). The greater part of the cast-iron used in the valley of the Seine is derived either from the mines upon the Belgian frontier, from the province of Berri, or from England; the importation from our own country being principally for the supply of the markets of Roney Havre, and the north-west of France. The wrought-iron comes from Berri and Flanders, and there are some scrap-iron-factories at Paris and Havre.

The great distance the iron has to be transported, and the dearness of fuel, render its use in the prodigal manner we are accustomed to, quite out of the question. At Paris castiron costs about 50 per cent. more than in London; at Havre it costs about 33 per cent. more. Its use is therefore avoided as much as possible, the more especially as wood and stone-

The clay of Forges is used for pots for glass-making, and similar purposes; that of Vanvres for kitchen-tiles. The frebricks used in Paris are either made at Stour-bridge, or at Hayange, on the Belgian frontier; some few are made in Burgundy, but they do not resist well.

work are so much cheaper than with us. French founders are, however, very skilful, and some very remarkable works are to be met with in Paris, executed in cast-iron. The northern gate of the Madeleine, the fountains and lamp-posts of the Place de la Concorde,

may be cited as illustrations.

1 (b). The best commercial wrought-iron is that from the province of Berri; but it is very unequal in quality, sometimes it is very unequal in quality, sometimes as tough as our best Welch iron, at others as short as the very commonest Stafford-shire, owing to the bad manipulation in the factories. The very high price of iron, also, prevents so much attention being paid to the details of its production as is the case where its economy renders its use a matter of every-day necessity. Indeed, the state of the ironworks in France is a singular illustration of the evils of the protective system. manufacturers have a monopoly; they fear no competition, and make a bad iron. The public pays dearly, and therefore uses as little iron as possible.

Since railways have been in fashion, however, the use of iron for roofs has become more general, and there are in Paris certainly some of the finest roofs in Europe. Amongst them may be cited the roofs over the Entrepôt réel des Marais, of the Halle aux Blés (in cast-iron), of the St. Germains and Rouen Railway, executed by M. Eugène Flachat.

The plate-iron box-girders are at present unknown; corrugated iron is but of very recent introduction, nor do the French architects appear to approve much of it.

Owing to the very bigh price of wrought-iron, the use of iron wire for suspensionbridges has been pushed to a very great extent throughout France. There are upon the Seine many very remarkable bridges executed with this material, such as the bridges at Triel, Gaillon, and Rouen. The iron wire is exposed to this inconvenience, that with all possible care in the fabrication of the chains, the separate threads cannot be drawn out to the full; the threads cannot be drawn out to the chains, therefore, always stretch, and the platform of the bridge necessarily sinks. Wire chains, however, bear a greater weight in proportion to their sectional area than square bars, and are more likely to be homogeneous in their strength. They avoid, moreover, the necessity for the coupling-links, which, on the latest sus pension-bridges executed, augment the weight of the chain 31 per cent. beyond that absolutely necessary, supposing the chain to be of one piece. The surface of oxidation is greater for the wires than for the bar-iron chains, nearly in the proportion of 40 to 1, and this becomes one of the greatest practical objections, for not only does it necessitate frequent painting, but it diminishes, in time, the real strength of the wire cables. The practical strength of these is found, in fact, to be as 0.70 to 1.00 of the theoretical strength; after a few years it falls to 0.66 The voids in the wire cables, according to theory, should be to the solids as 0.1025 to 10000; in practice they are found to be 0.25 to 1.00. On the suspension-bridges, the Government engineers enforce a proof of 17 kilogs. per millimetre square of the sectional area of the iron-wire chains, to insure a surplus of strength as a guarantee against deterioration; on the bar-iron chains the proof is only 12 kilogs.

very beautiful bridge was erected at snes, by M. Flachat, of hoop-iron bands Surcsnes, by M. Flachat, of hoop-iron bands to form the main chains, which answered remarkably well. This application attained a sort of medium result, both as to cost and strength, between the systems bitherto em-

There is a very beautiful adaptation of the use of the suspension principle to roofing purposes in the Panorama in the Champs Elysées, at Paris. The chains are of wrought-iron

wire.

2. Lead.—For building purposes, the bulk of the lead used is imported from England, Spain, and America. It is dearer than with us, consequently its use is not so general, zinc being generally substituted for it. The use and modes of fahrication, wherever it is employed, are precisely the same as in England. †
3. Copper.—France also draws the bulk of

its copper from foreign countries, at very considerable expense; its use is therefore very much restrained in building. The only in-stance I know of its application on a large scale is at the Halle aux Blés, which was covered with copper in the year 1812, and I think at the Bourse.*

4. Zinc .- The high price of the two lastnoticed metals has given rise to the use of zinc upon a very large scale throughout France. imported from Belgium and Germany in very large quantities, to the extent of 13,000 tons, worth 280,000l. Except upon the borders of the sea, it stands well in France; for the atmosphere does not contain (as in England, where so much coal is consumed) the carbonic and good which destroy gine. On the conacid gases which destroy zinc. On the contrary, in the interior, an oxidation of the ex-ternal face of the zinc takes place, which prevents its decay. The roof of the palace on the Quai d'Orçay, the Northern, and some parts of the Rouen Railway Station, the Orleans Station, and a crowd of other buildings, are

the architects. The sizes of the metals usually employed for roofing are as follow: — Lead in sheets, 12 feet 3 inches long, by 6 feet 1½ inches wide; the thicknesses are either a full eighth, short 3-16th of an inch: the first weighs $89 \frac{77}{100}$ lbs. per yard square; the second weighs 118 8 8 lbs. per yard square. The lap is generally made from 3 inches to 6 inches longitu-

covered with zinc, to the perfect satisfaction of

dinally. sheets of copper are made 3 feet 612 inches long by 3 feet 3 inches; the thicknesses are 0 0021236 and 0 0024526 of a foot, the respective weights 13 700 and 17:15 lbs. troy per

yard superficial.

The sheets of zinc are made6 feet 4 inches long by 3 feet 25 inches, the thickness varying from a short $\frac{1}{2\pi}$ to a very full $\frac{1}{2\pi}$; the weights are respectively 17:15 lbs.; 19:06 lbs.; 20:80 lbs. troy per yard superficial. The sheets of less thickness than these are rarely used in good buildings. Of late years, in the neighbourhood of Paris, zinc tiles have been much used; they are made from 14 inches to 16 inches long, by 12 inches to 14 inches wide; nailed at top, and fastened hy hooks to the slates, which lie im-mediately beneath them.

The compound metals used are brass, bronze, and the galvanized iron. No difference exists in the mode of preparing these compounds from that observed in England. The bronze is, however, much more often employed than with us. For instance, the columns of the Place Vendome, and of the Bastille; the gates of the Madelaine and St. Vincent de Paul; the fountains of La Place Louvoise and the numerous statues which adorn all the quarters of Paris are in this metal.

Painting and Glazing.—The modes of house-painting employed in Paris are similar to those we employ, except that the oils are better, but the colours and white lead immeasur-ably worse. Indeed, there is not the same necessity for excellence in the painter's art, so far at least as mere flat tints and common graining are concerned, in a country where oak is so universally employed for joinery. For all objects of luxury, however, we are frightfully behind our neighbours. The decora-tions of Notre Dame de Lorette, the Madelaine, the former Chamber of Peers, the Louvre, and the Sainte Chapelle, cease to be mere decorations, to pass into the higher walks of art. St. Vincent de Paul, St. Germain l'Auxerois, offer illustrations of polychromic decoration, which contrast painfully with the attempts we see in London.

These two last-named churches may also be cited as specimens of the excellence our neighbours have attained in the art of painting on politics have attached in the art of painting on glass. For drawing and colouring, the win-dows of St. Vincent de Paul are superior to anything, either ancient or modern, it has ever been my fortune to examine.

The decorations, painting, and glazing of the cafés and shops might afford useful lessons to the architectural student. Great attention is shown to the distribution of the light, and the general tone of the colouring, so to suit the goods exposed. Glass is cheaper than in England, and in consequence is more prodigally used. The window glass is, how-

ever, had, both in colour and in its powers of resistance; it is thin, green, and way

Although the above notice of the building materials employed in Paris, &c., has grown to a very great length, I have been forced to pass over some of the most important and in-teresting subjects the review suggests. The chemical process, called by the workmen saltpetring, and its action upon stones when laid bedwise, or against the bed; the manner in which stones are affected when exposed to the various strains; the composition of mortars and cements, and all the phenomena which attend their use in the air, or under water—saltorfresh; the qualities of woods and metals—have all glided before us; but from the limited time we can here devote to them, these subjects have not met with the attention they merit. Indeed, this remark holds good not only here but elsewhere. Very little is known, comparatively speaking, of the chemistry of our profession; what little we do know may principally he sought for amongst the French authors. Perhaps I may not have occupied your attention in vain, if my remarks should call attention to subjects so full of interest to us, but at present so involved in obscurity.

GEO. BUNNELL.

BISHOPP'S DISC ENGINE.

PAYING a visit the other morning to the Times Printing-office, we saw the new Disc Engine that has been put up there to drive Applegarth's two rotary printing machines, by which the 36,000 copies, or thereabouts, matutinally required,* are whiffled off at the rate of about 5,000 complete copies per hour. In this engine, the advantages of which have been long known, the objections that alone kept it out of general use, appear to have been successfully over-come. It is a 16-horse power engine, on the come. It is a 10-more power engine, on the high-pressure and condensing principle: it is, however, equally suitable to be worked as a simple low-pressure condensing engine. It stands in the machine-room close to a

wall, and occupies a singularly small space.+ The shafting for driving the printing machines is carried by brackets fixed to the wall over the engine, and is driven by two bands: the drum on the engine-shaft is 30 inches diameter, and the two pulleys overhead 4 feet

Our impressions in favour of the engine were confirmed by inquiry. It seems that, before being erected at the Times office, it was tested, during a month, by Mr. Penn, of Greenwich, and Mr. Farey (both good authorities), in a corn-mill belonging to the former. The comparison was made with a heam-engine the best construction; and, under similar circumstances, there was an important difference in favour of the disc engine, the engines driving alternately the same machinery, at an

equal speed, from the same boiler.

Several disc engines have been fixed in various parts of the kingdom during the last eight years, but the arrangements lately patented by Mr. G. D. Bishopp have so much improved it, as to open to it a much larger sphere of action. This at the *Times* office was manufactured by Messrs. Joseph Whitworth

and Co., of Manchester.

The peculiarity of the disc engine is, that it gives direct motion to a crank on the engineshaft, and exerts a perfectly uniform force on it throughout the revolution. There are, there-fore, no "dead points;" and when driving by gearing, without a fly-wheel, there is no back-lash in the wheels. Moreover, the steam can be cut off at a very early part of the stroke, without materially affecting the regularity of the driving force.

Other advantages besides the little space occupied are, that it can be fixed on the beams of a floor, or on a slight foundation, and that, although the speed of the piston (i.e., of the disc rings) is only 200 feet per minute, the engine makes three times as many revolutions per minute as a common engine, and consequently, in most cases, much expensive gearing is dis-pensed with. It appears to us admirably

^{*} France imported in 1845, 80,000 tons of cast and wrought iron, or steel.

[†] France imported in 1845, 22,000 tons of lead, of a prime cost value of 400,000/. storling.

^{*} France imported in 1845, 8,500 tons of copper, worth from 320,000L to 400,000L sterling,

^{*} On the last day of Rush's trial, 44,500 copies were sold, n the day the Ruyal Exchange was opened by the Queen, ,000 impressions were sold,—the largest number ever ruck off.

[†] Seven feet long and four feet wide; and the highest part of the engine is only three feet above the floor of the room.

adapted for driving the screw propeller direct, as the engine shaft has only to be extended through the vessel, and have the propeller fixed to it; it would thus enable sailing vessels which cannot spare much room to adopt the screw as auxiliary power. The disc engines are now made entirely from wooden patterns, and every wearing surface, it is said, can he refaced, or renewed, as in engines of the common construction. We cannot but think that this engine ought to come into general use.

Miscellanea.

PROJECTED WORKS .- Advertisements have been issued for tenders, hy 5th July, for the enlargement of the British Orphan Asylum, Clapham Rise; by dates not specified, for the erection of the St. Martin's Northern Schools, and for the erection of Sketty new Schools, and for the erection of Sketty new church; by August 6, for the enlargement of the London bridge station of the London and Brighton Railway; by July 11, for the erection of St. Matthias's Church, Weir district, Bristol; by 7th, for the restoration and additions of the masonry, carpenter, slating, and plaster works of the parish church of Irthington; by 30th inst., for the erection of abutter cross, at Knighton (Hereford), by of arthington; by 30th inst., for the erection of a butter cross, at Knighton (Hereford); by same date, for building a covered corn exchange, at Bedford; by 2nd July, for the erection of a national school-room and master's house, at Bewerley; by 2nd, for building a sea wall at Bowness; by 16th, for the erection and completion of bath rooms at the Shaw Heath Liquin Workburg Steakers and the state of the control of the state of the Heath Union Workhouse, Stockport, and for making drains and main sewers there; 11th, for keeping in repair the public conduits and other waterworks at Southampton, for two years; and by 10th, for 400 waggons for the Great Northern Railway.

Competitions, &c.—Advertisements have been issued for plans by July 18, for additional accommodation for 300 inmates, at St. Luke's workhouse, Chelsea, Premiums, 257, and 101.
Also for plans, drawings, and estimates, by September, for a church at Cheltenham, to contain 1,000 persons, at a cost of 4,0001.—The London and South-Western Railway Company requires a minimal variable and the contain 1,000 persons, at a cost of 4,0001.—The London and South-Western Railway Company requires a minimal variable and the contain 1,000 persons are proposed to the contain 1,000 persons are pr require a principal resident engineer experienced in designing and constructing railway works, and stations, &c.

The Church Building Society held its

The Church Building Society held its usual meeting on Monday week, when grants were made in aid of the erection of new churches at the new district of All Saints, Leeds; at Gravesend, for a district of that parish; towards rebuilding the churches at Virginstow, near Launceston, and East Walton, near Haverfordwest; enlarging the churches of St. Stephen, Islington, and Compton, near Petersfield; re-arranging the interior of the churches at Llanfihangel-Rhos-y-Corn, near Lampeter; Halstead, Essex; Hinton Charterhouse, near Beckington; Brooke, near of the churches at Llanfihangel-Rhos-y-Corn, near Lampeter; Halstead, Essex; Hinton Charterhouse, near Beckington; Brooke, near Norwich; Sutton, near Stalbam; Grately, near Andover; and Cheam, Surrey.

Exemption of Literary Institutions from Mr. W. Brown, the Attorney-General said that a bill had been uronosed to him on

from M. W. Brown, the Attorney General said that a bill had been proposed to him on this subject, to two of the provisions of which he entertained considerable objection. The one was that adjustment of disputes should be effected by trial at sessions, a course which would lead to litigation and expense; the other was to the creation of a new office for registration. He thought the machinery of the registry of friendly societies should be registration. He thought the machinery of the registry of friendly societies should be made available.—In reply to questions by Mr. M. Gibson and Mr. Bright, the Attorney-General said he would do all he could to promote a measure which did not contain the clauses to which he objected, but whether the Government would think it expedient to introduce the measure was another question. Government would think it expedient to introduce the measure was another question. He could not say whether such a measure would be introduced or not.

METROPOLITAN.—The principal figures in the mould of Mr. Carew's "Death of Nelson," for the moungest at Charica trans.

for the monument at Charing-cross, have been safely filled with molten bronze from some of sately filled with motion bronze from some of the cannon taken by the hero himself in action.

The first stone of the new Fishmongers Almshouses, at Wandsworth, was laid on Saturday last.—Two new courches are to be erected at Lambeth.

BIRMINGHAM SCHOOL OF DESIGN. Friday in last week the annual exhibition and distribution of prizes took place at the Society of Arts, New-Street, and was very numerously attended. The Bishop of Manchester was in the chair, and congratulated the donors and the chair, and congratulated the donors and subscribers on the progress made since last year. The number of students, as well as their proficiency, had much increased. In the female school the classes are full. Announcement was made of the increase of the Government grant, and the appointment of Mr. Kidd, a modeller, as second master, and of a pupil of last year, Mr. W. O. Williams, as third master. The drawings models &c. have since last year, Mr. W. O. Williams, as third master. The drawings, models, &c., have since been publicly exhibited.

BEDFORDSHIRE ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY held their annual meeting at Bedford on Thursday in last week, the Archdeacon of Bedford in the chair, when a number of objects of interest chair, when a number of objects of interest were exhibited, the report read, and papers also read, by Mr. M. H. Bloxham "On Conventual Arrangements;" by Mr. T. Bernard "On the Basilicæ of Rome;" and by Mr. Jackson "On Felmersham Church." Others by the Roy H. H. Been and the Roy. B. by the Rev. H. J. Rose and the Rev. B. Bridges were deferred till another meeting. Votes of thanks were accorded, and a committee appointed to alter some of the rules of

the society.

FLOATING THE TUBE FOR BRITANNIAnridge.—'Tuesday week was appointed for the transport of one of the central and largest tubes of this great work to its place across the Menai straits, near Bangor. From the break-ing of a capstan, however, the process was postponed till next day, when it was safely ac-complished, in the midst of the acclamations of thousands, mingled with the appropriate and stirring music of the sea-song, "I'm afloat." This tube is 470 feet long, 30 feet high in the centre, and diminishes in height to 22 feet at the extremities. The clear span between the towers, on which it is to rest, is 12 feet shorter. The weight of wrought-iron in the whole is 1,600 tons. It is painted stone colour, and protected by an arched roof of thin corrugated zinc. The masonry work is of as gigantic a character of course as the iron work. The abutment on the Anglesey side is 143 feet high and 173 long. The wing walls of both terminate in pedestals, on each of which are two colossal which are two colossal couched lions of Egyptian design, lifting their lime-stone foreheads in the face of every train, with bullet eyes as large as human heads. The hodies are each 25 feet long and 12 feet high, though crouched; the weight of each is 30 tons. There is some intention of surmounting the central tower with a colossal figure of Britan-nia, 60 feet high. The great Britannia Tower in the centre of the straits is 62 feet by 52 at its base; total height, 230 feet; it contains 148,625 cubic feet of limestone and 144,625 of sandstone; weighs 20,000 tons; and contains tons of cast-iron built into it in beams and girders. The total quantity of stone contained in the bridge is 1,500,000 cubic feet, in a total length of 1,849 feet. In the scaffolding used there are 570,000 cubic feet of timber and 20 tons of iron bolts. The tube launched on Wednesday week has been compared to the Burlington Arcade. If placed on end in St. Paul's Churchyard it would risc upwards of 100 feet show the two of the contract. 100 feet ahove the top of the cross. Fifteen miles of rope were required in the management of this Gulliver in Lilliput. The slightest change in temperature, gleam of sunshine, or shower of rain, is said to act on these tubes in situ in appreciable expansion or contraction and deflection. The cost of the whole structure has been estimated at 600,000l. to 700,000l.

Public Museum and Library at Salford.—The town council have resolved to provide and keep up the requisite accommodation and attendance for donations, &c., in a mansion-house, in Peel's Park, to which the public will have free access at all reasonable A rate of 1d. per pound may afterwards times. be authorized.

BLIND BUILDERS .- Tenders sent in for pulling down and rebuilding four third-rate

regional reduiting four thirds see in George-yard, Whitechapel:—
Palmer£1,145 Jacobs Hall and Son, Whitechapel.....

HAND WORK .- I said, early in this essay, HAND WORK.—I said, early in this essay, that hand-work might always be known from machine-work,—observing, however, at the same time, that it was possible for men to turn themselves into machines, and to reduce their labour to the machine level; but so long as men work as men, putting their heart into what they do, and doing their best, it matters not how bad workmen they may be, there will be that in the handling which is above price: it will be plainly seen that some places have been delighted in more than others—that there has been a pause, and a care about them; and then there will come careless bits and fast bits; and here the chisel will have struck hard, and there lightly, and anon timidly; and if the man's mind as well as his heart went with his work, all this will be in the right places, and each part will set off the the other; and the effect of the whole, as compared with the same design cut by a machine or a lifeless hand, will be like that of poetry well read and deeply felt to that of the same verses jangled by rote. There are many to whom the difference is imperceptible; but to those who love poetry it is everything—they had rather not hear it all, than hear it ill read: and to those who love architecture, the life and accent of the hand are everything. They had rather not have ornament at all, than see it ill cut-deadly cut, that is. I cannot too often repeat, it is not coarse cutting, it is not blunt cutting, that is necessarily bad; but it is cold cutting—the look of equal trouble everywhere—the smooth, diffused tranquillity

everywhere—the smooth, diffused tranquillity of heartless pains—the regularity of a plough in a level field.—Ruskin.

INSTITUTION OF CIVIL ENGINEERS.—On Tuesday, 19th, Mr. Joshua Field, President, in the chair, the paper read was "On the employment of bigh-pressure steam, working expansively, in marine engines," by Mr. John Seaward. In the course of the evening, the Earl of Rosse, President of the Royal Society, was presented, by Mr. Rennie, to the President of the institution, on his election as an honorary member. On the 26th, the paper read was "Observations on the Obstructions to Navigation in Tidal Rivers," by Mr. J. T. Harrison. This was the last meeting of the session.

session.

ESSEX COUNTY LUNATIC ASYLUM COM-PETITION.—The committee of magistrates appointed to receive designs and carry into execution the erection of the above asylum, have chosen that of Mr. H. E. Kendall, jun., for adoption. It is in the Tudor style,—to accommodate 400 patients,—and is to be erected near Brentwood.

No. CCCXXXV.

SATURDAY, JULY 7, 1849.

HE stern warning given to the Metropolitan Commission of Sewers by Mr. Phillips, their chief surveyor, and his proposal to construct 20 miles of

tunnel sewer at such a depth from the surface, say "100 feet below the bed of the river," as would render it independent of all barriers,have excited considerable attention, and seem to call for some observations on our part. We have watched the proceedings of the new commission with much solicitude from the first, and in our pages will be found the only continuous public record of their proceedings in open court.* 'The space which this record occupies is large, and we have, out of consideration for that section of our readers who may not feel immediately interested in the matter, avoided enlarging it hy observations. The present position of the commission, bowever, is so extraordinary, that to pass it by without comment is impossible.

We need not remind our readers in other than the shortest sentence, that the old Westminster Commission was superseded (and the other commissions went with it), mainly through the efforts of Mr. Leslie and Mr. Byng, two of its members, and the statements made, at what then seemed great pecuniary risk, by the clerk of the commission, Mr. Hertslet, and the surveyor, Mr. Phillips. About a year and a half ago the new commission was appointed, and these two memhers of the old body and these two officers were, as a matter of course, put on it. This was done, we say, but a year and a half ago, and we now find the new commission exactly in the position of the old one previous to its dissolution. Mr. Byng has withdrawn himself; Mr. Leslie has ceased his regular attendance; the surveyor considers it "time to speak out, both for the credit of the court and for the reputation of its officers," and to prevent proceedings "calculated to bring the commission into ridicule;" and Mr. Hertslet, whose ability, courtesy, and fitness for his office all have acknowledged, says he can no longer go on with the commissioners, and gives evidence of the strength of his conviction by the surrender of nine hundred good pounds a-year.

This surely is a conjunction of circumstances which should lead to a careful and searching self-examination on the part of the commission, Without expressing any decided opinion at this moment, we earnestly invite them to it, our inxiety simply being to see the commission working unanimously and well for the public good; and this, we are quite sure, is the desire of the excellent nobleman, the Earl of Carisle, who presides. The majority of the comnissioners scarcely appreciate the magnitude of their task, or see, what is the fact, the utter mpossibility of effecting it satisfactorily by the node they are now pursuing: some few of hem, indeed, we have no hesitation in saying, are quite unfit for the office. The establishment of principles has been sadly neglected; theout we will not now speak harshly-the com-

* Whether it is desirable to continue this may be open to ques

mission has had difficulties to contend against, and may yet claim our indulgence for a time.

To add to the present troubles of the commissioners, they have been thrown into Chancery. In pursuance of a recent order, the officers of the commission proceeded the other day to fill in the putrid and offensive ditches at Bermondsey, in the vicinity of which many fatal cases of cholera have recently occurred, and in consequence of this proceeding Mr. Rains, the owner of the property, has filed a bill in Chancery to restrain their operations; in which he prays that the commissioners may be decreed to give notice of the intended nature of their operations, that he may be enabled to make a proper claim for privilege and compensation money, or to make the necessary deposit in the Bank of England, according to the Lands Clauses Act, 1845, and that in the meantime the Metropolitan Commissioners may be restrained from doing any works which may affect his interests. The Vice-Chancellor gave the plaintiff leave to move on Thursday morning last for the injunction as prayed by the bill.* On that day, the subject having been partially discussed, was postponed till Saturday, in order that the commissioners, should they tbink fit, might bave the opportunity of exbibiting their plan of operations. The Judge, however, stated his decided opinion to be, that their proceedings were illegal, unless protected by the 61st section of their Act, enabling works of haste to be done without notice. The plaintiff's counsel responded, that this was a work that would occupy three months, and to proceed with it without notice, therefore, must be illegal on his honour's showing: the 61st section did not apply to such works at all. We shall see.

Now, as to the proposed tunnel sewer. The surveyor's letter, which has caused such commotion, is one result of the committee system.

Two plans for the improvement of the drainage of Westminster,—one by Mr. Austin, the other by Mr. Phillips,—were made sixteen months ago, and appear to have been referred to the "Survey Committee." Members of the commission have asked for them at various times,-but the court, as a court, has heard nothing of them. On the 15th of June, according to Mr. Phillips, the Survey Committee passed resolutions "approving in effect the suggestions of Mr. Austin's report;" and then, forthwith, comes out Mr. Phillips's letter, warning the commissioners against attempting to execute the works therein contemplated," and stating that these are "wholly impracticable, and unworthy the objects which should be kept in view for the perfect drainage of this great metropolis;" containing, moreover, an entirely fresh suggestion for improving the drainage,-that is, fresh so far as the commission is concerned. Now, this certainly does seem rather a pre-*A meeting of the court was held at a very short notice on Monday last, when the following resolution was passed:

- "That whereas it is of the greatest imnortance that the works in progress should not be stayed; and whereas an Act of Parliament provides for compensation to parties sustaining damage, —the application to the Court of Chaneery, of which notice has been given by Mr. Henry Rains, be opposed, and that the solicitors of the commissioners have suthority to give or accede to such undertakings or terms as a subject of the control of the motion, may require or approve it gives the supply of water, or otherwise, and to agree to any refuse and the plain iff sight being tried at law, or otherwise and other surveyor presented a report, which set forth that it would be recessary to hy down about 2,309 feet in length of 12-the pipe, for the purpose of supplying the tanneries and other works with water, the expense of which would be 350f.; and to accommodate the drainage of the houses and premises draining into the streams, about 3,739 feet; of 9-inch pipe would be required, at an expecse of 470f. These works would canable one branch for mill-treat no be filled up as far as George-row, as also another branch from Little dealt with hereafter. Other resolutions were passed showing that the commissioners are determined to proceed with the works.

cipitate proceeding on the part of the surveyor, scarcely warrantable; unless, indeed, those who are behind the curtain see that the resolution of a committee is in effect tantamount to a decision of the court, in which case the object might be to prevent the committee from bringing up their report in the threatened shape.

Mr. Austin's plan, which has been called the "converging system," is to divide the locality into certain districts, and to construct in each an enormous cesspool, or "sump." as he terms it, to which the drains of the district are to concentre. The contents, thus accumulated, are to be raised by steam-engines, and distributed from time to time, through subterranean pipes, over the country, or into the Thames. This plan, with every consideration for the ability of Mr. Austin, and the eminent engineers said to have been consulted upon it, is exceedingly unsatisfactory and objectionable. The great desideratum is to remove the refuse from us, not to accumulate it amongst us, and, moreover, to do this without contaminating our noble river, or transforming what should be a means of purification and a source of health, into a stream of corruption and the fruitful parent of disease.

All are now agreed as to the necessity of this latter condition, the preservation of the Thames: to persevere in the present course would show insanity, and all honour should be given to Mr. John Martin and others, who have been urging this point for years, before the public mind was awakened to its importance.*

The deep sewer proposed by Mr. Phillips is to be constructed in a slightly and uniformly curved direction, from Kingston on the western to the Kent or Essex marshes on the eastern extremity of the jurisdiction of the court, and there suitable reservoirs are to be provided, whence the refuse could be pumped up by steam power, and used either in a liquid or a solid state. It is to take off the whole of the house-drainage and other waters which at present compose the ordinary flow of the London sewers in fine weather, and the capacity of a tunnel for such a purpose he estimates would be 8 feet at Greenwich and 6 feet in diameter at Pimlico. In its passage it goes under the Thames twelve times, as well as under the West India Docks. The cost of 6 miles proposed to be immediately done he puts at 200,000%.

The general idea is not a new one, and for the purposes of the public it is none the worse for that.

In 1843 Mr. Thomas Cubit published a short pamphlet, entitled "Suggestions for improving the state of the River Thames and the Drainage of London" wherein, after pointing out the injury done by discharging the sewers into the Thames, he says,—

"My idea is, that the best means of obviating this evil would be to conduct the sewer drainage at once from the west and north parts of London, by the shortest and straightest lines that can be found, to a place to the east of the town (and perhaps the low lands of Plaistow or Barking Level would be the best calculated for the purpose), and there, near to the river, to form one or more very large reservoirs to receive the discharge from the sewers, where it should remain during the flow of the tide, having gates or sluices to be opened as

^{*} Mr. Martin has recently issued several pamphlets and-reprints, showing a number of important suggestions made by him from time to time,—"Thames and Metropolis Improvement Plan," by John Martin, K.L. London, Lindsey House, Chiesea, 1894; "Reprint of Report of the Committee appointed to take into consideration Mr. Martin's plan for every species of pollution," 1830,—and some others. Mr. Martin deserves the best opinion of his countrymeu.

so that it would only be the tide goes down; allowed to mix with the river when on its pas-sage to the sea, the gates being closed hefore he tide changes. By this plan none of the ewer water could travel back to London. the tide changes. With this view very deep sewers might be made, of sufficient capacity to take a large quantity of water in the most direct way, and to receive the contents of all the sewers crossing the lines. For example: one great line might he made to commence at Paddington, going along the New-road by King's Cross (or Battle-bridge), and there taking the Fleet Ditch; from thence, running towards the east by Islington, passing under the New River and the Canal, through Hackney and Bromley, and passing below the river Lea to its great receptacle: the distance from Paddington by this route would be only about 12 miles, being 6 miles less than the present course, which has to travel with the river, by all its windings and bendings, round the Isle of Dogs, and all other obstructions. Another great line might be carried along Oxford-street to the hottom of Holborn, where it could be made sufficiently deep to take the contents of that part of the Fleet Ditch, and which might be lowered from the river to run in that direction; then to continue across Smithfield, the grounds of the Charterhouse, along Old-street by Bethnalso eastward, to join green, and outlet. This would give an opportunity of draining many parts that are in a very crowded state, and at present without sufficient means of drainage.

For the south side of London he proposed a similar deep sewer running towards the east, on the other side of the Thames

The writer afterwards makes some observations on the means this arrangement would afford of trying experiments as to extracting some part of the immense quantity of fertilizing matter that is now wasted, but he very properly urges that the first consideration is to get rid of the refuse, without poisoning the river.

A meeting of the commissioners was held on Thursday, the 5th, and it will be seen in the report of their proceedings which is appended, that they directed the surveyor to submit full details of his plan to a special court to be held on the 23rd. Every willingness was professed to give it fair play, and, although some of the commissioners are very angry with the surveyor, and threaten his dismissal unless the first letter be withdrawn, they have agreed to postpone the consideration of his offence till his plan is fully before them.

The tunnel sewer is not without its difficulties and objections, but we are disposed, nevertheless, to think that the idea (however it may be modified) must be carried out now or hereafter. Lord Ebrington presided, and we would compliment his lordship on the good feeling and pleasant manner which he exhibited.

July 5 .- A report was received from Mr. Gotto Jany 3.—A report was received from art. Gows, assistant-surveyor, on the subject of a complaint that had been made by the Speaker of the House of Commons, of the offensive odours arising in the neighbourhood of the Houses of Parliament. He neighbourhood of the Houses of Parliament. He attributed a portion of the same to St. Margaret's churchyard, which was completely filled up with hodies in a state of decomposition, having saturated the soil with gases penetrating into the sewers; and from the inquiries he had made, it appeared that particular guilies were offensive at one time and not at another, which might be accounted for by the vind down one grating forcing the gases up another. Mr. Chadwick moved that the subject be deferred to the next court, which was agreed to.

Sir Edward Milne, from the Westminster Improvement Commissioners, attended the court, and wished to know the views of this commission as to the general system of drainage that would be finally

wished to know the views of this commission as to the general system of drainage that would be finally adopted for this district, as they were unable to commence operations until some general plan should be laid down. They should be very shortly in a position to open the new Victoria street, but no huilder would look at it until such plan was laid down.

Lord Ebrington promised speed.

On the resolution of the general committee of June 28 being read—" That the communication of

Mr. Phillips to the court, without reference to the merits of any scheme alluded to therein, is wholly unwarrantable; and that unless the next court shall receive an assurance from Mr. Phillips, that his letter is unequivocally withdrawn, and regret he expressed to the court for the nature of the communication, it has recommended to the court that Mr. Phillips should not continue in the service of the commission,"

Lord Ebrington said that this subject involved Lord Ebrington said that this subject involved two questions, viz., the suggestion of a plan by an officer who had devoted much time to the subject, having had great facilities of local knowledge and experience; and secondly, certain expressions he had used at the time. Before inquiring into the latter, it would he for them to consider whether the outline of the plan so drawn out should be accompanied with details and estimates. He understood that Mr. Phillips had already got a sketch drawn out, and therefore he (Lord E.) thought the hest course would be that a separate day should be fixed for their consideration. They should take care that to the consideration. They should take care that the public service should not be damaged by any personal matters, however unfitting those feelings might be for the dignity and proper working of the commission. He would accordingly move, that the

commission. We would be brought up on the 23rd, and that the same be previously printed. Mr. Leslie seconded the proposition of the chairman, without then expressing any opinion on the

Mr. Byng hoped that before proceeding in the aestion, they should have both plans (Mr. Austin's Mr. Byng hoped that before proceeding in the question, they should have both plans (Mr. Austin's and Mr. Phillips's) laid before them.

Mr. Chadwick said Mr. Austin had produced no plan for the entire drainage of London.

Sir H. de la Beche vindicated the acts of the

Sir H. de la beche vindicated the nees of the Survey Committee, who, he contended, had given no opinion whatever on any particular plan. Whatever was proved to be the best would be adopted. They were merely the trustees for the public, to do that which were have to the best feeting. which was the best for their interests.

A long desultory conversation ensued on the sub-ct, in which Mr. Chadwick, the Rev. W. Murray, Mr. C. Johnson, Mr. Slaney, and Dr. Arnott took part, and the motion was finally carried.

court, that the committee, taking into consideration the zealous and efficient services of Mr. Hertslet to the present and past commissions of sewers, would be happy if Mr. Hertslet would feel willing to continue in their service; but in any case for their service; mittee was then read :-- "That it be reported to the of happy it Mr. Prefixet would reel wining to con-tinue in their service; but in any case, for their own satisfaction, the commissioners would wish to re-ceive from Mr. Hertslet any communication he may think useful to make for their information."

Lord Evington moved its adoption by the court, and expressed the happiness he should experience if Mr. Hertslet should continue in the service, but would not press him to do so against his better judgment, or with any sacrifice of his health. Should judgment, or with any sacrince of his heatin. Should he persevere in his determination to retire, he trusted they would follow the same course in the question of his retirement as they had formerly adopted in the case of Mr. Roe.—Mr. Byng condemned such a course, in the formation of a non-descript office; he had the word of Mr. Hertslet had been country to make the best had been country to make the property of the second trust of the case of the that he now sought no pension.—Mr. Hertslet said he had not waived his right on that ground, hut in

his present position he was too proud to receive a pension out of the ratepayers' money.

Mr. Bullar said if by any modification of the onerous duties Mr. Hertslet could he induced to remain in the cournission, he was sure it would receive their unanisons of the course of the cours

remain in the commission, ne was sure it would receive their unanimous approval.

After a few words from Mr. Slaney, the motion was put and carried unanimously.

Mr. Hertslet believed such a course would he attended with delay. He had drawn up some reaches for his retirement, which he now had in his attended with delay. He had drawn up some rea-sons for his retirement, which he now had in his pecket, hat as they might apply to the future opera-tions of the commission, he begged at once to retire from the service, and that they should appoint his successor

After a long discussion, the following resolution After a long discussion, the following resolution on the subject of improvement rates was agreed to:

"That a separate department be constituted for the purpose of calculating and preparing improvement rates for all the works performed for the henefit of ratepayers, in such a manner as to diffuse the cost of each over a series of years, and apporting the amount to such extension; it has meaning the series of the property of the preparation. tion the amount to each ratepayer in the measure, as nearly as possible, of the benefit he derives from

St. Martin's Church, Birmingham. An architect, through the local Journal, calls attention to the dangerous state of the spire of this church, and its rapid decay. On examination, he finds its departure from the perpendicular to he far greater than it was, and its vibration during bell ringing to be rather alarming. The whole edifice is thought to alarming. The whole cannee is mought we require restoration or rebuilding, which there are surely people in Birmingham quite rich enough and ready enough to do,

AN ATTEMPT TO EXHIBIT THE TRUE PRINCIPLES OF ARCHITECTURAL AND PICTORIAL EFFECT IN REFERENCE TO STREETS, AND TO TOWNS GENERALLY.*

I HAVE pointed to natural principles in reference to streets, but it must be added, that on these principles the art itself is hased; for architecture, rightly considered, is an ideal imitation of a prototype, which may be found in the works of creation, which furnishes it with analogies. It is not the literal forms that architecture copies, but the principles they disclose; these are the rules of art, the geometry of which is but an instrument in its hands. In nature, designs may be everywhere discovered, and a secret rule which, like the laws of the Medes and Persians, altereth not. The first business of the student is to study these laws, and trace her beauty to its spring. Nature presents us with models eminently fit for our purpose; scarcely any of her objects, her groupings, or her combinations, but what are suggestive of principles for our guidance in architecture. "There is not one single object in nature, n nature," says an eloquent writer upon art, which is not capable of conveying ideas of beauty, and which, to the rightly-perceiving mind, does not present an incalculably greater number of beautiful than of deformed parts."

To this appropriating of the principles of nature true art owes her origin, and it is essential to her existence and progress. Nature is the true genius of architecture; her beauty is the muse—the inspiration of the architect: by a close study of nature, I consider the resources of the art may be greatly extended, its capabilities increased and enriched, and effects produced heyond anything that now exists or the world has yet seen;—whilst, on the other hand, if we lose sight of these principles, all must become anarchy in the mind, which will be a prey to the most incongruous and whim-

sical associations. Versed in these principles, and enamoured of their beauty, the student will have no difficulty in applying them to art. He will per-ceive that unity and variety are the ingredients

of beauty; that a building or street should have its various component parts strictly subordinate to the general design, and harmonizing one with the other, though each a distinct composition in itself; and in designing what in stone and wood is to give pleasure to the mind, he will consider the relative effects of form, pro-

portion, and arrangement, as they exist before him in creation, and work in accordance with those principles of beauty and harmony which are developed there.

If I am correct in this, I shall not be deemed hasty in my condemnation of the invariable use of the straight line in streets at the pre-sent day. What, I would ask, forms the chief heauty of a river or stream? Do those splendid phenomena, the magnificent characteristics of mountain scenery, owe their heauty to the straight line? The rocky pass, the verdant valley, the interesting combination of glade and thicket, woods, groves, hills, and lakes,—have not these been looked upon hy the architect in vain? Nature seems to abhor a straight line as she is said to do a vacuum. every leaf, every blade of glass, every part of the human body, presents us with some heautiful curve for imitation in works of art, both streets and houses might be pointed out in which scarce any line but the straight one can

be found. If I wanted an example of a street in which every precept of nature had been unheeded, I every precept of nature had been unheated, I could not do hetter than instance a well-known one in Liverpool, vix., Shaw-street, than which, perhaps, nothing more monotonous could be found. Formed on level ground, or nearly so, of one straight line, and, what is the most strange, though the houses are not enlisted under one design in the shape of a terrace, with the usual programment of centra and usual arrangement of centre and wings, the houses, as if cast in one mould, are from end to end fac-similes of each other. I appeal to any gentleman who has made the observation, whether he ever experienced in that street any of those sensations of pleasure that a first early of those sensations of pleasure that a fine street is calculated to awaken in every cultivated mind. With the exception of a couple of Ionic columns as a door-case to each house, it is one dead merely perforated wall from end to end, devoid of all provision

* See p. 293, unte.

for light and shade, innocent of anything that can relieve the wearied eye, or awaken a spark of interest in the mind. I mention this street because it is one of those in the design of which (if we are to have beauty in street architecture), from the cost and size of the houses, we have a right to expect some acknowledgment of the influence, and some obedience to the laws, of the beautiful. But it is the fault, in a greater or less degree, of many other streets, and arises from the pre-dominance in point of influence, of men who consider the beautiful incompatible with the useful, and have no idea of the moral agency On such a street, as far as all æsthetical qualities are concerned, those of London of the fourteenth century might have looked proudly down!

Men have hitherto been too prone to copy the foregone, to kneel at the shrines of their forefathers, afraid of striking out into new paths, however clearly pointed out by the finger-posts of nature and judgment. The projectors of Washington and the new cities imitated Babylon and other great capitals, instead of going to nature, a reference to which must at any time have a regenerating influence upon the art, renew its exhausted resources, and remove the corruptions to which it is liable from the fetters of prescription, the passing whim of fashion, and other destructive influences.

This beauty I am aware should be subordinate to constructive requirements, and to the dictates of utility, and should in a great measure arise out of them: but it does not entirely so arise,—when these have performed their part, there is something still left in the way of decoration, which must be done under the guidance of judgment and enlightened taste.

I have hitherto considered the picturesque more as to the arrangement and diversity of boxes the arrangement and diversity of

houses than as regards their individual forms, but the latter is an essential consideration; and there was perhaps never a time when the architect was more thickly surrounded by elements yielding hints and suggestions for originating the picturesque than at present; and though it is independent of styles, yet, for our present ideas of it, we are, I consider, greatly indebted to the rise, development, and fall of the latter.

The Romans, infinitely inferior to the Greeks

in purity of style, were superior to them in the pictorial: while less severe in taste and correct in expression, Rome exhibited more variety and richness, and produced greater magnifi-cence than Athens had known. That this was the case her relics attest: the still glorious ruins of her temples, palaces, baths, and tri-umphal arches (spoils of time yet trophies of genius at which travellers still pause and wonder), bear witness to her architectural dis-play in the days of Adrian. But beautiful and pure as was the Greek architecture, and rich pure as was the Greek architecture, and rich as must have been that of the Romans, who contributed largely to the riches of the art by the introduction of the arch, and by that crowning glory of the art—the dome,—it is the moderns that have produced the grandest combinations, and most striking effects: the enthronement of the Pantheon on the temple of peace was a triumple reserved for Rungel. of peace was a triumph reserved for Brunelleschi, Bramante, Michelangelo, and Wren;
—who, with Palladio, Inigo Jones, and others,
united the Greek and Roman elements to produce edifices, which, however far behind the ancient masters in purity of style, marked an advancement of the art in many qualities which nature suggests, and judgment sanctions.

The rise of Gothic architecture, remarkable for the variety of its forms, its profound scien-tific knowledge, and mechanical skill, intro-duced an entirely new feature into architecture in Europe, which gave an impulse to the study, and added to the resources of picturesque design. The inferiority of sandstone to marble in point of beauty must have given the new impetus to the struggle for decoration which it involved.

It was the genius of pointed design that first in Europe, leaving the horizontal principle of antiquity, introduced the vertical, which, according to the theory of some, was intended to

aspiring outlines, its bold projections, and deep recesses, its prominent and deeply-cut orna-ments, render it highly capable of the most elaborate expression. And, though much of such particular expression, admitting it to exist, must necessarily refer to doctrines and systems which have passed away, and be so far powerless, yet all must acknowledge that sufficient remains of a purely abstract character, capable of stirring, in no slight degree, the chords of the heart and imagination.

The most perfect examples of pointed design were produced in the thirteenth and fourteenth centuries; some of the cathedrals of that period here and on the continent, in their decorations, seeming to vie with the infinite variety of nature herself; but the picturesque was per-haps never more perfectly embodied than in ecclesiastical, monumental, and domestic Gothic of the later periods. Our old English, or Tudor, manor-houses houses and cottages. with their bay and oriel windows, turretted and pinnacled gables, niches, ornamental chimney-shafts and embattled porches, are the buildings, which, in their forms, beyond any others, harmonise with those of nature.

The introduction of Italian architecture into

England gave a fresh impulse to our ideas of the picturesque, and produced in domestic buildings effects unseen before. The love of thepicturesque, as embodied in Gothic buildings, prevented the native architect on its introduc-tion from adopting it entire; the continuous entablatures and flat pediments of the classic architecture, as exhibited at Rome, compared with the bold and varied composition, and endless decoration, of the Gothic, must have had much of the effect of humble prose beside the lofty flights of the poet: perhaps association and other causes attached him to his native style: however that may be, hy uniting the general principles of design and composition of the Tudor with the elements of the Palladian architecture, together with something of the quaint decoration of the German and Flemish schools, the style called the Elizabethan was produced.

For some time it was a mere parody on the classic; novelty and error went hand in hand, but something abstractly valuable to art, I consider, was gained; the study of picturesque beauty in connection with the antique orders was advanced, the wholesome effects of which were visible in the designs of Sir John Vanbrugh and others, who endeavoured to call back to the architecture of Palladio something of the spirit of the native Gothic.

Whilst speaking approvingly of the Elizabethan architecture, I wish it to be understood that I do not refer to that mixture of Gothic and Italian detail that is seen in some old buildings,—these were merely transitional; what I understand by Elizabethan is the style that was presented when the transition was complete, and then no Gothic details existed in it; and, consisting of Italian details, implanted on Gothic design and composition only, it is worthy of attention. It was, in only, it is worthy of attention. It was, in regard to the picturesque, a step in advance of the Italian,—which presented in general a straight outline, and suggestive of new combinations of the antique elements, more striking and beautiful than had yet been

It was unfortunate for the art that the love of the picturesque, as engendered by this state of things, united to the most successful efforts to introduce it into the architecture of the ancients, should have been condemned as faults, and have gained for the architects little else than abuse, both from their contemporarics and successors. Vanbrugh, who had an intense feeling for the picturesque, who displayed the most original and inventive genius, and the most consummate skill in composition, was derided and lampooned by the first critics and poets of the day, and regarded almost in the light of an impostor, because he would not reproduce Roman and Greek temples in this country, but attempted to weave into picturesque forms, adapted to native requirements, the elements of the classic, and infuse the most striking features of our own into the architecture of the ancients. His chief works, Blenheim and Castle Howard, cording to the theory of some, was intended to direct the mind heavenward, and the whole style, in various particulars, to be a sort of hieroglyphical exponent of theological doctrines and ecclesiastical usages. Indeed, its fered martyrdom in their reputations to their

Iove for the truth in architecture, convinced that whatever the style of a building, whatever the character of its details, the composition

may be picturesque.

I am aware that numberless whimsicalities and absurdities have been perpetrated in the name of the picturesque, but maintain, not-withstanding, that the picturesque is not, as has been supposed by many, inimical to purity of style, and that it can be obtained in the antique styles without violating their essential laws. The Greek architecture was for a different purpose to ours,—one which called for simplicity and solemnity. The source of the grand style of Greece was religion. Had they applied their architecture to domestic and other purposes, they would doubtless have engrafted new features thereon, and have drawn upon other principles. St. George's IIall, of this town, though pure Greek in style, and a new erection, is not unpicturesque. Many archi-tects, celebrated in their day, in order to produce picturesque forms and combinations, perverted principle; they sacrificed propriety perversed principle; they sacrined propriety to the pictorial, but the pictorial demanded no such sacrifice. The picturesque is of no style, but it may be obtained in any. It reigned in Greece and Rome, and may be found in India, and Egypt, and China, at the present day; and though the hand of time may be useful in producing its most affecting associations, it may be had in the newest building, where outline is attended to - where the laws of natural beauty are consulted.

Many of the old towns of the continent, and some nearer home—in Wales, for instance strangers to the spirit of improvement that has elsewhere been busy in the land, though certainly not models for imitation in this improved age, could not be looked upon by the architect of taste without suggesting to his mind valuable hints for originating the picturesque in houses and streets. The streets turesque in houses and streets. The streets of London, so far back as the fourteenth and fifteenth centuries, as exhibited in old prints, with their pointed gables and overhanging stories, though affording no lesson in constructive science, are instinct with beauty: many of them develop principles, and yield striking hints as regards relief, and are highly suggestive of the conditions on which beauty may be obtained.

may be obtained.

Time is certainly an agent in producing the picturesque: however injurious in other respects to works of art, be increases their pictorial beauty. To his hand the outlines of a building yield their stiffness: he varies its tones of colour, melting them as it were into more perfect keeping with the local scenery, and assimilating the whole to the condition of creation around. A building grows into harmony with nature by the effect of climate; it becomes adopted as it were by the genius loci, and they are united under the influence of the same causes; and when originally constructed in forms that harmonise with the works of God around, "they remind the spectator," to quote the language of Wordsworth, "of a pro-duction of nature, and appear to have grown rather than to have been erected; and, when clothed in part with a vegetable garb, appear to be received into the bosom of the living principle of things, as it acts and exists among the woods and fields."

The older towns and cities, therefore, assume more of the picturesque. A town erected at a variety of periods, and in which we behold the work of centuries, presents a proportionately greater variety in style, hue, and shape,—and most towns have in this particular the advantage of the one in which our lot is cast.

I have said that picturesque beauty of design is independent of style. In this I might be borne out by the beauty of most Mahomedan cities, which present, with their array of mosques and minarets (notwithstanding the information of the architecture, in the biase of the production o inferiority of the architecture in the higher principles), an entire result superior to what we see in many of their European compeers. Fancy and feeling, it is true, have been more consulted than judgment, but they have pro-duced a wonderful effect, and are very sugges-

It would be improper, in a treatise of this nature, to omit all mention of sculpture, which ranks high as an element of the picturesque in architecture. Statues were a crowning magnificence introduced on the apex of the temple pediments, as if the genius of the art, or the

spirit of heauty itself, had alighted upon it. Sculpture some one has aptly called "the voice of architecture:" without it, the art is not complete: if it be not a breathing into it the breath of life, it is at least an awakening of the breath of life, it is at least an awakening of it to a higher life, and rendering it capable of a more complete and divine expression. When we contemplate the result of a judicious application of statuary in architectural embellishment, we cannot but regret that so many empty niches should surround our public buildings. This is characteristic of English edifices. It would seem that English people have an antipathy to statues. The expense is, perhaps, one bar to their more extensive employment; but the chief one, I suspect, might be found in influences which had their birth at the Reformation.

the Reformation

There is a fault of modern streets which I have not before mentioned,—they too much resemble each other. I have heard travellers complain of the streets in some continental cities being so much alike that it was impossible for a strenger to three distinct the second strenger to the definition. sible for a stranger to thread his way through them. I would give diversity of character to streets as well as to houses, and for this there are resources in architecture. Public buildings, whilst they give life and dignity to the ings, whilst they give life and dignity to the view, play a conspicuous part in producing this desired variety, and characterising their respective streets; and, fortunately, these are greatly increasing in number, both in the metropolis and in the leading provincial towns, where, it must be confessed, despite the neglect of some important principles of beauty, a great deal has of late been done conducive to pictorial effect. In London, though but few fine streets could be named, there are many beautiful spots and interesting views,—many a picturesque nook that the artist would delight to sketch, and that the most uninformed specto sketch, and that the most uninformed spec-tator would feel and admire, though perhaps, in the words of Sterne, "without knowing why, or caring wherefore."

But the streets themselves are improved

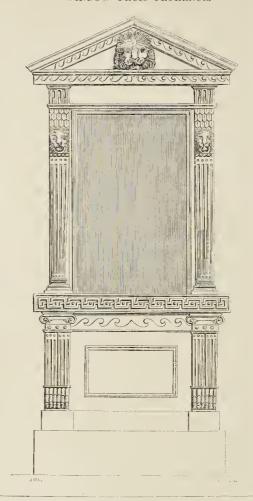

or caring wherefore."
But the streets themselves are improved. If we compare London of the present day with London of thirty or forty years ago, we must confess that great is the advantage of the former over the latter; and Liverpool has perhaps advanced in a similar ratio. Streets have been swelling into ampler width, and other provisions of beauty and usefulness hecoming more abundant. What I chiefly complain of is, the non-acknowledgment of those principles by which the greatest amount of pictorial beauty would be obtained from any given means; and maintain that the rage for uniformity that has been exhibited in the new streets had its origin in a mistaken notion of beauty; that whatever other advantages that and the straight line may possess yet to that quality which gives pleasure to the eye, and exhilaration to the mind, they must fail in other respects to late efforts, by any remarks I have made; I am merely contending for a principle that appears to me to be lost sight of, or at least neglected. I am aware that any errors I may have pointed out are seldom to be charged upon architects. The opportunity of, or at least neglected. I am aware that any errors I may have pointed out are seldom to be charged upon architects. The opportunity seldom occurs for putting in practice such principles as refer to the general form of thoroughfares in towns and cities; and I am also aware that there are circumstances connected with the planning of streets to which they must succumb,—circumstances of so much importance, that this paper may be deemed by some more artistic and theoretical than practical and useful: that it may be suggestive, however, of something advantageous to the art, I am not without hope.

however, of something advantageous to the art, I am not without hope.

But there are other considerations besides those of architectural and philosophical propriety and pictorial effect, which should have weight in the formation of streets: there are considerations of a sanitary nature, though those principles for which I contend have something indirectly to do with the health; they affect the spirits, and through that medium the body; for what gives interest and pleasure to the mind will, I need scarcely say, have no slight influence in maintaining and improving the physical organs.

Respect should be had in laying out a town and determining the hearing of the streets, to the direction of the prevailing winds. In Liverpool, where the winds are chiefly from the west, the healthful breeze, for a great portion of the length of the town, is excluded by

WINDOW FROM FLORENCE.

a wall of lofty warehouses, running north and south, and intersected by a very insufficient amount of opening. A good sanitary provision in the arrangement of a town would be the forming of large squares at the intersection of the main streets, and communicating with each other in the direction of the prevailing winds. But this is a subject into which I cannot enter now; it is one upon which I cannot enter now; it is one upon which alone volumes might be written, and I leave it to those who are better prepared for its discussion. It is every day receiving more and more of that serious attention to which it is entitled.*

SAMUEL HUGGINS.

WINDOW FROM FLORENCE.

THE window represented by the accompanying engraving, made from a drawing by Mr. Lockyer, is novel and not inelegant. It is from a place in the Via dei Servi, Floreuce, and is drawn to the scale of 1-6th of an inch to a foot. It may go amongst our hints for street architecture.

THE INTRODUCTION OF THE POINTED STYLE.

At the close of Mr. Fergusson's paper "On the Pointed Arch," read at the Institute of Architects on the 18th June, and which we have already printed in full, a discussion ensued, in the course of which Mr. The remarked that the question as to the invention of the pointed arch, and that as to the time of the introduction of the pointed system were quite distinct, and he thought the most interesting part of the inquiry would be, how was it, and when was it, that the rude architecture of the Romanesque period grew into the tecture of the Romanesque period grew into the pointed style

Mr. Sharpe acquiesced in the propriety of Mr. Tite's suggestion, that the discussion should be limited to the consideration of that period of architecture in which the pointed arch first made its appearance in Europe. He preferred the architectural rather than the antiquarian view of the question; and to consider the causes that led to the early use and the rapid adoption of the pointed arch in Europe,

* See p. 290 and p. 303, ante.

rather than the origin of its form and the country in which it first appeared. He did not wish, however, that it should go forth that that meeting adopted all that they had heard from Mr. Forgusson of the early use of the pointed arch in the east; he begged to enter his protest against the high antiquity proposed to be given to those parts of the buildings referred to which contained it. As regarded the whole of the illustrations of the first class referred to, with one exception, the term arch was altogether inapplicable-the principle was wanting-the form was there; so it was in the first book of Euclid; but forms were not arches; these examples were simply openings formed by stones overlapping one another, and such as any one might make in a common ashlar wall by knocking out the stones. Mr. Fergusson had applied the term "horizontal arch" to this form; he (Mr. S.) understood a very different form under that term-a form very common in Gothic architecture, consisting of a stone beam formed of several pieces joggled together; there you had the principle of the arch. As regarded the buildings of Cairo, there were no doubt a great number which contained pointed arches, but the important question was, what was their date? The proof that was necessary arches, but the important question was, what was their date? The proof that was necessary to establish their antiquity was to be sought for under this head, rather than from the fre-quent occurrence of the feature. Again, Mr. Fergusson had said that the mosque of Amrou had been much pulled about and altered; how could it be proved at this day that the parts in which the pointed arches occur were not amongst the very parts that had been so altered? We should be very chary in receiving assertions as to date, and look very carefully at the proof: if proof most conclusive and satis factory be wanting, this theory falls to the ground. As regards the question of the introground. As regards the question of the intro-duction of the pointed arch in Europe, he held the opinion that no new feature was adopted in the architecture of the middle ages, which had not some useful property contained in it. He believed he might go further and say that, in pro-portion to the utility of a member was the degree of ornament it received; he would content himself, however, at present, with the for-mer axiom. Of the sixty-six theories contained mer axiom. Of the sixty-six theories contained in Britton's fifth volume of the "Architectural Antiquities," only two attempted to account for the introduction of the pointed arch on this ground. One of these was the well-known theory, due to Dr. Whewell, and enlarged upon by him in his interesting work on the German Churches, which attributed the introduction of this form to the exigencies arising out of the difficulties of vaulting an oblong space, with circular arches, in horizontal courses, as exemplified in the buildings on the Rhine. The other was that advanced by Dr. Young and Mr. Weir, namely, that the use of the pointed arch was originally due to a disthe pointed arch was originally due to a discovery of its usefulness in diminishing lateral pressure. He (Mr. S.) was disposed to take the latter view; and for reasons that he was about to give at large, in a work now in the press, on the "Early History of the Pointed Arch in the south of France," and which he would shortly explain, with the assistance of some of the plates which he had with him, and which included views and sections of some of the year buildings which Mr. tions of some of the very buildings which Mr. Fergusson had referred to,—the whole of which he had himself visited and measured. In the first place, he must join issue with Mr. Fergusson in reference to his assertion that the pointed arch occurred generally under the circular arch in those buildings, and that its use was therefore anterior to the latter in point of time. He was prepared to maintain that there was a law which regulated the us of the two forms in the same building, and that a very important one,—but one very different from that laid down by Mr. Fergusson, and one evidently traceable to the cause already alluded to. The arches used in the churches of the middle ages might very properly be divided into two classes,—those used for the large openings, such as the vaulting arches, the arches of the crossing, and the pier arches, and which may be said to constitute the framework of the building; and those used for the smaller openings, such as the doorways, the which were totally distinct from them, and, in windows, the arcades, &c., and which might be said to belong to the panelling of the structure;—the former class might be properly termed arches of construction, and the that of the Church of St. Mark, at Venice—

latter arches of decoration. In the buildings of the transitional period,—and he was disposed to accept that term, as belonging par excellence to those buildings which exhibited the transition from the circular style to the pointed style, - he was prepared to assert, that for nearly half a century the pointed arch was y half a century the pointed area in the arches of construction, and the circular arch in arches of decoration. This rule was not laid down upon the authority of a few isolated examples; he had a list of no less than eighty buildings in England, France, and Germany, which he had himself visited, in Germany, which he had himself visited, in which this law obtained; and he had no doubt that the attention of the memhers of the Institute being called to the fact, this list would be hereafter very considerably increased; he spoke only of what hadfallen within his own personal observation, and he thought that a good rule for every one to follow. Mr. S. then read part of every one to follow. Mr. S. then read part of the list of examples to which he referred, and explained that a few exceptions existed, but that they were not of that nature, or to that extent, as in the least to invalidate the law as applied to the whole of the earlier buildings of the transitional period. He stated that the the transitional period. He stated that the number of buildings belonging to this period was much greater than was generally supposed, even in this country, and that they abounded on the continent; that they possessed peculiar details and characteristic marks perfectly distinctional than the belonged to the News tinct from those which belonged man, as well as the Early English period, and such as entitled them to separate classification. explained, that in the latter part of the period the pointed arch began to find its way into the arches of decoration, as in the choirs of Canterbury and Ripon Cathedrals, the for-mer of which belonged to the years 1185-1190; and immediately afterwards rapidly and universally in this country superseded the circular arch. As regarded its introduction into other parts of Europe, he believed that it was in the south of France that its earliest employment was to be looked for; the most usual mode of roofing the large spaces in that country in the Romanesque period was by a longitudinal barrel vault, or semi-cylinder, running the whole length of the huilding; this plan ob-Valence, both of which belonged, upon unquestionable evidence, to the middle of the eleventh century. This was, therefore, natu-rally the place where we should look for the rany the piace where we should not for the first appearance of the pointed arch; and here it is in fact that we first find it. We find it accompanied, or rather almost immediately followed, by that slight alteration of detail in the moulding and sculpture which accompanied its introduction in other countries,—and, as a natural consequence, by that reduction in the solid thickness of the walls, and that con-centration of abutment at particular points, which indicated here, as elsewhere, the progress of science in construction. To premise, as Mr. Fergusson did, that this style preceded the other; that the pointed arch, in these countries, was anterior to the circular; that the builders went back, in fact, from this advanced point to earlier and ruder principles was impossible, and was certainly unsupportable by documentary evidence of any kind. Mr. Sharpe then exhibited views and sections of the Cathedral of Vaisson, to which Mr. Fergusson had referred; the Cathedral of Sisteron; the Abhey Churches of Cadouin and Notre Dame, at Digne, and other buildings containing the pointed barrel vault, in support of his assertions,—the actual ascertained dates of which, he stated, bore out what he had said; and in the whole of which the pointed said. the pointed arch was used not only in the vaultings to which Mr. Fergusson supposed it was confined, but in all the other arches of construction, whilst the circular arch prevailed uniformly in the arches of decoration. The speaker then proceeded to notice a class of buildings in which the pointed arch occurred, of a very early, interesting, and peculiar kind, in the west of France, limited both as to number and the district in which they were found, which had been mixed up with those he had just been describing, but

or to go higher still, that of St. Sophia, at Constantinople—and consisted of five large square compartments, forming the Greek cross, and covered with five large hemi-spherical domes, supported by pendentives resting on enormous square piers. This was the type of the plan of the whole of them. In some the design had been mutilated, in others never entirely carried, and in others slightly modi-fied, to suit western requirements; but in the Cathedral of St. Front, at Perigueux, the Cathedral of St. Front, at Perigueux, the genuine Byzantine design is presented in its unmitigated Eastern aspect. He then exhibited parallel views of the interior of St. Mark's, Venice, and the cathedral of Perigueux, taken from the same point of view, which presented, with one exception, identically the same features, that exception being the occurrence, in the French building, of the pointed arch in place of the circular arch of St. Mark's, in the large arches which support the domical vault. He exhibited also views and plans of the cathedral churches of Cahors and Angoulême, and the abbey church of Souillac, all similar in their main features to St. Front. To the earliest of these buildings he was disposed to attach a very early date, not only on account of the extreme simplicity and rudeness of the work, and the nature of their details, but also, in the case of St. Front, on account of a certain striking correspondence of fact between the internal and external evidence of the building. He declined, how-ever, to enter into this part of the question, or to make any assertion at that moment as to the period at which the pointed arch was thus used in this part of France, further than to declare his belief that these buildings were earlier than the class he had previously noticed; and, therefore, in his opinion, the earliest not only in France hut in the west of be. The question still remained for solu-How came these buildings, so unlike any thing that remains in the countries uninfluenced by the Greek church, to be planted in this foreign soil? Was the pointed arch, as seen in these buildings, introduced along with the plan, or was it a local adaptation? We find it neither in its type (St. Mark's), nor its archetype (St. Sophia's). But is it likely that archetype (St. Sophia's). But is it likely that so important a feature was an insertion in a design which displays in every other part so unequivocally its foreign origin? He (Mr. S.) was not disposed to think so. He looked upon the determination of this question as one of no small interest in the history of the pointed arch, and one which might possibly lead to the conclusion that this form did in reality come to us from the East; but it was to be entered upon in a spirit of careful inquiry, and the facts were to be proved, step by step, in a manner which should leave as little room as possible for speculative opinion, or mere conecture; and, above all, without hastily accepting or rejecting the dates which we might find handed to us by previous inquirers; and never, if possible, without reference to the original records or the earliest existing documentary evidence, bearing upon the history of the building in question.*

FIRE-PROOF CEILINGS OF WIRE-WORK have been successfully applied, in place of lath, with plaster and stucco as usual, at the Chester Lunatic Asylum. The wires are about \(\frac{1}{4} \) in, apart, and the plaster forms an adhesive and conviceable to the plaster forms an adhesive and the plaster forms and the state of the plaster forms are planted in the plaster forms and the plaster forms are planted in the plaster forms are planted in the plaster forms are planted in the pl apare, and the plaster forms an adhesive and serviceable mass, even on both sides. The wire is galvanized, or japanned, to prevent corrosion. Not only ceilings, one would think, but thin partitions and walls in general, might be wired in place of lathed, and risk of fire thus greatly diminished by a moose nation. thus greatly diminished by a process neither patented nor costly.

THE NORTH KENT LINE OF RAIL, which will bring London into immediate railway communication with Lewisham, Woolwich, Dartford, Gravesend, Strood, Rochester, and Chatham, is now about completed, and is to be opened for passengers about the middle of July. The new portion, between London-bridge station and Gravesend, is 23½ miles in length, and, exclusive of rails and stations, the cost of construction—the original contract estimates for which were fixed at 638,0001. will amount, it is stated, to 400,000l. only.

^{*} At a meeting of the Institute, held on the 2nd inst-rofessor Cockerell read an important paper on the present sition of architecture, to which we shall give dus astention.

EAST END OF LINCOLN CATHEDRAL.

ABOVE we have the pleasure to place before our readers a view of the east end of Lincoln Minster, one of the finest of our mediæval buildings, and concerning which we have at various times spoken. Illustrations of the south porch, the fine rose window in transept, and of the chapter-house, a beautiful specimen of pure Early English, have been already

We may remind our readers that Lincoln Minster was commenced by Bisbop Hugh, at the close of the twelfth century, and was completed by Robert, called Grosse teste. The portion here represented is of the Geometrical style, or late Early English, so to speak, - the forerunner of the Decorated.

The engraving is from a drawing by Mr. Caveler, made for the purpose.

CHRONOLOGICAL ACCOUNT OF BUILD-INGS IN ITALY AND SICILY.*

Palermo Cathedrat.—1170 to 1185, by Walter of Ilamell, an Englishman (Knight). Aftar to north-east. Little remains of the original building but crypt and portions of south side and east end. The arches of crypt are pointed. 1420, great west door; south door, 1426; and porch, 1450 (Knight).

(Knight).

Monreale Cathedral.—1174 to 1182; the hronze

Monreau Cumurat.—1174 to 1102; the hronze doors, 1186, by Borumano.

S. Eustachio, Rome —1196; founded in Constantine's time (Rossi and Vasi); has one of the

brick towers.

S. Michele, Lucca.—1188, façade by Guidetto

S. Michele, Lucca.—1188, lagane by Gunder Un-Knight)
S. Sisto, Rome.—1200, restored. Founder un-known, but church mentioned by S. Gregory 600 (Severano): 1200, and restored in 1464-71 (Rossi); 1200, greatly repaired (Rycaut). Torre dei Coati.—Twelfth century, D'Agin-court, c. 1200 (Rycaut). S. Maria Toscanella.—c. 1206 (Knight).

* See page 256, ante.

S. Maria Plebe, Arczzo.—1216, tower. It is quite like the Roman (Knight).
S. Andrea, Vercelli.—1219, by Thomas, a French ecclesiastic (Knight).
Parma Baptistery.—1196 to 1281 (Knight); 1196 to 1260 (Hope).
Padna Great Hall.—1218, finished. Supposed to have been begun 1172; damaged by fire, 1429; and by storm, 1756 (Miczia).
S. Giovanni in Monte, Bologna.—1221; the camparile in 1286 (Willis).
S. Francesco, Assist.—1228, by a German architect (Knight).
S. Antonio, Padna.—1231, begun (Knight).
Ponte delle Grazie, Florence.—1236 (Richa).
SS. Trimta, Florence.—1236, by N Pisano; enlarged and embellished 1383; campanile 1395; facade 1593 (Richa); altar nearly west.
S. Chiara, Ravenna.—1250 (Fabri).
S. Caterina, Pisa.—1253, by Guglielmo Agnelli, pupil of Nicolo da Pisa. Injured by fire 1651, after which transept was added (Grassi). The upper arches are pointed, but details in general arc Italian.
S. Maria della Spina, Pisa.—1230; enlarced

S. Maria della Spina, Pisa — 1230 enlarged 1300 (Grassi), 1230 enlarged and enriched 1323

(Knight). This is the most Gothic-looking building in Pisa, but all the details throughout are Italianised.

Italianised.

S. Antonio Abbate, Rome.—1259 (Vasi, Rossi, and Severano); originally dedicated 467 (Rossi); altar to nortb. [At this era the pointed style seems to bave got a decided footing in Italy, as may be seen at Ferrara, Assisi, Pisa, Vercelli, &c. But these specimens all seem the work of strangers; the details are all Italianised; and we look in vain for any of the beautiful arrangements or details of our Early English or even Norman Cathedrals. I know notbing in Italy of this date which gives any idea of the heatiful scroll-work and other ornaments of the Early English period, nor of the hird's beak, the zigzag, or other Norman peculiarities.] liarities.

nartices. J articles. J 1216 to 1277, rebuilt from foundations as now seen (Severano); I585, re-

stored (Vasi).

S. Giacomo Magno, Bologna.—1267; roof 1497

S. Giacomo Magno, Bologna.—1207; rool 1497 (Willis).
S. Maria Novella, Florence.—1278, by Fra Restoro and Fra Sisto; façade 1349 to 1470; nave finished 1307; campanile c. 1330; struck by lightning 1358 (Richa); altar to north.
S. Maria del Popolo, Rome.—1277, rebuilt, having been huilt 1099; restored 1660 (Vasi); altar to cast.
Commo Santo. Pisa.—1278 to 1283, by Gio.

attar to east.

Campo Santo, Pisa.—1278 to 1283, by Gio.

Pisano; arches filled in 1464 (Grassi).

Pal. Publico, Piacenza.—1281, begun (Knight).

Or. San Michele, Florence.—1284, by Arnolfo di

Lupo; added to and decorated in 1337-1352, when

Cragana was employed (Riche).

Lupo; added to and decorated in 1337-1352, when Oreagna was employed (Richa).

8. Croce, Florence.—1295, by Arnolfo di Lupo; finished 1320. The façade from Porta Maggiore to the door of cloister commenced only in hlack and white marble, by Cronaca; tower and roof nearly destroyed, 1514; sacristy built hefore 1330; (Ricba); by Arnolfo, son of the stranger who built Gothic church at Assisi (Knight); 1294 (Villani); 1285 (Ilope); altar nearly to east.

Foro dei Mercanti, Bologna.—1294 (Willis).

Florence Cathedral.—1298, begun by Arnolfo di Cambio da Colle. Altar to cast.

Forence Uninearia.—1238, begun by Arnono ut Cambio da Colle. Altar to east. S. Anastasio, Verona.—C. 1300 (Maffei). S. Fermo Maggiore, Verona—1313, the subterranean church spoken of as old in 775 (Maffei). Ospitate Grande, Palermo.—1330, built in one wear (Knipht).

Ospitate Grande, Patermo.—1330, built in one year (Knight).

S. Maria delle Scale, Verona.—1328 (Maffei).

Badia Campanile. Florence.—1330: balf pulled down by populace 1307, and rebuilt as now seen; the church has been much injured by fire at various times (Richa); altar to south.

S. Niccolo, Florence.—1332 (Richa); altar to south.

piazza and façade over, 1485; 1500, by Bergamasco; centre window towards piazza, 1523-1538

masco; centre window towards piazza, 1523-1538 (Cicognara).

Ca. a' Oro, Venice.—1350 (Quadri), Cicognara states its date is uncertain.

Monza Cathedral.—1359, front (Hope); fourteenth century (Willis).

S. Maria sopra Minerra, Rome.—1370 (Bunsen and Vasi), 1273; the convent adjoining stands on site and ruins of temple of Minerva (Rossi).

Milan Cathedral.—1386 to 1411 (Oxford Glossary); 1387, doubtful whether by Arler, a German, or hy Campione, an Italian; but nearly all architects first employed on it were German; 1388, great east window by French architect (Knight); altar to cast.

S. Petronio, Bologna.-1184, consecrated (F. bri);

S. Perronto, postugnation 1390, altar to south.
Certosa, Pacia.—1396, begun; west front by Fossano, 1473 (Pettic).
S. Onofrio, Rome.—1439 (Pistolesi e Vasi); the body is groined, the apse semi-octagon, with pointed windows.

windows,
S. Spirito, Florence.—1435 to 1481, by F.
Brunelleschi (Richa); altar nearly north.
S. Susanna, Rome.—Originally by Constantine; rebuilt, 800; restored, 1475 and 1600, when front was built from foundations, also gilt ceiling then made (Rossi); c. 290, rebuilt 800 (Vasi); altar to north.

altar to north.

S. Agostino, Rome.—1480 (Bunsen and Vasi), by B. Fintelli; altar to north.

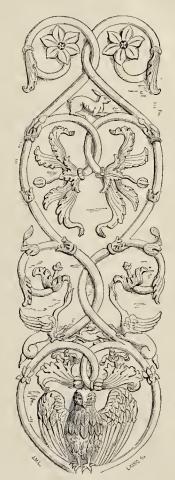

Pal. Vendramin, Venice.—1481, by one of the Lombardi (Cicognara).

Pal. Foscari, Venice.—1390 (Cicognara), 1439 (Willis).

(Willis).

Perhaps the most marked feature of Italian detail is the capital; six distinct styles may be recognised on careful investigation.

DECORATIONS FROM ABROAD.

FROM ARCHITRAVE, SPOLETO CATHEDRAL.

1. Imitation of the Roman, generally Corinthian, often Composite, and sometimes, but seldom, Ionic (S. Stefano Rotondo). This style, as might be expected, occurs in buildings of all ages, from the earliest time to the latest; from Ravenna, in the fifth century, to S. Caterina Pissa 1953. terina, Pisa, 1253.

2nd. The peculiar corhel capitals, as in the Roman brick tower, or in many of our Saxon churches. These have no dates which can be strictly relied on, but from their great prevalence at Ravenna, their presence in the ancient church of S. Vitale, and other indications, we may imagine them to be of Greek origin, more especially as the churches in Greece have their windows and domes formed with columns in windows and domes formed with columns in this style, though rather more ornate.

3rd. Those clearly Greek, the characteristics whereof are so clearly seen at S. Vitale, S. Fosca, S. Marc's, S. Donato, &c.

4th. Wherein the capitals are formed either of foliage cut out in the peculiar hard, flat style; or of animals, or of blocks, with the angles worked out in some ornamental way. These I imagine to be northern importations. These are first seen, so far as I can recollect, at S. Michele, Pavia, and are used at S. Stefano in Bologna, at S. Ambrogio in Milan, Pisa, Modena, S. Zeno in Verona, Palermo, Parma,

Where the Norman seems to have gained somewhat of the lightness of the Gothic, as seen in some of our transition work, as at Lentini, Sciacca, Syracuse, Messina, Ferrara, &c. I look upon these, also, as Transalpine.
6th. Where the intention has been, ob-

viously, to give somea hat of a Gothic charac-ter, the sculptor understanding only Italian detail, as at Pisa, Florence, Bologna, &c. A Milan the capitals are tolerably good Gothic.

ORNAMENT FROM DUOMO, SPOLETO.

THE cathedral at Spoleto dates from a very early period, having been originally erected under the Lombard dukes. Numerous, how-ever, arc the alterations and additions since that ever, are the atterations and additions since that date. The sculptured piece of ornament here represented is taken from the architrave (in marble) of the central doorway of the principal façade, now, with the two side doors, masked by Bramante's elegant picturesque portico (which, by the way, was given by the "Archi-tectural Publication Society" in their first issue of plates).

THE IRON TRADE.—At a preliminary meeting of masters, on Saturday last, a further reduction of 10s. per ton was resolved on, and it is considered to be very doubtful whether even the prices that now remain after the deduction of the recent nominal or admitted reductions of 30s., can be maintained. A notice of further reductions in wages has also been given.

NOTES IN THE PROVINCES.

THE old church at Halstead, lately decapitated by the removal of its spire—the materials of which were sold to pay the expenses of removal—begins to show other serious signs of decay. The props in the nave have begun to bend under pressure of the roof, and the edifiee has been pronounced by the diocesan architect, Mr. Clark, to be quite unsafe, so that the Bishop has ordered it to be closed. According to an estimate by the architect the cost of restoration will be 2,630*l*.; but the parochia resources heing exhausted in the building of a new church, 800l, alone can be mustered, and new church, 800l. alone can be mustered, and the authorities now appeal to the public for aid.—A new font, octagonal and decorated in style of fourteenth century, has been presented to St. Martin's Church, Leicester, by Mr. T. Comhe, of Oxford.—Workmen have been engaged at Mansfield in preparations for laying the foundation-stone of the Bentinck monument.— New parochial schools were founded at Foxearth, Essex, on 12th inst. The design is by Mr. J. Clark, and the cost will be 500l., chiefly defrayed by the rector.—In the little church of Bartlow the pews have been replaced by open benches, and the arch in the round tower re-opened; other restorations and repairs have been completed, and the church is re-opened.— The large west winchurch is re-opened.—The large west win-dow of Holy Rhood Church, Southampton, has been fitted with thick plate glass to exclude noise. Subscriptions are in progress, which it is hoped will enable the authorities to fill the st and chancel windows with stained glass The gurgoyles, which were objected to, are to be reduced to small appropriate ornaments. be reduced to small appropriate ornaments.—A stained ghas window of three compartments has been put up in the eastern chancel of the church of Muthern, Chepstow.—The new town hall at Yeovil was opened on Wednesday week. The hall is 58½ feet long, 35 feet broad, and 25 feet high. It is approached from the market-honse by iron gates and stone steps with cast-iron balustrades.—Statues to Neison and Wellington are to be placed on Southsea Common, where Nelson trod his native land for the last time, and where Wellington. native land for the last time, and where Wellington first stepped on British ground after his last greattriumph.—-Mangotsfield Church is to be repaired and renovated at a cost of about 850l., besides that of restoring the chancel by the lay impropriators and other offerings.

Messrs. Pope, Binden, and Clark, of Bristol, have furnished plans for the work.—The Walsall Town Improvement Commissioners, in choosing from the tenders for huildings, excavations, and gas holder for new gas works, have decided on the tender of Mr. Hale, of Walsall, for buildings and excavations, at 1,4931, with deduction of 101 if base to chimneys brick; and Messrs. Smith and Co., off West Bromwich, for making gas holder and removing old one, at a cost of 808l. 10s. The works are expected to commence the manufacture of gas at Christmas. — The Sheffield Water Company have caused blocks of gypsum to be deposited in their culvert, order to prevent the water from imbibing poisonous impurities from the lead cisterns and sonous impurities from the lead cisterns and service-pipes. This may be expected to take place by the water firstly imbibling the gypsum or sulphate of lime, of which it is to be presumed the analytical chemist, Mr. Haywood, who made the suggestion, has found the water to be deficient. — A stone tower, with a spire, is to be built on the church at Bootle, in place of the two unseemly towers, which have heen removed. Other alterations are to be made, and seat-room for 400 additional sitters provided.——A German Lutheran Church is to be built at Hull.——The inhabit--The inhabit-Church is to be built at Hull.—The inhabitants of Brigg, in that vicinity, have resolved to erect a Corn Exchange by joint stock shares of 101. each.—A monument has been placed in the east aise of the north transept of York Minster, to Dr. Beckwith, who bequeathed 45,0001. to the cathedral, the Yorkshire Museum, the York Charity Schools, and and other laudable objects.—The repair of Knox's house in the High-street of Edinhurgh being declared to be impossible, it is proposed to mark the stones, remove them piecemeal being declared to be impossible, it is proposed to mark the stones, remove them piecemeal, and rebuild the house.— The repair of Jedburgh Abbey has heen resumed by the Lothian family trustees. The east wing is now being restored.—Mr. Mackenzie, architect, Elgin, has constructed a design for the Culloden

monument. The model represents a large, irregular, conical mass of rock, with a rough road winding through clefts, &c., to the summit, where, crowning a preeipice, is a female figure, leaning on the rock, and mourning, along with her children. At prominent points are tablets, to be erected by clans, or in memory of individuals.—A church in Great Charles-street, Dublin, has been destroyed by fire.

RAILWAY JOTTINGS.

On the Oxford, Woreester, and Wolver-hampton line several hundred labourers, bricklayers, and miners have been discharged from the Mickleton tunnel from want of funds. Only forty men are now employed, and the works will shortly, it is said, be brought to a standstill.—On Wednesday week, in springstandstill.—On Wednesday week, in springing two arches of the bridge now building over the Teviot at Roxburgh, on the Kelso and St. Boswell branch of the Edinburgh and Hawick line, the pier gave way, and eight men were buried in the ruin, and killed on the spot. The North Staffordshire Company have entered into a contract for the working of their whole line. An extensive coach manufacturer at Saltley, near Birmingham, is the contractor. There were fourteen tenders. The contract, stock, and maintenance of permanent way, and does not interfere with the stations, clerks, and receipts. The company's engineer has the power to inflict a penalty of 10,000l., if not satisfied with the fulfilment of the contract. satisfied with the fulfillment of the contract. The mileage rate for working and maintaining the locomotives, &c., is about 10d. for passenger trains, and 1s. for goods trains, and penalties will be incurred by late arrivals or departures.——A scramble for the Pickfordian or carrier class of pickings on the London and North-Western seems be in progress. The company, it is said, take the singular liberty of breaking open such packages or parcels as they may suspect to contain goods for different parties separately directed, and themselves deliver the goods so separately packed, and appropriate the charges for delivery. Some carriers have had an in-terview with the Railway Board on this subterview with the Railway Board on this subject, and Mr. Labouchere is said to have admitted that a remedy must be provided. The company, it seems, defy the law, which saddles complainers with heavy expenses, even while they obtain favourable verdicts. Why should small carriers be treated on a different principle from the great carriers at St. Martin's-le-Grand? The post packages and mail hags are not broken open for the sake of such plunder: why should others be so,—and that, too, ex facie, on the mere a priori and that, too, ex facie, on the mere a priori chance of twice chargeable contents? Should other railway companies follow example, why not steam and other shipping companies, coach and omnibus proprietors, and other carriers themselves of all kinds inclusive? And if so, what seal would be safe and sacred from such an universal parcel hunt? No parent even could safely send a lot of ticketed toys to each of his children, no friend ticketed toys to each of his children, no friend enclose a few presents, without the chance of separate charges for the delivery of each, and none whatever nny parcel or package, without affording a feasible pretence, on the part of carriers of all sorts, for breaking it open and examining its contents. It is for Government Custom-house authorities alone, with any show of propriety or right, to be allowed such a license, as that so cavalierly practised and insisted on by these North-Western Railway authorities—great though they be—in this free authorities—great though they be—in this free country.—There are two million of rivets in the tubular bridge over the Menai Straits, each an inch in diameter.—A bollow girder bridge, of make similar to the tubular, but with the rails fixed above in place of in the interior, is in course of formation, to cross the Trent at Gainshorough on the Manchester, Sheffield, and Lincolnshire line. Two principal hollow girders form the parapets, and the roadway is supported by transverse wrought-iron hollow beams, or tubes, rectangular in section. This bridge was designed by Mr. W. Fowler, and the tubes have heen constructed by Mr. Fairbairn. The stone-work consists of a centre-pier, and two elliptical arches of 50 feet span each, terminated by the usual land abutments. The iron-work consists of two spans, together 308

feet, which gives a total length to the bridge of 460 feet. The principal girders are each 336 feet long, 12 feet high, and 3 feet 1 inch wide, having their tops formed of cells 18 inches wide, and 12 inches deep, to resist compression, and the bottom of double-rivetted plates, to withstand tension. They are fixed on the middle pier, and supported on the land abutments by rollers, resting on cast-iron plates embedded in the masonry, thus admitting of expansion and contraction. The first girder, if not now also the other, is already fixed.—Mr. Hennett, of Bristol, has just completed a wrought-iron bridge, which weighs 450 tons, and is intended to cross the Thames, at Slough, from the branch line of the Great Western to Windsor.

BENT TIMBER FOR ROOFING.

I OBSERVE that in your journal of the 23rd of May, Mr. John Hay, of Liverpool, has inserted a letter, the purport of which is to claim the nerit of the application of bent planks for roofing purposes. His letter is a singular instance of forgetfulness. May I trespass upon you to set him right as to the originality of his discoveries?

his discoveries?

Mr. Hay was employed as an architectural assistant upon the Rouen Railway, by Messrs. Mackenzie and Brassey in the year 1843. Whilst engaged on these works, he had the opportunity of examining the bridges of Bezons, Maisons Laffitte, Manoir, and Oissel, which were constructed under Mr. Locke's direction, with main ribs of bent plank.

To proceed to the use of such ribs in roofing did not require a great stretch of imagination. Such as was necessary was, however, made firstly by the foreman of the Rouen station, Mr. John Milroy. He made a model of a rib roof to cover the large shed of the station, building up the ribs with bent planks. This model Mr. Hay saw before he made his designs for the Scotch churches. Mr. Milroy's model was made in the spring; Mr. Hay's designs were made in the winter following.

Like all discussions upon the merit of in-

Like all discussions upon the merit of inventions, the last comers have painful reminiscences "that the ancients have stolen our good things." Whether Mr. Hay knew of Col. Emy's work, or not, he had seen several of Mr. Locke's timber bridges, and he was well aware that a bridge upon the same principle had been constructed near Newcastle some

years previously.

Mr. Tite executed a very beautiful roof over the Rue Verte station of the Rouen and Havre line with the main ribs of bent planks. Mr. Drake executed the roof of the station at Dieppe with elliptical ribs bnilt in the same manner. I used similar ribs to support the intermediate principals in a large goods shed I built at Havre, so that there is far from being any novelty in the plan. Indeed, when the French possess two elaborate works upon the subject, one by Col. Emy, the other by Col. Ardant, and a multitude of memoirs, one of which is by Navier (a man gathered to his fathers seven years since), it is the height of absurdity, if nothing else, to claim the merit of the invention.

Paris.

Geo. R. Burnell.

ARCHITECTURAL MATHEMATICIANS; or, MATHEMATICAL ARCHITECTS.

A WANT of mathematical acumen and lors has been, with some, a standing reproach against the architectural profession. Let such lovers of the abstract in form and number, i they be such, purchase and digest a recen work of Mr. II. P. Browning, architect,* and probably by the time they have mastered all it articles, definitions, and corollaries, they may be inclined to suspect that, after all, architect do know how to fathom the profundities of algebra and geometry, although they make no great hoast of their powers and acquisitions. The profession are certainly deeply indebted to Mr. Browning for his most able contribution towards the removal of even the shadow

a "An Algebra of Ratios, founded on simple and general definitions, with a theory of exponents extended to incommensurable ratios, and the propositions of the fifth book of Euclid easily and symbolically deduced," By Henry B Browning, Architect, Stanford. Cambridge: Macmillan Barclay, and Macmillan. London: Simpkin, Marshall, an Co. 1849.

of a ground for such reproaches. The more immediate object of his work, however, is to establish an algebra of ratios, on the same footing as that of abstract numbers, and thus to dispense with the unmathematical expedient of regarding all magnitudes as thus to dispense with the unmathematical expedient of regarding all magnitudes as commensurable with each other, and to furnish definite notions of the powers and roots of ratios in their most difficult and comprehensive forms. These purposes, in our humble opinion, he has accomplished in that efficient manner which might have been anticipated from his growing talent. "The application of algebrato geometry," as he observes, and "which is the great object of all who study mathematics with a view to the purposes of mathematics with a view to the purposes of life, will thus be rendered more satisfactory, if not more conclusive, in its results; and doctrine of proportion, as taught in the fifth book of Euclid, will be relieved of the circumlocution and tedious repetition in which his theory abounds."

Taking for granted that a certain degree of mathematical experience is requisite fully to comprehend the subject, he has assumed the re-sults of arithmetical algebra, and notwithstanding the prejudices of some, has adopted the def-nitions and language of limits, being persuaded that a studied avoidance of the use of limits in the treatment of continuous magnitude is of no advantage to the student, and introduces difficulties equal at least to those it professes difficulties equal at least to those it professes to remove. A few propositions, treating principally of the limits of concrete quantities, though apparently foreign to the work, have been introduced by way of furnishing concise and easily-remembered proofs of relations afterwards deduced; and having fully considered the ratios of concrete quantities, in the conclusion of the work, a definition of the notion of a ratio of ratios is appended.

We would willingly give a citation of the author's mode of dealing with his subject, but its subdivisions are so consecutively and logically linked, that it would be no easy matter to occupy a small space without being betrayed into yielding up a larger than our own geometrical limits will fairly allow.

AN ACCOUNT OF AN EXTRAORDINARY INSTANCE OF THE RAPID DECAY OF TIMBER, FROM DRY ROT, WHICH OCCURRED IN THE CHURCH OF THE HOLY TRINITY, AT CORK.*

So many naturalists and men of science having endeavoured to account for the origin of dry rot, I shall not advance any theory of my own on the subject, although I believe that much still remains to be inquired into respecting its causes and consequences; but with the view of attracting to it that attention which its when of attracting to it that attention which its importance demands, I beg leave to submit to the institution an account of an extraordinary case that occurred in Cork; at the same time urging on my professional brethren to record any other instances which may come within their knowledge, in order that those who may be disposed further to investigate the subject, may have the benefit of facts, given on the authority of practical men

may have the benefit of facts, given on the anthority of practical men.

The parish church of the Ho'y Trinity in Cork, in the year 1827, having been found to be in a bad state of repair, and quite deformed from bad and unequal foundations, the parishioners resolved on building a new church; but through want of funds, not being able to carry their design into avertion, and the property of the pr their design into execution, an extensive repair was decided on. The tower was taken down, and one side wall and the end of the church was rebuilt.

This church is 100 feet long by 50 feet wide, divided into a nave and aisles by double tiers divided into a nave and aisles by double tiers of columns, the lower tier being of solid timber, supporting galleries, and resting upon rude rubble stone piers in the vaults below, the upper tier being of built timber columns supporting the roof. It is necessary to describe the building, in order to show that from retaining a part of the old timber-work the evil of dry rot emanated.

For years there had not been anything inter-

For years there had not been anything intervening between a great part of the body of the old church and the burial vaults beneath, except a timber Hoor, and though the interior

was spacious, and even handsome, this abomination long continued.

Immediately under the floor of the church, and open to the vaults, longitudinal beams of Irish oak of from 12 to 14 inches square bad been placed, resting on piers, and forming sup-ports for the joists. Though these oak beams were decayed for an inch deep at their surfaces, sufficient of the timber (as it was thought) mained sound, and it was decided that neither they, nor the piers upon which they rested, should be removed. The vaults are arched over; memel joists, 6 inches by 4 inches, were placed on the vaulting, and connected with the placet of the valuing, and connected with the oak beams which rested on the piers; the floors were removed; the old pews were replaced; new columns, coated with seagliola, were erected over the galleries, the old ones in the lower tier retained; and the whole repairs having heen thus completed, the clurch was re-opened for divine service in April, 1829.

In November, 1830 (but eighteen months afterwards), the congregation was annoyed by an unpleasant smell, which, on examination, was found to proceed from dry rot of the most alarming nature.

On opening the floors under the pews most extraordinary appearance presented itself. There were flat fungi of immense size and thickness, some so large as almost to occupy a space equal to the size of a pew, and from 1 to 3 inches thick. In other places fungi appeared, growing with the ordinary dry rot, some of an unusual shape, in form like a convolvulus, with stems of from a quarter to half an inch in diameter. When first exposed, the whole was of a beautiful buff colour, and cmitted the usual smell of the dry rot fungus.

Whatever may have been the surprise at the rapid growth of the plant, its action on the best Memel timber was a source of greater astonishment. I took up, with nearly as much ease as I would a walking cane, that which eighteen months before, was a sound piece of timber (ore of the joists) from 12 to 14 feet long, 6 (ore of the joists) from 12 to 1. Sinches by 4 inches scantling; the form of the timber remained as it came from the saw, but its strength and weight were gone. The timits strength and weight were gone. The tim-ber of the joists and floor over the new brick rot, which was completely affected by the dry rot, which was rapidly spreading to the lower part of the columns under the galleries, so that at the rate the infection proceeded, the total destruction of the building would soon have

During a great part of the time occupied in the repairs of the church the weather was very the repairs of the church the weather was very rainy. The arches of the vaults having been turned before the roof was slated, the rain water saturated the partly decayed oak beams, before described. The flooring and joists, composed of fresh timber, were laid on the vaulting before it was dry, coming in contact at the same time with the old oak timber, which was abundantly supplied with the seeds of decay, stimulated by moisture, the bad atmosphere of an ill-contrived burial place, and afterwards by heat from the stoves constantly in use. All these circumstances account satisfactorily to these circumstances account satisfactorily to my mind for the extraordinary and rapid growth of the fungi.

growth of the tungl.

The large sum of 4,000*l*. having been so lately expended on the church, caused great auxiety to the parishioners. The opinions of the most experienced professional men were taken, and all agreed that the first effort should better.

temporary supports were removed, thereby avoiding the fracture consequent on ordinary wedging, so that all was effected without any disturbance or sinking of the galleries, and the columns which supported the roof, &c., the screws in each column being accurately adjusted, so as to meet the pressure from

The expense incurred by these repairs was very considerable; but it is satisfactory to state that there has not been a re-appearance of the dry rot since that time, now a period of

sixteen years.

Of late the subject has been diligently investigated by men of science, including the chemist and the naturalist. It is not my intention to dwell on the merits of the various preventative processes that have been suggested, or for which patents have heen taken out, as my object is only to give a simple account of a very peculiar case of the disease, the facts of which strengthen me in my opinion, that the best economy in extensive repairs is to be cautious in the use of old timber, and if it must be used, not to permit new timber to come in contact with it.

I shall conclude by observing that the seasoning of timber is seldom sufficiently attended to, and that the characters of professional men are frequently injured by not being more stringent in demanding proof of the stacking and seasoning of timber for a sufficient time.

Miscellanea.

OXFORD ARCHITECTURAL SOCIETY .- At the tenth annual meeting of the society, which took place in the society's rooms, Holywell, on Wednesday, the 20th of June, the Rev. W. Sewell, president, in the chair, a hope was expressed that the society might be of use in giving plans for almshouses, schools, &c., which would see it a pair in decourage to the second seeds a proper second seeds a pair in the second s would assist a parish clergyman when unable to employ an architect. The chairman stated that the committee had it in contemplation to estabthe committee had it in contemplation to estab-lish some elementary lectures in architecture. The Rev. Mr. George Williams, President of the Cambridge Architectural Society, then read a paper on the church of St. Sophia, at Con-stantinople. The secretaries intimated that they would be glad if any architect or parish clergy would furnish them from time to time with plans of schools. See with the actual cost with plans of schools, &c., with the actual cost of erection. We are the last persons in the of erection. We are the last persons in the world to attempt to prevent generous actions. All we have to say is, that if the Church Commissioners and other bodies obtain gratuitous plans of churches, to forward to those parishes who wish to build such,—the Poor-law Commissioners, plans of workhouses,—the Inspectors of Prisons, plans of jails, &c., there will be little employment for poor architects.

St. Andrew's TRANK SOMERSES—The

St. Andrew's, Trent, Somerset.—The present rector of this church, the Rev. W. H. Turner, a few years since lengthened the nave one bay to the westward, at the same time adding a little chapel on the north side of the nave to contain the organ, and a new roof to nave and chancel, unfortunately, groined with plaster ribs and spandrils; the whole of the seats are rendered uniform and copied from existing specimens; the lower part of the tower, which forms the south transept, is filled with plainer ones; a pulpit was given by the the most experienced professional men were taken, and all agreed that the first effort should be to cut off the communication with the galleries, the disease having already extended 3 feet upwards on the lower columns.

The new brick vaulting was found penetrated by the fungi, imposing the necessity of having the vaulting, as well as all the timber work in the lower part of the church, entirely and carefully removed. Newer and thicker vaulting was then substituted for that which was taken down, and the whole of the floor over it was laid with Yorkshire and Shannon flags set in Roman cement. New pews were erected, resting on iron chairs let into the flagging; the flooring of all the pews was constructed so as to be occasionally removed for inspection; Roman cement was internally used next to and at the bottom of the walls, and iron columns were substituted for those of timber in the lower tier. Here I must notice the clever plan of my friend, Richard Beamish, Esq. C.E., who caused a screw to be placed in the head of each iron column, which was screwed up, so as to take the load before the

^{*} By Sir Thomas Deane. From the "Transactions of the Institution of Civil Engineers of Ireland." Vol. II. Dub-lin, S. B. Oldham; London, Whittaker.

PROJECTED WORKS.—Advertisements have been issued for tenders, by 21st inst., for the erection of the Towcester National Schools; by 17th, for building the new Unitarian Chapel, at Banbury; by 11th, for the erection of the new church of St. Peter, at Croydon; by 23rd, for the construction of the drainage and water supply, and other sanitary works, at the workhouse premises, Amersham, Bucks; by 24th, for the erection of Harlow new schools; without delay, for the execution of the works of Sketty new church (Swansea); by 14th, for the erection of a school house and master's residence at Abergwessin (Hereford); by 10th, for the erection of the Welsh Educational Institution at Llandovery; by 9th, for the erection of the August, for the execution of contract No. 1 of the Londonidge station enlargement, comprising substructure of new station, ballast, permanent way, &c.; by 10th inst., for the erection and completion of a goods shed at Mirfield station of Lancashire and Yorkshire Railway, and hy 17th, for passenger-station at Bradford, on same line; by 20th, for making new line of road in parish of Leigh (Worcester); by 7th, for bricklayers', joiners', stone-massons, slaters', plumbers', and painters' works in repairing public conduits and water-works at Southampton; by 9th, for construction of service reservoir for Sunderland Water-works; by 18th, for fitting up large gas-holder at Paisley; and by 11th, for the several works in building St. Matthias's Church, Bristol.

The Position of Rallways.—Mr. A.

The Position of Railways.—Mr. A. Gordon, C.E., has recently republished his past anticipations of the present state of things, from which it does appear that since the outset of the railway system he has repeatedly warned the public of the false principles on which its direction and conduction were being carried on. As to recent disclosures, be estimates that even admitting the railway capital at large (200,000,000l.) to be now depreciated, so as to be only 100,000,000l., "the grand railway account would not show quite 1 per cent. per annum from which to pay dividends." And "still," he adds, "there is no provision made for replacement of capital." The high-blown bladder, which he appears to regard as still poised on high in full inflation, "must ere long burst," he believes; and, accordingly, he once more warns all and sundry not yet shareholders, "that pending the requisit remedial measure, the owners and representatives of the two hundred millions are not term-tied partners, but fluctuating shareholders, whose best chance of escaping from the dilemma is by keeping up the apparent value of the shares till some other narries (table their returns).

some other parties take their places."

TANN'S RELIANCE DETECTOR LOCK.—In this, which is a lever detector lock, a new feature has been introduced, namely, the protecting one or more of the levers by a guard. The guard is placed on one of the levers, and protects the lever either above or below it, so that even if a false key or pick succeeded in lifting to the proper height all the levers with unprotected fronts, it could not raise the one behind the guard, and the slightest extra lift of the guarded lever at once fixes the detector, and then the proper key only can regulate it. The addition seems to give much increased

security.

The Marble Arch.—We have no faith in the statement of some of our contemporaries that the marble arch is going to Windsor. One correspondent puts before us the suggestion made in the Athenaum, that it should be erected in front of the British Museum. We incline much more strongly to the suggestion in our own pages (among twenty others), that it should be made to form a fitting entrance to St. James's-park at Spring-gardens, where such is much needed.

BRITANNIA AND CONWAY TUBULAR BRIDGES.—At this moment, our readers may be glad to know of the publication of a brief description of these bridges.* Of a more important work on the same subject, by Mr. Fairbairn, just now issued,† maintaining the right of Mr. Fairbairn to a share of the public applause, we shall take an opportunity to speak.

ELECTRO-TELEGNAPHIC PROGRESS .- The modus operandi of the copying telegraph has at length been revealed. According to the spe-cification of the patent, two cylinders are made to revolve by clockwork, regulated by an electro-magnet four times in each revolution, so as to he perfectly coincident in time of rotation.
On one is rolled a sheet of tin foil, and on the other a sheet of paper saturated with a solu-tion which electricity will easily decompose and blacken through a metallic pointer, which presses on it and conducts the current to the paper after it passes from the tin foil on the other cylinder, through a similar metallic pointer pressing on it. The apparatus thus prepared, and the cylinders made to revolve, with the electricity in action,—the pointers are carried gradually from one end of the cylinders to the other, so that a spiral series of dark lines, closely continuous, is described on the paper from end to end, unless the current of electricity be intermitted, which it is by means of writing, or other characters or forms, on the conducting tinfoil round the other cylinder traced with a nonconducting varnish in place of ink. It is thus manifest that an exact copy of the tracing will be picked out as it were by blank in-tervals in the black or blue lined spiral tracery the papered cylinder, the pointer ceasing to blacken the paper wherever its fellow passes over or across the varnish on the tinfoil; and thus, by a contrivance of the most ingenious and simple description, accomplishing one of the most astonishing miracles of this age of wonders. With a single wire, 400 letters per minute can thus be transmitted. And the wonder does not end here, for the message or letter transmitted by correspondents (to their own paper and from their own tinfoil, of course, if desired), with its signature, &c., is a perfect fac-simile of the original in form or tracery, only written, as it were in white ink, on a dark ground like line engraving. Drawings, it is clear, too, or even portraits, plans, &c., may as readily be thus not only copied, but transmitted hundreds of miles at one and the same moment. The name of the inventor of this triumph of genius is Blakewell. The specification of the patent includes improvements in opening and closing commu-nication with different stations by means of one wire, and points to the establishment of a system of half-hourly dispatches. The facili-tation and cheapening of newspaper reports too by such means are very obvious, especially as shorthand can thus be still more readily

as shormand can thus be still more reamy and rapidly copied than ordinary writing.

GUTTA PERCHA TUBING.—A series of experiments have just been concluded at the Birmingham Water-Works, relative to the strength of gutta percha tubing, with a view to its applicability for the conveyance of water. The experiments were made under the direction of Mr. Henry Rofe, engineer, upon tubes of three quarters of an inch diameter and one-eighth thick of gutta percha. These were attached to the iron main and subjected for two months to a pressure of 200 feet head of water, without, as we are told, being in the slightest degree deteriorated. In order to ascertain, if possible, the maximum strength, one of the tubes was connected with the Water Company's hydraulic proofing pump, the regular load of which is 250 lbs. on the square inch. At this point the tube was unaffected, and the pump was worked up to 337 lbs., but, as we are informed, it still remained perfect.

FOLEY'S "INO AND INFANT BACCHES."

FOLEY'S "INO AND INFANT BACCHUS."
—In the Court of Queen's Bench on 29th ult.,
Lord Charles Townsend sought to recover
from Mr. Foley 250l. had and received to form
a group in marble on the model exhibited at
Westminster Hall as "Ino and the Infant
Bacchus," to be executed for 550 guineas.
His lordship, however, during its progress,
regretted he had not commissioned a single
figure, and ultimately, on an understanding
with Mr. Foley's brother, claimed the "refusal" of the group. Mr. Foley thereupon
sold it to Lord Ellesmerc for 750 guineas, and
Lord Townshend applied for a return of the
250l. advanced. The defendant urged the
usual practice of bargains with sculptors in
cases where the result of their commissioned
labour was rejected, namely, payment of onehalf the price in advance and no repayment,
leaving, in this case, 38l. 15s. due to the defendant, who, however, had offered to refer the
matter in dispute to Sir Robert Peel or other

competent arbitrator. Lord Denman recommended Lord Townshend to commission a single figure,—a proposal at once acceded to by both parties. After withdrawing a juror and entering a nonsuit, with costs to neither, Lord Denman decided, as requested, that the value be fixed by an arbiter, mutually agreed on, either party paying the difference to the other, if above or below 2006.

Lord Denman decided, as requested, that the value be fixed by an arbiter, mutually agreed on, either party paying the difference to the other, if above or below 200%.

Chester.—Curiosity has been awakened by some archæological discoveries in Commonhall-street, Chester. The workmen engaged in excavating for the public sewers first came across a footpath with curb stones set on edge at a depth of 7 feet, and afterwards laid bare what appeared to be the foundations of a row of columns three or four yards apart, set on a strong bed of concrete, 10 feet below the level of the present street. On the fourth of these foundations there still remained the base of a column. Many fragments of Roman bricks and tiles, with Latin letters on them, were found at the same depth. They have crossed, also, another of those mysterious passages in Common-hall-street, ahout 5 feet by 5 feet, cut out of the rock 11 feet 6 inches below the surface, but whether it has been used as a subterranean passage, or for the more ignoble purposes of a drain, there seems to be a difference of opinion. The horough engineer is using every exertion to collect and preserve these antiquities. As we hope to be present at the meeting of the British Archæological Association, to he held here at the end of the month, we may have something more to say of this hereafter.

The Shannon Improvement Works,—

The Shannon Improvement Works,—On Monday from 600 to 700 men were placed upon the works, which consist in deepening the bed of the river, and clearing away the remains of the ancient bridge which formerly connected the provinces of Leinster and Connaught. A good deal of disappointment was felt by those who had been rejected, many of the starving creatures having travelled a long distance with the hope of being engaged. Yesterday and to-day the number of hands has been considerably increased, and now upwards of 1,500 men find employment on these works.—Althow Independent.

Wall Paintings, Cullompton Church., walls of Cullompton Church, Devon, now being restored, are found, upon partially scraping off the white lining, to be covered interiorly with paintings in distemper. In the north aisle is a figure of St. Christopher, 9 feet high, with fishes and a mermaid at his feet, and his green twisted palm staff: other figures on an equally gigantic scale are sadly cut up by marble monuments; one of these is St. Michael weighing departed spirits: a demo-niacal horned head is grinning between the cords of the lighter scale. There is another figure with a sort of pontifical crown, and hearing a wand, cruciform at its termination. On the north side of the nave clerestory is St. Clara in an orange-coloured robe, with a mitre terminated by a ball: her name is on a ribbon beneath. There are other specimens of the colourist's art in foliage adapted to spandrels, which, as well as the dresses of the figures, also the mouldings of the pier arches, are chiefly of an Indian red colour. It is a matter of regret to many that our antiquaries do not unveil more of these figures and their inscriptions before the decayed plastering is renewed, which it necessarily must be very shortly.

E. Ashworth.

TENDERS.

No. CCCXXXVI.

SATURDAY, JULY 14, 1849.

N Thursday, the 12th inst., the Society for Improving the Condition of the Labouring Classes held their annual meeting at Willis's Rooms, St.James's, when

Lord Ashley presided, and a fair audience assembled to hear what progress had been made since the last anniversary. On that occasion, it will be remembered, Prince Albert. who was in the chair, made a speech which spread with electrical rapidity over the kingdom, quickening good impulses, inducing kind feelings, prompting noble acts. We went into the hall of the Freemasons' Tavern (where the meeting was held) accidentally; the president was speaking, and his words ring in our ears even now. "You may depend upon it," said he, "that the interests of often-contrasted classes are identified, and it is only ignorance which prevents their uniting for each other's advantage. To dispel that ignorance-to show how man can help man, notwithstanding the complicated state of civilized society, ought to be the aim of every philantbropic person; but it is more peculiarly the duty of those who, under the blessing of Divine Providence, enjoy station, wealth, and education. Let them be careful, however, to avoid any dictatorial interference with labour and employment, which frightens away capital, destroys that freedom of thought and independence of action which must remain to every one if he is to work out his own happiness, and impairs that confidence under which alone engagements for mutual benefit are possible. God has created man imperfect, and left him with many wants, as it were to stimulate each to individual exertion, and to make them all feel that it is only by united exertions and combined action that these imperfections can be supplied, and these wants satisfied;" and this the Prince said so earnestly that if it were not the honest, real conviction and sentiment of his heart, it was so much like it that every other heart responded to it and admitted its force.

Since then the society has not heen idle, as was shown by the report on Thursday;* they have commenced a block of new Model Houses for 48 families in Streatham-street, Bloomsbury; and with the view of showing how old and illarranged buildings may be renovated and fitted up, although not in such a way as to attain the standard of accommodation suppliable in new buildings, still, to effect a great improvement upon the existing state of things,—they have formed a lodging-house for men out of what

* Lord Ashley, in the course of his opening address, while impressing on all the fact that it repudiated all idea of heing a charitable association, however beneficial it might prove to those it aided in their endeavours to improve their physical and moral condition, stated that the example of the solicity was not only being imitated, as a model, in numerous towns throughout this country, but on the continent as well. That the President of the French Republic had contributed 2,000t, in aid of such efforts at Paris, and that he had himself the president of the renches of the Prussian Government as to the imply a member of the Prussian Government as to the imply a member of the Prussian Government as to the imply a member of the Prussian Government as to the imply a member of the post of Halleh, was and assured the meeting that one of the most poerie classes, and assured the meeting that one of the most poeriel predisposing causes of the scourge so unhappily prevalent. In the report which was then read, it the was stated that a committee for the improvement of the cotages of agricultural labourers had heen formed at Tunbridge Wells, and that the society's committee had agreed bridge with the property of the plans of the society in this respect being immediately carried into effect.

were three tenements, in Charles-street, Drurylane; and one for women at 76, Hattongarden.

The tenements in Charles-street were taken at a rent of 45%, per annum, were thrown into one house, the greater part of the yard was covered over and formed into a living room, and a scullery and offices, with a bath, were added—the whole of which, together with the fittings, furniture, &c., cost 1,163%. The tenants pay 4d. for each night, but if they remain a week, 2s. (the society do not profess to lower the ordinary price, but to improve the character of dwellings); and it seems that this has been the most profitable of their undertakings.

We annex a plan of the house in Hatton Garden as it originally stood, and another as altered, for the use of parties wishing to make similar adaptations.

Of the model houses in Streatham-street, designed by Mr. H. Roberts, the society's honorary architect, we give a view, serving to show as well the number of floors as the appearance of the building, a plan of the ground-floor, and one, on a larger scale, of a tenement or set of apartments.

In undertaking to provide in one pile of building for the accommodation of a large number of families, amongst the most important considerations was that of preserving the domestic privacy and independence of each distinct family, and so disconnecting their apartments as effectually to prevent the communication of contagious diseases; this, it will be seen, on reference to the plan, is accomplished by dispensing altogether with separate staircases and other internal communications between the different stories, and by adopting one common open staircase lead-

ing into galleries or corridors, open on one side to a spacious quadrangle, and on the other side having the outer doors of the several tenements, the rooms of which are protected from draught by a small entrance lobby. The galleries are supported next the quadrangle by a series of arcades, each embracing two stories in height, and the slate floors of the intermediate galleries rest on iron beams, which also carry the inclosure railing. The tenements being thus rendered separate dwellings, and having fewer than seven windows in each, it is hoped that they will not be liable to the window duty,—that abominable tax on light, health, architectural fitness, and morality.

The question of rendering the building fireproof had much consideration, and a plan was finally adopted to secure this. The floors and roofs of the houses are to he rendered fireproof by arching with hollow bricks slightly wedge-shaped, 6 inches high and 4 inches wide on the top part.

The rise of the arches will be from \$\frac{1}{2}\$ inch to 1 inch per foot on the span, and they will be set in cement. The arrangement of the building is such as to render these arches a continued series of abutments to each other, excepting at the extremities, where they will be tied in with iron rods. The floors of all the bed-rooms will be boarded.

The tenders for the erection of this building, which we gave a few weeks since, show it is to be erected with the fire-proof floors and roof for 7,370l., and that the extra cost of the fire-proof construction will be only 42l., or about 12s. per hundred pounds!

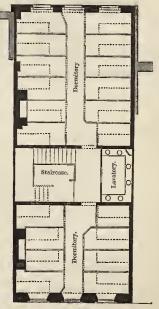

The plan fully describes the general arrangement of the principal floor; and that in the

MODEL HOUSES FOR FAMILIES, STREATHAM-STREET, BLOOMSBURY.

PLAN OF GROUND FLOOR

GEORGE STREET.

next page shows, at a larger scale, one tenement well as promoting field gardens, fisheries, and or set of apartments, with the fittings requisite for a well-ordered family: in addition to the bed-rooms there is provision for an enclosed bed in the closet out of the living-

The nature of the foundation rendering excavation to a considerable depth indispensable, a basement story is to be formed, with a range of workshops. We may mention that the site years, at a rent of 50l. per annum.

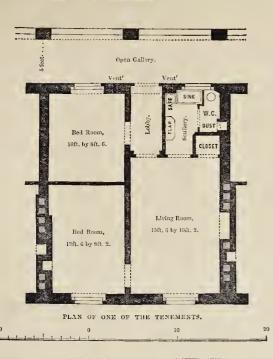

agricultural education; and they publish periodically an Industrial Magazine of information bearing on the means of improving the circuinstances of the lower classes. They appear to be strenuously striving to do their amount of good, and we cordially wish them success.

The competition opened by the Society of Arts for the best design for labourers' cottages was not successful; at all events the council was granted to the society on lease for 99 refused to award the prize to any competitor, on the ground, as we understood, either that The Royal Patriotic Society of Scotland is the designs were not equal in merit to those endeavouring to carry out objects similar to submitted last year, or that the stipulated sum, those of this society, at Edinburgh, Perth, 100l. for each five-roomed cottage, had been Inverness, and other neighbouring places, as overpassed. Several competitors wrote to us

indignantly on the subject. Three said, candidly, they found it quite impossible to give the accommodation required for the sum named. Another said,--" If I can show that my design has all the comforts that can reasonably or possibly be expected for a cottage that is to be built for 1001., have the Society of Arts any right to hold out a bait to take up the time, money, and may I say talent, of any person capable of competing, without taking sufficient pains to ascertain whether there was not one that had complied with all their demands; or did they advertise merely with a view to decorate their walls on occasion of an exhibition of arts and manufactures?"

STREATHAM STREET.

We do not remember the terms of the adver-

tisement, but doubtless the society reserved the right of withholding the premium if the existing standard were not passed, or at all events reached. Those who did not adhere to the regulations have no ground for complaint. It is quite true that in the ordinary modes of construction a labourer's cottage, containing five rooms, cannot be properly built for 100l. The question is, by what new mode, materials, or arrangement, can this he done, and to induce the discovery of this the Society of Arts are quite justified in offering a premium? Most persons could build a cottage containing the requisite accommodation for, say 200l. The desideratum is, to know bow it may be done for 100l., as the labourer can afford only a certain sum for rent, and money will not be invested without a prospect of due return for it.

The designs for cottages by Mr. Hine and Mr. Nicholl, to which the Society of Arts awarded prizes last year, have been published, with working drawings and specifications, and will be found very useful by proprietors.* These each contained five rooms, pantry, and store closet, and are estimated respectively at 2851, and 2991, the pair, exclusive of boundary walls.

We mentioned some time since Mr. Chadwick's MS. collection on the subject of hollow walls, floors, and roofs, with the view of leading to the cheap production of sound, dry, warm, and fire-proof residences. The importance of the inquiry cannot be over-rated; no time should be lost in pursuing it.

BIRMINGHAM WORKHOUSE COMPETITION. Birdingham workhouse competition.

Forty-three sets of plans have been received in competition, and Mr. John Shaw, London, Mr. Edge, Birmingham, and Mr. Stevens, Derby, have been requested to act as selecting architects.

F * " Prize Model Cottages," by Mr. T. C. Hine, Nottingham, and Mr. S. J. Nicholl, London. Dean and Son, Threadneedle-street.

HAMPTON COURT PALACE.

THOSE of our readers who want an instruc-tive as well as pleasant day's recreation, and have not seen the

Which from the neighb'ring Hampton takes its name,

as Pope sings, may find it there if they look for it with their eyes open. Those who have visited it do not need to be told that another and yet another visit will give fresh pleasure and fresh information. It is not the first time this has been urged in our pages; but the remembrance of a delightful day spent there last week impels us to say it again. Our party was not a common one.—chiefly men party was not a common one,-chiefly men capable of getting the utmost enjoyment out of what can be seen, and throwing light into a dark corner,—and we had the advantage of the running comments of Mr. Jesse, whose pleasant books every one knows; but it does not need these additions to make a visit to Hampton Court Palace snggestive, edifying, and delightful; the latter more especially if it be on a summer's day. Raffaelle, Wolsey, Henry VIII., Queen Elizabeth, William III., Christopher Wren, Alexander Pope, who—

- lisp'd in numbers, for the numbers came

are some of the names which flash iuto the are some of the names which flash into the memory when walking round its cool courts and exquisite gardens. The picture-galleries read a historical lecture more likely to impress the mind than many pen-written books. Efforts should be systematically made to render the collection here more complete, and to obtain a better arrangement of it. The Woods and Forests, by whom some time since a few very interesting pictures were purchased and hung, including the "Embarkation of William III.," and seven curious views of old London, should and seven curious views of old London, should appropriate a certain sum annually towards renappropriate a certain sum annually towards rendering the collection perfect; and individuals having isolated pictures, historically valuable, might be led to present them, if they were certain of a gracious reception;—pictures which alone are of little or no worth, may be exceedingly important as part of a series.

In several of these paintings at Hampton Court will be found fountains, furniture, lamps, &c., useful as suggestions for designers. Especially interesting, however, in this respect are the tapestries in the great hall and withdrawing-room,—some of which are as-

cribed by Evelyn to Raffaelle, while others may be by Albert Durer. These tapestries would of themselves furnish sufficient materials

for an interesting work.

The coloured and gilded decorations in the Great Hall have a better effect now than they had at first, time having toned them. The roof had at first, time having toned them. The roof of the chapel, an elaborate piece of groining with pendents of mongrel design, characteristic of the period (about 1536), bas been decorated at great cost, but with little good effect, inasmuch as the rest of the apartment is not brought into harmony with it. The windows especially need stained glass. With less gilding on this roof (the upholsterer's resource), and consequently at less cost, we are disposed to think a better effect might have been obtained, and with the money saved, the rest of the chapel with the money saved, the rest of the chapel might have been made harmonious. That the whole was decorated previous to the Common-

walth is made clear by contemporary records.
The fittings of the chapel are by Wren.
Throughout the palace the contrast of the
styles of two periods, those of Wolsey and
Wren, is very striking and suggestive.
In Mr. Crofton Croker's collection of MSS.

relating to Royal palaces, is a letter signed "Wm. Talman," who had the charge of Hampton Court, dated September 12, 1699, which shews what works were then going on, and is in other respects interesting. We steal the principal part of it for the benefit of our

readers.
"The 5 roomes (the writer says) are almost finished, the great stone staires is done, and the iron work putt up; the gallery for the cartoones of Raphell is soe forward, that I shall fix up the of Raphell is soe forward, that I shall fix up the pictures in a week; the King's great bed-hamber and two clossetts are in hand, that his Ma^{tie} will find I have made use of my time; for it proves a greater work than I expected, and I hope it will be to his Ma^{tis} satisfac'ion. Wee are making a road of 60 foot broad through the middle park, and a bason of 400 ft. diameter in the middle of the circle of trees, which will be very noble; wee have abundance of projects (if his Ma^{tis} will like them) by several noble Lords that wee here call the critiques. S', as to Derham, Mr. Wilcox came lately

S', as to Dorham, Mr. Wilcox came lately from thence, and tells mee all things there hee hopes are to yo' satisfac'ion. Mr. Watkins acquaints mee the same, and that you were thinking of goeing on with the floundacons of the garden front this season, but I believe

of the garden from this season, but I believe beginning early in the spring will doe better; but that is left to your better judgement.

So, as his Mai¹⁶ had given mee power to finish his lodgings at Hampton Court, I concluded I was to take care of every workman there employed, should be sufficient artist in his mean. If and one Consequent that had been sufficient artist in his way: I find one Greenoway, his Ma⁴¹ locksmith by warrant, who pretends hee has made the locks for all the lodgings ever since the Queen's death for Hampton Court,—the truth is, the man is a very dull smith, not brought up to that trade, but of late years has taken it was and has been every trade to be a late of the present the same and has been every trade as he had to be a late of the present the same and has been every trade as he had to be a late of the present trade of the present th up to that trade, but of late years has taken it up, and has beene several trades. I have no prejudice to the man, but hee is an ignorant fellow; my Lord Ranelagh has desired me to employ one Keys, who is the most ingenious man in Europe, and for whose work I will answer; hee is making ten locks for the gallery, King's bedchamher, little bedchamher, and the two clossetts, that the bocks of these rooms might answere the rest of 3° finishing, but S'John Stanley has sent mee a very sharp letter, that if I entrench upon my Lord Chamberthat if I entrench upon my Lord Chamber-laine's office, hee must complain to y' king. S', there is as much difference between the two men in their art as between Vulcan and Venus. men in their art as between Vulcan and Venus. S, if it is not improper to desire you to know of his Mat" whither I may goe on with those locks (they being already half done), and the other may doe the rest, for what I undertake I would have it of a peice, I should be glad of the favour of an answere, and am, with the profoundest respect S' your &'."

The letter is endorsed, "From Mr. Talman For y' king;" and may have been directed to Wren, but this does not appear. If any of our readers are led by it to notice the locks on the doors in the gallery made by this "Keys," they will find them nice pieces of work.

Respecting Raffaelle's cattoons here, Dr. Waagen, in the last number of the Art-Journal, makes a suggestion which we gladly echo. He is speaking of the importance of spreading abroad good works of art, and says,—

"This might be effected in your country, "This might be enected in your country, where the feeling is so strong and general in favour of enterprises of public utility, by the association of a number of benevolent friends of art and the people, who might employ a number of skilful artists to lithograph the famous cartoons at Hampton Court, in order to render them accessible, at a small price, to the lower classes. In England the knowledge of Scripture is so widely disseminated, that the valted and public interpretations of anostolical exalted and noble interpretations of apostolical history would meet with an extraordinary reinstory would meet with an extraordinal veception. At the same time the people would have a scale whereby to enable them to determine the truly great and beautiful, and to teach them to despise the base and ignoble. In this manner, by degrees, the choice productions of the state of the stat tions of the immense treasures of art, foreign as well as native, which Great Britain possesses, might become the common property of the nation."

But we may not afford more space to the subject just now; our intention is not to write an account of the place, but simply to say to our readers,—take a holiday and go to Hamp-

ROMANESQUE AND SARACENIC ART. MOSQUES AND MOORISH PALACES

THE subject of the last lecture by Mr. Ralph Wornum, at the Government School of Design,

Wornum, at the Government School of Design, Somerset House, was the Romanesque and Saracenic art of the middle ages.

In the preceding, said the lecturer, I introduced the subject of Christian symbolism and Byzantine art; and you will find, as we advance, that the elements then pointed out perform a very prominent part in the whole system of decoration throughout the middle ages, until the establishment of the cinque-cepto. until the establishment of the cinque-cento, when all symbolic elements were utterly discarded, even in Germany. Gothic art itself ceased to be practised. The Elizabethan in England—our version of the Italian Renaissance—and the Louis Quatorze in France, superseded all other styles in a later period. The superseased an orner styles in a later period. The symbolic elements, however, of the Romanesque styles were not limited to the Christian world; they entered originally largely into Saracenic art, as I shall presently show: they are prominent at Cairo, and they can be slightly traced

even in the later works of the Alhambra.

By the term Romanesque (on the utility of which the lecturer made a few remarks) we designate all the middle-age architecture of Europe not Pointed or Gothic, its development being horizontal rather than vertical. The Byzantine, Lombard, Norman, and even our own Saxon, are Romanesque in style. The Egyptian Romanesque presented a modification of the semicircular with the pointed arch. For many ages all ecclesiastical architecture was either Romanesque or Gothic: the Italian and classical styles were not applied to ecclesiastical purposes before the sixteenth century. The cross and dome were the only elements of the earlier style of decoration that were preserved, and though as architectural designs the cinquecento styles surpassed the earlier in their forms, cento styles surpassed the earlier in their forms, more especially in exterior, it is only in rare exceptions that they have even equalled the gorgeous decoration of the early Romanesque works, and more especially the Byzantine, as St. Sophia's at Constantinople, San Vitale at Ravenna, St. Mark's at Venice, or even the cathedrals of Pisa, Monreale, or Messina.

The description of St. Sophia ware of the cathedrals of St. Sophia ware of the cathedrals of Pisa, Monreale, or Messina.

The description of St. Sophia may suffice for all. Forty thousand pounds weight of silver were expended over the altar alone. The whole vault or ceiling of the church was gilded and decorated with the richest mosaics. The walls and pavements were of different coloured marbles, arranged in a variety of geometrical forms. The numerous columns, with their gilded capitals, were all composed of single blocks of the most precious marbles—the pink and white-yeared of Phrygia, the dark red of file Nile, the green of Laconia or Thessay, the saffron of Lybia, the black and white of Italy or the Bosphorus, and the red porphyry of Egypt. But most of these columns were from the ruins of heathen temples. The whole interior presented one blaze of magnificence; and Justinian, when he The description of St. Sophia may suffice

first looked upon his finished work, exclaimed, first looked upon his finished work, exclaimed, "Solomon, I have excelled thee!" Yet the exterior was completely plain—not even decorated with the common symbols of the later Romanesque, which prevailed throughout the whole ornamentation of the middle ages.

The most remarkable feature, perhaps, of Byzantine architecture in general, is its rich interiors as contrasted with its plain exteriors. The whole inner space is covered with ornament, the holy liturgy, or the glorification of

ment, the holy liturgy, or the glorification of Christ, being the subject generally illustrating the dome. The "Majesty" of the west—that is, Christ in a glory with his hands raised, or in the attitude of benediction, is only a summary treatment of the "Liturgy" of the Greeks Greeks.

The architecture of Byzantium, or Constan-The architecture of Byzantium, or Constantinople, spread in all directions. It extended in this country as far north as York and Hexham; it is still the standard style in Russia, and the exclusive model of the Mahomedans from Benares to Cadiz—from Cairo to Damascus; which last leads us to the second great art-development of the middle ages—the Saracenie—a magnificent system of decoration, and one, perhaps, better than all others suited to the general purposes of ornament.—to furniture, carnets, papers, dimersent.—to furniture, carnets, papers. ment,—to furniture, carpets, papers, dinner-services, cabinet-work, and the better materials

The earliest Saracenic works existing are the great mosques of Cairo in Egypt. The most ancient is that of Amrou, formerly of great magnificence, the whole being painted and gilded, but it is now deserted and a comparative ruin. It is the first building in which the pointed arch was adopted in preference to the round-the common Byzantine form, and, indeed, the universal form up to that time.

A mosque ordinarily consists of a square court surrounded by colonnades, with a basin or layer for ablutions in the centre. This basin is sometimes of itself a handsome building, and is often covered in with a circular or ogee-vaulted dome, surmounted by a crescent. Public baths and schools adjoin the great Public baths and schools adjoin the great mosques. Niches in the wall and pulpits indicate the side next Mecca. These are sometimes ornamented with the utinost attainable splendour. The roof of the Mosque of Amrou, supported on 250 columns of precious marbles, is flat, and was painted and gilded after the Egyptian fashion. The columns were mostly taken from ancient edifices; and to show the respect the Arabs had for classical precedents, some of the bases of the columns precedents, some of the bases of the columns are composed of capitals turned upside down. Every night the mosque was illuminated by 18,000 lamps, for the study of the Koran, many of the 1,300 copies of which in this one mosque were written entirely in gold.

Another great mosque at Cairo is that of Touloun, built in 876, and still in good preservation. It was designed by a Christian artist in prison. It is one of the most tasteful monuments in the world for stucco-work; and is, perhaps, the most characteristic example of Saracenic art, though the work of a Christian. It is also, thus, a sufficient corroboration of the belief that Saracenic art is only a Maho-medan development of Byzantine art. This mosque is like that of Amrou in plan: but mosque is nice that or piers ornamented with four engaged columns. It is of brick, covered with cement; and all the ornaments are in relief, in stucco-work, but uncoloured, except in the sanctuary. The windows are except in the sanctuary. The windows are not glazed, but are filled in with a very elegant not glazed, out are lined in with a very sergant geometrical tracery of calcareous stone. The whole was erected in two years, at a cost of 100,000 dinars, or nearly 50,000%, and Ahmed Ben Touloun rewarded the architect with 10,000 dinars, or nearly 5,000% (a tenth of the whole cost), for his two years' services.

whole cost), for his two years' services.

The Mosque El Azar, or "The Brilliant," is another great early work at Cairo. It was built in 981. The flat roof is supported on 380 marble columns. The principal entrance is ornamented in a style (of later date) at once simple and magnificent in the highest degree.

Many of the ornaments are familiar. Byzantine Many of the ornaments are familiar Byzantine forms,—as the trefoil, lily, and scrolls of foliage, in disguise,—the guilloche, fret, zig-

These three mosques are the chief types of Saracenic art, and the only monuments of its original development. Grand mosques, how-

ever, continued to be built at Cairo till as late as the fifteenth century, much in the same style, though somewhat more ornamented, as the Mosque Barhauk, of the twelfth century; Kalcom, of the thirty of

the Mosque Barhank, of the twelfth century; Kalaoun, of the thirteenth; Hassan, the grandest in the East, of the fourteenth; and the exquisite Del Maged, of the fifteenth century. The pointed arch is the prevailing form throughout all these structures; but the semi-circular, the horse-shoe, ogee, stilted, trefoil, cinquefoil, and scalloped arch also frequently occur.

occur.

All were, probably, originally designed to be coloured; those left plain were so, simply, from want of funds. The sum required for gilding and colouring such works, with their myriads of forms, was not much short of that required for their original construction. The grounds were generally blue or red, and the ornaments gilded.

The Arabs, like the Egyptians of old also

ornaments guided. The Arabs, like the Egyptians of old, also coloured the outsides of their houses. At Cairo it was a mark of distinction allowed only to Mecca pilgrims. The prevailing colour in these decorations is vermilion.

Sicily is another great repertory of Saracenic art. The principal remain at Palermo, the capital, is the palace of La Ziza. It is richly gilt and decorated, and is very profusely ornaand necorated, and is very profusely orna-inented with geometrical mosaics. Nor were the Saracens less active in Spain. Already, in the tenth century, Cordova was the rival of Damascus or of Cairo. The Arahian writers give an extraordinary account of the palace of Abdu-r-rahman III., at Azzahra, near Cordova. Its roof was supported by upwards of 4,0% o pillars of variegated marbles, brought from Carthage, Sfax, and other places in Africa. The floors and walls were decorated with the same material, and the chief apartwith the same material, and the their apartments with porphyry vases from Greece. In one apartment a fountain of quicksilver reflected in a thousand lights the rays of the sun. The hall of the Khalifs, or Audience Chamber, was of fairy magnificence. The Chamber, was of farry magnificence. The ceiling and walls were of brilliant mosaics, in glass and gold. The tiles of the roof were of pure gold. In the centre of the hall stood a splendid gilt bronze basin, a present of the Emperor Leo, sent from Constantinople. Within the palace was a mosque, not less magnificent, though smaller than that of Cordova itself

The Alhambra, at Granada, though a much later work, is of sufficient splendour to justify us in believing almost any account of these Moorish palaces, however apparently extravagant. Much of it is still in good preservation. Ibnu-l-almar began it in the earlier part of the thirteenth century, and it was only account of the work of the contract of t completed by Yusuf I., about a century after The name Alhambra signifies 'the Red Castle. It was originally a fortress. Different monarchs completed different portions of it. Yusuf re-painted and gilded the whole at an enormous painted and gilded the whole at an enormous cost. This gorgeous palace was built chiefly by means of tributes paid by Christians for protection. In the opinion of the Moorish architects, it was unrivalled in the whole world; but in comparison with some of the grand works of Cairo, or even of Sicily, there is a gaudy littleness of style about the decoration of the Alhambra which detracts greatly from the due effect of its grander features. The details are very much repeated; a species of lily form incessantly recurs. There is not that Byzantine character about these details which we find in the Cairo mosques. The beauty of this palace is in its general richness of effect, and its endless combinations of columns, arches, and endless combinations of columns, arches, and gorgeous surfaces, its gold and silver flowers and its intricate tracery, which all combine to give the impression of extraordinary splendour as a the impression of extraordinary splendour as a whole, while no particular part commands any special admiration. The principal features are its tracery, its multiplicity of rich columns, the variety and intersection of its arches, and their gilt and gaudy spandrels. The horse-shoe arch is supposed to be characteristic of the Alhambra and of Saracenic art generally; the Alhambra and of Saracenic art generally; it prevails at Cordova, but I believe nowhere else; certainly not in the Alhambra, where the ordinary, and stilted, pointed, and semicircular arches largely predominate. The scallop is the only approach to the form of the crescent in Saracenic art, except in the crowning and symbolical ornament of domes.

Two papers on Hampton Court Palace read before the Decorative Art Society, will be found in our 6th volume, p. 571, and p. 628.

Some of the Alhambra diapers are very effective. The general form of the capitals of columns is Byzantine. They are all coloured, generally in red grounds, with blue leaves and ornaments, bands and inscriptions in gold or white, in marble, on a blue ground,—sometimes

the reverse.

Much as has been done, there is one great province of natural materials hitherto wholly unexplored, namely, the insect tribe. The student could, perhaps, nowhere see so beautiful a display of brilliant colours as in the glass cases of the entomological collection in the British Museum, where he will see no false combinations of colours, and where every form has all the conditions of symmetry, nearly all being forms of three thicknesses, which is the most important element of a good diaper material. Not that you ought to imitate these insect forms, but use them, as the Saracens have used flowers, merely as the base of the

THE PARKS. AND PERIPATETICS.

To men of business who cannot quit London and its immediate precincts—and one million, at least, of the population are in this predicament—open and elevated spaces are of inestinable value; the Government of the country is fully alive to this fact, as is attested by those parties, of all shades of politics, who have been in office during the three last reigns—but particularly that of our present gracious sovereign. By them Victoria Park has been hought, enclosed, planted, and embellished; Battersea-fields have also been appropriated, if throwing 300 acres into wilderness be an appropriation, and Primrose-hill has been encircled with a fence and dedicated to public recreations.

These preliminary measures bode well for the people, and discover a forethought for the requirements of this leviathan metropolis which, notwithstanding the emigration from other parts of the kingdom, is increasing in a ratiothat makes one tremble for our atmosphere of fog and smoke, so ungenial for at least vegetablelife. These open spaces are the sanatoria of the tradesman, the mechanic, and the artisan; they conduce to the health, the enjoyment, and the morality of the people, and are now become so essential to their greatly improved habitudes, that every item which relates to the plantation and ornament of those liberties is of

paramount importance.

Who that walks an evening's hour within the floral bosquets of St. James's Park and Kensington Gardens, can view the innumerable groups of gratified promenaders, and the knots of noisy sportive children, and not be struck with the sweet influence of these charming and sylvan places of resort (perhaps hardly to be called retreats) on the expanding minds of the rising generation, and their sedative and consoling effects on the more adult. These fair scenes of cultivated nature harmonise and improve the hearts of all who take relaxation there, instead of in the bowling-yard or pothouse, when fatigued by the husiness or toils of day; they are as consecrated ground, inalienable from the great objects of general good, and to curtail their extent by a single rood, would be

a crime against reason and feligion.

For the adornment of these spaces great credit is due to the men in office, under whose auspices such improvements have been achieved. And here I may be permitted to indulge a recollection of gratitude and thankfulness to the genius and industry of Loudon, to whom the world is indehted for the perfection of landscape gardening.

Any one who remembers the bleak, house-bound, russet and waste-looking superficies of Hyde-park, fifteen years hack, must admit the great amelioration of its appearance, from the plantations which skirt its margins: how softened and tranquil is its look now,—how like an unheeded common then! Surely the promoters of so much general happiness—the implanters of so much taste, are entitled to public gratitude, if not to a testimonial as lasting as the stern brazen Achilles. But these are the works of peace: peace, then, to the originators.

originators.
Whilst admitting all this, the reflection comes that the hand of gentle improvement is staid, and that the spirit of studying and providing for the quiet enjoyment of those who

are yet to range the new enceintes of Battersea-park, hut chiefest of Primrose-hill, is laid or slumbering.

In this latter inclosure (ahout 160 acres)—one of the most beautiful as to position, and most apt for arborage,—not a tree has been planted, although it has been encircled for now three years with wood,—that is to say, a wooden park-paling!

The land bas been bought at a great cost—
it has been presented to the public—five or six
bare poles have been erected there for the
amusement of climbing boys, just chuck up
by the public road, as a sort of mock sanatorinm,—but not a shrub, nor tree, nor flower
—not a twig, as much as would perch a
sparrow, has yet been planted; no—three
years have been lost!

It might perhaps appear ungracious to allude to the deficit in the Woods and Forests exchequer, or to refer to the unhappy barrenness of crown lands which yield no usufruct, or next to nothing, to the national purse; but this liherality of serving up to the refection of John Bull and his family a coarse treat in quantity, resembles the ill-judged liberality of the host who dished his heef fresh, but without salt: so Primrose-hill is plain enough, but wants the garnish.

This is really pitiful, paltering, but it is not all; and to this subject I have before alluded in The BULLDER. A road (the external park road) divides the hill plot from Regent's park; the latter is closely planted along the margin, and the only open space through which a view is obtained of Primrose-hill is just at the point where the suspension-bridge conducts to the new park across the dell of the canal; here, having crossed the bridge, a detonr of about forty yards must be made to the right to get access (to cross the road only) to the inviting hills; whilst, immediately opposite the bridge, in the eye of the vista, intervens a building plot of ground of only two acres, which is labelled "to be let for building." When built on, a long row of houses will intercept the sight of the rising verdant hills, and repel the wanderer back from a bastion of wall to repose on the green sward within.

Then, indeed, will the beauty of this only rural and hilly landscape within many miles of town be totally discentanted. Lord Morpeth considered the point, agreed that it was essential to the design (or rather to prevent the two parks from being marred), that for the purposes of opposing entrances from one to the other it was indispensable; but there was no money to buy the two acres, as all had been expended on the 160; verily the management that built a house, and forgot the stairs, was wisdom to this.

So much for the stagnation impending over the new parks. Now, again, a word to the old one: the Regent's (which was planted and complete sometwenty years hack), with timber grown to wood, happened to contain within its limirs five houses, to each of which belonged a private reserve of about seven or eight acres. These mansions were ornamental, and although the public was excluded from these reserves, yet the floral shrubberies gave a private park aspect to each holding.

A few years back, for some reason not palpable to the uninitiated in official forms, large portions of the park were again fenced off, and added to the private grounds of the favoured residents—and thus an extent of from fifty to sixty acres of this now nearly central park (central to the west-end) was excised from the national liberty, closed against the public, and devoted to the lucky denizens of the inner circle.

We know not whether this alienation of crown lands much swelled the exchequer, or turned the halance of royal domains for even one year to the crown side; hut setting aside the royalties on minerals, it is quite clear, that for every acre of crown lands in official management, the state is some shillings the poorer. How would his grace of Sutherland or any great landlord contrive to live if the produce

of their acres were in this inverse ratio?

There is but one more fact relating to Regent's Park to be noticed just now, and that is that the whole margin of the canni from St. John's Wood Chapel for a quarter of a mile, has been granted to the use of an individual living outside the park, and opposite that chapel; and he also has had

another portion of about 1½ acre fenced off (within two years) for his use inside the park, at the extremity of the long strip forming the dell opposite Lord Dundonald's, to which slice of the park a hridge conducts across the canal opposite to the end of Charles-street, Portlandtown.

Over this bridge there ought be an entrance to the park for the accommodation of Portland and Titchfield-terraces (which front full the said dell and strip for upwards of 300 yards), as also for the now dense population of Portland-town; and this entrance is more particularly requisite, as the distance between Hanover and Macclesfield park gates exceeds half a mile!

One might suppose this park had been private and not public property,—it has heen so frittered, and the public so unceremoniously excluded.

If it be public or crown land, wherefore has one rood been alienated and desecrated? or why has an overgrown population been debarred access to the park for three-quarters of a mile?

The inhalitants feeling aggrieved, petitioned the Woods and Forest. Lord Dudley Stuart presented their petition; yet although the popular gales blew a hurricane, the Woods and Forests nodded not—no reply has been obtained!

Sir, if your province he to encourage architecture, every unwise change which tends to depreciate the value of buildings (and they are not ungraceful) encircling this beautiful park, must meet, as it merits your reprobation:—every restraint on the liherty of Englishmen to enjoy the little of rural scenery that is of right theirs, and in distance available, must meet your support.

These facts are palpable and indisputable, your advocacy is therefore sought by the public, which acknowledges with some proofs of its approbation your merits, whatever may be the regards due to the desultory remarks of QUONDAM.

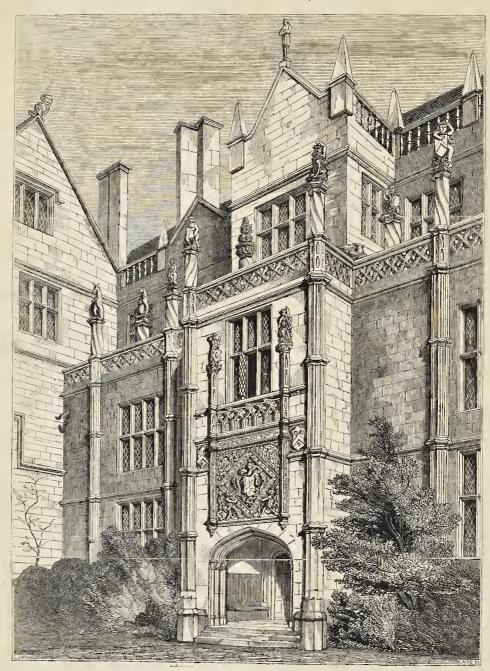

THE ARCHITECTURAL PUBLICATION SOCIETY.

The second part issued by this society for the year 1849 is a very good one. It contains, as the first did, twelve plates, and is accompanied by a "loose sheet" of descriptive matter, judiciously drawn up by Mr. J. W. Papworth. The subjects include further illustrations of the Italian Campanili; an interesting collection of chimney-tops; brick cornices, comparatively little known, and lakely to be suggestive; doorway from Loreto; a Gothic façade at Delft; metal work from Florence and Sienna; inlaid pavements; staircase, San Georgio, Venice; stained glass, Assisi; and window coronets, of Jacobean period, from Glasgow. The contributors are Messrs. J. Johnson, J. M. Lockyer, H. Parke, Heneker, D. Wyatt, C. Fowler, jun., Garling, T. Davies, Donaldson, Mocatta, and J. Wylson.

It was anticipated that the third part, containing letter-press, would be issued in the course of this month, but depending as this necessarily does on the leisure of men mostly fully occupied, it cannot be hoped for so soon. The subscribers, however, have every reason to be satisfied with what is done, and we would hint to then that the subscription for the next year should be paid forthwith, to enable the council to make the necessary provision.

MAP DECORATIONS FOR THE NEW HOUSES OF PARLIAMENT.—At a meeting of the Geographical Society, held on the 25th ult., Capt. Smyth, R.N., in the chair, a proposal for the construction of maps upon the walls of the corridors and committee-rooms of the new houses of Parliament, by Mr. Saxe Bannister, was read, with remarks upon the subject by Mr. G. B. Greenough, Mr. Bannister proposes the construction of maps on a large scale as mseful decorations to the new palace at Westminster; such as that constructed by Sebastian Cabot, suspended in the gallery at the palace of Whitehall, and as are in the Gallery of Geography of the Vatican. The idea is capable of very extensive amplification.

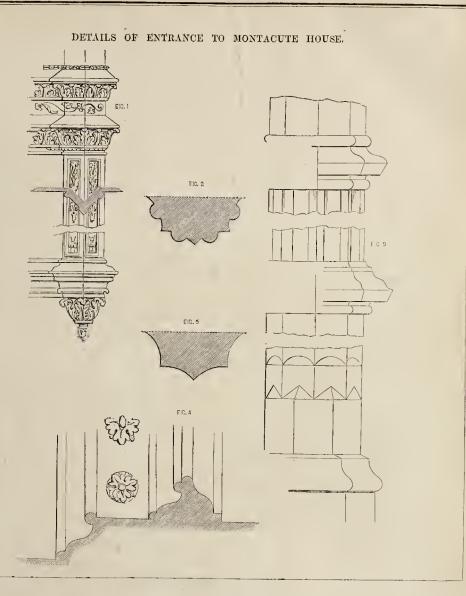

ENTRANCE TO MONTACUTE HOUSE, WILTSHIRE.

MONTACUTE HOUSE, WILTSHIRE.

We have previously given illustrations of Montacute House, near Yeovil, in Wiltshire; but the oldest, and, as far as architectural style is concerned, the hest portion, has never heen given by us, nor has it, indeed, been ever fairly illustrated in any work. Our view shows the north entrance to the building, which was commenced in 1580, and finished in 1601, for Sir Edward Phelips, serjeant to Queen Eliza-

beth. The screen, or entrance, shown in our view, is of the latest Tudor-Gothic style,—much older than the building itself. It is a fine example of the style, and such specimens are very few in numher. This screen was an addition to the building about the time of claim of the beautiful English Tudor-Gothic dividence belonging to the family. The front was brought to Montacute, and placed so that a passage was obtained, connecting the two wings, the centre

sunded by foliage, is very effective, and well deserving study.

PHE CULTIVATION OF ARCHITECTURAL KNOWLEDGE.

Ar a time when unparalleled progress is being made in every department of art and science, when literature has assumed universal sway over the mind of mankind, and consequently that the development of the human ntellect is making the most rapid onward strides, a few words may be said on the general and elevating moral tendencies of architecture. When talk of the poetry of painting, and of the southry of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms); is not that, then, which otherworthy of such terms of the most called the christian world? Do they not produce on the buman breast. The beautiful, then the such as the case, and that such are the sentiments which it inspires and in the expital of the Christian world? Do they not produce on the beholder a religious feeling of awe and devotion, which such a factor of architecture worthy the cultivation of the most exalted intellects? I think that no case, and that such are the sentiments which

progressively led to that development? Are not the pyramids of Egypt ever-enduring ex-amples? Do not the long-buried cities of Herculaneum and Pompeii convey to us dis-tinctly the character and enstoms of their inhabitants? It such, then, are its attributes and tendencies, why not, now that the question of the exhabit home of schools of decrea. iminationis? If such, then, are its attributes and tendencies, why not, now that the question of the establishment of schools of design, &c. has been taken up by those connected with the legislature of this country, establish also colleges and schools to be devoted to the study and cultivation of the science of architecture? Is not the design of a building equally worthy attention as its decoration? Surely the latter is but a subordinate part, and ought, therefore, to be considered as merely a branch of the former. No doubt that annually many gifted minds, which might rank with the most talented men of the day, and reflect honour on the country, are suffered to be neglected from the want of such an institution to call their latent talents into action. Now that private architectural institutions are springing up in most of our large towns and cities, and that private enterprise is doing so much to promote the best interests of that art, would it not be worthy the legislative government of the "queen of nations" to take some steps towards its advancement and cultivation? In common with every true and sincere admirer of the art, I shall hail with delight the day when the cultivation and improvement of architecture shall be deemed an object of sufficient importance to occupy the attention of the legislature: when, instead of the misshapen mass, we shall see arise the classic and magnificent pile, such as shall hand down the enduring fame of our country to remotes posterity, and confer upon her children an elevation of character and nobility of soul, which shall pass unimpaired from generation to generation, and shine the brighter through the lapse of ages.

W. M. Bucknall.

INTERFERENCE WITH ARCHITECTS'
WORKS.

THE WELLINGTON STATUE, EDINBURGH

WHATEVER may be the practice on the other side of the Atlantic, there is, in the old world at least, a peculiar sacredness attached to the literary works of meritorious men, which to the literary works of meritorious men, which effi-ctually protects them from the hand of the interpolator. We have just to imagine such an announcement as "The Lady of the Lake," or "Marmion," with additions and improvements by John Wilson, or the professor's own beautiful poems altered to suit the fashion of the times by a poet of some future age; and our whole nature seems instinctively to recoil from the very thought of such a sacrelege. Nor is this sentiment confined to literature alone. this sentiment confined to literature alone Painting and sculpture are also alike protected by this most salutary principle: Zeuxis may not add from his treasures to the canvass of Apelles; and the choicest tints of even his palette would be more obnoxious than the very blemishes of age and neglect upon the marble of Pravitales

Might I ask why it is that our "modern Athenians" so readily tolerate the infringement of this same morality in regard to the sister art of architecture? Can it be that we are as yet æsthetically blind to the merits of this noble art, and that in this particular instance our moral sense requires still to be awakened? Every noble building is a poem in stone and lime. Upon what principle, then, can we take it upon us, rot only to endanger the reputation It upon us, rot only to endanger the reputation of two architectural authors, but actually to break in upon and destroy those grand criteria of unity and propriety, which it is the highest ambition of every artist, whether poet or painter, sculptor or architect, to attain, by forcing into one incongruous result two distinct compositions, each in itself a completed design, and in nowise akin to the other?

" Humano capiti cervicem pictor equinam Jungere si velit, risum teneatis, amici ?"

We have been guilty of doing this in times past; and now it would appear that we are again about to repeat the offence. Look at the Royal Institution, Edinburgh.

Here is an instance in which the sculptor is obviously made amenable, in spite of himself, to architectural rules, and as an architect, or at least architectural rules, and as an architect, or at least with the architect, he is accordingly made to stand responsible to public judgment and criticism for the rank which that building occupies in the scale of merit as a completed work of art.* I do not hesitate to say that in consequence of this, a great injustice is done both to Mr. Pjayfair and to Mr. Steele; and I object to this interligenting or creek and interligent to the same architecture. ject to this interlineation or cross-reading, so to speak, of two architectural authors, just on to speak, of two architectural authors, just on the same principle that I would object to the introduction of a lyric ballad of one author into the epic poem of another. What is more beautiful, in its own place, than Moore's "Believe me if all those endearing young charms," &c.? yet how should we like in a new edition of Milton, to find it put into the mouth of Adam, in the course of his rapturous address to Eye in the garden of Parelical address to Eve in the garden of Paradise! Assuredly the elegance of the composition in-troduced, whether it be in literature or in art, will never justify the bad taste of such interpo-lations; far less will it compensate for the absence of those sentiments of veneration and of justice which ought at all times to protect the memorials of genius, whether living or departed, from such violent and unseemly abuses.

This objection applies with equal force to

the contemplated alteration of the Register House. This building, second to none in Edinhurgh in point of symmetrical elegance and just proportion, so broad and spacious, yet withal so light and graceful, is about to undergo a change. It is not my present purpose to discuss the question whether that change, so far as effect is concerned, is likely to be for the better or for the worse; although it certainly does appear to me to be an arrangement quite at variance with all propriety both in art and in sentiment. It is less to the esthetical than to the moral view of the quesesthetical than to the moral view of the ques-tion, as being that to which, with all its importance, we seem hitherto to have been scarcely, if at all, alive, that I would apply the preceding argument in giving in my humble protest against this contemplated innovation. Every great work of art is sucred to the memory of its author. The Register Office is Robert Adam's monument, the sacred to the memory of its author. The Register Office is Robert Adam's monument—the most beautiful of all the works of that eminent architect—"si monumentum quæris, circumspice." It is the temple of his name and fame, and upon its preservation his professional reputation with posterity mainly depends. Let all, therefore, who have any respect for the feeling which reveres at once the memory and the works of the departed sons of genius, and the works of the departed sons of genius, and especially let those influential men amongst us, who are now engaged in the fields of literature, art, and science, in rearing up their own honourable memorials, concur in this act of justice to the memory of Robert Adam, by preserving from the hand of a needless and indiscreet innovation, this edifice, which is his best and crowning work.

For my part, I should be disposed to remove

For my part, I should be disposed to remove the shabby railing in St. Andrew's-square, and, in the open Place, to set down the Wellington statue on the west of Melville's pillar, facing along George's-street; while, in a corresponding position on the east, might be placed the Earl of Hopetoun, who is at present certainly "lost to sight," however "dear to memory;" and, on the north and south, the statues of Queen Victoria and the Duke of York, both of which are at present in unfavourable positions. With such an arrangement, and a few more buildings like the Bank of the British Linen Company, this square might be made one of the finest in the world.

Edinburgh.

VITRUVIUS.

ARCHITECTURAL COMPETITIONS

PROPOSED CHURCH, SANDFORD DISTRICT, CHEL-TENHAM

THE instructions furnished to architects by The instructions furnished to architects by the committee for erecting a new church at Cheltenham, are of such an extraordinary character, that I venture to trouble you with a few remarks thereon, hoping that this, after the many warnings of a somewhat similar nature, though not so gross, that we have witnessed, may arouse the members of our profession to a knowledge of their own dignity and trough group registion, and to a deterministic and proper position, and to a determination not to suffer themselves to be dictated to by persons, who are either wholly ignorant of the subject they pretend to adjudicate upon, or else who insult the whole profession by issuing such instructions.

I enclose you a copy, by which you will perceive that accommodation is required for 1,000 worshippers in a church, to be built of stone, for the sum of 4,000t, including all internal fittings and fixtures, a dwarf boundary wall with two entrances, proper flues for warming and ventilating, architect's charges warning and ventilating, architect's charges for plans, working drawings, superintendence, travelling expenses, &c. This is simply an impossibility. To build a church as a church should be built, in the severest manner, would cost at least 6,000*l*., and this amount would not allow of oak being used either for the roofs or seats. That buildings sometimes are erected at a cheaper rate than this I cannot gainsay, as I saw a specimen of one a few weeks back, in the neighbourhood of London; and I may say that I never before witnessed and I may say that I never before witnessed more disgraceful workmanship. The walls were built in two thicknesses, the inner of brick and the outer of Kentish rag stone, without any bond, and the brickwork Iooked more like rubble work than anything else; all the dressed stone base mouldings were just sufficiently let into the wall to hide the joint—at the utmost an inch—and without a single

bond-stone. Had it not been that the masonry beneath was thicker than that above they could not have stood at all; and the res of the work was of a similarly bad description On asking who the architect was who could allow such work, and who the builder, I was informed that they were one and the same

informed that they were one and the same person.

Is it such a building as this that the Cheltenham committee require, or have they a few thousand pounds in reserve to place at the disposal of the architect they may give the work to? If the latter, I do not hesitate tt say that they act unfairly to the other competitors; and if the former, they would do better to advertise for a temporary church, to be used until their funds allow of their building a permanent one. The fault of the absure expectations of building committees, however must in some degree, I am sorry to say, res with some of the members of our profession.

I heard of an instance the other day in which a building committee called for designs for a clurch to accommodate 300 worshippers, for the sum of 1,300l., to include every possible expense, and I am credibly informed that from the plans they received for the same, they selected a set which professed to give them what they required, and a tower and spire, nearly 100 feet high, into the bargain. Now, in this case, the Committee can scarcely be blames for wishing to get the best they could for the money they have at their command; they acted no doubt in perfect ignorance as to the expensible of the plans of the plans they received in carrying out such a commodule to be incurred in carrying out such a commodule to be incurred in carrying out such a commodule to the carrying out such a commodule to the carrying out such a commodities of the carrying out such a commodities. no doubt in perfect ignorance as to the expens likely to be incurred in carrying out such design, and relied on the architect having pre-pared his design in accordance with their in pared his design in accordance with their in structions; but is it possible the author of the design could be ignorant himself about the probable cost of such a building? Let us see what chance there is of the sum named suffi-cing. First deduct the architect's commission which would amount to about 65t., and hit travelling expenses, say 25t., and there remain very little more than 1,200t. for the building one-half of which at least, would be require one-half of which, at least, would be require for the tower and spire, if properly buil-leaving 600l. for the crection of chancel, nave aisles, transept, and porch, together with a fixtures and fittings!

nxtures and ntungs:
Such cases could not occur if competer
judges were called in to make a selection.
The value the Cheltenham Building Com
mittee set upon an architect's professions
services is another point to which I wish t
call attention; in their instructions they "re can attention; in their instructions they "re serve to themselves the full right and power t delay or suspend, after commencement, th erection or completion of the works," which i very advisable that they should; but then the add, that "in case the building shall not be commenced within twelve months after notic to the architect that his plans are approved, he shall be entitled to receive for his plans. to the architect that his plans are approved, It shall be entitled to receive for his plans, do signs, and drawings, the sum of 50%, and more, in full discharge of all claims for sucplans, &c., which are then to become the preperty of the committee"—that is to say, the have only to delay the works a twelvemonth become entitled to a full set of working drawings and specification, together with the designised, for the sum of 50%. Such a set would comprise at least 100 drawings, which mists have been copied, and two copies of the specification. This, one would imagine, was be fication. This, one would imagine, was be enough; but should the works have been con menced the architect's position might be st worse, for should they be suspended who 1,000*l*. worth had been executed, he wou have furnished the above-named drawings, & and still only receive 50*l*, so that for his tic in setting out and superintending the worl and his travelling expenses, &c., he would n be remunerated at all.

Surely it is time that the architects shou bestir themselves, and put a stop to such is sults being offered them; how this is to done can best be determined by themselver I would only suggest that they should me together and lay down a set of regulations to on what terms they would furnish design in competition.

It always appears to me that these cormittees consider that they confer a favour of the profession by calling for a competition whereas, in reality, the great advantage is themselves. If there was no such thing competition, and a building committee quired a design, they would have to apply

^{*} The architect and the sculptor should work together .-

some architect or other to furnish them with one, for which they would have to pay a fair price. If they approved of the design, well and good; if, however, he did not suit them at all, as might be the case, they would either be obliged to obtain the services of some other architect or else carry out a design with which they were not pleased; now, this difficulty they overcome by calling on architects to sub-mit designs for approval, in many cases offering no remuneration whatever for the trouble they give. What they seek by competition is not to bring forward the most talented, who, perhaps, for want of connection or some other cause, may not be able to make his name known, but to obtain the best advice for themselves at the least possible cost. The present system is bad, and requires amendment; it has long been cried out against, but that is not sufficient; one or two members of the profession cannot effect what all might easily do; it rests with ourselves, then, to apply the remedy. If your influence can effect this you will be rendering a lasting obligation on the profession.

RAPHAEL BRANDON.

THE GAS MOVEMENT

HAS now an impetus that will carry it through all obstacles. It needs no further foster-ing care from any one. The public, everywhere, have been enlightened as to its merits and its purposes, and there is no longer any attempt to throw dust in their eyes, or even sterner obstacles in the way of a steady, prudent, yet determined and not very slow reduction of cost, and a consequent wide-spread diffusion of the benefits of good gas-light throughout the dwellings of the people at large. Our next crusade may even be one more obviously on the side of the diffusers of the light themselves, in aiding them-now that their own groundless fears and their own inveterate obstacles are being and have been overcome-in battering down those—it may be no less stub-born—fortifications of inertia and old habit which may still oppose the access of the light, even when available in cost and purity, within the domestic sphere of the million, where there is so vast a field for its profitable diffusion.*

That our systematic, matter-of-fact, reiterated, proofs that reduction of cost bas ever been, and will yet for a long time ever be, the sure forerunner of an equivalent rise in profits to the companies themselves, are now beginning to be duly appreciated, even where there is not the candour to give the cre-dit of it to our own demonstrative and persevering exertions, may be gathered from the recent published opinions of parties interested on behalf of the companies, as well as in that diffusion of the article to which we have proved, by repeated instances, that such reductions surely and inevitably lead. From a book of this surely and hervically lead. From a book of this class on gas-lighting, by Mr. J. O. N. Rutter, recently published by Parker, West Strand, we may quote the following remarks, in the truth of which we all the more cordially agree, inasmuch as they constitute the burden of that very outcry which we dinned for so long into deaf form into deaf ears.

were others we diffined for so fonginto deaf ears.

"The tide has turned. Men are growing wiser.
Large profits, on limited transactions, and from
few customers, have had their day. The reverse of
all this has now to be tried. Small profits, on extensive transactions, and a great number of custensive transactions, and a great number of custensive transactions, and a great number of customers, are in the ascendant. Better had it been
if the adoption of these views had not been so long
delayed. Most of the large provincial towns have
passed, or are now passing, through the ordeal of
low prices. Whatever at first may be the difficulties, there needs only courage, and patience, and
perseverance (on the part of the companies he is advising of course], and all will come right. There may
be fears; but there ought also to be a bold margin
allowed for confidence. The efforts of those who
led the way in reducing prices have been abundantly
rewarded. Whilst some companies have been looking on, struggling, and deliherating, doing nothing,
and not knowing what to do, the business of others
has increased so rapidly as to have outgrown all
their expectations. In every instance where the
experiment has been fairly tried, it has been successful. There is an elasticity about gas-lighting
understood only by those who have experienced its

**A correspondent ("X.") has sent us some very pertinent

Relieve it from the pressure of patronage and privileges, from protection and, its constant attendant, high prices, and it will soon exult in its freedom from such unnatural restraints.

A movement in the right direction has been commenced. It needs all the aids, and energies, and other appliances of persuasion and explanation to help it forward. The advantages of gas-light in to help it forward. The advantages of gas-light in private houses are beginning to be understood. It is still only a small beginning, and, in numerous instances, it has not even come to that. Gas companies must extend their operations. Low prices, and a small rate of profit, require large returns to pay satisfactory dividends. Here is a field so extensive, that all may labour in it, and in which the ground is so well prepared, that the results will he immediate, and in exact proportion to the energies put forth. The difficulties are but trifling, and many of them imaginary. By devoting constant and special attention to the lighting of private houses, a new business might be created.

**

**

Amidst the changes which are in progress, and the

Amidst the changes which are in progress, and the new light which is breaking in upon trade and manufactures, something must be ventured, or nothing great will be achieved. There must be confidence as well as hope—effort as well as expectation. In one light in the confidence is the confidence of the confidence as well as hope—effort as well as expectation. dence as well as hope—effort as well as expectation. In gas-lighting, low prices, within safe commercial limits, are the secret of success. Of this the examples are so numerous, and the illustrations so decisive, that they all point in the same direction. There is no longer either occasion, or excuse, for doubts, and fears, and forebodings. Those who were most frightened acknowledge they have been more frightened than hurt; and others, who were very lately brooding over anticipated losses, have begun already to reckon their gains."

NOTES IN THE PROVINCES.

THE first stone of the new church at Birch was laid on 26th ult. It is to be in the Middle Pointed style, and to consist of nave and aisles, chancel, tower, and spire,—material, flint with Caen stone quoins: accommodation for 500; cost about 3,000l. Mr. S. S. Teulon is the cost about 3,000% Mr. S. S. Teulon is the architect, and Messrs. Baldiston and Son, of Ipswich, are the builders.—The rebuilding of Cranoe Church in the Early Pointed style, with nave, chancel, and porch, has been completed, and the edifice opened for service. pleted, and the edifice opened for service. It is roofed with red and black Newcastle tiles, with crested ridge: the old tower has been retained. The nave is 37 feet long, 21 wide, and 27 high: chancel, 13 feet long, 14 wide, and 24 high: architect, Mr. Bland; builders, Messrs. Rudding and Thompson. The chancel windows are filled with stained glass by Messrs. Powell and Co.—A new organ has been built in Barkhy Church, by Messrs. Forster and Andrews, of Hull, at the sole cost of Mr. Pochin, of Barkby Hall. The cocasional absence, or want of an organist is soccasional absence, or want of an organist, is supplied in this instrument by 'a dumb organist,'—an apparatus which plays thirty tunes without interfering with the internal arrangements.—The foundation-stone of a new town-hall and market-house was laid at Brentford, by Lord Robert Grosvenor, on Thursday week before last.—The restoration of Salisbury Cathedral spire is far advanced towards completion. The vane has been re-placed. — The General Hospital burialground, opposite the Commercial-rooms, Batb, has been covered with concrete 5 inches thick.

The Chester Batbs and Washhouses were opened on Monday week hefore last, and during the first three days 2,406 persons availed themselves of the baths, 2,184 being admitted at the charge of one penny.

The nave roof of Hatton Bonville Church, near Northallerton, for some time in a prenear Northanerton, for some time in a pre-carious state, fell, lately, and hroke the pews and seats to pieces; a boy was much hurt, but the workmen employed in making a new roof were fortunately absent.——The founda-tion stone of a new congregational church was laid at Cockermouth on 27th ult. It is to be laid at Cockermouth on 27th ult. It is to be of white stone in the Pointed style, from a design by Mr. C. Eaglesfield, of Maryport. Length 72 feet 6, breadth 45 feet 6, height 60 feet. There will be seats for 550 adults and 200 children. Cost 1,700l., of which 700l. is yet to be subscribed.—The foundation stone of a new parish church was laid at Drigg, according to the Carlisle Journal, on Friday week.—The Lord Provost and magistrates of Edinburgh are determined to use every exof Edinburgh are determined to use every ex-

with statues, &c., along the Princes-street Gardens, at the Scott monument, certainly a very eligible site for such a monument. remarks on the subject will be found under another head.

METROPOLITAN COMMISSION OF SEWERS.

In the strictures you have made in your last number on the proceedings of the Metropolitan Commission of Sewers, you have hardly, I conceive, gone so far as the public interest would have warranted you in going. The fact is, the present commission is incapable of transacting properly the accumulated and accumulating business of the whole of the metropolitan district. It was the opinion of all practical men, that the business could not be carried on by one commission, but their evidence was excluded from the reports, and none but evidence on one side of the question taken, What is the fact as proved by a year and a half's experience? I can speak from personal knowledge of one district; it is left in the hands of one of the inferior officers of one of the late commissions,—one of their least efficient officers,—with no one to appeal to who has any knowledge of the locality; whilst I and others feel that we are left without our old protection against partiality and injustice. Can anything be worse than the proceedings of the commission? One commissioner has seceded because the acts of the commission are illegal; all the chief officers resign because the statements and proceedings of the commissioners tend to draw down ridicule and contempt upon them as officers of the commission.

I feel convinced, Sir, we must return to local commissions, and have a general com-mittee deputed from the local commissions, with proper powers conferred upon them, reversing the present ill-considered and hasty piece of legislation. What is the practical effect of the present commission? All business is trans-acted by two or three in committee, whilst so much presses on the court at large, that virtually there is no check upon the committees, and the public is without that safeguard that ought to exist. The act is one of those pieces of legislation that is termed smuggled through Parliament; only thirty-five members were present when the bill passed the House of Commons. I foresaw and placed on record the evils likely to accrue from the present system; and every evil that I foresaw is now in active operation. active operation.

I will not trespass further on your time except to add, that I have fully appreciated your publication as being the only one that contains regular and full reports of the proceedings of the commissioners, which reports I trust you will continue for the present at least, as well as your own occasional remarks.

LAW OF CONTRACT.

BURTON v. TRUSTEES OF ADELPHI CHAPEL,

HACKNEY.

ON the 7th, an action was tried in the Court of Common Pleas, brought by Thomas and Henry Burton, huilders, of Aldersgatestreet, against the trustees of the Adelphi Chapel, West Hackney, to recover the sum of 6,405L, for extras, beyond the sum of 2,340L. agreed to he paid for the building of the chapel,—such extras having been ordered in writing by Mr. Owen, the defendants' archi-

For the defendants, it was contended that there was no case to go to the jury, for the contract and specification stipulated that no alteration should take place in the building unless its cost was laid before the trustees and they consented to it by signature; and that, also, their architect and surveyor, Mr. Owen, was bound by the contract to certify that he was satisfied with the execution of the Neither of these stipulations had been works. complied with.

The plaintiffs were non-suited,

GRANITE.-A block of granite was lately blown out at the Dartmoor works, the length of which was 30 feet, breadth 23 feet, height 24 of Edinburgh are determined to use every extended to the front of the Wellington monument, designed by Mr. Steele, and destined for the front of the Register House, placed in preference on the grand terrace to be laid out

^{*} A correspondent ("X.") has sent us some very pertinent remarks on the domestic advantages of gas. The proper place for these, however, will be in the assault which it may be necessary or desirable to make in aid of its inundation throughout all the dark corners of dowestic retirement.

Miscellanea.

PRIZES IN CLASS OF ARCHITECTURE: UNIVERSITY COLLEGE.—The distribution of the prizes and certificates of honour in Mr. Donaldson's classes of architecture, at University College, for the session 1848-49, took place on the 30th June. We give a list of the recipients. Fine Art, 1st year: prize and 1st cer-tificate of honour—Thomas Gundry, of Sohosquare; 2nd certificate-W. Howden; 3rd square; 2nd cernineare—N. Howden; 3rd certificate—Joseph James; 4th certificate—G. Legg. Fine Art, 2nd year: prize and 1st certificate—W. R. Alchin, of Gray's Innroad; 2nd certificate—T. Hill; 3rd certificate—t—A. S. Goodridge; 4th certificate—Henry Wood. Construction, 1st year: prize 1st certificate-William Allingham London; 2nd certificate—Thomas Gundry; 3rd certificate—T. C. Tarring; 4th certificate -W. Howden; 5th certificate-B. W. Betts. —W. Howden; 5th certificate—B. W. Betts.
Construction, 2nd year: prize and 1st certificate—James Knowles, of Clapham; 2nd certificate—W. R. Alchin; 3rd certificate—Thos.
Ilil]; 4th certificate—Henry A. Darhishue.
RAILWAY JOTTINGS.—A comparison of the
earnings of the principal lines for the last half-

year contrasts very favourably, it appears, with those of the first half of last year; and there is said to be a large increase in particular during the last few weeks.—A bright summer's day was Monday week in the dark destiny of hundreds of the poor creatures who burrow in the miserable holes and corners of the parish of St. Matthias, Bethnal-green. On that day 1,400 of them, under the truly pastoral care of their clergyman, Mr. Joseph Brown, were whirled out of town by special train on the Eastern Counties line, to Havering-atte-Bower, where they spent the most part of a sunny day in health-yielding holiday-making in the open field and under the green-wood tree. There the tattered and torn and weary and worn lay scattered about in groups that would have formed at least as interesting and picturesque a subject for the daguerreotype or the pencil of the artist of feeling as Ascot or Eton in all their glory.—A' station clerk,' on the part of nearly 4,000 of his fellows, earnestly heseeches the aid of the press in procuring them a few days annually by way of holiday. From early morning till bed-time-Sunday and Saturday—seven days in every week—year after year—he complains—and without a single holiday—are such as he obliged to be at their posts; and with this result, as he insinuates, that in spite of the best intentions and the most watchful energy, listless habit of loose management inevitably supervenes, in the obviation of which the public itself has a special interest. There appears to be some reason in such a complaint, although the public certainly have also a special interest, in being assured that railway stations are not to be left even for a single day far less a week, in the hands of inexperienced clerks or managers. Two or three experienced far less a week, in the less a week, in the less a week, in clerks or managers. Two or three experienced hands, however, might surely be easily engaged as circuit clerks, to take the place of a stationed clerk, should be desire it, for a week; and we dare say many of the latter would willingly allow them to be paid out of their week's salary for doing their week's work, much rather than have no holiday at all. A plan such as this may be their only chance of amendment under present circumstances.—On Monday week the Act of Parliament, incorporating a Company for assuring sums of money in the event of loss of life or personal injury while travelling on the railways of the United Kingdom, came for the first time into operation. In the event of serious accidents, officers are to be sent to the spot with assistance and money on behalf of the assured. The joint terminus for the railways running into Portsmouth now rapidly approaches completion. We are told it will not have half so much ornament as many of the second-rate stations on the South Coast and South-Western lines. The entire works are heing constructed by Mr. Bushby, of Littlehampton, the contractor.

LORD ALBERT CONYNGHAM AND LADY AND LADY ALBERT CONYNGIAM AND LADY ALBERT, received the Council and other members of the British Archaelogical Association, at Hamilton-place, Piccadilly, on Wednesday evening last, for the purpose chiefly of shewing them some interesting matters brought from Greece, whence they have just returned.

PROJECTED WORKS .- Advertisements have been issued for tenders, by 28th inst., for the erection of a small church and par-sonage at Grazeley, Reading; by 17th, for building a new school-room, infirmary, and other works, at Faringdon work-house; by dates not specified, for erecting a brick bridge over the river Gipping, at Claydon, Suffolk,—for the erection of a house in May Fair.—and for building a chapel at Not-tingham; by 16th instant, for the restoration of the exterior of Fenstanton Church, Hunts; of the exterior of Fenstanton Church, Flunts; by same date, for the erection of a cottage in Gothic style near St. Ives; by 17th, for additions and alterations at Doddington workhouse; by 24th, for erection of Harlow new schools; by 14th, for erection of parish school-house and teacher's lodging at Houston, Paisley; by 20th, for enlargement of Andover Union Workhouse; by 14th August for 5 600 loads of Spanish and 14th August, for 5,600 loads of Spanish and Honduras mahogany timber, and 7,000 loads African timber, both for the navy; by 17th inst., for 1,000 tons hard Guernsey granite at Isleworth; by 17th, for 400 waggons to Villsleworth; and by Northern Railway (extension of time); and by line of road near Worcester. Proposals are also wanted, by 1st September, for lighting Lynn with gas for

Scenes behind New Oxford Street. · A ludicro-serious but touching remonstrance having heen sent to the Times by a number of poor wretches, living, or vegetating rather, in crowds, amongst filth and darkness in Church-street and Carrier-street, behind New Oxford-street, a reporter was sent to examine into the truth of their statement of grievances. The result is a most appalling detail, that speaks volumes, not only for itself, but, as a sample of scenes but too wide spread and common throughout this 'fair metropolis,' which too much resembles the state of many of its own fair consumptive occupants, all beautiful without but rotten to the core within. In reference to some of his details, the reporter says, "It would be too disgusting to enter says, "It would be too disgusting to enter into many minutie observed in this horrible place," and yet, "in spite of the demoralizing influence, many of its poorest inhabitants seem to desire cleanliness," In fact the want of public conveniences not only in such districts, but throughout the whole metropolis, though it may tend to keep up the 'fair outside,' is a sonrce of gross pollution and a disgrace to all concerned. But this is only one evil. The crowding of multitudes into single houses is The police return of inmates for each room in these dens of filth and fever gives an average of sixteen to eighteen per room. Speaking of one amongst many others occupied, by sixteen persons, the reporter says, "It appeared at first sight of this room to be physically impossible that sixteen persons could sleep in it; and indeed there could not be room unless some of them rested in a sitting position in the angles of the wall with their children on their knees." The opening of a The opening of a pavement flap exhibited a crowd of poor creatures in a dark celiar below, the atmosphere steaming from which was thick and moist with offensive effluvia and exhalations. Want of space alone prevents us from saying more at

present on this painful subject.

NEWLY-INVENTED TINTING TABLETS. The facility of giving the effect of light and The facility of giving the effect of high and shade to drawings is enhanced by the introduction of this newly prepared tinted paper. With no other labour than merely scraping the surface, where required, by a penknite, a graduated light is obtained, up to a brilliant light. Sketches made from nature, and but slightly tinted with colour to the forms, are by this new and facile means readily embued with the atmospheric effects of sky and cloud, the vivacity of daylight, and the rapid induction of chiaro-scuro. The advantages are apparent to those who would amass a store of recollections for professional purposes, and become equally inviting to the amateur, by abridging the toil and augmenting the truth of representation. An advertisement in another page of our journal will inform our readers where they can obtain it.

FULHAM UNION WORKHOUSE. — Some correspondents, who are candidates for the office of clerk of the works, complain of having had their time unnecessarily wasted by the guardians. We are not in a position, however, to enter into the question.

ANTIQUARIAN TRAVERSE. - The Roman houndary wall was lately traversed from the 'Wallsend' and Newcastle to Carlisle and Waisend and Newcaste to Cariste and Bowness, by a numerous party of antiquaries and other 'pilgrims.' The party appears to have been a zealous no less than a jovial one, and footed every foot of the way in their eight days' pilgrimage along the old wall, which in one place, near the Roman Magna, Caervorran, they found to be still ten feet in height, with not less than 13 courses of stones in the wall. That the pilgrimage was an orderly one, and within bounds in its progress throughout, may well be credited, inassess throughout, may well be credited, inassess throughout, may well be credited, inassess throughout the statement of its leaves and the statement of the statemen much as one of its leaders and lecturers was a clergyman, the Rev. J. C. Bruce, who ranged his congregation round King Arthur's Well on the way, and at one and the same time quenched their antiquarian thirst and their hysical.

CITY COURT OF SEWERS .- The City Commissioners, who appear to be anxious to do all that may conduce to the health of the inhabitants, meet regularly. At a court held on the 10th, Mr. Haywood, the surveyor, stated that every gulley is now trapped throughout the city; that the New River Company had given a vast quantity of water; and that the drains were flushed with water twice a-week, and the markets were flushed with water three or four times a-week.

DISCOVERY AT CHESTER .- A few days ago, a Roman pig of lead was discovered in excavation for the sewers in the city of Chester. It is in shape very much resembling those now lying at the British Museum; and the inscription upon it, so far as we have been enabled to ascertain, is as follows:-

CAESAR.....DOM The middle part of the inscription cannot at present be decyphered. It was found about 6 feet below the surface, embedded in a wall of masonry 3 feet thick; and as it had mortar on the top as well as the bottom and the sides, it is probable it has been built in the masonry. is the third Roman pig of lead which has been discovered in this neighbourhood. mysterious passage, already referred to, has also been crossed again in another street (Bunce); it is cut out of the solid rock, and about 13 feet 9 inches from the surface. We believe it is the intention of the Chester Archælogical Society to investigate the matter, so as to solve the problem as to whether it is a subterranean passage used for purposes of a religious or a warlike character, or, as before suggested, for the drainage of the town.

CONVERSAZIONE AT THE SCHOOL Design.—On the evening of Saturday, June 30, a conversazione was held by the students of the Government School of Design at Somerset House, and was numerously attended. The students' association for mutual improvement appear to have arranged it. They were in-debted to various manufacturers for the debted to various manufacturers for the loan of several interesting specimens of ornamental art and manufactures of various fabrics and materials; also to the masters and friends of the institution and the one at Spitalfields, who contributed a selection of pictures, ornamental designs, and port-folios of sketches.

TENDERS Received for the erection of the new County Hospital at ork: Messrs. J. B. and W. Atkinson, architects:-

duced a critical work on style, as adapted to

our ritual, to guide architects. They bave changed their "building regulations" every

No. CCCXXXVII.

SATURDAY, JULY 21, 1849.

HE Institute of Architects terminated the session on the 16th instant, with a paper from the president, Earl de Grey, and a very full room to listen to it,

Before referring to this, however, and offering a word to the council at parting, we must look back to the previous meeting (held on the 2nd), when a paper was read by Professor Cockerell, called "On Style in Architecture," which excited considerable interest,* not because the line of argument adopted has never been taken before, but because being now pronounced " from the chair," it comes to the ears of the world with greater weight, and will strengthen and support timid minds who think with him, but feared to rebel alone.

Mr. Cockerell commenced by denouncing " copyism," the choice of the day, and the Bahel it had produced,-alluding with regret to the latitude and license as to the choice of style which are not only now permitted, but professed. Art, he said, must degenerate and sink, unless upheld by principles. our own time architecture had pretended to be an impress of the age. As intensity of character is commonly distinguished in society by a peculiar aspect, habit, or bearing, so should the great national works of a people be distinguished in the pages of time. The architect, therefore, who limits his ambition to the reproduction of an antique model, carries a lie in his hand; he shows himself to posterity as a renegade to his country and his age; he is false to history, for his aim would seem to be to deceive posterity and to perpetuate anachronisms; he confesses his incapacity to delineate his own times, and shrinks from the exhibition of them, as if knowing their unworthiness. As well might the popular writer insist on the use of the style of Bede or Spenser, and the obsolete language of Wickliffe and Wykeham, as that the architect should absolutely reproduce the form and character of taste in that period; and if Art means anything, and we assume to read its language, the one proposition is certainly not more ridiculous than the other. This anomaly of styles, he continued, is not confined to England: Paris and Munich are equally open to the reproach. In speculating on the latent causes of the vicious system of copying without any attempt at modification, the professor said, that although the mere fashion of public opinion always influences Art, as it does everything else, yet he thought much of the evil might be attributed to the want of an enlightened, searching, and generous criticism, such as existed in the beginning and to the end of the last century, from Boileau and Pope to Payne Knight, Alison, and others. He especially drew attention to the fact that, during the last thirty years, of devotional buildings in which upwards of 1,400 cheap churches of England have been erected by the zeal of churchmen, not one of that

five or six years, and have waived all consistency; and they seem to have been satisfied in raising "folds" in any way for the wandering flock. Others had attributed the present state of architecture to a cheap press, which had made architectural knowledge secondary to antiquarian gossip. The decline of the drama-that mirror in which the state even of the arts was wont to be reflected has not been without its effect; and it is worthy of remark, said the Professor, that when the drama has flourished, so bave the sister Fine Arts, especially architecture. Some ascribe the decline to the conceit of "Young England," which has placed the classical at a discount for the elevation of the mediæval. The professor referred to Mr. Fergusson and to Mr. Ruskin (without naming them),-the first as the advocate of revolution, the second, of chains, and gave some long extracts from their works. Our only chance of retrieval, the reader thought, was to adopt one style, and use that alone. One of the great faults committed by architects was their allowing all logical consistency of feeling, all regularity, harmony, and conformity, enjoined by the first principles of sound sense and artistic composition, to be sacrificed to a pedantic display of our universal knowledge of historical styles and dates, and the trivial conceit of a dramatic reproduction to the very life (in the absence of the theatre itself) of the several periods they represent, Again, we find them preferring the ornaments, the rhetoric, so to speak, to the logic which is its only just foundation. This is mere pedantry and affectation. Such a spirit will not do in the war of the camp or of politics, at the bar, or in engineering. In music it is thought abominable. Why, then, should it be tolerated in the serious and responsible art of architecture? Nature is never illogical,-for her rhetoric is the mere appendage and the natural consequence of her use and purpose. How often do we find the young architect, fired with the beauty of the classic column and entablature, of the portico and the pediment, introducing them where their unfitness actually destroys the very beauty he is so anxious to display! The column carries nothing; it is carried. It is from this false principle that we have churches on a Roman-Catholic plan adapted to a Protestant Ritual,-buttressed walls with tie-beam roofs, belfry towers without bells, and all the quackery of sedilia, piscina, &c., where they are without use or purpose. The rigid adherence to Palladian or Italian example and dimensions in designing masonic architecture, without the slightest allowance for the growth of modern scantling,-the glazing of windows in Elizabethan or "early domestic" buildings with quarré glass, in bits of 4 inches square, in preference to the splendid and cheap plates of the present day, each of which would fill a window,-all this results from that mania for imitation which, far from showing progress in Art, is disgraceful retrogression. During the Greek mania, we built houses fit for the immortal Gods, and, --- no others. Amidst the difficulty we seek for aid,-in the darkness we are looking for light. Objections without a remedy are useless, and yet if we look to the works of the objectors who have recently written, we shall not find any mode of improvement pointed out. We want a judgment clear of fashion and caprice, founded on

reason. Architecture, it must always be remembered, is not merely a fine art, but a useful art. Fortunately science is always advancing. An architectural work is a contrivance for a certain end. Good architecture can arise only from a sound understanding of the structure. New ideas are scarce, few men have more than one, on which they may trade all their life. Knowledge of the structure and deep consideration of the materials are the right foundation of our art. As Gothic groining grew out of Roman vaulting, so will other changes come,-we must wait. It is in earnestness of purpose that we must look for what is called genius for fitness, novelty, and beauty. Genius, so called, is but the more strenuous attention to the means presented to our faculties by a closer criticism -by greater diligence in the artist-hy concurrent efforts, liberality, and patronageand, above all, by a field to work in, offered by the public. Until these conditions are presented, we shall of course bave imitation; that ready evasion of the most difficult and painful of all labour-the labour of thought. If the prize and occasion be mean, the enterprising and the powerful mind will take another career, leaving those pursuits to second and third-rate minds. The wise architect, while he admits the whole power of association in the effects and influence of his artwhile he sanctifies his work with archaisms, and bends in some degree to fashions-still seeks to embody the spirit of the actual times as well as that of antiquity, engrafting the useful powers of growing science and the recent graces of convenience with a certain reserve; and thus he fulfils the great purpose of his office, captivates all observers by the production of things new and old. Further, he should remember always the immortal words of Schiller-

> The artist is the child of his time Happy for him if he is not its pupil, Happier still if not its favouri

Present powers of trabeation should be considered in designing buildings. Except for ecclesiastical buildings, he thought the pointed style should not be used, and in these the plan should be adapted to our ritual. We are of classic tutelage, and the style of Greece and Rome would best meet modern requirements. The professor concluded by urging architects to be true to themselves; to remember that they are masters as well as servants to the public; and that they should, without pedantry, investigate and disseminate good principles, and, remembering the influence of their art for good, exercise a wholesome discretion.

Mr. Donaldson said he was desirous to follow out Mr. Cockerell's idea as to the progress towards a new style.* To have a new conception, there must be something to originate it. Amongst the ancients the impulse is seen to be some new material or fresh discovery in science. It was so with the Egyptians, the Greeks, and the Romans. Even the latter, when they wanted to cover in larger spaces, originated a new style. In Gothic architecture the changes were purely of construction. At the present time we should examine what the requirements are, and study the best means of satisfying them. A master-mind will presently arise to blend and amalgamate the whole into unity. A new style will come, if liberally met: novelties grow by degrees. It is to be regretted that public criticism is for the most part exercised by men who have done nothing themselves. Let the artist pursue the right

* At the same meeting Mr. J. F. Wadmore communi-cated "A short Account of the Cathedral of St. Peter's, Leon, in the Republic of Nicaragua, Central America, by Mr. J. Foster, British Consul to the Republic," and pre-sented an engraving of the building from a drawing by himself.

^{*} A viewlong since put forward and often urged by us.

path, and be fearless. Encourage others: do not discourage. As to fashions, he would not despise or disregard them; the architect was bound to satisfy public wants; his object should be to give them the right form and direction.

At the meeting on the 16th (already referred to) Earl de Grey presented the medals, &c., awarded during the session,—viz., the Royal Gold Medal of the Institute to Signor Canina; the Silver Medal to Mr. Wyath Papworth; and a book to Mr. Thomas Hill for the best series of sketches. There being no representative of Signor Canina present, the medal was placed in the hands of the foreign secretary to be sent to Rome,

Our own opinion of this uncalled for and ill-judged award has been too strongly expressed to allow us to record its consummation quite silently. We have the satisfaction of knowing that a large body of the members take the same view of it as ourselves.

With reference to the medals not awarded, the president urged on the younger men of the profession the necessity for exertion, and expressed his desire, that the council would always be rigorous in requiring essays and drawings of ability.* To Mr. Lamb, a fellow student of Mr. Hill, who received the prize for him in his absence, the president, who loves a quiet joke, said,—that he hoped the Hill would become a mountain, and the Lamb a full-grown sheep, browsing on Parnassus.

A communication from Sir Gardner Wilkinson was read, relating to the origin and early use of the pointed arch; and afterwards the president read a paper descriptive of the excavations now proceeding at Fountains Abbey, under his direction. Fountains has been a show place for years, hut nothing had been done there, and the wood around it was so thick that little could be seen. The Earl has had a portion of this removed, so as to give access to the structure. The new building discovered is to the southeast of the church, and is supposed to be the abbot's house. It includes a hall 167 feet long and 69 feet 10 inches wide, in three aisles, and an oratory 46 feet by 23 feet, and has this peculiarity, that the greater part of it is built over the river upon arches.+

The Dean of Westminster, in the course of some antiquarian chat which followed, suggested the publication of those few parts of Westminster Abbey which are known to be Saxon. The dean said that the side walls of the Westminster School (amongst other things) are of this period, and that the only remnant of the Saxon Church which preceded the present structure is an arch in the west side of the

south transept. On the maxim Ex pede Herculem, the size and character of the building might be judged.—And then with multitudinous applaudings and much smoke if not fire, the session closed for 1849.

In concluding our notice, we would remind the council that they have a serious work to do, and that we look to them to do it properly. The members at their last annual meeting came unanimously to the resolution, that an inquiry into the present position of the Institute was most essential, and that means should be sought to enlarge its scope and increase its usefulness. The resolution was in these words:—

"That it seems to this general meeting most desirable that the present position and prospects of this Institute of British Architects should be inquired into by the council,—because it appears to them that, after the period which has elapsed since its original foundation, it is desirable that a strict review should take place, in order to ascertain to what extent the view of its original founders has been carried out, viz., that of 'cultivating its many branches of science, and diffusing the knowledge of the principles of architecture, with credit to its members and with advantage to the noble art which they have the bonour to profess; 'also to inquire if any, and what, changes in the bye-laws may be desirable to enlarge the scope of the Institute and increase its usefunces. That this meeting, in confiding this inquiry to the council, feel satisfied that it will receive at their hands all the attention its importance deserves; and the meeting further beg to assure the council of their anxious co-operation in this most important subject."

The main object of those who moved and supported this resolution was the alteration of bye-law 21, which puts prominently among the grounds for the expulsion of any fellow or associate,—" for having engaged since his election in the measurement, valuation, or estimation of any works, undertaken or proposed to be undertaken by any building artificer, except such as are proposed to be executed, or have been executed, under the member's own designs or directions, except as referee or arhitrator." This regulation, as narrow, injurious, and unjust as it is impolitic, has given a reputation of exclusiveness to the institute which has been even more extensively hurtful than the prohibition itself. It is contrary to the spirit of the age, and opposed to common sense. Many of those now standing high in the profession were enabled in early life by measuring and estimating to stand their ground and pursue their studies, and but for this must have succumbed. We would even go beyond saying that no hinderance to measuring should be thrown in the way of the young practitioner struggling forward into position, and assert that great advantage results from it, in the knowledge of construction and the acquaintance with materials and prices, which are best gained so. For the preservation of the respectability of the institute, there is the ballot. If the applicant be not a man of probity, education, and respectability, black-ball him; but to say that simply because he measures work for artificers,-because, for example, placed in a country town, where positively there is not architectural practice enough to maintain him in respectability, he acts as a surveyor also,seems to us, as we said before, as narrow and unjust as it is impolitic in a financial point of view. The argument that, being occasionally employed by the tradesman, the architect is less likely to do his duty when employed by the proprietor, is suicidal when used by any in the profession. They would not say that because a barrister acted yesterday for a plaintiff, he is not likely to act efficiently for a defendant to-morrow? Why should they entertain a worse opinion of the members of their own profession?

CONSTRUCTION OF DRYING CLOSETS.

As at this time much attention is directed to the best arrangements for drying closets, I send you the following observations upon the subject, feeling that the results of experience, though ever so limited in amount, when thrown into the mass of information now accumulating, whether they make for or against our preconceived theories, are the best helps to the perfecting the matter in question. Annexed are drawings to illustrate the subject. They are reduced from working drawings of one in constant use for the last seven years, and of which closet I append the following report, copied from a certificate of its working, made to the order of a Board of Guardians:

Fuel consumed,	Cost of	Lighted 9.	Thermo-
including lighting.	Fuel.		meter.
Wood	-1/2 d.	half-past 9	68°
	11/2 d.	half-past 10	132°
at 21s. per	1s. 3d.	half-past 11	182°
chaldron		half-past 12	208°

The hourly consumption of fuel subsequent to the attaining this degree of heat is of course under control by those in management, and bears but a small proportion to it.

bears but a small proportion to it.

Memorandum.—It therefore cost 1s. 5d. to produce 208 degrees of heat, which heat is more than is required even for the coarsest sheets. The above heat was produced so gradually as not to make the exterior ironwork redhot, nor even the internal neck of the stove, which has generally been when worked by the laundry women. I saw ninety-eight sheets put on the horses all at once, and the laundry-women have dried sheets in ten minutes, which I shall not allow, as I consider it drying fast enough to be able to clear the first horse by the time the seventh is filled and closed, which I shull do.

I would make an observation respecting the capacity of a drying closet, to the effect that it is not enough alone to enumerate its cubic contents, as appears usual, for although one closet may be to another as two to one, yet as such

(Signed)

only the same may show a fallacious result.

The lineal dimensions of the drying rail, will, I would submit, show the best comparison taken in connection with the times such capacity is available for repetition of use, as instance the foregoing example—600 feet being its cubic content—might have been fitted with only 300 feet run of rail, instead of upwards of 500, as is the case. Yet these cubic dimensions suffice fully to furnish ample lineal room to evaporate the moisture with rapidity, enough to enable them to unload the first horse when the seventh is filled. Although not so good a test, a comparison may be stated by the quantities of water evaporated in the same times, but as lineal room is the means whereon the wetted surfaces are exposed, it consequently will be the best measure of value in relation to the power of the surfaces presenting the heat.

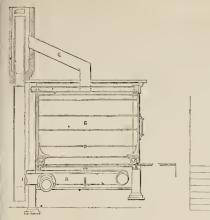

I will now observe, in few words, respecting the ventilation of drying closet, which is the topic more immediately under notice, and will say little more than recapitulate results of experience. The first large closet I erected was heated by a dry, or furnace heat, through a metal flue, as distinguished from the application of heat transmitted through the means or water, and in size was nearly one-half larger than that referred to above, the cubic contents being rather over 960 feet. An external or cold-air drain was formed with a transverse section of 5 superficial feet and furnished with a throttle valve, its mouth directly opening upon the heating surfaces, which were in themselves ample in quantity but were not under the drying closet, so that the clotbes were not acted upon by any radiant heat but wholly by the current of heated air. A large tubular air or steam passage was constructed in the roof of the closet, communicating with the chimney The heating surfaces were exposed to the full length of the closet, but dependent for effect wholly upon the air drain before described to carry the heat forward and upward into it. Upon the first trial, after firing briskly for 8 hours, the closet could not be raised higher than 114°. The upper or exit valve, having an area of 160 square inches, being only one-third

^{*} The following passage on this subject, from the report of the council, is worth quoting:—" (The multil have observed with deep concern the absence of the hard of above the absence of the subject of the council is worth quoting:—" (The multil have observed with deep concern the absence of the burst of above the above the absence of the passage of t

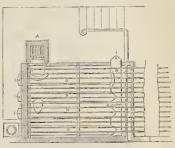

and success."

On the 21st of June Mr. M. H. Bloxam read a paper on a Conventual Arrangements," before the Bedfordshire Architectural Society, containing references to Fountains Abbey. Sc. Its given in extens in the Bedford Times, and might interest Earl de Grey, who is seeking information.

CONSTRUCTION OF DRYING CLOSETS.

LONGITUDINAL SECTION.

TRANSVERSE SECTION

PLAN

open during the time, and the valve in external drain as much closed, to produce even that heat. The second trial, after nine bours' firing, produced 157°, with the different valves similarly disposed. This arrangement was subseany disposed. This arrangement was subsequently altered by bringing the heating surfaces forward immediately beneath the drying closet, so that the direct radiant heat might be available. The entrance or external air drain was also closed up, but the upper ventilating tube remained as before, and is brought into constant and successful action by admitting sufficient air from the laundry into the closet at the floor line, to establish a current through the closet in a diagonal line upwards to the ventilating tube, with rapidity enough to carry away the steam as fast as it is formed opening or slot, extending the whole length of the front of the closet, viz., 14 feet long + \frac{1}{2} to \frac{5}{2} of an inch in width, affords ample air to and a mappe are to maintain this ventilation, and by joining the ventilation tube into the furnace flue, the strong rarefaction within it produced by the heat is a power sufficing perfectly to ventilate the closet; the valve in general being open but one half its range. This system, which I have followed its caused habits like with the title that the strong the control of the co in several public buildings since that time, has not in any instance failed, and is, I conceive, identical with the operation of that described as fixed at Middlessx Hospital, for although the external air-drain is rightly abolished, the same closet yet remains per-fectly ventilated, and, I do not doubt, upon exactly the same principles just described; for although the narrow slot may not be provided specially as I have done, yet I must contend that the steam cannot pass away with sufficient rapidity unless influenced so to do by a current of air through the closet powerful enough, by its levity compared with the ex-ternal air, to carry or pass such steam away, A small amount of apertures will in reality be sufficient, when it is considered how much the volume of the air admitted to the closet at 60 deg., is expanded during its passage through and out of it saturated with steam at over 200 deg., and that this is the operation constantly existing I have evidence corroborative, from a smaller closet I erected (heated hy hot water) a few years previous in Park-lane, where sliding entrance and exit air valves ere provided in the centres of floor and ceiling. When both were closed the wet clothes were invariably rendered thoroughly hot but never dry in twenty minutes, the whole of the steam that did escape finding its way into the laundry,

the smallest area of openings possible for the entrance of the cool air, I have in several closets assisted the upper or ventilating tube, where it enters the smoke flue by forming a distinct metal cylinder within it, to take up part of its waste heat more locally, or by forming such part of the chimney where the steam tube enters it, with a separating cast-iron withe of $2\frac{1}{2}$ or 3 yards in length, dividing the chimney into a smoke flue and a hot steam chamber. The heat so arrested at this point is a powerful accessory to extract the steam from, or induce rapid ventilation through the closet. It is also well, I have found, to extract the steam from two or more openings in the ceiling, in pre-ference to one, which openings should be joined together before entering the smoke flue; also the ceiling or roof (which I generally arch in brick; in fact, no one part should he allowed to be made of combustible material), should have an ascent from the front to the back to facilitate the egress of the steam.

Reference to the explanatory sketches will show we prefer and use a furnace, or fire place, distinct from the ironing stove, the whole of which fire-place is lined with six-inch thick Welsh lumps and the connection of such fireplace with the heated flues is at a depth from place with the heated flues is at a depth from the top of it; this arrangement allows coke always to be used: the charge being filled full to the top prevents any cold air from passing over the fire, as in the usual way, into the flues, to the evident waste of the fuel, and it induces a total absence of smoke, creating only a fine drift or powder witbin them, easily removable. I have been compelled to give a preference to a fire-place for the use alone of the drying-closet, as in two distinct instances I have proved that when the quantity of clothes I have proved that when the quantity of clothes to be dried has been large and the closet in constant use all day, and say, in five out of six days, the ironing stove, to be fully effective to the closet, has been obliged to be worked at far too great a heat for its own duration, besides overheating the room in which it is placed and where it is generally exposed. It has, consequently, been destroyed infinitely sooner than it would if confined to its own use. To end these remarks, and reverting to the

To end these remarks, and reverting to the air-drain principle, there is, I believe, only one way in which it may be efficiently and economically adopted, and it would be as follows:—by constructing an apparatus, containing very extensive heating surfaces (indeed far more extensive than the above method will admit), and making them of a number of verthe scape inding its way into the laundry, admit), and making them of a number of verbut on opening the valves, the lower valve (which communicated with a room below), one fourth the area of the upper one, a sufficient current of air was admitted to pass freely away the steam without much loss of heat, but evidently from two distinct trials the establishment of the current was imperative. With a view to promote and effect this ventilation with

ventilating tube; this would, I think, be the nearest approximation to the operation of na-ture, but of course can only apply to an estab-lishment where steam or mechanical power is at hand to propel the current, and is not applicable to the great majority of situations.

BUILDERS' BENEVOLENT INSTITUTION. ANNIVERSARY DINNER.

THE Earl of Carlisle presided on Wednesday last at the second anniversary dinner of the Builders' Benevolent Institution, which took place in the large room of the London Tavern, Bishopsgate-street, where nearly 300 persons were assembled. The arrangements were all

After the usual loyal toasts,
The Chairman proposed, "Prosperity to the
Builders' Benevolent Institution." Those who stood in the position he then occupied, of urging the claims of charitable institutions, could usually appeal to the benefits they had conferred through many years. But that special plea was not open to him. It was only in 1847 that the design to establish the present institution was effected, and this meeting was but the commemoration of its second anniversary. It behoved them, therefore, to make up their lee-way. They must make up in ardour what they wanted in age. The building trade had nothing to exempt it from the obligations of duty and benevolence. Though not initiated in the mysteries of that trade, nor even connected with the ancient society of Freemasons, he knew that no pursuit or calling had rendered more substantial services to every generation of our species. Though the patriarchs of Israel may have only pitched their tents in the plains, the history of the Pyramids showed how early the business of building left

for itself imperishable records in the annals of mankind. The remains of Nineveh, now being opened to us, bore the same testimony. In short, the business of the builder had pervaded every clime, survived every dynasty, and wea-thered every revolution. We found it giving immortal grace and beauty to the open porti-coes and chiselled friezes under the sunny skies of Athens; and in our northern cathedrals extinguishing the reproach attached to the name of "Gothic," and converting it into a title of distinction and of glory. But as in all preceding ages, so perhaps in our own too utilitarian age, too much thought was given to the building, and not enough to the builder. The workman was too often classed with the machinery-the crane and the pulley-and considered merely as part of the plant. It was to counteract such a tendency that the present institution had been founded. Reverses of trade and caprices of fashion often reduced honourable and deserving men to destitution, and if such were the case with the master huilder, still more often was it so with the workman. This institution nobly proposed to establish pensions for unfortunate masters, and temporary assistance to distressed workmen; and, as soon as the funds would allow it, to erect an asylum for the reception of distressed brethren of the craft. The claims of their less fortunate brethren in trade, and of the workmen who had given them their active and zealous toil, would not, he was snre, be over-looked by the company around him; and with reference to the proposed asylum, he would appeal not only to them but of our countrymen, not to suffer to every class it to be said that, in the building operations of our own day, we had been content with erecting dwellings for the opulent and luxurious, with building palaces, and sometimes selling them again,—with erecting for the Legislature a pile destined, he hoped, to be transmitted amongst the memorial glories of the country,— with raising splendid temples to the Supreme Architect of the universe,—but that, in addition to all this, we had left behind us, for the impoverished builder and the workmen, a shelter for their old age, and a refuge for their hour of poverty and distress. Resting on such claims, he could safely leave the cause of the society in the hands of the assembled eompany, whom he called upon to drink "Prosperity to the Builders' Benevolent Institution

Mr. Biers proposed the health of the Earl of Carlisle, to whom the society owed a debt of gratitude for the interest he had felt in its operations, and for the kind manner in which he had consented to preside on this occasion, postponing for the purpose one of the highest duties of his distinguished office. With his lordship's patronage and support, and the respectable and numerous attendance at this festival, no question could be asked as to the continuance and prosperity of the institution.

The Chairman was sure the Company would give him credit for feeling a due sense of gratitude for the cordial manner in which health bad been proposed and received. the cordial manner in which his been proposed and received. He health bad been proposed and received. He would only say that he never felt his deficiency of knowledge in the building craft more strongly than when he had anything to do with builders' bills. (Laughter). He meant to use that expression in the special sense of Bills brought into Parliament relating to builders; such for instance as for amending the Metropolitan Buildings' Act. On that pregnant and intricate subject, he would only observe, that he had last night brought into the House of Lords a Bill for that purpose; not, as they would believe, in the hope that it not, as they would believe, in the hope that it would obtain the sanction of the legislature this year; but be printed an in order that might printed and circulated, and that suggestions might be offered upon useful it. He would only add that, though truly it. He would only add that, though truly professing his ignorance of the mysteries of building, he held it to be the most brilliant part of the inheritance he had received from his ancestors, that from his earliest childhood he had been able to appreciate the master-piece of Sir John Vanbrugh, in the house of Castle Howard; and if any architect, or other Castle Howard; and if any architect, or other individual interested in the pursuits of the present company, should ever wish to inspect that edifice, he should be most happy to afford him every facility. His lordsbip concluded by proposing the health of the president, Mr.

As widely as that gentleman was Shows, he was thoroughly and cordially appre-ciated. He had especial claims upon their notice, from the zealous part he had taken in promoting the interests of the institution. Mr. Biers returned thanks in a sensible adtaken in

dress; and paid a well-merited tribute to Lord Dudley Stuart, for the patronage and support which his lordship had given to the society in the year 1847

The Chairman reiterated Mr. Biers' eulogium, in proposing the next toast,—the patrons of the Institution, in connection with the name the nobleman referred to.

Lord Dudley Stuart, in responding to the toast, rejoiced that he had been able to assist in the formation of the society. Though engaged at the time in the arduous labours a contested election, he had been glad turn aside from these labours, and give such aid as he could to the promoters of this society. Without being betrayed into exaggeration, or attempting to establish rivalry where there should be none, he would venture to say that, amongst numerous institutions of this description, the Builders' Benevolent Institution was one of the most deserving.

The next toast,—"The Vice-Presidents and Trustees," was acknowledged by Mr. W. Cubitt, M.P., who ably expressed his regret that the duty had not devolved on Mr. Stephen Bird, who had done much more for the institution than he had. Although he was himself one of the first consulted, and entered with alacrity into the project, he had heen alarmed lest unreasonable expectations should be raised; and, indeed, he had rather put on the drag to prevent the society going too fast; but, referring to the rules which he then held in his hand, he was of opinion that a foundation was laid there which any builder might say was a safe one.

The Chairman briefly proposed the healths of the architects, official referees, and district-surveyors, who had honoured the institution with their countenance and the company with their presence. Though comprised in one toast, their separate merits were fully appreciated by all whom he addressed. He h ave to couple with the toast the names of Mr. Poynter and Mr. Godwin,

Mr. Poynter briefly returned thanks. No class of persons were better acquainted with builders than architects; and no architects were better acquainted with them than those who, like himself, filled official situations; and he could say with pleasure that the more their acquaintance with the builders was extended. more they must esteem them, sense in which esteem could be applied.

Mr. Godwin could not resist the opportunity, afforded by the separate mention of his name. of congratulating of congratulating the company on the good position the institution had taken. Those who remembered the difficulties under which its founders lahoured, the cold water which was thrown upon their endeavours, must acknow-ledge that these difficulties would have discouraged men of less nerve and conination than those who founded mination than those who founded the Builders' Benevolent Institution. But these gentlemen knew what they had in view; they made up their minds to do it, and they had done it. He saw around him men nors districtions are the saw around him men. more distinguished in the science and art of architecture than himself; and he could only attribute the special honour con him to his connection with THE BUILDER, which might in some degree be regarded as their organ. If that were so, he considered it a high compliment, and would acknowledge that it gratified him; for when one had lawithout favour or affection, to do one's duty, and achieve the greatest amount of good in one's small way, it was gratifying to find the exertion recognised, and it could not fail to induce further efforts. The mention of Architecture called up many feelings in the mind of one who was enthusiastically devoted toit, and who claimed for professors of it a higher consideration than they usually received. A true architect was a poet; the man who expressed a fine thought in marble, or in stone, was as much a poet, and as much entitled to applanse and gratitude, as he who expressed it with the pen; and he was satisfied that this was beginning to be appreciated, and by none better than by the metropolitan builders who sided in corrust the control of the who aided in carrying out these thoughts, and

to whose ability, enterprise, and probity, as a body, he would bear willing testimony. This was a topic on which he would willingly have a long talk; but at that late hour he must content himself with thanking the company very warmly for the honour they had done him, and congratulating them on the presence of the noble lord in the chair, who, whether at the head of the Woods and Forests, or in the chair at a meeting to obtain a monument to Caxton,—opening a literary institution and urging the advantage of knowledge and the beauty of wisdom, or presiding at the dinner of the Builders' Beneolent Institution, was uniformly distinguished by zeal, ability, and eloquence; and more than this,—for it was more,—beyond being an accomplished nobleman, he was an excellent, earnest, and real man.

Mr. Biers proposed the health of Mr. George Bird, the treasurer of the institution, to whom much is due.

Mr. G. Bird having replied, The Chairman gave "The Ladies," in order, is he said, that he might deserve the character "real man;" and the company separated

In addition to the gentlemen whose names have been mentioned, we observed near us Mr. Ferrey, Mr. H. E. Kendall, Mr. Hakewill, Mr. C. Eales, Mr. S. Bird, Mr. Piper, Mr. Nesham, Mr. Tyerman, Mr. Salvin, jun., &c. The subscriptions amounted to about 500l.

LAMINATED ROOF TRUSSES.

WE have received several communications on We have received several communications of this sunject, but have not space for them in full. Mr. Hay, of Liverpool, in reply to Mr. Burnett (p. 320 atel.) re-asserts his position:—
"I repeat," he says, "that the mode of applying bent timher in the works executed from my designs is a different application of the principle that I have no where seen, or heard of being used; at the same time I do admit that the 'stretch of imagination' is so small that I was rather surprised that Lord Lovelace viewed it of such importance as to prepare a paper upon it. From the notice of this paper in The Builder I conceived it to be the same thing, and I informed the readers of THE BUILDER I had done it six years ago."

The fact is, however, the principle has been long worked on. As another correspondent, a "Liverpool Architect," writes, "the merit a "Liverpool Architect," writes, "the merit of inventing the laminated arched truss, as we usually have it, lies with M. De Saint Phar, who first suggested the idea in 1811, but it was first practically used by Colonel Emy, in roof principals, at Gironde, in France, in 1825; and then the year following, at Marac, near Bayonne, a roof of 65 feet span was constructed by the same engineer: the principals were of plank bent in courses over a mould or template, and then nailed or bolted firmly together. Also in a valuable work published by Wiley and Putnam, New York, in 1838, laminated arch rihs are shown, and not reckoned a novelty, but merely stating that the usual mode of forming them consists in making the rib of several concentric courses of timber, bent to a suitable curvature, the different courses to be firmly united together with hard wood keys and stirrups of iron.

LAW OF CONTRACTS ADELPHI CHAPEL,

S1B.—The claim against the Trustees of Adelphi Chapel was for 6407. 5s.; not, as your printers say, 6,4037. You will add largely to the benefits conferred through your publication by pointing out at times the legal difficulties contracts so often unwisely taken. instance it was ambiguously stated that written orders were necessary, which we obtained from the only party a builder communicates with— "the architect"—being ourselves certain that the party mostly interested was aware of such extras heing incurred. As to the certificate, the architect gave it as he considered fit, and had no other idea than that he had done so in such form as would satisfy his employers that the money was due to us, or that he should the money was due to have otherwise worded it.

HENRY BURTON.

^{*} The roof of the Palm House, at Loddige's Nursery at Hackney, built about 1920, is constructed of bent planks in laminte,—says another correspondent.

MR. BARRY'S REMUNERATION FOR NEW HOUSES OF PARLIAMENT.

To assist our readers in forming a judgment in the dispute hetween Mr. Barry and the Government as to the amount of remuneration for his past services as architect of the new Palace of Westminster, we place before them the principal heads of a letter addressed by the architect, in February last, to the commissioners. He says,—"You are doubtless aware that the proposition originally made to me by the Government, in 1839, was, that I should receive the sum of 25,000l. for the labour and responsibility to be imposed upon me in the superintendence, direction, and completion of the intended edifice, and that I was induced to accede conditionally to that proposition in the belief that it was made to me in the absence of a due appreciation of the enormous extent of that labour and responsibility, and that any attempt on my part, at that time, to prove the inadequacy of the sum proposed would have been fruitless. I was fur-ther induced to take this course from having then entered upon the duties of my appoint-ment as architect of the new palace for more than nineteen months, when I had already made extensive and costly arrangements to enable me to carry on the works; so that if, instead of acceding conditionally to the proposition, I had adopted the alternative of relinquishing the employment,—which, at the time, occurred to me,—I could not have done so without a considerable sacrifice. I preferred, therefore, to postpone all further appli-cation on the subject until I should be in a condition to prove incontestably the full ex-tent of my services, and then to rely upon the Government for a just and liberal determination of the question."

The architect was appointed unconditionally The architect was appointed unconditionary to carry his design into effect at the commencement of 1837, and expected his "remuneration would be of the customary amount." On the 1st of March, 1839, he had the first official intimation as to the latter from the Commissioners of Woods, that they bad given the condition of the state their best consideration to "all the circumstances of the case, the extent and importance of the buildings, the nature and description of the several works, the very large expenditure contemplated in the estimate, and the period within which it was proposed that such expenditure should be incurred," and thought the sum of 25,000l. would be a fair and reasonable remuneration. For the reasons before given he was induced " to accede conditionally to the proposition founded upon it-under a protest, however, as to the inadequacy of the amount proposed, and with an intimation that he should offer proof of its inadequacy when the building was in such an advanced state as to allow of a competent judgment being formed

on the subject.' He then proceeds to comment on the opinion expressed by the Commissioners of Woods. First, that from the want of professional knowledge, they were incompetent to form any just opinion on the subject;—that "the extent and importance of the work" is a reason rather for increasing than diminishing the customary reincreasing than diminishing the customary re-muneration of the architect. As to "the nature and description of the work," the new palace "is now sufficiently advanced to allow of an accurate judgment heing formed as to the amount of labour, skill, and responsibility that has been incurred in producing it. I invite a comparison between it and any other public building of modern times; and I think it will be evident, even to the uninitiated, that in point of variety of design, elaboration of details, and difficulties of combination and construction, the labour and responsibility incurred is much greater than in any other modern edifice that can be mentioned."

The delay and perplexities attendant on official communications have heen very great. "As one proof among many others that might be adduced of the enormous amount of labour that has already devolved upon me in conducting this great national work to its present state, it will not be irrelevant to mention, that sace, it will not be irrelevant to menuon; that mo less than between 8,000 and 9,000 original drawings and models have been prepared for it; a large portion of which emanated from my own hand, and the whole of the remainder baye been made under my own immediate di-rection and supervision."

The amount spent in the work he thought a fair criterion of the amount of skill and labour required in producing it. Various circumstances, too, had occurred to extend the time originally fixed for completion.

He then shows that he has had much more to do than is usual or could have been anticipated, through Dr. Reid,-the changes made in the mode of conducting the business of Parliament,—and the vagueness of the original instructions given. And he considers, there-fore, that he is justly entitled to at least the customary remuneration in respect of the outlay contemplated in the original design and estimate; and adds, that the whole of the arguments urged in favour of such remuneration apply with equal force to the expenditure upon extra works sanctioned by the Govern-ment or Parliament; "but to these it is scarcely necessary to observe, that the proposal for a limited amount of remuneration can have no reference." He looks, also, for a further remuneration for attendances on the Fine Arts Commission, and for drawings prepared for them, drawing up returns for House of Com-mons, &c. &c. In the course of ten years he mons, &c. &c. In the course of the years he has received of the 25,000*l*. originally proposed, 24,735*l*. 3s. 2d., or, after deducting his expenses, an income of 1,500*l*. per annum; which he considers does not by any means recompense him for the labours, responsibilities, and sacrifices incurred.

" The following is an account of the expenditure upon the building, exclusive of the river embankment wall, up to 31st December,

Amount already advanced on account of works comprised in the original estimate of 707,104L. £472,000 0 0 n account of extra works in the embankment of the river and in the foundations of the building, the new basement story, addi-tional residences and offices, central tower, stone carving, and all structural arrangements connected with warming, ventilating, &c., &c., which could not have been foreseen, and which, consequently, form no part of the original design and estimate,

amounting to..... n account of extra finishings, works of decoration, library and

taking down and shoring up old buildings, new roofs and addi-tions to Speaker's late residence and other old buildings, temporary roof and coverings, clerks of works' offices, casts of specimens for wood-carvers, &c., &c., amounting to.....

Total.....£841,630 17 11

210,842 16 2

139,415 3 0

19.372 18 9

On the above amount of expenditure, therefore, I claim, for the reasons which I have adduced, the accustomed remuneration of 5 per cent. :-

..£42,081 10 0 Upon which I have received on ac-24,735 4 2 Leaving a balance of --£17,346 6 10 And for special or extraneous services during a period of ten years, as above enumerated.... 5.256 0 0

Amount now claimed ... £22,602 6 10

Mr. Barry concludes by saying that though he could prove himself entitled to more than the customary remuneration, he proposes to adhere to the long-established and generallyadhere to the long-estandard of charge adopted by the profession generally, "in the hope that by so doing all controversy or contention on the subject may be avoided; and when," he continues, "the amount of the claim which, in consequence, I am now willing to receive as a recompense in full for my past services, is fairly considered with reference to the labour, responsibility, and sacrifices incurred in conducting, under very peculiar and trying circumstances, the largest and most elaborate archi-

tectural work ever, perhaps, undertaken at one time in this or any other country, to which I have devoted almost exclusively the hest period of my professional life; and when, also, it is contrasted with the incomes of other professions, such as those of the law, medicine, civil engineering, &c., which, it is well known, vary from 12,000l. to 20,000l. per annum, and even upwards; and when, also, the important fact to which I have before alluded is borne in mind, that every architect appointed to the superintendence of public works in this country, both before and since the date of my engagement, has been paid the full amount of the customary commission, I cannot doubt but that it will be generally admitted, not only that I am fully justified in the demand which I now that I have not unduly estimated the value of my services as the architect of such an important national work as the new Palace at Westminster."

PROPOSED CHURCH, SANDFORD DISTRICT, CHELTENHAM

MR BRANDON's remarks on the instructions for architects in this matter (see last number of THE BUILDER) are to the point, and though severe, they are not more so than are called for by the gross attempt to induce professional men to bestow their time and talents in such a paltry affair at the vague chance of receiving, ad Græcas kalendas, a fraction of their due for their designs, working drawings, specifications, estimates, time and attention given to inspections, as well as for reimbursement of their travelling expenses.

Perhaps the committee include in the architect's 5 per cent. commission the salary of the clerk of the works, under their comprehensive phrase "of every other possible expense incident, &c. &c.;" indeed they might as well do so, to be consistent in their attempted proceeding of applying the mechanical power called the screw to the hard earned pecuniary recompense of the first-named adviser.

A vein of amusing blundering pervades these instructions, and excites our compassion as well as our regret at the obvious tendency of the whole transaction. Thus, we are informed that the "stone" is not to he of the style usually called Roman, &c. &c." What is intended is of course obvious, but even with this excuse, the description of the style intended for the church is but a negative one: "it is not to be Roman, Grecian, or classical;" hut there are more styles than one not mentioned, ex. gr., Egyptian, Persian, Byzantine! will they suit the taste of the committee?

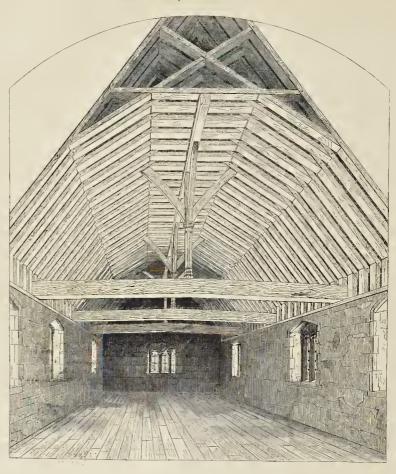

Among "the plans to be sent, are plans of the ground floor, and (if any) of galleries."
"If any!" Can the Committee for one moment suppose that 1,000 persons could be accommodated on the ground floor area alone, without galleries, in a building of the cheap description which their 4,000L could in any way produce? They give exact dimen-sions for the pews and free seats, and they could soon calculate the number of superficial feet that a building must contain to accommodate 1,000 persons in the area, besides date 1,000 persons in the area, besides the vacant space necessary for passages and chancel, vestry room, &c.: let them do this, and then see the length and breadth their church, for 4,000l., "all expenses included," would necessarily take up.

The scale to which the drawings are to be made is larger than usual-almost large enough made is larger than usual—annost mage chough to dispense with many detail drawings by the hand of the original designer, as the parts would appear distinct enough for successful transcribing and enlarging, if required, by another skilful hand !

The services of an honorary (?) solicitor, as well as the signature of an honorary secretary, are but too plainly discernible in the fast-bind, hard-bargain-driving clauses of this instructive intimation to architects, of whom so many as may rush in to compete for the prize generously offered to them will richly deserve the sweet fruits which the close of the competition will, nostro judicio, bring to maturity in the ap-Φ. proaching autumn.

^{* &}quot;The church to be built of stone (not being of the style usually called, &c. &c.):" sie in orig. /

OPEN ROOF, WARE PRIORY.

OPEN ROOF, WARE PRIORY.

THE "Priory," at Ware, in Hertfordshire, the seat of M. H. Gosselin, Esq., about to he restored under our direction, is an interesting

the seat of M. H. Gosselin, Esq., about to he restored nuler our direction, is an interesting structure of an early period, which has been much disfigured, from time to time, by the repairs and adornments of succeeding occupants. The original roof of one portion of the huilding, perhaps of all, for it is only in one part that it can be seen (a required increase in the number of rooms having led to its conversion into an additional story), is sufficiently curious to merit a record in our pages. The length of the apartment is 48 ft. 6 in., the width 23 ft.; the height from the floor to the top of the rafters is 26 ft. (There is a story below.) The height from the floor to the centre of the tie-heam, which cambers 4 in., is 10 ft. 2 in. The tie-heams are 12 in. by 11½ in., king posts. 5½ in. octagon shaft, and 5½ in. hy 5½ in ahove cap; struts, 6 in. hy 3 in.; the rafters, collars, braces, and hearers at feet of rafters, 4 in. hy 6 in.; the longitudinal bearer or purlin, helow collar, is 5 in. by 5½ in. The roof is covered with tiles.

We may say something more about the house bereafter.

We may say something more about the house hereafter.

FARRINGDON - STREET. — Correspondents continue to draw our attention to the delay in completing the thoroughfare from Farringdonstreet to Clerkenwell. "F. H. S." urges that the accumulations of animal and vegetable deposits here are very huntful. posits here are very hurtful,

NOTES IN THE PROVINCES.

THE parish church of Costock has been repaired and enlarged under Mr. Place's superintendence, and was lately reopened. It is fitted with open benches with oak ends to be carved. A new aisle has been added in the original decorated style of the chancel, and an open timber roof to correspond with the old one. Other restorations have been effected, and some are not yet completed. The open timber roof to correspond with the old one. Other restorations have been effected, and some are not yet completed. The builder employed was Mr. S. Hall, of Nottingham.—Clophill Church, Mr. T. Smith, of Hertford, architect, and Messrs. Smith and Appleford, of Pimlico, builders, was consecrated on Tuesday week. The sum at the disposal of the architect for this church was only about 2,300. There is a nave with clerestory, small chancel, and south asise with tower and porch: sittings 520. The nave is 62 feet by 26½; asise same length by 12½ wide.—The price of gas at Saffron Walden is to be reduced from 12s 6d; to 8s. 4d. per 1,000 cubic feet.—The "c omfortathe asylum for convicted thieves," at Portland, as the Bristol Journal very truly styles it, is steadily progressing. The skeleton stage which is to extend the whole length of the proposed breakwater is in progress, and the inclined planes, screw hreaks, drums, and wire ropes, are in active operation. The third hall of the prison is now tenanted by 150 convicts, and the fourth or 'D' division hall, will be shortly occupied. The chapel for 2,000 is in a forward state, and 40 cottages for warders, &c., are also in progress. The infirmary is

supplied with salt-water baths, and the "unfortunate" tenants of the asylum are already enjoying much better health than they did on arrival at their new watering place. A "very extensive and beautiful garden has been formed facing the prison," and the salubrity of this rather "fortunate" we think, than "unfortunate" island, is highly extolled by the authority above quoted, who adds, in the spirit of our own repeated observations, "what can honest paupers think of a system which provides abundance of food,

seems to go on steadily, and, with each successive reduction in price, it is said to advance in a still greater measure.—On Friday in week hefore last the first stone of the long-talked-of new floating dock was laid at Limerick. One of the commissioners of the hoard of works stated that the hoard had but 50,000! to complete the work, which it had taken under its own management. taken under its own management.

NORMANTON CHURCH, DERBYSHIRE.

THE village of Normanton is built on the hrow of a hill overlooking a portion of the county town of Derhy, from which it is distant about 1½ mile. It was this village which gave birth to Jedediah Strutt, who invented the machine for making ribbed stockings in 1758, in conjunction with the best countries of the countries with the set of the conjunction with the set of the countries with the set in conjunction with his brother-in-law, then a hosier in Derby. From this invention many most extensive fortunes have heen realized. He was an ancestor of the late Joseph Strutt, who presented the Arboretum—laid out by the well-known Loudon—to the inhabitants of Derby.

who presented the Arboretum—laid out by the well-known Loudon—to the inhabitants of Derby.

The church, the foundation of which is of great antiquity, mention heing made of it in the Domesday Book, stands on the highest portion or summit of the hill, but is scarcely seen on a near approach, from the road being many feet lower than the surrounding ground. From the churchayard may be discerned the churches of Little-Over (itself a curiosity), Spondon, and Shelbourne. The churchyard, though apparently full, has few memorials of any interest. There is one, however, exceedingly novel in design, having perpendicular tracery filling in its margins. The quatraction is sheld, &c., are well chiselled. The church stands east and west, and consists of nave, tower, and chancel, having a north and south doorway in nave, but no porch. The windows are few, and scarcely light the building sufficiently. The chancel fell down, or was removed, some years since,—an ugly excrescence heing built on a portion of the original stone walls which was preserved. The nave and tower are of stone, doubtless obtained from the Swarkstone-hridge, which is three-fourths of a mile in length, and not more than 3 miles distant. The spire has apparently not been erected more than thirty years. What it was originally it is hard to say, as no traces or sketches are extant. The tower is not so wide as the nave,—the nave wall being finished on either side as a buttress. The chancel is opened to the nave hy a semicircular arch, the crown of which has become much flattened; it is totally devoid of ornament, having merely a bead worked on the by a semicircular arch, the crown of which has become much flattened; it is totally devoid of ornament, having merely a bead worked on the arris. The church was evidently a Norman erection, but has had so much of churchwardens' alterations and improvements, that it is difficult to find many traces of its original state. The southern doorway had a circular head, but was pulled down and re-erected with an equilateral arch, the chevron moulding of the original being worked around it in small pieces as a label, producing a curious effect. The corbel tables of roof of nave, with its grotesque heads, seem to have alone remained entire. They are, however, much injured by Time,—that destroyer of all things, and yet more sparing than the hands of those mortals whom it is continually crushing. With the exception of a small window in the tower, the exception of a small window in the tower, the whole of them are interpolations.

Not being able to obtain the key, save hy a

three miles walk, I was compelled to limit my scrutiny to a glance in at the windows, so cannot describe the roof, or the monuments, cannot describe the root, of the access &c., of which there seem to he a few.

W. W.

SMITHFIELD MARKET.—The Parliamentary Committee to whom this matter was referred reported their opinion, after taking much cyidence, that it ought to be removed. They refer to the importance of a large open space, such as Smithfield, in the midst of a densely-populated district, and express a hope that in any contemplated alterations the greater portion of the present open space may he retained. The House of Commons do not seem disposed to attend to their committee's seem disposed to attend to their committee's recommendation.

STEPS TO PULPIT, PISA CATHEDRAL.

STEPS TO PULPIT IN THE DUOMO AT PISA.

THESE original and beautiful steps are not the least interesting remains of Giovanni da Pisa's capo d' opera, the marble pulpit in the duomo of that city. It was one of the many glories of that noble pile ruined by the disastrous fire of 1596 (the plumhers, as usual, were the cause of the wirelief). the cause of the mischief). It was completely crushed by the falling in of the roof: the fragments collected after the fire were but few in number, and are now worked up in the present pulpit. These steps wind round a column in the nave, against which the pulpit is placed.

RATING GAS COMPANIES.

The rating of the property belonging to gas, water, and railway companies, to the relief of the poor, being now so much in dispute, every decision thereon is of importance. On Friday, July 6th, a decision was made in the case of an appeal of the Phœnix Gas Company, against the assessment of their property to the poor-rate, in the parish of Greenwich, which assessment had been increased when the last rate was made, in April last, from the sum of 1,680*l*. to 5,671*l*. (hoth sums including the station and mains), withnast, from the sum of 1,000. to 5,071. (noth sums including the station and mains), without any alterations having been made by the company, to increase the value of their property in that parish.

The Phenix Gas Company have very extensive buildings and plant, the mains extending

into twenty-three parishes, with large manufacturing stations, at Vauxhall, Bankside, and Greenwich; also store stations in Kenningtonlane and Wellington-street.

The parish officers, hy the advice of their surveyor, Mr. Charles Penfold, valued the property belonging to the company, in the parish of Greenwich, as separate and distinct from the rest of the company's works and mains (although the whole is most intimately connected, also managed by one board of directors, having one office and only one set of clerks and officers), by which scheme, the clerks and officers), by which scheme, the whole value of the station and mains in Greenwich were assessed to the poor-rate of that parish, as well as a portion of the value of the gas rental of the other parishes, supplied with gas from the Greenwich station, for the reason that the gas used in these parishes passed through the mains laid in Greenwich parish. They then proceeded to ascertain the net rate-They then proceeded to ascertain the net rate-able value, by assuming the rent which a tenant would give, "from year to year," for the whole property in Greenwich, with the right of supplying that and the other parishes now supplied from the Greenwich station, and this assumed rent was arrived at by finding the power of production (not the quantity pro-duced), of gas, at the station in Greenwich; the result was—

Lewisham

Do. of the mains in Greenwich, supplying other parts....

Total net rateable value£5,671

The surveyor of the Company, Mr. Lee, contended that the whole of the property helonging to the Company must be considered as one concern, and taken as a whole, and so

assessed to the poor-rate,—or, that the rent which a tenant would give, "from year to year," for all the stations, stores, and mains, in the 23 parishes, must first he assumed; that the basis of this assumed rent should be the gas actually produced at the three stations, and sold in the 23 parishes; and from the rent, so ascertained, must be obtained the net

Then, that the net rateable values of all the stations and stores must be assumed and deducted from the net rateable value of the whole property, the balance being the net rateable value of all the mains in the twenty-three parishes, and that this balance should be divided in proportion to the quantity of mains in each parish,—or, that the stations and stores should be rated in the parishes in which they may happen to be situate, in proportion to their present value, and the net rateable value of all, deducted from the amount of the net rateable value of the whole property, including the stores and stations, and that the remainder should be divided amongst the twenty-three parishes, in proportion to the quantity of fixed apparatus situate in each parish, instrumental in earning gas rent,—the result would be:—

Net rateable value of all the stations ... £5,438 Ditto of all the mains 3,320

Total net rateable value of the whole property	£8.758
Net rateable value of the Greenwich station	£1,316
Net rateable value of all the property in Greenwich	£1,630

The total present value of all the stations
being ... £173,238
Ditto of all the street mains ... 105,761

Total present value of all the

property £278,999

The present value of the station at Greenwich being. £41,953

Ditto of the street mains at ditto. 11,048

Total value of the property in Greenwich£53,001

The court decided that the assessment must first be made on the whole of the property in the twenty-three parishes, as a whole, in accordance with "The Queen v. The Great Western Railway Company" and that it was to be then divided, as contended for by the company's surveyor; that the net rateable value of the whole was to be 13,600d, and in Greenwich parish, 2,532/, vix., station, 2,045/, mains, 457l. The case was gone into a great length; it came on by special appointment, and it occupied the court from nine until half-past seven o'clock.

The company have appealed against the assessment of their property in various parishes several times, for the purpose of having a principle decided, but have not succeeded before this case.

RAILWAY JOTTINGS.

A CONTEMPORARY, in allusion to past expenditure on some of our greater railway works, asys,—"The sum of 140,000l. has just been expended on a new station at Euston-square; 243,096l. on the bridge over the Tyne at Newscatte; 126,960l. on the bridge over the Tyne at Newscatte; 126,960l. on the bridge over the Tweed at Berwick; and in the Eastern Counties exposé, the stations at Cambridge, Ely, and Peterborough, figure respectively in the sums of 80,565l., 93,423l., and 93,234l. But these are bagatelles compared with the expenditure on the bridge over the Menai, at Bangor, which the Chester and Holyhead Directors have admitted will cost 600,000l. (some people believe it will exceed 750,000l.), although Mr. Stephenson's estimate was only 250,000l. Costly as that bridge is, it will be ont-Heroded by the projected Cornish railway bridge over the Tamar, at Saltash, where the centre pier is to be snak 80 feet deep below the water's surface at low water spring tides; and as the Government stipulated that the bridge should be carried 100 feet above the high-water surface, making a total height of upwards of 180 feet, and thereby making the works much

more extensive than those at Britannia-bridge, many persons doubt that Mr. Brunel will complete Saltash-bridge for less than one mil-The whole population of Cornwall, including the Scilly islands, was, by the last census, only 341,279." The amount of some of this heavy expenditure we were ourselves the first to point attention to; but, though we have no desire to defend what may appear to be improper or imprudent outlay, or to commend any generation of men for going beyond its means, still it would be well, in fairness, to consider, that the fruits of such expenditure in the present instance are great and noble works, that future generations may not only benefit by, but honour the present for rearing, as a monument of their own greatness,
—not blame them for as any thing like a monument. ment of folly. The extravagance will be forgotten while its fruits will carry forth the unsullied renown of the present generation into future ages. - Far other may be the fate of some of those who have reared up vast but vanishing monuments to themselves out of the hard-earned wealth of the present generation. Though among the first to warn we were among the last to reproach. past exposures may have exceeded previous belief, the present seem really past all belief. We are now assured that Mr. Hudson's cool moral courage went even so far as to convert 937½ shares, presented to him as a gift by one of those Companies over whom he reigned with his iron rule, into as many thousands and more; having sold out under the cloak of these gift-shares, no less than 10,894 in all, without the right to even a single share beyond the 937½ presented to him! We sincerely hope, however, for the honour of our race and generation, that the facts on which such a statement is grounded will be ultimately found to be capable of some much more charitable interpretation. Meantime it is asserted that a profit of 145,704l. was reaped on this one transprofit of 145,704t. was reaped on this one trans-action alone! — The Derby and Chesterfield Reporter speaks of a new cast-iron girder to be patented by Mr. Rutter, Railway Inspector, the advantages of which consist "in the conthe advantages of which consist struction of the joint, as the joinings of the two half beams in the middle of the span, where girders of a very long stretch cannot be cast with any safety, in consequence of breaking, and damage they might sustain thereby."
The girder is suitable, it is said, for bridges (railway) of 100 feet span and upwards.-A "railway steam-boat" of iron has been launched at Millwall, to ply as a sort of floating the Manchester, Sheffield, and Lincolnshire line with the town of Hull. It is supplied with engines of 150-horse power, and is expected to run at the rate of 15 miles an hour with passengers, who "step into a spacious saloon without the opportunity of knowing that they have left terra firma."—The erection of a large railway hridge, 75 feet 6 inches long and feet high, in a week, says the Bradford Observer, may be regarded by some as an impossibility, hut the feat has been all possible, in the Leeds and Thirsk Railway. Messrs. Garside and Parker, sub-contractors, laid the foundation of a bridge of the dimensions specified, behind the Retreat, at Armley, near Leeds, on Monday, June 25; on the evening of the following day the abutments were raised to the springing, and the centres placed for supporting the stones of the arch placed for supporting the stones of the during its construction. On the Wednesday evening the key stones were fixed. On the evening the following Friday the masonry on both sides was raised to the level of the cornices; and on the next day a roadway was made across the bridge, which would have been combeen completed but for some little delay in the supply of stones for the parapet wall.—— The viaduct at Coventry on the Nuneaton line has been completed. It is a quarter line has been completed. It is a quarter of a mile in length, is on a curvature, and consists of 28 arches each 40 feet span, and 15 rise. The pier and arches are of stone.—The Leeds and Thirsk line was formally opened on Monday week. It is 39 miles in length, with stations at Kirkstall, Horsforth, Starbeck, for Harrowgate and Knaresborough, Ripley, Ripon, and other points intermediate between the termini at Leeds and Thirsk. The Bramhope tunnel, already occasionally noticed. is one of the already occasionally noticed, is one of the principal works on this line. It is two miles

234 yards in length, 25 feet in height, from formation level, and 25 feet 6 in width. No less than 1,563,480,000 gallons of water are estimated to have been pumped out during its progress. The line of tunnelling is almost straight throughout. The Crumple Valley is crossed by a viaduct of ten semicircular arches of 50 feet span each, and at a height of about 64 feet. Another viaduct crosses the Nidd Valley: it is of seven segmental arches, 50 feet span each, and rises 93 feet above the water. In crossing the Ure Valley, there is an embankment 3½ miles long. An iron bridge 100 feet in span crosses the river

PUBLIC SCREENS-OR, PENALTIES INEVITABLE.

In my walks through the streets of London, I have been struck by the great negligence of the Board of Health, in not providing places of retirement for the wayfarer. It is unnecessary to particularize the long ranges of busy causeway that may be travelled without a resort—but I believe that three miles (from Farringdon-street to Hyde Park) presents no refugium for pedestrians. In France it is ordered otherwise, and there no occasion exists for such warnings as "Commit no nuisance." I need not tell you what the real nuisance is—nor that pollutions of the most permicious kind are driven into the narrowest alleys and amongst the densest of the poor population, and that there alone, in sight of women and children, those nuisances so obnoxious to the senses of the well bred are utterly unnoticed.

Impressed with the cruelty of these restrictions, and the injustice to the denizens of the lumble quarters, whose vital air is vitiated even at their doors, I wrote a year back to the Woods and Forests, but was answered that "they had no funds applicable to that purpose." To whom then are confided these fiscal provisions which regard the health of citizens? Surely so indispensable a precaution cannot be beneath the dignity of high officials. A distinguished statist once wrote, "Nihil alienum mihi puto qui sit humanum," the natural weaknesses of humanity should be respected—a night's lodging in a police cell is rather a hard penalty for a resort to the alleviation of necessity.

In these particulars we might with advantage imitate our neighbours across the straits, and by providing sanitary retreats, obviate all occasion for either the interference of the constabulary, or the standing indecencies of notices and inscriptions which make immundities palpahle, as well as the fact that the fashion of the day is mock modesty.

A few 7 feet slates fixed at stations not more than half a mile apart, with retreats, would obviate more irregularity than the whole police force, and at the same time conduce to the public health and decorum.

QUONDAM.

ON A METHOD OF COMMENCING DRAWING.

The following system * has been pursued for about twelve months with the children between the ages of six and twelve of a village school in Kent, chiefly with the view of promoting habits of correct observation, and of exercising all the faculties. The lessons were given once, and sometimes twice, a-week, with occasional intervals; and they occupied about an hour each.

First Stage: outline Drawing with Chalk on a Black Board, large Slate, or common Board.—'This material was adopted because it enforces a bold style, and precludes small drawing. More sketches can be made in a given time than with any other material: it can be erased with the greatest ease, and it is very cheap; but care must be taken that its facilities do not cause beedlessness and incorrectness.

not cause heedlessness and incorrectness.

I. Drawing from Simple Objects that require no Perspective; such as simple leaves, large feathers, a table-knife, gimlet, clasp-knife, hammer, apple, pear, turnip, carrot, onion, spade, shovel, painter's brush, flat brush, oval palette, hatchet, mallet, small

When simple forms can be sketched with tolerable ease and correctness, the pupils commence

^{*} According to the Journal of Design.

II. Sketching Objects in which Perspective is gradually introduced; such as cups, jugs, bottles, shoes, boots, caps, hats, large shells, candlesticks, pincers, coal-scuttles, boxes and books in various positions, open and shut, a twig with

several leaves, a simple flower, table, chair, &c.
III. Subsidiary Exercises, introduced occasionally for the sake of variety and the discipline they offer to the faculties in new direc-

tions.

a. Drawing, from Memory, objects previously drawn in I. and II.
b. Drawing from Outline Copies of familiar

objects—at first not requiring perspective, as side of a cottage, dog-kennel, bridge, tomb, well, wheelbarrow, very easy animals and figures, geometrical figures, Roman and writing letters, &c

c. Drawing small with a pencil on slate,

from objects and copies

d. Inventing and drawing very simple borders, patterns, and other ornaments, the idea occasionally taken from a leaf. Drawing, from memory, objects that have

not been drawn from nature or copies.

f. Petty compositions, as nurse and infant,

man and pig, gardener digging or rolling, &c. Exercises d, e, and f, were chiefly confined to pupils in the second part of this stage.

pupils in the second part of this stage.

Second Stage. Light and Shade: Rough drawing on brown paper, or coarse coloured paper, with black Conté chalk, putting in the light with white chalk, the paper serving for the middle tint. This appears to be the most rapid method practicable by a child, who loses patience and spirit, and fails, if the sketch is elaborate and takes much time.

I. Drawing common Objects that show light and shade very distinctly, as an apple, pear, orange, cup, jug, bottle, glass, vase, geo-metrical solids, book and box open and shut, models of animals, heads, &c., at first singly afterwards two or more arranged picturesquely, and in reference to light, shade, shadow, and

reflection, &c. Drawings from Copies of objects not

readily accessible, as houses, animals, the human figure, &c. III. Subsidiary Exercises, occasionally introduced

a. Sketching in outline, on black board, from memory, objects in I. and II.
 b. Inventing patterns and ornaments, as in d,

Stage I.

c. Drawing from memory, on black board, as in e, Stage I.

d. Original compositions, as in f, Stage I.
e. Drawing on white paper with lead pencil, small, to promote neatness.

This course of instruction has not yet been

This course of instruction has not yet been pursued further with the children. It appears to give great pleasure to all the pupils, about thirty in number, who have pursued it, even to those who are the slowest and least apt. It would probably be the guickest method of instructing youths and adults in drawing, inde-pendent of its effect as a discipline for the faculties, which last has been the main object with regard to the children who have used The lead pencil, sepia, and colour would, it is thought, follow with unusual ease and power, in those cases where such articles could be

in those cases where such articles could be purchased.*

*Common White Challs has been found the best insternal for beginners: it admits of large outline sketching only; forbids all but the most cosential lines; can be marked and rubbed out with the greatest facility; and allows a greater number of drawings to be made in a lesson than could be done with equal correctness and spirit by the use of any other material. As far as the pupil goes he succeeds, though done with equal correctness and spirit by the use of any other material. As far as the pupil goes he succeeds, though external control of the succeeds, though the material. As far as the pupil goes he succeeds, though external control of the succeeds of the succeeding the

METROPOLITAN COMMISSION OF SEWERS

A SPECIAL court was beld on Thursday, the 12th st., at the court house, Greek-street. The Earl inst., at the court house, Greek-street. of Carlisle in the chair.

The State of St. Giles's.—A voluminous report was presented to the court by Mr. Gotto, on the state of Church-lane, and other places in that locality. It represented them as being the resort of the most deprayed and filthy class of the community, and the remnant of the mass of buildings known as the "Rookery." Its condition was described as un-ROOKETY. The condition was described as un-paralleled in London, and a perfect disgrace to any civilised community; but while the most fearful degradation of the human character is exhibited, there apparently exists an universal sense of their degradation of the human character is exhibited, there apparently exists an universal sense of their sanitary dauger, and a sincere desire for relief: interest and gratitude are expressed on cery hand at even the prospect of being placed under circumstances affording the opportunity of cultivating cleanliness, comfort, and privacy, of which they are now wboily deprived. It also appeared that an extended system of sub-letting is carried on; the bouses in the first instance heing let for a term of years at about 20t, per annum; they are then re-let house by house; these are again sub-let out in rooms, and, lastly, the separate heds are underlet to tramps and others at about 3d, per night,—producing annually about 70t, per house per annum. The number of persons residing on this spot is described as being greater in proportion than in any other part of the metropolis. Ninety-five houses stand on 1 and 1-10th acre, with an average population of 2,580, or 30 persons to each house. The report concluded with various suggestions for the improvement of the neighbourhood, to be effected by means of an improvement-rate chargeable on the property for twenty-two years, to the amount of 795t. 5s. 8d., or an annual rate, to repay interest and principal, of 51t. 13s. 9d.

Lord Etriproton moved—"That, as a temporary.

Lord Ebrington moved-" That, as a temporary Lord Ebrington moved—"That, as a temporary relief, all the cesspools be immediately emptied, and the streets, yards, and courts washed out: that the necessity of thorough lime-whiting be immediately represented to the ground landlords."

Mr. Leslie wished to know from the surveyor whether there had been any communication with the landlords of the property?

Mr. Gotto said be had understood the owners were quite willing to co-operate with this commission for the promosed works, but that they were units.

sion for the proposed works, but that they were un-willing to pay for them all at once.

An agent who attended for Sir John Hanmer said

he had no doubt that Sir John would be delighted that these steps were in contemplation, and that he would be quite ready to acquiesce in any measures

would be quite ready to acquiesce in any measures for the improvement of his property.

The Earl of Carlisle thought it might admit of a question how these rates should he raised, if the houses were afterwards pulled down.—Lord Ehrington apprehended that it signified little whether a charge for the improvement of property were made all at once, or spread over a series of years.—Mr. Chadwick believed the same course was pursued with regard to land under the Inclosure Commis-Chadwick believed the same course was pursued with regard to land under the Inclosure Commis-

Mr. Bullar could not agree that this was a parallel case. If Sir John Hanner were called upon to pay at once for these improvements, and he afterwards pulled the bouses down, he would in that case be the only loser; but under the improve-ment rate, if the houses were pulled down and the space thrown into the street, the ratepayers would then have to pay these rates in addition to their ordinary charges. It was under consideration their ordinary charges. It was under consideration the propriety of applying to Parliament for fresh powers on the subject of improvement rates.—Mr. Leslie denied they had any power to charge the owners of land, and thought the proper course would be to summon the owners, and to hear what they intended to do as regarded their property, and to let them do it in their own way. He deprecated their practice of coming to a conclusion first, and then asking the consent of parties afterwards. This court had no power whatever to cleause private court had no power whatever to cleause private court had no power whatever to cleanse private cesspools on any premises without the consent of owners.

Several other commissioners baving expressed their opinions, the motion was put and agreed to, and resolutions were subsequently adopted to enable the owners to do the works themselves, and empowering the officers of the commission to proceed if the

The Drainage of Pheasant-court, Gray's Inn-The Drainage of Pheasant-court, Gray's Inn-lane.—The assistant-surveyor presented a report on the state of the houses in this neighbourhood, which represented them as being extremely filthy and dis-gusting, and crowded to excess with persons of the poorest classes. In one case eighty persons occu-pied one house, several others upwards of seventy and the average number of the whole varied from thirty to thirty-five persons in each house. The re-port stretch that protein/standing this health. thirty to unity, his persons in each house. The re-port stated that, notwithstanding this herding toge-ther of persons, the windows were frequently un-opened for days together, here was little or no drainage, and a tainted and pestiferous atmosphere. Within a few days six fatal eases of cholera had oecurred in the neighbourhood. The report concluded with recommendations that the houses should be lime whited, the cesspools abolished, and a proper drainage and supply of water laid down, the expense of which to be met by an improvement rate on the

Property.

Mr. Chadwick moved the adoption of the report, and believed that the system of charging improvements over a series of years would be found by the parishes to be a cheap course to take upon themparishes to be a cheap course to take upon them-selves for improvements, with but a small amount of risk.—Mr. Leslie again deprecated the principle of the court taking upon themselves charges that ought to he home by the owners of the property; and one result of their hasty proceedings was the suit in Chancery, which would he attended with the most frightful expenditure. He thought the question ought to have been taken up by the Board of Health.—Mr. Chadwick said the Board of Health had no power to prosente for a neglect of the Heatth.—Mr. Chadawick said the Board of Heatin had no power to prosecute for a neglect of their orders, but in every case where cholera had broken out they found a complete violation of their instruc-tions.—It was then resolved—"That the facts as to the deplorable state of Pheasant-court, Gray's Inn-lanc, be forthwith communicated to the local authorities, and that they be requested to carry into effect those of the remedies with which they are chargeable."

chargeable."

Several other detail resolutions on the subject were agreed to. Immediately upon these resolutions being carried, the following letter was handed into the court from Mr. Gotto:—

"My Lords and Gentlemen,—I beg most respectfully to call the attention of the court to the several works which have been ordered as urgent, upon reports in which I have either heen associated with other officers or prepared by myself, viz., Gulston-street, Sydenham, Church-lane, and Pheasant-court, Gray's-Inn-lane, as the court might suppose, these works, after they have been ordered, are immediately commenced. It is in order to be relieved from the responsibility and delay which might be thrown upon me in the event order to be releved from the responsibility and delay while bright be thrown upon me in the event of the outbreak of cholera, which is daily expected in such places, that I take the liberty of informing the court, that for want of bye-law regulations and other instructions, no steps whatever have been or can be taken in cases ordered some time ago; and that the works ordered to-day will be under the

same circumstances."

A conversation ensued upon the difficulty of get-A conversation ensued upon the dimetry of getting together a quorum of the Bye-Laws Committee, the legal members of it being from town on

the circuit, or otherwise actively engaged. The following resolution was finally adopted:—

'That the notices applicable to the works ordered at this court be prepared by the solicitors, and, on approval by the standing counsel, be made use of."

The Bermondsey Mill Streams .- A letter was read from Mr. Rains, addressed to the Earl of Car-lisle, asking for compensation for the destruction of

his property in the stoppage of the above mill-streams, by order of the commissioners.

Mr. Bullar believed counsel were strongly of opinion that the Vice-Chancellor had no power to order an injunction; and even were he to do so, it would be dissolved by the Lord Chancellor, under

would be dissolved by the Lord Chancellor, under the power of the 61st section.

(The 61st section recites "that the commis-sioners may undertake any work of any description without any notice or other proceeding hereinbefore required, where, from flood, storm, or other urgent cause, the commissioners shall deep it necessary. cause, the commissioners shall deem it necessary that the delay occasioned by sucb proceedings should be avoided.")

be avoided.")

Mr. Leslie believed that they were not justified in spending the ratepayers' money for law proceedings, and it was the opinion of barristers that, whether right or wrong, as they had commenced the work without notices, they would have to pay the expenses. In fact, they might consider themselves fortunate if they got out of the "mess" for 1,000?. This was one of the evils that had arisen from business heing done in committee instead of in open ness being done in committee instead of in open

eourt.

Mr. Chadwick denied that any such expense would be incurred in these proceedings. Their surveyor had received general orders to stop up what they believed to be the cause of death. Consideration postponed.

The Cholera.—Dr. Southwood Smith wished to know, as regarded districts where cholera had broken out, what processes for flushing and cleansing were in operation or in contemplation. He regretted that they were not in a better condition to meet the evil by permanent works, as they might have heen. evil by permanent works, as they might have been, had more cordiality existed amongst the members of the court. As they were not, however, ready to bring forward permanent measures, he hoped that temporary relief would be immediately given in those

temporary rener would be immediately given in those districts that were suffering the most.

Mr. Lovick said in Surrey and Kent, forty men were engaged in flushing, in addition to fifty previously employed. Several thousand cubic yards of filth bad been removed during the last week or

two.

Mr. Chadwick said it should be known that only

OSMASTON MANOR-HOUSE, DERBYSHIRE, is a great pile of building, comprising, besides numerous suites of apartments, a wilderness of

numerous suites of apartments, a wilderness of corridors, galleries, arcade, towers, chapel, school, riding school, conservatory, tennis court, bakery, laundries, dairies, kitchens, stables, coachhouses, and all sorts of other appliances, scientific, economical, and convenient. The pile has been already about three years in building, and is not yet completed, although the proprietor, Mr. Wright, and his numerous family, have recently got access to a portion of it. The whole, with some little exception, is freproof, and comprises extensive

ception, is fireproof, and comprises extensive arrangements for heating, smoke conduction,

&c. All the smoke from every quarter of the buildings is collected by flues into a tunnel 600 feet in length, which conducts it under-All the smoke from every quarter of the

ground, through a very extensive range of cellars, to a smoke tower in the kitchen gar-den, 21 feet square and 150 feet high, with an

iron staircase to the top and a circular brick shaft within. Along the same line of cellars is

shaft within. Along the same line of cellars is a railway, 300 feet long, with curves, turntables, &c., and a coal lift, with hydraulic machinery for lifting through four stories in height. Water, heated by five boilers, weighing 15 tons, is conducted all over the premises by four to five miles of pipes. Under the dining-room is a cistern for 30,000 gallons of the company of the collars alone, including wine water. In the cellars alone, including wine

cellars with strong doors, are about a million and a quarter of bricks, and throughout the

buildings are 350 tons weight of cast-iron, in

girders and other heavy castings. At the west corner of the mansion stands the fresh-air tower,

65 feet in height. There are also a flag tower

and a clock tower,—in all, four massive and conspicuous towers imbedded in the mass of

building. The east side of the mansion occu-ples an elevation 333 feet in length. Domestic

processes, such as washing, spit turning, &c.,

In the cellars alone, including wine

one-fourth of the evaporating surface of drainage one-tourth of the evaporating surface of ramage was under the control of the commissioners from sewers, as one-fourth arose from cesspools, and the remaining two-fourths from house drains.

The Earl of Carlisle said there was considerable odour from the drains at the end of the town to which he was called by his duties, and wished to

know if there was any method of trapping them to

meet the evil.

Mr. Chadwick said a plan for this purpose was before the Committee, but the difficulty was, that in trapping the drains, the gases were forced into the houses. In fact the offensive gases had been driven from the mouth of the sewer in the Thames as far back as Islington, at which point the sewers were perfectly clean.—The question was referred to the surveyors. surveyors.

Miscellanea,

THE IRON TRADE. -- In the face of the recent general stultification of the authority of the old quarterly meetings, a renewed attempt is being made, on the old model, to patch it up once more. The Times, for instance, lately so justly sickened with the general want of dependence to be placed on such an authority dependence to be placed on such an authority as a faithful index to the state of the trade at large, is now assured, notwithstanding the general repudiation of that authority by the trade itself, that "the first-rate firms, such as" so and so advertised, "invariably adopt and maintain the prices fixed at quarterly meetings, but the small and needy houses [all in short who dared to question the authority of those who set themselves up as the élite were "small who set themselves up as the élite were "small and needy houses," who] during the quarter, and needy houses," who during the quarter, not unfrequently, as heretofore, make reductions to suit exigencies." This used-up mode of enforcing a tyranny by threats of a stigma, however, is now unavailing. The old quarterly nurse of "high prices" and "great masters" may quote her authority—ad infinitum, but the Gamp game is up. That authority was recently found out to be nowhere, and it is too late now to give it a local habitation and a name. To stigmatice the trade of largeis too late now to give it a local nabilation and a name. To stigmatize the trade at large—which did recently repudiate both the old quarterly and her authority,—as "small and needy." is going rather too far. Even as an advertisement of—so and so—first-rate firms, the attempt is futile. As to late proceedings and present prospects, what says one of the most respectable of the old advocates of high prices, one whose own very works are now prices, one whose own very words are now being used about "small and needy" houses being used about "small and needy" houses alone selling at comparatively low prices?
"During the late quarterly meetings," says this veteran advocate of "great masters," Arris's Birmingham Gazette, "the apprehensions we last noticed of a further decline in prices have unfortunately been realised, and the nominal rates concluded upon at the preliminary deliberations of the iron masters, at Handsworth have hear alterative discrete. Handsworth, have been altogether disregarded —still no accession of activity has ensued," &c. It is high time, then, that the trade at large—with which the quarterly faction of this split camp can no longer be identified since it stigmatizes all but itself as not only "small and needy" but as sellers of "an inferior quality" of iron—were preparing to appoint some new and honester and less impracticable index, since even the very highest upholder of the old quarterly dictum now repudiates its authority altogether.

thority anogener. Errors in Awards.—In an arbitration between a builder at March, as plaintiff, and certain commissioners of the White Fen district in Benwick, the arbitre, an architect at St. Neot's, had inadvertently omitted formally to award a sum of 2571. for extras to the plaintiff, ahout which there was no dispute; but after-wards intimated the inadvertence to the de-fendants, and gave affidavit thereof. The defendants, however, insisted on the strict and literal terms of the award, and argued before Lord Denman, that the decision ought to be sustained, "it being a principle not to disturb awards which on the face of them appear cor-rect." His lordship said, that if a straining in the law as to such decisions was ever justifi-ahle, it was in this case, otherwise a great and ohvious injustice would be done to the plainonvious injustice would be uone to the plain-tiff, and after making some strong remarks on the conduct of the defendants in seeking to take advantage of such an error, his lordship made the rule absolute for setting aside the

are done by machinery, worked by a large water-wheel. At a pond three pumps, also worked by water power, force water up hill into the reservoir from which the honse is supplied. The design of the building, which have been accorded in resorber his. has been executed in sombre blue lime-stone, relieved by gritstone doorways, window jamhs, moulds, and ornaments, is by Mr. J. H Stevens, of Derby, and the main part of the works have been done by workmen employed by Mr. Wright himself. At a substantial entertainment lately given by the latter to the former and their wives, &c., nearly 500 persons assembled, and a splendid Bible and sons assembled, and a splendid blue and Prayer Book were presented in the name of the workmen to their employer, who thanked them in an unpretending speech, replete with kindly feeling. A silver inkstand was at same time presented to the Rev. W. B. Hayne, who had lectured to them every Wednesday during the present of the most. the progress of the works. The village and its church and school are also chiefly of recent construction, the whole being intended, as we are told, to form a sort of model TELEGRAPHIC COMMUNICATION. have occasionally drawn attention to Mr. Whishaw's exertions in the promotion of telegraphic communication, and recently had an opportunity of glancing over a variety of his arrangements in the Music-hall, Store-street, among which were exhibited many details that certainly seemed well adapted to facilitate the end in view. The French Govern-ment Commission appointed to proceed to London and examine the various systems of electric telegraphs here, would do well to visit and examine Mr. Whishaw's modifications and inventions. We may mention that the Metropolitan Central Terminus of the English line of telegraphs is to be put into immediate communication with the General Post-office, by an extension of the wires to St. Martin's Le Grand, and that the first Irish line of telegraph has just been constructed on the Great Southern and Western Railway for a couple of miles from the Kingsbridge terminus.

PATENT DECORATIVE GLASS.—We men-

PATENT DECORATIVE GLASS.—We mentioned when speaking of one of Lord Rosse's soirées, some specimens of this glass. Since then we have bad an opportunity of seeing something more of it. The process employed gives representations of net or other curtains with decorative borders, lace patterns, and bunches of flowers, and the singular cheapness of the glass thus prepared will doubtless ness of the glass thus prepared will doubtless lead to a considerable use of it.

PROJECTED WORKS .- Advertisements have PROJECTED WORKS.—Advertisements have been issued for tenders, by 31st inst., for the erection of a new workhouse for the Truro Union, Cornwall; by 24th, for paving that part of the New-road, west of Tottenham-court-road, in the parish of St. Pancras, with granite cubes; by Aug. 2nd, for the erection of a new heart. church at Blendworth, Hampshire; by 21st inst. church at Blendworth, Hampshire; by 21st inst. for the several works to be performed in erecting witnesses' rooms, &c. at the Grand Jury Chamber, Winchester; by 24th, for the erection of schools at Harlow; hy a date not specified, for alterations at No. 125, Lower Marsh, Lambeth; by 24th, for painting at Chelmsford Workhouse, &c.; by 25th, for a strend of British iron flee and years and supply of British iron, files, and rasps, paint, &c., for the East-India Company; and by 26th, for the re-construction of the drainage and water supply and for alterations, &c., at Cuckfield Workhouse.

AGENCY ON TRANSFER OF ESTATES: DOUBLE DEALING.—An action was recently brought before the Lord Chief Baron, on the home circuit, by Mr. Austin, a house agent in Conduit-street, Hyde-park, against Mr. Spear, a party for whom he had purchased an estate named Craven-hill Lodge, at Bayswater, for his commission of 2½ per cent. on the sale. The plaintiff's claim was resisted on the ground that he had no sooner contracted with the 24 feet. e had no sooner contracted with the defendant than he went to Mr. Lahee, the well-known eminent house-agent, and offered to provide a urchaser for the same property, on condition that he would give him a commission on the part of the owner, for whom Mr. Lahee acted, and that he had accordingly contracted with Mr. Lahee for 251,, the full half of Mr. Lahee's own fee, offered by the seller. The Chief Baron, in summing up the case, characterised the plaintiff's conduct as unjustifiable and dishonourable, and said he had no doubt that he had thus in law done away with the original contract. The jury were of the same opinion, and the plaintiff, therefore, by running with the hare and hunting with the hounds, lost both his case and his character, a verdict being at once returned against him.

ART-UNION OF LONDON,-If there be not ART-UNION OF HONDON.—If there be not 20,000 subscribers to the London Art-Union for this current year we shall be surprised. The council have obtained the completed plates by C. W. Sharp and W. D. Taylor, of Webster's capital pictures, "The Smile" and "The Frown." These will be delivered on payment of the absolute the subscriber of th of the subscription; and those who subscribe earliest will get the best impressions. In addition to these every member will receive a series of etchings from original drawings, illustrating Shakspeare's "Seven Ages," by D. Maclise, R.A., and still have a chance in the general distribution of prizes. When we tell our readers that the pair of plates after Webster alone were originally to have been published in the ordinary way at two guineas the pair, if we are correctly informed, the programme must be considered a tempting one. This arrangement, too, will enable the council to he similarly in advance for future years, and, if we mistake not, will gain for the society, and, consequently, for art and artists, even more extended success than that which it has enjoyed for the last thirteen years.

FALL OF HOUSES.—At Goulston-street, Whitechapel, facing the East London Baths and Washhouses, two of a row of seven or eight lofty houses, all occupied, suddlenly fell into a complete wreck on Sunday forenoon, burying occupants and furniture, the former much injured, though none killed; and the whole of the remainder of the row showing signs of also falling, the tenants were prudently ordered out without even being allowed to save their furniture. The giving way of the walls of a cesspool are supposed to have led to the fall. But sometime back one of the same row came down and destroyed several persons. At Westminster, too, on Thursday week, three houses in Strutton-ground, corner of Artillery-row, fell in with all their furniture, &c., after a loud crackling noise had given the inmates warning to save their lives.

THE SEWERS OF LONDON .- The report on the subterranean survey of the metropolitan sewers, has just been published, and shews that the majority of them are in a very foul and, in many cases, dangerous state.—A Bill to amend the new Sewers' Act has been read a STAINED GLASS FOR CANTERBURY CATHEBRAL.—A lozenge, for a window in Canterbury Cathedral, painted by Mr. J. A. Gibbs,
of the Hampstead-road, was submitted to us a
few days ago. It is intended to be placed
amongst the old glass there, and was painted
to accord with it, including the bad drawing,
the effects of age, and even the appearance of
accumulated dust against the leads! For the
purpose in question, we have nothing to say
against this, and would compliment the artist
on the attainment of a considerable degree of
richness in colour. As a general practice,
however, we should grieve over and condemn,
rather than praise, such imitations. Mr. Gibbs
is about to execute a window for Ely. STAINED GLASS FOR CANTERBURY CA is about to execute a window for Ely.

THE CONVERGING SYSTEM OF DRAINAGE —Mr. Austin has addressed a letter to us (reference to which was accidentally omitted last week), complaining of a misapprehension of his plan, to the extent, that instead of the contents of the "sumps" being distributed from time to time, the discharge would be going on without intermission:—"These sumps," he says, "would, in fact, be no larger than what is before any one man's door in any leading thoroughfare in the metropolis, in the shape of about 20 feet length of first-class sewer; and, as they would be very few and far between (one only being quite sufficient for the whole city of Westminster), covered over and removed from sight, and secured from the escape of bad odour, the amount of their inconvenience may be readily determined. The -Mr. Austin has addressed a letter to us (reescape of bad odour, the amount of their in-convenience may be readily determined. The discharge from these sumps' into the country would not be from 'time to time,' but con-stantly, steadily, always going on without in-termission.' Mr. Austin has published some observations on Mr. Phillips's tunnel scheme, but we must look at the whole matter together hereafter. hcreafter.

hereafter.

Warmley Church and Parsonage.—
At Warmley, in the parish of Siston, near
Bristol, the foundation-stone of a new church
vas laid on the 3rd inst. hy Mrs. F. Dickenson,
of Siston Court. The stone was one from the
neighbourhood, but under it was a fragment
of the 'rock of ages' from Mount Zion. The
pillage of Warmley and its neighbouring disvict will thus be erected into a new parish.
The late rector of Siston and his friends have
subscribed over 800L towards the church,
which, with the parsonage, will cost about
4,000L, upwards of half of which has been
dready assured, to carry out the design. Mr.
B. P. Harrison is the architect.

Yorkshire Architectural Society.—

YORKSHIRE ARCHITECTURAL SOCIETY. Yorkshire Architectural Society.—
The quarterly committee meeting of this sodety was held on the 5th instant at the rooms
a Minster-yard, York; the Hon. and Rev.
Y. Y. Savile, rector of Methley, in the chair.
The following grants were made, namely, 104.
Or restoration of oak roof over nave of Methay Church, and 31. for stem of font at
Aufferton Church. ey Church, and Nafferton Church,

INSTITUTION OF BUILDERS' FOREMEN .-We are glad to hear that since the last anni-rersary dinner, the progress of this useful istitution has been very satisfactory. Pro-essor Cockerell amongst others sent a subeription last week.

No. CCCXXXVIII.

SATURDAY, JULY 28, 1849.

HE space necessarily occupied in every number of our journal by architectural and decorative illustrations, essays on matters connected with our speciality, and information and opinions on the current

opics of the day, -striving, as we do, to give our readers early information of all that occurs itbin our province,-leaves us sometimes in rrear with our notices of published works. his is the case just now; and we find on the able a whole pile of hooks, concerning which ur readers ought to know something. Amongst hem we have from America, where attention to rt is rapidly awakening, " Hints on Public rebitecture," by Robert Dale Owen, *-a uarto volume, profusely illustrated, containng much interesting matter and many just pinions. It is true these are adopted rather nan struck out; moreover, there is a want of rangement which lessens the value of the ork; nevertheless, it cannot fail to have useful effect in America. It proceeds from building committee appointed to select plans nd erect a structure for the Smithsonian Initution, an important educational foundation Pennsylvania. Their first intention was mply to give the public information as to the an and style of architecture selected for the uilding, but hints in regard to public archicture, and information as to the merit and est of different manners, having accumulated iring their inquiry, they determined on putng the whole into a connected form, and they trusted the materials to their chairman, Mr. wen, for that purpose.

The heads of the chapters will give a general otion of the contents of the book, Touching some general conditions of excelnce in architecture," wherein the writer says stly-" It is among the conditions of a true chitecture, that it mould itself to the wants d the domestic habits and the public cusns and the political institutions and the relious sentiment of its country and its age; at it assort with the materials at hand, subtting to modifications as new materials present emselves; and that it avail itself, from time to ne, of the various aids which mathematical d mechanical and chemical science offer, for convenience and advancement." 2, "Conming some conditions of purity in style." "Concerning the two great divisions of nner in architecture,"-that is the "post l lintel architecture, and arch architecture." reats of the "adaptation of post and lintel hitecture to modern purposes," and the hor deduces that Grecian architecture can er become our architecture, -" seeing that rue architecture should serve, not dictate; uld minister to the wants of man, not demand t these wants should be squared and forized and schooled down, till they conform the measure of its arbitrary preconcepıs."

is to plan, he says, in this same chapter,s is strange, that, at this day, it should be essary to repeat, that, in planning any

ice, public or private, we ought to begin Published by Putnam, New York and London. 1849.

from within; that we should first suffer the specific wants and conveniences demanded, to block out its forms, to determine its interior proportions, and decide the connection of its parts,-and then adjust and elaborate its architecture as its appropriate garb; into the skilful fashioning of which there enter, in truth, grace and fair proportions, but yet in such guise, that the garment shall adapt itself to the individual form it is destined to clothe; fitting well, and displaying the peculiarities of that form to the best advantage." 5, is " Of hybrid architecture." 6, "Of arch architecture." In this, acknowledging his preference for Norman and Gothic structures as models, he says,-" But as a servile copy of manners is never happy or pleasing, so is it also in architecture. 'The letter killeth, but the spirit giveth life.' If the mere copying, with unquestioning fidelity, of any models, even the best selected, sufficed to impart excellence, reputation in art might be cheaply earned. But there go, to make a true architect, far other qualifications than these: original conception, that can shake itself free of previous canons; independent thought; creative genius. The works of others must be studied, not to believe and repeat, but to probe and anatomize. There must be sought, not the offspring, but the parent; not the mere superficial details, but the hidden principle that gave birth to them. If the effect, in any old example, be good, and the combination happy, it should be the effort of the student to catch and master the spirit whence these sprang. In his hands, perchance, it may produce effects as good, combinations as happy, but stamped with the individuality of his own genius, shaped by the circumstances of country and age and climate in which be designs, and modified, in each case, by the specific purpose or occasion that may chance to call forth the exercise of his talent." 7, treats "Of anachronisms in architecture," which Mr. Owen terminates, by asserting as a principle,-"That an anachronism in architecture may be either a merit, a whim, or an offence: a merit, when the foreign feature introduced is demanded by utility, harmonises with the spirit of the style upon which it is engrafted, adds a new beauty, or corrects an old defect; a whim, when the innovation is a mere fanciful variety, adding nothing of useful, or graceful, or appropriate, beyond what the original details of the style sufficed to supply; and an offence, when the exotic is transplanted into a soil unsuited to its growth, -when the anachronism produces incongruity, not conventional merely, but natural and inherent. To the genius of the architect it must, in each case, be left, to determine the exact line of demarcation between intemperate license and barren servility." 8, is "Relative to the comparative cost of the arch and post and lintel manners, "and shows, so far as the data given may be depended on, the great advantage of the arch manner. Chapter 9 is appropriated to a description of the "Smithsonian Institution Building," to which we propose to refer separately hereafter.

The design chosen (out of thirteen submitted), is, strange to say, what is called Norman, but is in reality the round-arch style of the Rhine towns, with such additions and variations as the architect, Mr. James Renwick, Jnn., of New York City, thought desirable. It has a frontage of 447 feet, and no less than nine towers of various sizes and heights, the largest being 37 feet square, and the most lofty 145 feet high. The lowest of fourteen tenders was to erect the building in marble, "ashlar finish," 228,500 dollars, or in Seneca freestone "ashlar finish," which was ultimately selected, 205,250 dollars.

Also from America comes "A Treatise on Landscape Gardening," by A. J. Downing, of which a fourth edition, just now published by Messrs. Longman, is before us.* We should be glad to see architects paying some little attention to landscape gardening: both they and proprietors may take our word for the fact that skill in it does not come by intuition. At the present moment we know scarcely any persons who may pretend to be masters in the art. We have met lately one or two spoilers of God's earth, who take their five guineas a-day, and know no more of what they profess than any of the bevy of bumpkins who, under their direction, are at this moment marring charms and obliterating beauties.

Loudon, who did so much for landscape, always recommended those who sought his advice how best to acquire skill in it, to begin by making careful drawings, in some accessible botanic gardens, of all trees and shruhs; then to visit all the villas he could, and make memorandum plans of the general distribution of the grounds and buildings; afterwards to study and sketch natural scenery. During this time the student would of course make himself acquainted with the best published works on the subject; and he need not omit Mr. Downing's book, which prompted this remark. The study of landscape gardening lends additional interest to every country ramble, where we-

"Pluck life's roses in the quiet fields,"

and brings a healthful as well as profitable result. To the flagging spirit of the hard worker in towns, the mere mention of quiet fields induces a refreshing and soothing vision. Happy those who for a time can realize it !

The second part of the "Transactions of the Society of Arts for 1847-8," is an exceedingly nice volume, illustrated by so large a number of lithographs, coloured and plain, that the cost of it must have been very great, -greater, indeed, than the amount of the subscription would justify, if it were not that no "Transactions" have been issued to the members for some time past.

It contains, amongst others, Mr. Whishaw's paper "On the application of heated currents to manufacturing and other purposes;" Mr. Hay's "Suggestions for rendering carved sandstone impervious to the action of the atmosphere" (by the application of bees' wax dissolved in spirits of turpentine, -not a new idea); Mr. Claudet's "Progress of Photography;" Mr. Cundall's paper "On Art as applied to Bookbinding;" Mr. Smith Williams's "Essay on Lithography;" Mr. Hunt's statement of the "Principles upon which the tinted glass used in the palm-house at Kew has been selected;" Mr. Findlay "On lighthouses and beacons;" and Mr. Woodcroft's general view of "Steam navigation."

Nearly all these papers were mentioned by us when brought before the society, so that it will be unnecessary now to refer to them.

As to the glass used in the palm-house, our readers will remember that it has a green tinge, and that the object of this is to obstruct the passage of the scorching rays, without interfering with any others. At the close of the paper the author suggests the use of glasses differently coloured to produce various effects. He con-

[&]quot;A Treatise on the Theory and Practice of Landscape Gardening, with a view to the improvement of Country Residences; with Remarks on Rural Architecture." By A. J. Downing, author of "Designs for Cottage Residences," &c. London: Lougnam and Co. 18jq.

siders that in all cases, germination of seeds may be accelerated by covering them with such blue glass as is used in making many finger glasses; and that the striking of cuttings would be quickened by similar glass shades. When there is a tendency in plants to form too much stalk or leaves, and it is desired to produce more wood, this is done by admitting as much light as possible with the smallest possible quantity of actinic power. To effect this he proposes to interpose glasses of a yellow colour, "which obstruct the passage of the chemical rays, but intercept but little light." And then, when, the vegetable functions being too active, and interfering with the reproductive powers of the plant, leaves are produced in the centre of the flower, he says all his experiments prove that the calorific radiations are the most active during the period when the plant produces flower, fruit, or seed, and " we may secure at will the absence of the luminous rays in considerable quantity, and a diminished quantity of the chemical or actinic radiations, without interfering with the heat-giving principle, by the use of glasses coloured red by the oxide of

"Pray do not let it he said that you are afraid of Mr. Fergusson's pamphlet on the British Museum," kindly exhorts one correspondent, with almost fraternal anxiety for our reputation; while a second says, with less consideration but much the same real animus, "We (that is, he and the world) infer from your silence that you are afraid of repeating Mr. Fergusson's opinions of the British Museum." There are some people on this earth so curiously fashioned and attuned that they are never happy unless they are snarling and biting, and who think that all who do not pursue the same course either want honesty or courage. Strangely enough, minds of this order are usually less patient under criticism themselves than others. A well-known architect once said; "I like THE BUILDER very well,-cannot get over Saturday without seeing it; but it is too good-natured; it does not abuse living architects half enough." A remark, by a correspondent, on one of his own buildings, accidentally appeared in our pages a short time afterwards, and he never forgave the plain speaking he had desired. Enough, however, of this: we are brave enough to look with consideration and kind feeling on the efforts of contemporaries, and are not afraid of doing anything but what is wrong.

Mr. Fergusson's pamphlet—" Observations on the British Museum, National Gallery, and National Record Office, with Suggestions for their Improvement," * is, like other works of the same author, an able expression of the thoughts of an intelligent mind. It has been called a "stunner," and a "slasher," and such like, and so it is. We would, however, with friendly admiration, caution Mr. Fergusson against being petted into the practice of constant fault-finding, and the acquirement of a dogmatic tone which results from such a course, and is contrary to his better feelings.

The British Museum is said to he "as bad and as extravagant a building as could well be designed," (the assertion afterwards made that none of the blame rests on Sir Robert Smirke goes for nothing); of Mr. Barry's new Houses of Parliament, the public are said to he "already tired before they are finished;" and Mr. Blore's new buildings at Buckingham Palace are termed "hideously ugly." Now, this really does not seem to us the right way

of dealing with such men; and this we say, notwithstanding our want of admiration for the Museum, our repeated protest against the reserve which shut out the public from any knowledge of what the building was to be until it was up, and the fact that, before the additions were made to Buckingham Palace, we showed our readers that they would be very unsatisfactory. "Hideously ugly," however, is not the term, and it is against this "stunning" and "slashing" to which Mr. Fergusson will be further led, if what has been elsewhere said of his pamphlet have any influence, that we with kindliest intention dissent.

THE POTTERY AND IRON FLOORS OF PARIS.

Amonger the improvements made in the art of building since the last "Exposition of Industry" in this town, one of the most important appears to be the application of wrought iron for flooring purposes. As this mode of employing a material we possess in such abundance, and at such very low prices, is but little known in England, some notes upon the subject may be useful. It is to be observed, firstly, that the practice of building in Parisbeing rarely to make floors of more than from 20 feet to 30 feet bearing, the notes are to be considered as applicable within those limits, unless otherwise specified.

There are three modes of employing wroughtiron: firstly, with wrought iron frames, filled in with hollow pots bedded with plaster. Secondly, the wrought iron frames are filled in with light rubble, also set with plaster. Thirdly, the main joists are made of wrought-iron, wood trimmers are introduced, and the whole framework is then bound together with the rods.

Firstly. The use of pottery for flooring purposes is far from being of modern invention; instances being met with in the ancient Roman edifices. The round church of Ravenna has walls and a dome of pottery. But the first attempts made to introduce the use of these hollow materials into general practice appears to have heen shortly before the revolution of 1759: about that time the Academy of Sciences of France made an elaborate report npon, and even began some experiments upon the force of resistance of, a system of flooring executed entirely in pots and plaster. Iron was in those days too dear to allow of its use in ordinary cases; these floors were therefore cambered. During the empire, and in the beginning of the restoration, the vaults of the spirit cellars of the Entreph'd des Vins were executed with skew backs of solid brickwork, and the arches were filled in with pottery; they were about 18 feet span. In the corridors of the Chamber of Deputies, arches from 26 feet to 27 feet span, panelled, and springing from pendentives, were executed in the same manner, as were also some of the circular-headed niches of the Madelaine.

In the palaces of Versailles and the Tuilleries pottery floors have been executed, the dimensions of which are about 66 feet in length by 33 feet in width. But for the usual dimensions of from 20 feet to 30 feet the usual course adopted is as follows:—

Framed wrought-iron girders (consisting of a chord bar $1\frac{1}{4} \times \frac{3}{4}$, with a bar of the same scantling curved so as to rise about 8 inches in the centre, maintained in their respective positions by clipping pieces, keys, and wedges) are inserted at distances of about 13 feet from centre to centre. An intermediate bar 2 inches by $\frac{3}{4}$ inch is placed between the girders, and this framework is kept in its vertical position by means of cross ties, which pass over and notch down upon the different beams; the cross ties are of $1\frac{1}{4} \times \frac{3}{4}$. Small square bars are laid upon the top of the cross ties (of $\frac{3}{4}$ inch square iron) and split rods $\frac{3}{4}$ inch square are laid upon these. In fact, a sort of net work is formed, the intervals of which are about 3 feet square, which is subsequently filled with pottery. This is done upon a centre large enough to take one bay at a time.

The pots used for flooring purposes are of two dimensions— $7\frac{7}{8}$ inches high by $4\frac{1}{14}$ inches diameter, and $8\frac{1}{14}$ inches high by $4\frac{1}{18}$ inches diameter. The upper end is beaten into a sort

of octagonal form, but the main body of the pots is cylindrical.

pots is cylindrical. A floor executed with pots $7\frac{\pi}{6}$ inches high carried a weight of about $3\frac{3}{4}$ cwt. to the foot superficial before breaking. Another floor, executed with pots $8\frac{\pi}{16}$ inches high, carried $4\frac{\pi}{2}$ cwt. to the foot superficial.

The French architects have also employed these hollow materials in positions which have allowed them to economise much room, namely, for partitions and party-walls. The police authorities some time since called upon the proprietors of the theatre, then called, of the Palais Royal, to separate it from the adjoining, tenements by a wall impervious to fire. This end was effected by building a wall, 36 feet long by 66 feet high, with hollow pots 8½ inches long, bedded in plaster and rendered on both sides with the same material. Our Building Activould hardly admit of the execution of a party-wall of these dimensions, for with the two coats of plaster it is barely 11 inches thick, yet experiments have shown, that for the purpose of intercepting the progress of fire it is established in the most favourable conditions. So satisfied are the French architects with this mode of employing the hollow material that in many of the most important modern buildings they have repeated its application; as, for instance, in the Palace of the Qual d'Orçay.

Secondly. — The wronght-iron floors are

Secondly. — The wrought-iron floors are sometimes executed with ribs, or bars, $6 \times \frac{3}{3}$, built into the walls every 3 feet 4 inches apart, when the spans are about 18 fect. Upon these, cross ties of $\frac{3}{4}$ square iron are laid, and split rods 3-sths thick complete the net-work; the crossties being spaced ahout 3 feet 4 inches from centre to centre, the split rods about 8 inches apart. The whole of this framing is then filled in solid with light plaster rubble, floated with plaster; care being taken not to carry the works close up against the walls, or the expansion of the plaster would either force them out, or cause the floor to sink.

Floors executed upon this system were first adopted in the year 1845, about the epoch of the great strike of the carpenters of Paris. They are now becoming of general use; but although they resist the transmission of fire; they are exposed to the very serious objections of being very heavy, of loading the walls to an unnecessary extent, and of being very expensive. In England, moreover, the absence or want of good plaster opposes an insurmountable objection to the adoption of this system. Cement might be substituted, but that is still, notwithstanding the great diminution in price, too expensive to admit of its use in such great quantities.

that is still, notwithstanding the great diminution in price, too expensive to admit of its use in such great quantities.

Thirdly.—A M. Rosier, master carpenter, o' Paris, has sent to the Exposition a specimen of a floor, which appears to ohviate the objections to the expense of the first system, and the unnecessary weight of the second. Every 3 feet 4 inches apart he introduces a wrought iron bar, of the shape of an H laid flat, 5 inches deep; the centre weh \(\frac{1}{2} \) inches hape of an H laid flat, 5 inches deep; the centre weh \(\frac{1}{2} \) inches from centre to the walls, and each alternate bar is tied down with vertica rods. Between these bars, at distances of 19: inches from centre to centre, trimmers of woos 5\(\frac{1}{2} \times 1\) \(\frac{2}{3} \) are introduced flush with the unde surfaces of the wrought-iron bars; and at the side of the trimmers a straining bolt \(\frac{1}{2} \)-inch i diameter, is placed to the the whole system together. The laths and floor boards an fastened to the trimmers, which, at the sam time, afford the means of introducing soun boarding and pugging. The wrought-iron bars weigh about 29 lbs. to 31 lbs. per 3 fet 4 inches run, or between 13 and 14 kilo grammers to the metre.

grammes to the metre.

These floors are exceedingly stiff, and whe covered with tiles, as they commonly are here they are, for all practical purposes, fire-proo although certainly not so efficient in the respect as the floors constructed upon the two previously described systems. All the differer modes have the great advantage of requirin but little comparative depth. For instance, if floor constructed upon either of the two lass named, need not be more than 8 inches thick flooring and ceiling included, for a span of 2 feet; for a span of 30 feet, 10 inches would sufficient. A pottery floor of 33 feet speneed not be more than 13 inches deep, wit floor and ceiling.

Paris, GEO. R. BURNELL.

ARCHITECTURAL CRITICISM AND PUBLIC TASTE.†

Tims subject is one of considerable importance, not only to the architectural profession, but also to the public. Good criticism is a means by which the taste of the masses may be greatly improved; by its influence the public are better enabled to judge of architecture than when left to their own resources. ture than when left to their own resources. Sheridan says,—"The number of those who undergo the fatigue of judging for themselves is very few indeed." This is unfortunately too true, and it shows the importance of public criticism, as a method of promulgating a knowledge of art. Negative criticism is worse than useless; it quickly pulls to pieces without advice or reason, instead of suggesting ideas in place of those it endeavours to destroy: the consequence is that the reader thinks no more consequence is that the reader thinks no more

† From a paper read at a meeting of the Architectural Association.

upon the subject. Or, perhaps, the critic is sarcastic, and leaves the victim wincing under the stinging bite of ridicule. A fair specimen of this style is contained in a foot-note of "Chambers's Architecture," it being a criticism on the present Somerset House, written by an engraver of the name of Williams, who signed himself Anthony Pasquin. He says

"This surprising, stupendous, and extraor-dinary heap of stones was called into order by the magic voice of that pineapple of knight-hood, Sir William Chambers, at the command of the great and sapient council of this realm, in 1774. It occupies a space of 500 feet in depth and 800 in width, and altogether is a most astonishing assemblage of contradictory objects. The entrance, or atrium, is so unappropriate that it looks like the narrow mouth of economy, through which we grope our pas-sage to the vast stomach of national ruin."

How easy is it, for a man who is thus in-clined to pile a string of sarcasms together— how easy is it for a man thus to show his vindictive feeling towards another. He goes on

"On the top of the corps de logis, or central part of this heterogeneous association of stones, we see a dirty black lump, which he calls a dome, and which is apparently stolen from that worst of embellishments of that worst of architects, Sir John Vanbrugh. It furnishes me we see a dirty black lump, which he calls a dome, and which is apparently stolen from that worst of embellishments of that worst of architects, Sir John Vanbrugh. It furnishes me with no other idea but an inverted punch-bowl, and, peradventure, might be intended by Sir

William Chambers as a durable symbol of sobriety, to operate on the senses of the clerks to keep them from tippling in the hours of

What a conceited mind this Mr. Williams, alias Anthony Pasquin, must have had to pen such a production, which appears to have been written with an idea that by such spirts of sarcastic with ecould crush at one stroke Somerset House, Sir William Chambers, and Sir John Vanbrugh. This malignant attack was too glaring for its meaning and worth to remain unappreciated by the public any great length of time, and a reply to this flippant criticism was printed in 1823, from the pen of Mr. Papworth, who, in one passage, says:—
"Would it not have been an advantage to public taste, if the critic who assumed this superior knowledge had pointed out the parts so conspicuously beautiful to his learned optics [this was in reference to the admiration professed by Williams of parts which he asserted were copied from Inigo Jones's original dewere copied from Inigo Jones's original de-sign], for we, among the rest, have yet to find them out? Master Pasquin, we have reason for believing, like many other audacious and unprincipled writers, made this assertion at a venture, knowing full well, from the success of venture, knowing full well, from the success of similar experiments founded on falsehood, that public credulity, general indifference for the subject, and the prevailing love of slander, would receive his dictum as authority, and that he should, favoured by these combined circumstances, remain secure from inquiry, and escape with applause."

It has often struck me that architects rather

It has often struck me that architects rather encourage this sort of criticism. We seldom encourage this sort of crucism. We seldom find in mutual criticism that one professional man has any bowels of compassion for another; they are very unwilling to trouble their hearers with the admirable parts of another's design, but, like wasps, leave their sting with out even partially withdrawing it. It is this indif-ference for the subject which fosters all our troubles, and it is owing to the public being generally ignorant of our art that they are un-

able properly to appreciate it.

Since Wren's time, until lately, with but few exceptions, architecture has been a dead letter; men with less brains than wits have forced the bastard styles on to the public gaze, thus giving a vitiated taste, which has had a bad effect upon architecture and architects, for the desire for art in building had gradually lessened, but not so the wants of an increasing lessened, but not so the wants of an increasing population—their dwellings and public edifices increased more rapidly than ever. Within these last forty or fifty years the principal part of London has been built—we may, with truth, say built—for, perhaps, there is not another large city in existence which evines such a want of the architect, with such evidences of the builder.

One of the ressons I take to be the fear

One of the reasons I take to be, the fear architects were held in by the public: from examples which were continually springing up, it was easily discernable what a thorough want of taste and science there was amongst the profession at that time.

Another abuse of architectural criticism has arisen from the great influx of antiquaries and archæologists, who arrogate to themselves a knowledge of architectural art far beyond that which a professional man could know; not that I mean to deny that they really did know more than an ordinary practitioner, or that this knowledge may have been useful; but I am afraid in many cases it was, on the contrary, of most deteriorating effect, tying down art to certain ancient examples, which, unless reproduced with the same spirit,—nay, I may almost say with the same mind,—will look as absurd as the antics of an ape when compared with the actions of a man. Bartholomew very aptly says, "nothing stopped our predecessors in the course of beauty and usefulness. But as over-tight lacing causes the strattened body to pro-trude sometimes in a manner which few think graceful or even decent, so now straitened architectural criticism leads to a similar result, and induces corruption in building of the very worst kind."

I would ask such critics whether they think
