

THE J. PAUL GETTY MUSEUM LIBRARY

AN

ILLUSTRATED WEEKLY MAGAZINE,

FOR THE

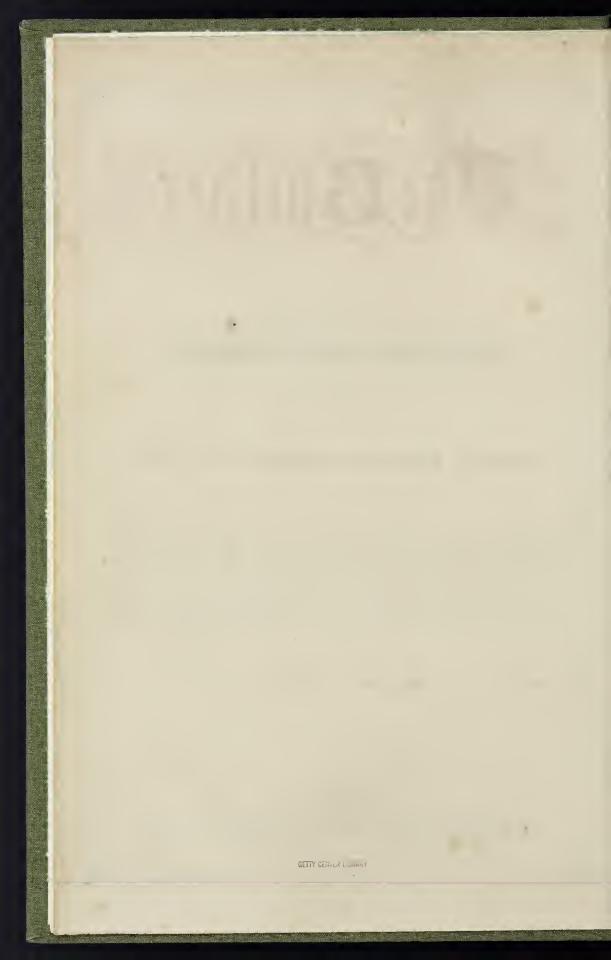

ARCHITECT, ENGINEER, OPERATIVE, AND ARTIST.

- "Every man's proper mansion-house, and home, being the theater of his hospitality, the seate of selfe-fruition, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kinde of private princedome, may, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned."
- "Our English word To Builo is the Anglo-Saxon Bylban, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."——Diversions of Publey.
- "Art shows us man as he can by no other means be made known. Art gives us 'nobler loves and nobler cares,'—furnishing objects by the contemplation of which we are taught and exalted,—and so are ultimately led to seek beauty in its highest form, which is GOODNESS."

VOLUME FOR 1849.

LONDON:

PUBLISHING OFFICE, 2, YORK STREET, COVENT GARDEN.

INDEX TO VOLUME VII.

** Under such general heads as those of "Archaeological," "Architectural," "Buildings Act," "Church," "Competition," "Drainage," "Hospital," "Railway," "Review," "Sewers," &c. &c., are sub-indices, to which collateral reference must more particularly be made, whether for proper names, as of individuals, associations, towns, &c., or otherwise.

VOLUME FOR 1849.

SATURDAY, JAN. 6.

BEGINNING THE YEAR.

E ended our last volume with thanks for favours received, and with a claim on the confidence and kind consideration of our readers. We begin the

new one with promises of continued endeavours to improve the character of our journal in all its departments, and so to merit increased support on the part of the public.

Our field is a large one, and, well tilled, cannot fail to yield abundant good. We have pressed into the service fresh lahourers, shall avail ourselves of all new discoveries and appliances, and, lahouring earnestly and continuously ourselves, shall look with confidence to the time of harvest.

The present would seem to be a turning point in the progress of art amongst us. The cry of "forward," uttered at first hy timid voices and with the fear of powerful opponents before their eyes, is now heard loudly in more quarters than one, and hegins to have echoes. We have been stationary too long, if not going backwards, say they; our arts are a disgrace to us, and the apathy and ignorance in respect of them, which exist even in the upper classes, deplorable and degrading. See what our forefathers did in architecture: look at the beautiful parish churches and noble cathedrals thickly spread over the country. And shall we, far, far advanced before them as we are in knowledge, and in science which is systematized knowledge, with powers and means within our control of which they never dreamt, pronounce ourselves inferior to them, insist on imitation, and forbid even the attempt to advance? Is art never again to have vitabty, and shall we not ourselves strike one blow for progress?

To aid this movement will be our province and our pleasure. Precedent should he an aid, not a trammel,—our servant, not our gaoler; nor shall we relax in our efforts to obtain improved and extended education in art, and to obtain for art that hetter appreciation which, as a mighty teacher, it would have were it so understood.

The improvement of dwellings; sanitary arrangements; construction; decoration; the literature of art and science; architectural jurisprudence; will receive constant attention; nor shall we cease to afford our readers the earliest intelligence on all matters likely to interest them, looking, as heretofore, into all parts of the United Kingdom for information and instruction. Our country friends may make this part of our work very complete by hiref communications from their separate localities.

We have in preparation illustrations of various huildings now in progress, and shall he glad to have our attention directed to others. THE NORTH PORCH OF THE REDCLIFFE CHURCH, AND "NIL DESPERANDUM."

EVERY one has heard of the "Red cliffe" Church at Bristol, St. Mary's; and most of our readers, probably, have seen it. Piety, science, art, literature, and mystery, have jointly and severally put their mark upon this heautiful structure, and made it an object of interest to so many classes of minds, that there are few buildings in this country which have a fame so world-wide.

Founded by one Bristol merchant, completed by another, and re-edified by a third, the Christian (even if careless of material heauty) may view it, beside its holy purpose, as a noble monument of the stint-less devotion of men in those times,—of men who thought not of the "nicely calculated less or more," and considered no expenditure short of the extreme of their power, no personal efforts and sacrifice, sufficient offering in the cause of the Great Good;—a spirit, let us say in passing, not extinct in our days, and often guided by higher considerations, perhaps, than actuated some at the period of which we are speaking.

The antiquary, the architect, the man of taste, find in it an exhibition of skill and inventive power of the highest character, producing, as a result, extraordinary beauty: it is to them also an invaluable autograph—the autograph of a past time, speaking loudly, and not uninstructively, to the present. Further, there are models for the draughtsman, an involved history to engage the attention of the archæologist, and a peculiarity in the joining together of the work of different periods at the west end, which increases the difficulty of the disentanglement.

Then, for the poet, the student of our literature, the investigator of mind in all its strange and startling phases, the hiographer, the philanthropist, the lover of romance, its connection with the wondrous boy who perished in his pride—the unbappy Chatterton, who, wanting so little, lost so much, an imperishable and pure renown—has made it a shrine demanding a pilgrimage.

Circumstances have thus concurred to increase the interest, as we have already said, attaching to Redcliffe Church, and it would seem that the list is to he lengthened. A mystery in our prosaic days,—in days when everything can be explained to meanest capacities, whether it he the cause of an earthquake, the ruin of a nation, or the advent of had weather, is a rarity: yet, lo! another mystery arises to throw its attractive mist around St. Mary's: a mist which, hy exciting attention and awakening curiosity, makes ohvious while it shrouds.

We need not now tell our readers of the miserable and much to be deplored condition of the fabric in question, for we have done so before; or that a certain amount of restoration has been effected at the east end; that there is an energetic restoration committee, the chairman of which, Mr. Proctor, has devoted himself hand and mind to the object in view; or that a "Canynge Society" has been established to aid in the good work, with the present (and three times before) mayor of Bristol, Mr. John Kerle Haherfield, at its head.

On the 22nd of June Mr. Proctor received a letter, signed "Nil Desperandum," following out a suggestion which had been made that the restoration of the church might he effected by inducing individuals to undertake distinct portions, and inquiring if the committee would ohtain drawings from their architect for the restoration of the north porch, and estimates from three respectable contractors in Bristol, for the execution of the work, to enable the writer to judge whether or not it would be in his power to provide sufficient funds to carry it out. The letter pointed out the mode of correspondence to be adopted, made secrecy an express condition of his contribution, stipulated that no effort should he made to discover him (his letters were to be seen by none but the chairman), and cuclosed 201. as an evidence of his sincerity. The committee of course gladly fell into his views, and the required tenders were obtained. The amount of the lowest was 2,500%,-a large sum when the size of the structure is considered, -indeed, larger than it should have been, resulting probably from the difficulty of estimating rightly the cost of the carving: and when 'Nil Desperandum' was informed of it, he at once replied, that it so far exceeded his anticipation that he could not engage to proceed under it. He offered, however, to furnish a certain sum of money, and to make a further contribution in the course of a year, and more afterwards, if the committee would undertake to expend it in the shape of Caen stone and labour, under the direction of their architect

Almost at the same time the committee found another coadjutor, where perhaps they would scarcely have looked for it. Mr. Richard Rowe, a liheral dissenter, addressed a letter to the chairman, offering,-as an evidence of his helief that the recent changes by which Bristol is made a free port will tend to restore the trade of the city, and at the same time to shew his appreciation of the zeal of the Redcliffe committee, and of the voluntary principle adopted,-to bring, in a vessel helonging to him, 100 tons of stone from Caen freight free! Without going further into details, suffice it to say that the money came, a cargo of stone was hought in Caen, and was freighted by Mr. Rowe; an able foreman, with others, well used to Gothic work, was engaged, and, quietly under cover, they are now proceeding vigorously, carving corhels and canopies, and storing them up ready for spring weather, when they will hegin to set.

Annexed we give an engraving of the porch* restored, as seen from the north-east, and

* See page 7.

showing a portion of the nave on one side and of the tower above. The body of the church, some of our readers will remember, is in the Perpendicular style throughout, with some of the details, especially in the transepts, little removed from the decorated. The porch in question is pure decorated, and this is most curiously connected with the church by an inner porch of beautiful Early English character.

To affix precise dates to the parts is not easy, nor have we here set ourselves that task. We shall content ourselves with saying, that though MSS, state that "a church was built [commenced to our Lady of Redcliffe, by Sir Simon de Burton, in the year 1292," it is certain that a church was here previously. The inner porch is usually considered a remaining part of Burton's work, but might very well belong to a somewhat earlier period. Part of the tower is also ascribed to him. William Canynge, the elder, according to the received accounts, completed Burton's church by 1376,

In 1442 or 1445, the spire was struck by lightning,* and, in falling, greatly ruined the body of the church so as to render re-edification necessary. This was done by William Canynge, the younger, to such an extent as to acquire for him the title of its founder.

Neither the builder of the north porch nor its exact date appears to be known. We should be disposed to attribute it to De Burton, who was Mayor as late as 1305, rather than to the elder Canynge, especially if, as seems likely, the body of the church was built by the latter much as we now see it, the re-edification by the younger Canynge being strictly a restoration. The upper part of the porch may have been injured when the spire fell.

The beauties of this work, the surprising variety of surface where "light and shade repose," which it presents, and the vigour and feeling exhibited in the carving, can be but feebly conveyed by any drawing. In shape the porch is a hexagon, 25 feet in diameter outside the walls, but being attached, only four of the sides and part of the fifth (next the tower) are exposed below: above, however, where it clears the inner porch, the whole of the hexagon is seen. † At each angle is a hexagonal buttress, of which four sides are seen, terminating above in one of square form, set angularly, on which was originally a large crocketed pinnacle, with four smaller pinnacles at the foot of it, as shewn in the view. Towards the south on the east side is a stairs' turret. This adjoins the inner porch, but belongs to the composition of the outer porch. A series of admirably designed canopies fill the lower part of a window in each face of the structure, and there are similar niches in the faces of the buttresses in continuation of this series, as well as in the lower story When these were filled with of them. sculptured figures (" cum ymaginibus regum operatis subtiliter in opere de frestone," as William Wyrcestre says), if these displayed the same skill as the figures in the corbels which supported them do, the effect must have heen extremely striking. The whole is now a black decaying mass, but sufficient remains of the latter to prove their great merits.

The sculpture around the north (or principal) doorway, is unique in design, rich, and beauti-

ful, but we want space for description. In the side next the turret there is a second doorway, very elegantly adorned with sculpture, and, strange to say, in the parallel face to this, or that immediately to the west of the principal entrance, there was a precisely similar doorway, now blocked up, but having the enrichments remaining.

Within there are several curious points which would well repay discussion, but we must content ourselves at this moment with alluding to the singular luxuriance of fancy which the carving displays. Every boss in the groined vaulting,* every patera, every corbel, is different,-some of them of very remarkable design. The whole appears to have been elaborately painted and gilt, though now totally obscured, carrying whitewash a quarter of an inch thick.

Dallaway, in his curious work "William Wyrcestre Redivivus," says,-" To propose that this portico should be restored to its pristine beauty, would be to indulge in a dream; because, although I am confident that ingenious masons might be found, competent to the undertaking, the funds of the trustees of the church do not equal the resources of Parliament. Besides, in a few years, the mischief would renew; and it would be as easy a task to remove Vesuvius, and to set it in the sea, as these pyramids [the neighbouring glass-houses], which, not like other volcanoshave a certain cessation, but continue to throw out volumes of dense smoke, both by day and night."

The dream, however, seems now more than likely to become a reality. The reason which the worthy gentleman gave for not attempting the restoration, reminds us of Billy Black, in the farce, who couldn't see the good of washing his face, since it would be dirty again to-morrow.

The circumstances attending the restoration of this part of the church have naturally excited much interest in the neighbourhood. On one day, Nov. 25, four of the Bristol papers, Felix Farley's Journal, the Mercury, the Mirror, and the Times, contained able leading articles on the subject; and, since then, some very cleverly written "conjectures" have appeared in the last-named paper, shadowing out individual inhabitants of the city as the probable benefactor. For our own part, we make no attempt to solve the mystery-

" A worthy act declares a worthy wight;" and we trust that the good example which he has set may be followed by others, to the extent of their ability.+

The motto of all now concerned in the church-and we commend it to other restoration - committees engaged throughout the country-is, with strong faith in it-

Bil Besperandum.

GEORGE GODWIN.

TRAVELLING NOTES IN ITALY. BY AN ARCHITECT. POMPEII.

THE position of the city is superb,—unsurpassed by any in Italy,—worthy even of Greece. On one side Vesuvius, sweeping up out of the rich plain, with its long heaving wave-like outline, and sending forth its cloud of smoke by day and vomiting out flame at night; to the south the delicious Bay of Naples, with its headlands and islands; and to the east the remoter Apennines. Looking from the PORUM, the files of Doric columns, broken, yet still erect, fall into magnificent combinations with the distant mountains mellowed into the softest aerial purple. All that the lowed into the softest aerial purple. All that the picture requires is vastness in the architectural precure requires is sushess in the architectural foreground. How superior this to any scene amid the ruins of imperial Rome! There the columns are few and scattered, blackened, half-buried, or built up, and never viewed in combination with a fine mountain distance. Before the great eruption which destroyed the city, the sea is thought to have washed the walls, though now some miles distant.

I had been so impressed at a former visit with

I had been so impressed at a former visit with the diminutiveness of every thing at Pompeii, that I was now surprised to find objects so large. The streets, if they fall short of our ideas of ancient magnificence, are as wide as most of those of modern Rome; usually straight and intersecting at right angles. They are paved with the massive polygonal blocks of basalt, commonly found on such fragments of the old Roman ways as still exist in Italy. The traces of cart and chariot wheels are very distinct, and sometimes worn exist in Italy. The traces of cart and chanot wheels are very distinct, and sometimes worn deep into the stone. Unlike the streets of modern Italy, these are furnished with a raised footway, and in the secondary streets, blocks, placed two or three in a row, enabled condentiate to the secondary streets. pedestrians to pass more conveniently from one footway to another; an arrangement more important, when, after heavy rains, the narrow roadway became a mere torrent of water.* Occasionally you may see a perforation in the curb-stone, supposed to be intended for securing a horse while the rider might be within the adjacent house. Some of the footways are paved with a kind of concreted mosaic, like that now known in Italy as the "Opera Veneziana." At one house, opposite the en-trance, the word "HAVE" (for "AVE"), inscribed in large letters on the pavement, welcomed the approaching visiter to the

The profuse display of mosaic, frescoes, arabesques, and ornamental bronze utensils, all found within the third part of a provincial town, is very remarkable, and gives a idea of the wealth and luxury, and devotion to art that once existed in these cities of the Campagna. How different would be the recampagna. How different would be the result were a modern town, even in this land of art and artists, to be hereafter disinterred! The entire towns of Portici and Castellamare, should they be buried under some future ruption of the still smoking crater, would not furnish forth so many objects of artistic curiosity as one of the secondary streets of Pompaii.

We are also struck, on examining the larger houses, with the fondness for gardens, fountains, flowers, and the life "al fresco" which distinguished the epicurean inhabitants of these doomed cities; a taste which Greek colonists probably brought with them from the East, and which is proved by the paintings still existing in the ancient tombs of Egypt to have been equally prevalent among the Egyptians.† A patrician's mansion, instead of the long suite of saloons which you find in a modern Italian palazzo, presented a series of colonnaded courts, uncovered Italia, and little architectural gardens, all opening upon, or

traverses the central part of the way for the same purpose.

4 "The ancient plans of gardens show that the Egyptians were not less fond than our ancestors of mathematical figures, straight walks, architectural decorations, and registration and safely suggested by inclosures within inclosures. It has hen remarked that in some old English places there were almost as many walled compartments within inclosures. This principle of sections, and an accessive love of uniform arrangement, are remarkably in displayed in the plan of a large square garden, which is a engraved in Rosellini's work. Here

MOSAICS FROM POMPEII.

visible from each other. Such was the "house of Sallust," in its original state (for it seems to have undergone successive alterations by its to have undergone successive alterations by its owner); as you stood in the central court you had a small garden before you, and another on each side. Some examples occur of a stone channel for flowers round the lip of a reservoir or tank; an idea which might be happily introduced into modern gardening. In one garden there were four parterres round a central fountain, each presenting a received a central fountain, each presenting a regular pattern, formed by similar channels made with tiles. The fountains were often attached to the wall, and incrusted with rustic work, or coloured mosaic, or with shells, the several architectural members being marked by the use of different shells. Fountains consisting use of different shells. of a simple stone water-spout were also common in the streets.

The general arrangement of the houses reminds the eastern traveller of the dwellings of Damascus, and of the mosques of Cairo, an arrangement which was introduced with their Damascus, and of the mosques of Cairo, an arrangement which was introduced with their architecture by the Moors into Spain. Instead of rooms lighted by windows, the Pompcian house consisted of large recesses, or alcores, (the very word has been borrowed from the Saracens), open to the central cont;—one always opposite the entrance, and others on each side, the fountain sparkling in the sunshine, being in the centre, and the deep cerulean sky forming the roof. Such a mansion in such a delicious climate, would be equally well adapted to the dreamy inactivity—the dolee fur niente life of the Asiatic, and to the gay conviviality of the more mercurial Greek.

The shops are small, and open towards the street. A counter extends along the front, leaving a narrow entrance. Those for the sale of oil are recognised by the immense oil jars imbedded in the solid counter. The sills of the shop fronts are of stone, and the groove for the shutters is still seen. Doors turned on bronze pivots, inserted in the pavement and the doorhead. The lintels of openings were of wood: the original ones having been burnt into charcoal during the catastrophe, they have been replaced by the excavators with new.

The fronts of the principal houses are of stone, but brick and stucco were the ordinary materials employed in the city. Stone columns were even occasionally stuccoed. The lower third of the column was painted red or yellow, those in one atrium or court being dissimilar to those in another. Painted capitals are rare. There is one instance of a mode of construction like our brick-nogging. F. ingeniously conjectured that this was adopted in repairing the dewron caused by the earthquake which materials employed in the city. Stone columns

conjectured that this was adopted in repairing the damage caused by the earthquake which preceded the fatal eruption, in order to avert future injury from such a cause. The mode of constructing the semi-hypæthral roof of the atrium is shown in the paintings on the walls. There was a large central opening in the roof over the square basin or impluvium in the middle of the pavement. The margin or curb of this opening was formed by the main timbers crossing each other at right angles, and these crossing each other at right angles, and these crossing each other at right angles, and these supported the ends of the joists which carried the roof.

In the suburban house of Diomed we have, perhaps, an example of the ordinary Pompeian villa. Here a large garden court is inclosed villa. Here a large garden court is inclosed by a corridor of piers and square interspaces. Painted chambers, or rather recesses, open upon one side of this court. These are the apartments which Bulwer, in his "Last Days of Pompeii," gives to the wealthy Diomed's daughter Julia. This house had three stories. Under the corridor runs a suite of cellars, lighted by loops from above. Here, resting against the wall, still stand the amphore as the owner left them. The fact that these amphore were filled with ashes may give some idea of the insinuating, irresistible nature of the showers of volcanic matter which entombed the showers of volcanic matter which entombed the snowers of voicanic matter which entonnees this devoted city. In the courtyard above were found two or three of the few skeletons that have come to light during the excavation. A key was found near one of them, but it had no wards, and may have been mercly an emblem of office.

The BATHS, though diminutive in compariness, far more interesting to the antiquary than

those rained piles. If the Houses of Pompei those ruined piles. If the Houses of Pompei remind us of those of Oriental cities, so do the BATHS recall the elaborate system of bathing which has prevailed in the east from time immemorial. In both we find the same gradation of temperature as you proceed from the frigidarium to the inner chamber, containing the hot bath. This system, if originally invented in Italy, was probably first transplanted into Evynta after its conquest by the Remander into Egypt after its conquest by the Romans, and there it must have come into universal use, since we hear that when the Saracens, under Amrou, took Alexandria, there were no fewer than 4,000 baths there. In one chamber, stands, a breath heart of ber stands a bronze brazier for charcoal, as large as a bedstead.

large as a bedstead.

The mode of heating the Caldarium is obvious on a glance at the construction, and is very well contrived. The walls and pavement are lined with tiles, leaving a narrow interval or flue all round the chamber, through which permeated the hot air or vapour from the hypocaust. Saloons were sometimes warmed in the same manner.

The plan of the Temple of Isis was borrowed with her worship from Ecvot. Instead

The pian of the Temple of Isis was borrowed with her worship from Egypt. Instead of standing out to public gaze on the Forum, the temple and its bald priests were shut up within a small court, where they enjoyed all that seclusion and privacy so necessary in celebrating the obscene orgies of the Isiac

The designs and patterns of the painted The designs and patterns of the painted walls and tesselated pavements are very varied and admirable. Black and white tesselation is common. One curious mosaic, in colour, represents Theseus slaying the Minotaur,—and this occupies the centre of a labyrinth of lines very much like a plan of the Labyrinth at Hampton Court, which was, no doubt, borrowed from Haly. In footways, a cheap kind of mosaic was much in vogue, consisting of a kind of "Opera Veneziana," with a simple pattern traced out by means of small diamonds of white inserted in the ground.*

Outside the city gate were the tombs bordering the highway, as at Rome. One of the

* Sketches of a few of these are annexed.

largest consisted of a circular mass with attached columns, raised upon a square basement. One tomb still retains its marble dwarf door, secured by irons. Near the gate are circular alcoves with stone benches, where pedestrians and loungers might repose and exchange the gossip of the day. The city walls, though low, are very massive, slightly receding inwards externally as they ascend, by means of offsets. Within the portal are arched lateral recesses.

I visited a honse then in progress of excavation, and observed, in section, the several layers of ashes as they had fallen in succession. The paintings on the lower part of the wall had been concealed, but not injured, by a bed of small white ashes, but above this, a layer of black ash, which had probably fallen hot, had changed the deep vermillion into a dull Indian red. Here you might better conceive the brilliant effect of the Pompeian mode of decorating walls when in its pristine beauty. The designs and patterns were rich and uncommon; the colours, which were still fresh and vivid, had been laid on with a free and vigorous pencil. The house had probably been decorated by an artist of repute, for the owner appears to have cut away some of the paintings from the walls after the destruction of the city. "Is it not rather surprising that rooms so

"Is it not rather surprising that rooms so mean in their dimensions should have contained works of such elegance?—that friezes scarcely a foot high should embrace such a world of fancy? Every extravagance that Vituvins condemns in the grotesque enters berc. The human and the brute forms are blended fantastically; the decorations remind us of the ancient elephants dancing on the tight rope; the landscapes are but the caperings of a sportive genius, and the architecture runs as mad as the Chinese."—Forsyth.

Nearly all the utensils in use at Pompeii appear to have been of bronze, as they were in ancient Egypt. A large collection of them, found in course of excavation, are now in the Museum at Naples. One of the most curious objects there is a little portable cooking apparatus, beautifully wrought in bronze, having its grate surrounded by a boiler after the most approved modern mode,—the whole scarcely larger than a folio volume. This elegant toy may perhaps once have formed the ornament of some rich lady's boudoir.

Pompeii was buried under falling ashes; Herculaneum, being nearer the crater, was submerged by a flood of running lava, which, of course, when cool, hardened into solid rock. Hence, to disinter the former, you have merely to remove the superincumbent ashes; while, to reach the ruins of Herculaneum, you must mine through the lava rock. As the excavations at Pompeii could thus be carried on with far greater facility and less cost than those at Herculaneum, the latter was soon abandoned, and the staff of Government explorers confined their operations to Pompeii. You descend into the theatre of Herculaneum by a shaft, and as you pass round its silent shadowy galleries, lighted by your torch, with the lava rock above, below, and around, you can better realise the awful catastrophe which entombed the city. In other respects, Herculaneum offers little of fresh interest to one who has already examined Pompeii.

ACCIDENT IN A CHURCH FROM STEAM PIPES.—At St. Ann's Church, Manchesster, on Sunday morning last, about 35 minutes after 10 o'clock, and soon after the commencement of Divine service, an accident of an alarming character occurred. The sacred edifice is heated by means of pipes containing hot water, and one of these, from some cause, hurst with a report so loud and startling that many people rushed from their seats much alarmed. The report was followed of course by the emission of a great quantity of steam, and two Sunday school boys, sitting near to the pipe, were scalded about the face. The remedy for these explosions is one of those points on which scientific men have not made up their minds, and "when doctors disagree, who shall decide?" It is to be hoped, however, that in public buildings, where this mode of warming is adopted, while the danger exists care will be taken not to let the apparatus get out of order. — Manchester Examiner and Times.

ON MONUMENTAL ARCHITECTURE.*

The sentence to which the fables of mythology have doomed the unburied in this world, to wander restless on the Stygian banks for a century, ere the ruthless Charon would ferry them across the flood to their future abodes in the regions of Elysium, is but the poetical realization of feelings which are natural to mankind in every stage of society.

markind in every stage of society.

A reverence for the dead, and an affection for their memory, have ever caused the rites of sepulture to be held as a sacred duty, and intuitively suggest some means to mark the place of burial, in order to preserve it from unwitting sacrilege, to rescue from oblivion, and to cherish in the minds of surviving friends the memory of the deceased.

irrents the memory of the deceased. A pillar of stone, afterwards rudely carved, or a raised mound of earth, sufficed for these purposes, and as the most simple and natural means, have been the types for sepulchral structures in all early stages of civilization. We find their remains even now abounding in most countries, having outlived many a more ambitious monument of later times.

Corvel, and almost as extensive, was the

ambitious monument of later times.

Coeval, and almost as extensive, was the custom of depositing with the dead their arms, ornaments, or utensils, on the supposition that they would require them in their future state of existence, and it has been continued down almost to modern times, long after the idea which gave it birth had completely vanished.

The striking resemblance, however, that the relics of the northern Celtic nations of Europe bear to those found on the borders of the Mediterranean, hardly discovering the difference that might be expected from their distinct national peculiarities, may perhaps be traced to some such means of communication as the commerce of the roving Syrian or Phoenician traders might afford. True it is that in the more opulent south, at times, these monuments attained an importance from their size, that the ruder cairns and barrows of the north never reached. Herodotus, for instance, mentions one raised to the memory of Alyattes, king of Lydia, which was three-quarters of a mile in circumference; and they were often surmounted by a pillar, or planted with trees, to increase their effect.

As yet art lent not its aid to add to the impressions which men sought to convey by size alone, and they vainly strove to rival in magnitude the lofty mountains that surrounded them. But when civilization advanced, and architecture, uniting character to utility, with its sister arts, painting and sculpture, afforded a medium for the expression of thought, and disclosed its capability of creation, other means of impression then opened to their view—proportion and symmetry were found to possess elements of grandeur and beauty beyond what mere vastness could produce; and in monumental architecture, deeply rooted as was its origin in the universal feelings and affections of man, this new language, as it were, soon discovered its influence, and was preserved, by the very solemnity of its purpose, from all affectation and meretricious display. Perhaps more than in any other branch of art, it reveals, simply and carnestly, the thoughts, actions, manners, national characteristics, the religion, supersticions, and mythologies of the people, with their progress in refinement and art, their costumes, implements, and weapons, link after link in the chain of the universal history of man, which else had perished with the lost records, or been mingled in hopeless confusion among the contradictory traditions of successive expressions.

cessive generations.

The Egyptians, who made the first advances in this march of civilization, bave left many wondrous examples of their monumental architecture, impressed with the solemn and mysterious character of the superstitions under which their priesteraft ruled them, and characterised by the extreme solicitude with which every access to them was concealed; while, nevertheless, the utmost magnificence was lavished on the interiors, although intended not for mortal inspection. In the valley of Bibau El Molook, each king, from the commencement of his reign, carved for himself his royal sepulchre,—whose rude portal once

passed, gallery after gallery led to chambers now stretching onwards in the rock, now branching out on either side; the whole adorned with paintings and hieroglyphics; the roof sustained by colossal pillars; till at last he golden hall, with its vaulted ceiling, displayed the costly sarcophagus, in which lay enshrined the monarch, with his exploits emblazoned on the walls around him.

Asia-Minor, in many places, as at Myra and Petra, presents numerous instances of a similar class of sepulchre, excavated in the precipitous sides of the bold hills, but differing in that the decoration was reserved for the exterior,—the substance of the stone being carved into architectural façades, with attached orders, porticeose, pediments, sculptured groups, and inscriptions, or with square mullions and panelled fronts, presenting the Greek type of a wooden construction. At times, a huge block, that may have rolled into the valleys, has been fashioned into shape for the same purpose. These monuments have a peculiar and striking effect, harmonising well with the scenery around. Similar façades, but with the orders of their own fanciful architecture, are to be found among the Hindoos.

The most general modes of burial among the ancients being those of embalming the body and depositing it in a sarcophagus, or burning it and collecting the ashes in cinerary urns,—where no rocks afforded the opportunity for excavation, tombs were constructed of sufficient size to contain a chamber in which ceremonies might be performed, and which were often ornamented with mosaics or paintings, and the front of the sarcophagus usually displayed some bas-relief or inscription. An idea of the magnificence of some of these structures may be gathered from the description of the tomb of Mausolus, by Pliny:—It was 411 feet in circumference; 140 feet in height; surrounded by thirty columns, above which rose a pyramid with a marble chariot on the summit. The sculptures, brought to England from Bodroum, are supposed to have belonged to it.

At Palmyra there are some peculiar sepulchral towers, of considerable height, divided into stages with bas-reliefs in semicircular recesses, representing the parents reclining, with their children standing around them. These, rising above the desert, have an im-

posing appearance.

In Greece and Italy the tombs were usually ranged along the sides of the streets approach the cities (within which burial was not permitted); thus affording a ready access to the mourning trains which annually repaired to hold a feast to the memory of the dead, in the enclosure which, for this purpose, sur-rounded each monument, and also impressing the stranger with due reverence for their de-parted great men. The Via Appia, in its course through the solitude of the vast campagna, displays on either side the ruins of those monuments that once graced its approach to the imperial city, which now, pic-turesquely covered with rank herbage and festoons of luxuriant creepers, and spoiled of their treasures to earlich the museums and galleries of Europe, still attest to what mag-nificence they attained in those days, when the wealth of conquered provinces swelled the luxury of Rome. Some were the sepulchres of a family, with all its retainers and slaves; and the spacious chamber requisite for such a purpose, with the small niches for each cinerary urn, obtained them the name of Columbaria.
The mausoleum of Hadrian, shorn of its columns and statues and converted into a columns and statues and converted into a fortress, having withstood the effects of violence and siege for ages, still stands like a watch-tower guarding over the city. The tanering pyramid of Caius Cestius, once covered with marble, gleamed brightly in the sunlight, and now, at its feet, nestles the more humble Protestant cemetery. The tomb of Cecilia Metella is also an imposing and beautiful monument: its sarcophagus, an exquisite work, is in the court of the Farnese palace. In general, the objects contained within the Iu general, the objects contained within the tombs merit attention. The sepulchral Cippi urns, inscriptions as well as the sarcophagi, display works of sculpture, sometimes of great hispay worse of sempeure, sometimes of great methology, historical events and traditions, the exploits and battles of the deceased, busts, bas-reliefs, portraits, &c. The sarcoplagus

^{*} Read before the Architectural Association, by Mr. Seddons.

taken from Scipio's tomb—a chaste and exquisite adaptation of the Doric order—adorns the gallery of the Vatican.

But these monuments, beautiful though they be, and expressive of their purpose, and from which many a lesson of simplicity and solemnity of character may be gathered, still speak of the superstition under which the age la-boured—their emblems are mourful, they speak of death as a deprivation of the joys of spean of teath as a department of the past, they tell of the history of the past, but of no hope in the future; all beyond the grave was shrouded from their view by the mists of uncertainty and superstition. The reversed torch, skulls, and implements of the charneltorcb, skulls, and implements of the charnel-house, and idle fables of mythology, but ill befit the sacred character of the tomb. But when Christianity dawned on the world, and at first the new faith was professed amid persecution and derision, they yet hopefully laid the martyr to his rest in the simple catacomb, and carved above the cheerful emblems of their religion, and death was to them a welcome guest. Hence sprung another class of monumental architecture, which, if it lacked the material beauty of refined Greece, or the magnificence of Rome, spoke more to the heart and less to the sense; and when at length Chrisnificence of Rome, spoke more to the heart and less to the sense; and when at length Christianity triumphed over Pagainsm, and the clouds of superstition were dispelled, the church gathered its members around and within it, the dead as well as the living, and there lay the crowned monarch, the mitred bishop, and mailed warrior, their hands lifted in prayer, reposing calmly as if but in sleep. The cross, the emblem of their faith, the palm branch and olive, the signs of victory, carved upon the tomb, all pointing to the more hopeful character of their religion. This spirit of Christianity among the chivalrous Teutonic nations of northern Europe, and in the hands nations of northern Europe, and in the hands of the masonic fraternity of artists, was em-bodied in their conception of ecclesiastical architecture, which, as the visible church on earth, in its perfect unity of design, soared to heaven in imitation of its prototype. The monu-mental architecture, likewise, west-alheaven in imitation of its prototype. The monumental architecture likewise partook of the same impulse, and they both advanced together to their full development, mutually enhanced by the connection; for the simple headstone and slab of bold design, in the same style as the details of the cathedral, extended its architectural character beyond the immediate walls; and within, the panelled altar tombs, with their rich canopies, added to the effect of the interior, increasing the playful distribution of light and shade, breaking the flatness of the walls, and by the colour and gilding with which they were often decorated, sparkling like gems amidst the grey columned aisles, whose clustered shafts needed but the reflected this that streamed from the painted windows upon them, and thus was the richness harmoniously distributed throughout the whole.

In England but few of the mediaval monuments of a date anterior to the twelfth century

ments of a date anterior to the twelfth century remain, and those are of a simple character, often as it were but the covers to the stone coffins, narrowing gradually from the head to the feet, and sometimes ridge-shaped, with the feet, and sometimes ridge-shaped, with crosses carved upon them. Their proportions are generally good, and the mouldings rich and bold. In the early part of the twelfth century effigies of ecclesiastics, and, in the latter part, of knights in armour, appear, as yet, on very low tombs; still in general the covers of the coffins sunk beneath the pavement. In the thirteenth century they were often placed under arched recesses in the wall, which at first were plain and obtusely pointed, and later first were plain and obtusely pointed, and later. under arched recesses in the wall, which at first were plain and obtusely pointed, and later equilateral and richly foliated, surmounted by finials, with pinnacled buttresses carried up at the angles: they harmonise well with the architecture of the church, even more so, perhaps, than those which were afterwards placed between the piers of the nave. The monument of Sir James Douglas, in Douglas Church. is a fine and characteristic example. Church, is a fine and characteristic example.

detail, which prevailed at a later period, with the sculptured figures upon them, reposing as it were from the turmoil of their earthly life, with a calm and obeerful countenance, the hands raised in a suppliant attitude, and sometimes the husband and wife lying side by side, not to be separated even by death, clad in the ecclesiastical robes, or the armour and costume of the period, with angels often supporting the head, and the feet resting on the heraldic animal of their armorial bearings,—all mark them as the work heaviful and all mark them as the most beautiful and perfect of sepulchral monuments, whether viewed in themselves or in their relation to the edifice they adorn. Their material is often of the richest quality, and the brilliant colouring of the enameling on the trappings and shields and inlaid bronze bands of black letter inscriptions within the mouldings, contrast finely with the grey tone of the marble monument, and shew the judicious application of these effective enrichments. fect of sepulchral monuments, whether viewed

these effective enrichments.

The tombs of Sir Oliver Ingani and Sir Roger and Margaret de Boys, in Ingam Church, Norfolk, of King John in Worcester Cathedral, and of John Beaufort, Duke of Somerset, and his duchess, in Wimborne Winster, which is of markle, and the efficies Somerset, and his duchess, in Wimborne Minster, which is of marble, and the effigies of alabaster, relieved with gold, are good and bold examples; as also that of the Black Prince in Canterbury Cathedral, whose effigy is of copper gilt, burnished, and enamelled with the utmost delicacy, on a rich tomb of grey marble, with a broad brass inscription plate let into the surbase mouldings; and in each panel round the sides of the tomb is a shield of enamelled brass, bearing the royal arms of France and England.

arms of France and England.

The canopies, which were often erected The canopies, which were often erected over these tombs, form a most picturesque and beautiful accessory, affording an opportunity for the display of that delicate lacework of tracery in which the Gothic architects took such delight; they were of various forms, some horizontal and attached to the pillars of the church; pyramidal or ogee shaped, such as the exquisite Percy shrine at Beverley; and in others rising in clustering pinnacles, with all the lightness of metal work, as from the graceful elliptic arch of Archbishop Bowet's graceful elliptic arch of Arcbbishop Bowet's de Spencer, Tewkesbury Church.

These caponies at a later period, were ex-

These canopies, at a later period, were extended, as it were, into Chantry chapels, surtended, as it were, into Chantry chapels, surrounding the tombs with a protecting veil of gossamer tracery, numberless pendants hanging from the groined ceiling in intricate confusion. The Cathedral of Winchester is remarkably rich in these beautiful works, particularly those of the Bisbops Fox, Wykeham, Waynefleet, and Beaufort. That to Isabel, Countess of Warwick, Tewkesbury Church, is a fine instance: they were formerly much more numerous than at present, having much more numerous than at present, having been destroyed by the Iconoclasts, and the been destroyed by the Iconoclasts, and the only trace remaining being the small piscina in the wall. To royal or noble families Mortuary Chapels were often erected, in connection with the chirch, to contain their monuments, which cluster round the choir, like the rich jewels in a casket, elaborate in ornament to a degree manufact to the contain the contained to a degree manufact to the contained to the containe degree unsuited to the more important structure. In the centre stands the tomb, enbanced hy the richness of its enclosure, the banners of the family suspended above, and their armorial bearings forming a repeated theme for the sculptor's chisel and for the painted glass, which, throwing its mellowed light over the whole completes the rightness of effort. which, throwing its mellowed light over the whole, completes the richness of effect. Of these, Henry the VII.'s Chapel, with its delicate panelling and fan-groined ceiling, is a magnificent specimen, as also Wolsey's tombhouse, St. George's Chapel, Windsor, and the Beauchamp Chapel, Warwick.

Scnlpture, however, being an art which depends on the individual feeling of the artist for its expression, and not to be confined by the rules to which architecture was with ad-

the rules to which architecture was with advantage subjected by the freemasons, without detriment, although the general sentiments of Church, is a fine and characteristic example.

In the fourteenth century, the altar or table tombs, with their cumbent efficies, placed in an isolated position in the church, became the type of the monuments in all those countries where the Gothic architecture flourished. Their simple appropriate character, this countries where the gap appropriate character, in some instances, bowever, this countries and teagrant design, with the abundant variety and tasteful application of the ornament with which they were decorated, devoid of the exuberance and profission of minute of the exuberance and profission of minute of the countries of the exuberance and profission of minute of the countries of the government, although the general sentiments of the Gothic type are conveyed by these efficies, a certain stiffness of manner generally prevails of their attitudes and a want of individuality of character. In some instances, bowever, much grace and dignity, with a freedom in the disposition of the draperies, are to be found in English works of Gothic art, and a beneficial influence is attributable to the sculp-timent, although the general sentiments of the Gothic type are conveyed by these efficies, a certain stiffness of manner generally prevails of character. In some instancts, however, such stances are the countries of the countries of the countries of the gothic type are conveyed by these efficies, and the gothic type are conveyed by these efficies, and the gothic type are conveyed by these efficies, and the countries of the gothic type are conveyed by these efficies, and the countries of the month of the gothic type are conveyed by these efficient, although the general sentiments of the Gothic type are conveyed by these efficiency and the timent, although the general sentiments of the Gothic type are conveyed by these efficient, although the general sentiments of the Gothic type are conveyed by the ferment, although the general sentiments of the Gothic type are conveyed by the efficient, although the general sentiments detriment, attnough the general sentiments of the Gothic type are conveyed by these effigies, a certain stiffness of manner generally prevails in their attitudes and a want of individuality of character. In some instances, bowever, mucb grace and dignity, with a freedom in the disposition of the draperies, are to be found in English works of Gothic art, and a beneficial influence is attributable to the sculp-tors from Italy. who visited England at various times. The statue of Eleanor, Queen of Edward the First, in Westminster Abbey, is a work of great beauty, and even ideality of conception and delicacy of execution. Her expression is youthful and sweet, the hair flows down to be about at the control of the cont down to her shoulders, the hands are disposed with ease, and the drapery falls in long and graceful folds, covering the feet.

graceful folds, covering the feet.

The monument of Aymer de Valence unites the excellencies of sculpture with those of architecture. The effigy, with the beautiful kneeling angels at its head, the figures in the niches surrounding the tomb, together with the foliage of the canopy, are exquisite. The tombs of Henry the Seventh, and the brass effigy of the Countess of Riebmond, his mother, by Torregiano, an Italian, are very fine. And the monument of Sir Francis de Vere, over whom four knights support his armour, on a tablet, is grandin conception and armour, on a tablet, is grand in conception and picturesque in effect,

In the vaults of S. Denis, near Paris, which contain the monuments of a long line of the examples of France, there are some beautiful examples of recumbent statues, which possess peculiar sweetness and grace.*

SHORT LEASES A SOCIAL EVIL.

THE importance of this subject, recently treated of in THE BULLDER,—"The Enfranchisement of Leasehold Tenures" over twenty years, has struck the attention of many who never before considered the evils inflicted on specific at large hus that requiring attentions. on society at large by that pernicious custom of short leases.

Seeing that it is impossible to obtain build-Seeing that it is impossible to obtain building leases in or near the metropolis for longer periods than 80, 70, or 60 years, huilders are compelled to accept them, and that, too, on the terms of the few great landlords, or to stop business and speculation; and in the valuable trading localities, or fashionable quarters, it is not unusual to make costly erections on 50, 40, and even 30 years' terms.

not unusual to make costly erections on 50, 40, and even 30 years' terms.

It is manifest that houses raised on such foundations cannot be built with the same solidity as if the duration of the lease were longer—and that rents must be higher in pro-

longer—and that rents must be higher in proportion as the annuity is curtailed.

But the evil is worse as regards tenants on half-elapsed leases, which may have, say 20 or 30 years to run. In such cases, renewal being next to impossible, innless at a premium amounting to a fee-simple purchase, the occupier, if he be a man of business. and prosperous, scruples not to disburse on his shop or country-house large sums, the produce of his thrift; or if a gentleman of fortune, and his mansion occupies an eligible nosition his mansion occupies an eligible position— this latter thinks nothing of laying out thousands in order to secure a fitting town mansion. But as prosperity in commerce is fluctuating, and the position of the wealthiest not free from the chances of reverse, what was expended by the father to improve his convenience, or gratify his taste, may to the son in adversity

be an object of great importance.

The sums, however, thus lavished are for ever gone from the tenant, and become the property of the more deeply-calculating lessor. A preference may be given of preoccupation or lease to the outgoing tenant, on expiration of his lease—but it is only a preference at rack rent, or the amount which the premises might

fetch in the market.

Few indeed are the holdings on Iong lease, upon which large sums have not been ex-pended by the occupiers; and yet fewer are the houses in London which are held on freehold tenure-there is hardly such a thing to

be nad.

For years past the corporations of London have been adding to their estates such properties, and thus extending the evil of short leases. This is not done overtly, indeed, for John Smith, or some other indifferent person, in denuted to attend the acts (Leat the hiddlings. is deputed to attend the sale (lest the biddings should be swelled as against a public body), and to add the item to the colossal estate of the Vintners', or Merchant Tailors', or some other guild,

Such, too, is the practice of great proprietors, who are adding to already inflated rentals every thing attainable within the limits of our Babylon.

This was not always so; but within the

^{*} To be continued.

ast century, the capital of a few noblemen has grown into leasehold principalities, and so well has the leasing practice told, that the body of moneyed oligarchs, compacted on a system, have engrossed pretty well all the fixed capital of the community so far as London is concerned.

The means of the multitude have been expended in fabrics, only to flow, through the lapse of two, or at most three generations, into the ocean (1 fear not the Pacific one) of aristocratic abundance.

Surely this is not a beneficial result, that the few should be enriched and the multitude impoverished.

The greatest good for the greatest number is a modern maxim, but so rooted is the principle we are speaking of, and so systematized, that the people have no power to redress it. If one man object to three or five guineas a-foot, for building plots, besides paying largely for the old structure, another will be found to outlay his principal on the alluring site, and the landlord has the legal right to reserve or forestall. It is a LEACUE (the league of wealth and power) against the nation, and nothing but an enactment of the Legislature can correct or redress it.

As your article of the 15th stated, Parliament found no difficulty in passing a law to enfranchise copyholds, because that grievous description of tenure affected the landed estates of the legislators. Copyholds were as much a privateright of property as leaseholds, and there can be no just reason for continuing the widely injurious tenure on leases, any more than the now antiquated custom of exacting fines and heriots on the alienation of lands, or on the death of their proprietors.

As the enfranchisement of a copyhold tenure may be fairly estimated and requited in a money payment, so may the interest in a lease be estimated by a valuation jury, or by any other equitable mode of purchase.

To the tenant in most instances the purchase would be an object of the deepest interest, while the lessor could not complain, as he too should have his equivalent in money to invest at large; and although perhaps not over one fourth part of the leaseholders would purchase the freehold of their occupations; still the practice of leasing out plots anew for building, on an extensive scale, would, by this plan, be effectually checked.

Of all the advantages, however, that must ensue from such an enfranchisement, the greatest would be the diffusion of fixed capital, the next the estoppal of the frightful concentration of property in a few noble families, who must in one more generation clutch within their grasp the heritage of the dispossessed families of London!

It must be apparent that the desired enfranchisement of leases will have the happiest influence on architecture—that substantiality will supersede economy, haste, and insecurity —that an Englisman may truly call his house his castle, and that the arts will be encouraged and exhibited in embellishment.

QUONDAM.

LIVERPOOLARCHITECTURALANDARCH.EOLOGICAL SOCIETY.—A meeting of this society was held on the 20th December, Mr. J.
A. Picton, vice-president, in the chair, when a
paper was read by Mr. Hornblower on "Constructive Carpentry." The chairman observed,
in pointing to various drawings and models,
that lessons could be drawn from the defects
as well as from the excellencies of the designs
presented. Pointing to the roof of St. Paul's,
Covent Garden, by Inigo Jones, he said that
its construction was very poor indeed, and
proved that Jones was no carpenter. He then
called attention to the scientific principles
upon which the old roofs were constructed, and
observed the peculiarity that there was scarcely
ever any iron used. Mr. Hay explained the
causes of the failure of the roof of St. Peter's
Church, at Rock Ferry. Mr. Reed explained
the method of raising the Egyptian ohelisks,
as shown in Rossellini's plates of the tombs,
and as actually executed in Hindostan 80 or
90 years since, witnessed and recorded by
Major Russell.

LECTURE ON HERALDRY.

Mr. W. PARTRIDGE has recently delivered some lectures on heraldry at various institutions, with the view chiefly of shewing that a knowledge of armorial ensigns is not solely the province of the antiquary or archeologist, but is important as a branch of general knowledge, and has a direct bearing on accuracy of taste in many of the arts and manufactures.

After noticing the discordant opinions respecting the origin of heraldry, some seeing the origin of it in the Phonetic alphabets of ancient India, others in the old Mexican sculptures, or in the double shields of Egypt, while others allow it to be not older than the Crusades, he traced it to the necessity for modes of distinction in the early stages of society, for the sake of order and discipline. He then took the two prominent features of heraldry, viz., shields and banners; the shield from its first and simplest construction among the early Greeks, its various shapes, sizes, and materials, from the fabulous, but magnificent shield of Achilles, by Homer,

"The immense and solid shield, Rich, various artifice emblazed the field,"

down through the historic periods of Greece and Rome to the middle ages, showing the subject to be closely blended with the state of the arts and manufactures in all these ages and countries, and alluding to the superb shield made recently as a present from the King of Prussia to the Prince of Wales.

The hanners of various ages, Pagan and Christian, the several ahbeys, the crusades, rival roses, tournaments, chivalry, and the important uses of heraldry in war, in property, as a key to architecture, history, and poetry, are intimately mixed up with the progress of every age, shewing the importance of accuracy in all works, and the want of such knowledge in some glaring instances in architecture and painting. In some of the latter, the period of history intended was falsified, and in the former the effect of the edifice often injured by the heraldic devices heing both ill designed and incorrect in themselves; making the importance of the subject even to practical men apparent.

LIME-ASH FLOORS FOR LABOURERS' COTTAGES.

The following letter from Sir Shafto Adair to Mr. Henry Roberts, the honorary architect of the Society for the Improvement of the Condition of the Labouring Classes, contains a detailed statement of the mode adopted in Somersetshire, of forming lime and sand floors for farm-houses and cottages in agricultural districts:—

"I have received the particulars of the mode of forming the stucco floors for farm-houses and cottages, employed in Somensetshire, and supposing it may form an useful addition to your valuable suggestions for building labourers' cottages, I take the liberty of transmitting it to you. My informant is Mr. John Easton, an intelligent farmer, residing in the parish of Bradford, near Taunton.

Directions for making.—Take good washed sand, free from all earth, and the ashes of lime, as taken from the lime-kiln, in the following proportions, viz.—Two-thirds sand, and one-third lime-ashes. Mix them well together and let them remain in a body for three days, then temper the mortar, and form the floor with it, three inches thick; let this remain so formed three days, when it will bear treading by men: their shoes must be without nails. After it is well and equally trodden, beat it with a flat wood mallet every day for two weeks, until it is become hard, then use a little water on the surface, and smooth it with a trowel; after this keep the floor free of dirt or dust, sweeping it with a brush till it is quite hard and solid. I have known our best floors last for forty years. The price we pay is 5d. per square yard (9 feet) for labour, and 8d, per yard for materials; altogether, 1s. 1d."*

THE BOSTON AQUEDUCT.

On 25th October last, the extensive works for the conveyance of water from lake Cochituate (or Koo-chee-awa, an aboriginal term of "clear, beautiful, water"), to Boston, a distance of nearly 20 miles by the usual route, were so nearly completed that the water was formally let on with great ceremonial, through an ornamental fountain at Boston common, when it immediately sprung to a height of nearly 80 feet, amidst the gratulations of an immense multitude, assembled from all parts of the state of Massachusetts, and even of new England throughout. The day was one of jubilee, opening with the sound of bells and cannon, followed by military reviews, and civilian processions through triumpbal arches, and closing with the spectacle of fireworks and illuminated fountains.

The undertaking was begun only two years and two months before, and was deemed one of peculiar difficulty. Indeed, it was only by the unintermitted labours of 3,500 men, chiefly Irish,—labourers, bricklayers, masons, blacksmiths, &c., inclusive,—most of whom carried on their labours, by turns of eight hours, night and day, that the difficulties were overcome and the work accomplished. One of the chief obstacles consisted of a long extent of quicksands, in the valley of the Snake brook, where fivesteam-engines, capable of raising 12,000,000 gallons 10 feet high in twenty-four hours, have been in constant employment. Another heavy labour in the same section of the contract consisted in the hardness of the porphyritic rock, which was estimated to have required seven times the usual quantity of powder and of labour in rock excavation. A work of still greater difficulty consisted of tunnel-excavation through two hills of equally hard rock, with water perpetually flowing through its seams and rents. The two tunnels measure 4,500 feet in length, and were excavated in eighteen months, through shafts seventy to seventy-five feet in depth, and by help of steam power.

The culvert is a brick oval in hydraulic cement, 6 feet 4 inches in height, and nearly 15 miles in length, extending only from the lake gate-house, which is of granite, to Brookline, where it ends in a reservoir of granite, whence the water is carried through cast-iron pipes to the town reservoirs. The other works in masonry are chiefly in granite, plain, but substantial. At Charles River, the aqueduct descends and re-ascends in form of two inverted syphons, connected with gate-houses on each beight, and with a waste weir at the low level. Both culverts and pipes are principally under ground. The fall, throughout, is only about 13 mile an hour. For further particulars as to the works extending from the culvert at Brookline to Boston, including the reservoirs at the termination, some of which stand at an elevation nearly as high as that of the lake itself, and whence the water will be forced by its own pressure through the highest building in the city,—we must refer to The Bullder, vol. v. p. 618. One of the reservoirs will contain two weeks' supply for the whole city, while the aqueduct is capable of discharging more than ten millions of gallons a day.

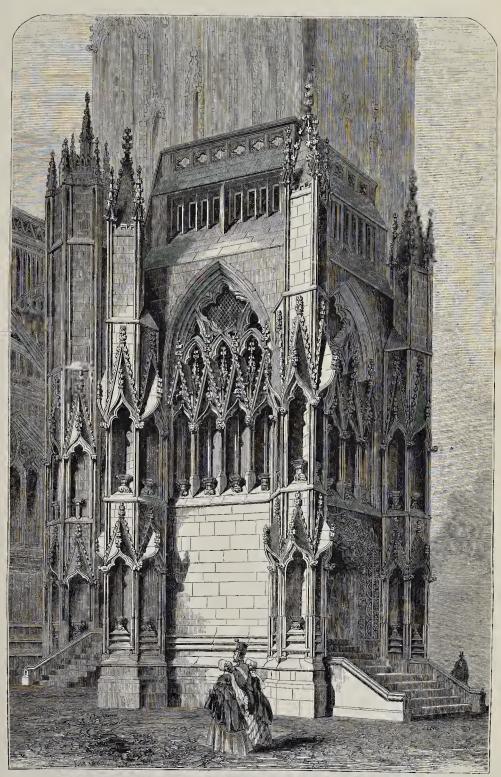

capanie or discharging more than ten minions of gallons a day.

The small pipes which are to be run into each house at the public expense, and of which about 100,000 feet were laid at the opening, are of lead; and as the water is said to be of remarkable purity, it is to be boped that the prudence of thus using a metal so apt to be acted on by water in the direct ratio of its purity has heen well tested.

About three millions of dollars have been expended on these works, and about half a million more will be requisite to complete the reservoirs and distribute the water at South Boston. The town lands, it is said, will redeem the whole expense in a few years, independent of the rate charged to individuals, which is to be a very low one, till altogether withdrawn, as it is intended ultimately to be, if not deemed requisite as a source of increased income to the city.

The chief engineer of the main division of the works, namely, between the lake and Brookline, was Mr. E. S. Chesbrough, of Newton, resident organeer, Mr. McKeam

^{*} A correspondent suggests that if a portion of pounded coke were used with the lime-ashes, it would render the floor exceedingly hard and durable.—ED.

ON THE STUDY OF DESIGN FROM VEGETAL GROWTH.

DECORATIVE ART SOCIETY.

At a late meeting of this society a paper was read by Mr. Laugher, "On the Study of De-sign from Vegetal Growth," illustrated by large sketches recently made in the Royal Botanic Gardens at Kew, by members of the society. This paper originated from a visit to Kew by Inis paper originated from a visit to kew by some members of the society, who were influ-enced by a desire to trace the relation which form and colour, as applied in the decorative arts, bear to prototypes of vegetal growth, and also, by a wish to render practically evident, a mode by which simple and beautiful designs may readily be derived for the purposes of the industrial arts. The writer stated that an effort of this kind conveyed an assurance, that the members were fearlessly seeking an acquaintance with the beautiful in nature,—being self-dependent, without any other guides that their own reasoning faculties to enlighten their path. We may read often, and it was gene-rally admitted, it was said, that whatever is excellent in art, is simply so from its harmonizing with natural results, more or less common to himan experience. The conceptions and expressions of grand works in painting, sculpture, and the other arts, it was observed, The conceptions derive their value from such an embodiument of scene, or action, or object, as shall have the harmonizing probability of a natural aspect rationally sustained throughout. It would be found, that it is this kind of probability which at once excites our sympathy, and induces those associative suggestions which are most impressive on the mind, whilst the reflective faculty, comparison—guided as it always is, and always must be, hy human experience—constitutes the test-tube, in which refinement in art can properly be estimated.

It was said that, in an endeayour to recognitions are the said that, in an endeayour to recognitions. derive their value from such an embodiment of

It was said that, in an endeavour to recog-nise and develope the beautiful in sketches from vegetal leaves and stems, it is accordingly necessary to perceive and set forth, in the first place, a general prohability of resemblance, and that comparison would afterwards enable us, individually, to trace the limits of application and value of purpose in each sketch. Under such restrictions and considerations, it was contended, that a broad and free translation of effect upon the sketch, rather than the actual minutize of microscopic imitation, should be attempted, for as much as poetic ideality can only be developed under the boldest and simplest aspects of probability, so thereby art becomes more congonial with, more readily suited to, and more self-sufficient for, the grasp of the human intellect.

A reference was made to the improbabilities in art, as evinced in the romantic phantasies, the exuberant caprices, of Raffaelle's grotesques, on the one hand; and in the inane tesques, on the one hand; and in the inane and meaningless incongruities, so unredeemingly applied, in our day, as decorations for manufactures, on the other. It was asked,—How much of prohability can he discovered in the myriads of acanthusian nonentities in the femoral scroll, or "thigh-bone nausea" of the French school, with which every description of manufacture has of late years been infested? None, it was said; and that such should therefore be laid aside, as of a degraded class of conventionalities, being without sympathetic appeal to, or influence on, the mind,—in short, as being without art. in short, as being without art.

After these remarks, the writer observed that it becomes necessary to divest the mind of the spurious elaborations with which the patterns of our manufactures abound, so as to patterns of our manufactures abound, so as to prepare the intellect for detecting and tracing the ever-varying lines of beautiful form, and the endless gradations, contrasts, and harmo-nies of colour, which pervade all productions of vegetal growth. He said, it was also to be borne in mind that, in thus looking for the beautiful, no two persons are competent to discern it with equal readiness and intensity; practice, and educational training, being necesary to an expert and keen discrimination in such a matter, and more especially so when it becomes the business of life to translate it for the reading of others,—when, as in litera-ture, it would be found that the poetic rendering proves more prepossessing and interesting, as art, to the million, than all the matter-of-fact, dry, and prosy details of merely exact imitation.

USE OF BATH STONE IN LIVERPOOL.

With reference to your observations on the Unitarian Church, now in course of erec-tion in Liverpool under our superintendence, we beg to say a few words as to the intro-duction of Bath stone, which you appear to think undesirable.

You are mistaken or misinformed in supposing that a desirable stone is easily obtained in this locality, at a price nearly approaching that of Bath stone, when the comparative amount of labour is considered. It is also difficult, even at an increased price, to obtain any stone which so well contrasts with our Upholland (not Rochdale) wall stone. Previously to our ohtaining tenders for this church we made a careful examination of the several descriptions of stone which were calculated to suit the building, and reported thereon to the committee. They were as follows:—Darley Dale stone (Derbyshire), Glasgow stone, Caen stone (which we chiefly wished to introduce), Longridge and Haughton Moor stone (in this neighhourhood), Bath stone, and, as a last resource, Stourton (Cheshire) stone. From motives of economy, all, except the two last-mentioned descriptions of stone, were rejected, as involving an expenditure beyond the available funds, and the question was between Bath and Stourton. It may be as well to mention that the Stourton stone, though much used in this neighbourhood, is very generally condemned, owing to its loose and clayer veins and its great liability to chip from at-mospheric action: it is also coarse in grain; these causes render it especially unsuit-for Gothic work, where sharp arrises, delicate carving, and deep undercutting abound. Now, Bath stone is admirably adapted for these mouldings, and for the most elaborate carvings and tracery, and we have here obtained it at a cost of 5 per cent. beyond the price of Stourton.

We have been the first to introduce Bath stone into Liverpool; and when we look at the churches and public buildings in and about London, and throughout the southern, western, and midland counties in England, in which Bath stone has been adopted, we do not think that we have taken a singular or an unadvised step in using it here, where good stone is so difficult to be had at a fair price. Besides, we have yet to learn that Bath stone is of that perishahle nature, of late (and only of late) so much attributed to it.

Nine-tenths of the failures imputed to this stone have occurred through the ignorance or inattention of workmen, or superintendents, in neglecting to work the stones so as to lay on their natural beds, which has laid the pores of the stone open to the effects of rain and frost. Yet, although there have been failures (and we think we are justified in saying that they have only been partial failures, and chiefly, if not entirely, owing to the neglect alluded to), there have been many successful specimens of Bath stonework, which may be seen in Lon-

don, Oxford, Bath, Bristol, &c.

We know an instance on the borders of
the Bristol Channel, where an extension of a church was effected some twelve years since, in which, although singularly exposed to action, no symptoms of decay have manifested themselves, although the walls were cased walls were cased

throughout with Bath ashlar. We have troubled you with this letter, not so much for the purpose of explaining as to the material we have used, as in the hope that it will lead to some practical remarks, which may elucidate more clearly how far Bath stone is or is not suitable for the buildings of this country.

BARRY AND BROWN.

CURIOUS DISCOVERY IN ROME.-The following interesting announcement forms part of a letter dated "English College, Rome, Sept. 28, 1848."—"In a vineyard belonging to the chapter of St. John Lateran, some curious sepulchral remains have heen discovered, but the series will not be altogether excavated before November. One piece represents a doorway to a temple in the forum, and even this remnant, in consequence of the name and site being inscribed on the cornice, threatens to disturb some portions of our Roman topography. As yet no one is allowed to sketch the fragments.

HOUSE DRAINAGE.

In a letter on this subject, addressed by Mr. Montagu Marriott to the Metropolitan Commissioners of Sewers, the writer gives evidence, founded on personal experience, in favour of small drains. Discovering "that no brick train of aritime and the search of the contraction of the search of the sea sman drains. Sheovering that no brick drain of ordinary construction would keep clean for any length of time," the supply of water being insufficient to prevent the solid matters from accumulating in the drains, and eventually stopping then, "although they have varied in sectional ages, from 1.13 (a.6) severa inches." sectional area from 113 to 16 square inches," he says he found an effectual remedy, which he then proceeds to describe,-

"I commenced by using 9-inch pipe drains, which, although much better than those of hrick, were subject to some of the same inconveniences, the chief of which was their too great size. I then tried 6-inch, 4-inch, and eventually 3-incb, which size I

6-inch, 4-inch, and eventually 3-incb, which size I now use, and find them sufficient for all purposes, and much more easily kept clean than any others. One of the greatest evils of the old system of drainage was the ohligation enforced by the Commissioners of Sewers of carrying every drain through the house to the front, frequently a length of 60 feet, although a much letter course might be found at the rear of the premises, within one-fourth of the distance, and which would avoid the injury to health and great part of the expense consequent upon the above regulation. On these considerations alone a back drainage, wherever practicule, should alone a back drainage, wherever practicable, should be adopted; but there is another of great import-ance, viz., that there is much less chance of a deposit being formed if the whole sewage and waste water of a range of bouses be carried along one channel than if it were divided into twenty driblets

channel than II it were divided into twenty dribles through as many separate drains.

The plan I now adopt, and which I find very effectual with houses not having water-closets, is to run a 3-inch pipe drain of glazed stone-ware from the privy along the backs of the bouses, when practically the pray along the backs of the bouses, when practicable, to the nearest sewer, keeping it down as low as possible, but allowing a fall of from one to two inches in ten feet, according to circumstances: the cesspool is then empticed and filled up with rub-bish, and the drain brought up with au clow to receive a common glazed stoneware closet-basin, the neck of which ought to be contracted to two lnches to prevent any larger substance from passing through. The next step is to provide a supply of water, and although the quantity furnished by the companies at enormous prices is notoriously defining to a supply of the companies at enormous prices is notoriously defining to a supply of the companies at enormous prices is notoriously defining to a supply of the companies at enormous prices is notoriously defining the companies of the companies and the companies are considered to the companies and the companies are considered to the companies are considered to the companies and the companies are considered to the considered to the companies are considered to the considered to the considered to the considered to the companies are considered to the considere fricint, and in most cases only supplied three times per week, it may nevertheless, by carefully attend-ing to the rule laid down above of keeping the drain ing to the rule laid down above of keeping the drain as low as possible, be made to answer the purpose of thoroughly cleansing it. The ball tap should be entirely removed from the supply-pipe,* and a waste-pipe 1\(^2\) tinches internal diameter fastened into the water-butt within about two or three inches of the top: this waste-pipe should then lead to and he connected with the orifice left in the water-closet row for that waveness each point staken to sake a the top: this waste-pipe should then lead to and he connected with the orifice left in the water-closet pan for that purpose, care being taken to make a syphon-bend in the lower part to prevent any possibility of the water hecoming contaminated. Branches from the rain-water pipe and sink are connected with the drain by means of proper junctions made for that purpose in the earthenware drain pipes: by these means the drain is thoroughly washed down three times per week, or as often as water is supplied to the houses, and all deposit prevented. The tenants in the houses where this plan has been tried speak of it in the highest terms, as rendering the lower rooms both habitable and healtby. healtby.

With bouses of a superior class where water-closets are already in use, a similar method should be adopted, with some slight variations. The old brick drain should be removed or stopped up, the former if possible, and replaced by a new tuberain, and the water-closet traps carefully looked to and altered to the O or syphon form, if not acting well. I do not consider it perfectly safe to remove the ball tap from the cisterns, as, from their being generally attached to the houses, the consequences of an accident, from frost or other causes, would be serious; but the waste-pipe should he cut two or three inobes shorter than usual, and the

would be serious; but the waste-pipe should he cut two or three incbes shorter than usual, and the mouth enlarged, so as to allow the water to pass rapidly off as soon as it rises to a certain height, and the ball tap would still act as a perfect safe-guard against overflowing in case of a stoppage of the waste-pipe.

The proper size of pipe drains is a question much discussed and not yet decided. The only necessary point to observe, in order to determine a minimum diameter, is the quantity of storm water they may by any possibility be required to carry off. Now, the greatest quantity I believe, with only one exception, registered during the last forty years, amounted to two inches per hour, which is the utmost it is necessary to provide for; and if we take

^{*} What do the water companies say to this ?-ED

the average surface of a third-rate house and outbuildings at 650 superficial feet, this will give about 108 cubic feet, and suppose the garden or yard to afford balf as much, this would give a total of 162 feet (or 1,012½ gallons) per bour: now it bas heen found by experiments lately made at the Sewers'-office, Soho-square, that this quantity of water will pass through fifty feet (the average length of a house drain) of four-inch pipes, laid at a dead level and without any head of water, in ahout 24 minutes; and although the relative capacity of the three-inch pipes is, compared with the four-inch, only as nine to sixteen, yet being laid with a fall of five inches in fifty feet and with a head of water of from one to three feet, they would carry off quite as much water as four-inch pipes laid on a dead level, and be amply sufficient to take the beaviest fall of storm water from two third-rate or three smaller houses, or the ordinary drainage from three times those numbers."

APPROPRIATION OF RAILWAY ARCHES.

Ir is a melancholy, but a certain truth, that in this immense metropolis a great amount of human suffering exists, for want of shelter during the inclement nights of winter. The police reports have shewn that several persons have even made a resting place of the dry trench in Hyde-park, and only a few days since an unfortunate man who was crippled by a railway accident, appeared in custody of the police, before a magistrate, for making a noise at the door of Lambeth workhouse, on being refused a night's lodging, having slept on the preceding evening on a heap of stones.

The parish of Lambeth spans a great part of the southern bank of the Thames, and contains a vast portion of the humble and miserable ahodes of the indigent classes. At one period before the new Poor-law was

The parish of Lambeth spans a great part of the southern bank of the Thames, and contains a vast portion of the humble and miserable ahodes of the indigent classes. At once period before the new Poor-law was exacted, there were five thousand out-door poor persons receiving weekly relief. In this very parish the recent extension of the South-Western Railway to the Waterloo-road, has occasioned the erection of two hundred and sixty-four dry arches. With the exception of the few appropriated to roadways, here are then the greater number of them of no apparent utdity, merely openings to receive refuse flith, engender damp, and to create cutting drafts of air during the wintry blasts.

If these arches were floored, and boarded on the sides, they would form a refuge for the houseless to sufficient extent that no unfortunate person in London would want a dry covering in the inclement season. A merely

If these arches were floored, and boarded on the sides, they would form a refuge for the houseless to sufficient extent that no unfortunate person in London would want a dry covering in the inclement season. A merely raised flooring on each side, like those in the military guard-rooms, would afford the worn and weary a better repose than a heap of stones, or dry trenches in the parks. Other details would be readily suggested by the philanthropic; but even for baths and washhouses for the poor, as well as soup-kitchens, these arches are well adapted. For the latter purpose, an enormous and constant supply of hot water could be obtained from the wasted heat of the extensive coke-ovens at Nine Elms, if boilers were erected there, from whence it could be conveyed in pipes,—and the heated pipes, by passing through those arches fitted up as receptacles for night refuge, would keep them healthily dry, and give genial warmth to the emaciated and distressed denizers.

If the pauperised parish of Lambeth cannot afford the cost of establishing a nightly home for their houseless poor. surely the various

If the pauperised parish of Lambeth cannot afford the cost of establishing a nightly home for their houseless poor, surely the various societies, who usually during the winter season display their humane care for fellow heings, might find the central position of these unemployed arches worthy of being permanently turned to some such purpose. Sufficient means would soon be found by a subscription, and the railway authorities would doubtless be glad to let the arches for this intention, upon

IDLER IN LONDON.

ASSESSMENT OF RAILWAYS.—A correspondent informs us, that at the Rugby sessions just held, the London and North-Western companyappealed successfully against a poor-rate in the parish of Church Lawford, levied at 1,800% per mile per annum. It was argued by the company, and confirmed by the bench, that 750% per mile per annum should be the sum assessed in future, and in other portions of the parish the rate was reduced from 1,500% per mile, to 500%.

NOTES IN THE PROVINCES.

THE new church of All Saints, in Great The new clurch of All Saints, in Great Nelson-street, Liverpool, was consecrated on Friday week. It was founded in March last, on a plan by Mr. A. H. Holme, who superintended the erection. It is a plain structure, of red stone, in the Early English style, with accommodation for about 1,050 persons, 600 sittings free, and cost, it is said, about 4,0002. The front to Great Nelson-street comprises a tower, with spire about 120 feet high, and four entrance-doors, the two central with porches. In the centre of the elevation is a tower, with spire about 120 feet high, and four entrance-doors, the two central with porches. In the centre of the elevation is a lofty gable, with lancet and circular windows. The pitch of the roof is said to be great, with large sky-lights visible from Great Homer-street; but interiorly it has been arranged to present the appearance of a clerestory and is regarded as a novelty. The gallery is sumported by progred spire arranged to present the appearance of a clerestory and is regarded as a novelty. The gallery is supported by bronzed spiral pillars. The free henches have sloping backs and foot-boards and other conveniences. The brickwork was executed by Messrs. Duckworth; the masonry by Messrs. Nuttail and Hargraves; the woodwork by Mr. Burroughs; and the plumbing by Mr. Crellin.—At Ancoates, says a Manchester paper, the mansion of Messrs. Kennedy, adjoining their mills, has been converted to the use of the women and young children, who, by the their mills, has been converted to the use of the women and young children, who, by the new Factories' Act, are excluded the mills at certain hours, during which they have generally been obliged to take their meals in the streets. The building has been well ventilated, and fitted up with benches, tahles, large fires, gas-burners, washing and dressing places, &c.,—a worthy example to hundreds of those whose wealth is based on the like founda-tion.——The Christ Church schools at Hull those whose wealth is based on the like foundation.—The Christ Church schools at Hull were opened on Wednesday week. The style is Gothic, and ventilation and space have been considered. The rooms will accomodate 640 children. The architect was Mr. C. Brodrick. Ground and building cost about 1,400.—The church at Edithweston, says a Lincolnshire paper, has been restored internally at the cost of Mr. and Mrs. Lyace. Six Cilbert. shire paper, nas over the cost of Mr. And Mrs. Lucas, Sir Gilbert Heathcote, and others, with new open seating on a raised floor, walls stripped of whitewash, &c. A painting in fresco, 7 feet high, was uncovered between the elerestory windows. The restoration was executed by Mr. Collins, of Stamford.—A school of design is about to be formed at Leicester.—Plans and estimates for a lock-up, &c., at Solihull, have been made out, and a memorial for its erection premade out, and a memorial for its erection premade out. mates for a lock-up, e.c., at Sommun, nave been made out, and a memorial for its erection presented to the magistrates at quarter sessions.

—The church at Kemp-town, says a Brighton paper, is now finished, and will be shortly consecrated. It has been erected by the Marquis of Bristal of Bristol.

Miscellanea.

DISCOVERIES IN ST. GEORGE'S CHURCH, CANTERBURY.—In this ancient edifice, which has lately been cleared out, for the purpose of re-pewing, some curions relies of early times have been brought to light. In the south wall, near the east end, were discovered three elaborately ornamented sedilia, or stone seats. One of these has apparently been used, since the Reformation, as a window, opening into the street, on which side of the wall is a square stone easement. The ancient iron hooks and the latchet hook of this window are as perfect as if only just placed there, so that they could not have been much used after they were fixed. Upon the east wall, and near to these seats was found, immediately concealed beneath a coating of lime, a piscina.

coating of time, a piscina.

Dover Harbour of Refuge.—According to the Dover Chronicle, the works here are conducted with industry. The timher framework of this great sea barrier has been carried out upwards of 260 feet from the point of shore at the old Cheeseman's-head; and by the aid of several diving-bells, helmets, &c., and an arrangement of travelling cranes, the ponderous stonework has been securely bedded in the chalk rock to a similar distance, and hrought up almost to the level of high water, within eight months. This compact body of masonry is said to contain no less than 150,000 cubic feet of stone of large dimensions. There is a steamengine, driving several sets of mortar and cement mills, and a crane for unloading vessels.

THE CENTRAL RAILWAY STATION, NEW-CASTLE.—If we may judge from an account of this station, in the Civil Engineer's Journal, it is an important work. The following are some of the particulars that are given:—The façade, or principal front, is 600 fect in length. The style of the building is Roman; and the most striking feature in the design is the portico in the centre, 200 feet in length by 70 feet in width, flanked on each side by an arcade, the same length by 35 feet in width, allowing sufficient room for carriages to drive in at the end of each arcade, to turn, and go out at each end of the projecting part of the portico. The exterior front of the portico is composed of seven arches, each 14 feet in width by 32 feet in height, divided by coupled insulated Doric columns, 29 feet in height, clevated on a basement of 7½ feet, and supporting a broken entablature and attic of the same style. The arcades on each side are formed of arches, of the same width as the portico, divided hy double inserted columns. These columns, with the key-stones of the arches, support a continued unbroken entablature, without an attic. The ends of the arcade terminate in front in a niche, having coupled insulated columns on each side, supporting an entablature and low attic. The entrance to the end of each arcade is by an arch 25 feet in width; and the arcades will be covered with groined ceilings of stone, with a circular light at each intersection. The front of the station-house facing the platform is concave, forming the segment of a circle of 800 feet the punction of the various lines of railway at this point; and the elevation is of rubble-stone, from Prudhoe quarry, of a plain Roman character, the doors and windows having arched heads, with moulded imposts and archivolts. The shed is 236 yards long and 61 yards wide, covering an area of 14,426 yards, or about three acres. The roof is composed of iron, divided into three compartments, and supported by columns 33 feet apart, and 23 feet high from the platform to the springing of th

Death of Mr. Alderman Johnson.—On Saturday morning Mr. Alderman Johnson expired at his residence, Millbank. The deceased alderman, who, in conjunction with his brother, succeeded to his father's business, was in early life extensively engaged as a paviour, and both also inherited a large fortune from their father, who made a fortunate speculation in a quarry in Devonshire, since known as the "Haytor Granite." He undertook the contract for the breakwater at Plymouth: this and other fortunate speculations tended to place the deceased alderman at the head of the stone trade. In 1845 he was elected to fill the civic chair, and during the year of his mayoralty distinguished it by a princely entertainment to scientific, literary, and artistical celebrities.

FLANMAN'S WORKS.—Our readers know that a series of casts, from the works of Flaxman, have been presented to University College, Gower-street, by his niece Miss Denman. According to the Atheneum, the library just erected will be approached through a vestibule which, with its dome, forms so conspicuous a feature in the front view of the edifice. In this vestibule will be placed the easts in question. The well-known group of the Archangel Michael overcoming Satan (the first work executed in bronze for the Art-Union of London), will form the leading feature—standing immediately under the centre of the dome.

The Pneumatic Pile-Driving Process.—A hollow iron cylinder, 24 feet in length and 4½ in diameter, was lately sunk, for mining purposes, into dry sand on the sea shore, at Wheal Ramorth Mine, Perranzabuloe, Cornwall, by Dr. Potts's pneumatic pile-driving process. The sinking, on the occasion first recorded, went on at the rate of 24 inches in 50 minutes; but the process was suspended to allow scientific men to witness its further progress on a day appointed, when the descent was continued "at the rate of 3 inches a minute, accomplishing a descent of 2 feet 2 inches in 8 minutes, when it was feared that it would disappear altogether, and the work was abruptly suspended."

PROJECTED WORKS.—Advertisements have been issued for tenders, by dates not specified, for building an inn at the Gretna station of the Caledonian Railway; and for constructing a sewer at Southampton.

A Horse-power Pocket-bollen.—At a recent meeting of the Academy of Sciences, at Paris, as already noticed by the Literary Gazette, M. Boutigny announced that M. Beauregard (a young engineer), had at length succeeded in forming a steam-engine, which was moved by the vapour or gases of water, generated on red hot plates, and known as water in the spheroidal state. The tremendous and explosive power of such vapour in a common boiler is but too well known; but it is doubtless quite possible to put even a power such as this—so dangerous when neither looked for nor wanted—into safety harness. From a mere globule or spheroid of water thus managed in a miniature boiler, an immense power is generated, which would appear to require decomposition of its elementary gases to explain; and if it be true that a drop of dew contains electric power enough to get up a good thunder-storm, a drop of water in a boiler like a smuff-hox, may well yield the power of a single horse. It is a singular fact, too, that the drop or spheroid of water in such circumstances does not at once exhaust itself, or altogether evaporate in yielding such a power. It rolls about on the red hot surface, slowly yielding immensely elastic vapours or gases, and never rising in temperature itself beyond 190 degrees, and this we should think not so difficult to account for as may be imagined. The red heat or the salient electricity excited by the heat, is no doubt capable of decomposing a film of the water in contact with the surface, and this in its immense expansion absorbs, and for the moment exhausts, so great a quantity of the elastic salient forces that the remainder of the globule is kept, if not frozen, cool, and rolling about, till another film be expanded as before, with the like reactive cooling effect. The law of constitutional relates the eat and electricity, rightly understood, thus readily explains all. A 400-horse-power engine on this principle is about to be made in this country. It is stated by a correspondent of the Times, however, that som

Caution to Builders.—In the course of an inquiry into the cause of a fire on premises, Clement's-court, Wood-street, Cheapside, Mr. Braidwood said, upon examining the place where the fire originated, he found that some workmen had lighted a fire on a hearthstone of a newly-erected fireplace, there being no stove fixed. He attributed the fire to the ignition of a timber shoring, which was only divided from the fireplace by about four inches of brickwork. Out of 700 fires occurring annually for the last twelve years, the great majority had been occasioned by the fact of timber existing in the brickwork of old buildings. He would suggest the necessity of builders boring the party walls of old huildings prior to constructing fireplaces, and then they would soon discover any of the old wood, well known to form a portion of the old houses in the city. The jury returned the following verdict:—"That the fire, which was accidental, originated in the ignition of certain portions of timber in an old party wall, against which had been recently erected a fireplace: and the jury recommend that, in addition to the usual precountions adopted in such constructions, huilders should adopt the most stringent regulations in all such cases, for the better protection of life and property."

THE CHICHESTER COMPETITION. — "A Sufferer" (who forwards his address), says, I paid the carriage of my drawings down to Chichester. I have had them returned with one shilling to pay, no cord round the case, three of the drawings burst (though they were mounted on strainers), and not a line accompanying them either of thanks, apology, or even acknowledging in any way their ever having seen them!

IMPROVEMENTS IN MIDDLESEX HOSPITAL.—The improvements which have been going on here for some time past, mainly in consequence of the munificent bequest of Lady Murray, are now nearly completed. The ward windows are cleverly arranged to open so that the current of air is upwards. The sinks have been so altered that effluvium is carried away into the external air. The inconvenience of incrustation in boilers and pipes from hot water is sought to be avoided by carrying the steam from a boiler in the basement, after supplying the laboratory, vapour baths, surgeons' rooms, washhouse and laundry, &c., through a coil of iron pipe in a cold tank, which holds 1,000 gallons of water. The steam is there condensed, the earthy deposit takes place on the exterior of the heating surface, and by feeding the boiler with the condensed steam instead of fresh water, incrustation is prevented. The foors are covered with desiccated wood, and the walls with a non-absorbent plaster, to lessen the chance of propagating any epidemic. Messrs, Wyatt and Brandon are the architects engaged. If it be true as stated that 20,000, the wisdom of the course adopted by the Government becomes questionable.

EGYPTIAN MONUMENTS.—At a meeting of

ment becomes questionable.
EGYPTIAN MONUMENTS.—At a meeting of the Syro-Egyptian Society, on the 12th December, the original drawings of Egyptian architectural remains, hy Mr. Roberts, R.A., were arranged round the room in chronological order. Mr. Roberts pointed out the most interesting points connected with each sketch, and called attention to the evidences of the action of fire which were visible in many of the interiors. Messrs. Sharpe and Bonomi pointed out the architectural varieties of style observable in the works of the Greek and Roman periods, as compared with those of the Pharaohs; and commented on the remarkable fact, that both Greeks and Romans in Egypt adhered to the Egyptian style of architecture, and though well acquainted with the use of the arch, did not employ it in their constructions. Mr. Roberts having stated an opinion entertained by Professor Cockerell, that the palace of the Pharaohs had been erected upon the roofs of the temples—an opinion founded on the presence of holes in the roofs, apparently for receiving posts for the support of some superstructure, and of spouts for carrying off water from the roof, in a country where rain falls so unfrequently,—a discussion was raised upon that point. The view taken by Professor Cockerell was opposed by Mr. Scoles, Mr. Nash, and others; who considered that the holes in the roof, which are usually about 4 inches in diameter, were for the insertion of flag-staves, similar to those known from ancient Egyptian drawings to have been placed in front of the propylea.—Mr. Johnston, however, observed that the Abyssinian sovereigns of the present day reside in tents, and that the holes in the roof alluded to might have supported canvas coverings.

to might have supported canvas coverings. Sea-sand.—Speaking of the conversation at the last meeting of the Institute of Architects, and of those who thought that sea-sand, when well blown, might be used for mortar, the editor of the Literary Guzette says,—"We advise the use of any sand in preference to sea-sand, blown or inhlown, for those who wish to have their apartments to continue unstained with picturesque drippings, or papered without tatters hanging grotesquely down. We had a cottagewall between the kitchen and dining-room fire-places once built with sea-sand; but no fire nor heat could prevent its droppings!"

fire nor heat could prevent its droppings!"

ENGRAVED PORTRAITS.—Mr. G. R. Ward, whose portraits in mezzotint we have had occasion to mention hefore, has recently completed two others—Mr. George Hudson, M.P., after a painting by F. Grant, R.A., and Mr. W. Astell, M.P., late Chairman of the East-India Company, from a painting by Mr. F. R. Say. These are good specimens of Mr. Ward's skill in his art, the head of Mr. Astell in particular, which is Iuminous and life-like. The accessories in the full length of Mr. Hudson are better than the figure. The right hand of the honourable member wants a little more work on it. It is at present a blot. A portrait of Mr. Maunder, engraved by Mr. E. Finden from a picture by Mr. Wauch, is the representation of a laborious, clear-headed, and painstaking writer, to whom the rising generation are much indebted.

MEALTH ACT IN UNDINGE.—On Monday, December 18, Mr. Ranger, one of the inspectors appointed by the General Board of Health, opened a court of inquiry at Undinger. A number of witnesses gave testimony of the necessity for the introduction of sanitary measures. The commissioner, attended by Mr. W. Rayner, surgeon, and several others, made a personal inspection of most of the localities. According to our informant, many of the courts were found very deficient in drainage. Gas is supplied to the public at 10s. per 1,000 feet by a company who promised a great reduction, but who have not yet made it.—The south side of the church has lately been rebuilt, with flint and Bath-stone dressings, under the direction of Mr. C. J. Shoppee, architect.

THE PHILHARMONIC CONCERT-HALL, LIVERPOOL.—With reference to a letter dated from Liverpool, and signed "John Cunningham," on which we commented in a recent article, we have received another communication from Liverpool, also signed "John Cunningbam," stating that the first fetter was written by one of his "good friends" there, and requesting us to insert his "flat denial of its authorship." We are obliged to take for granted that the second letter is correct, and the first not, although upon the face of them there is nothing to make us doubt one more than the other. We sincerely hope that Mr. Cunningham has not many such "good friends;" and that he will succeed in punishing the author of what would seem to be nothing less than a forgery.

BUILDERS' BENEVOLENT INSTITUTION.—
The arrangements for the ball in aid of the funds of this institution, which, as already mentioned, is to take place on the 9th, are progressing satisfactorily. Lord Dudley Stuart has promised to attend if in town, a good band has been engaged, and 300 out of the 400 tickets are already disposed of.

THE PEDESTAL TO THE STATUE OF CHARLES I. AT CHARING CROSS.—"A Subscriber" writes,—I think it is much to be regretted that some effectual step is not taken to restore the beautiful pedestal of Charles the First's statue at Charing Cross, before the ornaments and mouldings have entirely perished, to preclude the possibility of tracing either the one or the other.

MEETINGS OF SCIENTIFIC BODIES

Held during the ensuing week.

MONDAY, JAN. S .- Institute of British Architects, S P.M.

Tuesday, 9.—Institution of Civil Engineers, 8 P.M. (Opening meeting).

PITT'S PATENT SELF-ADJUSTING

No. CCCX.

SATURDAY, JANUARY 13, 1849.

OME recent disastrous events can scarcely fail to re-awaken public attention to the importance of well constructed dwellings, to the evils of inefficient

drainage, want of ventilation, and crowded graveyards in the midst of towns, and otherwise to quicken the sanitary move-ment, which had begun to lag. When the Registrar-General makes a report that while the annual deaths in the town districts of Manchester, for example, are 37 to 1,000 males living, in the extra-metropolitan parts of Surrey they are but 19,-in other words, that though the population of Surrey exceeded that of Manchester, yet in seven years 16,000 persons died in the latter place over and above the deaths in Surrey, and that these fell a sacrifice to known causes,-" Here in the most advanced nation in Europe-in one of the largest towns of England-in the midst of a population unmatched for its energy, industry, manufacturing skill-in Manchester, the centre of a victorious agitation for commercial freedom-aspiring to literary culture where Percival wrote and Dalton lived,"the public mind is roused to the necessity of proper measures, and for a time the subject appears to make good progress. Speedily, however, the fact is forgotten; and the enemy being hidden, they fall back into the more comfortable belief that they have been frightened at shadows, and that none exist.

Recent events, however, as we have said,the circumstances under which the more scrious outbreaks of cholera amongst us have occurred, a consideration of the localities wherein it is and is not found, will speak trumpet-tongued, and will materially aid in hastening the admission as axioms of those truths at which individuals long since arrived by painful and lengthened investigations, but which have been until recently wholly disregarded by the multitude. And these once universally admitted, the succeeding steps are easier.

When we find the first cases occurring near the mouth of a sewer; when we hear a jury summoned to inquire into the cause of death in the case of those persons who died recently in Rosemary-lane, Whitechapel, bringing in as their verdict—" That the deceased persons died natural (?) deaths from Asiatic cholera, caused by the fætid and abominable condition of the habitations situate in the courts and alleys in which they resided;" that at the Establishment for Pauper Children at Tooting, where there has been such a fearful loss of life, stagnant ditches, filled with decomposing vegetable and animal matter, abound, and that in a prison where the disease has beginn to rage violently, those who are able to judge ascribe it in great part to defective ventilation,-the necessity of steps to remove these causes of loss, suffering, and deprivation, becomes obvious to all.

What has been already gradually achieved by improvements made without the full appreciation of their paramount worth, should further encourage to persevering efforts. The term of human life has been lengthened over

the whole kingdom, -unnecessarily shortened, fearfully sacrificed, as it still is. "The year 1685," says Mr. Macaulay, in his philosophical and admirable history of England (the perusal of which has afforded us more enjoyment than we can well express), " was not accounted sickly; yet in the year 1685 more than one in 23 of the inhabitants of the capital died. At present only one inhabitant of the capital in 40 dies annually. The difference in salubrity between the London of the nineteenth century, and the London of the seventeenth century, is very far greater than the difference between London in an ordinary season, and London in the cholera."* And yet how much does it still need improvement; how greatly might life still be lengthened; how obvious, in many cases, are the means which offer themselves! Let us all strive to aid in the great work.

The superintending inspectors appointed by the Board of Health have been actively engaged in taking evidence in various towns, and the reports in some cases are, we believe, nearly ready. From these we shall be able to judge of the advantages which are likely to follow the inquiry. From Gloucester, amongst others, where numerous defilements exist, we have received intimation that the inspector, Mr. Cresy's, inquiry has been very elaborate and careful, which, knowing what we do of Mr. Cresy, is nothing more than we anticipated. Letters from another town, as to temper and prejudice exhibited by the inspector sent down there, are less satisfactory; we forbear, however, from any definite statements on the subject just now. It is stated that nearly one hundred towns and places have petitioned the Board to send down an officer to make public inquiry, with a view to the application of the Health Act: and, in consequence, the Board have appointed two additional inspectors, namely, Mr. T. W. Rammell, and Mr. W. Lee, of the firm of Flockton, Lee, and Flockton, of Sheffield, of which town he was surveyor of highways.

At Chelmsford, where the inquiry has just commenced, the inhabitants arc entering warmly into it,—anxiously affording all the assistance in their power. We are glad to find foremost in the official announcement of the subjects to be inquired into, "The State of the Burial Grounds," and sincerely hope that no pains will be spared to obtain accurate information on this head. That the burial grounds are most fruitful sources of disease, there can be no doubt on the minds of unprejudiced men who have inquired into the matter.

In the course of the investigation under the Act, which is now going on in Worcester, Mr. Orwin, a surgeon, brought the matter very prominently forward, giving a startling picture of the condition of the graveyards in that city. We extract two or three paragraphs from his evidence:-

" St. Martin's.-The present sexton has lived in a house adjoining the churchyard about six years. When he first resided there, he frequently

years. When he first resided there, he frequently

* The following quotation from the same work will be
found not impertinent. "Of the blessings which civilization and philosophy bring with them, a large proportion is
common to all ranks, and would, if withdrawn, be missed as
which the rustic can never as by the peer. The market place
which the rustic can never as by the peer. The market place
which the rustic can never as by the peer. The market place
which the rustic can never as year to the peer.
The street which now affords to the artisan, during the whole
inglift, a secure, a convenient, and a brilliantly lighted walk,
was, shundred and sixty years ago, as dark after sunset that he
would not have been able to see his hand, so ill-paved that
when the sum of the sum

experienced a very unpleasant smell, which affected his health very much, but he has now become more accustomed to it, and does not find the evil so serious. This ground is so full that they cannot tell where to make a grave without first horing the ground. The sexton has known the gravedigger

tell where to make a grave without first norms me ground. The sexton has known the gravedigger take up a coffin, in mistake, containing a corpse in a state of putrefaction, which he has heen obliged to put into the ground again and close the grave, and make one elsewhere.

Saint Nicholas.—This churchyard has heen closed for some time, owing to its being so over-crowded with the dead. There is a crypt beneath this church, in which corpses are huried in wooden coffins. The exhalations, which issue through the apertures on each side of the crypt, have caused great annoyance to the rector, who lives close to the church.

great annoyance to the rector, who lives close to the church.

Sr. Helen's.—This churchyard is so full that it has been closed. A respectable inhabitant, who lives near, has been frequently very much annoyed by the offensive stench. Interments have taken place in the church in wooden coffins; and the sexton informed me that, when a vault has been opened, he has known the smell to be almost intolerable, and has been obliged to throw the church windows open, and leave theme so for some time.

All Saint's.—This churchyard is very full, although interments still take place there. A very great annoyance used to be experienced by some of the inmates of the houses adjoining the churchyard, which have been recently pulled down. These houses were partly below the level of the yard, and in close contact with the soil. It was stated to me by some of the occupants that the putrid matters actually oozed through the wall, rendering it damp and discolured, and causing a most offensive smell. The health of all the members of the family was more or less affected.

Sr. Anderw's.—Coffins are frequently exposed.

more or less affected.

St. Andrew's.—Coffins are frequently exposed in digging graves. Many coffins have been placed in this ground with not more than 17 inches of earth above them.

St. Alban's.—The smell arising from interment.

ST. ALBAN'S.—The smell arising from interments here is frequently of a very obnoxious kind. There is also a plot of burial-ground banked up against the hack of the church, and enclosed from a populous street by a high wall, through which the rain may percolate and carry impurities from decomposed bodies into the street on the one hand, and underneath the church on the otber."

Some extraordinary facts, proving the deathdealing power of the gases given off by decomposing bodies on opening the ground, even long after interment, and where no smell was perceptible, will presently be made public. It is a mistake to suppose that when there is no smell there is no danger. On this point Mr. G. A. Walker says, in a recent letter to the Times,-"Though the nose is not merely an ornamental appendage to the face, but the registrar of odours; and though the "sentinel" may be constantly on guard, he cannot persist in the recognition of even the most disgusting effluvia beyond a certain period of time. Yet what does this prove? Why, that by the sense of smell we recognise the presence or absence of an odorous compound-that is all. Let not people, therefore, deceive themselves, or deceive others. Life has, in myriads of instances, been destroyed without any smell being perceptible. If it were not so, how comes it that the fathers and mothers of the generations that are past, have never smelt the miasms that impaired the health or destroyed the lives of their offspring by the various diseases to which childhood is more especially liable—as measles, scarletina, &c., &c.? Or why was it that, about this time last year, when the mortality in London alone exceeded by thousands the ordinary two-weeks' average-why was it, I say, that no man smelt anything peculiar; whilst this year, when cholera (an exaggerated form of typhus) is the destroying angel, have the victims seen, or have they recognised by the nose, the peculiar principles that have poisoned their blood, and 'knawed' them out of their lives?"

In this same letter, speaking of Clement'slane, Strand, and its graveyard, he says,-"That in this lane, in which the living breathe on all sides an atmosphere impregnated with the odour of the dead, the proportion of deaths on the eastern, the graveyard side of it, are at the rate of one in each house. That is, there are thirty-seven houses on that side, and thirty-seven dead bodies are taken out of these thirty-seven houses during the year."*

Our recent statement in respect of St. Margaret's Churchyard, Westminster, is even further borne out by fresh correspondents, with offers of evidence if required.

Passing to another and most important branch of sanitary inquiry,-the new Metropolitan Sewers' Commission has at length been issued and opened. A notice of the proceedings at the first meeting will be found in another place, including an admirable address by the Earl of Carlisle that will be read with interest.† It would not be amiss if one of their first acts were to direct their officers to set themselves right with the public to the extent that they have been damaged by the report of Messrs. Walker, Cubitt, and Brunel, on the city of London sewers, which by inference seems to question, in the politest manner it is true, something more than the judgment even of these officers.

Apart from any special statements, it must be distressing to such of the public as are anxious to arrive at the truth, to find an entire difference of opinion between men standing so high in estimation as the three engineers named, and those to whose direction the metropolitan sewers (without the city), are confided. While the latter attach considerable importance to the form of sewer, and condemn the flat bottomed, the former says :- "Although in strict theory the velocity of a given quantity of water running in the bottom of a sewer of the same height, width, and elevation, will be greater in the narrow-bottomed or egg-shaped than in the circular, it does not follow as a necessary consequence that this greater velocity or greater depth of water will more effectually carry with it the grit and sand that collect in the hottom. Practically the wear of the flatter sewer will be more uniform, and, as we have observed, experience has proved that the shape but little affects the deposit, while in other respects the flatter shape has advantages. So much are we impressed with this opinion, that in place of advising an invert more pointed and contracted than the semicircle, we should recommend the trial of a flat bottom of stone, or other hard material, 14 in. broad, for a sewer of 3 ft. in width at the springing of the arch, and 5 ft. high, as more likely to keep itself clear, less subject to unequal wear, and certainly very much more convenient for being cleansed.'

This, and other wide differences as to the size and efficiency of existing sewers are most important questions, and ought to be set at rest forthwith.

The "water question" can scarcely fail to occupy public attention, being one of the utmost importance. We have several pamphlets on the subject before us, but must seek another opportunity to refer to them. The reform of our cattle markets, and the removal of Smithfield, too, belong to the movement, and are brought to notice at this moment by the reopening of the Islington cattle market, which took place on the 9th.

Mr. R. B. Grantham, civil engineer, saying, with Shakspeare-

"Away with me, all you whose souls abhor Th' uncleanly savour of a slaughter-hous Th' uncleanly savour of a slaughter-house, For I am stifled with the smell,"—

has put together some valuable information on the abattoirs of Paris, and has considered, in an unprejudiced and able manner, the advantages to be gained by the introduction of similar establishments into England. Those who are investigating the question will do well to consult his treatise.*

We would again urge the paramount importance of the general question of sanitary improvement on our readers and the public, earnestly bidding them remember, that the great objects in view are,-

To SAVE MONEY,

To LESSEN SUFFERING, AND

To LENGTHEN LIFE:

and, moreover, that these grand results may all be obtained with certainty.

ON MONUMENTAL ARCHITECTURE. †

In Germany, the sculptors of the different schools—those of Cologne and Nuremburg, in particular—attained considerable perfection in their art, and a greater energy and variety of character may be found in their works in consequence. Of their altar tombs, those of Louis IV., Landegrave of Thuringia and Hesse, at Rheinhardsbrunn, of the thirteenth century, of the Landegraves Conrad and des Eisemen, with his wife, at Marhurg, are fine specimens. On that of the Archbishop Peter of Aspett, in the Cathedral of Mayence, he is represented the Cathedral of Mayence, he is represented with three youths, on two of whom he lays his hand to bless them. Some effigies are also to

head to bess unem. Some emgres are also to be found placed upright against the wall.

In the hronze tomb of the Emperor Maximilian, at Inspruck, the work of Tyrolese artists, the whole spirit of Feudal chivalry seems embodied. He is represented kneeling on his sarcophagus, and around him stand in solemn order the effigies of twenty-eight vassal sovereigns, dressed in their full costumes and sovereigns, cressed in their ten costonies and armour, as if guarding the remains of their imperial lord. The execution is vigorous and bold, and in character with the grand con-

ception of the whole.

The Gothic of northern Europe found no The Gothic of northern Europe tound no congenial resting-place in Italy. The hand of classic influence and fame, of civil freedom and contesting republics, had but little sympathy with Teutonic fendalism. The style of ecclessiastical architecture introduced from Germany with Teutonic feudaism. The style of ecclesiastical architecture introduced from Germany was completely modified,—it flourished only as an exotic, and as it were on sufferance, the native principle of horizontalism, which had descended as an heirloom from antiquity, continually battled against the aspiring tendency of the other. Still more powerfully was this influence exerted upon the monumental art. Surrounded by the classic models, the Italian sculptors drank deeply of the well thus institutingly offered to them; and their art depending for its progress on the exertions of the different masters of the various schools, in whom the profession of architecture and even of painting were generally combined, a greater individuality of character and energy of action supplanted the calmer repose of the Gothic monuments, which seem rather the reflex of the feelings of their nation and age, than the language of the individual thoughts of their authors. The simple piety and purity of mind

of these early artists prevented their feeling or these early artists prevented their feeling any sympathy with the uperstitious and pagan imagery of their models, from which they gathered only the principles of their art, the attitude and expression of the figures, com-position, and arrangement of the draperies. Their spirit was as yet completely Christian, and it was from sacred subjects, and the tradi-tions of the church, they theregoened the tions of the church, that they selected the themes for their chisel. In this progress Pisa took the lead; her school gave the type of the early Italian monumental architecture; she carly Italian monumental architecture; she adopted the sarcophagus in opposition to the altar tomb; a lofty canopy with pointed arch overshadowed it; two angels, drawing aside a curtain, revealed the effigy of the deceased in slumber or in death, while sometimes the figure was repeated above, seated or in action, dressed in the royal or sacerdotal robes, or in armour, or even mounted on a war lorse. At armour, or even mounted on a war horse, times, the lower figure is represented naked, or in the habit of a monk, to mark by the conin the habit of a monk, to mark by the conint the property of earthly grandeur. Of these, In the habit of a monk, to mark by the contrast the vanity of earthly grandeur. Of these, the tombs of Gregory X. at Arezzo, by Margaritone, and Pope Benedict XI. in S. Domenico, Perugia, by Giovanni Pisano, are good examples. That of Urbertino, in the Bardi Chapel, S. Croce, by Maso, represents him in a fresco within the arch, instead of the usual marble figure, reien from the accordance. marble figure, rising from the sarcophagus in full armour at the summons of the last

full armour at the summons of the last trumpet.

At Naples there are some magnificent sepulchral monuments, possessing more of the chivalrous spirit of northern Europe. Those of King Robert, and his son Charles, Duke of Calabria, in the church of S. Chiara, by Masaccio, are exceedingly rich; their figures are easy and dignified, represented both in life and in death. The king is seated on his throne, and beneath, lying on his sarcophagus, in the habit of the Franciscans. In the church of S. Giovanni, at Carbonara, is the tomb of Ladislaus, King of Hungary, by Ciccione. The Ladislaus, King of Hungary, by Ciccione. The equestrian statue of the monarch surmounts the arched canopy, which is supported by four

carvatides.

But when Brunelleschi recurred to the circular arch, and, abandoning every Gothic tendency, struck out a fresh path in architecture, and Michelangelo's genius in sculpture authorised the study and adaptation of the antique, the cinque cento revival burst every barrier to its progress, and, like a mighty torrent, swept onwards, overwhelming the pure spirit of Christian art, and having firmly established its rule, throughout, Italy metablished its Consum art, and naving mrmy established its rule throughout Italy, gradually spread over the whole of Europe. The spiritual and universal character of monumental art expired: henceforth we look only for the creations of the master minds of the epoch. The new style had no feelings of its own, no relivious enthus. had no feelings of its own, no religious enthusiam; it thrived on the mythology of the past, which at best combines but ill with the sacred character of a Christian tomb. For instance, see the heterogeneous combination of heathen gods and goddesses, sirens, angels, and saints, wunRoman warriors and emperors, that adorn the
tomb of the Doge Vendramini at Venice,
which is otherwise a fine work of art. It
is by their richness, elegance, and delicacy
of execution that the best monuments of
this period claim our attention. But though
the pulsations of this change beat to the
very extremities of civilised Europe, the genius
which atomed for it at its source was more and goddesses, sirens, angels, and saints, with which atoned for it at its source was more sluggish in its circulation. England in par-ticular had but little reason to be thankful for the innovation. In exchange for the glorious monuments of her Gothic architecture a cumbrons, heavy, tasteless, and corrupt style in general prevailed, till they sank at last into the most barbarous, mindless copyisms, whose numhing influence, with a reaction as complete and as general as was the change wrought by the cinque cento in the first instance, flowed back through the veins it had traversed till it froze the very life-hlood at the heart itself.

To Italy, however, this was the age of her maturity in the arts: popes and princes rivalled each other in the naturage, they actualled

maturity in the arts: popes and princes rivalled each other in the patronage they extended to them, and many and noble are the names of the great architects, painters, and sculptors who have immortalized themselves hy the works which they have left to us. Thankfully do we acknowled the randeur of their combet the exuberance of their fancy and powers of invention, with the richness and delicacy of their execution, and yet, particularly in the

subject hefore us, we cannot hut deplore the loss of that simplicity and earnestness which animated the early masters, now superseded hy a restless spirit of display, with the revived imagery and mythologies of paganism, which suited not as well as the monumental architec-ture of Christianit.

ture of Christianity.

The general type is hnt little changed,—the hody rests on the sarcophagus as hefore, the pointed arch of the canopy is hecome semicircular, classic columns and panelled pilasters, circular, classic columns and panelled pilasters, filled with graceful arahesques supported it, and they were adorned with statues and basreliefs representing the heathen deities, fawns, satyrs, griffins, and other fabulous creatures mingled with the personages of sacred and profane history, and the traditions of the Church. This was the prevailing tendency of the age, yet, from the vigorous hands of those masters whose genius shone with a splendour like that of the evening stars—their yery brillike that of the evening sta masters whose genius shone with a splendour like that of the evening stars—their very brilliancy deepening, by the contrast, the shades, which, when they were gone, obscured the arts, we have many fine works impressed with their individual originality of character.

Michelangelo, the leader of this revolution, has bequeathed to us, of the mighty creations of his impetuous imagination, the majestic

of his impetuous imagination, the majestic figure of Moses and the four caryatides, designed for the mausoleum of Julius II, and the monuments of Giuliano and Lorenzo de Medici, with their celebrated figures of Night, Morning, Noon, and Evening; and ahove them, in their separate niches, the stern armed statues of the two heroes themselves, of whom thus speaks Rogers in his "Italy:"—

"There, from age to age, Two ghosts are sitting on their sepulchres.
That is the Duke Lorenzo: mark him well.
He meditates—his head upon his hand.
What from heneath his helm-like honnet scowls?
Is it a face, or hut an eyeless skull?
'Tis lost in shade, yet, like the basilisk,
It fascinates, and is intolerable. His mien is nohle, most majestical! Then most so when the distant choir is heard At morn or eve.—Nor fail thou to attend On that thrice hallowed day, when all are there— When all, propitiating with solemn songs, Visit the dead. Then wilt thou feel his power."

The adaptation of the church of S. Francis de Rimini, hy Alherti, to the purpose of a mausoleum for Sigismond Malatesta, who desired that his marshals, with whom his for-tune in this world had heen cast, should be associated with him in death, is a noble conception. A simple arcade, of fine proportions, adorns the flank wall, under each recess of which, in their solemn order, stands one sar-cophagus, and on the adjoining pier a tahlet

records the name of its inmate.

records the name of its inmate.

Well suited to the condition of society and character of the nation in France, with the gay and voluptuons Francis I. and his pleasure-seeking Court at their lead, the spirit of the revival—introduced from Italy by Jean Joconde, the pupil of Brunclleschi, Demigiano, and Paul Pouce Trebati—soon hecame naturalised there; and in the hands of the sculptor architects of the time, its career was brilliant. architects of the time, its career was brilliant. Exuberant in richness and invention, graceful in execution, and delighting in the charms of heautiful females, whose naked forms every of heautiful females, whose naked forms every where meet the eye in their works of sculpture, painting, or jewellery,—we may wonder that, in some of their sepulchral monuments, a deep and serious feeling, and even a dignified propriety of character may be found, as in the tomb of Louis XII. and Anne de Bretagne in the Church of S. Denis, the design of which was by Jean Just, and the sculpture by Paul Pouce. Naked and stiff in all the fearful reality of death, their bodies are laid out on a which was ny Jean Juss, and the actipant I, Paul Pouce. Naked and stiff in all the fearful reality of death, their bodies are laid out on a rich sarcophagus, an arcade of light and elegant proportions surrounds them, in each opening of which is seated an apostle hearing his respective insignia: panelled pilasters, sculptured with arabesques of inconceivable delicacy and grace, support the entahlature, which is hroken over each, giving a playful effect: ahove are the kneeling statues of the king and queen in prayer. The whole stands on a hasement of black marble, with panels of bronze, representing the victories of Louis.

Of similar arrangement is that of Henry II, by Germain Pilou, also in S. Denis, but deficient in the chaste and severe sentiment which characterizes the other. Even by the naked

characterizes the other. Even hy the naked body of the king, three Pagan graces are re-

presented holding the vase which contains his

heart.

The reclining figure of Phillip Chahot, admiral of France, hy Jean Cousin, is a fine work hy that vigorous and powerful artist.

The tomh of Louis de Breze, in Rouen Cathedral, is an effective monument, of black

and white marhle. His hody lies on a fluted and with marine. It is now new or a nucus sarcophagus. The projecting wings are each supported by two columns, on the lower stage, and by caryatides above: under an arch in the centre compartment of the upper stage, is the equestrian statue of Lonis, armed cap à pié, and very spirited in execution. Also in this cathedral is the tomb of Cardinal Amhoise, by Roullant Le Roux, a chef d'œuvre of the Renaissance, displaying all the characteristic elegance, richness, picturesque variety of details, and delicate execution, of the style, but wanting in the appropriate character of a sepulchral monument.

Gradually, however, these last gleams of the horrowed light of classic Paganism died out, after having irretrievably destroyed the purer spirit of mediæval Christian art. A mist of thick darkness then crept over the monumen-tal architecture; for, awed by the superior excellence of the great artists of the revival, and in despair of ever equalling them, their successors dwindled into insufferable copyists: the mantle of Michælangelo had not fallen upon his unwortby initators, and never did genius exercise so disastrous an influence on posterity, as in this instance. Then were all the stores that were previously undisturbed, ransacked for ideas. Copies, like portraits taken from for ideas. Copies, like portraits taken from the clay cold corpse, utterly without regard to propriety: unintelligible, abstruse allusions; quotations from a dead language, were palmed upon a credulous age, under the specious authority of antiquity. Pyramids, and the property of the pr specious authority of antiquity. Pyramids, ohelisks, and urns, with scraps from Greek ohelisks, and urns, with scraps from Greek and Roman models, and every style that had ever existed, were now reproduced in harharous confusion, and as if the numbing influence of inability blighted every thing they touched: all the grace, the elegance and beauty of proportion of the originals had vanished, and they deserve not even the credit of faithful convists. In the medieval ages, men and they deserve not even the credit of raunful copyists. In the mediaval ages, men worked for the honour of God and for the rest of the souls of the departed; and, mistaken though they were in the latter motive, it was yet with them a labour of love and devotion. But now the pomp and pride of heraldry had assumed their place; the attempt to impose, and But now the place; the attempt to impose, and the vain, selfish spirit of display, obtrude themselves in all the works of the time, marring every effort, like the corroding influence of The architecture hecame cumbrous and rust. In a architecture necame cumprous and disproportionate, orders were piled above orders, with hroken pediments and entablatures, surmounted hy escutcheous and scrolls, lavishly adorned with gaudy colour and gilding, and with long pompous inscriptions. The officies are stiff and coarse in execution, and effigies are stiff and coarse in execution, and represented leaning on one arm, kneeling, ting, or standing; the hushand and wife at times facing each other with a faldstool he-tween them, and often their children in succession hetween them, or in a panel helow, the cession netween them, or in a paner nerow, the males on one side (the eldest of whom usually was alone clad in armour), and the females on the opposite side; while Cupids and Griffins support the shields with the coats of arms or

support the shields with the coats of arms or heavy wreaths and draperies.

Towards the seventeenth century, however, a change appears to have taken place, the predominant architectural character of the monuments declined, and gave place to the composition and grouping of the sculpture, with an increased energy of action and expression in the figures. They are consequently more dramatic than contemplative, and are thus opposed matic than contemplative, and are thus opposed to the abstracted imaginative symbolism, and calmer repose of the works of the infancy of Christian art,—a necessary result of the com-parative conditions of society, and not indeed to be regretted had the same simple, earnest spirit still approach the same simple, earnest spirit still animated them as formerly, for those were hut as the hudding hlossoms of an expectant, trustful spring, which had now passed into the more mature and full blaze of passes into the hore matter and full blaze of an autumnal sun, under the influence of which, the fruits, of which they only saw the promise, were enjoyed. But infortunately this position had its perils as well as its advantages, both in the restless, undirected wanderings of medio-crity, and in the still more fatal lapses of overweening selfishness, affectation, and impiety, which have induced a general want of purpose and character in these monuments, with over-strained attitudes and far-fetched allegories.

But in some hetter hands they have fared differently, and we have many works of modern times, which even more than answer our expectations, and shew that degree of excellence which we have a right to demand from the age. For, standing on a high vantage ground above the heathen of antiquty, groping in supersition, and over the medieval Christians, not only in the comparative purity of faith, and freedom from error, but also in the advance of science and knowledge, of civilization and liberty, we have a place in the universal history of art, which it is our duty to occupy;—a path of progress, and not retrogression, which we ought to tread.

The aim, then, of modern monuments heing the representation of the ideal and the expression of action, they claim to be judged of by the general canons of art, according to their expectations, and shew that degree of excel-

the general canons of art, according to their

individual merits.

Rysbrack, Roubiliac, Banks, Bacon, Flaxman, Chantrey, Canova, and Westmacott are among the chief of those sculptors whose monumental works are to be found principally in St. Paul's and Westminster Ahbey, and a few scattered in other cathedrals and churches.

In St. Paul's they appear to the hest advan-tage, combining well with the architecture, and imparting a life to its otherwise dreary untenanted space, and, although considered sepa-rately, most of them are unsuited to a Christian church, yet in their general effect such blemishes are lost.

blemishes are lost.

In Westminster Ahhey and the Gothic cathedrals they seem utterly out of harmony with the huilding, in one place blocking up a mullioned window, at another cutting into the panel work or hiding the piers, and by the violent contrasts of colour and even by the introduction of classic mouldings and details, can only he considered as hurtful to the general effect. ral effect.

Considered individually, however, the greater part will not bear too close an examination. part will flot lear too close an examination. The hero often bears but a subordinate part in the composition, perched up on a column, perhaps merely a bust or medallion of him which some condescending angel is putting in its place, or crowning with a wreath, while accompaniments have little of a sepulchral accompanients have inter of a sepulcinra character, weeping genii and cheruhs, with perhaps Hercules or Mercury attended by tame lions, or sitting composedly on the hulk of a ship, with a canopy of sail cloth suspended above, the affinity of all which, to a Christian

above, the affinity of all winch, to a Christian monument, it might he difficult to discover, Tbe monument to Mrs. Nightingale, by Roubiliac, in Westminster Ahhey, from the lower part of which death, as a skeleton, lifts lower part of which the husband is endeavouring to shield, is very original and of consummate execution, but displays all the terror that death can inspire, without the consolation that the religion (to which the edifice that contains it is consecrated) might he supposed to afford. Chantrey's Bishop Heher, who is blessing two children, is appropriate; and, taken hy itself, the monument to Sir Ralph Abercromhie is effective, and well grouped; the repose of the sphinx on either side contrasts finely with the more violent action of the centre, where a soldier supports the hero as he falls from his horse. The monument to Mrs. Warren in the Abhey is, however, a better work, by Sir R. Westmacott. In the works of Flaxman we find a proper sentiment and deep feeling, with high technical merit, general composition, grace, and managethat contains it is consecrated) might he supmerit, general composition, grace, and management of drapery; his monument to Lord Mansfield is a noble work; those to Nelson and Earl Howe are good. But it is chiefly Mansfield is a noble work; those to Nelson and Earl Howe are good. But it is chiefly from his hasreliefs the studies and casts of which have been lately given to University College, London, that a due estimate of his excellence can he gained; they are truly a rich store, from which many a useful hint may he gleaned, even with respect to the architectural composition of manufacts.

gleaned, even with respect to the architectural composition of monuments.

Among the eccentricities of genius, I would allude to a tomh which defice classification, but stands alone, remote from every thing which has been, is, or ever will he conceived—Sir John Soane's monument to the memory of his wife, in the burying ground of St. Gilesof his wife, in the hurying ground of St. Giles-in-the-fields, St. Pancras: it is as capricious

as his own museum, and nearly as deserving a pilgrimage.

These works, however, are confined to a few places, beyond which they seem to have had hut little influence. In the general mural monuments of our churches, and in the cemeteries, in which we possess a magnificent arena for the display of art, and where the imagination need not to be so restrained as in a church, we have indeed nothing as yet to leave to posterity, to mark our national character, religion, feelings, or tastes,—no trace of any originality of sentiment can be found. Ancient emblems of immortality, sometimes rendered in cement, as if in mockery, dwarf and triangular obelisks, broken columns, with urns and jars of every conceivable inelegant form, as if the custom of burning the dead still existed; and all the mournful, cheerless, emblems of paganism and mortality in disgusting profusion, yet none that the rich stores of the catacombs of Rome or the Gothic tombs would supply.

In all monumental works, simplicity is essential, yet not the false simplicity of the cemeteries, which places one luge slah on four source blocks, to reseable a seat as much as a

In all monumental works, simplicity is essential, yet not the false simplicity of the cemeteries, which places one lunge slah on four square blocks, to resemble a seat as much as a tomb, and which causes so many of our monuments to have no other interest than may be attached to polished specimens of granite or marble, mere empty concessions to inability;—but that arising from terse language with fulness of thought, suggesting more than is expressed, disdaining all gaudy fritter and affectation, but not forbidding richness and magnificence where there is much to be told.

magnificence where there is much to be told.

Also a solemnity of treatment, remembering their purpose, and withal a cheerfulness of character, in that the faith of a Christian should look beyond the terror of the grave.

Mournful despair should have no part therein.

Mournful despair should have no part therein.

Then a due regard should be had to its propriety with the situation it is intended for If to be in a building it should harmonize with the architecture, of which it should, as it were, form a part and an expansion.

form a part and an ornament.

If the building be a church, which indeed is an appropriate place for the memorials of her children, the character of the moument should be in accordance. No Pagan heroes or mythological allusions can there be tolerated. The dead lie there as members of the Christian church, and that which would have been indecorous for him when alive to have done, should not appear on his tomb, neither the orator on his rostrum, the soldier in the hreach, nor the trumpetings of fame, can be permitted on her monuments.

Yet again, if the building be a senate-house or a walhalla, the case would be altered, nor would there be any impropriety in such representations. There, worldly glory should receive its meed of postbumous renown, and the love and gratitude of their fellows may filly vie in appropriate panegyries. Man's, is there the presiding genius of the place, but not so in the temple of God.

John P. Seddon.

PROFESSOR COCKERELL'S LECTURES ON ARCHITECTURE,

The annual course of lectures on architecture at the Royal Academy commenced on Thursday the 4th instant. The professor said that the object of these lectures was to place before the students those essential theoretical points which do not present themselves prominently in professional practice. At the outset, the student flattered himself that his time was to be spent in the study of design, and the cultivation of the attractive graces of the art but in the mrgency of his office duties, be soon found that little time was left for these delights. Technical details demanded his attention, and what ought to be first became last. He became appalled at the extent of the demands upon his powers. He soon came to regard the fine art as a thing secondary in importance, whilst he learnt the truth that the urgency of office business is indeed the urgency of daily bread, finding, too, after all, his noble aspirations regarded by the vulgar as vain enthusiasm.

Another contingency which would befal the student, was the special preference which the master under whom he studied might have for a particular style. This the student folowed, and to all else became a bigot. Were

the style mediæval, he felt no excellence but in copying; if Greek, all else was barbarism. He found, too, that he was subject to fashions in architecture, which he must follow, as he might those of dress, and unhesitatingly, almost enthusiastically. The adoption of the Egyptian style, and of the Greek were such instances. In the case of the latter, the taste was signalized by complete misappropriation, and every house was built to make-believe a hexastyle Doric temple. The art had long wanted some learned champion, who should take up the cudgels of sound criticism, and battle for the right.

Upon such rocks as these, then, the professor said, the student might suffer shipwreck, and therefore what should be his means of safety? How should we emancipate ourselves? It was plain that if fashion were to he the arbiter, a doubt would arise in the student's mind as to the true dignity of his art. He might ask,—Is taste but a fashion?—How should he aspire, then, to think, originally? The answer should be found in these and similar institutions.

The professor then referred to the increased advantages now within the reach of the student, the different lectures and classes affording the means of acquiring every branch of knowledge; and although, as he showed, they were not so fortunate in this respect as the students in France, yet as these were advantages which our predecessors never had, present time ought to spare something for the art. He also adverted to other requisite qualifications, saying that the architect should be a good workman, and distinguished by dexterity of hand as well as of mind, and cited Anaxagoras, who attributed the supremacy of man as much to the powers of the hand, as of the head. He also related an anecdote of Rennic, who having repaired the wheel of a stage coach, in which he and an aristocratic fellow-traveller had previously been on colloquial terms, found himself, as a workman, treated with great reserve and hauteur, and described the amusing discomfiture of the same traveller, on finding next day that the most honoured guest of the noble lord with whom be had to dine, was his companion, the workman, who now treated him with corresponding distance.

The professor then made observations of a similar tendency to some in a previous course, on the influence which was to be attributed to painters, condemning, in the words of Philibert de POrne, the "pretty drawings" in which aerial effects, and efforts foreign to the art of architecture, were discernible. He said that the picturesque had heen a characteristic of all the arts of "the revival;" but in all cases, whichever art was prominent, the others were drawn towards it. For example, Greek art was sculpturesque, Egyptian art architectonic. This we should do well to bear in mind; and the greatest conceptions of our art had unquestionably been when architectonic art was pramount, and of opposite character, when following the treatment of painting and sculpture. In speaking of drawing, the professor conveyed the impression, that he did not esteem it of the engrossing importance sometimes claimed for it. Wren spoke of perspective, but it did not appear that he was a great draughtsman; but on bis works might be inscribed, numero, pondere, mensura. Amongst them great skill was to be found, the higher qualities of design he believed were impaired, whilst he had noticed that the architect of the Hotel de Ville, was inferior as a draughtsman. In the present day, we found the great number of our resources was being continually augmented, and calling for fresh adaptation of means to an end; but the art in its principles was ever unchangeable.

Finally,—in words which we must give verbatim, the professor said,—I congratulate you on the choice of a profession so entirely that of a gentleman; for as my German friends truly say, "no man can be a thorough gentleman unless he has something of the artist in him; and no man can be a thorough artist unless he is (in uind and character at least) a thorough gentleman."

I congratulate you because in this art and science, are comprehended all the supremacy and all the faculties of our nature, and all the privileges of the lord of the creation; for all

intellectual rank and authority are accorded to him, and all the conquests of the artificer man are his enjoyments,—the whole field of science, exact and natural, are open to his investigation, and explained and tested by him. As a thinker and as a workman, he finds the fullest enjoyment, and an ever fresh pursuit,—he is incapable of tedium, languor, or ennui. His associations are amongst the gifted, the virtuous, and the diligent; with them and from them he is ever learning "wisdom and understanding and knowledge," like Bezaleed or Hiram. He stands hefore princes, as their counsellor and confidential friend, and holds their purse-strings; and he takes by the hand the humblest artificer. As entrusted and endowed with so many talents and privileges, lie is their appointed arbiter, and establishes justice and judgment and equity between the little and the great; and thus discharging them with fidelity and modesty and skill, he becomes the key-stone of the social arch, and binds all the speculative and industrial classes together in a mutual support.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AT a meeting of the Institute, held on Monday the 8th, Mr. Sydney Smirke, vice-president, in the chair, Mr. C. H. Smith read a paper, "On the various Qualities of Caen Stone," which was written expressly for our pages, in continuation of the inquiry therein commenced, and will appear in due course. The paper will be found very vahuable, comprising analyses of the stone, and experiments on the ability of the different beds to resist compression, and on their powers of absorbtion.

Mr. Smith, in the course of reading the paper, made some additional remarks. As to Henry VII.'s chapel, he said, a general impression existed that it was originally built of Caen stone, and the miserable state into which it had fallen previous to its restoration had tended to destroy confidence in that stone. He could not find any record bearing on the subject, and it was his firm belief, after a long and careful inquiry, that it was not built of that stone. Speaking of the fact, that where the stones of a building in a smoky town are seen of their natural colour, decay is generally going on,—he said that temperature materially affected stone;—those sides of a building which received the rays of the sun decayed soonest.

The Chairman said nothing was more important to the architect than the proper choice of materials; he was like the peinter in this respect, hut was worse off, because cost must always be considered. This question of cost had aided the introduction of Caen stone. In one building erected under his own direction, the use of Caen stone instead of Portland involved a saving of 1,2001. or 1,4001.

Mr. Godwin being requested, made some observations on a table of experiments on the resistance of Caen stone to pressure exhibited by him,—to which we shall refer hereafter.

Mr. Bellamy and others also spoke.

SOMETHING ABOUT ST. PAUL'S CHURCHYARD, LONDON.

To begin at the beginning—as every city, town, or village presents the productions of the builder's art, in contra-distinction to the glorious works of nature on the broad expanse of bill and dale, so do these works of the human hand, where man delighteth to dwell, become pre-eminently distinguished above the rest when the architect has lavished on them the resources of genius in fine art conception and decoration. These enduring monuments record to after ages the degree-of civilization and mental acquirements of the epoch; they form the bistory of a people typified in marble or in stone. The Tower of London, Westmisster Abbey, and St. Paul's Cathedral are the three great landmarks of this vast metropolis,—the first, by its antiquity, indicating the advent of the Norman race to English rule; the second pourtraying the chivalric age

glorious of all the sacred edifices ever raised solely for Protestant Christian worship.

Lord Byron describes London as—

of the Edwards and Henrys, entounhed within its walls; and St. Paul's standing the most

"A motley mass of brick, and smoke, and shipping Dirty and dusky, but as wide as eye Could reach, with here and there a sail just skipping

Count renear, with the and there are all skipping. In sight, then amidst the forestry Of masts, a wilderness of steeples peeping On tip-toe, through their sea-coal canopy; A huge, dun cupola, like a foolscap crown On a fool's head,—and there is London town."

In the poet's imagination, the huge dome is the sole distinguishing feature of the City, and what painter could idealize the capital without its crowning crest? Thus, every visiter and traveller, either native or foreign, wends the way, on his arrival, to contemplate the fabric of Christopher Wren's master mind, After folling to traveller her Laberte hill.

wends the way, on his arrival, to contemplate the fabric of Christopher Wren's master mind, After toiling tortuously up Ludgate-hill, with an occasional glimpse of a slice of the principal front, steering amidst a throng of persons, all of whom appear to be a minute too late, the lover of architecture arrives at the corner of the churchyard, as the area around the cathedral is called. Here he finds the pathway and roadway, which encircle the edifice, narrowed by a heavy and supremely ugly iron railway, erected on a dwarf wall. The concourse of pedestrians, porters, cabs, omnibuses, coaches, carts, and waggons, are constantly choking the way, to the infinite profit of a numerous progeny of pickpockets, who readily detect a stranger, by his gaze on the architectural glories before him, the price of permission to view them being the abstraction of a handkerchief, a snuff-box, a purse, or a pocket-book. The Mansion-house police reports constantly register the active performances of this peculiar race of small depredators. The visiter may look wistfully to escape from the wire-drawing of the moving population in the confined look wistfully to escape from the wire-drawing of the moving population in the confined circuit, by hoping to indulge his reveries within the three gates of the enclosure, but that they are rarely opened is proclaimed by their dirty condition, and the abundant stains of pollution. The passage on the northern side could not permit the transit of vehicles from its extreme narrowness, without danger; every one thrusts through the crowd here in a hurry-a crowd much augmented by the shewy shops of a bazaar of silk-mercers, haberdashers, milliners, and ladies' cap-makers, attracting the gaze of the fair sex. Here, with their countenances rivetted on the pretty things seen through the 'plate-glass windows, they present an obstruction of bustles and flounces, while the City, men to save analogizing for accidental City men, to save apologizing for accidental concussions of Crinoline (compliments are not concussions of Crinoline (compliments are not profuse among wholesale traders), dart along almost in the longitudinal kennel which runs parallel with the church-yard enclosure. In this channel of stagnant and peripatetic vitality, the true Londoner may be detected with Cuvier-like perspicacity by his earnest walk and unshifting eye, as he wriggles through the current. A business man who has for 20 years run this gauntlet twice a-day at least, felt surprised and doubted the fact, when he was informed that a large portion of the enclosure at the north-east corner was a burialsure at the north-east corner was a burial-ground, filled with tombs and grave-stones; he had never ventured to let a look wander so far. The City blades have made it a standing subject of wagers whether or not there is a tree growing within St. Paul's church-yard, so little was the locality ever made a subject of contemplation or remark.

contemplation or remark.

Having already described a kennel running close by the wall of the enclosure, on the northern side, there will be found no fewer than seventeen tributary open cast-iron gutters leading from the habitations across the pavement, discharging their contents into the main stream. These transverse gutters are very suspicious of soap suds or dish washings—as some of them were streaming to the main channel during the intensely frosty days; the longitudinal grandgutter did not consequently get a boliday through the low temperature, but was active in conducting the specious fluid into the large gratings of the sewer which are studded at intervals. The open jaws of these cavernous deposits may not emit the sweetest of breaths, at least no violets bloom on their brinks. To increase olfactory attractions, a bevy of omnibuses have made a terminus of one portion, where the continued presence of borses adds to the aforesaid kennel a tolerable volume of stable droppings, which a troop of live fowls are inces-

santly occupied in tossing about. Further on, and opposite the official abode of some of the church dignitaries, a stand is creeted for porters to rest their loads thereon, and the wall is here largely desecrated in the same manner that defies the gates of the area in front of the edifice. The graveyard at the north-east corner completes the condition of the northern side: of such an adjunct the voice of reprobation has already spoken with trumpet tongue. A cab-stand occupies part of the southern side, and another on the eastern side, both obstructive to locomotive circulation.

It has always heen regretted that London's greatest architectural ornament should be so barred from an adequate view. The enormous value of house property here has hitherto rendered any expansion of space a serious question of expenditure. The house of Messrs. Butler, at the north-east corner, and that of Messrs. Goodyear, the corner of Wadingstreet, appear built purposely to create impediments. An angular slice from the fronts of Messrs. Hitchcock and Allanson, on the north side, would restore much of an evenness of line there, and these removals would be of comparatively small cost. But how much greater would be the advantages of display, if the ugly iron railing were demolished, and the entire area paved and made open, like Trafalgarsquare, or the space opposite the Royal Exchange. The ruinous condition of the wall on which the cumbrous railing is fixed, will eventually throw it down, unless the influence of good sense should add an embellishment to the city of London, instead of perpetuating an obstruction, until time shall make the dwarf wall a heap of ruins, crushed by the massive weight it bears. Ample room would be obtained for the traffic, by enlarging the roadway on the south-eastern space. The majestic portico would rise into due consequence, as well as the beautiful semi-circular ones of the transepts. Between the steps of the northern portico and the railing, twenty feet more of width would be added to the thoroughfare. What is now redolent of many evils, would become a great improvement and ornament of the metropolis, a source of enjoyment to the cuitivated class of inhahitants and visiters, as well as causing the abolition of a constricted circulation in its present impure and nasty state. The open areas recently added at Trafalgar-square and the Royal Exchange, afford delightful hreathing room to enjoy the scenes around, a kind of refuge from the sweeping torrent of the multitude in the incessant pursuit of mundane matters. There is no apprehension of the steps of the portico being infested by i

AN IDLER IN LONDON.

ARCHITECTURAL LIBRARIES.—Sir: I was much pleased with the remarks of B. in your last as to the Architectural Association, and as I conceive it to be the duty of all members of the profession to put forth any suggestion that shall tend to strengthen the hands of that association, I would submit a proposition for the promotion of a society in connection therewith, for enabling each person becoming a member within a certain period to see all, and be in possession of some, architectural books of his own selection. This I conceive might be done by every member subscribing a certain sum per month, having a right from time to time, as the funds of the society permit, first of drawing numbers on the list, and then in virtue of being one of certain numbers selecting a work of not more than a certain price (unless they pay the difference); parties having paid their subscriptions to be entitled to draw, but those who have not paid up to within a certain period. or who have not subscribed a certain sum by the drawing day, to be disqualified for that time. Or something might be done in the way of an ordinary book club; the work purchased, after having heen circulated, being put up to auction amongst the members.

ST. MICHAEL'S CHURCH, CHESTER

We are happy to learn that the spirit of restoration is stirring in Chester. A subscription is being raised for the purpose of renovating St. Michael's Church, and a design has been decided upon for repairing the tower (which is now in a very dilapidated and dangerous state) ye competition, the successful party being Mr. James Harrison, of that city. The other architects that competed were Messrs. Hod-kinson, Welch, and Park. The expense of the work will probably be about 600%. The present structure is of the Early English style of architecture, plain in character. The chancel was added to it in 1494, and enlarged in 1678. The present tower was built in 1610, and (like most of the other ecclesiastical edifices of that city) of the soft perishable red sand-stone of the district; and the consequent decomposed and weather-beaten aspect of the exterior gives it an appearance of greater aniquity. "This circumstance," says an historian, "seems to have caught the attention of Dean Swift. When this wit was once on his way from London to Dublin, he stopped for some time at the Yacht Inn, in Watergate-street; and being alone, sent an invitation to several clergymen un the city to dine and spend the evening with him. Not one of them, however made his appearance, upon which the Dean vented his spleen in the following epigrammatic philippic:—

"The church and clergy of this city Are very near akin; They're weather heaten all without, And empty all within."

It is intended to restore the tower of the church in the same style of architecture, but of a more ornamental character (?) to strengthen the pillars that support it, and to add buttresses at the angles. It is proposed to case the whole of the exterior of the tower with red sand-stone varying from 18 inches to 10 inches in thickness, and, it is said, of same quality of stone that has given so many proofs of its inapplicability for work of this character. It was proposed to cover this tower with Portland cement, but the building committee bave prudently abandoned that intention.

BLIND BUILDERS, OXFORD.

As you are ready at all times to expose the present injurious system of competition, which the building business is subject to, I beg you will accept of the subjoined list of tenders delivered on the 17th ultimo, for refitting the parish church at Hooknorton, Oxon. The drawings were made by Mr. Underwood, architect, of this city, and the most explicit information given, yet a dozen builders are found whose opinions vary in such an extraordinary degree upon so small a work.

So long as builders continue to rush blindly into competition at all hazards of sacrificing not only their time but their capital also, so long will the London Gazette teem, as of late, with the names of those engaged in this de-

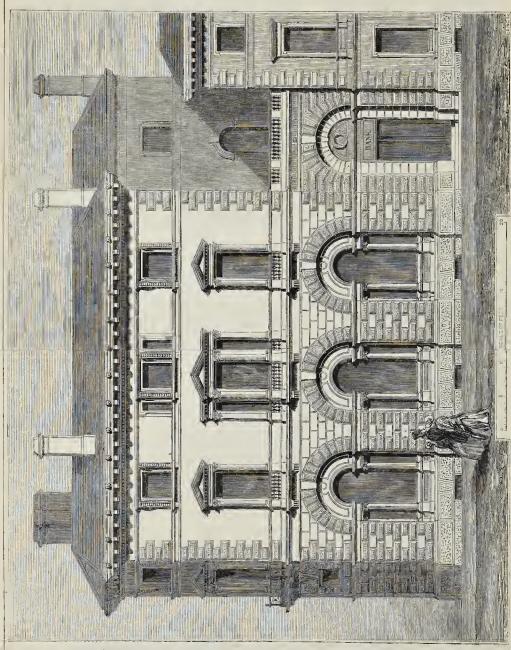

So long as builders continue to rush blindly into competition at all hazards of sacrificing not only their time but their capital also, so long will the London Gazette teem, as of late, with the names of those engaged in this department of commerce—and so long will private individuals and committees cling to a system which in itself both tends to the ruin of the respectable tradesman, and to result in the abominable practice of executing the work by employing improper craftsmen, and bad and unseasoned materials, which cannot fail to end in the mortification of those with whom the direction and the choice are placed:—

Lockwood, London	€895	0	0
Symms, Oxford	798	14	0
Cowley, Oxford	754	15	0
Davis, Banbury	743	17	6

Wyatt, Oxford	657	0	0
Strong, Stow-in-the-Wold (ac-			
cepted)	585	0	0
Herbert, Chipping Norton	575	0	0
Claridge, Banbury	546	2	0
Mackrony, Great Milton	499	10	0

Amongst other lists recently forwarded to us is one of tenders for a new shop front in Pall-mall East. The highest of five is 6201, (a bighly respectable London firm); the lowest 3401.

SIR BENJAMIN HEYWOOD'S BANK, MANCHESTER.

MR. J. E. GREGAN, ARCHITECT.

SIR BENJAMIN HEYWOOD'S NEW BANK, MANCHESTER.

In the course of a recent article on Manchester we made a few remarks on a bank then only partly up, which was being erected in St. Ann's-square, for Sir Benjamin Heywood and Co., under the direction of Mr. J. E. Gregan, architect.

Annexed we now give an engraving of the entrance front. The main building contains, on the ground floor, the public office of the work exactly as it lay in the quarry. This

precaution has been taken in order to preven the premature decay which occurs too fre-quently in our stone buildings, and which is almost invariably to be seen on those stones standing on edge, that is, with their natural bed outwards, and consequently exposed to the corroding influence of the atmosphere."*

* The miserable condition of St. Ann's Church immediately opposite this bank (and a comparatively modern work), is ascribed by the Manchester people to this oversight. It was here that the accident with the steam pipes happened the other day.

THE LIGHTING OF GREEK TEMPLES.

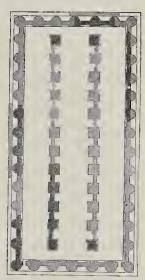

Fig. 2.—PLAN OF TEMPLE OF JUPITER AT AGRIGENTUM.

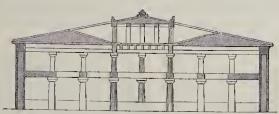

Fig. 3,-SECTION OF TEMPLE AT ELEUSIS.

Fig. 4.—SECTION OF PARTHENON.

Our author, with justice, will neither believe

* Stewart's "Athens," vol. v.

The lower building adjoining contains the domestic offices of the residence, and other rooms not immediately connected with the business of the bank, and is externally constructed with stock brickwork and so services already agreed upon.

The works are not being done by contract, but by measure, and schedules of prices already agreed upon.

THE LIGHTING OF GREEK TEMPLES.

MR. PERGUSSON'S "INQUING INTO THE PRING CIPELS OF PREAFT IN ART."

We have already given our readers some idea of the opinions on matters of art in England entertained by Mr. Fergusson, and of the bold and fearless manner in which he has attacked some errors and prejudices. What we have said has, we lone, led many of our readers to study his book themselves and to enjoy the pleasure the perusal of it affords.

As yet, however, led away by the more salient points, we have not referred to any of the architectural questions which Mr. Fergusson has sought to solve, and this mission we desire now to reetify.

There is nothing connected with the disposition of oreck temples which has given rise to more discussion than—the mode of lighting them. "Many authors, who have been shocked at the clumsinesswith which modern architects restore the hyperfrom, which is always done proposing the latter to the weather as an optromount, have denied its existence altogether." Our author the points out what he considers was the mode of lighting adopted to enjoy the pleasure the perusal of its affords.

As yet, however, led away by the more salient points, we have not referred to any of the architectural questions which Mr. Fergusson has sought to solve, and this omission we desire now to rectify.

There is nothing connected with the disposition of oreck temples which has given rise to move a contract the proposition of oreck temples which has given he had to be a contract to refer the proof to the problem."

The reflexion of the remple of Apollo Epicurius, at a friending normal restoration, at least explains brow in presenting the most of the temple of Apollo Epicur PROJECTED WORKS.—Advertisements have been issued for tenders, by 17th February, for the erection of a new church at Rusthall, near Tonbridge Wells, to be executed in stone; by 25th inst., for the erection of a parsonage-house at Exbury, with offices, chaise-house, &c.; by 1st March, for deepening, widening, &c., 100 miles of drain within the Middle Level, Norfolk, &c., with erection of bridges, sluices, tunnels, &c.; by 15th inst., for alterations and additions to Cleobury Mortimer Union Work-house; by 16th inst., for the formation of a public sewer at Newcastle; by 17th inst., for laying down water-pipes at Southampton; and by a date not specified, for a gas-holder and cast-iron tank, for the United General Gas Company, with six tons of tank plates, and 500 yards of 10-inch, and 400 yards of 6-inch gas mains.

FLOORS FOR COTTAGES.

A PRACTICAL plasterer writes as follows:-I have tried most materials for floors, and, as a composition, I think the best and most a composition, I think the best and most economical mode for ground floors is to lay, on a hard bottom, clean gravel, sand, lime, and tar, to form a concrete, and to prevent damp from rising: then lay down an inch and half thickness of good cement,—either Blashfield's No. I and three of coarse sand, or Atkinson's cement and three of sand, or patent Portland cement and four of clean coarse sand, floated in hy a rule on screeds; care being taken to prevent as much as possible the joints from setting, so that it may he one sheet. If the cement set slow, may he one sheet. If the cement set slow, while soft trowel it down, but not when it is setting or it will injure the face. If it set too quick for that, leave it with a rough key, and cover it an eighth thick with fine mortar, and cover it an eighth times with the morraa, and trowel it down gently before it begins to set. If the floor is not likely to be damp, instead of the gravel, &c., pave it with clean hard brickbats, half an inch apart, and cover it an inch thick only of good cement; this will make a very durable, hard, cheap floor, that will not harbour ditt wet, nor vermin; when done very durance, hard, cheap noot, that will not harbour dirt, wet, nor vermin: when done, it must not be trod on for a few days. As to lime-ash foors,—any lime compositions harden slowly, and don't set hard at once, so that they would not be fit to tread on for a long time; but lias lime and metallic sand trowelled a thin but has time and metaline sand trowelled a unit covered a unit coat on a rough coat of good cement, makes a lighter colour and very good floor; or where time is not an object, coarse metallic sand, in proportion of three to one of lias lime, finished with fine stuff, and well trowelled, makes an excellent floor.

When I saw in The Builder, the desire of "a correspondent" to know how the "lime ash" floors are made, I sent no reply, because I boped to see a communication from one who had seen them adopted in different counties (which I have not), and could thus compare their repective merits. The directions printed in your last are very clear, but there are two or three matters I would like to add whilst the subject is open. The first is that the sand subject is open. The first is that the sand should be fine, free from small stones, which would be loosened if in the surface of the floor, and, eventually, would quit their resting place. Secondly, in Devonshire (whence I obtained my knowledge of these floors), they mix the lime ash and sand in equal proportions, instead of "two-thirds sand and one-third lime ashes," and I have found it answer admirably. The third observation I will make differs from your correspondent, who states that the mixture is to remain "in a body, for three days." It should rather remain a fortnight (more rather than less), in order that the lime may be thoroughly slaked; for, otherwise the floor "bubbles," and the holes, thus formed, are eularged in an incredibly short formed, are entarged in an increasing short-time through moving the various articles of furniture. When once the surface is broken, it crumbles annoyingly; this renders repairs difficult and unsatisfactory, yet it is scarcely worth consideration, except to guard against its necessity, when we reflect that they last worth consideration, except to glinic against its necessity, when we reflect that they last without it for so long a period. I have seen floors that have lain for nearly forty years, and they are now without symptoms of decay. We must bear one thing in mind; that the success of the work is almost entirely dependent on the care bestowed in preparing it.

WM. BOUTCHER.

Another correspondent says :-- As, in a late number, you invite remarks on the formation number, you invite remarks on the formation of cottage floors, I can recommend to those gentlemen who have plenty of rough timber, and a common circular saw mill on their estates, in cutting their fire-wood, to reserve for wood bricks, of the same width and depth as common bricks, and in longer or shorter lengths, the offal pieces of timber, which might otherwise he thrown into the full basker. wise be thrown into the fuel basket.

They should be properly laid upon a sound foundation of lime, or coal ashes, are cheap, and more comfortable than brick or stone floors, and particularly adapted for children's feet in parish or other schools.

The objection to wood is, its retention of

damp after washing.

VALUE OF EXEMPTION FROM SUPER-

RAILWAY SHEDS-THEATRE STAIRS. RAILWAY SHEDS—THEATRE STAIRS.

THE Caledonian Railway Company have lost property to the extent of several thousands of pounds by a fire at the station in Lothian-road, Edinburgh. A spark from the engine (probably) set fire to a truck full of goods, which did the same bad office for the rest of the train. It then communicated to the goods' shed, which was wholly of wood, then to the northward passenger shed, which then to the northward passenger shed, which was of the same material, and then to the southward passenger shed, and this being mainly of iron the destruction was here stopped.

mainly of iron the destruction was here stopped. When the recent fatal accident at the Victoria Theatre, London, occurred, it was at first attributed to part of the gallery staircase having given way. We avoided referring to it, however, hecause this did not seem to be certain, and it would appear from the verdict of the jury (though the statements were any thing but clear) that this was not the case. The jury recommended greater attention to jury recommended greater attention to ventilation in similar approaches where large

numbers of people may congregate.

Now, whatever may have been the cause of this particular accident, it ought to lead at-tention to the condition and arrangement of the staircases, lobbies, and modes of exit in several of our theatres, and reconcile parties to clause in the Buildings Act, giving to the referees control over staircases and passages in public buildings. This clause only applies to new buildings or alterations, and it is really a question whether it ought not to be made to apply to existing structures, and cx tend to obtaining for the public the means of Were it not for the possibility ready egress. ready egress. Were it not for the possibility of causing an excitement and perhaps injuring the property of individuals, we could point to some places of amusement and for public neetings where the public assemble under circumstances of the greatest danger.

RAILWAY JOTTINGS.

The Morning Post announces that the Railway Commissioners "have approved of one amongst a multitude of plans for ensuring the safety of passengers in railway travelling," namely, the formation of "a series of footboards and holdfasts along the extent of a train, and by means of which, in the event of accident, the guards may communicate with either engine-drivers or passengers." In so long and so pertinaciously thrusting this long and so pertinaciously thrusting this desideratum on the notice of all and sundry interested in the public safety, we were encouraged in a series of efforts seconded by none (except through more or less prominent quotations from THE BUILDER itself), by the well grounded assurance that to this result at last it must and would come; and if the re-commendation of the Railway Commissioners be now seconded by the companies as it ought to be, we shall find the free transit of the guards to and fro along a train to be a most variously useful and successful means of en-suring one of the great objects for which the press has so long contended, namely, the safety and confidence of the public during railway transit. Then, too, will be the fitting time and opportunity for experiments with those much more varied than original details of much more varied than original details of plans for summoning the guards to particular carriages,—calls to which then only can they properly respond,—and then too will the name of "guard' itself be for the first time no misnomer.——In the United States a patent has been taken out for an improved mode of warming passenger trains by a combination of flues, connected by elastic and flexible hose with openings and rebination of flues, connected by elastic and flexible lose with openings and re-gisters in the bottom of the carriages.— Another of those desperate endeavours by which some companies have been striving of late to make both ends meet? was lately com-plained of in the *Times*, by one of the North-Western clerks. The directors, it seems, intend to reimburse themselves for any defalcations of making the dishopsory. of which the dishonest amongst those comparatively few clerks who finger the company's funds may plunder them, by themselves adopting a system of indiscriminate plunder out of the poor little salary fund of the honest clerks, as it passes through their own directorial fin-gers. Two-pence to four-pence a pound per

annum off each, or 1,000l. to 2,000l. in all, is to be the amount of the mulct, whatever be is to be the amount of the mulet, whatever be the limit of the defalcation,—only, should there he no defalcation, the directors have generously determined to—withdraw their fingers from the bonest clerks' pockets? Oh no! Once there, at any rate, they are not to be at that trouble for nothing; the honest clerks must then pay the negality exicitle for the wart of defal. pay the penalty exigible for the want of defal-cations and dishonest clerks, "by making up the deficiency" out of an incidental penny a the deficiency" out or an including proposed, which is still to stick to the tarry fingers! Is it credible?—"We pause for a reply." Meantime however, we may also ask—What has time, however, we may also ask—What has hecome of that still more noble and hopeful scheme of "the whole railway interest" under which careful "railway servants" were to be to the extent of one-fifth of their mulcted muleted "to the extent of one-into their annual salary," in order to "mitigate the losses" of "sufferers" by accidents arising not even so much from the faults of those careless servants whom the direc-torial "sufferers" wished to engage on such torial "sufferers" wished to engage on such reasonable security, as from their own.— The second tube at Conway was finally tested, prior to its being opened for traffic, on Wed-nesday week. The tube in use will be closed nesday week. The tube in use will be closed for a time, so as to substitute sleepers of iron for the present ones of wood. The entire structures will then consist of 2,600 tons of iron, slung over a span of 400 feet. Over nearly balf an acre, the extensive erections at the Edinburgh station of the Caledonian line have been ravaged by the fire. Twenty carriages, and a great quantity of goods, have been deyed, as well as the sheds, &c., on the ground. -A project for uniting all the railways round Paris, hy a line forming a circle to go from station to station, is mentioned in the French papers. The several companies interested have, it is said, already asked the Government to obtain the assent of the National Assembly to a grant of the necessary aid for the employ-ment of the working classes around the me-

ELECTRO-TELEGRAPIC PROGRESS.

The United States men are far a-head of us. President Polk's cumbrous message, says the New York Express, a message containing upwards of 50,000 words (!) was flashed all the way from Baltimore to St. Louis in twentyfour hours, and this, too, with the minutest punctuation marked in the document. Copies were also dropped on the way at York, Harriswere also dropped of the way at 10th, Harris-burg, Carlisle, Chambersburg, Bedford, and Pittsburgh, in Pennsylvania; Massillon, Cleve-land, Zanesville, Columbus, Dayton, and Cin-cinnati, in Ohio; Madison and Evansville, in Indiana; Louisville, in Kentucky; and Saline, Indiana; Louisvie, in Kenteky; and Saine, in Illinois. The gentlemen who accomplished this wonderful mental, mechanical, and electrical feat are Messrs. O'Reilly, of the Atlantic and Lake Telegraph Company, and H. J. Rogers, of the American Telegraph Company, Rogers, of the American Telegraph Company, who wished to prove beyond all cavil that the lightning line can be made available for the transmission of large documents as well as for short messages.—The various telegraph offices along the line from Cincinnati to Pittsburg, says the Cincinnati Times, were thrown into some excitement last evening by an incessage and winform tighting which accounts and winform tighting which accounts. sant and uniform ticking, which occurred their various registers. It appears that Pro-fessors Walker and Locke have connected an astronomical clock with the line in such a manner that its beats were conveyed to Pittsburg for determining longitude. That a clock going in Cincinnati should tick so loud as to be heard in Pittsburg or Philadelphia, and along the intermediate line, at one and the same moment, is an item of "natural magic" which a tew years ago count as Aull, that, notwithstanding the admission and pressure of sea water which has obtained access to the pipes (once water pipes) used, in crossing under one of the docks there, for enclosing the water-proof cased wires of the telegraph, not the slightest deflection of the needle has been diswhich a few years ago could scarcely have been covered in experiments instituted with a 72-plate battery.

BUILDERS' BENEVOLENT INSTITUTION. The ball given in aid of the funds of this institution on the 9th, passed off very satisfactorily, much to the credit of the acting members. We were sorry not to see more of the leading builders present.

COTTAGES AT £10 A-PIECE.

A WRITER in the Chelmsford paper has been shewing how agriculturists may provide cottages for his labourers, on their own land, at 10*l*. a-piece, by using clay lumps. We think with the editor of the paper in question that our labourers are entitled to a house sometime better that they had a long to the control of the paper in the paper in the control of the paper in the p that our labourers are entitled to a house some-thing better than 10.7 will rear; still the suggestion is not without use. The writer says,—"The best material for cottage build-ing, both for health and comfort, is the dried clay lump; the plan of construction should be a cross, by which means the dwelling room may be lengthened at the expense of the scullery. The walls should be placed 8 feet apart, leaving two rooms 16 feet long by 8 wide; the dwelling room may then be 24 feet apart, leaving two rooms 16 feet long by 8 wide; the dwelling room may then be 24 feet by 8. And the scullery 8 feet by 8. Any labourer can prepare the clay (which should have short straw well trodden in hy a horse) and cast the lumps in a mould, 20 inches long by 10 wide and 7 deep, at 3s. 6d. per hundred. When thoroughly dry the lumps should be placed in the same material as they are made with, and raised on the walls about three courses a day; the cost of lajving is 2s. per hundred. The walls being only 8 feet apart, the rafters for thatching may be made of slight poles nailed on another pole embedded on the wall; the window-frames are built in the walls, and the windows open on a pivot."

His estimate, very close cut, is as follows:—

His estimate, very close cut, is as follows:-

Piece of wood over fire-place Plastering the walls and ceiling, &c.....

NOTES IN THE PROVINCES.

In Ely Cathedral the introduction of stained Is Ely Cathedral the introduction of stained glass windows is rapidly going on. The large north-east window under the lantern—"the especial glory of the church"—has just been fitted by Wailes, as far as the funds raised by the undergraduates of Cambridge would allow. The principal figures represent King Edward, who was educated at Ely, and his Queen. In addition to the five stained windows provided by the munificence of the Rev. E. B. Sparke, four others, it is said, are in hand, to be presented by the Dean of Ely and others.—The keeper of the Lincoln Cathedral 'shew' lately met with a salutary lesson while rudely turning out an individual lesson while rudely turning out an individual caught in the sacrilegious act of coming up through the asle without coming down with the dust. The gentleman so 'caught' and pertinaciously expelled, turned out to be 'a tartar' in the shape of the new sub-dean, on whom it is to be hoped that this incidental perspective of the a posteriori visage of Janus will produce an expeller achieves. whom it is to be hoped that this incidental perspective of the a posteriori visage of Janus will produce an equally salntary impression, not to be oblictrated by the 'amiable countenance' that may meet his eye in future visits to his venerable Alma Mater.—A 'Penitent Females' Home' is to be erected at Lincoln, from plans prepared by Mr. Pearson Bellamy, a local architect. Contracts, according to the Lincolnshire Times, are to be speedily called for.—A disputed point with respect to work performed at the Springfield Gaol above the estimate and contract has arisen between the county magistrates and Messrs. Curtis, who threaten equity proceedings. The work, it is said, though not provided for in the contract deed, was done by order of the county surveyor; but there appears to be, nevertheless, a desire on the part of both magistrates and surveyor to stand by 'the bond.'—The sum of \$5.500l, has been ordered by the Essex county magistrates to be raised on loan, to pay for the site at Brentwood for the County Lunatic Asylum, and certain architects have been selected to furnish plans for a substantial building, without unnecessary ornament, to performed at the Spinighield Gaol above the estimate and contract has arisen between the estimate and contract has arisen between the county magistrates and Messrs. Curtis, who threaten equity proceedings. The work, it is said, though not provided for in the contract deed, was done by order of the county surveyor; but there appears to be, nevertheless, a desire on the part of both magistrates and surveyor to stand by 'the bond.'—The sum of 8,500l. has been ordered by the Essex county magistrates to be raised on loan, to pay for the site at Brentwood for the County Lunatic Asylum, and certain architects have been selected to furnish plans for a substantial building, without unnecessary ornament, to accommodate 200 males and 200 females, and capable of extension: plans to be sent in before 29th March, with estimates of all costs. The premiums to be awarded are 150l., or the

usual commission, for the best, 100l. for the second, and 50l. for the third.—In cleaning out and sinking the water-course called Stream Ditch, at Faringdon, Berks, an extensive workshop, belonging to a Mr. J. Fidel, and full of timber, deals, and tools, has been undermined and entirely destroyed. — The following estimates were sent in for the erection of the Corn Factors of the contract o tion of the Corn Exchange at Stourbridge:-

Mr. Edward Smith £465 10 0 , Thomas Nash 430 , William Smith 380 , Thomas Ostins 303

The commissioners voted by a majority for "Mr. Smith's estimate"—so says our authority—but which Mr. Smith does not appear; though, from preceding remarks as to the engagement of Mr. Edward Smith to "have the building completed in six weeks from the commencement of operations," it rather appears that his is the chosen estimate. Asylum Appears that his is the chosen estimate.

Nearly the whole of the new Lunatic Asylum Appears the central except the central Nearly the whole of the new Lunauc Asylum at Birmingham is roofed, except the central building. Plans and specifications for a supply of water are being obtained, and the boundary wall and other works contracted for are in rapid progress.—The old butter cross at Doncaster is being carefully taken down, to be re-erected elsewhere. The bell-turret came down with a crash while letting it through the conf with rones.—The foundation-stone of a roof with ropes.—The foundation-stone of a new 'British school' has been laid at Mexborough.—The warerooms of the Hull Glass Works lately took fire, and insured property valued at between 1,000l. and 2,000l. was destroyed. destroyed.

OPENING OF THE NEW CONSOLIDATED COMMISSION OF SEWERS.

COMMISSION OF SEWERS.

The long-delayed commission, under the new Sewers Act, was issued on Saturday last; and the members chosen to carry its operations into effect, by her Majesty, met for the first time on Wednesday, at the office, Greek-street, Soho-square. The names of the commissioners we have already given. The following were present:—The Earl of Carlisle, Viscount Ebrington, M.P., Hon. Frederick Byng, Yery Rev. Dr. Buckland, Dr. Southwood Smith, Mr. Joseph Hume, Mr. Edwin Chadwick, Mr. John Bidwell, Mr. Joseph Hodgson, Captain Robt. Kearsley Dawson, Mr. W. R. Grove, Mr. Thomas Banfield, Mr. Edward Lawes, Mr. Alexander Bain, Mr. Thomas Hawes, Mr. Cuthbert Johnson, Rev. W. Stone, Rev. Morgan Cowie, and Rev. Edward Murray.

The Earl of Carlisle having been called to the chair, the clerk formally opened the business by reading the Queen's commission by which they above the reading the Queen's commission by which they above more consolidated Metropolitan Commission of Sewers. It has indeed been a subject of regret to new consolidated Metropolitan Commission of Sewers. It has indeed been a subject of regret to me that, in consequence of legal and technical methat.

The Lari of Carlisle then rose and spoke as follows:—I have much satisfaction in opening the new consolidated Metropolitan Commission of Sewers. It has indeed been a subject of regret to me that, in consequence of legal and technical indrances, this has not taken place sooner. We ought only the more steadily to resolve, by increased diligence and exertion, to make up for any time that has been inevitably lost. It would be hardly becoming among ourselves that we should dwell upon the composition of the commission. I think any one who attentively scrutinizes it, will perceive that the selection lans been guided by a wish to comprise, within a manageable number, persons qualified by special experience, by high acquirements, hy successful exertions in the general cause of sanitary reform, and over whose unemployed leisure the Government might be presumed to have some fair claims. However, the best indication of the selection will be the character of the services performed, the work we turn out. Let us remember that we enter upon our labours at no ordinary time—under no common circumstances.

cessors. You are aware that the legislature has recently constituted a Board of Health, whose labours the Government contemplate with unceasing anxiety, and I think it will be wise both in this commission and in that board, to establish an interchange and reciprocity of assistance and services with each other. For this reason I look upon it as very desirable that at least one of the superior officers should have a mutual communication with both bodies. Although the number of this commission, as compared with former bodies of the kind, is most materially reduced, I think it plain that much which requires minute detail, and constant superintendence, can only be efficiently performed by committees and sub-committees, and it will he one of the most essential foundations we can lay this day for our future operations, to effect some formed by committees and suh-committees, and it will be one of the most essential foundations we can lay this day for our future operations, to effect some organisation of these committees. The very extent and variety of the acquirements, and reputations which are comprised in the list of the commission, must render inevitable occasional discrepancy of views and conflict of opinions. Let me carnestly, most carnestly enjoin upon all a spirit of candour and modesty, of allowance and forbearance for each other, of patient inquiry, and searching after truth, with a determination to find out the truth, and nothing but the truth. Let me recommend that we should combine a strict attention to the pecuniary interests of those for whom we act, with a fair and liheral consideration for the officers, and that above all we should hear in mind, that where there is so much matter controverted, unsettled, and still to be learned and established, our proceedings are bound to be cautious, tentative, gradual,—taking nothing for granted, and proving all as we go along. With these observations, which I feel that I owe some apology for having offered, I will only add one word of reference to the only source of wisdom and help, that He may guide our way and bless our work. (Loud and continued cheering.)

On the motion of Mr. Bullar, the rates made by the late commissions.

On the motion of Lord Ebrington, it was agreed

On the motion of Lord Ebrington, it was agreed that the ordinary courts should be held on the first Thursday in every month, at ten in the

that the ordinary courts should be held on the first Thursday in every month, at ten in the morning.

The Earl of Carlisle said that before they met, it had been recommended that in consequence of Mr. Stable's advanced age, he should not be continued in office as clerk to the Commission, but that his case should be referred to a committee for consideration. This suggestion was agreed to. It was also ordered that Mr. Stable's accounts should be handed over to Mr. Hatton, who should take charge of them provisionally.

A recommendation from the General Purposes Committee was read, that in consequence of the greatly increased services of Mr. Hertslet, clerk, and Messrs. Roe and Phillips, surveyors, they receive an advance of salary of 250½ to Messrs. Hertslet and Roe, and 200½ to Mr. Phillips. In the case of Mr. Hertslet, it appeared that he has performed the duties of clerk to Westminster and Middlesex Commission, to Holborn and Finsbury, Tower Hamlets, Poplar and Blackwall, St. Katherine's, Surrey and Kent, and Greenwich Commissions, without any addition to the salary received as clerk to Westminster Commission alone.

Mr. Hume wished to know whether any report had been received recommending this advance of salaries?

The Earl of Carlisle replied in the affirmative,

had been received recommending this advance or salaries? The Earl of Carlisle replied in the affirmative, and the resolution was carried.

It was next proposed and carried that Mr. Roe be the consulting surveyor, at a salary of 400L per anum, with liberty to retire at any time, on giving three months' notice, at 200L, provided he takes no other salaried office.

It was agreed that the solicitors should deliver a retainer to Mr. John Henderson, as standing counsel to this commission.

That the offices in Greek-street, Hatton-garden, Bethnal-green, and Borough-road, he continued as the district offices of this commission.

That complaint hooks he kept at each office, in

That complaint hooks be kept at each office, in which every ratepayer baving any complaint to make should enter the same.

In reference to the last resolution, Mr. Hume wished to know whether the books would be open to all persons, or only to ratepayers.

The Earl of Carlisle was of opinion that no objection would be offered to an inspection by the public consculle.

Books.

An Introduction to Heraldry: containing the Origin and Use of Arms; Rules for Blazoning; Dictionary of Terms, &c., &c. By Hugh Clark. Fourteenth edition. London: Washbourne, New Bridge-street, Blackfridge-street, Blackfriars.

A BOOK which has passed through fourteen editions searcely needs a recommendation: but having been asked by some correspondents to name a concise introduction to the science of heraldry,* and this edition (published 1845) before us, we point it out to them as

well calculated to supply their want.

A chapter on heraldry in conjunction with architecture, which has been added in this issue, gives it a further claim to notice.

The editor of the book cites the large shields on the side walls of the nave of West-Abbey, erected during the reign Henry III, A.D. 1249, as one of the early introductions of heraldry as an adjunct to architecture; and to Henry VII.'s Chapel at Westminster as a building wherein it was the most largely applied.

A paragraph on this same subject will be found on another page.

Miscellanea.

NECESSITY FOR APPLICATION AND INDUSTRY.—"This age," says Mr. Lyon Playfair, in an interesting address to the students at Putney College, 'On the importance of studying abstract science,' "is an age of action, and if you are to succeed in future life, you must now brace and prepare yourself for the struggle. If you fall asleep while you are young, in vigour, and able to prepare yourself for future life, the world will not know you when you awake, and it will be a long and a sad struggle for you to overtake those who a sad struggle for you to overtake those were active when you were passive. Recollect, that it is only by study, downright hard study now, that you can acquire that mental strength and vigour that will enable you to overcome the increasing difficulties of progress in life. The hopes that I have held out are hopes certain to be realised by him who employs his youth wall in acquiring a furthermark and youth well in acquiring a fundamental and accurate knowledge of the applied sciences, but they are hopes equally certain of frustra-tion to him who has misspent his period of study in idleness and neglect." Again,—"If you resort to the story of the human race from the earliest periods till now, if you view them the earnest periods the now, a you their indi-in their aggregate as nations or in their indi-vidualities, as exhibited by the great men of a particular period, you will find the same result in all, that the labits and studies of the young determined the character of an epoch, of a nation, or of an individual. No man in any profession ever rose to fame or station without in youth having exhibited habits of application and industry. If you do not show in youth that you have vigour and strength to hold your own in the stream of life, and skill to steer your bark amidst its shoals and perils, depend upon it, in age your bark will be pushed aside by those who have devoted their pushed astue by those who have devoted their time to acquire a knowledge of how to manage their own vessels, while you will be constantly in trouble, hazard, and dismay, running against shoals, tossed on the banks, and shipwrecked in your dearest hopes. Be assured, that in these dark the convince of the first hopes. these days, the carving out of your fortunes is entirely in your own hands. In this busy community of your own, the bees do not make honey for the drones. But the hive is still large enough to contain and cherish all those who enter in with habits of industry and skill in applying it."

skill in applying it."

IMPHOVEMENTS AT MIDDLESEX HOSPITAL.—With regard to a paragraph on this
subject, Mr. Wyatt asks us to say:—1st. The
recent alterations in no way originated from,
or were dependent upon, "the munificent
bequest of Lady Murray." It was not until
after a special general court of the governors
had sanctioned the works at an outlay of had sanctioned the works, at an outlay of 12,000L, that they were informed of this hand-some gift. 2ndly. The alterations have not cost 20,000L, as reported, and will probably not involve a greater outlay than half his original estimate for a real position. ginal estimate for a new hospital.

* A sort of question which, as a general rule, we are con pelled to decline answering.

THE WOODEN CHURCH, ESSEX.—We have already alluded to a paper by Mr. Burkitt on this subject, read at paper by Mil. Direction in subject, read at a meeting of the British Archæological Association. In this church was enshrined the body of Edmund the Martyr. According to the paper, Mr. Letheuillier, in 1728, drew up an account of this wooden church, which was published in the Votuce Recovering to their design. published in the Vetusta Monumenta, at which time there existed nearly entire the series of split trees which formed the four walls of the nave, since which a considerable portion of the old edifice has been removed. The east end opening into the chancel was pulled down the two parts, as well as a large to connect the two parts, as well as a large portion of the west end connecting it with the tower, which is used as the vestry; the south side has also been broken into, to form the modern entrance, leaving the north side the only fair specimen of the original building. The entire length of the shrine was 29 feet o inches, the breadth 14 feet. The sill rested on a low wall of brick, which formed the groundwork; the upper part of the frame consisted of rough-hew timber with a groundwork; sisted of rough-hewn timber, with a groove cut in the under part, and the uprights forming the walls, being cut in the form of a wedge at the top, by being inserted into the groove, were made fast by wooden pins. The series of the outer timbers were segments of the tree, with a board about 2 inches thick, taken from the middle, these boards probably serving for the themiddle, these boards probably setting for an interior lining of the shrine. On examining the state of the timber, during its recent demolition, it was too evident that neglect alone has been the cause of the serious inroads made on the otherwise sound timber, by the Ptinus Pectinicoinis, an insect well known to antiquaries, from its destructive powers on wood carvings, old books, &c., the larger sort at-tacking the stoutest timbers, and in a very short time reducing them to powder. insect which has, in a very short time, rendered it absolutely necessary to remove the wooden portion of Greensted Church, and wooden portion of Greensted Church, and although efforts have been made to replacesome of the old material, the portions rendered use-less have been very considerable. Mr. Burkitt urged the necessity of using means, by washing the timber with some liquid obnoxious to the insect, that the present age should be guiltless of the charge of neglecting one of the most interesting memorials of past times,

GREENWICH HOSPITAL: SCULPTURE. A subscriber writes thus:—"I recently had occasion to visit Greenwich Hospital, and in going into the Painted Hall it at once struck me how imposing and grand it might be rendered by the introduction of statues of the several naval commanders, placed on each side up the centre of the room. It is an opportunity that seldom occurs, of rendering it one of the most imposing rooms in the country by the introduction of statues of the several great commanders whose valour and prowess is depicted on the walls in the several pictures. In a country like our own, where every Englishman feels proud in learing the names of its great commanders extolled, both by sea and land, statues of such men create additional interest in the minds of the people. These things are not lost sight of on the continent, then why in this country? It has a parsi-monious appearance which ought not to exist, it is a want of proper pride. If you cast your eye on Trafalgar-square or Waterloo-hridge, what an opportunity again offers itself by the in-troduction of such ornaments, more especially on the latter—one of the most splendid bridges in the world; and what could render it a more imposing object still than by being surmounted by statues of generals, with a grand com-position of an arch leading from the Strand, more especially as it has now become one of the leading thoroughfares of the great metropolis. It is to be regretted that these oppor-tunities are so long lost sight of."

THE CHICHESTER TRAINING SCHOOL Competition.—We strongly suspected that things were not going quite correctly here, and asid so. Our suspicions would seem to be thoroughly borne out by an extraordinary statement received just before going to press, from Mr. John Elliott, who speaks more fear-lessly than architects are in the habit of doing. We will not risk weakening its force by a too hasty digest of it, and therefore defer it till our

IMPROVEMENT OF LEICESTER-SQUARE. The renewed suggestion in our pages to throw open the area of Leicester-square, has again open the area of Leicester-square, has again been largely echoed and approved,—to such an extent, indeed, as ought to lead to its adoption. The Literary Gazette and Athenæum adoption. The Literary Gazette and Attenueum both call it an excellent suggestion, which they would be glad to see carried into execution. The Attenueum remarks,—"Green trees in the heart of a city 'are and ever were most com-mendable,"—but the Dryads have evinced an insuperable objection to live in Leicester-square. Nature has no chance in that locality against art; Flora has been dead beat in that arena by Miss Linwood and Madame Wharton. One can conceive of any kind of singing in Leicester square but the singing of birds. It is useless for the householders to cling to the fond belief of an Arcadia before their upper-floor windows. Grass wont grow even in the untrodden part of that crowded but melancholy-looking thoroughfare. 'It is on evidence,' says the correspondent of The BUILDEN, 'that no person ever walks in the inclosure; the walks are mud,—and the trees that should be green are black. Traffic is here so much the engrossing object of life that 'nursery maids and children idling or taking exercise, as they do in the more aristocratic squares, would seem quite out of character.'— To reclaim this waste from its aspect of vegetable desolation by the scheme in question would certainly give an air of cheerfulness to the site by which both the passer through the square and the sojourner therein would be squares:— and we recommend the hint to those commissioned generally with the improvement of the architectural appearance of the metropolis, and to those particularly whom the subject more directly concerns."

THE BOARD OF TRADE AND THE LONDON ART-UNION.—By a letter from Sir Denis Le Marchant to the hon. secretary, dated the 3rd instant, the Board of Trade have withdrawn all their proposed alterations, being reluctant "to urge their views against the strongly expressed and deliberate sentiments of the committee of the London Art-Union, with whom they have been all along most anxious to co-operate." Having made a great mistake, the wisest course their lordships mistake, the wisest course their lordships could adopt was to retrace their steps, and this, we are glad to find, they have done with a good grace. It is to be hoped they will never again, by uncalled for interference, risk the prosperity of this most important institu-tion.

THE POLLUTION OF WATER BY POISONous Salts of Lead and Copper, -a subject, to the great importance of which The BUILDEN was the first popular medium through which the public attention was excited, now attracts particular attention. Facts and circumstances of more or less recent occurrence have been stated in the Times, Morning Herald, &c., by competent authorities (in the latter throughout a long and most interesting com-munication from Stratford-on-Avon, by Dr. Thomas Thomson), confirmatory of every thing stated or suggested in The BULLDER. The evil, Dr. Thomson believes, is a far more general and more deadly one (though probably not within the bounds of the metropolis), than not within the bounds of the metalopolis, that is even yet conceived; and in allusion to the discovery at Claremont, seeing that even royal palaces have not been exempted, the painful suspicion is excited that the bealth and suspicion is excited that the bealth and strength of one who was much beloved by the nation at large in bye-gone years were thus undermined while resident there. It is found to be in the precise ratio of its purity, as we long since noticed, that water becomes impregnated with the poison; for when it contains various neutral salts, especially sulphates, tains various neutral salts, especially sulphates, a protective crust is formed on the surface of the cistern, &c., which it is now recommended, as already in The Builder, to preserve rather than cleanse away. Besides the more serious symptoms of paralysis, colic, &c., a frequent index to the action of such poison is a dark blue line along the translucent edge of the grups. Sulphuric said diluted largely in line along the translucent edge. Sulphuric acid, diluted largely, in doses of 10 to 12 drops at a time, has been doses of 10 to 12 drops at a time, has been doses of the doses of 10 to 14 drops at a time, has been doses of 10 to 14 drops and to that end, recommended as a remedy, but determined prevention is better than cure; and to that end, wherever water tends to take up lead or copper, eartbenware pipes, glass pumps, and perhaps zinc cisterns—all cheap articles—are advisable,

Institution of Civil Engineers.—At the opening meeting, January 9, Mr. Joshua Field, president, in the chair, the paper read was "A Description of the improved Forms of Water-wheels," by Mr. William Fairbairn. After noticing the opportunity for improvement afforded by the substitution of cast and wrought iron for timber, in the construction of hydraulic machines, the author pointed out the disadvantages and loss of power attending the principle and the form of the old water-wheels, which disadvantages had induced him to adopt the construction described in the paper, and which he termed "The Ventilating Water-Wheel." The general object of these modifications was to prevent INSTITUTION OF CIVIL ENGINEERS ral object of these modifications was to prevent the condensation of the air, and to permit its escape during the filling of the bucket with water, as also its re-admission during the discharge of the water into the lower mill-race. These wheels were described to possess advantages beyond the overshot, the undershot, or the common breast wheels, and were best or the common breast wheels, and were best adapted for falls not exceeding eighteen or twenty feet, and where at times there was a considerable depth of back water. The wheel had a close sole, the tail ends of the buckets were turned up at a distance of two inches from the back of the sole plate, and running parallel with it, terminated within about two inches of the bend of the bucket, immediately above it. The water, in entering the bucket, drove the air out by the aperture into the space behind, and thence into the bucket above, and so on in succession. The converse occurred when the buckets were emptied, as the air was enabled to flow in as fast as the wheel arrived at such a position as to permit wheel arrived at such a position as to permit

the water to escape.
ARCHITECTURE IN OXFORD.—The Oxford ARCHITECTURE IN OXFORD.—Ine Cayora Herald mentions various architectural improvements with which the liberality of the university, of particular colleges, or of individuals, as well by the restoration of ancient buildings as by the erection of new ones, has lately adorned Alma Mater. One is the restoration of St. Mery's the Virgin under the directions adorned Alma Mater. One is the restoration of St. Mary's the Virgin, under the directions of Mr. Blore, at an expense which they think cannot be short of 3,000l. In the cathedral church, from the nave two cumbrous pews have been ousted, and their places supplied by low and massive oaken benches, the carving on their standards designed to harmonise with the massive Romanesque architecture of that portion of the cathedral. The principal and fellows of "the King's Hall and College of Brasenose" have caused no small portion of the oldwalls, built originally ofthe crumbling Head-Brasenose" have caused no small portion of the old walls, built originally of the crumbling Headington stone, to be renovated and repaired, that they may hand down their college buildings to their successors in a more perfect state. The new hall of Pembroke-college quandrangle is third pointed, with a tower at the end, and is well spoken of; there are new cemetery chapels, situate respectively in Jericho, Osney, and Holywell. The first of these is "Romanesque," while the two others are of the pointed styles,

esque, while the two others are of the pointed styles.

SHORT LEASES AND THE LEGACY DUTY.
—I am glad to see that, amongst other misconceptions of even the present day, the law of building on leases is likely to be discussed calmly, and, I will venture to say, amended in consequence at no very distant period. What can be a greater injustice than the following:
—Society requires healthful places of residences. The lord of a piece of land where such residence is not alone necessary but imperative, lets his land on building leases, not at its value, but at a hundred times its value, yearly,—a building is erected on it, worth, say 1,000L, it is to be the property of the erector of 01 years, taking the city leases for their suburb lands. In 20 years the owner dies and leaves it to a relative, the descendant of his grandfather; as it respects him it is personal property, and he must pay a legacy duty of 6 per cent.—60/. In 20 years more he dies, and leaves it also to a relation more distant, and again a legacy duty must be paid of 104L; a further period of 21 years, classes, and in again a legacy duty must be paid of 1041.; a further period of 21 years elapses, and in comes the landlord and takes all, stock and block, and the owner may thank his stars if he be not called upon to pay for some dilapidations which the indulgent landlord finds out to be desired according to the W. New St. 16 can be charged according to law. Now, Sir, if a great railway company have a penchant for my house or lands, they can take it at such value as a British jury of twelve men on their

oaths say it is reasonably worth, although it may be my ruin. Why, then, should not land wanted for building in suitable places not be subject to the like regulations—the wellbeing and health of people congregated together must surely be of equal moment. The landlord has all along had more than his due; and at length the descendants of the man who has spent 1,000*l*. in building on such freehold land, having paid legacy duty over and over again, find the landlord's descendant in possession of all, and not liable to legacy duty at all, because it is freehold!

Can such things be, and overcome us like
A summer cloud without our special wonder?

Is there any man alive bold enough to take oaths say it is reasonably worth, although it

Is there any man alive bold enough to take this bull by the horns.—L.

No. CCCXI.

SATURDAY, JANUARY 20, 1849.

F making books, there is no end:" nor do we desire there should be. If there were an end, what should we poor critics do? many of our con-

temporaries would say. To "book some new thing," is not an easy or often-occurring matter: new ideas and great thoughts are less plentiful than gold,-at all events, in California,-and some real thing yet unsaid is found with difficulty. To diversify the surface of knowledge, however; to put it in a fresh light, especially if a stronger; to gather together scattered fragments, and form thereout a whole; to lure some minds to what they had before disregarded, or provide instructive amusement for others, is of no trifling consequence: and long, therefore, may the world be able to exclaim, " of making books there is no end." What should we do without books .-- what should we be without books ? They preserve for us the best part of the best men; give us pure joys, and alleviate our sorrows: they take us back into the past, and aid us in preparing for the future.

With books such as those to which we are now particularly alluding, we have not editorially much to do, but they are our recreation and delight,-the medicine which "physics pain," and increases enjoyment,—and we speak in thankfulness.

In graver strain, and all the quieter for the foregoing spasm, let us make known to our readers the contents and character of two or three books now before us, which belong to our province, and have a certain sort of connection. First, then, of the

"MUSEUM DISNEIANUM."

The number of specimens of ancient art, real and forged, to be found treasured up in museums, and scattered about all over Europe, is quite extraordinary, and if it could be correctly stated, would scarcely be believed. In England alone these collections are enormous, and in many cases are little known. Available records of them, it need scarcely be said, are very valuable; while unknown beyond their owner's immediate circle, they are comparatively useless to investigators, and it is therefore most desirable that their possessors should be led to print catalogues and descriptions of them.

Amongst the finest of these collections is that belonging to Mr. Disney, F.R.S., at the Hyde, near Ingatestone, and, under the title we have just now quoted,* Mr. Disney has recently published two elegant volumes of descriptions, illustrated by numerous woodcuts and lithographs. The first part was exclusively dedicated to marbles. The second part, now issued, is confined to bronzes, some Anglo-Roman pottery, and three cinerary urns.

During a residence in Italy from 1795 to 1798, a relative of the collector was enabled to acquire many specimens taken at the time from Herculaneum and Pompeii, at much less cost and trouble than they can be procured for now. In those days the state of the country was such, and the indolence of the

* Museum Disneianum, being a description of a collection of various specimens of ancient art in the possession of John Disney, Esq., F.R.S.' London: Rodwell. Bond-street.

court of Naples in these matters so great, as almost to amount to indifference, and consequently the people had more facilities of selling objects which they found there. Greater care is at present taken of these relics; they are deposited in the Museo Borbonico; and the site of Pompeii, as all recent travellers know to their cost, is watched and guarded; so much so, indeed, that of many things even sketches cannot be obtained without putting a piece of silver on the eyelids of eager functionaries, to prevent them temporarily from

Of each object in Mr. Disney's collection an engraving is given, all executed by Mr. George Measom, and they are apparently very truthful. A few of them will doubtless be acceptable to our readers.

Fig. 1* is a tripod found at Pompeii in 1790. This was probably used (says Mr. Disney) to hold the frankincense and verbena upon the altar, and thence called a thuribulum. The interior (fig. 2) is highly wrought with Ieaves and the, so-called, honeysuckle, in a circle: in the centre is a head of Medusa,

Fig. 3 is a lamp found at Herculaneum about 1795, and ascribed to the best time of the Greek republics. It is 9 inches in diameter, and has ten lights, each terminating in a bull's head, so contrived that the flame would issue out from between the horns. Several other lamps are given in the work.

Fig. 4 is a vase handle, with two heart-shaped ears, highly ornamented, by which it seems to have been attached to the bowl. It is 51 inches wide and 6 inches high.

While one class of minds are discovering, collecting, and arranging the works of classic times,-and truly wonderful works these are, produced for the most part before the Christian era commenced,-others are working in the mediæval mine, and are multiplying for present use, and saving for posterity, by means of an accurate pencil and printer's ink, the forms of works which are scarcely likely to endure so long as those last mentioned. Mr. J. K. Colling has just now completed the first volume of

"GOTHIC ORNAMENTS DRAWN FROM EXISTING AUTHORITIES,"

and a very nice volume it is, containing 104 plates, 19 of which are enriched by gold and colour. † Well may the author say in his preface that he "has often paused in his labours to gaze, with wonder and admiration, at the never-ending variety and glorious genius displayed by our forefathers in the various portions of their works," The variety is neverending; and yet how few were the principles on which these men worked! how simple the course of their proceeding!

Our author continues,-" How great is the regret which arises in the mind when it is observed that, in our modern ecclesiastical structures, ornament is too often either altogether banished, on account of its expense, or left to the untutored hands of a common

Of late, however, a better spirit has arisen, and there are edifices erecting in different parts of the country which would do credit to our masons of old. Should the present work he found to conduce ever so slightly to the general promotion of this spirit, and assist the artist in his progress, the labours of the author will be amply repaid, and his utmost object realised."

* Sec p. 27.
† "Gothic Ornaments; being a series of Examples of
Enriched Details and Accessories of the Architecture of
Great Britain." Drawn from existing Authorities, by Jas.
K. Colling, Architect. London; Geo. Bell.

Viewed rightly as materials for study, as evidence of the mode adopted by the mediæval workmen in ornamentation, and as a collection of beautiful forms and arrangements for re-combination, it will assist the artist in his progress; but if it be used only as a collection of patterns, to be blindly and slavishly copied, it will only tend, in common with similar works, to perpetuate the reproach which attaches to us as a race of feeble imitators.

The examples are all classed, as Early English, Decorated, and Perpendicular; and a good notion of the peculiarities of ornamentation belonging to each style may be gained by an examination of the volume. Some of the coloured plates are very excellent; and it is satisfactory to observe a gradual improvement in the plates from first to last, because it leads to the anticipation that the second volume will be even better than the first, and ought to induce many who may have hesitated about subscribing till the work was finished, at once to send in their names, and so to encourage the artist in what must be a costly undertaking.

The book is particularly rich in examples of the decorated period. One of these we have engraved for our pages, as well because it is a beautiful specimen, and shews the application to nature made by the mediæval ornamentalist, as well as an evidence of the character of the book. It represents a stone canopy, from an arcade in the presbytery of Winchester Cathedral, on a scale of 11 inch to a foot.*

Throughout the book this resort to natural types, especially during the best period of mediæval art, is made evident, and has been fully felt by the author.

Having so often dwelt on the advantage which would follow a return to this study of natural forms for ornamental purposes, we have received with considerable satisfaction Mr. Whitaker's

"MATERIALS FOR A NEW STYLE OF ORNAMENTATION,

which consists of fruits and flowers drawn from nature in outline.† Amongst them we need scarcely say will be found the type of many a familiar object of ancient and mediæval

"The sunpurge presents the type of many a Gothic roset; the horny gentian, Solomon's seal, and red misletoe are almost well-known Grecian borders; in the convolvolus, the left hand flower is precisely the same as one on an Etruscan vase in the British Museum; the camelia, with the globe, having in the centre only a plain hollow, which follows the loss of the inner petals, they falling off a short time after the flower has blown, is a striking ancient type; about the honeysuckle, it is superfluous to say any thing; the iris must have given the idea of the Gothic finial; and the light-foot has the leaf most prevalent in the same style: the flowers in the drawings which agree with the ancient centres of architectural capitals it is useless to point out, as they all so palpably shew the derivation of those sculptured ornaments."

The great point is to teach the student how natural objects should be represented to render them consistent with architectural design. There is always a point of sight which is most advantageous, and this requires to be determined with judgment.

We have before this ventured on the asser-

* See p. 30.

† "Materials for a New Style of Ornamentation, consist-ing of Botanical Subjects and Compositions, Drawn from Nature." By H. Whitaker. 1849. London; Weale.

tion that natural forms, geometrically arranged, should be resorted to for ornamentation. Mr. Whitaker takes the same view, using, indeed, almost our words. Speaking of such an application of flowers in their natural form as is sometimes seen, without any connection with architectural features, he says,-"There has hitherto been a conventional blindness to the absurdity of their adoption in this way, which is a mode totally different from the one I am propounding, which proposes in the first instance to give by means of a geometrical representation an architectural character, and then to connect them with architectural designs on the most approved principle revealed in antique and mediæval art.

The book contains fifty plates, nicely litbographed, and will be found of important service, not merely to architects and decorators, but to muslin and calico designers, bookbinders, plasterers' modellers, paper-stainers, and all connected with ornamental design. We are firmly of opinion that Mr. Whitaker has done service by the production and publication of this book, and we hope it will find the good sale it deserves.

"Life is short and Art is long." Those who smooth the way deserve well of their

ON THE VARIOUS QUALITIES OF CAEN

In all well-regulated concerns of an extensive kind, a judicious division of labour is indispensable: an architect would require his life and faculties to be prolonged to the extent division of labour of the patriarchs of old were he to attempt, by his own personal observations, to gain a thorough knowledge of the numerous materials employed in an extensive edifice. The prac-tical part of his profession alone, if scientifically studied, is far too extensive for the brevity of one man's life; it must be the result of accumulated knowledge, the collective labour of many observant individuals; such a mass of information can, therefore, only be acquired collaterally, through the lium of books, and oral communications.

It is a duty incumbent on every member of society to use his best endeavours, however insignificant, to facilitate the advancement of knowledge, and to make his fellow creatures as much wiser and as much better informed as lies in his power. Under these impressions. venture to shew my zeal in the cause, by offering some observations on the nature and properties of stone from the quarries at Caen and its neighbourhood.

The stone in most general use for ornamental architecture, in the south of England, is obtained chiefly from that extensive tract of country usually denominated the "Oolitic district," which passes from Yorkshire through the various counties until treaches the coast of Dorsetshire. The same kind of stone again appears in Normandy, and its characteristic features prevail in the celebrated quarries around the city of Caen: diverging into several branches or ranges of hills, it traverses France, forms the great mass of the Jura Mountains, and constitutes part of the chain of the Alps. The Oolitic rocks of Normandy present a close analogy in their general, and even in some of minor divisions, to those of southern England: commencing in the vicinity of Havre de Grace, and extending our observa-tions to the neighbourhood of Caen and Falaise, we find a series of beds corresponding with those of the Oolite in our own country It would thus appear, that throughout a considerable portion of France and England, the causes which produced the Oolitic rocks did not differ materially; shewing, that at the time of their production, similar general causes were in action over a particular portion of the two countries, probably long before the sinking of the land which produced the English Channel.

The entire country from the sea to some distance beyond Falaise, and from Bayeux to a considerable distance east of Caen, is com-

posed of the same mineralogical description of posed of the same immeratogical description of strata; remarkably horizontal, and in all pro-bability continuous, or without interruptions. The comparative insignificance of elevations or depressions, merely of a few yards, up or down, is unimportant when considered on the principle of a general level. It rarely happens that a district, of 30 or 40 miles in area, presents so tame and unpicturesque a scene sents so tame and unpicturesque a scene, so apparently undisturbed by any geological becomena, as is to be found in the neighbourhood of Caen. All these various beds of Oolitic limestone are of marine origin—consequently they must have been deposited at the bottom of an ancient, see, and they subserved. bottom of an ancient sea, and then upheaved to their present position, where they appear to have remained undisturbed since the period of their consolidation, affording a striking example of long continued tranquillity; and remarkably contrasting with the violent distortions, depressions, fractures, and denudations, so conspicuous on the opposite coast, from the Isle of Wight to the extremity of Dorsetshire. The only instance of a geological disturbance in the district appeared to me to be in the line of the river Orne, and the varia-tion of level about the entrances to the prin-cipal quarries, which seems to have been caused by a fault, either of elevation or subsidence; and I am inclined to believe that the very same strata, which have been so long worked for architectural purposes, might be found beneath the meadows, on the low side of the river. Such a disruption of rocky masses is at first startling to the imagination of a common observer, but extremely insignificant to the geologist. Whether such change took place by upheaving or sinking, it must have been uniform over a considerable area, for there is hardly an instance in which the strata are bent or contorted from the level.

On approaching the coast of Normandy, from the English Channel, and for some dis-

tance up the river Orne, on the eastern bank, rocky masses of a hard calcareous are abundantly sprinkled near the and scarcely to be seen above which renders the navigation so nature are gerous, that vessels are cor a pilot to enter the Orne, compelled far dangerous, same stratum of limestone, being very nearly level, continues also inland to the eastward, where there are quarries at Cagny and at Bonneville; but the most extensive quarries of this material are situated at Ranville, close to the eastern bank of the Orne, about half-way between the sea and the city of Caen. This stone is composed almost entirely of Inis stone is composed almost entirely of broken shells, occasionally rather collice, and containing fragments of very small fossil corals: the whole slightly and irregularly laminated, is united into a mass with a strong calcareous and highly crystalline cement. In geological position this limestone rests upon the Caen freestone. It resembles in general structure and composition several varieties of similar material to be found in our own coun-try, such as the Hamhill stone near Yeovil, the Taynton near Burford, that of Weldon-in-the

l, Northamptonshire, and a few more, which are well known to be extremely durable, although they are usually rather too

coarse grained to be used for minute ornaments

coarse grained to be used for immure ornaments, but no doubt admirably adapted for bold architectural or engineering works.*

Before particularising the stone of any precise spot, it may he well to state that the city of Caen, together with its entire environs, rest immediately upon the rocks of freestone. The bare strata may be observed on the surface of the ground, all round the foundations of some of the principal buildings of the city and villages in the neighbourhood. Although the in general appear to be perfectly level, nevertheless, upon a more attentive examina-tion, through a distance of 10 or 12 miles, an evident depression may be observed from inland towards the sea, of probably about 100 feet, or an angle of something like 1 in height to Caen freestone are not to be found on the coast, where, if they are continuous, they are buried beneath the Ranville rocks, and probably form the hed of the ser

From the general flatness of the country it is rather difficult to distinguish the precise locali ties where older rocks have risen from beneath

to the surface through the freestone beds; and in the immediate neighbourhood of Caen such features appear to be of rare occurrence. It is pretty certain that the same calcareous strata may be traced in continuity round the city as far as St. Croix and Tourville on the west; also to Fontenay; and on the road from Caen to Falaise, with one or two slight interruptions, similar stone may be found throughout nearly the whole distance of 20 miles, for I am dis-posed to consider the quarries of St. Pierre and Aubigny merely as modifications of the same rock

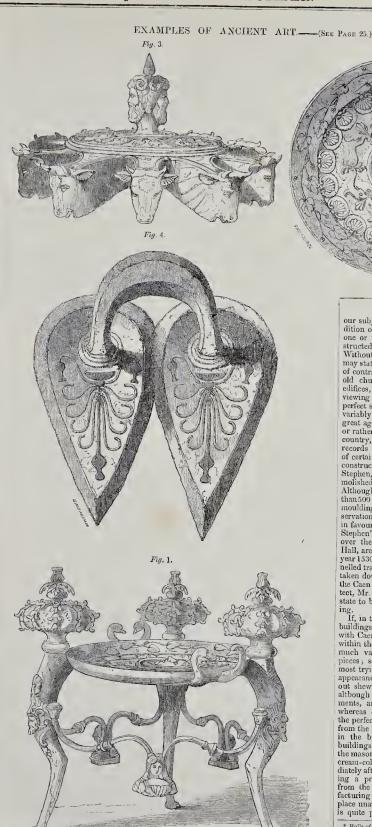

Leaving the consideration of subjects which may appear remote and hypothetical, I now proceed to the main object of inquiry, which is to describe the different qualities of Caen stone. As I have already stated, there are many places in the neighbourhood from whomes building stone is at this time. whence building stone is at this time pro-cured; and there are others where the name and inequality of surface would lead us to suppose that, in by-gone times, quarrying operations had been practised to a considerable extent, although long since discontinued. Even close to the walls of the citadel, and midway between two of the largest buildings midway between two of the largest buildings in the city, namely, the churches of St. Stephen and the Holy Trinity, there are places still retaining the names of the "Old Quarries," the "New Quarries," and the "Little Quarries," of these I shall have occasion to offer some remarks hereafter. But the principal quarries from whence Caen stone is procured, which, from their number and extent we raw iffer from whence Caen stone is procured, when, from their number and extent, we may infer have been in work during several centuries, are situated from 1½ mile to 2 miles' distance, on the south-west of the city, near to the village of Haute Allemagne. The surface the village of Haute Allemagne. The surface of the country, especially that part over the quarries, is nearly level, having a very slight inclination towards the north-east, so as to drain into the river which divides the high from the low land. The river above the city is very narrow and shallow, little more than a brook or rivulet, and has never been used for the conveyance of stone, although it must close the conveyance of stone, although it runs close by the entrances to the principal quarries. The quarries, to the number of about 30 or 40, are all subterranean, and are entered from a road an superranean, and are entered from a road along the side of the hill, or escarpment. A few shafts have been sunk from the surface perpendicularly, up which the blocks of stone are hoisted. The shaft quarries are situated at a considerable distance from those which are entered from the side of the hill, and have therefore no communication from one to the In one or two cases, these shaft quarries have been deserted, on account of the water finding its way from the surface into them.

The surface soil in the vicinity of Caen, as is usual in stone countries, is made up of little stones, partly disintegrated rock, and a small quantity of mould, or decomposed vegetable matter. Beneath this, from 20 to 50 feet deep, matter. Beneath this, from 20 to 50 feet and according to situation, as it may be near to, distant from, the river, are numerous strata of hard coarse rubbly limestone, of various thicknesses, from a few inches to 3 or 4 feet, with, occasionally, layers of small cherty nodules between the beds, a few inches thick. This entire mass of useless matter forms what is termed the head of the quarry. The actual number of beds is uncertain, for only six have been selected as marketable, or most fit for architectural purposes: beneath these, the stone is not extracted. These six beds, which rest upon each other without interposition, vary in thiness from about 2 feet to 5 feet or more. estimated aggregate thickness of them all, may be taken at ahout 17 feet, although in some places the total depth may probably amount to 22 feet. The natural vertical joints being square to each other, and wide apart, blocks of large and varied size can be obtained, even to the extent of 15 feet in length, hy 5 feet or more square, but such dimensions are never extracted or required, on account of the many practical difficulties in removal and transport. The names, dimensions, and certain distinctive characters of these workable beds, have been so ally described by Mr. Donaldson and have so recently appeared in THE BUILDER, from the pen of Mr. Godwin, that I need not attempt a repetition.*

Such then is a general outline of the geology of the Caen stone district. The next part of

^{*} I am informed that Ranville stone is being supplied for one part of the sea-wall of the Harbour at Dover.

^{*} Sec Vol. VI., p. 481 and p. 493.

our subject will be to notice the present condition of buildings in the city of Caen, and one or two in this country, which are constructed, beyond doubt, with similar material. Without mentioning any particular building, I may state in general terms, and with little fear of contradiction, that all the richly decorated old churches and other highly ornamented edifices, of early date, in the city of Caen are, viewing them collectively, in a comparatively perfect state; the stonework being almost invariably in good condition, considering the great age of some of the structures. There is, or rather was, one building of celebrity in this country, to which I may allude, because the records of the time state particulars and cost of certain quantities of Caen stone used in its construction.* I mean the chapel of St. Stephen, at Westminster, very recently demolished, except the crypt or under chapel. Although this building could not have been less than500 years old, yet the carved ornaments and mouldings were in a most excellent state of preservation. I will mention one more circumstance in favour of Caen stone. The clositers of St. Stephen's Chapel and ornamental Gothic work over them, on the east side of Westminster Hall, are said to have been receted about the year 1530. The greater portion of the richly panelled traceryabove these clositers has just been taken down to make certain alterations, and the Caen stonework is considered by the architect, Mr. Barry, to be in a sufficiently perfect state to be reconstructed without fresh work.

ing.

It, in the same manner, we examine modern buildings, or such as have been constructed with Caen stone, either in France or England, within the last twenty or thirty years, we find much variety in the durability of different pieces; some appear affectually to resist the most trying atmospheric influences, and, to all appearance, will remain for many years without shewing the slightest symptom of decay, although wrought into the most delicate ornaments, and placed in very exposed situations, whereas other stones, immediately adjoining the perfect ones, begin to moulder and perish from the first day after they have been placed in the building. In some few instances of buildings of recent date, the entire surface of the masonry retains very nearly the same clean, cream-coloured appearance which it had immediately after completion. Beware of so flattering a prospect. In an atmosphere remote from the metropolis, or from a smoky manufacturing town, such circumstances may take place unattended by premature decay; and it is quite possible tbat an architect, in his de-

^{*} Rolls of the time of Edward III., containing accounts of expenses relating to the erection of this chapel.—Smith's "Aniquities of Westminster."—Brayley and Britton's "History of the Ancient Palace and Houses of Parliament at Westminster," 1836.

clining years, may look with pleasure upon the ornaments which he had designed while yet a youthful aspirant to professional honours, without the annoyance of seeing them in a mouldering condition, or else half obscured by soot. But in London, wbenever 1 see an elevation, after ten or a dozen years' completion, with a clean surface, and presenting the pattern of the property of t aton, with a clean surface, and presenting the natural colour of the stone, I always expect to find symptoms of slow, gradual, and certain disintegration from the surface of the stone. Such process of decay may be unobserved in months or seasons, but an insignificant cause will produce a very surprising effect when continued for ages

It may appear difficult to explain the reason of so much difference in the durability of materials procured from the same locality; but materials procured from the same locality; but such variety is not peculiar to the Caen stone district alone; it is so with Portland stone, it is so with Bath, with Anston, and I believe it to be the same with all other stones. The numerous old and new buildings in this great metropolis alone, without mentioning any in the provinces, will abundantly prove my assertion.*

C. H. SMITH.

PROFESSOR COCKERELL'S LECTURES ON ARCHITECTURE.

The second lecture of the course on architecture, at the Royal Academy, was delivered on Thursday, the 11th inst. Having in his former lecture endeavoured to reply to any scepticism in reference to the existence of true theoretical principles of architecture, the pro-fessor further urged the necessity of inquiring into their nature. The successful pursuit of into their nature. The successful pursuit of every art and science required, first, innate feeling; and second, the acquirement of sound theory. He argued that, without the man, it was hopeless to attempt to teach music to one who had never whistled a tune, so it was one who had never whistled a tune, so it was to expect that education and labour would, to the requisite extent, supply the want of a natural aptitude for the art of architecture. He mentioned the case of Sir John Leech, who had commenced the study of architecture, but relinquished a pursuit for which he found him-self unfitted, for the profession of which he became one of the brightest ornaments.—But, however fortunate the student might be in natural qualifications, he had still much to derive from theory. It might, therefore, be expected that these principles should be extracted to be attracted. expected that these principles should be attempted to he established by writers, but it was somewhat disappointing to find their perspicuous development lost in metaphysic speculation, of which we might almost say as had been sometimes said of the philosophy of kant,—that it was doubtful whether the writer himself understood what he was attempt ing to enunciate. Criticism might assist the student in gaining the correct views he was in want of, were it dictated by any settled prin-ciples. But the critic dealt his blows right and left; we found sounding terms, but what these were he failed to tell us. Certainly we were entitled to expect some clear doctrines in the place of all such demonstration; but, after the indulgence of much ill blood, we were left to ask—in plain parlance—is there a theory of architecture, and what is it?

The professor argued that the existence of

such a theory was as undeniable as the exist-ence of fixed laws in the works of the great Architect of the Universe; and he proceeded to indicate the way in which that theory might to indicate the way in which that theory might be discovered.—The objects in nature and art were the same; heauty of form and colour were the ends contemplated by both. Regularity was the pervading principle of the works of nature, in which every thing was dictated by the purest taste and the most refined geometry. This was instanced by the beautiful process of court allowed to the contemplation. Peculiar uses became peculiar crystallization. Peculiar uses became peculiar ornaments—the ornament was co-existent with,

and arising out of the use.

We were, perhaps, in the habit of taking many things as mere appendages, without sufficient inquiry into their origin. For example, in the case of the horns of animals—as of the bull and stag. In southern countries, where means of defence were most required in the animal, we found the long horns of oxen, whilst nearer home short horns were common

* To be continued

and so, in inquiring into the development of all the works of nature, we should first trace an object of utdity, and afterwards that the forms were those which conduced to ornament. forms were those which conduced to ornament. The architect raised the arch and vault, and counteracted the thrust by buttresses, and the casual observer believed these heautiful features were so placed for ornament alone. But if the architect employed a roof with tie beams, and consequently avoided thrust, he dispensed with buttresses, and could substitute selvence and a character accordant with tute columns, and a character accordant with the altered construction. If he had to design a building for a southern latitude, where it v desirable to make the windows small, his design was not discordant with that object, but effect was gained by breadth, and the character given by the piers. But in a northern latitude, where the admission of the sun's rays was to be courted, he imparted character to the windows, and followed what was called the "fenestral" order of composition. And thus the skilful architect turned every circumstance of climate architect turned every circumstance of climate or purpose into a source of beauty. For it was only the pedantic architect who applied to all countries, and on all occasions, the same features, and who thus lost the lesson which nature gave. Of this our own empire furnished most striking instances. Instead of applying in particular climates such styles as had originated in similar climates, the lesson of nature, and all previous art, taught nothing to the modern architect. The stoa, or portico, which might be desirable in a southern climate, might, in a northern, be a nuisance, unless which might be desirable in a southern climate, might, in a northern, be a nuisance, unless glazed, as were the cloisters. The Grecian Doric order, on the Acropolis, seemed to grow out of the rockwork itself; but when placed in our modern streets, and combined with vertical lines, it appeared out of place, like an including the second of the control elephant in a cage. So, place upon a lofty pedestal an elaborate Gothic building with pinnacles and statues, and the effect would be equally inappropriate.

Thus, the professor said, structure was seen to be an important element in art, and out of it arose numerous and surprising results. No it arose numerous and surprising results. No fabric could equal the most ordinary one of nature, and if Sir Joshua Reynolds had said that painting was the art of seeing nature, we might say that architecture was the art of understanding it. In proof of the immediate advantage which was to be gained by a study of nature, the professor cited the instance he of had given,* on former occasions, of the deriva-tion of the construction of the dome of the ca-thedral at Florence from the structure of the human skull, -the great difference between this example and that at the Pantheon, in the openings, and particularly in the size of piers, the construction of which he could not be altogether aware of, rendering it necessary that Brunelleschi should devise some method which should combine strength with great The professor illustrated this of the subject hy a sketch on the board, shew ing in section the two thicknesses of the skull, and he also shewed that all the bones, on the same principle, combined strength with lightness. He also gave the other instance, in the derivation of the steeple of St. Bride's Church, with its spiral staircase and central pillar or newel, from a common form of spiral shell having a similar columello.† In St. Paul's we might not discover the same direct adaptation, as in Wren's other work just mentioned, but the professor shewed that it was not less the work of a child of nature. He also contrasted the methods practised in the domes, and for the support of the lanterns in St. Paul's, and in the Pantheon at Paris, by Soufflot, and said he could not conceive why the French architect had neglected the simple model of the baptistry at Pisa, which Wren was doubt-less well acquainted with, as he was with everything else, and why he should have used everything else, and why he should have used the three domes, and why the middle dome, when the other method appeared to be equally convenient in the section. It could only have arisen from the mere bravado of doing something different. The professor, also, alluding to the foresight of Wren, mentioned the stability of the foundation of St. Paul's, and said that compliance to the executors were not that openings to the casements were pro-vided only on that side of the building where the cold and damp air would not be likely to

find admittance.-We have not space to do justice to all the instances which were given of the analogy between architecture and nature, of the analogy between architecture and natic, seen even in the structure of shells, in which was noticed the principle which had been applied in one of the latest improvements of ship building, nor to do more than mention the beautiful passage in a work of Sir Charles Bell, in which the most striking instances of mechanical skill were shown to be infinitely surpassed in the structure of the human form, surpassed in the structure of the dealer evidencing as these did, the creative power which the persecuted Galileo saw even in the the floor of his dungeon. The professor reserved for future notice many instances of this analogy in more minute details, as in the parallel cases of the right lines of architecture, parallel cases of the right lines of architecture, and the line of the borizon at sea, and in the similarity of the forms of waves, and the outlines of sinuous mouldings. He cited such instances to show the uniformity which mustaines to show the uniformity which mustaines to show the uniformity which must shown that there was a theory in art as in nature, that we spoke of "the great Λrchitect of the Universe," that there was one great school of architecture, and that there was no other school, or "taste," or prophet under heaven, which could be compared with it; that it was not the knowledge of various styles, it was not the knowledge of various styles, and not the going to Greece or Rome, which made the true architect, but that the flowers of that the field offered better models than could be found in the works of man, and that if a national style was ever to be established, nature presented the true road to the grand in

THE CHICHESTER SCHOOL COM-PETITION

Mr. John Elliott has published some correspondence on this matter, involving two or three curious points. It seems that the money was provided by subscription for a memorial of Bishop Otter, and that a school being determined on as the form of the memorial, a competition took place several years was and a plan submitted by Mr. Elliott rial, a competition took place several years ago, and a plan submitted by Mr. Elliott being considered the best, he was elected the being considered the best, he was elected the architect. The matter remained dormant for a time, but his design, he states, was retained on the understanding that he was to be employed when the work was commenced.

On the appearance of the recent advertise-time where for a school to be sent

ment requesting plans for a school to be sent in competition, Mr. Elliott put forth his claim to the appointment, and as it seems to us (knowing nothing more of the circumstances than what appears in print), with great right. He had spent money on a chance in a lottery, and had drawn the prize, such as it was: it seems rather too bad to tell him afterwards

there was no prize.

The reply by the Rev. Mr. Parrington to his application was, that the "Otter memorial committee had handed over their whole powers and trust to the committee of the Chichester Training School," and that they knew nothing

of his appointment: knew nothing of his plans.
But, says Mr. Elliott,—"The 'handing
over of powers and trust' from one committee to another, surely implies the handing over also of obligations and liabilities. I will take the case that the present committee select a design from those to be sent in; they promise the architect that he shall be employe circumstances prevent the intention so formed and announced from being carried into innmediate effect; in the mean time, some of the members of this committee are changed, a change in the extent of the plan is deemed necessary, not in its purpose,—would either or necessary, not in its purpose,—would either or both these changes afford the shadow of a pretence for disregarding the claim of the archi-tect who had devoted his time and his talent tect who had devoted his time and his talent on the chance of being so elected, and who, being successful, had a moral right to the fruits of his labour? And in what respect, permit me to ask, does my case differ from this imaginary one? I devoted my time to preparing designs and estimates in a similar competition, and I was successful: for several years the matter has been in abeyance, but considering that I was in the hands of honourable men, who would, when the time arrived fulfil what had been promised to me, I made no application whatever for remuneration of any kind." He further offered, without extra

^{*} Vide THE BUILDER, vol. 4, p. 63.

charge, to make as many designs as they required till one was obtained to meet their views.

The snb-committee, however, had made up their minds, and all Mr. Elliott could get was a recommendation to compete again. His original plans being "discovered," were returned to him. The fresh competition he declined; and in a long letter asserted that he declined; and in a long letter asserted that he has been exposed to persecution and loss of practice by certain elergymen, and can only conclude that they are acting in the spirit of a policy "openly advocated by elergymen of the new school, to exclude from employment all architects objecting to go freely in certain papistical bye ways, miscalled the 'old paths.'" And he asserts that "those architects who will not zealously further such views, are regularly hunted down by their organ, libelled without mercy, or the slightest regard to truth, and refused redress on the plea that it was all done pour l'amour de Dieu."

Mr. Elliott goes on to shew how it was attempted, in another case, to put him aside, "in favour of Mr. Butler, the builder employed by the chapter;" and says,—" It was this same Mr. Butler, one of the very last men I should have to fear as a competitor in my profession (in which he is an interloper), whom the 'cathedral party' and the chapter agents have for some time past been so unfairly attempting to force into my practice, with whom I had to compete on the occasion when the committee chose my design for the Training School. It was not considered expedient to appoint bim at once after such a result, so it was resolved to have another competition, of which no intimation was conveyed to me. very ingenious advertisement was drawn up, and an equally ingenious reply framed, for those architects who might be foolish enough to waste their time in competing, and write for particulars,—the substance of it being that, if they required information other than the advertisement afforded, they must find it out for themselves. These things savoured out for themselves. These things savoured so strongly of an intended wrong, that they excited the suspicion and drew forth the comments of the editor of The Builder. The competition over, the seventy or cighty unlucky architects are informed by another ingenious advertisement in The Builder. that the committee have decided on the design marked "December, 1848;" and that the other parties may receive back their plans on application: of course the competitors must all be satisfied at this—the committee do not even yet know the name of the party who has got the prize: by the most extraordinary chance in the world, however, it turns out that "December, 1848," is Mr. Joseph Butler, the chapter's own man, the very party whom every one knowing any thing of the circumstances connected with the affair, knew it was intended should have it, by hook or by crook."
We give the pith of this not uninstructive story just as it comes to us, and leave our readers to draw their own inferences.

ACCESS TO CHURCHES.

DURING my late rambles in the provinces. as often as I came to a large town and wished to explore its ecclesiological remains, so often had I to utter the invariable cry,—"Where are the church keys?" With hardly a single exception, I found the church locked up, the clergyman living at a distance, the clerks engaged in their secular occupation, and even the sextoness sometimes gone "a-washing," In a few places a board is stuck up, stating that the sextoness lives in such-or-such place; but when the tired stranger has reached that locality, and inquired for this indescribable female, he is generally informed that she has changed her abode—perhaps to some distance. He then goes there, and finds she is "a-washing" at Mrs. Thompson's, or on some such woman's errand. On one occasion, having repaired to the advertised residence of a sextoness in a dark alley, I found her abode changed for one at some distance, where, having tracked her out with much difficulty, and mounted to some four-pair back, I found the poor female alone, ill in bed, the keys of the sacred edifice being entrusted to her sole care

coolly informed by him that, being engaged in his secular occupation, "he could not in his secular occupation, "he could not attend to me, and without him no one might visit the church, lest a Prayer-book should be stolen!!" I urged my plea that, as a stranger, I might not again have an opportunity of visiting the edifice, but to no effect; and, at a great inconvenience, had again to wait on him at the hour he named.

But, Sir, should this be so? If this utilitarian age consider it sufficient to worship God collectively once a-week, is it right, is it decent, that our churches should be sealed up decent, that our churches should be sealed up as hermetically as a prison—admittance hardly to be obtained—the keys found only after great delay—and when a hasty glance has been cast at the building, to be greeted, as I have been in a parochial church at Glastonbury, with the show-like expression, "We charges a shullin a head, zur!" If strangers found everywhere the courtesy displayed at St. Mary's Redcliffe, there would then be no need of complaint. need of complaint.

In making these observatious, I have not urged, as I could have done, the obstacles daily thrown in the way of members of the architectural profession, when endeavouring to obtain some memorial of past art. That these impediments are numerous, no one can deny; at none is more unnecessarily vexatious than this hiding of church keys, every one will admit; and it is in the hope that your columns will be open to deprecate so unjustices you. system, I have now ventured to address you. F. C. W. will be open to deprecate so unjustifiable a

THE MARBLE ARCH IN ST. JAMES'S PARK.

THE danger is imminent; the palace advances to completion; soon the hoard will be removed, and the arch, the costly monument of George the Fourth, is doomed to demolition. Perhaps this structure is not very remarkable for beauty of design, or for any elaborate finish; it stands, however, a solitary instance of regal magnificence, being the only evidence in marble of an architectural portal in London, and with its bronze gates, which are good specimens of their kind, is not an unworthy memento of a monarch whose refinement of taste conduced not a little to the embellishment of the metropolis and the encouragement of art.

Is this Arc de Triomphe to be abated, and to be lost to the nation whose liberality furnished 70,000l. to its edification? For the sake of the capital which boasts but two arches we

hope not.

By the way, says my boy who stands beside me, and to whom I refer sometimes as a mentor (for juvenile ideas have their value, albeit he is occasionally a tor-mentor), "Sir, you are mistaken, for there is Highgate Archivay, and also the Bar where the arch civic authority receives majesty, and tenders the keys of the city,—Temple Bar."

Well, it is true we do possess these monu-

ments: but still we hope that some site may be found whereon to reconstruct that which, if sold for its intrinsic worth, may not realize

Our city has a goodly range, and its locale is happily chosen. Piazzas and largos we have not, save the national fountains; yet there is no deficiency of positions where the restored marble arch might perpetuate the taste of its royal founder.

Could not some public contribution be got up to effect works of great public utility? We do know that St. Peter's was accomplished by such means, and that Peter's pence were collected for the object throughout all Christian Europe. We know that Mr. Cobden and Mr. Hudson had testimonials—colossal ones; and that now a monumental tribute is being collected for a mausoleum to Lord George Bentinck. Then why not, in this wealthy community, collect a fund to illustrate the greatest city of earth,—London? This might be done in shape of a poundage tax, to be levied within the range of the City and Liberties of London

and Westminster.

The noble esplanade extending from St.
Martin's Church through Pall Mall, now become the street of palaces,—what a glorious approach would that make to Hyde-park, if continued through Cleveland-row, and in a straight line to Buckingham Garden! At one When recently in Bristol, on my applying straight line to Buckingham Garden! At one parts. This description of fluor to a sexton for admittance to a church, I was end the spire and portico, at the other the open about 11d. per square yard.

park: this access breaking ont balf way be-tween the palace and the Triumphal Arch tween the palace and the Triumphal Arch (from which it might be distant about 200 yards) would present the finest central avenue in Europe, and afford an approach, without a hill, to Hyde-park.

It would be necessary to purchase the corner house of St. James's-street, and six other houses in Cleveland-row, and also the other houses in Cleveland-row, and also the insulated mansion facing the Green-park; this would open the space between Lord Ellesmere's new hall, the Dake of Sutherland's, and St. James's Palace; for the rest, the debris of the houses would form the road (about a quarter of a mile) over the flat park, and would effect a truly royal approach to Buckingham Palace, At the point of junction I would please the

At the point of junction I would place the marble arch. By this alteration, the noble mansions and palace would be worthy of this emporium of the world, and the gorgeous clubs of Pall Mall would add dignity to the central Boulevard, thus made light and ventilated by vital air.

At the same time, for the embellishment of the new palace and the St. James's park, the old Mall behind St. James's might be broken up and clothed in shrub and verdure, only reserving the width between two ranges of the trees, now trampled and hardly vegetating there: that is, maintaining the present road through one alley (there are now four) for royal use, and for the privileged classes, between the new palace and the Admiralty.

This would greatly enhance the beauty of St. James's park, and form a noble vista from the Portal Royal; for there is a space of at least twelve acres of russet gravel at present wasted in road.

In the days of James and Charles this was the Mall, and, therefore, had its uses; but now the promenaders frequent Hyde-park: and the lugubrious trees of the old Mall give melancholy shade to only a few stragglers; for the wandering valetudinarian, nurses and children, range the pleasant sward and water-side within the rails; the external parterre is any thing but pleasing, and is avoided, as would be a desert in an Oasis.

LIME-ASH FLOORS FOR COTTAGES.

TWENTY years ago the almost universal cottage floor in Devonshire was produced by floating down an admixture of pounded lime (used tolerably fresb), smiths' ashes, and cleau drift sand, in equal proportions; this was "run down" on a substratum of coarse gravel, brick bats, and lime core, about 6 inches in thickness, well saturated, then beaten to thickness, we a level surface.

The lime floor should be 3 inches thick and well floated, and then "ironed down" (the more labour the better), and beginning at the further corner of the room, the man should gradually "work himself out" at the door, so as not to walk upon the new work. In a week it will become hard and durable. It is easily repaired when requisite.

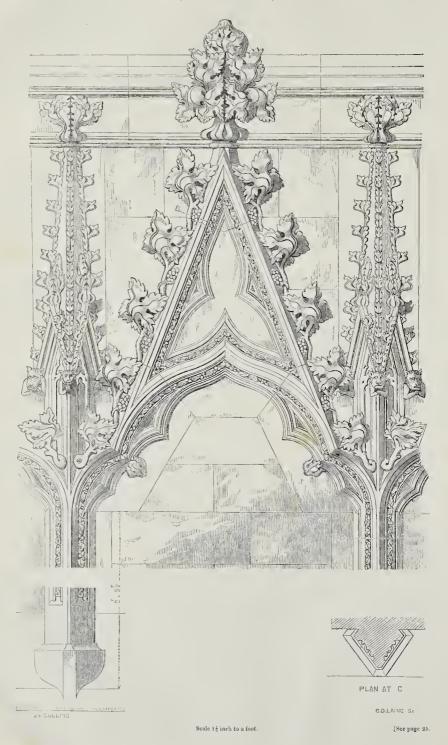

If smiths' ashes cannot be got in sufficient quantities, one-half of brick dust may be mixed with them before they are finally chaffed up with the lime and sand.

JOHN BURGES WATSON,

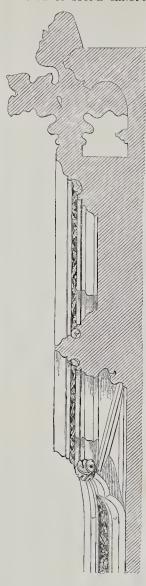

Another correspondent says, that—In Somersetsbire, artificial stone floors are constructed in the following manner: — The ground is prepared to receive the material; a concrete is then laid on, about two inches thick, consisting of one part lime to four of sand, well mixed together, taking care not to make it too wet It is then well rammed with a flat punner, until it becomes sufficiently consolidated to receive the second coat; another layer is then laid on, the same thickness as before, and well rammed: care must be taken to keep the surface level. After a short period it will be sufficiently hardened for use. It is then rubbed over with common oil, which gives it the appearance of stone instead of sand. "Cupola" ashes are used to give the floor a dark appearance. I have seen floors made of this material in imitation of tesselated pavement,—the ashes and lime making the dark portions, and the sand and lime the light parts. This description of flooring costs there

MR. BARRY AND THE SEWERS' COMMISSIONERS.

DRAINAGE OF THE NEW HOUSES OF PARLIAMENT.

A VERY curious document, comprising the report of Mr. Austin (on the part of the commission) on the drainage of the new Houses, Mr. Barry's reply, and Mr. Austin's observations thereon, has been printed, and is about to be issued for the use of the commissioners.

The matter can scarcely remain where it is, and is likely to excite much interest.

and is likely to excite much interest.

Circumstances having rendered an examination of the sewers at the building in question desirable, Mr. Austin was directed to make it, and to report to the board. From this report we learn (omitting other particulars) that a private sewer, 5 feet 6 inches high and 3 feet wide, traverses the whole length of the new buildings, joining the public sewer in Abingdon-street, at the southern end, and going directly (although not originally so) to the outfall into the river at Westminster-bridge, at the northern end. "On examination," says the report, "it is found that the portion of the sewer running through the buildings is constructed above the level of the floor of the vaults. On looking level of the floor of the yaults. On looking through one of the flapped communications which enter just above the invert, the sewer which enter just above the invert, the sewer appeared to be at that point nearly its entire height above the ground level. On reaching the centre of the buildings, however, we discovered an opening about 2 feet square broken through the arch of the sewer, apparently for some temporary purpose. On c'ambering through this opening we found ourselves in the very vaults of the new buildings."

The report continues—"The condition of this main sewer throughout its entire length.

this main sewer throughout its entire length must be regarded as extremely dangerous to the health of those who reside in, and frequent the headin of those who reside in, and requent these buildings. It is nothing but a con-tinuous cesspool from one end to the other, emitting most noxious effluyia; and being blocked up at each end with heavy flaps, the only source of ventilation is into the buildings themselves, or into the court-yards into which

themselves, or into the court-yards into which these buildings look.

Dr. Reid has been at great pains, and considerable cost, in the construction of an air shaft, to avoid taking air for ventilation from near a sewer, while all the time a sewer of the first class is pouring forth into the buildings, from one end to the other, malaria, evaporating from a surface of foul matter of between 2 000 and 3 000 square feet in extent 2,000 and 3,000 square feet in extent.

The foul matter throughout its whole extent is nearly equal to the full width of the sewer, and presents an evaporative surface for the exhalation of noxious effluvia equal to 150 ordinary cesspools."

Of the various communications from the Of the various communications from the buildings which open into the sewer, a most singular description, illustrated by sketches, is given. "Some of them," it is said, "are brick barrel drains, of 9, 12, 15, and 20 inches in diameter, wretchedly constructed. The outlet into the sewer of one 20-inch drain is about a fourth part of the drain itself.

Some of the communications are half-tile trains covered with brick fast are half-tile

drains covered with brick flat, with square drains covered with brick flat, with square openings broken through into the sewer. Several are stone-ware pipes; some of them projecting into the sewer several inches, others stopping several inches short; some broken right away at the mouth by being driven forcibly in. Some are obstructed at the outlet by bricks and lumps of cement."

It proceeds:—"So much has recently been said on the extravagant size of severe which

It proceeds:—"So much has recently been said on the extravagant size of sewers which generally prevails, that it will be unnecessary to enlarge upon this part of the subject; but it may be urged as a reason for such large constructions in this immediate district, that a certain amount of reservoir is required for the storage of storm waters during high tides, when the outlets of the sewers are closed; but these reservoirs, where indispensable, should never form the receptacles of the general refuse drainage. In the buildings in question, where every facility exists for the immediate discharge of all surface water into the river, this consideration should never have weighed at all; and in the new plans contemplated for at all; and in the new plans contemplated for the neighbourhood, it would indeed be ex-tremely injudicious to admit into the general system the surface waters from buildings occupying an area of between six and seven

acres, from which no decomposing matter would be conveyed by the rain, and from which any amount of storm water may at all times be immediately discharged into the Thames.

Thames,

Two fifteen-inch pipes falling each way
and discharging north and south, with the
inclination and pressure that would be obtained, would carry off the waters of the
greatest storm upon record from nearly double
the surface, or twelve acres of covered ground." the surface, or twelve acres of covered ground."
"The main sewer through the building Mr.

Barry has it in contemplation to alter, by cutting off its junction with the Abingdon-street sewer, and directing the inclination all in one direction, from the south end of the buildings to the outlet at Westminster-bridge; but if the proposed separation and immediate discharge of the surface waters were to be effected, a construction of these large dimensions would be totally unnecessary, inasmuch as it would be upwards of thirty times greater than the utmost provision that should be made; and as, while it is allowed to continue, the buildings can never be maintained in a healthy condition, I would strongly advise its entire

condition, I would strongly advise its entire removal.

The cost of the alteration would be comparatively most trifling; but even if it were considerable, it would be folly to be spending many thousands upon ventilation, and an attempt to provide fresh air, while this fruitful and extensive source of malaria is permitted to avist.

exist.

A nine-inch pipe, with a fall each way of an inch in ten feet, which can be obtained along the present line of sewer, would discharge 72,000 gallons of water per hour; a supply many times beyond what the requirements of the buildings can ever furnish."

Mr. Barry is, of course, somewhat angry with this, and complaining that "its highly-wrought descriptions and numerous mis-statements likely to be prejudicial to his professional character, have got into print," earnestly requests the Commissioners to assist him in giving the same publicity to his replies, him in giving the same publicity to his replies, as the allegations have had. Mr. Barry commences with the following remarks on the system of devisors educated.

mences with the following remarks on the system of drainage adopted:—
"That it was devised and commenced in accordance with the rules and regulations of the late Commission of Sewers for Westminster, and that the lowest available depth of drainage was adopted of which the data furnished but the Commission would admit

That the system was arranged at a time when the present vaults of the building were not in contemplation.

That the system is as yet only partially carried out, in consequence of the unfinished state of the building; and that many of the existing arrangements connected with the drainage are either unfinished, or are of a temporary nature.

That during ten hours upon an average in every tide, the outfalls of the public and palace main sewers are closed by the rise of the tide in the river, and all drainage from the New Palace is consequently storyed for that New Palace is consequently stopped for that

New Palace is consequently stopped to time periodically. Under these circumstances, no other system than that which was adopted was found to be practicable; but it has been long the intention of the architect to recommend the adoption of an exclusive system for the New Palace, by which its drains should be entirely cut off from the rubble sewers."

from the public sewers."

Omitting his replies to those parts of the report not mentioned by us, we pass to this,—"The main sewer is not, as stated, constructed above the floor of the vaults; the latter were not even projected when the sewer was formed. It is not the fact that it is even now in the vaults of the building; on the contrary, it passes nearly throughout its entire length under the courts and open gateways of the building. Under the courts it is imbedded in the earth, and under the gateways it occupies a space which is not a vault, and where it is intended to be imbedded in solid concrete. The only portion of it which passes under the building is for about 36 feet in length at the north end of it, where it is entirely below the vault-floor level, and imbedded in the earth. At no part of its length is the main sewer, as stated, 'nearly its entire height above the ground level,' or, as doubtless Mr. Austin means, the vault-floor level." Omitting his replies to those parts of the

Mr. Barry complains of a sketch which Mr. Austin gives in his report to shew the ap-pearance of the sewer in the vaults, as convey-ing an exaggerated idea of the latter, which he says are not vaults, but "arched spaces under an open gateway," "intended ultimately to be filled in around the sewer with concrete." He thinks that, "Owing to the levels of the outfalls of the public sewers into the river, the lower portion of the palace main sewer cannot be otherwise than a reservoir (termed by Mr Austin, a continuous cesspool) for ten hours in every tide; but no inconvenience or nuisance can possibly arise from this circumstance, when every drain connected with the main sewer is properly trapped, which is proposed to be done as they are successively connected with it.

The condition of this sewer, ventilated temporarily as it has hitherto been from the man-holes at the two extremities of the building, cannot even in its present unfinished state be considered, as reported, 'dangerous to health;' not the slightest escape of noxious offluvia bas ever been noticed either before or since the publication of Mr. Austin's Report during repeated and careful examinations made by the architect and his assistants, some made by the architect and his assistants, some of whom have remained in the sewer itself for three hours continuously without experiencing

three nours continuously winout experiencing the slightest inconvenience.

Upon a very eareful examination, the surface of the foul matter within the sever, instead of heing, as stated, 'hetween 2,000 and 3,000 feet in extent,' has been found not and 3,000 feet in extent, has been found not to exceed 1,350 square feet, and this deposit has been principally occasioned by the bricks and rubhish which have unavoidably fallen into the sewer in making the numerous communications with it that have at various times been required and which of cavers will be been required, and which, of course, will be entirely removed from time to time as the building approaches completion."
Mr. Austin says the currents of air through

Mr. Austin says the currents of air Unrough openings communicating with the sewer set outwards (showing that the foul air was passing into the buildings); Mr. Barry says they have been found invariably to set inwards.

"All communications with the main sewer,

which are intended to be permanent, are pro-perly and fairly constructed; the reported singular collection consist of temporary, but, for their present purpose, effective com-nunications with that sewer which have from time to time been required during the progress of the works, and will either he removed or made perfect when necessary.

The brick barrel drains are not, as alleged, 'wretchedly constructed.' On the contrary, it is impossible that such drains can he more perfectly constructed."

He thinks "the two 15-inch pipes recommended, considered, as they must be, as reservoirs for the storage of storm water during the time when the outfalls are closed by the tide, are utterly insufficient; they would not, for instance, contain 1-40th of the quantity of water which fell in three hours upon the area mentioned in the storm in the month of

August of the present year (1848).

The dimensions of the main sewer arc considered by the architect to be no greater than are absolutely necessary for the reception of the waters which at times must enter and be retained in it. The secape of noxious efflivia from it when the drainage is completed will be

impossible (?)

The cost of its removal, instead of being trifling, as alleged, would be very considerable The system of drainage now adopted, especially if rendered, as already mentioned, independent of the public sewers, will, in the opinion of the architect, he effective and free from all objections.

The 9-inch pipes here recommended for the

ordinary drainage of the New Palace would, for the reasons stated in respect of the 15-inch pipes, be utterly inadequate."

Upon this Mr. Austin rejoins, alluding darkly to a "very serious oversight of another "the state of the state of th kind in connection with the sewerage," men-tion of which was kept out of the printed report, and carries his attack even farther than before. He denies that the Westminster Comoesire. He defines that the Westminster Com-mission, "whatever blame they may have to bear," bad anything to do with the faults of drainage of the new Houses. As to the "vaults," he says,— "It would appear to matter little by what

term these portions of the basement of the building should be called; the fact being that there exists a perfect communication throughout there exists a perfect communication throughout the building by their means; that the whole of these works, whether of 'vaults' or 'arched spaces,' appears to be of precisely similar con-struction, and have, I am informed, always been known and spoken of before committees, and on the works, without distinction, as 'vaults;' and that although open gateways may exist immediately above this part, the

exposed sewer itself passes within about 12 yards from the basement of the grand central aloon connecting the Houses of Lords and Commons, with the vaults or arched spaces of which there is perfectly open communication, and through which I have myself passed more than once to the sewer."

Mr. Austin then re-asserts his statements; shews that in 1846 Mr. Phillips, in reply to complaints from Mr. Barry as to the public sewer with which the sewer in question com-municates, had pointed out that the latter was simply "an elongated cesspool, the great evil of which must eventually be very obnoxious and injurious," and that the main drainage should be entirely re-arranged; and he further urges that, by certain works done since his report, closing man-holes, &c., the sewer has been reduced to a more dangerous condition.

"Cut off from all possibility of ventilation, with constant foul deposit therein, the whole length of this sewer must shortly become nothing better than a vast retort, capable of holding some 15,000 cubic feet, in which the foulest gases will be perpetually generating and escaping in a concentrated form into the

It is a fallacy to suppose that flaps, placed at the mouths of the drains, communicating with the sewer, will at all times prevent the escape of this dangerous miasma. Even supposing that the contact of the surfaces could all times be perfectly preserved, every time that a discharge takes place, and the flap is raised, an opening is formed through which the foul and pent-up gases will rise and escape into the building."

We cannot, however, give space for more of the report than this one statement, viz., that "The defects of this construction and the bad consequences which must arise from it manifold, and of that serious nature, that nothing short of the entire removal of so faulty a work can cure the evil. It will admit of no real and practicable improvement, and after the attention which has been brought to bear upon the subject of improved drainage, and the sounder doctrines which have recently promulgated, the precedent cannot surely be allowed of a drainage work, full of defects, and devoid of all correct principle, remaining in connection with the most costly building of the country.

That the drainage in question is utterly bad seems to us clear, and we are sorry that Mr. Barry should have been betrayed, by what he may consider the too tranchant character of the report, into attempting to defend what is really indefensible, and what, if the report speaks truly, he himself considers so. We do not care about the minor points in the report, we will not ask if the report be exaggerated or not, nor even think it necessary to inquire if the sewer be above ground in "vaults," or "arched spaces." We dwell on the simple fact that there is beneath the building this enormous reservoir for the generation and retention of deletarious gases and which it would seem. deleterious gases, and which, it would seem, cannot he kept cleansed but by constant flashing. To prevent these gases, by means of traps, from discharging themselves into the buildings, seems to us impossible.

In conclusion, we would not have it inferred that we desire to attach blame to Mr. Barry. The sewer, it should be remembered, was built in 1837, when the received views in respect of sewerage were very different from what they are now; and as to the mode in which the communications with the drains are made, the clerks of works and the builders are respon-

ARTISTS' CONVERSAZIONE.-The first of these Conversazioni will be given on the 27tb inst.

FREEMASONS OF THE CHURCH.

THE first meeting of the above society, for The first meeting of the above society, for the present year, was held on January 9th, Mr. G. R. French in the chair. After the usual business, Mr. Jarman exhibited an Oriental casket of carved ivory mounted in steel. The chairman observed the singular likeness exhibited in this work, in its ornamentation, to many European productions of the thirteenth century. Mr. W. Harry Rogers exhibited a rubbing he had taken from an elaborate carved sandal-wood casket of the elaborate carved sandal-wood casket of close of the fifteenth century, in the collection of the late Sir S. Meyrick. This interesting of the late Sir S. Meyrick. relie is decorated with a profusion of knot-work, executed in relief, with the addition of roses, hearts, and the initials M. R. Mr. George Isaacs also exhibited an ancient jewel casket, of perpendicular taste, remarkable as being unusually architectural in its features. The corners of the lid are supported by four twisted columns, and the spaces between them are enriched with empanelled work of delicate finish. A short discussion having been entered into respecting the purpose and origin of these caskets, of which the middle ages produced an ahundant supply in various materials, Mr. J. W. Archer read a paper by Mr. D. Wilson, anundant supply in various materials, Mr. J. W. Archer read a paper by Mr. D. Wilson, secretary of the Royal Scottish Society of Antiquaries, "On some peculiarities in Scottish ecclesiastical architecture, with special reference to the Collegiate Church of the Holy Trinity at Edinburgh, demolished A.D. 1848." After detailing the wanton destruction of this venerable fabric which was founded in 1462 by able fabric, which was founded in 1462 by Mary of Gueldres, the widowed queen of James the Second of Scotland, and levelled with the ground in 1848, for the purpose of enlarging the area of a railway terminus, Mr. Wilson proceeded to the narration of some facts on the comparative dates of the successive styles of Gothic architecture in England and Seotland, particularly urging the very early intro-duction of decorated work in Scotland before even a symptom of its approach had been manifested south of the Tweed.

The chairman then announced the next paper, to be read February 13th, "On the importance of a knowledge and observance of the principles of art by designers," by Mr. W Smith Williams.

THE HORSE POWER POCKET BOILER.

Your paper of the 6th instant contains a notice of a new steam-engine by Mr. Beau-regard, in which it is stated, "a correspondent of the *Times* asserts that a steamer was navi-gated to Lisbon, some years back, on a similar

gated to Lisbon, some years oack, on a similar principle," &c.

The fact, that the principle sought to be obtained in this steamer, was the very reverse of that stated to be employed by M. Beauregard, renders it desirable that it may be

regard, renders it desirable that it may be generally known, in order that your readers may not be led away by chimerical accounts of results that never can be realised.

The vessel alluded to was the Comet, a Government steamer of 80-horse power, which was filled with Mr. Thos. Howard's vaporizers, by Messrs. Penn, the engineers. by Messrs. Penn, the engineers. The heating surface of these vaporizers containing but 6,298 in., being equal to 78.7 in. per horse-power, may well challenge a comparison with M. Beauregard's "horse-power pocket-hoiler," and further, from dry plates being used in both cases. But here all comparison must could be a surface of the property of the pro both cases. But here all comparison must end. It was Mr. Howard's object to inject the water in an extreme state of divisibility, upon plates, maintained at from 350° to 450° Fahrenheit, it being found, and confirmed by experiment, that the vaporization of water goes on much more quickly than at higher temperaon much more quickly than at higher tempera-ture. The maintenance of the "spheroidal state," as it is termed by M. Beauregard, was that sought to be avoided. This state occurs when water is thrown on plates at very high temperatures, and arises from its being kept from actual contact by a film of steam forming beneath it, and holding it in supenping thereby, agains it is absorbed. suspension, thereby eausing its apheroidal form, and preventing its speedy evaporation. I will not here enter into the system of

surcharging the steam, &c., employed by Mr. Howard. Suffice it to say, that the practical difficulties of employing heating surfaces at temperatures of 400° to 500°, were found to be

^{*} Reported in THE BUILDER at the time.

insuperable, and bis plan, which was excellent

in theory, was given up on account of them.

How perfectly insurmountable these difficulties will become when "red-hot plates are employed," is known to every engineer; and in heartily wishing M. Beauregard every success from his invention, I must recommend him to seek it from water in other forms than its "spheroidal state," and produced by other than "red-hot" surfaces.

WM. JEAKES, JUN.

SANITARY PROGRESS.

IT appears evident from the medical in-spector, Mr. Grainger's reports to the Board of Health, that the open ditches and other abominations in the neighbourhood of Mr. Drouet's establishment for paper children, at Lower Tooting, together with the crowding of nearly 1,400 children into an improperly planned, ill ventilated, and incommodious establishment, were predisposing causes, which, together with the epidemic condition of the atmosphere, produced so many cases of cholera among the children. Doubtless, too, pauper fare was an additional predisposing cause, otherwise the evil might have affected others in the same unwholesome vicinity, where moats of foul black putrefaction show an open surface of between 40,000 and 50,000 square feet to the face of day. Shortly previous to the outbreak, one of the foul ditches near the premises was emptied, and the filthy nud spread upon the banks in contravention of the regulations of the Board of Health, a circumstance quite sufficient of itself to ex-plain the predisposition of these children, in to such an attack in such a neighparticular, bonrhood.—A superintendent inspector is to be forthwith sent to Birmingham, at the request of the town, to make public inquiry as to the sewerage, water, burial grounds, &c.

—The Smoke Nuisance Committee of the Birmingham Street Commissioners have reported favourably of its suppression throughout the town. Thirty-one steam engines are under periodical inspection. Some of the worst chimneys at Newhall-hill have been rendered chimneys at Newhall-hill have been rendered smokeless. — Mr. Smith, of Deanston, has been engaged in sanitary inquiry at Lancaster, where the rate of mortality is above the average, and where Government have, therefore, sent Mr. Smith, without any partition from the inhabitants who seem to petition from the inhabitants, who seem to be reckless of their bad pre-eminence in the provincial 'bills of mortality.'—An instalment of the complete and thorough sewerage of the horough of Newcastle has been announced, in the shape of an advertisement for tenders for the construction of two great for tenders for the construction of two great sewers, one along Pilgrim-street and North-umberland-street, from the Royal Areade to St. Mary's-place; and the other from Union-street, by Newgate-street, to Green-court.— The Glasgow magistrates are ordering the discontinuance of burials in various over-cased burying grounds within the city crowded burying grounds within the city bounds as nuisances. The details are just a repetition of those awful and sickening dese-crations of the sacred remains of humanity with which the public are already but too familiar in reports of the state of intramural

RAILWAY JOTTINGS.

grave vards.

THE calls for January amount to 2,587,2251. about a million and a quarter more than for last month.—On the London and North-Western the following persons are employed, including those occupied in the collection and delivery of goods:—2 secretaries, 1 manager, 2 superintendents, 966 clerks, 3,054 porters, 701 police constables, 738 engine and firemen, 3,347 artificers, 1,452 labourers: total number, 10,263. The number of horses employed is 612, ditto vans, &c., 253. This great company has virtually abandoned the unworthy design of tually abandoned the unworthy design of clipping their clerks' salaries of a per centage, under the pretence of a "mutual" assurance fund scheme against defalcations. A per centage of 2d. a-pound, however, was first exacted, with a circular threat of dismissal against all grumblers, though "the full concurrence of the parties affected," is now alleged to have been a proviso of this notable

The London and North-Western scheme. have succeeded in reducing their rates in the Warwickshire district from 1,500%. to 500%. per mile, and in another from 8001, to 4001, The recorder of Canterhury has respited the rating case of the South-Eastern in Canterbury, the company to pay half the amount of future rates, till a decision of appeals, and the parish to allow the company any sums that may be paid in excess.—Nearly 30,000 may be paid in excess.—Nearly 30,000 gallons of milk are now sent weekly to the metropolis along the different lines of railway.

The Edinburgh and Northern have compromised the suit brought against them on behalf of the children of Mr. Wilson, dentist, Edinburgh, who was killed by falling into a cellar at the station, in October, 1847, for 1,100*l*., each party paying their own expenses.

——"It is said," says *Herepath*, referring to "It is said," says Herepath, referring to the Dover, "that, among other things, a large suin, about 40,0001. (not 4,0001., as erroneously printed in our last) has been used of the Company's money for other purposes. financial statement which has been expected, it is understood, will not be presented before the meeting."—An immense mass of chalk and earth, it is said, has again fallen in within a short distance of the spots where two previous falls took place, under St. Catherine's Hill, about half a mile from Guildford, and three and a half from Godalming.—A Shropshire paper also states that the Oakengates tunnel, near the Holyhead road, has again given way, and caused some of the road to sink in .embankment and sea-wall of that portion of the South Wales line which extends across the sands between Llanelly harhour and Bury-port, contracted for by Mr. Joseph Douglas port, contracted for by Mr. Joseph Douglas and others, bas been almost entirely washed away by the tide. It is not ascertained whether the loss will fall upon the contractor or the company, as the work was stopped by order of the directors.——"We were the first," says the Manchester Examiner, "to use the electric telegraph for the purpose of reporting, on the occasion of Mr. Cobden's election for the West Riding of Yorkshire; and we learn that on the meeting in the Free-trade Hall, the office succeeded in transmitting a column and a quarter of that meeting to London, giving a summary of the proceedings, for the London papers, in three hours. The telegraph is beginning to be more summary to be more than the summary that the summary than the summary than the summary that the summary than the summary that the summary than the summary that the summary eginning to be more appreciated as a means of communication.

METROPOLITAN COMMISSION OF SEWERS

A SPECIAL court was held on Tuesday, at the Sewers' Office, Greek-street; the Earl of Carlisle in the chair.

A letter was read from Mr. Roe, one of the sur-

A fetter was read from Mr. Roe, one of the sur-veyors, stating that in consequence of age and imperfect eyesight, he should accept the offer of a retiring allowance of 2001, per annum; but should nevertheless be at all times ready to render any service to the commission in his power.

The Late Cases of Cholera at the Asylum at Tooting.—A report by Mr. Lovick on the state of Tooting, presented to the General Board of Health, was read by Mr. Hertslet to the court.

Mr. Chadwick rose and said,—The considerations

arising from the reading of that report as to the effects of the effluvia from the sewers and recented described, upon the unfortunate occupants of the one over-crowded establishment, or the effects which might be produced upon the occupants of other establishments, whose sites are washed by the sewers, need not be dwelt upon before the court. Serious duties devolved upon the commissioners, who would have been moved to execute them at once. but that the place was not at the time the report was made within the jurisdiction of the commis-Since the new commission had been issued, ag had been brought under that jurisdic-Tooting had been brought under that jurisdic-tion, which was now called upon to exercise it. As against a summary exercise of power it was objected that the works in question were private property. Now, in respect to the works private property. Now, in respect to the works for damming up the sewer water for productive purposes, he must allege that it was an invasion of the public property. By custom, by the usual purposes, ne muse angue unit it was an invasion in the public property. By custom, by the usual course of legislation, and on all the principles which govern the application of such refuse, it belongs to the public, and he (Mr. Chadwick) submitted that the public, and he (Mr. Chadwick) submitted that steps should be taken to repress this invasion, and to prevent the like invasions at the expense of the lives, the health, and the convenience of the population. It appeared to him to be a case which came within the duty which devolved under the old statute of sewers, to amend and prostrate public encroachments. There could be no doubt that the remedial principles of the old law were too commonly overlooked, and that fitting occasions to recur to them were furnished, by such cases as the present. He took the liberty of reading the text of the old law, as laid down by Blackstone:—"Every man may abate a common nuisance. The nuisance may be abated, that is, taken away or removed by the aggrieved thereby, so as he commits no riot in doing it." "And the reason," says Blackstone, "why the law allows this private and summary method of doing one's self justice is because injuries of this kind, which obstruct or annoy such things as are of daily convenience and use, require an immediate remedy, and nience and use, require an immediate remedy, and cannot wait for the slow progress of the ordinary forms of justice.'' And the annotator adds, "That security of the lives and property may sometimes require so speedy a remedy as not to allow time to call on the person on whose property the mischief has arisen to remedy it." He concluded by moving "That a Committee should be appointed, to view the encroachments, and if they saw fit, to order them to be abated." them to he abated.

Mr. Broderip seconded the resolution, which was put by the Chairman, and unanimously adopted. It was next agreed "That this operation be assigned to a district to be called the 'Wandle district,' and the expense debited thereto."

It was ultimately agreed that Capt. Veitch, and Messrs. Hutton, Hawes, Johnson, and R. L. Jones, be the members of such committee.

New Palace at Westminster. Reports were then read on the drainage of the New Palace at Westminster, to which reference will be found in another minster, to which reference will be tound in anomaly page. The reading of them excited much interest.

They were ordered to be printed and circulated much interest.

among the commissioners.

A deputation attended the court from the meeting, held in Westminster last week, on the subject of "street orderlies," requesting the assistance of fits court to carry out their philanthropic objects.

The Earl of Carlisle said the application should receive ergent attention.

The Earl of Carliste said the application should receive every attention.

Mr. Cochrane (who headed the deputation), thanked his lordship for the courtesy with which they had been received.

Miscellanea.

YORKSHIRE ARCHITECTURAL SOCIETY. The quarterly committee meeting of this society was held on January 4th. It was stated by Mr. R. H. Sharp, that in consequence of a grant made at a former meeting towards the restoration of the tower windows of St. Saviour's Church, a very liberal sum had been allowed by the feoffees and churchwardens of that church, in furtherance of this desirable object. A grant of 40l. was made in aid of a fund for filling the west window of St. Mary's Church, Beverley, with stained glass, the design of which was submitted to the society and approved. Other grants were also made for restorations at Thorp Arch and Ilowden Churches.

WARWICKSHIRE ARCH MOLOGICAL CLETY.—The quarterly meeting of the War-wickshire National History and Archeological Society was held at the Museum in Thursday last week, and was well attended. The chief feature was a lecture on "The Religious Architecture of the Middle Ages, more particularly in reference to the Monuments of Egypt," by Mr. J. G. Jackson, of Learnington.

An EXTENSIVE UNDERTAKING. AN EXTENSIVE Consistent with the Chapel-hill pits, belonging to the British Iron Company, are at length freed from the coormous quantities of water—the accumulation of the company of the consistency of the company of the consistency of the c years—which have so long flooded them, and coal has at last been found. The water, two years ago, when operations were first commenced, was 84 yards deep, and the expense attending its draining is estimated at no less a sum than 10,000l. This includes the erection of engines, stacks, and whinseys, and the losses occasioned by breakages, &c.—Worcester

Chronicle.
IRISH MANUFACTURES - ORNAMEN-TAL CAST-IRON WINDOWS.—'The Messrs.
M'Adam, of Soho Foundry, Belfast, have recently completed a number of ornamental windows for the new palace of the Pacha of Egypt: they are of cast-iron, and of very large dimensions, being 20 feet high and 8 feet wide each window weighing 5 tons. They are to be bronzed and gilt after being erected. The same firm have also erected on the banks of the Nile, for the Egyptian Government, a number of very large steam pumping-engines, to raise the water of the river for the purpose of irrigation. These facts are interesting.

GENERAL MEETING OF INSTITUTION OF CIVIL ENGINEERS.—On the 16th of January, Mr. Field, President, in the chair, the annual general meeting of this institution was held, when the following gentlemen were elected to when the following gentlemen were elected to form the council for the ensuing year:—J. Field, President; W. Cubitt, J. M. Rendel, J. Simpson, and R. Stephenson, M.P., Vice-Presidents; I. F. Bateman, G. P. Bidder, I. K. Brunel, J. Cubitt, T. Fowler, C. H. Gregory, J. Locke, M.P., I. R. McLean, C. May, and J. Miller, Members; and W. Harding and T. Piper, Associates of Council. The report of the Council was read, and with reference to the pressure of the times, held out cheering hopes for the future, for, as it observed, "in a country like Great Britain, whose distinguishing characteristic is energetic whose distinguishing characteristic is energetic and indomitable courage in circumstances of difficulty, it is not probable that any foreign difficulty, it is not probable that any foreign political excitement can long continue to exercise a prejudicial effect: already the horizon is brightening, and a little reflection will demonstrate that, in proportion to the injury arising from the late stagnation, must be the activity on the resumption of the works; and it appears to be acknowledged that the forced economy which acknowledged that the forced economy which has been practised during the past year, has caused such a necessity for supplies of work-ing stock, and for the improvement of works, that the engineering profession must be gene-rally benefited on the return of confidence in financial affairs." Satisfactory reasons were given for the annual delay in the publication of the annual delay in the publi-cation of the minutes of proceedings, and a plan was detailed for paying off the debt incurred for the alterations of the house of the institution. Telford medals were presented to the Right Hon. the Earl of Lovelace, Mcssrs. Harrison, Mitchell, and Ransome; council premiums of books to Messrs. Harrison and Jackson, and Telford premiums of books to Messrs. Redman, Green, and Rankine; and memoirs were then read of deceased members.

The Walls of Etreuria.—Nothing, says Mr. Dennis, (in his work "The Cities and Cemeteries of Etruria,") gives a more exalted idea of the power and grandeur of this ancient people than the walls of their cities. These enormous piles of masonry, uncemented, yet so solid as to have withstood for three thousand years the destroying hand of man, the tempests, the earthquakes, the invisible yet more destructive power of atmospheric action, seem destined to endure to the end of time, yet often show a beauty, a perfection of workmanship that has never been surpassed. The style of masonry differs in the two great divisions of the land, and is determined in part hy the nature of the local materials. In the northern district the walls are composed of huge blocks, rectangular in general, but of various sizes and irregular arrangement, according as the masses of rock were hewn or split from the quarry; and in some instances of the larger blocks. There are, also, a few instances of the irregular, polygonal style,—as in the Cyclonean cities of central Italy. In the southern district the masonry is less massive and very regular.

A New Line of Railway Research.—
A New Line of Railway Research.—
A Coording to an amusing railway article in the Quarterly Review, attributed to Sir Francis Head, it appears from the books that the annual consumption at the Wolverton refreshment rooms averages—

182,500 Banbury cakes. 56,940 Queen's cakes. 5,110 lbs. of moist sugar 16,425 quarts of milk. 1,095 ,, cream. 17,520 bott. of lemonade. 29,200 patés. 36,500 lbs. of flour. 13,140 butter. soda water stout. 35,040 11 43,800 meat. 35,040 ale. 17,520 730 currants. 6,110 ginger beer ,, tea. port. sherry. 3,650 5.840 ,, loaf sugar. And, we regret to add,

730 bottles of gin.
731 ,, rum.
3,660 ,, brandy.

To the catables are to be added, or driven, thirty-five pigs, who, after having been from their birth most kindly treated and most luxuriously fed, are impartially promoted, by seniority, one after another, into an infinite number of pork pies.

ASHIESTEBL BRIDGE. — WHINSTONE RUBBLE CONSTRUCTION. — We mentioned some time since that a notice of this piece of construction, by Messrs. J. and T. Smith, of Darnick, was read at the Institute of Architects. The bridge has excited much interest in the neighbourhood, and we take the following particulars of it from the Border Advertiser — The arch is elliptical, commencing from the abutments on each side with a short curve drawn to a radius of 24 feet, with a chord line of about 15 feet. This is surmounted by a curve drawn to a radius of 110 feet. The arch springs exactly from the summer level of the river, and its height is 26 feet, with a span of 131½ feet. The breadth of the arch at the abutments is nearly 19 feet, and converges by regular curve lines on each side to 16 feet at the crown. The thickness of the arch, from the abutments to within 24 feet of the keystone, is 2½ feet, backed by four ribs, each 2½ by 2½ feet, and the depth of the arch from there to the keystone is 4 feet. The spandril walls in the haunches rest upon the ribs already mentioned, and are so managed as to be an exact counterpoise to the crown of the arch. The plan of the bridge is simple and plain: and with the exception of the cornice and coping of the parapet walls, there is not a hewn stone in the whole building. The whole of the arch is of common whinstone rubble, built with lime, with here and there a little levelling of the beds with Roman cement. There has been much talk among engineers and architects, as well as others, as to the probable issue of the experiment, and many have been the prognostications of its failure. It is supposed to be the boldest arch ever executed of the same material. The estimate, we understand, was only about 1,2007. A shiested is the place where Sir Walter Scott lived so long at, before sitting down at Abbotsford. It is some miles up Tweed.

SUBMARINE TELEGRAPHS.—Mr. Faraday having pointed attention to the highly insulating power of gutta percha, the very obvious application of it in covering the wires of the ctric telegraph was forthwith suggested in a notice some time ago in THE BUILDER. The fact of its mere capability of doing so scarcely required a formal trial. What is of much more importance is to test its permanency, especially in sea-water, for marine telegraphs. A formal trial, however, of the mere fact of its water-proof and insulating properties was lately made at Folkstone, when, notwithstanding the stupid and absurd management alluded to by the Literary Gazette, it was of course found that messages conveyed from a steamer through coils laid through the harbour (they might as well have been laid in the Thames or in a Bucket at the London station of the South-Eastern, and thus have saved the trouble of sending reporters all the way to Folkstone) were safely delivered in London, and met with a prompt response-all now mere child's play. The serious question is, whether gutta percha be a prudent coating under sea water, and accordingly it has been suggested that the potent halogens chlorine, bromine, and iodine, which pervade the ocean, as well as sulphuric and other acids also prevailing in marine com-binations, may speedily macerate and alter, if not destroy, a vegetable substance such as it But there is even a still more imminent is. peril, that no one seems to have thought of. Gutta percha may be a perfect tit-bit to myriads of the heterogeneous and indescribable living creatures which teem in the ocean, and bore their way through sand, and wood, and rock, consuming all that is not mineral. Time only, with experiments on a comparatively small scale, should be the test of such destructive according to the control of such destructive. Time only, with experiments of the test paratively small scale, should be the test of such destructive agencies, and then the "bites of large fishes," the "dragging of anchors," and other probable or dreaded agencies, may be dared on the large scale.

THE MODEL LODGING-HOUSE AT BATH

Vestgrate huldlings, for

THE MODEL LODGING-HOUSE AT BATH has been opened in Westgate-buildings, for forty persons, with separate beds, washing-stands, cupboards and boxes with locks and keys for all, a coffee-room, sick-room, gas throughout, &c., all, with cooking and attendance, for 1s. 9d. a week, and yet self-supporting: testimonials as to character are very properly demanded from candidates for so much comparative comfort at so little expense.

TESTIMONIAL TO MR. VERNON. — The proposal to raise by subscription sufficient funds to pay for the preparation of dies, and to present annually a gold medal, to be called the Vernon medal, for the encouragement of painting and sculpture, and in commemoration of Mr. Vernon's gift to the nation, appears to have found favour with all parties. A committee has been formed, containing many excellent names, and will shortly put the plan before the public. The medal will be confided to the Royal Academy.

LARGE SCYPILE FACTORY IN AMERICA.—
The scythe manufacturing establishment of Reuben B. Dunn, Esq., at North Wane, in Maine, is the largest of the kind in the world. The establishment consists, besides warehouses, furnishing shops, &c., of three principal buildings for manufacturing, two of which are 144 feet in length. In these, and in departments connected with the establishment, are employed about 100 men, many of whom have families settled at the place. A flourishing village has grown up within a few years, and is rapidly increasing. 12,000 dozen scythes are annually manufactured, to produce which are required 450,000 lbs. of iron, 75,600 lbs. of steel, 1,200 tons of hard coal, 10,000 bushels of charcoal, 100 tons of grindstones, and half a ton of borax. This last article is used in the process of welding. Mr. Dunn is erecting additional works in the vicinity, which will be soon completed, when he will be enabled to turn out 17,000 dozen scythes annually. This establishment is now more than double the extent of any other in the world—none even in England being found to compete with it.—New York Farmer and Mechanic.

The Iron Trade.—At the quarterly meetings just held, the masters again failed to raise prices, even as usual nominally, though, according to their out and out supporters, there was not only an improved demand, but a slight tendency to an advance. It must ever be remembered, however, that at these meetings of the masters, there is always 'a slight tendency to an advance.' Our steady refusal to quote their fictitious quarterly pricenominal, has at length been homologated by the example of one of their own respectable Birmingham supporters, the Journal, who says, "We will not attempt to give precise figures, inasmuch as prices, in some slight degree, must vary according to the situation of the works and the condition of the firms, &c.," all of which is quite true, if '&c.,' only comprehended the great desire of the quarterly meeters even for the nominal shadow of 'an advance,' failing the substance. For purchasers, the market is still of course in a very favourable position.

favourable position.

THE STATE OF THE SERPENTINE RIVER,
HYNE-PARK.—Finding that no steps have yet
been taken towards cleansing the Serpentine,
a public meeting of the inhabitants of the
neighbourhood was held at the Literary Institution, in Sloane-street, on Tnesday last, when
Dr. Jas. Copland took the chair; and Mr.
Lilwall, Mr. Goolden, Dr. Wilson, Mr. Geo.
Wooley, and others, addressed the meeting,
and shewed the necessity for improvement.
The chairman said,—The Serpentine River had
now become as certain a source of disease as
the waters in the rivers of Africa. Indeed, he
should say, from his own practical experience
and observation, that the water in these rivers
were not so foul or pestilential as that which
constituted the Serpentine, the latter only requiring an equally high state of temperature
to develope those diseases which appear in
tropical climates,—The sum of 35,000t. was
stated to be required for effecting the improvment. Surely the evil might be effectually
remedied for a much less amount than this. If
the mud be removed it must be done with
great caution.

BLIND BUILDERS.—The following is a list of tenders for the brewery, &c. at Camberwell-green, for Mr. Fleming, Mr. Robt. Brown, architect, opened on the 9th inst.:—

Norpolk Archeological Society.—
The Bishop of Norwich attended the annual meeting of the Norfolk Archeological Society, which was held on Thursday week. He said he had to congratulate the meeting on two points. The first being that the present was the best exhibition since the commencement of the society, and he hoped it would increase the interests of its proceedings. In the next place he had great pleasure in referring to a fact which would appear from the report that, unlike all the others in the city and country, this institution was in a flourishing state. The this institution was in a flourishing state. The subscriptions were increasing, and this would be a source of great satisfaction to them all.

INSTITUTION OF BUILDERS' FOREMEN. It will be seen by an advertisement, that the auniversary dinner of this Association will take place on the 31st. We shall be glad to find it well attended.

OUR RECORDS.—The occurrence of the late disastrous fire in Lincoln's-Inn affords an opportunity which should not be lost, of again forcing upon the public mind the importance of fire-proof buildings becoming more generally adopted, particularly when used as the repositories of valuable deeds and documents, the loss of which, as in the above instance, no amount of insurance can replace. Our national records too are liable to the like contingency: surely it is time they were better cared for. Let the columns of The Builder again send forth the voice of warning ere it be too late, and let OUR RECORDS .- The occurrence of the common of THE BUILDER again send forth the voice of warning ere it be too late, and let this reproach to England be erased, that she has no proper edifice in which to deposit her records, but that they are stowed away in un-come-at-able places, and liable to be destroyed at any time by the merest accident.

ize, adapted to the various situations for which they may be required; as also the WATER-CLOSET PANS OF IMPROVED CONSTRUCTION, and in the crior glaze far surpassing any other manufactured of Brown Stone Ware,

No. CCCXII.

SATURDAY, JANUARY 27, 1849.

MONGST the artisans of England are a large number of singularly intelligent, shrewd, and sensible men,—much larger than is supposed by the majority of

those who, by their position, are removed from contact with them: men worthy of respect, and deserving the greatest consideration.

Many of the multitudinous essays by working men, On the Sabbath, which were called forth not long ago by offered premiums, astonished those who were appointed to decide on their relative merits, by the closeness of reasoning, ability, and wisdom which they displayed.

Within a recent period there have been in our own pages more than one communication penned by hands made heavy and intractable by the mallet, yet full of sound sense, and shewing enlarged and comprehensive views. These are not men to be classed with the vulgar and uncared for. "These are not vulgar people," says Dante, "merely because they live in small cottages, lowly places: but those are vulgar who, hy their thoughts and deeds, strive to shut out any view of heauty." There are vulgar rich men as well as vulgar poor men. Being poor is not of itself a disqualification for being a gentleman. To be a gentleman is to be elevated above others in sentiment rather than situation. And the poor man with an enlarged and pure mind may he happier, too, than his richer neighbour without this elevation. Let the former only look at nature with an enlightened mind,-"a mind which can see and adore the Creator in his works, can consider them as demonstrations of his power, his wisdom, his goodness, and his truth; this man is greater, as well as happier, in his poverty, than the other in his riches. The one is but little higher than the beast, the other hut a little lower than an angel."*

Our simple object, however, is to say, in plain words, that the honest, upright, intelligent artisan deserves the consideration of all who have it in their power to improve or ameliorate his condition. And we are impelled to this hy the recent receipt of several saddening letters from men of this class, overcome hy hope deferred. These are records of suffering; can we wonder that they are interspersed with complaints and repinings? We may say to the writers of them, with Feltham, that "We do not wisely when we vent complaint and censure. Human nature is more sensible of smart in suffering than of pleasure in rejoicing, and the present endurances easily take up our thoughts. We cry out for a little pain, when we do but smile for a great deal of contentment."

But their complaints are too serious,—the grounds for them too apparent, for the reproach conveyed in this to apply. They have laboured all their lives; they are willing still to lahour, but they can find no employer.

The story of some amongst them who have work is sad enough: take the following, and let it not provoke derision, but desire to aid:—

* Jones of Nayland.

"I am a journeyman carpenter," says one, "thirty-eight years of age, and it is my firm conviction that I have worked physically upwards of ten hours on an average every day of my life since I was twelve years old, and worked hard too. From twelve to fifteen I laboured for an existence with a donkey and water-butt on a carriage, and after a while with a borse-butt, loading and drawing water from the river Lea, hawking it about the streets in a suburban village, and selling of it for a penny a turn, -a turn being the quantity of four common pails, which I used to carry in large ones with a pair of yokes, and empty into the butt or vessel of those that bought it. At fifteen I went to the trade; at eighteen my master broke. turned journeyman at twenty, married ["There's the rub!"], and three months afterwards fell out of work, and was out six months. I have been the father of ten children, five alive and five dead. I have been ohliged to work (or leave the employ) Sundays, Good Fridays, and Christmas days, whilst my employers have taken their carriage and gone to church, and all day and the major part of the night for weeks consecutively. As I lived upwards of two miles from the place, I have slept as I walked home, and once ran against a wall in my sleep. I so deranged the system by excessive labour, that it produced a deception of the vision, so that all manner of hideous figures would appear to dance or walk before me, and have appeared to be so close to me sometimes, that I have put my hand out to touch them. It has left a speck in each eye up to the present time, as a mark of the effect of excessive labour on the organ of vision. I have ever been abstemious in the necessaries of life, and never indulged in the luxuries; yet with all my working and abstemiousness I am still miserably poor, and I am not an exception to my class."

Truly, as one of the same grade said in a letter to the Times a few days ago,—

"If the possessors of wealth could see beneath the surface of a poor man's life, or ohtain a secret view of his home, they would do their utmost to alleviate the condition of respectable hut poor mechanics."

Words to men in want may be called wind; nevertheless, there may be comfort in the reminder that there is still good in their struggles. Hear what the benevolent Channing says:—

" I have faith in labour, and I see the goodness of God in placing us in a world where lahour alone can keep us alive. I would not change, if I could, our subjection to physical laws, our exposure to hunger and cold, and the necessity of constant conflicts with the material world. I would not, if I could, so temper the elements that they should infuse into us only grateful sensations, that they should make vegetation so exuberant as to anticipate every want, and the mineral so ductile as to offer no resistance to our strength and skill. Such a world would make a contemptible race. Man owes his growth, his energy, chiefly to that striving of the will, that conflict with difficulty, which we call effort. Easy, pleasant work does not make rohust minds, does not give men such a consciousness of their powers, does not train to endurance, to perseverance, to steady force of will, that force without which all other acquisitions avail nothing."

And then listen to what Charles Mackay, the poet of the people, sings of this same endurance:—

"Were the lonely acorn never bound
In the rude, cold grasp of the rotting ground;
Did the frigid frost never harden up
The mould above its hursting cup:
Were it never soaked in the rain and hail,
Or chilled by the breath of the wintry gale,
It would not sprout in the sunshine free,
Or give the promise of a tree;

* * * *

Or stand in the woods among its peers, Fed by the dews of a thousand years.

So thou, O man of a noble soul,
Starting in view of a glorious goal,
Wert thou never exposed to the hlasts forlorm—
The storms of sorrow—the sleets of scorn?
Wert thou never refined in pitiless fire,
From the dross of thy sloth and mean desire;
Wert thou never taught to feel and know
That the truest love has its roots in woe,
Thou would'st never unriddle the complex plan,
Or reach half way to the perfect man;
Thou would'st never attain the tranquil height
Where wisdom purifies the sight,
And God unfolds to the humblest gaze
The hiss and beauty of His ways.'

One of the correspondents to whom we are addressing these few recollections of what others have said rather than thoughts of our own, inquires as to the advisability of emigrating to Australia, no prospect opening to him here. We would say, obtain proper advice and guidance, and go by all means. If you are able and willing to labour, you will not fail to find there a fair field for your exertions.* Emigration generally we regard as a cure for many of our social evils. Admit that under better arrangements England could maintain in comfort a much larger number of persons than is now the case, still it is certain that the alterations necessary must be the work of time, and those who find it impossible to obtain remunerative employment bere will do well not to wait, but turn their attention to other quarters, and seek "fresh lands and pastures new."

Pent in wynds and closes narrow,
Breathing pestilential air,
Crush'd heneath oppression's harrow,
Faint with famine, howed with care,
Gaunt affliction's sons and daughters!
Why so slow to hear the call
Which The Voice upon the waters
Preaches solemnly to all?

Hark! old Ocean's tongue of thunder
Hoarsely calling hids you speed
To the shores he held asunder
Ouly for these times of need;
Now, upon his friendly surges
Ever ever roaring, Come,
All the sons of hope he urges
To a new, a richer Home!

England and her seagirt sisters
Pine for want in seeming wealth;
Though the gaudy surface glisters,
This is not the hue of health;
O! the honest lahour trying
Vainly here to earn its hread,—
O! the willing workers dying,
Unemployed, untaught, unfed!

* Br. Laing gives the following as an example of what may be done by a labouring man in Australia. John M. Millan, anative of Skipness, in the Highlands of Scotland, had, previous to the year 1810 (when he obtained a free passage for himself and family, as bounty emigrants to Port Philip) been for five or six years a common porter himself of the property of the passage of the property of the passage of the state of th

England's frank and sturdy bearing Scotland's judgment, true and tried, Erin's energetic daring, And the Welchman's honest pride,— Send these forth, and tame the savage, Sow his realm with British homes, Where till now wild monsters ravage, Or the wilder Bushman roams!

Let, as erst in Magna Græcia, Nobles, sages, join the ranks; And for vacant Austral-Asia And for vacant Austral-Asia Leave for good these swarming banks; Not as Exiled,—but with honour! Told in tale, and sung in song,— With the Queen,—Gop's blessing on her! Speeding this good work along!

Haste, then, all ye better natures, Help in what must bless the World!
See, those cellar-crowded creatures
To despair's own dungoon hurl'd,—
Send—or lead them o'er the waters
To the genial shores, that give
Britain's sacred sons and daughters
Mun's carret visiblement. Man's great privilege-to Live.

There,—for grudged and scanty wages, Grinding rent and parish tax,— In the wood, unheard for ages, Rings the cheerful freeman's axe; Kings the enterrui freeman's axe, whilst in yonder cozy clearing, Home, sweet Home, rejoices life, Full of thoughts and things endearing, Merry babes and rosy wife!

There,-instead of festering alleys There,—instead of festering alleys, Noisome dirt, and gnawing dearth, Sunny hills and smiling valleys Wait to yield the wealth of Earth! All She asks is—human labour, Healthy in the open air; All She gives is—every neighbour Wealthy, hale, and happy There!*

With energy and determination much may be done, let a man's position be what it may; without these, nothing. The possession or want of energy makes much of the difference between the weak and the powerful. Let some of our friends think over this: have a fixed purpose, and pursue it steadily

And to those of our readers who have the direction of extensive works, to the Government especially, and important corporations, we would say with great earnestness, Pause before you determine on discontinuing operations: if money must be saved, save it in other quarters, but do not add to the enormous amount of distress already existing, by discharging workmen.

If what we have here written prove of little value, it has, at least, a good intention and a pure purpose, which must serve as our excuse.

GEORGE GODWIN

ON THE VARIOUS QUALITIES OF CAEN STONE.+

IT seems to be the general opinion of the proprietors of quarries and their quarrymen, as well as of the masons and builders at Caen. that the most durable stone is obtained from the uppermost of the six workable beds, or from those beds which are nearest to the top, and freest from the little nebbly concretions which abound in the ceiling bed; and also that which abound in the ceiling bed; and also that the lowest beds are softer, and thereby more readily disintegrated by exposure to the weather. I feel disposed to pay attention to this statement, because it corresponds with practical observations and opinions entertained by most people who are well acquainted with quarrying and working stone of a similar mineralogical character in our own country. The top beds of Portland, Bath, Ketton, and other politic limestones are all the most other oolitic limestones, are all the most durable; whereas the undermost strata in the same quarries are well known to moulder away, if exposed to moisture and the usual atmospheric influences.

It is with all the varieties of Caen stone as with most other stones, that the goodness or power to resist decay depends chiefly upon the quantity and quality of the cementing substance by which the component grains adhere to each other. The cement that unites the grains, the ova, or other loose particles, into a mass, is formed of the same elements as the grains themselves, but more crystalline; it is, in fact, the decomposition of some of the superincumbent mass, saturating and crystallizing through-out the beds beneath. Water, even in its simplest state, may be considered to act as a solvent to most things; but when it contains acid, its power of dissolving calcareous substances is considerably augmented. Many waters are impregnated with carbonic acid, obtained partly from the atmosphere and frequently from subterranean sources. If they contain a superabundance of carbonic acid, they will rapidly decompose limestone, and carry the atoms thus sustained in solution until a certain quantity of the acid, in a gaseous state, has evaporated, when the atoms of lime-stone will again solidify in crystals, and per-haps assume a totally different character. If this ingenious process of nature be carried on for a great length of time, over a considerable thickness of loose calcareous matter, the pro-bability is, that the water thus charged with lime and carbonic acid will saturate the more porous parts, and thus ultimately form a wellcemented and compact limestone, of what was originally a congeries of loose ova, or grains.

Under these, or similar circumstances, it is but reasonable to suppose that in the deep recesses of the earth, where the extreme changes of surface-temperature, and vegeta-tion, and the influences which produce organization and life, cease to act,—there, even there, a creative power still pursues its never-ending task of giving new forms to matter, ending task of giving new forms to matter, and that, the longer a slightly-connected or porous limestone remains buried beneath a certain quantity of calcareous material, the more solid and indurated it will become. And if this stone be ultimately extracted, and used for ornamental architecture, it will be more durable than that which is of recent formation.

Exactly the converse of this process takes place after a stone is removed from its natural position in the quarry, and exposed to the numerous vicissitudes of climate, temperature, moisture, and other atmospheric changes which are constantly in operation. From the moment of its removal, destruction commences, and continues incessantly. In some instances, the action is far more rapid than in others; but whether the ruin be effected in ten years, or ten thousand, is only a question of time,—the same influence is for ever at work to bring about the disintegration, decay, and final dis-solution of all things.

Of all the causes of decay in stone, none is more destructive than variations of tempera-ture: the vicissitudes of heat and cold, dryness and moisture, frequently alternating, are more ruinous to the carved parts of a building than either of these extremes constantly operating. However slight the additional heat may be to which a hody is subjected, it will expand under its influence, and contract when the temperature is lowered. The thermometer will branched the man of the contract when will probably vary 100 degrees from the severe frost of a winter night to the direct rays of an afternoon summer sun, which never shines upon the north or north east sides of a buildupon the north or norm east sades of a hunding, except very obliquely at rising and setting; but the south and west fronts have the same degree of cold as the north and east during the night, with the additional warmth of meridian splendour daily. Such extremes must tend to loosen the component parts, and thereby separate many small fragments from the surface of stones, especially if the mass is made up of different substances, in which case some will expand and contract more, in proportion to their size and density, than others. The test of time proves this to be

others. The test of time proves this to be correct, for in all cases the greatest amount of disintegration has taken place, where the inequalities of temperature are greatest.

It is pretty evident, from both theory and practice, that there is a considerable difference between the upper and lower beds. The next question is, did the architects and builders of the numerically effects in Case. builders of the numerous old edifices in Caen and its neighbourhood generally, use only the top beds in the construction of their elaborate architectural works; or did they frequently, if not on all occasions, apply the stone from one particular quarry or district, to the exterior of their buildings; and a softer, or more expeditiously working material to the interior, in situations protected from the weather. If we examine the granulated texture of a

frcsh-broken fracture, from an old building, appearances are certainly in favour of the stone having been procured from some of the upper-most beds; or more probably, from a totally different quarry, for the stone is much harder, and of a lighter colour, than is to be found in any of the Allemagne quarries. But as there is no very evident distinction, no fossils or organic remains, peculiar to one bed more than another, no certain conclusion can be arrived at, from the most attentive examination in this wanner. After the lawse of several conturies wing been procured from some of the uppermanner. After the lapse of several centuries, the only mode of procedure is to draw an in-ference from circumstantial evidence.

The road which passes along the entrances to most of the quarries (about 35 in number), is on a level above the lower beds, or in other words, the road is formed upon those beds which are considered unfit for external works; consequently, whenever any of these subter-ranean quarries were opened or began to be worked, the stone first procured from them must have been taken from those beds which are now considered to be most durable; are now considered to be most durable; and as there is a regular descent, of a very slight inclination, from the road to the interior, nearly approaching to the extreme end of the quarries, it is quite certain that an enormous quantity of stone, of the best quality to be obtained in that particular district, must have been extracted, probably during several centuries, before they got far enough in, and deep enough down, to make use of the lower heads

In all countries, during feudal times, the hills or protuberances were generally occupied by the barons, either for the beauty of the prospect, or more probably on account of their commanding situation: thus, we find the castle at Caen, originally a fortress of considerable strength, surrounded by strong, lofty walls, and elevated on a rock considerably higher than any other ground in the neigh-bourhood. The inspection of these fortifica-tions, and the rock on which they are built, leads us to presume that the same stone which had been removed to form a moat was applied to construct the wall,—thus answering two purposes, and thereby rendering the approach of a hostile party more difficult. Buildings for protection against an enemy, generally precede those for the service of religion; and by finding a superabundance of stone, in con-structing a fort upon the crown of a rock, they would naturally be induced to open a quarry, close at hand, to supply materials for the erection of churches and other public edifices,—and accordingly we find the remains of many extensive quarries in different places

near the ancient castle.

If we observe the distance of the Allemagne quarries, and the proximity of those by the castle, to many of the old buildings, including the churches of St. Etienne and the Holy Trinity, it will require no great stretch of imagination to suppose that the architects or builders of these venerable structures availed themselves of good materials within a short distance, in preference to fetching stone of doubtful quality from three or four times the distance; and this opinion is strengthened by carefully examining specimens taken from the exterior of some of the cclebrated churches at exterior of some of the cerebrated chareness at Caen. According to tradition in the neighbourhood, no stone has been extracted from these ancient quarries for several hundred years: it is supposed they were deserted soon after those at Allemagne were discovered and become in the transfer of the second in the became in more general use,—perhaps from fear of the town being endangered by undermining, or because the more recent quarries were found to produce a softer and more

Between the beds of Caen stone, we some-times find a thin stratum of highly ferruginous times and a time stratum or nighty retruginous loam, especially between the lower beds; and this clayey oxide of iron may be traced, to a slight extent, throughout the stone of all the beds, particularly in that of the Franc Bane, which is a deeper colour somewhat of a giving to it a deeper colour, somewhat of a rusty tint: this circumstance may very likely be one of the causes why that bed is more perishable than the upper ones.

It is quite surprising to notice the great difference of hardness in the same specimen of Caen stone when thoroughly saturated with

^{*} We are indebted for these lines to Mr. Martin Tupper, the uthor of "Proverbial Philosophy," whose pen has before its enriched our pages. † See page 26 ante.

water, and when perfectly dry. In one case it may be almost abraded with the naked finger, and the nail will readily make an indent on the surface; whereas the very same piece of stone, when completely dried, is compara-tively so indurated, that it cannot be effaced without a sharp instrument, or some more violent effort. Independent of the gradual decomposition produced by the solvent power of water, a stone so absorbent and so softened by moisture, as it must frequently be, in a climate where wind and rain continue for days and weeks without ceasing,—such stone must be liable to be damaged by mechanical violence in a thousand ways that would have no effect

upon a harder material.

Much stress is generally laid upon Caen stone being "well seasoned:" although this scotte temp were seasoner: atmosgn time caution is important to a certain extent, it is usually overrated. All kinds of stone while in the rock, or when recently quarried, are more thoroughly saturated with moisture than can ever be accomplished after they have been once allowed to get dry. If the stone be remark-ably soft, it is advisable not to let it dry too fast, after it has been taken from the quarry, for fear of its cracking, in consequence of the moisture being removed from the outside before that in the interior of the block can have had time to evaporate; hence, while the central part remains of its original size, and extremely damp, the surface will dry and shrink, thereby causing many unobserved cracks, the effect of which will be evident in the following winter. The Caen stone merchants take no other care of the blocks after they are exposed for sale, or shipment, on the quay, than to cover them with matting during frosty weather. In addition to this, I would recommend placing them under an open shed, where they might have a free current of air, protection from rain, and be shaded from the sun, which might otherwise cause them to dry

too rapidly on the surface.

The cost of Caen stone buildings, compared with works constructed of materials proin this country, will, in a great degree, depend upon locality and other circumstances. At what in London for ahout two-thirds the aprice of Portland; and, for labour alone, the expense is certainly not more than half that upon Portland stone, or of that which is now being used at the New Houses of Parliament. Although elaborate architectural works may be constructed in that beautiful material, for a comparatively small sum, I wish it to be clearly understood that the material now generally known in the markets as Caen stone differs, in which in the markets as Caen stone differs, in many essential particulars, from the stone which forms the exterior of the venerable edifices which have adorned the city of Caen from the period of William the Conqueror until this time. Therefore it is too much to expect that the pales of our Security 19 expect that the palace of our Sovereign, the mansions of the wealthy, and the palatial looking club-houses, which have recently been constructed with Caen stone in the metropolis of England, should endure for seven or eight centuries, with as little appearance of decay as is at this time observable on the sacred structures in the vicinity of the quarries. However, if good judgment be exercised in selection, it is probable that the buildings now erecting with Caen stone in this country may continue in a fair state of preservation for at least one or two centuries.

In all cases, before commencing a work of magnitude or importance, I strongly recommend a visit to the quarries, and an attentive examination of old buildings in the vicinity, and, if possible, an interview with the pro-

Prietor or principal quarryman.

Before I describe and comment upon the tables and experiments,* I will briefly say a few words on the mode of investigating or searching after these unknown truths.

To examine the granular aggregation of a

stone, with a view to its fitness for exposure to the sun, air, moisture, &c., it should be washed thoroughly clean, to get rid of all washed thoroughly clean, to get rid of all dust of foreign matter from the surface; and observations should particularly he made on surfaces as large as possible, for they will present more palpable and more numerous distinguishing characteristics than minute ones. All experiments made with little bits of stone,

however accurately they may be watched, are but vague approximations, the best of which are likely to lead to erroneous results, owing to the variable nature of the stones upon which the experiments are performed. For example, if you observe the party-coloured appearance of some stones, and the tint of one entire slab compared with another, each slab representing a vertical section of one block of Caen stone a vertical section of one block of Caen stone, you will perceive by the colour, when half dry, the different qualities of hard and soft stone, each of which will, no doubt, vary considerably in duration.

C. H. SMITH.

ENFRANCHISEMENT OF LEASEHOLDS.

THE articles on this subject published in THE BUILDER, appear to have attracted considerable attention, and perhaps some remarks as to the utopian objects of the promulgator. The lords of wide urhan domains, whose interests (or at least the interests of whose sons, grandsons, or successors in tail) are the subject of revision and change, may cry aloud, "The plan is one of spoliation—it is a socialist doctrine, designed to enrich the many, by con-fiscating the estates of the few," whilst a great whilst a great fearful of anportion of the community, fearful of ap-proaching any theory which hath the savour of an invasion on property, perhaps recoil from a measure that seems to have that tendency.

But in buth nothing can be more illusory than the prejudice of either party in the present consideration; for its prominent characteristic is, that the enfranchisement of leasehold tenures, carried out on an equitable basis, cannot injure nor reduce the rentals of great proprietors; nor can it fail to benefit society at large by the creation of an extensive class of freeholders in houses, and at the same time put a stop to that concentration of fixed capital in oligarchic families, which prejudices the freedom of the electoral voice, harasses the relations of the civic family of mankind, bereaves the heirs of local residents of their houses and stations, and hath for its inevitable issue, the building up of auriferous principalities in the heart of England.

r from our design to interfere with or reduce the head rents reserved in original leases; or to ahate from the independence of families possessing thousands of houses; but as in every question of national policy, the scruples of the few must cede to the manifest scribes of the many,—so perhaps in this scheme, the abstract notions of vested interests of the oligarchy of wealth, must ultimately be made to have some regard to the

common weal.

The feu rights of lords of manors to copyhold levies of fines, heriots, &c. &c., were equally legitimate privileges, before the legislature thought fit to abrogate these seigniorial dues; the rights of freeholders in the tenure of freehold lands, were as indefeasible, until the national Parliament enacted that in all cases where a line of railway should intersect private property, individual benefit should give way to that of the public, and that such sections of property as fell into the plan of the proposed lines should be valued by sworn juries; and that the amount adjudged as the value thereof should be paid to the possessors on the transfer of such properties to the public com-

pany for such purposes.

In framing this Act of Parliament, how ever, a very discreet reservation was carefully guarded, on behalf of the proprietors of parks themselves being ordinarily the legislators the tenors), that no park, lawn, &c. &c., should be understood as coming under the provisions of the Act! This was a salvo for a salvo for the wealthy,—for the veto lay with them in all cases of converting private domain lands; and wherever such have been needed to carry out the plans of a railroad company, the most extortionate prices have been exacted and paid to propitiate the repugnance of the resident lord,—in many cases amounts equal to twenty times the fee simple value of the segment appropriated! Here the farmer, the modest yeoman, or town burgess, have to submit to the statutory enactment, whilst the magnate of the park could only be brought out at his own valuation. ation.

These are but examples to prove the acknowledgment of the Legislature that private right must cede to public utility and convenience, the right being duly compensated

In the matter of enfranchising leasehold tenures, the whole resident community is deeply concerned. If in the metropolis there are 300,000 houses and householders, we may safely infer that 100,000 must be deeply interested in any measure which would tend to the assurance of perpetuity in their abodes—in the houses of their sires and progenitors—in the security that the habitation (in which, in many instances, the independence of their condition has been amassed, and upon which large sums have been disbursed) shall not be forfeited, but transmitted to their children. On the other hand, these 100,000 houses belong to comparatively but few in number of being to comparatively out few in number of the renter class. Several of the leviathan lords are lessors and proprietors of above one thousand houses! and some of five times that number; and the longest lease known on such estates is ninety-nine,—but latterly seventy and sixty-one years have become the usual term on building estates. One estate in the most valuable part of the town has above 2,000 first and second-class houses, 2,000 thirdclass, and huilding sites for as many more. One-half of this estate is of new creation, and has seventy years to run, at ground rents averaging two guineas a foot, or 50% a house! On every house of this city of palaces at least 1,000% has been expended by the adventuring builder; so that, on the lapse of seventy years. supposing that no greater sums are disbursed in embellishments or improvements, the startling sum (in fixed property) of 8,000,0007. will fall into the hands and disposition of one sole potentate in rents! and this to the excluof the short-sighted outlayers of private capital. But this is not half,—turn we to the other moiety of the estate,—of the other 2,000 bouses. One-third part were leased ninety years back, one-third sixty, and one-third twenty, at the ground-rents incident to the value of these periods. For the lapsed portion, that is relet at rack rents (generally giving the preference on lease to the lessee or occupier), therefore one-third part has sixty years to run, and the last third portion has thirty years to

These statements are in general terms, but not far from the truth. Now for the tenants' interest on these holdings. The rule on this estate is, that no lease shall be renewed until within twenty years of its lapse or expiration. At this period the valuation is made, not by the tenart nor her advantagement. the tenant, nor by a valuation jury, hut by the landlord; he estimates the value to the tenant, and lays it on accordingly. The original rent in first-rate tenements may average 50l. a-y the improved rental on a renewed lease, from 250l. to 300l. a-year. The more money the predecessor or ancestor of the lessee has laid out on the premises, the greater will be the value thereof; and, therefore, the tenant, whose father or grandsire has converted a shop into a mansion, or a mansion into a palace, has to pay over again the improved value, if he wish to retain his ancestral dome.

It is thus, that in the lapse of sixty years, the whole extent of this great town and its suburbs will be divided amongst a few, and remain to be dealt with at their discretion; and of these the westward division will present the paramount feudalisms of Grosvenor and Belparamount feudalisms of Grosvenor and Bel-grave, Portland, Portman, Bedford, Fitz-Hardinge, Southampton, Northampton, Arun-del, or Norfolk, Sutton, and some other hospodars, pachalics, and principalities; so that the second generation issuing from the present and existent one, inhabiting one half of the metropolis, will be under the proprietory dominion of some degrap Archors or Covenes dominion of some dozen Archons or Cræsuses, dominion of some dozen Archons or Croesuses, who, knit together hy a community of feelings and interests, must form a fearful imperium in regno,—as dangerous to state policy as to civil polity.

To simplify the proposition which, although perhaps novel, has nothing of spoliation, violence, or injustice in it, the following development will sufficiently suffice.

ment will sufficiently suffice.

Suppose a tenant of a building plot, 30 feet frontage, in any new locality, held on lease of 80 years at a ground-rent of 20s. a foot, or 30l. a year;—if disposed to purchase the perpetuity before he builds, let him serve notices to that feet on the length of the perpetuity before he builds, let him serve notices to that effect on the Iandlord or his agent, and on the surveyor of the district. Within one month after the service of such notice

^{*} To be given next week,

(according to the desiderated law), a jury should be summoned to assess the amount of increased value for such perpetuity, either at an increased ground-rent, or in amount of purchase-money: at the option of the tenant so proposing. As no building has been erected on the plot, and as the term of surrender to the lord is so remote, a very trilling yearly increased rent would be surcharged on the original rent.

Or, suppose a case where the house and premises had been erected and the interest sold to an occupying tenant, and that ten years had elapsed (the vicinage being generally covered and occupied), then a comparatively larger, but still moderate, though increased amount of rental or purchase would be required.

Next take, for example, a house which may

Next take, for example, a house which may have been built forty years on an original lease of 80 years, which may have changed hands from purchaser to purchaser, and suppose the lease thereof has 40 years to run, at a ground rent of 50t. a-year (this is an ordinary case, as many mansions in the first situations have been leased at about 10s. a-foot, or say 50t. rental).

The same formalities of notice and valuations will follow. As the period of resumption by the landlord is more proximate, and the value of the buildings and locality are more considerable, then a larger award of compensation will be made by the jury; such as perhaps 500*l*. to purchase, or 25*l*. a-year to rent, added to the original head rent of 50*l*. a-year in perpetuity, if the tenant in occupation should be willing to take it at a rental.

In the same manner, the remaining unexpired terms of long leases at head-rents may be calculated, on the principles of justice and equity to both landlord and tenant; but in no case is it contemplated to affect or interfere with leases of houses let at rack-rent for 7, 14, or 21 years (reserving to the tenants the option of surrender at the determination of any seven years); nor would this be of general advantage to the class of occupiers who take houses with a view to short residence, either as standings for business or private residence: nor does equity seem to require in these cases any new modification, as such occupiers seldom outlay their capital on improvements.

The new law of enfranchisement would of course provide for the payment of the jurors (who should be professional men) and of the district surveyor, the charges for whom should be borne by the tenant or person issuing such professe.

The proceedings in this respect might be advantageously assimilated to those of valuations under railroad enactments, which appear to work well, and to give as little dissatisfaction as is possible between, on the one side, extortionate requirements, and parsimony or

niggardliness on the other.

As matters now stand, the holders of outrunning leases in valuable localities have no
certitude of renewal at any price. The family
residence held for 70 years at a rental fair at
the time of its origination, and upon which
5 or 10,000l. has heen sunk, may be denied
to the occupier and given to another, or the
owner may wish to play the same game over
again,—not to accept a premium, but to impose
a rack-rent of, say, 300l. (an ordinary advance),
and the still more onerons imposition of a
compulsory clause to rebuild, and to expend
10,000l. more, for the benefit of the succeeding
heritors on the lapse of 60 years more.

The predicament of an occupier and lessee in some cases is still harder;—having a lease of some 20 years to run at the original headrent renewed 60 years back; his house has fallen into decay, and is antiquated; requiring to be rebuilt, he proposes for a renewal, but is refused; such proposal is referred to the landlord's own committee of arbitration; but no, the lord has other views as to the house in question.

This is no imaginary case; it is matter of fact. So the unfortunate heritor or occupant of a favourite house is forced to abide in discomfort, if not slow torture and even imminent danger, or to throw up his term into the lap of the leviathan lord!

His tenement is crazy, he must prop it; the dry rot eats on its career, he must abide the issue; or if he be like the foolish builder (more foolish than he of the Scripture, for the certain mulct and forfeiture are before him),

then he must lose his outlay—for even in case of an ultimate renewal, the sum expended will lay a reduplicated valuation at his door.

lay a reduplicated valuation at his door.

Although this thesis does not contemplate the complete purchase of all head rents, that object is far from being unattainable; for an Act of the Legislature might with perfect equity compass such an enfranchisement also, varying the purchase on a scale of unexpired years, from thirty-three years' purchase (the highest price of funds) down to fifteen years, graduated according to the extent of unexpired term. The purchase of the head rent would be as equitable as that of the term in perpetuity, saving the head rent.

Instead of increasing in house property, which may be called the only fixed property of the capital, the landlord class would, in the event of large conversion of their rents into money, become great capitalists, and the multitude renting houses must, on the other hand, become freeholders, with fixed local interests; and there can be no question as to the effect of such a change on the population; or that the subdivision of house ownership must have the best influence, whether with respect to their domestic comforts, their fiscal importance, or to the character of the buildings, that unist in such case supplant the structures raised to endure but for a sensor.

endure but for a scason.

The arts, chiefly architecture, have important concern in this subject; the municipal rights of every citizen are wound up in it, as are the interests of the present generation, but most of all, their heirs in the generation to come.

QUONDAM.

ON DILAPIDATIONS.

This subject is one that has never received proper consideration from the hands of a large class who are interested and affected by it—"tenants." Men who are daily imposing upon themselves heavy responsibilities, the extent, or the peculiar obligations, and the ultimate result of which they are totally unacquainted with.

Few persons on taking a lease think of raising objections to covenants which are, they are informed, of the usual character; or, if prudent enough to pledge themselves to an agreement of but three years, they fearlessly, and without hesitation, affix their signatures to a clause promising to "uphold, maintain, and sustain," &c., or that which really may turn out an impossibility; for some houses, so to speak, have the elements of destruction and disease upon them from their infancy. Bad brickwork, causing by its humidity damp walls, rots everything: unseasoned timber, that shrinks and twists in all directions, throwing floors out of their level, and making settlements from top to bottom, through which the doors and windows have to be constantly eased and rehung; faulty and imperfect drainage, which becomes constantly choked; the roof acting like a sieve; and this list of ills that modern houses are heir to is no exaggeration; yet many a man, and he, too, who may be esteemed in his own husiness a prudent man, is induced, from a want of consideration, readily to promise to do and perform all needful and necessary repairs, or at least to leave the house in tenantable repair. It is not a little amusing to observe the tenant's surprise at the end of his tenancy on receiving a notice of dilapida-tions. What! he exclaims, and leave the house 100 per cent. hetter than when I took it? This and the various sums of money paid to jobbing tradesmen, all the accounts of whom jobbing tradesmen, all the accounts jobbing tradesmen, all the accounts of whom he can enumerate by heart, constitute the anchor of hope to the poor tenant, when informed, in spite of all the benefits the house has derived from him during his tenancy, that still such and such are dilapidations, and as such he is answerable for their being reinstated. In the present age, remarkable for the number of scantily-constructed houses, with so nice and clean, yet deceifful, an exterior, invitingly waiting for tenants on lease or agreement, it cannot fail to be useful to consider the nature of the obligation that exists between landlord and tenant upon the hire of between landlord and tenant upon the hire of house property; for as mistakes will happen in the best regulated families, so do the friendship and good understanding that may have existed between landlord and tenant suddenly cease with the termination of the lease. Covenants to repair, when once entered into, are irrevocable; it is, therefore, most important that each party should clearly understand what constitutes repairs or dilapidations; and as to all defects, whether they arise from accident, neglect, or decay, and by which party they are to be made good.

A landlord, on making a claim from his tenant for dilapidations, must shew that they are such as were stipulated for in the lease, as the obligation on the part of the tenant to make good varies, in nearly every case, according to the different covenants of the lease, by which the tenants are bound by more or less stringent clauses, involving greater or less responsibilities.

less stringent crauses, involving greater or less responsibilities.

Mr. Gibbons, in an excellent treatise on this subject, defines dilapidations as the act or default of a person having to use a tenement, to the injury of another having a right to the same tenement, or a tenant's chligation may be considered as depending on the old maxim—"You must not injure another's property, but use it as your own."

It is an imperative act of justice to himself for the future tenant to make a stipulation that, previous to the commencement of his tenancy, the premises shall be surveyed; so that, if then there can be considered any thing unsound or defective on the premises, it may be made good before the agreement is concluded, otherwise the tenant will find that he must make good all, whatever was the state of repair when he took possession of the premises.

Houses held on lease.—In the case of premises being let on lease, a tenant should not be compelled to supply and make good defects that may arise from time and use, because, as the tenant bargained for use, and gives to the owner an equivalent rent, the landlord has a claim only for a restoration of the tenement as injured by the tenant, but has no right to make a claim for the wear to be made good; but then, as the tenant agrees to keep the house in tenantable repair, he is bound to supply all occasional and accidental defects which may expose the premises to premature decay. Accidents happening during his tenancy, if not inevitable, must be made good by the tenant, for it is fair to presume, that had he adopted proper precautions, the accident might have been prevented; therefore, there exists an obligation not to suffer dilapidations, and it is evident that the tenant is equally bound not to do any act that will cause an injury to the tenement.

Journal Total to any activation in the tenement, it being held in law that a lessee cannot change the nature of the thing demised: the act of alteration exceeds the right to use, and infringes on the condition that the landlord shall receive back the premises in the same state and condition as when the lease was granted. It is, therefore, essential that a tenant contemplating an alteration or improvement should receive proper permission and authority from the landlord.

Permissice waste consists of a neglect on the part of a tenant to supply the repairs required by time and use, and also a neglect to make good occasional and accidental dilapidations. Houses and outbuildings are the principal subject of dilapidations, but the law extends to trees, land, changing the course of industry, &c.; but the chief subject is buildings. These, though subject to decay in the progress of time, are capable of liaving the defective or decayed parts made good, and are therefore subject to both permissive and voluntary waste.

A tenant hiring premises on lease is bound to perform tenantable repairs, which may he divided into three heads—the ornamental, which includes the trades of painter and paperhanger; the substantial, which includes the trades of bricklayer and carpenter: the third includes all works which tend to preserve the fabric from decay—as stopping out wind and weather, which includes the trades of the joiner, plasterer, and glazier.

Dilapidations caused by accident are very

Dilapidations caused by accident are very serious upon a tenant, as not only is the accident considered as a dilapidation, but all injuries arising therefrom, of which the following is an illustration from Mr. Gibhons:—"If a building be covered with weather boarding, and such boarding decay from age, so long as it forms an entire and complete covering, it is no dilapidation, but if, owing to any neglect,

any of the internal woodwork become injured, that is a dilapidation. If the main timhers decay, they are not chargeable as a dilapidation so long as they are an efficient support; but, if they give way, the tenant is bound not only to replace the timbers, but all an efficient damage done by their fall. Accident, shown to be inevitable, such as resulting from tempests, does not fall upon the tenant, as in the case of a house being prostrated, the tenant need not rebuild, but if the roof be blown off the tenant must replace it. A tenant generally speaking is not answerable dilapidations resulting from natural decay, or the result of time, or fair ordinary wear and tear, but is answerable for all extraordinary decay. For instance, as to decay caused by the premises being exposed to the weather, as if premises being exposed to the weather, as in the roof be suffered to go in had repair, the tenant must make good the rafters and other timbers, if they are injured. Lord Chief Justice Tindal defined a tenant's obligation to repair thus:—" Where an old building is let, and the tenant enters into a covenant to repair, it is not meant that the old building is to be restored in a renewed form at the expiration of his tenancy, or that the premises shall be of greater value than it was at the commencement. What the natural operation of time flowing on effects, and all that the elements bring about in diminishing the value, which so for, as it results from time and nature, consti-tutes a loss, falls upon the landlord. But then the tenant must be careful that the tenement do not suffer more than time and nature would effect. He is bound to keep the premises in nearly the same state of repair as when demised."

An annual tenant's obligation has been thus laid down by Lord Kenyon. 'A tenant from year to year, is bound to commit no waste, and to make from time to time fair and tenant. able repairs, such as windows and doors that be injured during the tenancy." Lord Ten-terden decided that an annual tenant was bound to keep the premises wind and water tight.

It seems but justice, that under any mode of letting or hiring of house property, a tenant should he bound to use all ordinary precautions to preserve the building from decay; therefore there exists an obligation to keep the outside and the roof sound, perfect, and water tight; and if the internal woodwork decay sooner than it otherwise would do for want of paint, &c., the tenant is bound to restore it. Glass, if cracked or broken, becomes dilapidation, it being an outside covering.

A tenant with no agreement as to duration of his tenancy, cannot be bound to perform any repairs, the nature of his tenancy being so weak that he cannot be expected to do an repairs, as his landlord might immediately de termine his tenancy, and reap the advantage to be derived from the outlay: besides, if the house require any repairs being done, the landlord can enter and take any necessary steps for its preservation; but not so with premises let for a definite time,—then, the landlord having granted the use for a certain period, has not right to enter upon the premises until the expiration of the tenancy. A tenant under this mode of letting, is however bound neither to commit nor permit waste. This kind of tenancy may be considered rather as a "deposit than as a letting on hire," and the tenant's obligation may be defined as "to use the house with care."

FRANCIS CROSS.

HOUSE PROPERTY .- A friend informs us that the St. Paul's Head freehold public-house in Crispin-street, Spitalfields, was sold by auction at the Mart, on Thursday, in last week, to Messrs. Taylor, the brewers, for 1,160 guineas. The rent receivable for the next guineas. The rent receivable for the next thirteen years is only 42l. per annum. Pro-perty in Chippenham, Wilts, must be mate-rially depreciated in value, for we learn from a local paper that property mortgaged some years since for 600l., and yielding a rental of years since for 600l., and yielding a rental of 40l. per annum, will not realize in the market 300*l.*; another property, let at 23*l.* per annum, and for which 400*l.* was refused eight years since, has been sold during the last week for MR. BARRY AND THE METROPOLITAN

DRAINAGE OF THE NEW PALACE AT WEST MINSTER.

SIR,-In the last number of THE BUILDER you have, as it seems to me, been betrayed into making unfavourable remarks upon the drainage of the New Palace at Westminster, from not being fully acquainted with all the circumstances relating to it. I think I cannot, there-fore, do better, in order to disabuse your mind on the subject, than to send to you the enclosed copy of a letter which I have this day forwarded to the Metropolitan Commissioners of Sewers, relative to Mr. Austin's rejoinder to my remarks upon his report on the drainage of the New Palace, to which, as well as to the documents therein referred to, I have to request of you to bestow an attentive

I am, Sir, yours faithfully, CHARLES BARRY. Westminster, January 23, 1849

This we have done, and we think we shall best discharge our duty to all parties by letting Mr. Barry speak for himself. We, therefore, We, therefore, give the principal part of his reply even where it refers to charges which we did not print. The letter is dated January 22nd. At the commencement Mr. Barry repeats his tion that the only information which the commissioners' engineer ever received from him relative to the drainage of the New Palace "was, as he well knows, afforded to him for a far different purpose than that of enabling him to understand the system of it in detail, or to form any competent judgment upon its merits as a whole." He repeats, that the system adopted was carried out in accordwith the rules and regulations of the Westminster Commission and assistance furnished by their officers.

" That with respect to the outfalls of the New "Inat with respect to the outfalls of the New Palace sewer, it was impossible, under the circum-stances, that they could be placed otherwise than in connection with the public sewers.

That, agreeing with Mr. Austin, in thinking it immaterial whether the main sewer of the palace masses through traulist or careful spaces." It

That, agreeing with Mr. Austin, in thinking it immaterial whether the main sewer of the palace passes through 'vaults,' or 'arched spaces,' I have to observe that the term 'arched spaces,' was made use of by me, to correct, in some degree, the false impression created by the exaggerated description and pictorial illustrations of those contained in his report; from which, it might be inferred, that the main sewer had been constructed in spacious vaults under the entire building, instead of passing, as it does, through comparatively small and insignificant spaces, at intervals, and under open gateways. spaces, at intervals, and under open gateways, intended to be filled up solid with concrete. It matters not, therefore, under such circumstances, whether the sewer passes, as he states, within 'about 12 yards from the basement of the grand saloon connecting the Houses of Lords and Commons, or immediately under it.'

The hole in the sewer alluded to, by which the engineer passed more than once into the vaults, was of course for temporary convenience. Mr. Barry understands one passage in the rejoinder as again referring to this hole, but this is not the case.

"That the whole of the statements in my remarks upon Mr. Austin's report, as to the levels of the main sewer, and the dimensions of the arched spaces through which it passes are correct, although attempted to be fallified by Mr. Austin, and that the inference which he deduces from one of them, as to the position of the summit level, is not warranted."

That no part of the sewer was to my knowlad no part of the sewer was to my know-ledge constructed at variance with the plans pre-pared for it, namely, with a current in the wrong direction; but that if this be the case, either from neglect or subsidence of the soil, the consequences are immaterial, and the remedy is simple and inex-

That the cause of a want of free drainage from the New Palace Sewer, has constantly been owing to the foul condition of the public sewers connected

with it."

"That Mr. Phillips's offer of assistance in improving the drainage of the building was not solicited, and was not accepted, as I did not consider any re-arrangement of it to be necessary.

"That the 'safety flap,' which is sneeringly alluded to by Mr. Austin (but the omission of the mention of which in his report is not accounted for), is so named, for a very different reason than that which he supposes, or chooses to infer; but that it did really protect the New Palace from the stench of the public sewer, at the time of his examination, I bave no doubt.

That Mr. Austin has unfairly assumed what he is

pleased to state I ongbt to bave said as to the venti-I have acknowledged that foul air has escaped into the buildings and courts."

That no inconvenience or nuisance can by any possibility arise from the main sewer of the palace possibility arise from the main sewer of the palace being at times a reservoir for the retention and discharge of the drainage at every tide, such reser-voir being perfectly ventilated by an up shaft, and every branch drain communicating with it being properly trapped, which Mr. Austin might have ascertained to be a part of the system, if he had thought proper to have duly examined or inquired into this matter.

"That the works recently executed in the sewer in furtherance of its completion, so far from reducing it to a dangerous condition, bave, in fact, im-

That it is not cut off, as stated, from all possibility of ventilation, heing, as alleged, 'no better than a vast retort of 15,000 cubic feet, in which the foulest gases will be perpetually generating and escaping in a concentrated form into the buildings.'

On the contrary, it is nerfectly ventilated, and escaping in a concentrated form into the buildings. On the contrary, it is perfectly ventilated, and whatever gases may be generated cannot, in any form or degree, escape into the buildings,—a fact which I am prepared to prove to the commissioners, if they are disposed to accompany me in a personal inspection of the sewer, and of which fact Mr. Austin might have been convinced, if he had applied to me for explanation as to the completion of the system adopted."

This ventilation of the sewer by artificial means is an important feature, which did not appear in the report or reply.

"That the flaps to the branch drains are not fixed for the purpose of preventing the escape of foul air into the building, as Mr. Austin seems to suppose, although they may contribute to that object; but that other and perfectly effective means are provided for that purpose, of which he appears to be ignorant. All Mr. Austin's reasoning, therefore, upon these flaps, and the admission of foul air into the building, falls to the ground."

Mr. Barry denies the foul state of the sewer, and invites the commissioners to accompany him in a personal inspection.

He thinks it is utterly impossible that any serious effects can be apprehended from the foul matter that may collect in the main sewer, and that the inference of Mr. Austin to the contrary is altogether false, and calculated only to create unfounded alarms and unfavourable impressions.

That there are no defects of a serious nature.

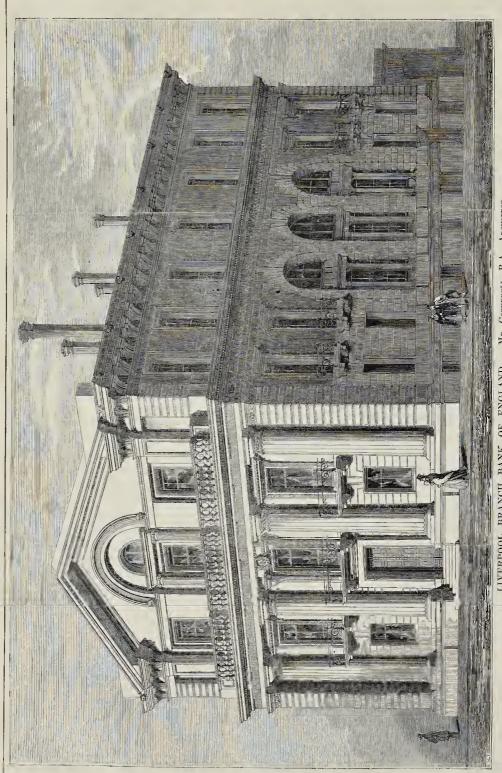

as stated, in the drainage of the New Palace, to justify the removal of the work connected with it, as recommended by Mr. Austin; and that, if the remedy the latter recommends were attempted, the consequence might be most serious, and the expense to be incurred, which he thinks must necessarily be very great, would be a most wanton waste of public

Barry considers that the provision of a reservoir for storage water and sullage is neither a great mistake, nor is it mischievous, the proposed 15-inch and 9-inch pipes would, under the circumstances, be in-sufficient and inefficient to meet the unusual and extraordinary contingencies of the site.

Mr. Barry, remarking that he is in a condition to prove the truth of any assertion which he has made, and is "ready to do so any competent, impartial, and unprejudiced tribunal," thus concludes:—

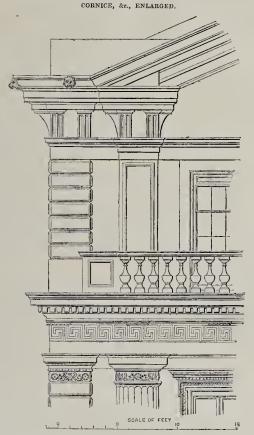

"With respect to Mr. Austin's assertion, that I With respect to air. Alistin's assertion, that a have myself admitted to a member of the Sewers Commission in his (Mr. Austin's) own hearing, since the issue of his report, that 'the drainage of the New Paluce was as bad as it could be,' I have to state, that to my knowledge I have never seen Mr. Austin since he made his report, and that I Mr. Austin since he made his report, and that I could not bave made such an admission to any member of the Sewers Commission, inasmuch as I firmly believe, and ever have believed, that the drainage of the building is as perfect as it can he, all urainage of the building is as perfect as it can he, all local and other circumstances being duly considered. If there is an impression on the mind of any commissioner that I have delivered a contrary opinion, such an impression must have arisen from misapprehension."

"CEMENTED BRICKS."-We read in the Oxford Chronicle that the first annual ball of the "Oxford Cemented Bricks" was held on Friday, the 5th inst. Who these bricks are or what is the purpose of their being cemented into a society, we are not informed. We sincerely hope it is for something better than "moistening their clay."

LIVERPOOL BRANCH BANK OF ENGLAND, --- Mr. Cockerell, R.A., Architect.

BRANCH BANK OF ENGLAND, LIVERPOOL.

BRANCH BANK OF ENGLAND, LIVERPOOL.

WE have already alluded to the building erected in Liverpool for the Bank of England, as one of Mr. Cockerell's most successful works, and we now give a perspective view of it, and an enlarged outline of part of the front.

It stands in Castle-street, at the corner of Cork-street; the frontage next the former is 60 fect, and next the latter 117 feet. The height to the top of the blocking is about 62 feet, and to the apex of the pediment 72 feet. The columns in front are 4 feet 2 inches in diameter, and ahout 31 feet high. Both fronts are executed in Darley Dale stone: the plinth is granite. The entrance has a moulded red granite door-case, polished; each jamb is in one stone, 12 feet 3 inches high, 2 feet 3 inches deep, and 1 foot 3 inches face for architrave.

The central portion of the hanking office (the whole area of which is 47 feet hy 50 feet), is 31 feet high, and occupies two stories in height—namely, the ground and one-pair stories. The ground and hasement stories are

hire-proof.

Messrs. Holmes are the contractors for the bank, at the sum of 23,135?.

bank, at the sum of 23,135l. The flank elevation, although plain, is exceedingly effective in execution.

Mr. Cockcrell has just commenced another building for the hank of nearly equal dimensions, but not so lofty, eastward of the new hank, in Cork-street. This consists of fireproof chambers for merchants, and has a stone exterior.

AWARDS OF OFFICIAL REFEREES.

DISTRICT SURVEYORS' FEES.

With regard to the premises No. 2 and 3, Cushion-court, Old Broad-street, in the district of the northern division of the City of London, the referees received a requisition from Messrs. Sabine, which recited "that the said premises, or house or houses, are united said premises, or house or houses, are unnearly means of openings in the third and fourth stories, heing the two topmost stories; and that the said premises taken as two distinct buildings are each of the second rate of the first class, but, taken together, constitute one building of the extra first rate, and that the district surveyor claimed that in respect of any services performed by him as district surveyor in respect of any part of the said premises, such services are to be considered as services performed in respect of the whole, that is, in respect of one extra first-rate dwelling-house." Messrs. Sahine, however, contended that any service or work performed in respect of part of service or work performed in respect of part of the said premises would be a service performed in respect of such part only, that is, in respect of, or to 'one second-rate dwelling-house; and they requested the referees, the district surveyor concurring in the application, to determine whether the said premises, by reason of their heing united, were to be deemed for the purposes of the Act, one huilding only as claimed by the said district surveyor, or two distinct huildings, as claimed by the said William Sabine and Son.

The question had relation to the fee charge-The question had relation to the rec charge-able by the district surveyor for inspecting and reporting to the official referees upon party walls, and the district surveyor stated at the hearing that he grounded his claim upon the rule in Part 1 of schedule C. of the Metropolitan Buildings Act, headed "Rule for ascertaining area," and contended that the premises constitute one huilding of the extra first rate, the whole of the one pair or third story being united hy openings in the party structure, and the whole of the said premises being in one occupation; to which Mr. Sabine replied that the premises had two separate entrances and staircases, and that the rates had been paid on the premises as for two houses. the premises as for two houses.

The referces determined that the premises

were to he deemed for the purposes of the Metropolitan Buildings Act, as to the matter in question, to be two distinct buildings, and that the fee payable to the surveyor was the fee for a building of the second rate. The

costs to he paid jointly.

CONSTRUCTION OF EAVES AND CORNICES,

In the case of two third-rate dwelling-houses in Studley-road, Clapham-road, in the district of the southern division of Lamheth, the district surveyor lodged an information to the effect that Mr. Rohert Cox had commenced the works requisite for the completion of the said two houses, without any notice of the same to the district surveyor, as directed in section 13 of the said Act, and had constructed overhanging eaves of timber, and covered the facia and softli with galvanized iron or zinc, contrary to schedule E of the said Act.

At the hearing it appeared that the roofs of the houses are separated by a party wall, but that the eaves are not so separated, that the two houses stand at a distance of about 7 feet from the next adjoining buildings in other In the case of two third-rate dwelling-houses

from the next adjoining buildings in other occupation, and of ahout 3 feet 6 inches from ground in other occupation, and that the houses stand on one side of a wide road, and are consequently far removed from the opposite

houses.

The referees directed that such parts of the The referees directed that such parts of the cornices as abut upon other huildings or ground not in the same occupation with the buildings, whereof the said cornices form a part, should he amended, hy taking down the metal casings which have been fixed upon the ends of the rafters, and replacing the same with iron laths and lime-and-hair plastering, such laths heing laid into the brickwork at the least 4 inches, and hent up to form a base for the plastering of the facia, and so as to cover the ends of the rafters and the edge of the eaves hoard; and, as respects the cornices on the ends of the rafters and the edge of the eaves hoard; and, as respects the cornices on the fronts of the said houses, that the same should be amended, hy separating them in the line of the party wall by a corbel of brick or stone of the full width of the party wall, and carried at the least 2½ inches above the roof, and 1 inch at the least below the soffit, and 1 inch at the least heyond the outside of every part of such cornices, such corbel heing huilt or fixed, as the case may be, to the satisfaction or fixed, as the case may he, to the satisfaction of the surveyor of the district.

THE GAS MOVEMENT. MISCELLANEOUS NOTES

EVERY ward or other district within the city hounds has of late heen rising, one after another, into an energetic resolve to have an abundant supply of cheap and good gas. At one of the most recent of these manifestations, in the ward of Farringdon Without, attention was drawn to another of those indirect means by which we have exposed some of the most of which we have exposed some of the most cherished secrets of the gas-house,—the report of a public establishment as to the expense of providing its own gas. The report referred to was that of the Pentonville Prison, from which it appeared that, in the consumption of gas and the expense of manufacturing it for that establishment, a very considerable saving had been effected, as shown by the following statement:—

·	III.CIID .								
	expended								
,,	in wages,	&c	• • •		• • • •	• • • •	140	19	11

Total.....£752 0 4

The sum produced by the sale of coke was 3981. 6s. 3d., leaving the net cost of gas 3531. 14s. 1d. The quantity of gas consumed in the prison was 2,093,000 cubic feet, which was at the rate of 2s. 7½d. per thousand, but which previously they had paid the company 7s. 6d. for, and which would have cost 942l. instead of 353l. Deduct the cost of wasnifectory of 353l. Deduct the cost of manufactur-

ing, &c., and there was a net saving of 588l. 17s. by manufacturing their own gas. This report, therefore, fully justifies our exposal of "the average cost of gas" from the records of an extensive establishment at Leicester obtained for the purpose. meeting passed resolutions expressive of their determination, and advised the appointment of gas inspectors by the City authorities, and the stamping and adjustment of meters, as of all other measures and weights. A continued 'pressure from without' upon the authorities was also resolved on.—A hybrid hetween a consumers' company and one of the old stock has been announced as "The Surrey Consumers' Gas-light and Coke Association," for the supply of gas at 5s. per 1,000 culnic feet, with a honus to the consumer of one-fourth of the profits, the other three-fourths being regas inspectors by the City authorities, and the the profits, the other three-fourths being re-served to the proprietors, who are also to sell superior screened coals at a reduced price, using the small for coke. The general want of faith in meters is proposed to be ohviated by a return, where desired, to the contract system, at charges per burner ranging from 2l. to 4l. per annum—surely far too high, as the 5s. per 1,000 also is, in these economical and reforming times, and especially with profits on coal, &c .-—In an unsuccessful attempt of the Bedford County magistrates lately to get the price of gas supplied to the prison reduced, the gas company confessed that "the practice of making a difference in the charges between public bodies and private individuals was unjust." The price charged is 7s.6d.—not a fair price as the county supressyr maintained. fair price, as the county surveyor maintained. Six shillings were offered, but refused by the company, and the surveyor stated, when the subject of making their own gas was under consideration, that while 75% per annum was payable to the company for lighting the prison, works would cost in all only 600*l*., expense of making the gas nothing, and saving on making the gas nothing, and saving on whole at least 3s, per 1,000 feet. Parties had undertaken to supply both gaol and town at a moderate rate. The Bedford Company, we perceive, by the way, sell their coke at 25s. per ton—'reduced price'—a fact that may be reafter be of use.——At Lynn the price of gas has been reduced to the rather too respectable price of 7s. per 1,000 feet.

—At Cambridge, lately, while the authorities had the subject of gas under discussion, and on a statement being made that the profits of the company did not amount to 10 per cent., an exposure was made by Mr. Foster of the but exposure was made by Mr. Poster of the but too general falsity of such statements. By this company's act a capital at least double what is called for or necessary, or in fact used, is authorised, and on the whole of this the goodly interest or profit of nearly 10 per cent. is thus being reaped. "After a careful examination," added Mr. Foster, "I am prepared to prove that the cost price of gas ranges helow 2s. 6d. per 1,000 cuhic feet, taking every thing into consideration. That taking every thing into consideration. That would bear a profit of 1s. 6d. at a price of 4s. 1 trust the company will read, mark, learn, and inwardly digest these things. Taking the necessary capital at 15,000L, the per centage is thus at once raised to 1s per cent."—A correspondent of the Liverpool Albion complains, that since the amalgamation of the homeometric three her expenses. companies there, he can scarcely distinguish the three rs,—fish, flesh, and fowl, at his dinner table, by the light they supply him with .-While Liverpool is thus retrograding into the darkness, some of those few primitive localities, which have never till now come out of it, are at length rejoicing in the light. Such, with the new year's advent, is the new state of things at Soham.—An ingenious pitman at Garesfield colliery, near Gateshead, according to the local Observer, bas of late been fitting up miniature gas works, for single establishments, at about 25L each. A Mr. Thomas Waugh, of Berry Edge, Gateshead, a publican, is amongst those already supplied.

"The Index."—Under this title the spirited manager of the Western Literary Institution has commenced "a weekly Repertory of the Results of Modern Progress." It was the first to give an abstract of Mr. Staite's patent, enrolled on the 12th. We do not find anything in this specification, by the way, which removes our fear as to the cost of producing the light.

A DEMONSTRATION ON KENNINGTON

The open spaces, known as squares, which peculiarly distinguished London from other metropolitan cities, have always been a theme of gratulation for healthful purpose, notwithstanding access to the enclosures is available only to a privileged few, and the external boundaries are not always kept in the neatest trim. The portion of the metropolis on the Surrey side, embracing so great an extent, is singularly deficient in this leading feature, with but one available exception. This is Kennington Common, an open area covering an exposure of seventeen acres. This ample space would make amends for the absence of lesser sanitary valves, if it were put into a condition for leisurable enjoyment and rational recreation. As this common and a great portion of the adjacent neighbourhood forming the manor of Kennington, an appendage of the Duchy of Cornwall, it exhibits a sad neglect of the administration of this property that such visible neglect should exist. The want of funds can never be pleaded for an excuse, as only within a short period the sum of 75,000. has been paid as a fine on renewal of the lease of the manor. This sum was exacted on account of the improvement of the value of the property, and surely it would be augmented in a great proportion beyond the outlay, if a small part of the above fine were applied to rescuing this seventeen acre common from its present degraded and dilapidated state.

In its present condition it is fenced with a low wooden ral, much of which disappeared at the Chartist meeting of April 10th last year, and a har or a rail vanishes so frequently since that it may soon become an open waste, liable to all kinds of pollution. The ground is a flat, lying below the level of the surrounding roads, worked into numerous hollows, with some pathway tracks crossing it as innocent of a layer of fresh gravel, as the trails of wanderers over the endless prairies of the far west. The stunted herbage is trodden and soiled by a troop of cows helonging to a neighbouring milkman. A kind of pond near one corner, and a deep ditch opposite Southplace, are the cemeteries of all the dead pupples and kittens of the vicinity. Their decaying carcases may be seen floating on the surface of their watery graves, in all the green and purple tints of putrefaction, and smelt too, if the nose is not too strongly tickled hy the fumes of the adjacent vitriol works. A diagonal trackway from Newington-place to the Brixton and Camberwell roads, is a great saving of distance to the tired, but after nightfall the pedestrian is exposed to annoyance, and when the weather proves continuously wet, the transit resembles the intricate navigation of an archipelago.

In the day time the common is the resort of idle youths occupied in low gambling, and towards the afternoon of summer days, numerous parties playing at cricket obstruct the paths in all directions, and render any desire of tranquil respiration liable to the penalty of having an eye knocked out or a nose hroken, which have happened on occasions. The respectable persons who sometimes use it as a cricket ground need not complain of any privation of their amusement, as not more than a hundred yards from the common, the enclosure of the Oval offers, at a very insignificant cost, ample accommodation, without causing annoyance or creating danger.

The extensive vitriol works on the eastern side emit a constant stream of sulphuric vapour exceedingly annoying to the nostrils. Whether the inhaling of it is heneficial or injurious to the lungs, is a question that ought to be answered by the sanitary oracles, but at any rate, they are so offensive to respiration that one is always glad to escape from their range. There can he no mistake though of the impurity of the ditches around and about the vitriol works: a very long one leading towards Camberwell, skirted by a foot-path, presents an accumulation of black offensive muddy liquid, receiving constant contributions from numerous unmentionable conveniences attached to a line of low cottage erections. The drainage of this locality being remarkably difficult, the foul matter of these ditches can only be absorbed by atmospheric action, instead of being conveyed to the "cloaca"

maxima," or universal cesspool, called the

Kennington Common, seventeen acres in extent, would at some outlay by able hands, become a great ornament to the southern half of the metropolis, if it were planted and laid out on a similar principle to the enclosure in St. James's-park. A broad walk should intersect it from Newington-place to the Brixton-road. Raised, gravelled, and lighted, it would become a public convenience, and it might be fenced off slightly, with occasional openings to be shut after dark. The entire circuit should be enclosed with a handsome railing, and gates at the required entrances. Opposite the Horns Tavern, a lodge, with a portico, might be introduced, in which some of the Quadrant cast-off columns would assist to construct an architectural ornament, in addition to an erection of utility.

About a mile beyond this, another smaller open space is in a worse condition of filth and neglect. Camberwell-green has heen suffered to be converted into a vast deposit of slush and mud of all descriptions. Carts are constantly emptying their contents into it; and it is now so loaded with soft wet stuff, that any attempt to penetrate otherwise than by the narrow beaten track, would inevitably plunge the daring adventurer knee deep. A solitary ancient tree in the centre wears the weeds of witherhood, and a few dwarf lime trees on one of the sides seem ashanned to bear any leaves. Camberwell-green will soon be a misnomer.

IDLER IN LONDON.

VENTILATION: WARMING.

The subject of ventilation is not confined to the dwelling-bouse alone, but extends to the air of cities and towns. It is scarcely necessary to allude to the innumerable sources of deleterious vapours, exhalations, odours, and gases that are constantly generated in cities where there is a deficiency in sewers, pavements, water, and general hahits of order and cleanliness. This subject fortunately has attracted much attention, and is beginning to be pretty generally known.

History informs us that pestilence, the scourge of society, has prevailed frequently and virulently in ages, countries, and even special districts, in which cleanliness and the proper ventilation of houses have heen little considered. Without entering on the various theories respecting the exciting causes of pestilential disease, a little research will afford sufficient proof that want of cleanliness has been a principal cause of their aggravation and rapid diffusion. If we read the account of our own metropolis during the last calamitous visitation of the plague in 1665, and compare it with its present state, we may convince ourselves, that our present exemption from the recurrence of such an evil is secured to us on better grounds than those of precautionary laws of quarantine. At that period, in the history of that vast city, the streets were narrow, the houses projected in the upper story, and the spaces between them crowded with large signs hung across, thus checking the free circulation of air, essentially necessary for the health of the inhabitants.

To the miasma constantly engendered and rising from open drains and neglected sewers, were added those caused by the fermentation of heaps of rubbish ejected from every house, and which the indolent inhabitants could scarcely be compelled to remove. Nature has provided means of carrying off impure air and replacing it with such as is suited to animal respiration; but here its intentions were defeated both by the construction of the buildings and the habits of the people. Drainage as well as ventilation of the buildings, was at one time totally disregarded, and the result was, a perpetual recurrence of fevers.

Another correspondent, S. S. T., calls attention to the common practice of planning and running up buildings, without first arranging the mode of warming and ventilating them. He says,—It often happens that, from want of this previous arrangement, the kind of apparatus best adapted to the purpose cannot be used; or the walls have to be cut into, disturbing their solidity; or something unsightly

or inconvenient has to be introduced into the apartments; to say nothing of the risk of fire, which is often incurred. Now, every one who understands warming buildings could arrange his plans, and give his estimate of them, quite as well from the architect's drawings as from the building itself. If architects would prepare for what was to be done beforehand, we might have better apparatus arranged, in a more convenient manner, at less expense.

Once a fortnight we are coolly asked to describe the various methods which might be used for warming this staircase or that house, and to point out the best. We have on various occasions treated the general question of heating and ventilating (may do so again), and never omit to mention fresh suggestions or inventions bearing upon it. The treatment of special cases we cannot enter upon: we recommend application to (ourselves professionally, if they please) properly qualified parties, who will advise with reference to the particular circumstances.

PORTER'S PATENT CORRUGATED IRON BEAMS.

MR. PORTER, of the Iron-roofing Works, Southwark, who has used corrugated iron largely in the construction of portable houses for exportation, has taken out a patent for the employment of it in the construction of beams, believing that the corrugations so far strengthen the iron as to obtain for beams so formed, great power of resistance with small weight of metal.

The following is an account of an experiment recently tried upon two beams made on this plan, of the extreme length of 22 ft. The span between supports was 20 ft. 6 in.; depth of beam, 18 in.; weight of beam, 8½ exts.; the top and bottom frames were of 4 in. × 4 in. T-iron, and the base ½ in. thick; the plates of corrugated iron forming the beam being of No. 16 gauge, and the bands 1½ in. × ½ in. thick. The two beams were placed 9 ft. apart, and across these were laid two large oak blocks, weighing 1 ton 3 cwts., and supporting the further load. These blocks, or hearrs (the one 19 in. and the other 24 in. wide), were 4 ft. 3 in. apart from centre to centre, and equidistant from their centres to the centre of the heam, 25½ in.; upon these were laid cast-iron blocks, weighing 6 tons 17 cwts. This weight was put on on Saturday and remained till Tuesday, without causing any deflection. On Tuesday, in the course of an bour-and-a-half, an additional load was applied of 121 bundles plate-iron, weighing 7 tons 3 cwts. Ogr. 16 lbs., producing a deflection of ½ in. This load was allowed to remain from 1 p.m. ou Tuesday until 10 a.m. on Wednesday, in course of which time the deflection had increased ½ in in. Fifty-one bundles of plate-iron, weighing 7 tons 3 cwts. 1 qr. 2 lbs., were now added, which caused a total deflection of 1 in. bare; rested a quarter of an bour, when 32 bundles of plate-iron, weighing 1 ton 18 cwts. 0 qr. 12 lbs. were added, which increased the deflection to 1½ in. and 1½ in. respectively; the difference being evidently occasioned by the settling down of the piers, giving a greater load to one heam. A further load, energing 2 tons 8 cwts. 3 qrs., brought the deflections to 1½ in and 1½ in. This loading was proceeded with gradually during three bours, when the load was left for an hour. In the meantime a slight noise called attention to a partial dividing of the bottom flange of 7 frion, in the beam which hitherto appeared the least strained: upon examination, it was found to have originated in a fla

The breaking weight is, therefore, considered to be about 25 tons, exclusive of the weight of the beams.

The inventor considers that his beams will not weigh more than one half, or 5-sths, of the weight of cast-iron beams to carry the same load, and that they may be made for 21*l*. per ton

A SCHOOL OF DESIGN FOR LEICESTER,

An influential and respectable meeting lately took place at Leicester, to memorialise Government for aid in their endeavours to establish a School of Design there. The mayor presided, and a series of addresses followed. Mr. Alfred Burgess impressed on the attention of the assembly the importance of an idea of our own, that the young should be taught to express or describe ideas by drawing, or in forms, just as they are taught to express them by writing, or in words; and the allusions of others to the same idea, as well as the responses of the meeting itself, were evidence that it was appre-ciated. Mr. Hollings remarked that the pursuit of the fine arts might be shewn to be necessary to society at large, as materially involving the diversion of labour into various channels. Want of a greater variety of employment was one of the great causes of existing Let it not be said, either, that the advantages of the fine arts were to be seen merely in the production of luxuries. What was the luxury one age, became a necessary in the next How much occupation was now afforded even there by the employments of carving, gilding, painting, inlaying, designing of furniture, marbling, engraving on copper and wood, &c. Yet how serious would be the effect, if those engaged in their production were suddenly withdrawn from this field of labour, and thrown into that of the staple manufacture of town! Moreover, the fine arts were so essentially connected, that the study and practice of one almost invariably called forth or involved that of others; and then, too, how much indirect advantage they further afforded, as involving numerous other occupations in themselves not purely artistic. Take, for instance, the manufacture of an ordinary porcelain vase -to be found on the mantelpiece of most of the middle classes in the town. How many branches of industry were connected with it, with which the genius of the designer had nothing to do. There was the collection and preparation of the crude material by the various processes of breaking, sifting, and working—the manufacture of the metallic oxydes to be used by the artist—the subsequent processes of glazing and firing; all distinct branches these, to be carried on both before and after the impression of the design upon the ornament-the only process upon which art was directly though essentially concerned. In short, the more we multiplied the influence and operations of art in connection with the production of luxuries, the more we should multiply profitable occupation and employment for the people. For, in this case, the usual maxim of political economy was reversed; instead of the demand creating the supply, the supply created the demand. As an illustration, just let them look at the improvement in the form and material of common earthenware within the last hundred years,—a change entirely owing to the residence of a few cheap Italian model-lers in England. It was for the above and similar reasons that he should like to see a School of Design established in Leicester, The importance of design and variety of pattern and style, even in the staple manufacture of embroidered gloves, fancy hosiery, &c., them-selves, was afterwards also pointed out by others ere the meeting closed.

COMBINATIONS AND STRIKES.

We have received several letters on the subject of recent differences between operatives and their employers, but do not think it desirable to prolong the agitation by publishing them. The majority of them are from working men, deprecating, to the credit of the writers be it said, any thing like intimidation. Some of them display much good sense. The following is part of one from "An Old Mason." "Combinations and strikes are decidedly

"Combinations and strikes are decidedly injurious, diminishing trade on the one hand, increasing immorality on the other; and are one of the great causes of our present distress, for an increase of crime will cause an increase of poverty. Crime, and that which leads to it, are the most expensive of all evils; witness, for instance, our prisons, hospitals, poorhouses, police force, and a multiplicity of other officers to put in force the laws of the country. These are some of the natural consequences

and expenses attendant on crime; and unless there be a decrease of crime, we may look in vain for better times.

We are as a nation conscious of labouring under great difficulties, and many and loud are the complaints against those who sit at the helm of affairs. But one truth is evident, the helm of affairs. But one truth is evident, that while such large sums of money are necessary for the punishment of crime, the expenditure must greatly diminish the means for promoting the moral welfare of the people. It is also obvious to any strict observer, that many of those who are loudest with their complaints, and are crying out for reform, are most effectually impoverishing their country. Even under present circumstances, the industrious and frugal mechanic can usually maintain himself respectably; and if we make a fair calculation, two-thirds of the poverty and distress experienced among the ing classes are brought on themselves by bad habits. There is too much ocular demonstration in this city for the fact to be denied. We want better times, is the common we want wages raised and taxes dimi-d. Let us suppose we could obtain them nished. both. A few that are economical would make more rapid progress to independence; the many who are careless and prodigal would descend in the scale. But still the desired object may be obtained, and obtained fairly. A decrease of crime will naturally cause a decrease in the taxes. Peace between employers and employed, the government and the people, will promote the prosperity of trade. Plenty of labour will of itself ensure a fair remuneration. A proper improvement of wages will keep poverty at a distance, and secure to us peace and plenty. It is evident, therefore, that crime, poverty, disease, and distress go hand in band, whilst peace, industry, and frugality lead to bappiness and independence. pendence. Reader, choose for yourself, remember, the man who is punished for his crimes at his country's expense is increasing the burthen of the honest and industrious."

THE ANCIENT CHURCH AT GREEN-STEAD.

SIR,—I infer, from a paragraph in THE BUILDER, that a wrong impression has gone forth as regards the wooden church at Green-stead, namely, that it has been destroyed, or at least partially so. Now, Sir, that is not the fact, and if any person, having seen the outside of the timbers six months ago, could see them at the present time, they would scarcely be able to say, from their appearance, whether they had been removed or not. It was also stated that it was owing to the ravages of insects that it had become necessary to take it down. This in some measure is correct, as the lower ends of the timbers were in many instances perforated, but not to any great extent. The principal cause of its being taken down was this: the oak cills having been laid on the earth, with merely some rough flint put under them at intervals, had become so rotten as to let the upright timbers drop through, and had not the ends of the wall plates rested on the brickwork of the chancel, a great part of the nave must have fallen. has been the particular wish of the rector, the Rev. Philip Ray, by whom the expense of the rebuilding the church is principally defrayed, and also of Mr. Wyatt, the architect, that every part of the old timbers should be preserved, and I have been earful to correct the control of the contr and I have been careful to carry out wishes: the only parts lost are about 6 inches cut from the lower ends; the timbers have been fresh tenoned and inserted in oak cill laid on brickwork, 12 inches from the ground, so that there is every reason to presume they will last as long as they have already stood, for the planks, when cut, were so hard as almost to defy the saw. A new roof, open, and stained oak has been put on, having dormer windows, with stained glass, inserted. The whole of the plastering having been taken off, the planks are now seen inside. The are taken away and new seating fixed. church will be open for divine service about the middle of February next, when any who feel a veneration for the relics of bygone days, will be able to see that this ancient structure has been preserved to the fullest extent JAMES BARLOW, Builder.

Chipping Ongar, Essex.

FLUSHING AND FLASHING.

SIR,—I see that you have used the word "flashing" (BULDER, vol. 7, p. 32, col. 2) with reference to the cleansing of sewers by water. Will you permit me to make a friendly protest against the substitution of "flashing" for "flushing?" "Flush" appears to be derived from the German Fluss, a flood,—and to be generally used with reference to fulness or bulk, as well as rapidity or violence. The idea involved appears to be that of a flood, or rushing body of water. "Flash" appears to be derived from \$\phi\oldots\$, and to be generally used with reference to brilliancy and extension. The idea involved appears to be that of a flame or sparkling appearance. I would submit that the rush of a bulk of water through a sewer may properly be termed a "flush," and the splashing of a sheet of water over a street might as properly be termed a "flush," and the splashing of a sheet of water over a street might as properly be termed a "flush," and the splashing of a flush be devocates for each of the words would have, it may be hoped, plenty of opportunities for using both without confusion; for if it be good that our sewers should be cleansed, it will not be denied that it would certainly be beneficial to the public, to have a little better scavengering above them than prevails at present; and the water which had "flashed" whe streets from hose or water-cart, might be dammed up, under ground, until it had head enough to "flush" the sewers. N. R.

Miscellanea.

St. Patrick's Cathedral.—The 4,000*l*. some time since subscribed for the restoration of much that was dilapidated and out of order, have not only been exhausted, but the Dean, the Hon. II. Pakenham, who began the work at his own expense, has become responsible himself for one-half of an equal sum, namely, 2,000*l*., and has paid the interest on it till now that he has subscribed a second time 1,000*l*. to aid in making up the deficiency and further advancing the good work, which is by no means complete, though twelve arches which bad been blocked up have been disencumbered, and other works accomplished. The lady chapel still lies uncovered, and the choir itself is in a most unfinished state. Subscriptions, therefore, are again solicited.

BIRMINGHAM WORKHOUSE COMPETITION.—Fifty-three sets of plans have been sent in. One would suppose, says the Birmingham Journal, that architects had been doing nothing else for the last month or two but making workhouses on paper, and erecting little models for the accommodation of the midland counties. The same paper doubts, with great reason, that the best design will be chosen, and thinks a proposition which was made, to "toss up for it," not so absurd as it seems.

St. Margaret's Churchyard again.—Sir: Perhaps there is greater danger in opening the ground here for interment than in any other churchyard in or near the metropolis. The soil is a loose sand, like the sand of an hour glass, and such is its tendency to run back that when opening a grave it is necessary to support the sides from top to bottom: it does not absorb the defunct remains, but they lie a dreadful compound, engendering malaria of direful effect. After rains, in hot weather, the evaporation is charged with effluvia as unbearable as a death chamber; add to which, the church is entirely lined with woollen cloth, and when the doors and windows are open, of necessity gets charged with this deleterious vapour. Although there may be some doubt of its affecting the stones of the abbey, there can he none that the numerous inhabitants of the abbey precincts must suffer incessantly from the bad atmosphere it creates. I know a lady injured in her health, which her physician attributed to her passing through. No time should be lost in covering over this pestiferous ground. It is a plague spot, that the most valuable lives in the empire, during the sitting of Parliament, are exposed to: besides, it is surrounded by a large population and overlooked by an hospital for the sick and maimed.—No loller in London.

GOVERNMENT INQUIRY AT CHELMSFORD. -On Tuesday week Mr. Cresy's inquiry was opened. Mr. Fenton presented a laborious map, said to show the exact state of the drainage in every bouse, and which is to be published (for behoof of sensible tenants, we presume, and as a hint to landlords, and an presume, and as a nine to ample to other towns). The drainage is exceedingly defective. Nuisances of a foul character were discovered lurking in back drains and ditches, and the sewerage also was found to be generally imperfect. In one spot found to be generally imperfect. In one spot 100 recently built houses are drained into one totally inadequate cesspool. Mr. Cresy suggested the formation of a system of sewerage into tanks for agricultural purposes (the sewage in which, Mr. Baker observed, could be precipitated by mere ordinary white-wash and the inodorous water drained off). The inspector also pointed out that house-drains, in place of passing below the apartments to a front or street sewer, might be centered in a sewer along the backs of the houses, and much more out of the way of pollution to the inhabitants. The supply of water from the Burgess well, ten or twelve Artesian wells, and otherwise, was examined, and the means of increasing and raising the supply to the second floors of houses subpry to the second notes of house considered. A diminution of late years was attributed to leakage and artesian wells. The crowded state of the principal church-yard was complained of, and four others considered, and it appeared but too probable that even the water was contaminated. The inclusion of Springfield with Chelmsford, and the universal dissatisfaction with the operation of the present Act, were the other chief subjects brought under the inspector's notice.

EVILS OF SHORT LEASES.—Sir: I am delighted to find you holding up to light the evils of short leases. I have lived in France, America, Canada, and all the Channel Islands: in all these countries leases, if leases they can he called, are without limit; and in all these places the leaseholder has the right to buy off the charge or give some other property for rent, and make his own free for ever. I went once with a friend in Paris to buy a large piece of land, near the Triumphal Arch. The owner told my friend that the purchase-money was 57 francs per toise, but he only required one house to be built, that all the purchase-money should lie at 5 per cent. until the purchaser pleased to pay it off. My friend agreed, built one house, and then sold the residue at a good profit. In consequence of the good title of all building land in France, and every other country I know but England, house property, heing freehold, ranks first in the list of securities for capital. It is quite the reverse in London: too true is this baneful story told. Look at the many mouldering carcases, fit for nothing but to pull down, standing on the Crown and City lands, New Oxford-street, Holhorn, &c. &c., taxed with a ground-rent of ruinous extent, and a lease so short that no honest or calculating man would have anything to do with them.—J. C.

Use of Bath Stone.—We have received several letters in favour of Bath stone, but no end would be answered by inserting them. The mere assertions of parties (however respectable), unknown beyond their own circle, will not weigh against recorded facts, and the published opinions of impartial men known to have studied the matter. Fresh facts and experiments establishing facts we will gladly insert and give attention to. One correspondent from Bradford, Wilts, who says he has used many thousand feet of it, writes thus:—The principal failure in Bath stone is attributed to inappropriation, and the remedy for this as advised, is to lay the stone as in its native bed. This system holds good in plain faces, but in cornices or other projecting parts which are more exposed, it does not: the stone should be used joint headed, and so of copings. There are many difficulties in the selection of stone, from whatever quarries it may be brought, particularly in Bath stone, which is dug in a range of hills extending many miles, each hill producing stone of a different relative value; and these are not to be selected by any inexperienced person, as it often happens that the best in appearance is the worst for use and durability, and it is even so that in the same block we may find one portion more durable than the other.

PROJECTED WORKS.—Advertisements have been issued for tenders, by 10th February, for erecting prisoners' cells, kitchen offices, infirmary, boundary wall, &c., at the county jail, Huntingdon; by 26th February, for the masons' and paviors' works, supply of Guern-sey granite chippings and Yorkshire paving for one year, for the parish of St. George's, Hanover-square; and by same date for the supply for one year of workmen's tools and hammers for stonebreaking and repairs of same, as also for iron lamp posts and gas fittings.

as also for iron lamp posts and repairs of saincy.

NOT BORN TO BE DROWNED.—A lad named Gilder, an embryo mason, was descending a ladder near Liverpool, when a round broke, and he fell to the ground upon his feet. Rebounding, he next came down into a deep well, whence he was drawn unhurt. Such escapes should he no encouragement to carelessness. A fall of as many inches another time may be his death. We remember seeing a carpenter some years ago fall from the top of a high building to the bottom, passing two floors of naked joists in his way (going through his work neatly, if we may so speak) and getting up unhurt; while on the same day an acquaintance coming down stairs, and fancying he was at the bottom of the flight when there was in reality yet one step to descend, broke his leg in the fall that ensued.

Hydrostatic Pressure Regulator.—

Hydrostatic Pressure Regulator.

A simple apparatus has lately been invented and registered by Mr. Bryce, plumber, Glasgow, for the reduction and regulation of the hydrostatic pressure in supply-pipes connected with street water-mains. It is said, hy its means, whatever the initial head pressure may be, the supply may be taken off for domestic purposes at any desired pressure less than such head pressure, with the view of avoiding the inconveniences resulting from an inordinate height of column, extreme rush of the water, the wear and leakage of cocks, &c.

Churchwandenisas.—A correspondent says,—"About six or seven weeks ago, I was saurprised at finding that the pinnacles which crowned the britterses of St. Peter's Church, Dorchester (the oldest one in this borough), were removed, for what purpose I could not then discover. However, I have since found out that it was in consequence of the church-wardens imagining that they might fall on some unlucky passer-by! although they had remained so many years immovable, and were at a distance of at least ten feet from the pavement, which was separated from the church by an iron railing. I hear, also, that there is no intention of their ever being replaced." Not knowing their condition, it is impossible for us to say whether or not the act is blameable. We trust, however, that the removal will lead to restoration.—"The churchwardens of Montton" ("THE BUILDER should be upon their bones," remarks the Gateshead Observer), are said to have "removed the mullions and stone tracery from almost all the windows" of the beautiful parish church "to allow the passage of more light into the interior." It is comparatively seldom, we are happy to say, that we have to record such acts now. Sturely there are some persons in Moulton who will vindicate architectural propriety. Had it been in Moultan instead of Moulton they could not have done any thing more barbarous.

PRESERVATION OF BOOKS.—A correspondent wishes to be informed the most desirable way of preserving books from the effects—indidew and damp, whether cases with glass doors, or frames without, and which is the most desirable wood for their construction.

Sale of Cast-Iron.—Messrs. Hutchison and Dixon, auctioneers, Glasgow, sold at Troon, by auction, about 1,203 tons cast-iron. Mr. Dixon explained that the metal consisted of tram rails, and chairs, which had been used on the Kilmarnock and Troon Railway. The whole was divided into eight parcels, and sold at from 38s. to 41s. per ton. The malleahle iron scraps brought 63s. 6d. The attendance of founders and dealers (the former of whom were the buyers) from all parts of the country was numerous. The sale was a quick and most spirited affair,—the biddings at the outset being near the prices realised. In addition to the price, there falls to be paid 3s. 9d. per ton of carriage to Glasgow, which brings the old iron nearly to the figure at which certain brands of pig are selling here.—North British Daily Mail.

No. CCCXIII.

SATURDAY, FEBRUARY 3, 1849.

HERE are three or four matters that have come before us during the week, on which we desire to say a few words to our readers; and not having left

ourselves space or time to treat each of them separately, we must string them together, as we have done on some other occasions, although in truth they have not much immediate connection.

On Thursday in last week, after listening to a paper on pointed architecture, at the Society of Antiquaries, written by the veteran architect, Mr. John Adey Repton (how much a veteran was shewn by the fact, that this was the continuation of a paper commenced by him forty years ago), we looked in at the adjoining pleasant room, where the Royal Society hold their meetings, to know what was going on there. We say a pleasant room, but to our minds it is the most pleasant room in London; its old sconces and wax lights, the quiet that prevails there, the portraits which cover every inch of the walls, including at all events one great architect, the men who are occasionally to be found there dozing with dignity amidst the hum of a paper, and the mace on the table, which, before Mr. Weld scandalously destroyed the belief, by proving that Charles the Second not merely bought but paid for it, we were able to point out to a country visiter as the veritable "bauble" which Cromwell bade his soldiers "take away,"-all concur to make it so.

There were very few members present-perhaps not forty-and Sir Robert Harry Inglis, bland and unctuous, with that bit of the beautiful in his button-hole in the shape of a flower, which seems as much part of his dress as his coat (and we like him for it), had by the hand a venerable looking, though not old man, and was admitting him, in the name of the Royal Society, "a fellow thereof;" and then he added a few happily chosen words, to mark his consideration of the new member-Sumner, Archbishop of Canterbury, and Primate of all England. Another neophyte approached, whom Sir Robert admitted as Lord John Russell, and to whom he said, in more and better words than we can remember, that he should not meet the views of the fellows if he did not add to his official duty, an earnest expression of their hope that all his lordship's efforts, as the Prime Minister of England, for the advantage of the country, might be crowned with success. The fellows regarded with no ordinary pleasure, he said, the accession of one who, he was satisfied, felt with him, that no earthly pursuit had stronger claims on the attention of all than the pursuits of science.

Our old friend the new secretary, Professor Bell, who has quite settled down into nis seat, then began to read some statements of the average fall of rain during certain showers, which will doubtless be very useful when printed, but as we did not desire to have cold water thrown on the feelings which what ve had seen had induced, we straightway departed, determined that our readers should have a note of it.

countries, this was a remarkable and significant scene, not without interest to any. While the infallible head of another church is a fugitive and an exile, and the ministers of other countries can scarce preserve the land from anarchy and spoliation,-here were the head of our cburch, and the prime minister of our country, quietly giving their adhesion to the cause of science, and taking their seats amongst its representatives.

On the previous evening we attended a meeting of a different character, from which we came away less satisfied. A placard on a wall in Westminster, setting forth that a lecture would be delivered to the Young Men's Missionary Association, on the 24th of January, by the Rev. John Aldis; subject-"The Connection of Idolatry and Architecture," took us to the Baptist Mission House in Moorgatestreet. The library, a good room, adorned by the prize pictures of "The Baptism of Christ," concerning which much was said at the time of the competition, was filled with persons; and the reverend lecturer spoke eloquently and fluently, though we cannot say well; for his eloquence was sadly thrown away on a futile idea, and his audience must have left with their notions on the subject of architecture curiously mystified and perverted. The dogmas which he specially wished to inculcate were these: that architecture was purely idolatrous; that while Paganism had produced an architecture, Christianity had done nothing for it (our glorious cathedrals were quite forgotten), and-chief point of all, that columns in Druid, Egyptian, Greek, and Roman architecture were simply symbols of gods or their attendants! In Greek buildings, for example, he said, the columns were wholly useless, and were not put up with the view of being of use; they were the beginning and the end of the building, representatives of gods to awe the worshippers. His main proof (good lack!) be rested on this, that all the parts of an order were symbolical, and that surely, therefore, the leading idea, the column, was so too. Thus, he said the triglyphs were suggestions of Apollo's harp! and the flutings of the columns were to represent the folds of a robe. The Doric order, he continued, had no pediment, the robe was supposed to be so large as to hide it. In the Ionic the robe was less (the column, therefore, smaller), and the pediment was visible. For a time we could not understand what the reverend gentleman meant by saying the Doric had no pediment, but as he went on we came to the conclusion that he meant "pedestal," and ought to have said "base." As to the constant use of columns in absurd situations by ourselves, which he condemned (he was not quite so wrong here), we had, like many other imitators, taken up an absurdity, although we would not have originated it; but he repeated, in classical architecture columns were simply representatives of gods, and purely idolatrous.

The rev. gentleman appeared to possess the ear and entire confidence of the meeting as one of their pastors; and making all his statements not as being in any degree matters of doubt, but as received truths, they were doubtless so considered by the majority of his

With a protest against such blind teaching, let us leave the speculative, however, and turn to the practical.

It is pretty evident, from the proceedings at a late Court of Sewers, reported in our present And surely, taken in connection with what number, that the Barry-Austin controversy is s passing around us, and the state of other one which may lead to considerable inconve- still unsettled.

nience. Now let us, by way of friendly warning, recommend the commissioners to keep themselves as much as possible out of hot water. They have clean and dirty water questions enough already on their hands, and they have a vast amount of serious business to get tbrough, all of which will require the exercise of cool brains, and the assistance of a friendly public opinion. We have had too many occasions of late for regretting the evident infusion of a mixture of acerbity, acidity, and acridity, into certain sanitary compositions, and what appeared to us a frequent diverging from the straightforward path of business for the sake of giving an unexpected kick at some real or imaginary opponent. There is much to be objected to in the tone of Mr. Austin's report on the drainage of the new Houses of Parliament, and to some of the circumstances attending it. If he had put forward a plain statement of facts in very temperate language, he would have laid a good ground for a temperate discussion. As the matter now stands, there is too much feeling involved in it, too much making of a case, and striving for victory, for us to hope that the controversy will end very pleasantly or profitably. The new views that have been recently taken on the subject of town drainage may be wholly or partially right or wrong. is very important to the public that their accuracy or inaccuracy should be distinctly ascertained, and that we should have the full benefit of a calm, unprejudiced investigation of the whole subject of town drainage by impartial and practical men of science, of whom there are several in the commission. If, however, the officers of the commission should be allowed to indulge in any thing approaching personalities, or should so shape their reports as to hurt in any avoidable manner the feelings of others, the consequence would be the excitement of something like party feeling, occasioning heated instead of temperate discussion, in the turmoil of which poor TRUTH might find berself flashed, or flushed, if our readers like it better, into a bottomless cesspool. Moreover, opposition to the views of the commission would be excited in numerous quarters where otherwise good will and aid might have been looked for. And though we have put the matter hypothetically, the truth is, this feeling is being excited, and an opposition is growing, and, therefore, we do most earnestly advise the commissioners to check any disposition to gladiatorial exhibition which may shew itself amongst them.

We have carefully endeavoured to steer an unbiassed course; our views, long ago and often expressed, are mainly those of the commission,—we "have done the state some service, and they know it;" but we have not the less painfully felt the injustice, as well as the impropriety in a political and in a mere gentlemanly point of view, of the apparent endeavour to cast a slur on men of standing and experience in their departments, which has been evinced by several recent publications, and which seems to have no other exciting cause than the fact, that the practice of these gentlemen and the new views are not altogether in accord. An obstinate adberence to antiquated notions clearly proved to be wrong, might justify a condemnation, which no man could be fairly required to suffer in silence, merely because he is told without proof tbat all his theory and practice have been based on error; but such a condemnation is doubly exasperating when it is pronounced with an assumption of infallibility on points obviously

Let us hope, then, that the Metropolitan Commissioners of Sewers, whom we cordially wish well through their arduous lahours, will establish an additional claim to the confidence of the public, by carefully preventing the publication of any report which is not couched in the most temperate terms. If they do not, they may find the task of deodorizing more difficult than they think for.

We are not fond of finding fault, or even of exposing misdoings; we would rather praise than blame; still, when occasion arises, we never shrink from the task, and unfortunately this is too often the case, especially in architectural competitions. The ink of our notice of very suspicious proceedings at Chichester was scarcely dry before we were called on to refer to others equally so at Birmingham.

To expect a just decision, excepting through chance, in a competition where a hoard of guardians, unaided, are to make the selection. even if they have the best intentions, and earnestly desire to do right, is simply ridiculous. In the case now under discussion, to which we referred last week, there would seem to be influences at work, apart from this actual impossibility, which will prevent the likelihood of justice being done to the competitors,least, if the statements forwarded to us, and others publicly made, be true.

We have before us the names of fifty-two competitors, and the initials of two. How these came to be public we do not know; but supposing that the competitors understood that it was to be so, we do not object to this. Twentyeight of these, according to the list, are from London and its suburbs, including some respectable names, and five are from Birmingham. In two meetings, or at most three, forty-seven of the designs were got rid of, seven being selected as the best. Of these seven, how many will our readers say were of the twentyeight from London, and how many from the Birmingham list? Supposing the talent equal in both places, and making some allowance for superior facilities for obtaining local information possessed by the architects of the town, the calculation is not difficult. We will wager a new case of instruments, however, with the best arithmetician who reads us, that the result of his sums will not coincide with the fact. The committee's list includes all five of the Birmingham competitors (at least so goes our information) and not one of the London men.*

The Birmingham Journal of Saturday last has a sensible leading article on the subject, pointing out the injustice that is being done to the competitors. In speaking of the selection the writer says, after remarking that of the two meetings in which the work had been done, considerable part of one was occupied in discussing merely the mode of determining the best,-" It may be as well to remind our readers that not one in ten of the guardians in committee assembled had the slightest practical knowledge of the subject before them. Few unprofessional men are able to 'read,' as it is termed, an architectural plan so as to understand even its general features, and we do not libel the guardians in saying that they are quite as competent to read a Greek poem, or a Sanscrit MS., as they are to analyse, still less to generalise, the necessarily elahorate and complicated details hefore them. If this be so, we are at a loss to determine on what principle they judged of, and threw overboard, the

forty-six plans referred to. Look also at the express speed with which they got through their work. Admitting that several of the plans were ineligible on the score of expense, or, for some cause not connected with their architectural arrangements, did not require examination, there was still a number sufficient to occupy the time of a competent tribunal for a week. Consider the facts already stated; the time the mere arrangement of the plans occupied, the numerous details demanding separate consideration with reference to themselves and to the building as a whole, the cost of producing these plans, and the professional character of the architects in some measure involved in the decision, then estimate the competency of the judges, and the attention bestowed on the plans at the two meetings with these considerations, and it must be admitted that the tribunal was as incompetent as the trial was hurried and unfair."

The writer, in conclusion, urges the guardians to retrace their steps; to appoint three architects of character who are not interested in the competition, and request them to examine and report upon the plans for the guidance of the Board.

One of the guardians has attempted, in a letter to Aris's Gazette, to reply to the Journal, but says nothing more so far as relates to the real question at issue than that the hoard had three meetings instead of two.

One of the competitors has, in a praiseworthy manner, exerted himself to obtain a reconsideration of the designs. A meeting of competitors was fixed to take place at Birmingham on Tuesday (it being understood that the hoard would make their final selection on Wednesday), but the notice was so short that we doubt if many were able to attend.* Several members of the hoard themselves feel that an injustice (if only through want of knowledge) is being committed, and have offered, we are told, to co-operate in bringing the matter fairly before the public, and giving the competitors a chance of redress

And so, having discoursed of Prime Ministers and Baptist Missionaries, Commissioners of Sewers and Board of Guardians, wandering without apology from London to Birmingham, we commend the matter of our paper to the consideration of the various parties whom it may concern, considering they will not find it wholly uninstructive,

THE RIGHTS AND RESPONSIBILITIES OF ARCHITECTS.

THE mutual positions of Architects; and their EMPLOYERS, differ in no material respect from the ordinary relations as by law established between principals and their agents. The most prominent peculiarity attaching to the intercourse between them arises from nature of their association,—which is neither honorary, as in the case of harristers and physicians in respect of their clients or pants, nor yet subject to any fixed and certain claims for services, as are the attendances of attorneys and solicitors. Hence it follows, that in all engagements made with architects, unless controlled by an express agreement, the amount of compensation due to them for their "professional assistance is estimated their professional assistance is estimated the the quantum meruit principle, and therefore must depend mainly upon the evidence ad-duced in each particular transaction, in support of the amount of skill and lahour entit to remuneration. A contract will be implied as having been entered into by the one party

to pay a fair and reasonable compensation to the other, in consideration of the duties and responsibilities which he assumes, and of the labour and services which he performs. in the absence of an express contract, is the in the absence of an express contract, is the extent of the implied agreement. The only question that can possibly arise out of this state of things goes to the value of the services actually rendered.

An architect's engagement or retainer is not, as has been frequently erroneously supposed, necessarily co-extensive with the complaints of the givine that

pletion of his original design, nor continuing pletion of his original design, nor contiming to the entire execution of the works primarily entrusted to his charge. The employer may at any time discharge one architect and engage another. In such a case, the architect displaced must seek his remedy on quantum meruit. Nor would his claim he limited to the works then actually performed or in progress; he would also he entitled to a remuneration commensurate with the prospective advantage accruing to his employer from the adoption of that design which he is denied the privilege of perfecting. privilege of perfecting.

An architect is bound to exercise due care and skill in execution of the trusts committed to his charge. Nor will any thing short of a personal investigation into all the details of personal investigation into all the details of every matter delegated to him be sufficient to exonerate him from the imputation of neglect. In case of the occurrence of any un-foreseen disaster, it will be no valid plea for him, in answer to the charge of negligence, to show that the particulars on which his celculations have been erroneously grounded were furnished to him by his employer. It is his duty to inspect, to test, and verify all data which may be supplied to him, if on the cor-rectness of those data the success or failure of rectness of those data the success or failure of his work depend. Hence, an architect, having been employed by a committee to erect a bridge, it was held that he was bound to ascertain for himself by personal experiment the nature of the soil; although a person previously appointed by the committee for that purpose communicated to him, by their express desire, the result of his inquiries.*

Nor can an architect establish any claim in respect of his services, when, either through neglect or ignorance, his calculations have been proved erroneous, and his estimates deceptive. Indeed, it is a general and most

ceptive. Indeed, it is a general and most equitable rule that no agent can demand remu-neration as for work and labour done, unless the principal derives some benefit from his assistance. T Common sense will accord its approval to that dictum of the law which declares want of competence or want of candour to be equally unworthy. Hence an architect, who, hy means of a grossly incorrect estimate, induces his employer to undertake work which cannot he appropriate attention. work which cannot he completed otherwise work which cannot be completed otherwise than at a much greater expense than was originally contemplated, is not entitled to recover any thing for his trouble, either in the making of such estimate—or for the execution of the works performed thereunder—or for any services connected therewith.\(\frac{1}{2}\) In such a case—that is to say, when the estimate is utterly erroneous and deceptive, no remedy is given to the architect in action upon quan-tum meruit; since the defendant may, without notice, and under plea of the general issue, § reduce the damages "by showing that the work was improperly done; and may entitle himself to a verdict by establishing its total in the control of the con

The words of Mr. Justice Le Blanc applied to an analagous case, I may be quoted as forming a very appropriate summary of the points ing a very appropriate summary of the points involving the necessity for the exercise of a fair degree of skill and care by an architect, for, as he observes, "the plaintiff must he prepared to show that his work was properly done. If a man contracted with another to build him a house for a certain sum, it surely would not be sufficient for the plaintiff to show that he had put together such a quantity of bricks and timher in the shape of a house,

^{*} We were requested to co-operate by giving intimation of the meeting to the London competitors, and previding at the meeting, but did not receive the letter until too late. † It is almost unnecessary to state that the rights and

treated as identical.

^{*} Moneypenny v. Hartland, 1 C. and P., 382; 2 id. 378 S. C. on second trial.

[†] See Stewart v. Kayle, 3 Stark, 161; Hamond v. Hol-liday, 1 C. and P., 384. † Moneypenny v. Hartland. Ante.

Basten v. Butter, 7 East-479 and 484.

The names of the selected are (without reference to the reference of merit). Coe and Goodwin, Lewisham; Brodrick, but and Whattey, Dury and Bateman, Newey, Hemondowe believe, but this is not quite clear in our list. Empson, it in O Bremingsam.

if it could be shown that it fell down the next day; but it ought to be shown that he had done the work according to his contract; and it is open to the defendant to prove that it was executed in such a manner as to be of no value to him."

The contract thus implied by the law to be incumbent on architects in common with all other professional men, being that they will exercise a reasonable amount of skill and care in the performance of their duties, any dere-liction from these implied obligations will incapacitate them from recovering the remu-neration otherwise usually accorded to their

Nor is an architect liable only for his own personal default. Being individually and personally trusted by his client, he is responsible also for those whom he employs in situations of a subordinate character; and therefore for his clerk of the works. No employment requiring skill or discretion can be legally delegated to another.* Nor would the fact of the employer undertaking to pay such clerk of the works discharge the architect from his liability. The subordinate is still regarded as the mere deputy or representative of his superior, who would be bound for his competency, and answerable for his conduct, on the principle of per se. The architect receives remuneration for his superintendence of the ancient maxim qui facit per alium, facit for his superintendence of the works, nor would his delegation of that duty to another person, nor his neglect to keep a strict watch over that person's proceedings be covered even by the proof that such an arrangement had been well known to, or approved of, by his (the rephirest) college. his (the architect's) employer. Such an appointment would be purely vicarial. The clerk is a mere agent of the architect, who ought to be, and hence impliedly becomes, the accredited judge of and guarantee for his pro-

Our course of reading has not furnished us with any judicial decision, especially applicable to this particular point. The dictum here by analogy laid down may, however, be received with confidence.† The practice of the profession is such as to show that it admits the responsibility. Of the many cases that might be cited in support of this view, one of the most remarkable as well as more recent may suffice.

An architect superintended the erection a chapel from his own designs, and in due course received his com upon completion of the works. commission-charge

Some few years had elapsed when some material defect manifested itself in the subsi-dence of the roof. On examination, it appeared that the original construction of the roof, as designed by the architect, had been varied by the builder, either with the consent, or through the carelessness of the clerk of the works, and that the default now becoming apparent, had been occasioned by these variations in its construction. The architect, at once acknowledging his liability, defrayed the costs of reinstatement.

When the architect's certificate is made a conditional precedent to the payment of a builder's bill, the latter cannot recover in an action without producing it; and this will be the rule whether such action be brought upon a contract or on an ad valorem charge. It is the usual practice to make the architect's certificate a condition precedent to payment in every builder's agreement; and in such a case, an account, the items of which are merely checked by the architect, and by him forwarded to his employer, will not amount to a certificate sufficient to satisfy such a condition, and to give the builder right of action. The certificate must state decidedly and unequivocally that the builder is entitled to a certain sum of

But although the architect's certificate is thus, in the great majority of cases, rendered necessary to the builder before he can recover his demand, he is not utterly without remedy when that certificate has been unfairly withheld or unreasonably refused. It seems certainly very doubtful whether any action at law could be sustained against an architect to compel the granting of a certificate. But a bill in chancery might be filed to enforce the special performance of that portion of his duty; and unless he could then show satisfactorily that his refusal was justifiable under the peculiar circumstances of the case, he would undoubtedly be desired to grant it. Until, however, it has been procured by some means, and is produced, it is quite clear that no action can be maintained, unless it can be shown that the defendant himself prevents the naintiff from complying with the condition. plaintiff from complying with the condition; or that the condition itself has become impossible of fulfilment, as in the case of the death of the architect.* The hardship entailed upon the plaintiff, by making the doing of an Act by a third party essential to complete his right of action, forms no just ground for complaint, since he himself voluntarily assented to the contract upon these terms; and baving once agreed to such a stipulation, he will not be allowed afterwards to repudiate it, simply because it has become inconvenient.

The remuneration of an architect has long been a vexata quæstiv. Nor has the law laid down any fixed principles by which it may be generally estimated. The profession have engenerally estimated. The profession have en-deavoured to establish a customary scale of charges by commission on the outlay, amounting in the aggregate to five per cent., + generally subdivided thus,-

Plans..... I per cent.

Estimate $1\frac{1}{4}$ Specification . . . $1\frac{1}{4}$ Superintendance . $1\frac{1}{4}$

This scale, however, has never been recog-sed in our courts. Indeed, it is questionable nised in our courts. Indeed, it is questionable whether it should be so recognised, at least in its details, which, although promulgated by those who rightly ought to be the fittest judges and protectors of their own interests, are manifestly unequal and unjust. Surely the study, thought, and time bestowed upon the preparations of a plan worthy to, he adouted, and fit nised in our courts. ration of a plan worthy to be adopted, and fit to be exactly carried out, is worthy of a higher reward than the per centage here accorded it. Again, the specification is a work of labour, to which the estimate is merely supplementary Least of all is the superintendence entitled to same remuneration.

The courts have long and pertinaciously en-deavoured to avoid a recognition of this per-centage principle; and even its most strenuous supporters must allow that some objections to it stand upon a broad and stable basis. In such a standard of remuneration (say its opponents), the architect engaged to guard the interests of his employer finds a direct incentive to neglect, if not to treachery. His profit is proportionate to the expenditure, not saving. His wits are exercised in daily contravention of his own interests. All his experience is directed to his own detriment. His honesty can be rewarded only by a cor-respondent diminution in its recompense. respondent diminution in its recompense. Perpetual self-denial only entails continual self-sacrifice; whilst the temptation is at once certain in its realisation, and secure of its en-

joyment.

To these most matter-of-fact and plausible objections, it is but an indifferent reply to urge that every architect acquires reor age that every architect acquires re-putation, and its consequent advantages by the economy which he exercises in the exe-cution of his designs. This is a proposition which experience has failed to prove. Even were such success the certain and unfailing consequence of uniform adherence to the strict path of duty, many would still be found more anxious to secure immediate advantage, than to live on in faith of fame deferred. The world must change its ways much before honesty becomes the rule, and want of it, the exception.

Faulty, however, as we all must acknow-ledge the per-centage principle to be, and determined as has been the opposition of the legal authorities to its establishment; it finds general favour with the public, and is pracgeneral favour with the public, and is practically adopted by all juries. Lord Denman, in a recent case, ‡ in vain inculcated his anti-

commission doctrines upon the jury, who, commission doctrines upon the jury, who, nevertheless, gave the prescribed commission on a quantum meruit count; and on a subsequent motion for a new trial, the court refused to nullify the verdict. So, in a similar case before Lord Ellenborough, that eminent judge left it to the jury to say whether the mode of charging by commission was vicious or unreasonable, and if they thought it so, to deduct from the damages accordingly. But, although he hinted his own disapprobation of the principle, the jury sanctioned it by giving the plaintiff a verdict for the full amount of his claim. Lord Kenyon held that a commissioncharge was not recoverable as such.

Amongst the various suggestions which have been lately put forward as actually tested by successful practice, is that of a direct establishment of a contract between the parties, by the delivery of a card of terms at the time of engagement. This remedy, however, seems worse than the disease. No profes-sional man would wish to commence an acquaintance with a collision so immediately view—whilst such an intimation of suspicion must be equally distasteful to his employer. It might, perbaps, place architects on higher ground with their employers, and certainly it would be more just to themselves, if the per would be more just to the actual cost. Such an arrange-nent could in no manner prejudice the client, whilst the architect would feel a double pride in exercising his disposition for economy, when certain of its full appreciation, and many bickerings would be removed from both. In default, however, of the substitution of some better and more equitable scheme for that which now exists, architects must rest content with the per-centage system; nor will they generally be disappointed in submitting their fair claims under that customary compensation to the decision of a jury.+

The architect's right to remuneration accrues, in case of an express contract, only upon completion of his duties. Such remuneration being contingent on benefit to be derived by the employer from services rendered, no reward will be due until the employer has actually obtained some definite advantage.‡ Where, however, the contract is only implied and not Where, expressed, the architect will be justified, after the expiration of a reasonable time, in refusing to continue his labours unless he be paid a sum on account proportionate to the work already performed. Ite may, moreover, on refusal, throw up his engagement, and recover

to the extent of such work, on quantum meruit. The practice of competition having of late been much extended, it may be well here to observe that there does not appear to be any copyright in architectural designs. Nor can any remuneration as for work and labour done, he recovered from any committee or individual who may have advertised for plans and estimates to be sent in upon the usual terms of competition. Architects thus invited to submit designs for any particular object, and complying with such invitation, are altogether without remedy in respect of compensation for the time and labour bestowed upon them. And this, even although the amount of reward may be specified, and the particulars and requisitions of the parties advertised strictly adhered to. Nor is it incumbent on the advertisers to select any one design, justify their exclusion or rejection of the others; since the parties soliciting the competition have impliedly constituted themselves

deration of circular and curved lines.

sole judges whether any remuneration bas been merited or not.*

A striking case of this kind recently occurred, A committee having advertised for competition plans, to be designed in accordance with cerplans, to be designed in accordance with cer-tain detailed particulars, received several. Of more than twenty which were offered, one design only was in strict accordance with the instructions issued; and the committee chose one which was utterly and altogether in direct contravention of their own prescribed rules. The architect who had conformed to the in-structions accounted account on the wester, of structions consulted counsel on the merits of his case, and was advised that he had no apparent remedy, since he was altogether de-pendent upon the good faith of the committee, who might vary their rules at pleasure, and, in default of any express contract, might make their own selection, however unjustly, without incurring any responsibility in respect of other parties.

G. TATTERSALL.

PROFESSOR COCKERELL'S LECTURES ON ARCHITECTURE,

THE third lecture of the course at the Royal Academy was given on Thursday, the 18th ult. On the previous occasion the professor had shown that, in regard to fitness and conception, nature was ever the great mistress of our art, and, by instances from the practice of Brunelleschi and of Wren, the advantage of of brunenessin and of wreh, the advantage of copying from the original, rather than from copies, as we were so apt to do. The analogies he had then given were mainly in reference to structure, but were equally to be discovered in what related to beauty, and be proceeded to show this analogy in the cases of straight and curved lines. and curved lines.

and curved lines.

In arriving at this part of his subject, he spoke of the conceit shown in admiring the work of art, simply from its being such, and neglecting to appreciate the beauty of a corresponding production of nature. For example, in some kinds of stone was a fossil of beautiful spiral outline, called the cornu ammonis. Discovered on the force of some one of the stones of covered on the face of some one of the stones of a garden wall, it would attract little attention. But, if this beautiful spiral were known to be a work of art, great would be the interest excited by it. There would be much discussion a work of are great would be much discussion as to its origin, and much speculation as to the mode of generating the curve, and we might be certain that afterwards, no other form of volute would be used but this. Whilst in the wall, the simple gardener would almost ask pardon for presuming to admire any thing so ordinary; but considered as a work of art, it would be rated beyond all price. As ascribed to nature, it was

The professor also noticed the beauty of form and structure in the common echinus, or sea urchin, and showed how suggestions might be taken from it, for the form and decoration of domes. If compared with any existing domes—for example, such as had any surface decoration, as in that of the Invalides at Paris—how vastly superior was the work of nature.

nature.

Thus, in some of the most pleasing works of art, we discovered the delightful freshness of nature. If we drew from the Grecian honeysuckle, we felt that it was an adaptation from nature. In the cornice of the nave of York Cathedral, we found an ornament which was, in fact, the common savoycabbage without disguise. In the capitals and other carvings we discovered the foliage of hedge-rows. Everywhere we had the evidence of the presence of nature, and culogised the work as "just like nature." Now, if thus we were always so reminded of nature, we could not but regard the labours of those who added to the knowledge of her as useful to our art. not but regard the labours of those who added to the knowledge of her as useful to our art. It was not to be wondered at, that a notion had prevailed that the old schools had been consulted usque ad nauseam, and been worked out, whence aspirations after dangerous novelty, and the idea that the powers of science exceeded those of art, now shown to be erroneous views. As Pope said,—

"Learn hence for ancient rules a just esteem,— To copy nature is to copy them."

The professor then proceeded to give instances of the universality of the influence, found in the different fashions of architecture,

* Taylor v. Brewer, 1 M. and Selw, 210

in contradistinction to the structural part of architecture, which altered with the progress of science. Amongst these instances were noticed right lines, angles, curves of mouldings, scrolls, spirals, and volutes, and the conic sections.—In illustration of the effect produced by a simple line, he sketched the line produced by a simple line, he sketched the line of the horizon on the ocean, contrasted with the rocky scenery of the coast. It was, he said, from the tranquil sublimity of this line, breaking in extended length on the view of the Grecian soldiers, in a foreign land, which made them exclaim $\theta a \lambda a \sigma \sigma a$, $\theta a \lambda a \sigma \sigma a$, as much as because they there beheld the road by which they might reach their native country. It was they might reach their native country. It was the maritime situation of Greece which made the maritime situation of Greece which made the horizontal line so delightful to her people, and the contrast of the low long line of the Grecian temple with rocky scenery excited our admiration in the architecture of Athens, as also in Agrigentim, where the energy of the long lines of the architecture would be con-fessed by every one. The too frequent breaks, often found in later styles, were apt to give feebleness, and what he might call collapse, to architecture so broken up. The works of the Adams might be instanced as indicative of Adams might be instanced as indicative of this effect, which was seen in Stratford-place, this effect, which was seen in Stratford-place, Oxford-street. The best works of the Halian architects were remarkable for their length of line, as in the Library of St. Mark, at Venice, and the Farnese Palace. A change to a broken effect, however, took place, and the altitude affected in the thirteenth century no doubt influenced the departure from the horizontal. It was seen in the works of Michaelande and was seen in the works of Michelangelo, and also in those of Sir Christopher Wren. It would seem as though the horizontal and vertical systems had gained prevalence by

When a building was seen in oblique perspective, there was no doubt, the professor said, that the horizontal principle was portant one to be observed, and the Library of St. Mark was so circumstanced. But, in parallel perspective, as when a building formed the termination of a street, the vertical principle was desirable, and it was therefore correctly employed in the triumphal arches; and, in the case of the façade of Guildhall, any other than the vertical charac-ter would have been inappropriate.—The same contrast and variety which proved the charm contrast and variety which proved the charm of the low building in elevated districts, dictated the choice of lofty outline and vertical character in flat countries, and it was merely the natural impulse for the Assyrians to exclaim—"Let us build a city and a tower, whose top may reach unto the heavens." The recollection of such objects and emotions would exhain much that would otherwise he see.

lection of such objects and chrowns whenever explain much that would otherwise be perplexing in the history of architecture.

In continuing the subject of contrast of lines, he alluded to that afforded by lines placed at angles, and made some interesting remarks on the value of the pediment in design. He referred to the absence of this feature in Egyptian architecture, as supplied by the pyra-mid, and by pyramidal inclination in certain portions of the buildings, noticed the use of pediment amongst the Greeks, and thence passed to the use of sculpture in pediments, passed to the use of sculpture in pediments, and the general treatment of this branch of the art in Greece. It was the aim of the the art in Greece. It was the aim of the architects here, he said, constantly to carry out this same principle of contrast, as evidenced by the general tendency of the lines of the groups in the pediments, and of the figures of the metopes, contrasted with the lines which metopes, contrasted with the lines which enclosed them. The professor illustrated this part of his lecture by some clever sketches on the hoard, and amongst other remarks, he attributed the introduction of sculpture in the metopes, and the general ten-dency of the lines in the groups, to the desire dency of the lines in the groups, to the desire to get rid of the square form of these spaces. He remarked that lines at right angles were avoided by the engraver, and instanced the effect of masonry set in cubes, to shew the deformity which there was danger of, in an art in which construction naturally led to the effect produced by right angles, and which was avoided in the entablature of the Doric order, by the introduction of scubture: and order, by the introduction of sculpture; and he referred to what has been called "decorative masonry," carefully attended to by Palladio and others, as intended to obviate the defect

The professor then passed to the consi-

compared the beautiful form of the rainbow with the appearance of the arch in passing under a bridge, and noticed the constant use of circular forms amongst the ancients, as seen in the apse, so often found in the Roman baths, and in the basilica of Trajan-a building of a size so vast that it would have enclosed the whole section of Westminster Hall, but-tresses included. In the buildings of Paris, he remarked that there were several instances of the successful use of circular forms: in this of the successful use of circular forms; in this country, their beauty had been scarcely attended to as it might have been, but he instanced Inigo Jones's projected Persian court at Whitehall, and the plan of the tower of St. Vedast's Church, Foster-lane. In the square tower, and other portions of buildings, we had a constant use of angular forms, but it could hardly be doubted that at some time to come the tendency would be again in favour of the circular styles. Amongst the ancients, he circular styles. Amongst the ancients, he instanced the constant recognition of the beauty of these forms, as in the tholus of the Greeks, in the dome of the Pantheon, and in the form of the column, especially when in contrast with the pilaster. In mouldings—as in the torus and cavetto—nothing could be admitted as so essential, for all the beauty of mouldings as so essential, for all the beauty of monthings lay in the beauty of contrast; and it was the contrast of the curves and bollows with the straight lines, and the contrast of size in the different features, which made the beauty of the human profile. In the contrasted size of the ovolo and bead under it, we had the charm produced by proportion and quantity. When, as a youth, he first saw a certain combination, as a youth, he first saw a certain combination, which he delineated, of a plain fascia with a crowning and bed moulding, he was at once struck with the beauty which was produced, by consideration of quantities. If these combinations struck the young mind, they must be beautiful, for it came nearer to nature than the old mind, oppressed with business, or wrought with care.—He also instanced the use of large with small columns, and the defect in one part of the 13th century, where the mould-ings were all resembling each other. He then alluded to the other circular forms,—as the alluded to the other circular forms,—as the cyma, or line of beauty, and the scroll,—remarking upon the subject of ornaments, that these should always take the form of the moulding which they were intended to decorate.—In speaking of the value of the conic sections, he showed that the cone gave us the lesson of the pyramidal form, applied in the spire and pyramid. Gradation in form was transmitted in colour. Diminution in objects lesson of the pyramidal form, applied in the spire and pyramid. Gradation in form was as essential as in colour. Diminution in objects was a natural desire, and was made to take place from the eye, as in the spire of a church, and the leg of a table. It had been lately certified, that the axes of the columns in Grecian temples inclined towards the cella. Grecian temples inclined towards the cella. He also compared the treatment of the curves of mouldings by the Greeks and by the Romans, Yenus was held to have two natures, to one of which there was no corporeal resemblance. She was worshipped under the form of a cone, the type of beauty. Finally, the professor said, he did not broach any new doctrine, but he recommended the requirement of the company of the c recommended the recurrence to nature on all occasions, by which, in proportion to its attention to such system, each school had been successful, and he might say, in the words of

"First follow nature, and your judgment frame By her just standard, which is still the same: Unerring nature, still divinely hright, One clear, unchanged, and universal light, Life, force, and heauty, must to all impart, At once the source, and end, and test of art."

Those rules of old discover'd, not devised,

"Those rules of old discover'd, not devised, Are nature still, but nature methodized: Nature, like liberty, is but restrain!d By the same laws which first herself ordain'd. Hear how learn'd Greece her useful rules indites, When to repress, and when indulge our flights: High on Parnassus' top her sons she show'd, And pointed out those arduous paths they trod; Held from afar, aloft, the immortal prize, And urged the rest by equal steps to rise. Just precepts thus from great examples given, She drew from them what they derived from Heaven. The generous critic fann'd the poet's fire, And taught the world with reason to admire."

"When first young Maro, in his boundless mind A work to outlast immortal Rome design'd, Perhaps he seem'd above the critic's law,

And but from nature's fountains scorn'd to draw : And out from nature's fountains scorn a to are But when to examine every part he came, Nature and Homer were, he found, the same. Couvinced, amazed, he checks the bold design, And rules as strict his labour'd work confine, As if the Stagyrite o'erlook'd each line. Learn hence for ancient rules a just esteem,—To copy nature is to copy them."

GREENWICH HOSPITAL-IRON BEAMS. ROYAL INSTITUTE OF ARCHITECTS.

AT a meeting held on Monday, the 22nd ult., Mr. Bellamy in the chair, a number of dona-tions were announced, including Mr. Warring-ton's new volume on stained glass, from the author, a handsome present, and a number of the original drawings for Greenwich Hospital, with Hawksmoor's signature upon them.* The latter were presented by Mr. Francis Dollman, and were justly considered by the members a valuable addition to the fall. On the valuable addition to the folio. One of the drawings is very interesting, as shewing a plan for the completion of the centre.

Mr. Bailey, honorary secretary, said, that knowing these drawings were to be presented, he had looked at Evelyn's "Diary," amongst other books on the subject of Greenwich Hospital, where he found some memoranda, which seemed to him interesting. He then read the following extracts from that work:—
May 5, 1695. I came to Deptford from Wotten in order to attend the first section.

ton in order to attend the first meeting of the commissioners for endowing an hospital for sea-men at Greenwich. It was at the Guildhall, London. Present—The Archbishop of Canter-bury, Lord Keeper, Lord Privy Seal, Lord Godolphin, Duke of Shrewsbury, Duke of Leeds, Earls of Dorset and Monmouth, Com-missioner of the Admiralty and Navy, Sir Robert Clayton, Sir Christopher Wren, and several more

May 17. Second meeting, and a committee appointed to go to Greenwich to survey the

place, I being one of them.

May 21. We went to survey Greenwich
Sir Robert Clayton, Sir C. Wren, Mr. Travers,
the King's surveyor, Capt. Sanders, and

the King's surveyor, Capt. Gauders, and myself.

24. We made a report of the state of Greenwich House, and how the standing part might he made serviceable at present for 6,000l., and what ground would be requisite for the whole design. My Lord Keeper ordered me to prepare a book for subscriptions, and a preamble to it.

31. Met again. Mr. Vanbrugh was made secretary to the commission by my nomination of him to the Lords, which was all done that

day.

June 7. The commissioners met at Guildhall, when there were scruples and contests of the Lord Mayor, who would not meet, not being named as one of the quorum, so that a new commission was required, though the Lord Keeper and the rest thought it too nice a

punctilio. 14. Met at Guildhall, but could do nothing

for want of a quorum.

July 5. Met at Guildhall; account of subscriptions about 7,000l. or 8,000l.

June 30, 1696. I went with a select commissioners for Greenwich Hospital, and with Sir C. Wren, where with him I laid the first stone of the intended foundation, precisely at 5 o'clock in the evening, after we had dined together,—Mr. Flamstead, the King's astronomical professor, observing the punctual time hy instrument.

July 4. Note. That my Lord Godolphin was the first of the subscribers, who paid any money to this noble fabric.

The subscription list given by Evelyn amounts to 9,0461. 13s. 4d.

Amongst the subscribers are, the King, 2,0004; Archbishop of Canterhury, 5001.: Lord Godolphin, the first profession of the subscribers are considered the subscribers are considered for the subscribers are consin June 30, 1696. I went with a select com-

from the several noblemen and gentlemen."

It was announced that a folio work, in twenty-one volumes, illustrating buildings, paintings, masques, &c., had been purchased by the honorary secretary for the Institute, at the sale of the Stowe library. From the transient glance we had at one of the volumes, this seems to be a valuable acquisition. We shall make acquaintance with it,—for the advantage of our readers.

Mr. Olinthus Donaldson, in the absence his father, then read "A Description of the Malleable Iron Beam-bridge, constructed in 1839, over the Polloc and Goyan Railway, on the Carmunnock-road, near Glasgow, by Mr. Andrew Thomson, engineer."

The chairman, with reference to girders constructed of boiler plate, said a difficulty presented itself to his mind in the general use of rivets rendered necessary by the shortness of the lengths of iron, inasmuch as they were liable the regular of non-intrinsing her hards to be loosened, and when so loosened formed the germ of destruction. Information on the subject of iron girders was much to be desired, and would, he loped, be contributed by memhers .- Mr. Pocock wanted to know how such girders were to be repaired when they became dilapidated?

Mr. Fowler observed that it was worth mention that the official referees, in reporting on buildings wherein cast-iron girders were used, always thought it necessary to warn parties against their uncertainty—Mr. Jennings said that, on examining an iron aqueduct which had failed, he found the defect was in the masonry and brickwork rather than in the ironwork, and that this had probably been caused by the contraction and expansion of the metal

Mr. Papworth said it was a curious fact that in Southwark-bridge, which was one of our most important iron hridges, no preparation had been made at first to admit of the expansion and contraction of the ironwork, and that it became necessary, in consequence, to cut through the granite at the abutments afterwards, at a greatly increased cost. He understood that the iron of this bridge flaked off in pieces of considerable size.

Mr. Godwin thought it scarcely necessary to mention that, for large spans, cast-iron girders were out of the question; and that even as regarded small spans, the fact that firemen were more fearful in entering a building when on fire, where the walls were carried on castiron, than they were in a building where the girders were of wood, showed that considera-tion was necessary in their use. He described Mr. Porter's corrugated iron beams (men-Mr. Porters corrugated from beams thought them thought our last number), thought them deserving of investigation by those who needed iron beams, and re-urged the suggestion made by Mr. Thomas Cuhitt, in the report on the mill at Oldham, that Government should offer premiums for machinery for producing large wrought iron girders.

Mr. Barry, jun., described an invention recently patented, and on which he had seen experiments, wherein the whole floor formed single beam, so to speak; there was boiler plate, top and bottom, connected by a web of the same material, if we understood rightly, and filled in solid with concrete. The concrete, though its weight was objectionable, had the advantage of making the floor fire-proof.*

Mr. G. Jennings, by permission of the meeting, afterwards explained the construction of his new water-closet.

NEW COAL FIELD .- We are informed it is intended to open coal fields in the neighbourhood of Bristol.

* The recent destructive fires should aid in leading to the adoption of fire-proof constructions. 26,000d is spoken of as the amount of the loss by the fire in New-quare Lincoln's-inn, and numerous deeds, court rolls, &c., were burnt which cannot be replaced. The fire at Irongate wharf destroyed a large amount of property. The buildings burnt down were 90 feet by 60 feet, and contained machinery of great cost.

DINNER OF THE INSTITUTION OF BUILDERS' FOREMEN.

THE anniversary dinner of this institution took place on Wednesday, 31st ult., at the Bay-Tree Tavern, St. Swithin's-lane, City. Mr. G. Godwin, architect, presided, and Mr. Crosse, in the absence of Mr. Thomas Allom, through illness, was in the vice chair. The attendance was very numerous, and included several of the master builders of the metropolis. Letters were read from Professor Cockerell, expressive of his interest in the Cockerell, expressive of his interest in the institution; Mr. Moseley, architect (with donation of one guinea), Mr. Biers, Mr. Allom, with donation; and other donations were announced from Mr. Bunning, architect, Mr. Piper, Messrs, Locke and Nesham, Mr. T. Patrick, and others. The Patent Dessicating Company sent the very handsome sum of 51. towards the provident fund.

We are anxious to aid what seems to us a very useful institution, and in giving the gist of the chairman's remarks, when proposing the principal toast of the evening, it may be taken as the expression of our own opinions. He congratulated the meeting on the receipt of the letters already mentioned, as indicating that the objects of the Institution were becoming better understood, and that the feeling of distrust was gradually disappearing. The objects of the Institution were two-fold, bene-volent and social,—to provide against illness and misfortune (to purchase or erect an asylum hereafter), and to obtain for foremen and clerks of the works, whose position is necessarily somewhat isolated, the advantage of intercourse with men of their own occupation, and the opportunity of discussing points of construction and gaining information. The Directors repudiated any interference hetween master and man, any attempt to coerce wages: they desired but to aid themselves, and hurt no one else. An anecdote occurred to him which might not be considered irrelevant. said that when the Emperor Augustus was passing through the baths at Rome on one occasion, he saw a veteran who had fought with him rubbing himself, after bathing, against one of the columns. The emperor inquired why he had not a boy to do this? and being told that he was too poor, ordered him the means of paying one. On his next visit he means of paying one. On his near vistone saw at every column an old man rubbing himself; and on making the same inquiry he received the same reply. His rejoinder, however, was not what they expected; for he said,—Well, gentlemen, as there are so many of you, a hould advice you to rub one guidher. was not what they expected; for he said,—Well, gentlemen, as there are so many of you, I should advise you to rub one another. Augustus here taught them sound wisdom; he taught them not to depend on the caprice of a patron, but to help one another. And this, the speaker continued, was what the members of the association were trying to do; and when compelled by illness or distress to receive aid, they might regard it as simply a return for money invested by themselves when the sun shone. The working men of England, by their conduct in the late crisis, when the working men of other countries had been levelling others instead of trying to raise themselves, had entitled themselves to the respect of the upper classes; the men had wisely seen that the interests of the employer and the employed were the same, and that injuring their masters was not the way to benefit themselves. That the good feeling which now prevailed might increase; that knowledge might spread; and that the contributions of the conduction of might increase; that knowledge might spread; and that every man might find employment, was his earnest wish. He thought the masters would do well to aid this institution more than they had done; and then the general public, when they saw this, would give their aid too. In the name of the committee he asked the public for this assistance; and he invited those present to driuk with hearty expression of good will,-

"Success to the Provident Institution of Builders' Foremen."

Builders' Foremen."

Mr. Allow said,—"That while all connected with the business of building must acknowledge the extreme value of the utmost importance to the futing takes place, it will be of the utmost importance to the futing takes place, it will be of the utmost importance to the futing takes place, it will be of the utmost importance to the futing takes place, to excrete a moral influence over all its members; and that make the builders, instead of dreading combination against their interests, may feel that in each member of the institution, they may depend on a trustworthy, efficient, and honourable assistant. That, from the inflients connection existing between each individual foreman, and the hest interests of the builder, the architect, and the employer, such qualities can bould be only more fully known to ensure its unequivocal and complete success."

ALTAR TOMB IN EXETER CATHEDRAL

(EARLY ENGLISH.)

FIC I

FIC. 2

0 | 2 3 FEET

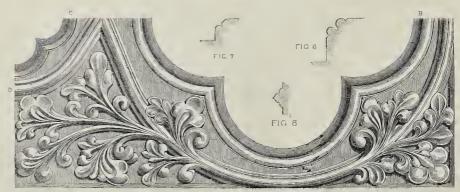

FIG. 5

ALTAR TOMB IN EXETER CATHEDRAL.

This very beautiful specimen of early English work (supposed to be the tomb of Bishop Marischall, who died in 1206), is placed under one of the arcbes separating the north aisle and choir: it appears to be of more ancient date than that part of the cathedral in which it stands, said to have been begun by Bishop Quivil, between 1281 and 1291.

The tomb, constructed of Purbeck marble, The tomb, constructed of Purbeck marble, is much decayed; it is surmounted by a quaint and stiffly-carved effigy of the bishop, in a kind of trefoil headed niche; one hand holds a crozier, the other is raised in the act of blessing. The figure is very flat, as usual on monuments of the period.

Fig. 1 of the accompanying illustrations represents the north side of the tomb, and Fig. 2 the south side. Fig. 3 is a spandril ornament, between two quatre-foils, each containing sculpture in the west end, and Fig. 4 a section at A A.

The present east end is a plain slab, but is probably not the original: Fig. 5. a compartment of foliage from the north side: Fig. 6. section at B, Fig. 7. section at C, Fig. 8. section at D.

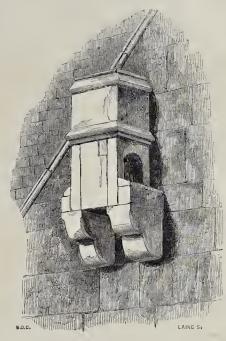

The details are drawn one-fourth the actual size.

DRAINAGE OF GUILDFORD. ENGINEERING COMPETITIONS

As the drainage of towns is becoming an important subject, perhaps an account of what is doing here may be interesting as well as instructive. The borough of Guildford comprises St. Mary's, Holy Trinity, parts of Stoke, Shalford, and St. Nicholas' parishes, that is the new borough,—the old borough, previously to its enlargement, consisted of the whole of St. Mary's, part of the Holy Trinity, and part of St. Nicholas' parishes. In 1812 an Act was obtained for paving, cleansing, improving, &c., which is now in existence, and its provisions are carried out by a board of paving commissioners, having power to raise of paving commissioners, having power to raise certain sums for that purpose not exceeding in the whole 5,300l. Recently a committee of the commissioners has been appointed to inspect and obtain the removal of nuisances; and with a view to keep out of the and with a view to keep out of the operations of the Health of Towns' Bill, the committee advertised in The Builder and committee advertised in The Builder and in the Times, about the middle of December last, "That engineers be requested to furnish the best plan for draining the town of Guildford," as to surface drainage, and that also "engineers be requested to specify the best mode of disposing of the refuse contents of the sewage, whether into tanks," &c., &c.; for an effectual system of drainage for the town, and that "plans, specifications, and estimates be prepared by them in accordance," &c., &c.; the successful engineer to carry out the works, and obtain tenders within his own estimate, with the usual allowance of 5 per cent., and the committee not binding themselves to accept any one of the plans. Such an advertisement was calculated to bring forward men of any one of the plans. Such an advertise-ment was calculated to bring forward men of ment was calculated to bring forward men of ability and standing in the profession to compete; and on the 15th of January (the day appointed), nineteen plans, specifications, and estimates were sent in; but the committee had not the candour to allude at all to their limited Act of Parliament; they did not say to these gentlemen, that although we put forth that advertisement. We have no payer beyond the advertisement, we have no power beyond the old borough; neither did they say (which is the most important part) that they only had power to raise 5,300l., and that they were already in debt more than half that sum. Nineteen respectable engineers came forward, relying on the honour of the committee, and that they really meant what they said, that the competition would be fair, plans having to be sent in with a number or motto; and after great trouble, expense, and loss of time, have the mortification to find the committee have not the means to pay or power to raise a sum much over 2,0001, they having required engineers to furnish estimates, &c., for works amounting at least to from 6,001. to 15,0001. Surely these nineteen gentlemen have been ill-used, and might claim remuneration for what they have suffered in pocket and in time.

Y. Z. respectable engineers came forward, relying on

CHIMNEY-ASLACKBY CHURCH, LINCOLNSHIRE.

A CHURCH CHIMNEY.

In a late number there is a letter from Mr. Orford, about ecclesiastical chimneys: I inclose a sketch of one from Aslackby Church, Lincolnshire, which you may think interesting enough to publish. It is on the north side of

Birmingham.

ON THE NATURE AND PROPERTIES OF THE METALS USED IN THE BUILDING TRADES.

BRASS AND OTHER ALLOYS OF ZINC, &c.

Almost all the metals combine with zinc, and some of its alloys are of great importance, The most ancient and universal of them all, however, is brass, which, strange to say, was made and known for centuries by those who knew not that zinc, one of its two sole constituents, had even an existence,-that is, as a metal; although, as already remarked, the Chinese and Hindoos were an enlightened

Brass has been most usually and easily made from copper and calamine, the latter an ore of zinc in which the metal is corroded and invisible, hence the ancient popular ignorance just noted. Strata or layers alternately of just noted. Strata or layers alternately of plate copper and of a mixture of calamine and charcoal,—the latter to absorb the corroding oxygen of the former; or a mixture of granulated copper and the same ingredients, exposed till red heated, enables the metallic zinc to volatilise, or rise in vapour, and penetrate, or unite with, the copper, so as at once to form, according to the relative proportions of the materials, either some one of the varieties of brass, or other of its kindred alloys, such as pinchbeck, prince's metal, tombac. Or these varieties may readily be formed, or brass modified, by afterwards uniting the alloy, once got, with additional proportions either of copper or zinc. The metallic zinc, however, may also be at once united with copper by fusion, but the operation is critical. but the operation is critical.

The authorities whom we have consulted differ greatly as to the actual or best propor-tions of zinc and copper for making brass. English brass, according to Parkes, consists of one particle or atom of zinc and one of copper; Dutch brass of one-zinc, two-copper. In the "Encyclopædia Britannica," however (supplement to latest edition) two of zinc to one of plement to latest edition) two of zinc to one of copper are stated as the best proportions. The heavier brass is, the more copper it contains, the lighter, the more zinc, as might be expected, zinc being the lighter metal. The specific gravity of brass, however, is greater than that of its separate metals. In Knight's "Cyclopædia" the process of formation, and the proportions of calamine, &c., are stated as follows—The copper is poured into water, and converted into shot copper, the metal being thus granulated into pieces from the size of small shot to that of a bean. Of this 45lb., to 60 lbs. of powdered calamine, and an equal small shot to that of a bean. Of this 451h, to 60 lbs. of powdered calamine, and an equal quantity of charcoal, are put into earthen crucibles, and fire applied for seven or eight hours. By pouring the molten metal into shallow grante moulds, it is made to form plates of brass, which are afterwards rolled into thin sheets called latten. For bars, cast-iron moulds are also used moulds are also used.

Brass is more fusible than copper, and hence more easily cast. It is also much less liable to more easily cast. It is also much less liable to tarnish as well as considerably malleable and ductile, and may therefore be beat out into very thin leaves, and drawn into fine wire. The thin leaves called Dutch gold, or Dutch metal, are just brass beaten out into an imitation of gold-leaf. The 'yellow metal, patented by Mr. Muntz, of Birmingham, and made into sheets thick enough for sheathing ships, in place of copper, is a composition of zinc (chiefly Belgian, we believe) and copper. Zinc itself, by the way, is now extensively used on the continent, and is even being introduced into this country, for a similar purpose. into this country, for a similar purpose.

Iron and zinc were, till lately, regarded as metals not easily united, on account of the volatility of the latter and the infusibility of the former. Dr. Graham, however, gave a different opinion: and, at all events, when plates of hot iron were dipped into a bath of melted_zinc, it was found that an appearance of tin plate was acquired, and the iron thus prevented from rusting. This is the process

wherehy "galvanized iron" is said to be prepared. And it is a curious fact, that when zinc is even merely kept in contact with iron, it will protect the iron from rust, and thus iron nails may be used with zinc sheeting, though nails of zinc itself are hest of all, inasmuch as all galvanic action is thus prevented, whereas even with iron, though the iron, as the less electro-positive or more electro-nega-tive metal, will be protected by an exaltation of the negative, it must, or at least would be, at some small expense of zinc, from an equivalent increase of its tendency to oxidize, were it not that the first slight scurf of grey oxide on its surface forms a firm, resistive, and complete coat of mail, protecting itself from all further injury by oxidation from ordinary causes. in fact, is thus a most singular and anomalous mass of contradictory properties. Chemically speaking, it so greedily devours oxygen, that it will strip even iron of it, yet we see how completely it can protect its own substance from this very tendency to oxidize, and this, too, from its very strength of affinity for oxygen. Chemically speaking it is so com-bustible, that it may be made to burn and blaze; and yet from its practical power to cover itself with a firm though thin shell or crust of stony or glassy oxide, and from the much stronger heat required to melt it, we have no doubt that it will constitute (though nave in dolln't that it will constitute (though not a fire-proof material like iron or stone), a safer covering for roofs than lead at least; for though, where the ordinary inflammables have already originated a conflagration, it will much rather promote than retard the blaze, yet certainly it will protect the woodwork of roofs from sparks, and burning embers, &c., contributed by adjoining conflagrations, both hy its surfacial incrustation, and by its solidity in circumstances where lead would melt and disappear, exposing the timber beneath to the burning embers.

Bronze is another of those alloys into the composition of which zinc essentially enters. Bronze is a composition of copper, zinc, and tin, and, like brass, is of ancient origin. Bronze vessels have been found at Nineveh and also at Herculaneum. With tin alone, too, zinc forms a useful alloy. In China and India various utensils and ornaments are made of zinc, inlaud with other metals. The 'white copper' of the Chinese is a composition of zinc, copper, and nickel, the zinc 7-16ths of the whole, and the remaining 9-16ths, of copper and nickel to each other as 5 to 13. The amalgam of zinc, or its alloy with mercury, is made by trituration in a mortar. This is the metaline substance which is spread over the rubber of the electrical

apparatus for creating electricity by friction. The use of zinc, also, in the galvanic circuit in connection with copper, has been already noted; but we may here remark that cast-iron, which contains the electro-negative carbon, was some time ago discovered to constitute what was regarded as an important substitute for the negative or copper-plate in the galvanic circuit. With other artificial associations of zinc with metals we have still less to do than even with some of the preceding; but we may remark, in conclusion, that while 1-20th part of platinum destroys the malleability of zinc, the mere presence of molten zinc in a crucible, side by side with molten gold, will render the gold quite brittle.

The metals with which zinc is naturally associated, and which also tend, as well as sulphur, to injure or destroy its malleability, are iron, lead, and arsenic. Probably the curious and anomalous fact, that impure, commercial, brittle, zinc, if heated to a certain temperature, will become malleable, and afterwards remain so even while cool, is attributable to arsenic or sulphur, which the heat may separate, these being both more volatile than zinc. A writer, however, remarks, that "a small per centage of iron is what renders most of the spelter, particularly English, unfit to roll."

NOTES IN THE PROVINCES.

THE curious and interesting process, but seldom resorted to, of drawing sloping walls back to the perpendicular by means of iron rods heated and thus lengthened, and then screwed up to the outer side of the wall, cooled again, and thus shortened, pulling the declining wall back to the perpendicular, has just been carried out on the walls of t been carried out on the walls of Church, which were more than a foot out of the perpendicular. They were also underpinned with what was regarded as a firm foundation. Other restorations and improve-ments have here been effected, both externally and internally, including a new open timber chancel roof of high pitch, with grey tiles, and new gables, above, and a solid body of concrete thrown in around the building below. Carved thrown in around the building below. Carved stalls, encaustic tiles, painted window glass, and other ornamental work have also been partially made use of in the restorations, which do not yet include the nave and other parts of this edifice.—Attempts to procure the greating of a corner. to procure the erection of a corn ex-change at Bedford have been renewed, 2,000*l*. being to be raised in 10*l*. shares for the purpose.—Roxton Church has been repaired at an expense of about 1,2001.—The Southampton Water Works Company have received the tenders called for for laying 1,050 yards lineal of cast-iron water-pipes. They were from Mr. Butler, 461. 5s., and 9½d. per yard; Mr. Eyre, 751. 10s., and 1s. per yard; Mr. Emmett, 491. 15s. 6d., and 9d. per yard; Messrs. Gale and Coombs, 477. 10s., and 10d. per yard; Mr. Weston, 391. 14s., and 8d. per yard. The tender of Mr. T. Weston, of East-street, was of course accented—It has heav resolved to purpose.—Roxton Church has been repaired at an expense of about 1,2001.—The Southof course accepted.—It has been resolved to erect a church at the village of Hucclecote, near Gloncester, from designs by Mr. John near Gloucester, from designs by Mr. John Jacques, architect.—Mr. Strong, builder, of Stow-on-the-Wold, has undertaken to refit the parish church at Hooknorton, Oxon, for 5851. Twelve firms, says the Gloucester Chronicle, competed; the highest offer was 8951.; the lowest 4991. 108.—The parish church at Runcorn, re-creeted at a cost of 10 0001 was consecrated on Thursday week. 10,000l., was consecrated on Thursday week before last.—An obituary stained glass window has been put up in the south aisle of the choir of Chester Cathedral, at a cost of 1001, by the dean of Chester.—Besides the district churches already built and projected at Sheffield, subscriptions have been opened for one at Moorfields. The Pitsmoor one is to be begun easy in the action. bor one at Moornedas. The ritsmoor one is to be begun early in the spring. Two church sites, one in Fenton-street and another in Coal-pit-lane, have been applied for to the town trustees. A sum has been offered towards the erection of a tower to the new church in Eldon-street. -The following is a return, by Mr. Rush-

— The following is a return, by Mr. Rushton, the building-surveyor, of houses and warehouses erected, or in course of erection, within the borough of Liverpool, from 1st January to 31st December, 1348: "-74, under 12l. per annum; 506, from 12l. to 25l.; 48,

from 25l. to 35l.; 28, from 35l. and upwards; total, 656 houses, together with 6 warehouses, The houses erected since 1838 are as follows:
—in 1835, 1,052; 1839, 997; 1840, 1,576; 1841, 1,761; 1842, 2,027; 1843, 1,390; 1,844, 2,450; 1845, 3,728; 1846, 3,460; 1847, 1,220; 1848, 656; total, 20,317.—The first stone of a bridge across the Don, at Sprotbro', near Doncaster, was laid by Lady Charlotte Copley, on Monday week. It will consist of seven arches, one of 100 feet span. Messrs. Waring, of Swinton, are the contractors.—The melodious voice of the great Peter Bell—not of Wordsworthian memory, but of York Cathedral tower—whose tongue has long bolled uselessly out of his capacious mouth, is now about to be made to tell the hours for behoof of all within hearing, by help of a weighty hammer, with clock-work power sufficient to strike him on the mouth with. The tenor in the other tower, in former use, is cracked.—On the Lancashire coast great damage has been done to property, particularly sea walls in Morecambe bay, by late strong gales and inundations of the sea. Even through the rise of the tide in the river Lune, the river overflowed, and inundated many houses and cellars, the promenade, and part of the North-Western Railway.—A water company in Sunderland supplies 400 poor families, gratis, with service pipes and water-taps in their houses, and with an unlimited supply of water at the rate of one penny per week. A model water company, indeed!—The workmen employed by the Derwent Iron Company, says the Gateshead Observer, have subscribed 50l. towards the erection of the new district church at Shotley-bridge.—Since the opening of the Newcastle Baths and Washhouses, in September, warm baths have been attended by 1,341 persons.—A new hospital for children is about to be erected at Edinburgh, with money bequeathed by a Mr. Daniel Stewart, and now amounting to 90,000l. How many more?

RAILWAY JOTTINGS.

A CORRESPONDENT, "A. S. S., Railway Inspector, Knaresborough," suggests that, for the protection of the boxes for facing points, from dust, rain, snow, &c., a cover with a short slip for the handle, over the long one in which it works, should be locked upon it, unless when worked, in which case it might be so adjusted as to be readily pushed hack, to allow the free working of the handle till again drawn over the open slip, and locked as before.

—Under Lord Campbell's Act regarding compensation in railway accidents an important case has just been settled by jury at Dundee, in which a Mrs. Cargill laid damages Dundee, in which a Mrs. Cargill laid damages at 5,000*l*. for the loss of her husband, a farmer. The Company (the Dundee and Perth) compromised the case by settling 75*l*. a year on the widow for life.—"A case," says the Cambridge Chronicle, "was lately decided in one of the courts by which it is now ruled that husbands who lose their wives by railway accidente, can only claim in compression. accidents can only claim, in compensation, the amount of any income which may have been cut short by their death. Thus, 'virtuous women, who were only crowns to their hus-bands,' will be valued, according to the tombstone cutter's rule, at five shillings. It has been suggested that at railway stations, beside the 'ladies' refreshment room,' there should be a 'ladies' valuation room,' with a proper officer in attendance. As the ladies pass, of the following tenor, it is supposed, would pass also. 'What sort of a wife are you, ma'am?'
- 'Sir?' 'Of what value are you to your husband?' -- 'Your question impertinent, Sir. I believe, althous impertinent, Sir. I believe, although I did not bring my husband a shilling, he would be filled with deep sorrow were he to lose me.' 'O, we have nothing to do with that, ma'am sorrow does not enter into railway calculations. You may pass.' Another enters — 'Pray, ma'am, how does your husband estimate you?' ma'am, now does your husband estimate you?

'You are as great a brute as my bushand, I
believe, and that is saying a great deal. I
bring him ten thousand a year, which goes
back to my relations if I die, as we have no
children, and yet the wretch uses me worse
than —.' 'Station-master! quick, quick!
Get a special train instantly for this lady, and

in a mortar. This is the metaline substance which is spread over the rubber of the electrical "A case of this very kind has occurred since these remarks were in type. We quote from the San newspaper remarks were in type. We quote from the San newspaper remarks were in type. We quote from the San newspaper remarks were in type. We quote from the San newspaper remarks were in the san the s

let a pilot engine go before, and a guardian angel behind!""—The South-Eastern trains now run right into the harbour terminus at Folkestone, to the steam-boat station, greatly to the discontent of some, though to the equal convenience of others. A great swing bridge has been thrown across the quay bridge has been thrown across the quay constructed for this purpose. The Company are about to enlarge their station accommodation there, with a view of making Folkestone their great water terminus. — The great North-Western is about to be converted into a buge circulating library, provided with all sorts of mental provender, 'to be consumed on the premises,' in transitu or rather in circuitu. Mr. Huish, the manager, it is said, is entitled to the merit of the suggestion and at entitled to the merit of the suggestion, and at same time, in order to effect a circulation not only of books but of cash, the whole of the stations on the line are to be 'undertaken' —for a very considerable consideration doubt--for a very considerable consideration doubt-less—by one party, namely, Messrs. Smith and Son, of the Strand. The passenger will have no more to do than merely to select his book at a station-stall, paying the price of it in the meantime—and, after travelling any time or distance on the line, will receive back his cash, less a trifle for perusal, on returning his book at either the same or any other stall. The idea is really a good one, and useful to the public; and when it is considered that six millions of passengers travel annually over the 500 miles of the North-Western, assuredly it ought to be a profitable one, both to the Company and their librarians.—The dividend of the North-Western, to be declared at next meeting, says Herepath, will be, we hear, at the rate of 7 per cent., leaving a surplus of 80,000l. The dividend of the Lancashire and Yorkshire will be 6 per cent.; that of Berwick 7 per cent., with a surplus of nearly 100,000l.; The York and North Midland 7; the Eastern Counties is variously reported, from 5s. upwards.—Mr. Andrews, Q.C., has awarded 148l. to one farmer and 145l. to another, for damage done to buildings and corn-stacks adjoining the Eastern Counties at Needingworth, fired by burning coke from the funnel of the engine of the mail train.—The rail-way-station at the village of Hatfield Peveril, on the Eastern Counties line, about three miles from Witham, has been destroyed by fire. Being small, and built of wood, it was fire. Heing small, and built of wood, it was speedily reduced to ashes, together, it is said, with books, tickets, and everything belonging to it, the brick chimney only being left standing. How the fire originated remains a mystery. But the Ipswich Express suggests mystery. But the Ipswich Express suggests that a cinder from the mail-train may have been the cause, though not likely, from the fact that it passes on the line farthest from the station. It is rather remarkable, adds the same authority, that the company had desired to the company had desired to the company had desired to the company had the same authority. to take down this station altogether, and that considerable hostility had very naturally been shown hy the inhabitants of Hatfield at the risk of being subjected to such inconvenience.

On the Liverpool and Bury line recent heavy rains are to blame for considerable damage to works. In many places the embankments have been injured by large portions of earth being washed from the slopes; but more serious mischief has resulted from the same cause, particu-larly at Wigan, in the partial destruction of an arch over the river Douglas. It is supposed that arch over the Fiver Douglas. It is supposed that the headlong current of the Douglas under-mined the foundations, and produced this disaster. A breakwater has now been formed in the middle of the river, to destroy the force in the middle of the five, with which, during heavy rain, it rushes through the arch. Some other bridges have through the arch. Some other bridges have been slightly impaired, and are being strengthened and renewed. A similar arch to the one over the Douglas has since given way at Weethoughton, according to the Wigan Herald. The affairs of the Waterford and Kilkenny The affairs of the Waterford and Kilkenny Company are now in a condition verging on bankruptey, with receipts for the last eighteen weeks of only 700L, whilst the expenditure amounts to 1,700L. This company has raised and expended 250,000L, and also a loan of 80,000L obtained from Government.—The first section of the Denerara Railway has just been opened, and the planters are availing themselves largely of the facilities it affords for the transmission of sugar, &c., from their states.—An electric telegraph is about to he erected between Berlin, Cologne, and Frankfort-on-the-Maine. ort-on-the-Maine.

FALL OF RAILWAY ARCHES AT MANCHESTER.

On Saturday week one of the brick arches of the North-Western's "Manchester, South Junction, and Altrincham" line of railway, adjoining Gloucester-street, Oxford-road, Manchester, gave way, and on the ensuing Thursday was followed by two more. The first fell while the centering was in course of removal, but the two latter had not had their centering at all loosened. By the fall of the first, three bricklayer's labourers were killed, and an inquest was therefore held on the bodies, at which it appeared in evidence that the arches which fell were to adjoin a central iron arch in widening the station works over Gloucester-street, and from a turn in the line at that point they were built somewhat askew. The dimensions of the first that fell were 40 feet span in the widest part, with a spring of 8 feet, the thickness of the brickwork being 2 ft. 9 in. It had been built about a month, and was supported by a centering of 12 ribs. Four of these had been removed, when a portion of the arch about 18 feet long at one end, and 7 feet at the other, anddealy experience. suddenly gave way.

Mr. George Shoreland, the corporation surveyor, gave it as his opinion that the arch had buckled up just above the spandrils on one side. He had no doubt the centres of the arch were correct before the brickwork was laid. The work had been The work had been grouted in the usual way with thin mortar, which would render the work more substantial. The fall,

would render the work more substantial. The fall, be conceived, was entirely accidental.

Mr. G. C. Pauling, civil engineer and railway contractor, said: From a very careful examination of the work and materials, I think they are as good as could be put together. In my opinion, the mortar was composed of one-and-a-half part sand to one part of lime in the arch, and of two-and-a-half parts and to said to a said to half parts sand to one of lime in the spandril, but it is difficult to speak with accuracy after the action of the air upon the mortar for a month or six weeks. I believe the cause of the month or its weeks. I believe the cause of the falling of the arch was the recent wet weather. On taking out the outside ribs they would throw a greater weight on the narrow side of the arch, from the backing of the wide end being much heavier. This caused the end to buckle and fall in a mass in Gloucester-street. My opinion is strengthened by the fact that a fracture has taken place in a parallel line with the ribs of the centre.

line with the ribs of the centre.

Mr. William Edwards, joiner, builder, and contractor, said that, taking into consideration the recent wet weather, three weeks were long enough for the centres to be under the arch. I have examined the mortar, which seems to be good, and sufficient for the purpose. I consider it is fully as good as is usually made, and that more care has been taken of it than usual, after having gone through a certain process. Each brick would absorb about a pound of water, and the weight of the moisture, no doubt, pressed the hricks down, and caused the arch to give way.

The jury returned the following verdict:—

The jury returned the following verdict:—
"That the men were accidentally killed when removing the centres from underneath an arch by the falling in of a portion of the arch, ren-dered insecure by the recent wet weather."

The contractors for this portion of the works Messrs. David Bellhouse and Son, who are said to have hitherto escaped all fatal or considerable accident in the progress of their

PATENT RIGHTS-CHIMNEY FLUES.

FOR the encouragement of arts, and the security of inventors of original discovery, or the application to useful purposes of what may not be even novel in itself, those privileges granted by the Crown are supposed to afford ample protection to the patentee; on looking, however, a little below the surface, we may easily discover the fact that the originator of an useful theory in science or invention in art is frequently thrown out of his justly art is frequency thrown out of his justify acquired merits, and debarred from its reward by others, who either boldly pirate or adapt his conceptions to a slightly modified arrangement.

About eight years back, the writer of this article took out a patent for building in the solid walls circular flues of iron-stone-ware, or terra-cotta; he applied them in structures, and tound them to answer the purposes of a perfect draught for the smoke and the obviation of concreted soot in chimneys: the material being hard, solid, and extremely durable, resisting the action of both fire and water, he also applied the same tubes for sewers

heat acquired and generated in the

chimney accelerated the draught, whilst the smooth surface gave a free flow to the sullage, and the circular form admitted of no deposit

Having incurred the expense of 120l. for the patent, &c., and 500l. more for a quantity of parent, etc., and 300t. more for a quantity of the material, which he had conveyed from Burslem, in Staffordshire, to a wharf at Belgrave Basin, London, he then published a pamphlet, and dispersed it widely amongst the architects and builders of the kingdom; from whom some orders and large acknowledgments and admissions of willing new received.

whom some orders and large acknowledgments and admissions of utility were received.

It should be here mentioned that a circular tube of 7 inches in diameter, for conveying the ashes from every stage of a building to a pit in the basement, formed part of the patented application (for a tube can hardly be called an invention). Well, for three years, the wharf was kept open for the sale of the materials, at only 10 per cent. profit on the cost price; a clerk was paid for that period, and yet not more than half of the supply on hand (only 500), worth) was consumed or hand (only 500% worth) was consumed or bought.

It may be supposed that the patented invention was not brought into use—but such was not the fact—for in her Majesty's Palace (Buckingham) they were applied, as they were also in all Mr. Cubitt's, Mr. Seth Smith's, and other wholesale builders' cities of mansions; and they are now applied, or being used, in all the clubs, mansions, Houses of Parliament, or palaces that we see springing up, and assuming the most ornate exteriors that art and expense can accomplish.

Complainant saw all this, and did complain; but he was told to seek an injunction in chancery. It may be supposed that the patented inven-

chancery.

After expending 1,000l. on the adventure, he was in no humour to embroil himself further; having been already seven years in that court, and sunk in its morasses 10,000*l*. and upwards in costs only.

At length, however, he submitted to the Commissioners of Sewers samples of his ware, as admirably adapted to sewage: his views were adopted, and suggestions approved—and the honourable Commissioners gave him 1001.

were adopted, and suggestions appear in 100%, for the residue of the flues (9 inches in diameter), which had cost him twice that sum. The office of Sewers has since adopted the plan, finding it eminently effective, but have discovered some other market for the commodity—having never given, nor offered, a contract to their slighted illuminator.

As the natural parton of arts, artists, science, and practical utility, The Builder is appealed to for publicity to these wrongs, if not for aid in their redress. "Sic vos non vobis" was the plaint of the poet long before copyrights or patents were thought of; edificates apes (which you may pronounce as you like) might be added by your correspondent,

CHONDAM.

I would send you a specimen of my patent flues, but they are now patent in every street in London where sewers are being repaired, and in every large house in progress of construction.

METROPOLITAN COMMISSION OF SEWERS.

A special court was held on the 23rd ult., at the house, Greek-street; the llon. Frederick Byng in the chair.

The late Cases of Cholera at Tooting .- In pur-The late Cases of Cholera at Tooling.—In pursance of a resolution passed at the last court, the committee, consisting of Capt. Veitch, R.E., Capt. Dawson, R.E., Mr. Johnson, Mr. Hutton, and Mr. Hawes, inspected the whole of the drainage of Tooting, on Friday last, and this day presented their report to the court. The conclusion arrived at by the committee was, that it would be inexpedient to remove the penstocks altogether, as exposing the sullage and fertile matterto atmospheric exhabition would large and fertile matterto atmospheric exhabition would

remove the penstocks altogether, as exposing the sullage and feetid matter to atmospheric exhalation would increase rather than diminish the evil. The committee recommended some temporary measures of relief till the adoption of some general and uniform system of drainage. The report being received, Mr. C. Johnson said that, as one of the committee, he wished to state in open court, that the committee were struck with the carelessness—if not the recklessness—of any public body, in the choice of such a place as they saw for the alms-houses of St. Clement Danes, which appeared to have been purchased at an expense of 4000, per acre, with an offensive open ditch close by the property. This work, commenced in error, was defended on the ground that the parish of St. George, Southwark, were in treaty for the adjoining field for a similar

purpose. He deprecated this carelessness—he would not call it by a stronger name—in this total disregard of public health, and he had felt it his duty to bring the matter before the court, as a caution to other bodies in their choice of sites for

too to other bodies in their choice of sites for building.

Dr. Southwood Smith, in an able speech, called the attention of the court to a particular case, as an exemplar of a class of cases which appeared to him to require the immediate and earnest attention of the commission. The General Board of Health have directed one of their medical superintending inspectors, Mr. Grainger, together with Dr. Arthur Farre, to examine the present condition of the workhouses of the metropolis, and more especially the state of the various establishments for pauper children, such as that at Tooting. The very first report made by these gentlemen on the establishments for pauper children in connection with the parish of Lamheth, showing, amongst other points, the existence of an open ditch in the neighbourhood, formed by the drains of the establishment: that immediately after open ditch in the neighbourhood, formed by the drains of the establishment: that immediately after a severe storm, in August, 1846, when the drains were overflowed, 120 of the children were seized with opthalma in the course of three days, and that since improvements were made in the privies, opthalma, previously a prominent and prevailing disease among the children, had nearly disappeared. The time may be short (said Dr. Smith) that is left us to labour at the work of prevention, and one of the most obvious means of prevention, and one of the most obvious means of prevention is the immediate removal from the close neighbourhood of dwelling houses of such muisances as that in question. I therefore move, "that the surveyor inspect the epen ditch near the "that the surveyor inspect the open ditch near the Norwood House of Industry, and report to the Committee of Works thereon." I earnestly hope Norwood House of Industry, and report to the Committee of Works thereon." I earnestly hope the continued) that we may be spared any further visitation of cholers; but we cannot conceal from ourselves that it is hovering over us, and that it

may swoop down upon us at any instant.

Mr. Broderip seconded the motion, and it was ultimately carried.

Resolutions were passed that two additional assistant surveyors he appointed at salaries of 250t.

per annum; and that all future appointments be
for one year only, at the expiration of which time
they are to be re-considered.

The Drainage of the New Palace at Westminster.
—The clerk read a document from Mr. Barry, on the subject of the drainage of the new Houses of Parliament, the pith of which has already appeared in our pages.

Mr. Bullar said this question reminded him of a Mr. Bullar said this question reminded him of a controversy that took place in France, commencing in pamphlets, and ending in volumes, and he wished to know where this controversy was to end.—Mr. Broderip said, where two gentlemen were at issue so much, a lawyer would say let a jury come at once.—The Rev. W. Stone said it was most important the principles contained in the two systems should be properly ascertained.

ne properly ascertained.

Mr. Leslie tbought any money spent on this subject well bestowed, to show the value of the two systems, and moved, "That at the request of Mr. Barry, and for the advantage of the public, the charges made by Mr. Austin, with Mr. Barry's reply, be printed in juxtaposition, tegether with the subsequent rejoinders of both these gentlemen."—

Motion put and agreed to.

Atiscellanea.

"ARTISTS' CONVERSAZIONE."-The first, "ARTISTS' CONVERSAZIONE."—The first, for the present session, of the series of conversazioni, given annually under this title at the Freemasons' Tavern, was held on the 27th ult. Amongst the works of art exhibited were a charming drawing of "Fox-Gloves," hy Mrs. Withers; a nice little picture, in Topham's style, by Mr. J. H. Mole; and a portfolio of sketches hy the same artist; a clever miniature hy Miss Cole; and a drawing in the Temple Church, hy her sister Miss E. Cole. Mr. E. A. Goodall exhibited an interior, more like some recent works of his brother than like some recent works of his hrother than his paintings are usually, and a portfolio of sketches. There were also a set of sketches in Tasmania, by Mr. Skinner Prout; illustrations of the Collegiate Church of the Holy Trinity, at Edinhurgh, by Mr. D. Wilson; and other interesting matters. This association has now heen in existence ahout twenty years, and is the root, whone sprung "The Granhic." like some recent works of his hrother than now heen in existence about twenty years, and is the root whence sprung "The Graphic,"—hut it has pursued the even tenour of its useful way so quietly that it is less known than many hodies of more recent establishment. The want of a more distinctive title, too, has perhaps had something to do with this.

Monument to Picton.—The monument erected at Carmarthen to the memory of Picton is at last completed. According to the Cambrian, which terms it a monument of had management, it is a clumsy disproportioned pyramid, manifesting by the rapid tapering of the shaft that the cash of the managers was exhausted, or that the builder was tired of his job. At the base run out four promontories, from each of which a large cannon, with feehle carriage, frowns on passengers as they ap-proach what they may mistake for the chimney of a manufactory.

Suspension Bridge at Pesth.—The bridge which is erected over the Danube at Pesth, was commenced in 1840, according to resth, was commenced in 1830, according to the designs and under the direction of William Tierney Clark, civil engineer, and has just heen completed at a cost of 650,000l. This hridge has a clear waterway of 1250 feet, the centre span or opening being 670 feet. The height of the suspension towers from the founion is 200 feet, heing founded in 50 feet of The sectional area of the suspending chains is 520 square inches of wrought iron, and the total weight of the same 1,300 tons

PRESERVATION OF BOOKS.—Ahout 25 years ago I was annoyed by finding the years ago I was annoyed by nnuing the hacks of several rows of hooks, some in a hookcase having glazed doors, which were kept locked, and others on adjoining open shelves, frequently mildewed. Wiping them shelves, frequently mildewed. Wi carefully cleaned them only for a fresh crops of mildew speedily disfigured them again. Remembering to have seen my them again. Remembering to have seen my father, who always made his own ink, finish off hy pouring a small glass of spirits of wine into the ink jar, in order to prevent its hecoming mouldy, I lightly washed over the backs and covers of the hooks with spirits of wine, using, as a hrush, the feather of a goose-quill. I frequently saw the hooks during the next five years, and I have occasionally seen them since, and there has not, so far as I am aware, been a single spot of mildew on them since the spirits of wine were applied. I have used spirits of wine to prevent mildew with equally good effect in other cases. N. R.

THE LOUVRE.—The Minister of Public Works, M. Vivien, has prepared an elahorate report of the present condition of the Louvre, for necessary repairs and embellishments, as well as opening other saloons. The sum re-quired for the present year is 200,000 francs, and 1,800,000 for the following one. The report is at considerable length; the principal features being—1st, The entire reconstruction of the roof of the grand gallery, to admit the light from the top, and to close the side windows. 2nd, To redecorate and alter the disposition of the Grand Salon, and the Salon des Sept Cheminées. 3rd, The entire reparation of sept Cheminess. Std, the entire reparation of the Gallery of Apollo. In the hudget for the present year, the first item is calculated to cause an expenditure of 160,000 francs. The redecoration of the Grand Salon is estimated at 600,000 francs; the Salon des Sept Cheminées is set down at 400,000 francs; and finally, the expenses calculated to restore the finally, the expenses calculated to restore the Gallery of Apollo at 1,000,000 francs. In consequence of this report, a commission was nominated to consider the proposition, and on its meeting, in the Hall of the Institute, most of the distinguished artists of Paris were present. The plan given by M. Dubau, the architect, was the subject of a very learned discussion. The style of a representation. the architect, was the subject of a very learned discussion. The style of ornamentation especially was investigated. M. Ingres proposed a red ground, with very rich decorative details; his opinion was strongly enforced by Messieurs Drolling and Horace Vernet. M. Delacroix suggested a more sober colour as the ground, with very slight ornament. It was remarked that good colouries. remarked that good colourists It was ment. It was remarked that good coloursts had always preferred a ground that would lower the lustre of tints, and render their hrilliancy more harmonious by opposition with a positive vivid colour; while, on the other hand, it was agreed that where colour was not the characteristic of artistic works, a more unohtrusive ground would give them due advantage. The proposition of Messicurs Ingres and Horace Vernet obtained the suffrages of the commission, and was finally adopted .- Art Journal.*

* The new number of the Art-Journal, with two fine engravings from the Vernon Gallery, and a profusion of other illustrations, is quite a marvel in periodical literature.

PROJECTED WORKS.—Advertisements have been issued for tenders, by 18th February, for building a new savings' bank and a new market-hall and corn-exchange, at Lichfield, by 20th, for the erection of a house at Harhleby 20th, for the erection of a house at Harhledown; by 8th, for erecting prisoners' cells, kitchen offices, infirmary, houndary wall, &c., at the county jail, Huntingdon; by 21st, for the various works to be done in the erection of the poor's hospital new buildings and offices at Paisley; by 6th, for the erection of a parsonage-house and offices at Ripon; and by 6th for a coverence of the tense of Abinedus. 6th, for a survey of the town of Ahingdon, Berks, and a report of the expense of draining the same hy proper and efficient sewerage.

GAS: REDUCTIONS IN THE PRICE, In consequence of past reductions at Don-caster, the consumption has so much increased that the Company have declared their intention, on that special ground, to repeat the experiment, by a further reduction to 4s. 7d. per 1,000 cubic feet.—The Cambridge shareholders appear to have now also as hopeful a holders appear to have now also as hopeful a prospect before their eyes in determining to carry out the like principle. They have just announced a reduction from 7s. to 6s, and the chairman "also stated that the committee of management had reason to hope that ultimately no town in the kingdom, of comparative size and population, would be lighted by gas at a less expense than Cambridge."—At Farelam, on the contrary, the company have the stupidity to refuse to reduce their price to 7s. 6d., while the consumers have not only 7s. 6d., while the consumers have not only determined not to pay more, hut have heen offered a supply at 5s. 6d. —The company at offered a supply at 5s. od.——Ine company as Brigg have reduced their price from 10s. to 8s. 4d., with the "hope that there will be an increase of private consumers," which there doubtless will he, though only to an extent equivalent to the smallness of the reduction, equivalent to the smallness of the reduction, or rather to the largeness of the remainder. of rather to the largeties of the railway station at 5s., exclusive of pipes and fittings.—It is proposed to light the shire hall at Chelmsford from gas jets outside the windows, a principle which we learn has been adopted in other court houses with excellent effect, both in brilliancy and comfort.—A petition to the Commons is in progress at Birmingham, according to the is in progress at Birmingham, according to the Journal, praying their to enact that all gas meters shall he properly proved and inspected, as measures generally are, and that the irre-sponsibility of companies, or of those by whom meters are supplied, as well as the liability of meters to register incorrectly, may he thus or otherwise properly checked. Mr. N. Scholfield, ., is to introduce a hill in the forthcoming session to remedy this evil.

IMPROVEMENT OF OPEN SPACES.—With reference to the suggestions for laying out Kennington-common, and the improvement of Camherwell-green, in your last number, allow me to suggest for further comment, that many wide spaces and thoroughfares round London are easily susceptible of similar improvement: Whitechapel-road, Islington, Blackfriars-road, and the various so called greens might he planted and systematically laid out, so as to present a pleasing aspect and healthy prome-nade, and that at comparatively trifling ex-pense. In many of the narrowest roads, the small gardens in front of the houses should he purchased for the widening of the tho-roughfares hefore the value is enhanced by their being converted into shops,—a process which is rapidly taking place in all the roads leading to the metropolis. In short, a public which is rapidly taking place in all the roads leading to the metropolis. In short, a public inspector ought to be appointed for the better regulation of such matters; it would not fail ultimately to save the public from great inconvenience as well as expense. For while we are going to great expense in widening some thoroughfares, we are suffering others to have first closed up.—Footpap. to he as fast closed up .- FOOTPAD.

Large Casting.—A cylinder, 95 inches in diameter and 10 feet stroke, was cast yesterday afternoon, at the Novelty Works, in presence of a large number of persons, who had been invited to witness the operation. No less than 25,000 lhs. of molten iron were used for the casting, which, when finished, will be ahout 20,000 lhs. This is, prohably, the largest and casting, which, when musica, 20,000 lhs. This is, prohably, the largest and heaviest casting of the kind ever made; and is for the first of Collins's line of sea-steamers, which are now in a great state of forwardness, two of which, we learn, will be launched early in January.—American Paper.

DESTRUCTION OF A LARGE GASHOLDER,

—At the Edinburgh Gas Company's Works, —At the Edinburgh Gas Company's Works, on Thursday week, a new telescopic gasholder tilted over by the breaking of a guide rod, and hy the friction, or otherwise, exploded, or at least set fire to, the gas, of which it contained nearly 300,000 enbic feet, being the largest gasholder in Scotland—40 feet in depth and 100 feet in diameter. Both gas and gasholder were destroyed, and the loss is estimated at about 2,000ℓ. The adjoining houses, windows, &c., were considerably injured.

STEAM-BOILER EXPLOSIONS IN THE UNITED STATES.—A report has just been presented to Congress, upon the subject of explosions in American steam-boilers. The report includes the number of accidents of this character from 1816 to 1848, and shows a total of 233 explosions, calculated from the average of the given cases.—Pecuniary loss—233 cases, at 13,302 dollars each, 3,099,366 dollars.—Loss of life—11 each, 2,563.—Wounded—9 each, 2,097—total killed and wounded, 4,660.

CURIOUS INVENTION.—Mr. Coupland, of Skellingthorpe, near Lincoln, has just pro-duced a very curious invention, for the purpose of preventing the strong glare of the sun's light being cast upon windows which front the south south.

MEDIÆVAL REMAINS.—The original floor of the ancient refectory at Durham has been discovered. About a foot and a half below the joists was an uniform surface of rubbish, on removing a portion of which, to the depth of about 3 feet, the workmen struck upon the floor of the property of th floor of the ancient refectory. It is composed of plain red encaustre tiles, about 10 inches square, and of much rougher composition than is now deemed requisite.—Sunderland

Westminster Abbey. — The following extract from the Northampton Mercury, of more than a hundred years since, will interest some of our readers:—" London, February 23, 1722-3. — The rebuilding of Solomon's porch and the rest of the north front of Westminster Abbey is now finish'd, according to the model of the old building of the Gothick order; and the workmanship, in the opinion of commetent judges, is reckon'd very beautiful order; and the workmanship, in the opinion of competent judges, is reckon'd very beautiful and curious, in which the moderns have not only equal'd, but even exceeded the ancients in their own manner of architecture. The great window of 32 foot square in the front is likewise glazed with glass curiously painted after the Antique fashion, by Mr. Price, who is reckon'd the only artist in England capable of doing it; so that that ornamental art is not so entirely lost as some have alledg'd."

"Tom Steele" AN ENGINEER.—Tom Steele, the devoted follower of O'Connell, whose melancholy end a short time since our readers will remember, was an associate of the Institute of Civil Engineers. In a memoir of him which was given at the general meeting of the Institution, mentioned last week, it was said that his attention being directed to the bad state of the navigation of the river Shannon, he determined to make a personal survey of the bed of the river, which he did in the most the bed of the river, which he do in the hos-complete manner, employing sometimes very original means; such, for instance, as stepping along the line of a reef or shoal, supporting himself with one hand upon the stern of a boat, whilst he measured and recorded all the inequalities of the surface, and ascertained the nature of the rock or ground. An account of mature of the rock or ground. An account of this survey was published by him; and no greater proof of its utility can be given than the fact of the greater portion of his suggestions having been followed in the works that have been since executed. His attention being thus directed to the diving bell, he devised several alterations in its construction and application; particularly a method of lighting the divers during their submarine labours. All these, with many similar subjects, were published in the current periodicals of the day, and some of them were communicated to the Institution. At a later period, a favourite theme upon which he repeatedly addressed the Institution was the purchase of the birth-place of Sir Isaac Newton, and its preservation by the scientific world, in the same manner that Shakspeare's house has since been obtained by the exertions of literary and dramatic men.

the exertions of literary and dramatic men,

No. CCCXIV.

SATURDAY, FEBRUARY 10, 1849.

HE Superintending Inspectors appointed by the Board of Health are actively proceeding in their inquiries, shifting from town to town, receiving evi-

dence, and making general examinations of the locality. We have before us a pile of the evidence offered in different quarters, several communications on the subject, and not a few requests that we should let the London public know what is going on in this respect. The number and extent of the inquiries (though in some cases, we may say in parenthesis, not by any means extensive enough, heing conducted on what may be called the "touch and go" system), would prevent us from doing so at any length, even if we were certain that the majority of our readers would be pleased by such a course. We will refer, however, to some of the principal points elicited during two or three of the more recent inquiries,

The bad condition of Lancaster in respect of health has been known for some time. Professor Owen, in his startling report on this place, published in the "Second Report of the Commissioners for inquiring into the state of large towns,"* put a mark upon it, which rendered any further proof that remedies are required there unnecessary. Mr. Smith, of Deanston, was the inspector appointed to attend there, and he opened the inquiry at the end of last month. The present mayor of Lancaster is Mr. Edmund Sharpe, architect, who is known to many of our readers hy his pubished works, especially by his fine book,
"Architectural Parallels," on the mcrits of which we spoke at some length not very long ago, and this gentleman went very fully into the subject, and gave a large amount of evidence, not merely in his capacity of mayor, but as representative of a local committee of health. Hear, however, first, what Mr. Grant, the

uperintendant registrar of the district, said, as o the rate of mortality there. Omitting the unatic asylum and workhouse, so far as oncerns paupers not belonging to Lancaster, e makes the deaths 28.98 per annum in very thousand, or one in every 37. "The eaths in the rural parts of the district are bout 17 per annum per thousand, showing an xcess of deaths in Lancaster of 130 per nnum." He found some time since that the verage age at death in Lancaster was about wenty-eight years, while in the other part of the istrict it is about thirty-five years. As regards ne infantile mortality of the working class, he ound that about 15 per cent. of the deaths of nat class are under six months old, about 44 nder five years, and nearly 50 per cent. under

Mr. Sharpe drew the inspector's attention to fir. Owen's report, already alluded to, and opecially to a diagram in it, representing the ream of life in three columns, which it is appossible not to view, in connection with the ate of things, without the deepest regret that the base been done to improve the health the town, and particularly the health of the borer classes. This diagram, as the witness

pointed out, represents the duration of life in three classes of the inhabitants of Lancaster respectively,-the gentry, the tradesmen, and the operatives,-and it appears from these returns that of every hundred that are born among the gentry, eighty-five live, on the average, to the age of ten years. In other words, it takes ten years to kill off fifteen individuals. How long does it take to kill off the same number among the working classes? According to the same return, only six months! Again, how many of the hundred survive to the age of thirty? Amongst the gentry, 72; amongst the operatives, 36, or one-half the former! Making due allowance for the many other causes that depress the state of health of the young of the poorer classes, it is impossible for us to close our eyes to the probability that the state of the atmosphere in which they live is one of the most important and fatal of those causes. This report was published in 1845, and two years and upwards passed over, continued the witness, without a remedial step of any kind having been taken to abate the shocking state of things so circumstantially described by him. He did not desire to impute hlame, but nothing had been done, and eight weeks ago the town was in the same state that it was five years ago. One main point dwelt upon by the witness,referring both to the sewers and wells of Lancaster, and which will scarcely be credited, even by those accustomed to hear of extraordinary things in matters of this nature,-was, that the whole of the substratum upon which the town of Lancaster stands is strongly impregnated with the sewage of the town. "This is a startling assertion, hut the fact is as I say. It is the common practice of builders in Lancaster to carry down the cesspools from waterclosets and privies until they reach the gravel; and having done so, to provide no overflow, the whole of the sewage being drained off hy the gravel. It frequently happens, that persons opening their cesspools after the lapse of several years, and expecting to find them full, have found them, to their great surprise, entirely empty. The whole contents have gone into the gravelly substratum in which the wells of the whole town are situated. The water in Lancaster is believed by many to be good. There may he isolated instances of good water, under peculiar circumstances of protection to the well, but no analysis that has ever yet been made, gives other than most unsatisfactory results. What has been here said of cesspools applies equally to sewers, public and private, many of which are built with dry walling at the sides, and none of which are water-tight." He then handed in analyses of the water from various wells, made by proper parties, as the foundation of his assertions. Other witnesses corroborated the statement.

Mr. Johnson, a medical man of the town, said that much of what the mayor had stated was fallacious; but afterwards, when giving connected evidence, he said nothing but what was confirmatory of the general statements of the miserable condition of the town in a sanitary point of view.

Evidence was given of the positive occurrence of fever through the stoppage of drains, and of its cessation when the stoppage was removed; of the evils of the window-tax, and the mischief caused by damp patbs and roads with a decomposing surface.

We do not find, however, that any material inquiry into the state of the burial-grounds took place,—a circumstance much to be regretted. It does seem most strange that, in spite of the overwhelming amount of evidence which exists proving the death-dealing character of over-crowded burial-grounds in towns, this most important matter is constantly shuffled out of sight by those in power. The victim cannot point to the spot and say, "Here I took the poison;" circumstantial evidence is disregarded, and deaths are looked upon as part of an inevitable course of events, which ought not to have occurred for years, and would not but, for our suicidal disregard of undeniable facts.

At Whitehaven, Mr. Rawlinson has heen conducting the inquiry; and there Dr. Falcon gave evidence relative to the crowded state of St. Nicholas's, or the old church-yard. He had lived opposite it twenty years, and during that period his family, he said, had suffered greatly from sickness, which he principally attributed to the noxious air which emanated from the church-yard.

The great want complained of here and elsewhere, was an adequate supply of pure water. Mr. Clarke, surgeon, agreeing in this, said something might nevertheless be done hy making drains and sewers. The importance of proper sewers might he shown by a case which had come within his own practice as a surgeon. He had been called to attend a case of dysentery, which had arisen from the imperfect state of a drain in George-street, which ran under the lohby of the house of his patient, and was covered only with thin hoards. The effluvia arising from the sewer had made the whole of the inhabitants-four persons-exceedingly ill. Two of the cases terminated in death; and, subsequently, he had been called in to attend the other two with fever!

At Leicester, Mr. Ranger was the inspector engaged, and much anxiety seems to have been shewn on the part of the inhahitants to give information, and obtain a satisfactory result. The inspector referred, in his opening address, to the comparative average duration of life at Leicester and Billesdon at the last census, from which he said it appeared that the total average loss of life to every individual in Leicester, as compared with the inhabitants of Billesdon, was 121 years; and taking the population into account, with the average of wages at 7s. per week, the total loss in labour had been to this town no less than 90,000l. since that time. It was shewn hy witnesses that the houses in which the women were engaged in stocking-making were ill-ventilated-in some cases back to back without through air; that the cesspools were often dug down to the springs, to avoid necessity for cleansing out, by which means the water was poisoned; and that the drainage, even in the best parts of the town, was most defective.

As to the supply of water, which will be insisted on by the Central Board here and elsewhere, the inspector said he would at once state that it is intended, in the sanitary regulations to be made, to have a full and constant supply of water, and perfect drainage: there is to be no intermission of the supplies of water—it will be constantly laid on to each house, and the sewerage will not he allowed to remain in a quiescent state. Indeed, he thought there could be no effectual drainage without an unceasing supply of water; it would be folly to attempt it without. The proper supply of water is, therefore, a matter determined upon.

At Leeds the town council have absurdly determined, by a majority of one, to postpone the consideration of the sewerage of the town

for six months. If it can be proved hereafter that death has occurred through want of efficient drainage, the council ought to be indicted for manslaughter.——At Gateshead, Mr. Dobson, architect, has been called in to advise as to the best mode of sewering the main thoroughfare.——And at Lincoln, Mr. Giles, engineer, is preparing plans, by direction of the corporation, for a system of underground

A striking evidence of the effect of locality, and improved structural arrangements, on the health of the inhabitants of towns, has just appeared in the shape of a report from Hamburgh, by Mr. Grainger. The fire of 1842 led to the re-arrangement of the greater part of the town, and under the direction of Mr. Lindley, engineer, the water supply, drainage, laying out of the streets, &c., have been carefully attended to. The result is said to be a diminution of disease to a considerable extent, and an exemption from cholera particularly, during the visitation of the present year, as remarkable as it is important.

The facts given in this report afford an additional confirmation of the great principle established by former researches-"that amidst the town populations the cholera visits with most severity the same class of persons and the same places, and is governed by similar circumstances, as typhus." "The firm establishment of this position is of infinite moment, inasmuch as hy bringing cholera into the same category as low fever, no one accustomed to these inquiries would doubt that as certainly as the per-centage of typhus decreases with improved drainage, paving, and ventilation, so also will epidemic cholera. The proof of this has been afforded on a grand scale at Hamburgh. The ravages of the disease have received a marked check, in the present outbreak, by the substitution of wide, open, and welldrained streets, for narrow, filthy, and damp thoroughfares; by the removal of high mounds of earth, blocking up the streets and overshadowing the bouses, and by guarding a large evaporating surface of water from contamination."

The influence of these improvements will not cease with the present year, but will be perpetuated for ages to come; they will benefit not merely the existing race, but distant generations of inhabitants; and the immediate expense incurred in effecting them will be found to he a vast ultimate economy, even in money, irrespective of the result—which is heyond price—the gain in improved health and lengthened life.

The Serpentine and Kensington Gardens,—The commissioners of her Majesty's Woods, &c., are now draining the Serpentine, prior to the measures they are about to adopt to remedy the stagnant state of the water. Would not this be a good opportunity to remove the dumb waiter at the end of the ornamental water in Kensington Gardens, and substitute a fountain of some architectural pretensions? A very small outlay would effect this, and I am sure, even those who have the most extreme views of retrenchment, would not object to see something there that we should not be ashamed of (as we all are at present). The two floating islands also, for the ornamental water fowls, alives common ducks, if necessary, might likewise be improved.—O.H.

PROFESSOR COCKERELL'S LECTURES ON ARCHITECTURE.

The fourth lecture of the course, at the Royal Academy, delivered on Thursday, the 25th ult., to which the limits of our usual summary bardly allow us to do proper justice, was a very able exposition of what the professor described as the two cardinal principles in design, namely, first, precedent or authority, and second, invention exercised by means of new combinations, or sometimes new elements. With regard to the first, he said that it was the great duty of institutions like the academy to direct attention to the models of antiquity, and to indicate the authors who were to he consulted. It was its office to stand, in the full conservative spirit, in opposition to all depreciation of tried experience. In a proper understanding of these models depended the true value of precedent. The love of it must not, however, be allowed to hold entire possession of the architect, or it would easily degenerate into superstition. Two states of the mind, therefore, were prospective, and we were to dispense with neither one nor the other: each had claims—each defects.

We might reflect that the intellectual man was compounded of knowledge, stored up in his early days. The appetite was suited to the age. The time came when he repented of every idle hour, and when he had to employ the knowledge he might possess. He would become deeply sensible of the value of information, and would be impressed with a wholesome reverence for precedent, but feeling these, he must guard against the danger of superstition and pedantry, which might tend to the dogmatic belief in no other model than the particular one he set up for himself, or no other master than the one from whom he gained his assumed precepts. Some in the love of novelty might depreciate former things; but it was hardly possible for an artist of sensibility to contemplate, without emotion, the monuments of former art, such as so powerfully impressed the mind of Brunelleschi in the grand monuments of ancient Rome. But we must guard against the misconception alluded to by the poet, who said,—

"To observations which ourselves we make,
We grow more partial for the observer's sake:"

We must enter into the considerations of structure in our buildings, and turn peculiar requirements into peculiar advantages. In so doing, we should find—

"Spontaneous beauties all around advance, Start e'en from difficulty, strike from chance."

We must impress our works with a character peculiarly their own, and not afford the opportunity of a contrast, such as that between the truth and beauty of the portraits of the old masters, and the portraits of our grandfathers.

On the other band, the professor continued, we had to deal with the innovators in art, and these were of twokinds. We had those who

On the other band, the professor continued, we had to deal with the innovators in art, and these were of twokinds. We had those who professed to bave discovered some entirely new principle, or made some new invention, and who argued with a certain show of reason. Such theories might, or might not, be correct, but we were not able to get ourselves to understand and assent to them. The injustice to the authors of such theories could not be avoided, and they must be content, if able, to rank themselves with Socrates, and others who were before their age, and whose opinions sooner or later might prevail. Others there were who laboured to show the defects in the present practice of the art, and what ought to have been avoided in this work or the other. But these gave us nothing in the place of what they condemned,—no stable principles,—but confessed that they must be left to time to unfold. It must of course he recollected that there were two parties to all inventions, namely, those who originated, and those who received the invention, that was to say, the public. The elements of our art, indeed, were few, but were capable of a multitude of combinations. From the seven notes in music were produced a great number of beautiful melodies; from the twenty-six letters of the alphabet was compounded all that Shakspeare had written. In these cases how small in number were the elements, but, how to accomplish a similar number of heautiful combinations, there was "the rab."

Away, then, said the professor, with those ideas of absolute novelty which presented themselves to some persons. Those who knocked down, must erect something instead. Our neighbours knocked down a monarchy, and they erected a republic.—He recommended the critical examination of buildings, as calculated to improve the mental qualifications for the practice of design, but impressed upon his bearers the propriety of accompanying criticism with moderation of temper. He suggested that they should strive to find out in what parts of a composition assthetical character was attained, and where it was deficient, and whether the proportion was right or wrong, and why. Criticism, he urged, was one thing, and abuse or diatribe another; and he pointed out by which spirit we should most contribute to what was accordant with morality. He, the professor, had shewn that there was a theory of beauty and geometry, in nature,—that nature was

"At once the source, and end, and test of art,"--

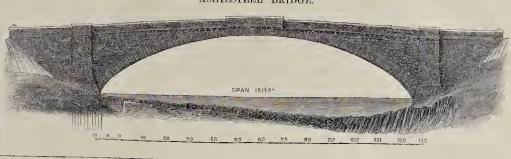

and that the great artists were those who best understood nature; and he intended also to shew, by a review of the history of the art, how minute were the changes which took place, and in answer to some who urged the desirableness of an entire alteration in present systems, with a view to novelty, how gradually the inventions of the old masters had been fostered. Comparing great things with small, that was to say, the laws of nature with those of art, we were struck by the occurrence of the same features in all animals, modified by a law of gradation. The snout of one animal hecame in another a prohoscis, or, in opposite terms, the features which were expanded in one animal, in another were hardly recognizable. The arcuated and traheated systems pervaded the whole of architecture, and yet invention had long consisted merely in the recombination of these elementary principles, at least not in the attainment of absolute novelty.

The professor then, to illustrate the subject further, glanced at the progress of invention, as seen in some of the most important examples of architecture. Commencing with the traheated, or post-and-beam system, he showed that this, wbether amongst the Egyptians, the Greeks, the Druids, or other nations, continued for a long period to hold possession of the art. Variations of character, was affected by waris for a long period to hold possession of the arts Variations of character were effected by variations of size, or by other means, as for example, sculptured decoration, and the arch known to the early Egyptians, and used at an early period by the Romans in works of utility, did not for centuries create any change in the decorative character of buildings. Instances of the importance of the arch in Roman architecture, were shown in the sections of one of the temples at Bäalbec, and in that of Venus at Rome. In the latter, the vault which formed the ceiling was 70 feet in span. Before alluding to the use of the arch in the Roman therme, he described the corresponding buildings of Greece, or gymnasia. He said, we must still Greece, or gymnasia. He said, we must still hope for further enlightenment on the arrangement of these buildings, which, existing at such places as Hierapolis, and Alexandria Troas, it would be extremely interesting to find contemporary with the age of Alexander. He gave a striking instance of the importance attached to gymnasia, and of their magnitude, in shewing that the gymnasium at Ephesus was one of three which existed in that city, and, by one of his elever comparative plans, that the building would cover a square space extending from the back of the Horse Guards up to the enclosure of the park. He also showed how Mr. Wilkins, who was the first to clear up the difficulties of the other commentators of Vitruvius, developed the plan of the building in accordance with the description of the author. Passing on to the therma, he showed the vast extent of the baths of Caracalla, which would cover a space equal to that enclosed by Pall-mall, St. James's-street, Piccadilly, and Regent-street. He pointed out Friceamy, and negent-street. The pointed out the beautiful forms, and the variety in the plans of the different apartments, and the effective introduction of apsidal and circular forms, and showed the immense size of the cella solaris, the dome of which was second only to that of the Pantheon. He also spoke of the immense transition of the control o only to that of the Pantheon. He also spoke of the ingenuity in providing the necessary

^{*} Amongst the publications before us in a very comprehensive "Report to the Town Council of Chester, on the Sewerage and other Works under the Improvement Act," by Mr. Baylis, the borough surveyor.—Mr. Wichcord, Jun., architect, has just now published (Wickham, Maisstone; Longman, London), "Observations on the Sanitary Condition of Blaidstone, with a view to the introduction of the Act for promoting the Fublic Health," which appears to be a sensible productory.

[†] In the official circular (No. 4) issued by the Board of Health.

ASHIESTEEL BRIDGE.

ahutments for those vast vaults, by disposition

ahutments for those vast vaults, by disposition of the walls of the different apartments.

As Brunelleschi—when questioned by the pope as to his celebrated boast, replied, "Yes, give me a fulcrum and I can move the world;" so, in the next step in the progress of the arch, the architect of the Church of Sta. Sophia might have said, "Give me an ahutment, and I can suspend a dome in the air," The professor gave a clear explanation of abutment, and I can suspend a dome in the air." The professor gave a clear explanation of the manner in which this was effected, by means of "pendentives:" he then alluded to the night of darkness in which Europe existed subsequently, and the use of the Byzantine style, and showed how the pointed arch—the next step—might have originated by omitting the crown of the lofty vault of the hall of the baths, and prolonging the lines of the haunches, which would then meet in a point. He also showed how naturally the column placed against a pier, in the same apartment, placed against a pier, in the same apartment, placed against a pier, in the same apartment, and supporting the portion of the vaulting here concentrated upon it, might have led to the clustered columns and shaft supporting the groining in Gothic buildings. So, said the professor, here we saw instances how, from one link to another, the gradual chain of architectural progress was captual forward forward.

the groining in Goulic betraings. So, saw the professor, here we saw instances how, from one link to another, the gradual chain of architectural progress was carried forward.

After describing the plan of Ely Cathedral, he passed to the condition of the art in Italy. In the earlier period of Italian architecture, we found that each house was a kiod of fortress, and whatever decoration was practised was reserved for the internal courts. But when, with the revival of learning in Italy, a state of comparative quiet accompanied it, then a new field was open for the inventions of architects. Bramante, for instance, adopted a double order; and this, perhaps suggested by previous works, was certainly not found in the antique. Vignola employed cantilevers in an entablature, as afterwards practised by Sir Christopher Wren. Vignola might have gained some idea of this method from ancient paintings, but certainly not from the temple at Bäalbec, where a similar method is found, for Vignola had never heard of that place. Another feature, the window, underwent important modifications. Previously small, and shuttered below;—in the palace at Florence it was ornamented with a pediment, and other decorations. At first, so great an innovation seemed as if it would occasion nothing but ridicule, but this method of treating the window had endured ever since. These features, therefore, and others like these, had never previously been seen in architecture: this, then, was truly invention, and this the only description of novelty which could be successful.

cessful.

These instances, the professor concluded, he had cited to show that, by attention to points arising out of structure, in our buildings, we might best attain excellence; but we must, at the same time, impress the character of the nineteenth century upon our works, and whilst recognising the value of precedent and authority, not shut our eyes to every other important consideration.

SUPPLY OF WATER TO THE CITY. — It is stated that the New River Company have agreed to furnish water to the whole of the courts and alleys in the city twice a day, gratis, for sanitary purposes.

ASHIESTEEL EL BRIDGE — WHINSTONE CONSTRUCTIONS.

SIR,-In the number of THE BUILDER for SIR,—In the number of THE BUILDER for December, 1848, page 617, we observe a short notice of a bridge which we huilt last year at Ashiesteel, given in a report of a meeting of the Institute of British Architects,* in which Mr. Burn expressed his disapprobation of the material of which the bridge was built, by cautioning the junior members against the impression that this was a good material for construction.

struction. What a strange conclusion he comes to! An arch has been huilt of 131½ ft. span to a radius of 110 feet, all of whinstone rubble, and yet Mr. Burn cautions the junior members against the impression that this is a good material. Why, Mr. Burn (unintentionally, we believe) does us much more honour than we think we are entitled to, as we differ from him so far as to hold that the material is good, more particularly for arches, and we beg to more particularly for arches, and we beg to observe that it is a material far too much underrated by most of the architects and engiunderrated by most of the architects and engineers of the present day. Io many situations in Scotland and elsewhere, a saving from the use of it might be had, from three to four hundred per cent., in place of hewn stone or granite. A good whinstone arch is equal, if not superior, to hewn stone, the one being much more durable than the other. We never heard of a whinstone arch falling from age, and there are some in this country many hundred years old.

With this we beg to hand you a small sketch of our bridge, which we hope you may think

of our bridge, which we hope you may think worthy a place in THE BUILDER.

JOHN AND THOS. SMITH.

ON THE CONSTRUCTION OF PRISONS.

ON THE CONSTRUCTION OF PRISONS.

There is no department in architecture which should call forth more of the study and attention of the architect than that of "prison-building," and being aware of many of the deficiencies which are apparent in the edifices already erected, the writer ventures to offer the following remarks to the public, trusting they may meet with a favourable reception, and be productive of beneficial results. Having for some time made this subject my particular study, and having taken every care to investigate, as far as possible, those defects to which I allude, I am inclined to hope that, in calling attention to it, I may not be considered as having entered the field unprepared. In this enlightened age, when art and science are making rapid strides to perfection, I consider it the duty of every man to contribute as much as may lie in his power to the advancement of those principles which are calculated to aid society in its moral and refined improvement. As there is no class of persons on whom more labour should be bestowed, in endeavouring to effect their reclamation, than the inhabitants of a prison, so should it be the utmost desire of every wellwisher to society, to neglect no opportunity of assisting in this praiseworthy prison, so should to be the utmost desire of every well-wisher to society, to neglect no opportunity of assisting in this praiseworthy object. Before immediately entering into a detail of the construction, I shall make a few preliminary remarks as to the advantages which

* It was further described in our last number but one, p. 34, ante.

one species of discipline appears to possess over another, which cannot be deemed inconsistent, as the plan of a prison will materially depend on the system which it is intended to carry into effect.

Punishment is the reward of crime; but though it is indispensably necessary for its suppression, and for the protection of the community against the assaults and malicious intents of the wicked, yet this alone is not the only point we are to consider;—there is another and a more exalted one, which should receive our strict attention—namely, the "reclamation of offenders." Since prevention is better than the cure, let us rather study the best possible means for the suppression of vice, than the most severe and painful mode of punishing those who have fallen victims to it. How often are we afforded examples of punishment strengthening crime: the greater Punishment is the reward of crime; but the thorn of the are we another examples punishment strengthening crime: the greater the chastisement received by a man hardened in villany, the more determined he becomes to resist the arm of the law. What benefit, then, does society receive, if the individual sentenced to undergo a certain term of confinement within the walls of a prison—that time having expired—comes forth again upon the world unimproved, and contemplating the the world inimproved, and contemplating the commission of more wickedness? It does not follow, because a man may fall a victim to passions which induce him to commit a crime, and for which the law sentences him to be incarcerated, that he may not be possessed of qualities which, if properly developed, would not only enable him to occupy a respectable position in society, but would also tend to the suppression of those evil propensities to which buman nature is subject. In what does the line of demarcation consist, which is so widely drawn between the wild untutored savage and the cducated man? In what? but in the cultivation of the mental faculties and understanding which man, in his most primitive cultivation of the mental faculties and understanding which man, in his most primitive state, is endowed with. Then it is the duty of those who are invested with authority to exercise their power both humanely and judicially; not only to reward the good, and punish the wicked, but, hy a careful education of the uncultivated faculties of the latter, to try and restore to society those who, perhaps from want of instruction alone, are looked upon as useless memhers. This is the grand desideratum to be obtained, and punishment alone will not effect it. Let the understanding and feelings of the prisoner be appealed to; let him be instructed in those principles which tend to the exaltation of the mind; let his habits be well regulated; and, above all, let him have sufficient time and opportunity for meditation and reflection. In the temptations and allurements of a sinful world, intoxicated by pleasure or hardened by misfortune—containing the singulated by held converted. and anurements of a sinful world, intoxicated by pleasure or hardened by misfortune—contaminated by bad examples or driven to desperation by the artful cunning or malicious advice of depraved associates,—many a man, possessing innately good and honest principles, may be prematurely hurried into sin, which, if a little time were afforded for reflection, never would bare been committed.

When Lennuagert, the

When I enumerate the many beneficial influences which reflection has upon the mind, I wish it also to be understood that a certain regimen of discipline is necessary to be observed, which may aid in the furtherance of the objects for which it is intended.

That which I consider to be an indispensable accompaniment to the provision of time and opportunity for reflection, is "a complete seclusion from all those characters who, by precept or example, might interfere in each other's reformation." It is, then, for us to find out that species of discipline which will embrace the objects I have enumerated, and which will combine not 'only the punishment of the offender, but also assist in every possible manner in his ultimate, if not his immediate, reformation. It is unnecessary to dwell, at any considerable length, upon the pernicious results arising from evil company and bad example; and as man, in his intercourse through life, is continually exposed to temptation, let his sojourn in a prison be calculated to enable him to resist the allurements of vice when his term for confinement shall have elapsed, and let him return to the world a better man than when first he entered his cell. It is against reason to expect that a man who has beer tempted, or, perhaps, in a great measure forced, to sin, hy dissolute companions, will, while under the influence of their precepts, make the slightest advances towards a reformation; and therefore it is absolutely necessary that a species of discipline be adopted, which will prevent the possibility of such communication taking

It is almost unnecessary for me to say (as it can be easily concluded from the preceding observations), that I am a strict advocate for the maintenance of the separate system; and though prejudices have been cast upon the public mind as to its influences, by the erropublic mind as to its influences, by the erro-neous opinions of authors, who have either taken an unfair view of them, or have not given themselves the trouble to inquire into the results produced by its observance, but have taken particular care to point out defects which existed onlyin their own imagination, which existed onlyin their own imagination,— it has been advanced that, on first viewing the principles of the separate system, humanity becomes affected by the means employed in earrying them out; but it is only in conse-quence of the mind being uninitiated in the beneficial results arising from their practice, and never for a moment taking those into consideration, but solely depending and giving its opinion on the effect produced upon its own nature, that this hasty conclusion is come to. There are many who consider that one to. There are many who consider that one of the principal advantages to be derived from the silent system (as opposed to the separate system), is, that the prisoners have the consolation of seeing each other. Now, I have already said sufficient, with respect to the detriment which arises from bad company, to render any further comment unnecessary; but those who admit that such communication is those who admit that such communication is advantageous, in my opinion, advocate a doctrine which is contrary to all reason and common sense. Another defect which is very manifest in this system is, the opportunities which are offered prisoners of committing breaches of discipline. I have heard it said that the great vigilance of the officers who enforce the observance of this system, prevents the chance of any intercourse taking place between the prisoners, but it is you form conbetween the prisoners; but it is my firm no matter how great the watch that may be kept upon them, or however effi-cient the officers may be to discharge their duty, they will, notwithstanding, find means to explain to one another their senti-ments. A look, a gesture, a motion of the hand, will frequently convey feelings which the tongue dares not utter. It must, then, follow as a matter of course, that detection and punishment are the immediate results of a violation of the prison laws. Now, how much better would it he to prevent all possibility of such being the case, than to throw a man in the way of temptation, and punish him for indulging in it. It would appear to me that, to carry out this system to any proper extent, the workshops of the prison should be constituted on the same arrivally as a setting. constructed on the same principle as a whispering gallery, so as to reverberate the least sound distinctly; for it is impossible that any buman ear, without artificial aid, could detect the whispers among a number of prisoners in I could enumerate a large room. a large room. I could enumerate many other deficiencies which are obvious in this system, but as too minute an examination into its but as too minute an examination into its principles might be considered irrelevant to the purposes of my essay, I shall merely content myself with making such remarks as are

necessary for my subject.

Let us now take a glance at the principles on which the separate system is conducted; and having compared the one with the other, I shall then leave the subject to my readers' discrimination, to draw their own conclusions. The prisoner inhabits an airy, well-ventilated cell, he is supplied with whatever machines and implements are suitable to his trade,—or, if he has never applied himself to any, he is taught one; he is permitted to have pens, ink, paper, and books (particularly those which are calculated to improve his mind and inspire within him a sorrow for the past, a solace for the present, and resolutions of amendment for the future. He is visited daily by the governor or his deputy, he receives comfort from the spiritual advice of the chaphain, he is permitted to have free communication and opportunities of intercourse with the officers of the prison, occasionally bis friends are admitted to see him, he is allowed a sufficient quantity of air and exercise, recompensed for the amount of his labour,—and, in a word, he is provided with everything necessary for existence. It is only by contrast we can judge impartially, and I cannot understand how any man, giving the subject proper consideration, can declare himself to be an enemy to a system which is based on principles that are the very foundation of everything that is calculated to bring a man to a proper sense of bis dnty, both spiritually and temporally.

The prison in Philadelphia is constructed for the observance of the separate system, but there is one very manifest defect in it, which I cannot but notice. On the orinicial story.

The prison in Philadelphia is constructed for the observance of the separate system, but there is one very manifest defect in it, which I cannot but notice. On the principal story, small narrow yards are attached to the cells—of course intended for the recreation of the prisoners. Now, for two reasons this should be objected to. In the first place, it prevents his inspection by the officers; and, in the second, it must prove detrimental to his health, as it is necessary to be observed that they should be detached from the main building, and constructed so as to admit a thorough current of air to pass through them: and I also find that, on the other stories, in order to compensate for the want of the yard, two cells are allowed to each prisoner. However permicious the first defect may be to which I have referred, this, I do not hesitate for a moment to say, is doubly so.

There are no structures which require move

moment to say, is doubly so.

There are no structures which require more precautions to be taken for the preservation of the health of the immates, than "prisons," and there is a great responsibility thrown upon the architect to make such provision as will enable the governor and his officers to carry out the system, without affecting the health of those under their charge. As the mental faculties of every human being are more or less influenced by the state of bis health, it is of very important consequence that the physical, as well as the moral benefit of the prisoner, should be attended to. The first advance towards this object should be in the selection of a site whereon to erect the building, and to this point too much consideration cannot be given. We are frequently afforded examples of malignant distempers breaking out and spread ng to a fearful extent in prisons, and hurrying immense numbers of the unfortunate inmates to a prenature grave; and these results have been too often found to axise from a previous inattention to healthful principles, in constructing the buildings in low, damp situations, exposed to the injurious effects of fogs, or in the neighbourhood of stagnant water. However destructive such inattention may be in the erection of other structures, it is doubly so in a prison, when we take into consideration that its inhabitants must perpetually suffer from its influences, and are denied the possibility of refreshing themselves by inhaling the pure atmosphere beyond its walls.*

Dublin.

Enposition of Manufactures in Birmingham.—A committee has been appointed to arrange an exposition of local manufactures, on the occasion of the visit of the British Association to this town in September next. We trust the endeavour will meet with the earnest co-operation of the manufacturers.

* To be continued.

THE GAS MOVEMENT.
METROPOLITAN AND PROVINCIAL.

While of late recording the wondrous alacrity and zeal with which (on the eve of certain city elections, we believe) the majority of the City Sewers Commissioners were advoof the City Sewers Commissioners were advo-cating the city gas-consumers' interests, and determining, with the aid of half a million of money, to extinguish all monopoly of gas within the city bounds for ever,—by a slight misgiving as to the somewhat suspicious in-tensity of that zeal, and even while giving, as in courtesy bound, to those who displayed so much of it, all due credit (more, it now appears, than all the credit really due), for its sincerity, we were induced just gently to hint, that "the city gas-consumers seemed to be somewhat suspicious of the permanence of the good intentions of the authorities." Now, it only remains for us, as in equal courtesy bound, to compliment "the city gas-consumers" on the perspicacity of their suspicions, and the depth of their sagacity. They were clearly far too old and experienced "birds of a feather" either to be caught with chaff, or entrapped by those "good intentions" with which Guildhall was at that time paved; and they hence resolved not to leave their good and hopeful cause entirely in the hands of such ticklish paviours. The City Sewers Commission has, in fact, eaten in its own wordy vapouring "bill," without even choaking on the tail of it. By a majority of 19 to 7, all its determinations and protestations have suddenly vanished in the cool resolution, " that no further proceedings be taken in prosecuting this bill." The few staunch and consistent supporters of previous resolutions, now in the minority, "were extremely indignant," as well minority, "were extremely indignant," as well they might, "after the infinite pains taken by the corporation to accomplish a reduction in the exorbitant price of so necessary an article." A trick such as this may be played but once, and may be played moreover at rather too high a stake. As to those, howrather too high a stake. As to those, how-ever, who can scarcely be said to have been betrayed, since they never really trusted, we doubt not they will go on with energy and resolution, increased, in place of diminished, by an act of self-staltification so complete.—A "Plain self-stultification so complete.—A "Plain Statement" was lately addressed to these commissioners, by a "Director of one of the Metropolitan Gas Companies,"—doubtless a city one, reciting a few of the fusty old falla-cious arguments in favour of monopoly and prices, arguments which might have been urged, with equal ineptitude, years since, while prices were double what they even already are. But "One of the Commissioners of Sewers for the City" (of course, one of the staunch seven), has thought it advisable to publish "An Examination of the 'Plain Statement," in which he good-humouredly, but efficiently, knocks the director off his wooden pegs. It is need-less for us, however, 'at this time of day,' to enter further into either 'Statement' or 'Bxamination.' Nor shall we deign even to fence with another 'Statement' which the alarmed monopolists have profusely showered over all monopolists have profusely showered over all the walls, in at least one extensive district of the metropolis. All we need do is to refer to The BUILDER'S "Indices," under head of "Gas Movement," &c., for the last few years.

On the 12th of February last, under head of "Gas in Guernsey," we made an assault on the stronghold of gas monopoly there, and endeavoured to point out to the gas proprietor (a resident in the metropolis by the way), the impracticalities of such a price as 12s, net 1,000 impracticability of such a price as 12s. per 1,000 cubic feet, and the folly, therefore, of persisting in the attempt to profit by sustaining it. I Guernsey Sun had also called the attention Guernsey gas consumers—or would-be consumers rather—to our disinterested gas consumers efforts in the cause of cheap, good, and abundant gas-light. The subject, it appears, continued thereafter to ferment, until the proprietor has at length been induced to mise a reduction of 2s. per 1,000 feet; foolishly for himself, postpones the reduction till a time when the consumers altogether cease from using their expensive gas for six months longer. Doubtless the proprietor calculates on thus diminishing the chance of competition (threatened at a further Doubtless the reduction of 3s. per 1,000) in the mistaken idea that he is putting off an evil day, while he is only tampering with his own best interests;

though, indeed, he need not expect much benefit from so small a reduction on so large a price. As it is, he has actually prevented his shop-keeping customers, by mere exorbitance of charge, from lighting their shops with gas, except on a Saturday night; and has kept the streets of a town parish population of 16,000 to 17,000, without even the expensive Inxury of a gas light, "Saturday or Sunday,"

—The Wirksworth Gas Company have reduced their price, at one step, from 12s. to 8s. 4d.

—The Hull corporation have resolved to allow the pipes of a new company to be laid through the streets of the town, the inhabitants having failed to induce the present lessee to lower his rate of charge from 6s. 8d. to 5s., as both lessee and shareholders have to reap their separate and shareholders have to reap their separate profits off it. They will probably now come to a mutual understanding. —— Stockport and Belfast are to be lighted, it is said, with the hy-drocarbon gas prepared from tar and water. It drocarbon gas prepared from tar and water. It is to be hoped the authorities are awake to the fact that failures abroad have already occurred with gas prepared on a like principle, and to the necessity therefore of being well-assured that the causes of previous failures have been overcome. Gas is thus prepared, it is said. it is said, at 1s. per 1,000 cubic feet.

ROYAL INSTITUTE OF ARCHITECTS.

AT a meeting held on the 5th inst., Mr. Poynter in the chair, a donation of great interest and value from Mr. Henry Garling, Fellow, was announced, namely, 20 folio volumes, including an early edition of Palladio (1570); Hamilton's Vases; Original Designs, by Lewis; Chambers' Civil Architecture, 3rd edition, with autograph of the author; W. Addam's designs (of Edinburgh); Gibb's works; and Rondelet's Traité Théorique et Pratique de l'Art de Bâtir. The AT a meeting held on the 5th inst., Mr. chairman very properly commented on the excellence of the quality as well as the number of the works thus liberally presented by Mr. Garling

The library of the institute is now becoming very extensive and excellent, and will, it is to be boped, be made good use of by the students. Mr. John Edward Gregan, of Manchester, was

elected a Fellow.

Mr. Scoles then read a paper "On the Topography and Antiquities of the City of Jerusalem," the principal portions of which we shall give in extense hereafter. In the course of it, the writer alluded to Mr. Fergusson's published theory as to the Mosque of Omar and the Church of the Holy Sepulchre, and and the Church of the Holy Sepulchre, and that gentleman being present, an interesting discussion ensued. Mr. David Roberts, R.A., (some of whose capital sketches were amongst the illustrations of the paper), joined in questioning Mr. Fergusson, who stood gallantly and good-naturedly a cross fire of objections.

Mr. Fergusson's views, as we gathered, may be briefly stated thus: namely, that the building known as the Mosque of Omar is, in truth, the Church of the Holy Sepulchre, and that what is called the Church of the Holy Sepulchre, and was burnt in 1808, was a building not carre, and was partial in 1800, was the carrier than the 12th century. His principal reasons for the first part of this belief are, that the so-called Mosque of Omar is unquestionably a circular Christian building of the time of Constantine, and is built over a rock standing up 15 feet from the floor, with a cave in it; further, that it could not have been a mosque, its shape and arrangements heing contrary to the requirements of the religion. In reply to the question, at what period was the truth lost sight of and the title of Church of the Holy Sepulchre given to the edifice which now bears it, Mr. Fergusson said about 150 years before the Crusades.—Mr. Scoles did not believe that the Crusades.—Mr. Scoles du not believe that the (so called) mosque of Omar was of the age of Constantine; the main arches were slightly pointed. He had never seen a pointed arch as old as Constantine. He considered that the columns used were from a more ancient buildcolumns used were from a more ancient building, but the structure itself was of a comparatively recent period.—Mr. Fergusson contended that the arches being pointed in no way weakened his opinion; he had elsewhere shown that the pointed arch, from 800 years B.C., had been the arch of that country—that is, the horizontal arch bracketed inwards to a is, the horizontal arch bracketted inwards to a

The Dean of Westminster, with reference to

a specimen of the stone of which the walls of Jerusalem are built, remarked that the stone in some of the most ancient buildings was not from beds of ancient formation, but from those which were actually in course of formation at the time, and which were taken from the quarry while ductile, and indurated afterwards. The temples at Pœstum, known as antiquities by the ancients themselves, were of limestone, the formation of which is still going on,—an imperishable material.

IMPROVEMENT OF OVENS.

I HAVE long been anxious to turn the attention of practical men to a most important improvement in the construction of bakers ovens. In a word, in place of the close un-wholesome oven now in use, I propose to substitute a ventilating one, securing at once the health of the journeymen, and saving a large quantity of a very valuable product, alcohol, to wit. The recent discovery by M. Violette, to wit. The recent discovery by M. violette, of the carbonization of wood, by means of heated steam, is greatly calculated to further this desirable innovation. By means of steam heated to 480 degrees Fahrenheit, it has been ascertained that the dough is converted into a light, fragrant, well-baked, and well-tasted loaf. There is no risk attendant on the process, as the steam, after coming in contact cess, as the steam, after coming in contact with the bread, is suffered to escape, loaded with all the impurities emitted by the bread, not into, but beyond the precincts of the bakeshouse. The steam is generated by a helix, or spiral iron tube, placed in a common furnace, which would be the process of th spiral from tuoe, placed in a common turnace, which would further serve to heat the oven, and economise the steam. The other important economical applications of M. Violette's discovery, in roasting coffee, cooking, in the seasoning of timber, in the pharmaceutical and other arts, I do not here propose to enlarge on. HENRY M'CORMAC, M.D.

SCULPTURE IN RELATION TO MODERN MEANS AND REQUIREMENTS.

AT a conversazione held in the Royal Institution, Manchester, last week, Mr. George Wallis delivered an address on the subject, and urged that our artists should use English and urged that our artists should use enginent instead of Greek eyes. He thought the artist should go to nature, but if so, it was essential he should read nature for himself: that he should not do it without availing himself of should not do it without avaiing must be the tests and aids which those who had preceded him were able to give him was true, but to bind himself down to the forms of expressions available of the was been as a constant. sion produced before him was wrong. If he did so, he thought in a groove which he could not get out of, for he found himself pressed on by the standard set up for him, and he could not give vent to his genius for the realisation of the works he proposed to accomplish. He must look to the productions of antiquity as the standard by which he was to work in the spirit of his own time. Hence it was that the artist should seek objects from his own times, from his own religion, and for his own times, and endeavour to realise them: he said this of painting as of sculpture. We heard an ontery for originality in art, but they who joined in it forgot that when a new work was produced, it

forgot that when a new work was produced, it was criticised and judged of by an antique standard, for which we went back to the past. Speaking of modern architecture he said,—Beauty had not been considered to any extent, and where originality had been studied it had run into absurdity rather than beauty. One great cause of this want of beauty was that we were trammelled by fiscal restrictions, and until we could mould bricks into forms and shapes, with which we could produce and shapes, with which we could produce and snapes, with which we could produce beauty in a building, we must be content to go on with square bricks made according to an exciseman's notion. In speaking of sculpture he was not alluding to mere marble statuary, but to all works in any material capable of carrying fixity of shape. Within the last century the mechanical arts had progressed to an extraordinary degree; new materials had been discovered, in which works of art could be produced, and of which the ancients had never dreamt. We had means of production which, fifty years ago, would not have been conceived, and, with them, means of adapting forms of beauty to objects of utility. By

getting our sculptors to pay more attention to the generalization of their art, and the diffusion of that beauty which they had been too apt to consider as merely applicable to one department of it, we should produce such an effect on the public taste, as would educate the people to appreciate its higher developments. But to suppose that no man was a sculptor unless he was a carver of marble, was to the term in a confined sense.

In the course of a discussion which ensued, In the course of a discussion which ensued, Mr. Wallis, remarking that we could not expect the public to give reward unless their minds were educated, said,—Our institutions were not fulfilling the purposes for which they were established; our schools of design were only drawing achieved. only drawing schools, and far from inculcating originality of conception or thought in the student, simply taught the mechanics of the art and nothing more.

THE NEW HALL, &c., PEMBROKE COLLEGE, OXFORD.

Various additions have lately been completed in Pembroke College, Oxford. Our engraving is a view of the new hall, which forms the western side of the new court there. This is a room 74 feet 8 inches by 27 feet, and 42 feet high from the floor to the ridge of the roof. The hall is divided into six bays, one of which, at the extreme end, where the dais is placed, is a trifle wider than the others. The main ribs of the roof spring from stone The main ribs of the root spring from score corbels, ornamented with roses, the badge of the college; the spaces between the ribs are filled with tracery, and the wall plate is carved with shields and roses alternately. The roof is surmounted with a lantern, constructed with view to obtain ventilation. The hall is lighted by four four-light windows on each side, two lights in height, and also by a large bay window on the dais, of eighteen lights. All these windows are to be filled with stained glass, which is to be executed by Messrs. Chance, of Smethwick, near Birmingham. The dais window has a stone groined ceiling on the inside.

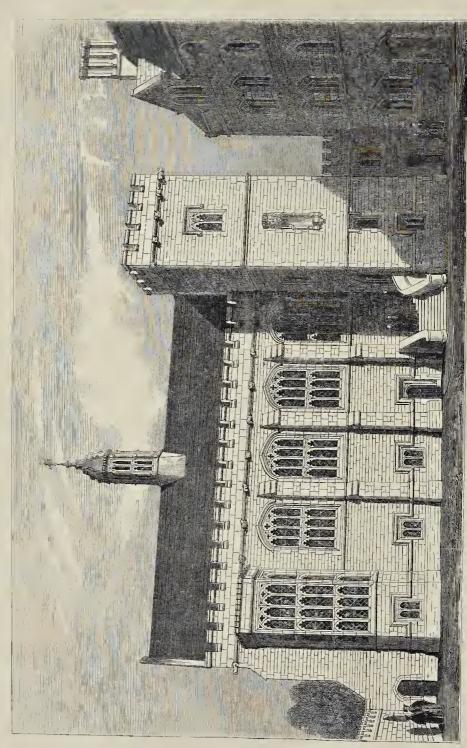

The hall is warmed by a fire-place on the west side, with a carved chimney-piece of Painswick stone, containing the arms of the college; and likewise by an apparatus in the basement, from which a constant stream of temperated air is passed into the hody of the The northern end is divided off by an oak screen, surmounted by a gallery, and the whole room is lined with wainscot panelling 8 feet in height. The entrance is by the tower 8 teet in neight at the north-east angle, forming an open perch, groined with stone, the external doorway of which is at a right angle, by which direct draughts of air are avoided.

In the centre of the ante-hall, behind the screen, is the buttery hatch, and further on the service-door for the kitchen, which, with the other offices, is placed in the basement, under The access to the tower archway is the half. The access to the tower archway is hy a flight of steps, seen in the view. The range work of the hall is of Bladon stone, and the dressings of Bath stone, from Combe Down.

The northern side of the new quadrangle, of which a part is seen in the view, consists of entirely new buildings, containing a bursary, common-room, lecture-rooms, and lodgings for fellows, and sixteen sets of rooms for undergraduates. The latter are less ornamental in character than the former, and separated from them by a slightly recessed building. The whole forms a pile 160 feet long.

The doorway to the fellows' rooms stands between two large bay windows, two stories in height, containing carved tracery, panelling, and shields. This building is parapeted, but that containing the undergraduates' rooms has that containing the underglatedates rooms has ornamental eaves gutters of galvanized iron. The eastern side of the new court consists wholly of old buildings, which have been made to accord with the court of which they form a

The architect is Mr. John Hayward, of Exeter. Mr. M. Arding, of London, has erected the hall and restored the cast side of the court. Praise is due to Dr. Jeune, the master, and the fellows of the college, for their efforts to improve the college committed to their care.

GEORGE GODWIN, F.R.S.

THE accompanying tables shew the physical and chemical properties of Caen stone. The specimens experimented upon were obtained direct from the quarries for this especial purpose, and may be considered fair average samples of the stone which the beds respectively produce. Of the five beds from the Allemagne quarries, three have been subjected to analysis by Mr. Richard Phillips, F.R.S. namely, the gros bane, the bane de 4 pieds, and the franc bane. It will be observed from table (A) that, as regards chemical composition, these three beds appear to be almost sition, these three total appears identical; and there is no reason to suppose that in this respect either of the other beds differs from them. The analysis of one specimen of old Caen stone, taken from the exterior of St. Stephen's Chapel, at Westminster, is placed in the table for comparison, because in general appearance, this stone resembles that employed outside the oldest buildings at Caen. It has been exposed to the usual atmospheric influences for several centuries, and presents influences for several centuries, and presents scarcely any symptoms of decay, therefore it will be interesting to see in what respects an old stone, well known to be durable, differs from the three samples obtained from the Allemagne quarries. In this instance we learn that a durable stone is composed almost entirely of carbonate of lime, with very small portions of other ingredients; whereas the franc bane, usually considered to be a perishable stone, contains a smaller quantity of able stone, contains a smaller quantity of carbonate of lime, and a larger amount of silica, than either of the other specimens.

Table (B) exhibits the avoirdupois weights of 6-inch cubes (one eighth of a cubic foot)—

a form as possible.—Eo.

† These experiments were made at Thames Bank (by the kind permission of Mr. Cubitt), with the assistance of Mr. Dines and an excellent hydrostatle press. The singular and striking difference in the results of the experiments on the gros bane is attributable to the varying strength of different parts of the stone, even in cubes of 2 inches adjoining each other in the hlock. This fact trakes the table of comparatively littlevalue towards determining the strength lost or gained by placing the blocks in a building the same way as in the bed.—Eb.

first, the weights of the specimens in the state in which the stones are usually employed for building purposes, having only been squared, and placed under an open shed, exposed to the atmosphere for several weeks.

The second column indicates the weights of the same cubes, after having been immersed in water forty-eight hours, so as to become com-pletely saturated, such weights having been ascertained immediately after the cubes were taken out of the water, and wiped with a dry

The third column contains the weights of the same specimens, after having been perfectly dried, in a hot-air chamber, for several days; in the meantime, being frequently weighed, until ultimately they ceased to decrease in

The fourth column shows the difference of weight between the same specimens, in their dried and in their saturated state; and indicates, therefore, the quantity (by weight) of water absorbed by each stone.

Table (C) shows the results of experiments relating to the cohesive strength of the stones, or their resistance to pressure, made with a hydrostatic press, under the eye of Mr. Godwin, upon cubes of 2-inch sides, in duplicate: the figures represent tons and decimals of a ton. The chief value of this table is to ton. The chief value of this table is to determine, if possible, whether any difference exists in the cohesive strength, if crushed with the pressing surfaces parallel to the horizon, as the stone lay in the quarry, or if the pressure be applied edgewise. It has long been the custom to attribute all failures of perishable stone to inattention in not placing them in the building on their natural bed. In a recent number of The Builder (309, January 6th), a correspondent, advocating the use of Bath stone for a church at Liverpool, states that, "Nine-tenths of the failures imputed to this stone have occurred through the ignorance or inattention of workmen or su-perintendents in neglecting to work the stones, so as to lay on their natural beds, which has laid the pores of the stone open to the effects of rain and frost." From my childhood this has been the universal theme of those who are half-learned in such matters. It is easy to determine the bed-way of sandstones; with reference to limestones and oolites, in the absence of fossil remains-and such things are of extremely rare occurrence in either Bath or Caen stone-I cannot discover any means of or Caen stone—I cannot cascover any means of detecting the slightest symptom of lamination, or, when once a block of Caen stone has been disturbed, of saying which way it lay in the rock. I have frequently heard this question discussed, during the last 30 years, by many

intelligent practical masons, and others conversant with the subject, who have professed their ability to determine, to a certainty, which is the hed way of a specimen of Bath or Caen stone. But, although I have grown grey in the service, I candidly confess that I am still ignorant upon the subject; and must either be extremely dull of comprehension or they be extremely dull of comprehension or they are deficient in the means of communicating this learning to a "brother chip." The importance of such precaution is generally very considerably overrated; I do not think it signifies which way a stone is fixed unless it presents a decidedly laminated structure, which scarcely ever occurs amongst the oolites. A stone of an open, powdery, and slightly cemented texture will, if exposed to the weather, decompose in a comparatively the weather, decompose in a comparative the weather, decompose in a comparatively short space of time, in whatever direction it may be fixed, or whichever surface may be parallel to the horizon.

Throughout the whole of these investigations and experiments, the utmost care has been taken to attend to the marks, indicating uppermost side of the stones, with reference to their position in the quarry; thereby to insure the greatest accuracy, espe-cially as regards cohesive strength. The table ciairy as regards conesive strength. The table of experiments now under consideration, will do little or nothing towards proving that there is an appreciable difference in crushing the stones flatwise, or edgewise, of the bed. According to theory, we might expect that they would bear a greater pressure, if applied parallel to the bed, than if edgewise; in the the table before us, there is very little difference, and in two cases out of the section. ference, and in two cases out of the seven, namely, the gros bane and the franc bane, the specimens bore a greater force edgewise than on their bed.

Were it possible to determine this question were it possible to determine this question to a certainty, so that the mason would have no difficulty in ascertaining the bed, or in working the stones for a building, so as to lay them all on their natural bed, the cost of masonry would then be greater, because he would frequently have to cut the blocks to a great disadvantage.

† This, so far as we know, is the first analysis of the Cae stone which has been made. Considering that an analysis would be useful to the public, we solicited this from the Museum of Economic Geology, for which the public pay. The director of this establishment, however, considering perhaps that it was rather to benefit ourselves than the public that the application was made, declined to comply with it. We do not quarrel with the decision, but we with it. We do not quarrel with the decision, but we have been more graduated that a contrary course would have been more graduated that a contrary course would have been more graduated that the public and outstand help thinking, nothing more than the public and outstand the professional assistance of a gentleman (connected too, with the Museum), in whom our readers will place confidence, Professor B. Phillips, and, though probably the half-dozen lines of the result of his investigation, will not lead to the sale of as many additional copies of THE BUILDER as they cost guineas to obtain, the occurrence will, we trust, serve to show our anxiety to place the subject before our readers in as perfect a form as possible.—Eo.

‡ These experiments were made at Thames Bank (by the

BIRMINGHAM WORKHOUSE COMPE-TITION

THE voting in committee on the seven selected plans terminated thus:—Mr. Hemming (Birmingham), 17; Messrs, Drury and Bate-man (Birmingham), 16; the rest no where. The greatest dissatisfaction prevails, and has caused a shower of letters on us, containing charges against various parties. Both the plans on which the question ultimately turned are by ex-members of the board, whose places

are positively not yet filled up.

It remains to be seen if the Board will ratify the decision of the Committee without further investigation,—we hope not. The selected plans may, for aught we know, he the best submitted, but unquestionably the circum-stances attending the selection are most disreputable

The following is suggested by a correspondent as a course to be taken :

1st. That a requisition, signed by all the competing architects, he addressed to the Board of Guardians, requesting them to appoint three architects of reputation, from a list to be submitted, with instructions

2nd. To examine and report upon the several designs for the proposed new workhouse.

3rd. To select three such designs as may best provide for the accommodation of 1,550 in-mates,—having due regard to convenience of arrangement and classification; ready access between the various classes and their dininghall and chapel, economy of lahour in the working and household departments, super-vision, ventilation, and drainage; ample, but not unnecessary extent of huildings; cheer-fulness of aspect; sound, but not extravagant, construction, combined with a sufficiently ornate style consistent with the object of the buildings

4th. To make especial remarks as to the respective merits or demerits of the three designs

so selected.

5th. That the authors of the three so selected be requested to furnish such further explanations as the objections urged against their respective designs may render necessary.

6th. That the Board of Guardians, being in possession of such evidence, proceed to select such design as shall best fulfil the several conditions.

conditions

7th. That when the final selection shall have hen mad when the min selection shall have been made, the opinions of the three examining architects be printed, and the whole of the designs sent in competition be exhibited to the

ENCROACHMENT ON THE NEW-ROAD, ISLINGTON.

METROPOLITAN IMPROVEMENTS.

Whilst contemplating with satisfaction the progress of opening new lines of street, widening others, and removing obstructions, it may excite some surprise to have our attention called to a movement in the opposite direction, which demands the attention, if not the inter-

ference, of the public.

The most important thoroughfare along the The most important thoroughfare along the north side of the metropolis is the New-road, and in proportion as its importance has increased from the vast extension of buildings heyond it, which has rendered it now more an internal street than an external road, so it has been gradually encroached upon, and is likely to become, in a few years, in its central portion, more like an argidnary street than the fine case. more like an ordinary street than the fine open arenue that it was originally. The fact is, that from the corner of Osnahurg-street to the top of the hill at Pentonville, the ground in front of the house crisicalle. front of the houses, originally appropriated as gardens or open courts, has, in numerous front of the houses, originally appropriated as gardens or open courts, has, in numerous instances, been built upon, to form shops and places for husiness, close out to the foot-path, particularly between the first-mentioned point and the Hampstead-road; and a large group of shops has very recently been erected near the corner of Osnaburg-street. Thus, the view and free air are obstructed, and the openness which characterized this leading thoroughness which characterized this leading thoroughness. view and free air are obstructed, and the open-ness which characterized this leading thorough-fare is becoming gradually extinguished. For many years past I had observed the increase of this evil, and lamented it as one that could of this evil, and lamented it as one that could not be remedied or prevented, conceiving that the parties had a right so to deal with their premises, and that the public view of the matter, if it ever occurred to them, was not for

a moment weighed against the commercial or pecuniary advantages to be gained by this mode of occupying their frontage ground. Under these circumstances I was agree surprised to learn that these erections actually illegal, and in contravention of a law specifically framed for the prevention of all such obstructions; it is, therefore, not a little astonishing that the law should not have been enforced, and that it should so long have remained inoperative

The Act of the 7th Geo. IV., for the consolidation of the metropolitan roads, provides that no building shall be placed within 50 feet of the New-road, or within 40 feet of the Cityroad, on any new foundations; and gives sum-mary power to remove any such huildings as nuisances; but the powers of this Act were transferred by the 10th Geo. IV., to the respective parishes on which the roads are situated; and the result shows how inefficient are such powers when so distributed, as compared with a central body of commissioners. Where private interests are involved, and legal proceedings are necessary to carry out a public object, it is hopeless to expect the interference of a parochial vestry, unless they can be urged of a parochial vestry, unless they can be urged forward by the force of public opinion, and this certainly is a case in which that potent lever might and ought to he employed. I hope, therefore that the powerful aid of The BullDer will not be wanting on this occasion. Whilst so many thousands are being spent in widening and disencumbering our streets and wheeling and usencumbering our streets and thoroughfares, it would be a great reproach to allow one of the principal lines to be narrowed, and probably occasion hereafter a large outlay and probably occasion hereafter a mage visco-of public money to remedy an evil which the legislature had visely provided against, but the proper authorities had foolishly and cul-ple producted. Viators.

SOCIETY OF ARTS.

On the 31st of January (Mr. W. Tooke, F.R.S., in the chair), a paper by Mr. A. Claudet was read, "On the Photographometer, for measuring the intensity of the chemical action of the rays of light on all photographic preparations, and for afford-ing a present of experience of the chair of the all photographic preparations, and for anoming a means of comparing the sensitiveness of the same." The art of photography, observed the author, is founded on the property with which light is endowed, namely, that of producing a photographic effect when it strikes unon certain chemical compounds. The effect ducing a photographic effect when it strikes upon certain chemical compounds. The effect being in proportion to the intensity of the light during a given space of time, it is necessary, for the success of the operation, to be able to ascertain the exact power of the light at my next they may be able to ascertain the exact power of the light at any particular moment; and the only means of so doing hitherto possessed by the or so using hitherto possessed by the photo-grapher is the effect it produces on the eye. A few only of the rays which emanate from the sun are capable of producing on the chemically-prepared updates as a few sections. from the sun are capable of producing on the chemically-prepared surface an effect which is the cause of the photographic picture; and if it were possible to admit into a room only the rays which are endowed with the power of affecting the photogenic preparation, the objects in the room would not he visible to the eye, as the room would appear to be plunged in darkness, while the objects in it would reflect some invisible rays which are capable of producing the photographic image. The property of the photographic image. The property of absorption possessed by red, orange, yellow, and green glass heing known to photographers, and the power of admitting through hlue glass and the power of admitting through intue glass nearly all the photogenic rays which are not luminous, combined with the improvements which have taken place since the discovery of the art hy Daguerre, enable the photographist the art hy Daguerre, enable the photographist of the present time to employ a very soft light, and to place the sitter in the shade. As the result of the photographic operation depends on the intensity of the actinic rays, and also upon the degree of the sensitiveness of the chemical menagation. Mr. Claudet has of the chemical preparation, Mr. Claudet has constructed an apparatus which is not only capable of measuring the photogenic light, but of testing the sensitiveness of the chemical preparation of the Daguerrotype plate. This instrument is constructed so that a plate being placed upon an inclined plane will always fall

2 millometres, the third 4, the fourth 8, the fifth 16, the sixth 32, and the seventh 64 millometres. The photographic surface is placed at nearly the bottom of the inclined plane, under a metallic plate pierced with seven plane, under a metallic plate pierced with seven circular holes corresponding with the openings of the moveable plate containing the proportionate apertures. When the moveable plate passes before the photogenic surface covered with the seven circular holes, the light strikes upon the spaces left open by the circular holes in various intensities. The space lighted by the opening of 64 millometres will be affected by an intensity double that which is lighted by 32 millometres conducted that the following the content of the conduction of the conduct lighted by 32 millometres, quadruple that of the next under theopening of 16, and so on until the last opening, which, being only 1 millo-metre, will have received 64 times less light than the first; so that after the operation, seven than the first; so that after the operation, seven round figures, or less, according to the inten-sity of light, are represented on the photographic plate. The photographer is thus enabled to ascertain how long it will be necessary to submit the plate to the action of the light on the camera, by the length of time required to develop the seven round figures.

DRAIN BRICKS AND THE DUTY.

An application for a new trial, in the case "The Attorney-General v. Walker," on the ground of misdirection on the part of the Chief Baron, of misdirection on the part of the Chief Baron, having been made, wherein the question is, whether bricks marked "Drain," and exempted by 2nd & 3rd of Victoria, cap. 24, sect. 18, from duty, might be used in bridges over drains? the judges in the Court of Exchequer have given their opinion and pronounced for a new trial. Mr. Baron Rolfe thought that no bricks were exempt which were not immediately necessary for the drainage, and that it was not enough that the necessary for the drainage, and that it was not enough that the necessary for the drainage, and that it was not enough that the necessary for the drainage, and that it was not enough that the necessary for the drainage, and that it was not enough that the necessary for the drainage, and that it was not enough that the necessary for the drainage, and that it was not enough that the necessary for the drainage, and that it was not enough that the necessary for the drainage and that it was not enough that the necessary for the drainage and that it was not enough that the necessary for the drainage and that it was not enough that the necessary for the drainage and that it was not enough that the necessary for the drainage and that it was not enough that the necessary for the drainage and the necessary for age, and that it was not enough that the ne-cessity for the works should arise collaterally from those authorised or required for the purfrom those authorised or required for the pur-pose of draining land. Necessary works must be taken to mean "physically necessary," and such as were reasonably used with reference to the physical necessity. If the bridges and parapets were not necessary to the drain, the hricks used ought to pay duty; and it did seem that these works, though convenient and desirable did not fall within the expention. desirable, did not fall within the exemption as physically necessary.—Mr. Baron Alderson said it was clear that these bridges did not said it was clear that these bridges did not assist the drainage; on the contrary, they might impede the water in times of flood, and it was difficult to see how such works could be necessary to the drain.—Mr. Baron Parke was of the same opinion.—Sir F. Pollock, Chief Baron, was sorry to differ from the rest of the Court.—His opinion are at the said. Court. His opinion was, that bricks were exempt from duty which were used on works exempt from duty which were used on works either legally or physically necessary for the purpose of drainage. "Necessary" meant "reasonably" necessary, in his view of the Act. If a large open drain were to be made, it would be legally necessary that it should be walled in for the protection of the public, or arched over, and the arch or wall would he essential to the drain. It was the wish of the Legislature to confine the exemption to the Legislature to confine the exemption to bond fide works executed for drainage, and to exclude all which were merely collateral, and were not physically and legally necessary by reason of some legal obligations which entailed their construction on the architect in connection with the drainage. However, the works are the works are the works and the state of the construction of the architect in connection with the drainage. their construction on the architect in connection with the drainage. Here the works are executed under a public Act by commissioners. The object of the Act 2nd & 3rd Victoria was to encourage such works, and its provisions ought to receive a liberal construction; and he could not think that the Legislature meant to confine its operations to works which were merely physically necessary, and to exclude those which were legally necessary, but that it was to be extended to such works as bridges and parapets as well as to the mere watercourse of the drain under them.

EDINBURGH SCHOOL OF DESIGN.—The competition drawings. &c., at the school under charge of the Board of Manufactures, were exhibited on Friday week, in the galleries of the Board Institute of the Republications. placed upon an inclined plane will always fall with the same rapidity for each operation. The plate has seven vertical slits or openings cut in it; these are placed parallel to each other, —the first being 1 millometre wide, the second displayed in the various branches of study.

METROPOLITAN COMMISSION OF SEWERS.

A GENERAL court was held on Thursday, Ist inst., at the Sewers Court, Greek-street, Sohosquare. Lord Ebrington, M.P., in the chair.

The Metropolitan Sewage Manure Company,—In answer to an application made by Dr. Guy, and a deputation, on behalf of the Metropolitan Sewage Manure Company, a resolution was passed to the effect that, as soon as arrangements were completed, the company would be permitted to take the sewage

the company would be permitted to take the swage water from the Counters Creek sweer for agricultural purposes, for a certain specific time.

A recommendation was received from the general committee, that it would be desirable to continue Mr. Roe as the consulting surveyor of this commission of the consulting surveyor of the commission of the commissio Mr. Roe as the consulting surveyor of this commis-sion, at a salary of 2001, per annum, such amount at the end of the first year to be further con-sidered. Mr. Hale was also appointed assistant surveyor at a salary of 2001. Regulation of Business of the Commission.—

Regulation of Business of the Commission.—
A paper of suggestions, drawu up by Mr. Chadwick and Mr. Bullar, for the regulation of the business of the Consolidated Commission, was laid before the court, but no decision upon it was come to. Among the matters of most immediately pressediately pressing importance, the following works are recom-

1. The scale and details of the survey map.

2. Street cleansing.
3. The manufacture of pipes, and provision of The maintained of Promaterials,
 The house drainage report and plan.
 The Westminster general drainage reports and

plans.

plans.

6. The land drainage report and plans.

Street Cleansing by Hose and Jet.—A report by the assistant surveyor, on the subject of a variety of experiments in street cleansing by the port by the assistant surveyor, on the subject of a variety of experiments in street cleansing by the use of hose and jet, set forth that many of the streets and courts in which these experiments were performed, were, before cleansing, in a most filthy and insalubrious condition, the surface coated with mud, and strewn with offal and refuse of the most discourties are supported by the most discourties are supported by the survey of the most discourties are supported by the survey of the most discourties and the survey of the sur disgusting nature; in the interstices between the paving, and in the hollows formed by its partial settlement, stagnant fectid liquids had collected, charging the atmosphere with their offensive exhalations. The calculation made for the Strand is, balations. The calculation made for the Strand is, that the whole of the carriage and footways should be daily cleansed thoroughly for 44d, per bouse per week, including the courts adjacent thereto; and for the borough of Soutbwark, at 33d. per house per week. According to this plan, taking the number of bouses in London at 270,000, and the carriage-way to each house at 27.7 square yards, equal to a total of 7,500,000 square yards; assuming this to be a paved surface, the cost of its application daily (carriage-way and foot-way), would be 93,414. per annum; while under the present process of merely sweeping, the cost would be 171,804. per annum.

Miscellanes.

THE ARUNDEL SOCIETY.—Under this title a "Society for promoting the Knowledge of Art," has been established for the publication, to annual subscribers of one guinea, of trans lations of foreign works, or original essays, illustrating the principles or the history of art, and engravings from important examples of and engravings from important campactures architecture, painting, &c. The prospectus says,—"The machinery which has proved so effective in the cultivation of literature, science, and archæology, has hitherto been employed only to a limited extent in promoting the knowledge of art. The productions, indeed, of ancient Greece and her colonies, their edifices and their sculpture, have been illustrated by the labours of the Dilettanti Society; and recently much light has been thrown upon mediaval architecture through means of the numerous institutions devoted exclusively to its elucidation. But no such body has hitherto attempted the systematic study of the monu-ments of painting, nor of the various orna-mental arts in which the middle ages were so eminently successful: nor has any undertaken the investigation of the theoretic principles common to all branches of art, by which its efforts should ever be guided, and its achievements judged." The council includes some good names, but will need an infusion of working men.

LEAMINGTON CHURCH CLOCK.—A clock has been placed in the tower of the parish church: the dials, 7 feet diameter, of masonry conted with mastic, are painted purple, and have the surface "smalted," as it is termed, that is, strewn with pulverised or fragmentary glass. The figures, 15 inches in height, are glass. gilt.

CALIFORNIA AND THE GOLD DIGGINGS. We have purposely avoided reference to the —We have purposely avoided reactive to the gold finders till now, having a natural suspicion that the extraordinary statements on the subject which have been flying over the country, were exaggerations that succeeding accounts would correct. Nothing, however, has yet occurred to confirm the misgiving, and we must be contented to believe and wonder. Mr. Wyld has published a map of the gold regions, and some "Geographical and Mineralo-gical Notes" to accompany it. Baily, Brothers, ave issued all the information they could rake together, under the title of "The Gold Regions of California;" and now even so staid and steady a writer as Professor Ansted is carried off by the prevailing current, and has published "The Gold Seeker's Manual," which even those who do not propose to give up kid gloves and take in "washing" at California may peruse with advantage. Mr. Ansted does not think that the quantity of the precious metals will be sufficiently great to alter permanently their value. — A stimulus will be given to industry, new markets will be opened, and, unless we are deceived, England will be more benefitted in the long run by this discovery than America. The Liverpool Albion says that Messrs. Starkey, requiring a place to store goods in now going California, arranged to send one or contract was consequently made with Messrs. Vernon for one to be built of iron, under the directions of Mr. Grantham, civil engineer The warehouse is of iron, and the roof is similar to those used at railway stations. The sides and roof are thin, covered with galvanized corrugated iron plates. There are large folding-doors in the centre, and windows in the roof. The order was given on the 5th ult., and the men were fairly at work on the 9th; and on Saturday, the 3rd inst., it was entirely erected and ready to be taken down, having been constructed in the short space of twentythree working days.

ELASTIC MOULDS.—At the Sheffield School

ELASTIC MOULDS.—At the Sheffield School of Design, last week, Mr. Young Mitchell, the master, gave a lecture, illustrated by experiments, on the art of making elastic moulds. These seem to have great advantages over the old plan. The moulds may be made at small cost, and with great rapidity. That which would occupy five or six days in the modelling, was he furnished by the expect in held for may be furnished by this process in half that number of hours. The principal material used for the elastic moulds is glue or gelatine. The best fish glue will answer as well as gelatine, and is much cheaper. The material is dissolved like glue, in a vessel placed over the fire in a pot of hot water, stirring it during the process. To cach pound of the gelatine it is necessary to add three quarters of a pint of water and half an ounce of bees' wax. It is ready for use when about the thickness of syrup. The model must be oiled carefully with sweet oil, and the convention must be poured upon it while composition must be poured upon it while warm, but not boiling. Having set, it may be taken off the model. When the model is small taken of the model. When the model is small it should be placed in a shoe or case, which gives facility for shaking the mould well when the plaster is poured in, so as to drive it well into the crevices. The plaster should be fine, and in order that it may harden and set quickly, about helf the course of characteristics. about half an ounce of alum should be to each pint of water, used in mixing it. Be-fore using the mould it should be carefully oiled. Great care is required in mixing the plaster, and watching it when in the mould, for if it be allowed to remain long enough to heat, the mould is destroyed.

heat, the mould is destroyed.

HINTTO DUNDEE.—Sir: Having remarked, in your valuable periodical, advertisements for designs for a memorial to be erected on the quay of Dundee, to celebrate the landing of her Majesty there, I beg to suggest to the respected inhabitants of that flourishing town that it would be much more to their convenience, much more to their health, and much more to their credit, were they, in lieu thereof, to employ their spare cash in draining their (an operation which is very much required), and erecting certain conveniences in a more decent manner, especially as the amount they propose to spend is but a tithe of what would be required to erect a monument of the magnitude proposed, or of the style which the occasion deserves.—ONE WHO HAS USED HIS OLFACTORIES.

* Van Voorst, Paternoster-row.

RAILWAY JOTTINGS .- A new, and it is thought, improved patent express locomotive engine has recently been manufactured by Messrs. R. Stephenson and Co., and placed on the York, Newcastle, and Berwick Railway. Its driving-wheels are 6 feet 6 inches in diameter. A single stroke covers nearly seven yards in length, and the rate of speed has been found to be nearly a mile a minute.—In the formation of a locomotive, there are 5,416 pieces to be put together and adjusted as accurately as the works of a watch.—A 'pit lad' at Killingworth colliery, ambitious, no doubt, to sustain the renown of that nursery of a Stephenson's genius, has invented an apparatus for working railway breaks and preventing collisions, which the Gateshead Observer, who patronises the meritorious object of the or in providing for the public safety, describes as a substitute for the screw and lever either on tenders or on carriages. By this apparatus, each carriage being provided with a piece of cord the length of itself, having a hook at one end and a loop at the other, a whole train can be placed at the command of the engine-driver as well as of the guard, and if on the tender, it would also work the break of the engine. Every wheel could thus be locked in a moment if necessary, the apparatus exerting a retarding power six times greater than that of the ordinary break, although costing but a trifle more.——The last annual report of the Railway Mechanics' Institution, at Rugby, states that there are seventy-six members, that the library contains 260 volumes of useful works, besides 100 more to be added, and that twelve lectures are delivered half-yearly, on instructive and me-chanical subjects.—The Great Western works, from Slough to Windsor, are in rapid progress.—"There seems a fatality," says the Railway Record, "attending the en-deavours of the Great Western contractors under Mr. Brunel, to obtain an adjustment of their transactions with the railway companies. Mr. Nixon, in respect of his 'contract' works, and other or 'extra' works, for the Taff Vale and other or 'extra works, for the Tan Yane Company, many years since, claiming a balance of 9,000*l*., has just been told by the Court of Chancery, that his remedy is at law, and not in equity; but this decision has been delayed so long, as to deprive him of that leyal remedy. M'Intosh's executors, after five years' litigation at law and in equity, have lately resorted to a court of equity to take the accounts of works in respect of which half a million is claimed against the Great Western. Mr. Ranger resorted to the same tribunal, eleven years ago, against the same company, and has not yet learnt where his accounts are to be taken. The London and North-Western sent their account with Mr. Burton to an accountant last year; and the result is, that the whole has been adjusted! The Manchester and Southampton sent their engineering accounts with Mr. Freebody to a referee, not a lawyer, and the result was equally favourable."

PUBLIC LIBRARIES.—We are glad to see that Mr. Ewart is about to move for a select committee upon the public libraries of Great Britain and Ireland, with the view of securing means for their improvement and extension.

Splitting Bank Notes.—Mr. Editor: Knowing you to be a firm friend to the working class, induces me to trouble you with this statement, that the process of splitting a bank note, or any other piece of paper, is the invention of a person, a print-mounter, who was induced to try the experiment to obtain the engraving from one of the illustrated papers without the letter-press showing through from the other side. The experiment of splitting a note was first tried at the house of Mr. Anderson, the George Tavern, Lambeth-walk (or at least for him): my motive for troubling you with this is, that the world may know that a working man is the originator of the above invention, which is the result of ten years' study.—A Working Man.

A contemporary gives the following mode statement, that the process of splitting a bank

study.—A WORKING MAN.

A contemporary gives the following mode for splitting paper:—Procure two rollers or cylinders of glass, or amher resin, or metallic amalgam; strongly excite them by the well-known means, so as to produce the attraction of cohesion, and then with pressure pass the paper between the rollers. One half will adhere to the under weller and the other to the here to the under roller, and the other to the upper roller, and the split will be perfect. Cease the excitation and remove each part.

THE CITY LANDS IN LAMBETH. - Sir: The OITY LANDS IN LAMBETH.—Shr: The notice in your paper of 23rd December last has brought down the ire of the officers, who have visited the principal tenant with a distress-warrant for ren only due at Christ-mas, scarcely asked for, and that hefore the mas, scarcely asked for, and that helde in usual time, as a terror to other complainers about drainage. Here, at Lambeth, is land forming at one time part of the Marsh over-flowed by the tide (built on under leases by those who foolishly thought sixty-one years could never arrive), which is covered with property placed on it by others, and yielding tothe landlord—the city of London—thousands a-year, and yet they are a program include. a-year, and yet they are so narrow-minded as to refuse draining any of the houses into the common sewers at their expense; and those tenants who endeavour to point out to them the propriety and necessity of it are visited with the revengeful spirit above described. It is easily the other transfer of the propriety and necessity of it are visited with the revengeful spirit above described. It is said the city has been a great obstacle to the salutary measures required for health, and this instance would seem to prove that it is truly said; for here is a case of the direst necessity treated with the meanest harshness, because it brought under their notice. I inclose my

card.—Another Sufferer. Builders' Foremen's I BUILDERS' FOREMEN'S INSTITUTION.— In reference to the report of the annual din-der of the Provident Institution for Builders' der of the Provident Institution for Builders' Foremen, which appeared in your last publication, I beg you will add the following handsome donations:—Mr. Cooper, 2l. 2s.; Mr. Stirling, 2l. 2s.; Mr. W. Trego, 2l. 2s.; Mr. Stirling, 2l. 2s.; Mr. W. Trego, 2l. 2s.; Mr. Ede, 2l. 2s.; Mr. Taylor, 2l. 2s.; Mr. Husler, 2l. 2s.; Mr. Dowell, 2l. 2s.; The Chairman, 1l. 1s.; Mr. Dowell, 2l. 2s.; The Chairman, 1l. 1s.; Mr. Withall, 1l. 1s.; Mr. T. Eden, 1l. 1s.; Mr. Edw. Eyre, 1l. 1s.; Mr. C. Haynes, 1l. 1s.; Mr. Brown, 1l. 1s.; Mr. Rose, 1l. 1s.; Mr. Manuche, 1l. 1s. Sevgral of the donors gave in their names as contributors of one guinea per annum to the provident fund. The stewards are anxions publicly to return their sincere thanks to the numerous donors their sincere thanks to the numerous donors and friends who responded to their invitation, and beg to assure them they close their labours with a deep sense of grati-tude for the honour conferred on them by so respectable and numerous an attendance; and also for the very great assistance contributed to the Provident Fund for the Benefit of Aged and Decayed Builders' Foremen. - W. ALLARD. Secretary.

ELABORATE SILVER VASE IN THE ETRUS-ELABORATE SILVER VASE IN THE ETRUSCAN FASHION.—A German workman (Antoine Vechte) in the employment of Messrs. Hunt and Roskell, has lately completed an alto-relievo richly wrought or embossed silver vase, the result of three years' labour, and mainly representing, in anatomical and other forms, the destruction of the Titans by Jupiter. The shape is Etruscan, of elegant contour. It is about 32 inches in height, with a cover and about 32 inches in height, with a cover and two handles, and measures from handle to handle 133 inches. Round the body of the vase are numerous groups of giants, climbing, falling, &c., while the handle or knob of the cover is in the form of Jupiter Tonans. Every portion of the surface is wrought in different grades of high and low relief. The article was commissioned by the artist's emnlovers, and is on sale for 2,0001.

ployers, and is on sale for 2,000.

Town Hall for Cork.—A town hall is about to be erected in Cork, but there seems to be some difficulty in finding an appropriate site. A laudable anxiety is manifested in the city that the building should be worthy the age, and well placed. age, and well placed.

DECORATION OF THE QUEEN'S ROBING ROOM.—The eighth report of the Commission on the Fine Arts, which has just been published, informs us, that the commission is ready to enter into an agreement with Mr. W. Dyce, R.A., for the decoration of her Majesty's robing-room in the palace at Westminer, with fresco illustrations of the legend of ing Arthur. Mr. Dyce undertakes to com-King Arthur. Mr. Dyce undertakes to complete certain stipulated works within a period of six years, for which he is to be remunerated (as proposed) at the rate of 800*l*. a-year.

(as proposed) at the rate of 800. a-year.

Plan of Clapham, Surrey.—Messrs.

A. and R. Bland, Charlton, Kent, have just now completed an engraved plan of the parish of Clapham, in the county of Surrey, on a large scale.* It shows every house, gives a section, and is altogether a free thing.

* Published by Batten, Clapham Common

PROPOSAL FOR A STATUE FOR JENNY LIND.—A correspondent, "W. Tomlinson," of Norwich, proposes that the inhabitants of that city should testify their gratitude to this lady (not more distinguished by her vocal power than by her benevolence and goodness), by erecting a statue to her, and he offers a subscription of 51 towards it. A proposition at present current in Norwich, to place a picture of Miss Lind in St. Andrew's Hall, he does not think a sufficient return for the immense assistance to the local charities afforded by her. If not a statue, he suggests a conby her. If not a statue, he suggests a commemorative window in the cathedral.

ARCHITECTURAL EXHIBITION.—The exhibition of architectural works determined on by "The Architectural Association," is fixed to take place in March next, at the gallery of the new Society of Painters in Water Colours, in Pall Mail. The committee will be prepared in Pall Mall. The committee will be prepared to receive, during the latter part of the present month, drawings of works contemplated or in month, drawings of works contemplated or in progress; designs submitted in competition during the year; studies and defineations of existing buildings and antiquities, and architectural models. The drawings should be either in frames or upon strainers. Considering the elevation of their art, by the diffusion of taste amongst the public, to be no less an object than the direct advantage of the profession, the society have determined to constitute the exhibition free, with the execution of

the exhibition free, with the exception of Saturdays. We hope they will receive the cordial co-operation of the profession.

RATING OF RAILWAY PROPERTY.—Endeavours are being made by the principal railway companies to obtain a remission of local taxation; they completely greatly effects. way companies to obtain a remission of local taxation; they complain greatly of the present system of assessments. A deputation of the chairmen of some of the companies had an interview lately with the chief Poor-law Commissioners on the subject. According to Herapath, the ten principal railways pay, on the average, the following sums per acre per annum for parochial taxes:—London and North-Western, 13l. 6s.; Great Western, 9l. 16s.; Lancashire and Yorkshire, 14l. 10s.; Midland, 7l. 6s.; York and North Midland, 5l. 14s.; York, Newcastle, and Berwick, 4l.; Eastern Counties, 4l. 12s.; South-Western, 7l. 16s.; Brighton, 10l. 14s.; Dovr., 14l. 6s. RAILWAY COMPENSATION.—Lancaster.

RAILWAY COMPENSATION .- LANCASTER AND CARLISLE RALLWAY.—According to the local paper, a trial took place, January 23, at Carlisle, before a special jury, to assess the value of six acres of land belonging to the Warryand Carlisle, Buil. value of six acres of land belonging to the Maryport and Carlisle Railway Company (now in the possession of Mr. Hudson), but which were required by the Lancaster and Carlisle Railway Company. Mr. Hudson, on behalf of the Maryport Company, first demanded 100,000l.; he then called about a dozen witnesses, who valued it at sums varying from 75,000l. to 79,800l. The Lancaster and Carlisle Company had previously offered 7,005. 75,000. to 79,800. The Lancaster and Car-lisle Company had previously offered 7,005. for the land. The jury, after two days' inves-tigation, gave a verdict for 7,171. Can this be correct? We run no risk of being in error

when we answer, no.

Preservation of Timbers.—A contemporary says,—that in taking down, a few years ago, in France, some portion of the ancient ago, in France, some portion of the ancient chateau of the Roque d'Ondres, it was found that the extremities of the oak girders, lodged in the walls, were perfectly preserved, although these timbers were supposed to have been in their places for upwards of 600 years. The whole of these extremities buried in the walls were completely wrapped round with plates of cork. When demolishing an ancient Benedictine church at Bayonne, it was found that the whole of the fir girders the whole of the nr girders were entirely worm eaten and rotten, with the exception, however, of the bearings, which, as in the case above mentioned, were also completely wrapped round with plates of cork. These facts deround with plates of cork. serve to be inquired into.

Prn-IIOLES IN IRON.—A correspondent from Sheffield says,—Can any of your scientific correspondents inform me what will prevent metal castings \(^1\) of an inch thick from the cupola, from heing, when ground and got up bright, full of small pin-holes \(^2\) Pig-metal from nearly all the blast furness; in the state of the property of of th from nearly all the blast furnaces in the three kingdoms, has been tried and variously mixed, but none appears free from them. If any composition or material can be named to prevent it, it will confer a lasting benefit on iron-

PROJECTED WORKS .- Advertisements have PROJECTED WORKS.—Advertisements have heen issued for tenders, by 26th inst., for huilding a new grammar school at Lichfield; by 20th, for the repair and restoration of the chancel and chancel aisles of the Collegiate Church of Wimborne Minster, Dorset; hy 12th, for the erection of offices and workshops for the Liverpool United Gas Company; by 18th, for the whole works in building a new 18th, for the whole works in building a new market-hall and corn-exchange at Lichfield; by same date, for the whole works in building a new savings' bank at Lichfield; by 23rd, for the results. a new savings' bank at Lichfield; by 23rd, for the maintenance of the permanent way of the Chester and Holyhead Railway; by 15th, for the execution of a viaduct in St. Paneras Parish; by 1st March, for the supply of 20 cattle waggons of East-India teak for the Great Northern Railway; by 3rd May, for supplying the Government dock-yards with cast-iron articles for twelve months' certain; and have a date not specified. for a condensing and have a date not specified. for a condensing and by a date not specified, for a condensing engine of 12 to 16-horse power, and one of 6 to 8-horse power, 30 tons of rails, and 160 of 9-inch pumps, at Leeds.

ELECTION OF THE CITY COMMISSIONERS
TO THE METROPOLITAN COURT OF SEWERS.

On Thursday a Court of Common Council —On Thursday a Court of Common Council was held, when the subject of the appointment of four commissioners to the Metropolitan Court of Sewers, to represent the interests of the City of London, was resumed. On behalf of the Court of Aldermen, the names of Alderman Lawrence and Alderman Humphrey. were proposed, but the former was elected by were proposed, but the former was elected by a large majority. Various gentlemen being proposed seriatin to fill the offices as members of the Court of Common Council, a very decided show of hands was in favour of Mr. Deputy Harrison and Mr. Deputy Peacock, but the Lord Mayor said the show was so nearly equal between Mr. Norris and Mr. H. L. Tavlor, that he was mable to teste. nearly equal between Mr. Norris and Mr. H.
L. Taylor, that he was unable to state on
whom the choice lad fallen. A second show
was then taken, which his lordship declared to
be in favour of Mr. Norris; therefore the new
commissioners are Mr. Alderman Lawrence,
Mr. Harrison, Mr. Peacock, and Mr. Norris.
SIR HANS SLOANE'S MONUMENT.—Happening to pass the old Chelsea church, which
stands at the end of Cheyne Walk, Chelsea,
where rest the remains of Sir Hans Sloane, I
stopped to read the inscription on the monu-

where rest the remains of Sir Hans Sloane, I stopped to read the inscription on the monument, which occupies a prominent position in the churchyard, close by the roadside; but, alas, it was with difficulty I could do so; the letters are all but obliterated. The monument itself is simple and imposing, and the inscription appeared to be equally so. Would it not be desirable to call attention to its state in your capable injurnal in order that some of the more valuable journal, in order that some of the more public-spirited of the inhabitants of that *locale* may be induced to subscribe a few shillings to have the letters re-cut deep into the stone before it is too late to decipher them?—ANTI-QUARY.

DURHAM COLLEGE LIBRARY AND MU-SEUN.—For architectural or other remains, a room nearly 200 feet long and of suitable breadth and height, is to be added to the library of the dean and chapter, by the appropriation of some of the old conventual apartments adding research by the adding to the state of the second se ments adjoining, vacant by the death of Dr. Wellesley, one of the prebends.

No. CCCXV.

SATURDAY, FEBRUARY 17, 1849.

OOR Architects! Or perhaps we should be nearer right if we said, stupid architects for the indignities to which they are now constantly subjected, have

been mainly led to by their own proceedings. The workhouse plot at Birmingham thickens. Private interest fighting against private interest led to disclosures at a meeting of the guardians, on the 6th, which otherwise, probably, would not have come out. The opposition to the selection made by the Committee appears, on the part of some of the guardians, to be no evidence of a desire to do justice to all the competitors, and discharge their duties conscientiously, but would seem to proceed simply from a desire to serve their own particular friend. Thus one of the committee stated at the meeting, that the sole reason why another member of the Board opposed plan No. 1, was, that his son was in the office of the architects of No. 2. It is to be hoped, however, that a majority of independent men will be found to look at the question in its proper light, and act irrespectively of private feelings and connections, so as to remove, if possible, the stigma which has been cast upon

It would seem that the fraud practised on the stranger-architects, who responded to their invitation, was systematic, and intended from the heginning. One of our correspondents shows that, even in the matter of time, the leaning to their local friends was evident. He says, as to depositing the plans .- "It was stated in the instructions that all plans must be sent in on or before the 1st of January, at twelve o'clock; and further, that all plans received after that time would not be looked at, but put on one side till applied for by their respective owners. Now this, one of the most important conditions (for a day is of infinite value in finishing such elaborate drawings as they must necessarily be for a building of this magnitude), was violated, and altogether set on one side by keeping the office open till eleven P.M.; and no notice of this was given to the competitors (excepting, of course, the Birmingham men, all of whom were fully aware of it), unless something like the following, which I received the day after my plans were deposited :- Requiring some explanation respecting the site, I wrote to the person appointed to furnish architects with particulars : I received an answer on the 2nd, with the necessary information, and also informing me of the extension of time to eleven P.M. I am sure no non-resident availed himself of this desirable extension,-for, upon depositing my plans, which I did some time before 12 on the 1st, I was told they were the forty-seventh. The ahove answer to my letter, coming on the 2nd of January, was certainly an Irishism, but whether wittingly or not I cannot say.**

* The same writer, who forwards his name, says,—" One thing more I would allude to, viz., the manner in which the committee came in possession of the names of the competitors. The instructions stated that each design was to be accompanied by a scaled letter, containing estimate, &c. Now I understood from this, and I am sure many others did but it appears that it is more to be sent in under a motto; but it appears that it is more to be sent in under a motto; but it appears that it is more than the property of the property

Even the strict prohibition from canvassing the guardians, which was published, must have been for the purpose of deterring the strangers only from endeavouring to make interest, for the canvassing on the part of the local architects, and of members of the Board for them, is not denied.

This view of the matter was fully borne out by one of the speakers at the meeting alluded to (Mr. Allday), who pointed out, at considerable length, the injustice which had been done to architects at a distance from Birmingham, "Those architects," he said, "were called on to prepare and send in plans; they were led to helieve that there was no limitation as to the expense of their buildings, while it was a fact that the Birmingham architects well knew that it was an understanding in the committee that the estimate should not exceed 30,000l. Was that fair? And yet he could shew that it was not an accidental thing; that the omission of such a fact was intentional. It was moved in the committee that the printed instructions should set forth that the estimate should not exceed 30,0001., but that motion could not be entertained. That was not doing justice to architects at a distance. If they had known this fact, as the local architects knew it to be a fact, did any one think that the architects in London and other places would have sent in plans varying in cost from 80,000l. to 30,000l. ? He could state it to be a fact, that the majority of the plans sent in were estimated at more than 30,000l., and some of them, of the most perfect and beautiful description, were rejected because they did not come within that sum. He left that fact before them; and, in his opinion, it gave ground for the charges made in the Birmingham Journal and THE BUILDER, that the majority of the architects had not had fair play."

"Comment," says the Journal, with reference to this striking new feature in the case, "would spoil the effect of this revelation. We had formed and expressed a very strong opinion on the mala fides of the proceedings, but no such deliberate trick as the above entered into our imagination. The knowledge of it should be sufficiently condemnatory of the whole transactions of the Committee from first to last; for it is quite evident that the omission was designed to lead competitors into error."

After much discussion, Mr. Edmonds, one of the guardians, moved—"That with a view to obtain further information, and more certainly limiting the cost of the new workhouse within the reasonable expectations of the ratepayers, the report be referred back to the Committee, who for that purpose shall be authorised to procure the written opinions of architects or builders of reputation, as to the relative merits of such of the plans as are not excluded from competition by the printed instructions, together with the grounds on which such opinions are hased; that on the receipt of the opinions so obtained, the committee proceed to report to this Board their opinion of the plan which ought to be ultimately selected; and that the opinions of the architects and builders be published in our local newspapers, for the information of the ratepayers." This was discussed at considerable length, and ultimately the meeting was adjourned to Tuesday, the 13th, but what was then done we do not yet know.

It appears that no less than 264 architects applied for copies of the printed instructions to competitors,

According to the report of the committee the estimated cost of the plan recommended is

27,700l., or at the rate of 16l. 15s. per head for 1,664 inmates. The accommodation is for 258 male, and 351 female adults; for 227 boys, 289 girls, and 143 infants. In the infirmary, provision is made for 159 males and 159 females. There is also accommodation for 26 male, and 26 female tramps, and for 22 married aged couples. There is a chapel, two separate dining halls, three separate schoolrooms, with two class rooms attached to each. The style was said by the committee to be Italian, but this some of the speakers denied, saying it was Elizabethan, and that this assertion was itself sufficient to prove the inefficiency of the tribunal by whom the plans had been judged. Alas! poor architects and poor architecture!*

But ahuse is thrown away, and pity is thrown away. See what the committee for restoring the Lewes Free Grammar School have the impertinence to make public. We were about to say the courage to make public, but it needs no courage. Architects have lost all proper spirit and self-esteem. The advertisement is directed-"To the Architects and Builders of Sussex," and stands thus,—"The architects and builders of Sussex are invited to furnish plans and estimates for rebuilding the Lewes Free Grammar School at an expense not to exceed 2,000 l., to be prepared according to instructions from a sub-committee already organized for that purpose, which instructions may be had on application at the office of Messrs. 'Gull and Co.,' to whom such plans and estimates are requested to be delivered on or before the 27th of February next. The architect or builder whose plan and estimate shall be finally adopted, will be entitled to a remuneration not exceeding ten pounds ten shillings, at the discretion of the committee."

A remuneration! mark that, ye rising Wykehamsand little Wrens. "Remuneration" means, according to the dictionary, reward, requital, recompense, but what does it mean according to these gentlemen of Sussex, on whose "discretion" architects are to depend? Why, it means, the remote chance of getting, for the work done, not one-fifth of what ought to be received for it without any risk at all. It marks the status the profession enjoys: it shows the contempt in which architects are held. A thing is worth what it will fetch, they say. If your talent is to

what it will fetch, they say. If your talent is to

he estimated by what it fetches at Lewes, it is We are too much out of small indeed. humour to discuss the matter further, and will only say to those who may he tempted hy this "remuneration" to make plans and estimates for rehuilding Lewes Free School, what we exclaimed at the commencement, -stupid

It has been suggested to us at various times that some of the best architectural subjects given in THE BUILDER, if printed in a superior manner on good paper, with the accompanying descriptions, plans, &c., and issued periodically, would form a work that would be acceptable not only to those who are not buyers of THE BUILDER, but to many who are, -the current engravings being often creased by the news vendors or otherwise injured. We are disposed to try the experiment, and to puhlish, in a neat wrapper, under an appropriate title, about eight plates, with eight pages of letter-press, folio size, every second month, price half-a-crown. The first part would consist of Oshorne House, with plan; Bridgewater House, plan and details; Church of St. Isaac, Petersburgh; Kensington Union Workhouse; Pembroke College, Oxford; the Liverpool Branch Bank; and the north porch of St. Mary Redcliffe, Bristol. Before determining upon the scheme, however, we should he glad to receive the names of such gentlemen as would he willing to become subscribers to the work.

THE NEW "PRINCE'S THEATRE ROYAL," GLASGOW.

In case they may happen to contain some points of practical interest to readers of The Bulder, I have thrown together the few following particulars of the construction of this theatre; and which may, perhaps, serve to elicit further information on the general subject from those who have had occasion to direct from those who have had occasion to direct their attention to it.

The premises which have just heen converted. were erected, under my direction, about two years ago, for the exhibition of certain dioramic years ago, for the exhibition of certain dioramic pictures by the brothers Daguerre. In planning the original structure, I recommended to the proprietor, in regard to its stability and permanency, that instead of limiting it to the probable existence of the diorama exhibition, it should be made capable of being finished interiorly in an architectural manner, and adapted to the purposes of a public hall, in which I considered the locality stood in need. Accordingly, the mode of construction adopted consisted as follows:—Two-feet coursed-rubble stone walls were erected to the

adopted consisted as follows:—Iwo-teet coursed-rubble stone walls were erected to the height to receive the floor, which is 13 feet above the ground line, leaving the entire area underneath clear, excepting the posts and pillars carrying the floor heams, and to he appropriated to another purpose. Upon these walls unas set a massive framing of timber, consisting lars carrying the floor heams, and to he appropriated to another purpose. Upon these walls was set a massive framing of timher, consisting of a cill plate, 12 inches by 9 inches; angle and intermediate posts averaging ahout 12 erect apart, and measuring 12 inches by 12 inches; and a head plate 12 inches by 6 inches, the posts heing tenoned at top and hottom into the plates, and braced up with struts 9 inches hy 6 inches where they occurred over openings in the stone walls beneath, in each of which cases the cill was sustained by the post above with a strong bolt, in the same manner as the tiestrong bolt, in the same manner as the tie-beam of a roof. The spaces in the framing were filled in with 9-inch hrickwork, the con-nection of which with the posts was insured by the insertion, midway in its thickness, of tongues of wrought iron, ahout 10 inches by 5 inches, and \(\frac{1}{2}\) inch thick, having a long spike at one end for driving into the posts, into which they were inserted at short intervals, of course edgeways. The roof, in order to its being edgeways. they were inserted at short intervals, of course edgeways. The roof, in order to its heing of a lightness suited to the walls, I formed something like the deck of a great ship, namely, a platform, with an external camber of—say 10 inches; in construction it consisted of trussed timher heams spanning the width of the huilding, placed coincident with the posts in the

side walls, and carrying joists 9 by 2, about 4 feet from centre to centre, these in their turn carrying inch floor hoarding, the joints grooved and tongued in the lower, and caulked with oakum in the upper part, then covered with strips of zinc, put on with zinced tacks, and the entire surface payed over with tar, lime, and sand, and finished with a coat of white, in order to its reflecting the sun's rays. The space thus enclosed measured 80 feet by 63 feet, and 33 feet high from floor line to top of wall framing.

feet, and 33 feet high from floor line to top of wall framing.

The truss beams were as follows: each consisted of two 12 by 5 flitches in the width, and these in two equal pieces in the length, well scarved and keyed together. These were set two inches apart, making the heam 12 inches square; and they rested, at the scarves, upon a cast-iron hearing-plate, 30 by 12, having a central hearing upright tongue, a few inches high, occupying the space hetween them. On either side of the plate was a square stuh for either side of the plate was a square stuh for preventing its moving longitudinally, and along the centre below was a semicircular groove for containing the tension rod, which was of twoinch round iron, and passed under it. This
compound heam was, at its extreme ends, inserted into a cast-iron hox, having flanges
helow, outside and inside the head plate of
the wall framing, and a strong cylindrical
sloping part on the top, at the back of which
the tension-rod, which was passed through it,
with screwed ends, was secured with a nut at
least 4 inches long: at intervals hetween the
end hoxes and central hearing-plate, were introduced between the flitches circular blockings 6 inches diameter, and 4 inches thick,
sunk an inch into the timber on either side,
through which the flitches were holted together: in the hoxes they were kept apart hy a
piece of 2-inch hoard. Where the upper edge
of the hoxes would have hit deeply into the
wood, upon the tightening of the tension rods,
a piece of hoiler-plate (malleable iron), was introduced; and where the end grains at the
scarves would have penetrated each other
from the same cause, that is, in the under
joints, pieces of sheet-iron were inserted. On
the other hand, the upper joints of the scarves,
the tendency of which was to open, were
strengthened with plate-iron and bolts; the
heams were tied down to the wall framing, by
holts passing diagonally through both: for a
few feet at hoth ends, the tension-rods were
increased in diameter, so as to preserve the
solid part of the screw the full 2 inches.

In the screwing up of these heams, I had an
opportunity of observing an effect of which containing the tension rod, which was of two inch round iron, and passed under it.

In the screwing up of these heams, I had an opportunity of observing an effect of which those trussing cast-iron beams of similar construction might remain in ignorance, namely, a decided tendency to turn up at the ends, caused by the tension-rod proceeding in a downward inclination from a point above the

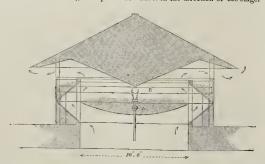

suspension, the strain thus produced must in suspension, the strain thus produced mine in some instances he dangerous. Shortly after the completion of the huilding, in order to allay the anxiety of the timid, who looked with some dread at the wide expanse of flat roof, and having sufficient space, I put in struts at either end, with straining-pieces between their heads, and another tye-rod at their feet. It seems strange that, notwithstanding its having heen years ago ascertained that tension-truss-ing, with a central point of support, is much stronger than with two points, inasmuch as the centre is necessarily the weakest point, engineers do yet continue the latter practice, when they could, where the span required it, employ the central supported point of their heams as a point of supension hy aid of which to truss the two halves.

The foregoing description explains the general form of the building; hut it remains to he mentioned that the diorama picture, which was selected as the first to be exhibited, was of such a size as to require that the end where it was hung should have a sinking in the floor of 4 feet in depth by s in width as and floor of 4 feet in depth hy 8 in width, as well as that the truss-heam there should be omitted, and a span-roof, with collar-tie, be thrown over the wide bay thus left in the main roof. By adopting this as the stage end, what with the elevation of the stage, its rise backwards (4) inch in the fort) and the densession in the (4-inch in the foot), and the depression in the floor, a range of dressing-rooms were obtained. The picture referred to required also an extension, on one side, of the width of the huilding, which has added to the commodiousness of the stage; and to increase the situation. the stage; and, to increase the vista in forest and other scenes, the central portion has been carried some distance hackward, in the form of a wing to the main huilding. At the side of this is a huilding containing the green-room, property-room, wardrohe, sundry dressing-

rooms, &c.

I now proceed to give some particulars of the construction and fitting-up of the theatre.

The box and gallery tiers are carried on heams, curved hy forming them in thicknesses set edgeways: these heams are 9 inches square, having eight 1½th inch hoards in their breadth. The mode of constructing them was as follows, taking the inner circle or horse-shoe. breadth. The mode of constructing them was as follows, taking the inner circle or horse-shoe, for example:—the figure being described full-size on the floor, a quantity of right-angled triangular brackets, about 15 inches hy 9 inches, were set on edge on the floor, radiating inward from the inner line, and against these the first hoard was nailed; the other thicknesses were then nailed on the outside successively, breaking joint carefully, until the required thickness was completed, when the whole was further secured together by bolting it through at short intervals, suited especially to the situations of the external cross joints. By this plan, an exceedingly tough heam was downward inclination from a point above the beam, and which, accompanied with the camber over the centre hearing-plate, produces something of a wavy form. In the present case, the distance of that point above the heam, and consequently the derangement produced, was very trifling; but in trussed-girder railway bridges which I have seen, with fins at their ends, and at the joints—the former for the very purpose of elevating the points of the external cross joints. By this plan, an exceedingly tough heam was obtained, having this advantage over a huilt one, that the grain of the wood was much less trocked, and, in a manner, run round from front, and corresponding ones at the hack, the distinct of the external cross joints. By this plan, an exceedingly tough heam was obtained, having this advantage over a huilt one, that the grain of the wood was much less trocked. Having such beams as these in front, and corresponding ones at the hack, the distinct of the walls, to countered any tendency to the beam and the produces.

whorls in the middle, over which ropes pass from a small windlass at one side, and allow the gas-pendant to be lowered, when unscrewed at the coupling, for the purpose of the glohes being cleaned, &c.

Lighting.—Credit is due to the firm of

Laidlaw and Son, of Glasgow and Edinburgh, Laddaw and Son, of Glasgow and Edinburgh, for the manner in which they have executed the gas-fittings, a branch requiring, in a theatre, more skill and ingennity than is brought into requisition in any other description of building. Two 1½ inch pipes extend round the edge of the stage, with Argand burners, chimneys, and shades to each: the burners in each pipe are 6 inches apart, but those in one row placed alternately, in relation to those in the other: the lights on the outer. to those in the other: the lights on the outer pipe have green glass chimneys, for moon-light scenes; those on the inner one, colourless chimneys for ordinary use: for melo-dramatic effects, wherein the pyrotechnists' art is commonly brought into play, I suppose red chimneys would, according to this mode, suffice. The 'gas-battens,' which light up the wings and borders, are a quarter-circle in their section, about a foot in width, and their section, about a foot in width, and their lengths suited to the beight and width of the stage openings; they are lined with galvanized sheet-iron, and hooped across in the open part, to prevent any combustible material which might flap against them coming in contact with the jets of gas, the pipe being placed in the helicus of tact with the jets of gas, to pipe in the hollow of the quarter-circle. At the prompter's place, where the arrangements are made for the raising and lowering of the lights in the stage and audience departments, the risk of the gas being turned off altogether, is obviated by having, at the stop-cock on each large pipe, small parallel pipes extending, so as to connect the large one in its two portions as to connect the large on the little state of the control of the reside, the small pipe being also provided with a stop-cock, should occasion require it. While the curtain is down, the quire it. While the curtain is down, not down to house is kept brilliantly lit up; but during berformance, the light is reduced, in order to the tablean.

enhance the effect of the tableau.

Seeing.—As regards the form of the house, it was greatly regulated in its proportions by those of the original structure; and these happily favoured the wide rather than the long form, which has the disadvantage, that the audience have a difficulty in seeing past each other, and are placed in an uncomfortable, constrained attitude, looking, as it were, askance at the stage. In taking up the subject, and considering the pitch of the different tiers, increasing, as they do, in steepness, as seen, say in the longitudinal section, it becomes obvious that the longer the central space is as compared with its width, the more must the pitch of any one tier increase in steepness in the direction from the centre round on either side towards the proscenium; for then the audience are looking more and more, as it were, into a well. This increase is usually, and most conveniently obtained by keeping the passages at the back about level, and lowering the inner beams as they approach the stage-end: by this means, the advantage is gained to the audience of seeing comfortably over each other, when looking towards the stage, as well as when looking at the lower tiers opposite them. The view from the back rows, to be perfect, ought of course to embrace the whole prosenium; this, however, it appears, involves a degree of comfort which it is not customary to attempt obtaining; the consideration being rather how little of the height of the proscenium will suffice, so as to reduce the entire height or get in the greatest number

of tiers of which it is capable,

Hearing.—The material of the ceiling is canvas, dense in quality, and rendered more so by the operations of the artist. Writers on acoustics affirm that sonorous vibrations will acoustics affirm that sonorous vibrations will be propagated in a speaking-trumpet lined with clotb, with equal effect as if it were formed of a metallic substance; and we have Dr. Arnott's interesting relation of the ringing of the bells in the city of St. Salvador, on the Brazilian coast, having been distinctly heard Brazilian coast, having been distinctly heard on board-ship 100 miles at sea, the sound being wafted by a gentle wind over smooth water, and interrupted in its progress, and concentrated to a focus, by the concave sail of the vessel; thus much for canvas: a dense body of vapour, even, it is allowed, may cause the reverberation of sound; and hence we have reasons to justify the use of so pliant a substance as canvas for a surface to reflect sound where a wooden sounding-board is not conveniently available. But woollen cloth, I have reason to believe, is a great absorbent of sound: at this theatre I have had an opportunity of comparing the singing in the retunity of comparing the singing in the re-

hearsals with the same in the public performance; when I was struck with the loss that was occasioned evidently by the presence of the audience, and which I mainly attribute to the amount of broad cloth present, though partially to the interruption caused to the rays of sound in passing towards the various reverberating surfaces; at the same time, not to forget the reverberable power of vapour, some slight share of said loss might possibly be chargeable to the diminished purity of the atmosphere (not to confess, for all that, that our ventilator was inefficient). We know that the more carbonic-acid gas is generated in an assembly the more dense the atmosphere becomes, the density of that gas being half as much again as pure air; the thick imperfect tones of the speaker in a church or hall crowded to suffocation, compared to the ringing sonorousness of his voice when he happens not to be quite so attractive, are very perceptible, and may be referred to the causes I have mentioned.

Means of communication all round the house have been preserved in the various tiers, as well as ample means of egress. In such places the latter is of much importance, as well as that the doors that are kept shut during performance should open outwards; it is also desirable to have the entrances to the various parts nearest those *places* which are least advisable: for experience proves that if they are at the best places, these will get first filled,

and thus form a barrier to reaching the others. Besides the precautions taken with the gasbattens against fire, arrangements are in progress for laying on a supply of water, at high pressure, in a standing-main behind pit, boxes, and gallery, with a short hose and nozzle to each; also a cistern on each wing-platform, with bose descending for the supply of a portable fire-engine on the stage: the partition which separates the audience and stage depart-ments on either side of the proscenium-open-ing is also of brick; and the small circular staircases which communicate with all the private-boxes and with the wing-platforms are of the same material.

In Giasgow, buildings are not regulated by any Buildings Act, but there is a board, called the Dean-of-Guild Court, hefore which parties intending to build are required to appear, order to their plans having its sanction, after affording to the owners of properties abutting upon the one in question, an opportunity for bringing forward objections. It takes cogni-zance, also, on the part of the lieges, of all cases, in respect to buildings, wherein danger may threaten, or accident have occurred. This court, for the satisfaction of the public, the gentleman for whom the theatre bas gentleman for whom the theatre has been inted up, memorialised, at my recommendation, for an inspection to be made by efficient persons as to the security of the structure. A readiness, in this manner, to consult the feelings and allay the fears of the uninitiated portion of the public, should ever be evinced; and I am disposed to think that, in many cases, public huidings another than the open of far use without been fitted buildings ought not to be opened for use without the concurrent testimony of experienced proresent case, sundry things were required, and being reasonable, were of course readily con-

The decorations are in carton-pierre, and were furnished by Messrs. Jackson, of Rathbone-place: they are in high relief, and com-prise festoons of fruit and flowers, medallions, and panels, containing groups of children; a mimic orchestra of these are perched in the box-front, on brackets in the line of the pillars; while over them, in the gallery-front, are termini, with brackets bearing crystal gas-lustres. The enrichments are white, picked out in gold, with pale blue back-grounds in

out in goid, with pair once back-grounds in panels, and the fronts of the tiers rose-colour. The scenes are chiefly what, in theatrical phraseology, are termed flats; the act-drop is, bowever, an exception, and it is due to the able young artist, Mr. Bough, who painted it, to state, that it is a work which foretokens distinction to him as a painter.

The whole arrangements evince the good taste of the manager, Mr. Edmund Glover, son of Mrs. Glover, of the Theatre Royal,

Haymarket; and the style in which the housefurnishings, the stage properties and dresses, and all other appointments have been pre-pared, show that he has spared neither pains nor expense. The performances are opera, vaudeville, and ballet,—the operatic corps being led hy the able baton of Mr. Howard Glover. The theatre was opened (notwith-standing the ill-instigated statement of a Lon-don contemporary, that it could got be the standing the III-insugated statement of a London contemporary, that it could not be), on Monday, January 15th, with the opera of "Giselle, or the Night Dancers," and the vandeville of the "Imperial Guard."

The theatre is calculated, when it is "a full house," to accommodate 1,400 persons comfortable.

fortably.

JAMES WYLSON.

EXHIBITION OF THE BRITISH INSTI-TUTION, PALL-MALL.

THE earliest of the annual displays of modern art was opened to the annual displays of modern art was opened to the public on Monday last, in the rooms of this association, and it may be pronounced as a very tolerable, if not abso-lutely a good collection. About 400 pictures are annually offered on its walls for sale, chiefly painted by artists to wbom the disposal of their performances is of vast object. are offered at a season when there is no competition of the greater gatherings, and the society being composed of the highest and most intellectual amateurs of modern artindividually its greatest patrons—at once brings the rising artist into prominent contact with their very best friends, on the most solid basis to promote future success. These are surely sufficient grounds for the public to recognise with approbation the labours of the association called the British Institution for the promotion of the fine arts of the country, and cause regret when its affairs are not well and cause regret when its analiss are not went administered. An accusation has been founded on a demand to enlarge the premises where the exhibition is held, and no doubt such an addition is very desirable. Reference thereon has been made to the fortunes of the government of the go nors and directors, and some inuendoes of nors and directors, and some innendoes of apathy on this point bave occasionally been promulgated. This is scarcely just, for the directors have made many efforts to obtain property in the rear for the purpose; and, although the property sought for was not of vast value, yet the impurity or vice of its application rendered it lucrative to the possessors,—consequently they have been met by the most outrageous and extravagant demands. the most outrageous and extravagant demands, such as could be viewed only as a gross attempt at extortion.

We are not going to enter into a discussion of the usual range of critical remarks, nor dwell with feminine rapture on works being replete with sweetness, or delicious colour, or delightful bits, or charming softness; for art-criticism demands other phrases, and certain fundamental acquirements upon which the capacity of judging can alone, with safety, he formed. It is not founded on vague perception, arises from no concatenation of ideas, is not taught by school learning. The sublime and beau-tiful in all objects of ocular investigation, influence the intelligent observer and the unlearned spectator, upon notions diametrically opposite. To arrive at a pure knowledge of a ork of art, requires an acquaintance with its inflexible principles of invention, the artistic construction, the difficulties of execution to be surmounted, and the degree of success with which any production has been completed. The scholar may arrive at a just understanding of the ideal and the inventive portion; although the fine arts form no branch of university education. But let bim once wander into the technical, and then we hear similar absurdities promulgated, as when a late writer on Spanish art, talks of transpager greens and alter professions. when a late writer on Spanish art, talks of transparent greys and ultra-marine with warm white glazings. And also Dr. Waagen, of Berlin, whose name is almost authoritative, does not scruple to praise the French school as a school of colour, thus running from the stony pallid hues of German art, to the opposite excess of tinsel gaudy glare. There are besides many who pretend to be connoisseurs, and employ their pen on the subject, whose sole attainment arises from a commarison of what they have ment arises from a comparison of what they have seen; omitting all reference to other existing examples, and not even taking the pains to be

^{*} We had the pleasure of recommending these manufac-turers to Mr. Glover, for this work; induced to do so by the able manner in which they had carried out Mr. Bradwell's biews at the Lyceum Theatre, Strand,—ED,

informed by reading what has been written hy the most accredited writers on the subject. On the other hand artists may be imagined to possess the most competent knowledge, but they are disposed to narrow their views to the single class of artistic works they have adopted single class of artistic works they have adopted for their own practice; and it is much to be regretted, however painfully true, that a number of our living painters are disculsified by the absence of sufficient general education to undertake the task. There are, nevertheless, great exceptions, but unfortunately they are much too chary of their labour for the public to profit by their instruction. The writings of Barry and Haydon are sound in principle, although imbued with more than a tinge of acerbity; nor can any maxims, more perfectly just and gracefully enunciated, exist, than are found in the writings of Sir Joshua Reynolds. Joshua Reynolds.

The difficulty of combining literary attainments with the routine of the atelier, and the theoretic attainments of anatomy, perspective other sciences, ought to damp the ardour of the ordinary critics upon pictorial art. In rendering an account of the present exhibition, we propose therefore to advance rather a résumé of its contents, and invite amateurs to investigate of its contents, and invite amateurs to investigate narrowly for themselves the exhibited works, upon the principles of composition, drawing, expression, colour, light and shade, with aerial and linear perspective. These qualities once achieved, the eye may then seek its pleature in the choice of arbitest. sure in the choice of subject.

The catalogue contains 518 numbers, 504 of which are attached to pictures, and fourteen to sculpture. As the clder sister, the sculptors? performances claim the precedence of notice over painting. The most consequential work is the life-size recumbent group in marble of "Ino and the infant Bacchus," by J. H. Foley, executed for the Earl of Ellesmere, in whose mansion it will form a becoming ornament mansion it will form a becoming ornament. A marble statue of a satyr, and a bust personifying innocence, by W. Calder Marshall, A.R.A., as well as a small marble figure of Musidora, by T. Earle, comprise the amount of noticeable works.

In painting, only one of the royal acade-icians (W. Lee) exhibits, and only five of the associates are in the same category.

The historical, or figure subjects, are not in great strength. The Chevalier Bezzuoli, President of the Florentine Academy, displays a picture taken from the life of Giotto, of considerable merit : the figures are well drawn, and sucrable ment: the figures are well drawn, and the folds of the draperies broad and well east. Still, if it is to be taken as a specimen of the condition of historical art in modern Italy, it will not rank very high; it possesses a good deal of the ancient Italian technicalities, but depicts the defunct body, from which the soul bas departed. R. T. Bott (to us a new name), has a composition of grave forces it in the state of the conditions of the state of has a composition of many figures, illustrating Victor Hugo's tale of the death of the banished lord. A good deal of clever arrangement of the subject on the surface is manifested, and some well-disposed lines. One of the most important well-disposed lines. One of the most important of figure compositions, being a group of nymphs and infants, with the inviting title of "Dolce far nieute," conceals the painter's name under the initials of G. F. W., to which a very professional address is appended in the catalogue. The picture is worth examining for many good within the control of th qualities. A small picture of a sitting figure, nude, called "A Naiad," by W. E. Frost, A.R.A., placed on the screen of the secretary's desk, is an elegant personation of the female figure, painted in rich tones, with admirable chiaro-scuro. It may be called a gem.

In the lower department of figure pictures, In the lower department of figure pictures, either conversational or amatory, there are many of considerable merit, nor is there a small affluence of the domestic pathetic, intended to excite the sighs and sympathies of tended to excite the sighs and sympathies of the fair sex. In pictures that may be termed dramatic, stands first, a work of high imagina-tive power by F. Danby, A.R.A., representing a mountain chieftain's funeral in the olden times. This picture has rarely been equalled times. This picture has rarely been equalled for a mysterious depth of tane; the faint moonlight that beams o'er the towering moun-tains is treated with all the mastery of art; the can't is treated with all the mastery of art; the entire scene is conceived with great grandeur of chiaro-scuro, and developed with true poetic feeling. Probably it will not please the multitude, because, as they will say, "it is so dark." Ou the opposite wall is placed one of

John Martin's inspirations of biblical miracles although a veteran in fame, he appears in all the vigour and freshness of his earliest powers. It is a representation of Joshua commanding the sun to stand still. There is an awful sublimity in the lighting up of the distant mountains, and the vast architectural edifice crested on the rock is pregnant with noble ideas, which will delight the student in this art. The style a graphyn wet swellingslead. art. The sky is a problem not readily solved by an ordinary observer of the phenomena of nature. It will make an admirable engraving.

Among the interiors or exteriors of buildings more particularly interesting to this journal, is a picture upwards of 13 feet long journal, is a picture upwards of 13 feet long by 4½ feet high, representing the interior of the picture gallery at Stafford-house, St. James's, painted by J. D. Wingfield. This apartment, the most gorgeous of any in the palatial abodes of the metropolis, is here made public to the hundreds who have sighed in vain to see the original. The por-tion represented is that where energed in . The portion represented is that where, encased in the walls, are the two wondrous Murillos. The mural decorations, with the massive chande-liers and candelabra, are painted in their minutest details. The enrichments of the fireplace in the centre have such a fac-simile of ef in the mouldings and ornaments, that we felt a desire to ascertain by the finger if they did not really project; but were deterred by reflecting that we should descend to the level of the birds which pecked at the imitative cherrics of the ancient Greek painter.

Landscape is the branch of art in which the school of England wields the sceptre of supremacy over all the European schools, and in the present exhibition is the dominant fea-ture. "The Deserted," by C. Branwhite, takes a first place in the ideal. The scene is a continuous lake, environed by forest scenery terminated only by the horizon, and seen from the ruins of a terrace: the sun is sinking below the horizontal line, and steeps in its evening gilding every part of the solitary glen. The picture depends on a single thought,—a very felicitous one, rendered magnificent by the scale of colour, although bordering on Germanism in scale. The opposite excess of purely mannaria in scare. The opposite excess of parsy natural transcript is contributed by R. Redgrave, A.R.A., called "Strawberry Galherers in Norbury Woods." The Professor of Botany in the Government School of Design has justified his appointment by the elaborate study of wild plants and perfection of foliage. The picture is of the highest order in its class; an ture is of the ingness order in its class, and a significant warning to the noviciate, that the road to success is the unfinching study of natural objects, and that in landscape painting it is the foreground which marks the degree of excellence in rural scenes. Thomas Danhy has two views in Wales. This painter came out with remarkable strength last year; but his present pictures do not quite equal the past. There is an unnatural blackness and want of atmosphere in the group of trees that intervenes between the stream and the distance of his principal work. The brother, James Danby, has a view of Scarhorough, well lighted and very transparent, C. Marshall has a lake scene with mountains called "Lynn Crafnant, Caernaryonshire," which no one can extend to be recommended. Caernarvonshire, which no one can mistake to have been painted on the spot, so fully is it invested with the natural charms of sunny light and atmosphere.

There are many other excellent landscapes worthy of examination. The most pretentious are two by F. R. Le.; R. A., with groups of cattle, by S. Cooper, A.R.A. Enough has been already written on these talented artists been already written on the statement of the cooper areas of the coop been already to a remark supernuous. To render remark supernuous subjects, R. Ansdell worthily supplies the absence of E. Landseer. He has three pictures, all admirable. The department of still life is supremely maintained by G. Lance, in five pictures. There is a good sprinkling of marine pictures. There is a good sprinkling of marine pictures. There is a good sprinkling of marine pictures. subjects and coast scenes, none betraying novelty, or wandering beyond the ordinary routine, although they are generally pleasing.

"On the Gulf of Spezzia," by G. E. Hering;
"A Scene in Epping Forest," by W. Linton;
"Prayer before the Mid-day Alms," by A. C. Hayter, jun.; "The Harvest Field," by H. Jutsun; "The Murder of Thomas à Becket," by J. Gilbert; "Burns and Capt. Grose," by R. S. Lauder; "The Trial of Land," hy Alex. Johnston, all deserve notice.

LINCOLN'S-INN FIELDS POPULARIZED

LONDON increases so rapidly in extent that every inch of open and available space within its present boundary should be carefully preserved, and improved for the healthful exercise and recreation of its inhabitants. Among places espe-cially adapted to this purpose, the enclosed areas of the numerous public squares demand particular notice. It not unfrequently occurs that those who live in the surrounding houses are far too exclusive and aristocratic, or too much occupied to expose themselves to the observation of their neighbours by adopting them as places of promenade, while at the same time numbers of residents in the immediate vicinity, of equal respectability, are strictly pre-cluded the privilege. At the West-end of the town, where the parks afford so much facility of air and exercise, this is, perhaps, of no great moment. There are, however, other localities where it is a matter of considerable importance. To those who are unacquainted with graphy of the metropolis east of Tottenham-court-road, it may be a subject of curious information to learn that there is such a region as Lincoln's-Inn Fields; that the houses which surround it form one of the noblest quadrangles in Europe, the site of which, if appropriated to public buildings, would afford a better opportunity for architectural display than ever the Forum of old Rome.

Within this imposing quadrangle, and enclosed in its entire circuit by a strong iron fence, there appears a well-wooded and fertile area, of great, if not unknown, extent. The few who are chartered to enter its umbrageous paths seem never to avail themselves of the advantage; and it is even supposed by some that, saving the solitary woodsman or occasional cultivator, it has never yet been trodden by human foot : whether its coverts and thickets harbour animals of the chase or wild beasts of prey, is also a question of curious speculation and conjecture. Can it be that the laws of William the Norman, as relating to the New Forest, are still in force in this and several similarly favoured spats, which now stretch in a northerly direction from this locality towards

Camden-town?

If this should prove to be the case, some effort should be made towards having them relaxed on behalf of all respectable persons, at least at certain times and seasons, as bas beed one at the Temple Gardens. FOOTPAD.

THE ABATTOIR QUESTION. INSTITUTION OF CIVIL ENGINEERS.

AT a meeting on February 6, Mr. Joshua Field, President, in the chair, the paper read was a "Description of the Abatoirs of Paris," by Mr. R. B. Grantham. It appeared from the account that, previous to the opening of the account that, previous to the opening of the Paris abattoirs, in 1818, slaughter-honses existed in the crowded districts of the city; and that (as at present in London) the passage of the cattle through the streets, and the con-sequent nuisances, were found to be intoler-able. The five ahattoirs were designed with

able. The five ahattoirs were designed with great care; they were crected within the barriers, at an average distance of a mile and three quarters from the centre of the city.

It appeared that the revenue (derived from tolls, charged upon all the meat killed, at per killogramme,) amounted, during one year, to 47,6081. 16s.; that the total expenses were 4,9581. 12s.; leaving a profit to the city of Paris of 42,6501. 4s., or ahout 6½ per cent. upon 650,0001, the original cost of all these establishments. The paper argued that, if this revenue was obtained from the tolls, &c., for slaughtering meat for a population not exceedslaughtering meat for a population not exceeding 1,000,000 souls, who did not consume anything like the amount of animal food that Englishmen habitually indulge in, how much greater would be the profit of such establishments for London, where there was a population nearly approaching 3,000,000 of souls!

In the discussion which ensued, and in which Mr. E. Chadwick, Professor Owen, Mr. Leslie, and others, took part, very interesting statistical facts were given in connection with the present state of the Smithfield market, which, it was said, appeared to be upheld merely as a question of revenue to the city, for which the public not only paid heavily, but suffered severely, by common annoyance, and by the deleterious effects on public health.

BIRMINGHAM BRASS-WORK.

In connection with the projected exposition of manufactures at that place, the Birmingham Journal has commenced a series of articles on its importance, wherein the various manufac-tures of the town are reviewed. We take from three of the town are reviewed one of them the following remarks on the brass-work:—The history and progress of brassfounding in Birmingham has yet to be brassionaring in British and has yet to be written, and we trust it will be done in brass on the stalls of the Exposition: in no town in England has the art been followed to greater advantage, as far as regards extensive produc-tion; how far successful as regards elegance and purity of design, we will not pretend to say—let the specimens sent for inspection and puts.)
say—let the specimens sent for inspection say—let the special when the blind led the blind, much could not be expected; the spirit of active improvement has not broken in upon of active improvement. tent to copy the common-place models of their predecessors, it is not to be wondered at there for a was for a very long period a reign of mediocrity, if not something worse. Then came an impression that something must be done; what to do, and how to do it, ended in the adoption of a bastard style of ornament, a wretched compound of shell and scroll. These, multiplied ad infinitum, clung like limpets to our bell-pulls, disfigured our curtain-pins, and perpetuated the sum of deformities. An impression got abroad, somehow or other, that the Grecian style was the only legitimate one; then honeysuckle and acanthus leaf, wretched approximations to the beautiful creations of Greek art, spread their unsightly shapes over all things of brass, useful or ornamental. A rage for animalism then took the place of the other two styles; our door-knockers were transformed two styles; our door-knockers were transformed into fearful-looking lions' heads, which grinned horribly at us; our tables were supported on their paws, while solemn-looking splinxes reclined, watching over the mysteries of the drawing-room. The inapplicability of these various styles of ornamentation for their different juriages, was apply copulaged by the inferent juriages. ferent purposes, was only equalled by the inferior mechanism or tame execution of the articles adorned; the substitution of the bell lever for the meagre looking cord, and the lever for the meagre looking cord, and the curtain band for the pin, was an era; it became necessary that a superior style of ornament should be introduced, and give an impetus to the trade generally. Minute and trifling as many of the details are which make up a cabinet brassfounder's trade, there are none, away to the second these superiors the are considered to the second trade of cabinet brassfounder's trade, there are none, saving those embracing the precious metals, in which greater taste may be shown, or more mechanical ingenuity applied. He who calls to mind the purchases made by the School of Design from the Parisan Exposition, will remember the richly foliated ornaments which covered not a few of the bronze articles containing each a lesson in themselves. But these days of false economy have wrought foul wrong to the trade whose progress we are attempting to describe; the progress we are attempting to describe: the stamp has been exchanged for the casting stamp has been exchanged for the casting box,—as a consequence, tinselly and gaudy ornament has taken the place of the quiet and rich leafage, which looked so substantial and natural when finished. That this is not confined to our own country, is most true. Our market has been deluged with the multi-tudinous drapery adornments of "Marsaux." Compelled in self-defence to fight against such fearful odds, it is not to be wondered at that we have. To a certain extent, been obliged to we have, to a certain extent, been obliged to follow, or compete—how unsuccessfully will best be shown by the mention of the disadvantages we labour under: first, that in the knowledge of design we are yet much behind. (In France it is not the fault of the workman himself if he is not instructed in this department of his trade.) With us, until of late years, it was impossible to acquire this important break of schools and the state break of schools and the state break of schools are the state of the tant branch of education. And secondly, most people are aware that the French mechanic can subsist on a pittance upon which our own countrymen would starve. however, are of opinion that the evil already mentioned will soon work its own cure, and that a better and more substantial articles must speedily take place of the flimsy productions of the day; such are in truth the butterflies of a craft which the first touch of class of the winter of a severer taste, and the acknow-ledgment that all is not really substantial which seems so, will speedily dissipate: we

trust our exposition specimens will help to prove this in a satisfactory manner. It may not be improper to remark, that these observations have been made in consequence of the deteriorating influence which the production of brass goods from plates of sheet metal and by pressure, exert upon the progress of legitimate ornament. The process of stamping effectually precludes the possibility of the shelving or undercutting heing introduced, which gives relief to the prominent parts, and is the foundation of all effect and true artistic beauty. It must not, however, be supposed that we are retrograding; far from it, there is a sensible improvement; there seems to be a better understanding abroad as to what is right or wrong, and the ornamentation is more applicable to the purposes or use of the object so ornamented: this recognition is an advance, and indicates a step in the right direction.

NOTES IN THE PROVINCES.

THE Braintree Union guardians have resolved, by a majority of one, "that a competent architect be employed to examine the union-house, and report to the board what can be done in the way of enlargement, and the expense thereof."—There are now three established churches and eleven dissenting in the parish of West Ham. Of the new church for the district of Stratford Marsh, named Christ Church, two lithographic views, exterior and interior, have been prepared, for subscribers of one guinea and upwards towards the building fund.—At a public meet-ing in the Council Chamber, Salisbury, to decide as to the erection of a new workhouse wing, at a cost of 5,000*l*., or alterations of the old, at a cost of 2,200*l*., it was stated by a member of council, who succeeded in postponing the decision for six months, that there was reason to believe the Government designed "to amalgamate seven or eight unions so far as regarded the juveniles, where they could be educated and brought up to industry."——Collumpton Church is to be reseated and repaired, one gallery removed, and another reduced in scale, with other alterations, all under the superintendence of Mr. Ashworth, of Exeter, architect .- The restoration of Christchurch Priory Church is advancing. The rood screen is finished, and works are in progress in the south aisle.—The new church at Leverstock Green, near Hemel Hempstead, will be ready for consecration in a few months. will be ready for consecration in a few months.

—A Gothic chapel is proposed to be erected in Heaton Norris, Stockport, from a design by Mr. E. Walters, of Manchester, architect, and under the name of Wycliffe Chapel. The cost will be about 2,200/., and the dimension 65 feet in length by 40 feet in width.

All the larger rooms of the new Athenæum as Shediald are nearly completed, and the openat Sheffield are nearly completed, and the open-ing of the new institution has been announced. -The dock works at Grimsby are in rapid progress, and it is reported that H.R.H. Prince Albert intends visiting them on 11th April, to lay the chief stone.—A Yorkshire genius, an innkeeper at Sowerby, according to a Leeds contemporary, has invented a steam machine to blow the bellows of Sowerby Church organ, to blow the bellows of sowerby church organ, to ring the church hells, and to keep the sitters 'warm without' while inwardly occupied with those more spiritual comforts, which themselves, too, have already been proposed to be administered wholesale by the electrotelegraphic machinery.—At Uplentham Hall, the Earl of Zetland's seat in Yorkshire, 900 feet of glass pipes have been laid down.

The Darlington Gas Company, with a view to supplying the town with water, have had the Tees water analyzed, and find it to be remarkably pure.—Upwards of one-half of the 2,000% to be realized for the commencement of the new Congregational Church at Scarof the new Congregations of the harbour and railway department of the Admiralty, has been at North Shields investigating the merits of a proposal to erect new quays, wharfs, and landings there. At the lead mines near Alston, and else-ere, the miners are paid 10s. a-week as 'subwhere, the miners are paid 10s. a-week as where, the miners are paid 10s. a-week as 'subsistence money,' and the balance (if any) of the sum for which they may have worked, as 'pay,' at the year's end,—a sum which, it is said, occasionally amounts to 100l. for one man, At a late reckoning at Nenthead, the 'pay'

exceeded, by 1,000L, the amount divided in any year within the last quarter of a century.

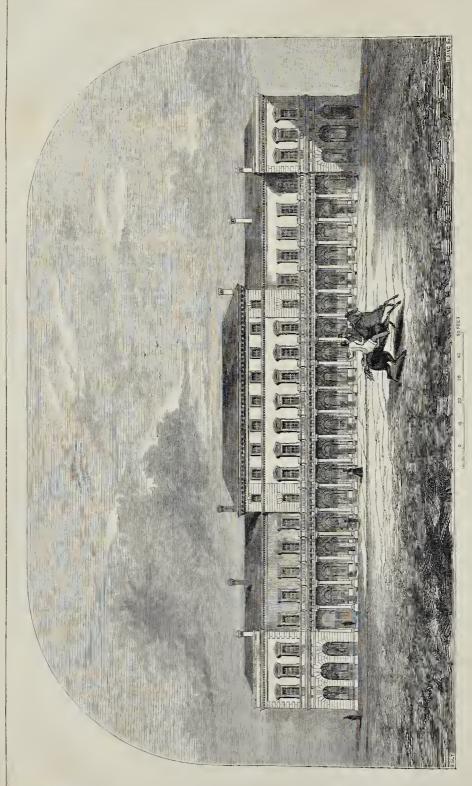

The carpenters at Messrs. Ritson and Co.'s yard, at Maryport, are standing out, it is said: 18s. a-week have been offered, with a prospect of constant employment for a lengthened period.—Tenders for the Workington Lock-up having heen lodged, Messr. Thomas Bromley and William Brown, builders, both of Workington, have been declared the contractors.—The ancient stone bridge at Inverness has been destroyed by an overflow of water from Lochness. The west side of the town has been much flooded.

RAILWAY JOTTINGS.

ONE of the new order of light brancb-traffic Steam-carriages was tried on the Eastern Counties, and worked satisfactorily till it 'broke down' at express speed 'from an over-straining,' as was said, ' of the delicate machinery.'—An American paper mentions a new casualty in railway travelling. night, the water in the engine of the afternoon train from Lawrence to Salem was frozen in Middleton Woods; and the passengers, about Mindeston Woods; and the passengers, about fourteen in number, were obliged to occupy the cars all night.—The gates on the Grimsby line, facing the Midland station, are now opened and shut by machinery.—A float for trains in crossing the Forth, similar, we presume that for accessing the Tax corresponds to sume, to that for crossing the Tay, so amusingly described by Punch, was lately launched at Glasgow into the Clyde. It is 170 feet in length, 34 feet in width between the paddles, and 10 feet in depth; and from the limited breadth of the river, it was launched broadside, breadth of the river, it was aumented broadstage falling safely 2½ feet into the water. An engine of 56 inch cylinder and 3 feet 6 inches stroke, with a chimney, has been shipped at each paddle. The whole float is of iron, ribbed with ½-inch plates on the bottom.—By a mailwith ½-inch plates on the bottom.—By a mailtrain accident on the Caledonian line, near Carlisle, five passengers (all labourers) have been killed. A second-class carriage, of improper gauge, belonging to the North-Western, is blamed.—Another casuality, but happily without loss of life, has occurred on the Edinburgh and Glasgow, by the breaking, it is said, of a driving-wheel tire only eight days in use.—Lord Brougham, in the House of Lords, has been advocating, by implication, the necessity of realizing our Austrian idea of rendering railway authorities responidea of rendering railway authorities responsible to a jury, in cases of neglect in the adoption of the best possible means of preventing accidents. In allusion to some expeventung accidents. In allusion to some experiments before the Privy Council on the strength of axles, in which the superiority of Hardy's patent axle was alleged to have been satisfactorily exhibited, his lordship said, satisfactorily exhibited, his fordship satisfactorily exhibited on the axle, and a shock of the most startling magnitude was given to the carriage. That patent axle was bent into a completely circular charge without a single feature height reliable. shape, without a single fracture being visible in it. Indeed, it was as good an axle, in point of solidity, after the accident as before it. Out of fifty other common axles which were sub-mitted to the same shock, only two were able to stand it. He complained that the directors railways did not substitute these patent axles, which were 30 per cent. cheaper than the common axles, for those axles, until they were common axies, for those axies, until they were either broken up or worn out. He took this opportunity of letting this fact be known to the Directors; for, if death should ensue hereafter from the breaking of an axle, he knew well what the verdict of a jury would be.—

A railway ring, it is said, has just been carned completely round that whirling circle of magical revolutions, Paris.—The communication by rail is now either complete, or will cation by rait is now entire complete, or will soon be, wid Calais, right through the heart of Europe, including Paris, Brussels, Cologne, Antwerp, the Rhine, Berlin, Warsaw, Leipsie, Vienna, Switzerland, and Venice. Arrangements are already in progress for a grand continuous tour, or route, through most of the places here nearly. Design the will shall be the places here named. Paris itself will thus be approximated to London by a time distance of only eleven hours, or a run actually shorter than that to either of its own provincial capitals, Edinburgh or Dublin.

ROYAL ACADEMY.—Mr. Richard Westmacott has been elected a Royai Academician.

LIME-STREET STATION OF NORTH-WESTERN RAILWAY, LIVERPOOL. NR. W. TITE, F.R.S., ARGHTECT.

LIVERPOOL STATION, LIME-STREET 22 40 THE OF THE LIME-STREET STATION OF THE NORTH-WESTERN RAILWAY, LIVER-POOL.

The Lime-street station, to which we have already briefly alluded, was originally built by Mr. Cunningham, of Liverpool. The façade, however, towards Lime-street, was erected from a design by Mr. Forster, the architect to the corporation, who received from the Company the necessary funds for that purpose. The station having become much too small for the greatly-increased traffic of the line, it was determined by the Directors, in 1846, to remodel and re-arrange it. To this end, the tunnel front has been cut back, and a very large area obtained by purchasing houses THE Lime-street station, to which we have end, the tunnel front has been cut back, and a very large area obtained by purchasing houses and premises to a great extent in Hothamstreet, Gloucester-street, and Sydney-street. Hotham-street is now crossed by a bridge, which allows the continuance of the platforms under that bridge up to the face of the tunnel, and by this means platforms, 500 feet in length, have been obtained.

This bridge is a level beam bridge, of casting, carried on Tuscan columns of very good

This bridge is a level beam bridge, of easi-iron, carried on Tuscan columns of very good proportion. It was designed and executed by Mr. Edward Wood, the resident engineer. The general arrangements of the stations are from the designs of Mr. J. Locke, M.P., the engineer-in-chief of the railway. The de-

are from the designs of Mr. J. Locke, M.P., the engineer-in-chief of the railway. The design of the offices, of which we engrave the clevation and plan, was entrusted to the care of Mr. W. Tite, F.R.S., architect, of London. The principal entrance is from the street called Lord Nelson-street; and the offices are all arranged lengthways on the platform. The one-pair floor is appropriated to the accommodation of the Board, the secretary, treasurer, &c., and the second, or upper floor to the ticket department.

The contractor is Mr. John Jay, of London-wall; the amount of the contract about 30,000%. The material used is principally brick; the colonnade and dressings being the mill-stone grit quarried at Darley-dale, in Derbyshire, the same stone as is used at St. George's Hall. The plinths of the columns and of the buildings generally are Devonshire granite. From the difficulty of erecting the new buildings without interfering with the large and active business carried on, it has been necessary to proceed very slowly with the work and to build it in two detached portions.

The part constructed now consists of a centre and the left wing, and to adapt this for temporary purposes the refreshment rooms are "for the nonce" used for the booking offices of the Northern trade. In the basement, are extensive offices, kitchens, third-class refreshment rooms, guards' and porters' rooms, and the other various requirements of a railway station.

extensive offices, kitchens, third-class refreshment rooms, guards' and porters' rooms, and the other various requirements of a railway station.

The great sbed is, at present, temporary. Mr. Turner, of Dublin, has contracted for an iron roof, in one elliptical span, the conjugate diameter being 150 feet. The first experiments on the principals of roof, made in Dublin in the autumn of last year, were unsatisfactory, the ribs having given way. He is now, however, as we understand, making another attempt with ribs of a different form.

Condition of the British Museum.

—Part of the evidence taken by the commissioners, appointed to inquire into the constitution and management of the British Museum, is about to be laid before the House of Commons. The commissioners seem to be moving very slowly: another commission must be appointed presently to inquire into their condition.

GRAVESTONE AT ISLAY.

GRAVESTONE AT ISLAY.

THE accompanying sketch is taken from a simple slab in the old burying ground in the Island of Islay, Argyleshire. There is no Islam of Islay, Argyleshire. There is no inscription, or any characters upon the stone, and the device itself is very rudely sculptured. It is a curious arrangement of four hearts, four rings (query, wedding?), a cross, and two circles, all blended one in the other, without

FOWNHOPE CHURCH, HEREFORDSHIRE HEREFORD ANTIQUARIAN SOCIETY

AT a recent soirée given by this society, Dr Strong, of Ross, read a paper on Fownhope Church. In the course of it the writer said,— Church. In the course of it the writer said,— Many hundred years has this temple mouldered and decayed in neglect and contempt, but the day has at length dawned when the taste and intelligence, the munificence and the skill, the piety or the pride, that presided over its erec-tion and added roof to roof for its rural wor-shippers, shall be again understood and appre-ciated, and even emulated. The size of the fabric is sufficiently considerable to arrest atshippers, shall be again understood and appre-ciated, and even emulated. The size of the fabric is sufficiently considerable to arrest at-tention, being no less than 110 feet long in the clear, and how a pile so large and so irre-gular came to be erected we have no written regard but there are stones about the side. gular came to he erected we have no written record, but there are stones about the edifice which, lightly interpreted, will throw a clear light upon its history. The most ancient, or at least the most authentically striking piece in the whole building, is the scriptural tympanum in the western wall, of which a cast was taken by the very Rev. the Dean of Hereford, and exhibited at the first soirée for the present season.

season.

There can be no question but this stone once filled up the semi-circular part of a Norman portal—a peculiarity of this style, the origin of which is unknown. Some have supposed that the early architects, not having as yet had much experience of the principle and resistance of the arch, thought it prudent to strengthen their work by imposing a stone between the door jambs: hence this support is commonly called the "impost stone." It thus became a called the "impost-stone." It thus became a sort of compromise between the Greek and the Roman doorway. Considerable pains have recently been taken to preserve this relic of the Norman era, but no trace of the arch or of the side-jambs remains either here or in any other part of the walls. And this is one of several reasons for concluding that the present church has been rebuilt. The early erection may even have been standing here prior to the conquest, like Bridstowe Church, which is in the same style, and which, upon the authority of the Liber Llandavensis, was consecrated two years before the battle of Hastings.

There appears to have been a custom pre-

There appears to have been a custom pre-vailing among the architects who succeeded the Normans of preserving the doorways of those

churches they rebuilt or altered, for doorways such as this in the Anglo-Norman style still exist in many churches, the other portions of exist in many enurches, the other portions of which were erected at a much later period. The reason for this may have proceeded from a laudable wish to retain some visible remem-brance of the piety of the founder, by whom the original work was designed. Some im-paired bases and capitals of Norman pillars, of paired bases and capitals of Norman pillars, of a size corresponding with the doorway, were, upon the authority of an antiquary who has long resided near the locality, to be seen some years since, as well as some fragments of very early Norman work under the singing-gallery. The two capitals are now preserved and used as flower-pots at the Vicarage-house door. An investigation of this unpretactions that

An investigation of this unpretending fabric An investigation of this unpretending fabric will reveal no less than five styles of architecture, marking as many equivalent epochs in our history, and lighting up in an unexpected manner, and from an unpromising quarter, some of the proceedings of the so-called dark ages. The Norman and semi-Norman styles are very decided, the guesseling styles will be supposed in the styles with the supposed in the styles will be supposed in the style of th

ages. The Norman and semi-Norman styles are very decided; the succeeding styles, viz., the early English, the Decorated, and the Perpendicular, no less so, though not so highly prized by the antiquary.

The style then of the impost-stone, or tympanum, leads to the conclusion that it formed part of the door-way to a small Norman chapel of the size of those at Kilpeck or Shobdon, which stood upon the site of the present chancel. It might have been in existence about a century when the addition to the fabric of the present tower was made: this is 25 feet about a century when the addition to the morn-of the present tower was made: this is 25 feet square, and exhibits particularly well the state of transition from the circular or Norman to the pointed or early English style. Thus, in of transition from the circular or Norman to the pointed or early English style. Thus, in the second story of the tower may be observed a lancet-headed couplet included in a pointed arch, while in the story immediately above is a circular window divided into two lights by a carted allies with swells have and explicit a circular window divided into two lights by a central pillar with regular bases and capitals, flanked by columns wrought in the jambs with corresponding mouldings, presenting a valuable specimen of early Norman workmanship. The intermixture of the Norman and early English styles in this fine tower, satisfactorily establishes the date of its erection; for this semi-Norman style originated about 1150, and is known to have continued in young until pear

never contemplated by the Norman architec It is framed of timber, and seems to be covered It is framed of timber, and seems to be covere by shingles, which, from the peculiar way i which they are split (along the veins of the wood), are found to be much better adapted t resist the weather than ordinary-sawn planks It may be of the same date, or earlier than th Court-house already mentioned. The Normal work finishes with the characteristic zig-zag ornament along the parapet, and the entire diffice, as it looked in the year 1200, must have been a very fine specimen of its class.

In the thirteenth century, the Foundation

been a very fine specimen of its class.

In the thirteenth century the Fownhope estates passed by marriage from the Berkeleys to the Chandos family, in the reign of Henry the Third, and the event would almost seem to be commemorated by the very liberal addition to the fabric, of the present nave. That it was constructed in this century we conclude from the graceful early English entrance on the morth side, whose slender banded pillars form a striking contrast to the massiveness of such parts of the structure as are of more remote date.

ST. JAMES'S CHURCH, CONGLETON.

This church was consecrated last week. We take the following particulars from the Chester Courant. The church, which consists of a nave, asiles, and chancel, is built of stone from the quarries of Congleton Edge. The pillars and arches, internally, are formed of the white stone from the quarries of Olliprotes of Olliprotes. from the quarries of Congleton Edge. The pillars and arches, internally, are formed of the white stone from the quarries of Ollington, and are covered with the white stone from the quarries of Ollington, are considerable powers. The roofs of the church and chancel are high pitched, and are covered with green. Westmoreland slate. The chancel has a triple lancets at the side. On the north side of the nave there is a porch. The nave and single lancets at the side. On the north side of the nave there is a porch. The nave and saisles are 77 feet long by 50 wide; the chancel 30 feet long by 17 wide. Mr. Samuel Faram, of Odd Rode, was the principal contractor, and Mr. Edward Massey, of Lawton, executed the wood work. There is a bell gable at the western end of the nave. Internally, the roof of the nave is open, shewing the timbers which support it. At the east end of the chancel is a stained-glass window, by Mr. Wailes, of Newcastle. The working people of St. James's district first commenced a subscription for this window, and what they were not able to raise was bountifully made up by a committee of ladies in Congleton and the neighbourhood, to whose exertions the church owes many of its many costly decorations. The window contains ten scenes from our Saviour's life. Within the chancel is a spacious pavement of encaustic tiles, a considerable portion of which are the gift of Mr. Minton. The pulpit is of carved oak, and an ancient one. It was purchased at a sale in Staffordshire, some time ago by the ladies' committee. In shape it is a hexagon. The panels are all finely carved. Two coronas suspended by rods of blue and gold from the roof of the rare live the star. a sale in Staffordshire, some time ago by the ladies' committee. In shape it is a hexagon. The panels are all finely carved. Two coronas suspended by rods of blue and gold from the roof of the nave light the church for evening service. They are of lightiron and brass work, of Gothic tracery and design, in character with the church, and are painted partly blue, partly scarlet, with some gilding. The seats are all open, and will accommodate 700 persons. Mr. James Trubshaw was the architect.

a circular window divided into two lights by a central pillar with regular bases and capitals, flanked by columns wrongth in the jambs with corresponding mouldings, presenting a valuable specimen of early Norman workmanship. The intermixture of the Norman and early English styles in this fine tower, satisfactorily establishes the date of its erection; for this semi-Norman style originated about 1150, and is known to have continued in vogue until near the close of the century, when the round arch was finally ahandoned. The tower, therefore, was undoubtedly huilt between 1250 and 1200; and as the noble family of Berkeley had these hands assigned to them soon after the Conquest, we may very reasonably conclude that it was erected at their expense. The two handsome towers of Exeter Cathedral, which in the twelfth century constituted the western crance, but now form the transepts, exhibit precisely the same transition or semi-Norman style; and there are documents extant to show that they were constructed within the half century above named.

The present spire, we may be sure, was

Miscellanea.

CONDITION OF THE CITY SEWERS .- Mr. W. Hayward, the surveyor to the City Sewers Commission, has made a report on the present state of the sewers within their jurisdiction, issection forth that they have been rendered throughout the whole of the city, entirely free from all deposit which, hy its retention and decomposition, might generate injurious vapours. All such inorganic matter, as by its situation or extent might have proved an ob-struction to the general flow of the sullage, has also been removed, but there is still much has also been removed, but there is sufficient ballast in the sewers, more especially in those lines connecting with the county, it being for the most part the detritus from the Macadamized roads, which is constantly coming down during times of rain. I will here state that which washans is not conseally known with the control of the c which, perhaps, is not generally known, viz., that the whole of the gullies in the public streets within the city of London are trapped, so that the escape of vitiated air is as much as possible prevented, by the side of the footways, or near to the houses. Most of these gullies have been trapped for many years, although the traps, it is true, are not so perfect in their action as those which modern science has produced. These it will be advisable to replace, as quickly as circumstances will permit, with those of the more approved construction. your honourable court is due the credit of the introduction of the system of trapping the street gullies, they having been first used by the city fifteen years since, by your then surveyor, Mr. Kelsey. The requisite ventilation of the sewers is still obtained by shafts, which rising from the crowns of the sewers, termi-nate with open gratings in the centre of the carriage-ways. This mode of ventilation must be admitted to be defective, and bad in prin-ciple; in truth, the ventilation of sewers, This mode of ventilation must without great expense, appears to be a diffi-cult problem, which should have the earliest consideration; the existing mode, however (bad as it is), is, I believe, the only one which has been attempted any where within the me-tropolis; and this much may be said of it, that tropons; and this lines had be said to be that it allows the escape of the vitiated air as far removed from the line of foot traffic and houses as possible, and in that situation where, obs. taining the most uninterrupted current of air, it is most quickly diluted by the atmosphere, and its noxious qualities to that extent negatived. This mode of ventilation was first devised by your former surveyor, Mr. Kelsey, and applied to your sewers about thirteen years ago."

Metropolitan Statue of Sharspeare.

—A correspondent points our attention to an advertisement calling for designs for a metropolitan statue to Shakspeare, to be erected at the west-end of London. He remarks that,—"To all lovers of the works of this great poet, such a tribute would afford gratification, but it is carnestly to be desired that it will not prove a second Nelsonian affair, and that the judges, or those on whom the selection of the best design may devolve, will not be led away by the brilliant colouring and elahorate finishing of any of these productions,—many of which will, no doubt, lay claim to this accomplishment. A very good and highly-finished drawing may make a 'very pretty picture,' but in this case intellect in design should rule the choice, that such a monument may be creeted as will be worthy of the great poet, and a lasting honour to the nation." All we can say is, that we know nothing of the matter; hut, as a general remark, if artists submit designs without knowing who the parties are that ask for them, and how the trihunal will be composed which is to decide upon their merits, they deserve what they will probably get, namely, their trooble for their pains.

Maryledone Sayungs' Bank.—At the

MARYLEBONE SAVINGS' BANK.—At the 19th annual general meeting, beld on the 9th inst., it appeared that 2,070 new deposits had been made in the last year. 19,019 deposit accounts remained open on the 20th November last, of which 14,455 held balances averaging less than 3t. 3s. 1d. each. Upwards of 291,386t, was then invested with the commissioners for the reduction of the national debt. This amount has since risen to 295,886t. The continued evidence thus afforded of the disposition of the working classes to provide against the casualties of life will prove a source of gratification to all reflecting minds.

YIELDING PIERS AND BREAKWATERS Mr. W. H. Smith, C.E., bas published a description of an invention, the result, as he says, of seven years' study, by means of which he hopes to overcome various obstacles, and ensure the establishment and continuance of available barbours of refuge, piers, break-waters, &c., on all coasts and in all circumstances. The structure is of timber, supported from the top and the sheeting separately, by yielding braces, so arranged and moored to mooring-blocks, and balanced by counter-balance weights, that pressure in either direc-tion gradually strikes the strain on either the blocks or the weights downwards into or upon the ground, while it also, in reaction, produces a similar strain downwards on the whole structure, which, moreover, is so connected and separated, so jointed and pivoted, as to admit of a horizontal and spiral freedom of motion throughout. All shocks are thus to be either eluded directly or thrown downward on the solid floor of the sea. Yet the power of resistance is said to be sufficient to overcome a momentum on the counter-balance weights and moorings equal to 2,000 tons. Mr. Smith calculates that a harbour, which, on existing principles, would cost 50,000l., will thus he made, by contractors of responsibility, for half as many hundreds. GALVANIZED

IRON.-TODD v. GELL. This was an action tried last week, in the Court of Queen's Bench, in which the declaration alleged that the defendant, by representing to the plaintiff that the defendant had manufactured certain galvanized tin-iron, which was impervious to rain, and would effectually protect the roofs of houses from the effects of wct, had induced the plaintiff to employ the defendant to cover a house of the aintiff's with that material, and the plaintiff alleged that it had not sufficiently protected the house, and that thereby the wet had got to the roof, and injured the same. The facts appeared to be, that the plaintiff, who had built several houses in the neighbourhood of St. John's Wood, had employed the defendant to roof some of them with this material, that the roof of one of them had sustained injury from the wet, and after many small repairings had taken place, the galvanized metal was obliged be removed, and one of zinc substituted. The plaintiff's witnesses, on cross-examination, expressed their opinion that there was some thing defective in the roofing itself, or in the way in which the slates had been put on, so that the water came through holes and underneath the galvanized metal. The counsel for the defendant, under these circumstances submitted that the declaration was not supported. Lord Denman bei the plaintiff was nonsuited. Lord Denman being of that opinion,

the plaintil was nonsuited.

Supply of Water to the Parish of St. Martin-in-the-Fields.—The committee appointed by this parish to inquire concerning the means of obtaining a cheaper, better, and more abundant supply of water, have published a report, wherein they state that hy means of Artesian wells, "for the sum of 4,068L, (about half the sum now paid by the parishes for the present intermittent, scarce, and impure supply) the two parishes could be provided with an ahundance of pure water, laid on at high pressure daily, and throughout the day: the quantity would be unlimited, and would be served by small pipes laid on to the main; it would not he contaminated hy standing in cisterns, which constantly require cleansing, but would be aspure aswhen raised from the bowels of the earth." They say truly, at the conclusion of their report, "There is no subject fraught with more annoyance to individuals—indeed, to the public generally—than the present ill-contrived and obnoxious method of water-supply to the metropolis. Fairly speaking, water should not he an article of traffic: like air, it should be untaxed, save for machiney necessary to adapt it for public needs."

* "At Hanwell Lunatic Asylum, the Artesian well is 290 feet deep; it penetrates into the stratum of flint, and at the surface discharges 100 gallons per minute, and rises with sufficient force, in a tube, to discharge, at 26 feet above the ground, 23 gallons per minute. In Orange-street, the Artesian well descends to 383 feet, and the contract with Gorenament stipulates that, if necessary, 350 gallons per minute shall be supplied to the Palaces of Westminuster and Plimlico and the public offices." A correspondent from Hadham says, "An attempt has been made to make an Artesian well in that neighbourhood, which has falled, the water only thowing within 178 feet of the surface. Will it be practicable or possible to 6x a lift-pump in this bore hole, which is only six linches in diameter? Some of your readers will, perhaps, favour us with a few observations upon this."

PROJECTED WORKS.—Advertisements have heen issued for tenders, by 3rd March, for the erection of a new chapel near Bolton; by 1st, for erecting a school-house and dwelling-house near Penrith; by 12th, for heating the new asylum at Prestwich; by 20th February, for supplying and fixing gas piping and fittings at the Borough Gaol, Manchester; by a date not specified, for lighting part of Hammer-smith parish; and by 7th March, for the valuation of all the rateable property in Tunbridge Wells.

Competition.—A premium of 201, is offered for the best plans for renewing and otherwise improving the interior of the parish church of Bridgewater.

church of Bridgewater.

ELECTRO-TELEGRAPHIC. — The guttapercha wire coating, we suggested, night be a perfect tit-bit to some of the fishy tribes, even if the wires themselves defied the sharks. We now observe that it is in the meantime likely to be an acceptable morsel in Chancery, where it has gone in a suit between Mr. Whatton—whose patent for its use dates from 1846—and the Electric Telegraph Company, who, we suppose, have no patent right to use it at all.—Whatever be the insulating merits of guttapercha, however, or whoever may be hest entitled to the exclusive benefit of Faraday's experimental genius and discovery, our imperial insular triunity is ahout to be more closely connected in the mutual bonds of telegraphic fellowship, by the casting of a submarine electric rope across the Irish Channel, from Holyhead to Dublin, whereby that drifting, reckless, weaker vessel of State, poor Ireland, is to be taken a little closer in tow, as a tender—we can scarcely call her a jolly-boat—along side the Britannia. The Treasury and the Admiralty, it seems, have granted to Mr. J. Blunt, C.B., the privilege of laying down this line of telegraph, and a Company is in course of formation for its accomplishment.

Cortage Floors.—Sir: In several of your

COTTAGE FLOORS.—Sir: In several of your late numbers I have noticed some remarks on floors for cottages. Allow me to say I have had the floors of barns laid with a concrete, formed of six parts of clean gravel to one of ground Lias lime, which has answered the purpose well, showing a smooth surface, and being impervious to damp, with the advantage of preventing the approach of vermin, as neither rats or mice can penetrate this material, especially if carried up six or eight inches as skirting. The floor would he sufficient for all purposes in a cottage, if three or four inches thick, which would not take more than half a hushel of lime (value 6d. in London), to the square yard superficial, and where gravel or ballast is cheap, the cost would he very trifling.—T.

GLASS PIPES ON A GREAT SCALE.—New York, it is said, is about to be supplied with the Saratoga water by a company with a capital of 300,000 dollars, who mean to carry it from the springs to the city, as the Conrier and Inquirer informs us, through a scrice of glass pipes passing under ground through grooved bricks, the space between the grooves and the bricks to be filled with cement. The expense is estimated at 1,000 dollars per mile, or 180,000 dollars for the entire distance.

The Discoveries at Ickleton and Cresterford.—The current number of the journal of the British Archæological Association contains an interesting account, by Mr. C. R. Smith, of the foundations of villas, &c., opened at Ickleton and Chesterford, on the borders of Essex and Cambridgeshire, which seem, as the writer shews, to have all the characteristics of Roman work. The remains of the hypocausts are to be seen, painted mural decorations, and fictile vessels in great variety.* According to a report of the proceedings of the Cambridge Antiquarian Society, given in the current number of the Gentleman's Magazine, it appears that the Cambridge antiquaries believe these remains belong to a later time. On what ground they arrive at this opinion, we cannot tell: judging simply from the statements and engravings before us, there would seem to be not the slightest doubt that they are correctly described as Roman work.

^{*} The same number of the journal contains "Observations on the practice of emballining among the uncient Egyptians," by Mr. Petitgrew; "On the charge in be raidry called a "rest," or "claim," by Mr. Planché; "On the sequichral character of cromlechs in the Channel Islands," by Mr. F. C. Lukis; &c., &c.

HALSTED OLD CHURCH STEEPLE. the force of a rough squall of wind, lately, the vane of the steeple, which was fixed in a wooden socket, rotten from age and neglect, became alarmingly displaced while the church was occupied, and the congregation being hastily and imprudently warned, rushed to-wards the doors like a flock of sheep and wards the doors like a nock of sueep and jammed up the way, so that had the whole mass been about to fall through the rotten roof, they adopted the very course likely to lead to their own destruction. As it was, they escaped with much less harm than in too many similar instances. The church authorimany similar instances. The church authorities, in place of repairing the spire or otherwise replacing it, demolished the vane and razed half the steeple, leaving nothing but the stump, while they sold the lead and other materials to pay the expenses. Their design, materials to pay the expenses. Their design, however, may have heen thus to appeal to the sympathies and purses, as well as the pride, of their fellow townsmen, in default of funds of their own. A document inclosed in a tin case, and dated in 1792-3 and 1803, was found in course of the demolition, from which it appears that a somewhat less prodigal measure than that of selling the materials to pay for the piecemeal demolition of the fabric had been then adouted in the renewal and section. been then adopted, in the renewal and repair of occrtain portions of the same appendages, when "a hean-feast was given to the workmen on the top scaffold, the ball being under the senter of the table, whereupon eight men senter of the table, whereupon eight men dined in the presence of a great number of spectators below." This record of bye-gone days and deeds was "wrote by Jos. Hayward, jun., whitesmith, of Halstead," whose name also appears in the list of workmen, employed by "Jos. Hayward," senior, we presume, and "Edward Argent."

STOCK OF IRON.—It is said that the im-STOCK OF HON.—It is said that the himmense increase in the make of iron both in Wales and Scotland has called forth an expression of some apprehension on the part of many conversant with the trade. "The stock of pig iron in the latter country at the beginning of the present year was supposed to be about 110,000 tons, and the probable make is calculated at 650,000 more, while the whole quantity disposed of during the year 1848 was quantity disposed of during the year to be ween only 550,000 tons, and that much exceeded the consumption of 1847; so that a large increase of stock is feared during the present year."—Pig iron in Staffordshire is in considerable request, and the best qualities com-

siderahle request, and the best quanties command rather higher figures.

Newcastle Society of Antiquanies.—On the 5th inst, the members held their annual meeting in the Castle Keep. The senior annual meeting in the Castle Keep. secretary read the report, which was favourable secretary read the reports which was rayout and on the whole, and recommended an appeal to the public for pecuniary assistance towards fitting up the castle. A vote of thanks was given to Mr. Dobson, the architect, for his

given to Mr. Dodson, the architect, for his services in partially restoring the castle. Drainage of Hull.—According to the local papers, the Superintending-Inspector (Mr. Smith), who has been holding an inquiry tat Hull, said that although in most of the towns he had seen the drainage was bad, in ocase had he met with it so bad as in Hull.

A RARE BIRD KNOWN TO BRICKLAYERS.

—An amateur naturalist has offered a reward to the man who will furnish him a live specimen of the "larick bat." This must surely be This must surely be the same individual who was inquiring the other day about the new fish recently discovered, and which turned out to be the gutta percha sole

BLIND BUILDERS .- Sir: Pray don't let the provincial blindnesses escape notice. The following tenders were opened on the 8th inst., for erecting some new agricultural buildings near Wainfleet, Lincolnshire. Mr. W. A. Nicholson architect

OF THE TERM "COLD HAR-BOUR."-The constant occurrence of this title throughout the country will be remembered A few weeks ago hy many of our readers. discussion as to its origin took place at the Society of Antiquaries, and this elicited a to the Literary Gazette from Mr. alhot. Mr. Talbot says, "As I thi Fox Talhot. As I think I have given the true origin of the curious name 'Cold Harbour' in my 'English Etymologies,' I beg to submit it to your judgment, and that of the learned society in question. The following is my account of the matter:— Cold Harbour. It has been suggested in the proceedings of the Philological Society, on the authority of a passage in Pepys, that this name signified a place where coals were depo-It may be conceded that such was the steed. If may be conceded that such was the meaning in the instance referred to, and perhaps in some others; but was it the custom to have depôts of coal (that is, charcoal) all over the kingdom in ancient times? Cold Harbour means 'shelter from the cold,' a good name enough for a small inn or public house, in a bleak and solitary situation. Or complice bleak and solitary situation. Or, more literally, it meant 'the Cold Inn.' Not an inviting name, certainly; but in old times people were not so particular, when journeys were always sure to be full of hardships. Nor are inns always to be judged of by their titles, since one of the best inns in Savoy is named Maltaverne. But if any one doubts, notwithstanding, our interpretation of the Call Levil standing, our interpretation of 'the Cold Inn,' we can produce good proof that such is the meaning. For, the name of Cold Harbour is we can produce good proof that such is the meaning. For, the name of Cold Harbour is found in Germany as well as in England. The name in German is Kalten Herberg; the meaning of which is evidently Cold Harbour. Such an inn is encountered by the traveller on the road from Basle to Freiburg, &c. &c. Herberg (French Auberge) is the English Harbour; whence we say 'to hurbour a person' (receive him, give him lodging, entertainment, &c.), to harbour a criminal (shelter him, hide, &c.), to harbour a thought (entertain it)." Sceneny.—In Buckstone's clever drama

"The Green Bushes," now playing again at The Green busines, now playing again at the Adelphi, there is some very clever land-scape scenery. We would particularly notice "A log cabin on the banks of the Missisippi" and "The Missisippi by sunset." They tell of this piece and the singularly long time during which it has been running how that a sailer. which it has been running, how that a sailor having seen it one night left for America, and, having accomplished his journey and returned, went again to the Adelphi and found the Green Bushes still on the bills; moreover, that after-wards going to India, he again found, on his watts going to finda, he again found, on his return, the same company playing it at the Haymarket.—At the Lyceum, the continued success of Mr. Planche's capital piece of fun and splendour, "The King of the Peacocks," prevents us from having any fresh matter to chronicle chronicle

SIR HANS SLOANE'S MONUMENT.-Your SIR HANS SLOANES MONUMENT. Tour correspondent "Antiquary," recommends the lettering on Sir Hans Sloane's monument to be "recut deep into the stone," as it is nearly obliterated. If this be done I would heg to

obliterated. If this be done I would beg to suggest, after they are so cut, that instead of merely blacking the letters inside, they should be filled up with a cement, flush with the surface; and this, if adopted, would insure more durability to all stone lettering.

The Duke's New Edinburgh Statue, and its Site.—This futther addition to the hundred-and-one Wellington memorials is, we learn, to be placed on its site in front of the Register House, on 18th June next. The Lord Provost and magistrates are being petitioned in the meantime by numerous parties on the in the meantime by numerous parties on the propriety of throwing back the screen in front of the hullding, so as to obtain a wider and more spacious communication between Leith-

more spacious communication detween Leith-street and Princes-street.

Competition for Church at Hepton-stall.—A correspondent says, Messis, Mal-linson and Healy, of Bradford, obtained the first premium; Mr. Crowther, of Manchester, the second; and Mr. Shellard, of Manchester, the third

A SECOND DANIEL."—A correspondent mentions that one of the old oaks in Donnington-park, the seat of the Marquis of Hastings, measures in girth (14 feet from the ground, where the branches expand), 36 feet! It is known in the neighbourhood as "Daniel

EXEMPTION OF LITERARY INSTITUTION FROM POOR-RAWE. — In the case of "The Birmingham New Library," touching the Birmingham New Library, touching it power of enforcing a poor-rate assessupon it, Lord Denman said, "In orde to bring the society within the exemption provided by the statute, it was necessary that it should be established for the promotion of literature and science, or the promotion of literature and science, or th promotion of literature and science, or the fine arts, exclusively; it must be supporte wholly or in part by voluntary contribution and must be prohibited by its laws frot making any distribution of its property amon its members. Upon the first point there coul be no question that the Birmingham New Library was a literary society within the meaning of the Act. There was some difficulty is ascertainty what was a present by a secretary or the secretary of the Act. ing of the Act. There was some dimension ascertaining what was meant by a society supported by voluntary contributions, but the court was of opinion that the subscription might be considered as voluntary if they were the subscription of the considered as voluntary in the war that the subscription might be considered as voluntary in the war that the subscription was the subscription of the considered as voluntary in the subscription of the considered as voluntary in the considered as voluntar commenced at the parties' own choice, and could be continued or discontinued without subjecting the subscribers to any action or los other than that of the privilege of membership According to this construction of the word According to this construction of the word
voluntary subscriptions, the society in question was entitled to the exemption claimed
As to the third point, the society at an annua
general meeting, held in the year 1845, passe,
a resolution against the division of its property
expressly in the words of the Act. But it was
contended that by another rule, in contravention of this a worft which he week or
the contravention of this, a profit might he made by a mem ber in transferring his share, and that this de-prived the society of the statutable exemption. The court, however, was of opinion that it would not, especially as there was no limit to the number of the members of the society Then it was said, that the society at a genera meeting might dissolve itself, and make a divi-sion of the common stock; but the 6th rule which defined the power of general meetings, seemed to exclude their power to dissolve the society. A better answer to the objection was that the statute must have a reasonable construction, and be taken as applying to a construction, and be taken as applying to a continuing body, and not as intending to deprive a society of the exemption which it conferred merely because the property of the society, in case of its dissolution, might, by the rules, become divisible among the members. Upon all these grounds, the court was of opinion that the society was entitled to the exemption claimed." This expression of the opinion of This expression of the opinion of the court is important.

IRON GIRDERS .- A correspondent, with reference to cast-iron girders, suggests for consi-deration the advisability of inserting a piece of flat wrought iron within the substance of the bottom flanches of girders, which may easily be done in the casting; he says,—it adds very much to the strength of the short beams, as I have proved by experiment. It appears to me to be simply carrying out more fully the principle laid down by Professor Hodgkinson in his "Treatise on Cast-Iron."

EFFECT OF SECURING IRON WITH LEAD. —In the course of a paper by Mr. Highton, on Improvements in Electric Telegraphs, read at the Society of Arts on the 7th inst., the writer alluded to the rapid oxidation of the iron railings in the squares of London, and showed, as noted hy others also, that the effect was due to a galvanization arising from the use of lead

for connecting the iron with the stone walls.

THE MURDER NEAR BRIGHTON,—Mr
George Stonhouse Griffith, who was murdered on the 6th instant, near Brighton, was the late estimable assistant secretary to the committee for promoting the establishment of baths and washhouses for the lahouring classes. The share which he had in examining the com-petition plans for the model establishment, and his polite attention to us when looking over them, call for this notice of him in our

obituary.

THE OLD WATER-COLOUR SOCIETY.—
Mr. Branwhite and Mr. Jenkins were elected members of the Old Water-Colour Society on

No. CCCXVI.

SATURDAY, FEBRUARY 24, 1849.

O pray tell me exactly how to make our house dry." " How sball we prevent the damp destroying the wood linings where there are any against our

church walls, and producing ugly stains where there are none?" "Be so kind as to explain to us clearly how we may prevent our drawing-room chimney from smoking and spoiling the decorations for which we have just now paid a hundred and fifty pounds." "Please give me in few words, and not technically, a comprehensive system of ventilation for my residence,"--Such, literally, are some of the requests which are forwarded to us week after week, and week after week again. Within these last six days we have received no less than four to the effect of the first of them alone,

There are usually no particulars, -without which even an approximate answer could not be given; and we are expected, empirically, to provide a cure applicable to any sort of case. Even if particulars be given, however, we are compelled to decline complying with such requests, for reasons which ought to he obvious. The general questions involved in such inquiries, as we recently had occasion to say with regard to heating, we have often discussed, and we shall, of course, continue to pursue the same system, but their application to special cases must he left to those who are enabled to examine the premises and weigh the various existing circumstances.

The endeavour to gain a cure for a damp or smoky house is not to be wondered at, the evils of either are so great and so obstinate. To obtain a perfectly dry house is no trifling achievement. and is seldom done. Consideration should more often be given to this, when building, than is now the case, especially in putting in the foundations and carrying up the underground work. When soft spongy bricks, or even good hricks or masonry, are placed on damp soil, forming a dry area, between the side of a wall and ground which may be against it, is of little use, hecause the damp will he absorbed from the bottom and rise, brick by brick (by capillary attraction), up the wall, until it reach a point where it is carried off by the external atmosphere or other influences. A layer of concrete under all the walls of a building (an excellent step in many other respects), will be found of great use in preventing the rise of damp. The bricks for the footings-if bricks are used-should be sound and dense, as slightly absorbent as they can he had; and the employment of cement, instead of mortar, in this position, is very desirable, and would make a scarcely appreciable difference in the cost of the structure. And, indeed, it may be said of good and bad work generally, that the expense of the former over the latter, considered as a per-centage on the whole cost of the building, would be in most cases trifling, and not to be weighed in any against the advantages which attend the former.

The ground, then, being kept off the external face of the wall by a dry area (formed, say, by a 4½-inch wall placed 4 inches from the face in question, and arranged so as to admit instance of the inefficacy of cement for the purpose in question is recorded in the "Transactions of the Institute of British Architects," vol. i., p. 59.

of the circulation of air), and the internal face the event of an unequal settlement of the founfreed from the soil, or protected from it, much dations, where the layer of asphalte was would have been done towards preventing the evil so far as the bottom is concerned.

In many cases it is desirable to take out the ground from the area enclosed by the building, and substitute a rough sort of concrete, or dry brick rubbish grouted insitu, to keep down damp vapours; and in others to provide an additional precaution in the shape of a layer of impermeable matter in all the walls above the level of the soil. A layer of slates in cement is often used for this purpose. In some cases the liorizontal surface of the wall is covered with a thin sheet of lead, but the duration of this for any length of time could not always be de-

In the case of a public building in Hull, where zinc, bedded in loam, and having the course of hricks immediately above it bedded in the same material, was thus employed, the zinc was found, when examined nine months after, at the time of introducing hot-water pipes, full of holes, and in a rapid state of oxidation. In many churches the earth lies against the walls to a higher level even than the floor of the church : as a matter of course, the walls are saturated with moisture,-the air within the church is affected by it; the woodwork in contact with the walls is ratted. Clearing away the earth so as to admit the sun and air to the walls, and forming a paved channel close against them, all round, so as to take away the surface-water, would often do much towards a cure,

There appears to he strong evidence in favour of the use of asphalte for the above purpose. A writer in M. Daly's Revue Générale de l'Architecture, quoted in the appendix to the second report of the Commissioners on the Fine Arts, says,-"In 1839 I superintended the construction of a house of three stories on the Lac d'Enghien. The foundation of the building is constantly in water, about 191 inches below the level of the ground-floor. The entire horizontal surface of the external and internal walls was covered, at the level of the internal ground-floor, with a layer of Seyssel aspbalte, less than half an inch thick, over which coarse sand was spread. Since the above date no trace of damp has shown itself round the walls of the lower story, which are for the most part painted in oil of a grey stone colour. It is well known that the least moisture produces round spots, darker or lighter, on walls so painted. Yet the pavement of the floor, resting on the soil itself, is only about 21 inches above the external surface of the soil, and only 191 inches at the utmost ahove that of the sheet of water."

In a lodge which the same writer huilt on a higher level, less exposed to moisture, the asphalte was not used, and there, he says, the walls are spotted with damp. And of another house built at the same period, he says,-"The area of the ground-floor of this second house is 2 feet 11 inch above the level of the garden, and rests on sleeper-joists separated from the soil by an empty space of above 2 feet 7 inches in height, which is ventilated by numerous air-holes. Before this floor was laid, the horizontal surface of the foundation walls had been covered with a layer of Roman cement, about an inch thick. Notwithstanding all these precautions the damp has ascended the walls as high as 3 feet and some inches above the level of the flooring, *"

To prevent a partial slip of the materials in

used, rows of flints were incrusted midway in the thickness of the masonry (and covered by the asphalte), to form a sort of key.

Various compositions have been proposed at different times in our pages for preventing damp from penetrating enclosing walls. Amongst the prescriptions is one which some of our querists, who were not then amongst our subscribers, may be glad to have. It came from a practical man, and is as follows : --

"Boil two quarts of tar with two ounces of kitchen grease, for a quarter of an hour, in an iron pot; add some of this tar to a mixture of slaked lime and powdered glass which have passed through a flour sieve and been dried completely over the fire in an iron pot, in the proportion of two parts of lime and one of glass, till the mixture becomes of the consistence of thin plaster. This cement must he used immediately after being mixed. It is not well to mix more at a time than will coat one square foot of wall, as it quickly becomes too hard for use, and continues to increase its hardness for three weeks. Great care must be taken to prevent any moisture from mixing with the cement. For a wall which is merely damp it will be sufficient to lay on one coating of cement about one-eighth of an inch thick, but should the wall be more than dainp or wet, it will be necessary to coat it a second time. Plaster made of lime, hair, and plaster of Paris, may be afterwards laid on the cement. This cement when put in water will suffer neither an increase nor diminution in its

The great point is, however, in all cases to take the evil at its source, and prevent the access of wet to the wall.

When dampness proceeds from deliquescence, nitrate of soda, &c., being present in the mortar,-washing the wall with a strong solution of alum has been tried with success.

In the report of the Fine Arts' Commissioners, to which we have already alluded, an account is given of the means of excluding damp from the internal surface of walls, not protected ahove the foundation in the way we have mentioned, by two French chemists, MM. D'Arcet and Thénard. To prepare the cupola of the Pantheon, Paris, for painting on, the face of the stones composing it was heated bit by bit, and a composition applied consisting of one part wax and three parts of oil, boiled with one-tenth of its weight of litharge. The absorption took place readily by means of heat, and the liquid penetrated the stone from a quarter to balf-an-inch. The composition acquired solidity as it cooled, and hecame hard in six weeks or two months.

For ordinary purposes resin might be substituted for wax : the ingredients then are, one part of lithargized oil to two or three parts of resin. This composition has been employed with effect, with the aid of heat, to protect internal walls from damp. A remarkable instance of its successful application, related in the same memoir, is here added. "Two rooms on the basement story at the Sorbonne happen to be several feet lower, on the east and south sides, than the ground-level of the neighbouring houses. The walls of the two rooms on these sides are impregnated with saltpetre. Some years since it was thought advisable to coat them with stucco, in the hope of driving the saltpetre to the outside; hut it penetrated the stucco, and re-appeared on its surface, producing so much damp that the plaster began to be decomposed, and the place became

uninhabitable even in summer. Our method was tried in these rooms in the following manner: -A mastic was composed, consisting of one part linseed oil, boiled with one-tenth of its weight of litharge, and two parts of resin. The latter was melted in the lithargized oil in a cast-iron vessel, the fire being duly regulated. The substances tumefied considerably at first, but, the fusion once completed, this effect ceased: the composition was suffered to cool, to be again heated for use. The tumefaction which takes place requires that the resin should be dissolved in the oil by degrees, otherwise it will overflow. The walls being very damp, it was necessary to dry them by means of a portable furnace."

The plaster was first thoroughly dried, then heated piece by piece, to enable the mastic to penetrate it: the mastic was applied without intermission till the plaster ceased to absorb.

A similar way of rendering pavements dry is also described. Vitruvius recommends a mixture of oil and lime as a cement well calculated to exclude damp from pavements.

This subject, which can scarcely be called a dry one, deserves further consideration.

PROFESSOR COCKERELL'S LECTURES ON ARCHITECTURE,

THE fifth lecture of this course was delivered on Thursday, the 1st instant. The professor began by expressing a hope that, in speculat-ing on the subject of classical art, he had not disseminated an idea that no other school was worthy of our regard. Each system had its proper application. He believed that the su-premacy of classical art was as incontrovertible our superiority in mental and moral philosophy, and every discovery tended to the establishment of this fact. The Greeks ever was would be our masters in art, and those who followed them, as the Romans and the artists of the Revival, had their proportionate measure of our regard.

He remarked, that if we looked to the com-He remarked, that if we looked to the commentators on Vitrouius, we were struck with their comparative ignorance of things with which we had become well acquainted. In his own time, great advances had been made, down to the discovery of the scamilli impares in Athenian buildings, hy Mr. Penrose, and he inferred that we were only on the threshold of accurate knowledge of the principles of all that we now so empirically admired. In proportion, especially, we had much to learn, and he considered that there was room for glory to our own country, by a new edition of Vitruvius.

The progress of investigation, from time to time demanded fresh examination of all subjects. In the history of Greece and Rome, all early histories were now as waste paper; in mediaeval architecture, the statements of the carlier writers, since the labours of Professor Willis, would have to be re-cast. It was to the ahuse, and not the use, of classical architecture that certain of his strictures had been mentators on Vitruvius, we were struck with

tecture that certain of his strictures had heen directed. He recommended a latitudinarian spirit, rather than one of bigotry, in regard to spirit, rather than one of bigotry, in regard to style. Each peculiarity of architecture had its application to time and place. Nature was emuently iatitudinarian, but nevertheless was governed by principles. He had therefore recommended the study of nature, and it was better to hecome pupils of her than of Ictinus, Phidias, or Inigo Jones.

Quoting a passage from Alberti, to the effect that beauty was never distinct from utility, he remarked that utility was the characteristic of remarked that utility was the characteristic or the Roman works, which were those of engi-neering, and the same might be said in Eng-land, for though he had never found any ob-jection expressed to heatily in a design, he had certainly never found it enjoined as a necessity.

On the subject of proportion, the professor remarked that each master had a theory of his remarked that each master and a theory of ms own. In some measure we all judged by a natural instinct, and we flattered ourselves that we had an eye for proportion. But, whilst, as Vitruin's said, other men than the artist could discover the good and the bad, the difference between the artist and the work-

man was, that one could foresee, and the other how inferior was the former. could not. He urged the importance of the study of proportion, in order to avoid those lamentable failures of which there were such frequent instances. The architect of a buildfrequent instances. The architect of a building often found too late, that with more modesty, and with good advice, and repeated study in drawing, and above all by models, he might have better attained the effect which he sought to impress upon the child of his hopes. Yet the architect should not consult too much his friend, nor too much his enemy, but rather endeavour to avoid the prejudices of each. He impressed upon his hearers the impactage of resolutions the second the importance of recollecting the wonder-ful power of proportion. By it, not only character, but magnitude was given to a huilding; it could make the small look large, character, but may huiding; it could make the small look large, and the large look small. In illustration of the former characteristic, he quoted a passage from an author, descriptive of a small sage from the small between the might be the small be a small state. the former characteristic, he quoted a passage from an author, descriptive of a small figure of Hercules, which, though it might be held in the hand, as you looked at it seemed to expand into a colossus; and of the latter, he instanced the interior of St. Peter's, at Rome, which was so ill devised that it actually appeared smaller than it was, a great actually appeared smaller than it was, a great of the proportion of the proportion of the propersymmetric proportion. error, and in expense extravagant in proportion to the result. Why were these opposite

Proportion, he defined to be of three kinds: Proportion, he defined to be of three kinds:
—Ist. Proportion of elements, expressed in
the orders; 2nd. Proportion of cubes and
solids, which would govern that of halls and
apartments; and 3rd. The proportion of areas,
courts, and squares. In the orders we found
expressed, in the most perfect manner, the
charm of quantities. The best masters had
constantly devoted their attention to these features of architecture; as much as the West. tures of architecture; so much so, that Wren complained, that architects attended to them companied, that architects attended to them as though they were the whole matter of the art. In considering the question of magnitude, it was to be remarked, how in the early Doric there were larger capitals and rapidly diminishing shafts, as compared with the late Doric, in which we noticed a gradual tendency to the vertical and pyramidal. Greek archi-tecture was characterised by a certain finality, to the vertical and pyramidal. Greek archi-tecture was characterised by a certain fibality, and it resulted from that characteristic, that where applied as a lower story it was bad, as we saw it in Buckingham Palace. He inferred that it was bad to diminish greatly the Doric in street architecture, and that it was from this application of it by the Romans that the altered diminition resulted. He inferred that the diminution resulted. He inferred, too, that the large capital was found incompatible with the altered position, and that it was intended to give magnitude by being diminished.

The Grecian Doric order, when alone, would

never look large; whilst the Roman columns, as that of Trajan, shewed the perfect consideration for this object of proportion. In the Corinthian order, varying the height of the capital altered the appearance of length in the columns; a lofty capital made the column look short; whilst by diminishing the capital, magnitude was attribuded. magnitude was attained. Similar means were apparent in all three of the orders. The system was found in the Parthenon especially. He found from Vitruvius, that the ancients recognised that the proportion should alter with the magnitude. In the temple of the In the temple of Giants at Agrigentum, the columns of which oranis at Agrigentum, the columns of which had a diameter of 13 fect, we found base mouldings,—an cutirely new feature in the Grecian Doric. At Pæstum, instead of the ordinary number, the columns had each twenty-four flutes. But at Sunium, where they were small, and where breadth of effect in the templatical features. the temple, viewed from the sea, was desirable, they had sixteen flutes. I am not, said the architect, raising a toy or a model, but a hulld-ing in which I must take into consideration all circumstances of size and position. He thought, therefore, that had he large columns to deal with, he should increase the number of the flutes, and diminish the capitals, whilst in small columns he might have sixteen or twelve flutes. As we found in nature, the youthful face had smooth outlines; but with the new dignity of strength and manhood, the features became more marked. The oak, as a young sapling, differed in like manner from the full grown tree, with its arms set at right angles, and the corrugated surface of its hark. To give magnitude, therefore, multitude of parts was necessary. Comparing the front of St. Peter's at Rome with that of the Parthenon, columns in the front were of immense size, yet the façade was one which would have been better suited to a parish church than to so vast a cathedral. It was to give magnitude that the new Parthenon had eight columns, instead of six, the number in the former building.

The professor then alluded to a theory which he had broached in former lectures, and which he had broached in former lectures, and which will be found referred to in our reports—viz., that beauty of proportion arose from inequalities. He illustrated this by diagrams, comparing the unequal disposition of parts in the man, with the opposite mode of distribution in the unonkey. In like manner the horse was contrasted with the ass. The principle was shewn to be of similar value in proportioning the heights of stories in houses. This, he said was the Empfluga of Virneyis. said, was the Ευρυθμια of Vitruvius.

Vitruvius had given directions for observing the different "styles" or dispositions of columns, as 1½ diameters apart for the pyenostyle, and so on. These directions were very important; but there was another practical point to be considered along with this—viz., varieties of height, according to the character of the building, whether tall or short. Now, this had never been sufficiently well attended to, for the commentators had drawn their illustrations the commentators had drawn their museratures to all scales, or according to the size of the paper. To render this as clear as requisite, the different "styles" should have been drawn to the same scale. Taking the pyenostyle and araeostyle as the two extremes, it would then areostyle as the two extremes, it would then be apparent there were certain characters; as in the latter instance, the low and compressed, and in the former, the tall—the other "styles" ranging between these extremes. Each of these distinct orders of disposition, no doubt, had its appropriate application. Now, instead of observing such as the control of t of observing such a system as that here shadowed forth, each of us had a type by which we measured all things. One artist invariably made his figures tall, another short mvariably made his figures tall, another short —but this was not nature. An architect, wanting a door, would go to an example, or to Sir William Chambers, and, without reflecting, would apply any proportion or size of aperture indifferently to a broad or tall disposition of columns. The professor shewed that in the arecestyle the door should be large in proportion to the order; whilst, in the pyenostyle, the opposite method should be practised; and so, he said, every aperture and indeed approximation. so, he said, every aperture, and indeed every stone, should have a general harmony with the design and character of the particular building. But, in opposition to this, one master was for the broad, another for the

narrow gauge.

The professor vindicated the authority of Vitruvius from the aspersions cast upon it, through ignorance of its true value, as shown in the instance he had given, by modern writers, who were certainly not artists. He quoted the lines from the Hiad, in which Helen describes the figures of Agamemon, Ulysses, and Ajax, and said that these were no doubt described by the head of th designed by the poet to express what we found in the works of Albert Durer, Titian, and sometimes Raffaelle, viz., character. Each of the characters we might affect had its own proper modulus or type, and hy applying each in its place, we obtained that contrast and beauty which was the charm of architecture. He instanced the guard-house at Cologne, by chinkel, as admirably suited to its position. He also mentioned Nottingham Castle, said to be a work of Inigo Jones, which contained some singularities, but had an admirable effect at a distance. Another building was the Loggia of the merchants, at Venice, by Sansovino. It of the merchants, at venuce, by Sansovino. It was only 30 feet high, and in any case, to give dignity to a building which was at the foot of a tower 300 feet in height, was not easy. The professor pointed out how this was effected, and said that the result was a low compressed character, which was in complete contrast with the tower above. Sansovino, on other occasions had shown bow he could feet other occasions, had shown how he could feel like an artist, when he had opposite circum-stances to deal with, when he adopted the tall character: lis art was not that of a bigot; he suited the character to the place. In giving suried the character to the place. In giving examples of successful attention to these principles, the church of St. Paul, Covent Garden, could not be forgotten, as an instance of the fine effect of the low broad character.

It would be recollected, the professor said, in

considering subjects of this kind with the aid of books, that illustrations were not drawn to the same scale. He said that considerations of this sort were much neglected in huildings. For example, we found the eustyle in relief, which made all the difference, and windows imprisoned as it were between the columns. He instanced the front of Lord Spencer's house, in the Green-park, as an example of the successful treatment of an engaged order with windows, the columns heing there Spencer's house, in the Green-park, as an example of the successful treatment of an engaged order with windows, the columns heing there placed diastyle, and consequently there was complete space for the windows, and all dressings. In our copies of Greek temples on the contrary, we had generally fallen into the error which the architect of that beautiful building had avoided. We had, indeed, been Greek mad, but not from too nuch learning, but from too little. He believed that, some day, a type of proportion would be discovered, applicable to every building. Wren had an eye to this. The interior of St. James's Church, Piecadilly, had a certain proportion of height, and magnitude was gained by that proportion. He instanced Sir Robert Taylor's garden-front of the Bank, as an instance of successful proportion. Sannichele was a great master in this; his gate in the front of the Lido had a rusticated Doric order, managed with the hand of a giant. In civic buildings he said, where frequent piers could not be avoided, character might be given by decorating the alternate windows.

windows.

The principle of a certain modulus of proportion, applied to interiors. St. Peter's, at Rome, ought to have had the bridge-like expanse, rather than, with a more vast dimension, the ordinary proportion of a church sion, the ordinary proportion of a church. In mediæval architecture, the height was In medieval architecture, the height was governed by the point of an equilateral triangle, and Wren was so true a mason, that he followed the same method. He concluded by remarking, that although there were many things which could hardly be taught, it behoved us still to reflect, and to acquire all the skill which we could possess, by learning on every side, in preference to depending upon the insuration of genius. the inspiration of genius.

ENFRANCHISEMENT OF LEASEHOLDS.

As no question of a novel nature can have As no question of a novel nature can have a more beneficial influence upon the arts and architecture, nor a greater elaim to the atten-tion of the resident population of the metro-polis, than this, no apology is needed for a few additional remarks upon it.

Having before shown that the proprietary, or landlord class, can make no objection to enfranchisement on the score of inequitable adjustment, and that full compensation can be meted out to them by valuation juries,—now it only remains to more. it only remains to prove,

it only remains to prove,—
That changes more direct, not to say more arbitrary and violent, have heen made by enactments of the legislative Parliament, in all sorts of property, whether lay or ecclesiastical, corporate or private.

That where the interests of the many, urged by the public voice, or the expediency of an altered system of law (led on by retired induce) required a sweeping charge in our

by an accrete system of law (led on by retured a sweeping charge in our social or relative positions as to property, no respect for private privileges interposed to stop the invasion of rights thitherto considered

stop the invasion of rights thitherto considered sacred.

If rights in law were immutable, and the *nolumus leges Angliw mutari* of Magna Charta, were still to coerce the advances of science and arts, and to conserve the usages of black letter jurisprudence, what a standitill generation should we be! What was mited to the state of society in the days of King John, became prejudicial in those of Henry the Eighth; and the expanding nide of a great nation in the latter eigns—discovering that, in progression of ime and prosperity, the shackles of old institutions were unsuited to the giant growth of a natured power—emancipated itself from the rammels of prejudice, and scrupled not to re-orm or altrogate those laws which repressed is luctant energies. It was in this spirit that he Act of Limitation was passed which aboshed, totally abolished, all claims, grounded a the 21st James II., to debt, on which legal rocess had not been entered up for a period f six years. If any one act of the Legislature

could be stigmatized as an act of spoliation, it was that which deprived the creditor, who was too lenient, or perhaps who had slept upon his right, of all suit or demand against his debtor, who had eluded or avoided the demand of his debt for that period. It would be curious to ascertain what might have been the sum total of immunity from payment consequent upon that act; of how many millions, or hundreds of millions the tradesmen and merchant have or initions the tradesinen and inecessarian layer been debarred, and what portion of that im-munity fell into the lap of the Lords and Com-mons, their relatives, and adherents. In this case the right of the honest tradesman was lost, and totally confiscated, no valuation having here interposed to give him a pro tanto annuity over time, as a requital; and yet we heard little complaint, certainly of no public demonstration against the passing of that law, for it was manifest to all that much litigation was saved, and the greater good achieved by that act of extinction. Another very recent interference with vested rights, took place on the enactment of 34 William IV., chapter 27. By that statute the fact of possession for twenty years conferred on the holder or tenant of fixed property, the absolute freehold title as indefeasible against all claimants. Here was an utter annihilation demonstration against the passing of that law, all claimants. Here was an utter annihilation and defeasance of all heritable claims on property, so circumstanced, how clear soever might be its deduction, and although the family of the rightful claimant might have been in possession up to twenty-one years antecedent, or his ancestors from the days of Harold in lineal succession.

We will not inquire what were the opera-tions of this statute, nor what complications of interests were set at rest by it, but only adduce these examples to prove that legislative wisdom hath abrogated and wholly annulled usages which hitherto admitted claims (rightful claims) to fixed property, and that, too, without contemplating any equivalent.

The remarks which have been made by powerful parties who are opposed to the enfranchisement of leasehold property, induce me these examples to prove that legislative wisdom

powerful parties who are opposed to the en-franchisement of leasehold property, induce me to offer these examples in addition to those already instanced, of "the enfranchisement of copyhold tenures," and the "valuation, free-hold, leasehold, copybold, &c., Act, empower-ing railway companies to purchase." However, in the proposed enfranchisement, or rather, the continuation in perpetuity of existing leases (originally above twenty-one vears) to the tenants in possession, the rents

existing leases (originally above twenty-one years) to the tenants in possession, the rents now payable must also he continued in perpetuity; and as in the great majority of cases, householders wishing to renew or perpetuate their tenures, would take that perpetuity at an increased tental rather than on nurselyses. their tenures, would take that perpetuity at an increased rental, rather than on purchase: so the immediate yearly income of the great landlords should be vastly increased; as, for instance, a house in Belgrave-square having 60 years to run, at 100*l*. a-year ground-rent, but now worth in the market 500*l*. a-year, might, by the payment (or valuation), be subjected to an additional 50*l*. a-year; a sum which, by accumulation on compound interest, must, in 60 years, exceed the value of the mansion at the end of the lease.

In the valuation of shorter terms, unlapsed, the increased rent would be proportionately larger; as for example, a house in Grosvenor-square having hut 20 years of lease to expire, and subject to 501. a-year, the present value being 5001. a-year; in this case 1501. a-year additional rent for the perpetuity might not be considered excessive; but however it might appear to others, the occupant would, in nine cases out of ten, rather pay it than suffer his term to lapse; and the more especially so, as on the renewed lease he might modernize, improve, and consolidate his mansion; whereas, if he were to suffer the lease to lapse, he must continue to occupy a dingy dwelling, falling into decadence, unsuited to his requirements, nd to the improving taste of the day.

Hence it is clear that the head proprietor

can in no case get less than his original rent, with a sum of money equivalent to the improved value of the premises leased in perpetuity; and that by such arrangements as should give an increased rental, instead of purchase, the present actual rental of the landlord must be treblad.

would be perpetuated on an increased rental would be perpetuated on an increased rental adding at once 200,000l. a-year! one-fourth would be purchased at the present estimated rental, or 50,000l. a-year, being the reduplicated amount of rent, and this, at twenty years' purchase, would produce one million in money, which would be, in round numbers, (at medium fund price) 30,000l. a-year. Institute 10. which would be, in round numbers, (at medium fund price) 30,000l. a year—leaving still the head rent undisturbed; and the other fourth part would probably be allowed to run out of lease.

This estate then, now producing 200,000l. ayear, by such regulation would return 330,000%. a-year until the lapse of the remaining fourth part, and of that portion the returns would be trebled on reletting, realizing a total income of 480,000%. a-year.

In estates which are strictly entailed, provision should be made by the Legislature for entailing in the funds of the country the amount of purchase money paid on enfranchisement,these funds being subject to the same limitathese ratios being subject to the same limita-tions as the houses converted into money. On the estate before referred to, no less a sum than one million would probably be invested,—this on only one estate. The total sum so invested must be in the event enormous; and the fixed must be in the event enormous; and the insea capitalization of such amounts would obviously tend to the stability of Consols, from the valuo of which, at the time of enfranchisement, the equivalent, or price, would be calculated. No one can argue that this is a confiscation;

No one can argue that this is a confiscation; in truth there are hut very few great proprietors in London and the environs—I should say but twenty at the most, possessing colossal incomes; and taking these twenty at an average of 2,000 houses each, there are of consequence 40,000 householders who would be benefited by the proposed argument, who being by the proposed enfranchisement, who, being tenants at a rent certain (that rent not being immoderate), would expend large sums in the consolidation and improvement, as well as the embellishment of their boldings. What a stimulus would this apply to the languishing tradesman—the brieklayer, mason, carpenter, and all the artists who follow in their train!

But let the present system of terminable leases go on for fifty years more, and then see the state of society,—all the habitations of the great towns will be at the disposal of twenty proprietors, who may expel, evict, dispossess, and disperse the whole population, as seems best to their lordly wisdom or caprice. Go thou there—rest thou here—this square shall be the abode of lords, that of commoners; this street shall be allotted to the squirearchy, and that to the professions! and that to the professions

One incident may explain more forcibly the tendency of the present practice of teasing than all that has preceded :—a certain tract of fields on the leviathan estate near Vauxhall, final that has preceded:—a certain tract of fields on the leviathan estate near Vauxhall, was let out lately to a great building firm, on a lease for ninety years, on condition of building 5,000 houses; and this at a rental of 5,000. A year,—these houses were to be of a class to assure the expenditure of 1,000. or 1,500. a house. It requires no complex arithmetic to prove that at the end of the term, or on the lapse of three generations, the enormous sum of five millions, disbursed by the public, must, at the expiration of that term, fall into the possession of the lessor lord, or of his posterity; and that the rental of those houses so erected by the community, if averaged at only 100. a year, must make the enormous addition of 500,000. to the rental of the advantage of the community? that one family should command whole districts of habitations, and that all mankind should be ousted? The reverse conclusion is so obvious that it The reverse conclusion is so obvious that it needs no elucidation; for better is it that 5,000 householders, with an interest in the tenements, should enjoy their privileges, nunicipal and other, than that all should fall into only one heritage. But at the male that cipal and other, than that all should tall into only one heritage. But at the end of the ninety-nine years, not only these 5,000 houses, but also, in half that period, 5,000 more of the old town (now the fashionable part), must fall to the same proprietor, unless the wisdom of our Legislature stop this frightful accumulation and forestilling of all the dark of the same propriety. mulation and forestalling of all fixed property in tenements. The forecast which provideth for a family should provide for a nation; and give an increased rental, instead of purchase, the present actual rental of the landlord must be trebled.

On one estate only, the estimate of increase (rough though it be) is not far from the mark. It stands thus: Of 200,000% a-year, one-balf all superior interests. The enfranchisement of

leaseholds may be a new theory, but it is facile as it is just. The interests of humanity require it; and the consummation of such an act will reflect credit on the member who may carry such a measure as this suggested hy

QUONDAM.

SURFACE-DELINEATION AND PLAN-MODELLING.

CARRINGTON'S MODEL OF YORKSHIRE AND LANCASHIRE.

At the present moment, while sanitary improvements and the general drainage of land occupy so much of the public attention, it is a matter of importance that the most judicious and economical mode of showing the undu-lating surface of ground, so as to devise the best method of draining it and effecting im-provements at the least possible cost, should

The present system of sections and contour lines gives but a partial knowledge of the character of ground, inasmmeh as the undulations can only be shown where the traverse is made with the level. Beyond this (on either side of the line traversed) has infrared to the contraction. of the line traversed), no information is supplied; so that, to arrive at any thing like a knowledge of the surface of supplied; so that, to arrive at any time, like a knowledge of the surface of a country, many sections and cross-sections are requisite. In like manner, contours following out lines of equal altitude show the form of the ground only where the level passes. Moreover, the expense of contouring a piece of country is more costly than most persons are aware of. To contour ground for practical purposes, so as to enable parties when on the ground to find the line traversed, it is requisite to have the contour line staked out: the distance between the stakes averages about one

For towns, a series of sections taken through

For towns, a series of sections taken through the streets is unquestionably the best method of obtaining the different altitudes. It is surprising to hear so many persons praise the system of contouring towns. Are they aware that, to a great extent, it is fiction? It may look very pretty on paper, and persons may fancy they have a knowledge of the ground from such a mode. Test its accuracy! It will be found void of truth. You cannot follow out a contour line in a town, where its direc-tion would be intercepted by buildings and offsets and obstructions innumerable. Contouring of towns, and of precipitous and rocky grounds, has never yet been accomplished. Valuable and indispensable as sections are, they fail to give that which is most desirable

in designing and carrying out any great work, a comprehensive and detailed whole.

This defect then existing, it seems a matter of regret to find that a heautiful and economical method of delineating ground has been passed over. This method (the horizontal delineation of ground, and which is so little demeasing of ground, and which is so fittle known) was introduced into the Ordannee Department by Mr. Dawson. So valuable and important was this particular study considered, that his Grace the Duke of Wellington, when Master-General of the Ordannee, ordered a limited number of two greatest parts to much limited number of young gentlemen to specifically study that art, in addition to every other

hranch of surveying.
Mr. Frederic A. Carrington, a gentleman who held an appointment from the Master-General and Board of Ordnance, and who was specially instructed in the above studies, after having delineated large tracts of country, an having delineated large tracts of country, and made finished topographical "hill" drawings for the Ordnance, of more than 8,000 square miles of country, has for the last three years particularly devoted his attention to the delineation of ground, and to modelling for practical purposes

This system of horizontal delineation (correctly done), combined with a judicious mode of levels, imparts a thorough knowledge of the surface of a country. Minute features, as well as rocky and contorted ground, are clearly expressed; and in designing the improvements and drainage of towns and estates, it is very

valuable. Were London, Liverpool, or any of our great towns surveyed in this manner, not only might the rise and fall of every street he exhibited, but the continuity of the fall. The height in feet at the intersection of the streets, and every other remarkable point, could be

Then, as regards estates, take the case of our great landed proprietors, anxious to im-prove their property in laying out new roads and draining the land. Supposing they were desirous of carrying

Supposing they were destrous of carrying out the work progressively, or from year to year, by having the estate delineated in the manner proposed, all improvements, as well as the thorough drainage of the property, could at once be projected; and, if required, laid out with the greater breatter and connection.

with the greatest nicety and conomy.

Models of towns, estates, and districts of country, executed in this manner, can be multiplied at a comparatively small cost. They can be produced in a composition resembling ivory, gutta percha, papier maché, &c., impervious to work. Among those we have seen are ivory, gutta percha, papier maché, &c., impervious to water. Among those we have seen are Blyth and Serlby Hall, in Nottinghamshire (to show its applicability to estates), on a scale of four chains to an inch; that of part of the town of Dundee, on a scale of 100 feet to an inch, for towns and boroughs generally; and, lastly, that which may be called the chief work, in illustration of a tract of country, on a scale of one inch to the mile. The portion chosen for this purpose is, perhaps, among the most difficult and interesting in the kingdom, "the great manufacturing districts of dom, "the great manufacturing districts of Yorkshire and Lancashire." There is much for contemplation in the district thus embraced, contemplation in the district thus embraced, extending from Lincoln westwards some 70 miles, to Congleton, in Cheshire; from Congleton northwards, by Manchester to Burnley (say 45); from Burnley, east, by Bradford and Leeds to South Cave on the Humber; and from the Humber, south to Lincoln,-it forms parallelogram including a surface of about 3,000 square miles. The site of six and forty 3,000 square miles. The site of six and forty cities and towns, villages innumerable, parks, woods, roads, railroads, and canals, are all shown in relief. The sources and windings of all the rivers and streams, among the hills and through the plains; the Trent and the Mersey, the Derwent and the Don, the Calder and the Dane, the Irwell and the Rother, may be seen at a glance.

be seen at a giance.

The physical peculiarities are, if anything, still more interesting. At once it may be seen wby geologists call the country near Manchester, the "Manchester basin"; the term is most apt, for the hills form a perfect crescent around it, of which it is as nearly as possible the it, of which it is as nearly as possible the centre. The great mountain ridge that divides Lancashire and Yorkshire, running in a northwest and south-east direction, is, to the north-east of Manchester, broken in a most remarkable manner, forming at this point the celebrated pass of Todmorden, which, circuitous and narrow, has been taken advantage of for turnpike, canal, and railroad, as affording, in the first instance, the easiest and best transit between the counties.

The summit ridge previously named, formed of millstone grit, varying from 1,500 to 2,000 feet above the sea (with the Luncashire and Yorkshire coal fields on its west and east side), is divided in two at the Peak of Derby, to make way for the upheaved mass of mountain lignestone, of which, the greater wat of that make way for the upheaved mass of mountain limestone, of which the greater part of that county is composed. The next great feature on the Yorkshive side is what may be called the magnesian limestone ridge, from 200 to nearly 600 feet high, gradually dying off in the soft features of the new red sandstone, till lost in the valley of the Trent, and the great flats near the Isle of Axholme, when it is again relieved by the lesser, but well-marked, oolite ridge, on which Lincoln stands, and along which the great line of the Roman road is taken direct to the Humper. the Humber

Where the canals were first constructed to Where the canals were first constructed to aid the transit between the counties, the rail-roads have followed in nearly a parallel line, with the exception of that great work, the Manchester and Sheffield line. We see in a moment where and to what extent, from the neighbouring hills, the Lancashire towns can be supplied with water for domestic, manufacturing, and sanitary surpasses. The same in turing, and sanitary purposes. The same in reference to Yorkshire, and far distant as they The same in are, the whole produce of the sources of the Derwent and the Dove, could be brought to the metropolis, should it so be willed. As it is necessary to impound and store the water in the hill districts for use; so in the plains, an important object is gained if we can regulate the upland drainage, or find means for its being more rapidly carried off from these low lands, in order to hring what are now marshes

into cultivation, to turn what is waste to profit, to make what is now a source of disease healthy and valuable.

neatiny and valuable.

Again, in a military point of view (for the use of an officer in command), nothing else can at all approach a work of this kind. To the Government such a work (always of course supposing it correct) is invaluable.

What do we know of our exposed southern costs and harbourn. If such harbourners the content of the property of t

coast and harbours? If such be the case at home, what must it be in reference to our possessions in the east and elsewhere? Who knows India? What is Sidney like? What are the features of the Cape Colonies and Port Natal ?

Impressed with the obvious advantage of this mode of surface-delineation, we are anxious that Mr. Carrington's system should have a fair investigation, and if found to fulfil all that it promises, a liberal encouragement.

PUBLIC BATHS AND WASHHOUSES.

For a special purpose, we are asked for some relative information concerning the baths and

For a special purpose, we are asked for some relative information concerning the baths and washhouses of the metropolis. The baths at George-street are a long strip of a building irregular, and taking parts of two sides of a square. A general description of it has appeared in our pages.

Those at Glassbouse-yard are merely half a dozen baths fitted up in different parts of the large refuge for the houseless poor. There are also scattered washing tubs and troughs.

The building at Goulston-square ("The Model Establishment,") described in This Building at Goulston-square ("The Building and one of the property of the

four baths, each in a separate apartment 6 fee square, and ninety-six washing places, each with its separate drying closet.

with its separate drying closet.

St. Martin's will probably cost 15,000.

About sixty-four baths and fifty-six washing places, each with its separate drying closet Cheaper plans are needed. At Goulston-squarthey have had and still have to go through the cost and disappointment of experiments. The plans have not been published.

The success at St. Martin's is said to be considerable. With only about thirty bath

plans have not been published.

The success at St. Martin's is said to be considerable. With only about thirty bath completed for use, the bathers during the first nineteen days have been 6,701, and the receipt 13s. 2d.

Baths and washhouses are about to he erected in Macclesfield.

ON THE TOPOGRAPHY AND ANTIQUI TIES OF THE CITY OF JERUSALEM.*

THE following paper relates first to the topography of the city of Jerusalem, and after wards to the existing antiquities. To illustrate wards to the existing antiquities. In mustact the topography, I annex a plan taken by m in the year 1825. It was measured unde circumstances of considerable difficulty, for a the period of my visit Jerusalem was in the possession of the Arab natives, who had som time before expelled their Turkish governo and his garrison; and during my sojour there, we were in expectation of a combine attack from the armies of the pashas of Da

Since then, circumstances have been mor favourable for research in the East. From the exhibition of Mr. Catherwood's panorama the exhibition of Mr. Catherwood's panorama and the publications of various travellers, the subject of the topography and antiquity of Jerusalain base negaged the attention of the biblical antiquary, and has given rise to much controversy and to many wild theories. Mobiget in this paper is not so much criticism a togive some information on a subject interesting alike to the architect and the archaeologist, and to direct the attention of the members and other

architects who may contemplate a journey abroad, to the fact that a visit to Jerusalem will afford much interest, and if they will give their attention to the investigation of the doubtful points, they will themselves derive much valuable information from the research, and contribute greatly to elucidate biblical antiquity. requires not only the accuracy but the eye of the travelled architect, who has been accustomed to antiquarian research, to decide on the disputed points; the doubts arise principally from the discoveries and descriptions being by those whose attention had not I previously directed to architectural detail.

The published works of Mr. Williams, Mr. Bartlett, and Dr. Robinson, and the notes by Mr. Tipping to Dr. Trail's new edition of Josephus, with others, will direct the attention of those who may contemplate what is now only summer's excursion (a visit to the Holy Land) to the debateable ground, and I will take this opportunity to state, that I shall not only be willing, but even feel obliged, by being consulted, as I have many questions to ask and much information to obtain on a subject which has at intervals occupied a portion of

my thought.

Jerusalem stands on the southern extremity of an elongated plain of a range of limestone mountains, elevated about 2,000 feet above the Mediterranean Sea. The city is bounded on the east by the valley of Jehosaphat, in which runs the brook Kedron, on the south by the valley of Ben Hinnom, on the west of Gihon, and on the north by ded to. The general appearance by the valley the plain alluded to. The general appearance of the country around is dreary, desolate, and barren; the valleys and ravines, however, are fertile, and the olive tree flourishes on the sides of the bills and ravines. Jerusalem occupied the site of four hills: Zion, or the upper city, on the south-west; Moriah (on which the temple was built), on the east; Bezetha, the new town, on the north; and Acra, the lower city, in the middle, and to the north of Zion. Zion was the highest of the four hills: it is computed about 250 fect above the valley of Jehosophat. A deep valley, called Millo, separated Acra from Moriah, which was in part filled up by the Asmonæan race, in order to join the lower city to the temple. The continuation of the valley is called by Josephus the Tyropoeon, and separates Zion from Acra as well as from Moriah. Zion was probably the first of the hills occupied, and on it stood the city or strong place of the Jebusites, which was finally taken by David A.M. 2957, who made it his capital, instead of Hehron, and called it the City of David. "He built round about from Millo inward," and Kliram, King of Tyre, sent cedars, and carpenters, and masons, and built him (David) a house on masons, and built min (David) a nouse on Zion. Mount Moriah, at this period, was the threshing-floor of Ornan, the Jebusite, of whom David purchased it, as a site for the house of the Lord, which Solomon began to build 32 years after the defeat of the Jebusites (A.M. 2992).* This mount is also the suct (A.M. 2992).* This mount is also the spot where Abraham had raised an altar to make the offering of his son Isaac as a sacrifice. The building the house of the Lord (Solomon's temple), as described in Kings and Chronicles, has given rise to many ingenious designs, learned dissertations, and curious theories. Solomont having selected 70,000 men to bear Solomon's naving selected 70,000 men to dear burdens, 80,000 more to hew in the mountains, and 3,600 to oversee them, sent to Hiram, King of Tyre, to send him "a man cunning to work in gold, and in silver, and in brass, and in iron, and in purple, and crimson, and that can skill to grave with the cunning men that are withme in Judah and Jerusalem "whom that are withme in Judah and Jerusalem," whom David his father had provided. And Hixam sent him a cunning man (endued with understanding). From the description by the sacred seaturing). From the description by the sacra-penman which follows, Wilkins has designed a Greek Doric temple, supposing from the situa-tion of Tyre on the coast that the architecture of Greece at that period was adopted in Syria. I must own I at one time inclined to this view, that is, as regards the style of the architecture of the temple; but after exploring the coast of Syria, and after an examination of the remains of Syria, and after an examination of the remains of the Egyptian buildings, I have thought it likely that the architecture of the temple resembled more the architecture of Egypt than that of Greece. We know there was much commu-

nication between Egypt and Syria. Solomon had horses and linen from there, and married a daughter of Pharaoh; and by a monument cut in the work (of Egyptian design, and of the period assigned to Sesostris), at the Nahr al Kelb, near Beirout, on the coast, a cast of which was brought to this country by Mr. Bonomi, and placed in the British Museum, we see that the architecture of Egypt was used in Syria at a spot more remote from the parent country than even Jerusalem, and a similar monument has been since found in

similar monument has been since found in Cyprus, whereas I am not aware that any example exists of Greek architecture of the age of Solomon in Jerusalem, or even Syria. The two pillars, "Jachin and Boaz," erected before the temple, and "the porch before the house," remind me of the Egyptian obelisk and the great propylons, whilst the "chambers round about the house," the "flat ceilings and roofs," resemble much more the temples of Egypt than those of Greece, besides the total Egypt than those of Greece, besides the total absence of any indication of a pediment and slanting roof, in the description of Solomon's temple,—features so prominent in the Greek temples. However, there is little hope of a satisfactory solution of this problem,—the successive destruction and rebuilding of the temple, I fear, has obliterated all traces of its original style.

After the first destruction of the temple by Nebuchadnezar, it was rebuilt and dedicated in the fifth year of the reign of Darius, A.M. 3416. The second temple—of which, I believe, there is no description on record—was re-built by Herod about four years hefore the birth of Christ, after having stood, like the

former, about 500 years.

This building of Herod is the temple of the This billiams of rierou is the empire of the New Testament, and was the scene of many of the events of our Saviour's life. The de-scription of it by Josephus, though perhaps much exaggerated as regards its beauty and dimensions, proves that it was a building of greater magnificence than any of the preceding ones. When more favourable times than the present will allow of excavation and further research on its site, it is probable that many fragments will be brought to light, and a restoration of its main features may be accomplished with some degree of certainty. (Some of the existing antiquities, which I shall hereafter describe, are probably of this period.)

During the great siege of Jerusalem by Titus, A.D. 70 or 72, the destruction of this work of Herod was so complete as to verify the prophecy that "one stone should not be left on another."

Since then the site of the temple has heen occupied by various buildings, Christian and Saracenic,—and finally the present mosque of Omar was built, partly of ancient fragments, —a spot so sacred to the Mahommedan that none others are allowed to enter even into the outer enclosure, much less to explore the huilding, and only a few other individuals hy stratagem have succeeded in obtaining a casual inspection of this mosque. M. Bonomi, accompanied by Messrs. Catherwood and Arundale, were however, some few years since, allowed to examine, measure, and make drawings of every part, under a misapprehension of the authorities that they had been deputed by Ibrahim, Pasha of Egypt, to report on the alleged dilapidated state of the mosque.

To proceed with the topography of Jeru-lem. It seems probable that Acra was occupied in the time of Solomon, and was always,

as it is now, the most populous part of the city.

Bezetha was a suburb occupied by the increasing population until the time of Agrippa, who enclosed it with a wall a few years after the crucifixion. (It is necessary to hear this fact in mind, as my plan of the restoration of the city walls, according to Josephus, has relation to this circumstance.)

At the present day Jerusalem is surrounded an embattled wall of imposing appearance, built by the Sultan Soleyman A.D. 1542, partly on old foundations; they are about 2½ miles in circuit, built of small squared stones, decorated at intervals by plain patnas, with fragments of older materials, columns, &c., worked in; and in many parts the ancient walls are standing to a considerable extent, both in length and height (which we shall hereafter allude to more particularly. Of the five grates now over particularly). Of the five gates now open, those called Zion and Damascus are the most

* 2 Chron. iii. 15.

ornamented, and the latter is a fair specimen of the style of the period. The wall runs in a north-east direction to the Damascus gate, and continues eastward to the north-east boundary of the city, abutting on the valley of Jeho-saphat. The wall from thence runs southward, forming the eastern side above the same valley, the greater portion of it heing also the enclosure of the temple area, in which is seen an ancient gateway, walled up, known as the Golden Gate. A portion of the south wall of Golden Gate. A portion of the south wall of the enclosure of the temple forms likewise the the enclosure of the temple forms likewise the city boundary, from whence there is a considerable jutting out of the wall southward, on a portion of the rock of Moriah, called Ophel. The south wall passing westward across the Tyropoean valley, passes over the upper part of Mount Zion, half of which is now without the walls. At the summit the wall turns off estimate and the test the same off estimate and the test the same off estimate and the test the same off estimate and the same of estimate and the wall turns off at right angles to the north, where it unites with the citadel, now called This being the entrance from David's Castle. This being the entrance from Jaffa and Bethlehem, the gate here is called not only by those names, but also the "Pilgrims' Gate," who generally arrive in the Holy Land hy way of Jaffa. The wall diverges to the north-west (and completes the western boundary), where it joins the angle at which I commenced the circuit.

Of the objects of most note within the walls, commencing at the north-western corner, are the Latin Convent, where travellers usually take up their abode;—the Church of the Holy Sepulchre, situate in the western part of the city, a description of which was given us two sessions since by Professor Willis, containing, among other assigned sacred localities, the site of the Crucifixion and the Sepulchre of our Lord, and the cave where St. Helena discovered the cross;—the "Via Dolorosa," or the way by which our Saviour carried the cross from Pilate's house (on the site of which is the present governor's honse) to Calvary, passing under by the Gate of Judgment, and the arch of "Ecce home," which is probably one of the ancient gates. On the site of Pilate's house, the "Scala Santa" (by which Christ ascended), now at Rome, was taken. A large excavation called the Pool of Bethesda, is seen in front of the north wall of the Tennole, enclosing probably covered the cross; -the "Via Dolorosa," the north wall of the Temple, enclosing probably part of the deep ditch in front of the famous fortress of Autonia. Another pool near to the tower of David, perhaps that formed by Ezekiel, and near the same tower, is the spot where the Protestant Church is being built. The convent of the Armenians is a large built in the convent of the Armenians is a large building, said to be on the site of the martyrdom of St. James; and, lastly, the mosque of Omar, which is by far the grandest object existing at Jerusalem at this time. Without the walls are some excavated tombs on the north and north-west, and in the Valley of Jehosaphat: those called the pillar of Absalom and the tomb of Zachariah, I described in a paper read here some few years since.

Passing by the garden of Getbsemani, from the valley of Jebosaphat, where exist some olive trees of great antiquity, a road leads to the summit of the Mount of Olives, which commands a fine view of Jerusalem. A hill, called Mount Offence, the traditional site of Solomon's idolatry, and the Hill of Evil Coun-sel, the supposed s te of the house of Caiaphas, where the priests and clders took counsel to destroy Christ, are conspicuous features in the

destroy Christ, are conspicuous features in the scenery around Jerusalem.

Opposite the village of Siloam is a fountain called of "The Virgin," from whence is a subterranean communication for the water to the Pool of Siloam, by a channel cut in the rock through the ridge called "Ophel." The pool is reached by a descent of time-worn steps: the clear refreshing waters, which ebb and and the beauty of the vegetation around on the walls of this pool, impart a peculiar charm to the spot. This, and the cultivated spot below, at the intersection of the valleys by the Well of Nehemial, form a sort of oasis the intersection of the valleys in this desolate region.

Near here is a remarkable white mulberry tree, the scene of the martyrdom of Isaiah

The sides of Zion, without the walls, contain a mosque on the site of the tomb of David; and the places of the sepulchres of the kings of Judah (probably formed in the rock) may he found buried under the accumulation of ages, and the ruins of the ancient palaces and building which was consultable as the second of buildings which once embellished this now half-

^{* 2} Chron., iii., iv., v. † 2 Chron., ii. 18; v. 2—7.

given amount of light, because it does not follow that, irrespective of modes of combustion, the same amount of gas consumed will furnish the same amount of light. You may burn a limited quantity of gas and have a very splendid light with one arrangement, while with another a prodigious consumption may be going on and but little light obtained. It is be going on and but little light obtained. It is then important to ascertain under what circumstances a maximum amount of light is obtained. The arrangement which I have placed on the table this evening, and which I think brings the true principles of economizing gas into application, is the very beautiful "tube burner" of Mr. Leslie, which is most probably well known to many of you. I am sorry any burner" of Mr. Leslie, which is most probably well known to many of you. I am sorry my time will not permit me to go into the details of the consumption of gas, but, perbaps, it is scarcely necessary; but there are some points about this flame which may be made obvious on the instant, and without long calculations. See the beautiful, clear, steady, white flame as it stands almost motionless in the glass "combustion-chamber." Now let me remove this glass and replace it by one of the common old cylindrical kind; the quantity of gas burnt is just the same as before, but every one burnt is just the same as before, but every one sees that the light has lost all its best qualities. I have admitted too much air by so doing, and therefore get less light; the deposit of carbon goes on as before, but it now goes on too rapidly, and we have a smoke. To get the same amount of light with this glass we must burn twice the quantity of gas which was required with Mr. Leslie's burner.

Having expressed a very favourable opinion of Mr. Leslie's burner and his glass "combustion-chamber" on theoretic grounds, and since then tried them practically with much satisfaction, we are glad to find ourselves strengthened by such an opinion as that we

strengthened by such an opinion as that we have given above.

The burner and glass are making their way into use steadily. The exterior of the Ordnance office, Pall Mall, affords a good specimen of their value for street lighting. The London Gas Company have put on eight of these burners from Scotland-yard to the corner of Whitehall. This company, we may mention, has the contract with the Woods and Forests for the whole of Regent-street, from the palace at Westminster

Regent-street, from the palace at vestiminster right through to Regent's-park.

At the General Post-office, St. Martin's-le-Grand, the burners have been in use three months, and if we are rightly informed the saving of gas over the corresponding thirteen weeks before is about eight hundred thousand cubic feet. The Thames Tunnel, also, is now lighted by them.

RIGHT OF ARBITRATORS TO COPY PLANS ENTRUSTED TO THEM.

ROYAL ITALIAN OPERA-HOUSE, COVENT GARDEN

SIR,-Under a deep sense of the duty I own SIR,—Under a deep sense of the duty I owe to the profession at large, as well as to myself, I feel hound, however reluctantly, to expose the following facts, which, if tacitly sanctioned, I consider would be derogatory to my professional character and highly prejudicial to the ends of justice, and I hope to meet at your hands the candour and support that my case deserves, and which it is well known you never withhold.

withhold.

The lessees of the Royal Italian Opera House chose, about a year after its completion, to contest two-thirds of my bill of 2,300L for superintending the erection of it, &c., obliging me to institute legal proceedings to recover the halance of it, when, after paying into court \$25L more than they had offered me just before going to the investment. just before going to the jury, they begged a reference (which I had originally offered and reference (which I had originally offered and they refused). To this I acceded, and Mr. T. L. Donaldson and Mr. T. Bellamy were appointed referees, and by them Mr. Samuel Angell was named as umpire, and, as the referees could not agree, Mr. S. Angell became the sole arbitrator and the depository of all my original designs and documents necessary to substantiate my claim.

On Mr. Angell's award being delivered, (of which, as you have, perhaps properly refused).

On Mr. Angeli's award being delivered, (or which, as you have, perhaps properly, refused to admit any comments on it, I must say nothing, whatever I may tbink), I applied at his office for my papers, and found to my astonishment that the most complete of my designs, working drawings, and papers, were

missing from the portfolios and tin boxes, and that many had been copied in Mr. Angell's office by two of his assistants, one of whom, being found by me in the act, was obliged to admit that it was by Mr. Angell's order that he had done so. Such proceedings seemed to demand an explanation, and I wrote to him that after the solemn assurance he had given to me in the presence of Mr. Donaldson, Mr. Smith, and others as to the safety of missing from the portfolios and tin boxes, and Smith, and others, as to the safety of my papers when delivered into his hands, I could not but regard his conduct as wholly unjustifiable, inasmuch as he was acting as umpire in the performance of a professional and judicial duty, and I requested him to deliver to me the other documents in his possession, and to render to me the most explicit explanation on the subject. Mr. Angell's reply was that the documents I claimed of him remained in his strong closet during his absence from town, but he admitted that my drawings and extracts of my papers had been copied in his not but regard his conduct as wholly unjustiextracts of my papers had been copied in bis office by bis authority, and that he considered he bad a perfect right to have any copies or extracts made from any documents or drawings put in by me as evidence in support of my claim, in order that his memoranda might my claim, in order that his memoranda might be complete, should there be hereafter any occasion to refer to it; and he went on to assure me that I need be under no apprehension whatever, and that he was quite prepared at any time to show the tracing made from my drawings to Mr. Donaldson, or to Mr. W. Cotterill (my solicitor), in expectation of satisfying them as to his mode of acting.

These explanations cannot be recarded as

These explanations cannot be regarded as offering anything like satisfaction, and as to his giving explanations to Mr. Cotterill, or Mr. Donaldson, I have only to refer to these gentlemen's letters, in which Mr. Donaldson says, that "the award has caused great survive and disconsistent to his parties." says, that "the award has caused great supprise and disappointment to him, particularly as regards Julian's salary, and that after much thought he could not understand why copies of my drawings were taken by Mr. Angell, they not being necessary to substantiate any point in the award, and that in so doing he had erred in judgment in this case altogether;" while Mr. Cotterill, the other gentleman referred to, wrote to me that "be had read over my correspondence with Mr. Angell. read over my correspondence with Mr. Angell, but did not see any use in examining the copies be had taken from my drawings. Certainly," Mr. Cotterill, says, "I cannot see any possible use in Mr. Angell's copying any of them for any purpose of the arbitration."

To these opinions of the gentlemen to whom be appealed, and of a great many more p ofessional men to whom I have mentioned the circumstances, it is necessary to add, that one of the copies made from my designs, and read over my correspondence with Mr. Angell,

circumstances, it is necessary to add, that one of the copies made from my designs, and on which his assistant was discovered, is marked No. 52, the title of which runs thus—" Longitudinal section of the new theatre, salcons, stage, &c., from the foundations to the roofs, complete as executed." On this copy Mr. Angell's assistant has written "Copies of this and some other drawings of Mr. Alband's works of Covent Garden by Mr. Albano's works of Covent Garden by Mr. Angell's order were taken by me and Mr. Wood, and are in Mr. Angell's possession. September 27, 1848, G. Judge, jun."

The law affording me no redress at this stage. I am obliged to state now what otherwisel would under no other circumstances bring forward. I have been a member of the wro. Albano's works of Covent Garden

forward. I have been a member of the pro-fession of civil engineers for a quarter of a century in this my adopted country, and have been engaged upon various works, which I presume have sufficiently established my claim to some ability; if not I would willingly allow my reputation to be estimated by what I have done at Covent Garden Theatre, the manner in which it has been accomplished, the very short period in which it was effected, and the smallness of the expenses attending it forward. I have been a member of the prosmallness of the expenses attending the smallness of the expenses attending it, considering that it required fifty-four original and elaborate designs, and above a hundred working drawings, specifications, &c. &c. (all put in evidence), besides daily and nightly attendance to the extent of from sixteen to twenty hours a-day, directing and superintending from the very foundations the construction and decoration of the new theatre, her Majesty's apartments, and the improvement of the whole establishment; converting at the same time the whole of the old materials; on which were daily engaged from 1,000 to 1,600 workmen of all trades, as well

as the attendance of six of my assistants and : clerk of the works, all their expenses and salary being defrayed by me during above six salary being defrayed by me during above six months up to the opening of the theatre and for about eight months afterward the expenses of myself and two assistants. I can confidently appeal to Mr. Hosking, who, in his official capa-city as official referee, inspected most minutely all my designs, and in his evidence declared that he saw the whole of the works and founda-tions, and that to the best of his indemnet tions, and that, to the best of his judgment, they were executed in an admirable manner, and displayed great ability without extravagance, and that he should not have allowed gante, and that he should not have anowed the theatre to be opened unless it bad been properly done. I could also appeal to the evidence of Mr. Allason, Mr. Braithwaite, Mr. Godwin, Mr. C. H. Gregory, Mr. W. Laxton, and Sir Mr. C. H. Gregory, Mr. W. Laxton, and Sir John Rennie, who had often visited the works during their progress, and unanimously declared it to be a very creditable work, and con-sidering its great intricacy and the short time allowed, it was executed in a scientific, work-man-like, and economical manner, and as a work of art carried on with great skill and success: and they all spoke very particularly as to my indefatigability and the fairness of the amount of my charges for a work un-equalled for the great sacrifice and exertion it demanded, and which had been admired by all impartial judges, to whom, as well as for the favourable unanimous opinion expressed by the public press, I owe a deep debt of gratitude

I consider myself in duty called upon, on public as well as on private grounds, to appeal to the judgment of my profession, either as engineers or architects, to the members of which I look with confidence, satisfied that their bigh character and honourable feelings their bigh character and nonourable feelings will induce them to form a right estimate of these proceedings, and will not allow my professional rights to be trampled on with impunity. I contend that Mr. Angell had neither right nor pretext whatever to take copies of my designs; his duty in the office to which he was apparent to the copies of my designs; his duty in the office to which he was appointed was to determine on the remuneration, which, in equity, I was entitled to upon my claim, without having any further duty to perform; and certainly nothing which could render it necessary or proper for him to retain copies of my drawings, and I leave it to the profession and to the public to form their opinion, both as to his conduct and the motive which may have influenced him on this occasion which may have innuenced nin of this occasion to copy my papers, which he still retains in his possession, conduct which I contend is wholly unprofessional and indefensible, and I refer it to the profession and to the public, on whose well-known love of impartial justice and hatrad of course in the content of the public of hatred of oppression I can confidently rely

I am, Sir, &c., B. ALBANO, Office, 22, King William-street, Strand, February, 1849.

NOTES IN THE PROVINCES.

THE church of St. Nicholas, Ipswich, has been considerably altered and enlarged. The old pewing has been replaced by seating in form of benches, but with separate sittings. In a part added to the north aisle a window partly filled with stained glass has been put up, the stained glass the work and gift of Mr. R. B. King. The alterations in all have cost between 500l. and 600l., of which the incumbent, Rev. M. G. Edgar, contributed 100l. and oak of equal value. Some curious carved figures, said to be of Saxon origin (?) have been discovered, and inserted in the north wall. discovered, and inserted in the north wall.—
At the Ely sessions the propriety of taking down the old court-house at Wisbech, said to be in a dangerous state, and of erecting a new one next the gaol, was lately taken into consideration. It was stated that the old materials were worth 1,600l, to 1,800l., a sum sufficient, it was said, to build the new one.— 'The foundation-stone of the Philanthropic Society's farm-school and chapel will be laid by H.R.H. Prince Albert on 30th April, near the Redhill and Reigate station of the Brighton Railway.— The re-building of Holy Rhoad Church and Reigate station of the Brighton Kallway.

The re-building of Holy Rhood Church, Southampton, proceeds with quickness, and the style and dimensions of the arches, and the proportions of the chancel, are now rendered clear, but the roof of the building closely behind the east window is much complained of in the local papers.

The vicinity plained of in the local papers.—The vicinit of Portsmouth has been much improved, it is

said, by the conversion of South-sea common into an agreeable park, by Lord F. Fitzclarence, and others, with the Clarence esplanade crowning the beach, and now a favourite promenade.

Two new veins of coal, between 5 and 6 feet thick, have been discovered in the parish feet thick, have been discovered in the parish of Radstock, on the Countess of Walde-grave's property, by Mr. Charles Ashman, the engineer and manager of her ladyship's other mines. The poor people in the parish are in joyful anticipation of employment, and general rejoicing has been manifested by the ringing of bells, &c.—A Liverpool paper says, with reference to the Birkenhead Docks, "It is now certain that these works must go on. The contract has been 'signed, scaled, and delivered the same of th on. The contract has over signed, seased, and delivered, and on Thursday the dock trustees held meetings for the purpose of arranging the details of the works."—The guardians of the Wincanton Union have accepted the tender of Messrs. Miles and Golding, of Shaftesbury, for the enlargement Golding, of Shaftesbury, for the enlargement of their workhouse. There were five tenders given in for the work, and the difference between the highest and lowest was 316*l*.; the one accepted being 530*l*., and the highest from a builder at Frome), 846*l*.——Mr. Walker, engineer, and Mr. May, the resident engineer, have surveyed the whole line of the Caledonian Canal from end to end. Every part of the grant from the surmit level westward is said canal, from the summit level westward, to have been in good order.—The Glasgow Harbour works at Springfield have been rather scriously interfered with by a heavy flooding in the Clyde, which filled the excavations. The new line of quay, however, is in an advanced state of progress

METROPOLITAN COMMISSION OF SEWERS.

A GENERAL court was held on Thursday last, the 15th, at the Sewers Court, Greek-street, Soho-square; Lord Ebrington, M.P., in the chair. On the recommendation of the in the chair. On the recommendation of the finance committee, several payments were ordered, and amongst the rest, a cheque was directed to be placed in the hands of Mr. Groom, the official assignee in bankruptey, for the amount due to Mr. Starkie, the contractor for the Grosvenor-square sewer, from the late Commissioners of Sewers, prior to his bankruptey. This long-litigated affair will now be brought to a close on the solicitors of this court receiving a satisfactory acknowledgment of the same. All the real business of the commission seems now to be done snugly and commission seems now to be done snugly and commission seems now to be done singly and quietly in committee, a system against which, when in the old Westminster commission, one at all events of the present commissioncrs was in the habit of protesting pretty constantly and loudly,—whether rightly or wrongly we do not stop now to inquire. The new Sewers Act appears to be very defective in several points, and is felt to be so by the Commissioners. Those who drewit up don't exactly understand the operation of some parts of it; so, unless we are wrongly informed, other opinious have been sought.

ENCROACHMENT ON THE NEW ROAD, ISLINGTON.

METROPOLITAN IMPROVEMENTS

REGRETTING equally with your correspondent "Viator," that the line of this road is being constantly trenched upon by the erection of buildings upon the fore-courts of the houses, I am sure he cannot be aware of the various attempts that have been made from time to time to prevent this great evil, or he would have thrown his sarcasm upon the parties who have really caused an Act of Parliament, intended for the protection of this line of road, to become totally inoperative, rather than have censured the parochial vestries, who have neicensured the parochai vestres, who have ner-ther foolishly nor culpably neglected their duties, but have endeavoured to enforce the law, though without avail, the magistrates refusing to convict. Further, the very par-ties who should have supported them have been the first to infringe its regulations, as may be seen in the instances of the Park-crescent, York-place, &c., which were ad-vanced beyond the prescribed limit by the Commissioners of Woods, &c.; and latterly the official referees defined the line of frontage of two public buildings as being 50 feet back from the footway, while a few months

subsequently these gentlemen came to a resolution to allow these erections on the fore-courts one story in height in roads 60 feet in width,—and, consequently, a few hundred yards off, two private buildings are now in course of erection at the western end, adjoining the Edgeware-road, as well as those referred to by your correspondent near Osnaberg-street. So much for the protection of the public interests to be derived protection of the public interests to be derived from central commissioners, whom your cor-respondent is so enamoured of, who to-day undo that which they have given effect to on the previous one. I am quite satisfied the parochial vestries of this metropolis have public spirit enough to place themselves above private interests, and only require the aid of the administrators of the law to maintain inviolate the powers vested in them, but which, unfortunately, is rarely given where the public interests are concerned, thereby aiding the designs of those whose interests it is to advance centralization, to the prejudice of the great fundamental law of this country,—local self-government.

THE COST OF THE CITY AND SURREY

If we were to print some of the comments we have received on this matter generally, they would displease more persons than one, and so far as we can see would do no good. Considerable surprise is expressed as to the differ-ence of cost between the two prisons. The Surrey prison, to be built on Wandsworth-Surrey prison, to be built on Wandsworthcommon, is to contain, as we understand, 790
cells, including chapel, laundry, boundary
walls, and airing-grounds. The city prison, to
be built at Holloway, is to contain 500 cells,
chapel, laundry, and boundary walls. The
Surrey prison is to cost 1302, per cell,
and the city of London 1842, per cell.
How is this difference made? say some. Some
part of it is to be attributed to the introduction of masonry in the city prison; and it tion of masonry in the city prison; and it may be that more fittings are included in one

The difference between the highest and the The difference between the highest and the lowest tenders, 17,410. in one, and 11,720. in the other, sounds large, especially as it was made wholly in the pricing,—the quantities being supplied: but looked at as a per centage on the amount, it is not so great as is often the case. The lowest tender for the city may be called 16 per cent. less than the highest, and that for the Surrey prison rather more than 10 per cent. One of our correspondents says that the charge made by the surveyors for taking out the quantities for the city prisons, including lithographing the bills, was 2,824. The 2½ per cent. pays better than the 5.

THE RIVER-WALL OF THE HOUSES OF PARLIAMENT.

A FEW days since, in passing over Westminster Bridge, my attention was drawn to the works now in progress for the purpose of removing the dam in front of the new palace. I was not a little surprised to observe that the piles forming the dam were being drawn. On a closer inspection I observed that these piles were a distance of at least 16 feet in the ground Now it struck the as being a most ill-advised plan to draw these timbers at all, inasmuch as the operation amounts to cutting a trench, or rather two trenches, there being two rows of piles, the whole length of the river frontage, and 16 feet deep, which I am disposed to think, with that unfortunate spectacle West-minster Bridge before one's eyes, is, to say the least, running an unnecessary risk. Moreover, as there is no good end served, I cannot conceive what can have been the motive for drawing the piles instead of cutting them off level with the proposed ground line, which every practical man knows could have been done at an expense of certainly not more than 500*l*. over the present method, and there would then have been scarcely a possibility of the then have been scarcely a possibility of the river frontage ever being injured, inasmuch as the timber left in the ground would have afforded an additional security in the event of the present bridge being removed, and another erected in all probability on a fresh site, which is as likely to cause an alteration in the set of the tide, and thereby to

deepen the river bed, as did the removal of the

old London Bridge.

I repeat, that without any end served, it is a matter of astonishment that the present course should have been pursued. I am aware that there is a line of piles at the foot of the river wall intended as a protection, but still the fact of disturbing a mass of ground to such a depth (to the bottom of the sheet piling) within a few fect of the wall, is most unadvisable. True, no immediate injury may result, but look at the bridge. I have no doubt, that when that structure was completed, it was deemed a substantial erection; but what has time proved it to be? And it may fairly be said, that a little foresight would have prevented its present deplorable appearance and a large outlay of money. Gain experience from the past: a motto which in this instance is deserving particular attention.

Miscelianea.

ISLINGTON MARKET .- This market was built by the late Mr. John Perkins, about fif-teen years since, having obtained an Act of Parliament, which gives the power of hold-ing the market, of slaughtering cattle, melting the fat for tallow, manufacturing the offal, &c. The area within the walls is 15 acres, and for The area within the waits is 15 acres, and 167 the sake of comparison, to enable any one to judge of its extent, we will quote Russell-square, which contains 11 A. 1 R. to the walls of the houses, and Lincoln's-inn Fields contains 10 A. 1 R. 29 P. There is accommodation for 8,000 head of cattle and 50,000 sheep, besides layers having 3,280 feet in length of roof, or nearly 2 acres. The extent of freehold roof, or nearly 2 acres. The extent of freehold property, upon which there are thirty bouses, is 7 acres, exclusive of the market, and 7 acres leasehold, upon which it is intended to erect ahattoirs and a dead-meat market. A main public sewer passes within 300 feet of the eastern entrance, and it is 18 feet lower than the sur-face of the market. The East and West India Dock Railway passes to within 400 yards of the market.

ARTESIAN WELLAT HADHAM.—I observe in the last number of THE BUILDER, that a correspondent wishes to know if it be practicable to fix a lifting pump in an Artesian bore of 6 inches diameter, the water level of the spring being 178 feet from the surface: such spring being 178 feet from the surface r such an operation is possible; it is obvious the rod should be arranged and steadied inside the rising main. The bucket and clacks require periodical examination; means of access to them should therefore be provided; indeed, facilities should be given for removing the whole pump, combined with perfect steadiness when fixed; it is almost needless to remark the nump nust on nearcount choke not be the pump to the pump of the pump must on no account choke up the

the pump must of no account chose up the bore. These matters require care in detail, and should be directed by a professional man. —John G. Swindell, 3, Kilburn Priory.

IMPROVEMENTS IN PARIS. —For completing the Louvre the estimates are—for the ground required for completing the Louvre, 6, 379,250f; for the buildings and other works, 23,000,000f.; and for the continuation of the Rue de Rivoli, 3,119,630f. The Municipal Council have come 3,119,630f. The Municipal Council have come to the resolution that the city should contribute the 3,119,630f. towards the continuation of the Rue de Rivoli. The plans for the new buildings comprise the establishment of the National Library, in the wing to be constructed towards the Rue de Rivoli, special galleries for the annual cylinhition of the works of modern painters and sculptors, and for the periodical exhibition of the products of the useful arts, next the gallery of the Museum; and the formation of an intermediate quadrangle, with a colossal fountain in the centre, surrounded by four quincunxes, ornamented with statues.

with statues.

Orsi and Armani's Metallic Lava.—
Of this material for paving we have already spoken briefly without offering any opinion on its merits, time being necessary to decide these. It would really seen, however, well deserving examination and to have many advantages, especially in places where the surface of other floorings would be made moist and mouldy by rising damp. Messrs. Orsi and Armani have produced from our pages, in their hlack and white lava, some of the mosaics from Pompeii, which we gave in a recent number (page 3).

PROJECTED WORKS .-- Advertisements have been issued for tenders, by 1st May, for repewing, &c., Bridgewater Church (with plans and drawings); by March 5th, for an addition, and drawings); by March 5th, for an addition, alteration, &c., at a shop in Caistor, Lincohnshire; also for a shop front with mahogany sashes and plate glass; by 24th, for the erection of a new aisle, &c., for Chiselhurst Church, Kent; hy 12th, for the erection of the new workhouse for the Fulham Union; by 1st, for the erection of certain almshouses at Herefard; by 38th interf. [School-11]. by ist, for the effection of certain amonoses at Hereford; by 28th inst., for rebuilding the parish church at Birch, Essex; and by 2nd March, for lighting the public lamps in the Grosvenor-place district with gas for five years

LITERARY INSTITUTIONS AND TAXES The claim of the Greenwich Scientific Society to have their building exempted from taxes has been rejected by Baron Alderson, Anti-corn-law and other meetings having been held

CHELSEA IMPROVEMENT ACT.—RATING.
—Mr. Bult, of Chelsea, having declined to
pay the Chelsea Improvement rate, was summoned before Mr. Burrell, at Westminster,
Mr. Bult argued that he was not bound to pay,
however the 17th section of the Chelsea Le. because the 174th section of the Chelsea Improvement Act stated, "that it shall be lawful for them (the commissioners) to make a rate upon the occupiers of all messuages, &c., for them (the commissioners) to make a rate upon the occupiers of all messuages, &c., which at the time of passing this Act were hy law liable to be rated to the repairs of the highways within the said limits," and neither his house nor any part of the street in which he resided was built at the time of the passing of the Act. He had come forward to oppose the claim from a sense of right, and complained that there were no gutters or gulley-holes in his street to carry off the rain, that there was no road formed, that it was in a most filthy and unwholesome state, that his own and family's health had been much affected by exhalations from filthy matter, and that his three children had but recently recovered from fever, caused by the nuisances produced by fever, caused by the nuisances produced by the filthy condition of the street.—Mr. Bodkin, on the part of the commissioners, said that the on the part of the commissioners, said that the construction put upon the section was monstrous. The section clearly intended to mean, not the identical buildings at that time in existence, but all that description of property which should subsequently be erected. The magistrate took the same view of it, and declared Mr. Bult liable to the rating.

SIR HANS SLOANE'S MONUMENT.—With reference to the recent remarks in Hamping and the same of the same to the recent remarks.

reference to the recent remarks in The Builder, on the monument to the memory of Sir Hans Sloane, which stands at the east corner of the old churchyard, Cheyne-walk, Chelsea, this monnment, as well as the in-scription in its present dilapidated condition. scription in its present dilapidated condition, demands the attention and aid of the public, in order that it may be restored and saved from the ravages of time, so that the memento, erected with so much liberality to the memory of the scientific attainments, devoted to the use and benefit of the public, of so celebrated a character, may be handed down to posterity. At a time when other improvements were being effected in this exist. down to posterity. At a time when other improvements were being effected in this neighbourhood, the churchwardens wrote to the family of the late Sir Hans Sloane, calling their attention to the diapidated state of the monument, in the house that they would be sometiment. monument, in the hope that they would cause the same to be repaired. The answer they re-ceived to his communication was, I believe, that the property had been dispersed, and that no funds remained in the hands of the trustees of recently applicable therets. The sale or executors, applicable thereto. The church-wardens, not having any funds which they can legally lay out in its repair, and the inhabi-tants also having already expended much upon the improvements, there remains but little pro-bability that anything can be done to rescue it from decay and ultimate ruin, unless, by being hrought before the public through the medium of your widely circulated insural the research nrought before the public through the medium of your widely circulated journal, there may be found among the various scientific bodies of our country, and public spirited individuals, a sufficient number who may feel sufficiently interested in the matter so as to aid by a small subscription, the repairing and restoring the monument.

J. Perry.

N.B. The Worshipful Company of Apothecaries are the trustees for the public of the collection, at Chelsea, of Sir Hans Sloane's botanical specimens.

LAVATORIES FOR THE BRITISH MUSEUM. LAYATORIES FOR THE BIRTISH MUSEUM.—Now that the "commissioners" have instructions to improve the arrangements of the Museum, it will be well for them to hear in mind the necessity of providing greater conveniences for those who frequent the library. A layatory is rather a necessity, if only for the protection of valuable works from being soiled, than a layary. The present arrangement of than a luxury. The present arrangement of the conveniences for the gentlemen is very un-satisfactory, and in any alteration the ladies should be consulted.

Brights Workhouse Competi-Tion.—The guardians resolved that the report of the committee should not be received, but that the six selected plans should be submitted to the test of ballot. On the 21st the votes

to the test of ballot. On the 21st the votes were taken, and the result was a majority of 10 for Mr. Hemming; the numbers being—Hemming, 36; Drury and Bateman, 26. The whole affair is very discreditable to the Board. PREVENTION OF CORROSION.—According to the Chemical Times, the best means of preventing the corrosion of metals is to dip the articles first into very dilute nitric acid, to immerse them afterwards in linseed oil, and to allow the excess of oil to drain off. By this process metals are effectively reserved from process metals are effectively reserved from process metals are effectively preserved from rust or oxidation.

Norman Tower, Bury St. Edmunds.—
The committee have reported to the subscribers that the restoration of the tower is completed. 3,100t have been disbursed, and about 300f. remain to be paid.

VERY BLIND BUILDERS.—I beg to inclose, says one correspondent, and seven others have done so in other words,—a specimen of esti-mating as exhibited on the 15th inst. at the offices of Mr. Lambert, for finishing fourteen 8-roomed houses, now in carcass, building outhouses, &c. There is evidently something o-rounce nouses, now in carcass, building outhouses, &c. There is evidently something very wrong in the system of contracting now followed by some men. One would think they were entirely ignorant of what they were doing, or grossly dishonest; one or the other is quite

Messrs, Piper	15,938

These amounts are exclusive of the foundations and drains, which have been put in at an expense of 2,800l.—An Architect who TRIES TO BE HONEST.

We have received some letters commenting in strong terms on the conduct of both committee and architect, but are not disposed to insert them, except with the writers' A Good Movement in the School of Design.—At Somerset House an association of the students has just been formed, for the purpose of inutual improvement, the first meeting of which was beld on Saturday, the 10th, in the large room at Somerset House, the use of which has been granted by the council. An introductory paper was read by Mr. D. W. Raimbach, the substance of which we shall give. shall give

Exposition of Inventions. patented and registered inventions would be an advantage to the public, and at the same time, facilitate the object which manufacturers have in view, viz., making their inventions generally known, and it is intended to open an exposition of the kind at the Bakeropen an exposition to the arms as the balance and assistants will be appointed, for the purpose of explaining the use and advantage of each invention, and to effect sales.

SHAPE IN RESPECT OF AREA.—Having seen, some time since, in The Builder, some questions as to the squaring of numbers, it occurred to me that it would be interesting to mention a fact relating to the areas of squares for buildings. A figure which has all its four sides equal, contains the greatest area within the same length of wall, viz. :-

Feet. Feet. Feet. 80² = 6400 and 320 length of walls. $60 \times 100 = 6000$ and 320 $70 \times 90 = 6300$ and 320 $50 \times 110 = 5500$ and 320

This may be useful to those concerned in building warehouses, &c., which case first called your obedient servant's attention to the

fact.—R. B. Grantham.

Wooden Barn Floors and Rats.—

Wooden Barn Floors and Rats.—

Dig arour Barn floors may be made impervious to rats by the following cheap method:—Dig around the building that has its foundations in the ground (in contradistinction to those supported on stone or brick piers), a dry area, sny 14 inches wide by 9 inches deep, pave the bottom with brick flats, the side farthest from the building to have two courses of $4\frac{1}{2}$ -inch work, whilst the other has a course of plain tiles or slates, nailed to the outside surface of the building: as this is to the outside surface of the building: as this is finished, fill in the area with the earth dug out. The rats will endeavour to make their entrance by burrowing, but they will invariably work themselves out at the surface, as they cannot effect their object, try how or where they will, and cunning as they are, they never commence burrowing away from the building, but close around it. This plan has never failed: rid yourself of the inside members and no outsiders can enter. The doorways may be simi-

yourself of the made members and no outsiders can enter. The doorways may be similarly secured by carrying up a dwarf wall along the opening.—John B. Watson.

Improvement in Scotland.—The writer of a paragraph relative to Dundee, which appeared in your paper of last week, under the signature of "One who has used his Olfuctories," is entitled to the thanks of every well-wisher of Scotland. Aware of the high estimation in which The Bullings is held in wisher of Scotland. Aware of the high estimation in which The Builder is held in
Scotland, would you permit an admirer of
that country to suggest, not only to the inhahitants of Dundee but to those of Scotland
generally, that probably the most delicate and
esteemed compliment they could pay to the
Queen and Prince Albert, would be for the
upper and middle classes in every parish
throughout the country, by their example,
advice, and assistance, to endeavour to effect
an improvement as regards cleanliness in the
habits of the lower classes. If each parish
had a distinct society formed for the purpose
of carrying out such improvements, great, and a distinct society formed for the purpose of carrying out such improvements, great, doubtless, would be the benefits derived therefrom; and it would ere long become a brand and a disgrace to build houses without having the usual contentiences attached.—R. B.

the usual conveniences attached.—R. B.
BREATHING ROOM FOR THE TOWER
HAMLETS.—Some eight years since I proposed (through the medium of the press), the
removal of that disgusting, and very unwholesome nuisance, the Tower ditch or moat, and
at the same time suggested that its site might,
advantageously, be converted into a public
garden or promenade. Shortly after I had the
gratification of seeing my proposition varie garden or promenade. Shortly after I had the gratification of seeing my proposition partly acceded to. The ditch was drained, but instead of completing the above arrangement, the bed was merely levelled (and not raised as I intended), and is now used once or twice a-

month, as an exercise ground, for the soldiers month, as an exercise ground, for the soldiers stationed within the garrison. Now, Sir, I appeal to you, as the acknowledged champion of metropolitan improvement, and ask your aid, in behalf of this densely peopled locality, in urging the Government to grant at once this highly desirable alteration, for no part of London is so destitute of "breathing" places as the Tower Hamlets. I had intended speaking also of the enclosure in Trinity-square, Towerhill, admission to which can only he obtained by paying "to some one" a fee of two guineas per annum, but will reserve that for a future per annum, but will reserve that for a future occasion .- N.

No. CCCXVII.

SATURDAY, MARCH 3, 1849.

ANY matters press upon us for consideration. Amongst them the late fearful calamity in the Theatre Royal at Glasgow, where nearly 70 persons lost their lives

in the crush produced by an alarm of fire, must not be passed by without comment. Several questions of great importance, and often discussed in our pages, are involved,-namely, the defective arrangement of the stairs and accesses in many of our theatres, the importance of ohtaining a cheap and efficient mode of fire-proof construction, and the necessity, or, otherwise, for Government supervision.

At the beginning of the year, on the occurrence of a serious accident at the Victoria Theatre, we drew attention to the condition and arrangement of the stairs, lohbies, and modes of exit in several of our theatres, and said it should reconcile parties to the control over staircases and passages given to the official referees by the Buildings Act; and that, as the clause only applied to new and altered huildings, it was a question whether it ought not to be made to apply to existing structures, and extend to obtaining for the public the means of ready egress.

With ourselves this is no longer a question; some step, with the same end in view, is imperatively demanded, and we suggest that the Government should, as a first move, name three or more competent persons (the referees, if their time he not too much occupied), to examine and report on the metropolitan theatres, concert-rooms, and other places of public resort, with reference to the means afforded in them for safe and rapid egress.

To managers themselves, and the proprietors of these structures, we would say, do not wait for this, hut set yourselves to work to render the approaches fire-proof, so far as possible, and the means of egress safe, ample, and commodious. Let it he well understood hy the public, that this has heen done, and the chance of panic, and of tumultuous rushing to escape on the slightest alarm, hy which the mischief is always brought ahout, will he materially lessened.

The sense of security felt when it is known, as in the Royal Italian Opera House, Covent Garden, constructed under the provisions of the Act, that the staircases from the highest part of the huilding, and the accesses, are indestructible, can scarcely be overlooked. We mention the Covent Garden Opera House, not as heing the only house where a certain degree of security in this respect may he enjoyed, but as a result of the compulsory clause in the Buildings Act.*

Were a fire to occur in some of our theatres, or even an alarm to be given sufficient to lead

* Some few alterations are being made in the Italian Opera House ready for the coming season, with a view to afford additional accommodation to visiters. The lower gallery, known as the box stalls, has been formed into boxes, and the corridor, heretofore cut off on this floor, continued all round the house. The amphitheatte bas been increased by forming two rows of seats on both sides of the house in lieu of the top tier of boxes. Not content with baving one of the best houses in London for seeing and hearing in, the facility of being lost desirable to increase for its visiters the facility of being lost desirable to increase for its visiters the facility of being lost the stall the facility of being lost the faci

the audience to endeavour, panic stricken, to escape, the result would he fearful.

"We will venture to say," remarks the Examiner, taking our view of the subject, "that there is not a theatre in London which at this moment would hear inspection, with a view to the safety of all its avenues, passages, and staircases. There is not one in which, in the event of fire or the false alarm of it, in some one quarter, or more than one, there would not be a jam of crushed and smothered hodies like that of Glasgow, hut prohably on a greater scale of destruction. But the Legislation which so sagely and carefully levels the powers of the law against penny theatres and unlicensed performances, takes no precautions to guard against this frightful mischief. There is an authority to prevent the performance of a play in which a word offensive to morals or decorum may be found, but there is none to prevent performances in a theatre so defectively constructed, that the false alarm of any drunkard, fool, or pickpocket may cause the destruction of masses of people inextrically jammed and pounded together, and perishing more cruelly than the sufferers in the hlack hole at Calcutta."

Irrespective of the materials composing the stairs and accesses, a careful revision should he made of the harriers and other obstructions on the stairs and in the passages. The doors, if not made to swing both ways, should all open outwards.

We have received from Glasgow a plan of the staircase wherein the disaster occurred. The stairs vary in width from 4 feet to ahout 4 feet 4 inches. One half the staircase forms a right angle with the other, and at the junction, where there are winders, there was a harrier, 51/2 feet high, and 2 feet 3 inches wide, opening outwards, hut held in its place by an iron har attached to the wall, and hooking into a staple in the door, so as to narrow the passage to 23 inches. Lower down, and nearer to the entrance from the street, was a pair of folding doors, each 21 inches wide. The one to the right (going down stairs) opened outwards, the other half opened the reverse way, and this was kept closed by a strong bar hooking into a staple in the door, so as to prevent any large number of persons from passing through at one time. Judging from the statements hefore us, it seems it was at these harriers that the mischief was done, and persons on the spot think the same thing. "On looking at the matter coolly," says the North British Mail, "at this distance of time, and after a careful examination of the premises, there can he no doubt that, to the obstructions offered by the two fixed doors in the stair, the awful catastrophe may he attributed. Of course, had there heen no panic, the narrow passages left open past the doors would have been sufficient to permit the leisurely and regular exit of the whole audience. But the possibility of a panic should always be provided for in such huildings, and the arrangements of the manager framed with a view of obviating such an occurrence should it happen."

There should he no fixed obstructions in the stairs or passages of a theatre.

Most of our readers have doubtless learnt from the daily papers the very trivial cause of the panic, hut we will nevertheless repeat it in few words for a purpose.

Round the front of the upper gallery are several large crystal globes, with a gas light in the centre of each. The lights on each side are supplied with gas through a block-tin tuhe

of about half-an-inch in diameter, connected with an iron gas-pipe at the end of the gallery -that is, the globes on each side of the gallery are supplied from separate pipes. Had this not been fortunately so, the flame would have extended each way and over double the distance. In this half-inch pipe a leak took place, the escaped gas found its way into the space formed by the framing, and a piece of lighted paper thrown down hy a hoy who had used it to light a pipe, ignited the escaping gas. The result was that the flame soon heated the pipe to the melting point, and the aperture gradually enlarged, until, in a few seconds, a portion of the pipe was entirely melted away, when the inflamed gas would issue with the full volume and force of a pipe of that diameter. The pipe continued thus to melt away gradually, and the ascending flame struck against the hoarding forming the front of the gallery. A carpenter extinguished the flame hy squeezing up the pipe with his blue honnet. and all danger was thought over, when, from some unexplained cause, the panic occurred and the disaster followed.

Now, it was a curious coincidence that, on the morning of the day on which the accident occurred, a letter appeared in the Glasgow Citizen, from our correspondent Mr. Wylson, on various defects in construction which increase the chances of conflagrations,* which contained the following paragraph:-" One more fire-raiser, and I have done: namely, composition and block-tin gas-tubing,-which I hope 1850 will see an end of. The relative costs of composition tube (i. e. old lead, with a few old solder joints), block-tin tube, and wrought-iron tuhe, are about as 2, 3, and 4; hence the inducement to adhere to the two former; but the first is worthless for horizontal work, heing soft and liable to sag hetween its hearings, and hold water; and hoth melt readily; and here is the danger. When a flame reaches the tuhe, it melts-the gas is ignited-and away it travels, hurning and melting, behind lathing, up hollow partitions, over ceilings, through roofs, and only ceasing when its metal is exhausted, leaving the gas flaring at its source-the main."

It might really he thought that this was written after the occurrence, instead of hefore it, and should serve as a proof to Mr. Wylson's fellow citizens of his correctness and foresight. It is a mercy that we have not to record a

It is a mercy that we have not to record a

*" if we cannot put an end to all fire insurance, by
adopting those principles of construction which render
buildings completely incombustible, there are yet improvements on ordinary practice which may be effected at little
cutra cost, and the omission of which I would fain see
example from the control of the cost of t

loss of life in London similar to that in Glasgow of wbich we have been speaking. On Sunday last St. John's Chapel, Bedford-row, was fired by means, it is said, of the iron smoke pipes from the furnaces, used to warm the building. The heat being intense, had ignited the bond timbers, and the flames from them extended to the roof. A rusb was made into the street by the congregation, but fortunately there were few people present, and no check-taker's barriers in the way, so that all escaped unhurt.

We were present at a meeting of the Institution of Civil Engineers on Tuesday evening last, when the general question of fire-proof constructions was discussed at some length. A paper by Mr. Braidwood was read, to which we shall refer hereafter, and an interesting discussion followed, wherein Professor Hosking, Mr. Farey, Mr. Cottam, Mr. Thomas Piper, Mr. Dines, and others, took part.

Apropos of warming, we must mention that poor Mr. Barry has again got into Dr. Reid's hot water. A petition from the doctor was presented to the House of Commons a few evenings since, complaining that ohstructions were thrown in the way of carrying out his plans in the New Houses, and praying that a committee might be appointed to investigate the matter, and to call himself and the architect before it.

It is much to be regretted that Mr. Barry ever permitted any right of interference with bis plans and arrangements to be given to another. He owes it to himself and the profession to make a stand and maintain his right position as architect. The architect is "the chief of the works," "first workman," and whatever is done should be subject to his approval and in accordance with his views. There cannot be two firsts in one series.

It is time that architects bestirred themselves; the prospect for them does not seem very brilliant. A new garrison chapel, which has been erected in Dublin, has led to some correspondence in the papers. The style is Norman, with transition to early English, and according to the designer's own statement, was taken from a church lately built in the west of England. The estimate was 3,0001., and the cost about 21. per sitting. The building was executed by contract, after public competition, by a builder who lost by the hargain. The accommodation afforded is for 1,560 adults and 224 children. A colonel in the Royal Engineers was the architect: and this is wby we mention it.

If matters go on as they have begun, there will soon be little occupation for the professional architect. Clergymen are found to be the best qualified to design and erect churches and schools; soldiers to construct barracks, gateways, and castles; sailor officers, docks and bridges; actors, theatres; and Manchester mill-owners, warehouses and dwellings.

Othello's own occupation heing gone, the only course remaining for him is to try another. There are some architects wbo would make uncommonly good manufacturers, and two or three who, if they would take to the stage, could play the "Jeremy Diddler" line of parts with considerable advantage to—themselves, a result which they seem usually to keep in view. There are many others, however, who would supply what the stage has often wanted,—well-bred and accomplished gentlemen, and for the sake of these, and for the sake of the art, we see with pain and regret bow architects are being sbouldered on all sides. Going to California would, perhaps, be thought infra dig (pronounce it how you like, if in the

humour for a pun), but unless architects begin to look about them, they will soon have little chance of picking up gold or reputation anywhere else.

Some of our contemporaries, during the week, have been commenting on two of the craft, who, in former times, did manage to pick up the first part of these very desirable things somewhere in the neighbourhood of the Regent's Park.

The appendix to a Parliamentary report on the management of the Woods and Forests, just now published, has supplied materials for an attack on the proceedings of this office in former times, of no ordinary force. It appears that parties possessing influence have received leases of land at ridiculously small rents, to the disadvantage, of course, of the national income. some of the cases quoted it is not improbable that an explanation of the circumstances in connection with the "take," would put the matter in a different light; as, for example, in respect of Nash, the architect, to whom, it appears, that for fifty-tbree houses out of sixty in Augustus-street, Regent's-park, his representatives pay only 11. per annum groundrent; or in the case of James Burton, to whom the land on which is built Chester-terrace, Regent's-park, was leased in such a way that, for each of thirty-one of these houses, a groundrent of 61. per annum only is paid.

We all know that owners are quite willing to let to one speculator a large piece of land at the commencement of operations, and, when there is a certain amount of risk attaching, for a much smaller sum than could be realised by letting for single houses at a later day, when the matter is fairly afloat; and further, that the speculator is often permitted so to divide the sum paid by him (within certain limits), that some of the houses would have hut a nominal ground-rent: indeed, it is by this arrangement that the speculators in building-land look for their profits, the sale of the improved ground-rents, subject to which the houses thus circumstanced can be disposed of, being certain.

We allude to these facts simply as showing that it is not unlikely that the discrepancy between the real value of the plots of land alluded to, and the rents agreed to be paid for them by these two "lucky architects" as they are termed, would be found less than it appears, if all the circumstances were known.

An explanation of this sort, however, could scarcely be looked for in the bulk of the cases quoted, as they mainly refer to members of the aristocracy, to whom plots of land have been let for their private purpose at singularly incommensurate rents. Thus, it is stated that George Fulke, Lord Lyttelton, had "a piece of ground, part of Greenwich Park," assigned to him in 1802, for 61 years, at 1/. per annum; nor does it appear that any fine or premium in respect of this grant was paid.

"Tbe beauty of the Green-park," says the Observer, "is celebrated in history and song. On the one hand it has the park of St. James's and its ornithology, with the Palace of Buckingbam and the gardens thereto attached; on the other it has Piccadilly, with the triumphal arch, the statue of Wellington; below is greensward, and around are the mansions of the great and the titled; in the centre was Rosamond's-pond, but it has been filled up, and at one side is the reservoir of some rich water company. Who knows not the Greenpark? But those who think they know it best, know very little of the private bistory connected with certain portions of it. For

instance, is there one man in a million aware of the fact that the Most Noble the Marquis of Salisbury-the successor of him who shook his head so significantly—the great Lord Burleigh-holds a piece of ground in this park. for 99 years from April 5, 1796, at an annual rent-nominal rent would be a more accurate description-of 101.7s.7d., and that he has never paid a penny as fine for the same. Most lucky as well as "most noble" Marquis of But he is not the only Adam in Salisbury! this fiscal Eden before the fall. Lord Vernon, who has another "piece of ground" adjacent, at 81. per annum; Lord Yarborough a third, at 71. 9s. 5d. per annum; Sir John Hoste a fourth, at 4l. 14s. per annum; Viscount Gage a fifth, at 81. 18s. 6d. per annum; Lord Romney a sixth, at 51. 4s. per annum: Lord Dundas a seventh, at 13l. per annum; the Earl of Cork an eighth, at 91. 2s. per annum; and the Earl of Moira a ninth, at 71. 16s. 3d. per annum,-all without prejudice in the shape of fine."

" Contrast this," says the journal we have quoted, " with the condition of certain tradesmen in the Strand, who have also the fortune to hold leases under the Crown. The house No. 2, Lowther-arcade, which is combined with No. 11 in the Strand, pays 601. a-year ground-rent to the Woods, Forests, and Land Revenue Board. No. 5, in the Arcade, which is a single house, consisting perhaps of four rooms, pays 24l. per annum. No. 8, which is in the same predicament, pays 351.; while Nos. 9 to 11, all similarly circumstanced, pay each 50l. a-year to the Crown-nearly as much as the Earl of Ellesmere pays for Bridgewater House, and ten times more than is paid by the Lord Romney. Contrast it also with the sum paid by the Duke of Buccleuch for his house and grounds in Privy Gardens-stretching from Whitehall to the Tbames, a miniature park hefore, a French pleasure garden behind -viz., 751. 16s.; or with the sum paid by Lord Prudhoe, 721., for his mansion in the same place; or with the sums in fact paid as ground-rent by any nobleman to the Crown; and then ask yourself whether or not one law for the ricb and another law for the poor has not been the practical rule in this country? The Marquis of Hertford pays for the grounds on which his villa stands, in the Regent'spark, occupying perhaps one-tenth of the superficial area of that place of public recreation, only 66l. per annum; while a tailor or a grocer, a hatter or a hosier, in Regent-street, pays from 60l, to 155l, a-year for the scanty plot upon which stands his frail tenementpays it to the Crown in the same manner as the most noble the Marquis of Hertford. Instances ad infinitum might be multiplied, but these will suffice for the present."

We are disposed to think that explanation would put a different face on some of these transactions, which certainly, as they now stand, look glaringly unjust.

The Iron Trade.—We hope that our bint, some short time since, to purchasers, as to the then favourable state of the market, was appreciated, as there appears to be now some little probability that the tide may turn. Indeed, an advance of 20s. on the nominal quarterly price has been already declared, and although little dependence need he placed on such an announcement, there are other slight symptoms of a start. The increased demand, however, exclusively arises, no doubt, from the mere fact that the market has lately been in so favourable a state for purchasers; there being no additional outlet for the article, nor any great call for its production.

ON THE TOPOGRAPHY AND ANTIQUITIES OF THE CITY OF JERUSALEM,*

HAVING in the previous paper described the principal localities connected with the present city, I will now as briefly as possible refer to the topographical description by Josephus hefore I call attention to the existing antiquities. Josephus describes the city of Jerusalem as heing fortified with three walls. The oldest walls, he says, began on the north, at the Tower Himsien and extended tha place called HAVING in the previous paper described the

walls, he says, began on the north, Tower Hippicus, and extended to a place called the Xistus, ending at the western porch of the temple. It passed on the other side, reckoning from the same place, hy Bethso to reckoning from the same place, hy Bethso to the Essene Gate, and to the southward by the Fountain of Siloam, where it struck off to the eastward towards the Pool of Solomon (Fountain of the Virgin), and thence by Ophlas to the east porch of the temple. The second wall began at Genath, a gate belonging to the former wall, and so runs by the north side of the city to the fort Antonia.

The third wall began at the tower Hippiens, and ran to that of Psephinos, which is described as being on the north-west angle, over against the sepulchre of Helena and by the

against the sepulcher of Helena and by the royal caverns, from the tower at the corner of the monument of the Fuller, whence it came royal caverns, from the tower at the corner of the monument of the Fuller, whence it came up to the old wall, in the valley of Kcdron. The foundation of this wall was the work of Agrippa, A.D. about 40, for the security of that part of the town he had built, as the city by this time had become so populous, that its space was too circumscribed; and the inhahitants had crept into a kind of suburb on the north side of the temple, next the hill called Bethesda, which is further alluded to as fronting Fort Antonia. The stones of this wall are described as heing 20 cubits long, 10 hroad, and very hard (probably of the native rock, as Mr. Roberts has possession of a fragment of the ancient walls, a compact limestone, similar to the rocks around); this wall had ninety towers, the middle or second wall fourteen, and the old wall sixty.

The circumference of the walls was thus 33 stadia. The tower of Ptephinos is described as a most exquisite piece of workmanship, octangular in form, and the summit afforded a prospect of Arabia, the sea, and the utmost confines of the Hebrews.

Herod built three towers on the old walls,

Herod built three towers on the old walls, called Hippicus, Phasael, and Mariamne, adjoining which, on the inside (therefore on Zion), was his palace, magnificent beyond description.

11erod also huilt the Fort Antonia, on an

Herod also huilt the Fort Antonia, on an angle looking west and north, raised on a rock 50 cubits high, which was faced with thin scales of marble from the bottom to the top, both for ornament and security; it was so slippery there was no possibility of ascending or descending it. It commanded the whole temple, and joined the galleries of the temple with passages for the soldiers to go down to the temple.

The description of the Townke its.

The description of the Temple, its courts, galleries, porticoes, &c., as huilt by Herod and described by Josephus, is no doubt familiar to all, and its restoration has engaged the

attention of many students.

The dimensions and description given by The dimensions and description given by Josephus must be regarded with caution; he evidently amplifies when he is on the subject of the magnificence of his eity, and as be wrote his work at a distance from the scene of the events, and after a lapse of some years, the particulars and measurements of his buildings and walls were most probably given from and walls were most prohably given from

and walls were most prohably given from inemory.

After the destruction of the temple by fire, in the siege and the taking of the city, in the second year of Vespasian, by Titus, he gave orders for laying the city and temple level with the ground, and to leave nothing standing hut the three famous towers Phasaelus, Hippicus, and Marianne, and, for the purpose of keeping a garrison, so much of the wall as enclosed the city on the left, which, as the attacks had been from the north side, would be either the vest wall of the temple area, which formed the eastern boundary of Acra and Zion, or the last wall of the same Acra, which formed the vatreme boundary of the whole of Jerusalem, both of which walls are, to a considerable extent, now standing.

extent, now standing.

To return again to the subject of the walls, t appears that, A.D. 136, Adrian rebuilt the

walls, and called the city Ælia, and included in it several places which formerly were without the gates. This addition, I imagine, was on the north side, as traces of wall in that direction have been discovered by Dr. Robinstein, and the state of the which are generally ascribed as the remains of the third wall built hy Agrippa; hut, in my opinion, the remains are of the wall built hy Adribed by Adrian.

From the period of the restoration of the eity by Adrian, the buildings erected by Constantine and Justinian belong to comparatively modern times, and now, what remains of the earlier periods of this once magnificent city, of the splendour of Solomon, or of the magnificence of Herod, and of its later Roman concence of Herod, and of its later Roman con-querors—of its walls, stately towers, royal sepulchres, kystus, bridge, palaces, and for-tresses? Nothing but some courses of ancient masonry of a doubtful period, some tombs of small dimensions and of questionable taste, and some vaults, cisterns, and reservoirs; but applying that can be called a building, or that and some values, easeline, and reservoirs; but nothing that can be called a building, or that will even lead to the restoration of any edifice, has hitherto been discovered. The remains in the citadel (supposed to be the tower Hippicus) consist of the lower part of a quadrangular building, about 70 feet by 56 feet, and 50 feet high, built of stones varying from 10 feet to 12 in length, and 3 feet in height. Hitherto no entrance has been found to the tower; but it is not probable that it is a solid mass of masonry 70 feet by 56 feet. At the joints of the stones the face is accurately sunk or chan-

the stones the face is accurately sunk or chan-nelled, as we term it, horizontally as well as vertically, but the face is left rough.

The springing stones of a large arch (pro-bably of the bridge or viaduct over the Tyro-peon alluded to by Josephus as connecting Zion with the temple) are worthy of notice.

Three courses of the arch remain, abutting on and connected with the ancient wall of the temple enclosure, near the south-west angle, extending lengthways 51 feet, and by calculaextending lengthways 51 feet, and by calcula-tion would give the arch a span of 60 feet, and as the distance to the precipitous natural rock on Zion is about 300 feet, it is conjectured rock on Zion is about 300 teet, it is conjectured there were five arches in the whole. The stones are above 20 feet in length, and one is 5 feet 4 inches thick; at the joints are similar sinkings to those of the tower of Hippicus; but in this remain the extreme surface of the stone is worked perfectly smooth. I think the masonry worked perfectly smooth. I think the masonry of hoth these remains are of the same age—perhaps that of Herod. I cannot assign it to any period anterior to the Roman, certainly not to Solomon, as some authors imagine.

A similar style of masonry and construction is seen on the lower part of the city walls, and is seen on the lower part of the city walls, and those which surround the temple area. On the south, east, and west sides of the latter, particularly at a spot on the west side, called the Jews' Wailing Place (where they, the Jews, have purchased permission to approach the boundary of the temple, to wail over the desolation of Judah, and implore the mercy and forgiveness of their God) are considerable forgiveness of their God), are considerable remains. In the eastern wall are seen the remains of an arched double gateway, walled up with Saracenic masonry, called the Golden Gate. The ornamental details of this arch are shown in a very careful sketch by Mr. Roberts, which leads me to suppose that it is a work of the period of Constantine, and not of Adrian, the period of Constantine, and not of Adrian, as some supposed. The interior of this gateway was first explored by Mr. Bonomi and his companions; and from the sketches made by him I think the style of architecture of the interior fully fixes on this remain as a work of Constanting. Constantine

The wall that now encloses the tower on the The wall that now encloses the tower on the north side I always conceived to be on the site of the Agrippa's or the third, wall. I am confirmed in this opinion hy the published report of Mr. Tipping, who has recently visited Jerusalem for the purpose of illustrating a new edition of Josephus, who has described this wall as exhibiting remains of the ancient a new edition of Josephus, who has described this wall as exhibiting remains of the ancient masonry to a considerable extent at the eastern angle, and as huilt of stones 24 feet long by 5 feet 8 inches broad and 3 feet 2 inches deep on the return angle, and likely and the long parts of the Damagens Gate: long by 5 feet 8 inches broad and 3 feet 2 inches deep on the return angle, and likewise at the inner parts of the Damaseus Gate 1; and, if I remember rightly, I saw some ancient masonry at the northern angle of this same wall. As it appears that the same style of masonry exists at these several spots, some of which we know the date of (Agrippa's wall for I Zion with high walls and strong towers, lest

instance), we cannot, I think, ascribe one part to the age of Solomon without ascribing the whole to that king. I should have men-tioned that the arch called "Ecce homo" being, I think, of ancient masonry, corroborates my view that the second wall passed in that direction according to the description of Jose-

Among other existing remains is an arcbed chamber or reservoir of ancient Roman masonry, chamberor reservoir of ancient Roman masonry, and a conduit for water, hewn out of the rock at a depth of 23 feet below the present surface, discovered by Mr. Johns, the architect, in digging for the foundation of the Protestant church near the citadel or town of Hippieus. Besides this discovery of Mr. Johns, a fragment of a Corinthian capital and a Dorie capital ment of a Corinthian capital and a Dorie capital (similar to that of the tomb of Zachariah)

were dug up on this site.

were dug up on this site.

The researches of Mr. Catherwood on Mount
Moriah, led to the discovery of very extensive substructure under the mosque of El Aksa,
and adjoining the east wall, consisting of piers
of squared stones, with arches from one to the other, and the spaces hetween vaulted, through which the roots of the trees growing on the which the roots of the trees growing on the ground around the mosque had penetrated and taken root again on the ground of the vaults beneath. I am not able to give any decisive opinion on the age of these substructures; the valuting may be of a later date than the piers, probably of Justinian's time. Mr. Tipping has since then discovered some more arched chambers, with columns, piers, and arcbes, and a gateway leading to the south side of the temple area, but the engravings from his views are not sufficiently clear to enable me to form a proper opinion of the age of these great

These substructures require a careful examination, and it is probable that the whole area of the temple platform may consist of similar constructions. I shall not attempt any description of the mosque of Omar, as my object is to describe the antiquities, and not the modern buildings. Even had I attempted I could only have done it from the dictation of Mr. Bonomi, who I hope will give some account of that beautiful and singular huilding.

In conclusion, I will allude to some of the points that have given rise to recent controversies. From the situation of the Holy Sepulchre, within the precincts of the present eity, doubts have arisen as to the authenticity of the site. If the second wall ran, as I suppose of the site. If the second wall ran, as I suppose it to have done, and the third wall, built after our Saviour's death, by Agrippa, was where the present north wall stands, the topographical difficulty at once ceases. As regards traditionary evidence, there can be no doubt, I tbink, of the correctness of the site. Many of the Christians who actured to Icrusham after the Christians who returned to Jerusalem after the Christians who returned to Jerusaiem after the seige of Titus, must have heen alive at the period of the Crucifixion, and the author of "Epitome Bellorum Sacrorum," asserts that forty-six years after the desecration of the city by Titus, the Christians obtained permission of Adrian to rebuild a church over the tomb of Adrian to reduce a charter over the tollow of our Saviour, and to enclose in the new city the other places venerated by Christians. From this time to Constantine and downwards, we have successive attestations of the correctness have successive attestations of the correctness of the site of Calvary. Another important argument in favour of the present site is, that tradition has never assigned any other locality for this sacred spot, and those who have rejected the present site have not been able to point out another site, excepting one writer (Mr. Fergusson), who has made a most start-ling suggestion viz. if I rightly nedesting ling suggestion, viz.—if I rightly understand him—that the cburch of the Resurrection was on Mount Moriah, north of the temple of Solomon.

The situation of Zion has only been, I believe, disputed by two writers. Dr. Clarke supposed the City of David to be on the Hill Evil Counsel, and what we called Zion to be Acra,—an assumption that has never heen supported by any writer. It is manifestly un-tenable, from the fact of its making Zion a mile from Mount Moriah, to which we know it was continued. it was contiguous, and joined by a bridge.

the Gentiles should come and destroy it again. Whereas I conceive the word "Zion," as her used, merely means the City of Jerusalem.

J. J. Scoles

ON THE CONSTRUCTION OF PRISONS.*

RESUMING the consideration of this subject, another important object to be obtained is a perfect sewerage, and a complete and speedy removal of all substances and fluids which, exremoval of all substances and finites winch, ashaling noxiouseffluvia, must prove most destructive to health. This, together with a wholesome system of ventilation (of which I shall speak more fully hereafter), are points which too often receive but very indifferent attention, and yet are those on which much depends. It will of course be a considerable advantage It will of course be a considerable advantage obtained to keep, under the rules of the system, a large number of prisoners with as few officers as possible; but I have found, in many instances, that too strict an observance of this principle has rendered the discipline exceedingly defective, and much devolves upon the architect to make such provisions for officers that the tiple will be suitable in proportion to as he thinks will be suitable in proportion to the number of prisoners. The entire front of as he thinks will be suitable in proportion to
the number of prisoners. The entire front of
the building should, in my opinion, be devoted
to the accommodation of persons connected
with the superintendence of the prison; with
suitable residences for the governor and chaptain equidistant from the centre. Those potions should project from the main building,
and be supplied with private entrances so as
to afford seclusion to themselves and families
from the rest of the apartments appointed for
the minor officers of the prison; but care the minor officers of the prison; but care should be also taken that means be afforded of immediate communication with the rest of the building when desirable. Although I am a great advocate for the buildings being constructed on a principle of "radiation," as proposed and effected by the model plans on the Pentonville system, and which have been conntonville system, and which have been con-Pentovine system, and which have been considered as the ne plus ultra of perfection, yet I must say that when it is intended to accommodate male and female prisoners, I think that its principles are still open to suggestions for improvement. So many instances have occurred of communication taking place in consequence of inattention to proper discipline, but more particularly on account of a mal-arrangement in the plan, that this is a mal-arrangement in the plan, that this is a very material point to be considered. In order to carry out the discipline fully, the male officers should be separated from the females, in the same manner as the prisoners, and in fact the plan should be so designed as to construct two prisons in one building, and, though in imme-diate connection, so arranged as that the in-habitants of one may no more interfere with the other than if they never existed. This cannot be effected by the plan above alluded to, and as the male and female prisons radiate from the same central point or inspection hall, the consequence must be, that opportunities of communication are afforded, which by some consideration could be prevented. The method by which I propose to obviate this difficulty, without interfering with the principles of radiation, is, by having separate halls for the reception of male and female prisoners placed at each side of the centre building, approp as officers' apartments, leading by corridors to inspection halls, from which the buildings designed for the males, and those for the females, respectively radiate. By this means the object will be completely gained, and no intercourse of any kind whatsoever can take place between the officers of the different sides of the prison. I could, from my own personal knowledge, enumerate many instances of communication of the most disgraceful description occurring in prisons where this defect exists, but I trust that the mere reference to its destructive principles will be sufficient to aid in guarding against them, without requiring me into a minute catalogue of those which have come under my own immediate observance. It is also the fact that in some prisons where the silent system is carried out (or rather attempted), female nurses attend sick male patients in the hospital wards, and sleep in rooms immediately contiguous to them. This is a point so glaringly defective, that it requires but very little comment, and hy some foresight on the part of the architect, many of those de-

ficiencies, and the bad results arising therefrom, could be easily prevented. Each corridor should be under the care of at least one officer, who, by his bumane and affable disposition would be suited for the discharge of the responsible duties which are imposed upon bim. Suitable provision should therefore be made for one at an extremity of each corridor. So much depends upon the prudence and gene-rosity which the officers exhibit to those under their charge, that a great deal of care should be taken in the selection of sober, steady, and intelligent persons to fill these situation would suggest that at another extremity of each corridor a wash room should be provided, not for ordinary purposes, but that the prisoners may occasionally have the opportunity of bathing themselves, and effecting a thorough octaming themselves, and extend a during themselves, and cleaning of their persons. This will be found most conducive to health. As an occasional change of wearing apparel is absolutely necessary, fumigating apartments with steaming apparatus complete should be fitted up in the basement story, for the purpose of removing vermin and all infectious tendencies which the clothes may have acquired. It would be desirable in large prisons to supply such ac-commodation as is necessary for religious dis-tinctions. In almost all the huildings which I have inspected, I remarked that there is a great inattention paid to this point, and that it is too often looked upon as a minor one, while it is in fact very material and deserving of much Great inconveniences consideration. arise from the celebration of the ceremonies of different persuasions in the same apartment, speak of the infringement of moral principles which this arrangement of moral I think that there should be separate accom-modation provided for the followers of each modation provided for the followers of each persuasion. I do not of course mean that there should be a distinct place of worship for the disciples of every sect which is likely to exist in a prison, but I wish to show that suitable distinction should be made between those which require apartments differently constructed and fitted up for the practice of their respective ceremonies. A church and chapel will effect the required objects. The seats would be so arranged in each as to prevent prisoners from seeing each other, at the same time affording them an opportunity of having a perfect view of the officiating clergy-

Infirmaries should be constructed at each side of the building for the accommodation of both sexes, consisting of sick wards, surgical ward, operation room, and convalescent ward, together with a bath room and nurse's apartments. Independent of these it would be well to construct apartments (with all necessary appendages) for patients suffering from fever and all other contagious diseases, in order to prevent their spreading to the rest of the inmates. Spacious airing grounds should be in immediate connection with each infirmary, and all the arrangements planned to afford facilities for carrying out the system.

To the juvenile departments of the prison school-rooms should be attached for instruction, fitted up with seats similar to the chapel, and supplied with a pulpit, from which the teachers have full inspection of their pupils; and adjoining these rooms there ought to be apartments provided for the accommodation of master and mistress.

The kitchen, culinary offices, &c., should be o arranged as to prevent the intercourse above alluded to, and to admit of the discipline being carried out as fully in this as well as other portions of the building. I think it would be advisable to place at each side of the prison such offices as are best suited to each sex; for such offices as are next stitled to each sex; for instance, the laundry and all necessary accommodation at the female side; and the bakehouse, with the requisite stores, at the male nouse, with the requisite stores, at the male side: by this plan each class may mutually assist the other in those departments which are best suited for the respective sexes. These huildings must be so designed as to admit of free access, and be situated within the space enclosed by boundary wall: apartments for officers, which is the property of the standard of t enclosed by boundary wall; apartments for officers should be judiciously distributed throughout, in order to afford them a perfect surveillance of the prisoners in fulfilling their different avocations.

Airing yards, on a radiating principle, with an inspecting officer's station in the centre, should be constructed at each side of the

prison, with open railings at each end, and of such dimensions as will supply sufficient space for the recreation and exercise of the prisoners.

The space between the boundary wall and the main building should be at least 30 feet, and extend around the entire prison, that free communication may be afforded to all parts. The outer wall must be 20 feet high, in order to prevent the possibility of escape. In many instances space enclosed (if any) by the boundary wall is so narrow, and the wall itself so dary wall, is so narrow, and the wall itself so low, that it frustrates the intention of preventing the escape of prisoners, and by its con-struction frequently affords them facilities for so doing. The depth of its foundations should so doing. also be attended to, as examples have been known of their having been undermined in a

very short time.
The corridors should be sufficiently spacious to prevent the prisoners communicating with each other from opposite cells—say 10 feet in width. The cells (particularly when the separate system is intended to be carried out) should be large enough to admit of the prisoners moving about, and exercising themselves therein: 13 feet by 8 feet are considered be carried out) good dimensions, and on no account should they be less than 12 feet by 7 feet, and 10 feet high. This proportion is best adapted for in-spection. There should be a total absence of spection. There should be a total absence wooden floors and ceiling joists; in the first wooden floors and ceiling joists; in the first place, for the purpose of preventing communication and the spread of fire. The cells should be floored with substantial flagging, and have eeilings arched with brick. A window must be supplied to each cell, which will admit a proper amount of light, placed at sufficient height from the ground to prevent the arisense from looking out. All necessary the prisoner from looking ont. All necessary apparatus for the convenience and comfort of the prisoner should be fitted up in each apparatus for the convenience and comfort of the prisoner should be fitted up in each apartment, and furnished with the means necessary for the preservation of his health. The doors ought to be formed of strong oak, sheeted with iron on both sides, with apertures for inspection and for the supply of provisions formed in each

All the buildings should be constructed on

a fire-proof principle.

The only point which now remains for me to draw attention to, is "the system of ventilation and warming to be observed throughout." Up to the present time so many improvements have been made in this department, that it is difficult to know which of the different systems most to approve of; but I have selected that which I consider the simplest and most economical, and which experience has shown to be efficacious. As the principle of ventilation may be reduced to two heads, namely, "the supply of fresh or heated air (as occasion." the supply of result of nesset and as obcasion may require), and a withdrawal of foul air," I shall explain how these may be effected. An apparatus is generally placed in the basement story of each side of the building, fitted with story of each side of the bulling, free wand all necessary tubes, pipes, &c., with which there is in immediate connection a large cold air flue, supplied by a shaft out of doors. The air by this means introduced may either be air by this means introduced may either be warmed or left at its natural temperature, and passes hence into a flue constructed under the orridor floor, from which small flues branch off, and pass up the inner wall, terminating immediately under the ceiling of the cells, through which the fresh or temperated air is through which the resh of the interest and is diffused by means of an iron grating. The foul air is extracted by a grating placed near the floor of each cell diagonally opposite to where the fresh air is introduced: this is the opening of a lateral flue which passes down the outer wall, and communicates with a main foul air flue, placed under the floor of basement. All flue, placed under the floor of basement. All the corridors are similarly ventilated. In order to effect a proper circulation, the main foul air flues are placed in the perpendicular ventilating shaft, on each side of the smoke flue of the apparatus, which is built up between them to about 15 feet of the top. It will be found desirable to construct the smoke flue of found desirable to construct the smoke flue of iron instead of brick, as the former is much better adapted for the propagation of heat. A damper (which will be under the command of a superintending officer) should be placed in the extracting flue, close to the outer doors of the cells, and so constructed as to leave sufficient room to effect a proper circulation. It would be well to observe that all chance of communication by means of the ventilating flues, should be strictly guarded against by the

architect. In conclusion, I cannot but observe that there is a very great carelessness and in-difference manifest in want of attention to some most essential points in constructing prisons; and I trust that these few notes may prove advantageous.

Dublin.

ROYAL INSTITUTE OF ARCHITECTS.

ARCHITECTS' PROPOSED BENEVOLENT FUND. On the 12th ultimo, a general meeting of the Institute was held, to receive a report from

the Committee appointed to inquire into the above matter.

It appears that the objects of the charter do not comprise the establishment of a benevolent fund, and the solicitor thinks that the Institute have not legally the power of establishing and administering such a fund. The committee, therefore, had confined themselves to the consideration of the proposed distribution of the fund through the medium of the Artists' General Benevolent Institution. From a letter addressed by the memorialists to the Council of the Institute, it appears that such proposed for the control of the Institute, it appeared that such proposed arrangement was by no means satisfactory to the general body of the memorialists,—the committee therefore suggested, "that a communication be made by the council to the memorialists, to the effect that it regrets the insuperable difficulties of the succession of the council to the superable difficulties of the succession culties arising from the terms of their charter, which prevent the Institute from undertaking the formation and distribution of the proposed henevolent fund, but offering, at the same time, to afford such support and encourage-ment for the establishment and maintenance of such a fund as the constitution of their charter will admit, and as the council of the Institute may from time to time consider expedient.

The report was received and adopted, so that the memorialists are just where they were at starting; and the profession, irrespective of the Institute, must take the matter into their own bands if they wish the fund established.

On Monday, the 19th ult., Mr. Sydney Smirke in the chair, Mr. James Fergusson (author of "An Inquiry into the Principle of Beauty in Art") and Mr. H. Oliver were elected associates.

Specimens of moulded bricks from the Specimens of mouded bricks from the estate of the Earl of Leicester, Holkham-park, were exhibited, including labels, copings, mullions, paving tiles, chimneys, &c. made of an excellent material. The price of a handsome Tudor chimney-top, 8 feet higb, thus formed, was stated to be 4l. 10s.

Whinstone.—Mr. Burn said he wished, before proceeding to the business of the evening, to withdraw an observation be had evening to withdraw an observation be had made on a recent occasion, to the effect that Wbinstone was a very absorbent material. He had been misled by adopting a general opinion. Experiment, to which he had been led by what was then said, had shewn him that Whinstone was but very slightly absorbent, and he wished to set himself right.

Mr. Charles Barry, Jun., then gave an account of a mode of constructing malleable iron fire-proof flooring, recently patented by Mr. Beardmore, the substance of which we give elsewhere. A variety of objections to the give elsewhere. A variety of objections to the invention raised by members were ally replied to by Mr. Barry; and Mr. Donaldson, in moving, and Mr. Poynter, in seconding, a vote of thanks, congratulated the profession on the débût of the son of their estcemed colleague.

Mr. T. H. Wyatt made some remarks upon the church of St. Andrew, at Greensted, in Essex, mainly in reply to published assertions that the ancient church had been demolished. We shall give a view of the church as restored, and append to it some few of Mr. Wyatt's

EXHIBITION OF THE SCOTTISH ACADEMY.

The present exhibition in Edinburgh is well — The present exhibition in Edinburgh is well spoken of, and attracts large numbers of persons. A taste for the fine arts is certainly increasing amongst the Scotch generally. Amongst the principal works are enumerated pictures by the late Sir D. Wilkie, the late W. Collins, and the late W. Simson; Roberts, Sir W. Allan, Maculloch, Noel Paton, and Watson Gordon. Watson Gordon.

THE LATE MR. HARVEY EGINTON.

MR. HARVEY EGINTON was the son of Mr. Raphael Eginton, a glass painter of some note, under whom he commenced his architectural career. His chief opportunity for acquiring a knowledge of architecture was limited to the resources afforded by studying in the cathedral of the city (Worcester) in which he resided; but this, with the information his father was able to render him, soon qualified him (being of a very persevering disposition) to assume the profession in which he afterwards made rapid progress. Having executed a few works of minor importance, he obtained the countenance of Mr. H. G. G. Ludlow, a magistrate of the county of Wilts, under whom he executed a work of magnitude, and whose friendship he retained up to the time of his decease, having completed a church built and endowed by that gentleman. Soon after this he was appointed (through the recommendation of Mr. Britton) architect for carrying ont the restoration of the parish church of Stratford-on-Avon. About this time, too, he was engaged in the restoration of St. Lawrence Church, Evesham. One of his last and best works was the re-storation of the parish church of Kiddermin-At the time of his decease he held three public appointments, that of county surveyor, architect to the Incorporated Society for Building Cburches and Chapels for the Worcester District, and Architect to the Worcester Discessan Church Building Society. The following architecture of the wisconsistent of the property of the pro Diocesan Church Building Society. Let au-lowing are the principal edifices upon which he was engaged. The erection of Brose-ley Church, Shropshire; Dawley Church, Shropshire; St. Luke's Church, Birming-ham; St. Michael's, Worcester; Westbury Cburch, Witts; Malwern Link Church; Flead-ley Cross Church. Trimpley Church North ley Cross Church; Trimpley Church; North Hill Church, Malvern; St. Paul's Church, Worcester. The restoration of Paulers Pury Hill Church, Marker, Worcester. The restoration of Paulers Pury Cburch, Northamptonshire; Bredon Church, Worcestershire; Pershore Abbey Church; Walton Church, Warwickshire; Clifton-on-Seine Church, Worcestershire; Stoke Prior Church; Honeybourn Church; Powick Church, Grimley Church. The erection of Church; Grimley Church. The erection of Church of Church; Grimley Church. Tenoury Vicarage; twerve ponce scatons, a mansion at Malvern; a mansion at Yelverton; Martley schools; Spetchley schools; St. Nicholas schools, Spetchley schools; St. Spetchley; glebe houses, Malvern; extension of Worcester County, Prison restration of Singley Castle houses, Malvern; extension of Worcester County Prison; restoration of Sudeley Castle and of Astley Hall. Mr. Eginton died on Ash Wednesday, at the early age of 40.

THE "BURIAL OF HAROLD." A CURIOUS CASE

SIR,-On the north side of Leicester-square, beneath the entrance to the premises known as Miss Linwood's Gallery, and subsequently as the Walhalla, you descend a few steps, where, on a very unpretending entrance, is inscribed "Wine Shades." It consists of two spacious saloons, laid out for refreshments in the usual style. Within these few days, whispers and rumours have led many of the curious, the inquisitive, and the most eminent in art, to make a visit to this subterranean abode of the juicy divinity; and it must be openly avowed that a problem is here elicited which must be satisfactorily solved, or the integrity and reputation of an artist will be injured.

We all recollect that Mr. F. R. Pickersgill, A.R.A., painted a picture representing the "Burial of Harold," which was rewarded by a "Burial of Harold," which was rewarded by a first-class premium, in the exhibition at West-minster Hall, in 1847. This picture was subsequently purchased by Government, at the recommendation of the Royal Commission for promoting the Fine Arts, to be placed in the New Palace at Westminster. What will be the astonishment created when it is stated that, in one of the saloons of this "Wine Shades," on the right-hand side in entering, there is hung a picture of this same composition, of small size, exactly the same in the arrangement of all the figures, with the single exception that one of them, in the single exception that one of them, in the middle distance, bears a shield. The straining-frame and canvas on which this phenomenon is painted bear the impress of at least half a century of manufacture, on examining the back. The execution of the picture is extremely wretched, and would at

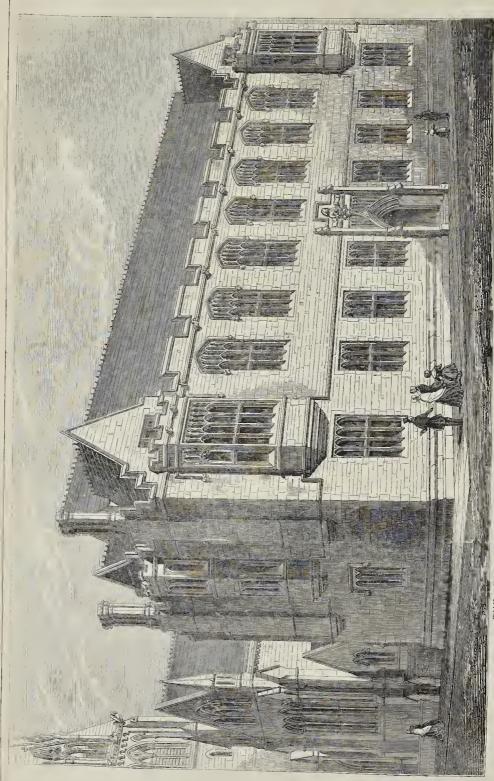

first glance impart the notion of being the production of a feeble hand copying a better work.

There can be no hesitation in asserting that the entire affair must be fully explained, and it behoves Mr. Pickersgill to take the initiative in the matter. If it prove to be, as we hope, a rascally daub got up upon an old canvas to ruin the character of a talented artist, no reprobation would be too strong for the transaction. As there is no restraining the extensive circulation of verbal calumny until the public ear becomes thoroughly poisoned, it is better that the circumstance should be investigated without delay. One of the attendants in the room where the picture is hung said, 100.4 had been offered for the picture since its new-born notoriety. If true, by whom?

* We have not inserted this without consideration and inquiry. We gave Mr. Pickers-gill intimation of this picture, and his reply is, that he "has never seen the picture in question, that he "has never seen the picture in question, nor is he aware of the existence of any work resembling the 'Harold,' either in subject or arrangement.' The identity is unquestionable, and the paint has a settled and old look, which does not appear, under the recent coat of varnish, to be deception. The possession of the picture has been traced for five years.

BALLOON RAILWAY.

A MECHANICIAN in Great Portland-street is been taxing his invention, with A MECHANICIAN in Great Portland-street has been taxing his invention, with the view of forwarding the quiet design of the Yankee Government to attract all sorts of 'lads of metal' to the great, but probably still more greatly exaggerated, Californian magnet, where they press and ruh against each other much more like files than filings, loose particles though they be, much more than integral and useful members of those communities whence they are attracted. For the facilitation of this useful process, it is proposed to supersede the mission of the iron horse altogether, even while following his railway track, or laying it down rather, right across the continent of America, up hill and down dale, and clear of all tunnelling, even through the Rocky Mountains. And the grand succedaneum to 'hell in harness' is the locomotive influence of that 'power of the air,' a fair wind, operative on an aerial, or really winged Pegasus, in the form of a manageable balloon that bitherto impracticable phenomenon, which it is now proposed to accomplish by help of a straight line of wooden rail with a saddle of iron (though without the horse), and with wheels to run underneath the saddle in place of on the rail, and to guide the flighty Pegasus and its gold hunting riders, with a fair wind direct, from Washington to the gold-washing fields of California, at the goodly rate of 50 miles an hour. And even though the wind should not be quite fair, the running train is to act as a rudder, the rail as a keel, and the balloon, we presume, as a sail, so that the 'land lubber' may cut along even by a side wind. Should the wind turn right in its teeth, or the ship-shape machinery chance to be be-calmed, the 'angelic train' might come down from above, "by means of ropes, in a car." from above, "by means of ropes, in a car." But what they might then do, especially in the midst of a boundless horizon of prairie-ocean, or a rushing and irresistible buffalo-tide, is prudently left to the pre-occupied funcies of the gold-hunting emigrants themselves.—The same really ingenious patentee has invented a wheel-rigged ship, or a whirligig-ship, we are not sure which, wherein the lame, the halt, and the blind, not likely to run away on arrival, may be made to work their way out of the old world into the new rid (Balifornia and the old world into the new, via California, and back again,—the latter a difficulty which, though only now somewhat singularly realised, at one time, by anticipation, very much pre-occupied the minds of unbelievers in the transatlantic land-seeking mission of that Noah's Dove, Columbus, ere he took wing on the ocean waste in search of the golden land.

THE CAVENDISH-STREET SCHOOLS, MANCHESTER .- MR. EDWARD WALTERS, ARCHITECT.

THE CAVENDISH-STREET SCHOOLS, MANCHESTER.

In the course of our notes in Manchester at the end of last year,* we mentioned an extensive school-house, then building, in Cavendishstreet, behind Dr. Halley's Independent Chapel. The annexed engraving is a representation of the schools, and shews also a part

of the chapel.

The huilding covers an area 127 ft. by 44 ft., containing boys', girls', and infants' schools on the ground floor. A spacious centre staircase leads to the grand centre hall, or Sunday school, on the upper floor, 80 ft. by 40 ft., with library and lecture room at either end, 44 ft. by 20 ft., separated from the hall by an enriched screen (glazed), affording a view of the entire range

(giazed), attording a view of the entire range of building.

The height of the hall is 3s feet, divided in with tracery. The hall is lighted by seven three-light windows on each side. Galleries carried on projecting brackets from the screens on three sides of the hall, afford communication to ten class-rooms over library and lecture rooms these rooms being only 14 ferms. ture rooms, these rooms being only 14 ft. in height. The schools on the ground floor are 18 ft. 6 in. high. In the basement are kitchens, and on the ground floor, in addition to what has been mentioned, are accommodations for parties residing on the premises.

The cost of the building was 4,700l, without fittings, these, namely forms and desks, will probably cost 500l. more.

The building was erected under the superintendence of Mr. Edward Walters, architect.

PROCEEDINGS AT BIRMINGHAM, MAN-CHESTER, AND HULL.

Sanitary inquiries have been going on at Birmingham and Hull; and one of the aldermen of Manchester has been lecturing his colleagues and constituents there on the sanitary, business, and other general improvement of that busy city.

The Government Inspector at Birmingham

was Mr. R. Rawlinson, appointed by the Board of Health in compliance with the request of one-tenth of the ratepayers of borough.

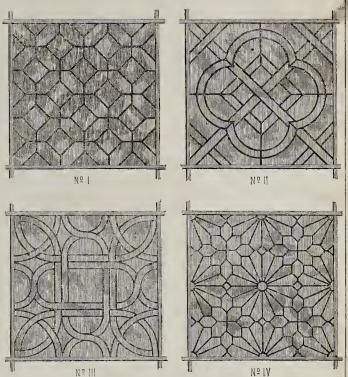

From the evidence adduced before him, it appears that the sewerage, so far as it has been carried out, is deemed unobjectionable; indeed, the inspector complimented the town surveyor, Mr. P. Smith, on the fact that, "unlike many other towns, Birmingham would not be required to undo anything of what they had done with regard to the sewerage." But the great evil there to provide against was the want of sufficient power to compel parties to lay in their drains. Throughcompet parties to lay in their drains. Infough-out 4½ miles 71 yards of the new sewerage of 1845, only about seventy-five private drains had heen laid in. Whereas privies, water-closets, and open cesspools, without such issue, not only abounded, but were on the increase. In more than one of the more aristocratic parts of the town, the water-closet refuse was regularly emptied into the street gutters! The town surveyor considered that the Commissioners for whom he acted should have power to form the drains as well as the sewers.

The defective supply of water,—the unwhole-some state of some of the grave-yards, the clerical proprietors of the worst of which had refused to abate the nuisance,—the unhealthy state of courts and lodging-houses,—the prestate of courts and lodging-houses,—the prevalence of local nuisances, in shape of foul ditches, slaughter-houses, &c. &c., were also all discussed. It appeared, however, that as far as possible an effective system of street cleansing by machines and otherwise was adopted, and that Birmingham had by no means a bad pre-eminence as to fever or general mortality compared with Manchester, Shefiled, &c.

The Hull inspector was Mr. Smith, of Deanston. Great complaint was made of the prevalence of pulmonary diseases in this district, an evil more particularly attributed to

phereacenee of pulmbhary messes in this dis-trict, an evil more particularly attributed to the saturation of the soil with undrained moisture. But the general mortality is greatly more than the lowest estimate at which the Board of Health think it right to interfere.

FORMS FOR WINDOW GLAZING.

Dr. Daly declared that house drainage in Hull had virtually no existence. Even the chief place of business is not half drained, and yet the inhabitants themselves apdrained, and yet the inhabitants themselves appear to he ostentationsly anxious to promote the salubrity of their respective neighbourhoods, or at all events their own individual reputation for cleanliness, as Mr. Smith remarked that "in many streets which were in a very defective condition the inhabitants and marked that "in many streets which were in a very defective condition, the inhabitants paid particular attention to the cleanliness of the flags in front of their doors." Some of the graveyards appear to be in a had condition. St. Mary's, in Lowgate, had no drainage whatever, and rises 6 feet above the old level of the street from the mere accurate time of human services. "The really sear mulations of human remains. The wells near it are polluted, and a heavy odour prevails all round it. Many of the inhabitants make most piteous complaints ahout the dirty, stinking, piteous compliants about the dirty, stanking, hrackish, hard, Hull water with which they are, medically speaking, still cleared out. Others stoutly uphold its salubrity, even while admitting that it is impregnated with all the sewerage of Beverley and Hull. The supply too is not sufficient. too is not sufficient.

The Manchester alderman, Mr. Hopkins, in rourse of a comprehensive and able disquisi-tion, in the Royal Institution, on the various requisites to the healthfulness, comfort, and business convenience of the city—a dis-quisition which we cannot venture even to broach—alluded to the water-works now in course of construction by the corporation to the east of the town. These, he remarked, "will, at an early period, furnish a supply of twenty millions of gallons of water each day, and, if it should be required, thirty millions. and, if it should be required, thirty millions. As the quantity furnished at present is only about three millions, it is evident there will not only be sufficient to supply the inhabitants, flush the sewers, and wash the streets, but also to use for any other public purpose that may be thought desirable, such as watering the streets, supplying fountains, &c. &c. This water is intended to be conveyed to every dwelling in the borough; and, as it will always be on—by night as well as by day—no want of it will be experienced by the poorest inhabitant."

FORMS FOR WINDOW GLAZING.

WE give the annexed specimens of glazing from buildings on the continent, as suggestions. Nos. 1 and 4 are from the Church of St. Denis, St. Omer; No. 2 from the Church of St. Etiennc, Beauvais; and No. 3 from the Church at Aire, in Flanders. Each pattern is about 2 feet square. We have others to follow.

ON A NEW FORM OF MALLEABLE IRON FLOOR,

LATELY PATENTED BY MR. NATHANIEL BEARD-MORE, CIVIL ENGINEER.

The paper on this subject, read by Mr. Barry, jun, at the Institute of Architects, as already mentioned, commenced by remarks upon the want of toughness in cast-iron, and its dangerous nature when highly heated, with a review of the comparative strength of cast and wrought-iron, as shown in the following

Table of Comparative Qualities of Cast and Wrought-iron.

	Power to resist Tension.	Power to resist Compression	Safe limits of Tensile Strength.	Price.
Cast-iron Wrought-iron	Per square inch. 7 tons. 24 tons.	50 tons. Maximum by Hodgkinson, 25 tons. Rondelet, 31.5 tons. Buchanan,	Per square inch, 4 tons. 16 tons.	Per ton. 91. 971. for plate girders, as boiler work.
		27 tons.		

From this it will be seen that, while the tensile strength of wrought with respect to cast iron may be computed at 4 to 1, their prices are in an inverse ratio, viz. as 3 to 1. It should, however, be remarked that in the case of cast iron, 4-7ths of ultimate strength cannot be safely exceeded, while in the case of wrought-iron, although 2-3rds of the ultimate strength is the load to be assumed for practice, a much higher proportion can be borne by it as a passing load, from its non-liability, as is the case with the former material, to fail at once, frequently from internal and unseen imperfections.

The many great failures in cast-iron girders in the manufacturing districts, and the experiments to ascertain the best form for the Holyhead tuhular bridges, induced Mr. Fairbaim of Manchester to consider this subject, and in 1845 he patented a beam formed with two webs connected by upper and lower flanges, riveted in each direction, the whole bearing.

in each direction, the whole being in the form of fig. 1; the tendency of the webs to bulge or collapse being counteracted by short transverse pieces of tubing, through which pass rivet bolts. The experiments, however, of Mr. Fairhairn and Mr. Hodg-kinson, showed that there was a limit to the reduction of weight in wrought-

iron beams, when used in thin and light forms: thus the compressibility of cast-iron is probably never less than 50 tons per square inch, while, in their experiments on rectangular wrought-iron tubes, formed of plate inch, it inch, and it of an inch thick respectively, the resistance to compression per square inch was only 19\;\;\) 14\;\), and 7\;\ \frac{1}{2}\ \text{ tons.}\). This great reduction in strength by the use of thin metal was caused, not by want of resistive strength, but from want of stability. The result of the experiments above referred to, is the very general introduction of tubular wrought-iron girders for railway bridges, hut the price (from 28\;\) to 32\;\). Per ton) must render them, without some modification, too expensive for ordinary use in buildings. It occurred then to the author of the floor which is described in this paper, that if some form could be adopted where advantage was taken of the full tensile strength of wrought-iron, while at the same time by insuring its stability power to resist compression were given, then it might be used very economically. No stronger construction was then known than the combination of square cells used for the floor of the Conway tubular bridge—aform of construction, however, far too expensive for ordinary floors, from the cost of riveting the top sheet of iron, especially on a small scale. After some construction are small scale.

sideration, experiments were made to determine the effect of a combination of iron for tensile and some other material for compressive strength, and several beams were made of the form fig. 2, where a is a Tbeam of sheet-iron stiffened by hrickwork, as shown at b; but it was found on loading these that the bricks cracked

and slipped off, in the manner indicated in the figure, showing that the mere resistance of brickwork to longitudinal pressure would not practically be of any value.

Fig. 2.

A rectangular tube was then selected, after one in Mr. Hodgkinson's experiments, formed of malleable iron 1-16th of an inch thick, 6 inches deep, 4 inches wide, and 7 feet 6 inches hearing; the top plate was omitted, but tiebolts were placed at intervals, connecting the sides, and the whole was filled in with concrete; the weight to break this down, when hung in the centre, was 7,206 lbs., the same tube empty, but with a top plate, was, by Mr. Hodgkinson's report, crushed with 3,156 lbs.

In the above experiment the failure was by the sides of the tube bulging outwards at the centre, and it suggested itself, that if there had been concrete outside as well as inside, the

bulging would not have occurred. A model was therefore constructed of sbeet and angle iron of the dimensions shewn in Fig. 3, the part lightly shaded being filled in with

concrete; the hearing was 12 feet, and the hreaking weight in the centre 5 tons 14 cwt., the bottom of the heam having been torn asunder without the slightest buckling of the vertical plates.

A heam of similar construction 23 feet hearing, and 13 inches deep, was made of sheet iron, 1-12th inch thick; the weight of iron altogether in this beam was 656lhs., and it carried 12 tons equally distributed (including

the weight of concrete), for several weeks, with a deflection of $1\frac{1}{2}$ inch, 1 inch of which recovered itself on removing the weight, a large portion of the remaining $\frac{1}{2}$ inch being due to a defective scarf. The weight of a cast-iron beam capable of supporting this load would be 1,800 lbs. These experiments and numerous

others seemed to shew that the uniform pressure of concrete against the whole surface of the web, and under the top flanges of the beam, would produce the effect of a continuous strut, and thus enable comparatively thin plates to assume the true character of a beam or girder.

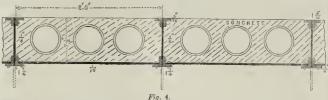

Fig. 4 shews the form of construction proposed by Mr. Beardmore, as evolved from the above and other experiments, for floors up to 18 feet span: it is constructed of vertical plates of sheet iron, with angle iron rivetted through. These light beams are then placed on the walls at the proper distances, and plates are rivetted to the hottom angle irons, and the whole filled in with concrete. Lightness may be obtained by introducing earthenware pipes, or this object may be effected by lengthening the vertical webs (as shown by dotted lines), when the floor may have a less thickness of concrete. The bottom plates, when liable to corrode, may be either of galvanised iron,* or iron coated with the peroxide paint patented by Mr. Welch.

The weight of the above floor, contrasted with one formed with cast-iron girders and half-brick arches, is shown in the following table:—

	Per square.	Per foot.	Span.	Depth of floor.
Floor formed with cast- iron beams and half- brick arches:—	lbs.	lhs.	feet.	inches,
Cast iron	1,008 5,824	10.1 58.2	15 to 18	14
	6,832	68.3		
Fig. 3, as described above:— Wrought iron Concrete, with earthen-	600	6.0	15 to 18	a 1
ware pipes	4,972	49.7	15 to 18	7 t
	5,572	55.7		

The concrete used in all these experiments was formed of White's Portland cement and shingle, in proportions of from 1 and 6 to 1 and 9. The cost of such is less than good hrickwork, and is remarkable from its setting properties and strength to resist compression.

The following is the inventor's summary of the apparent advantages of the proposed mode of construction:—

- The necessity of the floor being fire-proof from its mode of construction.
- 2. The non-liability to disintegrate when exposed to fierce flame, as brick arches are known to do, in flakes.
- That being of malleable iron, its cohesion could not be destroyed by sudden cooling when heated.
- 4. The small depth of this floor when contrasted with one of cast-iron of equal strength.
- 5. The absence of all lateral pressure on walls, and consequent necessity for tie bolts: and,

Lastly, that whereas in cast-iron constructions it is necessary to calculate the beams to bear not only the weight of the expected traffic on the floor, but also the weight of the brick arches themselves; in the proposed mode the concrete is not a weight independent of the floor which it is required to sustain, but a necessary element of the floor itself, thus rendering it nearly impossible to accumulate a great weight on any one spot, the floor being as it were one continuous beam, while with cast-iron girders the weight in the entire floor is necessarily thrown on them alone, which are consequently strained beyond the average strength required.

NOTES IN THE PROVINCES.

The prior's tomb, in the chancel of the church of St. Nicholas, Yarmouth, was opened on Monday week, and found to contain, in a white Purbeck marble coffin, a skeleton in good preservation, but evidently disturbed during a previous opening, it is supposed in 1650. No preservation, but evidently disturbed during a previous opening, it is supposed in 1650. No chalice, pastoral staff, &c., were found, though other traces of high ecclesiastical rank are said to have been noted.——"A house-agent in this town," says a Leicester paper, "has threatened to turn out every tenant of dwelling houses of which he has the management, who calls the attention of the inscretors of mixture calls the attention of the inscretors of mixture and the contract of the contract o calls the attention of the inspectors of nuis to any nuisance on the premises they occupy."
We know, too, of instances in which tenants
themselves refrain from complaint of nuisances from the mere anticipation of disagreeable contact with their landlords. It is to be hoped, however, that a little moral courage on the one hand, and a little forbearance on the other, ill gradually work out much sanitary benefit. We can readily conceive that landlords may be much annoyed with complaints and expense without great reason, but where a wholesale threat like the above is uttered in terrorem, as a gag to tenants suffering from nuisances, it is also to be hoped, and indeed it is highly probable, that every house so tabooed from all cleansing process will become a "noted house" in its neighbourhood, into which tenants will be as a fraid to enter as if it were haunted, or the scene of some recent slaughter; so that its landlord or agent may be at length induced to adopt as effectual means for turn-ing in a tenant as those now threatened may, ing in a tenant as those now threatened may, to his chagrin, really prove to be in turning him out.—Gloucester Cathedral lately stood in imminent peril, from fire in the college school-room over the chapter-room. One of the stoves is supposed to have set fire to the floor, which was much burnt, while books in flames fell into the chapter-room below.—The Mariners' Chapel at Gloucester was opened on Sunday week. The Journal describes it as a simple and appropriate structure. Mr. Jacques, of Gloucester, was the architect, and Mr. William Wingate, also of the same city, was the builder.—The Macthe same city, was the builder.—The Mac-clessfield committee for erection of baths and washhouse have selected the plan for a building at an estimated cost of about 1,200%. ing at an estimated cost or about 1,22004.

St. John's Cburch, Hurst, was consecrated on Monday week. It is in the Early English style of 13th century. Internally it is about 69 feet long hy about 43 feet wide, and divided into a nave and side aisles. It is without cleve and side aisles. It is without cle-The chancel is about 18 by 19 feet, into a nave and side assies. It is window correctory. The chancel is about 18 by 19 feet, with a vestry on the north side. In the west gable are two lofty lancet windows, with a quatrefoil light, surmounted by a plain bell turret, rising upwards of 50 feet from the ground. Near the south-west corner, on the south side, is a porch with high gabled roof. The nave pillars are of polished stone, the pews are low, and the roofs are open timbered stained in oak. There is a small gallery. Sittings in are low, and the roots are open timbered stained in oak. There is a small gallery. Sittings in all 750. Mr. E. H. Shellard, of Manchester, was the architect, and Messrs. Eaton and Hallas, stone-masons, were the contractors.

—Styd Church, Ribchester, is to be renovated.

—The Bradford council have formally discussed the orbits. vated.—The Bradford council have formany discussed the smoke nuisance, and appointed a smoke committee.—The works connected with the new Mechanics' Institute, in the city of Durham, have been commenced; and the building will be finished, it is thought, in October next,—The large bospital to be

^{*} We have received several serious statements relative to galvanized iron, to which we shall give attention.

erected at Calside, Paisley, by the Abbey Board, has heen contracted for, says the Reformer's Gazetie, by the following tradesmen:—The mason-work by Mr. William Bowes, Paisley; joiner do., J. Lamb and Son, Greenock; slater do., Mr. W.m. Gillespie, Paisley; plumber do., Mr. J. Gilmour, Paisley; plaster do., Mr. Andrew Mitchell. Architect, Mr. J. Lamb Mr. J. Lamb.

RIGHT OF ARBITRATORS TO COPY DRAWINGS

ROYAL ITALIAN OPERA-HOUSE, COVENT-GARDEN

SIR,—In a personal matter I should best consult my own feelings in abstaining from asking for a space in your valuable columns, which you might otherwise fill with some suhject of greater interest to your readers, but as an imputation has been made against my professional character in a charge brought against me by Mr. Albano, in your last week's journal, I have to request the favour of your insertion of a few words in reply.

Upon the matter of reference of Mr. Albano's accounts, in which I acted as umpire, it is impossible for me to say one word, but with regard to that part of Mr. Albano's letter complaining of my having, in his opinion, impropely caused traced copies of some of his properly caused traced copies of some of his drawings to be made, I beg to say that I am not disposed to enter on the discussion of the abstract right of an umpire to copy drawings produced in the course of any reference. In this case I acted under legal advice; and in the steps I have thought proper to take I have done nothing whatever derogatory to my character as an architect or a gentleman.—I am, Sir, &c., Sam. Angell.

18, Gower-street, Feb. 28, 1849.

WORKS AT BEVERLEY.

THE great window and the west end of the church of St. Mary being in an unsafe condi-tion, it was resolved to have it restored. The cost of the restoration of the window, west front, doorway, and turrets, was estimated at about 1,000l., and this the churchwardens hoped to effect by the funds of the church in two years, at the rate of 500l, a-year. To restore the window with common glass would have cost about 50l.; hut Mr. Pugin proposed to put in superior stained glass for 3001., and furnished a design, which was approved of by the parishioners and also by the Architectural the parismoners and also by the Architecturia. Society. The necessary sum has been subscribed, and it is expected that the window will be restored and the painted glass put in during the present year. The subject of the design is our Saviour and the twelve apostles, with the parton saint of the abuse. with the patron saint of the church, filling the fourteen compartments of the window. One or more of the nave windows, it is expected, will be restored and decorated in a similar way.
The church of St. Mary, Beverley, as remarked

by the correspondent to whom we are indehted for the above particulars "is well worth the attention of every one who admires or appreciates beautiful design and execution, and it is lamentable, here as elsewhere, to observe how little the decay of centuries has been arrested, and how dilapidated the structure has become Here, however, there has been no daubing or defacing, and although there is much to restore there is little to pull down."

restore there is little to pull down."

A site bas been secured in the centre of the town for a national school, for the united parishes of St. Mary and St. Nichelas, and a design has been prepared by Mr. Pearson, of London, architect. Subscriptions are in progress to defray the cost, which is estimated at 5711. 10s., exclusive of site 4557. Of the whole sum, about 3001. only remains to be made un by contributions, in aid of which a bazaar is up by contributions, in aid of which a bazaar is about to be held. The design is satisfactory.

To RESTORE OAK .- A few weeks since a correspondent asked for something that would restore oak to its original whiteness. I have often used, with success, 2 oz. oxalic acid dissolved hy friction in one quart of cold water. If the oak has been varnished it must be scraped clean before using the acid. -G. C.

ENCROACHMENT ON THE NEW ROAD.

SIR,—On looking into the current number of THE BUILDER, I was greatly surprised to find your correspondent, "C. E.," attacking the official referees on the ground, if I understand him rightly, that they, in common with the magistrates, were lending their aid to in-fringements of the Act of Parliament, 7 Geo. 3, to the extent of authorising buildings to be brought forward, so as to reduce the New Road to a less width than that statute prescribes and requires that it should be. A serious charge this: but your correspondent must surely be in error, as from all I know of the proceedings of this body, they have been found—to the sore discomfiture they have been found—to the sore discomfiture of many—to be strict conservators of the metropolitan streets and roads, be such streets and roads ever so wide; and I cannot help thinking that if the charge were to be inquired into, it would be found that when the Central Board "defined (found?) the line of frontage of two public buildings as being 50 feet back from the footway," they were doing their best to revive and uphold the Act of Parliament above mentioned, and that it would be further found that they have not, and moreover could notthat they have not, and moreover could not—
if they had the will to do so—have given any
decision or performed any other official act
that could in any way lessen or abridge the
provisions of that Act, and I should incline to
the supposition that any resolution which they
have come to (if they have come to any such
resolution as "C. E." describes), must have
reference to localities to which no statutory restrictions that would have the effect of imposing strictions that would bave the effect of imposing prohibitions against the erection of any inclosed promotions against the detection of any increase projections before a house, other than the shop front of ordinary projection, do apply or ought to be applied: and it would appear strange, if the "two private buildings" referred to by "C. E." are being erected in the New Road in consequence of any such resolution, that similar erections, long ago devoutly wished, are not being consummated in the various other roads over which the Act, 7 Geo. 3, has no control, and which, as I had supposed, were lying under the ban of the official re-SUUM CUIQUE.

Books.

The Year-Book of Facts in Science and Art, exhibiting the most important discoveries and improvements of the past Year. By JOHN TIMBS, Editor of "The Arcana of Science and Art." London. Bogue.

THE industrious ants of science," said Lord Northampton, at a meeting of the British Association, "laboriously bring to her grana-ries their numerous though small additions; ries their numerous though small adultions; and, in truth, accumulate facts destined for materials for the greater minds, that reason and systematize." For many years has Mr. Timbs, who quotes this on his title-page, quietly played the ant, for the advantage of the public, when he might, if he bad pleased, bave taken a more assuming part; and much is due to him for the good he has done in that capacity. As the original editor of the old "Mirror," he is perhaps best known to many of our readers, and now in connection with the widely-circulated "Hustrated News," the public have weekly the advantage of his intelligence and ability without knowing it.

The present "Year-Book," which consists of valuable facts extracted from the periodicals of the day, not forgetting our own, which furnishes its full share, is illustrated with a portrait of Sir David Brewster, and forms an excellent present-book for the young of either sex, which they cannot open without picking up something useful.

Archwologia Hibernica. A Hand-Book of Irish Antiquities, Pagan and Christian: especially of such as are easy of access from the Irish Metropolis. By W. F. WAKEMAN. Dub-lin, M'Glashan; London, Orr and Co.

EVERY person interested in architectural antiquities, who visits Ireland, should possess himself of this little hand-hook, which is nicely illustrated, and very sensibly put together. Nor is its value confined to those who are about to visit the green island; those who are not able to go there will find in it much to interest them. Ireland contains an extraor-

dinary series of monuments, commencing from very ancient date, which are much less known than they deserve to be.

Marshall's Index Ready Reckoner, for the Cal-culation of Wages. London: LONGMAN and Co

This little work is especially adapted to the use of railway contractors and other parties employing a number of hands, and who reemploying a number of natus, and who te-quire expedition in calculating the amount due to each. The calculations advance by quarters of a day, from one quarter to thirty days, at rates from one shilling to five shil-lings. A marginal index shows at once the page to be turned to, and adds much to the value of the work

Taylor's Builders' Price-Book, corrected to the Year 1849. Edited by Edward Cresy, Architect. London: Taylor, Wellington-

THE new edition of this long-established pricehook, edited by Mr. Cresy, contains, in addition to its ordinary information, the Public Health Act, in full; notes upon it, and a number of new tables of considerable value.

Mr. Taylor has published the Health Act separately in a convenient form.

Miscellanea.

THE SEWAGE MANURE COMPANY.—The secretary of this company wishes it to be stated that the resolution in their favour actually passed by the Commissioners of Sewers, is as follows: -- "Resolved, that saving all the jurisfollows:—"Resolved, that saving all the jurisdiction and rights of the Metropolitan Commission of Sewers, facilities be given to the Metropolitan Sewage Manure Company, for carrying out their experiments completely, by allowing them to take sewer water of a stronger quality than that chosen, viz., the Counters Creek Sewer." The secretary thinks that our report of the resolution come to by the Court of Sewers (p. 69 ante), is calculated to damage the company, and though we are disposed to the company, and though we are disposed to think he greatly overrates the difference, we willingly give the company all the advantage which the words of the resolution may be to them. We shall be glad to find this company seriously at work. Auxious as we are to further every effort to prevent the future defilement of the Thames, and to turn the sewage of the metropolis to its proper use, we have never found ourselves able to advocate warmly the interests of this company. They have never appeared to see their way, and we very much doubt if they do so yet. We shall be much doubt if they do so yet. glad to be undeceived.

THE CLOSED-DOOR BUSINESS OF THE METROPOLITAN COMMISSION OF SEWERS.
—Sir: I am happy to find that the "hole and corner" proceedings of the new commission have attracted attention, and drawn forth the remarks contained in your last number. It certainly does appear strange that a body professing the most unbounded regard for the public interests, and having in their hands so large a sum of the public money, should so closely imitate the worst features of some of the former Commissions of Sewers, by transthe former commissions of Sewers, by trans-acting nearly the whole of their business, in-volving the outlay of several thousands of pounds, with closed doors. It is true, that the amount is mentioned in the open court required for certain works,—not for the sake of in-formation, but merely to give it a formal legality, and this is done in so brief and hurried a manner, as to appear to the commissioners almost "like a thrice-told tale." No reason for it is given, no information is conveyed as to its necessity; but merely this or that "com-mittee" recommend it. A late member of the House of Commons once remarked,-" If wish a snug job to be done, give me a select committee." That this remark may not apply to the present Metropolitan Commission Sewers is the earnest hope and desire of-

ONE AMONGST THEM.

*** A long debate on this subject took place at a meeting of the commissioners on the 1st instant, but we are forced to postpone

PROJECTED WORKS .- Advertisements have PROJECTED WORKS.—Advertisements have been issued for tenders, by 7th inst., for the erection of the Printers' Almsbouses; by 6th, for the erection of a farmery for 700 acres of land at Eldo House, Rougham, near Bury St. Edmund's; by a date not specified, for finishing a few third-rate bouses near Mornington-crescent; also for the formation of a new road, 70 feet wide, from the Royal-crescent, Notting-hill, to Warwick-sonare, Kensington: new road, 70 feet wide, from the Royal-crescent, Notting-hill, to Warwick-square, Kensington; by 28th inst., with plans, specifications, &c., for the erection of lodgings, and accommoda-tion for the judges of assize, at Aylesbury; by tion for the judges of assize, at Aylesbury; by April 7tb, with plans, specifications, &c., for erection of gas-works, &c., at Aylesburn, Norfolk; by 12th inst., for the erection and completion of the two chaples, cloisters, catacombs, &c., at the Leicester Cemetery; by 12th, for the erection of a workhouse at Fulham; by 14th for expecting the masoure brickwork the erection of a workhouse at Fulham; by 13th, for executing the masonry, brickwork, and other works, and also the remainder of ironwork requisite for extending the Liverpool and Bury Railway to Titbebarn-street, Liverpool; by 19th, for the execution of the works required for the completion of the Knottingley branch of the York and North Midland Railway, a length of about three and a-quarter miles; by 19th, for the execution of the whole Railway, a length of about three and a-quarter miles; by 19th, for the execution of the whole works necessary for the completion of the Bishop Auckland branch of the York, New-castle, and Berwick Railway, and of the branch of same from Pensher to Sunderland, the former in two contracts of about 71 miles the former in two contracts of about $7\frac{1}{2}$ miles each, and the latter in one contract of 7 miles each, and the nater in one contract of 7 miles in length; by 19th, for a supply of 30 fifteen-feet and 30 twelve-feet turntables for the same line; by 8th, for 200 goods trucks for the Eastern Counties; by 19th, for the supply of the averages externs place they are the supply of the various cisterns, pipes, taps, and apparatus for distributing water through the Birmingham for distributing water through the Birmingham Lunatic Asylum for paupers, and for the works connected with fitting and fixing the same; by a date not specified, for an iron tank, about 30 feet by 30 feet, and 4 or 6 feet deep, for St. John's Wood; by 10th April, for ironmongery,—by 20th inst., for crown and sheet glass and window lead,—and by same date, for ironplate-workers' wares, all for the navy.

COMPETITIONS.—Plans, specifications, and estimates are wanted, from "architects and others," for lodgings and suitable accommodation for her Majesty's judges of assize at Aylesbury.—Twenty pounds and ten pounds are offered for the two hest designs for a cornmarket at Bedford.

market at begiord.

MASTER AND MAN.—On the 13th, at the
Town-hall, Nottingham, the following case was heard before the mayor and two other magis-trates. Mr. Lonsdale, plasterer, baving em-ployed a man 50 miles from Nottingham, to whitewash some ceilings at stations upon the Sheffield and Lincoln railway, refused to pay him his charge without the certificate of the foreman of the works (George Clark). This the foreman refused to give, because the man had charged for twelve days' work during two weeks, whereas be had only worked eight days. A summons being granted against Mr. whitewash some ceilings at stations A summons being granted against Mr. days. A summons being granted against Mr. Lousdale, the foreman attended the court, to prove to the magistrates the time that the man had worked, by book, showing the number of bours each day that he had worked. The mapoints each day that he had worked. The ma-gistrates arrived at the following decision:— that when the man had been at his work any that when the man had been at his work any part of a day, he was entitled to a full day's wages: two days the man admitted that he was not within 20 miles of his work, these were struck out of his account,—the bench allowing him ten days, instead of twelve days, which he had summoned his master for. Mr. Lonsdale to nay the costs (1/10, 3d.) Lonsdale to pay the costs (11. 19s. 6d.)

ENGLAND IN AN AMERICAN'S EYES.— Mr. Ralph Emerson, in a lecture on England Mr. Ralph Emerson, in a lecture on England at Boston, after his recent visit, referred to the elements of that power which the English now hold, and have held for centuries. After looking at her manufactories, scattered all over

hotel, where everything is provided to one's mind. On the railroads we ride twice as fast, and with one-half the shaking, that we do upon our roads. All England is a machine-everbody moves on a railway—no Englishman ever tuches the ground. England has the best working climate in the world; it is never best working climate in the world; it is never hot nor cold; their winter days are like our November days in the early part of the month. One of the few drawbacks which Mr. Emerson mentioned was the dark, dense smoke of many of the manufacturing thems providing and of the manufacturing towns, pervading and completely enveloping at times every surrounding object.

BUILDERS AND BUILDING IN LONDON BUILDERS AND BUILDING IN LONDON.— Our forefathers built houses singly; we build whole neighbourhoods. Belgravia, together with the new Bromptonian territories; Tibur-nia, and a new district recently discovered by northern travellers, east of Camden Town, sprung up at once. All this has not happened and is not going on without hands, hence the spiting up at once. All this has not happened and is not going on without hands, hence the Directory tells us of 406 architects, 779 builders, 431 bricklayers, 672 carpenters, 167 stone and marble masons, 66 plasterers, 400 plumbers, and 315 painters and glaziers. For the wholesale handy work of these artificers we beg to put in a plea against an imputation cast upon them by the author of "The Town," who says,—"In Elizabeth's time the London houses were still mostly of wood. We see remains of them in the Strand and Fleet-street, and in various parts of the city. They are like houses built of cards, one story projecting over houses built of cares, one story projecting over the other; but unless there is something in the art of building, which may in future dispense with solidity, the modern houses will hardly be as lasting. People in the old ones could at as lasting. People in the old ones could at least dance and make merry. Builders in former times did not spare their materials, nor introduce clauses in their leases against a jig. We fancy Elizabeth hearing of a builder who should introduce such a provise against the should introduce such a proviso against the health and merriment of her buxom subjects, heath and meriment of her buxom subjects, and sending to him with a good round oath, to take a little less care of his purse, and more of his own neck." We have heard of such clauses, but believe they appertain to houses ciauses, but beneve they appertain to nouses "run up" about the beginning of the present century, when the art of building was not so well understood as now. Although we do not deny that even some of the suburban contraction, when the suburban contraction is the suburban contraction. job villas are not built for eternity; nor, indeed, for perfect integrity after a severe equinox; yet the scientific researches of architects and builders into the relative ratios of the strength to the builk of materials, and the frequent substitution of iron for wood, have enabled them to build most of the modern houses with equal stability, but with infinitely loss clumsiness than their predecessors.—Daily villas are not built for eternity; nor, inless clumsiness than their predecessors.

Pyro-PNEUMATIC STOVE GRATE. AYRO-INDUMENTIC STOVE GRATE.—We have several times said that the great desideratum in heating and ventilating is to get a constant supply of pure air admitted to the apartment at a proper temperature. Under the above title, Mr. Pierce, of Jermyn-street, the above title, Mr. Pierce, or John, has patented a stove-grate which proposes to supply this want. It has an open fire-place, and is lined with fire-lumps. Within these lumps are tubular air-ways, made to commu-nicate with the external atmosphere, which, in thus passing into the apartment, is warmed

thus passing into the apartment, is warmen without coming into contact with heated metal. The fire-clay lining makes it economical also: metallic linings are very wasteful. Proposed Baths and Wash-Houses For the Parishes of St. Margaret's and St. John's, Westminster.—A meeting of the vestrymen of the above parishes was ing of the vestrymen of the above parishes was ing of the vestrymen of the above parishes was held on Saturday, in the vestry-room of St. Margaret's Church, for the purpose of considering the propriety of erecting baths and wash-houses. Mr. Trollope occupied the chair. The Hon. C. J. Talbot moved the appointment of commissioners under the Act 9 and 10 Vict., for encouraging baths and wash-houses. The looking at her manufactories, scattered all over the land, her commerce, her agriculture, her arts, and witnessing the stupendous results which have been wrought out, one is considered, said he, that if he would see the best development of common sense (the standard sense), he must go to England to witness it. The land, in every part so like a garden, shews the triumph of lahour; the fields look as if finished with the pencil, and not the plough. Every arable spot has been cultivated, and everything turned to the best possible use. England, he continued, is a huge mill, a grand

FREEMASONS OF THE CHURCH.-A mee FREEMASONS OF THE CHURCH.—A meeting of this society was held at 49, Great Mar. borough-street, on February 13th, the Rev George Pocock, LL.B., in the chair. Mr. J. Brown exhibited a chart illustrating the first the chair of the chair of the chair intended as a few seconds. brown exhibited a chart mustrating the first principles of perspective, intended as a first step in perspective. It was the object in this drawing to place at one view the meaning of the terms used in this art, illustrated by such familiar examples as will render them easily understood by the young student, and place familiar examples as will render them easily understood by the young student, and place in a more simple light the mathematical rules which will afterwards be required. Mr. Pell, of Southwark, attended for the purpose of placing before the chapter a series of ornamental glass windows, manufactured by him on a patent principle, for halls, passages, and conservatories. Mr. Wilmshurst, upon this subject, offered some remarks, explaining the effect frequently obtained in windows by a very moderate use of colours, strengthening his observations by reference to examples in his observations by reference to examples in many continental cathedrals, and especially in that of Seville. Mr. William Smith Williams then read a paper on "The Importance of a Knowledge and Observance of the Principles of Art by Designers," to which we shall recur.

VALUE OF ESTATES. —A short time ago the estates of Lord Suffield, at Middle-Value of Estates.—A short time ago the estates of Lord Suffield, at Middleton and Thornham, about 5 miles from Manchester on the one side, and equally distant from Rochdale on the other, were brought to the hammer at the Palatine Hotel, Manchester. The auctioneer described the capabilities and qualities of the property; after which some bids were made, the first of which was for 100,000l., by Mr. Robert Ashton, cotton manufacturer, at Hyde. Ultimately, Mr. Fisher said that there was a reserve bid of 200,000l. on the property, and any advance on that of 1,000l. would be received, but otherwise the property would be withdrawn. The required offer not being made, the sale was abandoned, and it is understood the property will be offered in small lots. The estates are freehold, comprising about 3,000 acres, including plots suitable for building purposes at Middleton, and containing also some valuable seams of coal. The preperty also includes the managed the managed tither was the sale was about adversary of the receivery of Middleton and the managed tither was the sale was a distance and the managed titles. The present the valuable advowson of the rectory of Midthe valuable autowson of the rectory of Mid-dleton, and the manorial rights. The present average rental has been about 10,000, per annum, the average rental of the land being about 34s. 6d. per acre.—Chellenham Journal.

about 34s. 6d. per acre.—Chettenham Journal.

How Low Contracts are carried out.—Sir: I bave frequently been much edified by the information which you have afforded under the head "Blind Builders," and beg to offer for your use the following particulars of a job which was to have been executed for the Corporation of this city (Manchester). The work consisted of the excavation of about 9,000 yards of earthwork, the fair cost of which might probably be some fair cost of which might probably be some 400l. There were about a dozen estimates tendered, varying from 115l. to 1,020l. The lowest was accepted, as is the custom in this neighbourhood. Some few "navvies" made their appearance, and slinked about as though they were arranging to begin in good earnest. This, however, proved to be a mere ruse to obtain a few weeks' credit at the beershops at which they located themselves. In order to support appearances, a few waggons were sent on the ground, but these, with the "navies," mysteriously vanished before daybreak one fine morning, when it was found no further credit could be obtained, and neither have since been heard of. The job remains in statu quo.-O.

TO OUR READERS.

It has heen suggested to us at various times that some of the best architectural subjects given in This Bullings, if printed in a superior manner on good paper, with the accompanying descriptions, plans, &c., and the sum of the subject of of t

No. CCCXVIII.

SATURDAY, MARCH 10, 1849.

HE endeavour of the Architectural Association to establish an annual exhibition of architectural art, free to the public, deserves the thanks of the pro-

fession generally, and should have commanded more assistance heyond its own walls than has yet been given to it. Composed as the association is, for the most part, of quite young men, students, this endeavour, which necessarily entails a considerable expense likely to fall on themselves, shows a degree of enthusiasm, energy, and pluck, if we may use a vulgar but expressive term, that commands our sympathy and praise. We suggest that a small subscription should be made by parties interested in the progress of our art, to meet the expenses of the gallery and attendants, so that the cost of a praisewortby endeavour may not fall on the young society, or the subscrihers individually. Members of the profession who would willingly have forwarded designs for exhibition, had their occupations spared them time to arrange them, and there were several in this position, may thus still lend their aid to the movement: we gladly do so ourselves.

It gives us much pleasure to find that the association is in a prosperous state, and comprises nearly 140 members. Many very good papers have been read (some afterwards appeared in our pages), and the class of design has heen well attended. Our readers will remember that the Architectural Association grew out of the "Association of Architectural Draughtsmen." The inauguration meeting of the new society was held in October, 1847, and Mr. Kerr, the first president (by whom the remodelling of the society had been induced), thus stated the object it had in view:-

"The Institution of the Architectural Association is an endeavour towards an improved system of architectural study-an endeavour on the part of the students themselves. The fundamental position that architectural education-the present system of training the architect, is defective and insufficient, if it has not been frequently agitated and loudly proclaimed, has not been the less continually felt by every thinking mind, and earnestly lamented by every aspirer after progress. And there may be nothing of novelty in a serious attempt to improve upon the system—an energetic endeavour for progression. If architecture is 'the only hranch of human ingenuity, which is an exception to this century in its intellectual advancement,'-if the profession of the architect has been a strange anomaly among professions, so unsettled in the principles of its subject and so uncared for in investigation and teaching, it has not been so without many an earnest mind baving been aroused to complain, and many an energetic scheme having been perseveringly urged. But in the present project there is certainly a novelty of nature. Whether it may succeed or not may scarcely yet be predicted; but as a scheme aiming at the association together on the largest scale, of the entire hody of our professional youth, for the end of self-education, and with the good trust of simple self-

be attractive enough to ensure an indulgent old friends: and his brother, Mr. Wyatt trial, and a straightforward earnestness of good purpose which deserves of every old man favour, of every young man help.' We thought so too, and willingly assisted in making it known and extending its influence; but we said then and we say now, that we could see no reason why this work should not he done in connection with the Institute,why this body of young and rising men should not be enabled to do exactly what they were about to do, in the rooms of the Institute. so as to avoid the payment of rent, which keeps down the efforts of all societies, and be aided by the use of the now excellent library of the Institute and the co-operation of the elder members of the profession, its members.

It seems to us most desirable for all parties that this junction should take place, and if any change be necessary in the rules of the institute to admit of it, the change should be made.

The Institute must open its arms wider, increase the number of its allies, objurgate narrownesses, and maintain its position, not by keeping hack others, but by advancing

We are being led away, however, from the exhibition, which was privately viewed on Wednesday, and is now open to the public free every day, except Saturday, when a shilling will be charged—an arrangement which it is supposed will enable that portion of the public who are interested in the progress of art, and can afford to assist the experiment to the extent of twelve pence, the opportunity of doing so, but which in practice, we fear, will simply have the effect of keeping the gallery empty one day out of the six.

Of this disinclination to pay, we will not much complain, if we see the rooms well frequented on the other days. As the association say in their preface, "whether the public will appreciate an exhibition exclusively devoted to architectural art, is a question never yet practically tested." We trust that the reply will be satisfactory, and agree with them in saying, that "whatever may be the deficiencies of that now offered to their notice-viewed as the initiative-we bope for it a candid judgment and liberal reception; and that ere long it will receive that full co-operation of the profession, which sball render it not unworthy of a position among those galleries of art that are annually thrown open to the public." We sball hope especially to see the various artisans of the metropolis availing themselves of the opportunity of inspecting the drawings which is thus gratuitously afforded to them.

The gallery contains 171 drawings and 9 models. The most noticeable of them have been exhibited hefore, and have been mentioned in our pages. Thus Mr. G. G. Scott sends bis design for the Army and Navy Club House (No. 7), and Newfoundland Cathedral (No. 68); Mr. Allom his fine drawing of the banks of the Thames (No. 38), and in conjunction with his partner, Mr. Crosse, a design for Chichester Training Schools (No. 31), the New Kensington Workhouse (No. 92), design for Army and Navy Club (No. 145), and others. Mr. E. B. Lamb is a good contributor: Shooting Residence at Loch Tulla (No. 40), Wadhurst Castle, Sussex, shewing alterations (No. 102), charming little drawings; Church and Schools at Prestwood (No. 118), are amongst the works he has sent. Mr. Papworth exhibits his design for a façade to St. Maria del Fiore, at Florence (No. 21), a Metropolitan Music Hall (No. 169), reliance, it possesses a novelty which ought to and a National Record Office (No. 170), all Club.

Papworth, has sent with other things, his design for a library, exhibited last year. Mr. Leeds has several of his suggestions for street architecture, thoughtful and original usually, but owing little to the colouring by which they are set forth, which indeed does not do justice to the ideas. Mr. Donaldson has sent his design for the mansion of the late Lord Hallyhurton, in Angusshire (No. 115), Mr. R. W. Billings, the Gothic screen, executed for Great Malvern Church (No. 103), Mr. Roumien, drawings of some villas now being erected, and a view of Old St. Pancras Church recently restored, and Mr. Raphael Brandon, some designs for churches (the Holy Trinity Church, Leverstock-green, Herts, now being erected, No. 150, and others), which shew he has not studied the village churches of old England uselessly.

The designs for churches are numerous, and mostly show an adherence to ancient models, and a congruity, whatever want or avoidance of invention may be observable. No. 5 is a design for a church at Tunbridge, hy Mr. Ewan Christian, (geometrical, with tower on south side of chancel). No. 9, Design for a Church, by Mr. Colling, (Early English, founded on the Temple Church, London). No. 33, New Church, &c., now building at Newton, by Mr. J. Colson (Early English, nave and chancel). No. 76, Design for a Parish Church, by Mr. C. Geoghan (Early English). No. 90, Design for the Consecrated Chapel at Leicester Cemetery, hy Mr. J. Johnson (Tuscan in style); and No. 117, hy the same architect, New Church, Heptonstall, Halifax (Early decorated, with massive square

Nos. 1, 2, and 3 give the elevations and section of Wren's original Design for St. Paul's, by Mr. E. C. Sayer, very nicely drawn, though the coloured decorations shown in the section are more suited to a drawing-room than a cathedral. No. 8 is a design for the Brighton Dispensary, by Mr. G. S. Clarke, to which the second premium was awarded: the style is Tudor, and the design has a turret at the angle,

No. 56, Entrance front of Villa designed for Alderman Moon, by Mr. Owen Jones, is founded on the Alhambra; clever, but, as it seems to us, unsuitable. No. 73 is a very clever Design for Carriage Gates, hy Mr. J. P. Seddon. In No. 48, by the same, the arrangement of the lines is similar, but there is a mixture of styles which makes it less satisfactory.

No. 67, Design for Galleries or Arcade over the roadway and footpaths fronting the National Gallery, by Mr. G. A. Elliott, is a curiously wild notion, effectively set forth. No. 93 gives a series of clever pen-and-ink sketches of Northamptonshire Churches, hy Mr J. D. Wyatt. No. 135, Font and Cover, Manchester Cathedral, by Mr. Truefitt, will enable our readers to judge if our commendation of the work some time since was deserved.

Mr. Leonard Collman, besides a view of the British Museum Hall as decorated by him, has a design for a sideboard (No. 137), which is one of the most masterly drawings in the room.

We can only add, that there are other designs hy Messrs. Jayne, Horace Jones, Charles Baily, C. Lee, C. Tinkler, G. P. Boyce, Butler and Hodge, C. W. Young, &c. &c.; and that Mr. C. Fripp exhibits a model entitled, "Study for a Façade," which, if we mistake not, is the design he submitted for the Army and Navy

HISTORY OF ECCLESIASTICAL ARCHITECTURE IN ENGLAND.*

THE INFLUENCE OF THE SAXON PERIOD UPON POINTED ARCHITECTURE.

In the interesting account of his laborious researches, which Mr. Layard gives in his recent book on ancient Nineveh, and in the examination of the works of a people of whose history and manners all other evidence has passed away,—in Pompeii—aptly termed a fossil remain of ancient life and manners,—in the rock-cut temples of India, or the pyramids of Egypt,—in the old world or the new,—wherever the growth of intelligence in man can claim a record in history, there the architect points to the value of his art as the mirror and impression of the past. As the silent deposits of the seen and the rock texture is the second and the rock texture of the seen and the rock texture is the seen and the rock texture is the seen and the rock texture is a first texture and the rock texture is the seen and the rock texture is the rock texture is the rock texture in the rock texture in the rock texture is the rock texture in the rock texture is the rock texture in the rock texture is the rock texture in the rock texture in the rock texture is the rock texture in the rock texture is the rock texture in the rock texture is the rock texture in the rock texture in the rock texture is the rock texture in the rock texture is the rock texture in the rock texture in th of the ocean, and the great convulsions of the land, have enabled the geologist to pourtray the structure and habits of animate beings in ages past in the earth's history—to which the Ninevel, are an insignificant fraction of time— so the mounds of the desert and the ashes of the volcano enshrined the existence of other generations, for the discovery and wonder of

the present.

The Assyrian passed away, and the empire which extended from beyond the Tigris to the Mediterranean, was lost to the historian, the very name of Nineveh was forgotten, and another race built upon its site, and, like its predecessor, perished in the night of time, and its works were covered with the sand; but the accumulations of ages only preserved the enduring record of architecture to be exposed in our own time. Shall, then, the architect not claim as a great art, that which has this high power of contributing to so year, a field of power of contributing to so vast a field of human inquiry? or shall the world think lightly of the enthusiasm which is aroused by the arts of Greece, or the relics of mediæval art in our

own country?

A modern generation, boastful of ingenuity in research, and power to accomplish great undertakings, may well marvel at the vast power of conception and the tasteful execution in the works of the mediæval architects in Europe. The untiring energy which was brought to bear on the erection of structures, which still even in their state of comparative poverty and dilapidation, so powerfully impress the be-holder, and the deep religious feeling of which it was the expression, are occasionally forgotten by some, who see only the superstition and priestcraft which did too often accompany We, however, can find such evidence of we, nowever, can find such evidence of the beautiful in art, and the good in Christian effort and example in these relies, that we are not altogether surprised, that some should now almost identify themselves with the whole spirit of the middle ages; and they are not without reaching. spirit of the middle ages; and they are not without words to answer those who venerate other schools of art, less Christian in purpose and character. Looking, however, from an age essentially practical, upon the works of "the masters of a great art in its highest application," with an anxiety to aid every effort to place before us, as Mr. Poole says, "a more vivid as well as a most just presenting of the vivid, as well as a more just perception of the merits of their works," hailing, indeed, every work that helps to complete the chain of that great history of human progress, of which—as we before said—architecture is the expression, we cannot but often wish that a different use were made of these works by some non-pro-fessional writers—as we so often wish a different application of their architectural features by architects. We therefore regret that Mr. Poole, in the laborious compilation which is very usefully included in the scheme of his history, has not, as it appears to us—notwith-standing the disclaimer in his preface—suffi-ciently distinguished in the text, between the opinions and feelings of the monkish historians—"left to speak for themselves on such rains—lett to speak for themselves on such subjects as miracles, doctrines, and counsels of perfection," and his own treatment of the subject. It is true we read that—"We neither do nor can think, believe, and feel with them ourselves, and we should depresent the retire retire. cate nothing more seriously than a use of their works which should lead others to an indiscriminate reception of their facts, or of their theology;" and we also are dis-

The author has endeavoured to combine, in his volume, "a general history of the greater English ecclesiastical architects of the middle English ecclesiasucal members of their ages with an equally general review of their works, and of the characters which distinguish the buildings of their respective ages;" and the work may therefore be taken to be a history of the church, as illustrated by the progress of pointed architecture, rather than a mere notice of peculiarities of styles, to which branch of the subject other writers had more particularly devoted themselves. Mr. Poole seems to have addressed himself to the general ublic, less than to those who may possess other works on the subject, since his hook has the peculiarity—in these days of elaborate illustration—of being entirely destitute of plates and woodcuts. A knowledge of the characteristics of the different styles, consequently, can perhaps better be gained by a novice, from other works, the author here seeming to enter rather into the rationale of a change, than to depict every imaginable variation in its occurrence.

But if, for a tolerable idea of the great skill, and the beauty of design and workmanship, displayed in the details of Gothic edifices, we must look elsewhere, Mr. Poole has given us evidence of the abilities and zeal of the men who erected the ecclesiastical edifices. The immense influence of this zeal, it is indeed difficult account of the content of difficult to convey an adequate impression of. Taking up the map of any country, wherever we find a church indicated, we shall make few mistakes in attributing it to the period which preceded the Reformation. Not that churches were never erected in the reigns of Charles II. and Queen Anne, or that the last few years have been idle in the work of building, but the number of such structures is insignificant, compared with the multitude of those, of which the thickly set villages of the country can each furnish an interesting example. In the year 1268, Branescombe, bishop of Exeter, is said to have consecrated no less than forty churches in his diocese, whilst we are told that now Devonport in the same diocese, "with a population of 26,000, has not a single church."

But this holy ardour in the erection of ecclesiastical edifices, is by no means peculiarly remarkable in the period subsequent to the Conquest, but is apparent during the Saxon period. It, in-deed, it may be doubted whether Sprott in his "Chronicle," has accurately stated the num-ber of churches, at the time of the Conquest, at 45,011, there is very little reason to doubt Mr. Poole's accuracy in inferring that it Mr. Poole's accuracy in inferring that it amounted to four thousand, or about one-

amounted to four thousand, or about one-third of the present number.

But these remarkable ancestors of those whom something more than national pride now characterizes as a remarkable race, were not distinguished merely by their zeal in spreading the influence of religion, nor by the number only of their contributions to its exercise. The architect accustomed to the rude masonry of such of the churches as are ascribed to the Saxons, of the churches as are ascribed to the Saxons, might perhaps has over as unimportant, the inventions of a people who may not have had the ability to conceive the beautiful models of their successors. But, even omitting the evidence of ancient manuscripts and illuminations to the skill of Saxon artists,—which, however, is most important in the history of art, when its several branches were more united than thevare at present.—we find a great amount than they are at present,—we find a great amount of skill in many branches of ecclesiastical art, in which, as it would be impossible to deny magnificence of effect, it might be equally easy

to recognise the element of taste. Indeed, whilst Italy passed through centuries of time, in which it is difficult to discover any evidence of the influence of art, the churchmen of England were devoted to the service of religion through its agency. Accomplished in all the learning of Glastonbury, and possessed of remarkable energy and devotion to all that could advance the influence of the church and could advance the influence of the church and the priesthood, Dunstan, as he was the most celebrated man of that day, so is he no unfit type of the learning of his class. His future greatness shadowed forth in childhood,—according to one of the characteristic stories of the period,—by the vision of an angel, who stretched a surveyor's measuring-line over the area of a church ("Mensoris funiculum per plana atrii extendens"), becoming "learned beyond all his fellows in philosophy, he was also wonderfully skilled in manual operations. He was a painter and a scribe, and we have still proofs remaining of his proficiency in these arts." But it is still more important to find the remark, that he was "a dilicent and skilful arts." But it is still more important to find the remark, that he was "a diligent and skilful artificer in gold, silver, brass, and iron, and used the more delicate graver's tools as well as the hammer and the tongs." And it is not the hammer and the tongs." And it is not unnecessary to notice, that he was acquainted with hoth the science and practice of music, and that he was able to make organs, nor that he could design patterns for embroidery. And we cannot read of the profuse application of the precious metals to the purposes of architecture, and the constant use of painting and sculpture, without inferring a very different state of the art during the Saxon period than the mere evidence of such churches as Brixworth or Earl's Barton now afford.

Barton now afford.

Though materials are found for the history of eeclesiastical architecture in a period even preceding that of the Saxons—commencing with the wooden building at Glastonbury, of the year of our Lord 63, unanimously allowed to have heen the oldest Christian church, and shown by Mr. Petrie to have heen most important in its influence over the churches of Ireland,—and although we find the name of King Lucius, in the second century, associated with the names of some which were afterwards important buildings—Westminster Ahbey amongst the number; although minster Ahbey amongst the number; although we have mention of a church at St. Albans "of most beautiful workmanship," and containing a shrine decorated "with gold and insules," and either whether the strength of the streng and although it has not been omitted to remark upon the indirect influence of the Roman sway, which taught the workmen of Britain the use of mortar, and made them Britain the use of mortar, and made them famous, and in which the use and disposition of bricks—often actually worked up into suc-ceeding buildings—greatly influenced the de-coration of the Saxon and Norman architects, coration of the Saxon and Norman architects,— although in the pages of Geoffry of Monmouth, and the story of Merlin, we might find evidence of the skill in the arts of construction which afterwards led to such great results, and we have notices of cathedrals and monasteries rebuilt by King Arthur—who dwelt in palaces adorned with gilded roofs—as well as the direct statement that dwing that time. "Buistin hed." adorned with gilded roots—as well as the direct statement that during that time "Britain had arrived at sueb a pitch of grandeur that, in abundance of riches, luxury of ornaments, and politeness of inhabitants, it far surpassed other kingdoms;" it is to our Saxon ancestors that we must more particularly look for influences upon the characteristic features of pointed architecture.

The influence of the Saxons is generally dated from the conversion of Ethelbert by Augustine

from the conversion of Ethelbert hy Augustine, about the year 597, and, in the history of the venerable Bede, we soon find records of the building and reparation of churches, and of the conversion of heathen temples to the serbuilding and reparation of churches, and of the conversion of heathen temples to the ser-vice of Christianity; we also find that sacred vessels, vestments, hooks, and relics were fur-nished from Rome, and the future state of architecture in England is thus early sha-dowed forth in the institution of monasteries, and the erection of churches at Canterbury, Rochester, London, and York, and oratories in various parts of the island. Then too, Jona, a barren rock in a tempestuous sea, became a school of knowledge, so that, though in a school of knowledge, so that, though in a later style of architecture, it has to this day "memorials of its past importance not to be surpassed in historic interest by the mighty piles of York and Durham, or the halls of Oxford or of Cambridge." So important a seat of learning was not without influence in

posed to consider that "the opinions which they express, the feelings which they avow, even the stories which they relate, whether they be or be not real and true in themselves, or in our judgment, are clearly so in the philosophy of the history of art;" but a practised writer might have been expected continually to provide against the possibility of misconception in this particular, as well elsewhere as in a preface, and wethe more regret this peculiarity of our author's style, as he displays in many places, a judicious critical discrimination between the characteristics of the art. Thus in speaking of polychromy for example, where he says, "we do not now think colour an additional beauty to really good imagery and carving," he is favourably contrasted in our mind, with some who seem to "plead in excuse of the excessive use of colour in the ecclesiastical decora-tions of the middle ages."

^{*} A History of Ecclesiastical Architecture in England," by George Ayliffe Poole, M.A., Vicar of Welford. London, Masters. 8vo.

places far from its remote locality. We find records of oratories and cathedrals raised by consecrated missionaries from the island of S. Columba; and though timber was the material often employed on a kind of building described as that of the Scots, of split wood with reed thatcb,* stone appears to have been equally common, and lead for a covering was even brought into use. Glass was introduced from Gaul in 671, by Benedict Biscop, at which time we find mention of the importation of pictures, and images, and relics from Rome, and of the use of masonry in the "Roman manner." These particulars we need not allude to the importance of, in the history of architecture, and the influence of Benedict

architecture, and the limitance of Benedict Biscop is scarcely to be overrated.

With Mr. Poole, we feel the difficulty of coming to a satisfactory conclusion in respect to the masonry of the "Roman manners of the property " as it seems clear that, as regards merc masonry, there must have been many examples of Roman work in England. Our author suggests that the difference might be, at least partly, one of ritual, and "altogether, rather of degree than of kind." Thus the arch may Thus the arch may have been more freely employed, consequent upon an adaptation of the aisles of the Roman inpon an adaptation of the aisses of the reoman basilica, along with the apse, and generally a more extensive character of building. He might, however, have noticed the use of the baluster in Saxon buildings, as showing a remarkable coincidence with so important a feature of the Italian architecture of later date; and it might afford curious matter for discusand it might about curious matter for unstus-sion, whether its presence does not argue in favour of the existence of the baluster in the architecture of Rome, previous to the time of Brunelleschi, a mode of reasoning by induc-tion which we do not remember has ever been brought to bear upon the interesting question of the origin of the use of the baluster by Halian architects. But, perhaps the most sig-nificant fact in the history of this period, was the introduction of the practice of burying in churches,—a practice of the most important influence on the forms of churches, and one which her retained its help churches, and one which has retained its hold more completely than any other custom of the middle ages, destructive as it has been to many of our finest works of architecture, as well as to health.

These important features having been introduced, it soon followed that works like those of men who had been to Rome,—as of Wilfrid at Hexham, York, and Ripon,—should be remarkable for their porticoes and polished pillars, marvellous length and height of walls, winding passages and spiral stairs, crypts and winding passages and spiral stairs, crypts and oratories, and sculptured and polychromatic decorations, as well as for their gold, silver, and precious stones, and purple and silk hangings. Wilfrid seems also to have introduced the use of whitewash. It is, however, most interesting to find mentioned in the church at Hexham three distinct stories, showing that the triforium must have here in showing that the triforium must have heen in the middle of the seventh century, use in During this century, also, an influence scarcely less important than the introduction of burials less important than the introduction of burnars in churches was introduced, resulting from the division of the country into parishes. It is remarked by Mr. Poole, that the effect of this would be that, whilst without the parochial country there were many distinct entering. system there were many distinct oratories, after the change took place, these would be united with, and become decorations of an existing fabric; and churches, though perhaps lessened in number, would become more important in regard to size and decoration, by combined resources of several parishes.

As it is in the monastic system that we discover the origin of the principal works of architecture in England, so this influence was greatly forwarded by the introduction of the Benedictine order in the tenth century, by Denstan, who early commenced the quarrels between the monks and the seenlar clergy, which are often thought to have had so important an influence upon the sculpture of ecclesias-tical edifices. King Edgar is said to have erccted,

or restored, forty-eight monasteries.

In the building of theabbey in the Isle of Ramsey, in Huntingdonshire, we find that pile-driving and concrete for foundations were employed; and if we recollect that the church at Brix-worth,—the most important Saxon church

now remaining,—must have been only a second or third-rate building, we shall be able to agree with Mr. Poole, that the arches there are evidence of the existence of much larger arches in more important buildings, and that in the accounts to which we have and that in the accounts to which we have evidence of great constructive skill, whether in vaulting or other portions of buildings. in vaulting or other portions of buildings. Many more important structural characteristics of medieval architecture, too, were thus early apparent. The use of a division into nave and asises, of the chancel, with apsidal termination, of the plan of the cross with a central tower, of the ordinary bell-tower, and—in one instance at least—of two fuwers one in each of these recitions, the towers, one in each of these positions; the important feature of the clerestory, the use of glass for windows; of lead, and even of copper, and of tiles, sometimes gilded, for roofs; the constant use of bells, and the provision requisite for organs and church music, along with other elements, some of them peculiar to England, even at this early period, contributed to the peculiar characteristics of Pointed architecture. The importance of these elements is well illustrated by Mr. Poole, as

"This notice of bells and clocks is not disproportioned to the influence which their introduction has had on ecclesiastical architecture. It is to the use of church-bells that we are indebted for the most prominent feature of almost every ecclesiastical fabric, and that which serves most to harmonise all the parts of a whole, sometimes so vast, and almost always whole, sometimes so vast, and almost aways so various, as a Gothic church. From the low central tower of a Norman abbey, but just rising above the roof, at the intersection of the cross, to the lofty towers or spires of Boston, Gloucester, Salisbury, Coventry, Louth, or Whitlesea, in whatever part of the church it may be placed, the steeple still gives an inexpressible grace and dignity to the whole outline, correcting immoderate length, reducing all miner want are moderate. ing all minor parts to proportion, giving variety ing all minor parts to proportion, giving variety to sameness, and harmony to the most licentious irregularity. The judicious use of the tower or spire is a great part of the secret of the characteristic boldness in minor details of the mediaval architects. The little excresences of such a building as York Minster, which are now lost in the grand whole, would at once become deformities if the towers. at once become deformities if the towers were The cathedral of Milan is in some removed. respects one of the most splendid buildings in the world; but, for want of a steeple of proportionate elevation, it is but a gigantic grove of pinuacles, in which statues seem to lost their way, and to be wandering without aim and without end. If, as is most probable, the central tower of Fountains had perished before the present northern tower was erected, what a heavy mass of irregularities must that splendid pile have seemed. The tower reduces all to proportion, and makes it once again a whole. Bolton Abbey had also suffered the loss of its tower, and that at the west end was loss of its tower, and tout at the west out and never raised above the level of the nave; and though it is far smaller and less irregular than though it is far smaller and less irregular than Fountains, what a long unrelieved length it presents to the eye. What is it which gives such vastness and importance to the cathedral, such grace and beauty to the parish church, at a distance, but the tower or spire? Nay, what is it but the bell-gable which in mere outline often distinguishes the retired chapel from some neighbouring barn? And for all this we are indebted to the introduction of bells; or if and for the existence of these or the like are indepted to the introduction of belis; or it not for the existence of these, or the like additions to the beauty of outline in our churches, yet at least for what is a part of their beauty,—their having a use, and being exactly adapted to their use."

We do well, then, to attend to any important alternate of this actuary.

element of this nature. But it was not in structural peculiarities alone, that the archi-tecture of the Saxon period originated features of most extensive development in succeeding periods. The Saxon masonry, known as "long and short work," analagous to the binding courses of brick in Roman masonry, differs from it in this remarkahle manner—viz., that it is vertical; and looking at the engaged shaft rising to the gable of the highly engaged shart rising to the game of the nighty conical roof in the tower of Sompting Church, we cannot but suppose that these were perhaps the first germs " of that verticality in Gothic art which at last expanded into the spires of

Salisbury and Coventry," and of that feature of panelling which was so marked a characteristic of the style of the fifteenth century. With the accession of Edward the Confessor the Norman variety of Romanesque was intro-duced into England; but to this period, and that of Pointed architecture, we must devote another paper.

THE LONDON FEVER HOSPITAL COMPETITION.

SIR,—I beg to hand you a memorandum of the Council of the Institute of British Archi-tects, relative to the new Fever Hospital competition, which I introduced to your notice by letter on the 26th of August, 1848, when I stated I should lay the case before the council of that body for its deliberation and decision.

In the letter above named I admitted the In the letter above named I admitted the right of the committee to use my design in these words:—"The plans and working-drawings were paid for and delivered to the committee, and the claims for the design abandoned." In another paragraph I added :—
"I had just my aviet with the committee." abandoned." In another paragraph I added :—
"A legal right may exist with the committee,
(in the use of the design), but there is an evident want of moral feeling; but this has arisen from the influence of the president,
Lord Devon. But what, Six, is to be said of a member of the profession, one of reputed high standing, who can attach his nazive to the ideas and almost the design of another committee. ideas and almost the design of another com-

It is on this latter point that I insisted, as It is an instance point that I instance, as involving the interests of the profession, and I leave it to your readers to form their awa opinion upon the report of the Council, and the

admission made by Mr. Fowler.

I did not solicit the intervention of the Institute on personal grounds, and am, there-fore, glad to find that the record of the opinion of the Council embraces the rules of practice which should have been followed in this case as in the establishment of a general principle, which is urged upon each and every individual of the profession. D. Mc Old Broad-street, March 6, 1849. D. MOCATTA,

"Royal Institute of British Architects, Incorporated

"Royal Institute of British Architects, Incorporated 7th William IV.
16, Lower Grosvenor-street.

Extract from the Minutes of Council, dated 26th of February, 1849.

Memorandum.—A reference to the Council of the Institute having been made by Mr. David Mocatta, Fellow, and by Mr. Charles Fowler, Fellow, relative to certain proceedings connected with the recent competition in which they were engaged for the new building for the London Fever Hospital:—The Council having taken into consideration the statement of the case received from Mr. Mocatta, bearing date 9th November, 1849, and a communication in reply thereto from Mr. Fowler, bearing date 22nd January, 1849, and having likewise examined the various documents and drawings for the huilding, are of opinion—

are of opinion—

That the building now in progress under the direction of Mr. Fowler resembles strongly, more especially in the application of double wards, the design submitted in competition by Mr. Mocatta, and selected by the Building Committee, and for which he subsequently accepted a certain remuneration.

which he subsequently accepted a certain remuneration.

That it does not appear that Mr. Fowler, in the design submitted in the competition, contemplated the introduction of double wards; the Council therefore consider that, although the trustees purchased Mr. Mocatta's drawings, and had a right to adopt any portions of the design they might see fit yet that an acknowledgment of such application is due from Mr. Fowler to Mr. Mocatta, as expressed in Mr. Fowler's letter to the Council of the 22nd January, wherein he says—'It may be proper to state that the trustees paid Mr. Mocatta for his plans, &c., therefore they ladan undoubted right to make every and full use of them; at the same time, it must he admitted that so far as their architect has done so, he is bound to acknowledge it, and this I

it must he admitted that so far as their architect has done so, he is bound to acknowledge it, and this I am most willing to do.'

The Council record their opinion as a general principle to he acted upon, to ensure full justice to the most deserving competitor, that the author of an original idea, if it he adopted, should he engaged to carry out his own conception, and that every memher of the profession should individually do his utmost to establish this principle.

Extracted from Minutes of Council, 1st March, 1849.

George Bailey, Honorary J. J. Scoles, Secretaries. J. J. Scoles,

Resolved,—That a copy of the memorandum of the Council relative to the London Fever Hospital be forwarded to Mr. Mocatta and Mr. Fowler,"

^{*} Possibly the church at Greensted, noticed in our pages, may have been a church of this description.

THE PERICLEAN AGE OF GRECIAN DECORATIVE ART.

THE CHRYS-ELEPHANTINE WORKS, &c.

A SERIES of lectures on the Periclean and A SERIES OF RECURES OF THE PETICLEAN AND Alexandrian ages of Greek art is in course of delivery by Mr. Ralph N. Wornum, at the Government School of Design, to a crowded and miscellaneous audience—of the people, properly so called, all of whom, young and old, female and male, high and low, seem to listen female and male, high and low, seem to listen throughout to the details of art with the closest attention. Such at least was the case on the evening of Friday, the 2nd, at the lecture whence the following notes were taken. From the time of Pericles to Alexander the

Great, rather more than a century, ornamental design in Greece itself was constantly design in Greece user was constantly no-gressing in richness and variety, perpetually exhibiting new and beautiful combinations, although, in Greece, the decorative arts never at any time attained that florid development which so conspicuously distinguishes the great works of Rome, in the beginning of the em-In these, however, notwithstanding the beauty of the individual members, the whole effect was materially injured by the super-abundance of detail, by the overloading of ornament, carried to such an excess in some monuments as scarcely to leave a single por-tion of plain surface. There is no repose for in such works, and the effect becomes the eye in such works, and use the merely general. This is a want of judgment, and calls to mind the memorable reproof of Apelles to one of his pupils, who had painted a picture of Helea of Troy, and loaded her with ornaments:—"So! said Apelles, because you could not paint her beautiful, you have made her rich!" However you have made her rich!" However much the Romans merit such a rebuke, certainly the Greeks do not. In their art nothing was overloaded, some of the most beautiful being remarkable for the compara tively moderate application of ornament, at least till about the Roman Conquest, when the Greek artists probably themselves followed out their art in the Roman capital, and to the

Roman taste,
Reviewing the development of ornamental
art among the Greeks (as the lecturer had previously been doing with illustrated reference to the spiral, acanthus, guilloche, &c.), we find the first great efforts at Samos, then at Ephesus, Ægina, Athens, and Delphi, Pæstum, and Sicily. Athens finally triumphed through the fostering care of Pericles, and the great school which arose out of his efforts reached its utmost perfection in the time of Alexander. unios perceuon in the time of Alexander. This is true not only of ornamental art, but of all other arts dependant on form and colour. The grand essential qualities of art developed in the works of Polygnotus and Phidias received their last refinements under the hands of I winner, and Amilea and their entires. of Lysippus and Apelles, and their contem-

Some idea was then given of the progress of the rivalry between the Doric in the west and the lonic in the east; of the decorations of those temples in which both orders were combined—the Propylea of Athens and Eleusis for example; of the finer monuments of hoth orders grouped together on the Acropolis, or citadel of Athens, and particularly of the Doric Parthenon, and the Ionic Erectheium. The probable general style of the polychromic embellishments of the Parthenon. embellishments of the Parthenou was illustrated by the restoration of Dr. Kugler of Berlin. The sanctuary, continued the lecturer, contained the goddess's statue, of gold and ivory, of most colossal proportions, the work of Phidias, and one of the greatest of those surprising and coetly productions of the Greeks called characteristics. called chrys-elephantine, that is of gold and ivory, and of which Phidias alone executed

The Chrys-elephantine statue of Minerva, in the Parthenon, was about 40 feet high. The flesh was entirely of ivory, the costume of gold, and the ornaments of gold, colour, and precions stones. There have been many spegold, and the compressions stones. There have been man, apprecial to the culations as to how these wory figures were constructed, and the eminent French anti-da Quincy, has deconstructed, and the eminent French anti-quary, M. Quatremére de Quincy, has de-voted an elaborate essay to this subject. Though ivory was much more abundant in ancient times than it is now, it is not to be for a moment supposed that these Chrys-elephantine figures were built entirely of ivory, even though hollow. The ivory was a mere

outer casing, fixed in small pieces upon a core of wood, or perhaps some other material, skilfally prepared to receive it; and it was probably laid on in uniform thicknesses—not a very difficult process, when we consider that the Greeks were in possession of a method of the Greeks were in possession of a method of softening their ivory. Plutarch mentions the softeners of ivory as one of the distinct classes of artists employed by Pericles, and these were the men probably employed to fix the ivory upon the core. Pausanias also mentions that the Greeks flattened the round pieces of elephants' tusks by first rendering them soft by heat—perhaps by steaming; and being then allowed to cool under pressure they might assume the required shape. When thus fixed the sculptor could fashion the

various parts to his taste.

The great triumph of this species of art was the colossal sitting statue of Jupiter, in his temple at Olympia, in Elis, a cluster of temples in the plain where the great periodical games of the Greeks took place. This incomparable work was the masterpiece of Phidias, and, like the Temple of Diana at Ephesus, one of the seven wonders of the world. The lecturer then described this celebrated statue in the words of Pausanias, which, for the sake of some our own readers, who may not be familiar h. or may wish to recall, the idea of this with, or may wish to recall, the idea of this wonder of the ancient world, we may here also note down from the lecturer's description. The god was represented scated on his throne, under the covering of the temple, and the whole height of the statue, exclusive of the pedestal, is said to have been something more than 40 feet, an almost incredible magnitude, when we consider the material and the manner of its workmanship. It occupied Phidias and his assistants about four years, during the 80th Olympiad, or from 437 to 433 B.C., inclusive, and immediately after the

433 h.c., inclusive, and immediately after the completion of the Minerva of the Partheion.

"The god," says Pausanias, "is seated on a throne made of ivory and gold. He wears a crown of olive branch on his head. In his right hand is the figure of Victory, also of gold and ivory, with a crown on her head, and holding a fillet. In his left hand he holds a beautiful sceptre set with all kinds of presence them. The highest hand he holds a beautiful sceptre set with all kinds of presence them. hand he holds a beautiful sceptre set with all kinds of precious stones. The bird on the top of it is an eagle. His sandals are also of gold, and his mantle likewise, which is ornamented with figures of animals and lilies. The throne itself is variegated with gold, stones, ivory, and ebony, and is decorated with painted reliefs. It is adorned, also, with statues. At each foot or leg of the throne are four dancing victories, and two others on the pedestal of each foot. On (above?) the two front feet are Theban youths carried away by sphinxes, and below the sphinxes are Apollo and Diana destroying the children of Niobe."

The charge of this statue, which remained at Olympia undisturbed for about 800 years, was given, in perpetuity, to the descendants of Phidias. Their duty was to keep it clean, and to rub it constantly with oil, to preserve the ivory from suffering any injury from the marshy atmosphere of the grove in which the temple stood. They were called Phaidrunta, which means, literally, polishers or cleaners. They hears, meraly, poisiners or cleaners. They had still the care of it in the time of Pausanias, who visited Olympia 500 years after the death of Phidias. This great sculptor died in the year 432 B.c., not many months after the completion of this master-piece.

There seems to have been considerable difficulty in kenning these always alphanting works.

There seems to have been considerable diffi-culty in keeping these chrys-elephantine works in order, the great difficulty being the climate, though, in Greece, at Olympia, it was too damp, at Athens too dry. While the Olympian Jupiter required to be frequently anointed with oil, the Minerva of the Parthenon, on the lofty dry Acropolis of Athens, required to be con-stantly sprinkled with water. A work, how-ever, of this class, also by Phidias, wholly free from these objections, was the statue of Escufrom these objections, was the statue of Esculapius at Epidaurus, which was placed immediately over a well, the evaporations from which maintained a constant degree of moisture in the attraspolare. in the atmosphere, and thus preserved the statue—a remedy as simple as efficacious.

The Olympian Jupiter is said, though not upon very authentic sources, to have heen carried to Constantinople, hy the orders of Theodosius the Great, and there to have perished, ahout a century afterwards, in the fire which consumed the Lauseion, in which it was placed, in the year 475.

After a cursory allusion to the still more

After a cursory allusion to the still more gigantic bronze statue of Minerva Promachos,

in the Acropolis at Athens, made from the spoils of Marathon, and forming the greatest of all the works of Phidias, the lecturer proceeded to explain, in detail, the various ornamental and other portions of Greek architecture previously alluded to, and especially with reference to the Erectheum, the distinction between the Attic and lonic column and base, and other decorative contrasts and comparisons, in which the Ionic temple of Ephesus, and various other examples, were illustrated, the elements of the voluted and Corinthian orders of architecture at large described, and the progress of the Periclean age of decorative Greek art traced through its increasing tendency to ricbness and abundance of ornament, rather than chastity of principles, till the conquest of Asia introduced a taste for even oriental display, which steadily progressed till the time of Nero, when mere vermillion and gilding were preferred to the tasteful poly-chromy of the Parthenon, and carved scrolls or griffins, or other monstrous combinations, were substituted for the noble decorations of Phidias. A disquisition on dolphins, tritons, satyrs, fauns, and 'chimeras dire' then followed, satyrs, fauns, and 'chimeras dire' then followed, with an account of the lavish expenditure of the Greeks on mural and other household decorations in the time of Alexander, who, according to Pliny, paid Apelles 50,000!. for a single picture of himself, as Jupiter Tonans. Then it was that artists had their golden age, even though at times compelled by threats and imprisonment, no less than by bribes and imprisonment, no less than by bribes and honour, to undertake their prized productions. Where the artist was so much in request as

Where the artist was so much in request as in Greece, whether painter, sculptor, or architect, be took his social position accordingly, and many of the Greek artists assumed an extraordinary degree of consequence, being most sumptuous in their habits, indulging in a costliness of costume worthy of a Sybarite. Zeuxis and his rival Parthasius, were notorious for ostentation and magnificence of dress. Zeuxis and the transfer area ways his nice. Zeuxis, latterly, even gave away his pic-tures, declaring that they were beyond all price, and he appeared in public with his name embroidered in letters of gold around the hem of his mantle. Parrhasius also always appeared in public with a golden head-dress and a purple robe. His sandals were bound by golden straps, and he carried a golden-headed staff otherwise richly decorated. Such was the appearance of a Greek painter in the time of Socrates; and though Parrhasius may have been somewhat extreme in his love of display—his dress rather according with our notions of regal costume than that of an artist—a man of such taste and eminere in art would never in public with a golden head-dress and a purple such taste and eminence in art would never have made himself ridiculous by his costume; and doubtless, therefore, the splendour of his attire was quite justified by the fashions of his

When considered together with what we of the gorgeous dress of the Syharites, read of the gorgeous dress of the synantes, this shows us that the love of art, when once developed, spreads itself in all directions, impressing every object with its beneficial influence, not less those of use than those of luxury. The costly and gorgeous structures of the Greeke great part works of huvnious Greeks were not mere works of luxurious extravagance. Though the contrast between the palace of the prince and the cottage of the artificer may be great, we must recollect that whole villages of cottages have sometimes owed their very existence to the erection of one of these palaces. The prince cannot indulge in the gratification of his taste for splendour without at the sametime, either directly or indirectly, gladdening the hearts of thousands of poor artificers; and we should look upon the artificers; and we should look upon the greatest buildings not as monuments of the extravagance of luxury, but rather of the skill and industry of the artist.

THE YARBOROUGH MONUMENT, at Bem-THE YARBOROUGH MONUMENT, at Bem-bridge-down, east end of Isle of Wight, had its capping-stone placed on Monday week. The structure, which is an obelisk, is of Penryn granite, 75 feet high, 14 feet at the base, and grante, 75 feet nigh, 14 feet at the dask, and 28 feet at the lower step. A lightning conductor passes through the centre. The panels for an inscription to the late Earl and Yacht-commodore, have not yet been filled up. The building, according to the Hampshire Advertiser, it is even as a convent the site houring. tiser, is to serve as a sea-mark, the site having been carefully selected to that end. Mr. Peter Rolt was the huilder.

MUTUAL INSTRUCTION AT THE SCHOOL OF DESIGN

THE following is the substance of the address read by Mr. Raimbach at the meeting of students mentioned in our last :-

Fellow Students,-You are aware that this school was established for the twofold purpose of educating a class of designers who should he able successfully to compete with the foreign ornamentist; and a sufficient number of skilled draughtsmen and pattern drawers to assist in carrying out the works of the firstmentioned. It is generally allowed that the latter object has been successful, and that not only this school, but the branch schools also, have produced first-rate draughtsmen in every department. But there is still the impression, among all who are interested in the subject, that the schools have altogether failed as schools of design. It is still asked, where are schools of design. It is still asked, where are the designers the schools were established to supply—who were to drive French and German patterns out of the British market—who were to raise the commercial value of our manufactures, by introducing beauty of design even in the meanest article of use or ornament, and to elevate the people by familiarising them with that elegance of form, harmony of colour, and fitness for use combined, which are only found among the productions of a refined age and nation

Although the school has been established Autough the school has been established above ten years, it is yet, perhaps, too much to expect so desirable an effect. But are we nearer our object than ten years ago? The patterns, as well of textile fabrica so f such articles as paper-hangings, furniture, and pottery, are as ordinary, not to say as uply as year and as paper-nangings, furniture, and pourty, are as ordinary, not to say as ugly, as ever,—and, as regards the latter, a substitute for the "willow pattern" is yet to be devised. If it he impossible to walk through any of our great thoroughfares without being struck with the great improvement displayed in every kind great improvement displayed in every kind of silk, satin, shawl, or muslin; who will say that the revision of the tariff has not had more effect in producing that improvement than the schools of design? Who will deny that, where the manufacture is native, the pattern is foreign? And when we hear of any nobleman's or gentleman's mansion being decorated with more than ordinary splendour, it is sure to have been done under the superintendence of some Herr Von Homberg, assisted by some artists and workmen, brought over from the artists and workmen, brought expense. The same practice is applied to club-houses, play-houses, palaces, and exchanges: our churches we adorn ourselves, - with whitewash.

And here let me remind you that I do not dispute the superiority of the foreign orna-mentists (though I think the preference for their works is supported rather by fashion than hy jndgment), but 1 will maintain that there is no reason that this superiority should continue. It does not exist in fine art, why should it in art applied to manufactures? That many difficulties have interposed to prevent many difficulties have interposed to prevent the attainment of the chief object for which the school was established, I am well aware. The greatest obstacle is, doubtless, the very general ignorance of the students as to the manufacturing processes to which their designs manufacturing processes to which their testigus must, more or less in every case, he adapted. This circumstance renders the designs produced in the school so usually unfitted for manufacture, as to make them practically useless. It matters little enough that a design possesses every artistic excellence, if it be in-capable of adaptation to a manufactured article; and while our manufacturers, by importing French patterns (in Manchester alone to the amount of above 20,000l. per annum), can obtain exactly what is suited to their purpose, it is not to be expected they will pur-chase what is not. This deficiency in the course of instruction was at one time attempted course of instruction was at one time attempted to be supplied. In 1843 a course of practical lectures on manufactures was delivered by Mr. Cowper, of King's College. But although regularly and numerously attended, they were discontinued. They comprised calico, silk, and letter-press printing; hand, power, plain, and figured wearing; pattery and procelain and figured weaving; pottery and porcelain, engraving and sculpture by machinery, type and streetype-founding and tie framing of machinery,—some of them rather foreign to

the great want of practical and technical knowledge, and proceeds to say, "It is remarked generally of all the schools, that instances continually occur of students who possess superior natural endowments, with competent knowledge of art and power of execution, but who from deficiency of that technical knowledge which can only he effectually learned by actual experience in the factory and workshop, cannot procure from manufacturers the employment they seek; while others who have found means to add this requisite information to their artistic knowledge readily obtain engagements.

I differ in opinion from this report, in so far that I think much practical knowledge may be attending the factory or obtained without working at the loom. A good lecture, with proper diagrams, can often explain a process which is quite unintelligible in actual operation; and a man might stew himself a long time in an engine-room hefore he got so clear a knowledge of the principles of action in the steam-engine as may be derived from a careful perusal of Dr. Lardner's book; and it is my firm belief and conviction that this difficulty can be best overcome by the students themselves, and that the formation of this association supplies a means not only for accomplishing this, but for the removal of other difficulties which have impeded the operations of the school ever since its commencement.

Our association has been formed under circumstances peculiarly favourable, and at at time when public attention, fatigued with the excitement of foreign revolutions and rehellions, and relieved from the fear of domestic disturbances, is returning to the contemplation of our own progress as a nation, the revision of our laws, the improvement of our manufactures, the advancement of our arts. The commendatory letter received from Mr. Deverell, on the part of the council of the school, and the interest taken in its welfare by the masters, are circumstances on which we may well congratulate ourselves. The free use of this noble room, in which to hold our weekly meetings; the fact of heing surrounded by examples of the highest class in every department of ornamental art of every age and from all countries; the power of reference to a valuable collection of books of prints and specimens, and the extended access to the lending library which has been accorded to such of our members who, in the preparation of papers or essays, wish to consult works on similar subjects, are further evidences of the favour with which we are viewed by the council and authorities. It is, therefore, incumbent on us to exert ourselves for our own advancement, and that we are both able and willing to do so is proved by the list of papers in preparation, which has been posted on the door of this room, among which are several on practical manufacturing subjects.

But our association has further objects in view; there is the management of the specimens of art belonging to the school, and the formation of a catalogue: the collection of materials under a uniform system will be a suitable employment for our younger members. The want of such a catalogue has long been felt, not only hy the students but by others. The school being open to the public, strangers may occasionally be seen, who, on entering, stare vacantly around, at a loss where to begin, apparently confused by the very heterogeneous arrangement of objects before them, and who, after a very short visit, depart neither im-proved nor gratified; whereas, with a proper arrangement and a cheap descriptive cata-logue, an afternoon might be both profitably and amusingly passed by the artisan, trades-

man, manufacturer, or artist.

The formation of a museum of ornamental art and other projects are so dependent on the extension of the accommodation provided by Government, that it would be premature to speak particularly of them; but that the attainment of them will be much accelerated by the exertions of this association is unques-tionable. Only let each member do his best, let each freely impart the knowledge he pos-sesses (and remember that there is nothing we learn so thoroughly as that we teach to others), and we shall see our association gaining strength and power, extending branches to the provin-cial schools, and rendering this school, as it should be, the best market for the manufacmachinery,—some of them rather foreign to the purpose for which they were intended.

The annual report for 1845 still alludes to

to a knowledge of ornamental art in all its provinces, and a means of placing our nation above all others in art applied to manufac-tures, as it is now in every other branch of tures. civilization.

AN EXAMPLE FOR THEIR "BETTERS." REDCLIFFE CHURCH TOWER

For some time past St. Mary Redcliffe Church, Bristol, has been kept open for visiters the whole day, free of any fee. A box is placed in a convenient position to receive donations towards the restoration from such as are disposed to aid a good work. There is also a book in which the donor may register the gift. A few weeks ago, three working men, wayfarers, examined the huilding in all its parts with evident delight, and on quitting left this entry in the subscription-book— "From three journeymen carpenters, on their way from London to Cork, seven shillings and six pence."

All honour to them for the good and right

feeling which prompted the act, and may it

serve as a stimulus to others!

The following report, which has appeared in the various Bristol papers, tells its own

"To the Vicar, Churchwardens, and Vestry of the Parish of St. Mary Redcliff, Bristol.

"Gentlemen,-By direction of your churchwarden, I beg leave to report to you that my attention being directed to the condition of the spiret, or pinnacle, as it is more commonly called, of the south-east turret on the tower of the parish church, I carefully examined the same on Monday last, and found it to be

in an imminently insecure and dangerous state.

"This applies not only to the spiret, with its finial, but to the upper part of the turret its finial, but to the upper part of the turret itself: the stones composing it are croded and crushed, it is rent in various places, and appears to have settled over slightly towards the body of the church, while the finial and top of the spiret have fallen towards the spire. The whole is in such a condition that, although it might remain as it now stands for come time a high wind the likelyst disables.

some time, a high wind, the slightest discharge of the electric fluid, or the further failure of some of the stones, which might bappen at any moment, could scarcely fail to precipitate it, for the most part on to the roof of the nave, and probably cause most serious damage to the inside of the church, and to the organ immediately below.

"It is with much reluctance that I recom-"It is with much reluctance that I recommend any step that will make more evident the ruin which is rapidly falling on this tower—a tower with scarcely its equal for beauty in the kingdom. The threatening state of the turret, however, forbids hesitation, and makes it my duty to advise that the upper portion of the swirst should be taken down, and the lower the spiret should be taken down, and the lower parts, at the foot, pinned up with cement, so as to render apparent any further movement.

The other turrets are in a miserable state of disruption and decay, but do not seem to threaten immediate danger.—I have the honour to subscribe myself, gentlemen, your obedient

"GEORGE GODWIN, Architect. "Brompton, Middlesex, Feb. 14, 1849." Part of the turret has since been taken down.

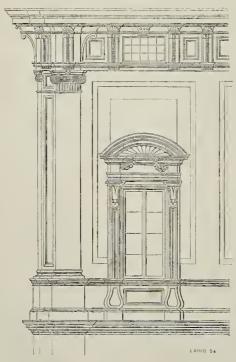

GALVANIZED IRON.

WE have before us a specimen of galvanized iron taken from a cistern which has been erected but two years. It is full of holes and utterly destroyed. We received, somet me utterly destroyed. We received, somet me since, from another quarter, a similar example of failure, but forbore from mentioning it. Remembering the high opinion of this material expressed by Professor Brande and others, and that it is now being very extensively used in lieu of lead and copper, it is desirable that the public should have the means of judging hetween that which will last and that which netweet that which will last and that which will not. One Company has addressed a letter to us, asserting that in their process no admixture of tin is used, and leading to the inference that it is where this second material is used that the result is unsatisfactory. What is wanted, however, is the guaranteed actual experience of disinterested parties, and this we shall be glad to receive.

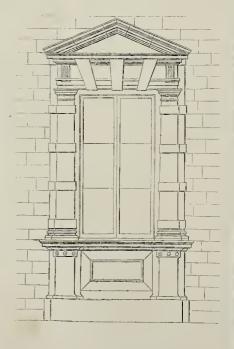

SUGGESTIONS FOR STREET-ARCHITECTURE.

PLAN AND ELEVATION OF PORTA ST. PANCRAZIO, AT ROME, ALSO CALLED THE AURELIAN AND JAMICULAN GATE.

SUGGESTIONS FOR STREET-ARCHITECTURE

PLAN AND ELEVATION OF PORTA ST. PAN-CRAZIO, AT ROME, ALSO CALLED THE AURELIAN AND JAMICULAN GATE.

This gate was built on the site of an older one, by Antonio de Rosái, about the middle of the seventeenth century.

ANGLE OF THE PALAZZO DELLA CON-SULTA, ON THE QUIRINAL, ROME.

This palace was built for Clement XIIth, by Fuga, about the year 1730. It stands on the most elevated ground in Rome, and forms one side of the square of Monte Cavallo. It is used for different public offices.

GROUND-FLOOR WINDOW OF A PALACE ON THE LUNGO L'ARORO, AT PISA.

This palace was built by Michelangelo Buo-narotti, and is also interesting as having been Lord Byron's residence during his stay in

WOODEN CHURCH AT GREENSTED, ESSEX

The interest due to this little building arises from the material of which it is constructed, from its undoubted antiquity, and from the strong evidence that exists of its having been originally built as a place for the reception of the corpse of St. Edmund, which, on its return from London to Bury St. Edmund's, in the year 1013, was, as Lydgate, a monk of that monastery (St. Edmund's) informs us, conveyed in a chest or feretory.

St. Edmund began to reign in "East Anglia," A.D. 855. He was crowned the following year at Bury. He is supposed to have THE interest due to this little building

glia," A.D. 855. He was crowned the following year at Bury. He is supposed to have been killed in battle fifteen years afterwards. Of the application of timber to the constitution of sacred buildings, we have, in these early days, abundant evidence in many of the northern countries, as well as in England. "One very remarkable building of this kind is yet in existence in Norway; it is the church of Hitterdall, in Tellemark, erected about the twelfth century. It is reared of balks of fir, now hardened and blackened by time, and decorated with carving of scales and lozenges." And with us, "There was a time," says the Venerable Bede, "when

there was not a stone church in all the land, but the custom was to build them all of wood." At York, the earliest cathedral was constructed of wood. The abbey church of Athelingey, built by the great Alfred, was built only of wood. And later still we find, "previously to the foundation of the present cathedral the Shighton with the third the centre." dral at Salisbury, in the thirteenth century, the first business of the monks was to erect and consecrate a wooden chapel for temporary

It is not then to be wondered at, that in a retired spot, for a purely temporary purpose, and in a county devoid of stone, wood should have been adopted as the material for a small structure, even of a very sacred kind. The inclosing walls of this building are apparently of oak, and not of chesnut, as has been sup-posed by some. They are about 6 feet high, including the cill and plate, and are formed of noticing the triant place, and are formed or rough half trees, averaging about 12 inches by 6 inches (the greatest length on the base line heing 18 inches by 9 inches, and the least 8 inches hy 6 inches). Mr. Suckling does not believe them to have been "half trees," but that "they had a portion of the centre, or heart, cut out, probably to furnish beams for the construction of the roof and cills; the outsides or slabs thus left being placed on the cills." We see no evidence of this, for the tim-bers were evidently left rough, and the dimensions prove them to have been, as nearly as may be, "half trees." These uprights were laid on an oak cill, 8 inches by 8 inches, and tenoned into a groove 13-inch deep, and secured with oak pins. The cill on the south side was with oak pins. The cill on the south side was laid on the actual earth; that on the north side had, in two places, some rough flints, without any mortar driven under. The roof plates averaged 7 inches by 7 inches, and had a groove corresponding with the cill, into which

refixed, measuring between plate and cill, are, on the north side, 4 feet 8 inches, on the south side, 4 feet 4 inches, the cills being bedded on a few courses the side, and the south side, 4 feet 4 inches, the cills being bedded on a few courses the side of the side of the source of the side of the source of the side of the sid few courses of brickwork in cement to keep them clear of damp. The uprights were tongued together at the junction with oak strips, and a together at the junction with oak strips, and a most effectual means it proved of keeping out the wet; for although the interior was plastered, there was no evidence, in any part, of wet having driven in at the feather edge junction of the uprights,—a strange contrast to many of our modern churches, where, with all the adjuncts of stone and mortar, it is found no easy matter to keep out the driving weather. Some the to keep out the driving weather from the south-west.

The roof was heavy, and without any par-The roof was neavy, and without any particular character; it consisted of a tic-beam, at less than 6 feet from the floor, with struts. The covering was tile. The inside of the timbers were plastcred, so that internally the character and interest of the construction was lost.

The seats were of all sorts of height and form, and, for so small a church, afforded some good specimens of the "cattle pen."
The church derived light from three dormer windows of most "domestic" appearance; and an open wooden porch, without any style or beauty, gave access to the church on the south side by means of a very low door. The restoration, as our readers are aware, has been effected under the direction of Messrs.

Wyatt and Brandon.

PROPOSED NEW WORKHOUSE FOR ST. MARGARET'S PARISH.—The Commissioners for Westminster Improvements have given for Westminster Improvements have given notice to the parochial authorities of St. Margaret, Westminster, that in six months hence they shall require a wing of the present workhouse for the new Victoria-street, and the whole of it cleared away in two years. The question has, therefore, been raised, as to where the new workhouse shall be built, as it will be necessary to set about it immediately, to have it ready for the reception of the poor by the expiration of the period named. The estimated cost of a new workhouse is 20,000?. This parish is governed by a close vestry, and the course which will be adopted for obtaining the best design is looked for with some interest.

ON FIRE-PROOF BUILDINGS.

ON FIRE-PROOF BUILDINGS.

Mr. Braidwood, in his paper "On Fire-proof Buildings," read at the Institution of Civil Engineers, on the 27th ult, demonstrated, by a collection of specimens of metal from buildings that had been destroyed by fire, that occasionally the temperature in the conflagration of large huildings rose almost to the melting point of cast-iron, and that, even in a small fire, beams and columns of cast-iron would be so affected by the heat and the jets of water upon them, that they would probably be destroyed, and sometimes cause a fearful loss of life, as in many of the so-called fire-proof warehouses of the city: a number of persons employed on the premises slept in the upper floors, and, if the lower beams gave way, the whole would be dragged down suddenly; whereas timber beams resisted fire some time, and allowed time for the inmates to escape.

Another point which the author considered Another point which the author considered had not been sufficiently insisted on, was the derangement of the brickwork by the expansion of the iron beams at high temperature, and its sudden contraction on the application of cold water; and, also, from the mortar becoming pulverized by the excessive heat—instances of which have been known to occur.

The following were the principles on which

The following were the principles on which Mr. Fairbairn had proposed to construct fireproof buildings :

1. The whole of the building to be composed incombustible materials, such as iron,

stone, or brick.

2. That every opening or crevice communicating with the external atmosphere be kept closed.

3. An isolated stone or iron staircase to be attached to every story, and to be furnished with a line of water-pipes communicating with the mains in the street.

The different warehouses to be divided by strong partition walls, and no more openings to he made than are absolutely necessary

5. That the iron columns, beams, and brick arches be of a strength sufficient not only to support a continuous dead pressure, but also to resist the force of impact to which they are subject

subject.

Lastly. That in order to prevent the columns from being melted, a current of cold air be introduced into the hollow of the columns from an arched tunnel under the floors.

Mr. Braidwood submitted that large buildings containing considerable quantities of combustible goods, and constructed on the usual system, were not practically fire-proof; and that the only construction which would render such buildings safe, would be groined brick arches, supported by pillars of the same material laid in cement. The author was also of opinion, that the loss by fire would be much reduced if warehouses were built of a more moderate size, and completely separated from each other by strong party-walls, instead of containing considerable quantities of comeach other by strong party-walls, instead of being constructed in immense ranges, into which, when fire had once penetrated, it set at defiance all efforts to exti-

defiance all efforts to extinguish it.

In the discussion which ensued, it was generally acknowledged that the principles upon which many buildings, particularly dwellings, were constructed, were very erroneous. It was argued, that even with the ordinary materials, if attention was paid to filling-in the partitions and ceilings, as practised in France, and mentioned in Professor Hosking's book on the regulation of buildings; using slate or stone for the stairs, as from its present cheanstone for the stairs, as from its present cheap-ness might be done, taking care to support the steps properly, a fire would spread very slowly, and would allow ample time for the escape of the inhalitants.*

At the following meeting (Tuesday, March 6) the discussion was renewed, and extended to such a length as to preclude the reading of any paper

any paper.

It was remarked, that the consideration of what was the actual loss of strength of castiron, under different degrees of elevation of temperature, was of vital importance. It appeared, from the evidence of Fairbairn's and Hodgkinson's experiments, that there was very little difference of strength between iron, at a temperature below freezing point, and

when raised to nearly 600 degrees Fahrenheit, When, however, cast-iron columns and beams were practically subjected to the draught, or current of air, of a tremendous fire, in an ex-tensive warehouse filled with combustible

tensive warehouse filled with combustible goods, and at the same time receiving large guantities of water from the engines, they must fail, either by melting or crushing.

It appeared, that all the means of arresting fires generally failed, when there was a large area on fire, and that the only effective means of prevention would be to have smaller and of prevention would be, to have smaller and detached warehouses, or separating walls within the larger storehouses; but, inasmuch as this was a very expensive mode of building, and the land where warehouses were required was very costly, it became entirely a mercan-tile question, whether it was better to lay out a large capital in making a building perfectly a targe capital in minking a building perfectly freproof, and providing such means as were in use in a mill at Oldham, for deluging the rooms, on an alarm of fire, or pay an insurance and incur a certain amount of risk.

It was shown, that the system of constructing mills containing machinery, with iron beams and brick arches, was as much for the beams and brick arches, was as much for the purpose of avoiding the tremulous movement imparted by wooden beams and floors, as for avoiding the risk of fire; for such were the precautions and care in the mills, that very few were destroyed by fire. It was suggested, that bricks might be made expressly of the proper form to surround the slight iron columns used in buildings, and thus completely protect them in buildings, and thus completely protect them from any injury from fire,

MANUFACTURES AND DECORATIONS AT THE SOCIETY OF ARTS.

A LARGE number of persons assembled in the Society's rooms on Wednesday evening at the opening of the third annual exhibition of specimens of recent British manufacture and decorative art. Sir John Boileau took the chair, decorative art. Sir John Boileau took the chair, in the absence of the Duke of Buccleugh, who was expected, while the energetic secretary of the society, Mr. Scott Russell, read a report, congratulating the members on the important character of the present collection, and the progress of the society (it now numbers 569 subscribers), and entering into some particulars as to the award of prizes.

The exhibition is particularly rich in works.

The exhibition is particularly rich in works in gold and silver, to which her Majesty,

in gold and silver, to which her Majesty, amongst others, has contributed.

At the suggestion of Prince Albert, prizes were offered for wood-carvings, executed by artisans who were not professional wood carvers, with the view of encouraging a home occupation. The result appears satisfactory as a commencement: the first prize was awarded to G. Cook, son of the gate-keeper, at Hydepark-corner. park-corner.

There is a collection of paper-hangings at which we may look when the room is crowded.*

ART-UNION OF LONDON

It will be remembered that the council of the Art-Union of London offered the sum of 100. for an original bas-relief in plaster, on a base of 24 inches by 8 inches high, to be afterwards engraved by the any-glyptograph process, for general distribution, to the subscribers of the current year, in addition to the way shall be a subscriber of the current year, in addition to the way to be a subscriber of the current year, in addition to the way to be a subscriber of the current year, in addition to the way to be a subscriber of the current year, in addition to the way to be a subscriber of the current year.

In reply to this advertisement, twenty-five bas-reliefs were sent in on the 1st inst., bearing the following titles :-

- g the following titles:—

 1. Slaughter of the Innocents.

 2. The Entry into Jerusalem.

 3. The Death of Juruma.

 4. Greatheart's Conquest over Giant Maul.

 5. A Greeian Harvest Festival.

 6. Pilgrims to Jerusalem.

 7. The Entrance of Richard II. and Bolingbroke into London.

 8. Reception of Henry VIII. and Emperor Charles V. by Cardinal Wolsey.

 9. The Death of Boadicea.

- Hermione.

 Comus offering the Cup to the Lady.

 Suffer little Children to come unto me.

 Christ entering Jerusalem riding on the Ass.
- Orpheus.
- The Lady rescued by her Brothers. A Triumphal Procession. Jubal.
- 16.
- The Fall of Satan.

- 18. I he Faul or Sasan,
 19. St. Paul preaching,
 20. Hope the alluring,
 21. The Brothers rush in with drawn Swords
- 22. The Beggar died, and was carried by the Angels into Abraham's Bosom.

 23. Acteon.
- Britannia Triumphant: and
 (Unfinished) Train up a Child in the way he should go.

After examination, the council resolved that the prize of 100l. be adjudged to No. 13, as best adapted for the purpose advertised,—and best adapted for the purpose advertised,—and opening the letter sent in with the device marked on No. 13, it was found to contain the name of John Hancock, 4, Brecknock Crescent, and 101, Stanhope-street, Mornington Crescent.

ton Crescent.

They afterwards decided that, in consequence of the merit of the bas-relief No. 9, overtures should be made to the artist for the purpose of purchasing it for the use of the society. This was found to be by Henry Hugh Armstead, of 37, Liquorpond-street.

The subscription-lists will close on the 31st.

TOPOGRAPHY OF JERUSALEM.

WHAT WAS MILLO?

In the interesting description of Jerusalem given in your pages, the writer states that a "deep valley, called Millo, separated Acra from Moriah." This, I venture to observe, is a mistake, there being no authority whatever for the supposition that there was a valley or district of any kind within the walls of Jerusalem called by that name. Several old wri-

salem called by that name. Several old writers have entertained the opinion that the causevay formed in the valley between Mount Zion and Mount Moriah was the Millo in question, but the weight of authority, based on the evidence of Scripture, is in favour of another view of the subject.

The "House of Millo" is referred to (Judges ix. 6, 20; 2 Kings xii. 20). "He (Hezekiah) built up all the wall that was broken, and raised it up to the towers, and repaired Millo in the city of David, and made darts and shields in abundance," (2 Chronicles xxxii. 5). "So David dwelt in the fort, and called it the city of David, and David, and called it the city of David, and David. repaired affice in the city of periodic less affice in abundance." (2 Chronicles xxxii. 5). "So David dwelt in the fort, and called it the city of David, and David built round about from Millo and inward." (2 Samuel v. 9). "Solomon built Millo, and repaired the breaches of the city of David his father." (1 Kings ix. 24). These nu nerous instances in which Millo is referred to, and the express terms used in several of the passages to denote its locality, place it beyond doubt, first, that Millo was a building—one of distinction both as to position and destination, and secondly, that it stood within or in close proximity to, the bulwarks of the city of David. The expression, that David "built round about from Millo and inward," favours the supposition that the "house of Millo" was a building of note, that the work performed was extensive, and that a great distance

NOTES IN THE PROVINCES.

IT is proposed to have St. Martin's Church, Salisbury, wholly repaired, at an estimated cost of 1,000l., of which nearly 600l. have been secured.—It is also proposed to restore the Poultry Cross at Salisbury.—The first stone of Cookley New Church, near Kidderminster, was recently laid by Mrs. William Hancocks, who means to present the chancel window. Mr. E. Smith, of Oldswinford, near Stourbridge, builder, is the contractor for the building, a design for which he also furnished. There is to be accommodation for 400, 147 of which will be free sittings.—The committee of the Welsh Educational Institution are about to erect a new college at Llandovery, from a design by Messrs. Fuller and Gingell, of Bristol. Tenders for the works will be called for shortly.—On the Birkenhead Dock-works, 160 men were lately set to work, and it was intended shortly to increase the corps to 500 or 600.—A project has heen started for the erection of a temperance hall in Leicester. According to the *Journal*, it is to bave two tiers of galleries, with seat-room for 1,665 persons, and a large reading-room, library, club-room, committee-rooms, kitchen, &c. The design, it is added, is in the hands of Mr. Flint, who estimates the cost at 300 guineas -On Tuesday week the foundation-stone of church was laid at Shelf, between Halifax and Bradford. Messrs. Mallinson and Healey are brattord. Heardy has given 500l. towards the building, and 2,500l. towards the endowment. The church will consist of a nave with aisles and a chancel. At the west end of the nave will be a bell-gable. The design is decorated, and similar to that now design is decorated, and similar to determine the recting at Bank Foot, also by the munificent aid of Mr. Hardy. The accommodation will be about 490, nearly all free. Cost of erection, including repair fund, about 1,800.

The Lords of Treasury bave consented to the The Lords of Freasury have consented to the sale of a piece of corporation land at Doncaster to the Cemetery Company there for the new cemetery. The area is 7 a. 2 r. 13 p., and costs 500l., to be applied in payment of corporation debts.—The town council of Newcastle have resolved on the erection of a new street from Neville-street and Westgatestreet to the Bigg-market, on condition that 10,500l. be sufficient to realize the project.

Two rows of workmen's houses, ten in a row, with a foreman's 'mansion' as a terminus row, with a foreman's mansion as a terminus between them, all under the somewhat ambi-tions title of 'New Gateshead,' have been erected behind the ironworks of Messrs. Hawks, Crawshay, and Sons, of Gateshead, as residences for some of those in their em-ployment. The lot, however, merits notice, ployment. The lot, however, merits notice, according to the Gateshead Observer, wbo, speaking of the unity of the design, as a crossbreed between the Elizabethan and the Swiss, declares that the whole has quite a collegiate aspect.—May such classical precincts never he defiled by 'puddle,' pig,' or 'donkey,' riony or not irony, all the same. Moreover, may they be illuminated with a never-ceasing shower of " sparks from the anvil," ever and anon elicited by some choice collegiate, with 'head and harigals' asclear as may their precincts ever then be.—The plan, when completed, will head and harigas' asclear asmay their precincts ever then be.—The plan, when completed, will comprise half-a-dozen such erections, each apart from the rest, but all facing inwards on a verdant square. The architects are Messrs. J. and B. Green, of Newcastle, and the contractor (at least of the section already erected) is Mr. C. J. Pearson, of Gateshead. The whole design, so far as regards the improvement of the physical condition of their workmen, is, says our authority, quite characteristic of the firm at whose desire and expense it is being carried out; and we cordially re-echo the aspiration—Would it were characteristic of every other!—A correspondent, says the same paper, calls our attention to the accidents —frequently serious, sometimes fatal—which occur at the Sunderland docks, now in progress of construction, and suggests that some better provision is needed for such emergencies. The infirmary, says he, is nearly a mile distant from the dock, and an bour every other! — A correspondent, says the same paper, calls our attention to the accidents

must elapse before surgical aid is rendered-perhaps 'too late.' A levy is made on th perhaps 'too late.' A levy is made on the workmen by the contractors, to which, I beworkmen by the contractors, to which, I believe, they contribute themselves; and all that is required is the provision of a properly furnished room at the docks, in which, if need be, a surgeon may render immediate assistance. Some better mode of conveyance to the infirmary might also be adopted. sure that the contractors will give a ready ear to such suggestions.—The town council of to such suggestions.-Edinburgh have agreed to apply to Government for leave to throw back the screen in front of the Register House, for 10 or more feet, so as to widen the carriage-way at the head of Leith-street, long a subject of complaint by the citizens. -- Four sites, extending in all to about 150 acres, have been selected at different points adjacent to Glasgow, where it is pro-posed to form pleasure-grounds for the people, with bowling-greens, curling and skating ponds, archery grounds, promenades, garden-lots, &c., and also with buildings for in-door amusement and instruction.

METROPOLITAN COMMISSION OF SEWERS.

IMPORTANT QUESTION.

A GENERAL court was held on Thursday, the 1st instant, at the Sewers'-office, Greek-street; the Right Hon. the Earl of Carlisle in the chair.

Adecree was received from the Lord Mayor of London, setting forth that, in compliance with the Act 11 & 12 Vict., four commissioners to represent the interests of the city of London at this court had been appointed—viz., Alderman Lawrence, Mr. Deputy Harrison, Mr. Deputy Peacock, and Mr. Norrie.

The Closed-door Business of the Commission.— The Hon. F. Byug moved that the minutes of the general committee of the 22nd Feb. beread. These set forth that a motion had been made in that committee by Mr. Leslie, seconded by Mr. Byng, that it be recommended to the Court of Sewers not to adopt the report of the Bye-laws Committee, dated Feb. 9, on report of the Bye-sins committee, date reco. 3, on the ground of the illegality of the recommendations contained therein, as no authority to delegate the powers of the commission to committees is to be found in the commission itself, or in the general statutes in the commission itself, of in the general statutes on sewers; but that every facility was given in the 11 & 12 Vict. to the commission, as a court of record, to carry out most advantageously for the public (by making the public fully acquainted with all its proceedings) the objects for which the commission issued. That the proceedings of this court could be reviewed by the Court of Queen's Bench; that the appointment of committees was in violation of the statute, and that the time of the officers, which ought to be occupied in the various works in progress, was taken up in almost daily attendance upon some one or other of the special or sub-com-mittees. This motion in the committee was nonmittees. This motion in the committee was negatived by a large majority.

The Earl of Carlisle wisbed to offer a few words

on a point that occurred to his mind, on a point that occurred to his mind, without ex-pressing any opinion on the main question involved in the resolutions that had been read, as to the manner of carrying on the business of this court. Whatever might be the expediency of that course, it was a question so material to the constitution and working of that court, be thought, if any doubt were entertained, that such doubt should he imme-diately cleared up: and therefore he suggested that diately cleared up; and therefore he suggested that a special case should be drawn up and submitted to the highest law officers of the crown.

the highest law officers of the crown.

Mr. Byng said the adoption of that course would not prevent him protesting against the illegality of what had been done already. He had before submitted a motion on the illegality of their proceedings, but how was that resolution met? Why, by tings, but how was that resolution met? Why, by the members of the Works' Committee passing certain resolutions; and therefore the attendance of certain resolutions; and therefore the attendance of himself and other commissioners was useless. Every proceeding of that commission should be made public, for, unless they carried the public with them, the public would be unrepresented, and their entire acts would be looked upon with suspicion; and, after all, what bad these committees done? The time had been wasted, for they had done little or nothing, but employed the officers of the court to the neglect of their ordinary duties. He had no wish unnecessarily to detain the court his former motion having been negatived, but he contended that all courts and committees should be one. Now as to the constitution of the Works' open. Now, as to the constitution of the Works' Committee, it was most essential that it should com-

in the court carrying out great works, as they bad been carried out by the court before. It was his opinion that all standing committees were illegal, especially constituted as they were of persons having on special knowledge of the work they had to superintend; and, as an instance, he might mention that he himself, without his knowledge or consent, had been placed on the finance committee, although he knew nothing of figures. As a member of the late Westminster commission, he bad worked, and with Mr. Leslie, succeeded, in bringing it into that contempt it eventually received; but as a commissioner of the present, he was by no means satisfied to act under any other hoard, not even the Board of Health. He hoped he should receive credit for having given every degree of force in his power to that board, but he would not give up his powers as a commissioner to would not give up his powers as a commissioner to make a branch of that board, or to pay the ex-penses of it. He hoped to see this court well would not give up his powers as a commissioner to make a branch of that board, or to pay the expenses of it. He hoped to see this court well carried out for the benefit of the public, but he objected to any proceedings or works that were not known to the public, who might well become suspicious of a small hody—and that hody, too, appointed by the Crown—with immense powers to rate property to the amount of seven millions. If their deeds were good they ought to carry the full approbation of the public with them. He could not omit to notice that on an hon. commissioner opposite being spoken to on this subject (Mr. Chadwick), that gentleman thought that if he (Mr. Byag) was dissatisfied with the course adopted, the most gentlemanly way would he to retire from the commission, and a threat was implied that if commissioners obstructed—that is to say—if they created discussion, and a threat was implied that it consistences obstructed—that is to say—if they created discussion, they would be superseded from the comission, and the names of other persons substituted; and the paid assistant secretary to the mission, and the paid assistant secretary tuted; and the paid assistant secretary comBoard of Health, who was also a sewers' commissioner, was at the same time personally rude
to him. During fifteen years he bad been a comto him. During intent years he had onever received such an affront in that room before. He again denounced these committees as an evasion of the law, and feeling the duty he owed to the public, the law, and feeling the tudy he obstate to parameter be would not be implicated in their acts, or attend there to register the proceedings of a committee which he firmly believed to he illegal. The bon, gentleman concluded by moving that all courts and com-

mittees should be open.

Mr. Chadwick said there was a very great difference between the new and old commissions, Mr. Chadwick said there was a very great unre-rence between the new and old commissions, when courts were held at long intervals, and the works were brought forward in a mob, and in a state that rendered it impossible that they could be properly considered; and proofs of it might be found in the works of the old commissioners, which were admitted to be a waste of the public money, even by the gentlemen opposite. He justified the subthe gentlemen opposite. He justified the sub-distinct of labour hy committees, and this was proved by the operation of the Ordanace Survey Committee. A member of the House of Commons well acquainted with map-making, had said that the survey could not be executed and accordance. could not he executed and carried out in less than six years, and at an expense of 300,000l. However, notwithstanding the obstructions uncessarily thrown in the way by members of the d commission now in the new commission, he one commission now in the new commission, he believed the work would be got through in one year; and that works that would formerly have cost 10,000. to 20,000. would now be done better and more completely for 3,000. or 4,000. There was no doubt that the necessities of the public now required different means of improvement to those carried on by the hon. gentleman and his colleagues in the old commission, and had it not been for the violent obstruction to the subject of honse drainage by memhers of the old commission-

by memners of the old commission—
The Earl of Carlisle objected to the use of the word
"obstruction;" every commissioner had a right to
express his opinion.
Mr. Chadwick resumed, and justified the subdivision of labour, for by it the wants of three distriets would be met by the same expense that genthems promeits did not these were sup, think out of tlemen opposite did not, three years ago, think out of the way for one. He was opposed to open com-mittees, as it would be impracticable to carry on mittees, as it would be impracticative to actry on the business of experiment if every body was allowed to be present. He then reviewed the works of improvement, and the saving effected in the works performed, and maintained it was in open vestries and open courts that "jobs" were more easily perpetrated. easily perpetra

easily perpetrated.

Mr. Leslie said he knew nothing of old or new commissioners. He was there as a commissioner under the Act 11 and 12 Vict., as a trustee for the public, and to do his best for the public interest, and that he would do; and he could not let the present opportunity pass without one or two observations on what had fallen from the commissioner opposite (Mr. Chadwick), which should be of the most friendly character. Mr. Chadwick thought the business of the commission best done by committees, and upon this point he (Mr. Leslie)

obtained the opinion of Sir Charles Pasley and other scientific as well as practical men concurring in bis opinion, and they were ultimately adopted. The hon. commissioner had spoken of the great difficulty experienced through the opposition to house drainage. Wby, the report had been about thirteen months, and they had never had a discussion. The report was full of error, and wrong in principle. He then referred to various points in it, which were port was full of error, and wrong in principle. He then referred to various points in it, which were all debatable questions, and ought to be brought into the court and discussed. He thought the public ought to be made acquainted with every thing that took place. The time of the officers, too, was completely taken up by these committees, instead of their being out and engaged in works of drainage; and at the last Finance Committee Mr. Lovick had stated that it was quite impossible that he could attend to his duties, for every day in the week he was in attendance on committees. He found eighty-five pages taken up with the minutes of these committees for a week. What were the commissioners to know of this "mob" of business, some of which involved engagements with a company which was not authorised by law, and involved a principle never discussed in that court! If the law officers of the Crown gave their opinion that under the 23rd section they could appoint committees, special committees, and sub-committees, there would he an end of the matter; but although they had lost their motion, yet in fact they had carried it, for the committee had passed a resolution to suspend their works, and that all commissioners might he present at committees. A Commissioner said they might be present, but were not allowed to speak or vote.

Mr. Leslie—At any rate we have got the wedge in.
He concluded by supporting Mr. Byng's resolution.

commissioners might he present at commissioner said they might be present, but were not allowed to speak or vote.

Mr. Leslie—At any rate we have got the wedge in. He concluded by supporting Mr. Byng's resolution. After a few words from Lord Ebrington, Sir H. de la Beche, and Mr. Lawes, the noble Chairman's suggestion was adopted, that the solicitor to the Court do prepare a special case, to be submitted to the law officers of the Crown, for their opinion as to the legality of transacting the business of the commission by committees.

The Metropolitan Sewage Manure Company.—A long discussion ensued on the following resolution:—" Resolved—Pursuant to the recommendation of the Works Committee, the court do allow 1,500 feet of pipe to be put down to connect the sewer at Walham-green with the sewer at Stamford Villas, Fulham-road, at an estimated expense of 437t., the Metropolitan Sewage Manure Company being allowed to diver the sewage to their works for one year, the company paying rent of 8 per cent. Hercon for the year."

Mr. Leslie opposed the motion as illegal, and this view was taken by some of the shareholders them-

thereon for the year."

Mr. Leslie opposed the motion as illegal, and this view was taken by some of the shareholders themselves, and a protest has been liberally circulated as to the illegality of the proceedings of the company. The motion, however, was eventually agreed to. Several orders for works were agreed to, and the court advanced.

Miscellanea.

The Attack on the Office of Woods.

—The suppositions that we offered last week, in reply to the attacks made by contemporaries on the office of Woods, prove to be correct, especially as regards the two "lucky architects," Nash and Burton. At the moment that our last number, shewing what was probably the real state of the case, was at press, Lord Carlisle, in the House of Peers, was stating positively that onr explanation was correct. The small rent, too, paid by certain members of the aristocracy for land in the Green-park is stated to be not for the land on which their houses stand, but for certain small pieces of pleasure-ground adjoining.

The Albion Plate Glass Compay.

A meeting of the shareholders of this incipient incorporation was held at the offices, Railway-place, Fenchurch-street, City, on 27th ult, her office the state of the state of the state. THE ATTACK ON THE OFFICE OF WOODS,

place, Fenchurch-street, City, on 27th ult., when office-bearers were elected, and a resolu-tion to hasten the complete establishment of tion to nasten the complete establishment of the company unanimously passed, on the ground that a great necessity exists for a further extension of the manufacture of plate glass. The manager, Mr. H. Howard, is said to have made considerable improvements for cheapening the manufacture, about to be untented. In

made considerable improvements for cheapening the manufacture, about to he patented. In the report read to the meeting, a comparison of British and foreign tenders for certain specific quantities of plate glass was made, and the amounts quoted as follows:—

Foreign houses.

For glazing purposes. \$\frac{\mathbb{E}}{2277}\$ 19 2 \$\frac{\mathbb{E}}{199}\$ 108 15 10 These prices of the English manufacturer, it was said, afford a large profit—averaging about 1s, per foot, so that it was believed foreign competition is now virtually excluded from the competition is now virtually excluded from the English market.

PROJECTED WORKS. -- Advertisements have PROFECTED WORKS.—Afternoon in the been issued for tenders, by 21st inst., for the erection of a new church at Mansfield, Nottingham; by 27th, for alterations and ad-Nottingham; by 27th, for alterations and additions to Hampstead workhouse; by April 2nd, for rebuilding a house and offices (chiefly with old materials) at Petham, near Canterhury; by 3rd, for the erection of a borough prison at Devonport; by 12th inst., for the construction of a pipe sewer of glazed stoneware, from the sewer at Walham-green to the sewer at Stamford Villas, Fulham; by 13th, for the construction of sewers in Tudor-street, Dorset-street, Primrose-hill, and elsewhere; by 26th, for the erection of the National, Inby 26th, for the erection of the National, Inby 20th, for the erection of the Matonia, In-dustrial, and Infant Schools at Henley-on-Thames, Oxon; by 21st, for the erection of St. Edmund's Church, Northampton; by St. Edmund's Church, Northampton; by 17th, for finishing four houses in Richmond-17th, for miniming four nouses in Adenmond-road, Westhourne-grove, Paddington; by 14th, (extension of time) for the erection of the Printers' Almshouses; by 13th, for the erection of a school-house at Montpelier; by erection of a school-house at Montpelier; by 15th, for the necessary works in the erection and completion of butchers' and fish markets at Worcester; by 24th, for the erection of a police station and strong rooms at Witham; by a date not specified, for the erection of a stone bridge near Airdrie, and for making a road there; also for constructing a road at stone bridge near Airdrie, and for making a road there; also for constructing a road at Birmingham-heath; by 13th, for repairing, paving, &c., footways and carriageways at Cambridge (separate contracts); by 20th, for 4,000 tons of railway chains, for the Great Northern Railway; by 12th, for laying nine miles of water-pipes at Boston; and by 26th, for laying 25 miles of lead-jointed iron pipes for Derby water-works. for Derby water-works.

COMPETITION.-Plans are required for the erection of a corn exchange and other buildings in the town of Northampton, at an outlay not exceeding 8,000%.

A FLOATING CHURGH.—The English Churchman gives a description, accompanied by an engraving, of an ecclesiastical edifice which is, as yet, we believe, without a parallel,—a real church affoat, a new Gothic structure with tower and spire, belfry and bell, and capable of accommodating 550 worshippers. Its seats are all free. Built, of course, of wood, it is painted to represent brown stone: from the deck to the bail on the spire is 80 feet in height—its dimensions are 86 feet by 34 feet, with a passage all round it. The whole rests on two boats of 90 tons burden. It was constructed at New Jersey, for the Churchmen's Missionary Association, and is to be moored at a wharf in Philadelphia, for the especial use of sailors and boatmen. FLOATING CHURCH. - The English of sailors and boatmen.

of sailors and boatmen.

MASONS' PROVIDENT INSTITUTION.—The
third annual meeting of the above institution
was held on Tuesday evening, March 6, at the
City of Westminster Literary Institution; Mr.
William Freeman, Treasurer, in the chair,
The report of the committee and auditors for
the past year shewed the balance in the hands t year shewed the balance in the hands the past year shewed the balance in the hands of the institution to he 2444. 19s. 2d., including the purchase of stock 3 per cent. consols to the amount of 2504. 4s. 9d.; and although not so gratifying as might have been anticipated, in consequence of the great depression of trade, congratulated the members upon the steady progress of the society. A resolution upon the choice of a president, in the room of the late Mr. Alderman John Johnson, will be found in our advertising columns. found in our advertising columns.

LONDON IMPROVEMENTS .-- Do, pray, direct HONDON INFROVEMENTS.—Do, pray, qurect public attention to the necessity of opening up Picket-place into Lincoln's-Inn-square, and pulling down all the houses which are now in the courts and alleys near it. The whole of that part north of the Strand is perfectly dissured to the present the courts and in which the proof of the present o that part north of the Strand is perfectly dis-gusting, and inhalited by people of the worst description. If a handsome street were built as a continuation of the present Picket-place to Lincoln's-lnn-square, the houses would let at high rents as chambers, and the ground-floors might be occupied as shops.—R. P.

APPROPRIATION OF RAILWAY ARCHES.— We peceive that the suggestion made in The BUILDER, for the conversion of railway arches for the houseless poor, is proposed to be car-ried out by an association under the title of "The Samaritan Society of England," but in their prospectus we do not see any reference whatever to the quarter whence the suggestion originated on which the scheme of benevolence

ST. SAVIOUR'S, SOUTHWARK.—A correspondent says, relative to a restoration here, "The south transept has a pinnacle at each corner surmounting the buttress, one of which corner surmounting the buttress, one of which thad become necessary to repair; this feat has been accomplished by about one-third being sliced off, and a flat stone with projecting edge being placed on it, giving it the appearance of a jelly glass turned topsy-turry, or a flat-bottomed extinguisher." On examination, we find the statement correct, but can scarcely suppose that the step in question is any thing more than a temporary measure. The condition of this church, in other respects, is a sad disgrace to the parish.

GEOMETRICAL PROPORTION.-At the conversational meeting of the York Philosophical Society, on the 26th February, Mr. Fowler Society, on the 26th February, Mr. Fowler Loss, architect, read a paper on the geometrical proportion of Gothic architecture, as introduced by Mr. Griffith in his work on that subject; and showed by examples in proof of alternating squares. Fraguets and house of alternating squares, triangles, and hexagon, heing the framework on which the plans heing the framework on which the pians and sections were constructed, that there was no doubt of the application of the system in the plan of York Minster, St. Mary's Abbey, York, the chancel of Howden Church, Selby ditto, Skelton, and various others.

The Smithfield Nuisance.—An attempt of Mr. J. T. Norris, in the City Court of Common Council, to have a special committee Common Council, to have a special committee appointed to provide a more suitable site for the market, was met by "the previous question," and by a deal of speechlifying, con. much more than pro, on the delivery of which the question was put, and the motion negatived without a livision. without a division.

A Bowling Saloon, on the American principle, has been recently got up at Liverpool, in a very showy style, it appears, and with five bowling alleys, and, of course, 'a commodious bar,' and suitable lounges and refreshment-rooms, &c. "The entrance," says Liverpool, napar, "Grossists of a vestibule. a Liverpool paper, "consists of a vestibule, enriched with windows of stained glass, and profusely decorated with ornaments in white and gold, and communicates with the interior by handsome folding-doors. The inhardsome and striking, the walls being divided handsome and striking, the walls being divided into compartments, in each of which is a a landscape, drawn in a masterly style, by an artist of celebrity, and ornaments of papier maché and gutta percha gilded are introduced in abundance, and with great skill and effect. The bowling-alleys have circular projections at the ends surmounted by statucs. The saloon is fitted up in the richest style of splendour." The whole concern was designed and executed by Messrs. Furness and kilpin.

BLIND BULLDERS—EXELL CHURCH.

BLIND BUILDERS.—EWELL CHURCH. The following tenders, says a correspondent, were delivered for works required to be done in pulling down the old parish church at Ewell, in pulming down the out parish church at Lweil, and for alterations and additions to the tower, to form the same into a hurial chapel, and for building boundary walls round the new churchyard; Mr. Hy. Clutton, architect.

Haynes, Ewell......£329 15 1 Stone, ditto 277 18 0 Hards, ditto 122 4 6

Old materials remaining to be the property of the contractor.

TO OUR READERS

It has been suggested to us at various times that ome of the best architectural subjects given in TRE BUILDER, if printed in a superior manner on good paper, with the accompanying descriptions, plans, &c., and issued periodically, would form a work that would be accomplished to the accompanying the second state. paper, with the accompanying unexcriptions, pains, excipand issued periodically, would form a work that would be acceptable not only to those who are not buyers of The Bullder, but to many who are,—the current engravings being often creased by the newswendors, or otherwise injured. We are disposed to try the experiment, and to publish, in a near wrapper, under the title, "Bulldings anni Monuments, Modern and Medlaval," about Eight Plates, with eight pages of letter-press, folio size, every second month, price balf-a-crown. The first part would consist of Osborne House, with plan; Bridgewater House, plan and details; Church of St. Issae, Petersburgh; Kensington Union Workhouse; Pembroke College, Oxford; the Liverpool Brauch Bank; and the north porch of St. Nary Redellife, Bristol. Before determining upon the scheme, however, we should be glad to receive the names of sach gentlemen as would be willing to become subscribers to the work,

No. CCCXIX.

SATURDAY, MARCH 17, 1849.

HE records of the London tradeguilds, fraternities, mysteries, crafts, or, as they are now called, Companies, much interesting and useful

matter, which would serve to throw light on the state of society in early times, to illustrate history, and to show, amongst other things, the progress of building and the growth of the metropolis. Indisposition on the part of the companies to permit access to these documents is probably the reason why little use has been made of them. We have a general history of the twelve principal companies, but there is a wide and promising field of research here yet open for the historian and archæologist.

In 1846, when describing the decorative paintings discovered in Carpenters' Hall, London-wall,* we suggested that the charters and records of the Carpenters' Company, which company formerly exercised great power over the trade, would probably afford much interesting information, and we expressed a hope that we might soon be able to avail ourselves of them. Since then, and led to it by the inquiries and remarks made at that time, Mr. Edward B. Jupp, the clerk of the company, has diligently examined all their records, and has now published a historical account of the company, chicfly compiled from these, which will be read with considerable interest by many, and will, we hope, serve as an inducement to others to follow the example.†

The formation of guilds in our own country dates from an early period in our history; they played an important part in the development of society, enabling the trading classes to resist the tyranny of the nobles, and lessening the distance between the two. Reigning monarchs saw what powerful checks these combinations were on the aristocracy, and willingly granted them charters of incorporation and important privileges.

The earliest charter possessed by the Carpenters' Company is dated 7th July, 1477 (the 17th of Edward IV.), but it is not by any means certain that this was the first; the common seal of the company and grant of arms are dated 1466, and there is a distinct notice of a guild of carpentry in 1421-2. Going still further back, the city records shew that at least as early as 1271, two master carpenters, and the same number of master masons, were sworn as officers, to perform certain duties with reference to buildings and walls, of much the same nature as those which were confided to the same number of members of these two companies, under the title of city viewers, until within little more than a century ago. Chaucer, too, in his "Canterbury Tales," written prohably in the reign of Richard II., introduces five individuals of different trades, whom he describes as clothed in the livery of "a grete fraternitie," and of these, one is a carpenter,-

"A haberdasher and a carpenter, A webbe, a deyer, and a tapiser, Were all y' clothed in o livere,

Of a solempne and grete fraternite."

† "A Historical Account of the Worshipful Company of Carpenters of the City of London, compiled chiefly from records in their possession, by Edward Basil Jupp, Clerk of the Company," London, Pickering.

The earliest entry in the Company's books is dated 1438, and is headed (abandoning the spelling of the time, which Mr. Jupp has carefully preserved), "Jesu and his mother dear have mercy on Croffton the carpenter. He gave you this book to all the company."

The preamble of the first charter, already alluded to, sets forth, on the part of King Edward, that understanding "that divers workmanships, or works in the mystery of carpentry, have oftentimes heretofore been made, and daily are made, insufficiently, which thing, if it should be suffered to be so done it would redound not only to our prejudice but also to the manifest deceit of our liege people and subjects, and that for want of government, correction, and oversight, to be had in the said mystery, we, willing to meet with such prejudice and deceit as we are bounden for the hettering of our lieges and subjects aforesaid," give license for the establishment of the guild, &c.

In this charter, full power and authority is given to the master and wardens "to oversee, search, rule, and govern the said commonalty and mystery, and all men occupying the same, their servants, stuffs, works, and merchandises whatsoever" appertaining to the mystery within the city, suburhs, and precincts, and to punish and correct at their discretion.

Various entries in the books show the course taken by the company under these powers: they granted licenses for the erection of huildings, and punished by fine or imprisonment where license had not been taken or the work badly done. We must content ourselves with two or three specimens :-

Thus, in 1474,-" Item; paid to serjeants hy diverse times for arresting of stuff" (seizing defective timber) 6s."

1500. "Item; received of Gyffte to have the good-will of the felowship to set up a house in Bridge-street, 10s."

1503. "Received of a foreign carpenter to have license to set up a house within Serjeant's Inn, Chancery-lane, 20d." (win the Serieant in, in Chauncelor-lane.)

1567. "Received of Thomas Huat for that his boards did not bear measure, 2s. 6d." And then in 1572, "John Curtis was committed to ward at the master's commandment, for the work which he did in St. Paul's Churchyard. without license of the master and wardens.

Matters in dispute were usually either decided by the court or referred to arhitrators, who in an early order-book of the company are styled "daysmen," an old term for umpire:* and it is seen that members of the company were sometimes made answerable for the "yll words" of their wives. Thus, in 1556, "Received of Frank Steleerag a fyne for ill-words that his wife gave to John Dorant, 2s." The ladies of the company are much better behaved now-a-days

In the same year, John Griffin was fined 6d. for coming to the hall in his coat and leather apron; and Master Abbot to the same extent, because he "helde not his peess before the master hade knockyd with the sylence 3

The opposition offered by the company to foreigners (a term which applied also to nonfreemen) was very determined and continuous.

* The term daysman is employed, says Mr. Jupp, in rendering that fine passage in the book of Job—"For is he not a man as I am, that I should answer him, and we should come together in judgment; neither is there any daysman betwixt us, that might lay his hand upon us both."

Spenser, also, ju the "Forcy Queene, says:—
"Spenser, also, ju the "Forcy Queene, says:—
"That make'st thyself her what art for prolong The vengeance prest?"

—Vol. II., canto viii., v. 28.

-Vol. II., canto viii., v. 28,

The entries of payments for their arrest are numerous.

In 1607 the jurisdiction of the Carpenters' Company was extended by charter of King James I. to the compass of two miles round the city. By this charter the oversight, search, correction, government, and reformation of all works and things concerning the art of carpentry, and of their measures, were granted to the company, also the control of all reparations and huildings. Power was given to a certain number of members of the company to enter into the premises of any one following the trade of a carpenter, to see if the works were skilfully done, to seize and dispose of all improper stuffs, punishing the offenders; and, upon application of any party grieved, to reform and correct the buildings, works, or reparations.

In the same year a set of stringent hye-laws were framed for the regulation of the company. By these no person of the fellowship is to meddle with other branches of the huilding trade, under penalty of 20s., more or less at the discretion of the master and wardens. And in order to discountenance masons, hricklayers, and others, who "oftentimes do take upon them in a bargain by great, not only to deal for such things as appertain to their own art, craft, or mystery, but also to finish diverse parts, and many times the whole buildings," "wherehy the king's majesty's subjects, heing owners of the buildings, are very much and often deceived of true and substantial stuff and workmanship,"-no carpenter was allowed to work for any mason, bricklayer, or other so acting, "hy bargain in great" (in the lump), hut only for wages by the day, under a penalty not exceeding 31.

Another hye-law provides that the master and wardens shall search for timber, hoards, joists, quarters, &c., belonging to the carpentry, to be sold, to see that the same contain the just length, measure, &c., according to a schedule which is given at length.

By a charter of Charles I., in 1640, the company's jurisdiction was further extended to a compass of four miles round the city of London, and their former powers were confirmed, with the exception of that of reforming and correcting buildings, "in lieu of which they were empowered to retard and delay all insufficient huildings, works, and workmanship until the Commissioners of the Crown in the cities of London and Westminster, and the neighbouring places, or any two or more of them, should have notice from the master and wardens, and should provide a fit remedy."

In connection with the powers of search, some of the entries are curious, showing that it was exercised very resolutely. In these searches the King's "master carpenter" was permitted to accompany the wardens if he pleased. Of those who held this appointment Mr. Jupp gives some particulars, as he does also of those who held the office of surveyor of the King's works. On our next page is a portrait of Portiogton, who held the former office many years, engraved from a picture in Carpenters' Hall: the second engraving is from a painting also in the hall.

The books of the company contain many entries connected with the impressment of workmen for the service of the crown. Amongst the latest instances is this :- " 1668, 22nd July-Spent with Sir John Denham, the King's surveyor, and others, about the twelve carpenters charged to be impressed for the King's work at Whitehall, 35s. 6d."

At the beginning of the seventeenth century,

W^m Portington Esq", M^r Carpenter in y^r office of his Ma^c buildings, who serned in y^c place 40 yeeres & departed this tife y^c 28 of March 1628, being aged 81 yeeres, who was a well wisher in this Societie, this being y^c yift of Mathew Bankes who served him 14 yeeres, & is at this present M^r of the said Co^c pany Aug. 19, 1637.

This Picture of John Scott Esq. Carpenter and Carrage Maker to the Offic of Ordnance In the Reigne of King Charles the 2d Was Placed Here By his Apprentic Matthew Bancks Esq. Master Carpenter to his Maje and Master of This Company this present yeare: 1698.

differences occurred between the Carpenters' Company and the Joiners' Company, and articles were drawn up by a committee describing minutely the several branches of trade to be pursued by each. At the end of that century the feud was renewed, but the companies nevertheless united to prevent the incorporation of the sawyers, and succeeded in their opposition. In 1654, the company, by direction of the Court of Aldermen, reported on the means of preventing the firing of buildings, wherein timber was laid too near the fire in chimneys; and in 1655 they gave the Lord Mayor recommendations for reducing the wages of labourers and workmen. These were as follows

1. That labourers take for wages 16d. a-day only.

2. That sawyers take only for sawing of timber as followeth. For oak by the hundred 2s. 8d., for elme by the hundred 2s. 6d., for fir by the hundred 2s. 4d., and for sawing of deal boards, 2s. 4d. a dozen only.

3. That "sufficient" carpenters take but 2s. 6d. a-day for wages at the most.

Soon after the great fire of 1666, Parliament passed an "Act for Rebuilding the City of London," in which it was enacted that the outsides of all buildings in and about the city should be made of brick or stone.

Surveyors were to be appointed by the city to carry the Act into execution, and severe penalties were imposed on persons building contrary to it,-thus superseding the Carpenters' Company in more ways than one. The Act also gave permission for carpenters and others not freemen of the city to enjoy the privileges of working as if they had been apprenticed for seven years; and all who should actually work in rebuilding the city for seven years had liberty to work at their trades for the rest of their lives as freemen. The company strove against this, but ineffectually; and although they still claimed right of search, their power was in reality gone. The natural course of events led to the abandonment of pageantry and pomp, and they found their only remaining hut very important duty was, to cultivate social and kindly feelings, and to supply the wants of their poorer brethren.

Mr. Jupp has performed his self-imposed task with care and ability, and has added a very interesting volume to the library of the antiquary and the historical student.

ON THE IMPORTANCE OF A KNOW-LEDGE AND OBSERVANCE OF THE PRINCIPLES OF ART BY DESIGNERS.

PRINCIPLES OF ART BY DESIGNERS.

The importance to designers of a knowledge of the ruling principles of the arts of design is so obvious, that it may appear almost superfluous to urge the necessity of understanding and observing them. Never, certainly, in this country, has so much attention been paid to the study of style as at the present time. In architecture, the principles of construction and adornment of Pagan and Christian temples have been investigated by both professional and amateur students; and if some architects of eminence in our own day are apt to regard the 'letter' of detail more than the 'spirit' of the ensemble, in their imitation of the classic and Gothic styles, such solecisms as Inigo Jones committed, when he stuck up a Corinthian portice before the old cathedral of St. Paul,—and Wren, when he reared the western towers of Westminster Abbey, would not now be tolerated. Yet there still remains much to be done in developing, defining, and enforcing the fundamental principles which should regulate every branch of design, as well as every style of art,—principles of taste, rationally deduced from scientific data, and regulated by the refined perception of fitness and congruity,—of utility and beauty.

perception or inness and congruity, or utility and beauty.

An accurate imitation of style is often mistaken for observance of the principles of art; but style is only a special part of a general comprehensive whole. By studying the principles of Greek or Christian architecture and ornament, one may imitate these styles to admiration; but something more is required in order to invent. It then becomes necessary to investigate, understand, and act upon those broad fundamental principles which form the basis of all art, and apply equally to every style, past, present, or to come; for without a due observance of principles, ingenuity hecomes perverted, invention runs wild, and then the types of past ages must be moulds in which alone the ever active mind of genius can pour forth its ideas with the certainty of their assuming shapes of beauty and dignity.

can pour forth its ideas with the certainty of their assuming shapes of beauty and dignity.

Two distinct movements, in opposite directions, are now observable in the world of art: the one is retrograde, the other progressive. The retrograde movement, however, is a far greater stride in point of science and taste, because it has the lights of the antique

world and the miscalled "dark ages" to guide it; while the progressive movement, having no chart of principles to direct its onward course, is devious as that of a traveller on a trackless desert without a guide, or a ship at sea without rudder or compass.

No wonder that those who reverence the monuments of antiquity that time has spared, and who have refined their taste by the study of those noble works of art, should be reluctant to leave "standing on the ancient ways," when they see the puerile absurdities and extravagant incongruities perpetrated by adventurous spirits in search of novelty.

But art cannot stand still: it must move either backward in the old tracks, or forward in new. The vitality and strength of genius consists in its originating faculty. Our greatest poet, Shakspeare, whose fecundity of invention is equal to the truth and vitality of bis creations, is an instance of a writer forming a new style of the drama: his departures from prescribed forms caused his crabbed contemporary, Ben Jonson, to say that Shakspeare wanted art; but we have come to discover, by the test of experience, that he was as great in the knowledge of his art as in the exercise of his imagination. So of the latest grand style of architecture, the Pointed English, or as it was nicknamed by the copyists of the debased classic style, the Gothic; and which even Wren called "crinkle-crankle," we have but recently come to appreciate the scientific daring shown in its construction, the infinite variety and beauty of its forms and ornaments, and its picturesque effects of light and shadow. This style was the growth of the English mind, elevated by the Christian faith, and it is in every point truly national: suited to the nature of our climate, to the forms of worship and habits of the period, and to the varied requisitions of domestic life as well as conventual, characterized by utility and fitness in plan and elevation, its adaptability is no less remarkable than the majestic grandeur of its spires, and the infinite richness and elegance of its details.

Yet neither Shakspearian drama nor pointed architecture, both English as they are, and alike admirable for the union of grandeur with beauty, of elegance with variety, should confine our poets and architects to the imitation of these glorious forms. The spirit of every age should impress the products of that age; and it is the privilege of genius alone to stamp the image of greatness and a character of originality upon the art of a period. But genius cannot adequately fulfil its mission unless it be unfettered by prescription and precedent; it must be free to strike out its own course, neither restricted to a prescribed track, nor

yoked to the chariot of antiquity. Let me not be misunderstood, however. In advocating the freedom of genius from restraints of precedent, I am not asserting its superiority to, or independence of, principles; what the laws of nature are to human existence, the true principles of art are to the efforts of genius. The artist of original powers may strike out a new path, but if he want to reach the goal of success he must know the bearings of his course and his object in taking it. Genius may overstep minute rules with advantage, hut can never violate great principles with

impunity.

What, then, are these fundamental principles of art, is the natural question. To enunciate them fully and definitely would require not only more space than is allowed me, but, I will frankly avow, more exact and extensive knowledge than I can lay claim to. I only assume to enforce the importance of ascertaining and observing these principles. It may he reasonably expected of me, however, to indicate and exemplify them, and this I will endeavour to do.

The province of the arts of design—the formative arts, or the fine arts, whichever they may be called—is to enrich, enliven, and elevate the mind by means of new and suggestive ideas of beauty and grandeur, of gaiety and grace, through the medium of representations of natural objects or fanciful inventions derived from the forms and colours of nature. From this definition I would deduce three

From this definition I would deduce three fundamental, or governing principles, which alike apply to all the formative arts:—

1st. That all art is only a medium for the expression of ideas tending to delight and purify the mind.

2nd. That art, being the silent utterance of ideas of beauty and grace, of grandeur or graiety, in visible shapes, whatever is ugly without being enlivening, or repulsive without being sublime, is alien to it.

3rd. That art, being only a medium for the expression of ideas, deceptive imitation is foreign to its purpose, because in illusion the attention is necessarily diverted from the ideas that ought to be conveyed to the trick of

deception.

To the author of that eloquent and original work on "Modern Painters," the graduate of Oxford, we are indebted for the enunciation and enforcement of these principles. The distinction between imitation and representation has been too often lost sight of. The notion yet prevails very extensively that painting and sculpture are merely imitative arts; but to prove that they are not so would occupy too much time. I will only observe, that if they be merely imitative, then wax-work is superior to either, and the models of Madame Tussaud are greater works of art than the sculptures of Michelangelo, or the paintings of Titian. The nearer the imitation of the substance and surface of living realities in shape, colour, and texture, the more strongly is felt the absence of those essential attributes of life—breath and motion. Hence the ghastly effect of wax models; the deception first shocks the sense, and then becomes ludierous. Besides being amenable to these general principles, each branch of art also has its peculiar limitations and functions,—consequently its particular governing principles. Their observance, so far from being a restraint to genius, is a means of strengthening its powers.

In architecture, the science of construction enters so largely into considerations that the

enters so largely into consideration, that the art of design forms but a part, though a conspicuous and essential part, of the architect's studies. And when it is considered that a great building lasts for ages, and is not easily removed or remodelled; that an ugly edifice is a perpetual eye-sore, and a handsome one a continual delight,—the elevation of a structure becomes a matter of public concern. Even the fragment of a noble design is a beautiful object; and the façade of the Banqueting-house, Whitehall, is one of the finest of the few fine works of art in the metropolis. Leigh Hunt has felicitously characterized it as "a piece of the very music of Inigo's art—the harmony of proportion." What the city of London owes to Wren, none know so well as those who have to pass their days within its dingy precincts; and since this has become my own lot, I have learnt to venerate

the name of Wren, and feel grateful for the relief which the dome of St. Paul's, and the spires of the churches in Cheapside and Cornhill, afford to the dreary monotony of the street perspective.

Justness of proportion is so universally acknowledged to be the main feature of beauty in architecture, that however rarely it may be attained, it is not in much danger of being neglected. The necessity of designing a building so as that the elevation may convey an idea of its uses, and that the exterior may accord with the character of the interior, does not appear to be so generally recognized. Where utility is the hasis of elegance, as in architectural and ornamental design, fitness is obviously an important element of beauty; but when we have a museum with the façade of a mausoleum, and a picture gallery and a college fashioned according to the same recipe, with useless porticoes and superfluors cupolas, it becomes needful to call attention to this principle. The importance of projection, both in plan and details, is also paramount, when it is considered that on this depends the effect of the sky outline, and those effects of light and shadow which are the painting of architecture. The buildings in the metropolis, from the commonest street to the last new palace, look as if they had been pared down by the abhorred shears of some demon of bad taste. The Gothic style, which not only admits of, but requires strong projections and deep recesses to give due effect of its picturesque capabilities, is too often reduced to tame, thin, colourless monotony, with walls seemingly thin as pasteboard, and ornaments as flat as flagree. The defect of that superb and costly structure, the Palace of Parliament, is its flat and monotonous façade.

The discussion of styles of architecture involves too many considerations to be entered into here; but it may be well to observe, that in the choice of style, the site, as well as the use of the building, should be taken into account, and that the imitation of any building, showever grand or beautiful, is unworthy of a great architect, and a solecism in taste. The attempt to emulate the majestic simplicity and beauty of Grecian temples, where the vast masses of polished marble rise in lustrous purity against brilliant blue skies, in edifices of brick and stucco, of sandstone or iron, soon to be blackened by the coal smoke and moisture of our dense atmosphere, is so futile, that had due regard been paid to the first principles of art, and the very rudiments of taste, such flagrant absurdities would never have been perpetrated. The colossal and costly folly that disfigures the grandest and most picturesque city in the kingdom, and makes Edinards and absurdum on this point. We may excuse tasteful churchwardens, who degrade an Athenian choragic monument to the office of a parish pump, with the additions of a spout like the snout of a rhinoceros, and a handle like a pigtail; but when we see Grecian pediments and Corinthian columns crowned with red chinney-pots, interminged with zine smoke-funnels in hideous variety, the reproach and ridicule must fall upon those from whom better things might have been expected. If the Greeks had been a fire-side people, their chinney-stacks would have been so elegant in design, that we should probably have converted them to colonnades, and perhaps have lined Regent-street or facaded the Museum with attic chimneys instead of Doric columns.

Our architecture is as yet imitative, not original; and when ancient styles are adapted to modern uses, it is rarely in the spirit of the ancients. The Greeks rendered use subservient to ornament; the flower of beauty blossomed from the stem of utility. So it should ever be. True, the Greeks imitated some of the forms and characteristics of wooden structures in marble edifices; but they did this with such consummate skill and grand effect, that it is impossible to object to the result; though, like the painting and gilding of statucs, it was a relic of barbarism. The Grecks erred magnificently; but do not let us moderns perpetuate their errors, or caricature their beauties. Principle before precedent always.

We use a new material for building,—iron, which ought to have given a distinct character to the design of our architecture, as it has done

in part to its construction. Yet we see marble columns and stone arches imitated in cast iron, instead of displaying light shafts of slender columns supporting parabolic arches of wide span. Iron roofs can now be suspended over a vast area, almost as simply as the awnings which covered the amphitheatres of old, yet this does not visibly affect our edifices. We erect Gothic spires in iron, 'tis true, but it is only imitative of stonework; and carving, admirable in stone, becomes mere mechanical work when cast in metal. An ingenious inventor lately devised a scheme of metallurgic architecture, in which new effects of light and shade externally, and of interior ornament, were to be produced, and some material improvements in construction were suggested. This was a bold step in the right direction, though, as yet, nothing has been done to test the value of it.

In sculpture, the due observance of right principles is of the greatest importance. The sculptor's aim is to represent life in rigid and monotonous substances—marble, metal, wood, or plaster. To imitate the appearances of living flesh and blood is impossible; though the effect of animation on the aspect of living men and animals can be represented vividly, by means of forms carved in relief. aiming at imitation of the colours of life, by painting a statue, the result is a gigantic toy; indeed, there are one or two equestrian statues in this nectronal. in this metropolis which exemplify the toy-man's craft without the aid of paint, as may be seen in Cockspur-street and at Hyde-parkcorner. The main points on which the sculp-tor has to rely being the outline of the mass -which in a detached group or figure varies with every change of the point of view-and the effect of light and shadow on the surface, the importance of a well-studied design, in which the effect of the whole shall be considered on every side, becomes evident; the ensemble should be expressive of character and ensemote should be expressive of character and suggestive of life, whether viewed near or from a distance. The Wellington statue, seen from Cumberland-gate, certainly conveys no idea whatever of heroic grandeur and dignity; it is whatever of heroic grandeur and dignity; it is more suggestive of a peasant on his mule or a costermonger on his donkey, than the hero of a hundred fights on his charger. Nor is it expressive of life on a nearer view; the horse appears a hollow thing of metal, the legs look like tubes, the cloak seems not to cover a human figure, and the cocked hat, with its valume of clinging feathers is an extinguished. human figure, and the cooked hat, with its plume of clinging feathers, is an extinguisher of any life there may have been in the head, Colossal in actual size, it does not seem grand, because the eye is distracted by paltry details; it is a huge heap of lifeless littleness. Chantrcy's statue of Pitt, in Hanover-square, is one of the best examples of character in physiognomy strikingly expressed in sculpturesque style. No sculptor of modern times has equalled Chantrey in the happy art of giving living intellitrey in the happy art of giving living intelligence to the eye, and in expressing physiogno-mical characteristics with delicacy and dignity: his busts seem to think. And this is attri-butable to the skill with which he observed the principles of his art in the modelling of his forms as well as in the design of the mass: he cast the strongest and sharpest shadows of the face from the brow, but so as that the play of face from the brow, but so as that the play of light and shade should give intelligence and vivacity to the eyes. We never find in his busts blank, sightless eyeballs, nor is our attention diverted from the brow to the lower parts of the face by the strong shadows of dilated nostrils or parted lips, as is often the case in sculpture; and the fleshy character of his modelling is inimitable. His statues of Horner and Watt, in Westminster Abbey, are fine examples of the excellence of Chantrey as a sculptor. as a sculptor.

The statue of Voltaire, by Houdon, in the vestibule of the Theatre Français, at Paris, might be cited as a wonderful example of the representation of mobility of feature and vivacity of expression. That of Newton, by Roubiliac, in the chapel of Trinity College, Cambridge, is remarkable for its animated air; though there is too much flutter of drapery, and the pose of the figure is better snited to a professor of legerdemain than a philosopher. Roubiliac himself recognised the prevalent defect of littleness and want of mass in his figures, when, after revisiting Italy and seeing the antique sculptures there, he exclaimed,

when viewing his own works in Westminster Abbey,—"They look like tobacco pipes:" a sentence that might be passed on other sculp-tures besides those of Roubiliac.

W. SMITH WILLIAMS

PROFESSOR COCKERELL'S CONCLUDING LECTURE ON ARCHITECTURE

THE sixth and concluding lecture of the The sixth and concluding records of the course at the Royal Academy, which was delivered on Thursday, the 8th ultimo, was very numerously attended by the leading members of the profession. In the ordinary probers of the profession. In the ordinary progress of the subject, the professor said, that ornament would be the next point to which he ought to call their attention, did not matters of a more practical nature claim further consideration. Having previously gone into the theoretical principles of classical architecture, deration. he now proposed to offer remarks upon their practical application, upon certain conventional licenses, and upon the proper method of carrying on our studies in early life. He therefore proceeded to consider what might be the opinion of foreigners upon peculiarities in our opinion of foreigners upon peculiarities in our national practice, remarking upon the value of the hint of a friend, or the sarcasm of an enemy, towards removing the tendency to self-gratulation in our own practice, and the works of our own country. He urged the danger of restricting ourselves to ideas derived from our own school, and the limited circle in which an artist moved. Although we out to the works. artist moved. Although we ought to know how much animadversion to ascribe to pure malice, he said that the prevailing vice of the

malice, he said that the prevaning vice of artist's mind was self-gratulation.

A foreigner visiting this country would remark, that whilst we had adopted Greek architecture, we bad abjured too often the principles which belonged to other styles, as in the case of the arch. We had to a great extent made use of the Palladian style, yet we had not sufficiently valued some of the most important characteristics of Palladio's works, especially in omitting his practice of weaving a minor order with a major, which gave proporminor order with a major, which gave propor-tion by comparison. In the same manner, we had neglected to give expression to our roofs, a point much attended to by Palladio, in bis villas especially. It might be said, that in England the roof formed no part of our study. It was an anomaly in design: we nei-ther made it altogether terrace fashion, with a balustrade, nor yet altogether projecting, with a cornice. Vignola was always good in this part of the design, whilst Palladio, though part of the design, whist railadio, though attentive to the effect of the roof in his villas, was negligent in his town houses. But in England, where, for example, we might ex-pect a terrace, we had a bit of roof just peeping over a parapet. The sky-line in our buildings—coincidently with this kind of defect bugs—considering with this kind of defect
—was unattended to, and any effect which
might be produced by the gable, was unthought of in England now, although our
streets during the middle ages gave sufficient
evidence of the recognition of this feature. He instanced the Founding Hospital, as a building in which a good effect was given by

the disposition of the roofs.

He said there was less reason for omitting to make use of the roof as an integral part of the composition. because we were untramthe compared with other countries—in the structural arrangement of that part of the building. We were not confined to a high the structural arrangement of that part of the building. We were not confined to a high pitch, for we had little snow, and the best slates in the world. He believed that the great masters always considered the roof at the outset. Now, a foreigner would say,—if we are obliged to have heavy roofs, we treat them boldly; hut you, in England, would have nothing to prevent your making them graceful, if you knew how. Many a fine building was spoilt by the roof, which we were so much afraid of making heavy. In the same manner, we had spoilt by the root, which we were somechand of making heavy. In the same manner, we had neglected chimney shafts. Somerset House was spoiled by its chimneys; but Vanhrugh displayed a consummate knowledge of effect in these features, as shown in Blenheim, and at King's Weston, near Bristol, where they were connected by arches, so as to group into a sort of tower.

A foreigner might continue to say,-You have turned your count-yards into squares and streets, which are of such extent that they are admirably suited to your foggy climate; but your excessive use of columnar architecture, adopted in every building, whether prison or palace, or in the use of columns of the Jupiter-Stator order over a shop front, would imply that such materials were your all in all. Your streets are characteristic enough of a nation of shopkeepers, everything being sacrificed to shop windows; but the same objects might have been better attained, without the deformity, by raising the bressummer to the secondwindow-sills, as actually done in some instances

In continuing the subject of columnar architecture, the professor urged the advantage of using pedestals to columns in interiors. If columns were placed on the floor, they lost much of their dignity, if only from being partly concealed by furniture; and Raffaelle and other great architects always employed pedestals: it might, too, be ascertained that it was the Greek system to use them in interiors. In the treatment of windows, broad lights and narrow piers were justifiable in many cases but, as hefore stated, opportunity had not heen taken to decorate the alternate windows.—He noticed, in like manner, similar instances of inattention, particularly in buildings in the country, where, he said, our love of Palladio had amounted to positive insanity. Sufficient advantage had not been taken in the arrangement of interiors of the autority of height ment of interiors, of the opportunity of height-ening principal rooms by throwing the ceiling into the upper floor. In another particular the ceiling into the upper floor. In another particular too, a great mistake had been common,—that stowing away all the offices in a separate ilding at the side of the main one, which building at the building was intended to be hid by a planta-tion, which, however, was never done,—whilst in the works of architects like John Thorpe, offices and principal rooms were combined in

one grand design.

But our affectation of a feudal character of architecture would create still more astonishment. The foreigner might see towers and battlements, approach by a drawbridge, and raise a ponderous knocker, and be ushered in, not by a dwarf or a giant, but hy servants in new liveries, to modern drawing-rooms, furnished with articles of Gillow's latest patterns,—all with articles of offinows fatest patterns, and this expressing that we lived in peace and security in our homes, whilst we tried to make believe the contrary; and yet such anomalies we were hardly aware of, till they were pointed -But, in reference to church architecture, although during the last thirty years 1,500 churches had been erected for the established religion alone, what would be the impression rengion alone, was wound one the impression produced on the foreigner? It might naturally have been expected, that the arrangement of churches for the Protestant religion would have become settled after the accumulated experience of previous years, yet in almost every fifth year we had had a change of style. The commissioners had complained that they commissioners had complained that they could get no suggestions from architects, but they had actually scaled up all the documents of the commission of the reign of Queen Anne, which was composed chiefly of archi-Anne, which was composed chiefly of architects. The present commission had been formed in distrust of architects.—The last change had been to the Roman Catholic arrangement, suited to other times, and to another ritual. He (the professor) had at one time given great offence to a certain society, by saying that the proper form of the Protestant church was that of the auditorium. Gothic architecture for churches better suited the old England of the rural districts than the the old England of the rural districts than the new England of the towns. We were, indeed, afflicted with the Pointed style, and with forms in total disunion with the neighbouring architecture; and an affectation of monastic structures in the present day was as ridiculous as it would he to see the Duke of Wellington ride to the House crowned with laurel, and clad in the Roman toga.—The professor then reviewed the question of proportions of interiors, althe question or proportions or interiors, al-luding to the greater length required in the medieval church; and he examined the general outline of the village church, particularly re-marking upon the want of balance between the tower and the chancel, which a skifful master republishment proposed in the proposed proposed in the contower and the chancel, which a skilful master would bave united in one composition. He considered that the Greek cross was the best form for our church, with the requisite elevation given by the lantern.—However, he pointed out the marked difference hetween the classical and the mediæval systems, the former embodying the carnal mind, the latter the spiritual mind; the one the body, the other the soul; the one the intellectual or the sump-tuous, the other, heavenly aspiration. The medieval edifice was full of sentiment, and the professor gave some instances of those details which have a symbolic meaning. Any misuse of the characteristics of the opposite styles, as to put large doors in the Gothic church, only hetokened the ignorant mind, from which might God preserve us.

Continuing, in a similar manner, his notices of modern practice, he passed to the architectural characteristics of our public buildings. Who would suppose, he said, that in the dark courts of the India House was carried on the government of a vast empire, or that from the Horse Guards the thunders of British power were heard over the whole world? The law sent forth its edicts from holes and corners, such as Rhadamanthus occupied in the infernal regions; and the goddesses Themis and Nemesis, certainly worshipped in England, had not such temples as that at Rhamnus. How would our public buildings compare with those of the little state of Bavaria?

In concluding the present course, the pro-fessor expressed the pleasure which the lectures had always afforded him, and said he frankly confessed, that he had learnt as much from that he had learnt as much from preparing them, as he had been able to impart to his hearers, and more than by all the travels and the labours of his life. "Docendo docitur," and the labours of his life. "Docendo docitur," he said. Whether he had been able to impart as much to them, remained to be proved by their future works. Schools might produce good scholars, but we could never become good masters without we avoided the practice of begging and borrowing from everything indiscriminately. It must be regretted that indiscriminately. It must be regretted that opportunities of instruction were not so great opportunities of instruction were not so great in London as might be wished; but still we had colleges in which the whole subject of architecture was explained by the most emi-nent professors, and the architects of London might challenge the world. He recommended travel, as likely to give independence of thought, but it should not be according to the ordinary rule of travel, not the rushing down ordinary rule of travel, not the rushing down to Italy and Greece, and losing ourselves in sentimentalities; but certainly we ought first to see every part of our own country, full of objects of interest, and next, rather the north of Europe than the south, and climates analogous to our own; and, lastly, Italy and Greece. Some of the best architects had never travelled. travelled at all,—and of these Wren was a striking instance. Architecture was an art which required thought as much as observation, and more might be done within four walls than in galloping over the world. It was possible to have seen everything, and yet have learnt nothing. When we had built up the fabric of our education, it became us to devote ourselves to the strict fulfilment of our duties; and impressing the importance of these upon hearers, the professor wished them health, industry, and success, until he next met them, concluding a most interesting course of lec-tures amidst the hearty applause of his

MONUMENTS IN CEMETERIES.

THE cause of the inscription upon Sir Hans Sloane's monument, at Chelsea, being almost illegible, arises not so much from the dilapidated state of the entire monument, as from the unfitness of the material of which the tablet alone is composed. The epitaph is inscribed upon a Carrara marble slab, let into solid Portland stone: a method of every day occurrence, as may be seen in the cemeteries around the metropolis. The delicate nature of white marble renders it extremely difficult to colour the letters with a durable paint, without staining the surface of the tablet. Whether the letters are to be black, or any other colour, is immaterial; the question is, what vehicle the pigment shall be mixed with: if oil is used, no matter how small the quantity, the colour will remain in the letters many years, but there will be a permanent dirty brown stain, half an inch round every letter. To avoid such stain, some be a permanent urty to was sain, use a re-round every letter. To avoid such stain, some kind of spirit varnish is used, which, during the process of drying and hardening, shrinks, loses its adhesive quality, and, therefore, in many cases, separates from the marble without leaving the slightest trace in the cavity of the

At present, I know of no remedy for these defects, if marble is introduced in situa-tions exposed to the weather.

Within a few years, it has become the practice amongst the wealthy to have sepulchral monuments constructed entirely of marhle, either to gratify the vanity of surpassing a humble neighbour, or under the impression of it being the most durable substance. Although marble, when fresh from the workman's hand. beautiful material than common is a more stone, yet it has disadvantages which ought to preclude it from ever being applied to external decorations. When Carrara markle has been exposed to the weather, and to variations of temperature, for thirty or forty years, the crystals no longer adhere firmly to each other; the external appearance as yet remains un-altered, but the decomposing influence of atmosphere continues to penetrate deeply into the mass; the cohesion of the particles is imperceptibly destroyed, and, after the lapse of a century, it entirely falls into a kind of sparkling sand. The group of Queen Anne, &c., in front of St. Paul's Cathedral, executed in Carrara marble hy Francis Bird, the beginning of the last century, has long since heen painted, in order to preserve it a little longer from total ruin. The statue of George the Third, exe-cuted in marble by J. Wilton, R. A., and placed in one of the niches at the old Royal Exchange, was taken down to be repaired, about twenty-five years since, and was found to he too much decomposed to be put up again: it has since actually crumbled to dust. A mural monuactually crumbled to dust. A mural monu-ment, in the utmost state of decay, still exists at the external end, facing the east, of the church of St. Giles's-in-the-Fields. The church itself, built with the hest kind of Portland stone, is in a remarkably perfect condition, whereas the monument, made of Carrara marhle some years after the completion of the church, is now in such a mouldering state, that it must very shortly fall completely to atoms. Numerous other instances might be named, but it is hoped the above are sufficient to show the unfitness of that description of

marole for such purposes.

Many sculptors and masons entertain a high opinion of the durability of Ravaccioni marble, printed the durantity of Ravaccioni marble, erroneously called Sicilian, of which the arch now in front of Buckingham Palace may be named as a specimen.* There certainly is reason to helieve it to be a material likely to resist the action of an English atmosphere longer than Italian veined, or white Carrara marble; but, on attentive examination, it will be found that its chemical and mineralogical character scarcely differs from them, except in weight, hardness, and containing a little more earbonaceous matter. These qualities are by no means sufficient to warrant an idea that the Ravaccioni marble will last considerably longer than such as have heretofore been in general

The question may be asked, "why have the Elgin marbles, and other antique sculptures, resisted the mouldering touch of time for more than twenty centuries?" A long and highly than twenty centuries?" A long and highly interesting article might be written upon this subject; but for the present, suffice it to say that the same elements uniting in the same proportions do not necessarily generate the same body. Common ehalk, Carrara marble, and many of the oolitic limestones scarcely present a trace of difference in their chemical composition. To all appropriate the procedure of the common composition. composition. To all appearance, the marble of Pentelicus, in the neighbourhood of Athens, is an aqueous deposit, similar to the stalagmites, travertines, and other calcareous formations, constantly operating in the fresh-water cur-rents of Italy; most of which are extremely durable when applied to architectural purposes. Taking many circumstances into consideration, besides observing the progress of decay in Desides diserving the progress of uccay in Carrara marble, and comparing them with a long series of experiments, undertaken some years back by Sir James Hall, to verify a prin-ciple previously assumed by Dr. Hutton, in his "Theory of the Earth," we are induced to believe that Carrara marble, has been materially modified in its crystalline structure, by volcanic agency, acting under an excessive pressure of superincumbent earth, and ex-

cluded from the atmosphere. The same elements are consolidated in one case through the agency of water; and in the other, hy the inof fire; therefore we must expect, that the produce will vary considerably in duration, if subjected to the same atmospheric influand the instances already mentioned are quite sufficient to show that Carrara marhle is a material wholly unfit to be placed in situations exposed to the weather in this country.

C. H. SMITH.

CHELSEA HOSPITAL GARDENS AND THE RIVER BANKS

THE instruction and healthful recreation of the dense mass of human beings living in this overgrown metropolis, has been recognised to be one of the duties of national government. The principle has been acted upon to a considerable extent during a few past years, but many of its great capabilities still remain untouched. A good deal of what has been effected has been undertaken by the authoritative powers being urged on by Parlia-mentary desire, or the pressure from without. To these causes we owe increased accommodation to the British Museum, the National Gallery, Greenwich Hospital, the Towes of London, as well as the laying out of Victoria Park at Bethnal-green, and a proposed new rark at Bethnal-green, and a proposed new one in Battersea-fields. Parks are, however, of slow growth; and while the trees may grow which are not yet planted in the last-named undertaking, I wish to call attention to great capabilities for healthful enjoyment on the opposite bank of the river at Chelsea.

all the suburbs of London where good residences abound, there is not one so ill laid out for main thoroughfares as this locality, The King's-road, leading out of Sloane-square, is obstructed on the south side by the wall of the Royal asylum, which does not leave space for a footpath even; and opposite it one might imagine a rivalry of obstructions had taken place, each inhabitant endeavouring to push of trade to the edge of the kennel. Beyond Church-lane, leading to Battersea-bridge, the same enmity of transit appears to have afflicted the huilders. Considerable improvement was effected by making the road-way that traverses the front of Chelsea Hospital; but beyond that, at a little distance, the same inconvenience of a single footpath is occa-sioned by the wall of the apothecaries' garden, and a narrow dirty lane of irregular houses must be threaded before you can arrive at the fine river terrace of Cheyne-walk.

In the pursuit of this healthful recreation, on the Sunday afternoons of last summer, more than 5,000 persons have landed at the numerous piers on this spot from the river steamers. The majority of these are the quiet respectable persons of the industrious class, with their families. Few but the idle, wicked, and dissolute can venture on the opposite shore, where, on every Sunday in fine weather, a disgraceful saturnalia is held, in defiance rality and all the decencies that honour existence.

The subject to which it is particularly wished to eall attention is Chelsea Hospital with its extensive grounds. Some accommodation is granted by the officials, of a limited character: this seems not generally known; and it would be a great and desirable improvement to inthe means for its free perambulation.

Chelsea Hospital is a great monument of national benevolence. Belonging to the nation, and sustained with pride by a and sustained with pride by a heavily taxed people, they may claim as a public right the tranquil enjoyment of its pleasure grounds. The edifice besides has its internal attraction of the trophies of victorious war. In the chapel are preserved the eagles of Napoleon, eaptured at Barrosa, Talavera, and Waterloo. In the dining-hall remain the fragments of the standards won at Blenbeim, from the proud Louis the Fourteenth, surnamed the "Grand," besides flags of all nations, down to the Chinese, with the dragon banners.

How few have been the visiters to these mementoes of our successes on the hattle field, comparatively with the affluence of the curious at Greenwich! The latter appears gay as a palace, with its myriads of strollers, while the Chelsea gardens are melancholy as a cemetery. They are but little frequented, although in a

measure open to the public, but woe to the sprightly child who dares to tread on the ver-dant turf; that is not privileged to youthful sportiveness; the greater portion is an enclosed preserve where certain happy cows can chew the cud in undisturbed comfort.

The large area on the north of the building, with its umbrageous alleys of horse-chesnut trees, is only penetrated by a few well-dressed individuals,—for this latter qualification is rigorously enforced. The handsome gates opposite the King's-road are constantly locked, and never opened but to the governor or a grandee. The large grassplats between the alleys are railed off: no human foot ever treads A rick of hay in one corner marks conspieuously that the herbage is a perquisite. A stable, with outcast heaps of dung, proclaim the condition of enjoyment possessed by the

proprietor of the perquisite.

The grounds on the hanks of the river are much on the same condition, that is, to be well-dressed and keep on the gravel. principal space abutting on the hospital has a broad walk leading to a terrace on the river side, bordered by dwarfed lime trees. is no trespassing on the grass here, for a wide ditch on each side, brimful of stagnaut water, impedes the attempt; and on the other sides the spaces are strongly hedged in for the benefit of the aforesaid happy cows. another large space of ground adjoining this formal piece, piece, where a greater freedom is possibly because the vast sewer that allowed. comes down from Knightsbridge runs here open by its side. This portion retains some fine trees, affording shelter from the summer sun, at the expense of inhaling the odour of a tank of mud, about 60 feet long and 30 feet wide, close hy the side of the principal walk was formerly part of the famed Ranelagh Gardens, and leads down to the mouth of the sewer, where the filthy stream is discharged into the Thames. Here, just on the bank where its languid course becomes changed by a sharp descent into a bustling activity of emitting its foul odours before the river absorbs the precious fluid, several seats are placed, to enable visiters to inhale at their ease an ample store of the anti-olfactory scent.

If the sewers were arehed over, an open terrace made to the river, the enclosed spaces thrown open, and the stagnant imitative canals filled up, the gardens of Chelsea Hospital would make, with their present plantations, one of the most beautiful parks on a small scale with which London eould adorned. The good conduct of the people has already been established where any such advantages have been made open to them.

The garden of the Apotheearies' Company is but a few places off, and contains a variety of rare medicinal plants. Two magnificent cedars, planted in 1633, adorn the grounds, and there would be pleasant frontage to the river, if the cheering, breathing prospect were not completely shut out by two lateral walls on the last of the stream where all the refuse the bank of the stream, where all the refuse and rubhish of the garden is preserved. No stranger is admitted within its gates, excepting he is provided with an especial permission from some member of the corporate body. Yet the garden was a legacy to this society by Sir Hans Sloane, and who can doubt that the munificent bequest was intended to be a public henefit. Another large area, with a grassy lawn, on which stand some noble trees, is to the hospital grounds, namely, that of the Royal Asylum. How much space do all these offer, if opened in a proper spirit, for exercise and recreation, independent of the mental enjoyment that would arise to the mul-titude in the contemplation of these various establishments dedicated to science, humanity, and gratitude to the defenders of our country

IDLER IN LONDON.

CROCKFORD'S CLUB-HOUSE, ST. JAMES'S-STREET, is being scraped down externally, and is about to be decorated internally, for (as we are told) a Militia Club. A correspondent we are total a Militia Club: A correspondent remarks on the improvement to the front of this building, which has several good quali-ties, that would be made by the addition of a portice or porch. The suggestion is well worth the consideration of those concerned in

^{*} The Italian veined, white statuary, dove-coloured, and Ravaccioni marbles, mineralogically considered, are but slight variations of the same substance: they are all procured from quarries in the immediate neighbourhood of the town or village of Carrara in Tascany.

THE "PALAZZO REZZONICO," VENICE.

In our last volume, we gave a view of the Pesaro Palace, erected, from the designs of Baldassare Longhena, on the Grand Canal, Venice. Annexed is an engraving made from a sketch by Mr. Horace Jones, of another work by that master, the Palazzo Rezzonico, in the same city. The general arrangement of the two fronts will be found very similar,—the same number of stories, same number of windows, same general distribution. In the details, however, there is considerable difference. In our last volume* we gave a view of the however, there is considerable difference. The effect of this structure is peculiarly fine, and it has an advantage over its sister edifice in sim-

The upper story is attributed to Carlo Massari.

Cost of Newark Corn Enchange.—
I see in the Hustrated London News, Feb. 3, the Newark Corn Exchange is stated to have cost 4,300l.; now I am credibly informed that the cost of that building was nearly (or fully) 7,000l.—a slight difference. Such mis-statements as these are calculated to injure the profession and to mislead the public. I send you my name.

J. B.

TOPOGRAPHY OF JERUSALEM. MILLO.

It is gratifying to note the increased interest taken in the topography of Jerusalem and in the geography of the Holy Land.

As regards Millo, the writer in the last number goes far in clearing up a very old and great difficulty; but he might have gone further. In the Jewish economy, the house of Millo was the Jewish senate; and at an earlier period the Jebusites had a "house of Millo," which was also the seat of judgment in both period the Jebusites had a "house of Millo," which was also the seat of judgment in both cases: but as then every man was trained to arms, and the captain of a thousand was a senator (together with the elders, or birth aristocracy), we can from "Millo" trace the terms "Miles," a soldier, and "Mill," a thousand, and better understand why the term "Millo" was used as a generic term. As thus,—"And all the men of Sheehem gathered together, and all the house of Millo (the senate, i.e. the elders and captains of thousands of all Israel), and went, and made Abimelech king." (Judges ix. 6.)

Ephraim. The remains of Joseph, brought out of Egypt, were interred at Shechem; and by virtue of the birthright vested in Joseph by his father Jacob, the seat of government was in the territory assigned to Ephraim.

The compiler of the genealogies given in the first book of Chronicles helps us much here — (chap. v. 2), "For Judah prevailed above his brethren, and of him came the chief ruler, but the birthright was Joseph's."

In process of time, according to Divine and Ephraim. The remains of Joseph, brought

ruler, but the birthright was Joseph's."

In process of time, according to Divine appointment, the birthright passed to Judah; and David took the eastle of the Jebusites, on Mount Zion, "and dwelt in the fort, and built round about from Millo inward." The best writers are agreed that, in David's time, the eity or eastle of the Jebusites, afterwards the city and castle of David (insulated from Mount Zion), was a rock or mount per se, with a valley all round its base. The principal gate was, as in other cities, the seat of judgment, and the house of Millo, the senate-house ment, and the house of Millo, the senate-house Israel), and went, and made Abtimelech king."
(Judges ix. 6.)
The birthright was then in Joseph, and vested in Ephraim, at Shechem, where Joshua, who was of the tribe of Ephraim, had had his inheritance. So had also Eleazar, the high priest contemporary with Joshna. And the tabernacle was at Shiloh, not far distant from Shechem, and both within the territory of queen's palace to the other side of the valley, on Mount Zion, thereafter better known and designated, in innumerable instances in Scripture, as "the daughter" of Zion. A better communication, historians tell us, was acquired betwixt the two localities, by filling up that portion of the valley which had separated the eastle of David from the queen's palace on the daughter of Zion. In our own times, Mr. Johns, the architect, had to go down above 40 feet below the surface to reach a foundation for the Anglican Church of St. James; and I believe he went through the soil stated to have been filled in by Solomon. Solomon was instructed by God to build the temple on Mount Moriah. It is not so clear that either David or Solomon were instructed to remove the house of Millo from Shechem to Mount Zion. The children of Israel at large did not think so. They built willingly on Mount Mount Moriah, but unwillingly on Mount Zion. After Solomon had finished the temple, he followed the queen, and built palaces and the house of the forest of Lebanon on the daughter of Zion. The latter was a new house of Millo, or senate-house, far exceeding the royal palaces in extent and splendour, which we can credit when we contrast our new Houses of Parliament with our palaces.

Solomon was seven vears in building the

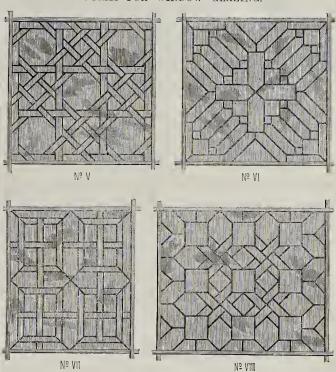

Solomon was seven years in building the temple, but he was thirteen years in building his own house. It did not please the tribe of Ephraim that the whole prestige of the seat of government at Shechem should thus be transferred to Mount Zion. The facts can be best stated in words of Scripture—"This is the reason of the levy which King Solomon raised; for to bmild the house of the Lord, and his own house, and Millo, and the wall of Jerusalem." (I Kings ix. 15.) "He (Solomon) made him (Jeroboam, an Ephraimite) ruler over all the charge (burden) of the house of Joseph." (I Kings xi. 28.) "And this was the cause that he (Jerohoam) lifted up his hand against the king; Solomon built Millo, and repaired the breaches of the city of David his father." (I Kings xi. 27.) "And Reboboam went to Shechem, for all Israel were come to Shechem to make him king." (I Kings xii. 1.)

From these passages it is clear that Solomon had displeased the people by adding burdens or levies for buildings on Mount Zion, which the people thought excessive and unwarranted, and they simply required from Rehoboam a little breathing time, which he refused to grant, and thus lost ten-twelfths of his kingdom. Rehoboam ought to have foreseen the result of a stern resolution on the part of the authorities not to come to Solomon's house of Millo, at Sbechem, notwithstanding the fact that the thrones of the house of David were set in the house of the forest of Lebanon. Joash was slain by his servants "in the house of Millo, at (2 Kings xii. 20), probably when being carried in a litter, ill ("on his bed"), from his palace to Siloam, which agrees with the site assigned by Dr. Richardson [vol. ii. page 268] to the house of the forest of Lebanon, and the ruins of which he hopes will one day be excavated from beneath the surrounding and accumulated soil. There are many other references in the Old Testament to, and highly interesting details of, the house of the forest of Lebanon, or Millo, in Josephus and Adrichom. I gather from the New Testament that a building for similar purposes and uses stood on the old site in the days of our Lord.

G. H.

Theatre Royal, Adelphi.—The new Adelphi drama, by Mr. Buckstone (and an Adelphi drama is a thing per se, and has been so for as many years as we can remember, consisting of exciting mystery, injudicious love, streaks of broad fun, dreadful murder, and O. Smith), contains three very well painted scenes;—the Hall of Raynham Castle, with columns and entablatures; the Hop-grounds; and a night-scene in the open country, "The Cross Roads." The disappearance of the castle on the hill, in the background of the latter, in the increasing darkness, and their re-appearance, illuminated by the moon, make a striking point, and show consideration. The wheel-tracks in the road give much completeness to the scene. Mr. Pitts is the chief artist here.

FORMS FOR WINDOW GLAZING.

PATTERNS FOR WINDOW GLAZING.

Above we add four to the patterns of glazing already given, and shall be glad to find them made use of. They are from various churches in France.

TELEGRAPHIC COMMUNICATION ACROSS SEAS.

The proposed Dublin and Holyhead submarine line of telegraph has been estimated by Mr. Blunt, the projector, to cost about 16,000. This sum, it was his desire, in the outset, the project being one of national importance, to obtain from the Treasury; but although he was assured that "their lordships had no wish to throw any impediment in the way of any experiment he might be disposed to make," and by the Admiralty that "they would hear of the success of this undertaking with much satisfaction," the proposal to advance the cash was declined, on the ground that their lordships "had no funds to apply to such purpose." It is under these auspices, such as they are, that Mr. Blunt proposes to carry out his design, unaided by the Treasury, but probably with the assistance of a company of shareholders. We know not whether it be intended to insulate the wires with gutta percha, but were it so, we have no hesitation in saying that such a scheme would be premature; for as yet nothing is known about the sufficiency, or even the existence, of any series of experimental tests of the capability of such an insulater to withstand even the physical or mechanical action of oceanic influences, especially the ravages of marine insects, or other of those living creatures which pervade the ocean, and, as we have already noted, bore their way through even the solid rock, consuming all that is not mineral. Moreover, the public as yet know notbing of the chemical power of gutta percha to resist various other destructive influences with which he ocean teems. In a slight experiment, instituted on the spur of the moment by ourselves for instance, we find that two at least, and not the most powerful, though in our case

the readiest, of those dissolving, penetrative, and insinuating agencies, the halogens, viz., bromine and iodine, which, with chlorine, constitute such peculiar and abundant elements in the chemical constitution of the ocean, in a very few minutes penetrate dceply into, blacken, and alter the substance of gutta percha, which does not appear to be capable, therefore, of resisting even these influences. Any appeal to the public for support should be preceded by adequate and successful experimental tests of the power of such wires, &c., as are to be used, to resist all sorts of oceanic influences, chemical as well as mechanical, for a sufficient length of time, and still to continue in good working order.

But it has even been suggested that we shall yet see the submarine electro-telegraphic communication established without conducting wires at all! and by the mere uninsulated circuit already completed between the ocean on the one hand, and the ocean bed on the other. Experiments, already made, at least give some countenance to the suggestion as a bare possibility, if not as a great probability, though many cannot even imagine the possibility of such a thing. May we be allowed to assist the fancy of the latter order of matter-of-fact minds a little without incurring the risk of being ranked with believers in the great probability of such a consummation, in place of in its mere bare possibility? We do love to dive a little into possibilities, and to put an unmitigated faith in the miraculous powers of nature, as the wonders of the nineteenth century so fully justify us in doing, without being such fools as to regard any thing as highly probable, merely because we deen it within the bounds of possibility. Our suggestion, however, is merely one of more or less slight analogy, and by no means one with higher pretensions as to explanation, &c. The possibility of such a communication, we think, may at least be conceived, when it is considered that an American-Indian is able to distinguisb impressions produced by footsteps, &c., on the ground at immense distances and beyond the reach of the eyesight, by merely planting his ear close to the ground on which

he stood. There is merely a vague analogy here, be it readily admitted, but it may give an idea of the possibility of electro-telegraphic impressions being distinguished by the apparatus of an electro-telegraphic ear, if we may so eall it, and at an immense distance apart, without any special or insulated line of transmission. Indeed the analogy is not so very vague, after all, as may be supposed; for we can readily conceive the possibility of a couple of sbarp-eared Indians carrying on an acousto-telegraphic communication by a preconcerted series of signal-impressions, transmitted backwards and forwards through the ground as the sole uninsulated medium. Moreover there is a stronger analogy we believe between the force called into action or excitation in electrics, than is generally imagined.

RAILWAY JOTTINGS.

CIRCULATING railway libraries seem to be now the order of the day, and about to have their run through all the railways, so that passengers themselves, no less than their parcels, may soon be any where "booked for a penny." The Great Western are having one with 100 volumes set against their Ded ith 1,000 volumes set agoing at their Paddington terminus, where passengers, for a like sum, may have the run of the whole, if they choose, or can get through them fast enough, "while waiting for the train." If this be all, however, and if it be only at the Paddington station that the 1,000 volumes are to be deposited and read, we ought rather denominate this one a station-ary library than a circulating or a railway one, for the latter of which, duplicate thousands will be requisite at various stations to complete the circle of rota-tion. Messrs, Marshall and Sons have taken the contract, and retain the management, at Paddington, where the library table is also to be supplied with all the metropolitan papers, periodicals, and other publications, for sale.— The railway servants at Rugby are getting up a co-operative club, or association, for the purchase of provisions, &c., at wholesale prices, and their distribution or sale amongst the members at a trifling retail profit.——The works at the Great Western Docks, Milbay, Plymouth, were lately stopped, in consequence of some difference between the contractor and the company.—The tunnelling portion of the Manchester and Matlock line, near Matlock, is in a state of great forwardness, and the other works are proceeding steadily.

—Some blasting operations of an extensive character have been effected at Bray Head, on the Waterford, Wexford, and Wicklow line of Three large drifts were lately made, 25 feet in depth, and 5 inches in diameter, with two supdepth, and 5 inches in diameter, with two supplemental ones of smaller dimensions. They were hored 15 feet from the surface of the rock, and about 6 feet apart. About 450 lbs. weight of gunpowder were used in charging them, principally government powder. They were connected with a 10-pair battery of Callan's, and fired. The explosive noise was not loud but rumhling, and the spalls were not driven any distance. The length of rock displaced was 45 feet, the breadth 25 feet, and cheth 25 feet. Mr. Copeland, the local engiplaced was 45 feet, the breadth 25 feet, and depth 25 feet. Mr. Copeland, the local engineer, was the operator. Several minor blasts were made, showing, it is said, the activity with which obstacles formerly considered impracticable, are now disappearing. The long tunnel at the southern end of the head can be passed through walking upright. The original intention of crossing the deeply-indented ravines made by the sea, by means of bridges, is abandoned, and all will now be filled up at a less amount of expresse of bridges, is abandoned, and all will now be filled up at a less amount of expense, and with equal stability and safety. A Liverpool contemporary quotes rather an odd story about a recent meeting of this Irish Company in London, called, according to another authority in a Bradford paper, by the Directors themselves. "Neither the chairman nor the secretary attended," says our authority, "but the secretary's clerk (was he an Irish griptlyman!) went in and coderather the chairman. gintleman?) went in and ordered the share-holders to depart, insulting them most grossly, and threatening, when remonstrated with, to call a policeman to clear the room. Being asked who had authorised him to attend and dissolve the meeting, he said he would answer

no impirtinent questions. Mr. Nash was called to the chair. It was resolved, that, in consequence of certain unsatisfactory matters relating to the accounts, a committee of three be appointed for their investigation, with liberty to report on the future prospects and manage-ment, or the suspension or sale of the line, and to bring these subjects before a committee of the House of Lords, now sitting on railway accounts."—The extension of the Blackwall line to Bow is now complete, as also is the alteration of gauge for the junction with the Eastern Counties line.—According to the Leeds Intelligencer, nearly three-fourths of the Leeds Intelligencer, nearly unrecounting to the immense wooden viaduct now erecting at Mytholm Bridge, on the Holmfirth branch of the Huddersfield and Penistone Junction with the Sheffield and Manchester Railway, were lately blown down. Many of with the Sheineld and Manchester Kailway, were lately blown down. Many of the colossal upright timber pieces composing the structure were snapped in twain as if they had been mere match-wood.—
The viaduct at Comrie Den, on the Stirling and The viaduct at Comre Den, on the Stirling and Dunfermline line, the foundation stone of which was laid on 5th February, 1847, was finished during the mouth just past. The length is 434 feet, width 45 feet, and height in centre from foundation-stone to top of cope-stone about 70 feet. feet.—The works at the eastern termini of the Manchester, Sheffield, and Lincoln are being urged forward. The works at New being urged forward. The works at New Holland, designed by Mr. Fowler to complete the ferries on that side, have been let to Messrs. the terries on that side, have been let to Messis. Wilson, of Leeds. They consist of an iron pontoon or floating pier of large dimensions, which is to rise and fall with the tide, and of two hollow wrought-iron girders, which will connect it with the present pier in such a way see analytic the presenters to despend under as to enable the passengers to descend, under cover, down a gentle incline from the railway train to the steam-boat. The works of the Great Grimsby Docks, as designed by Mr. Rendell, have been let to Messrs. Hutchings, Brown, and Wright.—The Great Western, says the Gloucester Journal, have made another retrenchment at the expense of the public convenience, by taking off several trains; amongst which is the 6 o'clock morning train from Paddington. The London papers do not in consequence reach Glocester, Bath, and Bristol until 12 o'clock, instead of 10, as formerly. What makes this alteration more remarkable is, that the train is taken off at the commencement of summer, during which pays, though it has been continued ough the winter, when it does not. through the winter, when it does not. — A Knaresborough correspondent, A. S. S., complains very justly of the miserable economy, or mistaken policy, whichever it be, still practised on various lines, of buddling all and sundry third-class passengers, at night, into unlighted carriages. Were these carriages lighted as they ought to he, not only would thieving and other practices he put a stop to, but, as our correspondent shreadly. observes, many who are able enough to pay for the higher classes of carriages, but who are actually induced to enter the third class under screen of the darkness no doubt in-tended to deter them, would be driven off to their own more betting class-carriages so soon as they were exposed to view among third-class passengers. In general, too, there third-class passengers. In general, too, there is not only a want of light but of ventilation in third-class carriages, which ought to be remedied, as it readily could be with very little expense.—A signal-light has been recently registered, "by the use of which a signal may be given by the presengers invided. be given by the passengers inside a carriage to the guard or attendant on the outside, whenever urgent necessity [such as the ignition of a carriage by friction or otherwise, the ent or dread of accidents from other causes, sudden illness or apparent death, ill-usage, or sudden liness or apparent death, ill-usage, or threats of murder, robbery, &c.] may require a communication to be opened between them." This is just another of those half measures which await the 'completion of the circle' of communication by the opening of a way of personal access to the carriages, whereby the guards may be the better able to judge of the urgency of the peril which such signal-lights may or may not faithfully indicate. The may or may not faithfully indicate. The Government railway commissioners, it may be recollected, lately recommended to railway companies the adoption of a protected line of footboards for this very purpose. We trust the recommendation will not be overlooked or neglected till some serious fatality occur in

which it may be proved to a jury that such a step would bave constituted an efficient and sure preventive.—The United States' Senate have adopted a resolution, directing a survey to be made by the topographical corps to ascertain the best route for a railroad from the Mississippi to San Francisco.

NOTES IN THE PROVINCES.

THE parish church of Aylsham remains closed for want of funds to render it safe. The foundations of the heavy tower had so far given way that the architect who examined them pronounced the whole building insecure till a considerable outlay shall have been devoted to it, Extensive repairs and alterations were recently made in the chancel by the vicar.—Numbers of unemployed hands have recently flocked to Portland in the hope of obtaining a share of the good things destined for the convicts. Not having made themselves eligible, they have not got "leave to toil" in accordance with their request. The supply, it appears, exceeds the demand. The works are progressing their request. The supply, it appears, exceeds the demand. The works are progressing expeditiously.—Plans have been provided for the restoration of the pewing of St. Martin's Church, Salisbury. The estimated cost will be under 1,000L, of which about 700L. can be obtained to start with, and a rate has been resolved on for the remainder, so that the restorations will be immediately proceeded with.—The modern altar-screen in Ludlow Church has been removed, and the original Church has been removed, and the original carved stone altar-picee again laid open to view and regilded. Mr. R. K. Penson is the architect selected to carry out the work of restoration here, for which a subscription is to be forthwith entered into. — The Swansea corporation lately proposed to borrow 50,000.

On corporate property, chiefly to make a wetdock but the Treasury, it is said have refused. dock but the Treasury, it is said, have refused to accede to the proposal.—The church of St. Peter, Everton, Liverpool, the foundationstone of which was lately laid, will nearly form an equilateral triangle with St. George's and Chair Charle. an equilateral triangle with St. George's and equilateral triangle with St. George's and Christ Church, Everton. It is arranged to accommodate 1,200, mostly free. The floor will be laid with red and blue tiles, and the househos will be loose and uniform. The architecture of the control of t will be find with red and blue ties, and the benches will be loose and uniform. The archi-tecture is middle pointed, and the building will be divided into a lofty nave, with clerestory, north and south aisles, with choir and chancel. A spire, 150 feet in height, is building at the west end of the north aisle. The extreme length from east to west is $45\frac{1}{2}$ yards, and the breadth from north to south 22 yards, exclusive of a large porch forming the access from Sackville-street. The amount of the contracts for its completion is 4,102l. Mr. Hay is the architect. An engraving of the edifice appears to have been prepared.—Amended plans for baths and washhouses at Manchester have been agreed on, and measures taken for obtaining tenders for the work.—One of the Norman windows of the south aisle of the nave of Southwell Collegiate Church has been recently filled with painted glass.—In "The Land we Live in," it is noted that a flax mill at Leeds measures ahout 400 feet long by more than 200 broad, and covers nearly two acres of ground "Birmingham," adds the writer, "is justly proud of its Townhall, but this wonderful proud of its Townhall, but this wonderful factory-room is nine times as large. Exeter Hall is one of the largest rooms in London, but it would require seven such to equal the area of this room."—Hawes Church, according to the Leeds Intelligencer, is now to be enlarged or a new one built.—Arrangements are in progress for the erection of a bridge across the Tyne at Ovingham.

ERECTION OF BARRACKS, &c.—A circular has just been issued from the Horse Guards, inclosing ordnance regulations for the future erection and repairs of barracks in the United Kingdom. It orders that, for the future, no repairs shall be made without representation to the authorities on the subject. It would appear, says the Morning Post, that the expenditure of money in barrack erection and repairing has been for some time carried on in the most reckless manner. In Ireland barrack johbing has been most wantonly carried on, although there is searcely a barrack in the country capable of affording comfortable accommodation to the officers and men.

GLOUCESTER.

The destruction of the noble cathedral of this city, as already noted by us, was lately threatened by a fire which broke out in the College School. The library of the school, which communicates with which communicates with it, is over the Chapter-room, on the north side of the catbedral, and abutting against the north transept. But for great exertions, the fire must have extended to the north transept.

There have been several other fires in

Gloucester since.

Another effort has been made in the town council to induce the establishment of a museum, and Mr. Bowly deserves credit for having done his utmost to induce the council to obtain accommodation for this purpose. We are sorry to say the proposition was negatived: that a city like Gloucester should have no museum is disgraceful to its many wealthy denizens. Not long ago a fine collection was offered them if they would but provide a proper place for its reception. Renew your efforts, Mr. Bowly, and persevere until you succeed.

THE SHIELD OF ÆNEAS-PITTS THE SCULPTOR.

SINCE you published my remark on the shield of Eneas last week, I have learned that on the death of Mr. Pitts, Messrs. Mortimer and Hunt (now Hunt and Roskill), spontaneously offered Mrs. Pitts 500l. for the model of the same, which offer was at once accepted by Mrs. Pitts, she reserving the right of disposing of casts in wax or plaster. At present no such casts have been made. The "Shield of Hercules from Hesiod," is will in the acceptance of the same of th The "Shield of Hercules from Hesiod," is still in the possession of Mr. Pitts' family. The "Pleiades adorning Night," was sold for only 50t,, not the value of the time employed in making the cast from the model. In describing the working of the shield in silver, I ought to have mentioned that the silver plates are hrought, by bending and hanimering them, into form over a hard metallic cast taken from the model hefore they are placed on the pitchy substance for chasing and finishing.

METROPOLITAN COMMISSION OF SEWERS.

OPINION OF THE LAW OFFICERS.

A GENERAL court of the Metropolitan Commissioners of Sewers was held yesterday at the district office, Hatton Garden, Mr. Edward Lawes in the

The court was held in consequence of the im-mense number of defaulters in the payment of sewer-rates, amounting altogether to nearly 10,000. This large number was produced partly in consequence of a practice which formerly existed in this commission, under the Local Act, 54th Geo. 3, c. 219, s. 10, to forego all sewer-rates on houses

commission, under the Local Act, 54th Geo. 3, c. 219, s. 10, to forego all sewer-rates on houses that were for any period unoccupied.

Long before the hour of commencing business, the vicinity of the office was so densely crowded with this immense number of appellants, that Hatton Garden was rendered almost impassable, and it required the assistance of a large body of police to preserve any thing like order. On the opening of the court the rush for admission was tremendous.

The New Isington Cattle Market.—The solicitor to Islington cattle market appealed against the rate, on wholly, but for such portion of it as was charged on the part appropriated as a layer for cattle, extending to fifteen acres. This part of the market had hitherto not been used for the purposes whatever. After some discussion it was agreed that a case should be drawn up by the solicitor to the company, and the subject receive further consideration.—The rest of the appeals were disposed of, the question of empty houses being reserved for future consideration.

The Clascal draw Rusiness of the Commission.

question of empty houses being reserved for future consideration.

The Closed door Business of the Commission.

Mr. Leslie then rose and said, it became his duty to move that the case and opinion of the attorney and solicitor general, as to the mode of conducting the business of the commission by committee, be printed and circulated amongst the commissioners. The case, as submitted, consists of nearly forty sheets of brief paper, but the following are the questions embracing the main point referred for the consideration of the law officers of the Crown, with their answer thereto: with their answer thereto:

QUESTIONS.

You are requested to advise the Blotropolitan Commis-sioners of Sewers if they can lawfully perform their duties by anch abuldision of labour as night be effected by means of committees appointed by the court, and consisting re-spectively of a limited number of commissioners, acting under the control of the court; and to what extent can the court delegate its authority to a committee, or sub-com-

mittee, and what, if any authority could be conferred on a limited number of commissioners to regulate works of a given kind, as, for instance, the cleansing of sewers, ditches, drains, &c., under sections 50, 52, and 58, or to regulate and manage the works of the commission generally. If the court can make such delegation, would the orders of the commission implicit movie the entering into contracts, requiring works to be done and paid for, or imposing burdens on parties, be of force until atterwards confirmed by a court of sewers? If the commissioners may appoint of the commissioners may be a confirmed by a court of sewers? If the commissioners may appoint of the commissioners may be a confirmed the commissioners and appointment of committees, without previously making formal bye-laws under the 123rd section of the new Act.

OPINION.

viously making formal byc-laws under the 123rd section of the new Act.

OPINION.

We think that the commissioners may lawfully perform all duties of mere regulation and management by means of committees specifically appointed for the specific purpose under the 21st section, and of direction and superintendence of works and operations in progress by means of one or two commissioners appointed according to the 22rd section.

Orders for works and expenditure, decrees, rates, byc-laws, and other things which the count, which speaks by its seal, and whose proceedings are public and recorded.

That originate with the court, which speaks by its seal, and whose proceedings are public and recorded.

That originate with the court, which speaks by its seal, and whose proceedings are public and recorded.

That original authority cannot be delegated, nor can any committee be empowered to use the seal. Under an order of court defining the purposes of the appointment, and referring the specific subject, a committee may lawfully by act of court. The committee and record only by act of court. The committee can originate no business, but any letters, plans, or accounts may be referred to a committee; and it may not only report on any nunteers of the seal of the seal of the court, but also may be referred to a committee; and it may not only report on any nunteer seferred to the forth of the information of the court, but also may be referred to a committee; and it may not only report on any nunteer seferred to the forth of the information of the court, but also may be referred to a forth of the information of the court, but also may be referred to a forth of the information of the court, but also may be referred to the commissioners, as a body, can act. Practically the court, in all details not reculting that act of court, by which alone the counties may be empowered from time to time, by appointment for the specific purpose, to suggest plans, consider reports of officers, proceeding the counties of the commissioners. Committees m

order of court.

Rules of general and permanent application would be "Syclaws," and must be made according to the provisions of the 12 ord section, and no new or additional offices can be created without a bye-law.

(Signed)

John Jervis, John Romilly, J. Henderson.

Temple, 10th March, 1849. After a few words from the Hon. F. Byng, Mr. Leslie's motion was put and carried unanimously, and the court adjourned.

Books.

Rudimentary Treatise on Geology, by Lieut .-

Ruamentary Treatise on Geology, by Lieut.-Col. Pourtlock, F.R.S.

Rudimentary Electricity, being a concise ex-position of the general principles of electri-cal sciences and the purposes to which it has been applied, by Sir W. Snow Harris, F.D.S.

Rudimentary Mechanics, being a concise exposition of the general principles of mechanical science, by Charles Tomlinson.

Rudimentary Treatise on Well-digging, Boring, and Pump Work, by J. G. SWINDELL, M.I.B.A., with 16 plates. London: Weale,

Mr. WEALE'S series of Rudimentary Works for beginners, of which these are four, has now advanced to a considerable extent, and forms a goodly range of little red books, well calculated to be of service to the rising generation. Each subject is treated briefly but perspicuously, and the name of the author is a guarantee of the general soundness of the ws advanced

Mr. Swindell's treatise would be found particularly useful by several correspondents who have recently questioned us on the subject of well-digging and boring.

well-digging and borng.
Relative to one part of the series reviewed
by us some time since, namely, the treatise on
"The Orders," a correspondent complains
that in the second edition of it, which has been
published, the definition of "copying," given
in the first is omitted.

in the first, is omitted.

"Copying," says the author, "is the process of converting design into manufacture, and an architect into a machine." "This (continues our correspondent) is a truth that every architect ought to know. Everybody cries out that architecture has declined, and at the present day we cannot produce such splendid works as those of our forefathers. Vcry true—but why? Because at the present day the principles of composition are usurped by the principles of copyism, and he who makes

the most perfect copy is lauded as a genius; whereas he who attempts to produce a new work upon asthetic principles is pool-poohed as an innovator, a booby who presumes to think, when thought is quite unnecessary in the architecture of the nineteenth century."
He calls on the publisher to restore the definition in subsequent issues, and we offer no objection.

Miscellanea.

ROYAL LYCEUM THEATRE. — A capital little piece by Mr. Planché, called "A Romantic Idea," in which Mr. Cbarles Mathews, Mr. Hall, Mr. Roxby, Miss Fitzwilliam, and others play admirably, bas given Mr. W. Beverley an occasion for two architectural paintings of considerable excellence. The first is the roins of a roofiess ball in a German castle, with the tower at the back, and the whole bathed in the mild moon beams, a beautiful piece of effect, and in no way offending an architectural enect, and in no way offending an architectural eye in the details. The second shews the hall restored; and remembering the "villanous compounds" which Gothic interiors some years ago usually presented on our stage, claims for Mr. Beverley great praise for congruous design as well as good painting. The sudden re-transformation to the ruin is very striking and effective. striking and effective.

EN'S COLLEGE OF CIVIL ENGINEERS AND ARCHITECTS, BIRMINGHAM.—The heads of Queen's College, Birmingham, have matured a plan for the addition of an engineering department to the college on a site adjoining, recently purchased. They have resolved, in confirming a report of the committee appointed to mature the plan, that lecture rooms, model rooms, workshop, laboratory, and students' chambers be fortbwith erected, and opened next October; that tutors and professors be appointed, the latter to give lectures on civil eigineering, land surveying, practical mathematics, geometrical and architectural drawing, geology, mineralogy, and the arts of construction; that the system of tuition embrace a three years' course; that an engineering workshop be furnished, also a model room; that junior students be of the age of about sixteen, and those for the three years' course about eighteen; that students prepare for matriculation in the University of London end of first year, and for taking their B.A. degree in same University end of third year; and that students who have matriculated and graduated be ad-nissible as caudidates for fellowships in Queen's College.

THE BURIAL IN TOWNS QUESTION .wilbe seen, hy an advertisement, that a public meeting will be held at the late Crown and Anchor, in the Strand, on the 4th of April, to petition Parliament to close burial places in cities and towns; Mr. Bond Cabbell, M.P., preside. will preside. The great importance of the question is becoming gradually felt. The City Sewers Commissioners have been stirring actively in it, and have caused the discon-tinuance of burials at St. Bride's. A corre-spondent who forwarded to us a short time since a plan of the abominable Spa-fields ground and the neighbourhood, suggested ground and the neighbourhood, suggested that a plan of the town, showing clearly all these plague-spiots, and accompanied by a few statistics, could not fail to have a powerful effect on the public.

HOUSE-PAINTERS' BRUSHES.—Mr. Nash, a

manufacturer, has registered a supposed im-provement in painters' brushes: it consists in the use of a metal binding, of circular form, flattened into a somewhat oval shape at the upper part of the brush near the flags of the bristles, with the view to cause the top of the brush to be flattened at the back and front of the same, in order to afford better surfaces for use. The asserted advantages of this arrangement are, that by the substitution of the metallic binding for strings wound round the flags of the bristles—as now in common use of wire, the brusbes are not so liable to one to pieces or allow loose hairs to come out. Whether or not the increased strain on the workman's wrist, slight though the extra weight may be, will be found disadvantageous, remains to he seen.

COMPETITION.—Five pounds are offered for a plan (to be approved of hy a committee) for the erection of a school-room at Deptford.

PROJECTED WORKS.—Advertisements have been issued for tenders, by 31st inst., for the restoration of a portion of Llandaff Cathedral (the Presbytery); by 9th April, for the erection of additional buildings to the workhouse of St. George (East), Middlesex; by 14th, for the execution and completion of the criminal court, &c., at Cardiff, Glamorganshire; by 4th, for the erection of baths and washhouses at Bristol; by 19th inst., for the complete restoration of the tower of Thurmaston Church; by 21st, for the erection of a new north aisle to the church at Great Barford, near St. Neots, and otherwise restoring the same, and building a new vestry, with other works,—also for the complete restoration of the chancel of same church, with new roof, &c. (separate tenders); by 5th April, for building a stone bridge of one arch or more, or an iron suspension-bridge, over the Ithon, at Disserth, Radnorshire; by 2nd, for re-building a house and offices (chiefly with old materials) at Petham, near Canterbury; by 3rd diaterials at Petham, near Canterbury; by 23rd inst., for the excavation of a new reservoir at North Shields, and the walling of a reservoir there, both for the North Shields Water-works (separate or together); hy 28th, for the removal of a portion of the hank of the fiver Clyde at Glasgow; by 27th, for erecting the works of a tunnel at Islington for the Great Northern Railway; hy 28th, for the erection of the stations, sheds, goods warehouse, &c., on the Shrewsbury and Birmingham line at Oaken Gates gludy and Shiffinal, and also for the stations at Albreydham and by 24th, for supplying and laying down Cornish granite kerb, Yorkshire paving, flag-paving, pebhlepaving, granite cubes,—also for taking up and relaying old paving, &c., all at Greenwich.

BLIND BUILDERS.—Tenders for the erection of a new wing to the Derbyshire General Infirmary, at Derhy, Mr. H. J. Stevens, architect. The countiline was furnished.

tect.	The quantities were furnished.

THE "BURIAL OF HANDLD."—Our readers will remember a letter from a correspondent in the last number but one of THE BULDER, on this subject. Further inquiry shows that the story given in writing (as we understand) at the bar of the house where the daub which led to the reports is, to persons who, much interested in the matter, went there to inquire, and which seemed to give colour to the case, was incorrect.* The statement now is that only eighteen months ago the canvas on which it is painted had on it the portraits of two children. We fully expected that the story could be proved wholly groundless, and gave place to the letter, finding the statement current in several quarters, with no other motive than that it should be so. Our only regret is that Mr. F. R. Pickersgill did not, instead of addressing a note to us as little marked by courtesy as wisdom, avail himself of the opportunity which was in kindness offered him, and disprove the assertions which were being made.

TOMB OF NAPOLEON, PARIS.-A French paper, quoted by the Athenaum, gives the fol-lowing details relating to works at the tomb of the Emperor Napoleon. An immense circular crypt has been dug beneath the dome; within which, on three shafts of green marhle, the sar cophagus containing the emperor's coffin will repose. The block of porphyry which the curious are now flocking to see on the Quai d'Orsay is destined to cover the sarcophagus. A lower gallery, paved in mosaics and lined with marble bas-reliefs representing the principal events in the Emperor's life, will admit the public to circulate about the sarcophagns. Twelve colossal statues in white sarcophagus. Twelve colossal statues in white marble—of which six are already placed—will sustain an upper gallery whence it may be looked down on and its details examined from above. These allegorical statues, from the chisel of Pradier, represent the principal branches of human activity—Science, Legislation, War, Arts, &c. A magnificent altar of branches of numan activity—Science, Legis-lation, War, Arts, &c. A magnificent altar of black marble veined with white rises in front of the tomb. Four large and beautiful columns, also of black and white marble, support the canopy of carved and gilt wood. Ten hroad steps, each cut from a single block of Carrara marble, lead up to the funeral altar. Beneath this altar is the passage to the lower gallery ahove spoken of, whose entrance is guarded on either side by the tombs, in black marble, of Bertrand and Duroc-dead marshals keeping wait at the door of the imperial dead. The marhles employed in the construction of this tomh cost not less than 60,0001. in the rough; the sculptures and bas-reliefs executed by Simart cost 24,000l. The block of porphyry for the covering of the sarcophagus weighs 45,000 kilogrammes; its extraction and carriage to Paris cost 5,600l.

DILAPIDATIONS.—On Wednesday last a case of considerable importance between land-ord and tenant was decided in the County Court at Kingsbridge, by the judge, Mr. W. M. Pread. The plaintiff sued the defendant for 4s. 6d., being the amount paid hy him for repairing the glass of the windows of a dwelling house, left by defendant on the 8th of December last, and which the defendant refused to repair. His honour inquired what agreement was made when defendant first took the house three years and a half ago? The plaintiff said that he could not recollect, but relied entirely on the custom of the country. He said he had been in the labit of letting many dwelling-houses of his own for the last twenty-five years, and had also been employed to some extent as an agent for other owners of houses, and had always relied on the custom of the country to compel the tenants to repair the glass broken by them. His honour immediately gave judgment for the defendant, observing, that a tenant was no more bound by the custom of the country to repair the glass of the windows, than the thatch or any other part of the house. Thus far the Devonport and Plymouth Chronicle. We should like to know where Judge Pread got his law from.

GUILDFORD DRAINAGE COMPETITION.—
What are we to think of the proceedings of the Commissioners of Pavements with respect to the plans, &c. lodged for the drainage of the town on the 15th January last? The only information I have received has been derived from your paper of the 3rd ult., which was not of the most satisfactory description. Should the statement made by your correspondent, in the number of your journal referred to, be correct, I hope the competitors will take some steps to expose such reprehensible practices on the part of public bodies, and lead to the parties in question putting forth some explanation of what they have been about, and what they intend to do.—A COMPETTION.

EMPLOYMENT OF THE WORKING CLASSES.

—A public meeting of the trades of London has been held at the Hall of Commerce, Threadneedle-street, "To take into consideration the distressed condition of the trades of the metropolis, and the working classes generally, with a view to petition Parliament to sanction the establishment of home colonies, as a mode of giving immediate employment to the numerous but compulsorily unemployed of our population. Also to consider the propriety of petitioning Parliament for the establishment of local boards of trade." The chair was taken by Mr. Luke J. Hansard.

THE LONDON EXCHANGE CHIMES.—The hells of the ROYal Exchange have caused some jangling, and have put the pipes out of several members of the Common Council. One of the Messrs, Mears, who have received the tin in exchange for their bell-metal, went to the court a few days ago, quite out of tune, objected to certain statements which had gone forth, and offered to make any alteration that might be required by the corporation. Of course he could not admit that his bells were cracked—thought perhaps that the epithet applied better to those in the court who would let their clappers run to his injury. Old citizens shake their heads, and say the new chimes would never have brought back "Whittington."

ROYAL INSTITUTE OF ARCHITECTS.—At a meeting held on the 5th inst., Mr. R. Lacon Sibley was elected an associate, and various donations of books were announced. Mr. Panson read a paper on the probable form and design of the Temple of Solomon at Jerusalem. The chairman announced that the council had resolved that papers read at one meeting should be open to discursive observations at the succeeding one, being of opinion that such arrangement would tend to elicit much valuable information.

DUDDEE ROYAL Anch Competition.— Competitors complain that they have as yet heard nothing of this matter. We are told that a very large number of designs have been received, and that the committee have divided them into three classes.

STATE OF HYDE-PARK.—Sir: I beg to call your attention to the curious manner in which the drainage of Hyde-park is conducted. Some time back the rain-water collected in the ditch between the Mount-gate of Kensington Gardens and the bridge at the Serpentine. This deep pond was allowed to remain a week or ten days, much to the dread of nursery-maids and children, and considerably so to pedestrians at night. Well, after a time, a pump was placed and the water drawn off, and as far as I could see no inspection made of the drain itself, which is no doubt choked up. The rain of Wednesday last refilled this ditch, and the same blind method will, I suppose, be adopted. I wish you would hint in your valuable columns, that the path running across from the Prince's-gate to the bridge is in a most disgraceful state of mud; and could you send one of your carpenters with his saw, to remove the rails, under which the pedestrian is now obliged to stoop, and perhaps break his back, it would be advantageous to do so.—COCKNEY.

SHAPE IN RESPECT OF AREA,—In THE BUILDER of 24th inst., your correspondent R. B. Grantham," gives a calculation elucidating "shape in respect of area;" he says,— "A figure which has all its four sides equal, contains the greatest area within the same length of wall," viz., 80 feet by 4, equal 320 feet, equal 6,400 feet area. Suppose a circle 320 feet in circumference, the area thus circumscribed will be found to contain 8,145 feet, exceeding the space inclosed by a square (as ahove) by 1,745 feet. It is another question whether the increased space gained between circular and square enclosures (each having a like quantity of walling) would compensate for difficulties of internal arrangement, for such purposes as your correspondent alludes to.

JOHN KELLY.

TO OUR READERS.

It has been suggested to us at various times that some of the best architectural subjects given in The BUILDER, if printed in a superior manner on good paper, with the accompanying descriptions, plans, &c, and issued periodically, would form a work that would be acceptable not only to those who are not buyers of The BUILDER, but to many who are,—the current engravings being often creased by the newswendors, or otherwise injured. We are disposed to try the experiment, and to publish, in a near wrapper, under the title, "BUILDINGS AND MONUMENTS, MODEEN AND MEDIEVAL," about Eight Plates, with eight pages of letter-press, folio size, every second month, price half-a-crown. The first part would consist of Osborne House, with plan: § Hridgewater House, plan and details; Church of St. Isaae, Petersburgh; Kensington Union Workhouse; Pembroke College, Oxford; the Liverpool Branch Bank; and the north porch of St. Mary Redeliffe, Bristol. Before determining upon the scheme, however, we should be glad to receive the names of such gentlemen as would be willing to become subscribers to the work.

[•] The story as given was, that the present owner of the picture had bought it four months ago in the "Out," Westminster. His attention being afterwards led to the likeness of it to the "Harold," he learnt that the party from whom he obtained it had had it about 23 years, and that he bought it of a picture dealer in the Blackfriars-road, who had had it in his possession more than two years.

No. CCCXX.

SATURDAY, MARCH 24, 1849.

MONGST the new works at this moment before us is a thin folio of Illustrations of Strixton Church, Northamptonshire, by Mr. E. Barr.*

Strixton Church is a remarkably simple Early English Church, consisting of a nave 20 feet wide, and twice 20 in length, and a chancel 30 feet long, and half that in width. It has a bell-cot at the west-end, and a little porch on the north side. It will seat 200 persons, supposing one-fourth to be children, and it is given "as an ancient example, of which the general effect is pleasing and good, while it may be built at a very moderate cost," -750l. says the estimator, including the fittings. The object of the publication is that the church may be copied. The introduction says, in tone gratulatory, that the bell-cot given in a similar publication of Wilcote Church "has been copied in numerous instances since," and that this of Strixton will probably "also be followed." The church is "an excellent model for imitation;" it presents valuable features "for an architect to copy," and so it goes on copy, copy, copy, itself being only forty-five lines in length.

Here are four walls with a roof on them, two doors required for access, and a few narrow windows for light, and all we men of the nineteenth century can do, boasting such power of intellect, and such dominion of knowledge, as dark ages guessed not at, is to copy the structures these ages left, without a thought of our own, and almost without a feeling. As was asked long ago, in our pages,-" Is the fountain of the beautiful a narrow shallow well, into which our fathers dipped and drained the utmost drop at once? Or is it a vast deep ocean, boundless, bottomless, into which they dipped and drew forth beauty, and into which we, in our turn, may dip and draw forth more,-dip with our far longer line, and reach far deeper and far denser regions in the infinite profundity of its teeming, teeming bosom?" It may be thought that we It may be thought that we have indeed become a race of brainless imi-

Of the value of careful representations of ancient examples, the necessity of an intimate acquaintance with the works of our forefathers, and of full investigations of the principles on which they worked, we have too often spoken to run any risk of being now misunderstood. To re-combine these materials and produce fresh beauties,—to work on these principles under the circumstances immediately occurring, and so to eliminate new results, we may at least aspire,—exhibiting some mind, improving where practicable, and meeting modern requirements.

Mere slavish re-production, and the condition of mind to which such a course necessarily leads, are to be carefully avoided and universally discouraged.

The Architectural Publication Society have issued the first part of their volume of illustrations for the current year, containing twelve plates from drawings by Messrs, John John-

* "Elevations, Sections, and Details of Strixton Church, Northamptonshire." J. H. Parker, Oxford and London. 1849. son, Sydney Smirke, J. M. Lockyer, C. Fowler, jun., John Davis, D. Wyatt, D. Mocatta, and T. L. Donaldson. The drawings are illustrative of the terms campanile, ceiling, chimney, corbel, cortile, loggia, pavement, staircase, &c., on which articles will be given, in such a manner as to take their place hereafter in that complete "Architectural Dictionary," at the production of which the society aim.

Under the head "Campanile," we have seven examples, inscribed Genoa (2), Lago di Guarda, Cremona, Mount Cenis, Lombardy, and Messina. "Cortile" is illustrated from the Palazzo Caprarola, by Vignola; "Loggia," from the cathedral, at Spoleto, by Bramante; and under the head "Staircase," there are four suggestive examples, from the castle of Bracciano, near Rome, the Church of Francesco, at Assisi, the Cathedral at Modena, and the Forum Romanum, by Bernini. The plates are executed in lithography, by Messrs, Day, on a paper, it may he well to mention, which will take colour. Of the lithography we cannot speak well; it is unworthy of Messrs. Day's reputation, and should lead the committee to hesitate before placing another set of drawings in their hands.

The idea of "The Architectural Scrap Book," by Messrs. Butler and Hodge, of which the two first parts are before us,* would almost seem to have been taken from the announced intention of the Publication Society, to issue periodical collections of sketches of parts of buildings. If so, the step is in bad taste. The first part contains four plates and seven subjects; Gateway, Magdalen College, Oxford (by Pugin); Chimneypiece, Stowe; Oriel window, Brazenose College, Oxford; two dormers, and two turrets. The authors point attention to the value of a Turret in composition, and remark on the neglect of this inexpensive feature in England.†

America contributes to our hudget of books a very useful volume on "School Architecture," by Mr. Barnard, a commissioner of public schools in Rhode Island,† of which 20,000 copies have been gratuitously circulated in the States, where the author has been called upon to labour in the cause of common-school improvement, or among the friends of popular education in other parts of the country,§ This book contains a large amount of information on the subject, especially as to the modes of ventilation adopted in the American school-houses, and as to the fittings.

The taste displayed in the elevation of most of the schools is not great, if we may judge from the engravings given; but a feeling of the important effect which well-ordered, well-proportioned, and fittingly-adorned buildings have in the education of children and on the character of a nation, is beginning to grow up in America. "Why," says one of their writers, Mrs. Sigonrney, "why should not the interior of our schoolhouses aim at somewhat of the taste and elegance of a parlour? Might not the vase of flowers enrich the mantelpiece, and the walls display not only well-executed maps, but historical engravings or

pictures? and the bookshelves be crowned with the bust of moralist or sage, orator or father of his country? Is it alleged that the expense, thus incurred, would be thrown away, the beautiful objects defaced, and the fair scenery desecrated? This is not a necessary result. I have been informed by teachers who had made the greatest advances towards the appropriate and elegant accommodation of their pupils, that it was not so. They have said it was easier to enforce habits of neatness and order among objects whose taste and value made them worthy of care, than amid that parsimony of apparatus, whose pitiful meanness operates as a temptation to waste and destroy." The same applies in the dwellings of the poor.

And again :- " Let the communities, now so anxious to raise the standard of education, venture the experiment of a more liberal adornment of the dwellings devoted to it. Let them put more faith in that respect for the beautiful, which really exists in the young heart, and requires only to be called forth and nurtured, to become an ally of virtue and a handmaid to religion. Knowledge has a more imposing effect on the young mind, when it stands, like the apostle with the gifts of healing, at the 'beautiful gate of the Temple.' Memory looks back to it more joyously from the distant or desolated tracks of life, for the bright scenery of its early path." "But when young children are transferred from the nursery to those buildings, whose structure, imperfect ventilation, and contracted limits furnish too strong an idea of a prison, the little spirits, which are in love with freedom and the fair face of nature, learn to connect the rudiments of knowledge with keen associations of task-work, discomfort, and thraldom,"

Let us all strive to cultivate a perception of the Beautiful, satisfied that it tends not merely to refine and delight, but to make better the world.

ON THE IMPORTANCE OF A KNOW-LEDGE AND OBSERVANCE OF THE PRINCIPLES OF ART BY DESIGNERS.*

In painting, the artist has to embody his ideas of scenes, persons, or incidents, by a pictorial representation of natural objects; and in proportion to the skill of his design and the truth of the representation, must be the vivid-ness with which his idea will be expressed. In considering what would be the most essential and universal characteristics of the subject to be depicted,—as light and atmosphere in a landscape, action and expression in a group of figures, breathing individuality in a portrait, we arrive at once at the most important points which the painter has to attain by means of his which the painter has to assume by art, and the most difficult of representation hy art, and the most difficult of representation hy the use of pigments on a flat surface. And here the principle that illusory imitation is not the province of painting, becomes strikingly apparent; for can light, atmosphere, motion, hreath, vitality, be imitated? They can only be indicated suggestively by depicting visible effects upon the scene or object; of course implies an accurate representation of the real forms, or rather, of their momentary appearance under the particular aspect; for it is the apparent forms, surface, and hues of things that the painter has to depict, though he can only do this by understanding their real form and nature, and the effects of light and atmosphere upon them. A picture is (or should he) the representation of what is seen, either in reality or in the mind's eye, from one point of view, at one moment of time, and should convey the impression of an idea stamped upon the mind of the painter at that moment; which all fine pictures do. Design gives unity and definition to the conception. But if the artist, unmindful of these principles, perverts his executive skill by imitating to illusion the

^{*} See page 122, ante.

chair in which his sitter is seated, the tablecover on which the hand rests, or the satindress in which a lady is attired, the vitality of the portrait is lessened, if not entirely lost; for the semblance of life in the face is made to appear unreal by contrast. So in a landscape; if a lit of rock in the forecared. appear unreal by contrast. So in a landscape; if a lit of rock in the foreground be painted with microscopic minuteness, unity of effect is destroyed; for it is evident that the eye, while scratinising a near object, cannot take in remote ones at the same moment. tempter to the same anomalis to the same anomalis to the sails of a windmill in a landscape, or a vessel tossing on a rough sea, have been represented so as to appear fixtures, reminding one of those sporting prints where the wheels of a chaise are depicted as spinning round with such velocity, that the spokes of the wheels are invisible, while the body of the vehicle, the horse and harness, the driver and his costume, are represented with all the minute details of still life? There is a popular coloured print of a smuggler presenting a pistol, in which it was attempted to convey an effect of reality it was attempted to convey an enect of reancy by protruding the figure out of the canvas; a violation of the principles of art that results in making the figure appear as flat as a pancake, and the pistol to lose what appearance of projection the painter had given it. The absurd and now obsolete practice of cutting out the portrait of a child from its panel and sticking it up in a corner to deceive the eye, results in a failure; for the loss of the background renthe eye, results in ders the figure flat, and destroys the illusion. In the execution of modern pictures, too, we have so often to regret the absence of luminous brightness in the light, of transparency in the shadows, and consequently of rotundity and shadows, and consequency of rounding and animation in the forms, and of atmosphere in the ensemble, that it is becoming evident to some of the most thoughtful and inquiring artists, that the modern painters have lost sight of the principles of colouring which were acted upon by the Venetian, Flemish, and Dutch schools, and also by our own Gainshorough.

But as design is more especially the subject of this paper; let us pass to the department of ornamental art, in which there is most need of principles to guide the inventive talent and adaptive premative of organization.

adaptive ingenuity of ornamentists.

The value of ornament consists in its being used to add beauty to common things, and to relieve the blankness of hare walls, floors, and ceilings. Since the Puritans banished colour from English churches until the present time, decorative art has performed perpetual penance in a sheet of whitewash, and our national ecclesiastical architecture has been mutilated and deformed, not only by tasteless churchwardens, but by accomplished architects, who, in respect of English architecture, were as ignorant as their employers. But let us not forget what we owe to Wren; nor that to his discerning encouragement we owe the development of the genius of the greatest ornamentist this country has seen — Grinling Gibbons, whose wood carvings have been so well appreciated and emulated in our own day hy Mr. Rogers.

In entering upon the wide field of ornament, it becomes necessary to draw a distinct line of demarcation between the several hranches of ornamental design; namely, the ornamentation of architecture; of vessels, utensils, and implements; and of textile fabrics. Each of these is governed by different principles, but in all, the practice of illusory imitation is alike objectionable; true art repudiates shams. The great blank space of raw white plaster that shocks the sense as well as the taste in almost every room we enter, from the poor man's garret to the gilded saloons of the wealthy, is a relic of puritanical aversion to colour; and the drab hues that make dreary our parlours and dining-rooms, are only a Quakerish compromise. The ceilings

"Where sprawl the saints of Verrio and La-

are had in taste, and equally inconvenient and disagreeable to look at: even pictures, though hy Ruhens, Titian, or Michaelangelo, when let into a ceiling, are solecisms in point of taste; for the penalty of admiring them is a crick in the neck, even though, as in the churches and palaces abroad, you are accommodated with cushions to enable you to view them in a supine posture. Minic balustrades and aper-

tures in ceilings, and still more, pictured skies, are obvious anomalies; they fail as attempts at illusion, and as ornaments they are not beautiful. Ornament is indispensable in a ceiling; and whether it be moulded in relief or not,—colour, or gilding, if not both, according to the character of the apartment and its ornaments and furniture, is necessary to make it harmonize with the walls: a waste of whiteness affronting a Persian carpet and pictured walls is a harbarism that, accustomed as we are to see it, cultivated taste revolts at. Yet paper-hangings are often so ugly as to make one resigned to the drab-tinted stucco. I have a vivid impression of the effect of a particular room, of the gloomiest coldness, that colour of any kind, not absolutely discordant, is preferable. This room was painted a leaden-coloured drah, with raw-white ceilings, of course, and it was hung with sad-coloured draperies edged with black; the chimney-piece was as black as the stove; the chairs and sofa, covered with black carpet; and prints in black frames enlivened the walls: it was a room in half-mourning, and its gloom fell like a pall upon a visiter. The exhilarating influence of a cheerful and elegant room is only inferior to that of a sunny day out of doors, or lively and agreeable society: black,—whether marble, horse-hair, wood, or iron,—should he inadmissible.

In painted decoration, and in the patterns of paper-hangings, curtains, or carpets, form ought to be regarded chiefly, if not merely, as a vehicle of colour. How tiresome and tantalizing is the reiteration of patterns in a paper-hanging, especially when great splotches of red, or some powerful colour, are scattered over it, or cutting lines of hlue, or some other positive hue, divide the wall into strips. Intense colours ought to he used sparingly, and skilfully distributed, so as to enlive the mass of secondary tints; for a room is made to seem smaller by strong contrasts of colour or harsh lines, as ceilings are apparently lowered by deep mouldings or powerful colours; indeed, vivid colours are not essential either to the elegant or cheerful aspect of a room. The walls should form a chaste, but not dull, hackground to the furniture, pictures, and occupants; gaudy carpets of large patterns are therefore objectionable. If positive colours are used, these should be subdivided by the intricacies of a small and undefinable pattern, like the Persian and Turkey carpets, which have never heen equalled for richness and sobrity combined.

The art of the decorator is not yet rightly understood, and therefore not duly appreciated. It should not be confined to the painting of walls and ceilings; for the effect of the richest and most heautiful decoration may be destroyed by a discordant cap et, ly hangings of inharmonious hues, and by ill-chosen furniture; nay, even by the injurious contrast of a hall, staircase, or ante-room, while a house may be rendered elegant and cheerful, without any parade of ornament, by a skilful assortment of colours, suited to the aspect and uses of each apartment, and the juxtaposition of ante-rooms and lobhies. But to effect this requires practised skill and taste on the part of the artist.

In designing patterns for textile fabrics, the uses to which the drapery is to he applied requires to be more considered than is commonly the case. Obviously the pattern for a dress should not be so large as that for a curtain; yet one sees silks and satins in the mercers' windows, the wearers of which would certainly appear as if robed in window curtains, or wall hangings. The elahorate imitation of flowers in dresses is wrong upon principle, because the effect is to divert attention from the ensemble presented hy the dress of the wearer; the non-descript patterns of India shawls, in which the effect is seen in the mass, are still superior to modern designs. A great nosegay of flowers on a shawl, or a dress sprinkled with bouquets, is only a degree less alisard than the horns and trumpets which decorate the dressing gown of Signor Lablache in "Il Fanatico per la Musica." The effect of harmonious combinations of colour is what the pattern designer should rely upon; and of these the variety is endless. The famous Swiss designer of patterns, whose fecundity of invention is extraordinary, when asked where he got

the materials for his varied and beautiful com-bina ions, replied, "The wealth of nature is inexhaustible." And he then explained that the colours of hirds and insects, of lichens, of sca-weeds as well as flowers, all furnished him with harmaritant. sea-weeds as well as flowers, all furnished him with barmonious contrasts of colour; but he did not content himself with picturing the objects entire—he did not sprinkle a dress with beetles or humming birds, or cover it with lichens or sea-weed, nor even with the most heautiful flowers; but he selected a particular harmony of hues, perhaps in the lottom of the calve of a flower out he breast of tom of the calyx of a flower, on the breast of a bird or the back of an insect, and applied it hy means of some arbitrary form, suggested also, probably, hy a natural object. The resources of the pattern designer in nature are boundless. if he uses them aright; but to copy literally the most heautiful object is crude and wasteful error. In designing patterns for draperies of all kinds, the artist may be content to seize and adapt the suggestions of nature, In designing decorations for architecture his fancy should become suggestive of ideas. But in hoth, wherever colour is employed, forms are valuable chiefly as a means of varying the quantities and distribution of colour; form is quantities and distribution of colour; form is the medium for displaying colour. In draperies that hang in heavy folds like cut tains, it is evident that the shape of the pattern is not seen truly; its effect, as shown in the play of colour, is infinitely varied by the folds, and therefore a large bold pattern, as in damask, is preferable. In dresses where the folds are smaller, and especially in scarfs, angular patterns are not only admissible, hut pleasing, because the multitude of cross-folds not only destroys the formality of pattern, hut gives rise to an infinity of piquant combinations. But when large plaids are worn in the flat drapery of a cloak, the back of the warrer gives rise to an infinity or piquant commu-tions. But when large plaids are worn in the flat drapery of a cloak, the back of the wearer is squared out in chequers, and one might almost as well hang a chess-table cover over the shoulders. So in damask, to hang flat in the panels of a room or diapered walls, the pattern need he so subdued either hy slight pattern need he so subduced either my signi-modulations of colour or smallness and intri-cacy, that the eye should be prevented from resting on the forms, and regard only the effect. resting on the forms, and regard only the effect. The pattern of a carpet, by the same rule, should not provoke attention to its details: its effect alone ought to be attractive. Nothing can he a greater violation of the principles of art than the French tapestry carpets, which, to he seen properly, ought to be placed in an empty room. In modern apartments, where the floor is almost hidden hy chairs and sofas, tables, and musical instruments, what are called bold and handsome patterns can never be seen; even if it were patterns can never be seen; even if it were ments, what are called bold and handsome patterns can never be seen; even if it were desirable. And to work coats of arms and other heraldic devices, is to trample upon the pride of ancestry and the pomp of heraldry. While noting the impropriety of applying honoured symbolstohase uses, I may be allowed to throw a word of derision on the offensive impropriety of nictured handle replaces. impropriety of pictured handkerchiefs: sporting men may like to tie the portrait of a race-horse round their necks, and country cousins may find a map of London on cambric as useful as the dwellers in the backwoods of America, where paper was scarce, did the newspaper which the Yankees tell us was printed in clay on linen, and washed off when the news was read to receive another im-pression; but to dry the moisture with Jenny ind's charming face is a very ignoble mode

of complimenting the Swedish nightingale.

In designs for hardware, whether of silver or hrass, glass or porcelain, form, and proportion are parameunt; no ornamentation, however rich or fanciful, can redeem had proportion or ungraceful form; while a heautiful form unadorned is itself ornament of the most refined and pleasing description. Neither should ornament he so prominent as to overlay, or prevent the full development of form; while neither form nor ornament ought to interfere with utility. The principle is so obvious that it is surprising there should be any need for enunciating it; yet if we look into the windows of our china shops, the infinite variety of ugliness of shape and proportion displayed in vases and other ornaments for mantel-pieces, is extraordinary. And the designs made hy artists for Felix Summerley's art-manufactures are more admirable for fanciful ornamentation than elegance and symmetry of form. But this does not dimi-

nish the claim which Felix Summerley has upon all who take an interest in art, for a fresh impulse to artistic ingenuity, and directing the attention of artists, manufacturers, and the public, to the value of ornament in things of common use, more especially since it has been his aim to strike out a new style, neither classic, nor Gothic, nor renaissance, but English and original. The shapes of Greek and Etruscan vases, beautiful as they are, are not more adapted to modern or hardware, than is the decoration of the fictile vases; we do not want to convert lachrymatories into scent bottles, funeral urns lachrymatories into scent bottles, funeral urns into teapots, vases into flower-pots; nor are the forms of amphora suitable for decanters, or of paterie for caudle cups. The material and uses of the vessel should determine its form; teapots that would not draw, Jugs that cannot be washed clean, glasses and cups that one cannot drink out of comfortably, however clegant their form, are essentially defective. And the adaptation of the thing to its purpose, so far from producing neiliness, tends to heauty: so far from producing ugliness, tends to beauty; for it involves fitness, which in articles of use is an ingredient of beauty, and it also induces new forms. The problem to be solved is simply this:—given the use and material of the article, to find a beautiful shape. In the comarticle, to find a beautiful shape. In the commonest, rudest, and oldest implements of husbandry, the plongh, the scythe, and the sickle, we have examples of simple and beautiful curves. The most elementary and simple forms, if well proportioned, and of graceful contour, are the most pleasing. To enter into the multifarious details of ornamental design would require a segrate paper upon each the multitatious details of ornamental design would require a separate paper upon each branch of ornament; and I have already, I fear, engaged attention too long a time. I will only, therefore, notice a few instances where principles are violated by misdirected ingenity. nuity

Each material has advantages and disad-Each material has advantages and disadvantages peculiar to itself, and to develop its best qualities ought to be the study of the designer. In glass, for instance, the facets of cut glass produce a brilliant prismatic effect by the refraction of light; angularities, combined with curved forms in glass, therefore, are beautiful and appropriate; but angularities in notifer years lives divine dealers. in pottery, vases, jugs, dishes, &c., are ugly and inappropriate. Nor are straight sides and angularities pleasing in metal, whether silver or not; swelling curves are the most beautiful forms for small articles of a polished material,

whether porcelain or metal.

The eagerness for novelty, both of pur-chasers and manufacturers, leads to the adoption of odd and ugly shapes, and the intro-duction of fantastic and unmeaning or inappropriate ornament; and the necessity for the restraint of principles to prevent ingenuity from being perverted is strongly apparent in from being perverted is strongly apparent in the department of ornamental pottery and hardware. The climax of skill would seen to be to achieve deception, aim at impossibility, and give to things the appearance of something which it is not. Thus we have the arum dwarfed, so as to deprive the graceful plant of its elegant form, the stem and leaves cast in hronze or brass with the flower in clouded glass, and stuck in a garden-pot by way of ornament, or converted into a gas-burner or a curtain-holder. Brass fuchsias and lilies hang pendent from cornice poles; hronze plants are pendent from cornicc poles; hronze plants are made to blossom with wax lights tables, and perhaps we may yet behold a castiron tree in a hall hearing fruit in the shape of hats and caps. These absurdities are equally as nucrile as the Toby Philpot jugs and duckshaped sauce-boats that we have come to ridicule. The beautiful paintings on Sevres porcelain, and the painted flowers in relief on Dresden china are equally objectionable in point of art, though for different reasons. In the instance of the Dresden china, the modelled and painted flowers, by their polish and hrittleness, want two of the most essential attributes of the beauty of flowers, rich transparent colour and softness: people exclaim, "how natural!" but it is neither true nature nor good art. Miniature paintings on vases are very heautiful; but why injure the effect of the picture by the curve of the vase, and lessen the peculiar beauty of the form of the vase by putting on it a picture that might he better The beautiful paintings on Sevres porputting on it a picture that might he better displayed in a frame? As for landscapes on dinner and deserter plates, they are still more absurd; the tart or the fruit effectually oblitegies when the sewer, whatever was raised by the engine went back again into the sewer.

rates the view of Windermere or Virginia-water whose beauties are left to the admiration of the scullery maid or the housekeeper. The ornamentation of the Chinese and Japanese vases are as yet unequalled in harmonious richness of colouring, and deserve attentive study, but not imitation. The principle exemplified in their scheme of The principle exemplified in their scheme of colour and style of ornament would, if differently carried out, lead to heautiful and novel results. The strange and grotesque become a valuable feature in painted ornament, because it disinclines the cye to follow the forms, and satisfies it with colour. Hence the popularity of the common "willow-pattern" ware; its incongruous and nondescript character, baffling stration, convert its bridge, and temple and attention, convert its bridge, and temple, and willows into merely vehicles of colour. The blurred pattern ware, where the outline appears as if it were traced in an absorbent material, was an accident; hut its effect was so good that it at once became popular: another proof that forms are subordinate, not principal, in

patterns.

The practice of ornamenting porcelain by giving it the appearance of marble, is another mistake: a marhle jug is an absurdity, almost as great as a mahogany wash-hand basin or a rosewood ewer. Equally absurd it is to paint zinc baths like wainscot, and give to tin chamber-pails the appearance of staves hooped round. Let ornament be ornamental, and shew for what it is,—decognation; and let it be shew for what it is,—decoration; and let it be appropriate and subordinate to utility, as well subservient to elegance.

There are other points that need to be touched upon, and these that have been ad-verted to need fuller investigation; but enough has been said, I trust, to prove the importance of a knowledge and observance of the prin-ciples of art by designers, and perhaps to shew, also, that these principles are easily ascertainable by studious attention and rational W. SMITH WILLIAMS.

WHAT THE SEWERS COMMISSION HAVE DONE FOR KENSINGTON,

SIE,—May I again claim your advocacy in THE BUILDER for something to be done towards remedying that nuisance, of which you have before written, the open, sinking, almost stagnant ditch which receives the whole drainage, of the tawn of Verying. drainage of the town of Kensington, and, passing through the Guardians' premises, has no outlet but into this ditch, which is 4 feet 6 inches above the bottom of the sewer which the Guardians have built under the direction of the Sewers Commission; the excuse now made is, and it is a mere subterfuge, that the levels are not completed. The same story was told last summer, accompanied by a promise that it was hoped that shortly some steps would be taken to remedy the evil that had been complained of, as noticed in The BUILDER.

It is right that the public should be informed of what has since occurred. James street and Jenning's-building have been visited by the cholera, so many as eighty cases having occurred in this locality, and even up to to-day there were three persons brought away from James-street with virulent fever, arising from this imperfect drainage. The Sewer Commissioners sent down what they called their disinfecting compounds, and the pumping apparatus. They were assisted by the parochial authorities in every possible way, and so far as any cleansing could be of any avail it was promptly deep best lives. any avail, it was promptly done; but all this deposit of filth and dirt now lies to the depth of several feet in the sewer which passes close to the Kensington Workhouse, in which there are between 300 and 400 immates; and only such portion of the dirt as will float away has any change of second and the reals in the any chance of escape, and then only into this

open onten.

The Sewer Commissioners, under the pretence of doing something to remedy the complaints of the inhabitants, about a month ago sent a steam-engine, and at the mouth of this large and substantial sewer set it to work; but as what they pumped up had to go into this open ditch, they only produced a most awful and destructive stench,—for of course, as the ditch is 4 feet 6 inches above the bottom

This attempt, like that of an endeavour to fill a sieve with water, was soon abandoned, and so the nuisance remains; but it is thought right that the public should be apprised fully of the doings and not-doings of the Sewer Commissioners, and no better channel through which this informatic information. which this information is to he conveyed is known than THE BUILDER,

Yours, Mr. Builder, ever truly,
E. H. NINON, J. P. and ViceChairman of the Kensington Board of Guardians,

Bladen Lodge, Old Brompton, 22nd March, 1849.

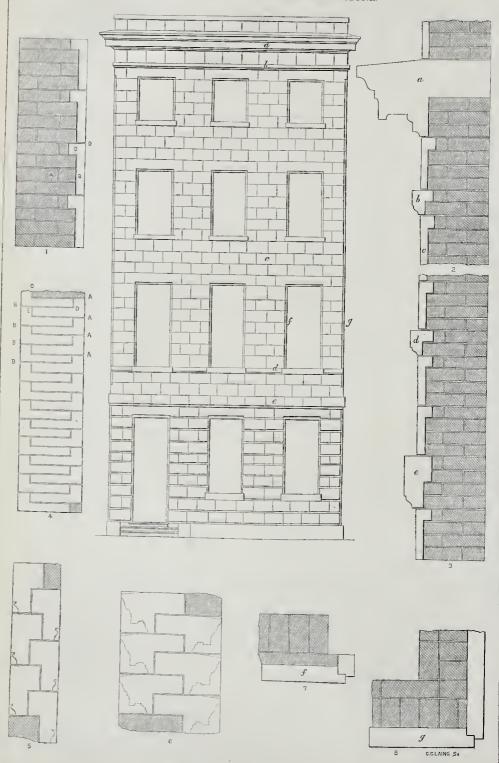

INSTITUTION OF CIVIL ENGINEERS.

On the 13th, the paper read was "A description of the Camden Station of the London and North-Western Railway," by Mr. R. B. Dockray. Particulars of this were given in THE BUILDER some time ago. In the first design of the railway, in 1833, this station was intended for the sole terminus of the line. and, after much discussion, thirty acres ground were purchased, although that quantity was considered preposterously large. A very short time demonstrated the necessity for the establishment of the Euston Station solely for establishment of the Euston Station solely for passengers; and fourteen acres were there se-cured, and ultimately covered with buildings. The whole station at Camden-town was then de-voted to goods and eattle; and, although in the original design great care was taken to an-ticipate the wants of the traffic, yet such has been the rapid development of the railway custom that in the sance of ten years it has system, that in the space of ten years it has proved necessary to sweep away almost every vestige of the original constructions, and entirely to remodel the station. As the increase of the traffic progressed, the trains in the sidings frequently became of such length as to cause danger to the passenger trains; therefore, became necessary to alter the whole disposition, which has been so done as now to give a length of double line of two thousand five bundred feet, for the goods' waggons only, entirely clear of the main line. The circular engine-house, 160 feet diameter, The circular engine-house, 160 feet diameter, to contain twenty-four engines and tender, with a central turn-table 41 feet in diameter, and an iron roof, was described. Some idea of the extent of the station was given by the statement, that the length of single line of railway, exclusive of the main lines, exceeded 12 miles. There were 112 sets of points, 196 turn plates, and 110 cranes, varying in power from 1½ to 20 tons. The area of goods' sheds was upwards of 135,000 superficial feet. from 1½ to 20 tons. The area of goods' sheds was upwards of 135,000 superficial feet, and that of the platforms was 30,000 feet. The annual consumption of gas exceeded six millions of cubic feet. The supply of water for the locomotive engines was treated of at for the locomotive engines was nearest of assome length, and exhibited some curious anomalies. The only water that could originally be used, was taken from wells at Tring and at Watford; an attempt was, however, made to obtain a supply at Camden Statiou, first from the Regent's Canal, and then by sinking a well down 145 feet into the chalk, or to a total depth of 300 feet below Trinity high-water mark. The water from the sand stratum was excluded, and although only that from the chalk was pumped up, which ought to have possessed the same qualities as the water at Tring and Watford, derived also from the chalk, yet it was found to cause the locomotive to "prime," or flush water through the cylinders, with the steam, to such an extent as to se-riously impede the progress of the trains. This was shown, by analysis, to arise from the excess of carbonate of soda contained in this well water, which there was an entire absence of in the waters of the wells at Tring and at Watford. The well, therefore, became useless for the engines, but the water was so excellent for household and other purposes, that it has been employed for the general uses of the sta-tion, and for the hotels and houses belonging to the company.

THE MARBLE ARCH .- As the ultimate THE MARBLE ARCH.—As the ununae destination of the marble arch at the Queen's Palace appears to be at present undecided, allow me to suggest the front of the British Museum (to which his Majesty George the Fourth was a most princely contributor) as an eligible situation.

J. U. S. C.

PATENT METHOD OF FACING WITH STONE.

A NEW MODE OF FACING WALLS.

MR. JOHN TAYLOR, Jun., architect, has obtained a patent for a mode of constructing and facing walls, which professes to avoid the objections bitherto existing against erecting brickwork with a facing of stone, arising from the subsidence of the numerous mortar joints in the former compared to the latter, by which the stone facing unavoidably becomes injuri-ously weighted, and the crushing of the bed is the result. To remedy this, he carries up the brickwork, simultaneously suspending the facing stones thereon, and bonds in every by weighting that part most adapted for it by the superstructure, but leaving the lower or bed joints open until the danger from the subsiding of the mortar joints is at an end, when the stone may be allowed to take a bearing, and become a portion of the construction by pointing up. He is thus enabled to dis-pense with much of the stonework hitherto necessary in the ordinary mode of construction, and reserves only sufficient for protection, appearance, &c.; and as be further proposes to obtain what is required by steam power, a saving of more than half, it is asserted, will be effected in the cost of the stone.

The annexed illustrations will explain the system: — Section No. 1. A, the brickwork, three courses of which having been carried up, and the mortar bed laid, the facing stone B is suspended thereon by the rebated part C, and in this state can be readily and properly ad-justed, and when weighted by the brickwork above the bonding, is complete. The joint D is to be left sufficiently open to allow for the subsidence of the mortar joints, and where this has takeu place the stone may be allowed to take a bearing by pointing.

Section No. 2 and 3 show how cornices,

string courses, &c., may be applied in the

same manner. No. 4 shews the method of cutting the facing-stones out of the block. The cuts, AAA, BBB, which form the face and back of the BBB, which form the face and back of the stones, may be made in any numher by one and the same operation. The cut, C, is then made and the first piece released, which, being the rough end of the block, is waste. Cut D is then made, and the first facing-stone delivered, also the second by the cut E, and in like manner till all are delivered.

Nos. 5 and 6 show the same method applied

to cornices, strings, &c.

Plan No. 7, reveals of windows, doors, &c., which may be formed by notching out the re-bate of the facing stone to admit that forming the reveal; any waste from the facing stones will form these.

Plan No. 8. The angles of the building formed in the same manner.

The Elevation is intended to show an ordinary building where the various parts are

applied.

The italics on the elevation refer to corresponding letters on the plans and sections

The patentee considers that the reduction which is effected in the cost of thus facing a wall with stone, together with the great facility in its erection (all the trouble and delay of procuring stone and making arrangements for working it being avoided), and the fact, more-over, that the material will be obtained and applied with no more trouble than facing bricks, will lead to its being used where otherwise cements would be resorted to.

THE ROYAL ITALIAN OPERA HOUSE. The production of Auber's opera of Massa-niello in a style of extraordinary magnificence and completeness (and which should be heard by all who love Beauty in sound), has led to some admirable painting by Messus. Grieve and Telbin. The view of the Bay of Naples is worthy of Stanfield, and preservation. The market scene, before which is sung the well known "prayer," so as it never was sung before perhaps, has the church and campanile carefully and effectively painted. Perhaps the most striking scene of all, however, is that with which the fourth act opens, where two Doric porches on each side of the stage stand out against the clear blue sky, with Vesuvius in the back ground, and pleasant villas and and completeness (and which should be heard in the back ground, and pleasant villas and quiet grounds at the foot, waiting to be over-whelmed by an eruption which is fearfully pourtrayed.

IMPROVEMENTS IN CONSTRUCTION.

SUGGESTED EXHIBITION.

In a late number you referred to two important exhibitions, one for the advancement of the study of architecture, the other for the encouragement of British manufactures; but there appears to me another exhibition required in the metropolis, viz., one embodying the improvements which have been recently made in all that relates to the mechanical and scientific branches of Architecture. The numerous inbranches of Architecture. The numerous inventions which are constantly reviewed by yourself, and advertised in your columns, will, am sure, without further remark, convince the architectural world of the value of such an exhibition. It requires but a slight effort to form the nucleus of a society to carry out this object, Such an exhibition would embrace improve-

ments of iron and timber, bridges, girders, roofs, floors, partitions, staircases, &c. Locks and fastenings of every description, and specimens of smith's work, sashes, window frames, shutters, skylights, ventilators, warming and heating apparatus, stained and plain glass, and improved modes of glazing. Water-closets, house drainage, &c. Specimens of brickwork, and improved modes of goodstruing chimaton. and improved modes of constructing chimneys. Samples of all cements and plasters, and specimens of application, and of scagliola work. Improved modes of lathing, and the best mode using iron laths for fire-proof work. modes of slating, also of forming flat roofs in slates, tiles, copper, lead, or iron.

in masonry, both stone, Improvements marble, and granite, especially as relates to the use of lead and iron in making joints. Specimens of architectural carving in stone and

marble, pavements, paper-hangings, house-painting and graining, &c.

By reviewing this list, you will see that by far the most numerous prizes for improvement may be conferred on working men, and I know nothing that can more elevate the workman than by thus fairly rewarding his genius, and bringing him into contact with the patrons and professors of architecture. Many a poor man would by such means have a chance of raising himself in society, whose present oppor-tunities are now indeed too few.

The spinning, weaving, printing, tool making, engineering, and other such like manufactures, require similar exhibitions, and in those parts of the kingdom best suited for such works; but I desire to hegin with the art which calls all others to its aid, and by turns fosters and nourishes the whole.

** We have on more than one occasion pointed out the advantage which such a collection would give to architects and those engaged in building.

THE CURIOSITIES OF ESTIMATING.

"THE more you knock," as the Frenchman said, "the more I wont let you in:" the more fully the system of estimating, or rather the want of system in estimating, pursued by some builders, is exposed, the more glaring are the inconsistencies exhibited. A correspondent from Chester, referring to our recent notice contemplated restorations there, says the fol-lowing tenders were submitted to the committee on the 9th, for taking down and re-building St. Michael's tower with white

But this difference, striking as it may seem, is nothing compared with what is found in the following list of tenders sent in on the 14th, for building the Printers' Almshouses, Woodgreen, Tottenham. Read and digest it:—

D. Bodger	£6,310
Glenn	2,480
Cripps	2,375
Carter and Ellis	2,225
Taylor	1,989
Cooper and Davis	1.940
Maxted and Harris	1,859
Walker and Soper	1,850
Roberts (accepted)	1.750
W. Lamprell	1,513

One result of such affairs as these must of course be, that respectable builders will refuse to tender, excepting with parties known to them.

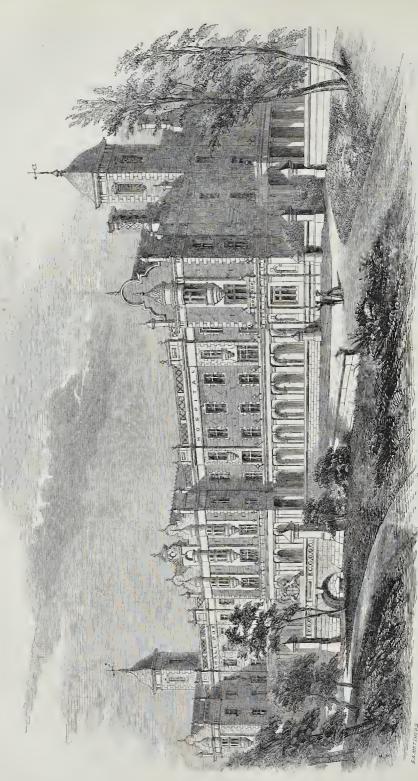

RAILWAY JOTTINGS

What we want for railways, says the Railway Journal, "are the following things:-1st. That the shareholders should bave much more power than they have in the election of good directors, and the dismissal of obnoxious and useless ones. 2nd. That railway accounts should be kept on one uniform and simple system, so that when a man understands one he may understand any. 3rd. That the accounts, and all documents connected with them, should be open to the inspection and examination of shareholders at proper times. 4th. That the capital accounts should be closed executively accounts should be closed, except under very special circumstances, within two years after the railway is opened for public traffic. 5th. That all contracts should buble traine. Still That all contracts should be let by public tender, and the lowest be accepted, if proper security should be preferred. 6th. A careful, proper, and impartial audit. If these tbings were done," adds the Journal, "railway property would immediately rise in value."—We understand, says the Railway Property (that the hostility). Record, "that the reductions which the directors of the Great Western Company have made in the number of passenger trains, will effect a saving in the expenditure of the company to the extent of 100/. a-day, or at the rate of up-wards of 30,000/. a-year. We have only the credit side of the account here, however.— Amongst other indications of a revival of trade, it appears that the traffic on the London and North-Western for seven weeks, since the closing of the last half-yearly account, shows an increase of nearly 17,000l. over the corresponding period of the previous twelve months, or an increase at the rate of 2,400l. per week. No new extensions have been opened.

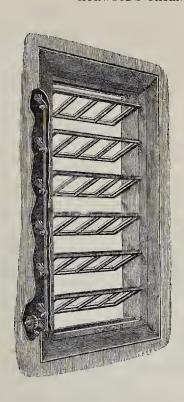

At the half-yearly meeting of the South-Eastern, Mr. J. Macgregor admitted that Lord Torrington, for his services in Parliament, had received out of the capital account a service of plate, worth 2,800l., hesides 1,000 No. 4 shares, given at a dinner which cost 3001.—A recent report of Mr. Stephenson, the engineer, states that the Britannia-bridge masonry is finished, and nearly ready for the reception of the hy-draulic presses for lifting the tubes. The Car-naryon platform for the short tubes is finished, and one of them commenced. The corresponding short tube on the Anglesey side is only the cast-iron work to be ready for floating. The arrangements for floating, including the hydraulic presses and pontoons, are nearly complete, and will be entirely so in May. The excess in works on this line beyond the Parliamentary estimate was 254,000l.; in stations, namentary estimate was 254,000*l*; in stations, 72,000*l*; in rails and sleepers, 95,000*l*; land, 124,000*l*; Conway-bridge, 50,000*l*; Britannia-bridge, 350,000*l*,—making a total excess of 945,000*l*. on a total amount of 3,084,650*l*. The amount yet to be expended on the works is stated to be 185,000*l*. The accounts to 31st December showed that 3,418,596*l*. had been received, and 3,358,271*l*, expended.—leaving a received, and 3,358,2711. expended,—leaving a balance of 60,379l. in cash and at interest. — The Lancaster and Carlisle Company have taken forcible possession of the Maryport and Carlisle Company's station and ground at Carlisle, at present leased by Mr. Hudson. By the Act of the Lancaster Company it is said they had the power to do so on paying the amount assessed by a special jury, and for the purposes of a central station. A body of navvies took possession by tearing up the rails and carrying off the station bodily! the building being a temporary one.

COLOURLESS INK.—Sir: While in the formation of an inkstand so much beauty is sometimes displayed, both in the form and the material, it is vexing to see, when it is put to its destined use, how soon it is soiled by the black liquid, and disfigured by the accumulation of dregs or dried ink. It occurred actumated the desired that the following the to me that, by saturating paper with one of the principal components of ink, and writing with the other, this would be avoided. The inkstand would then contain only a colourinkstand would then contain only a colour-less fluid, its beauty would not be injured; and if by any accident it were spilt, no mate-rial injury would be done either to dress or furniture. I have tried this, and find it answer very well, but probably others could improve upon it, especially in the construction of the paper.—James Edmeston.

HURWOOD'S PATENT FOR MOVING WINDOWS, &c.

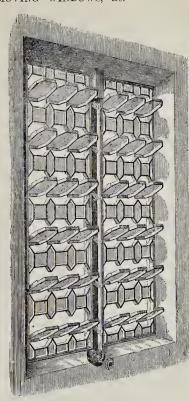

Fig. 2.

THE SMALL-POX HOSPITAL COMPETITION.

SEVERAL members of the profession have written to us expressing themselves very indignant, that in spite of the assertions of the committee that they would not select a design until assured that it could be executed for 12,000l., the lowest tender for the design, by Mr. Daukes, which was selected to he carried out, amounts with the foundations, &castready put in, to 18,700l. There is no occasion for us to repeat our opinion on the principle involved in this matter. The competitor who best gave the committee the required accommodation for the sum to which they limited architects, was the person entitled to the premium.

Mr. S. A. Matthews (a pupil of the late George Allen) has addressed a statement to us, in which he says, "My design for the Small Pox Hospital stood first in the estimation of Mr. S. Smirke and Mr. J. Shaw, the architects referred to, and of the committee, and would have been carried out, had not Mr. Daukes guaranteed to execute his design for about the sum of 12,000l. The Chairman informed me at the time he handed me the second premium, that mine was lost even then by one vote only. My design would cost about 13,000l." At the solicitation of Mr. Matthews, and because we think it may not in other respects be useless, we have engraved his design, and we give his statement as affording an example how the system works.*

* The following is the architect's description of his design:—The entire length of the building is 256 feet, width at feet 6 inches; depth of wing 93 feet 6 inches by 25 feet 6 inches wide, including the thickness of the walls. The basement does not include the wings nor the entire width, is 12 feet high, contained kitchen, scullery, pantries, provision stores. domestie washbouses, laundry, coal-cellar, 6c. Ground floor, 13 feet high, contained, on the left of principal entrance, visitors' waiting-room, stong-room, screen seet-room, board-room, and surgeons' and matron's sitting-

We are not advocating any claim of Mr. Matthews: for anything we know, it might be shown that to carry out his design would also cost much more than the sum named. In that case, he ought not to have had even the second premium. We have nothing to do witb persons, we are looking only to principles; and the right and wrong in this matter are so evident, that none can mistake who desire to go right.

HURWOOD'S PATENT FOR WINDOWS.

DURING a recent visit to Ipswich, we had the opportunity of examining some applications of a mode of moving and fastening windows (dispensing with pulleys, weights, fastenings, &c.), for which Mr. Hurwood, engineer of that town, obtained a patent some time since, and which deserves to be better known beyond Ipswich than it is. The principal feature in the invention is the application of the screw

the invention is the application of the screw rooms, stores, &c.; side entrance and corridor. To the eight of wincipal entrance-patients' receiving room and lift, surgeons' and physicians' rooms, library and museum, autrey, drug stores, and matrass and bedding stores, and room for reception of foul linen from shoot, &c.—First floor, 15 feet high, contained, on the left of centre, two acute wards for males, of the required dimensions, baths, water-cloatts, &c. The wing, with as eparate staircase, the surgeon's and matron's sleeping and spare rooms, &c. To the right of centre, the two wards for females ditto and children's wards. In right wing, ser vants' bed-rooms, &c., foul-linen shoot, and coal-lift. The centre occupated by nurses' room, and staircase at back 20 feet square (the width of the hall), and two sculleries. Second foor, 15 feet high, contained six wards for male and female convalescent patients; night nurses' sleeping-rooms in centre, with linen and other stores,—with all other conveniences as before mentioned, together with servants' sleeping-rooms. &c. The out-buildings not adjoining, and situate to the left, consist of washhouses, laundries, &c., with large airing-ground at back. The stables and piggeries are near the lodge care lodge adjoin the principal entrance to the building leads at once to the provision stores in the basement,

working into a wheel or rack as prime mover. It is applied to windows of various forms, two of which we illustrate.

In fig. 1, it will be seen that the window is divided into as many portions as there are panes in height. Each part turns upon two pivots, one of them being sufficiently long to pass through the frame to receive a small crank. A screw and portion of a screw wheel is fixed at the bottom of the frame independent of the sashes, to which a crank is also connected: a slight flat rod is attached to the crank fixed to the same axis as the screw wheel, and also to each of the cranks connected to the window, so that when motion is given to the screw wheel by the screw being turned, the window is more or less moved.

In fig. 2 the apparatus is fixed to the centre mullion of the window. In others only the top part of the window opens. For Lunatic Asylums, and other places, where it is of importance there should be good ventilation, and that the inmates should have no control over the windows (a key, it will be observed, is necessary), this invention of Mr. Hurwood will be found particularly available.

We had written a memorandum upon the town, but must postpone it for another number.

Supply of Water to Amsterdam.—A company, managed by a board in London, is being formed, with a capital of 600,000. in 30,000 shares of 20. each with 2l. per share deposit, to supply Amsterdam with water from the Rhine. The privilege has been conceded in perpetuity to this company, who are to be entitled to a maximum charge of twice the amount believed to be capable of yielding a return of 24 per cent. The responsibility is limited, it is said, to the amount subscribed.

THE PARKS AND APPROACHES.

WE may vaunt of the glories of our capital, its extent, commerce, river, structures, and parks; but we cannot boast of our avenues or approaches. There is no city of the modern approaches. Incre is no cuty of the monern world, inferior though it be in aggregate advantages, which does not distance us, longo intervallo, in the grand essential to preliminary importance—open and imposing avenues and

importance—open and imposing avenues and approaches.

Who, for a moment, would compare Paris, in these particulars, to London? We have, it is true, some noble central streets and squares, such as the Fleet-street line, Oxford and Holborn, Pall Mall, and not least, Regent-street and Portland-place; but all these terminate in infinite and everlasting masses of brick, and afforestments of chimneys; we have, too, a long houlevard,—the New and City roads. Nature endowed us with a river, and we have erected bridges.

In this department of architecture, no city in In this department of architecture, no city in the world is, I helieve, comparable to London, which being placed on a site possessing every element for adornment, appears to have been planned (if ever it was, which I very much least) without eavy executed to those force doubt) without any regard to those first postulates of grandeur.

There are few cities which some great imita-tors of Appius have not illustrated by cutting out noble avenues, if not arcs and portals, as well as hy the erection of that inestimable desideratum, quay walls to rivers.

Paris is notable amongst all others for her notable avenues,—that of Neuilly hardly requires mention; the Boulevards, Tuilleries, Champs Elysées, various approaches and barriers of colossal dimensions, and even quay walls to its tideless extents. its tideless stream.

Brussels, too, is familiar to English travellers in these attributes of civic consequence; and even Dublin has her granite quays of chisseled

masonry to the Liffey.

It is manifest that these advantages, products of industry and expense, under the guidance of good taste, formed no part of an original plan, but that these embellishments were added as the citize grew; and that the enterprise of the citizens effected what the advancements of the citizens effected what the citizens effected whether effected what the citizens effected whether effected whethe vancing taste of the age demanded, or that some great potentate imagined and executed

some great potentate imagined and executed what was useful and pleasing to the time.

Some may call these things accidents; so perhaps, in some sense, they are, as is the accumulation of houses and population in any city. If so, then our metropols is an unhappy city. If so, then our metropons is an unmappy, accident,—unhappy, at least, in its peculiar meagreness and utter want of both quay walls meagreness and commerce, Father Thames, to the parent of commerce, Father Thames and of appropriate approaches to this over

grown mart of all nations.
Having before, in THE BUILDER, alluded to Having before, in The Builder, alluded to the openings of one avenue in continuation of Pall Mall, allow me now to suggest another of not less important display, although of considerably less expense, in another quarter. The line of Portland-place, terminated by the Quadrant, but drawn out in extenso, you may say, to the Bank—on the other end sinks in a rail and shrubbery (perhaps, rather, scrubbery), at Park-crescent. This line is continued in a direction straight northward, by the onen in a rar and several and the property of property of the prope mervenes netween the top of formate-place and the park: the distance is not more than 420 feet, and this all public ground, without an obstruction. How trifling would be the cost of making 400 feet of carriage way, and railing it in on each side, and of constructing gates and lodges if necessary? The distance bence to the esplanade, or long walk, is all open park, and is perhaps 400 yards; this would require only a firm road to the point of junction, and when opened and finished would present as fine a chaussée as ever Paris can exhibit, terminating southward at Langham church and soirs restricted. church and spire, northward merging into the hilly undulations of Hampstead.

The cost of this whole improvement could The cost of this whole talpoot not (under private management) exceed 3,000l., and would bestow on this region of stately drear, now languishing in the dinge and gloom of bygone importance, a lightness and character to the study and practice of such plans and improvements.

No property, no house, could be injured by the change; on the contrary, the traffic must be, in a measure, diverted from the portals of the crescent by the medium route, whilst sufficient space of ornamental parterre would yet remain undisturbed for the égaiement of the frontages in the locality. The opening of the long walk, as an approach to the railway terminus and Hampstead, over the most elevated portion of this very pleasing, if not beautiful park, would also be a boon to the public (I mean the opening of the whole esplanade for private carrievals or hard-distinct the public of the whole esplanade for private carrievals or hard-distinct. nade for private carriages), as beneficial to the health and enjoyment of the citizens as to the increased requirements of a teering population. It was evidently the intention of the monarch who planned this park, and who laid out and planted this esplanade, that such adaptation should one day be made, to carry out the tasteful design of his offspring in the march of improvement. Record the march of improvement—Regent-street.

Now, as to this park and the new p

the new purchase of Primrose-hill, perhaps a few words may be excused on that subject.

The Commissioners of Woods and Forests, The Commissioners of Woods and Forests, whatever be their powers or incompetencies, have certainly the merit of having, within a few years, done work, in the plantation and embellishment of St. James's, Victoria, and Regent's parks—the purchase of 180 acres, including Primrose-hill—and in laying out plans for another park at Battersea, in order to provide lungs for a prespective town, and a to provide lungs for a prospective town, and a generation yet to spring up in that district; but for two years all has heen at a stand-still—a dead halt! Commissioners fluctuate with the Administration; they change in their goings out and comings in, with the Govern-ment of the day, and can have but little experience in the routine of office. No, the ma-nagement rests with the permanent fixtures at the board. Some people call this rather mis-

management. However, the commissioners always discovered an anxiety to carry out public improvements with spirit. But who can blame the commissioners for hesistaing to carry out essential public designs, if the public purse be exhausted, and that there are no funds in the exchequer of that department?

The point on which I would animadvert is the naked unplanted condition of Primrose-hill or Alhert-park, which has been two years enclosed, and particularly the omission to secure a building plot on the verge of Primrose-hill-park, interposed hetween that and Regent's-park—which is the only spot on which a gate or entrance could he effected facing that of the latter. This plot is directly opposite the suspensiontrance could be effected facing that of the latter. This plot is directly opposite the suspension-bridge (over the canal) which forms the exit from Regent's-park,—and a detour of 70 or 80 feet is now made close beyond the bridge, to the right, in order to approach the entrance

to Primrose-hill.
Should this plot be built on—and it is proshould this prot be built on—and it is proposed and labelled for building—a row of houses will present a bastion which will effectually cut off the view from park to park; and this is the most pleasing coup-d'œil, where, looking through the now matured groves, the hills are revealed merging one into the other.

This point is most pleasing, if not absolutely Into point is most pleasing, if not absolutely picturesque, but the eternal continuation of houses will mar all—not to speak of the two opposing entrances (for Park-road separates them) being 80 feet apart, and askew. Thus not only is the connection between the parks (with all view from one to the other) to be cut off, but all order violated, which should make the partials of office (if not the should make the portals of office (if not the paths which lead to them) straight.

Above two years has this place of popular resort been paled in: so much time has heen lost in its furniture by plantation—not one shrub gives note of a living Repton at the board. Yes; there is a garden—a bare garden, 100 paces square; and this is studded with ministre plants. besides there with miniature plants; besides there are planted here divers bare poles, and gymnastic contrivances, to exercise the athletæ; the plat so complete, and close to the open road, as to notify to all passengers the amount of official care for the amusement of the mob. What youth would there resort to be a mountebank in public view? No: place it in some sequestered nook.

Space admonishes me to leave this subject, and only to touch upon one item more—the hideous deformities in Hyde-park! Here are

the serjeant's guard-barrack, the magazine, the sub-rangers' lodge, another for an underthe sub-rangers' lodge, another for an under-ling, and a hovel for some inappreciable use ling, and a novel for some mappreciant use-these form a sequence of five unsightly con-structions that would be a disgrace to the bye-lanes of Epping or Willededn, and which occupy a space of six acres, paled off in a shapeless longitudinal section; the most beautiful and sylvan portion of Hyde-park, near the Receiving-house at the Serpentine, is thus deformed and disenchanted.

These intrusions destroy the privacy (if the term is admissible) of our national park. this spot, at unaccustomed hours, I have ranged, and, looking toward the Scrpentine, have indulged the pleasing illusion of complete sequestration; turn round two points of the compass, the elysium vanishes; the hovels, the poles, the lounging guards, at once a raken the palpable fact that you cannot indulge in a rural dream (momentary though it be) short

of Richmond-park.

It would be vain to inquire the utility of these obtrusions; for all those piles are droop-these obtrusions; for all those piles are droop-these obtrusions. these outrustates, for all those plant a refuge for one humble hanger-on and a locus penitentia for, perhaps, a refractory squad of the Cold-QUONDAM.

A LEASH OF PORTRAITS.

It will be remembered that a subscription was raised some time ago by the Builders' Society to present a testimonial of friendship to Mr. Thomas Cubitt, and that a portrait

to Mr. Thomas Cubitt, and that a portrait being determined on, to be afterwards engraved for the subscribers, Mr. Pickersgill, the Royal Academician, was commissioned to paint it. Calling at Mr. Pickersgill's last week, we found, amongst a batch of portraits going on, this "counterfeit presentment" of Mr. Cubitt next to a picture of Mr. Charles Barry, and on the other side of the latter the vraje ressent. hext to a picture of Mr. Charles Barry, and on the other side of the latter the vraie ressemblance of Mr. Grissell,—a triad which, when exhibited in the Academy, will interest many of our readers. The picture of Mr. Cubitt is a full length; those of Mr. Barry and Mr. Grissell are three-quarters. Mr. Barry is in a loose morning robe of quiet colour, with a roll in his hand, and an elevation of the Royal Tower on the table near him: Mr. Cubitt stands with his hand, in his west as seasons. stands with his hand in his vest, an accustomed position; and Mr. Grissell, out of doors, wears a cloak, the red velvet lining of which, with a cloak, the red vervet ining of which, with other accessories, produces a result sufficiently gay. As likenesses, these pictures are re-markably successful; and as works of art they are equal to any thing Mr. Pickersgill has done for a long time.

NOTES IN THE PROVINCES.

The first stone of the new church of Stan-more parish was lately laid by the Earl of Aberdeen, in presence of her Majesty the Queen Aberdeen, in presence of ber Majesty the Queen Dowager, the Bishop of London, &c. It is to accommodate 800 persons, one half free. The funds are being raised by subscription.—The funds are being raised by subscription.—The foundation stone of the first Primitive Methodist Chapel and School-rooms in Bristol was laid on Tuesday week. The building will be in the Norman style, and will contain 450 sittings, and scbool room for 300 children.—The new church of St. John the Evangelist. Ashton Haves, Tarvin. Cheshire, was consistent of the property of the strength of the consistency of the strength of the s The new church of St. John the Evange-list, Ashton Hayes, Tarvin, Cheshire, was con-secrated on 9th inst. The edifice is of stone, with a spire, and contains 305 sittings, more than one half free. It bas been erected, and fitted up at an expense of about 3,000l, at the sole cost of Mr. William Atkinson, of Ashton Hayes, who has also erected a parsonage house and schools, besides endowing the church with and schools, hesides endowing the church with 1,000l., and a repair fund of 150l.—The cost of the proposed Temperance-hall, at Leicester, lately noticed, is stated, it seems, at 3,000 guineas.—The exterior of the chancel of guineas.—The exterior of the chancel of Whitby Church, has had its ornamental tur-rets restored: they were blown down in 1829. of During a recent gale the wooden beacon erected on the sand banks, near the mouth of the river Esk, below Ravenglass, was blown

COMPETITION .- Plans and specifications are wanted from architects and gas engineers for gas-works, at Walsall, by 7th April: the successful competitor to superintend the works.

METROPOLITAN COMMISSION OF SEWERS

THE COMMITTEE QUESTION.

A GENERAL court was held on Thursday in last week, at the Sewers' Court, Greek-street; the Earl

of Carlisle in the chair.

Mr. Hertslet, the clerk, read the voluminous case submitted to the law officers of the crown on the business of the commission, with their opinion thereon, the substance of which appeared in The

BUILDER of last week.

Mr. Leslie then rose and said that he felt called upon, in this stage of the matter, to make a few observations. The court were aware that the opinion that had heen just read had been elicited in consequence of certain resolutions as to the in consequence of certain resolutions as to the business of Courts of Sewers coming up from the Bye-laws Committee, and, subsequently, to the General Committee. The case, as stated, gave the different readings and different opinions taken on the subject. On the opening of the commission he objected to the words "Standing Committees," that they ought not to he permanent, and that the main business of the commission should he does in one. business of the commission should he done in open court. Others thought that a great deal of business might be got through hy a subdivision of lahour through the means of committees. Now, what were the resolutions as to the Works Committee were the resolutions as to the Works Committee, why, these: —" To have under their immediate regulation and management (but subject to the General Committee), all the affairs of the commission relating to works and operations of the commission, and also the immediate control over the engineers, surveyors, assistant-surveyors, and other engineers, surveyors, assistant-surveyors, and other officers and servants of the commission employed about such works and operations; and should be empowered to obtain plans, sections, and estimates of all proposed works and operations, and to employ (but subject to the approval of the court) such clerks of the works and other subordinate officers and workmen as may be necessary." Now, here it was evident that the chief functions of the commission were to originate in functions of the commission were to originate in this committee, and on their report the court might adopt or reject their recommendations; but if the minutes of this committee were wanted, it required minutes of this committee were wanted, it required a requisition in writing from three commissioners to have them produced. Now, hy the opinion of the law officers, they were told that no husiness could originate with committees, but must originate in open court; therefore, on the first occasion, he submitted that the recommendations of the Bye-laws Committee could not be adopted, in consequence of their illegality. He had told them that if they could not get through the husiness, they might succifically Committee could not be adopted, in consequence of their illegality. He had told them that if they could not get through the husiness, they might specifically appoint committees to assist them, and that was precisely the view that had been taken hy the law officers of the crown, and, as he had shown, they could not make appointments in committee, or delegate the powers of the commission to any committee whatever. This power had been usurped in the appointment of Mr. Gotto as assistant-surveyor, as they had no right to make any such appointment. Although no power could he delegated to them, yet even so recently as Monday last, and since the opinion of the Attorney and Solicitor-general had heen received, which told the committee they could originate nothing, they had instructed Mr. Gotto to look out for a convenient site for trial works. The opinion said that the court must oricould originate nothing, they had instructed with Gotto to look out for a convenient site for trial works. The opinion said that the court must originate all the business, and that any court could alter, continue, or discontinue such committee at any court. (Cries of "No, no.")

The Earl of Carlisle said the words were, that

" committees may be empowered from time to

Mr. Leslie resumed :- As be read the words, Mr. Leslie resumed:—As be read the words, the court could alter or continue a committee at any court; and if any new matter was considered, it must be by an express order of court. If the rate-payers were dissatisfied with their proceedings, the matters could be removed by certiorari to the Court of Cheeck. matters could be removed by certovar to the Court of Queen's Bench; therefore no expenditure could take place unless by order of the court. He was told that this expenditure applied only to a class of cases, where the sums did not amount to 50%, which was most absurd, as they might make orders for fifty such cases, and order payment for the whole without coming to the court at all. Such being the same as to 60%; the court at all. Such being the case, he felt it to he his duty to step in and save the commission from total destruction, borne out as his view now was hy the opinion of the Attorney and Solicitor-General. There would be no difficulty in proceeding with the business, when they were empowered to have monthly courts, they were empowered to have monthly courts, special courts, and committees for specific purposes; special courts, and committees for specific purposes; hut it was not for the public interest that the husi-ness of the commission should be carried on as it ness of the commission should be carried on as it had been lately. They had been doing nothing lately hut spending hundreds of pounds of the rate-payers' money without any order of the court. Centlemen might smile, but he saw nothing to smile at, as he was prepared to prove it. As far as useful purposes, they had had for some time two plans for the improvement of the drainage of Westminster, one by Mr. Austin and the other by Mr. Phillips,—and yet they could not get the subject to discuss.

Another question had arisen,—an application from the Improvement Commissioners for a new line of sewer; but even this matter had never reached the

sewer; but even this matter had never reached the court, but in common had been passed over to the committee. The hon commissioner concluded hy reiterating some of his main points of objection.

Mr. Slaney remarked that he had listened with regret to this discussion. He hoped they would come to some amicable mode of carrying on the business of the commission. It appeared to be the opinion of gentlemen that some injury was about to opinion of gentlemen that some injury was about to be committed from their being excluded from certain committees. Now he, God help him, was not on any committee, and he was not in the least offended (a laugh), but he believed, that unless they delegated the details they could not efficiently carry on the business of the court. At the same time he thought there was a fault on the other side, and that a statement of the business to come on at the court should he issued, to give them an opportunity of

considering it.

Mr. R. L. Jones considered the number of the court would not prevent the whole duties being properly discharged if the court met weekly, when every geutleman might attend. The officers were w called away by committees, and could not end to their duties. The court, too, was placed in entire ignorance of what was going on, unless they ne to the court and read volumes of reports, and therefore he was satisfied the husiness could not be done unless they met weekly, as it was at present in a complete state of chaos. As a commissioner, a complete state of chaos. As a commissioner, had a right to he informed of what was going on,

or he had no husiness there at all.

The Hon. Fred. Byng said that Mr. Slaney's observation was unfair as regarded himself. He had objected to the constitution of a Works Committee, even supposing it to be legal, as the thirteen gentle men put on it formed a complete majority, ren-dering the opinions of the rest of the commis-sioners a mere nullity. He had impressed upon the committee the necessity of its heing open, and had come down to the court for the purpose of moving that all committees should be open, but found that, unknown to him, Mr. Leslie had made a similar motion, which he was happy to second. The resolutions had been borne out by the opinion of the law officers of the crown. He (Mr. Byng) was not on committees, therefore he could not he charged with having "obstructed" their husiness. The manuer of doing it had hitherto heen happy-go-lucky, and it was now time to divide their dis-

Lord Ebrington thought they would act wisely to acquiesce in the opinion received, and thereby put an end to useless and fruitless discussion, while the works of the commission were slumbering. He thought it would be prudent to take this opinion as their text for the interpretation of the law. With regard to the appointment of Mr. Gotto, the choice of an assistant-surveyor was specially referred to the Works' Committee. When he heard gentlemen talk of nothing being done, and in the same breath complained they could not read the reports, he thought the objections answered themselves. It was the practice of large hodies to refer details to smaller bodies, and in this they had an example in the high

practice of large nodes to reter details to smaller bodies, and in this they had an example in the high court of Parliament.

After a few words from Mr. Lawes,
The Earl of Carlisle trusted that persons appointed for the public good would act in harmony together, feeling assured that no expenditure could he valid unless it was authorised by the court ne valid unless it was authorised by the court. Cases of emergency, however, might arise to render it necessary to depart for Cases of emergency, however, might arise to render it necessary to depart from this rule; and whether it applied to bodies or individuals, they must rely upon the justice of the case for the approval of the act so performed. The law officers had declared that all husiness must originate in the court at large; and he thought they would act wisely by following the course there pointed out; yet the court might refer such hrauches of it as they were court might refer such hrauches of it as they were unable to settle themselves. As to attending weekly, he at present held more offices than he could properly discharge; but even with weekly attention, there were at present many pressing mat-ters,—such as house drainage, the size of sewers, and the withdrawal of pollution from the Thames, all great matters of principle, -which he thought it would he prudent to consider first, and refer to the court, believing there was no substantial difference of opinion in proceeding to the ordinary business of the court.

Mr. Bullar then submitted a string of fourteen resolutions, abolishing the general committee, converting sub-committees into committees provisionally, and defining the duties of them. The resolutions were seconded by the Rev. W. Stone.

Mr. Leslie deprecated these resolutions being Mr. Lesue deprecated these resolutions neing brought forward without notice of motion. He reiterated his objections to the abominable practice of committees, and, having discbarged his duty, if they chose to pass the resolutions, he should not say another word on the subject.

The resolutions were then put serialim, and carried as a provisional arrangement, Lord Carlisle remarking that unless something of the kind was

done, the whole business of the commission would

done, the whole observes of the commission would be completely at sea.

Mr. Byng then withdrew from the Finance Committee, and Mr. Leslie and Mr. Lambert Jones gave notice that at the end of a month they should also retire from that committee.

At a meeting on the 22nd, the minority entered a strong protest against the legality of the resolu-

Miscellanca.

HER MAJESTY'S THEATRE.-When Her Majesty's Theatre was decorated in 1846 we spoke of the work at some length, as one of the most successful and effective of its kind, and we gave praise to Mr. Johnson, the architect by whom it was designed, and to Mr. Marshall and Mr. Sang by whom it was carried out. It still holds its good place in estimation, and viewing it a few nights since we were more than ever impressed with the success with which a great desideratum had been obtained, -namely, unity, with variety. While the eye and mind find constant occupation in the and mind find constant occupation in the always varied groups, medallions, and Raf-faellesques displayed, there is a oneness and congruity about the whole which is particularly satisfying and admirable. Mr. Charles Marshall, by whom the scenery here is executed, stands high amongst the half dozen able men now painting for the London stage. We shall have an opportunity to speak some of his works.

ELECTRO - TELEGRAPHIC PROGRESS. -Mr. Brotherton, of Preston, has recently patented an invention for prevention of accidents on railways. It consists of an electric apparatus fixed beneath the rails, on which the wheels of the train act as they pass over it. A wire connects this apparatus with any station or junction which the train may be approaching, and at which an electric alarm is fixed. By this invention the attendants at froad. By this invention the attendants at any station or junction may, it is said, be apprised of the approach of a train any number of miles off, and in case any obstruction exists, of miles off, and in case any obstruction exists, a signal can be immediately forwarded to the train.—The projectors of the great submarine line across the Atlantic propose to construct it between the coast of Newfoundland and the nearest care of Ireland. They state that there is every reason to believe that a submarine bank extends from Newfound-land to the British Isles, to which they propose to anchor the wires, supported in tubes, at intervals of 10 miles. They have appealed to Congress to aid them in the enterprise, by appropriating a public vessel for their use, to ascertain the truth concerning the nature of the bottom. Should they not find soundings, they state they could still manage to anchor the buoys by means of buckets, &c. They exhort Congress "not to allow the British Government to anticipate the

United States in this sublime project."

CARD-BOARD MODELS.—In reply to a late inquiry from Tyro, wishing to know how to colour card-boards for models,—I have had many years' experience of the art, and find that best plan is to procure card-board of the colour required, such as stone, slate, or lead colour, and shade it with warm sepia. In all cases where brick colour was required, coloured the card-board with Indian red, and shaded as above, as I could not procure card-board of that colour; though I should think hoard of any colour could be procured in London, if required, which would be prefer-

able .- H. W. BENSON, North Shields PREVENTION OF COAL-PIT EXPLOSIONS Mr. George Dunn, of Doncaster, M.D., has invented a ventilator, which he has pre-sented to the public without appropriation by patent, and by means of which it appears from experiment at the Darley Main Colliery, where it has been tested, that such a perfectly free circulation is attainable through a pit as will obviate all chance of explosion. This venwill obviate an enact of explosion. The tribator, says Mr. Dunn, may be constructed of wood, zinc, tin, iron, or copper. One is to be placed, in the form of a hood or cowl, and self-acting, over the up-cast shaft, while another is placed over the down-cast shaft, with its en side or mouth to the wind, and will also be self-acting, where a down-cast shaft can be appropriated to it: by these means, a current of air is to be made to circulate through every part of a mine.

PROJECTED WORKS. - Advertisements have PROJECTED WORKS.—Advertisements have been issued for tenders, by April 11th, for the execution of various works for the completion of the Portsmouth station of the Brighton and South-Western Railways; by 26th, for the erection of a building for the Townhall and Market-house Company, at Brentford; by 2nd, for dredging a shoal in the river Thames, at Woolwich; by 17th, for various works (separate tenders) for the Folkstone Water Works Company; by 26th inst., for the erection of an additional story and other alterations to the Sewers' office, No. 1, Greekerection of an additional story and other alterations to the Sewers' office, No. 1, Greek-street, Soho; by 31st, for constructing dams and erecting new piers and other works, at Al-lington-lock, near Maidstone; by 14th April, for the execution and completion of the Criminal Court, and other works, at Cardiff; by 4th, for the erection of buildings for baths and washhouses, at Bristol; by 12th, for the works comprised in the construction of the dry-pool and entrance lock from the river Hull the Victoria dock, at Hull; hy 2nd, for the erection of committee-rooms and offices, and the enlargement and alteration of warehouses, at Stourbridge wharf; by 28th inst., for the building, finishing, and completing of a lock-up, at Maryport; by 28th, for alterations and additions at Bitterne Lodge (Southampton), together with the erection of an entrance lodge and greenhouse there; by 28th, for todge and greenhouse there; by 28th, for paying and materials for the repair of the roads in St. Mary's, Islington: by 27th inst., for planning a skeleton map of the township of Nicholforest (Longtown); by 2nd April, for two several quantities of tuhular glazed stoneware pipes, for Oxford; by 27th inst., for 900 yards of cast-iron pipes, and for the works of a sessivity siles & for former or the works of a sessivity siles & former or the works of a sessivity siles & former or the proches. the works of a reservoir, filter, &c. (separate tenders), for the Industrial schools, at Swinton

tenders), for the Industrial schools, at Swinton (Manchester); and hy 30th, for lead, tin, red lead, oil, &c., for Bristol Water-works.

LAVISH EXPENDITURE.—From the evidence of witnesses examined before a Parliamentary Committee, it appears, that although Parlyley Ladence. J. bec. it appears, that although Pembroke dockyard, begun in 1820, cost only 6,000l. in construction, the mere levelling of it afterwards cost 54,630l., and although many years have since transpired, the authorities are still paying nearly 1,500%, a-year for hired teams, in place of forming tramways at once. But even all that is nothing to the amount of private contracts for works connected with this same dockyard, and for which public competition has been either never sought for, or effectually put down by favouritism and official jobbing. One person and his brother-inofficial jobbing. One person and his brother-in-law (principal and agent), have, it is said, alone had nearly the whole amount of half a million of had nearly the whole amount of half a million of money in private contracts for works connected with this one dockyard: off that sum, however, they had to provide "dinners and saddle-horses," &c. for certain officers.

POWER FROM WATER IN AIR-TIGHT PIPES.—We have already alluded to this new application of power—the pressure of water in airtight pines. The Glargon Circus describes.

application of power—the pressure of water in air-tight pipes. The Glasgow Citizen describes a model engine in the office of the Gorbals Gravitation Water Company, Portland-street, as a beautiful contrivance:—"The model is as a beautiful contrivance:—"The model is about one-horse power, with a horizontal cylinder, and having a 12-inch stroke. The water, which here has a pressure of about 210 feet, is introduced to it from a common house pipe; and such is the simplicity of the machine, that a child could work it, and regulate its speed at pleasure, by the mere turning of a handle. The great advantage of this engine consists in the fact that it can be put up in any flat of a house of any street-wherever, in fact, there is a water-pipe. It takes up very little room; it registers the quantity of water which it uses; and it may be erected in those localities in cities where steam-power is prohibited on account of danger and nuisance from smoke, and without raising the rate of in-surance."

THE WINDOW TAX.—A meeting of the inhabitants of St. Mary, Whitechapel, was held in the vestry room, on the 5th inst., and a petition praying for the repeal of the injurious and unjust tax on light was unanimously resolved on.

FREEMASONS OF THE CHURCH .- A meeting of this society was held at Great Marlborough-street on the 13th. After the usual business the secretary read a paper, by Mr. D. Wilson, on the positions of founders' tombs in ancient collegiate churches, chantries, &c.

DECLINE OF TRADE IN SHEFFIELD .little union among the masters, and too much of it among the men, appear to be fast ruining this once busy seat of trade. Every one complains, yet no one moves an amendment. No sooner does a master undertake any large or important contract than the men are ready to pounce upon him with unreasonable demands, which, if resisted, lead to the sure destruction of his machinery. Thus, while Belgium, Germany, and the United States, in which no such pernicious system prevails, are beating the English out of extensive markets, and even bearding the Sheffielder in his own den. or shaving him rather with his own weapon. by help of the same sure instrumentality the latter is deliberately cutting his own throat -smashing his own machinery, in more senses than one. There is a talk of the necessity of some new trade. But of what use would a new trade be with the old system of 'union' and disunion? It is 'a new man' that wanted probably still more than a new

COMING WORKS .- The "Oxford Graduate" (Mr. Ruskin), advertises a new work, "The Seven Lamps of Architecture." Mr. W. Lea has in the press "Tables of the Strength and Deflection of Timher," for the purpose of determining by inspection, and therefore with-out having recourse to the extraction of roots or the solution of algebraical equations, the scantlings of any description of timber requi-site to carry a given weight and to have when loaded a given deflection. They are designed as a kind of ready reckoner for the use of engineers, architects, surveyors, builders, carpenters, joiners, and all persons who may be interested in the subject.

CALCINED GRANITE.—Mr. Archibald M'Donald, of Aberdeen, some time ago discovered a process for reducing Aberdeen granite to a fine clay, which was moulded into form at the Seaton Pottery, and presented an article of the most beautiful and durable character. Since then, Mr. M'Donald has had an experiment tried of working the calcined granite into water-pines. granite into water-pipes.

BEQUEST TO INSTITUTION OF CIVIL EN-GINEERS.—In the Rolls Court, a decision has just been come to which, if not reversed in a higher tribunal, will confirm in favour of the Institution of Civil Engineers a variety of sbares in public companies, &c., bequeatbed by Mr. Thomas Telford under his will, but resisted by his heir-at-law under the statute of mortmain

IMPROVEMENT OF GLOUCESTER. — The remarks on the want of spirit displayed by the citizens of Gloucester, contained in the last number of THE BUILDER, must have been acceptable and gratifying to every individual who really takes an interest in the prosperity of the "fair city." It was observed by a local contemporary that the citizens, during the raging of the late fire at the cathedral, were so laudably sensible of the value of that noble ornament of their city, that the anxiety of the great majority to be of service only made "confusion worse confounded," and yet some days subsequently, when the principal magis-trate of the city proposed to increase the efficiency of the fire engines (and no city in England of the same extent is, I am positive, more inefficiently supplied with the means for extinguishing fire), and to institute a fire brigade, persons were found who raised objections to that enlightened mode of pro-With respect to the proposed museum, I can safely say that no city is more deficient in means of rational amusement than Gioncester, and directly an enlightened member of the town-council, like Mr. S. Bowly, for in-stance, proposes the establishment of a museum, up rises a member of the same body, who is not very noted for the promotion of learning, and says, "Oh, you had better engage rooms instead for the supply of mutton chops to the poor," and the proposition is negatived. Comment is needless, Mr. William Vernon Guise some time since offered a fine collection to the city, upon condition that a kind of museum should be established within a given time. That period has now elassed and the city has been despised for within a given time. That period has now elapsed, and the city has been deprived of a very choice collection through the instrumentality of the majority of its local representatives A GLOUCESTRIAN.

WAGES OF MASONS IN AUSTRALIA Masons find plenty of employment at from 5s. 6d. to 7s. per day. Except in the town, very little wrought stone is used for building, unless for large bridges, churches, or other substantial erections. The stone quarries near Adelaide supply this material in abundance, and of excellent quality, and many of the shop fronts and stores in town are now embellished with elegant facings. Limestone is also abundant, and of good quality. In the country, houses are built of rough stone only; but in many parts a peculiar kind of white slatestone is found, which splits off in large slabs, and can be worked with great accuracy: it is as soft as the blue slate, and breaks with a clean straight fracture. In other parts there is a kind of blue marble, which also works well, and makes substantial dwellings. Masons going should take out theirown tools, with a few good wedges and crowbars to quarry stone. A wife and children will be no drawback, but the contrary.—A Working Man's Handbook to

FARM BUILDINGS.—The choice of a site for a farm-yard, says Bell's Weekly Messenger, and the arrangement of its buildings, are questions whose importance are far too seldom regarded. The landlords of England can hardly be too often reminded of these things. "Could they," remarks Mr. Grey, of Dilston, in a valuable paper on farm buildings (Journ. R. A. S., vol. 4, p. 2)—" could they hear now and then the discussions on their management which take place among the farmers around them, they might obtain useful hints for their own benefit." It is upon a general principle own benefit." It is upon a general principle only we can usefully dwell in these observations, and what Mr. Grey has in another place said so well, we need not attempt to express in any other words. In commending these things to the careful study of those who have the erection and improvement of farm buildings, we would, above all things, anxiously urge attention the paramount consideration of the health of their immates. It is idle to consider even the saving of lahour, and the other necessary conveniences of a farm-yard, if farmer's family are to be constantly visited rarmer's faminy are to be constantly visited with fevers, and other diseases consequent upon bad drainage; and if his live stock are to be constantly in the hands of the veterinary snrgeon. Let the landowner and the architect, then, ever take for their motto the words "health and comfort," whenever the buildings of a farm are under their consideration.

To Colour Monumental Inscriptions. -As Mr. C. H. Smith, in his last letter, mentions the difficulty of colouring inscriptions on monuments, I beg to state that I have found sealing-wax, dissolved in spirits of wine, answer the purpose admirably. Any colours may, of course, be used, and it should be laid on the same as paint.—G. T.

"BUILDINGS AND MONUMENTS, MODERN AND MEDILEVAL," being Illustrations of recently erected Edifices, and of some of the Architectural Works of the Middle Ages, with Descriptive Particulars. the Middle Ages, with Descriptive Particulars. Edited by George Godwin, F.R.S., Fellow of the Royal Institute of Architects, &c., &c., &c., Editor of THE BUILDER.

Under the above title it is proposed to publish in bi-monthly parts, price 2s. 6d. each, the principal Illustrations of Modern and Mediaval Buildings Hustrations of Modern and Medieval Buildings which have appeared from time to time in Ture Builden, with their accompanying descriptive particulars. Each part will contain about eight plates, folio size, and eight pages of letter press, with plans and details. The engravings will be printed separately, with care, on a tinted paper.

The first part will be issued in time to be forwarded with the magazines for May 1, and will contain:—

contain :

Her Majesty's Marine Residence, Osborne; with

The Carlton Club House, Pall-Mall. Church of St. Isaac, at St. Petersburgh; with

Kensington Union Workhouse The Liverpool Branch Bank of England; and

The North Porch, Restored, of St. Mary Red-cliffe, Bristol.

The Interior of Lincoln's-Inn Hall.

Persons desirous of becoming Subscribers, are equested to forward their names to the office of THE BUILDER.

No. CCCXXI.

SATURDAY, MARCH 31, 1849.

ATTERS artistical are taking their place before the public: the works done quietly in lone rooms, with Hope for a stimulator and support, are being

gathered together into the public places for commendation or sneer, sale or neglect. The harvest of the year is to be gathered. May the weather be fair for all, and the sun shine brightly on the deserving! Those who know best at what cost of time and labour art is attained, will the least willingly condemn, the most readily encourage. They will not expect to find a Michaelangelo or a Raffaelle in every striver after the beautiful; nor will they compare the works of the year of any set of men, with galleries of ancient art, -selected specimens of many masters from the works of many years.

On Monday, the Association for Promoting the Free Exhibition of Modern Art, opened their gallery. It contains 531 works of art, of which 15 only have been exhibited before, and is far superior, as a whole, to the collection in the same place last year.

At the private view on Saturday the attendance of visitors was very numerous, including many distinguished names, and eighteen pictures were purchased, being more, as we understand, than were sold there during the whole of last season, leaving out the sales to the Art-Union of London. The attendance of visitors since has been much better than it was last year, and will doubtless increase as the collection becomes known.

Nos. 6 and 7, "On the Trent," and "A Willowy Stream that turns a Mill," are two nice landscapes, by F. W. Hulme, at present better known by his excellent drawings on wood than by his pictures. No. 14, "Morning Prayers," by Marshall Claxton, is more to our fancy than some larger works by the same artist. The well fed, pompous hand seen at one corner of the picture, in the curtained pew, contrasts cleverly with the meek slight girls at their devotions in the "free-seat." In No. 23 E. H. Corbould gives a possible view of "The Old Hostelrie, High-road, Knightsbridge, A.D. 1497 (anciently ealled Kynge's-Brygg, or King'sbridge, but more commonly known as Stonebridge)." The dwellers in that pleasant suburb will scarcely recognise "the Green," now disgracefully disfigured by mud heaps, zinc cowls, and what looks like a very ugly warehouse or stable, but is in reality a free school, where young minds may be educated by externals (and how strong they are we all know), into due contempt of decency, order, and symmetry. No. 48, "Rngged Pastures," is by S. R. Percy, and has much excellence. The same artist exhibits five other landscapes, all possessing more or less merit.

55, "Christ teaching Humility," a finished study for a large picture, by R. S. Lauder, R.S.A., is one of the finest works in the gallery, and is calculated to raise the artist's reputation very considerably. It represents that incident in the life of the Saviour, when, in reply to the question, "who is greatest in the kingdom of heaven?" he exhorted bis dispicture alone would justify a visit to the gallery. No. 76, "Poggio Bracciolini discovering ancient Manuscripts," by D. W. Deane, has excellent qualities, which are still further displayed in 367, "Tasso reading his poems to Leonora D'Este," and 376, "Margaret prophecies the death of Richard III.," by the same painter.

No. 82, "King Lear," by Ford Maddox Brown, is a very remarkable work, and entitles Mr. Brown to a high place in the list of British artists. It is full of thought, and in finish, a perfect marvel. Mrs. M'Ian's "Soldiers' Wives waiting the result of a Battle," No. 92, should be published by the Peace Society: it is a touching scene, charmingly rendered. No. 100, "Highland Girls winnowing Corn, Fort William, Lochaber," is a pretty picture, by R. R. M'Ian.

J. E. Lauder exhibits two pictures, "Yorick and the Grisette,-the Pulse" (No. 103), and "Columbus" (275), which are both of great excellence. 146, "Kilns at Alfreton, Middleton Dale, Derhyshire," and 216, "Bonsall Dale, Derbyshire," are two of the best out of a number of very powerful landscapes by Niemann. If Mr. Niemann avoid falling from boldness into coarseness, he will not fail to make for himself a good reputation.

One of the best landscapes in the room is 106, "Lowering Weather,-Cader Iris," by Alfred W. Williams. This was bought by Mr. Creswick, A.R.A., showing a good feeling on the part of one connected with the Academy, which must be gratifying to the members of the association. 295, "Langdale Pikes, Westmoreland," by the same artist, is a delicious sunset amongst the hills, refresbing to the eyes of those locked in towns. No. 187 and 188 are two glittering views of the Eternal City, by W. Oliver. 200, "A Willow Bank," well painted by A. Gilbert. Mrs. Criddle, in 221, "Juliet," has a head full of deep feeling. Amongst the historical works will be noticed No. 290, "Claverhouse mortally wounded at Killiecrankie," by W. B. Johnstone, R. S. A., which although rather a picture of those who shot Claverhouse, than of Claverhouse bimself, has a breadth and largeness about it which redeems some bad painting. 308, "A Highland Stronghold," by H. M'Culloch, R.S.A., of whom Edinburgh is justly proud, is not quite so good as the picture exhibited here last year, but has all that truthfulness which distinguishes this artist's works. "Moss Dale Fell," by W. K. Briggs, is a clever piece of mountain scenery. 341, "Don Quixote preparing for his first achievement," by R. W. Buss, has much character. 260, "The Ascension of the Just," is earnest and well-intentioned, though defective in execution. 368, "The Girlhood of Mary, Virgin," by D. G. Rossetti, is in the manner of the early school, finished with extraordinary minuteness and displaying a high tone of mind. It is one of the most noticeable pictures in the gallery.

We must further mention J. D. Passmore, W. and H. Barraud (who have several excellent works), Wingfield, Dukes, Elen, Bullock (his fruit is quite faultless, better than nature and almost as good as Lance), Desanges (whose works, with much theatricality, display a mastery over some peculiar effects of light), J. T. Houlton, J. Peel, and others.

The Exhibition of the Society of British Artists will open on Monday. We may say, in anticipation, that it will be found above its average degree of attractiveness. Although ciples to become as little children. This there are no particularly striking pictures,

there are several of great merit, as, for example, Mr. Johnstone's "Mary at the Tomb," Mr. Anthony's "Lake of Killarney," and his " Round Tower" picture; Mr. Baxter's beautiful modelling and refined feeling for colour, as exemplified in his "Gipsey Heads," this year, and his admirable pourtrayal of childhood; Mr. Dobson's praiseworthy scriptural work; Mr. Hurlstone's gorgeous " Lady looking into the Glass;" the "Faerie Queene" picture of Mr. Gale; the Dutch-like transcript of the Wilsons, and hosts of sunny corners and cool green shady spots, from the pencils of Pyne, Allen, Boddington, &c. A new name to London, West, of Clifton, a natural genius, contributes a picture remarkably faithful and beautiful, executed much after the style of Creswick. These, with a very good gipsy episode, skilfully rendered by Mr. Hill; some three or four embodiments of Mr. Woolmer's gay dreams; some good marine subjects by Mr. Brunning, a new member; with the works of Messrs. Clint, Tennant, Herring, Clater, and members generally, constitute the nucleus of a much better collection than usual.

Most of our readers will be glad to hear that the Free Architectural Exhibition has hitherto more than realised the anticipations of the projectors, the number of visitors having just prior to the extremely cold weather reached to 560 and 670 in the day. His Royal Highness Prince Albert has bonoured the association with a visit; and amongst other distinguished visitors have been the Marquis of Northampton, Sir Robert Peel, Lord Codrington, and others. It remains open until the 5th April, -so that there is yet time for those of our readers who have not seen the exbibition to visit it.

The subscription list of the Art-Union of London, will be open just long enough after the issue of our present number, to enable such of our readers to add their names to it as have up to this time postponed doing so. We may mention, as news, that the council proposes to electrotype the two rewarded bas-reliefs, and to issue a certain number of copies of them in bronze as prizes. This is an excellent step.

The illustrated edition of "L'Allegro," having been very successful, the council determined on illustrating Goldsmith's "Traveller," and issuing it to all the subscribers. Amongst the artists who have already accepted commissions for this purpose, are T. Webster, R. A., J. Absolon, W. L. Leitch, W. E. Frost, A. R. A., C. Stanfield, R. A., E. H. Wehnert, R. Huskisson, Fk. Taylor, J. Gilbert, E. Corbould, R. Ansdell, and E. M. Ward, A. R. A.

The Art-Union of London has done good service and will do more.

ROYAL INSTITUTE OF ARCHITECTS."

AT a meeting held on the 12th inst., Mr. Ambrose Poynter, V. P., in the chair, a letter was read from Mr. B. Ferrey, giving a sketch of the life of the late Mr. Miles, an associate of the Institute, who died recently at the early age of thirty-two years.

In May, 1841, Mr. Miles left England for Hamburgh, travelled through Bavaria to Italy, stayed in Rome till December, went to Sicily. Greece, Constantinople, and returned to Rome.
He returned through Germany to England in
1842. During the whole of this time he
occupied himself most industriously, in taking sketches and measurements of the interesting buildings that came in his way. devoted himself more particularly, however, to the collecting of such details as might be valuable to him to consult in the prosecution of his future practice, knowing that many exquisite pictorial representations of the most celebrated

edifices had already been published, and feeling that it was the more practical kind of deprice of the same works: ing that it was the more practical kind of de-tails which the architect principally needed. This determination was creditable to him, he was possessed of no small skill as an artist and it must have been a struggle to him at times to act up fully to his resolution: not that he neglected perspective drawing, but that he knew the greater importance of severe outlines.

In conjunction with Mr. Sylvester, the engineer, he was engaged in erecting several works, in which the principles of atmospheric heat and ventilation required particular study; of these the flax mills at Patrington, near Hull, may be mentioned, and some conservatories in Cumberland and Derbyshire. Amongst other buildings, he erected a mansion in Hyde-park and two in Westbourne-terrace, a villa park and two in Westbourne-terrace, a villa for Herbert Ewans, Esq., Hampstead, and a cottage for Mr. Benj. Marshall, at Muswell-hill; at the period of his decease he was occupied on some extensive buildings in Scotland. The restoration of the chancel of Beddington Church, the national scbools at Beddington, Kilburn, and West-End, Hampstead, are also amongst his works.

Mr. Charles Googhegan exhibited a rubbing from the frieze of an Elizabethan mantel-piece discovered lately during the alterations to Wiarton House, near Staplehurst, Kent. In the original, which is elegantly executed in the Kentish rag stone, the pattern is very slightly Refine it agreement is very singlery incised in the stone, perhaps 1-50th of an inch, and it is a question if the same has not been traced out by means of an acid, this practice having been formerly much resorted to by the local masons.

Mr. Sydney Smirke, V. P., then read Mr. Sydney Smirke, V. P., then read a paper, "On the contents of a work by Sir Balthazar Gerbier, written in the 17th century, and entitled 'Counsel and Advice to all Builders,' together with some remarks suggested thereby."

These remarks referred to the condition of artizans now and at that period, and considering that they are calculated to be useful as shewing a progressive improvement in the condition of the working man, we give them prominence, and invite our readers of the class in question to a calm consideration of the facts set forth. To the other part paper we shall refer hereafter. To the other part of Mr. Smirke's

The Chairman said that, although this work of Gerbier's was undoubtedly one of the earliest works on the subject in our language, it was not the first. Walpole mentions a treatise by John Shute, a copy of which had recently been recovered by Professor Willis.*

Mr. Taylor, jun., then described his patent method of facing walls with stone, illustrated in onr pages last week. Mr. Fowler men-tioned, in connection with the subject, that the tower of Chelsea new church was cased after the brickwork of it was finished, and that the masons began at the top and worked down-wards. Projecting courses had been worked in.

ON THE CONDITION OF WORKMEN NOW AND IN EARLY TIMES.

A PERUSAL of the little book written by A PERUSAL of the Intle book written by Sir Balthazer Gerbier, in the seventeenth cen-tury, entitled "Counsel and Advice to all Builders," leads me to offer a few observations of a statistical nature, suggested by some data which the treatise affords, concerning the price of labour and materials in the latter half of the seventeenth century. Many, indeed most of the prices are stated in the book so loosely as not to admit of any safe comparison with the prices for the like work at the present day. Let me, however, take a few of Sir Balthazar's Let me, however, take a few of Sir Balthazar's prices,—such as do admit of exact comparison, and let me place beside them what may

Solder, 9d. to 10d. per lb 6d	l. to 9d.
Chalk lime, 6d. per bushel Lath and plaster, set, from 14d. to 17d. per yard Render, set, 3d. to 4d. Lathing only, 6d. Iron-bars, hinges, holts, staples, hooks, &c., 1\frac{1}{2}d. per lb	6¼d. 21d. 6d. 9½d. 1. to 6d 22s.

It is apparent, from the above comparison, that the prices of those works of which the value is composed of labour rather than of value is composed of labour rather than of material were low as compared with present prices, whilst those prices are comparatively high of which labour forms a less important element. Sir Balthazar, unfortunately, does not give us the wages of workmen in his day; but the researches of Mr. Macaulay, in his research whilehed history county, under the contractive of the contractive of the contractive of the contractive process. cently published history, supply ample evi-dence on this subject. He shows that the ordinary pay of a skilled workman was 6s. to 7s. per per week, whilst the ordinary pay of a onrer was 4s. per week. Compare these with the present wages of workmen, and we shall find that they receive more than four times as much as they did at the period in question.

Having thus shown how low the scale of workmen's wages was in those "good old days," let us inquire into the necessary exdays." let us inquire into the necessary expenses of a workman. On referring to the table given by Adam Smith of the prices of wheat, it will be seen that the average price, from the year 1637 to 1700 inclusive, was 51s. per quarter: the fluctuation was enormous, for in 1648 it was 85s., and only a year afterwards it was 35s. 6d.,—but the average was 51s. But what is the present price? About 51s. But what is the present price? extraordinarily low at the present mo-498. ment, I am aware, but the average of the last

eight years is little more than 54s.

It is therefore plain that during the Commonwealth, and subsequently, a workman must have paid about as much for his bread as he now pays, whilst he received rather less than one quarter of his present wages.

I have no data at hand as to the price of meat, but Mr. Macaulay reminds us that hundreds of thousands of families rarely, or never, touched it, and it probably did not the never, touched it, and it probably did not men form an article of ordinary consumption among the working classes; indeed, the risk and expense of bringing cattle to the London market in those days, would alone justify the presumption that meat was a comparatively high-priced luxury. Mr. Macaulay has also ascertained that the prices of the following articles in 1685 were not merely relatively, but articles in 1955 were not merely relatively, but actually, higher than in 1848:—viz., sugar, sait, coals, candles, soap, shoes, stockings, and, generally, all articles of hedding and clothing. Then, as now, these commodities comprised nearly all the personal comforts of a labouring man

a labouring man.

If we even look hack to so recent a period as the year 1800, I have it on excellent living testimony, that the wages of a good mason in London were only 16s. per week, who now receives from 30s. to 33s. In the year 1800, wheat was, on an average of five years, as appears by the tables given in Tooke's History

appears by the tables given in Tooke's History of Prices, 90s. 6d. per quarter; and, indeed, during a year of great scarcity about that period, the quartern loaf, for which we now pay 7d. or 8d., cost 1s. 10d.*

It is, indeed, most gratifying to trace the real and progressive improvement in the condition of the working man, since times to which many are too apt to look back with a vague feeling of regret,—as if the keener competition of later times had reduced both the means of employment and the reward of labour. It seems, however, to he a law of our nature that, with the growth of all the material gratifications of life, there grows up also (and in a still greater degree) an increased wish to obtain a larger share of them; and hence it is that contentment is not found to hence it is that contentment is not found to keep pace with improvement.

* Some interesting facts, tending to shew the improved condition of workmen within the last fifty years, are noticed, by M. Thiers, in his "Discours our le droit au travail," pronounced 13th September last.

I trust that my motives in making this contrast will not be misunderstood. I am anxious to shew to workmen that they have at least some grounds for satisfaction, but I am very far indeed from regretting their present wages. We, as architects, are too deeply interested in their welfare to admit of such a supposition. their welfare to admit of such a supposition. Our fortunes are bound up with theirs; upon their fidelity and care our professional character and credit depend. Nor can we expect them to use their energies with the same zeal and assiduity, whether we pay them with a grudging or a liberal hand. If ever it could be said with truth that a workman is worthy of his him they have the said of th hire, it can be said now of English workmen. In all the most important arts of manufacture, machinery, and architectural construction, English workmanship is without a rival. I appeal to those architects who have examined the present state of the art of building on the continent, to testify the perfect truth of this

If, in our solicitude for the welfare of this very intelligent, sober, industrious, and loyal class of men, we look around for the means of further advancement, we must turn to those causes over which we can reasonably expect to

exercise some control.

The rate of wages is everywhere determined The rate of wages is everywhere determined by causes which it is useless to attempt to influence; nor have we any reasonable prospect of removing the mischief arising from uncertainty of employment, or from the fluctuations in prosperty or fashion. But the further rein prosperity or fashion. But the further reduction of the cost of all the necessaries and comforts of life, is an object clearly within the sphere of our competency. That is the quarter from which we may, with reasonable confi-dence, anticipate an amelioration of the la-bourer's lot.

Among the articles of primary necessity is that of lodging; and it is unfortunately one in which the condition of working people cannot be shown to have experienced much, if any, improvement. Both in this and other countries this head of expense is one which for very many years past has been found to have comparatively little tendency to decrease. In many parts it has nominally increased in a great degree.

About fourteen years ago I ventured to put About fourteen years ago I ventured to put in print a few suggestions for cheapening and improving the dwellings of the labouring classes. The ground I then broke was, to the hest of my belief, a perfectly virgin soil: many have since entered on the same field, and much has been done; companies have been formed; many plans in various parts of the country laid down, and in part carried out. for providing haid down, and in part carried out, for providing cheap, healthy, and commodious dwellings. The idea, therefore, has struck root, and I trust it may continue to flourish and bear good fruit. I will now, in closing my remarks, quote the words of one of the ablest of French atesmen, M. Thiers, in reference to the defective condition of workmen as regards their dwellings-words which are certainly remarkable when coming from such a quarter. In speech recently pronounced by him, he says:—
"Il y a, je le répète, possibilité de loger le any it, je ie repete, possimite de toger les ouvriers dans les grandes villes à meilleur marché d'une maniere plus saine. Cherchez avec nous les moyens d'y arriver; mais il faut les chercher en hommes qui aiment le peuple et qui veulent faire son bonheur."

SYDNEY SMIRKE.

IMPROVEMENTS IN SHAPING METALS. Mr. John Frearson, of Birmingham, has obtained a patent for improvements in bending or shaping. The metal as supplied hot from the rollers, is drawn by tongs with a to and fro and closing and opening motion between a pair of cutters, and slantwise, across a mandril or die. The requisite length is cut off, and then drawn by the mandril between a pair of grooved rollers, supported in levers side by side. As the iron is drawn through, the rollers approach by cams acting on the free ends of the levers, bending it completely round the mandril. The link, when completed, is removed by the mandril being made to slide best, and but he dril being made to slide back, and by the forward action of a catch interposed between the link and sliding-plate in which the mandril is supported. The different parts are worked from the main shaft by an arrangement of cams and levers far too complicated to be described without diagrams.

[&]quot;This monument declares, that here the corps doe lye
Of him that sought in science sight to publish prudently,
Among the rest of things, the which he put in ure,
That ancient practice and profound, that hight of architecture.

A knowledge meet for those that buildings doe erect.

As by his workes, at large set forth, is shewne the full effect."—Ep.

THE HISTORY OF ECCLESIASTICAL ARCHITECTURE IN ENGLAND.* THE SEVERAL INFLUENCES WHICH CONTRIBUTED TO FORM GOTHIC ARCHITECTURE

To express the difficulty of certifying the date of an invention, we might repeat a trite proverb—"that there is nothing new under proverb—"that there is nothing new under the sun;" and architecture forms no exception to the applicability of the saying. We parti-cularise the present period for poverty of in-vention, and not entirely without reason, but we forget how few are the years over which our observation bas extended, compared with these in which gradual progress was at legath those in which gradual progress was at length consummated in the works which we admire. As we still practise those methods of construction which were described by Vitruvius near two thousand years ago, so the elements of the art are found in the very infancy of time. And as we can retrace the changes of style, and note the influence of nation upon nation, so the wonderful beauty of the Gothic cathedral was not altogether the work of the 13th, 14th, and 15th centuries; and so, even the Saxon style was the offshoot of another. —We might, indeed, have traced the spire to the Saxon period, from the illuminations of Cædmon's paraphrase.

From the degenerate architecture of the Roman empire—imitated, in its several relinquished provinces, or subsequently, as we have seen, from recollections of the "eternal city"—sprang the various phases of architecture in Europe.

But the architecture more Romano was composed of styles which merely indicated the common origin, The architecture Saxons, and the style which was introduced by Edward the Confessor, had many striking features of dissimilarity. With all its re-liance to a common origin, the style of the Normans was essentially that of a different race, and it infused not only new elements but new vigour into the architectural efforts of the country. The most characteristic decorations of pointed architecture—of the early period at least—were suggested in Norman buildings; whilst those structural elements which we have whilst those structural elements which we have noticed during the Saxon period, were more fully developed, and, generally, the several in-fluences which contributed to form the pointed style, are to be observed in the durable works of the Normans, and not mainly to be gleaned from written chronicles.

The science of masonry bas never heen carried to greater perfection than during the period of pointed architecture; and the period of the Norman style is thus important, if considered merely as that of the education of the English masons. The zeal and enterprise of those who raised our cathedrals may astonish those who raised our cathedrals may astonish all; the beauty of the arrangement of flying buttresses and groining may delight the artist; but the rich embroidery of the roof of Henry the Seventh's chapel is merely the encrustation of a wonderful design for the adjustment of stones, towards which the first steps were taken during the Narman period.

tion of a sound to the instance of stones, towards which the instance of stones, towards which the instance of continental architecture over that of this country—in which the importation of the most characteristic over the importance of the instance over the importance of the instance over the importance of the instance over the importance of the impor racteristic features of the pointed style—we discover another effect of the Norman invasion. -But other influences towards the establishment of the architectural works of a later period, have to be enumerated. Of these were the very defects of construction-such as did exist, notwithstanding the merit of the Norman works compared with those which Norman works compared with mose winen preceded them. In the extensive reparation which has taken place at Hereford, and in the accident which befel the nave of that huilding, we have had recent evidence of that imperfection of Norman masonry, to which we owe the earlier ruin of other important huildings. Thus from this cause alone—although in the twelfth from this cause alone—although in the twelfth century there were an immense number of churches and religious establishments—and excluding from consideration that continual desire to contribute to the splendour of the religious edifice, which occasioned continual changes in huildings—were produced many beautiful works, amongst which the latter. changes in huildings—were produced many beautiful works, amongst which the lantern at Ely may he particularly cited.—It is perhaps to a similar want of constructive skill that we must attribute the frequent absence of groined roofs of Norman date; and the fate which has so constantly followed the cathedral

* Continued from page 111.

at York, in which even the groining has always been of wood, attended many noble structures. But to such causes as these we owe the works

which rose from their ashes.

The most important influence over the forms of Gothic architecture — referable to this period—is one of which we scarcely think Mr. Poole has taken sufficient notice. The crusades may indeed have given to Europe the pointed arch itself, and though it may he obected that, as the form is found in buildings which are not Gothic, it is not sufficient to constitute a distinct style, it remained, throughconstitute a distinct style, it remained, into againout, an inseparable element, lasting even after the principle of verticality was absorbed in the rectangular character, and being retained in arouated forms in tracery, when abandoned in the circumscribing outline of the properties of the control of the doned in the circumscribing outline of the aperture.—It is not our purpose to pursue the inquiry into the question of the origin of the form, to justify the opinion of Sir Christopher Wren, or to revive the ingenious theory of Milner, any more than to resuscitate the picturesque fancies of Sir James Hall, respecting the origin of the style itself resuscitate the picturesque fancies of Sir James Hall, respecting the origin of the style itself. All that we now show is, that in the Norman period of English history, and of the progress of architecture, we may find sufficient evidence for a certain amount of reliance upon such theories.—The effect of the crusades upon the structural arrangement of churches was imstructural arrangement of churches was important, if only from the influence of the model of the church of the Holy Sepulchre, and the theory of the eastern origin of the pointed arch is still that which ghr of the pointed arch is said that which presents the greatest amount of prohability. With the Norman style the pointed lity. lity. With the Norman style the political arch was long co-existent; it was transmitted arch was long co-existent; the insular possessions from the continental to the insular possessions of the Normans; but it was a form with which the English crusader was already familiar, and which had been apparent in the intersecting arches of the Norman style. And what palmer or knight, however much under the influence of the religious fervour of that remarkable age, could see "the land of the east" without deriving some impressions of the beauties of nature, from which our closet life "in cities pent" too much removes us. The carved ornaments and capitals of the Early English period have not, perhaps, the truthful adherence to natural forms which is observed in a later style; but they have so great a resemblance to well-known plants, that there can he no doubt as to their evidence of an awakened perception of natural beauties; whilst the still conventional mode in which they are treated, recals the architecturalised treatment of foliage, which the Normans derived, along with even the Corinthian capital itself, from the Roman

Considered as the period of the introduction of heraldry, the crusades are equally important: for hetween this science and Gothic architecture there has always been a very intimate conthere has always been a very intunate connection. It would be erroneous to suppose that this connection subsisted mainly in that period when armorial bearings formed the principal soulptured decoration of buildings,—when the beact the content of the second the sec when the rose, the portcullis, and the fleur-de-lis, were planted in every imaginable poside-lis, were planted in every imaginable posi-tion, and when the religious principle which is believed to have chiefly inspired the monu-mental architecture of the middle ages, was most obtunisively impaired by trappings and me-mentoes of social strife—which were intruded upon the sleep of death—or hy the assertion of high lineage in the equality of the tomb. That the connection of architecture and he-raldry was more subtle and intimate, is evi-denced by the remarkable parallelism which denced by the remarkable parallelism which may be observed in their progress. The shield was not only in constant use as an architectural decoration, but its form altered with that of the arch. Architecture and heraldry—each had a symbolical meaning, and the symhols which they comployed were often the same. "But," according to Mr. Poole, "the great bond of union was the religious element. In theory every knight was a faithful and devoted Christian; in theory every architect was a servant of the living Gop. The knight received his arms and his hanner at the hands of the Church, after prayer and vigil; and the rules of his order, and his vow of chivalry, were full of religious requirements and promises. And the arms which he received from the Church he desired, at his last day, to suspend over his monument, in pious acknow-

ledgment that he had received them from GoD, that he had kept them unsullied by Gop's grace, and that he was permitted to offer them again to Gop in thankfulness and bonour. And so with the architect and his work. The church was an offering, in the heart, and from the heart of all concerned,—the founder, the architect, the artisans."

But symbolism most deeply pervaded the But symbotism most deeply pervaded the architecture of the middle ages, and however little we may countenance the opinions of some who would see in Durandus the highest authority in Arr, we are forced to admit, with Mr. Poole, that all who have decay greatly from the forms of do not depart greatly from the forms of Gothic architecture—and of such there are few " must still design their churches with submission to several laws which have no basis but that of symbolism." Our author, in his definition of intended symbolism, rejects the aspiring characteristic of the mediæval church; but he area. but he carefully excludes the application of symbolic meaning from details which there is no proof were ever accepted as symbolical, and does not convert the moral reflections of Durandus into legitimate interpretations. Durantus Into legitimate interpretations. Symbolism, however, was of the greatest im-portance in determining the peculiar character of pointed architecture. We might, indeed, have discovered its germination during the Saxon period,—in the recognition of the principle of orientation,—in the division into nave and aisles—symholic of the Trinity—and that into nave and chancel, and in at least the existence of the cruciform arrangement. But in the Norman period symbolism was fully developed. The richness of the doorways was not merely æsthetic, and suggestive of similar depth and richness at later periods. It was the distinctive principle of the Norman architect to present "the decrated face of every portion of the church to the advancing spectator;" and this—most completely expressed in the Norman style—was certainly a most marked characteristic of pointed architecture. tecture.

It is not our purpose here to enumerate all the component elements of pointed architecture, any more than we are able to touch upon the multitude of forms in which these found expression. We might, indeed, point out that expression. We might, indeed, point out that the arts of sculpture and painting, in their several hranches, were never more indissolubly in-terwoven with the whole conception of a style, than during the mediæval period, notwitbstanding that it has been urged against the revival of the style, that it can give no scope for the exer-cise of these arts.—We might, too, have enume-rated, amongst other influences, dating from an early period, that of veneration for the patron saint, such as led to entire changes of the structure of particular huildings, and consequent most important influences upon style. Thus we might instance the venerated memory of Edward the Confessor, which occasioned the erection of the entire new building of Westminster Ahbey,—a work most important in the minster Abbey,—a work most important in the history of architecture, from the circumstance that it is believed to give the earliest date of the introduction of the traceried principle.— The bishops of the Saxon and Norman periods hecame the venerated saints of the later church, the reputation of martyrs brought wealth to their shrines, and the edifice increased in splendour, though at length its structural harmony was interfered with.

mony was interfered with.

But it is impossible to exclude from predisposing influences the existence of the
guild of Freemasons, by which that remarkable uniformity of detail in structures
of the same age was communicated from
one locality to another. At the same time,
and the polyment of the present the present of the same age. as Mr. Poole well observes, this uniformity is often exaggerated, although he might have added to his discrimination of national peculiarities the distinctive characteristics of more minute divisions of style, such as are observable in the works of different counties. Some of these may have arisen from difference of materials, hut inother particulars, the churches of one locality are distinct from those of another of the same date.

It would be wrong, indeed, to ascribe that importance to the Freemasons which has been given to them by popular consent. That it was held an honour to belong to the craft, that was need as nonour to belong to the orac, that their inflaence over the art was great, and that their mysteries contained many of the princi-ples for which modern investigators are busily engaged in searching, seems obvious; but that

no merit is due to local workmen, may, after

recent investigations, be doubted.

Mr. Poole falls into the mistake which we have had occasion to point out in the work of another writer. The thrust of the semicircular another writer. The thrust of the semicircular arch is not almost entirely vertical. The acutely pointed arch exercised much less thrust acutely pointed arch exercised much less thrust than that which preceded it. In this was its great merit. The Norman "buttresses," which were shallow pilasters having merely a decorative purpose, suggested the buttresses of the Gothic style. These were necessary, notwithstanding the greater facilities of construction which the pointed arch afforded, because in place of resisting the thrust by a continuous wall of great thickness, it was concentrated at wall of great thickness, it was concentrated at a particular point, at which was placed a buttress, and this was required to resist not only the pressure of the aisle vaulting, but—unlike the presecting style—alea that of the vaulting. the pressure of the asic vaniting, but—unlike the preceding style—also that of the vaulted roof to the nave. As the arch became de-pressed, the increased thrust required that greater projection of the buttress which was given to it. The use of the buttress was dictated by sound geometry, and the most eco-nomical distribution of materials, and it rendered the thick walls of early buildings unnecessary in succeeding instances. To appreciate the full merit of the medieval architects, it requires that this should be properly understood.

It should be remarked that during the Per-

pendicular Period, many of those charac-teristics which we have noticed, were almost teristics which we have noticed, were almost wholly obliterated, and the period is, perhaps, not erroneously viewed as the long decline of But it was not without many distinctive excellencies; it added greatly to the resources of the art; and had not political and religious changes supervened, it is not alto-gether certain that the general abandonment gether certain that the general abandonment of Gothic architecture would have taken place; at least, a return to Decorated forms is sometimes observable, which betokens-we are inclined to think—rather an independence of thought, than that poverty of invention which is mainly characteristic of the facility of decoof panelling. ration which attended the use of Nevertheless, the error must be guarded against, that the subversion of Pointed Archiecturcisto betraced mainly to the Reformation. It was not consequent upon the dissolution of the monasteries, which indeed preceded the Reformation, and it is remarked that Wolsey had dissolved and despoiled religious houses to found his own college long before that event took place.

Mr. Poole leads us through the various changes of style, during which the several influences we have enumerated were at work, and gives the history of the principal buildings and gives the history of the principal buildings in which these changes are exemplified. He has generally executed his task with ability, and has produced a work of reference, which cannot but be found useful. We are the more prone to give him credit for what he has done, because if we may judge from his concluding paragraph, he has not the self-sufficiency, or "little knowledge," which has too often rejected the assistance of those who devute their district the assistance of those who devute their jected the assistance of those who devote their lives to architectural studies and practice, and because, in deprecating too severe a judgment npon what has been done in modern Gothic Architecture, he recognises " that it does not fall to the lot of the same person or the same generation, both to be first in action, and to profit by experience." There is a limit to all human ability, and time and circumstances have effected those changes in taste, over which individual architects had no power of control. We are now reaping the advantages of the labours of those who have examined and explained the characteristics of Gothic Archiprained the characteristics of Gothic Architecture. It must not be forgotten how recently the style has received this succinct exposition; and if we are superior to our ancestors in most things, and if we regret that our religious architecture, particularly, is an exception to that superiority, we may confidently say that the state of architectural knowledge in England gives ground for the anticipation that the ART will again achieve great results.

BUILDERS' BENEVOLENT INSTITUTION. Mr. Biers, the president, bad an interview with the Earl of Carlisle on Wednesday last, when his lordship consented to take the chair at the anniversary dinner, which is to take place early

ON COMPARISONS AND EXCLUSIONS OF STYLES IN ARCHITECTURE.*

It will probably be thought by most of us that, of late, enough and to spare has been said concerning style in architecture; and certainly, concerning style in arcintecture; and certainly, in an antagonistic mood, much praise has been bestowed on this style, and much abuse vented against that or the other; but I have had the presumption to think that no recognised style of architecture in existence calls for either that unqualified censure, or that exclusive praise, which has been so freely and abundantly ex-

For my own part, I have a strong desire to see rallied, as it were, under the banner of the grand, the heautiful, and the picturesque, all that is admirable and worthy of imitation in the various and sometimes conflicting attri-butes of the Grecian, the Roman, the Italian, and the Gothic styles; for that each of these does contain much that is admirable and worthy of imitation, the consent of a majority of the whole civilized world goes far to prove. Indeed, I should apologize for the assertion of so palpable a truism, were it not that the language of some amongst our architectural fraternity would tend to a contrary conclu-

There can be no doubt of there being There can be no doubt of there being such a thing as bigotry in the fine arts, as well as certain other matters, and in architecture it abounds exceedingly. As one way of being convinced of this, let any individual who has studied architecture progressively, for some fifteen or twenty years, consult his own personal experience. He will remember, perhaps, that, at the outset of his career, he was taught to put faith solely in the pure and sublime triad of Grecian orders; he was to take his stand upon the Acropolis of Athens, as upon the topmost summit—the veritable Olympus—of architectural excellence, and thence look down upon Rome and upon the nations given to the heresy of Gothicism, see containing repuels but debased imitations. the nations given to the heresy of Gothicism, as containing naught but debased imitations and barharous perversions of that art which, for sooth, the Greeks alone understood.

But, as years advance, this young student begins to perceive that the ruins of the Temple of Jupiter, situated in a cowfield at Rome, will almost bear comparison with the monument of Lysicrates, discovered in one of the gardens of his beloved Athens; and thus, by degrees, he begins to perceive the existence of beauties in Rome that he had never dreamt of; perhaps ultimately, like an inconstant lover, he entirely discards his first love, Greece, and he entirely discards his first love, Greece, and attaches himself, with a new-born fervency, to Rome. But still he prides himself upon heing a classicist, and that he has not defiled himself with Gothic incongruities and absurdities. As time advances, however, he finds himself compelled by self-interest, or necessity, to embrace even the Gothic, and afterwards, peradventure, the Elizabethan style, which, in the days of his innocence, he was taught to look upon as a monstrous jumble of all the abominations ever perpetrated in the name of architecture. Lastly, he throws to the dogs his early and verdant antipathies, surmounts antique prejudices, and, becoming a wiser and better man, finds beauty even in the Gothic and Elizabethan styles, and good in every one. To my thinking nothing can be more ludicrous than the controversies that sometimes take place between the upholders of one style of architecture and those of another.

Leeds has very justly remarked that "indiscriminate and exclusive admiration of any one style is more admiration of any one style is more admiration of any

one style is more akin to blind and ignorant prejudice, than to real sympathy with it, and to enlightened taste."
"Besides," as he further observes, "as much or even more depends upon the spirit with which a style is treated than what it is in

itself; for as the nohlest may be vulgarized, and be in course of time corrupted by the very means resorted to in order to maintain it in its pristine integrity, so may the poorest he aggrandized and elevated, if treated with

Of late years Gothic architecture has been thrust before us so multifariously, and, with some worthy exceptions, so *shabbily*, that to confess the simple truth, it cannot he wondered at that some restive and not very deeply re-

flective spirits should now kick against it altogether; but, as must always be the case in these outrageous partizanships, neither side is altogether in the right, some truth and a great deal of error being on both sides. I have said that these controversies about

styles are very ludicrous, and for this reason,—that the prejudice against any particular style is invariably more or less in proportion to the want of that knowledge of its principles which is only to be acquired by diligent and impartial

study and long practice.
One gentleman writes a facetious book, to prove that construction is no part of archi-tecture. Doubtless it is a very convenient doctrine for any who will not take the trouble to acquire a knowledge of the principles of the things condemned, to excuse an inactivity. No one individual has any right to condemn that which has met with the approval of a large number of men of taste and discernment, with-out adducing very clear and sufficient grounds for his dissent; and I must take the liherty of saying, that all I have heard advanced hy way objection against any style of architecture now in vogue, just amounts to what may be expressed by the vulgar distich-

" Different men are of different opinions, Some like leeks, some like inions."

There is a phrase in the classics to the same

I here is a phrase in the classics to the same effect, but not quite so expressive.

I bave supposed the case as of an unfavourable comparison of what has been called the Christian with the pagan styles, and the attempted exclusion or degradation of the former, but my argument would be precisely simiwere the circumstances reversed; and this will readily be believed when I avow that I am much less acquainted with the principles and practice of Gothic architecture than with other styles, and that, personally, I have the greater predilection for classical architecture. It is not in our art alone that the lack of

capacity or comprehension and patient study go hand in hand with contemptuous censure objection. Take music for example. When the grand symphonic compositions and the later instrumental quartets of the greatest composer the world ever saw, first appeared in this country, they were looked upon as being the wild emanations of agministrative models. wild emanations of semi-insanity, nobody could play them, nobody could understand them, but they have since exalted the name of

Beethoven to the highest pinnacle of fame.

And, again, there are the same crude and virulent antipathies with regard to styles of music, as exist in reference to styles of archi-

One party will take its stand upon the classical works of Haydn, Mozart, and Beetboven, and deny that any good thing can be found in those of Rossini, Donizetti, Auber, and others of the same school; and, as for the popular Jullien, he is a Goth of so outrageous a character, that they would almost sentence him to be hanged, drawn, and quartered. I trust I shall be pardoned for thus wandering into the

shall be paraoned to thus wanted a regions of another art than architecture, for the sake of analogy and illustration.

And now I would ask, to what good end does this chaos of opposition tend? I may be does this chaos of opposition tend? told that controversy itself has its good, but I maintain the contrary, unless such controversy be conducted upon sounder and better defined principles, or, as I may say, upon some prin-ciple rather than the no-principle which at present prevails.

In a number of a periodical published a few days since appeared some remarks which, after days since appeared some remarks which, after an allusion to the unequal circumstances and contrary prejudices of certain parties to a controversy, proceed thus:—"Controversy hetween such men is interminable. It is not pure controversy—not the controversy that but controvers—not the consoversy that leads to the discovery of truth; for the ears and eyes of both parties being partially shut, the truth can never be perceived by either. They are hoth blind of an eye; their ears are stopped; neither will yield one jot or tittle; and, in the heat of intellectual battle, they very often dearly that there is any truth or goodless. often deny that there is any truth or goodness the other side. This is not pure There can be no such thing until whatever on the other side. controversy. There can be no such thing until the ears and eyes of men are opened." In making this quotation I would not be understood as condemning even such imper-

fect controversy as we can get, supposing, as I have said before, that some definite leading

^{*} Read at a meeting of the Architectural Association on the 16th inst,

principles be primarily agreed upon, and rules laid down for our guidance in dehate. Now, although it is bootless labour for any one to rise and pronounce wholesale objections against any of the styles of architecture now practised in this country, there are portions or particular features of any of those styles which form legitimate objects of attack or subjects for discussion, but for my own art. Leonly and

form legitimate objects of attack or subjects for discussion, but for my own part I could not waste time in listening to that sort of crude and unsupported censure and objection to which I have before alluded.

In every case it should be imposed as a condition to the putting forth of an objection, that the objector be prepared by actual graphic illustrations to show the improvement to he gained by adonting his view of the case. You gained by adopting his view of the case. You have already had an example of what I would propose, in that paper of Mr. Kerr's in which he objects to the arrangement of the pediments he objects to the arrangement of the pediments of Grecian Doric temples; * although, unfortunately, he did not complete his illustration by drawings, in respect to his proposal to improve the Grecian Doric column by placing beneath it a square tile to counter-balance the abacus. But, however, Mr. Kerr's mode, so far as it extended, I must maintain to be the only one that we ought for a moment to tolerate.

Let us suppose, for further example, that an objection is started against any particular feature in an architectural composition, no matter of what style, of what date, or of what degree of celebrity. We will say, for instance, that the matter objected to is the introduction of grotesque figures of animals in Gothic arof grotesque figures of animals in Gothic ar-chitecture, and that one of the turrets and flying huttresses of Henry the Seventh's chapel is selected; perhaps, also at the same time, some other features in these portions of the building are condemned.

Well, all that we should require is, that the objector, or he that condemns, should produce two faithful and intelligible drawings, the one showing the example as it exists, and the other as he would improve it. Let him accompany these by his best reasons for the suggested improvement, and we shall have at once the only tangible and instructive, mode of control. only tangible and instructive mode of controversy on matters architectural.

With regard to the use of the grotesque in Gothic architecture, perhaps I may be per-mitted to say a few words. It appears to me that those who condemn it hedge themselves in, as it were, with one principle of architecin, as it were, with one principle of architectural effect, and cannot see that there are many others. Why, let us ask, did the Greek imagination introduce the repulsive satyr, side by side with the graceful Bacchante or the beauteous wood-nymph? And why, to this day, do painters delight in similar contrarieties? Why is it that the musician introduces passing discords in such a manner as to be absolutely painful to the ear until they are resolved into their succeeding harmonies? And wherefore have our most renowned poets introduced in their sublimest poems and introduced in their sublimest poems and dramas the lowest buffoonery, and made the most sudden and determined descents from most sudden and determined descents from the heroic to the vulgar, from the sublime to the ridiculous? May we not truly answer that it is for the sake of that principle universal throughout nature—CNTRAST? And such is the principle upon which the grotesque is made to mingle with the beautiful in architecture. To recur, parenthetically, for one moment, to dramatic poetry, it appears to me that, taking Æschylus and Euripides as the exponents of the Greeks, and Shakspeare as of ourselves, we have at once the same elements of difference between their dramas as those which exist hetween the archi-Shakspeare as of ourselves, he had a divided the same elements of difference between their dramas as those which exist between the architecture of the Greeks and that of the middle ages of modern Europe; and yet, so much more general is the predilection for the piquancy of contrast than for the insipidity of uniformity, that even the Greeks were not wholly free from the practice of introducing the grotesque. It is true that for the most part they dealt in the horrible instead of the comical, introducing Gorgons, furies, and so on,—but we must not forget those odd-lcoking horned fellows, half men half goats, that I have hefore mentioned. Then again, they had their Silenns: surely he was no great beauty. And be it remembered that all these have been used in the sculptured and painted decobered where the sure of t rations of classical architecture. Moreover, I would ask, what are the centaurs in the me-topes of the Parthenon; and the half-human half-fishy monsters in the frieze of the monu-

half-hishy monsters in the treeze of the monu-ment of Lysicrates, but grotesques? Nevertheless, we cannot deny that the Gothic architects indulged in the grotesque much more freely than did the ancients, but not a jot more than the peculiarities of their style demanded. What else could be so well adapted for giving picturesque beauty, con-trast, and effective outline, to the mitres and terminations of mouldings in Gothic buildings terminations of mouldings in Gothic buildings, as those queer-looking griffins, hogs, dogs, and devils, which the chisels of our old English masons have left us?

glish masons have left us?

Still, I am not here to defend, through thick and thin, everything that precedent-mongers would have us respect and adhere to in Gotbic architecture. If grotesque figures cannot be introduced significantly and as an augmentation of the general effect, I say, by all means let them be dispensed with; and, as a general rule, I would submit, that however grim and annular such figures might be on the avterior annular such figures might be on the avterior.

rule, I would submit, that however grim and angular such figures might be on the exterior portions of an edifice, internally they should exhibit solely the most graceful and purely heautiful forms.

I am fully conscious that this paper of mine is of a somewhat desultory character. In truth, I have had no time for condensation and arrangement. I will therefore proceed to impart the gist of what I would say in a few concluding remarks. I would contend, then. impart the gist of what I would say in a few concluding remarks. I would contend, then, that it is utterly useless to attempt to exclude from favour any one of the styles which the members of our profession, collectively, are called upon to practise; that, as regards one style with another, integrally, "comparisons are," as Mrs. Malaprop would say," odorous;" that all new applications of an existing style or combinations of the principles of one style with another, and all proposed modifications or improvements, should be illustrated and explained by drawings. This mode would also open a fine field for contrasting, by ocular demonstration, compositions in two or more different styles, for the same subject; and I different styles, for the same subject; and I cannot conceive of anything more interesting than one and the same person preparing two designs in, we will say, the Italian and Gothic styles, and exhibiting them, with his observa-tions, on what he conceives to be their relative merits, and the advantages of one style over the other.

Take even a church, for instance (for I am by no means of opinion that the Gothic is the only fit style for such a building), and fill in, as nearly as possible, the same outlines, one with classical, and the other with Gothic forms and details. This would enable us at once to form a true opinion, whereas all the mere talk in the world will leave us as far off the mark as ever.

I feel confident that this plan of proof and illustration, by drawings, would tend materially to enhance the interest of such matters, and would equally conduce to the improvement of the reasoning power and perceptions of all—so that, in the end, we should come to regard architecture as a grand and comprehensive whole, and not a mere thing of shreds and patches.

At all events, if, through lack of opportunity, or the non-possession of an active and all-grasping intellect, any amongst us should not attain to ability in all styles, I trust that there not attain to aniny in an styles, I trust that there would he begotten within us a spirit of justice and impartiality, to say nothing of charity, which would prompt us to pay due respect to every one, according to his peculiar talent, whether he he merely a worker in the Grecian strip, the Borger Ab. Lethic. style, the Roman, the Itaban, or the Gothic.

Perhaps we cannot all become equally successful in two or three styles of an entirely opposite nature; but it is in the power of most, if not all of us, to do one thing well, and respect the other for doing another thing well also. Look at painters—what various styles they choose, both of subject and execution, and yet how little they clash with vanous styles they choose, both of subject and execution, and yet how little they clash with one another. One chooses the high historical, and another the domestic or every day life. One selects landscape, another dogs and cattle, and another simple fruit and flowers; and yet I should think that the Ettys, Mulreadys, the Stanfields, the Landseers, the Coopers, and Lances very cordially agree to disagree, and each respect the other for what one can do and what another cannot do.

and what another cannot do.

Let us then he actuated by the same spirit, and a truce to all carpings and cavillings about style. Let us endeavour to improve and purify all styles, and, if possible, invent something new, rather than quarrel about what we have; and let us save ourselves from the ridicule and contempt of all reasonable men, by giving praise where praise is due, rather than he so free to condemn in cases wherein we know not what we condemn. what we condemn.

WILLIAM B. COLLING.

BUILDERS v. ARCHITECTS.

DESIGNS FOR THE UNITED GAS COMPANY, LIVER-POOL.

A SINGULAR case has occurred in Liverpool. The United Gas Company there, requiring larger offices and other premises, employed an architect to prepare plans. When the estimates came in (at about 8,000l.), they amounted to 2,000l. more than the committee had reason to 2,000/. more than the committee has reason to expect. This caused much dissatisfaction, and they determined to put the plans and specifications into the hands of another professional man to examine and report as to their sufficiency, the mode of construction, arrangement, convenience, and cost. A report was presented of a favourable nature. The committee however, were still dissatisfied, and was presented of a favourable nature. The committee, however, were still dissatisfied, and then came to the resolution of applying to six builders for designs and estimates. Four of the builders declined sending in, but two firms which profess to combine the functions of architects and builders undertook to prepare plans accordingly, which plans, if approved, they were themselves to execute.

A number of architects, heaving of these six.

A number of architects, hearing of these circumstances called a meeting, and drew up the following resolutions, which have been sent to the directors of the gas company and extensively circulated elsewhere.

the directors of the gas company and extensively circulated elsewhere.

"1st. That the profession of an architect and the business of a builder are separate and distinct occupations, and cannot be combined without lowering the moral character of both, and acting detrimentally on the public interests. That such must be the effect the following brief reasons may tend to show. The object of the architect (besides the preparation of designs, as works of art, which are to give a character to the town and the period), is to secure the best workmanship, the safest mode of construction, and the first quality of materials. In these respects he has often to come into collision with the builder, whose interests frequently appear to be conflicting. If the architect and builder are the same individual, who is to secure the due performance of his contract? A mere clerk of works, employed to superintend the designs prepared by another, must of necessity be a person of a class ill qualified to judge of the sufficiency of the plans and specifications in the first instance, and unprepared to meet the emergencies which constantly arise on the erection of every building of any importance.

2nd. That, holding these views, we have heard with deep regret of the circular issued by the directors of the gas company inviting builders to send in plans and estimates for their intended erection in Newington. We cannot but believe that this step has been inadvertently taken, without due consideration of the injury inflicted on a respectable profession, and in ignorance of the results which must necessarily follow. The judgment between plans thus sent in, involving a complicated comparison of design, arrangement, construction, detail, kind of material used, completeness of specification, and estimate of cost (all mutually acting and reacting on each other), could only be safely entrusted to an architect of extensive experience and first-rate standing. No respectable architect would understake such a task with builders' jenns; and treacting on

designs.

3rd. That the art of architecture can only be 3rd. That the art of architecture can only be successfully cultivated where it is liberally encouraged. That to public companies especially, the profession naturally looks for examples of enlightened support, but if public bodies become so far misled by a mistaken idea of self-interest, as to act in this short-sighted and parsimonious manner, the public cannot complain if architecture, from a liberal art, is degraded into a petty trade.

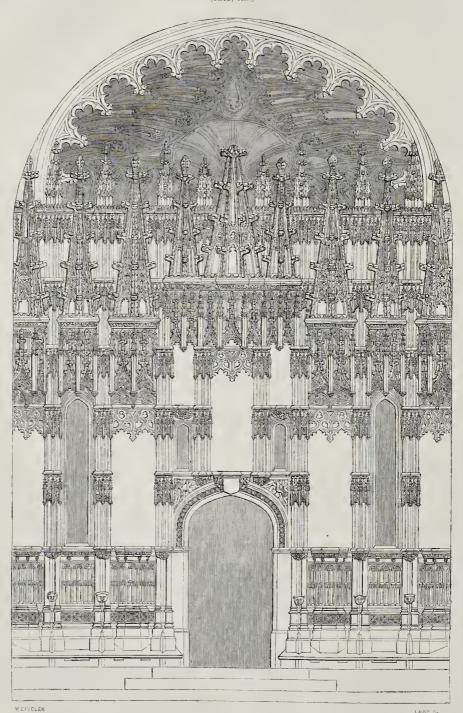

4th. That feeling satisfied that the views stated above are equally founded in justice to themselves and the public, the undersigned are resolved by every means in their power to discourage and discountenance the practices above alluded tq."

 ${\bf BISHOP\ ALCOCK'S\ CHAPEL},\ {\bf ELY\ CATHEDRAL}.$

[DATE, 1488.]

DECORATIONS FROM ABROAD.

PANEL FROM THE TOMB OF CARDINAL ASCANIO SFORZA, ROME.

BISHOP ALCOCK'S CHAPEL, ELY CATHEDRAL.

Few of our English cathedrals have of late years so much engaged the public attention as Ely; and there are several reasons for this : until the opening of the Eastern Counties Railway, its great and varied beauties were comparatively little known; it was not included in the noble series of cathedrals published by Mr. Britton, nor has any other author ever given a full and satisfactory account of it; so that when the opening of the railroad made it so easy of access it possessed greater novelty than perhaps any other cathedral in the kingdom. Since that time, several circumstances have Since that time, several circumstances have combined to increase the interest with which it was then regarded. Some five or six years back, it was decided by the dean and chapter that the whole pile should undergo an entire restoration—a restoration conceived and carried out in a proper spirit,—one, in fact, that has no parallel, with the exception of Canterbury Cathedral, the authorities of which set so good an example in their very complete renovation of that sulendid specimen of our ancient soon an example in their very complete reno-vation of that splendid specimen of our ancient ecclesiastical architecture. The works at York can hardly be called mere restoration; in con-sequence of the two lamentable fires that occurred there, it was necessary to do more than restore, in the common acceptation of the word. Considering that the expenses of the resto-ration at Ely are met entirely by voluntary con-tributions, it must be allowed that those persons who have aided in this very essential part of the work have been most liberal in their donations. Perhaps the most visible improve-ment, or at any rate that which is most effecment, or at any rate that which is most effective, is the substitution of painted glass windows for those of the commoner material so lately occupying the lantern; and although the whole of these windows are not yet completed, there can be no reasonable doubt but that they will be in the course of a short time. All these causes, and the satisfactory progress of the works, have induced architest and others to visit the cathedral year after year, and each time with increased interest,

and with the prospect of discovering some hitherto hidden beauty.

htherto hidden beauty.

It is quite unnecessary here to enter into a detailed description of the many points of interest to be noticed in this cathedral. We have, from time to time, as opportunities have presented themselves, illustrated some of the finest portions, such as the east front, the Galilee porch, &c. It has, however, some peculiarities that deserve a passing remark; the reprincipal of these is the central externor, with culiarities that deserve a passing remark; the principal of these is the central octagon, with its lantern; this feature is quite unique. The peculiar situation, and the beauty of the lady chapel, also call for attention, although the latter is much injured by its conversion into a parish church, with the usual unsightly fittings: let us hope, however, that these will shortly be removed. This cathedral affords every opportunity for a complete study of ancient ecclesiastical architecture, as it possesses each successive style in perfection. The nave is an excellent, although rather late, specimen of Norman—no finer examples of Early English are known than those to be seen in the east are known than those to be seen in the east front and the Gallilee porch—and where can any specimens of the Decorated style be found more valuable for beauty and delicacy of details than those in the choir of Ely and the Lady Chapel? In Perpendicular work the cathedral is not so rich, but yet it has some specimens of the style that it would be difficult to excel, so far at least as elaborate and delicate details are concerned. concerned.

The principal of these forms the subject of our illustration; it is situated at the east end of the north aisle, and is known as Bisbop Alcock's Chapel, having been built by that pre-late in 1488. There is no chantry chapel known in England that has so much elaborate

DECORATIONS FROM ABROAD.

CIRCULAR PANEL FROM THE PRESCO PAINT-INGS AT CAPRAROLA.

Federigo, Ottaviano, and Taddeo Zucelin, Tempesta, and even Vignola himself, were all engaged on the decorations of this master-piece of the great architect. This graceful composition forms a portion of the frescoes in one of the chambers ascribed to the Zuccheri. There are in the same chamber three similar compositions, all coloured in light and varied tints on a white ground.

PANEL FROM THE TOMB OF CARDINAL ASCANIO SFORZA, ROME.

ASCANIO SFORZA, ROME.

The tomb is a magnificent pile of marble, covered with elegant bassi-relievi, in the best style of the artist, Andrea Sausovino, who was invited to Rome expressly by Julius II. for this purpose. It is one of the finest examples of cinque cento in Rome, and was executed 1505—1507. Vasari mentions this tomb in high terms of praise. An elevation of the tomb (which is situated in the church Sta. Maria del Popolo) was given in our last volume, p. 318. volume, p. 318.

A MEMORANDUM IN IPSWICH. FOR THE BENEFIT OF THAT AND OTHER TOWNS.

By what course of reasoning the shrewd clear heads of Ipswich were led to concur in placing the station of the railroad so far out-side the town as it is, one can now scarcely discover. When railroads were first projected, and the word conjured up the idea of all sorts of horrid nuisances, towns in their ignorance spent thousands to drive the stations farther off, and would afterwards have spent double off, and would atterwards nave spent double the amount to bring them closer. But when the Ipswich station was settled on, parties were more enlightened upon the subject; moreover it was not done without some one to point out the mistake, and urge another course; for, in an old file of the local papers, we ran against the record of how Mr. Shave Gowing, a townsman, at a public meeting called Gowing, a townsman, at a public meeting called

to consider the subject, spoke long, almost alone, to induce them to insist on a nearer approach. Many must have lamented since then that they allowed themselves to be so hoodwinked as to be unable to see the true state of the case, or, if they did see it, to be

silent.

The new street, which was in consequence required to lead to the station, is a curious specimen of dispensent, as the French call it, and shows greatly the want of supervision on the part of the corporation. To render the formation of the street necessary by stopping the highroad—the railway—short of its destina-tion, was a great absurdity; but not to see that street was made properly, and with a view to the convenience and ornament of the town. shows a want of foresight, and almost a want of sense on the part of authorities which really deserves reprobation. It twists and turns ahout in all sorts of ways, without the slightest reason, so far as we could learn, and, instead of tending to the improvement of the place, as it and it would be a superior of the place, as it ought to have been made to do, is a posi-tive disfigurement, or rather series of disfigurements.

This is the more to be regretted and won-dered at, because much has been done here recently in a right direction, and the town is increasing greatly in size and apparently in prosperity. Many of the shops recently built or altered display taste; the new customhouse mentioned by us before this, has some good features, though not without flaws, and the delta bare here become greatly attacked. good features, though not without flaws, and the docks have been greatly extended and

A walk through the town has much to in There are many curiously carved and terest. There are many curiously carved and ornamented houses, remnants of the past. One, known as Mr. Sparrow's, the date of which is 1567, is a remarkable and well-known specimen. The connection of Ipswich with Wolsey is recalled, when wandering through the town, by a brick gateway erected by him, and now much needing repair; and the river Ginning on which the town is seated except. Gipping, on which the town is seated, suggests the origin of the name of the place, which was anciently written Gyppeswid, or Gippeswic,

the origin of the name of the place, which was anciently written Gyppeswid, or Gippeswic, and afterwards Yppyswyche.

The churches in the town, of which there are several, are mostly of the Perpendicular period, and have been sadly disfigured by repairers and restorers. The church of St. Mary at Elms has a Norman south door; St. Margaret's has a very handsome clerestory, externally, of late character, and a curious open roof,—one of the latest; the Key Church, as it is called (St. Mary's) displays some tolerable fiint-work; and in the church of St. Nicholas there are some very curious sculptures, the decorations of an earlier building, which were discovered during recent repairs. These are described by Dr. Drummond, in the papers of the "Suffolk Archæological Association," where drawings of them by Dr. Edward Clarke are given. Mr. Waller and others, qualified to judge, have considered them Saxon. They did not seem to us, however, to differ in any respect from some works of the same kind known to be of the Norman period.

Amongst other improvements in St. Nicho.

any respect from some works of the same kind known to be of the Norman period.

Amongst other improvements in St. Nicholas's, the interior has been wholly reseated by Mr. Ringbam, an able wood carver in the town, whose reputation is very justly extending. We saw in his workshops an oak lectern, pulpit, and altar rail, in progress, which were highly creditable to him.

creditable to him.
At St. Helen's, an old church, where the flint and stone work have been restored externally, a slight, ugly, queen post roof has been put up, to the great disfigurement of the building and the impeachment of the taste of all the parties concerned in the work.

A museum has recently been established and is making satisfactory progress; and there is a mechanics' institution, which has been in operation about five-and-twenty years, been in operation about nye-ann-twenty years, and has produced good fruits. There was a proposal some time since to huild new premises for its purposes, but nothing has yet been done in this respect. This institution has an extensive library, and should be heartily backed up by all interested in the well-being

After examining Mr. Hurwood's ingenious arrangements for windows and greenhouses,

illustrated last week, we took the opportunity to see the process of manufactur-ing Messrs. F. Ransome and Parson's patent ing Messrs. F. Ransome and Parson's patent artificial stone. In this, sands of various colours and degrees of coarseness are comcolours and degrees of coarseness are combined into a mass by flint or silica, brought into a semi-fluid state by subjecting it to the action of causticalkali, in a boiler at a high temperature under pressure. The artificial stone, after being moulded to the required form, is submitted in a kiln to a gradually increasing temperature up to a red heat. It seems calculated to be durable, and it was proposed, in the first instance, to apply it in the production of all varieties of architectural decorations. The feeling of the time, however, is opposed to imitative castwork, and at this moment, strange to say, the application of the material is nearly confined application of the material is nearly confined to the production of whetstones for scythes, and a patent water-purifier, and these are required in such numbers as to occupy the whole

In connection with the docks, we observed with no common gratification that an extensive piece of land, beautifully placed and commanding a charming view, has been planted and laid out as a public walking place, mainly through the influence, as we understand, of Mr. Alexander, a leading inhabitant of the town. All who have aided in this work have entitled themselves to the thanks not merely of their fellow-townsmen but theirfellow-countrymenof all who recognise the value of open areas for recreation and enjoyment, and regret the miserable deficiency of them observable in our

towns generally.

We should be glad to see some of the principal inhabitants form themselves into an Improvement Society, or Board of Adornment; or some existing body might extend their purposes so as to effect the object in view. Even if they had no power to control individuals, they might do much good, by pointing out evils to be avoided and improvements which might be made, keeping as wetchild eva conmight be made, keeping a watchful eye on every step taken, and omitting no opportunity to lead public opinion in the right way. At the present moment numbers of small houses are being built in Ipswich, enclosing and damaging it, and will be found hereafter to present vexatious obstacles to the extension of the good quarters.

In a sanitary point of view, much is needed Ipswich, and so fully was this felt by in Ipswich, and so fully was this felt by many of the inhabitants, that an engineer (Mr. H. Austin) was employed some time ago to report on the state of the town, and advise as to the improvements necessary. This was done, but from some cause or other the report did not exactly take the inhabitants with it, and nothing has been proceeded with. The drainage is bad, the paving worse, with. The drainage is bad, the paving worse, and the supply of water so ill regulated, that while thousands of gallons are constantly seen rushing down the streets to waste, producing annoyance, if not doing positive injury, many of the poorer inhabitants obtain it only with great difficulty.

It is to be hoped that steps for the improvement of the sanitary condition of the town will no longer be delayed; and with the expression of this opinion we end our present memorandum in Ipswich.

PATENT METHOD OF FACING WITH STONE.

THE description of Mr. Taylor's invention, in last week's BUILDER, professes to avoid the objections hitherto existing against erecting brickwork with a stone facing, arising from the subsidence of the numerous mortar joints, the subsidence of the numerous mortar joints, in the former, compared with the latter; by which the stone facing unavoidably becomes injuriously weighted, and the crushing of the bed joint is the result: a very reasonable conclusion to arrive at, as far as theory alone is concerned; but, with here and there an exception,* the mode of constructing brick walls with a stone facing, is the same now as it has been time out of memory; the two trades constructing bricks are the constructions of the same that been time out of memory; the two trades on simultaneously; as soon as the mason has fixed a course of stones, the bricklayer backs it up immediately after. If this method is known to be objectionable, why continue to

practise it? why do ninety-nine architects out of a hundred adopt a plan likely to crush the bed joints of the stone? I have practically examined the stonework of the principal build-ings in London, and have travelled extensively through the provinces for a similar object; yet through the provinces for a similar object; yet I cannot recollect an instance of crusbing, arising from the shrinking of mortar joints, not even where the most friable stone, such as that of Bath or Caen, has been used: occasionally the stone is fractured by iron cramps injudiciously inserted, as may be seen in many parts of Sir C. Wren's church at Greenwich; but this has pothing whatever to the with but this has nothing whatever to do with the subject of Mr. Taylor's patent. Buildings faced with stone are generally of a superior class, and it rarely happens that they are carried up faster than an average of two courses of bricks per day; so that an elevation 50 feet high would occupy three or four months in high would occupy three or four months in erection. No appreciable shrinkage takes place after the greater portion of moisture has been absorbed from the mortar, which, if the bricks are tolerably dry, becomes solidified in a few days, although induration occupies an infinitely longer time. Whatever the subsidence may be, it takes place within a week or ten days after the mortar, in a semi-fluid state, has been applied in the wall, and long before any considerable weight of masonry can be fixed, which is likely to fracture the bedding joints of the stones beneath.

** The main object of the patent is to cheapen the application of stone, so that it may be used intead of cement.

PROPOSAL RELATIVE TO THE COLLEC-TION AND DISTRIBUTION OF THE CONTENTS OF SEWERS, AND PRO-TECTION OF THE RIVER FROM POL-LUTION.

In the discussions which are now going on as to the best system of preventing pollution of the river Thames, and turning the contents of the metropolitan sewers to some practical advantage, a vast number of suggestions have been made, but none of them have been as yet, it would appear, of a sufficiently simple and useful character to meet with the appro-

and useful character to meet with the approbation of the parties appointed to consider the important subject.

It will, I hope, be excused, if a party, not altogether scientific, should venture to suggest a plan; as, although very imperfect, it may give rise to better ideas on the subject. Moreover, when we consider that many suggestions, some emanating from experienced practical engineers, have been found inapplicable, either from the greatness of the expense. cable, either from the greatness of the expense, or from the impossibility of adapting the schemes to the necessities of the case, does it not become the more important that any proposals should be received and considered, in order to give a better than the same proposals.

proposals should be received and considered, in order to give a better chance for the development of some new light upon the subject?

These remarks are made, not from any confidence that the writer is about to propose anything new—quite the reverse—but from a conviction that, in a matter so interesting and so deeply involving the health and comfort of an immense and increasing population, every liberty should be given to the inventive mind to exercise its ingenuity, and every considerato exercise its ingenuity, and every consideration be paid to suggestions, however farfetched and remote from practicability they may be.

The construction of branches parallel with the river, carrying the contents of the sewers towards Limehouse and Deptford, would demand too great an outlay, to be found sufficiently remunerative, besides interfering with property and business to an injurious extent.

A party has suggested that the contents of

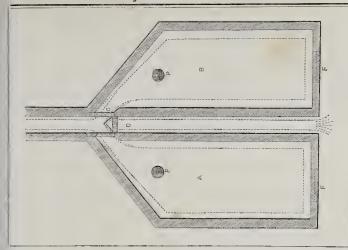

A party has suggested that the contents or the sewers should be conveyed down the hed of the river by means of pipes, but this obviously presents difficulties, which a little reflection will show to be insurmountable. A variety of A variety of

other suggestions has been made. other suggestions has been made.

Taking into consideration the fact of the impossibility of uniting all the sewers in one or two main sewers running eastward—or indeed of uniting several of them together without considerable difficulty and expense—it seams to be necessary that each main sewer it seams to be necessary that each main sewer. it seems to be necessary that each main sewer should have its contents collected separately, and distributed according to some simpler plan.

Can the following suggestions be made of any At the end of each of the main sewers shall

^{*} At the British Museum, the brickwork was completely erected, and the stone facing afterwards fixed, to the walls with cramps.

be constructed two reservoirs for receiving the contents as they flow towards the river, to be opened alternately in the manner shown in drawing. When the reservoir B is filled, the gate (c) to he closed, and that leading into reservoir A to be opened.

During the progress of filling, however, a pipe, descending from a building erected over the reservoir—having the lower part filled with holes, and susceptible of being raised or depressed at pleasure—should be made the means of conveying by suction the liquid part means of conveying by suction the liquid part of the contents into a reservoir, on the top of the huilding—from whence it may be conveyed in pipes $(p \ p)$ to any distance by pressure or otherwise.

In the course of time, a deposit of a more solid character would he formed, which, having acquired a given thickness, should be removed by mechanical means, if not by manual labour. A small steam-engine should be at work for the nurposes in question, and the lofty chim-

the purposes in question, and the lofty chimney he made, at the same time, the means for carrying off unpleasant vapours, supposing no chemical agent is available to destroy the same. This, however, I fancy, could be done in these reservoirs if they were properly con-

Such a plan would, of course, require that a such a pian would, or course, require that a man or two should be in constant attendance, although the time required for the raising of the one, and the lowering of the other gate, might very soon he pretty accurately ascertained.

Under any circumstances, in case the contents, by reason of rains and storms, suddenly increase.

increase, the upper parts of the reservoir should be provided with divisions (ff), which, on a given degree of pressure heing exercised by the flood within, should open to allow of the exit of the surplus to Father Thames. This would not have much effect, if any, upon the river.

A passage, D, should still be left hetween the reservoirs to the river, only to be used under circumstances of necessity, at the discretion of

circumstances of necessity, at the discretion of the guardian or keeper.

The upper surface of the reservoir should be just ahout on a level with the quays of the river, i. e., just about high tide—if the position of the sewer will admit of it: the lower part may he as deep as is consistent with the amount of liquid usually flowing from the

Smaller sewers might be turned into the greater ones, and thus as few such establishments he created as possible. But it appears to me, under any circumstances, that no plan would be cheaper, and that the profits arising from the sale of the liquid, and also from the sediment to he dug out from time to time, would he more than amply sufficient to repay any expenses incurred.

THE COMMISSIONERS OF WOODS AND FORESTS have accepted the tender of Mr. Robert Hicks, of Stangate, for the masons', carpenters,' and joiners' work required in the repairs and ordinary works to the royal palaces and public buildings of the metropolis.

RESTITUTION OF PROJECTING SHOP FRONTS WITHIN LIMITS OF THE BUILDINGS ACT.

In reply to some inquiries as to the views of the official referees concerning the re-construction of shop fronts in town at present projecting before the line of fronts, we cannot do better than place before our readers the sub-stance of an award made a short time ago, on the information of the Marylehone district surveyor, against the owner of No. 85, Oxford-street, and the builder employed. In this case the old shop front had projected very considerably hefore the line of fronts, and

the house being taken down, the owner con-tended that he was entitle to rebuild upon the site to the full extent of the said projection. Adjoining occupiers contended that the projection would be injurious to them.

The award set forth the following :

The award set forth the following:

"1st. With reference to the claim of the said builder and owner, that as the said house had been recently rebuilt, and a projection formerly existed in front thereof upon the ground of the same owner, they are entitled to rebuild the said projection to the same extent,—we, the said official referees, considering that it is by the first-mentioned Act (section 5) enacted, that buildings shall be huilt, rebuilt, 'enlarged, or altered, in reference, among other matters, to the projections and to any other parts or appendages of such buildings, in conformity with the several particulars, rules, and directions, which are specified and set forth in the several schedules, C, D, E, F, G, H, I, K, to the said Act annexed, and considering also that certain rules are by the said schedule E specified and set forth, 'with regard to buildings hereafter to be built or rebuilt in reference to projections therefrom,' and also 'with regard to huildings already built or hereafter to he rebuilt, as to bow windows or other projections of any kind,' do hereby determine and award, that it will not he lawful to rebuild any buildings so as to retain any projection contrary to such rules, or to rebuild any projection whatsover which it would be contrary to such rules newly to such rules, or to rebuild any projection whatso-ever which it would be contrary to such rules newly

2nd. With reference to the allegation that the rojection in question is a shop front, and as such, projection in question is a snop front, and as such, is permitted to project beyond the general line of the fronts of the houses in any street or alley, we do hereby determine and award, that the said projection is not wholly a shop front, but that it is in part a projection made before the front of the said house as an extension of the second or ground-floor story thereof, and is not allowed by the said firststory thereof, and is not allowed by the said first-mentioned Act to project beyond the general line of the fronts of the houses, and that the face of the front external wall of the said house No. 85, Oxford-street, above the said projection, is in the general line of the fronts of the houses in that part of Oxford street where the said house is situate, and that inasmuch as the said projection projects beyond such line, the same is contrary to the said first.

that inasmuch as the said projection projects beyond such line, the same is contrary to the said first-mentioned Act.

3rd. With reference to the allegation that the said projection would be injurious to the owners and occupiers of the buildings thereto adjoining, we do hereby find and certify, determine, and award, that the said projection will be injurious to the owners of such houses, and that such projection will be injurious to William Swinstead, by obstruct-

* We are not to be considered as necessarily assenting to the universal application of this dictum,—ED,

ing the view of his goods when displayed in any shop window that he may lawfully make hefore the froat of his house, and that such projection is in this respect contrary to the said first-uncationed Act.

And further, we are of opinion that in no case may any projection be made beyond the general line of froats, under the name of a shop front, so as to be in fact an enlargement of any floor or story of the building to which it belongs, but that where the said first-mentioned Act allows shop fronts to project beyond the general line, it is to be understood of shop fronts properly so called and not otherwise, and that any projection which projects to an extent greater than the reasonable width of a stall hoard cannot be included in the term "shop front," and that such reasonable width may be taken to he in the case of the huilding in question, and of the buildings on each side of it, two feet three inches, and no more, and that any cornice to such shop front may take reasonable width may be taken to he in the case of the huilding in question, and of the buildings on each side of it, two feet three inches, and no more, and that any comice to such shop front may take the reasonable projection of a cornice, so that in any case there be no overhanging or encroaching upon the public way, and so that such shop front and cornices if they project beyond the statuable width for wooden shop fronts and cornices, he wholly of brick, tile, stone, artificial stone, slate, cement, or metal, or of other proper and sufficient fire-proof materials, except the frames and sashes of the doors and windows, in reference to the necessary woodwork thereof.

And as to the proper separation of two shops, as well as to the injurious effect of shop fronts upon the adjoining owner, we do also declare our opinion that unless any two adjacent shop fronts he separated from one another by projecting brickwork, at least 8½ inches thick (which may he in two half bricks in the line of the party wall, het vector another, and of the party wall, he returns of the shop fronts ought to be kept wholly within the shop fronts ought to be kept wholly within the shop fronts with any accordingly directed to take down and remove so much of the projection as extended more than two feet three inches heyond the face of the front external wall of

heyond the face of the front external wall of the house.

FORMATION OF THE VAULTING OVER ST. GEORGE'S HALL, LIVERPOOL.

MR. ELMES intended that the vaulted ceiling of St. George's Hall should be formed in brickwork; Mr. Robert Rawlinson, however, intro-duced hollow pots for the purpose, as we mentioned in our recent notes on Liverpool. The ceiling has just heen completed, and the centres struck. It is 169 feet long and 65 feet in span, and according to the Liverpool Journal, the whole amount of subsidence was three-eighths of an inch at the crown, uniformly throughout the entire length of the crown. The journal in question says:—The arch has been turned with hollow tile, 12 inches in length, and 4 inches square on section, each tile being perforated, longitudinally, with a circular space 2 inches in diameter. soffit of the arch is panelled, having two breaks, or separate sinkings of four inches each. The whole is formed and worked in with the tile, so that portions of the ceiling are 4 and 8 inches below the general line of the inner pannel, which is one tile, or 12 inches in All the tiles are set as "headers" depth. All the tiles are set as "headers" in this portion of the arch, to secure means of ventilation. The main rihs are 2 feet, or two tiles in depth, also set as "headers." The tiles were made by Mr. Scragg, of Tarporley, in Cheshire, by his drain-tile machines, and were delivered on the ground at 31.5s. per thousand. About 140,000 have heen used in the arch. It would have taken ahout 230,000 bricks to construct an arch of the 230,000 bricks to construct an arch of the same dimensions and depth. The weight of the tiles in the arch is about 600 tons. Brickwork would have heen about 1,000 tons— there is, consequently, a saving of 400 tons in weight by using the hollow tile. The arch has been set in mortar, made from Halkin mountain lime, excepting 5 feet on each side

of the key, which is set in cement.*

The arch was keyed on the 3rd and the centres were struck on the 6th, and lowered about We shall probably give a section of the vault.

^{*} Many doubts have been thrown upon the practicability of turning this ceiling, by architects and builders; but its completion will be a full answer to all objections. Ceilings and arches have been turned with pottery-ware and tiles by the Romans, Italians, and French, but not of this magnitude and character. The successful completion of this arch will give an impetus to hollow brick and tile constructions, as the tile-making machines offer great facilities for their and included the successful proper with the successful and lightness are required. They will also be used for purposes of ventilation, for partition walls, and for lining external walls to prevent the admission of damp.

COSMOS.*

THE STUDY OF NATURE IN ITS RIGHT ORDER AND CONCURRENCE OF FORMS AND POWERS

THERE may be much more in heaven and earth than is dreamt of even in Baron Von Humholdt's philosophy, and, nevertheless, that same philosophy be perfectly correct; for, compendious as is his detail of what does exist in hoth of these rather extensive districts, his philosophy relates not so much to what ' may philosophy relates not so much to what 'may he' in either, as to its proper order or arrangement when it does 'turn up.' "A proper place for every thing, and every thing in its proper place," might very fairly he adopted hy the baron as his motto, were it not rather too homely for a cosmopolite so far-travelled, so far-seeing, and so recovered. seeing, and so renowned.

The sweep of this philosopher's mental vision is indeed a noble one,—his aim an all comprehensive one. We prefer, however, at comprehensive one. We prefer, however, at once to occupy our space with his own plain, modest, prefatorial explanation of his own great much rather than presume to transhis ideology into any other.

"The first volume contains a general view of nature, from the remotest nehulæ and revolving double stars to the terrestrial phenomena of the geographical distribution of plants, of animals, and of races of men; preceded by some preliminary considerations on the different degrees of enjoyment offered by the study of nature and the knowledge of her laws; and on the limits and method of a scientific exposition of the physical description of the tific exposition of the physical description of the Universe. I regard this as the most important and essential portion of my undertaking, as manifesting the intimate connection of the general with the property of the property with the connection of the general with essential portion of my undertaking, as manifesting the intimate connection of the general with the special, and as exemplifying, in form and style of composition, and in the selection of the results taken from the mass of our experimental knowledge, the spirit of the method in which I have proposed to myself to conduct the whole work. In the two succeeding volumes I design to consider some of the particular incitements to the study of Nature,—to treat of the history of the contemplation of the physical universe, or the gradual development of the idea of the concurrent action of natural forces cooperating in all that presents itself to our observation,—and lastly, to notice the specialities of the several hranches of science, of which the mutual connection is indicated in the general view of nature in the present volume."

We might as well attempt to give our readers an idea of the British Museum by the exhibi-tion of one or two of its lions or its eagles, or a 'specimen' or two of its gold or silver ores, as any correct idea of "Cosmos" from mere quotations within our limits: we must refer them to the work itself, which is must refer them to the work issen, which is now within the reach of all, at half-a-crown a-volume,—a phenomenon, the mere sight of which itself is 'well worth the money,' as an exhibitor might say of some one introductory wonder of the nineteenth century, issuing in a host of other varieties and valuables.

But we may fairly present an illustration of the author's general style, though even that is varied, ranging from what hefits the calm philosopher, to even the picturesque and glowing imagery of the artistical enthusiast. As an average specimen of the whole, however, we may quote a few of his preliminary observamay quote a few of his preliminary observa-tions on the general study of natural know-

ledge:—

"The clearer our insight into the connection of phenomena, the more easily shall we emancipate ourselves from the error of those who do not perceive that for the intellectual cultivation and for the prosperity of nations, all hranches of natural knowledge are alike important; whether the measuring and describing portion, or the examination of chemical constituents, or the investigation of the physical forces hy which all matter is pervaded. It has not hecu uncommon presumptuously to depreciate investigations arhitrarily characterised as 'purely theoretic,' forgetting that in the observation of a phenomenon which shall at first sight appear isolated, may lie concealed the germ of a great discovery. * * * * Where all the blossoms of civilisation unfold themselves with vigour under the shelter of wise laws and free institutions, there is no civilisation unfold themselves with vigour under the shelter of wise laws and free institutions, there is no danger of the development of the human mind in any one director proving prejudicial to it in others. Each offers to the nation precious fruits,—those which furnish necessary subsistence and comfort, and are the foundation of material wealth,—and those fruits of creative fancy which, far more

*** Sketch of a Physical Description of the Universe, by Alexander Von Humboldt, Translated under the superin-tendence of Lieut-cel. Edwarder, R.A., For. Sec. R.S. Fourth edition. London: Printed for Longman, Brown, Green, and Longmans, Paterrouter-row; and John Murray, Albemarle-street, 1819.***—18 we rolumes.

enduring than that wealth, transmit the glory of the nation to the remotest posterity. The Spartans, in spite of the Doric severity of their mode of thought, 'prayed the Gods to grant them the heautiful with the good.' As in that higher sphere of thought and feeling to which I have just alluded, in philosophy, poetry, and the fine arts, the primary aid of every study ought to be an inward one, that of enlarging and fertilising the intellect; so the direct aim of science should ever he the discovery of laws, and of the principles of unity, order, and connection, which every where reveal themselves in the universal life of nature. But hy that happy connection, wherehy every where reveal themselves in the universal life of nature. But hy that happy connection, wherehy the useful is ever linked with the true, the exalted, and the beautiful, science thus followed for her own sake will pour forth ahundant, overflowing streams, to enrich and fertilise that industrial prosperity which is a conquest of the intelligence of man over matter. (1)

Without desiring to institute any parallel, to express any opinion as to relative or to express any opinion as to relative or respective merits, we cannot conclude without reference to Mrs. Sommerville's most able work on the connection of the physical sciences, in especial juxta position with the context of such a quotation as this. In the context of such a quotation as this. In the only special notice of Mrs. Sommerville's work which we have remarked either in text or index, the haron himself does this lady the justice to allude to her "generally so exact and excellent treatise." With the translator, or rather the editor, we have at present only one fault to find, if fault it he: why still persist in giving the new centrifugal planet 'Neptungton as he does so prominently in the only throughout, beneath the text (Vol. I., p. the controversial, and hy no means co-relative name of 'Le Verrier?' even granting that it he not amiss to give the credit of the 'a-missing' a-mi planet's discovery to him and not to Adams Is it because the colonel happens to be the foreign sec. of the R. S. that it is so? By the fiat of astronomers in general, Le Verrier bimself included, if we mistake not, the planet in question has been already formally christened with the certainly heathen, but still co-relative, name of 'Neptune,' a much hetter associate for Jupiter, Saturn, and Uranus than 'Le Verrier' can ever be, at least until the nineteenth century be been in the mistage. tury he lost in the myths of ages, and then the already classical name of Sabine itself may, we hope, hold an honourable place, if not in the rank of Jupiter and Le Verrier, at least among

METROPOLITAN COMMISSION OF SEWERS.

Protest against the appointment of Committees.—At a general court held on the 22nd, to which we hriefly referred in our last, the Earl of Carlisle in the chair, the minutes of the last court having heen read, including which were fourteen resolution

teau, including which were fourteen resolutions for the appointment of committees,—
The Hon. F. Byng said he rose for the purpose of protesting against the passing of these orders.
When he left the last court he had little intention of when he left the last court he had little intention of returning to it, but for the astounding orders, cut and dried, that had been thrown upon the court by Mr. Bullar, apparently with the authority of law, and which were seconded by Mr. Stone, who then acknowledged that he had never seen them hefore. He (Mr. Byng) helieved them to be nothing more than an energies of the critical field. The (Mr. Dyng) neieved them to be nothing more than an evasion of the opinion of the law officers of the crown. Having considered the subject further, and taken good advice, he had come down for the purpose of protesting against these proceedings, and he should do so in spite of the charge of "obstruction" to the business of the court. Lunchite however he was consoft that court. Luckily, however, he was one of the small number hy whose "obstruction" they had gained for the public open doors and a knowledge of all their propublic open doors and a knowledge of all their proceedings. The regulation of their husiness had been submitted to two gentlemen, of whose ability there could he no doubt—Mr. Bullar and Mr. Chadwick, and they had submitted various suggestions. The mode of its transaction had lately hecome most serious and ought to he checked. He might allude to the Committee on the Ordnance Survey, from whom they had received no minutes, or any account as to what expense the commission would be put to —in fact, they had received no account whatever, except a frequent charge for wages. He then adverted to the charge for flushing, which, without curing the disease of fifth and dirt, had up to December cost 14,000. After some further observations, the hon. Commissioner recorded a length-ened project against the case. vations, the hon. Commissioner recorded a length-ened protest against the orders, which, after de-tailing the grounds of objection to individual orders, concludes with a general protest against the

"Because out of the seven committees consti-tuted or confirmed by these orders, four exclusively consist (with one single exception) of twelve of the

commissioners nominated upon the Works Com commissioners nominated upon the Works Committee; and hecause the system of permanent pri vate committees, as sanctioned by these orders, will destroy the responsibility of the officers, impair the efficiency of the court, and deprive the public of their main security against extravagance and caprice."

Mr. Leslie said he had seen the document, and had Mr. Lesie said he had seen the document, and ha great pleasure in signing the protest, as it put fairly hefore the court the true construction of the Act o Parliament. At the last court he wished these orders to stand as notices of motion; hut that heing refused, he had no course left hut to sign the protest.—Mr. Lawes also expressed his determination of signing it; and contended that referring matters in gross to committees was opposed to all principles of law.

law. The Earl of Carlisle said there could he no ob-

of law.

The Earl of Carlisle said there could he no objection to any commissioner protesting against their proceedings; thut as the question had hen decided by so large a majority at the last court, he thought it was not desirable to reverse that decision without notice.—Lord Ehrington said no idea of secrecy existed, hut only a discretion as to limiting the number, to prevent interruption to public husines.

Mr. Chadwick said on the question of publicity, so much talked of, he helieved there could he no greater evil or obstruction than heing called upon to pass a mass of uuexamined and unarranged husiness in open court. He helieved that it would he impossible to get through it unless hy a suhdivision of labour. Take, for instance, the Committee on the Ordnance survey, that had heen spoken of. Now, nothing could be more ignorantly absurd than to suppose that the husiness of a triangular survey could he done in open court. He then took a review of that work, and said that the public were deeply indefited to the indefatigable zeal of Sir Henry de la Beche, who had given a clearness and accuracy to the works of the survey that were heyond all praise. In point of money, he had saved the public 100,000/; and in point of time, several years. The county had had the best talent engaged on it; and when completed would be the greatest and most accurate work ever accomplished. He justified, next, the charge for flushing, as the only expedient that lay within their reach; and although it had accurate work ever accomplished. He justified, next, the charge for flushing, as the only expedient that lay within their reach; and although it had cost 14,0001, under the former system of carting it would have cost five or six times that amount.

Mr. Bullar denied any intention of evading the Act of Parliument.

Act of Parliament.

Act of Parliament.

The Ordnance Survey.—Three very voluminous reports were received on the subject of the survey, in which a variety of topics were treated on. It reports were received on the subject of the survey, in which a variety of topics were treated on. It appeared that the whole of the ground survey is complete except in some parts of Kent and Surrey, which would be complete in three or foour months, and the whole of the town area would be completed by the end of the year. These documents were accompanied by reports on the sutherranean survey, showing that the sewers in Soho, Fitzroy, Manchester, Cavendish, and Bryanstone squares were loaded with filthy deposit, and also those in Hyde-park gardens and the costly streets and squares adjacent, with Berkeley and Eaton squares. In fact, the only healthy spot in the whole city of Westminster was in the neighbourhood of the Seven Dials. As regarded the sewers of Kent and Surrey, Dials. As regarded the sewers of Kent and Surrey, they contained deposit varying from 5 feet in depth, and several explosions of choke damp had taken

and several explosions of choice damp had takenplace during the examination of them.

A long discussion ensued on the drainage of
Kensington, and the surveyors were ordered to report on the hest means of effecting this.

A proposition to employ street orderlies in conjunction with this commission in street cleansing
was negatived was negatived.

It was ordered that Hammersmith and Fulham he declared a sewers district.

An application from Guildford, asking that Mr. Phillips may assist in the inspection of plans for the drainage of that town, was respectfully declined by

arious lengths of pipe sewer were ordered to he put down.

THE DUNDEE ROYAL ARCH COMPETITION, Out of 300 designs submitted to them, the committee, described to us as heing wholly incapable of judging, have selected a Norman design, by Mr. J. T. Roughead, of Glasgow. We are informed by a professional correspondent that it consists of a pointed centre arch, dent that it consists of a pointed centre arch, two semicircular side ones, three tiers, one ahove another, of interlacing Norman arches, two octagonal turrets with battlements terminating the main piers. The selection has nating the main piers. caused great dissatisfaction.

^{*} This will serve as a reply to several inquirers on the subject of this competition.—ED.

Miscellanea,

FIREPROOF FLOORING AND ROOFING .-Mr. G. Nasmyth has obtained a patent for certain improvements in the construction of fire-proof flooring and roofing, which improvements are also applicable to the construction of viaducts, aqueducts, and culverts." According to contemporaries, these improvements consist in constructing floors and roofs of iron consist in constructing floors and roofs of iron plates, which are bent into the form of a segment of a circle, or into a conical, polygonal, or other shape, by the ordinary plate-bending machinery, or by any other suitable means. These bent plates are supported on chord plates, or tension bars, which have their ends bent upwards, whereby the plates are retained in their curved position when subjected to pressure. The ends of the chords rest upon the The ends of the chords rest upon the flanges of cast or wrought iron girders, shove which are cast or riveted knee pieces, which prevent the bent ends of the chords from springing; or, instead of iron plates, angle or T iron, bent into the required shape, and sup-Tiron, bent into the required shape, and supported upon chords resting upon the flanges of girders, may be employed. Over these curved ribs, iron plates are bent, with their ends placed underneath the bent-up ends of the chords. The spaces above the iron plates are filled up, to form the flooring, with Portland cement, mixed with broken bricks and other suitable materials. The improved girders are formed by bolting iron plates to the sides and top of stone arches and chords, combined as before. The side plates are made with flanges to support the arches and chords, which form the joists, and have also knee pieces bolted to to support the arches and chords, which form the joists, and have also knee pieces bolted to them to prevent the chords from springing when the arch is subjected to pressure. The arches and chords may be made of one piece each, or may be made of several pieces bolted or riveted together. Currents of air may be caused to pass in the hollow spaces left between the arches and their chords, and through preforations in the floor in the room. Chiefe the control of the cont perforations in the floor in the room,-Claims -1. The modes of constructing floors and roofs of buildings, and the beams or girders of bridges, viaducts, and aqueducts by means of metal arches, or other curved or angular figures, or both, which are supported by chords that serve as abutments to the arches.-2. The application of this flooring to the warming, cooling, and ventilating of buildings, by causing currents of air to pass through the hollow spaces left between the arched plates and the chord plates. We have not yet seen the construction. It seems similar to an arrangement the course the same time at Management the course the same time at Management the course time at Management time at Manage rangement we saw some time since at Mr. Porter's works, Southwark.

New Saw-Pilling and Setting Machine.—Messrs. Norton and Cottle, of Holme's Hole, have recently patented a machine for filing and setting saws, enabling the operator to whet and set the teeth of saws in such a manner that every tooth will be equal in size and length, the proportion being graduated by an index, and so adjusted as to suit the teeth of saws of every description. Saws that have been used and become useless in consequence of bad filing, can be recut. The set is attached to the machine in such a manner, that when the filing is completed, no alteration is required in the adjustment of the saw to complete the setting. The inventors have found by experience, that the hardest saws can be set without breaking or injuring the teeth. Saws considered in a measure useless having passed through this machine are said to work perfectly easy, and perform much faster than those filed in the usual manner; and the teeth being all of an equal length, will not require filing as frequently. These machines, if not too expensive, we think, will come into extensive use,—New York Mechanic.

SMALL-POX HOSPITAL DESIGN.—Sir: I was surprised to see, in The Builder of last Saturday, my design for the Small-pox Hospital (for which I received the 2nd premium) without my name attached to it. It should be by Moore and Matthews, and not Mathews only.—I am. Sir. vonrs. &c.—R. H. Moore.

without my name attached to it. It should be by Moore and Matthews, and not Mathews only.—I am, Sir, yours, &c.—R. H. Moore.

*** It was so published on the positive assertion of Mr. Matthews that the design was by himself alone. It is certain the premium was awarded to the two conjointly. We cannot enter into any discussion on the matter, and will only express the pain with which we ever yiew a want of good faith.

Projected Works.—Advertisements have been issued for tenders, by 5th April, for paving the carriageway and footway of a new street about to be formed from Bermondseystreet to Griffith's-rents; by a date not specified, for the delivery in Oxford of not less than 500 tons of granite, &c., annually; by 16th, for the erection of the east wing of the Royal Berkshire Hospital; by 2nd, for putting down 2,500 feet of 18-inch glazed stone-ware pipe sewer along Hutchinson's-lane, Earl's-court-lane, and Pembroke-road, Kensington; by 10th, for the rebuilding and restoration of Kingstone Church tower, &c. (Herefordshire); by 11th, for the whole works required to complete the Portsmouth station of the Brighton and South-Western Railway; by 30th, for the execution of a new bridge over the Trent, near Newark; by 17th, for laying iron pipes through Folkstone and from reservoir, and also for formation of reservoir, and of new road, and other works (separate tenders) for the Folkstone Water-works; by 2nd, for a workhouse kitchen-range, with iron boiler, &c. at New Forest Union; by 17th, for the construction of three reservoirs, with emhankments and stone work, &c., for Manchester Corporation Water-works; by 37d, for the works in erecting a chapel, schools, &c., at Everton (Liverpool); and by 12th, for the works in erecting a chapel, schools, &c., at Everton (Liverpool); and by 12th, for the exection of a stone or a iron suspension-bridge at Disserth, Radnor.—The last an-

Patentees in America.—The last annual report of the Commissioner of Patents in the United States contains the following passage:—"In my last annual report I had the honour to refer the attention of Congress to the expediency of placing the citizens and subjects of foreign governments, applying for patents in this country, on the same ground with regard to fees which our own citizens occupy. Deeming the matter of much importance to the interests of this country, I feel it to be my duty again to bring that subject to the consideration of that honourable body. At present, the subject of a foreign government who applies to this office for a patent is required to pay the sum of 500 dollars, if a subject of Great Britain, and 300 dollars if the subject or citizen of any other foreign power, before his application can be received, while the American citizen is required to pay only 30 dollars. It is true that the fees and duties required in most foreign countries are very much higher than those which our laws demanded, but they are imposed on all alike, whether subjects or foreigners. But even if it were just to make a discrimination in favour of American citizens with regard to fees for patents, I am of the opinion that the policy is injurious to the interests of this country, and therefore not expedient." We understand the

recommendation is likely to be acted on.

DISCOVERIES AT FOUNTAINS ARBEY.—In a thicket of underwood, near the lady chapel, and where the river Skell is arched over, some interesting remains of the abbot's house have been discovered. In repairing the arches, and on reaching a level just above the perfect parts of the structure, the workmen came to pavements of encaustic tiles, the bases of two rows of clustered Early English columns, and broken Netherdale marble shafts, similar to those now to be seen in the choir and lady chapel. Here, too, in what appears to have been the common ash-hole, were found some Ralley or Railage coal, and a silver tea-spoon! The remains seem to be spread over an extent not much less than the nave and choir of the Abbey Church, and, from what has already been uncovered, it appears that the whole ichnography of this important building may yet be retrieved by a careful excavation.

INSURANCE OF CHURCHES.—It has been

INSURANCE OF CHURCHES.—It has been urged, that while almost every house of any respectability in the country, and nine-tenths of the corn ricks and bomesteads are insured, scarcely any of the churches have had the same precaution used with regard to them. It is said that a legal opinion of a high ecclesiastical authority was given in respect of Portsmouth Church, not many years past, to the effect that "the churchwardens would be censurable, I had almost gone the length of saying punishable, for omitting the necessary precaution of insuring the parish church from fire." Churches erected under the Church Commissioners are all insured, and generally to the amount of two-thirds of their cost.

INSTITUTION OF CIVIL ENGINEERS -On the 27th, the paper read was a "Description of the Groynes formed on the South Rocks, the site of the new docks at Sunderland," by Mr. W. Brown, These groynes have been Mr. W. Brown. These groynes have been erected for the purpose of retaining the deposited materials excavated from the new docks, and of arresting the sand and shingle which naturally travel southward, in order to form a barrier beach, that should effectually exclude the sea from beyond a given line. The three first, whose lengths varied from 326 feet to 358 feet, were erected at a height above ordi-nary high-water mark of 2 feet 6 inches, and 10 feet at the seaward and inner ends re-spectively. The exterior was composed of ashlar-work; the interior partly of the excavated magnesian limestone, and partly of rubble set in mortar: the batter of the north sides was two and a half inches to a foot, was that of the south sides one to one, and the crest was formed into an arch, with a radius of 5 feet 6 inches. The four other groynes were constructed of a different form, in conse-quence of those first erected not retaining the deposited excavation, and accumulating the depositicd excavation, and accumulating other materials as was desirable, and from their having been injured by the sea during a heavy storm, which occurred at the time of the equinoctial tides, during the spring of 1848, when a breach was made in the first and third groynes, and at the same time some of the stones in the second groyne were loosened. These effects were produced at about the same point in each, namely, the intersection of the inclination of the groyne with the line of ordinary high-water mark; and it was found, from observation, that the momentum of the waves was greatest at or about the time of ligh water. The sides of these groynes were semi-cycloidal, each being generated by a circle of 12 feet 9 inches in diameter, and uniting at the apex: the seaward and inner ends are respectively the seaward and inner ends are respectively 7 feet and 10 feet above ordinary high-water mark, and their lengths varied from 510 feet to 579 feet. The foundations of these groynes to 579 feet. The foundations of these groynes consisted of a course of freestone, laid at an average depth of 2 feet below the surface; the sides were also of coursed freestone, set header and stretcher alternately, and the hearting of large-sized rubble, closely packed, the vacancies between it and the ashlar-work being filled with small stones set in Roman compat sea set to insure a salid head. in Roman cement, so as to insure a solid bed. At a depth of 6 feet below the crest of the groyne, and resting upon the rubble bearing, coursed ashlar was introduced, and carried as near to the crest as possible, the vacancy being filled with small rubble and Roman coment.

A STEAM STONE-DRILL.—Mr. Joseph J. Couch, of Boston, has invented a steam-drill, which, it is said, can be worked so as to apply the force at any angle with the requisite rotary motion, and to do the work of seventy-five to eighty hands at once by the aid of two. The "Atlas," in describing it, says—" The drill is attached to a shaft by means of a socket. The shaft is made to ply with great force by simple mechanism, and as the drill approaches the rock is detached as by throwing by hand, only more forcibly. At every blow a rotary motion is effected by means of a small ratchet on the drill shaft. In horizontal positions the power depends on the momentum of the drill shaft; in vertical and inclined positions the momentum is assisted by gravity. At the trial, the machine was placed in a horizontal position, and perforated a block of the hardest granite with a 4-inch drill at an average rate of 22 inches in the hour; with a 3-inch drill, it executed from 25 to 30 inches in the hour, it A medium rate is 125 blows per minute. But by heightening the speed, not only is the number, but the force of the blows increased. The machine can be seen at Mr. J. W. Fowle's, No. 16, East Orange-street." A machine of a like nature, we may here observe, but worked by hand or by horse, with a crank and flywheel, has been invented, or improved rather, by Mr. E. Nicholson, of Newcastle. It appears, however, to be only capable of drilling vertically. The drill is made to rotate also, and to be detached in falling and griped in lifting. With large drills, four men, or a horse, will thus cut a 4-inch hole in hard stone, it is said, at the rate of 2½ to 3½ feet an hour, and two men, with smaller machines, a 4-inch hole in free-stone, at the rate of 5 to 6 feet an hour,

A New Ric.—At Boston, U. S., a pamphlet on ship rigging has been lately published by Captain R. B. Forbes, who, from his numerous inventions and recommendations of improvements in ships, as to model, steering, chain-cables, pumps, windlasses, compasslights, lightning-conductors, life-boats, life-buoys, life-preservers—seems to be, if not a perfect Ark-wright in his way, at least a first-rate ship-wright. His last achievement is regarded as his first in point of importance. perfect Ark-wright in his way, as become the rate ship-wright. His last achievement is regarded as his first in point of importance, and as to economy, convenience, and safety. It is not exactly "a wheel-rigged ship," for halt and blind management that the captain has thus recently invented, but a simplification of the usual troublesome process of "taking of the usual troublesome process of "taking in a reef," which, indeed, as every landsman even knows who has read the thrilling strain of Falconer in his Shipwreck, becomes not only a troublesome but a dangerous, if not an impossible task in a strong gust of wind, when it is most of all essential to "take in a proof." (This boats of the sales) when it is most of all essential to "take in a reef." This boast of the daring and destruction of the rash has been disarmed, it is said, of all its terrors by this captain of captains. Without reducing the surface of canvass necessary to propel the ship, he has so arranged it, that the topsails and maintop gallant sail have only a single reef in each, which, once in, renders the ship as snug as if nnder close reefs of the old rig; and this is accomplished by having long lower mast heads, upon which the first topsails are set. His rig, in fact, has two topsails upon each topmast, one above, and the other below the cap. The nantical reader will upon each topmast, one above, and the dow the cap. The nantical reader will other below the cap. The nantical reader will therefore probably be of opinion that the upper topsail can always be carried to the last moment, simply because it can be easily taken in, and that then, without reefing at all, the ship is at once equal to one of the old rig, under double reefs. His yards, too, on the fore and main-mast are, all but one, of the same dimensions, an advantage, it is conceived, of no ordinary importance in the event of disaster aloft. This new rig, it is said, has been fully tested.

THE LEANING TOWER AT PISA.—It has ever appeared to me to be an error in judgment

ever appeared to me to be an error in judgment to represent the well known tower at Pisa in a leaning position. It was originally built straight, then why not represent it so? When architects discover ruins of an interesting building, their care is to arrange them in order, and to represent the fabric in its pristine state; why, then, make an exception in the case of the bcautiful structure alluded to, and represent it apparently tottering to the ground, and so seize upon an accident which greatly mars its effect? Had the building been originally constructed in a leaning position, it would have been an absurdity, on the part of the architect, not worthy of being recorded. The fact of the tower being constantly represented in claborate drawings and expensive plates under its present unsightly aspect, has led to the belief with many that the original designer intended thereby to produce a sort of architectural tour de force; and I met persons at Pisa who were astonished, upon examining the building, to find that its leaning position was owing to a local accident, which all the towers built in that city had been more or less subjected to. The dome of St. Genevieve, at Paris, subsided some years since, and was skilfully arrested in its fall; the oblique lines in the interior still tell the tale; but who would think of marking that defect in giving a representation of the design of that building?—A. W. H.

The MASTER CARPENTERS' SOCIETY held its March meeting at the Freemasons' Tavern tower being constantly represented in claborate

its March meeting at the Freemasons' Tavern its March meeting at the Freemasons' Tavern on Wednesday evening. In reply to several inquiries as to the intended New Buildings Bill, it was intimated by the chairman of the Buildings Bill Committee that it was now about to be printed, and he had no doubt that the improvements would give satisfaction. Previous to the meeting being adjourned, the

Previous to the meeting being adjourned, the whole of the members present consented to be stewards at the ensuing anniversary dinner of the Builders' Benevolent Institution.

Holdon Hill.—Sir: If the hill were made to start from the centre of Farringdonstreet, and gradually end at Fetter-lane, there would be less hill to encounter than on the Snow-hill side. Men are now lowering the crown. I have looked at it carefully, and cannot conceive the ntility of stepping off the taring a decreasy of an lease to incines, in mone of the gin-shop at the corner of Farringdonstreet.

THE ELECTRIC LIGHT is about to shine again, after temporary darkness. Mr. Staite is announced to give two lectures on its commercial value, at the Western Literary Institution, where it was first exhibited to the

ST. James's Church, Clerkenwell.— The trustees have given instructions to Mr. W. P. Griffith, architect, to take the necessary steps for the erection of a scaffolding to repair the steeple of this church, which is to be done by public contract, of which due notice will be given.

More Madness.—The following is a list of the tenders delivered for additions and altera-tions to the Hampstead workhouse. Mr. H. E. Kendall, jun., architect:—

Barr £8,644
Pollock and McLennan 6,894
Glenn 6,494
Smith 5,970
Reynolds and Co 5,691
Hill
Clowser 5,287
Pilbeam (accepted) 3,179

NOTICE.

"BUILDINGS AND MONUMENTS, MODERN AND
MEDLEVAL," being Illustrations of recently erected
Edifices, and of some of the Architectural Works of
tae Middle Ages, with Descriptive Particulars.
Edited by George Godwin, F.R.S., Fellow of the
Royal Institute of Architects, &c., &c., &c., Editor
of The Bullings.

of The Builder.

Under the above title it is proposed to publish, in bi-monthly parts, price 2s. 6d. each, the principal Illustrations of Modern and Medieval Buildings which have appeared from time to time in This Builder, with their accompanying descriptive particulars. Each part will contain about eight pates, folio size, and eight pages of letter press, with plans and details. The engravings will be printed separately, with care, on a tinted paper.

The first part will be issued in time to be forwarded with the magazines for May 1, and will contain:—

Her Majesty's Marine Residence, Osborne; with

The Carlton Club House, Pall Mall. Church of St. Isaac, at St. Petersburgh; with Details.

Kensington Union Workhouse. The Liverpool Branch Bank of England; and

Details.

Details.

The New Tbrone, Canterbury Cathedral.
The North Porch, Restored, of St. Mary Red-cliffe, Bristol.
The Interior of Lincoln's-Inn Hall.

Persons desirous of becoming Subscribers, are quested to forward their names to the office of THE BUILDER.

No. CCCXXII.

SATURDAY, APRIL 7, 1849.

ROM the letters received during the past week (such a varied budget, that to reply to them satisfactorily would demand an encyclopædic mind, and half a

dozen pairs of hands), we select for notice those on two or three subjects of more immediate interest. Prominent amongst these are a pile with reference to our brief remark on galvanized iron, and galvanized tinned iron, in a recent number. As we have hefore now said, we might commend a man or a material every week for a year, and never extort a single acknowledgment from him or its owner,-they stand too well to care for or need the praise of so small a thunderer,-it is simply their due; they have merit, and no thanks to them who observe and admit it. On the other hand, if we but question ever so slightly the infallibility of the man, or express a doubt as to the preeminent goodness of the material, a shower of letters forthwith arrives, to prove that although our good opinion is worth nothing, our bad opinion is very differently estimated.

What we said of galvanized iron was comprised in nineteen lines and a half, and was a simple statement of the fact that specimens of the material had been sent to us, which, after two years' use, were full of holes. Now we speak under the mark when we say that we have received, in consequence of these nineteen lines and a half, twenty visits and forty letters! Intentions have been altered, orders suspended: and both the Galvanized Iron Companyand the patentee of the Tinned Iron are receiving from different parts of the country constant reference to the paragraph in question.

The majority of the letters are from interested parties, for and against :- from persons engaged in the manufacture or the sale of this material, and from those who consider their interests affected by it. Amongst the former, however, are several, whose testimony in its favour, to the extent of five or six years' knowledge, is entitled to every consideration. It is far from our desire to interfere with the use of the galvanized metal, if it be really a durable material; and we are quite ready to admit that the examples of its failure forwarded to us, if isolated cases, are not to be considered sufficient proof to the contrary. There may have been some peculiarity in the water in each of these cases; and we know very well that under some circumstances even lead is acted on and rapidly destroyed. Dr. Ryan, the professor of chemistry, who has addressed us on the subject, says (as we ourselves have long hefore this stated):- "I have known cases in which the tubes and lining of leaden cisterns have been acted upon and dissolved by water to such an extent, as to be highly injurious to health, and, in some cases, fatal. Such, also, is the case with copper, under a variety of exposures." There is, in fact, no metal but gold or platina which will resist every action, either of air or water, to which it may possibly be subjected, even in the ordinary uses of life.

The doctor continues (and hy giving insertion to this, which is in truth a testimonial, we are shewing conclusively our willingness to

my own observation of galvanized tinned iron, for now more than six years, I am of opinion that it is as little acted upon hy either air or water, under the average of circumstances, as either lead or copper. There are circumstances under which the galvanized tinned iron is not applicable; for instance, when the medium in which it is placed contains acid, or acid vapours, an action takes place which must sooner or later destroy the metal.

Nor is it necessary that such acid or acid vapours be in a free or uncombined state, as by the well-known laws of chemical affinity, zinc will displace certain other bases from their combination with acids. If, for example, a piece of zinc he placed in water containing a salt of either iron, tin, copper, or lead, the zinc is dissolved by substitution, while the metal previously in combination with the acid, and held in solution by the water, is disengaged and precipitated, in most cases, in its metallic state. The applicability of the metal is, however, as easily ascertained as the applicability of any other material, under given circumstances; and it only requires the care and attention which an ordinarily prudent and intelligent person would exercise, and which must he exercised in the use of any other material whatever, to know, whether or not the metal is suitable for the purpose to which he intends to apply it."

We make no comparison hetween the two materials, the galvanized iron and the galvanized tinned iron, and consider the whole question still an open one with us, leaving the public to decide on the evidence hefore them.

The destruction of the Olympic Theatre hy fire, on the 29th ultimo, has led several correspondents to refer to our repeated remarks on the necessity of commodious and safe means of access and egress in theatres and public places, and the fearfully unsatisfactory condition of many of our theatres in this respect. The wildfire rapidity with which the house was entirely consumed would have given little chance of escape to the audience. Had the fire happened when the house was full instead of previously to the opening of the doors, as was happily the case, the majority must have been destroyed,-literally roasted as they stood.

A survey of the stairs and accesses of our theatres should fortbwith be made, and such alterations insisted on as might be found necessary for the safety of the public.

It is to be hoped that the fire may lead to the improvement of a part of the town much requiring it, and that the theatre, if rebuilt, will he placed on another site.

Mr. Smirke's paper of last week, on the relative condition of workmen in the seventeenth century and now, has not escaped commentators out of the class to which it was more immediately addressed. The letters, while setting forth the actual condition of many hundreds-must we not say, thousands -of intelligent artisans, are couched in a tone most honourable to the writers and the hody which they represent. Our reference recently to the effect of too much union amongst men and too little union amongst masters, has led one working man, the "Old Mason" to whose lucubrations we have hefore given publicity, to address to us a letter calling upon the masters to protect those men in their employ who refuse to enter into union with others, and not to dismiss them at the dictation of their other men. He says :-

"To illustrate the truth of these remarks: -Some time since a strike took place against give the material fair play)-- "Speaking from Mr. Trego, builder, of Lambeth, in respect of efforts of evil-disposed agitators.

the four o'clock movement, and the members of a society were prohibited from working for him, or to allow those whom he had employed since such strike, to work with them, under a penalty of 51. A mason who was at work at Mr. Trego's after the strike, having been discharged from his employ, applied at a respectable mason's in Pimlico, and obtained employment. He commenced work, by the foreman's directions: after working about an hour or so some of the masons working in the same sbop, informed the foreman that he had been previously working for an obnoxious employer: they further stated their determination to strike unless this man was immediately discharged. The consequence was this man was compelled to leave his work, take his tools, and quit the premises at a moment's notice,-and that through the conspiracy of the members of this society. The foreman informed him that it was through no ill-feeling on his part that he was discharged, but that he could not think of keeping him at work and be the cause of all the others leaving their employment. This man, then, must either join a society which is obnoxious to him, and illegally combined against him and others, or he must lose the benefit of his labour, which will be to take away his means of existence. Thus he is deprived of the liherty of an Englishman; he must only work how, when, and where others choose to dictate. and break the laws of his country to fulfil those of their making."

The same writer, a working man be it remembered, says, in another communication on the subject of equality,-" If the liberty that I take encroaches on the liberty of another, it ceases to be true liberty, and wears the aspect of oppression. There is but one method of securing universal liberty, and that is for each individual to be as anxious to promote the welfare of another as his own. We bold this true in theory, but it is a lesson the world has not yet learned to practise. Man is evidently selfish, and if allowed to have the extent of his desires, he often encroaches on the liberties and rights of others. From this we discover the necessity of law and order, without which no man's life or property would be secure. It is for the general good that laws are made and enforced; hut the question arises, whether or not one individual should have dominion over many? Are not all men of the same flesh and blood, and ought we not to contend for equality?

"Those wbo contemplate nature may discover that the universe teems with an infinite variety. If the eye of the mind, assisted by revelation, penetrates the upper regions, powers, excelling in wisdom and authority, are represented to his view. If we descend below ourselves in the scale of creation, as far as naturalists have discovered, the meanest insects seem to have order maintained among them by a few having authority over the many. Respecting governments among men, we are expressly informed, from the highest authority, that the powers that he are ordained of God, and whosoever resisteth the power resisteth the ordinance of God. That man enjoys the truest liberty who willingly and cheerfully submits to the proper performance of his duty, rendering to all their dues,fear to whom fear, honour to whom honour. Bind such a man with fetters of iron, his mind is still in the enjoyment of liberty.'

While we find such opinions as these current amongst our operatives, we need not fear the ON SIR BALTHAZAR GERBIER'S "COUNSEL AND ADVICE TO ALL BUILDERS."*

THE small volume of which I am now about to give you some account, possesses very slender claims to literary merit—nor has it much intrinsic professional value; yet it has, I think, still, great claims on our attention, as being among the very earliest of our native literary productions exclusively on the subject of our art.

The earliest edition of Sir Balthazar's Counsel and Advice is 1663. The early date, therefore, of this book gives it a value,—and a stronger interest attaches to it in our eyes, giving some insight into the practice of arc tecture at the period of our great master, Sir Christopher Wren. Sir Balthazar was born at Antwerp, in 1592, and was brought up as a miniature painter. He was knighted by Charles I., and was employed by him, in conjunction with Rubens, to negotiate a treaty with Spain; be also resided at Brussels in a diplomatic character. He was subsequently employed as an architect by Lord Craven.

I must not, however, conceal that his bio-

graphers give but a sorry account of him. He failed to secure the favour of the court, and was driven to adopt a variety of means of living. It is true he fell upon evil times. The death of Charles I, deprived him of hope at court. He migrated to Surinam, where he was persecuted by the Dutch; and although at the restoration of Charles II. he built tri-umphal arches in bonour of the young umpnal arches in bonour of the young monarch, he appears never to have attracted much of the royal favour. He died in 1667. Having said thus much of our author, and having, I trust, prepared you to expect very little of value or novelty in his work, I proceed to fulfil my engagement to give you some account of its contents.

Prefixed to the treatise are no less than forty-one dedications, which, in fact, occupy about half the duodecimo volume. Although about half the duodecimo volume. Although seldom, I believe, carried to so ridiculous an extent as in this case, the practice of preluding every literary attempt by these rhetorical invocations, through which it was hoped to win the favour of the great, was one of the literary foibles of that age; but the following observation in Mr. Macaulay's recently published history gives us some clue to the origin of these somewhat fulsome appeals—"The fee paid," he says, "for the dedication of a book was often much larger than the sum which any publisher would give for the copyright. Books were therefore frequently printed merely that they might be dedicated."

The treatise commences by adverting to the author's previous work, which he describes as author's previous work, which he describes as "a little manual concerning the 3 chief principles of magnificent building—viz., solidity, conveniency, and ornament;" wherein he "notes the incongruities committed by many undertakers of buildings." He points to the Grecians and Romans as the best builders, and urges that men should not be subject to fearlies nor, "included by mentage social bids." and urges that men should not be subject to fancies nor "inslaved by weather-cock-like spirits, to make their huildings according unto things à la mode. He further condemns the incongruity committed by surveyors, who were minded to show that they were skilled in describing columns, cornishes, and frontispieces, although, for the most part, placed as the wilde Americans are wont to put their pendants at their nostrils." at their nostrils.

The author then proceeds to treat more particularly of his advice to all builders. "Whoever," he says, "is disposed to build, ought, in the first place, to make choice of a skilful surveyor, from whose directions the several master workmen may receive instructions by way of draughts, models, and frames." I should here say that the author throughout uses the terms surveyor and architect as per-fect synonyms; there is no indication whatever of that distinction which is now, in England at least, universally received. He then adverts to some of the requirements of architects, and especially dwells on the knowledge of perspective as essential; he teaches that the architect should consider the ground whereon architect should consider the ground wheteen the building is to be erected, and then govern himself as the ground will give him leave; or, as Pope has since more elegantly expressed

it, "consult the genius of the place." He must place the front of a country house to-wards the east, "by which means he may shelter his double lodging rooms from the north-west." I cannot say that this piece of instruction is very intelligible. We can hardly regard the north-west as the aspect most to be shunned. The author here adds, what he quaintly calls a nota bene to builders-viz., he must cause all the back of his stonework (which stands within the brickwork), to be cut with a relate 3 inches broader than the breadth of his jambs and cornish, which will hinder the rain from piercing into the inside of the wall, and through the meeting of the brick the wail, and through the meeting of the brick and stone. He deems it necessary to make a sort of apology for this advice, as implying that "surveyors and master workmen in this refined age which abounds in books, with the portractures of the out and inside of the best huildings, are to seek the first points of their apprentiship; of whom I ask the reason why modern buildings are so exceedingly defective; and whether it is not because many of them have been hut apprentished. tices lately, and too soon become journeymen; and that surveyors (who either affect more the building to themselves a strong purse, or are blind to the faults which their workmen commit), like careless postillions, hasten with the packet maile to the post-office, be it never so ill-girted, whereby it oft falls in the midway."

The author then advises how to try the pacity of a surveyor. "The readiest way capacity of a surveyor. "The readiest way to try him," he says, "is to put him to draw a ground plot in the builder's presence; to make him describe the fittest place for a seat; the ordering of the rooms for summer or winter; to contrive well the staircases, doors, windows, and chimneys,—doors and windows so placed that they may not be inconvenient to the chimneys,—the bedstead place far from the doors and windows, and of a fit distance from chimneys."

He then adverts to the "seelings of rooms," adapting their height to the size, character, and use of the room. A bedchamer of state may be 30 feet wide, 40 feet in length, and 16 or 18 feet high; whereas a closet, 10 feet square, adjacent thereto, if made of the same height, would be "preposterous, and like a barber's comh-case." The dimensions here set down for a state bedchamber seem some-what extravagant; hut it must be remembered advice is apparently addresse to royal or noble builders; and in the 17th century business was transacted, and morning visitors were received, usually in the bedchamher, a practice which, at the present day, has not fallen altogether into desuctude on the continent.

The author then proceeds to the subject of exterior architecture. He points out the necessity of cornices over doors and windows, to prevent rain from falling on them, which he illustrates in his usual quant way, by comparing a "cornish" to "the hroad brim of the good hat of a traveller in a rainy day."

"The good surveyor," he adds, "will order ornaments to the front of a palace according unto its situation : shun too much carved ornaments on the upright, whereat the southerly windes raise much dust;" also "shun those spectacle-like cant windows which are of glass on all sides, for it may be supposed that the inhabitants of such houses and rooms with cant windows (exposed to the north-west) may well imitate a merry Italian fisher, who in a winter, windy, rainy day, had been stript to his skin, and having nothing left to cover him save his bare net, wherein he was wrapt, put his finger through one of the holes, asking of passengers what weather it was out of doors." It is here to be observed, that at the doors. It is here to be observed, and a period when our author wrote, classical architecture, on its revival, was still struggling with the Gothic forms that had prevailed for so many centuries previously. These cant or bow many centuries previously. These cant or bow windows were peculiarly characteristic of the Tudor and Elizabethan ages, and so firmly rooted were they in the domestic habits and usages of the time, that the revivers of classical architecture were driven to make many attempts to retain the old favourite form with a new dress; and down to the present day we seem to have remained true to the old spectacle-like cant window of our forefathers, which, whilst it is almost universal in England, can scarcely

be met with in modern architecture on the

Sir Balthazar then proceeds to give us advice of not a very important nature on the subject of balconies, balustrades, and cornishes. He says that the Grecian and Roman surveyors ever made the cornishes and ornaments about the windows of the upper stories to be bigger than those on the lower; and illustrates his remark by a somewhat pedantic reference to Michaelangelo, Raphael d'Urbin, and Albert Durer. He then teaches us as to the propor-tions of doors and windows. The chambers of a palace, he says, should have the doors wide enough for two to pass at once, and the height to be double the width; all other chamber doors should be convenient for a man of complete, stature to pass with his bat on of complete stature to pass with his hat on. Windows must he higher than they are wide, because light comes from above, and the middle transome should be above 6 feet from the floor, otherwise the transome would be opposite a man's eye; "hindersome," as he opposite a man's eye; "hindersome," as he says, "to the free discovery of the country." says, "to the free discovery of the country."
The leaning-height of a window should be 3½ foot, and not so low that wanton persons may sit on them and break the glass, they may show themselves in quippo to passengers. "A good surveyor," he says, "shuns the ordering of doors with stumbling-block thresholds, though our forefathers affected the ordering of goors with stumoning-block thresholds, though our forefathers affected them, perchance to perpetuate the ancient custom of bridegrooms, who, when formerly at their return from church, did use to lift up their bride, and knock her head against that part of the door, for a remembrance that she was not to passe the threshold of their house without their leave."

Doors, he says, should be on a row, and close to the windows, that when the doors are

opened they may serve for screens, and not to convey wind to the chimney.

The hearth of a chimney ought to be level with the floor; and chimney mantles ought to be of stone or marble. It is necessary to cover the top of chimneys to keep out rain and snow; the smoke holes can be very conveniently made on the sides of their heads. Had the knight lived in these times he would doubtless have been very severe, in his quaint way, upon the monstrous fashion of modern chimney-

the monstrous tashion of modern chimneypots.

"Roomes on moist grounds do well to be
paved with marhle," and "a good surveyor
shuns the making of timber partitions on the
undermost story." "The good surveyor doth
contrive the repartitions of his ground plot so
as most of the necessary servants may be
lodged in the first ground-story, whereby
there will he less disturbance, less danger of
fire, and all the family at hand on all occasions." "Finally, he ought from time to
time to visit the work to see whether the
building be performed according unto his
directions and moulds." The author then
proceeds to a chapter on clerks of works.
"A clarke of the werks," he says, "must be
verst in the prices of materials and the rates of
all things belonging to a building; know
where the best are to be had; provide them to
the workmen's hands," and so on, adding
that "though nails to some seem not very
considerable, yet ought the clarke of the
worker to be discreta in the distribution of considerable, yet ought the clarke of the werke to be discrete in the distributing of them to some carpenters whose pockets par-take much of the austruche's stomachs." "His eyes must wander about every workman's hands, as on those of the sawyers at their pit so that they waste no more than needs in slabs; on the laborers' hands in the digging of the foundation for the bricklayers, that all the loose earth may be removed and springs observed."

Some of the ordinary duties of a clerk works are then enumerated; as, that he should prevent bricks being tumbled out of the cart; that he should suffer no sammell bricks to he made use of, and that he should not suffer the bricklayers to lay any foundation except the ground be first rammed, though it seem never so firm. "No great and small stuff," he says, "should be huddled together in the foundation, but all laid down as even as

^{*} Read at a meeting of the Institute of Architects, as mentioned last week. The whole paper will probably be published hereafter in a more complete form,

^{*} Lord Baron, who wrote somewhat before the date of this book, had none of our author's prejudice against these embowed windows. "I hold them," says he in his well known essay on building, "of good use, for they he pretty retining places for conterner, and besides they keep both the would sad sun off, for that which would strike almost through the room doth scarce pass the window."

possibly can be, to ram it the better and the more equal, and must be of solid hard stuff with no concavities daubed over with store of mortar," and he adds here in a marginal note that these precautions were observed in building the foundations of Solomon's temple, but he does not give us his authority for this information.

The clerk of works is further to see that the line and plumb rule be often used; that the bricklayers make small scaffling holes, and never suffer them to begin scafflings in the morning, but before leaving of their work; "for if in the morning, he says," most of them will make it a day for the gathering of

Then follow some injunctions respecting mortar, that I scarcely need particularise—and the author proceeds to the subject of masonry. The workmen must observe exactly the surveyor's molds, and work close and neat joints, using but little mortar between them, not only because much mortar will be washed away, but that cornishes will also appear like a rank of open teeth; and they must not forget to shore up the middle part of the head of the windows, as well as the sides, to prevent an unequal settling of the work, and, conse-quently, cracks. There here ensue, for the next thirteen pages, detailed directions for the proportioning of the several orders. The masons "must divide the Tuscan column, or rustick base and capital (which is as much rustick base and capital (which is as much as to say, feet and head) seven times its thickness; the architrave, freeze, and cornish one-fourth-part of the column, with base and capital. If they make the said order without a pedestal, they must divide its whole height into seventeen parts and a half, which (in their constitutions). into seventeen parts and a nan, which (in their vocation phrase) are called models, and are divided into twelve equal parts: if they are directed by their surveyor to make them with a pedestal, then are they to divide the whole height into twenty-two and one-sixth part, for that the perfect shape of the said order requires a pedestal which must have a third part of the a petestal which must have a third part of the column. It seldom happens that a pedestal is put to the Tuscan order, because (as it represents an atlas, and that no man will take a dwarf to reach to the first story of a building) the said order requires, not to be set as a candlestick on a cubbert; it's as a substantive, that can stand without an adjective." And that can stand without an adjective. And then our author adds, for he loves a joke, then our author adds, for he season, "some whether in season or out of season, "some Venetian ladies must have their shoppings to veneral radius must have then snoppings to stand on, and were they as strong as the Tuscan, they would not need some of their Masaras to lean upon," which no doubt con-veyed a hard hit at the luxurious habits of the Venetians, then in the plenitude of their wealth and greatness, but which has lost its point now-the very terms used being obsolete.

The author then proceeds to lay down the proportions of the Doric, Ionic, Corinthian, and Composite orders: the necessity for adhering exactly to these proportions he con-siders paramount—"For it is a rule as cer-tain," he says, "as that without the same, tain," he says, "as that without the same, there cannot be a perfect building made, no more than a man could without good ortho-

graphie write true English."

"It is the rule of the ancient masters, whose reliques, to be seen throughout most places of Italy, make many strangers that come their so wide as that they need no gags

gape so wide as that they need no gags."

The author now enters upon the subject of carpentry. He teaches "That the carpenters should be good husbands in the management of the builder his timber; on the cutting of the scantlings; their sparing to make double mortices which doc but weaken the summers. To lay no gerders which are needless and hindersome to the bording of a room; no summers to be laid except the ends of them are either pitcht, or laid in loam to preserve them from rotting," "and therefore in Italy, France, and Germany, and among the most prudent and solid huilders, the free masons, put stone car-touches in the top of the inside walls which are bearers to the summers, as such cartouches are seen in divers churches, and some of them are carved in ornamental figures." He alludes, no doubt, here to the stone corbels upon which we sometimes see the ends of principal timbers resting: an excellent old practice which we in our own days follow, although in a much less picturesque way, hy inserting the ends of our timbers into cast-iron shoes pro-

jecting from the face of the wall. The utilitarian tendencies of modern practice have been very subversive of the old picturesque ways of our ancestors, whether on costume, furniture, or architecture. An upholsterer now ascertains with precision the size of the piece of oak that will just carry his table; he seeks till he finds the safe minimum scantling, and this successful discovery is the triumph of his art. Whilst our forefathers would take a log of oak, all regardless of this politico-economical search after the greatest possible strength with the least possible stuff, and would carve it into one of those ponderous and fantastic legs which charm us by their quaintness, although they defy our efforts to lift them.

In further illustration compare the broad, deep, capacious fire-places, whereby our forefathers would warm themselves, with th scientifically constructed, snug, rumfordized stove, with bevelled cheeks, no hobs, con-tracted openings, all contrivances admirably adapted to meet our modern requirements of convenience and economy; but how destructive to the poetry of our grandsires' ruder arrangements!—men of a rough, bold stamp, who, provided they secured to themselves a warm chimney corner, appeared to regard with great indifference the minor evils of smoke

and blacks.

Then follow many other details of the manner the carpenter is to lay his timber, and the author adds that the clerk of the works must be very careful not to suffer the carpenters to lay any timbers under the chimneys, "whereby many bouses have been set on fire, and burnt to the ground." We have then a variety of scantlings for the timbers of floors and roofs, scantings for the timpers of noors and roots, which scantlings he gives as fit for substantial structures, but which are "not usual in lime and hair bird-cage-like buildings"—a remark that leads us to the conclusion that the flimsy structure of modern speculators was not wbolly unknown to our ancestors. The care of the clerk of the works must also be on "materials of weight, as sauder, wherewith an unconscionable plummer can ingrosse his bill." In this repaummer can ingrosse his bill. In this re-spect we see that 200 years' experience has not advanced us—we have still "unconscionable plummers." "The clerk is to see sauder weighed and well managed, and in the attesting of bills have a care not to pass his eyes slightly over them, lest when a plummer sets pounds of candles used about his sauder, that trick prove as insupportable as that of one who, having played away a round sum of his mas ter's stock in a journey to the East Indies, set down in his bill to have paid a hundred pound for mustard." "He must likewise have a clear insight on the glass pains of the glazier; suffer no green pains of glass to be mixt with the wbite. He must with his eyes follow the measurer of the work, his rod or pole; so the line wherewith the joiner's work is measured, that it be not let slide through the measurer's fingers, since the joiner's work hath many goings in and out, and a leger-de-mayne may be prejudicial to the paymaster's purse. It were likewise better to agree with painters to have their work rated on running measure and on the straight, as the carpenter's work, who (being of honest Joseph's profession), are as deserving to be well payd as the painters who do but spend the sweat of wall nuts (to wit, oyle), the carpenters that of their browes."

As for coverings of buildings, lead is best for churches, for who would not them but goths and vandals? Blue slates are most comely for a nobleman's palace," "a roof covered with them is of an equal color, when as red tiled roofs the least breaking of them makes great chargeable work for the tiler, who offer reprocess the tiles there trees. who often removes ten tiles to lay two new ones in their place, and renders the nobleman's roof like a beggar's coat."

Our author then proceeds to some remarks on the making of bricks, and recommends the clerk of works to look well to the working of the clay, which, if not well wrought, will never make good bricks. He says, that it is usual to pay 5s. per thousand for making and burning bricks, the clay-digging therein comprehended. He then goes into some details as to the relative expense of making bricks, and purchasing them made; whereby it appears that only 6s. 8d. are saved in 20,000 bricks, by making them. He says, that of clam-burnt bricks, 500 out of 20,000 are unfit for work.

Various other details are entered into re-

specting the making and use of bricks. Men specting the making and use of bricks. Men dig clay, he says, for 6d. the thousand; lime is burnt at 4s. per load, and costs 40s. a load. Touching the use of chalk in building walls, he says, that "those that mend the making use of chalk in their walls must be contented (if the ground hath springs) with the green mold which breaks thro' the whitened walls within doors. Walls about a parke or court may be fited with chalk, which may be digged for 18s. per load, and brought for 2s. 6d. the load." "Good country bricklayers do work at 27s. the rod, the bricks not being rubbed. Good London bricklayers will work the rod for 40s. with rubbed bricks; the inside for 33s., arches with rubbed bricks; the inside for 33s., arches comprized."

Then follow some remarks about lime burning, describing the mode of burning it "in China and other parts of the Indies," wholly with wood and not in kilns.

Our author now proceeds to a new division of his work, which he heads, "As for choice of master workmen." "King Henry the of master workmen." "King Henry the Eighth," he says, "shewed a good president when the serjeant plummer, calling his workmen to caste, in his presence, a leaden medal which was given him?" the king told him, "he would have no walking master-workmen."
Those, therefore, which are fit to be employed are working masters, and not those who walk from one building to another; "nor will any master workman deny to have had as much more done and well, by bestirring their hands and tools in their workmen's presence than otherwise." I cannot refrain here from calling your attention to the singular axis. your attention to the singular social change that has taken place since King Henry inflicted that has taken pace since king Henry mineted this reprimand on the walking instead of the working master. Fertile as he is said to have been in oaths, certainly no usual oath would have sufficed to express the royal indignation had he lived in these times, to have seen the master workmen not walk, but drive up to his works in as fair an equipage as that of any of his most favoured courtiers. Our author proceeds to counsel that master workmen be bound to a precise time, and to observe exactly the model held forth to them by the chosen surveyor, and to make good at their own cost what they do amiss. He further counsels "to shun the reprehending a master workman of any oversight before his men; but rather privately; since it would be to him as prejudicial as a check to a commander at the head of his troops."

We have next a division of the work entitled "As for the Builder and Preprietor." He ceeds to counsel that master workmen

"As for the Builder and Proprietor." He advises the builder (by which term he always means the employer) to buy his own materials, and to have in reserve such a stock of his own as he can well spare, and also, he adds, "against

as he can well spare, and also, he adds, "agoinst the mistakes of workmen, a stock of patience;" nor to begin building walls before March, nor after the middle of September.

The next twenty-eight pages contain a variety of miscellaneous and not very well assorted notes respecting the prices of materials and workmanship.

Touching the paving of courts, to prevent the overgrowing of grass and the charge of too often weeding, he says, "it would not be amiss to lay chalk or lime under the paving, and to do the same in gardens under gravel walks"—a piece of advice which is well worthy of

With respect to street paving with pebble stones, he alludes to a Mons. Le Cœur having recently introduced great improvements in paving works done under the commissioners. This French undertaker appears to have formed a company for carrying out a new invention in paving, "whereby they are not only able to make a most substantial good pavement, but are likewise capable by that same new invention to maintain it durable for twenty-one years." Our author (who, as must have been years." Our author (who, as must have been observed, is remarkable for the want of order and method in his remarks), brings his book to a close with some, what he calls necessary notes. "What contributes more to the fatal end of many good mother's son is ill-building: end of many good mother's son is ill-building; paper-like walls: cobweb-like windows: doors made fast as with packthread, purposely made to tempt men who, through extreme want, are become weary of a languishing life, and to whose fatal end, ill builders are in a manner accessory." He says that the scarcity of thieves vaunted of by the Hollanders, German, and other porthern victors is to be estimated. and other northern nations, is to be attributed

to the defence they are wont to make against thieves: he then describes very particularly the Hollander's mode of making outside window-shutters so secure by fitting them very closely to the reveals, and by a careful arrangement of the bolts and hinges,—precautions which, however necessary, certainly do not lead us to entertain any evalted idea of Dutch beautiful the converted to the content of the conten honesty in the seventeenth century. Some further suggestions are then made for rendering doors and windows secure both from rogues within and without: a suggestion, even, is made for the better securing a house against "thieves who do untile houses." We have then some remarks on porches, which he says serve to distribute alms to the poor, but also prove often cumbersome, being the receptacle of foul creatures, who, as soon as they are gotten into a court, make it their rendezvous. The entrance to a hall, he says, is not so proper in the middle as at the end, or at all events, set as much as possible near the end. He urges, that the principal floor of a building should not be level with the ground; he then introduces "his story of one in authority, who, passing by a town wherein the people generally did not outlive their thirtieth year, caused all the backs of their houses to be made the front; and the windows which were forward to he made up, to free them from that then some remarks on porches, which he say forward to he made up, to free them from that infectious aire that did shorten their lives, which had its effect accordingly, and it is therefore I do so much insist on the point of placing a building where good ayre is, and that neither chimnies nor doors may be so placed as to serve for the attraction of infectious airc, which kills more than the sword, or the sea overturnes ships." A truth, which, although uttered in 1663, we seem now, in 1849, only just beginning to perceive the importance of. The book closes with some desultory remarks

The book closes with some desultory remarks of no great importance as to the choice of clerks of works and surveyors, from which I need only quote the following portion:—
"Let all owners [of houses, he means] be prepared to repent, whether they build or not, for it is like the fate of many who marry, or marry not. Let both the one and the other lay, as in a scale, their several charges, vexations, cares, lahomrs, and pleasures, they will find this to be true, viz., if they build they must be at great present dishursements, vext with as many oversights, and to be overeach'd in bargains concerning their materials. If they build not, they are subject to the inconvenience of houses bnilt according to the fancies of of houses built according to the fancies of [other] owners; and when they shall cast up the summs of money spent in the rent, besides many chargeable alterations, they shall finde that they might have huilt a better and more fit habitation for them and their posterity."

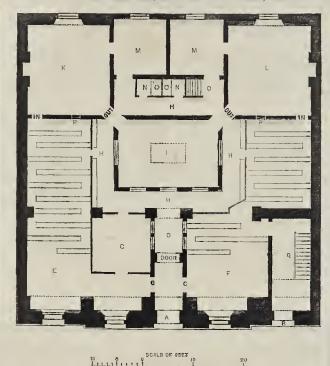

SYDNEY SMIRKE.

THE LATE MR. ROBERT SIBLEY.

WE record with regret the sudden decease (on We record with regret the student accesses (on the 31st uit.) of Mr. Robert Sibley, when apparently in perfect health, and at the age of 59. But a few days ago he wrote us on the subject of hirrials in towns, and the desertation of the dead, and now he himself lies in the lone grave. dead, and now he himself hes in the lone grave. Mr. Sibley was the county surveyor for many years, but resigned the appointment for that of the district surveyorship of Clerkenwell. He was, besides, surveyor to the Company of Ironmongers. He was a member of the Council of Civil Engineers. Amongst the buildings which he erected were the Hanwell County Lunatic Asylum the Light Horse buildings which he erected were the Hanwell County Lunatic Asplum, the Light Horse Volunteer Barrack in Gray's-Inn-lane, now a refuge for the destitute, and several small hridges, among which was Brentford. He also constructed the large iron wharf at London-bridge. The interim appointment to the district surveyorship has heen conferred on his son, Mr. R. L. Sibley, who is a candidate for the office permanently. The election will take place on the 19th.

St. Stephen's, Walbrook.—Thefinancial disputes in Walbrook being at last settled, we understand that the parish have now funds in hand to repair and adorn the church. We trust that no time will be lost in commencing this much-needed work, and that it will be done under proper direction, and thoroughly.

PLAN OF DISPENSARY, CLEVELAND-PLACE, BATH.

PLAN OF A DISPENSARY.

Annexed is the plan of the dispensary in Cleveland-place East, Bath, the arrangement of which seems very convenient, and may serve as a suggestive type. The annexed re-ferences will explain the appropriation of the apartments and show the modes of access.

- CCD
- A Public entrance.
 B Private ditto.
 C Patients' ditto.
 D Visitors' ditto.
 E Room for physician's patients.
 F Room for surgeon's patients.
 C New patients.
- New patients. Passages.
- - I Dispensing-room, with lantera light.
 K Physician's room.
 L Surgeon's ditto.
 M M Private ditto.
 N N Water closets.
 O Stairs to hot-water furnace.
 P P Variables.

 - Ventilate Q House stairs.

It will be seen that the physician's patients go in on the left-hand side of the hall, and taking a seat wait their turn to be admitted to his room (K) by the door marked "Ix:" having received his prescription, they retire by the door marked "Out," ohtain the medicine the door marked Out, ordan the medicale at the window of the dispensary-room (I), and leave the dispensary by D.

The surgeons' patients take the same course on the opposite side.

The building is warmed by hot-water pipes.

Above there is a large committee room with

Ahove there is a large committee-room, with sitting-room and three chambers.

In few ways can the afflient better aid their less fortunate hrethren than by founding and affording support to DISPENSARIES.

Public Necessaries.—Nothing has yet been done in this respect, and prohably will not be till the Health Commissioners take up the matter. It is one of very serious import, and is necessarily denied the advantage of while deversion.

THE ROMAN PERIOD OF GREEK DECORATIVE ART.

IMPORTANCE OF SYSTEM IN STYLE, AND OF TASTE AND SUBORDINATION IN ORNAMENT.

In pursuance of his course of lectures on decorative art, at the Government School of decorative art, at the Government School of Design, Somerset House, Mr. Wornum proceeded, on Friday, the 25th, to follow up his remarks on the Periclean age of Greek art (vide p. 112), with some account of its progress, or decline rather, under Roman auspices.

In the last lecture, said he, we reached the culminating point of Greek decorative art, illustrated in the Parthenon, the Erectheium, and the Choragic monument of Lysicrates. We have now to trace its decline, or point as

We have now to trace its decline, or point out that deterioration of style which immediately followed the period of Alexander, and which has caused this later age to be termed the

period of decline. period of decline.

The designation appears to be just, though, as regards the mere production of ornamental works, it exhibits not only a more profuse expenditure, but even more energetic enterprise, in, perhaps, every species of ornamental art, than any preceding age. The decline was in the art—in the manner in which the decorations were applied—not in the ornamental

in the art—in the manner in which the de-corations were applied—not in the ornaments themselves. These were the same, and, in most cases, equally well executed; but that quality which we term taste—that is, judi-cious selection and arrangement—seems to cious selection and arrangement—seems to have experienced a total revolution. Quantity was apparently mistaken for quality; and the whole decorative art of this period, viewed generally, well illustrates that deficiency of power in the artistic mind which Apelles so aptly exposed. If the Roman works are not beautiful, they are at least rich. When I say Roman works, I hy no means allude merely to works executed at Rome, but to all efforts of this period in any part of the ancient world to which Roman influence extended. And from the time of the conquest of Greece, ahout a century and a half after Alexander, few great works were underafter Alexander, few great works were under

after Alexander, few great works were under-

taken which did not owe their origin immediately to Rome, though perhaps in nearly all cases executed by Greek artists. The Romans even collected and exhibited works of Greek art at Rome within a century after the death of Alexander, as the works brought by Marcellus

Alexander, as the ver-from Syracuse, 214 B.C.
Under these circumstances we may, perhaps,
this period of decline—that is, safely term this period of decline—that is, from Marcellus to Constantine the Great—about five centuries—the Roman period of Greek art. We cannot call the art of these centuries Roman art, but it was strictly Greek art under Roman influence, and its chief monuments, even in the Oriental provinces, were raised by the orders of Roman Governors or Emperors, —as at Petra, Palmyra, Baalbec (Heliopolis),

Athens, Pola, and Spalatro.

The decline, then, which characterises this remarkable period is not one of poverty, but remarkable period is not one of poverty, but rather of luxury; it was an embarrassment of riches—an injudicious application of ornament, from the want of that proper discrimination which we term taste, or rather, perhaps, that want combined with the ostentatious rivalry of a luxurious age. And yet, with all its enterprise and boundless expenditure, this age has added but one single new form to those which constituted the elementary types of the preceding age. This new form is the shell, which we find cut on the modillions of the arch of constituted the elementary types of the pre-ceding age. This new form is the shell, which we find cut on the modilions of the arch of Titus, at Rome. This species of net-work is not new. Net-work of gold was introduced largely in the funeral car of Alexander the Great: it appears to be a mere imitation of basket-work, or what it literally is, net-work. We have in this period, also, vertical reeding, rare in Greek art, unless in furniture. Style and system may be looked upon as

Style and system may be looked upon as synonymous terms in ornamental art. Besides the ornaments themselves, we must have some system of applying them. And if the promisystem of applying them. And it he promi-nent and characteristic members of certain established styles are promiscuously thrown together, the principal features of one style applied as secondary to subordinate features of another, the value of all is diminished or lost, and the general effect has but its vagueness to characterise it. The same ornamental types may be used in the development of new styles, distinction of style depending not so much on distinction of style depending not so much on the types themselves as on the mode of using them. But in the development of any par-ticular historic style of ornament, we are strictly limited to the elements belonging to that style; and in combining styles, the various members belonging to the same style should preserve their relative degree of im-nortance. portance

The general decorations of the Roman period, however, and especially those of Pompeii, exhibit an utter disregard of these observances; and thus all distinctions of style

observances; and thus all distinctions of style and consequent peculiarities of character are lost. Systematic designing exhibits the art of the ornamentist in a highly intellectual light. Whatever style prevailed in a particular period, it is one expression of the spirit of that age; and by thus attending to these periodic or local developments of ornament, the designer affords not only the delight and gratification arising from the contemplation of a beautiful work of art, but at the same time presents an agreeable art, but at the same time presents an agreeable and instructive record of the past, full of the

most valuable suggestions.

These remarks apply as much to furniture as to decoration, and also, though in a less degree, to designs for costume and ornamental manufactures. For unless the designer for cabinet work, papers, furniture damasks, and stuffs generally, conforms as much as the decorator with the distinctions of style, these manufactures cannot contribute anything towards that complete developement of ornamental art which it is the object of these schools to foster. There is perhaps only one department of manufactures in which this discrimination of the various styles of ornament can be considered a matter of indifference, that is in the printed or woven fabrics for ladies' dresses. Here it should rather be avoided, as we do not wish to see our mothers, wives, and daughters look like antiques, or even as middle age ladies. For this class of fabrics, the most appropriate design is such as shall be completely unobtrusive, and while ornamental, at same time strictly subordinate. To make so conspicuous a design as to attract the attention from the lady herself to the pat-

tern of her dress is to commit a capital error : it then no longer adorns but rivals the person. This elaboration of an accessary at the cost of Inis cianoration of an accessary at the cost of the principal object, is an error too often committed in works of art, of which even the Greeks have afforded a sufficient number of examples: as Androcydes, the contemporary of Zeuxis, who painted a picture of the six-headed sea-monster Scylla, in which he gave so much care to the fish he introduced in the composition, that the monster herself, really the nicture, was comparatively unimportant position, that the monster herself, really the picture, was comparatively unimportant, and Androcydes was ever after ridiculed for having forgotten his art for his appetite, for he was known to have been very fond of fish. Protogenes too, the rival of Apelles, in his celebrated picture of a "Reposing Faun," had introduced a quail so admirably painted, that the first exclamation of the spectator was, "what a beautiful quail!" This so annoyed the great painter, that although the picture was already dedicated, he solicited and picture was already dedicated, he solicited and obtained leave to efface the offending bird.

Now, it is quite as easy for the ornamental designer to fall into this error as for the painter. His ornaments may become so prominent as completely to obscure the intention or destination of the object he has ostensibly endeavoured to adorn. Every addition by way of ornament should tend only more completely and elegantly to express the designer's purpose: otherwise what is principal is sacrificed to what is but secondary. It is the more or less strict observance of this principle which constitutes good or bad taste,—not the mere character of the design itself; for what might make very handsome carpets, oil cloths, or papers, would in most cases appear ridiculous if used for dresses.

Thus a deteriorated age may use all the ele-ments of the most refined,—possess even the same imitative or mechanical skill in execution,—and yet by a want of discrimination in the application of design, exhibit even a barbarous character in comparison with the design of that period, in which a due attention has been paid to the propriety of application, whether in quantity or quality. And thus a barbarous style of design may, perhaps, more easily arise out of too much ornament than tendition.

This, then, is the character of that period of decline which supervened upon the great age of art which attained its highest development in the time of Alexander the Great, and gave evidence of a decay even in the time of Alexander himself, the description of whose funeral, preserved by Diodorus, shows how completely the taste of the Greeks had become controlled. orientalized. Sumptuous solendour had taken the place of taste. The decline, however, was very gradual, especially in sculpture. Some of the most prized productions of ancient art are maintained by many critics to belong to a much later age than that of Alexander—as the Laccoon, the Torso of Apollonius, and the Apollo Belvedere—all of them assigned to the time of the Roman emperors. The school of Rhodes was the latest of the Greek schools that training descriptions. that maintained a great reputation. Painting seems to have been much less enduring. Mere technical excellencies of art became prominent, and higher qualities were overlooked—form became paramount over essence. Such was the decline of Grecian art which rapidly su-pervened on the close of the Alexandrian age. That it never revived from this decline is not remarkable. Greece not only became a Roman province, and lost her artists, but almost every important work that could be moved was transported either to Egypt or to Italy. Romans were not contented with removing pictures and statues, but the very walls were stripped of their plastering, and the pieces transported in wooden cases to Rome. The spoliations of the Grecian kingdoms of Asia and of Sicily continued uninterruptedly for about two centuries, yet such was the incon-ceivable wealth of Greece in works of art that Rhodes alone still contained upwards of 3,000 statues, and there could not have been less at Athens, at Olympia, or at Delphi. But all these were nothing compared with the myriads of works, pictures, and statues which were collected together in the public buildings of Rome. Cassiodorus says that Rome was one vast wonder, a statement we can well understand, if we are to judge from the temporary theatre constructed by Scaurus in honour of his ædileship, which he decorated with 3,000 bronze statues

Considering this unparalleled wealth, then, in works of fine art, it is quite consistent that the Romans should endeavour to decorate their buildings in a style of commensurate splendour and profusion, and thus we find that the most florid examples of purely Greek ornament are plain when compared with the Roman treatment of the same forms, although it is very probable that Greek artists were employed to ecute their elaborate designs.

By help of numerous illustrations the lecturer then proceeded to contrast the Greek and Roman orders, and to trace their variations, enrichments, transformations, complications, and confusions during their 'decline and fall.' and confusions during their 'decline and fall.' Examples of ancient ornamental art in the forms of armour, helmets, shields, &c., and of sculpture, candelabra, and other designs, were also referred to and described, with various "preposterous combinations" and "fanciful decorations," deprecated by Roman writers themselves as illustrations of "a beautiful system of ornamentrun mad—a bed of flowers overrun with weeds." The barbarous forms and colours of specimens of stucco-work and and colours of specimens of stucco-work and other decorative details from Pompeii were exhibited in justification of such complaints. That even Pompeii, however, a small provincial town, exhibited occasional traces of a magnificent system of decoration, was freely admitted.

Having passed in review every element of classical ornamental art, continued the lecturer, or at least every element of importance, we will now briefly consider what is the exact object of this historical investigation. * * * * This is the view with which we study the his This is the view with which we study the history of art,—to discriminate and individualize the styles of the various epochs, and, by thus developing distinct characters, to multiply to an equal extent our means of viewing nature, and our powers, consequently, of represen-tation. The real object of historical know-ledge, therefore, is not the mere copying what has been done before, but the acquisition of a power which not only supersedes all copying, but which alone will ensure the production of that variety of ornamental design which, the

that variety of ornamental design which, the simplest theory must make manifest, is the ostensible effort of every designer.

A knowledge of the various styles not only gives a very great command over the elements of ornamental art, but will enable you to view what comes under your own observation in several distinct lights. For instance, take a walk in one of our fields some summer's day, and make a series of different designs are designed. and make a series of different designs out of what you find there,—say a blade of grass, or a dock-leaf, butter-cups and daisies, an ear of wheat and a poppy or any other simple plant.
First throw them together in your own way,
and as you would do if you had no knowledge of ornamental design. Then, for example, consider how an Egyptian would have treated consider now an Egyphan would have these things, and arrange them into a frieze ornament, such as we have many examples of in the temples of Egypt. Then make an attempt at the Doric, and do not forget the anthemion; from that age pass to the Alexandram available. andrian, producing a more expansive and rich arrangement, bearing in mind the acanthus; and finally, try the Roman, in which you may put all the gorgeous exuberance of display of which your materials are capable, not for-getting the scroll, and that in both the Alex-andrian and Roman styles fabulous animals are admissible. This is only one of a thou-sand useful experiments or exercises that your historical translations will consider a service. historical knowledge will enable you to make in the arrangement of new materials in established forms; and it is a field of enterprise that, without historical knowledge, would be wholly closed to you. I may observe that you will ensure a much greater variety by dis-posing the same materials in different forms than by arranging different materials in the same forms.

same torms.

By following out this system, with a thorough knowledge of ornament, you cannot fail to produce variety and beauty at once,—the end of all these studies, and the object of every ornamentist, whatever may be the ulti-mate destination of his design.

BRICK DUTIES.—Mr. Peto has presented a petition from Norwich, praying for a reduction of duties on bricks and windows.

ST. BARNABAS' COLLEGE, PIMLICO.

MESSRS. CUNDY, ARCHITECTS.

ST. BARNABAS' COLLEGE, QUEEN STREET, PIMLICO,

IN THE DISTRICT OF ST. PAUL, KNIGHTSBRIDGE,

THE first stone of the college was laid St. Barnabas' day, 1846: it includes schools for boys, girls, and infants, about 600 in all, twenty-four of whom are to be on the foundation, to be clothed, boarded, and lodged, as well as educated, gratuitously. The residentiary house is constructed to hold four clergymen, whose duty it will be to attend to the parochial duties of the district, and to minister in the church. They will also teach in the schools, and have the special superintendence of the twelve choristers on the founda-tion. The church is intended to be entirely free, without pews or paid seats, and will be capable of holding 700 persons in open benches. The schools were opened on St. Barnabas'

day, 1847, and at present serve the purpose of a temporary church for the district.

a temporary church for the district.
The residentiary house has been completed, and is now occupied, and the church is built with the exception of the upper part of the tower and the spire, which are expected to be finished by the middle of the summer, and during the following year it is probable that the completion of the church may be accomplished, so as to be ready for consecution, by:

rag stone, both externally and internally, having dressings and a spire of Caen stone.

The roof of the church, chancel, sacristy,

The root of the church, chancel, sacristy, and choir vestry are of oak.

The cost of the schools, residentiary house, and church, with the enclosing walls and appurtenances, will be about 19,000!.

The freehold site of the college was the munificent gift of the Marquis of Westminster.

The funds, have been available highest her bear worked, but her her worked.

nificent gift of the Marquis of Westminster.

The funds bave been provided hitherto by the voluntary contribution of the inhabitants of St. Paul's district, through the indefatigable exertions of the Rev. W. G. Bennett, the incumbent. The style of the architecture is the first Pointed (Early English), and which appeared to the trustees of the college best adapted for the poor man's church. There is yet to be collected about 5,000. for the completion of this establishment.

The dimensions of the interior of the church.

The dimensions of the interior of the church are as follows:—The length is 97 feet from east to west, including the chancel, 30 feet deep; the width of the nave and aisless 51 feet; and the height of the nave 50 feet: the height of the tower and spire will be 170 feet. The general arrangement is a nave with north and south aisles, a tower at the west end of the north aisle, a south poreb, a chancel with aisles, a sacristy, and choir vestry, all attached, connecting the church to the other portions of the plished, so as to be ready for consecration by
St. Barnabas' day, 1850.

The buildings are constructed of Kentish

The buildings are constructed of Kentish

to be paved with tiles, and all the windows are to be appropriately glazed with stained glass, much of which has been already offered. There is a crypt under the chancel. The architects are Messrs. Cundy, to whom praise is due for the satisfactory manner in which this interesting pile of buildings is being carried our. carried out.

In our engraving, the schools are seen on the left, and the residentiary house on the right of the church.

THE AYLESBURY COMPETITION .-THE AYLESBURY COMPETITION.—The competition for the erection of judges' lodgings at Aylesbury, into which ten architects entered, has been decided in favour of Mr. Lamb. A respectable correspondent (one of the competitors) comments on an ambiguous statement made by the chairman of the magis-trates, Sir Thomas Aubrey, in announcing this result to the few who were present, to the effect "that the reason which had led to their choice was known amongst themselves, and the less said about it the better for all parties con-cerned;" but this statement is too vague to justify any suspicion of unfairness on our part.
ARTISTS' GENERAL BENEVOLENT FUND.

The thirty-fourth anniversary dinner of this institution was held on Saturday in last week. The Marquis of Westminster presided, and about 420% were subscribed.

LODGE, MANOR PARK, STREATHAM.

LODGE: STREATHAM.

THE accompanying engraving represents the tower lodge on the principal entrance to the Manor Park, Streatham. The building, which is from a design of Mr. R. L. Roumieu, architect, is in the Italian style of architecture, and built of brick, covered with metallic cement: it contains four hed-rooms, two sitting-rooms, with kitchen and scullery complete.

it contains four hed-rooms, two sitting-rooms, with kitchen and scullery complete.

The tower, which is 70 feet high, contains a staircase to the top, which commands a beautiful view of the surrounding country: on a clear day Epsom, Harrow-on-the-Hill, and Highgate can be seen without the aid of a glass. It was huilt for the residence of the agent to the estate. The park is being helted round with houses of various styles of architecture, leaving the interior open for walks and pleasure grounds.

ARCHITECTURAL SOIREE AT LIVERPOOL.

The Liverpool Architectural Society held their first soirée on the 28th ult., when a nice party assembled, and the whole of the proceedings passed off with great satisfaction. The band of the 46th and an exhibition of the electric light were pressed into the service, nor were the creature-comforts wanting; in fact, one of the local papers devotes about half the space allotted to an account of the meeting to commendation of the jellies and creams then and there dispensed.

The Rev. D. James, F.S.A., was in the chair.

chair.

Mr. J. A. Picton gave an account of the origin of the society, already stated in our pages. Mr. Picton further said,—It must he admitted that great improvements might he made in huilding, and in architecture generally, and these would he promoted by the establishment of their society. They proposed

to form a good architectural and artistical lihrary, hut that they were as yet unable to carry out. It would also be their object to furnish illustrations of the remains of antiquity in the neighbourhood. Besides this, the society would have a great effect in calling out the energies of architects still further than they had been, and affording greater facilities for students.

Mr. Cockerell, R.A., one of the guests of the evening, was then introduced to the meeting, and expressed the gratification with which he viewed the establishment of the society. Speaking of Liverpool, he said, he did not think that in Europe there was a modern huilding at all equal to St. George's Hall, as regarded its structure, unity of design, and magnificence of execution. Another huilding, the Town-hall and Exchange, had also on all occasions excited his admiration. He was happy to learn that, during the last year, an institution had grown up which it had always appeared to him was required in Liverpool, where there was a certain grandeur of mind, arising from the enterprise and commercial spirit for which it had been, at all times, remarkahle. He felt sure the art would flourish there, hecause they had not only many able architects, but they had amongst them teachers and guides in all the various walks of life. In the present state of progress it was highly desirable, unless the architects were to lag behind, that they should take up a position, and, hy union, create a hody, in order to balance the great social influence which was bearing upon them on all sides.

Mr. S. Holme said he thought that a good understanding ought to exist between the architect and the builder, as there was nothing more likely than such a course to promote permanent success. The minds of mechanical men were expanded by having the advantage of communicating with those of superior thought and intelligence, and architects themselves mightoe-

casionally receive practical hints which practical men were so able to give, and hy an action and re-action there would be an advantage to both. The theoretical architect would receive advantage from heing operated upon hy the practical architect, and practical good would result to themselves and to the society. When they looked at the achievements in science and art, at the present day, it was necessary, if architecture was to keep its place, that the members of the profession should undergo a course of study, and unite themselves together in order to promote their general improvement and experience. Unless they did so they must lag behind in that wonderful march of progress which they saw now in existence throughout the land.—Mr. Sharpe and other gentlemen also addressed the meeting.

THE SHEFFIELD TRADE.

In last week's Shefield Times is published the essay selected as the best of those presented in competition for the prize offered by the proprietors of that paper for an essay "On the Present Condition and Future Prospects of Sheffield." The successful competitor is Mr. Joseph Hutton, Saint Cross, Eckington, who appears to have had long experience in the trade as a manufacturer, and who was himself 'shelfed' by the unionist workmen no less than twenty-seven years since. His semiments on this particular subject correspond entirely with our own. If there are to be unions, he remarks, let the masters unite as well as the men, and come, if possible, to some mutual understanding for the settlement of differences, otherwise, "as things are now in Sheffield, the masters with money, who employ workmen, will soon disappear, and leave only working masters, who, like ravenous wolves, will tear each other to rags." As to new trades that might be advantageously introduced, he says,

"I know of no natural objection; but what man of sense or company of men would lay out their money in making preparations in Sheffield, so infected with trade-unions."

The dissatisfaction of the essayist, however, with the present state of things in Sheffield, does not rest here. He exposes what he conceives to be those technical and professional causes which have tended to blast the good fame of Sbeffield wares in general. These, virtually, he may be said to comprehend under the head of haste and carelessness in the production of worthless quantity, in place of and labour in the manufacture of sterling quality. "Softness of temper is the general complaint of Sheffield wares." If hardened to a sufficient extent, in the haste and carelessness of manufacture, the goods are de stroyed by wholesale. The grinder, moreover, seen ram dozens into the wheel-fire, and heat them red-hot, in order to dispatch his work more quickly;" otherwise, he either destroys or returns them to the manufacturer to soften them. Haste, too, in the manufacture of steel he deprecates, recommending strongly the preparation of cast steel by the strongly the preparation of cast steel by the manufacturers inder their own eye. "As to cast-steel," he says, "few are aware why it is so uniform in temperature; it is from heing melted, which mixes the high and the low conversions, the outside and the inside, in the crucible."

On the whole, the essayist's hope for Shef-field is by no means cheering. His concluding words, which do not very clearly express his meaning, are, "That the Sheffield trade may revive and progress is the fear, but still the fervent wish of the writer." He takes care to remark, wish of the writer." He takes care to remark, however, that if he were now a young man, about to enter into the business, he would about to enter into the business, he wo steer clear of Sheffield by a hundred miles,

NOTES IN THE PROVINCES.

PLANS for a new church at Birch, near PLANS for a new church at Birch, near Colchester, have been prepared by Mr. S. S. Teulon, architect. The style is Gothic, and the building is to have flint facings and Caen stone rusticated coins, a tower and spire: sittings, 600.—The sum of 3,000L is to be at length borrowed, on church-rate security, for the repair and re-opening of Ayleshury Church.—The Grimshy dock area reclaimed is 132 acres, length of dam and empankment, 6,500 feet, with projection into river beyond high water 2,900 feet; head of water against the dam at spring tides, 25 feet.—
It is proposed to erect a monument to Cromwell on the site of Slepe Hall, St. Ives, where he resided at the opening of his public career.— Trinity Congregational Chapel, is 132 acres, length of dam and embankment, career. — Trinity Congregational Chapel, Queen's-road, Reading, lately opened, is in the Early English style, with a turret and pinnacle at each of the four angles, and a triplet window and slightly projecting porch at the end facing Queen's-road. Swindon stone with Bath stone dressings have been used in its construction. The exterior presents carved corbels and finials, gable and dripstone terminations, &c., so far ornamental, but there is no 'superfluous decoration.' The roof, inte-The roof, inte riorly, is of simple construction, and the principals rest on stone corhels of carved foliage. There is a gallery of timber across the northern end. The benches are all open and low backed, with fleur de lis terminations. The woodwork with fleur de lis terminations. The woodwork in general is of deal, stained and varnished. Mr. W. F. Poulton, of Reading, was the architect, and the contractors were Messrs. Cooper and Sons, of Maidenhead; suh-contractors, Mr. Darter, painter, and Messrs. Wheeler for masonry and carving.—
The consternation and distress, says a contemporary, occasioned among the working mechanics and labourers in Physouthyard acts. chanics and labourers in Plymouth-yard, as the details of the Government plan of reduction become developed, is extreme. Many who have been doing duty as leading hands over bired mechanics for years, themselves having been previously entered on the dockyard estab lishment, and supposing themselves on that account secure from discharge, are to be summarily turned adrift at the close of the financial year; the only alternative being the bitter one of taking the bertb and pay (12s. a-week) of a labourer, and this considered a favour.—A baptismal font has just been added to the Holy Cross Church, Pershore. It was executed by

Messrs. Gibhs and Son, Oxford, and cost 301., raised by the curate. — The roof of Holy Rhood Church, Southampton, is now covered in, the galleries are in progress, and the interior masonry is almost finished. lumpton Church is to be almost entirely reseated and repaved, and the gallery obscuring the fan tracery vaulting of Lane's chapel removed, and the nave gallery reduced. A cbancel, as our readers are probably aware, was recently built.—The new church at Yardley Wood, near Birmingham, lately conseared. secrated, comprises a nave, aisles, and chancel, with short transepts, and a hell tower. th short transepts, and a hell tower.

The opening of the Manchester New Exchange, in May, is to be celebrated by a public hall, substantially for the benefit of the baths and wash-houses there—The Newcastle baths and wash-houses seem to be in busy use, not only hy the class for whom they were designed, but by 'the public' generally, and those truly industrious classes of the commu-nity, the maids of all work and the professional washerwomen, are getting fast initiated into all the mysteries of hot-air closets and steam-boilers, thus, as the Gateshead Observer remarks, at once saving their employers houses from damp and discomfort and their tempers from still worse evils.—Three ornamental windows have been executed and put up hy Mr. J. Gihson, of Newcastle, in the church at Walker.—A subscription has been opened to purchase the late Mr. David Scott's painting, "Vasco de Gama, the discoverer of the passage to India, doubling the Gape of Good Hope," to he placed in the hall of the Trinity House at Leith. Why do not corporations and other hedies purchase tempers from still worse evils .-- Three orna not corporations and other bodies purchase some of the large pictures round some of the large pictures now spoiling in artists' studios before the painter dies?

RAILWAY JOTTINGS.

Pokers,' states that 10,000,000l. were expended in Parliamentary inquiries and Parliamentary contests in 1845, 1846, and 1847, and that that money "would, at the pended in Parliamentary inquiries and califamentary contests in 1845, 1846, and 1847, and that that money "would, at the rate of 20,000l, per mile, have constructed a national railway 500 miles in length—say from London to Aherdeen."—The cost of advertising one railway scheme in the London morning papers alone is said to have heen 2,500l.—The Great Western Company, says The Great Western Company, says the Liverpool Times, "bave effected the Liverpool Times, "bave effected a saving of 15s, per annum hy wafering instead of sealing their letters. What an anomaly! their income is increased by waxing less." If the waferer, however, get no more a-week than the saving per annum, he will be apt to reduce the profit by eating the wafers -a circumstance which ought to be taken into consideration—though he will not wax so fat, we fear, even in such a way of faring, as to justify any further reduction of wages. Two hundred more of the workmen on this line, besides clerks, it is said, are to be discharged on 1st May—not a very bright summer's morning to them, poor fellows.— "At length," to them, poor fellows. — "At length," says Herepath, "the Government has determined to try whether the Great Western Railway Company of Common Carriers are to be amenable to the laws of the land or not; whether they shall be compelled, like other Companies and individuals, to obey the Acts of Parliament granted on their own solicitation, or shall treat them as waste paper. It will be remembered that, some time ago, the case for the reduction of the Great Western fares was laid before the Attorney and Solicitor General, and that they gave their opinion that the Great Western ought, under their Act, to reduce their fares and charges. The Great Western bave neglected to do so, and therefore Crown has ordered a bill to be filed in Chancery against them to compel them."—— The Copenhagen tunnel on the Great Northern The Copenhagen tunnel on the Great Northern is about to be let. This tunnel is about 600 yards in length: it commences at the end of Mr. Brassey's contract, towards, or rather into London. The short length, about three-quarters of a mile, between the Gopenhagen tunnel and King's Gross station, has already been contracted for, so that the Copenhagen tunnel will, when let, leave the line immediately into London completely contracted for. diately into London completely contracted for.

The only work which will then remain to be disposed of at the London end, will be the

King's Gross station.— -A railway bridge at Stowe, near the Marton-road station, has lately given way it is said.—The American Railway Journal states that no tends, 6,421 miles of railway were in actual operation within the limits of the United States at the within the limits of the present year. These 6,421 miles of railway were in actual operation within the limits of the United States at the commencement of the present year. These railways, including plant, have cost on an average about 30,000 dollars, or 6,000, per mile. Of course they are not on the same scale of magnificence as the lines of this country. In Canada very few miles of railway baye as yet here conserved. way have as yet been constructed.

ELECTRO-TELEGRAPHIC PROGRESS.

We understand, says a contemporary, that a proposition will shortly be brought before the public, having for its object such an extension of the facilities of electro-intercommunication, as to bring its use within the means of the million. It must be something extremely urgent which induces the capitalist to pay about 7s. per 100 miles for twenty words, when he can get a long detailed letter in five or six hours for one penny. The system in America has been established on thousands of miles of railway, on the principle of enabling the public generally to partake of its advantages; and a company in this country, on the same principle, charging about 6d. or 1s. per message, would soon find the decrease in price produce an enormous extent of business, and make the undertaking exceedingly popular. Increased undertaking exceedingly popular. Increased means of never-failing power, unquestionable secresy, and great reduction in charges, are recommendations that cannot fail to prove highly attractive to capitalist, merchant, and trader. —One of the most remarkable features in connection with the transmission of President Taylor's curtailed "message," by telegraph from Liyerpol to Lorden west. research Taylor's curtained message, by telegraph, from Liverpool to London, was the expense. It occupied about ninety-eight lines; and the sum paid by Willmer and Smith to the Electric Telegraph Company was Smith to the Electric Telegraph Company was 214. sterling. The same thing would have been done in America for as many dollars. How, says the European Times, can the English press, under its already heavy expenditure, endure pecuniary inflictions of this nature?—The wires of the telegraph working along the South-Western have been have been the sund from Fasshar to that terminal brought round from Fareham to the terminus at Landport, Portsmouth, and thence carried across the fortifications. The Admiralty are to communicate by cyphers, with, of course, a secret key. The old semaphore stations, bowever, are not to be given up, and a new one for Osborne is talked of.

METROPOLITAN COMMISSION OF SEWERS.

A GENERAL court was held on Thursday, at the Court-house, Greek-street, Soho-square; the Right Hon. the Earl of Carlisle in the chair.

The Drainage of Kensington.—A plan for the effectual drainage of the town and workhouse of Kensington, was presented by Messrs. Austin, Phillips, Gotto, and Lovick, pursuant to an order of the last court. They recommended that an 18-inch nps, tootto, and Lovick, pursuant to an order of the last court. They recommended that an 18-inch pipe sewer should he laid down to communicate with the Counters' Creek Sewer, at an estimated cost of 7904, towards which Mr. Bird, the builder, was willing to contribute 3004.

Mr. Leslie expressed his approhation generally of the line proposed, but helieved that it might he still further improved by passing it through a field on which 200 houses were about to be greated (the also

further improved hy passing it through a field on which 200 houses were about to be erected (the plan of which he produced), a straight line would he formed, and with a considerable saving of expense. formed, and with a considerable saving of expense. He would, however, for the pipe sewer proposed, lay down a substantial brickwork egg-shaped sewer, which, hy heing suhmitted to public competition, might be executed at 10s, per foot. By the adoption of his plan, a permanent remedy would be found for every complaint at Kensington, at an expense not exceeding 1,2002., a large proportion of which would be contributed by the owners of the adioptine property.

which would be contributed by the owners of the adjoining property.

Mr. Austin, the consulting engineer, said the Counters' Creek Sewer was a most offensive ditch, and, for the sake of improvement, it was desirable to divert the sawage from it altogether. Taking a general view of the drainage area, therefore, he was not prepared to recommend any drainage into it as a permanent work.—Mr. Chadwick objected to commissioners having a local knowledge of particular districts submitting their views for the drainage of them without proper plans, as what might he proper for a single place might turn out

highly improper for a whole district.—Lord Ebrington was in favour of the plans as proposed by the

The Earl of Carlisle said it was desirable to carry the scheme immediately into effect, as the state of the workhouse [recently set forth in The BUILDER]

the workhouse [recently set forth in The BULDER] would admit of no delay.—The motion for the adoption of the plan was then put and agreed to.

The Salaries of the Officers of the Commission.

—Mr. Bullar then moved, pursuant to notice, "That from January 5, 1849, the salary of the order clerk be 800!. a-year, the salary of the consulting engineer 400!. a-year, and the salary of Mr. Phillips, as one of the chief surveyors 600!. a-year. The motion was agreed to nem. com.

Phillips, as one of the chief surveyors outer a-year. The motion was agreed to nem. com.

On the motion of Mr. Chadwick, it was agreed "That it be referred to the Works' Committee to obtain plans, models, specimens of soil, pan appratus, taps, and sinks, for the completion of house drainage and providing public conveniences, in accordance with the Act, and not to expend more than 60% for that purpose."

than 60%. for that purpose."

On the motion of Mr. Bullar, seconded by Mr. Chadwick, the following resolutions were agreed

Chartest, the rendering to the contractor of the tradesmen, and no other expense be incurred, with reference to any work, experiment, or investigation, without the written certificate of the order clerk, the consulting engineer, or one of the chief surveyors, of the propriety of such order or expense."

pense."
"That it be an instruction to the Finance Committee, while it continues, to require and receive, regards orders given and expenses incurred before March 15, 1849, inclusive, the certificate as to its propriety of the officer under whose supervision the work, experiment, or investigation in question was conducted; and as regards orders given and ex-penses incurred with reference to works, experiments, and investigations after that day, the certifi-cate us to its propriety of the order clerk, the con-sulting engineer, or one of the chief surveyors."

The Committee Question.—On the motion that

The Committee Question.—On the motion that certain committees appointed provisionally at the last court be confirmed as orders of court,

Mr. Leslie rose and said that on the subject of these committees they had got the opinion of the law officers of the Crown. They had also got the resolutions and a protest against them, and he wished to know which was the correct view of the case. They were now called upon to take a long string of resolutions into consideration, and were string of resolutions have consideration, that they to pass them, in a week or two they might find that they were acting illegally again. To guard against such an occurrence, he felt it to be his duty. against sinen an occurrence, in terr it to be instudy, painful as it was, to move as an amendment, that the resolution proposed, with the protest that had been signed against them by four commissioners, he referred to the law officers of the Crown.

Mr. E. Lawes seconded the amendment.

Lord Ebrington was opposed to the reference of questions not involving points of law, hut of policy, and believing the present question to be one of policy he should vote against the amendment.

Mr. Belle was a product to the control of t

Mr. Bullar was not about to give his opinion as a lawyer, as he had before declined being the legal a lawyer, as he had before declined being an adviser of the Commission. However, since the last court he had taken the opinion of a friend residing in the Temple, and whose intelligence he helieved to be quite equal to that of the Attorney and Solicitor General (as we understood), and with the through the orders, and it was fissed in the solicit of and Solicitor General 'as we understood), and with him they went word by word through the orders, comparing them with the statute; and it was his friend's decided opinion that these orders were quite legal. Another friend, too, to whom be had submitted them had come to the same conclusion, except as to the 3rd rule, in which a question of legality might possibly arise. He (Mr. Bullar) had no wish to criticise the protest, but he felt assured that if he sat down for the opposite side he should find no difficulty in taking 500 objections, every one of which should be as valid as those contained in the protest.

in the protest.

Mr. Chadwick protested against the impression that anything had been going forward that was illegal. A great deal had been said about being taken into the Court of Queen's Bench by certain the Court of Que therein the court of queen's before of efficiency. In the thought on that subject gentlemen would be very unwilling to risk their own money. That the public money had been calpably misapplied in the waste of the time of the Court he believed in the waste of the time of the Court he believed no impartial man entertained a doubt; and as to the law of the case, he never heard of any so fun-damentally bad as had been opposed to the proceed-ings of a sub-division of labour. With regard to the reference of these orders to the law officers of the Crown, he (Mr. C.) should as soon think of referring to the Attorney-General on the construction of a water-closet as on any one of these regulations.

After some further discussion, the amendment was put and negatived by a majority of 12 to 2, and the confirmation of the appointment of the committees

was agreed to.

The Ordnance Survey.—A lengthy report was received from the Ordnance Survey Committee, which set out by giving a number of questions to Capt. Yolland, of the Royal Engineers, on the

practicability of increasing the three-mile radius to a scale of 10 feet to the mile, for the purpose of laying down the details of house drainage, with his answers thereto. It also stated the fact, that although the estimated cost of the survey was 24,000%, the work would be completed for 3,000% within that amount, and 5,000% below the estimate circum in the civil surveyors.

given in by the civil surveyors.

Sir H. de la Beche said it was very important as it would nearly enable them to engrave the plates, and to form blocks of houses. Without much trouble they would be enabled to enlarge such much trouble they would be enabled to enlarge such portions of the survey as might be desirable from time to time. The work of the survey had been one of extreme success, and might, if necessary, he consulted by persons laying out property, and for other purposes. He believed that when their labours were closed, it would be found that the interests of the public had been well protected.—Mr. Chadwick believed that the engraving of the plates would be executed at a cost of 6t. per sheet, in a manner superior to that of the Ordnance maps at 10t. per sheet.—The report was then received, and, after some works of emergency were ordered, the court adjourned. adjourned.

Miscellanca.

THE SANON CHURCH AT STOWE.—The nave foundations are now under repair with Yorkshire stone cramped together and laid in cement. It is said, too, that Archdeacon Stonehouse has entered into contracts for the nave and chancel repairs. Unfortunately, however, the parishioners appear to be restive under the anticipated infliction of a church rate for a system of repair carried out on one principle, while an alleged preference is given to another; so that between two extreme and opposing lines of procedure, it is possible that justice may fail to be done to this venerable mother church. Those who supply the rate appear to be mere utilitarians -or rather, we may say, necessitarians—who are only willing to vote for "necessary repairs," while the executive has an eye to a special system of alteration and adornment in combination with the mere prop work, but without the sympathy of his constituents. "For the restoration of this old church," says a contemporary, "a public appeal should be made, and the repairs and restorations should be under the direction of some experienced architect.'

PORTABLE STEAM-ENGINES .- The Scottish Agricultural Journal describes a farm steam-engine at work near Edinburgh. It is of four-horse power, and drives a six-horse thrashing mill. In length it is 8 feet, including fire box, boiler, smoke-hox, and carriage, which latter is constructed of timber, bound with iron work, and placed on iron axles and wheels; the fore carplacetto in non-axies and wheels, the role car-riage working on an axle, so as to admit of its being easily turned. The breadth over the axles is 6 feet, and the height to the top of the driving-wheel 8 feet. The height of the chimney is 15 feet, but when the engine is not at work, it is lowered by a joint at 10 feet from its summit, into "a saddle." The boiler is tubular, and can be easily repaired, and the smoke-box removed, so as to clean out the soot of the chimney and the tuhes: means are used to prevent any issue of sparks from the chim-ney. The driving wheel is about 5 feet in diameter. One of the boiler tubes is made of softer metal than the others, so that, in the event of neglect or stupidity in overloading the hoiler, this tube will give way and extin-guish the fire, thus preventing the chance of explosion. The engine, it is said, can do all the work generally executed by manual or hestial power on the farm steading, and may he employed in pumping water, making tiles, or sawing wood; and being "a moveable subject," it can be "sold, alienated, or disposed of the sawing water, and alienated or disposed of the sawing water, and water, and water, and water, and water water, and w at pleasure, or used jointly by a number of farmers.

GIRDER-DRIDGE AT BARNES.-An accident occurred here lately by the giving way of a winch on a travelling frame which crosses the Thames where a new iron girder-bridge is forming, to continue the loop line from the Barnes station of the Richmond Railway to Twickenham. A girder of seven tons weight had been raised from a barge and lowered to within three inches of its place, when the connecting rods and timber arm gave way, and the winch and platform fell, when one of three workmen jumped into the river, and was carried down with the tide and lost.

CALICO BY THE MILE, - VERY LONG CLOTH.—The cylinder printing machines in Messrs. Hoyle's print works, Manchester, print a mile of calico in an hour! If fifteen of these machines work uninterruptedly for ten hours each day, and for six days in the week, they would be able to print cotton dresses in one wound be able to print cotton dresses in one such week for one hundred and sixty-two thousand ladies! According to the Birming-ham Journal, the actual number of miles of calico printed by this firm alone in a single year exceeds ten thousand, one fourth more than the diameter of our plant.

than the diameter of our planet.

GAS MONITOR.—The assistant secretary of Gas Moniton.—The assistant secretary of the Baths and Washhouses for the Labouring Classes, Mr. Woolcott, has written to us to say that the advertisement in THE BUILDER of last week, which states that the use of the gas-light monitor has effected a saving of 10,000 cubic feet of gas, in six weeks, model establishment, Goulston-square, White-chapel, is incorrect: but as the note goes on to say that the monitor is no doubt useful regulating and saving the consumption of gas, and that the committee are about to have more of them fitted up, we do not see the value of

the contradiction.

THE ROYAL CYCLORAMA.—We spoke in terms of commendation of the Cyclorama of Lisbon's Destruction by Earthquake, at the Colosseum, when it was first opened, but its effect upon us then was less powerful than it was on a second visit lately. Mr. Bradwell has the machinery more under control now than at first, especially for the management of the lights, on which much depends. The sunrise in the opening view at the mouth of the Tagus is beautifully managed, and the effect of the storm is appalling. We were somewhat surprised to hear that neither Her Majesty the Queen, nor the Prince, has yet seen this work. visit from these illustrious personages, so ell qualified to judge of its merits, and nully willing to give their countenance ners it is deserved, would be a gratifying well usually reward to those who have carried out this undertaking, and one which, considering the elegance of the building raised for the exhibition, the extent of the painting, and the costliness of the experiment, they might not unreasonably hope for.

Mr. Henning, the Sculptor.—The Art-Journal for April contains an interesting sketch of the life of John Henning, sen., best known by his reduced and restored copy of the Elgin frieze, the chief intention of which is to raise a fund to engrave this work for the benefit of the sculptor. We cordially wish the scheme success. It was commenced by the late Mr. Freebairn, but went no further

than one plate.

than one plate.

Bust of Francis Bailly.—At the annual general meeting of the Royal Astronomical Society, Sir John F. W. Hersellel, Bart., presented to that body a marble bust of their late President, Francis Bailly, D.C.L. (the gift of Miss Baily, his only surviving sister), with an appropriate address, which appears in the Society's transactions for February, 1849.

COST OF PIPES AND DRAINS .- The following is a list of tenders for 6,350 ft. of stone-ware pipe, to be laid in Oxford, and 450 ft. of by 2 ft. 9 in. half-brick tunnel, in mortar, in the same line. The sizes of pipes were 4,100 ft. of 15 in., and 2,250 ft. of 12 in. Also a 15 in. cast-iron syphon-pipe, 20 ft. long, and a 9-in. wall, at each end of drain, for rest of mouth of pipes. Tenders opened on the 3rd

of April.

Treharne's tender for groundwork, &c., accepted; J. Doulton, of St. Helen's, accepted for the pipes.

PROJECTED WORKS.—Advertisements have been issued for tenders,—by a date not specified, for the erection of a new pauper Innatic asylum (in the neighbourhood of Devizes), for the county of Wilts; also for a large quantity of east-iron columns, sashes, and joists, to be the county of Wilis; also for a large quantity of east-iron columns, sashes, and joists, to be used in the above erection; by 18th inst., for the erection of a new chapel for the Bridge Union; by 18th inst., for sundry works required in reinstating the dwelling-house and warehouses recently destroyed by fire in Addle-street, Aldermanbury; by 17th inst., for 'alterations and additions to Hampstead Workhouse; by 20th, for the erection of a Sunday school to be attached to Beresford Episcopal Chapel, Walworth; by a date not specified, for the erection of the chapel, catacombs, cloisters, lodge, &c., at the Leicester Cemetery; by 10th, for the rebuilding and restoration of Kingstone Church tower, Herefordshire; by 11th, for the construction of the criminal court and other works at Cardiff; by 11th, for the erection of St. Augustine's new national schools, Bristol; by 13th, for the building, &c. of a lock-up at Alston; by 9th, for forming, culverting, &c., four new streets at Birmingham; and by 17th, for the supply of wrought-iron wheels, springs, bar-iron, oak and teak for waggons for Lancashire and Yorkshire Railway.

An Intal Speculation under English Auspices.—It is proposed, says the Irish Railway Gazette, to everse the postsh from

AN IRRISH SPECULATION UNDER ENGLISH
AUSPICES.—It is proposed, says the Irish
Railway Gazette, to extract the potash from
the granite stone extending over a district of
70 miles hetween Dalkey and Wexford,
where by, with an outlay of 10,000L capital, it
is expected that a gross present of 600CL. whereby, with an outlay of 10,000*l*. capital, it is expected that a gross revenue of 40,000*l*., to be chiefly expended in labour throughout the Kingstown district, may be realised by the sale of 2,000 tons of potash at 20*l*. per ton in place of 40*l*., the price of that imported from America; and that moreover a further sale of the extinct part of the chief. Americal and ona moreover a further sale of the article may also be pushed in America itself. Of course, as in preparing bread out of sawdust, or soup out of whinstones, it is by means of proper chemical and other materials and operations that this, it may be much more houseful project it to be carried. hopeful, project is to be carried out. The potash which it is designed to extract is that which prevades the external surface of the stone. Valuable chemical substances, we all know, have been extracted from shale and other mineral strata. All, of course, must depend on the relative value of the result when compared with that of the materials and labour

employed.

IMPORTANT TO RAILWAY CONTRACTORS.

On Thesday last, at the Court House (before J. Stanhope, J. Thornely, and T. Taylor, Esqrs.), the surveyors for the township of Denby obtained a summons against the Lancashire and Yorkshire Railway Company to recover compensation under the Railway Clauses Consolidation Act, for the injury done to the roads in the township of Denby. in the Clauses Consolidation Act, for the injury done to the roads in the township of Denby, in the making of the branch line of railway from Huddensfield to Penistone, comprising a distance, to which injury had been done, of upwards of ten miles of road. Mr. Barret, of Wakefield, solicitor, appeared in hehalf of the surveyors, and Mr. Tyas, of Barnsley, and Mr. Dransfield, of Penistone, solicitors, appeared in the interest of the railway company. After a very lengthened inquiry, the magistrates made an order on the company to make the necessary repairs to the roads within the space of one month, and in default thereof the magistrates imposed the penalty of 51. per day, pursuant to the above-mentioned act. day, pursuant to the above-mentioned act.

THE FIRE ANNIHILATOR .- Mr. Phillips' afford a subject for one of the Friday evening meetings, at the Royal Institution. As we have before said, we cannot understand the policy of the inventor of this machine, who contents himself with having it talked about periodically, and gives no opportunity for its practical application,

INSTITUTION FOR THE DEPOSIT OF WORKS CONNECTED WITH ARCHITECTURE.—I am highly gratified by your correspondent's remarks on the want of an Institution of Practical Science connected with building. Some time since I attempted to effect the same object at the Mechanics' Institution of Hastings, by medals and rewards, and I shall have great pleasure in assisting to support an institution for the purpose in London, by an annual subscription of 5*i*. I give you my name.—A CONSTANT READER.

CONSTANT READER.

Bells Abroad.—Mr. Reeves, of New York, has made a valuable improvement in fire bells. The great difficulty to be obviated was in repeating the blows of the hammer in the one place, by which the bell was generally cracked. This he has done by fixing the hell on a ratchet wheel, which causes it to revolve at each stoke of the hammer. The hammer is swung by a lever, and strikes in the same place only once in every 240 strokes.—The Roman Constituent Assembly has decreed that all church bells which are not strictly necess. all church bells which are not strictly neces-sary shall be melted down for cannon! Those of the cathedrals, parish churches, and such as are valuable in point of art, are excepted,—at

Present.
THE TRON STEEPLE AT GLASGOW being out of repair, a small part of the ashler work gave way, when some of the town council coolly proposed to save all future trouble and coolly proposed to save all future trouble and expense by razing this characteristic old feature of the Trongate to the ground. Bailie Orr indignantly expressed his astonishment at such a proposal, and the Lord Provost warmly concurred in the bailie's protest. The proposal itself accordingly fell to the ground, and the steeple was forthwith ordered to be repaired by the Finance Committee.

The Iron Trade.—It has been determined by the ironmasters at a recent preliminary quarter.

by the ironmasters at a recent preliminary quar-terly meeting, that the puddlers and other workmen shall for the future participate in the nominal advances of price that may be declared nominal advances of price that may be declared at each meeting; and accordingly, as an earnest of the earrying out of a principle which cannot but tend to induce something like respect for the quarterly price decisions if faithfully carried out, an advance in puddlers wages of 6d, per than out the head of the advance of price. One present that the property of the ton on the head of the advance of price, 20s. per ton, declared in February, is now decided on. Of course if the workmen are to benefit by every rise in price, they must expect an equivalent reduction of wages whenever a fall may hereafter duction of wages whenever a fair may hereafter happen in place of a rise.

Burials in Towns. — On Wednesday

BURIALS IN TOWNS. — On Wednesday evening a meeting was held at the old Crown and Anchor, in the Strand, to petition Parliament for the immediate closing of burial places in cities and towns. Lord Dudley Coutts Stuart, M.P., took the chair; Mr. Mackinnon, M.P., Mr. G. A. Walker, Mr. Ivat Briscoe, and others spoke, and there were from 800 to 1,000 persons present. It was the most important meeting on the subject which has yet taken place, and shewed clearly the hold the question is beginning to take on the public mind. Mr. Walker spoke with the earnestness of one who feels his subject deeply. of one who feels his subject deeply.

PIRACY OF REGISTERED DESIGNS.—We learn from the Sheffield and Rotherham Indelearn from the Sheffield and Rotherham Inde-pendent that a manufacturing firm at Sheffield has been awarded by the magistrates 151, and costs, payable by another manufacturer, for the infringement of a registered design for a candlestick, which was alleged to have been taken originally from some of the French pat-terns published from time to time in the Art Journal. The imitation, also a registered de-Journal. The imitation, also a registered design, was varied in the style of ornament.

MANCHESTER PARKS' TESTIMONIAL.—Mr. Malcolm Ross and Mr. Edward W. Wat-Mr. Macchar Ross and Mr. Floward W. Wat-kin, by whom the project was carried out, as Hon. Secretaries to the Parks' Committee, were lately presented, the former with a silverplated épergne, and the latter a silver tea-ser-vice, in the presence of the Bishop and Mayor of the city, and a numerous assemblage, at a dejeuner à la fourchette given by the Mayor in his parlour in honour of the occasion.

FOREIGN WINDOW GLASS .-- We understand that the importations at the present time of window glass, especially from Belgium, are very large. One vessel, the *Princess Victoria*, has just arrived in the river, from Antwerp, with 990 cases of the article on board, consigned to a firm in the metropolis.

CHURCH LEASEHOLD PROPERTY .but little known that a commission is now sitting to collect information and hear the resituing to collect information and hear the re-presentation of parties, on the proposal for the settlement of the question between the church and the lessees holding property under the dif-ferent deans and chapters. A meeting has been held in London on the subject, at which the Duke of Richmond presided, when a com-mittee of members of both Houses of Parlia-ment was appointed for the owners. ment was appointed for the purpose of communicating with the lessees of church property, in order to obtain and select evidence to be submitted to the Royal Commission now

No. CCCXXIII.

SATURDAY, APRIL 14, 1849.

N turning over the leaves of Mr. Brandon's work on "Parish Churches," the observer cannot avoid being struck by the diversity of forms and varied effects

apparent in structures identical in purpose, and so similar in general arrangement as these buildings necessarily are. A nave, with aisles or without; a porch on the south side of this, at the west end; a chancel growing out of the nave, and a tower, or bell-turret, as the case may be, are the features which go to make our ancient parish churches: the same class of windows, mouldings, and decorations, was used in all cburches huilt within particular periods; -and yet no two are exactly alike, but all present singular differences, and bave heauties entirely their own. Built on the same type, representations of the same feelings, provisions for the same wants, compounds of the same details,-the result, as a whole, is still so different, that it is only within a very short period of time, that it was discovered these buildings can all be classed under four heads, according to the date of the erection, and that, knowing this date, we may with tolerable certainty predict the components of the structure,-know what we may expect to find and where to find it.

This diversity, co-existent with uniformity, resulted from able miods working on the same principles and modes, controlled by existing circumstances, and could not have been produced by slavish copying. Ideas were of course constantly borrowed: what had been done served as the point from which to start again, and there were always inferior minds contented to follow where the master minds led. Moreover, that they were in the possession of formulæ by which certain satisfactory results were iovariably obtained, seems clear. Unless some system were followed, Mr. Fergusson remarks in his "Inquiry," "We must admit that between the ages of St. Louis and our Edward III., there was horn, in every great town of western Europe, an architect capable of designing a great catbedral, and in every village one capable of building a parish church; and that all this myriad of architects were endowed with the same modicum of genius, for all the huildings of that age, whether great or small, bear a nearly equal impress of perfection; and that this great race perished entirely in the following century, for the art of erecting such buildings was lost soon after it reached its highest point."

We are disposed to attach more importance to the efforts of the one man and his influence on the works of the multitude, than the author last quoted does; but that some system was followed, and that these productions were the result of a nation's lahour, and above all of the upper and most intellectual classes of society, we are fully satisfied.

Let us look back, however, to "Parish Churches," the interesting and useful volume which led us to the foregoing remarks,* and we shall see in every example an evidence of

Parish Churches; being Perspective Views of English Ecclesiastical Structures: accompanied by Plans, drawn to a uniform scale, and letter-press descriptions. By R. and J. A. Brandon, Architects. Bell, Fleet-street. the diversity and originality to which we referred.

This work contains views of sixty-three churches, from sixteen counties; nearly half of the illustrations, however, are from Lincolnshire and Northamptonshire. In the first view, Little Casterton Cburch, Rutlandshire, the west wall is continued up, and has two arched openings in it for hells, surmounted by gables, while against the face of the wall below are two massive buttresses in the line of the belfry, which produce a tower-like form, and give character at little cost.* The plan of the nave and aisles is a square, and the chancel is a double square.

At Howell Church, Lincolnshire, the west wall, to the extent required for a similar double belfry, is made to project slightly; and in Manton Church, Rutlandshire, with the same double helfry, one gable encloses the two openiogs, as it does also at Howell Church, and there is a buttress runs down the centre of the front.

At Herne Church, Kent, an interesting example, the tower, of massive proportions, is placed at the west end of the north aisle, and was built quite distinct from the church. The lower story, open to the church by means of arches, is groined over, and is made the baptistery. Brampton Church, Northamptonshire, is remarkable for its regularity: the tower, with broach spire, is in the centre of the west end; a porch on the south side is balanced by a porch on the north.

In Temple Balsal Church, Warwicksbire, an octagonal stairs' turret, which scarcely sbews at the south angle of the west front, is enlarged at the caves of the roof to a square tower. Warmington Church, Northamptonshire, a pure Early Eoglish church, shews in its beautiful broach spire three ranges of spire lights surmounted by elegant crosses.

Io Fleet Church, Lincolnshire, the tower is detached, and stands on the south side. In Donnington Church, Lincolnshire, the tower is on the south side of the nave aisle: the lower part of it is made to form the south porch. In Leckhampton Church, Gloucestershire, the tower is over the western extremity of the chancel, and in Clymping Church, Sussex, it is at the southero extremity of the south transept.

We cannot attempt to oote all the observations which occur on examining the plans and views here brought into juxta-position. One more, however, we cannot avoid making, and that is, the uniformity apparent in the size of the chancel of a large number of the examples given, however different the size of the rest of the building. Thus the length of the chancel of Trunch Church, Norfolk, is 34 feet 6 inches; Westwick Church, Norfolk, 31 feet 10 inches; North Mims, Herts, 32 feet 3 inches; Floore Church, Northamptonshire, 33 feet 6 inches; Etton Church, Northamptonshire, 35 feet 9 inches: Brampton Church, Northamptonshire, 31 feet 10 inches; Casterton Church, Rutlandshire, 32 feet; Long Stanton Church, Cambridgeshire, 29 feet 3 inches; Filby Church, Norfolk, 34 feet; Martham Church, Norfolk, 34 feet; Deopham Church, Norfolk, 32 feet 4 inches; Morley St. Botolph's Church, Norfolk, 34 feet 6 inches; Woolpit Church, Suffolk, 32 feet 8 inches; Achurch Church, Northamptonshire, 32 feet; Islip Church, Northamptonshire, 30 feet 6 inches; Gransley Church, Northamptonshire, 31 feet 6 incbes; Shiere Church, Surrey, 32 feet

* A similar arrangement is found in Long Stanton Church, Cambridgeshire.

2 ioches; Barton Church, Suffolk, 34 feet. The width is, in nearly every case, half the length.

It is much to be regretted that many of the churches named are, as we happen to know, in a miserably-neglected and decaying state. It is much to be wished that the desire to uphold and restore the evidences of our forefathers' piety and our forefathers' skill, now happily apparent in many quarters, may extend to the guardians of these,—and equally so that our architects, regarding these as proofs of the boundless variety of combinations obtainable in their art, should be led to work on the same system as their mediæval predecessors, rather than from the same moulds, and be artists instead of artificers.

ARGUMENTS IN FAVOUR OF INTERNAL ECCLESIASTICAL DECORATION.

These arguments, it is hoped, will remove in some measure the prejudices existing in many minds against internal ecclesiastical decoration, as well as direct the attention of the members of the Protestant church to its importance.

The desire of multiplying churches and chapels is so great, that all available funds are too requently lavished on walls and roofing—those absolute requisites to protect congregations from the weather. If decoration be at all considered, it is only with reference to their external architectural features, which is farther advanced in public favour than interior adornment. The question to be considered is, whether it would not strengthen the best interests of the Protestant cburch, and be its wisest policy, to build fewer, and render those already built worthier their consecrated purpose? Places of worship at present exhibit too much of factory-building economy; they awaken no reverence: designed for man rather than God, his mean and selfish nature pervades them: there is no evidence of his having devoted his highest powers to the service of the Most High. They do not burst upon the view as visible prayers ascending to the Creator, but are cold, dumb, and unthankful.

All funds are exhausted either before or at the time when internal decoration ought to be considered, so that those who may be inclined to favour it, but who do not possess sufficient influence to control the funds, are obliged to acquiesce and yield the gratification of their rational desire. This fact ought to be taken into consideration in forming any estimate of the numbers really opposed to it, and while prejudice is in the ascendant, Protestant places of worship will be left mere carcaises, without the soul of internal decoration. Would it not be better to neglect the exterior rather than the interior? Interior splendour would be typical of the Christian character, which ought not to consist in mere outward show, but in the inward and spiritual grace. It may be said by some that all decoration is mere outward show; so tis—but surely it is an outward show preferable to that of ngliness and deformity: is not all beauty a full voiced choir of praise? A lively faith, with an unsuppressed will, is irresistibly led to manifest itself in all possible directions, compelling dumb inanimate wood and stone to echo its admiration—reconciling discordant sounds and colours into barmonious love and praise.

It is not known to the writer on what ground any Christian can reasonably, or even consistently, object to painting and sculpture in the internal architectonic decoration of churches and chapels, who admits the propriety of their external decoration, or musical performance within them. It is not known wby the seose of hearing should precede sight in its holy gratification, except that it obeys the law of intellectual progression, namely, that the highest sense is the last gratified. Vision has always been considered the least gross and material of the senses; the idea of this power is exteoded to express Deity, as "The All-seeing"—its relative position in the human frame is typical of its superiority. If this be true, there would be no more harm in

preaching several sermons to defray the expenses of altar pictures and other decorations than to obtain funds for a carved and gitt organ. Illustrations of the proverb, "straining at a gnat and swallowing a camel," are too frequent; for, besides the anomalies referred to, there are others, such as the admission of numerous monumental effigies, combinations of variegated marbles, &c., brilliant velvet cushions fringed with gold; embellishments, denied the church, liberally bestowed on prayer-books and bibles. Again, insisting on the strict adherence to the precept, "thou shalt not make to thyself any graven image," and yet permitting the representation of Moses over the altar bearing the tablets of the law which contain it—pulling down sculptured representations of the passion, setting up the royal arms or the banners and escutcheons of noblemen and gentlemen. How long will men exhibit the capriciousness of children? To push notions to their limits, a church must have some form and colour; these are conditions which cannot be banished from heing; colour is peculiarly a manifestation of health and life; the church that endeavours to banish it is pale and sickly; colour will find its way into the temple even it is walls be reduced to black and white: deny these to be colours, bright hues steal in on bonnets—ribbons—silks—reduce these to grey—the roys tirts still modestly blush on the lips and cheeks of the fair Christian; banish it from hence, and it is an unmerciful and gloomy creed—a foul blotch on nature's visage—the sooner removed the better for society.

The following are the heads of arguments, addressed to courchwardens in particular and others whom it may concern. To enunciate the law of alternation, or of action and reaction, particularly as regards the affections and disaffections of society and individuals. The expediency of meeting the reaction in favour of ecelesiastical decoration, that the advantages of the persuasive influences of painting and sculpture may not accrue to those opposed to Protestantism, by yielding them the power of attracting men from the pale of its teachings. To show that form and colour are like musical sounds, mere agencies, edifying and elevating when ordered by virtue, noxious and degrading under the tyranny of vice. To suggest to those who would admit ornamentation in churches, without sanctioning the introduction of the human figure, painted or sculptured, abhorring idolatry; that if worshipping in presence of an image be idolatry, then all worship is idolatrous; and lastly, an argument on a lower basis—the importance of church decoration to the manufacturing community and general prosperity of the country.

It appears to be a universal law of nature to oscillate hetween extremes, and from any condition under which it has previously existed to seek its contrasting or opposing quality. The moral world of man, like the globe he inhabits, alternates between the laxity of summer and the severity of winter, dark night and bright day, storm and calm, action and repose, life and death; the same holds in regard to his physical being, which if excited exclusively in any one direction demands its complementary reaction,—fast leads to hunger, surfeit to disgust and abstinence. The artist and musician perceive the same physiological tendency to opposite states with regard to colour and sound. Society is the aggregate manifestation of man's individual nature, and is, therefore, similarly necessitated, as witnessed in its revolutions: when oppression of one kind has reached its limit, it is succeeded by one of an opposite nature—the oppressed become the avenging oppressors—examples are too familiar, even within our own times, to need any comment, save reminding the oppressor that there will inevitably be a day of retribution. Again, when the Latin church had run into excesses, it was opposed by the austere and iconoclastic extremes of the early reformers. The awe inspired by contemplating there is consoling evidence that every successive convulsion oscillates, as it were, in an arc less than the preceding, the antagonistic reacting extremes being the hridles which ultimately guide striving nature to that mid-point, the goal of unity and harmony.

Does not this law of alternation give the cluc—the perception of the necessity of the reaction which has visibly commenced with regard to church decoration? Men begin to pall of whitewashed churches and chapels, the extreme in this direction having heen indulged in long enough—the good no longer exists which pricked it onward in its course—the tide is on the turn—the antagonistic feeling which urged public opinion in this direction is fast dying, men begin to reflect calmly and rationally, whether they may not have gone too far in the spirit of opposition, and whether there be not danger in abstaining,—in fasting the senses on bare walls,—the danger of denial is, that when its gates are once unlocked, the imprisoned sense at once rushes into excess; it chafes in its chains and narrow cell impatient of restraint, and when liberated, turns its freedom to abuse till it finds itself again at the extent of its tether in the opposite extreme: men ought to have learned from experience—from historic precedent, that true social and moral liberty is alone left when their chains hang loosely about them, becoming conscious of thraldom only when they forsake the "in media tutissimis ibis" of reason—

"Austerity, severe and cold, Or wild excess— Voluptuous ease, in halls of gold, Not happiness: They true enjoyment find alone Who, bound between The torrid and the frigid zone, Observe the mean."

Let the Church of England and dissenters consider this law well—consider whether there be not a probability that the multitude will be attracted within the pale of those churches and chapels which offer them—

"Storied windows richly dight, Casting a dim religious light;"

the splendours of painting and sculpture, or the glorious anthem vibrating in the choir—

"There let the pealing organ blow,
To the full voic'd choir below,
In service high, and anthems clear,
As may with swiftness through mine ear,
Dissolve me into extasics,
And bring all heaven before mine eyes."

And oring all acaven before mine eyes."

Let Protestantism recollect that these quotations are tributes to the influences of such powers by one of its bulwarks and chief ornaments. Are not such influences a relief to the monotony of work-day life? Is not the Protestant church relinquishing advantages which might secure to it complete victory? Would it not be good policy to adopt it as a principle of allurement as well as defence? It may believe itself too strong to require such aids—but there is a danger in the supineness of fancied security. He would be hnt a had general who should consider his position strong enough when opportunities present themselves to make it stronger: "watch and prepare." The beautiful in form and colour enlisted in the worship of the Creator, might allure the indifferent with soft persuasion, within reach of argument and reason, and while softening man's grosser nature, open the gates of his understanding, that sound principles may enter freely. If such means be despised, the English church thay rest assured that others will continue to avail themselves of them whose doctrines it does not esteem, and the advantages to be derived from the use of such persuasives will thus he reaped by its enemies. Is it more criminal to starve the belly on Friday, than the eye, which has been famished the work-day week, on Sunday? Will not the hungry sense have a tendency to seek those who will give it food, and willingly agree as the price of its enjoyment to abjure flesh on the Friday? Theatres owe half their attractive influence to the fulsome and meretricious excitements of form and colour which vitiate taste, wanting a presiding influence to offer pure and holy beauty to the eyes of the people. The power of such excess is the greater under the denial and limited opportunities which the public have of gratifying the higber tastes; it is no wonder, therefore, that when adverse powers offer sense-excitements, they are readily embraced.

parents cannot foresee the inevitable consequences of many of their acts. It may be observed, that all are more susceptible of gross influences, who have been under restraint and denial: children that have been overawed and drilled into unwilling anchorites, at last break loose; the parent mourns too often the wiekedness of his children, instead of his own folly; the youth from the country often falls a victim to the seductive influences of the city; the extravagance of the sailor a-shore, and the improvidence of the poor, are proverbial; princes seek retirement and relief in the employments of their subjects; the libertine and anchorite often retrace their steps.

Forms, colours, and sounds, are mere agents,

Forms, colours, and sounds, are mere agents, not guilty in themselves. In the service of good they should contribute to its effulgent glory, that its intense light may extinguish the fascinating eyes of the serpent. They are in one shape or another the common weapons of good and evil. Both good and had spirits may inhabit beautiful dwellings,—the angel to awaken love to good,—the devil to seduce to evil. All that is lovely on the earth has been given for our use, not abuse.

" For nought so vile that on the earth doth live, But to the earth some special good doth give; Nor aught so good, but, strain'd from that fair

Revolts from true birth stumbling on abuse."

What evil is there in the form of the lily, the tints and perfume of the rose? Poisons may lurk in their juices, but the form, colour, and perfume may be abstracted from the noxious qualities which wear them. It is with form and colour as with gold, in a moral point of view,—all its good offices are forgotten, and only its crimes remembered; it is forgotten they are but mediums, subject to conflicting powers, and that only figuratively can we qualify them as bad or good. In this sense, with regard to gold, it is good that it has ransomed the captive—it is bad that it has purchased the slave; it may be alike used by the ministrants of charity and ahettors of crime. Parallels of use and abuse might be drawn with regard to form, colour, and sound.

The Reformation, in its antagonistic fanaticism, consigned all that was beautiful in the Latin church to destruction, considering it as heing tainted by its connection; but pure beauty, like pure virtue, might stand un-scathed, uncontaminated, even in hell. If scathed, uncontamnated, even in hell. It there had been evil in the glorious tints of flowers, the broidery on Nature's robes, Nature might, as an anchorite, have been cloaked in universal grey; and what ideal then would have been framed of heaven but cold monotony? But as we ascend from one beauty of the earth to another—as we mount up to the contemplation of its full splendour— the imagination still exclaims "excelsior." It is from things terrestrial alone that men are enabled to form some feeble idea of the aspect of heaven and revelation: still to exalt our of heaven and revelation's sell to exact our vision within the pale of our limited understanding, brings all the splendours of earth, even gold and precious stones, to frame an idea in our minds of a heavenly city. If such means are not considered derogatory in the sacred writings, why should men abjure that which has been consecrated? Let our churches and chapels then he typically adorned with the treasures and beauties of earth, that after our utmost powers have been exhausted, the ima-gination may still travel beyond. The Chinese believes his celestial empire transcends all others, because there is no mental liberty and progress. The American Indian is superior progress. The American Indian is superior in imagination, and dies in the antiepation of the delights of his beautiful hunting grounds, which having found to graduate in superiority, on earth, he believes will be transcended in the next world. We smile at bis credulity, at his health artists of the control of the contro the next world. We smile at bis credulity, atthis humble notion of heaven: yet the "excellisior" of mankind, in all its grades of progression, is analogous,—it is the anticipation of a more superlative enjoyment than the most elevated experienced on earth,—is more physical in its character in the first stages of civilisation, more refined and rational in itselater or advanced condition. The more them presented or man's intellectual vigious is extended. latter or advanced condition. The more the prospect of man's intellectual vision is extended, the nearer it is to heaven.

Before dismissing this part of the subject, it may be asked what sins lurk in the hues of the prism? who will impugn that which has

been consecrated in the ark - the covenant with Noah? Can men rationally then banish form and colour from ecclesiastical decoration? deny themselves walls and roofs, worship under the canopy of heaven—there will be the blue expanse, the bright sun, green trees, spark-ling flowers, and incense-laden winds—are these sinful? There would be no need of church-building were the climate constant; but the bright day may be overcast—the healthful storm must sweep the infectioncharged gullies, and purge nature of its rank growth and excess; Protestant churches and chapels still have the leaden aspect of the stormcloud of the Reformation upon them, but it is visibly breaking and gradually rolling in masses away—sunshine appears in golden patches—music awakens, and the bright hues sparkle in the iris.

There are very many wbo would go the length of admitting ornamental decoration in places of worship, but who would still object to the introduction of the human figure in cither painting or sculpture, dreading the imputation of idolatry. The worship and reliance on mere idols of wood and stone can alone appertain to the lowest condition of man; should such gross ignorance prevail in any class of society in Great Britain, the sin will be imputed to those who suffer such condition to exist when even moderate education would correct it. With the educated the image can never be more than typical—it is the emhodiment of the idea formed in the artist's mind by the study of Holy Writ, which he projects out of himself, that his thoughts may become objective to others. Every body has pictures on the tablet of the mind, unseen by others; the artist is able to copy his, that his thoughts may be seen. Every Christian has graven images in bis mind of the Saviour—his crucifixion—his burial—of the Apostles, and various descriptive to those who suffer such condition to exist burial-of the Apostles, and various descriptive passages of the sacred writings; the unseen Saviour to whom he bows is thus typically worshipped under the form of the image existing in his mind, designed and imprinted there by revelation. Had he the power of the artist again to reflect it out of himself we cannot see what harm there would be in worshipping in presence of the copy;—he must in presence of the original in his mind. If man-kind have these painted tablets within them it may he said that they require no others; hut the susceptibility of the artist's mind to receive a more vivid and correct impression than other men enables him to present mankind with a higher and more beautiful type-to replace the imperfect presentiments of ordinary minds; it is, perhaps, the rude undefined image existing in the ordinary mind that deludes it into believing it worships none—its own is so faint when compared with the reality of the artist's that the artist's completely effaces it-its own is forgotten. If men reflect calmly and dispassionately, they would find that the difference between the image of St. Paul in their own minds and that presented to them by Raffaelle is really the perfection of his compared with their own.

The embodiment, then, of the sacred personages or presentiments of the historical portions of holy-writ by a talented artist presents the community of Christians with a ligher interpretation, a higher realisation of Scripture than its own, and has the advantage as an adjunct of language of impressing its precepts and descriptions more forcibly on the mind by phenotyping it in connection with form and colour. If what has been said be true, the introduction of the human figure, deified in painting or sculpture, cannot be rationally objected to; revelation informs us that man was made in the likeness of his Creator.

The masses would acquire elevated tastes by the prevalence of ecclesiastical decoration, and the feelings imbibed on the Sunday would ultimately suffuse the productions of industry, for men are insensibly moulded by the outwa circumstances which surround them. Wh circumstances which surround them. While morally elevating the people, give them increased prosperity, and, to our productions in foreign markets, besides the superiority of fabric, superiority in design, and the inhabitants of Great Britain would then present to the foreigner the aspect of a higher and happier present.

W. CAVE THOMAS.

THE GAS MOVEMENT. N AND COUNTRY

HAS fairly broke away from the leading strings and the fostering care of THE BUILDER, beyond whose limits in has at same time so rapidly risen, that all fur-ther attempts to compress its substance within the skirts and outskirts of the few short articles in which alone we could afford to clothe its hale and hearty limbs and members, now, were vain. We are but too well pleased, however, to see our broader sheeted contem-poraries of the newspaper-press so willing, and anxious to adopt its cause, and we most warmly congratulate both them and it, as well as ourselves, on the promising result, although we do not mean to desert the ranks of future defenders, in which, on the contrary, we are ready at once to enrol ourselves even as humble 'privates' amongst the great guns in newspaper warfare,

The excitement in the city on the subject The excitement in the city on the singlet-of a supply of cheap and good gas has become so intense, that those who wrongly imagine they have cause to dread its issue, stigmatize it with the name of "mania;" magine they have cause to dread its issue, stigmatize it with the name of "mania;" and so extreme, on the other hand, is that most groundless dread itself, that it is characterised, by the very same parties, as a "panic," the reality of which, in the meantime, however groundless its cause, is but too clearly evidenced by "the continued fall in the value of their shares at the Stock Exchange" a fall of their shares at the Stock Exchange," which was lately acknowledged to have depreciated the metropolitan stock in gas alone 20 per cent., or to the extent of half a million of money, hut for which, we have not the least hesitation in saying, the holders have them-selves and their senseless 'panie' alone to blame. And these same panic stricken stags, not satisfied with dashing their own brains out, if they have any, have of late rushed into the provinces in print, by pamphlet and circular, to spread the infection amongst their own par-ticular flock throughout the length and breadth of the land, beseeching all and sundry gas companies, shareholders, and officials, to bestir aselves in the cause, to rouse heaven and themselves in the cause, to rouse heaven and earth, or at least the House of Commons and its shareholding constituents, to destroy that 'great central' bugbear, "the Great Central Gas Consumer's Company," by smothering its Bill in the birth, else "the principle, when once established, must necessarily extend itself throughout the kingdom," and the light, they might have added, necessarily shine, in consequence throughout every humble dwelling. quence, throughout every humble dwelling.

Now, that all this pitiful panic possesses no other essentiality than that of irrational and groundless absurdity, common to it with all panics, it would be very easy to show, were it worth our while, whose interests are identified with the extension and the triumph of a totally different cause,—the cause of the million. Yet having really also at heart the cause of the administrators, themselves, of this —poor man's light and heat, for kitchen and for parlour,—as we may well and truly say that gas is, or ought to be,—we shall just recall for an instant one case nearly in point, viz., that of the enforcement of reductions in price at the control of t Liverpool; and this we shall do most briefly and concisely by a short quotation from what we have already said on that subject. The metropolitan companies are now on the eve of being forced to swallow the very pill that has already done so much good to those who kicked and sprawled as lustily at Liverpool as our metroolitan friends are now engaged in doing here. "In that case, if our readers recollect, the company, after being literally pulled down from company, after being literally pulled down from 45s. to 15s., 12s. 6d., 8s., and 7s., declared that it was utterly impossible to make gas at a lower price,—then to 5s., when there was another dead stop, as it was declared to be a losing price,—then down to something less than a losing price, viz., 4s. 6d. which their own 'chief clerk' at length, in evidence, declared to be a very good reason why they should—raise it again? by no means, but —reduce it even to 3s. 6d.! And, in truth. —reduce it even to 3s. Sd.! And, in truth, the ruinous, losing, and impossible prices actually realised the highest dividends allowed by their Acts, viz., 10 per cent., which were shortly afterwards announced! and that, too, in the face of a constant rise in the price of coal!!"

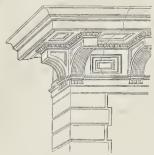

And now we may add, the expiry of another year, and even in the midst of a general devention is trade because when the midst of a general devention is trade because when the midst of a general devention.

rishing state of things brought about by the exercise of a little gentle compulsion on the part of the Liverpool gas consumers, in the administration of a pill—offensive, it may have been as assafætida, in prospect and administration, yet assuredly, wholesome as household bread in operation and effect.

But have we not proved, in short, to satisty, from their own returns to Parliament, that reductions in price, to an indefinite extent, have ever been attended with an equivalent increase in profit as in consumpt, and that there is not the slightest reason to think that the minimum of price, or any thing like it, has ever, as yet, been any where reached? At Liverpool itself, the price of coal has been much about the same with what it doubt-less has cost the metropolitan companies. Indeed, at one of the late city meetings, as reported by a contemporary, it was declared by Mr. Pontifex, that "one ton of coals, which he could get for 12s. (a less price by several shillings than that at Liverpool when 4s. 6d. became the highly profitable charge for gas there per 1,000 cubic feet), would produce from 9,000 to 10,000 cubic feet of gas, conse-quently his gas cost but 1s. 2½d, per 1,000 feet, the coke and residuum paying the cost of manufacture. If proper economy were used, 1s. 6d. per 1,000 feet would afford sufficient 18. Od. per 1,000 feet would afford sufficient profit when the supply was large. He was supplying the Great Western Railway Company at Swindon at 1s. 8d, per 1,000, and certainly did not lose hy it." Besides, even from the statement of Mr. Lowe, engineer to the Metropolitan "Chartered Gas Company," not only is the residual matter "of somuch more value in London than in Liverpool, that value in London than in Liverpool, that gas can be manufactured 5d, per 1,000 cheaper in the former place from that source alone, larger the quantity of gas made the cheaper the production;" but moreover, "when the quality of the Liverpool gas is tested by the quality of that burnt in other large towns and the price paid for the two, the former being 4s. 6d. per 1,000 cubic feet, and the latter 7s. per 1,000 cubic feet (as it then was in the metropolis itself)—the reference being had to quality alone,—the other—the Liverpool gas quanty alone,—the other—the Liverpool gas— would he relatively worth 14s. per 1,000 cubic feet." What are we to think of the present restive resistance and protestations of the metropolitan companies then, by comparison with past experience at Liverpool? The former are not only engaged in a repetition of the groundless panic and outery of the latter as to "losing prices," "ruinous losses," &c. &c., but they are losing all the little remnant of discretion which their past, though perfectly cognizant silence, under the infliction of our own hard knocks with stubborn facts, appeared to indi-cate. Desperation and the 'panic' aforesaid cate. Desperation and the 'panic' aforesaid have at length betrayed them into publication, or into a permission of publication, in their defence, and hy their own dependants, of some very formidable-looking and would-be-proof-positively-statistical, but only too-clearly demo-lishable, pamphleteering and other statements, such as those to which we have before given all the notice that they merited; and we only now recur to them to prove, by a single instance, and by internal evidence of their own showing, and altogether apart from that overwhelming evidence which we have already adduced from time to time in The Builder,—how truly preposterous and suicidal are their endeavours bolster up a bad cause, and to occupy a false and untenable position. The instance in question occurs in a recent pamphlet, in the form of a Letter to Lord Carlisle, by a Civil Engineer; and is repeated essentially, though in a more curt and manageable form, in a letter signed Thomas G. Barlow, addressed, teachly with the parablet in corrections of the control of the contro tetter signed monas ex-together with the pamphlet in question, to the editor of the Morning Advertiser,—an able defender of the good cause. In that letter, the statistical details of the pamphleteer are the statistical uctains of the paimparteer are thus essentially put:—One ton of coals, at 17s., yields 9,250 cubic feet of gas, which give 2l. 0s. 10d. at an average price of 4s. 5d. (arising from the iniquitous and unjustifiable overcharge of 2s. 2d. beyond what the city street lamps are lighted at, namely, 3s. 10d., their Acts, viz., 10 per cent., which were shortly afterwards announced! and that, too, in the face of a constant rise in the price of coal!!"

And now we may add, the expiry of another year, and even in the midst of a general depression in trade, has only confirmed the flou-

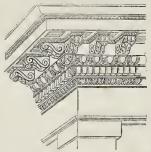

HINTS FOR STREET ARCHITECTURE

CORNICE, OR CORNICIONE, OF THE COLONNA PALACE, AT ROME,

CORNICE OF A HOUSE IN ROME.

CORNICE OF THE PALAZZO BORGHESE, ROME

rated wholesale price of the coal itself, namely, Tax. a sum of no less than 11. Os. 3d. is added to the expense on every ton of coal, for wages or salaries, loss, repairs, and other incidental items of outlay; and that, too, altogether exclusive of interest on capital or expense of works and interest on capital or expense of works and pipes no less than of cost of coal itself. In other words, it is alleged that for every ton of coals converted into gas, a City Company has to expend 1l. 0s, 8d. for mere wages, loss, repairs, and other incidental charges. It is to this sum of 1l. 0s. 8d. that e mean to restrict our present remarks. the same pamphlet we are told, that in the metropolis "the quantity of gas made and distributed, or lost by leakage, in the year 1848, was 3,200,000,000 cubic feet,"—to produce which, it informs us, 350,000 tons of coal were used. Now, 350,000 tons of coal, at 1l. 0s. 8d. a ton, amounts to about 361,666l. at 11.0s. 8d. a ton, amounts to about 361,6661.

—a sum which we are to believe that the metropolitan gas companies pay every year for mere salaries, repairs, and other incidental charges! If such really be the case, we can only say that it affords one of the strongest arguments that can possibly be urged in favour of a thorough reform in the administration and supply of this public and poor man's invaluable property—gas-light.

As to the general progress of the gas movement, both in town and country, we had much more to say. but our limits impel us to reserve it till further opportunity; meantime we have only room to remark, that while the metropolitan companies, or their representatives or defenders, are renewing the delusive estimates of apparently moderate profit or percentage on

of apparently moderate profit or percentage on their capital, estimates founded, as we have already showed, not on the capital actually laid out in necessary works, but on the whole of the enormous amounts authorised by their re-spective Acts of Parliament;* and while they are refusing, on many repeatedly disproved are retusing, on many repeatedly disproved and delaisive grounds, to reduce their present charges, we observe that one of them, the Phemix, is at present offering to supply gas at Bedford for 5s, per 1,000 cubic feet, on a small and comparative expensive scale, and with coal there at 17s. 6d. a ton; and that the same company has already erected works at the Stratford station of the Eastern Counties, and contracted to supply the same article there, on a probably still smaller scale for fourteen. a probably still smaller scale, for fourteen person a probably still smaller scale, for fourteen years, at a price beginning with 5s., to be afterwards reduced to 4s. and 3s. 6d., atthough unquestionably coal will there also cost considerably more than the same company can have it for in the materials; where the view of the probable where the view of the probable where the view of the probable where the view of have it for in the metropolis, where the price of gas on an immensely larger scale cannot be reduced below 6s. without a "ruinous loss!"

⁹ And exclusive of all allusion, of course, to the important but secret system of bonness, which we have occasionally exposed, so as to show that is averaged at least 30 per cent. of the dividend itself. Mr. Barden of the Great Central Gas Consumers' Company, recently so the Great the two city companies, "whose 80's, shares have for year of the two city companies," whose 80's, shares have for year of the two city companies, "whose 80's, shares have for year of the shorter the recent panie in shares, been quoted at 300's, and which pays 10's, per share, besides a frequent homes, which, it was offered to be proved in a court of justice, renders the annual profit of the 80's shares equal to 10's." Were we inclined we could also say something more about bonuses rom our own private knowledge, but that is unnecessary.

HINTS FOR STREET ARCHITECTURE.

CORNICE, OR CORNICIONE, OF THE COLONNA PALACE, AT ROME.

The exterior of this palace has little to attract attention, though the details are all very hand-some. In the interior the noble picture gallery is perhaps unrivalled for the beauty and splendour of its proportions and decorations.

CORNICE OF A HOUSE IN ROME

This design has been attributed to Raphael Sanzio, but it is not at all similar to his other works, which have all a marked character, and are easily to be distinguished.

CORNICE OF THE PALAZZO BORGHESE, NOME.

This enormous palace was commenced in 1590, by Cardinal Borghese, and was finished by Paul Vth about the year 1615. The first architect was Martino Longhi, and it was completed by Flaminio Ponzio.

BLINDS TO SHOPS WITHIN LIMITS OF BUILDINGS ACT.

WITH regard to a house in the Quadrant, WITH regard to a nouse in the Quadrant, Regent-street, in the district of St. James, Westminster, Mr. Pitt, a blind-maker, was about to fix on the top of the shop front a blind-box, framed of wood, which was to extend in a line with the shop front, and to the same extent at one and and which also same extent at one end, and which shop front continued over the whole thickness of the party wall, or nearly. The district surveyor objecting, the parties required the official referees to determine the following

questions, viz.:
1st. Whether the said blind-box, which they agreements, viz.—questions, vibid they consider only a tenant's shop fixture, would form a part of the shop front, it being intended to fix the same on the lead-flat over the said front, without altering the same, with iron brackets screwed thereto?

same on the lear-hat over the said front, without altering the same, with iron brackets screwed thereto?

2nd. Whether such blind-box would be at all subject to the rules of schedule E. of the said Act first above mentioned?

And 3rd. Whether if the entablature of a shop front be merely altered for the reception of a blind-box within it, it would require such entablature to be wholly made in conformity with the said schedule, by keeping all woodwork the required distance from the ceritary of the party wall, or stopping it with a pier or corbel of incombustible material?

The referees awarded,—" 1st. That the said slind-box, if fixed on the lead flat over the said shop front, will form a part of the said shop front. 2nd. That the said hilnd-box will be subject to the rules of schedule E. of the said Act first above mentioned. And 3rd. That if the wooden entablature of the said shop front be altered for the blature of the said shop front be altered for the rules of schedule E. of the said Act first above mentioned. And 3rd. That if the wooden entablature of the said shop front, must not be fixed nearer than 4½ inches to the centre line of any party wall or party walls; and if it be fixed at such distance of 4½ inches, then a pier or corbel, built of stone or of brick or other incombustible material, and of the width of 4½ inches at the least, must be fixed in the line of the party wall, so as to he high as the woodwork, and so as to project one incb at the least in front of the face thereof."

THE BRITTON TESTIMONIAL AND CLUB.

Many of our readers are interested in the testimonial to Mr. Britton, and will be glad to testmonial to Mr. Britton, and will be glad to learn what progress has been made in it. The "Club" which grev out of it had their first dinner (given by Mr. N. Gould, F.S.A.) on Tuesday last, and on the health of Mr. Britton being drunk, one of his friends read a short reply that he had written, being not sufficiently well to speak. We give the following portion of it, as affording the information desired:—

well to speak. We give the following portion of it, as affording the information desired:—

"On the 22nd of August, 1846, nearly a hundred of my kind and partial friends invited me to a public dinner at Richmond, as a compliment for my archeological and literary lahouts, promoting at the same time a general subscription, as a Trastruonntal of those exertions. Some of these friends knew that my gains in the literary market were never great, and that the profits on book-making, or authorship, are rarely commensurate with its tolls and anxieties; for the phrase "a poor author" is proverbial. At the same time I must endeavour to disabuse your minds of a popular prejudice, by assuring you that any professional author, whether man or woman, possessing but a fair proportion of talent, industry, and prudence, may obtain a respectable income hy a judicious exercise of the pen. The little I have acquired has arisen from other sources than writing and publication; and, although not rich, I am happy to acknowledge that I have saved enough to secure the comforts and some of the luxuries of life. Amongst the latter I include the cordial companion-hip and confidence of friends, whose talents, tastes, and characters render them valuable members of society at large, and examples to their families and associates. From an intercourse with such individuals I have derived much happiness; and as long as life may he granted to me I hope to deserve and enjoy their unreserved friendship and cordial sympathy. I have not yet mentioned the "mprecedented circumstance" belonging to this club, and the testimonial to which I have alluded. Sums of money, pieces of plate, and other honorary rewards have been often awarded to beroes, states. "unprecedented circumstance" belonging to this club, and the testimonial to which I have alluded. Sums of money, pieces of plate, and other honorary rewards have been often awarded to beroes, statesmen, and the officers of great public companies. In my own case the subscription already referred to commenced in the warm hearts of a few esteemed and estimable friends, who know the extent of my literary works, and the industry devoted to their production, together with the comparatively humble station in which I was contented to live. They enisted their immediate friends in the cause, and the amount collected bus far exceeded my most station in which I was contented to live. They entisted their immediate friends in the cause, and the amount collected has far exceeded my most sanguine anticipations.—for there has been no public appeal, through the medium of the newspaper press. The total will be at least 8001.—the whole of which will be expended in the preparation of an illustrated volume, which I am writing and preparing for publication, and which I trust, according to the market price of such articles, will be at least of equal value to the amount subscribed by each individual. Hence there will be a reciprocity of obligation between the giver and the receiver. By this engagement I have entailed upon myself an amount of personal and mental labour, which I little anticipated when I pledged myself to the task. If, however, life and health be granted me for a few months more, I hope and expect to see a volume completed, which will meither reflect discredit on the head nor heart of the author, nor impeach the taste or generosity of those kind friends, on whose account, and for whose gratification, it has been written."

Captain Smyth, director of S. A., in replying for the Astronomical Society, pointed to Mr. Britton as the founder and first secretary Mr. Britton as the founder and first secretary of the Geographical Society. Mr. W. Tooke, F.R.S., replied for the Royal Society; Mr. James Walker for the Institution of Civil Engineers; Mr. W. Cubitt, M.P., for the Building Interests, and Mr. Cunard in connection with Steam Navigation. Mr. Burgess, Mr. Cunningham, Mr. Ex-Sheriff Hill, Dr. Ure, Mr. Wansey, F.S.A., and others were also present. also present.

THE WOODEN ROOFS OF OLD ENGLAND.

AT a recent meeting of the Hereford Archæological Society, after other communi-cations (reported at length in the local papers), Mr. Beloe read some remarks on roofs.
